So then, whereas this is a Truth (as assuredly it is) certainly we may see that these huge Woods were not in vain made, but that they have some benefit (for so they have) viz. a most great Treasure for such who know it, and know how to use it. Which I will therefore shew, as clear as the Noon-day Sun, and will so set it afore the eyes of the blind and darksome world, that the Deriders and Contemners of natural Philosophy, such as is to be Learned only by the fire, and not out of *Aristotle*, may be even enforced, will they, nill they, to confess and grant that the Fire is the true Teacher and Master of natural Arts, and so will be; for whosoever they be that are Ignorant as to the Fire, and that know not its wonderful efficacy, tho' they may be most skilful Proficients in foreign Tongues or Languages (which in the more-secret Philosophy makes not at all to any purpose), yet nevertheless they will not be able to accomplish any the least matter in things of so great a moment: I do therefore say, that such men as are skilled in natural things, are not of right to be contemned, or secretly back-bitten by those who say, Believe not such a man that hath not attained the empty vain Title of a Doctor in the Universities. I confess ingeniously, that I never frequented the Universities, nor ever had a mind so to do; for should I have so done, haply I should never have arrived to that knowledge of Nature, which I mention without boasting, as I now possess; neither doth it ever repent me, that I have put my hands to the Coals, and have by the help of them penetrated into the knowledge of the Secrets of Nature; I do not desire to disturb any one in this way, or to thrust any out of their places; I never was willing to live on the costs of great men, but have with my own hands gotten me my Food and Raiment, alwaies advisedly thinking on that most known Verse;
— *Astutus*

— *Alterius non sit qui suus esse potest.*
 Let not him anothers be,
 Who can of himself be free.

But to return to my concentration of Wood, I can with truth affirm, and will experimentally demonstrate it, that the greatest Treasure of the World; yea, as great or greater than is in Wine or Corn, lies hidden in Wood. VVine and Corn do require the Labour of Man for its growth out of the Earth; but Leaves, Grass, Briars or Bushes, Shrubs, Twigs, all sorts of Trees great and small, do come forth out of their seeds and sprouts and grow up and encrease infinitely without any help of man at all.

Therefore I say that more profit may be reaped of VVood than of Corn and VVine, were the Art of extracting thencefrom so great a benefit but known to any.

So then, forasmuch as this little Book (as being the first part of the Treatise of concentration of things) treats of the emendation of Vegetables only; and that of VVine and Corn is already finished; I will now in the name of God set about VVood, Leaves, and Grass, and lay open those most great and hitherto hidden Treasures and Riches, and set them forth before the Eyes of the whole VVorld. And I pray God, the Omnipotent, VVise, Unsearchable and Merciful Lord and Father of all Creatures in Heaven, in the Earth, VVater and Air, that he would so govern and guide my hand that I may here write and teach nothing save only such things as serve for the Glory of his Divine name and the health of all Mankind. Amen.

VVe have shewn in the two foregoing Chapters how VVine and Corn are to be condensed into their Juices, that so they may be commodiously sent into those places, in which profit may be gotten.

Here now falls in this question, How the Juices are to be squeezed out of Herbs, Twigs, Shrubs and great Trees, and being pressed out what good they serve for, seeing they are not of use for meat and drink like those which are extracted out of Corn and VVine.

To this question I make this reply, that indeed there is not any food to be prepared from them, but that yet other things are thence preparable, and such as men cannot be without, viz. VVhole some Medicines, and likewise Gold and Silver wherewith a man may also buy, besides VVine and Corn, other necessities as Garments and other appurtenances which men stand in need of, besides meat and drink.

But to begin the work it self, we should in the first place teach the way how Juices may be squeezed out of Leaves, Grass, Shrubs, and then afterwards shew their use. But forasmuch as none is of so weak a judgment as to lay out Moneys or things valuable, and to bestow his labour and sweat on such a thing whose use and profit he is ignorant of; 'tis therefore necessary, that (before we come to teach the way of squeezing out the Juices) we first shew, what benefit and profit ariseth from that kind of work; that so a Man's labour may not be spent in vain: To give satisfaction herein, I affirm, that the greatest and best virtues of all Vegetables are hidden in a certain Salt which the Physicians and Philosophers call the Essential Salt. Of this Salt all Vegetables are full, but yet, one fuller than another as experience testifies. Such Herbs as have not much taste, as Lettuce, Coleworts, Rapes and such like have a less portion thereof, and are therefore easily putrefied. But such as are sharp and bite the Tongue, as *Water-cabbins*, *Arsmart*, *Laurel*, *Pepper-wort*, *Scurvy-grass*, all the kinds of *Cresses*, all the sorts of *Radishes*, *Leeks*, *Onions*, *Garlick*, *Mustard*,

and such like; also all bitter Herbs, as *Carduus benedictus*, *Wormwood*, *Fumitory*, *Esula*, &c. all such as these are full of it. Besides, all such Vegetable plants as are naturally sour, yield much of that Salt, amongst which, may be reckoned, unripe *Grapes*, sour *Apples*, sour *Cherries*, *Wild Plums*, rough (or wild) *Grapes*, the unripe *Mulberries* or *Black-berries*, the unripe *Barberries*, &c. But yet some of them yield more, others less Salt; which inequality and changableness is accidental, for they are as to their natural foundation like each other.

NB. Some Herbs and chiefly those which have a notable bitterness, as *Carduus benedictus*, *Wormwood*, *Fumitory*, do (after their being squeezed, and when their Juice is depurated, and the Phlegm draw off, and the remaining Juice concentered or condensed in the cold,) yield natural Nitre, and such as being put upon a burning Coal will presently burn up in a flame, like the common Salt-petre which is usually extracted out of the Earth digged in Stables, and so concentered, or crystallized): As for other Herbs and Fruits which are not bitter, but have a piercing sharpness, as all the *Cresses*, they (after their expression or squeezing) yield a volatile Salt, which does not burn like that which is drawn out of bitter Herbs: Such as have an acidity in them, as *Sorrel*, *Barberries*, *Ribes*, curled *Grapes*, wild *Apples* and Orchard ones, and other unripe Fruits, do yield another Salt, viz. a Salt tasting like the acid taste of Wine, and resembling Tartar of Wine, in taste, virtue, efficacy & propriety.

And now albeit that these three kinds of Salts are unlike in taste, yet notwithstanding the one is most easily transmuted into the other, insomuch that Tartar may be made Salt-petre, and Salt-petre Tartar. The third sort which is more volatile than the others, and which proceeds from the *Cresses*, *Mustard*, *Aron*, *Pepper-wort*, &c. will easily be turned into either of the former.

But as concerning this last, it is virtuous in Medicine, as I have hinted to you in several places in my other Writings, but (set aside its Medicinal use) and it is of but little benefit. The two latter, viz. The Nitrous, and Tartarous are of various use. The Dyers use Tartar in Dyeing their Cloths, and Salt-petre is used to make Gun-powder withal, and for the Transmutation of Metals, and other such like Arts, as I have clearly proved in my Explication of my *Miraculum Mundi*. Forasmuch therefore as both sorts of Salt are used in great quantity throughout the whole World, and that there can scarcely be had so much as serves for necessary use, and upon that account are always good Commodities, and that Salt-petre is twice the value of Tartar, therefore 'tis but fitting, and well worth while to extract Salt-petre out of the Juices of Herbs and Trees, it being of more value, and better price than other Salts. But if it should so be, that there should be so much Salt-petre as that it should be of a poor price, then may the Juices be turned into Tartar. But forasmuch as it will not easily so happen, that there should be such a glut of Salt-petre, it will be the best way, to improve those Juices on the making of it; and specially because it may at all times serve for the profitable bettering of Metals; nor can ever so great a quantity be produced, but that it will sometime sell off. 'Tis more profitable, and better to use it for the bettering of the meaner Minerals than to make Gun-powder with it; and were not that most pernicious Art already too well known, it were better to be without it, than to make it, so far should it be (from any one) to describe the manner of making Gun-powder. But

But forasmuch as neither my desire nor will tends to be any occasioner of hurting my Neighbour by the help of Salt-petre, but inclines rather to benefit him thereby; and to this end I have already clearly enough disclosed many most profitable Arts which proceed therefrom, *viz.* in my *Miraculum Mundi*, and in the Explication of the same, and moreover shall do in the following third and fourth part of this Book, about the bettering and concentrating of Metals: I am, verily, confident, that none will interpret it in the worst part, if I shew the way of making Salt-petre out of Wood and other things, that so, our Country may by the benefit of (such) Herbs, Grass, and Wood, which otherwise, by a rotting, and are of no profit, be enriched (if it be only sold) with abundance of Treasure, and may afterwards be spent on most profitable Arts, as may be seen in the *Miraculum Mundi*, and in the Concentration of Minerals and Metals. So that he that would not make it into Gun-powder, has no need so to do.

Besides these Virtues of Salt-petre which we have reckoned up, there do daily more and more new and admirable ones spring up out of the dark, all which, were they here to be summed up they would even draw the whole World into an admiration of them. But we will forbear to multiply more words concerning things of such moment; for it may easily be perceived from what has been hitherto demonstrated, and from those Publications I have made (by my Writings) that many more, and greater things lie hidden in this Subject, which neither I, nor others know of. Deservedly therefore may Salt-petre, or Nitre, be termed an Universal Subject, and Wonder of the World, notwithstanding many rude and unskilful Fellows, will upon this saying, shrink up their Noses, and audaciously contradict me (and say) that Nitre is not the true and Universal Dissolvent.

But if Nitre be not that Universal Subject, then let those that prate against this Judgment or Opinion of mine, produce another and better Subject; which, yet, in my Opinion they will never be able to do. If it were not an Universal Subject, how comes it to be so plentifully found to be in all things. Is it not found in all Vegetables? Is it not in all living Creatures that live either under the Earth, or in the Waters, or in the Air, or on the Earth? Is it not met with (or found) in the inmost Bowels of the Mountains, and even in the most hard Stones? I will demonstrate it in this small Treatise by most clear Arguments, and will most evidently evince it.

In the first place, that all Vegetables have it, is already clearly demonstrated and proved, for I myself (and I am the first, as I know of) made trial and turned their Juices into natural Salt-petre. But I will now so evidently shew the truth of this thing, that even those blind Back-biters and Detractors shall feel it with their hands.

In the first place therefore, I demand, whence the common Nitre is gotten? Is it not out of the Earth, which is digg'd out of the Stables where Beasts stand? For it has insinuated it self into (or joined it self with) this (Earth) passing out of the Excrements of the Beasts in length of time, and hath coagulated it self therein, out of which it is at length drawn by pouring on of water, and then is boiled up into Salt-petre. Who can deny this? I think nobody can. So then if this be granted, that Nitre is found in the Stables where Cattle stand, the Question is, By what means, and way it came into the Stables? Is it by the help of

the Urine and Excrements which the Beasts have there cast forth. Then again, I ask whether or no those Beasts have those Excrements from their Meat and Drink, or from elsewhere? They cannot arise from water, forasmuch as they drink nothing but Water: So that they must necessarily have their rise from the food they eat, and that consists of the Vegetables, Grass, and Herbs. Therefore we affirm, that the Salt-petre was of necessity in these Herbs, and Grass, afore the Beasts feeding on them. For if it had not been there it could never have been made in the Beasts Bodies that which it was not afore. For their Stomachs contribute nothing to this Operation, save a bare putrefaction. And besides, the Countrey men do even the same thing, for they gather up Stubble, the Leaves that fall from the Trees, the Grass, and such like things, and put a great quantity of them into a Pit together, and there leave them so long, till by the help of Putrefaction they are all turned into Dung, and therewith do they afterwards Dung their Ground (in such wise) as is wont to be done with the Excrements of Beasts. Therefore, forasmuch as that putrefied Grass and Stubble doth dung the ground and render it fruitful, (as well) as the Excrements of Beasts, it must needs be granted, that they have likewise Salt-petre in them. For it is not the Dung, but the Nitre in the Dung, that is, the Author of that Dugging Impregnation and Fertility, as I have already confirmed by Arguments in my *Miraculum Mundi*, and which will be sufficiently convincing proofs here in this place.

I would therefore fain see that Man that dares be so bold and heady as to deny this thing, that the Essential Salt neither is, nor can be made, Nitre.

And now we come to treat of the Beasts in the Fields, of the Fish in the Waters, and of the Birds in the Air, that so by a thorough examination of all these sorts we may see, whether or no they are enriched with Salt-petre, and whether or no their Essential Salt be like the Essential Salt of the Vegetables, and can by the same means pass into Nitre.

In the first place, and above all, this is here to be considered, as a main principle, (*viz.*) That all those things which dung the Fields and Lands, and fatten them, must necessarily contain in them Salt-petre. For from this only, and alone, comes all the fertility throughout the whole Earth, which Axiome cannot be gainsayed. But now, that the Animals, or Beasts, Birds, and Fishes are Partakers of the same Virtues, I firmly gather from hence.

First of all, it is not unusual for the Gardiners to put the Horns, Hoofs, and Bones of Beasts, to the Roots of Trees, and so cover them over with Earth, and that on this account, because they make them exceeding fruitful. This now is every where used: Likewise the Gardiners do every where buy up Hens Feathers, Hens, and Pidgeons Dung; as also from the Tanners and Curriers the Offals or Shavings of the Beasts Skins, and their Hairs, and use them to enrich their Gardens. The Vine-dressers also buy up the shavings of Horns of the Comb-makers in many places where they can get them, by which, they fatten their Vines, far better than with Dung, and that lasts for nine or ten years. The Gardiners do likewise buy up from the Tailors bits, or pieces of Woollen and Linen to dung their Gardens when they plant Colworts. If they did not find any Nitre, or Fertility in them, to what end would they lay out their Money on so base a Matter? To the Ignorant and

K k k k

Unskilful

Unskilful, these things may seem wonderful and incredible, because such a kind of dunging Land is not every where in use. He that is incredulous, let him go to *Celen* on the *Rhine*, and there he'll find that I have spoken nothing but the truth. All these things do the Gardiners make use of according to their ancient custom, for from their Predecessors learned they these Secrets. Nor know they what other reason to alledge for their doing this, but only tell you, that they serve exceeding well to enrich their Fields and Vineyards.

But I do assuredly affirm, that 'tis the Nitre that is hidden in these things; performs this effect: There is therefore far more abundance of Salt-petre in the Superfluities (as Nails, Horns, Hair, &c.) than in their Excrements, or Dung. And I thus prove it.

First, Because they will give you for one Sack full of the Shavings of Horns, half an Imperial, which is as much as will buy four or five such sacks full of Cow, or Sheeps dung.

Secondly, They will give the Tanners, or Curriers, above an Imperial for one Cart-load of the Shavings of the Hides, whereas with the same Money they may buy three or four Load of dung. Rags are sold for a quarter of an Imperial. Were they not virtuous or effectual, why should they be so dear? This here spoken, we have proved so to be, by the customary practice of the common men only, as Husbandmen and Gardiners. Were it lawful for me to reveal somewhat to the purpose, I could teach how to extract out of every hundred weight of Bones in Beasts, Birds, and Fishes, ten pound of Salt-petre. But this is not to be divulged.

Now it remains in the next place, to confirm, that Nitre does not only lie hidden most plentifully in the Vegetable and Animal Subjects, but that it may be digged, or gotten out, and prepar'd of Stones, Rocks, Cliffs, Hollows of Mountains, and out of the plain Field in a very many other places; and this is undeniable, for 'tis evidently known, and if need were, I could, for witness sake, make mention of many such Testimonies. He that is desirous of knowing more, as touching this salt of the Earth, let him peruse the ancient Philosophers. But forasmuch, as every one hath not those Books at hand, and that many Men cannot understand them, I will for Amplifications sake add yet one demonstration, to shew whence that Nitre ariseth, which sticks on to, or swells out of those moist and old Walls of Houses. Comes it not from the Mortar, with which the Bricks are joined together? Not only all Stones are fit for making Calx, or Lime of, but also all kinds of Stones, which break, or grow in the Waters, like Drops, or Pebbles: Likewise, those stony things which grow in the Sea, as Coral, the Pearl shells, or Mother of Pearl, and Shell-fish of all sorts, which being burnt, moulder in the Air, have in them plenty of Nitre, and will easily yield it forth to those who have the way of extracting it disclosed unto them. But this is not the place to mention it in, because I have determined to treat here, of only expressing the Juices of the Vegetables, concentrating them, and making them gainful or profitable.

Forasmuch as we have hitherto understood (or shewn) that Nitre or Salt-petre may be had from all things, viz. from Herbs, Wood, fourfooted Beasts and creeping Things, from Birds in the Air, and Fishes in the Water, yea from the very Elements themselves, as Earth, Water, Air, and Fire; It must needs follow that it is that so much spoken of Universal Spirit without which nothing can either be or live:

It is the begetter and destroyer of all things; in which all things are, as I have demonstrated in my *Miraculum Mundi*, out of the most ancient Philosopher *Hermes*. I therefore hope, that no body will any more doubt thereof or oppose himself with a perverse stubbornness against a truth so manifestly known. Were not the shortness of time an impediment unto me I could most easily produce more arguments and those too more pregnant. If any one is minded firmly to cleave to his own stubborn perverseness, even *Hermes* himself should be arise from the dead, would lose his Labour in teaching him; and therefore let them keep their contumacy to themselves.

We have sufficiently confirmed and that by arguments enough, that Salt-petre is an universal Subject, and every where to be found. Hence it may be easily believed that it may also be met with in woods, and that more strong, more powerful, more corporal, palpable, and visible than in any other Subject: Upon this account therefore is it to be also sought for, and drawn forth out of them too. But forasmuch as such an Extraction cannot be made afore that the Juices are prest out of the Wood, out of which Juices the Nitre is to be drawn forth, the whole Art consists in squeezing out these Juices, but yet by another kind of way than is done with Herbs. Therefore the due Presses being fitted ready, I shall be able to shew him who requesteth it at my hands (so as he does not endamage me) the way of squeezing them. For to prostrate a work of such great moment to every ones view, whereby those that are unworthy, should partake of such great Secrets, and by which a thing of so much value should be obnoxious to a common Abuse, is not verily, either necessary, profitable, or laudable. Let not any one therefore take it amiss, that I have so careful a regard of things so considerable. Let it suffice, that I have detected the thing, wherein such great Treasures have hidden themselves, which hitherto are profitable to no body, but are easily acquirable, or to be had. Do but look a little upon those most vast Woods of *Germany*, which are stored with such mighty abundance of Trees, that wood is of no account. There hath been none as yet that has converted them unto their use, save a few, who in some places make Pot-ashes of the wood they burn; and yet they have but small gains therefrom, because they can't have vent sufficient for as much as they could make by their burning the wood, nor do any use them, but Soap-boilers, and Dyers.

Besides, I never as yet saw the Man that duly attempted that Artifice, and so administered it as to get therefrom a greater gain. For sometimes they gather scarce an hundred weight of Pot-ashes out of the burning of ten or twenty great Trees, and they can hardly have above five or six Imperials for it. And now consider but the great Labour and Sweat in burning so much Wood into Ashes, and of boiling the Ashes into a black Salt, and then of making this Salt red hot in peculiar Furnaces, that it may become white, green, or blueish; all this consider'd, 'twould make a Man admire what 'tis that could stir up those that follow this work, or order it to be done, to suffer such a quantity of Trees to be burnt up, for so very little profit. But what need many words? They have the wood for nothing, and (as the Proverb runs) *The half White of the Egg, is better than the empty Shell.* Haply if they knew how to make any thing better, or more profitable out of their Wood, they would not omit so to do.

How many hundred weight of wood, are they to burn

burn afore they have one hundred of Pot-ashes? But now if the Juices that are squeeze'd out of them were boiled into Salt-petre, they would get ten times the profit with far less trouble.

Let us compute the case, and suppose that out of an hundred pounds of Wood, there are squeezed forth twenty pounds of Juice, and that from these twenty pounds of Juice, you have some 4 or 5 pounds of Nitre, and that a middling Oak or Beach will load, when cleft, some ten Carts, and each load hold twenty hundred weight. Now then, one hundred yielding five pound of Nitre, a load of twenty hundred, yields an hundred pound of Nitre; the Tree that is about ten load, yields a thousand weight.

Now we'll put case that a hundred weight of Nitre yields twenty Imperials, which being ten times multiplied, makes two hundred Imperials for ten loads, or for that one Tree divided into ten loads.

But to wave so accurate a computation, and not to extend it too far, we will suppose a hundred of Wood to hold only three pound of Nitre, and a load to be about twenty hundred of Wood; this load will yield Sixty pounds of Niter, and the Tree ten loads, so there will be Six hundred pounds of Niter. If now one hundred (of Nitre) will cost ten Imperials, that Tree will yield sixty Imperials for the six hundred pounds of Nitre. The smallness of the cost (in making it) makes the labour the more profitable; nay, if by this invention of mine, the price of Nitre should fall down, even to ten Imperials (which notwithstanding, will not so easily come to pass) yet would the gain thereby be great, yea ten times more than that which comes from the Pot-ashes. But he that knows how to use this Nitre, for the concentrating of Metals, (concerning which the three following parts of this Book shall treat) will not have any cause of fear, that this Nitre will lie on his hands and yield him no profit.

By what hath been said, the well-minded Reader will easily perceive what vast treasures are oft-times before his eyes, and through ignorance lie as yet unknown, and not used to advantage. What man knows God's end, in producing to light such great Mysteries and Secrets of Nature, in this most filthy Dregs of the World? To give thereof a Reason, we will not tire our understanding, but give most humble thanks to God for such great Mysteries that he hath revealed for the comfort of many men, and will pray unto him graciously to bestow on us his fatherly blessings, to the end that we may well use such great gifts so freely bestowed.

But now if any should be of the mind that it is wholly unnecessary, that this Art should be made publickly known, because that Gun-powder is made of Salt-petre, and that by Gun-powder many Cities and most strong holds are overthrown, and nothing is to be expected thencefrom, but Slaughters and Destruction: To such, I answer, That it was not for this end that I disclosed this most great and most profitable Art, that by its base abuse I might help on these horrid Calamities; but my aims have been chiefly at this, if haply any new Foreign Enemies should invade our most dear Country (which is a danger we seem not far off from) we might be able to receive them with like Arms or VVeapons, and by a just defence drive away such a Calamity.

And withal, that those most thick and vast VVoods being despoiled of their thicknes, may not for the time to come be a shelter for Thieves and Robbers, as likewise for wild beasts, all which oftentimes do much mischief.

And farther, That many thousands of Men may get their Food and Rayment more Commodiously and more easily, and may make good Gold and Silver from the unprofitable VVood. For by means of this Art, thousands of moneys may be gotten in our German Countries, without any hurt to our Neighbour. Nor is it needful to cut down any great Tree, for the superfluous Branches or Loppings, and the shrubby briary Underwood which is all about the Trees, and doth chiefly afford a passage to the Stags, and hiding places to other hurtful Creatures, will be sufficient for this kind of use or employment.

The other Trees that grow up aloft may be preferred to build Houses withal, which may be employed about Hunting: And besides, when the Trees are freed from that thicknes, and have thereby a free access of Air, they will the more easily dilate their Boughs, and grow up taller. And then too, those wild Beasts that are profitable, will (when such vast deal of underwood or shrubbiness is taken away) meet with fatter pasture, and with more plenty of Grass, and escape by having a freer Course from the pursuing VVolves, which now they are letted from by those most thick Shrubs and Bushes. But yet if so be that in such places in which is such a deal of VVood, and to no man useful; a good part even of the great Trees should likewise be cut down, and used about this Artifice of ours; yet notwithstanding there would not arise to the Possessors thereof any loss, but much Profit; and when all's done, there would be yet remaining a huge multitude of Trees. Consider I pray those most spacious VVoods the *Ardenne*, *Ottowick*, *Semane*, and *Bohemian* VVoods, and many others which the Countries in *Germany* are cloathed (or environed) with.

Can it be imagined, that they can at all be lessened by the Glass Furnaces, or the melting of Minerals and Metals.

These places that are one year bared by cutting down the Trees, you shall see in few years covered over again, by the benefit of nature, with new Trees; so that it cannot possibly be, that though even a very great many Presses should be used to press the Juices out; such a vast immenseness of Woods should be exhausted, and make any sensible diminution of the Wood.

But now, if any one shall believe these writings of mine, and shall, after the afore-mentioned way, set about the Concentration of Wine, or Corn, or Wood; I do faithfully affirm unto him, that I have in this Book openly proposed the very naked Truth, without any dissimulation, and have not omitted any thing save the revealing of the Presses, which for certain causes I conceal.

And therefore I certify every one, that I will not as yet divulge this most wonderful secret, of thus-boiling Nitre out of the Juices of Wood, or else I would have described the Press too. Besides, though a man should even see the Press, and know how to make it, and were ignorant of the purification and concentration of the Juices, he would not bring the Art to effect; so that, without my instruction, the work cannot so easily be made publickly known. And though this seems to be a thing so mean, yet this squeezing out of the Juices of Wood, is far beyond (or richer) than the operations on VVine or Corn. But I doubt not but that many, well considering of this unheard of, and very gainful Artifice, will begin to think whether or no good Nitre may not likewise be gotten out of other Subjects easie to come by. Now then I must methinks needs instruct these. The

The common Fossile Salt and Sea Salt may by the benefit of this Art, be also turned into Natural Nitre; but I judge it needless to speak more of this, for as much as that which I have already mentioned concerning the Wood seems abundantly enough. Briefly, God doth in all places set before our eyes His Omnipotency, where he gives not Wood, there vouchsafes He Stones and Bones, out of which Nitre may as well be extracted, by those that are skill'd in this Art, as it may out of other things. And where Fire is wanting, there is Water however. But I know that it is certain, and past all doubt, that by the certain experience of Art, plenty of good Nitre may be made out of Sea Water.

Now if any shall object and say; Thou affirmest that Nitre is to be found in all places of the World, but especially in Wood and Stones; but yet, that there are many places which have neither Wood or Stones, & have only a Marshy Moorish Soil, which brings forth Grass only: By what means can Nitre be there, or in what things, or what places should it be sought for, thinkest thou there?

I answer; I have already, in what hath been said afore, confirmed, that Nitre may be drawn in large quantity even out of Grass; but verily there's no such need here of so doing, to rob the beasts of their food, and to use the Grass about Nitre-making: For the Cheese and Butter that come from the Grass, will easily yield more than the Nitre that's made thereof; would; God deals not so unjustly or unwisely with the Creatures as to give his blessings with a liberal hand to one, and take the same away from another: No, no; The Treasure of his Riches is inexhaustible, and he gives his Creatures largely to partake of them; nor doth that axiome (or maxime) which is so very usual in this perverse World, prevail at all with him, viz. The fall of one is the rise of another; but his will is, that all should have their necessities abundantly supplied, that every one should have enough, and that every thing should come to perfection. Therefore it is not at all necessary, that Nitre should be extracted out of the Food which the Beasts live on, because it may easily be extracted out of other Subjects which which bring not any profit to Man or Beast, and this in great quantity too. For in such plain low Countries and moist watery grounds, where you shall not meet with either Mountains or Vallies, or Stones, or Wood: The most gracious God hath, like a provident and wise householder provided for the inhabitants, giving them a certain kind of earth inlaid with many Roots and Fibers that grow therein, which the Dutch call *Turf*, we *Toss*, the which they use instead of Woods, to boil with, and about other necessary uses; so that they may easily be without the wood, which is yearly brought them in such vast quantity out of other Countries. Now these same Turfs contain in them the like Essential Salt as Wood does which Nitre is extracted out of.

As concerning Stones, they do not in those places shew themselves to fight (as lying deep) if you except such as are burnt (or Bricks) and which are brought hither to build houses withal, yet God hath bestowed on them a matter sufficiently apt to make Lime withal, so that they may be without, even Stones themselves. The Shell-fishes of all Sorts (serve to this work), and sometimes the raging of the Sea, drives the Fishes shells ashore by heaps, and like little hills, the which being carried by the Inhabitants into the Cities and Villages, they put them in the Lime-Kilns, and reduce them by a strong fire into good Lime, and that by means of the Turfy firing we mentioned but now; so that I do not see any reason why, in these Countries that are de-

stitute of Wood and Stones, there should be found less Salt-petre than in others, in which huge quantities both of Wood and Stone are found. Nay, rather I affirm, that there is more there, than is in almost any Country of Europe; for do but compare the price of Turf and Wood, the Wood is dearer, the other cheaper; besides the Wood is harder to press out, and this yields its juice more easily.

So then, from all the foregoing demonstrations I absolutely conclude, that there is not any place in the whole World, wherein great quantities of Salt-petre may not be made.

And if I should say, that there is not to be found in the whole world any places in which Nitre may be easier and plentifullier made than in the low Countries of Germany, as Brabant, Holland, Zealand, Flanders, Friesland, the Groningen Fields, the County of Emden, and all those Countries which run as far as the German and Baltic Sea, in this their moorish kind of ground; verily I should not speak untruth, but if need were, I could witness it of a certainty.

But lest my Writings should remain too obscure and unknown to such as are unskilled, and that such may not overmuch torment their Brains by unnecessary Pleadings how this may be effected, I judge it altogether necessary openly to confess the Truth before every one, and say, That Nitre or Salt-petre, were but its true use known, is justly and worthily to be accounted of as the greatest Treasure of the whole world, as being a thing by the help of which, good Health, Honours, and Riches may be purchased; and this we shall confirm in the three following parts. If then that this be granted, then this also will be yielded too, that the Subject-matter out of which it is extracted, is not to be despised, but to be highly valued; and therefore ought Wood and Turf to have their due Honour given them, concerning which, I have by many Arguments affirmed, that the one of them is every where in the upper Germany in great plenty, and the other in the low Countries of Germany, (nor doth these at all come short of the others) and that both may and ought to yield Nitre. Besides, not only the bare Turf is hereto useful, but likewise the hitherto thrown-away ashes, which are every where cast out as unprofitable.

NB. They are not useful in washing, as wood-ashes, with which the Laundresses make Lyes, and being they are not, they are thrown away as good for nought. But yet there is in them a great quantity of a certain salt, which being inverted by Art, passeth into Nitre; therefore through meer ignorance is there cast away, together with those Turfy ashes, a vast quantity of unripe Salt-petre, from whence a mighty profit might redound to those Countries, but being providently thrown away, is meely lost. But yet I would not have any imagine, that the Salt which is made of the Lee of Turf-ashes, is presently Salt-petre; no, for 'tis needful that the subtilty of Art be first thereto used, afore such a Salt be brought to that pass, as to burn like Salt-petre: But yet care is to be taken, that that Art become not common, for then so Noble a thing, and so profitable to our Countries, will be known by Enemies as well as Friends; which to prevent, it must be warily handled, and the principal work here requisite is this, viz. That it may not be published so imprudently, as to render the ungrateful and unworthy partakers of the same, as well as the thankful and worthy ones.

By these things here spoken may every one see and gather, that God is no respecter of Kingdoms and Principalities, and provides for some better than for other some; all Men are His Creatures and Heirs of all His Goods

Goods, if so be they be but willing, and do not stubbornly oppose and slight the Divine Grace, and do not wantonly cast it away and neglect it: Concerning which we shall speak more in the following part, touching the Concentration of Minerals.

This we must yet farther add, viz. That common Salt-Nitre is in all Coasts, in all Tracts or Continents, and in all Countries; yea, even in all those places in which there's neither Wood, nor Stones, nor Leaves, nor Grass, nor Earth, nor any bottom of Earth: As for example; Near *Greenland*, where the Sea is said to have no bottom, where the Whales are caught, and which do greatly enrich the Merchants with their fat or oil: Did they but know, that the remaining Flesh and Bones were even yet of great use, and knew they but how to turn them into Salt-petre, they would prefer it far before their Fat, for the sake of which, so much labour and trouble is undertaken; for in the flesh of one Whale only (which as it is, is not at all profitable to any man) I dare say, that there may be found 20, 30, 40, 50, yea, sometimes 100 Centenaries, or hundreds weight of Salt-petre. And so likewise the Intrails of the dried Stock-fish that are caught in *Iceland* and *Normay*, should I affirm, that they would even almost excel the Fish itself in value, I should not be deceived. I find no difficulty that might hinder me from affirming this to be agreeable to the Truth.

Do not the Salt-petre-men prefer the Nitrous Earth that's found in old burying places (if they can have it) far beyond other Nitrous Earths? And this among others, that most excellent Examiner of Metals, *Lazarus Ercker*, in his Book of examining of Metals, affirms, and gives this Earth the chiefest place. Nor is it to be wondered at, that of late in *Poland*, towards *Masovsy*, where formerly great Battels have been, and many thousands of men slain, and by reason of the multitude of them, have (after the Battel) been thrown into deep Caverns of Mountains for the easier burying them) there hath been a great quantity of Salt-petre extracted out of the Earth. Were there not gain and profit to be gotten, those men that are employed in the extracting and boiling it, would not lay out so much Money on unprofitable Ashes of Carcases.

But to pass this by, let any one make but this Experiment: Fill some Vessel with Bulls or Ox-blood, and put it in a warm place till it putrefie and be turned as it were into Earth; then extract a Lye out of this Earth, and boil it so long, till a little skin appear on the top, then lay it by in a cold place, to shoot into Crystals, or little Stones, and these will be true Nitre.

NB. There is another and more compendious way of extracting Salt-petre out of the blood of Animals, which belongs not to this place to treat of; let us but compute the account a little. If there are yearly kill'd in some great City some ten thousand Oxen, besides Calves, Hogs, Sheep, and Goats, and the blood be cast away as unprofitable, [now an hundred weight of blood yields some 5, 6, 7, or 8 pound, or more, of Nitre.] the question is, How many Hundreds of Salt-petre is lost? That this may be the more clearly evidenced, viz. That there is much Salt-petre in all Beasts, Fishes, and Birds, take another Experiment: Let a Beast, Bird, or Fish be laid in some warm place, where no Rain comes, to putrefie, out of the Carcass there will come Worms; of these Worms or Maggots take about one pound, more or less, put them in a Glass with a narrow neck, stop the glass with Paper only, and set it at the Sun, but not too hot, and in a few daies the worms or maggots will be turned into water; then pour out this water into a Copper Vessel tin'd over, clarify it with the whites of Eggs, as Vegetable juices are wont

to be clarified; then evaporate the clarified Juice, by little and little, by decoction, till it be covered over with a skin; as we have taught you in the Vegetable Juices; then set it by in a cold Cellar, and there will shoot good and natural Nitre, but especially if that Liquor shall have stood a while afore in the air.

The self-same Experiment may any one make with other Vermin that arise from Flesh or Cheese, and he shall find that even living Creatures have Salt-petre in them: so then there is nothing to be found, wherein that Universal salt of the World is not seen to be; but in some the salt doth sooner put on a Salt-petre nature, and in others it is already made Salt-petre by Nature.

Let this serve as an example, viz. The Essential or Universal salt of Vegetables, Animals, & Minerals, is indeed in its own nature nitrous, but it does not conceive any flame afore it has attracted life and flame from the Air. Further, one salt attracts that Life sooner and willinglier than another does, according as it is by Nature framed. By how much the more volatile and urinous the salts are, so much the sooner do they change themselves into Nitre; and by how much the more biting and more corrosive, so much the more difficultly and slowly do they put on the nature of Salt-petre. But because Nitre is a salt that partakes of both natures, viz. of a Urinous and Corrosive Nature, and is compounded as it were of both a Urinous and a Corrosive Salt, therefore by the help thereof one skill'd in Nature may easily help the salts, and make of them whatsoever he pleaseth. Nor is there in the nature of things any salt, but may by the help of Art be turned into Nitre; but especially those salts which are sublimed by fire, and are elevated by the force thereof; as likewise those that are in the Urine and Excrements of all Animals; yea more, Animals, Vegetables, and Minerals themselves do easily assume the nature of Nitre: This now is the first degree of salts. Another degree of salts are those that are somewhat fixer, (as the Sons of Art call them) and are such as are left in the fire, from Vegetables, Animals, and Minerals: These do more hardly pass into the nature of Nitre; but the hardest of all, are those salts which are in the third degree, as common salt, Sea-salt, Mountain or Fossile salt, Alum and Vitriol; for by Art are even these brought to that state, as to pass into true Nitre, but harder than the former, for they need a longer time for transmutation, than the abovenamed flying, volatile, and urinous salts. And therefore I would not have any of you to opionate, that when I say in my Writings, that this or that salt may be converted into Salt-petre, as soon as ever it is extracted out of the *Lixivium*, or by barely calcining with fire, that (I say) it should presently be true burning Salt-petre; no, there is a yet farther time thereto required, whereto it may attract its life and soul out of the Air, and become burning or inflammable.

Every common Barber and mean-pated fellow, knows that the most Salt-petre hitherto made, hath been boiled out of a Lee, drawn out of the Earth taken out of old stables, wherein Sheep and other beasts have stood. And why, I pray, out of the old standing places of Sheep, Oxen, and the like Cattel, and not likewise out of the new? It is on this account, because old Stables do not only in long Process of time imbibe more salt out of the Excrements and Urine, and consequently yield more Salt-petre; but also those very salts (that come from the Excrements of the beasts) and which is the main thing, have in long process of time received their soul or life from the air, which new salts have not as yet attained unto: For

let any one boil and try his conclusions on the fresh Dung and Urine of Animals, as much as he list, they will never become Nitre, unless they draw their Life out of the Air. Let any one take some good Salt-petre, and mix it with Earth, and deffil off the Spirit in a Retort, there will come over into the Receiver such a sharp and corroding water, as will dissolve Metals, Stones, and all other even the hardest Mercurial Bodies, and yet the Salt-petre was not corrosive before, but it hath gotten that degree of corrosivity from the fire's operation. Contrariwise, let some good Salt Nitre be taken, and be calcined in a Crucible, with burning Coals or such-like other matters as will burn or calcine it: By this operation it will be changed into a very fiery and fixt Salt, but not so corrosive, and thus it will dissolve all Fat, Oils, Greases, and sulphureous Bodies, which thing the former corrosive Spirit will not do; for such bodies as are dissolvable by this fixt and urinous Salt, the former acid Spirit leaves them untouched; and on the other hand, it will dissolve those bodies which cannot be dissolved by the fixt Salt, and yet are they both extracted out of one and the same Subject, by the help of the fire. Hence may it easily be conjectured, that this is an Hermaphroditical Salt, and partakes of both natures, seeing it puts on both (or either) of them; for the Philosophical Maxim witnesseth, that every thing hath its Original out of that into which it can be changed and resolved.

Now when I pour the acid Spirit that distilled over into the Receiver on that fixt Salt again, they are both of them divested of their nature and property; the Spirit loseth his sharpness and acidity, and the fixt salt puts off its fiery nature, and so they both become again an Hermaphroditical Salt, but yet not presently, but 'tis necessary to allow them some time of standing together in the Air, whereby they may receive that life and that burning nature which the Fire hath deprived them of. But yet notwithstanding, this comes sooner to pass in this, than in other contrary subjects, because these two Contraries have heretofore already been one Salt-petre; for such as never have been Nitre, but are hereafter to be so, require a longer abode in the Air. These instructions we give to those that might haply think that Salts may be animated without the help of the Air.

And now, that I may perfectly demonstrate that Salts do get their life out of the air, without any encreasing in weight thereby, and not from elsewhere, I will give you this following example. Take 1 l. of Honey or Sugar, and let it be dissolved in ten pounds of Water, and let this Water be set for some weeks in a warm air, the Honey or Sugar will be as a magnet to this Water, and will by attracting a life out of the air turn it into sharp Vinegar, and that without any thing at all encreasing the weight of the same. By this means Water, by the addition of Honey, Sugar, Malt, or any other Vegetable Juice, will, by the operation of the hidden and attracting essential Salt, pass together with it into excellent Vinegar. But now some or other may imagine that the Honey, or the Juice of the Fruit and Corn, have in them an hidden acidity, which by the help of the warm encompassing air, hath revealed it self, and so did not attract its birth out of the air: But I will shew you the contrary, as follows: Take a pound of Honey, Sugar, or some other Vegetable Juice, and force it over in a Retort into a Receiver, and you will find that there will deffil over 10 or 12 lots (or half ounces) of insipid Water, and so many of acid water; the remainder is a dead ashes, and have

nothing in them; the Vinegar and Phlegm that ascended, will not yield one pound of Liquor, and the Vinegar it self, with its acidity, will scarce be so strong in taste as those ten pounds of water that are turned into Vinegar by the air.

This now demonstrates, that there was not in the Honey any more acidity than what was thence drawn out by the help of distillation, for the remaining ashes have not any taste at all. But put case that the acidity which is driven out of the Retort into the Receiver by the force of Fire, should be as sharp as *Aq. fortis*, (when as tho' it is scarce as fowre as Vinegar) yet would it hardly make ten pounds of Water so acid as to be compared with the other which is made by the essential Salt and the Air; so that it is evident that the acidity (as being a life) is drawn by the Magnetick Virtue of the Honey out of the air.

But as touching this Essential Salt of Vegetables, its being a Magnet, to extract an acetous spirit out of the air, and communicate it to the dead water. You are here well to observe, that the universal spirit or soul of the World may be drawn out of the Air many and sundry waies. In the aforementioned Example of Vinegar is a spirit extracted, which is fit for the converting of Vegetable Liquors into Vinegar. In Hermaphroditical salts, the Universal Nitrous spirit becomes burning, as in Wine, Ale, and Metheglin. All these are so made by the means of air, without which no Wine or Ale can ferment, and without fermentation it is impossible for a burning spirit to be generated; which said spirit is easily afterwards turned into Vinegar, and this Vinegar into Nitre, and this Nitre again into a burning spirit or Vinegar; for every Life is of one and the same original, and may by the benefit of Art be changed out of one nature or property into another.

So likewise the same is to be understood in the generation of Salt-petre, all Salts of Animals, Vegetables, and Minerals are dead, afore they get themselves a life after a magnetical manner out of the Air, and be made into Salt-petre; for amongst all salts, none deserve to be called a *Live Salt*, but that one of *Salt-petre*, which by the Philosophers is called the *Watchful Dragon*, which likewise at the beginning was dead, but hath got himself a Life out of the air. By all which it is most clearly manifest, that the life of all things ariseth out of the air, and that those Creatures which come not into the air want Life, and that such things as already have life, are choak'd and die if the air be taken from them. Hence comes the death of all things, by a suppressing or taking away of air, (in which air the Life of all things consists) what way soever it be done by, as the aforesaid example of the Vinegar teacheth; for if Honey or Sugar were not made thin with Water, there would never have hapned that changing into Vinegar. So likewise *Grapes, Apples, Pears, Barley, Oats, Wheat*, were they not moistened with water, but remained dry, they never would get the nature and property of Vinegar, and that for this reason, because the air could never infuse its life into a dry and shut-up body.

This they well know who are employed in making a quantity of Vinegar; and upon this account do they in Summer time set their Vessels open to the Sun, and in the Winter, they keep them in warm stoves near the fire, and both afore and behind, and at the bottom do they make holes to give the Air entrance, that so they might the speedilier promote the changing of the Wine, Ale and Metheglin into Vinegar.

They likewise know this too, that even strong Vinegar

negar if it be a long time shut and kept from Air, corrupts and dies. The which thing, seeing it is to be as well understood of other Subjects, as of these here, viz. Salt-petre and Vinegar, we may affirm thus much, That by how much the more of warm Air comes to the Wine or Ale, so much the sooner will they pass into Vinegar. And by how much the more of warm Air the Salts draw, so much the speedier will they draw a Life thereout-of, and put on themselves the nature and property of Salt-petre. This is the reason why the Salt-petre boilers do sometimes turn or dig up the Earth from whence they have had Salt-petre, and moisten it with water, that so the Air may the more commodiously penetrate that Earth by its operation, and infuse Nitre thereinto. But yet this business goes slowly on, and may be compared with that where a man presseth out Grapes or Apples a little, and then exposeth those Reliques of the presse'd Grapes or Apples to the Air, or else grinds Malt somewhat grossly and moistens it with water and so sets it by that it may be endued with the nature and virtues of Vinegar: It would indeed come to pass, but yet much slower than if Wine, Ale, or other Drinks were set by so, without the huskiness or bran: The same is to be observed in the making of Salt-petre. By how much the more, the Air toucheth the Salts, so much the speedier will it reduce them into living Nitre. This may be seen in old walls that are built in moist places, you see how the Lime sprouts out and is converted into Salt-petre. We see not the same thing done in the inside of the wall, where the Air can cannot penetrate into it. Hence know I of a truth, that it is not the husks of the Grapes, nor the husks or bran of the Corn grows four, but it is the thin Juice or Liquor that is either presse'd out of them, or extracted with water. And I likewise see that 'tis not the Ashes, nor Calx vive, nor the like calcined things that becomes Nitre, but only the Salt that is hidden in them. Therefore seeing that all calcined things being moistened with water and for a long time exposed to the warm Air do extract a Life and become Salt-petre, and that the Ashes and Calx are like a dead Earth and never yield Salt-petre, but remain a dead Earth. Likewise, forasmuch as such Earth doth not at all confer ought to the generation and making of Salt-petre, but is rather every where an hindrance thereunto, whereby the Air cannot associate it self to the Salt; therefore do I separate the earth, body, shell, and useles garment, and keep the Salt, and I introvert it by the Air and turn it into Salt-nitre, but yet not without the addition of Water, in which the Salt is dissolved and rendred more fit for extracting a Life out of the Air; for otherwise should the Salt remain dry this transmutation would be a tedious while a bringing to the desired end.

If therefore the Salts that are prepared by the fire are dissolved in water, and the water be together with it kept by peculiar Instruments in perpetual motion, and some heat be also thereto adjoined, so that there be not the least Atoms of the Salts to be found which have not the incessant penetration of the warm air, and which are not animated, (because the warm air and motion do in all places touch and vivify the Salts): Such an operation as this does more in four Weeks, than if the Salt lay in the heaped up Earth and open to the air (far longer) wherein it would not in a whole years time attain to so great a change. But this perpetual agitation and heating consisteth in a certain wooden Instrument which may of its own accord by an unceasing motion heat the Salt-water, so as that

every Week a growing alteration may be evidently seen and perceived. It is not of any great charge, and one may get ready as many Vessels to be filled with Salt-water to make Salt-petre with (as he pleaseth) for one Man can manage an hundred of them or more and conserve them in continual heat and motion, so that a Man may keep such an Art secret as long as he pleaseth. And as concerning the ordering the salt by the help of the fire and getting it a magnetick and attractive faculty afore it be dissolved in water to be put into the Vessels; and also how the Vessels are to be prepared, this cannot be conveniently declared in writing, but it is expedient that as well the manual operations requisite for the endowing of salt with a magnetick faculty, as the instruments necessary for the turning it into Salt-petre be also well lookt into, with all the appurtenances thereto belonging. Any one will easily comprehend them all, and be able to imitate them; yea far easier than any gross or great work, and it may be improved in any subject whatever. It is not any fordid kind of operation, but pure and clean, it needs not any making of Lixiviums, nor any decoction, nor any evaporation, but perfecteth it self without impediment or retarding the work, and coagulates the Salt into Nitre. Verily it is a most delicate and most profitable invention, from which many others may have a beginning and flow.

Thus have we declared and proved that the soul of the World vivifying dead salts, and turning them into Salt-petre, adds not unto them either weight or increase, and yet nevertheless it is of such abundant efficacy and power as to reduce them all to Life, which Life is no other thing but the little Bird of *Hermes*, and easily admits of being esteemed for the most noble amongst all the Creatures GOD hath made, set aside but the soul of Man, and may by the help of Art be again extracted out of the Salt-petre. But that I may mention the thing more openly and more clearly; I say, that the salts must (by the help of Fire and Art) first get a magnetick and attractive power and faculty afore they can draw a Life out of the air. Now then, after that the universal Life of the World is caught and fettered as it were by the salts, and hath turned the dead salts into living nitre, yet that life lies hidden in that Salt-petre invisibly, and can but a little or scarce anything at all shew out or display its virtues by reason of the Gross body of the salt.

NB. If so be that any one shall but know how to draw out this Life again out of the Nitre, and bring it into a body, and make it visible, he shall have a thing so admirable that he'll scarce find the like (as I believe) in all natural things. For there is such a sweet and red Liquor, as to sight, thence had, that one only small drop will tinge a thousand parts of water with a Golden colour: which (said Liquor) I have not as yet brought to a constant or fixed Medicine, but do make use of it in Medicine (as it is) and I find in it things wonderful. But this little Bird (as far as I know) cannot be again extracted out of the Nitre by any other subject than with a net artificially prepared of Sheeps-skins.

Such a worthy thing as this is, do I rank in the number of great secrets and mysteries, and I suppose it to be that work which the knowledge-desiring *Jason*, being holpen by *Medea* who was most skilful in the Chymical Art, took away from the Dragon, and called it the Golden Fleece: But I would not have any one perswade himself that I speak here of such a Tincture as is extracted out of fixt Nitre (and likewise the same is extractable out of Salt of Tartar) by Spirit

rit of VVine. No, that is no true Tincture, but the Spirit of Wine is somewhat altered and tinged by the fixt salt. But that Liquor of mine is the true, occult, and inmost Tincture, Virtue, and Life of the Nitre, and is of a golden Nature, but plainly flying and volatile, one drop whereof doth so gild an whole Imperial, as if it were gilt over with Ducket Gold. This Tincture cannot be changed or altered by any contrary Menstruum, be it Corrosive or Urinous, no nor by *Aqua-fortis*, or Liquor of Salt of Tartar; the like of which is scarce to be found in all nature.

For if there be a most delicate colour drawn out of the Vegetables, as Cochenele, Saffron, and such like, by the help of the Spirit of Wine, and there be dropt therein but one only drop of *Aqua-fortis*, the colour will presently turn pale, and if you add more, it will vanish for altogether. Or else if a drop of the Liquor of Salt of Tartar should be put therein, it would presently change colour and become duskyish. But now, this true Tincture of Nitre, or Soul of the World suffers not any change from either of the contraries. And should one have even a metallick Tincture, or extract even from Gold it self, yet would it not stand in this tryal, but would be precipitated either by the acid or the fixt salt, and separate from the Menstruums. But ours doth constantly abide in every trial, and resists both the contraries.

I do therefore repeat what I have often said, that there is more lies hidden in Nitre than many thousands of Men can perswade themselves of. But because it is so vile and abject a thing, no body thinks that there lies hidden any thing of good therein. But do but read the chiefest of the Philosophers, and you shall therein find that they do enigmatically point at Nitre, and do call it the Dragon which is to be slain by its Brother or Sister afore it parts with its Treasure; But enough of this.

The things hitherto mentioned, have I produced for this end, that my Neighbour may be the better certified concerning them. All the Philosophers Books are full of this thing, amongst whom, *Hermes*, and *Basil Valentine* excel, who have written most clearly. *Paracelsus* saith openly, Alchimy hath found it in Nitre. The late Philosopher *Nusiment*, hath published a Treatise of the Salt and Spirit of the World, and is verily most worthy the reading, which (said Book) I commend to the Reader that studies these things. Therefore do I here again repeat what I have so oft reiterated, viz. That Salt-petre is the most admirable, the most excellent, and the most powerful Subject of the whole World, whose wonderful properties cannot be enough search'd into. But because it hath its rise from dung and putrid rotten things the greatest company of foolish ones do despise it, but the small company of Philosophers and Wise-men (who are those that know what admirable virtues it has) do most highly esteem it, and set thereon a great value. The well disposed Reader will clearly find more as to its virtue and efficacy, in the three following parts.

O thou the original of all good things, and Treasure of all Treasures, vouchsafe that we may well and rightly improve this earthly and fading Treasure, and may so search after, and use it unto the end, that we lose not the chiefest good, but may rather find and keep thee for ever.

An Admonition, adjoined as an Over-plus.

IN the first Chapter of this first part of the concentration of things, have I plenarily manifested, by what means, new Wines and Musts are (by the help of an Artificial condensation) to be brought into a narrow compass, that so they might be carried into far remote places wherein there are no Wines, and may there be sold to great profit. But yet I forgot to shew, by what means the favour which the winy Juices contracted in their concentration, is wholly to be taken away in the fermentation when they are again dissolved in water, that so the Wines made of those Juices may not have any untoward and unpleasant taste. 'Tis an Artifice without which no man can easily quit himself in this Art of making Wine. But that I may certify every one hereabouts, the Medium (or Basis) necessary about the precipitation in this work is no other thing but common *Sulphur* excellently well purified, a little portion whereof (according to the nature and property or disposition of the Juices) is to be hereto added, which must boil up (or ferment) with the Wine, that so it may draw to it self all the filths, and all the strange odour, and favour or taste in the fermentation and by precipitation cast them down to the bottom, which being done the Wines become sweet, clear, and get a good favour. Furthermore it is to be known by what means (seeing that there are many faces and defilements that will separate themselves out of those kinds of Wines as well as out of others, and settle to the bottom) even they are to be put to some use, that so there may not be any loss, but that the gain may be by so much the greater. Divers ways are there of making profit from them; as for instance, The remaining Wines may by pressed out in bags, or else they may be turned into Vinegar, or a spirit may be thence distilled, and the remaining gross matter be boiled in water, and the Tartar therein dissolved, and press'd out in bags, that it may so shoot into Tartar. But as touching this expression I have taken care to have a peculiar Book published at *Norimberg*, (viz. *The Treatise of the Lees of Wine*.) So that it is wholly needless to make any mention of the same, in this place. The Courteous Reader may use it to his occasions, as being such a Book, in which he will find the said pressing out the Wine and Tartar, and also the making of Vinegar, clearly described, with all the circumstances thereabouts, and without all question if he rightly understands me, and sets about the work, he will do himself a great deal of good.

NB. But if so be that any shall know the Art of turning the Tartar of those Faces into Salt-petre, (and such a thing may be done and that in a very short time) he will get twice the profit, that is to be gotten by making Tartar of them; forasmuch as he need not put himself to the inconveniency of pressing them.

In the second Chapter of this first part where mention is made of the concentration of Corn, there it has been alleadged that the remaining husks or branny parts which remain after the extraction of the Juices, may be made to yield as much yea more Moneys than will pay the costs about the Corn. But it is well known, that those reliques that are left in your boiling up of Ale, are improved to fatten Beasts with. If now a *Medimnus* (a measure of about some 6 bushels) of Corn doth cost half, nay even a whole Imperial, those reliques (that are left of it in working) can scarce cost less than one eighth part of that Imperial. And now out of such a *Medimnus* or measure of such reliques,

liques, they would very hardly when turned in the Beasts, into nutriment, have made in them two pounds growth of flesh, the price of which (said two pounds) would not amount to the eighth part of the said Imperial: Whereas now, if those reliques were handled after the afore-mentioned way of reducing Wood into Juices, they would easily yield as much, or more Salt-petre than the price of the Corn was at the beginning. So that here's an enriching Treasure offers it self to the pious and diligent Householder, whereby he may do good to those in need.

In the third Chapter of the first part, is mention made only of the Concentration of Wood, of the pressing the Juices out of the Wood, and of the making Nitre; But because there is not every where such great quantity of Wood, as to employ it to the making of Salt-petre without omitting the more necessary use of it, yet notwithstanding the case may be so ordered as that a great quantity of Salt-nitre may be made of the Leaves of the Trees and the Grass that grows under the Trees, and there's no need to cut down the Trees, if a Man has no mind so to do. Besides too, in such places where there's but little Wood and much Corn, even the very stubble or straw (of the Corn) is fit enough to be made into Salt-petre. So that there is no place where there is not matter found for the making of Salt-petre.

And therefore I cannot forbear but must needs teach all pious Householders (whether they have their Houses in Cities or in Villages) a certain easie Artifice, by the help of which they may gather a Treasure for their Children, without any labour and costs, and such a one as Thieves can never rob them of.

And now, seeing I have revealed in this small Book, for the benefit both of Rich and Poor, high and low, three Artifices or Workmanhips by which, Wine, Corn, and Wood may be made more profitable; but yet have not brought any assisting help to such as want both Wine, Corn, and Wood, I have judged it worth the while (that so even they who have nothing, and yet nevertheless desire to provide for their Wives and Children in some honest way) to bestow on them a secret Art, whereby they may seek their advantage or profit. And I hope the thing will redound to the Honour of God, and to all our Healths.

Besides, I will shew away to such as have no inheritance left them from their Parents, nor have any thing come to them by Marriage, by what means they may without labour and trouble get a Treasure for their Children.

First of all, Let such a one take care to have some shade or hovel made, to join to that side of his dwelling that lies in the middle 'twixt the North and the East part of Heaven, or some other more convenient place, so as to admit the Sun and Air to it, but to keep off the Rain. Under this Pept-house or Hovel, let him dig a large Pit, and with the Earth he digs out let him make banks round the Pits mouth that so it may keep the Rain off of every side. This done, let him each day in every year, or whensoever he can conveniently carry and throw into that Pit these following matters, so long till his necessity forceth him to dig all out again, and to see how much Treasure he hath gotten, even whilest he slept. Now these matters are, All sharp and bitter Herbs, growing in by places, amongst bushes, and in the way sides, and such as the Beasts feed not on, as *Ejula*, *Cicuta* or Hemlock, Henbane, Fumitory, the thick stalks of Tabaco that are thrown away in those places where it is planted, the hard stalks of Colwort, which the Beasts eat not of,

and likewise all those things they leave in their Troughs; likewise Firr tops or Apples if you have them at hand; also the Leaves that fall from the Trees in Autumn are to be gathered; also Pigeons-dung, and Hens-dung, Birds and Hens Feathers; all the Ashes which Women usually make their Lees with, and other Ashes that are not fit for that use, as also such out of which the Lixivium or Lee is already extracted; the foot of Chimneys, Hogs hairs, the horns of Oxen and Cows, and the bones which the Dogs eat not of. All these matters may he throw into his Pit, and that he may the sooner fill it, he may gather as much as ever he can from the bordering places, and throw it therein, that so in one or two years time he may with all those things fill up his Pit. Mean while he must pour into the Pit the piss gathered in his House, and that he may have enough he must also get as much as he can from his Neighbours, so as to keep the things thrown in the Pit in a continual moisture, whereby they may the sooner putrefy. In want of Urine, common Water may be taken; if Sea-water or other Salt-water can be had, it will be the better. Also the Brine of Fishes-pickle, and the salting or salt-water that Flesh is macerated (or pickled) in are of good use in this business; likewise the Blood of Oxen, Cows, Calves, Sheep, which you may easily have at the Butchers; all these things putrefying together do put on the nature and property of Salt-petre.

If now, all those matters in your full pit shall have well putrefied, then cease from pouring on any more moisture, and all the things are to be left so long till they are dried. And then if you need Money, let a Salt-petre maker be sought for, and bargain with him about the price of drawing out your Salt-petre by water, of making it, and selling it. This done, cast the remaining Earth again into the Pit, together with the remaining Lixivium that shot not into Nitre, and there leave it for a year or two, and moisten it sometimes with Urine, or if you have not this, with common Water. This Earth will again yield Salt-nitre, but not above half so much as at first.

NB. If you stand not in need of Money, let the matter lie, and as oft as it dries, so often moisten it again with the aforesaid moisture, that so the Nitre may more and more grow and increase. By this means shall such a one gather a secret Treasure, & shall not know almost how he came by it. If he needs it not himself, his Children will find it. Thieves & Souldiers will not steal it away. If one Pit be full then another may be made, that so nothing at all of those matters, which otherwise are most base, (but in this case most suitable) may be lost. Now if there were but only one in every Village that were appointed to exercise this Labour, there would be found out as it were in a small Country many thousand hundreds of Salt-petre, and so these matters still serving for the same use, there would never be any scarcity of Salt-petre. And now, Nitre being present, Gold and Silver are not far off. Let every one observe this, and esteem it. Men will sometime or other at last, become thrifty and wise, and will see what blindness they have been possessed with.

Give GOD the thanks, and be helpful to thy Neighbour. GOD hath bestowed on me, I bestow on thee, do thou likewise bestow somewhat upon thy Neighbour, and it will be well with us all.

THE

THE SECOND PART

OF

The Prosperity of Germany.

Wherein is shewn,

By what means Minerals may be Concentrated by Nitre, and turned into Metallick, and better Bodies.

For the benefit of my Country, and of all such as affectionately and industriously follow after Metallick Affairs.

Friendly Reader,

I Have taught in the first part of this Book, by what way the Vegetables, as Wine, and Ale, are to be concentrated, whereby they may yield more profit than hitherto they have done, and also, how Wood is to be reduced into Salt-petre. In this present Second part, shall be taught, how the Salt-petre is to be used, and how, by it Minerals may be Concentrated, and wrought into Metallick Bodies. And as to this Concentration, thus stands the case; that is to say, forasmuch as a good part of Minerals are of very little use, and lie neglected as things of no worth, and prove not profitable to any one, (whereas if there were Men that understood but the Art of it, there might redound a great benefit to the Lands where they are. It hath seemed to me worth while to declare it to my Coun-

try, nor doubt I but that there will arise some diligent ingenuities, who will lay the thing to heart, and take care thereabouts, and will even set their hands to the work it self, and thence get much profit; which to me would be very pleasing and acceptable. Therefore (in the Name of God) will I set about the manifestation of the Gifts of God (which lie every where unknown, and wholly disesteemed, and which yield no Man any fruit) and lay them open before the Eyes of the whole World, that so they may be better known hereafter, and be of more benefit to the Country. And I beseech the most Wealthy, and the most Ancient Householder our most merciful Father, to bestow a Blessing, and good success on this my endeavour, that it may tend to the Honour of his most Holy Name, and the health of all our Souls. Amen.

Of the difference of Minerals, and what is understood by the Name of Minerals.

AS concerning the word Mineral, why all Fossile and Metallick Mines are so called afore they have been wrought upon, and brought by the fire into Malleable Metals, I judge it but of small moment to make any tedious Comment thereupon; besides, others have long ago thoroughly treated of that, and yet it makes but little to the thing it self. But my purpose is (at present) to teach, what means such little esteemed Minerals may be made useful, and profitable by; but afore I begin this work, I will recite, and shew the many sorts of Minerals that there be; then next that, I will shew how, by the benefit of fire, and the hands of the Artificer, they may be converted into better bodies, and become useful, and profitable for Mankind.

Under the Name of Minerals are comprehended, or reckoned these following, viz. Antimony, Auripigment, White, Yellow, and Red Arsenick, Cobolt, Lapis Calaminaris, Zink, Bismute, or the Silvery Marchasite, likewise the Golden Marchasite, Pyrites, or Copperas Stones, Vitriol of various kinds; as also, its kindred, may be added to the number of Minerals. And albeit, that some do also referr Alum, Salt-petre, Sal-Armoniack, Sal Gem, and others of that kind to the rank of Minerals, yet cannot I acknowledge them for such, or reckon them up amongst the number of the above mentioned, seeing there is nothing Metalline to be found in them: Such only therefore do I call Minerals, that have in them a Metalline nature, and which do admit of being joined with o-

ther Metals, and of being molten together with them in the fire, and out of which the known Malleable Metals, may be extracted. These are they which I intend to treat of, and will see, what good is thencefrom extractable.

And first of all we'll speak of Antimony.

Antimony is the noblest Mineral of all, not only because it doth for the most part contain Gold in it, but upon this account too, because more eminent Medicines may be thencefrom prepared for the use of Mankind. In the Mine-pits it has its peculiar Veins; that which is found in Transylvania, hath some little bigger portion of Gold in it, and is accounted of as the best in all Europe, next that is the Hungarian; which likewise doth sometimes contain no contemptible portion of Gold; next is the Feichtenbergsk, which is found at a small Town call'd, in the German Tongue, Gold-Gronack; the Polonian sort, and that which is found in most places of Germany, contains but little Gold, or none at all; but there is some which has much Silver in it, and (for the most part) is neither wont to be used, nor desired, or sought for, save by the Letter Founders, and these use it to make their Matters flow. Also many do use it (viz. 3) in Medicine, and do much good therewith, but it hath certain Enemies who are none of the wisest, and so is hated, and rejected. But yet there lies in it more hidden good, than all its Enemies are able to conceive of, witness my Panacea, which is mentioned in the second part of my Pharmacopœia Spagyrica.

And

And *Basil Valentine*, certainly an excellent Philosopher, writ the Triumphant Chariot in its Honour, which is an exquisite Book and profitable to read.

But as concerning the way of making a *Regulus* out of Antimony, and as to the uses it serves for, that I have described in the fourth part of my Furnaces. Moreover, as to the manner of depurating Gold thereby, and cleansing it from all Heterogeneous mixtures, and as to the graduating of silver, thereby, that it may become Golden, all this have I spoken of in the Explication of my *Miraculum Mundi*; and as to what other effects may profitably be done, therewith in Metallick Operations, shall be shown, partly in this Treatise, partly in the third and fourth ensuing parts. As concerning the way of separating it in quantity out of the Ore, *per descensum*, is to be seen in *George Agricola's* Book, that he wrote of the Metallick Art, and in others; nor indeed belongs it to this place to speak thereof.

Of Arsenick.

Arsenick likewise is a good Fossile, or profitable Mineral, and is put to many Uses. It also hath its singular, or distinct Veins in the Earth, whence it is taken; it is forced out of the Ore by Ascension, and Descension, and is purified for use: It is found white, yellow, and red. Also some silvery Minerals or Ores do in their solution, or melting, yield much *Arsenick*, which the Melters of the Ores do catch in Chimneys or Funnels made for that purpose, and keep it for use; concerning which, you may read in *George Agricola's* Writings. So likewise, *Cobolt* yields *Arsenick*, and so do some Golden Minerals, or Ore; that which is separated from a Minera of Gold, *per descensum*, is very red, and auriferous; and this, those that deal with Metals, have experience of; which, if they separate not from the Gold Ore afore they melt it, it carries away a great part of the Gold, and hides it in its Belly in the melting, so that they would not have so much Gold as there is in the Ore. For indeed, such a kind of *Arsenick*, is an unripe Gold, as shall be hereafter proved: So then, there lies more hidden in that Contemptible, and Venomous *Arsenick*, than any one will easily persuade himself to believe. There are also Medicines prepared out of it, but such, as serve only to be externally applied, in inveterate, and virulent Evils, as the Cancer, and Fistula. It is also used in Colouring and Dying Cloaths, concerning which, you may peruse my other Writings.

Of Auripigment.

This Mineral is in a manner of the same Essence that *Arsenick* is of; but this does not come forth of Minera's, or Metalline Ores, but hath peculiar Veins of its own, in which it is generated; it is an unripe Mineral, and doth for the most part also contain Gold. It is exceedingly Poisonous and Volatile, and therefore it is but little used, save only by Painters. It can be fixed by Nitre, and it makes Copper white, and brittle, as *Arsenick* doth: And it suffers it self to be sublimed out of its yellowness, into Transparent Rubies, which are used for Ornaments sake.

Of Cobolt.

Amongst all the Minerals that are to be found *Cobolt* is the most poisonous; it's an unripe silver, and it oftentimes yields in melting good silver, yet one sort more than other; some also there is which hath not any Silver at all, and is used about the sky-colour'd Smalt, to help make it, with an addition of Fusile Sand, and Potters Ashes. But when they meet with that which has Silver in it, they separate it thence from by Fusion; besides, it may be so fixed by the help of

Salt-petre as to yield permanent Silver, as shall anon be spoken of.

Of the Silvery Marchasite.

The silver *Marchasite*, or *Wismuth*, is a known Mineral; it's every where found to and again in the silver Mine-pits, as well as *Cobolt* is, but yet it is much more fixt than *Cobolt*; neither is it of so poisonous a Nature. It is gotten out of its Ore, or *Minera*, most easily by a small flame of wood fire, and is used by the Pewterers to make their Pewter hard, founding, and fluxile. Likewise, out of its scoria or drossy parts, is the blue Smalt also prepared, which the Potters use to glaze their Pots, and the Glassmen to make sky-colour'd Glasses. It doth very frequently abound with much silver, and 'tis rare to find any that is wholly void of silver: And if it holds so much silver, as is of more value than the *Marchasite* can be sold for (as 'tis barely *Bismute*) they separate it, if not, they leave it in it. For if an hundred weight doth not contain 20 or 30 Lots, or half Ounces they do not separate it, because the *Marchasite* will yield so much. But now, the Silver may be gotten out of the *Marchasite*, by Salt-petre, so as that the remaining *Marchasite* shall lose nothing of its goodness nor be at all spoiled, as I have shewed in the Explication of my *Miraculum Mundi*.

Of the Golden Marchasite.

The name of *Marchasite* is proper to every unripe Metallick matter (and is) of as many sorts as there are Metals; hereupon the matter which has Gold in it, is called the Golden *Marchasite*; that which has Copper, the Coppery; that which has Iron, the Irony, and so that which abounds with Sulphur, is called the Sulphureous *Marchasite*. But now there is Sulphur in all the *Marchasites*, and sometimes *Arsenick* too, but (the Golden ones) have more of Gold than the other *Marchasites* have; Besides, out of all kinds of *Marchasites* proceeds (for the most part) a Vitriol, which shews the nature of that Metal, which the *Marchasite* contains; one while Copper, sometimes Iron; 'tis rare to find a *Marchasite* that hath no Metal at all in it; if it hath nothing of Gold, Silver, or Copper, yet has it Iron, and gives out of it self a Vitriol useful for Dyers, and which such as prepare *Aqua-fortis* cannot be without.

Of Zink.

Zink is a Volatile Mineral, or a half ripe Metal when it is drawn out of its Ore. It is much clearer and brighter than Tin, yet not so malleable and fluxile as Tin is, and it is usually put to Tin to make it brighter and harder. We have it not much growing in Germany, but great quantity of it is every year brought us by the Merchants out of the East-Indies. The way how to prepare it for Medicinal uses, have I described in the first part of the Philosophical Furnaces. It is a golden but an unripe Mineral, it gives Red Copper a Yellow Colour and turns it into Brass, as *Lapis Calaminaris* doth; and indeed that same Stone is nothing else but unmelted *Zink*, and this *Zink* may properly be called a fusile *Lapis Calaminaris*; for as much as both of them partake of one nature. But with *Zink*, there is most an end conjoined Lead too, and then it is not fit to make Brass of, unless the Lead be first taken thereout of; so it is at *Goslar*, where together with the Minera or Ore of *Zink* is Lead also digg'd out mixt amongst it, and is called a Lead Ore, though there be contained in that Ore, four times more of *Zink* than there is of Lead, and yet they burn up the *Zink* for to have the Lead, which Lead hath some Silver in it. In the melting it flies away in fume, and it is a volatile and combustible Mineral, and sublimes it self up into the holes of the Furnace,

Furnace, whereupon the Melters or Founders are constrained to knock it off frequently, least it should too much lessen the Furnace; this matter they knock off, they call Calmei (which is Lapis Calaminaris) and which turns red Copper into Brass, with encrease (of its weight); and so verily by means of the not-knowing or being skill'd in this Ore, a great quantity is yearly burnt up and lost. Sometimes the founders do gather somewhat of the Zink, which is most excellently excellent; but that Ore might be melted with far greater profit, if they did not so burn up the Zink, and force it into fume; but seeing men are hardly drawn back from an old custom, it must be born with.

But yet (I say again) if that Ore were handled in a due manner, there would redound far greater profit thencefrom: than now doth. Such a kind of Mineral as this is doth Westphalia also yield, which the founders there account for a Leaden Ore, because it has some lead mixed with it, but when it comes to be freed or molten it goes (all) away in fume, and therefore they say, it is also a Calmei or Calaminaris Ore, and so it lies unused.

Of Calmei or Lapis Calaminaris.

Calmei Ore is digged out in many places in Germany, but there is none of such note as that which is found at *Aquisgrane*, for that is wholly void of all kind of Leadyness, and much different from that of *Gosharia*, or *Westphalia*; and therefore it is also very fit to make Brass of, which is there made in plenty, and farther, this has Gold in it, though not so much as to quit the Costs of separating it. But there is no Mineral richer with Gold than this, and could it but be ripened (and I doubt not at all of the possibility of so doing) a good deal of Gold might be drawn out from thence.

As concerning what else may be performed with that Mineral, I have formerly told you in my First and Second Part of Furnaces, nor is it needful to treat of the same thing more at large in this place.

Of Common Sulphur.

Sulphur or Brimstone is the most known, most used, and most combustible Mineral of all. As touching its uses in Medicine, and in Alchemy, about the separation of Metals; may you find something mentioned by my self, in the writings I formerly published, and in the writings of others too.

But at present we will only mind you of this, viz. That it is the very Foundation and Root of all the Metals; for tis rare to find any mine wherein Sulphur does not shew it self. Very many places in the World, is Sulphur both made and digged out of the Earth, in very great quantity, & that chiefly in *Iceland*, and in *Italy*, nigh to those always burning Mountains, *Heckla* and *Vesuvius*; it is also drawn out of *Marchalites per Descensum* in many places of Germany, so that enough of it may every where be had for a little money.

These are the chiefest Minerals that I ever knew of, and these are they which are commonly sought after, and applied to use. But now, besides these, there are so many various kinds of Fossiles and Minerals to be met withal, that one cannot reckon them all up, or give them peculiar Names. One contains Sulphur, and Arsenick; another, Cobolt and Sulphur; another Antimony, and Arsenick, and of that kind are there very many more. But yet those that we have reckoned up, are the most known, and most in use, and therefore shall at present be sufficient for us to speak of.

Having now taught what Minerals are, and which of them are most known & used; I will now teach, in the next place, by what means they may (by the help of Salt-petre, & of other Subjects) be fixed, concentrated,

imbodied, or brought into Metals, so as to be rendered profitable for the use of Mankind, and which otherwise lie every where to and again neglected and, are wont to be of no esteem.

And as to the Concentration of Minerals, thus stands the Case with them; they are either to be fixed & subdued, as 'twere by the help of Salt-petre, that so they may not so suddenly fly away in fume in the fire, and be burnt up, but may abide the fire and suffer themselves to be molten; or they are to be reduced into bodies by the help of Metals, that so they may come in use, and that by augmenting the Metals, as Lapis Calaminaris does, or they are to be purified, separated, and made better, as shall be mentioned of Sulphur, Antimony, and the others, that so those kind of Minerals of which there lies to and again, at present, great quantities, wholly neglected, and profitable to no body, may hereafter be of use and benefit.

And first of all, as to the fixation of the Minerals, the way of proceeding is thus, viz. The Mineral is to be powdered, and to be mixt with equal weight of burning Salt-petre, and so to be fired, that the combustible and volatile part of the Sulphur may be forc'd away, and the Mineral may afterwards brook the fire the better, and be molten and forced downwards (*per descensum*); which operation I have treated of in the explication of my *Miraculum Mundi*, and therefore think it needless to repeat the same thing again here. By this mean therefore may Arsenick, Auripigment, Cobolt, Zink, Bismute, and other Volatile Minerals be in some sort fixt by the inflaming and burning up with Salt-petre, so as afterwards to endure the fire, and to yield forth the good they have in them. There's also another way of embodying Volatile Minerals, viz. by the benefit of Metals; if the Metals and Minerals are joined together in a due measure, and be likewise united together by the virtue of a Cementing fire; then doth the volatile Mineral penetrate it self into the Metal, and becomes Metalline, and doth also encrease the Metal, as is evident in Calmei or Lapis Calaminaris, which being joined with red Copper and cemented, enters into it, augments and encrease it, and turneth it into Brass; whereas there cannot be any Metal educed out of the Calmei by the usual way of melting. In like manner may all Arsenical minerals be (by cementation) introduced into Copper, & made corporeal; and these do not colour the Copper yellow as Calmei doth, but make it white, nor is the Copper rendered maleable thereby but brittle; but yet 'tis not without profit; for if that white Copper be handled after a convenient manner of taming or over-mastering it, then the Gold and Silver that was in the Arsenick, betakes its self into Regulus's, which are to be depurated in a Test or Cupel, or else by the help of Salt-petre; but there cannot any metalline body be made out of Arsenick, Auripigment, or Cobolt, by bare melting. The way of proceeding with it is thus; The Copper is to be cut into small bits, and to be moistned over with *Linsseed Oil*, and the Arsenick, Auripigment, Cobolt or any other Regulus is to be powdered and strewed thereupon, and so a bed of Copper, and a bed of Arsenick to be put one a top of another in a melting Pot; then the Pot is to be well covered and fenced with Lute, and placed in a circulatory fire, and the fire is to be put nearer and nearer to it, until the Pot is through red hot, then let it cool, and you shall find that the Arsenick hath gotten ingreſs into the Copper, and makes it black and brittle. The Copper thus burnt, may be reduced into powder, and burnt with good Salt-petre, whereby the Volatile Gold and Silver which was contained in the Arsenick, is made corporeal, and abides as constant upon

upon the Test as other fixt Metals do; so that by this means permanent and good Gold and Silver may be gotten out of every sort of Arsenick, Auripigment, Cobolt, and the other volatile, venomous and base minerals.

NB. This kind of operation is very dangerous to those that are unskilful, and who being unversed in the Chymick Art, have not learned to take heed to themselves. And therefore it behoves every one to beware of doing ought rashly or heedlessly. He that knows not how to carry himself (or his business) warily, let him forbear to meddle at all with this labour or process: But as for one who is better versed, and pretty well experienc'd, he may set about this work safely and will gain by it: Because there is oftentimes found Arsenick and Auripigment that hath in it much hidden volatile Gold and Silver, and which cannot be retained in the common way of melting by Fire, but will totally fly away: But now if it be imprinted in the Copper by Cementation, and fixt in the same by Salt-petre, and then precipitated by means of Lead or Iron into Regulus's, it will render all that fixt which afore was unfixt and flying. But as concerning such a Cementation and Fixation to be done by Nitre, will be manifested by the following process.

NB. But you are carefully to observe, that one mineral must help another in the separation of their Gold and Silver (if you would undertake this Labour for profit): For so each will produce what it has in more abundance, and thou wilt have a greater reward for thy pains and costs. For example, I prove and try Auripigment or Arsenick, and find that it is auriferous, and I have a mind to perfect it and turn it unto my use; hereupon do I look for such Copper as is likewise auriferous, (and indeed there's plenty enough of such every where): Into this Copper do I introduce my auriferous Arsenick by Cementation, and that I may not need to cupellate (or blow off) the same upon a Test (for the very Labour of so doing will cost more than the gains will be of that separation) I do precipitate the Gold that is therein into a Regulus, which Regulus being purified, I obtain the Gold that was contained in that Arsenick and Copper, neither is there any need of cupellating all the Copper. But that the precipitation of the Regulus may be the more commodiously done, I proceed on this wise. I find out some Antimony of a good sort, and which is of a Golden nature; likewise such Iron as hath Gold in it, both which, viz. the Iron and the Antimony, may easily be gotten, and then I set on the separation which I thus institute.

First of all I implant the auriferous Arsenick into the auriferous Copper (if such may be had) then reduce I these into powder, and fire them with an equal admixt weight of burning Salt-petre; by this means the Arsenick is made a little more fixt, and suffers it self to be the better dealt withal in the fire; but if you are well skilled in this kind of labour you may spare your Salt-petre and may melt down your Copper (burnt with the Arsenick and powdered) with an equal weight of Antimony. And if of its own accord it lets fall a Regulus out of it self, then there needs no precipitation, the Regulus may be laid by, and that which remains may be likewise precipitated into a Regulus with common Iron; and this (last Regulus) is also of use, as shall hereafter follow: But if not (that no Regulus falls) then that Mass may again be put into a Crucible, be molten, and a little Iron filings be cast in to make it settle; the which must be stirr'd about with a red hot Iron rod, and when it's well molten,

'tis to be poured out into an Iron Cone; which being cool, the Regulus may be knockt off, in which Regulus will you have the Gold that was in the Arsenick, Copper, Antimony and Iron. This Regulus must be cupellated either by Salt-petre in a Crucible, or with Lead upon a Test; which done, you will have the Gold that lay hid, and shut up in the afore-mentioned Minerals.

But now, if one hath a mind to make that separation yet more compendious, and to have greater benefit thereby, he may add to that Copper burnt by the Arsenick, some Silver burnt with Brimstone, and so melt it with the Antimony, and by the means of Mars precipitate them into a Regulus, then the Silver will so much the better draw to it self the Gold out of the Arsenick and Antimony, and yield (in the separation) greater benefit.

NB. If so be a man be not skilful in this operation, let him forbear his Silver a little, and add some Silver to the Regulus by melting them, and then afterwards purify the Regulus by Salt-petre; for so the Gold that is in the Regulus associates its self to the adjoined Silver, and enricheth it with no little increase, viz. according as the Minerals have had more or less Silver, in the making their separation.

And this is such a work as seems sufficiently able commodiously to sustain life; but it requires an experienced Artift, not a giddy headed fellow. Neither have I written this process for those who are not as yet well versed in Pyrotechny, but for such who are well skill'd and dexterous; and although this kind of operation needs no great store of Art, yet notwithstanding, every one will not rightly perfect it, and therefore do I warn such as are not well skill'd in Pyrotechny to desist from this labour, and betake themselves to some other, and set themselves about doing such things in which haply they are better skill'd, and not to lay the blame on me, when they are frustrated of their expectation, as if I had not dealt faithfully and sincerely in my writing, but let them rather impute it to their own preposterous rashness and unskilfulness; and what loss soever they bring upon themselves, let them impute it only to their own (misconceptions).

To deal plainly with you, that labour is conjoyned with some difficulty; but yet if any one be diligent and well exercised in the Pyrotechnical Art, the operation will succeed in such an ones hands very pleasantly; nor will he want a worthy profit, especially if he takes such Minerals as are richest, and use them about this separation. But some perhaps will say, Whence shall I have those so good Minerals? Who demonstrates to me, which are auriferous, and which are not auriferous, which are good, and which are to be rejected, that so least being deluded in this, I should lose all my labour? I would have such a one know, that if he has not gotten so much skill and experience as to prove a Mineral, whether it be auriferous, or not, he is not at all fit to take upon him this Labour of separation, and he were far better advis'd, if he wholly abstained from setting about it. But yet that I may not omit ought which may seem to be desired from me, I will over and above add here in this place, what way Minerals may be proved by, whether they be auriferous or not, and 'tis on this wise to be done; all Realgars, as Arsenick, Auripigment, Cobolt, and others of that kind, are first of all to be implanted into Copper by cementation, then are they to be molten, or thoroughly purged and subdued with Lead (like as you do with a crude Mineral); after this, there

comes out a certain little silvery Pellet, and this you are to prove as you would for Gold. Now according to the moreness or lessness of the same, so is the business to be ordered, and compute to be made, whether or no the said Mineral is worth the pains of separation as aforesaid. Likewise the Copper it self may be cupellated with Lead alone, and then the remaining silver Pellet be proved for the Gold, with Aqua-Fortis; but as for the Antimony, and Iron, they may be well melted jointly together in a Telt under a Cover or Muffel, or in a clean Crucible in a Wind Furnace, with this observation, that there be used twice as much Antimony as Iron, and so a Regulus will settle, which is to be purged or tried with Lead in a Telt, and kept flowing till all the fugacious parts are evaporated, which done, there is found a silver Pellet, which is to be proved with Aqua-fortis, how much Gold it has.

NB. This probation, or trial is to be accounted of as a certain and lawful trial, but such though as you may easily err in the doing of, and so may have nothing, though it had in it a good part of Gold; for the Antimony will not easily suffer it self to be vanquished, or go off, but it will break the Telt, or Capel, and the little Pellet which is the probatory Globulus betakes it self (by reason of the fierceness, or eating penetrativeness into the Telt) so that the Proba or trial it self, may most easily become fallacious, and yield no certain discovery. Which to remedy, the business is to be thus managed, after that your two parts of Antimony shall have been well melted in the Crucible, with your one part of Iron, there must be put thereinto a little dried Salt-petre powder, and the Pot, or Crucible must again be covered over, and care taken to make them melt well together; then are they to be poured out into an Iron Cone first lined over with Wax, and when 'tis cold, the Regulus is to be knockt off from the Scoria, to which must be added twice or thrice the weight thereof of Lead, and the Regulus of the Antimony doth in the melting-pot separate it self by Salt-petre from the Lead, and the Lead is to be afterwards cupellated, and so that goes all off, and the true weight is had. But albeit, that this description be clearly enough delivered, yet certain I am, that one in ten will not understand it aright, and therefore it is behoeful, more fully to inform, and clearly to shew the Reduction of that Regulus into scoria by Salt-petre. To make this trial or proof 'tis not needful to take a huge vast pot to fill with Iron, 'tis sufficient to take of Iron 100 l. of the smaller probatory weight, and 200 l. of Antimony, both which are to be molten together, and to be precipitated with a little Salt-petre, for so the Regulus doth the better separate it self from the scoria's, the which is then to be washed and purified by Lead and Salt-petre. This Regulus that comes from the Antimony and Iron, put with three times its weight of Lead in a clean Crucible, and make them well to flow in a wind Furnace, but cover your pot close that no Coals fall in, and so hinder the work, then take off the cover and throw in a little powdered Salt-petre, and again cover the Crucible, and above all things have a care that there fall not in any Coals, and let them lie and operate a little upon each other, then the Salt-petre imbibes all the Antimony, Iron, and Lead, and thereby becomes hard. This being done, some more Salt-petre is to be again cast in, and you must make them flow together, and so all the whole parcel of Antimony, Iron, and Lead, betake themselves into the Salt-petre, and

pass into scoria, but part of the Lead remains whole or free, and is not scorified, and therein will the Gold be, which the Antimony and Iron had immixed in them, which if it be blown off on a probatory Capel, or Telt, under a Muffel, there will then remain the true weight.

NB. But it is expedient, that there be a just proportion observed in this kind of Work, that you take not overmuch Salt-petre to this solution, or converting it into scoria, and so bring all the Lead into scoria, but the business is so to be managed, that there be left remaining one third part at least, of those three parts of Lead you took, which is not reduced into scoria with the Antimony; then may it be poured out into a Cone, and when 'tis cool, the Regulus is to be knockt off from the scoria, and Capellated.

NB. He that is minded to wash Metals after this manner by the help of Salt-petre, and to reduce them into scoria, must have an especial care that not a Coal falls into the Crucible, for they will much hurt, and will again precipitate them, which the Salt-petre hath already imbibed, and so render the operation invalid. Besides, it is worth the while to admonish, and tell you that all Arsenick, and Antimony is auriferous, but yet so, as that one sort is richer than another, and that abundance of Copper and Iron hath likewise in it Gold, which no body finds out, nor can it be separated by that old beaten way of Cupellating it with Lead. But some, or other might here say, Where shall I find Arsenick, Antimony, Copper, and Iron, which have Gold in them? Had they any thing of worth in them, others would doubtlessly have extracted it, and not have suffered it to come to my hands whole and sound? To satisfy such an one, I answer thus, tho' those that work on the Metals, do for the most part know, that there is in Arsenick and Antimony, a Volatile Gold, yet know they not how to extract it thencefrom with profit, for the separating way they take would cost more than the Gold they should have would yield, because (according to their usual way and custom of working) all of it would vanish away with fume. And this is to be understood of Arsenick, Auripigment, Cobolt, and Antimony, all which may (by the way we have here mentioned) be tamed and introduced into Copper, and be made permanent and fixt.

But now, that there should sometimes be Gold implanted, naturally in Copper, and should there also be left remaining untouched, is so done on this account, because there is not in it so much as to pay the Costs of the separating it by Lead (for verily the Cupellating it with Lead on a Telt, requires great expences.) This is the reason why Gold lies immixed in the Copper oftentimes, and cannot be thence extracted with profit.

The same is to be understood of Iron, for a Vein of Iron doth oftentimes offer it self, which is very much impregnated with the more precious Metals, and yet no body either knows, or observes it. For the Ore of Iron is for the most part wont to be forced out by unskilful Men who have no care at all of the Gold, but only of such an Ore as contains a good portion of good and malleable Iron; and suppose they did certainly know, that there were in 100 l. of Iron, some Lots of Gold, by what means (I pray) would they extract it thencefrom? For Iron cannot be dealt withal by Cupellation on the Telt, much less can it be separated (as Copper is) by the means of Lead; so that there's no reason for any one to wonder

der that there are so few to be found, that promise themselves, or seek after much good out of Iron, seeing it is not so apt a Subject to be separated, and subdivided as Copper is. But by the help of Arsenick, Auripigment, or Antimony, 'tis no difficult matter to tame, and bring it under, so as to make it yield forth what it has: And 'tis thus. This Iron, which is auriferous, may first be cemented with Arsenick, as we have afore taught of doing so with Copper, then is it to be precipitated into Regulus's by means of Antimony, which Reguli being imbedded, or mixed with Lead, and reduced by Salt-petre into scoria, and cupellated, the Gold doth at last offer it self (which was hidden in the Minera's, or Ores, and so despised) and that with no contemptible profit. But now if any hath a mind to have the business yet more perfect, he may instead of Lead, add some Gold, and then reduce the Regulus into scoria's, by Salt-petre, and abstract it from the Gold; for so the Gold you put thereto doth the better hold that other Gold which it has attracted out of the Regulus, and there is made a much more plentiful encrease, than if the Regulus had been scorified upon Lead. Nor are the scoria to be thrown away, but they may be precipitated by throwing in live Coals, whereby the Salt-petre doth again let fall the Regulus which it hath swallowed up, and which Regulus you may separate from the dross when 'tis cold. This Regulus may be afterwards commodiously used in other Metallick Operations, that so it may yield anew out of it self the Gold; concerning which business there will a place fall in to speak of by and by. And besides, those drossy Offals (which for the gratest part are fixt Salt-petre) are also of good worth, which may be reserved for the subsequent Metallick Operation, which may be stiled a perpetual Metallick-working artifice; so that there is nothing at all wasted, but all things are of use. And this way of the separation of Metals is so very profitable, as that any one may get himself sufficient gain for to supply the necessities of Life. But if you have no fanlie to meddle with Arsenick, or Auripigment, and would willingly shun them by reason of their poisonous nature, they may even be omitted, and you may cement that auriferous Iron, with the Golden Marchasite, melt it with Antimony, and precipitate it into Regulus's. For even by this means too, the Gold that was in the Marchasite, is brought in use, and yields an increase to that Gold which is extracted out of the Iron and Antimony. But if so be there be no Golden Marchasite to be gotten, that separation may be ordered, even with Iron and Antimony, and if the Iron be but auriferous, the Labour will not be without profit.

This kind of separation or eduction of Gold out of the volatile Minerals, and baser Metals will be an egregious aid or benefit to such as have learned rightly to operate in the Fire, and whom (otherwise) a grievous want of things and small estate afflicts; for there is enough of the aforesaid Minerals, every where obvious, but they cannot be well handled, or wrought upon by reason of their unfixtness and immaturity, and therefore do they lie neglected and as it were wholly useless, and are not made beneficial to any. I know that some do well understand the way of fixing Cobolt, and Bismuth by Salt-petre, and do thence get an abundance of Silver; and likewise there are some that know how to tame and subdue Arsenick Realgars by the help of Salt-petre, so that they suffer themselves to be molten, and yield forth their hidden Gold and Silver. But he that shall so manage the business

as to adjoin thereto the auriferous imperfect Metals, such an one will make a more successful work thereof; especially if he gets himself some auriferous Iron, the which he may get for a small matter: And besides, if he makes his Salt-petre himself, then all that whole operation of fixing or separating the volatile Minerals would be done with very little costs, and yield much gain.

NB. But now if any one would yet get more profit by this separatory operation, then he must contrive the doing it not in Crucibles or Pots, but in hearths (or furnaces) where a great heap of the volatile Mineral may by fixing Nitre melt together, and be precipitated into Regulus: then the Regulus may be separated from the Scoria, and be depurated by Nitre in other Furnaces, and be fitted for use; and so by this means may there be so much gain gotten, the like whereof, the great heaps of Ores which Men are necessitated to dig out of the bowels of the Earth with so much expence and charges, will scarce afford.

Likewise all Minerals may by the help of Salt-petre be fixed by the moist way, so as to yield permanent Gold and Silver; whereby (without doubt) full as much, if not more, is obtained, as is by the dry way. The way of operating is this. Dissolve a volatile Mineral, be it Cobolt, or Zink, Wisnuth, Calmel, Arsenick, Auripigment, or any other the like mineral, in a strong *Aqua-fortis*; the solution being made, separate the *Aqua-fortis* again; then shall you have remaining a white Calx, which is fixed by the virtue of the *Aqua-fortis*: So that now it will admit of being molten with Lead, of being separated from the Scoria, and of being cupellated. But he that knows how to melt that Calx with Antimony and to precipitate it with auriferous Copper and Iron, gets more Gold than by that operation with Lead. But haply, every one can't perform that separation; for the excoction or melting, the reduction into Scoria, and Cupellating upon the Test, are operations more known and easier to be done.

Moreover, there are also some Minerals, which may be fixed with the moist fire, that is, with a moist strong *Aq. fortis*, so as to yield their Gold and Silver in the Scoria, but especially Tin, Quick-silver, and Lead: If a vehemently-strong *Aq. fortis* be but once abstracted from Tin, it makes it so fixt, as that it will not fly away in the greatest Fire, but will melt into a white Glass. But now, if you would have it to yield forth its Gold, you must melt other Metals with it, into which the Gold may insinuate it self, and be made corporeal, such as are Silver and Lead. Lead, if it be dissolved in *Aq. fortis*, and precipitated by Urine, it gets such a hardness, that it will scarce melt in a Crucible; if you precipitate it with a Lixivium, it becomes glassy; if with Salt-water, it is rendered exceedingly volatile; for common Salt makes all Metals volatile, and on the other hand, Nitre fixeth them both by the moist and by the dry way, binds them, and constrains them to abide in the Fire; and this you are to know aforehand. Now, for the better confirmation of this thing, see how easily the common Mercury is made to abide the fire, if *Aq. fortis* shall have been several times drawn off therefrom, inasmuch that it will suffer it self to be made wholly red-hot. But now, if the same be sublimed with Spirit of Salt, it becomes more and more volatile, so amongst all Salts there's not one that fixeth Minerals, save this most noble Nitre, and this hath a natural aptness to do it both by the moist and dry way, as hath been even now demonstrated.

And verily, this way of fixing the imperfect Metals (which

(which is done by the help of Nitre, by either the moist or dry way) is to be preferred far before that which is done only with a Fire of Wood, not barely on this account, because it is sooner and speedier performed, but for this reason too, because it fixeth better and more durably: For if any one shall endeavour to make *Arsenick*, *Cobolt*, or other volatile Minerals, permanent or fixt, by the bare force of common fire, How much time, I pray, must he allow it? Haply it will require some months for this kind of Work, if not a whole year, yet at least half a year 'twill need; whereas by the means of Nitre it may be done in one or two daies: For if a volatile Mineral be mixed with Nitre, do fulminate, and be edulcorated, and that fulmination be repeated 3 or 4 times, it will afterwards endure a sufficiently-vehement melting Fire. Or if a Mineral be only dissolved in *Aq. fort.* and that *Aq. fort.* again drawn off therefrom, it will even by this means be rendered fixt and constant in the Fire; so great is the force and virtue that lies hid in Salt-petre: And this the ancient Philosophers well knew, and therefore said that the most vehement Fire of all was to be used to the fixation of volatile Minerals; and this Fire is hid only in Nitre, and is no where else to be found; for the Central Fire hath too soon withdrawn it self from the volatile Minerals and baser Metals, and left them unripe, and they can be advanced to a maturity both by our common Wood-fire, and by the fire of Salt-petre, and be fixed. And now I suppose that I have more than sufficiently proved, by what I have said, That Salt-petre fixeth Minerals and Metals, both by the dry and moist way; nor can any one reasonably deny the same. Moreover, I judge it not fit to pass this too over in silence, viz. That Salt-petre doth likewise make volatile, not only the unripe Minerals, but also the fixt Metals themselves; so as that they suffer themselves to be sublimed and distilled wholly (like common Sulphur or Mercury) save the feces, which are somewhat blackish and stay behind. Any understanding man may easily consider here what benefit is to be hoped for from such a Distillation of Metals; for seeing that all things are by distillation brought to the highest purity (as is clearly evident) it may well be concluded, that when in impure metals the pure parts are separated from the impure, something of excellency must therefrom proceed. I will say no more of this matter at present, for I have already clearly enough demonstrated and plainly enough delivered this kind of distillation or purification of metals, in the third part of my *Spagy. Pharmacop.* and have there shewn, that every imperfect metal, if it shall be distilled, yields volatile Co'd, and that that volatile Gold may be made corporeal, without almost any Cost in a particular way, (and haply also in a universal, which I confess I have not as yet proved) thither therefore refer I the studious Reader of Hermetick and truly Philosophical *Arta* and Secrets.

But that the difference of those waies of fixing or concentrating the volatile Minerals, and likewise the imperfect Metals, may rightly be perceived and laid open, and that it may appear how much more compendious and easie that way which is done by Nitre is than that which is done with common fire; it will be a good help to set down here some process for an example, by which it will be manifest how laborious this way of doing it barely with Wood is, and contrarily how easie that way of doing it by the moist Fire of Nitre is.

It is impossible to fix *Arsenick*, *Auripigment*, *Cobolt*, and such-like as these are without the help of Salt-

petre, unless they are first introduced into other metallick bodies, and are together with them, burnt with a Fire of Coals, and reduced into Ashes, and turned into Scoria, and wholly destroyed, and then at last reduced again into a metalline form, by the force of the intense fire of a Blast or Bellows: All which, that they may be dexterously performed, you must proceed on this manner, as followeth.

First of all, the *Cobolt*, *Arsenick*, or any Realgar like these, that is antiferous, is to be introduced into Copper or Iron by cementation, in the way that we have aforementioned; then the Copper or Iron thus cemented with the Realgars, is to be reduced into fine powder, and to be commixed with Antimony, Calmei, or Calaminaris, the Marchasite, and such order is to be taken, (if for Gains sake you would do a greater heap of matter) to have them slowly and by little and little made red-hot in Furnaces or Ovens, such as in which the flame may have room to play, and as 'twere brandish it self at top of the matters, and stir them, and so let them be calcined and burnt into ashes, until they emit no more fume, and this will be in some few daies; then are they to be reduced in a convenient Furnace, and restored to their metalline form; then again must they be put into the former Oven, and there be calcined and burnt into ashes, still stirring them to and fro, and the ashes are to be reduced, by the vehement Blast of Bellows, and this ashifying and reduction is to be so long repeated, till there be a Regulus found in the reduction, and all the residue turns into unprofitable Scoria. This Regulus then is to be reduced on a Telt into Scoria, and the Regulus being cupellated, the Gold and Silver which the volatile Minerals contained in them, doth shew it self.

NB. Altho' this separation is attended on with indifferent labour, yet notwithstanding (if there be a great quantity of matter dealt in) it is also gainful, especially where Minerals and Coals are to be had for a small price, and also the other imperfect metals (as Lead, Copper, and the like) that concur in this kind of Operation; by which it also comes to pass, that there is a greater quantity of Gold and Silver extracted. For example, I burn Copper or Iron with *Arsenick*, *Cobolt*, and other poisonous volatile Realgars, or with bare Calmei only, which also avails to constringe or bind fast; with these I mix Antimony, Bismuth, Zink, and Lead, and melt them together: Hence ariseth a brittle mass, which is to be reduced into ashes, either in Ovens, as is already shewed, with the flame of Wood, which darts it self at top of that mixt matter, and by heating ripens it, or by live-Coals in a peculiar Furnace, and that on this wise: Let there be built a great or small Furnace, (of good Bricks or Tiles that will endure the Fire) according to the quantity of your matter which you take to prepare, let it be at least a foot over in the inside: in the forepart let it be open a foot's height from the Pavement or Ground, to this end, that the Grate may be put in and taken out, as need is. Then some 2 or 3 foot higher than the Grate, let a door be made, whereby you may throw in the Coals, and above or at top of the Furnace are to be made Chimneys, fitted to receive and condense the fume of the metal, that it may not fly into the air, but being there cool'd, may be taken out. All this being done, fill the Furnace with Coals, and when they are well kindled, cast in a portion of your metalline mixture, which will quickly melt, and being melted, will run through the fiery Coals, and still keep fuming, and elevate it self up into the appointed Chimneys; that which melts down through

through the Coals and Grates, and is in the form of metal under the Furnace, (which bottom must be made somewhat shelving, that the metal which falls down may run into a hole or pit, is to be taken up with an Iron Spoon, and again thrown in upon the Coals, and this is to be so often repeated, and so long, till all your whole mixture be burnt into ashes, or carried up in fume, and so shall be assified and sublimed in the appointed Tunnels or Chimneys, which Flores or metalline Fumes you must take and reduce them in a reducing Furnace, so part of them will pass into a fusile Metal, but brittle. This Metal now must be again assified in that roasting or burning Furnace, and be reduced by blast of Bellows; and this assifying and reduction is to be so often repeated, till all be seenturned into Dross or Glass; which Dross or Scorias are then to be reduced with the most vehement blast of Bellows, and so they will produce a Regulus which is to be cupellated with Lead, as is above said.

NB. But if so be that of the last-made Scoria a Regulus cannot be made by the blast of the Bellows, and that the Scoria remain Scoria, 'tis a sign that you have taken too much Tin, or that your Fire hath been too intense; and therefore you must take such Scorias, and beat them to powder, and mix them with a little of either the fluid Ore of Lead, or Spume thereof, and make them flow in a reducing Furnace, then the Lead draws the Gold and Silver out of the Scoria, which may afterwards be cupellated. But as concerning the manner of making the roasting or assifying Furnace, as likewise the fusing or reducing Furnace, I cannot indeed at present here decipher it, but I will do it in the Third Part following, where more such-like concentrations of Metals shall be mentioned and treated of. And farther, the well-minded Reader must also know, that this kind of Concentration is not at all written for those that are as yet wholly ignorant of the Art of melting metals, but for such only as have already sweated at the Fire, and have been often and much versed in such Separations or Liquefactions.

I question not, but there will be many that will despise this my way of operating, and count it an impossible thing, such are to be left to please themselves with their own fancies. But withal, some will be found, to whom the nature of metals is known, and these will give credit to what I say, and will abundantly profit themselves, especially in those places where Minerals, Coals, and other things requisite are to be had for a small price. The greatest Expence in this way of Concentration is the Coals, which too cannot be any thing much in those places where there are such vast Woods. Every one may have his liberty to try it or let it alone.

NB. But I do openly affirm, that if so be any one shall know how rightly to handle and manage this Work, it may be compared with the perpetual or alwaies-lasting mines; and where minerals may be had, it will be most gainful; but I will not perswade any to attempt it in those Coasts where all things are dear. Nor do I think it amiss to dissuade them that have no experience in these kind of Operations, left upon the ill management of the Operation, the effect should not succeed so luckily as they hoped for, and that then they should lay the blame upon me. That which I have at present written, is agreeable to the Truth, and may be successfully and gainfully performed by an experienced Artift or Laborator. And therefore as I have afore warned, so do I again advise the unexpert to abstain from this Work, unless he means to lose his Labour and Expences.

Such things as I have here omitted for brevities

I take to speak of the Concentration of Metals, the Third and Fourth Part shall abundantly declare; but whoever he be that shall know how to bring to pass such a Concentration, either by the means of Salt-petre, by the dry way of a flame, or the moist way, by the help of *Aq. fort.* shall have a better effect than he that useth the Fire of Wood; but on the other hand, this Fire by Wood is of less Cost than the administration of the Work of Salt-petre is. Alas! What a deal of costs and labours have I bestowed in my life, in searching out and trying those kind of businesses, and having now brought it to this pass, as to be able to yield me the Reward of my Pains, I am not able to manage so vehement a fire, and to order the matters which require so great a heat? Therefore do I now with a willing mind make an offer of these my Experiments, to those who are of a vigorous age, and have Bodies capable of undergoing the toiling in the Fire. But that I may return to the things afore spoken of, and that that assifying and reduction may not seem to the unexperient'd altogether impossible and incredible, I will for their sakes bring undeniable Reasons or Arguments, whereby it shall be sufficiently enough evidenced, that such a cineration or turning into Scoria, hath its foundation in Nature, and that after this manner: Whosoever he be that hath seen or experienced somewhat in metals, knows, that the separation of the more excellent metals from the more vile, is to be done by the benefit of the Fire: for if so be that Gold, Silver, Copper, Iron, Lead, Tin, should be melted together into one mass, and you would separate them by the Fire the one from the other; this cannot be done any other way; but by adding to that mixture some other adventitious and destructive thing whereby the baser metals may be dissipated and deprived of their metallick form, of which sort is common Sulphur and such-like; for this works first on the imperfect metals, destroys them, or brings them into scoria and dross, which when they are so, and no more metals, they have no communion with metals, nor desire or love to be commixt with them afterwards: and by how much the more sulphureity there is in Metals, so much the easier doth common Sulphur destroy them and turn them into Scoria: But, by how much the nobler the metals shall be, so much the less detriment doth Sulphur bring upon them, and the less able is it to disturb (or alter) them. But besides, Sulphur does not only do this, but even the Fire, and Salt-petre both in the moist and in the dry way. It is done with Sulphur, if the metallick mixture be granulated and burnt therewithal, or that it be despoiled of the metalline Nature, then must it be molten and by precipitation be driven or be separated into divers Regulus's. For the Sulphur converts the Mass into Scoria, which when they are molten, that which in them is the most noble doth always separate it self from the Scoria, and settle to the bottom; then next the most noble part comes other which is excellent, but yet short of the former, and so consequently it descends from one degree to another, as from Gold to Silver, from Silver to Lead, from this to Copper, from Copper to Iron, &c. as hath been by my formerly described separatory Art sufficiently enough shewn. But Nitre performs the separations it makes in a different manner: For after that the metallick Mass is molten in a Crucible, and that this (*viz.* Nitre) hath been therinto put, it doth in the first place set upon the sulphureous part, and turns that into Scoria, then the baser Metal, and thus it does on, so long till it hath attracted all the imperfect Metals to it self, and reduced them into Scoria: and so the perfect Metals remain alone, pure & which

which order or governance of Operation, is also to an again, extant in my Writings.

Again, the bare fire is wont to keep another different way of destroying and scorifying Metals, than Sulphur and Nitre do.

For if a Metalline mixture be put in the fire, the more imperfect part thereof is consumed in the first place, and driven into ashes, the more excellent part gathers up it self into a globular form; and as long as it finds any consumable thing therein, so long does it work and act thereupon, nor leaves it off afore it hath reduced all into ashes. But that part which is of a constant and durable nature, remains unhurt by the fire; but yet if the combustible part be too much bigger in bulk than the abiding part, it does not only carry away with it the silver, but sometimes also a good part of the Gold, and brings it into ashes. And now, if those ashes shall be molten with a strong fire, then the ashes which arise out of the imperfect Metals, are turned into Glass, or scoria, but the ashes of the perfect Metals do reduce, and restore themselves into a malleable Body, whether it be Silver or Gold, according as it had this or that Metalline mixture in it; and if you proceed yet farther, with melting the afore said scoria in the fire, there will a new Regulus fall out, which contains in it that Metal, which is the noblest next Gold and Silver, viz. Lead, and Copper; the Tin, and Iron do for the most part abide in the scoria: Even as it is in Cupellation, or the separation of the Metals by the Cupel, the separation is there also done, by the bare fire only, and when the fire acts upon the mixture, it reduceth the Lead into scoria, or spume, or Litharge, and while this is reduced thus, it spares not the Tin, Iron, or Copper, forasmuch as they are likewise combustible, and of affinity thereto, but turns these together also into scoria, which said scoria do then creep, or sink into that penetrable, and porous Cineritious Vessel, or Test, as long as any of it remains: But the Gold and Silver which know not how to be thus burnt up into scoria or ashes, like the other imperfect Metals are left depured and cleansed upon the Cupel: The like also, is to be judged of the afore said incineration of Volatile Minerals, or imperfect Metals; that is to say, when they undergo the force of the fire, they cannot but go into scoria and ashes, and if they have in them somewhat that is especially good, and durable, yet the greater part being combustible, has the prevalency; so that the more excellent part which is in it, is converted together into ashes and scoria. But yet it may be afterwards reduced, for by the vehement blast of Bellows, it separates it self from the more base part, and again assumes a body Metalline, whether it be Gold or Silver.

By this Discourse any one that is not wholly void of all Metallick knowledge may see, that the Metallick Incineration and Reduction, which we have afore delivered, is built upon a firm foundation: But he that cannot understand or apprehend these things, is incapable of being holpen by any art. But the following third and fourth parts will yield a more clear light, or instruction. Furthermore you are to observe, that there are likewise other ways whereby Metals are reduced into scoria, and the better and more excellent part is afterwards extracted out of the scoria, viz. by the help of Terrestrial things which are together, sulphureous, of which sort is all Sand, Flint, and the like. If ought of this kind be permixt and molten with the metalline Calxes, it retains with it the viler part, and lets go the more excellent;

as for instance, there's the Glass of Lead: For if the ashes of Lead be molten with Sand, or Flints, all the Lead together with the Flints is converted into Glass, or scoria, but the Silver or Gold which was in the Lead separates it self like a Regulus, and descends to the bottom.

Some kinds of Salts also are able to make those scoria's, viz. those Salts which are extracted out of burnt ashes, and are commonly called Alkalies, such as are the burnt faces of Wine, the Tartar of Wine, Potters-ashes made of the ashes of Wood, and other such like; these also love to dissolve the sulphureous parts of metals, and do leave the Gold and Silver that is therein whole and sound, and so make a separation of the good from the evil, and give them a notable splendour: Concerning which washing, we will treat more fully in the following third part.

Besides too, even common Salt destroyeth and reduceth the imperfect metals into scoria, but not after such a manner as Alkalies do by washing, but by dissolving and extracting. For if a metallick Calx, or Ore, be powdered and mixt with common Salt, and molten together, the Salt doth more readily seize upon the metal, than on the rest of the drossiness, dissolves it, and turns it into as it were scoria. But to illustrate this thing by an Example, If I would separate a mineral which hath in it, Iron, Copper, Gold, and Silver, and should melt it thus mixt with the Salt, then the Salt would the first time lay hold on the Iron only, and leave the other metals; but if so be there were not so much Iron, as for the Salt to satisfy its devouring self, it would dissolve the Copper too, the Silver and Gold remaining untouched; for Salt is a common Enemy to Silver, but a Friend to the Iron and Copper, which it willingly dissolves in the melting, and attracts to it self, whether it be each apart by themselves, or both jointly together, which if you are minded again to separate each from the other, you must powder that molten Mass, and pour water thereupon, and boil it; so the Iron and Copper enters into the water, together with the Salt, whereinto if you afterwards put some Iron Rods, the Copper precipitates it self, and the Iron abides in the salt water, and is made very fit to use in dying like Vitriol; but if it will not be coagulated like Vitriol, then the Copper (which hath precipitated it self about the Iron) is to be washed and molten, out of which comes purer Copper. But yet such a Copper may be converted to better use than to be molten, of which more shall be spoken in the third part.

By this means, may one separate and bring into use those Coppery Minerals, which have much Iron in them, and by which, the Copper is otherwise rendered unmaileable and unprofitable: and this is such an Evil, as the Metal-workers have hitherto little known what remedy to apply; whereas in the mean while there lie in many places no contemptible Mines of Copper, neglected and unmeddled withal, because they have Iron commixt with them. Some there have been, who have endeavoured to extract the Iron by the help of a Load-stone, but this way is too troublesome, and so is not profitable; but it may be aptly and conveniently done after this manner, did they but know how rightly to use here that afore said salt water, and the precipitated Copper: For the salt exalteth the Iron, and the Iron doth again exalt the salt, and animate it, so as that it may afterwards with a little labour and costs be, all of it, and without any loss, converted into good Salt-petre. But some or other may say, what profit would there redound unto me, if I should

should season one or two, or more Copper minerals with salt, whereby the Copper may be thence drawn out? I would have such an one to know, that in that Operation, some hundreds, or thousand pounds may be done together, and the business may be ordered upon fire in distinct Furnaces, that so a great profit may be gotten; and not only thus, but the same may likewise be done without any Furnace or Oven, with many hundred, or thousand pounds in one Operation, at the open Air in the Field, or in a Wood, where that Ore and salt are to be found; so that the salt may serve as a covering to the mineral, and the mineral as a covering to the salt, and the Wood may serve both for the Furnace and fire.

This now in my judgment is an artificial extraction of Copper out of the Mines, (especially when 'tis such an Ore, which (otherwise) is not of any profit by reason of the immixt Iron, or else consists of such a lean Vein of Copper, as will not suffice to quit the costs of getting it out, but yet it may by this means be separated, with no contemptible profit. For there are every where almost such poor Copper Ore as this which lie and are not dreamt of: For indeed it cannot be expected, that, (if when a Copper Mine (or Ore) doth contain in it some small matter of Copper, it being so overwhelmed as 'twere with the muchness of heterogeneous meddles or mixtures, that it cannot precipitate it self into *Regulus*'s but passeth into *Scoria*) it should answer the costs that are to be spent on the forcing it out; and therefore such *Minera*'s must of necessity remain without use. And how many such kind of Ores have I found in *Germany*, which a man may have by heaps, but no body regards them, for that (as we have already said) they are too barren or poor: Whereas notwithstanding they may be most easily perfected by the help of Salt, so as to be made very gainful, & the costs exceedingly well repaid that shall be laid out upon them, especially in those places where there is such an abundance of Salt, that the Inhabitants know not what to do with the plenty they have of it. Many such places there are in *Germany*, as *Tirole*, *Salzburg*, *Bavaria*, and the Diocess that we call *Berges-gaden*: in which places all the whole mountains do not only abound with Salts, but have no small portion of Copper too: Nor is it so in those places only, but likewise every where; Salt is common and of a small price throughout all *Germany*.

And as we have already shown you, that Iron and Copper may be commodiously extracted out of the Ores by melting it with common Salt, and may be again separated from each other by precipitation: So likewise may the same be done in a moist way by boiling; and is thus, if the Ore be ground and a long while boiled with very Salt-water, the Copper will be dissolved and passeth into the Salt-water, out of which it is to be precipitated, and so fitted for use. But now, if the Salt be distilled into a Spirit, then is it apt not only to extract Copper, but also Gold out of the Ore, and will be of exceeding much profit: But this operation hath already been long ago described by me, in the First Part of the Mineral Work.

NB. But it will be yet more profitable and gainful to prepare that water out of the Salts and especially out of Nitre, which water is but of small price, and yet notwithstanding it is of that Power and Virtue, as to dissolve or extract all the Metals out of the Ores: and as well the Silver as the Gold and Copper in the solution, may be again precipitated singularly or each *Per se* one after another; and this kind of water may you likewise use about all *Fossiles* or Ores with a most wonderful abbreviation.

But now, if you use common *Aqua-fortis*, it extracts only the Silver and Copper, and leaves the Gold: and if you take common *Aqua-regia*, it attracts only the Gold and Copper, and leaves the Silver; so that neither of these hath (as we use to say) all the points in it, especially seeing such a kind of Water serves but once only; nor is there as yet any one found who knows how to separate the metals in the solution one from another, so as that the water may still remain good and fit for other the like uses. But as concerning this Water of mine, thus stands the case, *viz.* One Metal may be precipitated after another out of the Water, and each distinctly, and yet for all this, the Water loseth not ought of its Virtue, but may be many times serviceable; certainly it is a most profitable invention, which (in the doing or perfecting some metals and minerals) is to be preferred many degrees before any melting by Fire. For if that there are several Metals of diverse kinds, in one Ore; as Gold, Silver, Iron, Lead (and this often happens so) and they should be forced out by Fire, they would yet remain mixt together; and there's a great deal of work to separate them. For first they are to be cupellated on Tels with a great deal of Lead, that so the imperfect Metals, as the Iron, Copper, Tin and Lead if therein, may go off; then the Gold is to be separated also apart, or by a particular operation, by the help of a separating Water, and this is not every bodies work, nor have all such as are skill'd in the Art, in all places necessary provision at hand. But on the other hand, there needs not in that other kind of way, any thing save the Water and some Glasses, with these may you manage and compleat all the whole business, and get a great deal of gain without noise and trouble. For as to such a one as betakes himself to this kind of work, his Neighbours cannot accuse him, that he will (one time or other) ruine their Fortunes and Houses by Fire, for they hear no blowing of the bellows, nor see they any Coals carried into his House. Nor will the *Smiths* say that 'tis his fault that Coals are so dear, as 'twas objected to him who called himself the little Country fellow. Besides too, he will shun the suspicion of the Magistrates, nor will he give them occasion to suspect him to be a rich blade, and so torment him with the more grievous exactions and with quartering of Souldiers.

And now yet more, This kind of extraction does not only appertain to the getting out the Gold and Silver out of the Ores or Minerals and such as are volatile and crude, and which are every where to be met withal, and may without detriment to any, and with a safe conscience be fixed and separated by the help of this Water: But you may also by the mediation of this Water, profitably and with very small Labour separate all metallick mixtures, such as are mixt at their first forcing out of the Ores, or are melted into one Mass on any other account, and so obtain each Metal pure and free from all heterogeneities. As for example, Put case I have in my hands a certain metallick Mass, which hath in it Gold, Silver, Lead, Tin, Iron, and Copper: Now I would willingly separate the Gold & Silver therefrom: hitherto there hath been no other way known of obtaining it but by cupellating such a Mass or mixture upon the Tels with Lead, and so depurating it; in which cupellation, the Copper, Tin, and Iron, do pass together with the Lead into the Tels, but the Gold and Silver remain behind, which are to be afterwards separated with *Aqua-fortis*, that you may have each by it self. But the Iron, Copper, Lead and Tin do remain intermixt with each other in the Tels, and should you again melt them even by the strongest

Strongest blast, yet will they be commixt, and can hardly be separated the one from the other. But by this way of ours if they be dissolved in the water together, you may continually precipitate thence one Metal from another, and take them each apart, and not only the Gold and the Silver by themselves, but the Copper, Tin, Iron, and Argent-vive (each apart).

But it is not so necessary (if in such a metalline Mass wherein are contained so many Metals, the Gold and Silver be but the smaller part) to dissolve all the other baser metals together, to get out the Gold and Silver; this will not be advisedly done, but it would be better, first to purify that Mass upon a Test with Lead, and so to separate the Gold and Silver by the help of that water, or else that Mass may be burnt with Brimstone, and the Gold be thence precipitated and depured. But if the Mass hath less of Iron, Copper, and Tin, than of Gold, there will not be such need of purifying the Mass, by first burning it upon a Test, and then separating it by *Aqua-fortis*, as is commonly known and used to be done; but the whole mixture must be dissolved, and the Gold and Silver, which you please, be separately, or apart precipitated into a clean Calx, then the Copper also apart, then the Tin; but as for the Iron, you may forbear to precipitate that, because there are no great matters to be performed with its Calx, and it will be better to draw off the *Aqua-fortis* thence, whereby it may again be had pure, and fit for use.

Then the Iron which abides behind, if it be made red hot, yields a most excellent Crocus Martis, and a most excellent Ingredient for Chirurgeons, for all their Wound-balsams and Exicatory Emplastres; it is stickick; it will also be serviceable to Painters to make exquisite colours therewithal, so that the Iron which is the basest Metal in the whole mixture, if it shall be thus wrought upon and brought into good Crocus Martis, yields the money that was laid out upon the water, and yet this very water, after its abstracting from the Iron is not less fit for use, but is better than it was before. For in its abstraction from the Iron, it brought over with it some Goldenness, which Golden property doth afterwards, in other metallick solutions, associate it self to the Metals, is imbodyed, and yields as much Gold as the price almost (of the water) afore (thus used) could be judged at.

So likewise there's no need of reducing the Calx of Venus into Copper, but it is twice more precious than other good common Copper, because it can in a few hours space be changed into excellent Verdigrease, and so is 4 or 6 times the value of Copper it self. Further, it is not needful to melt down the precipitated Calx of Silver without any farther profit, but 'tis better to melt it by the means of the liquor of Sulphur or Antimony, for by this operation will it become auriferous, and be meliorated. Finally, you are not bound to melt even the Calx of Sol, without any profit in melting, but you may even thereoutof draw some profit; for if it be amalgamated with the Mercury of h or d it becomes more augmented from the h and d ; or else it may be used by the Goldsmiths to Gild withal, and by Painters, if its brightness and splendour be first restored unto it, for so it may be used about Painting or writing. So then, from this operation doth result a manifold benefit, and both the Iron and Copper, as also the Gold and Silver are rendered better, and more precious than they would have otherwise been, if they had been separated each from the other after the common manner, by the fire.

Therefore, there is not only a great benefit gotten

in that way of operating, in thus extracting Gold and Silver out of their Ores, and out of the Crude Minerals, and in this so compendious a separation of a Mass (or mixture) of Metals; but also, that separation brings more profit than the commonly used and perceived way of separating Gold and Silver by *Aqua-fortis* doth, in which way the Mass is to be first burnt to purity, and all the heterogeneities are to be taken away upon a Test; then the Silver is to be dissolved in *Aqua-fortis*, and to be separated from the Gold; this done, then the dissolved Silver is to be precipitated either by Copper, or by putting water thereunto, or else the water is to be thencefrom distilled; from whence, there is not only to be expected no greater profit than what is had (or gotten) out of the Gold separated from the Silver, but withal even half the water is lost. But now here (in my way) the greatest part of the *Aqua-fortis* is preserved, and is indeed meliorated (if there were Tin or Iron in the Mass) the very bare Crocus Martis only yields as much as the water cost, & the Flos Æris is meer gains; the Calx of Silver is by a solution of Antimony enriched with Gold, the Golden Calx is augmented by Saturn, and Luna, so that the gain is fourfold, besides that Gold which is gotten by separation out of the Silver; and now may not I justly call this an Artificial extraction or separation of the Metals, by the moist way; but now, like as this is a very notably profitable way of extracting the Metals out of the Ores or Minerals, & of artificially separating them by the moist way; so likewise may the same be done in the dry way by fusion; if (*viz.*) the Minera's are dissolved by Antimony or Lead, & one of the Metals after another shall be thencefrom precipitated; so that it is not so altogether necessary to cupellate such a Mass, and by the separatory water (or *Aqua-fortis* to separate that, which (by that burning on the Test) shall have been thoroughly purged; But if all the Metals shall be molten together into one Mass, there may (first) be precipitated the Gold, then the Silver, then also the Copper, and by the help of Nitre be rendred pure and malleable; and this too may be done without much labour or costs; so that as well by the moist, as also by the dry way, all the Metals may be very commodiously and compendiously, and in short time separated the one from the other by the benefit of Salt-petre. Suppose I have a Mass that has Gold, Silver, or Copper and Iron in it, and I would have it suddenly depured; therefore I may only burn it with Sulphur, and by the help of Saturn precipitate one Metal from another, and purify the Regulus, by Nitre, and such a Mass though it were 100 pound weight could I separated with the easy labour of one day, & for 3 or 4 *Dols.* less costs; but as for such an one as hath no use for solution & precipitation, or hath not convenient melting Pots and Furnaces, he may granulate such a Mass, and thence precipitate the Gold, Silver, and Copper, each apart, and draw off the water from his Mars; then the Mars yields him the price of the water; the Calx of Venus yields the reward of his pains and labour, and the augmentation or melioration which happens to the Calx of Sol and Luna in the reduction is clear gain; so that the Gold and Silver are, as it were gratis, and without any expence separated from each other, and that both by the dry way and by the moist way; for the Silver is equally as well graduated and made auriferous in the dry way, by the fusion or melting in the operating, or by the transfusing (or through melting) with the Antimony; so then good Gold may by this way be precipitated out of any Silver which

not aureous, provided the business be but dexterously managed.

In the first part of this Book, (where I treated of the concentration of wood,) I wrote, that a Juice might be pressed, by a peculiar Press, out of any wood, which afterwards might be turned into good Salt-petre by the benefit of the Air and time: I likewise there added some reasons, whereby it might be evinced, that it was possible for Art to perform such things, which are no other but the Rewards Nature her self yields, and that the Salt-petre which is wont to be every where digged out of the Stalls, or Stables of Cattle, is nothing else but the essential salt of Vegetables, and Animals, which is in a long tract of time, and by the hidden virtue of the Air, turned into Salt-petre.

But now if any one should haply perswade himself, that if he exposeth that Juice of the Woods to the Air for some Days, or Weeks, that it will presently become Salt-petre, certainly he would be much besides his aim, neither indeed is it lawful to prescribe Nature the time of her Operation.

Does not a Husbandman deserve to be called Ass, or Blockhead, if some few days after he hath sown his Corn, he should go into his Field to see if his Corn were ripe or not? Just thus are you to conceive of this work, for in all things must you expect the due time, in the Generation both of Animals, Minerals, and Vegetables, so that there is not the least need of any farther proof of this matter: For every Generation requireth its own proper time.

But, that very many haply have wearied themselves with imagining about that kind of Press, which I have mentioned in the first part of the *Prosperity of Germany*, and yet have not found it, is not to be much wondred at. However it is assuredly true, that such a Press may very easily be prepared, by which you may daily press a great quantity of Juice out of Wood, be it believed or not believed. But seeing that such a Press hath been seen with me, and hath been beheld prepared, and wood squeezed out there-withal, and set to ripen in the Air, sure it cannot be long ere the truth will manifest it self and publicly vindicate it self from all its slanderers.

I say again, that such a Press is found by me, and that it is an artificial one, and is of less costs than will be easily believed. Nay more, every day brings forth new and better Compendiums, so that there will not hereafter be any use or need for the Press, to squeeze the wood out by: but every Vegetable and Animal, may without labour and trouble be in a short time, and without the press, transmuted into good Salt-petre, so that many hundred weight of Salt-petre may be generated, or produced (by the labour of only one person) out of the bare Wood, Leaves, and Grass, (where they may commodiously be had) and yet 'tis not the person aforesaid, but the air that causeth this Generation: for the person doth no more but expose to the air the subject matter, upon which it may operate, and out of which it may bring forth Salt-petre.

But there is nothing which I admire more at, then, that this present Age is so sluggish and averse from searching after the secrets of Nature. Whereas, were but the Properties only of that stupendious, or wonderful subject Salt-petre, well known, there might well be a forbearance of reading many Chymical Books seeing that by it alone may many wonderful things be performed. I have a little afore shown, how both a moist and dry extraction of Gold and Silver, & the other metals is to be done by Salt-petre; and if Nitre were of no other use but this only, yet were it well worthy to be beloved and esteemed by all, and they should as much as in them lies labour not only to produce it in plenty out of vile things, but withal to

know how to make use of the same with profit.

But whereas I have not so very openly and clearly described, or published the precipitation which is done as well by the moist, as by the dry way of the extraction and separation of metals; I would not that any one should take it in evil part; for there are exceeding weighty reasons, that make me fear to prostitute such excellent Inventions, or to chew meat (as it were) and thrust it into every Asses mouth. Let it suffice, that I have shewed, that such things are possible. But yet the Art lies not so fixed in my breast, nor is it my mind to suffer it to lie buried with me: No, God hath blessed me therewithal merely for this end, that I might help and succour others, to the performance of which, I am most ready and willing: but yet not every one without any exception, but such as are ingenious Lovers of the Wonders of God, and know how decently to use all things, least I being too improvidently liberal, should put new Weapons into the hands of mine enemies.

I could have buried-over these things in silence, and haply been at more quiet, but it was no ways possible for me to suppress the wonderful Works of God, so as to withhold them from coming abroad to light, and to the view of Men, to the Honour of God. And whensoever it so comes to pass, that the things delivered at present in this second part, and which shall be delivered in the following third and fourth parts, shall be believed, and be brought to effect and be done: then all the crew of Slanderers and Enemies of the truth shall be confounded with shame, before the whole World, and that Genuine Alchymy, shall again be embraced, and honourably flourish: For Salt-petre must be the Master, as *Paracelsus* saith, in a certain Chapter where he treats of common salt, and mentions Salt-petre with a commendable Testimony. Nor hath *Basil Valentine* done a less faithful Work as to his Nitre; but few there are that understand it.

I am not of the mind to boast of the knowledge of many things, but yet thus much I find, that there is not in all nature any subject given that may in good deed be compared with Nitre, as to eminency or excellency; much less deserves to be preferred before it. Let not the Lover of this Art be disquieted in his mind, so long as there are two parts to follow, and come forth: For then men will see, and be even enforced to confess these things which afore they did not believe. And upon this score do I shorten this part, that I may the sooner come to the third and fourth parts: In which parts (God willing) there shall be disclosed many most highly profitable inventions for the benefit of mankind, but yet they shall be veiled, after that same way and manner, as others afore me have used to do, that so Pearls may not be cast afore Swine.

But that I may return to my purpose, and shew that what I have said is true, and that great things may be done (as to the melioration of Metals) by the help of Salt-petre, it will be necessary, that those things which we have already written in this second part be made a little more clear, and may be visibly demonstrated to the unskilful and incredulous, in what it is, that this profit we at present speak of, is seated.

And first, as concerning the Generation of Salt-petre, there hath been enough said already, viz. That it may be prepared by heaps out of otherwise-unprofitable Wood, Shrubs, Briars, &c. which rather en-damage the Ground, than do any good, because they become a refuge for cruel Beasts, which sustain themselves upon the great ruining of the other Wild ones: Nor needs this work any greater costs than to cause a House to be built in the Woods, under which the wood, together with the circulatory Vessel, may

pppp

stand

stand dry; and besides too, one man is sufficiently able to manage the whole business, nor is there any thing else required but those unprofitable underwoods, or Briars, &c. or if you have not such, then, the Leaves that the wind blows off from the Trees. And if also you add some Salt thereto, even it will be likewise turned by the help of the wood into Salt-petre, and hereby will arise a greater profit: Neither is there any necessity of taking the Salt we use to season our meat withal. But yet if you can have it in plentiful quantity (as may be in many places of Germany, where it much abounds) it will be well, but if it be not to be so easily had, the wood it self will make Salt-petre enough; nor needs there any other thing, but to begin the work, and let Nature alone to perfect it, and to produce the Salt-petre. But farther, as Germany doth never want store of wood, so wants it not salt, for there are whole Mountains of salt, which to exhaust, is a thing impossible; especially in the Territories of the Arch-bishop of *Salzburg*, in the Elector of *Bavaria's* Country, the Diocess of *Berchtesgaden* as we call it; which places, besides their abounding with Salt, do also abound with store of Wood. Have I not reason to believe that great Treasures and Riches may be hence reaped. Salt they have at their Feet, and vast Defarts at hand, which are of no use: O improvident Mankind! What account shall we give that so behave our selves in our Stewardship. Would it not be much more praise-worthy to have drawn forth those Treasures, to the Honour of God, and not to have suffered them to have remained without being used, and unmanaged; what is the greatness of the charge requisite to the carrying on this Work that deterrs them? What expence I pray is it, seeing that a little shed may easily be built in the Woods? And besides, where great Woods, and many Trees are, there are also found Minerals both ripe and unripe, and the ripe may be forced out by Wood, or Coals, the unripe may be fixed, or ripened by the help of Salt-petre, and the Gold and Silver also may be afterwards thence separated by the Salt-petre.

And now I pray, would not the Country be enriched hereby with vast Treasures, and store of Wealth? But put the worst, if every Country did not abound with store of Wood, yet hath it a great deal of superfluous Grass and stubble, and this yields as good Salt-petre as the Wood does. And if in case every Country, or Seignory had not Minerals of their own, which might be ripened by Salt-petre, and from whence Gold and Silver might be drawn, yet nevertheless may they be had out of the bordering Provinces. Nay more, if so be the already excocted Metals should be advanced to a maturity by the means of Salt-petre, yet would not even this kind of work be without an acceptable gain, and it would be better for us so to do, than to hang them up at the Walls in our Houses, for Ornaments, and Pride's sake. If an Enemy comes, one Ounce of Gold, is better than a Thousand pounds of Tin, or Copper, which the owner thereof must necessarily be constrained to leave behind him, whereas he could carry away the Gold with him; which kind of concentration we shall treat of in the following third part: and in the fourth part shall be taught, by what means even Gold and Silver may be concentrated, that so it may lie hidden from the Enemy, and be transported (under another kind of form or shape) into such places, where it may be free from the Enemies Clutches.

And farther, that water which we speak of, serves not only to extract Gold and Silver out of the Ores, or Minerals, (which otherwise, could not be drawn forth by any excocting or forcing) but also for the tanning, and bringing to use that which is in huge Stones, Flints, and the baser Fossiles (in which, Gold

and Silver are only as it were, a little sticking, and will not be thence had by any art of melting) and that with profit too well worth the Labour. So that there is scarce required 6 or 7 Loths of water to extract the Gold and Silver out of 100 l. of Ore; and if there were but 2, 3, or 4 Loths of Silver at the most, in 100 l. of such matter, yet would it be a gainful extraction, especially if the things, or subject, be Arsenical, or as yet Volatile and cannot brook the intenseness of the fire, but are driven away by a strong blast. For in that extraction by the water, that which is volatile, is fixed, and retained together, that it afterwards admits of being fused, or molten, and that this is so, will evidently appear to any, experimentally. Let him but take Arsenick, and dissolve it in Aqua-fortis, and again draw off the water, and he will be able presently to melt the Arsenick, and make it red hot. Quicksilver is well known to be a very Volatile matter, but yet even that, (if the water of Salt-petre be severall times drawn off thencefrom) is made so fixt as to stand and abide wholly in a most intense fire. For, that which Wood and Coals do (in a long time) perform; the very same doth such a water effect in a few hours space.

But some or other may oppose or question thus; How can it possibly be, that if those matters be so very poor, 8 or 10 pound of water should be sufficient to extract the Gold & Silver which is contained in them; for it seems as if 8 or 10 pounds of water were hardly enough to moisten 100 l. of Ore or Minera, but would be lost amongst such a deal of Stuff: Let such an one know, that what I have written is possible and true; I can prove it and demonstrate it even to the sight; but as concerning the administration of that Work, 'tis not fit it should be made too common.

And verily, in this sticks the main difficulty, here is the Art and Skill; 'tis not for every one to acquit himself here, and if that the gold and silver were extracted by means of this Water, yet even then the chiefest of the Art is to know how to precipitate the pure Gold and Silver thencefrom, and incorporate it, which knack I justly reserve for my Friends; for verily, this is such an Art, as by the benefit of it alone I shall renew ancient friendship with many, and moreover purchase me more new friends: And therefore let no body be angry at me, or count it amiss, that I would not publickly disclose so excellent an Invention, and put new Weapons into mine Enemies hands to hurt me withal. [*This is taught in the following parts.*] And if I should do so much as clearly to mention every thing, yet nevertheless should I incur the enmity of many men, as much as if I never had done it; and besides too, it cannot possibly be, that all things should be so nakedly and plainly decyphered to the unskilful, as that they should presently be able to do every thing: If they once make trial, and cannot do the business that they aimed at in their minds, then they curse him that writ, and bestow many a bitter wish on him, as if he had been too obscure in expressing himself, and so they despise that which is otherwise laudable.

But if so be that the possibility of a thing is only demonstrated, and no Receipt added, then they will not undertake any frustaneous Labours, nor will have cause of cursing any. But some or other may here enquire, Where shall I find such a sort of Minerals and Fossiles, out of which I may extract Gold and Silver? If any such had been to have been found, they would not have lain idle & waited for my coming; others would have taken them away long ago, and converted them to their own uses. I think it expedient to demand as well of such a one, who those others should be, that should have taken them away before thee? If their Experience be as little as thine, and thine no greater than is theirs, there's no danger of your fore-prevent-
ing

ing or deceiving one another, seeing you are all alike ignorant of the thing.

Think'st thou that the number of those that are experienc'd in Metals is so large? 'Tis confess'd, there are enough Excofters or Metal-Separators, but yet they must perforce leave that untouch'd which they cannot find out, seeing they know no other way of ordering their Affairs, but the old Road. It oftentimes happens, that there is more Gold driven away into the air by these Excofters, than is left behind in the fire, and yet forsooth that Crew arrogate to themselves abundance of knowledge, and persuade themselves, that they stand not in any need of any ones advice. Nor indeed do I invite them to any new Studies and Operations; let all such as list, use the same way of excofing or separation that they have learned; but if there be among them those that are not ashamed to learn better, such may be counselled. My purpose at present is, to do some acceptable Service to those that have no Mine-pits, and who cannot separate Minerals or Ore in gross, as I may say, and yet would be very glad to enjoy in private some little small gleanings as 'twere of the bits or small pieces that the Excofters leave, whereby they may get sufficient gain for the commodious sustaining of Life. These are they whom I have a mind to assist; the Richer sort have enough already to fill or satiate themselves withal; nor need they any information of mine; as for the Poor, there's no regard had to them. The whole Artifice therefore consisteth in the extracting (when there's but a very little Water used) and then in the precipitation of the Metals, so that the Water may remain good, and fit for other uses. There's plenty enough of poor Minerals and Fossiles even every where, and which no body regards and knows. It would not be amiss to look upon or consider of all Flints, Rocks, and Stones you meet with, and consider what property they are of.

Concerning this I have written in the First Part of the *Mineral Work*, viz. How by the Spirit of Salt Gold may be extracted out of a Flint: But as hitherto, few there are that have set about that Work, partly because they could not prepare the spirit of Salt, and partly because they knew not how to precipitate from it the extracted Gold, nor knew how to melt the extracted Calx of *Sul* with Antimony; all which I must needs confess, is not for every one to perform. But now this Extraction which is made by the Water of Salt-petre, doth extract the Silver too, which being thence precipitated, the water remains as virtuous as afore; and indeed, if a comparison be made 'twixt this and that Extraction, there is as much difference as is between black and white, and between the day and night; therefore I say that this is a thing worth the learning, for it may be of exceeding much profit in times of affliction. Greatly is that pledge to be esteemed of, *Which* (as the old Proverb is) *redeems its Lord*. Art is no burthen to a man to carry, but it rather carries or bears up a Man, easeth him, and makes him be of a cheerful mind, because it is a thing on which we may safely trust. It is more precious than Gold and Gems, which may be lost, but this abides firm and constant even to the Grave, and doth abundantly enrich its master.

This Extraction doth likewise serve for the drawing forth Gold out of Silver, tho' it be not gilt, which to do is not in every ones power, tho' many know that Silver hath Gold in it, yet if it be not of so much value as to quit the Costs that are necessarily to be expended upon it, it is left as it is; and now there is no where separated Gold out of Silver, unless it be gilt, and they see it sticking thereupon. Any other silver whatsoever, how much gold soever it possesseth, is not separated, when as though, sometimes there might be

made more gain thencefrom. But I must needs confess, that the separation of the Gold from the Silver, the usual and known way is conjoined with abundance of labour, and not worth the costs spent about making the separation, unless, haply, the silver partakes much of the Gold: Whereas on the contrary, this my way of separating is done with light labour and small costs, and therefore may be used about all silver whatsoever, though it has in it never so little Gold.

But that the business may be yet more clear, and the better perceived, it will be useful to add this information. When you would separate the Gold from the Silver by Aqua-fortis, it must first be purified with Lead, by burning it upon a Test, now in this work there's the Test, Fire, the sufficient portion of Lead, the labour and time spent hereon to be considered, and when all this is done, then the Lead has entred, together with the Copper that was in the Silver, into the Test, and may be esteemed of but as a thing just kept from being lost. Besides too, the Copper carries away with it, a good part of the silver into the Test. And altho' that by a most vehement blast of Bellows the Test may be molten, and part of the Lead, Copper, and Silver recovered, yet the expences necessarily requisite to this operation, are more than the regain'd Metals are worth, so that these costs, charges, and troubles are too great. Then finally, when all this is done, and that the silver shall have been depured by burning, then it must after all this, be granulated, and this is some charge, and then when all this is done, it may be separated by Aqua-fortis, and being separated, be again molten into a Mass.

Now my way of working is freed from all these kind of linked labours, and so much trouble and loss of expences and time may be avoided; for when I take on me to separate any Silver, whether it has much or little Gold, I cut it into bits about the length and breadth of my Finger, so as that I but put it into my separatory Vessel; then I make it gently or by degrees red hot, to the end that the defilements may be the better wash'd off, and the separatory water may the better work upon it. Then pour I in the water, and suffer the Gold, Silver and Copper to be dissolved; then (after this) do I precipitate the Gold, then the Silver, then the Copper; all which operations, from the beginning to the end, are done in three or four hours space, nor requires it any expence save only the water, and a little fire, to keep the water warm, that it may the more strongly work upon and dissolve the Silver; the Metals thus separated from each other and edulcorated, may be melted; and now from thence may any one see, how much difference there is betwixt ours and the common separation of metal, by the moist way; and if there be any one that would use this way of mine, of separation, he would doubtlessly get much gain and riches, neither could any one endamage him by way of prevention, and he would get himself an exceeding profit wheresoever he be, not only out of guilt Silver, but also out of any other; for there is not a City so small, but it hath a Silver-smith, who buys up the old Silver, and separates it his own way, which is very laborious and costly, and therefore he would the willinglier give his Silver to another to separate, whereby himself might be spared the labour and costs, were there but any one that would offer him his help thereabouts.

And seeing that all Copper holds Gold hidden in it, and that that Copper is not any impediment in this my way of separation, but is resolved together with the Silver, therefore doth it always bring some increase to the Gold and consequently more gain; but the labour will be yet more gainful if it be prepared with a separatory water, which hath other Golden species or things added thereto in the making, and which render

the

The water aureous, such as are Lapis Calaminaris, Zink, the Minerals (or Ores) of Iron and Copper; for hereby is made a water that is in it self auriferous, and which doth readily (in the separation) join its volatile Gold to the Silver, and suffer its self to be incorporated; in so much that even such Silver as hath already been separated and purged, will yield Gold enough in the separation, if it be dissolved with such a separatory water, which hath been impregnated by graduating things.

And even as this same extraction which is done in the moist way, by the water of Salt-petre is exceedingly eminent and of much use, as being sufficient to supply many thousands of men with food and necessities for life, so as that they need not at all to be compelled to deceive or damnify one another; so likewise, no less excellent is the extraction, which is done by the dry way; *viz.* the Volatile Antimonial Minerals, or Ores (whether they contain in them Gold, or Silver, or Copper, Iron, or Tin, and what metals soever they contain in them) be molten with twice, thrice, or four times as much Antimony in a Crucible, and be (by the means of Iron) precipitated into Regulus's; for by this work, what good soever there was in the Ores, and even the Metals themselves, may be obtained each apart: for when the Antimony hath extracted the Gold out of the Minerals, the Gold may then be first precipitated, then the Silver, lastly the Copper; and all of them with a very small cost and little labour, in so much, that in one days time many pounds of Gold and Silver may be drawn by this art out of the Minerals: and this too by a little fire. For the Antimony penetrates the mineral like water, and dissolves what is good in it; and as for that which is of an earthy nature it calls off from it self, and brings it into scoria. But it brings the Metal to a Metalline form in the precipitation, which must then be cupellated, or purified by the help of Salt-petre. And if haply you cannot get Antimony for this work, than common Brimstone may serve in its stead, and it will perform the same thing, if the Minera be ground and mixt therewith, and be molten in a covered Pot or Crucible, and be precipitated by Iron, for so the Metals falls down in a Regulus, and the Sulphur abides behind in the scoria. But this kind of work requires a skilful Artist or Melter, who hath already been long and much versed in precipitations, for else he will be intangled therein, and not find the wish'd for success.

NB. This is to be understood of that kind of Minerals and Fossiles which partake of Antimony, Arsenick, Cobalt, Marshafite or Sulphur, being such as Antimony and Sulphur love to seize upon and dissolve in the melting: such Minerals or Ores as have sand and stones among them, they (*viz.* Antimony or Sulphur) will have nothing to do with them; of this kind are Granates, Talk, and such like: so neither, doth the water of Salt-petre in the moist way extend its virtue to all the Minerals, nor extracts it Gold and Silver out of all of them; but especially it acts not at all on them which are very sulphureous, unless they are first Torrifed or Calcined as 'twere, and so freed from the Sulphur, then at length the water performs its office else not. Nor doth the water act upon Granates or other Minerals and Fossiles which are (as to the outward appearance) smooth and as it were glassy. And therefore all such must first of necessity be master'd by an incense fire, and subdued.

There are likewise to be found some Minerals and Fossiles which suffer not what they have in them to be introduced into either Lead or Antimony, or to bestow their Treasure upon them; nor will they be forced out nor cupellated, but both are and remain scoria, and do retain that form of glass which they afore had, unless haply you make them sloop, and master them by

a most strong blast; for by this means they suffer their Gold and Silver to be wrested from them: But they may be mastered too, if you thereto add in the fusing some Porters-alhes, or salt of the Lees of Wine, or Alhes made of Wood, and melt them together, for so by this means also will they be obedient to thee; for salts dissolve in flux all stony Minerals, and such as resemble glass and scoria, which otherwise no other fire is able to do. But to make any more accurate description of that thing, appertains not to this place, but to the following Third Part of this Book; that which we have here minded, is only to make light touches as 'twere about shewing the variety of Fossiles and Minerals; and that, if haply any one should light on such a Mineral, out of which he cannot extract the metal, neither by the help of Antimony, nor by the water of Salt-petre, he should not think it void of every thing or that he has not dexterously and conveniently enough handled the same, but may know, that the only cause is, the property of the Mineral it self.

And now, even as the Sulphureous minerals do chiefly admit of being separated by Antimony admixed in the melting, and those that are stony, not so; even so the water of Salt-petre doth more willingly extract the stony Minerals, than the sulphureous ones; but yet, if the sulphur be taken from them by Torrifaction, it is able to dissolve even these too.

But it chiefly loves those that have Stria, and are a spotted (Quartz) sandy, poor kind of Minera: which (otherwise) you cannot extract commodiously neither by Fusion or by Mercury: But that you may never be deceived here, it will be altogether expedient to be acquainted with both ways both with this which is done by flux, & with that moist way which is done with Water; both ways are good, and exceedingly profitable in the separation of the Minerals or Ores; and that not only of such as may be every where had, but likewise of metalline mixtures: whether it be by melting them together, or else by some sad mischance of your Houses being burnt; or finally, if it proceed from thence, that Gold and Silver do lie hidden unknown in copper, Tin, Iron, or Lead; now they may with ease be separated from each other by both those afore said ways, and on such wise as that nothing may be lost.

The ancients knew not how to extract the Gold and Silver out of Copper as the modern Refiners are wont to do, but took them together as they lay and so applied them to any uses whether to make Bells or great Guns. Neither was the separation by *Aqua-fortis* so much in use in those days as in ours: Nay more, if in a Mark of Silver there was no less than the quantity of a Duckett of Gold, yet notwithstanding they did not separate it, but did make it up into money as it was, as the old Coins do sufficiently testify. For it is evident that all Silver almost, partakes of Gold, and ancients being unexercised and not well versed in the Art of separation, all the Silver though never so auriferous was Coined into Money, or put to other uses; but their successors smelt out what they had done, and therefore bought up all such Money, and separated it, & made thereof an exceeding gain: so that there is not in our age so much as a Dollar, Schrenckbergick, Gross, Crucifer, even to the smallest half Penny, of Gold Coin to be had throughout all Germany, all being changed and bought up and wiped off the Gold. But yet there is Silver enough left, both made into money, and wrought up by the Gold-Smiths, a Mark whereof contains, $\frac{1}{2}$ or $\frac{1}{4}$ of a Duckett of Gold; and therefore seeing the common way of separation by *Aqua-fortis* cannot be of use here, because the costs are too great, and the little portion of the Gold will not countervail the same; it may be done this way, and separated by either the moist, or by the dry

dry way, and that with profit, though there should be less than 1/4th part of a Duck in a Mark of Silver. And besides, Bells ever have much Silver in them, neither was it separated therefrom by the ancients (as we have said afore): and likewise old Tin hath a great deal of Gold and Silver in it, which was of old wont to be molten and wrought up with the Copper into Bells or great Guns. Many there are that well know, that there is Gold and Silver in these things, but how to extract them thence, they know not: For Copper admits not of being cupellated (or purified) by Lead, much less of being separated, & yet more difficult is it to do it by *Aqua-fortis*. But yet, it may be effected and that with a great deal of profit by the way which we have shewn, both the moist and dry too. And therefore he that shall be well skill'd in these operations, doing it either by melting with Antimony, or by the Water, will get abundance of profit out of your old and broken pieces of Bells: Nay should he buy them whole, yet would he get no small matter, for he may extract their Gold and Silver, and then melt them anew. For there is not barely in Bells that portion of Gold & Silver which the Copper and Tin had naturally in them, and of which the Bells are made; but also, it was the custom of the ancients, (when a new Bell was molten or founded,) to call some God-fathers or Witnesses (according to their ancient custom) who named the Bells afore they were baptized: And like as it is even at this day the usual custom every where throughout Christendom in the baptizing of Infants for the God-fathers to give their God-child some Money (or Plate) as a remembrance; so the ancients did do in the baptizing of their Bells, as they were flowing in the Furnace they cast thereinto Gold and Silver, to testify their affection to Holy uses, and also that the Bells might fuse the better, and yield a clearer sound. Upon this account I say, that 'tis no small gain that may be gotten out of old Bells, seeing there never is a Bell which is destitute of Gold and Silver.

And now the well-minded Reader sees what use this extraction and precipitation of Gold & Silver which is done either in the moist or in the dry way, is of; and that not only in Minerals and Fossiles, but likewise in metalline mixtures too, out of which there can nothing be obtained by any other way.

Who I pray will not now magnify or highly esteem of Salt-petre, and take care about having it prepared in great plenty, and so convert it to his profit, seeing it is clearly manifest that so much good may be done with it both in Metalline Affairs and Medicine? I do what I am able, I offer my self to all good Men: If they will not listen to me, I am not to be blamed but am void of fault. Man's Life is too short, than for one Man to be able to describe all the things that may be done by the help of Salt-petre; neither indeed is it to be wished that many should know it.

But seeing I but now treated of the precipitation of Metals and Minerals, I think it worth while, to shew the cause of that precipitation, that so the studious of Art may have a more certain foundation of this thing. That which is to be separated, must of necessity be a bound up or fast knit body, for else it would not need any separation; therefore forasmuch as one Metal knits up, or incloseth another, they cannot be separated from one another, but by the breaking or destruction of the bonds which they are tied withal, and knit each within another; this destruction now, is to be done by the Fire, both in the moist and likewise in the dry way. Copper, Tin, Iron, and Lead, may in the dry way be separated from Gold and Silver, if they are Cupellated together on a Test: For then the superfluous or burning Sulphur, in the imperfect Metals, acts upon it self and reduceth its own proper Body or Metal into Scoria, and seeing that there is a great part of Lead therein, those Scoria are fluxile, and it doth by little & little (as much of it as goes into scoria) insinuate it self or slide into the porous Tests or Hearths. But the Gold and Silver which have no superfluous Sulphur, do remain unhurt upon the Test, whilst and clean, & do now shew themselves in their clarity & bright-

ness; This is the separation of the good from the bad, or the combustible from the incombustible, which is done by the force of Fire only, and solely: by which, the imperfect Metals are by the help of Lead converted into brittle scoria, and so creep into the Tests, and separate themselves from the perfect Bodies; and this is a very easie work, and well enough known to every body, and is by the Refiners called Cupellation. But now in this separation, there's only a separation made of the imperfect Metals from the perfect, but the Gold and Silver remain mixt together, and if you would have each apart too, then 'tis necessary that the one be dissolved and separated from the other by a most strong *Aqua-fortis*. But if the portion of the Silver be more than the Gold, then the Silver is dissolved by a common *Aqua-fortis* made of Salt-petre and Vitriol, and so the Gold will fall to the bottom: and this way of separation is well enough known and used by all the Refiners and Goldsmiths; but if there be more Gold than there is Silver, then do they dissolve the Gold by *Aqua-regia*, and so the Silver remains undissolv'd; nor is the *Aqua-regia* any thing else but a strong water of Salt-petre, in which some *Sal-armoniack* is dissolved; for the common or simple water of Salt-petre doth dissolve the Silver only and leaves the Gold; and contrariwise the *Aqua-regia* dissolves the Gold only, and meddles not with the Silver; but if they know not the right way of ordering the *Aqua-regia*, they are wont to add to the Gold in the melting so much Silver as may make up three times the weight that there is of the Gold, and so they separate it by *Aqua-fortis*, which (kind of operation) we call (the Quarry).

There is yet another way of separation, which is known unto them, and this is done by Cementation, if (viz.) divers Metals are commixt together, and they are mixt with Vitriol, Salt, and Tiles, *Stratum super stratum*, and so kept together a while for some due time in a continual fire, then the Salt and Vitriol do assume to themselves the imperfect Metals, and leave the most perfect, that is the Gold, alone. Cementing doth also attract Silver and Iron, Copper and Lead; but this kind of separation is only used to impure Gold, perfectly to purify it.

There is yet another way of separation, which is done by Antimony, and is likewise only used to Gold, to cleanse it from its impurity and vitiosity. There is also another way of separating by fusion, in which, if you would have a metalline mixture which hath Gold, Silver, Copper, Iron, Tin, and Lead in it, to be separated into its several kinds, then the mixture must be granulated and burnt with Sulphur, and being burnt, it must be melted in a Pot, and so by precipitating it either with Lead or Iron, one Metal must be separated orderly from another; which way is wont to be used (as far as I know) but by few, because they are not so understanding in Nature, nor know any cause why one Metal separates it self from another, sooner and more readily out of the mass or metalline mixture, and settles to the bottom.

But that the ingenious Lover of Art may have some directory, as 'twere, and some occasion to consider with himself more deeply, and may have a willingness to undertake so excellent and profitable an Art, I have a mind to discover the cause of the precipitation. It is sufficiently evident, that like rejoiceth with like, and that there's a disagreement 'twixt unlike things. Oil loves to be mixt with Oil, & Water is willingly united with Water, but not at all with Oil, lest by a medium intervening. Hence it is, that for as much as one Metal is of a different nature from another, that such as are alike, love each other, and such as be unlike do abhor and shun each other; and therefore when there are divers Metals in one mass, and that you would separate them, it is necessary that you do it by adding such a thing as is of affinity to the more imperfect part, and is at Enmity with the perfecter part. As for examp Sulphur is a friend to all the Metals, save Gold, and that it hates; but yet it loves (even in the imperfect Metals) one better than another: for by how much the more like they are thereto, and the more imperfect, so much the more read-

dily is it a friend or enemy thereto. And therefore when the Sulphur shall have been put into the mass in the combustion, then the most noble parts flie off, and do their best to free themselves from the fellowship of the imperfect and unclean metals; but yet they cannot rid themselves without some assistance; and therefore if some sulphureous or imperfect Metal shall be put to the sulphureous mass, then the sulphur laies hold upon it, and lets go the more perfect part, tho' not so pure as yet, but it needs a greater purification; concerning which there may be read more at large in the Explication of my *Miraculum Mundi*. This work is called *Precipitation*, when the more perfect part is precipitated and separated from the more vile, and that out of one and the same mixture. The same reason is there in the precipitation made in the moist way, if (*viz.*) some Metals, or all together, be dissolved in the water, one is thence precipitated after another orderly. First, That which is the most noble and most perfect, then the 2 & 3, and so regularly, until they are all precipitated. This is that most excellent and hitherto wholly unknown, and most gallant Invention wherewith I hope to become serviceable to my Friends.

He that well understands this precipitation, will gain much, but if he only meddles with this operation in a careless manner, and merely customary as 'twere, and so not know the reason it self, why such, or such a thing is, he may worthily be compared to an Ass that carries a sack, but knows not what is therein contained, nor whether he is to carry it. Therefore I will yet farther add a more clear information. Iron precipitates Copper out of both the dry and moist solution; Copper precipitates silver both in the moist and dry solution: Mercury doth chiefly precipitate Gold, and altho' Copper, Iron, Tin, and Lead, do also precipitate Gold and Silver, yet each Metal hath its own peculiar precipitation, and farther note, that Precipitations done with Salts do exceed those done with the Metals, for by them may all the Metals be precipitated; and this hath even hitherto been kept secret.

And besides, one Metal does not only precipitate another, but doth likewise change or alter it. As for example, If I put the Plates of Copper in a solution of Silver, then (whether the solution or operation be done either in the moist way or in the dry way) the silver precipitates it self by means of the Copper. And if I but know how to manage that business knowingly and skilfully, the Silver will also graduate some of the Copper into Silver in the precipitation, and there will be gained more silver than was put in the solution. In like manner, if I precipitate Copper with Iron, out of a solution of Copper, then doth the Copper precipitate it self by reason of the Iron, but withal, some part of the Iron doth exalt it self in the precipitation into Copper; and seeing that this kind of operation is confirmed by often Experience, there is none can safely question it. But I do not say, that in such a graduation all the Iron is turned into Copper, or all the Copper into Silver; nor did I ever try it; but yet I readily believe, that it is a thing possible to be done by reiterated workings. Mercury precipitates Gold most willingly, but only in the moist way, for in the dry way it cannot subsist; but to precipitate it in that way, Iron serves excellently well; Copper also and Lead are profitably useful hereabout also, but yet Iron is better.

There is a singular precipitation of Silver with Mercury, which I will here mention. The Chymists some hundreds of years ago, made Silver out of Cinnabar, but without any benefit or profit; neither did their silver they got come from the Mercury, but from that silver which they added to the Cinnabar. They took common Cinnabar, made of Quick-silver and Brimstone, and brake it into small bits, about the bigness of the Nail of ones Finger, and made Layes, or *Servatum super servatum*, thereof, with filings of pure Silver, then they luted up all well, and kept it in a moderate heat for 20, 30, or 40 hours, and by this way they found that their Cinnabar, which at first was red, was made black; this matter they cupellated with

Lead upon a Telf, and so got as much Silver as was the weight of the Mercury in the Cinnabar.

NB. As much silver as they got, so much wanted there of the silver they put unto it, and so there was no Gain made from hence; and they supposed (but falsely) that the Quick-silver extracted the soul out of the silver put thereunto, and that therefore the said silver was rendered volatile. Nor indeed is it contrary to Reason, that *Argent-viv* should extract the soul from Silver, & thereby convert it self into silver; and that on the other hand, this exanimated silver be made wholly volatile, if it be not animated anew by other Metals; and this is what some have done and attained to, by the help of Lead.

But the Operation which I treat of at present is rather an attraction or precipitation of silver by Mercury, and this precipitation is to be done in the moist way, and is most wondrous ease; nor is it without Encrease or Gain, provided you are willing to wait its time, and 'tis thus.

If one part of purer silver be dissolved in *Aq. fortis*, and in the solution two parts of Rain-water be added to one Part of *Aq. fortis*, and there be likewise thrown in three or four parts of Quick-Mercury, and all this be left some daies or weeks in a cold place, unmoved, then the silver precipitates it self out of the Water to the Mercury, and the Mercury dissolves it self into the Water, and both together yield a wonderful representation of growing things, like Mountains and Vallies, and certainly is of a most pleasant aspect. The result of which is this, *viz.* if they stand so a long time and shall be afterwards edulcorated and reduced by Lead, then the Silver gets no small encrease from the Mercury: But yet there's no gain to be thence had unless those outgrowings (or representations of fine things) be suffered to operate and germinate above a Year: And this, few operators will yield to do, and to be withheld so long a time from the fruits of their Labours. Now the reason of this operation is thus: The *Aqua-fortis* is a moist and cold Fire, and ripens as well as the dry and hot Fire, but he need be a skillful Artist that sets upon this Work.

It is evident that some of the ancient Philosophers matured their Universal Medicine by a moist fire, as you may see in *Arctephus* and others. Other some Philosophers extracted a certain secret water, or universal Menstruum and dissolvent out of the Nitrous Sea, and did thereby perform most notable things, but they always kept it secret, and the description they have made thereof, hath been obscured, or painted over with Riddles, or dark expressions, when they say, that ϕ draws his secret water out of the Sea, of as clear brightness as the Moon: which way of drawing it belongs not to this place to shew: only thus much is hinted, that out of Nitre may be drawn an Universal Menstruum, which is more excellent than the Corrosive Spirit of Nitre, which said Spirit doth indeed dissolve all things, but after the manner of corrosives, whereas this which ϕ draws and is of the clear brightness of the Moon, hath nothing of Corrosivity in it, but is mild and sweet, and wets not the hands, or tingeth them, as that Corrosive doth; and altho' such a water be Volatile, and not fixt, yet is it of such a nature as to constringe, and fix other fugitive, and unfixt things. 'Tis a thing most worthy of admiration to consider how those Natures have a mutual love each to the other, and embrace one another, and are converted the one into the other. And thus much may suffice to have been spoken concerning the precipitation of the Metals out of both the dry, and moist solutions.

Let no body seek to fish ought more out of me by their Letters; but as for such as formerly have been my friends, and even now are, or shall hereafter be, to these I will not deny any thing, always provided, that nothing be done against a *decorum* (as they use to say) or a discreet behaviour.

But now if any one thinks that (if he comes flying from the East or West) I must presently lay aside all my business, and only attend upon doing and answering what he demands: No, that's a thing my Affairs won't permit me to do, for I have somewhat else to manage. And therefore

would

would I forewarn such an one, that he enters not on such a Journey afore he be certain whether or no it stands with my convenience or not. For this hath many a time already happened unto me, viz. for some one to come with a desire of knowing this or that secret, who (when I would have told it him, but that I had no time then to accommodate him) hath gone away stomaching at me, and began to reproach me publickly afore all Men, as if I were some inhumane, or mercilefs fellow, and would not satisfy his request. Some also there have been, who out of the meer malice of their mind have divulged, that I my self have nothing, seeing they can get nothing from me; there are many such perverse kind of men to be found, who make no Conscience of enervating, or sucking out the very Marrow of the Bones of others, so as they may be but benefited thereby themselves; which verily is a great evil and inhumanity. How often have such kind of men come unto me, whom, (when they have spoken with their kind words unto me, and also carry the garb, and outside shew of very honest Men, and promised all decent thankfulness) I have satisfied, and yet have afterwards fled off from, and broken their Faith: Therefore it is the best way for him who has any singular thing, to bury it over in silence, and so he need not fear of being drained by others, that know how (by the perswasive flattering Art) to get out his skill, and give no thanks afterwards for the same.

If I had not already began to describe the *Prosperity of Germany*, certainly I would not now begin; but forasmuch as I have taken upon me to finish what I have begun, I will stand to my promise, and will in like manner shortly publish (if God shall see it good) the third and fourth part.

And seeing that in both the following parts, the melioration, or concentration of the Metals, is chiefly to be done by the help of Salt-petre, I was willing more amply to confirm in this second part, that which I wrote in the first part of the Generation of Salt-petre. And I do again and again aver with the greatest asseveration, that such a generation of Salt-petre out of wood is very true, and is founded on Nature her self.

Now must I proceed a little onwards, and withal demonstrate to the simple, that the putrefactory Stomack, in which the wood is digested and putrefied, and which transmuteth all wood, and resolves likewise all Leaves and Grass in a short time, transmutes and reduceth it into Dung, is as the stomach of Animals is, and this may be done in a most vast Quantity, as hath been proved in the first part of the *Prosperity of Germany*; and this no Mortal Man can ever refute, viz. that the essential salt, or salt of Nature, is no other thing but Salt-petre, but is not as yet burning, or flaming up, until it be animated by the air, and conceive a life thencefrom, the essential salt of Vegetables, barely such, is not so, viz. Salt-petre, as hath been sufficiently manifested.

Now whatsoever gives fertility and power of growth, is Nitrous; if therefore there lay hid no Nitre in Minerals as in stones, why would the Gardiners carry slackt Lime into their Fields, and use it instead of Dung to dung their Fields withal? Whence doth the Salt-petre come that grows on upon old Walls, if not from the Lime? What is the reason that the Salt-petre men do seek after old ruined walls, to make Salt-petre thereof, were nothing in them? I verily believe that this is an indubitable Argument, that there is Salt-petre hidden in all things: For the salt of the World, or the Universal Essential salt, is nothing else but Salt-petre, when it hath after a due time attracted a life out of the air, to which end my secret circulatory instrument was invented, that such an animation might be the more conveniently brought to pass.

Nor do the other kinds of salts, viz. Sal-Gem, the salt made out of the natural salt fountains, or sea-salt, likewise all salts which are made out of the Lees of Wood ashes, or of Lime, also Alum and Vitriol; all these are not so widely different from salt-petre, but they may easily be transmuted, and converted into salt-petre by the animation of the air, by the help of my circulatory vessel; but for the better perception of the operation, I will subjoin this Example.

Dissolve as much Sal-Gem, sea salt, or salt made out of the salt fountains, or common salt which is frequently used in boiling of meats, or salt made of Wood ashes, or of the stones of Calx-vive, in Aq. fortis, as much as the water will assume to its self, or be able to dissolve, and let it again cool; then the salt does not concrete or shoot granularly, any more but into longish Cones like salt-petre. Pour off the Aq. fortis, or Salt-petre water, and dissolve it, viz. the salt, again in a Lixivium of Lime, and cristallize it, so shall you have therefrom a Natural, or Genuine Salt-petre, and no less combustible than any other Salt-petre that is digged out of the stables where Cattle have stood. Then again may there be, by the said Salt-petre water, more salt prepared, either common salt, or salt out of Herbs, or Wood, and be dissolved and cristallized, from whence results a new salt-petre, and this operation may be so long repeated, until all the salt-petre water be turned together with the salt, into salt-petre.

This transmutation of salt-petre is perfected in some hours, and from hence may a worthy reward for your pains be reaped, could it be otherwise performed than in Glasses; and indeed, out of one pound of salt-petre, would there come an hundred pounds of petre, if a part of the transmuted salt be still distilled anew into water, and more new salt be by it again transmuted. But there is no such need of setting about a work so laborious, seeing there is at hand a far speedier, or more dexterous way of doing the same, if viz. those salts shall be animated by the air, by the circulation that I have contrived, and so be turned into salt-petre in great quantity: which animation, or hatching as 'twere, may be done in vast quantity by easie labour, and little costs, the air (as we use to say) turning or making both sides of the Leaf: For one portion continually kindles and animates another, no otherwise than as a little Leaven doth a great Mass of Dough, and as a little Fœces, or Yeast, yea, as little as will lie in a Spoon, serves to ferment a whole Vessel of Ale; the same is done here. And indeed, common salt-petre may be implanted into other salts, even as a Vegetable Seed is sown in the Earth, so as thence to get in a short space of time a great encrease, even an hundred, or a thousand-fold.

But the sluggish Companions who had rather fatted themselves with eating, drinking, and sleeping, and wholly give themselves to laziness, who is able to wait so long in the expectation of this thing? Alas! for ye, ye sloathful, lazy, and devouring Gluttons, with what face dare ye so manifestly to betray your laziness? I pray, if you put out your Money to Use, and have 5 or 6 per Cent. as we use to say, a Year, must you not expect the years revolution afore ye receive it? And besides, you run here a hazard too, least your Debtor breaks, and defraud you of the very Principal it self: If you lay out your Moneys on building Houses, so to make a great gain thereby, may not your Tenant be reduced to such wants as not to have wherewithal to pay you, unless haply, out of the very Stubble, or Litter of his poverty? May not your Ships which float about in the Sea, be cast away by Storms and Tempests, or be taken by Pirates? Why are ye not as Patient in your expectation as the Husbandman is, who after he hath sown his Grain, must wait a whole year afore he reaps with advantage what he hath sown. Nay, yet more, if he be pretty fortunate, he scarce gains 6 in the 100, the costs and pains being reckoned; and in the mean time he is in fear, lest the Corn should be blighted by the cold, or being near ripe, should by a bad season be spoiled and corrupted in the field. If there happens a year that is drougthy, then the Corn cannot grow up high, or 'tis eaten by the Mice; but now in the preparation of Salt-petre all those Cares are saved, and 100 Dollars may yearly yield thee 2, 3, 4, or more gains, and that without any wronging thy Conscience, and without endamaging any other, and without Extortion; for if thou hast much Salt-petre, thou maist promise thy self much gold and silver also, for there will alwaies be such as buy it up; and if thou attentively hee-dest, thou hast so much delivered thee in my Writings, as that

that thou thy selfmaist spend it all on the melioration and separation of Metals: Nor needest thou, if thou thinkest it good, sell any of the same. Nor is there any reason that thou should be ashamed or repent of such a Work, because one man is sufficient, without any others help, to manage the greatest operation: nor need there great expence, save only a little to build a small Cottage, wherein the Salt-petre may be kept dry. If you have huge Woods at hand, you may make your Salt-petre out of wood; if you want wood, then out of the dung of Horses, Oxen, or other Beasts, and Sheep, or else out of even common Salt, which we use in seasoning our Meats, out of wood-ashes, and out of Lime: Whatever it be prepared from, it will not cost much, for 1 *l.* of Salt will yield thee 1 *l.* of Salt-petre.

But haply some other may be in the mind to think or demand, why *Glauber* himself sets not about this work, and reserve the whole Gain to himself? To these I answer, that I am not of such a greedy desire, as to wish for all to my self; nor will it at all be unacceptable to me, if another hath likewise somewhat; nor will it be at all less lawful for me to do for my self so much as seemeth me good, as for any other to take his liberty, and to do to himself as seemeth him good. Besides too, I am not of the mind to make the thing so very common, but will see whom I communicate ought unto, that so it may be applied to good uses, and not come into the hands of the Unworthy.

The first ten years however Salt-petre will not be of so vile a price, but that it may be made and sold to profit: Who knows whether or no he shall live so long? And if at the utmost it should after 20 or 30 years be of so mean a price, because of this Invention of mine, yet in the interim they may all that while enjoy the profit of the same, and it may be expected from the hands of God, that He will, for the time to come, provide for them some other waies: But never will it be so vile, as to be worth no-

thing; and if it were so, that you could not make any Money of it, (tho' it is impossible that it should ever be such a drug) yet (by that manufacture which I have afore given in the 1, 2, and 4th. Parts of my *Furnaces*; as also in *The Explication of Miraculum Mundi*; in the 2d. & 3d. Part of my *Pharmac. Spagy.* and in This Second, and shall be in the following Third and Fourth Parts of the *Prosperity of Germany*;) it may be improved about many eminent uses, and so Gain be thereof made; for Salt-petre is such a Subject, as you can never have too much of, and is therefore worth our labouring after, and our endeavouring how to prepare it in good quantity, and without finding out what benefit it is naturally able to afford us; for it is even a wonder to consider how great things may be done by the help thereof: It is the greatest Poison and yet may a most excellent Medicine be thereof prepared: Colder it is than Ice, and yet hotter than any fire. It is the Generator of all things, and also their Corrupter; it vivifies and kills all things; it is heavier than gold, and yet lighter than the Wind; it is also Fire and Water, Air and Earth, Male and Female; it impregnates and suffers it self to be impregnated: it is light, and is also darkness; it is black and white: There are in it as many Colours as the world affords; it is fixt and volatile, corporeal and spiritual; it kindles and burns all things, and doth also quench all burnings; it is the Beginning of all things, and yet it causeth the End of all things; that which is soft, it makes to be congealed and become stiff; and again, that which is stiff or hard, it makes soft.

O Thou Creator of all things, How great a vastness is there of thy wonderful Works? and what a fewness is there of those who understand, or know, or labour to know it! O thou eternal Light! illuminate the dark breasts of the lost Sons of the World; O thou vivifying fire, mollifie, enkindle, heat the stubborn hearts of sluggish Mankind, that are oppressed with sleep, and frozen with cold, that so they may seek thee, and know thee, and learn to fear thee in true Humility, and to honour & worship thee without Hypocrisie. Amen.

An Admonition, and short Repetition of those things which are treated of in this Treatise.

THAT the Friendly Reader may make this Book yet of more use and benefit to himself, I thought it worth while by way of an Overplus, again to set before his eyes those Secrets which have been herein mentioned, what use at the use of them doth consist properly in.

First of all, it hath been shown, how by the means of Salt-petre, all Volatile, and Immature Minerals are to be brought to a ripeness both in the moist way and in the dry way, that so they may yield forth out of themselves in the melting, good durable Gold and Silver. Then I taught by what way the Volatile, Arsenical, Cobaltick, and Antimonial, Auriferous and Argentiferous Minerals, may by an easy labour, be by an artificial fusion, and extraction, and also by a precipitation into Regulars, and by the purification or expellation of the said Regulars, by the help of Salt-petre, converted or brought into use in the dry way, and the Gold and Silver hidden in them be drawn forth. Thirdly, I have shown the extraction of Gold and Silver out of all the barren, or poorer sorts of Minerals or Ores, which are not worth the charges of extracting or the usual way of proceeding, and of the drawing them out by a singular Art, with the water of Salt-petre, and of rightly working them; which way is to be preferred far above any usual extraction of those poorer kinds of Minerals, not only because such an extraction is performed without a melting fire, and a Furnace; but also, because in this extraction there is more obtained than is by extraction or forcing out: And yet farther, that which was Volatile in them is fixed together, and retained, by the Water of Salt-petre which would otherwise in a melting Fire fly away in smoke. And more than this too, Gold and Silver may by this moist way, and that with very easy Labour be extracted and in a due manner perfected, and that commodiously and with no small profit, out of any, the vilest Fossiles (or things dig'd out of the Earth) as out of lifeless Earths, Duffs, Sands, and Flints, from whence, otherwise you cannot extract any thing neither by Extraction nor by Mercury: So that in all places of the World whatsoe'er soever, so it be somewhat a dryish soil, is to be found such kind of Earth, Clay (or Marble) Sand, Flints, and such like which contain in them a thin or spring kind of Gold and Silver, and from which they may profitably be extracted. Perchance it is a daunt Art which may be used in all parts of the World, nor is it at all burdensome to carry, but may be excellently (well, or safely) preserved till need requires. But this is to be noted that the safter Earth or Clay must first be made red hot and burnt afore it be moistened with the Water of Salt-petre. For without so doing, the Earth would always remain thick for clammy, would drink up much water, and it would not easily be separated, but being burnt, it suffers it self to be extracted no other than as if it were Sand. So neither do the Ore or Fossiles of Iron which are auriferous, and abound with Iron, suffer the Gold to be extracted and precipitated out of them as readily as other Minerals or Ores do. But the Iron, (if there be extracted of it) makes the Water thick and pappy like

Mud. And therefore you must put less that solution a part of common Water, to make it the thinner, that so the Gold and Silver may be the easier precipitated therefrom. The auriferous Coppery Ores are to be burnt first, if they are sulphureous, if not, they may then be extracted, though not burnt. The sandy, stony, brittle, and pebbly, Fossiles need no other preparation but to be burnt and ground.

Likewise all auriferous Irony, or Coppery Ores, may be separated by common salt, without a Furnace, or melting fire, and that in the open air (as we said afore where we treated of the poorer Coppery Minerals, or Ores;) and many hundreds of pounds may be done at one time, and with one labour, and the Gold which is extracted mainly with the Iron and Copper, may be separated out of the solution, by the moist precipitating way there delivered, and that with a mighty profit and gain, because that some precipitation hurts not in the least either the Copper, or the Iron, as to their malleability.

In like manner may you precipitate the Gold out of any Vitriol water, and that in quantity (when it has any in it); and on such wise too, that the precipitation of the Vitriol shall not at all change ought of its nature; and this is so commodious a way, as that if there were contained no more than one quarter of a Drachm of Gold in 100 *l.* of Vitriol, yet would not that precipitation be of no use or profit. And on this wise and manner may all other Mineral waters be precipitated.

Moreover, as concerning the means of easily preparing the salt so as to serve for the extracting the Copper, in all Countries, but especially on the Sea Coasts, the Concentration of salt out of the waters, or the Sea will afford you no mean, or obscure Documents touching that thing; which concentration is treated of in the Book intituled, *The Consolation of Navigators*.

But forasmuch as there is mention made in this Treatise of a yet other certain Artificial separation of Gold and Silver out of the imperfect Metals, in which, Antimonial scoria have place, in a foresaid extraction, which I would willingly (but as yet have not delivered; let no body so construe it, as if I either purposely or carelessly omitted the same; No! The Cause is far otherwise, and this is the true reason; seeing this Book now in hand it become more prolix than I intended, I determined with my self to reserve that most profitable process for the following third part, which God willing, I will very shortly publish, till then, I entreat the Friendly Reader to expect or wait for it with a good and patient mind.

Mean while he may acquiesce with these two ways, viz. the dry and the moist, and delight himself herein, and withal take care (as far as in him lies) to have ready by him, some quantity of Salt-petre; for the following third part shall treat of nothing else but the performing and doing of processes by the help of Salt-petre. He therefore that knows how to make it in plenty at a small rate, may hope for so much the greater benefit; and this I judged expedient, to add here for admonitions sake. More shall be discovered (God willing) in the third and fourth following parts. THH

THE
THIRD PART
OF THE
Prosperity of Germany.

In which is Delivered,

The way of most easily and plentifully extracting *Salt-petre* out of Various Subjects every where Obvious and at Hand.

TOGETHER

With a succinct Explication of *Paracelsus* his Prophecy; that is to say, in what manner it is to be understood the *Northren Lion* will Institute or Plant his political or civil Monarchy; and that *Paracelsus* himself will not abide in his Grave; and that a vast quantity of Riches will offer it self.

LIKEWISE

What an one that Artift *Elias* is, of whose coming in the last Days, and his disclosing abundance of Secrets, *Paracelsus* and others have predicted.

To the READER.

Friendly Reader,

Although there are very many Causes that might dissuade me from Publishing this Third and the Fourth following Part of the Prosperity of Germany in Print, (because of the inconveniencies and hurt done me by the perfidious Farnner, against whom no body hath hitherto opposed himself; but all have committed and wink'd thereat; and consequently have every one left such a perfidious Treachery unpunish'd) and encourage me to leave Germany, a most ungrateful Germany as it is. Yet notwithstanding, the Love to my Neighbours (amongst whom there are many honest and good Men to be found, who lead a troublesome kind of Life to get their daily food) hath compelled me. To such therefore as these are, would I willingly give [or hand forth] a Torch [so to direct them] that they may for time to come fare better and more easily get things necessary to uphold Life withal; but yet after such wise, as that they set their Hands to the Work, for the Gods sell not ought to those that Labour not, but all good things are sought, and found out by daily Labour and diligent search.

Now albeit, that all those things which are thoroughly handled in this book are true, and so confirmed by experience as that any one may easily understand and imitate them, yet notwithstanding, I am certain that there will be a very many who by reason of their ignorance, cannot understand them, and apply them to use; because the greatest part of mankind are too much addicted to laziness; and do for the most part refuse to apply their Limbs to work, but would rather walk abroad, and discourse of Arts when they are in their cups.

I say that these secrets of mine will no ways profit such kind of Men, for such must first learn in what manner the [necessary] Instruments are to be handled, and how the

Operations are to be rightly instituted and managed in seemly Order.

There are abundance of Men who (if they hap to read some Chymical Writings, or hear others talk of the profitableness of them, (they) are presently inflamed with such a love, that they will even wholly devote themselves to Chymistry on the hopes of growing rich. And now when they have proposed any thing to themselves, and attempt to do it, if they hap to have a sparkle of Fire light on their hands, or that by reason of some other obstacle, all things do not immediately fadge to their minds, they throw away the Tongs, and the Crucibles upon the Ground, and detest (or curse) the Author, because he hath not Written clear enough, and that they do not presently extract great store of Gold.

Let not such as these at all persuade themselves that they can receive any instruction from these my Writings; for my Writings require Men that are diligent, whose minds are never wearied with labour, and who are not sloathful, and impatient of Labour. Now to the studious (searchers) and especially to such Children (or Disciples) adopted or chosen by God, all these things will be unto them clear, manifestly evident, and easy to be imitated.

Forasmuch therefore as I have spoken many things in the First and Second Part of the Prosperity of Germany, concerning the making and use of Nitre, I do now go on in God's Name, and do teach in this third part, by what easie ways Nitre may be variously made, and be fruitfully and profitably used both by Noble Men and common Men; so that there is not a man in the whole World, but may (if he please) get great benefit thereby.

The Omnipotent God, the Author and giver of every good thing, bestow upon us to be able to enjoy and make use of his Gifts, that all things may tend to the Honour of his most Holy Name, and to the Safety and Preservation of us all. Amen

Rrrr

OF

Of the Preparation of SALT-PETRE.

I Shewed in the First Part of the *Prosperity of Germany*, the way whereby Wood may be concentrated and turned into excellent Nitre, and which otherwise is every where for the most part consumed by lying rotting in the Woods, and yields no benefit at all unto any Man.

This Operation is to be done with the help of a certain Press artificially contrived for that particular business, the due (or right) description of which, we gave you in the *Continuation of Miraculous Mundi*. But the circulatory Vessels by which the Lixivium of the wood (or the distilled Liquor out of the wood) is to be excited and heated by the Air, have not as yet been described; and therefore we have determined to do it in this Third Part. This Figure therefore represents them, and its use; and is as follows.

There must be two Boxes (as 'twere) made of Boards, each of them of like bigness and capacity, as the Figure (or Letter) A shews. These Boxes are to be so placed, that a Vessel may be set under one end of each Box, to receive in it (if need be) the Lixivium poured into them: Let one of the Boxes or Vessels be filled top full of Horse-dung, Hens, or Pigeons-dung; or else with the Leaves of the Trees, amongst which Fir-tree Leaves are best; then pour thereupon so much of this Lixivium which we shall make a description of by and by, so much as may suffice to moisten the Dang or Leaves contained in the Box or Vessel, and a little to over-top it. The next day (after you have so done) when you judge that all the matter is thoroughly wetted, let the Lixivium run out by a Tap, the which said Lixivium you must pour into the other Box filled with the like matters, and which stands just against it. Let these things stand thus wetted for some days; In the mean time, the matter contained in the first Box, grows hot, and the usefless moisture being most plentifully resolved into Vapours out of the Lixivium, the said matter doth daily get more and more efficacy. As long as you observe the heat of this Box to continue, and the evaporation of moisture to last, so long must it be left in the same posture whereby the Lixivium, thus poured on, may by its notable power consume and dissolve the Dang, or the other matters contained in the Box, and turn them into Water. And here you are to observe this direction. You must always put in new matter instead of that which is turned into Liquor, and so one Box may be always at all times kept full of the matters. But now when your materials being put in the first Box, begin to cool, the Lixivium which now lies in the second Box or Vessel, must be poured upon the matters yet warm, in the first Box, that so it may again contract a heat thence from by little and little, and so may dissolve those matters. And now whilst these things are thus detained in the first Box or Vessel, the materials that are in like manner put in the second Box do heat each other, and the unprofitable Phlegm evaporate: Now as long as this second Box vaporateth, the Lixivium must not be drawn out of the first Box and be poured thereinto, but all the matters are to be left to heat or burn (as it were) themselves. And when you perceive that the materials cool, then the Lixivium must be drawn off from the matters in the first Box, and be poured upon them in the second Box; and hereby the matters contained in the first Box will again wax hot, be burnt, and

be turned into Liquor. By how much the oftner and longer this repeated pouring on of Lixivium is done, so much the more, and sooner are the materials consumed; from which matters thus consumed, a most excellent Salt-petre may afterwards be made, for the heat makes the matters rot. Now then to make trial (if it be well enough done) take some of this Lixivium boil it away to a sufficient height for Chrystallization, set it in a cold place to shoot, dry the salt you find, being dry, put it on a live Coal, which if you find it burn up, it is a sign that it is full time to draw off, and take all your Lixivium to the intent that Salt-petre may be thereof made by due evaporation and coagulation. But if you chance to find it otherwise, and that the salt does not flame up, the Lixivium must lie longer in the Boxes to be heated and animated by the Air which is magnetically attracted by means of the heat: This labour being rightly ordered, there may be made excellent Salt-petre out of the said matters by the help of a convenient Lixivium, in ten or twelve Months space without any costs, save some small trifle about the Lixivium; neither is the Work so grievous or troublesome, for there is nothing more required but that the Lixivium be several times poured out of one Box into the other.

NB. There are yet, besides the other aforementioned several sorts of matters that offer themselves, out of which, Salt-petre may be made by the help of the Boxes, & a due Lixivium far speedier & plentifullier; but I judge it not needful to divulge every thing: Likewise there may be made a convenient Lixivium to prepare Salt-petre sooner, by and after another manner, to wit, in a dry form, without such putrifying as is done in the Boxes or Circulatories; but even this Artifice too, will I reserve yet a little longer for my Friends.

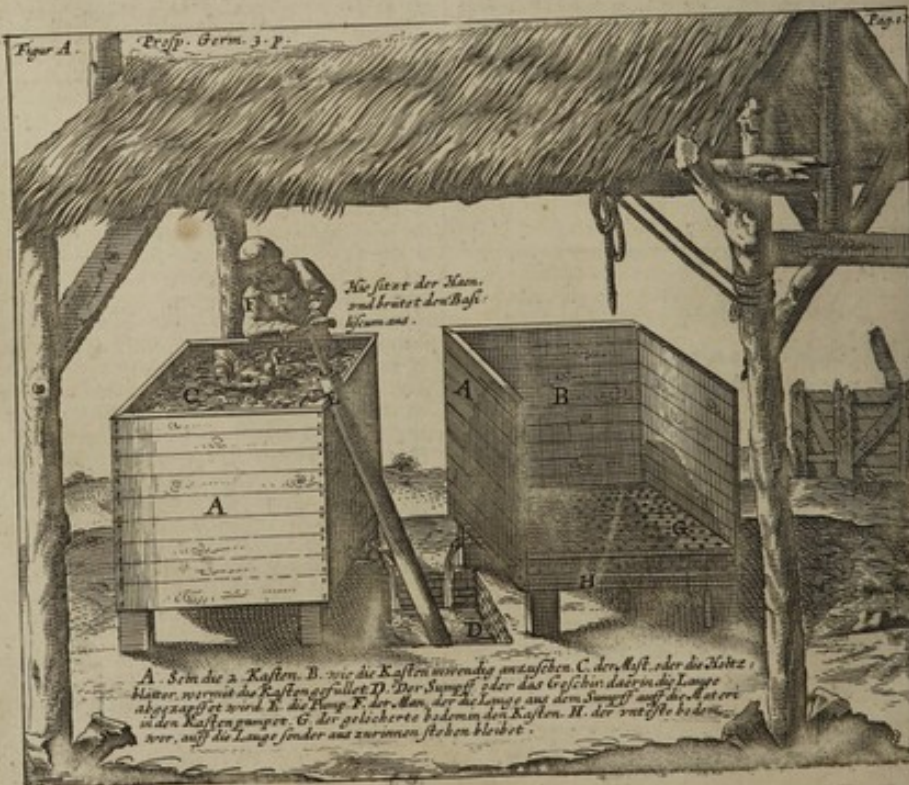

Nay yet more, there may be (by a yet secrete and shorter method) excellent Salt-petre extracted by the means of such a Lixivium in three hours space, and that with most great profit: And this way of preparing Salt-petre, I do prefer before all the others, and have found it the most excellent (Petre) of them all.

The Lixivium is on this wise made.

Make you a strong Lixivium of Wood-ashes, and when you burn the unprofitable Wood in the Woods into ashes, make by the same labour of your Fire some good Lime of stones fit for such a purpose; Then quench this Calx or Lime with Water, that so it may fall into powder, then pour thereon as much of the Lee of the Wood-ashes now spoken off, as is sufficient, mixt it with a wooden *Spatula*, and repeat this mixing and stirring it very often, some days following, that so the Lee may be made the stronger by reason of the Lime, and be like Fire, the which has an excellent virtue to putrefy the vegetables and animals, and to turn them into burning Salt-petre. (See the foregoing Figure belonging to this Operation noted at the top page, 1.)

Here

Here the Cock sits that hatches the Basilisk, by the top of the Chest.

A A Are the two Chests.

B The appearance of the Chests within.

C The Horse-dung, or Leaves of Trees, wherewith the Chests are filled.

D The Cistern or Vessel to receive the Lixivium.

E The Pump.

F The Man that pumps the Lixivium out of the Cistern, upon the matter in the Chests.

G The Bottom of the Chests full of holes.

H The second or lowermost Bottom where the Lixivium is kept without running out.

Another way of making Excellent Salt-petre in great Quantity out of Lime and the Lee of Wood.

TAKE the aforesaid Lime and Wood-ashes, of each as much as you will; and twice as much Horse-dung or Cows-dung, mix these matters exactly in a wooden Vessel or Tub, with Mans Urine or beasts Piss, and make it of the thickness as the thicker sort of Mortar that the *Masons* use, is wont to be of. You must have good store of this Paste made. Then make a certain arch of boards, which said arch must be some three, four, six or more feet broad, and deep or high, and the length of it must be double to that (or twice as much, as broad, and deep, or high) according to the conveniency of the place, and the quantity of Salt-petre you would make. The arch thus made, must be all over dawbed with the aforesaid mixture, the thickness of an hands breadth, just as we see Vaults, or Arches built up, of Stones and Lime upon wooden arches. Now when all is duly ordered, there must be put some Fire in under the vault of the arch, at first it must be very gentle, least the arch (of wood) as being the very foundation and supporter of the (other) arch should presently kindle and be burnt, which must not be, but be kept whole rather, untill the arch or covering thereon which is made of Lime, Ashes, and Dung, be perfectly dried. This done, there must be dawbed on, upon the said arch formerly made, more of the aforesaid prepared Calx, of about an hands-breadth thickness, and you will find that the humidity of this latter mass or second arching will be in a short time attracted by the first arch, and that this second pargetting will soon be dried: When this is done, there must be again the third time made another dawbing on, after the afore-prescribed manner. And this Operation is to be so long and so often repeated untill the arch be a foot or two in thickness, which when so, it is strong enough, nor needs it any more its wooden prop, and therefore now the Fire may be put thereto, and it may be burnt. And thus have you a vault or arch prepared, which is a most commodious instrument to make a quantity of Salt-petre by: And now if occasion require, and the condition of the place will permit, there may be built or made three or four arches after the same manner; though it be better to have them placed one by another, and to be of less magnitude or capacity; for so they are more convenient for Operation, as any one that practiseth hereabouts will easily apprehend and find.

Likewise it is better to build this arched Vault which we have called an Arch, long and narrow, than

short and broad, because the Fire being put under one part of such a long Chimney-like Vault, will very well diffuse its heat to every place thereof, and so keep the arch continually hot.

When this Chimney like vault is wholly dry, it must be again moistned with Mans or Beasts Piss, that it may thence contract more new humidity, which we observe will easily be, seeing we know that it is made up of Horse or Cows-dung, and not barely of Lime, for then it would not so readily and easily receive the humidity, as when Dung is mixt with it; the wetted Chimney-arch must be dried by the force of Fire put thereunder, the which may also be a little augmented proportionable to the bigness and thickness of the vault or arch.

NB. You must take good heed, that the Fire you put under be not too much augmented, and so hurt your arches, but let it always be such as may suffice to dry your arch by little and little, or else the Dung will be burnt up, and the already generated Salt-petre will be spoiled, for the Fire can easily endamage the Petre.

But now when we shall have often thus moistned the said arches with Piss, and shall take notice that they (*viz.* the arches) do attract no more thereof (*viz.* of the Piss) as being already filled with the Salt of the Urine, the which may be done in some four or six Weeks time, there must be little bits broken off with an Iron Instrument in several places of the arch, and these bits must be powdered and be dissolved in Water so to make a Lixivium of it, be filtered, and after a due evaporation made, must be Chrystallized and dried; the dried Salt matter must be put upon the Fire to see if it will flame or not: If we shall find it thus to be and to burn like Salt-petre, we must break down all the arch, and by the help of a certain Mill, reduce it into powder very fine, and pour hot Water thereupon, to extract the Lixivium with, then evaporate it as much as is convenient, and set it by in a cool place to Chrystallize; this artifice of Boiling and Chrystallizing shall be declared in proper Figures or Cuts in the end of this Work. But now if so be we perceive that the Salt extracted out of those little bits of the arch do not as yet flame up, 'tis a sign that it is not as yet sufficiently animated by the air: For the air gives life, which the Fire strongly attracteth, so that by the help of the Fire the air and life are attracted, whereby the Salt is animated and made inflammable. The Fire therefore here, is to be again administered (or put under) and the arched matter to be continually moistned with Rain water; and that Rain water is best, which (if it may be had) falls down when the Wind is in the North; though when there is no Rain water to be had, other water may be substituted in its stead. This pouring on of water is to be so long continued (always, permitting the Furnace or Arch to be rightly dried afore it be sprinkled with new water) untill the Salt, sticking in the arch, be found to be sufficiently animated by the benefit of the fire and air, and be inflammable when you make trial thereof by the aforesaid method.

This is a compendious way of making good Salt-petre in quantity enough, by only Lime, Wood-ashes, and Mans or Beasts Piss. If you proceed rightly on, you may get you a great quantity of Salt-petre in a most short space of time, and that for small costs, & in a manner no labour at all. The Lime and Ashes from whence the Petre is extracted, may be mixed again with new lime and new ashes, and other arched vaults be made thereof, upon which Urine must be continually poured

in like manner as we taught afore, that so they may be animated by the help of fire and air into Salt-petre. But if you have always at hand new Calx, or Lime and ashes, it is better to make new arches, thereof in the place of those you have pulled down, and to employ the residue of that, out of which the Salt-petre hath been already extracted about dunging some barren Soil, especially the moister sort of Ground, because it is impossible so thoroughly to separate all the Salt that nothing abides behind in the reliques.

This way I communicate to all, but I reserve for my Friends only the way by which, with the help of other Waters that cost nothing, and may be had in every place, a far greater quantity of Salt-petre may in a yet shorter time be prepared by the said arches, than is done by the help of Mans or Beasts Urine. Nay more, there are some waters which in eight days time, we have observed to have been coagulated into burning Salt-petre, which secret verily may be practically improved with most notable benefit in all parts of the World that Men live in.

Besides the subjects already mentioned, here offer themselves to our Hands many others which are obvious to all, of which such arches may be made, and which will yield more Salt-petre than the afore recited matters will; but let what has already been delivered, suffice. I cannot here forbear, but must tell you that there are some subjects to be found which (without the making the aforesaid arches, though there lie notwithstanding abundance of secrets therein) will bring a most notable benefit, and that belong not to this place, and which may be changed in three hours space into excellent Petre; which labour (or operation) I keep for my Friends, and should it be divulged, it would bring nothing but hurt, and therefore it is better to be silent: There shall more secrets be delivered in the following discourse, where we speak of the Northern Monarchie.

Here follows another way of plentifully extracting Salt-petre out of Rocks and Stones without Vegetables or Animals.

TO the intent therefore that it may be sufficiently evidenced, and that I may prove it to be true, that Salt-petre is an universal Salt or Subject, and is consequently contained in all the things the World possesseth, I judge it a thing worth while to set down here some proofs or trials thereto accommodated.

It hath been sufficiently enough already shown in the first part of the *Prosperity of Germany*, that good Salt-petre may by Art be extracted out of all the subjects of the World: But the way of so doing was not at all disclosed. For as much therefore as all Men do so greedily desire it, I determined with my self to describe first of all, the Presses requisite to the extraction of Salt-petre out of Wood, to the end that so it may evidently appear unto all Men, that it is a thing agreeable to nature, and that it is most easily accomplishable, to press a juice out of any Wood, which may be turned by the air into good Salt-petre. But as for the circulatory Vessels, I was not willing (then) to communicate them, but rather kept them a little longer for my Friends, which said Vessels I have notwithstanding set down in this Third Part.

Likewise it seemed not expedient unto me to reveal unto such as are enemies, the transformation (or changing) of Animals, much less of Minerals into

Salt-petre. Yet however I have done so much by my Manufacture, as for any wise Men easily to understand the same by what hath been exhibited, and I have in some sort opened it, that such things are possible to be done. But I have not so clearly shown the way of effecting the same, lest I should take away the occasion of other Mens exercising their ingenuity in bethinking themselves how it is to be done: Otherwise, it is not prohibited any one to seek a fuller information, from those that have knowledge in these affairs.

Therefore so far as the way of extracting Salt-petre out of Stones, is look'd on as a most impossible thing by such as are not skill'd in this Art, I have determined to describe the same, for the sake and benefit of such as succeed us; The knack of this Artifice consisteth more in the knowing of the Stones, than in the extracting of the Salt-petre out of them, for the extraction is not any other way to be done, than as the making of their Lee out of the common Nitrous Earth is wont to be, concerning which thing, *Lazarus Ercker* hath written at large. The knowledge therefore of the Stones, and the preparation of them whereby they may communicate (or let go) their Nitre unto Water, is the principal thing, and without that, there cannot be any thing done in this Operation.

First of all therefore 'tis necessary that the lover of Chymistry knows, that there are various Stones to be found that yield Salt-petre, viz. all such Stones of which (being commonly calcined by the force of the fire) they make Lime for to build houses withal. For there lies hidden in these kind of Stones, abundance of Salt-petre, which cannot be gotten out thence by the help of common Water by any kind of way or method: But when they are burnt with a violent Fire, they yield an hot Salt, extractable by the benefit of common water; which Salt indeed is not Salt-petre, but yet may most easily be turned by the air into Petre, like as it was formerly Salt-petre afore the Stone was burnt, and now first got another nature by the burning.

The truth of this thing, viz. That there resides natural Salt-petre in all Stones, which may be burnt into Lime, may be proved on this wise following:

Take of these Stones which Lime may be made of, $\frac{3}{4}$ lb. or $\frac{3}{4}$ lb. powder it very fine, pour thereupon as much of the best *Aqua-fortis*: Place the Glass in which this matter is contained, in a warm place upon ashes or sand, that the Stone may be dissolved in the *Aqua-fortis*: After it hath thus stood for about one quarter of an hour, take out your Glass out of the ashes or sand, though the Stone be not wholly dissolved as yet, and pour thereon drop by drop, some Lixivium of wood, untill the ebullition of the Lee or Lixivium poured upon the dissolved Stone ceaseth, and (the noise ceasing) you shall perceive some kind of Salt produced from them thus commixt, viz. from the dissolved Stone and the Lixivium. Pour some common Water upon this Salt, so much as may serve to dissolve the Salt in a warm place, the solution being made let the Liquor be filtered, or be strained through some thin Linen cloth, that so the part of the Stone undissolved, and the faeces may abide behind in the Filter or Linen cloth: The filtered Liquor must be coagulated into Salt by evaporating it away in a brass Vessel, then you are to weigh it: And now that we may exactly know, how much Salt-petre was in that $\frac{3}{4}$ lb. of the Stone, you must proceed on farther thus:

Take the same quantity of *Aqua-fortis* as you used but now, about the solution of the Lime-stone, and pour thereon likewise the same quantity of Lixivium, that you

you used about the precipitation of the dissolved stone, and let there be made a precipitation, let the precipitated matter be coagulated into the substance of a salt, and then also weigh how much this quantity of salt is: and now, as much less weight, as you observe to be in this salt than in the first salt in which the Lime-stone is, so much Salt-petre was there in that half ounce of Lime-stone. This is a most certain trial, and by this means may we most easily find how many pounds of Salt-petre, are contained in an hundred weight of stones.

NB. To the end that the proof you make, may be most certain, we must use the lesser Centenary, or hundred weight, as being more usual, and more accommodate for the trying of Metals.

And albeit, that the using of Aqua-fortis to this Operation, is altogether without profit, where you would extract that salt in great plenty out of the stones, yet notwithstanding, it is not so slight or trivial a thing to know a certain way of trying what stones do most abound with Salt-petre, that so if we have a mind to extract Salt-petre out of them, we may take those, in which it lies in a plentiful manner.

Besides, those stones which do commonly yield a Calx or Lime by Calcination, and which the Bricklayers use; there are found other stones, out of which there cannot be made any Lime by Calcination, and yet nevertheless, abundance of Salt-petre may be thence extracted without any previous Calcination. He that delights himself in this work, must exactly know beforehand such kind of stones: Forasmuch as no body would easily persuade himself that Salt-petre is contained in them. Nor do I think that ever afore this time the way of extracting Salt-petre out of these kinds of stones was used; but whether there was no body that knew that there was such a Salt contained in them, or judged it a thing not to be regarded, this I know not. But this I know well enough that that way of extracting Salt-petre out of them was never observed and used in Germany, though there lies a most notable quantity of Petre in them, and easily extractable thence, did we but know the way.

Therefore, forasmuch as there is plenty enough of such stones in all places, and that Salt-petre may easier be made of them, than of wood, I could not forbear, but must needs open and disclose this artifice for the good of the Country, and clearly explain it in this place.

Therefore, as concerning those stones which are here mentioned, there is such a plentiful store of them in most places, that they even make whole Mountains; they are in substance like a soft and tender stone, whitish in colour, [or of a shining colour] altho' colour'd or reddish, and are easily broken, and may be fashioned into all kind of shapes, or figures; and therefore they are frequently used about building Houses, for the making various Ornaments about the House, as for the corners of the Houses, the Doors, Windows, Steps or Stairs, or other External Ornaments. As long as they are yet in the Mountain, and not exposed to the air, they are of a considerable hardness enough, and do always hold it. When being used about Buildings, they are put in such places, where they may abide at all times dry, or else always moist.

But if so be they are one while dry, and another while moist, and are always obvious to the air [or weather] they easily become soft, and there scales off from them yearly, a little portion of the back of a Knives thickness, like Meal, so that they are yearly

lessen'd, and are not at all fit to build stable, or durable Houses with. The Stone-Cutters can easily distinguish these kind of stones from others, nor do they willingly use them where there is plenty of others to be had. And now, if you should go about to make your trial with these stones, like as you did with those that they make Lime of, according to the afore delivered Probation, so to know what quantity of Salt-petre is contained in them, it will not succeed so, because the Salt-petre becomes Volatile in the Calcination of it, and goes for the most part fly away into the air: and much less can you with [bare] water extract ought out of the Crude, and not Calcined stones; for such do not yield any Salt-petre at all, unless they have been placed in a moist air for about half a years space, whereby they may of themselves fall in pieces; for being so ordered, they easily yield forth their saltiness to the water that is poured on them, and consequently yield plenty of Salt-petre. Of which thing, this is a most certain Testimony, if (viz.) such stones are laid in some dry place, whereto the Rain cannot come, and we do most frequently sprinkle them with common water, and they do thereby turn into a powder. And if it fall out otherwise, 'tis a sign that there is very little Salt-petre to be found in them, and that the labour you shall bestow about them will be in vain. But such stones as grow soft, and fall in pieces, in six or eight Monthstime, do promise notable Rewards for your Labour, viz. a great quantity of the wish'd for salt; an hundred weight of these kind of stones thus fallen in pieces, will easily yield you ten pound of Salt-petre, more or less according to the Condition of the stone. The extracting of the Lee, or salt, is done with common water, in the same manner as the Lixivium is otherwise extracted out of that Earth which is digg'd up in the Stables where Beasts stand; which way of extracting Salt-petre, of coagulating and perfecting it, is clearly and perfectly enough described by *Lazarus Ercker*, heretofore the Emperours chief Overseer of the Metallick Affairs, in his most experienced Book of his Art of the proving of Metals; inasmuch, that I esteem him to have rendered the hardest, or most difficult part, very clear, and therefore I will refer the well minded Reader thither.

But for as much as every one cannot buy himself a Book of such great bulk, only to get thereby the knowledge of the way of extracting and evaporating Salt-petre, I have judg'd it worth while to set down here for the sake of the Chymical Students, such directions as the afore said *Lazarus Ercker* hath delivered us hereabouts. For I was never of the mind to cast off such things as have been well delivered by other men; I only add unto them, those things that are mine: Let others do the like, that are the Authors of any new thing, that so there may arise some benefit thereby unto our Neighbours, for whose sake, that we may (viz.) serve them, the most great and blessed God hath bestowed on us such various knowledge.

But that we may get a certain knowledge of distinguishing the said stones, I think it altogether necessary to treat of them more at large.

Therefore although this kind of stones are plentifully enough, to be found every where in the World, yet they are not known, or regarded, because we cannot persuade our selves, that there is any the least portion of Salt-petre contained in them; for albeit, that an hundred pounds of such stone should contain in it ten pound of Salt-petre, and we should reduce the same into a most subtil powder, and should labour to

extract

extract from thence a Lixivium or Lee, with either cold or hot water, yet should we not hereby get so much as one Ounce of Salt-petre. The reason is this, because there is not to be found in such a stone as soon as ever it is digged out of the earth, any Corporal Salt-petre, which may be extracted by means of water; but there lies hidden only a certain Soul or Magnet of Salt-petre, by the virtue of which, that which gives a Corporeity thereto is to be first attracted out of the air, to the end that Salt-petre may arise thencefrom. And this is hereby evident, for were it otherwise, and were there in that stone any Corporeal Petre at the first digging, it must necessarily be extracted thencefrom by the help of water; but we find it impossible to make any such extraction, unless that stone be before laid for some certain time in the air, and doth together with its softness, acquire (or make) Salt-petre in a Magnetical manner.

But for all this, we know that this our reason so exceedingly well founded, will not yet satisfy the unskilful, unless we make it yet more clear unto them with other Expressions, and various Examples; but I pray how is it possible to declare all such Circumstances to one that is utterly ignorant. 'Tis too much labour to boil Meat for another, and to thrust it into his Mouth too. It is surely sufficient enough to have shown the truth, and discovered the way by which the operation is to be contrived, though all things be not founded on such palpable Reasons.

But forasmuch, as the work, which I treat at present of, is an altogether new thing, and unknown to any men, the necessity of the thing requires, that we do a little more openly and clearly exhibit (and set down) the whole knack.

We presuppose, that it is a thing well known already, even to all, that each thing hath in it its peculiar magnet, by the benefit of which, it attracteth unto it salt from the air, or earth, whatsoever is profitable for it; and especially, because we have largely treated thereof in our Works; insomuch, that we deem it altogether needless to repeat the same here. However 'tis requisite that I add thus much, viz. That the Minerals do abound with a certain Magnetick Virtue, more than other things do; and that they do attract their Life, Figure, or Shape, and Essence, out of the air, like as the Animals do, that so they may be nourished, and encrease; but being destitute, or deprived thereof, they are observed to be as it were dead, and bound, or wholly void of vigor.

As for Example. Let the Minera, or Ore of Vitriol, or Alum, be digg'd out of the Earth, that the Vitriol, or Alum in this Minera, be already duly digested and ripened, the salt may even presently be extracted thereout of, with common water. But if they have not as yet attained their full maturity, there is no salt extracted thence, unless the Minera be first torrefied, or calcined. Nay more, a Minera, or Ore, that is yet less ripe, will not yield any Salt, neither by the force of the fire, nor without it; but must be yet further exposed to the air for some time, that so it may first attract that out of the air, that is requisite to make Vitriol or Alum of, and thus (these things being first done) the Alum, or Vitriol, is most easily gotten thereout of, by a convenient Extraction and Evaporation.

We made mention in the second part of the *Philosophica Lixiviorum*, of a certain Minera, or Ore of Vitriol, which is plentifully found at [*Herckrada in Hapsia*] sinking in that Earth, which in that place they make their Crucibles or Pots, in great quantity

with; and we shewed a way of making a red and sweet Oil of Vitriol thereof, yet with this Caution, viz. That we shall not have from the said Minera, nor the least portion at all of this Oil, if we do not expose it, broken in bits, to the cold air, for half a year, that so it may fall into powder. Such as have heeded this going to work, have made thereof amost sweet Oil; but such as have neglected the doing this, which I published out of a sincere heart, and have reduced the said Mineral into fine powder, and laboured to extract a salt thencefrom, by boiling it in simple water, bestowed their labour in vain, because of their refusing to expose that Minera for a while to the air, and they received not so much as one Grane of Vitriol; and thereupon they took occasion to slander me, and to accuse me of Lying.

But now, when they have observed that this Mineral that they cast away, being exposed to the air, had attracted therefrom a salt by its Magnetick Virtue, when it had lain so long as to mould into powder of its own accord, and that thereout of a Vitriol doth proceed, they were enforced to believe that there lay hidden some Vitriol in those stones; which notwithstanding, could not be extracted by means of water, and so they have afterward publicly confessed, that what they afore gainsay'd, or oppos'd, was agreeable to the truth.

Thus likewise, there are various sorts of Copper (Ores) endued with an attractive power, and upon that account, there cannot be separated any Metal, by fusion, when it is first taken out of the Earth, unless we have first exposed it for some Months unto the Air.

Every Nitrous Earth, out of which Salt-petre hath already been extracted, doth (when it is again exposed to the air) attract Salt-petre anew, and this we observe to happen in all Wood-alhes, but especially in Lime-stones Calcined; for, it attracteth more salt out of the air, than its weight was afore its being Calcined. For, at the first time, you will scarce get *ij.* or *ij.* lb. of salt out of a centenary, or hundred weight; now by how much the longer it lies exposed to the air afterwards, so much the more plenty of salt doth it yield, as is sufficiently well known already. He that is ignorant of that we speak, or else cannot understand it, let him make trial, and he shall find that what we say is a truth. Such as are Ideots do extremely need these kind of Admonitions, that so, the business being the better understood, we may take from them all occasion of ignorantly detracting from my Writings.

I say again, that if the stones which we here treat of, are but well known, though they do not at the first yield any salt, by endeavouring to extract it with simple water, yet is there no difficulty at all therein, nor should we at all mind that, but let them only be left in the air for some due time, and by this means they will plentifully enough attract, and yield us, by a convenient extraction, good Salt-petre. The Ancients did extract Salt-petre, chiefly out of stones, which way of Extraction is now wholly lost, or out of use. All the Europeans do now extract their Salt-petre out of the Earth of the Stables where Beasts stand; albeit, that the very Name it self of Salt-petre, doth declare, what matter it was first produced out of, viz. out of Rocks and stones: For 'tis as much as to say, salt educed out of Rocks.

Nay, even to this day there is Salt-petre extracted out of Rocks in the *East-Indies*, the which they transport thence in Ships into our Lands: Our Commonwealth

wealth of *Amsterdam* only doth yearly receive some thousands of hundreds of that Salt, which is extracted out of the bare Rocks without the addition of any other thing; I wonder what the reason is, that, that way of extracting is unknown to us *Germans*; surely I impute it merely to the want of skill to manage this business.

Thus therefore do we think we have sufficiently declared that Nitre may in very deed be extracted out of stones; and that so clearly that I cannot see what reason any have to misbelieve my words.

But now that the certainty of the thing may be the more apparent, and that no body may think it a fable, that Salt-petre may be extracted out of stones, we will shew some places in which Salt-petre lies in the stones in a most plentiful manner: And although that there are sundry such places that offer themselves unto us, where the stones contain Salt-petre in them, we will demonstrate the verity of this in those places we have lived in, for 'tis impossible for us expressly to pronounce such or such a Mountain in this or that Country full of Salt-petre, which places we never saw. 'Tis not given us to search all places of the Earth, but such places as we have seen and come to, we have left but few things in them untouched, whose nature we have not thoroughly examined.

Therefore for Examples sake, we will take some part out of our own Country, and exhibit or shew unto all Men, those stones which are therein found to participate of Salt-petre, any one that is studious in these affairs may do the same in other places, and make a diligent inquiry into them, and he will find that almost all Mountains are filled therewith, and yet is known to none or at least-wise to but a very few. In *Francia*, (or *Franconia*) and indeed at *Kitzing* where I dwelt before I came to *Holland*, I often went into the Field in clear weather, with an intent to search out Minerals, and although that sundry Men ignorant of (such) businesses, do report that there are not any Minerals at all to be found in *Franconia*, and that never any Veins of Gold or any other Metal have been found there, because all the Inhabitants do live contentedly with the plentiful provenue of Wine and Corn; nor do they labour about finding out any other Treasures (for there is not any Country in all *Germany* in which is gathered more abundance of Wine, and of a better sort, than in *Franconia* aforesaid; which gathering of Wine is to be accounted to the *Franks* or *Francomans* instead of Mine-pits, and yield them employment enough) yet nevertheless forasmuch as my mind was ever bent that way, and I was naturally inclined to search very inwardly into those things which offer themselves unto us, amongst the wonderful works of the most great and glorious God, I could not omit the visiting such places, which seemed to all Men as unfit for bringing forth Minerals, and which were judged to be clearly void of the same, as being willing to try whether or no some things that others knew not of might not offer themselves unto me. Nor was my hopes in vain, for I found far more than my expectation was, and if necessity required I could shew those very places.

But forasmuch as I have proposed to my self, here to shew such places only in which Salt-petre may be plentifully made, I will at this time pass by the other Minerals in silence: Yet so, as not wholly to leave such things, as offer themselves in the way, untouched. I will therefore take in hand some part of the *Rhine*, which is between *Kitzing* and *Alschaffenberg*, and will will very briefly (for my purpose is not to write a Chronicle) shew what treasures the most Great and

Blessed GGD hath vouchsafed unto those places, besides Wine and Corn so plentifully abounding there.

Kitzing is an Eminent Town and well built, belongs to the Bishoprick of *Wurtzburg*, and is founded upon Lime-stone, and therefore the soil is very fruitful; and yields Wine and Corn in abundance. But as soon as ever we are past over the Bridge of the *Athene*, the Earth begins to be sandy, and has abundance of Flints in it, which contain in them some Gold as well as Iron. The manner of extracting it, is described in the second Part of the *Prosperity of Germany*, and is confirmed in this third Part.

About a mile distance opposite to the said City is situated an high Mountain, very full of huge Trees, in this Mountain are various Castles (or Houses) the chief of which is the *Coffel* Castle, which is the House belonging by succession to the Lords of the County of *Coffel*: At the bottom of the Mountain there is a Village of the same name, belonging to the said Castle (or Palace.) In this Village there are abundance of Springs, the Waters of most of them I have often times tasted, and have perceived them to be mightily impregnated with Salt-petre, inasmuch that the Beasts do altogether shun the drinking of them, much less can Men use them about the boiling of their Victuals: Yet some of them yield sweet water very fit for domestick affairs. These Nitrous Fountains are of no use, nor do they effect ought, save that they drive some Mills, and run through the Village a particular way afore they fall into the *Athene*.

And forasmuch as the aforesaid Earls have known that the chief part (or most part) of the said Fountains are wholesome by reason of the plenty of Salt-petre in them; they have therefore taken care to have a great House built, that so the place may be rendred commodious for those that by reason of some disease should come unto this place for the sake of washing their sick bodies; and there are abundance known to come, that are ill, in the Summer time, from places far remote; several of them too by a due using this Bath are restored to their former health.

They know not any other use of these nitrous Fountains than what is aforesaid; whereas if they did but know how to add some Virtues to the said waters by the benefit of the Juice of the wood, of which there is great store in that place, they would find by the use of them then, many wonderful effects in the curing of Diseases.

Being therefore earnestly intent upon the search hereof, viz. from whence these nitrous Waters should chiefly proceed, I found that the Mountain nigh that place, extending it self for some miles, was every where full of Salt-petre, and that it stuck in the Rocks themselves, out of which whatsoever is on the Mountain grew. I did therefore diligently search out, what condition those Stones were of, which the workmen dig'd out in these places, and I knew that there was a great quantity of Salt-petre contained in them, inasmuch, that as many Mountains as here (abouts) seem to be replenished with the same: Nay more, if you shall break one or two of those Stones with which the Houses of the Village of *Coffel* are built, you shall find every where in them abundance of Salt-petre. I went to visit the place it self where those Stones are digged out, but found not any Salt-petre among the digging, because the Air had not as yet displayed its Virtues thereupon: But I observed that in those Stones exposed a while to the Air, there was plenty of Salt-petre. He that would see it with his own Eyes, let him go into any House of the *Coffel* Village, whose

Wall

Walls are of ancient standing, and he shall find that there is abundance of Salt-petre in those stones, and withal, that the Pillars belonging to the Bath-house do yearly wax less, for as much as scalings of the thickness of the back of a Knife do still fall off, by the power of the separated Salt-petre, as I have often very accurately and curiously observed. If the Earls or Counts did but know the true use of this excellent and occult Treasure, they would get far greater riches out of that bare Mountain only than by all the County. I doubt not but that seeing I have in this place detected this Treasure, there will some be found that will labour for their own profits sake to find it out.

Not far off from the said Mountain the whole Earth abounds with Iron, not in the form of Veins but of Reins, inasmuch that the Metal of Iron offers itself in various particles or pieces of diverse magnitudes; for in some places it is found as big as an Hazle-nut, or an Acorn; in other places as big as an Egg, or ones Fist, yea and as big sometimes as ones Head, which by the force of the Fire is made facile and yields abundance of Iron; nor did I ever yet meet with any Metal of that sort more excellent than that is, but no body knows it, though it may be commodiously prepared or fitted for the use of Man, because there is in this place plenty enough of Wood and Water to be had [for such a purpose.]

This Mountain stretcheth out itself some miles, reaching as far as *Iphovia*, and the jurisdiction of the City of *Wurtzburg*; so that the chiefest and greatest part thereof is seated in the Bishoprick of *Wurtzburg*: And therefore might immense and vast Treasures be gotten, were there but such as were lovers of Art and would make themselves skill'd in the Operation.

Besides, this Mountain yields abundance of white and red Gypsum, which may be reduced to an exceeding whiteness by the force of the Fire.

Besides this too, we have known Marble and Alabaster digg'd out hence, and yet it has not been very durable, for it becomes nitrous after it hath lain exposed a while to the Air, and falls to powder, and yields plenty of Salt-petre, were it but rightly managed, for there's no want of Wood here.

There is yet moreover found in the said Mountain another Castle which is called *Swanburg*, and belongs to the Bishoprick of *Wurtzburg*, where the Soldiers did heretofore use the Metallick Rods, to search after, and to see if they could find (by the using them) some Treasures; and they tried whether or no (the Castle being burnt by the occasion of the War) any such Treasures lay any where hidden. What they found I do not yet know: But this I know, that the said Rods did shew good Metal to be every where (thereabouts) The which thing gave occasion of explaining or unfolding the said matter in its proper places. Besides this, they digged up nothing else but such nitrous stones for some fathoms depth. I once viewed this place, and found that the stones extracted some years afore out of this Mountain were altogether brittle, and is a manifest token that the whole Mountain is fill'd with Salt-petre.

There is besides this Mountain, another nitrous one that I know of, of the like condition in the mid-way 'twixt *Kitzing* and *Wernfeld* (and is about a miles distance from *Carlsbad*) but that which is here had, differs from the former in this, viz. that the stones which it exhibits are of a red colour, nor are they so much impregnated with Salt-petre, as those of *Kitzing* afore said, for they are richer in Petre, and are of a more ally colour.

There are likewise such kind of stones also that they cut or dig forth at the *Moen* near the City *Rottenfeldt*, but they have not in them so much Salt-petre as those have that are found in the *Coffel* and *Swanburg* Mountain.

There's abundance of such stones in several places in *France*, but my purpose is not to mention them all, for I was minded to mention such only as my self have seen, and that are near bordering upon the *Moen*.

They that have a mind to deal with them may make their search, and they will find in all Countrys of the Earth fit stones for their purpose, the which we may hereby know, if being kept a while in the Air, they wax soft, and scale off in most thin leaves, and there sticks to your Fingers in rubbing them off, a reddish Meal.

Besides this too, you may have a most certain sign of such Petry places by those Spiders that have a small body and round, and long feet, for they stick to those stones in abundant measure: For such Spiders do not feed upon hearbs, grasse, flies or other insects, but on old Walls, and they seat themselves chiefest of all on those afore said stones. They are not all venomous as the common house Spiders are, and therefore the Children do gather them, and are much delighted with them. Now they sticking on to the softer sandish stones do most certainly demonstrate that Salt-petre is contained in them; for tis that which they are nourished with, and conserve their life by, and this I was willing to signify unto you. But put case that that no such nitrous stones were to be found, yet however there is not the opportunity denied us of making Salt-petre of the common Lime-making stones, and of them there is every where plenty enough, if they are calcined by the benefit of Wood, and made nitrous with the juice of wood.

What shall I say of the Calcined faces of *Tartar* which are yearly gathered up and thrown away in vast quantities, in all that tract which lies on the River *Moen*, between *Bamberg* and *Frankfort*, whereas notwithstanding some hundreds of hundreds weight of Salt-petre might be extracted thence-from, did they but mind it. For whatsoever *Tartar* is therein contained, is all of it Salt-petre when 'tis duly boiled with a Lixivium of Lime, and being hence strained, and a sufficient evaporation made, it be set by to ChrySTALLIZE. For it attracts the soul after a magnetick manner, which Operation if rightly instituted, there may be prepared thence from a most inflammable nitre in three days space, the which is likewise of far greater profit than the getting out the *Tartar* by the help of a Press, and with a great deal of labour; or else than the making Potashes, as we see usually done.

Besides too, there are found other stones that being burnt do yield abundance of Salt-petre, such as are the *Tophi* (or soft sandy stones) which may be abundantly gathered near *Triefelsberg*, which is a Monastery situate on the *Moen*, and in other places of *Germany* they make even whole Mountains: So that it is evident that there is no where any want of convenient matter to gather Salt-petre from, if Men would but set their hands to the work. These stones are obvious unto all; and who knows what Treasures the Woods (which we do not at all search into) abound withal? Would time permit me I could shew that various kinds of Metals are conserved in the Mountains situate between *Kitzing* and *Frankfort*, and especially in the *Speghardensine* (Mountain,) the disclosing of which, some other more commodious place will admit of.

Now

Now follows what we mentioned of the aforesaid

LAZARUS ERCKER.

Of the manner of Boiling Salt-petre.

AND FIRST

By what means a Lixivium is to be made out of a Nitrous Earth.

IF you are minded to make a Lixivium of such an Earth, dig it as deep as you shall find by proving it to be either good or naught, especially if you intend to make it in great quantity, and keep it in a dry place. Then take care to have some great wooden Tubs, or Vessels made, so large, that each of them may hold about some ten Wheel-barrows full of the Earth, and whereby you may be able to prepare Lixivium enough, answerable to the work you have proposed to your self to do, and to the bigness of your Copper. Now there are commonly required for such a work, to one Copper Pan that weighs two hundred weight, eight Wooden Vessels which are to be placed in such order, that on each side there may stand four in a row, opposite to each other. These same Tubs are to be so far distant from the next Colateral Vessels, as is requisite for the Wheel-Barrow wherein the Earth is brought to come between: Yea, and it is necessary that there be half an Ell's space betwixt the said Tubs and the Earth, or Ground, it self, wherein they are placed. Likewise, each of the Vessels, or Tubs, must have a hole in the fore-part, and towards the bottom thereof, fit to put in a Plug (or Tap) at: Then finally, there must be put under those Plugs, a long Vessel like a Channel-pipe, which may receive in it the Lixivium running out of the Tubs, and may guide it along into a peculiar Wooden Vessel, as into a common Store-house set in the Earth hollowed for that purpose, to receive the said Lee in.

All your Tubs being thus rightly ordered, put in upon every Tub's bottom another (false) wooden bottom, perforated with many Holes, and let it lie two Fingers breadth distant from the true bottom: Upon this (false) bottom lay yet another made of Bull-rushes, or your small sort of Reeds which grow plentifully in Ditches about the thickness of a quarter of an Ell: In want of these Reeds throw in upon the aforementioned perforated bottom, the quantity of a Span (thick) of Chopt Hay, or Straw, laying some very thin boards thereon, that so it may not be scattered (or float) abroad. And your Vessels are made compleatly ready.

Now then, put of the Earth you have already tried and gathered, as much into each of your Tubs; as they can hold, yet with this Caution, That the top part of your Vessel be empty a Spans height. And observe this, that if you can get some old ashes of the Curriers, or Soap-boilers, as much of it as two or three Wheel-barrows will carry, it must be put in

upon the topmost (made) bottom of the Tub, afore the Earth, but now spoken of, be put in. At the top of the earth, lay a Cover made of Twigs, (or Withes) and fasten it with a wooden stick at the top of the earth. This done, pour common water upon the earth contained in the Vessel, an Hands breadth in height, so as that it may rather touch (or be poured) on the Twigs, than the Earth it self, least the said earth become unequal thereby, and hollowed in several places. Let it stand thus for eight hours, which time being overpast, draw your Plug out, and let the water you poured on, run out at the hole beneath, which as long as it is muddy, you must always pour in again into the Vessel, repeating this so often, till it comes out clear, then keep it, and this water is called a weak Lee or Lixivium.

This done, pour common water again upon the earth from which the Lee hath been already, once separated, that so it may extract the residue of the Lixivium out of the earth; and this Lee is of no use, save that it may be poured on upon new earth, instead of simple water; for it oftentimes doth even yet contain a great deal of Nitre, inasmuch, that you may sometimes extract out of an hundred weight thereof, three or four pound of Nitre.

This Extraction being finished, take out the unprofitable earth out of the Vessel, and put in new; and continue the Operation, after the aforesaid manner, reiterating it so long, and so often, until you have gotten store enough of the Lixivium, that the work of boiling be not intermitted for want of Lixivium.

Besides, there must be some Wooden Vessel placed at the upper part of the Copper which this Lixivium is boiled in, out of which may run so much Lixivium into the Copper as is wasted away by boiling, that so there may be still kept the same order of boiling, and the same quantity of Lixivium in the Copper. This boiling is to be on this wise continued, until a Centenary, or hundred weight of Lixivium in the Copper, yields according to the less assay (or weight) twenty five pounds of Nitre; and this may be done in two Days, and one Night.

This being thus done, you must have ready yet two Tubs, or Vessels (more) of Wood, made after the afore prescribed manner, and furnished with a (false) perforated wooden bottom, besides its own bottom, and likewise with such a bottom as is made of Reeds (or Bull rushes); only you are to observe this here; That there must be put yet another perforated wooden bottom upon this topmost bottom of Reeds, upon

THE

which

which there must be first cast in some chop'd Straw, then some Ashes of Firr, Beach, or any other Tree, so much in quantity as may overtop the Straw an Ell or Cubit, [*Old*] high; or rather (if it may be had for a very mean price) as much as may fill the Tubs, or Vessels. But yet, these Ashes are not to be just simply thrown in (as they are) upon the Straw, but afore this is done, they must be first well mixt together, then moistened with some of the best hot Lixivium, that there may be made a Mass. Then when the Ashes are on this wise prepared, and put in the Vessel the Lixivium boil'd to its height, and which yields in the proof twenty five pound, must be poured thereon, as hot as possibly it may, and is to be often drawn off by the lower hole, until (if troubled or muddy) it becomes clear.

After that all the Lee hath thus passed through the Ashes of both Tubs (the which is done upon this account, That all its fatness may pass into (or be left with) the Ashes, which Ashes are hereby rendred stronger to wash withal) keep it in a peculiar Vessel.

Then pour the common Lee or Lixivium upon the Ashes remaining in the Tubs, which when it hath passed through the Ashes, is called the second stronger Lixivium: Then again pour on yet a third time, hot Lixivium, and when 'tis drawn off, it is called the second weaker Lixivium: Lastly, the common Lee, or Lixivium, may be poured on cold upon the Ashes, that so all the virtue of the same may be wholly extracted.

The Figure before going (*Numb. 1.*) will shew you the way of placing the Tubs, of preparing the Lixivium, and ordering the boiling.

A Are the eight Wooden Tubs, wherein the earth is put.

B Channels, or Conveyances, by which the water runs into the said Tubs.

C Channels, or Gutters, by which the Lixivium is conveyed into a Vessel set thereunder.

D The Vessel in which the Lixivium is gathered, or received.

E The little Vessel out of which the Lixivium runs into the Copper.

F The Furnace.

G The Copper.

H The door of the Furnace whereby Wood is put in under the Copper.

I The Lower Wind-draught (or Ash-hole) of the Furnace.

K The inward shape of the Furnace.

L An Iron Grate, which the Wood is put upon.

The manner of preparing the Liquor, out of which Salt-petre may be made by Boiling.

First of all, pour your second weaker Lixivium into your Copper, and set it a boiling, then let your second stronger Lixivium run thereinto by little and little; and then lastly, the first Lixivium it self, and which is the chiefest of all, until the Copper be almost filled, and the Lixivium be boil'd enough to shoot.

And now when you perceive that your Liquor is made strong enough by boiling, put in a Brass Ladle

perforated (or full of holes) several times, even to the bottom of the Copper, and if the Lixivium lets fall out of it any Salt, you will find it at the bottom, the which you may take up with your Ladle.

Note also, That the Scum which at the end of this Boiling is plentifully gathered, must be carefully taken away: Now then try the readiness of your Lixiviums Crystallization, on this wise: Put either two or three drops on a cold Iron, or on a Polish'd Plate of Iron, and if it stands, or grows hard; that is, if when you turn the Iron up and down, it does not run (or flow) down, these are signs of the fitness of your Liquors Crystallization. Or else, you may put some of the Lixivium in a Brass Vessel, and set it in cold water, and so you shall see whether the Liquor be fitted enough to Crystallize; for as soon as ever the Lixivium shall be cold, there will be plenty of Salt-petre generated: Nay, even the very Brass Spoon it self denotes the goodness of the Liquor, it being put into the Liquor, and again taken out, it will show it sticking on it, as if it were Oil.

Out of a Centenary, or hundred weight of Liquor thus perfectly prepared, there will proceed more than seventy pound of Salt-petre.

The way of rightly using the Liquor for the Generating of a more Crude Salt-petre.

POur your Liquor prepared after the afore-shown manner, out of the Copper into a narrow Tub, or Vessel, made of Firr, or Pine-tree wood; wherein let it remain quiet, till it be a little refrigerated, and the muddiness or sliminess [*Limus*] appear, and you find that the salt sticks on in Granes to the sides of the Vessel; now when you perceive your Lixivium so cooled, as that you can put your finger therein without burning, pull out the Plug, wherewith an hole made in this long Vessel, about a span's height from the bottom, was shut, or stopp'd, and so let the Liquor run forth, into very great Wooden Vessels, and deep, purposely made for such a business; or else into Copper Pans, buried almost (up to their Necks) in the earth, (for the cooler the place is, which they stand in, so much the better, and the more plenty of Salt-petre is gathered, and Crystallizeth) and you will find that your crude Salt-petre will shoot therein, the thickness of almost two fingers breadth, partly of a whitish colour, partly yellow, and partly blackish.

After that this boil'd Liquor hath stood for two days, and so many nights in the Vessel, the Lixivium of the Salt-petre which swims at top, must be taken away, which you may mix with the strong Lixivium, and pour a second time upon Ashes, for else the Lixivium will contract too much fatness, and there will be no Salt generated.

Sometimes it happens, that when the Ashes are not good, there's no salt at all gathered in the Liquor, in which case there is no present Remedy, than to mix such a Lixivium stronger than is fit, with another, and so pour it again upon new, and good Ashes, and then let the boiling be again perfected after the afore-prescribed manner.

Likewise, when in the boiling you find the Lixivium very muddy, whereby the Collection of the Salt is oft-times hindred, it must be taken away, and let the Washer-Women, or Lawdresses have it, and other

must be substituted in its room, and be farther purified by the help of Athes.

The Figure signed (Numb. 2.) shews the manner of preparing the Liquor by boiling, and of extracting and gathering the Salt thereof.

A Long narrow Tub, or Vessel, in which the decocted Liquor of the Lixivium is cooled.

B The Furnace wherein the Copper stands.

C The Man that manageth the boiling, and extracts, or draws out the salt with a Ladle, the which he lays in a Wicker Basket placed on the Copper, that so the Lixivium (in it) may again run down into the Copper.

D The little Basket.

E The little Tub out of which the strong Lixivium runs (by little and little) into the Copper.

F Coolers, or Vessels, in which the Crude Salt-petre shoots.

G Four Brass Pans put in the Earth, hollowed for the purpose, in which likewise the Salt-petre is generated (or shoots.)

H A strong Vessel whereinto the Lixivium remaining after the generating (or shooting) of the Salt-petre, is put.

The way to purifie the Crude Salt-petre.

When all these things are thus done, and the Lixivium that swims at the top of the Salt-petre is taken away, lift up those Vessels, or Brass Pans, containing that salt, and turn them up and down in some convenient place, that so the residue of the Lixivium, that lies as yet in them may flow, or run clearly out, into another Vessel set thereunder.

This done, take the Salt-petre out of the Coolers, or out of the Coppers (or Brass Pans) with an Iron Spatula, or rather with such an Instrument as your Plasterers use (rins tittle, a Truel) and put it in a Tub that has a hole in the bottom thereof, that so the Lixivium may be perfectly separated therefrom. They that sell that crude Salt-petre, and not at all purified, for the Salt-petre Boilers, do pour thereon pure (or clear) Well-water, by the means of which, it is made more white, that which is thencefrom separated they do again mix with other stronger Lixivium and so boil it up for the following use.

But if you have a mind to purifie this crude Nitre from its salt, and all its Impurities, that it may be rendered fair, and white, you are to proceed this following way:

Take almost as much Well-water as is sufficient for the dissolution of the Salt-petre, put it in the purifying Copper Vessel, first cleaned with water, and dried with a cloth, and put the fire under it, and make it most exceeding hot, then throw in your Salt-petre by little and little, and in pieces, continually stirring the Salt-petre that sticks at the bottom with a spoon, that it may be the easier, and sooner dissolved; this only is to be observed, that there is required a more gentle fire, while the Salt-petre is cast into the Copper, so as the water may be kept always hot. When all the Salt-petre is almost dissolved in the water, promote the boiling thereof, by augmenting the fire, then try if there be any salt in a (biggish) gross form, residing in the bottom of the Copper Vessel,

which if you find to be, (for indeed, the Salt-petre it self is not so very easily dissolved, nor doth its being admixt in a more copious manner, at all benefit the Lixivium) take it forth with a Spoon, (or Ladle.)

This done, separate the Scum swimming at top of the boiling water, then have ready a Brass Vessel that will hold about $\frac{3}{4}$ of Liquor, fill it half full with the Lixivium, set the Vessel in cold water to cool, and you shall find your Nitre presently to Crystallize, or shoot therein.

Hereby may you try whether your Purgative water be strong enough, or not; for if it be stronger than is fit, you will find a little skin spread it self over the matter contained in the Vessel, and when it comes to be so, add thereunto more hot water, keeping the fire in that degree of heat, as may suffice to keep the water contained in the Copper, gently boiling.

Now when you have kept it thus boiling for some season, try the goodness of your water again, after the aforesaid manner; and if you shall find a Crystallization therein, and no Concretion, or heaping-together, leaving a gaping, or chap in the midst, the business is well done; but if it be otherwise (than thus well done) so that it be wholly shut in (or gathers a skin all over) at top, pour on hot water, until your Matters come to succeed after the manner aforesaid.

Then after all this, take of the best Wine Vinegar, about one pound thereof, and pour it into the said water, and you will presently see a blackish spume, or filth arise in plenty at the top thereof, and when you have left it so a while, it may be easily taken off, because of the thickness it contracts.

The boiling being yet a while longer continued, pour in the same quantity of Vinegar again, and diligently separate the Scum as afore: This pouring on of Vinegar, and separating of the Scum, may be repeated yet a third time, and oftner, whereby the purgatory water may be made altogether pure, and that there appears not any more spume.

When all this is done, cast in upon this water two or three Ounces of Burnt-Alum, most finely powdered, stir all well with a Spatula, whereby the Salt-petre may shoot into longer Crystals.

Then after this, pour out the purgatory water into the aforementioned deep Vessels, and cover them over with Linen Cloths, that the Liquor cool not. Let it stand thus one hour or two at most, and a yellow slime will settle to the bottom: Then let the water while it is yet warm flow out hence, into other Vessels made of wood, and especially of Elm, and which are large enough; or else, you may let it run into Copper Pans set deep in the Earth, for the better coolings sake, which cover over very neatly with Cloths, that so the Crystallization may begin from the bottom, and not at the upper part, as we see it wont to happen, where it is not kept by Coverings from the External cold: And we also observe therein too, that the Crystals shoot not into that length, as when the Crystallization begins from the bottom.

Let them stand thus for two or three days, until you see no more Crystals generated, which you may on this wise try.

Put some of the Lixivium in your (little) probatory Vessel, wherein, if you find that there are no more Crystals generated, you may take out the rest of the Lixivium: Then take out the Petre with an Iron Spatula (or Truel) and put it into a Vessel that is full of holes in the bottom, that so all the Lixivium may be the better separated therefrom. And you shall have

have your Salt-petre pure and white, and freed from its Salt.

Forasmuch as the Lixivium here separated hath as yet some saltiness in it, it may be mixed with other strong Lixivium to be (again) boiled up, for the production of the Crude Salt-petre is usually holpen forward there-withal.

Some there are that for the better purifying the Petre, do put Calk vire in together (with it) whereby the water becomes most white like Milk, and the Salt-petre gets a greater fairness.

You must withal observe that during the time that the purifying water is contained in the Copper, your fire must be most gentle, least by overmuch boiling you get some damage, for a little fire is able easily to cause (a too vehement) ebullition, and when it has got strength (or the start of you) it is hardly allayed again. The scum which you take off from it you may pour upon ashes as if it were a Lixivium, that so nothing (from whence any profit can be hoped for) may be lost.

There is sometimes seen to stick to the bottom of the Copper (especially when it is used about many boilings) a certain stony and hard substance like Tartar, which unless it be taken away, your Copper will easily suffer damage under that same matter and be burnt.

The earth and ashes left, after the weak Lixivium (hath past through them) are to be laid up in some convenient place, and there kept for four years or more, that so they may be again apt to yield a new more Lixivium by extraction; which, that it may be the better and easier done, there must be made in them (many weeks afore they are wrought upon) by digging some Pits or Gutters, that so they may be freed by the heat of the Sun from that moisture wherewith they as yet abound. Nor do the ancients so much wander from the Truth in that they suppose it much better and more profitable to keep all the earth under a roof or shed, and that it will be far sooner reduced unto a fitting goodness, than to lie open to the weather, for much of the Salt-petre is corrupted (or spoiled) with an abundance of moisture, especially with the Rain it self: For it needs only a little wetting whereby it may be generated, and extremely shuns, or is injured by too much moisture.

Besides these ways, there are many that mix with this earth that is yet contained in the Tub the Saw-dust of Firr, or some other Wood (the height of) a Fingers length (on it): And they persuade that Salt-petre is also generated and multiplied from that fatness which is mixed with the Saw-dust, and that the earth prepared on this wise can be so changed in a years space (so it be kept in a dry place) that it may be again made use of as afore. Yea and they suppose too that they can do much here, if they pour upon such a barren (or lean) earth, thus lying in a dry place, the reliques or remains of the dyes, which the Dyers are otherwise wont to throw away, and evident it is that they are aluminous, but yet not so frequently.

Besides such waters of the Dyers they are wont also to mix foot with their earth, (yea and the ashes too of which Lawndresses do commonly make their Lee;) that so it may be made the more fruitful and may be the sooner brought to use.

This only is to be noted, that there are sometimes found earths that give a thick black Lee, which being used by it self is too fat, to which is to be added a leaner and dryer earth, that so the Salt-petre may be the better and more plentifully generated.

The way therefore how, and the instruments by which crude Salt-petre is purified, is shown by the 6 and 8 Figure (in *Lazarus Erckers* Book 1 think he means.)

The manner of purifying the gross and blackish Salt that comes out of the Salt petre.

That black or rather ashy colour Salt, which is found in the Copper while the nitre is prepared by boiling, and likewise in the narrow Tub or Vessel, may be reduced into very good Salt, and very convenient for daily use, and no ways at all hurtful to Man, if it be but duly purified; which said purification is to be thus ordered.

The Copper being well cleaned fill it with most clear Well-water, put fire under it and make it boil, throw in the said Salt by times (not all at once) into the boiling water, that so it may be dissolved; which, that it may be the sooner and better done, stir it continually with a *Spatula*, when you think that it is all dissolved pour out the Lixivium into some Vessel or Tub, & you shall see the grosser part will settle to the bottom, and the Lixivium will clear up: When you perceive this, pour this clear Lixivium again into the cleansed Copper, and boil it so long till the Salt settles to the bottom, which take out of the said Copper with a perforated Ladle, and put it in a Basket that is placed over the Copper, that so all the superfluous Lee or moisture may again run down into the Copper, and yields (or leaves) the Salt perfect and dry.

Some there are who afore they use this Salt about domestick affairs, do decrepitate it first, and persuade themselves that it becomes thereby the more virtuous (or strong.)

What remains behind of the Lixivium in the Copper, you may boil it up like as you would any other Lixivium appointed to be Crystallized, then pour it out into the Vessels destinated to that purpose, and you shall see Salt-petre to be generated in them; for seeing the said Salt proceedeth out of the Salt-petre, this Lixivium cannot be wholly void of Salt-petre, and therefore may it be separated from that Salt by the afore said way, and be purified.

But you are to note here, that where there is too great a quantity of Salt-petre permixt with the said Salt, or that the Salt it self is too black and impure, that Salt cannot get its due lustre and whiteness by barely one such a purifying Operation, and therefore there is requisite a reiteration of this Operation, so that it be again dissolved in new water, and be purified, whereby it may become altogether white.

However, such a black and impure Salt, may be purified even by this way (following). Pour the solution it self, while 'tis yet hot, (the water I mean in which the Salt is dissolved) upon the ashes which a Lixivium hath been already poured on before, and you shall see the Salt Lixivium to be wholly purified: But yet all the Salt which is extracted thence, is not sufficiently white, but that which is gathered last of all is yellowish, and therefore must be yet once again purified. Note also here, that when such a Lixivium of Salt is poured on the ashes, they must be well edulcorated (after the operation is finished) least the Salt sticking in the Reedy or Bull-rush-bottom should give an unfitting saltiness to the Lixivium that is next poured thereupon.

And thus have you the common method of boiling, and preparing Salt-petre, in which you meet with what

what may be well disallowed or rejected, viz. it is extremely tedious, nor is it at all gainful, for out of a centenary of Lixivium, we have no more than three or four pound of Petre; to get which too, all the rest of the water must be done off by evaporation, which is a long time doing, and requires no small costs. Yet I will shew in what follows, by what means this inconvenience may be prevented, which I have proved by mine own experience.

*The way of augmenting the Crude Lixivium
afore its boiling.*

THE Salt-petre boilers have hitherto variously sought after the way of augmenting (or fortifying) the Lixivium of Salt-petre, that is, of causing a more plentiful provenue of Salt-petre, in the Water remaining of the extraction of Salt-petre, but in vain, because they were ignorant of the lesser proof which all things here are tried by. Its augmentation is done on this wise.

Take of a Lixivium, a Centenary of which contains *iii*. lb. of Nitre, pour so much of it as a Tub or Vessel will hold, upon new earth, let it stand for twelve hours; then draw off the Lixivium, and as much as you find wanting of what you poured on (which may easily be known by the emptiness of the measure which it was in, afore you poured it on, and in which it is now gathered or received again) pour so much simple water on the Earth, which draw off in like manner, and mix it with the Lixivium, and you will then have the same quantity that you had in your Vessel afore. This done try the Lixivium by the lesser experiment or proof and you will find it to contain *vj*. lb. of Nitre. Pour this Lixivium that contains in it *vj*. lb. of Nitre upon other new earth, and proceed on the manner aforesaid, and you shall have your Lixivium to contain *ix*. lb. of Nitre. You may pour this a third time upon other new earth & proceed on with it after the aforesaid manner, and you shall yet have more Nitre out of a Centenary of Lixivium. But you must be always wary in this Operation, that you draw off, neither more nor less Lixivium from the earth than you had before, in the Vessel. These things it pleased me to add, concerning the second pouring on of water, merely for the experiments or proofs sake, whereby we may be made certain of the augmentation thereof (forasmuch as the Lixivium doth by this means hold in it more Nitre) and that we may be forced to acknowledge its augmentation even in that way. Then after this is done, you may use the weaker Lixivium instead of water, to fill up the first measure, and so the Lixivium will be the easier, and more augmented; and we may in a short time have sufficient quantity hereof for to boil. And although this augmentation of the Lixivium requires a great deal of labour, yet are all the (pains, &c.) recompensed, because we hereby get in one Weeks space, and with less expence of Wood, far more Nitre than by the other common ways: But yet there are requisite more Vessels for this kind of working, wherein the separated Lixivium may be kept.

I will also give the Reader a manuduction here, by what way the boiling of the Lixivium is to be ordered, or contrived: First of all, this is well to be regarded, that forasmuch as a great boiling requires a great quantity of earth, and yet there does not at all times, earth of a like goodness offer it self (especially seeing a Man cannot make proof of it all) upon which the costs

and labours (necessary about it) may be well (or at the best hand) bestowed: It seems wholly expedient, not to make such a great Cotion (or boiling-trade) but to do it with only three or four Tubs, that so we may choose only the best convenient earth, which we may dig in the Cities (or Towns) out of Houses of long standing, and out of Stables, but yet not too deep: Such a Lixivium as contains in an hundred weight of it eight pounds of Nitre, may be increased to eighteen or twenty pounds, if we proceed according to the aforesaid method. And therefore such Nitre boilers as inhabit those regions where there is scarcity of Wood may give hereunto good heed.

Now the Lixivium augmented on this wise, doth not attract all the nitre out of the earth it self, but there doth yet some always remain behind: And therefore you need not presently throw it away, but pour thereupon some simple Waters, which after it hath stood thereon for some hours, draw off again, and you shall have a weak Lixivium, which you may try by the proof, and proceed on therewith in the method of augmenting it, and so you will have a continual labour.

This likewise is to be observed in an especial manner, let the Work-house in which this boiling up of your Salt-petre is done, be very low, and covered with thatch, that so the heat may be the better kept about the Tubs, and this Operation may be done as well in the Winter as in the Summer, and that the weak Lixivium may not at all congeal.

And now, even as Salt-petre is made by boiling, out of the Lixivium which is made of Earth, even so is it of that Lixivium which is gotten out of Stones or the Lime (and Dung) Arches (afore-spoken of;) only there is this difference, That this last way of my contrivance (with stones &c.) is easier, and yields more Nitre. Such as are pleased with this kind of work may set about it, nor will they bestow their Labours in vain; there may be abundance of things, and those wonderful ones too, effected with Salt-petre, as I have abundantly demonstrated in my foregoing Writings, and shall in my following ones too, more clearly demonstrate if God vouchsafe strength and abilities.

But before I come to the practice it self, and to describe the benefits of Salt-petre in specie (or in particular) it is wholly necessary to shew how wonderful, yea how incomparable a subject, that Salt-petre is. And this thing I have already handled at large in the *Second Part of the Philosophical Furnaces*, in the *Second Part of the Pharmacopœia Spagyrica*, but especially in my *Miraculum Mundi*, and in the *Explication*, and *Continuation*, and *Defence* of the same.

Here the Author runs out into a large digression in his own vindication, upon the occasion of certain Letters sent him by one I. H. S. who styled himself the Son of Sendivogius; in which Letters he highly extols the Hermetick learning of the Author, but blames him for Writing so plainly of great secrets, and exhorts him to be more sparing and obscure for the future. Withal offering his service (and begging the Authors leave) to defend his Person and Writings against Farnner and others. The Author not taking his advice nor yet accepting of his service (suspecting him to be a self defender) this I. H. S. afterwards published a Book entitled *Lucerna Salis Philosophorum*. In which he offers to teach the making of the Philosophers-stone at a price or reward; and reproaches *isth* Glauber whom he before had so highly magnified in several Letters, advising People to avoid his writings as Sophistical. In this Treatise he mentions a Prediction or Prophecy of three Monarchs that were to appear in the

U u u u

World

World: The first of Paracelsus, concerning Elias the Artist. Secondly, That of Cosmopolita of the coming of the Northern Monarch. Thirdly, That of Jacob Behmen, That a Lily shall bring forth Flowers from the North. He intimates that himself is the Elias of Arts. Secondly, That some Northern Monarch shall do mighty things in the World: And Thirdly, that the Writings of Jacob Behmen should be again Printed a new. After the Author hath shewed the ill dealing of this I. H. S. with him, and vindicated himself, then he proceeds briefly to Comment upon these three Predictions or Prophecies.

By what hath been said, may the Candid and well-minded Reader judge what judgment is to be had of this Monarch of Arts I. H. S. Every one that reads them will find whether or no such a Monarchy is to be expected from such a ones Writings. But now that I my self may likewise here produce my opinion, concerning Paracelsus his meaning where he writeth, I say that the most secret Secrets will not be known afore Elias the Artist shall come and teach them: (But I pray) what hath the holy Man Elias to do with Arts? verily no thing at all. Paracelsus minded or pointed at some other thing, he well knew, that no body comes unto such knowledge, unless by Revelation from God, by godly Prayers, and by searching: This is the true Elias which Paracelsus speaketh of, if (*viz.*) the word Elias be read backwards, and E changed into A: For then 'tis the same with Salia (that is, Salts) such as these (*viz.* salts) are known unto, to them is Elias a master or teacher. And where the said Paracelsus speaketh of Salts he adds *Alchimy finds it (to be) in Nitre*: Hereby shewing and pointing at Salia, Salts, which word being read backward is Elias? And this is my opinion as touching the coming of Elias the Artist, and I do yet (again) say, that to him to whom Salts are known, hath Elias appeared. And let this be sufficient to have spoken of the first Monarchy of I. H. S. and what is to be judged thereof.

Now follows the Second Monarchy.

AS for the second Monarchy, he alledgeth the Prophecy of Paracelsus, which runs thus: *A Lion shall come from the North, and become the Monarch of the World*: Which Prediction is not at all to be understood according to the Letter. What has Paracelsus to do with the Northern Lion? What business has he with the Monarch of the World. Some there are that endeavour to attribute that Prophecy to one or other of the Northern Kings, but yet that was not in the least Paracelsus's meaning, he drove at a far other-guess business, and by that Lion he meant Salt-nitre, which is wont to be brought unto us by the Northern Winds, Rain and Snow, and that several times yearly as is well known unto all; hereupon many amongst the Philosophers, and some of them the latter Philosophers, have filled great Vessels with the Rain and Snow that comes out of the North, and aimed at the preparation of a Tincture thereof, but they found nothing else but Salt-petre, which to get, I have shewn a much shorter way.

Paracelsus, Basilins, and others have Written many things of the green and red Lion, all which are to be understood of Salt-nitre, which may most easily be transmuted into the green or red Lion, concerning which thing I my self have made mention in many places.

But some or other may reply, How can it be said

that the Lion shall be expected out of the North, if Paracelsus did by it understand or mean Salt-petre, for that cannot be said to be expected (or waited for) which hath always been? Surely the approach of this Northern Lion is not to be supposed or thought to be as to the outside aspect and known use, but only according to the internal virtue, & the Treasure therein hidden; concerning which, the Philosophers have written many things enigmatically, and kept up all things most secretly. Verily he to whom the inside of Salt-petre is known will be able to report wonderful things, for 'tis that only that is the true Monarch, and is able to institute a good governance for those that possess and know it. This Monarch will not be to any one a stirrer up to kill others, and to take from others their Goods and Kingdoms, and to disquiet the whole World, as we see other Monarchs do, but he will bring Peace and Concord, and will persuade the Soldiers to stay at home and to get their food by the labour of their hands, and not to shed the blood of the innocent; he will injoin the greedy Usurers to be beneficial to the poor & to put an end to their immoderate usury; he will shew to the Divines, that all their contentions are vain, and that they cause nothing but iniquity, dissention and discord amongst Men, and will require at their hands to Preach concerning friendship to, and love of ones Neighbour, which under this unprofitable contending is wholly lost, and to banish away all hatred; and contrary-wise to strive after patience and Christian humility. These kind of Doctrines and governance the inward or inside knowledge of the Northern Lion will bring with him, and not any War or shedding of Blood. But afore the said Lion is tamed and made gentle, he is very ravenous, and the venomous Basilisk, and devouring Dragon, preying both upon Men and Beasts, demolishing Cities and Castles, and destroying Goods and Men together. Thus have I in brief expounded my opinion of the coming of the Lion from the North, let every one believe it as he listeth. And thus much shall suffice for the Second Monarchy, and how it is to be understood.

Now follows the third Monarchical Prophecy.

AS for what concerns the third Prophecy which I. H. S. doth also make mention of, (& will have it) to concern a certain Writer, whose name is Jacob Behmen, who exercised the Shoemakers Craft, and published many Theological and also Chymical things, which John Beth doth again Print: As far as I know by his writings, he was an honest Man, but I do not know what he understood in Alchimy; but however this is evident, that he never exercised or practised Chymical Operations, and that his Chymical writings are most difficult to be understood, but his Theological writings are read by many. My opinion concerning the business is this, that this same I. H. S. was minded to quarrel with me, that so there being a brawling bred between us he might make his Books the more saleable. I have therefore thus plainly answered him, but if he proceed on in contrarying and opposing me, I shall be constrained *Notens Volens* to meet with him another kind of way, for I am even wearied and glutted with contention. If he will needs brawl and scold let him do it with those that have no work to do, such as he himself & his associates are, who have no Family to rule and look after, I can for my own part bestow my time better than in those contentions, which bring no

no profit, but only to the Bookfeller, whose Books before they are known sell well.

But to conclude, I will in a few words open the ill affected mind of J. H. S. to the Candid Reader. When I had lookt into his Treatise, and perceived that he had ranked me amongst the Sophisters, I showed to some of my faithful Friends, the Letters which he had written unto me, that so I might hear their Judgment concerning them; verily, there was not one amongst them all, but wondered at the wicked mind and falseness of this Man: Yea, one of them did afterwards inform him by his Letters, what way I had purposed to take, viz. again to wipe off that undeserved Title he had put upon me, and to defend my self against such monstrous Impiety; To which he received from the said J. H. S. an Answer, which he likewise shewed me, wherein (amongst other things) he pretends, that the cause of his hatred [against me] was, because I had in some places written so very clearly of the Universal Medicine: Yea, and he farther adds, that it is no such great despising one, or Contempt to call one a Sophister; for Geber was accounted for a Sophister, and yet was he a King. And that if I wrote against him, he would do the same against me, and

endamage not only me, but my Children too; which Epistle is yet kept safe. Now let any Honest Man consider whether this be a Human, or Diabolical action.

Some, when they heard this, perswaded me to pass over all in silence, and that there would come of it such another brawling business as was with Farmer, whose Exhortation I yielded to, that I would not so much as once answer him, how great Lies soever he told, but rather purposed by referring all till the next Spring, to get me Friends by the benefit of my very eminent Inventions (God willing) which should not only intercede, or stand up for me, but also for my Children too, after my Decease: I doubt not, but that there may be some principal persons found, which are capable of overturning such Inhuman Perversenesses.

These few things was I constrained to add (in a Parenthesis) for the defence of my Writings, thereby to paint out the deceitfulness of Men, and to discover what is to be opinionated concerning such turn-coated Foxes: The which I entreat the Reader not to take in evil part, but to accept of the Secrets laid open in this Treatise, as a Reward for his pains in reading this Apology.

Now follows the Most Potent Lion, and Monarch of the North; to whom none in the World may be compared, nor *did* ever any excel him in Glory and Power, or *shall* be like unto him.

But before I begin to write any thing of that Omnipotent Monarch, I have thought it profitable to add here in this place, for the better knowledge of the same, Paracelsus his Prophecie, as I met with it, whereby any one that is skill'd in nature, may sufficiently see, that Paracelsus did not mean a King, but the great Philosophical Mystery, and would point that out unto us: His Words therefore are as follows.

The Prophecie of Dr. Philip Theophrastus Paracelsus of the Northern Lion.

They will not leave me in my Sepulchre, but will hale me out thence, and lay me down towards the East: And I do foretell unto you, that there are three great Treasures hidden.

1. The First is at Weyda, at the Alps of Julia.
2. The Second is between Suevia, and Bavaria: The place I do not name at, because of avoiding the being the original of many evils, and because of the shedding of Blood.

3. The Third is between Spain and France.

He now that shall find these, will be carried in Triumph, and be admired by all: Likewise between Suevia (or Scawben) and Bavaria, there are Books which contain no mean and common Artifices, that will offer themselves together with precious Stones and a Carbuncle.

I will here likewise declare the Age of such as shall find them.

The First will be 31 years old.

The Second 50 years old.

The Third 28 years old.

And these shall be found not long after the exit (or ruine) of the Austrian Empire, and it shall happen, that in this very same time, a Yellow Lion shall come out of the North, which shall be Persecutor of the Eagle, and at length its Conquerour: He shall subvert under this Empire all Europe, and a part of Asia and Africa, and shall profess the good and Christian Religion, and shall have many Followers thereof. It shall first of all be a most troublesome work for him to chase away the Claws of the Eagle out of the Empire; but afore this comes to pass, there will arise extremely great Dissensions, and various Grudges amongst all Men in all Countries; the Inferior will rise against the Superior, so that there will be a great tumult, but yet notwithstanding the Members shall suffer the punishments of their wickedness, and the head abide safe.

Nor shall here be an end, but there shall be kindled a great fire, which shall turn all into ashes, but the Omnipotent God will be at hand to help his own people, for there shall yet remain a small sparkle of Piety, which will take rooting, and increase by little and little, and strike a terror into the plundering Robbers, and make that alive, which seems to be dead. The Enemies and Persecutors of Christ, will call themselves powerful, and every where bring in great Devastations, insomuch that there will seem to be an end of our Actions.

Now whilst the Enemy is placed in the very topmost pitch of fortune, the most Just God, will (by the help of a small company) destroy, and utterly root out the Northern Lion, accompanying him, together with all his Clerks; yet abundance shall be Converted, and believe on his Omnipotence, and in the most Holy Name of God.

When therefore this Lion hath gotten the Eagles Scepter, every body will reverence, and run after his Majesty: He shall

shall be powerful in Deeds and Counsels, and the Subjects that now refuse him, shall receive him with the greatest joy, and acknowledge him their Superior.

Then must the aforesaid Treasure 'twixt Suevia and Bavaria be found, which is equivalent to the Riches of twelve Kingdoms, where also lies hid, a Carbuncle, as big as an Egg, richer than any price.

The other Treasure that lies between Spain and France, is indeed great and potent, but yet it gives place to the former, it shall be manifested at the entrance of the Lion that comes from the North, and, which shall take the Eagle, and then at length shall men consider well what I Theophrastus have been.

Now when the praised Northern Lion hath finished his Course, and hath broken the edge of the Eagles Claws, then shall Peace and Concord every where speedily and vehemently fly thercunto, but yet he will send afore, some signs and tokens by which it shall appear unto us, that the Messengers sent forth shall declare the coming of the Lord. There is yet one only thing that I Theophrastus do beg at your hands, that ye do not any of you impute unto me the things which I now lay open; forasmuch as I cannot be against the Will of God, which I must put in execution in the Nature of things.

These are those Secrets of Secrets that I was willing to open unto you. This Treasure far exceeds other Treasures; my Arts are hidden in that place betwixt Suevia and Bavaria, and they are these, viz. The true Transmutation of Metals of a short way: The Universal, more than perfect: The so much talk'd of Aurum Potabile, and Philosophers stone: But he that by the guidance of God has an entrance opened to the finding of them, shall there find (besides other stones) a precious Carbuncle, which lies hidden in a little Box cunningly made by Men, and covered over with Gems; the Key of the little Box is in a Golden Coffin, the Golden is put in a Silver one; the Silver one in a Tin one; and it lies in such a place as God hath chosen, or appointed.

The Omnipotent God will bestow upon him that finds them his Divine Benediction in all his Affairs, and will give him power to oppress all evil, and to draw out good; whereby things necessary may likewise be obtained from God who is able again to reduce the world he made of nothing, into a nothing: Let the Son and Holy Spirit be also with us, the Blessed Trinity, for ever and ever. Amen.

First of all, Paracelsus saith in this his Prophecie, that Men shall draw him out of his Grave, and place him towards the East; who is so simple as to think that this is to be understood according to the Letter? What Profit and Honour would thence arise to Paracelsus, if his Bones were digg'd forth, and translated into another place? Whereas if he were even now living, he could not desire a better and more excellent Tomb, than that he lies in. Whilst he was living, he was not so proud; he very well knew that the Honours of this World are fading and vain. Nor did he ever require, that any Epitaph should be erected to his Honour: Although (when his Friends had taken care to lay him in a decent place.) The Magistrate commanded a very notable Epitaph to be engraven on his Tomb-stone for a Testimonial of his Deeds, the which Epitaph will bring him Praise enough while the World lasts. The said Epitaph runs thus.

The Epitaph of Theophrastus Paracelsus; which is to be seen Engraved on a Stone at Saltzburg, in the Hospital of St. Sebastian, erected against the Wall of the Church.

Here lies Buried Philippus Theophrastus, an Eminent Doctor of Physick: Who by a Wonderful Art, took away those Dire Maladies, the Leprosie, Gout, Dropsie, and other the Incurable Diseases of the Body; and Honourably Distributed, and gave his Goods unto the Poor. He Died the 24th. Day of September, Anno 1541.

How could he be possibly more praised after his Death, than I see to be done by this Epitaph. But yet I would not have you think that I desire you to account of my Opinion as if it were Gospel. It pleased me here to put it for this end, to shew, what my thoughts are, as concerning this thing, every one may believe as listeth him, but as for my part I will in no case believe, that the Prediction is to be explained according to the Words or Letter: But whereas it is said, that he shall be taken out of his Sepulchre, and put in another towards the East, I do thus interpret it: That if any shall understand his Writings, they shall thencefrom perceive what, and how great a one he was, and so will make his Cause their own, and will defend his Writings against Inimicitious Zoilists (or Carpers) and Ignorants, who as well since his Death, as whilst he was alive, entreated him very inhumanly, and as it were, oppressed him with Lies, and Infamous Libels, and so do they take him as it were out of his obscure Tomb, and place him towards the East, by which it may appear to every one what an incomparable Man he was; to the performance of which, I will not refuse to lend my poor help, though small, (God permitting.)

He doth afterwards add, that there are three great Treasures hidden, which whoever shall find, shall triumph very nobly; the places which Paracelsus points at, and where those Treasures are hidden, are, where the Metals are digged; and indeed such places they are, as in which there lies hidden the highest Tincture, and which otherwise is not to be found neither in Gold, nor Silver, nor in all the other Metals, or Minerals.

I do think that Paracelsus knew these Minerals, and made a Tincture of them, and thereupon was willing thus obscurely to describe such Treasures.

He that shall find, that is dig it forth, and shall know the way of preparing a Tincture thencefrom shall doubtless be magnified, especially if he will disclose them unto others.

Now I believe that if these Treasures should be digged out by some godly, honest, and wise Man, (for the finding them is denied unto reprobates) would not hunt after or affect vain Glory, but be contented in

in that he knows it: But it is not convenient to open or disclose what this *Minera* is, wherein God hath put such a singular Tincture, and which he hath hidden from the proud and covetous. But seeing that all things reside in the hands of God, who can give unto his own People that which he denies unto others, I do not at all fear any one's exhausting so easily a Treasure lying so profoundly hidden, although I should make known this subject.

Thus much I have experienced, that there lies in them a much more excellent Tincture than in the other Metals or Minerals, but I do not boast that I have thence drawn the universal Tincture and made it fix, for time and occasion would not as yet permit it. But I have often times in a particular way instituted a graduation of *Luna*, by the help thereof, inasmuch that it hath left some fix'd *Sol*: Whereby I have observed, that many excellent and profitable things may be effected, when that volatile Tincture is by the rule of Art made fix'd and fluid. However I will make trial, if God shall vouchsafe me life and strength, and see what I shall thence obtain.

As concerning the name of the subject, it is called *Magnesia Saturnina*: which is found between *France* and *Spain* in the *Piedmont* Mountains; 'tis commonly called the *Piedmont* *magnesia*, but 'tis very much unlike (to one another) for some of it is of a yellow colour, and this the *Phœtian* Glass-men use, when they make Glass, that it may become pellucid and transparent. The Glass doth at first become of a purple or Amethyst colour, but this colour abides not one hour in the subject, but it evaporates, because it is not fix'd enough as yet, and then the Glass becomes wholly transparent and bright, but if they would have the Glass hold the purple colour, they presently work it up as soon as ever the *Magnesia* is therein molten. Many years ago, when I attempted operations about things of less moment, and changed Crystals into variously colour'd Glasses, I found that this purple colour was not fix'd in the Fire; and that the *Magnesia* had in it many impurities, whereby my Glasses were obscured: But yet I attempted to extract from thence the pure Tincture by Art, and to free it from its unclean faeces, and to this end used various Menstruums, but yet effected nothing; until at length I saw that by mixing that *magnesia* with fix'd nitre, it was by boiling them in a strong Crucible, opened by the Nitre, from whence proceeded a delicate purple colour. I poured out the Mass and powdered it, and extracted it with hot Water, and passed the Liquor through a Filter, and then had I a most dainty purple fiery liquor, which did almost every hour (standing but only in the cold) change colour, so that it became one while green, then sky colour, another while of a blood colour of its own accord, then again presently it received other most elegant colours. Out of which liquor I did a new separate the more pure part, and I used this red powder to tinge my Glasses, the which thing I indeed obtained, but because the Tincture was more fusile than the green stone it self which it was extracted from I was constrained to leave it off. However this I experienced, that there lies a mighty Tincture hidden in the said *Magnesia*, and thenceforward I pondered upon the business more deeply, and adjoined the *Magnesia* thus fusile unto *Luna*, and then I found some *Sol*: but I could not bring the work to any fuller perfection because of the want of time, & store of business. I am of that opinion that (by Gods permission) a Tincture may thence be extracted for Metals and Animals. These are my conceptions, but I well know, that the igno-

rant *Momus*, or *Carper*, will hence take occasion of mocking at me, but this I cannot at all hinder.

This *Saturnine Magnesia* in the *Alps* of *Julia* is much purer and excellenter than that *Piedmont Magnesia*, is and there is in it more Tincture, the which we may extract most easily by the help of Nitre, and albeit the *Minera* be of a yellow colour, yet is there extracted thencefrom by the benefit of Salt-petre, a most elegant Tincture, of a greenish colour, and is likewise one while purple; then sky colour, then again red, and by and by again it assumes a green colour, the which also is so fusile, it fixeth every *Luna*, and doth in some sort make it golden. These two Minerals I have often times handled, and have thencefrom gotten the green Lion, but have not proceeded any farther.

The third Treasure 'twixt *Sœvia* and *Bavaria*, is not much unlike unto these two, and without doubt such kind of Treasures will offer themselves even in many other places where such Mountains & Mine-pits are found out, were but the right way of digging out and ripening them, but known unto us; which knowledge is only granted unto the Sons of GOD.

These things was I willing to mention, that so it may be known what my opinion is as touching those Treasures. For I am firmly perswaded that the universal Medicine may be thence prepared, especially out of that which very much abounds shining in Metal resembling a vein of Lead, and yet yields not any Metal by fusion, because of its exceeding volatility, and of wholly flying away in the form of a vapour: Yet nevertheless, that Northern Lion is able to master it and to fatten its young ones thereby. And if GOD shall vouchsafe any one such a Treasure, he will verily find more Art-containing Books than is indeed needful. And whereas *Paracelsus* adds that the Lion out of the North will (after he hath found the aforesaid Treasures) become a Potent Monarch, this is easie to be believed, for he is enriched with the digged-out Treasures, and is able to manage his affairs as listeth him. He will be able to give whole Kingdoms unto others, and yet his power will not be diminished, he will in like manner be able to institute good precepts and government, and there will be a notable affluence of all things, inasmuch that there will be nothing wanting. There are many Men would lead an honest Life, were they not constrained by poverty and need to do evilly.

The Northern Lion is able (when he hath found the Treasure to abolish all these vices, and contrarywise recover a good political Governance, Peace and Quietude. For Wealth and Riches are able to transmute Strife into Peace, and these the Northern Lion can abundantly exhibit, inasmuch that he may deservedly be Stiled a most Potent Monarch. But if so be that evil companion, viz. Sulphur be joined unto him, which may provoke him, he becomes more venomous than the Basilisk, and is able to kill in a moment of time, both Men and Beasts, yea to ruin Castles, Mountains, and Fortifications, and to annihilate them. But on the contrary when he hath found the Treasure, he becomes tame and liberal, and lays off his anger, and bestows on all Men sundry most acceptable gifts.

Furthermore, *Paracelsus* saith that a yellow Lion shall come out of the North, which shall dull the Eagles Claws; all which verily is to be only understood concerning Salt-petre's transmuting virtue much conducing to a perfecter augmentation of the Metals, from whence ☉ and ☿ together with the Carbuncle may be achieved; and not at all of a certain Northern King and the Roman Eagle. For the yellow and fiery

X x x

Lion

Lion which is here treated of, is fixt Nitro, and if it be joined to the volatile Eagle, that is, to the volatile Corrosive Salt; this (Eagle) is overcome by that (fixt Salt) and is tamed, because the Corrosive virtue which it abounded withal, is taken away: So that he that is skill'd in Chymistry may well enough understand what *Paracelsus* drives at, and that he does not at all mean those Monarchs and Rulers, as may be gathered out of his Manual, where he Writes, that the Blood of the red Lion is to be commixt with the liquor of the white Eagle, and that from them by a due Collation is the universal Tincture to be extracted.

Therefore they do evilly that interpret the Writings, and these predictions of *Paracelsus* otherwise, they earnestly expect external Monarchs, but experience hath taught that those Lions do bring with them nothing but an hungry Stomach, which can hardly be well filled (or satisfied) with the Sheep and Lambs of all Countries: And I pray God, turn them from us and continue unto us Peace and Concord, which is most of all to be wished for.

Moreover *Paracelsus* further saith, that he was constrained to detect this Treasure and hidden secrets, to shew the nearest way to the description of the Philosophers Stone, which (Stone) whoever finds and knows how to open the Gate, he shall find a Carbuncle as big as an Egg, together with other Gems, which are conserved in a Chest made of Gold and Gems, and this Chest in a Golden Sepulchre, the Golden one in a Silver one, the Silver one in a Tin one, on which the Key is placed.

And now will there be any one so foolish as to interpret this according to the alleaged Words: No certainly unless he be deprived of the light of Nature. It was never heard of, that ever there was any Carbuncle found of the bigness of an Egg: neither the *Roman*, nor *Grecian*, nor *Persian* Monarchs are reported to have had such an one, and from whence then should *Paracelsus* only have the same? All Men therefore see that this Prophecy is not at all to be understood barely according to the Letter. Now in that he calls the universal Medicine a Carbuncle, he does not therein offend, because even other Philosophers have imposed upon their Tincture this very name, and this merely because of the form it has, for if there is to be a certain Tincture that should tinge the white Metals into yellow Sol, it must of necessity be red; and therefore some of the Philosophers have likewise called their Tincture *Hamatisis*, for likeness sake.

Nay more, forasmuch as it is mentioned of the Carbuncle that it shines in the night like a burning live-Coal, and yet such a stone was never any where seen or found, it necessarily follows that those things which are delivered thereof are not to be understood according to the Letter. The chiefest *Lapidaries* do Witnefs that they never saw it; the Oriental Rubies are the chiefest red Gems that we know of, of which there is scarce one found that is bigger than ones nail, which notwithstanding, if it be pure and shining, is sold for many Thousands of Duckets. In like manner, Granates are red, and of a meaner price, and shine no more in the Night than Rubies do. But that a shining in the Night like a live-Coal, should be attributed to a Carbuncle, is not done without cause; verily, the Authors of that thing are not at all to be supposed to be such Merchants, continually handling Gems, (as if they had ever seen such a stone): No, but they were the Philosophers themselves, whose words which they wrote of the prepared Tincture,

the after Writers did fallily construe their meaning and understood it literally, perswading themselves that there was such a Carbuncle in the nature of things. Therefore we have no reason to induce us to believe that the ancient Philosophers did in very deed describe or mean such a Stone as shines by night, but let us rather perswade our selves as being thereto constrained by the Verity of the thing, that they did not in the least mean a natural stone, but a stone prepared by Art, and their Tincture. And this, the very Name it self seems to point out; for *Carbo* signifies a greater Coal; and *Carbunculus* signifies a little, or lesser Coal.

Now if so be that any one would endeavour to prove with Oaths to this blind, proud, and wicked World, that such a red stone shining by night, may be made of a Wood, or stone Coal, certainly every body would mock at him, and would say, That he propoundeth meer Lyes; and therefore no body ever dared (though he were never so certain of the Truth of the thing) to write ought of the same.

But some or other will say, Whence come you to know these things, and by what Notes or Testimonies do you prove that you are to be credited, as touching this Business, seeing no body ever writ that these things were so? To such an one I answer, That I leave every one at his liberty; for whether he believes my Sayings, or believes them not, 'tis all a case to me. However I say, that I can change by melting, a meer black Coal by the help of a Salt (but not common Salt) into a most red stone in one hours space. For Coals are nothing else but a fixt and volatile Sulphur, which if we will fix it, will be fixt; if we will volatilize it, it will be so. A wood Char-coal (though there's much difference amongst them) should it lie shut up firmly & most tight in an Iron Vessel even for an hundred Years so as that no air get in, and should be (all that while) kept in a most vehement fire, yet would it not shew the least sign of being consumed or changed, but let but the air come unto it, and it will be reduced into ashes in a moment. If now you have understanding and sense, consider with your self more largely as touching this thing, and you will find many profitable and good things if GOD shall open unto you the Eyes of your mind: This red stone having the form of Glafs, being poured out of the Crucible, shines in the dark like a burning Coal, according as is the Coal you prepare it of. And albeit that this Glafs can perform many good things in Medicine and Alchemy, yet it is not at all the Stone of the Philosophers, which they call a Carbuncle, for that must be fixt, and resist the Fire, both which are denied to this Glafs to be, for it is volatile, and can easily be changed by the Fires force.

I have several times made this stone of Salt and a Coal, but never had time as yet to bring it to a perfect fixation, and therefore I cannot determine certainly, what may be farther hereof made. However I would not have the lover of the wonders of GOD to be unacquainted with this, that (*viz.*) my said Stone of a Coal, or my red Carbuncle, if it be dissolved in the air, it yields a green fiery Liquor, which if smeared upon any Silver it gilds it as Sulphur does. If the Divine Clemency shall supply me with life and strength and that my enemies, and opportunity shall permit, I will some time or other set about the work of fixation, that so it may appear what is thence to be hoped for.

And now friendly Reader who art not addicted to either party tell me, whether or no there does not redound

dound unto thee more light from this [most brief treating of the Carbuncle, than from the obscure *Lucerna* or Candle of I. H. S. in whose Book there are indeed the names of a many Authors cited, but none of their Writings are explained, and therefore it is rather a bringing others into a Labyrinth, than a showing of the true way.

Paracelsus adds, that this Carbuncle is hid in a little Chest made of Gold and Gems, this Chest in a Golden Coffin (or Tomb), this in a Silver one, and finally this Silvery one in a Tin one; which sayings verily are to be taken or understood in a far other sense than they are uttered, as well as the words foregoing: For to what end should there be such a multitude and variety of Coffins? My opinion hereabouts is this: Forasmuch as there lies in Tin (as *Paracelsus* testifies in his Book of *Vexations*, when he saith, that *Jupiter* has much Gold in it, and not a little Silver) a spiritual Gold and Silver hidden, and that ☿ contains ☉, and ☉ contains ☿, we are to understand these things of them, they being as so many Coffins.

But some may say, to what use serve the Tin and Silver, if they are to be removed afore we can come to the Golden Coffin, and get to that which contains the Carbuncle, may we not presently even at first dash seek such a stone in ☉, and leave Tin and ☿ untouched? I could most easily satisfy such an objection, and give a sufficient reason of *Paracelsus* his Writing such things, but that I judge it inconvenient to communicate such things of so great a consideration (or moment) to wicked Zoilists or Carpers.

However I cannot here let this slip, viz. that there lies hid in ☿ an excellent Mercurial Liquor, which is thence extractable by the benefit of that Key which lies upon the Sepulchre or Tomb, viz. by the benefit of Salt-petre. This mercurial Liquor, loosens the bonds of ☿, and makes it fit, so as to be extracted (or made into the best ☿, out of which the Carbuncle is to be afterwards made, for every (kind of) ☉ doth not at all resemble the nature of a seed, but supplies the place only of an House or covering, which containeth seed in it, and which (covering) must of necessity be removed by him who desires the seed it self.

I have in other places shown how properly the metalline stock or nature may be compared to a Vegetable Apple: *Saturn* is the root of the Tree; *Mars* the Trunk or Body; *Jupiter* the Bark of the Trunk; *Mercury* the Juice contained betwixt the Bark and the Trunk; *Venus* the green Leaves; *Luna* the white Flower or Blossom; *Sol* the Fruit or Apple of the Tree containing the seed of the Vegetable.

Now then, even as it is a thing evident to all, that the Apple it self is not the seed of the Tree, but the Nut or Kernel is hidden in its inward part, so that the Apple doth only keep or hold in it the seed; even so in like manner ☉ is not at all to be accounted as the seed of Metal, but only as a preserver (and coverer over) of the seed. He now that lights on the true Key, which *Paracelsus* hath put upon the Golden Coffin, (viz.) the inside of Salt-nitre, he will be able to open, not only the Tin Coffin, but the Silver and Gold Coffin too, and to take that Coffin thereout of, which contains the Carbuncle and other Gems.

These are the things I was willing to publish according to my opinion, concerning that great Carbuncle lying so deeply hidden in those Coffins: I permit others to expound them otherwise, for I do not offer these things to the old Men who stiffly contend for their own conceptions as it were for the best thing they have, it being an hard matter to tame an old dog;

but I present them to such only as are the younger Students of the true Hermetick Physick or Medicine, and who are not already drawn into various errors by the reading of many Authors. And he that refuseth to believe that even the greatest *Arcana* may be handled or treated of in a meer simple or plain Style, and that they need not at all any prolixity, shall never attain his wish'd for end, though he were able to recite by heart even all the Philosophers Books. And thus much may suffice in this place.

Lastly, *Paracelsus* adds at the end of the Prophecy, that the most Great and Blessed GOD will grant to the finder out of these Treasures notable Power and Fortitude, whereby he may oppress all evils, detect good things, and get every profitable thing, certainly whoever he be that shall find such an universal Treasure, he will labour to suppress every noxious thing, and to disclose (on the other hand) whatsoever is any ways profitable for man-kind, and necessary, and this to the very utmost of his power. For the Philosophers say, *Our Art doth either find a Man honest and godly, or it even makes him such an one*; that is, it is altogether impossible for such an one that lights on such Treasures to be an ungodly Man, so, as for those highly precious gifts of God not to stir him up to godliness and Mercy.

I could render this Prophecy of *Paracelsus* more clear, but that I study to be brief, and could manifestly prove, that it is not to be understood according to the bare Letter, but that *Paracelsus* had regard to this great universal of the Philosophers, which is clearly enough hinted in these words which are mentioned at the end of the said Prophecy, viz. *That all evils may be kept under, (or abolished) and that all good things may be drawn forth or advanced, and withal, all necessary and useful things may be gotten.* These words do openly enough point at the universal Treasure of the Philosophers, by which all evil is kept under, and all good educed, and all necessary and profitable things acquired. On this wise are my Conceptions of them, let another interpret them according as seems him good. For when the Lion shall have found the said mineral Treasure, he will be incited or stirred up to such a great passionate wrath and power, that is able easily to dull the edge of the Eagles Claws, that is, his adversaries. 'Tis impossible for the Eagle to get such a Treasure, but a thing most easie to the Lion; For there is not a subject in all nature that can make the Lion so fiery and powerful as the *magnesia Saturnina* can, and therefore it easily tames all Corrosives, and cuts off their Claws. Experience confirms the things I here mention, and therefore I will say no more: Yet however I think it expedient to add this one thing more of the nature and properties of the Lion and Eagle.

It is sufficiently manifest, that the Eagle is called the King of all Birds, and the Lion the King of all four-footed Beasts. Not, as if the Eagle were the greatest amongst the Birds, and the Lion the strongest and greatest Animal amongst the Beasts: No, no, There are bigger Birds and Beasts than the Eagle or the Lion; Geese, Swans, and our Country Storks are bigger than an Eagle, (I omit to speak of the other huge Birds in *Asia*, *Africa*, &c. Amongst which the Ostrich is reckoned for one, which is as big almost as a Horse, and runs swifter than a Horse.) Then, for Beasts, there are some of the (like proportionable stature) as the Rhinoceros and Elephant, which fear the Lion no more than the Ostrich and other (great) Birds do the Eagle; yet nevertheless do they acknowledge

knowledge the Lion and Eagle for Kings, and that deservedly too, because of the Velocity, strength, valour, and other virtues that those Creatures have.

But yet Historians rank the Griffin and Dragon amongst the Birds and the greatest Animals. They paint (or describe) the Griffin, a winged Animal, one half part resembling a Lion, the other half part an Eagle; the Claws, Wings and Head like an Eagles, the other part of the body like a Lions. But this is a Philosophical and Poetical Fable, by which they would disclose and lay open other Mysteries and Arcana's. For there is never to be found in all this whole compass (of the World) such a Dragon as flies in the Air or spits out Fire; but all these sayings, point at Salt-petre. They likewise feign the Griffin to be of such power as to be able to carry away through the air an armed Souldier on Horse back; these and greater things than these can Salt-petre do; for 'tis able to blow up whole Castles and Fortresses with many myriades of Men into the air; and would to God this were not so well known. The Philosophers have only shadowed out their Dragon amongst other Birds. Our Dragon never dies but by the help of his Brother and Sister, that is of the fixt Lion, and corrosive fluid Eagle, the which thing may be likewise said of the Griffins. For of the fixt burning Lion, and fluxil or fluid corrosive Eagle, there is created no other thing but a Griffin, part Eagle and part Lion, which lifts (or blows) up Mountains of most vast weight; when they fight each with the other they kill one another and are raised up again out of the dead Carcasses. And thus there are regenerated (or again born) other Lions and other Eagles out of the Griffin, and (if you are so minded) both the Lion and also the Eagle may be fed and fattened with the common Flesh of other Wild Beasts, so as thence forward they may generate innumerable Griffins, which you may use not only in time of War against the Enemies, but also in the Mountains, to dig out Treasures thence, and being digged to carry them into the Nest.

N B. It is reported of the Griffin that he gathers much Gold which he carries with him into his Nest; But all these things are to be understood of the strength and virtues of Salt-petre; concerning which I could be much more prolix and more clear were I not even constrained to over-pass it and let it alone because of the ungodly crew of wicked men.

And now let us enter with the Philosopher *Virgil*, into the dark Cave or Den of the *Sybil*, and let us see whether or no we can find the Book there (that is Salt-petre) wherein are found all the secrets of nature: Or rather, let us enter into the Stable with the three wise Men or Kings that came from the East, and let us there seek the Son that was born of a Virgin, who is the King of the World & the King of all Kings, and let us apparel or adorn him with due gifts or presents, that his age & strength may grow up and be augmented, & he may at length drive away the Diseases of his three brethren, viz. of the Vegetable, Animal, and Mineral. This Infant needs not Gold, Myrrh, and Frankincense for his sustentation, but we will bestow upon him instead of Gold Myrrh, and Frankincense, three other things for multiplications sake; common Sulphur shall supply the room of Gold; common Salt, of Myrrh; the external green boughs of Firr or Elder, of Frankincense; thereof will we make his Bed, and these shall be his coverings.

The Salt which is animated by the Sulphur and converted into Milk shall be his food, so long until he becomes great and strong enough, yea a Potent Mo-

narch, and then will be gainfully reward his Tutor (or Guardian) *Joseph*, for his laborious Wardship.

The Magi and Philosophers observed the Star of our Infant, which shineth so brightly as that it dazzles the sight of the beholder; nor can any one look long upon it without hurting his sight, and thereupon it is worthily called the Son of the ☉: For there is not any clear or bright light without the Sun, the Country fellows therefore do not perceive such a light, but the Chymists can (whensoever pleaseth them) make and see such a light.

The things which I here declare concerning the nativity of Salt-petre, are most easie to be understood. It is generated or born in the Stables, The ☉ is its Father, the ☽ is its Mother, the Wind conveys the Paternal seed in a spiritual manner, into the moist Earth of the Stable, by which, the Virgin Earth being impregnated doth after due time produce its young to light.

N B. That Earth which produceth and conserves Herbs, Grass, and Metals is called the Mother; and that Earth which doth not produce (as in Stables, &c.) is as yet to be accounted as a Virgin, which doth afterwards yield so noble an offspring. No Earth out of which, Herbs, Trees, and Minerals are born doth ever conceive again, or ever intermits the production of such things, and for that reason is it called the Mother of all things. But now that Earth that is found in Stables, which conceives neither the Solar nor Lunar beams, nor is moistened with either Rain or Dew, cannot produce any thing, unless the beams are conveyed thereinto from the Sun by the Air, then the impregnated Virgin in the Stables, brings forth an offspring, which is by the Philosophers presented for its sustentation, with a threefold kind of gifts; to wit, Sulphur instead of Gold, and that being in like manner fixt and most pure; with Salt instead of Myrrh, which is pure and preservative, and with the Juice or Resin of the Firr-tree, or Elder, instead of sweet smelling Frankincense. These three things are the Aliment or food of the new Infant; The Green Boughs of the Firr or Elder, do furnish him with a Bed for his Cradle; The Sulphur and Salt yield him sweet milk to nourish him; so that there needs not any thing else but a good overseer, *Joseph*, that may keep off the Rain and the cold Air from this Infants Bed.

By such a means as this may we nourish our most tender Infant and advance him to his Kingly Monarchy; when he shall arrive thither he can make all his Brethren sound and rich: For the Vegetables do only desire profitable and convenient food, or some fat earth, whereby they (being well and sound) may attain to their perfection and encrease themselves; which thing Salt-petre does better than any other.

Nor do the Minerals desire ought else but that the impurity and superfluous Sulphur be taken away from them, that so they may (after a perfect Purification) cast forth their seed, that is Gold; and this, Salt-petre does most perfectly. Then Lastly, the Animals seek not after other food than what the Earth supplies them withal, which to effect, Salt-petre must of necessity be at hand.

Salt-petre therefore is the only preserver of all Vegetables Minerals and Animals, but the soul of Man doth not at all belong thereunto, for it is the propriety of Jesus Christ; but as for the bodies, Salt-petre is the most profitable medicament. Whatsoever I have here produced in this place, I have already Written the same in other places of my Treatises, in another kind

kind of manner and expression, and therefore I suppose it to be plainly needless to make any farther addition: He that will not be able to light his dark Candle at this shining light, will be blind all his life time, and consequently incurable.

As concerning the preparation of Sulphur with Salt, how it is to be made a *Lac Virginis* I have already mentioned it abundantly in many places. And as for the making of the Cradle or Bed, and what form 'tis of I shew'd about the beginning of this Work: So that now there remains nothing behind but the applying the hands to the work, if we desire to get honour and goods from (this) principal Monarch.

✧ Salt-petre is the only Artificer to reduce Metals unto their first matter, or of making them Astral. For the Stars are nothing else but pure fire. They exercise fiery Operations, and produce fiery things; like as the Vegetables do putrefy by the Salt-petre in the Dung, and are reduced unto perfection and multiplication, without which putrefying there can never be made any multiplication of the Vegetables, as Christ himself witnesseth; if the Wheat does (not) putrefy in the Earth it can produce no fruits. The like is in the Animals too, yet especially in the Eggs of Birds, which said Eggs must sink and rot afore the hatching of the Chicken comes. Therefore in vain have many tried so to defile (or putrefy) Metals and reduce them to their first matter. Now though the Philosophers tell us that Metals are to be first putrefied afore they can be multiplied, yet they meant not such a putrefaction, but the putrefaction of Metals must be done by the help of fire, and withal must be so effected by Artificers, here below, as the Metals are wrought by the Stars in the Heaven, for we must imitate Nature. And forasmuch as nature generates all Metals by a Celestial Fire, therefore the Artist must go no other way, but must imitate nature if he would do any good on't.

As for Vegetables and Animals, we willingly allow them a moist putrefaction, but for the Metals, a dry and fiery putrefaction suits with them, and which may be perfected in two or three hours space, as may be seen in my *Continuation of Miraculum Mundi*, and in (my) *Testimony of the Truth*, [or *Explication of Miraculum Mundi*:] And this is the only cause (or rock) against which many have fallen, and so have not gotten any good thing, (or profitable.) Now, afore putrefaction it cannot be encaused; and every thing which induceth a putrefaction into other things must of necessity consist of two contraries in its nature: Water poured upon Water remains Water, and there is no change wrought; but from Fire and Water do many wonderful things proceed. If we pour the corrosive Spirit of Nitre, of Salt or Vitriol upon another corrosive Spirit, they easily embrace each other and are commixt without noise, and there is not thence generated any new thing, but it always remains an acid corrosive Spirit. If we put one strong Lixivium to another like Lixivium, there is no noise (or hissing) stirred up, nor any change made; but now if we mix that same Lixivium with a corrosive Spirit the one operates upon the other, being both contraries, and there is generated of them both somewhat of a middle nature, which has not the likeness of either. This now is clearly evident in strong fixt Nitre, or any other Lixivium of Wood, when it is poured into *Aqua fortis*, and they act one upon the other; then of them both, there proceedeth a certain middle thing, viz. burning Salt-petre, which brings all things to putrefaction, and promotes or advanceth their multiplication, the which

thing is after a sort known in the Vegetables, and Animals; but as for the Metals, the Philosophers have accounted it as a secret even to this very day; and therefore hence comes it to pass that there hath been so much erring in putrefaction (which is the very key of the Art) and nothing hath hitherto been brought unto the wish'd for end.

Forasmuch therefore as Metals ought to be putrefied by the Fire, we do not find any thing more commodious than Salt-petre, which in one hours space, putrefieth all the Metals prepared aforehand, and multiplies them, viz. when a commodious and moist Matrix is put into the Fire, wherein (a man) may put his (metalline) seed to be therein multiplied; for seed is not multiplied without a Matrix, and this is daily observable in the Vegetables and Animals.

Now, as a Vegetable seed needeth for its multiplication a fat and moist Earth, and an Animal Matrix; so likewise the seed of Metals needs a metalline Matrix, without which it cannot be multiplied: And by how much the more apt and commodious the Matrix is, so much the more noble is the Fruit, and so on the contrary.

So then, by this time all men know that by how much the stronger and better the contraries be, so much the better are the fruits, as hath been already said. The stronger the *Aqua fortis* is, and the more fixt the Salt or Lee is, that are mixt together, the better and the more plenty of Salt-petre is there generated. But especially if we concentrate corrosive Spirits by Metals & do make them (thereby) yet more corrosive, as also if we concentrate fixt Salts by Flints, and so make them yet more fiery, they do then perform many wonderful Operations. For whereas the bare contraries do yield but only Salts; being concentrated, they do yield forth fruits that break out as if it were Trees: Concerning which you may see in the second part of the Furnaces, about the Liquor of Flints. This is that which we see and believe, viz. that by how much the more the contraries are contrary to each other, so much the greater product is there of Fruits. But because Fire and Water are naturally exceeding contrary to each other, therefore do they also produce the greater fruits, viz. Metals, which are greater than either the Vegetables or Animals are.

N B. If the Artist can think upon a yet hotter Fire than the common Fire is, and a colder Water (than usual) and know where to find them, such will of necessity likewise produce Metals that are more excellent than the Vulgar.

But seeing that amongst all the fires there is not given a hotter than Salt-petre, a cold wife is to be associated unto him, and the wedding is to be celebrated in Hell, then will both of them leave (behind them) Sons of Riches and Health.

'Tis an usual custom throughout all Germany, haply other Kingdoms have the like, that when two contract Matrimony, the Bridgroom and the Bride, are led into the bathes two or three days afore the Wedding is Celebrated, and they are there wash'd, to the end that they may be the more acceptable to each other: And although they put on their best apparel and do adorn themselves with most clean drellings, yet do they at last put off all their fine Ornaments when they desire to conjoin themselves and multiply.

The same is here to be understood of the new metallick multiplication: If each party be but only sound & of a good constitution (though the outward raiment be vile) yet are they able to beget as fair Children, as Royal Persons, (who are loaden with Gold, Silver,

Y Y Y Y

precious

precious Stones, and Pearls,) can. Hence it is apparent, that the Garments contribute nothing to the business, but that the multiplication doth solely depend upon the soundness and good constitution of the bodies; and this *Pythagoras* well knew, and willingly left it to posterity, for he observed that the soul of the Metals being by Art forced out of the body did presently pass into the highest bodies and after their death, again into the next: Hence it was, that he fell into a great error, when he concluded, that the same was also true as to the transmigration of the soul of man, and the order therein the same; to wit, that the soul of one man did not presently pass into another man, but as well into Sheep, Birds, Fishes, &c. And for that reason, his successors, (a great part of whom inhabit *Africa*) will not to this day kill so much as a little Worm, fearing least that they should kill such an Animal, as contains in it the soul of their Father or Mother. Besides too, he signified that the soul of a man was better and more pleasant in Frogs than in the most Potent King. Without doubt this error arose from hence, viz. his seeing the souls of Metals that are forced out of their bodies, to occupy or possess the nearest and more commodious subjects. By how much the purer the Subject is that the soul of Metals finds or lights on in its departure (or going off from the Metals) the willinglier doth it possess it. We Christians have a more perfect knowledge of the soul given us than was given *Pythagoras*, but if we speak of Metals, then this saying of *Pythagoras* hath good foundation, which thing, no experienced Philosopher will ever be able to gain-say or confute with truth. This we know most certainly, that God doth esteem the soul of a beggar as much as of a King; the bodies do indeed make the difference for some bodies are better adorned than other some. Likewise, the noble and not adulterated Alchemy teacheth us that the soul of $\text{\textcircled{J}}$ or $\text{\textcircled{S}}$ is as good as the soul of $\text{\textcircled{C}}$ is; herein is the difference between them, that their bodies are bigger and stronger, and so their noble soul is contemned and rejected by the ignorant, because of the rude grossness of their bodies. Hereupon, the curious searchers of nature have laboured to destroy those gross bodies, and to draw out their pure soul, that they might translate it into better and purer bodies, (the which thing also succeeded according to their desire) and by the extracted souls they transmuted the imperfect and impure bodies of the Metals into most pure Gold: Nor were they ignorant of the Artifice of particularly purifying the gross and impure bodies of the Metals, like as the sick bodies of men being purified by the virtue and help of medicaments are restored to their former health and vigour. For when an impure Patient meets with an expert Physician whom he (viz. the Physician) undertakes to cure, he doth first of all (if his Patient hath the *Itch*, *Scabs*, the *Scoury*, *Lues Venerea*, *Pustules* and other stinking sores) prescribe him a purge whereby all the impurities may be first expelled. Then he permits the sick person to use a sweating-house, or stove, in which he may sweat so much as to be very much debilitated by the heat. Lastly, he brings him into a Parlour or Chamber that has a pure air in it, to refresh him, and therein he manageth the cure of him, until he hath recovered his former health and purity; and if the sick be not made clean or pure by the first purgation and sweating, he reiterates the same remedies as often as need shall require, and till the sick be perfectly freed from impurities.

Just so, doth the skillful Chymist proceed in the purification of the imperfect Metals, for he expels all the

excrements which they are in an especial manner endued (or soil'd) withal, viz. the impure and stinking Sulphur by the help of the fire, and by the help of little appropriated stoves (or pots) even until they get their due purity; Art therefore imitates Art. But if so be that all Physicians were skill'd in Alchemy and Astronomy we should not need such plenty of Coffins, for in them (viz. Alchemy and Astronomy) one true Art doth continually produce out of it self another.

The Astronomer when he would give a man his judgment as to the manner and term of his life, doth first of all look to the hour of the nativity, and fisheth out what condition that aspect is of, that doth at that time bear chief rule in the Firmament, which when he hath found out he doth by the means of calculations predict what good or what evil things will befall the Child (or party) whilst he lives.

Although these prognostications are not at all infallible, yet are they not therefore by any means to be totally rejected. For we oftentimes find many things true by experience which otherwise we would not credit: Nor is it so much without reason that we so esteem them, but this ought not to be done compulsively (or, as if they forced us) for 'tis the usual Proverb, *The Stars incline, but do not necessitate*. For like as a man that is born under an evil aspect may by doctrine and information be made good, so that here the aspects may be of no moment; so on the other hand, we often find that such an one as is born under a most excellent aspect is corrupted and depraved by his conversation with evil men. And these very things doth even Alchemy demonstrate the truth of: For even as soon as ever the Infant is born & begins to suck in the air, he doth even then attract such influences (according to the opinion of Astronomers) as the Stars do that very hour emit from themselves upon the inferior bodies (or things here below,) and so consequently he imitates the nature of these: Even so the new born Metallick Infant, doth in the moment of his birth attract a metallick Astrum or Constellation, like to that which did at that time bear the chief sway, and so consequently receiveth qualities like the qualities of this Star or Astrum. And although that the metallick Infant were made a partaker of a good Star (or aspect) the first time of its nativity, yet notwithstanding it may be accidentally infected afterwards, so as thence to become an evil Metal: And on the other hand, that which was bad at the first may be reduced to that pass by Art and a convenient discipline of the fire, as that the best Metal may thencefrom proceed, and this, experience witnesseth every day, nor can it be denied by any but such from whom the light of nature lies hidden.

If now the superior Stars can exercise such great virtues, what hinders but that the inferior ones may exercise the same if not greater, provided we but rightly govern and tame them. The superior Stars are not at all subject unto our power, they are submitted or put under God's guidance only. But the inferior ones may be handled by us according to our pleasure. The Physician may apply them to Medicine, the Chymist may apply them to Alchemy. He then to whom the knowledge of using the inferior Astrums aright, is granted, may use them with most great honour, and eminent benefit, whether he be a Physician or a Chymist, which (said Astrums) others are constrained to leave untouched to their great disgrace and loss. But men now adays are too much given to laziness and sloth, so that there are but few to be found that will search after nature's Secrets. A many there are that chal-

lenge

lence to themselves the title of learned Philosophers and yet are altogether ignorant of the foundations of true Philosophy. There is not in this age scarce any esteem at all, of true Philosophers, though notwithstanding they deal with us so sincerely and do clearly set afore our Eyes, the interiors of nature, and leave us excellent Writings. So *Pythagoras* whom we mentioned afore did upon this account suppose, that, (because he saw the souls of Metals to be carried out of one body into another, and to Operate as well in this body as in the other former, and consequently to animate this, and make it more perfect,) the case was the very same with the human soul, and by this means he directed as it were his successours to the universal and particular work of Metals.

And even just after the same manner hath *Virgil* done, when he would that his Carcass should be cut into pieces, and be reduced unto a Life by a continual insillation (or dropping in) of burning Oil. Perhaps the occasion of his falling into those cogitations was this, either because he observed that the dead metallick bodies were by the operation of the Fire, and addition again animated, and so he perswaded himself that the like might possibly be done in man; or that well knowing the impossibility of doing this thing he would give an occasion to such as came after, more curiously to search, and so was willing to point out with his Fingers as it were at the multiplication and propagation of the metallick bodies (as *Pythagoras*, of the souls.)

Most certain it is, that it will not be any difficulty to him that knows Nitre aright, and can so order it as to operate in metalline bodies in the form of fire, to multiply *Sol* (in an universal way) and to make the viler Metals more perfect (in a particular way.) And this I was willing here to add. 'Tis well for him that useth the gifts granted him by God, to his glory and the benefit his neighbour.

And thus much may suffice to have been spoken in this place concerning the nativity and multiplication of Salt-petre, and the Potent Monarchy; more shall be spoken upon some other occasion if God please.

Now follows the use and benefit of Salt-petre.

Having thus shown the Generation of Salt-petre out of every Kingdom, viz. of the Vegetable, Animal, and Mineral Kingdom; it now remains yet, briefly to shew what wonderful things the same doth effect in Medicine and Alchemy, which thing we do not find that ever any one of the Philosophers did perform, but kept all to themselves for secrets.

Forasmuch therefore as I have made a beginning of the thing already in the second part of this Book, where I spake of a certain moist separation; that is, I there delivered that it is possible to extract Gold and Silver out of all (yea even the most vile) Metals, by the benefit of a nitrous Water, so as that any one that will but set his hand to the work may thence get his sustenance most plentifully; it seems a thing necessary to finish what hath been already well begun.

Now forasmuch as I did in that place let pass the describing the manner it self of Extraction, a many Friends have much desired an illustration of the things there spoken, but I could not hitherto by any means satisfy their petition, because that the abundance of my employments denied me the time of Writing.

Now therefore I have determined both to gratify these and others by opening this most noble artifice,

but yet so, as that I will reserve some things unto my self, that so all things may not be made so common to my Enemies. And if so be that any of my Friends desire a more plain explication, and desire an addition of the things I have omitted here, it will be an easie matter unto me to satisfy their requests.

This Art therefore doth not only conduce to this, viz. to extract fixt Gold and Silver out of all sand, earth, stones, yea and out of the more vile Metals (or Ores of Gold and Silver; (but also to extract the volatile and immature Gold, and Silver, and to make it fix, and that in such a compendious manner as that it will be a matter of (in a manner) no costs or labour: Nay more, if so be there cannot be had any poor Metals, Stones, or such like subjects that contain in them Gold and Silver (though even these are plentifully enough to be had in every part of the World): Yet nevertheless may that Art be exercised with profit, about even the imperfect Metals such as *S*, *S*, *V*, *h*, *S*, *Calmei*, *Zink*, *Bismuth*, *Cadmia*, *Arsenick*, *Antipiment*, *Gravater*, *Talk*, *Smiris*, *Hematitis*, and such kind of Fossiles, are; and which contain *⊙* & *☿*, partly fixt, and partly volatile, and may be commodiously extracted by the help of a nitrous Water.

Besides too, most excellent Gold may be in like manner profitably separated out of all such things as are made by Art of Silver, whether they be gilded with Gold, or not, inasmuch, that if there be but a most few grains contained in a large portion of Silver, they may be separated with gain. And if so be any be so minded to impregnate the separated *☿* again with Gold, that so it may again yield Gold by a following separation, he may most easily do so; yea, this operation may be so often repeated after this wise until all the *☿* pass (by Graduation) into *Sol*, which thing may be compared to a perpetual durable Mine-pit of Gold, and is perfected by the benefit of Salt-petre only; and therefore it both may and ought to be called and that deservedly a Store-house and comfort for mankind. For when we prepare that Salt-petre of medicinal Subjects, all the Salt-petre doth not put on the form of cristalls, but much of it abides permixt with the water, which water doth abound with a most notable nitrous virtue of thoroughly promoting Christallization, inasmuch that the seeds of Rye, Wheat, Millet, Oates, Beech-wheat, and such like, when they are macerated or steeped therein some due time, afore they are sown in the Earth, do multiply themselves extraordinarily, so that we see 3, 4, 6, yea and sometimes 20 plants spring forth out of one single Grain.

With the same nitrous Liquor too, (so it be prepared of true medicinal things, may be made a most excellent Medicine (which may be in a manner compared with potable Gold, and by the help of which, great diseases and as it were incurable, are happily healed) and that in a few hours space.

Forasmuch therefore as such a Kingly medicament (of which I have made some mention in the Second Part of my *Pharmacopœia Spagyrica*, where I treated of nitre) & such a most excellent & incomparable dunging of the Ground, may, together with the Salt-petre, be prepared & instituted; so most easily & almost without cost, (on which depends the health of the body, and fertility of the Ground, whether you respect Corn, or Wine, or Hops, or any other things, that man useth instead of Meat and Drink for the sustaining of Life; or else the extraction of *⊙* and *☿* out of all the most abject Subjects every where found) may we not justly pronounce thus much of Salt-petre, that it is altogether profitable and commodious to all men;

and

and therefore well worth the searching after, and the application to the use of Man.

Therefore like as by the help of Salt-petre, we see we are able to get all such things as an honest man seems to need, such as are Food, Drink, Health, yea and ☉ and ☿ too, and all this most plentifully and perfectly: so on the contrary, the use of this Salt-petre is very hurtful when it is used for evil, and this is sufficiently seen in the time of War. Yet nevertheless we should not esteem less of it than it really is, because of its being abused, but rather the benefits attending it (which are very many) should stir up our minds to make a diligent enquiry into it. The end of the World is at hand, and sundry things are detected, which the ancients reserved amongst the highest Secrets, but they are but little esteemed; some of them, I will here exhibit and show unto you.

Now follows the Process, Operation, or Manner of extracting Sol and Luna out of all the Metals with Profit.

That you may gainfully extract ☿ out of the Metal (or Mineral) of Silver, Litharge, stones, and the like fossils, which have ☿ in them. First of all you must commit them to the fire, that they may be made red hot (but yet this needs not be done with sand) then powder them, and put them in a Glass Cucurbite, pour thereupon as much *Aqua-fortis* as is sufficient, put this Cucurbite in a pan full of sand, and then heat the sand by little and little by putting Fire thereunder; that so the *Aqua-fortis* may by the help thereof attract the ☿ out of the powder; then pour off the *Aqua-fortis* from this powder, and pour it upon the other like conditioned powder, that it may also extract the ☿ out of that too, and this decanting and pouring on, must be repeated so often until there be no more dissolved.

The *Aqua-fortis* is always diminished or wasted because some of it adheres to the Metal, and therefore must there always be other *Aqua-fortis* put in the room of that which is wasted; The *Aqua-fortis* which adheres to the Metal is to be thence separated by the benefit of boiling, on this wise; Pour common Rain-water upon the Metal contained in the Cucurbite, and mix it well by strong shaking of the Glass, then heat the sand so as to make it boil, and so that hot water will draw to it self the *Aqua-fortis* out of the Metal, which said water contains ☿ in it. Then when this water is abstracted by inclination or pouring off, put on some Rain-water a second time upon the powdered Metal remaining in the Cucurbite, and this will extract that which the former water left of the *Aqua-fortis* partaking of ☿ (unwashed off:) and so let nothing of the ☿ remain in that metallick powder; when it's thus done the matter is to be thrown away as altogether unprofitable, unless there lies hid therein any Gold; which if it be so, we must pour some *Aqua-Regia* thereupon, and order the operation according to the foregoing method; then mix both the strong waters together, both that which extracted the ☿ and that which extracted the ☉, mix them diligently, and there will thence arise a certain white Water, and the solution will be like Milk; For the ☿ cannot abide the *Aqua-Regia*, but there will precipitate a white powder which snatcheth (or precipitateth) down with it self out of the Waters the Gold too. We may make use of the decanted Water to extract ☉ out of the

other Metals; for the pouring on of the *Aqua-fortis* with the ☿ in it, to the *Aqua-Regia*, doth not at all take away ought of the virtues.

Upon the precipitated powder of ☉ and ☿ hot Rain-water is to be several times poured, that so all the sharpness of the *Aqua-fortis* may be extracted. The powder of the ☿ is to be put upon some Cap-paper and dried. And as for the way of separating the ☿ from the ☉ we will presently teach in what follows.

The edulcorating waters as well of ☉ as of ☿, are to be all of them mixt together, and then the ☿ will settle to the bottom, and attracts the ☉ which was in the other water (or washings): so that there remains not any either ☉ or ☿ in the edulcorating Water (or washings): nor are these waters of any farther profit as to the work of separating as afore, yet notwithstanding there may be made excellent Salt-petre of them, as we shall mention in what follows.

When you have rightly edulcorated and dried the precipitates of ☉ and ☿, they are to be put into a strong Crucible, this Crucible is to be placed in a Gentle fire, until the matter therein contained doth flow, which is easily done, for it is very fluxile; as soon as ever you perceive it flow, turn it out, for fear least any of it should penetrate the Crucible, and so bring damage or loss to the Operator. When the ☿ is poured forth, you will find the ☉ sticking to the sides and bottom of the Crucible like pale Gold, altogether Crude and not at all fluxile. The ☿ turn'd out is brittle, fusile, and volatile, and is by the Chymists call'd Horny-Luna, but I call it the ☿ of ☿, it being of excellent use in Alchimy, as shall be shown in what follows.

The Crucible in which that ☉ remained may be kept to melt such like precipitates of ☉ & ☿ in again; when this hath been done pretty often (in the same pot) melt down this ☉ by adding a little borax, and you shall receive a palish Gold, because in this first melting, some of the ☿ doth adhere thereunto.

This now is the common way of separating these precipitates of ☉ and ☿ from each other, there shall follow a better way in what ensues.

NB. That if so be, both the Metals are boiled in a strong Lixivium after their edulcoration; or if some fixt Salt made of a Lixivium, be powdered and permixt with it afore melting, then the ☉ and ☿ are reduced together, and may be afterwards separated by the help of *Aqua-fortis*: There is yet a more accurate way; (and it is this) when we mix the edulcorated Calxes of Luna and Sol with (A.) and being mixt put them in a coated Retort, and put fire thereunder by degrees (as is wont to be done in distilling) and keep it for 6 or 8 hours in a continual Cementation; and so the volatile ☿ of ☿ is made fixt by the help of (A.) and corporeal: Yea and tingeth some part of the added (A.) so that by the benefit of this Cementation, the ☿ is made more Golden. This Cement is to be most finely powdered and to be reduced by the following melting: and you will find your ☉ and ☿ augmented. The melting is thus; Take of the best Salt-petre, and (A.) each alike: mix them, and separate the Spirit of Nitre by a Retort, which (Spirit) is much fitter for separation than simple *Aqua-fortis*: The Caput Mortuum remaining behind in the Retort, is to be powdered, the fixt Nitre is to be extracted with Rain-water out of the powder. This Lixivium or extracting Liquor will be of a green colour which is to be coagulated into a Salt by a due boiling; which Salt is able to reduce the ☿ of ☿; and

Caput Mortuum 3 Caput Mortuum

to make aureous or Golden, yea, and to reduce the Cemented ☿ (of ☿) too.

NB. It is better to mix the fixt Salt-petre, or the Green Lyon simply with the horny ☿, to cement it in a Retort, than (to take it) out of the Retort, (and) reduce it with a stronger fire; and so we shall have an excellent augmentation of ☿. *2. Capivale.*

NB. The Mercury of Luna cemented with (A) may be likewise reduced by this means, (viz. with this flux) that we take one part of Flints that will melt in the fire, and of the fixt salt of ashes four or five parts, and so mix them together, and melt them into a white glass; 'tis able to reduce the best Cements. And this is the best way of all of reduction.

Besides, all those ways of reducing a Cement, there may even this way too be instituted, and that not unprofitably. Take of the fusile Glass of Lead four parts, of the cementing Powder one part; melt them in an iron Crucible in a strong Fire, and some of the Lead will be reduced out of the Glass of Lead, and will be near (or partake of) ☿: This Lead is to be blown off on the Test, and you shall find an aureous ☿: But for as much as the Lead separated from the Glass of Lead in the iron Crucible, contracts a blackish colour from the Iron; it is profitable to add to the matter in the fusing or melting, some Salt of Ashes, as being that by which the Lead becomes depurated, and so is easily separated on the Test.

But if so be, that (for this work) the Metals (or Minerals) of ☿ & ☿ cannot be had to precipitate the Mercury of ☿ out of them, (then) the artificially-made (vessels or plate) whether simply Silver, or else gilded with ☿, may be made use of; let these be dissolved with the *Aq. For.* left after the precipitation, & precipitated with Salt water or *Aqua Regia*, and be edulcorated and mixt with (A) and be fixt in a Retort. Now this Operation is to be done in a Retort, that so the precipitated ☿ that is altogether volatile, may not be wasted, which in a Crucible evaporates away, a good part of it, which cannot be so done in a Retort; for in a Retort, that which flies up, sticks in the Neck, and may be separated thencefrom, and be mixt with other Cements: And besides too, the Cement is easier separated from the Glass, than from an uneven Crucible; for some part always sticks thereon, and cannot be gotten off.

When you are minded to purify this Cement sooner (or more speedily) it may be molten with an equal weight of Antimony, and there will arise from your golden ☿ a Regulus, which must be purified with Salt-petre. Concerning which work of Reduction, and which is far easier than that which is done by the help of the Glass of Lead, I have most clearly and fully handled it, in my Testimony of the Truth, or the Explication of my *Miraculum Mundi*. By this means every ☿ of ☿ may be rendred aureous, and that as oft as one will, yea, even until all the ☿ be changed into Gold by Cementation and Gradation. Now if you would otherwise separate enough of the aureous or golden ☿, or extract the Metals (where nevertheless you would reduce the separated ☿ and ☿) it may be effected by this means most commodiously and most gainfully of all, because the Calx of ☿ is made aureous by Cementation. This labour yields a continual augmentation of ☿, by which we may live very well and plentifully.

Another Augment or Encrease of Sol.

Dissolve ☿ or ☿ in *Aqua Fortis*, also ☿ in *Aqua Regia*: (NB. Let there be always thrice as much Silver as Tin;) mix the solutions very accurately, and when you see that all the matter is fallen down (or precipitated) to the bottom; pour off the water, which said water will very commodiously serve instead of *Aqua Regia*, to dissolve other ☿ in. NB. If your *Aqua Regia* be not strong enough, it will not at all dissolve the Tin, therefore in such a Case, you may pour on the Tin, *Aqua Fortis* mixt with simple water, which after they have a while acted upon each other, there must be some salt-water poured thereupon, that so the ☿ or ☿ may be precipitated to the bottom of the Vessel, in which (Vessel) the white ashes of the Tin ly. This matter lying in the bottom, is to be edulcorated, dried, and reduced by a strong fire, by which operation you have not only an augmentation of your Luna, but it is likewise made golden.

NB. This business may also be thus managed, First, dissolve ☿ or ☿ in *Aqua Fortis*; to the solution add an equal quantity of Rain-water, pour this mixture upon ☿, and let the solution be made in a pretty warm place with sand; separate that which is dissolved, the matter that is yet somewhat harder, by decanting or pouring it off, then make the precipitation with salt-water, edulcorate it dry it, and melt it, and you shall have Encrease.

But if this Mass will not so easily melt, then powder it, and mix it either with Antimony, Glass of Lead, or with a fluxing matter made of salt of ashes and flints, that thereby it may be made fluxile or meltable: That which is made fusile by the help of the Glass of Flints, is presently pure; so is not that which is done by the help of the Glass of Lead, for that must be hence separated, and be (by the benefit of ☿ and ☿) reduced into Reguluses, and be purified and washed by Salt-petre. Therefore it is the better way to promote the melting, with the Glass of Flints than with Antimony, because the ☿ may be afterwards separated without Loss, which is not so easie a thing for every one to do (otherwise.)

The Reduction which is made by the help of the Glass of Lead, is indeed (otherwise a most easy way, but by that way which is done with Antimony, we get more ☿ than by any other way.

Another way of Augmenting Sol.

Take the golden Talck, Granates, Smiris, Hematite, the aureous Scoria's of Copper, the greenish, reddish, golden Flint, Sand, or Clay; extract their volatile Gold with a strong *Aqua Regia*; pour into the solution, a solution of Lead made by *Aqua Fortis*; mix it well; when the matter is settled, separate the *Aqua Fortis* by inclination; edulcorate the said Calx of ☿ with water, and dry it, and so have we gotten the volatile Gold extracted out of the *Aqua Regia* by the ☿: This volatile Gold is made fixt on this wise. Take the most subtle Powder of ☿, or its most thin Leaves, add thereto thrice as much of this ☿ of ☿; or four times as much, or six times, according to the quantity of it, by which we formerly got (or fish'd out) the volatile Gold: Set it in such a place where it may have a gentler heat, so as that the ☿ of

Z z z z

h may

h may just flow, and not fume; the matter is to be thus kept in this heat for some hours, or rather days, that so the filings of © or its thin Leaves may by little and little attract the volatile Gold out of the ☿ of h, and consequently be therewithal augmented.

NB. But seeing it is a most difficult thing to keep such a very temperate heat as that nothing at all of the ☿ shall fly away, and the © shall not melt in the Crucible: It is better to put the ☿ mixt with the ☿ of h in a coated Retort, and set it at a strong Fire for a season for so nothing of the ☿ of h flies away, or penetrates the Crucible. That which ascends up to the Neck of the Retort may be separated, and be kept for common ☿ of h, out of which may be prepared a most excellent Medicine.

Another Augmentation of Sol.

TAKE of red Arsenick, Auripigment, *Hungarian* Antimony, or Cinnabar one part, of ☿ of h three parts, and some thin Plates of Gold; let them stand in a Glass Retort in a pretty hot place, and so the © will attract the volatile Gold out of the added Minerals, and will thereby augment it self. And if so be that there be any thing sublimed up to the neck of the Retort it may be taken thencefrom, and be reduced to a kind of Tincture. And so we may here have a particular augmentation of ©, and a matter whereout of a Tincture may be prepared.

NB. The vessel that is most fit for the fixation of the Tincture, is such an one as is made of fixt h.

NB. The ☿ of h or ☿ may be reduced by a secret fusion (or fusile matter) whereby it presently yields an aureous ☿ or h: but especially this ☿ of ☿ or h, by the help of which, there hath bin a fixt or volatile Gold extracted out of the earth, stones, sand, and such like Minerals, is to be on this wise reduced, whereby we may receive (and get) as well the volatile Gold as the fixt.

Likewise too, the ☿ of ☿ or h may be artificially distilled, purified, and prepared for a singular Medicament: But yet let no body persuade himself that such a distillation is to be perfected after the common way with retorts or cucurbites, for it is a meerly vain thing to hope for the separation of the pure from the impure that kind of way, for because the fire forceth up the good and bad alike, the which thing is not at all so done by my more secret Philosophical distillation; for by it, the most pure soul only of the Metal is driven up, as for the terrestreity that remains, it is separated of it self by that more impure (thing) to which it is conjoined, and makes a dirtyish slime. The purer part will be found (by the help of the Cementatory Copple) to contain both © and ☿; as well the purer part of that which is prepared by it self of this (bare) ☿ of ☿ and h: as that which is prepared of such (a ☿,) as by whose help fixt and volatile Gold hath been educed (or gotten) out of the nitrous Water; which way also is a most compendious one, of reducing the (extracted) volatile and fixt Gold. For when we reduce this ☿ of ☿ or h by the help of fusing things, some part of the © may easily perish and evaporate: But now here, nothing at all perisheth: For that which does not remain (behind) in the said artificial distillation, and so separate it self from impurities, goes out (or passeth over) and yields a most excellent Medicament more excellent than © it self, which you are well to observe.

Besides too, it is a thing most easie to be done to fix

the soul of ☿ or h (that is carried [or forced] up, together with the volatile Spirit,) in the said instrument with ©; which to effect, there (otherwise) needs a longer time. Therefore even by this one only process is both made a most excellent Medicament, and withal, © is gotten too. These things we have here exposed in very few and plain Words most agreeable to the truth, and do most exactly answer to experience; nor is there any reason of blaming me because of my speaking somewhat obscurely, seeing it is evident that not one of my Predecessors did ever exhibit (or publish) any of those things. Well, what shall I say? Excellent Gold may be extracted out of all the kinds of Metals, by the help of Salt-petre; yea with so much facility; that it would seem an incredible thing to most Men, though I should clearly set down all the circumstances, word for word: But yet this (extraction is) not (to be done) without the benefit (or help) of © and ☿: For when we have a purpose of augmenting any thing, there must in the first place of necessity be the seed of the thing that is to be augmented, and according to the quality of the seed there must be a fit matrix in which it may take its growth or increase. For example; When we seek for the increasing of any vegetable seed, we prepare a convenient Earth for the same, to which Earth we commit that seed, and so the like sort of Herb buds forth, which doth again produce thousands of seeds; which seeds are again put into the Earth, and so are multiplied even to infinity. This multiplication of Vegetables is sufficiently enough known, and a most easie work it is to multiply a Vegetable, if we have but its seed, and that it be well conserved least it die. So likewise out of one Fire may be made many yea infinite other Fires, for one is always kindled by another. But when all the seed is dead, 'tis an impossible thing to produce a new seed.

Therefore the most Great and Blessed GOD, hath most excellently ordered it, so that the seed of Vegetables may be kept the year about; for if it should not be so, we might well fear the destruction of the chief Herbs in the Winter season, which now (by the benefit of their seeds sowed in the Earth) we are able to produce a new.

Now the progress or order of the seed of Animals is widely different from these, although that even they are committed to such like Animal bodies, as being their fruitful soil, for multiplication sake: But yet this sowing is done by a vastly different way from that of Vegetables; For we can keep the seed of the Vegetables, and carry it from place to place and so plant or sow it in any part of the Earth we please; which cannot be done with the seed of Animals for we cannot so conserve that, or transport it out of one place into another, or sow it as listeth us our selves. But it must be committed unto the matrix, in that very moment of time that it passeth out, for it cannot be fruitful and entire if it be but a moment of time out of the body. The sowing therefore and conception are performed both together by both bodies, viz. by the Male and Female. The cause of this thing is thus, because the seed of the Animals abounds with a volatile, invisible, and living Spirit; which once lost the work of multiplication is wholly taken away. Therefore like as one [Animal] multiplication is perfected so is the other, nor may we by any means transgress the course of nature.

In like manner are the Minerals also multiplied, and by the same manner that it is once perfected by, is it to be always after perfected by. The

The Multiplication of the Vegetables and Animals is well enough known to every one, and is every where done, nor (by reason of its being so very common) doth it at all cause in any one an admiration; But the multiplication of the Minerals is not so publick a thing, for there are but a very few that understand it, though it be as easie as the multiplication of Vegetables and Animals, inasmuch that I also believe, that there is not any one to be found, that is so stupidly foolish, that would not be able presently to apprehend and do the same, were the way but shown unto him. Now that there are so many that erre, and who walk in an unlawful or contrary path, this is not to be imputed to the art it self, but to those that meddle therewithal so inconsiderately, and do not imitate nature, who always keeps her course allotted her by God.

The Multiplication therefore of the Metals doth solely consist in the knowledge of the seed; for as the condition or quality of the seed sown is, like fruits will follow, such nature as the seed you sow is of, such fruits will you reap, and no other. For Example, I seek after ☉: Therefore I must first of all, of necessity have the seed of ☉, at hand, afore I can sow it, or multiply it. Now to have this seed, we must not set about it with words or imagination, but by (getting) the knowledge of nature; for she shews us the safest way, if we did not withdraw our selves from hearing her teach us. Now like as she commits ☉ and ♀ to the Earth, even so, and no otherwise must we also do, if we hope for any good success.

And as we said above, that there lies hidden in every Vegetable and Animal seed, a certain vital or procreating Spirit, without which it is wholly unfit for ought; even so, there resides a certain Spirit in the Minerals, which vivifies and effecteth all, which being absent, death it self follows. This spirit is of no weight or form, and there is nothing to be seen by us but only the habitation or house wherein it dwells; so that scarce the thousandth part of the seed is life and spirit, all the rest is dead. The truth of this thing doth (among other things) appear even from hence, viz. if some Vegetable seed be kept beyond its due and naturally appointed time, whereby the Vegetative virtue and spirit vanisheth, it doth not yield any fruit at all, nor can it multiply it self, though it hath its former shape, bigness, and former weight. And therefore, there is not any thing in the three-fold Kingdom of either Vegetables, Animals, or Minerals, but is procreated and multiplied meere and solely by the benefit of this spirit and implanted Life.

Therefore, even as all the Metals were first wrought after a spiritual manner by the Stars in the Earth (in a convenient Matrix) by the Stars, and made fix; so according as the Matrix it self is pure or impure, so pure or impure Metals are generated; now the Matrix of all things is water or moist earth, in which the Stars are congregated (or united together) are made corporeal, grow up, and are multiplied. Here therefore, if Art would imitate nature, there are required Male-like Astrums and Feminine Matrixes, in which the Astrums may exercise their operations. Therefore by how much purer the metallick Astrum or seed is, and the Matrix purer, so much the nobler effect is produced; and so on the contrary.

But seeing that there is not any Star nobler than ☉, nor Matrix nobler than ♀, there is no more required, but that we make common ☉ Astral by Art; and that we prepare ♀ on such wise, as that it may be instead of a Matrix, wherein the Astrums of ☉ may exercise his operations; and so without doubt, there will thence

come such Children as will be like their Parents. Nor is there any ground for any one to think that there is any other way allotted to augment ☉ and ♀, besides that afore mentioned which is to be instituted in a spiritual manner: After this manner the World it self was Created, where the Spirit of God moved upon the Water and impregnated it; and even as we daily see that the Stars do impart to the inferior things their virtues, and they are thereby multiplied; even so may we do the same by art in these inferior things; for such as are above, are also beneath. Those above are beyond our reach; but the inferior ones, not so: For art can do the same with or upon the inferior things, as the Stars upon the superior ones. As *Hermes* doth clearly demonstrate in the *Smaragdine Table*. He that understands these my sayings, will also understand those things, which *Paracelsus* delivers in his Book of the *Fixation of Alchymists*, in the 5th. Rule especially of ♀; and *Basil (Valentine)* where he treats of Sulphur.

It is a thing most easie to be done, but most difficult to be found out, to multiply even the most vile Metals, by the help of the Astrums, and by this secret way. He that well knows Salt-petre and can rightly handle the same, will by the help thereof perform a many profitable things; for as it is altogether impossible to get ☉ out of the viler Metals, without it: So on the contrary it is most easie so to do by its help. Briefly, He that knows how to handle Salt-petre aright, he will excellently well understand the Writings of the Philosophers, and let him know, that he has a light given him, to arrive unto great Secrets.

For we may extract ☉ and ♀, out of all the common meaner or viler Metals, so that an expert Chymist needs not seek after peregrine, or strange Materials. An excellent purification, fixation, and augmentation may perfectly be done by the help of Salt-petre, which being a thing that but few know of, so seems it impossible, and yet the things I propound are most true. It makes bodies volatile and spiritual, and by and by again makes them fixt and compact: So that unto it alone is that saying of the Philosophers due, (*Make the fixt volatile, and the volatile fixt*) and to no other Subjects: Now if Metals be not spiritualized, there's no hopes of their augmentation. *Of something must a nothing be made, and again out of the nothing must something proceed*: So saith *Paracelsus*, which likewise is very true, though there are but a few that believe the same.

The melting together of variously mixt corporeal things, yields forth neither ☉ nor ♀: But contrarywise a spiritual Union which is done with a most strong heat, is a notable author (or promoter) of Multiplication; for the Spirits do most notably penetrate, and by variously acting upon each other, do induce alterations and meliorations, which is denied to dead bodies to perform. The Spirit doth diversly bestow a life, and vivifieth, but the body is of no other use, but to yield an house or habitation to the Spirit; the which is well to be regarded.

Those metalline Spirits (when the work is finished) do insinuate themselves anew into other bodies, which bodies they make far better than the former were, and all this by the help of Salt-petre.

Basil brings in Salt-petre speaking of it self on this wise. He that intends my death needs be a prudent Man, that so he may expel (or force out) my soul from me; when this is done, I adventure upon all the things I am able to do, but I can do nothing that has in it firmness (or substantially) in the bottom. (or radically:)

dically): *Venus* is my chearful Woman, whom (in this place) I take to Wife, but the wedding is celebrated in the very inward parts (or center) where the sweat flows out of us both in a most plentiful manner. So the subtle (part) in us, expelleth all defilements, whence it is, that we leave behind us most rich Children, and do reserve (or keep in store) most eminent Treasures for the dead bodies, which we give them by our Will and Testament. Who would speak more clearly, and would not understand these words of themselves, (or as they are) without any interpretation.

The ancient Philosophers wrote, that at the rising of the Sun is a Bird found in those hotter Countries; which builds his nest with Gold; and when he is grown old, and can live no longer, he gathers together exceeding dry Wood, which being kindled by the heat of the \odot , consumes both the Nest and the Bird too, from the ashes moistned with rain Water, they say there arise Worms which will be again changed into other Phenixes.

These sayings are indeed Fabulous, yet nevertheless there is a most high secret disclosed by them: for if we rightly consider all circumstances, we shall find that Salt-petre is hereby meant, which gathers the Gold into his Nest, that is, extracts the Gold out of Metals, Stones, and Minerals, and doth afterwards increase his Family by the burning them. This to a wise man is enough.

Now that this Arcanum may be the more manifest, I will add over and above, another way of extracting the fixt and volatile Gold out of Stones and all kinds of Minerals, by the help of Salt-petre, and of making them corporeal.

We may very well compare this work to a fishing Trade, concerning which the Philosophers have written many things, but very obscure; *Saunders*, hath more clearly treated of that thing, but *Isaac Holland* clearest of all. Verily this Philosopher was an excellent fisher of Pearls and an excellent presser of Cheese, and for this very reason he assumed to himself such a name. For *Isaac* by transposition of Letters is the same with *Cassius*, (or Cheefe.) So that it may be said to be *Holland* Cheese; not that *Hollandus* was in very deed a maker of the usual Cheese with milk, but that he bears some kind of resemblance (in his work) with such Men: For he bestowed abundance of labour about working on that Universal, that hath some Cheese-like fashion in it.

Even as the *Hollanders* gather the greatest quantity of Milk more than all Nations besides, out of which they press their Cheeses, and so sustain them and theirs; so the more skilful Chymists do frame or make Cheeses after a Philosophical manner, and that out of Metals, Salts, and Herbs: and this very much agreeable to that method, according to which we see the *Hollanders* proceed in making their Sheep-milk Cheese, where they boil in the Milk some green Herbs, and so do thence extract a colour afore they set about the coagulating or curdling of it. That is, they dissolve b or d in *Aqua-fortis*, and a Golden matter, though it be but g or v (if they have not at hand any better) in *Aqua Regia*: They mix together both solutions having both of them the form of Virgin-milk, and they add as much Salt as is sufficient. (NB. 'Tis better to add Salt-water, or Spirit of Salt,) and you shall presently see that milk to be coagulated, like as (when we pour on some Salt-water or Spirit of Salt upon Cow or Sheep milk) we observe daily to happen: where the Water is partly separated by decantation,

and partly by expression from the coagulated or cheefly substance wrapt up in a Linen cloth, that so a Cheese may thence be made.

Just so do we proceed in the making of our metallick Cheese; for when we pour Salt-water or Spirit of Salt upon the solution of d or b mixt with that (solution) which is of a goldenish Nature, viz. of g or v : we presently see a precipitation made; which done we abstract the clear water swimming at top of the precipitated matter, by inclination or pouring off; the which we may keep for farther uses, principally for the solution of other Metals and golden Subjects. We put the Cheese or white Coagulum abiding in the bottom of the Vessel, into a Linen cloth, and by strong squeezing it free it wholly from the wateriness, which said water is to be kept as well as the former, for being used about making new Cheeses, it makes them of the better favour, and more aureous and vendible.

This Whey, or that water which is plentifully gathered in the making the Cow-milk Cheeses, though it affords varieties of Profit to mankind, whether they give it their Hogs to fatten them, or use it themselves for their daily drink, especially in Summer time, or apply it to other uses as we see daily done, yet do not I see any better benefit than that which it yields to the *Curriers*. For they put in it some old Iron, and when the solution is made, they moisten with that water the hide already perfect (or ready dressed) and when 'tis dry they moisten it therewithal again, and this they do three or four times, until it hath gotten a fixt colour, blacker than a Coal. They do also sometimes administer some of it unto Children (with good success) to kill and expel the Worms: Nay more, they are likewise wont to make a Bath thereof very profitable for those that are troubled with the Scabs or Itch, because it hath gotten a drying force from the d , and thereupon it makes the skin smooth and hard: and seeing that the Country Fellows, and Labourers can do so much with it, what hinders but that we may institute such a curing more perfect, and that on this wise.

Take sweet Cow-milk, or (which is better) Goats-milk, two measures, boil it over the Fire, put thereto while it is yet warm 5j . or 3ij . of Spirit of Salt, mix it well, and you shall see the coagulum or curd presently separate from the whey; out of which Cheeses may be made by expressions, which are far better than others, by reason of the addition of the Spirit of Salt, whereto if you add some Cummine, Carraway, or some spices, they are yet better and more to be preferred. The Whey here separated is of a grateful favour, and by reason of the admixtion of the Spirit of Salt, is somewhat acidish, and a most certain and most safe loosner or absterger, being administered to Infants that are troubled with the Worms, or even to Elder ones that are feeble. How many Infants have we observed to die unexpectedly after they have been for some while and often afflicted with a burning Fever, the Convulsion fits, and other such like effects, and merely because we will not persuade our selves that they have the worms, & so forbear the using any remedies to purge them out? Now in such a case this whey is exceedingly excellent, being used after this manner.

Take of the most subtle filings of Steel as much as will lie upon a knife's point, mix it with as much honey as is sufficient, and give it the Children: and for their ordinary drink, let them use the said Whey, and so by this means, that filings being dissolved by the Whey kills the Worms, in the ventricle or stomach and drives them out, and verily is a most excellent Medicament:

cament; especially if taken two or three days; nor have I hitherto met with a nobler, than this is. And so there will redound some profit to Children and Infants too, by this our way of making Cheese, for which we owe immortal thanks to the Great and Glorious God.

Besides this, I have likewise observed the excellent use of this Whey, in the administration of my Panacea of Antimony, if there be taken a draught or two thereof, at the end of the Purgation; for it gently carries off the reliques that stick to the intestines.

He likewise that is so minded, may before his dropping in the Spirit of Salt, add some Anise-seed or Fennelseed to the milk as it boils, thereby to correct its Flatulency or Windiness.

And I do most courteously intreat the well-minded Reader to take it in good part, that I have been so prolix in declaring the virtues of our Whey; necessity it self, and the love of my neighbour forbade my concealing of them: For very many Infants are killed with the Fever, and Epilepsy, or Convulsion-fits, and so suddenly die, for no other cause but our not meeting with the Worms, which their bodies are full of, being ignorant of convenient remedies.

Now then to return again to our Cheese, and to demonstrate the most eminent benefit, both of it, and of our water which is thence separated; we are first of all to know, that even it is also able to tinge (some) subjects with a certain colour, not with such a black colour, indeed, as the Whey of Milk, prepared as aforesaid, dyes the Curriers Hides with, but with a yellow colour, and more durable than that which is given to the hide, for that we therewith extract a Tincture out of Σ and other aureous Subjects, and with the Tincture, do sometimes anoint (or tinge) *Luna*. If now the water abound with such virtues; what virtues will not the Cheese it self abound withal? And like as our Cheeses are diversly impregnated with spices, so are they of different favour, and price, and more or less wholesome. But now if that virtue which is in Ψ is also added to our Cheeses, there will proceed from thence admirable Cheeses; and this, that Philosopher was minded to point at, who writes that by the help of the Saturnine net, he is able even in a clear night to extract the little Fish *Eschineis* out of the Sea.

The Ultimate (or extrem) letters of this word *Eschineis* *i.* and *s.* if conjoined together, so as that the letter *z.* be thereof made, and then the word read backward, it will found in the *German* tongue the same with *Ziensech*, (*viz.*) the ashes of Tin; but yet let not any one persuade himself that those ashes of Tin are such as are made by means of the (bare) fire, but are prepared by the benefit of the spirit of Nitre.

Saturn does not only claim (or merit) the praises of being a husbandman, but also of being a good fisher, and hunter, as (among other writers) *Basil Valentine* doth egregiously shew.

When \odot , γ , Ψ , and δ pursue (or hunt) the wild beasts, η is bound to carry the net: *N.B.* the hunting dogs here are Salts, the hare that is caught, is much like the colour of the hares skin, being stript of the fames, he will yield excellent flesh, which the Princes can as little want as the Subjects can. See the foregoing Figure of the Hares and Hounds, with a Flaming Heart, and the word *VENUS*.

Common Vitriol, but that especially which is

found in those places where Gold is, is the green Sea containing excellent fishes.

Neither was *Isaac Holland* an excellent maker of Cheese only, as we said but now, but withal, he was a singular fisher of Pearls; for with the net of η (the night being clear) we may catch most excellent Pearls, but yet 'tis a very hard thing to take them out of the net, nor can they be separated but with a great deal of prudence and art, from the threds of the nets, to which they do stick so firmly.

But yet this separation is best of all done in a clear Light, the Sun shining upon the Earth with his beams, and wholly dissipating the Vapours, least it should be hindered by their being present. For the parts being exposed to the Air in a (perhaps he means unseasonable) seasonable weather are corrupted, nor does any thing remain behind but the shells. And even these shells do in their inside shew forth such diversity of delicate colours, as that the most ingenious Painter cannot imitate them with his pencil, and such they are as with which the other shells of mother of Pearl or the commoner sort cannot at all compare: For in one place they represent pure \odot , in another pure γ , in another they are of a Green colour, Sky colour, Red, Yellow, and variously coloured, so that they much exceed in beauty, the Peacocks Tail. If then the shells are so fair as that we cannot sufficiently enough admire them; what I pray will the beauty of the Pearls themselves be? Nor let any one persuade himself that I do here cast Pearls before swine by too much divulging secrecies; (no) for there are yet many necessary things hereto requisite to make the Pearls come in sight; and if so be that any one should know the way of dexterously extracting them out of the net it self; yet the fixing of them doth require abundance of labour still, whereby they may be able to defend their fairness and excellency, against all the Elements; however, in the mean time the lover of Chymistry, may delight his mind with those shells, and admire at the most admirable variety of the colours in them.

Some haply there will be, that when they have taken the said Pearl, by the help of η and γ , will think it a most easie thing to separate it from the net, by the benefit of distillation; but let those good men know, that this is a thing impossible to be done; for I my self bestowed abundance of labour in vain on this operation, and this hath to my knowledge so happened to others too; for in the common distillation, that Pearl being commixt with the net, even the Mother together with the Daughter do jointly ascend and get out; and thus to do is not at all agreeable or helpful for the great work; though nevertheless an excellent particular Medicament may thencefrom be made. Concerning which, I have spoken in the second and third Part of my *Pharmacopœia Spagyrica*; nor may we expect (by such a distillation) the thing we wish for. But if so be you desire to see the Mother, wrap the net together with the Infant in pure linen, first mundified, and waish in the fire; or put them in a glazed Stove, and put fire thereunder by degrees, and make the Net and Pearl to sweat largely, which being kept apart, yields a singular Medicament, for to quench all the Internal heat of the Body, and always to cool the burning Mercury.

The provocation of the sweat being finish'd, break the sweating glasses, and look for your Pearl, and you shall find that it is gone out of the shells, by the force of the heat, and is roasted (as it were) together

Aaaa

thre

ther with the Net, and cannot possibly be (as yet) seen; yet nevertheless it is brought to a farther maturity, and doth yield some profit in an especial (or particular) way. But the Sudatory it self, contracts incomparable Colours from the sweat of the Pearl.

Now then, live contented with the most beautiful mother, and delight thy mind by barely beholding it, until it shall please God to give unto thee, the infant also. When it was my hap at first to behold that beauteous mother, my mind, that was wearied with the long labour of searching thereinto, was so refreshed, that I can scarce declare it with words; yea I was so delighted, that I placed that delectable mother in such a place, where it might lie always open to my sight, and that so long till she shewed me her infant likewise, which Infant verily was not unlike to *Cupid*. Do you also seek, and you will find what you wish for: Implore God, and he will give unto you; Knock at his doors, and they will be opened unto thee, if so be that GOD shall find thee worthy; for he bestows his Grace and Mercy upon none, but such as are of an humble and thankful mind. Take for an example of this some Tinder, or Touch-wood, which being handled with dirty fingers, refuseth to take fire, though it be never so copiously smitten out of the Steel with the Stone (or Flint.)

All things depend on the mercy of GOD, nor can we effect any thing by our labour. Him only should we seek, and he will manifest himself by the works of nature, even as the nature of a man is known by Chiromancy, and Physiognomy.

Two contraries do always produce a third thing, and are the cause of every generation, and change of things; if fire be added to fire, there ariseth no new thing from thence; neither if you put water to water; but water and fire being conjoined, there are produced new Generations; for the fire acts upon the water, and impregnates it according to the nature and properties of (both) the water and fire; from whence there proceed things pure or impure, according to the purity or impurity of the water and fire.

The thing (or operation) it self, must be accurately known and handled, if you would have any good to redound from thence unto you. The Sun is in himself always good, yet doth he operate as well evil as good. If this same Sun bestows his Rays or Beams upon the Rain as it falls down, the Rain doth thence contract (or get) a honeyish dew, which falling upon the blossoming of Trees, makes them corrupt. Now we cannot rightly impute this evil to the Sun or to the honey it self; but we see that it proceedeth from hence, (viz.) because that honeyed dew is not duly and speedily enough waft away with the rain, but is evaporated by the heat of the ☉; whence it comes to pass, that the blossoms wither, and worms are generated in them, and so the whole blossom is corrupted.

We will set down here yet, one more similitude for the sake of such as love the truth. Put case thus then; a diligent Gardiner walks abroad in his Orchard for his recreation, and if he happens to find a large, great and curious principal Apple lying on the ground, he presently takes it up, and does not only well view and consider of it, but tastes it too; which if he finds to be of an acceptable savour, he seeks out the Tree it self, with an intention to pluck off more such like conditioned Apples; having found out the Tree, he much sets by it, or esteems

it, because the fruits thereof do exceed all the rest in the Orchard, both in tast and fairness, and he takes care about that more than the rest, dungs the roots well, prunes off the withered branches with a sharp crooked knife, and artificially cuts off those that are unprofitable, and usually called suckers, that draw away the juice from the fruit-bearing boughs.

Even just after this manner doth a diligent Chymist act; if therefore, (as he walks in his Laboratory,) searching out the secrets of nature, he happens upon a Golden Apple, he seeks after the tree, that bears such fruit, and having found it, he very charily keeps it, and ministers unto it all such things as are necessary to its conservation, that so he may thence receive more such like-conditioned Apples; and therefore gardiner - like he puts dung to the root, that is, Nitre; he prunes off the dry barren wood, and also the hurtful superfluous boughs, that is, the superfluous Sulphur, with a sharp red hot iron, whereby that same tree may, for the future, yield egregious or select fruits, without any impediment, which thing he also finds to come to pass.

N.B. *Paracelsus* doth very openly set before us this labour in his *Calum Philosophorum*, in the sixth Rule of Mercury, where he saith, Sacrifice the fat Vervains (or superfluous suckers); and yet, these words of his, are only superficially looked on, most people not understanding what *Paracelsus* means by those words, though he hath clearly and perspicuously enough signed his writings.

It is a necessary thing here for the Chymist to know, how the case stands, as concerning the metalline tree, and what is to be accomplished its Root, Trunk, Blossoms, and Fruits; *h* is the Root; *g* the Trunk or Body, *v* the Bark about the Trunk; *z* the nutritive Juice between the Bark and the Trunk; *q* the green Boughs and Leaves; *d* the pleasant Flower, or Blossom; and *c* the ripe Apple containing in it self the seed of the Tree.

That Apple which yet sticks on the tree, doth, when it hath arrived to its full maturity, fall down upon the earth, of its own accord, if it be not gathered by the Gardiner; and then afterwards the leaves themselves, when the weather is somewhat colder, fall off, which do as it were bury the apple, which lying hidden under the leaves, is consumed by rottenness, by little and little; but the seed assuming to it self a natural humidity from the putrefying tree (or fruit rather) instead of nutriment, begins to take root in the spring time; out of which there grow up, in process of time, Apple-trees, which are to be in their fit season transplanted: this transplanting being finished, the Gardiner joins to such a wild tree, generated from the seed, the Scions of such fruit as he has a mind to, and that by either ingrafting, or inoculation. And so an industrious gardiner may get from the fruit of one tree, an innumerable company of great trees, and those of such a nature and kind, and grateful a savour as he likes best.

Even on this wise doth the Chymist do, joining fruitful Scions to wild trunks or stocks, by inoculation, so that he never wants good fruits.

He that cannot learn ought from these things, I cannot help him any other way, for I do not see how I can set down those things clearer than I have done.

But for the undertaking of this labour, there is required an Artist, no less diligent than ingenious. And of how much the better quality the dung is, that

that is laid to the root of the tree, and (by how much) the knife which the boughs are cut off withal, is the sharper (that so it may not hurt the green (or growing) bark of the tree, and so the nutritive juice flow forth, so much the better are the fruits generated. As it is easie for a wife man to reap hence some things; so it's difficult for an imprudent man.

I doubt not but that there will be some, that being judicious men, will know that there is an opportunity given them by my writings, published out of a sincere mind, of making farther inquiry after a true transmutation, and consequently of esteeming it, more than we find to be usually done (because that most things are oft-times proposed craftily and cautiously.

But that such a noble art may be freed from any farther contempt, I have purposed, the next following Spring, to frame a convenient laboratory, and to demonstrate the truth thereof to my friends. And although my endeavours shall be to prohibit any entrance by any means to the faithless brethren of *Farnernus*, yet notwithstanding, I know I cannot so prevent and foresee, but that one or other may adjoin himself to the number of the true lovers of Chymistry, and feigning friendship, lay snares for me.

But put case that such a thing should not happen, it cannot be but that the Arcana's will be divulged; for such things as this or that man sees, and writes down, may reasonably be thought, will come to other mens hands after they are dead; especially if the preparation of Salt-petre be afore instituted, or set up in divers places; for nothing can be done in Alchemy, saith *Paracelsus* without Nitre; Alchemy is found to reside in Nitre say I. Salt-petre shewed us Alchemy, or, Alchemy was found out by Nitre.

He therefore that has abundance of Salt-petre, can perform egregious things in Alchemy. Had not the *Egyptians* been possessors of great plenty of Salt-petre, verily they would never have been so skilful in Alchemy; nor could they have had those riches, by which they were able to avert (or decline) the yoke of the Roman Monarchy.

As long as they knew the use of Sulphur (Salt-petre I believe he means) they enjoyed Monarchy (without servitude to others) (and this was even to the time of *Dioclesian* the Emperour, who knowing their power, commanded all the Books they used, to be burnt) and then their Monarchy and their Art it self perished together.

The Poets have feigned many stories of *Jupiter's* Golden shower; certainly did we but know the manner of duely managing Salt-petre and Ψ together, we should be likewise able to produce the golden shower.

Jupiter, when stirred up with anger, doth with his Thunder and Lightning, strike a terrour into all the Gods, and into whatsoever is upon the Earth; and yet the rain that falls then, at such a time, is of an excellent Quality, and makes the Earth more fruitful than the rain that commonly falls is wont to do; because there is a certain tingeing and penetrating spirit sticking in the Thunder, that tingeth the air and the rain, and animates it; if therefore we can (by the virtue of Nitre, and this same Ψ) produce such Thunders, & can give to the Thunder fire & air, by which it might operate; verily there would nothing hinder, but that we might (*Jupiter-like*) make a Golden shower too. The purer the Ψ shall be, and the more clear the Air, so much the purer will the Rain be, and the Air is more impregnated and fil-

led with the common Vital Spirit.

He now that knows how to separate the life out of the water and air, rightly animated, gets a true *astrum fixabile*, or the Soul of the world: besides this too, there offer themselves apparently such things to be done, as are able to exhibit his daily food. And thus much let suffice for this time.

He verily that perceives (or understands) not these things so clearly proposed, surely he will not, though all the Gods themselves should relate them, understand ought of those things that are taught. In the mean time, I hope that my friends will see with their Eyes, and feel with their Hands, the most certain truth of these, and the like operations, and consequently of my writings, in a laboratory, which God willing, I will in a short time erect, and will then defend me against all envious, and carping men.

This one thing I will yet add over and above, that the astrum of Gold doth tinge his own proper Mercury, or (the Σ) of the first *ent*, (therefore) chiefest of all: The Astrum of \mathfrak{h} (tingeth) Σ ; the Astrum of Ψ , common Σ ; the Astrum of δ , Σ ; for those three superiours do always operate upon these three inferiour (Planets;) so that they are, as it were, upper men, and lower women: \odot he is left in the midst, which whosoever adds unto the others for the compleating of the operations, will perform excellent things.

But he that knows how to make that Astrum of \odot corporeal and fixt, he may translate the Astrum of \odot on this wife prepared, out of one place into another, and conserve it like a Vegetable seed, to be implanted into all the Metals, in time and place convenient; which blessing, we rightly attribute to the blessed great GOD, the giver of every good thing, in the first place, and then to Salt-petre as being the Northern Monarch.

It now remains, that we briefly shew, by what means that Nitrous water, out of which that most noble Pearl, \odot and Gems are taken with the Net, may be prepared for farther uses, so that such a fishing may need but very small costs, and may nevertheless (besides the daily food which it most plentifully provides us) bestow on us a most excellent medicament.

We have taught in the foregoing directions, how we may by the help of *Aqua-fortis* or *Aqua-regia* most easily extract both the fixt and volatile \odot and Σ out of the Metals, Flints, Sand, Clay, and such subjects as are every where obvious, and precipitate, coagulate, dry, and reduce it into a fixt metallick body.

Now in doing these things, part of the separatory water here used, is as yet good enough, and may be kept for farther uses; but part thereof (*viz.*) that which is extracted out of the Metals by the help of common water, is, by reason of the mixing sweet or fair water therewith, rendred too weak for operating withal, and therefore must it be corrected and amended by some certain singular way, so as it may be again used about doing the same work.

Were it not for costs and labours we might separate that fair water from the *Aqua-fortis* and *Aqua-regia*, by the benefit of a glafs Cucurbite, but forasmuch as there is given us a more compendious way, we will make choice of that.

For he that intends to get himself riches by the benefit of this separatory work delivered by me, or by the extraction of \odot and Σ , will need a great deal of *Aqua-fortis* and *Aqua-Regia*, for what profit is it if you would extract them out of (but) a few Metals

or Minerals? Seeing that scarce the one half of those strong Waters can be separated by pouring off from those subjects upon which they are poured, but the chiefest (or biggest) part of them sticks to the said metalline Matters, and contains in it as much \odot and I , as that which we have abstracted by decanting it, and requisite it is that we thence abstract the same by the benefit of fair Water by due boiling, from whence it comes to pass that there will be also gathered a great deal of (insipid or useless) Water, (over and above.)

Those *Aqua-fortis*'s that are poured off, and hold in them \odot and I , when they are mixt together, the I and \odot precipitates to the bottom of the Glas like powder, so that there remains nothing of the Metal in either water, nor is that water arising from the mixing of the *Aqua-fortis* wherein the I was dissolved, and of the *Aqua-regia* wherein the \odot was dissolved, at all the weaker, but it retains the virtues of extracting \odot but not of I , because that the *Aqua-regia* being added to the *Aqua-fortis* converts it all of it into *Aqua-regia*.

This precipitation being made, and the clear water separated from the precipitation by decanting it, you may extract that acid Water, which yet adheres to the precipitate, with fair Water; but for as much as the virtues thereof are thereby much weakened, 'tis better to proceed after another kind of way, and we prefer this way (as best.)

Take the Calxes of \odot and I as they lie at the bottom of the *Aqua-regia* (or the acid mixt Spirits) and put them in a Linen cloth placed in a Funnel or over a Glas with a wide mouth, and the greatest part of the *Aqua-regia* will strain through into the Glas set thereunder; when no more water drops out, which we find is wont to be within half an hours space, tie up your cloth with a strong thred, that so nothing of the calx therein contained may get out; put it under some weight or heavy matter, that so all the *Aqua-regia* may be squeezed out, and the calx only may remain behind like Curd or new Cheese.

But for as much as the Calxes of \odot and I are not edulcorated, hence it comes to pass that the Cheese thence prepared, after the manner now spoken of, is as yet corrosive, nor is it easily dried. Both of them (\odot and I) we may easily correct, if we only admix therewith (as 'tis laid in a dish) a fourth part of fixt Salt, for by the virtue thereof even the corrosive Spirits sticking as yet therein are mortified, and the exsiccation, cementation, fixation, & reduction thereof is promoted. The Reduction being made of \odot and I which we are now made partakers of, that goldenish silvery Masse is to be granulated, and to be dissolved in new *Aqua-fortis*, and be precipitated with that *Aqua-regia* by the help of which, \odot hath been extracted out of the Metals; the Cheese is to be freed from the water by squeezing it, and is to be sprinkled over with a fixt Salt, and to be melted. And all these Operations are to be so often repeated as necessity shall require, and there shall be at hand any Metal whereout of Gold may be extracted; and so there may thence arise a continual Labour, which is beneficial, because that *Aqua-fortis* may (when the Labour or Operation is finished) be used about other such like extractions, and that which is the weaker sort may be prepared into Salt-petre: out of which may be made anew, excellent *Aqua-fortis* by the addition of Vitriol or Copperas, and so destilling them. The Vessels wherein the precipitation of Metals is performed, yea and the presses too by whose help the water is squeezed out of the Cheese, must be

framed of strong Glas or of glazing Earth well glazed.

But for as much as the Vessels of Glas are very subject to be broken, and earthen Vessels, unless they have the solidity of Glas, waste abundance of water, and so moulder away; it would seem more convenient in my judgment to make the expression of the water out of the Cheese, between two Plates of Silver, for the water of the Cheese doth not at all corrode the I : Yea and if the Tunnels requisite to this work were made of I , it would not be amiss, nor would there be any fear of their breaking.

NE. The Extraction also of \odot made with *Aqua-regia* may likewise be put into a Silver Cucurbite, whereby the work may be facilitated, and all loss and damage which otherwise may be lookt for (feared) from the using of Glasses, may be prevented: And suppose a Cucurbite, a Press and two Tunnels did cost one hundred imperials; yet notwithstanding the certainty and celerity of the Work will repay those costs very easily, seeing that all things are hereby done much faster, and much more speedily: Besides too, there's nothing lost but the price of the fashioning your Vessels, for the Silver is always of the same value, and may again be sold at your pleasure. But he that wants such like Silver Vessels or cannot buy them, he may make use of Glas ones so long till he can get Silver ones; but it is necessary that the Silver of which these Vessels are made be very pure, and have no Copper in it; least the *Aqua-regia* extract the Copper thereof out, and so the Vessels (especially the Cucurbites) do in process of time get an undue softness.

The manner of extracting Metals by the help of this Cheese-water, is already disclosed in the foregoing (writings); however this I am constrained to advise here, that it is much more expedient, to use presently at the beginning for the extraction of \odot , rectified Spirit of Salt accuated with *Aqua-fortis*, than *Aqua-regia*, because that by thus doing there will be more plenty of \odot gotten in the reduction than when the operation is accomplished by *Aqua-regia*. It would be too long to reckon up the cause of this thing in this place: 'tis sufficient that I have shown which is good, which ill. Nay more, Spirit of Salt is cheaper than *Aqua-regia*, if prepared according to my description: Nor is there any reason to give credit to that slanderous fellow, *Farrnerius*, as if such a Spirit made by Vitriol, according to the manner mentioned in the first part of the Philosophical Furnaces, were not of any use, or at least-wise could not be prepared in great quantity by the aforesaid way: For when all circumstances fall not out as is wisht, the blame is not to be imputed to my description, but to the ignorance and unaptness of the Chymist himself.

If now those good men cannot accomplish such operations which are word for word faithfully described unto them: how would they be able then to arrive by speculations and various trials to the knowledge of any thing, as I my self have done? I do therefore attest here too, that we are able most easily to prepare not barely 10 or 20, but even 30, 40, 50 pounds and more every day with one only Furnace.

Nay more, if men did more accurately ruminat upon this business, they would find, that out of one pound of Salt may be made in a Glas cucurbite in sand, one pound of the best, most grateful Spirit of Salt needing no rectification, and that in one hours space: And by the benefit of a Furnace scarce a span wide, and with a very few Char-coal, scarce exceeding three pound weight. Verily if there be any artificial distillation this

this is it: And now let the Find-faults look about them and see if they can understand these things we have spoken; we can at all times demonstrate the truth hereof. It is altogether inconvenient to shew such an artificial distillation unto swinish Men, it is only due to the Lovers of the truth, of which sort there are to be found but a very few in this present age.

And that this is true, viz. that a most grateful Spirit of Salt may most easily be prepared in vast quantity, doth even hencefrom most evidently appear, in that there are some in these places who having followed my information, do, because of their making it in great plenty and without any great Labour, sell a pound thereof for an imperial. For my own particular affairs do not permit me to take on me that Labour, yet notwithstanding, I have bestowed the artifice on such Men as now know it as well as I my self do, and who likewise do make that Spirit in such quantity as may supply all Europe. But forasmuch as I did not heretofore find out so far, as to see it excel *Aqua-regia* in the extraction of Gold out of such Stones, Sand, and Clay as contain Gold in them, and which are every where obvious. I could not omit the commending of it in this place, most highly unto all Men; for that Spirit hath an especial delight in \odot , not only in that which is fixt, but also with that which is volatile, whereby it extracts it and renders it fixt. There are some Minerals, Stones, Sand, Earths, which have in them a abundance of volatile Gold, which is not in the least durable (or fixt,) but is carried up (or forced away) in the form of a vapour and vanisheth into the air, and so consequently not at all to be accounted for true \odot , seeing it cannot brook the force of the melting Fire. Besides this, there do oft-times occur most precious Treasures of no profit to any man, which may be brought to most eminent uses (or benefit) by the Extraction, Precipitation, Cheese-making, and Liquefaction delivered by me. For such Metals as the Spirit of Salt do not tie and make fixt in the extractions, γ or δ makes them such, with which we have taken or sifted the Sol out of the *Aqua-regia* or Spirit of Salt; to the obtaining of which this is also of much conducement. If the Cheese now made be altogether fixt by the help of an artificial Cement, and the gradatory fluxing matter be especially reduced in such a Vessel, out of which not so much as the least volatile part can evaporate: by which it comes to pass, that not only the volatile Gold you have caught is made fixt, but even a part of the net of γ or δ is by graduation made aureous: For every volatile Gold doth exercise its operations in the Fire upon other Metals, and makes them aureous, so that the Sol ariseth thence to be of a greater quantity, than that was which by the help of the silver or leaden Dart was taken out of the extract. Heed these things and proceed on in a legitimate course, and you shall find such things as you cannot as yet conceive of. The Filing is clearly enough described in this place, and so is the Cementation and Reduction of the Cheese clearly proposed, and may be most easily perfected.

But God (if thou become acceptable unto him) can yet shew unto thee a much more compendious way of perfecting this work with less labour, and of obtaining greater things.

Be content for this time with what hath been at present taught, give God the thanks and forget not the Poor, and He will then shew unto thee more and more compendious ways, of cheerfully managing the work (here) described, to his Honour, and the Comfort of the Poor, and without any wronging thine own Conscience, or hurting of thy Neighbour.

You need not be much solicitous about such kind of Earths, Stones or Sand, from which you may extract the Gold, for every land is every where stored with such, nor need we spend much time in searching after them. Likewise it will be a most easie thing for thee by my

writings to make Salt-petre, of Salt-petre to make *Aqua-fortis* and *Aqua-regia*: One bare pound of *Aqua-fortis* may be sufficient for thee to begin the operation withal, for there is not much of it lost in the work it self; and what of it is wasted may easily be repaired by an addition of common Salt: And as for the extracting both the fixt and volatile Gold and Luna out of the Earth, and of perfecting it, thou hast no reason to hope of finding a more compendious way than that is which I have here exhibited unto thee.

You may leave such Metals (or Ores) as have in them plenty of Sol and Luna, unto others; and take only the scoria as 'twere, and thencefrom extract your part, and none will forbid you that. But if so be thou canst be but a partaker of an aureous Earth (or Ore) then will all things fadge the better.

NB. The \odot and γ that is in the Extractions may be precipitated by the help of γ , but much more chargeably and more difficultly than by δ or ϵ , because the γ used in this operation cannot be used a second time.

NB. The \odot and γ may be also extracted from the water without precipitation; by abstracting the *Aqua-regia* from the \odot and the *Aqua-fortis* from the γ : but besides this kind of proceeding being full of Labour, we should receive but little fixt Metal, and scarce the one half of what is gotten by the aforementioned way: For the γ and \odot do retain with them some part of the *Aqua-fortis* and *Aqua-regia*, and thereby become sharp or four which is a thing contrary (or an Enemy) to all Fluxes, and which also does not only cause an evaporation of such Volatile Gold and Silver as is therein. (but withal some part of that which is fixt too,) in the melting. But now in this Filing trade that I have described, being caught it is either edulcorated, or the corrosive power is extinguished by the addition of a fixt Salt; so that hereby the γ or δ holds with it self as well the volatile as fixt Gold and γ .

NB. He that shall institute this operation aright, will find that the volatile Gold will (in the secret Reduction) yet farther transmute part of the γ and δ into \odot by Graduation, and so will reap a double (portion of) \odot for which God is deserved to be thanked.

I have herein been more prolix than I intended, which I entreat others to accept in good part: It could hardly be that the things I have delivered, could be couched in fewer words. Wise Men indeed need not many words, but where are such? Better is it therefore to set down things at large.

Now it follows that we shew by what means we may have benefit out of the edulcoratory Water, and not be forced to throw it away.

WE have taught in the precedent discourse, how those waters which \odot is extracted and precipitated with, may be used for a farther extraction of \odot : For when the *Aqua-fortis* in which γ or δ is dissolved is mixt with the *Aqua-regia* wherein \odot is dissolved, there ariseth not any mutation or changing, but that γ or δ only which was in the *Aqua-fortis* settles to the bottom, so that this water wherein such a precipitation is made, may afterwards serve instead of *Aqua-regia*, and so consequently with it may \odot be extracted out of the Metals.

But seeing that the precipitated γ or δ must be excellently well edulcorated by often pourings on of water, afore it be dried, hence it comes to pass that there is gathered a vast deal of such edulcoratory Waters. Now that even this may not be thrown away as useless, and that nothing may be lost in so noble a work, I have here determined briefly to declare, by what means we may likewise catch some benefit even out of that too.

To do this, 'tis necessary that the useless water be separated from the *Aqua-fortis*; now such a separation can:

not be effected in metallick Vessels because of the sharpness of the *Aqua-fortis*; least in length of time they should be dissolved: But to perform the same in Vessels of Glais would take up much time and fire; there is therefore of necessity another way here required to perform the same; and a better than this, which I will here deliver, I think can hardly be contrived. Make you therefore an Arch of Lime, Ashes, and Horse-dung, according to the afore prescribed manner; where we treated of making Salt-petre (about the beginning of the book) dry it by putting fire thereunder, &c. The Arch being dried, pour on, by little and little, so much edulcorating water, as the Arch is capable of attracting, and until you shall find it to be made thoroughly moist; the Arch being on this wise moistened, dry it again: and being dried moisten it again as afore, and so repeat this work of moistning and drying so long till the Arch will receive into it self no more water. This done, there remains no more, but to do thus, viz. Let the said Arch be broken to pieces, and be ground with a Mill into fine powder; upon the powder let be thrown fair water, and so let there be made a Lixivium, out of which by due boiling may be made most excellent and delicate Salt-petre.

But here must be very good heed taken, that you use about the building of the Arch, Wood-Ashes, and Lime made of Stone (or Chalk); whereby the sharpness of the edulcoratory water may be extinguish'd (or mortified) by the fixt Salt inherent in the ashes and lime, and the corrosivity be taken away, and most excellent Nitre may arise thencefrom; for if *Aqua-fortis* be permixt with the fixt Salt of wood-ashes, both of them lose their Nature, and Nitre is made thereof.

But that the operation may more luckily succeed, and we may be the more certain of the event, it will be the best way, to put in, by little and little, some Lee of wood-ashes first of all, (afore the edulcorating water be thrown upon the Arch) and this putting on, to be so long continued till all ebullition and noise cease, whereby all the sharpness of that water may be taken away; this done, that water is to be poured upon the Arch, and you are to proceed on according to the afore-prescribed method; and so shall you have excellent Salt-petre, whether your Arch be made of Lime and Ashes, or of Mud and Ashes.

NB. If this taking away of the sharpness of the edulcoratory water by the benefit of a wood-ashes Lee, be not finished, and done before it be poured upon the Arch, it is clearly requisite that it be done in the Arch it self, by the goodness of the Lime and the said ashes, by which that sharpness may be extinguish'd.

It is, I confess, all a case whether that sharpness be extinguish'd with a *Lixivium* afore; or else be done in the Arch it self. Yet nevertheless, seeing that Operation is the safer which hath a foregoing taking away of the sharpness afore it be poured on the Furnace, therefore it is better so to institute it; specially seeing it then matters not at all any thing, what condition the matter is of which the Arch is made with; because then such a water needs no more but an unfolding (or evaporation) and coagulation, and this may as well be done by the help of an Arch made of mud, as by one made of Lime: Otherwise if the sharpness of the edulcoratory water be not taken away by the *Lixivium*, an Arch made of mud is of no use, for by this means you would not get any Salt-petre at all, but rather all the water would be consumed by evaporation, which need not be at all feared, if we use an Arch made of Lime and Ashes, seeing that that water is by this means mortified.

And so, by this means, that edulcoratory water may be most commodiously prepared for farther uses, and the Salt-petre which is extracted thence, is exceeding good to make *Aqua-fortis* with; and we may gather as much in quantity thereof as the extraction of ☿ and ☾ out of the Metals, Stones, Clay, and Minerals requires.

NB. If any one be desirous of more excellent benefits, let him dissolve, in that edulcoratory water, (B.) or (C.) and in the Lixivium (let him dissolve) (D.) then mix both Solutions: When the fermentation is over, he will have double the quantity of Nitre, than what he would otherwise have from the bare mixture of the contraries together, and pouring them on the Arch; the reason of which thing is this; because (E.) is nothing else inwardly but Nitre, but it cannot come forth to light before the body be broken, and till that salt which sticks (or lies hid) within, be wholly freed (of its bonds) whereby it may be torn together with the Corrosive Spirit into Nitre.

The like is to be understood of (F.) because even that also is broken (as I may say) to pieces by the Lee of the wood-ashes, and so the Salt that lies hid within, and which is nothing else but Nitre, shews it self to fight, and passeth with the other Salt of the Lixivium into Nitre.

Certainly this labour, viz. the mortification of the edulcorating water by a Lee of wood-ashes, and the concentration of Nitre, upon the Arches made of lime or mud, is an egregious invention; nor do I think that this business can be better managed any kind of way, than by what hath been here shewn, especially if the Species here notified, be also thereto adhibited (or made use of) (I know not I say, any way) by which greater plenty of Nitre may be gathered; for the coagulation cannot be done in a Copper or Iron pan, because not only the Pan would be corroded and wasted, but the Nitre would be rendred impure. But if now the operation be instituted aright, we shall get more Nitre than indeed is requisite for the extracting ☉ and ☿ out of the Metals; so that we may get us ☉ and ☿ without any costs: which invention verily is a most noble one even in all parts of the World, and a most high gift of God: for which, we have good reason above all things to render Him deserved thanks, and next Him, to those who open such a Noble and Unheard-of Invention, and which is so profitable to all Men.

But this Invention will be especially profitable in those places of the World, where *Aqua-fortis* is much used, and is presently after the first using thereof, thrown away as unprofitable, as it usually happens in the Mint houses, where a bundance of ☿ and ☉ is separated in great quantity, and consequently abundance of *Aqua-fortis* consumed, so that by the benefit of this invention of mine, we might get much every year; but most of all in those places where are found such Stones and Sand which are endued with Gold, but yet will not yield any by the help of the usual melting.

Besides too, this invention is exceeding profitable for such kind of Metals of ☉ and ☿, that have not as yet gotten their due ripeness or fixity, and so fly away in the melting, and yield either none at all, or at best but very little of Gold. For the common melting fire forceth away the Volatile Gold, and ☿ that resides in the Metals (or Ores) which is not at all so here, for all (of it) is made fixt by the *Aqua-fortis*, and preserved.

I do believe that there is not a place to be found, where such kind of Stones, Sand, or Clay may not be gathered, as hold in them Gold and ☿, either fixt on Volatile, and which may be extracted thencefrom most easily, and with exceeding profit according to the way aforespoken of.

But, for as much as there are many, who pretend that such like Stones, Sand, Clay, and Minerals as have Gold in them, are no where to be found, and that consequently this invention of mine is altogether in vain: To such as these I thus apply, viz. That such like Subjects are therefore unknown, because few there are that seek after them, or are willing to experience ought, but remain contented with such things only as the Ancients have taught, and persuaded themselves that ☉ and ☿ cannot be

be separated out of the Metals, but only by the force of fire, where as notwithstanding the operation may be far easilier, and more profitably instituted, according to the method by me prescribed, but especially in those Metals (or Ores) of \odot and Δ , which either require too much expence for their melting, or are as yet unripe and volatile, and so fly away in the melting; for a great quantity of \odot and Δ may be extracted with a little quantity of *Aqua-fortis*; yea the extraction being duly made, and to the best profit, there may be thereof made Salt-petre; so that such an extraction of \odot and Δ requires but very little costs.

If any one desires an easier way of extracting \odot let him use Spirit of Salt prepared after the manner by me delivered, which said Spirit he may fortify by adding a fourth part of Salt-petre, which very same (when the Extraction is finished) may be reduced into Salt-petre, like as we have said of *Aqua-fortis* that hath been already used.

NB. An easier operation yet then all these, is this, which may be performed the dry way *as follows*.

Take the Metal, Stones, or Mineral, reduce them into powder, mix them with the Salt (G) and make them with clay into Balls about the bigness of a little Head. Make these balls red hot, and by this means the Salt will dissolve the *Sol* in the Fire, and attract it out of the Metals. This done, grind the Balls or Pellets, and extract thencefrom in a large Pot or Vessel a Lixivium with boiling hot water, for the Salt which hath attracted the \odot in the Cementation, mixeth it self with the Water: Out of this Salt-water mayest thou afterwards catch the \odot by the help of a solution of h , added for the precipitation; now out of the Salt it self mayest thou make excellent Salt-petre. So that you may most easily extract out of the Earth both fixt and volatile \odot and Δ without any melting it. Nay not only Δ and \odot but even Copper too, whether we proceed the dry way or the moist way: For we may extract good *Sol* out of the scoria of *Sol* and *Luna* and *Venus* which are cast away, yea and out of *Mars* it self too, and by the afore-shown way.

NB. The reason is this, because the Iron being purged in a strong Fire is heapt up as it were into goldenish Scoria which but few know of, and will believe, though it be most true. For when a Metal is so burnt with such a vehement Fire as to resemble glassy Scoria, it hath gotten to it self a more noble nature, and thenceforth is able to exhibit or yield good *Sol*: Yea though they be the Scoria of Δ or δ , which thing that excellent Metallurgist Isaac Hollandus did also know, when he said, If any one makes Δ , δ or δ into Glass, and reduce it, it will not be Δ , δ , or δ , but \odot : And if any one shall turn \odot into Glass, and then reduce it, it will not be \odot , but Tincture.

Nor was this knack unknown to *Braccens*, who taught the making of the Philosophers Stone out of the scoria of Iron, but he is laught at, by another Philosopher, though undeservedly. Though I do not know the way of extracting the Tincture out of Iron, yet this I know; that there have been many who have extracted good *Sol* by *Aqua-regia* out of the very green Scoria of Iron, when notwithstanding, the δ it self out of which the Scoria came was destitute of Gold; the cause whereof we showed but now.

Now if they had but known my invention of most easie preparing a convenient Menstruum for the extracting of the Tincture, and then the manner of afterwards separating the *Sol* again, without losing the Water, certainly they would have been able to perfect that Extraction with a great deal of benefit, whereas (not having this) they only beheld the possibility of the thing without profit.

For if this Labour be instituted according to my invention afore-written, we may extract the *Venus* (which com-

monly is in the poorer Minerals) out of them, and that with much profit and in great quantity, and the extraction being made, (whether it be done the moist way or the dry) we may by the benefit of the solution of Δ or h , get out the \odot thence whilest it is yet mixt with the water, yea and afterwards by the benefit of δ the Copper it self. He now that well understands the reason of this Fishing and reduction needs not to search after the Metals (or Ores) of *Sol* and *Luna*, for whatsoever Metals (or Ores) of *Venus* contain but even a very little portion of them, will be able to furnish a man with necessities sufficiently enough.

But that the Reader may not think that these sayings of mine, viz. that there are subjects to be in all places found that are endued with Gold, are fictions, and are not founded upon any experiments, (for I doubt not but that abundance will not only account these sayings for fallities, but deride them too) I thought it not much from the purpose, if I shewed some little place only, where you may find such Metals (or Ores) as are endued with Gold, which notwithstanding were never brought into use, that so it may hence appear that such Golden subjects must be likewise found in many places.

Let us therefore cast an eye to a part of the *Moene*, and let us get out those Treasures that are there hidden, and at present are not profitable to any, which nevertheless may be of mighty conducement and benefit to the whole Inhabitants of those parts.

The *Moene* is a River most abounding with Boats and Fish; it hath its rise out of a very high pine-bearing Mountain, it is in some sort conjoined with three bordering well known Rivers, *Sata*, *Adrana*, and *Nava*; which again spread themselves unto the $\frac{1}{4}$ quarters of Heaven, as East, South, and North. (This pineiferous Mountain is not barely one Mountain, but consists of many which are exceeding full of Pine-trees, Beech, Oakes, Birch, and other Trees set very thick together, and so yields an Harbour for both wild and tame Beasts.)

This Pine-bearing Mountain, and which is the highest in all Germany (and of which *Gaspar Bruschius* wrote a particular Treatise, which is exceeding profitable for such as study metallick affairs to read,) is stored with many notable Metals (or Ores.) For there was not only Gold digged out plentifully in various parts of that Mountain, many years since, (and thereupon there's a City called *Goltraugh* by the Germans, as if you should say a Vein of Gold:) But withal the other more common Metals that lie here hidden do for the most part all of them contain Gold, with notwithstanding is not at this day by reason of the ignorance and unskilfulness of Men separated from them. Nor are the bare Metals only of that place all of them endued with Gold, but almost all the Earths, Sand, and Stones have *Sol* in them. Yea even in this time even Antimony the first *Ens* of Gold is digged out in that place. Therefore it may most easily be proved, that this Mountain out of which the *Moene* flows for th is stuffed with *Sol* both in the outside and inside parts, with which proof I must at present in this place rest, least I should be too tedious. All such as are skill'd in metallick Affairs do well know, that all the metalline Ore, that they get in and about this Mountain, is endued with Gold.

The most studious searcher of nature *Mathesius* in *Saxepia* testifies that he saw an Iron Stone or Ore endued with Veins of fixt and malleable Gold.

The afore-praised *Gaspar Bruschius* in the description of this Mountain, mentioneth amongst other things, that in a little Town called *Einädel*, situate near the said Mountain, was a Tin-mine heretofore found, by the Treasures of which the aforesaid little Town was built. There did a certain Metal-man called *Sigismund Ellens* learn from an Italian Woman, whom he married after the death of her former Husband, how *Sol* was to be separated from *Jupiter*: From whence he got him so much riches, that even afore he died, he caused an egregious Hospital

Spital to be built, and withal contributed thereto many thousands of Crowns, with which twelve ancient Men, and three Priests should be always nourished; to the performance of which there is verily a great deal of Gold required yearly.

This now is not to be at all accounted as a meer fable, but the very pure truth: For in that edifice, the Effigies of the Founder *Sigismund* *Illans*, and the Foundress *Barbery*, are yet to be seen even at this very day. Of which likewise *Matthæus Merianus* in his Description of *Franconia*, maketh mention. But it is sufficiently enough evident (besides these Testimonies) that this Mountain is repleat with Metals (or Ores) and especially with Golden ones, both within and without, and hence arose that Proverb of the ancients, *viz.* That the Country-man doth in this Pine-bearing Mountain oftentimes throw a stone at an Ox (or Cow,) that is more worth than the Ox it self. Strangers give credit hereunto, as *Italians* and others, and do yearly visit this Mountain, and dig the Gold out of those places where they know there lies much hidden, and take it up at their backs, and carry it away with them: And many such there have been with me, who have afforded their help to strangers in digging out Gold: Who forasmuch as they knew not the manner of extracting it (and that they understood by others that I also dealt in Metals,) brought me various kinds of Earths, Stones, Sands, Clays, that I might try what was in them: and they did all of them abound with Gold.

The Country-men that live about that Pine-bearing Mountain do daily for Gain's sake carry such earths and stones, endued with Gold, unto *Norimberge*; which one or other likewise buys, extracting thence by melting excellent Gold.

But now if so be these men did but know the extraction of \odot by the help of *Aqua-fortis* only (without melting) out of the earths and stones (as is here taught): the needy Country-men might live like the richest Citizens, the Citizens like the Nobles, and the Nobles like Princes; which seeing it hath not so pleased God (to have it) all (these) things have remained hidden. Every one may easily believe the things I here utter, seeing it is already taken for granted that this Mountain doth abound with egregious Metals (or Ores) and especially with Golden ones. Upon this account therefore the most Noble Marquess of *Aspach* who is Lord of this Pine-bearing Mountain hath prohibited any Foreigner from exporting such Earths (or Ores) thence for the time to come; and though he hath thereby done something to it, yet he cannot wholly hinder it, forasmuch as that Mountain is too vast and large.

But now when I pass down from this pine-bearing Mountain along the *Albene* downwards, to such places as are more plain (or even ground) where Wine and Corn grows, there's nobody seeks after *Sol* and *Luna* there, but each man professeth himself well enough content with the Wine and the Corn, nor hath there been any Metal digged thence or there sought for many years: Because they thought that no plains can produce Metals, which thing I judge to be false, and do gain-say it; and contrary-wise affirm that there are some parts in plains, that as to the production of Metals may be compared with the most high Pine-bearing Mountain. Now, elsewhere there ly high Mountains of each side of all the *Albene*, out of which there comes a mighty quantity of Wine, but the Metals ly hid to all.

Besides these, I my self tried, that there are Ores of all kinds to be found on both sides the *Albene* throughout all the East of *Franconia* even to *Maguntia* where the *Albene* runs into into the *Rheine*, but yet as far as I know, there is not any Metal anywhere digged but Iron only; and therefore neither can I positively shew and direct to such or such Mine-pits, out of which you may apparently get

Gold and Silver, but as is said, there are every where found some footings (as 'twere) that contain Gold and Silver, and that such Stones in the *Albene* are rarely without Metal: But nobody proves or tries them, or puts them to use.

At *Bamberg* (which is an Episcopal Metropolis) men are become more diligent, inasmuch that they have found out several places wherein is to be had the Metal (or Ore) of *Sol*: Such as this Metal (or Ore) of *Sol*, hath been very oft-times brought me by the Inhabitants of that City, but all of it in a manner did contain a fluxile and immature Gold, which cannot be extracted by the common way of melting, but vanisheth away into the Air, and so I did not at that time much esteem it, but left it as an unprofitable Ore. But now I have found that such fluxile Metals (or Ores) of *Sol* may be brought in use, not by the help of a vehement melting, but only by a nitrous Water, in which this kind of fluxile Metal (or Ore) of *Sol* is fixed in the extracting it, and then stays in the melting, and yields perfect *Sol*.

Concerning such a fixation of fluxile *Sol* in stones, by a nitrous Water, I did not at that time know it, otherwise this knowledge of mine would have been extraordinarily profitable to the Inhabitants of those places. Yea and the Bishop of *Bamberg* himself who is a great Lover of the Metals gave me some proofs of his Clemency for services of no moment that I did him, so that I would then gladly have bestowed my utmost power in lieu of his favours, but nothing could be effected by the way of melting, because of the volatility of such a Metal. But now there may be gathered very considerable Treasures by the benefit of nitrous Water. For not far from *Bamberg*, there is found a Stone of great bigness that is exceeding full of Granates, which are about the bigness of Millet or Hemp-seed: Besides too, all the Mountains of that place do most plentifully abound with Metal (or Ore) of *Sol*.

There is such a Vein of unripe Gold, not far from *Bamberg*, that lies thwart the *Albene*, which much hinders the Vessels, and especially those Boats which are wont to bring vast quantities of Boards, Beams, &c. yearly; inasmuch that they cannot always get over it, but at such time only when the waters are increased. Now in the Summer time, when Rain hath not fallen awhile, this Vein is seen bare, when the water is fallen away some Ells height; and hereupon the Mariners have smote against it with force, and Tools thereby to remove it, if possible, but all in vain.

But for as much as I never was minded to run thither, nor yet am so conditioned, as that envious Dog, who having hay under his possession, could neither eat it himself, nor would suffer the Ox to eat the same; therefore I was willing to lay open these things: I cannot at present say any more of this fluxile Ore of \odot ; yet if any one desires more, let him repair to an Inhabitant and Citizen of *Bamberg*, by name *N. N.* a Farrier, who many times delivered to me that kind of ore during my abode at *Kitzing*. This man will satisfy every ones request, and will shew where it is to be found.

There have verily been others that have brought unto me various kinds of Ores; but I have long since forgotten their names. If you only seek, you will find in that place, abundance of such Golden Metal (or Ores) but all of them in a manner, fluxile (or crude,) and possessing but little fixt Gold, and although they should not have in them any fixt \odot , and that not any thing could thence be extracted by the way of melting, yet notwithstanding it is now known to *D. G.* by what means (by the liquid way of Nitrous water) all the fluxile (or crude) \odot may be abundantly extracted out of the stones, be fixed, and be turned into good \odot with abundance of profit.

The *Albene* near *Bamberg* is occupied with Vessels or Ships, and I my self have sailed along the *Albene*, and on both

both sides of the *Albene* from *Bamberg* even to *Wirtzburg*, did light upon various kinds of Metals (or Ores) which were not void of ☉ and ☿, out of which much ☉ and ☿ may be extracted by the help of this invention of mine, by the moist way by Nitre water, if men would but only apply themselves to the work.

But indeed the Corn and the Wine which God hath so abundantly vouchsafed to those Countries, is the cause that no body minds any thing else, for they have enough to suffice them, and therefore leave the Metals (or Ores) of ☉ and ☿ untoacht.

Without doubt, the whole Wood that reacheth from *Wirtzburg* or *Kitzing*, even almost to *Bamberg*, is full of Metals (or Ores) and yet (as far as I know) there is not digged any of the Metal (or Ore) of Sol or Luna therein.

It is reported that there was Sol and Luna digged up heretofore at *Cassel*; at the other side of the *Albene*, towards the Town which the *Germans* call *Roningstorf*, in the Mountain they call *Hasberg*, there was heretofore Copper digged, which now is left of, because the Copper is not fusile enough, nor hath it any sulphureous flint joined with it, by the help of which it is made fluxile (but is) inclosed in a Sandstih Stone. Now out of 100 weight of this, there can hardly be extracted, by the help of a strong melting fire *iiij*. lb. for the Sandy Stone being destitute of a sulphureous flintiness, doth in the melting turn the Copper it self together into Scoria; yet notwithstanding we are able by the help of Vinegar to extract above *xij*. or *xvj*. lb. of Copper, and this I have tried more than once. But whether or no that Metal (or Ore) of Copper, contains in it any Volatile Gold, I never tried, but that there is some ☿ therein, is true; yea, and the Copper is very malleable, and we can thence extract by the help of Vinegar, that which is most fair, and this I humbly declared to the most noble *Magnus* Elector, he being at this time Bishop of *Wirtzburg*; but by the Tryers (or Refiners) of that place, it is haply accounted of as unprofitable because it yields but little by the help of Fusion.

I must needs confess that but little can be gotten out by melting, but such Copper may be profitably extracted by the Acetum of the Wood, which Grows in the places all about in abundance, and may be had for nothing.

The *Albene* doth every where yield such kind of Flints as are endued with Gold. Near *Carlsbad* there offers it self in a Wood a certain white and fat Earth, and after some sort silverish, otherwise firm (or strong) and is fit for making of Crucibles, and other Instruments (or Vessels) to be used about the Fire.

You may likewise find such conditioned Earth at *Klingenberg* upon the *Albene*, where most excellent Wine grows, which the *Glass-makers* of *Spechart* use to make the Crucibles or Pots in which they melt their Glass.

It hath not as yet been known that there hath been any Ore found in the County of *Wertheimen* where great plenty of *Russlein* Wine is gathered; yet nevertheless I have proved several Earths, which I found about *Breiberg*, which is the inexpugnable Castle of the Lord *Charles Ferdinand* and the Count of *Wertheimen*, in which I found there was contained much Gold.

Besides these, I found opposite to *Wertheimen* where there are Vineyards, an Iron stone (white like snow, covered over with other stones,) which is endued with ☿ and ☉: as to the external shape it resembles a white Flint, very weighty, so as that it scarce yields to the weight of a piece of Iron of like bigness: But it is nothing regarded, and is accounted of as a common stone.

The County of *Erbach* doth indeed yield plenty of Iron, but there is nothing at all found of other nobler Metals; yet my opinion is, that even in this Iron are contained both ☉ and ☿: because that there is sand found in several places thereof which yields good Gold, as I have observed more than once; the extraction of which may be excellently well performed by the benefit of Saltpetre.

Likewise Talk of sundry kinds is found in the said places, which is endued with ☉ and ☿: and it would easily yield them forth, were it but rightly handled, and dealt with according to the way by me prescribed: which hitherto we never heard to have been done by any.

The County of *Erbach* and likewise of *Wertheimen* do abound with Iron Metal (or Ore) and all kinds of Minerals, which contain in them, ☉ and ☿.

Nor are the Metals (or Ores) of less goodness that are in the *Specharten* Wood, and the bordering Countries; and yet notwithstanding 'tis evident that it yields nothing at all save this, viz. That there is excellent Salt made there and Glass, in great plenty. It is a thing well enough known to all men that here are various Metals (or Ores) found, but never hath any so procured as to have them wrought upon, and thereby to enjoy them.

We find in several places, an Earth impregnated with white, black, and yellow Talk, especially (in that part) which is near to *Aschiburg*, and which contains both ☿ and ☉: which notwithstanding by reason of the smallness of the quantity thereof have never hitherto been thencefrom separated.

Not far from a Village which the *Germans* call *Schiltkrop* there offers it self a stony Talk, somewhat reddish, which besides Copper contains also volatile ☉, and of no use at all because there's but little ☿ therein contained, and that the ☉ is volatile and cannot be obtained by the means of melting. Perhaps this Talk was known even of old time, for the place where it is found in plenty is by the Inhabitants of that place called the Gold-pit even to this day: for it is not incredible but that there was Gold found there.

However there is not at this time any extracted out of that Talk. I have very often extracted thence most beautiful Verde-grease by the help of distilled Vinegar. For seeing that there is plenty of Wood to be had in that place, and consequently requires no costs, we may get us vast quantities of Acetum gratis, (or for nothing): and by the help thereof extract the Copper out of the said Talk: Verily many noble Men would have (thencefrom) whereon to live honourably.

NB. But if we make a Spirit of Salt, and with it being fortified with a fourth part of Nitre, extract the Copper and the ☉ out of the said Talk, and then first catch the ☉ by h, and then precipitate the ☿ by j, we shall not only have very malleable Copper, but shall likewise receive even pure ☉; and this I testify upon my own knowledge.

He that hath determined the experimenting of these things, and yet sees that he does not rightly perceive the things we have here mentioned, I advise him to come unto me in a friendly way, and I will not be wanting unto him to serve him and the Country by any farther information.

Verily there lie hidden incredible Treasures in those places, which none know of, and which yield nothing at all by the help of Liquefaction, and which we are constrained if we would have them fixt and metalline to make them so by the benefit of a sharp Water, and this I was willing to open and notifie for the Countries sake.

O thou Zoilist or Carper that understandest not this knack, pass not thou thy judgment hereupon, but rather examine thy Wines, and tell us which is best, either the *Henbachen*, *Klingenbergick*, or *Wertheimen* sort: Verily neither of these Liquors though they are strong, are convenient for the extracting of Venus and Sol out of that Talk: There is a far stronger required, to wit, some nitrous Spirit of Salt, or Spirit of Nitre acuated with common Salt. When the extraction is ended there may be gathered plenty of Nitre out of the remaining Menstruum. Inasmuch that there is nothing else required but labour, for the costs expended on the work are not at all considerable: And thus in a little space of time, we may get a great quantity of Copper and Sol.

After the same manner as we have shown that it is a thing

Cccc

thing possible to extract Volatile *Sol* by the help of Salt-petre out of such a disregarded Talk and other Stones, and to make it fixt, so we can also extract the same out of several other Minerals, that are plentifully enough lying on both sides of the *Albion*. So that now, no body hath any ground to say that the Ores cannot be found in this or that Country, or such convenient Minerals, as out of which we may extract the volatile and also the ripe Gold according to *Glander's* prescription.

If now such may be found in those places that are adjacent to the *Albion*, which we always judged to be void of such treasures, what shall we not find in those places, which have already yielded us various kinds of Metals for some hundreds of years successively, and do yet daily exhibit them; such as are *Hassia*, the Dukedom of *Brandenburg*, *Saxony*, *Thuringia*, *Moravia*, *Bohemia*, *Hungary*, and that such like parts of the Earth abound with Metals. Therefore, Friendly Reader, do not thou persuade thyself that there is any place in which we are not able to extract many good things out of the Earth.

I have likewise found various Metals in our *Holland*, and yet never, did any one ever hear that there was the least particle of them therein found, especially in that place that they call *Velanum*; yet notwithstanding it yields Veins of Iron, and a Yellow Sand which hath in it \textcircled{S} & \textcircled{O} .

Neither doth that, place afford only such Sand Stones, & Earth, out of which volatile \textcircled{S} & \textcircled{O} may be extracted, but withal there offer themselves at the Sea-shore in those Sand hills, which the *Hollanders* call *Duyven*, which the stony Sea heaps up, Stones of a Sky colour, which contain \textcircled{S} . They are called by the *Hollanders*, *Ultramarine*.

In this place, is likewise gathered plenty of *Ostioicolla* it is about the length and thickness of ones Finger; yea and sometimes is as big as ones Arm; and as in a clear Season it is easily noted, (or met with) so in a Rainy Season it is not to be seen: It is in some sort hollowed in the inside; it is of a white colour, like stone-lime, and thereupon the Chyrurgions use it to consolidate the broken bones of their Patients.

Some (as they have related to me) have extracted \textcircled{S} thereout-of. There is not therefore, any place that does not contain some Metal, and especially \textcircled{S} and \textcircled{O} .

Thus Friendly Reader, you see that there are in all parts of the Earth, such Subjects, as do contain, if not fixt, yet at least wise volatile Gold; inasmuch that no body may on good ground, complain that nature hath denied him \textcircled{S} and \textcircled{O} , so he but knows how, and be willing to extract it.

Did *Germany* but know those Treasures which the Earth contains, and did use them aright; certainly they need not give place to the power of any Monarch. But it seems as if God had cast a blindness upon men, or at least keeps them blind, even until the due time approacheth of helping those that are his.

I have here shewn the way for the Country to get riches and power by; but as concerning the way by which we may extract both the volatile and fixt Gold out of Stones, Sand, and Clay, without any considerable labour & costs, according to this invention of mine; I will shew it in my Laboratory, which by Gods permission, I have begun to erect for the sake of Friends.

But whereas I have omitted some words in the description of this invention; you are to know that it was done upon this account; least otherwise such a noble Artifice should fall into the hands of my enemies; I will never be wanting to illustrate (or explain) such things as are somewhat more obscure, unto my friends. The main things are delivered clear enough, to such as are in any measure skill'd in Chymistry, but the unskilful may not hope for any thing else (thereby) but labour in vain. The thing in it self is easie, and without rubs, so as that any one who hath but once seen the way, may understand it, and manage it.

I could have exhibited the things I have delivered, in a briefer stile, but upon consideration of the common good I would not; he that cannot from these things perceive and learn ought, let him think that God is not willing to vouchsafe him the Grace of understanding them.

And now, if I had been minded to have exalted this work with mighty praises, I should not have done unseemly at all, for as much as this labour shines even in the dark, and makes many doubtful things firm and clear.

For by the means of this labour, we may get us, not only abundance of \textcircled{S} and \textcircled{O} very easily, but likewise most excellent medicaments, and which are not to be accounted common; nay, even the off-drawn Salt-petre it self, is a most excellent medicine for all Vegetables, because it is capable of multiplying them abundantly, in so much that he who is skilful in this kind of work and does not forbear from setting about it, will never want any thing.

What greater things can a man desire from God, than a sound Body, daily Bread, and as much \textcircled{S} & \textcircled{O} as necessity requires? now these gifts of God do abundantly flow in upon us by this labour; if it were not for the wicked Farnesianists who are not worthy of any good thing, and do condemn every thing that they understand not, and (so consequently) restrain me from treating of these things, with any longer and clearer discourse. The whole world would be amazed to see the so exceedingly easie method of bettering of the Metals, and of making them perfect, and which method but few there are that know. But whatsoever we have omitted here, shall, God willing, be shortly delivered in my work of *b*, where we will demonstrate by what means \textcircled{S} and \textcircled{O} may be extracted with exceeding profit out of vile (or common Lead, so that we need not any other subject, but Lead and the Salt of the Earth or a Mineral fire (by whose help, nature bringeth (or advanceth) all Metals to maturity) for the performing this work; and hence the word Alchymy (which signifies nothing else but the melting of Salt) seems to have taken its original.

He therefore that knows how by the help of Salt, to make Metals volatile, and again fixt (which is not to be done but by solution and coagulation) such an one knows the true and unspohiticate Alchymy, and follows the universal exhortation of the Philosophers, where they say, *Make the fixt Volatile, or the Volatile fixt, Dissolve & Coagulate, &c.*

He that hath in any measure meddled with Salt-petre, easily perceives what my meaning here is, and what I drive at. He whom Nitre obeys, him do all things else obey. I have determined (by God's permission) to erect a Tryumph Chariot for Nitre, & to set it thereupon, as the greatest Monarch of the Word & to exhibit it to the ignorant.

Whereas now I had written down this most noble way of compendiously extracting volatile and fixt Gold out of Stones, Sands, and Earths, and of farther augmenting other \textcircled{S} and \textcircled{O} thereby, I found nothing pretermitted of what may any waies help to the profitably accomplishing the Work. save this, *viz.* Whence such aureous Subjects are to be taken, out of which we may extract volatile and fixed *Sol*; or by what means they (*viz.* \textcircled{S} and \textcircled{O}) may be prepared by such like labour in great quantity.

To satisfy such as these I neither will nor can defer it. So then, as touching the Golden Materials, there hath been enough shewn already to prove that they are every where to be found, and put case there were none to be found, is there not a Golden Silver every where to be found, and that Silver may be separated from the Gold, be Cemented, and again made aureous, as often as one shall please. Yea, and Gold may be profitably extracted out of a certain (sort of) Tin, especially the *Geyersbergick*, and so likewise out of some Iron too.

Now that such, (*viz.* Gold) may be made in great quantity we may dissolve the \textcircled{S} that sticks in Stones, with Spirit of Salt, acuated with a little quantity of Nitre; for such a spirit will not be so costly as Nitrous water is, and

and besides this too, it will (after it hath been used in the said separation) yield excellent Salt-petre, of full as much price and value as the Spirit of Salt it self was of. So that by this means we may extract the \odot without those costs (too): And this moist extraction may be excellently well performed in a Vaporous *Balneo*.

But if we seek after the dry way (of doing it) then the Stones are to be mixt with Salt and a fourth part of Nitre, and being mixt are to be made up into little balls by the help of some fat Earth, so as to stick together: Then are they to be dried in a peculiar Furnace, or else even in the open field, with a Fire of Wood, the which may be done in ones hours time. The Cementation being made, they are to be powdered, and out of the powder is a Lixivium to be extracted by the means of Water, and you shall have the \odot permixt with the Lixivium, which is to be thence extracted by the help of the solution of γ , out of the Lixivium may Nitre be afterwards made. And now by this means may a moist easie and no ways costly operation at all, be instituted with some hundreds weight.

But as concerning the melting and reduction of the γ , which contains in it the \odot which it caught, it may easily be done, but 'tis by the benefit of a peculiar * Tigil or Pot, the making of which is known only unto my self; which said Tigil or Crucible lasts a long time, and doth not at all let any thing of what is thereunto put, run out, because it has its cover made of the Lute of Wisdom.

But now again here may arise another doubt, and it may be demanded, how we may have so much Spirit of Salt for the moist way, or so much Salt and Nitre for the dry way, as is requisite to make this extraction of the Metals. Salt-petre is chargeable, and the Spirit of Salt will be difficultly gotten in such plenty; and haply they will stand us in more than the Gold thereby extracted would be worth? To such I answer, It is not so precisely necessary to buy Salt-petre for this work, seeing that the said dissolvent when it hath done what you would have it, both in the dry and moist preparation, may be again turned by the help of common Salt and other mean Subjects, into excellent Nitre: so as we may thence have more Nitre, than it was afore. And farther, as concerning the Spirit of Salt it may be made in great plenty, in so much that (by the benefit of one Furnace) there may be daily made 50, 60, 70, yea 100 pounds thereof, and out of every pound of Salt may you extract a whole pound of rectified Spirit of Salt with the help of two or three pounds of Coals: So that, that Spirit will in a manner cost nothing at all save Salt and Coals, which doth again after it hath been put to its appointed use, yield more Nitre than the Salt and Coals cost. This operation therefore may be done without any costs as it were. The things I here mention are true, although I well know that scarce one of a hundred will believe what I say; however I matter it not, but it is sufficient to me that I know these things, and can exhibit (or demonstrate) them to any Friends.

Albeit that this be a most easie Labour and of no expences to extract volatile and fixt Gold out of Ores, Sand, Clay, according to the prescribed rule; yet I question not but that many men that are given to slothfulness will desire here, a yet easier way, whereby they may heap up a great deal of Gold without any trouble at all. To such as these, I verily could shew an easier way of extracting \odot out of the Minerals, without melting, did I not count it wholly an unbecoming thing, to detect all these secrets both to Friends and Enemies alike without any distinction. I will not be at all wanting to communicate my more secret way to those who deserve well, & thankfully acknowledge towards me and mine, the benefit they have received.

But yet, that the knack may be in some sort manifested, and it may be somewhat known by what means \odot and γ may be gotten even out of the Ores and Minerals them-

selves, I will a little stretch out the thred of my discourse, and will in some sort delineate the very work it self.

You are therefore to know, that all those Minerals which contain fluxile (or unripe) or volatile Gold, whether they be stony or not, do for the most part contain in them some Iron: Now then, when a man would thence extract the \odot by the Spirit of Salt, it cannot be but that together therewith the Iron would be dissolved too, to the doing of which there is much spirit required: And albeit you may make the said spirit most easily according to the way by me delivered, yea and may besides, by the addition of some even the most mean matter again make excellent Nitre, so as that the Nitre thence extracted shall be of more value, than the costs expended about the operation; yet notwithstanding, this business is not void of all kind of labour and trouble, and it requires diligent men (not drones) of which sort there's more scarcity than plenty. But now this which we treat of at present, may a beardless Country Boy of about some 10 or 12 years old perform: It requires but little Fire, and all the (Metals) may be extracted in great plenty. Which to do, you must know that where the Metals (or Ores) are sulphureous, that Sulphur must be taken away by the force of the fire, for else the Spirit of Salt leaves all untouched.

NB. However it is your best way not to force away by the fires violence the Sulphur out of the goldenish Flints, because that so, there goes off part of the spiritual \odot : but rather extract every such aureous Sulphur with a strong Lixivium made of fixt Nitre, and precipitate it with γ dissolved, and so the aureous Sulphur goes to the bottom, and is to be edulcorated; and γ , δ , or ϵ is to be thereto added, and so they will seize upon the volatile (Gold) and the \odot is by the means of the Lixivium made in some sort fixt, and is to be separated by destilling of the γ : The edulcorating waters do again yield Nitre. So that the extraction requires no costs at all, at leastwise but very little.

NB. When we have extracted the aureous Sulphur (by the help of fixt Nitre, or some other very strong Lee of Wood-ashes,) out of the Flints, and have precipitated it with the solution of the γ , and edulcorated it, and sublimed it by a Retort, there is thence made an elegant (or delicate) Cinnabar, which by the addition of the filings of Silver may be changed (by Cementation) into fixt γ which γ is aureous, by reason of the volatile \odot , which was permixt with the Sulphur. Whereas otherwise, other Cinnabar is by this way (of proceeding) wont to yield only δ : For the filings of the γ thereto added, become volatile, and vanish away into the Air, for the Cinnabar hath extracted the soul thereof, and hath by it made it self fixt; so that there redounds no profit at all thencefrom, save only that the possibility of nature is laid open. But now when the Cinnabar of this place (or mentioned in this place) is mixed with fusile γ , edulcorated and precipitated with Salt, or with the Calx of δ , either alone or else both mixt together (viz. the γ and δ) they do greedily betake themselves into each other, and there arises thencefrom a black stone, which being kept in an apt (or suitable) Fire by degrees, and that for a due time, doth daily more and more acquire a fixity: Yet do I believe that it needs a long time, to make it wholly fixt: which thing seeing I have not as yet any experience of, I will not here mention ought of certainty concerning it, perhaps some particular Tincture may thence be extracted, because that the subjects which constitute it are excellent ones, for as Sulphur is said to be the Father of all the \odot Metals, so is called the Mother. What may not a burning Sulphur not unlike the common Mineral Sulphur that is in all Metals, be extracted by Art out of any Vegetable? which (said Sulphur) I have implanted in mercurial subjects more than once, and have fixed it in them; yea and by the help thereof have so extracted natural Gold thencefrom.

Verily it is to be wondred at, that this science or skill hath been hitherto unknown to the Inhabitants of the world

worlds, and that no body hath committed the same to writing.

But indeed all men may cease to admire, when they shall consider that the Great and Blessed God bestows his gifts, and the knowledge of Nature to such only as it pleaseth him, viz. to such as bear an humble, and pious Mind; and contrariwise denyeth them to such as are impious and proud.

And here falls in a thing highly needfull to be known; by him especially, who would effect ought in Chymistry with profit (and that is this, viz.) That there can be no bettering of the Metals at all (be it either in the universal or in a particular way) but by the benefit of Sulphur (which is the father of all the Metals) & this both in the moist and in the dry way. (NB. The Spirits of Salt, of Nitre, Vitriol and Sulphur, serve instead of a sulphur though a moist one, and perform their office in the moist way.)

If therefore all the Metals were at first a Sulphur (for no Metal is there wherein it may not be found, and besides too, it is known to be in all the Vegetables) by what means possibly can it be, but that being by the help of a Sulphur, Salt, and apt Fire, reduced to fixity, it (viz. any Metal) should yield good ☉ seeing that it (viz. Gold) is nothing else but a fixt pure Sulphur. But for as much as Sulphur (as being of the Masculine kind) cannot produce any Metal alone, but that there must necessarily be ☿ thereto adjoined, (as being of the Feminine kind); every one is bound to seek after an apt or suitable ☿ (as being the Female) for his Sulphur (as being the Male) and to join that ☿ to this Sulphur, and let these two celebrate their Nuptials in Hell, where Vulcan is President.

Now then, when the Agent hath acted on the Patient, and perfected the operation, whether by the moist or by the dry way, it shews it self to be a pure product, and so much the purer too, by how much the Agent and Patient were more or less pure.

When we sow fruitful Seed in a fat Soil, good Fruits do thence - from proceed. Now then let Sulphur be the seed there, and ☿ the field it self, yet so as that your Sulphur (or seed) be pure, and that the ☿ (or ground) have no Tares in it; but let it be duly endued (or dungd) with Salt, and so let it have the fruition of the solar beams, and patiently wait for the thence proceeding fruits. Now if you meet with such a subject as hath both Sulphur and ☿ already joined together by nature; you are there only to begin the operation where nature left off, and so by the help of Fire and Salt, bring it unto its due perfection, which nature was constrained *volens, volens* to leave imperfect, by reason of the defect of Salt and fire.

I could here present the Student of *Hermetick* medicine, with such a foundation, as out of which abundance of commodious conveniencies might be expected; but the ingratitude of the men of this Age, prohibits the divulging such things.

Therefore do I herein follow Paracelsus, who saith, *We could verily lay open most mighty Arcana in a very few words, if it seemed good unto God to grant unto all men the same (equity of) Riches.*

Turn over and over his Writings, Reader; and thou wilt easily attain the foundation of the truth; but especially, view well such writings as he hath left us concerning Sulphur and Vitriol, which we will here rehearse in this place (because of the affinity of the matter) for thy sake and benefit, which writings of his if any one can make nothing of, verily neither will he understand those things which we shall add.

And now are all things (requisite) sufficiently laid open to such, to whom God vouchsafes his blessing; and contrariwise, the same will always remain hidden and unknown to the impious.

Thus much I add (viz.) That neither can any Tincture be obtained without Sulphur, nor any Sulphur fixt without Salt; both these now are found conjoined in Vitriol,

from which the noxious superfluity is to be separated, and the pure is to be made fixt.

Now follow Paracelsus his words, concerning SULPHUR and VITRIOL.

I Will present unto you, as one well skil'd, my experience in all respects concerning Sulphur, viz. what is contained in Sulphur, both as to Medicine and Alchemy, and to other things, and unless God be against it and hinder, the operations of Sulphur are so stupendous and admirable, that the natural Light in man cannot enough admire them. Now if God himself doth not hinder, then the defect is in the workmen, that so handles the Sulphur as that the operation answers not to the implanted Virtue.

Now seeing that every babling fellow is a Physician, and every prater an Alchymist, this is the cause why (in plain Terms) the Sciences (of Physick and Chymistry) cannot be brought to light.

This now is the Foundation or Basis, viz. That in Sulphur are contained such great Arcana and Virtues relating to both Faculties (viz. Medicine and Alchemy) that no body can ever search them out sufficiently: I say, that there lies such excellent Virtues hidden therein, as may very deservedly cause in all Men great admiration. For after long experience gained in both Faculties, such are the Virtues of Sulphur found and known to be, that there are not many other things that are either its superiour, or which may therewithal compare in Medicine and Alchemy.

Sulphur reproves Aristotle, when as he saith that the species of things cannot be changed: For Sulphur is transmuted; did Aristotle live now adays he would wholly be ashamed and blush.

Thus far he, as for the many more additions that he makes every one may read them in his Works.

As concerning my self, I say thus, That nothing at all can be done in Alchemy without Sulphur or sulphureous Salts; like as without seed, neither Vegetable nor Animal can; as is clearly evident, be possibly generated. Sulphur is instead of Seed, and Mercury instead of a Matrix: But you must not think that I do here speak of common Sulphur only, and common Mercury: [No!] I do comprise under them such as are far more excellent, and this you are well to heed. If now a metal be not sulphureous, it must be brought to a due softness by the force of Fire, which is done thus, viz. Making it red hot and quenching it some times in water. But if so be it is already soft enough, then bare powdering it is sufficient, without so much as ever heating it red hot and quenching the same. Put this powder in Pans of cast Iron, and that there may be the less waste of Fire, let it be encompassed with a wall or mured in a Furnace; fill them half full, and pour thereupon (whether it be Metal or Ore, or Sand, Stone, or Clay, or golden Mineral,) so much of the water which we shall by and by describe, as the Iron Vessel can contain, yet so that the said Vessels want of being top full the breadth of 3 or 4 fingers, least as you stir it about some of it spill over. This done, put to an hundred pound weight of the Metal or Ore, about one pound of an aureous, silvery, Magnet. Then put Fire under the Pans or Cauldrons, and make the water boil, continually stirring the matter contained in the Iron Pans, with an Iron Spatula.

Now forasmuch as this water is of such a quality as that it can neither dissolve ☉ nor ☿, it leaves both the ☉ and ☿, and by reason of the admixture of the Magnet, it attracts only the Iron or the Copper. When the water hath attracted as much ☿ or ☿ as it can, it is to be drawn away, and more new put on in the room thereof, and you must proceed on to boiling as afore-mentioned, and thus are you to reiterate this work, until all the ☿ or ☿ shall be extracted out of the Metal, and nothing remain behind save a dead Sand, which may most easily be separated

separated from the *Magnet*, by the pouring on of common Water, for the sand mixeth in self with it, and the *Magnet* remains pure in the bottom of the Vessel, which hath received into it self the ☉ and ☿: This ☉ now and ☿ is again easily separated from the *Magnet*, which said *Magnet* may be again used for such another work.

Thus now, one only person can by this means daily separate a great quantity of Metal from the ☉ and ☿ it has in it; all the artifice consisteth in the preparation of such a water as extracteth ☿ and ☿ out of the Metals or Ores: And therefore must it be of such a nature, as to dissolve neither ☉ nor ☿, & be nevertheless strong enough to dissolve ☿ & ☿ and to separate them from the ☉: For that the *Magnet* cannot extract the ☉ out of the ☿ and ☿ unless they be afore dissolved. But as touching the quality (or composition) of this water; 'tis no ways expedient to divulge it, forasmuch as the whole business dependeth thereupon, nor can any thing at all be effected without the knowledge thereof. When now *Venus* and *Mars*, or else *Venus* alone, or *Mars* alone, are extracted out of the stone (or ore) by the benefit of the said water, the precipitation of them may be made by the addition of some contrary thing, whereby it comes to pass, that not only its sharpness is taken away but also excellent Nitre may be thence prepared afterwards, which is to be separated from the *Mars* or *Venus*: The precipitated *Mars* may be reduced with a strong fire, and so it will be made fluxile, and which easily melts in a Crucible like *Venus*, and becomes malleable; yea, and of more worth than the best *Venus*, because it performs very many profitable things in Alchemy, which we forbear to speak of here, for some certain reason.

He therefore that knows such a menstruum or dissolvent, and which requires no costs to make it, and yet notwithstanding doth very well dissolve *Mars* and *Venus* (and leave the *Sol* and *Luna*): Such an one verily may in all places find plenty of *Mars* and *Jupiter* (*Venus* I believe he means) which contains plenty of both fixt and volatile *Sol* and *Luna*: neither need he be much solicitous about Golden Metals or Ores.

Forasmuch then as the whole Artifice consisteth in the knowledge only of the water, and in the manuals (or contriving) of the placing of the *Magnet*, and in the separating all the unprofitable matters from the ☉ and ☿; he that does not know such a *Magnet* and how to prepare such a dissolvent, by whose help ☉ and ☿ may be concentrated, and ☿ and ☿ be separated from them, let him search hereafter even as I my self have done: But if so be he cannot find out or invent either of them, let him get from me what he desires to know, and I will not omit to satisfy his request, provided it may be done without my detriment and disquiet. But now you must not think that therefore I will give answers to all such as trouble me with their tedious Letters, for my time permits not the doing of such matters.

There is yet another way by which we may expect profit out of such Minerals as contain in them much ☿ if we deal with them on this wise. Let it be reduced with the strong blast of bellows, and you shall find either a greater or lesser *Regulus* in the bottom (according to the muchness or lessness of the ☿ that the stone contains) which *Regulus* compriseth in it self the ☉ and ☿ which was in the Mineral or Ore, if such an Iron be malleable, Plates may be made of those *Reguluses*, with are to be dissolved (in the Cauldrons made of cast Iron) with that secret water, out of which solution, the ☉ may be extracted by the benefit of the *Magnet*, according to the aforeprescribed manner. But if the said *Regulus* be brittle, and not malleable, then may it be granulated: Nay, it would not be much amiss to make large Cauldrons and such like Pots thereof by melting, that may be of 2, 3, or 4 Fingers thickness. Nor must we suppose that what the said water dissolves of the Cauldron and takes from it;

besides that which it receives from the Plates or Granulated Iron put therein to dissolve, is merely lost: No, for even it doth in like manner exhibit its *Sol* too; so that by this means a most rich Mine-pit may be made.

But some will say, whence shall we have such Minerals that yield ☉, and that bring such great profit? We have said before, that such Minerals or Ores containing such Iron, are every where to be found: Nor can you light on any common ☿ which has not ☉ therein, which may easily be extracted from thence, and that with most great profit. This now is known unto most (Refiners) that there is plenty of corporeal ☉ to be found in the Iron that we commonly use which (said corporeal ☉) is far surmounted (as to quantity) by the volatile ☉; but if a man would separate it thence by the help of fusion and the addition of h, it requires too much costs, and therefore men never attempted any other way of extracting it.

All Germany affords this sort of Iron (that is thus endued with Gold) in a most plentiful manner, & I could shew very many places in which it may be found, if some pregnant (or notable) causes did not prohibit me from so doing.

But that all men may know, that I tell the very truth, and do not like a vain man tell you of great Treasures, and that they are every where to be found in Germany, and yet notwithstanding by reason of their not being known are not of any use; I will shew some of them with my very Fingers as it were, which haply in respect of other some that I know not of as yet, will be but a very few, and these very vile or poor, too.

First of all then, all the Iron that is in the Pine-bearing Mountain and about it, doth contain both fixt and volatile ☉; and this I have often experienced some years since, when I lived at *Kitzing* in *Franconia*, and extracted thence from by the help of a melting Fire excellent ☉: For as then, the manner of extracting ☉ from thence by waters only, without any melting fire, was to me unknown: For at that time those most eminent Men Mr. *Christoph Herist*, the chief Physician of the Prince of *Arspach*, and Mr. *Adam Remington* the said Prince's Lieutenant, and chief of his House, (or Governour) in the Castle of *Blasensburg* near *Culmbach*, presented me various kinds of minerals, to try what was in them contained: And amongst these Iron ones I find all of them to be endued with Gold, which might be exceeding profitably extracted thence by the afore-disclosed moist way. There were likewise given me such like conditioned stones and metals (or ores) which were found near *Bamberg*, of which we have said somewhat afore. The truth of this thing is the more confirmed by the Lord *Fleishman*, Governour of the Province of *Bamberg* my singular Friend, who wrote unto me some few months since, that an excellent Goldmine is found in the Province of *Bamberg*, but yet that the Gold thereof cannot at all be separated from the Iron by the force of Fire, which volatility of *Sol* I signified to him in my answer might most easily be amended.

Now like as all the Minerals and the Iron it self which are found near the Pine-bearing Mountain, are very much endued with Gold, so those which are found in *Misna*, *Saxony*, *Thuringia*, and *Bohemia*, do abound with ☿: both of which may be extracted thence by the way by me delivered, with very great profit. I know by good experience that in the *Hungarian* ☉ and ☿ Mine-pits much volatile Gold and Silver is forced away into the Air through meer ignorance.

Certain I am, that the Metals (or Ores) throughout all *Carinthia* and *Styria* do possess much volatile and fixt Gold; especially the Iron Metal (or Ore): For I have many a time made experiments of that thing.

Moreover, the *Hercinian* Wood, *Brunswick*, and *Halsia* yield such kind of Minerals. Nor is *Svevia* destitute of such Iron as is impregnate with ☉; and amongst other things I think good to declare, that some few months since, a certain *Basilian* Ruler sent me a potion

D d d d of

of such kind of Iron; withal relating, that the lesser experiment did there yield ten Crowns of Gold, and that an hundred weight was of this Iron sold for nine *Florins* price. Which Iron when I had tried by the help of a fusing or melting Fire I got a sufficiently great quantity of ☉, but in proceeding by my moist way, I got twice or thrice as much.

Such kinds of stones as these are found in plenty throughout all *Germany*, to which may be reckoned the red and black Talk, the Irony Talk, black and red *Granates*, *Smirits*, *Hematites*, and the like, which always are endued with ☉, if not with fixt, yet with volatile Gold. So that now it is manifestly apparent, that in those places where ☉ is digged, all the stones are repleat with volatile Gold at least, if not with fixt ☉ too: like as all the Iron that is digged in *Spain* doth of a certainty besides volatile Gold contain also corporeal Gold. Nay more, there are not only found such stones that have Gold in them in those hotter places, but also in most cold places too, witness *Normay*; where you may meet with whole Mountains consisting of Iron, Talk, and *Granates*; out of which there has not hitherto been any ☉ gotten by the help of a melting fire with any profit; though I my self have found ☉, in the lesser experiments.

Last year Mr. J. W. brought me various Ores out of the County of *Eysfelden*, that I might try what they contained. Amongst others, there were some little grains of Iron round like a Pease, though somewhat lesser, thus generated in the Earth naturally: This Earth as I was informed, is altogether black, one handful of which contains 10, 15, 20 Grains: wherefore it is not improbable that all the Earth of that place is repleat with Iron; these little Grains are so very tractable, as that they may be made into Plates with an Hammer, and contain much Gold.

Such a kind as this of black Iron grains (yet not so round or tractable as those but now spoken of) were brought me from *Saxony*, which are endued with plenty of Gold, but volatile; they are easily pulverisable, and (as was related to me) are to be found near the Mountain which the *Germans* call *Geyersberg*, where also is gathered a Tin stone, which doth also contain Gold, such as *Misnia* yields more plentifully. Out of 100 weight of this Tin, I found that 10 or 12 Crowns of Gold might indeed be extracted; but this work requires such costs as far exceed the price of that which is extracted: and therefore they sell off the Tin, just as 'tis digged out, to avoid the expence of extracting the ☉.

That which is gathered in the said Mountain, I have often tried, nor did I ever find it destitute of ☉, the which may be very well extracted by my moist separation.

The *Strabelein* Abbot presented me with such like Iron stones and several others that had Gold in them, together with diverse Minerals, some 18 months ago, some of which were gathered in *Westphalia*, some in the Province *Luttinge*, in that part that is under the Government of the Elector of *Cologne*, P. M. The Prince himself having a mind to see by what means I would extract the volatile Gold out of them, came unto me, but he died in his Journey homewards; since that I have not received any more of such like aureous Metals (or Ores.)

Amongst other (Ores) I knew an Iron Metal (or Ore) found in *Westphalia*, the half whereof was very aureous, but of no use, because the Metal-men were ignorant of the way of separating those Metals from one another; whereas notwithstanding both the pure Copper, and the ☉ it self may be most easily separated from the Iron according to the way by me delivered.

There were also a while ago several Iron stones brought me by the *Cologne* Merchants, and especially Mr. *Peter Sevet* (P. M.) which are found in plenty in the Mountains, and do abound with much ☉: Besides this too, all the Mountains of *Germany*, do yield a yellow Earth, endued with Iron and ☿: of which kind a certain

Physician of *Ersfurt* sent me some, which (as he related to me) at *Eysfeldt* near *Ersfurt* towards the Province of *Misguntia* is plenty thereof.

Such an Earth containing silver, I my self found here in the bordering places 'twixt *Arnheim* and *Embrick*, but not of such worth as that of *Eysfeldt* is.

Who knows but that that same place which we call *Velaw* hides in it vast Treasures. For I have found near *Amheim* a white Clay and Earth out of which I extracted some ☿: Yea and I found there too, true Veins of Iron, which whether or no they contain ☉ and ☿ I cannot tell: For I never proved them, but the first opportunity I have I intend (God willing) to make an Essay.

Thus 'tis evident that there is not at all wanting unto us the matter of effecting some good and profitable thing by, but the love of idleness is the reason why we neglect abundance of sufficiently obvious Treasures.

The Earth nourisheth men of diverse natures; for some of them are altogether slothful, sluggish, and extraordinarily backward to labour, and yet nevertheless get fat bodies enough: On the other hand, there are some who are very diligent, & do too much consume themselves, and concerning whom (being like unto a burning Candle) they may say thus of themselves, *by serving others, am I consumed*. And as much benefit as the Candle gets by affording a light unto others and by consuming it self; so much doth there redound, especially from ungrateful men, to a diligent man who by serving others waits and consumes himself.

These and such like most abject Subjects are plentifully enough to be found in all parts of the World where Mountains are, and out of them may you extract ☿ and ☉ by the help of my nitrous Water, were but the way of doing it known, which way hath been hitherto reserved amongst *Arcana* by reason of mens extreme ingratitude. And I pray is it not altogether useful and expedient that we should gather such Treasures, and make use of them to Gods Honour, and to the defence of Kingdoms and Mankind? Is there not sufficient store of idle fellows, whom it would be very expedient either to invite to labour or (if they shun work) to banish them the Kingdom?

I believe that this blindness will hardly leave men afore they are reduced to straits, but beware least you hap to begin to grow wise too late.

This work, like as is every other perfection of Metals is done by Sympathy and Antipathy: For that dissolvent which drives off ☉ and ☿ from it self, by Antipathy, all this doth a mercurial *Magnet* greedily attract by Sympathy, seeing it it thus, that *viz.* as like loves like, and draws it to it self; so one contrary hates another contrary, and drives it away.

Two contraries do always produce a third thing. Where the Agent acts upon the patient, and that this patient is even enforced to suffer against its will, and cannot by any means shun the force of the Agent, there must of necessity arise some better product from them.

When water is added to water, neither of them suffer, because they are both of them of the same nature: But when fire and water are joined together, the weaker is the sufferer, and from them doth a third thing proceed.

The stinking and volatile *Sulphur* is the enemy of ☉, and common Salt, of ☿; and by how much these have more stench the one, and sharpness the other, so much the greater is the hostility they shew. The greatest matters are performed by love and hatred; such things as are friendly beget a cheerfulness, joy, and vivacity: Whereas, on the other hand, the things that we abhor beget a tedious wearisomeness, grief and death: therefore the more acceptable a thing is, the more it brings of life; the less acceptable the more of dole doth it bring. All the perfection therefore of the baser metals consisteth only in Antipathy and Sympathy: And if once we do but rightly know the nature of metals, all things are easily accomplished. It

It is storied of a certain Philosopher in Italy. That he had committed some evil deed, for the which he was accused, apprehended, and cast into prison, being here shut up, he could not be brought, neither by entreaties, nor by threats; no, nor by any means to confess his fault; but at last they put into his company a man of no sobriety or modesty at all, who did so grievously exasperate him with his words, that the said Philosopher could not brook it, and so rather chose death; for he affirmed, that the mind of man was far more noble, than to be plagued by such a tag-rag, with reproachful contumelies.

Even just so is it with Metals, by how much the nobler and purer they are, so much the less will they commix themselves with impure things.

Gold the purest of the Metals cannot be knit with stinking impure and common Sulphur; for there is an antipathy betwixt them. Salt alone is endued with those virtues as to be able to reduce contrary natures into agreement, and to commix them; and being commixt, the fixt \odot is able to make the unfixt Sulphur, like unto it self in respect of fixity, whereas otherwise they always persecute each other with hatred. *Sol* cannot suffer any thing until it has gotten the nature of a Salt, and then may it be commixt (as it were) by the impure Sulphur, and be changed into better.

When the Soul of the imperfect Metals (which is a spiritual \odot) is to be forcibly pluckt, and severed from its body, it cannot possibly be done without the labour or pain of the Patient; for where the pure and spirituous golden substance that dwelleth in the corruptible bodies, is to be made Corporeal, and consequently assume a more noble form, the first form must necessarily be annihilated, that so the hidden tender body may come forth to light and be seen.

And this verily is done by another kind of way than the common and already known; by which (said common way) the Metals are separated by *Aqua-fortis* from one another, and are afterwards Melted. For if any one should make one Metalline Mass of δ , γ , ψ , ϕ , and π , by melting, and then would again separate them, by the help of common *Aqua-fortis*, he would effect nothing; for the *Aqua-fortis* would dissolve only δ and γ and part of ψ and ϕ , and leave the remainder with the π undissolved; or if he should pour on *Aqua-regia*, there would be only ϕ and π together with some part of ψ and δ dissolved, and that which remains of the ψ and δ (undissolved) would be left behind with the π , and so there would not be made any good separation.

But if so be that any one has a mind to attempt this thing on this wise, and should say, I will dissolve δ , γ , or ψ , by the help of *Aqua-fortis*, or as much of it as possibly I can, for so the π that is in the mixture must needs be dissolved. Now then when it is dissolved I will precipitate it (viz. the π) out of the solution, by salt water (if it be so yet); the ϕ therefore remains, which could not be dissolved by the *Aqua-fortis*; or, if I should dissolve the Metal (or mixture) by *Aqua-regia*, then the ϕ is dissolved, (but not the π), and so I can precipitate the ϕ out of the solution, by a Lixivium, and edulcorate it, and melt it, and so by this means may I get it. Well (let me tell you) that neither will this way fadge, for these Metals, and especially δ and ψ are too terrestrial, and admit not of such a separation, though there should be in the aforesaid Metals, abundance of Corporeal ϕ and π , whereas notwithstanding the greatest part is fluxile, and must be again made fixt and corporeal by solution; for in this work the already pure and fixt ϕ and π may be altered, so as that a Mercurial magnet cannot be able to assume them. As for example, Take you a Metal, as δ , ψ , or γ , in which (as is well known) there is Corporeal ϕ . Dissolve this in *Aqua-regia*, and precipitate the ϕ by a Lixivium of fixt Salt; boil this precipitate with ψ , and see if that precipitated ϕ will pass into the ψ ; you'll find not, for this ϕ hath gotten a Crust (as it were) in its precipitation by the Lixivium; that is, it is environed with a saline Terrestricity, in so much that the ψ cannot attract the ϕ .

Neither likewise can ψ attract or assume such a silvery Calx as is precipitated out of the solution with salt water, and that by reason of the terrestricity alone, which adheres thereunto by means of the precipitation, by which it is altered and deprived of a pure Metallick form.

The truth hereof may you easily experiment, on this wise. Dissolve a particle of pure π in *Aqua-fortis*, and dissolve the same quantity of pure ϕ in *Aqua-regia*, precipitate the π with salt water, and the ϕ with a Lixivium, so as that the π be precipitated into a white, and the ϕ into a yellow Calx; edulcorate both Calxes apart after the best way that possibly you can, with hot water many times, so long till the edulcorating water be wholly sweet, then weigh these dried Calxes, and you shall see that the π and ϕ you took, are one fourth part heavier than before the solution of them; and this is to be ascribed to the Salts only, that have adjoined themselves to the Metal in the precipitation, and cannot be thence separated by edulcoration; and therefore such a silvery Calx yields not (when molten) a pure Lunar body, but a certain Ashy coloured Mass, fluxile and volatile, by reason of the Salts; and this Calx is not changed (or swallowed up) into the ψ neither before nor after its being molten, nor (after its melting) can it e-

ver be dissolved by *Aqua-fortis* or *Aqua-regia*, which alteration proceeds merely from the Salts that have adjoined themselves thereto in the precipitation.

Even just so is it with such a golden Calx, which being separated by precipitation out of the *Aqua-regia* with a Lixivium, will not have ingress into ψ , by reason of the impurities that accompany it; and therefore this golden Calx (when it is made hot) kindles, and vehemently operateth upon it self, and this is merely from the Salts.

From hence it is clearly evident that the Calx of π precipitated by Salt, and the Calx of ϕ by a Lixivium, have not any communion with ψ , how then can such a Calx, which is (now) at first forced out from many terrestrial parts, and imperfect Metals, and separated from them, have a greater communion therewithal, have ingress thereinto, and conjoin it self therewith by digesting. Other ways therefore must be taken, by which you may extract the volatile and fixt Gold, that lies hidden in δ , ψ , γ , or π : Now many there be who do in vain search into those things which they know not the nature of, and so walk in darkness like one that hath already fallen into a Pit.

But if you come to know such a menstruum or dissolvent, which is an enemy to ϕ or π , and yet nevertheless doth plainly dissolve δ , ψ , γ , and π , then the spiritual ϕ that lies hidden, will manifestly appear corporeally and visibly, and will pass into the *Mercurial Magnet*.

Besides, this dissolvent must likewise be of such a nature, as that (when in the solution or digestion of the imperfect metals, it makes the spiritual and volatile Gold corporeal, and casts it off from it (as I may say) by antipathy in the form of a powder) this powder may not be environed with any crudeness as above said, but that both the Calx of π and of ϕ may have their natural metallick splendor, whereto the ψ may adhere, and may attract unto it self whatsoever the dissolvent separates by the continual digestion.

Farther, this Dissolvent must be of such a nature as not to be so sharp as to dissolve the ψ for then the work would not succeed; indeed it is scarcely necessary to make use of the ψ , to receive into it the spiritual and fixt Gold which is separated in the digestion fixation and separation of the Volatile ϕ of the Metals; for when it is once evacuated it will never again occupy (or seize upon) its impure body; yet notwithstanding this chiefly is done for this reason, viz. that the spiritual ϕ & π in the imperfect metals may be the more willingly made Corporeal, when it finds a fitting subject wherein it may be hidden and rest. Besides too, this spiritual ϕ and π of the Metals, is endued with such virtues, as that it tingeth some part of the ψ into ϕ and π , when it hath thereto entered, whereby it yields the more profit.

Thus much likewise are ye to know, that this labour does not only proceed in the moist way, but also in the dry; but yet far easier in the moist than in the dry way; yet in the (dry way) a greater profit is gotten in a shorter time. For like as to one measure of Milk are required 1, 2, 3 or 4 spoonfuls of Salt, that so the Cheese (or Curd) may be separated from the water (or whey), but there needs not the quantity of one spoonful of the Spirit, which is much stronger than the bare Salt: Even so stands the case with Metalline operations; for by how much the greater and more powerful the Agent or Contrary is, so much the sooner and stronger doth it perfect its operations. Hence it is, that where the Agent must be yet more strongly active (as in the dry way, it must of necessity be where the strong fire adds virtue and vigour to the Agent) it being consequently more contrary (or powerful) the separation is sooner perfected. For example, Let us see how it is with Milk, where 10 or 20 drops of Spirit of Salt separate some cold Milk, there will need but half the quantity only when the Milk is boiled or otherwise heated; even so is it with our Agent, whereby we make the Volatile Gold in the more vile or meaner Metals, corporeal and visible; it operates far more strongly in the dry way, than in the moist way; for in the dry way, the external fire aideth our fire, and hereupon finisheth its operation so much the sooner; but in the dry way must another Magnet be made use of.

Thus much let suffice touching the particular washing or external purgation of the viler Metals; as concerning the internal, central, universal washing, by which the interior Soul of ϕ and π is extracted for the Tincture, I do not as yet (certain) know any thing thereof, nor desire I to know such abstruse and hidden things; content I am with such things as God of his meer grace hath bestowed upon unworthy me, and if God shall so please, so far to profit mankind either by mine or any others help, he will also present an occasion of laying hold thereon (viz. on the Tincture) for all good things come from God.

Now in this action (or operation) is required an ocular inspection, such great things cannot be understood by Books or Writings; and he that desires to excel in these (operations) let him take it in good part, that (I say) he ought frequently to here me as a matter, and to see me labouring about these things, which otherwise he will never learn, for the common Alchemists are plainly ignorant of this work; yea the Ancient Philosophers did hide it as a secret, the most they could, that so it might not be trodden under foot by Swine.

But whereas I do so clearly set down these things, otherwise than ever any before hath done, the consideration of the time (or

(or age) requires it, and best of all known it is to God, why he now delivers these things to be divulged. Forasmuch as mention hath been made in the foregoing treatise of Spiritual ☉, which might be extracted, together with the corporeal, and some or other would perhaps very willingly know what is to be understood by the name of Spiritual ☉; I think it not much amiss a little more largely to explain these things for the sake of the Ignorant.

Every Spiritual thing is invisible, and void of a palpable body; but now if a body be given thereunto, in which that spirit may be made corporeal and visible, then the spirit is not any more a spirit, but is changed into a body; if therefore the Spirits are good, they do likewise make good Bodies, and so on the contrary. For all the Philosophers tell us, that the Spirit or Soul in Iron and Copper is more noble than in ☉ it self, because the body which it dwells in is gross, terrestrial, and impure.

The case then standing thus, it is no wonder that if these Spirits are separated by art and force, and expelled from such gross bodies, and joined to other purer subjects, they then produce some good thing. Would not the other Beasts reverence the As clad in a Lions skin, as if he were their King, and this merely by reason of his skin; though inwardly he were an As? If so be any man be but clothed in silken rayment, and go gawdily; do not every body put off their hats to him, and honour him, though inwardly he haply is a thief or a knave; and so on the contrary, if a most honest and most learned man go in tattered apparel, or at least in mean rayment, is he not rejected, and despised by all. From hence it sufficiently appears how insincerely the common people judge of all things, and neglect the inside, and only look to the outside shew. 'Tis the external Shape, according as tis good or bad, that makes a man esteemed by the vulgar either good or bad, contemptible or honourable, though his nature (or education) possesseth other properties.

The like is to be understood, concerning the contemptible Metals, *Mars* and *Venus*, which according to the report of all the Philosophers have more Tincture in them than *Sol* it self hath; but yet by reason of the grossness of their bodies are they rejected; now therefore, by how much better the means or way is by which this noble Spirit is extracted, and added to the pure bodies, so much the better is the product.

When therefore the gross bodies of ☿ and ♀ are artificially broken, and the spirit dissolved, and thence forced out, it seeks it self another body wherein it may dwell and be at rest. Therefore when we do by art disturb (as I may say) the gross bodies of *Mars*, *Venus*, *Jupiter*, or *Saturn*, and dissolve the pure Soul, and expel it by antipathy, out of its impure houses, and contemptible garments, and set before it a pure ☉, it possesseth it, and so assumeth another nobler body than it had before, and which then is ☉ and ♀, according as 'tis managed. This is my opinion, and after the same manner is the thing to be understood concerning Spiritual Gold.

But what business have we here with the Spiritual ☉ of Metals? Let us be content with the Corporeal, and leave the Spiritual to the Philosophers, to make the Tincture with. But forasmuch as upon the occasion of my teaching the means of extracting Corporeal ☉, I could not leave the speaking of the Spiritual wholly untouched, I made also some kind of mention of the same; and it will be beneficial to some or other, who till they do understand my meaning, may be content with the Corporeal ☉. But such as have open and attentive Ears to consider what my drift is in this discourse, my doctrine will be more profitable unto them, than either *Sol* or *Luna*.

There is yet one thing more to be added. In some places they are wont to reduce the *Sol* and *Luna* into a powder with ☉, that so the Corporeal ☉ and ♀ may be separated and extracted from the Stone (or Ore); and this is no new or unheard of thing.

But this is more rare (or seldom used): a Metal which hath not as yet arrived to his due maturity but is as yet conjoined with his first ens, and consequently it flies away in the melting, and neither yields ☉ nor ♀, when it (viz. such a Metal) is commixt with ☉ salt and vinegar, and let lie to rest upon each other for some days, it comes to pass that the Mercury attracts the immature, Spiritual ☉ and ♀, and makes it corporeal and fixt, so as it may thenceforward be molten. If then the Spiritual ☉ and ♀ doth so easily enter into the ☉, and make it Corporeal, it is yet much more facile to be done by my way, which is effected by the help of more strong (or powerful) instruments, than by bare ☉ only, and Salt and vinegar, with which they mix the Metal with the ☉, nor can they possibly do so much as my secret menstruum which penetrateth all things.

When now the Matter, together with the Salt and Vinegar is duly separated from the ☉ by the help of fair water, they pass the Mercury through a skin of Leather, which is again serviceable for the same uses; but that of it which adheres to the ☉, is thence separated in an Iron Retort, then is tried the weight of that which is separated, and as much as there wasteth of the weight of the ☉,

so much of ☉ do they receive in its stead, which is a thing well worthy thenoting, and deserves a farther inquiry, and is not here set down in vain.

Let not any one despise these few things which I have here adjoined, for they comprise in them most great mysteries; yea and greater than most will believe.

Neither let any one imagine that I will presently communicate this most noble Secret (which clearly shines in the dark) to every stranger; no, no such matter; I will (God permitting) shew these things to my honest friends, that so it may not perish together with me; but however I will well think on that much used Proverb, *Fide, sed cui vide*; Trust, but see whom you trust.

The *Franciscans* have given me this document; many there have been who have come unto me and declared the miserable state they were in, that what by the Wars, and by other misfortunes, they have lost their Goods, and have begged me for the love of God, to succour them, by communicating to them some operation, whereby they might sustain their lives, promising that they would requite this kindness by their earnest prayers unto God in my behalf.

These and such like words have sometimes moved me that I have given some secret to one or other, and have bestowed on them an overplus too; yet I obliged some of them, that they should convert it solely to their own use, and not communicate it to others without my privacy, which thing they promised largely enough. But as soon as they have been gone from me, they have presently sold those secrets of mine to others, and which is more, to my enemies. Now when by reason of their ignorance, they did not know how to institute the operation aright, they falsely affirmed, that they bought this Art of me at a price, and that they have been cheated; whereas they well know, that it was pure affection induced me to bestow these things upon them without any reward.

These and such other like *avjda* (or Gift-holders) have deterred me from communicating any thing to others for the future; and this I would have every one to consider, and not trouble me with either Letters or Visits.

Yet nevertheless I will communicate store of my secrets unto my Friends, that so they may not clearly perish with me, nor be thrown to my Enemies, and foolish men.

I have done as much as in me lay, nor will I omit to do more where I shall see a grateful mind; in the next place I will (for the service of my Friends) treat about and shew in the fourth part of the *Prosperity of Germany*, the Secrets of *Saturn*, by what means any one that is but a little versed in managing the hie, may seek (or make) some Country fellows, his tributaries, who may pay him an appointed tribute every week, after the Example of Kings and Princes, who bestow upon their faithful servants (that deserve well of the Country by their valour against the Enemies) Kingly gifts as whole Cities, Towns, Villages, and many subjects as an inheritance, of whom they may afterwards receive Tribute and live very abundantly or plentifully.

Now by how much the more Country-men there are that be Subject to a noble man, so much the richer is he supposed to be, for they pay the more tribute. And the more Ploughs the Countryman hath a going, the greater is the tribute he pays his Lord, which thing the governance of States or Common-wealths induceth, as being a just thing.

Now after the same manner as these things are in use in political governments, are they also in Alchemy, for it doth likewise when we have for some time faithfully served under her, bestow on us tributary Country men (as 'twere) by way of recompence, from whence we may have Food and Rayment.

The more Fields and Ploughs that we give to these country-folks, the more Tribute do they pay. Neither do these forsake their Masters, for they are shut up in a stall, and when their bellies are filled with Coals, and that they are safe from the Rain (or Weather) they are contented, and do perform the businesses that are imposed upon them.

By how many more the Ploughs are which we give unto them (though one Country-man can hardly manage above two or three, so much the more do they give.

Such Country-men as these doth the true Alchemy distribute amongst her Servants, whereby they may thenceforward lead a quiet Life.

If God shall vouchsafe me life and leisure yet a while longer, I have purposed with my self to bring most mighty benefits unto my Country.

In the mean while, let these things be accepted in good part. Those same tributary Country-men may be shewn my Friends, together with sundry other profitable Inventions, in my laboratory.

THE
FOURTH PART
OF THE
Prosperity of GERMANY.

In which are revealed many excellent, usefull Secrets, and such as are serviceable to the Country: and withall, severall Preparations of efficacious Cates extracted out of the Metals, and appointed to Physicall uses; as also various Confections of Golden Potions. To which is also adjoyned a small Treatise, which maketh mention of my Laboratory; in the which there shall be taught and demonstrated (for the publick good and benefit of Mankind) wonderfull Secrets, and unto every body most profitable, but hitherto unknown.

The PREFACE to the Friendly READER.

Although I promised, above a year ago, in the Preface to that Book which I published of the Nature of Salts, that (besides Salt) I would likewise adjoyn some Broth and sugared Sawces and Seasonings to the other Meats disht out upon the Table: yet notwithstanding such as are searchers after good Arts, would not in any case allow me so much time as to prepare those Sawces; and being prepared, to dish them forth upon the Table: but earnestly requested this boon only, viz. that I would not forget to furnish the said Table with Cheese and Butter. The satisfying of whose request, I confess my self very ready to yield unto, nor doe I find any other obstacle, save only the scantness of time, which I am constrained to imploy about other affairs more necessary.

But however, seeing it is esteemed a very praise-worthy action in a Man, by diffusing his kindnes in many places to benefit many, I have deemed it a thing well worth while, to adjoyn (setting aside other things) unto the afore-disht-out Meats those promised Sawces, with Butter and Cheese, in to boot; but yet, with as much brevity as conveniently may be.

Had a longer space of time been permitted me, I would have clarified the Sugar better, and made the Sawces more savory, which the hasty posting away of time hath hindered the performance of.

Besides, soasmuch as I have promised a Fourth Part of the Prosperity of Germany, together with a disclosing of excellent metallick Medicines, it hath seemed good unto me (for the fulfilling of my promise) to publish these my most efficacious Sawces under the Title of the Fourth Part of the Prosperity of Germany; and the rather, because I have not time sufficient for the description and detection of other Secrets.

Now by how much the wiler and more contemptible cloathing these present Arcana's do come abroad in, so much the greater and more noble virtues do they hide under their sordid or despicable rayment. I was of the mind, I confess, to have kept yet longer by me this Fourth Part, that so (being sent abroad to publick view in a more convenient season, it might have been more adorned with Secrets of greater moment afore its being exhibited to every ones view. And amongst those Secrets,

E e e e

one

one eminent one, is the Concentration of Gold and Silver, and their reduction into such a form and figure, as that it cannot at all be known by our Enemies: (who sometimes rush in upon us unlookt for, (which [fore affliction] God (of his mercy) keep us from.) And so by this means may it come to pass, that such kind of Bodies being thus hidden under an unknown Garment, will not be robb'd and taken away.

And whereas I have demonstrated in the foregoing Third Part, by what means great Treasures of Gold and Silver may easily be gotten in all places throughout all Germany, by the help of my Inventions; I make no question, (nor indeed can it otherwise be) but that such as are diligent House-holders will listen unto my sayings, and put in practise many of those things, especially seeing I will both counsel and assist them, as much as in me lyes.

If now the searching after so great Treasures be [nor] so securely and negligently handled, it will undoubtedly come to pass, that our Country will (by such a notable Medium, and such great Treasure) be rendred even wholly invincible. History maketh mention, that the Egyptians (by their skill in the Meliorating of Metals) enjoyed such vast riches, and so great a power, as that they cast from off their necks the Toak of the Roman Monarchy, even untill that time in which their Books comprising the Art were burnt by the Emperour Dioclesian, whereby they were enforced to be subject to the Empire of Rome. For the most noble Art of Printing Books was in those days unknown, and their Sciences were wont to be written in Parchment with great labour and much cost; and undoubtedly they were not thoroughly stored with such kind of Books, whereby the Romans did the easlier get them into their hands and burn them.

Now when once a Writing is committed to the Press, it may be printed off in an almost-infinite Number, for a Printer will doe more in one day, than a vast multitude of Scribes would be able to write. And being it is so, who could possibly be able to scrape together out of all the places of a whole Country such a multitude of Books, thereby to root them out in these our times, and by burning annihilate them, as the Romans did.

This one thing I here say, viz. Did I but know and find that those things which I have hitherto published, would not onely be acceptable, but be also put in use and practise, it would be as a spur unto me to stir me up to adjoyn to what is already done, more and greater Secrets. Mean while let what is at present offered be well accepted, and what is promised, be patiently expected.

Of the word Sawce, and what is meant thereby.

I Have obliged my self by promise, to adjoyn unto those my Meats which I have hitherto dish'd out upon the Table, some good Sawce and Pickle; which Meats, seeing they appertain not unto the plain common ways, but belong to a very excellent Skill or Science; it is altogether needfull, that the Sawces be correspondent thereunto, and that even they as well as the meats themselves, be by reason of their favouriness, gratefull unto the Palate. Now therefore as in the Feasts of great men, the Pickles are not set on the Table afore the Guests have fill'd themselves with Flesh and Fish, and so allayed their hunger, but are set afore them (afterwards) as so many Vehicles to drill down the Wine with the greater delectation, for such Pickles do for the most part communicate a sweeter (or toothsome) taste to all kind of Fruits, Seeds, and Spices, and Sugar: So likewise must I, in the making and dish'ing out such Sawces for this Feast of mine, mind onely this business, viz. to take care of providing my self of the best Sugar, and choice Spices; and these are extractable onely out of the Metals; Saturn affording Sugar, and Sol and Lune yielding most sweet Spiciness.

But afore I dish out my Pickles, I have thought good to set afore them a sweet Broth or Seasoning, [together] with Butter and Cheese, that haply one or other of my Guests are minded to dip a piece of Roast-meat therein, or else to taste of my Butter and Cheese, whereby they may with the greater delight taste the sweetnes of the following Sawces.

And although I was minded to exhibit in this place some excellent and efficacious Metallick Sawces: yet notwithstanding I could not chuse but first present you with a fore runner as 'twere, signifying unto you, how that by the help of Salt good Broths and Sawces may be made out of the Vegetables, and Sawces, serving for the bettering of Cheese and Butter made out of Animals: that so my Treatise of the Nature of Salts may not be at all defective, and that every one may see what a most noble and most excellent Creature Salt is, which is capable of exalting the Animals, Vegetables and Minerals to a far more worthy degree by so excellent a Melioration of them.

Salt and Vinegar are commonly reputed to be the best Sawce, and 'tis most truly spoken: For amongst all the Sawces and Seasonings put unto Meats, Salt and Vinegar bear the bell: now the Vinegar is for the most part made of Wine, Fruits, Ale, Honey: But as for Salt, if it be turned by distillation and rectification into a sweet and acid Spirit, it becomes a sweet and strong Vinegar, and to be preferred before all others: so that there's no need at all of the Vinegar of Wine, Ale, Honey, and Fruits. We will therefore shew unto such as are desirous of sweet or savoury Sawces and Picklings needfull for Flesh and Fish, and of well tasted Cheese and Butter, the way of preparing the same by the help of Salt; whereby a Man may make himself for his own Kitchen use or Cookery, various Sawces as him listeth. And having shewn this, we will proceed on to the description of metallick Sawces.

He that is desirous of a good Sawce or Pickle fit for Flesh and Fish, will not find any thing that is more fit or proper than a well-prepared and rectified

ed Spirit of Salt, the which he may prepare with whatsoever Herbs and Spices he pleaseth, according as is agreeable to his Palate.

For example, Like as otherwise most acceptable Broaths or Sawces are wont to be made with Wine, Vinegar, Pepper, and other Spices, and are put unto the Boiled or Baked Flesh or Fish in the same Dish, or set by the same in little Sawcers, that so all those Meats may leave the more gratefull tast upon the Palate: Even so may the same be effected with Spirit of Salt, and that far more commodiously, and to better profit than if Wine or Vinegar were made use of to the confection of those well tasted Sawces. But it is my Spirit of Salt I here speak of, (which being prepared according to my prescription, is of a most delicate pleasantness,) and not of that which is most an end sold in the Apothecaries Shops, and in other such like places, and is for the most part ill prepared, and not at all rectified, and consequently by its ungratefull sharp and harsh tast, it provokes to Vomir, if it be taken into the Stomach; 'Tis likewise of a yellowish colour, and with its sharp constriction draws up the Tongue, whereas it should be more clear and transparent than Fountain Water, and by the pleasantness of its acidity excell the Juices of Apples, Grapes, or Limons. And being furnished with such a sweet or pleasant Juice of Salt, I need not any Wine, Vinegar, or other sharp Juices of Grapes, Limons, Rasp Berries, Sorrel, and the like, to give a pleasant and favoury tast unto my Flesh or Fish: for it may be done far better with this good Spirit of Salt, than with Wine or Vinegar: For, that Spirit of Salt serves instead of them all, nor is it at all subject to corrupt as other Juices are, but conserves its sweet and pleasant essence without any decay. But if you would make use thereof singly or alone, then must a little Water or Sugar be mixed therewith, that the acidity or sharpness thereof may be a little allayed, and thus may it serve instead of a Sawce to be added to either baked or boiled Flesh or Fish. But now if a man be minded to add green Herbs for alterations sake of the tast, such as are Parsly, Garden Cresses, Spanish Pepper, and the like; he may beat or shred them small and moisten them with Spirit of Salt allayed with Water, and so put them instead of a cold Sawce to Flesh and Fish. But if now the Sawce is to be poured warm to the Fish and Flesh, then must a little Butter be thereto used, and that on this wise following. Take some pure and clean Water, and make it somewhat sharper (with good Spirit of Salt) then strong Wine, Vinegar, put thereunto some good Salt Butter or Fresh, at your pleasure; and likewise such Spice as (besides Pepper, Ginger, Nutmeg, and such like) you list to add, as also Salt if need be; put it in a little Earthen Glazed Pot, and not in a Copper or Iron Vessel, for they are altogether unfit for this Operation; set the Pot over a few Coals and heat it gently to melt the Butter, then stir it thoroughly about without ceasing, with a Wooden Spoon, and then being molten it assumes to itself the saline Vinegar, and the Sawce becomes thickish, the which must be then poured out to the boid, and seasoned Flesh or Fish. But if green Herbs, as Chervil, Parsly, Cresses, *Piperia* or Spanish Pepper, and such like are to be adjoynd therunto, you may bruise or chop them small, and then put them into the Pot unto your hot Broath or Sawce, and mix them well together, and then presently pour out your Sawce to the Flesh or Fish, for by this means

the Herbs retain their tast and greenness, and so delight the Eyes with their lovely aspect, and please the Palate with their pleasant tast, which would not be if they boiled much with the Liguour, for then they would lose both their subtile tast and green colour. Moreover, you are warily to observe in this thing, that this Broath or Sawce be not let lie upon the Coals too long, and so the *Acetum* separate itself again from the Butter; which to prevent, there may be mixt with the Sawce one, two, or three yelks of Eggs, which being well stirred with the same makes it the thicker, and better to stick on to the topping when you take it out of the Dish where the Flesh or Fish is.

Such Sawces do give the Fish either boiled or fried, a most acceptable tast, and probably if some Sugar be thereto added it would do very well for Flesh too. But yet, sharp Juices or Broaths are better and more agreeable for Fish. Now after this manner may every one make his own Sawce as he listeth, and render the same with some Herbs and Spices, the more favoury unto his Palate; and consequently needs not either Wine or Vinegar, nor any other acid things.

If any one has but any pure and clean Spirit of Salt at hand, he may (by the addition of certain Herbs and Spices) prepare his Sawce as best likes him, and make it far more pleasant and delightfome than if it were made with Wine, Vinegar, or Ale-Vinegar, nor can you get these every where neither. But the Spirit of Salt may be prepared and so had every where, and therefore on that account too is it deservedly to be preferred before all other seasonings.

Now in the Winter Season, when green Herbs are not to be gotten, the pounded Roots of Spanish Pepper may serve, or Mustard Powder reduced with Sugar and Spirit of Salt into hot and cold Sawces. Nor would I have any one to be so bold (and foolish) as to condemn these my Sawces, before he hath tasted of the same; for I doubt not but that if he once comes to tast the delightfome pleasantness of the same, he will prefer them above all other, and will give the Vinegar of Salt its due honour.

And now to give an experiment, taken out of the Treasury of Salt, unto those that are delighted with the tast of good Butter and Cheese; let them listen unto those things which here follow. If thou art desirous to prepare a durable Cheese of Cows Milk, and such Cheese as hath all the tokens of a good Cheese, viz. such as is weighty, compact, close without Eyes, and putrifying Holes, void of stinkiness and bad smell, thou mayst be a Master of thy desire by observing the following Operation.

Take of Cows Milk, Sheeps or Goats Milk, or of either of these which thou hast at hand, as much as thou pleasest, or as much as is sufficient, (but amongst these Milks, Goats Milk is the best, Sheeps next, and Cow Milk inferiour to the other two both in goodness and excellency.) Heat it at the Fire, and pour it out into a wooden Vessel. (N.B. Iron and Copper Vessels are not to be used in this way) and reduce the Milk into a Curd by the pouring on of Spirit of Salt. Now one Spoonfull of this Spirit is enough to curdle ten measures of Milk. This done, and the Milk and Spirit of Salt having been well stirred about with a wooden Ladle and curdled, put the same into Hair Strainers or in very clean Linnen ones, that so the Whey may drain out and be separated; then gather up the ends of your Strainer,

ner, and lay thereon heavy weights and squeeze out all the wheyish moisture. Then take your Cheese out of these Strainers, and put it into wooden Vessels, and there break it into small bits or pieces; which being thus broken, sprinkle some Salt, and some of your pure Spirit of Salt too thereupon, and mix all well together with a wooden Ladle or with your hands well cleansed: Being thus mixed, fill your Vessels or Cheese Fats [which let be] greater and lesser [as need is,] and squeeze and compress the matter well in, as they are wont to do in making of Cheeses. Then expose them to the warm Air, and dry them, and it will give you compact and durable Cheeses, not unlike to those they call Parmesant, and such as will be void of Eyes, and of foetid and putrid Holes, Slimyness, and such like defects usually incident to the common Cheeses, nay they never are obnoxious to those faults.

The reason is, because the first Coagulation or Congelation of the Milk is made by the help of pure Spirit of Salt, which defends from all putrefaction, and not by the help of the foetid putrid Renner, from which nothing can proceed but Rottenness and Worms.

Then farther, the Spirit of Salt being together with [Crude] Salt sprinkled thereupon (after the squeezing out of the Whey) doth in an especial manner resist all that putrefaction that is wont to be in Cheeses, and condenseth the Cheeses, and impedes any fermentation, which dilateth the said Cheeses and makes them spongy and porous; and by thus condensing them, it makes them remain safe and free from all putrefaction.

Such Cheese therefore as is brought to this perfection, doth well deserve the preeminence above the rest, and is extolled by the praise of those Ancient Verses, viz.

(*dalet*,

Good Cheese must neither *Argus* be, *Largus* nor *Mag-Methusalem*, nor *Habbacuck*, nor *Lazarus*, [Amen.]

That is, it must not be eyed like *Argus*, nor tough like *Largus*, nor hairy and crying like *Magdalen*, nor hoary like *Methusalem*, nor light like *Habbacuck*, nor full of stinking holes and rotten fores like *Lazarus*: which defects if Cheese wanteth, it well merits the title of goodness: and such are those Cheeses which are made by the help of the Spirit of Salt; do but make such a Cheese and try whether or no it will not be of a more pleasing relish than all others are.

Such Cheeses are never corrupted, they never become tenacious, limber, full of holes, and worms. The Spirit of Salt being poured into the holes of Sheep Milk Cheese, or Cow Milk Cheese, doth either kill all the Worms or cause them to get packing, it contracteth the holes, and turns the bad Cheeses into good ones, and this my self have tried.

Thus friendly Reader, hast thou learned how to make a fit Sawce for Fish and Flesh, and likewise good and durable Cheese; it now remains that we teach thee how also to make good Butter.

If you are desirous of making good Butter by the help of Spirit of Salt, and such as is dainty, pure and yellow, and of a most delicate tast, and such as will not easily contract a ranck tast, you may obtain your desire by proceeding on this wise. Take off the Cream from good Cow Milk, and make it into Butter, afore it be any thing mouldy, or of an unpleasant tast, and separate the Butter-milk accor-

ding to the usual custom, then put the Butter in a wooden Vessel, and wash it so long in pure cold Salt Water, untill there be no more Wheyishness left, and that the Salt Water do come off thencefrom, as clear as it was at first putting on, and that the Butter appears sufficiently clean, which wash it once again, on this wise following. Dissolve in pure and rectified Spirit of Salt, as much Salt as it will dissolve in the cold: And herewithall wash your Butter anew, yet several times, and work it well with that Spirit, and by thus proceeding will it absume the residue of the Wheyishness which is the cause and rise of rankness, and which common Salt Water could not remove. This done, the Butter is to be seasoned with common Salt according to the usual manner, and thus will it abide perfectly good for a long time. But now the big Sea Salt is accounted the fittest for this purpose, which being a little heated red hot in the Fire, comes to be of a very delicate whiteness, and doth the easier admit of reduction into fine Powder, and is better than that which is boiled up in Iron, or Lead Pans or Cauldrons.

N. B. But he that can get such a pure sort of Salt of a hexangular shape like a Dye, as is prepared in my Laboratory, he may use that, as being by far the purer. As for the Vessel it self whereinto the Butter, prepared and cleaned after the aforementioned manner, is to be put, it must be ordered on this wise following. You must get you a new Oaken Barrel, and so steep it in strong Salt Water, not the common [Sea Water,] as that it may well imbibe the Salt into this Vessel must the Butter, washed as aforesaid, be prest and thrust in so tight and close, that there may not be any hole or gaping place left therein; but you must leave two Fingers breadth in the Barrel at top of the Butter, which is to be filled up with Spirit of Salt, glutted with good and pure Salt dissolved therein, that so the Butter may be well covered over, and all Air being excluded, it may keep fine and favoury a long time. Now when you would Dish out some of this Butter on the Table, you must take it out of your Tub with a clean Wooden Spoon, and not an Iron one, and wash the same in pure and clear Water afore you eat it, if you would not have it retain the sharpness of the Spirit of Salt.

Well, here is yet a better way still, viz. Take new Butter and let it melt very gently over the Coals, and it will be covered over with much frothy Cheesynefs, let that froth be neatly skimmed off; which being so done, it will look in the Pot like to a pure and clear Oil, pour it out very clearly into another Vessel, that the sediment at the bottom may abide behind. This Butter when 'tis cold looks just like yellow Wax, but yet is it a little softer than it ought to be, and therefore it must be well wrought its due time with Spirit of Salt impregnated with new Salt, that it may obtain the hardness of common Butter, and then be salted, and barreld up, and kept for use, which will be far better than the common Butter. For although this purging it by the Fire takes from it all its Cheesynefs, from which it had its hardness; yet notwithstanding the Spirit of Salt gives unto it a far different and much better hardness, and causeth it to excell all other sorts in goodness and long keeping.

These things was I willing to take out of my Kitchen and set afore you, namely Sawce, Cheese, and Butter of good and exquisite tast, which if they please not the Palate of some or other, I would have him even

even forbear to use them. It is not without some weighty cause that I have done these things, which I well know will undoubtedly undergo the perverse Censures of Spies and Mockers, who probably will say, what Womanish Toys, and Childrens Baubles doth *Glauber* here Tattle about, making himself a Laughing Stock to the Women, and Female Sex, who will say of him, that by his teaching to make Butter and Cheese, he hath thrust his Sickle into the Womens Harvest. VVell, let them prate as pleaseth them, Geese are not wont to utter ought else but a Goose like Gagling. For my part I minded nothing else but to have this Treatise be a meer Woman's Work, and Boys Play, [but yet] it will reveal to the Ignorant more good, than [is attainable] by the perverse instructions of all such Authours whose Writings are Spinn'd out to that height of subtilty as to exceed every ones Capacity.

'Tis not every one that will easily apprehend these [Knacks] which I teach and reveal under this Cheese-making Trade, and these Kitchen Operations; nor indeed doth it much matter that they should understand. God will open the Eyes of such as he shall judge worthy of such great gifts, and will conceal and hide the same from the Proud and Wicked Crew.

Having thus finished this Cheese and Butter-making: Let us in Gods Name enter upon another Work of Women, and Boys Play, which Kitchen-like Labour, and Cheese and Butter-making, is meerly metallick and doth far excell in excellency and nobility the hitherto described Operations, although it be performed by the help of the self same Salt. For without Salt no imperfect Metal can be really bettered, the very title of the Art it self witnessing as much, which being filed Alchymy, signifies no other thing than a melting of Salt: but yet I do not tell what kind of Salt is here to be understood, [or, that any kind of Salt is here meant] but thus much onely do I averr, that the transmutations of the Inferiour Metals must be effected by Salt.

Now then, sofar as this Treatise of mine depends on a former, intituled of the nature of Salts, as being an overplus; so it is likewise altogether necessary, that instead of Fruit and Sugar, I use Salts and Metals about the preparation of these my Sawces.

And whereas the making of the Sawces [or Sweetmeats] with Sugar, doth not onely belong to the meaner Sex, but also to the more noble, and yet nevertheless the Operation it self is nothing else but a meer washing and boiling, and a true Womens Work, we will therefore in our description bring the same upon the Stage under the Title of the Work of Women, and Play of Children.

If we rightly look upon the Work of VVomen, and compare our metallick labour therewithall, there presents it self unto us, a very notable agreeableness betwixt them. The VVomens VVork is to boil and wash, and when they are about to boil, they set their Pots over the Fire, and having washt their Flesh, they strow thereon some Salt and Spices, and boil the same in the said Pots with VVater, VVine, or Vinegar, till it be tender, and become fit to be eaten. They likewise feed the Fire they boil withall by putting VVood thereon, whereby the heat may be kept up, and no impediment may betide their VVork: And this is the way and method observed by the Female Sex in their boiling.

But as to their washing off the filth from their Cloaths, they are wont in the first place to pour hot Water thereupon thereby to wash off the more gross part of the Dirt: and then they use a sharp Lee, or some Sope, or even both together to take away the remainder of the filth, and to wash out all the Spots and Dirt, then do they agen wash off the Sope and Lee with fair and hot Water: But as for the odour that the Sope leaves, and which by no washing how much or how oft soever it be done can be carried off, to get that off I say they are wont to lay their Linnen out in the open Field, and sprinkle and moisten it with pure Water, which being dried by the Sun, Air, and Wind, they do agen repeat the same labour, untill all the stinking smell of the Sope be drawn forth by the Sun and the Air, and a better and more wholesome Odour come in its room. Then at last they dry them at the Air and Sun, and being dry, they fold them up and put them in their Chests and Trunks, and keep them for their use.

Just so do we deal with Metals, when we wash off their defilements, and do by boiling turn them into wholesome Food or Medicaments; but yet we do not use common Vinegar, common Salt, and common Spices, but mineral or metallick subjects, as also a duplicate Fire, viz. one of them is a secer, philosophical, moist, cold, and vaporious Fire; and the other is the elementary and common Fire, by which we fir up the former Philosophical Fire to display its virtues, and render it powerfull and efficacious.

The elementary Fire we make with Wood, Coles, or Oil: The universal Agent, or Philosophical, Cold, Moist, Digesting, Penetrating, Mundifying, Bettering, and not Burning, but Conserving, and vaporious Fire, we seek for in Salt, and leave the Operation to the vivifying Sun and Air; which being well done, we obtain wonderfull Plants, and most efficacious Food, or Sawce for our Life.

And sofar as my purpose here is, to treat of such metallick and medicinal Sawces, I will here in Gods name adjoyn some of them, which being as so many samplers or patterns, every one may at his pleasure imitate in composing and making of the like. And he will here find a way of confecting some good Medicament, as clearly and evidently demonstrated by me as was lawfull for me to do, nor was it in my power to discover the same more perspicuously: And therefore I beseech every one to take in good part what is here presented, and to forbear to trouble me for the time to come with needless questions.

So then, seeing I am about to treat in this place of metallick Sawces, it is also behovefull to have a metallick Sugar and Spice, and this, *Saturn* will afford us in the seed of the common [Sugar] by whose help we reduce *Sol* and *Lune* as being most excellent Spices, into most effectual Medicines.

Nor would I have it seem strange to any one that I use Lead here instead of Sugar, for the inmost juice of Lead, doth exceedingly out-go the sweetness of any Sugar, which thing *Jean Holland* doth very evidently testifie in his Treatise of *Saturn*. The Ghymists do frequently extract a sweet Salt out of Lead, with distilled Vinegar, and call it the Sugar of Lead, and do very well know and find that there is such a sweetness in Lead as is not in any other Metal beside. From it therefore will we prepare our Sugar to make our metallick Sawces withall, as follows.

F f f f f

Take

Take of Lead-ashes one, two, three, or more pounds, which put in a strong well glazed Earthen Pot, then pour thereupon some Wine or Ale, Vinegar, or Vinegar of Honey, as much as may over top it an hand's breadth. Set your Pot upon the Coals and make the Vinegar boil.

N. B. The Ashes are to be incessantly stirred, in the boiling with a wooden *Spatula*, lest they gather into one entire solid Mass: After that the Vinegar has boiled for about half an hour, and is become yellow, and as sweet as Sugar, you must decant it from the Ashes, and pour on more, and again boil it, and extract more sweetness, and this labour must you repeat so often until the Vinegar can extract no more sweetness; then having put all these Vinegars together, pour them gently off from the Feces that settle in the bottom of the Vessel, and being thus separated, filter the same through Cap Paper or by a filter, that so the Liquors may be very clear, and may give you by separation, that sweetness of the Lead which they hold up in them.

Into these clear Vinegars, therefore being put in a Glass Vessel, pour therein (by little and little) as much rectified Spirit of Salt, that so the yellow Vinegar may be turned into a white Milk, and may by little and little settle to the bottom like curdled Cheese, from which the Vinegar being now become again clear is to be removed by decanting; then put the Saturnine Cheese in some strong Linnen Cloath and tie it hard up, and squeeze out the residue of the moisture, and so dry it and lay it by for use. It is a most tender Powder, of a bright snowy colour, and void of all taste; for in the precipitation, all the sweetness being introverted by the Spirit of Salt, hath hidden it self within, which doth again afterwards (when that mass shall be reduced into a Sawce) shew it self, and discovers its former taste, as we shall hear anon.

I would have the friendly Reader know, that I am not minded to produce here many and divers Operations, for I am straitened in my time, which stops me from giving you a more prolix and circumstantial description: I do only propose some few, and leave every one to his fancy to make the rest of the Sawces or Medicaments, according to the ways here prescribed, according to his liking, and that as many as he will, and out of such subjects as best please him.

But that I may contract these things concerning my Sawces into a narrow room, I suppose it is well enough known, that Sawces and Junkets are distill out in the second course for this end, either to close up and strengthen the Stomach, or that if a fudding storm be at hand it may drill the readlier down into the Stomack by these kinds of Vehicles.

But yet my purpose is not directed to this end as to teach the making of such banquetting Dishes in this place, as may allure Wine into the Stomach by such an unprofitable Prodigality, and so detriment the Body it self too. No, but the main drift of my Sawces should rather be this, viz. to remove that evil which is stirred up in the Body of Man, by the common Junkets and the overmuch guzzling in of Wine, and to strengthen the Stomach, Heart, Brain, and other Members of the Body, to heal the parts that are hurt, and in particular, to restore them to their former health: And finally, to be as a kind of guide and manuduction to lead on the Ingeny of Men in such wise, as that they may by an easier way

arrive unto the Knowledge of the universal Medicine.

To begin therefore, I confess that of [all] fruits preserved with Sugar, none have a more gratefull taste on my Palate than Bar-berries, and Ribes, or St. John's Grapes as they call them; which fruits, preserved up with Sugar, do not onely get the Stomach an Appetite, but do withall allay Thirst, and do extinguish all the internal heat stirred up and kindled by overmuch drinking: The like metallick Sawce or Junket shalt thou prepare on this wise.

Buy some Steel filings of the Needle-makers, and take thereof as much as you please, dissolve them in rectified Spirit of Salt, which Solution will be green, and be of a sweetish taste; abstract the insipid Phlegm, insipid I say, for although it be a very strong Spirit of Salt that is poured upon the Iron, yet nevertheless no Spirit comes off, but onely an insipid Phlegm in the abstraction and distillation, and the Iron retains all the acidity of the Salt, and remains a red, sweetish, astringent Juice.

Take of this, and of the Saturnine Powder which we taught you the making of but now, of each a like weight, and put them into a well coated Retort, and the *Saccharum Saturni* will presently drink up the Juice of the Steel. Put the Retort in a Vessel filled with Sand, and augment the Fire by little and little that all the insipid Phlegm may be wholly drawn off. When 'tis all come off, and that acid drops begin to come, then must you apply thereunto a Glass Receiver, and the Fire is to be encreased by degrees untill the Retort be thoroughly red hot, which must continue so about an hour, or half an hour a least. By this means, the Spirits of the Sale which were in the Steel, do almost wholly come over into the Receiver, and do carry over with them [the Spirits] of the *Saccharum Saturni*, and oil of *Mars*, in the form of a red sublimate, which settles it self in the neck of the Retort, which sublimate when the Retort is cold and broken you must take out of its Neck, and keep it from the Air, for in the Air it will dissolve into a red, sweet, and Astringent Oil, of no small virtues in Medicine and Alchymy. In the bottom of the Retort you will find a molten Mass, resembling *Lapis Hematiticus*, which being separated from all defilements, will give you a red, brittle, fusile Stone, and in some sort astringent, of great virtues in Medicine, and without doubt in Alchymy too, if it were but first made constantly to abide in the Fire. And even this too, must you keep from the Air, for it is still impregnated with the Salts, and therefore is easily resolved.

Now when you would make use of this Stone in Medicine, break a little bit thereof into small Powder (for it is no harder than other Salt, and therefore doth easily admit of grinding to Powder.) This Powder heals both internal and external Wounds and Ulcers, being administered in the quantity of two, three, four, five, six, or more Grains, according to the age and condition of the Sick, and being taken in a convenient and proper Vehicle, it is highly Sanative and a stopper of Blood. Being applied externally to Wounds, it wonderfully forwards healing; hinders all Symptoms, and fundamentally dries, and cures all Ulcers and Fistulae, if used outwardly and inwardly too.

It doth most safely and most certainly help all the overflowing of the Menstrues in Women, and is so excellent a Medicament in the *Dysentery*, *Lientery*, and other *Fluxes* of the Belly, that its like is not to be found.

Thus

Thus have we that true and genuine *Hematitis* of the Ancient Physicians, of which they have written so many things, but what through the carelessness of the Physicians that succeeded them, and what through the length of time it became wholly lost, instead of which there hath been hitherto used the insoluble and hard Stone of Iron.

The Ancients imposed upon their more noble Medicaments, Names deduced from similitudes or resemblances, as may be seen in this our living *Hematitis*, and in the dead *Hematitis* of the common Physicians, which is call'd for at the Apothecaries, and administered to stop Blood withall; But yet it is nothing else save the Stone of Iron, and such Oar as is very rich and abounding with this Metal, the fragments of which appears [either] in the form of spear-like Stria's or Streaks, or like a cleft stone. This our live *Hematitis* is of the same form, but soluble, and is of a very pleasant and astringent sweetness, and containeth most efficacious virtues for the allaying of all bloody Fluxes both outward and inward. Now that common and well-known *Hematitis* doth not possess any more virtues than that Iron Scinder-dust which the Smiths smite off at the Anvil, doth. And as for that red Sublimate which ascended up in the neck of the Retort, it is twice stronger in subduing the afore-mentioned diseases, but it is not of so sweet a Taste as the Stone it self, which resided in the bottom of the Retort. And being externally applied in cleansing and mundifying old Fungulous Ulcers, it works much stronger than this our *Hematitis* (which is more pleasantly administrable in internal defects) doth. But whoever he be that knows how (by many Solutions and Coagulations) to make this Stone constant in the fire, will obtain a far more excellent Medicament: concerning which, we will speak more in the end of this Treatise.

This now is such a Sawce or Junker, as every good Physician and Chyrurgeon hath just cause most highly to esteem in all Fluxes and Sores, both old and new, if he would obtain that repaire which he thirsteth after; for it is endued with great Virtues, whereas on the contrary, the Juice of Sloes, the common *Hematitis*, and *Crocus martis*, are, in comparison of this, to be accounted of as meer dead Medicaments. I could tell you of more virtues that are in the red Sublimate, and this in an especial manner, viz. that without being either bound on, or inwardly taken, but sympathetically and at a distance, it is able to cure any issues of Blood, whatever. But I shall doe better to pass these things over in silence, because to the greatest part of unskilfull Men, they will not onely seem wonderfull, but impossible likewise. However, I commend to every ones acceptance this so excellent a Medicament, for all internal and external issues of Blood, in all wounds and hurts, as also in all the obstructions of the Spleen, Liver, and other members of the body.

After such a manner as this, may any one easily turn all the Metals into Sugars, and into most excellent Medicaments. But forasmuch as the Metals are not all of them indifferently fit to be administered inwardly to the sick, I will make mention of Gold and Silver onely as being the best of all, and pass by the others, and will teach the preparation of yet more Sawces and Junkers; Copper, Tin, and Argent-[vive] are somewhat cruder bodies, and require greater care and diligence, to have the Title of good Medicaments. We will therefore let them

pass, as having Gold and Silver at hand, which are more ripe.

The manner of Preparing a good Sawce or Junker out of Silver, which helpeth the Distempers and Diseases of the Brain.

THE skilfull Chymical Physicians have assigned Silver for a Medicament for the Brain, which Assignment of theirs I acquiesce in, and doe here present you with such a Sawce or Junker as is of most especial use for the succouring of the Brain.

Take of common *Aqua Fortis* (such as is commonly used about the dissolution of Silver) one pound: In two ounces of which you must dissolve one ounce of pure Silver; Dissolve likewise one ounce of Lead by it self: Put both Solutions together in a glass with a wide mouth; and being thus mixt, pour thereupon as much rectified Spirit of Salt as is sufficient for the precipitation of both the Metals. Pour off the clear water from the precipitated Metals, and pour upon them some fresh water, and stir them well about; which done, and the precipitated Calx settled to the bottom, the water is to be again decanted off, and more fresh water poured thereon: and this Labour is to be so often repeated, untill that precipitated Powder be void of all Acrimony: then put it in a pure linnen Cloth placed in a Funnel, that so the remaining moisture may drain from it. Then tie the cloth very firm, and squeeze out, in two balls (or squeezings) all the residue of the moisture out of that silvery Cheese, and lay the same upon Cap-paper, and that will drink up all the rest of the moisture, and will soon dry your Cheese. This Cheese (or precipitated Powder) is to be put into a well coated Glas-retort, and to be forced with a gentle fire of Sand, that so all the superfluous moisture may be separated. Then, at last, the Fire being augmented, will force out part of the Silver and Lead in the form of white Flores, ascending up in the neck of the Retort. Now when the Retort hath been thus kept red-hot for one hour, let the fire go out of its own accord, and take out the cold Retort, and break it, and you will find in the bottom of the same a white and sweet Stone, which will melt (upon a red-hot Plate of Metal) like Wax, and penetrate the same, and is volatile like *Argent-vive*. Two, three, four, five Grains, even to eight or ten, of this Stone ground into a Powder, being administered (respect being had to the Patient's age and sickness) yield a most present comfort in the diseases of the Head and Brain, and so are those white Flores wont to doe likewise: but in Chymical operations they are of eminent use. Now although this Stone be it self of a fugacious nature, yet notwithstanding in progress of time it makes *Mercury*, together with it self, constant in the fire: of which thing I have elsewhere already mentioned in my Writings, so that I need not say any more thereof in this place.

However, I cannot omit to tell you, that, although, otherwise, there is no familiarity at all betwixt Silver, and Lead, and Salt, yet nevertheless these three may be so prepared as (by a certain mixtion) not to refuse each others society. Hence it comes to pass, that if the Salt be rightly fitted for this operation, it puts forth more powerfull virtues, and for that reason doth the Silver sulfer the more, and doth by so much the sooner attain to a constancy in the fire: and so 'tis evident, that the name of Alchymy or fusing of Salt, was not imposed on this Art for nothing.

For

For by the help of Salt, are the Metals to be molten and meliorated, which thing you may take notice of.

Another Sauce or Junket made of Gold and Silver.

Take some pure Silver, and dissolve it in *Aqua Fortis*, and precipitate it with Spirit of Salt, and free it from its Acrimony with common water, and squeeze out the water, and lay your matter upon cap-paper to dry, and deal with it in all respects as we spake afore in the Process of *Saturn*. Of this Calx take three parts, and one part of Gold dissolved in the Oil of Salt; and first put your Silver Calx into a strong Glass-retort, which must be well coated, then pour thereto your yellow Solution of Gold. Place the Retort in Sand, and, first, force out your Spirit of Salt, in which forcing out, the Calx of the Silver will retain with it self the Gold; and of them both will be made a purple Stone, inclining somewhat to redness, fusile, and volatile. But the Oil of the Salt will carry up with it something of the Gold and Silver into the neck of the Retort; which, together with the aforesaid Stone, you shall take out of the broken Retort; but yet you must keep each apart, for a medicament of great moment: [both] which (if they were turned (by Solution and Coagulation) into a fix Ruby,) would doubtlesly perform their work, in the metallick Operations, with greater benefit and profit.

So have you here, briefly described, the third Junket, which, should it be described with all its Circumstances, the Process it self would in good sooth be more prolix and tedious than is fitting. And forasmuch as my Writings may seem unto many sufficiently tedious, 'tis but fit that I aim at brevity here in this place; though (on the other hand) they will seem (I well know) too short and brief unto others. But *Jupiter* himself pleaseth not all alike. And the birth-day of him who can satisfy all, is yet to come; for he is not as yet born. For behave thy self as thou wilt in thy actions, either in briefly delivering thy self, or in uttering thy mind in a longer discourse, thou shalt not at any rate fulfill the expectation and desire of all men. I doe therefore here dish out this Junket, and commit the care of eating the same to the Guests. Every one that will, may more accurately weigh and consider of the same, that so he may come to find, how great the Efficacy and Utility of this Process is, though delivered so very briefly.

Another Junket or Sauce, viz. A Confection of a Mineral Alkermes.

There is in the Apothecaries shops a Confection made of the Berry or Grains of *Kermes*, known by the name of *Confectio Alkermes*; in which composition, there are added to the said Berries some Pearls done into Powder, and Leaf-Gold, and Amber-grease, and other such-like corroborating Simples. This medicament being confectioned with Sugar, is lookt on as the chiefest amongst all those Medicines which are wont to be administered for strengthening the Heart, and it merits the praise ascribed to it. But now instead of the Leaves of Gold, (which cannot be digested or concocted by the stomach, and are therefore carried forth with the Excrements without any operation,) I will substitute another Gold, which being made suitable, and accommodated unto nature, shall

be able to put forth its virtues, and supply the place of foliated Gold, in the Confection of Alkermes.

And if any one be so minded, he may omit even the grains or the berry it self (for they are not to be had every-where) and make use of this Juice of Gold, which I am about to teach in this place, and mix it with Sugar and other Powders that are strengtheners of the Heart. For this Golden Confection of a purple Colour, doth most notably strengthen the Heart by its corroborative virtue, and the Gold it self gives a far more excellent purple or scarlet Colour than the Grains of that berry doe, which are brought us from *Mompelien*. The way of preparing the said Gold, is as follows.

Dissolve the Calx of *Sol*, or of Gold, in strong Spirit of Salt, and pour upon the Solution some three or four parts of water more than the Solution is, that so the Acrimony of the Spirit of Salt may be somewhat allayed. Being thus prepared, put thereto a bit of Tin, and such as hath no Lead commix therewith, which said Tin, the allayed Spirit of Salt will seize upon, and dissolve part thereof. And being also debilitated thereby, it will let fall all the Gold that it contained, in the form of a purple Powder, adhering partly on to the Tin, and part will be of its own natural colour, and settle to the bottom, but as subtle as the Atoms that fly about in the Sun-beams, and resembling little stars. When therefore the whole body of the Gold is precipitated into a most delicate and fine Powder, out of the Spirit of Salt, which will now be clear and bright: Pour off the Spirit, and take the Tin out from the Golden Powder, and wash the Powder with clean and pure water, that so none of the Spirit of Salt may be therein discerned; and being now thus prepared, it may be used instead of Gold about the Confection of Alkermes.

Moreover, if you are so minded, you may take some pure Sugar-candy, and make it up into a syrup with weak Spirit of Salt, and then put thereto this Golden Powder with a little Amber grease and some Powder of Pearls, and so make full as good, nay a better Confection than that common *Confectio Alkermes* is; because a greater corroborating of the powers of the Heart, and a delicater purple Colour cannot be found in any other thing than in Gold. If now you operate aright, it cannot otherwise be but you must needs attain to this purple and golden Confection.

N. B. The Tin must be very pure and clean, for by how much the whiter it is, and the acuter found it has, so much the fitter is it for this work. And in the Composition it self you may use this following weight or measure.

Take of the Calx of Gold one Lot [or half ounce] and dissolve it in three or four Lots of strong rectified Spirit of Salt: Pour unto the Solution twelve or fifteen Lots of pure water; then to all this, put two Lots of Tin, and set the Glass that the Solution is in, upon hot Sand, and heat it scalding-hot, but let it not boil. When it hath thus stood for one or two hours, all the Gold will be turned into Powder, of a Purple and Gold-like hue, and settle to the bottom. Then having poured out the Water, and separated the Tin, separate all the Acrimony from the Powder by several washings, and so will you have it fitted for the Confection. This done, take twelve Lots of Sugar-candy, and one Lot of rectified Spirit of Salt, and as much pure fair water as is sufficient to reduce the Sugar into a thick Syrup; Hereto add

add one Lot of that purple and tender golden Powder, and it will tinge all the Sugar with a Purple or Scarlet-colour. Then add likewise thereunto, two Lots of Pearls made into fine Powder, and one Quintula (about two drams and an half) of Amber-grease, mix them well together and set it by for use, as being a most efficacious Confection. And if you please, you may add to the former ingredients other strengthening and refreshing Powders. The Dose of this Confection is from 3, 6, 9, 12, 15, to 20 Grains, according as the persons are. It corroborates the Heart, Brain, and the whole Body, and doth likewise (by reason of the Spirit of Salt) allay thirst, and stirs up the appetite to food.

And thus much may suffice this time about Sawces or Junkers. It now remains that we likewise search after some select and harmless Purges out of the Metals too, and adjoyn them to the former. When in feasting (or merry-meetings) the Guests are wont to drink Healths to their Lords, and tope off many Cups, and store of Glasses full of strong Wine, it cannot possibly be, but that their Stomachs must be stuft with tenacious and clammy humours, and the Head much oppressed with Carthars, and the Bowels fill'd with store of wind. Now here cannot be a better and more profitable way of succouring these Stomachs and Heads, thus beset with so many tenacious humours, and of helping the whole body thus corrupted by so often repeated draughts, than by a purgative Medicine, which by expelling all the evil and offensive humours opens all the passages of the Body, and again brings the so necessary respiration. We will therefore present you here with three such purging Medicaments, and those very good ones. One is of Antimony; The second of Silver and Antimony; And the third of Gold and Antimony: Each of which, by it self, doth far exceed the other purging Medicaments made of the Vegetables.

For Metals do penetrate the Body far better, and do perform their Operations with less hazard than the Vegetables do, most of which abound with a resinous clamminess, which doth often stick to the Bowels, and cause great gripings, which is not to be feared at all from metallick purgative Medicines: which (upon this account) are to be preferred before those that are prepared of the Vegetables; nor do I condemn these Vegetable Purges, for they are good, and may be made use of, where better are not at hand.

Therefore, sofar as I have in my time, made trial of many such Medicaments, and have in very deed found, that metallick Purges do excel the Vegetable ones both in pleasantness and efficacy, and are far safer; I could not but commend the same above all other Purges to such as come after me, but yet leaving every one at his pleasure to make use of either these or them.

C A Purge of Saturn.

Dissolve two ounces of Lead in pure *Aqua Fortis*, and pour upon the Solution one ounce of Butter of Antimony, that so they may be precipitated together into a white *Coagulum* or Curd, whereto you must put a good quantity of fair water, and stir it very well about, that it may imbibe the Spirit of Salt which was in the Butter.

Then pour off this water, and put on more, and repeat this labour so long, untill all the sharpness be

wash out of the precipitated Powder. This white Powder being dried is a most excellent Purge, educating all evil and hurtfull humours out of the Body without danger, and being administered from one Grain to ten, according as the Patient is, doth work downwards, especially when it is given in a lesser Dose. But if there be need of vomiting too, then the Dose may be encreased, especially unto those that can brook vomiting, and cast with ease. It may be used without danger as a good and safe Purge, in all such Diseases as purgative Medicaments are, and may be administered.

A Purge of Lune.

Dissolve two ounces of pure Silver in four ounces of *Aqua Fortis*, and pour upon this Solution one ounce of the Butter of Antimony, which together with the Silver will go into a white Curd, as we said but now of the Lead in the preceeding Process. Wash this Powder with common water, and dry it and administer it in the same Dose as the Saturnine Powder is to be given; and it will perform its part in all Diseases, but especially in those of the Head.

N. B. The Butter of Antimony must be made of the *Regulus* of Antimony, with rectified Spirit of Salt, and not with *Mercury* sublimated, as the common custom is.

Purging Gold.

In the first place, you must make a most strong Spirit of Niter thus, *viz.* put equal parts of calcined Allum and good Salt-peter into a well coated Retort, out of which is to be drawn (leisurely and by degrees into a very large Receiver luted on to the neck of the Retort) a Spirit, which will make the Receiver look red. All the Spirit being distilled, let the Fire go out of its own accord, and leave on the Receiver so long till all the Spirits are settled, and that the Receiver be become clear agen: Macerate the Lute, which joyned the Receiver on to the Retort, with water, and have an especial care when you take off the Receiver, that none of the Lute fall into the Spirit. Put the Spirit in a strong Glass, and shut it up well with Wax, that it may not exhale, for it is very strong, and is red as Blood, because it had no water put unto it in the Receiver.

Pour two ounces of this strong Spirit upon one ounce of the Butter of Antimony, and it will presently pass into a red Solution, whereto put one ounce of pure Gold that it may be dissolved, which Solution will be redder than Blood. Then pour in thereupon some common fair water, and the Antimony and the Gold will precipitate into a Purple Powder, which is to be wash'd well with water, and so dried.

Its Dose is from one, two Grains to six, (according as the Age and Party is,) it may be given in Wine, Ale, Water, or any other Liqueur, which may be as a Vehicle unto it. It works without any danger, and doth safely and pleasantly (beyond all other Purges) drive out all offending Humours out of the Body of Man.

Aurum Diaphoreticum, or Sweating Gold.

If no water be poured upon the just now-spoken of red Solution, thereby to precipitate the same, but
G g g g g that

that that strong Spirit of Niter be drawn off by a Retort, it then takes from the Antimony its purging and vomiting power and makes it Diaphorical. Nor needs the Purple Powder, when it's taken out of the Glass, any washing at all, because being administered in two, three, four, five, six, or ten Grains Dose it may be safely taken, and it provokes Sweat. It is therefore very profitable in all the Diseases that are to be expelled by Sweat; yea in the Leptosie, Gout, Dropsie, French-pox, Plague, Scurvey, and in all Feavers doth it play its part even to admiration, for (by reason of the Gold which it contains in it) it doth both provoke Sweat, and strengthen the powers of the Body.

The former Powder or purging Gold, being mixt with an equal weight of purging Lume, or purging Saturn, and molten in a Crucible, turns into a red Stone or Glass, of which little Tablets or Pellets somewhat bigger than a Pea may be again cast or molten, and kept for use. And now when there's need of purging, let one of those Tablets be put into some Spoonfulls of Wine and lie therein all night, and let the Wine be drunk off in the morning following, just after the self same manner as other purges are wont to be administered. For there is so much virtue extracted by the Wine out of the glazen Tablet as to give several Stools. If one Tablet or Pellet be not sufficient, then may a second, or a third, or more be adjoyned thereunto, and so left all night in the Wine, that so the Wine may work more effectually if need requires. The Tablets or Pellets remain good a long time, and may be many times applied to the self same use.

But if any one should be desirous of performing this labour even yet better, he may get a little Pot or Cup to be made for him of white Earth, and and may have it glazed both inside and outside with this same Glass; for two or three Spoonfulls of Wine infused for a night in such a Cup, and drunk off next morning, are capable of purging you even as doth the other.

These are the effects of these purges in Medicine. They likewise do some good in Alchymy, if all three of them, viz. the Saturnine, the Lunar, and the Solar are reduced by melting into a Glass: this Glass being Philosophically cemented somewhat of the Silver, Lead, and Antimony will be meliorated, and turned into Gold by the Gold.

Now for a Farewell, take this which follows. If the God *Appollo* the Inventer of Medicine, would bestow his light upon any one, and by his hot Beams melt the waxen Wings of the untamed, flying, and (to his Father *Dedalus*) disobedient Son *Icarus*, (and flying out of the Isle of *Crete*, over the *Icarian* Sea,) that so he might fall down into the sweet and sulphureous Sea of the Sun, and may remain drowned therein: Then from this dead Body (which is not wont to be subdued by any other means) may a most excellent Medicine be prepared. For what way soever he is handled by otherwise, whether he be turned into a white sublimate, or be reduced into a yellow or red precipitate, he is notwithstanding always corrosive; and brings more hurt than good, and therefore may very deservedly be eschewed.

Or if we did but know the way of fixing it without any corrosivity, by those three principal Columns of all Medicine, namely *Vitriol*, *Sulphur*, and *Antimony*, he would undoubtedly be administrable

without any fear, and be withall capable of performing great matters. For then he would not stir up and cause so many purgations, and such vehement Salivations, and other hurtfull symptoms as usually comes to pass, but would bring a most speedy help to the Sick by his gentle operation by Sweat and Urine, and get the Physician a most eminent praise.

This I would have every one know, that *Sulphur* has a power of killing all Corrosives, and reducing them to a sweetness, whether it be done by the dry way or by the moist. And of all *Sulphurs*, a Vegetable *Sulphur* is the fittest, which being freed from its inflamable nature, is capable of reducing [any] Corrosives, though never so great, unto a sweetness in one hours space. Nay more, any Metal being first dissolved in such like Corrosives, doth together with the same become a sweet Medicament: And so when Gold is dissolved in Spirit of Salt, and Silver, Tin, Copper, Iron, and Lead are dissolved in *Aqua Fortis*, and that that Corrosive Dissolvent is transmuted by a sweet *Sulphur*, it so comes to pass that the Metal together with the Corrosive is made a Medicament; and becomes potable. Such potable liquor of the Metals, (but especially of Gold and Silver,) and void of all Corrosivity, will you meet withall in my Medical-shop; which liquor, as well those of Silver, and Copper, as that of Gold, are red. The Liquor of Gold may be used instead of *Aurum Potabile*, and it gilds Quicksilver and the other Metals with a golden Colour, like as the Silver-liquor gilds *Mercury*, and Silver [or Copper, probably] with a Silver Hue; and the Coppery-liquor gilds *Mercury* and Iron with a Coppery Colour.

N. B. *Aurora* being inflamed with the love of *Jupiter*, and withdrawing him together with her self into Heaven, if both of them be again thrust down headlong by the other Gods into the Salt-Sea, they come forth out of this Bath, so delicate and so white, that she resembles the fairness of *Diana*; and he, the comeliness of *Appollo*: but not as yet constant in the Fire. But when the time of bathing is over, *Mars* coming to the Sea Shore, draws both of them out upon a dry Island called *Iruny*, from Iron; where they are yet once more washed by *Vulcan*, (who makes use of *Saturns* help) in a dry Bath, who washeth off the Defilements far more accurately than the Salt Sea could, for he leaves not off washing and purging them, until all the Defilements are separated from both their Bodies, and that they be made like unto *Diana* and *Appollo*, in Constancy and comeliness.

Mars seeing that his Sister *Venus*, and Brother *Jupiter* did come forth out of the Salt Sea with so lovely a fairness, leapt thereinto himself, that so by spending some time in washing, he might rinse off those black Defilements from his black Body. But there was such store of filth washed off, as made all the Sea green and sweet, and it hid [or swallowed up] *Mars* himself, being now much diminished, in so much that he could never have escaped out of that Sea, had not *Sal*, out of meer pity on him, dried up the water of the Sea, for old limping *Saturn* to come unto him, and to take poor wretched him out of the Dirt and Mire, which he also did.

But because there was such a deal of Mire and Filth as that this (slim) lame, (hopping Fellow) could not get out again, he even there stuck fast with *Mars*, and so lost his Life. Of the dead Bodies of these two, viz. of *Mars* and *Saturn*, *Vulcan* did at length

length make one Head having two Faces, or a double Countenance, one resembling *Apollo*, the other *Diana*; and upon this account was the name of double-visaged *Janus* bestowed upon it by *Vulcan*.

By these few and short Operations and Processes, may any one make and devise many more such like. I am not at this time, for my part, minded to busie and trouble my self about any more tedious a description of such matters, for I guess that in what I have already said and disclosed to the unthankfull, I have too much exceeded my bounds. Every one may choose to himself those things which he shall deem most profitable, and forbear to despise that which he shall not be capable of apprehending the meaning of.

'Tis a usual Proverb, *That a Cup of generous Wine must accompany Dainty Delicacies.*

Because therefore we have in the three precedent Sawces or Junkets, presented you with fine favoury Cates, it is but fitting that we accompany the same with three dainty draughts, and those drawn out of the best of Metals too, namely out of Gold and Silver, because the Cates or Sawces themselves were composed of the same. Our Ancient Predecessors called those Drinks of old time *Nectar*, or the drink of the Gods, which in our days are known by the names of potable Gold, and potable Silver.

Concerning these two, do many of *Ignoramus* his Fraternity babble many Stories, and fallily boast that no true potable Gold can be prepared, or be in Being without the Philosophers Stone. This conclusion of theirs is clearly untrue, for a Man may easily make Gold and Silver potable, though he hath not any knowledge at all of the universal Medicine, which is to be thus understood, *viz.* when the Gold and Silver either alone or conjoynd, are dissolved in a sweet and not Corrosive *Menstruum*, and rendered fit to be administered to the Sick in Water, Ale, Wine, or any other Liquor. For those kind of Solutions may be taken for a simple potable Gold and Silver.

But now for any one to dissolve Gold in that corroding *Aqua Regia*, or Silver in *Aqua Fortis*, and then to imagine that he hath potable Gold and Silver, he is altogether in an Errour. Potable indeed they are, because they may be drunk like other Liquors: But forasmuch as those kind of Solutions do corrode all things, and bring extreame Detriment, they are justly rejected, and the rather because being poured into Wine or Ale, they desile and thicken the same; which, no true potable Gold dissolved in a Not-corrosive *Menstruum*, will do, but when 'tis mixt with Wine, Ale, or Water, it remains bright and clear. Besides too, true potable Gold must be of such a property, as to have no visible corporal Gold producible thereof of, and yet notwithstanding, be able to indue the meaner Metals, yea and *Mercury* it self with a golden nature; if they be therein boiled, or to coagulate and transmute them into Gold by the dry way in a Crucible, whether it be done with profit or without profit [it matters not.] Now this tinging virtue comes not from corporeal and dead Gold, but from a spiritual living and tinging Gold.

If therefore the common and corroding solution of Gold, cannot be accounted for a true *Aurum Potabile*, and that the spiritual and tinging Gold, which is dissolved without any corrosiveness should not come under this Title neither, whence I pray should it be sought for, and where should it be inquired

after. I confess, I do easily perswade my self, that as for the first Ens of Gold if we did but know how to wash and purge it in such wise, as that being turned into a bloud red liquor, it would admit of Distillation by an Alembick or a Retort, we should have a better potable Gold. But where shall we find such an Artificer, as can teach us the way of preparing such a potable Gold? 'Tis therefore our best way to content our selves with such Medicaments as we have at hand, so long untill God bestoweth better upon us. This likewise I believe, that if we did but know such an Artifice as to wash and purge *Mercury*, in such sort as that it might pass into a pondeous and sweet Water, and if we could so adjoyn some pure Gold thereunto instead of a ferment that they might lift up [or sublime] themselves together, and again become constant and fix: that then, from them would arise a red and soluble Carbuncle, or true potable Gold. But these are onely my simple thoughts and conceptions, no dispraise to those suppositions which other men have entertained concerning this matter. So likewise if spiritual Gold, and the spiritual Sulphur of the Vine be conjoynd by the help of Salt, they give a good potable Gold, which contains in it Gold potentially, but not actually or palpably, as may be seen in my Treatise of the true *Aurum Potabile*, which being clear like Water, and a bright or fair potable Gold, I do adjoyn to my Cates or Sawces instead of White wine.

But even as White wine the longer it is kept, the yellower it grows, so likewise white *Aurum Potabile* doth not retain its whiteness above two or three months, but becomes more and more yellow, and is at length turned into a redness, but still retains its tinging faculty. Heretofore that shall not be well pleased with the tast of [my] Wine or potable Gold, let him tarry till being more old they become yellow or red, for then they are of a pleasanter tast, as having (through long Process of time) lost their Sulphureous Tast.

But as touching the manner of making that potable Gold, as also all other unpleasant, fugacious, and unripe metallick Potions, pleasant, ripe, fix, and sweet Liquors, that shall be revealed afterwards.

Furthermore, I do here serve out instead of a good drink, the golden-coloured Soul, or my Tincture made of Niter, of which I have spoken in the second part of my Spagyricall Dispensatory. It is of as much virtue in Medicine as that potable Gold is, which I made mention of but now, but performs nothing in Alchymy or in the Transmutation of Metals; but what it would do if it were made fix and constant in the Fire, I do not as yet know, for I have not as yet brought it to that pass. But how it may be made fix shall be presently shewn. This very Tincture in the degree it is at present in, produceth great effects in Medicine, yea and greater too than those which I published about it, in the second part of my Spagyricall Dispensatory. It is of a delightfull Tast to the Palate, it removes the obstructions of the Liver, Lungs, and Spleen, it provokes Urine, expels the Stone, prohibits Obstructions with the Excrements, it may be most safely used by old and young, yea even by those whose strength is much debilitated, and it is wont to afford them present help; it wonderfully Corroborates, and makes all Animals, Minerals, and Vegetables fruitful, and this will easily appear so to be, if you do but take some Vegetable Seed and macerate in the same, and then put in the Earth, it grows far speedier

dier and ripens much sooner than other Seeds are wont to do.

I have sometimes macerated Wheat, Barly, Pease, and the Seeds of such like Corn in this Liquor for a night, and being thus steeped, have sown it in pure Sand, and they have grown ripe far sooner than those which have been planted in good and fat Earth: which is such a thing, as hath made many Men extremely to wonder, when they saw Corn grow in bare Sand without any other Earth or Dung, and be able to arrive to such perfect maturity.

Many other Salts there are of no great cost, and such as are to be had in vast quantity, with which, Corn being macerated and sown in barren Lands, and in such as are not dunged doth come to perfect maturity; and this I have tried not onely once, but oftentimes; and have also purposed (if God please) to bring it into publick use, in these United Provinces: to which end, the most Supreme Orders, General and Provincial, have granted me a Priviledge (or Patent) for many years; whereby it is forbidden to sow or plant barren, sandy Grounds and undunged, after this kind of way, without my consent. The main Basis of the knack lies in Sea-salt, which may be plentifully had in these places, and be easily prepared and made use of (to fatten lean and dry Grounds with) instead of Dung.

But amongst all such like Medicaments, the Tincture of Nitre bears away the Bell, for it causeth many Stalks to spring up out of one Grane, and to yield fruit, a thousand fold. Nor doth it onely make the Vegetables fruitfull, but Men too, and the terrestrial Animals, and even the Birds themselves that live in the Air. And by the same reason also may it be brought to pass, that even the Metals may be multiplied by the help thereof, as we shall declare upon, in what follows.

Both these Wines or efficacious Drinks doe very well suit with the metallick Sawces or Junkets, they heat the Body, help the concoction of the Stomach, corroborate the Spirits, give good Nourishment, drive forth out of the Body the superfluous Excrements, in a due manner by Stool and Urine, they cause Clearfulness, bestow a prosperous Health, give a comely Look, and change the Complexions into the Sanguine and best Complexion; in the accomplishment of all which things, that pure and golden coloured Tincture of Nitre excels.

And here I must make a little digression, and set somewhat more clearly afore your Eyes, the four primary Complexions; from which the other mixt ones do arise, according as a Man partakes the more of this or that Complexion.

Therefore as touching the Complexions, the Ancient Physicians judged thereof according to the form and colour of the Hair, and were of this Opinion, that the Sanguine Complexion which of all others is the purest, produceth red Hairs and a white Skin full of small and bright Pores, such Men being indured with hot and moist Blood, and of a sound Constitution are diligent, learned, pious, prone to Venerie, Ingenious, Clearfull, and for the most part long liv'd, but are subject to hot Diseases, as Feavers, the Plague, and the like; and do in their nature resemble the Sun, amongst the Planets, and Gold amongst the Metals.

The Choleric have very black Hair, a yellowish Skin, and their Blood is hot and dry, and they are wrathfull, quarrellome, strong, bold, Warriours, addicted to Whoredoms, subtle, wicked, false, mer-

cileis, rejoycing at others harms, as is wont to be in War. They are tormented with raging Feavers, as also with the overflowing of the Gall, and they are of the nature of *Mars* and *Venus* amongst the Planets; and of Iron and Copper amongst the Metals.

The Hairs of the *Melancholy* Complexion are for the most part betwixt a white and black colour, and their Skin is white. They are of a cold and dry nature, quiet, laborious, musing, industrious, sincere, pious, and mercifull, inclined rather to weeping than laughter, if they hear of any mischances, they aim at Justice, and fear God without Hypocrisie, or esteem of Men. They are subject to all kinds of Diseases, are afflicted with a debility of their Limbs, and are compared to *Saturn* and *Jupiter* amongst the Planets, and to Lead and Tin amongst the Metals.

The nature and property of the *Phlegmatick* is moist and cold, the Hair and Skin white, the Wit dull, a dreaming sleepy quality, negligent, carefull of nothing, obstinate, envious, slow, and gross, and unteachable, the Body consists of thick or homely Limbs, and is wont to be troubled with the Scab, Uiccers, and cold Feavers. Amongst the Planets the Moon, and amongst the Metals, Silver, are supposed not much to differ from their Disposition.

These are the marks (as is believed) of the Complexions in Men and Beasts. But yet you are to know, that one [single] Complexion doth very rarely bear absolute sway in any Man, but they are for the most part mixt, and so the denomination is given according to the predominant Complexion.

A Man that consists of a sanguine and phlegmatick property, is as it were double complexioned, and both the colour and denomination are divided, so that from red and white, yellow hairs arise, and the Men themselves are of a good, temperate and fruitfull nature; and thus is it to be understood of other Commixtions.

But so far as a pure and sanguine complexion is esteemed the best and wholesomest, the Ancient Physicians in their Cures were wont to call the superfluity of any phlegmatick scabby person, Phlegma and watery Blood: [the superfluity] of the Melancholick, sad and irksome cogitations [or pensive dumps:] and [the superfluity] of Choleric, a mad raging brain. Now of this Phlegmatick, Melancholy, or Choleric [person] do we make a Sanguine one, that is, a Man of a sound and pure blood. Upon this account have they ascribed this property unto their Universal Medicine, viz. that it does not onely change all the imperfect complexions of Men, as the Choleric, Melancholy, and Phlegmatick into the Sanguine; but doth also transmute all the imperfect, unripe, gross, and volatile Metals into pure Gold. For if a Medicine be of so much virtue as to convert all the Complexions into the Sanguine one, it will necessarily transmute all the imperfect Metals likewise, as *Saturn*, *Jupiter*, *Mars*, *Venus*, *Mercury* and *Lune* into *Sol* or *Gold*.

Now so far as I have often found by the frequent Experiments that I have made, that my said Medicine, or Tincture of Nitre is wont to colour all kinds of Hair, as white, brown, black, (black I say, which may seem impossible unto many, but nevertheless is very true; for to dye white Hair with a yellow colour is a thing commonly known, but to tinge black Hair with a yellow or red colour, is a great secret) and even all other colours, none excepted, with a golden colour; and this it does while it

it is as yet of an unripe and flying nature : Upon this account I dare persuade my self, that if it were but brought to a fix and constant nature, it could not possibly be, but that it would bestow upon the imperfect Metals, a golden nature and perfection. But by reason of its too tender a nature, which is extremely impatient of a Fire of Coals, I pondered upon the business more accurately, and perceived, that it is indeed a thing possible to be done, although that hitherto I never had a convenient time of perfecting of the same. And as concerning the manner how it may be done, I cannot but out of Christian Love, discover the same to my Neighbour.

During the time that I considered not the Words of the Angel in the Sepulchre of Christ, saying, *Why seek ye the Living among the Dead?* and therefore search'd about in filthy Sepulchres, in which I could not find the Life. God at length vouchsafed to look upon me with his gracious and mercifull Eyes, and brought me into the right way, inasmuch that leaving the Sepulchres and Monuments or Tombs of the Dead, I began to look for Life amongst the Living, and not amongst the Dead.

God onely is the alone and eternal Life, who bestoweth upon us the so much desirable *Sun*, (as being the Servant of God) by the help of the Air. Let us boil, roast, bake, and labour as much, and in what manner soever we please; yet shall we never find any liveliness, save from the *Sun*, the Servant, Minister, or instrument of the Omnipotent God. For else we [doe but] prepare us Medicaments destitute of virtues, of fine out-side Colours, but within, dead and full of poison, because from things wanting life, no help can be expected.

Forasmuch therefore, as we gave not life unto our own selves, neither can we defend the same against death without that one onely life coming unto us from above: it is very expedient, that, omitting the stinking dung, we betake our selves to the pure and living fountain of God, as being the Centre of all life; and doe seek for life, from the *Sun*, as being the great master of all the created Palace [or World.] The way of effecting this, will I reveal unto you in a few words.

If we accurately weigh with the utmost of our discretions this whole business, we clearly see it afore our Eyes, that there is no other life to be any-where found, besides that universal life which God hath implanted in the *Sun*, and which the *Sun* sends down unto us by the help of the Air. Let any one make trial, what way soever it likes him, and he shall find this most true.

If you would putrefie an Herb or Animal in a shut glass, so that the Air cannot penetrate [into it,] there will indeed be Magots generated, but they will want life so long, untill the glass being opened, they receive life and motion from the Air. If you put Herbs, or the Flesh of living Creatures chopt or bruised in a glass, and shut it close, and keep the glass for a while in hot Horse dung, or else in warm water, there will Vermine [or Maggots] be indeed generated, but yet void of life, which (the glass being opened) will begin to stir of themselves; and so having gotten life, creep out, and become greater, and will get other forms or shapes. Place likewise in a warm place, some little Barrel half full of Wine, and let the bung-hole be open, that it may putrefie and begin to wax fowre; The ascending vapour will gather it self about the said Bung hole into a tenacious matter, which will yield small little vermine [or

Mites,] much like those which are engendred in Cheese; and which at length will, by reason of the Air, live and creep forth. If you put a Cover over the hole, all these little Mites will again dye, because they are deprived of the Air from which Life doth proceed. Then the Cover being again taken off, and the Air admitted, they doe agen creep; and following after the Air, endeavour to get out of the Barrel: out of which, if they doe but stay some hours onely, and feel the full Air, they attain to another form, and get wings and fly away, which cannot be done without the Air, seeing that without it they can have no life.

Let such Earth as hath Seeds sown therein be so covered over, as that the Air cannot penetrate into it; which being shut out, nothing will be brought forth: or let it be some Plant, which hath already sprouted up out of the earth; if you doe but take the Air therefrom, it will cease growing and plainly wither and come to nought.

From whence it is clearly evident, that the rise of all Life is to be imputed to the Air, which very Life it self, the *Sun* hath first wrought in the Air, and Art knows how to extract the same again thereout of, by a certain Magnetical way, and make it visible, palpable, and sensible.

But all the Air is not meer life, but contains this same life dispersed, or dilated in it, like a great deal of water containing in it but little Salt, it self being visible, but the Salt which is therein, invisible. And just so is the life dispersed in the bodies of Men, and other Animals, and, being invisible, hath its habitation in the blood, so that, without it, the whole body would be immovable and remain dead. Now when either a Man, or any other living Creature is conversant in the open Air, he attracteth to himself by his breathing, (by a certain Sympathetical power and property) as much Air as is requisite for the Heart, (which is the Center, Receptacle, or House of the Life) for the nourishment of the spiritual Life, and as for the residue, and unprofitable part, it casts it away by the Antipathetical virtue and property of the out-blowing (breath or) expiration. So that no Man, no Animal, no Herb, no Mineral, can possibly enjoy a living and growing faculty, if this food of Life were withdrawn therefrom. Which seeing it is so, and cannot be otherwise, it doth necessarily follow, that the true universal Medicine cannot be prepared in any shut up (or close) Vessels as is commonly done. Do but look I pray upon the Birth and Generation of Salt-peter, the Body of which is nothing else but the essential Salt of the Vegetables, Animals, or Minerals, which attracteth to it self the Fire out of the Air, as is well known.

Therefore, whereas all Salts are wont to be turned (by the help of the Fire and Air) into burning and live Salt-peter, and that no body can bring the same to pass without Air: we should by good right learn from thence thus much, *viz.* to endeavour to make our Medicaments too, alive by the Air. For a Medicine that is destitute of life will subdue and destroy a Disease even just as much as common Salt will overturn a Mountain, and throw it out of its place, without being animated as it were by the Air, and transmuted into burning and living Salt-peter. Truly therefore and by experience do I say, that all the faculty of growth, all Transplantation, and every life owes its birth to the Air, and without it do they all become dead and so remain.

The Air receives [its] vital food from the Sun, and the Sun derives its Original from God, the Center and Beginning of every Life. And therefore when we are desirous of extracting that vital food out of the Air by the help of Art, and of reducing it into a visible body, it is behoovefull and expedient; that we expose thereunto a certain Magnet, which may draw the same unto it self, and be by little and little augmented therewithall, and may grow both in quantity and virtue, even as an Herb out of the Earth; or as an Animal gets it self growth and encrease by meat and drink, and adds to it self an augmentation of strength and greatness, and at length associates it self unto [or couples with] its like, and multiplieth its kind.

Man himself doth without intermission attract to himself the Air, by the help of his Lungs; but the Heart retains onely the vital food thereof, and rejecteth all the rest like so much excrement. The Body it self also doth daily assume food and sustenance by the Mouth, but the Stomach transmits the nutriment that is separated thereout of, to the Liver, to be reduced into blood and flesh: but the Excrements, as the Dung, Urine, Sweat, and the like, it banisheth out of the body by the usual passages. Thus like wise stands the case with our Medicament. According as the Magnet is, that we expose to the said Air, so accordingly doth it attract its like out of the said Air, whereby it may get to it self, Life, Virtue, and Power. But it cannot possibly be, that it should extract that virtue and faculty simply pure and clean; No, but it gets to it self also a certain, unprofitable, and watery Essence, which is associated unto that [virtue,] which acquiesce doth again go off, as a superfluous Excrement, and must necessarily bestow the Life onely upon the Magnet, that it may be therewithall encreased and strengthened. If I desire to have a Vegetable, then must I sow a Vegetable Seed; or such a Magnet is to be placed there, as may associate or adjoyn unto it self its like out of the Air. If you would have an Animal, then an Animal Seed, or Animal Magnet is to be used. But if that which I seek is to be more pure, and more constant [or lasting:] a purer Magnet must necessarily be exposed; for like doth always seek its like; love, overcome, and conserve it: according to the testimony of the Ancient Wise men, *Nature rejiceth with Nature: Nature overcomes Nature: Nature retains Nature.*

And therefore seeing our purpose tends to this, namely, to extract the invisible faculty of Life, the power and virtue of the Sun out of the Air; to concentrate it, and make it corporeal, visible, and palpable; It behooves us to provide our selves with a fitting Seed or Magnet, which may earnestly attract, overcome, and hold the same. Now such Magnets are pure Gold, and the most pure Soul of Salt-peter, both of them being the true offspring of the vivifying Sun.

Because therefore like desires its like, loves, and seeks after it, a poisonous Magnet must not be exposed [to attract] a vital food: For as is the nature of the Magnet, so likewise doth it attract good or evil out of the Air. It is a thing that Husbandmen are well acquainted withall, namely, that Wheat produceth nothing else but Wheat, and from Tares do Tares arise. If the Seed or Magnet be aureous and pure, it will also acquire to it self pure and golden Virtues, and be encreased by them.

The manner of so placing the Magnets, that (by Solutions and Coagulations) they may receive the Astral and vivifying Rays of the Sun, and may render them visible, corporeal, palpable, and durable in the Fire.

YOU must get made some flat and strong glass Dishes or Platters, in which you must put your Magnet the thickness of half a fingers breadth, and expose it moist to the Sun, that the unprofitable humidity may vanish by evaporation. Which done, (and in the Summer-time it will be done in a few hours, especially if there were not too much of the Golden Liquor put into the Dishes) expose the same Dishes, which contain in them the [thus] dried Salt, in the night-time, open to the cold and moist Lunar Beams, that the Salt may by its magnetick virtue associate unto it self from the Air, the Water, which carries in it the universal food of the Air, and consequently may be dissolved. This Solution is to be agen fer out in the day-time to the Sun-beams, which will again dry up the unprofitable moisture, and leave in the Salt, that vivifying and golden Seed, which it contracted in the cold Night and Air, together with the humidity, which is void of any virtue. The Salt being freed by the Sun from its superfluous moisture, must be again exposed at Night to the Lunar beams, that it may again imbibe the Astral virtues, and may be agen dissolved in the imbibed water, that, being the next day, as the day afore, exposed to the Sun, it may be animated anew with those same virtues: These exposings by turns [to the Sun and Moon,] must be so long and so often repeated, untill the said Magnet, (after its being dried at the day-time in the Sun) will, at the night-time, hardly admit of any moisture from the Air, and that being dry and put upon a red-hot Plate, it readily melts without fume. For then may it be applied to use, as being a constant and fix Medicament.

This interchangeable Solution and Coagulation must be repeated some hundreds of times, and every Solution and Coagulation is to be accounted for a Philosophical day.

If now in the Summer-season the heat of the Sun be not strong enough in our Countries for the effecting of this operation, the said heat may be concentrated by Glasses, or metallick Instruments, and be made more efficacious, that the Coagulation may be ripened [or hastned.] But in defect of such Instruments, and want of the heat of the Sun, which is frequently over-cast with store of Clouds, you may easily forward the Coagulation with our Common Fire, and that too with a more unfailable and speedier operation than that is, wherein the drying up by the Solar heat is always to be waited for. And although this operation, which is performed in the Sun, is to be accounted of as far the better, yet notwithstanding the Sun doth operate together with our Common Fire after an invisible manner, when we cannot make use of the Sun it self. For where-soever the Air is, there also is to be found the invisible Sun, and the occult virtue and power of life. He that can have the opportunity of using the Sun in this operation, needs not any other Fire. But the using of our Common Fire requireth a peculiar Iron Furnace, whereon the Dishes or Basins are to be placed to dry. But yet the heat must not be underneath, and strike at the bottom of the said Basins, but

but it must be such as may strike the heat downwards at top of the matter onely, and may gently and by little and little consume the humidity: For else there would be hazard of the Liquors boiling over, and of being lost, if the heat should be placed under the bottom of the Dishes. The Iron Furnace may be made of Iron Plates, resembling Arched work, [or Oven like] and be placed within a Stone Furnace, and have a Door fitted thereunto, that so neither Dust nor Athes may fly thereinto, and by this way will the Salts be dried in two or three hours time. And now, that you may not need to wait till the night approacheth, you may have a wooden Box or Chest made, and covered over at the top, but pierced full of holes all round about the sides, which (with the Basons placed therein) may in the Winter-season be set abroad to the cold Air, and in the Summer-time may be placed in some moist Cellar, that so the Salts may attract from the Air the food of Life. For in all places of the World doth the Air contain in it (though in one place more plentifully, and better, than in another) that occult faculty and virtue of Life, without which, neither Men nor Animals are able to live. But by how much purer the Air shall be, so much the purer and more excellent is the acquired Medicine. As for the Transmutation of Metals, it matters not much what Air it is that you get, for every sort of Air is fit for this operation. We doe in this place manifest onely the way of fixing it: Now every one knows that a pure and clean Air is better than a gross and an impure one, and that the heat of the Sun is better than the heat of Coles, or of a Lamp.

Thomas Aquinas writes, that God with his Angels cannot want our fire, and therefore is he reproved by Paracelsus, because he saith that God cannot want the Elementary fire. Alas, Good man, he did not so accurately weigh this matter, for this proposition tends onely to this end, namely, to set afore our eyes the purity of the Fire necessary for the Coction of our Medicine. From whence it is sufficiently manifest, that a Medicament will be so much the better, by how much the purer the Fire shall be. For a gross Air begets a gross Blood. But in this operation, the Air is the Meat and Drink of our Golden Salt, but the Water or Phlegm is to be driven away by heat, it being a superfluous Excrement adhering on to that Air. Now in those manifold Solutions and Coagulations, the Magnet doth always retain some good thing, and encreaseth both in weight and virtue, and attaineth a constancy: like as Men and other Animals are encreased with Meat and Drink, and doe grow in stature, and multiply themselves. The whole work therefore of making this kingly Medicament by the help of the secret Solar fire, doth consist in a good, pure, and golden Magnet, and afterwards in a true Solution and Coagulation: Which if it be too speedy and strong, the over-much heat will burn up and consume the attracted food of Life. If therefore a Medium be not used, it so happens, as 'tis wont to be in any Earth that is too moist, and therefore not [capable of] bearing fruit. So that nothing is more necessary than to have a due regard of mediocrity, not onely in the Solution, but in the Coagulation likewise.

And this is that way by which the Solution done in the Air, and the Coagulation made in the Sun, doe reduce the Mercurial water, and the Minerals prepared with Salt into fusile and tinging Stones;

which thing the Common fire will never perform in a glass closed up, and without the Air.

Note this, and believe it, and doe it, and thou wilt find what thou hast believed, come to pass.

Supper being ended, and the Drinking-bout over, 'tis time for the Guests to go to Bed, unto whom the custom of some is to present a closing Cup, made of good and profitable Herbs, amongst which, such as are more bitter, are for the most part in greatest esteem, because they close up the mouth of the Stomach, and beget a quiet Sleep.

Now to parallel this Custom, I will here set one down, for those that are desirous of such like bitter Potions, and such an one as they may prepare according to their pleasure, and apply to use.

Take of common *Aqua Fortis*, which you must rectifie by a Cucurbit, or by a Retort, that it may be bright and clear. Dissolve therein, by boiling in hot Sand, as much cupellated Silver as it will dissolve; but you are to note here, that there must not be any Copper at all in the Silver, for it would spoil the Medicament. Into the Solution pour strong and well rectified Spirit of *Sal-Armoniack*, so long till the *Aqua Fortis* makes no more Ebullition. When all the tilling and noise is over, there will be about the half part of the Silver precipitated, and settled to the bottom, and will be of an ashy colour. Place the Glass in Sand, put Fire thereunder, and boil the precipitated Silver with the *Menstruum*, in which boiling there will separate yet more Silver out of the *Menstruum*, and the residue will remain dissolved up in the *Menstruum*, which is to be filtered through Cap paper, and then to be evaporated by little and little in Sand, that all the humidity may be abstracted.

N. B. The *Aqua Fortis* and Spirit of *Sal-Armoniack*, turn into a liquid and volatile Salt, and have lost their corroding property, which Salt hath introverted the Silver, and drawn its bitterness forth, in so much that both Salts are converted into one bitter and green Salt. This Salt must be dissolved, filtered, and purified by pouring Water thereon, and again drawing it off; and being hereby rendered more pure, it resolves it self in the cold Air into a green and bitter Liquor, one drop of which is able to make a whole Cupfull of Wine bitter. And this Wine being drunk is profitable to the Stomach, causeth quiet Sleep, dissipates Windiness, and keeps the Belly Soluble.

N. B. This Salt guilds over Glasses, and other glazed Vessels with Silver, nor does it vanish away but remains constant. It likewise performs other considerable effects in Alchymy, as may be seen in my other Writings, but especially in the second part of my Furnaces, of the last Edition. And thus do I leave the Guests to their rest, that they may Sleep even till broad Day-light.

The Sun being up, and some of the Guests being very drouthy or thirsty with their Yesternight Surfeiting, and being tormented with overmuch Heat; they endeavour to extinguish this Inflammation of the Liver, with cold Fountain Water, or with small Beer, or with hungry and sharpening Wine. Others send to the Apothecaries for some Syrup of Roses, or Violets, and mix that with Fountain Water, and so drink it off. But the burning hot Liver is presently smitten with a sudden horror, the Stomach is refrigerated, and beset with clammy Humours, and most at end the Limbs are debilitated, the Skin becomes Scabby and cold Feavers posses the Stomach.

Instead

Instead therefore of such like drink, I will here substitute a far better cooling Potion, which shall not hinder the health, as those do, but be profitable to the same.

Take one pound of Spirit of Salt, not of that yellow, unrectified Spirit that is sold in the Shops, but of our well rectified Spirit; wherein dissolve as much Tartar as it will associate unto it self in a gentle boiling; filter the Solution through Cap-paper, that so all the Fœces which were in the Tartar, may abide in the Paper, and the Spirit of Salt it self together with the [dissolved] Tartar may pass through, bright and clear; if the Solution stands long in a cold place, part of the Tartar will shoot into Crystals, and part thereof will remain mixt with the Spirit of Salt, and give it a gratefull vinous Acidity. If you use white Tartar then the said Spirit will remain white, red Tartar tinge it the same with the colour of a Ruby. *N. B.* The Spirit of Salt is of such a nature, as that it makes all colours more fair. You may therefore use red Tartar to make this Potion withall, because of the loveliness of the colour, wherewith it tingeth the Spirit of Salt, for as to the virtues and efficacy of them, there is no difference to be found between them.

This Tartarized Spirit of Salt is very sweet, and tastes like an acid Wine, some drops of which, being drunk in cold Fountain Water, will not at all hurt the Liver: nor will it onely allay the droughness and thirst, but also stir up in the Stomach an Appetite to meat and drink. And therefore I do commend this Tartarized Spirit of Salt, beyond all other thirst-allaying Remedies, and it may be taken safely and pleasantly, both Summer and Winter, because the unripe and acid Wines being drunk with Fountain Water and Sugar, do refrigerate the Stomach, and load it with tenacious humours, and weaken the Appetite, and hinder digestion.

Most profitable therefore is this our Spirit unto those, who daily drinking much Ale, may always mix a little of the same with their Ale. For it makes the Ale to taste like an acidish Wine, it allays thirst, so that there will not need such a guzzling in of so great a quantity of thick Ale, it dissolveth Wind, expels Urine, hinders the generation of the Stone in the Bladder and Reins, and if it be already generated it dissolves and consumes the same, and by little and little drives out the same with the Urine. Being administered to such as are troubled with the Peaver, Gout, Stone, and Scurvy, and that in all their drink, it is a pleasant and profitable Remedy. Concerning the use of which, you may find more spoken in my Treatise, intituled, *The Consolation of Sailors*.

Now besides all this, there is yet one thing more that I shall here admonish you of; namely, that by the Spirit of Salts help may a Remedy be administered to many more hurtfull disorders, but especially in the stead of those sharpish Waters, unto which, Men are wont to come from far and undertake long Journeys, losing their most pretious time and Money, neglecting their Calling, their Household Affairs, their Wife and Children, upon the bare hope of recovering their former Health: Whereas notwithstanding, the Spirit of Salt well prepared with Tartar, and having a little Steel Powder put thereinto, will perform the very same effect as the Calibeat Waters are wont to do, and so they may avoid the loss of so much expences, and of their pretious time; and thus every one may discharge and follow his own Calling and Domestick Affairs, and yet for

all that, be cured by the help of the Tartarized and Calibeat Spirit of Salt which openeth the Obstructions of the Liver and Spleen.

But what shall I say much for? Some haply there are that go the more willingly to those Waters every year for other reasons. Such as have old chiding Wives at Home, that take it very ill if their Husbands do but stir out of Doors, and are continually plaguing them with Scoldings and ill Words, have not these think you great reason to seek some Diversion?

Young Women also love to visit these Waters and Baths, who meeting not with so much heat in their feeble and aged Husbands, as to beget them with Child, betake themselves to those Waters and Baths, where at all times they meet with active strong Companions, full of strength and Metal, who without doubt do frequent the said places, for this very end, namely, to apply warm suppositories to those cold Women, and uterine emplasters to make them Fruitfull, and to take away Sterility. Such kind of Dames being restored to their former health, and returned Home, their Husbands find (after some few Months) how effectual the use of those Waters have been upon their Wives.

Besides, it most an end happens that the Master and Mistress being absent, the Household Affairs are very awkwardly administered and managed by the Children, the Men-servants, and Maid servants; and that common German Proverb doth usually take place; *The Cat being out of the way, The Mice upon the Shelves do play.* The truth of this is sufficiently testified by frequent Examples. And therefore it is much better to drink these acid Waters at Home, whereby both Money and Time is spared, and many evils prevented. And thus much may suffice to have been said concerning a refrigerating Drink.

And now, seeing we have at hand good Cheese and Butter, good Sawces or Cates, and delicate Drink, can we not be here with content? Verily in my Judgment here's enough disht out for one Banquet. But some may say, in very good time! *Glauber* [indeed] does not onely teach us the preparation of good Meats, but likewise of Cheese, Butter, Sawces, [or Junkers,] and precious Wine, but yet tells us not from whence the Milk to make the Cheese and Butter withall is to be had, nor whence the Sugar and Spices for the Cates, and the Grapes needfull to make the Wine with, are to be gotten? What benefit have we by knowing how to make Cheese and Butter, and yet want Cows to yield us Milk? To satisfy these, we will demonstrate unto them, that even both the Milk it self, and the precious Spices, and most excellent Grapes are all attainable by the help of Salt.

In my Treatise called *Miraculum Mundi*, as likewise in that called *The continuation of the same*, and in that Book, of the nature of Salts, I have clearly enough shewn, that all the faculty of the Growth and Nourishment of all growing and movable Creatures doth take its rise and original out of Salt alone, and that the correction or melioration, not onely of Vegetables and Animals, but even of the Minerals too, is to be sought for from the same.

But so far as this bettering of the Metals meets with but little credit and is very hardly believed and understood, (nay 'tis plainly thought a thing impossible to be effected,) I could not chooseth but manifest and demonstrate the truth of the same unto the whole World; namely, that like as the Metals are

are in long process of time matured by Salt in the Bowels of the Earth: Even so may the same be likewise matured, mundified, and amended out of the Earth, by Salt, by the help and benefit of Art; not onely by the moist way, but also by the dry, and that with one Fire, in one Furnace, and with one Servant, whom I will in this place call *The Countryman paying his yearly Rent*. When his belly is continually fill'd with Coles, his Plows never cease going, so that weekly, monthly and yearly he is able to pay his master the due hire, namely Gold and Silver, wherewith all things necessary for household expences may be gotten.

And although this Countryman, which I will here describe, be not that [great] Country-Farmer, which I have mentioned in the *Third Part of the Prosperity of Germany*: yet notwithstanding he is a little one, and one that will discover so much unto the ignorant as to cause them to believe that the things which I speak of are possible to be done, and that there is a yet richer and better Countryman. But this here is to be accounted as a small Cow, and which will however supply you with Milk, Butter and Cheese, for necessary uses, if not with Sugar, Spices, and Wine too, to be set out upon the Table. If this Country fellow be too little and small for any one, he may even provide himself of a better, and learn by the consideration of this, by what means such Countrymen are to be nourished, that so the Rent may be gotten from him in its due time.

A. *The little Country Tenant with one Plow.* B. *The Countryman with three Plows.* C. *The Countryman's Cap.* D. *His three Plows.* E. *The Registers to govern the Fire by.* F. *The Glass set in with his Alembick and Receiver.* G. *The Door to shut the Crate.* H. *The Ashbole.* I. *A Basket of Coals.* [See the Fig. before the 3d. p. of the *Prosperity of Germ.* noted with pag 76.]

In the first place you must prepare you some pounds of good Spirit of Salt, after the way which I prescribed with Vitriol, without which it will effect nothing, for out of this [Vitriol] it doth in the preparation carry over with it the spiritual Gold, or tinging Spirit, which said [spiritual Gold] is, in the performing of the operation, fixed, together with that spiritual Gold, which lies hidden in the inferior Metals, and so becomes manifest.

Then (in the next place) you must build you a Furnace, which is called by the Chymists the *slow Henry*, or *dull Harry*, but I call it *The little Country Farmer or yearly Renter*: you may build it, I say, of what bigness you please; or for Example sake, the Tower which holds the Coles may be about Man-height, and about one Cubit broad in the inside, but so, that the top part and bottom part be narrower, and the middle part wider. To this Tower you must adjoyn two or three Furnaces, which are here called the Countryman's Plows, and in which the Vessels are to be placed, which hold the Metals that are to be matured by the Spirit of Salt, and which have a continual heat, whereby the never-ceasing coction is holpen from the Tower that contains the Coles. Now see that you make all things cleverly and well proportioned, whereby that the Fire may be well and commodiously governed, and may be conserved for twenty four hours at least, without any looking too or meddling with, as may be seen by the now described Figure.

The Vessel, in which the Spirit of Salt, with the Metal, isto be exercised (or laboured) with a daily Coction, must be made of such matter as doth not

sie with the heat of the Fire, nor is not eaten with the sharpness of the Spirit, (but) such as may be seen in my Laboratory, and will for the most part dure and hold the Spirit of Salt a whole year without breaking.

All things being ready and fitted, the Countryman's Belly is to be filled with Coals up to the Neck, and his Head covered with a Cap, that the Fire may not find any out-let, save by the lower holes, through which, the heat may find an entrance into the adjoined Furnaces; and as for the Vessels, they are to be filled with the Spirit of Salt, and with Metals fitted for this Operation, and to be covered with their Alembicks, that the Spirits which ascend in the boiling may be received and conserved. When all the Spirits of the Salt are come over, they are to be again returned back upon the dried matter in the Cucurbit, and are to be agen drawn off by distillation. This operation and cohobation being often repeated, doth ripen and fix the spiritual Silver and Gold, whereby it becomes Corporeal: But yet the Spirit of Salt alone is not able to give Gold, but ripens Silver onely, but by the addition of other Salts, it will give Gold too. And even for the fixation of Silver, common Salt may be also added to the Spirit of Salt, that so the Spirit of the Salt may be made strong in the digestion; yea and in time so very strong, as to fume even in the cold Air, and therefore a little water may be also added besides the Salt.

Hence it comes to pass, that in one days digestion six pounds of Spirit of Salt will give seven pounds of the same; unto which, if you again add one pound of Water, and one pound of Salt, you shall have eight pound of Spirit of Salt: which by the addition of another pound of Salt, and one pound of Water more, it may be farther augmented; insomuch that the Spirit of Salt, by a continually-repeated addition of Water and Salt, gets a perpetual encrease, and the Metal is so far from being at all hindred in its maturation, as that it is daily ripened more and more. For the Agent and Patient are continually encreased, and become bettered both in quantity and quality, which verily is a most excellent work, and never so manifestly described by any body as by my self.

But that I may be yet better understood by every one, I will here adjoyn a way which every one may imitate, and which teacheth how, by the Spirit of Salt alone affording not Gold but Silver, the said operation may be instituted with Copper.

You must take care to have a Vessel made either bigger or lesser, of such matter as the Spirit of Salt cannot spoil or prey upon; And pour thereinto as many pounds of the Spirit of Salt as it will well hold, and as many pounds as there be [of Spirit,] so many ounces of Copper-plate must you put in, and to them add twice as many ounces of Salt, so that to one ounce of Copper there may be two ounces of Salt. The Spirit of Salt being drawn off even till the Copper and Salt be dry, it will be stronger and more in quantity, because, from the adjoined Salt, it hath acquired to it self an encrease and greater Virtues. Pour this Spirit agen upon the Copper, which in the first distillation was wholly dissolved up; and boil the Spirit of Salt over the fire, that the Copper, together with the Salt, which was not carried over by the Spirit in the first distillation, may be again dissolved.

The Furnace being cool'd, Take the glass out of the Sand, and pass the Spirit of Salt with the dissolved Copper through Cap-paper, and wash the white

Calk that remains in the Paper with water, dry it, and melt it with a fix Lixivial Salt, and you shall find as much pure Silver, nay, even somewhat more than the Copper had in it by its own nature. Put the green filtered Solution agen into the Cucurbit, being first well wash't; of which, if there be six pounds, add thereunto one pound of Salt, and half a pound of Water, that so there may be seven pounds and an half, provided the Cucurbit will contain so many pounds, if not, then put the less matter therein. Then being placed in Sand, draw off the Spirit of Salt from the added Salt, even to dryness, and as much increase as you find it have above six pounds, lay it by, and add as much water to these remaining six pounds, which you must again put upon the dry matter in the Cucurbit, and then agen distill it off till the said matter be dry, and repeat the same Operation again by pouring on and distilling off. If the Spirit of Salt be augmented in quantity one pound, then put more Salt into the Cucurbit, and agen augment the six pounds of Spirit of Salt by the addition of Water, and repeat the pourings on, and drawings off after the aforesaid manner, always removing at each Distillation, the increase that is over and above six pound: and renewing the apposition of more Salt, after that the former is drawn off, untill you shall have gotten in the fifth, sixth, seventh, eighth, or tenth Distillation as much Spirit as you at first took, to begin your Distillation, [which was six pound.] Now all the operation consisteth in this knack, namely, that you so operate, as that nothing flies away in fume, for all the increase ariseth from the Salt and Water which you added thereunto. When you have gained thus much, you may (without adding any more new Salt) pour on the Spirit of Salt several times upon the Salt which is left remaining in the Cucurbit, and agen draw it off so often thencefrom, untill it hath brought over with it self almost all that Salt. Which [Salt] being almost wholly changed by the Spirit of Salt that was poured into the Cucurbit, Dissolve up the remaining Mass of the Copper and Salt, and the Sand being cold, take out your Cucurbit, Filter the Spirit through Cap-paper, and wash the white Powder left in the Paper, and dry it, and melt it as afore with a Lixivial Salt, and you shall have as much pure Silver as the Spirit of Salt was able to fix, of the Copper, in such a time. Then put this green Spirit of Salt into the Cucurbit together with more new Salt, and repeat the said labours ten or twelve times, and the Spirit of Salt will be always increased and rendred more strong, and the Copper will agen yield forth Silver.

This Labour, you may at your pleasure, continue as long as you list, for you will always get some Silver, and have an encrease of Spirit. For both the Agent, *viz.* the Spirit of Salt, and the Patient, *viz.* the Copper doe encrease both as to quantity and quality.

But it may be demanded, Whence that Silver comes? That which gave forth it self the first time we impute not unto the Spirit of Salt, as if by it made, no! but we say that it was in the Copper before, and was melted out of the Oar, together with the Copper, for this may well be. For there's no Copper to be found which does not hold some Silver hidden in its belly: and though the Refiners have as accurately separated it as they could, yet nevertheless we doe conclude that that first Silver separated in the first Operation, was what was left of the Oar

in the Copper, and remained unseparated by the Melters [or Refiners] therefrom, and was not made by the Spirit of Salt, but onely separated. And the Spirit of Salt being in its nature an enemy to Silver, does not dissolve it. But whence then did that come, which offered it self unto us the second, third, and fourth time; whereas in the first Solution, all the Silver was clearly taken out, and none at all left therein, but was all of it separated by filtration? What shall we here say, or indeed how shall we dare say otherwise, but that we believe and confesse, that the Spirit of Salt did by its operation make the same of the Copper. Nor is there any reason why this should seem so very strange unto us, forasmuch as yearly, in the Earth, all Copper is naturally turned by Salt into Silver, and not onely Copper, but all the other Metals were at first, Salts: not such indeed as we use about our Cookery in the Kitchens, but such as are impregnated by the Sulphureous Stars [or Constellations.]

But forasmuch as we doe at present treat onely of Copper, we doe not therefore meddle with the rest of the Metals: for very rarely is Copper digged out of the Earth but it hath Vitriol therein, or, in defect of Vitriol, a Sulphur salted with a vitriolate Salt. For any sort of Sulphur being burnt, and its fatness flaming, the sharp Salt is released, and passeth away in fume, resembling the tast, of the fiery Oil of Vitriol, and is captivated [or caught] in the great Alembick under which the Sulphur is burnt. This sharp Oil supplies the place of an Agent as to the Minera's or Oars, in the Veins of the Earth; and doth more and more ripen the Minerals and Metals, but exceeding slowly: for Nature doth scarce attain to that limit in a thousand Years, which Art doth in a few Months time. For there are no impediments to obstruct the operativeness of our Agent, such as are the Stones, Flints, Sands, and various Earths which frequently occur, and are much abounding in the bowels of the [Metallick] Veins: inasmuch that it can discharge its Operations freely, and without any Impediment at all: and besides too, we use our external fire by which we help this our Agent, and strengthen its virtues, and keep it in a continual action.

By all this discourse may every one see, that when we speak of ripening Silver out of Copper by the Operations of the Spirit of Salt, it is not contrary to nature, but altogether agreeable with the same. But now we doe not say that any one will suddenly become rich by this Labour, done with the Spirit of Salt and Copper, but we have described this Operation in this place, for this end, namely, that hereby the possibility of the thing may be learned, and that there may be good ground to believe, that even this too is most true, *viz.* when we write that by such or such an Agent, corroborated or fortified with such or such Subjects, and placed in such-like Digestions, Gold may be extracted as well as Silver out of the meaner Metals, which how little soever there be of, may notwithstanding prove profitable. For having once made onely some pounds of Spirit of Salt, you will not need to make any more anew, for in the digestion and maturation of the Metals, it will daily encrease, and that in a plentiful manner, and that too without any considerable costs, seeing that the Salt it self, which is to be added, is likewise cheap enough. If you make your Cucurbit of pure Silver, (for the Spirit of Salt will not work upon that) and digest your matters therein, you need not

not then stand in fear of the breaking of Glasses: Besides too, you may always let such a made Vessel lie in the Furnace, and as soon as ever the Spirit is drawn off, you may presently put it on again, nor is there any need of your waiting so long, and ceasing from the work till the Vessel cool. If therefore a Tower to put the Coals in (as afore) be added to that Furnace, or Furnaces, then is it a true Country Farmer, or Tenant, for the sustaining of whom, there will need no other charge but that of Coals, and yet notwithstanding he gives you a perpetual gain without labour, cost, and trouble. Nay more, if we do but rightly weigh the business, we shall find that the daily encrease of the Spirit of Salt in these labours, is easily sold for more Money than the Coals will cost, so that all that Gold and Silver which is gotten out of the Metals, doth offer it self unto us for nothing. Besides, such kind of Metals may be taken for this Operation as are wont to yield more Silver and Gold than Copper, and the plentifulness thereof will be yet more, if several such kinds of Metals are joyned together and so dissolved, and digested, in which operation they better one another by a mutual action; for one supplies what another wants, and likewise from another, are those superfluities which it has in it, taken therefrom: so that (as we said afore) the mutual melioration of those Metals may be set on foot and promoted, as it were without any cost, and by a very little labour.

Whoever he be therefore that has the knowledge and experience of the nature and property of the Metals, which they are, that have a correspondence with each other, and that love to better each the other; and is not ignorant what Agents are agreeable to Gold; such a one I say as this is, will commit unto his Country Tenant the care of Weekly and Monthly paying the due Rent, and will be able by this means to serve God his Creator without wicked Usury; to do good unto his Neighbour, to extricate himself out of that Diabolical Fellowship, of the impious and the great crew of evil Men; and to lead his Life in Tranquillity and Quietude; which verily is a great and singular gift of God, unto any one that can arrive unto such a knowledge.

But yet no Man hath any reason to persuade himself, should he be a Master of this Art and Science [here shown,] that he shall be able daily to separate great heaps of Gold out of the more imperfect Metals, whereby he may be enabled to lead a vicious Life. No, for my endeavour shall (in the first place) be, not to make any wicked Man partaker of this Art.

And secondly, the whole business consisteth in the blessing of God, as we find it Written, *Paul hath planted, and Apollo Watered, but God hath given the Blessing*: For without this Blessing, all our Labour is but in vain; And this the Prophet David doth likewise testify, saying, *In vain do ye rise up early, and being laden with many cares, go to Bed late, and eat your Bread with troubles: For unto them whom God is favourable shall he bestow his gifts even while they are Asleep*. Moreover St. Paul saith, *It is not of him that wills, nor of him that runs, but of God that sheweth mercy*. And therefore a wicked Man, though he should possess to great a thing, yet would he not do any good upon it, if he wanteth Gods Blessing. Besides, I do not here bring forth my little Countryman upon the Stage, as if he could help any one unto huge Treasures; no, but only as one that can bestow so much as may suffice, honestly to live. Un-

less haply a Man should light upon rich Veins and metalline Oars, which should abound with much corporeal Gold, and so by this means should yield great Treasures. Now so much cannot be looked for, from such Metals as have in them but a spiritual Gold only, unless the true weight be found, and that there be gotten the knowledge of those Metals which have a great affinity with each other, and which being joined together yield forth Gold. Otherwise you must not expect ought else from this Operation save an honest and moderate profit.

But now, as touching what Metals they are that have such affinity, and what the true proportion of the weight is, no body hath any reason to enquire of me, for I do not as yet profess my self an expert and absolute Artift in this matter, for sometimes I have a very gainfull success of my trials that I make, and sometimes again I get less.

I was willing therefore to shew the way here, of ripening the meaner Metals by the help of Salt, and that too in a manner without any costs: which way of so doing being by me laid open, may suffice for this time, nor did ever any reveal it before me (I speak it without boasting) or produce it unto publick view in so open a manifestation as I have done.

And now if this separation should be used about the fixed Gold only which lies hidden in the Oars and Metals, yet might great profit be thereby gotten in all places; for there is no place in the World in which there are not to be found such Earth, Sand, and Stones as contain in them corporeal Gold, which may be extracted by the afore prescribed way without any costs at all. But here is to be observed that those things which I have written, and clearly demonstrated concerning such separatory Operations in the third part of the Prosperity of Germany, are to be again read over, and well lookt into.

Moreover, this is also to be known, that this maturation if instituted by the dry way, brings more profit than if done by the moist way; for in the dry way the Agent is more holpen than in the moist way, in which there is always plenty of moisture. But however, both ways namely the dry way, and the moist may be done with one and the same Fire, nor will the cost be any more than if the moist way were made use of alone by it self.

For that Tower wherein the Coals are, and which is to keep the Spirit of Salt in perpetual digestion, and to heat the adjoined Furnaces, is always bright hot at the Grate, upon which [grate] if a cementing Vessel filled with Salt and Metals be placed, there will then be even thence as much profit as by an adjoined Furnace, and so by the Fire of one Furnace; and by the self same labour and cost is a double Operation performed, and a continual rent may be expected from the double Countryman.

You must likewise note, that there is a great difference of Salts, and that one Salt is more fit for this labour, and another for that; but by how much greater the Acrimony is, that the Salt abounds with, so much the more potent an Agent it is: inso-much that it is of great concernment for a Man to know how to concentrate the moist Fire or Agent, concerning which Concentration there is no need of mentioning any thing in this place; forasmuch as I suppose that these things which are at present spoken are sufficient enough.

Moreover I would have the Son of Art know, that the Salt of the *Maercofm* or of the Ocean, which we have taught the making the Spirit of, is nothing

nothing at all so efficacious as that which is gotten out of the *Microcosm*: For whatsoever things are found to be in the *Microcosm* or greater World, the same are likewise in the *Macrocosm* or lesser World, namely, Man. But it is not my purpose to discourse farther of this thing in this place, but will (God so permitting) treat more at large of the same, if I come to write somewhat of the nature and signature of the greater World. For hereby great mysteries may be learned, which omitting to speak more of, I keep close to Salt and say, that that Salt which comes out of the Ocean or Sea of Man, or of some other Animal, that is, which is voided out of the Bladder, is far more fit for the Transmutation of Metals, than that which is gotten out of the Sea, as being the Bladder of the great Animal.

The Ancients have called the World the great Animal, and very rightly, for in its Center it hath a fiery heart by which (as being the great Animal) it moves it self, and conserves its life, as shall be spoken of in another place if God shall permit, for according to the common Proverb, *Man propoeth and God disposeth*.

Morien was not ignorant that *Arcana's* of great moment lie hidden in Urine, but hath manifestly signified it. For when he had prepared the Tincture for King *Calid*, he wrote upon the Vessel in which it was, these words, *He that carries all things with him, needs not any others help*. And having so done, he silently betook himself unto his Cell. But he had said before unto the King, In thee O King! the Medicine is, by which words, he meant Urine. For out of Man's Urine may a fix Stone be made, which shall be manifested in other places.

Furthermore this likewise is to be here known, that it is a most notable and a true experiment and artifice in Alchymy, that is, in the true melting of Salt, when the Agent of Salt, and the Patient, or Metal, are so thoroughly conjoined and mixed, as that the Agent is dispersed throughout the Patient, that so the Patient may suffer the more, and consequently that that Patient Metal may be the sooner ripened and fixed. When a Flock of Sheep being in the Fold, see the Woolf coming, they are indeed all terribly affrighted, but are not all bitten and torn, and so a part of them feel the hurt and the other part remain free. But if the Woolf seizeth upon the Sheep in the open Field, and that the Sheep are scattered far and wide so that they cannot possibly flock together, they will certainly suffer more grievously.

For Example sake, when I would meliorate Lead by means of Salt, whether by the moist way by Spirit of Salt or by the dry way by dry Salts, if now I cannot radically conjoin the said Salts and Lead together, I do but little to purpose, because Lead and Silver, unless prepared by singular Ingenuity and Skill, are not touched upon by Salt and its Spirit, and so suffering but superficially onely they are able to resist a long time. But being radically united unto Salt by the benefit of Art, so as that they cannot be distinguished from each other, then they suffer in all their parts and die, which death is their melioration and life. He that desires to arrive at this Goal, must rise betimes, and use a most notable diligence, for sloathfulness hedgeth up the way of coming thereunto: Even I my self am no perfect Artificer, but wait upon the Omnipotent God, expecting what he will please to bestow upon me for time to come, and

I live content with my present enjoyments. Thus likewise let another do.

But if now *Saturn* is to be used after another way and to serve instead of Earth to receive and multiply the metallick Seed, there's no need of dissolving it in Salts, but it will be better to have it onely swell or puff up in them, and keep in such a posture as Earth is, conserving the Seed sown therein, in a moderate humidity and in the temperate heat of the Sun, which way is also a good one and commodious for the production of good metallick Fruits, and that by the help of Salt, as the following Process shews, under this title, namely,

The Fire and Azoth wash Laton.

SOME of the Philosophers have called their Patient *Laton*, and their Agent *Azoth*. But what subject that is which they meant by the name of *Laton* there are many Opinions of Authors concerning it, in whose Writings may be seen, that the greatest part of them do intend thereby *Saturn*, but yet not the vulgar: and even so is it too concerning their *Azoth*, or Vinegar, that being likewise diversely accepted. But be it as it will, yet this is certain, that even in the common *Saturn* do many abstruse secrets lie hidden, (to say nothing of the more mysterious *Saturn*, did we but know how to get it out.)

All Philosophers do suppose, that the Heart in *Saturn* is better than that in Gold it self, and for that reason do they call Lead a Leaprous Gold, and say, that if it could be mundified by a true washing, some great matter would proceed thereout of. Many Men have very much busied themselves about this washing, but yet have not attained unto ought else, save that they have brought the *Saturn* into a white, fugacious, and liquid Body, concerning which labour I have made mention in this Treatise of metallick Cates and Sawces, and also in the third Part of the Prosperity of Germany.

In my judgment, the common *Saturn* is a commodious Earth, for the reception of a metallick Seed, and for bringing the same unto multiplication; Witness *Paracelsus* himself who tells us, that *Saturn* may be compared to the Earth, for all such things as it seizeth on it makes like it self, and turns them into Earth, viz. in the common Fire, for *Paracelsus* here intends that.

But now, if some metallick Seed be sown in *Saturn*, as being a commodious metallick Earth, and that such an Earth and such a Seed be moistned with a due metallick Water, and be exposed to the fruit producing and vivifying Sun, the earth together with the Seed, doth by reason of the moistning caused by the pouring on, or affusion of the mineral Water, swell up, and become porous, and receives and conserves the Water, so that the ripening Sun cannot dry up the Earth, and consequently burn up the Seed. And by how much the oftner the Earth is moistned with the mineral Water, and the Sun expelleth the said humidity, so much the speedier doth the Seed ripen, and attain to his maturity.

For like as the Husband-man when he is about to sow this Corn, chooseth such a ground, as contains a fat and tenacious mould, which may not be washed away with the Rain, nor suffer the due nourishment to be withdrawn from the Seed; for if the Seed be sown in Sand, a little Rain can easily wash away the Sand and Seed, and impede the faculty of growth,

growth, which in a fat and tenacious Soil is not wont to happen. For the Water or Rain should but onely moisten the Earth, that it may not be too closely comprest, but become porous and admit of the Rains penetrating unto the Seed: which when so, then is there hopes of the Seeds sprouting, in such a fat Earth which swells up by means of the Water, and of bringing forth its Fruit.

Even just after the same manner are the metallick Seeds to be sown, and ripened; and for Example sake, let us take the vulgar and common *Saturn*, (well mundified) for that Earth, into which we will sow such a Seed as having a great affinity with *Saturn*, loves to be augmented therein, whereby it may bring forth fruit. And like as the Seed of any Animal requires an Animal Matrix, as a Field or Earth to be multiplied in, and hath not any affinity with the common Earth: Even so likewise doth a metallick Seed require a metallick Earth, Matrix, or Ground, wherein it may germinate and be multiplied.

Now this multiplication is on such wise made, as is done in the Animals, by the conjunction of Male and Female, one performing the office of the Agent, and the other of the Patient. So then, we will make some trial in this Process which is here annexed, not for the intent of getting great Treasures thereby, but for the sake of searching into, and getting the knowledge of Nature; we will take the Male in the room of the Seed, and the Female instead of the Ground or Field, and we will try whether or no the Seed will admit of multiplication.

Let us therefore take the common *Saturn* for the Feminine Matrix, and Antimony of the Male-like seed, which we will sow into its own Matrix, as Husbandmen are wont to do. I do not gain-say but that there are other Seeds, and probably better to be found to be implanted in *Saturn*, than Antimony is: But yet here I content my self with this of Antimony, as having an intention of onely shewing at this present, by what way it may appear that a metallick Seed may be brought to a faculty or possibility of growth in the Saturnine Earth. And upon this account for Demonstrations sake of this Labour, was I willing to use Antimony, it being a masculine Seed of a Saturnine kind. For common *Saturn* is usually accounted for the true first Ens of *Lune*, and Antimony for the true first Ens of *Sol*, and they are in very deed found so to be. For you shall not find any Lead without Silver, nor any Antimony without Gold; so that I strongly perswade my self that from those two, there cannot arise ought else but what is good and profitable, did we but know how legitimately to compound and handle them. And although I do not profess my self to know many things, yet will I simply tell you my opinion, concerning the way which I suppose such a Commixtion and Maturation may be effected by.

A Philosopher saith thus,

*By Gold and Silver you will nothing do,
Unless you use their first Ens therunto.*

The first Entities of both these are Lead and Antimony, the latter of which, (*viz.* Antimony) is not to be admitted in that impure state that we find it in, unto the former, as unto its Bride or Spouse, but must first be washed in a hot and sharp Lixivial Bath, that it may thereby attain to a delicate silvery white-

ness, and shine like a Star in the Firmament; which Antimony thus purged, is called by *Paracelsus*, the signed Star.

But yet I would not have any one to think, that I do here mean the common stellate *Regulus* of *Mars*, which would be dissolved in Spirit of Salt, and would separate it self from the Lead, which ought not to be: But that signed Star must be so prepared, as not to admit of being dissolved in Spirit of Salt, for else it will not serve for this Work. It must be so concreted as if it were so many thin Shells (one within another,) and so very hard as to be able to cut Glais, and to strike Fire out of a Flint. This signed Star being so washed, is to be sown into its own Matrix, and by the solar Heat and fruitfull Rain, to be promoted and enforced unto growth.

Take of the thus prepared masculine Seed, or signed Star, [A] 9 parts, and of the feminine kind, [B] 4 parts, melt the signed Star in a pure Crucible, unto which being molten cast the Woman in, which being cast in, there is presently made a sweet Conjunction and Commixtion of them both in that infernal Heat, in which they familiarly couple together.

The Mass being commixt, is to be poured out of the Crucible through wet Brooms into cold water, and is to be reduced into Grains, and so the masculine Seed or Husband will be legitimately and duly mixt with its Earth or Ground, or Wife: which Earth together with the Seed which it contains is to be put into a firm Vessel, which fears not the violent corrosion of the Spirit of Salt, but in such a quantity as that scarcely a tenth part of the Vessel may be filled therewithall: Then must there be put thereon as much mineral Water, namely pure Spirit of Salt, as the Cucurbit can bear, and Fire is to be put thereunder, whereby the Spirit of Salt is to be again drawn off, by which Operation, the Earth together with the included Seed will day by day be refreshed, be moistned and swell up, by reason of the Spirit of Salt, no otherwise than as if you should moisten some dry and as it were parched Earth, with Water. For the *Saturn* is not dissolved by the Spirit of Salt, but onely swells up, and becomes foliated, and yet remains whole or entire, nor is it much unlike unto lovely lookt Talk, which shines with a delicate whiteness: and therefore the Philosophers say, sow your Gold in white foliated Earth. Without doubt they meant not common Gold, for then they would not have said, our Gold, but would have simply said onely Gold, had they not intended a peculiar Gold, or first Ens of Gold.

N. B. I cannot by any means omit to give you thus much notice, namely, He that cannot hit upon the manner of preparing the said signed Star, may endeavour the making of common *Saturn* aureous, particularly after this manner, as follows. Extract with Spirit of Salt out of the Oars or Veins and metallick fugacious Earths, the spiritual Gold that lies hidden therein, and extract or draw off this Spirit thus impregnated with Gold from *Saturn*, which Spirit may by this means be all agen had, and be used about new extractions. And as for the Gold which the Spirit extracted, that the *Saturn* hath imbibed, and indues it self thereby with a golden nature; which if you imbue or moisten with many such extractions, that goldenness will, as I may so term it, grow up or increase in each cobobation, and the Spirit of Salt it self will become augmented.

K k k k k

If

If now the *Saturn* be imbued with a sufficient Portion of spiritual Gold, it must be reduced by X, or Alkalies, that so the spiritual Gold may be made corporeal, which will exhibit it self pure unto you, after that the *Saturn* shall be driven away on the Test. But yet there is no need of doing this, seeing it will be better to granulate the *Saturn*, and by those repeated cohobations to draw off the Spirit of Salt agen, being each time impregnated with that spiritual Gold, and so by this means will you enrich your *Saturn* with the greater plenty of Gold. And being so enriched it must be reduced by a fixing X, in my secret Crucible, which neither suffers any thing to go away in fume, nor to run out; in which reduction the spiritual Gold and the fugacious *Saturn* it self are fixed, so that both Gold and Silver are found on the Test with great profit, this labour requiring no other costs save those of the Fire.

This Operation which separates fugacious and fix Gold out of the Oars and Stones, is far better than that which is made by the Solutions of *Lune* and *Saturn*, described at large in the third part of the Prosperity of Germany. For here, we do not need either *Aq. Fortis* or Vinegar for the Solution of *Saturn* or *Lune*, neither need we the same to get the extracted Gold out of the Spirit of Salt, but being free from that labour and costs, we [onely] draw off from *Saturn*, that Spirit which hath extracted the Gold, which [*Saturn*] attracts and holds the volatile and fix Gold that was in the extraction, insomuch that there is not requisite to this labour of drawing off the extractions from *Saturn*, any thing else save onely Coals and Fire. Add hereunto also, the gainfull increase which daily comes in by the addition of Salt and Water, by which the Spirit of Salt is day by day augmented without any costs.

N. B. When the Spirit of Salt becomes too strong by reason of the Salt put thereto, that Water where-with the Oar is wash, after the first extraction of the Spirit of Salt, [or after it hath first been extracted with Spirit of Salt] may be made use of [and put thereto] instead of common Water. For it is somewhat fourish, and hath likewise a golden nature.

N. B. Praise God, and forget not the Poor, seeing thou art sufficiently informed and taught by what means thou maist get great Treasures.

The things I here write, are not for this end, namely, to teach others how to make great heaps of Gold, but onely to shew them a way of attaining to a good Medicament, and withall, of knowing and perceiving by the same labour, that the melioration of the Metals is altogether possible and certain.

Whoever he be that could attain so far as to bring Antimony and Lead, as being the first Ens of Gold and Silver, into a certain Dissolvent, so as that the one would not precipitate the other; then at length would he have entrance upon the right way, which leadeth unto great things, like as also Gold and Silver being dissolved in one and the same *Mensurum* gives beginning to things of great moment. I dare affirm therefore, that he that can reduce Gold and Silver, or Antimony and Lead, with Salt, into an agreement, hath opened a most strong Gate which leads unto a great Treasure; for then the Patient must suffer even unto death, and must die, out of whose dead Body, new and living Bodies do afterwards come forth.

Although I have often told you in my Writings that Gold has no greater enemy than combustibile

Sulphur, and that nothing is more inimicitious to Silver than Salt, and nothing more displeasing to Mercury than a strong *Lixivium*, and that amongst these contraries there is a perpetual Antipathy so long, untill they are constrained by Art and Skill to become friends and mutually to embrace each other: yet notwithstanding, this will not be so easily sensible by every prating Boaster, and that makes a great noise by his lofty vapouring speeches; no, but for the sake of these very Men, are such great *Arcana's* justly and deservedly wrapt up in darkness, and indeed 'tis fit they should so be.

Moreover if there be required a great suffering, 'tis necessary that both the Gold and Silver, as being Male and Female, should suffer together and not barely the one or the other apart: for hereby this Regeneration will be made so much the nobler and the more magnificent. For Example, make a Circle, and cut or divide it with Diameters cross-wise [or at right Angles through the Center] so that the extrems of the Diameters which divide themselves in the middle or central point of the cross may touch the Circle, and that of those four extrems [or Semi-diameters] one may touch above, and the other beneath, and the other twain may reach, one to the right side, and 'tother to the left. Place the Gold in the uppermost extrem marked with the letter A, and his enemy, namely Sulphur, in the lower extrem, which the letter C, demonstrates. In like manner place Silver on the left side of the Gold, at the letter B, and its enemy, *viz.* Salt on the right side marked D, and you will see how averily these enemies behold each the other. The *Sol* looking about him spies his capital enemy, Sulphur, directly opposite unto him, and hath *Lune* at his left side, and Salt at his right; and very willingly would he enter into friendship with *Lune*, and Salt which are joyned at his side, if they but would, or indeed could. But he honours not his capital enemy Sulphur, with so much as a look. The *Lune* placed by the side of the Sun, does not permit the Salt to joyn it self with the Gold. For when the Salt is with the *Sol*, it clearly hinders the *Lune* from associating it self with the same. Nor can it possibly be that Salt, *Lune* and Gold should enter into a thorough familiarity. Thus too is it with *Lune*, who hath her capital enemy diametrically opposite unto her, and very willingly would she enter into friendship with both her neighbours, *viz.* *Sol* and Sulphur, if they were not such great enemies (to each other,) and refused this familiarity. For if *Lune* associates unto her self the Sun, then Sulphur denies to come into the society. If she admits the Sulphur as her companion then, then *Sol* is excluded, as abominating the friendship with his enemy Sulphur. Much less therefore can *Lune* be the companion of them both together. See the Fig. in the Book of Dialog.

But now if the Gods please, that these four capital enemies, should unite in one sociable amity, and that wonderfull regenerations should arise from this new familiarity, (then) do they command *Vulcan* to heat in the Fire this Circle comprizing those four capital enemies, thus constituted in the four aforesaid extrems, and casting such hatefull looks upon each other, and yet not knowing how to escape out of the Circle, and to press them together more and more with his Hammer by little and little, untill all four being driven into one mass, do come together into one body, which body doth then obtain a power of reconciling all enemies, and of effecting great matters.

By

By this here spoken may any one easily conjecture, what great suffering there is in this Conjunction, and what great streights do afflict these enemies, when each of them must thus against their will enter into friendship with his capital enemy. Verily we find them to be such sufferings as have not their like again, and therefore do they produce to light, such great and such wonderful regenerations. Now whatsoever it be that is exercised in but a small suffering, the same doth admit of but small emendation.

The greater the suffering, the greater the melioration, so that that affliction which brings with it even death it self, brings with it also so much the more noble and magnificent Regeneration and Resurrection. He that suffers not in this World, shall not have the Crown put upon him after his Resurrection. By how much the greater and more innocent the suffering and affliction of this life is, so much the greater, and fairer a Crown may be expected in the other World.

The Grape is prest so long, till it be rid of all its juice, this juice doth indeed bring a sweet and pleasant delightfulness unto mortal man, but the Grape it self which the juice is prest out of, ceaseth to be a Grape, and perisheth through defect of juice, and passeth into nothing. But unto the noble Vine, hath God given this benefit, that it yearly bears not barely one but many Grapes together: All which being plucked off, it doth nevertheless produce the following year no fewer, but rather more Grapes; and still remains a blessed and fruitfull Vine, because it is furnished with roots and fertile Boughs. On the contrary, they that have devoured the good and sweet juice themselves, remain always hungry and thirsty, and that for this reason, because they guzzle down the juice too new and fresh, whereby their Bellies swell, and they receive no nutriment therefrom.

This is a thing certain and undoubted, that the bodies of the Metals become by suffering and dying far more excellent and more noble. He therefore that knows that the patient is to be subjected unto its own agent, and doth also understand by what way they are to be conjoined, will never labour in vain, but will reap the wished reward of his pains.

When the agent doth touch onely the superficies of the patient, and penetrates not into its heart or root, there will verily be but a very little good done, save onely this, *viz.* That the Agent being afore rendered aureous, is able to give unto its patient also a golden nature, and to bring the same to an aureous degree, and to bestow upon it the perfection of Gold: but that melioration which is done onely by it self proceeds on very slowly.

As concerning the manner of enduing the Spirit of Salt with an aureous nature, that so it may the sooner render its patient a partaker of golden virtues, we have spoken of that already, and demonstrated it clearly enough; he that does not understand, we cannot help him any other way.

N. B. When the Eagle, the Servant of *Jupiter*, hath with his beak and talons plucked out the coagulated beams of the Sun out of the Cliffs and Rocks, and brings them unto *Jupiter*, he is so very bountifull, that he sends down the same unto us by the Rain, which is of so much efficacy, as that all the Herbs upon which it falls are bettered, and the martial, venereal, saturnine, *Lunar* and mercurial Herbs do put on the golden nature of the Sun; so efficacious is the golden Rain of *Jupiter*, if the Eagle hath first brought unto him the coagulated rays of the Sun.

And that I may be the better understood, and that it may be known, that the Melioration of Metals may be accomplished by a dry Agent, full as well, yea and better, and more profitably than by a moist Agent; I have judged it a thing worth while to adjoyn the following Process under the Title of the *Great Country Farmer*.

And let the studious Artift know, that the amending of the Metals by the dry way, by the operation of dry Salt, is far more easie, and may likewise be dispatcht in a greater quantity, than is wont to be done by the moist way: and that there is nothing required to this operation save Salt and Coals, be the Metals that are to be fixed, even what they will.

For Example, if a man be desirous to fix *Saturn*, or to procure unto it a Silvery nature, there needs not pure Lead be taken for this work, seeing he may have the Oar or Vein thereof for much less price; and indeed there is some that is a wild and sulphureous Oar, which yields not, in the melting, any good Lead, and may be had in great plenty in some places of *Germany* that I know of, for a very small price, or rather for none at all. Such a wild Oar of Lead as this is, which yields neither good Lead, nor is fit for the Potters to glaze their Pots withall, by reason of its hard fusion, doe I chuse for my operation, not onely because it costs less than other such Oars of Lead doe, but for this reason too, because it hath store of Sulphur, and fit enough for fixation.

This Vein or Oar doe I bring into small Powder, and mix as much Salt thereto as need requires, then cast it in upon the Coals, in such a Furnace as I have described to make store of Spirit of Salt in: The Salt and the Sulphur exercising their vehement or powerful virtues upon the Lead, causeth it to be afflicted with terrible dolours, insomuch that part thereof ascendeth on high [or sublimeth] with part of the Salt, and betakes it self into Receivers fitted on for that purpose. In which sublimation, the Salt and the Lead ascend in a spiritual manner, and contrary to their will, suffer spiritually, and so are constrained to enter into friendship, finding a place of quietude in those cold Receivers, and there settling together. The residue of the Oar, and part of the Salt being burnt up, and emitting no more fumes, but falling down through the Grate like Ashes, more new or fresh Coals must be put into the Furnace, and new matter must be thrown thereupon, as afore; and this Labour is to be continued so long, as it shall please any one to follow it. Now by this, the *Saturn* is far more vehemently afflicted, than in the moist way by the Spirit of Salt; And if unto the Oven [or Receiver] receiving the fume, and in which the flowers of the Salt and Lead settle, there shall be applied yet several Receivers, there will then be therein caught store of Spirit of Salt, which being rectified, may be agen made use of in the moist way. The flowers being taken out of the Oven or Receiver into which the fume goes, are to be agen thrown in upon the live Coals in the Furnace, that they may suffer anew and be sublimed. After that they are all sublimed again on this wise, they are to be agen taken out of the Oven, and be cast in upon the live Coals; and must be afflicted with these Labours so often repeated, untill they become fix and ascend no more, but fall down into the Ashes. Which being washed, will yield a Salt profitable for many things, and will quit all the costs which have been laid out upon

upon Lead, Salt, and Coals; so that the Spirit of Salt which is gotten, and that which is amended in the Lead Oar by the Salt, cost nothing. The Ashes being washed are to be reduced, in a Furnace, by blast, and be so often tormented, till a good portion of Silver be gotten by this operation, which the elaborated matter, being purged by a due separation upon the Testis, will give. And so shall you have Gold and Silver by the benefit of this operation, by which [operation] we have manifested unto you the *Great Country Farmer paying his yearly Rent*.

Now like as *Saturn* is dealt withall in this operation, even so are the other Metals wont to be handled too; but yet you must observe the Regiment of the fire, which, according to the diversity of the Metals, must also be diversly administered. And even the Commixtion it self requires good heeding, as being a business of no small moment.

Moreover, in this operation you must also note, That one Salt is more fit for this operation than another is; for by how the sharper nature they have, so much the more commodious and profitable doe they shew themselves to be. So Common Salt sublimed, as is done in this Labour, will operate far stronger than Common Salt it self unsublimed. Besides, there are Salts to be found which work yet far more powerfully, yea so strongly, as that they need not the help of an external fire, but doe produce their effects even in the cold. The operation of which, in the moist way, if any be desirous to promote and strengthen by an external fire, he may so doe, in a Lamp-Furnace, and free himself of the charge of Coals, and be exempt from that frequent Labour by which the Fire is to be maintained.

Some moist Fires are of such great virtues, as that they need not any Lamp-fire, but a small golden thread or wire in burning Spirit of Wine is capable of administering heat sufficient.

And the burning Spirit, if made of Leaves, Grasse, rotten Fruit, or Corn, and Grape-stones or husks will be but of small costs, or in a manner none at all. Now a pound of such Spirit being placed with a Golden wick in a convenient Lamp will suffice for three or four days, and give heat enough. But yet nevertheless, that moist fire doth ripen its Metal without the help of any external fire at all, and yields its profit, but then it requires a longer space of time.

Put case therefore, that I make my moist fire so strong as to be able to perform its office in the cold, and that it needs not any external fire: And if I were to make a fire, it would needs require one Duckers charge: If now, standing any-where, it yields me two Golden Duckets out of the matured Metal, it would doe well enough, and abundantly recompence the labour and costs expended. For there's nothing wanting of the Metal [you took to ripen] save that which is changed into Gold and Silver.

And forasmuch as I can see by many such Vessels, and those great ones too, there's no doubt to be made, but that my gain will be the greater, and that with very little labour. For now, at first, the labour of preparing the moist fire, is in a manner no labour at all, for in three or four days may be so much made as is sufficient for the maturing of a great deal of Metal. For this fire may be compared to a Seed, which being sown in the Earth afore Winter, doth in the Summer-season produce store of Fruit, and fit to be reaped.

And though this maturation proceeds on exceed-

ing slowly, and excludes all hast, yet it brings with it this benefit, namely, that it requireth no other labour in the Winter-time, but to be onely once laid by, and the perfecting thereof must be committed to God and Time.

There are various and divers such cold Fires, that promote the maturation of the Metals, and may be gotten out of divers Subjects, namely, out of Tartar, Urine, Hairs of Animals, Horns, Calx-vive, Soor, the Blood of Animals, the Feathers of Birds, the Bones of Horses, Oxen, and other Beasts, out of which such a fire is very difficultly prepared, one of them, here reckoned up, excepted, out of which the said fire may by an easie labour and business be made, and without costs. It is therefore a great gift of God, and an especial grace from our Creator, if he maketh us possessors of such a Country Farmer, which being sustained without any costs, doth notwithstanding very largely pay his yearly Rent. To God therefore are unceasing thanks to be returned for so great a benefit.

But we have said enough of these moist and dry Metal-ripening Fires; what way soever any one is minded to chuse, that way may he follow, for it lyes in his own free choice. If he chance to err, let him not lay the blame upon me, who out of a good mind have undertaken these labours of writing, but cannot thrust the chewed meat into any ones mouth. I will by God's permission show the wonders of God to some friends this next Summer, that so such as come after us may likewise have occasion of praising God, and of giving him thanks.

But even as the common Earth, when it is moistened with often showers, and now and then freed of them by the heat of the Sun, retains in it self a fruitful Salt, and doth necessarily acquire a fertility: So likewise our Earth doth not onely daily encrease in goodness, but in weight too, and becomes more ponderous: but you must not think that this heaviness or weight proceeds from the Spirit of Salt's insinuating it self into the porous Earth, no: For if the said Mass should be but onely eight days time in the digestion, and the Spirit of Salt be [then] washed off, yet would it be encreased a quarter part; which ponderosity comes indeed from the Spirit of Salt, out of which the *Saturn* draws something unto it self for nutritious sake, as the Common Earth does out of the showres of Rain, and becomes more weighty.

For if there were no occult and nitrous virtue in the Rain, it would conduce but little to fertility; and if there were no spiritual and astral Gold, or spiritual and astral Sun in Salt, the immature Metals could not be ripened by the same. By how much the oftner therefore, a good Spirit of Salt is drawn off from the *Saturnine* Earth, and *Saturnine* Seed, so much the sooner also doth that Seed arrive unto its full ripeness. For at every turn [of drawing off] something of the good part of the Spirit of Salt remains behind, attracted by the Earth and Seed, from which the melioration and augmentation doe arise: as may be seen in the Vegetable Seeds which sprout forth out of the Earth, and are encreased by the help of Rain.

The possibility of these things I have seen, but have not hitherto brought the said matters to a full maturity, or to speak more rightly, I have not finished the whole operation. He that is minded to make a thorough trial, may so doe: and if he misse the effect of his endeavours, let him not blame me, for I doe not aim at drilling on any one by my persuasions,

sions, to bestow his charges on an uncertain thing. But I mention these things that to the nature of Metals as also of Salts may be known, and that (by the help of this knowledge) the Writings of the Philosophers may be the better understood. For the labour here proposed avoucheth the truth of those Operations which the Philosophers call their Calcination, Dealbation, Incineration, Ascention, Descention, Cohobation, Inceration, Distillation, Sublimation, Volatilization, Maturation, Fixation, and say that all these and the like Chymical Operations may be made in one Vessel, with one Fire, in one Furnace, without any change of the Labours, Vessels, or Fire.

For the Philosophers have described their greatest secrets and Arcana parabolically, and in Riddles, but especially the Poets, as Ovid, Virgil, and many others, who are very hard to be understood by those that have not the knowledge of the nature of Metals, which being once known and understood, renders the meaning of the Poets easy. For the Poets were wont to impose one while such a name upon such a Metal, another time another name upon another Metal, which custom of theirs, he that does not heedfully mark will easily fall into an error, and miss the apprehension of their meaning.

For Example, in one place they call Copper *Venus*, in another, the Wife of *Mars*, in another, the Sister and Wife of *Jupiter*. And so deal they with Silver too, one while they call it *Luna*, by and by *Diana* or *Jana*, another time *Vesta*. *Apollo* is by them stiled one while *Sol*, then *Phaëton*, then *Latona*, so that it is exceeding necessary, for those that are desirous to learn ought out of their Writings, to be well acquainted with those different names and Appellations. And although the Poets do account all the Metals for the Sons of *Saturn*, yet do they subdistinguish them and stile them, *Saturn*, *Jupiter*, *Venus*, &c.

The common Lead is *Saturn*, and so is Antimony, *Saturn*, *Bismute*, *Tutia*, *Lapis Calaminaris*, the Ashy Colour, Yellow, White, and red *Magnesia* are termed by the name of *Saturn*: The white *Marcasite* and *Zink* are deemed to be of the Family or Pedegree of *Jupiter*: *Orichalcum* or white and red Copper, are stiled by the name of *Venus*. But according as *Venus* is impregnated, and according as the Copper is white or red, so hath it its name. The red Copper is as yet a Virgin. Forasmuch therefore as the Poets have committed unto Writing the Transmutation of the Metals under the Cover, and veil of Fables, and have made mention of *Saturn*, *Jupiter*, *Mars* and *Venus*; it can never possibly be, that he who knows not this different distinction can understand their meaning. And for an Example hereof, consider but the Fable of *Diana* and *Apollo*, brought forth at one Birth by *Latona*, who was gotten with Child by lying with *Jupiter*, and was driven into exile by jealous *Jana*, and having a long time suffered Persecution by the biting Serpent *Python*, and being driven to fly through all the Countries of the World, did at last after many grievous labours and troubles, pass over the tempestuous Sea into the Island *Ortygia*, and betook her self to her Sister *Aferia*, by whom she was received, and begat these Twins, viz. *Diana* and *Apollo*.

Who will be able to apprehend the meaning of this Fable, save he that well understands the nature of the Metals? Verily nobody will so much as dream of so finell our ought of those Mysteries, unless he shall meet with such like Histories in his metalline li-

bours, and then at length will he understand what the meaning of the Philosophers is. But for Example sake, let us take two Metals which have an affinity with each other, namely *Jupiter* and *Venus*, these I joyn together, that to the Woman may be impregnated with the masculine Seed. *Latona* therefore being great with Child, I cast her forth into exile, that she may be continually persecuted by the biting Serpent *Python*, untill she flies through the Salt and stormy Sea, into the Island *Ortygia*, to her Sister *Aferia*, dwelling in the Island *Ortygia*, and there bring forth the fair *Diana* and *Apollo*. Now these things are easily understood, were but the genuine Appellations substituted in the room of such strange terms, of which thing I have onely some knowledge, but do not profess my self a perfect Interpreter. Yet methinks I cannot choose but say somewhat. The venomous Serpent *Python* is a surname of *Apollo*, for he is produced by the efficacy of the Sun, and is that corrosive Salt which doth so long afflict and torment the impregnated *Latona* all over the dry part of the World, untill she betakes her self by the Sea, that is, by that strong Salt Water, unto her Sister, that is, unto pure *Venus*, and precipitates her self, and brings forth the fruits of *Jupiter*, namely, *Diana* and *Apollo* together. The Poet doth here mind both the moist and the dry way together, when the Metal is wrought with a due Cement, and made fix it is then dissolved with the Salt Water of the Sea, and pure Pores of *Venus* are put into it thus dissolved, that so the pure Metal may draw unto it self her impregnated Sister, who brings together with her Gold and Silver, which having been so long hidden in its body doth now manifest it self.

It is indeed the better to fix the Metals by Cements, and so to render their fugacious Gold and Silver compact, which may be as well done in the moist way by sharp Waters and moist Fires. But if the Metals legitimately impregnated, do first pass through a dry and burning hot Fire, and are afterwards yet once more transmitted through the moist and cold Fires, then *Plura* sends the mundified Soul out of Purgatory unto *Neptune*, by whom it is carried into Paradise, where it doth afterwards remain safe and free from all danger of the Serpent.

Upon occasion of the aforesaid Fable, and particular Transmutation of the inferior Metals, this is to be yet more observed, that every *Jupiter* is not fit to impregnate *Latona*, but that onely which is yet living, efficacious, young, and full of Seed is able to impregnate *Latona*. For *Latona* carried with her no more but the Seed onely of *Jupiter* into the Island *Ortygia*, and left behind her all the body of *Jupiter*.

Moreover this is to be considered, that *Latona* did bring forth *Diana* first, in the Bosom or Lap of *Venus*, that is, of the Midwife, but *Diana*, presently after she was Born, performed the office of a Midwife in receiving her Brother *Apollo* in her Lap, which thing is sufficiently manifest unto those who have laboured (though but little) in the Metals. For should the Nativity of *Apollo* have preceeded, *Venus* could not have received him, for which reason *Diana* ought to come forth first, that so she might the more commodiously receive *Apollo* from *Latona*. I know not how by any means it may be proposed more clearly.

Every

Every one that does but know the nature of the Metals doth well understand, that when Gold and Silver are spiritually dissolved in one Water, and that plates [of *Mars* probably] are put in to the Solution of the Gold and Silver, neither of those Metals will adhere to the Plates. But if the Plates of Copper are put into that Bath, he shall presently see that all the Silver that was in the Water will adjoyn it self thereunto. And now, after that the Silver is thus precipitated and sticks on to the Copper, the Gold will likewise fall down out of the Solution, and apply it self to the Silver; which labour I have more at large handled in the third part of the Prosperity of *Germany*. It could not therefore otherwise be, but that *Latona* must first bring forth *Diana* and *Apollo* afterwards, seeing that *Venus* the Sister of *Latona* could be helpfull onely in the bringing forth of *Diana*. It was therefore necessary that *Diana* her self should be an assistant in the Birth of her Brother *Apollo*, for otherwise he could not have been Born.

My time admits not of producing any more such similitudes in this place. We will defer them till some other time, namely, for the Edition of the Work of *Saturn*, wherein shall be taught how the most vile, and most abject Metals are to be maturated by the benefit of Salts, whereby they may in a particular way yield forth Gold and Silver.

But forasmuch as I cannot divine, what impediments may put a stop to the edition of the work of *Saturn*, and that in this very Treatise here is often mention made of *Saturn*. It cannot I think be any ways hurtfull, if some good thing be yet farther adjoyned. And such things as are here manifested of *Saturn*, it will not be needfull agen to mention them in other places, seeing there doth yet still remain matter enough for to fill a whole Book of the Secrets of *Saturn*. And there lie such wonderfull Secrets under the vile and dirty Garment of *Saturn*, as being manifested, would exceed all the belief of unskillfull Men. For he is not onely an expert Fisher in Fishing Pearls out of the Salt Sea, but is withall an expert Hunter, in driving the Wild Beast out of his green Grove or Cops, and of catching him in his Nets, as we have told you in the foregoing third part of the Prosperity of *Germany*.

Nay, he is a bathing Gentleman of singular skill, who by his bathing and washing his Children, adorneth them with the comeliness of *Diana* and *Apollo*. When he is alone, he serves onely for *Apollo* and *Diana* to wash off their accidental impurities and defilements, that so they may recover their natural fairness. The other Metals can't brook his so over sharp and rigid bathing, but are rather suffocated and killed therein, than become more fair and more pure. But if *Saturn* shall have first washed himself even unto the highest whiteness, in a Bath of common Salt, he is not then so austere and severe, but prepares for his Children a far more tolerable Bath, which being agreeable [or proportionable] to their Weakness and Sicknes, renders them all fairer and more pure. His greatest virtue consists in his Water which doth both particularly and universally free the Metals of all their defilements. I have often had a particular experience [hereof,] and yet daily can (God be praised) shew and teach the same unto others. But I cannot do any such thing in an universal way, and inform others as to that; nor do I vainly brag of so great a matter, though I have my thoughts as touching the manner how this thing may be effected. Nay the more I conceived about

that matter, the lesler would I boast of the same.

Verily it is a great shame to boast of that thing, of which thou hast not even the smallest knowledge, or at least dost not know any thing else, but what thou hast drawn in, by the reading of other Writers. 'Tis a common proverb, *That those Cows which Bellow, or Low evermuch, are said to yield the least Milk*, and that this is a thing true, yea most true, experience it self doth testify.

The Chymical Art is become at present so common, that almost every body, after he hath but viewed over one or two Chymical Books, (though he never moved his hands to the Work, nor understands so much as the Chymical Terms themselves) is nevertheless wont impudently and lyingly to boast of the knowledge of the universal Medicine. Nay thou shalt see some to proceed on to that height of boldness, as even to write Books of so great a Secret, and to dare promise the Revelation of the same unto others, and yet for all this know nothing at all, and have not so much as any the meanest foundation, but rely solely upon that knowledge, which (being as we said afore, drawn out of other Writers) causeth in them a most uncertain hope, of a thing most extremely obscure.

He that is not a stranger unto, nor ignorant of metallick affairs, can easily discern the Lyes from the true Writers, and can judge who are true, and who false. Such as do know somewhat are not wont to make a bragging noise of their skill. On the contrary, those Brethren of Ignorance do offer unto every one that most secret miracle of Art and Nature, namely, the universal Medicine, which thing a true Philosopher neither ever did, nor ever will do. But as for the revealing of the particular washings, purgations, and meliorations of the Metals, whereby Gold and Silver are to be extracted, if any one doth know these things and discloseth them, and desires not to bury his Talent in the Earth, he does well.

Neither would any one be endamaged by such a discovery though those particular *Arcana's* should be known even unto all Men, and that every body could effect such Operations; for nothing could redound from them but great gain throughout all the World.

But these things here mentioned may sufficiently serve for an evident and manifest admonition for every one to beware of the Books of such Writers, (but why do I say Writers? they are rather Collectors and Describers, who after the manner of Borchers do patch up new Books out of old cast Garments) and to give no credit at all unto them as containing nothing of truth in them, and to think that those kind of Men betake themselves to this Book-patching Trade, meerly to get their Bread by.

Some such Men have I known, that provide not either for their Food or Rayment any other way, than by the sale of such false Philosophical Books, which they have from the Printers to sell to others, receiving a certain price for their labour, which they bestow in profering them to Sale. O miserable Philosopher! Who doth not know so much as to get his Food at Home in his own House, but is constrained to shift after it by the bare selling of such kind of Books. Let this here spoken be as a warning. If need required, and occasion were, I would not fear to divulge their names too; who having not any the least knowledge of nature, do nevertheless dare to offer the Revelation and Confession of

of the great universal unto others, and cast such a great blemish of reproach upon the most noble Chymical Art, as makes it much contemned, whereas a more noble and more excellent Art cannot be found. He not censure any, but yet it would become the magistrate to examine those great Philosophers, whether or no they were actually and in very deed skill'd in that great universal, (which they boast so wonderfully of, and write Books of such great moment, and promise to teach others too, as if they excelled even *Hermes* himself in the knowledge of the Art) and if in the proof or tryal they gave good satisfaction, and confirmed the truth of their Writings by a real and true melioration of the Metals, then to honour, defend, and protect them, as rare and singular Philosophers. But if they know nothing nor could perform ought of their pretended Art, the magistrates would not do unjustly if they punished such men, and made them exemplary, seeing too that they endeavour to asperse and backbite other honest men, who are endued with the skill and knowledge of such great things, with lying reproaches. A good Gardener being wont to gather good Honey out of the Bee hive which he has in his Garden, if he finds a Nest of Wasps or Hornets any where near, built in some hollow Tree, and that they steal away the Honey from his Bees, he right worthily destroys such a Nest, and roots out of his Garden those Thieves and Robbers of his Honey, that so for the future they may not detriment them any more.

Were but one or two of those Fellows handled in such a manner the rest would be deterred and would not so easily promise others by their deceitful Writings, the making of the Philosophers Stone, which they are so extremely ignorant of. Certain it is therefore, that no true Philosopher, were he a partaker of the great universal, will indifferently offer the same unto all Men, and caluminate (without any cause given) those that are so innocent (and who have forgotten more than others have learned) and publicly bespatter them with most false Lyes before the whole World, to the great detriment of the Persons so abused.

But to return to my purpose, and to shew in this place yet another very considerable *Arcanum of Saturn*, you must know, that I have already published divers great secrets in this fourth and third preceding part, but cursorily only, because I have not as yet attained to the one half part of their most great utility, and I was willing only to shew what things might be done.

But forasmuch as I have fortified their use with good and sharp Weapons, and that one or other sometime lighting thereupon by chance, and reaping great profit therefrom, may possibly judge that he is no ways at all bound or beholden unto me for the same; I was willing for the better information, and instruction sake, to adjoin these few things, which are very weighty and considerable.

In divers places of the foregoing third part, and of this fourth part too, I have the preparation of the *Mercury of Saturn* and *Luna*, that is, I have shewn how *Saturn* and *Luna* may be reduced out of their Solutions, by the help of Salt, into a Snow-like, fusile, fugacious, pure and dry Water; which Waters are, by me called the *Asterisks of Saturn* and *Luna*, by reason of their fusile and volatile nature: They are metallick Waters not wetting the hands, and yet by reason of their form do they bear the name of Water, because being put into a Crucible,

and molten with a small Fire, they are pellucid and transparent like unto Fountain Water, inasmuch that they may be seen through even to the very bottom: But yet the Water of *Saturn* is of a more transparent clarity than the Water of *Luna* is.

But forasmuch as our main scope in this place is to make some mention of the use of the Saturnine Water, we will let pass other matters, and declare some of the virtues of the said wonderfull Water in the melioration of the Metals.

Let the lover of Art therefore know, that the Saturnine Water doth display its virtues in washing the Metals that are to be amended. For if any imperfect Metal, as Iron, or Tin, or Copper, be adjoynd therunto, and held in such a Vessel, as in which, that Water cannot by means of its fugaciousness vanish away, nor through its subtile and penetrating power run out, and that it be digested for a while in such a Vessel, this Saturnine Bath seizeth upon, washeth, and purgeth the Metal, and transmuteth it into a better and more pure Metal, but yet with no great profit, for it onely shews the possibility.

But yet if some tinging Species be adjoynd therunto, it does not onely make a pure washing, but likewise exalteth and tingeth the same, according as the tendency of the adjoynd subject is, either unto a white or a red Tincture. But what those Species are, there's no need of disclosing them to every one. 'Tis sufficient that I have laid open the Water, and the use thereof in the washing of the Metals.

But that the Saturnine Bath may the sooner and readier seize upon the Metals, and wash them, it is the best way, to add one third part of the Mercurial Water of *Luna*, to the Mercurial Water of *Saturn*: which Waters do very readily conjoin, and each help the other in the washing, and do also tinge, according as the property of that Tincture is, which is adjoynd therunto. I will for Example sake adjoin the manner, which shall both shew the possibility of the thing, and administer occasion of farther search.

Dissolve one ounce of pure Silver in *Aq. Fortis*, and three ounces of common Lead, in more *Aq. Fortis*, mix both the Solutions together, and precipitate them, either with common Salt Water, or with Spirit of Salt, which is all a case. Pour off the *Aq. Fortis* from the *Coagulum*, after its being settled to the bottom, which said *Coagulum*, you need not wash with Rain Water, for this Work, but press the liquor onely through a thick Cloth and so free it of its humidity; this done, dry this metallick Cheese by the Fire, and you shall have a Bath very fit to wash *Venus*, *Mars*, and *Jupiter*. And now when you are minded to try whether or no the success will fadge well, divide your Bath into three parts, and wash those three Metals on the following manner.

N. B. Let no Body take it in evil part, that I here silently pass over my secret bathing Laver, serving to wash the Metals in, and not permitting the Water itself to go away in fume: He that is minded to try this Operation, may for the first time make use of Crucibles, which, although they may bring some loss by letting go part of the Saturnine Bath, yet notwithstanding they will demonstrate the success of the business, and the loss by them caused may afterwards be prevented by due Medicaments. The manner of using the Bath aforesaid, is as followeth.

Take

Take of the filings of pure Iron, Copper or Tin one part, mix it with three parts of our dry Bath, and put the matter thus mixt into an earthen Vessel, which hath the compactness of Glass, such as those are, which are made at *Siburg* near *Cölen*, at *Ramberg* in *Francia*, and at *Waldenburg*, near *Cassela* in *Hessia*, and in other places of *Germany*. (N. B. The common Vessels and Crucibles cannot retain this Water, but it penetrates through them like Oil.) Heat your Vessel so hot as to cause the Water together with the Metals to melt and flow well, in which liquefaction, part indeed of the water will pass away in fume, but this loss may be easily prevented.

When therefore your Metal hath been thus boild for about one quarter of an hour, part of the same will be found washed and turned into good Silver: nor must you thus understand me as if the Silver in the said Water were onely precipitated by the Metal, and that no part of the Metal itself underwent any Transmutation. For albeit that that Silver which was added to the Saturnine Water be precipitated by the adjoynd Metal, and returns into its former Body, yet nevertheless there is more Silver gotten than was added to the Water. For that Saturnine Bath while it is occupied about the dissolution of the Metal, doth by the efficacy and Operation of the adjoynd *Lave*, exalt and tinge part of the Metal to an higher degree.

But although this labour does not promise any golden Mountains, it is here put for this end onely, namely, that the possibility of the thing may be learned hereby: yet notwithstanding, if any one did but know how to adjoin to this Saturnine Water, a golden Ferment, instead of a silvery one, it could not otherwise be but that he would get no contemptible gain and profit: yet if the same Operation be so instituted with a white Ferment, as that not any the least part thereof may go away in fume, and be lost of the Bath, it will bring no loss. N. B. Neither is it always needfull that the Ferments of pure Metals be adjoynd to this Saturnine Bath, for I think that apt Minerals may be found, which may be adhibited in the room of aureous and argenteous Ferments. Nay more, I do likewise think that such subjects may be adjoynd to this Saturnine Mercurial Water, as may be therein fixed into white and red Tinctures; the thing itself I have not as yet tried, nor do I profess myself to great a Master, for I propose to myself this onely end in my Writing, namely, to shew unto such as are desirous after transmutations, the way of arriving unto the truth itself. For it will be far easier for every one that searcheth into the business more thoroughly, and that maketh more accurate tryals, to find out far greater things, yea much more than he could ever believe. More such Woman like Washings, and more Boys Plays shall (God willing) be manifested in my Work of *Saturn*.

But now this Saturnine dry Bath may be prepared much easier, on this wise following; choose you out such an Oar or *Minera* of Lead, which is very pure and clean, and hath not either Iron, or Copper, or any other Metal admixt therewithall: (N. B. If Silver be likewise in the Oar, it rather profits than hinders, but the said Oar must not have much earth mixt in it, and that which is on to it must be taken from it by washing off the same with fair Water.) One, two, three, or more pounds of this leaden Oar thus washed, must be put into a strong Cucurbit,

and so many pounds of Spirit of Salt must be (put on and) drawn off thencefrom, which Spirit of Salt, as being a moist and Philosophical Fire, will reduce the pure Oar of Lead, which it toucheth every where and in all places of the same, into a bright, Snowy, easily Meltable, and fugacious Calx, which is to be well washed with Water and be dried: This is that metallick Bath, and that dry Water of the Ancients, which wets not the hands, and which is able to perform admirable things in the Metals.

But that this Philosophical and moist Calcination of the Oar of Lead, may be accomplished without any costs, some Salt Water must be poured upon the Spirit of Salt, in the Cucurbit, that the Salt may ascend together with the Spirit, and may augment the same with so great a quantity of Spirit, as may quit the costs of the Oar and Fire, and yield you the dry Saturnine Bath for nothing, which said Bath may be employed various ways about the washings and emendations of the Metals. For out of the Oars which never underwent the burning by the Fire, and were never as yet deprived of their growing faculty, this Bath thus prepared is to be preferred far above that, which is made of the molten Metal.

I do here open to the studious of Art, the Gate that leads unto most great secrets, which were never so clearly manifested by any Man. It must necessarily therefore be, that either God must put a stop, or that the Operator or Labourer himself must be of a stupid and simple capacity, if he cannot learn from these instructions, as much as to live in quietude, and so furnish himself with Food and Rayment.

If therefore God shall vouchsafe his Blessing unto thee in the use of this secer, then give unto him, the bestower of all good things, thy utmost thanks, and be not unmindfull of the Poor. Sustain thy life by the works of thy hands, and let thy light shine before the blind, neither bury the same enviously in the Earth. Do good to every one, that it may be discerned and appear what Treethou art. Entertain not too great an opinion of thy self, but remember that thou art a Man and mai'st err and fail. Give no body occasion of quarrelling and brawling. If an unjust conflict be brought upon thee, commit thy self wholly unto God, and he will succour thee. Give place to the greater, and spare the lesser, God will defend thee and suppress thine Enemies.

The Heathen Philosophers accounted the Prophet *Ezekiel* as a clownish Philosopher, because he wrote so very clearly of the Divine Mysteries. For they took it very untowardly, that he was not so envious, as to involve such great Mysteries in silence, but wrote so openly of the same.

He that will now-a-days make it his design to wind himself out of the crew of Sophisters, and such kind of Philosophers that putteth together hurtfull Books, consisting of fine spun, and seducing words onely meerly for their own gain, and without any profitable information at all in them; he I say that would free himself from such, overcome them, and bear away the prize, must imitate that countrey man, who on a time entering into a Fencing School at *Nürnberg* did behold the Fencers artificially combat together so strongly and so long, untill all the others being tired, and forsaking the Stage, there remained but onely one as sole victor; who, with a disdainfull look, contemning all the rest, assured himself of the victory.

Being

Being therefore about taking up the Prize-Money there deposited, our steps the Countryman, saying, you shall not have the reward, except you beat me too off the Stage: Fight therefore he must with the Countryman, or forsake the prize; but promising himself an assured Victory, he exerciseth his most curious and artificial postures, which he had learned in the fencing School, thereby to make a speedy dispatch with the Countryman, supposing that the Countryman would be frighted, and laying down his Weapons, quit the Stage. The Countryman being no ways scared stood very quiet (as confiding in his own strength) so long, till the Fencer approaching nearer with his oblique Flourishes, made as 'twere a Wheel afore his Nose, whom the Countryman struck all along, with such a smart blow as made the Hair of his Head fly off, and the Blood run about his Ears. So artificial a Combatant as this being overthrow, he was asked by that plain Country Fellow, whether or no he would yet once more try the fortune of the Play, but he would no more prove the Country down-right blow of a Non-Citizen, but left both the Money and Honour of the Victory to the Countryman, who being asked how he durst adventure upon so artificial and experienced a Fencer, and could so overcome him, he replied, that he perceived the Fencer used many oblique Skipplings, but was no strong Man: and therefore I opposed my strength to his artificial Flourishes, and so with one blow struck him down. By this History it is evident, that that finely Spun, and sophistical prating of the Schools, makes nothing to the purpose but a certain experience, and an infallible knowledge of things both as and so remains the sole Mistress.

For the sake of those that are lovers of divine and natural Miracles, 'tis expedient that I yet farther manifest some certain secrets of Salt, which are hitherto altogether unknown, and shall be shewn unto my Friends in my Laboratory. Nor do I at all doubt, but that some few will be found who will easily understand these things, and look on them as things credible. But I matter not, whether they credit me who speak the very truth or not. It sufficeth me that I can, not onely perform the things I say, but likewise shew them to Friends, whereby they may be able to reap some benefit and profit therefrom.

Salt may be so introverted by the Operation of the Fire, as that it shall lose its sharp properties, and acquire a sweetness, and be brought by the help of other Vegetables and of Water, unto Fermentation, and so yield a good and sweet burning Spirit, a clear, sweet, and strong white Ale, conserving its taste for many years; various drinks, not unlike in taste to the Wine made of Honey and Fruits of Trees, strong and clear Vinegar, and white Tartar, fully as profitable for such Operations, as the common and natural Tartar of Wine is wont to be used about, and may be with those others [afore mentioned] prepared with small charges.

The Air and Fire do in a short time transmute Salt, into true natural Salt-peter, which is no small profit.

The Fire doth likewise very easily endow common Salt with such kind of properties, as render it capable of fattning and dunging barren Fields, Vines, Fruit Trees, Hops, and all other Garden Herbs as well as Sheeps or Beasts Dung.

Salt is also so changed by the Fire in few hours time, as to put on a magnetick nature, and attract

the moisture and water out of the Air, and to retain it with it self a long while, and therefore is not easily dried up by the Sun. Corn, as Oats, Barley, Rye, Wheat, Pease, Beans, and other Seeds being steeped in such a Salt for a Night, do by means thereof, grow up the speedier out of the Earth. It is very profitable therefore in the Summer Season, wherein there's scarcity of Rain, and especially in sandy Grounds, because it holds the Rain Water a good while, so that it is not so easily dried up by the Sun. Besides, too, that Salt is of such attracting virtues as that one ounce thereof, being put in some little Glass to two ounces of Water, hardens all this Water, in the likeness of Salt, so as that you may carry the same about you in a Paper; whereas there were two parts of Water to one of Salt.

This Salt abounds with yet many other wonderfull virtues, some of which I have declared in my Treatise, of the Nature of Salts, filing it by the name of *Sal Mirabilis*, and that not without good cause. It is of the form of Salt-peter, and is void of all Acrimony, it is a little bitterish to the taste, and is of a Balsamick Nature. For being rub'd on Beef or other such like Flesh, it keeps the same, though exposed to the open Air, from being infested with Magots, and from being corrupted: And therefore it is an efficacious subject, with which as being a most efficacious Balsom, dead Bodies are conserved from corruption. It converts all things put into it, in long process of time, into an hard Stone, and abounds with many other wondrous virtues, which (for certain causes,) I pass by in silence at this time. *Paracelsus* calls it *Sal Enicum*, but I *Sal Mirabilis*.

Nor ought it to seem at all wonderfull, that common Salt doth so easily obtain by the Operation of the Fire, a better and sweeter quality. I do in very deed affirm, that not onely the common Kitchen Salt, but even those too, which are of a most biting corrosivity, as *Aqua Fortis*, *Aqua Regia*, Oil of Salt, of Sulphur, and of Vitriol, may by a certain sweet Vegetable, (without the addition of any contrary Salt) be brought to such a pass in three hours time, as that a Man cannot perceive the least Corrosion at all in them. Nay more, if this very Salt hath dissolved up any Metals, it does not part with them, but holds them still: so that the corrosive Solution of Gold which is made with Oil of Salt, becomes a sweet liquor, which likewise comes so to pass, with the Solutions of Silver, and of the other Metals: so that by this way excellent Medicaments may most easily be made out of Metals.

New Wines being fermented with such a Salt, do change their Tartar into sweet Wine, and become clear in a months time, and suddenly have both the taste and odour as old Wines usually have. Certainly it is a secret of very great concernment, when by reason of the coldness of the Air, the Wines cannot attain unto their due maturity. *N. B.* There appertains to this fermentation, a singular and excellent Artifice, by which the Wines and other drinks are promoted to a speedy and strong fermentation, inasmuch that the Wine boils in the Vessel, though the Vessel should be set out to the Snow and Ice in the coldest time of Winter: whereby the Wines must needs be made better, stronger, and sweeter. It is a very artificial invention, hitherto concealed by me, but now I am minded to reveal the same unto my Friends.

M m m m m

By

By the same Salt too, Wine, Ale, Metheglin, and other drinks may be in short time turned into good and sharp Vinegar without the help of the Sun, or of a warm Stove.

If therefore any one needs for his Operations any distilled Vinegar, he may even distill it in wooden Vessels, without any sparkle of Fire, onely in the Air, by the proper efficacy of the liquors themselves, and by the help of the Air: and this in such wise, as that a whole Barrel of distilled Vinegar will not cost so much as one Token, the Barrells or Vessels excepted, which verily is a most Artificial Distillation.

Thus likewise by the same means may a sweet burning Spirit be distilled out of Ale, Wine, and other the like Liquors.

Any common Wine may be rendred so strong by the help of a certain sweet Salt and artificial fermentation, as that it cannot be drunk because of its strength. Some Pots full onely thereof, being poured into a Barrel full of small Wine, will make the same so strong, as to equalize it with generous Wine. He that is so minded may add some sweet Spices in the fermentation, and so make it the more sweet, more efficacious, and more wholesome, and so a little quantity thereof being poured into another Barrel will make all the Wine therein contained become sweet and good.

Out of common Salt may easily be made good Alum and Vitriol, no less usefull for the Dyers than the natural are.

It is likewise a thing easily feasible, and that too in few hours space, to turn the same into a fiery nature, and make it have the same property as the Salt made of Wood Ashes, and of the burnt Lees of Wine and such like, and as Pot. Ashes have, and may serve for the Soap Boilers and be applied to the same uses that those Salts are used for.

Moreover, store of sweet Spirit of Salt may be gotten with small charges out of common Salt, serving not onely for the preparation of many excellent Medicaments, but also for the maturation of the meaner and unripe Metals, as we said afore.

These and the like wonderfull things, yea and very many such effects incredible to the unskillfull doth that contemptible and common Salt produce, to the exceeding benefit and profit of mankind: which excellent things I neither would nor could (for the honour of God, the giver of all good things, and for the sake and profit of mankind) any longer conceal. But some or other may object and say, if by the help of common Salt, such great things may be effected, why do not you prefer the same before Salt-peter, which you have so exceedingly praised in the third Part of the Prosperity of Germany, and have constituted it the Monarch as it were of the whole World: whereas notwithstanding it is so venomous a Dragon as is wont to devour all things. Can't these two Salts I pray, namely the common and Salt-peter, dividethe Government of the World between them, and bear sway and command both together.

To such I answer, that although that common Salt be the producer of many wonderfull effects, yet must it needs give place unto Salt-peter, which being inflamed and on Fire is wont to overturn huge Mountains, and blow them up into the Air, which thing seeing common Salt cannot do, 'tis but fitting and right that it should be dignified with so great a Title. However, being by the Operation of the

Fire and Air made equal unto Salt-peter, and performing the same effects, it may then worthily be graced as Salt-peter is with the Title of Monarchy.

The effects which I have attributed to common Salt and Salt-peter, I can every hour shew, in very deed, to be most true. Ill therefore do they do, that bark against me for saying that Salt-peter is a universal Dissolvent, and that endeavour by their railing reproaches to obstruct the truth.

Why do they not produce some better thing, seeing they will not admit of this universal Dissolvent? such Men as these do nothing else but bewray their own foolishness, and kick against the Pricks.

Had they ever done ought, or set their hands to work, for the sake of searching thoroughly into nature, they would never so boldly contemn, and reject that, which they never as yet understood. They behave themselves very basely, and clearly discover unto all Men's view, that they have sucked in their uncertain and foolish Opinions, by the bare reading and hearing of uncertain and dubious Writers, whose meaning notwithstanding they understand not; for my part I remain constant in my Opinion, and say, that Salt-peter is an universal Dissolvent, and is able to dissolve all the things in the whole World, if it be made use of in three forms or shapes. Whatsoever the acid Spirit thereof, or the Eagle with its sharp Claws cannot effect, its fixed Salt, or the fiery Lyon will accomplish: and whatsoever is impossible to be done by these two, the Griffon which hath its rise from the Eagle and Lyon, will artificially perform.

N. B. The acid Spirit of Niter doth not dissolve sulphureous subjects, but mercurials onely: Contrarywise, the fix Niter doth not seize upon mercurial subjects, but sulphureous ones; but the flame of Salt-peter performs both: which verily is wonderfull, that things so unlike should in some few hours time be extracted out of one and the same subject. For the corrosive Spirit prepared out of Salt-peter by Distillation, and likewise the fix Salt, are most bitter enemies to each other, which ruining and slaying one another, and being dead, return agen unto that which they were afore, and partakes of both natures; which the Ancient Philosophers do clearly point out unto us by the Griffon, which is headed and winged like an Eagle, and the hinder part of its Body like a Lyon, as we have mentioned more at large in the foregoing third part of the Prosperity of Germany.

Upon him that rightly understands this ancient Fable of the Griffon, Lion, and Eagle, doth the Sun shine, for he will get no small profit to himself thencefrom. Whatsoever the Corrosive Eagle dissolves and tears a-pieces, that the fix and fiery Lion precipitates. And whatsoever the Lion devours, that the Eagle doth agen snatch from him: but they kill each the other, of whose dead bodies the Griffon exists, which hath the body of the Eagle and Lion. By how much the oftner this labour is repeated, so much the more potent and stronger doth the Griffon come to be, [especially] if both the Eagle and the Lion have filled themselves with food and are grown fat; or by how much the bigger the Eagle and the Lion are grown, by such Subjects as are agreeable unto them, afore their mutual fighting; the Griffon doth also become of magnitude proportionable.

Once every day therefore may such a conflict, slaughter, revivification, and transmutation of these two fighting and capital Enemies, viz. the Eagle and Lion,

Lion into the Griffon be made. But if you would have it profitable, then must *Vulcan* sharpen *Saturn's* Sythe, by which he may divide the Griffon [in twain,] and may turn whatever proceeded from the Eagle, into the Eagle again; and may transmute that which arose from the Lion into the Lion again. When the dominion of the Griffon is divided, and that the Eagle bears sway only over his birds, and the Lion only over his beasts, like two Kings, then all is well, and there's no war. But if once the Eagle endeavours to snatch away from the Lion his prey, then ariseth a great war, and of so long a continuance, till they have slain each the other, of whose bodies the Gods doe make the Griffon. But when the Griffon becomes too disdainfull, and affecteth Tyranny, and designs to bear rule over birds and beasts together, he is again divided by *Vulcan*, by the perswasion of old *Saturn*, that so he may return by a reiterated transmutation into the Eagle and Lion: which wheel [or rotation] of reciprocal transmutation doth never rest, but converts it self [or turns it self round] in a perpetual course for Man's punishment, as long as it shall please the most high God, who, at last, will put an end to all fightings, slaughter, and contention, that afflict this world: at which time all the Eagles and Lions which ever were in the world, shall be turned into the Great Griffon, which will rend and overthrow the whole Earth.

This time all pious Souls doe expect and wait for with ardent desire, and many sighs, that they may be at last freed from the talons of the Eagles, which rend all things a pieces, and from the claws of the roaring Lions, and enjoy everlasting peace and quietude.

Thus much may suffice to have been spoken of Salt-peter at this time, which, how it may be prepared very plentifully, and with great profit, out of the Salts of Vegetables, Animals, and Minerals, I have already declared in the foregoing third Part of the *Prosperity of Germany*. He now that dreams of so managing his affairs as to reap benefit and profit to himself thencefrom, may inquire into the business by a more accurate meditation and search. Yet let him know, That Salt-peter may be very easily made of many vile Subjects, which may be every-where had: of which Salt, if you have plenty, you cannot want other things. For not onely most excellent Medicaments against all kinds of Diseases may be made with Salt-peter, as likewise the growing faculty of Fruits springing out of the Earth, be promoted, as of Corn, Wine, and such like things necessary for the sustaining of the life of Man; but also pure good Gold may very easily, but with great profit, be gotten out of the imperfect Metals.

Seeing then, that by means thereof, a man may be supplied with firm health, food, and rayment, and with Gold and Silver, what other thing is there, I pray, that he can want? That which I have so often said, I doe here repeat and affirm, That there is not in the whole World any subject that can compare with Salt-peter, much less be preferred before it.

Such a noble, yea so kingly a Subject therefore as this is, well deserves to be most highly honoured by us, and to be searcht into by the utmost of our endeavours, because of the so great benefits it bestows upon Mankind. We will therefore proclaim and pronounce Salt-peter to be the Monarch of the whole World, though all its and my enemies, who endeavour to bespatter our honour and repute with the

brands of infamy, doe even burst for malice.

O most foolish men, with how vain a hope doe ye expect the Lion and Monarch from the North, as the *Jews* doe their Messiah, who came above 1600 years ago. The Lion of the North, and the Monarch of the World is even at this time present, and hath always been, but yet hath been known but by a few; the full and perfect revelation of which, God alone knows. I doe verily think the time is now at hand; These things which are known unto us concerning him, are all of them but particulars, and very few too. But if the said Northern Lion shall find out and dig forth the treasures which lye hidden in the Mountains, then will he at last exhibit his power to be seen, and shew himself to be the Monarch of the whole World.

Salt-peter is that great and fire-spitting Dragon, the keeper of the Golden Apples, and that venomous Basilisk which kills all things with his looks. If he be but fixt and made constant in the fire, then is he that Salamander living in the fire, and that Phoenix the bird of the Sun, which having gathered pure Gold out of the Sand, useth it to the making of her nest, and arriving to its utmost old age, burns herself; out of whose Ashes other Phoenix's are produced.

He that desires to know more of the Griffon, Phoenix, Dragon, Basilisk, and Salamander, all which doe exceedingly thirst after Gold, and dig it out of the Earth and keep it, may read *Pliny*, and other the ancient Writers of natural things; as also *Ambrosius Calepine's* Dictionary of eight Languages, and of the last Edition.

The Conclusion.

THESE (O friendly Reader) are the things which I was willing to publish at this time for the Countries good; Had I had more time and opportunity, I would have added more profitable secrets, and such too as are of no small moment. If I find that these here written are acceptable, I will in a subjoyned Appendix make a clearer interpretation of such obscure places as may be herein met with.

N. B. I would have the friendly Reader here know, that although I have written these Four Parts of the *Prosperity of Germany* clear enough, above my other [Writings] [or more clear than the others] yet notwithstanding I have reserved for my self and my friends somewhat amongst all the Processes, and ways of operation, so that I know how to effect the preparations of Salt-peter, and to make use of its various properties, in extracting Gold and Silver out of the Oars, and in the melioration of the imperfect Metals, and transmuting them into Gold and Silver much easier, and far more compendiously, and with much less costs.

The things which I have written, I have written for every one, Friends and Foes together; The other, and those better Secrets, I have reserved to my self and my friends. This shall now (God willing) be my chiefest care, that my Laboratory, in which the truth of the whole business shall be shown unto my friends, may be fitted up and made ready. In the mean time, the Princes and Noble men, whose territories such metallick treasures are in, and cannot be extracted by the help of common fusion, may consider, whether or no it will be agreeable to their minds to make use of these my Artificial, and not vulgar Operations in extracting the Gold and Silver

by

by Salt and Salt-peter out of such-like auriferous subjects. If it shall seem unto them a thing worth while, to institute such operations for the profit of their Countries, they may send unto me a fit person, and one that knows how to deal in the fire, and one that is of a silent disposition, and of good education, who may learn the very work it self in my Laboratory.

But they that are Lords of such places as doe not contain in them those auriferous Minera's or Oars, and can nevertheless get store of them from the bordering Countries, and are desirous of amending them, and using them for their profit, we deny not to shew and disclose the Art unto them too, (the persons always considered,) namely that artificial and moist Extraction of the volatile and fix Gold, not onely out of Minerals, Stones, Sand, and Clay, but likewise out of the already-molten Metals themselves, as Lead, Tin, Iron, and Copper; in which Metals, there is often times hidden much Gold and Silver,

which admits not of being extracted by the common melting Fire; but is easily drawn thereout of, by the maturation and separation that is caused by Salt and Salt-peter, and so brought to common use.

All these things we will not be loth to make friends partakers of, as likewise of other rare and artificial inventions, and such as are profitable to all kinds of men, none excepted; which are such things as will bring much profit to my Country, and shall be shewn in my Laboratory, publicly, and privately unto friends: but with this proviso, namely, if the said friends will faithfully promise unto me, that they will with a faithfull silence conceal those secrets which they shall see and learn from me, and improve the same, onely to the honour of God, to the comfort of the sick, to the help and succour of poor Widows and Orphans, and to the defence of the Truth; and not use them to Diabolical disdain, and detestable pride, and other fooleries and vanities.

The End of the Fourth Part of the Prosperity of Germany.

THE FIFTH PART OF THE Prosperity of GERMANY.

Clearly and Solidly demonstrating, and as it were shewing with the Fingers, what Alchymy is, and what benefit may by the help thereof, be gotten every where, and in most places of *Germany*. Written and Published to the Honour of God the giver of all good things, primarily; and to the Honour of all the great ones of the Country; and for the Health, Profit, and Assistance against Forreign Invasions, of all their Inhabitants that are by due right and obedience subject unto them.

LIKE as the weighty command of God injoyns all Children to love their Parents, and to submit themselves unto them, with a due obedience in all lawfull and equitable things, and to yield them due fidelity: Even so likewise doth he require from every subject a due obedience to their particular Magistrates, that they most willingly obey them (with a faithfull obſervance, as being the Fathers of the Country, and to whom they are tied by all right of Fidelity) in all such things as pass not be-

yond the boundaries of equity, and withall it behoves each such subject to communicate any thing whatsoever that is requisite for their safety and defence, and for the repelling and beating off the Enemies.

The consideration of this dutifull service, which binds every Subject to his Magistrate, stirred me up (seeing that greivous and sudden Fire which almost destroyed all the Kingdom of *Poland*, and therefore fearing, lest by dilating it self it should also detri-

ment

ment our Country) to take care in publishing, some four years ago, a little Book intitled the first Part of the Prosperity of Germany. I therein taught, by what means the vast plenty of Corn and Wine might be so concentrated as to be easily preserved and kept, and so be made serviceable for the common good, and of exceeding profit, in future calamitous times.

I likewise shewed the way and manner of some other Arts, and such as are most usefull for the common good of the Country, amongst which, that discovery of making Salt-peter out of old and rotten Wood, (from which may a vast quantity thereof be had) is none of the meanest.

I have also bethought my self of another way of pleasuring my Country with no small benefit afore I die, and thus I intend it.

First of all, I would have the whole World know by this small Work or Treatise, that I have a mind to demonstrate the most profitable and principal secrets which I have treated of (partly openly or plainly, and partly obscurely or more darkly) in those four parts of the Prosperity of Germany, and that both to the high and low in my publick and private Laboratory, afore this year is run about. To this end, I have already the chiefest and most necessary Utensils at hand, and when all the necessary provision is gotten together and made ready, those said *Arcanum* which will be so exceedingly profitable to the Country, shall be visibly demonstrated to such as the chiefest Magistrates shall make choise of, and to other honest Citizens and Men of the Country. And amongst these *Arcana* which are of such great benefit, the three following ones are the most principal.

The first is, the making of good Salt-peter out of contemptible, and every where obvious subjects.

The second is, how by the help of this Salt-peter, easily and copiously to extract the fugitive, and the fixt Gold and Silver and Copper out of the *Minerals* or Oars, with a great deal of profit and mighty advantage, and that without any melting or fusion by Fire.

The third is this, the truth and certainty of Alchymy shall be shewn, and it shall be proved, that it is not any vain dream, deceitfull Phantasie or Fallacy, as the greatest part and number of its haters and *Ignorant*'s have hitherto slanderously reported; but that it is a most true Artifice, and of wondrous consequence, by the help of which, (it making use of Fire and Salt,) all contemptible Minerals and Metals, and which are of no great gain, as Lead, Iron, Tin, Bismuth, Cobalt, Zinc, Lap Calaminaris, Marshmallows, all other fugacious Minerals may be so fixed and ripened, as that much and true and constant Gold and Silver may be extracted out of them with small costs, but abundance of profit.

These three secrets verily are in my judgment of great moment and therefore are worthy for the great ones, and Princes, and other Fathers of the common Weal to be made partakers thereof by revealing the same unto them.

I have deemed it worth while, in a few words to illustrate the incredible utility thencefrom arising, that any one that hath but any reason may perceive it.

And first, as concerning Salt-peter, the whole World knows what profitable and needfull a subject it is. There can never be so great a quantity thereof prepared, but it may not onely be applied to ne-

cessary uses but also to such as bring a great deal of profit. I forbear to speak of its most great use and exceeding profit in making Gun-powder, which no Kingdoms, no Common-wealths can want to defend their Country withall, and drive off their Enemies.

And if there were no need of it for this thing, yet would it be of mighty moment, and bring in abundance of profit by extracting Gold and Silver out of the poorer Oars which will not bear the charges of melting, and now there will never be so much Gold and Silver, as that it will not be of any profit to a Country.

Nay more, if there were no want of Gun-powder, nor of Gold nor Silver, (which time when 'twill come, and how it should come, for my part I cannot see) yet (having Peter) we cannot be in want of Bread; and how great soever the plenty is of Wine, and Corn, and Fruits, yet there is never want to be too much. Corn and Seeds being macerated with Salt-peter afore they are sown, and the Roots of Vines and Trees being moistned with a very little of its liquor, do not onely grow more plentifully, but also produce more plenty of Fruits, and such as ripen far sooner, and are of a sweeter Taste, than if they were dung'd with that stinking Beasts Dung liquor. If then, Salt-peter be a subject so excellent, as that we can by no means want it, and that it may so easily be prepared out of Wood and Stones in plenty; if above all other things it makes the Earth fruitful, if it can extract plenty of true Gold and Silver out of the contemptible Sand and Flints, what can we desire more from it, unless it be a sound and healthfull Body, whereby we may in fulness of health quietly and peaceably enjoy such great benefits vouchsafed us by God? But now this very same Salt being justly called the wonder of the World can bestow upon us, this very health we speak of.

I do affirm that Alchymy it self, or the Transmutation of the lesser, or meaner Metals into the greater or more noble, and into Gold and Silver, is not a vain dreaming dottage, and an opinion void of reason, but is the very truth it self, and confirmed by many experiments; the demonstration of which, I do, God willing, this Summer not rashly but advisedly set about shewing it by publick and evident experiments, and its use for the good of the Country.

Now then, forasmuch as the Country is every where sufficiently stored with Iron, Lead, Salt and other mineral matters, and such like contemptible subjects, and yet notwithstanding there is not at present any profit arising thereby; verily it cannot be, but that in a few years time (if such melting Houses were in all places made) Men would be rendred Masters of great Treasures. Who knows what God will do, and whether or no it may not so come to pass, that it may be said of the great ones of [our] Country as is mentioned in Holy Writ concerning *Salomon*. And he made Silver as plentiful as the Stones that lie in the Streets, &c.

But that I may yet more open the Eyes of the Studious after all, and show them, by what means all these things may come to pass, and fall out true, I do hereby assure him, that there's no need of taking those Metals for this Fusion, that are already pure enough as Iron, Lead, Tin, and already fit to be employed about Mans use; no, those common and sulphureous leaden *Minerals* or Oars which are found to be incapable of yielding profitable and vernal or

fellable Lead, are well enough for this Fusion and operation we speak of; and so likewise those Irony and Coppery Oars, out of which (seeing they admit not by nature of any fusion or melting) malleable fusible Copper or Iron cannot be extracted. For this Operation of ours needs not Copper, Iron or Lead to work upon, as being content with those poor sort of Oars, and with the bare Salt which the Earth is every where well replenished withall, so that there's no cause to fear that there will ever be a want of any matter for such an Operation.

But what need I speak much of these unknown, and so very profoundly hidden secrets of nature, seeing I have openly enough taught already, in the second part of the *Miraculum Mundi*, by what means, pure and natural Gold may be gotten out of every Herb. This very thing I publicly demonstrated in my Laboratory above a year ago, in the presence of most learned Men, Professors, Doctors of Physick, and other Men both noble and ignoble, as their Testimonies, which are [under] hand affirm.

But there's no need of that, forasmuch as the manner it self of the Operation is published in Print, and manifested to every one, and there can hardly pass over one years space, but that even a thousand Men or more may imitate the Operation and search into the truth it self of the business.

But that the well minded Reader may have a little more light, and may himself see what foundations the work I have undertaken is built upon, I have judged it altogether necessary in a few words to set afore your Eyes, what Alchymy it self is, and whether or no it has any foundation in Nature and Art. For if so be any ingenious Man gives an Herb, an Animal, or a Man any name, certainly he does it not rashly and without any ground, but well knows and understands for what cause he intitles any thing by such or such a name, and it is chiefly done on this account that by such assumed names the nature of the Herb, Animal, or Man, and its properties might be known. A few Examples will illustrate it the more.

What reason have the Physicians and Philosophers of old to call the Herb *St. Johnswort*, *perforata*? Because its leaves are full of small holes, and it is so signed by nature, to shew, that it has eminent virtues [and peculiarly appointed] to take away and cure external and internal stabs and wounds of the Body, and this is confirmed by experience. Why are some Herbs called *Saxifragers*? because their nature is, to cleave assunder and break through great heaps of Stones in their growing up, and to penetrate through old Walls, by the growth of their hard roots. Their Seeds likewise are like unto the smallest Sand and after a sort stonyish and do break the stony matter in the Reins and Bladder of Man's Body and bring it forth. So a Serpent hath its denomination from creeping, because it wants Feet, and creeps and crawls along on the Earth.

A Shoemaker hath his title from his making and sewing of Shoes. A Blacksmith is not wont to be called a Goldsmith, because he works not on Gold but on Iron, and he hath his denomination from Iron, which he is occupied about.

The same is to be understood of the word Alchymy, which denoteth no other thing save a Fusion and liquefaction of Salt, and so it teacheth us, what cause it was for, that the Ancients called the Transmutation of Metals Alchymy; viz. because of the fusing or melting of Salt, without which, no parti-

cular Transmutation of the viler Metals can be perfected and accomplished. Therefore it was not an unadvised and rash action that the Ancient Philosophers did when they put the title of Alchymy on the Transmutation of Metals, but as a Goldsmith is so called from the Gold, which he is a Labourer in, so is it with this.

The name therefore doth openly point out the matter transmuting the baser Metals into the more noble, viz. Salt, which being as an universal Agent does not onely mature and bring to due perfection the Metals generated in the Bowels of the Earth by a natural Operation, but it also does the same out of the Earth by the Operation of Art, Salt alone, and Fire alone are sufficient for the maturation and transmutation of the unripe Metals. For Salt (as being the Agent) is driven or forced as 'twere by the Fire to display its virtues upon the Metals and by exercising its power, to render them better and more noble, as *Paracelsus* openly witnesseth in his *Celum Philosophorum*, saying, that the Corporal mixture of metals though commixt a long time and kept so in Fusion, is neither wont to give, (nor indeed can contribute so much as ought to their Transmutation. But if so be the metals are to be perfected by any amending, they are to be conjoynd in a spiritual commixtion, and so they come to their hoped-for amendment; and this is very agreeable to the truth, and evidently signifies, that without a saline agent and fire, there is no way of attaining to a particular transmutation and bettering in the metals. *Elias* the Prophet, whose name inverted yields the word *Saline* [or Salts,] did not work his most great miracles afore he came into *Zarpath*, or *Sarepta*, that is, into the melting House [or fusing Work-shop] where he filled the poor Widows Oil Vessels, that so she might have wherewith to live in a time of scarcity. For as long as the terrestrial Salts do lie hid in barren stoney Mountains, in which there grows nothing but *Juniper* Bushes, and are [there] nourished by the Stars, they cannot shew forth their wonders, but they are wont then to disclose them when they come into the melting Houses. Even so is it with Salt, when it comes into the melting Shop, it doth effect so much as not onely to fill the Oil Barrels but the Cellars and Barns too, and that plentifully, but especially when the due [or suitable] Salts *Elias* and *Elisa* do come together, and *Elias* is carried in his fiery Chariot into Heaven, and sundred from *Elisa* and doth send down a double portion of his Spirit upon *Elisa* his Companion; by which, *Elisa* being strengthened and acquiring more strength than it had afore, is made fit for greater and more powerful Operations.

But amongst those most great miracles, this was an eminent one, that after the departure of *Elisa* the Prophet out of this life, there was another dead Man thrown into his Sepulchre who by the touch of his Bones was restored to life.

Therefore, like as this miracle did supernaturally happen by the divine power: Even so [doth it come to pass] naturally, by the virtues of our *Sal Mirabilis* corroborated with a double Spirit, which doth not onely restore a dead [body] and Wood turned by the Fire into Charcoal, when it is cast into the Sepulchre, that is into the Earthen Pot or Crucible to the white Bones of our *Sal Mirabilis*, and bring it (in the space of one quarter of an hour) unto its former viridity and life, and with this very green Liquor of the Wood may other half dead Trees, as al-

so other things be restored to viridity, and increase, and their former fertility, more than by any thing else: But also, even various dead insects, if they be put to our *Sal Mirabilis* can recover life again. And although that this may seem a new unheard of, and incredible thing, yea a meer Paradox to any one, yet is it as true as truth itself; the true way of which Operation I will (God willing) describe and shew clearly in the first Century of my general Appendix.

But although that these wonderfull Operations of my *Sal Mirabilis* may seem such, as to be never capable of being effected yet, to all such as know its Composition, 'tis a thing very easily accomplished. Nor can it be but that the divine wonders should be still more and more laid open by the help of my *Sal Mirabilis*, and be exceedingly sown abroad, and made known to such as are ignorant. Which being done, the World will conceive a far other guests Opinion of Alchymy, and judge otherwise thereof than hitherto it has done.

But that such as are admirers of the divine and natural wonders, may clearly see how large an extent those things I have hitherto discovered, are of, I cannot omit the adding of the solar Work or Smaragdine Table of *Hermes*, the Father of all the Philosophers, the which being in my judgment accommodated to this discourse of mine I will illustrate.

But to sum up all I will say, I have here briefly declared, that if a Spirit be elevated or sublimed from a true Salt by the help of a strong Fire, or be drawn from out of its Body, and be again returned to the same own fixed Body left behind and be restored to it in a due manner; that fix Salt, gets double the strength and virtue it had, (as hath been shewn concerning my *Sal Mirabilis*) and does perform things wonderfull; which *Hermes* and *Basil Valentine* have hinted unto us in these next ensuing expressions.

Hitherto belongs the small Circular Figure, noted Pag. 19. at the beginning of the third Part of the Prosperity of Germany.

The Smaragdine Table of *Hermes*, &c.

[See it at the end of the First Part of *Miraculum Mundi*.]

The Enigma of Brother Basil Valentine.

There is a Stone, of all others the least precious, out of which is extracted a fugitive [or volatile] Fire, and out of this Fire is the Stone itself made, it is of colour white and red and yet is it no Stone. In this Stone doth nature operate, and produceth a Limpid or clear Fountain, which choaketh in the Waters and swallows up his own fixed Father, untill at length a Soul be given [or restored] him, and [his] fugitive Mother be made like [him] in the Kingdom. Likewise this Stone brings power and great strength, it exceeds the Sun in Age, [its] fugitive Mother [is] prepared by *Vulcan* and [its] Father [was] begotten by the Spirit. Likewise the Soul, Body, and Spirit consist or abide in two, out of which, all things are; these things are of one, and is one thing, conjoyning the fix and the fugi-

five. They are two, and three, and one, and if thou art ignorant of this, thou wilt be frustrated and deprived of the effect of the Art.

Adam is placed in a Bath, in which *Venus* finds her like, now this Bath was prepared by that old Dragon, when he had lost his strength and power. But now this is nothing else (saith a Philosopher) but a duplicate *Mercury*. In this is its name hidden, which is to be sought after with all diligence and continual labour.

The Event proves the Allient.

It seemed unto me very expedient to set down here in this place, these few, but exceeding weighty words of *Hermes* and Brother *Basil*, because they do so notably square with this Work of mine which I have here described. And therefore I do here again affirm what I have often said, viz. That he who knows Salts well, but especially Niter and Vitriol, and knows how to conjoin them, is well skilled in Medicine and Alchymy, and sufficiently enough understands that the Smaragdine Table of *Hermes* is Vitriol, an excellent Smaragd or Emerald, and that Niter is (according as *Paracelsus* and *Basil Valentine* have at large described) the Kingly Infant of the Sun, with whose descriptions we at present content our selves. I will make a more prolix mention of the same in my Centuries, those things that I have adjoyned here I could not, for certain reasons let slip and pass by.

Now by these few words it is manifest, what virtues Salts are endowed withall, and what miraculous effects they shew, when they are cast into the melting Fire, viz. Such Salts as are corroborated with a double Spirit poured down from above. These Salts (I say) are wont not onely to fill the poor Widows Oil Vessels, but even the Cellars and Barns with Wine and Corn.

But I would not that any should interpret it amiss, in that I make some kind of Comparison twixt the wonderfull virtues of Salts, and the miracles of the Holy Prophets: For verily the thing it self admits it, and by such Comparisons, the natural light is greatly strengthened, which thing we shall speak more at large of elsewhere.

Whosoever he be that well knows the nature and properties of Salts, and is something skilled in the management of the Fire, he will hereby easily learn thus much, as easily to perceive that there is such a thing, as a profitable transmutation of the more vile Metals into the more noble ones.

But there are requisite to this Operation manual Arts, peculiar Furnaces, and singular Commixtions of Metals, the knowledge of all which, he must have that desires beneficially to employ himself in these Operations. The whole Operation with all the appurtenances requisite, and all the things thereto appertaining, shall (if God please) be exposed to be seen in my Laboratory this Summer. As my Writings lately published, and the Labours performed in my Laboratory the last year, do sufficiently enough testify that I have both publickly and privately demonstrated and manifested the truth of the chiefest secrets which I have mentioned in my Writings. And as for what remained of being done the last year, this present Book promisseth the demonstration of, this Summer. What Writer alive, did ever endeavour the demonstration of the truth of his Writings by most evident experiments? None at all save *Glauber*. There-

Therefore I doubt not but that seeing this little Book offers the Countrey such great benefits and Commodity, there will not onely be some of the Vulgar sort, but also many of the Noble ones [or Magistrates] be found, to whom the reading of the same will not be a tedious thing.

And now I return again to speak of Alchymy, openly disclosing my Opinion concerning it, and firmly averring, that Salts onely have power to wash, maturate, and perfect the unripe Metals.

But some or other may here say, if Alchymy be the fusing of Salt, by what means can it possibly ever be, that Gold and Silver should be gotten out of Salt by melting? If there were Gold in it, cannot it be gotten forth easier than by melting in the Fire? I answer, you are not so to understand it, as if huge heaps of Gold could be gotten by a bare fusing and melting of Salt. No! no such matter. But when the Metals have Salts adjoynd to them in a due manner, and so undergo a melting Fire, they do (in that fusing) display their virtues upon the Metals, and do so bring them to a maturity as to yield forth Gold and Silver. For Salts are the universal ripening Agents, both in the dry and in the moist way, as is clearly evident from the third and fourth part of the Prosperity of Germany, so that there needs no more to be spoken as to this.

But yet, that these things may not seem new, or altogether absurd, I say, that in all Salts there lies hidden spiritual Gold, but yet it cannot be extracted from them without the addition of the Metals. For all the things that are, are generated, encreased, and sustained by the Sun, (and amongst these may be reckoned up the smallest Vegetable) do contain the fugacious beams of the Sun hidden in them, which said beams may by the benefit of Art be made corporeal and fixt. This I taught and demonstrated more prolidly in the second part of my *Miraculum Mundi*. I will teach the same in the first Century of my general Appendix, which said Appendix shall illustrate all my Writings with more clear notes; and I will evidently show the way, by which true and natural Gold is to be gotten (by the benefit of a certain precipitating matter, out of Sea Salt, both by the dry and by the moist way. This Operation brings not any considerable profit, but doth in very truth show the possibility of the thing. But he who knows the way of conjoyning true and due [or proper] Metals with legitimate [or suitable] Salts, and of handling them in a due and true way of Fusion, will get Gold and Silver out of all the imperfect Metals, and that with no small profit; and this shall be demonstrated in my Laboratory this present Summer by God's help.

And for the more evident proof hereof, it seems worth while to adjoin a Story out of the Journal of William Ligon of England, [rather Scotland] who Journeying through Italy, testifies that he saw in *Trapundia*, a City in *Sicilia*, much Gold excoiled or drawn out of Sea Salt; which thing, seeing it agrees with my Opinion, and confirms what I say, I will add the words of the Authour himself as they are in *Ligon*.

"The fourth City of *Sicily*, is *Trapundia*, situate in the West-side, and opposite to the City *Biserta*, seated on the *Barbarian Coast of Africa*, which yields pure Gold, which is exported by the Merchants into *Italy*, *Venice*, *Dalmatia*, and *Greece*. It is excoiled in some Artificially made Salt-pits

"by the more vehement Beams of the Sun, which Pits are filled and emptied every month. Now the Salt here on the Sea shore, has a colour like the redness of a Ruby, or Corral: The City is almost the one half of it employed about working thereupon. The Gold it self being purged is distributed throughout the whole Christian World.

These are the words of the said Authour, I know nothing of the certainty of the thing it self, he that is desirous to find out the truth of this Relation may easily do it. As for my self, I easily credit this Relation, because of the Mount *Aetna* which always is burning in that Island, and because of the Sulphur too, which all the Land of *Sicily* abounds withall. And verily it seems a thing altogether likely, that when the Inhabitants of this Island upon the Sea shore, make Salt of the Sea Water for their necessary use, by digging Pits in the Earth after the manner of all those hot Countries, and letting in the Sea Water, and that the warm beams of the Sun separate [or any of] the unprofitable sweet [or insipid] Water, in Vapour, and that that Water of Salt is endued with a notable sharpness; it extracts the Sulphur out of the Earth which is there in plenty every where, and it renders this [Sulphur] by the help of the heat of the Sun, constant, corporal and fixt, so as that it can be afterwards molten in a melting Furnace into Gold. If now the most hot beams of the Sun, and Salt Water can change common earthly Sulphur into Gold, why may not the same be done also by the benefit of Fire, Salt, and Art.

That all Gold is at first naturally generated of a pure Sulphur in the Earth, no body will indeed deny. That any Sulphur may by the help of Fire and Salt be fixed and changed into natural Gold, daily experience witnesseth, not onely in my own Laboratory, but in my Disciples Laboratories too, the which, visibly demonstrates, and even by manual Operation confirms the truth of those things which I have mentioned in the second part of my *Miraculum Mundi*, hereabouts.

That which is mentioned in the old Hymn of the Ancient Church-Fathers, viz. who made Gold of Rods or Twigs, and Gems of Stones, seems to the ignorant altogether as Paradoxal, new, and incredible: and from which 'tis gathered that St. *John* the Evangelist made Gold of Sticks of Wood, and Gems of common Stones: I can in a few words demonstrate that both are true.

Dissolve common Sulphur, or any Vegetable in common Salt, this Solution will make the Sulphur of a red colour. Keep this Solution for at least one hours space in the Fire, you shall find a little of the Sulphur changed into Gold; to the red Salt, adjoin the Calx of *Saturn*, melt them by Fusion into one Body, and reduce the Lead by a Cupel, you shall find a grain of Gold, it yields indeed no profit but demonstrates the certainty and possibility of Art. But if any one shall be skilled in managing this Operation in great quantity (as shall be done this Summer in my Laboratory) he will not complain of loss, but will always get profit.

But let this suffice as to the making Gold out of any Wood, or any Herb, by the help of Fire and Salt.

Let us now see by what means Stones of manifold colours may be made by the help of Salt, out of Wood or any Herb. Adjoin to the red Salt made of Wood, a little Powder of white Flints, put them

In a Crucible, and melt them in the Fire, that they may become a red Glass, resembling almost the colour of a Ruby; if you keep them longer in the melting, the red colour will be changed into a green, and have the likeness of an Emerald: After this, comes a sky-colour, resembling a Saphir, then follows a yellow, not unlike a Jacynth: then in a longer continuance of Fire, it becomes black and like an Agath. Indeed these Stones are no harder than common Glass, but as to their colours and beauty do exactly resemble the precious natural Stones.

These two Arcanum's indeed do as to the outside view seem not very excellent, but yet I believe, the well minded Reader, to whom I offer them as a pledge or Love token for to remember me by, will not think them (seeing they teach the extracting of Gold out of any Wood or Vegetable, and how by white Flints to make Stones of several colours) of so small a moment or value, as they appear here to be,

but will believe that he has a foundation laid open for him, to arrive to greater secrets.

As concerning these kind of wonderfull things, and Transmutations hitherto unknown to the World, and changing things into more noble and better Species, I will treat more at large in the ten Centuries, in which, my Writings shall be declared with more evident and clearer Explications, to which I refer the well minded Reader, concluding this Book with those Verses of Ovid.

*Jamque opus exegi, quod nec Jovis ira, nec Ignis,
Nec poterit ferrum, nec edax abolere vetustas.*

*And now, a work I finish have, of which, Jove's wrath,
or flame,
Or Sword, or all devouring time can ne'er raze out the
name.*

An APPENDIX

TO THE

FIFTH PART

OF THE

Prosperity of GERMANY.

Clearly and perspicuously revealing and declaring, (for the benefit and profit's sake of the whole Countrey) by what means those three Arcana's promised in the said fifth part are to be advantageously effected. Together with an adjoynd Explication of some obscurer places which are not so clearly disclosed in the third and fourth parts of the Prosperity of Germany, as likewise in the first Century.

Friendly Reader,

I doubt not, but it will seem a wonder to many, that Arcana's of so great moment and so much utility should be laid open by me, in so perspicuous and evident a description, as for every one thoroughly to know them.

However, any Body may easily persuade himself that I have not so done without weighty causes, which to reckon up here at present, I judge it not so altogether necessary, but that it will be more commodious to refer it to some other convenient time. The chiefeſt and which is the most over-swaying reason amongst all the rest, is this, viz. the perverseness of some abusive Men, not onely endeavouring to make my Writings envied [or bated] by Men of common rank, but also by the great ones, by their lying reproachfull slanders; and especially most falsely averring, that those three Arcana's which I promised in the Fifth Part of the Prosperity of Germany, are of no profit,

O o o o o

and

and therefore cannot be effected with any advantage, and that I my self sought after nothing else by promising their discovery, save onely by imposing them upon (or selling them unto) others to scrape some Monies together. Now forasmuch as this is the property of Slanders, to be admitted far easilier and readilier than the truth it self, and that for this reason many have diverted their minds from the truth of this thing by busying them about these Calumnies, and so have not known how the case stands; but (on the contrary) seeing I am conscious of mine own Innocency, and am far wide of those Crimes so falsely charged on me, I have judged it most just and most highly necessary, not to suffer those most false Accusations to rest upon me, but to shew the contrary to the Eyes of the whole World, and by demonstrating and disclosing the very truth it self, to recover my honour so perfidiously and treacherously snatcht from me; the which could not possibly be done by any better way than this.

Necessity therefore required the Work it self to speak, and to defend its own self, which indeed is a true and genuine defence, and way of stopping the shameless and lying Mouths of all reproachfull Slanderers. God will in time recompence such false Mens most wicked Works, whereby they have exceedingly injured me. Mean while every one may apply these most profitable inventions to their use, and undertake the doing one or other of the Operations whereby they may reap some benefit, which I wish them from my Soul.

Nor do I doubt, but that a very many Men will, by following the Doctrine by me prescribed, and insisting upon the foot-steps of my Writings, which are founded on the truth, as being a sure Foundation, get themselves no small profit; whilst they quietly and peaceably enjoy the gainfull practising on my Arcana's: And especially of that most easie secret, by which, fugacious and volatile Gold is extrahed out of all kinds of Flints, (every where plentifully offering themselves, and so by the help of Lead, is rendred Corporeal. Which Work verily is such, as that one Man doth no ways damage another by, but may rather help and profit him. Therefore do I at present affirm to every body with that truth which God loves, and will defend, that all the following Operations which I manifest in the publishing this little Treatise, have been wrought by me not once onely but often times, and have been shown to many others, so that no body has any reason to doubt hereof, nor need he be solicitous about any other thing but how wisely to manage, the Operation, and to be diligent about his labours. But if it should so fall out as that a Man should commit an error or two, which may easily happen, let him not ascribe the errors he commits, to the Art it self, and thereupon to accuse it of falsity, but let him rather inquire into the occasions and reasons of his own errors, and without doubt by such enquiries will he attain his end, and get the hoped for fruit: in which thing, my first and second Century will by an easie Manuduction help him.

These are the things which for the truths sake and to witness it, was I willing to produce. And I do hereby signifie to every one that now my publick Laboratory is at an end, and shall remain shut for time to come, which I was willing every one should know.

[The first] Operation shewing the way of reducing any Lead, or any Vein of Lead by the help of common Salt, [and] by Coals, into Ashes, in the Furnace called Stüchsen, that so the Gold and Silver may be extracted with profit.

TAKE of Lead or a Leaden Vein two parts, and of common Salt one part. The Lead Oar is to be ground in a Mill, and so are they to be commixt, and by little and little thrown with a Shovel upon the Coals in the Furnace, serving to make Ashes, and which has Pipes or Chimnyes fitted thereunto to receive the fume and the ascending Flores. That molten part of Metal and Salt which falls through the Grate is to be again taken up with your Shovel, and cast in upon the Coals until the whole Metal, or all that metallick Vein shall be turned into Ashes. Then farther, all the burnt matter, is to be freed by divers washings from all the defilements, and the remaining Ashes of the Metal or Metallick Vein, is to be reduced into a Metal in a Furnace which the Germans call Stüchsen. These incinerations and reductions are to be so often and so long repeated, until you find (by making trial with some little piece) that your Lead is now fitted to be handled or wrought on in the Hearths or Furnaces by the Fire of Separation. For then in the Hearths

or Tests it is changed into Litharge, whereby it may the more commodiously yield forth the Gold and Silver, which by the Fire and Salt are therein matured.

N. B. But you are here to observe that the leaden Oars can indeed be commixed with the Salt, and so thrown in upon the Coals: But now Lead admits not of being so dealt withall, for it is not mixable with the Salt, and therefore it requires that the Salt be first cast in upon the Coals, and then must it be thrown in afterwards at top of it. And this way is to be observed and so often repeated and so long, always throwing in, first the Salt then the Lead, till the Lead being turned into ashes, hath wholly lost its metallick Fusion. The said ashes are to be washt with Water and reduced in the Furnace, on such wise as we spake of but now.

N. B. Other lesser Metals may be added to the Lead or to the leaden Vein or Oar, and so be reduced into Ashes together, as Tin, Iron or Copper. But yet these leaden Oars are more advantageous and profitable if they are taken alone, as being more fit for this kind of labour, seeing they have already in them Iron and Copper, and yield not any good and vendible Lead, by reason of their wild nature, and so there's no need of burning up Copper and Tin which are already vendible.

N. B. Whilst

N. B. Whilest this Incineration is done, many Metallick Flores does ascend up into the Receptacles appointed for the fume to go up in, and which are adjoynd to the Furnace, which (if need be) may be taken out, and by washings be freed from the Salt which ascended together with them; and by Reduction be restored or reduced to their former body: and will yield Lead which contains in it Silver, and is to be converted into Litharge like other Lead, that the Silver may be separated therefrom.

This likewise is heedfully to be observed in the other *Minerals* or Oars turned into Ashes, that afore their Reduction, they be thoroughly washt from all the Salt, and the light filths or defilements are to be well separated from the metalline body; for if this be neglected, the Salt being forced with the strong blast of the Bellows would carry off the Metal together with it self, and the Ashes of the Coals would hinder the Fusion of the Metal it self, and reduce the same into *Scoria's*.

As concerning the Reduction it self, this is well to be regarded, that the Fire must be kindled in the Furnace at least two hours afore the Ashes of the Oars that are to be reduced, are to be put in, that so the Furnace may be thoroughly bright-hot within; for if it be not through fiery-hot, the Cast in *Minerals* melt not, and being not molten they lie in the Fire, and hinder the blast of the Bellows, and spoil the Operation it self.

These labours therefore require a skillfull Artificer, and one versed in such Operations, for they are not so very Facile as they seem to many, to appear to be.

Then farther, this is likewise to be noted, that if the *Minerals* or Oars that you take to this Operation are full of Sulphur, and that that Sulphur is not wholly taken away by torrefying [or calcining them] it will by its fierceness reduce in the melting the body of the good Metal into *Scoria's*, and instead of Metal present you with Dross. And this is that Incineration and Reduction which I have shewed in my Laboratory, both to Friends and Enemies; But yet I have (since that time) found out a far easier way of doing this labour, by the help of which, one Man will do more in one day, than he could otherwise in eight days. But because this way is not as yet made common, it seems not convenient in my Opinion to divulge it here; for as much as I have determined with my self in this present Appendix to disclose onely those things which I exposed to be seen in my Laboratory by others.

By what means Gold, Silver, yea and Copper too, may with great profit be extracted out of the poor Metallick Veins by the moist way, and which cannot quit the costs of doing it by Fire.

First of all, the metallick Earths are to be made red hot, and to be quenched in cold Water, that so being made brittle they may be ground in a Mill. If Sulphur be admixt in them, then must they by a foregoing firing be freed from the same, because the Sulphur hinders the *Aqua Fortis*, from duely dissolving those Oars. Being now thus prepared, they are to be put into the stronger Glasses, or into Earthen Cucurbits made of the best Clay, and the following Water is to be poured upon them, and is to cover them over three fingers breadth. The Cucurbit being filled with these matters is to be set in a Case [or Pot] full of Sand, and prepared for this use, and

all the Water is to be drawn therefrom by Distillation: which is not onely all of it again recovered, but withall doth get it self an encrease or augmentation from the Salt-peter or the Salt, so that there ascends more Water by Distillation than was poured on.

The Oars are to be taken out of the Cucurbit, (or Cucurbits, if there were more Pots used) and being taken forth you must pour common Water thereupon to extract the remaining Salt thereof out, in the which Salt is found the Gold and the Silver that was in the Oars.

N. B. This is to be observed in this labour, that all the Spirits are not to be drawn off from the Oars even to the dry Salt; and this not onely to shun the damage that might happen by breaking the Glasses, but also for this reason, viz. that there may be left behind with the Salt a little Acrimony, because of some Salts which easily pass into Salt-peter when some *Aqua Fortis* is drawn off them. And albeit that *Aqua Fortis* will easily turn the whole Body of Kitchen Salt into Salt-peter, yet notwithstanding amongst all the Salts one Salt admits of a speedier, another of a slow Transmutation, according as it is more or less akin in its nature unto Salt-peter.

And therefore to prevent this error, some humidity is to be left with the Oars. For when all the Spirits are drawn off, and the Salt is turned into Salt-peter, the Water would not be sharp enough to hold up the Gold that is extracted, when the Solution is made, for the Water would dissolve barely the Salt-peter, and leave the Gold remaining behind with the Oar.

If this error should chance to be committed, the Salt-peter is to be extracted out of the Oars with the Water, and more new Salt must be poured on upon the same Oars together with the *Aqua Regis* that was drawn off by Distillation; that so this *Aqua Regis* having been once abstracted may not afterwards transmute all the Salt thereto added into Salt-peter. For by how much the oftner the *Aqua Fortis* is drawn off from the Salt, so much the less is the Salt turned by it into Salt-peter, and at length, it will come to such a pass as to remain just as it was afore the abstraction [of the so oft drawn off Spirit.] For this is the nature of *Aqua Fortis*, viz. to transmute half its weight of Salt into Salt-peter at the first time; the second time it transmutes but a fourth part; the third time much less; and at length will transmute none at all; but puts on the nature of Spirit of Salt: which notwithstanding is most fit to extract Gold and Copper withall out of the Oars in infinitum, if Salt be thereto added, out of which, it is wont to get it self a perpetual encrease (and be) like other Spirit of Salt.

Now then, to prevent this inconvenience, the *Aqua Fortis* may be left off for altogether, and those Minerals and Metallick Earths may be extracted with the Spirit of Salt onely, and Salt added thereunto: onely observing this thing in the Distillation, viz. that some of the humidity be left behind with the Oars whereby they may be the easier taken out of the Glasses.

Moreover this is to be likewise known, that Gold, Silver, and Copper may be extracted out of their Oars or Earths even without *Aqua Fortis* or Spirit of Salt, if onely Salt or Salt-peter be but added. For if some Oil of Vitriol or of Sulphur be poured upon the Water of Salt-peter, or that the Water of Salt be acuated therewithall, it becomes strong enough to extract Gold, and after the extraction and distilling the Phlegm

Phlegm off, there follows by distilling a pleasant Spirit of Salt, or from Salt-peter a good *Aqua Fortis*. This labour therefore is more gainfull and less troublesome, than if *Aqua Fortis* or Spirit of Salt were used thereunto.

There are other easier and more compendious ways of extracting Gold, Silver and Copper out of their Earths, which, seeing they have not been as yet shown in my Laboratory, I shall silently pass them by at present and that not without reason. But yet there is frequent mention made of the like [Operations] in my first Century, in which he who has an earnest desire to know more of those kind of ways, may make enquiry.

The Preparation of suitable and proper Waters to extract Gold, Silver and Copper out of poor Oars.

TAKE of Salt-peter one part, of common *Aqua Fortis* two parts; these being joyned together, extract Silver and also Copper. But to extract Gold out of its Oars or Minerals, there must be taken one part of common Salt, and four parts of *Aqua Fortis*. One pound of Salt, and four of *Aqua Fortis*, make four pounds and $\frac{1}{2}$ of *Aqua Regia*, the other half pound of Salt stays behind with the Metallick Veins or Oars in the bottom of the Cucurbit, and contains the Gold that was in them, and is to be extracted with common Water.

The way of getting out the Gold and Silver out of the waste-cut Salts by precipitation, and of reducing them to their peculiar bodies without detriment or loss.

IF it be Water of Salt-peter and hath Silver in it, the Water of Salt being poured in, precipitates the Silver to the bottom. But if Water of Salt, and has Gold in it, the Gold is precipitated by pouring on a *Lixivium* which hath in it a little liquor of Flints. And now this Water it self thus mixt by pouring (other precipitating liquors on it) yields (by decoction) most excellent Salt-peter. And the *Aqua Fortis* and *Aqua Regia*, which ascended by Distillation, are fit to make new extractions of Gold, Silver, and Copper out of their Earths; and by iterated extractions (by the Salts and Waters thereto added) do they get a perpetual encrease, insomuch that in these extractions of Gold, Silver, and Copper, there are not required at all any other expences save those few, bestowed on firing. Therefore in the beginning of this Work there is not required ought else but one onely pound of *Aqua Fortis*, because in the progress of the Work it proceeds on to an infinite encrease, yea, enough for the extraction of many thousands of pounds.

(Hence is it that this Work is an unheard of Operation, and doth almost exceed all belief, and from which there must an immense gain of necessity accrue, because Gold, Silver, and Copper may by this means be extracted out of their poor Metallick Earths without costs.

There remains yet one thing, which is to be heedfully regarded in the precipitation of the Gold and Silver. A common *Lixivium* cannot precipitate all the Gold out of the *Aqua Regia*, and therefore I bid you add to the *Lixivium* some liquor of Flints, and this will also appear in my first Century.

Therefore it behoves every one, clearly to see whether or no he makes use of true and genuine Liquor of Flints in his Operation, that so he may not

instead of it, use a bare simple *Lixivium* onely, and so commit a great error, as it hath happened to some as I have been told.

But he that can't make true and good liquor of Flints, or else has it not at hand, may substitute in its stead, common Spirit of Urine prepared in a Copper still, which together with the said liquor precipitates all the Gold out of the *Aqua Regia*.

N. B. But this Gold thus precipitated by Spirit of Urine, fulminates like Gun-powder, unless it be burnt with common Brimstone afore the Reduction, and that this fulminating faculty be taken away from it, which inconvenience the liquor of Flints is not wont to bring.

N. B. If there should be much Zink, Iron, or *Lapis Calaminaris* in the Oars of Gold or Silver, the *Aqua Fortis* or *Aqua Regia* would not all ascend by the Distillation, nor get increase; but some part thereof would stay with those Metallick Earths, and with the *Lapis Calaminaris*, &c. and by adhering thereunto be concentrated: but yet there would not be any loss by that, for by the pouring on a *Lixivium* of Wood-ashes, may it be turned into good Salt-peter, of as much value as may easily recompence the charges of the *Aq. Fortis*, or *Aq. Regia*.

Besides, you are likewise to observe this, that if there should be Copper admixt in the Oars of the Gold and Silver, the *Aq. Fortis* would extract the Copper too, as well as the Silver.

But now the nearest way of separating these two Metals from each other, is this, Let Spirit of Salt be poured to the *Aq. Fortis*, and it will precipitate all the Silver out of the *Aq. Fortis*, down to the bottom, and the Copper will be left in the water; which if you put some Iron into, it will stick to the Iron, and by this means be gotten out of the water.

This water now, after the Metals are withdrawn from it, is fit to make new Salt-peter with, and by addition of Vitriol to yield a new *Aq. Fortis* by distillation.

Alkali Salts do in the Fusing bring the precipitated Silver to its former body, which otherwise is very fugacious.

The Copper is turned into excellent Verdigrease. And so the Oars of Copper, though never so poor, may be extracted, and that with no small benefit: Because the Verdigrease made of the bare Copper is twice the price of the molten Copper it self.

The manner of making good Salt-peter in plenty, out of Kitchen-Salt and Calx-vive.

TAKE the Stones of Lime, which have been thorowly changed or reduced into Powder by the Air, four parts: of Kitchen Salt, or Common Salt, one part, [by weight, and not by measure] whether pure or impure [it matters not:] and of this mixture is a thickish paste to be made by moistning it with Urine, or, in want of that, with Water; which is to be made up into a Pile with Wood, and so may it be made *Stratum super stratum*, of what bigness you please: and it may be done in a Furnace made for that purpose, or else in the open Field abroad in the Air. But you must beware in the building up of this Pile, that the mass of Salt and *Calx-vive* be not too thick laid, and too much; but it would be better to make it up in balls or pellets, that so they may be well fired by the flame, which must penetrate everywhere through the pervious heap or pile: which cannot

not be, if the mass be spread too broad, and so stop up the passages of the flame.

The heap being made as big as you are minded to have it, the fire must be put under, and so long fed, till all the wood is burnt, and the balls themselves have been red-hot, a whole hour at least: that the Acrimony of the Salt may in so great a heat be changed by the *Calc-vive*, and get it self a milder nature, and consequently be so much the easier transmuted into Salt-peter.

N. B. The Salt that is on this wise transmuted, is most fit for dunging Lands, and to be used instead of the common beasts dung, as I have at large taught long ago in many places of my Writings.

This is the preparation of turning Salt into Salt-peter, which Artifice, if any be minded to work about, it is necessary for him to order his Operation this following way.

The manner of making Salt-peter out of this prepared Salt.

First of all, this introverted Salt must be exposed to the open Air, and beams of the Sun; but yet so, as that the heap may not be moistened by the Rain, and it must lie in its heap the height of some three or four Feet; the which heap is to be wetted either with Man's piss or Beasts; or if there be not enough of this to be had, then with bare water onely, that so the pellets or balls lying quietly for some days, may be dissolved and be mixed with the rest of the matter.

Now when the warm Air hath consumed all the humidity, and dried up the heap, the aforesaid moistning is to be repeated; which being again consumed, and the heap dried, the labour of repeated moistnings and exsiccatations is to be so long continued, as long as necessity requireth: For in long progress of time is the Salt-peter generated, which must be washed out with water, and by decoction be reduced into Stria's or Crytalls.

This generation of Salt-peter proceeds indeed slowly on, but yet it brings a great profit. For if once the Salt-peter be but generated in such an heap of Salt, and the reliques left after the washing out of the Peter be again put to the same heap, there will new Salt-peter be generated in process of time: so that new Salt-peter will every year offer it self to be washed out of the heap: and this work may be continued without end.

But he that would have some Salt-peter from this introverted Salt in a shorter tract of time, let him know, that the Seed or Ferment of Salt-peter must be added unto the said heap, that so this same Seed may get augmentation from the Salt, and encrease and grow, like as an herb is wont to grow in a fat and saline Earth. For all things have their Seeds, and doe draw their Encrease out of other Salts. The Seed of Salt-peter is volatile, as is its acid Spirit: its Root is fixed Niter; which being implanted in all sharp Salts, doth beget Salt-peter in a most plentiful manner, and such as is very good, or even better than that which ariseth out of those acid Salts and Alcalies.

We doe not here show this propagation of fix Salt-peter by acid Salts, because it is described in the following Labour and Operation.

Therefore like as any Vegetable may be propagated and multiplied not onely by the help of its Seed, but even of its Root too; Even just so is it with Salt-peter, for it admits of propagation and multiplication

by the means both of its Seed and of its Root, as other Herbs doe.

As concerning the Seed of Salt-peter, it is very easily preparable by those who deal in metallick separations and extractions by the moist way. For if Gold be separated from Silver by *Aq. Fortis*; or that Gold and Silver be by it extracted out of their Oars, this very operation hath already abundantly recompensed the charges laid out thereon, and so it offers it self without any costs, and as it were *Gratis*.

And now, if I pour this water on, instead of common Water, upon the introverted Salt, it does not onely become good Salt-peter, but doth also yield (as being the Seed of true Salt-peter) an hundred fold encrease, after the manner of the Seed of all Vegetables, and doth the same as they do. And by how much the more of this Nitrous Seed is sown in the Earth, so much the more Salt-peter, and so much the sooner too is generated. For when a Gardener doth sow his Seed sparingly, he must necessarily have but a thin harvest: and so on the contrary is it to be understood of a plentiful harvest. And if now there should be any one that should upbraid the Gardener with the slowness of his Seed, because it produceth not Buds, nor Stalks, nor Flowers, nor Fruits in a few days space, would not he say that he cannot compell nature, for it reserves to it self its due time, and its natural course?

The very same would I have you understand here concerning Salt-peter: if haply my Enemies, those most ignorant Sheepsheads, would object against me, that seeing the Salt-peter doth not presently, in a few days, grow or spring forth from its seed sown, therefore that seed was not true nor good, or that it is altogether impossible that Salt-peter should be generated so plentifully out of Common Salt: I answer such, as the Gardener does, 'Tis necessary to allow Nature her own appointed time.

But that it may evidently appear, that this my planting of Salt-peter, and that this augmentation may be far more evidently demonstrated, than that of any Vegetable seed; the business may be tried for confirmation sake in a small Experiment, afore you set about a more laborious and prolix exercise, and to prevent your fears of attempting it in vain.

Take the Salt prepared with the *Calc-vive* three pound, and put each a-part in several Earthen Vessels. Take likewise of the Water of Salt-peter already used (as being the Seed of Salt-peter) one ounce, two ounces, and four ounces: with the one ounce of that *Aq. Fortis* commix as much Common water as may serve to moisten one pound of the aforesaid introverted Salt: Then to the two ounces of the same *Aq. Fortis*, adjoyn likewise as much water as may serve to moisten the other pound of Salt with: And so doe with the other four ounces, and therewithall moisten the third pound: Set those three Pots, containing the three several pounds of the said prepared Salt, at the heat of the Sun, but so, as that the Rain may not come, and wash off all the Salt. All the moisture being consumed by the Solar heat, moisten your matters in your pots with Rain water onely, so often, as the drying needs the watering it. When two or three months are over, take out each pound separately by washing it out of the matters in each pot, and you shall find a vast difference, and shall see that that one pound of Salt which had those four ounces of Nitrous seed in it will be all transmuted into Salt-peter, save a few feces: But that pound

P p p p

which

which had two ounces of the said Seed poured upon it, will contain a lesser portion of Salt-peter; and the other which had but one ounce onely will have the least portion. Moreover, if you pour those Salt-waters you washt out, and which are not yet turned into Salt-peter, upon the feces again, and so dry it as afore, and bestow yet other three months on these exsiccations and moistnings, and then again boil the Salt-peter out of the Salt, it will be much encreased and bettered; and so you will have so much the greater encrease of Salt, by how much the longer you shall have prosecuted this Labour. Such Experiments doe demonstrate, that by how much the more Seed there is sown in a fat and salt Earth, so much the more plentifull encrease of the Seed is to be expected.

But those deriding mockers and persecutors of Art and Truth may here object and say, that the Salt-peter ariseth from the Salt-peter water onely that was put thereunto, and not from the Salt it self? But I answer, That that used *Aq. Fortis* is indeed the Seed of Salt-peter, but can never recover the Nature of Salt-peter without the help of some fix body: Like as the Seed of an herb cannot become an herb, unless it be cast into a moist and salt Earth, from thence doth it get its body, and so is encreased.

Verily I willingly confesse, that the Spirit of Nitre may be reduced to the former nature of Salt-peter, by assuming it self a body out of all the fix Salts. But yet, as far as I have hitherto known, by my manifold inquiries and investigations a long time, I could not find any other Salt (save the following) by the help of which, those Waters used about metalline Washings, may be sooner and better transmuted into Salt-peter, like as this, and the following Salts doe: And therefore I doe commend it as of the best rank for the making of Salt-peter. The manner of preparing good salt Nitre out of the extracted Oars is already revealed in the first Century, and therefore needs no superfluous repetition here.

Another Preparation of Salt for the making of Salt-peter.

TAKE Common Salt one part, and of a sulphureous Oar, which the Germans call *Schewelkie*, two or three parts, if they contain less Sulphur: But if they have Vitriol in them too, then must you take equal parts of both. Grind the sulphureous Mineral in a Mill, mix it with the Salt, and heat it red-hot by well torrifying or calcining them for two hours (in Furnaces serving for such a work,) either upon a Grate, or else without a Grate, upon Hearths; that so, during this Candefaction, the Sulphur may have ingress into the Salt, and may alter it. This Salt being washt out of the sulphureous Minera with water, and boiled till a skin gathers at top of the water, it shoots into long Stria's or Crytalls, like Salt-peter, and tastes like it, but falls into Powder in a warmish Air. If it be burnt and prepared by putting *Calx-vive* thereto, after the way afore going, it is convertible into good Salt-peter, but sooner and in a shorter time. If the Minera's you use have Copper in them, or any other Metal, yet nevertheless may they be gotten out thence by fusion, for there will be nothing lost in this operation but the Sulphur; and this must have been driven away by burning it, however, if you would have any of the Metal out of the Minera.

N. B. The *Caput mortuum* out of which the Spirit of Salt by the addition of the Vitriol is extracted, yields such a like Salt, and very fit to make Salt-peter withall. There are also several other ways, which yield no small plenty of such Salts, and that in a manner without any costs, especially if the help of Stone-coals be thereto used. Besides too; this you are to be advised of, that (seeing the Salt is to be burnt with the *Calx-vive*) one Calx is better than another, for some Lime stones are more apt for the making of Salt-peter, but primarily those, which when you touch your tongue with, doe yield a fiery tast; with which sort, the Lime made of Sea-shells doth not compare as to goodness.

By what means the Root of Salt-peter is to be implanted in acid Salts, so as to be thereby augmented, like as the Root of a Vegetable, being transplanted, gets an increase from the saltiness of the Earth.

EVEN as we have demonstrated in the foregoing discourse, that the acid Spirit of Nitre is the seed of Salt-peter, and doth encrease it self out of Alkali Salts like as an Herb doth out of the Earth: Even so by the same reason, fix Salt-peter, which is the root of Salt-peter, admits of transplantation, yet not by fixed Salts, like as the sharp Spirit does, but by sharp Salts, whereto it is to be united by implantation: For, two Acidities, and two Alkalies, cannot produce any new Essence, but two Contraries doe always produce a third. The acid Salt, which is of the meanest acidity, and which doth easiest admit of being transmuted into Salt-peter, is the common Kitchen-Salt, which we taught the way but even now of inverting by the Minera's of Sulphur. And if that such provision cannot be had to prepare it by, the very Kitchen salt it self being taken both in the moist and in the dry way, would perform the same, as I have already shewn in other places of my Writings. And as for the making of fix Nitre, you may meet with the way of doing that too and agen in my other Writings, and especially in that place where I have treated of the dry separation of washing of Metals, viz. when sulphureous and Antimonial Metals are washed by Nitre.

The way of preparing Spirit of Salt, necessary for the Extracting of Gold and Copper out of their Oars; as likewise of making good Salt-peter of the matter left after the distillation is finished.

MIX with two parts of Vitriol or Allum, one part of Kitchen-salt, and throw in this mixture upon hot burning Coals, the Spirits of which are to be taken in great Leaden Cisterns instead of Receivers. This operation (besides the salt Spirit it gives) yields also sharp Flores. If any shall provide himself with double Leaden Cisterns, and shall make the Outer one to hold in it the lesser Cistern, and so fill this outer one with cold water, he shall obtain more plenty of Spirits by reason of this better refrigeration. But such Cisterns requires a great deal of Lead; for verily even those three alone which I had in my Laboratory contained a thousand and forty pounds of sheet Lead.

There may be other kinds of Receivers applied to this use, which, to reckon up, would be too tedious in this Book.

The matter remaining after the Distillation may be ground in a Mill, and one part thereof mixt with two parts of *Calx-vivæ*; and so balls are to be made thereof, and to be put upon wood and burnt, as we shewed afore, that so they may be transmuted into Salt-peter.

But besides all these, there hath been a far better and more compendious incineration, and bettering of the lesser and more imperfect Metals shown and demonstrated to my friends, in my Laboratory, which requires not so many Circumstances and Labours, as the foregoing more prolix operation, which is performed by throwing Common Salt upon the Coals, does: For it is to be done in a peculiar Furnace, and with purer Salts; and being wrought about a greater work, yields very considerable profit: so that it impregnates Silver and Lead with Gold, with twenty four hours ease labour, and renders them worth the labour of separation.

In like manner, Copper may by the help of such Labours be very much amended, and gets no small portion of Silver, if it be added: so that with a little fire and a very few expences, every sort of Copper, though it has endured the fire scarce twenty four hours, is wont to be so much bettered, as to shew in the Touchstone the marks of two, three, and sometimes six Lots, according as it has been diligently and circumspectly handled. Hence comes it to pass, that by vile and every-where obvious Subjects any Silver and Lead may be matured by little and little into Gold, and so may Copper it self be ripened without any detriment into good Silver, by a few repeated Labours. Now these operations requiring but small costs, and but a few labours to accomplish it, may be exercised without intermission, and bring vast profit. These inventions are such as never were as yet thought on by any, and so never at any time saw the Light. But now they that saw and learned, in my Laboratory, the great incineration, did not all of them see this Labour and Artifice, and apprehend its use, but such of them only that stayed our constant, even to the end of the whole Demonstration in my Laboratory. And as for such as too soon forsook their Master and the School, they are (and indeed very deservedly) altogether ignorant of this operation. For should they have been masters of this *Arcanum* too, they would verily have detrimented me more, which God of his mercy prevented, and hereby provided, that all [my Arcana's] should not fall altogether into mine Enemies hands. The Furnace which I used about the said Incineration and Melioration of Metals, is as yet in my Laboratory, and will haply there remain all this *Winter*. But as for mine own part, I have determined with my self to leave off Chymical Labours, communicating them to others, with whom this more compendious bettering of the Metals will be yet longer to be seen. Therefore all the whole Drove of my Enemies, though never so big, will not at all be able to oppress the truth, what mad attempts soever they make against it. For although one or another of them hath theevishly stole from me my Secrets, yet presently the Divine goodness hath largely supplied me with others. I have now laid a sure Foundation in Alchemy, and have kindled a Light for both Friends and Enemies, which will very hardly be extinguishd as long as the World endures.

But now, that some little knowledge may be had of this more compendious Incineration, and bettering of Metals, *viz.* of Iron, Copper, Tin and Lead into

Silver, and of *Lune* into Gold; I say that it is to be done in a twofold manner. The first is, when the Metals are destroyed either with common, or else with prepared and moist Chymical Fires, and converted out of their own Metallick being into an Earthy nature and Essence, are imbibed with spiritual Salts, and burnt by a close Cementation, so as by their mutual efficacy and actings upon each other, to amend themselves, and afterwards by reduction and separation to yield forth Silver and Gold with profit. And this Labour admits of being exercised in as great a quantity and plenty as any one pleaseth, and is clearly void of tedious troublesome, and great expences, for one onely person may discharge this Operation in one onely Chimney, and that with no small quantity of matter too. Nay more, (and which is of greater moment) if any one shall in this operation make use of such Salts as they call Graduating Salts, which are ease to be got, and cost almost nothing, he will get far greater profit, especially if he shall put Copper-plates to be burnt with the Metals reduced by the said Cementation into ashes, which said Plates, those Graduating Spirits will penetrate wholly and throughout, and in this penetration, better them, and bring them unto a more noble degree, so as to give on the Test, Silver impregnated with Gold. Nor is it necessary that those Copper-plates be separated by Lead in the secret Pot, so to get the Gold and Silver made in them, by the said operation, though they have already gotten a meanly-white Colour. 'Tis better and more profitable to put them yet again in some new Cementations, and urge them more with the violence of the Fire, and they will be enriched with a greater access of Gold and Silver, then afterwards are they to be separated by adding a due [quantity of] Lead, which is [thus] done, when the Lead containing the Gold and Silver, together with the Copper, are melted together into a great Cake, these are to be put in the Furnace, which the *Germani* call *Sagerofen*, that so the Lead melting may flow down, and in flowing or running down may carry away with it all the Silver and Gold that was in the Copper. By this Artifice is the Copper conserved, and is to be a-new made into Plates, and to be used about new Labours, and be again enriched with Gold and Silver by Cementation.

N. B. There is not at all any need of any peculiar Lead for this separation of the Copper, forasmuch as that Lead may be used thereabouts which is molten out of the Powders of the Cement, and already contains in it Gold and Silver, which Metals are conserved by one and the same work in the labour of Separation, and are already gotten by the Gradatory Cements out of the Minerals, and the more imperfect Metals.

And this now is my more compendious Incineration and Cementation of the imperfect Metals, to make them better and more perfect. This Operation have I shown to some Friends in my Laboratory, which will moreover be in many places exercised with profit. And now any one may easily foresee and guess, what shame mine Enemies, (who with their Diabolical Clamours and Calumnies, say my Writings are unprofitable and all over full of Lyes,) must at length be confounded withall, and how basely they have behaved themselves. Nor verily is it to be doubted but that there will be such frequent exercise and so familiar a practice of Alchemy (which is an Art that produceth infinite benefits) through-

out all Europe, that even abundance of Work-men [or Tradesmen] will leave their Trades, and many Countrey-men leave their Plows, and set themselves about Alchymy, and by the Assistance of my Writings get themselves Food and Rayment in an easier and pleasanter way, even out of the contemptible Sand, and abject Stones. Whereupon it will of necessity follow, that in all those places where now poverty is rife, plenty of Gold and Silver will again come in sight. These are new fruits which God bestoweth in this Age. And every one that gets so far as to obtain these fruits, let him have regard to the poor and needy, and not forget his Benefactors from whom such things proceeded: lest he pull upon himself the wrath and anger of God.

Moreover, there were some other Arcana's ocularily demonstrated in my Laboratory, during the shewing of those meer prolix secrets, the reckoning up of which here I judge needless. Some of them are of no small concernment, which by the same Sinister or unlucky mishap fell into the hands of mine Enemies, and will without all doubt be by them manifested. For that very reason will I my self reveal some, in my second Century (God permitting) that it may not be concealed from any one, what excellent secrets I have disclosed for the use of mankind.

'Mongst other Arcana's, this is none of the meanest, which, [viz.] teacheth to extract Copper, (by Waters of almost no cost or charges, out of poor Oars of Copper which are every where obvious, and are not rich enough to defray the charges necessary for a melting Fire,) and bring it to use, and that in great quantity, and so easily as that without question the poor Countrey-men that can very hardly sustain themselves, their Wives and Children, will for the time to come set about such an Operation, and get such Minera's or Oars, or even the Scorias of them, to extract the Copper out of them and sell it, and so provide themselves Food and Rayment against a sharp Winter, whereas otherwise they must live miserably in want and poverty. The Operation it self is this.

How Copper may easily and very profitably be extracted and made corporeal (without any melting or fusion) by a certain Water of very small expences.

There are two sorts of Oars or Veins of Copper met withall, some are mixt with Sulphur, and refuse extracting with *Aqua Fortis*; inasmuch that you must first remove the Sulphur from them by roasting as it were and burning them, afore that Salts or sharp Waters can display their virtues upon them. Now that roasting (or calcining) then, is to be done on Hearths by the flame of Wood, on which, that metalline matter broken into Powder, is to be incessantly stirred with Iron Instruments, so long till it emits no more sulphureous stench: This done, they admit of extraction with *Aqua Fortis*.

Other Minera's or Oars which have no Sulphur admixt with them, need not this calcining, for they are to be only heated red hot in the Fire and quencht, with Water and so broken to pieces, and then are they made fit for extraction.

But all sharp Waters which dissolve Copper may be used to extract the Copper out of poor coppery Oars, and that with profit, when the Waters are of no great costs, but are to be had for a very little charges. Such are an *Acetum* or Vinegar of Corn, *Acetum* of Woods, which any Countryman may get

easily and in great quantity; also, Water of common Salt, Water of the Lees of Wine, out of which adust Wine (or Brandy) or Spirit of Wine is prepared, and which else are cast away. These two latter are of the meanest price, and may therefore be easiest of all gotten. The Operation it self is this.

The Oars being reduced into Powder must be put into small and low (Copper) Pans, about the thickness of a Span, for if they should lie too thick or compact, they would more hardly be stirred with a wooden Stick: Upon them thus lying in the Pans, pour that acid Water the height of a Span or at least a hands breadth above the matters; then put Fire under the Pans, let it boil strongly, and let the matter be incessantly stirred, that so the Water coming to it in every part, it may extract all the Copper the more easily. When this Water has boiled one or two hours, and so gotten a most green colour, and that it can dissolve no more Copper, it must be poured out, and more put on, and be on such wise boiled so long till it hath gotten the same colour. Now this pouring on is to be repeated with new Water so often and so long till it imbibes (or extracts) no more greenness, which is a sign that all the Copper is extracted out of the Oars.

N. B. If there should be but little Copper in the Oars, the first Water will extract all the Copper, and so there will not need the pouring on any other Water. Nay more, it sometimes happens that even the first Water would attract more Copper if the Oars had had more of the same. Therefore the Copper is not to be precipitated out of that Water which hath not extracted Copper enough, but is to be reserved and poured upon new Oars, that it may be thoroughly impregnated with Copper, and so the precipitation with Iron may not be used in vain. For by how much the more Copper, the Waters shall be extracted (or held up in them) so much the greater is the gain, and so much the less Water is required to this Work.

It is a thing easie to be understood by him that shall thoroughly search into this Operation, and manage it with due diligence, so as to commit no error.

N. B. If you have store of these green Waters, put in some old Iron for one or two nights, and you shall get out the Copper that will adhere unto it like filed Copper, and 'twill leave the Water white and clear, which said Water can be used no more about this kind of extraction, but may not be poured upon *Calx-vivæ* mixt with Wood-ashes, and so be dried up, by the Air or the Sun, under some Roof to keep off Rain, and from this used Water, and the *Calx* or Lime is Salt-peter generated in such a manner as I taught afore.

N. B. This Copper which sticks on to the Iron, is to be freed from all the Saltiness by washing it with common Water, and is to be afterwards dried, and so may be used in the stead of pure Copper, for if molten it nothing at all differs therefrom; if the Operation be but well managed. Nay more, it has in it a most notable Commodity, as being more tender and more pure, and more commodious for many Operations than that gross common Copper is. 'Tis also very fit to be converted into most excellent Viridigreefe, if it be moistned with sharp Vinegar and set in the heat.

Moreover I have shewn in my publick Laboratory, by what means Spirit of Salt, *Aqua Fortis*, *Aqua Regæ*, and my *Sal Mirabile* may be easily gotten, and

and that in great quantity too, by a Separatory Sulphur, which is nothing else but Oil of Sulphur or of Vitriol, of which I have very clearly treated in the second part of the *Miraculum Mundi*. Likewise how Gold may in one quarter of an hours space be converted by the *Sal Mirabilis* (in a Crucible) into its first matter; or, into a red, transparent, sulphureous, and soluble Stone, which suffers it self to be dissolved by common Water into a most excellent Medicine. This golden Water being poured to the roots of Herbs, makes them to have a golden property, as concerning this thing you may consult my Treatise of the nature of Salts, and the second part of my *Miraculum Mundi*.

Besides, I have shown to some of my Friends, how in the extraction of Gold and Silver out of the poor Oars a Gradatory and withall fixing Spirit may be received, which is able by graduation to perfect (or exalt) any *Argent-vive* into Gold and Silver, according as the extraction has been made either of Gold or Silver Oars.

This so great a secret hath as yet escaped mine enemies hands, and so has that my secret incineration and cementation of Metals, of which they would likewise have been Masters had they waited but yet two or three days longer; for I presently showed such Operations to those that stayed, and unto other honest Spectators.

To these may be also added that notable *Arcanum* of bringing Lead in one quarter of an hours space to such a pass, by means of a graduating Fulmen, without almost any costs, as to be so impregnated with Gold as to be worth the separating.

These and such like *Arcana's* with many most profitable discourses have been seen and heard in my Laboratory, a tedious and needless Repetition of which I willingly omit.

Finally, to mention somewhat by way of addition, 'tis necessary that I say onely thus much, that happily in some short time, the business will so come about that many Men will not for the time to come take on them such a deal of care about the laborious, costly, and uncertain ordering of Mine pits, but will rather lay hold on and manage (and that with greater profit) such as can be had and gotten better on the outside of the Earth. But especially there will not be a few who will set about these Cementations of mine for gains sake, for they have many times many lying idle by them, and which yields them no profit, which by this assisting way they will augment, and without doubt it will be effected too by many.

Verily I cannot at all see (as far as I know) whether there can be found any honest and certain way of sustaining Life in the whole World, than this true melioration of Metals, which brings with it so great a benefit. For even Merchandise it self though it be so very gainfull, yet doth it stick amidst Sins, as firmly as a Nail does in a Wall.

The Services of Lords and great Men are laborious and full of servitude, which many have experienced. And as for War, that snatcher away abundance of Men by an immature death.

Far better therefore is it to live quietly with one's Family in some poor Cottage, and to feed on a piece of Bread, than to hunt after uncertain Riches by most great dangers. Therefore I doubt not but there will be many found for time to come, who being holpen by my Writings, will more commodiously sustain themselves together with their Wives and Chil-

dren, than hath been hitherto done. Nor do I at all doubt, but that many will take it very untowardly, that I have so manifestly and so peripatetically revealed all things. For this is often done and daily is it, that I am upon that account reprehended by others, as the following Letter may witness, the like of which I could have here added more had I so listed.

There is no Body can satisfie all. Even *Jupiter* is not the same (or alike acceptable) to all: One is troubled with heat, another is burthened with cold. What things soever I have written, they are clear and evident to such as are skilfull in the Art, and have understanding in the business, and therefore they had rather I had written more darkly. But the unskilfull and ignorant do judge that I have played the Sophister in Writing, because they hit not the mark.

But all their judgments and Censures might be tolerated whatever they be that they pass upon my Writings, did they not by reason of their ignorance, condemn the good things themselves, and say of such things as are most true, that they are Fallacies and Lies: but this needs not seem strange to any, so far as such wicked condemnings proceed from those that by reason of ignorance and blockishness do no better understand the business. But this is plainly diabolical, to be highly benefited by any one, and to be made partaker of such great secrets, and yet afterwards impudently to deny the same and say, that they never had any good thing conferred upon them. The detestable malice and impiety of these Men hath enforced me to manifest in this Appendix, so many excellent secrets, which I would at no time have laid open, had I not been so treacherously deceived by those perfidious Men.

This is the Letter written unto me, of which I made some mention even now.

" **T**HOU hast written too clearly, and again too
" manifestly; beware lest God stir not up
" against thee another new *Farnerian* Devil, to punish
" thy easiness [or forwardness] of publishing such
" Mysteries. For they are not to be profaned by
" the ungodly, let not the present corruption of
" Men deceive thee, and that blindness [of theirs]
" which for the most part ariseth therefrom; for all
" wicked Men are not blind, I know many *Farners*
" that are defiled with all kinds of Evil, and yet
" are not all of them so blinded as thy *Farner* is.
" Nay, their Wit is so penetrative and so clear-sighted,
" that should they but read the divine Books
" that thou hast published there would not be a secret
" in all nature, but they would know it; nay
" more, they would in a short time perfect that Philosophick
" Work. Which should it so come to pass,
" (the more's the grief) what many Slaughters,
" what Whoredoms, how many ruinings! And what
" evils of all sorts would break in upon mankind; of
" the which, thou thy self (though innocent) wouldst
" be the cause. I know that the detestable Calumnies
" of the impious *Farner* enforced thee to publish
" them, for he every where reported and to all,
" that thou wert ignorant of them. But my most
" dear Sir, what is your knowledge as a thing of nothing,
" unless another likewise knows that you
" know it? God knows that thou knowest, for he
" gave thee thy knowledge. Thine own conscience
" also knows it. What? Cannot these two most plenarily
" bless or make a *Wife* Man happy? The pleasure
" that depends on the Opinion of Men is unhappy. In

"vain do we seek after true Felicity without us, if to be its solid principle or foundation should be within us. What matters it, if Men think thee to be less learned than thou art, as long as the very light it self of nature shines unto thee? I would to God that I could once accomplish that, which, by thy divine Books it is most certainly manifest unto me, thou hast perfected, and let all Men believe me to be a most stupid Fellow; I wish not thus, as if I did at all doubt of the truth of any Work. For though I should have perfected the whole work an hundred times, I could scarce be more certain of the truth thereof [than now.] He that knows the way of concentrating Fire, and of uniting the terrestriall Sun to this concentrated Fire, and the *Arcanæ* of Fermentations doubts not, nor seeks after any thing more. I may boldly say, that seeing nature doth perform whatever she has a mind unto, by these three, it must necessarily be, that it should do some most eminent thing. But if I could but once have finished the Work it self amidst those thousand of busineses that have hitherto withheld me, and kept me off from the Operation, I should have been long ago able to wind my self out of the intricacies of this present Age, and wholly devoted my self unto God, and to the most holy Philosophy. I beseech thee therefore my [dear] Master, and entreat thee by God and by the most laudable charity thou owest thy Neighbours, to write more obscurely for the time to come, nay, and if it may be, to wrap over the Books thou hast already published with some new cloudings, lest that celestial treasure fall into the hands of the unworthy, and so become hurtfull to pious Men. Pardon Sir the liberty of my complaint, for there is no other cause thereof save piety to God, and a Zeal to the most Learned, most upright Man, and one that too well deserves from ungratefull mankind. And albeit thou knowest not me, yet canst thou not be unknown to the Curious, seeing thou hast Written such wonderfull things. Nor can there be any one that shall but once have read over thy Books, but he will be highly obliged unto thee, if he has but any light of Justice [or Righteousness] remaining in him, &c.

Many such like Letters as these, have been oftentimes sent me from learned and skilfull Men, tending to this end, to warn me not to publish such excellent secrets for the time to come. Yet nevertheless, amongst those that are rendred partaker of such, there are some who (although the Operation it self has been sometimes manually showed them very perspicuously and clearly,) are notwithstanding so sottish and ignorant, as that they cannot imitate the aforesaid Operation. But some there are also that are come to such an height of Treachery, as that (being either seduced by their own false malice, or drawn away with the desire of profit,) they deny even the truth, certainty and stability of that very thing themselves have manually experienced, and dare to say it is false, this verily is an astonishing and detestably malicious wickedness, and justly and deservedly gives every one an occasion to shun such devilish Men more than a Dog or Snake.

I Gleaner may justly and deservedly be compared with a burning Candle, by serving others, am I consumed; have not I by the publishing such very excellent Writings kindled a clear and new light to the

whole World, and added and consumed mine own peculiar Oil, and that in vain too, as reaping no recompence proceeding from a gratefull mind?

An Explanation of some obscure places which are to be met withall in the Third and Fourth Part of the Prosperity of Germany, and in the first Century.

In the Third Part of the Prosperity of Germany.

IN the Operation which teacheth to extract Gold and Silver with profit, out of all Oars or Metallick Earths, in Page 360, A. signifies Lapis Calaminaris.

Page 361. A. is once met withall there, and signifies the same Lapis Calaminaris.

In Page 370, the same Letter A, once put, signifies the same Lapis Calaminaris.

In Page 370. b. where we treat of the Waters used about Washing or Edulcoration, and show their use, the Letter B signifies pieces of Cloth, and the Letter C. the shells of Eggs, and all Cockle-shells and Musle-shells, [or Shell-fish] of all kinds, in the water and out of the water: but the Letter D. denotes the Feces or Lees of Wine.

In the same Page, the Letter E. shows or signifies Egg-shells, and the Shells of all Shell-fish.

The Letter F. signifies Stones and Lime.

In Page 371. a. the Letter G. signifies Oil of Vitriol.

In the Fourth Part of the Prosperity of Germany.

In Page 397. b. the Letter A. signifies one part, and B. three parts.

In Page 398. a. by the first X. is understood Alkalies, and by the other X. is meant a fixt Salt, helping on Liquefaction or Fusion.

Here follow some profitable Operations, and which appertain to the Extraction of Metallick Earths; they are indeed treated of, or published in the first Century; but because of the omitting of some words, they are hard to be understood: which, forasmuch as they comprise the things that primarily concern the Extraction of Gold and Silver, it seemed to me a matter worth the while to insert the same in this Appendix: the which (as I hope) will not be unacceptable to those that search after such great Secrets.

31. By what means volatile Gold is to be compendiously extracted by the moist way, out of coloured Flints, red Talk, Granates, Sand, Clay, and such-like Oars or Minerals, and made corporeal.

First of all, such Minerals are to be heated red-hot in the Fire, and be quenched, then ground with Mill-stones, and are to be put in Stone Pots, or Waldenburg-Pots, or Colein-Pots, that in them they may be moistned with pouring *Aqua Regia* thereupon. These Pots you must put Coals about, and heat them well. The Minera's being together with the *Aqua Regia* well heated, there must be poured thereupon so much Common warm water, as will suffice to wash off the *Aqua Regia*. Being on this wise

wife moistned, they are to be put into great Pots made of good Potters Earth, having a many little holes in the bottom, over which is some Cap paper to be spread, that nothing of the Oars fall out through the holes, but the water onely may distill down. After that all the first water is run out, you must pour on more hot water, and these pourings on are to be so often repeated, till the water tastes on more saltish, for then it has carried off with it the *Aqua Regia* that contained the Gold in it.

N. B. The Pots are to be set upon a Drefel that hath holes in it, so that the [Waters] may pass through the bottoms by the holes, and Vessels may be set there-under.

N. B. The Minerals may also be put in Barrels, having a double bottom, such as those Barrels are in which they use to wash out the Salt-peter with Common water out of the Earth. And now after the same manner are the pourings on of Common water to be so long continued till there is no more saltishness perceived.

N. B. Albeit that there is no more taste of saltishness discernable, yet nevertheless some of the Salt doth as yet abide with them, [viz. with the Oars] and which is to be turned into Salt-peter, on this wise following.

32. How good Salt-peter is to be made with profit even out of these Oars.

MIX these Minera's that are thus deprived of their Gold with an equal weight of *Calx-vive* and Wood-ashes, then heap them up in a heap under some Shed or Pent-house, and moisten them for half a year, or for an whole year by repeated pourings on, of either Man's piss or Beasts, as often as (after the drying up of the moisture) need requires. In want of Piss you may use Common water. By this means the *Aqua Regia*, which was not thoroughly wash off with the warm water, and so remained behind in the Oars, will, by the assistance of Urine, or even of Rain-water, convert the Salt in the *Calx-vive* into good Salt-peter, which is to be wash off like other Salt-peters, and be reduced into Stria's or Crystals. The remaining matter being freed of the Salt peter by washing it off, may be again put under the same Shed or Roof, to keep off the Rain, and be exposed to the Air and Solar heat, and be moistned with Urine, and it will in its season again yield Salt-peter, and will even keep doing the same for many following years, if it be dealt with all on the like manner. And so even the very *Aqua Fortis* it self, which remained behind in the Oars, will bring its benefit. The reason of this manner of Salt peter making is this, because the *Aqua Fortis*, or Spirit of Nitre, is as it were the seed of Salt-peter, and is of this nature, viz. when it is put among other Salts, (like as when some Vegetable seed is sown in the Earth,) it augments it self thereby, and is multiplied, even as the Seeds of Herbs are wont to doe. And haply, hence came that old Proverb, of sowing Salt, which the unskillfull and ignorant mock at, saying, How can it be possibly done, that Salt should be sown and multiplied, seeing the Rain can dissolve it and wash it away? These foolish ones did not know either what Salt was to be sown, or how. Evident it is, that even this is the sentence and opinion of the ancient Philosophers, that even Salt may be sown and multiplied in the manner of Vegetables.

N. B. Out of the extracted Oars or Minerals

being conjoyned with *Calx-vive* and Wood-ashes, may Salt-peter be made, in a few days space, by moistning the matters with pouring on, even barely Common water, and so drying it up again: but then there will not be such a quantity, as when more continued and more frequent pourings on of Urine have preceded.

N. B. It is likewise a thing possible to be done, to make good Salt-peter even in one days space, with the Waters used about the Edulcoration [or washing of the Oars] if they be poured upon *Calx-vive* so long till all the noise [or rissing ceaseth] which is made in the Solution. And thus out of the sharp water of Salt-peter, and the fix Salt in the *Calx-vive* is presently generated Salt-peter, shooting into long and delicate Crystals, after that the superfluous moisture shall have been thence drawn off in a Copper-pan. The remaining Salt-peter water must be again boiled in a Copper even to the appearance of a thin skin, and then be set in the cold to shoot more Salt-peter; these Labours are you to go on withall untill all the Salt-peter be boil'd out.

I think now that I have written and delivered all things perspicuously and clearly: He that cannot comprehend them, must even let them alone as an Ass must the Harp.

As concerning the sharp Waters which are used about the Extracting of Gold out of the Minerals or Oars, so as the Gold may not be lost that is in them, but be conserved, and that with profit, there are several ways that offer themselves, amongst which we have thought good to produce these following.

33. The ways of Reducing volatile and fix Gold unto a body, out of the Edulcorating Waters (so called) with which the Gold aforesaid hath been Extracted out of the Oars; and also of usefully or profitably improving the said already used Waters themselves.

HE that desireth to enter upon the best way, may pour into the Solution of the Gold, or into the Water containing the dissolved Gold, a Solution of Silver or Lead, and in such a quantity as he shall guess the Gold is of, that is dissolved in the Water. As for Example.

Suppose there be two or three Lots [Lotones or half Ounces] of Gold in the water, there must then likewise be dissolved so many Lots of Silver or Lead in *Aqua Fortis*, or thereabouts; which Solution is to be (be it more or less) put to the said water, and to be well mixt by a strong shaking it to and fro, till it becomes like Milk. When it shall have settled, it must be shaken again, and those strong agitations must be several times repeated in an hours space. Then all being well settled, the clear water is to be poured off, and the grosser matter is to be put in a Filter, that so all the humidity may by distillation [or filtration] be removed from the dissolved *Lune*, or dissolved Lead, and the Metals themselves may afterwards by reduction be reduced into their pristine body, by such an help as we will presently reach.

N. B. If the Silver or the Lead should not have extracted all the Gold out of the Water, or drawn it to themselves, which may easily happen, yet notwithstanding there is not any loss of the same. For, because the *Aqua Regia* being debilitated by pouring plenty of water thereupon is rendred unfit to extract any Oar anew, there may be poured into that edulcorating Water out of which the Gold is already drawn by the Solution of Silver or Lead, a sharp [or strong]

strong] *Lixivium* made of Wood-ashes and *Calce-vive*, and rendred a little sharper by a little Liquor of Flints. For the Flints doe precipitate all the Gold out of the Solutions. And now the *Aqua Regia* being kill'd by the *Lixivium*, lets fall every Metal that it has in it, whether it be onely Gold, or Copper, or Iron, in the form of a yellow Powder: This Powder is to be dried, and to be reduced after that manner which I told you but now, that I would teach.

The same Gold may likewise be gotten out of the *Aqua Regia* (first debilitated by Common water) very commodiously by a Solution of Mercury or Quicksilver put therein; The Mercury abides in the *Aqua Regia*, and the Gold falls to the bottom like a tender fine Powder, which being washt and made corporeal by reduction will be 24 Carrafts fine. And as for getting the Mercury out of the *Aqua Regia*, it is not to be better done than by pouring therein a sharp *Lixivium*, by which the Mercury is constrained to fall down to the bottom like a yellow Powder, which is profitable for such-like precipitations. The *Aqua Regia* and the *Lixivium* serve for to make Salt peter withall.

The Edulcorating-water out of which all the Metals are already reduced [or precipitated] being boild in Coppers, till a skin appear at top, and then poured out into other Coppers or wooden Vessels, yield excellent Salt-peter, fit for the distillation of *Aqua Fortis* for a new Operation. He that is skill'd in managing this work, will get as much Salt-peter as will pay the costs of the *Aqua Fortis*; inasmuch, that the Gold is extracted without any costs. For five or six pound of *Aqua Fortis*, which holds in it two or three pound of dissolved Salt, and is precipitated with a sharp *Lixivium* of *Calce-vive* yields about some ten pounds of Salt-peter: and this will certainly answer the price of the Water or *Aqua Fortis*; and so you will have Gold extracted out of the Stones without expence or charges.

34. Another and better way of getting out the Gold that is Extracted out of the Oars, out of the *Aqua Fortis*.

MAke, by Calcination, some Ashes, of one part of Tin, and four parts of Lead, and put them in an Iron-pot, whereto pour the extracted Gold, or the *Aqua Fortis* containing the Gold, boild it and continually stir the Calx with an Iron rod, that so all the sharp Spirits may cleave to the Lead and Tin ashes, and the Phlegm onely may exhale. After that the said Calx of the Metals hath concentrated all the Spirits, and is become wholly dry, let it be taken out, and be cast upon Coals in a secret Melting-pot or Crucible, in which operation the fire forceth out all the Spirits into the Recipient, which are to be again made use of for new Extractions. The volatile Gold, and which is mixt with Iron, adheres to the Calx of the Metals, and is to be reduced in the Furnace which the Germans call *Stichofen*; whereby the Lead impregnated with the Gold, and exalted by it, is gotten, which by separation yields the Gold and Silver.

N. B. If that Lead should not contain Gold enough as to be worth the while of separating it on the Cupel [or Test] it is to be again commixt with Tin, and be reduced into Ashes, and by this Calx are new Extractions to be Concentrated, that so by the so many repeated Labours, the Lead is at length made rich enough, and yields (by separation) a good portion of Gold and Silver.

If (in the separating) the matter be turned by the blast of Bellows into Litharge, it is not needfull to melt such a deal of Lead on the Tests, which would require so much fire. But however, it is a thing feasible for the Gold to be gotten out of [or by] the Tests without melting, which shall be taught afterwards.

35. How an *Aqua Regia* is easily acquired for the Extraction of Stones.

FORasmuch as Spirit of Salt may be had in great quantity, you need onely dissolve some Salt-peter therein, and this Solution is to be used to extract the Minerals withall. For the Spirit of Salt being made stronger by the Salt-peter, doth readily and willingly seize upon the tender Gold that is in the Stones. And as for the Spirit of Salt, it may be used as it comes over in the first distillation without any rectification.

36. An easier way of getting an *Aqua Regia* usefull for extraction.

Because that these Operations do always bring forth Silver impregnated with Gold, and that *Aqua Fortis* is requisite to make the Separation of them; the Solution of Silver may be used, and so the labour of the aforesaid incineration be omitted. Into the *Aqua Regia* wherewith you have extracted the Gold, pour in a Solution of Silver, and it will fish out the greatest part of the Gold out of the *Aq. Reg.* and is, [viz. the *Aq. Reg.*] to be afterwards made use of to a new extraction, and be again diverted of its extracted Gold by a Solution of Silver. In want of a Solution of Silver, the extract is to be concentrated with the Ashes of Lead, and you must proceed (by driving off the Spirit out of the Ashes, and by reducing the same Ashes in a Furnace,) after the same manner as we taught you but now in our foregoing directions.

N. B. You are here to note, that the *Aq. Fort.* which containeth in it the dissolved Silver, and is poured into the *Aq. Reg.* or nitrous Spirit of Salt, doth add an encrease unto these same Waters. For the *Aq. Fort.* doth corroborate the Spirit of Salt far better than Salt-peter doth.

37. How the Silver (wherewith the Gold has been separated out of the *Aq. Regia*) is to be gotten [or reduced] out of its Calx.

After that the Solution of the Silver being poured into the *Aqua Regia*, hath extracted the greatest part of the Gold; the *Aqua Regia* is to be poured off clear from the Silver remaining in the bottom, and is to be used about new Extractions. But if so be it should yet contain Iron in it, it must be concentrated by Lead-ashes. The white Calx of Silver is to be put upon some Cloth over a glass or stone Vessel, and so is to be freed from the remaining *Aqua Regia*, which will drop from it; and by pouring on of warm water, it must be altogether rid of the *Aqua Regia*, which as yet adheres thereunto. This done, your Linnen-cloth being strong and three double, the Common water is to be squeezed strongly thereout of, and the Calx it self laid by, to dry; which may afterwards be reduced in the Secret Crucible, or be used about a Cementation of *Lapis Calaminaris* into Gold and Silver.

38. How

38 *How the said Calx of Silver is to be reduced without any loss of its weight, and without any Detriment.*

Forasmuch as this white Calx of Silver is made so very volatile by the Salts, as that it cannot be reduced at all in the common melting Pots or Crucibles without great Detriment, there is no way of preventing that loss more commodiously than this which follows.

Mix this silvery Calx with an equal weight of a Sal Alkali, and cast it into the secret red hot Crucible, wider at bottom and narrower at the top, the which you must cover with its Cover made of the Lute of Witedom. By this means will the Calx melt, nor will it lose any thing by fume, nor will it penetrate into the melting Pot or Crucible: and so the Silver impregnated with the Gold will be conserved without hurt, which being granulated the Gold may be separated by *Aq. Fortis*: Now this very Solution of the Silver by the *Aq. Fortis*, may be again used to gather [or separate] more new extracted Gold, and so will afterwards produce the Silver to be reduced the same way we instructed thee, and so give thee a perpetual Separatory Operation of Gold and Silver, which may every where be exercised with a great deal of profit.

39 *Another way teaching to reduce fugacious Silver with greater profit.*

Put upon the Rudder of thy Silvery Ship, the little Fish called *Remora*, that so it may be freed from its speedy flight, and abide quiet. Melt thy said Ship together with the *Remora* that sits on the Rudder in the secret four-square melting Pot, in which melting together, there is not onely recovered all the Silver without any Detriment, but it doth also get an increase of its weight, out of the white Bristles or Fins of the little Fish, and becomes enriched with Gold by its Blood: so that this Additament yields (in the Reduction) a greater quantity of better Silver than other Additaments do. But as concerning other Commodities or Benefits that this fugacious Silver bestows, it shall (God willing) be taught afterwards.

Thus much was I willing at present to teach and reveal, concerning the extracting of volatile Gold out of Stones and the poorer Oars, and of a successive graduating of Silver into Gold. There shall be more taught elsewhere.

40 *A gainfull extraction out of the poor Oars or Minera's of Silver and Copper, by the moist way.*

These Minerals or Oars are to be dealt with after the same way as we showed above about the Minera's of Gold, viz. they are to be heated red hot, quenched, and ground with Mill-stones, and be moistened with *Aqua Fortis*, and to be extracted after the like manner as the Oars or Minera's of Gold are, all the difference being onely in the Waters; for *Aqua Regia* is to be used to extract the Gold with, and *Aqua Fortis* for the extraction of the Silver. If therefore there be the Minera's of Gold and Silver at hand, the Gold is to be extracted by *Aqua Regia*, and the Silver by *Aqua Fortis*; and both the Solutions are to be mixt together, in which mixture the Silver precipitates to the bottom in the *Aqua Re-*

gia, and withall fisheth out the Gold out of the *Aqua Regia*.

Neither is it here any impediment if the Oar of Silver should also contain Copper in it, which will be extracted together with the *Aqua Fortis*. For the Silver and Gold fall down to the bottom, and the Copper abides in the *Aqua Regia*, which is again fit to extract more Gold withall, and may indeed be used as many times as any one shall please. The Copper it self is extracted out of the *Aqua Regia* by Iron Plates, but they tinge the *Aqua Regia* with a yellow colour, and therefore make it altogether unfit for any farther labours of this kind. Better is it therefore to concentrate it upon the Ashes of Lead, that so that spiritual Iron in the *Aqua Regia*, may convert some of the Lead into Gold by Gradation, and the *Aqua Regia* it self having been so often used may be yet again used.

41 *Another far easier way of plentifully extracting Gold and Silver out of the poor Minera's or Oars, Sand and Clay, and the like Minerals without the Fire of melting.*

Fill a Glass Cucurbit, or one made of the best Earth, and excellently well luted a little more than half full, with the Minera, Sand, or Stones containing in them, fugitive and fix Gold, and hereupon pour as much of the following *Mensstruum* as is sufficient to moisten them; then presently put on an Alembick (for as soon as ever the dissolving Water is poured on the Oars or Minera's, it presently works and fumes) and draw off therefrom (in Sand) all the humidity by Distillation: that so in the distilling the Gold it self may be dissolved, and the *Aqua Regia* it self may by Distillation be recovered; which is again profitable for a new Operation, as we shall tell you by and by. All the moisture being drawn off, let the Cucurbit cool in the Sand, and then take it out, and put in some Water, that the Minera's and Salt may be softened. Now extract very carefully and diligently, all the Salt out of the Oar, in which said Salt is the Gold that is extracted out of the Oars or Minera's, and boil it up into a red Salt, to which must be added some Litharge, and so must be molten in such Pots as will not break. The Litharge will imbibe all the Gold, which how it is to be separated from the Lead, we will presently teach in the following discourse.

42 *The preparation of the Water necessary to this extraction.*

For the extraction of Gold, Salt is to be dissolved in *Aqua Fortis*, and for the extraction of Silver, you must dissolve Salt-peter in *Aqua Fortis*. With these Waters, of which you may furnish your self with plenty without any great labour, moisten the Oars and then distill them off again from the said Oars, and they will be always fit for such like Operations, insomuch that you need never to make new Waters. Nay more, in all the several Operations and Extractions of the Oars, they will be more and more augmented, so that if thou usest but at first no more than two pounds of the same Waters, they may suffice thee for infinite extractions.

N. B. By this means, all the Gold, how little soever, may be extracted by thee out of all Flints, Sand, and other Minerals without any expences, the Fire onely excepted.

R r r r r

This

This also is expedient for me here to show, that sometimes there are to be found fugacious Minera's of Gold, and coloured Flints which are sufficiently rich with Gold, and are painted as 'twere with delicate colours, *viz.* green, sky-colour, and red: but in the heating them red-hot, those colours vanish, and leave the Flints white. Such as these admit not of heating red-hot, like as others do, which retain their colours in a red-hot Fire. Therefore such must be reduced into Powder without any previous heating red-hot, and you must extract them [as they are] that to the volatile Gold may be attracted by the *Aqua Regia*, which said Gold being abstracted [again] by the Ashes of Lead commits it self to [or imbibes it self in] the said Ashes, which are to be reduced by the help of the secret Crucible; in which Reduction, the Gold becomes corporeal and admits of being separated from the Lead with profit.

N. B. Such Stones may likewise be mixed with the sharp coagulated Spirits, and these [Spirits] may be forced over by a Retort: For so, the fugitive Spirits of the Salts carry over with them the Volatile Gold, and make a very excellent Gradatory-water, transmuting fugitive Mercury into Gold, with greater profit, than if this very volatile Gold had been made Corporeal with Lead.

This secret is none of the least of those which teach the Extraction of Gold out of colour'd Flints or Stones.

Such a volatile Gold may also pass into other Metals by gentle Cementations, and so become fix, and will bring no small profit, nay rather a greater benefit than if it were gotten out by fusion. In such Cementations, the volatile Gold hath time of getting a body with the other Metals, and of acquiring a fixity, and is as it were a golden Seed, which augments it self into Gold, in, or out of the Metallick Earth.

43. *Another Water to Extract Gold and Silver withall.*

For Gold, let Salt; for Silver, let Salt-peter be dissolved in the Water [or *Aqua Fortis*] and let be thereto added as much Oil of Vitriol as half the Salt is you put. This Water extracteth Gold and Silver out of the poor Minera's Sand and Stones, and requireth the same operation as the precedent ones doe. It is likewise augmented even to infinity, inasmuch, that Gold and Silver may be extracted out of the poor Mines without Costs, if you except but the fire.

N. B. Oil of Sulphur does the same that Oil of Vitriol doth, and therefore may it serve instead thereof in such Extractions of Gold and Silver.

44. *Another far easier way of plentifully Extracting Gold and Silver out of the poor Minera's or Oars, with very little or in a manner no Costs at all.*

Mix the Oars or Minera's with their due Waters, and therewithall fill small Pots or Crucibles made of the best Earth, which put near one another in a great Iron pot. Put an Alembick upon the Pot, and draw off the Spirits by distillation, which [Spirits] will requite all thy disbursements, and will so give thee Gold *Gratis*, which you are to wash out of the Oars with Water, and get it [or corporifie] by Saturn.

45. *Another yet easier way.*

Moisten the Oars with their due Waters, cast them

in by little and little upon the live Coals, and that in such a manner as we taught thee about distilling Spirit of Salt. By this Distillation the Spirits pass into the receiving Vessels, and the Gold and Silver are dissolved and stay behind with the *Sal Mirabilis*, and is to be washed out of the Oars with Water, and to be molten with Saturn. Thus is gotten the Gold and Silver that was in the Minera's or Oars, without any expences, and the Spirits quit all the Costs.

46. *How Gold and Silver may plentifully be extracted out of Fat Clay.*

Although that the Extraction of Gold and Silver by moist waters is a fordid operation, as was aforesaid at the beginning, yet is it not done without profit; because the Gold and Silver may be gotten out of the Waters by precipitation, and of the used Waters may Salt-peter be made. But now the case is far otherwise with fat Clay, for that, it being fat, the Spirits hide themselves therein, that the one half thereof can hardly be recovered, unless such an Earth be freed of its fatness by heating it red-hot: and this requires some labour to effect it.

But seeing that in all places of the World, where-soever any Earth is, there is such a kind of Earth, and that in no small quantity, that contains Gold and Silver: and there hath not as yet been any body that hath endeavour'd to reduce it to any profit, and bring it into use, but especially when it contains not in it so much Gold and Silver as to defray the charges of separating it by Lead. But I have found out a very easie way of doing it with profit, and I think it my duty to disclose that Artifice for the publick good; and it is thus:

Mix such an Earth as contains therein Gold and Silver with the Water of Vitriol, which I have aforesaid described, and make it up into balls somewhat bigger than ones fist, which throw orderly and by little and little into my first Furnace, or into my second distillatory Furnace, and draw off the Spirit by Distillation. The dissolved Gold and Silver remaining in the *Sal-Mirabilis* is to be extracted out of those balls broken small, with warm water, and to be reduced by Lead, after the aforesaid described manner.

47. *By what Artifice Gold may be plentifully and easily extracted out of Granates, Azates, Sapphires, Rubies, Sand, or other hard Minerals which suffer not themselves to be tamed neither with Lead, nor with sharp Waters.*

It is certain that all Granates, what Colour soever they are of, or what place soever you meet with them in, whether you have them out of Rivers, or wash them out of Sand or fat Clay, or that you find them in the high Mountains and Rocks; they always contain in them much Gold: but by reason of their Glassy nature, they cannot by any means be extracted with *Aqua Fortis* or strong Waters, nor can they by reason of the hardness of their bodies fusion be molten with Lead. Hence it is, that as hitherto they have never been so handled as to have their Gold extracted out of them with profit, and therefore are they neglected as unprofitable, unworthy, abject, and contemptible Minerals, whereas notwithstanding it is a thing feasible for a man to enjoy their Gold and Silver with a little labour, and as it were without any trouble. But now what course must we take to doe this, seeing they elude the sharpest powers

powers or efficacy of all strong or sharp Waters, whereby their heart may be penetrated, and Gold may be extracted out of their bowels? I answer; They are to be overcome by Concentrated Spirits, and which are reduced to the form of Salt, as also by a fusile Salt of Lead, and be so divested of the Gold they contain in them, and without this will the victory over them hardly be obtained. For Spirits being reduced to the form of Salt, doe abide the fire most patiently, and perform a double labour; one by their Acrimony, the other by a strong fire, insomuch that nothing can escape their power, and therefore all things are tamed and subdued by them, and doe afterwards readily obey the virtues or power of Saturnine Salt, and yield forth their Gold by fusion.

47. *A Demonstration, above the reach of any Confutation, shewing that more Gold and Silver may be gotten out of the Oars or Miners of Gold and Silver, by the hitherto prescribed ways, by sharp Waters or Salts, and in a manner without Costs, than is wont to be done by many Expences, and by the fire of Melting.*

I believe it is not unknown to any one that is but a little acquainted with the knowledge of the Miners of Gold, that the Gold cannot be gotten out of them without the addition of Lead, or the help of some matter rendering the fusion more easie. And now when such Oars contain but little Gold, and contrariwise much Lead, or matters requisite to promote fusion are of necessity to be thereto used, how can it be, that that little portion of Gold or Silver should recompence or defray such great expences? Therefore such poorer Oars have hitherto lain as cast-aways, as being incapable of bearing the Expences of separation, and so are not put to any use, nor are at all profitable.

But admit that the Oars do contain as much Gold and Silver, as that the Costs of melting may be repaid by them; yet such a fusion, compared with this invention of mine of Extracting Gold and Silver with Waters and Salts, is as if you should compare Water with Wine, or the night with the most brightsome day, which have no comparison.

For, first of all, the common melting of Metals is accompanied with far greater Expences, than that Extraction of mine with Salts, which verily needs but a very little charge. Then farther, it can never be, that all the Gold should be so perfectly Extracted out of the Oars, but that some of the same will abide in the Scoria's; besides, the volatile Gold and Silver, which must necessarily be blown off by the vehement blast of the bellows, and the acuteness of the fire, and so be lost.

Now amongst all the conveniencies that arise from the Extracting of Gold and Silver out of the poor Mines, that is none of the meanest, viz. that not onely all the fix Gold and Silver are conserved by the Salts, but also the Volatile too, and this latter is made fix and constant in the fire, together with that former fix part, whereas by the Fusing fire it is all of it lost.

N. B. For the Waters of the Salts doe make the volatile Spirits of Gold and Silver, and which otherwise would vanish away fix and constant; for by a strong blast and force of fire are they rendered yet more fugacious. Hence comes it to pass, that [there is but the] one half part of that Gold extracted by the fire of the usual way of melting, that the Waters

of Salts get out of the Oars. Upon this account my Invention doth not onely yield this commodiousness as to get both the fix and volatile Gold and Silver together, without any detriment out of the Oars, but also gets not a little in sparing Coals, (not to mention this, that one man does more in the Extraction of Gold and Silver by Salts, than three men are wont to doe in the common way of Fusion.

By what hath now been said, it is evidently apparent, what a deal of benefit and profit this invention will bring in all places of Germany. For this Extraction may be used commodiously and profitably, not onely in all Miners or Oars both rich and poor ones, but also may be used in Extracting the Gold and Silver out of all colour'd Flints, wherewith all Rivers, Brooks and Fields do abound.

But some or other may haply say here, by what means can it possibly be, that Gold and Silver should be extracted out of the Stones that lie too and agen every where in the Streets? I answer such, that indeed it is very rare to find fix Gold and Silver in such Stones, but yet they have in them a spiritual, unripe and volatile Gold, which is not onely made fix and constant in the extraction made by Salts, but it doth likewise turn some of the Lead it self that is added in the fusing and separating it into its own nature by Graduation. Hence 'tis evident, that in all places of the Terrestrial Globe wheresoever Stones are, good Gold and Silver may be gotten with profit, by a little labour and small costs. Praise and glory be eternally given to the most bountifull Lord God for such Inventions. Amen.

These are the Secrets which I publickly demonstrated and divulged [or communicated] in my Laboratory, for the benefit of my Countrey. And I do now again affirm and witness that if even the very bare Letter be observed, no body can err. And if so be that any one should change this or that order, and so think to better the Operations, and should err, let him not lay the fault upon me who have Written the naked truth, but let him blame himself.

I had several other things of no small moment, to have spoken to here at present, the which I shall God willing very suddenly dispatch in my second Century, for the present time does not permit it.

And in the said Century will I declare with a yet clearer and easier manifestation, those Secrets here disclosed, the which could not at present be done because of my too much haste.

And now I wish to all the pious Students after this so great an Art, a large and plenteous blessing from the mercifull Lord God, as to this so very excellent a Work, that the poverty and want of abundance of miserable People may be supplied in many places. Which if it be (as I hope it will) it will exalt the honour and glory of the most high, and will encrease the Prosperity of the Countrey, and withall will check and keep under the most base attempts of mine Enemies. But especially if the counsel that I have proposed in my first Century, (viz. that every one may have liberty to exercise such Operations,) takes place. This being granted, it cannot be, but that Gold and Silver and Copper will every where be gotten out of the Earth, with the help of these my Writings, to the great profit and benefit of all the whole Countrey.

And

And so I conclude this so much hastned Appendix, wrestled from me occasionally by perverse Men. Those things that I have not in such or such a place clearly and evidently enough expressed for want of

time, I will express God willing in my second Century with a clearer Explanation, and thither do I refer the well-minded Reader.

The End of the Appendix.

THE
SIXTH and Last PART
OF THE
Prosperity of GERMANY.

In which the *Arcana's* already revealed in the Fifth Part are not onely illustrated with a clearer Elucidation; but also such are manifested as are most highly necessary to be known for the Defence of the Country against the *Turks*: Together with an evident Demonstration, adjoyned [shewing] That both a particular and universal Transmutation of the imperfect Metals into more perfect ones by Salt and Fire is most true; and withall, by what means any one that is endued with but a mean knowledge in managing the Fire, may experimentally try the truth hereof in four and twenty hours space.

To the Friendly READER, Health.

I Taught in the First Part how the over-abounding quantity of Wine and Corn is to be Concentrated, that it may abide uncorrupt for a very many years, and when necessity requires it may be an help to many in need.

In the Second, Third, Fourth and Fifth Parts I taught the Extraktion of both fix and unfix Metals, to great profit, and almost without any Costs, out of the bodies of vile, poor Minerals and Metallick Earths, which will not quit the Costs of a Fusing-fire, and this to be done by no costly Waters; and withall, how to bring them into use, which no body afore me ever did. And did not I disburse a great deal of Monies in building a convenient Laboratory, in which I produced such most profitable things to the view of every one, and demonstrated them to be true? And what have I reaped for these so great benefits I have done, but a most ungratefull casting off their remembrance? Have not all the things I have taught been accused of falsity and deceit both to the high and low, by those who have so audaciously dared to deny the Melioration of Metals by Fire and Salt? These have also asserted, that the making of Salt-peter of Common Salt is altogether impossible; and they have affirmed it to be a thing quite contrary unto nature, that Metals should be gotten out of the poorer sort of Metallick Earths by the help of a Water made of Salt-peter; but yet that even this is most certainly true, the Appendix of my Fifth Part, and my Second Century, doe demonstrate by indubitable Experiments.

And

And albeit that the three said Arcana's are evidently enough delivered and described, so as even to be palpably felt by the hands of those that know how to manage the Fire, yet notwithstanding they have brought but very little benefit as yet, because that although they are most true, yet are they contemned and disregarded by unskillfull Men, out of meer Envy and most perverse hatred, and doe even yet stick in contempt.

However, not regarding these [base dealings] and that I may mete them all things in full measure, I have a mind yet farther to detect some secrets, by which there may redound to the Country very notable fruits: And that not onely by converting the many Metallick Earths that contain in them Gold and Silver, and which have not hitherto been profitable to any unto a gainfull and a beneficial use; but also by defending the Country against the most dangerous invasion of the Turks, who are the Capital Enemies of the whole Christian World, and that by so strong and efficacious a defence, as never any mortal man did yet contrive the like of.

As to what belongs to Mineral Treasures, I have exhibited a sufficiently clear and manifest description of them in the second, third, fourth and fifth Part of the Prosperity of Germany, and also in the Appendix to the fifth Part, and in the second Century. But yet there is nothing so perfect and absolute but that in process of time there may be added and adjoynd thereto some new thing, and somewhat of perfection: Witness my Instrument which I mentioned in the second Century, by the help of which, Gold, Silver and Copper are easily and plentifully extraited out of their Metallick Earths, and that on such wise, as that there are requisite no other Costs but the bare Charges of the fire. And farther, this way would bring no small profit even from those Metallick Earths which are ranked amongst the poorest sort of Oars; if it were well known, and exercised in many places, there would flow thencefrom most mighty profit throughout all Germany, and the said Instrument would by its assistance wonderfully promote the same.

For although I have heretofore publisht several ways of preparing sharp Waters, and of extraiting the Metals with them out of the poor Minerals; (and yet even these ways bring no despicable gain) yet they perform not that which is wont to be accomplished by the help of the said Instrument. For this Instrument serves not onely to extrait those sharp Waters in a greater quantity, but is also far fitter and more convenient for the Extraition even of the Metals themselves out of their Earths, and for the separation of the Dissolving Menstruum from the Metals, than those Glass Vessels are, which have been commonly used about this Operation.

Therefore it much concerns him that employs himself about these kind of Operations, well and thoroughly to know its Use. I made indeed some mention of the same in my Second Century, but yet not so clearly as for any one thoroughly to understand its Use by what I there spake. Therefore I have thought it expedient to give here somewhat a clearer and more perspicuous description of the same, that so I may not seem to be at all wanting in my diligence unto any one; but may be said to have done all things with a due candour and openness.

The Description of the Instrument, serving for the plentifully preparing of Spirits, and for the easie extraition of Metals out of their Oars, without much Cost.

THis Instrument is to be made of good Earth, that can sustain both the Fire and the Spirits; Metals are unprofitable to make it with, because they doe not long resist the Corrosion of the Spirits: But now, that the said Instrument may the longer abide in the Fire, its outside superficies must be fenced with Iron bonds. This Earthen Vessel therefore must be made of such an Earth as abides the violence of the Fire, and resisteth the Corrosivity of the Spirits, so as that it breaks not nor chaps with too much heat, nor be corroded and eaten thorough by the Corroding Spirits. Such Earths there are enough of too and agen in Germany. Moreover, this said Instrument may be made greater or lesser, according as you are minded to prepare a greater or lesser quantity of Spirits; But however, it must not be made too big, for then (if it exceeds a due magnitude) it will not abide the fire so well. Therefore is it necessary to have several of these Instruments made, if a man be minded to make at one and the same time a great quantity of Spirits. But if any be minded to set about this Operation so as to have huge quantities

of Spirits, it will be his best way to have his Instrument made of Iron plates, such as the Armourers use, and to strengthen them with Iron rods, and so fence it both in the inside and on the outside every-where with Lute or strong Clay. For by this means the Instrument being made of a sufficient bigness for the work you would put it to, will in its inward superficies hold the Corroding Spirits, and in its outward superficies undergo the violence of the fire without detriment, and be far more commodious than so many little Instruments that are made onely of Earth.

Of the Form and Figure of this Instrument.

THE matters out of which the sharp Spirits are to be drawn, are not to be put nakedly in [as I may say] into the Instrument it self, but are to be put in some strong Earthen-pots and so put in, that after the Spirits are distilled off they may be again taken forth, and other Pots fill'd with new matter may be put in, in their room; and this to be so often done as need requires.

And seeing the Salts that are to be distilled are not put naked into the Instrument, but are put in, in Earthen-pots; the Instrument must necessarily be so prepared, as that those Pots may be put in as often as need is, and be again taken forth, when the

Still

Distillari-

Diffillation is done, and new ones be put in, in their stead.

The Instrument therefore must be of a like bigness both above and below, and 'tis no matter to have it much exceed the height of your Pots you put in.

One side of it must have a Door to put in the Pots at, and to take them out again, the which Door must be made to shut handfomly after your putting in and taking forth.

To the other side must be fitted a Pipe somewhat large, by which the Spirits may have a passage forth into the Receiver. And the Instrument must be on such wise placed in the Furnace, as that the Door and Pipe may lie without the said Furnace. To the Pipe must be added another Leaden Pipe, twining round like a Serpent, and therefore is by the Chymists called a Serpent [or a Worm:] the which must be set in a Vessel full of Water, that so the Spirits passing out may be cooled and be caught in the Recipient.

Of the use of the Instrument.

WHEN you will distill your Spirits, you must put thereinto so many Pots filled with your prepared Salts as your Instrument can hold, then close the Door well, and put Fire in the Furnace. This done, the Spirits will ascend out of the Pots thus heated in the Instrument, and finding no other out-let but by the Pipe and Worm, they will enter into them, and being there cooled will run down into the Receiver. You shall know if all the Spirits are forced out of the Salts or not, when they cease to flow out through the Worm into the Recipient. Which when you shall perceive, you must open your Door and take out the Pots in order, and then put in new, that so the Diffillation may be continued on without any delaying. But now, those Pots that are to be put a new into the Instrument, must be set nigh the Furnace a while, that they may grow hot: for else being put in cold, they would not brook the sudden heat, but chap and break. When all the Spirits are distilled off, then you may put in other new Pots in the room of them you took out, and the Operation is to be so long and so often repeated as need shall require, or as any one has a mind to do. The Salts that remain behind in the Pots you take out, are to be moistned and macerated with some Phlegm or weak Spirit, and they do again, sometimes emit Spirits by Diffillation, but yet not in such quantity as at first they did.

This is that way of preparing sharp Waters usefull for the extractions of Copper and Gold. But as for *Aqua Fortis* requisite for the extracting of Silver, it cannot be prepared by this same Instrument, because it will corrode the Worm or Leaden Pipe, if it should pass through it, which the Spirit of Salt and *Aqua Regis* do not do.

N. B. When therefore you would make an *Aq. Fortis*, you must make you another twining Pipe or Worm of some other Metal which will not be preyed on by the *Aqua Fortis*, or else set some other Stone Vessels to the Nose of the Pipe that goes out of the Furnace.

It is also a thing possible to be done, to make such strong *alectum* of Corn and Honey by the addition of some Salts, as that it shall not onely extract Gold and Silver, but also Copper and Lead out of metallick Veins or Earths.

Thus much may at present suffice to be spoken concerning the preparation of sharp Waters needfull for the extraction of Metals out of the Oars. The preparation [or Operation] it self follows.

How Metals are to be extracted out of their Earths or Oars, by the help of this Instrument.

THE preparing or fitting of the Minera's or metallick Earths for extraction, hath been described in the Appendix of the fifth part, and therefore needs not be repeated here.

But as we there showed, that the roasted [or calcined] and powdered Oars were to be put into Glasse or Stone Cucurbits, that so they might be moistned with the sharp Waters, and be macerated [setting the Cucurbits] in warm Sand; so the very same thing is to be done here, this onely excepted, that [viz.] the earthen Pots supply the place of Glasse and Stone Cucurbits, and the Instrument it self in which the extraction is made, performs the office of Sand: After the extraction, the Water impregnated with the extracted Metals is poured off, and the remaining matter it self is wastd by pouring common Water thereupon, after such a manner as hath been prescribed in the Appendix of the fifth part.

By What means the Metals extracted by the dissolving Water out of the Oars are to be separated from that same sharp Water without any Detriment, may rather with an augmentation of the said Water.

WE have taught in the Appendix of the fifth part, that if a Man be not minded to precipitate the Metals out of the Solution by the contraries, viz. by Alkalizate Liquors, then there is no commodiouser and nearer way than that which separates the dissolving Water from the extracted Metal, by Diffillation in Glasse or earthen Vessels.

If now any one is minded to encrease his dissolving Water in this separation he may be Master of his desire by adding thereto common Salt, and drawing off the Water from it, which said Water will by this means be encreased and rendred stronger. And now there will come no inconvenience to the Metals themselves that are held up in that Water, in that some Salt remains with them, (no,) for in the reducing them, the said Salt gets them an easier and readier Fusion and Flux.

But yet it is not necessary to leave the Salt with the Metals, seeing it is better to separate it from the Metals with common Water, and so use it again to the same labours rather than let it be lost in the melting.

The Reduction of the Metals from which the dissolving Water is separated.

Albeit that that Reduction hath been already described in my second Century, yet I thought it worth while here again to repeat the same in a few words.

It is to be done two manner of ways, and that partly in Crucibles, and partly in the melting Furnace which the Germans call *Stuebelen*. The pure Metals, as the Gold and Silver are wont to be molten and reduced in Crucibles: the Copper may be reduced in the said Furnace, and needs nothing to be added about its Reduction. But for the reducing of Gold and Silver, fix Salts, the Glasse of Lead, Bo-

tax and other additions of that kind, (of which we have made mention in the second Century) may be made use of. And as touching the addition of those matters which are wont to be used to promote the easier Fusion, this is primarily to be regarded, whether or no the Metals are pure and alone [by themselves] or else have other Metals mixt with them, that (so accordingly) convenient additions may be applied. For if the Gold should also have Copper or Iron in it, then there cannot be any better thing added than Antimony, which reduceth the Gold by one and the same labour [or Operation] and also separates the Copper and Iron therefrom, which thing, other such like matters that are used to make the Fusion the easier, do not perform. Therefore it is necessary that he who would set himself about such Operations, do well understand the Artifice of a metallick Fusion, and so administer or order his labours by adding or taking from, according as the subject requires and as is best. It is impossible to prescribe such things to any one in such a manner as to make him presently understand, learn, and imitate the same.

Some other manual Operations which are needfull to be known in the use of this Instrument and which may be exercised.

First of all, it would be no small or mean Compendium, [or good Contrivance] if this same Instrument were composed of two or three parts, taking for the lowermost part a broad Iron Pot, and so to set on the upper part with its Door and Pipe thereto annexed. And because the bottoms of the Iron Pots do a little bow rounding, and that yet notwithstanding the Pots you put therein may not stand leaning or awry, the bottom is to be made level with calcined Allum, that so the Pots put in upon that may stand upright. From hence likewise ariseth this Commodity too, that if your Pots should chance to break, and the dissolvent run out, it would not be so lost but would lodge it self in the burnt Allum, and may easily be recovered in the preparation of the sharp Waters and be applied to use.

Secondly, the Instrument may likewise be so prepared, as that the Pots may be put thereinto by taking off the upper part, and then the Pots being put in, the upper part must be adjoynd again to the nether part, and [so] be again covered with its Cover; for being thus, there needs not the Door in the side to put the Pots in by.

N. B. There must be some Notch or Channel likewise fitted to the top of that upper part, which being filled with Sand may receive in it the Cover, and so prevent the out-let of the Spirits that way, by means of its tight shutting; as we have taught in the second part of the Furnaces. The Instrument prepared on this wise, will haply be more commodious to many Men, than if it had a Hole or Door in the side. But every Man may choose either this or the other way, which he pleaseth.

Thus have I now taught, and opened the use of my more secret way of easily preparing the sharp Spirits of Salts in great quantity, and the manner of dealing about the Extraction of Metals out of the poorer metallick Earths: Away (I say) most easie to do such great things, and which was never as yet known unto the World.

But yet I doubt not but that the Metals will for the time to come be plentifully and very profitably

extracted (and so applied to common use) by the help of this Artifice and Instrument, out of the poorer Minerals which contain in them Gold, Silver, and Copper, and which will not quit the costs of the Fire; and forasmuch as by the help of this Instrument, the sharp Spirits of Salts may be gotten easily and in large quantity, not onely for the Extraction of the Minerals, but also for the concentrating of moist Fires, and seeing that wonderfull things may be done by the help of those Fires; I do therefore commend it to the Studios of Art, as a thing of better esteeme than ordinary, and have sufficient reason of so doing. For to omit the saying, that those cold Fires do give an excellent Magnet for Water or Ice, they do also abound with such virtue as by which they can ripen and better the Metals; the which we will make a larger description of, in what follows.

Besides too, there may haply be effected far greater matters with those cold Fires, as to the defence of the Countrey against the *Turk*, that Capital and Blood-thirsty Tyrant and Enemy of the Christians, in some cases than with Gun powder: if such moist Fires be cast into places a pretty distance off by suitable Instruments, or be forced out of those lesser and greater Guns and War-like Canes, they will bring far greater Detriment to the Enemies than Gun-powder is want to do.

By this means, one weak Woman will in some cases be able to repel many armed Men; but this is a thing which such Men as are unskilfull in natural affairs, will deny till it be made manifest, and used against the *Turk*. Therefore I have a mind to set aside all other businesses, and to make those kinds of admirable Fires to the utmost of my power in great quantity, forasmuch as I well and assuredly know how great Detriment may be brought upon the *Turks* by the help thereof.

Fires they are which any one may carry about with him like Waters; they will not burn or overthrow Horse and Man sooner than any have a mind they shall. Nay yet more, if any has a mind to fortifie their Virtues, he may by adding other Fire-breathing matters, make them far more vehement and efficacious, and do far greater matters with them as being much more hurtfull than with those simple Fires.

And now seeing I have so very much commended the concentrated Fires of Salts, to

1. Diligent and provident Masters of Families, thereby to take away the superfluous watriness from their smaller Wines, Ales, and other Drinks, and so to concentrate them, and carry them (in case of necessity) into the strong and fenced Cities;

2. To the poor Chymists, that they might by them correct and better the Metals and so help their own poverty and want;

3. And to the Christian Chieftains of War, and faithfull Rulers of the Countrey, that they may stoutly resist the *Turks*, that are the sworn Enemies of the Christians.

I judge it altogether necessary to treat of them somewhat more clearly.

By what means and way this threefold use of cold Salts may be most profitable to the Countrey.

First of all, the concentrated Spirits of Salt may bring most great advantage, by concentrating the poorer sort of Wines, the which they make better,

ter, as is shown in the second Century: when the superfluous Water is removed from them, inasmuch that they do not onely keep their goodnesse constant and durable, but may likewise be far more commodiously and easily transported out of one place into another, so that necessity requiring, they may be more easily transported out of such places as are more remote from Cities and fenced places into the stronger holds and fenced Cities, and so be conserved.

It is as yet fresh in every ones Memory how miserably the case stood with Men in the foregoing War, which lasted thirty years. If any Farmer had his Cellars full of Wines, and the Soldiers break in to the Countrey, did horribly abuse the gifts of God, that which they could not consume by their detestable Gluttony, they wickedly spilled upon the ground; the Soldiers I say, and such Men as profest themselves Christians, and durst boast of the Christian Religion. From hence may it easily be conjectured what it would be, if such a multitude of *Turks* should over-run our Countrey, which imminent evil, God of his mercy turn away from us.

In the days of *Nab*, the Men then lived in all security, and not at all regarded the Preachings and Admonitions of that godly Man, by which he exhorted them unto Repentance for 120 years together, they did Eat, they Drank, Married and gave in Marriage, till the Flood swept them all away, and there was no more room for Repentance left, as sacred Writ testifies.

We read of *Sodom* and *Gomorra*, that the Inhabitants of those Cities being even drown'd in Leachery, did so despise the reproofs and warnings of the godly Man *Lot*, untill a Fire was sent upon them from the wrath of God and consumed them.

Who is there that in this Season feareth God, and lives piously? He that is the strongest oppresseth the weaker, nor does at all think on this, that there is one far more powerfull than he himself is, who comes when he pleaseth, and punisheth such powerfull Oppressors. But these things, and such warnings of this nature are plainly mockt at.

Did not God sufficiently enough warn us the last year 1660, and shewed unto us his wrath, by those dreadfull Tempests and Storms, and Earthquakes, wherewith almost all *Europe* trembled. Doth he not also this very present year (1661) shew us his self-same displeasure? What portends that Comet that was seen in the Heaven, any one may easily guess what it means. Verily it threatens nothing else but evil, especially because it extended its Tail contrary to the usual wont of other Comets, towards the upper part of the Heaven, just as if it should say, I will show unto the Men, that 'tis not this or that Countrey, this or that Enemy that shall chastise you, but 'tis the King himself of all Kings, who is in Heaven, that hath purposed to punish you for your Wickedness; whose Rod ye may [yet] divert from you that is stretcht out to punish you, if you apply your selves to him by serious Prayers, true Repentance, and unfeigned amendment of your Lives, now whilst you have time allotted ye to repent in, if such admonitions as these can but find entertainment with you. And what I pray will this warm Winter bring upon us, the which being destitute of all cold Ice and Snow hath permitted the Trees to flourish in the very month of *February*, and the Meadows to be clad in Flowers, and ripe Cherries to be seen? Without doubt, nothing else but all kinds of poysonous Diseases and which will speedily kill Men, and with

which mankind will be afflicted; and if so be that an intense cold should yet follow, which may easily be, there would doubtlesse follow a great Dearth of Grain and Provision by spoiling the Wine and Corn, whose buddings are already come so far forth, as that the cold may easily destroy them. And now are we not sufficiently enough admonished by these fore-runners and signs of the wrath of God coming on us, and hanging over our Heads?

Besides all this, let us consider that great Conjunction of all the Planets in *Sagittary*, such as hath never been since that time in which all the Planets were in Conjunction in *Aquarius*. And this Conjunction [in *Aquary*] preceded the deluge, which destroyed all mankind by the breakings in of the Waters, *Noah* and his onely excepted. But as concerning what that great Conjunction in *Sagittary* the next year 1663 will show us, and bring upon us God knows. *Sagittary* is a martial sign, and deadly, and portends nothing but Dissentions, Seditions, and uproars of War; and therefore prophesieth unto us nothing but bloody Wars, inasmuch that it is much to be feared that this ungratefull World will be consumed, and blotted out as 'twere by Fire, and the Sword, and the anger of God: which evil, God of his mercy turn away from us. Certainly these Conjunctions are not wont to fore-signifie or bring along with them any good. But I heartily wish I may prove a Liar in this case, though I fear me, that there is more evil coming upon us than will be welcome unto us.

For when God sheweth us any thing with his Finger, it should be of more concernment unto us than all humane Writings, for they may err. But God never does any thing in vain and without cause. Never did there at any time a Comet shew it self in the Air but many Calamities succeeded it. That old Proverb may very likely prove true, which the Ancients have pronounced, viz. that it will come to pass in the year 1660, that Alchymy will begin to flourish, but will bring along with it such changes for [some] years following, and such dreadfull changes too, that the third part of Men will perish with Famine and Pestilence, the third part will perish with Fire and Sword, and there will be but a third part onely left.

But yet I would not that you should take or look upon this my prognostication on such wise as if all these things should infallibly come to pass as I have predicted. No, I was willing onely to open to you my Meditations upon the years to come. For all things are seated in Gods power alone, in whose hands onely and alone we know our firm helps and assistance to be ready for us, and therefore do not in the least confide in our own strength and power, which are more vain than are all fading things.

But so far as there are natural means granted us, of driving away our Enemies, we may well use them as far as in us lies, for that it belongs unto every Christian Man, to do his utmost to repell with all his power the common Capital Enemy of all Christendom.

And now therefore that I my self may not be found to be the least in defending my Countrey, I have determined to exhibit in this Book the help and assistance that I can afford, and this is not Money and Wealth which I have not, but by offering such artificial inventions, and disclosing them, whereby the Enemies may be valiantly resisted. For in all things we see, that many times far greater things may be done with Wisdom and Prudence, than with Strength and Fortitude, and this is clearly evident.

evident in the most efficacious Operations of Gun-powder, which produce far greater effects than Mens hands, though never so strong, could ever bring forth.

'Tis well known, that the use of Gun-powder was not always known, but was first found out by a certain Monk in *Germany*, in the year of our Lord 1380, who by chance lighted on the finding of its dreadfull strength. Neither is there any one ignorant, what great Victories they that well knew its use, obtained over their Enemies afore it was made manifest. But when it became publickly known, then it served both Parties, so that neither part had more advantage by it than the other, and then the deciding the Controversie consisted (next the blessing of God) in the multitude of the Men, of which their power was composed, and not in Art. And like as it seemed a merely incredible thing at first when it was heard of, that a Powder of such mighty force could be made of such vile Subjects, viz. Brimstone, and Salt-peter, and Charcoals: Even so will it at first exceed all belief, when it shall be heard say that Waters may be prepared out of such Subjects, which said Waters can doe such wonderfull, and so many great things.

It is also reported [or Chronicled] that the said Monk did not search after Gun-powder purposely, but being addicted to Chymistry, and occupied about Operations upon Salt-peter and Sulphur, endeavoured to distill a Water from them. Now these being mixt, and by chance taking fire, he perceived them to break every thing, and rend it into pieces: And hence came that man to know the unheard-of Virtues of Salt-peter and Sulphur, which being so thoroughly contrary to each other, made such great concussions or shakings. The same thing hapned even unto my self, for purposing to make sharp Waters out of Sulphur, Salt-peter, and other Salts fit for my purpose; I perceived in such Operations, that far greater things mought be brought to pass by such firey Waters than could be done by Gun-powder. Nevertheless, I buried these Secrets in great silence, nor manifested I them to any man, though I knew them above these twenty years; fearing this, that should they be known, they might be as Instruments in the hands of the Christians to torment one another with.

But now seeing God hath vouchsafed to bestow a peace upon the whole Christian World, and that the *Turks* doe begin more and more to persecute and vex the Christians by their Tyrannical Persecutions, and endeavour even thoroughly to root them out, as they have already made a beginning in *Hungary* of their detestable attempts, I advised with my friends whether or no it would not be expedient to detect and lay open those Secrets to the Christians, that so they may be used against the *Turks*, and I was advised by these my friends to proceed on in the revealing of them. Upon this account (all other businesses laid aside) I wholly betook my self to this very one thing, to get great store of those kind of firey Waters in readiness, which may be made use of as most substantial bucklers or defence both offensively and defensively against the *Turks*. Now I have done this the more willingly and readily, because they kill no man, but doe onely so far debilitate them, that they may be overcome, and easily taken and made Captives. For were this invention of mine such as would kill men, I would never have at any time produced it in publick, and thus divulged it. And therefore I am even

yet of this mind, that that Monk *Bartbold* did not well in divulging the preparation and use of Gun-powder, by which such a multitude of Men are destroyed and slain.

But by this Invention of mine, no man is slain, and yet the victory wrested out of the Enemies hands. And the Enemies being taken alive and made Captives, may be constrained to work, and in my opinion may bring more benefit than if they were slain.

I doubt not but that the things I here propound may seem impossible even to the wisest [sort of] men of this World; nor indeed is it to be wondred at if it be so; for they are unheard-of Secrets, and unseen, and so exceed all belief. I dare not here trust my Pen too much, though I could disclose them in a few words, and so, as to bring every one to acknowledge the truth hereof, and to feel it as it were with his hands. But I must deal warily, lest such sharp, and yet not killing, weapons fall into the Enemies hands.

But yet that I may in some sort satisfy the desirous Reader, I doe signifie unto him in brief, that all the whole Art lyes coucht in this knack, that vast quantities of those artificial Waters may be gotten without great Expences; and being prepared, may be afterwards applied to use by some certain secret Instruments both offensively and defensively. For those watry Fires, or firey Waters which I speak of, are of such a burning nature, that neither Men nor Horses whom they touch are able to resist [or endure] them; And yet they doe not kill, unless one be minded to slay others, and then they must have a more peculiar preparation. But as they are by themselves, they kill none, but doe extremely disturb both Horse and Man, that it makes them even impatient of the pains, and so forceth them upon one another, whereby their order being broken, they ruine themselves. This done, the victory is as it were given into the adverse parties hands, whereby they can without any labour vanquish and take their Enemies Captives. I dare not to say any more hereabouts, this onely I add by way of overplus, that even Women (where Men are wanting) may not onely (by this invention of mine) drive off the Enemies from any fenced place, but they may force them out again out of the place, or overwhelm the Company of them that are entred with Stones. Though this seems an incredible thing, yet is it most true, and will without doubt, after it shall come to light, in a short time serve as a most notable defence for the Countrey.

And as touching the ease, and not at all costly preparation of the moist Fires and their due use, together with the Instruments hereto requisite; all this shall be shown and directed to those onely who both can and will use them against the *Turks*. But to others not, and this we were willing to signifie by way of admonition or advice.

This little, but yet exceeding weighty Secret, and which may be used against our Countries Enemies with most notable benefit, I have revealed enough of at this time. Mean while I hope, that even this very year the Enemies of the Christian World will be notably endamaged by it, which God of his grace and mercy grant, that it may be a solace and help to the Christian World so dreadfully persecuted by the *Turk*, even for the honour and glory of his holy Name. Amen.

T t t t t New

Now follows the third use, and that consists in the melioration of the Metals, by which also great benefit may redound to the Country.

AS for such things as concern the true and indubitable melioration of Metals by Salt and Fire, I have already sufficiently enough demonstrated in the fifth part of the Prosperity of Germany, and in the Appendix thereunto.

But seeing my true demonstration there made, seemed not sufficiently clear and evident to not a few, and that therefore they have most lyingly dared to aver, that there is no such thing as a true transmutation of Metals, and that such like Affirmations as these are meer fables, meer falsities, and meer dreams: Therefore I could not choose but (to stop the mouths of such wicked Men, and shame them,) to lay open and publish an evident and palpable truth.

And this is no great task for me to do, for I was many years ago certain of the truth hereof, and therefore can easily set it afore the Eyes of others, and that not onely particularly [or a particular transmutation] but also universally, inasmuch that even the blind may see and palpably feel, that the transmutation of Metals is not an old Wives Fable, but is a certain and firm Science, and what is risen even from the foundation of nature her self. If now I shall prove it to be thus, I have then I hope secured my affairs, and have not onely defended the Writings my self have sent abroad, but withall the most true assertions of other honest Men, and so shall have evidently demonstrated those things which to the greatest part of Men seems a thing impossible to be done.

Albeit that there are many who have left us the truth in their Writings, yet are they so involved in obscurity, that such as know not the Fundamentals of the Art, can never learn ought of certainty from them. Whence it comes to pass, that so many Men have vainly attempted the Art, and therefore the Art it self hath been mightily despised.

The Transmutation of Metals is not a thing of so small a moment (as that eminent Philosopher *Sandrovigius* witnesseth) in his Preface prefixed to his Writings; where he also tells us, that he that obtains the knowledge of the same, so as to transmute any imperfect Metal into a more perfect one, though it be done without benefit, hath met with an open Gate, and entrance leading to greater matters, and this is also exceedingly agreeable with the truth. For if any one shall take some imperfect Metal, and by handling or dealing with it with such or such matters, shall find that it is advanced to a golden or silvery nature, may more deeply look into the business with fuller and more accurate Meditations, and [at length] wholly search it out, viz. whence that bettering proceeds, and by what means or in what manner his labours are to be contrived.

And now when such an one doth make fix and constant, such or such a Metal by the benefit of the Fire, and useth no other matter about the Operation but Salt, and doth really find a true melioration of the Metal, certainly he cannot ascribe it to any other thing but the Fire and Salt: and now whereas he assuredly knows, that the melioration of Metals can be perfected by the help of no other thing but of Fire and Salt, he will not need to search for any other, but will rather wholly apply himself thereunto, whereby he may most commodiously deal with the

Metals by the means of Fire and Salt, and better them with profit. And if now he be once Master of his desire, he will gain sufficiently thereby. But if not, he cannot blame the Art but himself, who indeed sees the possibility of the Art but hath not (yet) entered in by it, or through it to the great Treasures it discloseth, so as to take to himself a due or competent part. But forasmuch as such happy Men are very seldom found, who find the Key that opens the Doors to such Mysteries, I judged it a thing worth while if I did here detect this very Key, and show by what means the Gate (by which the closet of Arts is made fast) is wont to be opened. And if now it shall please the Studious Artist to enter thereinto, he may with all my heart, and so enjoy those Treasures. I will not pass the bounds I have intended to observe: it is sufficient for me to have shown the right and kingly way, wherein every one may go that listeth, that so he may arrive to his wish for end.

But as for the Key that unlocks the Closet of Art in true Alchymy, I do confidently affirm, that Salts are such Keys, and especially Salt-peter, and also common Salt and Vitriol, each of which is of it self efficacious enough to open the Door which shuts the Parlour or Closet of Arts in Alchymy. But one Salt joyned with another as is expedient and in convenient wise as Art requires, does effect more and show greater power than if it abode alone, and this my Writings do too and agen largely shew. But those Salts are in an especial manner more excellent as to power and virtues than others are, those I say which being first made volatile or spiritual are afterwards made corporeal, like as the following example doth evidently demonstrate.

An evident demonstration of the possibility of transmuting the viler Metals by Salt and Fire into more noble ones. *Phil 257 A*

TAKE of Vitriol two parts, and of good Salt-peter one part, mix them well, and being mixt distill an *Aqua Fortis* therefrom, with this Water, dissolve Silver or Lead, and pour into the Solution some Spirit of Salt, or else some common Salt onely dissolved in Water, that so the dissolved Metals may be turned into white Powder, and precipitate to the bottom of the Vessel. This done, wash off the *Aqua Fortis* from the *Cals* of Silver or Lead, with Rain-water, and you shall find it to be one quarter part encreased, and this augmentation cannot be washt off with any Water. Now these saline Spirits do make the *Lune* and *Saturn* so very volatile, fusile, and flying, that they melt in a small heat and penetrate all hard Bodies. Upon this account I called those fugacious and fusile Metals, by the name of a *Mercury*, which said *Mercury* of *Lune*, or of *Saturn* hath assumed to it self onely so much of the Salts as it needed, to amend it self in the Fire, when they mutually act upon each other, and the Salt maturates the Metal.

But what course shall we now take with these Metals, seeing they are so very volatile, that they cannot resist the indifferently strong force of Fire, and therefore go away in fume? And forasmuch as they abide not the Fire and do not die, by what means can they be amended?

There is no better way to be taken with them here, than (for prevention of their volatility) to add to them some metallick body, into which, the fugacious exceeding fusile, and Salt Metal may hide it

it self, and so brook the Fire. And amongst these fix metallick Bodies, I know not as yet of any better than Tin reduced into Ashes, which is most fit for this Operation, because it is the most unfit or hard to melt of any the *Calx's* of the rest of the Metals.

If therefore you will make experiment of this Operation, adjoyn to one part of the *Mercury of Lune* or *Saturn* two parts of the white Ashes of Tin, which being well mixt and put into a Glass Cucurbit well fenced with Lute, set it into Sand, put Fire therein to by little and little untill the matter in the Glass be well heated; in this darkish red hot hear, leave it so long untill some part of the matter doth ascend by sublimation up into the Alembick placed at top, and up the neck of the Cucurbit. Then you must put on another Alembick, and take out all the sublimate out of the former Alembick, and put it back upon its matter in the Cucurbit, and it is to be again left so long in the Fire, untill there doth again ascend some part by sublimation into the Head. This being taken out of the Head is to be again put into the Cucurbit, and to be added to its own matter, (and to be proceeded with) till again some portion sublimes up out of the matter into the Alembick. Now these labours are to be so often repeated, untill there ascends no more matter up into the Head, and all the matter abides behind in the bottom of the Cucurbit fixt. This being done, a stronger Fire is to be administered, that the Metals may be operated upon by the Salts. For by how much the more and longer they endure the violence of the Salts, so much the better do they grow, which being taken forth and reduced by the adding unto them their due matters and being separated by a Cupel do yield forth a notable encrease of Gold and Silver.

This undoubted Experiment and evident Demonstration, doth (by its evident Operation) clearly and perspicuously teach and prove the melioration and transmutation of the Metals into better and more pure; but if this way seems to any very laborious and full of troubles, I will show him a more compendious way and such as is of less labour, for the sake of searching out the truth.

Fill a Hassick Crucible (one of the best make) with the self same mixture, viz. one part of the *Mercury of Saturn*, and two parts of Tin-ashes, and squeeze in the matter thereto with your Thumb pretty hard, and fit at top of this Pot, another somewhat lesser, so as that they may shut close and tight at their mouths, and one may not fall off from the other, if they be turned (topple turvy:) Now in this upper Pot, put some Plates of Copper in, afore you place it on the lower one, yet on such wise that in the turning the Pots (up and down) they fall not out of their places. Each Pot likewise is to be well fenced with Lute such as will not chap when it is dried, and yet it may be mended if it should a little cleave by dawbing some more on, and this is done, that no fume at all get out. The Lute being dried, place this double Pot or Crucible in a circular Fire, and augment the Fire more and more, and move it nearer and nearer it untill it be well heated. Then put thereto larger Coals, and cover the Pot all over with them, that it may be every where red hot, in which great heat of the Fire it is to be left some two or three hours. Then being cool, take out and open your Pot, and you shall find the Copper Plates in some sort tinged with a white colour, but yet this colour is not so constant and fix as to abide in the Cu-

pel or on the Test with its Body. Therefore necessity requires that those Plates be dissolved in *Aqua Fortis*, and be precipitated by pouring thereon Salt dissolved in common Water, in which precipitation the Silver *Calx* settles to the bottom. This *Calx* being freed of its Saltiness by pouring Water thereon, and being dried, is to be wrapt up in a Plate of Lead, or some sheet Lead made as thin as Paper, and be put on a red hot Test, in which there must be a little Lead in Flux, which may the more readily receive the silvery *Calx* wrapt up in the leaden Paper, and which is volatile, and may hinder it from going away in fume; the Lead being consumed, there will be a grain of Silver abiding on the Test, which being dissolved in *Aqua Fortis*, will let fall some Gold to the bottom. If any of the remaining matter in the Crucible be to be reduced, then boil it with Lead, and let it be reduced into *Scoria's*: out of the *Regulus* will there also remain on the Test a grain of Silver containing Gold in it. But this way brings no profit, as being here taught for this onely end to demonstrate the possibility of the thing. But if you would get any profit by such an Operation, it will be altogether necessary to use such Vessels in which nothing at all may go away in fume, but all the matter may abide together, and may so get a fixity and constancy: and this cannot be done in Crucibles, but it will bring a profitable melioration by the said way.

Some may now demand from whence that Gold and Silver should come? whether out of the Lead or out of the Tin? doubtlesly it comes from both. And therefore seeing the Copper Plates in this Cementation, as likewise the cementing powder it self have put on a golden and silvery nature, can any one doubt that this is a true Transmutation by Fire and Salt? And this is especially manifest even from the Copper Plates, which had nothing at all toucht them, save the saline Spirits ascending up out of the Cementatory Powder, which in the heat of the Fire penetrated the Copper, and amended it in so short a time. Is there any one now so blinded as that he cannot here see, that this bettering the Metals proceeded from Salt and Fire. Certainly no body will be able to heal him that is blinded with such a darkness of his sight, and therefore must he even tie all his life time in such obscure mists. For this Operation is set down so clearly and evidently that it may be even felt and perceived with the hands.

N. B. If to be any one is desirous of getting more Gold and Silver by the help of this Operation, he may use the *Mercury of Lune* instead of the *Mercury of Lead*, for it will yield far more than *Saturn* will.

I could exhibit no small variety of these kind of Experiments, but that the shortness of time bids me stop, and forbear their description; those that cannot learn ought from these things, greater ones will not be at all usefull unto them. Thus have I a new evidently demonstrated, that a particular melioration of the Metals is done by, and proceeds from Salt and Fire alone.

An infallible demonstration, that a true tincture or universal Medicine may be made by Salt and Fire, for the melioration of Metals.

Recipe one pound of the *Mercury of Lead*, or rather of *Lune*, of the Ashes of Tin two pounds, mix these matters together and put them into a Glass Retort

Retort coated, and put it in Sand, or rather in an open Fire, and give a Fire by degrees. In this Operation, the Salts inhering in the *Mercury of Saturn* or *Lune*, do display or exercise their virtues upon *Jupiter*, and seize upon it and leave the *Lune* or *Lead*, and ascend up into the neck of the Retort like *Mercury* sublimate, and are very heavy and ponderous, and do very rarely fall down into the Receiver, because they presently settle as soon as ever they feel any Refrigeration. Therefore it is needfull that the neck of the Retort be somewhat wide, that so the *Mercury* sublimate may meet with space and room enough, and may not by wanting room break the Retort. Now when the Retort has been kept three hours in a red hot heat, which time is requisite for the *Mercury* sublimate to ascend in, then cease from continuing or keeping on your Fire, that so it may cool. Then take out the sublimate out of the neck of the Retort when cold, and you shall find about some eight Lots & Ounces, and proceed with it the way following, as we shall by and by tell you.

Mix the Reliques or what is left, with two parts of *Regulus* of Antimony made with Iron, and melt it into a body: Wash off the *Regulus* and Tin from the Silver with Salt-peter, and you shall have your Silver not onely encreased by the *Jupiter*, but also indued with somewhat of a golden nature; as much as the Salts could maturate in so short a time, which is indeed a speedy Transmutation. But if you use *Mercury* of *Saturn*, there will not follow much amendment in so short a time. Yet nevertheless, that even the truth it self may even by this means be searcht out, there may be added a little Lead, and be boiled and reduced into *Scoria's*, in which there will remain a grain of Silver, which will give you information, how much melioration the saline Spirits are able to bestow in three or four hours space.

But this is not the right way of getting profit, for as much as it shows onely the possibility of the thing.

But if you would have any profit by such an Operation, you must get you a Cucurbit for this sublimation made of good and vitreous or glazefying Earth; and the sublimed *Mercury* must be taken forth of the Alembick, and be again added to the dry matter lying in the bottom of the Cucurbit, and this Operation of subliming it must be so often repeated, till there ascend up no more, and that all abides fix with the Tin. Then is a stronger Fire to be put thereto, and the *Jupiter* and *Saturn* will be maturated by the Salt as we taught afore. And if now any be minded to take that same sublimated matter, as it ascended in the first sublimation, and would make it fix and constant (*per se*) in a Glas, he would get a Tincture that will in projection tinge with a white and red colour, but yet I never have as yet tried the latter of these. However I doubt not, but it may be done. For seeing that this sublimed matter, doth (though it be so volatile) penetrate the Plates of Copper, by three or four hours time cementation, and turns somewhat of the said Plates into the nature of Gold and Silver by graduation, how much more would it do, if being brought to a due fixity and constancy, it should be projected into some molten and flowing Metal? For that in such a white sublimate (principally in that which proceeds from *Lune*) there lies hid also an occult redness, and may be manifested by the Fire, this I say, mine Eyes have seen, and mine hands have felt, but have not as yet brought the Operation to its compleat end, by reason of various lets and want of time.

Farther, by such a sublimate *Mercury* may likewise be wrought various Transmutations, which I think not fit to divulge. It is in its nature fugacious and volatile, and yet notwithstanding doth it in process of time make all other volatile and fugacious matters, such as are Arsenick, Auripigment, Cobolt, and even the most flying of all, *viz.* common *Mercury*, fix and constant, which effect is to be attributed to the Salt onely. He that knows rightly to manage this Operation, will not labour in vain, but will be rendred a partaker of great secrets, which thing I leave to the Sons of Art, as a Testament or Will.

But yet that I may kindle some little Torch for to guide the desirous Reader, and may make him more certain of a true Tincture, which this abject *Mercury* sublimate showing it self in a white colour hides in it, I have thought good, yet farther to add this following way.

Extract out of this sublimate a running *Mercury*, vivifying and separating it by apt and magnetick subjects; and evaporate a little portion or particle thereof, of about the bigness of a Pea, in a Silver Spoon; when 'tis all gone, you will find a purple Powder left in the Spoon. If you cast this Powder upon hot boiling Lead, you will find after its blowing off, a grain of Gold on the Telt. The Spoon it self will bear the mark of a purple spot in that place, in which the *Mercury* went away in fume, and it cannot be blotted or rubbed out, because the *Mercury* hath deeply impressed the Tincture in the Spoon.

Now may some or other say unto me, whence did that little grain of Gold left on the Cupel, and that purple spot which tinged the Silver Spoon, proceed, came it from the Lead or from the Tin, or from the Silver, or out of the saline Spirits? The greatest part of Men will say it proceeded out of the Lead, Tin, or Silver. But I say, that it did indeed come out of the Lead, Tin or Silver, but that the Tincture adjoynd thereunto is for the most part the true Soul of Niter, which the *Mercury* took unto it self, and again left it and forsook it as soon as ever it was vexed or forced with the Fire. But I doubt not but that if such a *Mercury* impregnated with the Soul of Niter, were fixed and made constant in the Fire, it would afford an universal Tincture.

I confess I have tried many a time this Operation in small Experiments, which sometimes answered not my desires, what diligence soever I used thereabouts; but when I attempted it in a greater quantity it never succeeded. This thing seems to be posited in the will and pleasure onely of the Omnipotent God, who will not have those his so great Mysteries and Gifts profaned. I have indeed (like unto *Moses*) seen the promised Land, but yet I do not know whether or no God will bring me thither in this Life, that so I may enjoy those most precious Fruits.

And if God should not vouchsafe me that benefit, yet do I willingly rest content with this, that I have seen with mine Eyes, and felt with mine hands the truth of the Art more than once, which Art so many thousands of Men do so greedily gape after, but yet not with such good hap and success as to find it out or see it.

I have I say seen the truth, but not the Tincture brought to its end or perfection, but yet have I seen its beginning which makes me certainly assured so far, as that I dare to affirm, and confidently aver, that there is in nature such a thing as a true Tincture, and that it may by Gods blessing be prepared by an Artists hand. I have not yet had so much

quiet

quiet and so much time as to undertake this so weighty a Work. Yet now I have a resolution to set aside all worldly cares, solitudes and businesses, and to attempt and wait upon this kingly Work, and expect what the divine grace will bestow upon me. For we are to look for all good things from above, for else we labour in vain, whatsoever diligence we make use of.

These things I was willing to publish for the Assertion sake of the truth, and to prove that there was in nature a true Tincture, that so it may evidently appear that Metals may be transmuted both universally and particularly. And if by some desperate Men or by a sudden and immature death (which chances God of his mercy graciously keep from me) all the *Mediums* or means of perfecting so great a Work, and finishing it should be cut off from me, yet notwithstanding the truth it self will be able to bear witness to my sayings when I am dead and gone. For I have by me even yet those Silver Plates tinged with Purple Spots, which can at all times witness the truth of those things I have here delivered. For it is an impossible thing that Silver should be tinged with a purple colour without a Tincture. If therefore there is to be found the truth in that white and fugacious sublimate, what I pray would be found in the fix and Fire-abiding red Tincture? Would it not be, that effects of far greater moment would be produced by such a Tincture. The Ancients therefore that desired firmness of health and a long life, bestowed such labours and sweats upon getting a true Medicine for humane and metallick Bodies, and some of them arrived to their wish-for end, but the greatest part of them were deceived with vain labours, and frustrated of their conceived hopes.

If any Man did certainly know that there were in some places to be found mighty treasures of Gold, Pearls, and Precious Stones, and it were granted every one to search after them for his own proper advantage, what think you, he would be lazy and slow, and would not set himself to seek after them. But if any should so order his search that like a blind Man, he neither knows nor sees what it is he seeks after, or in what place it is to be sought by him, certainly such an one would labour in vain, and lose both his time, pains, and costs; and this usually betides the greatest part of Men, for they spend their labours in vain in their search after this Work, because (like blind Men) they neither know what they are to seek, nor where. But yet 'tis credible that there would not such a multitude of them have stray'd from the truth, had but any one so clearly and perspicuously shown and pointed as it were with the Fingers at the place where the Treasure lyeth hidden, as I have now done.

And although the envious and lying Devil should oppose the truth even with his greatest power, and should most cruelly rage against it, yet notwithstanding he will not be able to shew us any one Man that hath produced and brought the truth forth to the light with greater perspicuity and evidence than *Glauber* hath.

I have therefore yet once more at present shown by a most evident demonstration even before the whole World, and have asserted it for a truth, that not only the more imperfect Metals do admit of being really transmuted by Salt and Fire into the more perfect ones, but wishall, that by them, [*viz.* Fire and Salt] a Tincture may be made.

And now let all mine enemies visible and invisible

ones, open and secret ones, what name soever stiled by, come forth and publickly produce the true Transmutation of Metals, with a clearer and more conspicuous manifestation than I have here done. I acquiesce with what I have hitherto spoken; if God shall please I will divulge admirable things in my next third Century. In this little Treatise there are laid open onely four secrets, but yet so clearly and conspicuously that no body hath as yet manifested such and so eminent things with clearer and more perspicuous expressions.

For that first Instrument is clearly enough described, by the help of which, not onely a great plenty of all sharp Spirits may be prepared with very little costs and easie labour, and the four-fold use of these Spirits is able to bring most great profit to the Countrey.

1. All Gold, Silver, and Copper are thereby extracted out of the poorer sort of Oars which *Germany* abounds with every where, and that in a far easier manner than by fusion, and are so brought to a very gainfull improvement, to the great benefit of all *Germany*, the which hath never been hitherto done.

2. Of the said Spirits is made a Water-attracting Magnet, for the bettering of poorer Wines, that so they may keep good, and be the easilier transported out of one place into another, as I have signified in my second Century. It is a secret which offers gain both to the rich and poor, and may be prepared in great plenty.

3. The imperfect Metals are sundry ways bettered by those saline Spirits, of which may be made vast quantities as I have shown in this Work or Book, and this melioration my Writings do variously teach and treat of.

4. By the help of these fiery Spirits of Salts, preparable in mighty plenty, which is a thing commodiously to be done by the Instrument described in this Book, may the *Turks* who are the Enemies of the Christian World be resisted without any Blood-shed. Concerning these fiery Waters, which being such a notable destruction on the Enemies, this is here to be noted, that immense quantities of them are easily gotten without any Distillation and with very little expences.

For if much be to be effected by them, it is necessarily requisite to have vast quantities of them in readiness, without which, no great matters are in this case to be accomplished. But as concerning the manner of so greatly endamaging the *Turks* by these moist Waters I cannot so accurately describe the same here, as being a meer stranger to, and ignorant in military affairs. However I will briefly and in few words shaddow out, what way I think it may, be done by, *viz.* to resist and mightily endamage the Enemies by them.

First of all, this is the nature and property of these moist Waters. As to outward view they are like Water, and may be handled or dealt with as other common Waters, but their inward virtue is nothing but a meer Fire. And because these moist Waters may be thrown not onely with the hands, but with greater Warlike Engines or Guns a good way off, by artificial Instruments prepared for that purpose; therefore is the use of them manifold, and as necessary requires may they be used several ways for the expulsion and overcoming of the Enemies. We will illustrate our meaning by an example. Suppose I am in a City or Castle besieged by the Enemies, and that I have by me some of those kind of Instruments

U u u u

which

which are accommodated to this use for the moist Fires. If now the Enemy should set upon the Trench, Wall, or a Bul-wark, and I were furnished with that defensive Water of mine, should stand behind the Wall or Bul-wark in that place which the Enemy sets upon, he could not possibly come at me; for those moist Fires may be cast by the said Instruments far without the City, like a fiery shower of Rain, or like a Cloud, which Rain being forced out of but one onely Instrument would dilate it self far and wide upon many hundreds of Men, and whatsoever it touched it would hurt and burn like common natural Fire, and it would especially blind their sight, so that the Men would not be able to look up or see. If now the Enemies should make their attempt upon any place, and there should be showered down upon them such a fiery Rain, and by hurting their Eyesight make them quite blind, how would they be able being blinded to get over the Walls or Bul-warks? I do believe that if they should have gotten over the Walls or Forts, and be made thus blind, they would be heartily glad if they could but get out again and recover their own party. But it would be better to beat them off, and blind them when they come with their Ladders to scale the Walls, than to permit them to approach any nearer. But yet if it should so happen that the Enemies had gotten even into the City it self, and there were some Houses in the principal places or streets in which the defendants may rally themselves and that such Houses were furnished with such moist Fires, and that such fiery showers were shot out thence so blinding them that they durst not open their Eyes, what I pray would they be able to do, being blinded and clearly deprived of the use of their sight? Would they not throw away their Arms and solely mind the getting the Fire out of their Eyes, and yet it would hardly be so done in half a days time, nay if it should touch their Eyes in pretty quantity, it would scarce be quenched in two days time, and if they should go to wipe their Eyes with their hands, then would they make their torments much more intolerable, and would add more Fire to their Eyes, because their hands are likewise moistened and plagued with that continual shower. And now may not such unbidden Guests be overwhelmed and slain with Stones cast on them out of the adjoining Houses? And may not one single Woman with such a little Instrument onely filled with these moist Fires defend her House against an hundred Soldiers. Verily in my opinion there may be made a better defence with such a little Instrument that one may carry about with him, than with ten or even an hundred Muskets. For 100 Muskets require 100 Men, all which when they have discharged their Guns once, and have slain some ten or twelve Men (and yet it is not wont usually to happen so in such cases neither) they need some time to load their Muskets again, if they would keep on shooting. But this Instrument may be used even by Women, two or three of whom will haply do more hurt to the Enemy than twenty or thirty, yea haply one hundred Men are able to do with their Muskets. And if the Women and other weak Men do but blind their Enemies, the armed Men may take them thus blinded Prisoners; that so not being killed but made Slaves, they may be set to Work and Till the Land, and this would be far more profitable than the killing of them would be. So then, may not an hundred Soldiers by the help of my Instruments defend

any Fortresses with greater and more certain defence than a thousand Men could otherwise do. Verily I believe they may. For these blinding Fires of mine, or fiery Clouds and Rain being adjoynd to other usual and customary military Weapons, will most mightily endamage the Enemy, nor will there need so many Soldiers, for the Citizens themselves may use the other [customary] Arms, and the Women and Children may use the Instruments, whereby they would haply defend themselves more strongly than if they committed their defence to chosen and registred Souldiers.

For these Instruments, (by which the moist Fires are driven far off upon the Enemies like fiery showers and Clouds of Rain, and that without intermission, and as oft as ever need requires) although they be great, yet a few Men may govern or manage them, so that it will be impossible for the Enemies to effect any considerable enterprize in besieging any City. But it is needfull to place such Instruments that thus squirt forth Fire, behind the Walls and Bul-warks, that the Enemies great Ordinance may not hurt or destroy them. Verily I cannot so very accurately and completely show what [the best] way [is] of endamaging the Enemies by the help thereof, for this the practice it self will better shew us. I can furnish forth the Instruments themselves and the moist Fires belonging thereunto. I commend the use of them unto the Souldiers, who may learn to use them as they shall find good by experience. I do again repeat what I have hitherto so often spoken, and I do affirm, that with one such Instrument may some thousands of Men be blinded in a moments time, and being blinded what I pray can they then do? If so be that others shall endeavour to come to help them and fetch them off, they may likewise be blinded, nor can they run away, and therefore must necessarily be taken Prisoners. And this in my judgment may be done in Hostile Invasions and Sieges.

But now whether or no there may be any use of such Instruments in Battails and Conflicts with the Enemies, I do not well know, but that a City, Castle, or House may be defended by their means, and so drive off the Assailants, is a thing evident and undoubted. Should there be a thousand Enemies beset the House of some particular Citizen, yet must they depart if onely such a fiery Cloud or Rain (the Doors and Windows being shut) should be showered down upon them. For so they would be rendered blind and not be able to see or find the Door, as it was in *Loss* time, when his Enemies environed his House to have out those two Strangers, they were smitten with such blindness that they were constrained to leave the House, and it was permitted *Lot*, and his, to pass out of the same without any impediment. And is it not lawfull for us to smite our Capital Enemies the *Turks* with blindness, and to defend our selves, our Wives and Children?

God himself saith, I will encompass those that are mine, with a Wall of Fire, and defend them against their Enemies. Briefly, this invention of mine, of making such a fiery Mist or Rain, is an incomparable defence and safeguard, the like of which was never as yet known in the World. And now may any one easily conjecture what may be done offensively with this same invention. For example, suppose 'tis necessary to take such or such a place from the Enemy, but now there is not time enough left, nor are there Souldiers enough for the enterprize; and therefore some Stratagem must be used to become Masters

of one of the Gates at least whereby the Souldiers may be let in.

And now in my judgment some Gate may be seized on and that easily by the help of these moist Fires of mine, and 'tis thus, let some Souldier or other fit for such a design, be taught the use of my Fire spitting Instruments, and when he understands it, he may be clad in Countrey Habit, and so let him go to them upon the Guard, and in the Court of Guard-houses in which they be, let him shour in upon them a fiery, Eye-blinding, and forcibly hissing shour. [This done] how can the Guarders possibly resist those that come to the Gate and are ready to enter in? Nay more, the Souldier thus clad may have a Granadoe given him to carry in a Sack, which being filled with those moist Fires, may of its own accord (without any benefit of Gun-powder) leap assunder and fill all the whole room with his blind making Dew, he may throw into those Watch-houses where they keep Guard, and so make all that are there present unfit to fight. And if so be there should be more of those Houses than one, the same Souldier may likewise have more such Granadoes given him, one of which he may throw into each House. Nay farther, if need be, and that you would have it fadge better and have it more certainly succeed, there may be sent several Souldiers with such Fire-breathing Granadoes to several Gates, to overwhelm the Watchmen and possess them. For the Watchmen suspecting no evil from one Countrey-man only, will not cry out Arm, Arm, but let him in without any impediment. Such Fire-breathing Balls or Granadoes may be made of Iron, Copper or Earth, which however, properly are not Fires as long as they feel not the Air, and they then become Fires only, when any one is so minded to have them such, breaking every thing in their reach like Gun-powder burning, and depriving all such as are present of their sight, and making them Sick. Granadoes made on this manner, and of about the bigness of a Mans Head, do not of their own accord conceive a flame without Air, nor do they flie assunder, or at all operate. But if you would that the Air be let in whereby they may operate, there must be a little Spicket or Tap to be drawn out of the Granadoe, that so the Air entering in may vivifie the Fire that lies in the Ball or Granadoe. Such a Granadoe being thrown into any Watch-house, the Watchmen will without doubt presently run and take it up and see what it should be, and what end it was thrown in there for; then as they all of them stand round and contemplate upon the novelty, if any of them hap to draw out the Spicket, which without all question they would do, the Air gets in, and the Fire enkindles and breaks that Granadoe thus stuf with that venomous Fire all to pieces, and so will strike them all down together. And may not now the Souldiers in the mean time hasten and break in to that fenced place without any let, and become Masters of the Gate? Verily methinks it should succeed very well. I tell you my thoughts of the business, I never tried the thing it self nor do I ever desire to try. Such as have a desire to try it, and have occasion and opportunity of doing it, may more accurately contemplate thereupon, and so will they find what way they may most conveniently detriment their Enemies most of all by. I have laid the foundation, others must valiantly proceed on and bring the thing to a most usefull issue. However I do not doubt but that the most part of Men that shall hear me say, that there may be such

effects produced by these fiery Waters, that may equal the dreadfull Operations of Gun-powder, will mock at me, and judge it an impossible thing; nor will it be any thing strange they should, because they have not any knowledge of nature.

Before those dreadfull virtues of Gun-powder were known, certainly no body would have believed the same, had they heard it told, that it were a possible thing to hurry or throw such a great Ball of Iron, into so far a place with so little Powder. And now it is a thing so very common, that he that will not believe it will be laught at. Even so, those things I have here mentioned of moist Fires will seem extraordinarily wonderfull and absurd to the ignorant, untill they shall see with their Eyes, and feel with their hands, that the *Ticks* shall even this very Summer feel it if God permit, and vouchsafe me health so long. If God (I say) shall permit, which I would have you understand, as thus, *viz.* unless the wrath of God shall be so enkindled against the Christians, and shall therefore put a stop, and prevent the accruing of any benefit, by any help how great soever it be. For when God pleaseth to punish any Countrey with deserved afflictions, certainly no Instruments of defence will at all help or do ought.

These things was I willing to declare at present, to demonstrate in what manner the Enemies power may by such Artificial moist Fires, and a peculiar kind of Granadoes, such things as never were as yet known in the World be broken. There are verily other far greater effects, and which exceed Mans belief, that may be effected by these my newly found-out Fires; and such as are not to be written but to be revealed only unto those that are truly well Willers to the common Weal, and who study how to destroy the Capital Enemy of all the Christian World. But thus much I add, that by these Artificial, Secrer, and unknown burning and flame-conceiving Fires, far greater things may in my judgment be effected at any time whensoever one is minded, than by Gun-powder, for that it operates not afore it be enkindled with the Fire. But my Fires are enkindled and inflamed by the Air, and therefore must necessarily exceed Gun-powder in the production of greater effects, and this time will manifest.

Those common Granadoes being thrown into any City may be covered with wet Hides or Cloaths and be quenched, so as not at all to operate, but it cannot be so with my Instruments. And therefore it is not without cause that I prefer them afore Gun-powder.

'Tis not expedient to make any larger discourse concerning these matters, and to take up any more room by revealing more. I could verily in a few words so disclose these things that every one might be able palpably to feel, and visibly to see them, and so as that he would assuredly know that far greater things might be effected by these my Fires than by Gun-powder. They may together with the Gun-powder use these my moist Fires as they think good and as need requires. And I do not question but that hereafter Wars will be waged after another manner than hath hitherto been done, and force must give place to Art. For Art doth sometimes overcome strength. We will illustrate the business by an example.

When any little weak Man Fights with a bigger and stronger than himself, and they have both of them like skill in the use of their Arms, the stronger over Masters the weaker and Conquers him. But
now

now if the little Man be better skilled in the use of Weapons than the greater and stronger one is, he beats him and becomes the Victour. And when two are of equal Stature and Strength; they finite alike forcibly, and beat one another alike, just as your Laundresses that beat Cloaths with a wash Beetle, so do these lay on blows on each other with like measure. So among the Ancients did they fight Man to Man, and the strength of the blows prevailed. But when Gun-powder was found out, then a few could kill and put to flight a greater number than themselves.

And now again 'tis every where known, that Men now a days do again fight with equal hand, as 'twere, neither party having more help [by Art] than the other party hath: save that the stronger party doth for the most part get the Victory, so that the Wars in our time consist not in Art, but in the multitude and company of Men. Mean while I firmly hope that if the use of my moist Fires be but known, there will be another kind of Warfare than now is, by fighting on equal Terms with blows as the Countrey fellows do, and whereby the stronger can overmaster and subdue the weaker. But now by the help of Art, the weaker may overcome the stronger. And if so be that Art and strength concur together they are wont to be most efficacious. *David* with his sling shewed the skilfulness of his Art, and subdued that great *Goliath*, who little expected such a mischance from such a little Shepherd. And like as *Goliath* mocked at *David* with his Sling, so perhaps will the *Turk* have us in derision, should we meet him with such Water-throwing Instruments. But even as that great *Goliath* was smitten down by a Stone of the Shepherd, so may the *Turk* be easily burnt and radically rooted out by those moist Fires, if the Christians will themselves.

But some or other may here object and say, suppose some perfidious Christian should happen to lie to the *Turks*, and put such Weapons into their hands, to use against the Christians agen, what shall we do then? [I answer,] such [a mischief] may be prevented by an accurate diligent wariness, that these secrets be not revealed to every body, but to such onely as are known, and that have possessions, Wives, and Children: for such will hardly be allured or corrupted with any reward. Besides too, the vulgar will not be so easily apprehensive of all things hereto requisite, seeing the Art consists not barely in one or two, but in many things [or circumstances.] It cannot therefore be that such inventions should so easily fall into the Enemies hands, and that for several causes which I forbear to reckon up here. Nay more, if necessity should require there mought (by accurate meditation) a farther inquisition be made, whereby more such inventions mought be found out. For this may easily be effected by Men of a quick piercing Wit, viz. by their diligent search to add to what is found out and to better the same, for 'twill be a facile thing to do. For nature being so most exceedingly richly stored can never at any time be thoroughly found out. And therefore even I my self do hope in some short time greatly to augment [or meliorate] the said Inventions of mine. If God vouchsafe me life, there shall be even yet produced by me to light wonderfull things, which will miraculously promote the safety and happiness of my Countrey, and especially if I shall but find amongst Men a thankfull remembrance thereof.

Moreover, I doubt not but that abundance of Men will wonder if they shall see these my newly invented Warlike Instruments to be published in Print, which is a thing that I would never do, for I have resolved to make such onely partakers of the knowledge of the same, as stand in need thereof.

But because I have conferred with one or two (whom I thought to have borne me a loving and friendly mind) about these things, and spake to them too openly about the very business itself, they got some part of the Art itself, and saw the very Instruments in the Workmens hands whom I had taken order with about making them, and without doubt perswaded themselves that they had the full knowledge of the whole Art. Presently upon this they were become invisible and withdrew themselves, inasmuch that I suspect that those perfidious Men have repaired to the Courts of some great Men, to offer and sell these my inventions as if they were their own. Now then to meet with such treacherous perfidiousness, I thought good to publish openly somewhat concerning these matters, that so every one may know that whatever Men shall sell such secrets as their own, they were not invented by them but by me, and they have fraudulently stolen them from me. But I except those here, to whom I have revealed them to this intent, that, viz. they may make use of them against the *Turk*.

And because I can methinks prophetically as it were conjecture that these my newly invented military Instruments will be desired and sought after by a great many both high and low, I judged it a thing worth the while, to take care for the getting some of those same Instruments, and also those moist Fires thereunto appertaining to be prepared, and sent into those places, where they may detriment or annoy the *Turks*. For without doubt there may be far stronger resistance made with these newly invented Instruments against those our Capital Enemies, than can ever be done with Gun-powder. For Gun-powder is never wont to operate afore it be kindled with the Fire, which kindling and inflammation Water will hinder, and now my moist Fires are not at all impeded thereby. And upon this account it is a thing altogether possible that a fiery Globe [or Granadoe] may be as well emitted [or be as forcible] out of the deep Waters with [or by] them, as it may with Gun-powder out of the Water, the which seems indeed incredible, but yet is very easie to him that is endued with the knowledge of these things.

There yet rest a few admonitions to be given, viz. that no body pass his sentence upon these my secrets here disclosed, with a prejudiced and forestalled judgment, unless he has a mind to slur himself with an infamous mark, but let him have patience, till he of his own knowledge perceive the whole Basis of the business. Many things there be that lie as yet hidden, which (as Prophecies tell us) must be manifested before the Worlds end. This time draws nearer and nearer, though so few believe it. For my part I am verily of this Opinion, that there is such a wonderfull time at hand, the like of which hath neither been seen or heard of from the time of the Flood even to these our days. I pray God to Defend the Pious, and to Convert the Wicked, Amen.

The End of the First Part.

THE
SECOND PART
OF
GLAUBER'S
WORKS.

The First CENTURY,
OR
Wealthy Store-House of Treasures.

BEING

A General *Appendix* to all his hitherto-published Writings.

The which doth not onely illustrate all obscure places, as well in his Philosophical and Medicinal as Chymical Writings, and explain those hard places to be understood; but also do so abundantly supply those which are defective, that the learned and the unlearned, the highest and the lowest, and more, the meanest Workmen and Husbandmen, may sufficiently be able to comprehend that *Glauber* hath in all his Writings, written the pure and simple Truth, and hath again brought to light the most noble Art of Alchymy which hath so long lain hid in darkness hitherto; and hath discovered it for the common good of Mankind.

L O N D O N, Printed in the Year MDCLXXXIX.

THE PREFACE.

Courtous Reader,

THAT every promise becomes a debt, is reported by a common Proverb or By-word, and therefore to stand to ones word or promise, is a thing which procures a great Ornament or grace no less to Juniors than to Seniors. Since therefore in my Writings I have ingaged my Faith or Credit through the promising of some little Works, and yet have not been able, by reason of the scantiness of time, hitherto to satisfy the expectation and desire of very many, by publishing of the same; yea since greater Discommodities and Impediments being cast in my way, do hinder me from day to day whereby I cannot write more things, although I have nothing more in my desires than that in standing to my promise, I may acquit my credit, and set forth the said little Works; to wit, my Vegetable Work, my Work of Saturn, my Book of Dialogues or Discourse, the fourth part of my Spagyricall Pharmacopoea or Chymical Dispensatory, and my admirable little Book of the concentring of the Heaven and Earth: truly they being Treatises containing most excellent Arcanums or Secrets, and the most worthy ones whereof Men can be made partakers, notwithstanding I am of necessity destitute of time for the writing of any Treatise peculiarly, and for that cause I am constrained to insist in a nearer path, and for the sake of promoting the publick good, to send forth the said Treatises in publick by a less labour and trouble. The present Treatise notified with the Title of an universal Chest or Cabinet full of Riches, or of a general Appendix of all my Writings hitherto exposed to the publick view performs this, whereby all things which have been either the more briefly and obscurely spoken in them, are with a more clear or perspicuous illustration explained, or things that have been wholly omitted are supplied, and by the same endeavour the promised Treatises are added, yet not in that order wherein they ought otherwise to be written down, and the which order here to be observed, would administer very much trouble; but wherein all the secrets have in process of time been made known unto me, and committed to Paper. But it is free for any one to add according to his own Judgment, Medicinal Secrets unto Medicinal ones, Mineral Secrets unto Mineral ones, Chymical Secrets unto Chymical ones, if it shall so please him, and time shall also permit the same, which it in no wise permitteth unto me, every one that acquiesceth and is content with these things may consider, if a certain Cook should set a Dish on the Table filled with the best Meats, as being destitute of time, to put every sort of Meat in a several Dish, whether he could of right be angry with him, or by whisperingly prating he could dare to say, he was to be blamed as being not skilfull in the affairs of the Kitchen, because collecting so many delicate and such dainty Meats into one Dish, and daring to set them on the Table? I suppose not any one could of right complain of such a deed of any Cook; the Cook desiring to have it taken in good part, such Meats as he had, such he sets before them; he that refuseth to take of them, may use his own liberty, and may let those Meats alone, which he is not compelled to receive, even as the Cook also may be constrained by none in preparing of the same according to his own will or judgment.

The PREFACE.

Whatsoever Meat doth not please the Pallate of one, yet will not be ingratefull to the Pallate of another, but on the contrary gratefull, seeing one Food is wont to savour or relish this Man, and another the other, neither is he inordinately affected with the disdain of confused Meats, who taketh of those which relish him, and leaveth the rest for others.

Let every one that blameth these Writings do the same, not in hastily taking them in evil part, but in friendly and courteously excusing me that I have not sent them abroad in a more harmonious order.

They are like unto a certain true and great Cabinet or Chest, filled with very many excellent Secrets, being reduced into my knowledge through a successive diligent search of thirty years and so collected into one heap, that they might either be conserved for my own or at some time be made of publick use or service: out of this Chest every one shall be able to exhaust those Arcanums and Secrets, which shall please him or serve his uses.

As to what concerns my self, because I daily behold sometimes this Man, sometimes that Man being snatched away by death, to be carried forth and committed to the Earth, I may easily conclude rationally with my self, that those changes or chances will in a short time happen also unto me; I should commit a very grievous offence or errour, that so many costs, labours and troubles, of so many and so great Secrets being consumed in vain, I should carry them away with me under ground, and not bestow them for a common good: I shall here perform the office of a good House-holder, or skilfull House-keeper or Steward, who after that he hath made abundant of Provision for Winter-cloathing for himself, his Wife, Children and whole Family, if he hath as yet plenty of Linnen and Woollen Cloth remaining, he doth not cast them away, but rather casts them together into a Chest, so long to be kept, untill he shall obtain an occasion of administering them for the use of his Neighbour. In the name of the Lord therefore, in making a beginning with the opening of my Chest of Treasures, I will empty it out by little and little by degrees, and will offer it for a common use, that out of so many Treasures, every one may convert unto his own use, what things he shall judge to be profitable unto him; to wit, a Physician Medicinal things, and a Chymist Chymical things, even as every one shall discern any thing to be fit for his own use, every one of what rank soever shall find those things wherewith he might be content, so indeed that whatsoever he shall not meet withall in the first, second, or third Century may be found in the rest, for which things sake, if ten Centuries shall not be sufficient, I will adjoyn other ten or more, that so I may remove from me all those cares, and carefulnesses wherewith the custody of so great Treasures hath importuned and affected me for so many years. Like unto a travelling Woman, who with the greatest desire expecteth the hour of her delivery, and who desireth the beholding of her Fruit, do I desire that time wherein all things shall be printed in Letters. The Almighty God bestow on me so much presence of mind, health, and strength, and prolong my Life so far, that I may finish it to his Honour, and the Succour, Comfort and Profit of all Mankind. Amen.

THE FIRST CENTURY: OR

GLAUBER'S Wealthy Store-House of Treasures.

PART II.

In the Name of the most Holy Trinity I begin to write the First Century of my General Appendix, or an Exposition of all my Writings hitherto set forth.

I. Concerning Fire and Salt, and what Alchymy is.

ALCHYMY is a Science, and Art of destroying, of purging immature or unripe and impure Metals, by Fire and Salt, and by a singular Artifice, of converting the more pure part into a better form and kind, according to the words of Paracelsus, who saith, *Every Something is to be converted into Nothing, and every Nothing into Something.* Also Corruption renders that which is good perfect, the which is to be equally understood of particular and universal Operations.

Nevertheless it is not of necessity that I should here tediously treat of a particular Transmutation of Metals by Fire and Salt, because that hath been already long since performed in the second part of the Miracle of the World, and also in the fifth part of the prosperity of Germany.

A Square within a Circle.

*In the Sun
and Salt are
all things.*

II. A Demonstration whereby it is proved that Fire and Salt are most noble Creatures of God, and that in Fire there lies hid the purest Salt, and in Salt a most efficacious Fire.

THAT Fire and Salt are most noble Creatures of God I have evidently enough demonstrated in my little work concerning the nature of Salts. But that there is a subtle saltish spirit in any fire, and that between the heat of the Sun, and of our Kitchen fire, as to their saltish spirit, a great difference

doth interpose is sufficiently and over sufficiently known. But to comprehend or lay hold of, to center such a pure saltish spirit of *Sol*, to render it corporal, palpable or perceivable, and visible, remains hidden and unknown to us by reason of our sins; because God reserves so great mysteries for his own alone, of whom he is honoured and feared: for God himself useth no better similitude than the fire, whereunto the Ancients exhibited divine honour, and by the help of the same, perfected all their Sacrifices: So among the *Caldeans*, Fire, and God are called by one and the same name of *Esh*: and among the *Heathens*, the chief Philosophers, yea *Hermes* himself thought the Sun to be a God, and worshipped it for a God. These things are found exprest by *Mutius* concerning the nature of Gods, and therefore those things are not necessary which may be here repeated. Yet that is well to be noted, that God hath always appeared to his Saints under the shew of fire, and hath talked with them out of it, it being that which is full of the greatest mysteries, yet observed but by a few, as in a peculiar little work concerning the concentration of the Heaven and the Earth I will more plainly and fully declare. I affirm therefore, that it can scarce be, that the admirable, yea incredible nature of fire should be described without the revelation of the highest or greatest mysteries of God. Therefore it is better that such Secrets are passed by in silence, than that precious pearls should be cast before Swine, who are wont to receive them with laughter, and proclaim that they are nothing but the mere sophisteris of triflers, even as is evidently manifest from the description of *J. H. S.* of the Philosophers Stone, wherein Nature, he saith, makes not use of Glasses, Vessels, Fire, Salt, Urine, and the like in the bowels of the Earth; and the universal *Elixir* may very fitly be prepared by him, who also hath not handled any Chymical Labours,

hours, or was never busied about Fire or Salt: Let it shame the man of such stinking lies, wherewith he endeavours to cover his own ignorance, I on the contrary affirm, that all those that know not how to handle Fire and Salt, do in very deed know nothing, but do give credit unto those things only which they hear, or read in others writings, and also for that cause are unworthy of the name and title of true Philosophers; for true Philosophy is to be thoroughly or perfectly learned by the help of Fire and Salt alone, the which God willing shall be more evidently demonstrated.

III. *It is moreover demonstrated, that in all Salts an admirable Fire doth lurk as being laid up therein, through the endeavour wherof very many admirable things may be perfected as well in Medicine as in Alchemy, and also that it may be altogether performed, that out of Vitriol the Stone of the ancient Wise men, out of Salt Peter a Spiritual Gold, and an excellent yellow tincture, and out of common Salt the true Pearl of the Philosophers may be prepared.*

IN all Salts, that a most potent Fire doth lurk as being laid up therein, those have best known who have the labours of the fire thoroughly viewed and certainly known. For through the efficacy and operation hereof, salts are reduced unto a fiery force, or power, or unto a moist fire, out of which they before arose, after the laying down of their earthliness, yet one salt draws out one fire far unlike to the fire of another, so that this is volatile, the other is fixed, and remaining constant in the fire; another is partly volatile and partly fixed, even as the operation shall procure this or the other property unto them, yet all such fiery salts may by the benefit of Art be concentrated, and made more efficacious than they were made by some one distillation. For example sake. If any one beholdeth Vitriol, and considers of the nature thereof, he shall in very deed certainly find that by the help of a strong fire, there may be allured or extracted out of it that which was in the beginning, to wit, a fiery spirit, which by the aid of external fire, being reduced into a narrow Central room, or Concentration, draws out that internal fire, uncloathing it self of, or displaying so great virtues, that it reduceth into a Coal all things which it moisteneth or encompasseth, even like as if it had been burnt up by common Kitchen fire, or by Glasses receiving the Sun-beams and burning up all things that are objected against it. Concerning these fiery salts, and the preparation and use of them, I being here to deliver a few things, I will take my beginning from the fire of Vitriol, and the preparation of the same, the various and manifold use whereof shall be afterwards explained in its own place.

IV. Of the Preparation of the Fire of Vitriol.

Retorts made of the best earth do draw out the fire of Vitriol by distillation after this manner following.

Common Vitriol is calcined in earthen pots unto a redness, and reduced into a powder, it is put into an earthen Retort, and placed in a Furnace, and a great vessel adjoynd to the neck of the Retort, which is to receive the spirits going forth; the fire is kindled by degrees, and so gradually increased untill the Retort be brightly red hot, in which degree of fire it is so long to be urged untill no white Clouds

or little vapoury Mists do any longer appear. This operation is perfected in 24 hours space at the most. But if the Retort shall be very large all the Oyl cannot be extracted in the space of 24 hours, but will require a longer time for the operation, which experience it self will determine: after all the Spirits are distilled off and settled to the bottom of the Receiver, the clay luting which joyned the Receiver to the neck of the Retort is to be mollified with a wet cloth put round about it, and the Receiver taken off, and the spirits poured out of it into a glass body well coated with Clay, the which (having an Alembick put on) is to be let in sand, that the volatile spirit may slowly and gently be drawn off, and kept for its use afterwards to be taught. Also afterwards the phlegm is to be drawn off, and reserved for its own uses, because it hath its own peculiar virtues. At length also the last spirit is to be received in a peculiar vessel, the which, after that it hath ceased, and fiery drops do follow, the fire is (by degrees) to be removed, and when the sand is cold, the gourd is to be taken out, in which (the Alembick or head being taken away) thou shalt find a fiery Oyl of a black or somewhat reddish colour, the which is again to be rectified in an open fire in a Retort well coated, that it may be rendred more fiery and clear.

By this oyl admirable things, and those not only profitable for Physicians but also for Chymists, and other Artificers, are perfected as we shall straiway see.

There are indeed other ways or means also by which this oyl is attained, but this afore taught is the easiest of all, although it require the more time. But if any one stand in need of a greater quantity of the same, he may procure those greater Cans prepared of the best Earth, they being so joyned to each other, that the uppermost being placed on the fire, the rest might be placed without the fire, so that the lowermost may receive the oyl going out by descent.

V. *A proof whether this Oyl of Vitriol be well prepared and strong, and fit enough for that operation of which we here treat.*

LET down a quill or some small piece of wood into the Oyl, the which, when thou hast left in it for some small time, draw it out; if it shall be burnt unto a Coal the oyl is well prepared, but if not, it is a sign that somewhat of moisture is as yet therein, which is again to be expelled by fire.

VI. Another tryal or experiment.

DIP in the oyl a piece of woollen, linnen, or which is better a piece of cotton cloth extended to the breadth of a finger, and pour on the same being taken out and laid down some drops of the spirit or oyl of Turpentine, the which if being kindled they shall conceive a flame it is a sign that the oyl was well prepared.

VII. Another further Proof.

POUR into some little glass some small quantity of spirit of wine wanting all phlegm, and pour on the same some drops of this oyl by little and little; and if the spirit of wine kindle and burn all away the oyl is prepared after a due manner.

NB. I admonish that every one doth warily handle

dle this operation: for in these two fires, to wit, saltish and sulphureous ones, there is great virtue hidden, the which seems probable but to a few, if it should be manifested unto them, neither that have I consulted or decreed that it should be made known to very many. These few particulars do sufficiently teach what sort such fires are to be used in Medicine, Alchymy and other Arts; but these experiments are sufficient.

VIII. Concerning the use of this Fire of Vitriol in Medicine.

THE use of this fire, as also of the volatile spirit of the same, and of its slegm, thou shalt find described in the second part of my Furnaces, and among other Authours; so that the repetition thereof is here superfluous, this is onely to be known that this fire being onely besmeared or anointed with a feather on all incurable and Cancerous or eating Ulcers, kills the Poyson, and causeth that such Ulcers do very easily admit of cure, if so be the Escharre be first removed by the applying some ointment or emplaster which cures adulation or burning. For this oyl burns up all wild or foreign flesh, and that which (as proud) lifts up it self with an abounding poyson, like unto a certain bright burning Iron, and separates all evil and hurtfull flesh from the good and sound flesh.

IX. Of the general use of this Oyl in Alchymy.

BY this mineral fire, all kind of Transmutations of things are perfected, but particularly it exalteth some of the more base metals into a higher degree, and makes them more constant, of which more shall be said in the following Chapters or Treatises.

In the general, some Vegetables, Animal and Mineral subjects, may by the operation of this Oyl be reduced into fixt Medicines, and indeed far more commodiously than by the common fire of Wood or Coals. And moreover which is a far greater thing in this very oyl a fiery Tincture is hidden, and is manifested by the benefit of Art, as Fryer *Basilus*, and other Philosophers do affirm.

X. Of the use of this fire in other Arts.

BY the virtues of this invisible, and yet essential fire, all sorts of most profitable matters are performed, the which notwithstanding is not here safe for me to describe, but I am constrained to refer it till another time, it onely in this place seems worthy my labour, briefly to shew that this fire performs all those things which the fire of Coals is otherwise wont to effect.

Truly it is a fire, but it shineth not like the fire of Wood or Coals: But he that will have it to shine, he must needs add unto it a subtiler or finer Sulphur, that he may extract or allure forth of it a visible fire.

This fire being defended against the entrance of the Air, remains occult for many thousands of years, and doth not manifest it self, unless any one make it manifest.

Truly it is an admirable fire, and most fit for the effecting of many incredible things, whereof we have spoken many things sufficient for this time.

XI. An evident demonstration of such a fire lying hid even in the Salt of the Kitchen, and that known to every one.

AFTER that Plato and many other Philosophers took notice that nothing endowed with life did consist without Salt, and that dead Carcasses themselves were preserved for a long time from putrefaction by the virtues of the same; they thought and wrote that a certain divine thing lay hid in it. But after what sort this divine and hidden thing is to be made visible, they have not taught. But without doubt, those most wise Philosophers would by this word shew and denote something of a singular excellency.

Because therefore God himself is a fire, and hath never appeared to his Saints in any other shape but that of fire, and besides also all Salts are generated in the moist bowels of the earth from an Astral fire, and on the contrary, a true fire may by the operation of Art be extracted and rendered palpable and visible out of all Salts, it being that which without doubt lay not hid unto them, therefore it is also very likely that those Philosophers have not without a cause of great moment written that a certain Divine or fiery Being did secretly lurk in Salt.

But that they have initiated not any thing to be better, or more noble than that fiery and saltish Spirit may be foreseen by an easie conjecture; for if a certain divine thing shall lie hid in Salt as they write, it shall of necessity follow that that divine spark being freed from all its earthly bonds should be far superiour to all earthly things in beauty, virtues, efficacy and power; and that next to the eternal God himself it should remain the chiefest and most precious Pearl in the World.

But who shall teach us the manner of separating so precious a Pearl out of the common and Kitchen Salt? none but God alone, or some good friend; who can make his friend a partaker of the knowledge received from God?

But since that very few mortals do seek, love, fear and honour God with sincere hearts, but do much rather cleave fast unto the frail and unjust Mammon, and attribute divine honour unto the same; its no wonder that God doth reserve those things to himself, or at least doth sparingly bestow on us those things which he abundantly supplied the Ancients withall from his own bountifull hand: And moreover the same omnipotent Creatour enlightening some fit subject, with a certain spark of nature, grants unto him also so much wit that he knows that by a due silence he is to beware of this wicked dreg or dross of the World. Whence it is no wonder that the light of nature is at this day made known to so few mortals.

But before I treat in many particulars of that precious Pearl of Salt, it seems altogether necessary for me, first to shew the manner and reason of extracting that fire out of Kitchen Salt; the separation whereof can be perfected in no other respect than through the violence of common fire, to wit, when as the Salt being mixt with a certain earthly matter that it cannot flow, is urged in a retort with a most strong fire, that the more pure part of the Salt, which is nothing else but a sharp spirit, may depart into the Receiver joyned to the Retort, in which sharp and sweet spirit a most efficacious fire lurketh which in manner following is to be extracted and concentrated.

XII. Of

XII. Of the preparation of the fire of Salt.

TAKE of this acid or sharp spirit of Salt, rectifie it out of a Glass Retort in sand; the flegm will come over first, which was put in the receiving Vessel in the first Distillation to condense or collect the spirits the more commodiously. After that all the flegm is come off, and acid drops begin to come, remove or change your Receiver, and take your spirits therein; continue the Distillation so long untill all the spirits be come forth, it being indowed with an acid sweetness, is an effector of very many operations, which doth bring much profit both in Medicine and Alchymy, as is manifest out of diverse of my writings, and especially out of the 2d. part of my Furnaces, and the comfort of Mariners.

In this sweet and sharp spirit like Wine there is an infernal fire hidden, which doth equally like Coals burn up all things put into it, like as the fire of wood and coals doth Vegetables and Animals, and it reduceth all things which common fire doth, by calcining them into ashes, such as are immature metals, tin, lead and the like, which when they are put into it, it burns them up by calcining them into white ashes.

XIII. A Concentrating the rectified Spirit of Salt into a moist and cold Fire.

EVERY Spirit of Salt consisteth of two things, to wit, Fire and Water, which water the fire doth so firmly co knit to it self, that it cannot be wholly separated by any distillation or rectifying; but it always adheres to the fire, how often soever it be rectified or distilled: if any one therefore desireth by rectifying to separate them he must of necessity put immature metal-like subjects to the Spirit of Salt, the which, by how much the more immature or unripe they are, by so much they render the spirit of salt the purer; such are *Lapis Calaminaris*, *Zink*, and *Iron*, which by reason of their moist and attracting nature, do draw to them that invisible fire out of the spirit of salt, as it were that agent whereof (as to their maturity or perfection) they are necessarily destitute, and without which fiery agent, a metallick kind of body is able to attain unto no perfection in the earth.

Such metallick subjects therefore, the spirit of salt, they being put into it, assaulteth, and as much as it can dissolves them. This solution being distilled out of a glass retort by sand, with the more gentle fire, sends forth nothing but a meer and unfavoury phlegm, the fiery essence it self remaining with the mineral in the Retort, the which if it be more and more urged, and the fire more increased, that it may become plainly burning bright, then that mineral cannot longer retain the fire of the salt, but dismisseth it, which descending into the receiving vessel, is condensed into a thick and fiery oyl, which is afterwards to be kept in strong and well stoppt glasses, because it fumes without intermission, and desires to return into the air, as it were its Chaos from whence it came forth.

This fire is the operator of great effects in Alchymy and Medicine, of which effects very few have known how to discourse. But it hath far different properties and qualities from that which is extracted out of Vitriol, whereof it shall be afterwards treated.

And although through the help of this fire, incredible things may be performed as well by Chy-

mists as Physicians, and other Artificers; yet it is a consuming, destroying, and also a ripening fire; neither hath it the least of the most noble Pearl with it whereof we have made mention above, and the which in this preparation is converted into such a fire.

That Pearl, if it should be extracted or allured out of Salt, in my simple opinion it were to be extracted not by the benefit of the fire, but through the endeavour of metallick and attracting subjects.

But although I do not profess my self to be so skillfull a Master, and do not arrogate to my self the knowledge of so precious a pearl, yet I cannot but bewray that small little spark of Nature which God hath granted unto me, that so every one may have a clear knowledge and sight of what admirable mysteries Salt doth hide in its own vile body.

XIV. The manner whereby that most precious Pearl of Salt may at least wise in some respect be rendred conspicuous or apparent.

EVEN as I have admonished in my foregoing writings, that the powers, colours, and virtues of all Vegetables, Animals, and Minerals are found concentrated in Fire and Salt, so also I now affirm and assert the same thing that by Salt through the benefit of Fire, all Vegetables, Animals, and Metals, may in their own species, nature and properties be increased and propagated into an infinity. So that we have the seeds of them.

For example sake. I prepare Kitchen Salt by the fire, that its tartness being lost, it puts on the nature of an Alkali or Lixivial Salt, I mix some parts thereof with some barren earth, or with naked sand, the which I moisten with water, in these I sow the seeds of vegetables, that they may be nourished by that Salt and may grow, which in thus growing do obtain their own proper figures, virtues and colours, they appear green, yellow and red, sky-coloured, purple coloured, and white, &c. and have a sweeter, sour, sharp, bitter, savour, even as God hath bestowed on every particular kind its own proper nature, which operation proceeds from this one onely Salt, and the fiery beams of the Sun being tempered with air.

When therefore Beasts are fed with these Herbs growing, and receiving nourishment from the Salt, they are of necessity also nourished and increased by the same; even as also the same Herbs growing from the same Salt do supply nourishment and increase themselves.

But if any one could obtain the true seed of Gold, and increase that seed by the help of Salt and Fire; he might (without doubt) obtain great plenty of Gold, but God will not have it that the tail of the Goat should be as long as the Cows, the which being lifted up with too much pride, would strike out her own eyes with her too long tail.

If therefore all things and Gold it self, as also Silver, Pearls, and precious Stones, are after an invisible and occult manner hidden in Salt, and may by the help of art and nature be rendred palpable and visible; why also might it not come to pass that the most excellent Medicine and most precious Pearl of the wise men might be allured forth out of the same Salt? Truly common Pearls are bred out of Salt waters, wherein if the first matter of Pearls were not, after what manner or sort should they bewray themselves out of the same? Therefore that it may evidently be made manifest, that by the operation

ration of art, also Pearls may be extracted out of Salt which do far excell those Pearls, which by fishing are drawn out of the depth of the Sea, in beauty, virtue, efficacy and excellency; I will prescribe as much indeed as hath been granted unto me, for demonstrating the possibility of the thing, a certain manner whereby every one shall be able to take to him a firm and sure foundation of weighing or considering of the matter more exactly.

XV. *An operation of alluring forth a Philosophical Pearl out of Salt.* *Pl. 43. B.*

Dissolve thou in common water, as much of common Salt as thou wilt, by how much the greater plenty thou shalt take, by so much the more thou shalt obtain.

In like manner dissolve in *aq. fort.* one or two Ounces of Silver, pour this solution of *Lune* on the dissolved Salt, and stir both the dissolutions up and down divers times, that it may become white and like unto Milk. For Silver cannot well indure the Salt, but departing from it is precipitated to the bottom, and there resides, in the form of a snow-like Powder, which by the effusion or pouring off the water is to be separated and dried.

This silver powder hath extracted a spiritual and philosophical gold, or the said precious Pearl out of the Salt Water. Because *Diana* hath known no less how to fish Pearls in the Salt Sea, than to hunt wild Beasts in the green Woods: But that Pearl is made corporal and visible in manner following.

XVI. *How the Pearl being attained is made visible.*

It is to be noted that that silver powder being thus by it self, and without an admixture of other fixed Salts, doth very hardly by fusion return into its former form of silver, but that it flows like Salt, and pierceth any vessel whatsoever, yea doth depart into a smoak. For the spirits of the Salt do render the silver so fluid and volatile, that it is made altogether mercurial; and therefore its more tender and noble part may be separated from its more gross part by distillation, if this could be done by glassen, or earthen, or metallick vessels.

When this mercury of *Lune* is melted in an open crucible, it vanisheth into smoak. It being put into a Glass Retort, refuseth to yield to the fire, the which being too much increased makes the glass to melt, and destroys the glass together with the silver. If earthen vessels be used, the same mercury pierceth the same unhurt like oyled Leather, when it departs, the Salts also depart into smoak, and do leave little grains of silver adhering to the vessel, whereof in this respect there is made a loss, which renders the sublimation void.

Of Iron vessels also here is no use, because of the Salts that are admixed with the silver rising up against the Iron, they dissolve the silver reduced to its ancient body, and besides a little spirit of salt they send forth nothing, so that no separation is made, but the pure and impure do remain co-mixt.

For the sake of avoiding those discommodities I have tried many ways and manners in vain, and at length I took notice, that if such a matter be added to the most penetrating mercury of *Lune*, which may so hinder its efficacy of solving and co-melting, that it may be changed into a porous lump, than that, through the benefit of fire there might be an easie separation

thereof, which without this help doth most difficultly exist.

In the name of the Lord, therefore adjoyn thou unto thy fishing Net; that is, unto the mercury of *Lune*, such a matter in due weight and measure which admits not of melting, and which suffers not the mercury of *Lune* to conflux, or melt together. Such are wooden Coals being reduced into a fine powder, with the which being mixt with the mercury of *Lune*, thou shalt fill thy distilling vessel, whether it be earth, or iron, or glass which is the best of all, even unto the half part, and shall set it in the fire, the which is to be gently increased by degrees, until the glass become burning bright, keep the vessel so long in this heat untill all the spirits are departed, which ceasing, thou shalt take away the vessel being cold, in which thou wilt find the remainder of the mercury which did not ascend, reduced into a corporal or imbodyed silver, or at least wile such, to which adding a little borace is easily reduced into silver, the which doth contain somewhat of gold; but keep thou that subtil and pure matter, which ascended in distillation as a precious treasure, and meditate after what sort, or by what means thou mayst be able to fix this precious Pearl; and convert it into a fusible, or flowable, and piercing stone.

But in what respect, or in what manner this thing is to be done, in very deed I cannot tell, because I am he who have not hitherto had leisure, nor time of perfecting that thing, and therefore I have been willing here to shew onely these things which I have seen with my eyes, and handled with my hands.

Another shall be able by his own judgment to make tryal, and to see what God will bestow upon him, I have shewn in stead of the mercurial Statue or Image, that which shall suffice at present.

XVII. *A more easie manner of obtaining a Philosophical Pearl.*

If thou shalt be desirous of obtaining a Philosophical Pearl after a more easie manner, thou must of necessity thus operate.

Unto half a Loton, i. e. two drams of the mercury of *Lune*, add a little of the powder of Coals, and put the conjoynd matters into a small glass, the which set in a crucible encompassed with sand unto that height which the matter in the glass itself shall determine. On the mouth of the glass put a small piece of some glass that it may be well covered, and so place thou a less crucible with the upside downward upon that little glass, that its (top) utmost and highest bound being overwhelmed with the said sand may drive away all air from that little glass.

Set that crucible being in this manner co-fitted, and containing the little glass shut up between them in live Coals of Wood, and make them bright burning hot, that that may remain fired for a quarter of an hours space, then let them cool, and thou shalt find a little lifted up by sublimation, the rest being melted by borace, will afford a silver impregnated with gold, yet without gain, the which demonstrateth onely in the space of half an hour, what may be done: but what gain may be obtained by this very operation shall hereafter be shewn.

Furthermore it is here to be seen how most beautiful a Pearl doth bewray it self, although very little of it come forth, because in this labour no small part thereof flies away into the air, and sheweth onely its colours alone in the glass, far more beautiful than gold, silver, and precious stones; if any one shall

rightly

rightly operate, neither shall there be any Painter who shall express it by imitating and painting.

For this time take what hath been spoken in right and good part, and immediately weigh thou so great a thing the more exactly, pray, labour, seek, and in seeking thou shalt find such things which thou couldst never before have believed.

The Brethren of ignorance, my enemies, will here object against me, and say, that these most elegant colours have drawn their original from the silver: unto those I briefly answer, That they were indeed extracted out of the Salt by the help of the silver, but that they do not (*per se*) or by themselves pertain to the silver, for if they were of the silver they would also be solved by *aq. fortis*, the which, since it is not done, they are not silver, but the meer *Anima* or Soul of the salt. That this thing may be confirmed by a more evident argument, I bring the solution of Saturn or Lead, the which it self also can fish out the same Pearl from Salt, without Silver. If any one shall operate after the same manner which I but now shewed, I also add this, that I am hereafter to reach a way whereby Saturn may be able to fish pure simple gold out of all salts.

Let us now return unto the moist and cold fire of the Philosophers, and see what an admirable fire God hath hidden in Salt Peter.

That a most potent fire doth lurk in Salt Peter is not worth our confirming by any argument. That horrible Gunpowder which shakes or rends all things asunder proveth the thing most manifestly, and *Aq. Fortis*, which dissolveth and destroyeth all Metals, yet another fire of far more powerfull virtue is hidden in the same Salt, which very few have known and beheld, and the which we will here make manifest, for the honour of God, and the profit of all mankind.

XVIII. Of the preparation of the moist and cold fire of Salt Peter.

Take of Potters earth being without sand, and burnt, 2 parts, and 1 part of Salt Peter very well purified, with both these matters being reduced into powder and well mixed together, fill a glass retort well coated with clay, put it in a Furnace for distillation, and joyn a Receiver to the Neck of the Retort, into which put as many pints or pounds of water as there were pounds of Salt Peter mixed with the earth, that the Spirits going forth may so much the sooner be condensed into moisture, after thou hast exactly joyned and luted thy Receiver to the neck of the Retort, with a due lute (or clay) kindle a fire according to Art by degrees, and the spirit of the Salt Peter (representing a yellow or red mist in going forth) will joyn it self to the water placed in the Receiver.

All the Spirits being come forth, take off thy Receiver, and separate them from the water, put this sharp spirit of Niter into some strong glass: it being by distillation freed from its superfluous phlegm and rectified, is applied unto Medicinal and Chymical uses: concerning the operations and virtues whereof there is mention made in the second part of my Furnaces, and in the Dispensatory of *Sebroderus*. Moreover, the manner of extracting and concentrating a fire of this spirit is this.

Pour this spirit of Niter on the powder of *Lap. Calaminaris* or *Zink* reduced into small little grains that it may dissolve as much as it can: and when it will

dissolve no more in the Cold, place the glass in hot sand that it may dissolve more of the matter, filtre the solution and by sand draw off all the phlegm in a glass retort; the phlegm being all come off, change thy Receiver, and increase thy fire and drive out a fiery oyl, which oyl thou shalt keep well stopp'd, because it unceasingly fuming would wholly vanish away in the Air.

This fiery smoke of Salt Peter, as also that of Vitriol, and common Salt, burns up all Herbs, Grass, Leaves and Flowers, and whatsoever it toucheth, just as if they were burnt with a strong heat of the Sun or Fire.

And this is the preparation of the moist and cold fire of Salt Peter, of the use and efficacious operation whereof in Medicine and Alchymy, it shall be more exactly and fully treated on in the following Chapters.

XIX. Of the moist fire of Allume.

Allume also by the work of Distillation and Concentration yields an efficacious fire most like to that of Vitriol, in efficacy and virtues, but the plenty doth not answer by reason of too much earth wherewith it abounds, yet if somewhat of the other Salts be added unto it, it rightly and orderly bestows its fire.

XX. Of the moist and cold fire of Sulphur.

Although Sulphur finds not a place in the order of Salts, because it refuseth the solving in water, yet it contains a vitriolated salt laid up in it, which doth not manifest it self before that the more fat substance thereof shall be withdrawn by inflaming, by the operation whereof the salt is attenuated or made thin, and is carried on high by the flame like a sharp smoke, so that this sharp sulphureous spirit burns all things which it toucheth, after the manner of all those fires which are drawn out of salts.

For the attaining this vitriolated and sulphureous spirit the flame of the sulphur is to be received, in a certain Alembick made of glass or earth, peculiarly for this operation, wherein that vitriolated spirit of salt condenseth it self, and issues forth like a thick fat, and fiery oyl, not unlike to that which is made of Vitriol, whereof it is treated on in my Furnaces.

All these things do very evidently confirm those particulars, which I have many years ago committed to memory: concerning Sulphur and Vitriol, to wit, that Sulphur is the original of all metals, and that no metal at all is digged out of the earth, which hath not either Vitriol or Sulphur, or for the most part both adjoyned unto it, for no sulphur is destitute of vitriol, nor vitriol of sulphur, so that both of them do challenge the rise or birth of any kind of metals whatsoever unto themselves. And every sulphur is by its own proper agent or vitriolated salt, which it hath in its possession by nature (whereto the central fire of the earth is an assistant) excocted or boiled up more and more into a metal; neither doth this universal agent or vitriolated salt depart from the farness, or its patient, untill the farness together with the agent shall depart into a malleable metal, or a metal that undergoes the hammer. Lead, iron and copper, do make this thing manifest, which metals do never appear without vitriol and sulphur, and that for this cause; because they being as yet unripe and imperfect ones, do stand in need of their agent.

A less

A less plenty of Sulphur or Vitriol is found with silver, than with Copper.

Gold hath little of Vitriol or Sulphur, yea plainly none at all, if it shall attain to its highest maturity, because it is then found to be pure and malleable, and wants not a further fusion or melting, but by how much the more of Copper, Gold, and Silver have, by so much the more of Vitriol or Sulphur they have, as also require the more time for their excoction and perfecting.

From these particulars, it manifestly appears in what respect metals may in a long time be generated in the bowels of the earth by their first principle, namely Sulphur; and may be ripened to perfection, by its own Salt, or agent, which it hath in its possession.

If nature doth effect this in a long time, why also may it not come to pass, that art should perform the same in a shorter time?

But let these things that have been spoken be sufficient, he that understands not, nor also perceiveth the scope or mark, which I so clearly shew is blind, and doth not admit of a remedy for his blindness.

Truly I judge these few things, (but yet such as shew a most long way with a most shining Torch) to be sufficient concerning the moist and cold fires of minerals, by which the ripening and perfecting of metals, are to be perfected as well by nature in the bowels of the earth, as by art above the earth.

N. B. If therefore a mineral may by the help and impulse of its own vitriolated Salt, wherewith it is endowed, be ripened from its vile form and lowest degree unto a better, and at length unto the best of all, that is, unto the purest gold, it being that which none (that is seasoned but with the least knowledge of natural things) will deny.

Also if such a Sulphur is hidden in any vegetable, which answers to a mineral Sulphur in its nature and properties, why also might it not come to pass, that this same Sulphur might be perfected into mature gold, alike equal to the other? from hence it most evidently appeareth that in any Herb, although the most abject one, which is promoted by the Sun unto its maturity, a spark of the immature beams of *Sol* may be found, which through the operation of art, are to be changed into pure gold. But after what manner such a Sulphur may be extracted out of any Herb or any Wood whatsoever, in all things like to a mineral one, I have long since delivered in my little work concerning the nature of Salts, and in the second part of the *miraculum mundi*, and below I will demonstrate by a much more clear manifestation.

Let us proceed to Animals and Vegetables, and consider whether in these very things, such a ripening fire may be found, and may from thence also be drawn and made visible.

But we must know that no small living creature or small Herb can grow, live, and receive, increase without a certain fiery and Salt Agent; the which although it cannot be believed by any one that is lifted up with pride, and of a stupid brain, yet it in very deed existeth, and can easily be demonstrated by the hand of the Artificer.

XXI. A most powerfull manner of extracting a fire out of any Wood, or any Herb whatsoever, and of rendering it palpable and visible.

FILL some glass, stony, or earthen distilling vessel with any dried Wood or dried Herb, and

distill off the Vinegar or sharp liquor from thence, and separate the Oyl from it; and pour that sharp liquor on *Lapis Calaminaris*, *Zink*, or ashes of lead, which matters do diminish all the unfavoury moisture in distilling, and retain the whole sharpness with themselves, the which being distilled from thence ascends like unto meer fire, it being of great use as well in Medicine as Alchymy, whereof mention shall be made hereafter.

But here it is to be noted that this fire extracted by distillation, is onely a part of that fire of the Wood and Herbs, and that the other part remains in the Coals thereof, which is far more fixed than that which ascended, and is that Sulphur which we spoke of but now, which wholly answers to the nature of a mineral Sulphur, and which may be extracted out of the Coals being solved by *Sal. Mirabilis*, which shall be taught and manifested in the following Chapter.

For if there were no fire in them, after what sort should they burn and draw out heat? all Coals being converted into ashes, after that their hidden Sulphur hath done its office, the feces of the Wood remains like dead ashes, wherein as yet lies hid a certain singular vegetable fire, being altogether of another nature, and wholly contrary to that which ascended in Distillation. This water being extracted out of the ashes presents a *Lixivium*, the which by decoction exhaleth all the moisture, and leaves the rest a fiery Salt, whereof in the second part of my Dispensatory. If it be made hot without fusion, or melting, it becomes the more fiery, so that it being bound to the skin for some hours in the bigness of a pea, it burns a small hole therein as if it had been burnt with a bright burning iron. And therefore Chyrurgeons make use of such fires that they may open unripe Ulcers, or make Issues.

It may be seen by these particulars that in any Wood or any Herb, there are also fires of divers kinds, the which also are found in living creatures, they being partly volatile and sharp, and partly fixed, and obtaining the nature of *Alcalies* or *Lixivial* Salts.

Both Salts or Fires, after they are conjoynd they lose their fiery nature, and get unto themselves another quality and property; to wit, a middle one, and these two contrary fires become an essential tartarous Salt, and sweet in use, wherein no fire appears, although that fire being turned out and in by art, may be again extracted and made visible.

Concerning these wonderfull changes of nature, and conversions out of one species or particular kind into another, many things are found up and down in my writings. In the first part of the continuation of the miracle of the World, it is manifestly described after what sort a plenty of such fire may be attained out of Woods, but the concentrating thereof is here delivered. In general it is here to be noted, that one Wood or one Herb doth more abound with such a fire than another. But by how much any Wood or Herb is the elder, and by how much the longer the Sun-beams have operated on it, by so much the more of fire is in it, as is manifest from the Vine; which hath received plentiful Rays of that sort, and therefore excels all other vegetables in the greater and stronger fire, as appears not onely by the burning spirit, but also the tartar, or tartarous Salt thereof, which is almost all fire, and yet without Distillation and Calcination it cannot be manifested.

That therefore it may be brought forth into open view,

view, and be rendred visible, we must make use of the following operation.

XXII. *The manner of manifesting the fire of the Vine.*

FILL thou a Glas Retort with common Tartar, and distill forth the volatile spirit and oyl, the which thou shalt separate after a due manner. Great virtues are in this oyl, whereof I have made mention in the second part of my Furnaces. The spirit is to be rectified in B. that the fiery substance onely may depart, and the unprofitable slegm remain behind; the rectified spirit is to be poured on the fixed Salt, (residing in the Retort, which must be first calcined by a strong fire and made fiery) and from thence again distilled, that the fixed Salt may retain the rest of the unprofitable slegm, and the spirit attain the greater fiery virtues for the performing of wonderfull effects in medicine, the which my writings do teach.

XXIII. *Another manner of extracting or drawing forth a far more stronger fire out of Tartar.*

Dissolve thou that Alcalized Salt from which the spirit was abstracted in rectifying in a little water, that it may become a very sharp *Lixivium* or Lye; pour one pound of this *Lixivium* on two pounds of white Tartar in a Gourd, and that being reduced into powder, put on a head which being well luted on with clay, set it in sand and kindle a fire by degrees, if thou shalt rightly work thou shalt obtain a most subtile fire, one drop whereof doth burn the tongue, as if it had been touched with a burning Iron.

How wonderfull things may be effected by this fire, I have already shown in other places of my writings.

XXIV. *A manner of drawing forth as yet a more vehement fire out of Tartar.*

TAKE of crude Tartar and the *Regulus of Mars*, or the purest metallick part of iron, the scoria being separated, equal parts, the which thou shalt mix by beating together, put them in a crucible with a cover to well fenced with clay that it may admit of no air, keep them in a bright burning fire for the space of an hour, then take them away.

From all these particulars it is made known to every one that a vehement fire lies hidden in vegetables readily serving for the effecting of many admirable things in Medicine, Alchymy and other arts, from the declaring whereof the shortness of time and this treatise commands us at this time to cease. But moreover we must see whether living creatures also are potent in the same fire, and in what respect any one may be made partakers of the same.

XXV. *The preparation and Concentration of fire out of Animals.*

AS the Vine is the most noble of all vegetables, so man also is esteemed by all that are indowed with judgment to be the most noble of all Animals, or living Creatures; the truth whereof the thing it self affirmeth by a plentiful Testimony.

Therefore we pass by all other Animals in silence, and do here shew (by the following manner) the preparation of that fire onely that lieth hid in Man.

The Ancient Philosophers have called the great

World, *Macrocosmus*, and man as it were the lesser World, *Microcosmus*, and a comparison being made, they have determined that what things are found in the great World, the same are to be found in the lesser World, that is in Man.

From whence also they unanimously believed, and also committed to memory, that as well the life of the greater, as of the lesser World, doth consist in a saline and saltish spirit, and that this spirit doth bear rule in one place more, in another less. Neither is there any one also who will or can deny, that the whole earth is filled with Salt as it were its Balsam; and that minerals are alike equally bred thereby in the very bowels of the earth, as vegetables are in the Superficies.

Yet notwithstanding the Salt of the great World is no where more plentifully found than in water, or in the Seas; the which as it is a thing most known, it needs no confirmation. The same thing is to be understood concerning the little World, viz. Man, and although the whole body in all its parts abound with their true Balsam, yet a greater plenty of this Salt and Balsamick spirit, is found in his flesh than in his bones, a greater plenty likewise in his blood than in his flesh, but the greatest plenty in his Bladder, or in the Salt Sea of the lesser World, the which is hidden to none, but it is the custom not to seek necessary things in remote places, but in places nigh where they are most easie to be found.

Hence because a more plentiful Salt is no where found in man than in his Urine, we of right lay hold on an occasion of seeking and concentrating the fire in the same, and we make use of the following preparation.

XXVI. *The operation of preparing a fire out of man's Urine.*

I HAVE at large delivered this operation in the second part of my Furnaces, whither I refer the Reader; where he shall not onely find a manifold composing of this fire, but also its various use in Medicine.

But although it be needless to describe that operation there repeated, yet it seems meet to me (for a more evident declaration's sake) here to adjoyn some admonitions which concern it.

XXVII. *Observations which concern the preparation of an Animal Fire.*

SUCH a fire is for the most part drawn forth out of man's Urine being putrified by it self for the space of some weeks, and is by rectifying converted into a moist and fiery essence as the second part of my Furnaces sheweth; I have there taught a more easy manner of drawing forth the same fire out of *Sal Armoniack*, which is prepared out of Urine, and by the addition of a strong *Lixivium* it is distilled and rectified.

I have also taught the manner of preparing the same fire out of *Sal armoniack* by the Addition of *Lapis Calaminaris*, by distilling it through a Retort.

Spirits rightly prepared after these manners are equally profitable in Medicine, Alchymy, and other arts; because they are those which being well made are all of them good, after what manner soever they may be prepared.

But although these volatile animal fires do readily serve for the performing of famous and notable things (and the fixed Salt of Urine it self, may by Distillation and

and rectification be concentrated into another kind of fire) yet they are at a far distance from that true Philosophical fire which the Ancients have hidden with so great care and diligence, because that in these preparations the best and chiefest part of the fire flies away and is lost. But this I say, that these fiery Spirits of Urine being concentrated even as I have taught them to be, are indeed able to effect all those things which I have attributed to them, and shall as yet attribute. But indeed they do not coagulate the concentrated fire of the Vine, which coagulation is not the least key for the composing of an universal Medicine.

For when the Spirit of Urine attains this nature, that by coagulating the most subtle Spirit of Wine, (when poured on it) into a Salt, this Salt extracts the soul of Gold duly prepared; the which also, if it be changed by it self, and converted into a dry and sweeter Salt, and be fixed, possesse the virtues of a Medicament of a most famous and great use in Medicine.

Every one that is illustrated, but even with the least light of nature, shall be able by an easy business, to smell out what may hiddenly lurk under this Salt.

From the most pure Vine is the substance of the Spirit of Wine, which strengthens the heart of man beyond all other things, as also his brain, and other members.

The Spirit of Urine is the purest and most subtle Mercurial Animal Salt, not having its like in penetrating, opening, and resolving.

This subtle Mercurial, Animal and piercing fire therefore, being joyned to the most pure vegetable, that is, the Spirit of Wine, that it may be changed together with it into a dry Medicine, any one shall be able by an easy conjecture to foresee what it will effect in Medicine.

But that I may make manifest the error, and demonstrate the cause wherefore a Spirit of Urine is so seldom prepared, which will coagulate the Spirit of Wine into a Salt, I admonish that a respect be had by every one of the following particulars.

For first it is to be taken notice of, that the most subtle part onely of the Spirit of Urine, and not the more gross part, is fit for the coagulation of the Spirit of Wine: If therefore in the preparation of the same, the most subtle part shall be lost, through the negligence or ignorance of the operator, it can in no wise be brought to pass, that the more gross and dreggy part should cause that coagulation.

But that most subtle Spirit doth not onely vanish away in distillation through an insufficiency of the Luteing not being good, but also a great part of the same is lost before distilling, to wit, when the Urine being successively gathered, is constrained to stand and wait too long, so that the Spirit by little and little exhaleth and departs into the Air, especially when it is gathered together in the Summer or Winter time, for that fire not being patient of any extreme, is expelled by a little heat or cold, and therefore the fittest times for collecting the same are the Months called *March* and *May*, or *September* and *October*, in which Months the Air is temperate, neither too hot, nor too cold, those Months therefore are the fittest for collecting and extracting of an Animal fire out of it.

Furthermore, *Calx-vive* or *unslaked Lime* is to be added to the Urine (when putrified) and distilled, that the insipid water may be so much the more ea-

sily or readily separated from that volatile fire, the which is not done if it be distilled *per se*.

I would not pass by these few things in silence for the sake of the Reader, and of him that is studious of good Medicines: But after what manner Metals may be amended by this Animal fire is not here shewn, but God willing shall by and by in the following Chapters. But we put an end to the preparation and concentration of Animal and Vegetable fires, with these sayings, whose admirable virtues and faculties in medicines, Alchimy and other profitable Arts, shall here be manifested in order, as much as time will permit.

Look I pray you on the Elementary Sun, as also on the fire of woods, and the virtues of light, and the virtue of both, the which all creatures, and especially mankind it self, is constrained to make use of for their own safety; could even the least grass bewray it self? or any small worm be bred and live without the Sun? could any workmanship or artifice be exercised without the help of common fire? the which, if it were not, we should be constrained to eat unboyled Herbs, and raw Flesh like wild Beasts: yea, the whole conversation and negotiation or traffique among men should be wholly taken away, if earthly fire and light should be wanting unto us.

If there were some one man onely in some whole City or Province, or in a whole Kingdom, who alone could make others partakers of fire and light, would there not be made the greatest concourse of all men unto him? but because it is known to every one, and every one hath known by an easy manner, how to strike it out of flints, it is had in no esteem, for it is customary not to esteem those things which are made common, although they are precious. The same thing hath happened to the fire, the which although it ought to be made of greatest account, yet it is reckoned of no worth because it is common and vulgar.

But even as the common fire, and that known to every one, doth by very many most profitable operations bring much good to mortals, who can least of all want the use thereof; so also I affirm that those artificial and hidden fires are to be very much accounted of, because a Physician can hardly be without them, for the preparations of efficacious Medicines, and a Chymist can never want for the transmutation of the more base metals into better, either of them without the aid of those fires shall perform nothing of any great moment in Chymical Labours.

He that works and is ignorant of such fires, what will he effect in metallick operations? he being conversant in cold and darkness is afflicted with the same difficulty, as a certain brewer or baker is, who wants wood in the winter season, or who is not able to use water, it being congealed into ice, the one he cannot bake although he hath the best meal, and the other brew drink although he have abundance of the best malt.

So also goes the matter with Alchymical Affairs, the want whereof causeth that we handle not the most noble Alchimy with any profit, but rather receive loss from the same, daily experience being witness, that too are wont to be sooner undone than that it happens to any one man to get himself riches thereby. The blame of which discommodity is not to be transferred on an impossibility of the art, but rather to be imputed to the want of those moist, cold, and

ripening fires extracted out of Salts, the which after what sort they ought to be used for the amendment of metals, as also for medicine and other arts, shall be taught partly in this, and partly in the other Centuries.

XXVIII *The general use of our concentrated fiery and ripening Spirits, extracted out of Salts, in the amendment and converting of metals into more noble ones; also the preparation of many excellent medicaments, and the increase and amendment of many other arts, are briefly here demonstrated; the which, God granting, shall more largely be declared in their particular use.*

THAT I may discourse in few words whether imperfect metals may by the operation of the more common and gross Salts, and of the fire be broken, destroyed, cleaned, and reduced into a better form, it being that which the fifth part of the prosperity of Germany confirmeth by divers experiments.

I affirm that the pure Spirits of Salts, do with a greater efficacy, and far better effect the same, the which, since those simple Spirits are able, better and more easily to perform than gross Salts, why should not also concentrated Spirits after the best and easiest manner of all perform the same thing?

From a like reason the use of Salts shall not be of so great efficacy in the preparation of medicines, and other arts, as the using of common Spirits is; the which, notwithstanding being still for the most part clogged with much phlegm, do of necessity not disclose so great virtues, as those concentrated fiery Spirits do which are freed from all phlegm.

The Sun-beams are for an example which do not send forth so great heat, when they are co-mixed with a moist air, as also green and wet Woods do not so vehemently burn with heat, as withered and dry ones are wont to do.

Yea if the hot beams of the Sun are concentrated in or by some hollow glass increasing the fire, or the fires of Coals by a strong blowing of the Bellows, and are as it were constrained into straights or narrow passages, they effect ten times, yea one hundred times more than those which are not centred together after such a sort. But by how much the more strictly those forces of the beams of the Sun, or of other fires are concentrated by so much the greater, stronger, and sharper heat they draw out.

A burning glass of one foot Diameter, onely enflames Wood; but one of two foot Diameter will melt Tin, Lead, and other metallick matters of that sort, which are easie to be melted, as *Bismuthum*, or the whitest, lightest, and basest kind of Lead, *Zink*, the non-splendent metallick dark matter *Koboltum*, &c. But if you extend the Diameter to four foot, the Sun-beams taking the stronger increase will melt silver and copper, and will render iron it self so bright burning hot, that it may be wrought with a hammer, as if it had been heated with Coals. This effect is to be ascribed unto the concentrating of the Sun-beams by an instrument, and to the constraining of the heat of Coals, by Bellows, or Wind.

The same thing is to be understood concerning our concentrated and moist fires, which ought to be compared, not onely with the common beams of the Sun, or with the heat of Kitchen fire, but also with those Sun-beams which are concentrated by a glass, and with the fiery heat of Coals constrained or forced by windy blasts. Whence they must of necessity be of greater virtues than the common Salts, and watery

Spirits of them, the which the more quick sighted will sufficiently comprehend and believe. Simple Country People do see this thing with their eyes, and handle it with their hands, as well knowing, that the subtle, hot, sweet Spirits of Wine and Ale, (and those procuring strength to the heart) when they are freed from all moisture by Distillation, and concentrated by Rectification; effect ten fold more than if they had still remained with their humidities.

That thou mayest understand the thing more clearly, well weigh thou Grapes, Bread-corn, or the Fruits of Trees, which we eat in that substance as the trees bring them forth unto us: and they afford us a nourishment, but not such a one, as their juice being pressed out, and separated from its dreggs, and by fermentation reduced into a clear and sweet drink.

If necessity compell, Bread-corn may be used for nourishment as it is, yet not so well as when it is separated from its husks, being changed into meal, and reduced by water into a mass or lump, and Salt and Leaven added, and by Fire concocted or digested into Bread of the best Savour. By the same reason Bread-corn being boiled in fair water yields a potion indeed somewhat better than the water it self, but if it be artificially handled, and boyled up into Ale or Beer, the husks are separated from the more pure juice, the which afterwards by fermentation, separates many dreggs from it, and arrives to a more noble nature, yielding a sweeter and better drink. But if the same juice be after that brought by distillation into a greater purity, and concentrated together by rectifying, that the virtues thereof may come into a narrow compass, (because it is a meer fire) it will exercise far greater virtues, than gross Bread-corn which wants a power of exercising so great virtues.

So also doth it succeed with concentrated Salts, to wit, when the dreggs are separated from them by the help of art, and the more pure parts converted, and concentrated into a fiery substance, performing effects of great moment in Alchymy. But that Salts do commonly destroy metals, as well by a moist as a dry way, is known to every Barber, and persons of no reputation. But after what manner metals being destroyed may be reduced into more noble bodies than they were before, there hath been none hitherto (who being skilled in that artifice or craft) that have not hid it with the greatest care. Hence it hath come to pass, that nothing of profit hath been perceived from metallick transmutations, and Alchymy it self hath been made a mock of by the most unskilful rout of ignorant ones, as if it were most false, and at the farthest distance from truth.

That this doubt therefore may be taken away, and the truth it self may be more evidently placed in our view, I have resolved in my mind, by God's assistance, to place before the eyes of the whole world, a true and profitable transmutation of metals, by a clear description, and to assert the certainty of so many writings set forth by such men, by the most true experiments, so that every one that is seasoned but even with a light or small knowledge of the fire, may by an easy business hereafter obtain some profit from them. But I will first treat of common and crude Salts, and then of the simple Spirits of those, and at length of their concentrated Spirits and Fires, which we have taught to extract out of them.

But before I attempt to describe and assert this kingly and noble art, I have been led first to shew the cause why some places do occur in the description

on of the same, wherein words are omitted, and signs or blanks reposed instead of the same.

Indeed this was therefore done, that the art may be concealed from the unworthy, and they in all respects to be driven from the same, and may be made known onely to Adeptists, and the Sons of Art.

Besides also that all secrets may not in all places, and without difference be divulged, but that the chief things thereof may be preserved for friends, lest they be trodden under foot, and broken to pieces by the unworthy, but that they may be left to friends as it were a certain secret stroke, and that an unknown one to others, for to fight successfully.

I therefore earnestly require of every one by a friendly Petition that he be not suddenly angry, if he be not able clearly to perceive, by the sharpness of his wit, all those things which I propose, but rather let him consider that they are not written for him, but for others; by whose capacity they can be perceived. Neither is it altogether necessary that all do know all things, neither also would it be of concernment if friends and enemies attain all those things in their understanding alike, without any difference, which I here openly produce by my descriptions; it is sufficient that some onely, and indeed those that are worthy may clearly and knowingly possess the same, and testify the truth.

XXIX. *An infallible practice of changing the more imperfect Metals into more perfect ones by the help of crude Salts.*

AS I have already a little before, and also in other places of my writings, evidently enough demonstrated that Salts, or the spirits of Salts, are in the earth, or out of the earth a universal Agent, promoting the maturation or ripening of metals: So here I again firmly affirm the same thing, and do say, that by Salts the gross bodies of metals are destroyed, and trans-changed into more noble metals, and that indeed after divers manners, and that more easily or difficultly as any one shall be more or less conversant in Chymical labours.

I will hear God willing make manifest all things, yet not to every one, but to the worthy onely; and that indeed after the manner of a Clock or Watch-maker, who taking some Clock or Watch in pieces, do lay up all the parts thereof in some place without any order; the which he that is unskillful in the art, shall never again compose and reduce into order. But another who before hath handled that art, will by an easie labour again conjoyn all those parts, and reduce them into the former body of a Clock or Watch.

All those therefore who have experienced the foregoing labours to be perfected by the fire, shall by these my descriptions easily dispatch or accommodate themselves in future things, not easie to be understood by the rout of ignorant persons which have made no experiments in the fire; who will in vain look into those things which I have written; no otherwise than as if any one being plainly unskillful in reading and writing, should behold written letters, and knows not what they signifie, or what argument they may contain: Such a man if he would be angry with the writer, should he not do him much injury, because as being far remote from the fault of that ignorance which hinders him, whereby he cannot read these letters which he had never learned to read.

The same thing must be understood concerning my writings, which are openly published, not for the sake of any one, but onely of those who have first learned to understand those kind of writings.

But that I may set upon the thing it self, and may teach the amendment of metals for the better, and shew the very foundation of the whole business, I say, that a true changing of them is attempted in vain, unless they are first destroyed, and wholly slain. A grain of Wheat, as Christ himself saith, will never increase or multiply, unless it first putrifies in the earth. If therefore metals ought to be destroyed by Putrefaction, that must needs be done by the help of Salts, according to the truth of the Philosophers Maxim: the corruption of one thing, is the generation of another. The death of one thing, is the life of another. Since therefore metals must die, it must needs be that death be brought on them by enemies, or contrary things, because nothing in natural or artificial things dieth, unless it be slain by its own enemy.

Since metals therefore ought to be destroyed, and killed by their enemies; it is of necessity that they are invaded, tortured, and so long vexed by the same, until the Agent as the stronger part, be overcome by the Patient as the weaker part; that it be slain by it, [or rather the Patient be overcome by the Agent,] and be translated into a better nature, in which action the Patient ought not to depart from the Agent, but to be tortured with an un-intermitting torment.

Whoever seeing his enemy and conceives himself of the weaker force, indeavours as much as in him lies to decline him, by retreating, but all occasions of running away and slipping aside being taken away, he is constrained to deliver his life to his enemy, who handles the Patient or suffering party according to his own pleasure, and doth whatsoever he will, therefore after the same manner is the melioration of metals, the which although they should be melted together with Salts their enemies, yet would they make little account of them, but would separate themselves from the same; so that every part of them being unhurt, would keep its own nature and essence. But if the Salts do take away the occasion of flight from metals, and do inclose them in their Prisons, that they have no way of escaping, but remain, suffer, and die, then they obtain victory over the Salt, and of slain metals are made more pure and better.

This thing is done in the fire by the moist and dry way, of which enough hath been spoken already.

This is the whole and intire art, and there needs no other superfluous teachings; yet he whom these things doth not suffice, let him read the following operations thorough, wherein he shall find truth, and see with his eyes, and handle with his hand; those things which have been heretofore impossible to him, and very many more.

XXX. *After what manner Metals may be slain by their enemies and be transmuted into better.*

UNTO Metals not one but many enemies are adverse; and part of those enemies are enemies to some and friends to others, but the other part is friendly to some, and at enmity with others. For example sake.

Nothing more prosecutes Gold with an hostile hatred than burning Sulphur and sulphurous Salts, such as are Alkalies, and crude tartar; the cause of this hatred is, because Gold is nothing else, but a fix-

ed Sulphur, and therefore it disagreeeth by a capital hatred, with every burning Sulphur; Silver and Lead do love every Sulphur, and all sulphureous Salts, such as are Vitriol, Salt Peter, Salt Armoniack, and the like, the which they stand in need of for their colour; they have an hatred against Kitching Salt, because it is of a mercurial nature, and therefore not requiring its help, but onely desiring a Sulphur and Tincture, Copper, Iron, and Argent vive, or Quick-silver do possess both natures, to wit, a mercurial and sulphureous one, and for that cause they prosecute all Sulphurs, and any Salts with love.

Tin is an enemy of all Salts, whether they are sulphureous or mercurial ones, when it is slain by Sulphur and Salt, and recalled unto life, it obtains a more pure and thin or fine body, whether of Gold or Silver, according as it shall be handled.

Moreover, if any should desire to obtain as yet a better essence out of better metals, its necessary that he slay them by their enemies, and raise them up again by their friends; by how much the greater and vehement the enemies are whereby metals are slain, by so much the more those metals do suffer, and with so much the more famous and better bodies do they re-arise.

The whole art therefore consisteth in this, that metals are overwhelmed by their greatest enemies, are slain by them, and after death are separated from them, and that by their best friends, are restored unto a better life.

Thou hast the whole art, neither doth any other thing remain than that thou attempt the matter, and set to thine hand.

For example sake, I will add an operation. Slay a light metallick matter by the sharp Spirits of sulphurous Salts, that it may become a white calx; free this from the Salt Spirits, by water being poured thereon, the which being freed, cannot be reduced into a metallick body by any violence of fire. Likewise slay mercurial metals as are B. by mercurial, Salts their enemies, and change them into white calx's, the which being freed from their saltiness, will be liquid or flowable; mix those calx's, to wit, the mercurial and sulphurous being slain, put them into a double vessel of cement, cover the uppermost with a certain plenty of B. fence well the juncture of the cementing vessel with clay, set them into a cementing furnace, and at the beginning administer a gentle fire, that the calx's may rise up against or assault each other, and the fixed sulphur may bind the fugitive flowable and mercurial calx's, D. for although in the cement something would depart into smoke, yet that is intercepted by E. and after a certain manner is thus exalted into the degree of F. Too much fire is not presently to be joyned to the cement or plaistering it self, that some time may be granted to the matter that is swift of flight, whereby it may adjoyn it self unto the fixed matter, and may also become fixed and constant with the same for four hours space, therefore the fire shall be somewhat the more slack, and afterwards for the space of eight or ten hours, it shall be kept in a clear bright burning hear, that G. may not melt: the said time being ended, the fire is to be extinguished, and the cementing vessel to be taken away, in G. a black or brittle body shall be found containing Silver, the easy separation whereof we shall afterwards hear.

The calx of both metals being coagulated into a hard stone, if by grinding it be reduced into powder, and be put into a furnace fit for this thing, a metallick

body will be attained, being impregnated, not with a little Gold and Silver, especially if the metals shall be slain, not by the Spirits of common Salts, but with gradatory martial waters. In this cement, H. is rendered aureal or golden, and I. is silvery, by one and the same endeavour. The profit also it self is of no small moment, especially if this operation be exercised with the greater quantity, and the bigger instruments alwaies to supply or afford Silver being pregnant with Gold for separation.

XXXI. A brief and compendious manner of extracting and rendering corporeal, a volatile Gold out of coloured Flints, Red Talck, Granates or Red Marble Stones, Sand, White Clay and the like metallick earths.

AT the beginning, these mineral or metallick earths are to be made bright burning hot, to be quenched in cold water, and to be broken in a mill, into meal or powder.

After that they are thus broken, thou shalt put them into some Waldenburge, or Cullein Can, and shalt pour so much of Aq. Regu on them, that they may onely be moistened, and let them, together with the Can, be placed in a fire of coals, and encompassed therewith, to be made hot; after that the minerals and Aq. Regu have waxed well hot together, so much hot water is to be poured on those very minerals as shall be necessary for the extracting of the Aq. Regu.

Put the minerals thus moistened with the water into great pots, and those made of the best earth, having many little holes in the bottom, on which lay paper for sustaining of the minerals that they may not fall out through the holes, but may dismiss the water onely. After the first water is gone forth, other hot water is again to be poured on, and this effusion of water is so long to be continued, untill it depart with the very same sweetness as when it was poured on, and no longer offers any sharpness to the tast. So the common and hot water brings away with it the Aq. Regu, and the Aq. Regu Gold out of the minerals.

The earthen pots may be placed in a bench bored thorough with holes, through which their bottoms may pass, that so the water may be received in vessels set under them.

N. B. The minerals may also be put into barrels or hogsheads having a double bottom, such as are used for the cleaning of Salt-Peter, that so water may be so long poured on them, untill all the acrimony be extracted by the water.

XXXII. After what manner out of Minerals being extracted, a true Salt-Peter may as yet be gotten with profit.

THE minerals being after the said manner freed by extraction, they are to be co-mixed with an equal weight of calx vive and wood ashes, and cast together into an heap under some open gallery or room, that now and then it may be moistened with Urine, or in want of that with Rain-water, as oft as they shall be dried.

In this operation the Aq. Regu, which remained in the minerals, and was not wholly extracted by the hot water by the help of the Urine or Rain-water, changeth the Salt in the calx vive into the best Salt-Peter, the which may be washed off with Rain-

Rain-water, and boiled up after the wonted manner.

Therefore after the said minerals have been handled for half or a whole year after the said manner, and are by rinceing deprived of the Salt it self, they may again be (under an open Gallery or Roof so exposed to the air, that Rain come not at it) collected into an heap and be handled after the former manner, for the supplying (in their own time) new Salt Peter, the which may be done for many years together. So also from that *Aq. Regis* which could not be drawn forth from the minerals, a profit is received.

The cause of this Salt Peter, its being made, is this, because the *Aq. fortis*, or *Aq. Regis*, or Spirit of Nitre in the same Waters, contains as it were the seed of Salt Peter, it obtains that nature, that like an Herb it may take an increase from other Salts, and be multiplied; whence perhaps the old proverb arose, to sow Salt, which thing the ignorant have received with mock, saying after what sort can Salt be sown and multiplied, when it is solved and drawn from Rain water? But it hath lain hid from those, what kind of Salt it is, and after what manner it is to be sown; the which we have here demonstrated, also the saying of the Ancient Philosophers, asserting that Salt may be sown and multiplied like Vegetables.

As to what pertains to those sharp waters, whereby gold is extracted out of minerals, by what skill they are to be handled as also without loss, yea that they may render that gold with profit; the following operations are to be observed.

XXXIII. *A way shewing the extraction of a volatile and fixed Gold out of the Water, from which the Minerals are withdrawn, and the profit which may be received by that Water.*

THE best way is this, into the solution of gold, or into the water which containeth gold, pour in the solution of Lave or Saturn more or less, even as you suspect more or less of gold to be in that water: As for example. Let there be in the water two or three half ounces of gold, dissolve thou therefore about two or three half ounces of silver, or lead, in *aq. fortis*, and pour this solution into the water containing the gold, be it more or less, mix them well together by shaking or stirring, that the water may obtain the form of milk; after they have settled in quietness, shake or stir them again, and repeat this motion for divers times the space of one hour, and at length suffer all quietly to settle to the bottom. Separate all the clear water from the sediment by pouring it out, and strain the sediment it self through a filtre, that the water may be wholly separated from the silver.

This silver is to be dried, and reduced into its former body, after the manner which shall be and by follow.

N. B. If the silver or lead had not extracted all the gold, the which may easily happen, yet that gold is not lost, for because sweet water whereby the *Aq. Regis* is weakened is present, the which now remains unfit for another use of extracting out of minerals; now by the solution of Lave or Saturn deprived of their gold, a sharp *Lixivium* made of wood-ashes, and *Calx vive* may be poured on the same, with which a little is to be added or admixed. For do precipitate or fix all gold in solutions.

After this manner the *Aq. Regis* is killed, and every metal which it has yet retaineth, it dissolveth like a yellow powder, whether it be gold alone, or mixed with copper or iron, which powder is to be dried, and reduced after the manner which shall strait-way be taught.

N. B. That the water after the total precipitating of the metals, being exhaled in a Copper Kettle unto a thin skin, and exposed in peculiar vessels unto the cold, it will afford thee a beautifull Salt-peter, concentered or grown together into drops or Ice-acles, whereof thou mayst again make an *Aq. fortis*, to be again made use of for the like operations.

He that shall rightly operate shall get so much Salt Peter as will recompence the charges of the *Aq. fortis*, and *Aq. Regis*: So that he shall extract his gold without costs. For five or six pounds of *Aq. fortis*, wherein two or three pounds of Salt is dissolved, and the which hath at length been precipitated by a sharp *Lixivium* prepared with *Calx vive*, doth render ten pound of Salt Peter, the which doth answer the price of five pound of *Aq. fortis*, and this is the manner of extracting gold out of minerals without cost.

XXXIV. *Another and better manner of extracting gold by Aq. Regis.*

TAKE of by torrifying made into ashes, pour the extraction into an iron Pot, and stir the *Calx* with an iron *Spatula* while it boileth. All the sharp spirits do stick fast to the the phlegm alone vanisheth by exhalation. When therefore the spirits are wholly concentered with the and are dried, they are to be put into a close Tigil or Crucible upon Coals in a secret Crucible or melting Pot, then the fire expels the concentered spirits into a receiving vessel; the which spirits may be used for a new extraction. A fugacious gold mixt with iron, remaineth with the which *Calx* being reduced in a Furnace fit for those operations, which the Germans do call *Stichofen*, draws out a lead mixt with gold, the which being expelled by a Cupel enricheth the operators with the best gold and silver.

N. B. But if such lead should not contain so much of gold and silver, as that it should deserve a separation by a Cupel, that is again to be mixt with and to be reduced into ashes, and the operation is so long to be repeated, untill the lead being rich enough in gold, may deserve that separation.

The separation is also to be perfected with the Bellows, lest so great a plenty of lead should be melted out of the Tests, which operation requires much fire, yet the lead may be collected or conjoyned in the Test without a wastefull melting, as shall be taught hereafter.

XXXV. *An easie making or composing of Aq. Regis, for extracting of minerals.*

BECAUSE a plenteous quantity of spirit of Salt is easily prepared, the Salt Peter is onely to be dissolved therein, and with that solution minerals are to be extracted. For the Salt Peter strengthens the spirit of Salt, that it can so much the more easie set upon and snatch to it the tender gold in those minerals.

The same spirit of Salt, may also without any rectifying be administered for this operation, to wit, such as ascends in the first Distillation.

XXXVI. Another as yet more easier way of preparing *Aq. Regis* for extraction.

BECAUSE silver doth always in this operation bewray its being impregnated with gold, which is to be separated by *Aq. fortis*, the solution of silver is also fitly used to extract after this manner.

Pour the said solution into *Aq. Regis* which hath extracted gold, that the silver may attract the greatest part thereof to it self. But the same *Aq. Regis* may again extract other gold, and be attracted by the solution of silver.

But if there should be no solution of silver in readiness, the gold extracted is concentrated with and the operation is perfected by the means or after the manner abovesaid, by driving the spirit out of the and by reducing it in a Furnace, called by the Germans *Stiebsen*, as was said before.

N. B. *Aq. fortis* being dissolved therein, or poured on or into *Aq. Regis*, or the nitrous spirit of Salt, it adds an increase and strength to the *Aq. Regis*, because *Aq. fortis* doth corroborate the spirit of Salt better than Salt Peter.

XXXVII. How the Calx of silver, which hath fished out gold by *Aq. Regis*, is to be recovered.

WHEN the solution of silver is poured into *Aq. Regis*, and the chiefest part of the gold is extracted; rest is so long granted unto it, that the Calx of the silver may settle to the bottom, and afterwards the *Aq. Regis* by pouring it forth is separated, cleared from the Calx of the silver, again to be used for a new extraction; unless perhaps as much of iron had been admixed with it, in which case the white Calx of the silver is put into some Cloath laid in an earthen or glass Tonnell, and hot water is to be poured on it, to take away with it the *Aq. Regis*, which is left in the Calx of the silver. The remaining water is to be pressed out of the Towel or Cloath, and the Calx dried, and reduced in the secret Crucible, or is made use of in the concentrating of into silver or gold, viz. gold and silver.

XXXVIII. After what manner precipitated silver is to be reduced without a loss of its weight.

SEeing the greatest fugacity is procured unto this Calx of silver, so that its former body cannot be restored unto it in common Crucibles without great loss, this discommodity cannot after a more convenient manner be prevented than by that which follows.

Mix thou an equal weight of with this volatile Calx, and cast it into a close bright burning Crucible, that is narrow above, and broad beneath; the which after thou hast covered with a Cover, and well fenced with the lute of Wisdom, thou shalt melt the matter together, nothing whereof shall depart into smoke, neither shall so much as the least of it pierce through the Crucible, and all the silver which the gold received is by this means attained without any loss.

This silver thou shalt by fusion reduce into grains, and shalt separate the gold from the same in *Aq. fortis*. And thou shalt again apply the silver thus reduced unto a new labour, in which labour thou proceeding without intermission shalt have a continual separatory operation of gold and silver; and this labour thou mayest exercise with great profit in all places.

XXXIX. Another manner of reducing a fugacious or volatile silver, with greater profit.

PLACE thou at the Stern of this little golden Ship, a little fish whose name is *Remora*, that it may be spoiled of its swiftness and may be at a stand, cast this silver little Ship with the little fish *Remora*, sitting at its Stern, into a close and square Tigil or Crucible, that by fusion they may depart into one body. In this fusion not onely all the silver is returned without any loss into its former body, but also is by the white *Finnis* of the little fish, augmented with a certain increase of its weight, and becomes more golden; so that by this additament more of better silver is gotten, than if by the addition of other things it had been restored to its former body.

What other profits any one may be able to obtain through the help of this volatile silver, we will God willing hereafter teach.

These are the things which I at this time have been willing to teach, concerning the extraction of a volatile gold out of stones, and the more poor minerals, as also of the extending or bringing forward silver by successive degrees into gold; of which matter more things shall be spoken in other places.

XI. An operation, teaching to extract Stones and Minerals, or Mines that are poor in Silver, and Copper by a moist way.

THese matters being made bright burning hot, are to be quenched with water, then moistened and extracted with *Aq. fortis*; after the same manner as was taught above concerning the minerals of gold, and no difference is here met with but in the waters extracting, since gold is extracted with *Aq. Regis*, and silver with *Aq. fortis*.

If the minerals or mines of gold and silver are at once in readiness, the gold is extracted by *Aq. Regis*, and the silver by *Aq. fortis*, and the solutions are to be united, in which dissolving, the silver being precipitated by the *Aq. Regis*, doth also snatch with it the gold from the *Aq. Regis*; and although copper shall be present with the mine of silver, and it be extracted together with the silver by *Aq. fortis*, yet it is no impediment to the operation, for the silver and gold do sink to the bottom, and the copper is retained by the *Aq. Regis* to be afterwards administered for a new operation, and that indeed as often as any one shall be willing.

The copper is recovered from the *Aq. Regis* by thin plates of iron being put therein, which operation makes the *Aq. Regis* red, and wholly unfit for the like labours.

Therefore the iron being then spiritual, promotes something out of the lead unto the degree of gold, and so the *Aq. Regis* being thus often used, it is again rendered profitable.

XLII. *A more easy manner as yet by far, of plentifully extracting Gold and Silver out of poor mines, as Sand, White Clay, and other the like minerals, by fire without fusion.*

THE mine or mineral *Argilla*, or White Clay, &c. containing a volatile and fixed Gold, being roasted or calcined, and broken in pieces in a mill, fill thou a glass gourd therewith fenced with clay, or made of the best earth, half full, and pour so much of the following *menstruum* on that matter, as that it may be well moistened: but as soon as that *menstruum* is poured thereon, it presently begins to give a smok, wherefore it is altogether necessary, that thou presently put a head on the gourd or body, which is to be set in sand, and all the moisture separated by distilling, and that while the distillation is performing the gold may be dissolved, but the following matter is left to be collected in a receiver by it self, the which hath the virtues of *Aq. Regis*, and may be again applied for use, as shall by and by be shewn.

After that all the humidity is come forth, take the gourd (being cold) out of the sand, and pour some water on the matter that it may become soft, and that a Salt may be extracted from it, wherein the Gold lurketh, which was contained in the mine; coagulate the Lixivium being full of Gold, into a Red Salt, the which by adding Litharge, is to be melted in such Crucibles which are not broken.

The Litharge draws the Gold unto it out of the Salt, which is to be separated from the Lead, after that manner which shall be shewn in the following Chapters or Treatises.

XLIII. *The preparation of a Water necessary for the extracting of Gold.*

TAKE of

this water of small charges, which thou shalt prepare plentifully without trouble, pour upon mines, and again separate it by distillation, to be again used in new labours, that there may be no need to prepare it again anew, because this doth not onely alwaies remain effectual, but also is increased in every operation: So that thou mayest be able to extract mines and minerals *ad infinitum*, if so be thou shalt prepare but one pound or pint at the first.

N. B. By this means all Gold how little soever it be, is plentifully extracted out of slints, sand, and any other minerals, without any cost excepting fire.

XLIII. *Another water for extracting silver.*

TAKE

this water extracteth silver out of the poor mines of silver, sand, and stones; the operation of the same, is like the former one, and its increase is like the increase of the former water, so that after this manner silver may be plentifully extracted out of poor minerals, and no other cost is required besides fire.

N. B. Instead of may be taken since it performs the same thing in extracting, which the other performeth.

XLIV. *Another easy manner of plentifully extracting gold and silver out of poor minerals, it being of little or no cost.*

MIX thou the mine or minerals with the requisite waters, fill with the same of good earth, set them near each other in a great put it in and distill the spirits, which pay all the charges, and which supply gold and silver without any costs, the which is to be received by lead.

XLV. *Another more easy manner of extracting gold and silver out of minerals.*

MIX the mine or mineral with the requisite waters, and moisten it by degrees, cast the whole into the spirits depart into a receiving vessel, and in the time of distillation, the gold and silver are dissolved by that dissolvant, the which being extracted, remain with or among and are rinsed by water out of the mineral, so that they are attained without costs, and the spirits being collected in the receiving vessel, do recompence all charges.

XLVI. *An easy operation of plentifully extracting gold and silver out of fat white Clay or Pottery-earth.*

ALTHOUGH gold and silver be extracted out of minerals by moist waters, by a troublesome operation as we have taught in the beginning, yet such an extraction brings no small profit, because they may be freed from those waters by precipitation; and those very waters do readily serve for the making or preparing of Salt Peter. With a fat Argilla or white Clay, the matter goes otherwise, because the spirit hath crept into the fat earth, and scarce a half part is received, unless the earth be first deprived of its fatness by making burning bright, it being that which doth also require its own peculiar labour.

Seeing that therefore in all places of the world, where soever earth is found, such fat white Clays containing gold and silver do plentifully offer themselves, and none hath been hitherto found, who hath indeavoured to extract and bring them to use, especially whenas they contain but little of gold or silver, not able to defray the charges of the lead bestowed.

I could not but open a very easy way of performing that thing with no small profit, the which is perfected by the following labour.

Mix such an earth containing gold or silver, with or of that greater one, and cast it by degrees into my first or second Distillatory Furnaces, and draw forth the spirits by distilling, that the solved gold or silver may remain in

From that which is broken by a Mill or grinding is washed off with hot water, and is reduced by lead as is shewed before.

XLVII. *After what manner by the help of art, gold may be easily and plentifully extracted from the sand of Granates, Agaths, Saphyrs, and Rubies, and other stony Mineral earths, which do neither admit of fusion, nor Lead, nor sharp Waters.*

IT is certain that all Granates or Marbles, the red, black, ash-coloured, dusky, also of whatsoever colour

colour they are, or wheresoever they are found, whether in Brooks or Rivers, or in Sand, or in Earth, or in high Rocks, do always contain much of Gold, but that by reason of their glassy nature, they cannot be tamed by *Aq. fortis*'s, and by reason of their most difficult fusion cannot be wrought by Saturn or Lead; for that cause they have made none partaker of their gold, and they have been neglected as unprofitable earths, whereas notwithstanding they being handled by little labour, they are able to afford much gold.

Some one therefore may ask, because they cannot be subdued either by lead or *Aque fortis*'s, what course must be taken, that gold may be extracted out of their bowels? I answer,

and also by a Fusible

they may be overcome, that the gold which they have may be withdrawn from them with profit, for because they can bear the fire, they are and perform by a double labour, one through their sharpness, and another by reason of a strong fire, so that nothing is safe from so great forces, but all things are constrained to yield unto so great violence. Hence they do willingly afterwards enter the Salt of Lead, and in time of melting do readily draw out their gold.

XLVIII. *A most firm demonstration, that sharp Waters and Salts after the manner of the ways hitherto described, do draw forth more Gold and Silver as it were without cost, out of Mines or Minerals containing Gold and Silver, than sumptuous or costly melting Fires.*

IT is not unknown to every one that is seasoned but even with a mean knowledge of gold-bearing Mines, that without the addition of Lead or other flowable things, Gold can in no wise be melted out of them, whereas therefore there is little Gold in those, and nevertheless much of Lead or other matters is required to be added for an easie fusion or melting sake, who shall be fit for the undergoing of so great costs? Hence it hath come to pass that such poor minerals could bring nothing of profit in common.

It being also granted, that there is so much of Gold and Silver in Minerals, that they will defray the charges of fire and fusion, and afford Gold and Silver with profit, yet such operations are not comparable to my inventions using Waters and Salts, no more than as Water to Wine, or Night to Day.

For first, fusion or melting far exceeds in its costs the extraction which is perfected by Salt and Waters. And then it can never be brought to pass that fusion should expell all the Gold and Silver out of Mines and Minerals, but leaves some thereof in the drosses, next also there is made aloof of all the volatile Gold and Silver, which are cast forth by a most strong fire, and driven away into the air; on the contrary, of the more ample and wealthy profits, which the extraction of Gold and Silver out of Minerals bringeth, this is not the least, that not onely all the Gold and Silver which is fixed, is drawn out without any detriment or loss, but also those two metals being as yet volatile are extracted at once and made fixt and constant in the fire, whereas notwithstanding by the vehemence of a melting fire, they are wholly dispersed and reduced into nothing. For the Waters of Salts do fix the volatile fugative spirits of Gold and Silver, the which by the vehe-

ment blasts of Bellows, are rendred as yet far more volatile, so that by the help of fusion scarce half the Gold is gotten which the extraction by the Waters of Salt affordeth.

Add to this, that not onely all the Silver and Gold, as well the volatile as the fixt is gotten together without any loss, but also the charges of Coals are far less, and one operator may perform as much of this extraction of Gold and Silver as three in the labour of fusion or melting.

From hence it is easily to be seen, how much profit and fruit may be gained by this my most excellent invention in all places of Germany. For this extraction is not onely for extracting Gold and Silver as well out of rich as poor Mines, but also snatcheth out all the Gold and Silver, in Flints tinged with any colour, wherewith all Brooks, Rivers, and Fields are filled.

Now follow some particular transmutations of the imperfect Metals into more perfect ones, by common fire, and Crude Salt, and by the not common concentrated moist fire of Salt.

XLIX. *A fundamental and evident demonstration, that a true transmutation, or trans-changing of Metals may be exercised in all places of the earth, wheresoever Men may dwell, yea in the least Cottages of Countrey folks, and indeed by the same matters and vessels which are found in them.*

IT is well known, that even the poorest and vilest or meanest Countrey can want neither fire, nor salt, nor earthen vessels, necessary for the boyling of Meats. Therefore being furnished with Salt, a piece of Copper of some old Kettle shall easily supply him, the which it shall be free for him, by fire and salt to trans change into a better and more noble body, but because Man hath a far better and commodious Salt for the transmutation of Metals in his possession, which excels common Salt in its goodness, he may of right and worthily make use of his own proper Salt before a strange and foreign one, and that after this manner.

Boil thy own, or the Urine of another man, to the consistancy of Honey, in which decoction, all the unprofitable moisture of the Urine departs by exhalation, and the Salt thereof remains in the Kettle or earthen Pot; admix thou with this condensed Urine, so much of *Calx-vivæ*, or the ashes of burnt Woods, that it may come into a thick or gross lump. But thin plates of Copper cut in pieces, and purged by making them bright burning hot ought to be in readiness, and also an earthen Pot having its Cover, wherein let that mass of Urine, and *Calx-vivæ*, together with the thin plates of Copper be put; when thou hast all these things in a readiness, mix the Urine as abovesaid with the *Calx* or slack-lime or ashes, and fill thy Pot to the height of three or four fingers, upon which put some of the plates of Copper, and so *stratum super-stratum* till the Pot is full, then cover it with its Cover, which thou shalt well fence with Lute made of Meal, Water, and Paper, that not any vapour at all may come forth. For as soon as the *Calx-vivæ* is mixed with the condensed or co-thickned Urine, the spirit of Urine begins to operate by its own proper efficacy, and therefore it is necessary that the Cover be straightway laid on the Pot, and be fenced with a due Lute or Clay; the Pot being thus filled and cover'd, set it aside in some certain place for the space of half a year, in which time

time the spirit of Urine being stirred up by the *Calc-vivæ*, displays its virtues on the Copper, and exalts it into a higher degree, as that it is tinged of a skie and green colour mixed, and is rendred fit for the Painters Art; one pound whereof is more worth than two or three pounds of Copper, one pound whereof doth for the most part render one pound with four or five ounces of this colour, and and so it affords a profitable transmutation of Copper.

L. After what manner, out of this partly Green, partly Skie-colour of Copper, Gold and Silver is to be separated.

HE that desires to separate Gold and Silver out of this colour, whereof no great masses are attained, but onely and alone whereby it is demonstrated that the thing may be done, he must use the following operation.

First, he must take good heed in taking the colour out of the earthen Pot, lest any thing of the mass of the Urine, and *Calc* be mixed with the beautiful colour, and render it impure.

The thin plates being taken out, they are to be often crookedly bowed, and moved upwards and downwards, that the colour may fall off from the plates like scales. The remaining Copper which is not yet turned into colour, is reserved for a new labour; to be repeated after the same manner. Wine-vinegar is poured on the colour, or the sharp water of Tartar extracted after the Distillation of adust Wine from its Lees, with water by decoction, and it is to be so long boiled in a Copper Kettle, or an earthen Pot glazed, till all the colour shall be solved; the solution being cast into a Filtre, the Vinegar or Water of Tartar onely passeth through, and a reddish powder is left in the Filtre, the which being melted with Lead in a Cupel, after the exhalation of the Lead, it leaves a grain of Gold. For the spirit of Urine hath ripened somewhat of the Copper into Gold, which the Vinegar or Water of Tartar did not dissolve but left, attracting onely the Copper by solution. And because somewhat of Silver is ripened in the Copper through this same operation, and is dissolved with the Copper, by the Vinegar or Water of Tartar, something of common Salt is to be added to the Water of Tartar or Vinegar, that the Silver may not be solved by the same, but may remain with the *Calc* of Gold, and may be retained with the same.

N. B. Pure and clear Vinegar ought to be taken for this labour, if you would preserve the colour unhurt, for after some part of the Vinegar is evaporated away, the green colour of the Copper grows together into fair green small stones, one pound whereof is more to be esteemed than five or six pounds of Verdigrease, which is sold in the Shops.

This artificial operation therefore affords a beautiful and cristalline vitriol of *Venus*, and some small quantity of Gold and Silver; whereof although there be not so great plenty that it may bring profit, yet it shews the possibility of the thing, and teacheth that a transmutation of Metals, may be exercised in any small Cottage by any Country Man.

But if any one shall collect Urine, and extract from thence the volatile spirit of its Salt by Distillation, he shall far more deeply pierce the heart of the Copper, and shall obtain more of Gold and Silver than he can get by the but now mentioned

rustical labour, of which matter more things are found in other places of my Writings.

LI. After what sort pure Gold may be extracted out of any Copper.

IN all Copper a spiritual occult Gold lies hid, the which in the labour of separation by Lead in a Cupel or Test, is not taken notice of, or considered. But this very Gold is nothing else but the colour of Copper, so firmly adhering unto its body, that it remaineth very difficult to be separated from thence, but the operation being rightly instituted, although it be not gainfull, yet it demonstrates a possibility of the thing, for the sake of experiencing whereof, to wit, whether there be Gold in all Copper, thou must labour after the following manner.

Dissolve Copper in *Aq. Regis*, and pour much water on the solution, that by this water the dissolved Copper may be largely diffused. Into this solution diffused by the water, pour Lead that is dissolved in *Aq. Fortis*, so that one or two half ounces of Lead may answer to one pound of Copper. But as often as the Lead shall settle to the bottom, thou shalt shake or stir it, that the solution may be well mixed, and that the Lead may attract something of Gold; and may precipitate it with it self to the bottom, the which being dried and separated in a Cupel, will leave a small quantity of Gold, not for an argument of profit, but a token of a possibility, which testifies that there is Gold in all Copper. But if any thing of profit were to be received, such Copper was to be taken which was already changed into vitriol. But among vitriols the Hungarian, Cyprian, Indian, Japanick, and other the like do excell, which do offer themselves in the Mines of Gold-bearing Copper, and are handled after the following manner.

LII. The manner of extracting Gold out of natural vitriol.

Dissolve thou vitriol in common water, and pour on the vitriol dissolved, a litted of dissolved Lead, and stir both solutions by frequent motions, that the Lead may attract the Gold out of the vitriol, to be dried and separated by a Cupel, which will remain like a grain of greater or lesser quantity, as the vitriol shall contain more or less of the same.

Of the vitriolated water out of which the Gold was extracted, thou shalt again make vitriol by so long boiling, and evaporating till a thin skin appear, which being then exposed to the cold will shoot into Crystals. But this operation brings with it more profit, if it be not now boiled up into Crystals, but that vitriol onely be taken which is drawn out of its Mineral into Water, and after the extraction of the Gold, is at length boiled up into vitriol.

But least this fishing of Gold out of vitriol should seem wonderfull unto any, we will shew a way, whereby Gold may be extracted out of Sea Water, or Sea Salt, the solution of Lead assisting: The manner is as followeth.

LIII. After what manner Gold is to be extracted out of Sea Salt, or Sea Water, not indeed with profit, but onely that it may be demonstrated, that Gold is hidden even in Sea Water or Sea Salt.

FILL a great Copper Kettle with Sea Water, and pour thereon a little dissolved Lead; the which

F

goes

goes to the bottom because it cannot indure Salt, and is straightway precipitated into a white powder, move and stir the water in the Kettle often, that the solution of Lead may every where touch the Sea-Salt-Water.

Through this action, a spiritual Gold adheres to the leaden powder, and sinks to the bottom together with it, which powder being freed from its Salt by common Water, and dried, and melted in a Cupel, leaves a small grain of Gold, as a remainder.

N. B. For this fishing Silver is more fit than Lead.

LIV. *How, out of poor Mines of Copper, from which no profit can be perceived, Copper, as also Gold is self if it be present, is to be easily and without costs, extracted and separated.*

THE sandy or sulphurous Mine or Mineral of Copper is to be roasted or calcined, by burning even to the consuming of the Sulphur, because sharp waters do not assault sulphureous matters, the Mineral being calcined and beaten into a powder, fill a gourd, and pour our solving secret on the same, the which I have taught above at the extracting of Minerals.

The whole dissolvent in abstracting or distilling is recovered, and that indeed not without increase. But the Copper and Silver do stick fast in the dissolved Salt, which remained in the Mineral after the abstraction, and the which is to be washed out with water, out of which water, which drew out that Salt, the Gold contained therein, may by the solution of Lead or Silver, be drawn forth.

But if the same water be boiled untill a thin skin appear at the top, and exposed to the cold, it will shoot into a green vitriol, but for the extracting the Copper out of the Salt-Water, Rods of Iron are to be put therein, which do attract the Copper, the which being withdrawn and washed clean, and melted into Copper by fusion, is administered for other uses: For because it is like to a tender and filed powder, it is changed by an easie business into Verdi-grease, after the manner which shall by and by be taught.

LV. *After what manner Gold may by an easie business by Fire and Salt, be separated out of Copper.*

IF Gold shall be mixed with a mass or lump of Copper, all the Copper is to be reduced in a bright burning Fire into Ashes: and the Ashes are to be infused in our secret *Acuum* or Vinegar, the which dissolveth the Copper onely by decoction, and leaveth the Gold undissolved, like a shining powder, to be dried and melted with Borace, out of which Gold of twenty three Carats proceedeth.

That Vinegar, our secret *Acuum*, draws all the Copper from the golden *Cals*. The Copper is separated from the Vinegar by Rods of Iron, being laid therein as we have taught in the foregoing manner.

LVI. *How Copper being extracted out of vitriolated Water, and adhering to Rods of Iron, is to be changed into Verdi-grease.*

THIS pure Copper may be moistened with the strongest Vinegar, and put into earthen Pots,

the which being covered with its Cover well fenced with Clay, are to be placed in Horse dung, and to be left therein for a time, yet so as that the heap of Dung be sometimes renewed. All the Copper is in a short time changed into Verdi-grease, and indeed far more pure than that which is set forth to Sale in the Shops, and which is made in Spain, by the husks or pressed out of clusters of Grapes.

N. B. In extracting Copper out of Mines, regard is to be had unto this thing, to wit, that with poor and wild or course veins of Copper, *Lapis Calaminaris*, or Zink is sometimes found to be admixed; which is no ways perceived to be in them. But if those Minerals are extracted with *Aq. Regis*, and this be to be taken away by Distillation, none of the *Aq. Regis* goes forth, but onely a flegm without savour, because the *Lapis Calaminaris* or Zink doth retain all the Acrimony with it, just as if those two Minerals should say to the *Aq. Regis*, we do not as yet let thee go, because as yet, we have need of thy endeavour for our amendment, &c.

But it is certain that whatsoever Minerals and Metals do retain with them sharp spirits, are as yet immature, and may be ripened by those spirits, that they may bestow Gold and Silver, as hath been already said, and shall as yet more largely be spoken to.

LVII. *Out of wild or course Minerals, or veins of Lead, admitting of no melting, out of which no good Lead, much less Gold or Silver, can be drawn, how to extract not onely Lead, but also Gold and Silver with profit.*

AS we have said above, that some Minerals or Veins of Copper do appear in Mines, the which by reason of *Lapis Calaminaris* or Zink do refuse all melting, and can be by no fire reduced: So also we here admonish, that Minerals of Lead are found, the which do indeed contain much Lead, but by reason of the *Lapis Calaminaris*, Zink, and a sulphureous Sand being admixed with them, they cannot be overcome by any melting, for these matters do take away a ready flowing from the Lead, and do cause that such Minerals, which for the most part together with Lead, do also hide not a little of Gold and Silver, are cast away as altogether unfit, and unprofitable, whenas notwithstanding very much profit might be received from them after this manner.

Let the Mineral by pounding be broken in small pieces, and in my little secret Furnace which I have fitted for the calcining of Minerals, let it be roasted with bright burning Coals, that the gross Sulphur may conceive a flame, and burn. If in time of operation the matter should gather it self into heaps or knobs, and in co-heaping should make round Pellets, it being taken out of the Furnace, let it again be beaten, be set upon live Coals and roasted, and these labours be so often repeated, untill all the Sulphur shall be consumed, and the Mineral doth no longer co-heap it self into knobs, but being made bright burning hot like dead ashes; it no longer sends forth a sulphureous stink. At length out of these ashes being well washed, a dead and unprofitable matter separates its self from the good and metallick earth, the which being melted by it self in a Furnace called by the Germans *Stichofen*, becomes a flowable Lead which containeth Gold and Silver.

But if the Mineral be so stubborn that it altogether refusing all melting, could not by it self be reduced,

duced, and nevertheless contain Gold and Silver, something of Litharge is to be added to that metallick earth, which procures a flux unto it, and yields that Gold and Silver bearing Lead, which by the common operation wholly refuseth to offer it self.

LVIII. Another way teaching by the help of Salt and Fire to draw Silver and Gold with great profit, out of all stubborn or rude and untamed metallick earths, in whose Veins Lead, Copper, Gravel, or course Sands, Iron, or Lapis Calaminaris have for the most part conjoyned in Society, and which do deny all profit by vulgar operations.

AS Fire burns up every gross and combustible Sulphur in Mines or Minerals, that these do at length subject themselves unto melting, and do render Metals easie to be hammered: so also Salt fixeth, and makes constant whatsoever volatile body endeavours to flie away into the air, that it may afford a ripened, melted, and profitable Metal. For that cause such Minerals common Salt being added as was abovesaid, are to be roasted in live Coals, that that devouring gross Sulphur may vanish by burning with a flame, and that together also the Metal it self may be promoted to maturity, and so that by this very thing, good Gold and Silver may be separated, whenas notwithstanding otherwise, not any one should obtain so much as the least thereof out of these very Minerals.

Such an amendment and changing the more imperfect Metals into the more perfect ones, may be attained by the help of Salt and Fire.

If therefore common Salt and gross Fire are able to perform this in Minerals, what shall not these, not common but secret Fires of Salts effect, in transchanging Metals already pure, into more pure and subtile ones?

LIX. After what manner Metals are to be amended by pure Fire, or the fiery spirits of Salts.

IT may easily be perceived if a gross Salt and Fire do some good to more gross Metals, that also a more pure Fire and Salt may do more good on purer Metals. Instruments whose edges are made very sharp by whetting, are far more fit for operation than those that are dull, and will perform more. By how much the sharper an Auger or Wimple is, by so much the sooner it boareth thorough the Wood, and on the contrary, by how much the more blunt it is, by so much the slower it pierceth thorough.

He that is earnestly desirous to obtain any good in the amendment of Metals, he must of necessity apply the subtile and strong spirits of Salts, that he may destroy Metals with the same, may kill them, and reduce them unto their former life, and so may procure more noble bodies unto them. When their former body is restored to those moist and cold Fires of Salts, to wit, that they may return unto the form of Salt, but of a more noble and subtile one, Metals may far more speedily be destroyed; a double Fire performs more than a single one, since therefore Salt is by it self no other thing but a meer and concentrated Fire, and the Fire of Wood or Coals joyning it self with the other a greater efficacy must needs be expected from them than by common Fire alone, but we have hitherto made mention of such operations, and therefore its needless

here to repeat them. From what hath been hitherto said, every Chymist may gather and learn those things which concern the amendment of Metals, wanting the help of Salt and Fire; more God willing shall follow.

LX. Let us now ascend bigger, and demonstrate what incredible miracles or wonders our secret Fires of Salts may effect nigh to that great work of Philosophers.

AS in the foregoing Chapters it hath been sufficiently confirmed, that unripe Metals may by the help of Fire and Salt, be particularly promoted to a more perfect maturity: So also in the multiplying of Animals and Vegetables, that thing evidently appeareth; to wit, if sufficient meat and drink be administered to any Infant, that he groweth dayly in bigness, and strength of body, untill he come to the age and perfection of a Man. The same multiplying in Vegetables offers it self to our view, in that a small seed or root do snatch to them their nourishment from an earthly Salt; and the beams of the Sun, and do rise up into a perfect, great, and fruitfull Tree. This particular transmutation is conversant before our eyes, and therefore is a thing most known, but after what sort the most noble part or purest essence is to be extracted out of the bodies of Vegetables, Minerals, and Animals, that other more weak bodies may be strengthened and amended by the same Philosophers have always hidden and covered with the greatest endeavour. Hence it is, that there hath been very few, and as yet are, who have had the knowledge of this highest Science.

As to what therefore belongs to the great work of the Philosophers, all the Philosophers do in their writings with one accord affirm, the which I do also in all my writings affirm to be most true, and do as it were shew with my Fingers, to wit, that nothing in the nature of things doth effect a Tincture and Tinge with a most gratefull colour, but Sulphur alone, and that one onely, and that this same combustible immature and volatile Sulphur is fixed and changed by the operation and help of Salts into a true Tincture, the which is as certain as that which is most certain, and yet laborious also, and requiring a space of time long enough, especially if any one doth insist in a moist way. The way of coming unto the end of such a work as I think, yet with the safety of others judgment, this is the best, if any one bind or fix such a Sulphur, which was already brought unto a perfect maturity by nature, they might bring this profit with it, that it should not require a longer time for its maturity.

But such a fixed and tinged Sulphur, is no where more nearly found than in Metals, and especially in Copper and Iron, but the better and more pure in Gold; the finding out whereof notwithstanding (by reason of its most firm and intimate conjunction with its body, as also its separation) hath been always esteemed almost impossible. For unto diligent searchers, a true separator which might separate the pure part from the impure, hath for the most part every where been wanting.

For as it is known such a hard or compacted metallick body, can very difficultly be separated and divided into its parts.

The solution of sharp waters, sups up indeed every Metal, but it effects no separation. For because Metals

Metals are Homo-geneal things, and the metallick Sulphur is so strictly bound to its metallick mercury, by the bond of the metallick Salt, it can never be brought to pass, that by such solutions, or by precipitations, or by other ways, one part should be separated from the other.

If a Metal being dissolved by a water be precipitated all its parts being so mixed as they were before its dissolution do fall down and settle, and admit of no separation. But if any one would also render Metals spiritual, that so the more pure parts might be disjoyned from the more impure ones by distillation, yet there is no separation made, but the more pure body it self ascends, and again as before, it consisteth of three principles, performing indeed more in Alchymy and in Medicine than the more gross bodies of Metals, but is unfit for a true Tincture, because nothing operates in all bodies, but a lively Soul, and that which vivifies or quickens other dead bodies, for it is the spirit, as Christ saith, which quickneth, the body is unprofitable. Let man, or any other living creature be for an example, the which as long as it lives, it moves it self and operates as long as the spirit, the Author of Life is present with it; but that vanishing away the body wants all motion, and remains a dead Carcass. If now it could be brought to pass, that we could lay hold of such Animal Spirits, and could render them corporal ones, we might also perform incredible things by the same, and perhaps fashion or form a living creature of a lump of earth, the which notwithstanding God hath reserved to his own self. But this that bountifull Father hath granted unto us, that out of unmoveable subjects, or those wanting a moveable and animal life, we may extract their pure Souls or Essences, and render them corporal, and effect thereby things of great moment in Medicine and Alchymy.

But the souls of Metals do excell herein, as being more fixed and constant than the essences of vegetables, but they are far more difficultly attained. For the souls of vegetables do suffer themselves to be easily extracted, but the colours and souls of Metals do hardly admit of extraction, and for that cause are accounted of by the ignorant for a thing impossible to be done, nor indeed is it altogether without some cause; for the separation of the tinging soul from the hard metallick body is a thing of great moment: many are the ways that have been attempted for the procuring of this Sulphur; and some ignorant fellows have written Books, of the acquiring or getting of the same, whereas 'tis evident that they never saw such a Sulphur.

The most learned and most witty *Helmont* wrote egregiously concerning this Sulphur; but yet not so clearly as that any one could out of those his writings get a perfect knowledge of the same. Nor indeed is it expedient that such kind of Pearls should be cast under the feet of swinish Men. There is no Writer (as far as I know) that hath mentioned any thing concerning this matter, clearer than *Isaac Holland* in his *Ch. De Amasus*, where he teacheth, that he who hath gotten the art of changing Metals into transparent Glasses with their peculiar colours, hath purchased a notable secret in Metallick affairs. He alludes (by way of likeness) to the bodies of Men brought to a clarity or brightness after this life, and thus declares his Doctrine and says; The souls of Metals do shine forth through their *Amasus's*, or clarified bodies, clad in their proper colours, even as the

Souls of Men shall hereafter shine in the other World, from [or through] their clarified bodies. And further he saith, that when such *Amasus's* [or Glasses] are reduced into their former bodies; then the *Amasus's* of Copper and Iron become fixt, that of Silver becomes Gold, and that of Gold becomes Tincture. The said Authour hath not clearly expressed the manner of accomplishing this, but in my opinion (without prescribing ought to any one) this is the nearest way of attaining to such an operation, viz. of getting the souls, or the pure Sulphurs of Metals, viz. If the Metals be first reduced into *Amasus's* or transparent Glasses, out of which their souls are easier extractable than out of their gross bodies. But now, for such an extraction here is such a *menstruum* required as doth not work upon all the whole body, or dissolve it, but doth onely attract there out of the colour and purest Sulphur, and leaves the body behind white. But where shall we find the description of such a *menstruum*? none speak of it openly, but many mention it obscurely; nor indeed is it so necessary that such an *Aregnum* of so great moment be manifested to every one.

But however, this in brief you are to be admonished of, that like draws its like and extracts it. If a mercuriality be to be extracted out of the metallick masses [or bodies,] then 'tis expedient to use a mercurial *menstruum*, for like rejoiceth in its like. So sulphureous essences are extractable by sulphureous *menstruums*, and not by mercurial ones. For Water doth willingly associate it self with Water, and Oyl with Oyl's. And forasmuch as all the Philosophers write that the Sulphur or tinging Soul in Iron and Copper, doth as to goodness and nobleness equalize the Sulphur in Gold, it will be needful (in my opinion) to take Gold, but to bring Iron and Copper to that pass, that they may become transparent Glasses, from which their colours may be extracted. But if so be that any one is minded to prefer Gold before these, and to extract the tincture hence from, he may do as he pleases, and will find in many places of my writings a manuduction, [directing him] to the transmutation of Gold, (and so of the other Metals too) into transparent bodies, which thing is highly necessary. For there is not and easier way of extracting the tincture out of Metals, than by first reducing them into transparent *Amasus's*. Now the *menstruum* serving for this extracting of the Sulphurs out of the metallick bodies is to be so prepared, that it dissolve not the body, but extract onely the Sulphur or pure Soul there out of. Such *menstruums* *Paracelsus* himself makes mention of, and affirms, that with them the skie coloured Saphyrs, the red Rubies, and the yellow Jacynth may be so deprived of their colours, as that there remains no more of them save onely the white bodies. Besides, that white Crystals may (by the help of tinging sulphureous spirits) be died with various colours. Verily 'tis a secret of most mighty concernment, to have the skill how to prepare such a *menstruum* as will penetrate the most hard Stones and most compact Glasses to extract them, and withall to communicate to other some various colours, without the corrupting, breaking and destruction of any of the bodies, the which thing seems in my opinion very likely to be true, though as yet I know not how to do it. That which I have tryed by my operations I can write and teach, viz. how all the Metals may very easily (yet one more easily

easily than another) be changed into fair transparent and most delicately coloured glasses, and how out of these glasses the pure and tinging metallick souls may be extracted, viz. by such *menstruums* as are sulphureous, subtiler, not dissolving, but onely extracting.

But for as much as these kinds of *menstruums* are not (as far as I know) described by any one, and yet are the producers of such notable effects; I could not omit the discovering of something concerning them, for the sake of such as are Students in true Philosophy, and after some sort shew that kind of extraction, which is to be accomplished by the help of our concentrated spirits of salt, or of our most Philosophical fires.

LXI. How a vegetable subtiler sulphur is to be so attuned by the nitrous mist fire, that it may extract the first sulphur of metals, or their pure tinging soul.

First of all, the oyls of the vegetables are to be exalted by distillations, and often repeated rectifications to the highest degree of purity and subtilty, and afterwards to be once rectified by some concentrated nitrous fire, that so being already of themselves subtiler, they may get a fiery vigour endued with a faculty of seizing upon metallick sulphurs, and of extracting them out of the hard and compact bodies. For any vegetable oyl how subtilly soever it be prepared, hath not any power of entering into the metals, and much less of having any ingress into their glasses, nor can it extract in the least, though such bodies should be covered with it for a long season. But now if an artificial operation shall have sharpened such an oyl with those most subtiler spirits of salts, and have rendered it more acute and penetrative than those concentrated spirits of the salt do lead in the sulphur, and bestow on it a power of attracting to it self its like.

And albeit that such concentrated spirits do when *per se*, and alone, wholly dissolve metallick glasses and make no separation at all, no, nor do not extract the least particle of any sulphureous substance, yet the case with them is vastly altered, when such fiery spirits are artificially united with most pure sulphureous oyls; inasmuch that they bestow on them a faculty of working upon metals, and of extracting from them a most pure sulphur; nay farther, they purchase these oyls a capacity not onely of extracting the colours out of metals, but also out of other things. Now we have taught at large in our second part of Furnaces, the manner of rendering the oyls of vegetables subtiler; and as for the nitrous fire requisite to this operation, the way of concentrating it is to be found in this Book a little before, so that 'tis wholly needless to repeat the same things over again which have been afore treated of. And thus far is my knowledge come, viz. how (by the help of oyls animated and actuated by the aforesaid means) to extract the most pure soul out of metallick *Aman-fa's*, or those hard and glassy subjects: But how such a sulphur is to be brought into a tinging medicine, I (professing not my self so great a master) do not as yet know. Neither is it at present needfull to exceed the due bounds by so large a treating of such worthy things; for things wonderfull may be effected by this *menstruum* both in Medicine and Alchymy, and in other arts, concerning which we shall (God willing) presently add somewhat more.

And whereas I have made mention here of clari-

fied bodies, and concentrated spirits; I judge it worth while also to shew what difference there is betwixt those concentrated spirits and clarified bodies as the Chymists call them.

The clarified bodies therefore are nothing else save bodies purged and mundified by the operation of the fire. For the fire is the ultimate examiner of all things, as being endued with such a power by which it burns up all things, reduceth them into ashes and powder, and out of the ashes makes glass; that being the utmost or ultimate thing whereunto all things are reduced. If therefore there be in any thing any good, which being burnt in the fire is by fusion or melting, turned into transparent glass, it doth manifest it self in its utmost or ultimate essence, and shine forth in its brightness, inasmuch that every one may see what lay hidden in its life afore thus burning it. For example, I take wood, an herb, or an animal, I burn it and transmute it into ashes; these ashes I melt and turn into glass. Having thus done, there appears no colour visible, for the glass is white, and that because the sulphur is consumed in the burning; and the mercury is fled away into the air in smoke, as being two principles which are no ways able to resist the force of fire: But the salt, as being a contentener of the fire remained in the earth of no efficacy.

But now a metal being by the fire turned into ashes, though part of the sulphur and mercury hath in the combustion and vitrification flown away into the air, yet notwithstanding the best part remains; and this is the reason why such metallick glasses are coloured according to the metals nature and property, and which (afore thus burning it) was hidden. We will yet farther evidence it by an example.

If I burnt copper or iron, and reduce it into ashes, and do by melting it turn it into glass, then the copper if *per se* and no other thing added unto it, yields a green glass, and the iron yields a yellow coloured glass. But if there be made an addition, then are produced glasses of other colours, as for example.

If I add to burn iron or *crocus martis* the glass of lead, then the glass made by melting will have the yellow colour of a Hyacinth. The same *crocus martis* being molten with common glass, made of wood-ashes and salt; yields a greenish coloured glass which is the natural and proper colour of the iron. For the lead altered the colour of the former mentioned glass of the iron and made it yellow in the melting, and so hindered it from manifesting its true and natural colour. The glasses of two several colours being molten together do exhibit false colours, as may be seen by co-melting a skie colour and a yellow glass, the which being molten together yield a green colour, and doth so represent it self both in the fire and out of it too. From hence took I occasion to write and teach the way of finding out (by molten glasses) what kind of metal is hidden in any mineral or metallick earth. Which way of proving mines or minerals is far better and speedier than that which is usually done by a decoction and exhalation of lead in the Cupel. Thus may you mix five, six, eight or ten grains of some finely powdered mineral, with one or two lots of Venice glass being of easie fusion, and put the matter thus mixed in a well covered crucible, and by melting it reduce it into glass. The colour which will be in the said glass, will shew what metal the *minera* contained: Lead will yield a dusky colour, tin, a white, copper, a Sea-green; iron a somewhat greenish, silver a yellow, and gold a skie.

a skie coloured: each of which colours is the true and internal colour of the respective metal. Gold doth also resemble a Ruby as to colour if other colours be added thereunto. But yet in the mean time, the skie-colour is its proper and natural colour, and so is yellow of silver: and this is notably agreeable with the truth, though to such as are ignorant, it seems a thing wonderfull, for indeed such mens knowledge ends in external things, but they are wholly ignorant of internal ones. But now the colours of gold and silver are better and more perfectly known, if there be added unto them some fix and white sulphur, which prevents the gold and silver from being thoroughly reduced into their peculiar bodies by fusion. If the *Cals* of gold or silver be molten with Borax, they both return into their former bodies, and do not pass into glass any ways coloured: But that some glass of easie fusion be mixed with those *Cals*, together with a little powder of flints and so molten, then the flints will (by reason of their sulphur) hold with themselves the gold and silver and so keep them that they admit not of fusion [or reduction] in their whole body, but do remain in the glass with some part of the metalline property which renders their internal colours visible, which else would not appear to sight.

N. B. If you have the minera's of gold and silver at hand and melt them with glass, their colours will also appear, because that in the minera's there always is some sulphur that hinders the metal from wholly returning into a body, so that some part of it abides in the glass and therein shews its colour. This also is to be minded, that if haply some minera or metallick earth contains not one metal barely, but 2 or 3 more metals, then always that metal of which the most quantity is in the said minera doth after fusing shine in the glass beyond the rest. As for example.

Suppose I would make tryal in the red Granates [stones] I powder some eight or ten gr. and mix them with one lot of white Venice glass finely powdered, and I melt them, and so turn them into glass. Now in this transmutation the glass doth not become red, but of a delicate grass colour, and so teacheth me what metals are hidden in those Granates, viz. copper and iron, and also more of this, [viz. the iron] than of the other. And though there should be some gold too, yet is it unperceivable because of the predominancy of the iron over the copper and over the gold: For (in this operation) that metal onely manifests it self to sight, which is in greater plenty therein than the rest be.

Isaac Holland would by this vitrification signifie unto us, that after this life, viz. when the world is consumed with fire, there shall arise from the bodies of men reduced into ashes other clarified bodies, and of such and such colours, according as their souls have (either good or bad) framed, or as it were made unto themselves in this life-time in their gross bodies. What other thing [I pray] are fair colours, but the virtues of those subjects out of which they emit or send forth their splendour.

Take a similitude hereof from the melting of minerals, wherein though a mineral of silver or copper hath in it much silver or gold, yet if the superfluous sulphur be not (before the melting the said mineral) separated by a little as 'twere roasting fire; but be (together with that gross sulphur,) set in a vehement melting fire, there will not verily be any metal gotten hencefrom, but that stinking sulphur would

transmute the good metal into black Scoria's. So likewise, no fair and transparent glass can be (by melting) made out of pure metals, if that kind of gross sulphur should adhere unto them.

These few things touching clarified bodies, I could not pass over in silence, and much less could I omit this, viz. that the bodies of all things may be much better transmuted into clarified bodies by our secret fire, than by the common fire. For the common fire drives away the volatile parts, whereas on the contrary, our fire doth preserve them and renders them fix and transparent as well as the other parts. And therefore of necessity these bodies must needs shine with fairer and brighter colours than those others, in which the common fire hath expelled the mercury and sulphur, and left remaining nothing else but the salt.

But now as concerning such a transmutation into ashes by our moist and secret fires, any one may easily guess the way. For whatsoever is put in them must be necessarily burned into ashes, and they far better ashes too than are made by burning in the common fire. For if the common fire burns any herb or wood into ashes, the sulphur burns away in a flame, the mercury betakes it self to its wings and away flies it, and the salt abides behind in a few ashes or a little earth. Now our Philosophical calcination takes away nothing but conserves all [the principles so called] together; and doth in the first place produce to view a black coal, then afterwards other various curious colours, and then a white colour, and at last to compleat the operation, it yields a red fusile and medicinal stone.

N. B. Here it is to be noted that for preparing a pure medicine, a pure subject is to be made use of; for if so be that any one would endeavour the transmutation of an herb, wood, or any animal into a medicament by the help of the secret fires, then all the ashes and feces which were in the herb would also adhere unto the medicament and would render it impure, therefore necessity requires that you do not take the whole herb, or the whole animal, but onely their essential salt, the which being void of feces consists onely of the pure principles of the herb; and doth easily admit of being transmuted into a red tinging, and more soluble stone than the herb it self with its feces by it, doth.

I would not have you to account of these things here delivered you as if they were of small moment. No, for they are such things as cover over with this their vile or base covering, such matters as are of great weight, and which will not come to every bodies knowledge. Surely 'tis a considerable thing that a part of any vegetable, animal or mineral body should (by conserving all the most volatile parts, and by rendering them altogether constant and stable, without the least loss of weight) be ripened into a fix soluble and tinging red, and medicinal stone. This way of transmuting all things without loss of the weight thereof into clarified bodies, is of all others the best. And those bodies on this wise clarified are without doubt of greater efficacy than are the gross bodies themselves of the animals, vegetables, and minerals, which do as yet abound with their gross and impure feces.

But if so be any one be not herewithall content but panteth after higher things, he may advise with himself about extracting the soul out of this red and fixed stone, and reduce it again by a reiterated operation unto the form of a stone, whereby he will

without

without doubt make it yet far more effectual. And by how much the oftner any one shall repeat this same operation, so much the more effectual a medicine will he obtain, for it will at every reiteration notably augment its virtues, for by such actions the efficacy and virtues of things are concentrated and driven into a very little compass, wherewithall wonderful things may be performed.

We are yet moreover to see what spirits are, but principally what concentrated spirits are, and what they are able to do.

And because the matter in hand gives occasion for treating thereof in this place, we will briefly give you a declaration of the same.

LXII. *What spirits are, and by what means they operate good or evil.*

IN the first place, there are spirits called vegetable ones, viz. When vegetables are beaten to pieces, and being confused are moistened with water, (provided they have not juicyness enough of their own, or do altogether want it) and so fermented, being fermented they are to be distilled, which distillation brings forth subtle and efficacious spirits, and such as are the effecters of many profitable things in Alchymy and in other arts, besides the use thereof in medicine.

Secondly, sundry and divers spirits are also made out of animals by distillation, as out of Blood, Urine, Hairs, Horns, Hoofs, and such other parts of animals, also which spirits have their use in Medicine and Alchymy.

Thirdly, there are also spirits which are expelled, or forced out of minerals and metals by the force of fire, but principally out of Salts, as Vitriol, Allum, Salt Peter, common Salt and such like; of the preparations of which kind of spirits, the Books of Chymists are full, and therefore stop us from the superfluous repetitions of the same. But as for the concentrating of them and the utility of them, it hath been already described by us.

I hereby give occasion for all the diligent searchers after true Medicine and Alchymy; to contemplate, what may be effected in Medicine and Alchymy, if those fugitive spirits were, by our fixing and moist fires which separate not any one part from each other, but do fix all the parts together, deprived of their volatility and made fixt. These few things we were willing to mention concerning the spirits which are subjected to a Man's power and are within his reach, and serviceable for the use of mortal Men.

LXIII. *The particular medicinal use of the concentrated spirits of salts.*

WE have heard that the concentrated spirits or moist fires of salts do reduce all things into a Calx, after a Philosophical manner, without a forcing away of the mercurial part, and a burning up of the sulphureous: insomuch that (by conserving, altering and bettering) they fix the whole. Being therefore compelled by a love to my neighbour, I have a mind to set down in this place some medicaments, as well universal as particular; but yet so as that they may not fall into the clutches of [my] unworthy enemies, but may be reserved onely for friends.

And first, here shall be a medicine mentioned,

that amendeth the weak digestion of the Stomach.

* Take out the teeth of a Wolf or a Dog when he is half dead, (being first shot with a Gun) and pour thereupon two or three parts of the concentrated spirit of salt in a Cucurbit, set the glass upon sand that it may be heated moderately, whereby the oyl of salt may dissolve them and bring them into a thick pulse or mass. Upon this mass pour warmed water that so all the Acrimony of the spirit of salt may be separated therefrom, and that there remain onely the white pulse, wherewith (because some of the oyl of the salt doth yet remain, and is not washable off wholly with water) a little Sugar-candy is to be mixed, that so that remaining Acrimony may be allayed, and the pulse be the pleasanter for your uses.

LXIV. *An Antidote against Poyson.*

THE teeth of a mad Dog being prepared after the aforesaid manner, do yield an Antidote against Poyson. And indeed so do the teeth of all Animals, but especially the teeth of Stags and their Horns, do (after such a preparation) resist all Poysons.

LXV. *What Beasts they are whose Teeth and Horns doe (as to medicine) exceed the rest.*

THE teeth of all ravenous animals, as likewise of Sea-monsters, and their Horns, are of great use in medicine; as of Wolves, Bears, Lynxes, Tigers, Lyons, Leopards; and as to the watery animals, Crocodiles, and such like ravenous fishes, whose horn, teeth, and scales, and likewise the claws of Birds of Prey, may be by the concentrated spirit of salt, converted (after the aforesaid manner) into good medicaments.

LXVI. *An experimental discovery of what Vermine are fit for the use of medicine.*

TAKE strong and well rectified spirit of salt, or onely a strong *Aq. Fortis*, put thereinto your Vermine, of what kind soever it be, and it will presently endeavour to get out as soon as ever it feels the said moist fire. But being it cannot get out, it will struggle till it dies. Now by how much the longer the worm or flie liveth in the *Aq. Fortis*, by so much are its virtues in medicine greater, and this may serve as advice to every one. As for the way of preparing medicaments out of Bark of Trees and Husks shall be mentioned by and by.

LXVII. *An experimental discovery, of what Herbs are profitable for Medicine, or unprofitable.*

YOU are to make use of the way but now mentioned concerning Vermine, and such Herbs as thou knowest not, or such whose virtues are to thee unknown, put (one after another) into the moist fire; and that Herb which is of a slower solution, excels that which is sooner dissolved, both in strength and virtues. For example, Lettice, Purslane, Melons, Cucumbers, and such like waterish Herbs, (and so is it with fruits too,) have a moist nature, and are presently turned into water by those fires. But Rosemary, Sage, Thyme, Dodder, and other hotter Herbs, require a longer time for their solution. Ginger, Pepper, Cloves, Nutmegs, Cinamond, Cardamoms, Zedoary, &c. do require a yet longer time

time as to their solution, afore they will thoroughly pass into a water. From hence may any one know the nature and properties of Herbs very easily. This also is to be observed, that the Medicine out of a Vermine, or out of any Herb, is by so much the more efficacious, by how much the vehementer venosity it abounds withall.

LXVIII. *The manner of preparing an effectual medicament out of venomous Vermine and Insects.*

I have taught in the second part of my spagyricall *Pharmacopœa*, a way of correcting venomous insects by the fixt Liquor of Niter, and of transmuting their venome into an effectual Medicine, which [way of preparation] he who is studious of good medicaments will there find. But now in this place is taught, by what means such like Vermine, and such Herbs as abound with Venome are to be corrected by the concentrated fire of salt, and to be turned into excellent and penetrative medicaments. The operation whereof is thus.

Pour into some glass vessel, one, two or three ounces of our concentrated fire of salt, then put thereunto such Vermine as you would prepare your Medicine of, one after another, provided that you do not put more in, than the said fire is able to dissolve and consume. When all are dissolved and converted into water, all the poysonousness is lost [or gone] and they become good medicaments.

LXIX. *The manner of separating the medicament made of Vermine dissolved by the moist fire.*

There is found to be a great difference amongst Vermine and venomous insects. For some of them are of a dry nature and property, some of a moist, some of a fat and oily nature, insomuch that it is altogether needfull to make a due distinction of their natures. Such insects as be of a dry nature as Cantharides and such like, are to be used in the form of a salt. The aqueous Vermine, as Earth-worms, Spiders, and such like; they exhibit their medicinality in the form of a Liquor: The Balsamick Vermine, as the May-worms, and others of that kind, do (beside the medicament they afford) yield also a fat and Balsamick Oyl; and indeed (both for external and internal medicinal use,) much more effectual than the Liquor it self.

But that the thing may be the better understood, I will here set down an operation, which every one may follow as a leading Star.

LXX. *How the operation in dealing with all kinds of Vermine is to be used.*

TAKE some ounces of May-worms, put them in a glass, pour upon them so much of the concentrated spirit of salt, that the Worms may be well covered therewith and be by little and little dissolved; after that they are wholly dissolved, put the solution into a separating glass, shut the mouth of the glass with your finger, then turn the glass upside down, keeping it so long shut with your finger, till all the fat oil swim at top of the Liquour. Then take away your finger that the Liquour may run out, and when the oil comes, shut the mouth of the glass again with your finger, and let it run out into another glass. Keep this Oil or Balsam as a precious treasure, with the which thou wilt perform wonderfull effects in the

curing of diseases, but principally in the Gout and Stone. But yet thou wilt get but little oil from these Worms, and when you put them into your dissolving Liquor, you must have a care that you do not touch them with your hands, but take or catch them with a small Forceps, and to put them into your glass. For they have in them this property; if you touch them with your hands, they presently colour them with their fat Balsom that they cast out, which somewhat resembles the smell of Musk. As if they should say, *Pray let us live, for we give thee all we have: Take this Balsom and make use thereof for the curing of incurable diseases.*

Some men studiously carefull in such affairs have gathered this Balsom, and have found it to be far more efficacious than the Worms themselves, yea indeed too strong, because they were ignorant of the way of correcting it.

LXXI. *The separation of the medicinal Liquor from the moist fire, after the separation of the Oil.*

AS concerning the Liquor from which the Balsom is separated, viz. the medicinal parts is very hardly separated without a mortifying of the moist fire; therefore the moist fire of the Salt is to be killed with a contrary fire, that so the separation that is required may be made; and 'tis thus to be effected.

Filter the Liquor consisting partly of the dissolved Worms, and partly of the fire of salt, that so it may be rendred clear, and free from the Coals or Husks of the Worms, if haply there be any of them remaining undissolved. And if (by reason of the too much fatness) it be very difficult to filter, pour thereunto so much common water as to make it thinner, and more ready to pass through the Cap Paper. Into this thus cleared Liquor, drop the Liquor of Salt of Tartar, and it will kill the sharp fire of the salt; so that there will arise from the fire of the salt and from this Alkaly-salt a salt of a middle nature, and concreting into Crystals, and will leave the other part in a liquid form; the which said part will be either white or yellow according as the saline fire which you made use of, is. Now this Liquor is more virtuous than the concreted salt is, as being that which contains the essence of the Worms, which doth not congeal or thoor with the salt, but abides in the form of a Liquor. Experience will teach the business more largely.

Now such qualities as these Worms had afore their preparation and as yet not deprived of their Venome; the same do they obtain after their preparation, but with this provizo, these qualities are safely used, which afore were hazardous. But now the properties of these Worms are these, they do not onely draw out of the body all podagrical humours, but also expell the Stone out of the Reins and Bladder beyond all other medicaments; and besides, do cure other such like diseases as are meely unknown, and are adjudged plainly incurable. More, it wholly takes away that volatile Gout, which runs wandering through the Members of the Body. But here ariseth this Query.

LXXII. *Whether or no every moist fire of salt is also fit for this labour?*

FOR answer I say, that indeed this very labour may be accomplished by any moist fire; whether

ther it be prepared out of vitriol or common salt, or salt peter. But withall I affirm, that there proceeds a great difference from those salts. For the concentrated spirit of niter, doth (after its being mortified with a fix salt) shoot into salt peter. The concentrated spirit of salt, shoots into square Crystals. The same doth oil of vitriol and salt of tartar. But the salt that is in this operation made of the common salt exceeds the others, as to sweetness. That which comes from vitriol, doth beget a nauseating by reason of its bitterness; and that which ariseth of salt peter is of a middle nature. But yet they do all three of them enjoy a laxative and purging faculty; and likewise provoke Urine either stronger or weaker according as the Vermine are, which these said fires have been used in the dissolution of.

N. B. That the operation of the Liquor doth always exceed the virtues of the salts. When the sharp spirits of salt are not mortified with a *Lixivium* of Tartar, but with the spirits of Urine or of *Sal. Armeniack*; the salt and liquor become far stronger, than when the precipitation is done with Salt of Tartar. For the spirit of *Sal. Armeniack* doth for the most part precipitate the dissolved and corrected Vermine into a Powder, which being washed off with common water, and freed from all Acrimony or sharpness is used in medicine, in a dry form. But this, the *Lixivium* will not do, but always preserves the Vermine in the form of a liquor.

LXXIII. Question. Whether or no there may be any more or any other usefull things learned from this solution of venomous Vermine?

FOR Answer. Yes, for this operation doth not only teach the good and bad properties of all Vermine, but doth withall evidently demonstrate, that every animal of what kind soever, (yea and Men themselves too) when they are put into such an agony and perceive the approach of death, do discover and clearly evidence the internal motions of [their] nature, which they have (in their life time) been inducted withall.

LXXIV. The way how to know the internal nature of every Worm in the earth, Fish in the water, Birds in the air, yea even of Man himself.

TAKE a *Scarabeus* or Beetle, either such a one as lives in Horse dung, or else one that is of a coppery colour, put him into a glass whercin is some *Aq. Fortis*, and you shall see that in the utmost necessity [or last agony] of death, he will not endeavour to get from out of the *Aq. Fortis*, but will strive to hide himself in the earth according to his innate property. But whereas the bottom of the glass is too hard for him to get thorough, he will be so long endeavouring to accomplish his desire, and in striving to get through the bottom till he dies. From hence may it be perceived what his ultimate refuge [or shift] is: viz. to endeavour the shunning of his approaching death, by sheltering himself within the earth.

If you put a flie in the *Aq. Fortis*, she will not go to the bottom but will do her utmost to get out at top, because her living is in the air, and so all volatile or flying things are wont to do. As for a fish if it be put to its shifts, it endeavours to shun the danger by beraking it self to the bottom.

In such a kind of manner doth the nature of men

become apparent, when they are reduced to the extreamest of difficulties. A godly man, whose thoughts are in this life time always upon God, will constantly adhere unto him in his Agony, and being upon dying will betake himself to him for his refuge, in whom he hath at all times built his hope, and waiting or looking for help from thence, from whence he hath always hoped for it.

But the ungodly Man who hath never in his life time feared God, nor set him before his eyes, but hath always yielded himself with his thoughts unto the will of Satan, he will very hardly implore (in his greatest anguish) the help of any other than of him, to whom he hath (in this life time) adhered in all his thoughts and actions.

LXXV. The preparation of good medicaments out of venomous vegetables, by the concentrated spirits of salts.

WE have hitherto taught, that our moist fires of salts do indeed destroy all things, but do not burn up, or force away ought of such things as the common fires are wont to do. That this is true, even the vegetables themselves bear witness, which being put into our moist fires are therein dissolved, and pass into a water. But their oil which is in them is separated, and swimmeth at the top, and so may be separated thencefrom, as we have mentioned above concerning the May-worms. After the same manner the essence of the herb may be severed from the spirits of the salts, as we have there declared. The oyls which by this operation are drawn out of the herbs and other vegetables, do obtain great and peculiar virtues, because they are excellently well corrected by the efficacy of the moist fires, and are amended, which correction, and bettering they do not at all attain by their being distilled and expelled.

LXXVI. The correction of the too vehemently purging subjects by the moist fires, whereby they may be safely made use of.

Dioscoridium or *Scammony*, *Hellebor*, *Cataputia*, *Gambogia* and other vehemently purging subjects may be disposed of their venomous faculty, by the aforementioned way, and be rendered more sweet and milder.

LXXVII. The correction of the too vehemently operative Diureticks, whereby they may be of safe use in the cure of the Stone.

Dissolve *Cantharides*, May-worms, Earth-worms, *Millipides* or *Pig-lice*, in our concentrated fires, and follow those ways of operation which we have afore prescribed, and you shall acquire an excellent and safe medicament, having a faculty of healing the Stone of the Bladder and Reins.

LXXVIII. The amending of narcotick and somniferous subjects by our moist fires, that so they may perform or shew their virtues without hurt or danger.

TAKE *Opium*, *Henbane seed*, *Mandrake*, or the like subject that provokes to sleep, pour on it the concentrated spirit of salt, and it will melt [or dissolve] therein; if there be in it any oilyness, as in the *Henbane seed* is usual, it will separate it self, and

and swim on the top of the liquor, the which is to be seivered from the liquor, and to be warily kept; because it being onely anointed on the Temples will presently cause sleep. The liquor is to be used internally, as we have prescribed in the precedent preparations.

LXXXIX. *The amending of venomous subjects, that are together purgative, sudorifick, diuretick, and somniferous, by our moist fires; insomuch that they do not onely become safe, but are the effecters of much good in medicine.*

Amongst the number of such kind of subjects, are Stavesacre, or the seed of the louse killing herb, Levant Berries, vomiting Nuts, and many others of such a like faculty, which are to be proceeded withall after the same manner, and by the same operations as the former.

By this or the like way may all venomous, and vehemently operative vegetables and animals be corrected, so as to be safely admitted to internal uses, and to be producers of such effects as are of great moment in Physick; whereas otherwise (though they have in them excellent virtues) they cannot by reason of their vehement operations be taken into the body without danger.

LXXX. *Whether or no poisonous minerals may be corrected as well as the vegetables and animals, by our secret and moist fire of salt, and be turned into whole some medicaments.*

YOU are to know, that not onely venomous animals and vegetables but likewise all the minerals that abound with poison may be amended, and their most present or speedily operative poison be converted into most excellent medicines. For example.

LXXXI. *How the venenate and volatile minerals are so to be inverted by our moist fires, that the volatile be rendered fix, and the poison be made a medicine.*

TAKE of white or red Arsnick one part, pour thereto two or three parts of the concentrated fire of niter, the which [niter-spirit] you shall distill thencefrom in a head and body in sand; then take the remaining matter out of the glass, and wash it with common water; which being done, you shall have the Arsnick, Diaphoretick, and such as may with safety be taken into the body; but yet in a small dose, because it doth sometimes provoke vomit, and principally when the nitrous fire is something of the weakest. But to prevent such vomiting, the said fire is to be twice or thrice drawn off from the Arsnick, by an Alembick; that so the poison may the better be slain, and the volatility transmuted into a fixity; and the same Arsnick may be afterwards molten and handled with the other metals without all danger of poison, which was impossible to be done afore. For the Arsnick whose poisonousness is not as yet removed from it, cannot be admitted into the body without great danger. Neither do we here insert the preparation of such medicaments out of Arsnick, and the like venomous minerals, for this cause that they should be introduced into medicine; no, for there are other safer medicaments to be had, our aim herein is onely this, to shew that even the most poisonous, and most fugacious or

volatile minerals may be inverted or turned in and out by our moist fire, and dispoiled of their venomosity and rendered fix.

LXXXII. *The manner of transmuting the fugacious and easily fluxible minerals by the moist fires of salts, so as that being fixed they hardly admit of fusion or melting.*

TO exemplifie this, let us consider of Tin or Zink, which are reckoned amongst the metals of most easie melting, and are most volatile. For the vulgar know that Tin is molten with a very little fire, and doth thereby vanish in fume, if it be but kept in continual flux. But if it be calcined by continually stirring it into ashes, it becometh fix, nor doth it admit of reduction to its former body by any violence of fire, but is turned into glass.

So after the same manner do we roast or calcine Tin, Zink, and the other flying metals with our moist fires, and burn them into ashes, and they such ones too as do not return to their former body, and thus 'tis done; when we pour on them our fiery liquors, so as that they heat together, or do even by abstraction [or distillation,] again free the said metals from those liquors; for then these metals remain in the bottom like to dead ashes, nor do they suffer themselves to be by any means reduced to their former bodies.

N. B. But whoever he be that knows the using of such matters and powders therunto, as can reduce such ashes to their former and fusile bodies, such a one will not spend his labour in vain; for he will get a metal of a much more noble and better nature than Tin, whose greatest internal part is gold and silver.

But yet let no body imagine that he can perform this reduction by the help of Borax or Salts; no, in no-wise. For there are metallick matters required to this labour, to cause a fluxing or melting, sundry preparations whereof I have taught to and again in my writings, but not under such a title or name as if this power or efficacy of thus doing were ascribable unto them. For I have barely mentioned their use in other metallick transmutations.

LXXXIII. *How flying mercury is to be so fixed as to admit of heating red hot.*

COAGULATE common mercury with common sulphur into a black ashes, and then mix this ashes with the concentrated fire of vitriol, or rather with such a fire as is extracted from sulphur itself; so as that there may arise from this mixture a thin mass; of which mass put one or two lots in linnen or cotton rags, and so rowl them up that one fold may come over another, and the mercury may be in the middle. Then tie this ball firmly and strongly with a thread, and let it be environed all about with the fire, that so all those rags may be red hot and changed into Coals.

Take out all this red hot mass, let it cool, separate the burnt linnen rags, and you shall find the mercury turned into a red powder; but yet it hath no ingress into the metals, nor performeth it any thing of much moment in medicine, because it is converted by the burning of our fire into a dead earth. Neither have I here mentioned this coagulation as if any gain were to be received thencefrom; but onely on this account, that the most great virtues

tues and powers of our fires may by the operation thereof be demonstrated.

LXXXIV. *Another experiment easily demonstrating the possibility of rendering mercury constant in the fire, by our secret fires of salts, which thing the known and common fire can never do.*

MELT one part of common and yellow sulphur in a crucible or earthen Pot, and being molten like oil cast therein two parts of common mercury, and mix the matter well with a *Spatula*, that the sulphur may assume the mercury, and may pass with it into a black mass. To which mass you must yet add so much sulphur as the weight of the whole mass in the Pot is of. Then all is to be molten together, and to be by well stirring so long mixt until it get an ashy colour. Then you are to dip in the said mass as it is in flux, pieces of linnen, such as they are wont to use about fuming their Barrels with a brimstone odour, to preserve them from stinking. Such rags being put on an Iron Crook may be kindled, by which kindling they are burnt up, the sulphur and part of the mercury vanishing into the air, but some part being calcined with the flame of the sulphur and fixt, sticks to the burnt linnen. But what virtues this calcined mercury abounds withall I cannot tell, as having never experimented it, and I have onely inserted here this operation, for this end, that the power of our moist fires may be made apparent. Many more meditations and inquisitions will be thereby laid open, which otherwise would never have been sought after nor found out. For in this labour there opereth a twofold fire, viz. the visible flame, and invisible moist fire which the sulphur hideth, and by the burning up of its body, manifesteth, and renders visible and efficacious.

For that heavy acid oil of sulphur, which sticks hidden in all sulphur, performeth most great matters in metalline things; and because the flame or external fire exasperates and forceth on the internal, sharp and moist fire of the sulphur, that acid quality sets upon that subject that is adjoynd to it, and destroyeth the same, and advanceth unto a more fixed state.

But that I may in some sort satisfy the greedy searcher after truth in this thing, it seems to me expedient here to mention the occasion, which (without studying thereafter, viz. this coagulation of mercury) did by chance bring me thereunto; and did chiefly shew me an excellent *Arcaum* of bringing all Wines, Vinegars, and other such like drinks easily and speedily to a clarity and transparency. Such a secret it is, as I believe never was known as yet to any, and therefore worthy to be here set down for the common benefit of mankind.

LXXXV. *An historical discovery of the reduction and restoration of tenacious and corrupt Wine, to its former clarity and goodness.*

I had some Wine in a Vessel that became viscid or ropy and tenacious; for the amending of which, I sent for a Wine cooper, he pours it out (as is the usual custom) into another fresh vessel, and used thereunto all his art, that so he might better it. He pallied it oft times through a long Pipe made of white plates, and perforated with many small holes, and many other means he used, even whatever he had knowledge of, but yet all he attempted was in vain, then at last he put into the Wine no small portion of

salt, and shook them both together very strongly, but all in vain, insomuch that he left my Wine corrupt [as he found it] and out of all hope of restoring it.

But because there was too much salt thrown into the Wine, yea so much as that it might be perceived even by the taste, the Wine was rendered unfit to be drunk, though it should have [thereby] recovered its former clearness. So there remained nothing else to be done therewithall, save the extracting of its spirit by distillation. Yet nevertheless I had a good mind yet to try whether or no it could possibly be freed from that tenacity: to this end therefore I kindled some sulphurized rags, being sprinkled over with the mineral or oar of lead reduced into powder, and with that fume imbued I my Wine, as is the usual custom when Wines are through corruption degenerated from their good state or condition. I added thereto the oar of lead because that as the sulphur was burning the fume of the lead might penetrate the Wine and precipitate all the densities to the bottom. But this experiment did not sadge. Then I took mercury and mixt it with sulphur after the aforethown manner [in the foregoing Chapter] and dipt some rags therein and kindled them, hoping that the mercury being transmuted into fume would have ingreſs into the Wine. But yet it appeared quite contrary in the use, the sulphur indeed was consumed by burning, but the mercury would emit no fume, but was contrarily turned into a red powder, and stuck on to the burnt rags. After these burnings, (viz. of this mercurialized sulphur) often reiterated, the Wine did not smell of the Brimstone, as it's usual to do, but of Musk or Ambergrate, and recovered its former clarity; but yet not fit to be drunk because of the overmuch quantity of the salt thrown therein.

Thus it happened unto me, the which thing others may consider of with a more accurate meditation, and may haply (from this history) apprehend such things, as may in other matters be very profitable. For it is not in vain that I mention these things in this place. Enough is said to the wise. 'Tis sufficient that I have showed the way, if any one refuse to go in the same, let him blame himself.

LXXXVI. *How our moist fires of Salt are able after a sort to fix the yellow and common sulphur, so that it may be used with profit both in Medicine and Alchemy.*

TAKE one part of yellow sulphur beaten into powder, and four or five times so much in weight of the concentrated fire of salt peter, which spirit pour upon the said powder in a glass cucurbit, and abstract it thencefrom several times by an Alembick; this done, the sulphur in the cucurbit will get a red colour and become pellucid or transparent.

If it resolves in the air into a fat oil, the operation is well handled; if not the labour is to be repeated either with the self same fire or with more new, which is the better way. For the said fires are to be so often drawn off thencefrom until it flow [or resolve] into a fat oil: An oil I say of sulphur which is endued with great virtues, not onely in Alchemy and Medicine, but may likewise be used in other arts with a great deal of profit. But especially it is an egregious Balsom, resisting all the sicknesses of the Lungs, and other purrifying corruptions,

tions, as shall be apparently evidenced in the following Centuries, more largely treating about these things.

LXXXVII. *A way of turning Antimony into a snow-white medicament, by our moist fires of salts, and which is of safe and profitable use against the Plague, all Fevers, and other diseases.*

WHEN the *Regulus* of Antimony made *per se* without iron, and beaten into a powder is perfused or thoroughly moistened with the concentrated fire of salt peter, and is for a while kept in warm sand; the moist fire burns the *Regulus* of the Antimony into a white powder. After that the whole shall be of a white colour, pour thereto common water, and it will imbibe or draw to it the fire of the niter, which will again be fitting for other labours, and perform the office of spirit of niter.

The white powder being by many washings rendered sweet, and then dried, performs the office of an excellent diaphoretick medicament and may with safety be used; it strongly resists the Plague, all Fevers and other diseases, that are to be expelled by sweat.

LXXXVIII. *By what means black and crude Antimony is to be reduced by the nitrous fire into a white powder, and the combustible and yellow sulphur separated therefrom, that it may serve as a Panacea for the resisting of all diseases, and may operate by the four Emmunitories, Vomit, Stool, Sweat, and Urine.*

Antimony is by so much the better and nobler, by how much the longer and fairer Rays or Stria's it appears to be of, and therefore such is of greater efficacy in medicine than all other sorts. To this therefore being powdered, pour so much of the nitrous fire as may serve to dissolve it; the which fire will presently even in the cold, begin the work of its dissolving. When that is done, put the glass in warm sand that all the Antimony may be dissolved, and its yellow sulphur may swim at top of the solution like a yellow powder. The solution being cold, strain it thorough a pure linnen cloath, and the sulphur will stay behind in the cloath, and hath its peculiar use in Medicine and Alchymy. But to the solution pour common water, thereby to quench and weaken the nitrous fire, so that the Antimony may fall down to the bottom, in the form of a tender and snow-white powder; the which being well washed and dried, may be made use of as a *Panacea* to drive away many diseases: For it operateth with a singular efficacy by all the Emmunitories, but yet very safely, unless any one doth too foolishly and unskillfully abuse the administration; It is also endued with all those virtues that I have ascribed to my red *Panacea*.

LXXXIX. *By what means the con-centred fire of Kirchin salt drives over Antimony in a retort like Butter, and affordeth a matter of profitable use in Medicine and Alchymy.*

POUR upon the *Regulus* of Antimony beaten into a powder, the heavy con-centrated oil of common salt, the which being again drawn off thencefrom in a retort by distillation, brings over with it as much of the *Regulus* of the Antimony as it can, and ascendeth like a thick Butter. It is a migh-

ty fire, and very fit for the ripening of some immature metals; and withall is most profitable in Surgery, and lays a good Basis and foundation for the curing of incurable and cancerous Ulcers. If you pour water upon this oil, the Antimony precipitateth out of it, in the form of a white powder; and is to be afterwards well washed and dried; so that being reduced into that white powder, it becomes a good medicament to be used in all those diseases, wherein the aforesaid medicaments are applicable; but with this caution, that it be given but in a very small dose, because it is of a more powerfull operation than the aforesaid medicaments prepared by the help of the nitrous fire are of, and that for this reason, because the oil of common salt makes things fugacious or flying, but the nitrous fire renders them more constant in the fire.

XC. *The way of turning mercury into a red, and strongly purging medicament by the operation of the nitrous fire.*

Abstract two or three parts of our nitrous fire, from one part of purged mercury, by distillation in a glass cucurbit; and it will make the mercury far more fixt than if *Aqua Fortis* were many times drawn off therefrom by distillation. This red mercury is to be freed from its saltiness with common water, and so becomes a strong purge, and is to be used in a small dose of one, two, three, or at the most four grains, and effecteth the cure of *Morbus Gallicus*, and other such like loathsome diseases.

After the same manner there may be easily prepared, not onely sundry and excellent medicaments, by the operation of our moist fires, but there may be likewise done things of great moment in Alchymy and other arts; concerning which time will not permit me at this present to make a more ample narration of, but I will remit it to the next following Centuries.

Now sofarasmuch as I call in this Treatise the concentrated spirits of salt, moist fires, and yet as to their outward shape they represent no shew of fire at all; I deem it necessary to shew by a more firm demonstration, that they abound not onely with fiery virtues, but also are (after their inside is turned outwards, and their outside inwards) true, visible, palpable, and sensible fires, but especially the nitrous fire, which best of all confirms this our opinion and saying, it being prepared by the Chymick Art and operation out of a fiery subject.

XCI. *The way of converting or turning the internal and yellow colour of our moist and white nitrous fire from the inmost parts, outward, and making it visible.*

THAT there is hidden a yellowness and redness in niter, is not beyond the reach of any ones capacity, but it is very easily likely, and credible. For seeing that salt peter is a solar child, it must necessarily answer to (or resemble) its father the Sun in colour, form, virtue and efficacy, if it would purchase belief with any one as to its original and nativity. But salt peter shines with a white colour, but the Sun is clad with a yellow garment and shines like the fire; insomuch that there is no correspondency or likeness of Colours, though otherwise there is found the greatest similitude in burning, and in ripening all things. This onely being the difference

difference between salt peter and the Sun, the one, viz. the peter doth particularly onely augment, ripen and advance all things; but the Sun doth universally bestow on all things, life, increase or growth, and nutriment, but yet the salt his companion is an helping assistant as shall be evidently proved in the end of this book.

I do verily believe, that if it were an easily accomplishable thing by us, viz. to extravert the internal and innate redness in salt peter outwards, and to separate the same from its unclean and gross body, and knew we how to render it fix and constant, we should perform things of most great moment, in an universal way.

But yet for the removing of this doubt, I will shew that salt peter is the son of Sol, though (as to its outward Physiognomy, it resembles not its Father. I do therefore say, that its Father is the yellow Sun, from him it is generated, but yet by the help of the white Moon, she is the Mother, and bestows on it the white colour. But I say, that the paternal blood and fiery virtues it hides in its inmost bowels. So wisely is Salt Peter signed by its Parents, viz. by the Sun its Father, and the Moon its Mother. The Father bestows on this, his Son a fiery heart; the Mother a white and cold body; from hence 'tis that it is clad with an Hermaphroditical nature, being Male and Female together, hot and cold, red and white, vivifying and killing.

XCII. *Of the admirable nature of Magnetism, attracting to it self its like.*

According to my simple and small judgment, the red colour of salt peter is not (by the operation of any other thing) to be separated from its white body, better and more commodiously than by the affinity and likeness of some certain magnet that will touch it.

For example: Let us consider a little of common gold and common quick silver, they are so linked with a tie of mutual love, and internal likeness to each other; that the one draws the other unto it self.

For if in dealing with mercury any portion thereof should happen to fall on the ground, and dashing it self into a thousand Atoms, it cannot be by any kind of way better gotten together again, than by the help of such a magnet, as will attract to it self the dispersed and dilated Atoms; such a magnet metals are, and especially gold, as being conjoined to it in the nearest affinity; therefore I sweep together this so widely dispersed mercury, together with the earth and other defilements from which the said mercury is scarcely distinguishable as being all over covered therewithall: and to these defilements do I put a piece of copper, silver or gold, which being well shaken to and agen amongst these filthes, draws to it self the widely dispersed and small Atoms of the mercury, and so recovers it by extracting it out of all that rubbish.

Now when the metal hath attracted mercury enough, and can attract no more, the mercury is to be wiped off from the metal with a linnen cloath; which being again well shook amongst the trash as you did afore, draws to it self the other Atoms; these labours are to be so often repeated, till it be all extracted, and so renders it thee the same without any loss.

Just so and after the self same manner may the in-

most soul, and which is largely dispersed throughout the whole body of the salt peter, be extracted thence from; were onely such a magnet but known unto us, as had a great affinity with the soul of the niter.

I will yet set down another, and a more evident similitude, that so the business may become the more clear and manifest and be the better understood.

XCIII. *A clear and evident demonstration, whereby is shown that even the most hidden things may be manifested and rendered visible by their magnets.*

LET the admirable nature and property of the common magnet be well considered; nature having endowed it with two plainly contrary virtues, one of attraction, the other of expulsion. For on one of its sides it draws iron to it self, and on the other of its sides it drives it off; and thus it does, not onely in its great pieces, but also when 'tis broken into very small bits. For always on one side it draws to it self the iron, and on the other side drives it from it self, by this operation respecting both poles, viz. the Northern and the Southern.

But to return to my purpose: I will demonstrate by evident examples and operation, that the inmost and most hidden nature and properties of things, are wont to be most evidently manifested and obtained, by attracting, and repelling magnets. For all the things that are, have their enemies and their friends, as shall be proved in the following operations.

XCIV. *An operation demonstrating or affirming, that the internal and hidden natures and properties of things may be manifested and obtained by attractive or repulsive magnets.*

DISSOLVE some lots of lead, and such as is wholly void of silver, in *Aq. Fortis*, and precipitate the lead by pouring thereunto some salt water, this [precipitated lead] wash with fair water and dry it. Take some three or four ounces of this *Calx* of lead, and thereto admix a fifth part of pure gold, being first reduced into most pure and most subtil Atoms, on such wise as hath been taught in other places of my writings; but if you have not at hand such a *Calx*, use another *Calx* of gold prepared any kind of way, but yet the first *Calx* is the fittest for this operation. Melt both the *Calx*'s, viz. the leaden and golden one in a crucible, that the lead may become a fusile stone; but the gold *Calx* will (by this operation) be much heavier, and be white, this whiteness is nothing else save pure and good silver, drawn out of Saturn by Sol sympathetically, and made visible, which (afore) lay hidden in the lead in a spiritual and invisible manner.

But some may here demand; forasmuch as there is so much silver hidden in all lead, whence comes it that none are found that get it out from thence? I answer, that there are indeed a many that would get our great masses of silver out of lead, did they but understand the art, and could so bring it to effect. But seeing they are ignorant of the natures of metals and their properties, and know not how to do any thing, they cannot become masters of their wishes. Now in this extraction, there is a two-fold cause presents is self, viz. Sympathy, and Antipathy. The gold by reason of the kin and amity

it hath with the lead, draws thencefrom unto it self the spiritual silver; and because of an inbred hatred it has to salt, it drives away the same from it self. The gold therefore (in extracting the spiritual silver out of the lead, hath an assistant, aiding it by a contrary operation, and so bringing to pass, that there is so much the more silver extracted, because the salt being added to the lead, doth by reason of that inbred enmity and difference 'twixt it and silver drive this, [viz. the silver] away from it as its enemy.

And although that out of such lead prepared with salt may silver be always molten, yea without adding any gold thereunto, merely because of the inimicousness that is between silver and salt, whereby is caused that the silver is thrust out of the lead by the same as by its enemy; yet so much silver is not gotten by that way, no not by the half, as is drawn out by the addition of gold.

For when the gold attracts, and the salt expels, there are made two actions together, the one by Sympathy, the other by Antipathy, both aiming at this mark, viz. to extract the hidden silver and gold out of the lead.

Let there be evaporated in a cupel two small centenaries or hundreds weight, each of like weight; and to one of the centenaries add some pounds (of the proportionable small weight as the centenaries are) of pure gold, and there will come from that centenary more silver by the help of the gold, than from the other, whereto was added no gold: But the gain by this operation will not be much, or happily none at all; but this is onely to shew, that it is verily possible, for gold being put upon the cupel with lead, to get some silver thereout of, and to be more in weight; which effect is produced onely by a sympathetical faculty. Be now if salt doth also lend to gold its assistance, then is there a twofold operation of a double operator; whilst in extracting of the silver out of the lead, the gold is occupied in attracting, and the salt in expulsion.

These things were of necessity to be laid open by me, forasmuch as they teach by what means the inmost and most pure parts are to be separated from the more gross; so that every one may know the natures and properties of things themselves, viz. with what love they embrace each other, or what hatred there is betwixt them.

By this experiment then, may any wise and understanding man easily learn and believe, that even out of salt peter or (any) other white body, the red soul may be extracted. Whosoever therefore shall know how to get these helpers, viz. Sympathy and Antipathy for his purpose, shall never labour in vain, but shall at all times reap fruit by his labours.

And as we have shewn that out of any lead, by the help of gold, a good part of silver may be extracted; so likewise may the same be clearly proved to be done with the other metals, and which may also be effected without the help of gold. Yet nevertheless the more fixt metal doth more readily and willingly attract the more volatile and purer part of the other impurer metals, than an unclean metal doth, and even much more readily yet, when there is afore adjoynd to that metal from which any thing is to be extracted, an enemy of that thing which you labour to extract.

Upon this account therefore was I willing to insert an experiment, that so none might account of the thing mentioned as of small moment, but rather

that he accurately ponder thereupon in his mind, that so he may thereby arrive to things of great moment by a well examining of the same.

Now as it hath been clearly and evidently taught that fixt silver may be gotten out of any lead, as well by Sympathy as by Antipathy, even so may it easily be proved, that the spiritual gold may be extracted out of other metals, partly by Antipathy, and partly by Sympathy, but much easier by Antipathy and Sympathy joyntly together, so that one matter may draw unto its self the object it loves, and the other may drive from it what it hates; as we have proved in lead. If then this may be done in metals, why may it not be likewise done in other subjects.

We will therefore proceed on and see, whether or no it can be so brought to pass, that the hidden redness may be drawn out of salt peter by Sympathy and Antipathy.

Having therefore understood by the things already spoken, that like draws to it self its like, and is repelled from its unlike, there remains nothing else for us to do but to know what that like is, by which salt peter suffers it self to be extracted.

When we advisedly consider the rise or birth of salt peter, it is not to us unknown that it draws its originality from the excrements of animals, but especially from the dung of horned Beasts, as Cows and sheep. And forasmuch as Sheep and Cows do feed onely on Herbs and Grasse that grow in the Fields, and that those vegetables do proceed from the terrestrial salt by the help of the solar beams, it is more clearly evident than the Noon day light, that the hot Sun is the Father of salt peter and the cold night the Mother, the earth the Nurse, and Salt the Food, nutriment and encrease of the same; the which is to be understood as in reference to the *Macrocosm* or great World. But the vegetables, or all shrubs, herbs, and all grasse which arise out of the earth in the *Macrocosm*, cannot be more aptly compared with ought, than with the Hairs and Wool of Men and Beasts, which are born out of the earth of the *Microcosm* or out of the animal body, like as the shrubs and herbs, and grasse do spring forth and grow out of the *Macrocosmical* Earth. Upon this score, the hairs, hoofs, or claws, and horns of Beasts; likewise the feathers and claws of Birds, and also the teeth and scales of Fishes, do altogether square as to their similitude with salt peter; they being such things as whereout of, together with other the superfluous excrements of nature, true and good salt peter may be made with ease.

And like as to the procreation of vegetables in the *Macrocosm*, and for their increase or growth, there is requisite a fat and salt earth, the warm splendor of the Sun, and the fruitful Rain, whereby all kinds of fruits are born, and ripened; but contrarily by the penury or want of salt (it being the onely nutriment,) and of the warm Sun beams, and of the Rain which is the promouer of all fertility, every thing that is vegetable must needs perish and die; even so is it in the body of Man: For as long as the heart of Man is in a prosperous healthfulness, and that the central fire, or vital spirit, and radical moisture be not defective, all things are well and in good equipage, and the whole body takes increase or growth, and the hairs grow plentifully: But on the contrary, when meat and drink fail, the whole body suffers loss, consumes and withers away and the hairs fall off.

But

But to comprize all in brief, I say, that all growths and augmentations as well in the *Macrocosm* as in the *Microcosm*, must of necessity be at a stand and lessen as soon as the warm solar beams, together with the nutriment it self ceaseth and is deficient. So then it is a truth, that in Man as being a *Microcosm* or little World, and in the other animals, the hairs may be compared with the Trees, Shrubs, Herbs, and Grasse of the great World, because of the great likeness that is between them.

And therefore the hairs of animals and hoofs, claws, feathers and scales of them are very like to salt peter, inasmuch that one part doth after a sympathetic manner extract from the other, the most great virtues and inmost soul, and so one doth manifest the other.

For example, when the skin, hairs, claws, hoofs, or nails of a man or any other animal, as likewise the feathers of Birds are smeared with the spirit of niter, or anointed therewithall, they presently become as yellow as gold, and do as if were put on a golden hue. It may now be demanded, from whence ariseth that colour? comes it from the hairs themselves, or from the niter spirit? If that golden colour did arise from the hairs themselves, then it would of necessity be, that it should also discover it self, when the hairs are moistened with other sharp and strong waters; but thus 'twill never do, but onely when they are smeared with the spirit of niter, or else with *Aq. Fortis*, which containeth the niter spirit. From these things therefore it is evident, that the superfluities of the *Microcosm* have a most notable affinity with the superfluities of the *Macrocosm*, viz. herbs, and grasse. Hence comes it to pass, that one part draws or sucks from the other part its best virtues and power, and renders them visible, which afore lay hidden invisibly and impalpably in their gross bodies.

XCV. The manner of extracting out of niter its gold-like soul.

IF we would go the nearest way to work with niter to extract its soul, then the gross niter is first to be mundified by distillation, then afterwards out of this purged body is the most pure part to be extracted by a convenient magnet, and the gross forces to be removed; and this most pure soul to be brought by concentration and fixation to the utmost degree of perfection and dignity.

And albeit I could here set down in more clear expressions, the manner of extracting it, yet I am not so minded to do because of the unworthy. Let this manuduction suffice, whereby is shown what means it is to be done by, viz. by fine magnet attraiting to it self its like by a magnetick operation. I can at all times exhibit such a yellow gold like soul of niter, and use it in the sicknesses of my neighbour. But, enough as touching these matters, we shall be more large concerning them, in the following Centuries.

XCVI. How the moist and cold fire of niter is to be so ordered as to yield its visible flame.

PUT some ounces of our concentrated and moist fire of niter in a glass, and pour thereupon drop by drop a sharp *Lixivium* made of Wood ashes; or rather of fixed niter, and keep pouring on so long, till all the noise, fuming, and ebullition cease, and that the moist fire it self be wholly allayed and slain.

This done, all the corroding faculty is taken away from that fire, which said fire doth by this operation return to its former nature, and is changed into such a salt peter as it was afore its being converted into a moist fire. Out of this salt peter, being now made purer and better by so many conversions and operations, may a new moist fire be extracted by distillation and concentration, which is far better and much stronger than the former.

And now if this second moist fire be again extinguished with a *Lixivium* of fixt niter, and be again turned into salt peter, and this peter be by a new distillation and concentration turned into a moist fire, this said fire will be endued with far greater virtues: For in every mortification and vivification it becomes one degree stronger, nobler, and more efficacious; and so is the salt peter it self too by those conversions and reductions exalted several degrees, and is at length brought to that pass, that it can do more wonderful things than the common is wont to do; for one pound of such a salt peter being exalted to the utmost degree of subtilty is far more efficacious than many pounds of common salt peter, and stronger, and much excels it in virtue. But it is not expedient that every one should know, what may be effected with such a most subtle and most pure salt peter.

The ancient Philosophers hid the preparation and use of common salt peter; and why should not we also hide such a salt peter exalted to the utmost degree of subtilty, wherewith the common peter is noe at all comparable, especially in all such labours whereunto the common sort is wont to be applied, this operates much readiler, and far better and more effectually.

But that the truth may be clearer than the noon-day, I will add one operation of a metallick transmutation, by which it shall be clearly evidenced unto every one what such a most subtle salt peter is able to effect.

XCVII. An operation shewing the manner how by the help of salt peter promoted to the highest degree of subtilty, the superfluous combustible sulphur of the imperfect metals may be kindled and burnt up; even as common fire burns up wood, inasmuch as nothing will be left remaining save a little fixt salt and ashes; so likewise in this burning up of the impure metals by our most pure salt peter, there remains also nothing save that fixt gold and silver which lay spiritually hidden in the metals, and is [now] left by the combustible Scoria's.

EVERY one knows that out of the common Salt Peter and Brimstone, may Gunpowder be made; but yet short in goodness, of that which is made of purified salt peter. By how much the purer and subtiler the salt peter is, so much the better and stronger powder doth it make. The same may be understood as touching the other uses of salt peter.

Further, every one knows that the common salt peter reduceth the common metals into a Scoria by burning them, and washeth gold and silver, and leaves them pure, concerning which fiery washing I have hitherto mentioned several things. But that the common salt peter doth perform this washing better than the pure, and this pure better and more efficaciously than the purest, is no such matter in the least, which thing experience will most manifestly open

open to him who will try the same. Verily a small fire will not do those things which a greater will do, nor will this greater effect such things as the greatest will, and this is so evident and manifest that there is none dares deny it.

Take one part of the *Regulus* of Antimony and four parts of pure Tin; melt them in a crucible and pour them out, and let them cool; this mass makes all iron and steel fusile, therefore when you would melt iron or steel, fill a crucible with either of the metals, set it in a Wind Furnace, and leave it so long in the Coles till all the matter wax highly red hot. Then take off the cover and put into the crucible, half as much of the said mixt mass of *Regulus* of Antimony and Tin, as the iron or steel put in the crucible weighed, then put on the cover, and cover it over with the Coles, and urge the fire as strongly as ever possibly you can, that so the mass you put in, may cause the iron or steel to melt. When 'tis all well molten, pour it presently forth, least the Tin flying away in fume, leave the molten iron, and so it returned to its former hardness and not suffer it self to be fused.

This matter consisting of the *Regulus* of Antimony, Tin, and Iron, or Steel, is so hard, that you may strike fire thereout of with a flint.

Now then if you would experiment the abovesaid combustion or burning up, take a good strong crucible made of potters earth, and fill it with salt peter, set it on live Coals so that the salt peter may melt, then having cast your tin and iron in the form of small rods, heat one end of the rods so as not to melt, hold the other end in a pair of Tongs, and put it into the molten salt peter, that the iron together with the tin and *Regulus* of Antimony may be burnt up as if it were wood, and vanish away with the flame into a fume. For almost all tin and iron are a meer sulphur, and being consumed by the flame, leave nothing else in the crucible save *Scoria's*, which being washed with water, and boiled on a cupel or test with lead and blown off, do leave behind, the true gold and silver hidden in both metals.

For when by the flame of so pure a salt peter, the impure sulphur of the iron and tin is burnt up, it must necessarily be that what good soever was in the metals do remain behind.

I do not therefore here set down this operation, as if I would thereby promise any one golden mountains. No such matter. For I onely manifest these, and such like labours meely for this end, that every one may know, that salt peter being brought to a requisite purity, is wont to burn up imperfect metals as one burns up wood; and it may be easily gathered thencefrom, that such a pure salt peter doth as to its virtues much exceed the common peter.

As for such like labours of burning up the imperfect metals by salt peter purified in a due manner, and of getting pure gold and silver with profit, they shall be taught in the following Century (God willing.)

For even as this first Century doth for the most part treat of fire and salt; so the chiefeft part of the following Century shall treat of the wonderfull and great efficacy of purified salt peter in destroying, and reducing metals, and that with great bettering of them, and with no small profit. And albeit I was desirous of inserting in this first Century, such like profitable betterings of the metals, yet it could not well be done; principally because that there are many other things concerning the profitable use of

the concentrated spirits of salt, that I must necessarily pass over here, because the number of this Century is already up, and therefore must I refer them to the following Centuries.

And forasmuch as there is frequent mention made in this Century, of glasses and crucibles, which none can be without in the preparing and use of these moist fires, because of the many hazards and losses wherewithal common instruments are accompanied, for they often break, or else easily let out or spill the boiling matters; it is altogether requisite that I should here have manifested this excellent invention of mine, which preventeth all such discommodities; and which I hinted at in the second part of my *Miraculum Mundi*.

But whereas I have bestowed both those inventions there on the poor, of meer gift, it would be an unjust thing to take away from them what is theirs; nay rather they should have by good right more bestowed on them. So then being not able to proceed any farther as to this case, this thing onely remains, *viz.* an affirmation that neither Medicine nor Alchymy can want or be without such excellent Inventions. But yet if any one desires to have them, he may write to those two men, to whom I have given them, that they may trade for the poor; whatsoever any one that is desirous of knowing those secrets shall bargain with them for, he will not be repulsed but obtain his desire, and purchase from them the secret; the which process I will nevertheless describe, omitting the naming of the matters.

XCVIII. The way of putting glasses in distillation and digestion, and so conserving them, that the boiling matter be not spilt.

TAKE

with this matter sence your glass, that the matters you put into them run not out, or be spilt, and you shall not lose them.

XCIX. The manner of preparing such crucibles as will hold metals in flux a long time, and which can neither be broken nor melted.

R.

mix these matters and moisten them with common water, that they may be converted into a mass, of which you shall (by a crucible mold) frame small and great crucibles, knocking them into your mold with an heavy mallet, according to the manner I described in the fifth part of my Furnaces. Then take them forth of the mold and dry them in the air, and when they are dry use them; for they need not any burning in the Potters Furnace. They will (being rightly handled) stand a long time in the coals, and will not chap, neither will they melt with the most vehement fire.

C. An infallible demonstration, that in salt and fire all things lie hidden; or, that by the help of the Sun and Salt all things are generated, arise, grow, and encrease.

Forasmuch as I caused to be stamped at the beginning of this small work, a circle with a square in its inside, and with these annexed words, *In the Sun, and in Salt are all things;* (the truth of which figure

figure and inscription is sufficiently enough evidenced by the so many operations described in this Century;) it seemed worth while unto me, to make an assertion here in the end of this Treatise by a true and evident demonstration, that all things are procreated, conserved, and encreased by the Sun and Salt, as being the principal and most noble creatures of God; but with this proviso, that there be present the seeds of those things that require multiplication.

For though the Sun and Salt were yet far excellenter and nobler subjects than they now be, yet notwithstanding could they not produce or generate so much as the smallest herb or meanest worm (to say nothing of a Man) without seed. If we have but seed, then it is permitted us by God, to propagate the same by the Sun and Salt. The begetting of seeds, God hath reserved to himself alone. The seed therefore is for us sufficient, which if we have, we are able to propagate and encrease it even to infinity, by the efficacy of the Sun and Salt, (that universal nutriment of all things.)

The universal medicament and nutriment that the Countrey men use about conserving their Vineyards, Grounds, and Pastures, is the Dung of Cattle and Sheep; from the which Dung being laid to the roots of the Vines and Trees, and thrown into the Fields and Pastures, the Vegetables do attract their necessary nutriment, do grow and bring forth fruits needfull for the support and nourishment of Men and Beasts.

But forasmuch as this nutriment which all the Vegetables do extract out of the Dung of the Beasts is nothing else but a urinous Salt, and that we know how to prepare out of the common Salt, such a urinous Salt which may be used about dunging and fattening the Earth instead of Dung, therefore verily we may be without that said Dung, being but furnished with such a Salt; the which being Alkalized by the fire doth extend it self much wider, or goes farther, and dures much longer in the Earth, nourishing and dunging it, than the Beasts Dung doth.

Besides it gives to all Fruits and Corn, a far sweeter favour, and smell, than Dung it self doth, the truth of which will easily appear to him that will make trial of the same. Nay more, and what is of far greater moment; theremay (by the help of such Salts) be communicated to Fruits, especially to those that grow on Trees, and to Grapes, a most fragrant odour; if instead of Dung, such Salts be used to the Fields and Gardens, and some spices or other things of a fragrant smell be mixed with those Salts, and put to the roots of the Vegetables. An example will illustrate it more clearly.

Plow up some part of some barren Ground, such as is so for want of Dung; or, even some meer sandy Ground, and throw upon it of the said salt as much as is sufficient, and by plowing mix it with the Earth it self, and sow therein any kind of grain you please, and it will spring up out of the salted Earth or Sand, and be encreased, and recompence the pains taken about it, with an hundred fold encrease of the seed, even just as if you had dunged it, nay better than with the common Dunging.

And now I pray, whence doth that faculty of growing, encreasing, and multiplying arise, save from Salt alone, which you sowed your barren Field withall? For the seed cannot purchase to it self nutriment, and aliment, growth and encrease from the barren Sand and Rain-water onely. And this you may try the truth of very easily, if you fill

two wooden Chests or Boxes with common Sand, and put to the Sand in one of them one, two, or three pounds of that inverted Salt, (according to the bigness or smallness of your box) and in the other box let there be onely Sand. If now you sow divers seeds in each of the Sands, and set them in the air, moistening them with Rain-water, those seeds will indeed grow out of both the Sand boxes and get encrease, but yet that which grows where it has been sprinkled with Salt is far fuller and perfecter, insomuch that it will hold on its growth till it comes to its utmost ripeness, whereas the other seeds in the other Sand-box will by little and little perish and dye.

It evidently appears from hence that the faculty of growing and increasing, in all things proceedeth from Salt onely. If so be therefore, that Pease, Beans, Oats, Barly, Rye, Wheat, Wine, and all kinds of Fruits, do grow, and are increased by the benefit of Salt, it necessarily follows, that Salt is the subject and universal nutriment.

But that it may be understood how the common Salt (which otherwise is wont to corrupt or extinguish all the faculty of growth in those things it is mixed withall) is to be inverted or turned in and out, that its hurtfull corroding property being put off it may put on the nature of Alkalies or urinous Salts, I do here covertly set down the manner of the operation, so that it may remain hidden to mine enemies and be communicated onely to my friends.

Take common Salt, &c. [See the Preparation in Append §. p. *Prosp. Germ.*]

Let them be well heated red hot together at the fire, this done, the salt will be dispoiled of its Acrimony and get an urinous property, and being used in a due quantity instead of Dung, to barren Grounds, causeth that the seeds sown therein produce much fruit. But this kind of dunging requireth frequenter Rains than that which is done with Dung; and therefore it may be better and more commodious in moorish places than Beasts Dung, if it may be done, which conjoyns the said salt, and produceth the most wished effects.

But especially the said salt is far better for Vines and Fruit Trees than Dung is: for it gives to Grapes, Apples, Pears and such like Tree-fruits, a far better favour than Dung is wont to afford: Besides, this benefit accrues to Vines thereby, that being sprinkled with that Salt, they have oft times nutriment enough for twenty years, and do every year bring forth Fruit most plentifully: whereas the nutriment of dunging will scarce suffice for five or six years.

Further, That Salt may be far easier, and with much less costs carried and transported into the high Mountains than Dung can; for a far greater quantity of Dung is required than of the said Salt, which said Salt diffuseth it self far larger, or goes much farther than the Dung, and dures longer.

I did this very spring-time last past, put such an inverted salt to some half dead Vines, which being planted in a lean sandy ground could scarce grow up a fingers height, and they presently began to flourish, and grew up so fast that the growth was day by day perceivable. When therefore on a certain day I was shewing some Friends of mine the melioration of metals, in my Laboratory, to be effected by the help of common salt, as they were wondering at the thing, I shewed them those Vines afore my Laboratory, that sprang up from the half dead stocks, and they

they measuring some of the branches of the Vines, found that in two or three months they were grown some 6, 7, 10, and 11 foot long, and the stocks or stalks whence they grew were two or three times thicker than at first; which great change or transmutation in the Vines, proceeding from the salt, would be more admirable and profitable than that of metals, if we did not look upon that transmutation of gold with such covetous eyes. And forasmuch as this transmutation spoken of, was observed in the month of July, and that there are almost yet three months for Vines to encrease and grow; any one may easily conjecture what an encrease the wood [or branches] of the Vines would have in the space of a whole Summer.

But let this suffice concerning the inversion of the common salt, being a most profitable promoter of the growing faculty in all things; the which things I was necessitated to declare here in the end of this small work, that so I might demonstrate those things which I asserted at the beginning of the same, viz. that in salt lie all things hidden, and by the seeds of things and the help of the Sun are rendred visible, palpable and essential.

An Admonition to the friendly Reader, or a Proposition not prescribing or tying to any body, whereby is shewn how much benefit the Countrey may in general obtain by my not chargeable extraction of Gold and Silver out of the fugacious or flying Minerals.

THAT my inventions may be in many places profitable for the whole Countrey, I judged it worth while, briefly to declare my meditations or conceptions thereabouts; and to make a declaration of the way or manner which I judge it may most exceeding profitably be done by.

First of all, I suppose it is sufficiently well known that Princes and Noblemen are occupied or troubled with otherguels burdens and business than to employ or busie themselves with the care and enquiry after the metalline mine-pits, that are here and there in the Countries subject unto them. And if they should commit the care of these things to their servants, 'tis likely that they would rather pass their time in feasting or merry meetings, than in a painfull search of Mines and metallick Veins in the woods and mountains. And as for the subjects themselves, seeing they are altogether rude and ignorant of such arts, by what means, and with what success they can undertake such kind of Labours, any one may easily guess. These are the Causes why things of such great moment are let slip without any profit at all, and are plainly neglected. But in my judgment, though it be but slender, any Prince that hath many Subjects under his obedience, may every year gather store of gold and silver, and that without costs, if he would but onely cause a small Laboratory to be erected, wherein the poor Mines may be extracted with due waters; and leave given to such of his subjects as breath after the knowledge of such Arts, to frequent such a Laboratory, and there to learn such

Arts, with this *Proviso*, that every one should bring the gold, silver and copper boiled or gotten out of the poor minerals by the help of the said extraction, into the Mony-shop or Coining house, at such a rate as they are every where esteemed or valued at, and not transport it out of the Countrey. Now by this means, not only the chief Magistrate would without any cost and labour get no small profit by the mony, but likewise every body would to their utmost, labour in the inquisition after such poor Mines, that he might get Gold and Silver, and other Metals, out of those poor metallick Veins, and get gain for him and his. But now if the Prince or Magistrate will not permit his Subjects the exercise of such a work, but keep all to himself, any one may easily conjecture, that not so much as a man will set about searching after such Mines, but will rather hide them, especially if the Magistrate (as is wont to be sometimes done) would constrain his Subjects to such kind of Labours.

This (according to my simple opinion, no ways prescribing to any what to doe) would be the readiest way, without hurting of any man (nay rather it would help and assist many a man) of furnishing our Countrey with Gold and Silver Coin, which Foreigners have made it bare of. But this will not be by any way, unless the Magistrates themselves do make a beginning, as to the institution of such a work, by this means inviting and stirring up their Subjects to undertake such like Labours, which will bring great Treasures even to the whole Countrey. By this means may rich Mints be set up in very many places, instead of those which at this time afford Mony or Coin so sparingly, and no small portion of Copper too, mixed with it.

These few things was I willing to advise for the sake of the good of the whole Countrey; only laying down my simple opinion without prescribing a rule to any, hoping, that no body of what rank or condition soever they be, will take it otherwise than well.

Secondly, Every Prince and great man would mightily promote the common welfare of his poor, if he would but take the care of shewing the way of so inverting common Salt by one hours heating it red hot, and bringing it to that pass, that it may be made use of instead of Cattles dung, for the fatning and bettering of barren Vineyards, unfruitfull Gardens, and other Fields that are backward or slow in bearing Fruits: for verily, even from this very Art would redound much profit to some Countries. For many Vineyards here and there, and many Grounds do want due tillage because of the scarcity of Dung, whereas otherwise they would prove very profitable both to the Subjects and Magistrates, if they could be fatned and made fertile by this kind of way.

Besides too, all Wines would be had in much more plenty, and be of a far sweeter and pleasanter taste, by such a medium, than if the Vineyards and Fields were dunged with Beasts dung. But as touching this thing, see more in the continuation of my *Miscellum Mundi*.

The end of the First Century.

The Second Century

OF

GLAUBER'S

Wealthy Store-house of Treasures.

Which doth Illustrate his hitherto published Writings, with a more evident Explanation, and doth more clearly demonstrate the Truth hidden in them.

The First Arcanum or Secret of the Second Century,

SHEWETH,

By what means such Metals as are imperfect, wild, and in a manner unapt for use or sale, may be ripened or bettered by Common Salt and Fire, so as to yield forth Gold and Silver with benefit and advantage.

I have in the foregoing first Century, as also in the Appendix to the fifth part of the prosperity of Germany, described the incineration or reduction into ashes, which is to be done with Coals in a peculiar Furnace, fit for torrefaction or calcining.

Though this be a laborious way and tedious, yet is it not without its benefit, provided that a great quantity (as I have already oft times said) of the not vendible minerals and metals be thereto used. But that such an incineration may be done after a more easie and compendious manner, the following way may be made use of.

Build an Hearth of good and sitting earth upon a firm foundation, put thereupon a Furnace [or an Arch] of good stones, adjoyn hereto an Oven, [or side Furnace] out of which the fire may play and emit its flame over all the said Hearth, and pass thereout of by a Chimney made for that purpose. Upon this Hearth put those metalline earths being broken in a Mill, and commix them with the Salt, and Coals reduced into powder, and leave them for twenty or twenty four hours, that they may be all well fired and heated red hot: For by this means, the salt makes the fugitive metal in some sort constant and able to brook the fire; and the wild sulphureousness leaves the metalline mineral, and adjoyns it self to the salt, and converteth it into a vitriol or *Sal. Mirabile*. This twenty or twenty four hours heat, gets a constancy and fluxibility to those

wild metallick veins, and doth withall by that labour so fit and prepare the salt, that it doth afterwards by an easie mutation pass into good salt peter.

After that the said minerals have gotten themselves a better state by the said Cementation, they are to be drawn out of the Fire or Hearth, with iron instruments fit for such a purpose, and new and fresh minerals are to be put in, and to be dealt withall after the same manner as we said but now.

The minerals that are taken forth are to be broken in a Mill, and then the salt to be washed off with common water, and to be afterwards used about making salt peter, the which we have taught in the Appendix.

The light Coals [or Scinders] and unprofitable earth is to be separated by water, from the metalline part, and this metalline part, or heavier *limus*, being reduced and molten in the Furnace called *Stichofen*, yields a beautifull or pure and gainfull metal.

There are sometimes found in many places of Germany, wild, fugacious, and unmeltable minerals of lead, which for that they contain in them Sulphur, Antimony, or *Lapis Calaminaris*, do not admit of reduction in the Furnace called *Stichofen*, but do either go off in fume, or turn into dross. But being first roasted after the aforesaid manner, and fitted for liquefaction, the lead, comprehending in it silver too, may be thence gotten with profit, whereas otherwise they are wont to be dealt withall without any fruit, and are therefore given over. This incineration

incineration therefore is profitably used to such degenerate minerals.

Now if so be any would deal with vendible and good metals, and would have profit from them by incineration, he must proceed this following way.

II. *The manner of reducing lead into ashes, and so handling it with the spirits of salt, that gold and silver may be thence gotten with profit.*

I have at large taught in my first Century, that in the ripening of metals and other chymical operations, a greater fire is endued with stronger power than a lesser, which is easie to be understood by those that have any wit.

I just now taught the maturation and bettering of unprofitable and wild metallick earths with crude and gross salt.

But forasmuch as the gross salt and a weak fire cannot of necessity put forth so much strength as a stronger fire is wont to doe, therefore for such as desire a stronger fire than the common salt, the purer part is to be (by the help of Art) drawn out of the crude salt and to be separated from its grossness and impurity, the which is easily brought to pass by distillation. And as for these fires of salts, and the procuring them in great plenty, my writings, but especially the precedent first Century, do clearly and evidently treat of them, and this second Century will yet treat of it more.

III. *The operation of incinerating the lead, or reducing it into ashes.*

HAVING built a Furnace such as is for Cementation, put therein a strong iron Pot, just after such a manner as the said cupels [or pans] are wont to be made, let there be a Grate to make a fire on, let the Furnace be bigger or lesser according to the bigness or littleness of the Pot you would put in, or according to the quantity of lead-ashes you would make. Put fire under the Pot and heat it red hot, and put thereinto so much lead as is requisite for the covering of the bottom of the Pot; the lead being molten, stir it about in the Pot without ceasing, with an iron spoon having a long handle, the which labour will turn the lead into ashes in the space of about two hours. Take these ashes out, and put in more lead into the Pot, and repeat this labour so often untill you have gotten enough ashes. These ashes of lead are fitted to receive an amendment by the spirits of salts, and afterwards to yield their gold and silver by fusion, and that with profit.

IV. *The manner of bettering the ashes of lead by the spirits of salts, and of extracting thencefrom the gold and silver with gain.*

FIRST of all, you must have plenty of the spirit of salt or *Aq. Regis*, as concerning the easie getting such spirits, we have mentioned the way at large in the foregoing Appendix, and will yet treat more of them in this present second Century.

Besides, you must also provide your self of red or reddish kind of flints, which (besides iron) do also contain in them a volatile gold. Out of these is the tincture to be extracted by the spirit of salt, or by *Aq. Regis*; after that manner I delivered at large in the first Century, and in the Appendix to the fifth part of the prosperity of *Germany*, and will yet

further teach more clearly and more compendiously in this Century.

These extractions are to be poured upon the lead-ashes, that they may be well moistened therewithall; the unprofitable phlegm is to be evaporated by a gentle heat, and the fire to be augmented that the spirits also may follow; of which more heavy spirits there will be enough remaining in the secret Cementatory Pot, and as much as is sufficient for the due operation upon the lead, that so being bettered it may afterwards prove a gainfull emitter of its gold and silver.

He that has a desire of exercising this labour with greater profit, may satisfie his desire, if he will but pour on such extractions twice or thrice upon the said lead-ashes, that they may be concentrated by them afore they are cemented in the Cementatory Vessel, and may be reduced into the bettered lead. For by this means, all the labours and costs will be more largely recompensed, and the more plenty of gain gotten.

This now is the making the lead-ashes, whether you do either *per se*, or by the help of the other metals, convert it by Cementation into a better metal.

V. *A brief description of the secret Cementatory Pot, which admits not of any spilling, and which is sealed with the Seal of Hermes, of which I made mention in the first Century.*

BUILD with Stones or Clay or Potters earth such a Furnace as that is, which I described in the first part of my Furnaces, as necessary for the making of spirit of salt. But let the lower part thereof be a little broader than the Metals being cast upon the Coals may not stick to the walls of the Furnace and so be somewhat lost, but may fall directly down on the live Coals. It must be made four square and of such a bigness as may serve the purpose according as you are minded to cement a greater or lesser quantity of metal therein.

VI. *Of the Cover of the Cementatory-pot, what it ought to be, that so it may suffer nothing to go away in fume.*

THIS Cover of this Cementatory Box or Furnace which I told you was to be made of the Lute of Wisdom, is not properly a Cover but a Leaden Cistern, serving for the reception of those spirits which are driven up by the fire out of the Lead-ashes. This Lead receiver is to lie in another Leaden Cistern, which is to be filled with water, and 'tis to be so fitted to a pipe that is to come out of the Furnace, that the ascending spirits passing thereinto may be the better refrigerated by the water, and the sooner condensed, and saved for farther uses.

VII. *Of the use and benefit of this secret Cementing Pot.*

WHEN any one has a mind to cement the coloured Flints have been sometimes abstracted in the said Cementatory Box, and to graduate them, or so bring to pass that they may contain [or hold the] Gold and Silver, let him first of all fill his Furnace with Charcoal, and let him so order it that his fire may kindle by little and little till the Furnace be well heated red hot; till this is done, the Cover that is at top is to be taken so long off, that so neither the heat

heat nor smoke may pass out at the side through the Pipe into the adjoynd Leaden Cistern.

When the Furnace is thoroughly heated, and that 'tis now time to begin the Cementation, the top of the Furnace is to be shut with its Cover, that the heat may be forced to pass through the Pipe into the Receiver. Having so done, you are to fill an Iron Spoon or Ladle of your prepared Lead-ashes, and put them into the Furnace at the fore hole which serves for the throwing in your Coals, the which ashes are to be so put in as to cover the Coals over, but not so as to choke them but that they may have air enough to burn, and that the fire be not put out, but doe just in that manner as you are wont to distill the Spirit of Salt. By this means all the Spirits that remained yet behind in the Lead-ashes, will betake themselves into the Receiver, and the Ashes of the Lead will be bettered by the graduating and tinging spirits, and will part of them be reduced into a body, and part will yet retain the form of ashes, and fall down through the Grate to the bottom of the Furnace. Then the Furnace is to be again filled with Coals, and more Ashes are to be put thereon with a Spoon as afore, and this labour is to be continued so long till all the Ashes are consumed.

All the labour being finished, take out your Ashes together with the lead reduced into a body, melt them in the Furnace which is called *Stiebofen*, they will melt wondrous easie, then put some small part thereof to the Test, thereby to try whether or no they are enriched enough, to be turned into a Litharge and undergoe the metallick separation.

If they won't as yet brook the trial, let the Lead be again turned into Ashes in your Iron Pot, and repeat the whole afore prescribed labour, and that so often till at length the Lead be rendered rich enough in Gold and Silver, the which may be converted into Litharge after the usual manner, and separated from the Gold and Silver. The Litharge being taken away, and gathered together, and broken in a Mill, serves for farther uses in this operation. The *Regulus* of the Gold and Silver that is left upon the hearth is to be taken out and to be farther mundified in a Cupel after the accustomed way.

This is that more compendious incineration and reduction of Lead, which kind of bettering it, enricheth the operators with Gold and Silver.

N. B. That in this Cementation the sharp spirits do carry over with them some of the Volatile Lead into the Receiver, and there it settles to the bottom; the which powder being freed from all the Acrimony of the spirits by due washings, and being then dried, may be used to all such intents and operations to which the Mercury of Saturn is wont to be used, and which is made by dissolving the Lead in *Aq. Fortis*, and precipitating it by Salt water.

N. B. This distilled Mercury hath more hidden under it than the other hath; for it carries hidden in it a Volatile Gold, which may be separated from it and improved about the gradation and Tincture of other Metals, and that with no small profit, concerning which we will say more afterwards.

Thus, friendly Reader, halt thou my more compendious incineration and reduction into better Metals; the which I would not hide from thee, and hereby shall I satisfy those to whom the way prescribed in my Appendix is too tedious and laborious and they may make use of this way instead of that other, which withall is easier and will without all doubt yield more Gold and Silver than that other way.

VIII. Another emendation or bettering of Lead by the graduating extractions of coloured Flints.

EXTRACT either coloured Flints, such as have in them Volatile Gold or Sand or Clay, by the spirit of Salt or *Aq. Regu*, and draw off the Liquor by Distillation. If you thereto add Salt afore their extraction the dissolvent will receive encrease from the Salt, especially if done in such an instrument, in which a great quantity of extracted matters may be abstracted in a few hours, without either Cucurbits or the other commonly known distilling Vessels, and the same operation may be continued a long while. By this means, there is not onely the least loss of your dissolvent, but it rather gets no small encrease from the Salt. By this instrument also, thou maist not onely prepare great store of sharp spirits necessary for thy operation at the beginning, but likewise commodiously extract your Minerals, and separate the dissolvent again from the Minerals so extracted, so that you shall not lose the least particle of your dissolvent.

But forasmuch as all the Gold, Silver, and Copper may much easier be separated from its *Menstruum*, by this so unheard of and never seen instrument, than by the way of precipitation, 'tis altogether better and safer for a Man not to precipitate his extracted Metals, but rather draw off the *Menstruum* from them, that so he may have them dry. And though that all the spirits go not wholly off, so as that nothing of them abide with the Metals, yet they do no hurt, but rather exalt the Litharge that is put unto them into an higher degree, as it also does to the Ashes themselves of the Lead, when they are cemented together in the afore described cementing Furnace; in which Cementation the Volatile Gold is, together with the corporal Gold conserved, and which otherwise would vanish away in the common melting Fire.

But if so be that any one has a mind to precipitate the Metals extracted out of poor Mines, after the manner prescribed in the Appendix, to the intent he may after the precipitation make Salt Peter of the remaining Waters, he may reduce the *Calx* of the Metals, and principally of the Gold very easily and without any loss, by this following way.

IX. The manner of reducing the precipitated and washed Calx of Sol without any loss.

THE precipitation of Gold by *Lixiviums*, Liquor of Flints, Spirit of Urine, Solution of Mercury, hath been clearly enough described in the Appendix to the fifth part of the prosperity of Germany; but yet the reduction of the same was past over in silence, because of the too much haste of the said Book. Therefore it seemed unto me necessary to insert the same here, for their sakes, who have but little knowledge, or in a manner none at all in these affairs; for should I go to propound such a thing for the skillfull Chymists, I should but do what is already done, especially because he deserves not the name of a Chymist who is ignorant of the reduction of the solar *Calx*.

But forasmuch as it may so happen, that even the unskillfull may set about this extracting of the Minerals, and yet be ignorant of the way of reducing the Gold though they should have extracted it; therefore have I judged it not amiss to illustrate that reduction

duction by my describing thereof here, the which being divers, according as the precipitation is made by such or such a means, doth also require different operations.

X. *The reduction of the solar Calx precipitated by the Liquor of Flints.*

ALbeit that Borax reduceth every Calx of Sol to its former body, if it be therewith mixed and melted in a Crucible, yet that would prove too dear, if somewhat a greater quantity thereof be required for the reduction; for there must be of it at least twice or thrice as much in weight as is of the Gold, if you would have a due reduction of the Gold made. The reason is this, because the Flints precipitated to the bottom together with the Gold, and so sticking on to the Gold impede its fusion so that it cannot rightly come together into its due body. Hereupon is it necessary that there should be the double or treble weight of Borax added to the Gold if you would have all your Gold return unto its former body without detriment.

But whereas there are also other matters to be found which make the Gold fusible and are not so dear as Borax is, the use of such things is to be admitted, but especially when a great quantity of Gold is to be reduced. Otherwise if it be but little Gold that is to be reduced, and you have not the aforesaid matters at hand, one may for such a small trial use Borax. But where there is a greater quantity to be reduced the following matter will be found to be far more profitable and beneficial.

XI. *How the Gold which is precipitated by the Liquor of Flints, is to be melted without Borax, by the Glais of Lead only, which is of a far meaner price.*

TAKE of your Gold precipitated by the Liquor of Flints and dried, one part, of Glais made of Lead and beaten into powder, three parts; the which mix well with the Gold and put into a Crucible, which said Crucible let be put into another bigger one (for which operation the Hessian pots are most fit) that so if the Gold chance to flow out of the inner pot, it may stay in the outer and be conserved. For the Glais of Lead is of such a nature that it usually perforates or runs through the pot. Having thus done put your twofold Crucible containing your commixed matters into a wind Furnace, such an one as I have described, and when you have covered it, put Coals under it [or about it] and urge your fire for one quarter of an hour, that all may well flow, then pour it out, and separate the *Regulus* of Gold with a stroke or two from the glais of the Lead; which said Glais hath attracted to it self all the stony matter, and suffers the pure and malleable Gold to settle to the bottom into a *Regulus*.

N. B. If your glais of Lead be still yellow as it was before the operation, 'tis a sign that all the Gold is separated therefrom; but if it be of a green colour 'tis a sure sign that it has as yet some Gold mixed with it. For Gold being mixed with Glais shews its being there by yielding a skie-colour, the which skie-colour is necessarily changed in the yellow glais of Lead into a green; because every yellow and skie colour do in their commixtion beget a green.

Now then that you may get out the reliques of the Gold out of the leaden Glais you must proceed the following way.

XII. *By what means the Glais of Lead which as yet contains in it some reliques of Gold is to be dealt withall, that it may let them goe out of its body.*

MELT that Glais of Lead in a well covered pot, that I mean in which you suppose some Gold to be, and being well molten cast in a little iron filings, and mix it well by stirring it with an iron rod, and leave it in the fire thus molten, for one quarter of an hour, that the sulphur of the Glais may be killed by its corroding of the iron, and may let fall a leady *Regulus* wherein the Gold will be, and which (in the first melting) the Glais held up, will separate it by the Cupel from the Lead.

N. B. But here you are to observe that the filings of the iron are to be used very sparingly to this precipitation; for by how much the more iron is added, so much the greater will the *Regulus* of the lead be, and consequently require a greater Cupel, which is not so necessary.

For put case the Glais of Lead in which the Gold is suspected to be is about one pound weight, and there is but about a *Quinta*, or certain small weight of Gold; now it is not necessary to have any more than one Lot of Lead or thereabouts, precipitated thereout into a *Regulus*, to which precipitation is required no more than one Lot of the filings of Iron. For the *Regulus* of Lead precipitated out of the Glais, doth for the most part answer in weight, to the weight of the Iron filings used about the precipitation, or to speak more clearly, you will get so much leaden *Regulus*, as the Iron is you added.

The remaining Glais becomes black and is unprofitable for any farther melting with Gold, but yet needs not be cast away, because those *Scoria's* do yet contain much Lead, and therefore serve to be mixt with such Pots as you have used and broken about Metals, or with other wild and hardly fusible metallick Veins, to render them fusible, being I say commixt with these, and put in the Furnace which the Germans call *Stiebofen*, do not onely yield forth all their Lead, but withall draw out the Metals out of those matters which were mixed with them in the melting. But they are principally profitable for the melting and reducing of those Metals, which do not onely very difficultly admit of fusion by themselves, but withall do, being mixed with the Ashes of Tin, so much the more difficultly suffer themselves to be reduced by melting, unto their former bodies. But in defects of such Metals and Minerals, as are not but with much adoe tamed by Liquefaction, you may put to that black Glais of Lead, one fourth part onely of filings, or *Scoria's* of Iron made into powder, that so both the matters thus commixt may be molten in the Furnace *Stiebofen*. So by the addition and help of the Iron, all the Lead will be reduced to its former body, and will withall extract out of the Iron whatsoever of Gold and Silver lay therein hidden; so that by this means there may be reaped a great benefit from this reduction of the Glais of Lead. But yet that Lead is to be tryed by a foregoing tryal, whether or no it be rich enough in Gold and Silver to quit the the costs of separation? For if it be not, it must be used to the aforesaid incineration, that so there may be no loss either of the Gold or the Lead.

XIII. *The preparation of the Glass of Lead, for the reducing such Gold as being precipitated by the Liquour of Flints, is of difficult fusion.*

TAKE of white and fusile Flints [or Pebbles] one part, and of Minium, or any other Athes of Lead, or else even of Litharge it self four parts, each of which being powdered apart, you are to commix and melt them well in a strong double Pot, then pour them out, and you will have a Hyacinth-coloured Glass, the which Glass is to be powdered and mixt with the Gold, and it makes the Gold Powder which resisteth melting fusible.

XIV. *Another way of reducing Gold precipitated by the Liquour of Flints.*

TO one part of this hardly-melting Gold which is precipitated by the Liquour of Flints, admix two or three parts of Litharge, which matters put in a strong double Pot, and cover it well, and melt them well down in a Wind Furnace, that the Litharge may draw unto it self all the Flints, and all the Gold may separate. Having separated the *Regulus* from the *Scoria* of the Lead, you must precipitate these *Scoria*s, which do as yet hold in them some small portion of Gold into a small leaden *Regulus*, with the filings of Iron, as we shewed you but now, that so you may also have even that residue of Gold. The *Scoria* are conserved by being reduced in the Furnace *Stichofen*, according to the operation already spoken of.

XV. *Another way of rendring the Gold precipitated by the Liquour of Flints fusible.*

TAKE of the said Gold one part, and the fixt Salt made of Salt Peter and Tartar, by combustion or calcination, three parts; commix them and melt them down in a crucible well covered. In this co-melting the Salt swallows up the Flints, and the Gold being at liberty settles to the bottom. Pour out the molten mass, and separate the *Regulus* of the Gold from the Salt, the which being dissolved with common water gives you your Liquour of Flints, to be again used to precipitate more extracted Gold.

This Salt doth not so easily perforate the Crucibles as those Glasses of Lead do, and therefore is it to be accounted of as the best and easiest of all these three prescribed ways.

XVI. *The way of reducing Gold, precipitated by the spirit of Urine.*

THE spirit of Urine or of *Sal. Armoniack* doth perfectly precipitate all the Gold out of the *Aq. Regu*; the which being washed and dried, doth not admit of reduction after the manner of the other Gold, for if it be but onely heated a little before it becomes red hot, it presently takes fire, and fulminates with a far more dreadful noise than any Gunpowder. For if you put a small portion of the same, and no bigger than a Pea in a Silver, Iron, or Copper Spoon, and put it on the Coals that it may wax hot, it will give such an horrible crack, that 'twill even dull the hearing, and make a dent in the Spoon as if it had been beaten in with a Hammer. From whence it may easily be conjectured, that if somewhat a bigger quantity be put in a Pot on

the Fire, it would make Pot and Furnace flie, by its so dreadful thundring a stroak into most small shivers.

So then there is need of great wariness, to prevent the happening of so great danger, which is easily prevented by the following manner of operating.

XVII. *By what means the fulminating force of Gold precipitated by a Lixivium, or spirit of Urine is to be taken away.*

MIX with this Gold precipitated by a *Lixivium*, or by the spirit of Urine, half a part of Sulphur reduced into Powder, and let the said Sulphur be removed therefrom by burning amidst live Coals; for so being despoiled of that fulminating force, it may without danger be reduced by any kind of such matters as promote fusibility.

XVIII. *By what means Gold that is despoiled of its fulminating force, by means of Sulphur may be reduced.*

FORasmuch as this Gold is void of all impurity, there needs [not] the addition of such matters as promote fusion, seeing it is of it self prone enough to melt. But yet least some grains of the Gold should stick on to the Pot, 'tis expedient to add some portion at least of such a kind of matter as accelerates or hasteneth fusion. And for this work, Borax, and the dry Liquour of Flints are excellent, of which if you add but one half part onely to such Gold, (or, if you take of the Flints prepared with Salt of Tartar) it will by that means presently melt, and the Borax, or Liquour of Flints will not retain the least doir of the Gold.

XIX. *The manner of reducing the Metals that are not gotten out of the Waters by precipitation, but are freed from them by abstracting them.*

THE Metals which are extracted out of the Mines, and freed from the waters by the abstracting of the dissolvent, cannot be so pure as those are which settle to the bottom by precipitation. For it is very rare for Gold and Silver to be found in metalline Veins, Stones, or Clay, without being commixed with other Metals; because for the most part, Copper is mixt with Silver, and Copper or Iron with Gold, the which being unseparated in the reduction makes the Gold and Silver impure. But now in the precipitation one Metal is freed after another from the *Menstruum*, and are not mixed with each other. But on the contrary, in the way of abstracting it, all the metals remain mixt together without any separation, and require a new separation and consequently a double labour, and more expences.

This inconveniency may be easily remedied by him who is versed in the knowledge of my dry separation of Metals. I have mentioned it in divers places of my writings, so that it would be needless to trouble the Reader with a superfluous rehearsal of the same in this place.

But forasmuch as every one hath not by him all my writings, I believed that it would be worth while, if I should here set down that Laver or Bath which washeth off the Metals with the help of Salt peter by the dry way. For, without the knowledge of this Artifice of separating the extracted Metals from each other, there would be yet requisite much labour, and much costs for the obtaining of the said Metals.

Metals. But they are very easily, and with little labour, and with small costs separated the one from the other by the way here by us described, and indeed with more gain than is wont to be had by the way of precipitation.

And even as in the precipitation of Metals there is always some [portion] of the Waters, that puts on the nature of Salt Peter, viz. when the Waters that have been used, which are as it were the Seeds of Salt Peter, are implanted in an Alkalifate Salt, and so do multiply themselves in a wonderful manner.

So likewise in the dry separation of Metals, there is in a manner, yet more Salt Peter gotten, viz. thus when they are separated in the melting Pots, from each other by Salt Peter, and by an artificial precipitation of one Metal after another, the Salt Peter you used is rendred fixt and Alkalizated, which Alkalizated niter is to be accounted of, as the root of Salt Peter. This root being implanted in acid Salts, is in like manner enriched with a plentiful encrease, and reduced into natural and inflammable Salt Peter; for, by it do the sharp Waters get to themselves the nature of Salt Peter, from those Alkalizate Salts. And if so be you seek not after the common Salt Peter, it is better to sow the Seed of Salt Peter (that is, some spirit of niter which you have used into the appropriate root of Salt Peter, that is, into fixt niter. For by that means you will have (at the encrease) a wonderful Salt Peter, which, in all operations, doth far more powerfully act than the common Salt Peter, what way soever it be mundified by; which is evidenced in my foregoing first Century.

Therefore sofar as in the separation of Metals by the dry way, there remains (after the operation is over) so much fixt Salt Peter as there was of nitrous Water in the moist extraction, it always abundantly supplies both Seed and Root of Salt Peter, so that they may be exceeding plentifully multiplied by other Salts, nor will you have any need of buying any more new Salt Peter for the now spoken of Labour. Verily this is a most compendious way, not onely of separating all Metals even in fusion, but also of somewhat bettering them, as shall be afterwards demonstrated.

XX. By what means such Gold as is commixt with Iron or Copper, and from which (being extracted out of the Minerals) the dissolvent has been drawn off, is to be reduced.

LET such unclean Gold be commixt with two or three parts of its weight of the Glas of Lead, and melt them in a strong Crucible. If there happen to be much Iron, it will of its own accord yield a leaden *Regulus*, which being forced by the heat of the Fire in a Cupel will leave your Gold pure, because the Glas of Lead is wont to attract unto itself Iron and Copper. But if so be there is but little Iron mixt with your Gold the *Regulus* of Lead will not separate or precipitate in the melting, and therefore as it melts some filings of Iron are to be added, and to be accurately stirred with a red hot Iron, that so a *Regulus* of Lead may fall to the bottom, bigger or lesser according to the muchness or littleness of the Iron you added.

XXI. Another proper and fitting matter to reduce such Gold as hath Iron in it.

TAKE of Salt Peter one part, and of Antimony four parts, reduce them into a black Glas, by

melting them. This Glas being powdered and commixt with a wild or raw and not fusile Gold and so molten, precipitates the *Regulus* of the Gold to the bottom, and brings the Iron into *Scoria's*.

XXII. The separation of the Antimony from the Gold.

SUCH golden *Regulus's* do not admit of separation in the Cupel, like as those do which the Glas of Lead is used to. Therefore Salt Peter is to be used in the melting Pots or Crucibles, to make the separation of them.

Put this Antimonial *Regulus* in a melting Pot, melt it down in a Wind Furnace, and being molten cast in by little and little some dry Salt Peter, that so it may seize upon the *Regulus* and transmute it into *Scoria's*. The *Scoria* flowing in the Pot like water, are a sign that the Gold is well cleaned, and that all the Antimony is reduced into *Scoria's*. Then pour it forth into a Cone that it may cool, and the pure and malleable Gold will settle into a *Regulus* at the bottom. Now all the Salt Peter is rendred fixt in this operation, then if you put your *Scoria's* again in the Crucible, and put into it some Coals and melt your *Scoria* down, almost all the Antimony being freed from the Salt Peter will gather into a *Regulus*, and will again serve for reducing of more Gold; for it will as readily reduce your extracted Gold unto its former body, as the [afore said] Glas it self will. But this labour requires a diligent Operator who knows how to handle it with singular skill, though it be easie, and requireth not any great Artifice, but onely an accurate diligence, which use onely makes a Man skilled in.

The Salt Peter used about this labour, gets the nature of an Alkali Salt, and being put on the live Coals doth no more burn, but being dissolved in Water yields a sharp *Lixivium*, very proper for many operations, and serving instead of a Lye made with Wood-ashes. But the chiefest use thereof is this, viz. seeing it is the true root of Salt Peter, it may be added to other Salts, out of which in process of time, it will be notably augmented and produce new burning Salt Peter. He that has a desire gainfully to augment this fixt Salt Peter with common Kitchen Salt, and again to transmute it into inflammable Salt Peter, may accomplish his desire if he makes use of the following operation.

XXIII. The way of making most excellent and inflammable Salt Peter in plenty, and with profit out of common Kitchen Salt and the Lixivium of Salt Peter that has been used.

THERE is so small a difference betwixt common Kitchen Salt, and Salt Peter, that the Salt may easily be turned into Salt Peter, and that by several operations, as well by the seed of Salt Peter as by sharp spirits, as we have taught above, or even by fixt niter which operation we will here shew.

We will use for an example, the baking of Bread, and the brewing of Ale. If when the Meal is with Water brought into Dough, there be added unto it but a few grounds of Ale or Leven, the whole mass begins to heave it self up, and becoming thin [or light] is rendred fit to be baked into Bread, the which hath altogether the same property as those few Ale Grounds, or that little Leven had. And so that very self same Dough is likewise fit to make other Meal ferment, even to infinity. The same is likewise

likewise observable in the brewing of Ale, so that he who hath but once only so much Ale Grounds [or Yest,] or leavened Dough as served his turn once, may brew Ale and bake Bread even to infinity. So likewise is the same evidently manifest by the encrease of Vegetables, which may be infinitely multiplied by the Alkalized Salt of the Earth, if you have but once their Seeds and Roots. In like manner may the same propagation be performed by another way, *viz.* by ingrafting of that which you would propagate into another of the same kind. For example, I have in my Garden excellent Apples, Pears, Cherries, or suchlike Treefruits, and I have a mind to see more of them in my Garden; therefore do I cut off some branch, or perhaps even the Tree it self to the trunk or body; of some wild, or at least not so noble a Fruit-bearing Pear Tree or Apple Tree, and therein, *viz.* in that branch or stock, do I ingraft according to Art some little boughs or cions of some other Tree that bears excellent Fruit, and which I desire to encrease, the which Tree now doth no more produce the wild and degenerate or bad Fruits, it did according to its kind, but such Fruits as the Tree whence the cion was taken, bears.

By these kind of similitudes may any one that hath understanding easily see, that it is possible by Art, to transmute one nature into another, if, *viz.* the Seeds and Roots of things are applied to this transmutation. But now if any one should plant a stalk or leaf in the digged earth, and would thereby encrease or propagate it, he will never see any success of his labour; for the stalks and leaves would rot and so no new Herb would again bud out from them as is wont to be out of the Seed and Roots.

Even on this wise is it with Salt Peter, which if it be mixed with common Salt it would not verily produce any encrease, as 'tis wont to do out of its Seed and Root, as we have already laid open.

Such likewise is the nature of Metals, touching the propagation and encrease of which their proper seeds and roots are requisite. What I pray are those Tinctures, (one only particle of which and that no bigger than a Pea, being cast on an whole pound of Tin or Lead, transmuteth that same Metal into pure good Gold, and changeth and augmenteth it self (as being the true seed of Metals) a thousand fold, out of so gross and earthly a body into so noble and so golden a nature in so short a space of time,) what (I say) are those Tinctures, but the very seeds of Metals, and the very metallick roots. But by what means they are to be obtained, and to be brought under a Man's power, for my part I do not know. But yet I could not but deliver my simple opinion and conceptions concerning this thing, to the studios of Art.

'Tis certain that all Metals have their rise out of one and the same Seed, but that they differ so very much amongst themselves, and that one becomes more ripe than another, is to be imputed to the diversity of accidents. In one and the same Tree are produced Blossoms, and small Fruits of an unpleasant taste; then afterwards bitter and immature ones, and at length ripe and sweeter ones, and are not alike either in form, odour, or flavour, nor are they of like effects, and yet do they all arise out of one beginning, *viz.* out of their Seed and Root. So is it even with Metals.

For as touching their Seed I do verily believe, that it from the most lost and as yet most immature Me-

als, such as Zinc, Lead, Tin, Antimony, Bismute, Cobalt, &c. their stinking combustible and superfluous Sulphur, could by some Bath or other be so taken away, as that nothing may remain save only a most pure Mercury, that then I say such a Mercury, or such a Seed of Metals may be easily transmuted by pure Gold, as being the most pure Root of Metals into a true Tincture.

But to turn common Salt into Salt Peter, the operation is thus.

Take one part of black or of any other common Salt, and mix it with two or three parts of *Calx-vive* being reduced into Powder by lying in the Air, and lay it in such a place as lies open to the Air and Sun-beams, but yet keeps off the Rain, as we have taught in the Appendix.

Moisten this heap with the above said *Lixivium* of Salt Peter, and being dried, repeat the moistening and drying so long, untill the ferment shall have converted all the common Salt and turned it into inflammable Salt Peter, the which doth either sooner or later happen, according as the operation hath been the more diligently or negligently handled. All being turned into Salt Peter, let an extraction be made with common Water, as the usual custom is, and lay the Reliques in the aforesaid place, and again moisten them with the said *Lixivium* as afore, or in defect thereof sprinkle them with common Water, still moistening them after each drying, untill there be a new encrease of Salt Peter begotten, the which you are to wash off with common Water. And so this operation proceeds, or holds on even to infinity.

XXIV. Another far more compendious way of converting common Salt, by the help of fixt Salt Peter into excellent Salt Peter.

MIX some certain weight of common Salt dissolved *per se* in common Water, and as much of fixt Salt Peter likewise dissolved in common Water, mix them in a wooden Vessel; in which Vessel the fixt Salt Peter being as it were a ferment will seize upon the common Salt, and turn it by fermentation into excellent Salt Peter.

He that desires a more mature Salt Peter may instead of the solution of common Salt, pour upon the fixt Salt Peter *Lixivium*, those sharp waters of Salt Peter, which have already been used about other labours, and they will seize upon that *Lixivium* with a more vehement operation, so that of both the solutions as well the acid and spiritual, as the fixt and corporeal Peter, there will be gotten in a few hours space, the most excellent Salt Peter and such as cannot be by any other way whatsoever purchased.

N. B. If any one has a mind of getting a greater quantity of Salt Peter, he may first dissolve his common Salt in the sharp Water of Salt Peter, and [mix it] in that self same *Lixivium*, [*viz.* of Peter,] and after the mixing of these two contrary solutions evaporate the common Water, that the Salt Peter may shoot into Crystals, of which there will indeed be a greater quantity, but then it will not be so good as that which was made by the first operation.

XXV. Another gainfull way of making good and burning Salt Peter out of common Salt, by the help of fixt Salt Peter.

COMMIX equal parts of the *Scoria's* of fixt Salt Peter that you have used, and of the common
M Kitchen

Kitchen Salt together, and add thereunto twice as much *Calce-vive* first reduced into Powder by lying in the Air, [as they both weigh.] Of this mixture make up round Balls, and so pile or stow them with Wood, that it may be a *Stratum Superstratum*, [or a Bed of each orderly,] as the Chymists call it. Kindle your pile of Wood and let all your Balls be red hot for an hour: And the fixt Salt Peter will by a wonderfull inversion transmute the nature of the common Salt, and turn it into Salt Peter, but yet not inflammable till the Sales have been moistned some due time, and so attracted a life out of the Air, and made fit to conceive a flame, or to burn.

N. B. If instead of Rain-water you use such Waters as you have already used and extracted your Minerals withall, to moisten your mass with, then will you thence get in some few Weeks space, an inflammable Salt Peter.

But forasmuch as in the extraction of Minerals and separation of Metals, there will be such a great quantity of sharpnitrous Waters, and likewise of fixt Salt Peter offer themselves for the accomplishment of this operation, and so great a benefit and gain is gotten by that so plentifull an augmentation of your Salt Peter (which hath already sufficiently profitably paid your costs) out of vile and common Salt; hence clearly follows, that all those hitherto described labours and operations are effected, in a manner without any costs or expences, which is indeed an unheard of thing, but yet most true, and exceeds the belief of ignorant Men.

XXVI. *The reduction of Silver extracted out of the Minerals, and freed from the Aq. Fortis by abstraction, [or drawing off the said Aq. Fortis.]*

THE Silver from which *Aq. Fortis* has been drawn by Distillation, needs not any matter to help on fusibility, for as much as it doth of its own nature admit of a very easie Flux; but that the Fugitive Spirits that adhere unto it would carry away somewhat of the same. So now, to prevent this discommodity, you may add unto such a Silver a little of the fixt Salt separated out of the *Lixivium* [of fixt Peter,] the which Salt Alkaly will mortifie the acid spirits so, that they shall not be able to carry off any thing at all in the melting.

XXVII. *The reduction of extracted Copper.*

IF the Copper be not mixt with any other Metals, and be but little in quantity, it may be reduced so in Crucibles by it self, but if it be in a plentifull quantity it may be done by blast.

But where it contains Iron or *Lapis Calaminaris*, (which two the Minerals [of Copper] do frequently abound withall) there it admits not of reduction *per se* without the help of other matters, because of the Iron, Zink, or *Calaminaris*; which Minerals associating themselves with the Copper, in the melting are wont to make it brittle. But this inconveniency may be prevented the following way.

XXVIII. *The way of making Copper, which hath Iron in it malleable by reduction.*

MIX such Copper as hath in it *Lapis Calaminaris* or Iron, with common Salt, and put it in a Crucible and melt it, that so the Salt may associate or draw unto it self the Iron or *Lapis Calamina-*

ris out of the Copper, and turn them into *Scoria's*, leaving the Copper, which will settle to the bottom and go into a *Regulus*.

XXIX. *By what means Copper is to be separated from the Silver, if they are both together extracted out of the Mines, and the Silver has not been precipitated out of the solution by the Water of Salt, but the dissolving Menstruum hath been abstracted from them so conjoynd both together.*

IF the Silver be more in quantity than the Copper, then the Copper is easily extracted out of the other by the Water of Salt wherein a little Tartar hath been dissolved. For Salt and Tartar do readily dissolve Copper, and leave the Silver.

But if the Copper bear the Bell, and there be more of that than the Silver, then will it be better to precipitate the Silver first by the Water of Salt, out of the first extraction of the Minerals; and afterwards the Copper will be likewise freed by abstracting the dissolving *Menstruum*, inasmuch that each of these two Metals are gotten apart.

XXX. *If the extracted Copper comprehends in it any Gold, by what means the Gold may be therefrom separated.*

ALbeit if a solution of Saturn or Lime being poured on the dissolved Copper, and well shook with the same solution will fish out some Gold, yet it gets not all unless it be debilitated by some *Lixivium*. But now the *Lixivium* being poured thereunto that so the solvent being debilitated may the easier let go its Gold thereby, hath with it this inconveniency, *viz.* that the solvent is made wholly unprofitable to be used about any more extractions. Nay more, there's also this discommodity, that if an error be committed by pouring on a little more *Lixivium* than is expedient, there will also precipitate some of the Copper together with the Gold.

To prevent therefore these inconveniencies, the solution of the Copper which contains in it Gold, is to be drawn off even unto driness, in my secret and by me invented distilling Vessel, in which Vessel it may easily and in great plenty be done; and the following *Menstruum* which dissolveth onely Copper and not Gold is to be poured upon the dried matter, that the Copper may be dissolved, and the Gold (be it either much or little) may remain in the bottom undissolved. The dissolved Copper may be precipitated out of the Water with a *Lixivium*, whereto is added some of the Liquor of Flints, and be washed and dried, and with strong Vinegar be turned into a most delicate Verdigreace. The Water that is thus made use of, if it be poured on Alkalized Salts yields good Salt Peter.

He that does not much regard that green colour may separate the dissolvent from the Copper by Distillation, and again use the same for the like dissolving of new Copper.

But now there must be in the Copper so much Gold as to quit the costs of this labour, and to prove gainfull; otherwise it is better to leave the Gold with the Copper than to buy it at so dear a rate.

XXXI. *The*

XXXI. *The making of such a Menstruum as dissolveth the Copper and drives from it self, or precipitates the Gold.*

THIS dissolvent is no other than *Aq. Fortis*, wherein a little Tartar is dissolved. For the Tartar being an enemy to the Gold, is wont to precipitate the Gold out of the solutions like as common Salt doth Silver out of *Aq. Fortis*. By this way may all the Copper be easily separated from the Gold, concerning which, more shall be spoken in its due place.

XXXII. *Another reduction of Copper that hath Gold in it, and the perfect separation of the Copper from the Gold.*

ADD to such Copper that hath Gold in it, some Silver, and melt it with so much *Regulus* of Antimony as is twice the weight of the said Metals thus together taken. Separate the said *Regulus* together with the Copper from the Silver by the addition of Salt Peter, that so the Silver may retain with the Gold that was in the Copper, the which is to be afterwards separated if it be worth the while. Now it is not necessary presently to separate it, so much as it is far better many times to abstract such a Copper that has Gold therein from such a Silver, that so the Silver may be enriched with a great quantity of Gold by so many abstractions; the which abstractions require but very little costs besides the charges of the Fire and Crucibles.

For all the Salt Peter used hereabouts, together with all the Copper and all the *Regulus* of Antimony may be thencefrom again recovered, by him who rightly knows the precipitation. Besides, there lies hid under this operation, some great matter as concerning the amending of the Metals. For it is a way of arriving to the knowledge of impregnating all Silver by Copper, with Gold, and Copper it self with Silver; concerning which thing there are more instructions to be found in other places of my Writings.

These things may at present suffice, touching the reduction of the Metals extracted out of the poor Mines, and [concerning those things which by reason of the hasty Edition of the Appendix to the fifth part of the prosperity of Germany were omitted therein;] the which defects the well minded Reader may from hence supply.

XXXIII. *A brief description of the above mentioned artificial Instrument, by the help whereof the spirits necessary for the extraction of the Metals out of the poor Mines that contain in them Gold, Silver and Copper, are plentifully prepared, the Minerals themselves extracted, and the dissolving Menstruums, again easily separated from the Metals.*

THIS incomparable and by me newly found out Instrument, being most profitable and commodious for the easie extractions of Metals, and preparations of the dissolving *Menstruums*, is made of a peculiar earth, and is almost of the figure or likeness of a Bakers Oven, and is either of a bigger or lesser size, according to the quantity any one has a mind to labour in; In the forepart it hath a Door, and in the end [or top] or very near it, it hath an Outlet. To the Cover serving instead of an Alem-

bick, a great receiving Vessel is to be fitted, fit for the reception of the outgoing spirits. After that the Furnace is heated, the prepared Salts being put in peculiar Pots or Crucibles made of the best earth are to be put with a pair of Tongs prepared for this peculiar use into the Instrument, and all the spirits will be drawn off with a speedy Distillation. Now there is no danger here of breaking the Instruments, and the Distillation may be done in the space of one or two hours, how great a quantity soever of Salt was used to the Distillation. When the Distillation is over, the Pots that were put into that Instrument or Furnace are to be again taken out with your Tongs, and presently other Pots filled with Salts are to be put in the room of them you took out, and the spirits again driven out by a new Distillation. This labour may be kept on as long as one pleaseth, or as long as he hath any matter to distill withall; because the Vessel never cools as long as the Distillation is continued. This Furnace therefore is most notably fit for the Distillation of a great quantity of Salts, and that by a labour which is so exceeding speedily finished.

The same way of Distillation is to be observed in the extraction of Minerals or Metalline Earths, the which can be far sooner extracted and far speedier this way, than by that described in the Appendix which is to be done by heating the Glasses.

After the same manner is the dissolving *Menstruum* it self speedily again abstracted from the extracted Metals, and being thereby preserved without any loss is to be applied to farther use. This Instrument therefore doth so compendiously and easily dispatch all those said labours, that (set aside your Fire and Salt) the plentiful making your spirits, the abundant extraction of the Minerals, and the separation of your *Menstruum's* from the extracted Metals and its preservation, are in a manner done without any costs.

XXXIV. *Now follows an explication of some secrets effected by the help of my Sal. Mirabilis, concerning which there is mention made in the second part of Miraculum Mundi.*

IT is clearly evident from many places of my Writings, and principally in the second part of *Miraculum Mundi* that my *Sal. Mirabilis* is diversly prepared; hence it follows of course, that the use thereof is different. For it hath one use when (after the spirit is thencefrom distilled) it is taken out of the Cucurbit, and hath as yet a corrosive nature. Contrarily, it hath another kind of use when this corrosive Salt is dissolved in common Water, and filtered, and set in the cold, that so the best part thereof may shoot into long Crystals, which having no corrosive power, serve for a peculiar use. It hath likewise another use when it is deprived of all corrosivity and turned into a sweetness, as I have shown in many places of my Writings. This is to be known by such as would use it, for this or that labour, that so they may commit no error, but be thereby rendered Masters of their desires the more easily.

We will therefore make inspection into some of those principal secrets which are declared in the second part of *Miraculum Mundi*, and examine whether or no they can be effected after the same manner I prescribed?

XXXV. *By*

XXXV. *By what means any Water, Wine, Ale, Vinegar and other liquors may be coagulated in a few hours (space into hard pieces like Ice, by the Sal. Mirabilis.*

FOR such a coagulation of all watery and moist things, well edulcorated (as the Chymists phrase is) *Sal. Mirabilis* is to be taken and such as is shot into long Crystals, prepared of an equal weight of Salt and good Oil of Vitriol, because a most great driness ariseth from the Oil of Vitriol.

Such an excellently well prepared *Sal. Mirabilis*, and which is shot into long Crystals, is to be reduced (by calcination in the Sun) into a fine powder, that so it may lose all its moistness and yet not melt. For if it melts, then it would need grinding again; one part of this calcined *Sal. Mirabilis* is able to coagulate three parts of Water, Wine, Ale, or any other liquor which it is mixed withall, into a dry matter like to Ice, inasmuch that it may be carried in a Sack or a Sieve full of holes.

But what use such a coagulation may serve for, would be too tedious to declare in this place. Any one will find what use is to be thereof made, if he well meditates upon the thing.

XXXVI. *The separation of the Water, Wine, or Ale, from the Sal. Mirabilis.*

THE coagulated liquors may be commodiously separated from the *Sal. Mirabilis* by Distillation; but the aquosity of the coagulated Wine and Ale are to be separated onely by Distillation, and the grosser part remains behind in the Cucurbit with the Salt. But the *Sal. Mirabilis* is by calcination, again freed from all impurity, and again made white and fit for any other such like new effect.

N. B. I doubt not but that there are other ways of coagulating watery liquors into Ice, concerning which we shall say somewhat in their due place.

XXXVII. *How the sharp Spirits of Salts, as Aq. Fortis, Aq. Regis, Spirit of Salt, Spirit of Vitriol, of Alum, and the like may be coagulated into hard Salts, not unlike to frozen Water.*

THIS coagulation of sharp Spirits out of Salts, is done the same way as the coagulation of common Water, and other sweet liquors is performed by; but the separation ought to be done in Vessels of the best Earth, or in Glais, because of their sharpness. And certain it is, that with these coagulated Spirits of Salts many things of great moment may be done, the mentioning whereof we for brevity sake do here pass over.

For I have purposed to demonstrate at this time, some secrets onely which are mentioned in the second part of *Miraculum Mundi*, and to assert the truth of them.

By these two described coagulations any one may easily learn that the coagulation of other moist things are possible to be done.

XXXVIII. *How the head of a fountain may be stopped up by this Sal. Mirabilis.*

IT sometimes happens that there breaks out a Spring of Waters in some places where it proves offensive and hurtfull. And forasmuch as they are

sometimes very difficult to be stopp'd up, I will set down a way in this place of stopp'ing it by *Sal. Mirabilis*, but chiefly to this end, that the nature and property of things may be thoroughly learned, and besides, that even Arts and Sciences themselves do sometime bring no small help, especially when no counsel avails. Take therefore of your *Sal. Mirabilis*, heated red hot as much as is sufficient, wrap it up in a linnen cloth and thrust it into the hole of the Fountain, and it will be turned with the Water into an hard Stone, and thereby enforceth the Fountain to seek it self some other passage.

XXXIX. *The way of separating the Phlegm from subtil Spirits.*

BECAUSE the Volatile and sulphureous Spirits of Salts are of great efficacy in Medicine, and principally when their Phlegm or aqueous humidities are removed from them, the which thing every one can't bring to pass, I have therefore judged it worth while, even for the sake of the Sick, to discover an easie way of so doing, by my *Sal. Mirabilis* as follows.

Fill a Glais Cucurbit half full with *Sal. Mirabilis*, pour thereupon the Volatile Spirit of Vitriol, Niter, or common Salt, and distill thence by B. the most subtil Spirit, the which will come off, and leave the unprofitable Phlegm behind with the *Sal. Mirabilis*, the which (by heating red hot) you may again render fit for new operations.

XL. *Another and easier way, yea even almost an incredible and miraculous one of freeing Wine, Ale, Vinegar, Brandy, and all other moist liquors from their unprofitable Phlegm in a moment of time, by my Sal. Mirabilis.*

THE precedent coagulation of moist liquors ariseth from that most great driness which lies hid in the *Sal. Mirabilis*. But this way we now deliver, proceedeth from the concentrated cold of moist Fires, which Fires we have treated of in the first Century, and 'tis thus.

Take one pound of the above said *Sal. Mirabilis*, put it in a strong Glais, and pour thereupon two parts or pounds of the concentrated and cold Fire of some Salts, whether it be of Vitriol, or common Salt, or Salt Peter, whose Fire excels the Fires of other Salts; and let them lie quiet for some hours, and there will be made an Icy mass of them both, the which you shall in the Winter time set out in the Snow or in some cold place which by how much the colder so much the better; where the longer it abides in the cold, the more will the cold Fire be concentrated, and consequently so much the greater matters may by such a concentrated body be effected.

XLI. *The receiving or catching the breath of Men, as they sit in some warm Stove, and the changing it into the form of Ice.*

IF thou hast a mind to create a kind of admiration amongst thy Guests or Friends when they are with thee, and to give them some profitable recreation, you may accomplish your desire the following way.

Carry with thee a Glais full of the moist Fire of Salt, and which is coagulated by the *Sal. Mirabilis*, and hath stood some hours in the cold, into the warm Stove, and hang it up over the Table by a thread

thread or small line, when your Guests are set at the Table, and when they ask you what this signifies, you may tell them that you will for their Recreations sake, shew them some pleasant diversion; after they have made an end of eating and drinking, upon this they will all of them have a desire to see those tricks and ever now and then cast up their eyes upon the Glass. But after that the Glass has there hang'd a minute or half minutes space, the breath of the Men that sit about it will presently apply it self to the Glass, and stick on to the outside thereof like Snow, and cover it all over; and thicken more and more, insomuch that in a short time it will have a thick and hoary beard, all about consisting of natural Ice; and will so long keep on its encreasing as the concentrated cold lasts in the Glass. Then at length the Glass growing a little hot, after the internal cold of the concentrated Fire is consumed, that icy beard begins again to melt and being resolved, to distill into a Water, for the receiving of which distilling drops some Vessel is to be set under. This is a wonderfull Distillation of Men's breath, which coming out of their mouths in their discoursing, is reduced by the concentrated Fire of Salt into Ice, and at length, again into Water by the heat of the Stove.

This so speedy an operation or transmutation of a moist and watery vapour into natural Ice, seems indeed at the outside view to be but a vile and unprofitable thing; but if it be but well minded by the sight of the internal mind, it not onely begets a most great admiration, but withall opens the most excellent knowledge of natural things.

Such as greedily hunger after Gold will say, what benefit comes from these tricks? had Gold but distilled from the Glass we would have saved it, what need we any Water? or if it had been noble or generous Wine, we could have prized such an ingenious knack, and drunk it off. Take away that filthy Water and bring us the gallant Wine. Such discourse as this, let one of thy Friends purposely utter, being thereto first suborned by thee, that so thou maist the more delight the rest of thy Friends that are ignorant of these things, by thy presently satisfying him that is so desirous of Wine, saying, that if thy Friends and Guests do desire better Wine, thou art ready to draw it them. Upon this, thy Guests will diligently listen and desire to see what better Wine thou wilt draw them out of thy Cellar. The chiefest of these will well know that thou hast not in thy Cellar such variety of Wines.

In the mean while, have ready some small Glasses which contain some Ounces, filled with the concentrated Fires of Salts, and well shut and strings tied ready unto them; now when thou hast a mind to give them a relish of thy Art of bettering Wines, and rendering them more generous, command a Cann of common Wine to be brought thee, and give it to thy Guests to drink. But now when they shall perceive that it is the same sort of Wine they had formerly, and that thou hast not given them any better, thou shalt satisfy them by the following way.

XLII. A momentary operation of rendering any common Wine more generous, and exceedingly bettered by the cold Fires of Salts; and that in the presence of many Men.

Command one of those Glasses prepared for this purpose to be brought unto thee, and let it

down by the thread into the Glass full of Wine, which being done, the concentrated cold that lies in thy little Glass, which thou hang'st in the greater one of Wine will draw to it self the watery and unprofitable parts of the Wine, and change it into an incipid Ice. And by how much the longer you leave that little Glass in your Wine, so much the more Water will be drawn there out of, and the Wine will be made the more generous thereby. But the sooner you take it out, the less Water will be separated; so that out of one Cann of Wine you may by this means give your Guests several sorts of Wine to drink, or rather may let them better the Wine themselves even according to their pleasure. For by this operation the unprofitable Water being drawn out of the Wine and turned into Ice, is separated and taken away; part therefore of the Water being taken away, the remainder must necessarily be much more efficacious and more sweet than it was afore, when it had Water conjoined as yet with it.

A Master of a Family using this Artifice may make for himself and his Guests, divers Wines though drawn out of one Barrel.

Now such a secret is not onely full of Curiosity, but also of profit, and may prove helpfull and do much good several ways. I could if need required declare a thousand conveniences, and Commodities proceeding therefrom. But because I judge it needless to spend time in declaring them, I will at present mention onely some few, remitting the rest to the following Centuries, in which shall be made mention of them according as the [matter and] time requires or permits.

XLIII. The amending of any malling or smallish Ale in the Winter Season, as well at Home as Abroad.

It sometimes happens that a Master of a Family hath but onely one sort of Wine or of Ale in his Cellar, the which he is accustomed to drink, and puts not in his Cellar any better Wine or Ale either by reason of poverty, or else because the Cellar lies open to every body, both Men-servants and Maid-servants, and they will to the best Tap, and so he fears it will be too chargeable.

But so far as old Men's Stomachs, when they sometimes feed on Stock-fish dried, or on Martelmas Beef, or Fish, by reason of its debility through old Age, cannot perform its office of Concoction: The Ale or Wine may by the help of this secret be presently rendered stronger, especially in the Winter Season, in which Season a warmer and stronger draught of Ale and Wine is more beneficial than in the former months, and then they can better brook the want of the same. But some may object and say, where shall I get such a concentrated cold as may enable me to extract the Water out of the Wine? hereunto I answer that there will be many that will prepare it for time to come and will spare it to others; and yet no body needs so great a quantity thereof neither. If a Master of a Family hath but one onely half pound of the same, he may use it his whole life time, if he but keep it so as that the Glass break not and spill it. For when he hath taken away the Water of one or two Pots of Ale or Wine, let him remove the Ice from the Glass, and set it again in the cold till he needs it. For such a cold concentrating Magnet always keeps its virtues, and is never corrupted, but always fit for the effecting of many wonderfull things.

N. B. If you have not those fires of Salts the heavy Oil of Vitriol, Oil of Salt, or *Aq. Fortis* may be used hereabout; but yet these Oils do not in any comparison perform what those concentrated Fires of Salts are able to effect. But however they demonstrate the thing it self though they bring no great store of profit, and this any one may easily understand.

For there is a great difference betwixt the watery and not watery Fires of Salts, any common and simply bare Water cannot become so cold as the Water of any Salt, and this Salt-water cannot be so cold as a common Spirit of Salt, nor can this Spirit by any means arrive to that degree of cold as a concentrated Spirit usually attains to. So a skin of Leather is never so cold as Wood, nor Wood as a Stone, nor a Stone as an heavy Metal; the difference proceeding from the thickness of the compaction, for verily any thing will concentrate the more cold or heat and fix it with it self, by how much the compacter and thicker body it shall be of. For it is the property of a concentrated cold to kill a thing and to make it hard and stiff. Contrarywise a concentrated heat gives a speedy life, and correction, and emendation, and this experience it self teacheth.

O happy Man is he that can make a Metalline Sale as compact and thick, and heavy as a Metal, and can by conserving it a due time in the heat of the Fire, that the heat may by little and little and gradually be concentrated and fixed therein, make it fusile. Without doubt such an one would get a Tincture that would cure the most grievous Diseases, and change the imperfect Metals into perfect. For it is the Fire onely that begets a maturity to any thing, and by how much the stronger and greater the Fire is so much the speedier and better amending of any thing may be expected.

These things which I have here briefly declared are of greater moment, dignity, and weight than any one can believe; and besides there's no doubt but that there will shortly some step forth, who will without any fear testify the verity of Art, by changing imperfect Metals and turning them into pure Gold; so common will Alchymy become in this Age, which was neither heard of nor seen before in this World. Nay more, Men will make this Art so familiar unto them that they will not much esteem even of particular Tinctures.

But why God permits such things to be done, is to us wholly unknown, thus much we see onely, that doubtless there will follow some great change in the World; happy shall they be who having the fear of God before their eyes, and are of a pure mind, cannot be hurt by the Devil nor Sin his Mother.

XLIV. *Wherein this secret is beneficial to those that travel in the Winter Season.*

Necessity doth sometimes enforce old Men to undertake a Journey in the Winter, which, if no urgent hast forceth, may be so ordered that at Noon and Night quiet rest may be always taken in such a place in which is plenty of Meat and Drink.

But if so be that an urgency of occasion requires a going on forward, whether one ride on Horseback, or in a Coach or Waggon, and that either the Snow render the way difficult, or some Wheel of the Waggon be by chance broken, and so the journeying Person hindered from coming to the place aimed at in the appointed time, he is sometimes by

this means constrained to turn aside to a poor Peasants lodging, or if his fortune be a little more favourable, he is necessitated to Inn in some poor Village, where he can neither meet with Wine or good Ale; he now that thus journieth may out of the poor Wine or Ale make himself better Wine or Ale, and the better provide for his health if he hath about him, such a magnet in some small Glass that attracteth Ice to it.

XLV. *What profit those that sail in the Sea may have by this secret.*

It may so happen that a Man taking Ship with hopes of arriving in a short space of time to the end of his Voyage, though he has some little of good Wine or Ale, may be enforced if the Wind prove contrary to stay longer upon the Sea; his good Wine therefore and his Ale being spent, he may make that small Beer in the Ship which the common Marriners drink of, better, and preserve his own health.

XLVI. *How by the help of this secret the unprofitable Phlegm of Brandy made of Corn may be taken away, that so it may become equal to the spirit that is made of the lees of Wine.*

To the effecting of this business there is required a greater Magnet, which may remove that Phlegm then needed to the Wine or Ale, because Brandy is of an hotter nature than Wine or Ale, which do more willingly let go their wateriness than adust Wine is wont to do.

XLVII. *By what means the superfluous wateriness is to be taken away from the weaker or waterish Vinegar, that so it may be made stronger.*

THE wateriness of the weaker or more aqueous sort of Vinegar doth suffer it self to be more easily extracted by the help of that Ice-attracting Magnet, and the rather because it, viz. the Vinegar puts on an icy form much sooner than any other Drinks.

XLVIII. *It may be queried whether or no this bettering of Wine, Ale, Vinegar, Brandy, and other Drinks, and rendering them stronger and sweeter, may be done in great plenty, or whether it is to be accounted of as a curiosity onely?*

FOR answer, verily it is a most excellent secret most aptly satisfying the curious inquiry of mortal Men, which the World as yet never knew, and yet it can effect such unheard of things, which it is not necessary that they should be divulged.

As touching the plentiful separation of Water from Wine, Ale, or other Drinks [in great quantity] the same may be done and that with profit, and in some places bring no small gain to him, who knows how rightly and artificially to accomplish the same. I have done enough as to my affairs in laying it open; we must not boil meat for the slothfull and thrust it into their mouths. Let them get it themselves if they will, and rightly take care of their own matters.

XLIX. *Where*

XLIX. Whether or no likewise a great quantity of cold Fires out of Salts may be easily prepared.

FOR answer, yes, so great a quantity of them may be prepared as a Man would wish for, or as his necessity shall enforce him to desire. But because such cold Fires of Salts are the effecters of admirable and incredible things which the World never knew of, therefore the copious preparing and getting of them deserves to be concealed. Let therefore every one be content with those things which I have published in the first Century: haply in process of time more may follow.

L. How my Sal Mirabilis can free watery Oils of their superfluous humidity.

MIX one pound of this my Sal Mirabilis reduced by warmth into a fine Powder, with ten or twenty pounds of good Oil Olive, or new Linseed Oil; the Sal Mirabilis is to be commixt warm with the Oil, and being well stirred about with it, draws to it self all the Water, and settles to the bottom of the Vessel, from which the clear Oil is to be separated by pouring it off; and all the Water and impurity of the Oil is to be severed from the Sal Mirabilis, that so it may be recovered and be again profitable for such like operations.

LI. The way of taking off the mustiness or stink from a Vessel corrupted or grown musty by lying, that it may be again fit to put more Wine into.

SMear over the inside hollowness of such a Vessel with the concentrated moist Fire of Salt, that it may be every where wetted, and sprinkle thereupon so much of the Sal Mirabilis as will stick thereunto. For so that cold Fire of concentrated Salt, with the attracted Sal Mirabilis will become hard and not run, and stick on to the Vessel; and that said Fire will in a few days space burn up all the mouldiness and stink, just as if the common Fire of Wood had been used thereabouts. The Vessel being washed with boiling Water is again rendered fit and convenient to put Wine into.

This operation is not here taught for some stinking Vessels sake that is not worth the while, but to this end, that other secrets of greater moment, and which are profitable, may be learned thereby and known. For under these operations lie hidden many wonderful things, and such as the greatest part of the Readers will not consider. But to what end is it to light up a Torch before such Men, that are left by God in blindness and darkness, and hath not vouchsafed to bestow on them any Eyes.

LII. The manner of preserving all kinds of Fruits, Eggs, Onions, and other moist Fruits of the ground a long time from corrupting.

THE sweet or dulcified Sal Mirabilis is to be well dried by the help of the Fire, and being put in some Vessel with Fruits, Eggs or such like, with a thick and close laying [or bed of one upon the other] doth by its driness so preserve all things, and by its attracting virtue of all corrupting humidity, that for a long time they feel not the least corruption.

LIII. Question. Why doth the Sal Mirabilis, which Corn has been macerated withall afore its sowing, and some whereof is mixed with the Earth, [or sown] attract the Rain, coagulate it, and hold it with it self longer than other Salts?

FOR answer, this is to be imputed to its most great driness which it abounds withall.

LIV. The preparation of the Sal Mirabilis, so as that it may become an universal Medicine for all Vegetables.

THE Sal Mirabilis as it is of it self, is by reason of its corroding virtues which it as yet retains plainly unfit for the multiplication of the Vegetables, for that being so used would prove more hurtfull than profitable. Upon this account it is necessary that to one part of it be added two parts by weight, of the best Calx-vive, which being moistened with Water and made up into Balls, are to be well heated red hot for an hour, that so all the corrosivity being introverted the Sal Mirabilis may be Alkalized, and used to the Vegetables for an universal Medicine; for it conserves its attracting force, and loseth it not in the heating red hot.

LV. What's the reason that Wood lying long in the Water wherein Sal Mirabilis is dissolved, is turned into an hard Stone?

FOR answer, this operation is to be ascribed to the incredible astringent property and nature, that the Sal Mirabilis is endued withall.

LVI. To reduce an half dead Tree to life again by the help of Sal Mirabilis, that it may revive and begin again to sprout out.

MIX with the digged up Earth, with which the Roots of the Trees are covered, one, two, three or more pounds of the Sal Mirabilis, according to the bigness or littleness of the Tree, and again, cover over the Roots with the same, and pour upon the Earth it self, some Rain water, that being thereby moistened, the Roots may the better partake of the Salt that is mixed with it.

By this means, the Tree will attract to it self the Medicine or good nutriment out of the Salt, and will be cherished and refreshed just as a piece of bread or other food being given to an hunger-starv'd Man restores him his strength again.

LVIII. How by the help of Sal Mirabilis most hard and insoluble subjects may be very easily dissolved.

LET the nature and property of a Char-coal of Wood be considered, the which is such, as that if it be kept in the greatest Fire for many years, and all external air kept out from it; it will neither ever melt, nor ever lose ought of its body, but will come out again in the very same form as it had at your putting it into the Fire.

So likewise a Wood coal is able to endure an hundred, yea a thousand years in the Earth, Water, or even the most sharp corrosive Waters unhurt. This so most sharp a tryal, neither Gold nor Silver though they be the purest and most constant are able to undergo. And although a Coal be thus durable, yet nevertheless will I dissolve it in half an hours space, and

and convert it into a red fusile Salt, which is dissolvable with Water, and yields a wonderfull liquor which is the effector of incredible operations both in Medicine and in Alchymy.

LIX. *What Sal Mirabilis is to be used to dissolve the Coles.*

THE *Sal Mirabilis* is diversly prepared, as appears in the second part of *Miraculum Mundi*; but what way soever it be prepared by, it may be commodiously applied to the solution of Char-coals, nor needeth it any farther preparation, but even just so as it is taken out of the Cucurbit and is as yet corrosive is to be used to dissolve all things.

LX. *The manner of reducing any Char-coal in half an hours space to its first matter, that is, into a sulphureous Salt, by the Sal Mirabilis.*

MELT two or three ounces of *Sal Mirabilis* in some Pot or Crucible, and throw in a peice of Wood-coal or Char-coal, and cover the Pot with its Cover, and let it flow for one half hour, that so the Salt may dissolve as much of that Coal as it can, and may leave the rest of it which it cannot dissolve, undissolved. Then pour out your matter and you shall find a red Stone of Salt, which being tasted upon the Tongue burns it like Fire, as all Alkaly Salts do. For the corrosive force is inverted by the Vegetable Sulphur, and changed into an Alkaly.

This red Carbuncle being dissolved in Water yields a green Solution, which being filtered, and let stand still for some hours, appears of a white colour, and being let alone quiet longer, acquirith a yellow colour. One drop thereof gilds over an imperial as Sulphur does, if it be therein put. For the Char-coal is no other thing but a Sulphur of the same nature as the Mineral Sulphur is of, and penetrating all the Metals, suffers it self to be fixed with them, and doth after another manner perform all those things that the Mineral Sulphur is wont to do.

The very well skilled *Sensidvow* in his Dialogue concerning the Sulphur of the Wife Men, saith he is strongly guarded, and sits Captive in a dark Prison, and is not easily freed; but Salt gives him a deadly wound.

A Sulphur therefore sits in this black Coal in a dark and obscure Prison, shut up with strong Bands, and is a Captive, nor can any one free him from those Bands but onely Salt. But being once released out of Prison, he is wont to come in view, and not before.

Thus now have we brought forth Sulphur out of his obscure Body. And now will we also bring him forth to publick view.

LXI. *How the Vegetable Sulphur is to be made visible.*

IF you pour into the white Solution of the Coals some Acidity, as Vinegar, Spirit of Salt, of Vitriol, or some *Aq. Fortis*, and that leisurely and by little and little as much as is requisite for the killing of the *Sal Alkaly*; the Sulphur will settle to the bottom like a white Powder, which being separated from the Salts, and washed with fair Water, and dried, will burn and exactly answer to the virtues of the Mineral Sulphur.

LXII. *Another way demonstrating that a Mineral Sulphur lies hidden in all Vegetables.*

PUT this green or white juice of the Wood or Coals expressed or squeezed out by the Salt, in a Glass Cucurbit upon some *Sal. Armoniack* powdered, put on an Alembick and draw off all the moisture by Distillation, in which Distillation the spirit of the *Sal. Armoniack* will bring over the Helm, the Vegetable Sulphur of a golden colour. It is a most penetrative Spirit and of wonderfull efficacy in Alchymy and Medicine, and this will easily be credited by him, who knows its penetrating and graduating virtue and property, in which it excels all other penetrative Spirits, you must keep it very warily because it easily vaniseth.

LXIII. *There is yet another way of making the same Sulphur of Coals visible.*

WHEN you have poured out our Carbuncle out of your melting Pot, beat it into Powder and mix therewith half its weight of *Sal. Armoniack* powdered, draw off by a Glass Retort, both matters exactly commixt by Distillation, that the *Sal Armoniack* may bring over with it that Sulphur. Wash off this red matter drawn out by Sublimation, with common Water, the which being freed from the *Sal. Armoniack*, is a Sulphur inclining from its reddiness to a yellow colour, and is altogether like to the Mineral Sulphur.

LXIV. *There is likewise another way of extracting the same Sulphur out of Coals.*

FIRST of all, exactly melt the Coals by the *Sal Mirabilis* in a melting Pot, that the Salt may be accurately Alkalized by the Coals, and burn the Tongue like Fire. Then pour it forth and beat the Coals into Powder and put them in a Glass, and pour upon them Spirit of Wine freed from all its Phlegm. Then set the Glass in warm Sand and ever and anon take it out and shake it well that the Spirit of Wine may extract the Sulphur, and leave the Salt untouched. Your Spirit being as red as blood, pour it out into another Glass, and again, pour on more Spirit of Wine upon the matter, and repeat the former operation; these pourings on, and castings off are to be so often repeated, till the Spirit of Wine when poured on will extract no more. Put all these red extractions into a Glass Cucurbit, and separate the Spirit of Wine by a B. and it will leave behind in the Cucurbit a sweet Oil of the colour of blood; a Medicine of so great moment in all Chronical Diseases, as that none is to be preferred afore it. For this Sulphur is far better than the Mineral Sulphur, which for the most part is mixt with some Arsenical property, whereas this is extracted out of the Coals of Wood, and is therefore far purer and necessarily more conducive to Man's health.

And as touching the whole operation of this precious balsamical Sulphur, which is but little inferior to potable Gold, the chief knack of duely making it consisteth in this, viz. that the *Sal Mirabilis* be well and accurately Alkalized by the Coals. For if not, the Spirit of Wine would dissolve the *Sal Mirabilis*, and would not extract the Sulphur, nor would it answer thy wishes, if it be not deprived or despoiled of all its humidity.

He that shall be well skilled in the due handling of this Operation, will obtain a most excellent Medicine not much inferior to potable Gold, of a sweet and pleasant Taste, and of an admirably grateful Odour and Colour. By such a means as this, is extracted out of a dead Herb, or dead Wood, its greenness in the first Solution made by Water; and after the Extraction with Spirit of Wine, the most delicate red Colour thereof, with a most sweet vegetable Odour; all which lay hidden in the black Coal, and are again brought forth to light.

The use of this most delicate Oil of Sulphur is not small both as to the metalline Operations and other Arts; and this so speedy a putrefaction and revivification of the dead Vegetables into a living medicine carries in its Intrails a great mystery.

LXV. *It may be demanded, whether or no the Coles themselves are to be only made use of for this revivification of the dead Vegetables, and not the green or dry Wood they are made of, and the Herbs too, may also be thus dealt with.*

FOR answer, even the Herb it self, or the unburnt Wood it self may be changed in a Crucible into a red Stone by the *Sal Mirabilis*. For the operation tends to the same end be it Herb or Wood, green or dry, or made into a Cole.

LXVI. *It may be queried, what Wood or what Herb being changed after that same manner by the *Sal Mirabilis*, yields the most excellent Medicine.*

FOR answer, the Woods that are weightiest do excel all others; for they are riper and have in them a better Sulphur, than those Woods or those Herbs have which are lighter, and grow up in half a years time, the older the Trees are, the more fit for medicine they are; such as are the Roots of Vines, Juniper, Box, Beech, Oak, Cedar, and such like.

LXVII. *A Demonstration, that out of dead Herbs and such as are again restored to life, may new Herbs be produced without the addition of the Seed of other Herbs.*

FILL some Pots with some Fertile Earth or Clay, void of all Herbs or Seeds, and moisten it with the green or white Juice of the Coals. If now you expose these to the Sun and Rain, there will spring up thencefrom divers new and unknown Herbs.

LXVIII. *How by the help of *Sal Mirabilis*, Metals are to be dissolved by the dry way, and to be converted into most excellent Medicaments, and first of Gold.*

WHEN you would make your trial of Gold take a piece of golden Money, and bow it, and add thereunto so much *Sal Mirabilis* as may be 5, 6, or 8 times the weight of the Gold. Melt it in a Wind Furnace, and pour it out into a Vessel fit for to receive molten Metals; and you shall find your Salt to be of a purple Colour. If all the Gold should not be dissolved but some part thereof should settle to the bottom, separate that *Regulus* from the purple Salt, and dissolve your remaining Gold in a Crucible with new *Sal Mirabilis*, that so all the Gold being dissolved may colour the Salt with a purple Colour. With this purple Salt may be performed many very profitable things, which appertain not to this place.

Mongst which those are chiefest which respect the emendation or bettering of Metals, concerning which, I will here add only one Operation.

LXIX. *The graduating of any Iron into Gold by this purple Salt.*

FOR the due performing of this, you are to have stone-like melting Pots, and the best that can be, such as by no means may drink in the Salt, or let it run through, for that the Solution of the Gold with the Salt is otherwise wont to hide it self in such Pots as are not strong enough.

If thou canst not get such, 'tis better for thee to abstain from this labour, than to lose thy Gold, unless haply thou hast a mind to try the possibility of the same.

If therefore thou desirest to encrease the *Quinta*, [or small weight] of thy Gold which thou hast added to thy Salt, with some Augmentation; put two or three *Quinta's* of Iron bits or pieces into a good Crucible, and having putthereto your purple Salt, melt it very accurately for one half hour, in which time, the Gold will precipitate it self out of the Salt into the Iron, and graduate some of it by turning it into Gold. For whilst the purple Salt doth eat upon the Iron and consume it, it doth together therewithall make some of it participant of a golden Nature by graduation.

I do not insert this Operation here, to the end that by the help thereof a Man should think of getting Masses of Gold, no; for the sole end of my proposing it was this, that I might confirm the possibility of the thing by ocular Demonstration.

Now as here the Iron is graduated by the help of the Gold or golden Ferment, into Gold; so likewise may Copper be graduated and exalted into pure Silver; by the application of a silvery Ferment, as followeth.

LXX. *The manner of exalting Copper into Silver.*

Dissolve Silver in a Crucible by the *Sal Mirabilis*, made of Salt peter and Oil of Vitriol; in which Solution you shall get a green Salt, fit for the graduating of Copper into Silver, after the same manner as we taught but now of the Gold.

And albeit the Silver augmentation be not so great, yet the possibility of the Art is thence apparent and demonstrateth, that one Metal admits of being converted into another. But yet he that has good skill in handling this labour, will, if he be fraught with good and apt Crucibles, which can hold the *Sal Mirabilis* and not swallow it up, receive no small benefit by this same Operation. The *Scoria* which are remaining in this, and the precedent Operation are not to be thrown away, but to be mixed with Litharge, that so being reduced by blast, they may graduate the Lead, and enrich it with no contemptible Portion of Gold and Silver. For great are the Vertues of this Salt in graduations, which the Ancient Philosophers have openly enough hinted at, saying that their Salt augments the redness of the Gold and whiteness of the Silver, and that this is a thing most true, he who shall in a due manner perform the Operation will learn that so it is, by his own Experience.

But least an Error should be committed and some of your Gold and Silver lost, it is better that a Man exercise himself in making his Experiments in the lesser Metals; and omit the dealing with Gold and Silver so long till these lesser Metals make him a sufficient

sufficiently experienced Master for the dealing with the greater.

LXXI. *How Iron may be exalted into Copper in the melting by the help of Sal Mirabilis.*

Dissolve one or two whole Lots of Copper in melting it by *Sal Mirabilis*, which Solution will yield thee a Salt enclining from a green, to a black colour.

Into the same Pot which contains your Copper dissolved by the *Sal Mirabilis*, put three or four Lots of bits of Iron, and adjoyn them to the Copper dissolved in the *Sal Mirabilis*, and force it with the Fire, so that they may be kept in flux together for one half hours space. By this means the dissolved Copper will adhere to the Iron by precipitation and exalt some particles of the Iron into Copper. All being well molten, pour it out into your Cone that the Copper may settle in a *Regular*. The *Sal Mirabilis* and Iron being turned into a *Scoria*, are usefull for the enriching of Litharge, in the strong melting by blast, with Gold and Silver.

N. B. If the Mercury of Saturn be mixed with these, or else with those other *Scoria's* which were left by the Gold and Silver and are far better, and so be melted together with a strong Fire, the Lead will be bettered and that by an encrease not to be contemned, and will abundantly pay for the labour and costs. But yet I would not put any one upon the undertaking of this work; except he be well versed with meltings in Crucibles and without them, by the Bellows upon Hearths. For I write not these things for young Beginners, but onely for such who well know what belongs to the Art of melting.

But yet that he may have some manuduction into these labours, I will declare the general use of the *Sal Mirabilis* in the emendation of Metals.

LXXII. *The universal use of Sal Mirabilis in the emendation of Metals.*

Though the wonderfull Salt of Art dissolve all Metals, and conjoyneth them in a spirital manner as it were, and renders them efficacious to better each the other in the Fire, yet is there a difference to be observed in that thing, by him who desires to follow the nearest way, and to decline all diversions, or goings about. For example.

He that has a mind to dissolve and conjoyn the Metals, Gold, Silver, Lead, Copper, Tin, and Iron, by the *Sal Mirabilis*, that they may display their virtues in operating to the perfection of each other, must take for the Gold, Iron, Copper, and Tin, such a *Sal Mirabilis* as being prepared of common Salt doth easily dissolve those Metals. But now the same Salt used about Silver and Lead, would effect nothing as to their Solution, because there is no familiarity or friendship between common Salt, and Lune, and Lead, for it is an enemy to those Metals, kills them, and reduceth them to nothing.

N. B. But when those Metals are by the help of Salt reduced into their Mercuries, then may it come so to pass, as that they may be conjoined with Gold, Iron, Copper, and Tin; for without a foregoing preparation, they enter not into the Salt, unless the *Lune* and *Saturn* be dissolved in that *Sal Mirabilis* which is prepared of Niter, and be adjoyned to the Solution of *Mars* and *Venus*; of which Solutions the one doth very willingly embrace the other, inso-

much that one Metal doth easily operate upon the other, and consequently a profitable graduation, fixation, and emendation succeeds.

But now if you would have your Metals, not constant in the Fire, but volatile and made flying, then, that *Sal Mirabilis* is to be used, which is made of Salt Peter or Kirchin Salt, by the help of Sulphur.

This is the universal use of *Sal Mirabilis*, serving for the Solution, Graduation, Fixation, and contrariwise Volatilisation, or the conversion of all Metals into a volatile nature. But the special Solutions, Fixations, or Graduations of them by the Salt of Art, require an addition of some Vegetable Sulphur, which being adjoyned to the Metal, yields some help to the *Sal Artis* in the Graduation of a baser Metal, which help the conjunctions of Metals that be of a sulphureous nature, do not at all need; though indeed 'tis better if you help them with some Vegetable Sulphur. For Sulphur and *Sal Artis* are like Male and Female, they bear a mutual love to each other, and beget a rich Offspring; when they lovingly court each other in the Fire, even alone and without the addition of any Metal, and are brought unto perfection. So then, thus by these operations may gain and profit be divers ways, and in divers manners gotten, as well particularly, as haply also universally, (but this last way I am not as yet acquainted with.)

All these things do sufficiently, yea abundantly shew one the way of arriving by the help of the Salt of Art, to the attainment of such things as are of some moment. Enough to the wise.

Although that the Metals do admit of a most easie Solution by the *Sal Mirabilis* in the dry way, yet notwithstanding, that Solution may yet more commodiously be perfected the following way, viz. thus, when the Metals are put into the Cucurbit or Retort, in the distilling off the Spirit. For whilst the Spirit is driven off, out of those distilling Vessels, the Metal is dissolved during the Distillation, and remains in the bottom with the *Sal Mirabilis*. But whatever of the Metal remains undissolved, is to be removed; but the golden Lunar, Venerial Salt, &c. is to be kept for such uses as it is necessary for.

N. B. If so be any be minded to pour on again that distilled Spirit, upon the Metalline Salt abiding in the bottom he may so do, and 'tis profitable; because that Metalline Salt is by this means rendred far more commodious and apter for Transmutation.

But that none may err from the right way, it is necessary that we first shew how the Metals (out of which being bettered, Gold and Silver are to be extracted) are to be afore prepared, that so they may admit of being the more easily exalted and amended. For all things are to be done by the prescribed method, and to be managed by [promoting them to] their appointed limit and scope, if any profit is thence sought.

Lune and *Saturn* do not by any commixion associate themselves to the Metalline Salt, unless these same metals be first reduced into their Mercuries, concerning which thing we have treated at large in the third and fourth part of the prosperity of Germany.

LXXIII. *By what means the imperfect Metals may (by the Sal Mirabilis) be turned into perfect ones.*

TAKE of *Sal Mirabilis* four ounces, the filings of *Venus* half an ounce. Put this matter in a strong, double,

double, and well covered Hassack Pot, set it in a wind Furnace, melt it strongly for half an hour, that the *Sal Mirabilis* may rightly dissolve the Copper and make it spiritual. To this Copper thus made spiritual, add half a part in weight of the Mercury of Saturn, and melt together both metals by a repeated melting, for an half or even an whole hour. In this conjunction and operation, the spiritual Copper will get to the Saturn by graduation, no small bettering and fixation. For by how much the longer they are kept in flux, so much the greater amendment doth Saturn purchase. But yet no *Regulus* can thus *per se* settle to the bottom, unless some Iron be added in the melting, concerning which, no certain weight can be prescribed. For when some small bits onely thereof, or some little particles are put in the Crucible, the Salt is mortified by corroding of the Iron, and less fall the amended Lead which in the Cupel leaves the Gold and Silver.

This way shews you the manner of using the *Sal Mirabilis* for the amending of metals.

N. B. Other metals may also be rendred spiritual by the *Sal Mirabilis*, by which not onely Saturn but likewise Luna may be graduated, or exalted to a like degree. But yet Saturn is more commodious and fitter for this operation than Luna is. For when the Mercury of Saturn is graduated and reduced, there needs no other labour than the separating of that *Regulus* on the Test, where the Gold and Silver is left behind in the Cupel. But if the Lunar Mercury be amended by graduation, and precipitated into a *Regulus*, it is first to be separated by Lead in the Cupel, and afterwards the Gold and Silver are to be separated by *Aq. Fortis*; so that there is requisite a twofold labour, which in the operation by Saturn is but one; and therefore it is to be preferred as to these operations before Luna.

N. B. All such subjects as have a graduating virtue, as *Lapis Calaminaris*, *Hematitis*, *Smiris*, *Granato*, *Talk*, &c. may be used to these labours. But however Gold is the best of all, which if so be that any one is minded to use, it behoves him to be furnished with such Pots and Crucibles, which do not drink up the Gold, and so rob you of more than the produced gain amounts to.

Thus have we demonstrated the use of the simple *Sal Mirabilis*, in the bettering of metals.

If some Sulphur be added to the *Sal Mirabilis*, it exalts the metals with a far more profitable graduation, and brings more gain than that single operation, which is instituted by the *Sal Mirabilis* simply and alone *per se*.

LXXIV. The manner of conjoining Gold contrary to its nature, with any burning and Volatile Vegetable Sulphur, and of amending the other Metals, all done by the help of my *Sal Mirabilis*.

Every body full well knows that there is no affinity or familiarity betwixt burning Sulphur and Gold, which is a fixt Sulphur; forasmuch as they are exceedingly inimicitious to each other, and yet this enmity may be at length changed into the greatest amity.

For 'tis usual with all such as are wont to separate molten Gold from Silver by precipitation, to use common Sulphur about that precipitation, which by its innate Antipathy thrusts out the Gold from the Silver; the same thing is likewise done in the moist way, when the same Gold is precipitated out

of *Aq. Regis* or Spirit of Salt, by sulphureous Salts, such as are Crude Tartar, Salt of Tartar, Spirit of Urine, and other Alkali Salts.

These are to shew that Gold hateth and shuns Sulphur worse than any thing, as being its Capital Enemy; and yet these most bitter enemies doth the *Sal Mirabilis* easily reconcile and convert this so great an enmity into sweet friendship. This operation hiding in its Bowels great Mysteries deservedly, and by all right lies hidden to this ungratefull World, if these Mysteries could be excepted which fell into the hands of mine enemies, in my Laboratory, unwittingly to me, who without any regard had to the Writings given me by way of an Oath under their Hands, do now make merchandise of such secrets, and so basely abuse my good Will. Although the manifold use of this great Treasure hath escaped them, upon this account it hath seemed good unto me to reveal unto the whole World, those things that fell within their reach, that so it may be known to all, that such great secrets proceeded from me onely, and not from others, nor from those mine enemies themselves.

Take one *Quinta* or small weight of Gold, more or less, reduce it into thin leaves or plates, and bow them in the fashion of a Cilinder, and add thereunto six, eight or ten parts of *Sal Mirabilis*, which matters you must melt in a Crucible with an accurate and strong fusion: When they flow, throw in some pieces of Coals into the Salt and Gold as they are melting in the Pot, that the *Sal Mirabilis* may dissolve the Gold and Coals in the melting, which usually is done in half an hour or thereabouts. The matter being poured out will shew you whether or no you have well operated for all the Gold, as likewise the *Sal Mirabilis* and Coals will be dissolved and changed into a red Stone, that bites the Tongue as if it were Fire.

This Fire and red Stone, is the golden Carbuncle of the Ancients, for it shines in the dark like a burning Coal, and produceth such wonderfull effects in Medicine and in Alchymy, which we have no mind at present to reveal. For this Gold being thus conjoynd contrary to its nature with Sulphur and Salt, is by that means unlockt, opened and prepared; as that it may by an easie business [or labour] be made spiritual, and that divers ways by divers *Menstruums*, either Acid or Urinous, and be distilled over the Helms, and the pure separated from the impure.

And albeit that I here make use of no Circumlocution and speak no plainer, yet have I spoken enough to the Wise, and have shewed them such a way to go in, as that whereby they may without labour, as 'twere arrive to the most happy and wished end, unless God for some singular causes prohibit it.

But that I may not altogether shut the door of Art upon the Son's of Art, I will teach them the making of a most excellent Medicine out of this Carbuncle.

LXXV. The way of making a most excellent Medicine out of the Carbuncle of Gold.

THIS Carbuncle is to be beaten into Powder, and the best Spirit of Wine is to be poured thereupon, which may extract the Tincture. This tinged Liqueur is to be poured off into another Glass, and more fresh Spirit is to be again poured upon the matter, that it may again extract in the heat more Tincture; these Labours you must repeat so often

till all the Tincture is extracted, and the Spirit will be no more coloured. The Spirit being drawn off by distillations in a Bath leaves behind a most red Tincture in the bottom, in the form of a Liquour named COS, for here are present, *Colour, Odour, Savour, or Taste*; the Colour and Odour from the Gold, and Sulphur; the Savour from the Salt. The remainder which is left after the Extraction of the Tincture is not to be thrown away as unprofitable, but to be converted with new *Sal Mirabilis*, and Coals made of Vine wood into a red Stone, by fusion, and to be so long extracted till all the Gold be converted with the vegetable Sulphur into a Medicine. For one onely labour serves not to extract the whole Gold by the Spirit of Wine; but the oft repeated labours attain to the end proposed.

Thus hast thou friendly Reader a Medicine of great moment and of great efficacy; in which the most pure parts of the Gold and of the Vine are conjoynd, nor can they be other than a most profitable Medicament for men and metals.

LXXVI. *How by the help of this Medicament, there may be conferred on the Seeds of Vegetables, such an excellent faculty of growth, that they may be as it were seen grow, and may obtain a much nobler Nature, Colours, Savours, and Vertues, than they are wont to get out of the most stinking Dung.*

MIX with one part of fat Lome, Clay, or Earth done into Powder, four parts of Sand, that so the firmness of the Earth may be somewhat allayed. With this mixture fill a Pot, such a one as the Gardeners are wont to keep their Flowers in; pour thereupon some Rain-water wherein is mixt [or dissolved] a little of that Medicament made of the Carbuncle, and plant or sow in that Earth some of those Herbs which abide unhurt by the Winters cold. Set the Pot with the implanted Herbs to the warm Air, but so, as that no Rain come at it, for the Rain may wash away that medicinal nutriment. When the Earth becomes dry, you must pour on more of the Medicine prepared of the Carbuncle, and that so often as need requires. So will the Herbs begin to grow, which if they meet with no other nutriment besides the Rain-water, they cannot attract any other whereby their faculty of growing may be promoted and encreased. And for as much as the Golden medicament was adjoynd to the Rain-water, the Herbs must necessarily draw it to themselves together with the Water, and obtain other properties than if they grew from the stinking Beasts Dung.

N. B. Under your Pot that contains your Herbs is to be put a Dish made of good and firm Earth, or else of some Metal, which may serve to catch the medicinal Water, that flows through the bottom of the upper Pot, or distills thence, and having received it may not drink it up but conserve it. Besides, it would not be amiss if some of that medicinal Water were put in the under Platter, which might always keep the bottom of the upper Pot moist, and so may supply the Herbs with an incessant nutriment. It would be better also, if the Pot it self were made of some Metal and not of Earth, that so it may not drink in that precious Water, but rather conserve it.

LXXVII. *What is to be observed in this Operation, that a good effect may proceed from thence.*

IN the first place, diligent heed is to be taken, that the Lome or Earth you take, partake not of

any salt faculty, nor hath any other corrosive Property, for many such Earths there be which would hinder and spoil the faculty of growing.

Secondly, there must regard be had to the moistening of the Earth, lest the Seed be choked with too much humidity, or in defect of sufficient moisture, dry up and wither.

Thirdly, there must be observed a measure of the Medicament it self, that neither too much, nor too little of the same be commixt with the Rain-water. For an overmuch quantity thereof burns up the Seed, and a more sparing Portion cannot yield nutriment enough to the Herbs.

Farther, some Musk or other things that emit a fragrant Odour may be therewith mixed, which addition is wont to get to the Herbs a most fragrant Odour. If so be a man fears to apply the aforesaid precious Medicament to this Operation, because of the Costs of the same, he may use that Tincture which we taught a little afore, to prepare of Coles onely without Gold; and which indeed will perform all those things, (as in reference to the growing faculty) which that Golden medicament is wont to perform; this onely excepted, *viz.* that the Herbs will not partake of that golden Property which they obtain by that Golden medicament.

The things we have here written and published concerning the promoting the faculty of growth in golden Herbs, though they seem not of any great moment, yet hide they under them mysteries of great moment, the which many Artifts will apprehend, and convert unto their Use.

LXXVIII. *How any Wood or any Wood-coal may be so prepared by the Sal Mirabilis, as to be capable of a long while resisting the Fire.*

DISSOLVE some *Sal Mirabilis* in common Water, put some Wood or Wood-coal therein, let it lye in it for some days, or so long till it be well glutted with the Liquor and become ponderous. Then take it out and dry it very well at the fire, that all the moisture vanishing away may leave the *Sal Mirabilis* in the Wood: Then put it in the said Solution yet again, and take it out and again dry it, which labour will render the Wood so much the solidier by how much the oftener it shall be repeated. By this means, all the Pores will be filled with the Salt and the Air will be shut out, that it can penetrate it no more; without which Air no Wood can ever take fire or burn. If now you put such Wood or such Coals with other Wood and Coals in the fire, these [un-imbibed Coals, &c.] will be consumed by the Fire in a short time and be reduced into Ashes, but those others will remain untouched, and may be taken out unhurt, though indeed even they too will be burnt if they lye over long in the Fire. This is certain concerning Coals, that those that are made of more weighty Wood, and which abound with a greater Quantity of Salt, such as are the Oak, Beech, Juniper, Vines, and other Trees whose Wood is ponderous dure far longer in the Fire than those Coals do which are made of Firr, Pine, Alder, Willows, and such like lighter Trees, and which have a lesser Quantity of Salt, and this now I do not mention barely for fashions sake, but to this intent, that occasion may be given from this kind of knowledge of drawing some profitable matter therefrom; as for Example.

LXXIX. *How*

LXXIX. *How such kind of Woods which are always so near the Fire, as that they are still in danger of being burnt, and thereby threaten damage may be preserved from firing.*

Dissolve some *Sal Mirabilis* in Water, and with a Pencil linear over such Wood which by reason of its nearness to the Fire is always in danger of being burnt. When the Water is dried up, moisten it again with the same Water, and repeat this moistening so often, till it hath drunk in a sufficient Quantity of the *Sal Mirabilis*, and become able to resist the heat. By this means might men be often freed of many fears and cares, in ships dawb'd with pitch and in other places, where by reason of the too nearness of dry Timber there is danger of firing.

LXXX. *How by the help of Sal Mirabilis any Wood may be preserved so, as for a long time to remain unburnt in the Water.*

He that desires to preserve Wood, that it may not be detrimented by the Water nor rot in a long time, may be master of his wishes, the following way. Dry your wood very well, and being dry moisten it with strong Oil of Vitriol very exactly, and being moistened sprinkle it with the *Sal Mirabilis* beaten into Powder, that it may stick well on to the Oil of the Vitriol. For the Oil of Vitriol doth in its penetrating of the wood carry in the Salt therein, and makes in the outside thereof every where about a black Crust, just as if that wood had been burnt by the Fire. Now because Coals resist putrefaction, it must necessarily follow that the wood being in that wise ordered must remain a long time unhurt in the water.

LXXXI. *The Preparation of the Sal Mirabilis for this Work.*

There ariseth no small difference amongst the Salts themselves from the different way used in making the *Sal Mirabilis*.

If the Oil of Vitriol wherewithal this *Sal Mirabilis* is prepared, be not by reason of the superfluous humidity strong enough, any one may easily conjecture that a good *Sal Mirabilis* cannot be made thereof, because the Kitchen Salt would receive therefrom but little alteration. To prevent this in convenience therefore, you are to take equal weights of Salt and Oil, that so one may be assured that the common Salt is well inverted, and made a good *Sal Mirabilis*.

LXXXII. *By what means trial may be made, if the Sal Mirabilis be duly prepared, and how it may be fitted for this and other Uses.*

IT S Colour ought to be white and transparent; its figure is in long Stria's or Chrystals; its tast is like Ice melting upon the Tongue and yields some bitterness. Being dried in the Fire and all the moisture gone off, it will loose three parts of its own Body, and retain a fourth Part onely; being dissolved in Water it will recover those three Parts again.

But on the contrary, if it shoot into a square Figure, and hath as yet a saltish tast, and being dried loseth but little of its weight; it is not worth a rush,

and shews that either the Oil of Vitriol it self was not good, or that there was not enough used to the Operation. These things we would not bury in silence, that so we might well advise young beginners, and withdraw them from their Errours.

LXXXIII. *It may be queried, whether the Sal Mirabilis serves for the use of Artificers and Craftsmen.*

FOR answer, yes. For this *Sal Mirabilis* is not onely able to perform things of great moment, and those too, such as are not common; both in Alchimy and in Medicine; (a rehearal of which, we shall for brevities sake omit) but withall it may be used in other Arts and Handycrafts with great admiration and profit; and this we cannot neither at this time demonstrate because of the but now mentioned brevities sake. We will onely shew here, that even the poorest Husbandman, might (if they knew its preparation use it to notable advantage and profit.

LXXXIV. *How every Countreyman may encrease any kind of Corn or Seed with a thousand fold encrease, by the Sal Mirabilis if he can get it.*

WE have aforetold you, that the *Sal Mirabilis* being so, as it is *per se*, is plainly unapt for the multiplication of the Vegetables, unless that corrosive Faculty be taken therefrom by lime or other *Alkali Salts*, [the which must be done] if you would expect therefrom any good concerning this multiplication. Here now will I disclose a business of no small moment; yet not to this end as if I would persuade the Countreymen, to get for the future, or afford to their Corn so plentiful a faculty of encreasing. No, no, I well know that they know not how to make the *Sal Mirabilis*, and if they did, yet would they not depart a Nails breadth from their Ancient Custom. For 'tis a common Proverb, Old Dogs are very difficultly tamed; and this, the common Course of mens Lives doth clearly teach; wherein you'll find, that a man hardly unlearns that in his old Age which he learned in his Youth; so that an Old man doth very difficultly suffer himself to be withdrawn from those things whereto he hath been accustomed when young. Neither is it my purpose so to do, for as much as I insert the things here mentioned by me, for this end onely, *viz.* that the possibility and wonderous Properties of the *Sal Mirabilis* may be brought out of Darkness unto Light; and may be made evident to the whole World.

I would likewise be thus understood as touching other Workmen, for whom these things are not delivered or treated of, that they should desist from their old Custom, and obey my admonitions and instructions; but for this end it is onely that I publish these things, *viz.* that they every one may know that my *Sal Mirabilis* can be an helper to men of all ranks, and also may bring even to the Craftsmen themselves and to the poorest Husbandmen, great fruit and benefit.

Now when you hear it mentioned that some Grain of Corn is augmentable beyond the usual Custom, by an unheard of multiplication, it must of necessity be, that it emit more than one, two, or three Stalks, for as much as so few Stalks, cannot yield so great an Encrease. But now if one Grain is to put forth so many Stalks, it is wholly necessary that it be done by some certain singular and strong efficacy

efficacy of expulsion; and that too, even presently and at the beginning when the grain is at first sown in the earth. For whatsoever is not here done even at the beginning, will never be done afterwards.

For all the stalks that spring forth after are small, and quite unfit to bring forth Corn. So then, seeing that many stalks are to break out at one and the same time out of one grain, if an eminent multiplication is expected to follow, then verily 'tis even necessary that some help be administered to that same grain afore it be put in the earth, that so it may plentifully grow and be speedy, in presently sending forth even at the very beginning, good store of stalks.

The Countreymen know not any thing serving to such an operation but onely Dung; but I do even now again say as I have often done afore, that this effect of the usual and common multiplication ariseth not from the Dung it self, (as being but the outside Husk) but from that sulphureous Salt that lies hidden in the Dung. Hence it is, that by how much the purer and better the Salt is so much the speedier and more efficacious an operation ariseth therefrom. If then, that such a Salt can be made by Art, which performs the same that Dung does, it altogether follows that we are able to do the same without Dung, and that far better than by Dung, in which the Salt is so much dilated, and which (by the benefit of Art) we contract into a narrow compass.

I hope the well minded Reader will not be displeased that I use so many words here, about the stinking Dung of Animals, because I can't indeed use in this place any other manner of speaking, seeing I intended the laying open of this thing, and therefore am I even compelled to speak of the same: For he that minds the publication of any thing, cannot do it, unless he speaks of the same. And although that Dung may seem to some finical Men a very contemptible thing, yet notwithstanding it is the onely and principal Medium, by the help whereby our daily Bread and the necessary sustaining of our Bodies is had. But as for the stinking Dung of Animals, I even remit it to the Dunghill, and return to my *Sal Mirabilis*.

LXXXV. Whether or no a thousandfold increase may be had of Corn by the *Sal Mirabilis*.

MELT one or two pounds of *Sal Mirabilis* in a Crucible, then throw in some Coals and dissolve them, and reduce them by Solution into a red and fiery Stone; which matter being compounded by melting of them both, beat into Powder and pour thereupon common Spirit of Wine, that it may wax red by extracting out the Tincture. Pour this out into another Vessel, and pour on other Spirit upon the aforesaid matter. And this pouring on and canting off, is to be repeated so often till all the redness is extracted. By this extraction you shall get a sulphureous Salt, fit to steep or macerate Corn withall; because it agrees very well to the properties of that Salt which sticks hidden in the Dung of Beasts: Now I use Spirit of Wine to the extraction for this cause, for that it hastens the germination or budding of the Seeds even as well as the Salt doth, and enricheth it with an emission of many Stalks. But yet your Spirit of Wine must not be over strong, for then it would hinder the faculty of growing, the which thing even the Salt will also do if too great a quantity thereof be added to the weaker Spirit of

Wine, because it would by burning up the Seed, be an impediment to the faculty of the Seeds growth. It is therefore necessary that a good regard be had (in those operations) to a due measure. For an overmuch access of any thing is wont to be no less hurtfull than a defect or clearly wanting of the same.

This is the preparation of the *Sal Mirabilis*, necessary for the macerating of Corn, that so it may produce many Stalks; now follows the true and genuine use thereof in macerating of the same.

LXXXVI. The true and right way of macerating Corn in the *Sal Mirabilis*.

THERE are several kinds of Corn, and of these various and different sorts. Hence is it, that one Seed is longer a macerating than another is; and that because one becomes soft sooner than doth another, or attracts humidities to it self quicker than another, so that regard is to be well had to the difference thereof. Rye and Wheat are encompassed with thin Skins, and therefore are the sooner macerated, Oats require a longer time, and so doth Barley which has a yet harder Husk than the Oats hath, and therefore requires a longer time for its maceration. But as touching these things, every one may find them out by his own understanding and often experience, because it is impossible to mention all things so clearly and perspicuously. But this is a general rule, your Corn is to be so long left in steep, untill you may easily bite it a pieces, for you must beware of softning it too much, for then it would presently putrify, and by that its putrefaction corrupt and spoil all the growing faculty. But experience will instruct you far more commodiously and more perfectly herein, than a larger description can.

LXXXVII. The true and right way of sowing your macerated Corn in the Earth.

ANY one may easily conjecture that if the Corn macerated by the foregoing way, be sown in the Fields the usual way and so thick as the Husbandmen are wont to do, it will not succeed because of the overmuch thronging and thickness by which the Corn would hinder each other and so choak themselves. This incommodity therefore is to be prevented, and such macerated Grain to be thinly sown in the Fields that they may have room for the freeness of Air, and so may grow up and not spoil each other by a mutual suffocation.

Nay rather that the more accurate diligence may be had or used about this sowing, a Man may make him some wooden Instrument, whereby together and at once many grains of Corn may be sown in the earth in good order and at a certain distance; concerning which labour I have purposed to speak more at large in another place. For so no grain will unprofitably perish, and with one Sack of Corn may be sown more Ground than six, eight or ten Sacks are wont to do otherwise; my too short time constrains me to break off my discourse concerning these things.

LXXXVIII. By what means the *Sal Mirabilis* may bring profit to the Dressers of Vines.

IF there could be a good quantity had of *Sal Mirabilis*, and that without great costs, 'tis without doubt

doubt but the Vines might be made very fruitfull therewithall.

But because they are ignorant of the preparation thereof, who dress Vines; 'tis expedient for them to acquiesce in their Beasts Dung, or make use of that only for the fattening and dunging of their Vines, which is made of common or Kitchen Salt by inverting and Alkalizing it by *Calc-vive*. Unless a man has Vines about his House or in his Garden, and would make them fruitfuller than ordinary. For to make tryal thereof in great Vineyards would be too costly.

But yet I will propound another way to the Vine dressers, by the help whereof they may get plenty of Wine every year. I have at large taught in my foregoing Writings, and that by various descriptions, by what means one may be Master of noble and ripe Wines every year, yea even in those times, in which by reason of the coldness and unseasonableness of the Air, and the want of the Solar-beams, the Grapes cannot attain their due maturity: and withall, how in those places where they seldom or never grow ripe, [they may be ripened] by concentration by the help of the Fire, or else by fermentation with their own vinous spirit distilled out of the Lees, and added to the said Wine; [having I say already taught this] there's no need of repeating it again. Yet nevertheless if God lengthen my life out so long, I have purposed to write a peculiar Book of the propagating and bettering of Wines.

But that I may ingratiate my self with those who not much caring for poor thin Wines, desire to have some noble Wine in their Cellars, I will here reveal a certain secret which may not only refresh the body and spirit of many thousands of Men, high and low, rich and poor, throughout all *Germany*, yea and all *Europe* too; but also administer them no small profit.

I have taught a little afore, how by the help of the *Sal Mirabilis*, and of the concentrated and cold Fire of Salts, a Man may make his Guests different Wines out of one Cup, and therewithall refresh them; and I have likewise shewed, that such a bettering of Wine may be exercised in most places, with notable profit.

The truth of which thing, it hath seemed good unto me to demonstrate divers ways, for the sake of my Neighbour.

I have frequently laid open in my Writings some excellent secrets, and have withall made a discovery of the most great benefit which one may thereby receive.

But because I have not pointed out with my Fingers where and whence such notable profit is to be gotten, the most part could not apprehend or find the same, and have therefore rejected the thing it self being it was not so perspicuously and clearly laid open, as unprofitable and worth nothing. And now least it thus happen to this secret, if I should not shew and point as it were with my Fingers, the benefit thereof, and if therefore such secrets lying in the dark should not come forth to the profit and use of mankind, (which would be a grievous thing and to be lamented, if it should not,) it hath seemed good unto me to manifest the utilities of the same.

LXXXIX. By what means notable profit may be gotten by my Water attracting Magnet.

First of all, it is no small benefit when the overmuch Water is taken away from the poorer sort

of Wines, with which *Germany* doth every where almost abound, and the Wines made nobler, stronger, more efficacious, and more durable, and do get a far more acceptable favour.

For the unripe and watery Wines are not of any long lasting, but do in a while lose all their favour and all their strength, and become mouldy, and corrupt with lying, and 'tis not seldom that they grow tenacious, or ropy, thick and muddy, reddish and filthy: all which incommunities doth my Magnet cure in the space of one onely hour, by the drawing away the overmuch waterishness.

XC. The second benefit.

IF the plentiful Vintage or large encrease of the Wine should be more than you have Barrels to fill, nothing can be more acceptable than that the Wine may be concentrated by the Magnet, (which draws to it self the Water and turns it into Ice) by extracting the overmuchness of the Water, that so by this means the more contracted Wines may be laid up the more commodiously, and may if not very good, be rendered better.

XCI. The third benefit, and which is most acceptable to all Masters of Families.

IF so be that the Master of the House had a whole Cellar full of Wine, and every Vessel filled with the like or self same noble Wine, without any difference; then verily the Master and Servant would be of equal degree, nor should the Master have any prerogative above the Servant. But now using the help of the said Magnet, he may have his Wines bettered as he pleaseth, and have divers VVines in his Cellar, as we taught a little above; if, viz. he shall draw from it the unprofitable watery part.

XCII. Another way of getting profit by the Magnet's drawing the Water out of Wines.

THE Anatomizing and examen of VVine discovers, that in twelve measures thereof, there is about one of more noble spirit, and almost one measure of Tartar. The residue are nought else but an insipid water altogether like to common water. Now when the Wines are to be transported out of the Countries wherein they grow into more remote places, what need is there of carrying the water with it so long a Journey? would it not be better to separate some part thereof from the Wine, and so transport the VVine, and let the water alone, and thereby shun a great deal of charges disburfit for the carriage of water into such places as have enough already? would there not redound a great benefit hereby, both to the Buyers and Sellers of Wines? yea verily, I believe that there will not onely redound unto them a great conveniency, but withall a great deal of Treasure.

XCIII. There's yet another way of getting notable profit by the said Magnet, viz. if the ill taste and fetidness be taken away from the Brandy, usually made of Corn.

THERE is some mention made in what went afore concerning this amending; but 'tis not done so clearly and manifestly. I will therefore open it more clearly and more perspicuously in this place.

Mix one part of your Brandy made of Corn, with two parts of common water poured thereunto, that the

the stench and ungratefull favour may diffuse it self into the added water. Having so done, you must again free this Brandy thus tempered with water by putting your Magnet therein, and so will you draw therefrom all the stinkingness, and 'tis just as if you had washed that VVine, and rinsed off all its filth.

XCIV. *The benefit purchased by separating the Water from Vinegar.*

IF you would have benefit by this liquor, the same may be done by the same reason; in those places out of which it is transported into other Countries; if, viz. the unprofitable water be removed after the same manner as we taught to be separated from the VVine.

XCv. *By what means good Wine and Vinegar may be every year prepared by the help of this same Magnet, in those Countries in which the Grapes do not ripen.*

ALTHOUGH that in all the Coasts situated upon the Rhine, as in *Rhinovia, Moguntia, Wormatia, Algentorati*; in *Alsacia, the Palatinate, Franconia, Austria*, and the Dukedom of *Wurtemberg*, (in which places, the Wines do for the most part arrive to their perfection every year) this Art be not so very necessary; yet nevertheless *Saxonia, Misnia, Thuringia, Suevia*, and *Bavaria* do stand in need thereof; in which Countries the Wine doth for the most part remain acid, unless the Summer hath by a singular chance hapned to be very hot. For in these places it is no less profitable than pleasant to drink a sweeter and nobler Wine instead of the more acid Wine, if so be one could get it by the help of the said Art. Besides, this same Art yields no small profit and benefit in those Countries, in which though the Wine is (as we said but now) wont to be noble. For it may happen that some unseasonable Weather may hinder the ripening of the Grapes, and that the Vineyards wanting the due heat of the Sun cannot arrive unto maturity. For oftentimes in one and the same Countrey, there are divers Wines produced, so that one sort exceeds another in nobility and goodness. Those therefore that are good and generous need not the help of this Art, but contrarily the smaller and less noble Wines want it. Hence I conclude that in all the Countries of the World, wheresoever Wines are made, this Art may be serviceable and profitable to any one.

XCvi. *How in those cold Countries; as in Poland, Denmark, Suedeland, Norway, &c. Which by reason of the Coldness of the Air admit not of making Wine, there may nevertheless good Wine and Vinegar conducive to the health of Man be made.*

THOUGH the Cold may so hinder as that Vines will not grow, nor Vineyards be, yet notwithstanding those places so obnoxious to the Cold, have plenty of Apples, Pears, and such like Tree-fruits; whose Juice being pressed out, and fermented, and after the Fermentation, freed of the greatest part of the unprofitable water, will give a better and more durable Drink, than that which is made the usual way of Apples and Pears. For this drink cannot last long because of the muchness of the humidity, but becomes ropy, acid and muddy, and so corrupts.

So likewise may those Countries that abound with Corn be rendered partakers of most excellent and wine-like Drink, which may be used and drunk instead of Wine, to the great benefit and advancement of the health of the Body; and it is to be thus done.

First of all, let very good Wheat be made to germinate [or sprout] by stewing in some gentle heat; [as in making of Mault] then after the sprouting let it be put in some warm Furnace, or in great Coppers, and stirred about with some wooden thing without ceasing till it be dried. In this Operation you must have an especial care, that the Corn smatch not of the Fire, which is then brought by drying to a sufficient hardness, when it is not lost in biting it with your Teeth, but leaps as 'twere in pieces; this is a sign that you have done your work well. Having prepared it thus, let it be broken [or ground] and boiled after the manner of other Ale, without Hops; and then after it has fermented let it be freed from its superfluous moisture by our Magnet. So will you have remaining a sweet Drink not much unlike to VVine; which Liquor if you would yet have more near in its likeness to VVine, you must put in for every Tun or every Butt about a pound of Tartar in the Fermentation, that so it may ferment together with the Corn, and may give unto this Drink a winy Taft.

After the same manner may excellent Metheglin be made of Honey and Sugar, or such a kind of Drink as but little differs from the Savour of VVine. An Art; verily, most profitable in those places which have no VVine, but have that defect supplied by the great Quantity of Honey and Sugar. The manner of making such a kind of Drink is this.

Let there be added to the Honey so much water as is sufficient, for their boiling together in a Copper, and let them being boiled be diligently scummed so long till the Honey becomes thick again, and gets a dusky or a reddish Colour, which is a sign, that the less sweet, and less honied Savour is removed away, by the boiling.

To this Honey reduced to the said thickness, let be again added as much water as is sufficient, that they may be boiled together, and being boiled put up in Barrels. Whilst it is yet warm some Ale yeast must be added, which being fermented, renders this Liquor so sweet that it is but little inferior to Wine; moreover it will come nearer to the Taft of Wine, if a due part of dissolved Tartar shall be added thereunto in the Fermentation, that so being fermented together herewith, it may acquire to it self a winy Taft.

N.B. But here good heed must be had, that in the last Solution there be not taken too little water, but rather more than is wont to be taken in the making of common Mede. The reason is this; because the Honey gets not its due Fermentation, but retains its usual and a kind of nauseous Sweetness, and cannot be made partaker of a winy Savour.

But now, water enough being added, promotes the Fermentation, and causeth that it gets its Purity and Clarity much sooner, and is of an excellent sweet Savour. After that this Metheglin hath gotten the requisite Clarity, the superfluous water is to be abstracted thencefrom by your Magnet, which water being removed, the remaining ungratefull Savour of the Honey going away together with the water, vanisheth, and this VVine of the Honey, gets its strong Spirits from the Honey, and has a winy

winy Savour from the Tartar. If any one be so minded, he may add to the Honey in the first boiling, some Spices, or which is better, may hang them in a little Bag in at the Bung, that so they may be fermented with the Metheglin, and give it a sweet Savour. The Spices are these that follow: Cardamoms one, Coriander two, Orris Roots three parts; the which will give the Metheglin a fine Taste. The Flowers of Elder make it tast full like VVine made of the Apian or Muscadell Grapes. Cinamon and Cloves also do give it a delicate Sweetness. But every one may use such Spices as he thinks best, according as he fancieth this or that Taste. Of such Metheglin is made most excellent Vinegar, which scarce is inferior to wine Vinegar though of the very best Sort.

XCVII. *Whether or no, there be any other benefit, which our Magnet can bestow.*

HE that shall onely diligently enquire by trials made, will without doubt, find, that such a Magnet as attracteth water, can be profitable many ways; which to treat largely of here, the time will not permit. For because that this Magnet draws out of all Liquors, their superfluous water, it doth certainly bring much Benefit, and manifold Fruits, very many of which, we would here declare it need required. But the time admits not of any longer dwelling about these things. But yet, however, I will reveal an Art for the Poor's sake who have no VVine growing, nor any money to buy it, and are therefore enforced (but especially in the winter Season) to drink cold water after their hard Labours; by the help of which said Art they may have good VVine to drink all the year both in the Summer and VVinter months; I mean in those places in which there's plenty of VVine made, and is in the Autumn Season squeezed out with wine Presses.

In all those places in which store of Grapes are prest out with Presses, there is great store of the husks, the which is partly kept for the Beasts to nourish them in the VVinter, and partly thrown away as unprofitable, especially in those Seasons which afford a great Quantity of VVine. But if so be that the Wine Harvest be somewhat poor and not so plentiful, then they pour water upon all the husks or on some part of them, and leave it so for some days, and again press them; and thereby is made a Drink that has some kind of wine-like Savour which is given to the Servants, and other Labourers to drink instead of bare water.

But now in such Years wherein they are thoroughly busied in curing or making much VVine, they have not the time to bestow about making that Drink then. Nay sometimes they have such a deal of VVine that they have not Cask to put it in, but are compelled to give away their smaller VVines to others, and stuff their Cellars with the more noble.

If therefore the poorer fort would have now and then a good Draught of VVine, they must get them some large Vessels which they must fill with the Offal of the Grapes, and with water poured thereupon, and leave them thus, so long until the rich People have done with their wine Presses and stowed their VVines in their Cellars. Then may they also press out their second VVines in the rich mens wine Presses, and by the oft-spoken of Magnet separate the unprofitable water therefrom, and so lay up their VVine, the which will last and abide good and durable

all the Year about, which it will not otherwise do. For such kind of second VVines dure only (for the most part) but the VVinter and Spring, and part of the Summer, and the utmost time they remain any thing good is but till the Month of July, afterwards they grow ropy or multy. But now the unprofitable part of the water being separated, they get a shorter or longer durability according to the moreness or lessness of their Concentration. This advice and secret was I willing to bestow upon the poor that they may also drink good VVine.

But they may demand where should we get us such a Magnet, by the using of which we might make our second VVines good? I answer, they may borrow it of the Rich men who have Vineyards, for so long; and when they have done with it may restore it them again; for it is so lasting that it never loseth any thing of its Body nor of its Virtue; but always remains good. The rich men therefore will buy it of the Chymists, the preparation whereof is clearly and perspicuously delivered in my first Century. If now this be done (which I doubt not of) the Chymist by preparing, and the Merchant by using of the same will reap no small Benefit and profit. And questionless, there will be found some men that are studious of new things, who will make trial of this Concentration of Wines in small experiments; that so they may fish out the possibility of the thing. But I know not whether they will exercise this Operation in a greater Quantity or no. For its neither here nor there to me whether they will exercise this Art or let it alone. For this is the natural disposition of most men, they would very willingly get store of gain, provided it could be done without great labour and much trouble. From hence it is certain, that this Art of Concentrating Wines by cold Fires will not be so soon common, especially because I have not here delivered how such a Magnet may be made in great Quantity, and applied to use.

But yet I think I have sufficiently done [or hinted at] those things I have revealed. Let others draw out of their own store too, if they have any thing. More things I could not reveal, for many weighty causes which I count it needless to mention here. Very many men will commit many Errours, ere they attain the right Scope. Verily it would be much better if there were a greater Number of such Persons as readily understood this Art; especially in those places of Germany in which the Wines are so acid, that it will make ones Eyes run with water if a bigger Draught than ordinary be drunk to quench Thirst. And therefore in those places Ale is in the most esteem, and indeed it is no contemptible drink; if good, but yet it is not at all comparable to the noble Wine, concerning which noble Liquor these Verses may rightly be pronounced.

*With what a lovely gift are all things blest
By th' noble Wine from tender Vines express,
To sick mens pains it doth an easement bring,
It joys the Countrey Peasant, makes him sing,
And you shall see that man whom whom to day
By means of Wine lies tumbling in the way,
Will on the Morrow have his rotter lay.*

There are many Songs in the praise of Wine, but Ale is not celebrated with any ditty, though it be never so good. Upon this account therefore the noble Juice of Wine is not undeservedly preferred before all the rest, provided it has its due generousness and excellency goodness. But if it be not good, 'tis wholly expedient to help it, left by keeping its Sou-

rishness

richness and waterishness it perish. But filthy covetousness bears too great a sway upon mortals, in so much that there are too many to be found that would rather pour water to their Wine and spoil it, than better it by abstracting of the water.

I have often heard the complaints of Vineyard Masters in those Seasons, in which they have had whole Cellars full of small and poor Wines, which have not arrived to so much ripeness as to be able to be sold and transported into other Countries. Hence comes it to pass, that if they lie along while and be not drunk up, they degenerate more and more, and become exceeding poor, and at length corrupt by lying and so perish for altogether; unless it happens by chance that some years of a more happy Vintage do succeed, with which more noble Wines they may mix their small ones, and so sell them off, but yet with a poor profit, because the Merchants are not wont to buy middling Wines, but the very best of all. But they may have noble Wine every year by that means that I have shewn. For if one eighth part of water were extracted from the Wine, it might have the name of good Wine. But now if a fourth part of that water should be taken away thence, from it would become far more excellent, for a little water is able to make a most noble Wine smaller and more base, a trial whereof you may make as follows.

A Hoghead of rich Wine, containing some six Renish Oms or Aulms, costs an hundred imperials; yea [sometimes] more, an hundred Duckets; Now if you take thence from one eighth part of the measure, and put in the room thereof one eighth part of water, you will find by the tast, that its goodness is so much diminished, that that Vessel will be scarcely valued at fifty imperials. But if a quarter part be taken away, and so much water put in its room, any one may easily conjecture that such a Vessel filled with such Wine will be hardly judged worth twenty imperials.

So then by this way that I have told, any Wine might be brought to such a nobleness by taking away one fourth part onely of its water, that a Vessel which afore would have yielded but twelve imperials, will afterwards yield three times the price.

By all this that hath been spoken may any one easily conclude the truth of the true Alchymy, and what incredible benefits may be reaped thencefrom. From this ground I say, that that delicate sup of Wine which I have here taught the preparation of will so inflame many, even of the enemies of Alchymy, that they will for the future put their hands to the Coals, and try to get thereby such a delicate Magnet, and to have it by them.

This Magnet will also help not a few Alchymists themselves that are in straits and want, and afford them a good Cup of Wine; whose Vineyards, House, and all their substance, the smoak and hot fire hath already driven up the Chimny, and [in lieu thereof] this cold fire will recover them again with no contemptible increase. For this Leap year 1660 is the first year since the World's Creation, in which the miserable Coal-blowers may arrive to a way of getting their Bread, if they will but stretch out their hands. And that I may be here well understood, I don't onely mind the concentration of Wine, for there are other most profitable uses to be found out of these cold fires; which time will manifest.

It seems good unto me to add by way of an overplus (because I have taught the making of a Cup of

good Wine, and there is a great familiarity 'twixt Wine and Corn,) the showing away how one may get a most delicate sort of Bread and of an excellent favour, that so he may be furnished with the choicest of Food and Drink.

Let some part of the water be extracted by the cold Magnet out of new Milk, that it may be made better than the common Milk. This would be a most excellent nutriment for the sustaining of Infants, whose Mothers die too soon. For every Infant cannot bear raw Cows Milk; and if the superfluity of the Water be removed by boiling, the Milk (not brooking much boiling) doth easily tast of the fire, which would not be if it were freed of its water by the oft mentioned Magnet, for it would remain sweet, and be of an excellent Tast. With this fat Milk, moisten your Wheat Meal, (which must be of the best) in the stead of water; and let the Bread be baked, and without doubt the Bread will be of an excellent Tast, which could not be by the common baking, although that Butter were added thereunto. One may feed upon this Bread alone, without Cheese and Butter, because the Cheese and the Butter are with the Milk in which they lie hidden, added unto the Bread. Such Bread is strong nourishment and far better for filling and nourishing than the common; and in eating thereof one may easily commit excess, because it notably pleaseth the Pallat by the sweetness of its tast. For so it happened on a time to me, for eating such Bread as was made up with fat Sheeps Milk I exceeded a mediocrity in my eating. But verily this is wont to happen to such as in their eating and drinking, abuse the delicate Meats and Drinks, and so fall into the hands of the Physicians, because indeed the most Diseases do arise from too much fulness and surfeiting. And therefore good reason is it that a most special regard be had to a mediocrity and temperance in all things.

XCIII. How the Water attravelling Magnet may be serviceable to Physicians.

IN my opinion a Physician may very well examine the Urine of the Sick, and Anotamize the same, and that more easily than by an external bare aspect or looking-on onely, if, viz. he separate and take away therefrom a part of the water by the Magnet. For by this means he will discern a great difference betwixt the one and the other part, and know the causes and properties of Diseases; and that far better and more certainly than by a bare outside view, after the Gallenical fashion, or by the weight, and by Distillation according to the custom of Paracelsus and Turnbeiser; But I leave it to every ones pleasure to enquire which of these three ways is to be preferred.

And now follows by way of Corrolary or Surplusage, a description of certain most excellent Medicines to be administred, for the curing of most greivous Diseases both in Men and Beasts.

XCIX. The Cure of the Stone in the Reins and Bladder, and likewise of the Gout.

THE Stone of the Reins and Bladder, and the Gout, are judged to be the most greivous Diseases, and in very deed they are most greivous Sicknesses, but especially the Gout, which being various and manifold afflicts the Body of Man with most greivous Pains. Now for the cure and removal of these

these Diseases, I will prescribe a certain and safe Medicament, easily preparable, and of small charge.

Take one or two pounds of white Tartar, and pour upon every pound beaten into Powder about some eight or ten pound of common water, which set over the Coals in a well glazed earthen Pot, and boil it so long, till all the Tartar shall be dissolved by the water, which you may try if done or no with a clean wooden Spoon, putting it to the bottom and seeing if there be any left undissolved. In the boiling you must very diligently take off the Scum with a wooden Scummer, that so there may remain no impurity. After that all the Tartar is dissolved and that there appears no more Scum, evaporate the water so long till a thin skin appears at the top. Then take off the Pot from the Coals, and set it in some cold place, and leave it there unfirred for a day, and there will stick on to the sides of the Pot, delicate Crystals like a Dye, having a Cubical form. *Paracelsus* calls this mundified Tartar *Lulus*, and that very properly, and without doubt he did so, because it gets (after its purification) the shape of the square Dice. Out of this pure and Cube-like Tartar is prepared an universal Medicine against all tartarous Diseases, as follows.

If you have one pound of this pure and Cubical Tartar, reduce one pound of Crude Tartar into a white Salt by Calcination; the which you are to dissolve with so much common water as is necessary to its dissolution; filter the dissolved Salt through Cap-Paper, that you may have your sharp *Lixivium* freed of all its Fæces. Pour this *Lixivium* into the glazed Pot wherein your pound of the said purified Tartar is, and boil it accurately therewithall; in which boiling the Tartar will be easily dissolved by the *Lixivium*, and be turned with the same into a reddish coloured juice; though that your *Lixivium* and Tartar had each of them a white and clear colour. The reason is this, because the Tartar is as yet defiled with many hidden and black Fæces, and doth at length after its solution with the *Lixivium* render them visible and manifest. Pass this muddy solution through a filter, and it will be a yellow liquor, and leave many Fæces in the Filter, good for nothing but to be thrown away, for they are of no virtue more. Verily 'tis a thing worth the admiring, that there should yet be so many Fæces left in so well purified a Tartar. This liquor being thus prepared is very profitable for the taking away and curing of all kinds of Tartarous Diseases, by being daily used, or however, it doth at least strongly tame their violence, but you must first purge the Body by Antimonial Medicaments, one of which we will presently shew you.

N. B. This Medicament will be yet far more noble, if all the humidity be vapoured away and the reddish Salt that is left be dissolved in good spirit of Wine and filtered, and the said spirit of Wine be again separated therefrom by a gentle Distillation. For so by this second solution, there will be severed yet more Fæces and the Salt it self will get a yet greater purity.

This Salt may be safely used as a most precious Treasure against all the abovesaid tartarous Diseases; For it expels Urine, and drives out all the impurities out of the Reins and Bladder, and hinders the gathering together, and generation of Sand or Stones in those Members.

But if there be already Stones generated, and that they be not too hard, it consumes them by little

and little, and carries them off; provided that Antimonial purges be (as we said but now) afore used to purge the Body with.

I have in these few words taught thee how the *Lulus*, that is, the Dye like figured Tartar is changed by its own proper liquor Alkalest, or its own Alkalizate Salt into a Medicine resisting all Tartareous Diseases. The Dose thereof is a Scruple in Wine, Ale, or other Vehicles, oftentimes every day, or twice at the least, viz. Morning and Evening, for such as are fifteen or twenty years old and upwards, and they must fast after the taking of the medicament, for some due time.

Such as are younger, from three, four, to ten, or twelve may take at onetime, three, four, six, eight, or ten grains, according as they are older or younger.

This so excellent a medicament have I described for the benefit of mankind, nor is there as far as I know, a better, though it seems to arise of so vile a Parentage, and be so mean. Suffer not thy self to be affrighted by any one, but use the same boldly, whensoever necessity requires; and firmly believe me that thou wilt not find a better, I do not deceive thee; and the truth hereof will be demonstrated by its use.

This is a quick and wonderfull purification of Tartar, and a changing it into a sweet Salt, which is neither sweet nor sour, but a midling tast 'twixt both, and it gets a middle nature, from the Acid and the Alkalizate Tartar. Now follows the Antimonial Purge.

C. An universal Antimonial Purge to be used in all grievous Diseases, with a very happy success.

TAKE of Crude Antimony, Tartar, and Niter, of each alike, Powder them each apart, commix the Powders, being mixt, put them in a melting Pot or Crucible, and kindle them with a live Coal, that by this kindling they may flame up, and go into a ruddish kind of coloured mass. Your Pot being yet hot set it into your Wind Furnace, and melt it, that all your matter may flow in the Crucible like water, then pour it out into your Cone, and being cold take it out, and separate the *Regulus* therefrom, and lay it by for other uses, because 'tis not serviceable for the operation here minded. Now out of one pound of Antimony, you'll have eight Lots, or four ounces of *Regulus*, so that of your one pound you will get a *Regulus* of four ounces or the fourth part of the pound. The *Scoria's* which will be of a reddish colour and of a fiery tast upon the Tongue must be again melted in the same Pot they were melted in, if it be whole, or in some new Pot, and when they flow, put a live Coal into the Pot. The Salt-peter will seize upon the Coal, and being occupied about corroding the same, will let fall the remainder of the *Regulus* it as yet held up. Then the matters being poured out into your Cone, and cool, strike off the *Regulus* at the bottom with the stroke of an hammer, and beat the *Scoria's* which will be of a red colour and fiery tast, into Powder, and being thus powdered let the Salts be extracted [or dissolved] in the heat with common fair water; the which holding in them the most pure Sulphur of Antimony do turn the water into a red *Lixivium*, in which is hidden the Medicine that we seek after; and is to be gotten thence by the following way. For after that the Sulphur is dissolved, by dissolving all

all that will be separated by the Salts or Lye, the Reliques or Remainder are good for nothing.

Having so done, dissolve white and purified Tartar in fair water, in some glazed Pot, and thou shalt have an acid Solution; being thus hot as it is (for when 'tis cold the Tartar will again shoot in it) pour it by little and little into the Antimonial *Lixivium*, and it will debilitate the same, so that the Sulphur of the Antimony will fall down to the bottom in the form of a yellowish or reddish Powder. When all the Sulphur is settled, separate the clear Water of the Salt, from the Sulphur, by canting it off; then pour on some warm Water and wash it so often till all the Salt be gone off. Then filter it, that all the Water may be separated and the Powder stay in the Filter, which you shall put upon new and dry Cap-paper thereby to remove all the wateriness, and then dry it in the heat of the Sun. This is that Universal purging Medicament which drives out all malignant humours by all the Emunctories, viz. by Vomit, Stool, Sweat, Urine, and Spit, out of the whole Body; and that very safely if warily administr'd, and the Dose thereof not too much encreased; in which case even the Galenical medicines themselves do hurt, if their due Dose be exceeded. Hereupon it is better that there be used at the beginning rather a lesser Dose than too much, that so no error may be committed, and a safe trial may be made, how much the strength of the Patient will bear or not bear. And albeit that the Dose of this medicament should be given in so small a Quantity as not to work, or have any visible Operation at all, yet nevertheless it well performs its Office, and drives out the Distempers, but yet more slowly than when 'tis administr'd in a due Dose, such as may give about one, two, or three Stools. And to such as are strong and youthfull Persons, the Dose may be given in such a Quantity as to cause Vomit, in such I say as can brook vomiting. The usual Dose for those that are above fifteen Years of Age is, one, two, three, four, or five Grains, according as they are older or younger. To Infants and such as are a little elder an eighth part, a quarter, or half a Grain even to an whole Grain, may be administr'd, with regard had to the Age and the Disease. This medicine is of good use in all kinds of Diseases, and in all kinds of Men, [and Women] save onely Women with Child; and to them you must administer either none at all, or at least with so little as to be sure it provokes not to any inclination of vomiting. And the like is to be observed by such Persons who are so weak, as that they clearly want strength requisite for this Operation [of vomiting.] But yet it may be used even to new born Infants, viz. for Convulsion Fits with which a great many of them are wont to be snatch'd away without any remedy. The Dose must not exceed the bigness of a Rape-seed, and it must be administr'd in the Mothers milk. But if the Infants are grown already up to be somewhat stronger and are above half a Year old, the Dose of the said medicament is to be a little encreased, that it may operate visibly, and so cast forth all the malignant humours out of their Bodies; and they themselves may not be afterwards afflicted with the Small-pox, and other such like Diseases as Infants are subject unto. Verily, all the Children whom I have given this medicine unto, have not hitherto tasted of those Diseases; the which truth the Parents of such Infants and others can confirm by their Testimonies. But especially this medica-

ment is a most present remedy against the Epilepsie both in young and old, and a most certain Secret in the Plague and all Feavers; and a most excellent purge in the Gout, Leoprofie, French-pox and other most grievous Diseases; and likewise in external new Wounds, in Fistula's and old Ulcers, what Name soever they are called by, if it be but used inwardly to purge them. Briefly, this medicament hath scarce its fellow, so that we have no reason at all to regard such men as out of meer ignorance, oppose and slander Antimony in their learned bawlings, and say that it is nothing else but Poison, and therefore no ways profitable. But let no body believe their barking, but first try the same, and he will clearly find the contrary.

This indeed I readily confess that Antimony is of no use in the body of man, nor can it be, afore it is prepared; but after preparation I do boldly affirm it to be a most admirable medicine.

Concerning which, read but the chiefest of the Ancient Philosophers, especially *Basil Valentine*, who in the honour of Antimony wrote the Triumphant Chariot [thereof.] Do but see what *Paracelsus*, *Alexander Suchten*, and several others have recorded in writing, concerning the incomparable Vertues and Power of Antimony; by all whose Writings is clearly evinced, what things lie hidden in Antimony, I forbear to speak of other Physicians as well modern as ancient. For it possesseth the Vertues and Powers of all Vertues and Powers concentrated. What need many words? Let it be brought but to the Test, and it will most apparently testify by its trial, what Treasures it carries in its bosom. The things that I speak of here proceed out of meer pity and love to my Neighbour, that I might help his sickness and miseries. A very small Portion of the said medicament may be able not onely to preserve a whole Family for a whole Year free from all the Diseases that might befall them, but also to rid them of them. So likewise it sends packing all the sicknesses of beasts by its effectual Virtue. I was willing from a faithfull and good mind to bestow this comfort and help upon mankind, against all incident Diseases, whether external or internal; In the third following Century shall be described more very excellent medicines against all kinds of Diseases, which may be made use of by such as without cause are afraid of Antimony.

And as touching that Salt which is made by the mixture of the acid Water of the Tartar, and the *Lixivium* made of the Tartar calcined; it is not inferior as to its excellency and eminency to the but now spoken of Sulphur of the Antimony it self; herein onely is the difference, that there is to be administr'd a bigger Dose thereof. And therefore it must not be thrown away, but after that the Sulphur is separated, the insipid Water is to be evaporated, and there will then remain a yellow Salt behind, which has even yet in it no small Portion of the Antimonial Sulphur; and therefore 'tis in a manner better than the Sulphur it self, because of its own peculiar Nature, which by the discharging its own office [or proper work,] may be even *per se* reckoned up amongst those most excellent medicines which strongly resist all Tartareous diseases.

For that reason therefore do I commend this Salt most highly to all such as are burdened with grievous Diseases. The preparation thereof is altogether easie, for it is not made of any chargeable matters, but mean ones, and therefore not without cause to be highly esteem'd of.

The

The dose of this so excellent a Salt is to be encreased or diminished according to the Quality of the Persons and the Diseases. To such as are of ripe Age, one Scruple or somewhat more is sufficient. To Infants, and to such as are a little older, from one to twelve Grains may be given, regard being had to the difference of their Years. It gently purgeth the belly, without any kind of Danger, it draws out all evil humours, and especially it helps the gouty and stony Persons with a most wisht for Ease.

The weight of those two contrary Salts, viz. of the fixt Salt of Tartar by which the Sulphur is extracted out of the Antimony, and of the common and acid Tartar dissolved in Water, and which precipitateth the Sulphur of the Antimony out of the *Lixivium*, cannot be certainly defined and limited. For according to the greater or lesser Quantity of the *Lixivium*, is required more or less of the Tartar water to be poured upon the *Lixivium*, that so being mortified it may let go that Sulphur of Antimony it holds up in it self. The *Lixivium* it self will shew you if you have not poured on Water enough of the Tartar by its being not yet freed of all the Sulphur, and that there is more Water of Tartar required to allay all its Acrimony that all the whole Sulphur may be turned out. A bigger Quantity of the Water of Tartar poured on the *Lixivium* [than just

enough] doth not spoil it; it takes in as much of the dissolved Tartar as it can, and what is overplus remains an acid Tartar, and is not changed in its Nature. But whatever of it is dissolved in the *Lixivium* is no more Tartar, because it becomes a middling Salt of the two, neither acid nor sweet, but partaking of both Natures, and dissolves in cold Water, which the acid Tartar will not do.

This Salt therefore is able to perform great matters in medicine, and not onely in medicine but in Alchimy too, and in other Arts can it exhibit abundance of riches; concerning which thing, more shall be spoken in another place.

Thus finish I now this my second Century, wherein I have not onely abundantly supplied those things which by reason of the overmuch haste, I could not insert in the *Appendix* to the fifth Part of the *Profperity of Germany*, but have withall laid open some part of the Use of my *Sal Mirabilis*, as much as the shortness of my time would give me leave to do.

If by the Grace of God I have a yet longer Life vouchsafed me, I will about half a Year hence, bring so great a benefit not onely unto my own Countrey, but perhaps even to the whole Christian World, as ever they received from any man, in so much that the World shall seem as if 'twere new, and so for the present I rest and make an End.

The Third Century

OF

GLAUBER'S Wealthy Store-house of Treasures.

Wherein many Profitable Chymical Secrets are discovered.

Faithfully translated out of the High-Dutch of the Authour.

Courteous Reader,

HAVING some Tears since begun to communicate to the World my manifold profitable Inventions in Centuries, but of late been hindred by sickness and other impediments from continuing the same: yet now being solicited thereto by many Lovers of Art, I could do no less than to endeavour to give them some satisfaction by the publishing of these; and withall assuring them, that, in case God be pleased to continue my Life (notwithstanding that because of great Age and Sickness I am fain to keep my bed) I intend to compleat the rest of my promised Centuries, desiring the kind Reader in the mean time to accept of these three, and to pardon the confused manner of writing them, having for want of leisure, set them down as I found them in my Notes, being chiefly the occasional discoveries and inventions during my Chymical Labours. Neither would I have the Reader offended that in some places I break off so abruptly, especially where I am speaking of the matter which Adam brought with him out of Paradise, for whatever may be wanting in this fifth Century shall God willing be supplied in the sixth: I also desire the Reader not to be moved by the Calumnies of any Envious ignorant Persons, to think that the things here set down (being most of them new and unheard of inventions) are mere Fables and invented matters, and no real experimented Truths, but rather remit the verification of them to time and his own Experience, which will not fail to satisfy him of the Truth of the Particulars herein contained. Farewel.

R

THE

THE THIRD CENTURY.

1. TO wash common Tartar Snow white in a few hours time, and reduce it to a pleasant Salt which dissolves in cold Water, and wherewith of Sugar, Honey, or any sweet Fruits at all times, yea all hours of the day, and in all places Liquors may be prepared like to Wine in Taste, smell, colour, strength and virtue, and of which afterwards good Brandy and Vinegar may be made with great profit.

2. To purifie common Salt in great quantity, in one days time, so as to become very white, pure and transparent and of a pleasant Taste, shooting into cubical Crystals fit for the Tables of great Persons, its taste being very agreeable, and the meat season'd with it much more wholesome than that which is dress'd with the common Salt. See the *Treatise of the nature of Salts*.

3. A secret to preserve all sorts of Wine, and make them durable, whether of Grapes, Sugar, Honey, Apples, Pears, Quinces, Figs, Plums, Cherries, Malt, Wheat, &c. and is of great use to a House keeper.

4. Any of the forementioned Wines may with ease be turned into very good Vinegar, not inferior to that which is made of French or Rhenish Wine. See my *Vegetable Work*.

5. To make good Sal Armoniack of several contemptible matters which are trod under foot and cast out on the Dunghill very easily and in great quantities, so as one Man every day may prepare one hundred pound weight of it with ten shillings charges. See my *Treatise of the Mineral Squill in order to long life*.

6. A secret water wherewith in an hours time the yellow colour in Diamonds may be drawn from them, which makes them ten times more worth than they were before. See my *Treatise of the Divine Character*.

7. In like manner may the dark red colour of Granates be extracted, leaving them onely so much colour as makes them like Rubies. For Granates and Rubies resemble each other in their bodies and colour, the onely difference between them being, that the Granates abound with too much colour, which makes them less valued, when therefore some part of their colour is extracted from them, they do in virtue, hardness and beauty, equal Rubies, one Karat of which is more worth than ten pound of Granates, so as this extraction must be very gainfull to him that is Master of it. See my *third Appendix to the seventh part of my Pharmacopoea Spagyrica*.

8. In like manner also may be extracted the colours of blue Saphyrs, yellow Jacinths, Topazes, and Purple Amethyists, by which means they become white as Diamonds, and when brought to the same degree of hardness are every whit as valuable as they. See my *third Appendix as before*.

9. In a moments time to rob Sol of its colour and make it white as Silver. See my *Treatise of the Seal of God*.

10. To separate from Mars and Venus when dissolved in Water as well as from any other Vitriol, by means of an artificial Precipitation, their hidden spiritual Sol or Tincture, and that in a moment; a thing of great use in Physick, as well as in the transmutation of Metals. See the *second Appendix*.

11. To extract Sol out of Sand and Stones with great ease and little charges, which by precipitation is afterwards separated from the dissolvent, retaining its former strength, and may be made use of again for the like extraction. See the *prosperity of Germany the seventh part, or Novum Lumen Chymicum*.

12. To extract Sol from Luna with a small quantity of dissolvent, which, after precipitation of the Sol, remains in its full strength, and may be used as before to the great gain of the Artist. See *Glauber's Laboratory, and prosperity of Germany, 7th. part*.

13. In one days time to prepare a particular, whereof one part will tinge three parts of Venus into Lune. N. B. This Tincture is a white Stone which being placed in a fit Furnace, and a due fire administered, within few days the whiteness will be changed to a yellow colour, and that into a fix'd red, whereof one part being cast upon four parts of Lune in Flux, exalts it so far that in the separation it gives a fourth part of Sol. Which sudden fixation is performed by the proper Agent of the matter which is white of it self, and yet affords a red Tincture, when handled, as is here set down. See my *Treatise of the secret fire of Artepheus*.

14. In a short time to prepare a particular Tincture of a red subject, which exalts Silver to that degree, as to yield much Sol in the separation. See my *explication upon Pontanus his Letter*.

15. A good graduating water which being digested with Lune, makes it yield much Sol in separation. See the *Treatise concerning the most secret natural Sal Armoniack every where to be found*.

16. Another graduating water in which Mercury being digested, becomes coagulated into Sol and Luna. See the *fiery Alkabeß*.

17. Another fixing water, which being once or twice abstracted from Mercury makes it lose its property of making Sol and Venus white, and on the contrary gilds Lune when rub'd upon it. I have as yet carried this experiment no further, but am of opinion that if Mercury were long enough digested in the same, it would turn the Mercury into Tincture, coagulating and fixing each common Mercury into Sol. See *Haffecal*.

18. A volatilizing Water which being abstracted from Sol highly exalts its natural colour, and carries it over the Helm, which done it is no more common Sol, but may in a short time be fixed into a transparent red Carbuncle. See my *third Appendix, &c.* concerning the Griffins Claws, and Eagles Wings.

19. A water of like nature that volatilizeth all fixt matters, wherewith in one single Distillation, the Tincture or Soul may be extracted from Mars, Venus, and all coloured Stones, and carried over the Helm; which Tinctures afterwards with one rectification are highly purified, and have their Medicinal and tinging virtue doubled, which exalted and multiplied Tinctures, notwithstanding their great volatility may within twenty four hours time be concentrated, by means of a secret Magnet, and fixed into a Stone, penetrating all compact Bodies, with which incredible things may be done in Alchemy and Physick. See my *third Appendix, &c.*

20. To prepare a Salt in an hours time, and without extraordinary charges, which makes all fixt mat-

ters volatile, and is of such virtue that when a little of it is joyned with Spirit of Wine it makes it so strong and fiery, that it dissolves all Metals, Minerals, Animals and Vegetables, carrying their Q. Essence over the Helm, and is the effecter of wonders in Physick and Alchymy: so that he who knows how to prepare and make use of this wonderfull Salt, needs never want either bodily health, or a competent supply of maintenance. See my Treatise of Elias Artista in Quarto.

21. A wonderfull, to all Men known, but withall contemptible matter, which every where may be had for nothing, which whosoever knows, together with the use of it, needs never want, because thereby he may effect whatsoever is necessary for Soul or Body. See my first, second and third Appendix of Pharmacopoea Spagyrica.

22. The manner of preparing a running Mercury out of all Minerals and Metals, and that in one days time, which joyn'd with Sol becomes fixed into Sol. See my third Appendix.

23. How such a Mercury may be prepared in an hours time of the martial *Regulus* of Antimony, with out any charges to speak of, which is a true Tincture, fixing the imperfect Metals into Sol. See my Treatise concerning the secret Fire of the Magi.

24. A water made of a particular sort of Chalk which changeth a yellow or brown skin into white, and which cannot be wash'd off with water, of valuable use for Ladies and Gentlewomen. See my 4th Century in Folio.

25. A water prepar'd of Sol, which turns white hairs into a yellow gold colour. See my Laboratory.

26. Another water made of Silver, which tinges hair cole black, good for such as are gray hair'd, and endeavour to conceal their Age. See Glaub. Concentrate.

27. A water made of Sol, which colours the hair and skin of Man, as also the bones and horns of Beasts, and feathers of Birds, of a fair lasting Purple. See Glauber's Laboratory in Quarto.

28. A water into which when any Metal is put, it begins to grow within twenty four hours time in the form of Plants and Trees, each Metal according to its inmost colour and property, which Metalline Vegetations are called Philosophical Trees, both pleasant to the Eye and of good use. Vide my fourth Century.

29. A water made of Sand and Flints, having the property of changing Wood that is laid in it, in a short time into hard Stone of several colours according to the pleasure of the Artist.

30. A dry water, or rather Stone, upon which if any volatile saline Spirit be poured and set in the Sun, it presently sucks in the volatile mineral Spirit and in one days time makes it so fixt that it may be made red hot in the Fire, without any evaporation. See my universal Coagulator.

31. By this means also may the combustible stinking Sulphur, the greatest enemy of Metals be fixed, which afterwards being cast upon the imperfect Metals in Flux, doth meliorate them, and make them afford Sol and Luna on the Cupel with profit. See my second Appendix.

32. In like manner may Antimony without any loss of weight be fixed, so as no more to cause vomiting, but casts all evil out of the Body insensibly by sweat, restoring health, and renewing youth. See my proper Agent.

33. In the same manner may Orpiment be fixed, so as no longer to be a Poison, but a Meliorator of imperfect Metals.

34. Likewise also may Arsenick be fixed within two or three days time, so as it may safely be taken inwardly, being an excellent Diaphoretick for the cure of Diseases, and good to exalt Metals, so that in separation they afford Gold and Luna. See my proper Agent.

35. Much after the same manner may Mercury, without any considerable loss of weight (though with longer time and more patience) be fixed, so as to suffer himself to be melted and hammer'd like any other Metal, and on the Cupel leaves Sol and Luna. See my Treatise of the universal Coagulator.

36. In like manner may the martial *Regulus* of Antimony be fixed into a tinging Stone, that meliorates all imperfect metals.

37. A wonderfull Magnet which being put into any watry Liquors or Oils, draws the water to it self leaving the Oils more pure, subtle and penetrating. See Elias Artista.

38. By means of this Magnet, we can separate from the highest rectified Spirit of Wine, one half of insipid water, which Spirit of Wine after this separation is an effecter of wonders.

39. This Spirit of Wine when poured on pulverised Coral and thence abstracted, brings their red Tincture over the Helm, being a wonderfull Cordial and purifier of the Blood.

40. By means of this Spirit of Wine, may the Cordial Virtue of Pearls be brought over the Helm, being of great efficacy for the recovery of sick and weak Persons.

41. This Q. Essence of Wine being poured upon clean washed Egg shells, dissolves them, and distilled from them, brings over with it their Stone-breaking and dissolving virtue, and is a singular remedy in the Gout, and the Stone of Kidney or Bladder.

42. The same also dissolves the *Lapis Lyncis* and *Judaicum*, as also Crabs Eyes so called, and other Stones found in Fishes, carrying their virtues with it over the Helm. See my fifth Century.

43. The same Spirit of Wine dissolves, extracts and brings over the Helm, the inmost virtues of all Animals and Vegetables carrying them over the Helm, whence incomparable medicaments may be prepared.

44. Black Snails such as are found in May on the Grass dissolved in the same, and brought over the Helm, and duely exhibited to those that have the Gout or Stone, carries off all tartareous slimy matter from the Kidneys, Bladder, and other parts of the Body by Seige and Urine.

45. Aloes, Saffron and Myrrh dissolved in the same, and their Tinctures carried over the Helm, affords an excellent *Elixir Proprietatis*, very conducive to long Life. See Paracelsus concerning Elixirs.

46. Cantharides dissolved therewith, and brought over, are a powerfull Diaphoretick, above all others, cleansing the Kidneys and Bladder, but ought to be heedfully used, because it is a vehement Medicine, which being overdo'sd will hurt the Kidneys, Bladder and Ureters.

47. The Leaves of Helleboraster, extracted and brought over with the same, affords an Excellent *Aqua Vita*, conducing to long Life. See Paracelsus.

48. Sea Squills being dissolved in this Spirit of Wine, and spiritualized by being brought over the helm, is of great use for removing of Diseases, and maintaining of health.

49. *Nux Vomica*, being first grated and then dissolved therein, and their restoring Vertue being brought

brought over the Helm, doth wonders in restoring the decayed strength and health of man, but must be used with understanding.

50. Common Mercury dissolved and brought over with the same, is the highest Medicine against the French Pox and all venereal Diseases.

51. Mercury of Antimony prepared after the same manner, affords a Medicine against all Diseases of mankind.

52. Fixed Antimony thus extracted and brought over is a Diaphoretick curing all Diseases, and restoring the highest degree of health.

53. In like manner may many excellent Remedies be prepared, out of all Vegetables and Minerals, for restoring and preserving of health.

54. A further use of our Water attracting Magnet is this. Abstract the Oil of Tartar, Hartshorn, Amber, Soot, or that which is distilled from Smiths Coals, and the Magnet will attract all the Water and bad Smell to it self, which remains with the Magnet, and the pure clear and subtil Oil, onely comes over, which Magnet being made red hot, loseth its water and stink and may be made use of as before.

55. In like manner may the Oil of Wax and Bricks, commonly called the Oil of Philosophers, be deprived of their bad Scents, and made exceeding penetrative and pleasant.

56. So also may all Vegetable and Animal Oils distilled by retort, be purified and made pleasant.

57. Likewise all the Oils of Herbs, Seeds, Woods and Spices, which with the addition of Water are distilled by a common Still, may by distilling them from our Magnet be made much more subtil, and their sweet Smells much more strong and piercing; so that a little of these Oils set in an open Vessel, perfumes not onely the Room in which it is but also the whole house, they being so volatile that without any Fire they vanish in the Air.

58. And as by means of this volatilizing fiery Spirit, the pleasant and well scented Oils of Spices may be greatly meliorated and exalted; so likewise may all stinking and poisonous Vegetables, Animals or Minerals, thereby be made much more stinking and venomous, so as their Smell alone will be sufficient to kill men, doing it with far greater expedition than any Corporal poisons whatsoever. See *Elias Artista*.

59. All well scented Oils, may by means of our volatile saline Spirit, be purified to the highest Degree, and afterwards be reduced to a hard Body: which Body then is no common gross Body (as being a coagulated Spirit) but a clear, transparent spiritual pure Body.

60. This Labour may with profit be practis'd on Amber, whose Oil being by rectification made clear and transparent, and then digested with our fiery salt Spirit, becomes hard again as it was before distillation; by which means we may make pieces of Amber as big as we please, and may mix with it some small Threads of *Sol*, and so shall have the old highly esteemed Stone called Chrysophoros; or else we may put into it, whilst yet it is soft, little Worms, Flies, Spiders, Pisimires, or whatever else we please, which is a notable Curiosity and shews as if they were grown there, to those that are ignorant of this Art.

61. In the same manner may the Oil of Turpentine be reduced to a hard Gum, to very good use and purpose.

62. All distilled Oils of Seeds, Woods and Spices, when by long standing, they turn yellow, red or

thick, may by means of this fiery salt Spirit be again made clear, thin and transparent, when some of the said Spirit is poured on the said Oils and so distilled, some part of the Oil comes over clear and transparent, the other part remaining in the Glass, in the form of an hard Gum, in which small Insects may be inclosed as before said of the Amber.

63. Amongst all Oils these following are apt to grow thick and ropy, viz. the Oils of *Lignum Rhodii*, Oranges, Limmons, Juniper-berries; those of Cloves and Cinamon are apt to grow red. The Oils of Fennel-seed, Annis, Coriander, Caraway and Cummin-seed, and all other Oils distilled from Herbs and Seeds, that have hollow Stalks, and are umbelliferous, forasmuch as they abound with much volatile Salt, are apt to turn thick: If any of these be rectified with an acid saline Spirit, it immediately destroys the volatile Salt, and the Oil becomes clear and transparent, and the remaining part of the Oil becomes hard as a Gum, and is a special inward and outward Medicine.

64. And forasmuch as a fiery saline Spirit can make old and red Oils clear, thin and transparent, we may conclude, that such a Spirit is able also to volatilize and bring over by distillation those Oils which by length of time are become hard and dry in Seeds, Herbs and Woods, and cannot by maceration in water be brought over, but must by this more powerfull means be made thin and volatile, that they may afford their Oils as easily in distillation, as green Seeds and Woods are used to do.

65. Now as thick and ropy distilled Oils may be made thin, by means of saline Spirits; so there are some salt Spirits wherewith we can coagulate all thin and subtil Oils, in the form of a volatile pleasant strong scented Salt, of great use in Physick.

66. In this manner, viz. by pouring a strong saline Spirit upon them, we can distill subtil and powerfull Oils from all rosin, gums and thick juices, and afterwards reduce them again to the hardness of Amber.

Thus Mastick, Frankincense, Benzoin, Storax, Camphir, &c. afford very pure clear and transparent Oils, which when hardened to the consistence of Amber, draw straws and other light matters to them like it.

67. In like manner also can all sulphureous Minerals be purified to the highest degree, when distilled with such a Spirit, and then may be reduced again to hard transparent clarified Bodies: and amongst the rest Antimony and Orpiment do afford in this way most powerfull and superlatively penetrating medicinal Stones.

68. And as these fiery saline Spirits do bring over by distillation all unfixed sulphureous Subjects, and purify them; so they do the same in fixed sulphureous Metals, Eg. *Mars* and *Venus*, which Metals being thus purified may be fixed into tinging medicinal Stones.

69. They who know the art of the metallick purification and fixation, are possessors of an incomparable Treasure, forasmuch as by this means in three days time with the charge of one Crown, a true universal Medicine may be prepared, for the Bodies of men and metals, not in great quantity indeed but sufficient to assure the Possibility of it, and may afterwards be tried in greater quantity.

70. By means of such a fiery salt Spirit fixed Chrystals, Flints, and other hard Stones may be made volatile and spiritual, and then may tinge them with what

what colours we please, and coagulate them again into hard transparent colour'd Stones, and that of what form and fashion we please. This is a very gainfull Art, because fair transparent colour'd Stones are always preferable to *Sol*.

71. And as we have understood that by means of volatilizing waters, not onely Vegetables and Animals, but also minerals and fixt metals may be made volatile, and their purest parts brought over the Helm, and by this means do wonders as well in Physick as Alchymy. Now though this separation of the pure part from the impure, by means of Distillation be highly to be valued, yet there is a better, easier and less chargeable way to separate the purer parts from all Metals, Minerals, Stones, Sand, and coloured Earths containing *Sol* and Tincture, by means of a Magnet, which being laid in the Solutions of Metals, and extractions of Stones, within a few hours time draws to it all the spiritual as well as fixt *Sol* and Tincture contain'd in the said Solutions; so that after abstraction of the dissolvent by Distillation, we find the dis-animated dead Body, which being put aside, we separate the attracted *Sol* or Tincture from the Magnet, and thus obtain whatsoever good was hid in the foresaid gross Bodies. *N. B.* Though indeed this extraction of *Sol* and Tinctures be very easie, as hath been said, yet I shall here, for further information of the Reader, set down what ought to be observed in the extracting of *Sol* from each Metal, Mineral, Stone, or Earth. And first of fixt *Sol*.

72. When there is fixt *Sol* in Sand or Stones, we need onely to pulverize them, and pour upon them *Aq. Regis* wherein common Salt hath been dissolved, and let them boil together a quarter of an hour, by which means the *Aq. Regis* draws the *Sol* out of the Sand and Stones, in which extraction if we then put the *Sol* attracting Magnet, it will draw the *Sol* to it self, which being separated from the Magnet, is melted down with fluxing Powder, the *Aq. Regis* continuing good to be employed on the like occasion.

73. But when in the Sand or Stones there is no fixt but onely a volatile unripe *Sol*, then we must put the Sand or pulverized Stones into a Glass Retort, and pour upon them of our volatilizing fiery Alkahest, and abstract the same from the Sand or Stone, by which means it carries the *Sol* over with it, which hath been attracted by the golden Magnet, which being reduced will be found good and fix'd *Sol*. The dissolvent may again be used to the same purpose.

74. But if the Stones besides the *Sol*, do also contain *Lime*, then an *Aq. Fortis* must first be poured upon them to extract the *Lime*, and afterwards precipitate it by casting some common Salt into the Solution, by which addition of Salt the *Aq. Fortis* is turned into an *Aq. Regis*, and being poured upon the Stones, it extracts the *Sol* also.

75. For if at first we should pour an *Aq. Regis* upon these Stones, it would indeed extract the *Sol*, but withall so alter the *Lime*, that it would be impossible afterwards to extract it with *Aq. Fortis*, and therefore we are to proceed in the manner above-said.

76. In like manner also we are to proceed with white, yellow and red Earths, for to extract the *Lime* and *Sol* that is in them. And if it be a fat Earth and contains fix'd *Sol*, it must first be made red hot to rob it of its fatness, because else it would devour too much *Aq. Fortis*.

77. But when the Earth contains onely volatile *Sol*, as the yellow Earth of *Silesia* and the red *Terra Lemnia Sigillata*, it must not be made red hot, but pour some Alkahest upon it, and so bring the *Sol* over the Helm.

78. Yellow and red Earths do commonly contain *Sol* or *Lime* or both, and therefore we may boldly make trial of them; for oftentimes a great treasure is shut up in very contemptible Earth, such as might serve to maintain many thousands.

79. In the same manner we may extract the fixt as well as immature *Sol* out of Ruddle, red Jasper, and red Blood-Stones, which in some parts are found in great quantities.

80. With our *Sol* attracting Magnet, we can extract much *Sol* out of any common Vitriol, and after the *Sol* is extracted, reduce the Solution to Vitriol again, which is as good for the Dyers use as it was before.

81. With the same Magnet, good *Sol* may be extracted out of those yellowish, reddish, and greenish waters which flow from some Mountains, which waters being to be had for nothing, must make this work very gainfull.

82. And in case we should not be able to meet with this sort of running waters, then we may take the Copperas Stones which are often found in Sand, but for the most part grow in fat Earth, which when they are expos'd to the Air, fall in pieces, and having water poured upon them afford a good Vitriol, which easily yields the spiritual *Sol* it contains to our Magnet. So that an Artist can scarcely be to seek for subjects, from whence unripe volatile or fixt *Sol* may be had with profit.

83. *N. B.* But when we have a mind to bring the volatile *Sol* which is in red Sand, Stones and Clay, with volatilizing waters by Distillation over the Helm, it is good to add to our Eagles Wings, or volatilizing water, some of our most secret *Sol Armeniack*, by which the same is extremely strengthened and animated, so that like a *Griffin* for strength, it carries the Man on Horseback away in the Air to his Nest.

84. *N. B.* This *Griffin* is the Artist, that prepares this fiery water, wherewith he seizeth as with his Talons the Man armed Cap a Pe; that is, red Stones, Sand and Earth, abounding with a martial Tincture, extracts and carries them to the young ones in his Nest, that is, provides a good maintenance for his Family thereby.

85. But because to these operations of extracting *Sol* volatile and fixt, and Tinctures from the subjects just now mentioned, when we work them in quantities, much *Aq. Regis*, or other like waters are required, which every one hath not an opportunity to prepare for himself, and therefore must buy them, which encreaseth the charges of the operation; wherefore I am willing to teach a near way to prepare these corrosive waters.

86. Forasmuch then as we know that Vitriol is an universal acid, and the chief of all *Salts*, and the Spirit it yields by Distillation, much more fiery than that which is forc'd from other *Salts*, therefore we may make use of the Oil of Vitriol, for a *Basis* with the help of others *Salts*, to prepare several sorts of saline Spirits, with small labour and charges, in manner as follows.

87. Recipe two parts of Niter dissolved in water and one part of Oil of Vitriol, distill them in an Alembick, and you will obtain a good *Aq. Fortis* to dissolve *Lune*, *Saturn*, and *Mercury*. This operation spends little Fire and comes over easily.

88. And if we dissolve one pound of Salt, and as much Niter in three pound of Water, adding thereto one pound of Oil of Vitriol, and distill it in Sand, by Alembick or Retort we shall get six pound of good and strong *Aq. Regis* to dissolve *Sol*, *Venus*, *Mars* and *Jupiter*.

89. But when we take two pound of Salt, and dissolve it in three pound of Water adding one pound of Oil of Vitriol, we get five pound of good Spirit of Salt. The Salt that stays behind is called *Sol Mirabilis* or wonderfull Salt, because wonders may be done with it, as appears from several parts of my Writings, these Salts being of divers vertues according to the nature of those Salts that are added to the Oil of Vitriol in Distillation.

90. These Salts are commonly added to metals, and melted down with them in Crucibles, by which means they become dissolved in the dry way, which is much easier and readier than the wet way of dissolving.

91. In particular by this way we can dissolve Sulphur, which resists all corrosive saline Spirits, and remains undissolved by them.

92. Now to obtain Oil of Vitriol with ease and in great quantity, we may proceed several ways, and especially thus, by dissolving Vitriol in water, adding a contrary to it, which separates all its impurities, by which means the purified Vitriol may with a small Fire be reduced to Oil, so as one pound of Oil of Vitriol will not require above ten pound of Coals.

93. And because Oil of Sulphur is of the same nature with Oil of Vitriol, yea is more proper for some operations than it, therefore we may make use of the same Oil of Sulphur, to prepare strong saline Spirits, especially because the same may be prepared in quantity and very compendiously, according to a particular way described by the Ancient Philosophers.

94. They have taught us the preparation of Oil of Sulphur in their wittily devised Fables, giving to this Oil the name of *Venus*, whom *Vulcan* when come to Man's estate took to Wife: by the word *Vulcan*, we are to understand every combustible Sulphur, and by the word *Venus*, its incombustible corrosive Oil, which for this reason probably they called *Venus*, because when a drop of it falls on burning Coals, it gives forth a red smoke like to *Venus*, or because this acid Oil like a wicked Woman, has sharp Teeth, and a keen deceitfull Tongue, wherewith they lay hold of Men, and lead them astray in the same manner as this Oil cleaves to, and enters a League with every metal to which it is joyned, forasmuch as all metals proceed from Sulphur, and have great affinity with it, as the Woman hath with Man.

Here follows an Explication of the Poetical Table, teaching us to make the Oil of Sulphur in quantity.

95. We read that *Vulcan*, that is, a combustible Sulphur, took *Venus* to Wife, by which is meant the incombustible Oil of Sulphur; now whilst *Vulcan* was busie at his work in the Caves of the Earth, for he was a Miner and a Black-smith, *Venus* betakes herself to *Mars*, who lies with her; now when *Vulcan* found his Wife in the embraces of another Man, he calls all the Gods to his help, who appearing, cast an Iron Net over *Mars* and *Venus* that they might not escape, but with great shame be exposed to the derision of the Gods.

96. When *Vulcan* is kindled in a Furnace made for that purpose, that is, labours in metals, the flame carries *Venus*, i. e. the Oil of Sulphur into *Mars* his lodging, that is, into the Recipient, which must be fill'd with Steel Wire, where she commits Adultery with *Mars*, that is, begins to dissolve the same, and produceth a Vitriol, which when exposed to the moist Air, becomes resolved into a clear sweet water, which from the Steel Wire runs into the Vessel appointed to receive it, which sweet water is nothing else but *Arostrus* the Son of *Mars* and *Venus*, or the martial Oil of Sulphur, or to speak more plainly, the Vitriol of *Mars*.

97. This Vitriol of *Mars* is called by the Philosophers the juice or water of the Birch Tree, and of which they say the Philosophers Stone may be prepared, for many of them have writ concerning it, and pointed to this sweet Iron Juice, which they have termed Birch Tree Waters, because of the likeness it has therewith, for when in the Spring time we make a hole with a Piercer, reaching to the Pith of the Tree, and thrust into it a Quill or Faucet, much sweet water proceeds from it, which some make use of to brew Beer, because the same is accounted very good against the Stone in the Kidneys and Bladder.

98. This Vitriol also is *Virgil's Arbor Opaca*, or dark Tree, whose Branches he declares to be easily flexible; now what is more flexible than Iron, or Copper Wire, which are therefore compared to the Birch, which is a very juicy Tree, and hath very flexible branches.

99. That this shady Tree is the fittest, according to *Virgil's* Doctrine, to break off one golden Twig after another is also certain, for I have tried it divers ways and found it to be true, that it affords its golden Twigs very freely to him that knows how to handle *Proserpina*.

100. But if the Artist be acquainted with the use of our *Sol* attracting Magnet, he may then with ease and more profit, without Distillation or Fire, break off the said Twigs, than he could do with the help of *Proserpina*.

And thus I conclude this third Century, the fourth and fifth follows, which will be found of better use than this.

THE FOURTH CENTURY.

To extract the Sol that is in Granates.

1. IF Granates be melted with Glass, that contains Lunc, the Lunc containing Glass will unite it self with the Sol that is in the Granates, which with an *Aq. Regia* may be afterwards separated.

To make a good Mercury of Wine.

2. Recipe Crude Tartar and pour upon it a Lye of Salt of Tartar, distill in an Alembick, and you'll have a strong Mercury of Wine, which is a much stronger and more fiery Spirit, than Spirit of Urine, especially if some *Sal Armoniack* be added to it.

To make a Mercury of Metals.

3. And if before we dissolve a Metal or Mineral in the foresaid lye of Salt of Tartar, or in the Crude Tartar, before that both these contraries be put together, then the volatile Spirit of Tartar will bring over the Tincture or Mercury of the said metal or mineral in the form of a subtil Spirit. In this manner we may drive the Mercury of all minerals and metals over the Helm.

What the Soul of the greater and lesser World is.

4. Plato call'd common Salt the Soul of the great World, and if so, then Salt of Tartar may very well be accounted the Soul of the lesser World: for whatsoever is in the Macrocosm, the same is also in the Microcosm.

All superfluities of Nature afford a volatile Salt.

5. For the Salt of Hartshorn of Hair, Soot, Blood, and of the Seeds of Mustard, Cresses and Scurvygrass, &c. are much of the same Nature as Salt of Tartar.

A Good Bath.

6. Common water sprinkled upon red hot Flints or Pebbles that are found in running Streams, affords an hot Vapour, which by reason of the subtil Sulphur of the Stones it carries up with it, is very penetrating, so that in this manner without any other Fire we may prepare an hot dry Bath, very available to cure many Diseases by sweating, the great vertue of it chiefly proceeding from the sulphureous Spirit of the Stones.

To separate Sol from Luna by fluxing in a Crucible.

7. When we have a mind to separate Sol from Luna by means of Sulphur we need not make use of granulated or filed Saturn for precipitation, but instead thereof we may make use of Antimony, because the granulated or filed Saturn is made hard and inflexible by the Sulphur: neither shall we make use of common Venus for precipitation, as *Erker* teaches, but such a Venus as hath been made friable with Arsenick or Orpiment, by which means we shall get more Sol than without Arsenick, because Arsenick and Orpiment contain much volatile Sol, which in this Operation becomes fixed with the Luna.

To recover the Sol and Luna which is got into the Pores of the Crucible.

8. The Crucible must be beaten into fine Powder, and put into a reverberatory fire, stirring it continually by which means the Antimony and Sulphur vapour away, and the Sol and Luna remains with the Earth, which, with strong Waters may be separated.

Another way to perform the same.

9. Or we may add filings of Saturn to the powder of the Crucibles, and give them a strong heat, by which means the Saturn will take in the Sol and Luna. N. B. But the Separation with strong Waters is the more easie way of the two.

To extract the Colour from Sol.

10. Venus, Jupiter and Regulus Martis melted into a mass with Sol, and Venus, the Jupiter and Regulus Martis afterwards separated from the Sol by Niter, then melt other metals as before with the Sol, and separate them as before with Niter, which must be continued till the Sol have lost his Colour.

11. The dross being afterwards melted in a Crucible, and a small quantity of Coles made of Blood cast upon it, the extracted Tincture of Sol will separate it self from the dross, falling to the bottom like a Regulus. N. B. The metals Venus, Jupiter and the martial Regulus may be separated from the dross only with common wood Coal.

12. Niter fixed by the Regulus of Antimony, and distill'd with Sal Armoniack, gives an excellent Mercury of metals, which hath a scent like musk.

To extract Sol out of Stones.

13. If we take Sand or Stones that contain Sol, and melt them with Lead ashes into Glass, and reduce them again with fixed Salt, then by cupelling this Lead ashes, and the reduced Sand or Stones severaltimes, we shall have the Sol that was in the Stones.

To extract Sol from Stones.

14. The black or brown Pebbles found in Brooks, and which break smooth like Glass, being mixed with the best Eagles wings and distilled by retort, yield much Sol.

A Tincture from Metals.

15. Jupiter is the highest Regent over the upper Constellations. Sol gives to all Stars their Light, Mars rules upon Earth, and Saturn in the Earth, and of these four an universal Tincture may be prepared.

16. Mars and Saturn in particular yields great riches, when being reduced to Glass they are severaltimes driven through a Reverberatory, according to that of the Ancient Philosophers; by Saturn and Mars, fire and art, great wealth may be found.

That there is a renovating vertue hid in Spiders.

17. Spiders renew themselves every month by casting their skins, wherefore a medicine prepared of them by the Flame of Spirit of Wine renews man.

18. If

18. It is also to be observed that all Birds, especially those that feed upon Flies and Worms, when they are sick, cure themselves by eating Spiders.

Secrets of Serpents.

19. All sorts of Serpents renovate themselves once a year by casting their skins, wherefore if we extract them with Spirit of Wine, and correct them by burning away the Spirit of Wine, they yield an assured medicine against all Poyson, and renews man.

X 20. *Regulus* of Antimony being duely fixed with *Sol*, tingeth as well in the wet as dry way.

Sol and Sulphur yield a Tincture.

21. Common combustible Sulphur cannot join with the incombustible Sulphur of *Sol*, without such a medium as partakes of both their Natures, viz. Antimony: when by this means the combustible Sulphur is fixed by the incombustible Sulphur of *Sol*, the *Sol* gives it ingress into imperfect metals to tinge them.

To make Sol red.

22. If the Blood of the Lion be digested with Tartar and *Aqua Fortis*, this purple Colour will be changed into a red, and separate it self from the Salt, falling in form of red powder to the bottom, and is a most excellent Colour for Painters.

To make Purpurissa, or a Paint to make the Face look ruddy.

23. Dissolve *Sol* and *Jupiter* in *Aqua Regis*, digest and edulcorate with Water, yields an excellent paint for Women. N. B. But a little Oil of Talk ought to be added to it.

An Experiment upon Purpurissa or the Blood of the Lyon.

24. When we digest or boil the Blood of the Lion so long till the red Colour becomes as white as milk, and then pour upon it as much Water, as has been evaporated during the boiling, this milk will be chang'd again to Blood.

25. Of the blue Paint called Smalt, by means of Salt of Tartar may a most excellent Paint be made for Limners, not inferiour to Ultramarine.

26. Of Mercury, *Jupiter*, Sulphur and *Sal. Armoniac* is made the Paint called *Aurum Musivum*.

A Cementation that graduates Venus into Sol.

27. Recipe Vitriol calcined to Redness, mix it with Salt and Coal dust, lay this with thin Copper Plates *stratum super stratum*, put them into a Fire that may keep the Plates of *Venus* red hot for six hours without melting them, by which means the *Sol* in the *Venus* will be encreased; if we repeat this Cementation several times till the *Venus* be of a golden colour, the gain will be much greater. N. B. The cause of this melioration is, because the Coal Dust hinders the corrosive Spirits of the Vitriol and Salt from corroding the *Venus*, and therefore onely penetrates and graduates the same.

To make all Corrosives sweet.

28. Vitriol distilled with Salt yields a Corrosive Spirit, but if Coal Dust be mixed with them, they give a sweet Spirit, which graduates *Lune* into *Sol* when digested therein.

X 29. Recipe, Calx of *Jupiter* mixed with Mercury of *Lune*, and therewith Cement plates of *Venus*, by which means the saline Spirits introduce the white Sulphur of *Jupiter* into the *Venus*, and change it into *Lune* containing much *Sol*.

A sweet graduating Spirit, usefull to the Melioration of Metals.

30. Recipe, Coal Dust, mix them with *Sal Mirabilis*, and distill by resort, and you will get a sweet graduating Spirit, exalting some Metals to *Sol*.

The Philosophical Work.

31. The Father of all things is the warm Son, their Mother is the moist Moon, the Earth is the Womb, the Wind carries the Seed through the Suns driving into the Womb the Earth, which foment, and at last brings forth the Child.

Sulphur is the Father of all Metals.

32. The Central Fire in the Earth mounts upward continually into the hollow places of the Earth, and meeting with water or moisture, cleaves to it and makes Stones, as also all Metals and Minerals of different natures and properties, according as the water is pure or impure.

X *Sulphur is the universal Coagulator.*

33. A sulphureous vapour is that which coagulates Mercury, as well in Vegetables and Animals as Minerals.

Demogorgon the Grand-father of all things.

34. The Central Fire in the great World keeps it in continual motion, and causeth the growth of all things as well upon, as under the Earth, being the Governour of the great World.

The Vital Spirit, or radical moisture, is the Life and Growth of all Men.

35. As the great World is governed and maintained by the Demogorgon or Central Fire, so Man the little World is governed, and maintained in continual motion and growth, by the Vital Spirit seated in his heart.

36. Fire is the Father of all things, Water the Mother, the Earth is the Womb, the Wind or Air drives the Fire, being the universal Agent, into the Water, being the universal Patient, in order to bring forth Fruit. See my Treatise of the divine Character.

37. Man, Beasts, Fish and Fowl, and all that lives and grows, draw their life from the Air, onely the Salamander draws his life, and has his Body from the Fire, wherefore also in power and strength he excels all living Creatures.

38. The secret Fire of the *Chaldeans*, which at all times draws Fire out of the Air, wherewith the Jewish Priests kindled their Sacrifice, as may be seen in the *Maccabees*, is made of Steel, Niter and Sulphur.

39. When we abstract an *Aqua Regia* wherein Sol is dissolved from the Butter of Antimony, the Soul of Sol and Antimony comes Bloud-red over the helm, which poured upon a Solution of Lume, the Lume falls to the bottom, and draws the Tincture of Sol and Antimony to its self out of the Water, and the Lume by this means becomes red, and is a Tincture and Universal medicine for humane and metallick Bodies. N. B. The remainder of the Sol and Antimony that did not come over is wholly fixt, and a good Diaphoretick, thus the Souls of the dead, i. e. of Sol and Lume, are brought up from Hell. See *Nuifement de Spiritu & sale Mandi*.

40. When in the manner now said with the Butter of Antimony, we bring over the Soul of Mars we get a much higher Tincture than from that of Sol, and in coming over becomes wholly fixt. See my *Treatise de 2 principis Metallorum*.

41. In like manner may from the Butter of Arsenick and Lume a white Tincture be brought over the helm, tinging Venus, Mars, Jupiter and Saturn into Lume. N. B. These Tinctures in coming over are fixed by Plato's Stygian Water, so as to need no further fixation.

42. But if we precipitate these Tinctures of Mars and Antimony with the Solution of Sol, and then edulcorate and dry the same, we by this means do obtain a dry graduating Water, which being molten with any white or red metals makes them yield good Gold, and Lume on the Cupel to the great profit of the Artist.

43. Oil of Vitriol mixed with Sal Armoniack, is also of good use to bring over Tinctures, but not in that quantity as Butter of Antimony.

44. Our dry, sweet universal tinging water dissolves white Pebbles and Crystals, and changeth the same into precious Stones of several colours, excepting only their hardness, which it cannot communicate.

45. The easiest way to get the Sol or Lume that is in Jupiter, is by casting it upon molten Venus, which draws the Sol and Lume to it self out of the Jupiter.

46. In like manner doth the Regulus of Antimony when in flux readily draw to it the Sol and Lume in Jupiter, and then washing the Regulus with Niter we get the Sol and Lume contained in Jupiter.

47. But this operation ought not to be done in Crucibles made of common Earth, which easily break and spill the metal, but in those that are made of a fat crucible Clay, mix'd with coal dust, as is taught in the fifth part of my Furnaces.

48. As the Sulphur in Tartar coagulates a thin water into a hard Hepar, or Liver so called, so likewise doth a fixt Sulphur coagulate Mercury into Sol and Lume.

49. The often calcining of Salts and dissolving them in Water, doth purifie them, and makes them easily fluxible, and in particular Vitriol may by this means be so purified, as to yield its Oil with a very small heat.

50. The Solution of Saturn and Lume poured into a volatile Spirit of Mars or Venus, draws the tinging volatile Sulphur out of the Water to it self, and makes the same Corporal and fixed.

51. Tartar contains a coagulating and tinging Sulphur, for it coagulates Water into a Hepar, and

tinges red metals to a white Stone, which may be pulverized; this Sulphur is the cause why Tartar will not dissolve in cold Water as other Salts.

52. When therefore the Tartar is freed of this Sulphur that coagulates all Water, then much good may be done therewith as well in Physick as Alchemy, and many other Arts besides.

53. Tartar by being boiled in a strong Lye, lets go its coagulating Sulphur, and a neutral Salt proceeds from them both; but if we have a mind to separate the Lye from the purified Tartar we must do it with an acid, that may mortifie the Lye, by which means the purified Tartar will be left snow white.

54. If the Lye be kill'd with a Spirit of Niter or *Aqua Fortis*, then from both these contraries proceeds a good Niter.

55. But if we make use of a Spirit of Salt, then there is made up of both a tartarized Spirit of Salt.

56. If we take distill'd Vinegar to mortifie the Lye, then from the joyning of those both proceeds a neutral volatile Salt which is a good Diuretick in the Gout and Stone.

57. This is the best way of purifying Tartar, which after this Operation is of far greater use in Physick and Alchemy than the common Tartar.

58. Tartar as hath been said, contains a coagulating and tinging Sulphur, coagulating all Water into a thick Hepar, and exalting the Colours of metals. Thus we see that by boiling Golden or Silver Vessels with Tartar, their several Colours are exalted.

59. And whosoever has the Art of separating this Sulphur from Tartar, may by means thereof effect great and wonderfull things.

60. A like wonder working Sulphur is likewise found in Animals, and more especially in man, who brings it with him into the World.

61. Whence some Philosophers tell us, that Adam brought the Philosophers Stone with him out of Paradise, and after his death carried it with him into his grave.

62. Minerals also afford the same coagulating fixing and tinging Sulphur, for which reason the Philosophers Stone is said to be Animal, Vegetable and Mineral, because of each of these three Kingdoms an Universal medicine may be made for men and metals.

63. But the easiest way is, when we extract the best part of all these three Kingdoms, and conjoin them according to Art for an Universal medicine.

64. Wine is the chief of Vegetables, Man of Animals, and Gold of Metals.

65. Spirit of Wine purges and purifies all things, with its purifying Flame; as may be seen in my Purgatory of the Philosophers.

66. The volatile Salt of Animals, and especially of Man purifies all things by its volatilizing Virtue, as appears in our most secret Sal Armoniack.

67. The incombustible Sulphur of metals tingeth the Bodies of men and metals, to the highest pitch of Health, as may be seen in the third Appendix to the seventh part of my *Pharmacopoea Spagyrica*.

68. Demogorgon with his Russet mantle and green Coat, is the Grandfather of all the Heathen Gods i. e. of all metals.

69. And like as in the Earth he doth generate and bring to perfection all metals, so also out of the same, if the Artist knows how to manage him, he perfects all unripe and imperfect metals, in a short time, with the help of Fire, to that degree that they shall endure the Test as well as Sol or Lume.

70. This

70. This wonderfull virtue of fixing all volatile minerals, the Philosophers call their secret Fire or proper Agent, wherewith not onely the imperfect metals, as *Saturn*, *Jupiter*, *Venus*, and *Mars*, but also volatile *Mercury*, combustible common Sulphur, Antimony, Orpiment, and Arsenick may be fixed, so as on the Cupel to leave *Sol* and *Lune*.

71. And as this Demogorgon, or invisible secret Fire of the wise Men, doth fix the unripe minerals and metals into *Lune* and *Sol*; so likewise can it fix the said minerals and metals, and exalt them to an higher degree than that of *Sol*, even to the *plusquam* perfection of true Tinctures, whereby all imperfect metals may be changed into *Sol*.

72. This our Demogorgon hath the virtue even as it comes raw and unprepared out of the Earth to change and meliorate all metals as follows.

73. It makes *Saturn* as hard and white as *Lune*, when tinged with it, of which all manner of Vessels and Dishes may be made, it onely wants the found of *Lune* and enduring of the Test.

74. If a little of this Tincture be cast upon fluxed *Venus* it presently becomes white and hard as Steel, continues as fusible as before, and yet is so hard that it cannot be filed, so that several Vessels may be made of it, not subject to bending or breaking.

75. When cast upon melted *Jupiter*, it makes it hard as *Lune*, and sounding like it, is of great use to make all sorts of Vessels of.

76. And amongst other things that may be made of it with great profit, this is one, viz. that Looking-Glasses may be made thereof, which being polished continue a long time clear and fair, without being obscured in moist Weather, as other metalline Glasses are, and all this by reason of the extraordinary hardness of the metal. See my Treatise of Looking-glasses.

77. This Tincture cast upon *Lune*, makes the same Coal-black throughout, so that it is no more like *Lune*, of which Bells and Clocks may be made of a far better and clearer sound than those that are made of *Venus* and *Jupiter*.

78. By this means also in times of War, or other danger *Lune* may be disguised as not to be known for such, and so may be a good way to preserve it from being taken by the Enemy.

79. In like manner it makes *Sol* so hard that it can no way be bent or destroyed, and therefore might be of good use in many of the following cases.

80. It would be very proper for some great Emperour or King to make his Statue of, it being indestructible, and not to be diminished or injur'd by any way whatsoever.

81. Money coin'd of this *Sol* would be of good use if a King or Prince had a mind that his Coin should not be transported elsewhere, because differing so much from common *Sol* it would not be passible in other Countries.

82. This golden Coin also would not be subject to be clipped or fil'd.

83. Medals also might be made of this *Sol*, and would be a great curiosity besides the indestructibility of them.

84. It would be excellent also to make Rings of, especially such as are designed for the remembrance of Friends, as lasting for ever.

85. It would be very proper to cast Seals of, or the divine Character or other secret *Sigils*. See my Treatise of the Divine Character and Seal of God.

86. Or the said Divine Character being expressed upon my *Lapis Ignis* (which being but for a little

while carried in ones mouth, cures many grievous Diseases without any other Medicine) might be set in this hard *Sol*, and so without waiting be carried constantly about one. See my Treatise of the Mineral Squilla in order to a long life.

87. Great Princes also might have Armour and Arms made of this hardened *Sol*, which would be much better than any of Iron or Steel, which easily take rust, to which *Sol* is not Subject.

88. Of this *Sol* might also very conveniently be made Candlesticks and Lamps, with other Vessels for the use of the Church and Altar.

89. To many more uses this *Sol* might be put, especially for that by reason of its hardness, it suffers it self to be polished to that degree, as to cast a great lustre from it, like the Sun.

90. As to the further use hereof, See my Treatise de tribus Lapidibus ignium secretorum.

91. With the hardened *Lune*, *Venus*, *Jupiter*, *Mars* and *Saturn*, many profitable and curious things may be done, which for brevity sake are here omitted.

92. The Sulphur of the Philosophers when set free from his dark Prison, wherein he is detain'd by his Brethren, by our Key that opens all Locks, gives his Deliverer for reward, the possession of the three Kingdoms in the World, viz. enabling him to make all Vegetables grow swiftly, and very fruitful, to cure the Diseases of all Animals, and to meliorate and exalt all Metals.

93. And when the Philosophers, saith *Sendrevogius*, see this Sulphur restor'd to liberty, swimming in their Sea, they worship it, and draw it out with a Silver Line, though others do it with their *Sol* attracting Magnet, and fix it into an universal Medicine, wherewith they afterwards effect wonders: As may be seen in my Elias Artista, and Purgatory of Philosophers.

94. The Philosophers say, except first you make our *Sol* (that is, the redeemed Sulphur) and Mercury white, you'll never be able to make them red.

95. They say also, our *Sol* tingeth not except it be first tinged it self, that is exalted in its colour.

96. All things in the World have their rise from Fire and Water, and derive their Purity or Impurity, from the Purity or Impurity of their Parents.

97. The common Fire brings forth its Fruits very slowly, whether they be Stones, Minerals, Animals, or Vegetables.

98. And so do likewise the warm and dry Sun, and moist Earth: but when we assist Nature with Art, then she works much more swiftly, and brings her Fruits to maturity in much shorter time.

99. The Meteors in the Firmament which are made of Fire and Water, especially Thunder and Lightning, produce sometimes Stones, and cast them to the Earth.

100. A common fulminating Powder made of Sulphur, Niter and Tartar gives a stinking offensive smoke, corrupting some things, and meliorating others: whereas a Fulmen prepared of Niter, *Jupiter* and Mercury, yields a particular tinging mercurial Water. The Fulmen of *Venus* tinges *Mars* into Copper, that of *Lune* graduates *Venus* into *Lune*; and the Fulmen of *Sol* graduates and tinges *Mars* into *Sol*.

The universal Fulmen of the great Tincture graduates all Metals into *Sol*, which God of his mercy grant unto us, Amen.

THE FIFTH CENTURY.

The best particular and cheapest Universal.

1. **W**HEN with the help of *Sensuogius* his *Chalybs*, or *Glauber's* *Magner*, we have extracted the colour from *Sol*, and again restored it through *Venus* and *Antimony*, we may by oft repeating the said extraction and restoration get great profit, this being one of the best particulars that can be. This multiplication of *Sol* may very well be compared with the generation of *Man*, for as a *Man* in generating, doth with meat and drink restore the loss of his Seed, by which means he continues the said multiplication for a long time, by turning the meat he eats into Prolifick Seed; so likewise the Chymist changeth *Venus*, *Mars*, *Jupiter*, *Saturn*, *Mercury* and *Lune* into *Sol*, by feeding the dispirited *Sol* that has lost its colour with them, restoring it to its former strength and vigour.

2. The Sperm of *Man* is not the Seed of *Man*, but onely the Shell and receptacle thereof, as may be seen in Old Men, whose Sperm is unfit for generation by reason of the weakness of their vital Spirit.

3. So likewise the Seeds of Vegetables, are not all pure Seed, but the House and Vehicle thereof, that is, of the growing and multiplying virtue, which appears in that when the Seeds have been kept so long till this vital virtue is exhale from them, they never bring forth any thing.

4. No more can *Sol* be said to be the Seed of metals, but onely the receptacle thereof, for the Seed is not the whole Body, but onely the lively colour of the Body, and the vegetative and multiplicative virtue that is hid in it.

5. Now as the Seed of Vegetables is more perfect and noble than the Vegetables, so likewise is mature fixt *Sol*, more perfect than *Mercury*, *Saturn*, *Jupiter*, *Venus*, *Mars*, though in the imperfect metals also a Seed be hid, but not so fixt and good as that in Gold.

6. The imperfect metals may be compared to an Herb, whose Seed is not yet ripe, which being put into the ground cannot grow or multiply, but rots in the Earth.

7. The virtue of Corals lies not in their whole Bodies, but in their colour; and therefore *Paracelsus* bids us not to make use of Corals in substance, but extract their Tincture, and use that for Physick, wherefore also he rejects white Corals, as being an unripe Fruit, from any use in Physick.

8. For this reason also the immature gray Pearls, which are frequently found in Cockle Shells in fresh running waters, are looked upon as useles in Physick.

9. And this not without reason, for as unripe Grapes are the cause of griping of the Guts, and hurt the Body; so ripe Grapes nourish and strengthen the same, especially when by fermentation they have quitted their Faeces.

10. All imperfect metals subvert and trouble the Stomach, and cause vomiting and purging, and that by reason of their unripeness.

11. Whereas on the contrary *Sol* taken into the Body causerh not the least alteration, but powerfully strengthens the same when reduc'd to Potability.

12. Thus *Sol* may be compared to ripe Grapes, which when eaten raw, do indeed no hurt to the Body, but rather affords some nourishment, yet cannot strengthen the Heart, Brain, and whole Body, and make a chearfull mind; but when by fermentation they are delivered from their skins and other impurities, they readily and as it were in a moment perform all this.

13. In like manner when *Sol* by fermentation hath laid aside his gross Body and become Spirituall, if then made use of, it not onely nourisheth as ripe Grapes, but exerts its virtue like a Spirit or Q. Essence of Wine, penetrating the whole, and making it lively, strong and vigorous throughout.

14. Neither do the other metals display their hidden virtue, untill by fermentation and distillation, they be subtilized and their gross Bodies laid aside.

15. Thus when *Lune* by fermentation and distillation is subtilized, then it draws away all Diseases of the Brain, and corroborates the same exceedingly even as *Sol* doth the Heart.

16. *Venus* so purified strengthens the Reins and precreative faculty.

17. The volatile sweet Spirit of *Mars*, removes all obstructions whatsoever, provokes the terms in Women, and opens the Hemorrhoides in Men.

18. The sweet Spirit of *Saturn* cures all inward and outward hot Distempers.

19. The sweet Spirit of *Jupiter* cures all Distempers of the Lungs.

20. The volatile Spirit of *Mercury* cures the venereal Distemper.

21. N. B. These volatile spirits of metals must be cautiously used, as being of very great force.

22. The manner of preparing them, may be seen in my Book of Fires, but most plainly set down in my description of the most secret *Sal Armoniac*.

23. All Spirits act according to their nature and property either good or ill, as the Bodies are good or evil from whence they are taken.

24. The Spirit quickens, the Body or Flesh profits nothing, saith Christ, John 6.

25. These words are ill interpreted, when understood by some, as if Spirits onely were of use, and Bodies not at all, which is a great mistake, as it is applied by some.

26. Indeed in Metals, Vegetables and all Animals without the use of reason, who grow, move, and live, by the driving of their in-born Spirit, it does hold true, for when their Spirits are by Art separated from their Bodies, the said Bodies are thenceforward of no use, as being upon the separation of their Spirit, dead and without all virtue.

27. But the case is different with *Man*, who being created in the Image of God, and endowed besides his Animal Spirit, with an immortal Soul, which latter onely and immediately derives from God, and not from nature, as the mortal Spirits of Animals do.

28. Wherefore *Pythagoras* was much mistaken, in believing that the immortal Souls of Men, when departed from their Bodies did immediately enter into those of Beasts.

29. Which mistake of his seems to have been occasioned hence, because he knew how by Art to take

pl 29 163 80
13:167
12:35 168

take away the Soul, i. e. Tincture from Sol, and transfer the same to an imperfect metal, thereby making the same in all things like to true natural Sol.

30. Certain it is that this may be done by art, for the fixt Body of Sol may be destroyed, its Soul extracted, and by being joyn'd to another metal make it good Sol.

31. When this disanimation of Sol is duely performed, the Body is left wholly dead, and is in all things like a volatile unmaileable mineral, and cannot endure the rest, but fumes away like Arsenick with a little Fire.

32. But in case this disanimating of Sol be not rightly done, so that the Body continues as white as *Lune*, and malleable (which is a sign that some life is still left in it) then his Colour may be restored again by means of imperfect minerals, as well as his former fixedness in the Fire.

33. But when the Body of Sol will no longer endure the fire, but goes away in smoak, then we can say it is truly dead and no more Sol.

34. He that finds difficulty to believe this, let him reade *Paracelsus*, *Sendivogius* and other Philosophers.

35. *Sendivogius* saith, Our Steel, that is, our Magnet, can draw from the Rayes of the Sun, what many have sought for and not found; if this our Magnet copulate eleven times with Sol, the Sol becomes weakned almost to death, and the Steel or Magnet shall conceive and bring forth a Son more illustrious than his Father.

36. From which words it appears that *Sendivogius* had the Art to disanimate Sol, else could never have writ so plainly concerning it.

37. It is certain also that there are some, that at this time can do as much within a few hours, I having lately been an Eye-witness of the same, with three other persons in company.

38. It is not necessary to say any more how this cheap and speedy way of disanimating Sol is to be performed; forasmuch as all the Philosophers writings are full of it.

39. However to pleasure the unskillfull I will add thus much, that this may be done four several ways.

40. But the easiest and cheapest way is by means of Spirit of Wine, and a microcosmical saline Spirit; yea this extraction may be performed by a Spirit of Wine alone, without any animal Spirit, or by an animal saline Spirit without the Spirit of Wine.

41. If this were not so, we might have reason to accuse both ancient and modern Philosophers of falsehood, who tells us that *Adam* brought the Philosophers Stone with him out of Paradise, and after his death took it with him into his Grave.

42. Which words may seem strange to some, forasmuch as he was driven bare and naked out of Paradise.

43. Yet the Authority of those who assert this being so great and incontestable, it cannot well be called in question.

44. What therefore the Philosophers meant by this Stone which *Adam* brought with him out of Paradise, is well worthy our Enquiry.

45. The Philosophers commonly say our stone is a stone and no stone, &c. which implies thus much, that to outward view it is a stone, but in deed and in virtue, a Concentrate form of Sol.

46. Wherefore *Petrus Bonus* saith, We do not seek Sol, but the form of Sol.

47. What is then properly this form of Sol?

48. *Ans.* It is a substance which to outward view looks like a contemptible stone, and yet is of such superlative Vertue, that when joyned with imperfect metals on the Fire, it transmutates them into the highest perfection of Sol.

49. It may further be demanded, whether *Adam* brought such a matter with him out of Paradise, whereby this transmutation of metals into Sol may be performed?

50. *Ans.* Yes he did bring such a matter with him out of Paradise, and after death took it with him to his Grave, wherewith all Diseases of mankind may be cured, and all metals changed into the finest Sol.

51. If this be so, might some say, *Adam* must either have been very blind, in not discerning the Treasure he was possessed of; or very envious in not communicating the same to his Posterity.

52. I cannot believe that *Adam*, out of envy withheld this secret from his Children, but rather suppose that the blindness into which his fall had cast him, was the cause of his not perceiving the great Jewel he had about him.

53. But how could he be blind, who was made by God himself, and after his own Image?

54. *Adam* was certainly blind, and his blindness proceeded from his Pride, because he aspired to be like to God; he was not blind as to his outward Eyes, but his heart was blinded, which is by far the worst blindness of the two: For all sin and wickedness blinds the hearts of men, that they cannot perceive the folly of their doings.

55. Thus *Adam* also by means of his disobedience to God, became so blind, as not to perceive, or be sensible of the Love that God had for him before his Fall, and how richly he had endowed him.

56. Whence also his Children were so wicked and blind, that the one Brother slew the other; which wickedness hath still increased in their Posterity, as appears by the deluge, and the destruction of *Sodom* and *Gomorrab*.

57. And thus the World from day to day still grows worse and worse, notwithstanding the Examples of God's Vengeance against Sinners.

58. And all this proceeds because men are so generally blinded by the Devil in sin and wickedness.

59. But to leave this, it may be further questioned; that seeing all mankind is become so blinded through *Adam's* fall, as not to discern the Jewel they carry about them; who then was the Person that first discovered, that man was the Possessor of so great a Treasure?

60. *Ans.* Who was the first discoverer of this Treasure I cannot tell, but thus much is certain, that it was an honest man and fearing God; because God doth not reveal his secrets to the wicked; wherefore *Tho. Aquinas* saith, Our Holy Art, either finds a man holy, or makes him so.

61. But some will say, don't we reade of Heathens that have been Possessors of the Philosophers stone; and how can we imagine that those who have no knowledge of God, and are blinded with sin, should ever be able to find out so great a Mystery?

62. *Ans.* Those Heathens that have been Possessors of this great secret, were not without the knowledge of God; for they lived according to the Law of Nature, honouring God and loving their Neighbour; wherefore also God accepted of them. They learnt to know God from his Works of Wvonder, and

and according to their knowledge, loved, honoured and feared him; and so were made Partakers of his grace, light, and the knowledge of his secrets.

63. We are also to know that the Ancient Philosophers know more than one way to attain the Philosophers Stone; though indeed the most of them sought it in minerals and metals, which is the longest way.

64. And that because it is impossible to change the metallick species, without bringing metals back into their first matter. See my *Treatise of the principles of metals*, and the seventh part of my *Pharmacopœa Spagyrica*.

65. But others have taken a nearer way to attain this secret; and to some Christians God hath been pleased to discover the shortest way of all, by revealing unto them that he made *Adam* every way perfect, giving him all that was necessary, either for his Soul or Body.

66. Now that *Adam* could not discern how richly God had endowed him, was his own fault, because he was disobedient to God, following the deceitfull Serpents advice.

67. And after this manner doth the Devil yet daily deceive Men, by perswading them to do against the commands of God, and that their disobedience shall not bring any such mischief upon them as God's threatenings seem to import.

68. This then is the reason why Men do not understand the secrets of God, because they give too much way to Sin, whereby they become blinded, that they can neither see nor hear the good that comes from above.

69. Now the reason why most of the Alchymists have sought for this great gift of God in minerals and metals, and especially in *Sol*, is this, because their intention was to multiply *Sol*, which they supposed could no way better be done than by sowing it like other Seeds in the Earth, but could not imagine that besides common *Sol*, there were other subjects, wherein the *sol-making* virtue did reside.

70. Which opinion of theirs was probably grounded upon that saying of the Philosophers. *What you sow, that you will reap.*

71. This seems at first sight very rational, that from filth or excrements no good, and so no *Sol* can come; but let us hear the other side also, and we shall be otherwise informed.

72. For the Philosophers say that their Medicine is Vegetable, Animal and Mineral; so that Vegetables and Animals are not excepted.

73. *Albertus Magnus*, writes that the greatest mineral aurifying virtue is in Man, and especially in his Head between the Teeth, and proves it; because in dead Men's Skuls he had found grains of *Sol* sticking between the Teeth.

74. The same is also confirmed by *Thomas Aquinas*, *Rhasis*, *Janus Lacinius*, and others.

75. There is also an old Book, whose Authour is unknown, which treats at large of that subject which *Adam* brought with him out of *Paradise*, wherein the Operator is warned to have a great care of the fumes of the matter as he would avoid the Plague, or the most deadly Poyson. From this Authour I have alledged some passages in my other Writings, and shewed that the Philosophers Stone may be prepared of any subject whose Elements may be separated.

76. Now certain it is that from all Animals and Vegetables, the Elements may be separated, and

consequently follows, that from all Vegetable and Animal Subjects, the Philosophers Stone, or universal Medicine for the Bodies of Men, and Metals may be prepared.

77. *Morienus Romanus*, who prepared this Medicine for King *Calid*, declares that he took the subject matter of it from Man.

78. For when the King asked *Morienus*, in what kind of subject the Philosophers Stone was to be looked for; he answered, the Medicine is in thy self O King; wherefore also after that he had finished the Work, he wrote round about the Glass, in which the Medicine was, these words: *He who carries all about him, needs not the help of another.*

79. Thereby intimating, that he always carried about with him, whatsoever was necessary for the preparing of the Medicine, and therefore did not stand in need of the King's assistance.

80. This same honest *Morienus*, writes plainly concerning the preparation of this Medicine, and doth as it were with his finger point us to the matter, in these words of his, quoted by *Arnoldus de villa nova*; *Grind the Phlegmatick and Choleric with the Sanguin, untill it become a tinging Heaven, &c.*

81. *Arnoldus* explains these words of *Morienus* thus: *The Phlegmatick is cold, as Mercury, the Sanguin is warm and moist, as the Sol or Gold, the Choleric is hot and dry, as Sal Armoniack*: intimating that of these three, *Mercury*, *Sol*, and *Sal Armoniack*, the Philosophers Stone is to be prepared.

82. But that he meant not this concerning common *Mercury*, *Sol*, and *Sal Armoniack* is apparent from this, that *Morienus*, as soon as he had prepared the Medicine for the King, went away privately, without expecting any reward from the King; it also appears from the answer before mentioned, which he made to the King, that he spoke of such a *Mercury*, *Sol*, and *Sal Armoniack* which every Man carries about with him.

83. This is abundantly confirmed by all the Philosophers that went his way, forasmuch as they declare that no charges are required to the preparation of it, that their subject is a contemptible matter cast out upon Dunghills, and trod under feet, and that the Poor have it as well as the Rich.

84. *Morienus* yet more clearly intimates this, in telling us that the matter whilst it is preparing, exhales a smell like to that which comes from the Graves of the Dead, which is a very offensive smell.

85. Now like as Vegetables whilst they are putrifying give forth an ill scent, and Animals a worse, as appears in the stink of rotten Eggs, and the putrefaction of Man's Blood, especially when the same are putrified in a close Glass in warm Horse Dung.

86. For without putrefaction, there can be no separation of the Elements by Distillation, and if no separation be made, neither can any melioration or exaltation be expected.

87. We know that every *Chaos*, as it is a product of the four Elements, contains many impurities, and in particular much dead Earth, and Water void of all virtue; and that the Element of Fire alone is proper to heal and meliorate Men and Metals.

88. Wherefore seeing that no separation of the Elements can be without a foregoing putrefaction we must conclude putrefaction to be the beginning of our Work, without which no good end can be expected.

89. Now he that knows our Horse Dung, and how to putrify the well known and every where to be found most universal natural subject by means of the

same, he will easily afterwards by Distillation separate the most pure and all things penetrating and meliorating Element of Fire, from the gross Chaos to his great satisfaction, and make use of the same to the astonishment and wonder of the ignorant.

90. But in this state it is onely good for the health of Man; and therefore in order to its meliorating of Metals, the pure Element of Fire must be first fix'd with *Sol*, by which means it obtains ingress into imperfect Metals, reducing them to the perfection of *Sol*.

91. Now when the pure Element of Fire is separated from the Chaos, and reduced to the highest degree of purity, then it stinks no more, neither is poisonous as it was before purification, but is an Antidote against all poisons whatsoever, wherefore also the Philosophers have called their Medicine *The riaca*.

92. But all this is to be understood onely of that subject which every man carries about with him, and brings with him out of his Mothers Womb.

93. If any one following the Letter of *Morienus*, should take for his subject common *Mercury*, *Sol* and *Sal Armoniac*, neither will he be mistaken, but if he rightly proceeds will have a good Work, though it be not at all necessary to make use of common *Sol* and *Mercury*, because our natural subject contains both a living *Sol* and *Mercury*.

94. It is no prejudice to our Animal Subject, if we join Minerals with it, because our *Sol* joins it self with all subjects, and unites it self readily with them. But if we be ignorant of the due proportion and composition of *Sol*, *Mercury*, Sulphur, or any other metal or mineral, then it is better to prepare our Medicine out of this one subject onely, because so there is less danger of erring, as I can witness by experience.

95. I have also found by experience that this Microcosmical Subject is alone sufficient, without the ad-

dition of any minerals or metals, to meliorate all imperfect metals.

96. As to a particular this of all others hath pleas'd me best, viz. *Recipe* common *Sol*, and with the help of our Magnet disanimate it so, that it may be no longer *Sol*, as not enduring the Test, and smoking away with a small Fire like Arsenick.

97. Then take this *Sol* and conjoin it with our Microcosmical Subject, with which digest a solution of *Lune*, by which means the *Lune* will be meliorated, and on the Cupel leave *Sol* to good profit.

98. But if we joyn common *Mercury* and common *Sol* with it, and cast this mixture into a solution of *Mars*, and digest it for some days then the pure *Sol* and easily flowing *Mercury* graduates a good part of the gross and difficultly flowing *Mars* into good *Sol*, to the great satisfaction of the Artift.

99. And if we unite *Lune* and *Jupiter* therewith, and cast this mixture into a solution of *Venus*, and digest it the moist way, then by means of our secret Salt these two white united metals change the red *Venus* with little loss of weight into good *Lune* that will abide the Test. And it is indeed matter of wonder, that our universal Salt, should be of so great virtue, when fermented with white or red metals, to change other imperfect metals into good *Sol* and *Lune* on the Test.

100. Wherefore this shall be my conclusion, that in Man is hid the greatest virtue of changing all metals, as well as the Bodies of Men, both universally, and particularly; which if intended for the melioration of metals, the adding of fixt *Sol* and *Lune* for a ferment will facilitate the ingress into other metals, and further diffuse its tinging virtue.

N. B. I shall not be satisfied till I have given a fuller and plainer description of this Royal Labour, which I intend to do in the sixth Century, if God permit.

Novum Lumen Chymicum:

OR A

NEW CHYMICAL LIGHT.

Being a Revelation of a certain new invented secret, never before manifested to the World.

Whereby a clear and unextinguishable light is set before the Eyes of the blind World, and, as it were, palpably demonstrated, that good Gold may be found and attained with profit, every where throughout the whole World, as well in cold as in hot Regions, so that in all those places, where Sand and Stones are found, a Man cannot set his Foot, where, not onely Gold, but also the true matter of the Stone of Philosophers is afforded.

READER,

I will now address myself to the discovering of the wonders of God, not hitherto heard of; to wit, that throughout the whole Earth, no less in cold than in hot Countries, where there are Sand and Stones to be had, good Gold may be extracted from thence with profit. Because a Man cannot set his foot in any place where Gold doth not exist. Nevertheless Chalk, or Lime-Stones, are to be thence excepted; because they onely seldom or never contain any thing of Gold, otherwise all sandy and rocky Stones, all Flints of what colour soever, as also all Sand, fine and coarse, all sandy Stones upon high Mountains, in deep Valleys, in the bowels of the Earth, in Ponds and Rivers, and lastly, all the Sand on the Sea-shore, none excepted, although it hath as yet obtained no colour, but be white and clear. The which indeed will seem incredible to very many, but is asserted by me as a sincere truth, which I never found, by reading or hearsay, but have proved by many and various experiments. Some of which I will here set down for the confirming and demonstrating the truth of my Writings, that by those, all Men of a sound mind may be able to discern, that my Assertion is no Dream, nor fabulous trifle, but sufficiently founded upon experience in the light of nature.

Therefore I would not have thee judge of those things which thou understandest not, nor canst not at present apprehend, but remember that the wonders of God triumph with magnificence and power. But search out those things in every part before thou presumest to interpose thy immature judgment. And although in the proof thou shouldst be mistaken as may easily happen to one making tryal, yet do not impute the error to my Writings, but rather to thy own unready Wit. For I will here write nothing but what I have oftentimes performed, and can yet perform at any time. Consult other searchers after this matter, among which I think all cannot err, in a matter so easie, that even a Boy of ten years of Age may apprehend it, for what belongs to the possibility of it, but it will be evident to many of them with me, That there is Gold in all Sand and Stones, through all places of the World. But there is no need that I should here shew the way of extracting it from them, in a great quantity or large use, but rather I shall beware, that I put not so sharp a Dart into the hands of my Adversaries, to wound myself, for I have published this to gratifie candid Friends, not Counterseits, but least of all the Compilers of notorious Libels, in which opinion, I will remain and acquiesce.

We

WE will now proceed to the Trial whether those things which I have here written be true, and are able to abide the Examen of the Cupel, to wit, that in all Sand, there is good Gold.

The first Specimen of Probation.

Recipe one Ounce of white Sand or Flint, which you esteeme to be altogether void of Gold, with which mix three parts of *Minium*, or of any other Ashes of *Saturn*. Put this mixture into a VVind Furnace, or to the Bellows, let it flow well together for an hour, and it will turn to a yellow glass; suffer it not to stand too long lest the glass of *Saturn* perforate the Crucible, and run out into the Ashes. Pour out the glass and powder it, and mix it with half its weight of *Sal Alkali* or Pot ashes, put this mixture into an Iron Crucible, into which you have first put some bits of Iron, or old Nails; give fire and cause the matter to flow, and the glass of *Saturn* will be continually reduced by the *Mars*, and at length return into Lead: Pour it out into a Cone, and the *Regulus* of *Saturn* will sink to the bottom, and the Sand or Flint will be uppermost as a dross. After all is cold, take out the *Regulus* of *Saturn*, which hath drawn to it self so great a roughness and blackness from the Iron, that it cannot easily be cupellated: which you may remedy thus: put this black *Regulus* of *Saturn* into a Crucible in a VVind Furnace, cause it to flow well; and if there be of that one Ounce, cast upon it a Drachm or somewhat more of Salt-peter, and make them flow together, then the Salt-peter will attract the roughness from the *Saturn* and turn it into *Scoria*. Which being poured out and the *Regulus* of *Saturn* separated from the *Scoria*, it will be white and tractable, and easily runneth upon the Cupel. This I call washing. But if thou knowest not how to perform this Lotion, which yet in it self consisteth in an easie labour, put thy black and rough *Regulus* of *Saturn* into such an Instrument (as they call *Treib Scherbe*) or a close Cupel, under a covering [or Muffle,] and suffer it to be defecated for the space of half or at least a quarter of an hour, pour it out and separate the *Scoria* from the *Regulus*; which will be white and tractable. But the Lotion by Salt-peter is much the better.

Of this *Regulus* of *Saturn*, and of that same Lead of which the Ashes of *Saturn* were made, take equally the same weight, exactly weighed with the lesser weights, put each of them apart upon a dephlegmed Cupel, suffer them to run; compare one with the other, and you shall find, that *Saturn* which was blown off with the Sand or Flint to leave behind it a grain of Gold, but on the contrary, the common *Saturn* will onely leave a grain of Silver. Who now can deny, but that the grain of Gold proceedeth from the white Sand or Flint? For no Gold could come from the Salts. This Specimen of Probation is a palpable Argument, that Gold is contained in all Sand and Flints of what Colour soever. But that there is no difference between one Sand or Flint, and another, so that there is no more Gold in one than another, I do not assert, for (in that respect) they greatly differ. Also that the Sand of hot Regions containeth more Gold than that of cold Countreys, is in no wise to be doubted, as every prudent Man will easily think. For we have set down this Specimen of Probation, onely to the end that you may find Gold to be in all the Sand and Flints of the whole World.

The second Specimen of Probation.

Recipe one part of white Flint or Sand, with which mix three or four times as much Salt of Tartar, or of any other Alkali, which mixture put into a Crucible, so that it be not above a third part full, because this mixture in the melting might rise up and run over the Crucible; let it stand half an hour, that it may be well melted, and it will be turned into a white transparent glass. Pour it out and dissolve it in water, or rather in a *Lixivium*, and the Sand or Flint will be dissolved, and converted into a thick Liquor. In this Liquor digest for the space of an hour or two, half an Ounce of Filings or Raspings or rather thin shavings of Lead, and the Lead will extract the spiritual Gold from the VVater of Flints, and will thence grow yellow: VVhich being taken out of the VVater dry, cupel it, and you shall find a grain of Gold. Also cupel another half Ounce of the same Lead, and you shall find a grain of Silver, as is commonly wont to be had from all Lead, from which you may be certain that white Flints and Sand, contain spiritual Gold, which becometh corporeal with Metals.

A Third Specimen of Probation.

Dissolve *Saturn* in *Aqua Fortis*, and pour into the solution Salt water, and all the Lead will fall from the VVater like a white Powder: mix three parts of thisedulcorated and dried *Cals* of *Saturn* with one part of Sand, to which add half so much of the Salt of a *Lixivium* or other Alkali; which mixture put into an Iron Crucible, into which you have first put some bits of Iron, which being covered, suffer it to melt for the space of full half an hour, untill the sharp Spirits of Salt which were in the Lead be mortified by the Iron, for then the *Saturn* is reduced and rendered corporeal, which being poured out into a Cone, the *Regulus* of *Saturn* falleth to the bottom, which you may wash with Salt-peter as we have taught above, or purge it from the Faeces on the *Treib Scherbe* [or Muffle] weigh it exactly by the lesser Probatory Weights, weigh also as much of any other common Lead, which is not melted with Sand, cupel each by it self; and that Lead which was melted with the Sand, will leave a grain of Gold in the Cupel, but the other common Lead leaveth onely a grain of Silver. Which sufficiently proveth that there is Gold in all Sand, none excepted. But I do not assert that all Sand containeth so much Gold as that it may be thence extracted with profit. Because some Sand is poor, other rich, another richer. Therefore whosoever intendeth any profit by this ought before hand to know the difference of Sand and Stones, that he may not lose his labour. The which may easily be found out by experience, to wit, if you do nothing in great Quantities, before you have made trial in lesser, that is, such as may be performed by the lesser Specimens of Probation.

A Legitimate and Infallible way and manner of finding out and proving every Flint, Stone, and Sand, whether it containeth much or little Gold.

Recipe four ounces of Sand, Flint, or other Stones or Rocks, which you have a mind to prove; heat them red hot in a Crucible, and cast them so into cold Water, where they will become tractable,

tractable, and may easily be brought to fine Powder, to those four ounces of powdered Flints, Sand or Stones, put into a small Glafs Cucurbit, pour two ounces of *Aq. Regis*, that the Sand may be well moistned; set the Cucurbit upon warm Sand for half an hour, and the *Aqua Regis* will attract to it self the Gold which is contained in the Sand or Flint. To which if two ounces of hot Water be poured into the Cucurbit, and mixed by a strong shaking it together, and filtered through a brown Paper, the Water with the Gold goeth through the filter, and the Sand will remain in the Paper, to which if you pour a little common Water, and let it run through it will take out the residue of the Gold, which yet adhereth to the Sand, which is to be added to the first. Upon this Solution if you pour a *Lixivium*, but rather Spirit of Urine; that *Lixivium* or Spirit of Urine, mortifieth the *Aqua Regis* and precipitateth the Gold which is in it in form of a yellow Powder, from which the Water is to be poured off, and the *Sol* to be edulcorated with fresh Water, and dried, and that very warily, because Gold of this sort, when it groweth hot, fulminateth, so that it is shattered into minute parts. To this fulminating Gold if you add a little common Sulphur, and make it red hot in a Crucible, it doth not fulminate. If you reduce such a *Cals* of Gold mixed with Borax in a clean Crucible, you will find how much Gold that four Ounces of Sand or Flint contained. *N. B.* Except the Sand or Flint should happen also to be impregnated with Iron, which would render the *Sol* brittle and pale. For in that case, the *Sol* precipitated from the *Aqua Regis*, and burned with Sulphur would not flow with Borax, because the Iron being mixed with it, would adulterate the Probation: But if you cupel such Gold partaking of Iron, with *Saturn*, the Iron may be separated from the *Sol*, and the proof will be void of error. *N. B.* That Sand and Flints, may indeed be proved another way, but seeing this which we have here prescribed, is easie to be practised, we will rest in that.

But this one thing is also necessary to be known, *viz.* It is indeed true, that in all Sand and Flints there is Gold, as the above mentioned proofs do witness; nevertheless know that there is a difference between native, corporeal, and solid Gold, and the volatile spiritual first Ens of Gold. For the corporeal Gold is easily extracted by the help of corrosive Waters or Salts; but the spiritual not so. And because corporeal Gold is always elicited by the benefit of the above mentioned Probation it may thence happen, that although in white Sand there should plainly be no corporeal Gold, nevertheless by the help of the aforesaid Probations it would be thence elicited, indeed not much, nor no more than what the Lead which was used for the proof, did contain of Silver: because the *Luna* in the melting or dissolving hath attracted to it self the spiritual Gold, from the Flint or Sand, so that it is thence tinted and transmuted into Gold. Which is manifest in that the grain of *Sol* doth not exceed the magnitude of the grain of Silver, which is gotten from other common Lead. But if besides the spiritual, there be also corporeal Gold in the Sand, the grain of *Sol* will necessarily exceed that of *Luna*, for the Silver which was contained in the *Saturn* doth not vanish into Air but remaineth. and because it doth not remain the same Silver, but passeth into Gold, that change is ascribed to the notable Operation of the first Ens of Gold, or spiritual Gold in the Sand. Wherefore who-

soever intendeth to extract Gold from Sand, Flint or Stones with profit, ought to know certainly before by smaller experiments, that besides spiritual, they also contain corporal Gold. For I have written this Book onely upon the account of extracting from them corporal Gold, leaving the spiritual Gold to Philosophers that of it they may make their Stone. But necessity required that I should lightly touch at those few things. For if according to my prescribed Probations, any one in working should have found a grain of Gold of equal quantity with the grain of Silver, he might wonder in his mind, which way the Silver had made its escape, seeing that he had found Gold instead of Silver. Wherefore I thought it necessary to shew the reason of that, for the taking away all scruple from every ignorant mind. Wherefore whosoever seeketh Gold from Sand or Stones, let him chuse such, from which corporal Gold may be extracted with profit. For they will afford him such profitable fruit, as the white Sand denieth. But that for the performing my Specimens of Probation, I have taught to take white Sand, I have done it for this reason, that I might make it evident to every one that there is Gold in all Sand, but that it cannot be extracted from all with gain. For white Sand or Flint is very often void of corporal Gold, but never of spiritual, by which Silver may be converted into good Gold. I might have passed by this admonition with silence, seeing that those things are not necessary to be known by the vulgar, in asmuch as corporal Gold will abundantly satisfy their desire; but a Philosopher neither wanteth, nor seeketh corporal Gold, but onely spiritual, to prepare of it a Tincture. Add, that to him it is sufficiently known, in what subjects the first Ens of Gold is plentifully contained. Hence, although the first Ens of Gold be also in white Sand, as is manifest by the foregoing proofs, he useth not that, but rather seeketh such Stones for his work, as contain much Tincture. Neither also doth any true Philosopher so tie himself to this or that subject onely, that he will not elicit his Tincture from any other, inasmuch as it is evident to him that the first Ens of Gold may be found in all things in the whole World. For wheresoever there is Sulphur, there may also be had the first Ens of Gold, whence a Tincture may be prepared. But it is evident that in all Vegetables, Animals and Minerals there is Sulphur. For the matter of the Stone of Philosophers, every where offereth it self, so that the poor as well as the rich may attain it without cost, according to that saying of the Philosopher; *That their matter is every where obvious, and prepared without money, trod under foot and thrown to Dungbills.* So the true Philosophers speak and write. But Sophisters, who falsely assume the name of Philosophers, wandering up and down from Court to Court, where they offer their service for the acquiring the Philosophers Stone, by their lying Fables, perswade credulous Noble men, that the matter of the Stone is to be sought in this or that place or mountain, as in *Hungary*, *Transylvania*, the Forrest of *Hereynia*, *Thuringia* or *Bohemia*, or in the Rocks of *Sweden* or *Norway*, and elsewhere. Others again perswade credulous Persons, that the Stone of Philosophers, can be made of nothing but common Gold, and therefore require of their Patrons not onely some ounces, but some pounds of Gold, for their own greater profit. One of those Pseudo-philosophers was lately here at *Amsterdam*, who by per-

swading certain Merchants, trickt them out of two and twenty Marks of Gold, thence to make the Philosophers Stone. He indeed put the Gold into the Vessel according to his own manner, before those Merchants, giving to it a continuall Fire. But after much time being elapsed, when they expected to reap the Fruit, he, who had plaid the Philosopher, privately withdrew himself into I know not what Countrey, and would not return to take out the two and twenty marks of gold. Therefore the Merchants themselves being about to take them out, found those solar Birds were flown, and had left onely the empty nest. Which empty nest as yet lies in a place in this City, nor doth any one know how to convert it to his own use. But if the Merchant had given to that impostor in hand, onely two, or at the most three ounces of gold, they had not received so great a loss. But as they unadvisedly credited his fine Clothes, and his finer words, so they were intollerably deceived.

A true Philosopher wanteth not so much gold for his Medicine, inasmuch as if he bringeth but one half ounce to perfection, it may suffice for his whole life, and may be in his own power to do the same again as often as necessity shall require, so that he will have no need to run up and down from one to another who are greedy of gold, to blemish the noble art of Chymistry, and bring it into hatred with the whole World.

Some years since, when I had written of the Prosperity of Germany, and from a good intention had taught how Wine and Corn might be concentrated, and in case of necessity, might be commodiously carried from one Countrey to another, and there safely kept in Garrisons or Fortresses for future use; fearing that at sometime while the Shepherd slept, that most ravenous Wolf the Turk might break into the German Fold, and cut the throats of what Sheep he could not carry away. Against which, Farmer with his accomplices, hath fer forth notorious Libels, and hath every where traduced me for a false Prophet: Whose Calumnies I have not opposed, because he hath sheltered himself under the protection of Princes. Moreover, this Farmer, with a consort of ruiners of fame, or good name, have reproachfully wounded my Honour, by falsely accusing my Writings, and traducing them for Lyes: And seeing that almost all of them abide in great Men's Courts, and have not put their names to ther invective Papers, I have not indeed been able to reach them. But yet at length those Men of darkness, who have concealed their names, that they might give the greater reputation to their slanderous Papers, do come to be more and more known to me. Besides at last the event hath shewed those things to be true, which I had predicted should happen; to wit, that the depraved Christians should be chastised by the Turks and Tartars. But it is to be pitied that also Men of better note, should be ensnared and captivated by the common judgment, by reason of that Company of the Devils attendants. For the unerring truth declareth, that the righteous scourge of God, will not be taken away from us, before such spoils of a Man's good name be restrained by the Magistrate.

Now, to return to our purpose, to demonstrate, that not onely Gold, but also somewhat more rare; to wit, a true Tincture is hidden in Stones, and by the help of Art may be extracted from them, which the Ancients have hinted at in these words: *Auro quod dicitur? Jaspis, &c.* And that there is much

Tincture contained in the Jasper, I have long since inculcated in other places of my Writings. *Paracelsus* highly commendeth *Red Talc*, *Granates*, *Antimony*, and *Lapis Lazuli*, adding that Tinctures or the first Ens of Gold, may be gotten from them by the help of sublimation. Moreover the first Ens of Gold, may also be found in other Stones, especially in the *Hematitis*, *Seytha*, *Magnesia* of *Piedmont*, *Smiris*, and others of that kind, in which it is so fixed, that there is nothing wanting to obtain it but onely the way of extracting, and giving it ingress by *Sol*. On the contrary, the first Ens of Gold is indeed in Vegetable, Animal, and Mineral Sulphur, Marcasites, and Antimony, and that abundantly, but so volatile that Stones are to be preferred to them.

And although my intention in this Book extendeth no farther than the extracting of Gold out of Stones, Sand, and Flints, yet nothing hinders but that in a few words, I may also shew, that in Stones, there is not onely fixed Gold, but also volatile, whence a true Tincture may be perfected. Which Tincture I have not as yet made, but nevertheless I am certainly perswaded that it is in no wise impossible to be done. For whosoever can render the first Ens of Gold, in Stones, volatile, and draw it out by Distillation, he will continually obtain a gradatory water, whereby he may coagulate every running Mercury into good Gold. But he that knoweth how to joyn this volatile Gold with corporal *Sol*, to unite them and procure ingress, may thence expect a far greater good. For the first Ens of Gold is more conducive for the preparing Tinctures, than corporal Gold, as one of the Philosophers hath signified in the following words: *Thou canst not make Gold or Silver, except thou shalt obtain their first Ens.* The first Ens of Gold, which is hidden in all Vegetables and Animals, coagulateth Mercury also into a yellowness, but not constant; but if it shall be fixed, it also coagulateth and fixeth with constancy, but not before. Therefore it is most certainly true, that where Sulphur is, there is also the first Ens of Gold; and where there is the first Ens of Gold, there is also Tincture. Therefore seeing that Sulphur may be found, in all things in the World, even in the smallest Herb, it followeth that also from every Herb, Wood, Stone, or Bone, a true Tincture may be prepared. Whosoever will believe, let him, it matters little to me whether it be believed or not, I think my self satisfied in that I have not put that light which I have received under a Bushel, but have exhibited it to the World for information. For the light conduceth nothing to him who is blind, and resolveth to remain so. You shall find more in my third Century, as also in the sixth part of my *Pharmacopoea Spagyrica*.

How it may be known whether Sand, Flints, and the like Stones, being pregnant with Gold, contain much Gold, or but little.

WHite Sand and Flint, contain the least Gold of all; which Sand indeed is never without Gold, although it cannot be extracted from it with profit. In the white and red, there is more Gold than in the white, nevertheless not always so much as will pay the cost. In the yellow, brown, or black, there is commonly much Gold contained, whensoever veins of white or yellow Sand run through them, and especially when such Sand shineth with abundance of small golden

golden sparks, closely adhering to each other. In like manner that Sand is rich in *Sol*, which is like to Talck, or when Stones are found in it, in which there is red or brown Talck, even as *Sol* is contained almost in every Talck, nevertheless in some more, in other less.

All River Pebbles, which although outwardly they appear white, yet when heated red hot and broken, are stained with yellowness, and contain *Sol* are in extracting sufficiently rich in Gold.

Green, yellow, or blue Stones, being transparent like horn [called in the German Tongue *Hornstein*] are also for the most part fruitfull in Gold. Also all red, dark coloured and black Flints contain Gold, with which Iron is frequently admixed, which in the extraction is drawn out with the *Sol*, and weakeneth the *Menstruum*, and rendereth it unprofitable.

All Quarries or rocky Stones, whether they be found in the Earth after the manner of Ducts, or whether they lie in the open Air, when they are coloured, contain Gold. Every *Hematites*, and that which is a kin to it, the *Smiris*, the *Granate*, and *Lapis Lazuli*, all contain Gold, nevertheless always one more than another, so that some of them are rich in Gold.

All Granates contain Gold, and besides Gold, also the first Ens of gold; but they are endowed with so hard a body, that *Aqua Fortis* cannot exercise its power upon them. But there may be a remedy found, by whose help their extraction may be instituted.

In every golden Stone called *Chrysocolla*, *Sapphyr*, *Ruby*, *Amethyst*, and *Hyacinth*, there is gold, but difficult to be extracted. All Fluors or things fluxing, which are applied to the Mines of *Sol* and *Lune*, for the bringing their Oars to a flux or melting, whether they be of a violet colour, or purple, yellow, red, or green) are all endowed with unripe and volatile gold. Which if you shall make red hot, the colour evaporateth like a green, yellow, or red smoke, leaving the Stones white. But if any Man shall know how to intercept, and detain such fugacious *Sol*, he may therewith coagulate *Mercury* into gold. In like manner from all Stones, in which is the first Ens of gold, a green-water may be extracted by the help of Distillation, in which *Mercury* coagulateth it self into gold. The Ancient Philosophers have called such a green-water, their *Green Lyon*, which devourerth gold, and of it preparerth a Tincture for *Lune* and *Mercury*.

Concerning this matter, I could indeed say somewhat more, did not the avarice and improbity of Men, who seek nothing but the damage of their Neighbour, restrain me. Hence all those in which any light of God shall arise, ought diligently to beware that they communicate nothing of it to wicked Men, although they put on the shape of an Angel. For Faith is now no where kept among Men, as these following words of a golden Alphabet do witness.

Soli Deo tu Confidat,
Premissa benevolum diffidat,
Deus solus fidem servat,
Et mundo fides exulat.

In God alone repose thy trust,
With Mens pretence be not beguiled;
God onely keepeth Faith, is Just,
Which from the World is quite exiled.

If many years ago, I had known those things which I now do, it would have profited me much in being aware of the dissembled sanctity of impostors. But what is past cannot be recalled: Let these things at this time suffice to be spoken of the knowledge of Sand and Stones, every Man may look further for himself, and search out and learn more. If any Man findeth any good from what I have written in this Book, let him give God thanks, and be mindfull of the Poor; if not, let him look upon himself as unworthy to be partaker of it. For I have here written more perspicuously, than any Philosopher hath done before me, in which I rest. It now remains that we should say something concerning the easie way, and incomparable invention, by whose benefit *Sol* may be extracted from Sand and Stones, in great quantity and with a considerable gain. Which invention hath been hitherto unknown to the World, and it is almost impossible that a better should be found. But that the searcher into Art may see that this new invention of mine, is of all the most easie for the extracting of Gold from Sand or Flints, and that the World hath never known the like, I have thought fit to shew in what this *Compendium* consists, and it is thus. It is sufficiently known with what labour and costs the ancient Workers in Metals, and even those at this day, have extracted, and do extract Gold from Sand and Stones, viz. when first they burn the Oars or Stones, then grind it in peculiar Mills accommodated to that purpose, with *Argent-vive* and water, where the *Argent-vive* draweth to it self the *Sol*, and the Stone goeth away in the washing, and the greatest part of the *Argent-vive* is strain'd from the gold through Leather, which may again serve for the same use. Then in Iron Retorts they drive out the residue of the *Argent-vive*, which yet adhered to the *Sol*, which is saved; then they melt the *Sol*. In which operation they lose much of the *Argent-vive*, which in the grinding and washing goeth away: so that often times the charge of the *Mercury* is no less than the gain of the gold. Therefore by this way nothing can be gotten from a poor Mine. But this is the easiest way they have to separate *Sol* from its Oar or Stones.

Another way is, when they mix the washed Oar (which the Germans call *Schlicht*) with its weight of Licharge, and melt it with Bellows, then cupel the *Regulus* of Saturn, and so they obtain the *Sol* which was in the Oar. Which way of melting, is also dear, because much of the Lead is lost: But yet they are obliged to follow this way, who know no better. Now I will compare my way with this, that it may be evident which of them is the most easie and profitable. As for my method of extracting, it chiefly depends upon four singular *Compendiums*, by which the operation is rendred easie. The first of which is a water of small cost, which may be copiously prepared, without Distillation.

The second is a singular Meral, of which the Kettles or Pans are made, in which the Stones or Sand is boiled with the water of small cost, and yet are not corroded nor consumed. And when the water shall have dissolved and imbibed the *Sol* in the Sand, the Oar, Sand, or Stones, with the water are to be taken out of the boiling Vessel, and put into another Vessel adapted to this use, with a bottom all over perforated with small holes [like a Colander] and first covered with inside, with a thin Matr, then the water will drop down through the Sand

and Matt into another Vessel placed under it; more-over more hot water is to be poured upon the same Sand, and let to run through it, which water will also extract the gold which as yet remained in the Sand. And after this Elixivation, the Sand, (which is now of no use) is to be taken out of the filtering Vessel, and this labour to be continued so long, until no more Sand is to be extracted.

The third *Compendium* is this, when the *Lixivium* of Gold, is collected to a just quantity, a singular Water of small cost, is poured into the Solution of Gold, whence all the *Sol* is precipitated from the Solvent, the Solvent by inclination is decanted from the *Calx* of *Sol*, and may again be used for the like extraction, seeing that it still retaineth its strength, being nothing weakened by the precipitation. Therefore we may use this Solvent a long time. And that which is lost by pouring too and again, is of small charge, because it may be recruited again by the like cheap Water. But if one should mortifie that dissolvent with other contrary *Lixiviums*, to precipitate the *Sol*, as otherwise is wont to be done, and I have taught above, about the proving of Sand, what a loss should we undergo, if at every time we should destroy our Solvent? Besides such an extraction is costly and laborious, when made in glass or earthen Cucurbits.

But this extraction is almost of no charge, seeing that it may be perfected in great Kettles, and the Gold thence precipitated without loss of the Water. This extraction of Gold is like the extraction of Salt-peter from Earth, where the Workmen also elixivate one part of the Earth, by the help of Water, which Earth they then throw away, and in room of that put other Earth into the Vessel, which they also elixivate or wash, and that so often till they have elixivated all their Earth impregnated with Salt-peter. And by the same reason we elicit our Gold from Sand, as they make their Salt-peter.

The fourth *Compendium* is this, that the precipitated *Calx* of *Sol*, after the Water is filtered from it, is taken out of the filter and dried, and by the benefit of a certain singular good flux, not at all costly, is reduced, so that in the melting nothing of the Gold is lost.

In those four *Compendiums* the whole work of our extraction consisteth, as a building standing upon four Pillars, one of which failing, the whole structure is ruined. He that knoweth those four *Compendiums* may boldly enter upon the work, to extract *Sol* from Sand and Stones: for then it will be a work of profit to him, otherwise not, which I have declared for the information of every man.

But that I have made none of those four *Compendiums* manifest, let no man wonder, because I have been sufficiently hurt by the slanderous Forgeries of cavelling Detractions. For when by reason of their dull apprehension, they could not understand nor perform those things which I had written openly and plain enough, they falsely traduced my Writings, as abounding with lies.

Let these things suffice to be written at this time, concerning the extraction of Gold out of Stones, Sand or Flints: which I doubt not but will be of use hereafter to many indigent Persons. For although all men should apply themselves to that extraction, yet they would in no wise incommode one another, seeing there are Sand and Stones every where obvious to all. And also the Salts for extrac-

ting are so plentifully afforded, that nothing is wanting but a man to put his hand to the work. But some one may here object and say: I do indeed believe *Glauber*, that in the Sand and Stones of the East and West Indies, Africa, Spain, Italy, France, and other hot Countries, much Gold may be found, but who will remove his dwelling thither to extract it? There is no need that any should go dwell in Africa, or either Indies, thence to fetch us Gold, seeing that it may be had sufficiently in Europe, and may be found in all cold places. It is well known, that in many parts of Germany, Gold is elicited from the Sand as well of small, as great Rivers and Lakes. But that more Gold may not be had in Germany, which is temperate, than in cold Norway, or Sweden, and less in Germany than in France or Spain, I will not deny. Therefore we need no Commerce with thirtieth Africa, or America, as that with great peril of body and mind, we should seek Gold thence, seeing that we have it in every Countrey of Europe, and that not onely under ground in the Veins of the Earth, whence it is to be digged out with great trouble, cost and labour; but it is also every where manifest upon the Earth, where it is much more largely and easily acquired. The most famous Monarch of Philosophers, *Paracelsus*, in his Book of the Vexations of Alchymists saith: That more Gold and Silver may be found above the Earth, than in its profundity, and that oftentimes a Countryman throweth a Stone at a Cow, which is of greater value than the Price of the Cow. Which thing indeed is certainly true, nevertheless whosoever will not with *Glauber* believe it, let him remain in his unbelief. In *Esdra*, we read these words: There is much Earth of which Pottery is made, but a small quantity of Powder or Dust of which Gold is made. Which words are commonly thus interpreted, that, by the words powder or dust of which Gold is made, the Writer hath understood the Stone of Philosophers. The which is very agreeable to truth, but yet no Earth is found void of metals, nevertheless all are not so rich, as to afford any profit in the extracting. On the contrary all Stones and Sand (although every of them doth not contain corporal *Sol* so largely, as to be thence extracted with gain) rejoyce in the first Ens of Gold, or such a *Calx* by whose benefit Gold may be made. Which powder, if we know how to extract from them, we may make it better than Gold itself. But seeing such an Aurifick *Calx* is very largely diffused in Sand or Stones, and cannot be thence hammered out, but is extracted by Art alone, therefore the blind Covetours of Gold, with the Ignorant, will not believe it, because they know not how to perfect it. Hence an Art of this kind was by the Philosophers kept most secret, where *Paracelsus* speaking of the first Ens of Gold, saith that it may be elicited by sublimation. *Basilus* writeth that the preparation of the universal Tincture, may be compared to the distillation of a burning Spirit from the Lees of Wine. A comparison sufficiently perspicuous! For even as in a great quantity of Wine or Beer, there is hidden but a small quantity of good Spirit, and the residue is nothing but an unprofitable mud, but nevertheless that little Spirit, by the help of distillation is always extracted from the great quantity of unprofitable mud, with gain, and is concentrated into a very subtle penetrating Spirit, of which one spoonfull is more to be esteemed than a whole pail full of Lees. By such means the Philosophers would have us extract

tract by Art, that first Ens or form of Gold being very far dispersed in Sand and Stones, and concentrate or bring it into a small compass, of which, but asmuch as the magnitude of a Pease, is of greater worth than a huge Mountain of unprofitable Earth. Moreover, this I will not conceal, that throughout all *Germany*, in and about the Rivers may be found Stones, which are sufficiently rich in Gold and Silver, and moreover if you break them into pieces, you shall find within them little Holes and Caverns, which abound with a yellow or brown Powder, which if any one shall take out, and melt it together with Borax, he will acquire *Sol* mixed with Silver. But as yet, I never saw any man, who knew this sort of stones, and much less that golden *Cake* which is hidden in them. Which thing without doubt they have passed by, by reason of their negligence, not loving or seeking to know the physical *Magnalia* of God. I have found many the like stones in the sandy Hills about *Utrecht*, and in other Sand-pits of this Belgick Nation, but more about the Banks of the *Rhine*, and the *Ile*, as also the Coast of the Southern Sea, some of which stones I have yet by me. Also in the rough places of *Walavia* you may find much Sand and Stones, which contain corporal Gold. But there is no man knoweth any thing of them. And this might be of great use to Children, if they were placed for a time in the Shop or Workhouse of some Artist, of whom they might learn, whence in any case of necessity they might be able to sustain themselves. But the rich, relying upon their own fortunes, think that they have Wealth enough for their Children, but if any adverse fortune shall chance to befall them, as their Houses to be burnt, or their Ships robbed by Pyrates of their rich Merchandizes, or be cast away by Tempests, or their Debtours break and run away in their Debts, then they know not which way to turn themselves; and because they have learned no Art, whereby to get their living, they commonly degenerate into men of a desperate life. For one leaveth his Wife and Children, and goeth into the *Indies*, where not a few have become a Prey to wild Beasts or Cannibals. Another, for a small stipend or pay, selleth his Freedom to fight by Sea and Land, until like a mad Dog he is miserably slain. [I have heard

that it is a Custom in Germany, that a man may play away, pawn, or sell his Liberty or Freedom, which being once gone, he becomes a Vassal or Slave to the publick Service of the Prince or State, during his Life.] Others, (after they have consumed and wasted all their substance, and have learned nothing that is gainfull in their youth, whence they might honestly maintain themselves and Families) betake themselves to a vicious kind of life, till they perish in it. To have truly learned Mechanick Arts, indeed helpeth much in fortunate times; but when the times happen to be troublesome and difficult, and many men in the same City exercise one and the same Art, one often hurts another, by eating the Bread out of his mouth, and reduceth him to straits. But if a Physician knoweth somewhat besides the Profession of Physick, by which he may obtain a Living, he will have no need to make so many Visits to the Sick out of a pressing desire and expectation of getting money for his diligent attendance. Therefore Hermetick Philosophy and Medicine, with their Cousen *German* natural Alchymy, are the most excellent of all Arts, and will so remain to the End of the World.

Seeing therefore that such great Treasures (as we have heard) are hidden in the despised Earth, and in such subjects as are every where trampled under foot, wherefore should we not extract them, for an honest maintenance, and defence against the injury of the times? Why should we not leave *India* to the *Indians*, and have regard to our own *Europe*, which abundantly affordeth whatsoever we need for the sustentation of Life? I cannot but say again and again, that were I but ten years younger than I am, I would not cease, but for the good of the publick, would publickly teach, and demonstrate to the Eye, true Philosophy, Medicine, and Alchymy. But my glass being almost run, I must commit the care of this labour to others who are younger and have greater strength of Body. Therefore in the mean time, whatsoever good I can do my Neighbour by wholesome Writings, I will not omit. I intend shortly (God favouring my design) to publish many secrets, hitherto unheard of. Nothing now remains but to close this little Treatise with,

The End.

Glory be to God alone.

An Admonition to the READER.

W^Hatsoever I have written in this little Book of the compendious extracting of Gold, out of Sand and Stones, is so true, that nothing at all is to be doubted concerning it: Nevertheless after this Treatise was gone to the Press, another way, and that much better came into my mind, by the benefit of which, Gold may be extracted with a much greater expedition, than by the help of the former. Because for the operation of this last way, there is no need of any Kettles or Pans made of a certain singular Metal, but the extraction may be made in quantity without any boiling, in such Vessels as are every where in hand, and may be had, so that one man in one day, may by an easie business perform the extraction of a thousand Pounds weight of Sand. Which method is indeed much to be preferred to the former. Wherefore I could not but also notifie this way of extraction. What seekest thou? If I shall find that those my profitable inventions are gratefully received, I will not neglect officiously to serve the publick, in this present evil Age, and in the worse to come, by publishing the same. With which, benevolent Reader, I commit thee to the Divine Care and Protection. Dated at Amsterdam the 26th. Day of July 1664.

A
Spagyrical Pharmacopœa:
O R
DISPENSATORY.

Being an exact description by what means, profitable, efficacious, and penetrating Medicines may be made, and prepared out of Vegetables, Animals, and Minerals; after an unwonted and easie method.

P A R T I.

To the well minded Reader.

SOME or other will perhaps wonder at, and vain know what the reason should be of my describing this Pharmacopœa Spagyrica, or Chymical Dispensatory, especially when they consider that there are not only found various preparations of divers Chymical Remedies in my Books that I have published, but also many such innumerable Writings of such kind of busineses, are publick even from the days of old down to this very day, both profitable ones (of which the number is very small) and also unprofitable ones (of which there are a great multitude) insomuch that it might seem altogether needless to commit to the Press any more matters of that kind. To satisfy such a one that thus enquires, I judge it well worth my while to demonstrate in this place, that it is not only very profitable, but also highly necessary, well to distinguish between good and tried Medicines, and such as are not proved ones, not because you should neglect, correct, reject, and suppress other Mens Writings, and to esteem highly of mine. No such matter, for I well know that none can give more than he possesseth, and if any one doth (out of a candid mind) bring to light any thing for the profit and benefit of his Neighbour, how vile soever, and mean the thing be, yet is it to be most thankfully accepted of; and therefore let no body be so proud, as to presume upon the rejecting of the industry and labour of another Man, but rather extoll it with praises, though he himself could have done better. And so by what is here spoken, I would hint unto you that the very reason why I have published this small Treatise, is this, viz. that my inventions may reach out an helping hand to poor afflicted mankind, and that I may assist them in a Christian manner, according to the will and command of the most high. And although I have already described the preparation of many profitable Medicines, as well out of Vegetables and Animals, as out of Minerals, in my Philosophical Furnaces, by the use of which in case of necessity, every curable Disease may be sufficiently enough driven out and carried off; yet nevertheless it hath seemed expedient unto me, to set forth this little Work under three Parts, each of which parts shall contain singular Medicaments as for example. The first Part shall comprehend such Medicines, as proceed from Vegetables, the second Part, such as proceed from Animals, and the third Part, such as may be had out of Minerals. And this also is a primary reason why I have comprised each kind of Medicaments in a singular Work or Treatise, because of the envious know-littles, and foolish deriders, and despisers of Art, who reject all Mineral Medicaments, (but they know not their properties) as unsafe at all times, because not taken forth out of the wholesome Vegetables, (whose use and virtue [say they] hath been approved for many Ages) but out of the poisonous Minerals and Metals, whereto no trust is to be given, and the use of them too is to this day very rare, and their operation too vehement. Now that I may stop the mouths of these kind of Men, and that they may see and know, that I likewise am well versed in the virtues of Vegetables, and their true preparations, together with their purification and fundamental Anatomy, and with their reduction into most wholesome and most safe Medicaments, I have purposed with my self in my first part of my Spagyrical Dispensatory, to treat of no other things save only such Medicaments as are made out of known Vegetable Simples, without the addition of any other things, (either Animal or Mineral) as for instance, out of Herbs, Flowers, Roots, Fruits, and Seeds, their separation by Art, and their reduction into a better form. In the second part, we will treat of such things only as proceed from, and are prepared out of Man, and other Creatures, and such as live in the Air, and also such as live in the Waters. But in the third Part I shall not desist from defending those Medicaments of mine, which I published some years since, and were prepared of Minerals, and shall demonstrate unto you, that they are not at any rate to be shunned or neglected, if rightly prepared and applied, but are to be preferred far before those Medicaments that are prepared out of Vegetables and Animals. To them I will also adjoyn the use and preparations of several other things, which I never as yet made mention of. Nor do I doubt but that the eyes of the blind will sometime or other be opened, so as to see the truth, and confess it and love it, to the doing wherof, I pray God, that Eternal, Immutible, and durable Light, the Father and defender of the truth so help us. Amen.

THE

T H E
SPAGYRICAL PHARMACOPOEA:
O R
DISPENSATORY.

What Vegetables are, or what is meant by the name of Vegetables?

YOU are in the first place to note, that under the name Vegetable, comes all that which hath its Food out of the Earth, which grows or is encreased, be they Herbs, Shrubs, or tall Trees with what appertains unto them, as the Root, Stalk, Leaves, Flowers, Seeds, and Fruits of them, as well cultivated as wild, both of our own Countrey, and Forreign, as well the known wholesomes one, as the unknown and hurtfull, whatsoever name they are called by, the kinds, shape, form, property, virtue, and power; of which, may be found described by many ancient and later Philosophers and Physicians, so that 'tis needless to make any farther rehearsal of them.

My purpose is onely to tell by what means, and by what most excellent way that innate virtue, operation, and efficacy, which God hath implanted into them, may, and indeed ought, by the dexterity and industry of Man, to be separated from their dead Faeces and Husks, and be concentrated and applied in a convenient form to Diseases, and be reduced into a most pleasant and acceptable Essence. But some may object and say, what good is here in bestowing such a deal of labour and care to extract the virtues out of Herbs, and concentrate them, and so at last administer them to the Sick? Will it not be all one, if any one know their natures, virtues and properties, (the which may abundantly enough be known by the large description given of them, in the Books both of the Ancient and Modern Physicians) and so make use of them, green and dried, according as they are at hand, or else first steep them in Wine, Ale, Water, or any other drink used at Meals, or else boil them therein, or omit the decoction, and drink the infusion, and so administer help. Will not that perform the very same effect, that the well prepared, pure, subtil, sweet, and efficacious essence will? I answer that without question, there is extracted some kind of virtue out of the Herbs, by such a kind of infusion in Wine, Ale, or such other like drinks, and is together with the Wine carried into the Body, and effects no small things, if it meets not with too much matter that is to be turned out. But yet no body will deny but that their virtues being extracted and concentrated, and taken in a spoonfull of Wine or Ale, will operate more speedily, and be taken in more pleasantly, and display its virtues more effectually than the boiled Herbs, or its infusion; wherein by reason of the virtue of some few drops as it were lying hid in a whole handfull

of Herbs, we are constrained to drink down together herewith such a deal of Wine or Ale, which too is rendred very unpleasant and ungratefull by the Herbs: This the Ancient Physicians well observed, and made an accurate search many Ages ago, by what means they might best of all prepare Herbs sundry ways, so as to be taken inwardly with delight, and be encreased in their virtues. Thence it came to pass that so many preparations are brought into the Dispensatories, which abide in use even to this very day: amongst which there are distilled Waters, Oils, Balsoms, Ointments, Juices, Electuaries, Conerves, and such like; the which I do not by any mans reject, but onely mention how the virtues of Herbs may be administered to the Sick, in a far more pleasant form. It is all one to me, if the aforesaid and usual preparation of Herbs be still in best repute and so continue, for I neither sow there, nor expect to reap thence. And should I need their help (which God forbid) and that I had no better to supply my necessity, I would give God thanks, for his vouchsafing me a part of those prepared Herbs, lest I be constrained to make use of raw Herbs, in that manner that the Cows eat grass, but yet that I have better, no Body can blame me, if I rather use them, and am willing to communicate them out of love and duty to my Neighbour. Verily no Body is compelled to do otherwise than as please him, one useth Herbs in an infusion of Wine, another eats them with Vinegar, Salt, and Oil, another takes them green as they are, and cuts them small, mixeth them with Sugar, and as soon as they are come to a dryness, brings them into Powder, and takes them in some Broth; Another may thicken them with Honey, and Sugar, squeeze them in a Press, and so use them. And plainly 'tis no matter what way a Man takes in using them. Some there are that can't abide any Powders, because they stick to their Gullet and will not pass down into the Stomach, others can't endure Pills, and some you will meet with to whom all sweet things as Honey and Sugar are distastfull. And you will find many too that can't endure Wine or Ale, wherein Herbs have been steeped but all night. Upon this account venerable Antiquity considered of so many preparations of Herbs, that if haply one way did not like them in administering them, the Physician might make use of another way, and so Men did year after year attempt more and more the preparation of sweet Medicaments, and so trimmed and adorned their *Pharmacopoeia* daily by little and little, and brought it to a better state: And that is thus evident (I will now speak onely of the Vegetables,) viz. there are to be found almost in all well constituted

tured *Pharmacopæia's*, burning Spirits, which are produced (by distillation) out of fermented Herbs, as likewise Salts, which are extracted out of calcined Herbs and again coagulated; also extracts, and (by the mediation of the Spirit of Wine) thickned Juices are extracted; also distilled Oils, and some coagulated into Balsoms. And many more preparations of this kind, and better sorts there are, which have not been of any very long standing, but have been by little and little added by good and faithfull Physicians, all which things do perform as much as they ought (or may be expected in the rank in which they are) nor ought any one to throw them clear off. But now if any one knows how ingeniously to extract the virtue of an Herb, and to concentrate it in such a manner, as that one onely drop shall be of as much efficacy as a whole cupfull of distilled Water, or as a spoonfull of Powder, Juice, Syrrup, or Conserve. Why I pray, should not one drop be in all likelihood more willingly taken than a full Cup, or a spoonfull? That which may be done by a few, needs not be done by a great many. But haply some other will say, how can I be certain that there is a greater virtue in some drops of some good Essence, than in a whole spoonfull of dried and finely powdered Herbs, or of green Herbs condired and beaten with Sugar, or than a Potfull of distilled waters; now this may be known by the virtue, odour, and taste, and that on this wise. If a few drops be put into a potfull of pure fountain water, and be stirred with a *Spatula*, the said water doth then exactly resemble the odour of the Herb when whole, and doth as to its taste agree with that water which is drawn out of the green Herb by distillation. If therefore the odour and taste be there, the virtue cannot be far off, besides the use will easily shew it, if both of them are in the proof compared together. And this now cannot be contradicted by any probable argument, for it is clearly evident to every one, that such a kind of Essence is an hundred thousand times more efficacious (respect being had to the quality and quantity of the same) than the Herb either green or dried: Besides there also ariseth this benefit, that such a kind of Essence doth not at all lose any thing of its virtues though kept a great many years, whereas the other preparations and especially the distilled waters will grow musty and putrifie. But an Essence will (if warily preserved) endure as efficacious above ten, yea an hundred years, as it was the very first day that it was made. Forasmuch therefore as these things are without controversy thus, we should rather mind the chusing of such things which being but small in quantity, are pleasanter and more efficacious than those that are of so great a bulk, which indeed are of little or no efficacy at all. There is no body will deny, but that the virtues of Herbs are widely dispersed and hidden in themselves, and for which virtues sake we are forced to take the whole Herb, that is, the dead body for that little virtue that lies hidden therein, just as if a Man instead of Bread should eat the crude wheat together with the stalk whereon it grows, which certainly would prove very hurtfull to the Stomach, and would together with its allaying our hunger corrupt the Stomach, and make it unfit for digestion. If therefore the Country-men who are the most sluggish and unapt Men of all others, have by a long course of time arrived unto and experimented this Wisdom and Dexterity, viz. that the Corn is not just as it comes out of the ground

in its husk and stalk, at all fit for the use of Man, and do likewise well know that it is far more profitable (if the grain be first threshed out of the Eare, then ground small in a Mill, the husky Bran be separated, and then the pure Meal mixed with a little water and Salt, or ferment Leaven, and so the Pasts suffered to ferment, and afterwards be baked) than to use the crude Corn just as it grows, why should we not use also the utmost of our endeavours to extract the most pure Essence out of medical Herbs, and so to administer them to the Sick; than to use the crude Herb as it comes out of the Earth? And this I instance onely for example sake, that it may appear that a legitimal preparation exalteth a thing into a far better state than it was before. And this may be demonstrated by sundry examples, if need required, but here is no body that is such an unwise Tatler as to dare to oppose it. Forasmuch then as the case stands thus, that an extracted, pure, and subtile Medicine, operates far more speedily and safely, than when prepared after the common manner, I judge it much amiss to conceal the way that leadeth thereunto, and not to give directions for the use and profit of ones Neighbour. Nor indeed can I say that this invention of preparing Essences of Herbs did proceed first of all from my self; for 'tis unknown to me what another may either have done, or is able to do. But this I know, that no body hath hitherto mentioned the same either in Writings or otherwise, and that this preparation is no where known or in use. Well be it as it will, whether or no others know it as well as I, or have known it before me, yet it ought to be accounted a good thing, that I bring it forth to light for the sake of so many sick People. And it would have been much more acceptable unto me, if any body else had published it before me, and had eased me of this labour. But that I may return to my purpose; I will begin a brief but very clear description of the way whereby the virtue of Herbs is to be extracted and concentrated, that so by this means they may be more effectually operative in Diseases, and be more commodiously administered than the crude and unprepared Herb, and it is to be done as followeth.

The Preparation of the Essences of Vegetables.

TAKE of an Herb cleaned from the Earth, and its withered and putrified Leaves, both Root, Stalk, Leaves, Seed if they may be had, as much as you list, but however let it be at the least some fifty pounds weight, for the Fermentation will not succeed so well in a lesser quantity, as if taken in a due measure and plenty. Cut the Herb, &c. small, pour Water hereupon as much as is sufficient to fill your Copper Still, within an hands breadth of the top, urge your fire somewhat strong, and there will distill forth a clear and well smelling Water, together with a little Oil, which you must separate from the Water by a tritortory or separating glass, and reserve it apart: then take out the Herbs remaining in the Still, put more of your Herbs in, and distil the Water and Oil as before, this repeat so long, until you have distilled all the Herbs, always separating the Oil from the Water, and keeping it apart. Now then all the Herbs being thus distilled, pour water on them again, and put thereto a spoonfull of good new Ale yeast, and let them ferment together in a wooden Vessel covered over for some three or four Days: Then when the Herb begins to leave off working,

working, 'tis enough, and is fitted to send forth in a volatile manner by distillation its most pure parts, viz. Salt and Sulphur. Stir the matter well with a stick, that so both thick and thin may be well mixed together; fill your Still herewithal, give a fire by degrees, that the Herbs burn not too, and the Spirit tast of an Emphyreume. Distill it with a Refrigeratory so long as the water hath any favour, the which you may easily find by tasting it often, when the water comes forth insipid cease from the Distillation, keep what is distilled forth in glasses: Then empty your Still and fill it again with more fermented Herbs, even within an hands breadth of the top, distil thence the Spirit, the which so long repeat until there remains nothing of the Herb undistilled. Then having cleaned the Still and Refrigeratory, pour hereinto all your distilled Spirits, and rectifie them, take onely the strong Spirits, pour out the insipid water left in the Still; rectifie the Spirit again in an Alembick in *B. M.* and it will again put off an insipid water; and if need be repeat this rectification yet once more in a glass Alembick, that so the Spirit being exalted by a farther operation may become very strong and subtil, and its internal Vertue may be concentrated. So then, now take the Herb from which the Oil and Spirits proceeded, make thereof small Balls which dry in the *Sun* or at the Fire, burn them un to Ashes, from which Ashes extract the Salt with the insipid water left in rectifying your Spirit, and coagulate it: This Salt you must again dissolve with more new water and filter, and coagulate it and then it is enough. To one part of this Salt, pour two parts of the rectified Spirit, and gently abstract it in a *B. M.* and so the Spirit will receive into it self as much as it needeth of the fixed Salt, and bring it over with it self by the Alembick: But the fixed Salt holds back the Phlegm, which as yet lurked in the Spirit. But now the Salt thus moist, if it be again fired (or calcined) is as good as it was before. To this Spirit thus concentrated even to the utmost, pour an half or a third part of the Oil you distilled before out of the said Herb, mix them together by shaking them well, and the Concentrated and Alkalized Spirit will in a moment devour his said proper Oil, and will all of it be converted into a clear efficacious and pleasant Essence. In which Essence the volatile Salt and Sulphur of that Herb are united with the fixed Salt, and are to be accounted of, as a pleasant, penetrative, efficacious Essence, and friendly to nature; the which may be mixed and profitably taken with any Liquor: A few drops of which have more Vertue than a whole handfull of the crude Herb. And this Essence being taken into the Body, doth not onely operate more efficaciously in those kinds of Diseases which the Herb served for before its being thus prepared, but doth also (by reason of its subtil purity) more speedily display its Vertues, and being externally applied, doth (by its Odour) corroborate the Heart and Brain beyond all other, how sweet and odoriferous soever thickened Oils, prepared with Civer, Musk and Ambergrese; all which if compared with this Essence, are to be esteemed of as a dead Body: For in this Essence, the volatile Salt which is conjoynd with the Oil, doth presently introduce (or lead it inwards) and make it subtil, even to Admiration. And so this Medicine serves as well for inward, as for outward Uses. And certain it is, that the sweet Odour of any Herb, such an one as by which the Heart might be comforted, as it were in a moment, doth sometimes ef-

fect more than another comforting Medicine taken into the Body. For the Heart of a Man lives of the Air, as a Fish doth in the *VV*ater, the which being pure, the Heart becomes also well thereby, and soon the contrary ill. Why should a Man love to smell a Flower, did not the sweet Odour comfort his Heart and Brain, and were not his Spirits refreshed thereby. If then the Flower and Herb effecteth thus much, where the sweet and comforting Spirits are as yet encompassed, involved, wildly diffused, and tied to their dead Body; what will the Spirit do, being separated from the Body, highly depurated and again concentrated. Besides the daily, and (to all) well known experience, that a pleasant Air refresheth the Heart, but a corrupt and infected Air (as is evident in the time of the Plague, doth (on the other hand) debilitate it, and plainly suffocate it; It might be an easie matter to produce Histories to prove and verifie the same, but that it would be too tedious. But yet I must needs set down here one or two memorable ones, for the better confirmations sake of my Opinion. *Josephus de Acosta* an acute and very expert Philosopher, of the Order of the Jesuits, wrote a Book of the Condition and Property of the Isles of the *West Indies* newly found out, and amongst other things in the third Book, and ninth Chapter, speaks of things no less incredible than true, concerning the nature of some Winds which (in some Provinces situate beyond *Chili*) leap down as it were from the Tops of Mountains and Defarts, and faith of them, that these Winds, do (by reason of the notable piercing cold) not onely cast or throw down for dead, the Passengers passing that way, who not dreaming of any such thing are not well provided against it, but doth also wholly kill some meerly from that most subtle Cold, so contrary and extremely inimiculous to the Spirits and Life of Man. For even as a pleasant and temperate Air doth preserve and cherish our vital Spirit, and nourisheth it; so on the contrary an intemperate and cold Air, doth suffocate and kill it: The which thing is wont to happen to such as sail at Sea, for there the Air is infected by the motion of the salt Sea, and doth so affect and debilitate those that are unaccustomed thereunto, and especially their Brain, Heart, and Ventricle (as we said above concerning the cold Wind, in the Defarts about *Chili*) that it causeth men to vomit, their Head and Heart pains them, they loath both Meat and Drink, until they are accustomed to the Air, and can well brook it. Besides this story I will yet add another, to shew that an infected Air can bring more detriment to the life of a man, than any corporal Poyson. For a corporal Poyson invades the stomach onely, which by the help of Nature doth easily expel the same again, which is sufficiently witnessed by all well known Histories, viz. that a man casts out by vomit a Poyson that is drunk down inwardly, but that spiritual Poysons do hasten to the Heart, to suffocate the vital Spirit, unless a man be well armed, and this shall be instanced unto you by the following History.

About some 30 years ago, there were two Mountebanks at *Paris*, that had their stations not much distant from one another, and they did each of them to their utmost commend their own Treacle which they sold to the Inhabitants, thereby to disparage each other, and each to allure the men to himself onely. But at last they came to a bargain betwixt themselves, which was this, each of them should defend himself with his own Treacle, against the Poyson the one

should give unto the other, and thereby defend the excellency of his Medicine. Well, one of them takes a huge Toad, swallows down one half, gives the other half to his Companion to devour, the which he also swallowed and neither of them hurt. The next day following, the other invites his Adversary and used this Stratagem. He took a Viper, together with a Toad and put them into a Drum, adding hereto an handfull of Salt, and ordered the Drum to be beaten a while with Drum sticks, with which unwonted noise both the Serpent and Toad being enraged, breathed forth their spiritual Venome, and filled all the Drum herewith: This done, he bid his guest put his nose to the hole of the Drum, which is usually about the middle of it, for the letting forth of the sound, who as soon as ever he had drawn in the spiritual Venome, fell backwards and died presently, not dreaming any such matter, nor understanding that the spirits either good or bad have as effectual operation upon the body, as a corporal Poyson hath.

I have not inserted these two stories, to fill the Paper up with words, but to shew, that Spirits being separated and freed from their bodies, are in there virtue and operation an hundred times stronger than the bodies themselves are, though conjoined with their Spirits. The which thing doth as well take place in such subjects that are wholesome and friendly to Man's nature, as in these here rehearsed. It is abundantly known how many good and subtle Spirits I have described for the sake of the Sick, in my second part of Philosophical Furnaces; yet few are here to be found that set about the preparation of them. Amongst which Spirits, that of *Sal Armoniack* is not the meanest, which because of its penetrating and temperate heat doth exhibit a most present operation, and is a Spirit worth all Men's knowledge, and worthy every where to be had at the Apothecaries Shops. Yet I have not as yet seen it any where to be had, though I described a short easie way of preparing of it: But of this (if God will) more shall be spoken in the next part, where we treat of such Medicaments as are prepared out of Animals. Such as are their volatile Salts, and fixed ones, wherein a great virtue lieth hidden, and are (in some cases) to be far preferred before those Medicaments that are made out of Vegetables. But yet though it be thus, I cannot but admonish here that good and subtle Medicines are to be circumspectly used, and not to be administered to the Sick in a greater quantity than their nature will bear. Good and sound Wine is able to comfort, and conserve in health, the Heart, Brain, and whole Body of him that useth it aright. Whereas another that useth it immoderately, even the same Wine is able to inflame and infect his Lungs and Liver, to possess his Head, to bring a trembling into his Hands, and a Gout into his Feet, to weaken his Sight, and to fill his Reins and Bladder with the Stone; and for this end it was never given by God, nor gotten with so much labour, but was created onely to serve for the health of Man. O what curious secrets do lie hidden in the Wine onely (not to speak of Corn and other Fruits) all which the World neither knows nor cares to know, and I have determined with my self to publish, in my Vegetable Work, but yet it is at the pleasure of God, whether he will permit so to do or not. It is sufficiently manifest by Wine alone, that the abuse of a thing hurts not the abused subject, and the same may be said of other penetrating Medicines, whose operation

is according as you use them. We do not suffer a Child or a Fool (neither of which are *compes mentis*, to meddle with a sharp Knife, for fear lest they should hurt both themselves and others too; but now a Wise Man useth it aright, and knows how to employ it both to his own and the use of other Men. If then one hurts another with a Knife, the fault lies not in the Smith that made it, because he gave it such a keen edge, but in him rather that used it amiss.

Thus much I judged it worth the while to advise you of, lest haply some of the Essences which I have described, should undergo a wrong censure, as if they were too hot, but if they should, it may be known what answer to give. For I confess that too much heat doth as well extinguish the Vital Spirit (seeing it is a temperate warmth that is its life and nutriment) as the cold, which is an enemy to nature; and therefore you are here taught not to drink down these fiery Essences as if they were your ordinary drink, but they must be wisely administered, viz. 4, 2, 3, or 4 drops at a time according as the Patient is, in a spoonfull of Ale, Wine, or other liquors. And so the Medicine penetrateth through the whole body, and performeth that effect which God hath given it. But this is to be known, that the force and essence of all good and wholesome Herbs consisteth of heat, the which by how much the more it is dilated and diffused throughout the body of that Herb, so much the less observable is it; and by how much it is contracted, by so much the more visibly and sensibly is it apprehended. Whatsoever yields a temperate heat, is acceptable and wholesome to nature; and contrariy, whatsoever refrigerateth too much, all that is inimicous and deadly, and this even every one, to whom nature is in any small measure known, is enforced to acknowledge.

The death and destruction of the life of Man, is no other thing saving a dissimilitude and contrariety, whereby that which is alike and temperate is destroyed and dissipated, whether it be done by too much heat or too much cold, 'tis both on the same manner. Too much heat doth exhaust the strength out of a Man's body, just as a great fire draws to its self a lesser. But a mighty cold drives the spirit and life of a Man to the heart, and is worse than the heat, but yet more insensible, and this is clearly evident in Wine, which being set in a Vessel at the Fire, the Sun, or some warm place, the heat draws to it self the spirit and life of the Wine, and leaves behind an insipid or unfavoury matter, because like covers its like; but if a Vessel filled with Wine, be set in an intense cold, that cold doth not attract the Spirit as the Fire did; but hates it as being unlike it, drives it into a little room into the center of the Vessel, so that having broken the Vessel and separated the Ice, the Spirit will be found whole by it self, which otherwise, and in the heat did ascend and might be caught in a Receiver set hereto. So then, the Spirit is constrained as well by too much cold, as by too much heat to forsake its Soul and Habitation and leave it to the power of Death.

And many things might be spoken both of the nature of heat and cold which are understood but by few. There lies hidden therein great *arcana* which is not at all fit for the contentments to be acquainted withall. An hot and temperate Air, and the light of the day being dispersed widely or a far off, are the graces and virtue of God. But the concentrated hot Air and Light of the Day, what can

can they be else but God himself, the Habitation of pure Spirits. The darksome and cold night is nothing else, but the emitted and widely dispersed or dilated curse and wrath of God. But the concentrated and dark night is nothing else but the eternally mortifying power and center of all evil, and Habitation of evil Spirits, where is howling and gnashing of Teeth. Do but a little consider, what is it that a little concentrated hanafall as it were of the Sun will not do? will not the heat kindle Wood, as it were in a moment, and melt Lead and Tin? what would not the Sun do if intercepted the breadth of three or four paces? without doubt it would suffice to melt Iron and Copper. But it exceeds all understanding to guess if the shining Sun were concentrated a miles breadth what would it then do. But yet it is likely that it would burn up the whole World in a moment, and make it vanish away in smoke, should the Sun shine on it in this wise. This may be demonstrated by the contact and union of the Sun's beams in Concave one a burning Glass. And if we are unable to behold the light of the Sun, when a little collected by some instrument because the brightness thereof is such, as to hurt the Sight; who is able to stand before the Sun itself, (and yet he is but as an egress or out-gone virtue of God) much less before God himself who is the Center of light. And could the darkness be so concentrated as the light is, what an incomprehensible and dreadful monster (such as Death, the Devil, and the infernal Pit are) should we see, which God in mercy prevent. For by how much the fairer, excellent, and more unutterable the concentrated light is, as being the divine presence and clarity by so much must the concentrated darkness be the more horrible and more dreadful, for these two are contraries. I may haply have made too wide a digression, but yet these things are well worth your consideration, that so it may even from hence appear how little the nature of man is able to abide the extremes and centers of either heat or cold, for either of these is a death and poison, but their temperature is the life of a man. Forasmuch therefore as a Physician ought to be a Philosopher and Spagyrist, and such an one who hath nature in his hand and power, it is not difficult for him to find out a true temperature, which may give to nature that which the desires and stands in need of. Thus now it is hereby proved, that my Vegetable Essences are not to be therefore thinned, because they are in themselves hot, for then we might upon the same account shun God too, who in himself is a consuming Fire; but it lies in the Physicians hands to temperate and moderate these kinds of Essences with proper and suitable vehicles, according as best conduceth to the help of the Sick.

Moreover the external use of those Essences is very notable in the cold affects of the members, in which case they are a present help: for the volatile Spirit is as it were a leading vehicle to the Oil and volatile Salt, and the use of them is pleasant, if a little Cotton be herewith impregnated, and so put to the Nostrils and smelt to. It doth most notably vivify (in time of infected Air) and comfort the Spirits, preserves the heart from the corrupt Air and contagious Vapours. It doth also correct and refresh the pent up Air in Parlors and Chambers, &c. if the Glass wherein they be opened and exposed to the Air, from whence the subtle Essence may be without ceasing diffused into the Air, and make the room

smell sweet. So that whosoever is already in the room, or goeth hereinto will be refreshed with the friendliness of the Odour. Nor are they very dear neither to him that knows how rightly to prepare them, and is not to seek in manual operations.

But now this method (which I have spoken of) serves for such Herbs onely as may be had fresh and plenty, and not so well for foreign Herbs, dried Spices, Woods, Seeds, and Roots, for they require another way which is as followeth.

Process for Spices, &c.

FOrasmuch as that extraneous well smelling Vegetables are not every where to be had, as our home grown Herbs are, we must deal more sparingly with them, and that on this wise. They must be powdered, and to every pound must be put five or six pounds of common water, and be macerated some three or four days in a warm place (whether it be Root, Wood, Herb, Seed, or the like) then put them into a Still and by Distillation draw according to Art some part of the water, and there will come forth together herewithall an Oil of that Herb or Fruit, which you must separate from the waters and keep by it self, untill you get the Spirit and volatile Salt also, the which are to be joyned with the Oil and be converted into a sweet Essence. Then take out the water that remains together with the Vegetable out of the Still, put it in a wooden Vessel, and add hereto the water you distilled and put thereto so many pounds of Sugar as the Vegetable weighed. When your Sugar is dissolved in the Water, mix therewith new Ale-yest, and let it stand in a warmish place, and the Spice will ferment as if it were a new Herb; when it hath done working, put it into your Still, and it will yield a Spirit, like as the new fresh Herbs did, and such an one as will both taste and smell strong of that Seed or Wood you distilled, the which you ought to rectify as is said before: the residue is to be burnt into ashes, the Salt is to be extracted, and the Spirit to be thence distilled, with which the Oil is to be conjoynd according to the before prescribed weight.

N. B. Now forasmuch as the out landish Spices can scarce be distilled in quantity enough at one time onely, so as to yield Salt enough out of the remainder thereof, it will be well enough, to use the Salt of another Herb, instead of its own, or in defect of that too, you may use highly depurated Salt of Tartar as a substitute, but yet it is better to use its own proper Salt, provided it may be had.

This is the true and genuine description, how the Essences both of our own home-grown Vegetables and likewise of foreign and dry Vegetables are to be prepared. Now remains that we describe the virtue and efficacy of the prepared Essences; and this I could do, would it not be too tedious, viz. to describe the virtues and efficacy of the several Herbs. But seeing there are already Books that are full thereof, I look upon it as superfluous to repeat the same, but refer the well minded Reader, to those kind of Herbals which treat of the virtues of the said Herbs. For whatsoever virtues the Herb either green or dry abounds withall, its Essence possesseth the same much more excellently, as being what is brought into a small compass, and so multiplied: whereas otherwise a good part of the Herb goes to the said contained virtues; especially of our Herbs here in Germany, in which the virtue is widely dispersed, and it is therefore

fore far more advifedly done to collect them into a narrower room, that they may be the more commodiouſly adminiſtered. This moreover is well worth the noting; *viz.* that we can ſearch out the Vertues of all Vegetables by their Signature, far better than by reading thoſe Books that are compoſed of ſcraps from one, and ſcraps from another &c. Neither is it ſo well always to acquieſce in the Writings of the Ancients, who alſo remained ignorant of ſuch things as God taught them not, by nature. Pray what Maſter is there of knowledge that never erred from the truth? and who is it that you can in all things ſafely truſt?

O! I could wiſh, that we could but read, and underſtand the Writings and Signs of the ſaid Herbs, by which it ſpeaketh with us, we ſhould not need ſo many ſeducing Books. Who I pray exalted *Moſes*, *Daniel*, *Joſeph*, *Solomon*, and many other Philoſophers, to ſuch an height of Wiſdom and Art? It was onely God, who yet lives and can at any time eaſily doe whatever he formerly could: who can doubt as touching him, when God minds the enlightning or bleſſing of any one with his Gifts, he makes no uſe of any Books, for this purpoſe, and ſo inſtruct out of them, nor doth he diſpute or controvert with him. We ſhould ſeek unto this Maſter and learn from him, and not out of the elegantly written *Arabian*, *Græcian* and *Latine* Books. But now the world is come to ſuch an height of pride and error, that it can neither believe nor comprehend that any one can learn ought but in the Schools, and yet the moſt expert and moſt famous men that ever lived in the world, arrived to that famous light of nature without making uſe of the Schools, and the things that they wrote, they did not publiſh them in a ſtrange Language, but in their own Mother Tongue, as is ſufficiently evident. And this is the ſaying to this very day, *viz.* Whence hath this man his underſtanding, and was never bred up in the Schools? I knew him from his youth, and that he had nothing in him. Alas good Sir, you are very wiſe. Brought you with you into the World more than I did? Were not you born a naked Infant as well as I, and that ſkill which any one hath, received it he from his Parents, hereditary? Is it not the gift of God, whether it be much or little? Art doth not conſiſt in the variety of ſtrange Languages, but in experience. It is one Art to underſtand and ſpeak ſeveral Tongues, it is another Art to calculate the Courſe of the Sun, Moon and Stars, and to predict from them the Changes of Times and Seaſons. Again, it is another Art to prepare and purifie the Nature, Properties, Vertue and Efficacy of all the Vegetables, partly for the conſervation of the Life of Man, and partly for diverting accidental Diſeaſes, and to know how to uſe them as need requires. Beſides it is another Art, to get out of the Earth thoſe many rare kinds of the wonderfull Creatures of God, and thoſe Fruits of the Earth as the Minerals and Metals, for Man's uſe, (which is the End they were created for, and which we cannot want) and to depurate them by the Fire, to tranſmute them out of one form into another better form, and to have the knowledge, underſtanding and experience of them all.

As concerning the ſignature of Herbs, by which God teacheth us their hidden Vertues, many things might be ſaid, and it were to be wiſh'd, that ſuch a knowledge were earneſtly deſired, and fought after by all thoſe that deal in Phyſick, and do thencefrom get their food, there would not then be ſo much

need of troubling ones Brains with ſo many foreign and domeſtick Writings, where you ſhall find one gainſaying another, and ſo leave they as doubtfull what party we were beſt addiſt our ſelves unto and believe; but now we may eaſily find out the certainty and truth by their ſignature, and diſtinguiſh what is erroneous, and proceed on with more ſafety in all the practice, yea and in time too (by God's permiſſion) come into a far better State. And here you are to remember, that the ſignature of Herbs, do ſhew a Phyſician their Vertues as well as Books do, for indeed they rather trace by paths, than walk in the way of truth. And here would be a very convenient place to treat of the ſignatures of Vegetables, but forasmuch as I have written a peculiar Book concerning them (which God willing) ſhall ſuddenly come abroad, let the friendly Reader have a little patience and expect it, wherein he ſhall find things wonderfull and unheard of.

But that there may appear ſome footſteps thereof in this firſt part, *viz.* by what means you are to meet with Diſeaſes by the Eſſences which I have deſcribed above, I could not omit the reckoning up of ſome ſpecificall ones, which I have proved by moſt certain experience to be good againſt ſome principal and well known Diſeaſes: That is to ſay, in the Gout, there is Hellebore but eſpecially Helleborafter (which is a kind of Ellebore) the *German's Tobacco*, and the Tobacco of the *West Indies* are a ſingular ſpecifick and moſt notable aſſwager and helper in all Podagrical griefs. Now the Phyſician ſhould know and underſtand, what the reaſon is that Ellebore and Tobacco ought to be uſed in ſuch kinds of Diſeaſes. Then for the ſtone, I commend the Eſſence of the ſeed of the Aſh [or Aſh-keys] before all other ſtone-breaking Diuretick Medicines. For verily very many men have (by that ſame Medicine) been freed and reſtored to health, who have lain ſick of it many years, inſomuch that after their death there hath not been found (in anatomizing them) not ſo much as the leaſt footſtep thereof either in their Reins or Bladder: And yet before they uſed this Medicine, they were almoſt every day pained with the ſame. This ſpecifick is made of the ſeed of Aſh, which is uſually ripe in Autumn, the ſeed you are firſt of all to bruſe well, and then mixing water therewith diſtil it into your Still, and ſeparate the Oil from the Water, and reduce it into ſmall Morſels or Troches with Sugar, for your daily uſe. But a whole ſack full, and as much as a man can carry, will ſcarce yield you an Ounce or two of Oil: and one Ounce of this Oil will ſuffice for two pounds of Sugar, for a greater quantity makes the Sugar too unpleaſant; for the Oil of the Aſh-keys is very unpleaſant and nauſeous, inſomuch that it will provoke to vomit, if too much of it be taken, otherwiſe it performs wonderfull effects in this caſe. But now if out of what remains behind, you do (by the means of fermentation) diſtil its Spirit, and after its concentration extract the fixed Salt out of the Aſhes, and unite it with the Oil, then will you have a perfect Medicine, and moſt high ſpecifick in the ſtone. And ſeeing that we treat onely of Vegetables in this part, it will not be expedient to mix herewith the Animal and Mineral medicaments, but in the ſecond part ſomewhat ſhall be mentioned of Animals, which doth efficaciously bring forth ſtony and goury Humours. Inſomuch that the Urine of ſuch a ſick Perſon, doth (after the uſe of this Medicine) being heated at the fire, coagulate (like Cheeſe or Cows Milk) in the manner

manner of natural *Calx vive* that is made out of stones. There is likewise amongst the Minerals, one of them that efficaciously drives out the stone and gouty Humours, which also we shall speak of, in its due place, viz. in the third part. In some internal affects of the Liver and Spleen, and in all concremented Blood be it from a blow, fall, or any other accident, the Essence of *St. John's wort* bears the chieftest note: For it banisheth away all pains, resolvethe congeal'd Blood, and healeth an hurt (or wounded) affect provided the evil be not too inveterate. As for the Uterine affects of Women, when the Womb hath taken Cold and is moved out of its place, or otherwise hurt, the which produceth to Women many difficult and chronical Diseases; the Essences of Tobacco, Henbane, (of all sorts) being applied by means of a Sponge in a Uterine Instrument, are a most certain lenative and sure Medicine: they restore the *Matrix* to its place and quietude, and heal all other infirmities. In weak decrepid and decayed men, what will not the true Essence of Roses and Cinamon do? if often taken, it comforts the Heart and Brain above all other Medicaments: But this Essence must be prepared, and concentrated into a narrow room, that to one or two drops, whether put on the Tongue, or put to the Nose, may corroborate the whole Body by its vertue, and the stander by may have enough to do to admire its sweet Odour.

N. B. If any one hath a mind to make such an Essence, it behoves him that he first gets the true Oil of Roses, which is distilled out of the yellow Thrums on which the Roses grow, and not out of *Lignum Rhodum*, and is gotten out by the mediation of water (but you must not ferment them before you have gotten their Oil) then afterwards ferment them with new Yeast, whereby you may get their Spirit, for if you observe not this method, you will effect nothing, the reason is this: because if you set them a fermenting first, the Oil (as being the best and most efficacious part) is mixed and united with the Spirit, and so widely dilated, that it will be a hard matter again to concentrate it. Well, what shall I need say more of the vertue and efficacy of the vegetable Essences, seeing that the Nature and Vertue of them is enough known already: But yet thus much I must needs confess, that I have not in all my life time seen any thing done, which was more sweet, friendly and efficacious, than these Essences of Vegetables. For if the Essences are but prepared according to this description of mine, we can hardly be satisfied with their Odour, especially if made out of well smelling Herbs, as Roses, Violets, Clove-gill-flowers, Bawm, Camomile, Pennyroyal, and other such like. Besides such kind of Essences may be made out of Gums, when their Oil is driven forth by the Spirit of Salt, (lest else they favour of an Empyreum, and become unpleasant) but with this Proviso that you use the Alcalized well swelling Spirit of some other Herb, whose Odour is not much unlike, for the Gums do not afford a Spirit. Now there's *Alfa Fatida*, or Benzoin, Storax, Mastick, Camphire, Amber, and the like, nay even Civer, Musk, and Ambergrese may be reduced into very fair and pellucid Essences, by an Alcalized Spirit, and be rendered far more pleasant than the common Musk, Ambergrese, and Civer: For the volatile Salt contained in the Spirit, makes the Body volatile and spiritual, so that at the opening of the Glasse, wherein such an Essence is, the whole room will be filled with the sweetness of the Odour: But more of this

in the second and next following part, wherein shall be taught, by what means a sweet Odour may be extracted out of our small Animals in *Germany*, not unlike to Civer. What shall I say more, methinks I have done enough, he that understands not this, would much less understand the things that are more subtil, should they be described. And though I could shew a far more compendious way of preparing Essences, yet haply the ingratitude of the World being considered, this that I have already done is too much, and if any is minded to carp at these here, let him first give us better than these, but they will have a care how they attempt that. For he that is endowed with understanding, even he also understands that the labour and diligence of another man is not in the least to be disesteemed, for the truth will remain truth though never so much exposed to injuries. And as we have said, that good and efficacious Essences, may be prepared out of pleasant and well smelling Herbs: Even so by the same rule may ill smelling ones be made out of bad smelling Vegetables and Animals, which also have their use and are profitable, as in the suitation of the *Matrix*, where, (for the most part) such things that egregiously stink are applied to Womens Nostrils, that (by their grievous smell) they may inpead and repress the rising up of the Womb: And this doth sometimes succeed very prosperously; these are *Alfa Fatida*, *Castercum*, burnt Rags, burnt Feathers and such like, which yield a most filthy Odour: And if now the unprepared Body, in which the Odour lies largely dilated doth nevertheless perform notable Operations, what would it be think you if the Oil of such bad smelling things were conjoynd with the volatile Alcalized Spirit? I say it would do more than the crude Body, not onely ten, but twenty or thirty times more. But amongst all the fetid and ill smelling things, which are not inimicitious to Nature, these I find the strongest, viz. the black Oil of Tartar, which is drawn forth by distillation, and that too which is distilled out of Goats horns, Hogs hoofs, Birds feathers, and the Hairs of all Animals, all which do stink extremely, and yet are not hurtfull unto man, as those stinks are which proceed from rottenness, as from dead Beasts, Fishes, rotten Eggs, and such like, whose stink is wholly inimicitious to the Spirit of Life, do threaten its destruction, and are (as much as possible can be) to be shunned. For the Heart, Brain, and whole Body is therewith infected, and debilitated. But why such strong smelling Oils as those are, that come from Beasts horns, Hairs, and Hoofs, do not perform the same, shall be told in the following second part, where we will treat of Animals and of such parts of them, as may be made use of for Medicine.

And thus will I put an end to the first part of my *Spagyricall Pharmacopœa*, and would have the Reader admonished that (if he would use this my Description of Essences) he would have a watchfull Eye by whom they are prepared, and not trust every Body that hath scarce saluted even the very first entrance of Art, and yet dares to make Medicaments, and administer them to others. For under this covering will be exercised great deceit, for some will not for their gain sake, bestow so much Labour and Costs, as to make Essences out of good and new Herbs, but scrape up any thing, that thereby they might onely bring forth somewhat of other that may resemble the Odour and Savour of the Herb. And although such Essences should be prepared

pared of some of the best Vegetables, yet the covetousness of profit may cause that the Spirit be in too great a quantity mixed with the Oils, which may easily be done, if to one part of Oil, five, eight, ten, or twelve parts of Spirit be taken, because the Spirit is easier to be had than the Oil, (whereas according to my prescription two or three parts are to be taken onely) and therefore may you easily conjecture, that such Essences are far less efficacious; for the greatest virtue consists in the Oil, the which being by the Alkalized Spirit, made volatile and penetrable, is introduced (or carried more inwards.) And besides this is not all, but there may be another abuse too, as when a Man willing to spare his own labour, doth not himself make the Oils, but buys them cheap from some sweet Powder-makers, which Oils may (and sometimes 'tis so) have in length of time lost their most subtle part, and are become rank and clammy, and so makes use of such, from whence no laudable matter can be effected, as is manifest to every Body. But admit it be so, that new Oils can neither be had nor prepared with your own hand, because of the defect of the Commodity, yet may such Oils as are never so old and never so much clammy be rendred usefull, if they are first distilled and then rectified in a Retort, by Spirit of Salt: For then they come over clear, and become fit for an Alkalized Spirit to dissolve them, which such Oils as are old will not do. This I thought good to advise, lest haply he that thinks he enjoys a good Medicine, should impute the blame to me, or lay the fault to the Essence, when the effect answers not his expectation: For thus it hath hitherto hapned to my Medicaments, and doth even to this day fall out so, viz. that very many (in sundry places) do falsely pretend as if they knew my secrets, but 'tis untrue, and a meer diabolical couzenage, for they administer their own unprofitable Medicaments, selling them for mine, and especially my *Fanacea* and Tincture of Antimony, which notwithstanding hath no affinity with mine, and what is more too they fear not to affirm that such Medicaments are made by my universal *Menstruum* (which they neither understand nor know how to use.) And because here falls in some mention of this *Menstruum*, 'twill be expedient to say somewhat of it, viz. what is to be understood concerning it, seeing there are so many various opinions of the same. Most People think that the Alkahest is a subtle water, whether drawn out of the Air by certain instruments, or prepared by subtle Distillations, but in this opinion, they err. But yet I will not deny but an efficacious water may be drawn, not onely out of the Air, but also out of the most intense light of the Sun, and thus I my self have sometime done. But this moist dry *Menstruum* which I call by the name Alkahest, is nothing else but the Salt of the Earth, and may be used both in a moist and a dry form, and thus much the very Etimology of the word signifies, if rightly lookt into and read, viz. *Alkali est*, for the word Alkahest is compounded of two words, of *Alkali* and *est*, where the *l* and *e*, by a transverse line are made one letter, viz. *h*, and is then read Alkahest, but take away the transverse line, and then 'tis read *Alkali est*. Hence 'tis manifest to every body, that I have not rashly imposed that name upon this *Menstruum*, but have thereby openly named the subject. For this very reason it will be very expedient to suspend your judgment, and not to be so hasty in uttering your opi-

nion and censure of such a thing as you do not at all know, but rather think thus, who knows if I understand what I say or not: I may happen to say somewhat unadvisedly which may easily be refuted, the which we see here to be done. For there have been various discourses of this *Menstruum*, as if I had given it a name so famous without any ground, seeing it ariseth from Salt onely, when as the Alkahest is a subtle water. But by what I have abovesaid it appears that I have not given it an improper name, but have called it by its peculiar Title; the which I did for the sakes of such as contend, to prevent any future controversie about the name thereof, but how it is to be used as to those secrets contained in *Miraculum Mundi*, is not to be spoken of here. Let it suffice the well minded Reader that I do again, and again assure him, that all and every of the things I have there spoken, may without controversie be done by this one onely subject, viz. the Salt of the Earth. And so that Treatise doth rightly deserve the Title of *Miraculum Mundi*. But yet I do again by way of Summary as 'twere, Admonish, if any one should use this my Essence, and have it not rightly prepared, he throw not the blame on me, as that I had written unprofitable things, but rather let him that has not rightly prepared it, bear the blame.

But yet 'tis not to be doubted but that men of all states or conditions will in process of time endeavour the preparing of those Essences, not onely because they are a pleasant and efficacious Medicament, but withall because of their comforting, penetrating, and highly gratefull Odour. For the crude and cold Air in pent in rooms may not onely be tempered and rendred acceptable and friendly to nature, but it may also be happily and safely made use of in external cures and Diseases, as need requires.

It will therefore behoove everyone what way he may most profitably attain them by. The preparation is easie, so he use but diligence, and then may a good quantity of those kinds of Essences of all the Vegetables and Spices which are in use in the Shops, be easily gotten. Now such an one that hath conveniences to prepare them himself, he verily best knows what he has, and may safely trust thereto. There is also great difference in the Essences according as they are prepared; one will happily prepare them very neatly, another but rudely, but the difference will easily appear as well by its efficacy as by its sweet smell; as for instance. That Essence which is rightly prepared according to the abovesaid weight and proportion, must necessarily be very subtle, sweet, efficacious, and of a strong Odour and Savour. But if it be otherwise 'tis a sign that the Oil was too sparingly added, and it can't be accounted of as a rightly prepared Essence.

N. B. The things which I have here spoken, of Odour and Savour which the Essences ought to have, are to be understood onely of well-swalling Vegetables, such as are Roses, Marjoram, Rosemary, Violets, Camomil, for the Essences that are prepared out of these, must needs be well-smelling and efficacious. But as for those Essences which are prepared out of those kind of Vegetables that have no such notable Odour, it can't be expected that the Essences prepared from them can afford more Odour than the Vegetable had, but yet do they excite a more present efficacy, as for example. The Essence of Wine which doth easily exceed all other comfortatives is notwithstanding void of any eminent Odour, nor haply doth it resemble any other than the flower of the Vine in Spring.

Spring-time; and therefore being taken into the body, it displays its Virtues, but not by its Odour; even so, neither doth the Wine it self being taken into the body operate by its Odour.

And hitherto belongs the teaching how to come to get such an Essence, seeing that it is not prepared after such a manner as I have delivered for the general dealing with Vegetables, and that, because the pleasant Oil of Wine (without which [oiliness] no Essence can be prepared) is hard to come by. I will therefore teach the way of preparing it, but what I now write is only for the sake of weak and decrepid old Men, and also the poor, but not for the wiclings and unworthy Deriders. For I very well know that some or other after he hath read this Book, will out of the good conceit he has of himself say, this is no news to me, I knew this many years ago, *Glauber* doth not publish this of himself, but hath gotten it elsewhere out of some old Book or other: He that thus judgeth of me doth for no other cause say so, but out of envy and hatred to detract from my Writings: And the answer I make to such envious men is this. That I do not know whether any one heretofore either had, or at present hath either such or such a secret which I have made mention of in my Writings, or no: It may be for ought I know that such secrets were extant above an hundred years ago, and may be even at present in use with some, that I know not: however that's nothing to me: For it is assuredly false, if any say that I have borrowed from any one, or else out of any old Books, so much as one, much less most of, or all the secrets (according as the envious say) which I have published in my *Miraculum Mundi*, or in any of my other Writings: But I obtained them through the Grace of God by the many Trials I made, searching after them with my Costs and Labour. And forasmuch as such envy me, therefore do they privily scatter abroad their lies concerning me, which will in short time (God permitting) be demonstrated. But put case that I did take whatsoever I have written out of others, and out of ancient Books, will they I pray be either more or less profitable because of that, than if they were my own: Is it not one and the same for any notable thing to be emitted, who writes it, or whom it proceeds from, so that it be, and may be exceeding profitable to very many. But because of this envy and calumny which I undergo from wicked men, I do keep within my breast many things, which otherwise I would have communicated for the common good. And if so be that they cannot believe nor comprehend what is mentioned in my *Miraculum Mundi*, (and yet is not of such deep search as the unskillfull imagine) how will they believe, that I should set before them far higher things? Well therefore may the old Proverb take place, *Secret things are for secret Men, and foolish things for foolish Men.*

Now followeth the process of preparing a comfortable and pleasant Essence out of the Oil of Wine, and its fixt and volatile Salt. I think there's no body will deny, but that hitherto there hath not been made any mention by those that are wont to distill Wine of any such thing as an Oil: save that by those that have written, that the Oil of Wine is to be sought for in Tartar and in the Facces, and that a black Oil may be distilled both out of the dried Facces of Wine and also out of Tartar, I think is sufficiently known to all Chymists: But such an Oil doth purchase to it self (by this way of proceeding) such an ungrate-

full Odour, that it is merely on that score, used neither inwardly nor outwardly, though it be endued with good Vertues. For verily I do not yet know whether there can be found (amongst all other things) any thing that stinks worse than that Oil that is prepared out of Tartar, and therewithall mayst thou drive away both Men and Beasts; because the Odour that it emits, is in a manner intolerable. Whereas this which I here mention, is a pleasant, friendly, clear and bright Oil, and is made thus. In the Vintage time, when the Grapes are pressed forth, take some pure Must, let it ferment in a Barrel, until it becomes white, and the greatest part of the Facces settle to the bottom, which done begin your distillation, and draw out the Spirit, either out of a Copper Still tinned in the inside, or some other distillatory Vessel; of the Spirit will be no great quantity. After it hath ceased, take off the head, and pour that which remains into clean Glasses, let it stand for some days, and there will swim at the Top a white Oil, and sometimes it will settle to the bottom, the which is to be separated from the Must, and will serve for the making the above said Essence. But the Must, from which the Spirit and Oil are taken, may be mixed with your other Must, and it will again ferment and become Wine, but if you can't do thus for want of skill, make thereof a Vinegar. This is a most compendious and the most easie way of preparing the Oil of Wine, and although I know another way besides this, and how such an Oil may be had even out of the Autumn Season, yet doth it seem to me not so well to publish all things together, and at once: This way of preparation that I have now taught will to many be hard enough to effect, though it be clear enough described. And you are to observe, that in this work the due time of distillation is to be regarded, *viz.* When the Must is so far fermented, as that its tast is neither plainly sweet, nor plainly vinous, but a midling between both; which if neglected the fault is none of mine, for I have advised you of all things to a tittle. If you begin your distillation too soon before the Must is sufficiently dissolved, it affords no Oil; if you tarry too long, the Oil precipitates with the Facces, nor wilt thou get ought, and therefore all things are to be done in their due time. But how this Oil is to be reduced, with his own Spirit, and his fixt and volatile Salt, into an Essence, is mentioned before, what use this Essence serves for needs no description. For every body well knows what a vivifying and comforting vertue there is in Wine, and yet the Wine is endued but with little Oil (though the Oil as we said before is the best part of the Vegetable) and besides, it is united with a great quantity of insipid Water, and crude Tartar, but the Essence is freed from those Crudities of Water and Tartar, and is compounded of a due proportion of the most pure parts, or of the three Principles, Salt, Sulphur, and Mercury, and may deservedly be called the Quintessence or Soul of the Wine.

Whosoever he be that hath it, will see what good it is endued with, and how to be used. To me it seems to be an Antidote against Poisons; for seeing it is written of old, that a Serpent or other venomous Animal, cannot abide in the Vineyards at such time as the Vine flowreth, therefore the Oil and Essence of the Wine resembling this very Odour, the Essence may not unfaily be thought to be good in healing contagious Diseases.

But this is to be noted concerning Essences, that they

they must not be stoppt with such things that will be melted by the Essence, but be rather stoppt in with a double Bladder, lest the volatile Spirit should fly away. For should this so be, the Oil would again be debilitated and let go its Spirit, and the Essence would be corrupted.

And because my purpose was to speak of the preparation of Vegetable Essences, but not make a description of their most ample use, I will now put a period to this business, leaving every one to be wiser as his own capacity is. But yet, would the present time have permitted, I would have mentioned some specifics, which may haply be elsewhere done. But thus much I say, that in Wine, lies hidden very much which but few know, and which if one would reckon up, would stir up admiration. But it appertains not to this place, but to the Vegetable Work, which (if God permit) shall soon follow. But seeing I have made mention of Wine, I cannot omit to add in this place one thing, viz. what yet farther use the Essences of Herbs might be of, if always to be had ready prepared in the Apothecaries Shops: For one, two, three, or more drops of Essences, being put in a Cup of Wine at pleasure and stirred about, that the Wine may be united with the Essence, do presently make the Wine clear and pleasant, resembling the kind and nature of the Essence you put in; and by this means divers kinds of Wines may presently be made out of one and the same Vessel, to refresh and please your guests: And this way far exceeds the using of extracts, which make the Wine troubled, but this leaves

it clear. It will be needless therefore to put different sorts of Wines in several Vessels in Cellars, where they will all of them by degrees wax weaker and weaker, unless they are kept always full; but one onely Vessel, is sufficient for to make various kinds of Wines at your pleasure; and this is a very profitable secret for great Men and others, who sometimes must have various Wines. It is a usual thing with many to drink a draught of Physical Wine in a morning on a fasting Stomach, to strengthen the weak Stomach, and to preserve it from hurtfull Air, if they can but get it, and if they use that which is usually made of the Reliques of the Wine, and such decayed stuff, such is void of virtue, and brings more hurt than benefit. But now, having these Essences of Herbs, you may easily impregnate generous Wine therewith and make it Medicinal, and by this way maist thou be certain that thou hast good Wine, and not such as is made out of the droppings and refuse, which is usually employed to make Medicinal Wines of, and from whence gripings and other incommodities do frequently exist: But that which is composed of generous Wine, and a well prepared Essence deserves the name of wholesome Physical Wine. These things I was willing to add to this first part of my *Spagyrick Pharmacopœia* by way of Ornament, and do request the well minded Reader, that he think well of my Labour, Diligence, and Intention. There shall follow (God permitting) in the two next parts, more good Medicines.

The End of the First Part.

THE
SECOND PART
OF THE
Spagyrical Dispensatory.

Concerning the preparation of Animals, Vegetables, and Minerals, by an Universal Dissolvent.

Wherein is clearly demonstrated and exactly described, that Niter is the true Universal Dissolvent, and how all Vegetables, Animals, and Minerals, are therewithall dissolved, corrected, and their venomous and obnoxious property changed into wholsome Medicaments, contrary to the opinion of many ignorant Men.

What Animals are, and what is understood or meant by them.

I do here understand by the name of Animals all such things as have life, and a vital motion, as Men, all kinds of Beasts, Worms, and Insects, either in the Earth or above the Earth, the Fishes in the Water, the Birds in the Air, and all the Creatures that can move themselves, and that do partake of a visible life. Amongst these living Creatures, there is this difference to be observed, *viz.* that some of them serve for the use of Medicine; other some of them are not fit for Medicine; for all those Animals which nourish mankind and sustain his body, have not a medical but nutritive power, so that out of them can't be prepared Medicaments resisting Diseases. For although that out of some Animals (as Oxen, Sheep, Goats, Hens, Birds, and such like) a good Essence may (by the benefit of Art) be extracted, so as to restore and strengthen a body that is debilitated by sickness (as you may see in my Book of the Kitchen Art) yet that labour doth appertain to the Kitchen, and Cooks, rather than to the Apothecaries. Therefore in this Treatise nothing else shall be mentioned, but concerning such Animals onely as do not nourish the body of Man, but (being eaten or any ways entering into Man's Belly, or other parts of his body) do by their venome most greatly hurt: But being inverted or turned in and out by the Spagyrical Art do become excellent Medicines; and (without that bettering them) would remain venomous and hurtfull: such as these are Vipers, Serpents, Toads, Scorpions, Spiders, and other venomous Insects; the which being spoiled of their venome or changed by Art, do become Medicines of a penetrative efficacy. Indeed a Serpent, a Toad, and other like venomous Creatures being onely boiled in common water, are

barred of their Poison, and may be eaten without any hurt, seeing that their Poison consists not in the Flesh, but in the Spirit, and vanisheth by a bare decoction. Many examples do confirm this thing, and 'tis evidently known that Serpents have been oftentimes boiled and eaten instead of Eels. It is no new thing in *India*, that that People do feed on great Serpents boiled, instead of Food, and contrariwise other Animals there are which do not deposite or lay aside their venome by a bare boiling, but do retain it, such as are Scorpions, Tarantula's and such like. But now, if to such kind of Vermine that are endued with so hurtfull a Poison, a water or liquor of a stronger efficacy be added, wherein they may be digested, their venome is turned into a wholsome Antidote, and is a resister of Poison, as shall be proved anon. This is certain, that the omnipotent God hath not created so much as the least Worm in vain, which cannot bring some profit, though by the under sort of Men, it be contemned and plainly neglected. But forasmuch as almost all such Vermine and Insects, are (by reason of their Poison) rarely used in Medicine, and scarce any one knows their occult virtues, from that signature God hath given them, or cares to know, the use of them remains unknown and in the dark. Nay it is well done, that (seeing the way of correcting such Poisons, or turning them into Medicine, hath lain hid from the greatest part of the Learned ones) their use was thrown out of the Apothecaries Shops. But yet in process of time, some of those kind of Vermine were admitted by the Physicians, as the Scorpions, Cantharides, and such like. The Scorpions being suffocated in Oil Olive do tame their own proper Poison; Cantharides, great Worms, and Millipedes, or Pigs lice, are used to provoke Urine. But yet not without danger, because of the venome they abound with. Nevertheless Men have dared to use them, and many times they have proved very profitable.

fixable But had their bettering been known; and had they (being thus corrected) been made use of, they would (without all fear of danger) have procured a greater honour to those that used them. Now the usual way of all such as know not the manner of correcting them, such little Animals are dried, and (crude as they are) beaten into a powder, and so administered to the sick, and do sometimes (though with mighty hazard) perform great cures. Were the signature of such Vermine well examined, and their use in Medicine well known, and they were afterwards transmuted and changed (by the help of an universal Dissolvent) into a safe Medicament, they do then become such safe and effectual remedies, as to take away most grievous, (and in the accompt of some plainly incurable) Diseases, and do in many Degrees exceed the weak operations of Vegetables. For the Animals which God hath gifted with life, are of a far greater efficacy than the Vegetables, and this any one will not be over hard in believing of. You will find many wonderfull things in my Book of the signature of Animals, Vegetables, and Minerals (which shall shortly come forth to light) nay and besides their signatures, as well their unknown and occult Vertues as their known Vertues shall be herein declared. But in this Treatise, shall onely be mentioned some of the principal small Animals of use in Medicine, viz. by what means they may be reduced into most excellent and most safe Medicines, by the help of the universal Dissolvent. As for their Vertues, and Efficacy, the well minded Reader may search for them in my other Writings. And although I have met with admirable Vertues in some hitherto neglected Vermine, and would have also described them for the profit of my Neighbour, and so purposed to have made a large discourse concerning them; yet the love to my Neighbour (whom I would not willingly lead about in many erroneous Turnings) hindered me from performing it. For all the Vertues that are apart dispersed amongst all the Vegetables and Animals, are all of them concentrated in one Mineral, and found perfectly united, so that there's no need of using so many distinct Medicines of Vegetables, Animals, and Minerals, and therefore I refer the Reader thereunto. But yet for satisfactions sake of such who abhor such Medicines as are made of Minerals, and dread them as if they were a Poison, I will detect the Vertue and Power of some of the most principal ones in Medicine.

Of the Signature, Property, and Medicinal Vertues of the Bull-like and Horned Scarabæus or Beetle.

I Have known some of the biggest and flying *Scarabæus*: that have weighed half an Ounce, or a whole Ounce, and of a Chestnut Colour, and they will firmly stick to any thing by reason of their sharp Feet, and are furnished with double Wings, the upper ones are hard and smooth like an horn, the under ones are very thin and transparent, and shew like the dried leaves of Poppy. The Male is for the most part bigger than the Female, and is armed with two horns, which in their branchings resemble the Figure of Stags horns, hard and smooth like horn, and hollow on the inside, without any marrow, with these he defends himself. If you put one of them on a Table, and smite him often with some small twigs, and enrage and provoke him to anger, he doth not run away like as other Animals do, but

sets upon his Enemy, with his upright and variously branched horns, as if he would revenge himself for the injury done him; and whatsoever you reach out to him, he presently snatcheth with his Jaws, and holds it so fast, that 'tis a hard matter to get it from him: If the thing be too heavy, he then leaves it, and goes his way without it: But if it be light, he carries it away with him, and afterwards unlooseth his horns from it and lets it fall. The Females two horns are lesser and crooked, which open and shut like Pincers; whatsoever they seize on, they hold it most firmly, and if you expose to its horns any thing that is not hard the doth gripe it so long, till the tops of her horns touch each other. Being hanged at a Cats or a Dogs Ear she presently pierceth it through, and so holds that the Dog can't cast her off with her Feet, but (not knowing what is happened to him) runs to and fro, howling and crying out, as if he implored help from some body else, such is the innate anger and malice of this small Creature. They feed not upon Grasse and the Leaves of Trees as other *Scarabæus* do, but are nourished with the Juice of the thin soft reasiness which is in Summer Flowers out of those Trees that bears fruit with stones in them, such as Nuts, Cherries, Plums, Pruens, Peaches, and such like. These Trees they sticking fast on, do by sucking out the Rosin thence flowing, support their lives withal. These small Creatures are truly Martial, and as if they were endued purposely by nature with Weapons, and armed. Some men do break off their horns, and carry them about them, as if they were a safeguard against the invasions and being set upon by wild Beasts, but I count this as superstitious. Some (I know) do reduce them with their Wings into powder, and make use thereof, and have healed the inward pains and prickings of the Body: And have cured Quartanes, yea have in all Feavers hanged it about the Neck; but yet I believe it would bring more profit, if it be duely prepared and so taken into the Body. But what effects they will perform in the other parts of the Body I know not, nor have I hitherto tried or known them to have been used to any other intent than before mentioned. But I am certainly assured, that there is a most wholesome Vertue in this insect, because of his thus living on, and being nourished by those resinous Juices which flow out of such Trees as bear those kinds of Fruits that have Stones in their inside: Wherefore I think that their whole Body is of a balsamick Nature, and I do judge by their signature, that they may be profitably used in curing all inward and outward hurts arising from beating, wounding, stabbing, and shooting, if they are first reduced into an Essence according to my method. The horns and those hard wings, may be reduced into a Magistery, apart by the universal Dissolvent, and serve for inward Use. And the body being on like manner prepared, may be applied and made use of for the allaying of all griefs, or pains both externally and internally. Without doubt it aboundeth with many other hidden Vertues which are unknown both to my self and other men.

Of the Pilular or Globular Scarabæus.

THERE are other *Scarabæus* used in Medicine, viz. the black and globular ones, usually abiding in Horse dung, and also those that live in Oaks, and be of an ashy Colour, and are pleasant food to Poultry,

Poultry, who by feeding on them do lay abundance of Eggs, but the black ones they abstain from, and do not eat them. I know not whether or no these last mentioned (*viz.* the Oak ones) are any thing at all helpfull in Medicine. But yet thus much they do, if they are bruised and applied to the bare skin they cause Pustules, and so do those too that are called golden *Scarabeus's* that are usually on Roses, and Elder-flowers. Both these sorts have this property internally and externally, and so have the *Cantharides* or those green Flies called Spanish Flies, and do most vehemently provoke Urine. If now these are by Art changed, and their venomous quality taken away, they are profitably used, and safely, in curing the Gout, Stone, and other grievous Diseases and bring a great deal of benefit. The black and globular ones are martial, and are not much unlike to the horned *Scarabeus's*; the ashy ones are of a Saturnine nature, the green ones of a venereal Quality, and the red and little ones are of a solar property. These last mentioned, are by the *Germans* called Golden and God Almighty's Birds, and some do boast that they have gotten out from them good Gold, and put it to the Test, which to me doth seem unlikely. I will not deny but that there lieth hidden in them a strengthening Cordial (as they call it) properly for corroborating a man's heart if a preparation or correction precede, I should be unwilling to make use of them crude and unmended. Besides the aforesaid reckoned up *Scarabeus's*, there is yet another kind of black ones which creep along the Grass in the Months of *May* and *June*, and cannot fly as the above mentioned ones can, and yet have little Wings. These are exceeding slow creepers, and being put upon ones hand, do turn out a strong smelling Liquor, and are called *May* Birds, and the *Worms* of Fat by the *Germans*; the *Latines* call them the unctuous *Scarabeus's*. They operate most efficaciously, and are used by many for curing those most grievous Diseases of the Gout, Stone, Leprosie, French-pox, and Dropsie, one two or three Grains of them being reduced into powder, are usually administered, in some proper Vehicle. They do most vehemently expel Desilements, by vomit, stool, and Urine, insomuch that the Urine of the Gouty, Leprotous, or those that are afflicted with the Stone will be conglutinated like Milk, or will become tenacious, and wax hard like a stone, the which event may well astonish any one to consider of. I know very many that have had the Gout, and been cured of it thereby, though I confess it is a Medicine somewhat hazardous because of the force of its operation. But if it be first corrected by the Universal Salt, it may be most safely afterwards used in the curing of the said Diseases. *Wierus*, a very learned Physician, did heretofore publish a Treatise of the wandering Gout, and highly commended this *May* Worm, so called by some: And likewise the great common Earth-worms, for curing it. Neither is it without ground that this Worm [or *Scarabeus*] we mention, far exceed all the rest of them that are endued with Virtues, healing Diseases. The *Cantharides* come far short of it, and the sky coloured Flies, which are formed onely in Carkasses, are far short of the *Cantharides*. In the next place follow those greater Flies, that usually stay in men's houses, and keep buzzing about till they can find some raw Flesh, whereon they cast their filth in the likeness of small Eggs or Knits, which become *Worms* in a days time. And I do believe that there is scarce any Creature endued

with a smelling so acute and subtil as this Fly, and upon that account I do not question, but that it would shew its Virtues in hidden Diseases. Yet I would not be any man's Authour or encourager to make use of him, because nature her self cannot by any means endure (when a man by chance eats the flesh that is defiled with their Excrements) their filth in the Stomach, but doth presently cast it forth by vomit as that it were a Poison. I ascribe to these Flies a mercurial Nature, and I likewise affirm that there are in the common Worms medicinal Virtues. For they do strongly expel by Urine and Sweat, and being made use of, crude as they are, they provoke to stool, and cause vomiting. But I verily believe, that being corrected by the universal dissolvent and transmuted into a sweet Essence, they will become an excellent Specifick against Impotency, and a notable corroborative to such that are tired with the venereal Sport. Their signature is testimony enough, and the Figure of their Bodies, for they will sometimes stretch out themselves at length, otherwhile contract themselves into a shortness, one while become thicker, then presently, and as often as they please can they extenuate themselves or become smaller, nor can any Animal do thus besides themselves. Nor know I any Animal that doth (in Coition) more firmly adhere to the Female, than this Worm, whom I have many a time seen, in the Spring Season when the Cold is allwaged and the Earth again open, to join himself to the Female (not under the Earth) but to creep out of the Earth with half his Body, and so apply himself to the half part of the Female, who likewise creeps out of the Earth, and he so long labours with her, till there is made a thorough conjoining of both their Bodies. And these two Worms are so pertinacious or earnestly bent on this action, that they will rather suffer themselves to be slain than be separated. This venereal Labour being finished, they do each of them betake themselves into their Caverns or Holes. Such Hens as feed on them do plentifully lay Eggs daily, and sometimes two on a day, the which thing no sort of Corn will make them do. That Earth-worm is endued therefore with a venereal Nature and Property. There are besides these, other small Vermine that are far more prone (and approach nigher) to a venereal Nature, and they are a sort that have six Feet and run most nimbly, and have wings but do not make use of them. They are small and broad, and are in great companies in old Walls, and old rotten Boards of Stables, and lay their Eggs in the Walls and Wood. They come abroad onely in curious Weather, and in a rainy and cold Season do betake themselves to their Holes, and in fair weather out come they again, and observe no order in their coupling. The Female going, carries the Male along with her sitting on her back, another Male being stronger throws him off, and himself gets up upon the Female, and he again being thrown off in his room comes a new trader, and thus spend they the day in this riding kind of Sport, and the Female is exercised with an incessant Change of Males. They are not seen to eat any Food. Some of them I shut up in a Glass so that they could not get away, yet (in this captivity) they betook themselves to this venereal Act, and at length setting upon each other, would rather perish with Famine than be separated. They are so small that an hundred of them will but weigh an Ounce: Their wings are red and spotted with black. They run exceeding

ceeding swiftly, I never could find any thing written of them. I gave them to Cats and Dogs to eat with their meat, and I found wonderfull things. Hens and other Birds will not eat them, haply because they cannot brook the too vehement operation of them. They must needs be endued with singular gifts, he that will make trial, may so do, but yet so as not to use them but corrected, because (amongst all the Vermine that I know of they do most excell, and abound with the greatest venereal Venome. There are yet besides these, other Worms (or Vermine) that are profitable to make Medicine of. The food and nutriment of the *Aselli* or Pig-lice is rotten Wood; if you touch them they rowl up themselves into a round Ball. They are for the most part used for repressing of the Stone. The Cimexes, or Knats, or Flies, are of a red colour, and do vex and disquiet a Man at night, they suck his blood, and usually quarter in old Pine-wood, and in ancient Chambers, and are detestable things because of the stinch they emit. And besides them, there is another kind of such Vermine that are of a green colour, and more venomous, and yield a more filthy stinch than the red Worms do. This Insect has wings, and is four times bigger than the Cimex, and live in the Grass; but when the cold Winter approacheth, they then live in hollow Trees, or hide in the Chinks that be in Walls. If an Ox or Cow do by chance in eating Grass swallow down such a kind of Vermine, they swell up, and sometimes die of it; but yet they do so well know how to shun them, that the Beasts seldom swallow them. I do from hence guess, that there lies hidden in this kind of Animal, some singular matter, because of its wonderfull disposition it hath: For I have tried by certain experiments that it can either retain, or emit its stinch as it pleaseth. It is a notable subtile and fallacious Creature, and this I could confirm by wonderfull stories. It doth exactly imitate the perverse disposition of all Turn-Coats, Lustfull, Venereal, and Bestial Men. It doth presently depose or lose its stinch in the universal *Menstruum*, but what it will (being thus prepared) perform, I having as yet omitted farther inquisition, cannot tell. Infinite is the number of these and such like Insects, and without doubt they were not created in vain, they prosecute each other with a mutual and deadly hatred, and do by laying snares endeavour to destroy each the other. I have known one little small Worm or Insect, that by sucking out the juice and strength of the great Earth-Worms do wax fat, and is in all places his Superiour or Master. In the Spring-time he is a small lean Worm, and is not so big as the Blatta, that live upon Meal, but in Summer time he doth so fatten himself with the Earth-worms, and becomes so unwieldy that he can hardly creep: He is black as a Coal, and moves himself by the many short feet he has, is about the thickness of a Quill, and about a fingers length, and under the earth shrewdly bites the poor Earth-worm, and sucks from him his best juice, which said Earth-worm being no ways able to defend himself, doth out of meer pain creep out of the Earth, and brings out his fast adhering Enemy: he sticks on to him so close, that he can't be driven off, and so long sucks, untill being well satiated and full, he at length falls off of his own accord. I have often seen these Earth-worms so long vered with them and twined themselves to and fro till this little Vermine hath pierced the Worm through, and divided him in twain, but

yet closable together again, if he can but onely get into the Earth. You may see evident signs of the malice of this small Vermine, upon some of the older Worms, that have had several such bitings, and yet closed together again. For I know no enemies the great Earth worms have, save onely the Mole, and this same Worm. This black and martial Worm having done with one, presently sets upon another Worm, and so sucks out the best juice, and leaves the body of the said great Worm destitute of any strength. He is of great virtue and as to his excellency is to be preferred far before all other Worms if but well prepared: As for Spiders, there are many talks of them as if they were poisonous, but I could never as yet find any such thing in those that grow in the space of one year, and then vanish away again; they are such that make their Webs on Trees, Bushes, and the like to catch Flies in, and are croff-bearing Spiders, because they have on their backs the figure of a Cross. Every month they put off their old skin, and so do those too that make their Webs in the corners and holes in Houses, and will live three months without either meat or drink before they die. These are somewhat worse than the former, and yet not so poisonous as the report goes, and as is believed. All the green sort of Spiders, that live in the Grass and among Leaves are void of all Poison, (and all others) save those which abide in cold places, as Cellars, and moist Vaults, and nourish themselves with Insects, and are covered over with a black and roughish skin like black Silk or Velvet, are slow paced, and as being the Kings of all Spiders, do kill the others by their biting, and devour them if they can but get them within their power. If one Spider be thrown into the Nest of another, the stronger drives out the weaker, but they cannot any of them abide these black Spiders, abhorring their presence, and running away as fast as they can. Nay more, neither the Black-bird, nor other Birds (whose food's the other Spiders are wont to be) will eat them. They grow old very slowly, and live in a Cellar many a year, as being patient endurers of the cold, and do not renew their skin as the rest do. Those likewise that devour the Flies in stores in the Winter, or at least-wise are nourished with the sweet fume or vapour of Hony, Sugar, and such like things, and arrive to an old Age, are also venomous. All these are rarely used in Medicine, there being indeed no need of them amongst such plenty as there is of good Medicaments. This one benefit I have observed in them that they so purge sick Hens, as that they recover their former health, and do presently after get strength and wax fat. Emmets that live by the juices and Rosins of Trees, are also used in Medicine, but yet do no great matters. Locusts, Grylli (a kind of Grass-hopper) and such like Insects, (though they are endued with hidden virtues) are notwithstanding neglected, so far as much as there is one onely Mineral that can effect more then all the bigger or lesser Animals, Worms, and Insects, and therefore well may they be despised. There are also some things that are taken from the bodies of the bigger sort of Animals that are used in Medicine, as the Stomach, Intestines, and Teeth of the Wolf; the Lungs of the Fox: The Gall, the Hair, the Skin, the Excrement, the Horns, &c. of other Animals; but yet no great matters have been hitherto done by all this ado, because they are parts or Members of such Animals, as being altogether void of Poison, are usually Man's Food, or may so be.

Whereas

Whereas were they the parts of Animals that would alter our nature, or were they the Teeth, Bones, Horns, or other parts of venomous Creatures, and then changed and reduced into good Medicaments, somewhat might be done by them. By such as alter nature I mean, the Teeth of Dogs, Wolves, Bears, Lions, and such ravenous Creatures: the Bones and Horns of the Elie, Goats, Kids, Does, Stags, Elephants, and the Hairs of Men and other Animals. Amongst the venomous Animals, the Teeth and Skins of Vipers, Serpents, Toads, Salamanders, &c. In the third degree are the Teeth of the Sea dog, and Whale, and of the horned Fishes, and those which the Dutch Marriners call Walrusen, and others the Unicorn: the Horns of them, and of other such like Sea Monsters, whose Flesh is venomous, and therefore their Teeth must necessarily be endued with medicinal Vertues, provided they be changed and converted into a convenient Essence. Besides in the Excrements of all Animals, lies hid a singular medicinal Vertue, nor is the volatile Salt (but especially of those that are poisonous) to be contemned. The fixed Salt being the subduer of many Diseases, doth not a little help to the making of Medicine. But I am not minded to treat of these at present, but will only demonstrate by what means all Animals are to be dissolved by the universal *Menstruum*, and Poison to be converted into most wholesome Medicine. The Vertues of them are already known, nor is ought more required save a due preparation, the knowledge of which I am minded to manifest in this Treatise. It is apparently evident that the Teeth, Horns, Skin, Hairs, and Claws or Hoofs, are by so much the better and more efficacious Antidote, by how much the greater and more present Poison their Flesh is endued withal, and this we see by experience. Such as desire to know more, of such like venomous Animals, may read my Book, of the signature of things, wherein they will find many profitable things and worthy of consideration.

The preparation and changing of all venomous Animals and Worms, &c. into safe and efficacious Medicaments.

As touching what belongs to their preparation, it doth not consist in the way that hath been hitherto used as to the preparing of Animals for medicinal Use, the which have hitherto been either reduced into Powder, or else have been converted into Spirits, Waters, and Oils, by decoction in a B, or else turned (by Calcination) into Ashes, that so their fixt Salt, may be extracted, or (by sublimation) pass into a volatile Salt. I do not wish condemn these, and other hitherto used ways and methods of preparing Animals for the use of medicine, for in very deed they are good and profitable. But forasmuch as I have the knowledge of a better and more compendious way of doing all these things, I neither would nor could any longer hide the same, but communicate it for the good of mankind, and for the help and comfort of the sick. And now that the well minded Reader, may perceive a difference between the old way of preparing these Medicaments and my way, I will briefly declare and demonstrate the same. I have not hitherto heard or read of any other way than this which followeth,

viz. The Animals are either wholly or else some part of them, dried in the Air, then powdered and administered in Powder in some appropriate Vehicle, or else some Honey or Sugar is added to the Powder, thereby to make it into an Electuary; or else the Animals are digested (whilst new or fresh) in Oil, then pressed out, and changed into a Balsam, that so they may serve either for inward or outward Uses as necessity requires. Or else they are made up into other Medicines, and so collected and kept for use. Or, being new, are distilled by a B. in water, the residue is by Calcination burnt into Ashes, and the fixed Salt, is (by the benefit of distilled water) extracted out of the Ashes. Some do distill the bodies of Animals, dry, or moist, in a Retort, and do get a stinking Spirit, Oil, and volatile Salt, which parts they Sever from each other, rectifie them, and keep them to use in time of need. Others do put the venomous Animals alive into Oil, or into some other Oil drawn out of an Aromatical Vegetable by distillation, and so suffocate them herein; and do afterwards use that Oil for outward and inward Uses, as is evident in the Oil of Scorpions. These are the ways hitherto made use of for the preparation of medicaments out of Animals, nor have they been fruitlessly used. But whereas I saw, that the Animals being prepared the aforementioned ways are venomous and crude, but especially when they are but only dried and powdered, and soured, and that the administering them to the sick is not without danger, because they set upon nature with too much vehemency, if any (nay the smallest) error be committed in the Dose: and besides, they do (by their ungratefull and loathsome favour) beget a nausea, and withal considering, that the Spirits, Oils, and Waters drawn out of Animals by distillation, do for the most part smell of an *Empyreum*, and are extremely distastefull to nature; and that though the volatile Salt, and the fixt, which contain the greatest Vertues of the Animals, and may more commodiously be taken into the body than the Oil, which is plainly intolerable to sick Persons because of its stink; yet forasmuch as in such an Operation the chiefest Vertue is burnt up, and corrupted, and that therefore the Medicament so distilled is less profitable than the crude Body of the Animal; this way and method cannot at all be accounted of as worthy the being ranked amongst the best sort of Medicines. Seeing then and well perceiving all these Circumstances, I counted it wholly necessary to bethink my self of a more profitable and better way, and such a way too, as by the help whereof, every Animal, or at least such a part of it according as is requisite, may (without any separating of the whole body into divers parts) be dissolved, and changed in its whole substance by a certain dissolving and correcting Water poured upon it, and so its venome be converted into Medicine. Now the dissolving Water, and the dissolved Medicine stand in such a posture, as that it may be again abstracted and separated from the dissolved and corrected body after its dissolution and correction, and this so corrected or purged body may be administered in some convenient Vehicle to the sick, or else alone by its self, as shall be more clearly manifested in the following discourse.

A universal Menstruum by the help of which all Vegetables, Animals, and Minerals are dissolved, corrected, and reduced into a most pure and most safe Medicament.

I have in my *Miraculum Mundi*, taught and told you that Niter is the true universal dissolvent, and is operated withall three manner of ways.

1. As it is in its own proper nature and form.
2. When it is changed into a fixt and fiery Liquor.

3. When (by the benefit of the fire) it is distilled into an Acid Spirit. With these three instruments are dissolved all whatsoever is in the nature of things, are amended, and transmuted into a better and purer substance. But the manner how this is done shall clearly be taught in this Treatise, and explained, inasmuch that all such as have either out of gross Ignorance, or conceited Pride, or meer diabolical hatred and envy, hitherto contemned, despised, and traduced it as a thing impossible to be done (as *Farnerus* for one) may be confounded with shame, and be driven to confess, that their meer ignorance, pride, and envy, caused them to oppose the Noon-day light, and attempt the extinguishing, blotting out, and obscuring the same. And although that I have described the preparation and use of the universal *Menstruum*, both in my *Miraculum Mundi*, and in its explication, as likewise in my Apology against *Farnerus*; yet notwithstanding many persuade themselves, that that description is too much clad over with darkness, and that without a more accurate and plainer declaration or explication, it cannot be understood, and consequently not made use of. Therefore that such Men may have their food ready chewed, and thrust into their mouths, and may have no farther cause of labour and consideration, I will give a plainer declaration and make (in God's name, for whose honour, and for the benefit of all mankind, I have thus purposed to do) an initiation, and perfectly demonstrate, that Niter is (by the three aforementioned ways) able to dissolve, and alter all whatsoever is in the nature of things, and to reduce them into a better substance. These are the weapons wherewith I enter the list with all deriders and haters of the truth, and do demand, if they have any better and more powerfull thing, than this universal dissolvent out of Niter, if so, to produce it; if not, then to let this alone. Every man has his liberty, (if he hath better) to publish it for the common good; but if he can't produce a better, he may well submit himself to the truth. Verily would any man discover a better universal dissolvent, he would do mean acceptable thing, and I would most readily acknowledge any errors I have committed in this matter, and would refuse my own proper writings. But that some such will arise and do this thing, I do not in the least fear. If such an one should come, we will hear and see him, and receive him with a decent reply. In the mean while we will address our selves, to the preparation of good Medicines, to the honour of God, and benefit of our Neighbour. The bettering and correcting metals, which is to be accomplished by the said Niter, is exactly described and demonstrated in the second, third, and fourth part of the Treatise of the prosperity of my Countrey; in this place we have purposed to treat onely of medicines. But as for the way of reducing Niter into a fixt and fiery Liquor, and al-

so into a Volatile, Acid and fiery Spirit; we have already taught in other places of our writings, so that it is a meer needless thing, here again, to repeat the same. But because it is profitable to the lover of Arts, that he find both the preparations here conjoined, I have deemed it necessary to set them down both to your view.

The Process of turning Salt-peter into a fiery Liquor.

TAKE of pure Salt-peter, and such as is free from all common Salt one pound, put it into a strong and well burned Pot or Crucible, with a Cover to it, put it into a Wind Furnace, urge it so long with Coals till it be a bright red hot, and all the Niter flow; which being molten and in flux, cast in a little Powder of good Char-coals, that so it swimming at top of the Salt-peter may burn up. This Coal Powder being consumed, throw in some more of the same, and proceed on thus with casting on Coal Powder so long till the Coal Powder you cast in will not take Fire any more, and the Salt-peter appear of a greenish and sky-colour. Then pour it out thus molten into a warmed Mortar or Basin, (for if you throw it into a cold Vessel, it will leap up into your Face) and there let it lie till it be cold. If you touch your tongue with some of this Salt, you shall find it fiery like the Salt of Tartar. Beat this Salt into a Powder and put it into a Glass, or else set it in some moist or cold Cellar, and in few days, nay, or hours, it will be dissolved into a clear and fiery liquor, which strain through Cap Paper or a Filter (as they call it) and set it up for use.

The use thereof in the preparation of such Medicaments as are made out of Animals, and also Vegetables.

FORASMUCH as the use of this *Menstruum* is already demonstrated in my first Apology against *Farnerus*, and in the first part of this *Spagyricall Pharmacopoea*, wherein the Essences of Herbs are taught. But in this Treatise shall mention be made onely of such Medicaments as are preparable out of Animals. I will here set down the way and manner of operation, whereby not onely Animals, but also Vegetables may be corrected and transmuted into safe Medicaments. And here it is to be noted, that the use of this *Menstruum*, takes place onely in correcting such Herbs and Animals as are strongly operative and as it were venomous, whose malice is to be necessarily removed. For those Herbs that are good, and used in the Kitchen, and without any hurt in them, need not any correction, except one will make out of them, an extract by Spirit of Vine, or make of them a burning Spirit, and Oil, as also a fixed Salt, and conjoin them by the benefit of Arr, and make them into sweet Essences, which labour is accurately described in the first part of my *Spagyricall Pharmacopoea*. In this place we treat onely of turning Animals, Vegetables, and Minerals into sweet Medicaments, by the benefit of Salt-peter: And in other places of my Writings is sufficiently enough taught by what other ways, and those various ones too, several Medicaments may be prepared, and that without the help of this universal dissolvent, whereto I refer the well minded Reader, and proceed on here to teach the preparation of the said Medicaments by that hitherto often named fiery dissolvent, which (without any additions) is of notable effect.

The Preparation of Animals and Vegetables by the fiery Liquor of Niter, their Dissolution, Correction, and Transmutation into wholesome Medicines.

TAKE any Animal or Herb, what you please, if it be new, cut it small; if the Animal or Herb be dry, beat it into Powder, and pour thereto the liquor of fixt Niter, that it may well moisten the Animal or the Herb, and may cover it all over; set the Glass in a B. and digest the venomous Animal or Herb for one day and night, in which time the liquor of Niter will ripen the venomous Animal or Herb, and transmute it, and make a Medicine of the Poison. After the Cucurbit is cooled in the Balneo, take it out and pour forth the liquor, together with the corrected Animal or Herb into another Glass having a long Neck, and pour thereon the best Spirit of Wine, or burning Spirit of Corn, and such as is well purged from all Phlegm, that it may swim on the solution the height of two fingers. Note well, that the liquor of Niter, and likewise the burning Spirit, must be well freed from all Phlegm, so that the Spirit may not conjoin it self with the Niter, but swim on the top of it. For if both of them be watery or phlegmy, there would be a conjunction or commixion of them both, and your labour would miss the event hoped for, and this is well to be observed. Therefore seeing that such a commixion, is prevented by removing of the aquosity, the burning Spirit will attract to it self, the true and corrected Essence of the Herb or Animal, and leave the fixt liquor together with the unprofitable Faces of the Herb or Animal. Separate the burning Spirit thus impregnated with the Essence, and so much that it can attract no more, by pouring it off from the liquor, and pour more Spirit thereupon, repeating this labour to long and so often, untill all the Essence shall be extracted out of the liquor of the Niter. Then take all these extractions which contain the transmuted or corrected venome of the Herb or Animal, and put them together in a Cucurbit, in a B. M. and draw off the burning Spirit with a gentle heat, that so at length the remaining liquor, may be of a thick and dark coloured reddishness. Note well that the best part of the burning Spirit may be also separated in a B. and reserved for farther use, but its remaining and weaker part may be taken out with the extract, out of the B. M. and be evaporated in a Glass Vessel, over a vaporous B. to the thickness of Honey. For in so doing, there's no fear of burning the extract in the Cucurbit, if the B. should be over hot; and this you are to have an especial regard unto. But if the evaporation cannot be done in Glass Vessels, by a vaporous B. then when the Essence is brought to such a pass in a little Cucurbit, pour thereto some of that burning Spirit, that came first over, and presently shake it well about, and mix it well, and this will again forthwith extract the purest part of the Essence, and leave behind a few Faces, with a little of the fixt Niter Liquor, from the which, the burning Spirit together with the Essence, is to be forthwith separated, by pouring it off, left it should (by any longer stay on the Faces) draw also to it self the Salt, and so not get the sweet Savour and Odour of the Essence. But if any one doth yet desire to make the Essence more pure and more sweet, he may extract it yet a third time after the aforesaid manner, and after this third labour there will remain again some more Salt, and the Essence

will become sweeter. If a diligent regard be not had hereunto, there will (for the most part) some of the fixed Salt abide with the Essence, and render it of an unpleasant savour: this admonition therefore is not to be neglected, but such a one that covers the obtaining of any good must bestow his labour with all kind of diligence.

This is an exact description of the manner of preparing most efficacious Medicines, out of the most venomous Herbs and Animals. Furthermore this is to be noted, that when the Essence is extracted by the burning Spirit, out of the Alkalized Herb or Animal, the remainder is to be boiled in an earthen or glazed Pot even to driness, and afterwards to be made red hot, that all the impurity may be consumed by calcination, and the pure fixt Niter may remain alone, which if you set in a Cellar, and do again let it dissolve into a liquor, it will be of the same virtues as before, and thus will it be many a time, and so may the Spirit of the Wine be used for the like operation.

Now although this fixed Niter doth change as well venomous Minerals, as Animals and Vegetables, and reduce their venomosity into wholesome Medicine: yet is it more fit for the sulphureous Vegetables, Animals, and Minerals, than for mercurial ones; and for such the Acid Spirit of Niter is more fit, though it doth also dissolve, correct, and transmute Vegetables, Animals, and Minerals; the which is chiefly observable in the Minerals, for therein may be learned the wonderfull property, and the all-things-changing efficacy of this Fire. For Niter crude as it is in its body, being mixed with combustible Animals and Vegetables, and enkindled, burns up all things, and drives them with the flame up into the Air, inasmuch that nothing save the fixt Salt onely is left remaining: And therefore this crude Niter is altogether unfit for Vegetables and Animals, if you would have any good from them. But in the venomous Minerals it performeth its office better than the fixt Niter, or than the volatile corrosive or Acid Spirit, as shall be afterwards shown where we treat of Minerals. This I thought expedient to advise you of, and have thus done to this end, that those that are desirous of the Art may learn the divers operations of Niter. The crude Niter doth (by its flame, display its virtues upon the venomous Animals, and changeth them in few hours space into safe Medicaments) Being reduced into a fixt liquor, it dissolveth all sulphureous Vegetables, Animals, and Minerals, the which thing the common or crude Niter, as also the acid and corrosive Spirit will never do: As this fixt liquor of Niter also dissolveth wholly the sulphureous Minerals, and leaves nothing behind save the onely Faces. So the acid Spirit of Niter dissolveth all mercurial Minerals, that nothing remains undissolved. From whence 'tis evident, that every nature doth lovingly embrace its like, and is willingly conjoined therewithall, and especially if such natures are pure and clean, and not mixed with any other things. But that you may yet better understand these things, hearken a little farther. There is no Herb, no Animal, no Mineral, that consisteth not of its three first principles, *viz.* Salt, Sulphur, and Mercury, but yet are these very unequal: for in one subject, the Salt is most powerfull, in another, the Sulphur, in a third, the Mercury: But when in such subjects consisting of the three principles, there is not too much inequality, and that no principle bears sway over another, then either the acid Spirit,

Spirit, or the fixed Salt of the Niter will alike dissolve them, as is evident in many Vegetables, Minerals, and Animals, which being compounded of well tempered Principles, do admit of Solution and Correction, both by the fixt Liquor, as also by the volatile acid Spirit: For example. I take some Herb, be it *Napellus*, or *Mandragora*, or *Opium*, or some Animal, as a Spider, Scorpion, or Golden *Scarabæus*, I deal on this Subject now with fixt Niter (as I afore taught) and the whole will be dissolved, changed, and become a safe Medicament, (for they consist of well tempered Principles.) If now I pour upon either Subject the acid Spirit of Niter, it will be dissolved therein, changed, and corrected, and put on the nature of an wholesome Medicine, as well as when dissolved in the aforesaid Liquor. Now though both Liquors, viz. the fixt Liquor and the acid Spirit do arise out of one Root, yet do they exceedingly differ in their nature, and do prosecute as it were each the other with a deadly hatred: And that because the fixt Liquor, as well as the acid Spirit, are in some sort as yet adversaries, and do not absolutely bear such sway as if they were in one Nature. For they are from one Subject, and are by the fire drawn out of common Salt-peter, and reduced into two contrary parts and into Enemies opposing each other. But they are again conjoined, that they may mutually set upon each other, with that enmity they have received from the fire, and may overcome and kill each other, then neither the fiery Liquor, nor the acid Spirit is any more discerned, but they return unto that which they were before, and from which they were born, viz. unto Niter or common Salt-peter. Excellently well therefore say the Philosophers, make the fixt Volatile, and the Volatile fixt. *Hermes* also saith, that our Dragon dieth not without his Brother and Sister, many things might be spoken of this matter, but they belong not to this place, but to the fourth part of the Prosperity of *Germany*, in which is treated of the Concentration of Gold and Silver into Tinctures, but if so be that one of the aforesaid Principles, whether it be Sulphur or Mercury (for the Salt is not to be here considered) do bear overmuch sway in any Subject, then both the dissolvents cannot alike dissolve that body, but that dissolvent onely which is appropriated to the nature of that Subject: As for example. The seed of any Herb (though it hath a mercurial Salt) yet the Sulphur hath the predominancy, and therefore admits of dissolution by the fixt Liquor rather than by the acid Spirit. But if the Oil be separated from the mercurial Salt, either by expressing it or distilling it out of the Seed, then the fixt Liquor hath a greater efficacy of operation upon its like, and dissolves all the Oil, without leaving any part thereof behind. But contrariwise, the Oil being severed from its mercurial Salt, which admitteth of the acid Spirit onely, the acid Spirit hath no power at all to dissolve it, though he be arisen from the very same Subject, as his brother the fixt Liquor is. So then the Sister answers not the brother in the like operation, and 'tis impossible for the Sister to accomplish those things that the Brother doth. But when both brother and sister are mixed together, they do again beget Children like to their Parents, viz. *Hermaphrodites*, from whence themselves had their Original, returning to simple and crude Niter, out of which there do again proceed the like Procreations and Generations of the masculine and feminine Sex. And so one birth

transmutes it self into another, augmenteth and bettereth each other and that even to infinity, if it do but get its own conjugal bed, and be dealt withal in a Philosophical manner. And what we have said of the vegetable Sulphur, the same may likewise be understood of the Animal and Mineral. For such a Sulphur as is severed from its Salt and Mercury, the acid Spirit of Niter will not dissolve, but its sulphureous Liquor doth readily perform it, and this doth wholly dissolve the common mineral Sulphur, whereas the acid Spirit leaves it untouched. But such a Subject as participates of both Natures, viz. of the sulphureous and mercurial one, doth admit of dissolution both by the fixt Liquor, and by the acid Spirit, whether it be a Vegetable, Animal, or Mineral. Therefore the extremes, viz. the beginning and the end, the first Ens and last Essentiality, the volatile and combustible, and the fixt and incombustible, are to be compared with each other, (as thus.) Let the common combustible Sulphur and which adheres to Minerals and Veins of Metals be accounted of as the beginning, and let Gold be accounted the end. The fixt Liquor now dissolves the Sulphur wholly, but cannot do so with the ripe Gold; but the acid Spirit dissolves that, and cannot at all dissolve the Sulphur. But now such as are middle Subjects and do partake of both natures, viz. of a sulphureous and a mercurial, such as are *Saturn*, *Jupiter*, *Mars*, *Venus*, *Mercury*, *Lune*; for they are dissolveable by both, viz. by the fixt Liquor, and also by the acid Spirit. But by how much the more either of them partake of combustible Sulphur, by so much the easier doth it admit Solution by the fixt Liquor. So this Liquor doth easily dissolve these Minerals, viz. Antimony, Auripigment, common Sulphur, red Arsenick, &c. and of metals these, *Mars*, *Venus*, *Jupiter*, *Saturn*, difficultly; *Lune* more difficultly; *Mercury* most difficultly; but for *Sol*, which is the last and best of all, it doth in no wise dissolve, because it is plainly freed by nature from its superfluous, extraneous, and burning Sulphur, and is washed, purified, and maturated into a most pure mercurial Substance. Contrariwise the acid Spirit (if it be strong enough) doth dissolve all, even from the supreme metal, to the lowest Mineral. Sulphur onely excepted, which it can't dissolve. Yet doth it more easily dissolve one Subject than another according as it is of more affinity with, or remote, from its own Nature. And therefore every Chymist may easily know the Nature and Properties of every metal and mineral by the dissolving them, with these two, viz. Liquor and acid Spirit. Note well, I have (by this means) found out what Metals and Minerals are of nearest Affinity with Gold, and this kind of enquiry is far more certain and safer than the reading of many Books; nor will it be hurtfull to him if he did understand the signature of metals and minerals, and thereby know how to learn their Nature and Property; but my intent is not to treat of that, in this place, but will refer my labour to the second part of my Treatise of the Prosperity of *Germany*, where we will speak of the Concentration of Metals and Minerals. But that I may trifle out no more time in the discoursing of the difference of metals and minerals, I will go on and describe how the venomous Subjects of Animals and Vegetables are to be dissolved by the acid Spirit of Niter, to be transmuted and ripened thereby, and converted into safe Medicaments.

The Process and Preparation is as follows.

TAKE either *Nux Vomica*, or venomous party-coloured Toads, Scorpions, Cantharides, or such like venomous Vegetables or Animals. Cut your Vegetables, but take your Animals whole as they are, that so dying (in the *Mensstruum*) they become greater and safer Medicaments, put them in some glass: As for example. Take one Ounce or two Ounces of the Spirit of Niter; put it in a glass with a narrow neck, that so it may be stopped, and put into that Spirit such Vegetables as you would dissolve; which being dissolved into a Liquor, then put yet more Herbs, thus doing so long till the Spirit grows thickish, and can dissolve no more. After the same manner may you proceed with the Animals if dead; but if alive, then to the Spirit add some water before you put the Vermine thereinto; for the too too vehement force of the Spirit, is to be so allayed, that the Vermine being put in alive may not presently die, but may kill himself with his own proper Poison. For if the Spirit be too strong, such kind of Animals will die in less than a moment, and not know what hath happened unto them. But now they live longer in the milder Spirit, and when they see that they must needs die, they are extremely enraged, do prick, and bite, and kill themselves with their own Poison, inasmuch that the venome is increased, and the Medicine acquires the greater Virtues. So then those which thou hast put in being dissolved, add more until the Spirit becoming thick, can dissolve no more; strain this Solution through a thin Linnen Cloth into another glass, and pour thereon by little and little, or drop by drop, the fixt Liquor of Niter, that it may kill the acid Spirit, and they both having lost their strengths return into Salt-peter as they were before, and the corrected Vegetable or Animal may be precipitated to the bottom in the form of a Powder. When you have so done pour on some more fresh Water, or Rain-water, that the Salt-peter may be the better dissolved. Then pour out all the Solution, through a thin Linnen Cloth placed in a glass Funnel, into another glass, that so the Salt-peter, which before was partly an acid Spirit, and partly a fixt Liquor, and is again become Niter, may (being dissolved with the water poured thereon) run through the Cloth, and that corrected Vegetable or Animal may stay behind in the same, the which by pouring on store of fair water, is to be freed of all Saltiness, and afterwards to be put together with the Cloth upon Cap-paper several times doubled. This Paper will drink up all the moisture, and the remaining Animal or Vegetable Powder will stay behind: which being thus dried is to be lay'd up for use, and may afterwards be used either *per se* in the form of a Powder or be reduced into Pills, which before this preparation could not be safely used, nor without much danger. There is besides, another way of turning Animals and Vegetables by the acid Spirit of Niter, or by the fixt Liquor into wholesome Medicaments: and the manner thereof is thus.

Those Subjects which refuse to be dissolved by the fixt Liquor, are dissolved by the acid Spirit, and precipitated with the fixt Liquor, or contrariwise those which are not dissolvable by the acid Spirit, are dissolved by the fixt Liquor, and precipitated by the acid Spirit. All being precipitated, and the Dissolvent sufficiently slain, let some more of the fixt

Liquor be poured thereupon, so that it may much exceed in quantity the acid Spirit. This done, let the Phlegm be drawn off in a vaporous B, and to the remaining Liquor, let be poured as much burning Spirit as is sufficient, that so it may by extraction extract all that is to be extracted. This burning Spirit operates upon, and attracteth to it self, no other thing save the onely Essence of the Herb or Animal alone, and leaves the Dissolvents untouched. But this Essence is no ways inferiour neither in virtue or efficacy, to that which was prepared after the before described manner. And thus much let suffice to have been said of the preparation of Vegetable and Animal Medicaments. And now we will betake our selves (in God's Name) to speak likewise of Mineral and Metalline Medicaments, and see what good thing the Omnipotent God bestoweth on us by the benefit of these things.

The preparation of Metalline Medicaments is almost a-kin, and like to the precedent preparation of Vegetable and Animal ones, and doth herein onely differ, that the most part of Minerals and Metals, are dissolved, corrected, and converted into safe Medicaments by crude and purified Niter, as the following manner demonstrates.

Take of powdered Antimony and purged Niter each alike, mix these equal parts in a covered Pot least the Mass leap out, calcine it, after Calcination pour it forth, and reduce the Mass into a Powder, and wash off the Salt-peter with Water and dry the Antimony, which hath now lost its black Colour, and is become white. Mix it again with an equal part of Salt-peter, calcine it, and wash it, and repeat this Labour a third time. This done, the Antimony hath laid aside all its venomosity and blackness, and become white, and such a medicament, as may be most safely administered in expelling all Diseases by Sweat, the Dose from two, three, four, even to six Grains. Note well, if you use the *Regulus* instead of the Crude Antimony, it will presently, in the first operation become a white Diaphoretick, and to be adhibited in the same Dose. Even after the same manner may you deprive poisonous Arsenick, Auripigment, and such like Poisons of all their venomousness, and transmute them into most safe Diaphoretick Powders. But forasmuch as the preparations of them do not correspond with every ones mind, yea and may easily injure the ignorant and unskillfull, my advice to such men is this, that they abstain from meddling with them and betake themselves to Antimony onely, and to fix him well, for that they may use him with far more safety. But that I speak here of those most highly venomous Objects, I did it for this end, that every one might know, that even the chiefest Poisons may be corrected and transmuted into Medicines, merely by the help of Niter alone. But he that desires yet farther to render Antimony safer and better, let him use the following preparation: Take the aforesaid Diaphoretick Antimony, fixed by the help of Niter, dissolve it up in strong *Aqua Fortis*: and being dissolved, precipitate it with the fixt Liquor of Niter, that it may settle to the bottom like a snowy Powder: Pour off the moisture, vapour away some part of the humidity, and let by the remainder that the Salt may shoot, and so will you have your Niter again. As for the Powder, dry it and wash it well with water, and it may well be styled a *Beccardicum* Mineral, being a most excellent Medicine to expel all Diseases by Sweat, the Dose of which is one, two, three, four,

D d

fix,

fix, even to twelve Grains, according as the Disease and Patient is. But I have sufficiently enough treated of this Medicine at large in my other Writings, and therefore needs not to be repeated in this place. So then all, Metals, Minerals, Stones, and whatsoever is in the World, may by these three ways be dissolved and corrected by Niter, either crude, fixed, or acid, and be transmuted into Medicines void of all kind of danger. Thou maist dissolve all the Metals (Gold onely excepted) with the acid Spirit of Niter, and if thou put thereto a little *Sal Armoniack*, or rectifie it with common Salt, then it will likewise dissolve common Gold. But the Minerals are dissolved with the fixt Liquor of Niter, and precipitated, and then washed with common water, and being washed are used to make Medicine with. They yield subtile Powders, according to the nature and property of their Metals and Minerals. The Powder of Gold is yellow, and is called *Aurum Fulminans*; of Silver, Ashy, of Copper, Green, of Iron, Red, of Tin, and Lead, White, of Antimony, white; of *Lapis Calaminaris*, Tutia, and *Cadmia*, Ashy: But the common Sulphur, and all the precious and common Stones, it (*viz.* the acid Spirit) cannot dissolve, but leaves them for her Brother, the fixed Liquor to dissolve. So then what the Sister cannot do, that the Brother can perform with ease, and that which the Brother can't effect, that the Sister undertakes the accomplishment of; and what neither of them can possibly perform, we see it possible to be done, by their Father and Mother, *viz.* the crude Niter, in so much that to this subject is a power given of doing what you please. But that I may perfectly demonstrate, that Niter is able to dissolve all the things that are in the World, and may withall shew, how those subjects, which yields not to a Solution by the acid Spirit may come under the power of the fixt Niter, I will proceed on, and begin with the common Sulphur.

Take Sulphur reduced into Powder, one part, of fixt Niter two parts, put them in a Cucurbit, pour thereon twice as much water as they both of them weigh, *viz.* six parts. Boil them about one hour in Sand, in which boiling the Liquor of the fixt Niter, will dissolve the Sulphur into a red Solution. Strain it through Cap Paper, and precipitate it by the acid Spirit, then wash it, and you shall have a white and subtile Powder, profitable in the Diseases of the Lungs. And now it remains that I shew you Flints, Sand, Crystal, all kinds of Stones both precious ones and common, (which the acid Spirit is not capable of dissolving) may be dissolved by the fixt Niter, and display their Virtues, the which is thus done. Make the Flint, Crystal, Marble, or any other Stone that is meltable in the Fire into a Glass, very red hot, and presently quench it in cold Water, and dry it, that it may be powdered with ease. Take one part of this Powder, and three or four parts of fixt Niter, mix them well, put them into a Crucible, and cover the Pot, and melt them with a strong Fire in a Wind Furnace, that it may become a transparent Glass. Then turn it out, Powder it, and set it in a Glass Vessel in a moist Cellar, that the Stone may be turned into a Liquor; or else having powdered the said molten Glass, pour common Water thereupon, which will dissolve the Powder. If now you pour the said acid Spirit of Niter on the clear Solution, then the fixt Niter being deprived of its fiery virtue and force, will let fall the dissolved

Stone in the form of a Powder, which is to be washed with store of Water, and be dried, and it will be the Magistery of that Stone, which this operation is bestowed on. These Stones may likewise be digested and dissolved in a strong Glass set on Sand, with the fixt Niter Liquor, but this moist way is more slow and tedious than the former dry way which is done by melting. And besides, the Glasses themselves cannot long endure this liquor, but are therewith also dissolved. Now these Magisteries or Stones thus prepared are profitable in the Stone, the which they do not onely expel out of the Reins, but likewise out of the Bladder, if it be not too much hardened. If you desire to make this Medicine yet better, then do thus. Take the Liquor of the Flints or Crystals, that are dissolved in a Cellar after their having been melted, put it in a Vial having a long Neck, whereon pour twice as much Spirit of Wine, but see that the Belly of your Glass be but half full; then let some body or other shake the Glass in their hands strongly up and down, and commix the Liquor and Spirit of Wine well, then will the Spirit penetrate, dissolve and render it sweet. Note well, this agitation is necessary, because if it be not thus tolled to and fro, the Spirit of Wine will stand at the top of the Liquor, and not attract the fixt Niter to itself. Now when the Spirit of Wine that you poured first on, is sharp enough, pour that out and pour on more, and when that is sharp enough, decant that also, and pour on more, repeat this operation so often, untill the Liquor of the Stones be rendered sweet. Note well, the Spirit of Wine must be void of all Phlegm, for if there be in it any water, the Liquor of the Stones would be precipitated into a Powder. But he that proceeds well and rightly will obtain a noble Medicine against the Stone of the Microcosm.

N. B. After that the Liquor of the Stones is brought to a sweetness, it is to be covered over with the Spirit of Wine, in the Glass you keep it in, that so the Liquor may abide in its Liquidity, otherwise it will in a few days space be turned into a Stone in the Glass. When you would use the Liquor, stop the mouth of the Glass with your Thumb, and turn down the Glass that the Spirit of Wine may (as being lighter) give place for the Liquor to flow out by your Thumb, and thus may you take out as much Liquor as you please. I have been the more curious in describing this preparation in this place, that so no error may be committed, seeing this labour requires an expert Man, and not such a rude and insipid Sot as *Farnernus* is. Experience testifies that the Liquor, and the Magistery of Sand, Flints, Crystals, and such like Stones, are endued with one and the same virtues. Any one may chuse which in his opinion is best. I commend the common white Flints, that are in the Sands of Rivers. The Magistery of these are notably conducive to weak Stomachs, nor is any thing corrupted by the same, whatsoever Diseases they be used unto. The Dose of the Powder is 4, 8, 12, 20, 30 Grains, of the Liquor, 1, 2, 3, 4, even to 10 Grains. This Liquor, whereforever it comes, adheres to every matter it meets with, if it be kept in a dry place, it becomes a natural and transparent Stone. In Man's Body, it attracts to it self its like, and carries it off with it self. There lie hid in it many other secrets, which forasmuch as they pertain not to this place, are to be found in my other Writings. Moreover there are Stones found which do not admit of Solution either by the fixt Liquor or acid Spirit, and they are to be thus tamed. Take that

that Stone which yields not to a Solution by the fixt Niter Liquor, nor by the acid Spirit, beat it into Powder, then mix it with three times as much of the Powder of pure and well dried Niter. Then with this mixture fill a Crucible half full, take up a Coal with your Tongs, and put it into the matter, and hold it hard on, least the flame throw it clear out again. So the Niter being kindled by the Coal doth (together with the Stone) flame and burn up, and cause such a speedy and vehement Fire, that the Stone is thereby penetrated and opened, and may (after this operation) be dissolved with common Water. This done, the Solution which hath imbibed (or which contains) the dissolved Stone, is to be purified by passing it through Cap Paper, and to be precipitated by pouring in of the acid Spirit, that so the Stone may settle down in the form of a Powder, the which is to be washed with Water, to be dried and kept for use. Thus now have we dissolved all the Metals, all Stones, all Vegetables, and Animals, and transmuted them into Medicaments. And were there yet any other thing in nature besides these subjects, or could there be found any thing else, I would have taught its Solution by this my universal *Mensstruum*. But forasmuch as I find nothing else besides Vegetables, Animals, and Minerals, as likewise all kinds of Stones, yea and Glass itself, nor can find ought besides, it will deservedly remain an universal *Mensstruum*, and Dissolvent (though the moanish deriders, and brethren of ignorance, and haters of the truth, split for anger) constant, unconquered, and incomparable, as long as the World stands. As to its efficacy in bettering and correcting Metals, the second, third, and fourth Parts of my Treatise of the Prosperity of Germany will testify, for therein we treat of the concentration of Metals. But as for such other mysteries as concern true Hermetick Philosophy, and that lie hid in this wonderfull subject, they are accurately and succinctly described in my Treatise of the Nature of Gold, and of the concentration of the Elements, in which Book the studious Reader may delight himself with divine and humane Miracles. So now we have proved and demonstrated, that Niter is an universal *Mensstruum* and Dissolvent, seeing there is nothing in the nature of things that is able to resist its dissolving virtues; nor can its like be found out. Well therefore may it most deservedly remain, as in very deed it is, and as 'tis accounted of both by my self and all skillfull Chymists. But now if any one shall object and say, that the before produced proofs are no ways satisfactory to him, neither do demonstrate that this dissolvent is also profitable as to the Philosophick Work, I do not intend to answer him, nor will I so open my Bosom to such Adventurers as *Arnoldus* did to *Lully*, but leave secrets things in a secret place. I have spoken enough, and do also speak much in my Treatise of the concentration of Heaven and Earth. He that understands not my sayings, and doth as yet despise them, has no reason to reckon himself amongst the Adepts and Sons of *Hermes*, but rather is of the rank of the *Farnersian* sodality, and must remain at the Hogs Trough.

The Use, Power, and Virtues, of the Medicaments out of Vegetables, Animals, and Minerals: The Composition whereof we taught above.

AS concerning Vegetables, some few of them there are that need correcting by the universal

dissolvent. For such things as are in their own nature whole and sound, need not any Medicament. For Rosemary, Fetherfew, sweet Marjoram, Sage, Thyme, and such like Herbs needs no correction, but may be reduced into their sweet Essences, according to the ways that I have prescribed in the first part; but those Herbs that are more strongly operative, and used in medicinal affairs, are not without danger, such as are *Hibane*, *Hemlock*, *Mandrake*, *Opium*, *Tobacco*, *Napellus*, *Levanti-Berries*, *Nux Vomica*, &c. these must be amended by a good correction, or else can they not be safely taken into the body. If they be dissolved by the fiery operative *Mensstruum* and corrected thereby, (as we shewed in the foregoing discourse) then may they be taken into the Body most safely, and without any danger, and will perform things wonderfull in Medicine. And whatsoever was a Poison before is afterwards rendered a Poison subduing Antidote. For Example, *Hibane*, *Mandrake*, *Opium*, have by their nature a stupefactive power, and do suppress the vital Spirit, do infect, or destroy, the *Humidum Radicale*, do procure overmuch Sleep, yea, do close up the Life in perpetual Sleep. But now those Herbs being corrected by the force of the fiery Water, and being dissolved of their Poison, do no more hurt, but allay all inward and outward pains, do pacify the vital Spirits being provoked and enraged, do compose all inquietudes with a sweet pleasant rest, do expell venomous humours out of the Body by Sweat, and do by reducing all things into a quiet State, heal many Diseases. The *Cicuta* or *Hemlock*, *Napellus*, *Levanti berries*, *Nux Vomica*, &c. do not onely cause a most deadly Sleep, but do also provoke most vehement vomitings, and make most accute prickings in the body, and deprive Men of their Sciences and understandings, and do at last bring on Death, if they be admitted into the Body in too great a quantity, and are not drawn out from thence again by strong vomitings. But such Herbs being corrected, and changing the Poison into wholesome Medicaments, do no more cause such horrible and dreadfully painfull Symptoms, but by penetrating the whole Body in a harmless and insensible manner, do take away all obstructions, and cast forth all hurtfull things out of the Body, by sweat, urine, and stool, and frees the inward bowels by purging them from all impure humours, and do happily take away occult Diseases. And now if they did before load the head with a very great heaviness and render it mad and unsound, it doth now mundify it, and purge it, and free it from grievous and obnoxious Vapours, and do comfort the Brain and make Ingenuity or Memory better. So that what they did corrupt (before their correction) they do now (after their being bettered) amend and refresh it. But however you are to have good regard, that you be carefully provident in the use of these Medicaments, that you exceed not a due measure, and so commit an error, for it is not lawfull to play with such kind of penetrative Medicaments.

The strongest purgative Medicaments, as *Ejula*, *Cataputia*, *Stavesacre*, *Gummi Gutta*, and such like, being dissolved in this *Mensstruum*, and precipitated, do lose their vehement, and as it were venomous quality, and become safe and gentle purges. N. B. You are here to observe (as concerning this Solution) that forasmuch as the Seed of *Ejula*, *Cataputia*, *Stavesacre*, as likewise *Gutta Gambogia*, and *Scammony*, are of a fat and resinous nature, are not to be dissolved with the acid Spirit of Niter, but with its

fixe

fixt Liqueur, or better with the Spirit of Wine corroborated and alkalized by fixt Niter, and to be precipitated with the acid Spirit. And so with the same Spirit of Wine, being made more strong by the addition of the fixt Niter, all Gums that have a fat quality (may be thus dealt with) and contrariwise such as are not fat may be dissolved with the acid Spirit, and precipitated with its contrary Liqueur. So likewise all bitter Juices, as Aloes, Myrrh, and the like, being therewith dissolved and corrected do acquire a more sweeter and more gratefull Savour. It is also very fitting, for the grievously smelling Gums, as *Alfa Farida* is, and for correcting other such like stinking things arising from Animals or Vegetables, and so spoil them of their grievous Odour, and for correcting them into a gratefull smell. In so much that some things that emit even almost an ungratefull stench may be so transmuted as that they may afterwards yield a pleasant smell. And although that I made some mention of this Work or Operation some years ago in the first Book of my Philosophical Furnaces, where mention is made of the Spirit of Salt, yet will I not leave it off so, but describe more, yea and compendiously ways too in my third part of the *Spagyricall Pharmacopoeia*, for effecting such matters, and thereto refer the studious for the preparing of pleasant and efficacious Medicines.

As for such Animals as serve for the Kitchen, as Beef, Mutton, Pork, Hens, Geese, and such like, also Fishes and Birds, they need not much correction. Those of them that are a year old or more may be boiled with Water, Salt, Spice, Wine, and Vinegar, &c. the younger may be roasted on a Spit. These are not hurtfull to such men as are in health, if they feed on them and drink after it a good draught of good Wine or Ale, that so they may thereby wash down into the Stomach any such matters as might stay by the way in the Throat, &c.

If now any one would make use of venomous Worms, and Insects in Medicines (for sometimes they perform far more in Medicine than Vegetables can, as experience witnesseth) they are not to be adhibited without correction. But I do not here understand the Kitchen correction, which is done by Wine, Sugar, and Spices; but such an one as in which all the parts remain together, and are corrected and amended by the fiery *Menstruum*, and that without the addition of any other thing as we taught before. And being on this wise corrected, they do not onely safely conduce to a Medicinal help in desperate Diseases, but do also become of greater assistance and comfort to many a sick Person, and purchase to their Authours a greater honour. It is well known even to blind Bayards and Barbars what effects sometimes the great Earth-worms, *Scarabaeus*'s, *Cantharides*, *Aselli* or Pigs-lice, and such like Urine provoking Insects do effect, being administered to the sick, crude, dried onely and so powdered; he that desires to procure a good quantity of Earth-worms, let him bro thrust a stick into the Earth, and stir it to and fro thereby to disquiet the Worms, for they will presently guess that the devouring Mole is at hand, and will for fear creep by heaps out of the Earth, so as you may then easily take them. If any one loaths the Worms themselves, let him take that Earth which the Worms do cast out to the top of the ground, after a warm Rain in the Spring time, and is like small bunches; as if they should say, give us our lives for this Earth's sake; and from thence you may extract an Essence, which

will be as profitable to you as if you took us: N.B. The *Merula* or Blackbirds seeks after this Earth and carries it to her young ones lying in the Nest, which thing they would not do, did it contain no good in it, but would rather take the Worms themselves and carry them. A Dog which hath devoured many bones seeks out for some clean place to dung in, either on a smooth stone, or on the grass, as that he should say, This do I give you by way of thankfulness for the food which you have bestowed on me, keep it and use it according to your knowledge. N.B. The greatest Vertues of Animals are placed in their Excrements, and not in their flesh. Next the Excrements are the superfluities of the bodies, which (in men) are, the Hair, Teeth, and Nails: In Beasts, the Hairs, Teeth, Hoofs, and Horns: In Birds, the Claws, and Feathers, &c. And that the *May* Worm frees from the Gout and Stone, See Doctour *Wierus*, he hath written a peculiar Treatise of the Gout, and of the wandering or moveable pains of the Joints, and of the intrinsical and hidden Scurvy, and other such like Diseases, and which are commonly accounted of as incurable; all which he teacheth the removal of, by the means of the *May* worms, or unctious *Scarabaeus*'s. Nor indeed is it without ground, that there is sometimes more effected by such abject and contemptible Vermine, than by the most precious and highly esteemed Compositions and Vegetables: This now they do crude as they are, and uncorrected. But if the great Earth-worms, and principally their Enemies, viz. those black, smooth, and many footed Vermine, that suck from the Worms their Juice and Strength; and likewise those broad, and party-coloured, venereous small Vermine, which we have before mentioned (if all these I say) be corrected by the fiery *Menstruum*, they would not onely drive forth Urine, and the Stone, safely and without hurt, but would withal most notably strengthen the nature of Man, and be a great comfort to many debilitated Gallants. The green *Scarabaeus*'s, the *Cantharides*, and green Flies, being all of a venereal Nature, do (being corrected) not onely drive forth the Stone and Urine, but do also wonderfully shew their efficacy in the Feet Gout, wandering Gout, and other grievous Diseases which have already gotten deep rooting: But that black and slow creeping *May* worm, or unctious *Scarabaeus* doth operate the most efficacious of them all, and may be plentifully enough had in the Months of *May* and *June*. The whole knack of the business doth consist in this, that such Vermine be well corrected with the Liqueur Alkalest, and so prepared before they be made use of. As for those great and horned *Scarabaeus*'s, that live upon the Juice and Rosins of Nuts, Cherries, and Plums, and are wholly of a Balsamick Nature, if they be corrected, I do highly encourage the use of them both inwardly and outwardly, viz. when the internal and external Members are tormented with most vehement pricking Pains and Torments. As for Emmets or Ants they have a wholesome and efficacious Balsam, and are healers both of inward and outward Dolours. But the chiefeft of them are those that live in Woods wherein are store of Pines, and Fir-trees, and do there feed upon the Rosins of the Trees, and do not as the others do, live upon leaves and grass, but do in the Summer Months store their little Holes with the small Grains of those Rosins for their Winter food. And this the Inhabitants of those Woods know full well, and do seek

seek after it and sell it the Druggists instead of Mastic. For it answers to the Mastic that comes out of *India* in efficacy, vertues, form, and odour, and happily we might not need that Gum, knew we but how to get and use this. There is great variety and plenty of such like Insects as these, which without all question may be of great use in medicine; but seeing they can't be gotten in such plenty as the Vegetables and Minerals may be, the use of them is forborn, and rarely are they sought after. Nor indeed is it necessary to seek after and fetch from far, such things as we have present before our Eyes. The drift of my writing is this primarily, that I may demonstrate, that there are in the universal *Materia*, such vertues as are able to correct all venomous Animals, and deprive them of their Poisons, and to convert them into wholesome Medicaments, for the honour and renown of it, was I even constrained to write these things. And as to its energetical Operation on venomous Minerals, it is sufficiently enough known, and doth most clearly appear even in its effect upon Antimony alone, the which being burnt twice or thrice with common Niter, is wholly deprived of its blackness, and cloaths it self with a most white colour, and becomes a Diaphoretick and an all-evil resisting Powder. So is it to with Arsenick and Auripigment, those most vehement Poisons, which may be so changed in a few hours space, as that they may be taken afterwards into the Body without any hurt or danger, and will subdue and expel the greatest Poisons, though indeed there's no necessity of making use of those venomous Subjects, seeing there is plenty enough of other means. 'Tis sufficient that we have shown, that Niter hath such notable vertues, as to be able to invert the venomous Nature of every Vegetable, Animal, and Mineral, and of transmuting the Poison into a wholesome Medicament. Now because the Animal vertues are more efficacious than the Vegetables, and that the Minerals exceed them both, therefore by good right are those Minerals of greatest use in medicine, which be most efficacious, most sweet, and most safe. But yet we would willingly have the Animals and Vegetables to retain their own dignity and station: And for the better discovery of the difference betwixt these, and that my Neighbour may be the better and more sincerely served, necessity doth even require a larger explanation. This therefore is generally to be observed, that by how much the riper the Minerals be (and so 'tis with the Animals and Vegetables) by so much the nearer they are to the Sun, and abide therein, so much the safer and securer may they be taken into the Body. All Herbs, Vermine, and Animals, that delight in a warm Air, and love to abide therein, are never infected or impregnated with so great a Poison as those are that delight rather in obscure, shady, and darksome places. For *Napellus*, *Mandragora*, *Cicuta*, and such like Herbs are never, or at least most rarely, to be found in other than dark places that are shaded over. And so the most venomous Animals and Vermine, do most willingly take up their abode in holes of the Earth, in cold and darksome Dens; and by reason of the want of the warm Air remain venomous, and do necessarily hurt mankind. But being digested by the Liquor of fixt Niter, they deposit their venomous quality and become wholesome Medicaments. So then all the maturation of things consisteth in heat, but Poison consisteth in cold, witness Wine and the Fruits of Trees, the

which being ripened by the solar heat, men may feed on them without hurt, but if they be eaten raw and unripe they corrupt their Stomachs. Now as we have said of Animals and Vegetables, the same is also to be understood of the unripe minerals and metals. By how much the unriper and cruder they be, so much the more do they hurt, and are unfit for the making of medicine. And as for metals, they do by little and little, and step by step go on towards their perfection, and end: Like as an Infant doth by little and little arrive to its highest degree of age. And as there is more to be found in a man that is arrived to man's Estate than there is in an Infant, so is there in minerals and metals that have in long success of time attained to their maturity: And forasmuch as in them may be found, most safe, sweet, and efficacious Medicines, I have deemed it necessary briefly to detect their dignity and degrees, and shew the Ladder as it were, or Scale, wherein the metals stand in order, and how by their signature that perfection which they have gradually arrived unto, may be known. I do resemble the mines of metals to a Tree, thus, *Saturn* is the Root, *Mars* the trunk or body, *Jupiter* the bark that covers the Tree over, *Mercury* the Juice that sticks between the bark and the trunk, *Venus* the green leaves, *Luna* the flower, and *Sol* the fruit. The ancient Physicians or Naturalists, compared the seven principal metals with the seven Planets, the which comparison squares notably well with them. For the Planets and Metals have a mutual correspondency with each other. The Chymists ascribe Lead to *Saturn*: Tin to *Jupiter*: Iron to *Mars*: Copper to *Venus*: Quick-silver to *Mercury*: Silver to *Luna*: and Gold to *Sol*: And even as the Planets do excel one the other in brightness, vertues, and other things; even so do the metals, and this their nature informs us of, and their different signature demonstrates. Verily when the ancients would mark out to us a perfect thing, they described it under the form of a round Circle: And by how much imperfecter the thing was, by so much the less roundness did they give unto it. The Character of the Sun is *Sol*, viz. a Circle with a point in the midst: The Circle denotes the Golds perfection, the point in the middle of the Circle signifies the Original of perfection. The sign of Silver or the Moon was this *Luna*: which consisteth of two half Circles, and tells us of its half perfection: So is it with the other signs, and signatures of the other metals. How much the nearer they approach to a roundness, so much the nearer are they to perfection, and so on the contrary. The Sun being the noblest amongst all the Stars, doth also yield and make the noblest metal, viz. Gold, the which is likewise to be observed of the other metals. But by how much perfecter the metals be, so much excellenter are the Medicaments that proceed therefrom. *Saturn* or Lead, is not much profitable for the inward use of the body, except it be in the Plague, and in other most hot Diseases. Being outwardly applied it dries up the moist affects of the body, and moist Ulcers, and healeth heat and all the external affects arising thencefrom. *Jupiter* or Tin is somewhat hotter than *Saturn*, but yet is withal very dry. *Mars* or Iron is hot and dry. *Venus* or Copper is hot and moist. *Mercury* or *Argent vive* is hotter and moister. *Luna* or Silver is of a midling heat and moisture. *Sol* or Gold is at length of temperate heat and moisture. If now any good thing be made out of Gold, it corro-

Et borates

borates the heart as being the most noble member of the body of man. And so in like manner, Silver doth the brain: *Argent vive* the Liver: Tin the Lungs: Iron the Gall: Lead the Milt or Spleen: and Copper the Reins. Thus have the ancient Philosophers and Physicians distributed the metals and distinguished them, the which I leave as I find it, though perhaps some of them may yet admit of another distinction. But so long may they remain (as they are) until *Elias* the Artist, shall by his coming release us of our Errors. Amongst the Minerals Antimony is the chiefest, in whom the Vertues of all the Vegetables, Animals and Minerals, are collected and concentrated into one, as its signature declareth. For the Philosophers have signed it with a round Sphere, by which the Earth is deciphered, and on it a cross put, and is without doubt for this reason, because the Earth never produced any fitter Subject for medicine, and this is attested by all true Chymists, as may be read in their Writings; but especially in *Basil Valentine's* triumphant Chariot of Antimony, being a Treatise he wrote in honour of this Mineral. The same thing doth that Philosopher testifie, saying, common Gold and Silver doe not effect it, but their first Ens does it. Now that Antimony is the first and true genuine Ens of Gold, is not onely testified by all the Philosophers, but also daily experience it self witnesseth the same, from whence it is as clear as Noon day, that Antimony is rarely to be found in any other places but in Gold Mines, nor is there (besides) any Antimony but what is pregnant with Gold, but yet some Antimony contains more Gold and other some less. Nay farther, amongst the very Veins of Gold it self is Antimony often met with, and may therefore undeservedly be filled an unripe Gold. I my self have seen a piece of golden Vein, which was digged out of the Gold Mines, and contained some pounds weight, in one side there was pure Gold, mixt with the hard Flint, on the other side was a black Vein of Antimony. There is a place in Germany called Gold Granack, nigh which in the *Sudetis* Mountains called *Fichtelberg* by the Germans, was found heretofore much Gold, but now at this day is there digged out onely Antimony, cleaving on to the hard Flints and Rocks. And herewithal is immixed a golden Marquesite, which being separated therefrom, and prepared after a due manner, becomes a most excellent Medicament, of which we shall hereafter make mention. Further, had we not this testimony of a daily experience, yet have we the witness of the true Alchymy, which doth most assuredly affirm, that true Gold may by the help of Art be extracted out of Antimony. Nay more, this incomparable Art, doth not onely perform this, *viz.* of bringing Antimony to the true ripeness of Gold, but doth also so change the Gold (by extracting its Soul) that it is no more Gold, but is plainly indistinguishable from any *Regulus* of Antimony both as to the form, volatility, nature, and properties of the same. And although an infinite number of men will contradict these sayings of mine, yet shall they never draw me from this my opinion, for I believe but what my Eyes have seen. One Eye witness is of more value than ten hear-say ones. Such as do gain-say these things, do build on no other foundations save such as they have gotten by reading or hear-say, and what will not at all correspond with experience. Well, I will remain stable in my opinion and in very truth demonstrate, that there is no Subject to be found in

the nature of things, that may be preferred in Medicine, before Antimony, so that it be but duely brought into its true Essence. I confesse that whilst it is crude and as yet unprepared, it is a mere Poison, and the use thereof is accompanied with a great deal of danger. And such as do use the common glaſs of Antimony, and other Medicaments made thereof after a rude manner, and so hurt the sick, must impute the blame to themselves and not the Antimony.

I have mentioned in my *Miraculum Alundi*, and in my first part of my *Spagyricall Pharmacopœa*, the preparation of a Medicine out of Antimony, and have called it a *Panacea*. This now out strips the capacity of very many rude and ignorant men, to whom it seems unlikely and impossible, that a Medicine of such wonderfull efficacy should lie hidden in so contemptible and base a thing as to deserve such a Title as a *Panacea*: but especially seeing some unskillfull men, have instead of it, administered to the sick crude Antimony, and by saying it is my *Panacea* have with a wicked boldness deceived men, and have hereby brought an *Odium* and contempt amongst very many men, upon this true Medicine of mine. Amongst these is that faithless *Farmacist* none of the least, yea rather is more eminent or standard-bearer to the rest, and such a one as may rightly be termed the blot and scandal too of other men. For my part, he that lists may persecute Antimony with as much hatred as he pleaseth. But whereas I have already praised it, and the thing doth withal concern my Neighbour's profit, I could not omit yet farther to magnifie and exalt it with greater praises, and in very deed confirm this truth, *viz.* that such a Medicine may be made thereof of as I have described, and therefore every one that judgeth of the truth without prejudice must confesse, that there is not a better, an effectualler, or a more harmless medicament, and purchasable by a meaner price, insomuch that both rich and poor may enjoy the same, if so be it be but prepared and used as it ought. But that he who is studious after good medicaments may withal see, that I have not spent my labour altogether on Antimony, but on other Subjects too, I will adjoin the description of the preparation, use and efficacy of other Subjects, and will take care for the preparation of those medicaments for the benefit of mankind, and of the sick, and for the distribution of them amongst the needy. For by this means shall I satisfie my conscience and shall not be accused thereby of burying the Talent given me, out of envy and hatred to my Neighbour. And whoever he be that hath any good thing, let him make it common, and being moved with pity and commiseration become serviceable unto his Neighbour. But if he neither hath, nor knoweth ought better, let him desist from condemning this, and omit despising the things he is ignorant of. And let him not deprive the miserable poor sick people of such things as himself cannot give, that so he may remain an honest and pious man. But as touching the Medicaments, which are here treated of, they are indeed but few, however they are such as may next God be safely confided in.

I have formerly written of preparing a *Panacea* of common Antimony, and taught its way of making. But whereas the description is dispersed in divers tracts, and is obscurer thereby, and haply one man may not have all those Treatises, I have judged it expedient to repeat that description in this place, and to mention it in this Treatise.

21. The preparation doth for the most part consist in the Calcination by Niter, which corrects and changeth the venome and immature Quality of the Antimony. Then afterwards the pure part is extracted by Spirit of Wine, and becomes a tender and spadicous (or light-red) Powder, and can effect those things, which I do here ascribe unto it. It may be taken in a morning before you eat, either in Wine, Ale, or some hot Broth, or in a soft poached Egg, or roasted Apple, and fasting some hours after it until its operation be finished. The Dose is $\frac{1}{4}$ or $\frac{1}{2}$ of a Grain, or 1, 2, 3, or 4 Grains at most for one time, regard being had to the Age and Disease, concerning which, the well minded Reader will find more written, in the first part of this *Spagyricall Pharmacopoeia*, and in my *Miraculum Mundi*, but yet I will here likewise annex it for the benefit of the sick.

Of the common use of this Medicine.

THIS Universal Medicine may safely and without any kind of danger be used in all the natural Diseases of new born Infants, as well as in those of years, and strong people, and may be used I say without any danger, and in so small a dose as may not move in any one either a loathing or a nausea, as these large Cup-fulls of the common Potions are wont to do when they are drank down. For that dose exceeds not 1, 2, 3, or 4 Grains at the most, and may most easily be taken down in a spoonfull of warm Broath, Wine, Ale, Water, or Milk, as the necessity of the sick requires. For if this prescribed dose be observed, it operates after an invisible manner, and strengthens the radical Moisture, and purgeth and expelleth out after a wonderfull manner, every hurtfull thing (by little and little) out of the whole body, if it be daily used, (or every second or third day) once each day according as the condition, or necessity of any one requirerh. It defendeth every body from all hurtfull Causes and Diseases, and admits not the least venomous Air, but if the Dose be augmented, it doth also display its virtues, by a visible operation, and drives out by Sweat and Urine, or Spittle, sometimes upwards and downwards, every noxious thing, and operateth even as you will have it, according as your dose is either more or less, and as your Disease needeth. A dose that is very small and void of any visible operation, is wont to heal many Diseases, yea and the greatest part of them. But some Diseases there be which have deep rooting, and do therefore require a visible operation, forasmuch as they cannot be expelled with a small and invisible operating Dose. Every one therefore that preparerh and administrerh this Medicine, must accurately observe this direction, that so (having regard to the Disease) he neither exceed nor come short in the administration of this Medicament, but by a right using of the same, he may obtain praise and glory.

But that the whole matter may be the better and more clearly apprehended, I will set down the use of the said Medicine, according as my self have experienced it, in the most grievous Diseases, that so the sick may be instructed and helped, and the less Errours committed.

In the Plague and other raging burning Diseases, and contagious Fevers, this Medicament doth (next God's help) preserve every one that takes it daily, in this proportion, *viz.* to Infants $\frac{1}{4}$ a Grain, to those of a middling Age, 1, 2, or 3, at most. But

if any one be infected by either of those Diseases, then the dose is to be doubled according to the parties age, or trebled, that the sick being well covered may sweat. If one time sufficeth not to free him of this Disease, the dose of the said Medicine may be repeated the day following, or the third day, and so is it to be proceeded on with, till the Disease being weakened is cast forth.

This way of preservation and curing is not onely to be observed in the Plague, but in all contagious Diseases that assaults with heat or cold, and in all kind of Feavers whatsoever. The sick need not any other Medicaments, for this is powerfull and effectual enough; provided you pray seriously therewithal, that it may (by the help of God) drive away that abominable and detestable Disease the Plague, and the pricking paining Pleurisie, with the other Feavers. Nay farther, there is no Medicament, no use of the best that performs what this can.

In the Epilepsie, or Convulsions of Children, of whom a great Number destitute of such help die, this *Panacea* is a most experienced and certain remedy for them, and is to be administred to a little Infant presently after its Birth, the quantity of the $\frac{1}{4}$ part or $\frac{1}{2}$ part of a grain, in a little Milk, or else in some warmed fresh Butter, and is to be repeated again the third and eighth day following. But if it should be so, that after some days, weeks, or months, the fits do again come, then let your Dose be somewhat stronger if the Child needs it, and be so often reiterated until the Disease be wholly subdued and carried off. I do most highly commend this Medicine to all Mothers, for that abundance of Infants (otherwise healthfull and sound enough) are without any help, snatched away by the violence of Death. And here the error of some Physicians deserves to be taxed, who administer to the poor little Babes, whole Glassfulls of the Water of Pearls void of all kind of Virtue. Also the Powder of *Bezoar* Stone either with, or without the Water, together with the infusion of such like unprofitable things.

Such Men as are of riper years, may daily use the Dose of one, two, or three grains, and it will profit them. If not daily then may they repeat it every third or fourth day at least, and so continue until the Disease being subdued pass away: 'Tis needless for them to use any other kind of thing, onely to observe this direction, *viz.* that day that they do use this Medicament, let them shun the cold Air, and abstain from Food three or four hours at least.

In the Leprosie, and other like detestable Diseases of whatsoever name they are called by, and in every kind of Scabbiness, there is not to be found any Remedy, whereby those affects are more easily and without any trouble or labour, taken away better than this, which never fails your hoped event, provided the sick be so strong as to brook the Cure.

In that detestable and venomous Disease of Whoredom usually called the French Pox, there is nothing can be administred safer and securer than this Medicament, if the Dose be but so much augmented, as not onely to cause Swear strongly, but also to provoke Vomits and Stools; and you are so long to go on with using this Medicine every other day, until the Sick be well, which may be in some eight or fourteen days.

He

He that is overwhelmed with the Dropsie, may take one Dose every Day, and for bear eating (for some hours) after the use of this Medicine, (the which is necessary to be done in other Diseases also) but let him that takes it so as to work strongly, proceed gradually from one grain to two, &c. untill it causeth a kind of nauſeate (but without vomiting) in as big a Dose as is needfull, and as the Patient can well bear. Which being thus done, the Dose is afterwards to be lessened one or two grains, and the lessening to be continued untill all the Water be cast forth by Sweat, Urine, and Stool, and the Sick become as healthy as he was before. Nor is there any reason why any one should doubt of radically taking away this Disease, (except it be plainly deplorable or desperate) by this my *Panacea* onely, forasmuch as experience demonstrateth it more clear than the Noon-day Light.

In the Gout (a Disease accounted by the common Physicians for incurable, as well as the Leprosie and Dropsie) doth this Medicament perform wonderfull things, and doth effect more in a short space of time than any one would either imagine or believe, provided it be rightly administred. For it doth in a short time draw back the affluence of noxious humours, and brings them forth out of the Body after an invisible manner; so that, Day after Day, the pains do by little and little remie and abate, the tumours lessen, and the Fit becomes more tolerable, comes the slower, and at length vanisheth for altogether. As for the Dose, you are to observe the same instructions that we gave you but now for the Dropsie, viz. that you daily make the same addition unto one grain so long till you cause a nauſeate (but no vomit) and then must you again lessen it one or two grains. The Patient must do thus daily on a fasting Stomach, (and keep himself warm and abstain from Food four hours, after the use of this Medicament) as long as need shall require. Haply the things which I here mention, will meet with many incredulous Men, and such as will not believe it possible, for such a Disease as hath been hitherto esteemed incurable by almost all Men, to be rooted out by the aforesaid Medicament; the Opinion of such Men I confess that I cannot take in bad part, forasmuch as even I my self was but a few years since (before I had experienced the wonderfull efficacy of this Medicament) of the very same Opinion. But after my experience had taught me to judge otherwise I do truly and faithfully affirm, that this Disease is in no wise incurable, but may (provided it be not too inveterate, and that the strength of the Sick, either through old Age, or Debilities, hinder not the Medicines operation, or that God himself withdraws not his own blessing) by a good and suitable Medicament, be, if not radically rooted out, yet for the greatest of it expelled. Now it is not to be thought, that he who useth this *Panacea* may be at his choice to live as he list, viz. either soberly, or to stuff his Stomach daily with hurtfull and forbidden Food, and to swallow in Wine as he pleaseth. No such matter, such Men err most hugely, for even the Philosophers Stone it self, that is, the so much famed rooter out of Diseases would not help there. For whatsoever those most excellent Medicines do mend in the Fore-noon, and correct, the After noons Surfeiting and Gluttony, and the so large excess of Meat and Drink, will again destroy and corrupt. Nor is there any room for the Opinion of those Men that think to be freed of this Disease, by

a bare Abstinence from Wine: No, this Disease comes not always from drinking of Wine, for it is most evidently known, that sometimes even the poorest of Men that never drank Wine are afflicted with this Disease. And therefore the fault is not wholly to be imputed to the Wine. Every kind of repletion or overfilling whether with too much Wine or Ale, may procreate and encrease a Disease, but that is not the onely or sole cause. For there are many other causes, from whence this Disease is wont to arise. Verily, often being wrathfull doth most vehemently disturb the Family, as it were, of the internal Bowels. Lust, and an often use of Venery (which is the usual attender and follower of Drunkenness) doth vehemently enervate and debilitate the strength of the body. From hence nature being enervated and debilitated, is not able to expell out of the body the copious reliſts and excrements, remaining of the too much abundance of meat and drink, and therefore those excrements abiding in the body and exercising their powers without controll, do produce most grievous Diseases. For that part which nature is weakest in, there doth the Enemy make his first attempt, according to the usual German Proverb, every one climbs over the Hedge in that place where it is lowest. The same doth for the most part fall out in the procreation of this Disease, viz. when the body is loaden and filled with overmuch Food and Drink, for the body being overwhelmed with overmuch Wine, and then an immoderate coition or act of venery presently following thereon, doth most exceedingly weaken the body. For nature being by this means weakened, hath not strength enough to expel those remaining excrements, which sooner Head, to the great hurt and detriment of the whole body, and do make themselves a fixed seat, the which is to be well heeded in this Disease.

Besides this Medicament doth resist all the obstructions of the Milt and Liver, (which corrupt the Blood, and stir up most grievous Diseases, as the Scurvy, Joynt-Aches, Erysipelas, continued Head-aches, weakness of the Limbs, a Stinking Breath; and in Women a suffocation of the Matrix, a suppression of the Months, panting of the Heart, Swounings, the Lipothimy, and many such known, and unknown Diseases) far more efficaciously than all other Medicaments do. All these aforementioned Diseases are healed by the said Medicine, being taken oftner or seldomer every Week according as the Disease is, and you will see wonderfull effects produced.

I commend also this Medicament to all those that employ themselves in Surgery, that they respect it as the chiefeſt Remedy that they can get. For being daily given in a small Dose to those that are wounded, it heals all new wounds in the Flesh, without the assisting help of any vulnerary potions, and external applications of Emplaisters that are compounded of so very many simples. For it withholdeth all Symptoms, and advanceth healing even from the very bottom, and so to the external parts, and doth also consolidate; but this is to be understood of those wounds in which are no hurt or broken bones, for as for these the manual Art is requisite, which may again set the Bones in their due order and place. Likewise deep Stabs are to have Tents used to them according as the Chirurgeons order is to apply them. But no external thing need to be used besides, save onely the Patients own Urine and Salt-Water, wherewithall the wounds are to be washed, and after washing, to be

be covered with pure or clean Linnen, that the coldness of the Air hurt them not.

But if wounds be dangerous and over great, then may also be applyed some vulnerary Balsam, and Plaisters made of the Flores of Minerals and Metals, and done up with Wax, Turpentine, and Oil: (Such Emplaisters I have taught the composition of in my other Writings.) So that there's no need of so many Oils, Unguents, Emplaisters, and such like, to be applyed to new wounds, if this medicament of mine be daily administred to the wounded Patient.

This medicine doth operate even to admiration in open Fistulae, rotten and stinking Ulcers, nor is there any need of outward remedies, save haply some Mineral Balsam to keep the Ulcer clean, and some Plaister made of common Wax and Turpentine to keep off the cold Air. For this Medicament doth begin its healing even from the very bottom, and carries it on very successfully even to the outer Skin, and doth thoroughly consolidate and perfectly cure all Ulcers, without any other external remedies than aforesaid.

Having then well considered these things, and that every one cannot prepare the prescribed Medicine, and yet very many may be found that would willingly partake of the same; It seemed good unto me to adjoin this admonition, that they that know how to prepare it, be entreated not to count it burthen-some, but rather being moved by a Christian compassion, readily make such as are ignorant of the manner of preparing it, partakers of the same; And not to mind wholly their own profit, according to the custome of this perverse world, and the scraping up of store of wealth, but to be well content with an honest and just reward for their charges and labour which they have bestowed. And forasmuch as the often spoken of Medicament, if sent abroad either in a Liquid form, or in the form of Powder, into other parts, cannot be in due manner used by every body, because an Error may easily be committed in the measuring of Drops, and in weighing of Grains, and so more or less be given. I have therefore deemed it very necessary to reduce it into Pills, that so the less Errors may be committed in its administration; and one Pill weighs one Grain, and two Pills two Grains, and so on; so that the Patient needs neither to measure or weigh, but onely to use them as the disease requires, and as I have before prescribed, 1, 2, 3, 4, or more Pills at one time.

These now are the principal Vertues of my *Panacea* made of Antimony. As for the rest that are besides these, and are (for brevity sake) omitted, they may be easily understood and known by every Judicious man, from the before described circumstances. I do therefore yet again testify, that all the things that I have ascribed to this Medicament, yea far more than they can be done and effected thereby, if it be rightly prepared and administred; And principally, if the Name of God be seriously invoked. For prayers and a trust in God do strengthen every Medicine, and make it happy by his benediction, though the wicked will neither believe it, nor hearken thereunto. Indeed some Medicament may, by God's permission, restore one (without prayers) to his former health; And so may Bread allay hunger without giving thanks, and this we see daily done amongst the unreasonable Creatures: But this enjoying of the gifts of God is bestial, and not humane. But this now is truly Christian-like when (in our diseases) the help of God is invoked, and then after that, the

Medicine used. And this way of using of Medicaments is necessarily accompanied with an happy event. But if thou wouldest periwade thy self, that every Disease, how inveterate soever, may, by the help of this Medicine, be certainly removed without any difference, thou extremely erreth. For we speak here of those Diseases, natural Remedies are able (by God's help) to heal. For sometimes Man's inward bowels or parts, are so stuffed and obstructed with gross humours, that they cannot be freed by even the most efficacious Medicaments. Sometimes the Lungs and Liver are almost wholly corrupted, soer the true place of healing is sought after. And who, I pray, is able to restore the things that are lost? For Man's inward bowels and principal members do not again grow, being once lost, as the Crab's shells and Spider's feet that are broken off and lost, doe. Farther, sometimes God inflicts a disease upon a Man, whom he will not suffer to be cured: Such like Diseases as these cannot be taken away with natural remedies. With God all things are possible; who alone is able to bring help and remedy in such kind of diseases, whensoever pleaseth him? but besides him alone none can help. There are therefore some incurable diseases, which cannot be cured by any *Panacea*, yet not the Quartane, Leprosie, Gout, Epilepsie, and Dropsie, as most men think, though Experience (or the being put on trial) should witness the contrary. And although that all humane diseases be, in process of Years and Ages become worse, and more troublesome, and doe, together with the augmentation of sins, encrease; Yet the most bounteous God hath also bestowed thus much, that there are more and more efficacious and natural Remedies to be found out (by the Divine instinct) by diligent men.

It happened some few years ago, that an honest man's child, of about some ten years old, had its Tongue perforated with many Exulcerations, which pained it very much day and night. To cure which, the Parents spared for no costs nor pains, and consulted with divers of their neighbouring Physicians, but they used all their Labour and Skill to no purpose, for the Exulcerations daily encreased with much pain, and grew worse and worse; and the poor child, being destitute of all help, wasted away. Then, at last, they called me to advise with them, and having told me how many, and otherwise famous Physicians, could not by all the labour and pains they bestowed for full two years do any thing to the purpose, but had at last left the poor child destitute of help and succour. I seeing the effect, considered that this was nothing else but a Corrosive Catarrh arising from infected blood, which did so possess the Tongue, and perforate it, and was the cause of this burning, eating, and cancrus effect, and so hitherto refused any kind of healing, and gave the Parents such an answer, that in my opinion there was no better way to meet with this evil, than by some purging Minerals, which were capable of working upon even the fix'd humours, and of bringing them away, and that to be done principally by an Antimonial Vomit. The Parents assented to my opinion, and requested me to begin the cure, the which I did, and first I gave a small Dose of my Antimonial *Panacea*, not doubting but that it would stir up one Vomit at the least; but yet it fell out otherwise, for there succeeded no sensible operation at all: The following day I gave again the same Dose, but without any sensible operation too, but yet nevertheless all the pain vanished,

F f and

and the Child could again move its Tongue, and use it, and also ask't for Meat, which it had not done in a year before, but was forced to be content with Broths, because its Tongue could not brook any solid food. The third day I administred the same Dose again, and so the Exulcerations began to be consolidated, and all the whole Tongue was thoroughly healed in eight days space, inasmuch that there scarce appeared any place where it had been ulcerated; and the Child daily grew better and better, its natural Colour returned, the which drew all that knew it into admiration as well as my self. By this Cure that I have told you of, the vertue and efficacy of my *Panacea* did farther manifest unto me what I knew not before to be in it, nor should ever have believed it, (had I not perceived a manifest operation) *viz.* that the Bloud should, by the help of so little Medicine, which was not in all above six grains, be able in such a short space of time to effect so much; And afterwards I perceived the same effects in other Diseases likewise, and found that the daily use of this Medicine did not onely shew its operation upon the Tartar in the Reins and Bladder not as yet coagulated, but did by little and little lessen the already hardened Sand and Stone, and in length of time expell it: And did also in succets of time resolve and root out even Podagrical inveterate humours.

But thus much may suffice to have been spoken of the common Antimonial *Panacea*. This name *Panacea* hath made some envious men stare, and such as judge this Medicament unworthy such a name, seeing it is prepared out of so vile a subject, and doth withall sometimes (when too unskilfully handled) stir up vehement Vomings, which is not the property of a *Panacea* to do. That I may answer such, I say, that the name *Panacea* denoteth such a Medicament as may profitably be administred in all Diseases, the which thing the *Panacea* of Antimony is also wont to doe as daily experience testifies. But as for its being taken out of such a vile and (by many brethren in ignorance) despised subject, that doth not at all derogate from its Name, provided that the Medicine thence drawn performs those things that are spoken of it. Pray what brought David, that contemptible Shepherd, unto a Kingdom? was not he of a low name, and low birth: the same is to be understood of this Medicament. It is its most noble efficacy and operation hath given it this name, and not its vile birth, nor contemptible nativity and abject form. Neither is this any lett thereunto, *viz.* that it is prepared out of a mean subject, and such a one as the ignorant condemn and despise, and which (before its preparation) was a Poison: for the Poison is now transmuted by the help of Art, and of the fire, into a wholesome Medicament, and the more strong operation thereof, such as to cause vehement Vomits, is not to be imputed to the Medicine it self, but unto the abuse of it. For so the best Wine and most fragrant Spices, are a poison to such as do abuse them. Abuse may turn the best Medicine into Poison; and Art and Fire, both can and usually are wont to turn Poison into a Medicament. That which I have often spoken, I do here again repeat, and call God and the Truth to witness, that I never met with any subject, that might with more profit be transmuted into a wholesome Medicine, than the vile and contemptible Antimony; The which I will take care to see it prepared ready for the Poors use: And as for the Rich, to them I commend the Golden Purple-coloured *Panacea*, which hath the same efficacy as

the former has, but herein differs from it, *viz.* it operates more gently, and is less sensible in the operation, and may be far more safely administred unto Infants and old Men, and may be doubled in the Dose. Some few years since, many men of high and low degree have by the help of this Medicine been freed, not onely from the Gout, but from other grievous and inveterate Diseases: Nor have I ever heard since the time I have prepared it, for my Neighbours benefit, that the use of it wanted some good effect: Nor is there any cause to fear offending by the abuse or excess thereof, as is in the vulgar Antimonial Medicament. But this Golden Medicine will rarely stir up Vomiting in the sick, unless a due measure be by a wanton abuse exceeded, or the Dose too too much enlarged. For this reason I will hereafter have by me, for such as need the same, this Golden Medicine, in the form of a Purple Powder, and the common Antimonial (because that it being like a red Powder may be easily counterfeited, and so ill-prepared Antimony may chance to be sold to the sick instead of a *Panacea*) shall be ready made up in Pills, and in that form onely, each of which shall contain one Grain, that so being ready weighed the sick that use them may receive no detriment by weighing and so taking them. These now may be used by such men as are of a midling age, or elder; but to those that are Infants, and aged, and weak persons I commend the Golden, as operating more gently and safely. The Antimonial *Panacea* made up in a Pillular form, may be most exceedingly profitable in those long East and West-India Navigations, in which the Souldiers and Mariners are so extremely troubled with the Scurvy, and debilitated thereby, and yet have so little benefit or help from the Medicaments which they carry with them. Now this Medicine is able so far to help them, as that they may make their Navigations with a more courageous and more cheerfull mind. For I have not hitherto met with any subject in the whole nature of things, that can oppose it self with greater efficacy against all the corruption of the bloud, and oppilations of the inward members, than this Medicine; the which both Souldiers and Marriners may have with them, it being not very dear, nor easily corruptible, and so make use thereof in necessitous Cases. There is not to be found in the whole World a more commodious and more wholesome Medicine, as well for the Marriners that sail for many Months in the vast Ocean, as for the Souldiers lying in Camps, that undergo troubles and discommodities of all sorts, and lead a disorderly life. And therefore if Chyrurgions that be in Ships and Camps were furnished with this Medicament, they would verily preserve the lives of many Marriners and Souldiers, and would with one onely Ounce, which is of no great price, out of which may some Hundreds of Doses be made, easily effect far more than with a whole Chest full of such Medicaments as are but of small virtue. If a Physician or Chyrurgion, that follows the Camp, had by him some Ounces, he would preserve the Lives of many Thousands of men, which would otherwise miserably perish. It is a Medicine of ease carriage, and as easily kept, which is a thing deservedly to be accounted of, seeing it much concerneth him who is a Commander, to have at hand some present remedy for his Souldiers that are usually oppressed with the Plague, Scurvy, Dysentery, malignant Feavers, and other such like diseases, with which whole heaps of them perish, as Flies do in a cold season. This incomparable

comparable Medicine doth easily resist all those diseases. Upon this account I will have ready by me for time to come, good store of this Medicament, and such as need the same may seek it from me, and be made partakers thereof. I will perform the office of a good Christian, who being not born onely for himself, but for his Neighbours too, ought to be helpfull unto them, even as the hand helps the hand, and one member helps another, the which thing verily every one should necessarily (and well worthy it is to be) observe more carefully.

Next this Antimonial Medicine, in the form of Pills, and the Golden *Panacea* (of a Purple Colour) follows, my *Nepenthes*, or Anodine medicament, allaying all Pains, and is made of corrected *Opium*, extract of Saffron, and the Volatile Sulphur of Vitriol. Every one knows that *Opium* is stupefactive and soporiferous, because so much mention is made of the correcting and preparing it, and the way, described by many, of so doing; For they well perceived, that it being sometimes imprudently administered, did not onely cause sleep, but brought also the brother of Sleep too, *viz.* Death, insomuch that the sick being cast into an everlasting sleep, could not be awakened any more, (for it is a praise-worthy Medicament, and such an one as will beget credit enough;) and therefore they not knowing how to take away this Poison, did bend their studies thereabouts more and more, to correct the *Opium*, and to tame the venomous force it had. Therefore they dried it thoroughly, and reduced it into Powder, and dissolved it with Spirit of Wine or Vinegar, and extracted it, and by distillation abstracted these *Mensfrusum*, and brought the extracted *Opium* to the consistency of Honey, and thereto admixed a certain portion of the best Saffron, wherewith they endeavoured to tame and correct the venomous quality of the *Opium*. Others mixed that Powder with Oil of Anniseeds, Liquid Storax, or extract of Saffron, (which are Simples that will procure Sleep without *Opium*) and made it up in a Mass, and accounted it a most excellent confection, as being every-where hitherto in the Apothecaries shops, and used by the Physicians with good success, sometimes in many deplorable diseases: And is even to this day (and deservedly too) in use, for there could not be found a better and more safe one. But now forasmuch as a better and safer way is found out, 'tis but just to admit of this, and omit the other which is not so good. Since the time that I knew the use of the Universal Dissolvent, or moist and cold Fire, I found out and corrected many Subjects by the help of the same. And amongst others, I dissolved *Opium* in the Liquor of Niter after my way, and prepared it, and perceived wonderfull effects therein, but especially when I adjoined to it the Volatile Sulphur of Vitriol, which is of it self an excellent and incomparable Somniferous Anodine, allaying all Pains with a wonderfull success. I also hereunto added the Essence of Saffron, a wonderfull strengthener of the Heart. *Opium* being uncorrected, is a vehement Saturnine stupefier, which doth by its immoderate stupefying property constringe as it were and choke the Vital faculties, insomuch that the often using the same make men pale, and to sleep (for the most part) with their mouths and eyes open, and they can hardly be awakened before the operation thereof be over: And therefore many do deservedly abhor the use of the same. The adding of the Oil of Anniseed and Saffron, may in some sort restrain the cruel rage of

it, but cannot thoroughly subdue it; But yet even this may be done with ease, when being reduced unto Powder, it be dissolved with the Volatile Spirit of Vitriol, instead of the Spirit of Wine or Vinegar, and so strained through a Paper, and precipitated with the contrary (or different nature) Liquor of Niter, and be washed with common Water, be dried and prepared into a Mass with the Essence of Saffron, in which operation the Narcotick Sulphur of the Vitriol adjoins it self to the *Opium*, and this is far better, and corrects it by its sulphureous and acid Spirit. But that the Spirit of Vitriol is most fit for this effect, I will shew the well-minded Reader. The common Vitriol doth, for the most part, consist of a Sulphureous Salt, and of an Earth containing Iron or Copper. But when it is distilled by the Fire, the Spirit of the Salt carrieth up with it a Volatile and Sulphureous Spirit out of the *Mars*; the which being precipitated with somewhat that is of a contrary nature, affords you a subtil Narcotick Sulphur, very little in quantity, but of a most wonderfull efficacy, the which I have made mention of in the Second Part of my Furnaces. But if now there be added to the Calcined Vitriol an equal weight of Iron filings or Iron cinders, such as are smitten off from the red-hot Iron on an Anvil, and half a pound of Salt-peter, and a water be distilled out of these matters thus conjoined, the Spirit of Niter will bring over a great portion of the Spirit of *Mars*. This Volatile Sulphureous Spirit is to be separated from the Corrosive Spirit by rectification, and to be distilled into a Receiver that has in it a little fair water. This Volatile rectified Spirit, and not that corrosive one that was left behind in the rectification, is to be used for the dissolving and correcting of the *Opium*. And although that many diligent Chymists have before now understood somewhat of this Narcotick Vitriol, as I my self did, yet we have done but little as to the preparation thereof. But at length when on a certain time I had added Filings of Iron to Calcined Vitriol, to distill thence from an *Aq. Fortis*, my Retort being very red-hot, did by chance break, so that the matter fell out into the fire, out of which proceeded so sulphureous a fume, and so much, and so filled all the Laboratory that I could not stay in the Room; therefore I took the live Coals out of the Furnace, as speedily as possible I could, because of the suppressions and difficulties (of breathing) which that Spirit overwhelmed me as it were withall, and hardly got my self out of the Laboratory-door, but having got a little fresh Air, I presently came to my self again, and perceived that the whole House was filled with the fume, and therefore to let it out, I opened all the windows and doors of the House. When I had thus done, presently hapned another danger, for the burning Coals that I had pulled out of the Furnace, had kindled the other Coals that were next them; There being danger of fire, and that I might prevent it (being destitute of water, and in the night-time hapning) I ran to the rest that were sleeping in the Chamber, to get them to arise and fetch water, and to help me quench the fire. But they slept so exceeding soundly, that though I called and did my best to awaken them about quenching the fire, yet was I forced to go about it my self, and do it as well as I could. Having quenched it, away go I into the Chamber to see what they were doing of, and I found them all oppressed with a most heavy sleep, yea and the sweat dropped from all their faces, though it was Winter-season. When

it was light they awoke and arose, to whom I told the danger I was in, and that I could not awaken them. They all of them confessed that they dreamed that they were oppressed with some heavy thing, so that they could not stir themselves. From this mischance, learned I two things, the first is this, viz. that in Vitriol and Iron lay hid an highly Narcotick Sulphur: The other was this, what the cause is that some Men but especially melancholy Men do in the Night Dream, that they are so oppressed with some thing, and yet cannot be awakened. For the Sulphureous martial and saturnine Vapours which cast the Brain and Heart into such straits, and do bind as 'twere the vital Spirits with a Cord, do cause such Dreams. This breaking therefore of my Retort, discovered to me an excellent Medicine, and the Disease subject to the same, so that there is nothing so evil out of which some good doth not sometimes spring up. I judged it worth my labour, to gratifie those that are studious in Medicine by adding to the foregoing things, this story, hoping it will not be a thing tedious to any. Besides this is worthy of consideration, that hapned to one of the Children sleeping in the same case, whose head was much troubled with phlegminess, but the Catarrhs were so dissolved and loosened by the efficacy of this fume, that it was ever after of a sound head. From hence did I conjecture that there was more to be found in the Sulphur of Vitriol than can be believed, and this did I conjoyn with the corrected Opium, by the often use of which Medicine, I have freed many Children from the Epilepsie or Convulsions, and found besides that it was most exceedingly profitable for old Men, and such as were of riper years; But with this proviso, that my Antimonial Panacea be first administered, to those of a miding Age, and my golden Panacea to Infants and old Men, which being premised or first used, this most excellent Nephretick, can by so much the better and more commodiously display its virtues. By this Medicine all internal pains, a disquiet mind, and light headedness in Fevers, are allayed, a quiet and gentle sleep procured, the Winds and Gripes of Infants and elder Men, that afflict their Bellies and Intestines are driven away, a good ingenuity and chearfull mind is procured, all wild and unquiet Spirits that molest the Heart and Brain are restrained and laid a sleep: The vital Spirit being overcome and suppressed with corrupt humours is reduced to its former liberty, and the lost strength and vigour of the Body so happily restored, that a most evident help is presently perceived, and principally if the Opium be well corrected by the help of the volatile Spirit of Vitriol. It may likewise be profitably corrected by the fixd Liquor of Niter, extracted with Spirit of Wine, and be reduced into an Essence. But if this correction be made by the acid Spirit, it is better and more profitable, than that made by fixd Niter. For in correcting it by the fixd Niter, the corrected Essence is to be extracted by Spirit of Wine, which makes the powers of the Opium too volatile and penetrative, the which thing we seek not after in this place, being it is far better, that the Opium sets upon his enemy leisurely and not too strongly; and this experience sufficiently testifies the necessity of. This most excellent medicine is one of the four Cardinal Pillars, whereon the whole fabrick of medicine is built. The Antimonial Panacea is a most excellent and safe purge, most fit to drive out all the evil humours out of the whole Body. The golden Panacea is the best and most excellent

Diaphoretick and Sudorifick. But the corrected Opium and vitriolate Sulphur is the most eminent Anodine and Somniferous Medicament.

A Diuretick and Nephretick, extracted by the help of a certain proper Vegetable Spirit, and endued with excellent Virtues.

TAKE of Cantharides one ounce, *Asellor* Hegl-Lice two ounces, put into a Glass, and pour upon them three ounces of the Spirit of Niter, and dissolve the Vermine in a gentle heat, that they may be reduced into Water, which will be in few hours, or else leave them in a Cellar for some days and nights, and they will be dissolved as well as in the heat. Afterwards add to this Solution three ounces of Earth-worms and leave them yet for some days more in the Cellar. When they are all dissolved strain them through a fine Linnen Cloth, put in a Funnel of Glass, that the Solution may be separated from the Faeces, which if many, squeeze well the Cloth with your Fingers, that the whole Solution may be separated from the Faeces, then throw away the said remaining Faeces. And to the Solution that you strained through the Funnel into the Glass, pour the Liquor of fixd Niter by little and little, and so long until all the ebullition shall have ceased, and a thorough precipitation be made. All things thus done, separate the Liquor by pouring them off from the Vermine, and coagulate it, that it may be again made Salt Peter, and be usefull for more occasions. Wash your precipitated Vermine well with common Water, thereby freeing them from all saltness, and dry them in a gentle heat, that they may be reduced into a pillular form, or into an Electuary: The which medicament may be most safely and without all danger used in the Stone, of the Bladder and Reins, being given from one, two, four, six, eight, and twelve grains at most, according to the condition of the Sick: For it brings forth the Urine and the Sandiness and Tartar; that is, as yet uncongealed, and not lumped together in the Reins and Bladder. If any one desire to have them shew their Virtues more strongly, he may then extract the dissolved, precipitated, washed, dried, and corrected Vermine with some burning Spirit of Saxifrage, Parsly, Juniper berries, Ash, or such like Stone expelling Herbs, that so there may be yet again a separation of Faeces, and the Spirit may draw unto it self the purest Essence. This Spirit being separated by a gentle heat in a B leaves in the bottom an Essence like a red Balsam, which is far sweeter, profitabler, and pleasanter in the forenamed Diseases, than it was before the extraction, when in the form of Powder, Pills, or Electuary. N.B. If a venereal Medicine be to be prepared out of the Earth-worms, then the Cantharides and *Aselli* are to be omitted, and an half part of those venereal Vermine, which are in the Summer Months in Gardens, and adhere to old Seats, and old Walls in abundance, to be added to the Worms, and to these is to be added one fourth part of a Stage Pizzle and all to be prepared after that manner we have taught and prescribed. The Worms are to be gathered at such a time as the Earth first opens it self after the cold Season, and may be dig'd out, that so you may have the Worms before they creep forth out of the Earth, and have enervated each other by their coition, for when they are thus gotten they are endued with wonderful virtues, and are far more efficacious than they

be afterwards. These Worms being dissolved, precipitated, and well washed with common Water; if they are yet once extracted by the burning Spirit of Satyrion, Hop, or Sparagus-roots, and reduced into a sweet Essence, do become a present and effectual Medicament against impotency.

All Diuretick and principally Earth-worms being matured and corrected, have a power to strengthen the venereal faculty. But the correcting of them must not be after the usual Kitchen way of Women, where Wine, Sugar, Spices, and such like things are added to correct any subject by. No, but it is to be done by the benefit of Fire, after a Philosophical manner, without the addition of any other things, nor with the Kitchen Fire, but with that Philosophical, moist, vaporous, digesting, altering, penetrating, ripening, amending, conserving, and in one degree always abiding Fire, the which is to be sought after in Niter. Great is the error that is committed in the decoctions of Vegetables, when Herbs, Flowers, Seeds and the like are boiled in some Liquors, as Water, Wine, Ale, and the like, and being boiled the decoction is given the Sick to drink, as if it had extracted all the virtues of the Herbs; nor is it in the mean time considered that in such decoctions, the penetrating and effectual Spirit, and sweet Oil vapoured away with the water into the Air, and yet may this be easily smelt, for the Vapour that goes out in such boilings is always endued with a sweeter Odour than the remainder left behind is, and which they use in Medicine, and this can be denied by none. Why I pray are the Waters in the Shops, where abundance of them are used, and sold, wont to be distilled now, not any more in a *B. per se*, but for the most part, in a Copper Still with common water added, to prevent burning too; of which waters it is likewise said, that they are as good as those that be distilled in a *B. per se*, without Water, and this is agreeable to truth: For in the distillation, the most subtil moisture of the herb only rising up, and the common Water (as being the heavier) stays behind in the bottom of the Still, and therefore they have a certain sign in the distillation of the said waters, *viz.* when the ascending water, tastes no more of the distilled herb: Then do they desist from farther operating, and cast away the remaining herb with the water in the bottom. But such whose study it is to make sweeter and more efficacious Waters, do take the water which came off in the distillation, and pour it upon more of the fresh herb, and do again distil it, and draw off the most pure part of the herb, and make their Water more efficacious, which way of preparing the Waters of Herbs, is good and profitable. Besides every one knows, that the Spirit and Oils of Vegetables, are to be distilled by a Copper Still by the apposition of a great deal of Water, as we have taught in the first part of this *Pharmacopoeia*: It is therefore manifest, that the common decoction of herbs in water is of no value, and that the best part vanisheth away into the Air in boiling, and that the less sweet, and most efficacious part alone remains behind. Some skilfull Cooks know this full well, and never put in the Spices into the Pot to boil, but let the Flesh be first boiled, and already set at the Table, by which they take care of losing the best Odour of the Spices by boiling them. If you go by the Ale-Brewers when they are boiling the Hop, and the Houses of the Apothecaries, you shall meet with a far sweeter fragrant, and what doth more comfort the heart,

than what remains behind, and is given men to drink? And this cannot be otherwise, by the forealleged reasons, for the chiefeft and best part go away in boiling. Therefore I do here again repeat what I said before, and do affirm, that that Decoction which is done in the cold by the universal fiery Water, is to be preferred far before that otherway. Now it is sufficiently enough known that the greatest part of the food we eat, whether Flesh, Fish, or Pulse, are wont to be boiled in the Kitchen by the help of Water to preserve them from burning; that thereby they may be the better digested and concocted by the Stomach. And why are not medicaments prepared after the same manner? Now though in the decoction of Flesh, Fish, and Pulse, there goes off some of the virtues of the same, yet that is a matter of no great moment, for the remainder is what stuffs the Stomach from whence the body may get its nourishment. But in medicinal decoctions, no such great quantity is to be administered, but a little of them given to the Sick to drink of; and therefore they must necessarily have their virtues left in them, and not be deprived of them by decoction, and yet this Curtation of theirs cannot be shunned when the decoctions are done over the fire with common water in open Vessels. This way therefore of mine, by the fiery Water is far to be preferred before that other way. For in this decoction there can't be lost so much as the least virtues of the herb or Animal, seeing it is done in the Cold. But all abide together, in the watery or fiery Water, are ripened, bettered, and changed into medicine, and must necessarily be transmuted, whether they will or not. There is no way for the virtues to go off as is in that other decoction, where the most noble virtues vanish away in the Air. Therefore this digesting, conserving, ripening, and amending Fire and Water ought to be highly esteemed by the Physicians, wherewith they may prepare their medicaments, or at least for the preparing of some few good ones which cannot else be gotten, as is apparent in Diureticks, which being so inverted by this Philosophical water, do not only afterwards expel Urine, and the Stone, and all things pertaining thereunto; but do also corroborate, even as all things that have a hot subtil and penetrating Nature whether simples or compounds are wont to do: Inasmuch that they do not any more cause torments and pains by a forceable expulsion of Urine and the Stone, but do gently and sweetly stir up to a casting them out, and do withal strengthen and conserve the virile Nature: But contrarily those immature and crude Simples, do by their Crudity and Wildness hurt, and not only expel Urine, but even stir up pains. This discourse and proposed matter, concerning the watery Fire and fiery Water (by the benefit of which venomous Vegetables, Animals and Minerals may be (as I have taught) turned into wholesome medicaments) will haply create in many some disagreeable Cogitations, and may seem to them as if it were a strange thing, that I should call the Liquor of fixt Niter, and the Spirit of corrosive Niter, fiery Waters, and watery Fires, whereas there is in them no apparent visible Fire. Well, to remove this Scuple from their minds, I do in the first place judge it expedient to demonstrate that Niter is no other than a mere Fire: For put but Niter on a live Coal, and 'twill all rise up and burn away in the Air: this now is evidently seen in Gun-powder, in which the Salt-peter is together with those other added matters discharged all of

it into the Air. Niter being brought by Calcination to a fixity or constancy in the Fire, or else by distillation to a corrosive Water, hath not for all this lost its fire, but hath it as yet perfectly with it self. And that this is true is hereby cleared, viz. that both those Liquors the fixt and the corrosive volatile one being mixt together, do deposit that nature they got from the Fire, and do return to their form, or Saltpeter nature. Hence may it be manifestly proved that both these Liquors as well the fixt one as the acid Spirit may and ought to be called fiery Waters, seeing that they do in very deed demonstrate their fiery vertues. For they do yet retain their Fire, and do melt all things and reduce them into Water, whatsoever you put into them. This demonstration I hope is a sufficient satisfactory testimony to such as have any understanding though not so well skilled in the light of nature. But that I may yet meet with the most unskillful of men, who are for the most part wont to measure by their most unskillful fancy, such things as are to them wholly unknown, and that I may set it most clearly before their Eyes, that the said Waters are mere true Fires; I would persuade them that for trial of the truth they would put one little drop onely or one small piece of a Grain upon their Tongues, and see whether or no they will not in less than a moment of time find, and say that that Fire is hidden in the Water, and is just as if their Tongue had been touched with a Coal of Fire. But if they would see the very flame it self, they may coagulate or concenter either both or either Liquor, either by Antimony or *Lapis Calaminaris*, by which all Corrosives do chiefly love to be concentered, and to put off their adjoined Waters. Therefore when you have a mind to see a flame pour upon your concentrated acid Spirit, or on your fixt Liquor of Niter, the pure Spirit of Wine, and what is separated from all Phlegm: By which pouring on, the hidden Fire of the concentrated Niter, will forthwith manifest it self, and will kindle and burn up the Spirit of Wine. If he would yet farther try the truth of this thing, let him fix Niter by *Regulus Martis*, and coagulate it into a fiery Mass, and keep it in a strong earthen Vessel well shut, that so the Air enter not therein, and that the Fire may remain so long hidden as he pleaseth. Now if he would have it grow hot, let him pour in a little water into the Vessel, which done the hidden Fire will become presently manifest, and make the Vessel so hot, that it cannot be held in ones hand: By how much the more the Water is that is poured thereupon, so much the hotter the Vessel becomes, so that by the too much effusion of water, there is danger of the Vessels breaking into Pieces. A mean therefore is to be observed in the pouring water on, if you would have your Vessel endure the longer, and give a lasting heat. This secret doth not onely reach the Miracles of Nature, but is likewise profitable for such as journey in the Winter Season, whether in a Wagon, or a Ship, day and night, in exceeding cold Weather, for by the help of such a Vessel may they heat themselves. For if they have a Vessel containing about one or two Pounds of this concentrated Fire, it will keep heat for 24 hours: And so in case of necessity such as Journey may have with them greater and more Vessels, and not be scantied of this Fire. And if in the extremity of cold they want water, they may heat the Vessel by stirring up the same Fire with their own Urine. How vile soever this secret appears, yet lies there

in it a great mystery, and what is serving to true Philosophy, and in which such a Fire lies hid as was buried by the Priests, mentioned in the *Maccabees*, and after some hundreds of years again digged out and found. For such a kind of Fire being fenced against the access of the Air, remains uncorrupt for too, yea a thousand years, and this verily is a thing most worthy of diligent consideration. We have by what has been said sufficiently demonstrated that fixt Niter is a mere Fire, and that it manifests it self so to be whensoever any one is so minded as to try. The acid Liquor doth the same, and hath a far different nature and property from the fixt Niter, the which nevertheless doth also produce to light its occult Fire according as the Artist pleaseth, and is on this wise done. Dissolve in it Iron or *Lapis Calaminaris*, and draw off the moisture by Fire, N. B. You shall have nothing else come over or evaporate save onely a sweet water void of all salt, and the fiery part will concenter it self in the Iron or in the *Lapis Calaminaris*, and become a fiery and dry Earth, the which being preserved against the ingress of the Air, will remain dry, nor will it ever change it self into water. This fiery Spirit thus concentrated in this Earth is so burning hot, that if it be put to the Tongue in no bigger a piece than a Hempseed, it will burn it just as if you had touched it with an hot Iron. And if you would have fire thereout of, pour in some Spirit of Wine, and you shall see the flame break out: But if you would warm your self with that hear, as we before spake of in the fixt Niter, then put in a few drops of water, which done, the hidden and concentrated Fire will become manifested (as in the fixt Niter) and continue a long while, if there be not too much water poured thereupon. If you would quench your Fire and have the Vessel cool, then shut it, and if you would have it again hot, then open it and pour on a little water. Thus therefore shalt thou have this Fire most ready for thy use whensoever thou hast a mind to employ it. So then all these things do most abundantly confirm that the acid Spirit of Niter is a cold and hidden Fire, for if you put into it a little piece of Iron or *Lapis Calaminaris*, it will make the glass so hot, that you cannot hold it in your hand. We hereby learn that from this Original do the Baths arise, and is thus. When an acid mineral Spirit joins it self in the Mountains to some Fountain of sweet Water, and doth together therewithal pass through some Mines of *Lapis Calaminaris*, or Iron, it becometh so hot that it breaks out like water heated in a Copper. Nor are Baths any where to be found save in Mountains, and in places that abound with *Lapis Calaminaris* or Veins of Iron, as may be seen in many places, but especially in that of *Aquis Granum*, where the most curious or bravest Baths of all Europe are found to be, and the Mountains that lie round it do abound with Iron, and *Lapis Calaminaris*. But as concerning those other profitable and gallant Secrets, that lie hidden in this concentrated Fire, 'tis not expedient to speak of them here. We have revealed to you enough already, and he that learns nothing hencefrom, shall have nothing, nor is it given him of God to know the unsearchable properties of this Fire, and to open the Gate of true Philosophy and Hermetical Medicine. Here then the Son of Art sees what a concentrated Fire is able to effect, and how its many vertues are as yet impeded by reason of the Earth, (consisting of the Iron *Calaminaris*, and Antimony) wherein it is included

cluded and hindered from answering the event that may be hoped for from it. For an impure body is able even to make a pure Soul inhabiting in it, ignoble and impure, yea and plainly to kill it; and this may be understood as well of Men as Minerals. Now it may be easily conjectured what such a pure Soul, and which is separated from all Faces is able to do. Things incredible and almost Divine may be effected by such a Fire. The Fire of common Wood and Coals, if concentrated will perform things wonderfull. But I pray what then will the concentrated Fire of the Sun do, which is a thousand times purer than that. Next after God, is the Sun, next the Sun the Fire of Coals and Wood, is of all things in the whole World, the most noble. Were it lawfull openly for me to declare my opinion of the Fire for the rude and unskilfull to understand, I should enlighten many a dark Corner. For the Elementary Sun, which bestows upon the whole World all Light, and all Life, is nothing else but the Garment and Covering as it were of the omnipotent God. If then the Garment and Covering be so noble, so efficacious, and so potent, in its Essence, how great then is and ever will be the Majesty of God, that Eternal Light and Center of all Lights? We cannot so much as look upon that Garment, viz. the Sun without hurting our sight, nor search out its wonderfull virtues and properties by all our speculations, and as I may say, Philosophations. Why then are Men so foolish to speak, and think so lightly of God, and yet know nothing of him? Hence is it that almost every one feigns to himself a peculiar God, and worshippeth and adoreth him, which horrid impiety, the true and onely God abominates. The Ancient Physicians attributed the round fiery Sphere that hath its rise from God, unto the Sun, and figured it out by the sign of perfection, viz. a Circle with a prick in the middle, whereby the Center is deciphered. But seeing that in all things, the Center is far more noble and excellent than the circumference it self, which hath its birth from the Center, but the circumference it self doth by so much the more differ from the Center, and is more unequal to it, by how much the farther off it is from it: And contrariwise, is to be judged so much the equaller to it, by how much the nearer it approacheth thereunto: What then shall the prick in the Sun be, seeing that the Sun it self being but as the circumference to that point, be such a most noble and excellent Essence? What name shall we call that point by? To whom is it lawfull thus to do, (viz. to describe that name) in this perverse World? I even constrained, though against my will, to forbear farther discoursing thereabouts, and to refer it to my Treatise of the concentrating of the Heaven and the Earth. But thus much I say, that our Terrestrial Fire which we daily make use of, is the first degree of that Ladder whereby we ascend to God, so as to comprehend (or lay hold on) this omnipotency, to perceive and search into it, to Love, Fear, Worship, and at last to see and be rendred (through Divine Grace) partaker of the Divine Majesty: Seeing then that the common Fire and which every body knows is as I will yet again say, the first degree in that Scale or Ladder, whereby we may ascend to God and his Mysteries, and yet the property thereof is so much unknown unto us: What I pray shall we think then of the second and third degree, the which we know nothing of, though we think our selves to know so much. I do therefore affirm here, and that boldly,

that our knowledge is as nothing, and there is not one amongst many thousands that knows the second, (much less the third) degree. But haply hereafter I shall speak and demonstrate more things of this nature.

A Cordial and Comfortative to be used in great and continual Diseases.

TAKE the Flowers of Marjoram, Sage, Rosemary, Mace, two ounces, Nutmegs, Cardamoms, Zedoary, Galangall, one ounce, chosen Cinamon eight ounces, extract the Tincture with Spirit of Wine, then dissolve in rectified Spirit of Salt, and which is acuated by an addition of Niter, one ounce of Gold: Pour this Solution to the Spirit of Wine, which is impregnated with the Tincture of the said simples, and put them to distill in a Glass Retort in a dry B. There will first come over the Aromaticall Spirit of Wine, not onely sweet but withall clear, which when it begins to come white and troubled, take off the Glass that you received your Spirit in, and put on another, and draw off all the moisture in a gentle heat, till there comes out no more Spirit of Wine, and an acid Water of an unpleasant Taft follows. Then take out all the Fire from under your Retort, that it may cool. In which (when all is cool) and the Solution taken forth, you shall find the Oil of the Spices swimming on the top, which is as red as blood and is impregnated with the Tincture of the Gold: The which being separated by a separating Glass from the Spirit of the Salt, you must add to the Aromaticall Wine that came first over, which will presently imbibe the said Oil, and be tinged with a most curious red. As for the remaining Gold, which the Oil of the Spices hath not attracted to it self, you may precipitate into a tender and bright Calc, and wash it well with water and add it to the Aromaticall Spirit, and Oil with a sufficient quantity of Sugar Candy, that the Spirit may be rendred sweet and pleasant. So shall you have a most efficacious *Aqua Vitæ*, the which doth wonderfully corroborate and refresh the Sick, in all kinds of weakneses. But this precipitation is not to be made like as the common is, in which the Powders that are precipitated do lose their Metalline form as Gold, which being changed into a yellow Powder is called fulminating Gold, and being put upon a Plate, and heated, gives a noise like a Gun, the sound it gives is very loud, and the blow strikes downwards, so that the bigness of a small Pea being kindled in a silver Spoon will make a little hole. But you are to precipitate the Gold on such wise as that it may retain a Metalline form, but so tender and fine that it may be well brooked even in the Eyes. Neither must all the Gold be precipitated, but onely the most noble part, and as it were its Soul, which as to its colour is much fairer and sublimer than common Gold is. But the more vile part is to be separated by a peculiar precipitation, and to be reduced by fusion. To this pale part is its former colour to be restored by Antimony, so that no loss may be made. If then the former part being precipitated, is better than pure common Gold, the latter part must necessarily be (being reduced by fusion) more vile, or thus, if the latter be baser than common pure Gold, the former shall be better than it is, and will therefore be more profitable in Medicine, forasmuch as it will (being digested and consumed in the Stomach) display its virtues, which the common filed Gold,

Gold, or yet the Leaf Gold will not do. I purposely tried this matter, and found the things I tell you of, to be true. But if so be as any doubt as yet of this thing, concerning the first precipitated Gold as being the best part thereof, and which we bid you to add to the Aromatized Spirit, he may melt it down with some *Borax*, and compare it with the latter precipitated Gold, and then he will easily perceive the wide difference that is betwixt them. The first will as to its Colour, far exceed the Gold of the best Duckats or Rose Noble, but the latter will be far worse. That first being again dissolved and precipitated after a Philosophical manner, that half of it may again settle down, it will become more noble, and again leave behind it a particle of pale Gold. Which operation is verily most worthy admiration, by the help whereof, Gold certainly may be at length haply so concentrated, as to be able (when reduced to the highest nobility, colour, efficacy and virtue) to give colour to the other metals, and amend them. But this is not what I have hitherto, for want of time, tried: But I hope (God permitting me) shortly to shew such a Gold to the studious of Art, seeking after it merely for this cause, that I might thereof make an excellent medicine. I will treat more plainly and more fully in my fourth part of the Prosperity of *Germany*, concerning the Artificial and Philosophical Concentration of Gold and Silver into good Medicaments; but that I may here give the Lovers of Art some small Testimony how such a precipitation may be effected, take with you these few things. The precipitation may be done as well in the dry as moist way, but there the moist way is used, which is requisite in the making of this Medicine, but yet it is troublesome and hazardous, because that sometimes the glasses break, and the Gold falls amongst the Ashes. But the dry way and which is void of any danger, belongs not to this place but to the fourth part of the Prosperity of my Country. I mention it for this end only, that it may be seen and considered, that it is possible to make some Separation in Gold as well as in the meaner metals. For he that knows how by the benefit of Art to make a Separation in some metals of the best part from the worst, hath a profitable amendment of the metal. We teach in the second part of the Prosperity of *Germany*, how the volatile and unripe Minerals, may by Niter be reduced into malleable Metals. In the third part we shew the way of turning the common and imperfect Metals into perfect Gold and Silver. Then at last in the fourth part we shew by what means Gold and Silver may be advanced into more than perfect Bodies and appertaining to medicine; concerning which Separation more shall be spoken in what next follows. Nor hath any one reason to make any Scruple and imagine that I contradict my self, seeing that in the aforesaid medicament I make use of precipitation and render Gold; and yet have openly in many places spoken the contrary, *viz.* that corporeal Gold can not be concocted and digested in the Stomach, and this I have most often tried. For the Gold which we teach the precipitation of here is much better and more noble than the common Gold, and upon that account is not to be accounted of as corporeal, but for the very Kernel, and Soul thereof as it were, which being digested in the Stomach of a man, doth produce its virtues into open light. *N.B.* That the said golden *Aq. Vite* being to be used, you must first shake the glass a little wherein it is kept, that to the

most subtil Atomes of the Gold may conmix themselves with the *Aq. Vite*; then afterwards some few drops of the same according as the Person and Disease is, are to be administered in some convenient Vehicle. If you make trial with one or two small drops, you shall experience its wonderfull heart strengthening Vertues, and its most profitable use in all weakneses.

Another Metallick Medicament prepared by the help of Nitre, out of a Vein of Lead containing Silver, and most profitable in all the Sickneses or Distempers of the Brain.

TAKE a Vein of Lead that is rich in Silver, nor hath either Copper or Iron mixed with it, but by how much the richer it is with Silver, so much the better and more beneficial is it for this work. Separate from this Vein all the Sulphureity or Brimstoniness by Niter, according to the Spagyricall Art, that to the most pure, most subtil, and most highly Volatile and fluid Mercurial part may remain. Wash off the Niter as carefully as you can, and separate it, that a bright snow coloured heavy Powder may remain. This most exceeding fluid and Volatile Powder is the *Mercury of Saturn*, 1, 2, 3, 4, 5, even to 12 grains thereof, being administered in convenient Vehicles, doth exceeding quickly yield help in all grievous affects of the Brain, in the Plague, Pains of Children that are troubled with Worms; it quencheth all internal heat, and withholds the gross Vapours from ascending up into the Brain, it opens all the obstructions of the Liver, exhilarates the melancholy, restores the Lunatick, foolish and phantastick Ingeny, especially if their Bodies be first prepared by my Antimonial *Panacea*. Nay more, this Cephalick medicament will operate yet better, if after the first preparation by Niter it be again washed, and made more subtil, yea and plainly fixed, that so it may exercise its virtues and power with the greater efficacy. Last of all, it is yet rendered most efficacious, if this *Mercury of Saturn* be in the last Operation driven over in a Retort and to converted into a sweet Milk, demonstrating the truth of that Philosophical saying, *The Fire and Azoth do wash the Laton*. Niter is the true Azoth of the Philosophers, and besides it, is no other to be found: It is the Scope of the wise men, the universal Bath of Metals; The said sweet Milk may be coagulated, and fixed into a transparent and fluid Stone, which again coagulateth and fixeth common purged Mercury. But I have not as yet brought it to such pass as to undergo *Saturn's* trial in the Cupel as they call it; yet am I doing it, and hope to bring it to pass. But although the Stone is yet volatile, yet doth it penetrate the imperfect Metals as *Mars* and *Venus*, and makes them easily fluxible and volatile; but seeing it does so now, what would it do were it reduced to a fixity, this any one may easily conjecture what effects it would have. Haply this work is not much different from the work of the little Countreyman. But seeing that purification is not different from this matter, we think it worth while briefly to teach, what it is, and in what it consisteth: But principally because all my writings tend to this end, *viz.* the separating of the pure from the impure, from which ground have we given this Book its name. Few are they that know the way and manner of Separations, and therefore we deem'd it highly necessary to speak somewhat thereof in this place:

place. For all the Philosophers do cry out with one voice, make the fixt volatile, and the volatile fixt. An hard and fixt thing doth by laying down its Earth become fluid and volatile, and this is a Philosophical separation and operation; after it comes sublimation and distillation, by which a thing is yet again made more pure, being separated from its gross Faces. For by how much the oftner any thing is distilled or sublimed, so much the purer doth it become, and by how much the purer it is, so much the more efficacious and penetrative it is found to be. Now again if the most pure part of that thing be brought to such a pass as that it will resist the most violent and all things consuming forces of the Fire, every one will easily conjecture what may be obtained by such like operations as these. These things we have spoken do shew the metallick purification, effected by the benefit of the Spagyricall Art. The abluion of Vegetables, Animals, and Minerals is threefold; The first washing carries off by the help of Water the adhering impurities, as Sand, Powder, and Earth. The second separates the thin and watery parts from the earthy ones, by distillation, and doth the same thing as sublimation is known to do in the separation of Metals. The third separation is performed by the Fire, viz. when the subject that is to be purified is made red hot in the Fire, that so the combustible Sulphur being inflamed may be consumed, the Mercury may go away in fume, and the fixt Earth only with the Salt stay behind, the which is to be understood of Vegetables and Animals. The case stands otherwise with the Metals, whose three principles are so knit by nature with so straight and radical a tie, into such an homogenous matter and so hard, that they very hardly admit of separation, but do either very slowly and by little and little ascend together by Cohobation, or else abide constantly together in the bottom. And albeit that some black Metal, be either by sublimation elevated into Flores, or by calcination reduced into white Ashes, yet after reduction the Metal is found to be as before of the same form, and endued with the same properties, which it had before calcination, so that these operations do no ways deserve the name of Philosophical Purgations. How many have deceived themselves, by thinking if they turned *Mars* into a red *Crocus* they should therewithal make *Lune* fixt, not considering that that *Crocus* returns by reduction to its own former nature and Iron shape. Common *Mercury* is precipitated into a most fair and most red Powder, and returneth by reduction to its first running nature. *Saturn* being calcined by common Salt becomes red Powder, or a *Minium*, which being reduced is the same Black-lead as it was before. Hereupon may such an one be deservedly said to wash the Black-moor that bestows his labour on this work. The same *Saturn* being washed with Vinegar or any other corrosive liquor, gives indeed a white Ceruse, but it is but a borrowed colour, and he covers his black body over with a white Robe, but yet for all that is presently disrobed of the same by *Vulcan*: The true Philosophers do nothing esteem of this sophistical Purification. *Saturn* is by all the Philosophers accounted for a black and leproous Gold, for they openly say, that there is in *Saturn* what the Philosophers seek: Read but *Paracelsus* his Book of the vexation of the Alchymists, and there he mentions more. Nor is it without cause that that old Symbol or Proverb is used amongst the Chymists. *The Fire and Azoth do wash Laton*. *Azoth* is Niter, and *La-*

ton signifies the matter of the Stone. Some do ascribe *Laton* to *Saturn*, I will forbear, only thus much is to be observed, that the word *Laton* signifies the matter of the Stone, which is to be washed by *Azoth* or the *Acetum* of the Philosophers that is Niter. Verily I well know that besides the common *Saturn* and Antimony, there is another, more easily washed by Niter; but because we here treat of the Vulgar, or the first *Ens of Lune*, and the reducing it into a good Medicament by Niter, we will acquiesce in what is already spoken, & put off the explication of the said matter to another place.

A Uterine approved Medicament.

FORasmuch as I have hitherto taught the preparation of some notably efficacious Medicines by the help of Niter, and yet have not in the mean while made any mention of the Sickneses familiar to the Feminine Sex. I judged it wholly necessary to help this weak and infirm Sex (which is appointed for the propagation of mankind) with some singular Medicament: For (besides those Diseases whereto the Women are subject as well as the Male Sex) they are yet afflicted with many Sickneses that do arise out of the Matrix, wherewith all as well Maids as married Women, and these last also are troubled not only before Child-bearing, but afterwards, viz. when the Matrix is not well purged after Child birth, and so begets various Sickneses, Pains, Winds, Inflammations, Suffocations, the ascending of evil Vapours unto the Heart, or else by obstruction of the Menstrues, do cause a swelling Belly, Weakness, Debilitation of the Strength, a straightning of the Heart and Brain, most vehement Griets, and lastly Death it self: Or else the Matrix may be moved out of its place, in Child birth, its Bonds broken; and the Matrix it self so much repleated and debilitated with overmuch moisture, that it has not so much power as to be put and retained firm in its due place; but some are constrained to leave it hanging out, to their great detriment, and are extremely tormented with this so great a detriment, the Matrix presently slips down out of the Body by either vehemently walking, or any other violent motions, and are necessitated always to carry about them a pessary framed to the intent of keeping the said Matrix up in their bodies, and that to their exceeding great trouble. Now then for the meeting with, and resisting these aforementioned and other such like discommodities, but especially such as are overwhelmed (as it were) with them, I will set down the way and manner of so doing. As concerning the Matrix and its Diseases which do arise after Childbirth, if so be that the Matrix be not rightly cleansed, even the Women themselves know their own Remedies, and do for that reason plant those Herbs that are usefull thereto in their own Gardens, or gather them in a fit season and so keep them by them, till they have need to use them in expelling the remains and trash left after Childbirth: Such as these are *Pulegium*, or Penny-royal, Mother-wort, Mug-wort, Savin, and the like Herbs, which have a powerfull expulsive virtue, and there are waters too in the Apothecaries Shops distilled to this intent, concerning which it is needless to write any more in this place: Thus much only we would advise, that such Herbs and Species as are used for such effects, are to be rendred first more subtile by separating the pure from the impure, that they may afterwards operate more speedily and better. The which thing may be most commodiously done on such wise and manner as I have taught,

and prescribed in the first Part of this *Spagyricall Pharmacopoeia* concerning the Essences of Herbs. But the obstructions of the Matrix, and stoppage of the *Menstrues* are not so easily unlocked by bare Medicaments thus barely taken in, for they penetrate not so far with their Vertues, but rather, as experience teacheth, is effected by such Medicaments as are applied beneath, and that more easily, and which we have already mentioned in the Second Part of the Furnaces in the Ch. of Spirit of Urine, where I have manifested a peculiar instrument by which such necessary Medicaments may be intromitted into the Matrix. I have therewithall hitherto performed many happy Cures. But forasmuch as I have since that time found out a far fitter instrument for such diseases, I will clearly describe it for the sake, comfort, and help, of such Women as are obedient to their Husbands; and chastly observe the bands of Wedlock, *viz.* both how to prepare and how to apply the same. You are to get an Instrument made of good Silver (not of Copper) its figure to be round, and like a small Cane, and shut in the fore part, and to be a little longer than a man's finger, and about that bigness; You are likewise to get another a little smaller so as to go into the other, which other or bigger one must have three little edges on its inside all the length of it, thereby to keep the smaller instrument about the back of a knives breadth from each side of the bigger one, that so it may not touch it. In the hinder part let be a Cover made which may shut the Instrument tight when the Medicine is put in, lest the spiritual vertue of the same fly back out of the body, and so order it that it may perform its operation on the Matrix through the Instrument, which is to be perforated (towards the top) with holes. To the hinder part of this Instrument let a Thread be tied whereby it may be plucked out when its operation is over: Therefore like as the disease is, so shall a suitable Medicament (and what is made exceeding Spiritual) be applied: On this wise let a small piece of fine Sponge be embued therewithall, and let the inner small Pipe be filled therewith, and be so put up to the Matrix. If the *Menstrues* be obstructed, then the most approved remedy is the concentrated Spirit of Urine, which by its subtle, penetrating, warming, mollifying, and opening vertue opens the little Veins of the Matrix, and gives an Exit to the obstructed *Menstrues*. But if the Matrix labour not with this disease, but is onely besieged as it were with cold and tenacious humours, then the hot and penetrating Oil of Tiles or Wax, rectified most subtilly, is to be applied, which being lineared on some Sponge, is to be conveyed in by the Instrument into the cold and watry Matrix, the which will thereby be warmed, dried, and freed from the greatness of its moisture. But if so be the Matrix shall be moved out of its place, or its cords broken, or too much relaxed, or any other way affected, and so not be capable of retaining the Matrix, and keeping it from sliding forth out of the body; Then must astringent things be used, which may constringe the too much loosened bands, and may heal and tie the Matrix again in its due place, and strengthen it. Such as these are the distilled Oils out of mens hair, out of the Wool of Sheep, and such-like Animals, out of the Horns of Goats, Claws of wild Beasts, and Feathers of wild and ravenous Birds, and such-like things, which being laid upon the Coals, do draw themselves up together, and do by that contraction shew to us as it were their use. But the manner of distilling and

rectifying these Oils we have already taught in the Second Part of our Furnaces, so that it is plainly needless to repeat the same in this place. I say, and that truly, that if so be that these three kinds of Medicaments be rightly applied in those three affects of the Matrix, that they will perform things even wonderfull, and many pious Mothers might be preserved sound, a longer time amongst their poor Children, were they but help'd by such remedies. For it cannot be that much help should be brought to the sick and hurt Matrix by the Portions that are drunk of, or the hysterical watry Medicines that are injected by a Syringe. For such Medicaments as are taken in at the mouth cannot penetrate with their Vertues home to the Matrix, so as to help it, to open, to purge, and to heal it, or to heal the dissolved and relaxed bands. And as for Waters and Decoctions that are applied beneath, and there injected, they presently slide out again, and do help the Matrix but little, or nothing at all. But now these Oils of mine and Spirits are commodiously applied by means of the Instrument, and discharge their office most efficaciously. But there is yet one thing necessary here to advise you of, *viz.* that such as desire to use the Spirit of Urine, Oil of Tiles, or Wax, or Oils out of Horns, Hairs, or Feathers, for curing of the said defects of the Matrix, do prepare them themselves, or commit them to such to prepare them, as are skilled in the Art of distillation, and versed in rectifying such Spirits and Oils, thereby exalting them to the highest subtilty. For if so be that any would buy in some Apothecaries shop, those things that he knows not how they are prepared, and haply such as are corrupted already, and not fit for use, will be grossly mistaken. For it is not sufficient (if a thing is to be made use of) that it hath a bare name onely, and be destitute of the Vertues themselves, and which are no ways effectual) for the said Sicknesses of the Matrix are here taught to be cured not with corporeal, but with spiritual and efficacious Medicaments. It is therefore necessarily requisite, that the Medicines we have spoken of, *viz.* those Oils and Spirits, be excellently well prepared, and so as to exercise their Vertues by emitting or ejecting their invisible odour and vigour onely. The Spirit of Urine is to be so volatile and very subtille, as that it will vanish away out of an opened glass, and therefore there needs a greater diligence in preserving and keeping it: It is to be well preserved in glasses close stopp'd, for if the Spirit vanisheth away, there remains onely an unprofitable Water void of all kind of Vertues. I have therefore taught the making of peculiar Glasses, which will not let go the Spirits, the shape of them are described in the Second Part of my Chymical Furnaces, in that place where I treat of the Spirit of Urine. In like manner the said Oils are to be well rectified, and to be made exceedingly volatile, so that being exposed some few hours to the warm Air, they will vanish away; which if they will not doe, neither will they effect ought. I must needs confess that all the time in which I have lived, I never found a good Spirit of Urine, nor well rectified Oil of Wax or Tiles. I will say nothing of the Spirits of Hairs, Horns, Feathers or Quills (for there's no use of them). I have indeed found amongst many, a bare worthless, stultish Phlegm, but the very true Spirit of Urine it self I have not met withall. The Oils of Tiles and Wax are indeed found in all Apothecaries shops, but are for the most part corrupted by their long lying, and

and are old, thickish, red, tenacious, and deprived of their due odour, are sinking, and spoiled of all their virtues. For 'tis very rare that such Oils are rectified, but are sold, such as they be, when they come first out of the Retort, with a falsh kind of Acrimony adjoined unto them, which in the rectification abides in the bottom, and is at last separated from the Oil. Such Oils are of no value, and appertain not to this curing, for they will do just nothing; and thus much I could not omit advising you of. For haply when some sick person or other readeth here in this my book, that such Oils do most highly conduce to expell the said defaults of the Matrix, and yet perceive no comfort or help by the use of them, without doubt the fault will be laid on me, as that I had written a lie, and not upon the ill prepared Oils. This therefore do I affirm, that except your Oils be good, you will never have from them the hoped for event. And how (indeed) shall the sick man know if the Oils be good or not. The Merchant or Seller of them won't confess them to be old, ill prepared, and deprived of their odour. So oft times the fault is laid upon the Apothecary, and he's condemned for writing unprofitable things, and which are not agreeable to the truth. But the fault verily can light on none save upon the Magistrates, who (by winking at such things) do permit it. And when any one goes to be furnished with these things which are requisite, in some Apothecaries shop, and the Apothecary haply sells but few Wares, and all the rest wax old as they lie, and are corrupted; and if haply sometimes one or two such and such Simples or Medicaments be sought for but once or twice, it may be, in a whole year, he delivers the things he has by him, which if helpless as to the sick buyer, yet are helpfull to the Apothecaries purse. But yet this is an unjust thing, and a thing contrary to the love that is due unto our Neighbour, and what will burthen the Conscience. The sick man thirsting for help, puts the hope of his help and comfort in the Medicine exhibited him, which if not good the disease prevailing, the sick man dyes, but had good and profitable Medicaments been used, instead of the unprofitable and evil ones, he might have recovered. He therefore that is guilty of such evils, let him look to it, what account he will at last give unto God for his transgression; That which I have aforesaid, doe I again repeat, and do yet firmly alledge, that the before-mentioned Spirit of Urine, as likewise the Oils of Tiles and Wax, and those other Oils of Horns, Hairs, and Feathers, and their most efficacious Spirits may be made use of in the expulsion of the affects of the Matrix of what kind soever, both in the younger Maids or Women, and in those that are of riper years, and that with most high admiration. It is therefore a just and right thing that they should be found in all the Apothecaries shops, and that they should all of them be prepared after a due manner. For they are not onely good in those diseases that afflict the Womb, but do likewise operate miraculously and doe things incredible in many other diseases and affects of the Body if well and rightly prepared and duly administered inwardly and outwardly; Concerning which we have written more at large in the Second Part of the Furnaces, viz. how they are to be prepared and made use of. Any one that is endued with understanding will perceive easily that a living Spirit is far more efficacious than a dead Body and exanimated Carcass. Forasmuch therefore as you have here heard that such grievous

and incurable (so accounted at least by almost all Men) diseases of the Matrix, by which so many Women are swept away without any help, are to be cured by the alone application of subtile Spirits, and so few know the preparation of them, I will teach for the sake of that weaker Sex a better and more effectual Medicine, and withall will prove it by an example, that all subtile Spagyric Spirits may be concentrated and augmented in their Virtues by the help of Art, and that one Spirit hath the power of concentrating another. And because this Treatise, and all the Medicaments therein proposed, aim onely at this end, to shew the wonderfull Vertues of Niter; And it hath been besides shown, how all the said Medicaments ought, by the help thereof, to be prepared; the same shall likewise be done in the demonstration of this Medicine.

I taught in the Second Part of my Furnaces to prepare a Spirit of Urine and *Sal Armeniack* by the addition of Calcined Tartar; But yet the already concentrated Urine or *Sal Armeniack* may be mixed with double the quantity as its own weight is, of fixed Niter, and so be distilled, for so those Spirits will be more strong and more efficacious than if Tartar were added unto them. And if the Oil of Tiles or of Wax, which is made by the addition of Earth, so heated as to imbibe the Oil or Wax, be yet once more distilled by the concentrated Spirit of Niter, it will be brought to the highest subtilty, and 'tis to be done after this following manner.

Dissolve in one pound of the Spirit of Niter, four ounces of *Lapis Calaminaris*; Put the Solution in a Glass-Viol upon a vaporous or dry B, that the Phlegm may evaporate by little and little (for the *Lapis Calaminaris* holds all the Spirits, and permits the Phlegm to go off) and the Spirit of Niter will remain behind in the Viol-like Oil. Take one part of this concentrated Spirit of Niter, and half a part of Oil of Tiles or Wax, put them both in a glass Retort well luted, and force them out (by a distillation in Sand) from the concentrated Spirit into a great Receiver; and by this operation it will be far more penetrative than it was before. For the Spirit of Niter being by concentration by the *Calaminaris* freed from all its Phlegm, and seeing it is thereby become the more attractive, and can find nothing else that it might attract, it associates to its self all the humidity that lies hidden in the Oil, and which could not be separated by the former distillation, and hereby brings to pass that the Oil doth necessarily become more subtile and efficacious, yea so penetrative, as that it performeth wonderfull things, especially in the effects of the Matrix, the which nought but very subtile Spirits can heal, and which those concentrated Spirits are wont to do far more certainly and securely than all the other Medicaments in the whole world: After the same manner is the concentration and purification of the other Oils to be performed. And now that none might scruple as to Waters being mixed with the said Oil or Wax, which have no affinity with Water, the separation of which from the Oils, I have here taught; I would have such an one to know, that much fatness, as the expressed Oils of Vegetables are never without an aqueous moisture, though it be invisible, and cannot be perceived. For the fire can make it manifest by distillation: As for instance; There's Oil olive, one pound of which is wont to yield six or seven Lots of Acid Water by distillation; and thus do all Oils; Wax, Turpentine, Rosin, Gums, Pitch,

Pitch, Amber, and all combustible fatnesses. Yea even the very burning Spirit of Wine it self, and such others as are prepared of Vegetables, can never be thoroughly rid of their Phlegm, unless they be poured on some Calcined Salt, and so rectified, they leave their humidity therein, and become more subtle. But this is to be noted, that by how much the drier and more attractive that Salt shall be, so much the readier will it attract the moisture out of the winy Spirit and hold it. Therefore the Salts of Vegetables, Calcined Tartar, and principally fixed Niter, serve for such a rectification. The other Corrosive Salts, as fixt *Sal Armeniack*, Calcined Vitriol, and such like, do rather love to hold and retain the Phlegm of their own peculiar Volatile Spirit than of the Spirit of Wine. And thus much let suffice as to making subtle Oils more subtle, that they may perform wonderfull things in Medicine. And now having described in this my Second Part of the *Spagyricall Pharmacopœa*, some of the most necessary Medicaments, that are preparable by Niter, and have shewed the way of using them, and which may safely be given in chief diseases as well for preservation as cure: I could to these add many more, and so encrease the number of them. But because there are not a few of such good kind of Medicaments in the writing I have hitherto published, viz. in the first, second, third, fourth, and fifth Part of the Furnaces, in the *Miraculum Mundi*, and in the Mineral-Book, and there shall yet follow more in the following third Part in this *Pharmacopœa Spagyrica*, in the Vegetable work, as also in the second, third, and fourth Parts of the Prosperity of my Country, I judged it needless any longer to dwell on these here, but will only by way of conclusion, and for (as it were) ornaments sake, yet add one onely Medicament of Niter, which will be none of the meanest. But so far as much as this is not a common preparation, but comprehends in it great Mysteries, it seems not good unto me to set down its preparation before the eyes of the perverse world. Let it therefore suffice to give onely some hint, that the Common Niter, which to our Eyes appears most white, doth contain in it a Soul of a deep red Colour, which by the benefit of the Vulcanick Art may be thence educed. For when *Vulcan* hath reduced that old Dragon, bound in Chains, unto a most high streight by his Iron and fiery Mallet, and yet cannot plainly kill him; *Neptune* coming in to help, meets the Basilisk with a clear Looking-glass, and turns on him his own peculiar poison, and so slays him. As soon as he begins to die, and ceaseth to vomit forth fire, *Neptune* laying aside all fear, approacheth boldly near him, and puts a Sheeps-skin over his Jaws, and receives his Bloud and Soul, and precipitates it into the Salt-sea, wherein being drowned and choaked, he lays off all his venome and all his filth, and is converted into a most fair and most red Medicine. One onely drop of this Soul of Niter can tinge an ordinary glass full of Common water with a golden Colour. But he that can turn this Bloud of the Dragon by the help of fire into a fire-resisting Salamander, he may deservedly be compared with the happy *Jason*, and obtain most great Honours, Treasures, and Riches. From all these things may a studious Artist easily see what Mysteries lie hid in Niter. The things which I have hitherto described are onely as it were small sparklings of those kinds of Mysteries that lie hidden in Niter. There shall be described in the fourth Part of the Prosperity of my Country, and in the follow-

ing third Treatise of this *Spagyricall Pharmacopœa* more and eminenter Metallick Medicines, and which are preparable by Niter: and this is done to the intent, that every one may know, how wonderfull and excellent a subject Niter is, the which is notably hidden by the Antients, and never wont to be called by its true name, but by Enigmatical Riddles. From hence has sprung up even infinite names, as, a dry water, a water not wetting the hands, an Hermaphroditical Mercury, a *Balneum Regium*, the Soap of the Wife men, the flying Dragon, the Urine of Boys, a Dunghill, Azoth, the washer of Laton, a most sharp Vinegar, the Stygian-water, the Death of the Living, the Life of the Dead, the Purgatory of the imperfect Bodies, the Basilisk, the forked Serpent, the most great Venome, the Venome of Herbs, the *Menstrue* of Women, and such like infinite names, whereby they have wrapped over its true hidden name in Cimmerian darkneses, but is now by me revealed, and is set before the eyes of the whole world, and it shall farther be revealed and detected in the three remaining Treatises of the Prosperity of Germany, which shall very shortly follow, and so its wonderfull power and most efficacious vertues, which it performeth in the bettering of Metals, and in preparing Metalline Medicaments may be manifested and laid open before the whole world. I will not onely declare this in writing, but also will (God permitting) very shortly shew, even manually and in very deed in a convenient Laboratory, the making and use of all my Furnaces, hitherto published in my writings, and the preparation of many excellent Medicines, as also the truth of the metallick Transmutation. Nor will I do thus to the end that I may advance my own profit, but will rather do it for this intent, viz. that the health and safety of many thousands may be provided for that are afflicted with various sicknesses, and that the whole World may see, believe and confess, that the Transmutation of Metals by the abject Niter may be effected. But because in such a like demonstration, if the Laboratory be frequented but for one years space onely, and daily laboured in, and the confecting of so many Medicaments be shown, such a great quantity of various Medicaments as I shall have by me, cannot be all used by my self, nor can they be of any use if laid up, and therefore they shall be sold to any one for a small and vile price, that so they may each that needs them use them in their necessity. It is not Covetousness that driveth us thus to doe, thinking thereby to get great riches, but onely to get just as much as may serve to pay for all the necessary matters, as Coals, Glasses, and other things. So then by this so good and laudable a work, there will not onely be laid open to the whole world, the occult Mysteries of Nature, to the honour of God: But withall, the most miserable poor Sick will easily obtain good Medicaments, and recover their former health. Nay farther, not a few of such as have been in want will be able by the most profitable use of Niter in transmuting the inferiour Metals into better, be able to sustain themselves better and more quietly. But that the whole world may see and consider that my own peculiar profit and gain is not sought, but that my Neighbours profit is out of a Christian affection onely aimed at, there shall be adjoined at the end of the following third Part, the price of every Medicament; from whence every one may easily conjecture, that there is not expected any gain or large profit, but onely the re-

covering

recovering of my disbursements; seeing no one is to be found who, bestowing great costs in teaching others, would willingly lose both his Expences and Labour too. I will with a willing mind teach others, but I will not lay out my Money and run the hazard. The World is wise enough, and great is the number of those sick people that need help: And therefore this publick Laboratory will (by God's help) be able to bring abundance of profit to all mankind; In this Laboratory there shall be all the Furnaces and all the Instruments whereof I have made mention in the Writings by me published, but the resemblances of them not pictured, because there's no occasion for that to be added: And withall, those Furnaces, Presses, and Instruments which we have mentioned or shall mention in the first, second, third, and fourth Part of the Prosperity of my Country, and in

the Vegetable work, and my other Writings shall be there to be seen, the which certainly will be exceedingly helpfull to most men that abhor not to labour, to procure them food and sustenance in their necessity.

Furthermore, forasmuch as all my Writings hitherto published, are very negligently and faultily printed here and there by other men, against my knowledge. I will again send them forth corrected, amended, adorned, and encreased with the figures hitherto omitted. And this I was unwilling to conceal from the Lovers and Students of Arts. Herewithall will I conclude this Second Part of my *Spagyricall Dispensatory*, and shortly add the Third Part, onely wishing that this Work of mine may serve for the comfort and assistance of very many sick persons. Amen.

The End of the Second Part.

THE THIRD PART OF THE Spagyricall Pharmacopœa.

Wherein is taught, how by Salt and Fire, the Vegetables, Animals and Minerals may by a *Spagyricall* way and method be Mundified, and how from them, Medicaments wonderfully penetrating and most speedily operating may be prepared.

AS for the manner of reducing Vegetables, Animals, and Minerals, by Distillation into good and pure Medicaments, by the help of the Spirits of Salt, thus stands the case: The manner and way of distilling Vegetables, Animals, or Minerals *per se*, after the common manner or way into Oil, Spirit, and Volatile Salt either in a B. Sand, or naked Fire, which hath been long ago, and also is at this day in much use, I cannot in all respects commend, because that such Spirits, Oils, and Volatile Salts, (whether from Animals, or Vegetables) do all of them stink, and though they be often rectified, yet do they not totally lose that innate stink gotten in their Distillation, but do always retain a kind of an ungratefull *Empireum*, and are thereby loathsome to the Sick (and that not without cause too) whereas otherwise they have abundance of virtues; but being rectified with Spirit of Salt (as I have taught in the second Part of my Furnaces)

they become pure, and losing their stink are gratefull and acceptable, but not at all so without that rectification. Now all Men know, especially the Spagyricists, that the chief virtues of Vegetables and Animals are placed in their Oils and Volatile Salts, (for you must note that in Minerals the contrary is found, for their mercurial parts are most virtuous) but both Oil and Salt do in distilling by a Retort pass over adust or burnt, and therefore are not made use of, and (the more's the pity) are serviceable to none. For all such as distill the Oils of Vegetables, by the apposition of common water, in Copper Stills, do know how very little a Portion is obtained by such a process, and that the greatest part of them (Oils) do abide in the Still, and are of no profit, because common water can't be made hot enough, to drive out the fatness, but it gives onely some little portion, the residue is made thick and tenacious by the boiling, and remaineth in the Herbs: Hereupon some

I Men

Men knowing this thing, do add to the Herbs common Salt, and Tartar of Wine, whereby the water being rendred one degree hotter, gives more Oil: This is a way that I do indeed approve of, but yet the one half part of the Oil will not ascend, and therefore distilled Oils are commonly very dear, especially if made out of dear things. Whereas if the Oils were distilled by this method of mine, they would have much more Oil, whereby the poor might also buy them. I will instance in one similitude whereby it shall appear, what great profit may be made by distilling of Oils according to my method, and what a vast difference there is betwixt my method here described, and the common usual way. Suppose therefore that I seek after an excellent Medicine for the Stone, and that I do certainly know that it lies in the Ash, (as I have clearly enough discovered in the first and second part of this *Spagyricall Pharmacopœa*, certainly knowing, that the Oil distilled out of its Seed doth (by manifold experience) far exceed all other Medicaments against the Stone.) This Ash indeed yields a pretty quantity of Seed, but much of that Seed yields but very little Oil, because 'tis resinous, and doth not distill over with the water, and upon that account is prepared but by a few, and such poor Men as are sick, can't partake of it because of its dearth, and this is much to be bewailed, that the Omnipotent God should set before our Eyes this Medicine in such plenty and yet no body enjoy it. Besides this is to be observed, that if some diligent Physician should distill such an Oil, and yet not know how to correct it according to my method, he may sometimes do more hurt than good, because that Oil brings over with it a certain volatile Salt, which (infects or works on) the Copper Vessel it is distilled in, and the Copper refrigeratory which it passeth through, and is usually thereby rendred yellowish, or green, and hath been by many discreet Men made use of without any regard thereunto, and (by reason of the Copper) hath put a nauſeate and debility of Stomach upon the Sick, and hath been more hurtfull than beneficial. But now if they had rectified it with Spirit of Salt once, or at least well shook it in a Glass with the said Salt Spirit, that so the Copper might have been extracted by the Spirit of Salt, and so have administered it, they had done well, and would have gotten a most excellent Medicine, though I confess somewhat dear, (proceeding this way) because that a Sackfull of the Seed, and as much as a Porter can carry at once, will scarce give two ounces of Oil, and this is too dear for the Poor Man's Purſe.

For the sake therefore of all sick People as well Poor as Rich, I will discover my way that I use in getting the Oils, Spirits, and Volatile Salts out of all the Vegetables, and that in good quantity, and with very small Costs, that so all Men may partake of the gifts of God, and may all have occasion of giving thanks to the Creator of all good things.

Take therefore in Gods name whatsoever Vegetable you list, and fill a great Glass Retort therewithall, and by degrees distill over all that will come. Separate the Oil from the Spirit, and the Spirit by rectification from the Volatile Salt; rectify also this Volatile Salt, and the Spirit upon its own *Caput Mort.* or upon some other Salt of Ashes being first fired and calcined, and so they will become pure and lose that fetid stench that they got in the Distillation: If one rectification is not enough, add a second or a third, always provided that it be done

on the fixed Salt of that Herb out of which you drew the Spirit. Now though the Oil be also depurated by a rectification upon the *Caput Mort.* yet that depuration and rectification is not comparable to this of mine which I mention here, and therefore well do we prefer this way, and 'tis thus.

Take your black distilled Oil, put it in a Glass Retort with six or seven times as much rectified Spirit of Salt, and give first a gentle Fire, then a greater as the thing requires, so the Oil will pass over pure with the Spirit of Salt, and the stench together with the blackness, will stay behind with a part of the Spirit of Salt. If now you will have that Oil yet purer, then rectify it again with new Spirit of Salt untill both the Odour and Colour thereof please you. As for the Oil that stayed behind and did not ascend, separate it from the Spirit of Salt, and 'twill be somewhat thickish like to a black Balsam, and hath great virtue both inwardly and outwardly, but its inward use we need not, for we have enough of the pure Oil for that purpose. But that I may be yet farther serviceable to my Neighbour, and that he may understand me more thereby, I will make use of this similitude or example. Put case, that I have some four, five, or six pounds of the Seed of the Ash, which falls from the Trees in the Month of September or October, I do fill a Retort with the same and by it distill the said Seeds, and I usually have about one or two, sometimes three, four, five, or six drams of black Oil, some ounces of Volatile Salt, and some pounds of Acid Spirit: Now forasmuch as I seek for the Oil only, I separate this from the Spirit, and rectify it with Spirit of Salt untill it becomes pure, and this I keep for my use; and I make of the Spirit either a certain Essence, as I have taught in the first part of my *Pharmacopœa*, or sugared Tablets, (or Lozenges) or what I please: And by this way do I get more Oil out of five or six pound of the Seed of the Trees, than otherwise by the *Vesica* or common hot Still, out of 100 pound, and that which remaineth after rectifying is profitable for external uses, if it be prepared as follows, *viz.* Separate this thick Oil from the Spirit of Salt and mix it with Wax, that so it may be made somewhat thicker, so as to be spread like an Emplaister, the which put upon the Reins, and use the distilled Oil inwardly, and thus this Emplaister will perform as much outwardly as the distilled Oil operates inwardly, and so the Patient is thereby doubly repaired and helped. And if you desire yet a third way of healing, then rectify the acid Spirit well, and dissolve the Volatile Salt by subliming it with the Spirit, and use this Spirit every day (besides the inward use of the distilled Oil) on this wise: Heat it a little, and dip in it some Linnen Cloaths and therewith wash or bath the Back and Reins putting on the Emplaister afterwards, and hereby the Sick Person will in a short time (unless God doth in a singular manner put a stop thereto) certainly recover.

Note well, after this manner may you distill all other Vegetables into Oils, Spirits, and Emplaisters, and make use of them in this Disease, such as are Saxifrage, Parsly, Cumin, Carraways, and such like other Herbs and Roots: Neither is it always necessary to have the Ash Seed, unless you please: For that this Tree is not to be had in all places, and it yields also at some Seasons but little Seed? *N. B.* Here some may demand and say, you have taught us the manner of preparing Oils, Spirits, and Balsams out of the Seeds, but now if such a Medicine could

could be made out of the Herbs it would be something, for whence shall so much Seed be had? I Answer. If thou hast not so much Seed, thou may'st make the Medicine out of the whole Plant, as the Root, Stalk, Flowers, and Leaves: And the reason why I mentioned onely Seed, was this, because the chief virtue of all the Vegetables, is occultly placed and concentrated in the Seed, else the whole Plant may (as aforesaid) be made use of, which although it yield not so much Oil as the Seed does, yet may we even this way receive a good quantity: And if we should neither take Seed, Herb, Leaves, or Stalks, yet would the Root alone afford much Oil; but in Trees, as in Ash, Linden, Nur, Cherry, Peach, and the like, the very bare Wood itself will abundantly supply, if distilled *per descensum*, or by a Fire of suppression (of which afore.) so that a little Ash if rightly handled may afford you some pounds.

Nor are you to suppose that this way of plentifully preparing the Oils of Vegetables and clarifying them by Spirit of Salt, serves onely for such Vegetables as are good against the Stone, because I have onely instanced them as examples; No, but even all Vegetables, serving for every Disease, may be by this aforesaid way reduced into most sweet Medicaments. Nay not onely Vegetables may, but also Animals and Minerals too, but with some difference and distinction, which we shall mention in what follows.

There remains yet one thing more to be mentioned about the Oils of Vegetables, and the Distillation of them, and 'tis this. Some or other may reply and say, that haply such Oils as are prepared first by a Retort and *per descensum*, and then rectified and clarified by Spirit of Salt, are not equivalent in their virtues to those which are distilled in a Copper by the help of Water. For prevention of this Quæry, and the removal of such needless cares, we do in the first place demand, in what the virtues of the Animals and Vegetables do consist, whether or no in their connate and occult property, or in the Odour, Savour, and Taste. For answer, the greatest virtue of most Herbs, and living Creatures doth for the most and greatest part consist in their Co-nate or Co-born nature and property, and not in the Odour or Savour, as is sufficiently evident in some Plants, which have scarce any Odour or Savour, and yet are found notably efficacious in Medicine, and some there are both of a sweet Odour and Savour, which have no Medicinal use, and some that have an ungrateful Odour and Savour, and yet have no mean Medicinal Virtues. And many there be of things which both smell and taste sweet, and are also profitable in medicine, because God hath created them so or to that intent. I must needs confess that sometimes an Odour or Savour of such an Herb as hath but little virtue is notably refreshing and comfortable to the Vital Spirit, nay more, the very seeing of a fair and comely thing is capable of comforting the Heart, and an ugly thing of debilitating it; a notable example hereof we have in a friendly man, and in Gold, as being things which by the very beholding of them do refresh the Heart, whereas contrariwise, an angry man, and a venomous Creature do terrify it, (*viz.* the Heart) and as 'twere make it Sick, yea and sometimes kill outright. Besides, not onely the seeing of such and such objects do profit or hurt, but even the very voice of a man, or of a living Creature do hurt, weaken, and kill, if proceeding from a malignity. Farther, the bare ana-

gination can effect good or evil, heal or hurt; but this belongs not to this place, but such things are treated of in my short Treatise of things natural and supernatural. That which I have here spoken is to this end, that the unskillfull might know, that the virtues of Vegetables do consist more in their Co-born Nature than in the Savour or Odour, and that this Distillation by a Retort, and rectification by Spirit of Salt, can neither add to or diminish from their virtues, because their virtue remains always unhurt, in what manner soever the Distillation be made, provided that that which is distilled be diligently depurated, and all the ungratefulness removed therefrom which it got in the operation, that is to say, when Oils are adust (or Savour of burning) by their being distilled in a Retort, then that accident may be taken away from them by rectification with Spirit of Salt, and this now I add for the sake of the Ignorant.

Moreover as it is with Vegetables, so likewise must you order your distillation of the Oil, Salt, and Spirit of Animals: Neither need you to proceed farther or otherwise. As for the Virtues of both Animals and Vegetables, the Physician ought to know them by their Signature, and not by the books of Writers, because the Signature doth shew us the Virtues of all things much clearer and righter than many Writers, who write many things meerly from hear-say, whereas themselves do in truth know very little or nothing at all. And thus for this time I omit to say any more, for that the present occasion will not admit of a more prolix discourse hereabouts. What I have done is for the Sick that are poor, that they might know my method of purifying the Spirits of the Acid Salts from Vegetables or Animals, by Spirit of Salt, and of bringing them into wholesome Medicaments: And this cannot be accomplished so plentifully without this Medium; and now this way being shown, the Poor may also enjoy the benefit of them, and be able to pay the Apothecary, whereas before even the Rich could hardly have any of the good (in them). Note well, you are yet farther to observe, that indeed the Animals are first to be distilled by a Retort (as we spake before concerning the Vegetables) that so their Oil, Spirit, and Volatile Salt, may pass over together; and their Spirit and Volatile Salt may be rectified and purified the aforesaid way. But the Oil will not come over by a bare Spirit of Common Salt, or of Niter, but that Spirit must be first concentrated with *Calaminaris*, and then it brings over the Oils of Animals, else not. But as touching the Concentration of the Acid Spirit for this rectification, we shall speak of it anon, and will therefore first set down (for better instructions sake) one certain process of distillation and rectification, lest any might err, and that all might rightly apprehend my meaning; and 'tis this: Take some pounds of Turpentine, distill thence an Oil, and the Faces of the Turpentine will stay behind. This Oil though it be rendered by Distillation purer than 'twas before, yet it hath put on another nature by means of the Fire, *viz.* an hotter nature, and therefore serveth not for every effect which the Turpentine before served for, because the Turpentine is not very thick nor very thin, nor too hot or too cold, nor too subtil or too thick or gross, but is of a temperate essence and property, which now by Distillation it possesseth no longer, but because of its heat and subtilty, it is unusefull. Well, what of all this? Why some or other might have objected to me that

that indeed things are by distillation rendered more pure and subtle, but doe thereby get an hotter nature and vertue, and therefore that way of purifying doth not doe well in all subjects. Well, to prevent this objection, and that the distilled Oils may after their purification be restored to the same degree of thickness, rarity or thinness, colour or frigidty, that they had before, and yet retain the purity they got by distilling: the method is easie, and is thus done. Suppose that Turpentine be (as it is Turpentine) hot and subtile in the first degree, but being distilled it arrives to the third degree, and being rectified to the fourth. I must now needs confess that that subtile Oil is to be used onely in cold affects, and in no others, whereas it might before have been employed about other accidents. To this I say, and yield, that if it be proceeded with after the common and known way, 'tis so: But my way is far otherwise to be reckoned of: For though hereby the things distilled doe, together with a purity, get a subtile heat, and doe in some operations become too thin and hot, yet in rectifying them by the Acid Spirit, such qualities are broken, divided and dissipated, so that it is in part rendered of a like thickness and tenacity as it was at first, and a part of it remains subtile. So that you may have out of one subject, both thin, hot, thick and temperate parts together, but both of those parts pure, as shall be evinced by this Example.

The Spirit of Salt, or of Niter is indeed inwardly a mere Fire, but externally a mere Cold, by which all thin things do stiffen and wax hard. Therefore as the distillation doth induce heat, expels and extenuates, so the rectification doth by the acid Spirit compel or drive the same inward, thickeneth it, and reduceth it into an equal temperature: For the Oil in the first distillation is plainly hotter and subtiler both within and without, than 'twas before, but by rectifying it with the acid Spirit, the most subtil part comes over first, then the middle part, and the thickest resides in the bottom, which is of an equal degree of heat and thickness as the Turpentine is, and is as usefull both inwardly and outwardly as the Turpentine it self is. And I have over and above that middle Oil, and that most subtil Spirit burning and penetrative, the which I can make use of for those effects, which require such subtilty, or if I list, thicken it with what I left remaining of it self behind, which is thick, but yet purified, or else thicken it with some other convenient thing. And thus may I reduce one Subject into as many Degrees as I please, whereas the Turpentine had before but onely one Degree: From hence may the friendly Reader see what *Basis* this my distillation and rectification by an acid Spirit hath: Whereby not onely a great deal, yea 3, 4, or 5 times more Oil comes over than by the common hot Still; but also the Volatile Salts and the Spirits, and sharp Vinegars may be hereby gotten out of Vegetables and Animals, and besides a pretty quantity of thick Oil to be externally used, and which otherwise in distillation by water in a *Vesica* or hot Still, would remain wholly behind. The benefit therefore of this distillation and rectification, doth not onely consist in the getting a far greater quantity of the pure Oil, but also in getting the Volatile Salt, (which as to its use is equivalent in vertue to the Oil) and withal, an acid Spirit which abundantly sufficeth both inwardly and outwardly according to its Office. I do therefore earnestly demand of all skilfull Spagyrits (for 'tis in vain to

appeal to such as are yet ignorant what the Art of Fire is) whether or no this distillation is not to be preferred before the others, and to be made use of for the benefit of mankind. I hope that the well minded Reader will follow this rule, and will apprehend from this one process onely, so much as to be afterwards easily able to reduce every distilled Oil into its former hardness, by the help of an acid Spirit. Let us consider Amber onely, 'tis indeed a fine transparent kind of stone, which was before (or at first) soft and fluid as Turpentine was, an Oil or a kind of thin Baumen, but now so hardened by the salt Water that it may be beaten to a Powder, yet may it be distilled and so separated and cleansed from its earthly Nature: And the pure Oil may be reduced into its former hardness, by the help of Spirit of Salt onely: For it became at first hardened by Salt, when it flowed thin out of the Rock: But of this enough, we shall say more of it in another place.

Now follows the Process of purifying Minerals by distillation or sublimation, and of deparating them even to the utmost, by rectifying them by an Acid Spirit. To exemplifie which, I will instance in Common Sulphur, according to which rule the other purification of Minerals may be instituted.

Take common Brimstone, sublime it the usual way into Flowers, or by it self in a Coated glass retort, or let it be mixt with decrepitated Salt, for so will it be freed from its most crude terrestrity, and be rendered fit for a farther Mundification by an Acid Spirit. Take one pound of these Flowers of Sulphur, and put it into a strong Glass Body coated, then pour in one or two pounds of the Spirit of Niter, or of common Salt, and place it in an Earthen vessel in Sand: Put there under a Fire, encreasing it gradually untill the Spirit of Salt boils in the Retort, and the Sulphur melts, and there will swim somewhat like Oil on the top of the Water: N. B. An Alembick is to be put on the Body, lest the Spirit of Salt ascending up, goes away in fume; but in the Alembick it will be refrigerated, condensed, and may be saved. This boiling is finished in some five or six hours, and so the Sulphur is mundified, and becomes as clear and transparent as Glass. For the Spirit of Salt attracteth the Metalline Parts, which are in the Sulphur, whether it be Copper, Arsenick, Auripigment, Vitriol, or such-like impurities which are commonly adherent, and stickers on to the Sulphur, and would otherwise have remained in it, and done more hurt in Medicine: And this *Paracelsus* knew, and adviseth to beware of; For certain it is there lye hidden in Sulphur incredible Vertues, and such as its common Flowers do not shew or discover, as being yet infected with Mineral venenate Spirits, which may be taken thencefrom by the Spirit of Salt. And if then either the Flowers be sublimed out of it, or that it be dissolved in a *Balneum* with Spirit of Juniper, or of Turpentine, or be by any other way reduced into a Liquid form, it doth much good in Medicine, nor is there any more fear of its venomous nature, for the Spirit of Salt hath took that away. I could indeed here mention some preparations of Common Sulphur, into efficacious Medicaments, but that I have intended to proceed no farther with it here, than onely as touching its purification by the Spirit of Salt: the rest we will leave to another time.

As Sulphur may be proceeded with, so likewise may you deal with the other Minerals, and first mundifie them by a Retort, and distill them into black Oils, then may the Oils be clarified with Spirit

rit of Salt, and be reduced into sweet Oils and Balsams. Nor will any man easily believe what notable Vertues there are hidden in the mountainous and terrestrial Minerals, and yet not usefull at all inwardly, because of their Arsenical nature, which may with ease be taken away from them by Spirit of Salt, and be thereby more securely used as to Medicine. And had I not purposely tried it, I would not at all have written of it. For information therefore of the unexperienced, I will tell you a story, whereby it will appear, that those Minerals do usually lodge in them evil and venomous Arsenical Spirits.

In the County or Province of *Erzbach*, situate between the *Maine* and *Neker* in *Franconia*, is found plenty of a Sand knit as it were together by a fluid Mineral, and grown together into huge heaps like little Mountains of a dusky colour; which if you lay on burning Coals, emits a sweet odour altogether like Amber. When I saw it, I put some into a Retort, and distilled an Oil thencefrom, wholly like the Oil of Amber both in colour and smell, and had used it in its stead, had I not shortly after tried another knack: For ordering the Chambers to be fumed with the Sand, because it yielded such a fragrant odour, I very seasonably observed that that fume was unwholesome and venomous, for it caused pains of the Head, and a kind of nausea, 'twas also offensive to the Stomach, and this made me leave off my Fumigations, and set about rectifying the Oil thence distilled, by the Spirit of Salt, and by this means I got a clear and pure Oil, and the Spirit of Salt attracted to it self the Arsenical Essence, which being purged and rectified, yielded me at the bottom real Arsenick, whence I perceived that all those Minerals are very Arsenical, and no ways fit for internal use, unless they be first mundified by the Spirit of Salt. Many such kinds of Minerals are to be found, which we neither care for, nor know: some of which are as hard as a Stone, some thin, some fluid like Oil; such an one is that Fountain about *Baccharach* that boils up in the middle of the *Rhine*, and fills the whole *Rhine* for about three miles space and an half with its fumes, and yields a most fragrant odour, is of a dusky colour. For as I was ferrying by it, I took up some of the water in my hand, and questionless the Fountain of it must needs flow very plentifully, forasmuch as the whole *Rhine* is filled therewith as far as you can see, and yet scarce one Man amongst a hundred or a thousand doe in their sailing by it take notice thereof. Doubtless this Fountain hath its efflux and rise out of the Mountains which border on each side the River. Did it break out at the top of the Earth, it would be worth Gold and Cedar, but lying so deep, 'tis of no use. Were curious Men inhabitants there, they would doubtless find out this Fountain; For on this part of the *Rhine*, where the City *Baccharach* lies, is a high Mountain, where grows precious Wine, and is in Foreign parts sold at a dear rate, because of its most sweet savour and odour, and by the Inhabitants is called *Muscadel*, and 'tis a sort of Wine produced onely in this Mountain; nor can the neighbouring adjacent places make the like. Hence I presume that this Fountain at *Baccharach* ariseth from a Mineral Oil, flowing out from this Mountain into the *Rhine*, and that hence also ariseth the goodness of the Wine. And whereas this Mountain affords not such a quantity of Wine as the Inhabitants wish, they bethought themselves of a remedy for

this scarcity, casting in Herb-scarlet into the common Wine, from which it got the same kind of taste, and became almost *Muscadel*. Nor let it seem strange to any one for the Wine to attract a savour from the Earth lying about it, for 'tis very certain, and I myself have tried it; And since it is so that this matter affords me opportunity of speaking of these things, I will give you my opinion more clearly in what follows.

Below *Frankford*, some four miles from the River *Maine*, there lies a Village called *Hobenbeime* under the *Moguntia* Elector, and there's a Mountain which yields very good Wine, though not of so delicate a savour as that of *Baccharach*, yet 'tis of a sweet smell, whereby it exceeds all the Rhenish Wine, and is therefore dear; The cause of this, I attribute to the Soil, in which the Vines grow, which Soil brings forth Stone Coals, and were heretofore digged hence, and are now again sought after, which Coals have in them a sweet Mineral Oil, as I shall shew you. Farther, there lies a high Mountain at the River *Maine* about the Castle *Klingenberg*, situate between *Odenwall* and *Spejart*, where that Earth is found too, such as I above mentioned, which yields a sweet Oil in distillation. And this Mountain doth likewise produce sweet and good Wine, so that it yields not a whit (in its kind) to that of *Baccharach* or *Hobenbeime*. But now whether or no the Mineral Oil that is not far off to be here found, be wholly the cause, I doe not affirm, but I believe it, for my part, so to be, let another follow his own opinion. There is also a great Mountain at *Herbipolis*, at the *Steine* so called, that yields precious Wine, but not of a savour like these three. Hence arose that Proverb: At *Baccharach* on the *Rhine*, *Herbipolis* on the *Steine*, *Klingenberg* on the *Maine*, and *Hochbeime* on the *Rebn*, are the four best Wines.

I confess there grows good Wine every-where on the River *Maine*, but yet these four do far exceed all the others, and that haply because of that sweet savour which they attract out of the Earth where they grow. For it is certain that the Vine doth draw an odour and savour (more than all other Plants do) out of the Earth, whence it hath its nutriment: So that it is not very difficult for a good Physician to communicate to the Vine any savour that he listeth (which will be) according to the nutriment which is put to the Root. I make no doubt but that there will be some Zoilists that will make a mock of these Reasons of mine, as concerning the ground and rise of the taste of the Wine at *Baccharach*, *Herbipolis*, *Klingenberg* and *Hochbeime*, and will not attribute the cause to the Soil, but say that my Reasons are invalid shallow ones, the which derision I shall patiently undergo: such kind of Men will rather drink the good Wine even to excess, than produce any reasons whence the savour proceeds. But I speak experimentally, and say that the Vines do attract a savour from the Soil whence they are planted, the which I have many a time tried and found so to be. Verily the Gardiners know, that Man's dung will give a nutriment or encrease to Flowers, but yet will put an odd smell upon them; And therefore do they carefully shun the putting it to the Roots of sweet-smelling Flowers, but use it rather to such as are void of odour, as Tulips and such like, that so they may grow the sooner. 'Tis also evidently observed, that if the Root of the Vine be planted in such a place where Man's dung lieth, it acquires an unpleasant odour, and the Grapes are thereby rendered

dered unfit to be eaten. Besides, the most curious Vine-dressers have long ago attained to this experience, that if the Scarlea or any other odoriferous Herb be applied to the Root of the Vine, it will bestow its Odour on the Grapes, (but it serves for no more years than that onely) whereas if they pour upon the Root an Oil of a sweet and strong Odour, that Vine will produce Muscadell for ten years and more, the which I have handled at large in the Vegetable work, and do mention it herein briefly upon this account; Because that a Mineral Oil lies hid in the Earth in abundance, the which being incorporated in Plants, but in Vines especially, produceth excellent Fruits, whereof but a few Men have the knowledge.

But now that I may yet demonstrate this more clearly to the unskillfull, and consequently incredulous, viz. that there is a most great sweetness in the Minerals, which may here be extracted by distillation and rectification with Spirit of Salt, I will instance this example: 'Tis well known to all Men that the Stone Coals which are in many places digged out of the Earth, doe (being burnt) emit an ungratefull Odour, and are hence usually esteemed of as venomous; but in those places where they are plentifully digged, they are daily used in coction, nor doth any hurt arise therefrom: So that it must needs be acknowledged, that they do not stink of themselves, but that the Fire onely is the cause of the stink, and that their innate sateness is of a savoury and sweet-smelling nature, yea so sweet as any Vegetable, as I can easily evidence. You have an Example in Roses, or any other Vegetable, which if distilled by a Retort, loseth its sweet odour, and puts on a smell of burning too: What hinders from being so in Minerals, as in Pit Coals, and the like? I grant indeed, that if enough Oil would come over out of the Vegetables by an hot Still, there would be no need of this distilling by a Retort, and rectifying by Spirit of Salt, because it requires a great deal of labour; but forasmuch as there doth not distill enough over, 'twill behove us to acquiesce in this method. Nor fear I to affirm, that if it were possible to distill an Oil out of such Coals by a hot Still, it would give place to no Aromaticall Oil whatsoever in the sweetness of the smell. From whence, I pray, should so many kinds of Herbs draw such various Odours and Savours, were there not lying hid in the Earth an Universal Sulphur or Balsam?

But to put an end to this discourse, and that I may shew that the Pit-Coals do contain in them an Oil or pretious and wholesome Balsam, no whit inferiour as to its Vertues to any of the most pretious Oils or Balsams brought us out of the Indies observe but this process.

✓ Fill a Retort with Coals, and distill a black Oil, the which separate from the Acid-water that came over the Helm with it, and rectifie it by Spirit of Salt, and so there will first of all come the clear and pure Oil, then a yellow Oil, not so sweet as the former, and the thick and black Oil remains behind, and serves for to be mixt with Emplaisters; for 'tis a wonderfull healer, by reason of its innate siccity; now the yellow Oil may be yet farther rectified once more by Spirit of Salt, that it may become pure, white, and fair: But if you are yet farther minded to make a difference betwixt these pure Oils, and will again rectifie them with new Spirit, then shall you take the most pure part by it self, which as to heat, subtilty, and sweetness, is fully equal to the

true Oil of Peter; and which being kept apart, and used for cold accidents, both inwardly and outwardly, will do the same, yea and much more than is attributed to the Oil of Peter. Nor is there any fear at all of these Oils being Arsenical, for the Spirit of Salt hath took off all the Arsenick in the rectification, and if you please you may use the Oil which comes next after the most subtille Oil in mixing it with Balsams, or it may be safely used by it self, either inwardly or outwardly, and 'twill perform wonderfull things, and such as exceed belief, forasmuch as in Pit-Coals lieth a most great Balsamick vertue; If the depurated Sulphur which we spake of afore be dissolved with this Oil, and reduced into a Balsam, thou shalt have a Medicament, which may deservedly be styled an Universal terrestriall Mineral Balsam, and doth both as to inward and outward uses far exceed all other Balsams: And therefore 'tis in my mind to prepare this Balsam in great quantity, for the benefit of Mankind: The most notable Vertues thereof should I describe, the very description would amount to a particular Treatise, but that belongs not to this place, but it sufficeth me to have at this time explained the manner of the preparation. I may haply (if God please) more largely teach concerning its Vertues, another time, as likewise the Vertues of the rest of my Medicines.

And thus will I put an end to the Third Part of my *Pharmacopœa Spagyrica*, in which I have (in my opinion) mentioned sufficient enough; and although it be but a small Book to sight, yet do great things lie hidden under it, which one amongst a thousand will scarce comprehend. But that the well-minded Reader may understand, what reality there is hidden in this Treatise, I will here teach by way of an Appendix one Process onely, whereby it shall evidently appear how noble the Art of Purging things by distillation is. This operation is well enough known in the Vegetables and Animals, viz. that always from the thing you distill, the purer part comes over first, then the more vile part, but the unprofitable earthiness abides in the bottom with the fixed Salt. Now in Metals this Process is not so well known, nor will it be so soon made publick and common, nor indeed is it expedient, for this world is not worthy the knowledge thereof. But that I may satisfie my premise, and shew, that Metals may by distillation be made Spirits, and purged in the highest degree. I will make use of this following Example: 'Tis known to every one, that if any dry thing is to be distilled by the fire, some moisture must be mingled therewithall, which may attract to it self the gross and heavy part, as you may see in the common distillation of Herbs, to which Herbs (when dry) Water is added, with which their favour and vertue distilleth over: And to every dry thing there is requisite its proper humidity, which must of necessity have a Communion or Affinity with the dry, if it be to bring over the dry with it self. Now common Water is able to carry over (in distilling) the odour and favour of Herbs, yea and of Salts, but not of hard Sulphureous or Mercurial Minerals, much less of the fixed Metals. But forasmuch as Metals are Homogeneous, and cannot be purged by any force of Fire, nor separated from the impure part, unless they be dissolved by agreeable and convenient *Mensstruums*, and be rendered apt by distillation, for always that which is brought into Flores doth (if reduced) yield such a Metallick body

body as it at first came from. Thence arose an opinion of an impossibility of separating the pure part from the impure. Indeed to the blockish and unskilfull all things seem impossible, and therefore from them is not to be lookt for any judging of good secrets.

But to return to my purpose, and shew that a Golden Essence may be distilled and separated out of the crude Metals by Distillations, I will make use of a common Example. Dissolve in a Common *Aq. Fortis*, made the usual way of Niter and Vitriol, one Ounce of pure Silver; which being wholly dissolved and reduced into pure Water, pour out the Solution gently into another Glass, that so if haply any Gold were mixt with your Silver it might stay behind, and not be dissolved, or mixed together, lest the Experiment prove fallacious. Then some common Salt is to be dissolved in common Water, the Salt to be in weight equal to your Silver; and this Water is to be added to the dissolved Silver, and to be so long poured out of one Glass into another untill it be well mixt, then let it settle, and let the pure Water be poured off, and a white Powder of the Silver will remain, which is again to be macerated with pure Water several times, untill the Calx of the Silver be freed from all Saltness and Corrosivity; Then dry it, and you shall have a white and tender Powder, and very fusile, so that it will melt even with the flame of a Candle, and is not unlike to a *Mercury*, but may well be called the *Mercury of Lunc*, but the Chymists usually call it the horned *Moon*, for being molten it resembles the shape of an Horn, and with this may be wonderfull things effected both in Medicine and Alchymy; but belongs not to this place to speak of, and therefore are to be but just hinted. And like as we have spoken of *Lunc*, so likewise must we proceed with *Saturn*; and he will also yield you a white Volatile and fusile Powder, as easily melting, yea easier than the *Mercury of Silver*, and is deservedly called the *Mercury of Saturn*. These two are willingly associated to a third, viz. to Common *Mercury*, and do fix him, and so is that Axiome of the Philosophers fulfilled, *Nature rejoiceth with Nature, Nature overcomes Nature, Nature retains Nature*. Farther, these *Mercuries* do admit of distillation and a separation of the pure part from the impure, no otherwise than as doth a Vegetable. But the way of doing this is not to be so hastily written, I spent a whole year in searching after it, till I found it, and so let another seek; and if God grants it him, he may enjoy it; And if God vouchsafeth him so much, he will also give him the knowledge how to use it: If the *Mercury*, which in it self is white, volatile and fusile, is rendered more white by distillation; 'tis also a necessary consequence that it will become likewise more volatile, more fusile, and more pure: but of this enough.

But to come yet nearer to the matter, and to shew that Metals may be so separated by distillation as to become golden, take this Example: Take two Ounces of the aforesaid horny *Lunc*, and reduce it into Corporeal or pliable Silver, and separate it by a Cupel, for then thou art assured that no other thing is in it but Silver: Dissolve this Cupellated Silver again in common *Aq. Fortis*, and it will leave a good part of Golden Calx. Now it may be demanded, whence comes this Golden Calx? Comes it from the Silver, or the *Aq. Fortis*, or from the Salt-water, all which three were in use in the precipitation? I answer, that the Spirit of Niter brought over with

it self, in the distillation, a certain Goldenishness from the Iron and Copper which were in the Vitriol, and that in the form of a Spirit, and assumed its Body from the *Lunc*. Now if any other Body concludes it to be otherwise, viz. that the aforesaid Gold comes from the *Lunc* onely, and not from the *Aq. Fortis*, I do but ask him this Query, Why the very same sort of Silver, being dissolved and precipitated out of the *Aq. Fortis* with Salt of Tartar, or by Copper Plates, be not equally as golden as this is which is precipitated with Salt-water? But some may yet urge farther, that this Gold proceeds onely from the Salt with which the Silver is precipitated, and not from the *Aq. Fortis* or Silver, because the Silver being dissolved in *Aq. Fortis*, and precipitated with Brais Plates, or the Liquor of Salt of Tartar, yields no Gold; but that onely gives Gold which is precipitated with Salt-water. To answer this Objection, and clearly to demonstrate that this Gold owes its Original to them both, viz. the Tincture to the *Aq. Fortis*, but the Body to the Silver, and not to the common Salt, (for though there lies hidden in all common Salt a certain Golden power, which may be thence drawn by Art, yet that is not to be done this kind of way, but by another, which we mention in our Book called *the Consolation of Sailours*) I do certainly know, that this Gold proceeding from the precipitated Silver, doth arise from the Vitriol and Silver onely, and not from the Salt: And this may be clearly observed thus; If you add to the Vitriol and Niter a Verdigrise prepared with Sulphur and Salt, the *Aq. Fortis* will be twice more Golden than if 'twere made of onely Vitriol; the reason is this, because the Iron and the Copper are fixed in the Vitriol, and do not easily yield Gold; but if the Copper be first reduced with Salt and Sulphur into a Volatile Calx, and be added to the Vitriol and Niter, then is this kind of Labour done to profit, else not: This which I write is onely to demonstrate the possibility. And should you add to the Vitriol and Niter, or to Allum and Niter, other Species containing Volatile Gold, as *Calaminaris*, *Zinck*, and such like, the Water will be rendered so much the more Golden: But if you add to the Niter and Vitriol such Species as contain in them Volatile Silver, such as are *Cobalt*, *Bismuth*, *Arsenick*, then the *Aq. Fortis* is rendered more Silvery, and makes part of the Copper in the Solution purely Silvery, like as the Goldenish water when 'tis in the Solution makes part of the Silver Golden. By which it is demonstrated, that crude Metals are depurated by distillation, and may be made Volatile, and that by that means of Solution, Corporal Gold and Silver may be precipitated out of the Metals, according as the Dissolvent is prepared out of Golden or Silvery Subjects.

This Example I account sufficient to evidence, that the crude Metals may be purged by Distillation so as to become golden. If then it be so with the crude and impure Metals, what then may be done with the pure ones if they be made by Distillation, yet more pure; without all question a most excellent medicine might be from thence prepared, and far to be preferred to Gold or Silver. This discourse do I here make use of to the intent that it may be seen, that even fixt metals being after a due manner opened and made volatile, are capable of sending out their best part, and of being separated by Distillation from the more crude part. But this Treatise appertains not to Alchymy but to Medicine, and yet I thought

thought good to induce this argument, viz. (that out of crude Vitriol; may a volatile Gold be drawn by Distillation and be incorporated with Gold and Silver) to this end that all men might know of a certainty, how much good may be done in metals by Distillation, and what a pure substance may be thence drawn. Nor doth *Basil Valentine* that German Philosopher, doubt expressly to write that the Philosophers Stone is full as easie, yea easier to be prepared out of Vitriol than Gold. If therefore the highest universal medicine both for man and metals may be prepared out of common Vitriol, why may not the same be possible to be done out of the purer metals if they were reduced into Vitriol, and so as to admit of Distillation, whereby the pure may be separated from the impure.

X If now the common Vitriol of Copper and Iron, do in Distillation yield volatile Gold, why should not the Vitriol of *Lune* do it much more and yield it nobler, as being indeed the true and onely metallick Vitriol of the Philosophers, which *Basilus* appoints to be taken for his Work, and doth truly deserve the name of Vitriol. For if you would have your common Vitriol tinge, you must add Galls thereto, but this Vitriol doth truly blacken all things without Galls. But you must not imagine that I do here intend such a Vitriol of *Lune*, as is by solution (in *Aq. Fortis* reduced into a white Crystal, or such as is precipitated by the water of Salt out of the Solution (in *Aq. Fortis*) no such matter? For this resembles not Vitriol, because it may be again reduced (into Silver.) But the true Vitriol of the Philosophers is prepared out of *Lune* without *Aq. Fortis* or such like Corrosives, and is not reduceable in the strongest Fire, but remains a Vitriol, tingeth the Tongue, is astringent, and yields a golden Water, which dissolveth Gold and fixeth it therewith. Such a Vitriol will we make use of in medicine and Alchymy, and leave the common Vitriol for the Dyers. The Ancients called their Sale Vitriol, on this account, because that it did as to its external Figure resemble Vitriol, but though they so called it, yet they took not the common Vitriol, which every wise man may be easily perswaded to believe. So then let the *Lune* be the Earth, Gold the Seed, and *Mercury* the (Water, but not the common *Mercury*) with which it is to be watered, and let the rest be committed to God and Art. Thus far have I declared to you my opinion, let every man follow his own. But thus is confirmed the assertion of that excellent Philosopher *Basil Valentine*, who affirms, that even out of common Vitriol may be extracted a certain goldenness; how much more credible then is it, that a

Vitriol prepared out of the more pure metals may yield a better goldenness. Every one may believe what I here write for I have oft times tried it, but yet I have received more Gold sometimes than at other some according as I ordered my process, and reduced my precipitated Silver; for you are to know, that such a kind of Silver as is precipitated out of *Aq. Fortis*, by the Water of Salt is wholly volatile, nor melteth it like to a Calx of *Lune*, but goes away partly in fume, and part is reduced into an horny Stone, and yet by a peculiar Distillation doth all come over, but enough of this. Hereupon is Salt of Tarrar to be added to this volatile Calx, lest being molten it vanisheth away in fume, for Borax doth not prevent it. But it melteth better if it be help by that notable fluxing Powder, made of Niter, Tarter, and Sulphur, and it be kindled by a little Coal and burnt up, but then all the Silver doth not melt, but part of it goes away in fume. N. B. If you catch this fume which is a thing easily done, it resembles the form of a red Powder, and will abundantly recompence your pains, nor may that saying of *Paracelsus* be unjustly applied hereunto, viz. to corrupt is totally to perfect, because these Flores of Silver are not lost, but are of a greater price than the Silver was. He that well knows this labour (for indeed experience is the best master) will not labour in vain. And if he learns nothing from this little here taught, neither will he find out ought from a greater. For I have in these few words revealed much, yea haply more than I ought to have done. All which we do in the first and chiefest place attribute to God, next him to Niter, which renders Metals so fluxible. From hence may the well minded Reader perceive that there is in Niter, not onely a power to fix all volatile Minerals and Metals (of which I have treated in my second part of the Prosperity of Germany) but also of making them wholly volatile, so that they may be distilled and purged, as is sufficiently evident in the foregoing example: Besides, there is another way of making Metals volatile, as well as by Niter, but so as that they be not wholly dissolved, but are by a moist nitrous Fire reduced so far as to retain the form which they put upon themselves in the said moist Fire, and yet they become so volatile, as to suffer themselves to be wholly distilled and sublimed, and will in the *Proba* give Gold, the which the gradatory Water hath made in them. But of these things more at large in the fourth part of the Prosperity of Germany: Thus with what hath been said, will I finish the third part of my *Pharmacopœa Spagyrica*.

The End of the Third Part.

THE

THE
FOURTH PART
OF THE
Spagyrical Pharmacopœa.

Treating of the four principal Pillars of Medicine, *viz.* Sulphur, Vitriol, Antimony, and Mercury, but chiefly of the great harmony between the Superiour Elementary Sun and Moon, and the Inferiour and Terrestrial Gold and Silver, and the magnetick way of attracting the Virtues of *Sol* and *Lune* by the Air, and of rendring them palpable and visible.

READER,

After that I had intended to publish in the Fourth Part of this my Spagyrical Pharmacopœa, some singular and excellent Medicines, and such as might much exceed all others, and so must consequently be prepared of choice and excellent Subjects and matters; I accounted it my task in the first place to shew you out of what Subjects such efficacious Medicines may be drawn and extracted, *viz.* out of Gold, Wine, and Antimony, as likewise out of Vitriol and Mercury, but not the vulgar Mercury.

Now although most Men are blinded with a thick darkness, but principally those that prosecute the truth with a deadly hatred, and do prate much, and by reason of their blindness and ignorance do affirm, that Gold being a thick and compact body is not at all fit to admit of such a preparation as thereby to display its most efficacious virtues in Man's Body: And as for Antimony and Mercury, that they are most present Poisons, and can't serve as Medicines without great danger; but as for Wine, that it is indeed fit to be drunk, but is of no validity in Medicine, not knowing how to employ it about any Medicinal use, but are rather ready and skilfull Artists at swallowing it down in full draughts; however though they thus chat yet these objections are frivolous, and do proceed from their ignorance which is wrapped about with most thick Clouds, and which I refute by this brief and strong Reply. But I do not at all deny, that Gold reduced even to the smallest Powder, and so made use of (as 'twas wont of old to be by the Ancient, yea and latter Galenists, and is even too at this day) by mixing it with such Medicines as are for the comforting and strengthening the Heart and Vitals of Men, cannot contribute so much as the least iota to the health and preservation of the body of Man: And so I say of Antimony and Mercury, that they are not at all salutiferous to Man's Body, but contrariwise are deadly and destructive Medicaments, untill (by a due preparation) they are deprived of all their Venosity, and thereby rendred fit to be safely made use of. So Wine it self being taken *per se* as it is, is a restoring and refreshing Drink for Man, provided it be moderately used: But contrarily is a cause of many Diseases if it be frequently and in large quantities swallowed in, and doth operate in Man's Body more hurt than good, this daily experience doth sufficiently testifie, and renders it evident, that being so immoderately taken, it fills all the Members of the whole Body with Tartar, and makes obstructions and stirs up intolerable Pains, and principally in the Bladder, Reins, and other parts of the Body, *viz.* if coagulated in the Hands, Knees, and Feet, whereupon it doth not easily suffer it self to be exterminated, unless by such Artists as well know the properties and nature of Tartar, but of such Men there is at this day a great scarcity, and therefore that proverbial Verse still takes place.

Solvere Nodum Nescit Medicina Podagram.

The Art of Physick can't root out
(Thy dire Disease) the Knotty Gout.

L 1

But

But he who is so well skilled as to separate the fiery, penetrative, wholesome, and true Medicinal Spirit of Wine; Tea its true Balsam from its Faeces, he will easily expel out of the Body of Man all tartarous impurities and defilements, and will perform things wonderfull in the Stone and Gout. But now forasmuch as the educing so wholesome a Medicine out of gross crude Tartar is known but to a very few, no wonder that there hath been so little or rather nothing at all performed by Physicians in such like most grievous tartarous Diseases that have gotten deep rooting in the Body of Man. But the way how you may be rendred Possessors of such a Spirit of Wine shall be spoken of afterwards. Yet I would not that any one should perswade himself that my meaning and intention in this place is about the common Spirit of Wine, or either that which is gotten out of Tartar by the usual known way of Distillation. No, there's a vast difference betwixt that Spirit which I here make mention of and the other. For in this Spirit the crude Tartar is first to be washed by common Water from all its Defilements, and that without the addition of any other things, so as to shine like Snow, then to be afterwards made black by putrefaction, and out of that blackness the said Balsam is to be drawn off, of which we shall hereafter make a more ample Declaration. This now is that Spirit which doth Anatomically resolve the compacted Body of Gold, and converteth the venomousness of Antimony into a wholesome Medicine, and doth perform things wonderfull in all tartarous Diseases. 'Tis the true Wine of Health, and the very Aq. Vitis of the Philosophers, and hath a great familiarity with Gold and Man, and may be excellently compared with the coagulated solar beams.

Therefore as it is evidently known to every body, that Gold and Wine are advanced on to maturity, by the heat of the Sun, and that Men do notably love and desire both of them. So may any one conjecture what Gold and Wine would do if a Man could but have them reduced to a spiritual essence. Hence now it seems necessary unto me, that before I pass on to the preparation of the said Medicine, I do in a few words describe the harmonial love that is between the superiour and inferiour Sun and Man, that so it may appear, what a bond or tie of love and necessity there is betwixt these three most noble Creatures of God, to one another.

CHAP. I.

Of the Harmony and Agreeableness between the Superior Elementary, and Inferiour Earthly Sun, with Wine and Man.

TIS well known even to the blind Bayards and Barbars, that the Sun in the heavenly Firmament, is the most noble and most eminent Creature God made. For it is that onely light which makes all the Stars partakers of its Splendour, Light and Brightness. 'Tis also the onely Fountain and as it were Father of all the Creatures, because if they are deprived of it, they are in the dark and die: Nay even man himself cannot live without the help of the Sun, and all things would perish, should the Sun be but one moment withdrawn from them. For all things that are do receive their Life and Augmentation from the Sun; and he was (according to Moses his Doctrine) the first and chiefest that did proceed forth by God's creating, and will doubtless be the last when all things shall be dissolved, and pass into a better State at the final Destruction of this worldly Fabrick. The Sun supplies the place of a heart in the wonderful Structure of the Macrocosm: And in like manner the heart it self in man's Body is aptly compared to the Sun, as being the first liver, and last dier in the humane Fabrick; and this is known to every body. And therefore amongst all the Creatures indued with life and motion, man doth in nobility and magnificence excel them all, as having gotten his body from the earth, his Spirit and Life from the Sun, and his Soul from God.

But as to the insensible Creatures the highest Degree of Nobleness is attributed unto Gold, the which

is likewise generated by the Sun. These three admirable Creatures, viz. the Sun, Man, and Gold are coupled with a bond of wonderfull Necessity and Friendship, and are conjoined by the instinct of Nature her self. Men do desire the Light of the Sun, as also its heat in a dark and cold Season, for thencefrom proceeds all life, and all the encrease of life, because the Sun's beams do perform the office of the universal Spirit, and Life in the Conservation of the Life of Man. But now as touching Gold, men do partake of that in a particular way onely, and one man is usually stored with a bigger Portion, another with a lesser, not by the instinct of nature, for she bestoweth it on us onely for our use, but by reason of the abusive malice, avarice and the unsatiable Covetousness of men; but yet this way is not the right manner of loving Gold, nor genuine, but false and oft times very hazardous. We should rather love it because of its wonderfull Vertues which it possesseth, hidden in its body, and may afford a most notable Comfort to man's sickness and infirmities. Verily the Ancient Philosophers were not ignorant of the incredible Vertues, which the Gold hides in it self, it being truly no other thing than a body consisting and compacted of the coagulated and fixed Beams of the Sun, and this was well known to those men who were most skilfull in the nature of all things. Seeing then that the Sun's beams being as yet unfixed can bestow on all things life and encrease, why may not the same be accomplished by them when fixed, and made constant, if so be they be rendred spiritual, and thereby be capable of displaying their Vertues in a visible and palpable efficacy, which thing they could not do if they retain their corporal Coagulation, nor can display their occult Vertues.

Many

Many men have industriously attempted with great Labour, artificially to open Gold, and to reduce it to a spiritual Nature, and to render it living and efficacious, but few there have been that have been Masters of their desires, but such as at length had thereto attained, did perform things wonderful in the sicknesses of mankind, and this is witnessed by many most true Histories, as for instance, by the *Tarba* of the Philosophers, and by the *Theatrum Chymicum*. The which Books do indeed describe such a notable secret, but so obscurely and intricately, as that no body can therefrom learn its preparation, unless God reveals it to them, or it be manifested by some good friend or other that knows the Art. 'Tis no wonder that amongst many thousands of Searchers, so very few do arrive to the knowledge of the same. For God hath barred up this so great a secret with such firm bolts, that all wicked and malicious men are easily excluded from the knowledge of finding it out. Verily I must needs say (but I boast not of it) that I see by what means those bonds are to be loosed, and that precious Pearl may by removal of those bolts be taken forth. But yet I profess not my self to be a perfect and absolute Master, and such an one as perfectly knows its preparation, and would make it publick by describing it. No! the Crumbs serves my turn, and the Fragments of the Bread, with which hunger may be allayed as well as with the Bread it self.

I have I confess tasted somewhat of the Crumbs of what pertains to so worthy a Medicament, and with what great Vertues they abound. And such things as my experience have administered unto me I have here purposed to reveal them, for the comfort and sake of my Neighbour, as far as the time and occasion will permit; but yet with this *Salvo*, that I cast not Pearl before Swine, and so incur the Philosophers Curse. To whomsoever the things that I speak shall be more obscure, let him wrestle earnestly by his Prayers to God for light, and refrain from troubling me with multiplicity of entreaties, for I have firmly resolved with my self not to reveal for the time to come more than what I have opened in the present description.

C H A P. II.

Of Gold, and the Comparisons betwixt it when living, and when dead.

IT is so well known as that nothing can be more known, that Gold being so compact and corporeal and without any opening, doth not when used inwardly to man's Body emit any Vertues at all. I will instance in one Example of Mercury; This being living and unbroken and undissolved, doth not, though used inwardly in a great weight, bring any hurt, but passeth out again as 'twas before taken in without any alteration of the Body. But if it be sublimed with Salt, or shall be dissolved by some other corrosive Water, and be administered to a man to drink the quantity of 1, 2, or 3 Grains it will shrewdly hazard his Life, because the Salts have made its hidden lurking Poyson manifest. Thus stands the case with Gold, which cannot shew forth its hidden force and vertues as long as it remains bound and tied with the fetters of its own compaction, but (on the other hand) displays them, alloon as ever it shall be released from its bonds, be vivified by Salts, and rendered efficacious. You see in a black

Coal, whilst it is not fired, there is not any heat at all perceived, but being kindled, and being by the Air rendered living, it discovers the fire and heat being therein hidden, the which you may likewise consider of concerning Gold.

C H A P. III.

Of the Preparation of Gold, and its Dissolution into most tender Atoms apt for vivification and profitable application to Medicinal use.

GOLD doth not by any way more easily admit of being turned into most tender and most subtil Atomes than by this following

Dissolve pure Gold in *Aq. Regia*, and being dissolved pour thereto as much of the Water of Tartar as is sufficient: So the clear Gold, and clothed too with a golden Colour, will precipitate it self to the bottom of the Vessel, nor will it be a darkish Powder, as 'tis wont to be if precipitated by *Lixivium* or by the Spirit of Urine: But it is light and tender, and shews in brightness like little golden Stars, yea becomes so very tender and subtil, that it swims as 'twere in the Water and settles to the bottom exceeding leisurely, and is thereby so much worthier than all other *Calxes* of Gold how subtil soever they be, that they may be accounted of (if compared with this) but onely as a gross Earth; whereas these shining golden little Stars are made so tender and so subtil, as that they may easily discover and demonstrate their Vertues in medicinal use very notably, by the help of other things, and by being dissolved sundry ways.

C H A P. IV.

By what means this most pure Calx of Gold is to be further opened, whereby it may be inverted, made volatile, and rendered like to a Vegetable.

THIS tender *Sol* or *Calx* may be brought to such a pass, without any corrosive in 24 hours space, as that it shall not remain a fixed metalline Body, but become wholly volatile as it was at its beginning. Now this is effected by the help of the Salt of Nature onely, which is to be found every where, and may be gotten by the poor as well as by the rich. Yea so easie as that it is scarce credible, should it be manifested openly and clearly, and which those Brethren of ignorance and proud Court-like Flatterers would entertain with scorn and derision, and account the truth it self to be a lie, as hath been oft times done hitherto. 'Tis better therefore to pass over such things in silence, than by benefitting others to injure ones self. For such Arcana's are to be wrapt up in silence, and not to be cast before such Hogs. But yet to the Adept shall be revealed such things in the end of this writing or treatise, as they have been hitherto ignorant of.

C H A P. V.

Query, Whether or no these most subtil Atoms of Gold are capable of performing any thing in Medicine, and of displaying their hidden Vertues like Vegetables, without any other unlocking of them.

FOR answer, I say no. For the Stomach is too weak to dissolve and get thence that efficacy as it doth

doth from Vegetables, though it be thus reduced in a most tender and subtil substance. In vain therefore is it administred to the sick, because it passeth out again with the Excrements so as 'twas taken in, and that without any remarkable efficacy.

CHAP. VI.

Query, Whether or no the Stomach may not be so help'd as that it may be able to dissolve and consume Gold as well as Iron and Copper.

FOR answer I say, yes. And forasmuch as the most thin filings of Iron and Copper, being given any one to drink, are digested and consumed by the natural acidity of the Stomach, or are by dissolution there turned into Vitriol, which (said Vitriol) doth vehemently stir up the Body by Vomit, and by Stool (according to the quantity of the exhibited Metals) and killeth the Worms both in old and young folks, and casteth them forth, and coloureth the very Excrements as black as a Coal; hereby evidently demonstrating, that being dissolved and consumed by the Stomach, it hath brought out, together with it self, the slain Worms; Any body may easily conjecture that the Acidity of the Stomach was sufficiently strong to set upon the two aforesaid Metals, being of a Salt nature, and of an easie Solution, and to reduce them so far as to cause them to display their hidden Vertues. But now the Stomach is not endued with so strong an Acidity, as to be able to set upon and dissolve Gold and Silver, being Metals as 'twere void of Salt, and admitting no Solution there. Hereupon it usually happens, that they being used inwardly in Medicine, do come away with the Excrements in such form as they were administred in. Thence do the unskillfull conclude (but falsely) that there are no Vertues in Gold and Silver, because that being brought into a most subtil Powder, and administred to the sick, they are notwithstanding destitute of any kind of Vertues. The reason why they do not operate at all is, because the Acidity of the Stomach is not sufficient enough to work upon them, and to stir them up to operation. But being dissolved by Acid Spirits, viz. the Gold by Spirit of Salt, and the Silver by Spirit of Niter, they doe evidently shew their Vertues in Medicine, being inwardly taken, and do purge the Body no less than Copper and Iron doe, and do withall colour the Excrements black, and kill the Worms both in old and young: Neither indeed will any find a more present remedy for killing the Worms, which do oftentimes destroy many Infants and Children destitute of any kind of help, than the Vitriol of Gold and Silver, about which shall be written a peculiar Chapter anon.

But forasmuch as the dissolved Metals, but especially Gold and Silver, do by their ungratefull favour offend the Palate, and dye the Tongue and Lips of a black Colour; Men do abhor to use them, although they might be very helpfull in Medicine: But however these discommodities may be prevented, by rendring the said Metals acceptable to the Palate, and so ordering them as that they shall no more Colour the Lips, but evidently shew forth their Vertues, and perform great matters in Medicine. This now may be done divers ways, some whereof shall be here described and declared.

CHAP. VII.

By what means Gold may be brought to such a pass as that (being inwardly made use of in Medicine) it may display its virtues and be stirred up to operation by a guider (or leading Card as 'twere) added thereunto.

GOLD being reduced by the way now spoken of into most tender (Atoms, may be stirred up divers ways, so as that being inwardly administred, it may manifest its virtues and that notably and efficaciously.

As first when such Salts are thereunto added as do corroborate the Stomach, and augment its acidity, so as to make it strong enough to work upon the tender Gold and dissolve it, and to turn it into Vitriol in the Stomach, in which case my *Sal Mirabilis* is very excellent, but yet other Salts are not to be despised, to each of which I give the honour due unto them.

Then farther, the same may be done when such Mineral Species are added to the said Golden Calx as do by their natural propriety expell by Sweat and Urine: For a Mineral Medicine, as soon as ever it begins its operation in the Body, whether by Sweat or by expulsion by Urine, doth also stir up the Gold to operate, so that it works too after the same manner as the Medicament adjoynd to it is wont to operate, just as 'tis usually wont to be in some kind of Fraternity or Confortship; If one begins to sing, to dance, to be enamoured with a Virgin, to brawl, or to play, he presently stirs up others to do the same, who would otherwise have abode still. Now as to the Minerals, amongst the many inciters there, Antimony obtaineth the first place, and doth stir up to operate with himself any such things as are thereunto adjoynd, whether they be Gold or Silver, yea though they be dead. And so a Mineral being purgative, or Diuretick, being mixt with Gold, doth perform its operation much more safely and efficaciously than if it were alone and used *per se*, inwardly, without any addition of Gold thereunto. For the tender Gold is stirred up and driven as 'twere to Co-operate together with the operation of the Mineral Medicament, which otherwise, and without such an impulsion and incitement would have remained as dead, and void of any kind of operation, and so passed forth together with the Excrements.

CHAP. VIII.

A better way of making Gold and Silver living and efficacious.

GOLD and Silver may be made living and efficacious after another and better way and manner, thus. If they be dissolved in suitable Waters, and made Spiritual, and so used in Medicine, for they are by this means fitted to operate and display their Vertues after their manner, and according to their preparation.

The manner of making such well opened and unlocked Golden Water, I taught some years since, and published it under the title of *Aurum Potabile*. For I then knew a way of reducing Gold into a white Water by some certain Medicinal Salts, and have it now

now by me at all times, as being better and far more excellent than that former *Aurum Potabile*, and may supply the place of an Universal Medicine; and that on this account, because it doth operate universally in all curable diseases, and doth withall excell all the other Medicaments that I know of in its wholesome operation, for it doth by little and little expell every obnoxious thing out of the whole body. I confess that the same things are performed by my Golden *Panacea*, or my Purging Gold, and Diaphoretick Gold, but in some cases I prefer this white *Aurum Potabile* of mine, as I now prepare it, before them, for it hath an invisible and contrary or different operation from my Purging Gold, or Golden *Panacea*, which do, for the most part, work visibly. And whereas I have formerly divulged those Medicaments in my Treatises, I will omit their superfluous description here, and onely add thus much, That these three Medicaments of mine, viz. the Golden *Panacea*, my Diaphoretick Gold, and my white *Aurum Potabile* are so abundantly sufficient both for the preserving from, and curing of all diseases, that whoever will onely use them, need not at all any other Medicaments.

But forasmuch as Men are delighted with variety, and that sometimes such or such a coloured Medicine, or such an Odour or Savour is far more acceptable, I have judged it worth while to add for the sake of the sick yet two or three excellent Medicines more, and such, as to the best of my knowledge, were as yet never divulged. 'Tis at every ones liberty to make use of such an one as best likes him, or now and then to try this Medicine or that, and so to make use of that which best pleaseth him.

The incomparable *Paracelsus*, the Monarch of Philosophers and Physicians, supposed, that these four Minerals, viz. Sulphur, Mercury, Antimony, and Vitriol, did prop up the whole Medicinal Art, like so many Capital Pillars, and that by them mought all things be prepared, as were necessarily requisite for any kind of cure. And indeed the thing it self (or the effect) sufficiently proves the truth of this opinion, and so doe those four Minerals themselves too, if they be but dissected, purged, and prepared according to Art, else they are of no worth, but doe more hurt than good, because if they be not duly prepared, they are not deprived of their Venosity, and are not turned into wholesome Medicines. But as for such as are set to sale in our days in the Apothecaries shops, they are verily but of small moment. For the Antimony which (being turned into Glass) they sell, hath never as yet admitted of any separation of the good from the evil.

And as for Mercury, they turn him into a Sublimate, abounding with Venom, and likewise into a red Precipitate, both of which are sufficiently hazardous both in external and internal Medicinal uses; For the vulgar Mercury never desisteth from his malice, unless it be exalted by a safer and better preparation. It is sufficient (to say) that being prepared after the aforesaid usual ways, it ought to be wholly shunned, and so it will not create any danger.

As for Common Sulphur, although it be exalted into Flores, and those exceeding subtle too, such as are at this day in use, yet shews it no wonderfull matters; for there is not as yet made any separation of the pure part from the impure, neither is it thoroughly opened by Sublimation, or rendered subtle or fit, to operate upon the Body of Man; for as it was taken in, so it passeth out with the Excrements:

For the Acidity of the Stomach cannot dissolve it; so far is it from yielding to the Stomach any efficacy, for a strong *Aq. Fortis* cannot dissolve it.

As for Vitriol, it yields the Workmen an austere or fowr Oil, and a sharp Spirit, little availing to Medicinal uses, this onely excepted, viz. the mixing it with cooling Syrups and Conserve, gives them a gratefull soweriness; the which Spirit of Salt well rectified, would perform much better. Hence it comes to pass, that these four Minerals, according as they are at this day used, and sold by the Apothecaries, cannot be accounted for the four Pillars of the whole Body of Medicine, and possess that title, which *Paracelsus* exalteth them by, unless they are prepared after another manner than they have hitherto been.

As for Sulphur, I bring it to the highest purity by a due washing, and do by suitable and proper Salts turn the same, together with Gold, into a clear water, that so our Nature may assume it to it self, as is to be seen in my *Aurum Potabile*.

I draw from Antimony its purer part, and I implant it in exceedingly well prepared Gold, that it may make the Gold efficacious, witness my Purging Gold.

Instead of the common Vitriol, I use the Vitriol made of Gold, the which is wont to perform such effects in Medicine as the common Vitriol never will, as shall be taught by and by.

Instead of the common and poysonous Mercury, I make use of a Mercury prepared out of a good Metal, or artificially extracted by a certain Magnet from the beams of *Sol* and *Luna*, as shall be taught anon. And this Mercury is rightly called the Universal Mercury of the Philosophers, because being as yet an invisible thing, is extracted out of the Air, and made visible and palpable, and is the effector of wonderful things in Medicine and Alchymy, as we shall hear anon.

But before I proceed to Vitriol and Mercury, I count it fit, first to set down a good Medicine prepared out of Silver by the help of Antimony, that so every body may know, that even Gold and Silver (how thick and compact soever they be) may, by the addition of other Medicinal Subjects, be quickened and stirred up, and be brought to such a pass as to emit their Vertues, as we have afore mentioned more at large. The preparation of this Medicine out of Silver and Antimony is as followeth.

CHAP. IX.

The manner of preparing a good Medicament out of Silver and Antimony.

IN the first place prepare out of the Mineral or Oar of Antimony an *Accum* by distillation, according to Art: Then take one part of the best Antimony, and two parts of the Calx of Silver; which being well washed, mix it with the Antimony, by grinding them very well together, that they may be changed into a grayish or somewhat a blackish Powder. Put this Powder into a small Glass, Cucurbit or little Retort, and pour thereupon so much of the Antimonial Vinegar as may serve to bring the said Powder into a thin Pultis or Pap. Put the Glass in Sand, and distill off the said Vinegar, this pouring on, and drawing off let be so often repeated until the Antimony shall have lost its blackness, and the

M m

Silver

Silver its whiteness, and be both of them turned into a red Stone, like to *Cinaber*, which is usually done in the third or fourth Cohobation.

Note well, if such an error should be committed as that your fire being too strong should when you draw off the *Acetum* melt the mass in the Glass, it would be rendered wholly incapable of admitting or drinking up the *Acetum*, and then you must of necessity break the Glass and take out the mass and reduce it again into small Powder by grinding, and repeat the operations according to the aforesaid way. This Medicament being turned into a red Stone, and ground upon a Marble into a most subtle Powder, is called by me purging *Lune*, and may be made use of in all Diseases as a kind of *Panacea*, (like as my purging Gold may be) with great fruit and good success. For this Medicine of Silver doth operate very gently, expelling all evil humours out of all the Members of the whole Body of Man, and this scarce any other Medicine will do save my golden *Panacea*. For it leaveth no impurity in the Body, (but expels it) not only by purgation, but also by Sweat and Urine. If you should chance to err and take too big a Dose, it will also cause vomiting, but especially with such as abounding with Cholera are prone to Vomit. To Infants under four Weeks old may a Dose be given of about the bigness of a Rape Seed, and be mixt in a Spoon with a little of its Mothers Milk, and so given them. It conserves them free from the invasion of the Epilepsie, and frees them. If you find that they are infected with the Small pox or the like, within a years space, the Dose is to be augmented, and a fourth or eighth part of a grain may be administered to them, the which will bring out of the Infants all the impurities by Stool, and preserve the Face untouched. Those that are from one to two, or twelve years of age, and being troubled with the Worms, do fall into acute Feavers, (and hereby a great many perish destitute of all help) may have the Dose augmented if need be, and that as their age is, from $\frac{1}{2}$ a grain to two grains, for so the Worms will be killed, and the Feaver sent packing. Nay farther, if the Feavers in Children, be they Boys or Girls, do not proceed from the Worms but from other causes, yet may so much of this Medicine be administered to them as may be requisite to purge and sweat them, and by this means will they be (without any hazard of their lives) restored to their former health. There can scarce be found a more profitable and more present remedy against the Plague and other Feavers in young men, middle aged men, and old men than my golden *Panacea* or purging Gold, and this same purging *Lune* here described, the Dose is from one grain to five or six grains with reference to the age and Disease. Such a Dyet is to be observed as I have prescribed in the use of my *Panacea*, viz. that the Sick (after the taking of this purging Silver) do abstain from Sleep and all kind of Food for three or four hours at least, and beware of the cold Air, and have an especial regard to keep a good Dyet. This Medicine of mine, together with my *Panacea Aurea* (or golden universal Medicine) may be safely, and without any fear of danger made use of in the French Pox, Dropsie, Leprosie, Stone, Gout, and other such Diseases, whatever name they are called by; inasmuch that men may (next their trust in God) safely confide therein. And besides by this Medicament may very many things be performed in metalline affairs, the discovering of which we shall at this time omit, con-

tenting our selves with having shewn the things that appertain to the use of Medicine. Furthermore it is likewise notably efficacious in curing of external Wounds and Ulcers, provided it be discreetly administered inwardly, and the external defects of the body be kept sweet and clean. There will in a short time be much more benefit received therefrom, than from such a deal of Ointments and Emplaisters as are frequently used. Praise God and give him thanks for such great benefits.

CHAP. X

The preparation of the Vitriol of Gold and its use in Medicine.

Dissolve Gold in some acid sulphureous *Sal Mirabilis*, and not alkalized, viz. by the moist way, pass the solution through a Philter, and abstract the unprofitable Phlegm so far untill there appear a thin skin at the top, which appearing, set the remainder in the cold, and you shall get a green Stone like to an Emerald. That part of the Liquor which is not shot, evaporate again even so long till a skin appears, that so you may get the rest of your Vitriol: So all the Gold will together with the *Sal Mirabilis* shoot into a Vitriol, resembling the greenness of Grass, (and so green) as nature never produced the like. In this Smaragdine Table are found written (or engraven) many wonderful things, which will neither be read nor understood by every body. I will hint some few things concerning it, and such as appertain to Medicine: And in the first place, what kind of Vitriol this ought to be, and what notes and marks it is to be distinguished by, (as thus) a little of it being rubbed with your thumb, on pure or cleansed Iron, doth guild it of a golden colour, whereas the common Vitriol makes the Iron look of a coppery colour. This is a sign of this golden Vitriol's being prepared after a due manner, which said Vitriol will effect those things in Medicine which I am about to ascribe to it. Besides, it makes Copper and Brass shew of a golden colour and performs wonderful things with Mercury, if digested with it, in the moist way, but for brevity sake I omit these things. For it grows like a little Tree, and sends forth golden Sprouts.

As touching its Medicinal Virtues such of them as I have found out, are here briefly described; without question there lie hid in it yet more and more excellent Virtues, which as yet are unknown unto me, but will come to light in process of time.

But the chief efficacy and virtue of this golden Vitriol as far as I know, doth consist in purging and bringing out all evil and noxious humours out of the whole body of Man, and withall in corroborating and strengthening him. And as to this office it outstrips all other Medicines whatsoever. Nay more, it performs its operation speedily, yea more speedily than any other purge doth. For as soon as ever it shall be taken into the body it doth presently begin to work, because the Salt is soluble, and therefore such bodies as are not opened, can't at all compare with it, for they must necessarily lie in the Stomach at least half an hour, or a whole hour before they begin their operation. And because every common Vitriol is a capital enemy to all the Worms of the Belly, and the Feavers arising therefrom, wherewith a very many Infants both Boys and Girls do die, void

of all kind of help, I do most highly commend this Vitriol of Gold to all such Fathers and Mothers of Families, whose Children are dear unto them, that they at all times have it in a readiness, to be made use of in cases of necessity. For verily I never found any better or certainer Remedy against the Worms than this very same, because it not onely kills them, but also casts them out, and doth by strengthening the Sick, take away all the Feavers both of old and young. It is also a most great secret in the Plague, in which Disease verily, a longer delay or abiding of a Medicine in the Body (without working) is hurtfull. Besides, it is not onely a certain and safe curative Medicine, but likewise a preservative too in the Plague, and in all acute and contagious Feavers, as well of young as old, the like to which is scarce, yea very rare to be found. For this Vitriol doth speedily and swiftly draw back from the heart every Poison, and every burning heat, and being drawn back from all the Members of the whole Body, doth drive it forth by all the Ejectories of the whole Body, but principally by Stool and Sweat. Furthermore, if the Disease require it, and the Patients strength permit it, it may be administered in a bigger Dose, and then 'twill provoke to Vomit, and powerfully expel Choler. It doth in the *Lues Venerea* shew it self most efficaciously virtuous, and powerfully casts out Tartarous Fluxes and acute humours out of all the whole Body: By which operation it likewise brings much help and comfort to such as are troubled with the Stone and Gout, it removes the Epilepsie both from young and old, and frees the Hydrophical of the Water betwixt the Skin. And that I may comprise all as 'twere in one word, 'tis such an universal purge as that it roots out of the whole Body whatsoever is found to be hurtfull and offensive therein. It hath not its fellow as to Remedy the Feavers of Children whether proceeding from Worms or from a corrupted Stomach, the which kill such abundance of Infants of both Sexes, without any help left. Nor do I think that there can be found a better Remedy in the Plague, and in all other acute Feavers which usually kill Men suddenly, than this Vitriol of Gold, if it be but rightly made use of. The Dose is small, and is easily made pleasant to Childrens Palats, by putting a little Sugar thereunto, or some such like sweet things. To Infants newly born, you may give scarce an eighth part of a grain, against (or to prevent) the Epilepsie, or Convulsions. To such as are from one year old, to 10 or 12 years of age, the Dose may be one, two, or three grains, according as their age is, the which Dose may be augmented in such as are older, according as the age and condition of the Sick requires. Where the Disease is Worms, there the Dose must be so strong as not onely by well purging to kill them, but also to cast them forth when killed. For from those slain Worms, if they abide in the Bowels, other new Worms usually breed. I hope that by my thus revealing this Medicament, I shall so bring it to pass, as that for the time to come, so many Infants both Boys and Girls will not be destroyed by Feavers arising from Worms, but very many will be safely preserved from so immature a death.

But here, some or other may say or at least think within himself, what is the reason that I have such an especial regard to Infants and Children, and am so very solicitous of preserving them from an untimely end. I answer hereunto, that nothing is more necessary than to afford some comfortable due help to

Infants, and poor innocent Babes, who do evil to none, and whose loss their Parents do sadly brook. For it is certain and without all kind of doubt, that (amongst Diseases) the Epilepsie or Convulsion is the first that sets upon new born Infants and sweeps them away. Then presently follows Measels, Small Pox, and suchlike, and these kill not a few. Then comes the Worms, and they cause Feavers which afflict them with a continual burning, whereby they lose all their Appetite to eating, and covet nothing but drink, and the Parents use no remedy to suppress them, being ignorant that such guests are lodged there, and do not perceive them when the poor sick Babes Bellies do not swell. But further, when by the swelling of their Bellies, they do know that they have the Worms, and though they desire to use some Remedies, yet can they hardly make their little ones to take them as being so averse to them. Nay more, though sometimes they do administer common Worm seed, or some other Vegetable Powders good against the Worms, yet there's scarce one in ten that is help'd, and the poor sick Children grow worse and worse: And at last when the Disease hath gotten such head as that the Parents see that death is at hand, then is the Physician sent for, who (if he knows the Disease to arise from Worms, and be furnished with a good Medicine) doth presently help the Sick, and free him of the Disease. But if he be destitute of a good Medicine, and attempts to refresh or cherish the Sick with his sweet Syrups, &c. he widely erreth, for by such kind of sweet Juices he gives Nutriment to the Worms. Neither doth it at all avail to put Linnen Cloaths, dipped in Rose water, to the Head, thereby to allay its burning heat, and to little purpose are the gentle purging drinks prescribed. For as soon as ever the Worms do perceive any thing given to the Sick, which is contrary to them, they presently hide themselves (or run to holes) and do wreath themselves into a kind of Ring, and pass out with the Excrements. But if they perceive any sweet thing which is pleasant to them to be given to the Sick, they do receive their nourishment thencefrom and remain alive. And, if by some hap or other it doth so chance that one or more is hurried away with the Excrements, yet the rest of them remain unhurt, and the Disease is not taken away, but prevaleth more and more, and at last deprives the Sick of Life. He therefore that endeavoureth after the happy curing of such Feavers as arise by reason of Worms, must of necessity (in defect of this golden Vitriol) give his Patient such things to drink for three or four days as do cause a bitterness in the Stomach. And although bitter things are unpleasant to the Palate of poor Sick Infants, yet are they enemies to the Worms, and do kill them. Such bitter things therefore being drunk for three or four days, the Worms do sometimes in some Sick Children die the first or second day, but in other some 'tis the fourth day ere they die.

Now then as concerning such bitter Medicaments, which I here write of, that they may not be bitter in the Mouth, but be made so in the Stomach, I say, that the Metals are such, and especially Iron, Copper, Gold and Silver, the which being dissolved do obtain a very bitter and ungratefull Savour. But the reason why Gold and Silver being taken into the body, when they are filed and ground most exceeding small, do not operate any thing at all, comes from thence, viz. because the Acidity of the Stomach

mach is too weak to fet upon them : And therefore 'tis neccellary that they be firft converted into Vitriols, if you would have them operative in the Stomach, as I have taught you concerning Gold. But forasmuch as every Body cannot be Masters of such a golden or silver Vitriol, it seemed expedient to me to reveal to the poor, a certain and never failing Secret, by the help whereof the Worms both in old People and young are killed.

It is not unknown to Physicians that every common Vitriol wherewith Dyers use to dye their black Colour, doth (being adminiftered to young People) kill the Worms and caft them out too. But becaufe of its unpleafant and odd taft 'tis a hard matter to make Children take it. But now if you do a little more accurately examine the properties of common Vitriol, you will find it to be nothing elfe but a mere acid Salt, by which Iron or Copper, or both together are diffolved in the Earth, by nature. If now we are fo minded, we can alfo make a Vitriol in the Stomach, which will be equally as operative as that which is made by nature and taken in at the mouth, and 'tis done thus. If we give moft fmall filings of Iron or Copper to little Infants in a due weight, thefe now may be eafily adminiftered unto them, as containing no ungratefull taft. For, being reduced into thin or curious filings, and being a metal eafily admitting of Solution, as foon as ever it comes into the Stomach, the Acidity of the Stomach doth meet with it, by which 'tis eafily diffolved, and turned into a Vitriol, and fo endued with the very fame operation as that is, which is prepared in the Earth by Nature.

But you are here to obferve the difference that is betwixt the filings of Copper and Iron, and that is this, the Copper works ftrongly, and the Iron much milder. Befides the Copper makes the Stomach vomit, but the Iron caufeth no Vomits, and doth very rarely difturb the Stomach, and when it doth, 'tis onely in this cafe, viz. when 'tis adminiftered in too great a Dofe. Therefore amongst all fuch Medicaments, Iron is the beft, the fafeft, and the leaft coft, though to proud men it may appear fufficiently vile and bafe. Nor is it to be queftioned but that the brethren of ignorance will entertain it with derifion, and fay; if *Glauber* knows no better remedy for the Worms than this, which confifts of the grofs filings of Iron, he had done a great deal better to have kept it onely to himfelf: And if Iron abounds with fuch Vertues there's no reason for him fo to praife his pretious Vitriol of Gold with fuch a deal of commendations. To this I anfwer, that my aim in teaching the preparation of the Vitriol of Gold is not directed for the Worms in Children fo much. But I have added this remedy of Iron to the defcription I have made of the vertues of the golden Vitriol, to this end, that I may demonftrate it felf alfo is fo excellent a remedy againft Worms, and for the removal of thofe Feavers as are caufed by them. But becaufe their cure can be more eafily perfected (as we juft now fpake about the filings of Iron) 'tis worth the while to have regard to the way that is moft compendious. He that pleafeth may adminifter of the Vitriol of Gold, but I commend Iron to fuch as are poor, for they may have that even every where. There is no Village fo fmall but hath a Smith living in it, who can when your neceffity requires fupply you with fome filings of Iron.

But that my mind may be fully underftood, I judge it neceffary yet more clearly to give you a Declara-

tion of this thing, viz. in what manner and with what conveniency the filings of Iron may be adminiftered to the fick Infants. And 'tis thus done. Whilft the Infants are unweaned, fome Grains of the faid filings from 2, to 6 or 8 Grains, may be mixt with a little Sugar and put into their mouths, and then prefently give them fuck, that fo thofe filings may be fuckt down together with the Milk into the Stomach. Do this three days together and the Worms will be deftroyed, and the Feaver vanifh. But if any body will make ufe of any other Vehicle than what is the Child's ordinary food, he may do fo if he pleafe. But as for fuch as do not fuck, but do drink out of a sucking Bottle according as the ufual cuftom is, you may eafily give it them, on this wife; Put a little into the Bottle and flop the hole of the Bottle with your finger, and fo turn it upfide down that the filings may flide down to the hole, and fo let the Infant fuck it down, and 'twill pafs with the drink into the Stomach. To fuch Boys and Girls as are bigger, and have more underftanding, it may be given eafily and any way you pleafe, onely telling them that they will be reforted to their former health. To fuch as are 10 or 12 years old a quarter part, or an half of the weight which we ufually call Quintlein [from 10 to 20 grains] may be given fafely, for 3 or 4 days. But in the mean while let not the meats they ufe be of hard Concoction, but made of Pottage, Prunes, and fuch like mollifying and loofening things, which may help forward the operation of the Iron, and fo the fick will become the fooner well. I could not refrain from highly commending to all tender Mothers that love their Children, this moft fafe and not at all coftly Medicine againft all the Feavers proceeding from Worms, which do kill fo many poor little ones deftitute of all kind of help. Let no body matter its vilenefs, but rather think with himfelf, that God hath alfo endowed vile and contemptible things with great vertues. Verily this Cure, and thus taking away the Worms, and the Difeaes arifing therefrom, is ftrongly founded on natural reasons, or arguments. For feeing that the common Vitriol is a Poyfon to Worms, but becaufe of its bitter and naufeous taft 'tis exceeding unpleafant to the Palate, they do very well, that fubftitute Iron as being void of all Savour, in the room of the common Vitriol, that fo being given to their Children it may be converted to Vitriol in their Stomachs, and fo kill and drive out the Worms. I my felf have tryed many experiments about the Cure of the Worms in my Children, but never found any thing fafer and better than contemptible Iron.

A Story of a Child that had Worms.

I Will tell you an inftrutting Story, concerning a great and eminent man's Child in fuch a Difafe proceeding from the Worms, in which my felf was concerned. A certain rich man did on a time confult with me, (or ask my advice) about this Child's Difafe. I gave him as much filing of Iron as was fufficient for one Dofe, for his Child to drink. It feemed an abfurd thing to the good man, to give an Infant filings of Iron, upon this conceit he omitted to ufe it, and having called two Physicians he fhews them the filings, and afke them whether they would advife him to adminifter it to his Infant. They earneftly difswaded him from ufing it, faying that if he ufed it his Child would be killed, and that it was a Medicine

Medicine only fit for curing of Horſes, and that they would preſcribe a far ſafer and better one. They ſaid there was no danger in the Child of Worms, and therefore they preſcribed it a cooling and purging Syrup, thereby to take away the Feaver, and they alſo added confections of Pearls, with other cooling Waters. Death deſpiſed theſe kind of Potions, and ſnatcht away the Infant: The Child being dead, there crept out of his mouth great Worms, and clearly teſtified to the Parents their unreaſonable rejecting my advice, haply becauſe the Medicine I preſcribed was not coſtly, but prepared out of a vile Subject. But it repented the Parents too late: The Mother coming afterwards into the Houſe of a certain Neighbour, gave that filings which I had delivered them, unto an Infant troubled with a Feaver and the Worms, who upon the taking of that one doſe only became better, and by little and little returned to its former ſtate of health, I was willing to ſet down this hiſtory to the end that I might demonſtrate, that vile and abject things are many times capable of performing more than Pearls and precious Stones can.

And ſo I conclude this ſo very neceſſary a diſcourſe concerning Worms, and the Feavers ariſing from them, whereby great multitudes of poor Infants are deſtroyed. I hope that no body will take it amiſs that I have made ſo long a diſcourſe concerning Worms. For I judged it neceſſary to ſhew the cauſe from whence ſo many little ones do dye in the flower of their Age. He that reſuſeth to believe what I ſay, let him try the thing by his own loſs.

CHAP. XI.

Of Mercury and its excellent Vertues, both Medicinal and Chymical, I mean not the common and well known Mercury, but the Mercury of the Philoſophers, the which is extracted by the Vulgar and well known Gold and Silver, (but they are to be firſt rendered Magnetic) out of the Beams of the ſuperiour Sun and Moon, by the help and aſſiſtance of the Air.

IT is well known to thoſe that have looked over the manifold Writings which are extant at this day, how many and how great ſearches have been made, and how various and many opinions there have been abroad for many Ages, concerning the Philoſophers Mercury; as many men ſo many minds, one man concludes with himſelf to prepare it out of ſuch a matter, another out of ſuch a thing, and 'tis hereby come to ſuch a paſs as that, there's no more ſaith left for any ſuch Mercury, and 'tis lookt on as if there were no ſuch thing in nature, nor is at preſent any where extant: Becauſe ſo many thouſands of men have been occupied in the ſearch thereof, and ſo moſt exceedingly ſmall a number have been maſters thereof.

Others have opinionated, that the moſt pure ſubſtance is to be extracted out of Gold and Silver, but not in the form of a running Mercury, but in a watery form, and to be coagulated and fixed by the help of the Fire into a medicinal Stone.

Otherſome have perſwaded themſelves that Gold and Silver being ripe and fixt, are no ways fit for ſo great a work, but 'tis rather to be ſought for in ſuch Subjects as never aſſumed to themſelves any ſhape, but do as yet lie hidden in that great and univerſal Chaos the Air, becauſe they ſaw that the life of all

things lay hidden in the Air; and that out of it every Creature of God doth daily and without intermiſſion attract it unto it ſelf after a magnetical manner, both for its own life and augmentation, and that it is ſo too with the ſeeds, abundance of them (and they moſt different ſorts too) being ſown in the ſame Earth, do each of them (according as its nature and property is) acquire to it ſelf both life and augmentation thencefrom, viz. the Air.

So likewiſe may it be brought to paſs, that even the Metals may according to their nature and propriety extract their encreaſe out of the Earth or Air, knew we but how to get the true Seed, or true Magnet which might get out that augmentation. For why ſhould not God have as well given a Seed to theſe his Creatures for their encreaſing, as well as to the other Creatures? So then there are very many fundry Opinions ſprung up, concerning the Mercury of the Philoſophers, and very many men have to their uttermoſt ſearched after it, yet but a very few have obtained the ſame. Though it be thus, yet the fault is not to be imputed either to Nature or Art, but to the ſearcher after it, becauſe he errs and ſeeks not in the due place. Verily I did very many years ago exceeding ſtudiouſly apply my ſelf to the ſearch of ſuch a ſpiritual and Gold and Silver attracting Magnet, but I could not hitherto attain to the true Scope, until I at length by chance found that a true living and running Mercury might, by the benefit of Art, without any Addition of Mercurial things, be extracted out of the fugacious and imperfect Metals, ſuch as are Lead, Tin, Biſmuth, Zink, and Antimony. And although I had read many Philoſophers affirming this thing, yet did I always doubt of the ſame; and indeed not without cauſe; for in my youthfull days, ſerving a man of great note in Chymical Labours, I tried in two years ſpace two hundred ways of making the Mercury of Saturn, and not ſo much as one of them ſucceeded. Now my ſaid Maſter was ſtirred up to the ſearch of this Saturnine Mercury upon this occaſion as follows. He had ſome familiarity with many noble Perſonages that were alſo addiſted to the ſtudy of Alchimy: One of them knew how to make running Mercury out of Lead, and to turn it into the beſt Gold, and he ſent unto my Maſter one lot or ſomewhat better of that ſaid Mercury, together with the way of turning it and fixing it into Gold. We ſet about the work and it ſucceeded to our deſires, and yielded us as much Gold as there was Mercury ſent us. This hoped for ſucceſs did ſo edge on my Maſter, that he could not reſt till he had obtained from him that knew it, the manner of making this Saturnine Spirit. But as often as ever we tried the operation according to the way preſcribed us, both our hopes and labour were in vain. And then my ſaid Maſter readily granted, that we could not effect it. Hereupon it was that he ſought all abroad with the greateſt diligence, and had got ſuch abundance of proceſſes and operations, that two years did ſcarce ſuffice me to try them all; though there was not ſo much as one amongſt them all that answered our wiſhes, but all our Labours were in vain. Upon this ſcore, I could believe neither Baſilius or Paracelſus when I read in them, that Gold and Silver might be reſolved into true and running Mercury, ſeeing that the bare turning of unripe Lead into Mercury, did coſt me and others ſo great Labour and Pains, and yet we could not obtain it neither. Whereupon I fell into this opinion, that the Philoſophers pointed

at some other thing, by their running *Mercury*: And I did so long adhere to this opinion of mine, untill I chanced to light on the making of a running *Mercury* out of Lead, and I have several times repeated the operation with the same success.

I have likewise revealed it to others, who have also done the same, but onely in small quantities hitherto. But some of them have bestowed much pains about it, and to prepare it in a greater quantity; and that principally, because 'tis certainly manifest that no small benefit lies herein hidden. Nay if it were no otherwise profitable than barely thus, that it may be turned into Gold, and of this I am certain, (twere worth while) For if the said *Mercury* be but rubbed upon a piece of Gold, it makes it white, and being then put upon the Coals, it separates indeed from it, but yet leaves it tinged of a higher and deeper Colour. If this Labour be ought repeated, the Gold will become weightier. And hence may easily be conjectured, that if it were adjoyned to a pure Golden Calx, it would in a short space of time easily pass into good Gold. Neither is there any doubt, but that if any one did but know the manner of rightly handling such a *Mercury*, he would obtain some notable thing out of it, because all the Philosophers do in their Writings promise so much good of *Saturn*. They generally affirm that Lead is (inwardly) far beyond Gold. How many Philosophers are there that teach the preparation of the universal Work from thence? See the Universal Work of *Isaac Holland*, *Paracelsus* his Heaven of Philosophers, The great and small Countryman, &c. Many do expressly write, that all things which the Philosophers do seek for, are to be found in Lead; Hereupon they called it Lepraous Gold. And some Philosophers do write, that in *Mercury* are all things that are sought for, haply they mean not the Common, but such an one as is drawn out of Metals. But we'll even let pass this *Mercury* of *Saturn*, and see whether or no we cannot find a better *Mercury*, and such a one as is of greater moment. In the mean time the said *Mercury* of *Saturn* will fly about, and bring good news to the Lovers of Truth, viz. that *GLAUBER* is now in the way, to triumph, by the help of God, over all his Enemies.

We will therefore go on to search out, whether or no there is not another and better running *Mercury* than that to be found, which comes out of Lead. When I did somewhat more accurately search into Nature's secrets, I clearly saw, that all things which live and doe in growing take an encrease, do proceed or come forth by the Sun's operation, inasmuch that such fruits as are nearer hereunto are the more excellent, and by how much the farther off any are from it, by so much the vilder be they. As for example in Wine; by how much the nearer it is to the Sun, so much the nobler is it; and by how much the farther it is from it, so much the vilder is it.

The same may be observed in the generation of Metals, viz. that in the hotter regions there is a greater quantity of Gold, and of Silver, than in the colder Countries. This is well known, and out of all dispute: So then when I saw that the hot beams of the Sun, together with the cold and refreshing light of the Moon, did not onely ripen Gold, but also those excellent Wines, and the best tasted Fruits, yea and the most contemptible Herbs, and that it gave to all things their most acceptable Savour; well did I conclude, that if a convenient Matrix, or suitable Magnet were exposed to the hot Sun-beams, and to the cold light of the Moon, that might day

and night receive their Operations; It could not possibly be, but that the Seeds of those (viz. of *Sol* and *Luna*) insinuating themselves into such a Magnet, will pass into most excellent Fruit, and obtain a perfect maturation. I did once make trial to see whether it would be so or no, and having artificially prepared Gold and Silver, opened them, and brought them to a Magnetick attractive vertue; and being well mixed, I exposed them to the *Sun* and *Moon*, to see and try what would proceed thencefrom. Then afterwards, supposing them to have stood long enough at the *Sun* and *Moon*, I put them into a small Glass Retort, and placed it in Sand, and separated (by distillation) all the moisture from the Golden and Silver Magnet, that it had attracted from the Air. I got indeed a sweet Water, but yet not without Vertues. But having administered a stronger fire to this Magnet, I drew therefrom an astringent Liquor, resembling a golden yellow Colour, and like to Gold. I again exposed the said dried Magnet to the beams of the *Sun* and *Moon*, that it might by them be impregnated, and that I might see whether or no a Second, and more Births would be produced, answering in all respects to the former. I doe not doubt of them, I confess but that they will be of a like property and nature as their Father and Mother are, or indeed be more fair and excellent than they be: For that first-begotten offspring brought with it self into the World a far more excellent fairness than its Father had.

Farther, bringing this Birth of *Sol* and *Luna* to a more accurate trial, that so I might find out its vertues and efficacy, I first of all perceived, that there lay hidden therein (though as yet so Volatile) a Medicine of great moment. And dealing with it upon a certain time, and putting a little of it by chance upon Gold, I found that it made the Gold white; and rubbing the said Liquor many times upon the Gold, it did at length produce (or shew forth) the live *Mercury* that lay hidden therein, which said *Mercury* thus living and visible, I extracted out of this same Liquor; but it is better not to vivifie it, but to take it as 'tis born, and so fix it and make it constant. And now, I suppose, that such a *Mercury* as is extracted out of the Air, by Gold and Silver, being not so much corporeal as spiritual, is to be accounted of as the true *Mercury* of the Philosophers.

But if now any will object and say, that this *Mercury* doth not proceed forth from the Air, or that it is not extracted out of the beams of *Sol* or *Luna* by the Magnetick Gold and Silver; such a one may even say what he pleaseth, but in the mean time he will not get the things he fisheth for. Besides, I do not matter it so much, viz. whence it ariseth, provided I can obtain the same; If it did proceed out of the Gold and Silver, it were not therefore to be rejected, but it would be altogether better than that which is made out of gross Lead, nay haply it might become a Tincture, did but any one know how rightly to handle it.

It is a usual Proverb, that the Apple falls not far from the Tree, and each thing follows the Seeds of its proper and peculiar nature. By how much the nobler the Tree is, by so much the more worthy is the Wood thereof. The younger sort sing over the same Song as the old ones doe. Now these Proverbs do declare, that the Fruits are so much the more excellent, by how much a better nature the Tree is of, and this is a sure rule: And therefore it necessarily follows, that such a *Mercury* as is drawn by Gold and Silver out of the Air,

Air, or doth proceed barely from Gold and Silver, must needs be far better than that which hath its rise from Lead: And herein I acquiesce. Let every one take from thence what best likes him, I was willing to leave to such as come after me, those things which I met withall of so great moment.

And as concerning the Medicinal Vertues of this Golden Mercury, I doe give this caution about it, that if it be used as it came over at first in the distillation in Medicine, because 'tis as yet immature, and but newly born, it may work too strongly upon the Body of Man. It is therefore better that it be fixed with some corporal well-opened Gold, and so 'twill effect those things which a Universal Medicine is onely able to perform. I confess that hitherto I have not brought it to any constancy or fixity, because I have not had time of rightly handling it: In the mean while there are others that will set about this labour, and will in due time manifest more things concerning it. Let every one be content therefore with this present discovery, viz. that a truly live and running Mercury may be extracted, not onely out of the soft and volatile Metals, and consequently unripe ones, but also out of the ripe Metals. And seeing that most Men doubt much of the truth of such a thing, I could not omit the affirmation of the same, as being a most true thing: He that listeth may make trial of the same. 'Tis enough for me to have shown you the way. Let others likewise publish something, that so the truth which hath been so long suppressed hitherto, may at length spring forth out of the darkness into light.

And now, at last, let's come to treat of Wine, and examine what an harmony and familiarity there is in it with Gold and Man.

CHAP. XII.

Sheweth how great harmony, familiarity, and love, there is in Wine, with Mankind and Gold.

IT is evident, even from the Writings of all the Philosophers, that Wine and Gold is a wholesome remedy for Mankind, but yet not in such a gross state, and without any preparation, as they come forth out of the Earth, but they are to be destroyed, and their most pure parts to be extracted, and again conjoynd. To obtain this knack, there have been used many *Menstruums*, and one more excellent than another. The common Spirit of Wine hath no familiarity at all with Gold, because of its unripe and combustible Sulphur, from which Gold is wholly averse, as being its enemy. This thing I have in several places of my Writings made mention of, and have also taught it in this very Treatise, that Gold being dissolved in *Aq. Regia*, and precipitated with the Water of Tartar, yields most curious fine Atoms, which cannot be done any other kind of way. For the common gross Wine, and the common sulphureous and unripe Tartar are enemies to the Gold, the which is evidently manifest by this preparation of the most subtile Calx of Gold, caused by the pouring of the Water of Tartar thereunto, whereby 'tis precipitated unto the bottom.

The certainty of the truth of this thing may be thus tried, if a little Gold being dissolved in *Aq. Regia* be put into a glass full of Rhenish, or any other sharpe Wine: The Gold will be presently precipitated, by the Tartar which is in the Wine, into a

tender and shining Powder, but it will not in a moment of time settle to the bottom, but by little and little. And yet if you put the Wine in a Vessel over a fire of Coals, and boil it, then will it be speedily precipitated. From whence 'tis evidently apparent, that Wine being as yet not at all separated from its impurities, doth as it were differ from Gold, with a deadly hatred, and yet carries hidden in its bowels a substance most friendly to the Gold, the which will, in the end, manifest it self so to be, when the more gross parts are separated from the more subtile.

Basilus teacheth its preparation by a peculiar proper instrument, wherein (as I judge) the Spirit of Wine is to be kindled and burnt, that so by the burning up of the Sulphureity, the Mercurial Salt may be separated and caught in a cold Receiver. And with this very Salt (saith he) may a Tincture be extracted out of Gold, which seems very probable to be so, if one could but get or catch that said Mercurial Salt. Many indeed have attempted this labour, but perhaps not a man hath found an answer to his expectation, where the defect lies, God knows.

Others have mixed Gold with *Alkalies*, and have taught the extracting of a Tincture by an Alkalized Spirit of Wine, which way, though they may doe somewhat, yet it is not the genuine way.

Also some have by distillation gotten a certain fiery Spirit out of Tartar, and therewith endeavoured to conquer Gold. Here indeed is an appearance of some kind of possibility, but yet this Spirit is not to be attempted for that, which unlocketh all the bowels of the Gold; and that for this reason, because it doth as yet abound with combustible Sulphur, to which Gold is a bitter enemy. But now if you would duely joyn Gold with Wine, then must all the combustible Sulphur (of the Wine) be first separated from its Mercurial part, and the Mercury of the Wine is to be brought by distillation into a notable fiery Spirit; if this be not done, there will be no great matters effected with it.

CHAP. XIII.

By what means such a Spirit of Wine as doth associate it self to the Gold may be prepared.

WITHOUT doubt many such as perceive that there is a possibility of preparing such a Spirit will be most vehemently desirous to know the operation, how 'tis to be done. But it is even a wickedness to cast such a great Secret before the unworthy and impure Swine. It therefore will be sufficient to shew both that it may be done, and after what manner; the rest to be left to God.

But that the studious Artist may not be wholly affrighted or kept back, I will here declare, so much as may be sufficient to any one that is versed in the Labours of the Fire, for the acquisition of so great a Spirit: But yet with this proviso, that he make use of Patience in his operation, for this work is not to be dispatched in a day, like as that labour which in one days distillation affords a Spirit out of the Lees of Wine, or out of Tartar. No! But the manner of the work is thus:

Take white or red Tartar (for both of them being well mundified, are as good one as the other) dissolve it in Water, and separate all its gross Sulphur by

by a certain precipitating matter. This impurity abiding in the Water, is to be separated from the precipitated Tartar, by pouring out the Water, the which (Tartar) remains in the bottom like a snowy Sand, and is to be well purged by reiterated washings with Water, so long untill (all the impurities being well separated) the Powder it self becomes like to the white Snow. Now although that this Tartar be most exceeding white, yet doth it contain as yet many Sulphureous Faeces; which being black, do never suffer themselves to be separated by any Solutions and Coagulations, but it is necessary that they be precipitated by a certain precipitating matter. Therefore let that Tartar be again dissolved in pure Water, and be precipitated, the which Solutions and Precipitations let be so often and so long repeated, untill there appear no more black Faeces. This most pure and most acceptable Tartar melteth in the mouth, and doth almost in the manner of other Salts easily admit of Solution in cold water. Being brought to this pass, it is rendred fit to be dealt withall in the following manner.

Dissolve some pounds of this pure Tartar in cold water, so as to make it sufficiently acid. Put this Solution in some warm place, or rather in Horfe-dung, or in a warm Balneo, that the Tartar may begin to putrefie and lose its acidity, and get a kind of sweetishness, which before it will come to be, there is required the time of some months. After it hath thus putrefied, and lost its acidity, all the unprofitable Water is to be evaporated by a Balneum, untill it become a thick and black Juice like Honey; the which being set in the Glass in Sand, and being urged with a stronger fire than was made in the Balneo, will yield a fiery Spirit, and such an one as will mix it self with Gold dissolved in Spirit of Salt, and will separate the purer parts by digestion, and draw them to it self, from the more gross parts, and so will perform its office in Medicine even to most high admiration. For any one may easily conjecture that the most pure parts of Wine, Salt, and Gold will operate no evil effect.

What it will perform in Metalline affairs, I doe not as yet know; But, without question, if it be rightly administred, and duely made use of, it will play its part very notably.

This operation before set down, seems easie to be done, if barely looked on outwardly, but there's more labour and trouble in it than one would imagine. Such as have not the gift of patience, and knows not what belongs to patient working, may forbeare this labour. For the putrefaction proceeds on very slowly, and there is required the knowledge of a matter precipitating Tartar, without which it will never suffer it self to be precipitated and purged, 'tis an hard thing to find, but he that knows it, it renders him all his labour facile and easie. Any impure Tartar, whether it be white or red, may be so washed in one or two hours space, and so purged, that (losing nothing save its Faeces) it will become most white, and much more apt for many operations. But my time will not admit of treating farther of these affairs, it may (God willing) be done afterwards in another place.

However, thus much I will yet add more; That if Spirit of Wine brought to the highest purity, so as to retain no filthy savour or odour, be in a due quantity conjoynd by the help of common Water with this excellently well depurated Tartar, there will result from them two a drink of a most excellent fa-

vour, like to natural Wine, and may be used instead of wholesome Wine. This would be a most profitable thing for those that travel, had they but that Spirit of Wine, and that so excellently well prepared Tartar. For there is Water to be had in all places, and so they may at all times and every where make themselves good Wine, yea so good and so strong as they please, according as they add more or less of that Spirit and Tartar.

N. B. This Art would be very profitable for the cold Countries, in which Countries, in the want of Spirit of Wine, because no Wine grows there, the Spirit of Corn will perform the same. The chiefest knack is, to be furnished with that Tartar, which by an easie Solution enters into (or is dissolved in) the Water. But this is a business of a greater moment than to be divulged. I have already opened to some the manner of preparing such a Tartar, who make it in plenty, and so any one may easily get from them as much as they shall need.

Besides the use of that kind of Tartar, conduceth to the accomplishing of many other things, but not to be spoken of, lest it should prove a detriment to such as know it. But I doe here truly and sincerely affirm, that whosoever he be that can without wast and cost so prepare the common vulgar Tartar, he will be hereby able to get his food and rayment, and other necessities for life, wheresoever and in what Country soever he shall abide. This thing will in process of time have a farther progress, and many will by the benefit thereof live more happily, and perform things incredible. I have made a beginning, and the Mice shall never gnaw off what I have here written, but contrarily my Successors shall enjoy the same to God's glory, even to the Worlds end, and will in the first place thank God, and next him, me, as being the Authour and Revealer of the same. I could reveal many most profitable things that might be done by such a Tartar, were it not for injuring such as get their living by it, and which for certain causes are not at present to be mentioned. I have said enough to Wise men, and as for deriders and mockers, I have said too much, for they will say all are Lies, because they know not how to doe thus.

As to what appertains to the use of this here described Liquor, conjoynd of Gold, Tartar, and Salt, it may serve instead of *Aurum Potabile*, in all Sickneses, and may be profitably administred, in corroborating the vital Spirits; for it doth not discover its Vertues by a remarkable and visible operation, but it strengthens the Body, and doth very gently drive out Urine and Sweat, and seldom is it that it provokes to stool, unless it be given in a strong Dose. The Dose is from one, two, three, six, nine Drops, even to a Scruple, according as the Sick is, in Water, Wine, or Ale, or other Liquors, in a Morning upon a fasting Stomach, and at Evening after Supper, for some days together. It keeps the Body open, and strengthens the Brain, and all the Members. But principally (before the use of this Liquor) the Body be well purged with good purging Remedies, such as are my purging Gold, and purging Lunc, because then this Medicine of the said Golden Liquor operates far better, and more profitably. In using it, you are to observe whether or no the Excrements become black, if not, the Dose is so long to be augmented or continued untill the Excrements that come away be of a black Colour. Moreover, the Disease decreasing, the

Dose

Dose is to be lessened by little and little, according as necessity or the disease requires.

These things I thought good, at this time, to publish in the Fourth Part of my *Spagyricall Pharmacopœia*. I entreat that every one would take in

good part these few Medicinal Secrets, but of very wide and large extent. And, God willing, my Third Century will shortly come abroad and present you with a Manifestation of more excellent Medicines, and other profitable Secrets.

The End of the Fourth Part.

THE FIFTH PART OF THE Spagyricall Dispensatory.

Discourfing of the true Universal Medicine, and of those most Eminent *Arcana's*, as well Universal as Particular, which are hitherto unknown unto the World; by the help of which unheard-of and almost incredible Operations may be effected, not onely in Medicine, but also in Alchymy. Propos'd by way of *Question* and *Answer*.

Question 1.

WHether or no it is a thing possible in nature for such a Tincture, or so Universal a Medicament to be prepared, as by the help of which, both the Bodies of Men and Metals may be promoted unto an higher, better, and more noble Degree or Essence?

Answer.

It is not at all to be doubted of, for, as well the Authority of so many and so great Men (who confess by their Writings which they have published that they have made the same) as daily experience demonstrates the same to be a truth, void of any doubt.

Question 2.

If those things which so many illuminated Philosophers have written of this Universal Medicine be true; how comes it to pass, that though almost the whole World search after the same, yet scarce one of so many thousands is master of the same, and that the greatest part of the inquisitors after it, waste their Estates in the search to no purpose?

Answer.

The Art is not to be blamed, because of the fruitless endeavours of so very many men that so greedily gape after so great a treasure; but the fault is to be imputed to their own selves, for they are hereto driven and stirred up by their insatiable covetousness and unjust intentions, to make their search after so divine a gift, and their design is to scrape up to themselves, by the help thereof, great Riches and Honours, little thinking that God always hath and still doth bestow his gifts upon such as are upright and sincere, and who doe not onely daily pray unto him for the same, but do also search after them with uncessant Labours. This the Apostle himself doth witness in expresse words, saying, *It is not of him that wills, nor of him that runs, but of God that shows mercy.* And yet the extreemly blinded World believes it not, nor proposeth unto it self any other Scope than the scraping together of Gold and Silver right or wrong, and fain would as it were wrest this so great a treasure out of the hands of God; and having gotten it, add fuel to their malice, pride, and impiety; And so by this means, more nearly approach (even in this life) to the Devil the Father of all wickedness, and be at last plainly like him. And this now is the primary and principal cause, why so very many as are

O o busied

busied about the search of so great a treasure, do lose both their labour and expence.

Question 3.

But are there no other impediments that present themselves, and which may be an hindrance and bar even against pious men too, and such as lead a blameless life before God and Man, whereby they cannot have admission to the knowledge of so great a Medicament?

Answer.

Yes verily, there are exceeding many, or almost innumerable impediments that lie in the way, and shut up the passage even against the approaches of pious men to so great a work, though they attempt the same too with a good intention, and do sue unto God by their daily prayers, and make their search with a most diligent meditation, and continual Labours thereabout.

Question 4.

What are those impediments, I pray?

Answer.

To reckon up all those impediments apart, and to set down each of them so clearly as for every one to understand and apprehend the same, cannot at present be done; neither is it necessary to mention all, for it would not onely amount to a great Volume, but would also be a burthen to the Reader, and be rather an hindrance than an imitation and encouragement unto him concerning the attainment of the knowledge of so great a work.

But yet that I may satisfy in some sort, the desires of some or other, I will recount some of the chiefest of those impediments, by the knowledge of which, every one may know the reasons that are wont to stave off even pious men from so great a Secret.

N. B. First of all therefore, there are a many that have not means necessary or requisite to begin and perfect the Work withall, though they have a good Judgment, and are inflamed with an ardent desire of searching after nature and its miraculous effects, and doe not at all fear, nor are discouraged at the hard labours that are necessarily requisite to Chymical Operations. Such men therefore as these are (being stirr'd up by a singular candour and sincerity of mind to a love of honesty) doe not thrust themselves forward after the manner of impious and deceitfull Impostors and slanderous Vagrants that thirst after nothing but Gold, and pretend to some greedy Miser, that they will teach him the making of the Philosopher's Stone (the knowledge of which themselves are clearly destitute of.) No! but they even loath such vain acquaintance, and disdain that despicable name of Gold makers, and content themselves rather to set at home, and enjoy those few things which God hath vouchsafed to bestow upon them, than to turn Parasites, and live in the Courts of Princes and great Men, where they must strive by a Fox-like subtilty to please every one, and to bow the head to each shoulder, and to scrape with his feet. This now is the first impediment, which keeps off not a few good Men from the possession of so great a Secret.

Besides, there are not a few of this sort, that briefly

and cursorily running over the Writings of the Philosophers without any serious meditation upon the thing they read, or without understanding of the same, do think themselves masters of a great deal of Wisdom, and firmly persuade themselves, that if they have a little snatch of Learning, and have but the knowledge of a Tongue or two, and have but by some Anagrams pleasantly tingling in the Ears of some great Men, sooth'd their minds a little, and wip'd them of some of their Silver, the finding out of so great a mystery cannot possibly escape their profound Scholarship, but they must needs catch it. But yet (by their leave) they are quite out, and full well are they known unto God, who with-holds from those proud deriders, and envious contemners of the truth, his benediction, and leaves them wallowing in their courtly pastimes so long, untill at length (after their turning and applying themselves from one foolish deceived man to another, and so on) they doe themselves lay open their own gross ignorance and most filthy shifts, which they have wrapt over with such a drestable babbling, and by the fruitfulness of the event shew that their large promises of golden Mountains are most vain and idle. And hereupon their hopes of having the Philosopher's Stone (which they seek for merely to advance their pride, and the more easily to suppress the truth) vanishing away with the smoak, they lose all their credit and their good report, and can find no more such credulous persons that will suffer themselves to be fooled by their most vain promises. And this is another kind of those that bestow their labour in vain about this so great a work, who doe thereby add a great load to their wickedness, by wasting other mens goods, and deceiving the too credulous, and ruining others as well as themselves. There are yet a third kind of erroneous searchers, and who deceive themselves with their vain labour, and they are such as being a little too credulous and simple when they have lighted upon some of the Philosophers Writings, and read what vast treasures are to be gotten by Chymical Labours, doe presently feel an itching desire after Gold, and being inflamed with the covetous desire of such hungry treasures, doe apply themselves with unwarthen hands (as we may so say) to the reading of the same, and then follow the bare letter in their operations. From whence it comes to pass, that (all things being obscure and dark to them, being ignorant and unskilfull, and the light of nature not shining upon them) they wander from the right path, and immerse themselves in the fruitless attempts of vain Labours. Some there are that have indeed some kind of knowledge of managing the Fire, and who doe very diligently read over the Writings of the Philosophers, but yet are quite confounded by their reading them, seeing that they cannot find out the true Fire, and true matter of the Stone, which the Philosophers have so obscurely and so variously written of. For some of them teach the making of the Stone out of fixt Gold and Silver, and not out of the other immature and volatile Minerals, because what a Man sows, that he reaps; others tell us the quite contrary, and say that there cannot be any better thing made of fixt Gold and Silver, seeing they are already brought by nature unto that perfection as not to be reduceable into their first matter, out of which (said first matter) they affirm that their Universal Medicine is to be made, and not of fixt Gold and Silver: And therefore rejecting fixt Gold and Silver, they say that the first Entities (of the said *Sol* and *Luna*) being yet Volatile,

lute, are the true first matter of the Philosophers Stone, because they are as yet immature (as they phrase it) and tender, and fit for the making of those things which we are desirous to accomplish, which (they tell us) cannot be possibly made out of those two fixed bodies. And to help forward yet more confusion, the multiplicity and variety of names, which the matter of the Philosophers is filled, is no mean impediment to the understanding. One bids us seek it in Vitriol, another in Mercury, some in Saturn, others in Magnesia: And thus is that matter deciphered by various and innumerable names, insomuch that it is impossible but that he who is ignorant, and not well versed in these affairs should be hurried into various doubts and perplexities, being clearly ignorant whether or no the Philosophers mean the common Vitriol, or a Vitriol extracted out of the fixed Metals, especially seeing they too and again affirm, that their Vitriol Mercury and Saturn are not those vulgar Metals of Gold, Quicksilver, and Lead. Who therefore I pray could be so wise and prudent as to rid himself out of the so many confused and intricate windings of this Labyrinth? Even hence it is that the most learned and diligent searchers have been wound into so many erroneous Labours, nor could by any means get clear of those hedged up turnings.

Nay yet more, the inconstancy of such as labour is no small impediment, who (should they have the matter) would not perfect the same by reason of their fickle inconstancy. For if the Stone does not presently come forth, and make them masters of what they desire, away they throw their Books and tread upon them, and load the Authours with curses and imprecations, accusing them of wicked deceit, in that they have not written clear enough for every one to understand so great an Art at the very first dash, and to become a master of such a notable treasure without any labour at all.

You shall likewise meet with some that are so very wise as that it seems no ways likely unto them, that so divine a gift can be prepared out of so vile abject, and contemptible things, whereas though (by their leave) every good thing (for the most part) is wont to be abject and mean, and not precious, witness Sandivov, who tells us that he had declared the whole Work to not a few, even from the beginning to the end, but (by reason of the meanness of the same) they judged it to be but of small moment, believing that no good could possibly proceed thencefrom.

Besides too, it oft times happens that even many of those who by their reading and diligent scrutiny have attained the knowledge of the true matter, are notwithstanding that ignorant of the true Fire that gives Tincture unto that true matter, and therefore cannot be masters of their wishes and desires. Infinite is the number of these and such like obstacles which impede, and retard the desirous searchers after so great a Work. For many there be that seek, but few are they that find.

Question 5.

Whether or no the Philosophers do so much differ amongst each other, as that one hath prepared that Universal Medicament of this matter, and another of that?

Answer.

Yea, verily they seem much to differ amongst them-

selves, not onely as to the external Letter, but their Opinions also that concern the very matter it self are very various and discrepant, but yet as to the Basis and Fundamentals of the truth, there they are of one mind, though one hath prepared his universal Medicament of one matter, and another of another matter, and have each (after the finishing of their Work) described the operation agreeable to their own way of proceeding.

Question 6.

Whether or no there are more universal matters than one, out of which the universal Tincture is prepared?

Answer.

As far forth as we can gather from the Writings, both of the Ancient and Modern Philosophers, they have not onely used divers matters, but also different ways of operation, in the preparing of their Tinctures: But the Tincture being acquired, each had an universal Medicine, and was therewithall content, though (I confess) one Medicine was more virtuous and efficacious than another.

Question 7.

Which of the Metals and Minerals are to be accounted of as the true matter of the Stone?

Answer.

If you should onely mind the literal sence, the Philosophers then seem to know a way of preparing their Tincture, not onely out of all the Metals, but even out of the Minerals too: For they have imposed so many names upon their matter, calling it one while Gold, another while Silver, or Mars, or Saturn, yea and Magnesia, Arsenick, Sulphur, Soot, Urine, Blood, Sperm, Menstruum, and I know not how many absurd names, which have seduced the unskillfull Searchers into various errors, whereby they have bestowed their Labours, and spent their Estates upon unprofitable matters, and so lost both their Pains and Charges.

Question 8.

Whether or not the Tincture may not be extracted as well out of fixt Gold and Silver as out of the other imperfect Metals, and immature and volatile Minerals, seeing that the Philosophers say, that all the Minerals and Metals have their original out of one and the same root, and do agree as to their inward Essence, the difference that is between them consisting onely in the purity or impurity, and in the fixity or volatility of them. If therefore the pure be but separated from the impure, and Shew from the Kernel, that separated purity of the imperfect Metals will give the same that the most pure Gold and Silver will. Nay more, if it were necessary it might easily be demonstrated, that a true Tincture, and wholesome for both the bodies of Men and Metals, may not onely be prepared out of any Metal and Mineral, but even out of the Vegetables and Animals themselves too, and that by reason of their included Sulphur, which is the Father and Original of all the Metals?

Answer.

But what need is there of seeking that in far re-

more places, which offers it self nearer at hand? wisely therefore did the Philosophers reject all the Vegetables and Animals, and other the like unprofitable things, as to the making the universal Tincture, they expressly advised us, that such things as you desire to reap, you must sow; and that he that thinks with himself of bestowing his labours about such operations, must begin with those things that nature hath left off at, and could not advance to a farther perfection. And what else I pray do Artifts seek for but Gold and Silver? if so, then (as the Philosophers do seriously admonish us) we must take their Seeds and Sow them, if we would Reap a much augmented and exalted Crop of Gold and Silver.

Question 9.

If the case stands thus with these labours, as that those things which are sown, are again reaped in a multiplied increase, why is not the most noble Seed of Gold only sown? What need is there of adding Silver thereunto which there's no appearance (as to the outside view) of any colour.

Answer.

Although there be not any apparent colour in the Silver, yet is it certain that there lies abundance of colour therein hidden, which notwithstanding does not dissolve it self before it is unlockt and inverted by the labour and help of the true Chymick Art, and that its external whiteness be hidden, and its internal redness be brought forth to light. For verily a true Tincture necessary for the transmutation of the Metals can never be prepared out of bare simple Gold, without an addition of Silver thereunto: For Silver is the Matrix of Gold, in which, this (as being the masculine Seed) germinates, grows and multiplies its colour.

Question 10.

This seems to every body a wonder that a red colour should also lie hidden in white Silver, seeing that there are not a few who think that even Gold it self does not contain more of colour than it needs for its own self. How therefore must this be understood?

Answer.

As to this, you must not at all mind the external shape, but that which lies occultly hidden. The internal parts of any Seed are not visible to the sight, as for example. A Vegetable Seed presents you not with the sight of any various colours, but when it is committed to the Earth as to its Matrix, it then sends forth first green Sprouts, then Stalks, then Leaves, after which succeed most curiously painted colours, that at last the Seed comes forth with an incredible augmentation, all which were not visible in the bare Seed.

Consider also the Egg of any Bird, in which no body can discern any Bird, consisting of such divers and various Members, and adorned with such delicate Feathers afore the said Bird is hatcht, the Egg being ripened by an external cherishing heat.

Question 11.

This similitude of the Seed of a Vegetable, and of a Bird, doth not a little enlighten my mind and give me encouragement to believe: I do therefore firmly believe that there is

hidden an abundance of colour not onely in yellow Gold, but also in white Silver it self too, inasmuch that I do assuredly persuade my self, that a constant and most high Tincture may easily be prepared out of Gold and Silver, and that it is a very difficult matter to prepare a permanent Fire brooking Tincture out of the imperfect Metals, and immature Minerals (though they also hide within their inside bowels most exquisite colours) by reason of that imperfection and unripeness which they lie under.

Answer.

Your judgment and opinion is true. For although the lesser Metals, as also the Minerals themselves too do hide within their bowels, the most high colours, and though those very colours may easily be separated from their unprofitable bodies, yet notwithstanding there is requisite to such operations a long space of time, great expence, and hard labour, viz. to make such Tinctures constant, permanent, and fixt by the common Fire of Wood and Coals. But yet he that knows the secret Fire of the Philosophers, will easily give unto such Tinctures that constancy in the Fire that is requisite, which otherwise, and by the common Fire, will very difficultly and hardly ever be effected. For example, common water will always remain water, and therefore will never be brought into a stony or metallick nature by the Fire of Wood or Coals. But a thing may be easily reduced unto that which it was before: If an hard Stone be turned into pure water, it may be reduced (even by the help of the common Fire) out of that same Water into a more pure Stone, and so is it likewise with a Metal, if treated with the same operation.

But yet I do not deny but that even any common water, or any Stone may be changed into a Metal, but then I say, it must be done by the help, not of the common Fire, but of the Fire of the Wise Men, by which Fire, even the Waters are wont to be changed into Metals in the Earth: For all Metals and all Stones have their rise out of the Water, and were at first Water. Whosoever therefore doth well and thoroughly know this secret Fire, which the Philosophers have always with their utmost diligence and care concealed, he may work upon all the first beings of Gold and Silver, as common Sulphur, Mercury, Antimony, Arsenick, Auripigment, Cobolt, and others of that kind, and transmute them into red and white Tinctures. But if he has no knowledge at all of the same, let him in God's name apply himself onely to fixt Gold and Silver, and having volatilized them, turn them into Water, and again turn this same Water into a fixed Stone, which if he brings but to pass, he enters upon the nearest way, and will be a master of that which he bestows his labour in the search of.

Question 12.

If this be the most compendious way of getting the Philosophers Tincture, viz. out of those known Metals, as fixt Gold and Silver; Why do some of the Philosophers write that their Sol and Luna is not that common and well known Gold and Silver, and that as well the Poor as the Rich have that Sol and Luna as is theirs, and may easily prepare the Tincture it self there out of; so that (it seems) all such as busie themselves in the searching after that most eminent Medicine in the common Gold and Silver, do extremely err?

Answer.

Answer.

These Philosophers that reject the common and well known Gold and Silver, were clearly ignorant of the knowledge of making of the Tincture out of them, which had they but known and well understood, they would not so confidently have affirmed such a thing in their Writings. But forasmuch as they knew but that one way of making the Tincture out of the volatile Minerals, and that that way of making it with fixt Gold and Silver was unknown unto them, they could not mention unto us any other way than their own; whereas though there are not a few of the Philosophers, that on the other hand commend unto us the common Gold and Silver, and reject all the other Metals. Nor is the number too very small, of such as do confess, that the Tincture may be made of the more imperfect Metals, and volatile Minerals, but yet with this caution, that one subject is much easier, speedier, and better to operate upon than another is.

No Man can all at once clearly know and apprehend every thing, and therefore it would be much better for a man to judge onely of the things he knows, and not censure the things he is ignorant of, that so the World may not by this means be stult with so many Writings which thwart one another. Some there are who persuade themselves, that (when they do at long run arrive by many turnings and windings unto the wisht for place) there is no certain, nor more compendious way than that which they took in making their Journey. Hence it is, that the Writings of the Philosophers are so involved with intricate opinions, out of which no body can well free himself, unless the whole knowledge of nature be opened unto him: But seeing the number of such is very small, therefore it must of necessity follow, that they who err are very many, and that they who become masters of the truth, are but a very few.

Question 13.

What therefore is it that is necessary for us to know, or what things must we be furnished withall, when we apply our minds to the search of so great a secret?

Answer.

Forasmuch as the universal Medicine is the gift of God, and not of Man, it is but just, that the same be sought for at the hands of God, and not of Men, who (in one night and by a Dream) can reveal those things, which a Man will not get all his life long by his reading of the many intricate Books extant; And thus much doth David teach us, saying, *In vain do you rise up early, and go to Bed laden with cares, for God bestows his gifts upon those that love him, even whilst they Sleep.*

Question 14.

By what means may a gift so divine be obtained from God?

Answer.

By daily praying unto him, and by accompanying your Prayers with daily and diligent Labour. For Prayers alone wont serve turn, unless the rea-

ding of good Authours, and continued Labour be also adjoynd thereto. God reveals his good things to mortal Men, by their serious Prayers, and and continual Labours.

Question 15.

Are all Men fit to beg so great a gift at God's hands, without any difference at all, or doth so great a secret require onely some particular Men's Supplications, and not admit every one, as if all were fitted thereunto?

Answer.

Verily every body is not fit or worthy to be a master of the same. For should it be granted every one, this so exquisite an Art, and of so great a concernment, would become as common as the baking of Bread, and brewing of Ale, but this is contrary to the command of God, who wills not, that the Goat should have so long a Tail as the Cow, for so in Pride she may smite out her own Eyes. God well knows when, and where to give, and who it is that merits such great favours. But however this is an undoubted truth that the proud shall never obtain any good thing at the hands of God.

Whoever therefore has a desire after great things, let him thoroughly search his heart, and see if it be upright and sincere towards God, or no, and it is necessarily expedient for him well to examine himself, (before he sets about the Labours of so great an Arcanum) for this reason, lest it should happen to him, as it did to that ambitious and proud Guest, who (as Christ teacheth) sate himself down in the chiefest place of the Feast, which he was not worthy of, and was afterwards constrained (to his great shame and reproach) to yield the same to a worthier and honest Man than himself.

Question 16.

How must such a Man be qualified, that desires to obtain from God by his Prayers, so great a secret, and by his Labours to bring it to a final end?

Answer.

First of all an Arcanum of so great an importance requires a free Man, and such an one as is not bound to any other, nor intangled with any other humane affairs, that so being in a quiet and silent posture, he may by his daily Prayers sue unto God for his Blessing, and may be at leisure continually to read good Authours, and to let no time slip wherein his Labours are required. Then farther, such a Man must likewise be pious and liberal, and forward in helping of the Poor: he must also be no Tatler, he must have a good and sound mind, and be given to temperance and sobriety. He must not do as the roving Mountebank doth, insinuating himself one while into this Man's Acquaintance, another while into that Mans: He must not be over credulous, presently to believe every ones pretension: He must not mind his sole benefit nor be prone to covetousness, and aim at grasping all unto himself. He must not be of an unconstant mind, but expect and wait for (with a patient and constant Resolution) the end of that which his desire inclines him to, and therefore he must not be presently enraged, or be affected with a wearisomness if it should so happen unto him as not

to have every thing presently answering his expectation. He does not propose unto himself the getting of great honours in the World, and of having in his hands power and authority, but rather aims at the honour of God, and the helping and succouring the poor sick and distressed ones. Farther yet, he must be furnished with necessary means, lest he be constrained through the want of Coals, Materials, and other necessities, to leave off the Work he has begun. But he must especially have God always before his Eyes, and expect the happy event from him alone, and attribute nothing at all to his own peculiar Wisdom, and be daily at his Prayers, and labour without ceasing, and with a patient mind wait on the Lord for a successful end.

Briefly, he that is studious after such a secret, must so lead his life, as to walk unblamably both before God and Man.

Question. 17.

Which of these two ways is most safe and most easie for the attainment of this divine gift, that which makes use of the common Gold and Silver, or that which useth the unknown, and as yet volatile Gold of the Philosophers?

Answer.

You must know that both ways are good, and lead you on to your wished end, if they be but rightly and orderly according to Art proceeded withall.

Question 18.

By what means shall an unskilfull beginner, and one who is ignorant of so great an Art, enter upon the right way, and not err, whenas he hath not any one to guide him as it were along by the hand?

Answer.

Who shewed the way unto the other Philosophers that were before us? were not all of them (some few excepted who confess that they learned the Art from good Friends) constrained to learn the same out of the Books of the Ancients, and by the divine Revelation?

Question 19.

Where may a Man find such good and well disposed Friends who will shew the way to him that is unskilfull?

Answer.

Such men are wondrous rare, and indeed good reason have they so to be, and to deal warily and wisely in revealing such notable secrets. It is not engraven on each Man's Forehead, whether he be good or evil; we rarely meet with any example, whereby it hath appeared, that even a Father hath disclosed to his Son so great a secret before his death. Nay more, if Parents have left ought written for their Children at their death; yet hath it been so intricate as that they could not do any good on it without divine Revelation. And upon this very account have divers such desisted from the work, find-

ing that the Writings which their Parents left them were fully as hard to be understood as those written by other Authours, and which were not penned and published for the sake of their Children, but for the sake of all others in general.

Question 20.

What use are such intricate and obscure Writings of? would it not have been better that they had not Written at all? If they had but only disclosed the true matter, it would have afforded the searching inquirers more light, and they would have been able more easily to have apprehended the truth?

Answer.

No surely, it would not have been better, if they had passed over so weighty a thing in silence. Whence I pray should we their Successors have known, that there is such an excellent Medicament in nature? The Books they have written do remove from us even every Scruple of doubt, and cause us to believe, that there hath been, is, and may be made such an universal Medicament, if God permits. The reason why they have not jump't together in disclosing the matter of the Stone with one unanimous consent, is this, because one used this matter, another that, for the making of their universal Tincture, and so each of them have described the way of making the same after his own way. Hence it is, that one hath delivered this manner, but another that hath proceeded another way could not give us the self same account of making it just as the other did, but hath hinted unto us onely, the way which he himself used.

The greatest difference is about the matter onely of the Stone; one part of them saith that the common and fixt Sol and Luna is the matter of the Stone, and lays by or rejects all other Subjects. Another part affirms that a volatile and an unripe Gold is the Master of the same, and that the common Sol and Luna are to be wholly waved as being unprofitable for the matter of the Stone. Moreover the Philosophers in their description of making the Stone mention a dry way and a moist way, a long way and a short way, a common Fire and a secret Fire, which they used in the ripening of their Tinctures. And now (on this account) it could not otherwise be; but that they should publish such unlike, dubious, and thwarting Writings, which have rendred the way of finding out the truth so difficult and intricate, and have led the Lovers of the Art into such abundance of Errours, and fruitless Labours. The common Fire I wish, is destitute of the power of ripening volatile Gold, and reducing it into a Tincture, which that secret Fire, continually burning with its flame in the glass upon the matter of the Stone, is able to effect. Now besides the common Fire, there must necessarily be the assistance of the moist Fire, which being kindled by the Fire of Coals and made efficacious, doth radically conjoin the fixt Gold and Silver, brings them unto a volatility, and makes them again constant in the Fire. This way (in my judgment) is the shortest, easiest and safest of all; for it makes the fixt Sol and Luna spiritual and volatile in three days time, and turns them into the Mercury of the Philosophers, which white Mercury of the Philosophers doth afterwards pass in one days space, into the black Lead of the wise men, if a small Fire be administered thereunto. This Lead being

ing put into its requisite glass, may (by the help of common Fire) be reduced (after its changing of Colours) into a constant Tincture.

And now though the ripe and fixt Gold cost and be far dearer than the immature *Sol* is, yet that's no matter, for there needs not a pound of Gold to be used about the compleating of this work, but half a pound onely, or else but two or three ounces, that so the operation may be the sooner ended. Nor will he that shall once have brought one half Ounce unto a due perfection, need such a deal of Gold, for he wants not Gold any more, wherewith to begin the operation a new. And although on the other hand the maturation of the immature Gold by the secret Fire doth not require so much expence as the common Gold doth, yet it requires more time for its perfection. Besides too, the moist way is always subject to more Casualty and Hazard, and requires a much longer time to bring it to the desired perfection. It is therefore at every man's pleasure, to choose which of these two ways pleaseth him, onely he must proceed warily and prudently. And if he should chance to commit some Errour once or twice, yet will not such Errours be of any great detriment unto him, if he can but at last arrive unto the wisht for end, and reap the multiplied and manifold Fruits of his Crop. Thus much was I willing (and indeed ought) to communicate of my opinion (concerning the universal Medicine) unto the Disciples of *Hermes*, but yet without prescribing (or obtruding my thoughts) upon any one, but leaving every one to his own Conceptions.

Mean while I would advise every one not to attempt a thing of so great a moment, rashly and inconsiderately, but in the first place accurately to weigh all things in his mind, as to what may be done, and what may not, lest he repent him at last and be quite tired with his fruitless Labours. For it is no mean slight business to prepare the true Tincture of the Philosophers, neither is it given unto every man to have the knowledge and possession of so great a Work.

Question 21.

Would it not be a very convenient thing for two or three Friends to joyn their hands together, and help each other by their mutual Labour and Expences, and so ease that trouble which otherwise one alone must undergo? Or if any one be so minded as to attempt the work alone, would it not be better for him to get him some faithfull and diligent Operatour, whose help he might make use of, in the promoting and forwarding of his Operations.

Answer.

For my part, I would not advise any one to do thus. For when a work of so great a moment is to be undertaken, and to be accomplished by the common mutual Expence and Labour of others, the Affairs are then obnoxious to no small hazard, and for the most part come short of the hop'd for event, by reason of the most different Opinions amongst men, concerning which the Comedian said very right, so many heads so many opinions, every one hath a peculiar fancy.

Now then, from one desiring this thing another that, there can't arise ought else but confused actions and operations, which are so far from forwarding the work, as that they retard and obstruct the

same. Many Work-men disagreeing amongst themselves, can never build an House agreeable to the right dimensions of building. And therefore it is far better for every one to apply himself single and alone to the performing of so great a work, and quietly to attend upon the same, and invoke God's help alone, and leave off his expectations from man, amongst whom fidelity and love, are like the rare Bird in the Earth, and as scarce as a black Swan! Nay even the friendship of brethren is wondrous rare, and (which is worst of all) the bond of friendship is too often broken asunder betwixt Parents and Children. The golden Alphabet doth likewise in its beginning teach us the very same, saying, trust in God onely, and in him place thy hope, given not any credit to the promises of man, God onely is faithfull, fidelity is banished out of the World.

'Tis sufficiently evident, what kind of doings there is in the Courts of great men, you'll there find 2, 3, 4, or more Chymical Operatours busily employed about making the Philosophers Stone, for they seek after nothing less, but yet by reason of their ignorance, they effect but very little or nothing at all, for the main thing that they mind is to strut it bravely out in their Silks and gay Apparel, and to have their Tables furnished with plenty of various Dishes, and generous Wines and Drinks, whereby they may stuff their Bellies; and this is clearly testified by daily experience: and as for taking to ones self an Operatour, that is more hazardous than the other, where the work is attempted by a confederacy, at their common mutual Expences and Labour. For seeing you cannot make an inspection into any man's heart, whereby to know what Monster he there cherisheth, and what good or evil he has hidden in the inside of his heart, you cannot possibly promise your self any certainty of his taciturnity or fidelity, and therefore plainly ignorant must you needs be whether the man you would take to assist you be faithfull and no traitor. Verily even the common Labour cannot be committed to such men without hurt and damage, but great Arcana's cannot be left to their care without assured loss of all. 'Tis wondrous rare to find a Servant so faithfull, who (after he hath slyly gotten the knowledge of one or two Secrets though but trifling ones too) does not presently persuade himself, that now he's a skilfull Artift enough, and no longer needs the instructions and manuductions of any other. These kind of perverse men being by thus (evilly persuading themselves) seduced, are presently wont secretly to withdraw themselves, or if haply they do stay yet longer with their Master, they behave themselves so malepertly and unmannerly, as that they spoil the things committed to their Charge merely to accomplish this end that their Master may dismiss them. If therefore you will not wink at and suffer them to spoil and destroy, by their saucy regardless Labours the things they have under their hands, but are constrained to put away these most ungrateful and plainly unmindfull men of the benefits they have received, yet will they not acquiesce here with an honest dismissal and parting, but will every where gnaw and wound thy good name by abundance of reproachfull Stories, as being now thus opiniated that they far excel you, their Master in Wisdom, Skill and Knowledge. But yet I except in this place those Servants that are honest, pious and diligent, and that love vertue, and make a conscience of their ways. For the Devil has not got the possession of all

all men's hearts, for there are some Chymical Operatours to be found who are so faithfull unto their Masters, as that could they of a farthing make a Florin for their Masters, they would most cheerfully do it. But yet these men are so very rare, that scarce one in ten can be found that you may give credit to, and trust. And my own thirty years experience hath taught me, and therefore I tell you no more than what my self have to my own detriment experienced. Read but what *Paracelsus* hath written of these perfidious Knaves, amongst other things he confesseth, that thirteen of his Servants came under the Hangman's lash, and that of them all he found but one faithfull, (and that was *Operinus*) and yet he (after *Paracelsus* his death) did manifestly enough bewray his dissimulation and unfaithfulness; for he did not only load him with reproaches, but also published slanderous Writings of him. This is the thankfulness the World is wont to repay for the good that is done it, shun therefore such as these the most you can, for they neither fearing God nor reverencing men, make no matter at all of either opposing the most apparent truths, or of defending it by most manifest and evident Lies. And although the malicious wickedness of a man, be not presently known, yet notwithstanding it bewrays it self by the slanderous reproachfull lies, with which it requites the good turns done him by his Neighbour.

Thus much I judg'd worth while to communicate to all the Disciples of the Hermetick Art, that so they may learn to beware of these kind of Harpies.

Question 22.

Seeing it is not good to enter into friendship or consorting with others, in order to the attempting so great a work: And seeing a man runs a greater hazard in taking to himself an unknown Operatour, haply it would be the best way to seek after some particular Medicament which may be serviceable for the benefit of both high and low, and which may not only prove helpfull unto the poor, but also by which a necessary Sustenance may be found even amongst the rich, and so by this means may a man lead a quiet life.

Answer.

This advice or determination I confess seems far better and more safe than the two former, but even this too needs a provident wariness, viz. if a man should haply (by his sedulous search) acquire the knowledge of some eminent and excellent Medicaments, he must take heed lest by presently making every one partaker of the same, he pulls damage on his own head. For 'tis an usual custom amongst wicked men to endeavour (as soon as they find any one gifted by God with such a blessing) to get it out of the breast of the Possessor of the same, by most cunning Subtilties, and promise even golden Mountains, and such as they are never able to perform. And if once thou let'st the Art pass but out of thy hands and come within the Clutches of other men, thou may'st well fear in the first place lest it should be made publick, and so thy self be deprived of the benefit of the same, though they whom thou hast trusted with the same have bound their credit with the firmest obligations imaginable, and this now is to be understood of such men from whom such bonds as they call them may be demanded. But as for the great ones that are wont to give onely

their words (and stand upon that) when they have got any *Arcanum*, they are wont to deliver it to their Chymical Operatours to make, for themselves are partly ignorant of Chymical Operations, and partly set not their own hands to work; if their Operatours be skillfull in Chymical Operations and bring the same to the expected end, you shall be presented with some small reward, and even of this too will he (whose charge the presenting of it is committed unto) keep to himself the better half. This now is done unwittingly to their Masters, and who dares inform them of such deceitfull Servants, and purchase to himself the envy and hatred of the Courtiers? And so those who are commanded to bring thee good sweet Milk, do themselves first take away the sweet fat Cream, and then bring thee the four Whey. But if for the more surety, thou sendest any Servant that may be there at the perfecting of the Operations, he will (if faithfull satisfy thee; if not, he will present thee with as much of the reward as himself pleaseth. Thus hath it hapned unto me, for amongst other Servants I have had such, that in their Cups have impudently boasted of such kind of theft, and have prevented me of a present or two that belonged unto me, and have made themselves merry therewithall.

These and other such like inconveniences are wont to happen upon the revealing of *Arcanum*, though they should fully answer the expectation of those whom they are revealed unto. But if it should happen that those Chymical Operatours should by reason of their ignorance commit some Error in their Labour, or should have no mind to the work as being a little more troublesome than ordinary, fearing lest the Sparks of the Coals should light upon their Silken Garments, and that their hands should be defiled with the blackness of the Coals, they presently perswade their Lords, that the *Arcanum* which was thus revealed is false, and that you are a cheat and a mere vapour, and so they do not onely rob thee of thy good name, but do likewise by their fraudulent and lying tricks deceive their Masters affirming those things to be false, which notwithstanding are most certainly true. Several Letters I have by me, written unto me from such Court Operatours, in which they confess that they have wrought up (or made) those *Arcanums* (which were sent them) not without good Success, and that therefore they would desire yet greater ones than those: but yet they have afterwards spread abroad a false report, and said that they never could receive any benefit by them at all. And that fruit or reward which was due unto me for my discovery, themselves intercepted, some got them fat Offices, others were gifted with Nobility and Money. And so indeed is it an usual thing for those that dress the Vines, and press the Grapes and make the Wine, to be (by a forced put) content with the Husks, whilst the idle and such as work not, drink up the Wine. Far better is it therefore, for every one to press out his own Grapes. By this means will a man know what is his, what he has, and what he does, whereby he may use his own things as best likes him. Now then well may the man that knows many Secrets be deterred by the so many and such adverse Chances, from making others partakers also of the same, and well may he esteem it much better to enjoy the few things God hath bestowed on him, with a quiet mind, than to expect many things (but with a great deal of danger) from others.

And

And thus much shall suffice to have been premised by way of *Questions and Answers*. Now follows the use of some eminent *Arcanums* and incomparable Medicaments, which have been mentioned in the Books I last published, one of which treats of occult Fires, and the other contains three Dialogues.

Of the Lyon, or of the Blood of the Lyon, or Gold, how it is to be prepared, and to be most profitably used as well in Medicine as in other Arts.

AS concerning the way of preparing this Blood of Gold, it is already described in the first Dialogue, and its adjoynd Corollary, inasmuch that there needs no fuller declaration in this place. But yet you are to know that I have met with (since the writing the first Dialogue) a far easier and more compendious way of converting or turning any Gold, even in a moment, into Blood, by the help of our occult *Sal Armoniack*. But this Blood is not to be used in Medicine, as it is *per se*, because of the *Sal Armoniack*, which transfigures the Gold and changeth it into Blood. For these sharp Saline and Corrosive Spirits are unprofitable, and hurtfull in Medicine, and are therefore to be separated from the Gold, which is done by the pouring on of common Water or Rain-water, which imbibes the Spirits of the Salts, and precipitates the most red Powder of the Gold to the bottom of the Vessel. This Powder must be well wash't by several waters, and be well freed from all its saltiness; which being so freed, may (by the addition of some Cordial Water) be reduced to the consistence of a Syrup, and so kept; the Dose whereof may be augmented or diminished according to the condition of the sick, and the disease. But commonly so much of this Golden Blood is sufficient as serves to tinge a spoonfull of Wine, Ale, or other Vehicle, with a red Colour. It is usefull in all diseases in which the Heart needs strengthening. But especially it allays the immoderate Flux of Blood both in Men and Women, and cures the Gonorrhoea, Leprosie, and French Pox, if the Body shall be purged with due Purging and Sudorifick Medicaments. It heals those Pustules in the Skin, the Nose, and other places of the Face if outwardly anointed with a Feather several times a day. For it dries vehemently, and makes the Skin it self fair and smooth. And therefore upon this account it is exceeding profitable for Women that have naturally pale Faces and Lips, for being laid on, it changeth the paleness into a comely and natural Colour, especially if a little white Oil made of Talk be thereto admixed, to temper and allay that most red Colour of the Gold, and it likewise is a most delicate Fucus for such Women whose Faces are not onely pale, but also dyed with a duskyish or yellow Colour, and by means of this Cosmetick or Fucus may they paint their Faces of a natural Colour. For no Fucus may compare with this, for it is so commodious and durable that it cannot be distinguished or known, nor be corrupted as others are, which being done with Vinegar, sowre Wine, Lemon-juyce and such like things do presently, by a breathing on them, turn into a filthy Colour, and bewray a painted Face. For this Golden Blood is so very constant, and doth so keep its most curious Colour, as that it remains safe from all injury of the Elements.

Furthermore, this Blood (before it is freed from its Saline Spirits) tingeth the Hair, Skin, Wool, Bones of Beasts, and Feathers of Birds, with a most delicate

purple Colour; which passing into a redness, is so constant, as that no sharp Waters can corrupt it, and therefore it is far beyond all other purple Colours, what name soever called by, and worthily may it be accounted for a kingly Colour.

It would be too long to reckon up in this place its various other uses: It serves in Medicine for the tinging of divers Confections and Cordial Waters, which Colour is much nobler, and more profitable than those wherewith Confectio Alkermes and Cordial Waters are wont to be tinged. 'Tis evident that the Colour of Gold doth rather benefit than hurt the Sick, which if the said Confections or Cordial Waters are coloured withall, they become the fairer, and they are rendred yet more delicate, if the Atoms of Gold, being thereunto adjoynd, fly about in the Wine or Water like so many very small Stars. For if to an *Aq. Vite*, which is already tinged with the Blood of Gold, a little of the said Atoms be admixt, they will shine out of that delicate purple Colour, like the most bright *Aurora* (or day-break) in the Heavens. This is a most excellent way of making *Aq. Vite*, for the Atoms of the Gold are so very subtil, as that they easily admit of concoction and digestion by the heat of the Stomach, and emit their Virtues, which those common Gold leaves which are mixt with *Confectio Alkermes*, *Aq. Vite*, and such like compositions onely for ornaments sake, doe not doe: And therefore they are no ways comparable to those Atoms of ours. 'Tis no small trivial matter that I disclose unto you, and verily it would be well worth the while for the Apothecaries shops of noble men to esteem highly of the same: And as for what and how great things may farther be done with this same Tincture of Gold, as to the Metallick matter, may be found in the first Dialogue.

An easie way of making and preparing the Atoms of Gold.

Dissolve an Ounce and an half of Gold in strong Spirit of Salt, or if you are not furnished with this Spirit, then dissolve the same in common *Aq. Reg.* and pour upon the Solution one pound or two of Rain water, whereto is admixt about one pound of Rhenish Wine, mix them altogether in a glass, and shake them well, and shut the glass close that no dust fall therein, set it by for some days in a warm place that so the Gold may precipitate out of the Water, and settle to the bottom of the Vessel in the likeness of most curious small Stars. But if all the Gold shall not be precipitated in this time, set then the Glass in a B, and let the Solution boil a while; then when it is again cool, set by the Vessel some-where that the Gold may settle, which being dissolved into Atoms, (and the Water and Wine poured neatly off) is to be taken out of the Glass, and to be often wash't with pure water: So shall you have the Atoms of Gold, which you may safely make use of in Medicine.

N. B. But you are to note, that it is impossible for the Gold to be by thus proceeding so dissolved as for nothing at all thereof to remain in the dissolving water. And therefore 'tis necessary that you separate the residue of the Gold out of the water by precipitation. And in my other Writings will you meet with several ways of separating the same. These most fine and subtil Atoms of Gold may you also make use of with most notable profit even in o-

ther Chymical operations, concerning which you will find clear instructions in other places of my Writings.

And forasmuch as I here make mention of a most excellent *Aq. Vita*, it seems in my Judgment necessary and profitable to add here a full description of the same, together with the use thereof.

The way of making a Golden Aq. Vita, and such as never as yet hath been described and published unto us by any Physician.

Take of the best and purest Salt-petre, and of white and pure Tartar, each one pound, of yellow Sulphur half a pound, make these matters into Powder, and having well mixt them, put them into a Crucible, and by putting thereunto a live Wood coal, kindle them, that they may take fire and burn up, and leave a yellow mass behind in the Crucible; which being molten in the fire, and turned forth into a Mortar, will give you a fiery sulphureous Stone, bring the tongue by reason of its sharpness. Now whilst it is yet warm, powder it, for it presently attracts (when cool) humidity out of the Air, and admits not of pulverization. Being powdered, pour thereupon two or three pounds of the best Spirit of Wine, and set it by in a cold place for some days, but with this proviso, that you daily shake or stir your matter in the Vessel with the Spirit of Wine: By this means will the Spirit of Wine attract a red Tincture out of the Sulphur, and will withall acuate it self with the Salt, by the Calcined Tartar, then filter this Spirit of Wine by Cap-paper or a Filter, as they call it, and draw off two third parts by distillation in a B, that so you may have your Spirit again, but of a very pleasing taste and smell, which it gets out of the Sulphur, as out of the Center of all odour.

This Spirit of Wine, having the following Spices and Flowers steeped therein, and being again distilled off in a B, will give thee an efficacious Cordial Spirit of Wine, which said Spirit you may colour red, with the Tincture of the Gold, and by the apposition of as much of the Atoms of the Gold as is sufficient, make it Aureous. Now as much as there shall be in quantity of this same Spirit, you may thereto afterwards add so much sweet volatile Spirit of Gold, as will allay the overmuch heat of the said Vinous Spirit. But that this yet overmuch heat may be yet more allayed, and that the strong odour it self of the Aureous Spirit may be corrected, you may therein dissolve about some four ounces of Sugar-candy beaten into fine Powder, and this will make this truly Aureous *Aq. Vita* most sweet. This most incomparable *Aq. Vita* may be used in all the Sickneses of the Body most safely and most profitably where the Vital Spirits the Heart and Brain need strengthening. For the Aromaticall Spirit of Wine doth even *per se* corroborate the Vital Spirits, and now the Spirit of Gold makes it more potent and effectual, and the Atoms of the Gold too, doth render it yet more vertuous, insomuch that this *Aq. Vita* bears away the Bell from all others, nor can a better and more powerfull be prepared. For not onely the red Tincture of the Gold, but likewise even the Gold it self being thus turned into Atoms, is constrained to undergo the concoction and digestion of the Stomach of Mankind: And therefore

where 'tis used, the Excrements are generally black, which could not be if the Gold past forth again undigested. Seeing therefore it is an undoubted truth, that it is thus overcome and subdued by the Stomach's digestion, it cannot be but that by its most wholesome operation it must needs prove helpfull to the sick body. Besides too, I think it not amiss to tell you, that the very Excrements (save your presence) of those sick Patients that daily make use of this *Aq. Vita*, are not to be thrown away, for they will even yet afford some small benefit, if they are laid to the roots of Vines to dung them with, for it will make the Vines produce such Grapes as have their Stones speckled with little Golden Stars, as my self have tried. And perhaps something of greater moment may be effected in the Metallick trade by such kind of Excrements, though I confess 'tis needless, seeing good may be done upon them by other ways.

The Spices and Flowers which are to be extracted by the aforesaid Alcolized Spirit of Wine, and to be used in the *Aqua Vita*.

Take the Flowers of the Lilly of the Valley three ounces, Of Red Roses, Cinnamon, Mace, Cardamoms, Borage, Rosemary, Sage, Lavender, two ounces, of Ambergrease, Musk, a scruple. All these Flowers fresh gathered are to be put, with the dry Spices, into the Spirit of Wine, and are to be therein macerated, and then distilled. If you can't get fresh Flowers, you must even content your self with dried ones, but yet the fresh-gathered are better if they can be had.

The Use of the Universal Medicament described in my second Dialogue. pa. 161. 6. 2. 1st

THE vertue and efficacy of this Medicament is of such a large extent, as cannot be comprehended nor apprehended by humane understanding. It is prepared of the immature, and as yet volatile, and not fire brooking Mineral, called by the Philosophers the *Magnesia of Saturn*.

When this black Mineral is purged from all gross impurity, and reduced into a most white and delicate Colour, and is in the form of a most delicate, fine, bright, and very ponderous Powder, it may be used with notable benefit about the curing of the most grievous diseases. It casts forth out of the Body of Man all hurtfull things, and that both by a visible and invisible operation, freeing and purging it of all hurtfull and ill humours, beyond all other Medicaments, what name soever distinguish't by. It shews incredible Vertues in a very little Dose, insomuch that there hath not been found hitherto any Medicament, which being exhibited in so small a quantity, hath shewn such incredible efficacy. And although Antimonial Medicines are notably vertuous, and cause every one to wonder at them, as appears by my Golden *Panacea*, and my *Panacea* of Antimony, which for this twenty years space have been famous all over Europe, yet can they not be in any case compared to this Universal Medicament.

1. For first of all, they are far inferior in virtues to this, for one grain of this will do more than two, three, or four grains of the other can effect.

2. Secondly, this is heavier and more ponderous than the others, for one ounce of this will lie in less room than three, four, or five times as much of my Antimonial, or of my golden *Panacea*, and therefore is it much easier and more commodious to be taken by the Sick.

3. Thirdly, this is also to be preferred before the others if you consider them as to taste and smell, for this hath neither odour nor taste, whereas that Antimonial and the golden *Panacea* have always some odour and taste of the Salts, and for that reason do breed a nausea and loathing in the Sick if often used.

Therefore I have determined with my self to substitute this universal Medicament, in the room of my *Panacea* made of Antimony, and the rather for this reason, because Deceivers and Cheaters have made a red Powder of Antimony, and perfidiously sold the same for my *Panacea*; but now this deceit of theirs must end, for they will never be able by all their deceitful imitations to counterfeit this ponderous Medicament void both of smell and taste.

As for the Dose of this Medicament, there must care be had that scarce one quarter part so much of it, be administered as is wont to be of my *Panacea* of Antimony. There must scarce be given the tenth or twelfth part of one grain at one time, to such Infants as are under six Months old, and which are afflicted with the Epilepsie or Convulsions, the Small Pox or Measels, the Feavers or such like Diseases. To such as are upwards of six Months, even to 12, 15, or 24 Months old, an 8th, 6th, or 4th. part of a grain may be administered, to such as are 2, 3, 6, 8, or 10 Years old, $\frac{1}{4}$ or $\frac{1}{2}$ part of a grain may be given. To such as are upwards of 10, even to 20 years old, $\frac{1}{2}$ a grain, or $\frac{3}{4}$ or at utmost but 1 whole grain may be administered. Those that are between the 10th. or 20th. Years of their age, may use 1 grain or 1 gr. and $\frac{1}{2}$, nor must they exceed 2 grains at most. From the 20th year, all the rest of their age even to their lives end, the Dose of this universal Medicament is to be again lessened, for old age is not able to brook so much as youth, and as a Man in the prime of his years can. But however you may administer this so notable an universal Medicament to every age, pleasantly, safely, and without any danger at all, if a due Dose be but observed: Inasmuch that you need not fear to administer the same even to Women with Child. But yet the lesser half part of the Dose which other Men use is enough for them. In Feavers it must be given afore the Fit, in the Plague as soon as it's felt and afterwards too, in the Dropsie once (or if that one Dose be not sufficient) twice every month; in the Gout and Stone twice a Week; in the Leprosie, French Pox, and such like Diseases as arise from the impurity of the Blood, thrice a Week, in obstructions of the Milt, Liver, Mesentery, once a Week; in the Epilepsie, Madnesse, and other preternatural affects of the Head, let it be given twice a Week, and this so long till the evil be quite removed. The affects of the Chollick will need a Dose every day before they cease. This is the manner of curing the aforesaid Diseases of the Body and all others, by the help of this universal Medicament. Which being used inwardly performs things incredi-

ble, and doth likewise work admirably in all dangerous wounds, open or running Sores, as well old as new, the Cancer, Fistula, and the like.

Being inwardly taken once in eight days it consumes all untoward Salt Humours, and hinders them from running to the Wounds or Sores, and making them by that means worse and more dangerous. But yet you must likewise apply externally excellent Balsams and Emplaisters, such as are mentioned in my third Century, that so the Wounds and Ulcers being duely purged, may admit of help by the applied Remedies and be the more easily cured.

This also is to be considered in the using of this Medicament, the Sick is to lie in his Bed four or five hours at least after he hath taken it, nor must he either eat or drink all that time, and he must abide all that day in Bed, or at least in his Chamber, for the avoiding of the Air, nor must he sleep afore the Medicament hath finishd its operation.

The Vehicles which it is to be mixt with, and to be taken in, are Wine, Ale, the warm Broath of Flesh, Syrups, Conerves of Roses, fresh Butter, roasted Apples, and such like. Neither is it amiss to make a light Supper, and feed upon easily digestible Food, and which may make the Stomach more apt and fit for purging, the night afore you are to take the Medicine the next morning: And those are Prunes, Raysons, and other such like Food, as by their laxative property make the tough and viscid humours slippery and softer; when the operation is over, the sick Patient is to avoid hard meats and strong drinks, nor must he presently stuff his Stomach therewithall, but rather use much temperance the next day after his purgation, and feed onely upon the Broaths of Herbs, as Chervil, Fennel, Spinach; and the like, whereby the Medicament may operate the more easily, but it will yet more readily perform its operation, if just at your administering it you add a Drachm of pure white powdered Tarrar, and boil it with a Drachm of Sugar, or (which is better) some Manna, in some pure clean Water, and so drink it warm, which said potion following after your Medicament first taken, is wont well to purge and cleanse the Stomach and Intestines.

And this is the use of our Mineral Medicament, which if you do but accurately regard, there will no error be committed, and the said Medicament will (by its laudable operation) abundantly satisfy every ones desires. But we have now said enough of this incomparable Medicament in the form of a Powder. But if this Powder be reduced, by melting it into small Stones of the colour of Milk, it then requires another way of using it. If therefore you would use one of the said Stones, instead of the aforesaid Powder, and purge and free the Body hereby from all hurtfull humours, you must then put it for some hours in a spoonfull of Wine, and so drink off the Wine, and it will effect the same operation, that the Powder is wont to do. But yet you must be wary in the use of these Stones, that you do not waste and spend the strength of the Sick so much, but that there may be but just as much as is requisite for them, and as they can bear. But when their strength is spent, you must put in a greater or lesser Stone into the Wine to be imbibed; but an Infant is not so strong, nor can bear so much as a strong Man can, whose strength is far greater. It is therefore necessary that those, who desire happily to cure the Diseases of mankind by the help of these Stones do (for the first time) leave one of these Stones one, two, or three hours

hours in the Wine, and then heedfully mind the operation of the said Wine when drunk off. If the operation be to his mind, he may always observe that length of time, as it lay in the said Wine. If the operation be less than what you would have it be, it may lie longer; if stronger and greater than what you would have it, it must lie less while in the Wine, and thus by this provident forecast may you so order it, as to have it just to your mind.

Now, although the use of this Medicament in the form of a Stone be far better than using it in the form of a Powder as being more pleasant, and more gratefull, yet notwithstanding it is better for him that cannot so accurately observe the use of the same, to make use of the Powder it self, that so they may be the surer of what they do. But they that do know the way of using the said Stones, they need not use the body of the Powder, forasmuch as they who drink that Wine wherein the Stones are macerated, may have the fruition of the virtues alone, without the corporeity. Those very Stones too, though they are several times steeped in the Wine, do not (I confess) lose their virtues, but yet they grow less especially if (for the stronger purgations sake) they are boiled in the Wine which is poured upon them, for the boiling diminisheth its little body, and lessens the Stone. And these are the directions which concerns the use both of the Stones, and of the Powder it self, in the taking away and purging out all the hurtfull and evil humours in Man's Body, both in young and old.

The body therefore being sufficiently purged by our said universal Medicament, it will be expedient (for the prevention of a relapse) to observe a due Dyer, and to hold such a Stone in their mouths a quarter or half an hour every day, which will attract unto it self not a little vicious tough moisture, out of the Brain and Stomach, which you are to spit out so often, and so long, untill there flows no more plenty of waterishness into the mouth. This attraction will much ease the Brain and Stomach, and free it from noxious obstructions, and will take away the preternatural Appetite and Thirst, and so may a Man expect his Dinner without any preternatural Appetite. For when the internal Vessels of the Body of Man, as the Spleen, the Liver, the Mesentery, are obstructed with tough humours, and the Stomach it self is frust with these obstructions, insomuch that for some hours after his rising out of his Bed, he is usually troubled with a preternatural Hunger and Thirst, and with a debility and faintness of his Members; many think that these inconveniences can be averted by Food and Drink, but they are out. For experience teacheth that the weakness of such Men is increased by eating and drinking a little, so far is it from being capable of being removed and taken away by such means.

From whence it is clearly manifest that that weakness is not to be imputed to the want of meat and drink, but rather to the obstructions of those inward Vessels, which hindring the passage of the Vital Spirit to the Nerves, which it ought to strengthen, doth of necessity cause such a debility and weakening of the Members, and begets in the Stomach a preternatural Appetite. If therefore such obstructions be by little and little taken away by the daily use of these Stones, so that those tough humours cannot encrease, it must necessarily follow, that the Disease must give place by little and little

too, and be diminished and consequently the former good health must follow with a prolongation of the Life.

The Stomach therefore being beset with such tough and Melancholy humours, it cannot possibly be that they should so very easily be expelled, but 'tis behovefull, that the Wine wherein the Stone hath been boiled be drunk, and so cast them forth: And that Stone may be afterwards held in the mouth (according to the aforementioned way) for conservation sake of health. But if it should happen that those tough humours of the nauseate and weak Stomach, and those clammy obstructions of the Vessels, and that preternatural Hunger and Thirst should not be taken away by this way of healing; 'tis a sign that all these inconveniences have a deeper rooting and cannot be thoroughly removed by the said Medicaments. And therefore such Remedies as are stronger and more powerfull are to be made use of, which may soften those tenacious humours of the Stomach, may incite them, and cast them out, and may unlock all the obstructions of the body, and open the passages of the Vital Spirit, to enter unto all the Members, and may strengthen the weakened Stomach, whereby it may be capable of concocting the meats it takes, with a laudable digestion, and generate good and laudable blood.

Forasmuch therefore as such an efficacious Medicament as is fit to take away all the obstructions of the inward Bowels, and Vessels, and to corroborate a weak Stomach, is to be found but with a very few, it hath seemed good unto me, to reveal at present such a Medicament (for the sake of mankind) and which is so efficacious a Remedy, as I dare boldly affirm the like thereof hath not for above these hundred years last past been in the hands of any Physician, but was found out by my self by divine instinct, and which I here publish with a willing mind.

The Preparation thereof is as follows.

TAKE of new and strong smelling Myrrh, and of the purest and clearest Aloes, and of the best English Saffron, of each one, two, or three ounces. Beat them all into Powder, and pour thereupon the strong, operative, and volatile Spirit of Mars, (of which I have made mention in my Book of Fires) and dissolve as much thereof as will dissolve, to the Solution add a little of my secret Ferment, which will presently cause it to ferment. Now before the putting your ferment thereunto, you must have an Alembick or Head ready at hand, and Paper and Past wherewith the Alembick being put upon the Body, may be well lured, and suffer nothing to pass out.

For as soon as ever the Ferment, shall be added to the Solution, it presently begins to ferment, and the glass being placed in Bal. and feeling the heat, that volatile Spirit of the Iron will ascend readily and nimbly like the Spirit of Wine, much inferior thereunto as to its heat I confess, but yet of a far more penetrating efficacy. The Spirit being all ascended the remaining humidity is to be drawn off even to the consistence of honey, but yet so gently, that the remaining Juice may not at all smell of burning. This done, take out the glass and let it cool, and pour on upon the Juice after its refrigeration the same volatile Spirit of Mars which you separated from the matter by distillation; which Spirit will dissolve that thick Juice, which be-

ing

ing dissolved will become a Balsam of a strong Odour, a penetrating Efficacy, and a red Colour like blood; which (by reason of its penetrative Efficacy) is to be kept well shut, and may be accounted of as a Balsam of Life; for it takes away the obstructions of the whole body, and doth mightily corroborate and strengthen all the internal Vessels and Members, and preserves them safe from all corruptions. Nor is there any Balsam whatever, being brought whencesoever it will, that is comparable unto this. For it does not only defend the living bodies of men from all Diseases, but likewise performs the same effects in the preservation of the dead bodies from putrefaction, as other Balsams do, but far more efficaciously: For it penetrates all things, and by its so admirable vertue keeps them from putrifying, in so much that no body can enough admire these so great and wonderfull works of God. Now to try the truth of this, any man may make proof thereof with a Frog, Mouse, or such like small Creature.

The use of this same Balsam as to the taking away of all the obstructions of the internal Vessels, and corroborating the weak Stomach, is this, *viz.* The body is first of all to be well purged, and then 1, 2, 3, 4, even to 10 or 12 drops thereof (according to the Age of the Patient) is to be administered to a fasting Stomach, in that Water, which was drawn over after the volatile Spirit was all come, as aforesaid.

After the taking of the Medicament, you must fast an hour or two, this Balsam penetrates all the Members of the whole Body, and strengthens the Stomach, Brain, Heart, and all the internal Vessels, takes away all obstructions, makes good blood, excites a good appetite to meat and drink, and augments the radical humidity, and so conserves the body of man (by God's Grace and Blessing) even unto old Age.

But let it not seem to any one a strange thing, nor let them suffer any such thoughts to come into their minds, as if others have already had this Balsam, because *Paracelsus* made his *Elixir Proprietatis* of Myrrh, Aloes, and Saffron, and so others too insisting on or tracing his footsteps have made the same, and which hitherto hath been in great esteem amongst all skilfull Physicians; no, no. That *Elixir* of *Paracelsus*, being as yet in its corporeal form, and being nothing else but the meer body, is far short of the Vertues of my Balsam; for my Balsam of Life excels, by reason of its most efficacious Spirits, which penetrate the whole body of man, and fills all his Spirits, and even the whole body itself with its most pure vertues, corroborating the same, and driving away all corruption and rottenness.

Farther, if any one be minded to make this Balsam of Life yet far more efficacious and powerfull, he may instead of the aperitive Spirit of *Mars*, use the Spirit of Gold, which questionless will enrich the said Balsam with far greater vertues, but then the cost will be the more, so that this Medicament will be fit for the rich only. A man may also in the preparation of this Medicament, preserve the volatile Spirit apart, and use the same as a spiritual Balsam, or *Elixir* of Subtility, for the conserving of the inward parts of the body, and so thou wilt most potently dissolve (by its more penetrative, more potent, and more efficacious vertues, all hurtfull obstructions, and all the most clammy and tenacious humours. And after the same manner

may you reserve the simple Balsam apart for its proper use.

Now by this way which I have here delivered, may be made likewise other efficacious and penetrating Spirits and Balsams of great worth, out of other Animals, Vegetables, and Minerals, wherewith a man may perform wonderfull effects in Medicine. I have here laid a foundation, whereupon every one may as he thinks good build a strong Edifice. Nothing verily would be more desirable, and more to be wisht for, than to substitute, and introduce such subtil and penetrating Medicaments, in the room of so many unprofitable compositions made by their boilings and stewings, &c. It would be far better for the health of mankind, nor would so many mendic, remediless, of such small and contemptible Diseases as arise meerly from the tenacious and pituitous humours of the Stomach: What vertues I pray can there be in the common distilled waters of herbs? Verily scarce any at all. But if they be prepared according to the way by me prescribed, they would be (both in odour, taste, and vertues) much better and more profitable.

If to some common Wine, which hath already undergone its natural and accustomed fermentation, there be another fermentation given it by the help of my secret ferment, and then the Spirit thence extracted, it will be of so strong and efficacious a flavour and odour (especially if some Spices, and other sweet smelling fragrant Herbs, be fermented together therewith) as that other Wines may be thereby rendered savoury and well tasted, and odoriferous too. Upon this account I dare boldly and constantly aver, that the Spirits of Metals deserve the chiefest place in Medicine above all other things whatsoever: But I do not as yet know what may be done with them in metallick matters, onely thus much, *viz.* they are wont to coagulate the common and running Quicksilver. Did we but know the Art of fixing them (Spirits) and making them constant, without question we should not onely obtain an excellent universal Medicament in medicine for the conservation of the health of mankind, but also a most absolute Tincture for the tinging of the bodies of the metals. That this is possible, the Writings of the Ancient Philosophers do too and again hint so much, but yet I have not as hitherto effected the same. However I am content, and most heartily thank my God, in that he hath honoured me with so excellent a Medicament, which haply no body for this hundred years last past hath been rendered a partaker of: For had it so been, it would long since have been revealed and disclosed. 'Tis not a Boys play nor so very mean a thing, to bring not onely Vegetables and Minerals, but even the most fixed metals themselves, in (as it were) a moments time, to such a pass, as to undergo a fermentation, and to yield (by distillation and rectification) so strong and penetrative a Spirit; believe it or not believe it, 'tis a case. 'Tis enough for me that I can perform the same whensoever I please; which thing the incredulous shall very shortly, (God willing) find to be most true, and see it with their Eyes, and feel it with their hands. But however, by the same way, as the aforesaid Balsam is ordered to be prepared, may various and unknown effectual Medicaments be made out of other matters.

A Preparation of *Opium* would yield such a Spirit, as (by its odour) would procure rest, and lay the exterior Senses asleep.

R r

The

The like would Tobacco, or Henbane, and other such like Herbs effect, and so would the other inebriating Herbs, whose Spirit being mixt (even in the least Dose) with Wine, or Ale, and so drunk off, would presently make a Man drunk. By the help of such kind of Spirits might many waggish tricks be done, as for example, If Barley, Pease, Beans, or other Seed and dry Fruits were moistened or steeped in the same, and thrown to Fishs, Birds, and other wild Animals, and they eat of the same, they would be made so drunk, as that you may take them with your hands. In like manner, by such kind of Spirits emitting such a strong odour, may all mischievous wild Beasts, as Bears, Wolves, Foxes, and other such ravenous Creatures be driven away; and on the contrary, may Fishes disperse in the Waters be gathered together into one place. For they (*viz.* the Beasts) shun all strong odours and stinks, but these (*viz.* the Fishes) are wont to follow after them in the Water.

Briefly, and in a word, those aforesaid Spirits would be fit for the effecting of such wonderfull conclusions, as is no ways fit so much as once to mention, much less to reveal and make known the same. And for this reason I have determined with my self to bury this so great a Secret of Fermentation with me in my Grave, and not to disclose it to any one. In the mean while I will take care to provide a sufficient plenty of the best Medicaments, whereby I may be serviceable unto my Neighbour. And I will omit taking care about other needless affairs, unless it should chance to happen, that that Turkish Tyrant thirsting after nothing but Bloud, should approach too near unto us (which God forbid) against whom my wonderfull and hitherto unknown Artificial Fires, and other new inventions of mine, arising from my unwearied Labours, will be of such resistance, as that I am confident his numerous host will be rid of the care of again returning back. For it is beyond all kind of doubt, that such fiery Globes [or Granadoes] may be made, as for one pound thereof to exceed the violence even of twenty pounds of Gunpowder. And who knows for what cause God hath vouchsafed the revealment of such great Secrets, at this nick of time? Perhaps to shew his Omnipotency, he will effect some singular and admirable work for the freeing of the Christian World by this ultimate and extreame defensive way, out of the most present and imminent dangers: And though it (*viz.* the Christian World) be immerst and even drowned in the Labyrinths of various Errors, and is gone greatly astray from a true Christian-like life, yet notwithstanding it doth yet contain many a pious Soul. Never did God

make, or vouchsafe ought without a cause; And therefore it is altogether credible, that these new inventions did not light into the hands of men in vain, the which time will manifest.

The Explication of the two Circular Figures of the Quintessence at the beginning of this Fifth Part of the Pharm. Spagyr.

ABout the Circle of the first Figure. *The Quintessence of the Minerals, is a Universal Medicine.*

Without side the Square in the Circle. *Separate the pure from the impure.*

Within side the same Square. *The four Elements.*

In the four Angles of the Square. *Fire, Air, Water, Earth.*

Without side the Triangle. *The three Principles.*

Within the three Angles. *Salt, Sulphur, Mercury.*

Make the first Volatile.

Within the Circle, in the Triangle. *Two Contraries.*

Within the Central Circle. *The first Ens.*

Which if you begin to read in the Center, the sense will be thus. *From the first Ens, proceed two Contraries; from thence the three Principles; from them the four Elements; from which, if you separate the pure from the impure, you obtain the Quintessence, which is an Universal Medicine.*

About the Circle of the second Figure. *The Sale of Metals, is the Stone of the Philosophers.*

Without side the Square in the Circle. *And bring it unto Maturity.*

Within side the same Square. *The four Elements.*

In the four Angles of the Square. *Fire, Air, Water, Earth.*

Without side the Triangle. *The three Principles.*

Within the three Angles. *Salt, Sulphur, Mercury.*

And the Volatile, make fixt.

Within the Circle of the Triangle. *Dissolve, Coagulate.*

Within the Central Circle. *The primum Mobile.*

To understand the Scope of those two Figures, you are to begin with the first, in the Center, and next read the Center of the second, for they answer one another in all their Parts. As in the Center of the first Figure are these words: *The first Ens.* Which in the Center of the second is, *The primum Mobile.* And so on to all the other parts.

The End of the Fifth Part.

descripta.*

THE
SIXTH PART
OF THE
Spagyrical Pharmacopœa.

Or a Light lately risen, and a strong Key for opening Philosophick Verity, treating of the most secret Fire of Philosophers, *viz.* How it is to be used profitably and commodiously for the preparation of many Royal Medicaments; and how, by the benefit of it, *Vegetables, Animals, and Minerals*; venomous, fœtid, noxious, and wholly adverse to Humane Nature, may be converted into a gratefull and most salubrious Medicine, Mineral-Salts, and the Corrosive Spirits of them dulcified; and fixed Metallick; Bodies transmuted into Volatile Spirits. As also how these Volatile Spirits may again be changed into Bodies fixed, tinging, and penetrating through every Metal and Glafs, and other rare things of that kind may be performed.

READER,

I did some time since, sincerely discover to certain of my Friends, some of the best of the Arcanums (described now publickly) in this Treatise, with such condition as they themselves should prepare the same: but they have not as yet set about the Work, and perhaps for no other reason, than because they thought it a matter not of great but of small moment. Hence it was, that they could not believe so great a Medicine could be prepared in so few days. It is manifest by the Writings of Philosophers, that Maria the Prophetess, Sister of Moses, could ripen the Stone of Philosophers in three Days. Likewise, some Philosophers have absolved their Work in a Week. Others have consumed some Months labour upon the same. But now, those erroneous Fellows (who run from one to another, and although themselves be rude and ignorant of all things, profess their labour for reward to make the Stone of Philosophers) require to themselves for digestion the space of one, two or three whole years. But what a vast difference is there between three days and three years. As for my self, I indeed as yet have never elaborated so great a Work, but have seen with my Eyes so great a possibility thereof, and with my hands handled things so, as (if time and place be given, and God grant success) I am confident I shall prepare this supream Medicine in a very short space of time. But I can truly affirm, that in all my life I never aspired to things so high; yet what hath been conferred on me by God, I now make common. Wherefore, he (whom God shall favour) may there begin, where I have ended, and happily consummate the Work: but, if he (whom God favours not) shall attempt any thing therein, let him not disquiet me with troublesome Interrogatories; for I know not how to answer more, than are here discovered by me. Yet (if God please) after some short space of time, I will clearly expose to publick view, whatsoever I have found and seen in the particular Melioration of Metals. Which indeed will contribute great Light to this later Age of the darkened World.

CHAP. I.

Describing that artificial Philosophick Distillatory Furnace (of which the little Book of Fires treats) by the help of which in the space of one hour, all Chymical Operations at one time, the secret Fire mediating, may be demonstrated so, as was never yet described by any Man.

GET a Furnace made of good Earth (which in burning will be rendered as compact and solid as Glass; such you may find about *Colen, Sibburg, Freickent, or Waltenburg*) in its Diameter, at least two Foot broad, but rather (if that well may be) three. Prepare a Vessel like the Hemisphere or half-Globe, having three or four handles, to be hanged up by, fill that with cold Water, and your Recipient or Blind-head will be perfect. Then fit to it a plain Pan of good Earth, the breadth of three or four Thumbs; and a Thumbs breadth high. This Pan fill with common Sulphur, mixt with some other Mineral Subject, as *Mercury, Auripigment, Arsenick, or Antimony*; which you desire to fix, either particularly into *Sel*, or universally into Medicine. Kindle the Sulphur that it may burn, then this Sulphur will calcine and fix that subject (in the Fire continually burning,) which was put in to be fixed. If in burning the Sulphur be deficient, it must be supplied with other Sulphur. If the Sulphur should happen to be extinguished, you must kindle it again, that it may constantly burn and never go out. It will not easily go out, if you prevent the extinction, by putting a little Cotton in the midst of the Pan. When the burning Sulphur, with its penetrating and ripening Fire, penetrates the subject added, then the volatile Mineral at first cannot bear patiently the vehemency of the Fire, but a part of the same is elevated upwards with the fiery Oil (fixing all Mineral subjects) which concretes round about to the Vessel, and again distills down upon the burning Sulphur into the Pan, so as it excites no small admiration

in the Beholders. The motion of this Oil, which is so often and long driven upwards and downwards; Philosophers have named their Distillation, Ascent, and Descent, also Cohobation and Circulation: but the Sulphur continually burning, they called Calcination and Solution. For, in this operation, two very potent Fires act. The flame of Sulphur is a strong fixing Fire, but stronger yet is that fiery Oil continually distilling. By the help of both which *Stygian Fires*, the volatile subject in the Pan, is in a short space of time (unless it was very impure before) without any diminution of its weight fixed into a fixed Medicine. It is to be admired, with how great virtue, either Fire is endowed, for fixing volatile Metals; also it is pleasant to behold, how (when any drop of that Oil of Sulphur driven upwards distills down again upon the burning Sulphur) the flame that ascends then, will be red as blood, which otherwise from Sulphur only ascends yellowish. The repeated Distillation of that into the under set Vessel was by Philosophers called Incarnation: But when the whole resided in the bottom without any ascending fume, that was by them called Fixation.

These operations I have performed with my own Hands, and seen with my own Eyes. More at this time I dare not publish; for more than enough is already spoken to impious Men. Which indeed I should not have done, if this excellent Philosophick Work had not been made too common already, or (to express my meaning more plainly) if it had not fallen into the hands of unworthy Persons, to me most ungratefull. For indeed I permitted onely some few of my Friends to see this Philosophick fixing Furnace; yet the knowledge of it was by them so far divulged, as I repented I had ever communicated it. Nevertheless, instead of that, not long after by God was given to me a certain other, far better and more elegant gift, for he shewed me such an Instrument, as would far more commodiously than the former, receive the ascending sulphureous fume, so as none of it should be lost. Therefore this divine gift shall by me be more warily kept than the former.

The Explanation of the C U T.

- A Is the standing part of the Furnace.
 B The lower Hemisphere or half Globe, which is to contain the Sulphur, or what you intend to make into Oils or Spirits.
 C The upper Hemisphere with its Pipe to draw the Oils or Spirits by.
 D The body that holds the Water.
 E The Cavity or top of the body to put in the Water.
 FFF. The handles by which it is hanged up, which are

- made of the same Earth that the Body is made of.
 G. The Cock to let out the Water, that you may put in more cold.
 H. The Hemisphere to work the Minerals and bath no Pipe.
 I. The body to hold the Water to keep it Cool.
 K. The Cavity of the Body to put in the Water.
 LLL. The handles to hang it by.
 M. The Cock to let out the Water that you may put in more cold.

CHAP. II.

The way of preparing another Medicine of Sulphur only.

FILL an earthen Pan full of Sulphur, and set it under the Blind head. Kindle the Sulphur and keep it continually burning for eight or fourteen days. And when the burning Sulphur causeth its Oil to ascend, and the same again descends upon it, and this ascent and descent hath so long been made, as untill the Oil is fixed, and no more ascent is perceived, then let the Fire go out, and that which you find in the bottom, looking black as a Coal, take out, pour clear Water upon it, and make them boil together. In this boiling the Water extracts the fixed Oil of Sulphur, which passed into Salt, from the black Faces. This extracted Salt distill through a Filter, and permit the Water to exhale in Balneo; so the Residue will remain in the bottom sweet, in the form of a sowerish gratefull yellow Salt. Which take out, and put into a clean Crucible, where keep it hot, but not red hot; then the Salt will wax red. This dissolve again and Filter, and it will leave some Faces. You may reiterate this operation if you will, and the Salt will be so

much the more pure. This Salt is of a middle tast between sower and sweet: Of which five or six grains being taken inwardly will penetrate the body and strongly provoke sweat. But a larger Dose will provoke gentle Seidges, especially if the operation be made in some Iron Pan, yet it contracts from the Iron a sweetish tast, but that is not at all to be feared, because the Salt plainly deposits this tast, especially if you heat it hot and dissolve it, coagulate and heat it hot again, unto the third time. For then it loseth that tast, and becomes a sweet red Salt, which is a safe remedy against all Diseases, where there is need of sweating and purging.

Note, here is need of caution, that in making it hot, your Fire be not too strong, and so the virtues of your Salt diminished, which is a thing accurately to be minded. Ancient Philosophers likened this operation to such a Fire-vomiting Dragon, as devours his own Tail, and converts it into a salutary Medicine. The Dragon is burning Sulphur, his Tail is its fiery Oil, which slides down upon the burning Sulphur, and in it converts it self into an efficacious Medicine.

Note, I would have you give credit to me, in these Works, which I here have opened in few words, are many things of great worth contained. Therefore, if you be wise, you will more diligently search into

the matter, and find out much more than is here disclosed by me.

CHAP. III.

Another secret Fire of Philosophers, by which all venemous and fetid Vegetable, Animal, and Mineral Subjects, may be changed and prepared into a most efficacious Medicine.

Rectifie Spirit of Wine so perfectly well from all Phlegm, as it will all burn away. For this way you will have a secret Fire, by help of which you will be able to effect wonders in Medicine.

CHAP. IV.

Where first is exhibited an efficacious Medicine from this Vegetable Fire it self.

Prepare you of stony Earth polishable in Fire, or of Metal, a Furnace in such wise, as under it a flaming Fire may burn, and yet none of the fume fly away, but in it condense either into Water or Oil, and thence descend into some fit Receiver. Under such a Furnace, in some earthen Pan kindle an ounce or two of this subtil Fire, and let it burn. The Spirit of Wine being burnt, the volatile Salt as incombustible (yet the volatile Mercury of the Wine) comes forth, is cooled in the Receiver, and so preserved.

Note, when the first Spirit of Wine is burned, more must be put in. Of how great profit it will be in Medicine, you may easily judge, because it is the immortal and incombustible Soul of Wine. How much it is able to effect in Alchymy, is not very well known to me, I not having laboured much in it as yet. *Basilus* touching this Mercury, thus Writes: Whosoever can obtain it, will be a principal Master in Chymistry. He, as I judge, well knew how from Gold its Tincture was to be extracted by the help of this. But of these enough at this time.

CHAP. V.

How by the benefit of this secret Vegetable Fire, the Mercurosmick Mercury may be corrected, freed from its nauseous stink, and converted into a sweet Medicine.

Rectifie Spirit of Urine as highly as you can, according to my Prescripts, largely described in the Book of Furnaces. To this Animal Mercury add five fold or six fold its weight of our Vegetable Fire, with which fill a Pan, and kindle this Fire under our Philosophick Alembick; then will our Fire burn up all the nauseous stink of the Animal Mercury, so as it will ascend with a gratefull odour and taste. If it be not to your mind the first time, commit the same to this purgation a second time, and make it pass over; then you will find your Animal Mercury sweet, by virtue of which you will be able to do great things in Medicine, because it forcibly penetrates. Therefore a diligent Physician should not be ignorant of the use of this. It is known that Spirit of Urine doth much good in Medicine, yet it is commonly abhorred by reason of its unpleasant taste. But when it hath sustained the trial of our

Philosophick purgation, then it ascends into its Heaven, that is, into the Alembick without stink. Also by help of this purgation, all other fetid, bitter and unfavoury Vegetable, Mineral, and Animal Subjects, may be purged, rendred sweet, pleasant, and gratefull, as the following examples will prove.

CHAP. VI.

Recipe of common Sulphur, Tartar, and Niter, of each one pound, pulverise, mix and decrepitate them in a Crucible, kindling them on the top, otherwise they will fulminate. When decrepitated, melt and pour out the mixture, reduce it to Powder, and extract thence the Tincture with Spirit of Wine. Burn away the Spirit of Wine under the Philosophick Alembick, and what ascends reserve for your use in Medicine. What remains in the bottom will be sweet and void of all evil favour, because the Spirit of Wine hath burnt up all the stink. This Medicine is a most excellent Diaphoretick.

CHAP. VII.

How the Tincture or Soul of Antimony may be purified by the benefit of this Vegetable Fire.

Recipe of Antimony, Tartar, and Niter, of each alike; decrepitate, melt, pulverise, and extract the Tincture, which cause to pass through this Purgatory Fire, and you will have a safe Medicine against all Diseases. But if you would render it yet more excellent, to this Antimony (which hath already once sustained that Purgation) again add its own weight of Tartar and Niter; decrepitate, melt, extract, and cause it to burn as before, and you will have your Medicine more excellent. And if you shall repeat this labour the third time, you will have it far more excellent, for every time there are some Faces deposited, whence the Medicine becomes more efficacious.

As is said of Sulphur and Antimony, so also all other stinking and bitter Subjects; yea the stinking Dungs of Animals may be so purified as to become sweet. But there is no necessity to speak hereabout in this place. For whosoever studiously searcheth for some famous Medicine, will easily find some excellent thing, so as he may attain both Riches and Honour according to his wish.

CHAP. VIII.

How by help of the Vegetable Fire, Mineral Fires may be extinguished, and the corrosive fiery disposition of them converted into sweetness.

It is very well known, that the greater common Fire doth always (as often as one is set near the other) either extinguish the lesser, or cause it to languish, the same also happens to Philosophick Fires. As for example, Put into a Stone dish or Pan, Spirit of Salt, Vitriol, Niter, or Sulphur, or some other acid Spirit, and three, four, or six parts of the best Spirit of Wine which kindle, and the Spirit of Wine will burn away, but the acid Spirit through the subtilty of the flame becomes sweet. Which sweet Spirits, especially that of Sulphur and Salt, manifest

manifest great Vertues in Medicine. *Basil Valentine* speaks of the dulcified Spirit of Salt, that it extracts from Gold its Tincture; and that he, who knows how to dulcify it, will be honoured by Philosophers. He in like manner teacheth, that Spirit of Wine is seven times to be abstracted thence: Yet undoubtedly he intended not the vulgar Abstraction, but this secret Abstraction rather, of which we now speak. Because such Spirits are not dulcified at one time, but Spirit of Wine is often to be abstracted thence by the help of Fire, before they will be sufficiently dulcified.

CHAP. IX.

Another way, by help of ether Fires, to cleanse and sweeten Vegetable, Animal and Mineral Subjects.

Every man knows, that the Nature and Property of common Fire is, to absume every stinking Sulphur, to drive away Mercury, and leave nothing but dead Ashes, with a little fixed Salt; which is no Correction, but a violent Destruction and Corruption of good things. Therefore, in preparing famous medicines, we should use a better Fire, viz. such, as neither consumes Sulphur, nor drives away Mercury, but only ripens, cleanseth and sweetens them; as will be proved by these following Examples.

First let us make trial with the (to us abominable) Dung of men, and see, whether its Stink can be totally taken away, and of it an Universal medicine be prepared.

It is very manifest, that the Dungs of Animals crude and not prepared, are of some use in medicine, and we know they have been long in use with Galenists and Apothecaries: For they presume to cure the Jaundies with Goose dung; Feavers with Horse-dung; Inflammations of the Bowels with the distilled Water of Cow-dung, which they call the Water of all Flowers; and the Quinsy, with the white Dung of a Dog, which they call *Album Græcum*. Pertinent to the purpose, History makes mention of a certain Countryman labouring with a Quinsy. To this man a Physician gives a Bill, by which he was to go to an Apothecaries Shop, and buy *Album Græcum*. The Bill he gave to a Boy in the Shop, who having read it, looked into the Box in which *Album Græcum* was wont to be kept; and finding the Box empty, bid the Countryman stay a little, and he would serve him presently. But the Boy not wise enough to conceal the Secret, runs presently into the Church Yard, where he gathered some of the white Dung of Dogs, which he brought home, and put into his Mortar to pulverise. The Countryman seeing this, spake to the Boy thus: I pray thee lay aside those things, and give me what I have need of; for I can stay no longer. To which the Boy answered: This is that the Physician prescribed you; therefore stay but a little while, for it will be beat enough presently. Then the Countryman angrily said: What do you say, you Whelp? Must I buy Dogs-turd of you for Silver? I have enough of that at home: Therefore you and your Doctour shall eat it your selves for me. And having spoken thus, he went out of the Apothecaries Shop in a great rage. Many such Histories are variously commemorated: by which you may clearly see, that the Dungs of Animals, although crude and not at all prepared, have been used by Apothecaries. All which had

they not been usefull in Medicine, would long since have been abrogated. But humane Dung, which deservedly is to be preferred before all other, is not used medicinally; and that only because of its evil smell. Yet I have known some old Women give that to be taken inwardly by such as laboured with Feavers (but without their knowledge) and so have expelled those Feavers. There are some Chirurgeons so skilfull as to know, that the Salt of humane Dung only generates Putrefaction, but on the contrary all other Salts preserve from it. Wherefore they use that for putrifying such excrecent Caruncles, as they fear to cut off, by reason of the intermixed Veins. Yet, that humane Dung (if inwardly taken) wants not its effects, no man doubts: but because of its great Stink, its use is to be abstained from, and not to be admitted in medicine. Nevertheless, if it can be freed from its abominable Odour, it may be used in medicine, otherwise not. Wherefore, *Paracelsus* so highly esteemed it, as he said: From him Heaven and Earth is hid, to whom humane Dung is not known. An History, which shews what happened in *Cæsar's* Court, between him and the Court Physicians, plainly sheweth this. For when those Physicians asked him to leave behind him some medicinal Experiment unto them, *Paracelsus* ordered humane Dung to be brought and laid before them. They seeing that, went away in a rage and reviled him. But *Paracelsus* answered. You indeed run away, thereby proving your selves unworthy of the Secret I purposed to have discovered to you. Whence it is very manifest, that *Paracelsus* knew how to render stinking Excrements fit for use. For undoubtedly, he never administered them to any man, before they were prepared; because he had other Medicaments always in readiness. Now, that it may be known to be possible to take away the Stink of Dungs, I will prove the same by the following.

To a sound and healthfull Man for two days together give nothing to eat, but a little well baked Wheat bread; or to drink, but good Wine. His Excrements for these two days cast away. On the third day let him eat a peculiar Bread, with which is mixed before it is baked about an Ounce and half, or one Ounce of my Blood of *Sel*; also let him have an Ounce and half, or one Ounce of the same Blood of *Sel* mixed with his Drink, that it may thereby be tinged with a red Colour. And all the third day let him eat nothing but this Bread, in which the Blood of *Sel*, or Gold rendered irreducible hath been baked, and use that Wine only, which the Tincture of Gold hath coloured. Then on the fourth day, let his Excrements (which will be tinged with blackness like a Coal) be put into a glazed Pan or Dish, yet with this Caution, that no Urine be mixed therewith; because that will be injurious. Indeed these Excrements will have a very evil Odour, but that you may take away their stink, and convert them into an Universal Medicine, proceed thus.

If these Excrements be in weight one pound, or somewhat above, pour on them two Ounces of well dephlegmated Oil of Sulphur, or in defect of that, as much strong and well rectified Oil of Vitriol; mix the whole well stirring it with a wooden Spatula, that the Oil may act upon the Excrements: Expose the whole to the Air for one Night; and that mineral Fire will calcine the Dung Philosophically, and deprive it of all its stink, without any diminution of its Weight; which is very strange. And if any part

of

of the evil Odour should be left remaining, add to it again one Ounce and half of the Mineral Fire, and suffer them to stand together for one Day and Night. Then must you also have in readiness the Animal Fire, *viz.* Spirit of Urine exactly rectified, of which pour leisurely and by degrees upon the Dung, so much, as until both those contrary Spirits cease to act each upon other, and are still: For then those two contending Fires have mortified each other, whence a middle Salt is generated. Upon this mixture put into a Glass do you also pour so much of the Vegetable Fire, (that is, of the best Spirit of Wine) as may rise in height above it two fingers breadth. Set this glass in *Balneo*, and digest the whole for twenty four hours: For in that time the Spirit of Wine dissolveth that Salt, which proceeded from both the contrary Fires, together with the Microcosmick Salt, Sulphur and Mercury; and from that Gold, now the second time inverted, extracts the Tincture, which it hath, and is thereby tinged red as Blood. This Tincture pour off, and re-pour on other Spirit of Wine, and let that also stand twenty four hours in *Balneo* for extracting what remains: but this will have but little Tincture, because the first extraction drew forth almost all. Add both extractions together, and in *Balneo*, with very gentle heat, by Alembick abstract the Spirit of Wine from the Tincture; then will remain in the bottom of the Vessel a very red and pleasant Salt; upon which must be poured so much Aromatick Spirit of Wine, as will suffice to dissolve all the Salt. Which Solution pour out from the Glass it was dissolved in, into a strong and very clean Glass-bottle, and keep it by you as a most precious Treasure.

The Dose of it is very small: for if you give, at one time, 1, 2, 3, 4, 5, or 6 drops, it will provoke Urine, expel Sweat, and the Stone also powerfully. But if the dose be augmented, it purgeth the Belly, and that without any molestation. In a word, this Universal Medicine may safely be used in all Diseases. Yet because I intend brevity, I forbear to write more touching this Medicine.

The Excrements or Faeces, from which this Tincture is extracted, are not to be cast away, but must be calcined with Fire till they are red hot, and (after a strong *Aqua Regia* hath been poured upon them) the remaining Gold, which was not before extracted, must be dissolved. Yet you shall have very little of that; because the Man's Stomach did a second time invert that Gold, (which was once before inverted) and made it reducible, so as it could be extracted with Spirit of Wine by help of the Mineral and Animal Mercury. It is hard for me to believe, that a more excellent Diuretick and Diaphoretick Medicine can be found, than this Microcosmick Salt, which is tinged with *Sol*. For you will know of how great vertue this Diuretick and Diaphoretick Salt is, when you shall precipitate the acid Oil of Sulphur (or in defect of that, rectified Oil of Vitriol) with good Spirit of Urine, and reduce it into Salt. And will not such a Salt as this be far more excellent, when Sulphur the (Philosophically calcined) Salt and Mercury of the humane Body, together with the Tincture of Gold have Access?

I have not writ any thing here of this Universal Medicine, to the end it should be preferred before others, because I very well know, we can of other Subjects prepare famous Medicines, and easily be without humane Dung; but whatsoever I delivered here, I did it for the good of all. For my part, I

say, if any one hath no mind to proceed in this Operation, let him forbear. It sufficeth me, that I have signified to the World, how by the help of Art, all venomous and stinking Subjects may be amended and cleaned.

Thus may the industrious Physician, by the benefit of the three Principal Fires prepare many excellent Medicines, and before all sluggish and careless Physicians be had in great honour by the Sick, and obtain the favour of GOD and Men. For he may invert the Venom of Vipers, Serpents and Scorpions, and convert the same into an Antidote powerfull against the Pestilence, and other Venoms. He also understands how to prepare a Medicament of Toads safe to be given to dropical Persons: of Spiders a Medicine healing the Leprous; of Cantharides and May-Worms, a certain Salt good against the Stone of the Reins and Bladder; of Earth-Worms, or Rain-Worms, a venereal Experiment; of Opium, Tobacco and Henbane, a famous Somniferous Medicine; of Wormwood a Stomachal and Antifebrile; of Hellebore, Agarick, Spurge, Asarabacca, Squill, and the like, an Universal Purging Salt; of Pearle-Stones, and Crabs-Eyes, a Nephritick Medicine against the Stone of the Reins and Bladder; and of Napellus, Stavesacre, and Wake Robbin, a famous Antipodagrick. These, and other such most excellent and presently medicinal Salts may after the same manner be prepared: These, for the health of infirm Mankind I could not content my self to conceal. Indeed I could have writ more at large touching this matter; but brevity, which I now study, forbids a more ample Declaration.

CHAP. X.

Of the Nature and Property of that Fire, which lies hid in Tartar, or the Stony Faces of Wine.

Tartar is a Salt, which in Fermentation separating it self from the Wine, adheres partly to the sides of Wine Cask, and partly resides with the Dregs in the Bottom. This Salt or Tartar, although it is numbred among Salts, yet it is of another disposition than all other Salts; because they may be dissolved in cold Water, but this Tartar cannot be dissolved, except in boiling Water onely. No Man hitherto was willing to open the Cause of this hard Tye. But I, seeing Death daily approaching nearer and nearer, was not willing to carry it with me to my long Home, therefore I chose rather to leave it behind me for Mankind's sake. And thus it is with Tartar. Tartar contains in it self a peculiar Sulphur by which the Salt is so bound or fixed, as it cannot like other Salt be dissolved in cold Water. For if the Sulphur be separated from it, it is easily dissolved in cold Water, like other Salts. Yet so soon as such Sulphur is taken from it, the secret Fire which lay hid in it, is also taken away: and thenceforth it can no more serve instead of a secret Fire, by which Metals are ripened into Tinctures; but is rendred onely fit to perform its Office in medicine. Touching which, for brevity sake we shall here make no mention.

The method of depriving Tartar of its tinging Sulphur, that it may be dissolved in cold, is thus: By burning two Pound of Tartar, reduce it into a white Salt, upon which, if you pour Water to dissolve it, it will become a *Lixivium*. Which *Lixivium* pour upon one Pound of Tartar, and boil them together

together in an Earthen glazed Pot: Then the *Lixivium* dissolves the Tartar, and separates the binding or fixing Sulphur from the Salt. Then pour on one part of common Tartar, boil them together yet once, filter the boiled Liquour through Paper; then in the bottom will remain the Sulphureous Fæces, and the Water of Tartar pass through yellowish; upon which Water pour distilled Vinegar to mortify the *Lixivium*. This being done, the Vinegar will also be coagulated with both Salts, and be changed into one Salt; which Salt in Medicine and Alchymy is of great use and benefit; touching which if I should here write more I should be too tedious; but (GOD willing) the manifold use of it shall be shewed in my Third Century. For here my purpose is not more at large to speak of the matter. [*vide Helm. Fol. 183. and Basilus p. 240.*]

† That feculent Slime, which adheres to the sides of the Filter you should not cast away, but endeavour to fix. For then you will find some admirable thing, and more than here I dare discover. Because that is the genuine Coagulator of running Waters, which it hardens, and is joined in a singular familiarity with metals, and especially with *Sol*; as I with admiration have experienced. For in a few hours it tinged *Sol* with whiteness, and turned it into brittle Glass; whereas otherwise *Sol* is an Enemy to every volatile Sulphur. I do not believe there is any other thing in Nature second to this wonderfull Sulphur; which is endued with a potency coagulating and hardning running Subjects. For nothing, except Sulphur onely, can be found, which coagulates and tingeth. *Mercury* and Salt tinge not: but Sulphur doth that. Consider I pray, how great power common Sulphur hath over *Mercury*, since four Ounces of it can coagulate a Pound of running *Mercury* into hard and red Cinnabar. Also four Ounces of common Sulphur can coagulate two or three Pounds of Oil into a Liver-like Mass: and one Pound of Oil reduce ten Pounds of *Lixivium* into hard Soap. Likewise one or two half Ounces of the volatile Vapour of Sulphur in subterranean Veins, can coagulate serene Water into hard Rocks and Stones, as also all sorts of minerals and metals. So, that little Sulphur which is found in Tartar, can render much softer Wine or Water hard as a Liver; as is known to those that labour in Wine and Vinegar.

I once purposed and endeavoured to extract from Gold its Tincture by the benefit of Salts, among which Salts Tartar also was; whence my Gold came out white and altogether brittle as Glass. But I, being willing to prove whether my Gold was constantly white or no, cupellated that with *Saturn*; and then I found my God not to remain white, but to have received its pristine yellow Colour. That whiteness proceeded from nothing else, than the ringing Sulphur of Tartar, and because the Colour was not fixed, therefore in cupellating it vanished away:

Note: Hence, when I had broken small a little of this tinged white and brittle *Sol*, and cast it upon a little vulgar *Mercury* made hot in a Crucible, it presently had ingressed, and coagulated the *Mercury* into an heavy white Body, which when I exposed to a cineritious *Examen*, all the *Mercury* vanished, and the *Sol* onely remained in its Colour. The Reason hereof was because the aforesaid Sulphur of Tartar was not fixed. Yet thence I observed, that it might be fixed with *Sol* into a constant Redness. If any

one hath convenient time and place, he may more profoundly search into this Work, because in it lies a great *Arcanum*. But how otherwise from Gold its Tincture is to be extracted, shall afterward be taught. Enough of that at this time.

But there remains this one thing to be spoken, viz. that whosoever knows how to conjoin the Sulphur of Tartar with the Sulphur of Metals, and to fix it with them, may certainly obtain the Tincture: As *Ripley* clearly intimated, when he said, He saw a red Toad so long and so often drinking of the Juice of Grapes, as until his Bowels burst. If you do more seriously think of this (and GOD judge you worthy of his Grace) you will experience wonderful things; if not, then conclude thou wast not worthy of those Secrets. So much may suffice for this time to be spoken touching the admirable Sulphur of Tartar. More elsewhere of it, if GOD will.

CHAP. XI.

Proceeding now to Metallick fixed Salts, Mercurial volatile and most subtil Spirits, let us see what they are able to effect in Medicine. And first let us speak of Antimony, as the Radical Juice of all Metals.

Recipe of the Minera of Antimony finely pulverised one Pound, of our secret *Sal Armoniack* six or eight half Ounces; which diligently mixed put into a coated Glass Retort, which set into a Distillatory Furnace, and apply a Receiver thereto, ministering Fire leisurely according to Art, that the Glass be not broken. In distilling first of all ascends a little fowrish Water, then (the Retort being hot) a thick Oil fat and yellow, in which is contained the most excellent *Mercury* of Antimony, which you may thence thus separate.

Upon the yellow Oil distilled, pour common Water, which Water will draw to it self the Salts, and precipitate the *Mercury*, like a yellow ponderous and shining *Calx*, which being edulcorated and dried, will be an Universal Purger. Its dose is very small. I use no more than a quarter of a Grain, which (saying your Reverence) gives me 3, 4, or 5 Stools: but to a robust man I give half a Grain, a whole Grain, and sometimes two Grains. Note: If a larger dose be given, this *Mercury* excites vomiting also, though very gently. If you would render it Diaphoretick, you must thence abstract rectified Oil of Vitriol. Then this *Mercury* of Antimony, which before was liquable as Wax, becomes altogether fixed and unmeltable; and then you may give of it from 1, 2, 3, to 8, or 10 Grains, which indeed move not Seidges, but provoke Sweat without weariness to the Patient, and performs the Office of a blessed Medicine against all Diseases, where Sweat is needfull. Reduce the *Caput Mortuum* taken out of the Retort to Powder (the finer the Powder is the better your Work will succeed) and having put it into a Phial pour Spirit of Wine upon it, mix them by a continued stirring and shaking of the Glass (for otherwise it turns it self into an hard stony Mass) and in *Balneo* digest it for a natural Day. Thence the Spirit of Wine will acquire a red Colour, which pour off, and repour on fresh Spirit, which also permit to extract as much as it can. Then with gentle heat of *Balneo*, abstract the Spirit of Wine from the Tincture, which will reside in the bottom like a red Salt. Which Salt is

Spagyric

so great a Treasure in Medicine, as exceeds all estimation. For it passeth through the whole Body like Fire, and consumes Diseases, as Fire burns up Wood. For according as it finds any defect in the Body so it operates, expelling Sweat and Urine, purging out all malignant and noxious Humours of the whole Body, and highly purifying the Blood, so as I believe no more noble Tincture and Salt than this can be extracted out of Antimony. Its dose indeed is very small, but of great efficacy, insomuch as using but half a Grain of it you will find a most evident Operation. Therefore, if a Master of a Family provide for himself but one Drachm of this Medicine, he may by the help of that for the space of one whole year not only preserve himself and family from many Diseases, but also defend himself and them from all other Afflicts every where prevailing. Therefore let GOD have the Praise of it.

CHAP. XII.

That this way also may be prepared from Auripigment and Arsenick a Mercurial Oil, and a fixed Tincture.

Recipe of Auripigment one Pound of our secret Sal Armoniack four Ounces, which reduced to Powder mix, and distil in a Retort by degrees a volatile yellow corrosive Oil. At last, in the neck of the Retort will ascend a sublimate Red as Blood, transparent and as beautifull as an Oriental Ruby; the external use of which is famously medicinal against Ulcers and gangrenous Afflicts. And the yellow Oil is a most present Remedy for mortifying all gangrenous Ulcers, and laying a solid Foundation for their Cure, if the part affected be onely anointed with a Feather dipt therein. If any one pour Water upon the aforesaid Oil, that corrosive, which ascended with the Auripigment, will be separated and precipitated into a yellow Calx, which edulcorated and dried, becomes so strong and vomitive, as it cannot safely be given inwardly: but outwardly sprinkled upon Wounds, it lays a good foundation for healing. But if from the aforesaid yellow Powder, Oil of Vitriol be abstracted, it then becomes so fixed, as it will bear the force of a most violent Fire, without any exhalation of fume; and then loseth all its venome, and may be most safely used from 1, 2, 3, 4, to 6, or 8 Grains, against the Pestilence, all Fevers, and such Diseases where Sweat is needfull. It is to be admired, that this Subject so very volatile and venomous, should by one onely abstraction of Oil of Vitriol, become so fixed and constant in Fire. Also it is no less admirable, that this Oil like any other Oil of Minerals, doth not ascend in the form of a Liquor, but like and in the form of some fat Vegetable Oil, whereas in it is not any fatness at all, because all proceeds from the Auripigment.

Moreover, it will be profitable also to teach, that the aforesaid fixed Auripigment (whensoever unto it, by the help of Mercury of Luna, ingress is procured) projected upon a Red-hot Plate of Copper, renders the same totally white and as tractable as Silver. Which things being known, although of little use, do notwithstanding favour of a pleasing Curiosity, by which you will find, that of red Copper, white Silver may be made. Also, after the same manner of white and red Arsenick, such a medicinal Oil and Tincture may be prepared for Venues. Note: Whosoever is desirous to labour herein,

must studiously avoid the venomous fume: For Arsenick cannot well be handled without peril.

I might here also say something of the running Mercuries of Metals; but since they rather appertain to the Transmutation of Metals, than unto Medicine, I thought it best to pass over the mentioning of these in this small Treatise, and to publish them in the following Centuries.

CHAP. XIII.

Of the subtil and most penetrating Medicinal Spirits of Metals.

IN my little Book of Fires, and also in my fifth Part of the Spagyrick Pharmacopoeia, I have indeed made some mention of volatile Spirits, but for brevity sake concealed the method of preparing. When I considered, that such Works were judged by many impossible, I thought it would be worth while here to insert the Preparation of them; and that onely from one Metal, that every Man may see the Verity of all the other. For whosoever is desirous to operate in Metals, he may be able by this one Process sufficiently to learn so much Skill, as it will not be difficult for him to extract such volatile Spirits from other Metals also.

The way of preparing the volatile Spirits of Metals.

Recipe of the Steel Wyars, which the Needlemakers cannot use, one Pound, which so heat in the Fire, as all squalidness and filth may be burned away. Afterward put them into a glass Body, and pour on them of the hereafter described dissolving Water 4, or 5, Pound. Place the Vessel in Balneo or in Sand, and administer Fire so to it, as the Water in the Glass surrounding the Steel may wax hot and not boil; then the Water preys upon the Iron to be dissolved. For in this Operation the Steel is dissolved, and fermented like new Beer or Wine. In this Fermentation a certain most subtil Spirit of Mars ascends, without any corrosive, breathing a very strong Odour, and ended with a Taste vehemently penetrating. For such a Spirit so penetrates the Tongue, as the taste long remains, although a Man wash his mouth, yet this taste is not unpleasant. By penetrating the Body of him that takes it down, it provokes Sweat copiously, opens obstructions of the Liver, Spleen and Lungs, and comforts the vital Spirits and Stomach. Also it is admirably conducent to the Health of those, who are accustomed to drink Wine mixt with Water; because it gives the Wine a grateful Taste, and that far better, than the best of fowrth Springs are able to perform. If any one knows how to fortifie, or concentrate this Spirit by Rectification, he will be able to effect wonders by the benefit of it; which indeed yields not to be so readily concentrated, as Spirit of Wine: as you shall hear anon, yet it is possible.

The Water is prepared in this manner.

Recipe of common Salt one Pound, which dissolve in 4, or 5 Pound of common Water, and pour upon it half a Pound of Oil of Vitriol, to which superadd some Steel-wyar, and thence by distilling separate the VWater; then no sharp Spirits will ascend with the VWater, but all the corrosive will remain

remain with the *Mars*, and nothing ascend but a subtil Spirit void of Corrosion. This moveth admiration, that of such an hard and fixed Metal, with the help of so gentle heat, should ascend such a flying and penetrating Spirit. But it is more to be admired, that this white, volatile and penetrating Spirit, in a few hours space, is able to turn it self into a fixed red Tincture: yet you will find this incredible Miracle verified, thus.

Fill a glass Body above half full with our Spirit of *Mars*, yet take no more of it than 5 or 6 Pound, because that would be more than is needfull for Probation. Place the Body, with its Head luted well in Sand, and distil off almost the VVater by Ascend, so as onely half a Pound may be left remaining in the bottom. Take what ascends out of the Receiver, and you will find it endowed with little more taste than Rain-water; and that because the volatile Spirit in this Abstraction or Decoction is separated from the VVater, and again converted into a fixed Body, viz. A most red Powder. VVhich red Powder is indeed a true Tincture, yet it hath no ingress into Metals, unless that be procured to it by the help of Gold. Hence is fulfilled the Precept of Philosophers thus teaching: Make the fixed volatile, and render the volatile fixed. VVhat, I pray, is more fixed than Iron? VVhat more volatile than its Spirit? And lastly, what more constant in Fire, than the Spirit again fixed into a red Tincture?

Note: VVhensoever the Glass with the remaining Water, in which the red Powder is, shall by motion be disturbed, the Water will seem to be blew, which blew colour ariseth onely from the Tincture, which by that agitation is dissipated into most small Atoms. For when the Tincture red as Blood is again settled in the bottom, the Water stands above it white as before. Touching this flaming Sulphur *Cosmopolita* thus speaks: *When Philosophers have freed their Sulphur from his tenebrous Prison, and see him swimming in his own Sea, they adore him, that is, are delighted with his Beauty.* But whosoever would operate any thing to purpose, it will be expedient for him to provide in readiness a good quantity of this Water, because from ten pound of this Water, there is no more than one Scruple of our Sulphur to be expected. Which *Avicen*, in his advice to his Son observed, saying, he had need to procure to himself sixty pounds of that Water before he began his Work. Touching which also *Braceus* hath excellently discoursed, although he was [seemingly] refuted by *Tauladanus*, who (by reason of the great subtilty of his Wit) could not conceive, that any good could be hid in despicable gross Iron. But that good Man *Tauladanus* no more understood the meaning of *Braceus* than he knew the nature of Iron. If any one be seized with the desire of operating in this Subject, let him read *Braceus*, by whom he will be sufficiently informed. But many by his Writings have erred, through their mistake of what he mentions in the latter end of his Book, viz. that he spake not of vulgar Iron, which by strong Fire might be again reduced into Iron; but that such Iron was to be chosen, as by the force of strong Fire, could turn it self into a green or blewish Glass. Where the simple Readers following the bare letter, sought their Tincture in common Scales of Iron, but to no purpose. Here I speak of a blew or green *Scoria*, which can no more be reduced into Iron. For whensoever any one shall melt our fixed Sulphur mixt with *Borax*, although with most vehement Fire, yet he shall

never reduce it into Iron, but into a greenish Glass. This *Crocus Martis* cannot do, nor any other destroyed Iron; but in Reduction it will always yield some small Grains of Iron, wherefore thence no Tincture can be made. For whatsoever is endowed with a tinging Vertue must not be Metal, according to the Universal Consent of all Philosophers. If any one would find out some excellent thing, let him learn the Art of concentrating that, by which Concentration it will be multiplied in vertue.

These few things I was willing at this time to communicate touching the volatile Spirit, and fixed Sulphur of *Mars*, for publick good. The whole work is neither difficult nor chargeable, because we may use one and the same *Mensuram* always again and again, nor is there need of new Expences, which are now easily acquirable. These are things accurately to be noted, according as that most ingenious Poet *Virgil* hath perspicuously hinted in these Verses.

Consider first, what here is to be done:

*A Golden Branch, with Leaves of Gold thereon,
Upon a Tree concealed groweth: This
To the Infernal Juno sacred is.
But the whole Grove, with dismal shades of Night,
Obscure and keep this Tree from humane Sight;
And till some one shall take down from the Tree
This Golden Branch, there can no Entrance be
Into Earths Caverns. Beauteous Proserpine
Ordained hath that this rare Gift divine
Shall brought be unto her. No sooner is
The first Branch crop, but in the place of this
A second sprouts; and that most pure and fine,
As did the first, with golden Leaves will shine.
Therefore distinguish Right; when rightly known
This Branch is unto thee, then with thy own
Hands crop the same: for it will follow Thee,
If thou, by Fates, for this Work chosen be;
If otherwise, no humane Violence,
Nor strength of Iron force it can from thence.*

By these it evidently appears, that when one golden Bough is cropped off that Tree, another follows; and not onely one and another, but as often as you will crop one, another follows: Provided the Heavens favour our Enterprize; otherwise all endeavour will be vain. Yea, it will be impossible with hard Iron, or from hard Iron (as the Gold-bearing Tree) to acquire or crop one Branch. Consider these things in your Mind. For here are words plain and clear enough to every man, whose Ears and Eyes GOD shall open.

CHAP. XIV.

Of the Preparation of the volatile and subtil Spirits of other Metals, and of their Use.

NOTE: This labour of preparing subtil Spirits of fixed Metals, and of reducing volatile Spirits, into fixed Bodies, so fully explains the Table of *Hermes*, as even Children may understand it. Also it proves the verity of that Aphorism unanimously used by all Philosophers: The fixed make volatile, and the volatile fixed. He, whom GOD favours, will easily understand this; but to all others it will remain most firmly locked, although it be described to them with great clearness. I doubt not, but that this

Work

Work (when these my Writings in time to come shall fall into the hands of most diligent Searchers) will be more thoroughly sought into, and a nearer way found, than this here described by me, by the benefit of which, the Sulphur of Philosophers may be released out of that dark Prison, in which he is kept bound with most strong Iron Chains. It would amaze a man to think, that from such a tenebrous and shadowed black Tree, such fair golden Branches should be cropped. Although they (who are not Philosophers, but would be accounted such, whilst they walk magnificently adorned with splendid cloathing) by reason of their blind Pride cannot see what I have here clearly written; yet those Artificers, who wearing Linnen Frocks, labour in their simplicity, will see; because to their Endeavours GOD gives his Benediction.

I have here taught the way of extracting penetrating volatile Spirits from contemptible old Iron, and of reducing those Spirits into fixed tinging Bodies; so also from other Metals the same may be prepared. Indeed one Metal is more apt for such an Operation than another: yet such Spirits may be extracted from all Metals, but with the help of divers Solutions. For that Water which dissolves Gold, leaves Silver undissolved, and what will dissolve Silver, dissolves not Gold. Common Salt, and Salt Niter, with the Water and Oil of Vitriol, (but rather of Sulphur) dissolve *Sal, Mars, Venus* and *Jupiter*. Niter the Water and Oil of Sulphur dissolve *Lune* and *Venus*. Most sharp Vine Vinegar dissolveth *Saturn*. The Spirit of Gold coagulates *Mercury* into *Sal*, the Spirit of Silver coagulates it into *Lune*. Both these Spirits are Medicinal. The Spirits of *Venus* and *Jupiter* are of a loathsome Taste and Odour, and therefore unfit for Medicine. Spirit of *Saturn* is a mere penetrating Venome, or a VWater, which by its Odour suffocates the vital Spirit, wherefore every man should studiously avoid it, since its use cannot be without Peril; otherwise that Spirit in metallick VWorks excels all. Nor do I believe we can easily prepare a Tincture, whereby to coagulate *Mercury*, unless by the help of *Saturn* cold and killing all living things, yet it must be warily handled.

VWith these I close up my discourse of these Spirits; because, although of them much more might be spoken, yet it will not be the part of a considerate man to cast Pearls before Swine. Besides, I judge I have already divulged more than is fit. But it is worthy of all observation, that GOD is a faithfull Defender and Governour of all most subtil Arts and Things.

CHAP. XV.

How by the Benefit of a Magnet from the Air may be extracted an Universal Medicine.

IT is sufficiently known, that the Life of all things is reconded in the Air, without which Spirit, or Soul of the VWorld, nothing in this Universality of things can live or grow. But the Ancient Philosophers sought out various ways, by which that Spirit might be brought from a far off nigh unto us, be received and exhibited palpable, and at length they found the way, and by the benefit of it performed great things both in Medicine and in Alchemy, and that more or less, according as one knew better than another how to intercept and concentrate it. For

the whole Art consists in this Concentration. Therefore, since by the Grace of GOD, unto me also is something known touching a like Concentration of the Universal Macrocosmick Spirit of Life, I was not willing (like some envious or covetous man) to keep so great a Gift of GOD to my self onely, and suffer the same to be buried with me; but chose rather (for the health of mankind, for the profit of my Neighbour, and for the Honour and Glory of GOD) to impart something thereabout; yet no more than is fit or convenient.

If any one desireth to extract some good thing from the Air, he must first well understand what will be a good Magnet, and how to make choice of an opportune place and time. For in a moist Season, you shall extract nothing but an unprofitable Water from the Air. Wherefore no man should undertake this labour of extracting, unless in the height or midst of Summer, when the Air is very serene, void of Clouds, and hot with the Solar Rays. Because, at such a time, the Magnet, which you shall hang up in the Sun, immediately (from the hot Rays of the Sun) extracts a medicinal Water, which every one may use according to his Capacity. Also, I would have you to know, that various Magnets are found, by help of which Water may be extracted from the hot Air, but all such Waters make not for our Universal Medicine. Yet I am willing here to subjoin some of those vulgar Magnets.

The First Magnet.

With 3, 4, or 6 Pound of *Mercury*, or more or less fill small Stone Jugs, or strong Glasses, which Glasses firmly closed let down into a deep cold Well, where the *Mercury* in it self will concentrate the Cold. Now, if you would extract Water from the Air, hang up such a cold Glas or Jug full of *Mercury* in the Air, where it will presently draw Water to it self. Therefore under the Glas or Jug must be set a Glas Tunnel with a long Pipe; by which the distilling Water may be received, and conveyed through the Pipe, from the hot Sun into a cold Cellar. If this be not done, the Sun will again draw to it self the distilled Spirit. You may leave the Magnet hanging as long as it remains cold and Water distils from it: But as soon as no more water will distil, you must immerge it again in a Cold VWell, that it may recover its Coldness. In the mean while, instead of it hang up another; and repeat the labour so often as until you have gathered water enough.

Another Magnet.

Hang up in the hot Sun Jugs or Glasses full of such water; which of their own accord will their contract so great Coldness, as you can scarcely endure to touch them with your hand. To them, as is above said, water will adhere, and distil into the Tunnels set under them.

A Cold water is thus prepared. In common water, or Spirit of Vitriol, dissolve of *Sal. Armeniack* and *Salepeter* equal parts, as much as can be dissolved. VWith this water fill your Glasses, and with them, as is above shewed, extract water from the Air; and that will be equal in vertue to the former. If you be desirous to extract something more excellent from the Air, you must also expose to it more excellent Magnets. For as is the Magnet so it extracts.

CHAP.

C H A P. XVI.

Proceed in your Work thus.

Prepare 3 or 4 Pound of Oil of Sulphur per Campana, which rectifie, that it may become very fiery: Then provide a large Trough like a Chest or Box, which you may cover with linnen Cloath so, as through it no Dust, but the Air onely may penetrate. In this Chest fet your rectified Oil of Sulphur, poured into divers small Pans or Dishes so as they be not above half full. Leave these there three or four Days, or so long Day and Night expose them to the Air, as until the Oil of Sulphur hath drawn to it self so much VWater as it self was, and filled the Dishes. This being done, empty out all the Dishes into one Glasse Body, and in Balneo with gentle heat abstract thence all the humidity. The Oil remaining in the Bottome again expose to the Air in those Dishes, as before, so long as until they be filled. That water again abstract thence, and proceed in extracting so long, as until you have got water enough. This water passeth through all Tinctures; but I have not as yet compleated this VWork.

Note: All the best of that, which this Magnet draws from the Air, remains with the Magnet itself or Oil of Sulphur, as its true *Matrix*, in which it is nourished and ripened; as the most Ancient *Hermes*, or the Father of all Philosophers, in his Smaragdine Table, hath described in these words. Here the Soul of the VWorld speaks. My Father is *Sol*; my Mother is *Luna*; the VWind or Air secretly bears me in its Belly: the Earth conceived and brought me forth, and is my Nurse, &c. The Spirit of the VWorld can bring forth no Fruits, unless it be first feminated in a fit *Matrix*; because nothing in the VWorld can be progenited without a VVomb. This our Magnet is of all Magnets most gratefull to the Soul of the VWorld, and a most natural Friend to the Spirit of the VWorld.

Much might be spoken touching this, but it is not necessary to thrust pulse ready chewed into a slug gish Crows mouth, let him fly out and seek for himself. Here, in this Work are verified those sayings of Philosophers: Nature rejoyleth in Nature, Nature overcomes Nature, Nature retains Nature. Here it is proper also to observe, what *Hermes*, at the end of his Table saith; *viz.* My power is not intire, or perfect, before I am turned into Earth. But how this is to be done, I leave to the consideration of every Man. For the unworthiness of the present wicked World forbids me to discourse more amply thereof. To all men, whom GOD shall favour, these will be clear enough. Yet elsewhere touching this matter (if GOD will) ere long shall be taught.

C H A P. XVII.

How from Gold its Tincture may be extracted by help of a Magnet.

Recipe of most pure Gold an ounce and a half, and of the *Stellate Regulus* of Antimony made with Steel, one ounce, both which melt together in a covered Crucible; and whilst in flux cast at times a little Salt-peter, until the Niter shall have extracted all the *Regulus* of Antimony from the Gold, and turned

it into *Scoria*. Permit the whole to flow well for some time, that the Gold may well settle to the bottom from the *Scoria*, which will flow like water. Then pour all out into a Cone, where the Gold becomes a *Regulus*, which must be separated from the *Scorias*. This *Regulus* of *Sol* comes forth much paler than it was before. If this pallid *Sol* be again melted with the aforesaid Martial *Regulus*, and the *Regulus* thence abstracted by the help of salt Niter, the Gold will come forth a little paler than it did the first time. If you repeat this Operation 8, 10, or 12 times, you will find your Gold at length almost totally white, and that its Tincture is extracted from it by the help of that *Regulus*. The Tincture of *Sol* is absconded in the *Scorias*; this, by the benefit of a certain Antipathetick Salt, will be precipitated from the *Faces* liquified, like a *Regulus* highly tinged.

Note: Yet in these Cases, the Precipitation must be warily handled, lest you also precipitate the *Regulus* [of Antimony] together with it, and so vitiate the Tincture. For this Extraction no vulgar *Regulus* is conducent; but such onely, as is made of good Steel, and hath such a property, as when a Flint is strook upon it, it yields fiery Sparks, no otherwise, than as from hardened Steel. VWhich virtue, if it hath not, it cannot rightly draw to it self the Tincture of Gold, but all endeavour will be in vain. This Extraction, *Cosmopolita*, in his new Chymical Light, hath very well described and discovered in these words. Such *Chalibis* must be taken, as is endewed with power of extracting that from the Rays of the Sun, which many have sought, but few found. But further he saith: There is found yet another *Chalibi*, which from Gold extracts its Seed (if it be united or copulate with it 12 times) and thence is impregnated; but the Gold is infirmed even to death. But the *Chalibi* or Magnet brings forth a Son, which will be more excellent than his Father, *viz.* Gold, whence he proceeded, whosoever knows this Magnet (of which *Cosmopolita* makes mention, and an hint of the preparation whereof I have here shewed) and understands how to use the same, in two or three Days he will behold and find so great things, as with the joy thereof his heart will be satisfied. For, if any one hath Philosophick Eyes, he will see what is most pleasing, if not, he will be no more delighted than a Swine, who among the Sweepings of Vineyards hath swallowed an inestimable Pearl or Jewel, but knows not the difference between a Pearl and that Dung.

C H A P. XVIII.

How from Gold its Tincture may be extracted by another Method, or by the benefit of a certain other Chalibi.

First, prepare the Green Lyon of Ancient Philosophers (by help of my mineral Salt) of sulphureous Subjects. To this Green Lyon cast *Sol*, that is, pure Gold; which he, through his greedy desire of devouring always, will swallow, and thereby acquire to himself notable Strength, Power and Beauty. For his whole Body will be thence renewed. His head, with the fore part of his Body will shine with a Grayish Hair, very like a Crows Head; but his Tail with the hinder part of his Body will acquire many various and beautifull Colours, resembling the genuine form

of the Rain-Bow, or the Tail of a Peacock. And as soon as the Green Lion hath sufficiently concocted and digested the yellow Lion or Sol in his Stomach, he by Seidge expells the Residue, which will be void of Colour or Bloud. Then the Lion, proud and adorned with various and beautifull Colours, walks to the Waters, in which he immergeth himself, and washeth away all his Colours, and becomes totally white like a Swan, which white Swan the Cook roasteth at the Fire: where that white Swan first waxeth yellow, then more and more Red, untill he is able at length to bear the Fire, and, like a Salamander, live in it without any peril or hurt. This Red Salamander is one of the most noble Medicaments that can be prepared by Art. This Operation I performed but once; and then unto me appeared all those Colours one after another, untill I obtained a Red Salamander, which is a most present Remedy against all Diseases. But what it is able to effect in Chymistry, as yet I have not known, being onely content with a Medicine for Health.

CHAP. XIX.

Yet another way of extracting the Tincture from Gold.

Recipe of our dried Red Bloud of Sol, in the form of Powder irreducible one ounce, or an ounce an half of our Sulphureous fixed *Sal-mirabile*, five, six or seven ounces. Both which mixt together, put into a strong Crucible; which covered, set into a Wind-Furnace, giving Fire so, as they may flow together like Water for the space of half an hour: afterward pour them out into some Iron Vessel, or Cone, when the *Sal-mirabile* hath drawn from the Tincture of Gold a Bloudy Colour. The Mixture cooled, separate the Red *Scoria* from the *Regulus*, which will be white as *Luna*. Pulverise the Red *Scoria*, or tinged *Sal-mirabile*, upon which pour common Water; this Water dissolves the *Sal-mirabile*, not indeed tinged with a Red, but greenish Colour. Filter the Solution, and evaporate the unprofitable Water in a Glass dish. Then in the bottom will remain a Red Salt, which fortified with the Seal of *Hermes* or Luting of *Sapience*, keep for a sufficient time in a continual Fire of Coals: for then the Sulphur, as yet immature, will fix it self with the Sol, and become constant in Fire. From that Lute of *Sapience*, you may afterward (by the help of a proper Magnet) abstract a fixed Tincture, and convert the same to Medicinal use.

Note: That green Saline Water, in which the Redness is latent, coagulates *Mercury* into Sol, not indeed for wealthy profit, but onely by the benefit of that to know the possibility of such a Work. The Red slime, whence the Salt is extracted by the benefit of common Water, must be taken out of the Filter, mixed with new *Sal-mirabile*, and in a strong Crucible be made to flow well for half an hour. Then also more Tincture will be extracted, and a white *Regulus* of Sol again settle to the bottom. If this labour be a third time repeated, the Tincture will be good, and a white *Regulus* will again settle, yet not so much, as was the first and second time.

CHAP. XX.

How by the benefit of a certain Metallick Salt, from Venus her Son Cupid, or rather the true Mercury

of Philosophers, may be prepared in the space of One Day, so, as to sustain the Trial of a Cupel: and indeed, it is neither Sol nor Luna, but a Tincture most ample for certain white Subjects.
