bumble deuotion,

JOHN PARKINSON:

The Life of Sir

TO
THE QUEENES
MOST EXCELLENT
MAJESTIE

My humble duty

Knowing your Majestic so much delighted with all the faire flowers of a Garden, and furnished with them as faire beyond others, as you are eminent before them; this my Worke of a Garden, long before this intended to be published, and but now only finished, seemed as it were destined, to be first offered into your Highnesse hands, as of right challenging the propriety of Patronage from all others. Accept I beseech your Majestic this speaking Garden, that may informe you in all the particulars of your store, as well as want; when you cannot see any of them fresh upon the ground; and it shall further encourage him to accomplish the remainder; who, in praying that your Highnesse may enjoy the heavenly Paradise after the many years fruition of this earthly, labourer to be

Your Majesties

in all

humble devotion,

JOHN PARKINSON.

TO THE COURTEOUS

READER.

Although the ancient Heathens did appropriate the first invention of the knowledge of Herbes, and so consequently of Physicke, some vnto Chiron the Centaure, and others vnto Apollo or Esculapius his sonne; yet wee that are Christians haue out of a better Schoole learned, that God, the Creator of Heauen and Earth, at the beginning when he created Adam, inspired him with the knowledge of all naturall things (which successiuely descended to Noah afterwarde, and to his Posterity): for, as he was able to giue names to all the lining Creatures, according to their seuerall natures; so no doubt but hee had also the knowledge, both what Herbes and Fruits were fit, eyther for Meate or Medicine, for Vse or for Delight. And that Adam might exercise this knowledge, God planted a Garden for him to line in, (wherein euen in his innocency he was to labour and spend his time) which hee stored with the best and choysest Herbes and Fruits the earth could produce, that he might haue not onely for necessitie whereon to feede, but for pleasure also; the place or garden called Paradise importing as much, and more plainly the words set downe in Genesis the second, which are these; Out of the ground the Lord God made to grow euerie tree pleasant to the sight and good for meate; and in the 24. of Numbers, the Parable of Balaam, mentioning the Aloe trees that God planted; and in other places if there were neede to recite them. But my purpose is onely to shew you, that Paradise was a place (whether you will call it a Garden, or Orchard, or both, no doubt of some large extent) wherein Adam was first placed to abide; that God was the Planter thereof, hauing furnished it with trees and herbes, as well pleasant to the sight, as good for meate, and that hee being to dresse and keepe this place, must of necessity know all the things that grew therein, and to what vses they serued, or else his labour about them, and knowledge in them, had been in vaine. And although Adam lost the place for his transgression, yet he lost not the naturall knowledge, nor vse of them: but that, as God made the whole world, and all the Creatures therein for Man, so hee may vse all things as well of pleasure as of necessitie, to hee helpe vnto him to serue his God. Let men therefore, according to their first institution, so vse their seruice, that they also in them may remember their seruice to God, and not (like our Grand-mother Eve) set their affections so strongly on the pleasure in them, as to deserue the losse of them in this Paradise, yea and of Heauen also. For truly from all sorts of Herbes and Flowers we may draw matter at all times not onely to magnifie the Creator that hath giuen them such diuersities of formes, sents and colours, that the most cunning

The Epistle to the Reader.

Worke-man cannot imitate, and such vertues and properties, that although wee know many, yet many more lye hidden and unknowne, but many good instructions also to our selues: That as many herbes and flowers with their fragrant sweet smells doe comfort, and as it were reuive the spirits, and perfume a whole house, even so such men as liue vertuously, labouring to doe good, and profit the Church of God and the Common wealth by their paines or penne, doe as it were send forth a pleasing saour of sweet instructions, not only to that time wherein they liue, and are fresh, but being drye, withered and dead, cease not in all after ages to doe as much or more. Many herbes and flowers that haue small beautie or saour to commend them, haue much more good vse and vertue: so many men of excellent rare parts and good qualities doe lye hid unknowen and not respected, vntill time and vse of them doe set forth their properties. Again, many flowers haue a glorious shew of beauty and brauery, yet stinking in smell, or else of no other vse: so many doe make a glorious ostentation, and flourish in the world, when as if they stinke not horribly before God, and all good men, yet surely they haue no other vertue then their outside to commend them, or leaue behind them. Some also rise vp and appear like a Lilly among Thornes, or as a goodly Flower among many Weedes or Graspe, eyther by their honourable authoritie, or eminence of learning or riches, whereby they excell others, and thereby may doe good to many. The frailty also of Mans life is learned by the soone fading of them before their flowing, or in their pride, or soone after, being either cropt by the hand of the spectator, or by a sudden blast withered and parched, or by the reuolution of time decaying of it owne nature: as also that the fairest flowers or fruits first ripe, are soonest and first gathered. The mutabilitie also of states and persons, by this, that as where many goodly flowers & fruits did grow this yeare and age, in another they are quite pulled or digged vp, and eyther weedes and graspe grow in their place, or some building erected thereon, and their place is no more known. The Ciuill respects to be learned from them are many also: for the delight of the varieties both of formes, colours and properties of Herbes and Flowers, hath euer bene powerfull ouer dull, vnmurtured, rusticke and savage people, led only by Natures instinct: how much more powerfull is it, on should be in the mindes of generous person: for it may well bee said, he is not humane, that is not allured with this obiect. The study, knowledge, and traueil in them, as they haue been entertained of great Kings, Princes and Potentates, without disparagement to their Greatnesse, or hinderance to their more serious and weighty Affaires: so no doubt vnto all that are capable thereof, it is not onely pleasant, but profitable, by comforting the minde, spirits and senses with an harmelesse delight, and by enabling the iudgement to conferre and apply helpe to many dangerous diseases. It is also an Instructor in the verity of the genuine Plants of the Ancients, and a Correcter of the many errors whereunto the world by continuance hath bin diuerted, and almost therein fixed, by eradicating in time, and by degrees, the pertinacious wilfulnesse of many, who because they were brought vp in their errors, are most vnwilling to leaue them without consideration of the good or euill, the right or wrong, they draw on therewith. And for my selfe I may well say, that had not mine owne paines and studies by a naturall inclination bene more powerfull in mee then any others helpe (although some through an euill disposition and ignorance haue so far traduced me as to say this was rather another mans worke then mine owne, but I leaue them to their folly), I had neuer done so much as I here publish, nor been fit or prepared for a larger, as time may suddenly (by Gods permission) bring to light, if the maleuolent dispositions of degenerate spirits doe not hinder the accomplishment.

But

The Epistle to the Reader.

But perswading my selfe there is no shewre that produceth not some fruit, or no word but worketh some effect, eyther of good to perswade, or of reproofe to convince, I could not but declare my mind here in, let others iudge or say what they please. For I have alwaies held it a thing unfit, to conceale or bury that knowledge God hath given, and not to impart it, and further others therewith as much as is convenient, I rest on no instruction, which I have euer hated. Now further to informe the courteous Reader, of both of the occasion that led me onto this worke, and the other circumstances to it. First, having perused many Herball in Latine, I observed that most of them had eyther neglected or not knowe the many diversities of these flower Plants, and rare fruits are known to us at this time, and (except Clusius) have made mention but of a very few. In English likewise we have some extant, as Turner and Dodonæus translated, who have said little of Flowers, Gerard who is last, hath no doubt given vs the knowledge of as many as he attained unto in his time, but since his daies we have had many more varieties, then he or they ever heard of, as may be perceiued by the store I haue here produced. And none of them haue particularly seuered those that are beautifull flower plants, fit to store a garden of delight and pleasure, from the wilde and consuet, but haue enterlaced many one among another, whereby many that haue desired to haue faire flowers, haue not known either what to choose, or what to desire. Diuers Bookes of Flowers also haue beene set forth, some in our owne Countrey, and more in others, all which are as it were but handfulls snatched from the plentifull Treasury of Nature, none of them being willing or able to open all sorts, and to take them fully, but the greatest hinderance of all mens delight was, that none of them had giuen any description of them, but the bare name only. To satisfie therefore their desires that are louers of such Delights, I took vpon me this labour and charge, and haue here selected and set forth a Garden of all the chiefest for choyce, and fairest for shew, from among all the seuerall Tribes and Kindreds of Natures beauty, and haue ranked them as neere as I could, or as the worke would permit, in affinity one vnto another. Secondly, and for their sakes that are studious in Authors, I haue set down the names haue bin formerly giuen vnto them, with some of their errors, not intending to cumber this worke with all that might bee said of them, because the deciding of the many controuersies, doubts, and questions that concerne them, pertaine more fitly to a generall History: yet I haue bene in some places more copious and ample then at the first I had intended, the occasion drawing on my desire to informe others with what I thought was fit to be known, reseruing what else might be said to another time & worke, wherein (God willing) I will inlarge my selfe, the subiect matter requiring it at my hands, in what my small ability can effect. Thirdly, I haue also to embellish this Worke set forth the figures of all such plants and flowers as are materiall and different one from another: but not as some others haue done, that is, a number of the figures of one sort of plant that haue nothing to distinguish them but the colour, for that I hold to be superfluous and waste. Fourthly, I haue also set down the Vertues and Properties of them in a brieue manner, rather desiring to giue you the knowledge of a few certaine and true, then to relate, as others haue done, a needlesse and false multiplicitee, that so there might as well profit as pleasure be taken from them, and that nothing might be wanting to accomplish it fully. And so much for this first part, my Garden of pleasant and delightfull Flowers. My next Garden consisteth of Herbes and Rootes, fit to be eaten of the rich and poor as nourishment and food, as sawce or condiment, as sallet or refreshing, for pleasure or profit, where I doe as well play the Gardiner, to shew you (in brieue, but not at large) the times

The Epistle to the Reader.

and manner of sowing, setting, planting, replanting, and the like (although all these things, and many more then are true, are set down very largely in the severall bookes that others haue written of this subiect) as also to shew some of the Kitchen uses (because they are Kitchen herbes &c.) although I confesse but very sparingly, not intending a treatise of cookery, but briefly to giue a touch thereof; and also the Physicall properties, to shew somewhat that others haue not set forth; yet not to play the Empericke, and giue you receipts of medicines for all diseases, but only to shew in some sort the qualities of Herbes, to quicken the minds of the studious. And lastly an Orchard of all sorts of domesticke or forraine, rare and good fruits, fit for this our Land and Countrey, which is at this time better stored and furnished then euer in any age before. I haue herein endeauoured, as in the other Gardens, to set forth the varieties of euery sort in as brieue a manner as possibly could be, without superfluous repetitions of descriptions, and onely with especiall notes of difference in leaues, flowers and fruits. Some few properties also are set downe, rather the chiefeest then the most, as the worke did require. And moreouer before euery of these parts I haue giuen Treatises of the ordering, preparing and keeping the severall Gardens and Orchard, with whatsoeuer I thought was conuenient to be known for euery of them.

Thus haue I shewed you both the occasion and scope of this Worke, and herein haue spent my time, paines and charge, which if well accepted, I shall thinke well employed, and may the sooner hasten the fourth Part, A Garden of Simples; which will be quiet no longer at home, then that it can bring his Master newes of faire weather for the iourney.

Thine in what he may,

JOHN PARKINSON.

Med. Lond. socius.

Amico suo Ioanni Parkinsono.

Extollunt alij quos (Parkinsonæ) labores
Da mihi iam veniam comminuisse tuos.
Extremos poteris credi migrasse per Indos:
Cum liber haud aliud quam tuus hortus hic est:

Ipse habitare Indos tecum facis, haud petis Indos

I nunc, & tuâ me comminuisse refer.

Est liber Effigies, tuus hic qui pingitur hortus,

Digna manu facies hæc, facieque manus!

Vidi ego splendentem varigatis vndique gemmis

Una fuit Salomon, turba quid ergo fuit?

Vt vario splendent Pallacia regia sumptu,

Et Procerum turbis Atria tota nitent:

Tunc cum festa dies veniam dedit esse superbis

Quosque fons texit, nunc tria rura tegunt:

Plena tuo pariter spectatur Curia in Horto,

Hic Princeps, Dux hic, Sponsaque pulchra Ducis.

Quæque dies est festa dies, nec parcius unquam

Luxuriant, lauta hæc; Quotidiana tamen.

Ecce velut Patriæ Paradisi haud immemor Exul,

Hunc naturali pingit amore sibi.

Pingit & ad vivum sub eodem nomine, & hic est

Fronticuli sudor quem cerebrique dedit:

Astat Adam medius Paradiso noster in isto

Et species nomen cuique dat ipse suum.

Hos cape pro meritis, qui florem nomine donas

Eternum florens tu tibi Nomen habe.

Guilielmus Atkins.

THE ORDERING OF THE GARDEN OF PLEASURE.

CHAP. I.

The situation of a Garden of pleasure, with the nature of soyles, and how to amend the defects that are in many sorts of situations and grounds.

TH E feuerall situations of mens dwellings, are for the most part vnauoideable and vnremoueable, for most men cannot appoint forth such a manner of situation for their dwelling, as is most fit to auoide all the inconueniences of winde and weather, but must bee content with such as the place will afford them; yet all men doe well know, that some situations are more excellent than others: according therfore to the feuerall situation of mens dwellings, so are the situations of their gardens also for the most part. And although diuers doe diuersly preferre their owne feuerall places which they haue chosen, or wherein they dwell; As some those places that are neare vnto a riuer or brooke to be best for the pleasantnesse of the water, the ease of transportation of themselves, their friends and goods, as also for the fertility of the soyle, which is seldome bad neare vnto a riuers side; And others extoll the side or top of an hill, bee it small or great, for the prospects sake; And againe, some the plaine or champion ground, for the euen leuell thereof: euery one of which, as they haue their commodities accompanying them, so haue they also their discommodities belonging vnto them, according to the Latine Prouerbe, *Omne commodum fert suum incommodum*. Yet to shew you for euerie of these situations which is the fittest place to plant your garden in, and how to defend it from the iniuries of the cold windes and frosts that may annoy it, will, I hope, be well accepted. And first, for the water side, I suppose the North side of the water to be the best side for your garden, that it may haue the comfort of the South Sunne to lye vpon it and face it, and the dwelling house to bee aboue it, to defend the cold windes and frosts both from your herbes, and flowers, and early fruits. And so likewise I iudge for the hill side, that it may lye full open to the South Sunne, and the house aboue it, both for the comfort the ground shall receiue of the water and raine descending into it, and of defence from winter and colds. Now for the plaine leuell ground, the buildings of the house should be on the North side of the garden, that so they might bee a defence of much sufficiency to safeguard it from many iniurious cold nights and dayes, which else might spoyle the pride thereof in the bud. But because euery one cannot so appoint his dwelling, as I here appoint the fittest place for it to be, euery ones pleasure thereof shall be according to the site, cost, and endeauours they bestow, to cause it come nearest to this proportion, by such helpes of bricke or stone wals to defend it, or by the helpe of high growne and well spread trees, planted on the North side thereof, to keepe it the warmer. And euery of these three situations, hauing the fairest buildings of the house facing the garden in this manner before specified, besides the benefit of shelter it shall haue from them, the buildings and roomes abutting thereon, shall haue reciprocally the beautifull prospect into it, and haue both sight and sent of whatsoeuer is excellent, and worthy to giue content out from it, which is one of the greatest pleasures a garden can yeeld his Master. Now hauing shewed you the best place where this your

garden should be, let me likewise aduise you where it should not be, at least that it is the worst place wherein it may be, if it be either on the West or East side of your house, or that it stand in a moorish ground, or other vnwholsome ayre (for many, both fruits, herbes, and flowers that are tender, participate with the ayre, taking in a manner their chiefest thriuing from thence) or neare any common Lay-stalles, or common Sewers, or else neare any great Brew-house, Dye-house, or any other place where there is much smoake, whether it be of straw, wood, or especially of sea-coales, which of all other is the worst, as our Citie of London can giue prooffe sufficient, wherein neither herbe nor tree will long prosper, nor hath done euer since the vse of sea-coales beganne to bee frequent therein. And likewise that it is much the worse, if it bee neare vnto any Barnes or Stacks of corne or hey, because that from thence will continually with the winde bee brought into the garden the strawe and chaffe of the corne, the dust and seede of the hey to choake or pester it. Next vnto the place or situation, let mee shew you the grounds or soyles for it, eyther naturall or artificiall. No man will deny, but the naturall blacke mould is not only the fattest and richest, but farre exceedeth any other either naturall or artificiall, as well in goodnesse as durability. And next thereunto, I hold the sandy loame (which is light and yet firme, but not loose as sand, nor stiffe like vnto clay) to be little inferiour for this our Garden of pleasure; for that it doth cause all bulbous and tuberous rooted plants to thriue sufficiently therein, as likewise all other flower-plants, Roses, Trees, &c. which if it shall decay by much turning and working out the heart of it, may soone be helped with old stable manure of horses, being well turned in, when it is old and almost conuerted to mould. Other grounds, as chalke, sand, grauell, or clay, are euery of them one more or lesse fertill or barren than other; and therefore doe require such helpes as is most fit for them. And those grounds that are ouer dry, loose, and dustie, the manure of stall fedde beasts and cattell being buried or trenched into the earth, and when it is thorough rotten (which will require twice the time that the stable soyle of horses will) well turned and mixed with the earth, is the best soyle to temper both the heate and drinesse of them. So contrariwise the stable dung of horses is the best for cold grounds, to giue them heate and life. But of all other sorts of grounds, the stiffe clay is the very worst for this purpose; for that although you should digge out the whole compasse of your Garden, carry it away, and bring other good mould in the stead thereof, and fill vp the place, yet the nature of that clay is so predominant, that in a small time it will eate out the heart of the good mould, and conuert it to its owne nature, or very neare vnto it: so that to bring it to any good, there must bee continuall labour bestowed thereon, by bringing into it good store of chalke, lime, sand, or else ashes eyther of wood or of sea-coales (which is the best for this ground) well mixed and turned in with it. And as this stiffe clay is the worst, so what ground soeuer commeth nearest vnto the nature thereof, is nearest vnto it in badnesse, the signes whereof are the ouermuch moisture thereof in Winter, and the much cleauing and chapping thereof in Summer, when the heate of the yeare hath consumed the moisture, which tyed and bound it fast together, as also the stiffe and hard working therein: but if the nature of the clay bee not too stiffe, but as it were tempered and mixed with sand or other earths, your old stable soyle of horses will helpe well the small rifting or chapping thereof, to be plentifully bestowed therein in a fit season. Some also do commend the casting of ponds and ditches, to helpe to manure these stiffe chapping grounds. Other grounds, that are ouer moist by springs, that lye too neare the vpper face of the earth, besides that the beds thereof had need to be laid vp higher, and the allies, as trenches and furrowes, to lye lower, the ground it selfe had neede to haue some good store of chalke-stones bestowed thereon, some certaine yeares, if it may be, before it be laid into a Garden, that the Winter frosts may breake the chalke small, and the Raine dissolue it into mould, that so they may bee well mixed together; than which, there is not any better manure to soyle such a moist ground, to helpe to dry vp the moisture, and to giue heate and life to the coldnesse thereof, which doth alwayes accompany these moist grounds, and also to cause it abide longer in heart than any other. For the sandy and grauelly grounds, although I know the well mollified manure of beasts and cattell to be excellent good, yet I know also, that some commend a white Marle, and some a clay to be well spread thereon, and after turned thereinto: and for the chalkie ground, *et conuersa*, I commend fatte clay to helpe it. You must vnderstand, that the lesse rich or more barren that your ground is, there needeth

deth the more care, labour, and cost to bee bestowed thereon, both to order it rightly, & so to preserve it from time to time: for no artificiall or forc't ground can endure good any long time, but that within a few yeares it must be refreshed more or lesse, according as it doth require. Yet you shall likewise vnderstand, that this Garden of pleasure stored with these Out-landish flowers, that is, bulbous and tuberous rooted plants, and other fine flowers, that I haue hereafter described, and assigned vnto it, needeth not so much or so often manuring with soyle, &c. as another Garden planted with the other sorts of English flowers, or a Garden of ordinary Kitchen herbes doth. Your ground likewise for this Garden had neede to bee well cleansed from all annoyances (that may hinder the well doing or prospering of the flowers therein) as stones, weedes, rootes of trees, bushes, &c. and all other things cumbersome or hurtfull; and therefore the earth being not naturally fine enough of it selfe, is vsed to bee sifted to make it the finer, and that either through a hurdle made of sticks, or lathes, or through square or round sieues plated with fine and strong thin stickes, or with wyers in the bottome. Or else the whole earth of the Garden being coarse, may be cast in the same manner that men vse to try or fine sand from grauell, that is, against a wall; whereby the courser and more stony, falling downe from the fine, is to be taken away from the foote of the heape, the finer sand and ground remaining still aboue, and on the heape. Or else in the want of a wall to cast it against, I haue seene earth fined by it selfe in this manner: Hauing made the floore or vpper part of a large plat of ground cleane from stones, &c. let there a reasonable round heape of fine earth be set in the midst thereof, or in stead thereof a large Garden flower-pot, or other great pot, the bottome turned vpwads, and then poure your coarse earth on the top or head thereof, one shouell full after another somewhat gently, and thereby all the coarse stufte and stones will fall downe to the bottome round about the heape, which must continually be carefully taken away, and thus you may make your earth as fine as if it were cast against a wall, the heape being growne great, seruing in stead thereof. Those that will not prepare their grounds in some of these manners aforesaid, shall soone finde to their losse the neglect thereof: for the trash and stones shall so hinder the encrease of their roots, that they will be halfe lost in the earth among the stones, which else might be saued to serue to plant wheresoeuer they please.

CHAP. II.

The frame or forme of a Garden of delight and pleasure, with the severall varieties thereof.

Although many men must be content with any plat of ground, of what forme or quantity soeuer it bee, more or lesse, for their Garden, because a more large or conuenient cannot bee had to their habitation: Yet I perswade my selfe, that Gentlemen of the better sort and quality, will provide such a parcell of ground to bee laid out for their Garden, and in such conuenient manner, as may be fit and answerable to the degree they hold. To prescribe one forme for euery man to follow, were too great presumption and folly: for euery man will please his owne fancie; according to the extent he designeth out for that purpose, be it orbicular or round, triangular or three square, quadrangular or foure square, or more long than broad. I will onely shew you here the severall formes that many men haue taken and delighted in, let euery man chuse which him liketh best, or may most fitly agree to that proportion of ground hee hath set out for that purpose. The orbicular or round forme is held in it owne proper existence to be the most absolute forme, containing within it all other formes whatsoeuer; but few I thinke will chuse such a proportion to be ioyned to their habitation, being not accepted any where I thinke, but for the generall Garden to the Vniuersity at Padoa. The triangular or three square is such a forme also, as is seldome chosen by any that may make another choise, and as I thinke is onely had where another forme cannot be had, necessitie constraining them to be therewith content. The foure square forme is the most vsually accepted with all, and doth best agree to any mans dwelling, being (as I said before) behinde the house, all the backe windowes thereof opening into it. Yet if it bee longer than the breadth, or broader than the length, the proportion of walkes, squares, and knots may be soon brought to the square forme, and be so cast, as the beauty thereof may

bee no lesse than the foure square proportion, or any other better forme, if any be. To forme it therefore with walks, crosse the middle both waies, and round about it also with hedges, with squares, knots and trayles, or any other worke within the foure square parts, is according as euery mans conceit alloweth of it, and they will be at the charge: For there may be therein walkes cyther open or close, cyther publike, or priuate, a maze or wilderness, a rocke or mount, with a fountaine in the midst thereof to conuey water to euery part of the Garden, cyther in pipes vnder the ground, or brought by hand, and emptied into large Cisternes or great Turkie Iarres, placed in conuenient places, to serue as an ease to water the nearest parts thereunto. Arbours also being both gracefull and necessary, may be appointed in such conuenient places, as the corners, or else where, as may be most fit, to serue both for shadow and rest after walking. And because many are desirous to see the formes of trayles, knots, and other compartiments, and because the open knots are more proper for these Out-landish flowers; I haue here caused some to be drawne, to satisfie their desires, not intending to cumber this worke with ouer manie, in that it would be almost endlesse, to expresse so many as might bee conceiued and set downe, for that euery man may inuent others farre differing from these, or any other can be set forth. Let euery man therefore, if hee like of these, take what may please his mind, or out of these or his own conceit, frame any other to his fancy, or cause others to be done as he liketh best, obseruing this *deceitum*, that according to his ground he do cast out his knots, with conuenient roome for allies and walkes; for the fairer and larger your allies and walkes be, the more grace your Garden shall haue, the lesse harme the herbes and flowers shall receiue, by passing by them that grow next vnto the allies sides, and the better shall your Weeders cleanse both the beds and the allies.

CHAP. III.

The many sorts of herbes and other things, wherewith the beds and parts of knots are bordered to set out the forme of them, with their commodities and discommodities.

IT is necessary also, that I shew you the seuerall materials, wherewith these knots and trayles are set forth and bordered; which are of two sorts: The one are liuing herbes, and the other are dead materials; as leade, boords, bones, tyles, &c. Of herbes, there are many sorts wherewith the knots and beds in a Garden are vsed to be set, to shew forth the forme of them, and to preferue them the longer in their forme, as also to be as Greene, and sweete herbes, while they grow, to be cut to perfume the house, keeping them in such order and proportion, as may be most contentient for their seuerall natures, and euery mans pleasure and fancy: Of all which, I intend to giue you the knowledge here in this place; and first, to begin with that which hath bene most anciently receiued, which is Thrift. This is an euerliuing Greene herbe, which many take to border their beds, and set their knots and trayles, and therein much delight, because it will grow thicke and bushie, and may be kept, being cut with a paire of Garden sheeres, in some good handsome manner and proportion for a time, and besides, in the Summer time send forth many short stalkes of pleasant flowers; to decke vp an house among other sweete herbes: Yet these inconueniences doe accompany it; it will not onely in a small time ouergrow the knot or trayle in many places, by growing so thicke and bushie, that it will put out the forme of a knot in many places: but also much thereof will dye with the frosts and snowes in Winter, and with the drought in Summer, whereby many voide places will be seene in the knot, which doth much deforme it, and must therefore bee yearly refreshed: the thicknesse also and bushing thereof doth hide and shelter snayles and other small noy some wormes so plentifully, that Gilloflowers, and other fine herbes and flowers being planted therein, are much spoyled by them, and cannot be helped without much industry, and very great and daily attendanceto destroy them. Germander is another herbe, in former times also much vsed, and yet also in many places, and because it will grow thicke, and may be kept also in some forme and proportion with cutting, and that the cuttings are much vsed as a strawing herbe for houses, being pretty and sweete, is also much affected by diuers: but this also will often dye and grow out of forme, and besides that, the stalkes will grow too great, hard and Rubby, the rootes doe so farre shoote vnder ground, that vpon a little continuance thereof, will

spread into many places within the knot, which if continually they be not plucked vp, they will spoile the whole knot it selfe; and therefore once in three or foure yeares at the most, it must be taken vp and new set, or else it will grow too roynish and cumbersome. Hyssope hath also been vsed to be set about a knot, and being sweet, will serue for strewings, as Germander: But this, although the rootes doe not runne or creep like it, yet the stalkes doe quickly grow great aboue ground, and dye often after the first yeares setting, whereby the grace of the knot will be much lost. Marierome, Sauorie, and Thyme, in the like manner being sweete herbes, are vsed to border vp beds and knots, and will be kept for a little while, with cutting, into some conformity; but all and euery of them serue most commonly but for one yeares vse, and will soone decay and perish: and therefore none of these, no more than any of the former, doe I commend for a good bordering herbe for this purpose. Lauander Cotton also being finely slipped and set, is of many, and those of the highest respect of late daies, accepted, both for the beauty and forme of the herbe, being of a whitish greene mealy colour, for his sent smelling somewhat strong, and being cuerliuing and abiding greene all the Winter, will, by cutting, be kept in as euen proportion as any other herbe may be. This will likewise soone grow great and stubbed, notwithstanding the cutting, and besides will now and then perish in some places, especially if you doe not strike or put off the snow, before the Sunne lying vpon it dissolue it: The rarity & nouelty of this herbe, being for the most part but in the Gardens of great persons, doth cause it to be of the greater regard, it must therefore be renewed wholly every second or third yeare at the most, because of the great growing therof. Slips of Iuniper or Yew are also receiued of some & planted, because they are alwayes green, and that the Iuniper especially hath not that ill sent that Boxe hath, which I will presently commend vnto you, yet both Iuniper and Yew will soon grow too great and stubbed, and force you to take vp your knot sooner, than if it were planted with Boxe. Which lastly, I chiefly and aboue all other herbes commend vnto you, and being a small, lowe, or dwarfe kinde, is called French or Dutch Boxe, and serueth very well to set out any knot, or border out any beds: for besides that it is euer greene, it being reasonable thicke set, will easily be cut and formed into any fashion one will, according to the nature thereof, which is to grow very slowly, and will not in a long time rise to be of any height, but shooting forth many small branches from the roote, will grow very thicke, and yet not require so great tending, nor so much perish as any of the former, and is onely receiued into the Gardens of those that are curious. This (as I before said) I commend and hold to bee the best and surest herbe to abide faire and greene in all the bitter stormes of the sharpest Winter, and all the great heates and droughts of Summer, and doth recompence the want of a good sweet sent with his fresh verdure, euen proportion, and long lasting continuance. Yet these inconueniences it hath, that besides the vnpleasing sent which many mislike, and yet is but small, the rootes of this Boxe do so much spread themselues into the ground of the knot, and doe draw from thence so much nourishment, that it robbeth all the herbes that grow neare it of their sap and substance, thereby making all the earth about it barren, or at least lesse fertile. Wherefore to shew you the remedy of this inconuenience of spreading, without either taking vp the Boxe of the border, or the herbes and flowers in the knot, is I thinke a secret knowne but vnto a few, which is this: You shall take a broad pointed Iron like vnto a Slife or Chesseill, which thrust downe right into the ground a good depth all along the inside of the border of Boxe somewhat close thereunto, you may thereby cut away the spreading rootes thereof, which draw so much moisture from the other herbes on the inside, and by this meanes both preserue your herbes and flowers in the knot, and your Boxe also, for that the Boxe will be nourished sufficiently from the rest of the rootes it shooteth on all the other sides. And thus much for the liuing herbes, that serue to set or border vp any knot. Now for the dead materials, they are also, as I said before diuers: as first, Leade, which some that are curious doe border their knots withall, causing it to be cut of the breadth of foure fingers, bowing the lower edge a little outward, that it may lye vnder the vpper crust of the ground, and that it may stand the faster, and making the vpper edge either plain, or cut out like vnto the battlements of a Church: this fashion hath delighted some, who haue accounted it stately (at the least costly) and fit for their degrec, and the rather, because it will be bowed and bended into any round square, angular, or other proportion as one listeth, and is not much to be misliked, in that the Leade doth

doth not easily breake or spoile without much iniury, and keepeth vp a knot for a very long time in his due proportion: but in my opinion, the Leade is ouer-hot for Summer, and ouer-cold for Winter. Others doe take Oaken inch boords, and sawing them foure or five inches broad, do hold vp their knot therewith: but in that these boordes cannot bee drawne compasse into any small scantling, they must serue rather for long outright beds, or such knots as haue no rounds, halfe rounds, or compassings in them. And besides, these boordes are not long lasting, because they stand continually in the weather, especially the ends where they are fastned together will soonest rot and perish, and so the whole forme will be spoyled. To preuent that fault, some others haue chosen the shanke bones of Sheep, which after they haue beene well cleafed and boyled, to take out the fat from them, are stucke into the ground the small end downwards, and the knockle head vpwards, and thus being set side to side, or end to end close together, they set out the whole knot therewith, which heads of bones although they looke not white the first yeare, yet after they haue abiden some frosts and heates will become white, and prettily grace out the ground: but this inconuenience is incident to them, that the Winter frosts will raise them out of the ground oftentimes, and if by chance the knockle head of any doe breake, or be stricke off with any ones foot, &c. going by, from your store, that lyeth by you of the same sort, set another in the place, hauing first taken away the broken peece: although these will last long in forme and order, yet because they are but bones many mislike them, and indeed I know but few that vse them. Tyles are also vsed by some, which by reason they may bee brought compasse into any fashion many are pleased with them, who doe not take the whole Tyle at length, but halfe Tyles, and other broken peeces set somewhat deepe into the ground, that they may stand fast, and these take vp but little roome, and keepe vp the edge of the beds and knots in a pretty comely manner, but they are often out of frame, in that many of them are broken and spoiled, both with mens feete passing by, the weather and weight of the earth beating them downe and breaking them, but especially the frosts in Winter doe so cracke off their edges, both at the toppes and sides that stand close one vnto another, that they must bee continually tended and repaired, with fresh and sound ones put in the place of them that are broken or decayed. And lastly (for it is the latest inuention) round whitish or blewish pebble stones, of some reasonable proportion and bignesse, neither too great nor too little, haue beene vsed by some to be set, or rather in a manner but laide vpon the ground to fashion out the traile or knot, or all along by the large grauelly walke sides to set out the walke, and maketh a pretty handsome shew, and because the stones will not decay with the iniuries of any time or weather, and will be placed in their places againe, if any should be thrust out by any accident, as also that their sight is so conspicuous vpon the ground, especially if they be not hid with the store of herbes growing in the knot, is accounted both for durability, beauty of the sight, handsomnesse in the worke, and ease in the working and charge, to be of all other dead materials the chiefe. And thus, Gentlemen, I haue shewed you all the varieties that I know are vsed by any in our Countrey, that are worth the reciting (but as for the fashion of lawe-bones, vsed by some in the Low Countries, and other places beyond the Seas, being too grosse and base, I make no mention of them) among which euery one may take what pleaseth him best, or may most fitly be had, or may best agree with the ground or knot. Moreouer, all these herbes that serue for borderings, doe serue as well to be set vpon the ground of a leuelled knot, that is, where the allies and foot-pathes are of the same leuell with the knot, as they may serue also for the raised knot, that is, where the beds of the knot are raised higher than the allies: but both Leade, Boordes, Bones, and Tyles, are only for the raised ground, be it knot or beds. The pebble stones againe are onely for the leuelled ground, because they are so shallow, that as I said before, they rather lye vpon the earth than are thrust any way into it. All this that I haue here set downe, you must vnderstand is proper for the knots alone of a Garden. But for to border the whole square or knot about, to serue as a hedge thereunto, euery one taketh what liketh him best; as either Priuet alone, or sweete Bryer, and white Thorne enterlaced together, and Roses of one, or two, or more sorts placed here and there amongst them. Some also take Lauander, Rosemary, Sage, Southernwood, Lauander Cotton, or some such other thing. Some againe plant Cornell Trees, and plash them, or keepe them lowe, to
forme

forme them into an hedge. And some againe take a lowe prickly shrubbe, that abideth alwayes greene, described in the end of this Booke, called in Latine *Pyracantha*, which in time will make an ever greene hedge or border, and when it beareth fruit, which are red berries like vnto Hawthorne berries, make a glorious shew among the greene leaues in the Winter time, when no other shrubbes haue fruit or leaues.

CHAP. IV.

The nature and names of diuers Out-landish flowers, that for their pride, beauty, and earlinesse, are to be planted in Gardens of pleasure for delight.

HAuing thus formed out a Garden, and diuided it into his fit and due proportion, with all the gracefull knots, arbours, walkes, &c. likewise what is fit to keepe it in the same comely order, is appointed vnto it, both for the borders of the squares, and for the knots and beds themselves; let vs now come and furnish the inward parts, and beds with those fine flowers that (being strangers vnto vs, and giuing the beauty and brauery of their colours so early before many of our owne bred flowers, the more to entice vs to their delight) are most becomming it: and namely, with Daffodils, Fritillarias, Iacinthes, Saffron-flowers, Lillies, Flowerdeluces, Tulipas, Anemones, French Cowslips, or Beares eares, and a number of such other flowers, very beautifull, delightfull, and pleasant, hereafter described at full, whereof although many haue little sweete sent to commend them, yet their earlinesse and exceeding great beautie and varietie doth so farre counteruaile that defect (and yet I must tell you with all, that there is among the many sorts of them some, and that not a few, that doe excell in sweetnesse, being so strong and heady, that they rather offend by too much than by too little sent, and some againe are of so milde and moderate temper, that they scarce come short of your most delicate and danciest flowers) that they are almost in all places with all persons, especially with the better sort of the Gentry of the Land, as greatly desired and accepted as any other the most choicest, and the rather, for that the most part of these Out-landish flowers, do shew forth their beauty and colours so early in the yeare, that they seeme to make a Garden of delight euen in the Winter time, and doe so giue their flowers one after another, that all their brauery is not fully spent, vntil that Gilliflowers, the pride of our English Gardens, do shew themselves: So that whosoeuer would haue of euery sort of these flowers, may haue for euery moneth seuerall colours and varieties, euen from Christmas vntill Midsummer, or after; and then, after some little respite, vntill Christmas againe, and that in some plenty, with great content and without forcing, so that euery man may haue them in euery place, if they will take any care of them. And because there bee many Gentlewomen and others, that would gladly haue some fine flowers to furnish their Gardens, but know not what the names of those things are that they desire, nor what are the times of their flowring, nor the skill and knowledge of their right ordering, planting, displanting, transplanting, and replanting; I haue here for their sakes set downe the nature, names, times, and manner of ordering in a briebe manner, referring the more ample declaration of them to the worke following. And first of their names and natures: Of Daffodils there are almost an hundred sorts, as they are seuerally described hereafter, euery one to be distinguished from other, both in their times, formes, and colours, some being eyther white, or yellow, or mixt, or else being small or great, single or double, and some hauing but one flower vpon a stalke, others many, whereof many are so exceeding sweete, that a very few are sufficient to perfume a whole chamber, and besides, many of them be so faire and double, eyther one vpon a stalke, or many vpon a stalke, that one or two stalkes of flowers are in stead of a whole nose-gay, or bundell of flowers tyed together. This I doe affirme vpon good knowledge and certaine experience, and not as a great many others doe, tell of the wonders of another world, which themselves neuer saw nor euer heard of, except some superficial relation, which themselves haue augmented according to their owne fanisie and conceit. Againe, let me here also by the way tell you, that many idle and ignorant Gardiners and others, who get names by stealth, as they doe many other things, doe call some

some of these Daffodils Narcissus, when as all know that know any Latine, that Narcissus is the Latine name, and Daffodill the English of one and the same thing; and therefore alone without any other Epithite cannot properly distinguish severall things. I would willingly therefore that all would grow iudicious, and call every thing by his proper English name in speaking English, or else by such Latine name as every thing hath that hath not a proper English name, that thereby they may distinguish the severall varieties of things and not confound them, as also to take away all excuses of mistaking; as for example: The single English bastard Daffodill (which groweth wilde in many Woods, Groves, and Orchards in England.) The double English bastard Daffodill. The French single white Daffodill many vpon a stalke. The French double yellow Daffodill. The great, or the little, or the least Spanish yellow bastard Daffodill, or the great or little Spanish white Daffodill. The Turkie single white Daffodill, or, The Turkie single or double white Daffodill many vpon a stalke, &c. Of Fritillaria, or the checkerd Daffodill; there are halfe a score severall sorts, both white and red; both yellow and blacke, which are a wonderfull grace and ornament to a Garden in regard of the Checker like spots are in the flowers. Of Iacinthes there are about halfe an hundred sorts; as they are specified hereafter; some like vnto little bells or starres, others like vnto little bottles or pearles, both white and blew, sky-coloured and bluish; and some starlike of many pretty various formes, and all to giue delight to them that will be curious to obserue them. Of Crocus or Saffron flowers, there are also twenty sorts; some of the Spring time, others flowring onely in the Autume or Fall, earlier or later than another, some whereof abide but a while, others indure about a moneth in their glorious beauty. The Colchicum or Medowe Saffron, which some call the sonne before the father, but not properly, is of many sorts also; some flowring in the Spring of the year, but the most in Autume, whereof some haue faire double flowers very delightfull to behold; and some party coloured both single and double so variable, that it would make any one admire the worke of the Creatour in the various spots and stripes of these flowers. Then haue wee of Lillies twenty severall sorts and colours, among whom I must reckon the Crowne Imperiall; that for his stately forme deserueth some speciall place in this Garden, as also the Martagons, both white and red, both bluish and yellow, that require to be set by themselves apart, as it were in a small round or square of a knot, without many other, or tall flowers growing neare them. But to tell you of all the sorts of Tulips (which are the pride of delight) they are so many, and as I may say, almost infinite, doth both passe my ability, and as I beleue the skill of any other. They are of two especiall sorts, some flowring earlier, and others later than their fellowes, and that naturally in all grounds, wherein there is such a wonderfull variety and mixture of colours, that it is almost impossible for the wit of man to descipher them thoroughly, and to giue names that may be true & severall distinctions to every flower; threescore severall sorts of colours simple and mixed of each kind I can reckon vp that I haue, and of especiall note, and yet I doubt not, but for every one of them there are ten or thers differing from them, which may be seen at severall times, and in severall places: & besides this glory of variety in colors that these flowers haue, they carry so stately & delightfull a forme, & do abide so long in their brauery (enduring about three whole moneths from the first vnto the last) that there is no Lady or Gentlewoman of any worth that is not caught with this delight, or not delighted with these flowers. The Anemones likewise or Windflowers are so full of variety and so dainty; so pleasant and so delightfome flowers, that the sight of them doth enforce an earnest longing desire in the minde of any one to be a possessor of some of them at the least: For without all doubt, this one kinde of flower, so variable in colours, so differing in forme (being almost as many sorts of them double as single) so plentiful in bearing flowers, and so durable in lasting; and also so easie both to preferue and to encrease, is of it selfe alone almost sufficient to furnish a garden with their flowers for almost halfe the yeare, as I shall shew you in a fit and conuenient place. The Beares eares or French Cowslips must not want their deserued commendations; seeing that their flowers, being many set together vpon a stalke, doe seeme every one of them to bee a Nofegay alone of it selfe: and besides the many differing colours that are to be seene in them, as white, yellow, bluish, purple, red, tawney, murrey, haire colour, &c. which encrease much delight in all sorts of the Gentry of the Land, they are not vnfurnished with a pretty sweete sent,
which

which doth adde an encrease of pleasure in those that make them an Ornament for their wearing. Flowerdeluces also are of many sorts, but diuided into two especiall kindes; the one bearing a leafe like a flagge, whose rootes are tuberous, thicke and short (one kinde of them being the Orris rootes that are sold at the Apothecaries, whereof sweete powders are made to lye among garments) the other hauing round rootes like vnto Onions, and narrow long leaues somewhat like grasse: Of both these kindes there is much variety, especially in their colours. The greater Flagge kinde is frequent enough and disperied in this Land, and well doth serue to decke vp both a Garden and House with natures beauties: But the chiefe of all is your Sable flower, so fit for a mourning habit, that I thinke in the whole compasse of natures store, there is not a more patheticall, or of greater correspondency, nor yet among all the flowers I know any one comming neare vnto the colour of it. The other kinde which hath bulbous or Onion like rootes, diuersifieth it selfe also into so many fine colours, being of a more neate shape and succinct forme than the former, that it must not bee wanting to furnish this Garden. The Hepatica or Noble Liuerwoort is another flower of account, whereof some are white, others red, or blew, or purple, somewhat resembling Violets, but that there are white threads in the midst of their flowers, which adde the more grace vnto them; and one kinde of them is so double, that it resembleth a double thicke Daffie or Marigold, but being small and of an excellent blew colour, is like vnto a Button: but that which commendeth the flower as much as the beauty, is the earliness in flowring, for that it is one of the very first flowers that open themselves after Christmas, euen in the midst of Winter. The Cyclamen or Sowerbread is a flower of rare receipt, because it is naturally hard to encrease, and that the flowers are like vnto red or bluish coloured Violets, flowring in the end of Summer or beginning of Autumne: the leaues likewise hereof haue no small delight in their pleasant colour, being spotted and circled white vpon greene, and that which most preferreth it, is the Physicall properties thereof for women, which I will declare when I shall shew you the seuerall descriptions of the varieties in his proper place. Many other sorts of flowers there are fit to furnish this Garden, as Leucoium or Bulbous Violet, both early and late flowring. Muscari or Muske Grape flower. Starre flowers of diuers sorts. Phalangium or Spiderwort, the chiefe of many is that sort whose flowers are like vnto a white Lilly. Winter Crowfoote or Wolfesbane. The Christmas flower like vnto a single white Rose. Bell flowers of many kindes. Yellow Larkes spur, the prettiest flower of a score in a Garden. Flower-gentle or Floramour. Flower of the Sunne. The Maruaile of Peru or of the world. Double Marsh Marigold or double yellow Buttons, much differing and farre exceeding your double yellow Crowfoote, which some call Batchelours Buttons. Double French Marigolds that smell well, and is a greater kinde than the ordinary, and farre surpasseth it. The double red Ranunculus or Crowfoote (farre excelling the most glorious double Anemone) and is like vnto our great yellow double Crowfoote. Thus hauing giuen you the knowledge of some of the choicest flowers for the beds of this Garden, let me also shew you what are fittest for your borders, and for your arbours. The Iasmine white and yellow. The double Honysockle. The Ladies Bower, both white, and red, and purple single and double, are the fittest of Outlandish plants to set by arbours and banqueting houses, that are open, both before and aboue to helpe to couer them, and to giue both sight, smell, and delight. The sorts of Roses are fittest for standards in the hedges or borders. The Cherry Bay or Laurocerasus. The Rose Bay or Oleander. The white and the blew Syringa or Pipe tree, are all gracefull and delightfull to set at seuerall distances in the borders of knots; for some of them giue beautifull and sweete flowers. The Pyracantha or Prickly Corall tree doth remaine with greene leaues all the yeare, and may be plashed, or laid downe, or tyed to make a fine hedge to border the whole knot, as is said before. The Wilde Bay or Laurus Tinus, doth chiefly desire to be sheltered vnder a wall, where it will best thrive, and giue you his beautifull flowers in Winter for your delight, in recompence of his fenced dwelling. The Dwarfie Bay or Mese-reon, is most commonly either placed in the midst of a knot, or at the corners thereof, and sometimes all along a walke for the more grace. And thus to fit euery ones fancy, I haue shewed you the variety of natures store in some part for you to dispose of them to your best content.

CHAP. V.

The nature and names of those that are called vsually English flowers.

THose flowers that haue beene vsually planted in former times in Gardens of this Kingdome (when as our forefathers knew few or none of those that are recited before) haue by time and custome attained the name of English flowers, although the most of them were neuer naturall of this our Land, but brought in from other Countries at one time or other, by those that tooke pleasure in them where they first saw them: and I doubt not, but many other sorts than here are set downe, or now knowne to vs, haue beene brought, which either haue perished by their negligence or want of skill that brought them, or else because they could not abide our cold Winters; those onely remaining with vs that haue endured of themselves, and by their encreasing haue beene distributed ouer the whole Land. If I should make any large discourse of them, being so well knowne to all, I doubt I should make a long tale to small purpose: I will therefore but briefly recite them, that you may haue them together in one place, with some little declaration of the nature and quality of them, and so passe to other matters. And first of Primroses and Cowslips, whereof there are many prettie varieties; some better knowne in the West parts of this Kingdome, others in the North, than in any other, vntill of late being obserued by some curious louers of varieties, they haue beene transplanted diuersly, and so made more common: for although we haue had formerly in these parts about London greene Primroses vsually, yet we neuer saw or heard of greene Cowslips both single and double but of late dayes, and so likewise for Primroses to be both single and double from one roote, and diuers vpon one stalke of diuers fashions, I am sure is not vsuall: all which desire rather to be planted vnder some hedge, or fence, or in the shade, than in the Sunne. Single Rose Campions, both white, red, and bluish; and the double red Rose Campion also is knowne sufficiently, and will abide moderate Sunne as well as the shade. The flower of Bristow or None-such is likewise another kinde of Campion, whereof there is both white flowering plants and bluish as well as Orange colour, all of them being single flowers require a moderate Sunne and not the shadow: But the Orange colour None-such with double flowers, as it is rare and not common, so for his brauery doth well deserue a Master of account that will take care to keepe and preserue it. Batchelours Buttons both white and red, are kindes of wilde Campions of a very double forme, and will reasonably well like the Sunne but not the shade. Wall-flowers are common in euery Garden, as well the ordinary double as the single, and the double kinde desireth no more shade than the single, but the greater kindes both double and single must haue the Sunne. Stock-Gilliflowers likewise are almost as common as Wall-flowers, especially the single kindes in euery womans Garden, but the double kindes are much more rare, and possessed but of a few, and those onely that will bee carefull to preserue them in Winter; for besides that the most of them are more tender, they yeeld no seede as the single kindes doe to preserue them, although one kinde from the sowing of the seed yeeld double flowers: They will all require the comfort of the Sunne, especially the double kindes, and to be defended from cold, yet so as in the Summer they doe not want water wherein they much ioy, and which is as it were their life. Queenes Gilliflowers (which some call Dames Violets, and some Winter Gilliflowers, are a kinde of Stock-Gilliflower) planted in Gardens to serue to fill vp the parts thereof for want of better things, hauing in mine opinion neither sight nor sent much to commend them. Violets are the Springs chiefe flowers for beauty, smell, and vse, both single and double, the more shadie and moist they stand the better. Snapdragon are flowers of much more delight, and in that they are more tender to keepe, and will hardly endure the sharpe Winters, vnlesse they stand well defended, are scarce seene in many Gardens. Columbines single and double, of many sorts, fashions, and colours, very variable both speckled and party coloured, are flowers of that respect, as that no Garden would willingly bee without them, that could tell how to haue them, yet the rarer the flowers are, the more trouble to keepe; the ordinary sorts on the contrary

trary part will not be lost, doe what one will. Larkes heeles, or spurres, or toes, as in severall Countries they are called, exceed in the varietie of colours, both single and double, any of the former times; for vntill of late dayes none of the most pleasant colours were seene or heard of: but now the single kindes are reasonable well disperst ouer the Land, yet the double kindes of all those pleasant colours (and some other also as beautifull) which stand like little double Roses, are enioyed but of a few: all of them rise from seed, and must be sowne euery yeare, the double as well as the single. Pansyes or Hartes eases of diuers colours, and although without sent, yet not without some respect and delight. Double Poppies are flowers of a great and goodly proportion, adorning a Garden with their variable colours to the delight of the beholders, wherein there is some speciall care to be taken, lest they turne single; and that is, if you see them grow vp too thicke, that you must pull them vp, and not suffer them to grow within lesse than halfe a yard distance, or more one from another. Double Daiesies are flowers not to be forgotten, although they be common enough in euery Garden, being both white and red, both bluish and speckled, or party coloured, besides that which is called Iacke an Apes on horsebacke, they require a moist and shadowie place; for they are scorched away, if they stand in the Sunne in any dry place. Double Marigolds also are the most common in all Gardens. And so are the French Marigolds that haue a strong heady sent, both single and double, whose glorious shew for colour would cause any to beleue there were some rare goodnesse or vertue in them. These all are sometimes preserued in the Winter, if they bee well defended from the cold. But what shall I say to the Queene of delight and of flowers, Carnations and Gilloflowers, whose brauery, variety, and sweete smell ioyned together, tyeth euery ones affection with great earnestnesse, both to like and to haue them? Those that were knowne, and enioyed in former times with much acceptation, are now for the most part lesse accounted of, except a very few: for now there are so many other varieties of later inuention, that troubleth the other both in number, beauty, and worth: The names of them doe differ very variably, in that names are imposed and altered as euery ones fancy will haue them, that carryed or sent them into the severall Countries from London, where their truest name is to be had, in mine opinion. I will here but giue you the names of some, and referre you to the worke ensuing for your further knowledge. The red and the gray Hulo. The old Carnation, differing from them both. The Gran Pere. The Camberfine. The Sauadge. The Christall. The Prince. The white Carnation, or Delicate. The ground Carnation. The French Carnation. The Douer. The Oxford. The Bristow. The Westminster. The Daintie. The Granado, and many other Gilloflowers too tedious to recite in this place, because I haue amply declared them in the booke following. But there is another sort of great delight and varietie, called the Orange tawny Gilloflower, which for the most part hath risen from seed, and doth giue seed in a more plentifull manner than any of the former sorts, and likewise by the sowing of the seed there hath been gained so many varieties of that excellent worth and respect, that it can hardly be expressed or beleueed, and called by diuers names according to the marking of the flowers; as The Infanta. The Stript Tawny. The Speckled Tawny. The Flackt Tawny. The Griseld Tawny, and many others, euery one to bee distinguished from others: Some also haue their flowers more double and large than others, and some from the same seed haue single flowers like broad single Pinkes: the further relation of them, viz. their order to sowe, encrease, and preserue them, you shall haue in the subsequent discourse in a place by it selfe. Pinkes likewise both single and double are of much variety, all of them very sweete, comming neare the Gilloflowers. Sweete Williams and Sweete Iohns, both single and double, both white, red, and spotted, as they are kindes of wilde Pinkes, so for their grace and beauty helpe to furnish a Garden, yet desire not to stand so open to the Sunne as the former. Double and single Peonies are fit flowers to furnish a Garden, and by reason of their durability, giue out fresh pleasure euery yeare without any further trouble of sowing. And lastly, Hollihocks both single and double, of many and sundry colours, yeeld out their flowers like Roses on their tall branches, like Trees, to sute you with flowers, when almost you haue no other to grace out your Garden: the single and double doe both yeeld seed, and yet doe after their seeding abide many yeares. Thus haue I shewed you most of the English, as well as (I did before) the Outlandish

landish flowers, that are fit to furnish the knots, trailes, beds, and borders of this Garden. Roses onely, as I said before, I referue to circle or encompasse all the rest, because that for the most part they are planted in the outer borders of the quarters, and sometimes by themselves in the middle of long beds, the sorts or kindes whereof are many, as they are declared in their proper place: but the White Rose, the Red, and the Damaske, are the most ancient Standards in England, and therefore accounted naturall.

CHAP. VI.

The order and manner to plant and replant all the sorts of Out-landish flowers spoken of before, as well those with bulbous rootes, as others with stringie rootes.

WHEREAS it is the vsuall custome of most in this Land, to turne vp their Gardens, and to plant them againe in the Spring of the yeare, which is the best time that may bee chosen for all English flowers, yet it is not so for your Out-landish flowers. And herein indeede hath beene not onely the error of a great many to hinder their rootes from bearing out their flowers as they should, but also to hinder many to take delight in them, because as they say they will not thrive and prosper with them, when as the whole fault is in the want of knowledge of the fit and conuenient time wherein they should bee planted. And because our English Gardiners are all or the most of them vtterly ignorant in the ordering of these Out-landish flowers, as not being trained vp to know them, I haue here taken vpon mee the forme of a new Gardiner, to giue instructions to those that will take pleasure in them, that they may be the better enabled with these helps I shall shew them, both to know how they should be ordered, and to direct their Gardiners that are ignorant thereof, rightly to dispose them according to their naturall qualities. And I doe wish all Gentlemen and Gentlewomen, whom it may concerne for their owne good, to bee as carefull whom they trust with the planting and replanting of these fine flowers, as they would be with so many Jewels; for the rootes of many of them being small, and of great value, may be soone conueyed away, and a cleanly tale faire told, that such a roote is rotten, or perished in the ground if none be seene where it should be, or else that the flower hath changed his colour, when it hath been taken away, or a counterfeite one hath beene put in the place thereof; and thus many haue beene deceiued of their daintiest flowers, without remedy or true knowledge of the defect. You shall therefore, if you will take the right course that is proper for these kindes of flowers, not set or plant them among your English flowers; for that when the one may be remoued, the other may not be stirred: but plant those rootes that are bulbous, or round like Onions, eyther in knots or beds by themselves which is the best, or with but very few English or Out-landish flower plants that haue stringie rootes: For you must take this for a generall rule, that all those rootes that are like Lillies or Onions, are to bee planted in the moneths of Iuly or August, or vnto the middle or end of September at the furthest, if you will haue them to prosper as they should, and not in the Spring of the yeare, when other gardening is vsed. Yet I must likewise giue you to vnderstand, that if Tulipas, and Daffodils, and some other that are firme and hard rootes, and not limber or spongie, being taken vp out of the ground in their fit season, that is, in Iune, Iuly, and August, and likewise kept well and dry, may bee reserued out of the ground vntill Christmas or after, and then (if they could not be set sooner) being set, will thrive reasonable well, but not altogether so well as the former, being set long before: but if you shall remoue these bulbous rootes againe, either presently after their planting hauing shot their small fibres vnder the round rootes, and sprung likewise vpwards, or before they be in flower at the soonest (yet Tulipas, Daffodils, and many other bulbous, may be safely remoued being in flower, and transplanted into other places, so as they be not kept too long out of the ground) you shall much endanger them either vtterly to perish, or to be hindered from bearing out their flowers they then would haue borne,

borne, and for two or three years after from bearing flowers againe. For the order of their planting there are diuers wayes, some whereof I will shew you in this place: Your knot or beds being prepared fitly, as before is declared, you may place and order your rootes therein thus, Eyther many rootes of one kind set together in a round or cluster, or longwise crosse a bed one by another, whereby the beauty of many flowers of one kinde being together, may make a faire shew well pleasing to many; Or else you may plant one or two in a place dispersedly ouer the whole knot, or in a proportion or diameter one place answering another of the knot, as your store will suffer you, or your knot permit: Or you may also mingle these rootes in their planting many of diuers sorts together, that they may giue the more glorious shew when they are in flower; and that you may so doe, you must first obserue the seuerall kindes of them, which doe flower at one and the same time, and then to place them in such order and so neare one vnto another, that their flowers appearing together of seuerall colours, will cause the more admiration in the beholders: as thus, The Vernall Crocus or Saffron flowers of the Spring, white, purple, yellow, and stript, with some Vernall Colchicum or Meadow Saffron among them, some Deus Caninus or Dogges teeth, and some of the small early Leucoium or Bulbous Violet, all planted in some proportion as neare one vnto another as is fit for them, will giue such a grace to the Garden, that the place will seeme like a peece of tapestry of many glorious colours, to encrease euery ones delight: Or else many of one sort together, as the blew, white and bluish Grape flowers in the same manner intermingled, doe make a maruellous delectable shew, especially because all of them rise almost to an equall height, which causeth the greater grace, as well neare hand as farre of. The like order may be kept with many other things, as the Hepatica, white, blew, purple, and red set or sowne together, will make many to belecue that one roote doth beare all those colours: But aboue and beyond all others, the Tulipas may be so matched, one colour answering and setting of another, that the place where they stand may resemble a peece of curious needle-worke, or peece of painting: and I haue knowne in a Garden, the Master as much commended for this artificall forme in placing the colours of Tulipas, as for the goodnesse of his flowers, or any other thing. The diuers sorts and colours of Anemones or Winde-flowers may be so ordered likewise, which are very beautifull, to haue the seuerall varieties planted one neare vnto another, that their seuerall colours appearing in one place will be a very great grace in a Garden, or if they be dispersed among the other sorts of flowers, they will make a glorious shew. Another order in planting you may obserue; which is this, That those plants that grow low, as the Aconitum Hyemale or Winter-wolues bane, the Vernall Crocus or Saffron flowers of diuers sorts, the little early Leucoium or Bulbous Violet, and some such other as rise not vp high, as also some Anemones may be very well placed somewhat neare or about your Martagons, Lillies, or Crownes Imperiall, both because these little plants will flower earlier than they, and so will bee gone and past, before the other greater plants will rise vp to any height to hinder them; which is a way may well be admitted in those Gardens that are small, to saue roome, and to place things to the most aduantage. Thus hauing shewed you diuers wayes and orders how to plant your rootes, that your flowers may giue the greater grace in the Garden, let mee shew you likewise how to set these kindes of rootes into the ground; for many know not well eyther which end to set vpwards or downewards, nor yet to what depth they should be placed in the ground. Daffodils if they be great rootes, will require (as must bee obserued in all other great plants) to bee planted somewhat deeper then the smaller of the same kinde, as also that the tops or heads of the rootes be about two or three fingers breadth hid vnder ground. The Tulipas likewise if you set them deepe, they will be the safer from frosts if your ground be cold, which will also cause them to be a little later before they be in flower, yet vsually if the mould be good, they are to be set a good hand breadth deep within the ground, so that there may be three or foure inches of earth at the least aboue the head, which is the smaller end of the roote: for if they shall lye too neare the vpper face or crust of the earth, the colds & frosts will pierce and pinch them the sooner. After the same order and manner must Hyacinthes, whether great or small, and other such great rootes be planted. Your greater rootes, as Martagons, Lillies, and Crownes Imperiall, must be set much deeper then any other bulbous roote, because they are greater rootes then others, and by themselves also, as

is most vsuall either in some square, round, triangle, or other small part in the Garden, because they spread and take vp a very great deale of ground. All of them likewise are to be set with the broad end of the roote downewards, and the small end vpwards, that is, both Lillies, Daffodils, Hyacinthes, and Tulipas, and all other sorts of round rootes, which shew one end to bee smaller than another. But the Colchicum or Meadow-Saffron onely requireth an exception to this generall rule, in regard the roote thereof hath a small eminence or part on the one side thereof, which must bee set or planted downeward, and not vpward; for you shall obserue, if the roote lye a little moist out of the ground, that it will shoote fibres out at the small long end thereof, although you may perceiue when you take it vp, that the fibres were at the other broad end or side of the roote. As for the Crowne Imperiall, which is a broad round roote and flat withall, hauing a hole in the middle, for the most part quite thorow, when it is taken vp in his due time out of the ground, you shall perceiue the scales or cloues of the rootes to bee a little open on the vpper side, and close and flat on the vnder side, which will direct you which part to set vpward, as also that the hole is bigger aboue then it is below. The Persian Lilly is almost like vnto the Crowne Imperiall, but that the roote thereof is not so flat, and that it hath a smaller head at the one part, whereby it may be discerned the plainer how to be set. The Fritillaria is a small white root diuided as it were into two parts, so that many haue doubted, as formerly in the Crowne Imperiall, what part to set vppermost; you shall therefore marke, that the two parts of the roote are ioyned together at the bottome, where it shooteh out fibres or small stringie rootes, as all other sorts of bulbous rootes doe, and withall you shall see, that betweene the two parts of the roote a small head will appeare, which is the burgeon that will spring vp to beare leaues and flowers. In the rootes of Anemones there are small round swelling heads, easie enough to be obserued if you marke it, which must be set vpwards. All other sorts of stringie rooted plants (and not bulbous or tuberous rooted) that lose their Greene leaues in Winter, will shew a head from whence the leaues and flowers will spring, and all others that keepe their Greene leaues, are to bee planted in the same manner that other herbes and flower-plants are accustomed to be. But yet for the better thriuing of the stringie rooted plants, when you will plant them, let me informe you of the best way of planting, and the most sure to cause any plant to comprehend in the ground without failing, and is no common way with any Gardiner in this Kingdome, that euer I heard or knew, which is thus: Presuming that the stringie rooted plant is fresh and not old gathered, and a plant that being remoued will grow againe, make a hole in the ground large enough where you meane to set this roote, and raise the earth within the hole a little higher in the middle then on the sides, and set the roote thereon, spreading the strings all abroad about the middle, that they may as it were couer the middle, and then put the earth gently round about it, pressing it a little close, and afterwards water it well, if it be in Summer, or in a dry time, or otherwise moderately: thus shall euery seuerall string of the roote haue earth enough to cause it to shoote forth, and thereby to encrease farre better than by the vsuall way, which is without any great care and respect to thrust the rootes together into the ground. Diuers other flower plants are but annuall, to bee new sowne euery yeare; as the Maruaile of the world, the Indian Cresses, or yellow Larkes heeles, the Flower of the Sunne, and diuers other: they therefore that will take pleasure in them, that they may enioy their flowers the earlier in the yeare, and thereby haue ripe seede of them while warme weather lasteth, must nurse vp their seedes in a bed of hot dung, as Melons and Cowcubers are, but your bed must be provided earlier for these seeds, than for Melons, &c. that they may haue the more comfort of the Summer, which are to be carefully tended after they are transplanted from the hot bed, and couered with straw from colds, whereby you shall not faile to gaine ripe seed euery yeare, which otherwise if you should misse of a very kindly & hot Summer, you should neuer haue. Some of these seedes neede likewise to be transplanted from the bed of dung vnder a warme wall, as the Flower of the Sunne, and the Maruaile of the world, and some others, and that for a while after their transplanting, as also in the heate of Summer, you water them at the roote with water that hath stood a day or two in the Sunne, hauing first laid a round wispe of hay or such other thing round about the roote, that so all helpes may further their giuing of ripe seede. One or two rules more I will giue you concerning these

these dainty flowers, the first whereof is this, That you shall not bee carefull to water any of your bulbous or tuberous rooted plants at any time, for they all of them do better prosper in a dry ground than in a wet, onely all sorts of tuberous rooted Flowerdeluces vpon their remouall had neede of a little water, and some will doe so also to such Tulipas and other bulbous rootes as they transplant, when they are in flower, and this is I grant in some sort tolerable, if it bee not too much, and done onely to cause the stalke and flower to abide sometime the longer before they wither, but else in no other case to be permitted. The second rule is, That I would aduise you to water none of your dainty flowers or herbes, with any water that hath presently before been drawne out of a well or pumpe, but onely with such water that hath stood open in the Sunne in some cisterne, tubbe, or pot for a day at the least, if more the better: for that water which is presently drawne out of a well, &c. is so cold, that it presently chillth & killeth any dainty plant be it younger or elder grown, wherof I haue had sufficient prooffe: and therefore I giue you this caution by mine own experience. Thus haue I directed you from point to point, in all the particulars of preparing & planting that belong to this Garden, sauing only that yet I would further enforme you, of the time of the flowring of these Out-landish plants, according to the seuerall moneths in the yeare, that euery one may know what flowers euery moneth yeeldeth, and may chuse what them liketh best, in that they may see that there is no moneth, but glorieth in some peculiar sorts of rare flowers. I would likewise rather in this place shew you, the true and best manner & order to encrease and preferue all sorts of Gilloflowers & Carnations, then ioine it with the Chapter of Gilloflowers in the worke following, because it would in that place take vp too much roome. And lastly, I must of necessity oppose three sundry errours, that haue possessed the mindes of many both in former and later times, which are, that any flower may be made to grow double by art, that was but single before by nature: And that one may by art cause any flower to grow of what colour they will: And that any plants may be forced to flower out of their due seasons, either earlier or later, by an art which some can vse. All which being declared, I then suppose enough is spoken for an introduction to this worke, referring many other things to the seuerall directions in the Chapters of the booke.

CHAP. VII.

The seuerall times of the flowring of these Out-landish flowers, according to the seuerall moneths of the yeare.

Intend in this place onely to giue you briefly, the names of some of the chiefeft of these Out-landish flowers, according to the seuerall moneths of the yeare wherein they flower, that euery one seeing what sorts of flowers euery moneth yeeldeth, may take of them which they like best. I begin with January, as the first moneth of the yeare, wherein if the frosts be not extreme, you shall haue these flowers of plants; the Christmas flower or Helleborus niger verus, Winter wolues bane or Aconitum hyemale, Hepatica or Noble Liuer wort blew and red, and of shrubbes, the Laurus Tinus or Wilde Bay tree, and Mesereon or the dwarfe Bay: but because Ianuarie is oftentimes too deepe in frosts and snow, I therefore referre the Hepaticas vnto the moneth following, which is February, wherein the weather beginneth to be a little milder, and then they will flower much better, as also diuers sorts of Crocus or Saffron flower will appeare, the little early Summer foole or Leucoium bulbosum, and towards the latter end thereof the Vernall Colchicum, the Dogges tooth Violet or Deus Caminus, and some Anemones, both single and double, which in some places will flower all the Winter long. March will yeeld more varieties; for besides that it holdeth some of the flowers of the former moneth, it will yeeld you both the double blew Hepatica, and the white and the bluish single: then also you shall haue diuers other sorts of Crocus or Saffron flowers, Double yellow Daffodils, Orientall Iacinths and others, the Crowne Imperiall, diuers sorts of early Tulipas, some sorts of French Cowslips, both tawney, murry, yellow, and bluish, the early Fritillaria or checkerd Daffodill,

dill, and some other sorts of early Daffodils, and many sorts of Anemones. In Aprill cometh on the pride of these strangers; for herein you may behold all the sorts of Auricula Vrsi or Beares Eares; many sorts of Anemones; both single and double, both the sorts of Tulipas, the earlier vntill the middle of the moneth, and the later then beginning, which are of so many different colours, that it is almost impossible to expresse them, the white, red, blacke, and yellow Fritillarias, the Muscari or Muske Grape flower, both hast colour and yellow. Diuers other sorts of Iacincts and Daffodils, both single and double, the smaller sorts of Flowerdeluces, the Veluet Flowerdeluce and double Honyuckles, with diuers others. May likewise at the beginning seemeth as glorious as Aprill, although toward the end it doth decline, in regard the heate of the Sunne hath by this time drawne forth all the store of natures tenderest dainties, which are vsually spent by the end of this moneth, and then those of stronger constitution come forward. Herein are to bee scene at the beginning the middle flowering Tulipas, and at the end the later sort: some kindes of Daffodils, the Day Lillies, the great white Starre flower, the Flowerdeluce of Constantinople or the mourning Sable flower, the other sorts of Flowerdeluces. Single and double white Crowfoote, and single and double red Crowfoot, the glory of a Garden: the early red Martagon, the Persian Lilly, the yellow Martagon, the Gladiolus or Corne flagge, both white, red, and bluish: the double yellow Rose, and some other sorts of Roses. In Iune doe flower the white and the bluish Martagon, the Martagon Imperiall, the mountaine Lillies, and the other sorts of white and red Lillies, the bulbous Flowerdeluces of diuers sorts, the red flowred Ladies bower, the single and double purple flowred Ladies bower, the white Syringa or Pipetree, for the blew Pipe tree flowreth earlier, the white and the yellow Iasmin. Iuly holdeth in flower some of the Ladies bowers and Iasmines, and besides doth glory in the Female Balsame apple, the Indian Cresses or yellow Larkes spurres, the purple Flower-gentle and the Rose Bay. In August begin some of the Autumne bulbous flowers to appeare, as the white and the purple Colchicum or Medow Saffron, the purple mountaine Crocus or Saffron flower, the little Autumne Leucoium and Autumne Iacinct, the Italian Starrewort, called of some the purple Marigold, the Meruaile of Peru or of the world, the Flower of the Sunne, the great blew Bell-flower, the great double French Marigold. September flourisheth with the Flower of the Sunne, the Meruaile of the world, the purple Marigold, and blew Bell-flower spoken of before, and likewise the other sorts of Medow Saffron, and the double kinde likewise, the siluer Crocus, the Autumne yellow Daffodill, Cyclamen also or Sowbread shew their flowers in the end of this moneth. October also will shew the flowers of Cyclamen, and some of the Medow Saffrons. In Nouember, as also sometimes in the moneth before, the party coloured Medow Saffron may bee scene, that will longest hold his flower, because it is the latest that sheweth it selfe, and the ash coloured mountaine Crocus. And euen Decembre it selfe will not want the true blacke Hellebor or Christmas flower, and the glorious shew of the Laurus Tinus or wilde Bay tree. Thus haue I shewed you some of the flowers for euery moneth, but I referre you to the more ample declaration of them and all the others, vnto the work following.

CHAP. VIII.

The true manner and order to encrease and preserve all sorts of Gilloflowers, as well by slipes as seedes.

BEcause that Carnations and Gilloflowers bee the chiefeft flowers of account in all our English Gardens, I haue thought good to entreate somewhat amply of them, and that a part by it selfe, as I said a little before, in regard there is so much to be said concerning them, and that if all the matters to be entreated of should haue beene inserted in the Chapter of Gilloflowers, it would haue made it too tedious and large, and taken yp too much roome. The particular matters whereof I mean in this place to entreate are these: How to encrease Gilloflowers by planting and by

sowing, and how to preserve them being encreased, both in Summer from noysome and hurtfull vermine that destroy them, and in Winter from frosts, snowes, and windes, that spoile them. There are two wayes of planting, whereby to encrease these faire flowers; the one is by slipping, which is the old and ready vsuall way, best knowne in this Kingdome; the other is more sure, perfect, ready, and of later inuention, *videlicet*, by laying downe the branches. The way to encrease Gilloflowers by slipping, is so common with all that euer kept any of them, that I thinke most persons may thinke me idle, to spend time to set downe in writing that which is so well known vnto all: Yet giue me leaue to tell them that so might imagine, that (when they haue heard or read what I haue written thereof, if they did know fully as much before) what I here write, was not to informe them, but such as did not know the best, or so good a way as I teach them: For I am assured, the greatest number doe vse, and follow the most vsuall way, and that is not alwaies the best, especially when by good experience a better way is found, and may be learned; and therefore if some can doe a thing better than others, I thinke it is no shame to learne it of them. You shall not then (to take the surest course) take any long spindled branches, nor those branches that haue any young shootes from the ioynts on them, nor yet slue or teare any slippe or branch from the roote; for all these waies are vsuall and common with most, which causeth so many good rootes to rot and perish, and also so many slippes to be lost, when as for the most part, not the one halfe, or with some, not a third part doth grow and thriue of those slippes they set. And although many that haue store of plants, doe not so much care what hauocke they make to gaine some, yet to saue both labour and plants, I doe wish them to obserue these orders: Take from those rootes from whence you intend to make your encrease, those shootes onely that are reasonable strong, but yet young; and not either too small and slender, or hauing any shootes from the ioynts vpon them; cut these slippes or shootes off from the stemme or roote with a knife, as conueniently as the shoote or branch will permit, that is, either close vnto the maine branch, if it be short, or leauing a ioynt or two behinde you, if it be long enough, at which it may shoote anew: When you haue cut off your slippes, you may either set them by and by, or else as the best Gardiners vse to doe, cast them into a tubbe or pot with water for a day or two, and then hauing prepared a place conuenient to set them in, which had neede to bee of the finest, richest, and best mould you can prouide, that they may thriue therein the better, cut off your slippe close at the ioynt, and hauing cut away the lowest leaues close to the stalke, and the vppermost euen at the top, with a little sticke make a little hole in the earth, and put your slippe therein so deep, as that the vpper leaues may be wholly aboue the ground, (some vse to cleaue the stalke in the middle, and put a little earth or elay within the cleft, but many good and skilfull Gardiners doe not vse it); put the earth a little close to the slippe with your finger and thumbe, and there let it rest, and in this manner doe with as many slippes as you haue, setting them somewhat close together, and not too farre in sunder, both to saue ground and cost thereon, in that a small compasse will serue for the first planting, and also the better to giue them shadow: For you must remember in any case, that these slippes new set, haue no sight of the Sunne, vntill they be well taken in the ground, and shot aboue ground, and also that they want not water, both vpon the new planting and after. When these slippes are well growne vp, they must be transplanted into such other places as you thinke meete; that is, either into the ground in beds, or otherwise, or into pots, which that you may the more safely doe, after you haue well watered the ground, for halfe a day before you intend to transplant them, you shall separate them feuerally, by putting down a broad pointed knife on each side of the slippe, so cutting it out, take euery one by it selfe, with the earth cleauing close vnto the root, which by reason of the moisture it had formerly, and that which you gaue presently before, will be sufficient with any care had, to cause it to hold fast vnto the roote for the transplanting of it: for if the earth were dry, and that it should fall away from the roote in the transplanting, it would hazzard and endanger the roote very much, if it did thriue at all. You must remember also, that vpon the removing of these slips, you shadow them from the heate of the Sunne for a while with some straw or other thing, vntill they haue taken hold in their new place. Thus although it bee a little more labour and care than the ordinary way is, yet it is safer, and will giue you plants that

will be so strongly growne before Winter, that with the care hereafter specified, you shall haue them beare flowers the next yeare after, and yeeld you encrease of slippes also. To giue you any set time, wherein these slippes will take roote, and begin to shoote aboue ground, is very hard to doe; for that euery slip, or yet euery kinde of Gilloflower is not alike apt to grow; nor is euery earth in like manner fit to produce and bring forward the slippes that are set therein: but if both the slippe be apt to grow, and the earth of the best, fit to produce, I thinke within a fortnight or three weekes, you shall see them begin to put forth young leaues in the middle, or else it may be a moneth and more before you shall see any springing. The best time likewise when to plant, is a speciall thing to be knowne, and of as great consequence as any thing else: For if you slippe and set in September, as many vse to doe, or yet in August, as some may thinke will doe well, yet (vnlesse they be the most ordinary sorts, which are likely to grow at any time, and in any place) the most of them, if not all, will either assuredly perish, or neuer prosper well: for the more excellent and dainty the Gilloflower is, the more tender for the most part, and hard to nurse vp will the slippes be. The best time therefore is, that you cut off such slippes as are likely, and such as your rootes may spare, from the beginning of May vntill the middle of Iune at the furthest, and order them as I haue shewed you before, that so you may haue faire plants, plenty of flowers, and encrease sufficient for new supply, without offence or losse of your store. For the enriching likewise of your earth, wherein you shall plant your slippes, that they may the better thrive and prosper, diuers haue vsed diuers sorts of manure; as stable soyle of horse, beasts or kine, of sheepe, and pigeons, all which are very good when they are thoroughly turned to mould, to mixe with your other earth, or being steeped in water, may serue to water the earth at times, and turned in with it. And some haue likewise proued Tanners earth, that is, their barke, which after they haue vsed, doth lye on heapes and rot in their yards, or the like mould from wood-stacks or yards; but especially, and beyond all other is commended the Willow earth, that is, that mould which is found in the hollow of old Willow trees; to be the most principall to mixe with other good earth for this purpose. And as I haue now giuen you directions for the first way to encrease them by slipping, so before I come to the other way, let mee giue you a caueat or two for the preseruing of them, when they are beginning to runne vterly to decay and perish: The one is, that whereas many are ouer greedy to haue their plants to giue them flowers, and therefore let them runne all to flower, so farre spending themselues thereby, that after they haue done flowring, they grow so weake, hauing out spent themselues, that they cannot possibly be preserued from the iniuries of the succeeding Winter; you shall therefore keepe the kinde of any sort you are delighted withall, if you carefully looke that too many branches doe not runne vp and spindle for flowers, but rather either cut some of them downe, before they are runne vp too high, within two or three of the rootes; or else plucke away the innermost leaues where it springeth forwards, which you see in the middle of euery branch, before it be runne vp too high, which will cause them to breake out the faster into slippes and suckers at the ioynts, to hinder their forward luxurie, and to preserue them the longer: The other is, If you shall perceiue any of your Gilloflower leaues to change their naturall fresh verdure, and turne yellowish, or begin to wither in anie part or branch thereof, it is a sure signe that the roote is infected with some cancker or rottenesse, and will soone shew it selfe in all the rest of the branches, whereby the plant will quickly be lost: to preserue it therefore, you shall betime, before it be runne too farre, (for otherwise it is impossible to saue it) either couer all or most of the branches with frost earth, or else take the fairest slippes from it, as many as you can possibly, and cast them into a pot or tubbe with water, and let them there abide for two or three daies at the least: the first way hath recovered many, being taken in time. You shall see them recouer their former stiffenesse and colour, and then you may plant them as you haue beene heretofore directed; and although many of them may perish, yet shall you haue some of them that will grow to continue the kinde againe. The other or second way to encrease Gilloflowers by planting, is, as I said before, by in-laying or laying downe the branches of them, and is a way of later inuention, and as frequently vsed, not onely for the tawney or yellow Gilloflower, and all the varieties thereof, but with the other kinds of Gilloflowers, whereof experience hath shewed that

that they will likewise take if they be so vsed; the manner whereof is thus: You must choose out the youngest, likeliest, and lowest branches that are nearest the ground (for the vpper branches will sooner breake at the ioynt, than bend downe so low into the earth, without some pot with earth raised vp vnto them) and cut it on the vnder side thereof vpwards at the second ioynt next vnto the roote, to the middle of the branch, and no more, and not quite thorough in any case, and then from that second ioynt vnto the third, slit or cut the branch in the middle longwise, that so it may be the more easily bended into the ground, the cut ioynt seeming like the end of a flippe, when you haue bended downe the branch where it is cut into the ground (which must be done very gently for feare of breaking) with a little sticke or two thrust slopewise, crosse ouer it, keepe it downe within the earth, and raise vp sufficient earth ouer it, that there it may lye and take roote, which commonly will be effected within sixe weekes or two moneths in the Summer time; and then (or longer if you doubt the time too short for it to take sufficient roote) you may take or cut it away, and transplant it where you thinke good, yet so as in any case you shadow it from the heate of the Sunne, vntill it haue taken good hold in the ground. The other way to encrease Gilloflowers, is by sowing the seede: It is not vsuall with all sorts of Gilloflowers to giue seede, but such of them as doe yeeld seede may be encreased thereby, in the same manner as is here set downe. The Orange tawney Gilloflower and the varieties thereof is the most vsuall kinde, (and it is a kinde by it selfe, how various soeuer the plants be that rise from the seede) that doth giue seede, and is sowne, and from thence ariseth so many varieties of colours, both plaine and mixt, both single and double, that one can hardly set them downe in writing: yet such as I haue obserued and marked, you shall finde expressed in the Chapter of Gilloflowers in the worke following. First therefore make choise of your seede that you intend to sowe (if you doe not desire to haue as many more single flowers as double) that it bee taken from double flowers, and not from single, and from the best colours, howsoeuer some may boast to haue had double and stript flowers from the seede of a single one; which if it were so, yet one Swallow (as we say) maketh no Summer, nor a thing comming by chance cannot bee reckoned for a certaine and constant rule; you may be assured they will not vsuall doe so: but the best, fairest, and most double flowers come alwaies, or for the most part, from the seede of those flowers that were best, fairest, and most double; and I doe aduise you to take the best and most double: for euen from them you shall haue single ones enow, you neede not to sowe any worser sort. And againe, see that your seede bee new, of the last yeares gathering, and also that it was full ripe before it was gathered, lest you lose your labour, or misse of your purpose, which is, to haue faire and double flowers. Hauing now made choise of your seede, and prepared you a bedde to sowe them on, the earth whereof must be rich and good, and likewise sifted to make it the finer; for the better it is, the better shall your profit and pleasure bee: hereon, being first made leuell, plaine, and smooth, sowe your seede somewhat thinne, and not too thicke in any case, and as euenly as you can, that they be not too many in one place, and too few in another, which afterwards couer with fine sifted earth ouer them about one fingers thicke; let this be done in the middle of Aprill, if the time of the yeare be temperate, and not too cold, or else stay vntill the end of the moneth: after they are sprung vp and growne to be somewhat bigge, let them bee drawne forth that are too close and neare one vnto another, and plant them in such place where they shall continue, so that they stand halfe a yard of ground distance asunder, which after the planting, let be shadowed for a time, as is before specified; and this may bee done in the end of Iuly, or sooner if there be cause. I haue not set downe in all this discourse of planting, transplanting, sowing, setting, &c. any mention of watering those slips or plants, not doubting but that every ones reason will induce them to thinke, that they cannot prosper without watering: But let this Caueat be a sufficient remembrance vnto you, that you neuer water any of these Gilloflowers, nor yet indeede any other fine herbe or plant with cold water, such as you haue presently before drawne out from a pumpe or Well, &c. but with such water as hath stood open in the aire in a cisterne, tubbe, or pot, for one whole day at the least; if it be two or three daies it will be neuer the worse, but rather the better, as I haue related before: yet take especiall heede that you doe not giue them too much to ouer-glut them at any time, but temperately to ir-

rorate

rorate, bedew or sprinkle them often. From the seedes of these Gilloflowers hath risen both white, red, bluish, stamell, tawny lighter and sadder, marbled, speckled, striped, flaked, and that in diuers manners, both single and double flowers, as you shall see them set downe in a more ample manner in the Chapter of Gilloflowers. And thus much for their encrease by the two wayes of planting and sowing: For as for a third way, by grafting one into or vpon another, I know none such to be true, nor to be of any more worth than an old Wiues tale, both nature, reason, and experience, all contesting against such an idle fancy, let men make what ostentation they please. It now resteth, that we also shew you the manner how to preserue them, as well in Summer from all noysome and hurtfull things, as in the Winter and Spring from the sharp and chilling colds, and the sharpe and bitter killing windes in March. The hurtfull things in the Summer are especially these, too much heate of the Sunne which scorcheth them, which you must be carefull to preuent, by placing boughes, boords, clothes or mats, &c. before them, if they bee in the ground; or else if they bee in pots, to remoue into them into the shadow, to giue them refreshing from the heate, and giue them water also for their life: too much water, or too little is another annoyance, which you must order as you see there is iust cause, by withholding or giuing them water gently out of a watering pot, and not cast on by dishfuls: Some also to water their Gilloflowers, vse to set their pots into tubbes or pots halfe full of water, that so the water may soake in at the lower holes in each flower pot, to giue moisture to the roots of the Gilloflowers onely, without casting any water vpon the leaues, and assuredly it is an excellent way to moisten the rootes so sufficiently at one time, that it doth saue a great deale of paines many other times. Earwicks are a most infestuous vermine, to spoyle the whole beauty of your flowers, and that in one night or day, for these creatures delighting to creepe into any hollow or shadowie place, doe creepe into the long greene pods of the Gilloflowers, and doe eate away the white bottomes of their leaues, which are sweete, whereby the leaues of the flowers being loose, doe either fall away of themselves before, or when they are gathered, or handled, or presently wither within the pods before they are gathered, and blowne away with the winde. To auoide which inconuenience, many haue deuised many waies and inuentions to destroy them, as pots with double verges or brimmes, containing a hollow gutter betweene them, which being filled with water, will not suffer these small vermines to passe ouer it to the Gilloflowers to spoile them. Others haue vsed old shooes, and such like hollow things to bee set by them to take them in: but the best and most vsuall things now vsed, are eyther long hollow canes, or else beasts hooves, which being turned downe vpon stickes ends set into the ground, or into the pots of earth, will soone draw into them many Earwicks, lying hid therein from sunne, winde, and raine, and by care and diligence may soone bee destroyed, if euery morning and euening one take the hooves gently off from the stickes, and knocking them against the ground in a plain allie, shake out all the Earwicks that are crept into them, which quickly with ones foot may be trode to peeces. For sodain blasting with thunder and lightning, or fierce sharpe windes, &c. I know no other remedy, vnlesse you can couer them therefrom when you first foresee the danger, but patiently to abide the losse, whatsoeuer some haue aduised, to lay litter about them to auoide blasting; for if any shall make tryall thereof, I am in doubt, he shall more endanger his rootes thereby, being the Summer time, when any such feare of blasting is, than any wise saue them from it, or doe them any good. For the Winter preseruatiō of them, some haue aduised to couer them with Bee-hiues, or else with small Willow stickes, prickt crossewise into the ground ouer your flowers, and bowed archwise, and with litter laid thereon, to couer the Gilloflowers quite ouer, after they haue beene sprinkled with sope ashes and lyme mixt together: and this way is commended by some that haue written thereof, to be such an admirable defence vnto them in Winter, that neither Ants, nor Snayles, nor Earwicks shall touch them, because of the sope ashes and lyme, and neyther frosts nor stormes shall hurt them, because of the litter which so well will defend them; and hereby also your Gilloflowers will bee ready to flower, not onely in the Spring very early, but euen all the Winter. But whosoever shall follow these directions, may peraduenture finde them in some part true, as they are there set downe for the Winter time, and while they are kept close and couered; but let them bee assured, that

that all such plants, or the most part of them, will certainly perish and dye before the Summer be at an end: for the sope ashes and lyme will burne vp and spoile any herbe; and againe, it is impossible for any plant that is kept so warme in Winter, to abide cyther the cold or the winde in the Spring following, or any heate of the Sun, but that both of them will scorch them, and carry them quite away. One great hurt vnto them, and to all other herbes that wee preferue in Winter, is to suffer the snow to lye vpon them any time after it is fallen, for that it doth so chill them, that the Sunne afterward, although in Winter, doth scorch them and burne them vp: looke therefore vnto your Gilloflowers in those times, and shake or strike off the snow gently off from them, not suffering it to abide on them any day or night if you can; for assure your selfe, if it doth not abide on them, the better they will be. The frosts likewise is another great annoyance vnto them, to corrupt the rootes, and to cause them to swell, rot, and breake: to preuent which inconuenience, I would aduise you to take the straw or litter of your horse stable, and lay some thereof about euery roote of your Gilloflowers (especially those of the best account) close vnto them vpon the ground, but be as carefull as you can, that none thereof lye vpon the greene leaues, or as little as may be, and by this onely way haue they been better defended from the frosts that spoile them in Winter, then by any other that I haue seen or knowne. The windes in March, and Sunnes shine dayes then, are one of the greatest inconueniences that happeneth vnto them: for they that haue had hundreds of plants, that haue kept faire and greene all the Winter vntill the beginning or middle of March, before the end thereof, haue had scarce one of many, that either hath not vtterly perished, or been so tainted, that quickly after haue not been lost, which hath happened chiefly by the neglect of these cautions before specified, or in not defending them from the bitter sharpe windes and sunne in this moneth of March. You shall therefore for their better preservation, besides the litter laid about the rootes, which I aduise you not to remoue as yet, shelter them somewhat from the windes, with cyther bottomlesse pots, pales, or such like things, to keep away the violent force both of windes and sun for that moneth, and for some time before & after it also: yet so, that they be not couered close aboute, but open to receiue ayre & raine. Some also vse to wind withes of hey or straw about the rootes of their Gilloflowers, and fasten them with stickes thrust into the ground, which serue very well in the stead of the other. Thus haue I shewed you the whole preferuation of these worthy and dainty flowers, with the whole manner of ordering them for their encrease: if any one haue any other better way, I shall be as willing to learne it of them, as I haue beene to giue them or any others the knowledge of that I haue here set downe.

CHAP. IX.

That there is not any art whereby any flower may be made to grow double, that was naturally single, nor of any other sent or colour than it first had by nature; nor that the sowing or planting of herbes one deeper than other, will cause them to be in flower one after another, euery moneth in the year.

THe wonderfull desire that many haue to see faire, double, and sweete flowers, hath transported them beyond both reason and nature, feigning and boasting often of what they would haue, as if they had it. And I thinke, from this desire and boasting hath risen all the false tales and reports, of making flowers double as they list, and of giuing them colour and sent as they please, and to flower likewise at what time they will; I doubt not, but that some of these errors are ancient, and continued long by tradition, and others are of later inuention: and therefore the more to be condemned, that men of wit and iudgement in these dayes should expose themselves in their writings, to be rather laughed at, then beleened for such idle tales. And although in the contradiction of them, I know I shall vndergoe many calumnies, yet notwithstanding, I will endeaouour to set downe and declare so much, as I hope may by reason perswade

perswade many in the truth, although I cannot hope of all, some being so strongly wedded to their owne will, and the errours they haue beene bred in; that no reason may alter them. First therefore I say, that if there were any art to make some flowers to grow double, that naturally were single, by the same art, all sorts of flowers that are single by nature, may be made to grow double: but the sorts of flowers that are single by nature, whereof some are double, were neuer made double by art; for many sorts abide still single, whereof there was neuer seene double: and therefore there is no such art in any mans knowledge to bring it to passe. If any man shall say, that because there are many flowers double, whereof there are single also of the same kinde, as for example, Violets, Marigolds, Daisies, Daffodils, Anemones, and many other, that therefore those double flowers were so made by the art of man: viz. by the obseruation of the change of the Moone, the constellations or coniunctions of Planets, or some other Starres or celestiall bodies. Although I doe confesse and acknowledge, that I thinke some constellations, and peradventure changes of the Moone, &c. were appointed by the God of nature, as conducing and helping to the making of those flowers double, that nature hath so produced; yet I doe deny, that any man hath or shall euer be able to proue, that it was done by any art of man, or that any man can tell the true causes and seasons, what changes of the Moone, or constellations of the Planets, wrought together for the producing of those double flowers, or can imitate nature, or rather the God of nature, to doe the like. If it shall bee demanded, From whence then came these double flowers that we haue, if they were not so made by art? I answer, that assuredly all such flowers did first grow wilde, and were so found double, as they doe now grow in Gardens, but for how long before they were found they became double, no man can tell; we onely haue them as nature hath produced them, and so they remaine. Again, if any shall say, that it is likely that these double flowers were forced so to be, by the often planting and transplanting of them, because it is obserued in most of them, that if they stand long in any one place, and not be often removed, they will grow still lesse double, and in the end turne single. I doe confesse, that *Facilior est descensus quam ascensus*, and that the vnfruitfulness of the ground they are planted in, or the neglect or little care had of them, or the growing of them too thicke or too long, are oftentimes a cause of the diminishing of the flowers doublenesse; but withall you shall obserue, that the same rootes that did beare double flowers (and not any other that neuer were double before) haue returned to their former doublenesse againe, by good ordering and looking vnto: single flowers haue only beene made somewhat fairer or larger, by being planted in the richer and more fruitfull ground of the Garden, than they were found wilde by nature; but neuer made to grow double, as that which is naturally so found of it selfe: For I will shew you mine owne experience in the matter. I haue been as inquisitiue as any man might be, with euery one I knew, that made any such report, or that I thought could say any thing therein, but I neuer could finde any one, that could assuredly resolue me, that he knew certainly any such thing to be done: all that they could say was but report, for the obseruation of the Moone, to remove plants before the change, that is, as some say, the full of the Moone, others the new Moone, whereupon I haue made tryall at many times, and in many sorts of plants, accordingly, and as I thought fit, by planting & transplanting them, but I could neuer see the effect desired, but rather in many of them the losse of my plants. And were there indeed such a certaine art, to make single flowers to grow double, it would haue beene knowne certainly to some that would practise it, and there are so many single flowers, whereof there were neuer any of the kinde seene double, that to produce such of them to be double, would procure both credit and coyne enough to him that should vse it; but *Ultra posse non est esse*: and therefore let no man belecue any such reports, bee they neuer so ancient; for they are but meere tales and fables. Concerning colours and sents, the many rules and directions extant in manie mens writings, to cause flowers to grow yellow, red, greene, or white, that neuer were so naturally, as also to be of the sent of Cinamon, Muske, &c. would almost perswade any, that the matters thus set downe by such persons, and with some shew of probability, were constant and assured proofes thereof: but when they come to the triall, they all vanish away like smoake. I will in a few words shew you the matters and manners of their proceedings to effect this purpose: First (they say) if you shall sleepe
your

your seedes in the lees of red Wine, you shall haue the flowers of those plants to be of a purple colour. If you will haue Lillies or Gilloflowers to be of a Scarlet red colour, you shall put Vermillion or Cynaber betweene the rinde and the small heads growing about the roote: if you will haue them blew, you shall dissolue Azur or Byse between the rinde and the heads: if yellow, Orpiment: if Greene, Vardigrease, and thus of any other colour. Others doe aduise to open the head of the roote, and poure into it any colour dissolued, so that there be no fretting or corroding thing therein for feare of hurting the roote, and looke what colour you put in, iust such or neare vnto it shall the colour of the flower bee. Some againe doe aduise to water the plants you would haue changed, with such coloured liquor as you desire the flower to be of, and they shall grow to be so. Also to make Roses to bee yellow, that you should graft a white Rose (some say a Damaske) vpon a Broome stalke, and the flower will be yellow, supposing because the Broome flower is yellow, therefore the Rose will be yellow. Some affirme the like, if a Rose be grafted on a Barbery bush, because both the blossome and the barke of the Barbery is yellow, &c. In the like manner for sentes, they haue set downe in their writings, that by putting Cloues, Muske, Cinamon, Benzoin, or any other such sweete thing, bruised with Rose water, between the barke and the body of trees, the fruit of them will smell and taste of the same that is put vnto them, and if they bee put vnto the toppe of the rootes, or else bound vnto the head of the roote, they will cause the flowers to smell of that sent the matter put vnto them is of: as also to steep the seeds of Roses, and other plants in the water of such like sweet things, and then to sowe them, and water them morning and euening with such like liquor, vntill they be growne vp; besides a number of such like rules and directions set downe in bookes, so confidently, as if the matters were without all doubt or question: when as without all doubt and question I will assure you, that they are all but meere idle tales & fancies, without all reason or truth, or shadow of reason or truth: For sentes and colours are both such qualities as follow the essence of plants, euen as formes are also; and one may as well make any plant to grow of what forme you will, as to make it of what sent or colour you will; and if any man can forme plants at his will and pleasure, he can doe as much as God himselfe that created them. For the things they would adde vnto the plants to giue them colour, are all corporeall, or of a bodily substance, and whatsoeuer should giue any colour vnto a liuing and growing plant, must be spirituall: for no solide corporeall substance can ioine it selfe with the life and essence of an herbe or tree, and the spirituall part of the colour thereof is not the same with the bodily substance, but is a meere vapour that riseth from the substance, and feedeth the plant, whereby it groweth, so that there is no ground or colour of reason, that a substantiall colour should giue colour to a growing herbe or tree: but for sent (which is a meere vapour) you will say there is more probability. Yet consider also, that what sweete sent soeuer you binde or put vnto the rootes of herbes or trees, must be either buried, or as good as buried in the earth, or barke of the tree, whereby the substance will in a small time corrupt and rot, and before it can ioine it selfe with the life, spirit, and essence of the plant, the sent also will perish with the substance: For no heterogeneous things can bee mixed naturally together, as Iron and Clay, and no other thing but homogeneall, can be nourishment or conuertible into the substance of man or beast: And as the stomach of man or beast altereth both formes, sentes, and colours of all digestible things, so whatsoeuer sent or colour is wholesome, and not poysonfull to nature, being receiued into the body of man or beast, doth neither change the blood or skinne into that colour or sent was receiued: no more doth any colour or sent to any plant; for the plants are onely nourished by the moisture they draw naturally vnto them, be it of wine or any other liquor is put vnto them, and not by any corporeall substance, or heterogeneous vapour or sent, because the earth like vnto the stomach doth soone alter them, before they are conuerted into the nature and substance of the plant. Now for the last part I vndertooke to confute, that no man can by art make all flowers to spring at what time of the yeare hee will, although, as I haue here before shewed, there are flowers for euery moneth of the yeare, yet I hope there is not any one, that hath any knowledge in flowers and gardening, but knoweth that the flowers that appeare and shew themselves in the seuerall moneths of the yeare, are not one and the same, and so made to flower by art, but that they are seuerall sorts of plants, which will

will flower naturally and constantly in the same moneths one yeare, that they vse to doe in another, or with but little alteration, if the yeares proue not alike kindly: As for example, those plants that doe flower in Ianuary and February, will by no art or industry of man be caused to flower in Summer or in Autumne; and those that flower in Aprill and May, will not flower in Ianuary or February; or those in Iuly, August, &c. either in the Winter or Spring: but euery one knoweth their owne appointed naturall times, which they constantly obserue and keepe, according to the temperature of the yeare, or the temper of the climate, being further North or South, to bring them on earlier or later, as it doth with all other fruits, flowers, and growing greene herbes, &c. except that by chance, some one or other extraordinarily may be hindered in their due season of flowing, and so giue their flowers out of time, or else to giue their flowers twice in the yeare, by the superabundance of nourishment, or the mildnesse of the season, by moderate showers of raine, &c. as it sometimes also happeneth with fruits, which chance, as it is seldome, and not constant, so we then terme it but *Lusus naturæ*: or else by forcing them in hot stoues, which then will perish, when they haue giuen their flowers or fruits. It is not then, as some haue written, the sowing of the seedes of Lillies, or any other plants a foote deepe, or halfe a foote deepe, or two inches deepe, that will cause them to be in flower one after another, as they are sowne euery moneth of the yeare; for it were too grosse to thinke, that any man of reason and iudgement would so beleue. Nor is it likewise in the power of any man, to make the same plants to abide a moneth, two, or three, or longer in their beauty of flowing, then naturally they vse to doe; for I thinke that were no humane art, but a supernaturall worke. For nature still bendeth and tendeth to perfection, that is, after flowing to giue fruit or seede; nor can it bee hindered in the course thereof without manifest danger of destruction, euen as it is in all other fruit-bearing creatures, which stay no longer, then their appointed time is naturall vnto them, without apparent damage. Some things I grant may be so ordered in the planting, that according to that order and time which is obserued in their planting, they shall shew forth their faire flowers, and they are Anemones, which will in that manner, that I haue shewed in the worke following, flower in seuerall moneths of the yeare; which thing as it is incident to none or very few other plants, and is found out but of late, so likewise is it knowne but vnto a very few. Thus haue I shewed you the true solution of these doubts: And although they haue not beene amplified with such Philosophicall arguments and reasons, as one of greater learning might haue done, yet are they truely and sincerely set downe, that they may serue *tanquam galeatam*, against all the calumnies and obiections of wilfull and obdurate persons, that will not be reformed. As first, that all double flowers were so found wilde, being the worke of nature alone, and not the art of any man, by planting or transplanting, at or before the new or full Moone, or any other obseruation of time, that hath caused the flower to grow double, that naturally was single: Secondly, that the rules and directions, to cause flowers to bee of contrary or different colours or sents, from that they were or would be naturally, are meere fancies of men, without any ground of reason or truth. And thirdly, that there is no power or art in man, to cause flowers to shew their beauty diuers moneths before their naturall time, nor to abide in their beauty longer then the appointed naturall time for euery one of them.

will be naturally and constantly in the same manner one year, that they also
 do not flourish, or which but in the spring, if the year be planted in the kind: As
 for example, those plants that do flower in January and February, will by no means
 in April and May, will not flower in January or February, or in July, August,
 &c. either in the winter or spring: but every one knows that it is not so pointed out
 in all times, which they constantly observe and keep, according to the temper
 of the year, or the temper of the climate, being in the month of March, to bring
 them on earlier or later, as it doth with all other things, flowers, and growing
 herbs, &c. except that by chance, some one or other, extraordinary may be made
 to in their due season of flowering, and to give them flowers out of time, or others
 give them flowers twice in the year, by the superabundance of nourishment, or the
 mildness of the season, by moderate flowers of rain, &c. as it sometimes happens
 growth with fruit, which chance, as it is a kind of chance, and not constant to us, the
 it but a few years, or else by forcing them in hot houses, which then will grow, when
 they have given their flowers or fruits. It is not then, as some have written, the law
 ing of the seeds of Lillies, or any other plants a look upon, or rather a look upon
 or two inches deeper, than will cause them to be in flower and able to bear, as the
 towns every month of the year, for it were too gross to think, that any man of
 reason and judgment would be so foolish. Now it is likewise in the power of any man
 to make the same plants to be a month, two, or three, or longer in their beauty of
 flowering, then naturally they do, for I think that were no manner of
 labour at all, for nature still bestows and sends in to perfection, that is, after
 flowering to give fruit or seed, nor can it be hindered in the course thereof without
 manifest danger of destruction, such as it is in all other fruit-bearing creatures, which
 say no longer, that their appointed time is natural, and there, without any
 danger. Some things I grant may be ordered in the planting, that according to
 that order and time which is ordered in their planting, they shall bear forth their
 fruit flowers, and they are Agronomers, which will in their manner, that I have showed
 in the work following, how to keep the months of the year, which thing is as
 incident to none or very few other plants, and is found out but of late, to live it is
 known to be a very few. Thus have I showed you the true solution of this
 doubts. And although they have not been amplified with such Philosophical argu-
 ments and reasons, as one of your learned might have done, yet are they truly and
 sincerely set down, that they may serve to instruct, against all the calumnies
 and objections of willful and obstinate persons, that will not be reformed. And
 that all double flowers were so found wild, being the work of nature alone, and not
 the art of any man, by planting or transplanting, as of before the new or full moon,
 or any other operation of time, that hath caused the flower to grow double, that na-
 turally was single: Secondly, that the rules and directions, to cause flowers to be of
 contrary or different colours or scents, from that they were or would be naturally, are
 mere fancies of men, without any ground of reason or truth. And thirdly, that there
 is no power or art in man, to cause flowers to show their beauty divers months before
 their natural time, nor to abide in their beauty longer than the appointed natural
 time for every one of them.

THE GARDEN OF PLEASANT FLOWERS.

CHAP. I.

Corona Imperialis. The Crowne Imperiall.

Because the Lilly is the more stately flower among manie: and amongst the wonderfull varietie of Lillies, knowne to vs in these daies, much more then in former times, whereof some are white, others bluish, some purple, others red or yellow, some spotted, others without spots, some standing vpright, others hanging or turning downewards, The Crowne Imperiall for his stately beautifullness, deserueth the first place in this our Garden of delight, to be here entreated of before all other Lillies: but because it is so well knowne to most persons, being in a manner euery where common, I shall neede onely to giue you a relation of the chiefe parts

thereof (as I intend in such other things) which are these: The roote is yellowish on the outside, composed of fewer, but much thicker scales, then any other Lilly but the Persian, and doth grow sometimes to be as great as a pretty bigge childes head, but somewhat flat withall, from the sides whereof, and not from the bottome, it shooteth forth thicke long fibres, which perish euery yeare, hauing a hole in the midst thereof, at the end of the yeare, when the old stalke is dry and withered, and out of the which a new stalke doth spring againe (from a bud or head to be seen within the hollownesse on the one side) the yeare following: the stalke then filling vp the hollownesse, riseth vp three or foure foote high, being great, round, and of a purplish colour at the bottome, but Greene aboue, beset from thence to the middle thereof with many long and broad Greene leaues, very like to the leaues of our ordinary white Lilly, but somewhat shorter and narrower, confusedly without order, and from the middle is bare or naked without leaues, for a certaine space vpwads, and then beareth foure, sixe, or tenne flowers, more or lesse, according to the age of the plant, and the fertility of the soyle where it groweth: The buddes at the first appearing are whitish, standing vpright among a bush or tuft of Greene leaues, smaller then those below, and standing aboue the flowers, after a while they turne themselves, and hang downewards euery one vpon his owne foote stalke, round about the great stemme or stalke, sometimes of an euen depth, and other while one lower or higher than another, which flowers are neare the forme of an ordinary Lilly, yet somewhat lesser and closer, consisting of sixe leaues of an Orange colour, striped with purplish lines and veines, which adde a great grace to the flowers: At the bottome of the flower next vnto the stalke, euery

leafe thereof hath on the outside a certaine bunch or eminence, of a darke purplish colour, and on the inside there lyeth in those hollow bunched places, certaine cleare drops of water like vnto pearles, of a very sweete taste almost like sugar: in the midst of each flower is a long white stile or pointell, forked or diuided at the end, and fixe white chiues tipt with yellowish pendants, standing close about it: after the flowers are past, appeare fixe square seede vessels standing vpright, winged as it were or welted on the edges, yet seeming but three square, because each couple of those welted edges are ioyned closer together, wherein are contained broad, flat, and thinne feedes, of a pale brownish colour, like vnto other Lillies, but much greater and thicker also. The stalke of this plant doth oftentimes grow flat, two, three, or foure fingers broad, and then beareth many more flowers, but for the most part smaller then when it beareth round stalkes. And sometimes it happeneth the stalke to be diuided at the top, carrying two or three tufts of greene leaues, without any flowers on them. And sometimes likewise, to beare two or three rowes or crownes of flowers one aboue another vpon one stalke, which is seldome and scarce seene, and besides, is but meere accidentall: the whole plant and euery part thereof, as well rootes, as leaues and flowers, doe smell somewhat strong as it were the fauour of a Foxe, so that if any doe but come neare it, he cannot but smell it, which yet is not vnwholsome.

I haue not obserued any variety in the colour of this flower, more then that it will be fairer in a cleare open ayre, and paler, or as it were blasted in a muddy or smoakie ayre. And although some haue boasted of one with white flowers, yet I could neuer heare that any such hath endured in one vniforme colour.

The Place.

This plant was first brought from Constantinople into these Christian Countries, and by the relation of some that sent it, groweth naturally in Persia.

The Time.

It flowreth most commonly in the end of March, if the weather be milde, and springeth not out of the ground vntill the end of February, or beginning of March, so quicke it is in the springing: the heads with seed are ripe in the end of May.

The Names.

It is of some called *Lilium Persicum*, the Persian Lilly: but because wee haue another, which is more vsually called by that name, as shall be shewed in the next Chapter, I had rather with Alphonsus Pancius the Duke of Florence his Physitian, (who first sent the figure thereof vnto M^r. Iohn de Brancion) call it *Corona Imperialis*, The Crowne Imperiall, then by any other name, as also for that this name is now more generally receiued. It hath been sent also by the name *Tusai*, and *Tuschai*, and *Tursani*, or *Tursanda*, being, as it is like, the Turkish names.

The Vertues.

For any Physicall Vertues that are in it, I know of none, nor haue heard that any hath been found out: notwithstanding the strong sent would perswade it might be applied to good purpose.

CHAP. II.

Lilium Persicum. The Persian Lilly.

THe roote of the Persian Lilly is very like vnto the root of the Crowne Imperi-
to all, and losing his fibres in like maner euery yeare, hauing a hole therein likewise
where the old stalke grew, but whiter, rounder, and a little longer, smaller, and
not sinking at all like it, from whence springeth vpa round whitish greene stalke, not
much

1 *Corona Imperialis*. The Crowne Imperiall. 2 *Lilium Persicum*. The Persian Lilly.

3 *Martagon Imperiale*. The Martagon Imperiall.

much lower than the Crowne Imperiall, but much smaller, beset from the bottome to the middle thereof, with many long and narrow leaues, of a whitish or blewish Greene colour, almost like to the leafe of a Tulipa: from the middle vpwards, to the toppe of the stalke, stand many flowers one above another round about it, with leaues at the foote of euery one of them, each whereof is pendulous or hanging downe the head, like vnto the Crowne Imperiall, and not turning vp any of the flowers againe, but smaller than in any other kinde of Lilly, yea not so bigge as the flower of a Fritillaria, consisting of sixe leaues a peece, of a dead or ouerworne purplish colour, hauing in the midst a small long pointell, with certaine chiuës tipt with yellow pendants: after the flowers are past (which abide open a long time, and for the most part flower by degrees, the lowest first, and so vpwards) if the weather be temperate, come sixe square heads or seede vessels, seeming to be but three square, by reason of the wings, very like to the heads of the Crowne Imperiall, but smaller and shorter, wherein are contained such like flat seed, but smaller also, and of a darker colour.

The Place.

This was, as it is thought, first brought from Persia vnto Constantinople, and from thence, sent vnto vs by the meanes of diuers Turkie Merchants, and in especiall, by the procurement of M^r. Nicholas Lete, a worthy Merchant, and a louer of all faire flowers.

The Time.

It springeth out of the ground very neare a moneth before the Crowne Imperiall, but doth not flower till it bee quite past (that is to say) not vntill the latter end of Aprill, or beginning of May: the seed (when it doth come to perfection, as it seldome doth) is not ripe vntill Iuly.

The Names.

It hath been sent by the name of *Pennachio Persiano*, and wee thereupon doe most vsually call it *Lilium Persicum*, The Persian Lilly. Clusius saith it hath been sent into the Low-Countries vnder the name of *Sufam giul*, and he thereupon thinking it came from Sufis in Persia, called it *Lilium Sufianum*, The Lilly of Sufis.

The Vertues.

Wee haue not yet heard, that this hath beene applyed for any Physicall respect.

CHAP. III.

Martagon Imperiale, siue Lilium Montanum maius,
The Martagon Imperiall.

VNder this title of *Lilium Montanum*, or *Lilium Siluestre*, I do comprehend only those kindes of Lillies, which carry diuers circles of Greene leaues set together at certaine distances, round about the stalke, and not sparsedly as the two former, and as other kindes that follow, doe. And although there bee many of this sort, yet because their chiefest difference is in the colour of the flower, wee will containe them all in one Chapter, and begin with the most stately of them all, because of the number of flowers it beareth vpon one stalke. The Imperiall Lilly hath a scaly roote, like vnto all the rest of the Lillies, but of a paler yellow colour, closely compact or set together, being short and small oftentimes, in comparifon of the greatnesse of the stemme

stemme growing from it. The stalke is brownish and round at the bottome, and sometimes flat from the middle vpwards, three foote high or more, beset at certaine distances with rondles or circles of many broad leaues, larger and broader for the most part than any other of this kinde, and of a darke green colour: It hath two or three, and sometimes foure of these rondles or circles of leaues, and bare without any leafe betweene; but aboue toward the tops of the stalkes, it hath here and there some leaues vpon it, but smaller than any of the other leaues: at the toppe of the stalke come forth many flowers, sometime three or foure score, thicke thrust, or confusedly set together, and not thinne or sparsedly one aboue another, as in the lesser of this kinde of Mountaine Lilly. It hath been sometimes also obserued in this kinde, that it hath borne manie flowers at three seuerall spaces of the stalke, one aboue another, which hath made a goodly shew; each flower whereof is pendulous, hanging downe, and each leafe of the flower turning vp againe, being thicke or fleshy, of a fine delayed purple colour, spotted with many blackish or brownish spots, of a very pleasant sweet sent, which maketh it the more acceptable: in the middle of the flower hangeth downe a stile or pointell, knobbed or buttoned at the end with fixe yellow chiuies, tipt with loose pendants of an Orient red or Vermillion colour, which will easily sticke like dust vpon any thing that toucheth them: the heads or seede vessels are small and round, with small edges about them, wherein is contained flat browne seede like other Lillies, but lesser. The root is very apt to encrease or set of, as we call it, wherby the plant seldome cometh to so great a head of flowers, but riseth vp with many stalkes, and then carry fewer flowers.

Of this kinde there is sometimes one found, that beareth flowers without any spots: the leaues whereof and stalke likewise are paler, but not else differing.

*Martagon
Imperiale
flore nou pino
clato.*

Martagon flore albo. The White Martagon.

We haue also some other of this kind, the first wherof hath his stalke & leafe greener than the former, the stalke is a little higher, but not bearing so thicke a head of flowers, although much more plentifull than the lesser Mountaine Lilly, being altogether of a fine white colour, without any spots, or but very few, and that but sometimes also: the pendants in the middle of this flower are not red, as the former, but yellow; the roote of this, and of the other two that follow, are of a pale yellow colour, the cloues or scales of them being brittle, and not closely compact, yet so as if two, and sometimes three scales or cloues grew one vpon the head or vpperpart of another; which difference is a speciall note to know these three kinds, from any other kinde of Mountaine Lilly, as in all old rootes that I haue seene, I haue obserued, as also in them that are reasonably well growne, but in the young rootes it is not yet so manifest.

Martagon flore albo maculato. The White spotted Martagon.

The second is like vnto the first in all things, save in this, that the flowers hereof are not altogether so white, and besides hath many reddish spots on the inside of the leaues of the flower, and the stalke also is not so Greene but brownish.

Martagon flore carneo. The bluish Martagon.

A third sort there is of this kinde, whose flowers are wholly of a delayed flesh colour, with many spots on the flowers, and this is the difference hereof from the former.

Lilium Montanum sine siluestre minus. The lesser Mountaine Lilly.

The lesser Mountaine Lilly is so like in root vnto the greater that is first described, that it is hard to distinguish them asunder; but when this is sprung vp out of the ground, which is a moneth after the first: it also carrieth his leaues in rondles about the stalke, although not altogether so great nor so many. The flowers are more thinly set on the stalkes one aboue another, with more distance betweene each flower than the former, and are of a little deeper flesh colour or purple, spotted in the same manner. The buds

or,

1 *Martagon flore albo*. The white Martagon. 2 *Martagon sine Lilium Canadense maculatum*. The spotted Martagon; or Lilly of Canads. 3 *Martagon Pomponium*. The Martagon Pompony, or early red Martagon.

or

or heads of flowers, in some of these before they be blowne, are hoary white, or hairie, whereas in others, there is no hoarinesse at all, but the buddes are smooth and purplish: in other things this differeth not from the former.

Of this sort also there is one that hath but few spots on the flowers, whose colour is somewhat paler than the other.

Lilium Martagone
montanum
maculatum.

Martagon Canadense maculatum. The spotted Martagon of Canada.

Although this strange Lilly hath not his flowers hanging downe, and turning vp again, as the former kinds set forth in this Chapter, yet because the green leaves stand at severall ioynts as they do, I must needs insert it here, not knowing where more fitly to place it. It hath a small scaly roote, with many small long fibres thereat, from whence riseth vp a reasonable great stalke, almost as high as any of the former, bearing at three or foure distances many long and narrow Greene leaves, but not so many or so broad as the former, with diuers ribbes in them: from among the vppermost rundle of leaves breake forth foure or fise flowers together, euery one standing on a long slender foote stalke, being almost as large as a red Lilly, but a little bending downewards, and of a faire yellow colour, spotted on the inside with diuers blackish purple spots or strakes, hauing a middle pointell, and sixe chiues, with pendants on them.

The Place.

All these Lillies haue been found in the diuers Countries of Germany, as Austria, Hungaria, Pannonia, Stiria, &c. and are all made Denisons in our London Gardens, where they flourish as in their owne naturall places. The last was brought into France from Canada by the French Colonie, and from thence vnto vs.

The Time.

They flower about the later end of Iune for the most part, yet the first springeth out of the ground a moneth at the least before the other, which are most vsually in flower before it, like vnto the Serotine Tulipas, all of them being early vp, and neuer the neere.

The Names.

The first is vsually called *Martagon Imperiale*, the Imperiall Martagon, and is *Lilium Montanum maius*, the greatest Mountaine Lilly, for so it deserueth the name, because of the number of flowers vpon a head or stalke. Some haue called it *Lilium Sarasenicum*, and some *Hemerocallis*, but neither of them doth so fitly agree vnto it.

The second is *Lilium Montanum minus flore albo*, and of some *Martagon Imperiale flore albo*, but most vsually *Martagon flore albo*, the white Martagon. The second sort of this second kinde, is called *Martagon flore albo maculato*, the spotted white Martagon. And the third, *Martagon flore carneo*, the bluish Martagon.

The third kinde is called *Lilium Montanum*; the Mountaine Lilly, and some adde the title *minus*, the lesser, to know it more distinctly from the other. Some also *Lilium Siluestre*, as Clusius, and some others, and of Matthioli *Martagon*. Of diuers women here in England, from the Dutch name, Lilly of Nazareth. The last hath his title *Americanum & Canadense*, and in English accordingly.

CHAP. IV.

1. *Martagon Pomponium* siue *Lilium rubrum præcox*, vel *Lilium Macedonicum*.
The early red Martagon, or Martagon Pompony.

1. *Martagon*
Pomponium
angustifolium
præcox.

AS in the former Chapter we described vnto you such Lillies, whose flowers being pendulous, turne their leaues backe againe, and haue their Greene leaues, set by spaces about the stalke: so in this wee will set downe those sorts, which carry their Greene leaues more sparsedly, and all along the stalke, their flowers hanging downe, and turning vp againe as the former, and begin with that which is of greatest beauty, or at least of most rarity.

1. This rate Martagon hath a scaly root closely compact, with broader and thinner scales than others, in time growing very great, and of a more deepe yellow colour then the former, from whence doth spring vp a round Greene stalke in some plants, and flat in others, two or three foote high, bearing a number of small, long, and narrow Greene leaues, very like vnto the leaues of Pinkes, but greener, set very thicke together, and without order about the stalke, vp almost vnto the toppe, and lesser by degrees vpwards, where stand many flowers, according to the age of the plant, and thriving in the place where it groweth; in those that are young, but a few, and more sparsedly, and in others that are old many more, and thicker set: for I haue reckoned threescore flowers and more, growing thicke together on one plant with mee, and an hundred flowers on another: these flowers are of a pale or yellowish red colour, and not so deep red as the red Martagon of Constantinople, hereafter set down, nor fully so large: yet of the same fashion, that is, euery flower hanging downe, and turning vp his leaues againe. It is not so plentiful in bearing of seede as the other Lillies, but when it doth, it differeth not but in being lesse.

2. *Martagon*
angustifolium
magis serotinum.

There is another, whose Greene leaues are not so thicke set on the stalke, but else differeth not but in flowering a fortnight later.

3. *Martagon*
Pomponium
latifolium præcox.

There is another also of this kind, so like vnto the former in root, stalk, flower, & manner of growing, that the difference is hardly discerned; but consisteth chiefly in these two points: First, that the leaues of this are a little broader and shorter then the former, and secondly, that it beareth his flowers a fortnight earlier than the first. In the colour or forme of the flower, there can no difference bee discerned, nor (as I said) in any other thing. All these Lillies doe spring very late out of the ground, euen as the yellow Martagons doe, but are sooner in flower then any others.

4. *Martagon*
florum planiusculis.

A fourth kinde hereof hath of late been knowne to vs, whose leaues are broader and shorter then the last, and the flowers of a paler red, tending to yellow, of some called a golden red colour: but flowereth not so early as they.

2. *Lilium rubrum Byzantinum*, siue *Martagon Constantinopolitanum*.

The red Martagon of Constantinople.

1. The red Martagon of Constantinople is become so common euery where, and so well knowne to all louers of these delights, that I shall seeme vnto them to lose time, to bestow many lines vpon it; yet because it is so faire a flower, and was at the first so highly esteemed, it deserveth his place and commendations; howsoeuer encreasing the plenty hath not made it dainty. It riseth out of the ground early in the spring, before many other Lillies; from a great thicke yellow scaly root, bearing a round brownish stalke, beset with many faire Greene leaues confusedly thereon, but not so broad as the common white Lilly, vpon the toppe whereof stand one, two, or three, or more flowers, vpon long foote stalkes, which hang downe their heads, and turne vp their leaues againe, of an excellent red crimson colour, and sometimes paler, hauing a long pointell in the middle, compassed with fixe whitish chiues, tipt with loose yellow pendants, of a reasonable good sent, but somewhat faint. It likewise beareth seede in heads, like vnto the other, but greater.

2. *Martagon*

Martagon Constantinopolitanum maculatum.
The red spotted Martagon of Constantinople.

We haue another of this kinde, that groweth somewhat greater and higher, with a larger flower, and of a deeper colour, spotted with diuers blacke spots, or strakes and lines, as is to be seene in the Mountaine Lillies, and in some other hereafter to be described; but is not so in the former of this kinde, which hath no shew of spots at all. The whole plant as it is rare, so it is of much more beauty then the former.

2. Martagon Pannonicum, siue Exoticum flore spadiceo.
The bright red Martagon of Hungarie.

Although this Martagon or Lilly bee of another Countrey, yet by reason of the neerenesse both in leafe and flower vnto the former, may more fitly be placed next vnto them, then in any other place. It hath his roote very like the other, but the leaues are somewhat larger, and more sparsedly set vpon the stalke, else not much vnlike: the flowers bend downe, and turne vp their leaues againe, but somewhat larger, and of a bright red, tending to an Orenge colour, that is, somewhat yellowish, and not crimson, like the other.

3. Martagon Luteum punctatum. The Yellow spotted Martagon.

1. This Yellow Martagon hath a great scaly or cloued roote, and yellow, like vnto all these sorts of turning Lillies, from whence springeth vp a round greene strong stalke, three foote high at the least, confusedly set with narrow long greene leaues, white on the edges vp to the very toppe thereof almost, hauing diuers flowers on the head, turning vp againe as the former doe, of a faint yellowish, or greenish yellow colour, with many blacke spots or strakes about the middle of the leafe of euery flower, and a forked pointell, with sixe chiues about it, tipped with reddish pendants, of a heauie strong smell, not very pleasant to many. It beareth seede very plentifully, in great heads, like vnto the other former Lillies, but a little paler.

2. Martagon Luteum non maculatum. The Yellow Martagon without spots.

The other yellow Martagon differeth in no other thing from the former, but onely that it hath no spots at all vpon any of the leaues of the flowers, agreeing with the former, in colour, forme, height, and all things else.

3. Martagon Luteum serotinum. The late flowering Yellow Martagon.

There is yet another yellow Martagon, that hath no other difference then the time of his flowering, which is not vntill Iuly, vnlesse in this, that the flower is of a deeper yellow colour.

The Place.

The knowledge of the first kindes of these early Martagons hath come from Italy, from whence they haue bin sent into the Low-Countries, and to vs, and, as it seemeth by the name, whereby they haue bin sent by some into these parts, his originall should be from the mountaines in Macedonia.

The second sort is sufficiently knowne by his name, being first brought from Constantinople, his naturall place being not farre from thence, as it is likely. But the next sort of this second kinde, doth plainly tell vs his place of birth to be the mountaines of Pannonia or Hungarie.

The third kindes grow on the Pyrenean mountaines, where they haue been searched out, and found by diuers louers of plants, as also in the Kingdome of Naples.

The Time.

The first early Martagons flower in the end of May, or beginning of June, and that is a moneth at the least before those that come from Constantinople, which is the second kinde. The two first yellow Martagons flower somewhat more early, then the early red Martagons, and sometimes at the same time with them. But the third yellow Martagon, as is said, flowreth a moneth later or more, and is in flower when the red Martagon of Constantinople flowreth. And although the early red and yellow Martagons, spring later then the other Martagons or Lillies, yet they are in flower before them.

The Names.

The first early red Lillies or Martagons haue beene sent vnto vs by seuerall names, as *Martagon Pomponcum*, and thereafter are called Martagon of Pompony, and also *Lilium* or *Martagon Macedonicum*, the Lilly or Martagon of Macedonia. They are also called by Clusius *Lilium rubrum pracox*, the one *angustiore folio*, the other *latiore folio*. And the last of this kinde hath the title *flore phaniceo* added or giuen vnto it, that is, the Martagon or Lilly of Macedonia with gold red flowers.

The Martagons of Constantinople haue beene sent by the Turkish name *Zufniare*, and is called *Martagon*, or *Lilium Byzantinum* by some, and *Hemerocallis Chalcedonica* by others, but by the name of the Martagon of Constantinople they are most commonly receiued with vs, with the distinction of *maculatum* to the one, to distinguish the sorts. The last kinde in this *classis*, hath his name in his title, as it hath been sent vnto vs.

The Yellow Martagons are distinguished in their seuerall titles, as much as is conuenient for them.

CHAP. V.

Lilium Aureum & Lilium Rubrum. The Gold and Red Lillies.

There are yet some other kindes of red Lillies to bee described, which differ from all the former, and remaine to be spoken of in this place. Some of them grow high, and some lowe, some haue small knots, which wee call bulbes, growing vpon the stalkes, at the ioynts of the leaues or flowers, and some haue none: all which shall be intreated of in their seuerall orders.

Lilium pumilum cruentum. The dwarfe red Lilly.

The dwarfered Lilly hath a scaly roote, somewhat like vnto other Lillies, but white, and not yellow at all, and the cloues or scales thicker, shorter, and fewer in number, then in most of the former: the stalke hereof is not aboue a foote and a halfe high, round and Greene, set confusedly with many faire and short Greene leaues, on the toppe of which doe stand sometimes but a few flowers, and sometimes many, of a faire purplish red colour, and a little paler in the middle, euery flower standing vpright, and not hanging downe, as in the former, on the leaues whereof here and there are some blacke spots, lines or markes, and in the middle of the flower a long pointell, with some chiues about it, as is in the rest of these Lillies.

This kinde is sometimes found to yeeld double flowers, as if all the single flowers should grow into one, and so make it consist of many leaues, which notwithstanding

1 *Martagon rubrum sine luteum*. The red or the yellow Martagon. 2 *Lilium Bulbosum*. The red bulb-lilly. 3 *Lilium aureum*. The gold red Lilly. 4 *Lilium album*. The white Lilly.

his so continuing sundry yeares, vpon transplanting, will *redire ad ingenium*, that is, quickly come againe to his old byas or forme.

Lilium Aureum. The Gold red Lilly.

The second red Lilly without bulbes groweth much higher then the first, and almost as high as any other Lilly: the roote hereof is white and scaly, the leaues are somewhat longer, and of a darke or sad greene colour; the flowers are many and large, standing vpright as all these sorts of red Lillies doe, of a paler red colour tending to an Orenge on the inside, with many blacke spots, and lines on them, as in the former, and more yellow on the outside: the seede vessels are like vnto the roundish heads of other Lillies, and so are the seedes in them likewise.

1. *Lilium minus bulbiferum*. The dwarfe bulbed Lilly.

The first of the Lillies that carrieth bulbes on the stalke, hath a white scaly roote like the former; from whence riseth vp a small round stalke, not much higher then the first dwarfe Lilly, seeming to be edged, hauing many leaues thereon of a sad green colour set about it, close thrust together: the greene heads for flowers, will haue a kind of woolliness on them, before the flowers begin to open, and betweene these heads of flowers, as also vnder them, and among the vppermost leaues, appeare small bulbes or heads, which being ripe if they be put into the ground, or if they fall of themselves, will shoote forth leaues, and beare flowers within two or three yeares like the mother plant, and so will the bulbes of the other hereafter described: the flowers of this Lilly are of a faire gold yellow colour, shadowed ouer with a shew of purple, but not so red as the first, or the next to bee described. This Lilly will shoote strings vnder ground, like as the last red Lilly will doe also, whereat will grow white bulbed roots, like the rootes of the mother plant, thereby quickly encreasing it selfe.

2. *Lilium Cruentum bulbiferum*. The Fierie red bulbed Lilly.

The second bulbed Lilly riseth vp with his stalke as high as any of these Lillies, carrying many long and narrow darke greene leaues about it, and at the toppe many faire red flowers, as large or larger then any of the former, and of a deeper red colour, with spots on them likewise, hauing greater bulbes growing about the toppe of the stalke and among the flowers, then any else.

Lilium Cruentum flore pleno. The Fierie red double Lilly.

The difference of this doth chiefly consist in the flower, which is composed of manie leaues, as if many flowers went to make one, spotted with black spots, and without any bulbes when it thus beareth, which is but accidentall, as the former double Lilly is said to be.

3. *Lilium maius bulbiferum*. The greater bulbed red Lilly.

The third red Lilly with bulbes, riseth vp almost as high as the last, and is the most common kinde we haue bearing bulbes. It hath many leaues about the stalke, but not of so sad a greene colour as the former: the flowers are of as pale a reddish yellow colour as any of the former, and comming neereft vnto the colour of the Gold red Lilly. This is more plentifull in bulbes, and in shooting strings, to encrease rootes vnder ground, then the others.

The Place.

These Lillies doe all grow in Gardens, but their naturall places of growing is the Mountaines and the Vallies neere them in Italy, as Matthiolus saith:

faith: and in many Countries of Germany, as Hungarie, Austria, Stiria, and Bohemia, as Clusius and other doe report.

The Time.

They flower for the most part in Iune, yet the first of these is the earliest of all the rest.

The Names.

All these Lillies are called *Lilia Rubra*, Red Lillies: Some call them *Lilium Aureum*, *Lilium Purpureum*, *Lilium Puniceum*, & *Lilium Cruentum*. Some also call them *Martagon Chimistarum*. Clusius calleth these bulbed Lillies *Martagon Bulbiferum*. It is thought to be *Hyacinthus Poetarum*, but I referre the discussing thereof to a fitter time. Wee haue, to distinguish them most fitly (as I take it) giuen their proper names in their seuerall titles.

CHAP. VI.

Lilium Album. The White Lilly.

NOW remaineth onely the White Lilly, of all the whole family or stocke of the Lillies, to bee spoken of, which is of two sorts. The one is our common or vulgar White Lilly; and the other, that which was brought from Constantinople.

Lilium Album vulgare. The ordinary White Lilly.

The ordinary White Lilly scarce needeth any description, it is so well knowne, and so frequent in euery Garden; but to say somewhat thereof, as I vse to doe of euery thing, be it neuer so common and knowne; it hath a cloued or scaly roote, yellower and bigger then any of the red Lillies: the stalke is of a blackish Greene colour, and riseth as high as most of the Lillies, hauing many faire, broad, and long Greene leaues thereon, larger and longer beneath, and smaller vpon the stalke vpwards; the flowers are many or few, according to the age of the plant, fertility of the soile, and time of standing where it groweth: and stand vpon long Greene footstalkes, of a faire white colour, with a long pointell in the middle, and white chiuets tip with yellow pendants about it; the smell is somewhat heady and strong.

Lilium Album Byzantium. The White Lilly of Constantinople.

The other White Lilly, differeth but little from the former White Lilly, either in roote, leafe, or flower, but only that this vsually groweth with more number of flowers, then euer we saw in our ordinary White Lilly: for I haue scene the stalke of this Lilly turne flat, of the breadth of an hand, bearing neere two hundred flowers vpon a head, yet most commonly it beareth not aboue a dozen, or twenty flowers, but smaller then the ordinary, as the Greene leaues are likewise.

The Place.

The first groweth onely in Gardens, and hath not bene declared where it is found wilde, by any that I can heare of. The other hath bene sent from Constantinople, among other rootes, and therefore is likely to grow in some parts neere thereunto.

The Time.

They flower in Iune or thereabouts, but shoote forth Greene leaues in

Autumne, which abide greene all the Winter, the stalke springing vp betwene the lower leaues in the Spring.

The Names.

It is called *Lilium Album*, the White Lilly, by most Writers; but by Poets *Rosa lunonis*, Iuno's Rose. The other hath his name in his title.

The Vertues.

This Lilly aboue all the rest, yea, and I thinke this onely, and none of the rest is vsed in medicines now adayes, although in former times Empiricks vsed the red; and therefore I haue spoken nothing of them in the end of their Chapters, reseruing what is to be said in this. This hath a mollifying, digesting, and cleansing quality, helping to suppurate tumours, and to digest them, for which purpose the roote is much vsed. The water of the flowers distilled, is of excellent vertue for women in trauell of childe bearing, to procure an easie deliuey, as Matthiolus and Camerarius report. It is vsed also of diuers women outwardly, for their faces to cleanse the skin, and make it white and fresh. Diuers other properties there are in these Lillies, which my purpose is not to declare in this place. Nor is it the scope of this worke, this that hath been said is sufficient: for were it not, that I would giue you some taste of the qualities of plants (as I said in my Preface) as I goe along with them, a generall worke were fitter to declare them then this.

CHAP. VII.

Fritillaria. The checkerd Daffodill.

Although diuers learned men do by the name giuen vnto this delightfull plant, thinke it doth in some things partake with a Tulipa or Daffodill, and haue therefore placed it betwene them; yet I, finding it most like vnto a little Lilly, both in roote, stalke, leafe, flower, and seede, haue (as you see here) placed it next vnto the Lillies, and before them. Hereof there are many sorts found out of late, as white, red, blacke, and yellow, besides the purple, which was first knowne; and of each of them there are also diuers sorts: and first of that which is most frequent, and then of the rest, euery one in his place and order.

Fritillaria vulgaris. The common checkerd Daffodill.

The ordinary checkerd Daffodill (as it is vsually called, but might more properly be called the small checkerd Lilly) hath a small round white roe, and somewhat flat, made as it were of two cloues, and diuided in a maner into two parts, yet ioyning together at the bottome or seate of the roote, which holdeth them both together: from betwene this cleft or diuision, the budde for the stalke &c. appeareth, which in time riseth vp a foote, or a foote and a halfe high, being round and of a brownish Greene colour, especially nere vnto the ground, whereon there standeth disperfedly foure or fve narrow long and Greene leaues, being a little hollow: at the toppe of the stalke, betwene the vpper leaues (which are smaller then the lowest) the flower sheweth it selfe, hanging or turning downe the head, but not turning vp againe any of his leaues, as some of the Lillies before described doe, (sometimes this stalke beareth two flowers, and very seldome three) consisting of fixe leaues, of a reddish purple colour, spotted diuersly with great spots, appearing like vnto square checkers, of a deeper colour; the inside of the flower is of a brighter colour then the outside, which hath some greenesse at the bottome of euery leafe: within the flower there appeare

1. *Fritillaria vulgaris*, The common Fritillaria. 2. *Fritillaria flore atrovirente*, The dark red Fritillaria. 4. *Fritillaria alba*, The white Fritillaria. 7. *Fritillaria lutea punctata*, The yellow & checkered Fritillaria. 8. *Fritillaria lutea Italica*, The great yellow Italian Fritillaria. 10. *Fritillaria lutea Lusitanica*, The small yellow Fritillaria of Portugal. 11. *Fritillaria Pyrenaica*, The black Fritillaria. 12. *Fritillaria umbellifera*, The Spanish black Fritillaria.

sixe chiues tipt with yellow pendants, and a three-forked stile or pointell compassing a Greene head, which when the flower is past, riseth vpright againe, and becommeth the seede vessell, being somewhat long and round, yet hauing a small shew of edges, flat at the head, like the head of a Lilly, and without any crowne as the Tulipa hath, wherein is contained pale coloured flat seede, like vnto a Lilly, but smaller.

*Fritillaria vult-
garis pallidior,
præcox, & se-
ssima.*

There is some variety to be seene in this flower; for in some the colour is paler, and in others againe of a very high or deepe colour: sometimes also they haue eight leaues, and sometimes ten or twelue, as if two flowers were made one, which some thereupon haue called a Double Fritillaria. Some of them likewise doe flower very early, euen with or before the early flowring Tulipas; and some againe flower not vntill a moneth or more after the former.

2. *Fritillaria flore atrorubente.* The blood red Fritillaria.

The roote of this Fritillaria is somewhat rounder and closer then the former, from whence the stalke riseth vp, being shorter and lower then in any other of these kindes, hauing one or two leaues thereon, and at the top thereof two or three more set closer together, which are broader, shorter, and whiter then any of them before, almost like vnto the leaues of the yellow Fritillaria, from among which toppe leaues commeth forth the flower, somewhat bending downe, or rather standing forth, being larger then any of the former, and almost equall in bignesse vnto the yellow Fritillaria, of a duskie gray colour all ouer on the outside, and of a very darke red colour on the inside, diuersly spotted or straked: this very hardly encreaseth by the roote, and as seldome giueth ripe seede, but flowreth with the other first sorts, and before the blacke, and abideth lesse time in flower then any.

3. *Fritillaria maxima purpurea suæuolens.* The great purple or red Fritillaria.

This great Fritillaria hath his roote equall to the bignesse of the rest of his parts, from whence riseth vp one, & oftentimes two stalks, hauing one, two or three flowers a peece on them, as nature and the seasons are fitting: euery one of these flowers are larger and greater then any of the former described, and pendulous as they are, of a sad red or purplish colour, with many thwart lines on them, and small long markes, which hardly seeme checkerwise, nor are so eminent or conspicuous as in the former: the stalke is strong and high, whereon are set diuers long whitish Greene leaues, larger and broader then those of the former.

4. *Fritillaria alba.* The white Fritillaria.

The white Fritillaria is so like vnto the first, that I shall not neede to make another description of this: it shall (I hope) be sufficient to shew the chiefe differences, and so proceed to the rest. The stalke and leanes of this are wholly Greene, whereby it may easily be knowne from the former, which, as is said, is brownish at the bottome. The flower is white, without almost any shew of spot or marke in it, yet in some the markes are somewhat more plainly to be seene, and in some againe there is a shew of a faint kinde of bluish colour to be seene in the flower, especially in the inside, the bottomes of the leaues of euery flower sometimes are greenish, hauing also a small list of Greene, comming downe towards the middle of each leafe: the head or seede vessell, as also the seede and the roote, are so like vnto the former, that the most cunning cannot distinguish them.

5. *Fritillaria flore duplici albicante.* The double bluish Fritillaria.

This Fritillaria hath a round flattish white roote, very like vnto the last Fritillaria, bearing a stalke with long Greene leaues thereon, little differing from it, or the first ordinary Fritillaria: the flower is said to be constant, composed of many leaues, being ten at the least, and most vsually twelue, of a pale whitish purple colour, spotted like vnto the paler ordinary Fritillaria that is early, so that one would verily thinke it were but

but an accidentall kinde thereof, whereas it is (as is said before) held to bee constant, continuing in this manner.

6. *Fritillaria flore luteo puro.* The pure yellow Fritillaria.

The pure yellow Fritillaria hath a more round, and not so flat a whitish roote as the former kindes, and of a meane bignesse; from the middle riseth vp a stalke a foote and a halfe high, and sometimes higher, whereon are set without order diuers long and somewhat broad leaues of a whitish Greene colour, like vnto the leaues of the blacke Fritillaria, but not aboue halfe so broad: the flower is somewhat small and long, not much vnlike to the blacke for shape and fashion, but that the leaues are smaller and rounder pointed, of a faint yellowish colour, without any shew of spots or checkers at all, eyther within or without the flower, hauing some chiues and yellow pendants in the middle, as is to be seene in all of them: the seede is like the first kinde.

7. *Fritillaria flore luteo vario sine punctato.* The checkerd yellow Fritillaria.

This Fritillaria groweth not much lower then the former, and brownish at the rising vp, hauing his leaues whiter, broader, and shorter then it, and almost round pointed. The flower is greater, and larger spread then any other before, of a faire pale yellow colour, spotted in very good order, with fine small checkers, which adde a wonderfull pleasing beauty thereunto: it hath also some lists of Greene running downe the backe of euery leafe. It seldome giueth seede; the roote also is like the other, but not so flat.

8. *Fritillaria lutea maxima Italica.* The great yellow Italian Fritillaria.

This kinde of Fritillaria riseth vp with a round and browne Greene stalke, whereon are set diuers leaues somewhat broad and short, which compasse the stalke at the bottome of them, of a darke Greene colour; at the toppe of the stalke, which bendeth a little downwards, doe most vsually stand three or foure leaues, betweene which cometh forth most vsually but one flower, which is longer then the last, hanging downe the head as all the others doe, consisting of fixe leaues, of a darke yellowish purple colour, spotted with some small red checkers. This kinde flowreth late, and not vntill all the rest are past.

9. *Fritillaria Italorum polyanthos flore paruo.* The small Italian Fritillaria.

This small Italian Fritillaria carrieth more store of flowers on the stalke, but they are much smaller, and of a yellowish Greene colour, spotted with long and small darke red checkers or markes: the stalke hath diuers small short Greene leaues thereon, vnto the very toppe.

10. *Fritillaria lutea luncifolia Lusitanica.* The small yellow Fritillaria of Portugall.

The leaues of this Fritillaria are so small, narrow and long, that it hath caused them to take the name of rushes, as if you should call it, The rush leaved Fritillaria, which stand on a long weake round stalke, set without order: the flower is small and yellow, but thicker checkerd with red spots then any of the other yellow Fritillaria's; the stalk of the flower, at the head thereof, being also of a yellowish colour.

11. *Fritillaria Pyrenaea sine Apenninea.* The blacke Fritillaria.

The roote of this kinde doth often grow so great, that it seemeth like vnto the roote of a small Crowne Imperiall: the stalke is strong, round, and high, set without order, with broader and whiter Greene leaues then any of the former, bearing one, two, or three flowers; sometimes at the toppe, being not so large as those of the ordinary purple Fritillaria, but smaller, longer, and rounder, sometimes a little turning vp the brims or edges of the leaues againe, and are of a yellowish shining Greene colour on
the

the inside, sometimes spotted with red spots almost through the whole inside of the flower, vnto the very edge, which abideth of a pale yellow colour, and sometimes there are very few spots to be seene, and those from the middle onely on the inside (for on the outside there neuer appeareth any spots at all in this kinde) and sometimes with no shew of spots at all, sometimes also of a more pale Greene, and sometime of a more yellow colour: the outside of the flowers doe likewise vary, for in some the outside of the leaues are of a darke sullen yellow, &c. else more pale yellow, and in other of a darke purplish yellow colour, which in some is so deepe, and so much, that it rather seemeth blacke then purple or yellow, and this especially about the bottome of the flower, next vnto the stalke, but the edges are still of a yellowish Greene: the head of seede, and the seede likewise is like vnto the former, but bigger in all respects.

12. *Fritillaria Hispanica umbellifera*. The Spanish blacke Fritillaria.

This Fritillaria is no doubt of kindred to the last recited, it is so like, but greater in all parts thereof, as if growing in a more fruitfull soile, it were the stronger and lustier to beare more store of flowers: the flowers grow foure or fise from the head together, hanging downe round about the stalke, like vnto a Crowne Imperiall, and are of a yellowish Greene colour on the inside, spotted with a few red spots, the outside being blackish as the former.

The Place.

The first of these plants was first brought to our knowledge from France, where it groweth plentifully about Orleance; the other sorts grow in diuers other Countries, as some in Portugall, Spaine, Italy, &c. as their names doe import, and as in time they haue been obserued by those that were curious searchers of these rarities, haue been sent to vs.

The Time.

The early kinds doe flower in the beginning of Aprill or thereabouts, according to the mildnesse or sharpenesse of the precedent Winter. The other doe flower after the first are past, for a moneths space one after another, and the great yellow is very late, not flowring vntill about the middle or end of May.

The Names.

This hath receiued diuers names: some calling it *Flos Meleagridis*, the Ginny Hen Elower, of the variety of the colours in the flower, agreeing with the feathers of that Bird. Some call it *Narcissus Caparonius*, of the name of the first inuentor or finder thereof, called Noel Caperon, an Apothecary dwelling in Orleance, at the time he first found it, and was shortly after the finding thereof taken away in the Massacre in France. It is now generally called *Fritillaria*, of the word *Fritillus*, which diuers doe take for the Chesse borde or table whereon they play, whereunto, by reason of the resemblance of the great squares or spots so like it, they did presently referre it. It is called by Lobel *Lilionarcissus purpureus variegatus, & tessellatus*, making it a kinde of Tulipa; but as I said in the beginning of the Chapter, it doth most neerely resemble a small pendulous Lilly, and might therefore rightly hold the name of *Lilium variegatum*, or in English, the checkerd Lilly. But because the errour which first referred it to a Daffodill, is growne strong by custome of continuance, I leaue to euery one their owne will, to call it in English eyther Fritillaria, as it is called of most, or the checkerd Daffodill, or the Ginnie Hen flower, or, as I doe, the checkerd Lilly. I shall not neede in this place further to explaine the seuerall names of euery of them, hauing given you them in their titles.

The

The Vertues.

I haue not found or heard by any others of any property peculiar in this plant, to be applied either inwardly or outwardly for any disease: the chiefe or onely vse thereof is, to be an ornament for the Gardens of the curious louers of these delights, and to be worne of them abroad, which for the gallant beauty of many of them, deserueth their courteous entertainment, among many other the like pleasures.

CHAP. VIII.

Tulipa. The Turkes Cap.

NExt vnto the Lillies, and before the Narcissi or Daffodils, the discourse of Tulipas deserueth his place, for that it partaketh of both their natures; agreeing with the Lillies in leaues, flowers, and seede, and somewhat with the Daffodils in rootes. There are not onely diuers kindes of Tulipas, but fundry diuersities of colours in them, found out in these later dayes by many the searchers of natures varieties, which haue not formerly been obserued: our age being more delighted in the search, curiosity, and rarities of these pleasant delights, then any age I thinke before. But indeede, this flower, aboue many other, deserueth his true commendations and acceptance with all louers of these beauties, both for the stately aspect, and for the admirable varietie of colours, that daily doe arise in them, farre beyond all other plants that grow, in so much, that I doubt, although I shall in this Chapter set downe the varieties of a great many, I shall leaue more vnspoken of, then I shall describe; for I may well say, there is in this one plant no end of diuersity to be expected, euery yeare yeelding a mixture and variety that hath not before been obserued, and all this arising from the sowing of the seede. The chiefe diuision of Tulipas, is into two sorts: *Præcoces*, early flowring Tulipas, and *Serotina*, late flowring Tulipas. For that sort which is called *Media* or *Dubia*, that is, which flower in the middle time betweene them both, and may be thought to be a kinde or sort by it selfe, as well as any of the other two: yet because they doe neerer participate with the *Serotina* then with the *Præcoces*, not onely in the colour of the leafe, being of the same greenesse with the *Serotina*, and most vsually also, for that it beareth his stalke and flower, high and large like as the *Serotina* doe; but especially, for that the seede of a *Media Tulipa* did neuer bring forth a *Præcox* flower (although I know Clusius, an industrious, learned, and painfull searcher and publisher of these rarities, saith otherwise) so farre as euer I could, by mine owne care or knowledge, in sowing their seede apart, or the assurance of any others, the louers and sowers of Tulipa seede, obserue, learne, or know: and because also that the seede of the *Serotina* bringeth forth *Medias*, and the seede of *Medias Serotina*, they may well bee comprehended vnder the generall title of *Serotina*: But because they haue generally receiued the name of *Media*, or middle flowring Tulipas, to distinguish betweene them, and those that vsually doe flower after them, I am content to set them downe, and speake of them seuerally, as of three sorts. Vnto the place and ranke likewise of the *Præcoces*, or early flowring Tulipas, there are some other kinde of Tulipas to be added, which are notably differing, not onely from the former *Præcox Tulipa*, but euery one of them, one from another, in some speciall note or other: as the *Tulipa Boloniensis flore rubro*, the red Bolonia Tulipa. *Tulipa Boloniensis flore lacteo*, the yellow Bolonia Tulipa. *Tulipa Persica*, the Persian Tulipa. *Tulipa Cretica*, the Candie Tulipa, and others: all which shall bee described and entreated of, euery one apart by it selfe, in the end of the ranke of the *Præcoces*, because all of them flower much about their time. To begin then with the *Præcox*, or early flowring Tulipas, and after them with the *Medias* and *Serotines*, I shall for the better method, diuide their flowers into foure primary or principall colours, that is to say, White, Purple, Red, and Yellow, and vnder euery one of these colours, set downe the seuerall varieties

ties of mixtures we haue seene and obserued in them, that so they may be both the better described by me, and the better conceiued by others, and euery one placed in their proper ranke. Yet I shall in this, as I intend to doe in diuers other plants that are variable, giue but one description in generall of the plant, and then set downe the variety of forme or colour afterwards briefly by themselves.

Tulipa praeox. The early flowering Tulipa.

The early Tulipa (and so all other Tulipas) springeth out of the ground with his leaues folded one within another, the first or lowest leaf riseth vp first, sharpe pointed, and folded round together, vntill it be an inch or two aboue the ground, which then openeth it selfe, shewing another leaf folded also in the bosome or belly of the first, which in time likewise opening it selfe, sheweth forth a third, and sometimes a fourth and a fifth: the lower leaues are larger then the vpper, and are faire, thicke, broad, long, and hollow like a gutter, and sometimes crumpled on the edges, which will hold water that falleth thereon a long time, of a pale or whitish Greene colour, (and the *Media* and *Serotina* more Greene) couered ouer as it were with a meallinesse or hoarinesse, with an eye or shew of rednesse towards the bottome of the leaues, and the edges in this kinde being more notable white, which are two principall notes to know a *Praeox Tulipa* from a *Media* or *Serotina*: the stalke with the flower riseth vp in the middle, as it were through these leaues, which in time stand one aboue another, compassing it at certaine ynequall distances, and is often obserued to bend it selfe crookedly downe to the ground, as if it would thrust his head thereinto, but turning vp his head (which will be the flower) againe, afterwards standeth vp right, sometimes but three or foure fingers or inches high, but more often halfe a foote, and a foot high, but the *Medias*, and *Serotinas* much higher, carrying (for the most part) but one flower on the toppe thereof, like vnto a Lilly for the forme, consisting of fixe leaues, Greene at the first, and afterwards changing into diuers and sundry seuerall colours and varieties, the bottomes likewise of the leaues of these sometimes, but most especially of the *Media*, being as variable as the flower, which are in some yellow, or green, or blacke, in others white, blew, purple, or tawne; and sometimes one colour circling another: some of them haue little or no sent at all, and some haue a better then others. After it hath been blowne open three or foure dayes or more, it will in the heate of the Sunne spread it selfe open, and lay it selfe almost flat to the stalke: in the middle of the flower standeth a Greene long head (which will be the seed vessell) compassed about with fixe chimes, which doe much vary, in being sometimes of one, and sometimes of another colour, tipped with pendants diuersly varied likewise: the head in the middle of the flower groweth after the flower is fallen, to be long, round, and edged, as it were three square, the edges meeting at the toppe, where it is smallest, and making as it were a crowne (which is not seen in the head of any Lilly) and when it is ripe, diuideth it selfe on the inside into fixe rowes, of flat, thinne, brownish, gristly seede, very like vnto the seede of the Lillies, but brighter, stiffer, and more transparent: the roote being well growne is round, and somewhat great, small and pointed at the toppe, and broader, yet roundish at the bottome, with a certaine eminence or seate on the one side, as the roote of the Colchicum hath; but not so long, or great, it hath also an hollownesse on the one side (if it haue borne a flower) where the stalke grew, (for although in the time of the first springing vp, vntill it shew the budde for flower, the stalke with the leaues thereon rise vp out of the middle of the roote; yet when the stalke is risen vp, and sheweth the budde for flower, it commeth to one side, making an impression therein) couered ouer with a brownish thin coate or skin, like an Onion, hauing a little woollinesse at the bottome; but white within, and firme, yet composed of many coates, one folding within another, as the roote of the Daffodils be, of a reasonable good taste, neyther very sweete, nor yet vnpleasant. This description may well serue for the other Tulipas, being *Medias* or *Serotinas*, concerning their springing and bearing, which haue not any other great variety therein worth the note, which is not expressed here; the chiefe difference resting in the variety of the colours of the flower, and their seuerall mixtures and markes, as I said before: sauing onely, that the flowers of some are great and large, and of others smaller, and the leaues of some long and

1 *Tulipa praecox alba sine rubra, &c. unicoloris.* The early white or red Tulipa, &c. being of one colour. 2 *Tulipa praecox purpurea oris albis.* The early purple Tulipa with white edges, or the Prince. 3 *Tulipa praecox variegata.* The early stripe Tulipa. 4 *Tulipa praecox rubra oris luteis.* The early red Tulipa with yellow edges, or the Duke.

and pointed, and of others broad and round, or bluntly pointed, as shall bee shewed in the end of the Chapter: I shall therefore onely expresse the colours, with the mixture or composure of them, and giue you withall the names of some of them, (for it is impossible I thinke to any man, to giue seuerall names to all varieties) as they are called by those that chiefly delight in them with vs.

Tulipa praeox Alba.

- 1 *Ninea tota interdum purpureis staminibus, vel saltem luteis, fundo puro haud luteo.*
- 2 *Alba siue ninea fundo luteo.*
- 3 *Albida.*
- 4 *Alba, venis caruleis in dorso.*
- 5 *Alba purpureis oris.*
- 6 *Alba caruleis oris.*
- 7 *Alba sanguineis oris.*
- 8 *Alba oris magnis caruleis, & venis intro respicientibus.*
- 9 *Alba extra, carulei vero coloris intus, oras habens carneas saturatiores.*
- 10 *Albida, oris rubris, vel oris purpureis.*
- 11 *Albida purpurascens maculis extra, intus vero caruleis vinacissimis.*
- 12 *Alba, purpureis maculis aspersa extra, intus vero alba purpurantibus oris.*
- 13 *Dux Alba, s. e. coccineis & albis variata flammis, à medio ad oras intercurrentibus.*
- 14 *Princessa, i. e. argentei coloris maculis purpurascens.*
- 15 *Regina pulcherrima, albis & sanguineis aspersa radijs & punctis.*

The early White Tulipa.

- 1 The flower whereof is either pure snow white, with purple sometimes, or at least with yellow chiuces, without any yellow bottom.
- 2 Or pure white with a yellow bottom.
- 3 Or milk white that is not so pure white.
- 4 White with blew veines on the outside.
- 5 White with purple edges.
- 6 White with bluish edges.
- 7 White with red edges.
- 8 White with great bluish edges, and some strakes running from the edge inward.
- 9 White without, and somewhat bluish within, with edges of a deeper bluish.
- 10 Whitish, or pale white with red or purple edges.
- 11 Whitish without, with some purplish veins & spots, & of a lively bluish within.
- 12 White without, spotted with small purple spots, and white within with purple edges.
- 13 A white Duke, that is, parted with white & crimson flames, from the middle of each leafe to the edge.
- 14 The Princess, that is, a silver colour spotted with fine deepe bluish spots.
- 15 The Queen, that is, a fine white sprinkled with blood red spots, and greater strakes.

Tulipa praeox purpurea.

- 1 *Purpurea saturat rubescens, vel violacea.*
- 2 *Purpurea pallida, Columbina dicta.*
- 3 *Persici coloris saturi.*
- 4 *Persici coloris pallidioris.*
- 5 *Paonia floris coloris.*
- 6 *Rosea.*
- 7 *Chermesina peramena.*
- 8 *Chermesina parum striata.*

The early purple Tulipa.

- 1 A deep reddish purple, or more violet.
- 2 A pale purple, called a Doue colour.
- 3 A deep Peach colour.
- 4 A paler Peach colour.
- 5 A Peony flower colour.
- 6 A Rose colour.
- 7 A Crimson very bright.
- 8 A Crimson stript with a little white.

9 Princeps,

- 9 Princeps, i.e. purpurea saturatior vel dilutior, oris albis magnis vel parvis, fundo luteo, vel albo orbe, quæ multum variatur, & colore, & oris, ita ut purpurea elegans oris magnis albis, dicta est Princeps excellens, & Princeps dilutior.
- 10 Princeps Columbina, purpurea dilutior.
- 11 Purpurea Chermesina, rubicundioris coloris, albidis vel albis oris.
- 12 Purpurea vel obsoleta albidis oris Princeps Brancion.
- 13 Purpurea diluta, oris dilutioris purpurei coloris.
- 14 Purpurea in exterioribus, carnei vero ad mediam intus, oris albis, fundo luteo.
- 15 Purpurea albo plumata extra, oris albis, purpurascens intus, fundo luteo, vel orbe albo.
- 16 Alia, minus elegans plumata, minoribusq; oris albidis.

- 9 A Prince or Bracklar, that is, a deepe or pale purple, with white edges, greater or smaller, and a yellow bottome, or circled with white, which varieth much, both in the purple & edges, so that a faire deep purple, with great white edges, is called, The best or chiefe Prince, and
- 10 A paler purple with white edges, called a Doue coloured Prince.
- 11 A Crimson Prince or Bracklar.
- 12 A Brancion Prince, or purple Brancion.
- 13 A purple with more pale purple edges.
- 14 Purple without, and bluish halfe way within, with white edges, and a yellow bottome.
- 15 Purple feathered with white on the out side, with white edges, and pale purple within, the ground being a little yellow, or circled with white.
- 16 Another very neere vnto it, but not so fairely feathered, being more obscure, and the edges not so great or whitish.

Tulipa praeox rubra.

The early red Tulipa.

- 1 Rubra vulgaris fundo luteo, & aliquando nigro.
- 2 Rubra satūra oris luteis parvis, dicta Roan.
- 3 Baro, i.e. rubra magis intensa, oris luteis parvis.
- 4 Dux maior & minor, i.e. rubra magis aut minus elegans satūra, oris luteis maximis vel minoribus, & fundo luteo magno. Alia alijs est magis amena, in alijs etiam fundo nigro vel obscuro viridi.
- 5 Ducissa, i.e. Duci similis, at plus lutei quam rubri, oris magnis luteis, & rubore magis aut minus intus in gyrum actō, fundo item luteo magno.
- 6 Testamentum Brancion, i.e. rubra sanguinea satūra, aut minus rubra, oris pallidis, magnis vel parvis: alia alijs magis aut minus elegans diuersimodo.

- 1 An ordinary red, with a yellow, & sometimes a blacke bottome.
- 2 A deep red, with a small edge of yellow, called a Roane.
- 3 A Baron, that is, a faire red with a small yellow edge.
- 4 A Duke, a greater and a lesser, that is, a more or less faire deep red, with greater or lesser yellow edges, and a great yellow bottome. Some of this sort are much more or lesse faire then others, some also haue a blacke or darke greene bottome.
- 5 A Dutchesse, that is like vnto the Duke, but more yellow then red, with greater yellow edges, and the red more or lesse circling the middle of the flower on the inside, with a large yellow bottome.
- 6 A Testament Brancion, or a Brancion

- 7 *Flambant*, ex rubore & flavedine radiata, vel striata fundo luteo.
 8 *Mali Aurantij coloris*, ex rubore, & flavedine integrè, non separatim mixta, oris luteis parvis, vel absq; oris.
 9 *Minij*, sine Cinabaris coloris, i.e. ex purpurea, rubedine, & flavedine radiata, vnguib; luteis, & aliquando oris.
 10 *Rex Tuliparum*, i.e. ex sanguineo & aureo radiatim mixta, à flamma diuersa, fundo luteo, orbe rubro.
 11 *Tunica Merionis*, i.e. ex rubore & aureo separatim diuisa.

Duke, that is, a faire deepe red, or lesse red, with a pale yellow or butter coloured edge, some larger others smaller: and some more pleasing then others, in a very variable manner.

- 7 A *Flambant*, differing from the Dutcheffe; for this hath no such great yellow edge, but streaks of yellow through the leafe vnto the very edge.
 8 An *Orenge colour*, that is, a reddish yellow, or a red and yellow equally mixed, with small yellow edges, and sometimes without.
 9 A *Vermillion*, that is, a purplish red, streamed with yellow, the bottome yellow, and sometimes the edges.
 10 The *Kings flower*, that is, a crimson or bloud red, streamed with a gold yellow, differing from the *Flambant*, the bottome yellow, circled with red.
 11 A *Foolcs coate*, parted with red and yellow guardes.

Tulipa praeox lutea.

- 1 *Lutea siue flaua.*
 2 *Pallida lutea siue straminea.*
 3 *Aurea, oris rubicundis.*
 4 *Straminea, oris rubris.*
 5 *Aurea, rubore persusa extra.*
 6 *Aurea, vel magis pallida, rubore in gyrum acta simillima Ducisse, nisi minus rubedinis habet.*
 7 *Aurea, extremitatibus rubris, dici potest, Merionis Pilaeus praeox.*

The early yellow Tulipa.

- 1 A faire gold yellow without mixture.
 2 A strawe colour.
 3 A faire yellow with reddish edges.
 4 A strawe colour, with red edges.
 5 A faire yellow, reddish on the out side onely.
 6 A gold or paler yellow, circled on the inside a little with red, very like the Dutcheffe, but that it hath lesse red therein.
 7 A gold yellow with red toppes, and may be called, The early Foolcs Cap.

Tulipa de Caffa. The Tulipa of Caffa.

There is another sort or kinde of early Tulipa, differing from the former, whose pale green leaues being as broad and large as they, and sometimes crumpled or waued at the edges, in some haue the edges onely of the said leaues for a good breadth, of a whitish or whitish yellow colour; and in others, the leaues are listed or parted with whitish yellow and Greene: the stalke riseth not vp so high as the former, and beareth a flower at the toppe like vnto the former, in some of a reddish yellow colour; with a russet coloured ground or bottome, and in others, of other feuerall colours: the seede and roote is so like vnto others of this kinde, that they cannot be distinguished.

There is (as I doe heare) of this kinde, both *Præcoces*, and *Serotina*, early flowering, and late flowering, whereof although wee haue not so exact knowledge, as of the rest, yet I thought good to speake so much, as I could hitherto vnderstand of them; and giue others leaue (if I doe not) hereafter to amplifie it.

Tulipa Boloniensis, sive Bombycina flore rubro maior. The greater red Bolonia Tulipa.

There are likewise other kinds of early Tulipas to bee spoken of, and first of the red Bolonia Tulipa; the roote whereof is plainly discerned, to be differing from all others: for that it is longer, and not hauing so plaine an eminence at the bottome thereof, as the former and later Tulipas, but more especially because the toppe is plentifully stored with a yellowish silke-like woodlinese: the outside likewise or skinne is of a brighter or paler red, not so easie to be pilled away, and runneth vnder ground both downeright and sidewise (especially in the Countrey ground and ayre, where it will encrease abundantly, but not either in our London ayre, or foret grounds) somewhat like vnto the yellow Bolonia Tulipa next following. It shooteth out of the ground with broad and long leaues, like the former; but neither so broad, nor of so white or mealy a Greene colour as the former, but more darke then the late flowering Tulipa, so that this may bee easily discerned by his leafe from any other Tulipa aboue the ground, by one that is skilfull. It beareth likewise three or foure leaues vpon the stalke, like the former, and a flower also at the toppe of the same fashion, but that the leaues hereof are alwayes long; and somewhat narrow, hauing a large blacke bottome, made like vnto a cheuerne, the point whereof riseth vp vnto the middle of the leafe, higher then any other Tulipa; the flower is of a pale red colour, nothing so liuely as in the early or late red Tulipas, yet sweeter for the most part then any of them, and neerest vnto the yellow Bolonia Tulipa, which is much about the same sent.

Tulipa pumilio rubra, sive Bergomensis rubra media & minor. The dwarte red Bergamo Tulipa, a bigger and a lesser.

There are two other sorts hereof, and because they were found about Bergamo, doe carry that name, the one bigger or lesser then another, yet neither so great as the former, hauing very little other difference to bee obserued in them, then that they are smaller in all parts of them.

Tulipa Boloniensis flore luteo. The yellow Bolonia Tulipa.

The roote of this Tulipa may likewise bee knowne from the former red (or any other Tulipa) in that it seldome cometh to bee so bigge, and is not so woolly at the toppe, and the skinne or outside is somewhat paler, harder, and sharper pointed: but the bottome is like the former red, and not so eminent as the early or late Tulipas. This beareth much longer and narrower leaues then any (except the Persian & dwarte yellow Tulipas) and of a whitish Greene colour: it beareth sometimes but one flower on a stalke, and sometimes two or three wholly yellow, but smaller, & more open then the other kinds, and (as I said) smelleth sweete, the head for seede is smaller then in others, and hath not that crowne at the head thereof, yet the seed is like, but smaller.

Tulipa Narbonensis, sine Monspelienfis vel pumilio.

The French or dwarfe yellow Tulipa.

This Tulipa is very like vnto the yellow Bolonia Tulipa, both in roote, leafe, and flower, as also in the colour thereof, being yellow: the onely difference is, that it is in all things lesler and lower, and is not so apt to beare, nor so plentifull to encrease by the roote.

Tulipa Italica maior & minor. The Italian Tulipa the greater and the lesser.

Both these kindes of Tulipas doe so neere resemble the last kinde, that I might almost say they were the same; but that some difference which I saw in them, maketh mee sett them apart; and consisteth in these things, the stalkes of neither of both these rise so high, as of the first yellow Bolonia Tulipa: the leaues of both sorts are writhed in and out at the edges, or made like a waue of the sea, lying neerer the ground, and the flower being yellow within, is brownish or reddish on the backe, in the middle of the three outer leaues the edges appearing yellow. Both these kindes doe differ one from the other in nothing, but in that one is bigger, and the other smaller then the other which I saw with Iohn Tradescante, my very good friend often remembered.

Tulipa Lustranica, sine pumilio var ficalor. The dwarfe stript Tulipa.

This dwarfe Tulipa is also of the same kindred with the three last described; for there is no other difference in this from them, then that the flower hath some red veins running in the leaues thereof.

There are two other sorts of dwarfe Tulipas with white flowers, whereof Lobel hath made mention in the Appendix to his *Aduersaria*; the one whereof is the same that Clusius setteth forth, vnder the title of *Pumilio altera*: but because I haue not seen either of them both, I speake no further of them.

Tulipa pumilio alba. The white dwarfe Tulipa.

But that white flower that Iohn Tradescante shewed me, and as hee saith, was deliuered him for a white *Pumilio*, had a stalke longer then they set out theirs to haue, and the flower also larger, but yet had narrower leaues then other sorts of white Tulipas haue.

Tulipa Bicolor. The small party coloured Tulipa.

Vnto these kindes, I may well adde this kinde of Tulipa also, which was sent out of Italy, whose leaues are small, long, and narrow, and of a darke Greene colour, somewhat like vnto the leaues of an Hyacinth: the flower is small also, consisting of sixe leaues, as all other Tulipas doe, three whereof are wholly of a red colour, and the other three wholly of a yellow.

Tulipa Persica. The Persian Tulipa.

This rare Tulipa, wherewith we haue beene but lately acquainted, doth most fitly deserue to be described in this place, because it doth so neerely participate with the Bolonia and Italian Tulipas, in roote, leafe, and flower: the roote hereof is small, couered with a thicke hard blackish shell or skinne, with a yellowish woolliness, both at the toppe, and vnder the shell. It riseth out of the ground at the first, with one very long and small round leafe, which when it is three or foure inches high, doth open it selfe, and shew forth another small leafe, (as long almost as the former) breaking out of the one side thereat, and after it a third, and sometimes a fourth, and a fift; but each shorter then other, which afterwards be of the breadth of the dwarfe yellow Tulipa, or somewhat broader, but much longer then any other, and abiding more hollow, and of the colour of the early Tulipas on the inside: the stalke riseth vp a foot and a halfe

high

1. *Tulipa Zambeyensis* flore rubra. The red Bolonia Tulipa. 2. *Tulipa Boloniensis* flore lutea. The yellow Bolonia Tulipa. 3. *Tulipa pumilio* rubra. The red or yellow dwarf Tulipa. 4. *Folium Tulipae de Caffa per totum striatum*. The leaf of the Tulipa of Caffa striped throughout the whole leaf. 5. *Folium Tulipae de Caffa per marginem striatum*. The leaf of the Tulipa of Caffa striped at the edges only. 6. *Tulipa Persica*. The Persian Tulipa. 7. *Tulipa Cretica*. The Tulipa of Candia. 8. *Tulipa Armeniaca*. The Tulipa of Armenia.

high sometimes, bearing one flower thereon, composed of six long and pointed leaues of the forme of other small Tulipas, and not shewing much bigger then the yellow Italian Tulipa, and is wholly white, both inside and outside of all the leaues, except the three outtermost, which haue on the backe of them, from the middle toward the edges, a shew of a brownish bluish, or pale red colour, yet deeper in the midst, and the edges remaining wholly white: the bottomes of all these leaues are of a darke or dun tawne colour, and the chiues and tippes of a darkish purple or tawne also. This doth beare seed but seldome in our Country, that euer I could vnderstand, but when it doth, it is small like vnto the Bolonia or dwarfe yellow Tulipas, being not so plentifull also in parting, or setting off by the roote as they, and neuer groweth nor abideth so great as it is brought vnto vs, and seldome likewise flowreth after the first yeare: for the rootes for the most part with euery one grow lesse and lesse, decaying euery yeare, and so perish for the most part by reason of the frosts and cold, and yet they haue been set deepe to defend them, although of their owne nature they will runne downe deep into the ground.

Tulipa Byzantina *Aschus floribus Clusij.* The small Tulipa of Constantinople.

The small Tulipa of Constantinople, beareth for the most part but two leaues on the stalke, which are faire and broad, almost like vnto the Candy Tulipa, next hereunto to be described: the stalke it selfe riseth not aboue a foote high, bearing sometimes but one flower, but most commonly two thereon, one below another, and are no bigger then the flowers of the yellow Bolonia Tulipa, but differing in colour; for this is on the outside of a purplish colour, mixed with white and Greene, and on the inside of a faire bluish colour, the bottome and chiues being yellow, and the tippes or pendants blackish: the roote is very like the yellow Bolonia Tulipa.

Tulipa Cretica. The Tulipa of Candie.

This Tulipa is of later knowledge with vs then the Persian, but doth more hardly thriue, in regard of our cold climate; the description whereof, for so much as wee haue knowledge, by the sight of the roote and leafe, and relation from others of the flower, (for I haue not yet heard that it hath very often flowered in our Country) is as followeth. It beareth faire broad leaues, resembling the leaues of a Lilly, of a greenish colour, and not very whitish: the stalke beareth thereon one flower, larger and more open then many other, which is eyther wholly white, or of a deepe red colour, or else is variably mixed, white with a fine reddish purple, the bottomes being yellow, with purplish chiues tipt with blackish pendants: the roote is small, and somewhat like the dwarfe yellow Tulipa, but somewhat bigger.

Tulipa Armeniaca. The Tulipa of Armenia.

This small Tulipa is much differing from all the former (except the small or dwarfe white Tulipas remembred by Lobel and Clusius, as is before set downe) in that it beareth three or foure small, long, and somewhat narrow Greene leaues, altogether at one ioynt or place; the stalke being not high, and naked or without leaues from them to the toppe, where it beareth one small flower like vnto an ordinary red Tulipa, but somewhat more yellow, tending to an Orange colour with a blacke bottome: the roote is not much bigger then the ordinary yellow Bolonia Tulipa, before set downe. And these are the sorts of this first *Classu* of early Tulipas.

Tulipa media. The meaner or middle flowring Tulipa.

For any other, or further description of this kinde of Tulipa, it shall not neede, hauing giuen it sufficiently in the former early Tulipa, the maine difference consisting first in the time of flowring, which is about a moneth after the early Tulipas, yet some more some lesse: for euen in the *Præcoces*, or early ones, some flower a little earlier, and later then others, and then in the colours of the flowers; for wee haue obserued many
colours,

colours, and mixtures; or varieties of colours in the *Medias*, which we could neuer see in the *Præcoces*; and so also some in the *Præcoces*, which are not in the *Medias*: yet there is farre greater varieties of mixture of colours in these *Medias*, then hath been obserued in all the *Præcoces*, (although Clusius saith otherwise) eyther by my selfe, or by any other that I haue conuerſed with about this matter, and all this hath happened by the ſowing of the ſeede, as I ſaid before. I will therefore in this place not trouble you with any further circumſtance, then to diſtinguiſh them, as I haue done in the former early Tulipas; into their foure primariy colours, and vnder them, giue you their ſeueral varieties and names, for ſo much as hath come to my knowledge, not doubting, but that many that haue trauelled in the ſowing of the ſeed of Tulipas many yeares, may obſerue each of them to haue ſome variety that others haue not: and therefore I thinke no one man can come to the knowledge of all particular diſtinctions.

Tulipa media alba.

The white meane flowring Tulipa.

- 1 Niua, fundo albo vel luteo.
- 2 Argentea, quaſi alba cineracea fundo luteo ſcente, purpureis ſtaminibus.
- 3 Margaritina alba, carneo diſtinctiſſima.
- 4 Alba, fundo caruleo vel nigro.
- 5 Albida.
- 6 Alba, oris rubris.
- 7 Alba, purpureis oris.
- 8 Alba, oris coccineis.
- 9 Albida primum, deinde albidior, oris purpureis, & vniſis inſpectantibus, diſta nobis Hackney.
- 10 Alba, ſanguineo colore variata, fundo vel albiſſimo, vel alio.
- 11 Alba, radiatim diſpoſita ſtaminibus, & maculis coccineis.
- 12 Alba, purpurea rubedine plumata, diuerſarum ſpecierum, qua cum ſuperiore, vel albo, vel luteo, vel purpureo caruleo conſtant fundo, qua conſtanter tenent punctatos colores, & non diſpergunt, ſed poſt triſimum aut quatuordecimum ſpatium pulchriores apparent.
- 13 Panni argentei coloris, i.e. alba, plumata, punctata, ſtriata, vel diuerſimode variata, rubedine dilutiore, vel ſaturatiore purpurea, interius vel exterius, vel vtriuſque, diuerſarum ſpecierum.
- 14 Tunica morionis alba varia, i.e. ex albo & purpureo ſtriata diuerſimode, fundo albo vel alio.
- 15 Holias alba vel albida, abſq. fundo, vel fundo purpureo caruleo, vel caruleo albo circumdato, diuerſe ſignata, vel variata intus ad medietatem foliorum, ſurſum in orbem ut plurimum, vel ad ora pertingens amplas & albas. Haec ſpecies tantopere multiplicatur, ut vix ſint explicabiles.

- 1 A ſnow white, with a white or yellow bottome.
- 2 A ſiluer colour, that is, a very pale or whitith aſhe colour, with a yellowiſh bottome and purple chiuies.
- 3 A Pearle colour, that is, white, with a waſh or ſhew of bluſh.
- 4 A white, with a blew or black bottome.
- 5 A Creame colour.
- 6 A white, with red edges.
- 7 A white, with purple edges.
- 8 A white, with crimſon edges.
- 9 A pale or whitith yellow, which after a few dayes groweth more white, with purpliſh red edges, and ſome ſtreakes running inward from the edge, which we call an Hackney.
- 10 A white mixed with a bloud red very variably, and with a pure white, or other coloured bottome.
- 11 A white, ſtreamed with crimſon flames, and ſpots through the whole flower.
- 12 A white, ſpeckled with a reddiſh purple, more or leſſe, of diuerſ ſorts, with white, yellow, or blew bottomes; all which doe hold their markes conſtant, and doe not ſpread their colours, but ſhew fairer after they haue ſtood blown three or foure dayes.
- 13 A cloth of ſiluer of diuerſ ſorts, that is, a white ſpotted, ſtriped, or otherwiſe marked with red or purple, in ſome paler, in ſome deeper, either on the inſide, or on the outſide, or on both.
- 14 A white Fooles coate of diuerſ ſorts; that is, purple or pale crimſon, and white, as it were empaled together, eyther with a white ground or other, whereof there is great variety.
- 15 A white Holias, that is, a faire white, or paler white, eyther without a bottome, or with a blewish purple bottome, or blew and white circling the bottome, and

1. *Tulipa arvensis*, vel *pandulata*, &c. The clove of flure, or other flowers. 2. *Tulipa alba*, vel *flammarum*, &c. The white flowers without a bottom. 3. *Tulipa*
argentea, vel *pandulata*, &c. The clove of flure, or other flowers. 4. *Tulipa alba*, vel *flammarum*, &c. The white flowers without a bottom. 5. *Tulipa*
alba, &c. *fundo purpureo*, &c. A white flower, &c. with a purple bottom. 6. *Tulipa arvensis*, vel *pandulata*, &c. A red and yellow flared Tu-
 lipa, &c. 7. *Tulipa alba*, vel *pandulata*, &c. A white striped and spotted Tulipa. 8. *Tulipa alba*, vel *pandulata*, &c. Another variable Tulipa.

Tulipa mediarubra.

The meane flowring red Tulipa.

- 1 Rubra communis, fundo luteo, vel nigro.
- 2 Mali Auranti coloris.
- 3 Cinabaris coloris.
- 4 Lateriti coloris.
- 5 Rubra, luteo aspersa.
- 6 Rubra, oris luteis.
- 7 Testamentum Brancion rubra saturo, oris pallidis, dinerfarum specierum, rubore variantium, & orarum amplitudine.
- 8 Cinabaris radiata, magis aut minus serotina.
- 9 Rubra purpurascens obsoleta, exterioribus folijs, persusa luteo intus, oris pallidis luteis.
- 10 Rubra purpurascens elegans extra, & intus lutescens, oris pallidis luteis, fundo luteo vel viridi.
- 11 Rubra flambans coccinea, crebris maculis luteis absq; fundo.
- 12 Flambans elegantior rubra, i.e. radijs luteis intercurrentibus ruborem.
- 13 Flambans remissior utroq; colore.
- 14 Panni aurei coloris.
- 15 Tunica Morionis verior, seu Palto du Set. optima, tenijs amplius amenis & crebris, ex rubro & flauo separatim diuisis & excurrentibus, flos constans.
- 16 Tunica Morionis altera, tenijs minoribus & minus frequentibus, magis aut minus alia alijs inconstans.
- 17 Tunica Morionis pallida, i.e. tenijs vel strijs frequentioribus in utroq; colore pallidis, flos est constans & elegans.
- 18 Pileus Morionis, radijs luteis, in medio foliorum latis, per ruborem excurrentibus, fundo luteo, apicibus luteis, & tribus exterioribus folijs luteis oris rubris, vel absq; oris.

- 1 A faire red which is ordinary, with a yellow or blacke bottome.
- 2 A deepe Orenge colour.
- 3 A Vermillion.
- 4 A pale red, or Bricke colour.
- 5 A Gingeline colour.
- 6 A red with small yellow edges.
- 7 A Testament Brancion of diuers sorts, differing both in the deepnesse of the red, and largenesse of the pale coloured edges.
- 8 A Vermillion flamed, flowring later or earlier.
- 9 A dead purplish red without, and of a yellowish red within, with pale yellow edges.
- 10 A bright Crimson red on the outside, more yellowish on the inside, with pale yellow edges, and a bottome yellow or Greene.
- 11 A red Flambant, spotted thicke with yellow spots without any bottome.
- 12 A more excellent red Flambant, with flames of yellow running through the red.
- 13 A pale coloured Flambant.
- 14 A cloth of gold colour.
- 15 A true Fooles Coate, the best is a faire red & a faire yellow, parted into guards euery one apart, varied through euery leafe to the very edge, yet in most abiding constant.
- 16 Another Fooles Coate, not so fairely marked, nor so much, some of these are more or lesse constant in their marks, & some more variable then others.
- 17 A pale Fooles Coate, that is, with pale red, and pale yellow guardes or stripes very faire and constant.
- 18 A Fooles Cappe, that is, with lifts or stripes of yellow running through the middle of euery leafe of the red, broader at the bottome then above, the bottome being yellow, the three outet leaues being yellow with red edges, or without.

1 *Tulipa tricolor*. A Tulipa of three colours. 2 *Tulipa Macedonica*, *fusca* de Caffa varia. The Tulipa of Caffa purple, with pale white stripes. 3 *Tulipa Helweta charmesina variegata*. A pure Claret wine colour variable. 4 *Tulipa Corymbiflora* Wilmer. Mr. Wilmer's Gilloflower Tulipa. 5 *Tulipa Chermesina flammula alba*. A Crimson with white flames. 6 *Tulipa Goliah*. A kind of Zwifter called Goliah. 7 *Tulipa de Zwift*. A Tulipa called the Zwifter. 8 *Tulipa alba flammula coccinea*. Another white Plumbant or Footy Coeur. 9 *Tulipa Cinnabarinia alba flammata*. The Vermillion flamed. 10 *Tulipa pinnata rubra & lutea*. The feathered Tulipa red and yellow.

- 19 *Le Suisse, tenijs radiata magnis ex rubore & pallore.*
- 20 *Altera dicta Goliath à floris magnitudine, tenijs radiata simillima le Suisse, nisi ruber & albedo sint elegantiores.*
- 21 *Holias rubra, i.e. sanguinea argenteis radijs, & guttis in orbem dispositis, præsertim interiùs, fundo viridi saturo.*
- 22 *Holias coccinea, rubra coccinea, albo radiata in orbem, circa medium foliorum interiùs, fundo albo.*
- 23 *Alia huic similis, fundo albo & carnleo.*
- 19 A Suisse, pained with a faire red and pale white or strawe colour.
- 20 A Goliath, so called of the bignesse of the flower, most like to the Suisse in the marks and guardes, but that the red and white is more liuely.
- 21 A red Holias. A bloud red stript with siluer white veines and spots, with a darke green bottome.
- 22 A Crimson red Holias, that is, a faire purplish red, spotted with white circlewise about the middle of the inner leaues, and a white bottome.
- 23 Another like thereunto, with a blew and white bottome.

Tulipa media lutea.

- 1 *Lutea, siue Anrea vulgaris.*
- 2 *Straminea.*
- 3 *Sulphurea.*
- 4 *Atali Aurantij pallidi coloris.*
- 5 *Lutea dilute purpurea striata, aurei panni pallidi instar.*
- 6 *Pallide lutea fuscetudine adumbrata.*
- 7 *Flava, oris rubri magnis, aut parvis.*
- 8 *Straminea oris rubris magnis intensis, vel parvis remissis.*
- 9 *Obscura & fuliginosa lutea, instar Folij decidui, ideoq. Folium mortuum appellatur.*
- 10 *Flava, rubore perfusa, etiamque striata per totum, dorso coccineo, oris pallidis.*
- 11 *Pallide lutea, perfusa & magis aut minus rubore striata, fundo vel luteo, vel viridi.*
- 12 *Testamentum Clusij, i.e. lutea pallida fuligine obscura, exteriùs & interiùs ad aras usq. pallidas, per totum vero floris medium, maculis interiùs aspersa instar omnium aliarum Holias, dorso obscuriore, fundo viridi.*

The meane flowring yellow Tulipa.

- 1 A faire gold yellow.
- 2 A Strawe colour.
- 3 A Brimstone colour pale yellowish Greene.
- 4 A pale Orange colour.
- 5 A pale cloth of gold colour.
- 6 A Custard colour a pale yellow shadowed ouer with a browne.
- 7 A gold yellow with red edges, greater or smaller.
- 8 A Strawe colour with red edges, deeper or paler, greater or smaller.
- 9 A sullen or smoakie yellow, like a dead leafe that is fallen, and therefore called, *Fucille mort.*
- 10 A yellow shadowed with red, and striped also through all the leaues, the backside of them being of a red crimson, and the edges pale.
- 11 A pale yellow, shadowed and striped with red, in some more in some lesse, the bottomes being either yellow or green.
- 12 A Testamentum Clusij, that is, a shadowed pale yellow, both within & without, spotted round about the middle on the inside, as all other Holias are, the backe of the leaues being more obscure or shadowed with pale yellow edges, and a Greene bottome.

- 13 *Flambans lutea, diuersimode intus magis aut minus striata, vel in alijs extra maculata rubore, fundo vt plurimum nigro, vel in alijs luteo.* 13 A yellow Flambant of diuers sorts, that is, the whole flower more or lesse streaked or spotted on the inside, and in some on the outside with red, the bottome in most being blacke, yet in some yellow.
- 14 *Flambans pallidior & elegantior.* 14 A paler yellow Flambant more beautiful.
- 15 *Holias lutea intensior vel remissior diuersimode, in orbem radiata interius, rubra maculis ad supremas vsq; oras, aliquoties crebre, alias parce, fundo viridi, vel tancto obscuro.* 15 A yellow Holias, paler or deeper yellow very variable, spotted on the inside round about the middle, with red sometimes plentifully, or else sparingly, with a green or dark tawny bottome.
- 16 *Holias straminea rubore striata & punctata, instar alba Holias.* 16 A strawe coloured Holias, spotted and streaked with red, as is to bee seene in the white Holias.
- 17 *Tunica Morionis lutea, alijs dicta Flammica, in qua color strabus magis & conspicuus rubore, diuersimode radiata.* 17 A yellow Fooles coate, of some called a flame colour, wherein the yellow is more then the red, diuersly streaked. Vnto these may be added the greene Tulipomp, which is also of diuers sorts. One hauing a great flower of a deepe green colour, seldome opening it selfe, but abiding alwaies, as it were halfe shut vp and closed, the chiuies being as it were feathered. Another of a paler or yellowish green, paned with yellow, and is called, The Parret, &c. with white edges. A third of a more yellowish green, with red or purplish edges. A fourth, hath the leaues of the flower equally almost parted, with greene and a light purple colour, which abiding a long time in flower, groweth in time to be fairer marked: for at the first it doth not shew it selfe so plainly diuided. Some call this a greene Swiffer. A fifth hath the longest leaues standing like a starre, consisting of greene and purple.

Tulipa Serotina. The late flowering Tulipa.

The late flowering Tulipa hath had his description expressed in the precedent discourse; so that I shall not neede to make a repetition of what hath already beene set downe. The greatest matter of knowledge in this kinde is this; That it hath no such plentiful variety of colours or mixtures in his flowers, as are in the two former sorts, but is confined within these limits here expressed, as farre as hath come to our knowledge.

Tulipa Serotina.

The late flowering Tulipa.

- Rosea intensior, aut remissior.* A Rose colour deeper or paler.
- Rubra vulgaris, aut saturatio, & quasi nigricans, fundo luteo vel nigro, vel nigro orbe, aureo incluso, dicta Oculis Solis.* An ordinary red, or else a deeper red like blacke bloud, with a blacke or yellow bottome, or blacke circled with yellow, called the Suns eye.
- Lutea communis.* An ordinary yellow.
- Lutea oris rubris.* A yellow with red edges.
- Lutea guttis sanguineis, fundo nigro vel vario.* A yellow with red spots and veines, the bottome blacke or discoloured.

There yet remaine many obseruations, concerning these beautifull flowers, fit to be knowne, which could not, without too much prolixity, be comprehended within the body of the description of them; but are referred to bee intreated of a part by themselves.

All sorts of Tulipas beare vsually but one stalke, and that without any branches: but sometimes nature is so plentifull in bearing, that it hath two or three stalkes, and sometimes two, or more branches out of one stalke (euery stalke or branch bearing one flower at the toppe) but this is but seldome seene; and when it doth happen once, it is hardly seene againe in the same roote, but is a great signe, that the roote that doth thus, being an old roote, will the same yeare part into diuers rootes, whereof euery one, being of a reasonable greatnesse, will beare both his stalke and flower the next yeare, agreeing with the mother plant in colour, as all the of-fets of Tulipas doe for the most part: for although the young of-fets of some doe vary from the maine roote, euery while it groweth with them, yet being separated, it will bee of the same colour with the mother plant.

There groweth oftentimes in the *Medias*, and sometimes also in the *Præcoces*, but more seldome, a small bulbe or roote, hard about the ground, at the bottome of the stalke, and betwene it and the lower leafe, which when the stalke is dry, and it ripe, being put into the ground, will bring forth in time a flower like vnto the mother plant, from whence it was taken.

The flowers also of Tulipas consist most commonly of fixe leaues, but sometimes they are seene to haue eight or tenne, or more leaues, but vsually, those rootes beare but their ordinary number of fixe leaues the next yeare: the head for seede then, is for the most part foure square, which at all other times is but three square, or when the flower wanteth a leafe or two, as sometimes also it doth, it then is flat, hauing but two sides.

The forme of the flower is also very variable; for the leaues of some Tulipas are all sharpe pointed, or all blunt and round pointed, and many haue the three outer leaues sharpe pointed, and the three inner round or pointed, and some contrariwise, the three outermost round pointed, and the three inner sharpe pointed. Again, some haue all the leaues of the flowers long and narrow, and some haue them broader and shorter. Some *Præcoces* also haue their flowers very large and great, equall vnto cyther the *Media*, or *Serotina*, which most commonly are the largest, and others haue them as small as the *Bolonia* Tulipa.

The bottomes of the leaues of the flowers are also variably diuersified, and so are both the chins or threds that stand vp about the head, and the tips or pendants that are hanging loose on the toppes of them; and by the difference of the bottomes or chins, many flowers are distinguished, which else are very like in colour, and alike also marked.

For the smell also there is some diuersity; for that the flowers of some are very sweete, of others nothing at all, and some betwene both, of a small sent, but not offensive: and yet some I haue obserued haue had a strong ill sent; but how to shew you to distinguish them, more then by your owne sense, I cannot: for the seedes of sweete smelling Tulipas doe not follow their mother plant; no more then they doe in the colour.

And lastly, take this, which is not the least obseruation, worth the noting, that I haue obserued in many: When they haue bene of one entire colour for diuers yeares, yet in some yeares they haue altered very much, as if it had not bene the same, viz. from a purple or stamell, it hath bene variably either parted, or mixed, or striped with white, cyther in part, or through the whole flower, and so in a red or yellow flower, that it hath had cyther red or yellow edges, or yellow or red spots, lines, veines, or flames, running through the red or yellow colour, and sometimes it hath happened, that three leaues haue bene equally parted in the middle with red and yellow, the other three abiding of one colour, and in some the red had some yellow in it, and the yellow some red spots in it also; whereof I haue obserued, that all such flowers, not hauing their originall in that manner, (for some that haue such or the like markes from the beginning, that is, from the first and second yeares flowring, are constant, and doe not change) but as I said, were of one colour at the first, doe shew the

weaknesse

weaknesse and decay of the roote; and that this extraordinary beauty in the flower, is but as the brightnesse of a light, upon the very extinguishing thereof, and doth plainly declare, that it can doe his Master no more service, and therefore with this iollity doth bid him good night. I know thereto is a common opinion among many (and very confidently maintained) that a Tulipa with a white flower, hath changed to beare a red or yellow, and so of the red or yellow, and other colours, that they are likewise inconstant, as though no flowers were certaine: but I could neuer either see, or heare for certain any such alteration, nor any other variation, but what is formerly expressed. Let not therefore any iudicious be carried away with any such idle conceit, but rather suspect some deceit in their Gardeners or others, by taking vp one, and putting in another in the place, or else their owne mistaking.

Now for the sowing, planting, transplanting, choise, and ordering of Tulipas, which is not the least of regard, concerning this subject in hand, but (as I think) would be willingly entertained. What I haue by my best endeuours learned, by mine owne paines in almost forty yeares trauell, or from others informations, I am willing here to set downe, not doubting, but that some may adde what hath not come to my knowledge.

First, in the sowing of seedes of Tulipas, I haue not obserued (whatsoeuer others haue written) nor could of certainty learne of others, that there doth arise from the seedes of *Præcoces* any *Medias* or *Serotine* Tulipas, (or but very seldome) nor am certainly assured of any: but that the seedes of all *Præcoces* (so they be not doubtfull, or of the last flowering sorts) will bring *Præcoces*: And I am out of doubt, that I neuer saw, nor could learne, that euer the seede of the *Medias* or *Serotines* haue giuen *Præcoces*; but *Medias* or *Serotines*, according to their naturall kinde. But if there should bee any degeneration, I rather incline to thinke, that it sooner cometh to passe (*à meliore ad peius*, for *facilis est descensus*, that is) that *Præcoces* may giue *Medias*, then that *Medias* or *Serotines* should giue *Præcoces*.

For the choise of your seede to sowe. First, for the *Præcoces*, Clusius saith, that the *Præcox Tulipa*, that beareth a white flower, is the best to giue the greatest variety of colours. Some among vs haue reported, that they haue found great variety rise from the seede of the red *Præcox*, which I can more hardly beleene: but Clusius his experience hath the greater probability, but especially if it haue some mixture of red or purple in it. The purple I haue found to be the best, next thereunto is the purple with white edges, and so likewise the red with yellow edges, each of them will bring most of their owne colours. Then the choise of the best *Medias*, is to take those colours that are light, rather white then yellow, and purple then red; yea white, not yellow, purple, not red: but these againe to be spotted is the best, and the more the better; but withall, or aboue all in these, respect the ground or bottome of the flower, (which in the *Præcox Tulipa* cannot, because you shall seldome see any other ground in them but yellow) for if the flower be white, or whitish, spotted, or edged, and straked, and the bottome blew or purple (such as is found in the *Holias*, and in the *Cloth of siluer*, this is beyond all other the most excellent, and out of question the choicest of an hundred, to haue the greatest and most pleasant variety and rarity. And so in degree, the meener in beauty you sowe, the lesser shall your pleasure in rarities be. Bestowe not your time in sowing red or yellow Tulipa seede, or the diuers mixtures of them; for they will (as I haue found by experience) seldome be worth your paines. The *Serotina*, or late flowering Tulipa, because it is seldome scene, with any especiall beautifull variety, you may easily your selues ghesse that it can bring forth (euen as I haue also learned) no raritie, and little or no diuersity at all.

The time and manner to sowe these seedes is next to be considered. You may not sowe them in the spring of the yeare; if you hope to haue any good of them; but in the Autumne, or presently after they be thorough ripe and dry: yet if you sowe them not vntill the end of October, they will come forward neuer the worse, but rather the better; for it is often scene, that ouer early sowing causeth them to spring out of the ground ouer early, so that if a sharpe spring chance to follow, it may goe neere to spoile all, or the most of your seede. Wee usually sowe the same yeares seede, yet if you chance to keepe of your owne, or haue from others such seed, as is two yeares old, they will thrue and doe well enough, especially if they were ripe and well gathered:

You must not sowe them too thicke; for so doing hath lost many a pecke of good seede, as I can tell; for if the seede lye one vpon another, that it hath not roome vpon the sprouting, to enter and take roote in the earth, it perisheth by and by. Some vse to tread downe the ground, where they meane to sowe their seede, and hauing sowne them thereon, doe couer them ouer the thickeesse of a mans thimble with fine sifted earth, and they thinke they doe well, and haue good reason for it: for considering the nature of the young Tulipa rootes, is to runne downe deeper into the ground; every yeare more then other; they thinke to hinder their quicke descent by the fastnesse of the ground, that so they may encrease the better. This way may please some; but I doe not vse it, nor can finde the reason sufficient; for they doe not consider, that the stiffenesse of the earth, doth cause the rootes of the young Tulipas to bee long before they grow great; in that a stiffe ground doth more hinder the well thriving of the rootes, then a loose doth; and although the rootes doe runne downe deeper in a loose earth, yet they may easily by transplanting be holpen, and raised vp high enough. I haue also seene some Tulipas not once remoued from their sowing to their flowering; but if you will not lose them, you must take them vp while their leafe or stalke is fresh, and not withered: for if you doe not follow the stalke downe to the roote, be it neuer so deepe, you will leaue them behinde you. The ground also must be respected; for the finer, softer, and richer the mould is, wherein you sowe your seede, the greater shall be your encrease and varietie: Sift it therefore from all stones and rubbish, and let it be either fat naturall ground of it selfe, or being mucky, that it bee thoroughly rotten: but some I know, to mend their ground, doe make such a mixture of grounds, that they marre it in the making.

After the seede is thus sowne, the first yeares springing bringeth forth leaues, little bigger then the ordinary grasse leaues; the second yeare bigger; and so by degrees every yeare bigger then other. The leaues of the *Præcozes* while they are young, may be discerned from the *Medias* by this note, which I haue obserued. The leaues of them doe wholly stand vp above the ground, shewing the small footstalkes, whereby euery leafe doth stand; but the leaues of the *Medias* or *Serotines* doe neuer wholly appeare out of the ground, but the lower part which is broad, abideth vnder the vpper face of the earth. Those Tulipas now growing to bee three yeares old, (yet some at the second, if the ground and ayre be correspondent) are to bee taken vp out of the ground, wherein yee shall finde they haue runne deepe, and to be anew planted, after they haue been a little dried and cleansed, cyther in the same, or another ground againe; placing them reasonable neare one vnto another, according to their greatnesse, which being planted and couered ouer with earth againe, of about an inch or two thickeesse, may be left vntaken vp againe for two yeare longer, if you will, or else remoued euery yeare after, as you please; and thus by transplanting them in their due season (which is still in the end of Iuly, or beginning of August, or thereabouts) you shall according to your seede and soyle, haue some come to bearing, in the fifth yeare after the flowering, (and some haue had them in the fourth, but that hath bene but few, and none of the best, or in a rich ground) some in the sixth and seuenth, and some peraduenture, not vntill the eighth or tenth yeare: but still remember, that as your rootes growe greater, that in re-planting you giue them the more roome to be distant one from another, or else the one will hinder, if not rot the other.

The seede of the *Præcozes*, doe not thrine and come forward so fast as the *Medias* or *Serotines*, nor doe giue any off-sets in their running downe as the *Medias* doe, which vsually leaue a small roote at the head of the other that is runne downe euery yeare; and besides, are more tender, and require more care and attendance then the *Medias*, and therefore they are the more respected.

This is a generall and certainerule in all Tulipas, that all the while they beare but one leafe, they will nor beare flower; whether they bee seedlings, or the off-sets of elder rootes, or the rootes themselues, that haue heretofore borne flowers; but when they shew a second leafe, breaking out of the first, it is a certaine signe, that it will then beare a flower, vnlesse some casualty hinder it, as frost or raine, to nip or spoile the bud, or other vntimely accident befall it.

To set or plant your best and bearing Tulipas somewhat deeper then other rootes, I hold it the best way; for if the ground bee either cold, or lye too open to the cold

Northerne

Northerne ayre, they will be the better defended therein; and not suffer the frosts or cold to pierce them so soone: for the deepe frosts and snowes doe pinch the *Præcoces* chiefly, if they bee too neare the vppermost crust of the earth; and therefore many, with good successe, couer ouer their ground before Winter, with either fresh or old rotten dung, and that will maruellously preserue them. The like course you may hold with seedlings, to cause them to come on the forwarder, so it bee after the first yeares sowing, and not till then.

To remoue Tulipas after they haue shot forth their fibres or small strings, which grow vnder the great round rootes, (that is, from September vntill they bee in flower) is very dangerous; for by remouing them when they haue taken fast hold in the ground, you doe both hinder them in the bearing out their flower, and besides, put them in hazzard to perish, at least to bee put backe from bearing for a while after, as oftentimes I haue proued by experience. But when they are now risen to flower, and so for any time after, you may safely take them vp if you will, and remoue them without danger, if you haue any good regard vnto them, vntill it be a young bearing roote, which you shall in so doing much hinder, because it is yet tender, by reason it now beareth his first flower. But all Tulipa rootes when their stalke and leaues are dry, may most safely then be taken vp out of the ground, and be so kept (so that they lye in a dry, and not in a moist place) for sixe moneths, without any great harme: yea I haue knowne them that haue had them nine moneths out of the ground, and haue done reasonable well, but this you must vnderstand withall, that they haue not been young but elder rootes, and they haue been orderly taken vp and preserued. The dryer you keep a Tulipa roote the better, so as you let it not lye in the sunne or winde, which will pierce it and spoile it.

Thus Gentlewomen for your delights, (for these pleasures are the delights of leisure, which hath bred your loue & liking to them, and although you are herein predominant, yet cannot they be barred from your beloued, who I doubt not, wil share with you in the delight as much as is fit) haue I taken this paines, to set downe, and bring to your knowledge such rules of art, as my small skill hath enabled mee withall concerning this subiect, which of all other, seemed fittest in this manner to be enlarged, both for the varietie of matter, and excellency of beautie herein; and also that these rules set forth together in one place, might saue many repetitions in other places, so that for the planting and ordering of all other bulbous rootes, and the sowing the seedes of them, you may haue recourse vnto these rules, (*tantum ad normam & examen*) which may serue in generall for all other, little diuersitie of particulars needing exception.

The Place.

The greater Tulipas haue first bene sent vs from Constantinople, and other parts of Turkie, where it is said they grow naturally wilde in the Fields, Woods, and Mountaines; as Thracia, Macedonia, Pontus about the Euxine Sea, Cappadocia, Bithynia, and about Tripolis and Aleppo in Syria also: the lesser haue come from other seuerall places, as their names doe descipher it out vnto vs, as Armenia, Persia, Candie, Portugall, Spaine, Italy, and France. They are all now made Denizens in our Gardens, where they yeeld vs more delight, and more encrease for their proportion, by reason of the culture, then they did vnto their owne naturals,

The Time.

These doe flower some earlier, some later, for three whole moneths together at the least, therein adorning out a Garden most gloriously, in that being but one kinde of flower, it is so full of variety, as no other (except the Daffodils, which yet are not comparable, in that they yeeld not that alluring pleasant variety) doe the like besides. Some of the *Præcoces* haue bene in flower with vs, (for I speake not of their owne naturall places, where the Winters are milder, and the Spring earlier then ours) in the moneth of Ianuary, when the Winter before hath bene milde, but many in February,

and all the *Præcoces*, from the beginning to the end of March; if the yeare be kindly: at what time the *Medias* doe begin, and abide all Aprill, and part of May; when the *Serotines* flower and fade; but this, as I said, if the yeare be kindly, or else each kinde will be a moneth later. The feede is ripe in June and Iuly, according to their early or late flowering.

The Names.

There haue bene diuers opinions among our moderne Writers, by what name this plant was knowne to the ancient Authors: Some would haue it be *Cosmosandator*, of the Ancient. Dodonæus referreth it to *many* of Theophrastus, in his seuenth Booke and thirteenth Chapter: but thereof he is so brieue, that besides the bare name, wee cannot finde him to make any further relation of forme, or quality. And Bauhinus, vpon Matthioli Commentaries of Dioscorides, and in his Pinax alio, followeth his opinion. Camerarius in his Hortus Medicus is of opinion, it may be referred to the *Helychrysum* of Crateua. Gesner, as I thinke, first of all, and after him Lobel, Camerarius, Clusius and many others, referre it to the *Satyrium* of Dioscorides: and surely this opinion is the most probable for many reasons. First, for that this plant doth grow very frequent in many places of Greece, and the lesser Asia, which were no doubt sufficiently knowne both to Theophrastus, and Dioscorides, and was accounted among bulbous rootes, although by sundry names. And secondly, as Dioscorides setteth forth his *Satyrium*, so this most commonly beareth three leaues vpon a stalke (although sometimes with vs it hath foure or fise) like vnto a Lilly, whereof some are often seen to be both red, in the first springing, and also vpon the decaying, especially in a dry time, and in a dry ground: the flower likewise of some is white, and like a Lilly; the roote is round, and as white within as the white of an egge, couered with a browne coate, hauing a sweetish, but not vnpleasant taste, as any man without danger many try. This description doth so liuely set forth this plant, that I thinke wee shall not neede to be any longer in doubt, where to finde Dioscorides his *Satyrium Triphyllum*, seeing wee haue such plenty growing with vs. And thirdly, there is no doubt, but that it hath the same qualities, as you shall hereafter heare further. And lastly, that plant likewise that beareth a red flower, may very well agree with his *Erythronium*; for the descriptions in Dioscorides are both alike, as are their qualities, the greatest doubt may be in the feede, which yet may agree vnto Lin or Flaxe as fitly, or rather more then many other plants doe, in many of his comparisons, which yet wee receiue for currant. For the feede of Tulipas are flat, hard, and shining as the feede of *Linum* or Flaxe, although of another colour, and bigger, as Dioscorides himselfe setteth it downe. But if there should be a mistaking in the writing of *his* for *his* in the Greeke Text, as the slippe is both easie and likely, to were then out of all question the same: for the feede is very like vnto the feede of Lillies, as any man may easily discern that know them, or will compare them. It is generally called by all the late Writers, *Tulipa*, which is deriued from the name *Tulpan*, whereby the Turkes of *Dalmatia* doe entitle their head Tyres, or Caps; and this flower being blowne, laide open, and inuerted, doth very well resemble them. We haue receiued the early kinde from Constantinople, by the name of *Casa lala*, and the other by the name of *Caula lala*. Lobel and others doe call it *Lilio narcissus*, because it doth resemble a Lilly in the leafe, flower, and feede, and a Daffodill in the roote. We call it in English the Turkes Cap, but most vsually Tulipa, as most other Christian Countries that delight therein doe. Dalechampsius calleth it *Oulada*.

The Vertues.

Dioscorides writeth, that his first *Satyrium* is profitable for them that haue

have a convulsion in their necke, (which wee call a cricke in the necke) if it be drunke in harsh (which we call red) wine.

That the roots of Tulipas are nourishing, there is no doubt, the pleasant, or at least the not unpleasant taste, may hereto perswade; for diuers haue had them sent by their friends from beyond Sea, and mistaking them to bee Onions, haue vsed them as Onions in their pottage or broth; and neuer found any cause of dislike, or any sense of euill quality produced by them, but accounted them sweete Onions.

Further, I haue made tryall of them my selfe in this manner: I haue prepared the rootes of these Tulipas in Sugar, as I haue done the rootes of E-ringus, Orchis, or any other such like, and haue found them to be almost as pleasant as the E-ringus rootes, being firme and sound, fit to be presented to the curious; but for force of Venerous quality, I cannot say, either from my selfe, not hauing eaten many, or from any other, on whom I haue bestowed them: but surely, if there be any speciall propertie in the rootes of Orchis, or some other tending to that purpose, I thinke this may as well haue it as they. It should seeme, that Dioscorides doth attribute a great Venerous faculty to the seede, whereof I know not any hath made any especiall experiment with vs as yet.

CHAR. IX.

Narcissus. The Daffodill.

Here hath beene great confusion among many of our moderne Writers of plants, in not distinguishing the manifold varieties of Daffodils; for euery one almost, without consideration of kinde or forme, or other speciall note, giueth names so diuersly one from another, that if any one shall receiue from seuerall places the Catalogues of their names (as I haue had many) as they set them down, and compare the one Catalogue with the other, he shall scarce haue three names in a dozen to agree together, one calling that by one name, which another calleth by another, that very few can tell what they meane. And this their confusion, in not distinguishing the name of *Narcissus* from *Pseudonarcissus*, is of all other in this kinde the greatest and grossest error. To auoide therefore that gulf, whereof I complaine that so manie haue bin endrenched; and to reduce the Daffodils into such a methodicall order, that euery one may know, to what *Classis* or forme any one doth appertaine, I will first diuide them into two principall or primary kindes: that is, into *Narcissos*, true Daffodils, and *Pseudonarcissos*; bastard Daffodils: which distinction I hold to be most necessary to be set downe first of all, that euery one may be named without confusion vnder his owne primary kind, and then to let the other parts of the subdiuision follow, as is proper to them, and fittest to expresse them. Now to cause you to vnderstand the difference betweene a true Daffodill and a false; is this; it consisteth onely in the flower, (when as in all other parts they cannot bee distinguished) and chiefly in the middle cup or chalice; for that we doe in a manner onely account those to bee *Pseudonarcissos*, bastard Daffodils, whose middle cup is altogether as long, and sometime a little longer then the outter leaues that doe encompassse it, so that it seemeth rather like a trunke or long nose, then a cup or chalice, such as almost all the *Narcissi*, or true Daffodils haue; I say almost, because I know that some of them haue their middle cup so small, that we rather call it a crowne then a cup; and againe, some of them haue them so long, that they may seem to be of the number of the *Pseudonarcissi*, or bastard Daffodils; but yet may easily be knowne from them, in that, although the cup of some of the true Daffodils be great, yet it is wider open at the brim or edge, and not so long and narrow all alike as the bastard kindes are; and this is the chiefe and onely way to know how to seuer these kindes, which rule holdeth certaine in all, except that kinde which is called *Narcissus tuncifolius reflexo flore*; whose cup is narrow, and as long as the leaues that turne vp againe.

Secondly,

Secondly, I will subdiuide each of these againe apart by themselves, into foure sorts; and first the *Narcissos*, or true Daffodils into,

Latifolios, broad leaved Daffodils,

Angustifolios, narrow leaved Daffodils,

Iuncifolios, Rushe Daffodils, and

Marinos, Sea Daffodils.

These sorts againe doe comprehend vnder them some other diuisions, whereby they may the better be distinguished, and yet still bee referred to one of those foure former sorts: as

Monanthos, that is, Daffodils that beare but one flower, or two at the most vpon a stalke, and

Polyanthos, those that beare many flowers together vpon a stalke: as also

Simplici flore, those that beare single flowers, and

Multiplici flore, or *flore pleno*, that is, haue double flowers.

Vernales, those that flower in the Spring, and among them some that are earlier, and therefore called

Præcoces, early flowering Daffodils, and

Autumnales, those that flower in Autumne onely.

And lastly, with the *Pseudonarcissos*, or bastard Daffodils, I will keepe the same order, to distinguish them likewise into their foure seuerall sorts; and as with the true Daffodils, so with these false, describe vnder euery sort: first, those that beare single flowers, whether one or many vpon a stalke; and then those that beare double flowers, one or many also. As for the distinctions of *maior* and *minor*, greater and lesser, and of *maximus* and *minimus*, greatest and least, they doe not onely belong to these Daffodils; and therefore must be vsed as occasion permitteth, but vnto all other sort of plants. To begin therefore, I thinke fittest with that stately Daffodill, which for his excellency carrieth the name of None such.

1. *Narcissus latifolius omnium maximus, amplo calice flauo, sine Nompaeille.*

The great None such Daffodill, or Incomparable Daffodill.

This *Narcissus Nompaeille* hath three or foure long and broad leaues, of a grayish Greene colour, among which riseth vp a stalke two foote high at the least, at the toppe whereof, out of a thinn skinnie huske, as all Daffodils haue, commeth forth one large single flower, and no more vsually, consisting of sixe very pale yellow large leaues, almost round at the point, with a large cuppe in the middle, somewhat yellower then the leaues, the bottome whereof next vnto the stalke is narrow and round, rising wider to the mouth, which is very large and open, and vneuenly cut in or indented about the edges. The cup doth very well resemble the chalice, that in former dayes with vs, and beyond the Seas is still vsed to hold the Sacramentall Wine, that is with a narrower bottome, and a wide mouth. After the flower is past, sometimes there cometh (for it doth not often) a round Greene head, and blacke round seede therein, like vnto other Daffodils, but greater. The roote is great, as other Daffodils that beare large flowers, and is couered ouer with a brownish coate or skinne. The flower hath little or no sent at all.

Flora geminato. This doth sometimes bring forth a flower with ten or twelue leaues, and a cup much larger, as if it would be two, euen as the flower seemeth.

2. *Narcissus omnium maximus flore & calice flauo.*

The great yellow Incomparable Daffodill.

This other kinde differeth neither in forme, nor bignesse of leafe or flower from the former, but in the colour of the circling leaues of the flower, which are of the same yellow colour with the cup.

Flora geminato. This doth sometimes degenerate and grow luxurious also, bringing forth two flowers vpon a stalke, each distinct from other, and sometimes two flowers thrust together, as if they were but one, although it be but seldome; for it is not a peculiar kinde that is constant, yearly abiding in the same forme.

13. *Narcissus maximus griseus calice flavo.* The gray Peerlesse Daffodill. This Peerlesse Daffodill well deserueth his place among these kindes, for that it doth much resemble them, and peraduenture is but a difference raised from the seed of the former, it is so like in leaf and flower, but that the leaues seeme to be somewhat greater, and the sixe outer leaues of the flower to be of a glistering whitish gray colour, and the cup yellow; as the former, but larger.

14. *Narcissus latifolius flavo flore amplo calice, sine Martenese.* The lesser yellow Nompaille, or the Lady Marteneffes Daffodill. The leaues of this Daffodill are somewhat like ynto the leaues of the first kind, but not altogether so long or broad: the stalke likewise riseth not vp fully so high; and beareth one flower like the former, but lesser, and both the cuppe and the leaues are of one colour, that is, of a pale yellow, yet more yellow then in the former: the cup of this also is lesser, and a little differing; for it is neither fully so small in the bottome, nor so large at the edges, nor so crumpled at the brimmes, so that all these differences doe plainly shew it to be another kinde; quite from the former.

The Places.

The places of none of these are certainly knowne to vs where they grow naturally, but we haue them onely in our Gardens, and haue beene sent, and procured from diuers places.

The Time.

They flower sometimes in the end of March, but chiefly in Aprill.

The Names.

The first and second haue been sent vs by the name of *Narcisse Nompaille*, as it is called in French; and in Latine, *Narcissus omnium maximus ample calice flavo*, and *Narcissus incomparabilis*, that is, the Incomparable Daffodill, or the greatest Daffodill of all other, with a large yellow cuppe: but assuredly, although this Daffodill doth exceed many other, both in length and bignesse, yet the great Spanish bastard Daffodill, which shall be spoken of hereafter, is in my perswasion oftentimes a farre higher and larger flower; and therefore this name was given but relatively, we may call it in English, The great None such Daffodill, or the Incomparable Daffodill, or the great Peerlesse Daffodill, or the Nompaille Daffodill, which you will: for they all doe answer either the French or the Latine name; and because this name *Nompaille* is growne currant by custome, I know not well how to alter it. The third kinde may passe with the title given it, without controule. The last is very well knowne beyond the Seas, especially in the Low Countries, and those parts, by the Lady Marteneffe Daffodill, because Clusius receiued it from her. We may call it in English, for the correspondence with the former, The lesser yellow Nompaille, or Peerlesse Daffodill, or the Lady Marteneffe Daffodill, which you will.

The Place.

Narcissus Indicus flore rubro, dictus Iacobus.

The Indian Daffodill with a red flower.

This Indian Daffodill is so differing, both in forme, not hauing a cuppe, and in colour, being red, from the whole Family of the Daffodils (except the next that followeth, and the Autumne Daffodils) that some might iustly question the fittest place here: But because as all the plants, whether bulbous or other, that come from the

the Indies, either East or West (although they differ very notably, from those that grow in these parts of the world) must in a generall survey and muster be ranked euery one, as neere as the surueiours wit will direct him, vnder some other growing with vs, that is of neereft likenesse; Euen so vntill some other can direct his place more fitly; I shall require you to accept of him in this, with this description that followeth, which I must tell you also, is more by relation then knowledge, or sight of the plant it selfe. This Daffodill hath diuers broad leaues, somewhat like vnto the common or ordinary white Daffodill, of a grayish Greene colour; from the sides whereof, as also from the middle of them, rise vp sometimes two stalkes together, but most vsually one after another (for very often it flowreth twice in a Summer) and often also but one stalke alone, which is of a faint reddish colour, about a foote high or more, at the toppe whereof, out of a deepe red skinne or huske, commeth forth one flower bending downewards, consisting of sixe long leaues without any cup in the middle, of an excellent red colour, tending to a crimson; three of these leaues that turne vpwards, are somewhat larger then those three that hang downewards, hauing sixe threads or chiues in the middle, tipt with yellow pendants, and a threeforked stile longer then the rest, and turning vp the end thereof againe: the roote is round and bigge, of a brownish colour on the outside, and white within. This is set forth by Aldinus, Cardinall Farnesius his Physitian; that at Rome it rose vp with stalkes of flowers, before any leaues appeared.

The Place, Time, and Names.

This naturally groweth in the West Indies, from whence it was brought into Spaine, where it bore both in Iune and Iuly, and by the Indians in their tongue named AZCAL XOCHITL, and hath beene sent from Spaine, vnto diuers louers of plants, into seuerall parts of Christendome, but haue not thriued long in these transalpine colder Countries, so far as I can heare.

Narcissus Trapezunticus flore lateo praecocissimus.

The early Daffodill of Trebizond.

Because this Daffodill is so like in flower vnto the former, although differing in colour, I thought it the fittest place to ioyne it the next thereunto. This early Daffodill hath three or foure short very Greene leaues, so like vnto the leaues of the Autumne Daffodill, that many may easily bee deceiued in mistaking one for another, the difference consisting chiefly in this, that the leaues of this are not so broad or so long, nor rise vp in Autumne: in the midst of these leaues riseth vp a short green stalke, an handfull high, or not much higher vsually, (I speake of it as it hath often flowred with mee, whether the cause be the coldnesse of the time wherein it flowreth, or the nature of the plant, or of our climate, I am in some doubt; but I doe well remember, that the stalkes of some plants, that haue flowred later with me then the first, haue by the greater strength, and comfort of the Sunne, risen a good deale higher then the first) bearing at the top, out of a whitish thinne skinne striped with Greene, one flower a little bending downewards, consisting of sixe leaues, laid open almost in the same manner with the former Indian Daffodill, whereof some doe a little turne vp their points againe, of a faire pale yellow colour, hauing sixe white chiues within it, tipt with yellow pendants, and a longer pointell: the roote is not very great, but blackish on the outside, so like vnto the Autumne Daffodill; but that it is yellow vnder the first or outermost coate, that one may easily mistake one for another.

The Place.

It was sent vs from Constantinople among other rootes, but as wee may ghesse by the name, it should come thither from Trapezunte or Trebizond.

The Time. It flowreth sometimes in December, if the former part of the Winter haue

- 1 *Narcissus Nomporeille*. The incomparable Daffodill. 2 *Narcissus Marteneſe*. The leſſer yellow Nomporeille Daffodill. 3 *Narcissus Lacopius flore rubra*. The red Indian Daffodill. 4 *Narcissus Trapezanticus*. The early Daffodill of Trapezond. 5 *Narcissus Montanus albus apophyllar creditus*. The white winged Daffodill. 6 *Narcissus Montanus, ſine Nomporeille totus albus*. The white Nomporeille, or Pceſelle Daffodill. 7 *Narcissus albus oblongocalice*. The white Daffodill with a long cup,

haue been milde, but most vsually about the end of Ianuary, or else in February the beginning or the end.

The Names.

Wee doe vsually call it from the Turkish name, *Narcissus Trapezunticus*, and some also call it *Narcissus vernus praecox*, as Clusius doth, in English, The early Daffodill of Trebizond.

Narcissus Montanus albus apophysibus praeitus.
The white Mountaine Daffodill with eares, or
The white winged Daffodill.

This Mountaine Daffodill riseth vp with three or foure broad leaues, somewhat long, of a whitish Greene colour, among which riseth vp a stalke a foote and a halfe high, whereon standeth one large flower, and sometimes two, consisting of sixe white leaues a peece, not very broad, and without any shew of yellownesse in them, three whereof haue vsually each of them on the backe part, at the bottome vpon the one side of them, and not on both, a little small white peece of a leafe like an eare, the other three hauing none at all: the cup is almost as large, or not much lesse then the small Nompaille, small at the bottome, and very large, open at the brimme, of a faire yellow colour, and sometimes the edges or brimmes of the cup will haue a deeper yellow colour about it, like as if it were discoloured with Saffron: the flower is verie sweete, the roote is great and white, couered with a pale coate or skinne, not verie blacke, and is not very apt to encrease, seldome giuing off-sets; neither haue I euer gathered seede thereof, because it passeth away without bearing any with me.

Narcissus Montanus, siue Nompaille totus albus amplo calice.
The white Nompaille Daffodill.

This white Nompaille Daffodill, is in roote and leafe very like vnto the former mountain or winged Daffodill, but that they are a little larger: the stalke from among the leaues riseth vp not much higher then it, bearing at the top one large flower, composed of sixe long white leaues, each whereof is as it were folded halfe way together, in the middle whereof standeth forth a large white cup, broader at the mouth or brims then at the bottome, very like vnto the lesser Nompaille Daffodill before remembred, which hath caused it to be so entituled: the sent whereof is no lesse sweete then the former.

The Place.

The naturall places of these Daffodils are not certainly knowne to vs; but by the names they carry, they should seeme to bee bred in the Mountaines.

The Time.

These flower not so early as many other kindes doe, but rather are to bee accounted among the late flowering Daffodils; for they shew not their flowers vntill the beginning of May, or the latter end of Aprill, with the soonest.

The Names.

The names set downe ouer the heads of either of them be such, whereby they are knowne to vs: yet some doe call the first *Narcissus auriculatus*, that is to say, The Daffodill with eares: and the other, *Narcissus Nompaille totus albus*, that is to say, The white Nompaille, or Peerlesse Daffodill.

x. *Narcissus*

1. *Narcissus albus oblongo calice luteo praecox minor.*

The small early white Daffodill with a long cup.

The leaues of this early Daffodill are broad, very Greene, and not whitish as others, three or foure standing together, about a foote long or better, among which riseth vp a Greene stalke, not full so high as the leaues, bearing one flower at the toppe thereof of a reasonable bignesse, but not so great as the later kindes that follow are, consisting of six whitish leaues, but not perfect white, hauing a shew of a Creame colour appearing in them; in the middle is a long round yellow cup, about halfe an inch long or better. The smell of this flower is reasonable sweete, the roote is of a reasonable bignesse, yet lesser then the rootes of the later kindes.

2. *Narcissus pallidus oblongo calice flauo praecox.*

The early Strawe coloured Daffodill with a long cup.

The leaues of this Daffodill are as Greene as the former, but much narrower; and the leaues of the flower are more enclining to yellow, but yet very pale, as if it were a light strawe colour, and seeme to bee a little more narrow and pointed then the former: the cup of this, is as long and yellow as the precedent. The smell whereof is very like the former, yet neither of them being so sweete as those that follow.

3. *Narcissus albus oblongo calice luteo serotinus maior.*

The great late flowering white Daffodill with a long cup.

This later flowering Daffodill hath his leaues somewhat narrow & long, of a grayish or whitish Greene colour, among which the stalke riseth vp a foote and a halfe high, bearing one flower at the toppe, made of six white leaues, hauing the cup in the middle thereof as long as the former, and of a deepe yellow: the edges of this cuppe are sometimes plane, and sometimes a little crumpled; they are often also circled at the brimmes with a Saffron colour, and often also without it, the smell whereof is very pleasant, and not heady: the roote hereof is reasonable bigge, and couered ouer rather with a pae then blackish skinne. This flower doth sometimes alter his forme into eight leaues, which being narrow and long, seeme like a white starre, compassing a yellow trunk.

4. *Narcissus totus pallidus oblongo calice serotinus minor.*

The late pale coloured Daffodill with a long cup.

There is another of this kinde, whose flower is wholly of a pale white, or yellowish colour, differing neither in leafe nor roote from the former.

5. *Narcissus pallidus oblongo calice flauo serotinus.*

The Strawe coloured late flowering Daffodill with a long yellow cup.

The chief difference of this Daffodill from the former, consisteth in the colour of the top of the lower, which is of a more yellow colour, and a little larger then the former, and the brimmes or edges of the cup of a deeper yellow, or Saffron colour. The smell of this is no lesse sweete then in the former.

6. *Narcissus albus oblongo calice flauo serotinus, duobus floribus in caule.*

The late white Daffodill with a long cup, and two flowers on a stalke.

This Daffodill is surely a kinde of it selfe, although it be so like the former, abiding constant in his forme and manner of flowering, vsually bearing without missing two flowers vpon a stalke, very like vnto the former great white kinde, that one cannot know any greater matter of difference betweene them, then that it beareth two flowers on a stalke: the uppes whereof are seldome touched with any shew of Saffron colour on them at the brimmes or edges, as some of the former haue,

The Place.

All these Daffodils doe grow on the Pyrenæan mountaines, and haue beene brought out, and brought into these parts, by those curious or conuious searchers of these delights, that haue made vs partakers of them.

The Time.

The former kinde flower earlier by a fortnight then the later, the one in the later end of March, and the other not vntill the middle of Aprill.

The Names.

Their names are giuen to euery one of them in their severall titles, as fitly as may best agree with their natures; and therefore I shall not neede to speake any further of them.

Narcissus mediolatens vulgaris.

The common white Daffodill called Primrose Peerlesse.

This Daffodill is so common in euery Countrey Garden almost through England, that I doubt I shall but spend my time in vaine, to describe that which is so well knowne, yet for their sakes that know it not, I will set downe the description of it in this manner. It hath long limber and broad leaues, of a grayish Greene colour, among which riseth vp a stalke, bearing at the toppe out of a skinnie huske sometimes but one flower, but most commonly two flowers, and seldome three or more, but larger for the most part, then any that beare many flowers vpon a stalke, of a pale whitish Creame colour, tending somewhat neare vnto the colour of a pale Primrose (which hath caused our Countrey Gentlewomen, I thinke, to entitle it Primrose Peerlesse) with a small round flat Crowne, rather then a cup in the middle, of a pale yellow colour, with some pale chiuies standing therein, being of a sweete, but stuffing sent: the roote is reasonable great, and encreasing more then a better plant.

Narcissus medietroceus serotinus. The late flowering white Daffodill.

This Daffodill hath much smaller leaues, and shorter then the last, the stalke also riseth not so high by much, and beareth but one flower thereon, of a pure white colour, made of six small leaues, and somewhat narrow, standing seuerally one from another, and not so close together as the former, but appearing like a stare: the cup is small and round, of a pale yellow colour, but saffrony about the brims, hauing six small pale chiuies in the middle, the smell whereof is much sweeter then the former.

The Place.

The first is thought to grow naturally in England, but I could neuer heare of his naturall place. I am sure it is plentifull enough in all Countrey Gardens, so that wee scarce giue it place in our more curious parks. The second liueth onely with them that delight in varieties.

The Time.

The first Daffodill flowreth in the middle time, being neither of the earliest, nor of the latest; but about the middle, or end of Aprill. The other flowreth with the latest in May.

The Names.

I shall not neede to trouble you with further repetition of names, they hauing been set downe in their titles, which are proper to them.

1. *Narcissus vulgaris medio luteus*. The common white Daffodill, or Primrose Peerele. 2. *Narcissus medio purpureus maximus*. The great white purple ringed Daffodill. 3. *Narcissus medio purpureus parvus*. The early purple ringed Daffodill. 4. *Narcissus medio purpureus stellatus*. The starry purple ringed Daffodill. 5. *Narcissus Perficar*, The Petrus Daffodill. 6. *Narcissus Anemalis minor*. The lesser Winter Daffodill. 7. *Narcissus Anemalis maior*. The greater Winter Daffodill.

1. *Narcissus medio purpureus praecox*. The early purple ringed Daffodill.

This early Daffodill hath many long grayish Greene leaues, somewhat narrower and stiffer then the former common white Daffodill, among which riseth vp a long naked hollow stalke (as all other Daffodils haue) bearing at the toppc one flower, and seldome two, made of fixe long white leaues, standing close together about the stalke, the cup is yellow, and so flat, that it might rather bee called a crowne: for it standeth very close to the middle, and very open at the brimmes, circled with a reddish or purple coloured ring, hauing certaine chiuies in the middle of it also. The smell hereof is very sweete, exceeding many other.

2. *Narcissus medio purpureus serotinus*. The late purple ringed Daffodill.

The leaues of this Daffodill are alwayes broader then the former early one, and some are very neare twice as broad: the flower is very like the former, being large, and his leaues standing close one to the side of another; the ring likewise that compasseth the yellow coronet, is sometimes of a paler reddish purple, and sometimes as deepe a red as the former: so that it differeth not in any other materiall point, then that it flowreth notvntill the other is past and gone. The sent of this is like the former, the roote hereof is greater, as well as the leafe and flower.

3. *Narcissus medio purpureus maximus*.
The great white purple ringed Daffodill.

There is another kinde, whose flower (as well as leaues and rootes) is larger then any other of this kinde, which onely maketh it a distinct sort from the other: it flowreth also with the later sort of these purple ringed Daffodils.

4. *Narcissus medio purpureus stellaris*. The starry purple ringed Daffodill.

This Daffodill hath his leaues a little narrower and greener then the former sorts, the flower also of this hath his fixe white leaues not so broad, but narrower, and seeming longer then they, not closing together, but standing apart one from another, making it seeme like a white starre: it hath also a yellow coronet in the middle, circled about with purple, like the former. This doth smell nothing so sweete as the first, but yet hath a good sent.

The Place.

The first, third, and fourth of these Daffodils, haue alwayes beene sent vs from Constantinople among other bulbous rootes, so that wee know no further of their naturall places.

The second groweth in many places of Europe, both in Germany, France, and Italy, as Clusius hath noted.

The Time.

The first flowreth very early in March, euen with the first Daffodils. The second, third, and fourth, about a moneth after.

The Names.

The early and starre Daffodils, haue beene sent vs by the Turkish name of *Denebohini*, and *Serincade*. But their names, they haue receiued since, to be endenizond with vs, are set downe in their seuerall titles.

Narcissus Persicus. The Persian Daffodill.

This Persian Daffodill differeth from all other kindes of Daffodils in his manner of growing,

growing, for it neuer hath leaues and flowers at one time together, wherein it is like vnto a Colchicum, yet in roote and leafe it is a Daffodill. The roote is a little blackish on the outside, somewhat like the roote of the Autumne Daffodill, from whence riseth vp a naked foote stalke, bearing one pale yellow flower, breaking through a thinne skinne, which first enclosed it, composed of six leaues, the three outermost being a little larger then the rest, in the middle of the flower there are six small chiues, and a longer pointell. The whole flower is of an vnpleasant sent: After the flower is past, come vp the leaues, sometimes before Winter, but most vsually after the deepe of Winter is past with vs, in the beginning of the yeare, which are broad, long, and of a pale Greene colour, like the leaues of other Daffodils, but not Greene as the Autumne Daffodill is, and besides they doe a little twine themselues, as some of the Pancratium, or bastard Sea Daffodils doe.

Narcissus Autumnalis maior. The greater Autumne or Winter Daffodill.

The greater Autumne Daffodill riseth vp with three or foure faire broad and short leaues at the first, but afterwards grow longer, of a very deepe or darke Greene colour, in the middle of which riseth vp a short, stiffe, round foote stalke, bearing one faire yellow flower on the head thereof (inclosed at the first in a thinne skinne, or huske) and consisteth of six leaues as the former, with certaine chiues in the middle, as all or most other Daffodils haue, which passeth away without shew of any seed, or head for seed, although vnder the head there is a little Greene knot, which peraduenture would beare seede, if our sharpe Winters did not hinder it. The roote is great and round, couered ouer with a blackish skinne or coate.

Narcissus Autumnalis minor. The lesser Autumne or Winter Daffodill.

Clusius setteth downe, that the manner of the flowring of this lesser Daffodill, is more like vnto the Persian Daffodill; then vnto the former greater Autumne kind, but I doe finde that it doth in the same sort, as the greater kinde, rise vp with his leaues first, and the flowers a while after: the flower of this is lesser, and a little paler then the flower of the greater kinde, but consisting in like sort of six leaues, narrow and sharpe pointed; the Greene leaues also are almost of as deepe a Greene colour; as the greater kinde, but smaller and narrower, and a little hollow in the middle. The roote is also alike, but lesser, and couered with a blackish skinne as the former. This hath sometimes borne blacke round seede in three square heads.

The Place.

The Persian Daffodill hath beene sent sometimes, but very seldome, among other rootes from Constantinople, and it is probable by the name whereby it was sent, that it should naturally grow in Persia.

The other two haue likewise beene sent from Constantinople, and as it is thought, grow in Thracia, or thereabouts.

The Time.

They all doe flower much about one time, that is, about the end of September, and in October.

The Names.

The first hath been sent by the name of *Serincade Persiana*, and thereupon is called *Narcissus Persicus*, The Persian Daffodill.

The other two haue been thought by diuers to be Colchica, and so haue they called them, vpon no other ground, but that their flower is in forme and time somewhat like Colchicum, when as if they had marked them better, they might plainly discern, that in all other things they did resemble Daffodils; but now the names of *Colchicum latifolium*, & *minius*, is quite

lost,

lost, time hauing worne them out, and they are called by most Herbarists now adayes, *Narcissus Autumnalis maior & minor*, The greater and the lesser Autumne Daffodill.

Thus farre haue I proceeded with those Daffodils, that hauing broad leaues, beare but one single flower, or two at the most vpon a stalke: And now to proceed with the rest, that haue broad leaues, and beare single flowers, but many vpon a stalke.

Narcissus Africanus aureus maior. The great yellow Daffodill of Africa.

This braue and stately Daffodill hath many very long and broad leaues, of a better Greene colour, then many others that are grayish; among which appeareth a stalke, not rising to the height of the leaues, bearing at the toppe out of a skinnie hose many faire, goodly, and large flowers, to the number of ten or twelue, if the roote bee well growne, and stand in a warme place, euery one being larger then any of the French, Spanish, or Turkie Daffodils, that beare many single flowers vpon a stalke, and cometh neere vnto the bignesse of the English Daffodill, called Primrose Peerlesse, before described, or that French kinde hereafter described, that beareth the largest flowers, many vpon a stalke (which some would make to bee a kinde of that English Daffodill, but bearing more flowers) and of a faire shining yellow colour, hauing large, round, and open cups or boules, yellower then the outer leaues, and is of so exceeding sweete a sent, that it doth rather offend the senses by the abundance thereof: the roote is great, and couered with a blackish browne coate or skinne.

Narcissus Africanus aureus minor. The lesser Barbary Daffodill.

This lesser kinde is very neere the same with the former, but that it lacketh somewhat of his stateliness of height, largeness of flower and cup (being of a paler yellow) and beauty of colour, for it beareth neither of these equall vnto the former, but is in them all inferiour. And thus by this priuatiue, you may vnderstand his positue, and that shall be sufficient at this time.

Narcissus Byzantinus totus luteus. The yellow Turkie Daffodill.

Whereas the last described, came short of the beauty of the former, so this lacketh of that beauty is in the last; for this, although it haue very long leaues, and a high stalke, yet the flowers are neither so many, as not being aboue foure or fise, nor so large, being not much greater then the ordinary French Daffodill hereafter described, nor the colour so faire, but much paler, and the cup also smaller, and herein consisteth the chiefe differences betweene this, and both the other, but that the sent of this is also weaker.

The Place.

The first and the second grow in Barbary, about Argier, and Fez, as by the relation of them, that haue brought them into these parts, wee haue been enformed.

The last hath been often brought from Constantinople among other varieties of Daffodils, but from whence they receiued them, I could neuer learne.

The Time.

These Daffodils do flower very early, euen with the first sort of Daffodils, I meane after they haue been accustomed vnto our climate: for oftentimes vpon their first bringing ouer, they flower in Ianuary or February, especially if they be preserued from the frosts, and kept in any warme place; for they are very tender, and will soone perishe, being left abroad.

The Names.

The first is called by diuers in French, *Narcisse d'Algers*, and in many places

places of the Low Countries, *Narcissus van Heek*, or *Narcissus Heckius*; by diuers others *Narcissus Africanus aureus maior*, we may call it in English, The great African Daffodill, or the great Barbary Daffodill, or the great yellow Daffodill of Argiers, which you please.

The second hath no other variation of name, then a diminutiue of the former, as is set downe in the title.

The third is no doubt the same, that Clusius setteth downe in the twelfth Chapter of his second Booke of the History of more rare plants, and maketh the fourth sort, which came from Constantinople, and may also be the same, which he maketh his fifth, which (as he saith) he receiued from Doctor *Simor Tovar* of Scuill in Spaine. Wee call it, from the place from whence we receiued it, *Narcissus Byzantium*, with the addition of *totus luteus*, to put a difference from other sorts that come from thence also: in English, The yellow single Daffodill of Turkie.

Narcissus Sulphureus maior. The greater Lemon coloured Daffodill.

The greater of these Daffodils, beareth three or foure Greene and very long leaues, a foote and a halfe long at the least, among which riseth vp a round, yet crested stalke, not so high as the leaues, bearing five or sixe single flowers thereon, euery one of them being greater then the ordinary French or Italian Daffodils, with many flowers vpon a stalke, of a faint, but yet pleasant yellow colour at the first, which after they haue been in flower a fortnight or thereabouts, change into a deeper, or more fullen yellow colour: the cup in the middle is likewise larger, then in those formerly named, and of a deeper yellow colour then the outer leaues, hauing onely three chiues within it. The smell is very pleasant.

Narcissus Sulphureus minor. The lesser Lemon coloured Daffodill.

This lesser Daffodill hath broader and shorter leaues then the former, of the colour of other Daffodils, and not Greene like the former: the stalke of this riseth vp higher then the leaues, bearing foure or five flowers vpon shorter footestalkes, and no bigger then the French Daffodill, of a pale yellow, which most doe call a Brimstone colour, the cup or rather crowne in the middle, is small, and broad open, of a little deeper yellow, hauing many chiues within it, and is as it were sprinkled ouer with a kinde of mealesse. The smell of this is not full so pleasant as the former.

The Place.

Both these haue been gathered on the Pyrenæan Mountaines, and both likewise haue been sent out of Italy.

The Time.

They both flower in the middle time of the Daffodils flowering, that is, in Aprill.

The Names.

They haue their Latine names expressed in their titles, and so are their English also, if you please so to let them passe, or else according to the Latine, you may call them, The greater and the lesser Brimstone coloured Daffodils, some haue called them *Narcissus Italicus*, but the Italians themselves haue sent them by the name of *Narcisso Solfarigno*.

Narcissus totus albus polyanthus. The milke white Daffodill many vpon a stalke.

The leaues of this Daffodill are of a meane size, both for length and breadth, yet somewhat greener then in the ordinary sorts; that haue some whitenesse in them; the flowers

flowers are many vpon the stalke, as small for the most part, as any of these kindes that beare many together, being wholly of a milke, or rather snow white colour, both the cuppe, which is small, and the outer leaues that compasse it, after which come small heads, wherein is contained round blacke seede, as all other Daffodils doe, although some greater, and others lesser, according to the proportion of the plants: the roote is couered ouer with a blackish skinne or coate, the smell is very sweete.

There are two other sorts more of this kinde, the differences whereof are, that the one hath his leaues somewhat broader, and the flowers greater then the former: And the other smaller leaues and flowers also, whose cups being small, are neuer seene fully open, but as it were halfe closed at the brimmes.

Narcissus latifolius totus albus, mediocricalice reflexus.

The milke white Daffodill with the great cup.

There is yet another sort of these milke white Daffodils, whose leaues are as broad as any of the former, and whose cup in the middle of the flower, is somewhat larger then in any of the lesser sorts, and lesser then in the greater kinde: but the leaues of the flowers doe a little turne themselues vpwards, which maketh a chiefe difference.

The Place.

These Daffodils grow in Spaine, from whence I receiued many that flourished a while, but perished by some fierce cold Winters: they likewise grow in France, from whence many also haue been brought vnto vs. They haue likewise been sent from Constantinople to vs, among other kindes of Daffodils.

The Time.

They that come from Constantinople, for the most part doe flower earlier then the other, euen after they are accustomed to our ayre. Some of them flower notwithstanding in the end of March, the rest in Aprill.

The Names.

They are vsually called *Narcissus totus albus polyanthos*, adding thereunto the differences of *maior*, *medius*, and *minor*, that is, The milke white Daffodill, the greater, the middle, and the lesser; for so some doe distinguish them. The last, for distinction, hath his name in his title sufficient to expresse him.

1. *Narcissus Narbonensis, sine medio latens praeox,*

The early French Daffodill.

The leaues of this Daffodill, spring vp out of the ground a moneth or two sometimes before the other of this kinde, that follow; being also shorter, and narrower: the stalke likewise is not very high, bearing diuers flowers at the top, breaking through a thinne skinne, as is vsuall with all the Daffodils, euery one whereof is small, consisting of six white leaues, and a small yellow cup in the middle, which is of a prettie small sent, nothing so strong as many others: the roote is great and round, and seldome parteth into of-fets, euen as all the other that follow, bearing many single flowers, doe.

2. *Narcissus Narbonensis vulgaris.* The ordinary French Daffodill.

This Daffodill hath long and broad greene leaues, a little hollowish in the middle, and edged on both sides; the stalke is a foote and a halfe high, bearing at the toppe diuers flowers, somewhat larger then the former, consisting of six white leaues, somewhat round; the cup is yellow in the middle, small and round, like vnto an Acorne cuppe, or a little fuller in the middle: this is the forme of that sort which was first brought

1. *Narcissus Africanus auratus maior*. The great yellow Daffodill of Africa. 2. *Narcissus Africanus lateris minor*. The lesser yellow Daffodill of Africa. 3. *Narcissus Narbonneus medio lateris*. The French Daffodill. 4. *Narcissus Pisani*, vel totus albus. The Italian Daffodill, or the all white Daffodill. 5. *Narcissus Mussart*, Mussart his Daffodill. 6. *Narcissus Anglicus polyanthus*. The great English Daffodill.

brought vnto vs : But since there is found out some, whose cup is shorter, others flatter, some of a paler, others of a deeper yellow colour, and some that haue their cuppe longer then the rest. The rootes of them all are couered with a blackish skin or coate.

3. *Narcissus Narbonensis maior amplo flore.*
The French Daffodill with great flowers.

The leaues of this Daffodill are somewhat like vnto the last, but not so broad, yet full as long, and spring sooner out of the ground, yet not so early as the first of these kindes: the stalke hereof is flatter, and riseth higher, bearing foure or fise flowers, much larger then any of this kinde; for euery one of them doth equall the English Daffodill, before described, but whiter then it, and the yellow cup larger, and more open then in any of the rest. The roote of this is not so great, or round, as the former, but is more plentiful in of-fets, then any other of these French, or Italian kindes.

4. *Narcissus Pisanus.* The Italian Daffodill.

This Italian Daffodill hath his leaues as large, or larger then the second French Daffodill, and his stalke somewhat higher, bearing many white flowers, very like vnto the common French Daffodill, but somewhat larger also; and the yellow cup in the middle likewise is larger, and rounder, then is vsually seen in any of the French kindes, except the last with the greatest flowers.

5. *Narcissus mediocracens polyanthos.*
The French Daffodill with Saffron coloured cups.

This French Daffodill hath diuers leaues of a grayish Greene colour, not so broad or long as the last recited Daffodill, but coming neerer vnto the second French kinde, the flowers likewise are white, and many vpon a stalke, like thereunto, but the yellow cup is somewhat large, and circled with a Saffron like brimme or edge, which maketh the chiefe difference.

6. *Narcissus mediocracens alter, dictus Mussart.* Mussart his Daffodill.

The affinity between this & the last, (for it is not the same to be expressed vnder one title) hath made me ioine it next vnto it, yet because it hath a notable difference, it deserueth a place by himselfe. The leaues are large and long, and the flowers, being white, are larger also then in any other, except the greatest, but the cup hereof is small and short, rather seeming a coronet then a cup, of a deepe Saffron colour all about the brimmes or edges.

7. *Narcissus Anglicus polyanthos.* The great English Daffodill.

This Daffodill hath his leaues not much broader or longer, then the French kinde with great flowers, before described, the stalke with flowers riseth not fully so high as it, bearing many flowers thereon, not altogether so white, yet whiter then the former English Daffodill, called Printrose Peerlesse, but nothing so large, and with short, broad, and almost round leaues, standing close one vnto another: the yellow cup in the middle is bowle fashion, being somewhat deeper then in any of the former kindes, but not much greater: the smell hereof is very sweete and pleasant.

8. *Narcissus Narbonensis, sine medio luteus serotinus maior.*
The greater late flowring French Daffodill.

The rootes as well as the leaues of this Daffodill, are greater, larger, broader, and longer then in any other of the former French, or Italian kindes; the stalke is as high as any of them, bearing at the toppe fise or fixe white flowers, standing open spread like a starre, and not close together, euery one whereof is large, and round pointed, the

the cup is yellow, small and short, yet not lying flat to the flower, but a little standing out with some threads in the middle, as all the former Daffodils haue. This is not so sweete as the earlier kindes.

9. *Narcissus medioluteus alter serotinus calice breui.*

The lesser late flowering French Daffodill.

This Daffodill is of the same kinde with the last described, the onely difference is, that it is lesser, and the yellow cuppe in the middle of the flower, is somewhat shorter then the former, although the former be shorter then many others, otherwise it differeth not, no not in time; for it flowreth late as the former doth.

The Place.

These Daffodils haue been brought vs from diuers places: The first and second grow naturally in many places of Spaine, that are open to the Sea: they grow likewise about Mompelier, and those parts in France. They haue been likewise sent among many other sorts of Daffodils from Constantino-ple, so that I may thinke, they grow in some places neere thereunto.

The fourth groweth plentifully in Italy, about Pisa in Tuscan, from whence we haue had plants to furnish our Gardens.

The seuenth is accounted beyond Sea to be naturall of our Country, but I know not any with vs that haue it, but they haue had it from them.

The rest haue been brought at diuers times, but wee know no further of their naturall places.

The Time.

The first flowreth earlier then any of the rest by a moneth, euen in the beginning of March, or earlier, if the weather be milde. The other in Aprill, some a little before or after another. The late kinds flower not vntill May.

The Names.

There can be no more said of the names of any of them, then hath beene set out in their titles; for they distinguish euery sort as fitly as we can: onely some doe call the first two sorts, by the name of *Donax Narbonensis*.

After all these Daffodils, that hauing broad leaues beare single flowers, either one or many vpon a stalke, I shall now goe on to set forth those broad leaved Daffodils, that carry double flowers, either one or many vpon a stalke together, in the same order that we haue vsed before.

1. *Narcissus albus multiplex.* The double white Daffodill.

The leaues of this Daffodill are not very broad, but rather of a meane size, being of the same largenesse with the leaues of the purple ringed Daffodill, the stalke riseth vp to be a foote and a halfe high, bearing out of a thinne white skinne or hose, one flower and no more, consisting of many leaues, of a faire white colour, the flower is larger then any other double white Daffodill, hauing euery leafe, especially the outermost, as large almost as any leafe of the single Daffodill with the yellow cup, or purple ring. Sometimes it happeneth, that the flower is very little double, and almost single, but that is either in a bad ground; or for that it hath stood long in a place without remo-uing; for then it hath such a great encrease of rootes about it, that it draweth away in- to many parts, the nourishment that should be for a few: but if you doe transplant it, taking away the of-fets, and set his rootes single, it will then thrue, and beare his flower as goodly and double, as I haue before described it: and is very sweete.

2. *Narcissus mediopurpureus multiplex.* The double purple ringed Daffodill.

There is little difference in the leaues of this kinde, from the leaues of the single pur-
ple

ple ringed Daffodill; for it is probable it is of the same kinde, but by natures gift (and not by any humane art) made more plentifull, which abideth constant, and hath not that dalliance, which oftentimes nature sheweth, to recreate the senses of men for the present, and appeareth not againe in the same forme: the chiefest difference is, that the flower (being but sometimes one on a stalke, and sometimes two) consisteth of six white outer leaues, as large as the leaues of the single kinde, hauing many small yellow peeces, edged with purple circles round about them, instead of a cup; and in the middle of these peeces, stand other six white leaues, lesser then the former, and a yellow cup edged with a purple circle likewise, parted into peeces, and they comprehend a few other white leaues, smaller then any of the other, hauing among them some broken peeces of the cup, with a few chiues also in the middle of the flower. The flower is very sweete.

There is of this kinde another, whose flower hath not so plaine a distinction, of a triple rowe of leaues in it: but the whole flower is confusedly set together, the outer leaues being not so large, and the inner leaues larger then the former; the broken yellow cuppe, which is tipt with purple, running diuersly among the leaues; so that it sheweth a fairer, and more double flower then the former, as it is indeed.

3. *Narcissus mediolanteus corona duplici.*

The Turkie Daffodill with a double crowne.

This Daffodill hath three or foure leaues, as large and long almost, as the great double Daffodill of Constantinople next following hath: the stalke likewise is very neere as great, but as high altogether, bearing at the toppe foure or fve flowers, the leaues whereof are as large, as of the first or second kinde of French Daffodils, before described, but not altogether of so pure a white colour, and being six in number, stand like the former single French Daffodils, but that the yellow cup in the middle of this is thicke and double, or as it were crumpled together, not standing very high to be conspicuous, but abiding lowe and short, so that it is not presently marked, vnlesse one looke vpon it precisely; yet is exceeding sweete. The roote is like vnto the roote of the purpleringed Daffodill, or somewhat bigger.

4. *Narcissus Chalcedonicus flore pleno albo polyanthos.*

The double white Daffodill of Constantinople.

This beautifull and goodly Daffodill (wherewith all Florists greatly desire to bee acquainted, as well for the beauty of his double flowers, as also for his superabounding sweete smell, one stalke with flowers being instead of a nosegay) hath many very broad, and very long leaues, somewhat greener then gray, among which riseth vp a strong round stalke, being sometimes almost flat, and ribbed, bearing foure or fve, or more white flowers at the toppe, euery one being very great, large, and double, the leaues being confusedly set together, hauing little peeces of a yellow cup running among them, without any shew of that purple ring that is in the former, and fall away without bearing seed, euen as all, or most other double flowers doe: the smell is so exceeding sweet and strong, that it will soone offend the senses of any, that shall smell much vnto it: the roote is great and thicke, couered with a blackish coate.

5. *Narcissus Chalcedonicus fimbriatus multiplex polyanthos.*

The great double purple ringed Daffodill of Constantinople.

This Daffodill differeth very little or nothing in leafe from the former, the onely difference is in the flowers, which although they bee double, and beare many vpon a stalke, like vnto them, yet this hath the peeces of the yellow cuppes tipt with purple, as if they were shred or scattered among the white leaues, whereas the other hath only the yellow, without any shew of purple tips vpon them: the smell of this is as strong as of the other.

1. *Narcissus albus multiplex*. The double white Daffodill. 2. *Narcissus medialis coronae duplici*. The Turkie Daffodill with a double crown. 3. *Narcissus medius purpureus multiplex*. The double purple ringed Daffodill. 4. *Narcissus chalcidonicus flore pleno albo polyanthus*. The double white Daffodill of Constantinople.

6. *Narcissus Cypricus flore pleno luteo polyanthos.*
The double yellow Daffodill of Cyprus.

The leaues of this Daffodill are almost as broad and long as the former, the stalke is a foot high and more, bearing foure or fiue flowers on the top, euery one very double, and of a fine pale yellow colour, of a strong heady sent. The root of this is also like the former.

The Place.

The first of these Daffodils, was first brought into England by Mr. Iohn de Franqueuille the elder, who gathered it in his owne Countrey of Cambray, where it groweth wilde, from whose sonne, Mr. Iohn de Franqueuille, now liuing, we all haue had it. The rest haue come from Constantinople at seuerall times; and the last is thought to come from Cyprus. Wee haue it credibly affirmed also, that it groweth in Barbary about Fez and Argiers. Some of the double white kindes grow in Candy, and about Aleppo also.

The Time.

The Turkie kindes doe for the most part all flower early, in the end of March, or beginning of Aprill at the furthest, and the first double, about the middle or end of Aprill.

The Names.

All these Daffodils, except the first, haue had diuers Turkish names set vpon the packets, wherein they haue been sent, but there is small regard of certainty to be expected from them; for that the name *Serincade*, without any more addition, which is a single Daffodill, hath beene imposed vpon that parcell of rootes, that haue borne most of them double flowers of diuers sorts; and the name *Serincade Catamerale*, which signifieth a double flowered Daffodill, hath had many single white flowers, with yellow cups, and some whose flowers haue been wholly white, cuppe and all, and some purple ringed, and double also among them. Their names, whereby they are knowne and called with vs, are, as fitly as may be, imposed in their titles: And this I hope shall suffice, to haue spoken of these sorts of Daffodils.

Having finished the discourse of the former sort of broad leaved Daffodils, it is fit to proceede to the next, which are *Angustifolios Narcissos*, those Daffodils that haue narrow leaues, and first to set downe those that beare single flowers, whether one or many flowers vpon a stalke, and then those that beare double flowers in the same manner.

Narcissus Virginicus. The Virginia Daffodill.

This plant I thought fittest to place here in the beginning of this *Classis*, not finding where better to shroud it. It hath two or three long, and very narrow leaues, as Greene as the leaues of the great *Leucoium bulbosum*, and shining withall, which grow sometimes reddish, especially at the edges: the stalke riseth vp a spanne high, bearing one flower and no more on the head thereof, standing vpright like a little Lilly or Tulipa, made of six leaues, wholly white, both within and without, except that at the bottome next to the stalke, and a little on the backside of the three outer leaues, it hath a small dash or shew of a reddish purple colour: it hath in the middle a few chiuies, standing about a small head pointed; which head groweth to bee small and long, containing small blackish flat seede: the roote is small, long, and round, a little blackish on the outside, and white on the inside.

The

The Place.

This bulbous plant was brought vs from Virginia, where they grow abundantly; but they hardly thrive and abide in our Gardens to beare flowers.

The Time.

It flowreth in May, and seldome before.

The Names.

The Indians in Virginia do call it *Attamisco*, some among vs do call it *Liliumarcessus Virginianus*, of the likenesse of the flower to a Lilly, and the leaues and roote to a Daffodill. Wee for breuity doe call it *Narcissus Virginicus*, that is, The Daffodill of Virginia, or else you may call it according to the former Latine name, The Lilly Daffodill of Virginia, which you will; for both names may serue well to expresse the plant.

Narcissus angustifolius albidus praecox oblongo calice.

The early white narrow leaved Daffodill with a long cup.

This Daffodill hath three or foure narrow, long, and very greene leaues, a foote long for the most part: the stalke riseth not vp so high as the leaues, whereon standeth one flower, not altogether so great as the late flowring Daffodill, with a long cuppe, described before among the broad leaved ones, which consisteth of six pale coloured leaues, not pure white, but hauing a wash of light yellow among the white: the cuppe in the middle is round and long, yet not so long as to bee accounted a bastard Daffodill, within which is a middle pointell, compassed with six chiuces, hauing yellow mealy pendants.

The Place.

This Daffodill groweth with the other sorts of broad leaved ones, on the Pyrenæan Mountaines, from whence they haue beene brought vnto vs, to furnish our Gardens.

The Time.

It flowreth early, a moneth before the other sorts of the same fashion, that is, in the beginning of March, if the time be milde, which the other before spoken of doe not.

The Names.

It hath no other name that I know, then is expressed in the title.

2. *Narcissus mediocrocus tenuifolius.* The finall Daffodill with a Saffron crown.

This finall Daffodill hath foure or fve narrow leaues about a spanne long, among which riseth vp a stalke some nine inches high, bearing at the toppet one small white flower, made of six leaues, with a small yellow cup in the middle, shadowed ouer at the brimmes with a Saffron colour: the roote is small, round, and little long withall, couered with a blackish skinne or coate.

3. *Narcissus minimus medioparpareus.* The least purple ringed Daffodill.

This little Daffodill hath small narrow leaues, shorter by much then any of the purple ringed Daffodills, before described: the stalke and flower keepe an equall proportion to the rest of the plant, being in forme and colour of the flower, like vnto the

Starre Daffodill before recited, but vnlike in the greatnesse: this also is to bee obserued, that the purple colour that circleth the brimmes of the cuppe, is so small, that sometimes it is not well perceiued.

4. *Narcissus minimus luncifolij flore.* The least Daffodill of all.

This least Daffodill hath two or three whitish Greene leaues, narrower then the two last recited Daffodils, and shorter by halfe, being not aboue two or three inches long, the stalke likewise is not aboue three or foure inches high, bearing one single flower at the toppe, somewhat bigger then the smalnesse of the plant should seeme to beare, very like vnto the least Rush Daffodill, and of the same bignesse, or rather somewhat bigger, being of a faint yellow colour, both leaues, and cup, or crowne, (if you please so to call it); for the middle part is spread very much, euen to the middle of the leaues almost, and lyeth flat open vpon the flower: the roote is small, euen the smallest of any Daffodill, and couered with a blackish skinne or coate.

The Place.

The first of these Daffodils haue beene brought vs from the Pyrenæan Mountaines, among a number of other rare plants, and the last by a French man, called Francis le Veau, the honestest roote-gatherer that euer came ouer to vs. The second was sent to M^r. Iohn de Franqueuille, before remembred, who imparted it to mee, as hee hath done many other good things; but his naturall place wee know not.

The Time.

They all flower about the latter end of Aprill.

The Names.

Being brought without names, wee haue giuen them their names according to their face and fashion, as they are set downe in their titles.

Narcissus Autummalis minor albus. The little white Autumne Daffodill.

This little Autumne Daffodill riseth with his flowers first out of the ground, without any leaues at all. It springeth vp with one or two stalkes about a finger long, euery one bearing out of a small huske one small white flower, laid open abroad like vnto the Starre white Daffodill, before spoken of: in the middle of the flower is a small yellow cup of a meane size, and after the flower is past, there commeth in the same place a small head, containing small, round, blacke seede, like vnto the Autumne Hyacinth: the leaues come vp after the seede is ripe and gone, being small and narrow, not much bigger then the Autumne Hyacinth: the roote is small and blackish on the outside.

The Place.

This Daffodill groweth in Spaine, where Clusius saw it, and brought it into these parts.

The Time.

It flowreth in the beginning of Autumne, and his seede is ripe in the end of October in those hot Countries, but in ours it will scarce abide to shew a flower.

The Names.

The Spaniards, as Clusius reporteth, call it *Tonada*, and he vpon the sight thereof,

1. *Narcissus Virginicus*, The Virginian Daffodill. 2. *Narcissus minimus luteifolius* flore, The least Daffodill of all. 3. *Narcissus Autumnalis minor albus*, The little white Autumnal Daffodill. 4. *Narcissus albus Autumnalis mediae stigmatis*, The white Autumnal Daffodill with a fallen crown. 5. *Narcissus luteifolius maximus amplifolius*, The great Daffodill with the largest flower or cup. 6. *Narcissus ternus albus flore pleno Virginianus*, The double white Daffodill of Virginia.

thereof, *Narcissus Autumnalis minor albus*, and wee in English thereafter,
The little white Autumne Daffodill.

Narcissus albus Autumnalis medio obsoletus.

The white Autumne Daffodill with a fullen crowne.

This Autumne Daffodill hath two or three leaues at the most, and very narrow, so that some doe reckon it among the Rush Daffodils, being somewhat broad at the bottome, and more pointed at the toppe, betweene these leaues commeth vp the stalke, bearing vsually two flowers and no more at the toppe, made of fixe white leaues a peece, pointed and not round: the cup is small and round, like vnto the cup or crowne of the least Rush Daffodill, of a yellow colour at the bottome, but toward the edge of a dunne or fullen colour.

Narcissus angustifolius luteus semper florens Caccini.

The yellow Italian Daffodill of Caccini.

This Daffodill beareth a number of small, long, narrow, and very Greene leaues, broader then the leaues of any Rush Daffodill, among which rise vp diuers stalkes, bearing at the head two or three flowers a peece, each of them being small and yellow, the cup or crowne is small also, of a deeper yellow then the flower. The Nobleman of Florence, who first sent this plant to Christian Porret at Leyden, after the death of Carolus Clusius, writeth that euery stalke doth beare with him more store of flowers, then are formerly set downe, and that it neuer ceaseth to beare flowers, but that after one or moe stalkes haue been in flower together, and are past, there succeed other in their places.

The Place.

The first is naturall of Spain, the naturall place of the other is not known to vs.

The Time.

The times of the flowring, are set downe both in the title and in the descriptions, the one to be in Autumne, the other to be all the Summer long.

The Names.

The Latine names are imposed on them, as are fittest for them, and the last by that honourable man that sent it, which is most fit to continue, and not to bee changed. But wee, to let it bee knowne by an English name to English people, haue entituled it, The yellow Italian Daffodill of Caccini: if any man can giue it a more proper name, I shall bee therewith right well content.

Narcissus angustifolius, sive luncifolius maximus amplo calice.

The great Iunquilia with the large flower or cup.

Although this Daffodill importeth by his name, not to be of this family, but of the next, considering it is so like vnto them, but bigger, yet I haue thought good to place it in the end of these narrow leaved Daffodils, as being indifferent, whether it should bee referred to this or to that. For this carrieth diuers long Greene leaues, like vnto the other Rush Daffodils, but thicker and broader, so that it may without any great errour, bee reckoned among these narrow leaved Daffodils, bearing at the toppe two or three very faire large flowers, with a large and more open cuppe, then in any other of the Rush Daffodils, both of them of a faire yellow colour, yet the cuppe a little deeper then the flower, and a little crumpled about the edges, and hath a pretty sharpe sent: the roote is greater and longer then the other Rush Daffodill, and conered likewise with a blackish coate.

The

The Place.

We haue this in Gardens onely, and haue not heard of his naturall place:

The Time.

It flowreth in Aprill.

The Names.

I leane it indifferent, as I said, whether you will call it *Narcissus angustifolius*, or *lanceifolius magnocalice*, or *maximus*; because it is the greatest of all the rest of that kinde.

Narcissus totus albus flore pleno Virginianus.

The double white Daffodill of Virginia.

The roote of this Daffodill, is very like vnto the former single Virginia Daffodill; set forth in the first place of this ranke of narrow leaved Daffodills; but that it is a little bigger and rounder; being a little long withall; and blackish also on the outside, as that is: from whence riseth vp two leaues; somewhat broader then the former: but of a like greenesse: the stalke riseth vp betwene these two leaues, about a span high, or not much higher, bearing one faire double snow white flower, very like in the fashion vnto the pale yellow double Daffodill, or bastard Daffodill of Robinus, hereafter described: For it is in the like manner laid open flat, and composed of six rowes of leaues, euery rowe lying in order iust opposite, or one before another, whereof those six leaues that make the first or outermost course, are the greatest, and all the rest lying, as I said, one vpon or before another, are euery rowe smaller then others from the middle of this flower, thrusterth forth a small long pointed forke or horne, white as the flower is.

The Place.

The place is named to be Virginia, but in what part it is not known to vs:

The Time.

It flowreth in the end of Aprill.

The Names.

It may be that this doth grow among the former single kinde, and called by the same name Attamulco, for that the plant is not much differing, yet hereof I am not certaine: But we, from the forme and countenance of the plant, doe call it *Narcissus Virginianus*. The Virginian Daffodill, and because it beareth a double flower, it hath the title of double added vnto it.

The third order of Daffodills, I said in the beginning, was of *lanceifolias*, Rush Daffodills, which are now next to be entreated of, I shall herein keepe the same order I vsed in the former; but because I finde none of this order, that beare but one flower vpon a stalke, I must begin with those that beare many.

Narcissus lanceifolius albus. The white Iunquilla.

This white Rush Daffodill hath small long leaues, a little broader; and of a whiter Greene colour then the ordinary yellow Rush Daffodills: the stalke riseth vp halfe a foote high or more, bearing two or three small white flowers: ypon a stalke, yet somewhat bigger then the common yellow Rush Daffodill, hauing a small round cuppe in the middle, white also as the leaues are. The seede is small, blacke,

blacke, and round, as other seedes of Daffodils are: the roote is small and round, covered with a blackish coate.

Narcissus luncifolius albus magni calice. The white Iunquilia with a great cup.

There is of this kinde another sort, that hath the cup in the middle of the flower, a little larger then the other, but in all other things alike.

2. *Narcissus luncifolius flore albo reflexo.*

The white turning Iunquilia, or Rush Daffodill.

This turning white Daffodill hath foure or five long Greene leaues, yet shorter and broader then the ordinary yellow Iunquilia, and fully as Greene also, from among which riseth vp a slender Greene stalke, a foote high, bearing out of a thinn skinnie huske, three or foure, or more snow white flowers, standing vpon long Greene foot-stalkes, euery flower hanging downe his head, and turning vp his six narrow and long leaues, enen to the very foot-stalke againe: from the middle of the flower hangeth downe a long round cuppe, as white as the leaues, within which are contained three small white chiuies, tipt with yellow, and a small long pointell, thrusting out beyond the brimmes of the cup: after the flowers are past, there come vp in their places small three square heads, wherein is contained very small, round, and blacke shining seede: the roote is small, round, and a little long withall, covered with a blackish browne coate or skin. The flower is quite without any good sent, or indeed rather none at all.

3. *Narcissus luncifolius flore luteo reflexo.*

The yellow turning Iunquilia, or Rush Daffodill.

The leaues of this Rush Daffodill are greater and longer then the former, and of a paler Greene colour: the stalke riseth somewhat higher, bearing two or three flowers thereon wholly of a gold yellow colour, both the cuppe and the leaues that turne vp againe.

4. *Narcissus luncifolius calice albo reflexis folijs luteis.*

The yellow turning Iunquilia with a white cup.

This Daffodill hath his long rush-like leaues standing vpright as the former, betweene which riseth vp a Greene stalke, about a foote high or more, bearing two or three flowers thereon, whose turning leaues are of a faire pale yellow, and the cuppe pale white, and not so pure a white as the former.

5. *Narcissus luncifolius calice luteo reflexis folijs albidis.*

The white turning Iunquilia with a yellow cup.

As the last had the leaues of the flower that turne vp againe yellow, and the cuppe whitish, so this hath contrariwise the turning leaues of a whitish yellow, and the long cup yellow, else in his long green leaues, or any other thing, there is small difference.

6. *Narcissus luncifolius luteus magni calice.*

The Iunquilia, or Rush Daffodill with a great cup.

This Rush Daffodill hath bigger leaues, and longer then the ordinary yellow Rush Daffodill, being a little flat on the one side, and round on the other, but of the same greenesse with all the rest: the stalke riseth vp two foote high, bearing two, and sometimes three flowers thereon, being of a faire yellow colour, with a large open cup in the middle, of a little deeper yellow colour, like vnto the great Iunquilia with the large flower, before set downe, whereof this is a kinde, no doubt; but that is larger and greater then this, both in leafe, flower, cup, &c. and this onely somewhat lesse in all parts then that.

7. *Narcissus*

1. *Narcissus tazetta* L. The white tazetta. 2. *Narcissus tazetta* L. var. *alba* L. The white tazetta. 3. *Narcissus tazetta* L. var. *alba* L. The white tazetta. 4. *Narcissus tazetta* L. var. *alba* L. The white tazetta. 5. *Narcissus tazetta* L. var. *alba* L. The white tazetta. 6. *Narcissus tazetta* L. var. *alba* L. The white tazetta. 7. *Narcissus tazetta* L. var. *alba* L. The white tazetta. 8. *Narcissus tazetta* L. var. *alba* L. The white tazetta.

7. *Narcissus Iuncifolius luteus vulgaris maior.*
The ordinary Iunquilia, or Rush Daffodill.

This ordinary Rush Daffodill hath foure or fve long Greene round leaues, like vnto Rushes, whereof it tooke the name: among these leaues riseth vp the stalke, round and Greene, a foote and a halfe high very often, bearing at the toppe three or foure flowers all yellow, but much smaller then the last, and so is the cup also: the seede is small and blacke, inclosed in small cornered heads; the roote is blackish on the outside. The smell of the flower is very sweete in all these sorts of Rush Daffodils.

8. *Narcissus Iuncifolius luteus medius.* The smaller Iunquilia, or Rush Daffodill.

The leaues of this Daffodill are like vnto the former, but smaller and rounder, the stalke riseth not vp so high, nor are the flowers so great, but the leaues of the flower are a little rounder, and not so pointed as in the former, in all things else alike, sauing lesser.

9. *Narcissus Iuncifolius luteus minor.* The least Iunquilia, or Rush Daffodill.

This least Daffodill hath fve or six small Greene leaues, a little broader, and not so long as the last, among which riseth vp a stalke almost a foote high, bearing one or two small flowers at the toppe, of a paler yellow colour then the former, with a yellow open cuppe, or crowne rather in the middle, bigger then in either of the last two: the roote is very small and blacke, like vnto the last in roundnesse and colour.

10. *Narcissus Iuncifolius luteus albicantibus lineis distinctus.*
The yellow Iunquilia, or Rush Daffodill with white lines.

This Rush Daffodill hath round, Greene, and long leaues, like vnto the ordinary Rush Daffodill, with a stalke bearing two or three yellow flowers, hauing leaues somewhat round at the point or end, with a line or strake of white in the middle of euerie one of them, the cup is short, and crowne fashion, a little crumpled about the brims: the seede, roote, or any thing else differeth not.

11. *Narcissus Iuncifolius Autumnalis flore viridi.*
The Autumne Rush Daffodill with a Greene flower.

This strange Rush Daffodill (I call it strange, not onely because it differeth from all others of this kinde, but also because there are but few in these parts that haue had it, and fewer that doe still enioy it, in that it is perished withall that had it) hath but one onely leafe, very long, round, and Greene, in all that euer I saw growing, which beareth no flower while that Greene leafe is fresh, and to bee seene: but afterwards the stalke riseth vp, being like vnto the former Greene leafe, round, naked, and Greene vp to the toppe, where two or three flowers breake forth out of a small thin skinne, euerie one consisting of six small and narrow Greene leaues, very sharpe pointed at the end, and as it were ending in a small pricke or thorne: in the middle whereof is a small round cup, or rather crowne, of the same colour with the leaues and stalke, which flower smelleth very sweete, somewhat like vnto the rest of the Rush Daffodils: this sheweth not his flower vntill October, and the frosts quickly following after their flowring, cause them soone to perish.

12. *Narcissus angustifolius aureus multiplex.*
The golden double narrow leaved Daffodill.

The leaues of this Daffodill are very narrow, and of a whitish Greene colour, not aboue foure or fve inches long, from among which riseth vp a stalke about a foote high, bearing at the top one flower, consisting of some outer leaues, which are of a yellow

low colour, and of many other leaues in the middle being smaller, and set thicke and round together of a more yellow gold colour, but with some whiter leaues among them, the middle part a little pointing forth: the flower standeth long before it doth perfect his colour, and abideth long in flower before the colour decay: the roote is in fashion almost like the ordinary Iunquilia, or Rush Daffodill. I acknowledge this Daffodill hath not his proper place, but because the figure is set in this table, let it thus passe at this time.

13. *Narcissus lancifolius luteus flore pleno.* The double Iunquilia, or Rush Daffodill.

The double Rush Daffodill hath his long Greene leaues round, like the leaues of the common or ordinary Rush Daffodill, and of the same bignesse, among which riseth vp a long slender Greene stalke, bearing two or three, seldome more small flowers, yellow and double, that is, with diuers rowes of leaues, hauing the yellow cup such as is in the single flower, broken into small threads or peeces, running among the leaues of the flower, which peeces in some flowers are not so easily seene, being smaller then in others, this beareth no button or head vnder the flower for seede, his roote is round and blackish, browne on the outside, so like vnto the common Rush Daffodill, that it is almost impossible to know the one from the other.

There is another of this kinde, whose flowers are smaller, and not so double, one, After mineri
flore. two, or three at the most vpon a stalke, and of lesse beauty by much.

The Place.

All these Rush Daffodils, doe for the most part grow in Spaine and France, and on the Pyrenean Mountaines, which are betweene Spaine and France, which Mountaines are the Nourseries of many of the finest flowers, that doe adorne the Gardens of these louers of natures pride, and gathered in part by iudicious, learned, generous men, inhabiting neare thereunto, and in part by such as make a gaine of their labours, bestowed vpon these things. Onely that with the Greene flower was gathered in Barbary, and imparted vnto vs from France.

The Time.

They flower in the Spring, that is, in March and Aprill, except such whose time is set downe to be in Autumne.

The Names.

Their names are specified in their titles, and therefore I shall not need to set downe any further repetitions.

To conclude therefore this discourse of true Daffodils, there remaineth to speake of the Sea Daffodils, which (as I said in the beginning) is but one, that is frequent, and doth abide with vs. But there bee some others found about the Cape of good Hope, and in the West Indies, and brought into these parts rather for ostentation, then continuance, where they haue flowered onely once (if peraduenture so often) so that being such strangers, of so remote Countries, and of so diuers natures, I shall but shew you some of them, rather cursorily then curiously, and but onely for your satisfaction, giue you knowledge of two or three of them, that there haue bene seene such in flower, and that they are scarce to bee seene againe, except they bee fetcht a new euery yeare that they be seene.

Narcissus Maritimus, sive vertius Matthioli.
The great white Sea Daffodill, or Matthiolus his third Daffodill.

The roote of this Daffodill by long continuance, standing in one place without being remoued, groweth to be much greater and larger, then any other Daffodill whatsoever,

soeuer, and as bigge as any meane Squilla or Sea Onion roote, hauing many long, thicke, and white fibres, or long rootes, diuersly branched, and spread vnder the vpper part of the earth, beside some others that grow downward, and perish not euery yeare, as the fibres of all, or most of the other Daffodils doe; and therefore this plant will not thriue, and beare flowers, if it be often transplanted, but rather desire to abide in one place without remouing, as I said, and that not to be ouershadowed, or couered with other herbes standing too neare it, which then will flourish, and beare abundantly: from this roote, which is couered with many blackish coates, ariseth six or seuen, or more leaues, twice so broad almost, as any of the former Daffodils, but not so long by halfe as many of them, being but short, in comparison of the breadth, and of a white Greene colour; from the middle of which leaues, as also from the sides sometimes, springeth vp one or two, or more stalkes, roundish and thicke, and sometimes a little flat and cornered, a foote high or somewhat more, bearing at the toppe, out of a skinnie huske, eight, ten, twelue, or more very large flowers, consisting of six white leaues a peece, spread or laid open, with a white short cuppe or crowne in the middle, lying flat vpon the leaues, cut or diuided into six corners (and not whole, as the cuppe or crowne of any other single Daffodill) from euery of which edges, or corners of this cup or crowne, standeth one white long thread, a little crooked or turning vp at the end, tipt with a yellow pendent, and some other white threads tipt with yellow pendants, standing also in the middle: after the flower is past, there come vp great three square heads, wherein the seede is contained, which is great, blacke, and round, like vnto the seede of other Daffodils, but greater: the flower hath a reasonable good sent, but not very strong.

The Place.

It was first found by the Sea side, in the Isle of Sardinia, and on the high Mountaines also of the same Isle, where it hath borne by report, thirty five flowers vpon a stalke: it groweth likewise about Illyricum, and in diuers other places.

The Time.

It springeth later out of the ground then any other Daffodill, that is to say, not vntill the later end of March, or beginning of Aprill, and flowreth in the end of May, or the beginning of Iune: the seede is ripe in the end of Iuly, or beginning of August.

The Names.

The first that hath made mention of this Daffodill, was Matthiolus, who placed it in the third place among his Daffodils, and is most usually now a dayes called, *Narcissus tertius Matthioli*, Matthiolus his third Daffodill, the rather, because Clusius vpon a more mature deliberation, first referred it thereunto, but called it at the first, *Lilionarcissus Hemerocallidis facie*, and, as hee saith, Iacobus Plateau (who first sent him the figure hereof, with the description) called it *Lilionarcissus Orientalis*, but Clusius vpon certaine information, that it grew in the places aforesaid, misliked the name of *Orientalis*, and added *Hemerocallis*, which yet is not fit, for that his *Hemerocallis Valentina*, is a plaine Pancration or Sea bastard Daffodill, whose middle cup is longer then the cup of any true Daffodill, which (as I said in the beginning of this Chapter) is the chiefest note of difference, betweene a true and a bastard Daffodill. I receiued the seede of this Daffodill among many other seedes of rare plants, from the liberality of M^r. Doctor Flud, one of the Physitians of the Colledge in London, who gathered them in the Vniuersity Garden at Pisa in Italy, and brought them with him, returning home from his trauailes into those parts, by the name of *Martagon rarissimum*, (and hauing sowne them, expected fourteene yeares, before I saw them beare a flower, which the first yeare that it did flower, bore foure stalkes of flowers,

1 *Narcissus tertius Matthioli*. The great white Sea Daffodill. 2 *Narcissus Indicus Autumnalis*. The Indian Autumn Daffodill. 3 *Narcissus maritimus Africanus*. The Sea Daffodill of Africa. 4 *Narcissus maritimus exoticus*. The strange Sea Daffodill.

flowers, with euery one of them eight or ten flowers on them) which of all other names, doth least answer the forme or qualities of this plant. It may most fitly be called *Narcissus marinus maximus*, in English, The great Sea Daffodill, both because it is a true Daffodill, and the greatest of all other, and also because it hath not been found, but in Islands, or else in other places neare the Sea. Lobelius entitleth it *Pancratium Indicum alterum vernum*, *sive Narcissus Indicus alter facie Pancratij Monspelici*, but all this is wide from the matter, as may easily be known, by that that hath been said before. It is generally (as I said before) called of all *Narcissus tertius Matthioli*, Matthiolum his third Daffodill, which may either so passe with vs, or as I called it, The great Sea Daffodill, which you will, & so Clusius doth lastly entitle it.

1. *Pancratium Indicum, aut Narcissus Indicus Autumnalis quorundam Lobelij.*
The Indian Autumne Daffodill of Lobel.

This plant hath in my opinion, a farre nearer resemblance vnto an Hyacinthus, then vnto any Daffodill: But because Lobel hath so set it forth, I will so publish it vnto you, leauing it to iudgement. The roote is, as he saith, a span long, and of the thicknesse of a mans arme, couered with many white shells, whereof the outermost are of a darke red or Chestnut colour: the flowers rise vp in September, and October, being eight or ten in number, euery one by it selfe vpon a small footstake, made of six leaues a peece, somewhat long, narrow, and pointed, like vnto the flowers of the English Colchicum, or Medowe Saffron, of a whitish yellow dunne colour, with six long threads in the middle: the greene leaues are long and broad, and broad pointed.

2. *Narcissus Marinus Africanus, sive Exoticus Lobelij.*
The Sea Daffodill of Africa.

The roote of this strange plant (which of some likenesse is called a Daffodill) is very great, made as it were of many scaly cloues, from whence riseth vp a small short stalke, bearing hard about the ground two faire broad greene pointed leaues, more long then broad, so compassing the stalke at the bottome, that it seemeth to run through them: the stalke is spotted with diuers discoloured spots, and is bare or naked from these two leaues vnto the toppe, where it beareth one faire double flower, like vnto a double Aueuone, of a delayed reddish colour, tending to a blush, with many threads set about the middle head.

3. *Narcissus Marinus Exoticus.* The strange Sea Daffodill

This strange Sea Daffodill, hath five or six large and long leaues of a pale greene colour, from among which riseth vp a strong and bigge stalke, bearing at the toppe, out of a thinne hose or skinne, many very large flowers, made of six long and pointed leaues a peece, of a blewish purple colour, with a large round open cup in the middle, of a sadder colour then the leaues: the roote is very great, yet like vnto other great Daffodils, the outer skins whereof are of a darke browne colour.

The Place.

The Indian Daffodils grew in the vpper part of Hispaniola in the West Indies, and brought hither, where they all soone perished.

The other grew neare the Cape of good Hope, and was brought into the parts of Holland and thereabouts, from whence we had it, & perished also. The last is vnkowne where it was gathered.

The Time.

The first flowered in Autumne, as it is said.

The other in the first Summer of their bringing.

And so did the last, but the same rootes will not flower with vs againe.

The

The Names.

So much hath been said of their names in their titles; as hath comē to our knowledge; and therefore let that suffice.

Thus having gone through the whole Family of the true Daffodils, (for so much as hath come to our knowledge) and set them downe euery one by his name, and in his order; it is fit that we speake of their bastard brethren, and shew you them also, in the same order held with the former, as neare as the plenty of variety herein, which is not the like with the former, will giue leaue, that when you know them both by face and name, you may the better know to place or distinguish of others, that haue not passed vnder this rodd.

Pseudonarcissus aureus Hispanicus maximus.

The great yellow Spanish bastard Daffodill.

The roote of this kinde of Daffodill is reasonable great, and blackish on the outside, desiring to be deepe in the ground; and therefore will runne downe, where it will then encrease into many off-sets, from whence rise vp many thicke, long, and stiffe leaues, of a grayish Greene colour, among which riseth vp a round strong stalke, sometimes three foote high or better, bearing at the toppe one onely faire great yellow flower, standing forth right, and not pendulous, consisting of six short and somewhat broad leaues, with a very great, large, and long trunk, of an equall largenesse, but open at the mouth, and turning vp the brimmes a little, which are somewhat crumpled: after the flower is past, there commeth in the place a three square head, containing round blacke feede, like vnto other Daffodils.

Pseudonarcissus Pyrenæus Hispanico & Anglico similis.

The Mountaine bastard Daffodill of diuers kindes.

There is much variety in this kinde of bastard Daffodill: For one sort hath verie broad and whitish Greene leaues, somewhat short in comparison of others, that are of that breadth: the flower is wholly yellow, but a little paler then the former Spanish kinde, hauing the leaues of his flower long, and somewhat narrow, standing like wings about the middle trunk, which is as long as the leaues, and smaller then in many other of this kinde, but a little yellower then the wings. Another sort hath narrower green leaues then this last, and longer, the flower is all yellow, but the trunk is larger, wider, and more open at the mouth then the former, and almost as large as the former Spanish, but not so high as the last. A third hath the wings of the flower of a Strawe colour, but the trunk is long and narrow, of a faire yellow. A fourth hath such like flowers, but that it is shorter, both the wings and the trunk: Some likewise haue the wings of the flower longer, then the long trunk, and some shorter. Some also are all yellow, and some haue their wings onely a little more pale or white, like the English kinde: Some againe haue their trunks long and narrow, others haue them larger and wider open, and crumpled at the brimmes; so that it is needlesse, to spend a great deale of time and labour vpon such small respected flowers, but that in the beholding of them, we may therin admire the worke of the Creatour, who can frame such diuersity in onething: But this is beside the text, yet not impertinent.

Pseudonarcissus pallidus præcox. The early Strawe coloured bastard Daffodill.

The leaues of this Daffodill are of a meane size, betweene the broadest and the narrower kindes, of a grayish Greene colour, and not very long; the stalke riseth vp a foote high or more, whereon standeth one large great flower, equalling the greatest Spanish bastard Daffodill, before described: in the largenesse of his trunk, and hauing the brimmes turned vp a little, which maketh it seeme the larger: the wings or outer leaues are in a manner as short, as they are in the greatest Spanish kinde, (and not long flagging down, like vnto the Mountain kinds) and stand straight outright: all the whole flower is

of one euen colour, that is, of a fine pale yellow, somewhat like vnto the colour of a Lemon peelee or rinde, but somewhat whiter, which vsually we call a Strawe colour: the greatnesse of the flower, the earlinesse of the flowring, and the difference of colour from all the rest of this kinde, hath made me entreate of it apart by it selfe, as being no lesse worthy.

Pseudonarcissus Hispanicus flore albo maior.

The great white Spanishbastard Daffodill.

This bastard Daffodill hath diuers leaues rising vp together, long and broad, somewhat like vnto the first Spanish kinde, but a little broader, and of a whiter Greene colour, yet not so white, as in the lesser Spanish white kindes, hereafter described: among these leaues riseth vp a round strong stalke, about two foote high, bearing one white flower at the toppe, bending downe the head, as all these white kindes doe, but is not of so pure a white, as the lesser kindes that follow, yet whiter then the greatest white Spanish kinde, next of all to be described: the whole flower, as well trunke as wings, is much larger then the lesser white kindes, and almost equalling the first Spanish yellow, but a little longer and narrower, a little crumpled and turning vp at the brimmes: the head and seede are like the first; the roote is greater and thicker then the first Spanish, and doth not encrease so much, nor is couered with a blacke, but rather with a whitish coate.

Pseudonarcissus Hispanicus maximus albidus.

The greatest Spanish white bastard Daffodill.

This kinde of bastard Daffodill is very like the last mentioned Daffodill, both in leaues and flowers, but larger in both: the flower of this is not full so white, but hath some shew of palenesse therein, and more vpon the first opening of the flower then afterwards, and is as great altogether, as the great Spanish yellow, at the least with a longer, and somewhat narrower trunke: the seede is like vnto the former, and so is the roote also, but greater, being white on the outside, and not blacke.

Pseudonarcissus Hispanicus flore albo medius & minor.

The two lesser white Spanish bastard Daffodills.

There are two other of these kindes of white Spanish Daffodills, one greater or lesser then the other, but neither of them so great as the former. The leaues of both are of a whitish Greene colour, one a little broader then the other: the flowers of both are pure white, and bending downe the heads, that they almost touch the stalke againe, the greater flower hath the longer and narrower trunke, and the lesser flower, the shorter and wider open, yet both a little crumpled at the edges or brimmes: the rootes of both are like one vnto another, but differ in the greatnesse. From the seede of these haue sprung much variety, few or none keeping either colour or height with the mother plants.

Pseudonarcissus Anglicus vulgaris. Our common English wilde bastard Daffodill.

This bastard Daffodill is so common in all England, both in Copes, Woods, and Orchards, that I might well forbear the description thereof, and especially, in that growing wilde, it is of little respect in our Garden: but yet, lest I bee challenged of ignorance in common plants, and in regard of some variety therein worth the marking, I will set downe his description and variety, as briefly as I may: It hath three or foure grayish Greene leaues, long and somewhat narrow, among which riseth vp the stalke, about a span high or little higher, bearing at the toppe, out of a skinnie huske, as all other Daffodills haue, one flower (although sometimes I haue seene two together) somewhat large, hauing the six leaues that stand like wings, of a pale yellow colour, and the long trunke in the middle of a faire yellow, with the edges or brimmes a little crumpled or vneuen: after the flower is past, it beareth a round head, seeming three square, containing round blacke seede; the roote is somewhat blackish on the outside.

But

1 *Narcissus Hispanicus maximus aureus*. The great yellow Spanish bellid Daffodill. 2 *Narcissus Pyrenaicus platifolius*. The Mountain bellid Daffodill of flowers kin let. 3 *Narcissus Hispanicus minor albus*. The greater white Spanish bellid Daffodill. 4 *Narcissus Hispanicus minor albus*. The lesser Spanish white bellid Daffodill. 5 *Narcissus furcata sinuata*. The six cornered bellid Daffodill. 6 *Narcissus maximus aureus*. The great yellow bellid Daffodill. 7 *Narcissus aureus Anglicus maximus*. The greater yellow bellid Daffodill. 8 *Narcissus Hispanicus aureus flore pleno*. The double Spanish bellid Daffodill, or Parkinsons double Daffodill. 9 *Narcissus Gallicus major flore pleno*. The greater double French bellid Daffodill. 10 *Narcissus Anglicus flore pleno*. The double English bellid Daffodill, or Getards double Daffodill.

But there is another of this kinde like vnto the former, whose further description you haue here before; the wings of which flower are much more white then the former, and in a manner of a milke white colour, the trunke remaining almost as yellow as the former, and not differing in any thing else.

Pseudonarcissus tubo sexangulari, The six cornered bastard Daffodill.

This kinde of Daffodill hath two or three long, and somewhat broader leaues then the last, between which commeth forth a stalke, bearing one flower somewhat large, hauing the six outer leaues of a pale yellow colour, and the long trunke plaited or cornered all along vnto the very edge into six parts, of a little deeper yellow then the wings.

The Place.

The first great Spanish kinde was brought out of Spaine. The rest from the Pyrenæan Mountaines, onely the last sauing one is plentiful in our owne Countrey, but the white sort of that kinde came with the rest from the same Mountaines.

The Time.

The pale or thirde kinde, and the English bee the most early, all the rest flower in Aprill, and the greatest yellow somewhat earlier, then the other greater or lesser white.

The Names.

Their seuerall names are expressed in their titles sufficient to distinguish them, and therefore there needeth no more to be said of them.

1. *Pseudonarcissus aureus maximus flore pleno, sine Rosæ Tradescanti.*

The greatest double yellow bastard Daffodill, or
Iohn Tradescant his great Rose Daffodill.

This Prince of Daffodils (belongeth primarily to Iohn Tradescant, as the first founder thereof, that we know, and may well bee entituled the Glory of Daffodils) hath a great round roote, like vnto other Daffodils, couered with a brownish outer skinne or peeling, from whence riseth vp foure or fise somewhat large and broad leaues, of a grayish Greene colour, yet not fully so long and large as the next following Daffodill: from the middle whereof riseth vp a stalke almost as high and great as it, bearing at the toppe (out of a skinnie huske) one faire large great flower (the budde, before it breake open, being shorter and thicker in the middle, and ending in a longer and sharper point then any of the other Daffodils) very much spread open, consisting of smaller and shorter leaues then the next, but more in number, and thicker and rounder set together, making it seeme as great and double as any Prouince Rose, and intermixe with diuers yellow and pale leaues, as it were in rowes one vnder another. It abideth long in flower, and spreadeth, by standing long, to be the broadest in compasse of any of the Daffodils, but falleth away at the last without giuing any seede, as all double Daffodils doe.

2. *Pseudonarcissus aureus Anglicus maximus*, Mr. Wilmers great double Daffodill.

The other great double Daffodill doth so neare resemble our ordinary English double kinde, that I doe not finde therein any greater difference, then the largenesse both of leaues and flowers, &c. and the statelinesse of growth. It beareth three or foure large, long, and broad leaues, somewhat longer and broader then the former, and of a whitish Greene colour: the stalke riseth to bee two foote high, growing (in a fruitfull and fat soyle) strong, and somewhat round, bearing at the toppe, out of a thin skinne, one great and faire double flower, each leafe whereof is twice as large and broad

broad as the former, diuersly intermixt with a rowe of paler, and a rowe of deeper yellow leaues, wholly dispersed throughout the flower, the pale colour as well as the deeper yellow, in this as in the other small English kinde, growing deeper by standing: sometimes the leaues hereof are scattered, and spread wholly, making it shew a faire, broad, open flower: and sometimes the outer leaues stand separate from the middle trunk, which is whole and vnbroken, and very thicke of leaues: and sometimes the middle trunk will bee halfe broken, neither expressing a full open double flower, nor a close double trunk, as it is likewise seene in the small English kinde, as shall bee declared in his place: this beareth no seede; the roote hereof is thicke and great, and encreaseth as well as any other Daffodill.

3. *Pseudonarcissus aureus Hispanicus flore pleno.*

The great double yellow Spanish bastard Daffodill, or Parkinsons Daffodill.

This double Spanish Daffodill hath diuers leaues rising from the roote, stiffer, narrower, and not of so whitish a Greene colour as the former, but more fullen or grayish, plainly resembling the leaues of the single great kinde, from whence this hath risen: the stalke hereof likewise riseth almost as high as it, and neare the height of the last recited double, bearing one double flower at the toppe, alwayes spread open, and neuer forming a double trunk like the former, yet not so faire and large as it, the outermost leaues whereof being of a greenish colour at the first, and afterward more yellow, doe a little turne themselves backe againe to the stalke, the other leaues are some of a pale yellow, and others of a more gold yellow colour; those that stand in the middle are smaller, and some of them shew as if they were hollow trunked, so that they seeme to be greenish, whitish, yellow, and gold yellow, all mixed one among another: the root is great, round, and whitish on the inside, couered with darke coloured skinned or peelings. I thinke none euer had this kinde before my selfe, nor did I my selfe euer see it before the year 1618. for it is of mine own raising and flowering first in my Garden.

4. *Pseudonarcissus Gallicus maior flore pleno.*

The greater double French bastard Daffodill.

This greater double Daffodill, hath his whitish Greene leaues longer and broader then the smaller French kinde; hereafter following, to bee described, and broader, longer, and more limber then the double English kinde: the stalke riseth vp not much higher, then the smaller French kinde, but a little bigger, bearing at the top one great double flower, which when it is fully and perfectly blowne open (which is but seldom; for that it is very tender, the leaues being much thinner, and thereby continually subiect, vpon any little distemperature of the time, to cleaue so fast one vnto another, that the flower cannot blow open faire) is a faire and a goodly flower, larger by halfe then the smaller kinde, and fuller of leaues, of the same pale whitish yellow, or Lemon colour, with the lesser, or rather a little whiter, and not set in the same order of rowes as it is, but more confusedly together, and turning backe the ends of the outermost leaues to the stalke againe, and hauing the bottome of the flower on the backside somewhat Greene, neither of which is found in the lesser kinde: the roote is very like vnto the lesser kinde, but a little bigger and longer.

5. *Pseudonarcissus Anglicus flore pleno.*

The double English bastard Daffodill, or Gerrards double Daffodill.

The leaues of this double Daffodill are very like vnto the single kinde, being of a whitish Greene colour, and somewhat broad, a little shorter and narrower, yet stiffer then the former French kinde: the stalke riseth vp about a foote high, bearing at the toppe one very double flower; the outermost leaues being of the same pale colour, that is to bee seene in the wings of the single kinde; those that stand next them, are some as deepe a yellow as the trunk of the single, and others of the same pale colour, with some Greene stripes on the backe of diuers of the leaues: thus is the whole flower variably intermixt with pale and deepe yellow, and some Greene stripes among them, when

when it is fully open, and the leaues disperfed and broken. For sometimes the flower sheweth a close and round yellow trunk in the middle, separate from the pale outer wings, which trunk is very double, shewing some pale leaues within it, disperfed among the yellow: And sometimes the trunk is more open, or in part broken, shewing forth the same colours intermixt within it: the flower passeth away without giuing any seede, as all other bulbous rootes doe that beare double flowers: the roote is small, very like vnto the French double kindes, especially the lesser, that it is verie hard to know the one from the other.

The Place.

The first and greatest kinde, we had first from Iohn Tradescante (as I said before) whether raised from seed, or gained from beyond Sea, I know not.

The second we first had from Vincent Sion, borne in Flanders, dwelling on the Banke side, in his liues time, but now dead; an industrious and worthy loue of faire flowers, who cherished it in his Garden for many yeares, without bearing of any flowers vntill the yeare 1620. that hauing flowred with him, (and hee not knowing of whom hee receiued it, nor hauing euer seene the like flower before) he sheweth it to M^r. Iohn de Franqueuille, of whom he supposed he had receiued it, (for from beyond Sea he neuer receiued any) who finding it to bee a kinde neuer seene or knowen to vs before, caused him to respect it the more, as it is well worthy. And M^r. George Wilmer of Stratford Bowe Esquire, in his liues time hauing likewise receiued it of him (as my selfe did also) would needes appropriate it to himselfe, as if he were the first founder thereof, and call it by his owne name Wilmers double Daffodill, which since hath so continued.

The third is of mine owne fostering or raising, as I said before; for assuredly, it is risen from the seede of the great Spanish single kinde, which I sowed in mine owne Garden, and cherished it, vntill it gaue such a flower as is described.

The fourth is not certainly knowne where his originall should be: Some thinke it to be of France, and others of Germany.

The last is assuredly first naturall of our owne Countrey, for M^r. Gerrard first discovered it to the world, finding it in a poore womans Garden in the West parts of England, where it grew before the woman came to dwell there, and, as I haue heard since, is naturall of the Isle of Wight.

The Time.

They doe all flower much about one time, that is, from the middle or end of March, as the yeare is forward, vnto the middle of Aprill.

The Names.

Vpon the three first I haue imposed the names in Latine, as they are expressed in their titles: and for the English names, if you please, you may let them passe likewise as they are expressed there also, that thereby euery one may be truly distinguished, and not confounded. The fourth, besides the name in the title, is called of some *Narcissus Germanicus*, which whether it be of Germany, or no, I know not; but that the name should import so much. The last doth vsually carry M^r. Gerrards name, and called Gerrards double Daffodill.

1. *Pseudonarcissus angustifolius flore flauescens et tubo quasi abscisso.*

The narrow leaved bastard Daffodill with the clipt trunk.

This kinde of Daffodill hath long and narrow grayish Greene leaues, bearing one single flower at the toppe of his stalke, like vnto the former single bastard kindes, before

fore specified, having his outer leaues of a pale yellow colour, and his trunk of a deeper yellow: the chiefe differences in this from the former, is in the leaues, being narrow, and then in the trunk of the flower, which is not crumpled or turned vp, as most of the other are; and that the brimmes or edges of the flower is as if it had beene clipt off, or cut even.

2. *Pseudonarcissus Hispanicus medius & minor luteus.*

The two lesser Spanish yellow bastard Daffodils.

These two lesser kindes of Spanish Daffodils, doe but differ in greatnesse the one from the other, and not in any thing else; so that in declaring the one, you may vnderstand the other, to bee a little greater. The lesser then hath three or foure narrow short whitish Greene leaues, from among which commeth forth a short stalke, not above an hand breadth, or halfe a foote high, bearing one single flower, not fully standing outright, but a little bending downe, consisting of six small leaues, standing as wings about a small, but long trunk, a little crumpled at the brimmes: the whole flower, as well leaues as trunk, are of one deepe yellow colour, like vnto the great Spanish kinde: the roote is but small, and covered with a darkish coate. The other is in all parts greater, and (as I said) differeth not else.

3. *Pseudonarcissus Hispanicus luteus minimus.*

The least Spanish yellow bastard Daffodill.

The leaues of this small kinde are smaller and shorter then the former, seldome exceeding the length of three inches, and very narrow withall, but of the same grayish Greene colour with the former: euery flower standeth vpon a small and short foote-stalke, scarce rising about the ground, so that his nose, for the most part, doth lye or touch the ground, and is made after the same fashion, and of the same colour with the former, but much smaller, as his roote is so likewise.

4. *Pseudonarcissus Gallicus minor flore pleno.*

The lesser French double bastard Daffodill.

The rootes of this lesser French kinde (if I may lawfully call it, or the greater kinde before specified, a bastard Daffodill; for I somewhat doubt thereof, in that the flower of either is not made after the fashion of any of the other bastard Daffodils, but doth more nearely resemble the forme of the double white Daffodill, expressed before among the true Daffodils) are like vnto the double English kinde, as also to the former double greater French kinde, and the leaues are of the same whitish Greene colour also, but narrower and not longer: the stalke riseth a little higher then the English, and not fully so high as the greater French, bearing one faire double flower thereon, of a pale yellow or Lemon colour, consisting of six rowes of leaues, euery rowe growing smaller then other vnto the middle, and so set and placed, that euery leafe of the flower doth stand directly almost in all, one vpon or before another vnto the middle, where the leaues are smallest, the outermost being the greatest, which maketh the flower seeme the more beautifull: this and the greater kinde hath no trunk, or shew of any other thing in the middle, as all or most of the other former double bastard Daffodils haue, but are flowers wholly composed of leaues, standing double euen to the middle.

The Place.

The first is vndoubtedly a naturall of the Pyrenean Mountaines.

The Spanish kindes grew in Spaine, and

The French double kinde about Orleance in France, where it is said to grow plentifully.

The Time.

The first flowreth at the end of March.

The

The Spanish kinds are the most early, flowering betimes in March.

The French double doth flower presently after.

The Names.

More cannot bee said or added, concerning the names of any of these Daffodils, then hath been set downe in their titles: onely the French kinde is most vsually called Robinus his Daffodill.

Pseudonarcissus luncifolius albus. The white bastard Rush Daffodill, or Iunquilia.

This bastard Rush Daffodill hath two or three long and very Greene leaues, very like vnto the small yellow Rush Daffodill, formerly described, but not altogether so round, among which riseth vp a short stalke, seldome halfe a foote high, bearing at the toppe, out of a small skinnie huske, one small white flower, sometime declining to a pale colour, hauing six small and short leaues, standing about the middle of the trunke, which is long, and much wider open at the mouth, then at the bottome: the small outer leaues or wings are a little tending to Greene, and the trunke (as I said) is either white, or whitish, hauing the brimmes a little vneuen: the seede is small, blacke, and round, like vnto other Rush Daffodils, but smaller.

Pseudonarcissus luncifolius luteus maior.

The greater yellow Iunquilia, or bastard Daffodill.

The leaues of this greater kinde are longer, greater, and a little broader then the former; the stalke also is higher, and the flower larger, more open at the mouth and crumpled, then the white, but wholly of a yellow colour: the seede and the roots are bigger, according to the proportion of the plant.

Pseudonarcissus luncifolius luteus minor. The lesser yellow bastard Iunquilia.

This is so like vnto the last in all things, that I shall not neede to trouble you with repetitions of the same things formerly spoken, the chiefe difference is the smallnesse of the plant in all parts.

Pseudonarcissus luncifolius luteus serotinus. The late yellow bastard Iunquilia.

There is likewise a third kinde, as great as the greater yellow, and in all his parts expressing and equalling it, but is accounted the fairer, and flowreth somewhat later.

The Places.

The Pyrenean Hills haue afforded vs all these varieties, and wee preferue them carefully, for they are all tender.

The Time.

All these flower in Aprill, except the last, which is a moneth later.

The Names.

The French and Lowe-Country men call them *Trompettes*, that is, Trumpets, from the forme of the trunke; wee sometimes call them also by that name, but more vsually bastard Iunquilia's.

Pseudonarcissus maritimus albus, *Pauercratium vulgo*.

The white Sea bastard Daffodill.

The Sea bastard Daffodill (to conclude this Chapter, and the discourse of Daffodils)

- 1 *Pseudonarcissus tuberosus* abissi. The bastard Daffodill with the clipped trunk. 2 *Pseudonarcissus Hispanicus minor*. The lesser Spanish bastard Daffodill.
 3 *Pseudonarcissus Hispanicus minimus*. The least Spanish bastard Daffodill. 4 *Pseudonarcissus Gallicus minor flore pleno*. The lesser double French bastard Daffodill. 5 *Pancratium flore albo*. The white Sea bastard Daffodill. 6 *Pseudonarcissus luteifolius luteus maior*. The greater yellow bastard lunquilia.
 7 *Pseudonarcissus luteifolius luteus minor*. The lesser yellow bastard lunquilia. 8 *Pseudonarcissus luteifolius luteus frutescens*. The late yellow bastard lunquilia. 9 *Leucium bulbosum praeox minus*. The great early bulbous Violet. 10 *Leucium bulbosum praeox minus*. The lesser early bulbous Violet.
 11 *Leucium bulbosum autumnale*. The small Autumnal bulbous Violet. 12 *Leucium bulbosum autumnale frutescens*. The great late flowering bulbous Violet.

dils) hath diuers broad whitish Greene leaues, but not very long, among which riseth vp a stiffe round stalke, at the top whereof breaketh out of a great round skinny huske, fise or six flowers, euery one made somewhat of the fashion of the great bastard Rush Daffodill, but greater, and wholly white; the six leaues, being larger and longer then in the Rush kinde, and extending beyond the trunke, are tipt with Greene at the point of each leafe, and downe the middle likewise on the backside. The trunke is longer, larger, and wider open at the mouth, cut in or indented at the brims or edges, and small at the bottome, with diuers white threeds in the middle, and is very sweet: vnder the flower is a round Greene head, which groweth very great, hauing within it, when it is ripe; flat and blacke seede: the roote is great and white.

*Flare lutea, &
flare rubra.*

It is reported, that there are found other sorts, some that beare yellow flowers, and others that beare red: but we haue seene none such, and therefore I can say no more of them.

The Place.

This kinde groweth neare the Sea side, both in Spaine, Italy, and France, within the Straights, and for the most part, vpon all the Leuant shoare and Islands also, but will seldome either flower, or abide with vs in these colder Countries, as I haue both seene by those that I receiued from a friend, and heard by others.

The Time.

It flowreth in the end of Summer, that is, in August and September.

The Name.

Diuers doe call it *Pancratium*, as the learned of Mompeher, and others, with the addition of *flare Lily*, after they had left their old errour, in taking it to be *Scylla*, and vsing it for *Scylla*, in the *Trochiscs* that go into Andromachus Treakle. The learned of Valentia in Spaine, as Clusius saith, doe call it *Hemerocallis*, thinking it to be a Lilly; and Clusius doth thereupon call it, *Hemerocallis Valentina*: but in my opinion, all these are deceived in this plant; for it is neither a Lilly, to haue the name of *Hemerocallis* giuen vnto it, nor *Scylla*, nor *Pancratium*, as many doe yet call it: for certainly this is a kinde of Daffodill; the forme both of roote, leafe, and flower, doth assure me that haue seene it, and not *Pancratium*, which (as Dioscorides testifieth) is a kinde of *Scylla*, and in his time called *Scylla*, with a red roote, and a leafe like a Lilly, but longer, and was vsed both with the same preparation and quantity, and for the same diseases that *Scylla* was vsed, but that his force was weaker: all which doth plainly shew the errours that many learned men haue been conuersant in, and that all may see how necessary the knowledge of Herbarisme is to the practice of Physicke; And lest the roote of this Sea bastard Daffodill bee vsed in the stead of an wholsome remedy, which (as Clusius maketh mention) was deadly to him that did but cut his meate with that knife, which had immediately before cut this roote, and done in malice by him, that knew the force thereof, to kill his fellow, it working the more forceably by the euill attracting quality of the iron.

The Vertues of Daffodils in generall.

Howsoeuer Dioscorides and others, doe giue vnto some of them speciall properties, both for inward and outward diseases, yet know I not any in these dayes with vs, that apply any of them as a remedy for any grieffe, whatsoeuer Gerrard or others haue written.

CHAP. X.

Leucoium bulbosum. The bulbous Violet.

HAuing thus set downe the whole family, both of the true and bastard Daffodils, I should next set in hand with the Hyacinths; but because *Leucoium bulbosum*, The bulbous Violet is a plant that doth challenge a place next vnto the Daffodils, as most nearly partaking with them, and a little with the Hyacinthes, I must of necessity interpose them, and shew their descriptions and differences, whereof some are early, of the first Spring, others later, and some of the Autumne.

Leucoium bulbosum praecox mains. The greater early bulbous Violet.

This bulbous Violet hath three or foure very Greene, broad, flat, and short leaues, among which riseth vp a naked Greene stalke, bearing out of a small skinny hose (as the former Daffodils doe) one white flower, hanging downe his head by a very small foot-stalke, made of six leaues, of an equall length, euery one whereof is tip at the end with a small greenish yellow spot: after the flower is past, the head or seed-vesseil groweth to be reasonable great, somewhat long and round, wherein is contained hard round seede, which being dry, is cleare, and of a whitish yellow colour: the roote is somewhat like a Daffodill roote, and couered with a blackish outside or skinne.

Leucoium bulbosum praecox minus. The lesser early bulbous Violet.

This lesser kinde riseth vp with two narrow grayish Greene leaues, between which commeth forth the stalke, five or six inches high, bearing one small pendulous flower, consisting of three white leaues, which are small and pointed, standing on the outside, and hauing three other shorter leaues, which seeme like a cup in the middle, being each of them round at the ends, and cut in the middle, making the forme of an heart, with a Greene tippe or spot at the broad end or edge: the seede is whitish, inclosed in long and round heads, like the former, but lesser: the roote is like a small Daffodill, with a blackish gray coate, and quickly diuideth into many of-sets.

There is another of this kinde, that came among other bulbous rootes from Constantinople, and differeth in nothing from it, but that it is a little greater, both in roote, leafe, and flower.

The Place.

The two first are found in many places of Germany, and Hungary. The third, as I said, was brought from Constantinople.

The Time.

The two lesser sorts doe most commonly flower in February, if the weather be any thing milde, or at the furthest in the beginning of March, but the first is seldome in flower, before the other be well neare past, or altogether.

The Names.

Lobel and Dodonæus call the lesser kinde *Leucoium triphyllum*, and *Leuconarcissolirion triphyllum*, of the three leaues in the flower. Some doe call it *Viola bulbosa alba*. The first or greater kinde is called by Lobel, *Leuconarcissolirion paucioribus floribus*, and by Dodonæus, *Leucoium bulbosum hexaphyllum*. We doe most vsually call them, *Leucoium bulbosum praecox mains*, & *minus*, The greater, or the lesser early bulbous Violet. In Dutch, *Somer Sottekens*, and not *Druifkens*, which are Grape-flowers, as some haue thought.

1. *Leucoium bulbosum Vernal minimum.*
The small bulbous Violet of the Spring.

This small *Leucoium* sendeth forth his small and long greene leaues, like haire in Autumne, and before Winter, which abide greene vntill Aprill, and then wither away quite, and about May there ariseth vp a naked slender stalke, at the toppe whereof breake forth two small white flowers, made of six leaues a peece, hanging downe their heads, the three inner leaues being a little larger then the three outward, a little reddish neare the stalke, and very sweet: the roote is small and round, and couered with a darke coate.

2. *Leucoium bulbosum Autumnale.* The small Autumne bulbous Violet.

As the former small *Leucoium* sprang vp with his leaues without flowers in Autumne, so this contrariwise, riseth vp with his slender brownish stalke of flowers in Autumne, before any greene leaues appeare, whereon stand two or three very small snow white pendulous flowers, consisting of six leaues a peece, and a little reddish at the bottome of the flower next vnto the stalke, so like vnto the former, that one would take them to be both one: after which, there grow small browne heads, containing small, blacke, round seed; after the flower is past, and the seede is ripening, and sometimes after the heads are ripe, the leaues begin to spring vp, which when they are full growne, are long, greene, and as small, or smaller then the leaues of the Autumne Hyacinth, which abide all the Winter, and Spring following, and wither away in the beginning of Summer: the roote is small, long, and white.

3. *Leucoium matius bulbosum serotinum.*

The great late flowering bulbous Violet.

The late bulbous Violet hath three or foure broad flat greene leaues, very like vnto the first, but longer, among which riseth vp a flattish stalke, being thicker in the middle then at both edges, on the toppe whereof stand three or foure flowers, hanging downe their heads, consisting of six leaues a peece, all of an equall length and bignesse, wholly white, except that each leafe hath a greene tippe at the end of them: the seede hereof is blacke and round; the roote is reasonable great and white.

The Place.

The two former small ones were first found in Spaine, and Portugall, and sent to me by Guillaume Boel; but the first was so tender, that scarce one of a score sprang with me, or would abide. The greatest haue beene found wilde in Germany and Austria.

The Time.

The small ones haue their times expressed in their titles and descriptions, the last flowreth not vntill May.

The Names.

These names that are set downe in their titles, doe passe with all Herbarists in these daies.

The Vertues.

Wee haue not knowne these plants vsed Physically, either inwardly or outwardly, to any purposes in these dayes.

CHAP. XI.

Hyacinthus. The Hyacinth or Iacynth.

THe Iacynths are next to be entreated of, whereof there are many more kinds found out in these later times, then formerly were knowne, which for order and method sake, I will digest vnder seuerall sorts, as neare as I can, that auoiding confusion, by enterlacing one among another, I may the better put euery sort vnder his owne kinde.

Hyacinthus Indicus maior tuberosa radice.

The greater Indian knobbed Iacynth.

I haue thought fittest to begin with this Iacynth, both because it is the greatest and highest, and also because the flowers hereof are in some likenesse neare vnto a Daffodill, although his roote be tuberous, and not bulbous as all the rest are. This Indian Iacynth hath a thicke knobbed roote (yet formed into seuerall heads, somewhat like vnto bulbous rootes) with many thicke fibres at the bottome of them; from the diuers heads of this roote arise diuers strong and very tall stalkes, beset with diuers faire, long, and broad leaues, ioyned at the bottome close vnto the stalke, where they are greatest, and grow smaller to the very end, and those that grow higher to the toppe, being smaller and smaller, which being broken, there appeare many threeds like wooll in them: the toppes of the stalkes are garnished with many faire large white flowers, each whereof is composed of six leaues, lying spread open, as the flowers of the white Daffodill, with some short threeds in the middle, and of a very sweete sent, or rather strong and headie.

Hyacinthus Indicus minor tuberosa radice.

The smaller Indian knobbed Iacynth.

The roote of this Iacynth is knobbed, like the roote of Arum or Wake Robin, from whence doe spring many leaues, lying vpon the ground, and compassing one another at the bottome, being long and narrow, and hollow guttered to the end, which is small and pointed, no lesse woolly, or full of threeds then the former: from the middle of these leaues riseth vp the stalke, being very long and slender, three or foure foot long, so that without it be propped vp, it will bend downe, and lye vpon the ground, whereon are set at certaine distances many short leaues, being broad at the bottome, where they doe almost compasse the stalke, and are smaller toward the end where it is sharpe pointed: at the top of the stalke stand many flowers, with a small peece of a green leafe at the bottome of euery foot-stalke, which seeme to bee like so many white Orientall Iacynths, being composed of six leaues, which are much thicker then the former, with six chiues or threeds in the middle, tipt with pale yellow pendants.

The Place.

They both grow naturally in the West Indies, from whence being first brought into Spaine, haue from thence been disperfed vnto diuers louers of plants.

The Time.

They flower not in these cold Countries vntill the middle of August, or not at all, if they bee not carefully preserued from the iniury of our cold Winters, and then if the precedent Summer be hot, it may be flower a moneth sooner.

The Names.

Clusius calleth the lesser (for I thinke hee neuer saw the first) *Hyacinthus*

K 2

Indicus

Indicus tuber of a radice, that is in English, The Indian Iacynth with a tuberous roote: Some would call these *Hyacinthus Eriophorus Indicus*, that is, The Indian woolly Iacynth, because they haue much wooll in them when they are broken; yet some doe doubt that they are not two plants seuerall, as of greater and lesser, but that the greatnesse is caused by the fertility of the soyle wherein it grew.

1. *Hyacinthus Botroides maior Moschatus, sine Muscari flore flauo.*

The great yellow Muske Grape-flower, or yellow Muscari.

This Muske Iacynth or Grape-flower, hath five or six leaues spread vpon the ground in two or three heads, which at the first budding or shooting forth out of the ground, are of a reddish purple colour, and after become long, thicke, hollow, or guttered on the vpper side, of a whitish Greene colour, and round and darke coloured vnderneath: in the middle of these heads of leaues, rise vp one or two hollow weake brownish stalkes, sometimes lying on the ground with the weight of the flowers, (but especially of the seede) yet for the most part standing vpright, when they are laden towards the toppe, with many bottle-like flowers, which at their first appearing, and vntill the flowers begin to blow open, are of a browne red colour, and when they are blowne, of a faire yellow colour, flowring first below, and so vpwards by degrees, euery one of these flowers is made like vnto a little pitcher or bottle, being bigge in the belly, and small at the mouth, which is round, and a little turned vp, very sweete in smell, like vnto Muske, whereof it tooke the name *Muscari*; after the flowers are past, there come three square thicke heads, puffed vp as if it were bladders, made of a spongie substance, wherein are here and there placed blacke round seed: the roote is long, round, and very thicke, and white on the outside, with a little woollinesse on them, being broken, and full of a slimie iuice, whereunto are annexed thicke, fat, and long fibres, which perish not as most of the other Iacynths; and therefore desireth not to bee often remoued, as the other sorts may.

2. *Hyacinthus Botroides maior Moschatus, seu Muscari flore cineritis.*

The Ashcoloured Muske Grape-flower, or Muscari.

This Muscari differeth not in rootes, or forme of leaues or flowers from the former, the chiefe differences are these: the leaues hereof do not appeare so red at the first budding out of the ground, nor are so darke when they are fully growne; the stalke also most vsually hath more store of flowers thereon, the colour whereof at the first budding is a little duskie, and when they are full blowne, are of a bleake, yet bright ash-colour, with a little shew of purple in them, and by long standing change a little more gray; being as sweete, or as some thinke, more sweete then the former: the roote (as I said) is like the former, yet yeeldeth more encrease, and will better endure our cold clymate, although it doth more seldome giue ripe seede.

3. *Hyacinthus Botroides maior Moschatus, sine Muscari flore rubro.*

The red Muske Grape-flower.

This kinde (if there be any such, for I am in some doubt thereof) doth chiefly differ in the colour of the flower from the first, in that this should beare flowers when they are blowne, of a red colour tending to yellownesse.

4. *Hyacinthus Botroides maior Moschatus, sine Muscari flore albo.*

The white Muske Grape-flower.

This also is said to haue (if there bee such an one) his leaues like vnto the second kinde, but of a little whiter Greene, and the flowers pale, tending to a white: the roots of these two last are said vsually not to grow to be so great as of the former two.

The Place.

The rootes of the two first sorts, haue been often sent from Constantino-
ple,

1 *Hyacinthus Indicus major tuberosa radice*. The greater Indian knobbed Iacynth. 2 *Hyacinthus Indicus minor tuberosa radice*. The lesser Indian knobbed Iacynth. 3 *Muscari flava flava*. The yellow Muscari. 4 *Muscari flava alba*. The white coloured Muscari. 5 *Hyacinthus Boreoides variegatus*. The streaked Grape-flower. 6 *Hyacinthus Boreoides flava*. The white Grape-flower. 7 *Hyacinthus Boreoides ramosus*. The branched Grape-flower.

ple, among many other sorts of rootes, and it may be come thither from beyond the Bosphorus in Asia; we haue them in our Gardens.

The other two sorts are sprung (it is probable, if they be *in rerum natura*) from the seede of the two former; for we could neuer get such from Constantinople, as if the Turkes had neuer knowledge of any such.

The Time.

They flower in March or April, as the yeare is temperate, but the first is soonest vp out of the ground.

The Names.

The two former haue beene sent from Turkie by the name of *Muschoromi* and *Dipcadi*. Matthiolus calleth it *Bulbus vomitorius*, saying that no root doth more prouoke vomit then it. Caspar Bauhinus doth most properly call it *Hyacinthus Moschatus*. It is most generally called *Muscari*, by all Herbarists and Florists, yet because it doth so neerely resemble the Grape-flower, I haue named it *Hyacinthus Botroides maior Moschatus*, to put a difference from the lesser Grape-flowers that follow; in English, The great Muske Grape-flower, or Muscari.

Hyacinthus Botroides minor ceruleus obscurus.

The darke blew Grape-flower.

This Grape-flower hath many small, fat, and weake leaues lying vpon the ground, which are somewhat brownish at their first comming vp, and of a sad Greene afterwards, hollow on the vpper side, and round vnderneath, among which rise vp round, smooth, weake stalkes, bearing at the toppe many small heauie bottle-like flowers, in shape like the former Muscari, but very thicke thrust together, smaller, and of a very darke or blackish blew colour, of a very strong smell, like vnto Starch when it is new made, and hot: the root is round, and blackish without, being compassed with a number of small rootes, or of-fets round about it, so that it will quickly choke a ground, if it be suffered long in it. For which cause, most men doe cast it into some by-corner, if they meane to preferue it, or cast it out of the Garden quite.

Alter maior.

There is another of this kinde that is greater, both in leafe and flower, and differeth not in colour or any thing else.

Hyacinthus Botroides ceruleus amarus. The skie coloured Grape-flower.

This Iacynth springeth vp with fewer leaues then the first, and not reddish, but green at his first appearing; the leaues, when they are full growne, are long and hollow, like the former, but greener, shorter, and broader, standing vp right, and not lying along vpon the ground as they doe: the flowers grow at the toppe of the stalke, more sparsedly set thereon, and not so thicke together, but like a thinne bunch of grapes, and bottle-like as the former, of a perfect blew or skie-colour, euery flower hauing some white spots about the brimmes of them: this hath a very sweet smell, nothing like the former: this roote is whiter, and doth not so much encrease as the former, yet plentiful enough.

Hyacinthus Botroides ramosus. The branched Grape-flower.

Of this kinde, there is another found to grow with many branches of flowers, breaking out from the sides of the greater stalkes or branches: the leaues as all the rest of the plant is greater then the former.

Hyacinthus Botroides flore albo. The white Grape-flower.

The white Grape-flower hath his Greene leaues a little whiter, then the blew or skie

skie coloured Grape-flower, his flowers are very pure white, alike sparsedly set on the stalkes, but a little lower and smaller then it, in all other things there is no difference.

Hyacinthus Botroides flore alborubente. The bluish Grape-flower.

The roote of this Grape-flower groweth greater, then either the skie coloured, or white Grape-flower, and seldome hath any small rootes or of-fets, as the other haue: his leaues also are larger, and somewhat broader; the flowers are of a pale, or bleake bluish colour out of a white, and are a little larger, and grow a little higher and fuller of flowers then the white.

The Place.

They naturally grow in many places both of Germany and Hungary; in Spaine likewise, and on Mount Baldus in Italy, and Narbone in France, about the borders of the fields: we haue them in our Gardens for delight.

The Time.

These flower from the beginning of March, or sooner sometimes, vntill the beginning of May.

The Names.

They are most commonly called *Botroides*, but more truly *Botryodes*, of *Botrys* the Greeke word, which signifieth a bunch or cluster of grapes: Lobelius calleth the white one, *Dipsadi flore albo*, transferring the name *Dipsadi*, whereby the *Muscari* is called to this Iacynth, as if they were both one. Their seuerall names, whereby they are knowne and called, are set downe in their titles. The Dutchmen call them *Drinekens*, as I said before. Some English Gentlewomen call the white Grape-flower Pearles of Spaine.

1. *Hyacinthus Comosus albus.* The white haired Iacynth.

This Iacynth doth more neerly resemble the Grape-flowers; then the faire haired Iacynths that follow, whereof it beareth the name, in that it hath no haire or threeds at the toppe of the stalke or sides, as they: and therefore I haue placed it next vnto them, and the other to follow it, as being of another kinde. The root hereof is blackish, a little long and round, from whence rise vp three or foure leaues, being smooth and whitish, long, narrow, and hollow, like a trough or gutter on the vpper side: among which the stalke riseth vp a foote high or more, bearing at the toppe diuers small flowers, somewhat like the former, but not so thicke set together, being a little longer, and larger, and wider at the mouth, and as it were diuided into six edges, of a darke whitish colour, with some blacker spots about the brimmes on the inside: the heads or seedevessels are three square, and somewhat larger, then the heads of any of the former lesser Grape-flowers, wherein is contained round blacke seede.

2. *Hyacinthus Comosus Byzantinus.* The Turkie faire haired Iacynth.

This other Iacynth which came from Constantinople, is somewhat like the former; but that it is bigger, both in roote, and leafe, and flower, and bearing greater store of flowers on the head of the stalke: the lower flowers, although they haue short stalkes at their first flowring, yet afterwards the stalkes grow longer, and those that are lower, stand out further then those that are highest, whose foot-stalkes are short, and almost close to the stemme, and of a more perfect purple then any below, which are of a duskie greenish purple colour: the whole stalke of flowers seem like a Pyramis, broad belowe, and small aboue, or as other compare it, to a water sprinkle; yet neither of both these Iacynths haue any threeds at the tops of the stalkes, as the other following haue.

3. *Hyacinthus*

3. *Hyacinthus Comosus maior purpureus.*
The great purple faire haired Iacynth.

This faire haired Iacynth hath his leaues softer, longer, broader, and lesse hollow then the former, lying for the most part vpon the ground: the stalke riseth vp in the midst of the leaues, being stronger, higher, and bearing a greater and longer head of flowers also then they: the flowers of this stand not vpon such long foote-stalkes, but are shorter below, and close almost to the stalke aboue, hauing many bright purplish blew threeds, growing highest aboue the flowers, as it were in a bush together, euery one of these threeds hauing a little head at the end of them, somewhat like vnto one of the flowers, but much smaller: the rest of the flowers below this bush, are of a sadder or deader purple, and not so bright a colour, and the lowest worst of all, rather enclining to a greene, like vnto the last Turkie kinde: the whole stalke with the flowers vpon it, doth somewhat resemble a long Purse tassell, and thereupon diuers Gentlewomen haue so named it: the heads and seede are like vnto the former, but greater: the roote is great and white, with some rednesse on the outside,

4. *Hyacinthus Comosus ramosus purpureus.*
The faire haired branched Iacynth.

The leaues of this Iacynth are broader, shorter, and greener then of the last, not lying so weakly on the ground, but standing somewhat more vpright: the stalke riseth vp as high as the former, but branched out on euery side into many tufts of threeds, with knappes, as it were heads of flowers, at the ends of them, like vnto the head of threeds at the toppe of the former Iacynth, but of a little darker, and not so faire a blewish purple colour: this Iacynth doth somewhat resemble the next Curld haire Iacynth, but that the branches are not so fairely composed altogether of curled threeds, nor of so excellent a faire purple or Doue colour, but more duskie by much: the roote is greater and shorter then of the next, and encreaseth faster.

5. *Hyacinthus Pennatus, sive Comosus ramosus elegantior.*
The faire Curld-haire Iacynth.

This admirable Iacynth riseth vp with three or foure leaues, somewhat like vnto the leaues of the Muske Grape-flower, but lesser; betweene which riseth vp the stalke about a foote high, or somewhat more, bearing at the toppe a bush or tuft of flowers, which at the first appearing, is like vnto a Cone or Pineapple, and afterwards opening it selfe, spreadeth into many branches, yet still retaining the forme of a Pyramis, being broad spread below, and narrow vp aboue: each of these branches is againe diuided into many tufts of threeds or strings, twisted or curled at the ends, and of an excellent purple or Doue colour, both stalkes and haire. This abideth a great while in his beauty, but afterwards all these flowers (if you will so call them) do fall away without any seede at all, spending it selfe as it should seeme in the abundance of the flowers: the roote is not so great as the last, but white on the outside.

The Place.

The two first haue been sent diuers times from Constantinople, the third is found wilde in many places of Europe, and as well in Germany, as in Italy. The two last are onely with vs in Gardens, and their naturall places are not knowne vnto vs.

The Time.

The three former kindes doe flower in Aprill, the two last in May.

The Names.

The first and second haue no other names then are expressed in their titles.

1 *Hyacinthus Comosus albus*. The white haired Iacynth. 2 *Hyacinthus Comosus pyramidalis*. The Turkie faire haired Iacynth.
 3 *Hyacinthus Comosus major purpureus*. The purple faire haired Iacynth, or Purple cassels. 4 *Hyacinthus Comosus ramosus*, sine
calamistratus. The faire haired branched Iacynth. 5 *Hyacinthus Pinnatus*, sine *Comosus elegantior*. The faire curld haired
 Iacynth.

cles. The third is called of some onely *Hyacinthus maior*, and of others *Hyacinthus comosus maior*: We call it in English, The purple faire haired Iacynth, because of his tuft of purple threds, like haire at the toppe, and (as I said) of diuers Gentlewomen, purple tasse's. The fourth is called by some as it is in the title, *Hyacinthus comosus ramosus*, and of others *Hyacinthus Calamistratus*. And the last or fifth is diuersly called by diuers, Fabius Columna in his *Phytobasanos* the second part, calleth it *Hyacinthus Sannesi*, because hee first saw it in that Cardinals Garden at Rome. Robin of Paris sent to vs the former of the two last, by the name of *Hyacinthus Pennatus*, and *Hyacinthus Calamistratus*, when as others sent the last by the name *Pennatus*, and the other by the name of *Calamistratus*; but I thinke the name *Cincinnatus* is more fit and proper for it, in that the curled threds which seeme like haire, are better expressed by the word *Cincinnus*, then *Calamistrum*, this signifying but the bodkin or instrument wherewith they vse to frisle or curl the haire, and that the bush of haire it selfe being curled. Some also haue giuen to both these last the names of *Hyacinthus Comosus Parnassi*, the one fairer then the other. Of all these names you may vse which you please; but for the last kinde, the name *Cincinnatus*, as I said, is the more proper, but *Pennatus* is the more common, and *Calamistratus* for the former of the two last.

1. *Hyacinthus Orientalis Brumalis, sine praeox flore albo.*
The white Winter Orientall Iacynth.

This early Iacynth riseth vp with his greene leaues (which are in all respects liketo the ordinary Orientall Iacynth, but somewhat narrower) before Winter, and sometimes it is in flower also before Winter, and is in forme and colour a plaine white Orientall Iacynth, but somewhat lesser, differing onely in no other thing, then the time of his flowring, which is alwayes certaine to be long before the other sorts.

2. *Hyacinthus Orientalis Brumalis, sine praeox flore purpureo.*
The purple Winter Orientall Iacynth.

The difference of colour in this flower causeth it to bee distinguished, for else it is of the kindred of the Orientall Iacynth, and is, as the former, more early then the rest that follow: Vnderstand then, that this is the same with the former, but hauing fine blewish purple flowers.

3. *Hyacinthus Orientalis maior praeox, dictus Zumbul Indi.*
The greatest Orientall Iacynth, or Zumbul Indi.

The roote of this Orientall Iacynth, is vsually greater then any other of his kinde, and most commonly white on the outside, from whence rise vp one or two great round stalkes, spotted from within the ground, with the lower part of the leaues also vpward to the middle of the stalkes, or rather higher, like vnto the stalkes of Dragons, but darker; being set among a number of broad, long, and somewhat hollow greene leaues, almost as large as the leaues of the white Lilly: at the toppe of the stalkes stand more store of flowers, then in any other of this kinde, euery flower being as great as the greatest sort of Orientall Iacynth, ending in six leaues, which turne at the points, of a faire blewish purple colour, and all standing many times on one side of the stalkes, and many times on both sides.

4. *Hyacinthus Orientalis vulgaris diuersiformis colorum.*
The ordinary Orientall Iacynth.

The common Orientall Iacynth (I call it common, because it is now so plentiful in all Gardens, that it is almost not esteemed) hath many greene leaues, long, somewhat broad and hollow, among which riseth vp a long greene round stalke, beset from the middle thereof almost, with diuers flowers, standing on both sides

of

of the stalkes, one about another vnto the toppe, each whereof next vnto the foote-
stalke is long, hollow, round, and close, ending in six small leaues laid open,
and a little turning at the points, of a very sweete smell: the colours of these
flowers are diuers, for some are pure white, without any shew of other colour in
them: another is almost white, but hauing a shew of blewnesse, especially at the brims
and bottomes of the flowers. Others againe are of a very faint bluish, tending towards
a white: Some are of as deepe a purple as a Violet, others of a purple tending to red-
nesse, and some of a paler purple. Some againe are of a faire blew, others more wat-
chet, and some so pale a blew, as if it were more white then blew: after the flowers
are past, there rise vp great three square heads, bearing round blacke seede, great and
shining: the roote is great, and white on the outside, and oftentimes purplish also, flat
at the bottome, and small at the head.

There is a kinde of these Iacincths, whose flowers are of a deepe purplish Violet co-
lour, hauing whitish lines downe the backe of euery leafe of the flower, which turne
themselves a little backwards at the points.

There is another, whose flowers stand all opening one way, and not on all sides, but
are herein like the great Zumbul Indi, before set out.

There is againe another kinde which flowreth later then all the rest, and the flow-
ers are smaller, standing more vpright, which are either white or blew, or mixt with
white and purple.

*Flora purpurea
violaceo lineis
albicantis in
dorso.
Floribus antro-
sum respicienti-
bus.
Serotinus ere-
ctis floribus
diuersorum co-
lorum.*

5. *Hyacinthus Orientalis folioso caule.* The bushy stalked Orientall Iacincth.

This strange Iacincth hath his rootes, leaues, and flowers, like vnto the former Ori-
entall Iacincths: the onely difference in this is, that his stalke is not bare or naked, but
hath very narrow long leaues, growing dispersedly, and without order, with the flow-
ers thereon, which are blew, and hauing for the most part one leafe, and sometimes
two at the foote, or setting on of euery flower, yet sometimes it happeneth, some flow-
ers to be without any leafe at the bottome, as nature, that is very variable in this plant,
listeth to play: the heads and seede are blacke and round, like the other also.

6. *Hyacinthus Orientalis flore duplici.* The bleake Orientall Iacincth once double.

This double Iacincth hath diuers long leaues, like vnto the other Orientall Iacincths,
almost standing vpright, among which riseth vp a stalke, brownish at the first, but
growing greene afterwards, bearing many flowers at the toppe, made like the flowers
of the former Iacincths, and ending in six leaues, greene at the first, and of a blewish
white when they are open, yet retaining some shew of greenesse in them, the brims
of the leaues being white: from the middle of each flower standeth forth another
small flower, consisting of three leaues, of the same colour with the other flower, but
with a greene line on the backe of each of these inner leaues: in the middle of this lit-
tle flower, there stand some threads tipped with blacke: the smell of this flower is not so
sweete as of the forme, the heads, seede, and rootes are like the former.

7. *Hyacinthus Orientalis flore pleno ceruleo, vel purpureo violaceo.*

The faire double blew, or purple Orientall Iacincth.

The leaues of these Iacincths are smaller, then the leaues of most of the other for-
mer sorts: the stalkes are shorter, and smaller, bearing but three or foure flowers on
the heads of them for the most part, which are not composed like the last, but are more
faire, full, and double of leaues, where they shew out their full beauties, and of a faire
blew colour in some, and purple in others, smelling pretty sweete; but these doe sel-
dome beare out their flowers faire; and besides, haue diuers other flowers that will be
either single, or very little double vpon the same stalke.

8. *Hyacinthus Orientalis candidissimus flore pleno.*

The pure white double Orientall Iacincth.

This double white Iacincth hath his leaues like vnto the single white Orientall Iac-
cincth;

cinth; his stalke is likewise long, slender, and Greene, bearing at the toppe two or three flowers at the most, very double and full of leaues, of a pure white colour, without any other mixture therein, hanging downe their heads a little, and are reasonable sweete. I haue this but by relation, not by sight, and therefore I can giue no further assurance as yet.

The Place.

All these Orientall Iacincths, except the last, haue beene brought out of Turkie, and from Constantinople: but where their true originall place is, is not as yet vnderstood.

The Time.

The two first (as is said) flower the earliest, sometimes before Christmas, but more vsually after, and abide a great while in flower, in great beauty, especially if the weather be milde, when as few or no other flowers at that time are able to match them. The other greatest kinde flowreth also earlier then the rest that follow, for the most part. The ordinary kindes flower some in March, and some in Aprill, and some sooner also; and so doe the double ones likewise. The bushy stalked Iacincth flowreth much about the same time.

The Names.

The former two sorts are called *Hyacinthus Orientalis Brumalis*, and *Hyacinthus Orientalis praecox flore albo*, or *caeruleo*. The third is called of many *Zumbul Indicum*, or *Zumbul Indi*, and corruptly *Simboline*; of others, and that more properly, *Hyacinthus Orientalis maior praecox*. The Turkes doe call all Iacincths *Zumbul*, and by adding the name of *Indi*, or *Arabi*, do shew from what place they are receiued. In English, The greatest Orientall Iacincth; yet some doe call it after the Turkish name *Zumbul Indi*, or *Simboline*, as is said before. The rest haue their names set downe in their titles, which are most fit for them.

Hyacinthus Hispanicus minor Orientalis facte.

The little Summer Orientall Iacincth.

flore caerulea. This little Iacincth hath foure or fise long narrow Greene leaues, lying vpon the ground, among which riseth vp a slender smooth stalke, about a spanne high or more, bearing at the toppe many slender bleake blew flowers, with some white stripes and edges to be seene in most of them; fashioned very like vnto the flowers of the Orientall Iacincth, but much smaller: the flower hath no sent at all; the seede is like the seede of the English Iacincth, or Harebells: the roote is small and white.

flore albo. There is another of this kinde, differing in nothing but in the colour of the flower, which is pure white.

flore rubens. There is also another, whose flowers are of a fine delayed red colour, with some deeper coloured veines, running along the three outer leaues of the flower, differing in no other thing from the former.

The Place.

These plants haue been gathered on the Pyrenæan Mountaines, which are next vnto Spaine, from whence, as is often said, many rare plants haue likewise been gathered.

The Time.

They flower very late, euen after all or most of the Iacincths, in May for the most part.

The

1 *Hyacinthus Orientalis brumalis*, The Winter Orientall Iacynth. 2 *Zumbul Indi*, The greatest Orientall Iacynth. 3 *Hyacinthus Orientalis vulgaris*, The ordinary Orientall Iacynth. 4 *Hyacinthus Orientalis folioso caule*, The bushy stalked Orientall Iacynth. 5 *Hyacinthus Orientalis flore duplici*, The Orientall Iacynth once double. 6 *Hyacinthus Orientalis flore pleno carmine*, The faire double blew Orientall Iacynth.

The Names.

They are called eyther *Hyacinthus Hispanicus minor Orientalis facie*, as it is in the title, or *Hyacinthus Orientalis facie*, that is to say, The lesser Spanish Iacynth, like vnto the Orientall: yet some haue called them, *Hyacinthus Orientalis serotinus minor*, The lesser late Orientall Iacynth, that thereby they may be knowne from the rest.

Hyacinthus Hispanicus obsoletus. The Spanish dunne coloured Iacynth.

This Spanish Iacynth springeth very late out of the ground, bearing foure or five short, hollow, and soft whitish Greene leaues, with a white line in the middle of euery one of them, among which rise vp one or more stalkes, bearing diuers flowers at the toppes of them, all looking one way, or standing on the one side, hanging downe their heads, consisting of six leaues, three whereof being the outermost, lay open their leaues, and turne back the ends a little again: the other three which are innermost, do as it were close together in the middle of the flower, without laying themselves open at all, being a little whitish at the edges: the whole flower is of a purplish yellow colour, with some white and green as it were mixed among it, of no sent at all: it beareth blacke and flat seede in three square, great, and bunched out heads: the roote is reasonable great, and white on the outside, with many strong white fibres at it, which perish not yearly, as the fibres of many other Iacynths doe, and as it springeth late, so it holdeth his Greene leaues almost vntill Winter.

Mauritanicus.

There hath been another hereof brought from about Fez and Marocco in Barbary, which in all respects was greater, but else differed little.

Maximus Ethiopicus.

There was another also brought from the Cape of good Hope, whose leaues were stronger and greener then the former, the stalke also thicker, bearing diuers flowers, confusedly standing vpon longer foote-stalkes, yet made after the same fashion, but that the three inner leaues were whitish, and dented about the edges, otherwise the flowers were yellow and greenish on the inside.

The Place.

These plants grow in Spaine, Barbary, and Ethiopia, according as their names and descriptions doe declare.

The Time.

The first flowreth not vntill Iune; for, as I said, it is very late before it springeth vp out of the ground, and holdeth his leaues as is said, vntill September, in the meane time the seede thereof ripeneth.

The Names.

They haue their names according to the place of their growing; for one is called *Hyacinthus Hispanicus obsoletioris coloris*. The other is called also *Hyacinthus Mauritanicus*. And the last, *Hyacinthus Ethiopicus obsoletus*. In English, The Spanish, Barbary, or Ethiopian Iacynth, of a dunne or duskie colour.

Hyacinthus Anglicus Belgicus, vel Hispanicus.
English Haref-bels, or Spanish Iacynth.

Our English Iacynth or Haref-bels is so common euery where, that it scarce needeth any description. It beareth diuers, long and narrow Greene leaues, not standing vp right, nor yet fully lying vpon the ground, among which springeth vp the stalke, bearing at the toppe many long and hollow flowers, hanging downe their heads all forwards

forwards for the most part, parted at the brimmes into six parts, turning vp their points a little againe, of a sweetish, but heady sent, somewhat like vnto the Grape-flower: the heads for seede are long and square, wherein is much blacke seede: the colour of the flowers are in some of a deeper blew, tending to a purple; in others of a paler blew, or of a bleake blew, tending to an ash colour: Some are pure white, and some are party coloured, blew and white; and some are of a fine delayed purplish red or bluish colour, which some call a peach colour. The rootes of all sorts agree, and are alike, being white and very slimie; some whereof will be great and round, others long and slender, and thosethat lye neare the toppe of the earth bare, will be greene.

Hyacinthus Hispanicus maior flore campanule instar.
The greater Spanish bell-flowred Iacinth.

This Spanish bell-flowred Iacinth, is very like the former English or Spanish Iacinth, but greater in all parts, as well of leaues as flowers, many growing together at the toppe of the stalke, with many short greene leaues among them, hanging downe their heads, with larger, greater, and wider open mouths, like vnto bells, of a darke blew colour, and no good sent.

The Place.

The first groweth in many places of England, the Lowe-Countries, as we call them, and Spaine, but the last chiefly in Spaine.

The Time.

They flower in Aprill for the most part, and sometimes in May.

The Names.

Because the first is more frequent in England, then in Spain, or the Lowe-Countries, it is called with vs *Hyacinthus Anglicus*, The English Iacinth; but it is also called as well *Belgicus*, as *Hispanicus*: yet Dodonæus calleth it *Hyacinthus non scriptus*, because it was not written of by any Authour before himselfe. It is generally knowne in England by the name of Harebells. The other Spanish Iacinth beareth his name in his title.

Hyacinthus Eriophorus. The Woolly Iacinth.

This Woolly Iacinth hath many broad, long, and faire greene leaues, very like vnto some of the Iacintis, but stiffer, or standing more vpright, which being broken, doe yeeld many threads, as if a little fine cotton wooll were drawne out: among these leaues riseth vp a long greene round stalke, a foote and a halfe high or more, whereon is set a great long bush of flowers, which blowing open by degrees, first below, and so vpwards, are very long in flowring: the toppe of the stalke, with the flowers, and their little footstalkes, are all blew, euery flower standing outright with his stalke, and spreading like a starre, diuided into six leaues, hauing many small blew threads, standing about the middle head, which neuer gaue ripe seede, as farre as I can heare of: the root is white, somewhat like the root of a Muscari, but as full of wooll or threads, or rather more, then the leaues, or any other part of it.

The Place.

This hath been sent diuers times out of Turkie into England, where it continued a long time as well in my Garden as in others, but some hard frosty Winters caused it to perish with me, and diuers others, yet I haue had it againe from a friend, and doth abide fresh and greene euery yeare in my Garden.

The Time.

This flowered in the Garden of M^r. Richard Barnesley at Lambeth, onely once in the moneth of May, in the year 1606. after hee had there preferred it a long time: but neither he, nor any else in England that I know, but those that saw it at that time, ever saw it beare flower, either before or since.

The Names.

It is called by diuers *Bulbus Eriophorus*, or *Laniferus*, that is, Woolly Bulbous; but because it is a Iacynth, both in roote, leafe, and flower, and not a *Narcissus*, or Daffodill, it is called *Hyacinthus Eriophorus*, or *Laniferus*, The Woolly Iacynth. It is very likely, that Theophrastus in his seventh Book & thirteenth Chapter, did meane this plant, where hee declareth, that garments were made of the woolly substance of a bulbous roote, that was taken from between the core or heart of the roote (which, as hee saith, was vsed to be eaten) and the outermost shels or peelings; yet Clusius seemeth to fasten this woolly bulbous of Theophrastus, vpon the next Iacynth of Spaine.

Hyacinthus Stellatus Baticus maior, vulgò Peruanus.

The great Spanish Starry Iacynth, or of Peru.

This Iacynth (the greatest of those, whose flowers are spread like a starre, except the two first Indians) hath five or six, or more, very broad, and long Greene leaues, spread vpon the ground, round about the roote, which being broken are woolly, or full of threeds, like the former: in the middle of these leaues riseth vp a round short stalke, in comparison of the greatnesse of the plant (for the stalke of the Orientall Iacynth is sometimes twice so high, whose roote is not so great) bearing at the toppe a great head or bush of flowers, fashioned in the beginning, before they bee blowne or separated, very like to a Cone or Pineapple, and begin to flower belowe, and so vpwards by degrees, euery flower standing vpon a long blackish blew foote-stalke, which when they are blowne open, are of a perfect blew colour, tending to a Violet, and made of six small leaues, laid open like a starre, the threeds likewise are blewish, tipped with yellow pendants, standing about the middle head, which is of a deeper blew, not hauing any good sent to be perceiued in it, but commendable only for the beauty of the flowers: after the flowers are past, there come three square heads, containing round blacke feede: the roote is great, and somewhat yellowish on the outside, with a knobbe or bunch at the lower end of the roote, (which is called the seate of the roote) like vnto the *Muscari*, *Scylla*, and many other bulbous rootes, at which hang diuers white, thicke, and long fibres, whereby it is fastened in the ground, which perish not euery yeare, but abide continually, and therefore doth not desire much remouing.

Hyacinthus Stellatus Baticus, sine Peruanus flore albo.

The great white Spanish Starry Iacynth.

This other Spanish Iacynth is in most parts like vnto the former, but that his leaues are not so large, nor so deep a Greene: the stalks of flowers likewise hath not so thicke a head, or bush on it, but fewer and thinner set: the flowers themselves also are whitish, yet hauing a small dash of blush in them: the threeds are whitish, tipped with yellow pendants: the feede and rootes are like vnto the former, and herein consisteth the difference betweene this and the other sorts.

Hyacinthus Stellatus Baticus, sine Peruanus flore carneo.

The great bluish coloured Spanish Starry Iacynth.

This likewise differeth little from the two former, but onely in the colour of the flowers;

1. *Hyacinthus Orientalis facie*. The little Summer Oriental lacinth. 2. *Hyacinthus Mauritanicus*. The Barbary lacinth. 3. *Hyacinthus asilatus Hispanicus*. The Spanish darkie lacinth. 4. *Hyacinthus Hispanicus flore campanula*. The greater Spanish bell flower'd lacinth. 5. *Hyacinthus Anglicus*. The English lacinth or Harebell. 6. *Hyacinthus Eriophorum*. The Woolly lacinth. 7. *Hyacinthus Stehartsii*. *Latium meior*, *fus Pennicum*. The great Spanish lacinth, or of Peru.

flowers, for this being found growing among both the other, hath his head of flowers as great and large as the first, but the buds of his flowers, before they are open, are of a deepe bluish colour, which being open, are more delayed, and of a pleasant pale purple, or bluish colour, standing vpon purplish stalkes: the heads in the middle are whitish, and so are the threeds compassing it, tipped with yellow.

The Place.

These doe naturally grow in Spaine, in the Medowes a little off from the Sea, as well in the Island Gades, usually called Cales, as likewise in other parts along the Sea side, as one goeth from thence to Porto Santa Maria, which when they be in flower, growing so thicke together, seeme to couer the ground, like vnto a tapistry of diuers colours, as I haue bene credibly enformed by Guillaume Boel, a Freeze-lander borne, often before and hereafter remembred, who being in search of rare plants in Spaine, in the yeare of our Lord 1607. after that most violent frosty Winter, which perished both the rootes of this, and many other fine plants with vs, sent mee ouer some of these rootes for my Garden, and affirmed this for a truth, which is here formerly set downe, and that himselfe gathered those he sent mee, and many others in the places named, with his owne hands; but hee saith, that both that with the white, and with the bluish flowers, are farre more rare then the other.

The Time.

They flower in May, the seede is ripe in Iuly.

The Names.

This hath bene formerly named *Eriophorus Peruanus*, and *Hyacinthus Stellatus Peruanus*, The Starry Iacynth of Peru, being thought to haue grown in Peru, a Prouince of the West Indies; but he that gaue that name first vnto it, eyther knew not his naturall place, or willingly imposed that name, to conceale it, or to make it the better esteemed. It is most generally receiued by the name *Hyacinthus Peruanus*, from the first imposer thereof, that is, the Iacynth of Peru: but I had rather giue the name agreeing most fitly vnto it, and call it as it is indeede *Hyacinthus Stellatus Baticus*, The Spanish Starry Iacynth; and because it is the greatest that I know hath come from thence, I call it, The great Starry Iacynth of Spaine, or Spanish Iacynth.

Hyacinthus Stellatus vulgaris, sine Bisolius Fuchsij.

The common blew Starry Iacynth.

This Starry Iacynth (being longest knowne, and therefore most common) riseth out of the ground, vsually but with two browne leaues, yet sometimes with three, inclosing within them the stalke of flowers, the buds appearing of a darke whitish colour, as soone as the leaues open themselues, which leaues being growne, are long, and hollow, of a whitish Greene on the vpper side, and browne on the vnder side, and halfe round, the browne stalke rising vp higher, beareth fise or fixe small starre-like flowers thereon, consisting of six leaues, of a faire deepe blew, tending to a purple. The seede is yellowish, and round, contained in round pointed heads, which by reason of their heauinesse, and the weaknesse of the stalke, lye vpon the ground, and often perish with wet and frosts, &c. The roote is somewhat long, and couered with a yellowish coate.

Hyacinthus stellatus flore albo. The white Starry Iacynth.

The white Starry Iacynth hath his leaues like the former, but Greene and fresh, not browne, and a little narrower also: the buddes for flowers at the first appeare a little bluish, which when they are blowne, are white, but yet retaine in them a small shew of that bluish colour.

We haue another, whose flowers are pure white, and smaller then the other, the leaues whereof are of a pale fresh greene, and somewhat narrower.

Hyacinthus Stellatus flore rubente. The bluish coloured Starry Iacynth.

The difference in this from the former, is onely in the flowers, which are of a faire bluish colour, much more eminent then in the others, in all things else alike.

Hyacinthus Stellatus Martius, sine praecox caruleus.

The early blew Starry Iacynth.

This Iacynth hath his leaues a little broader, of a fresher greene, and not browne at all, as the first blew Iacynth of Fuchsius last remembered: the buds of the flowers, while they are enclosed within the leaues, and after, when the stalke is gowne vp; doe remaine more blew then the buds of the former: the flowers, when they are blowne open, are like the former, but somewhat larger, and of a more liuely blew colour: the roote also is a little whiter on the outside. This doth more seldome beare feede then the former.

Hyacinthus Stellatus praecox flore albo. The white early Starry Iacynth.

There is also one other of this kinde, that beareth pure white flowers, the green leafe thereof being a little narrower then the former, and no other difference.

Hyacinthus Stellatus praecox flore suauis rubente.

The early bluish coloured Starry Iacynth.

This bluish coloured Iacynth is very rare, but very pleasant, his flowers being as large as the first of this last kinde, and somewhat larger then the bluish of the other kinde: the leaues and rootes differ not from the last recited Iacynth.

The Place.

All these Iacynths haue beene found in the Woods and Mountaines of Germany, Bohemia, and Austria, as Fuchsius and Gesner doe report, and in Naples, as Imperatus and others doe testifie. Wee cherish them all with great care in our Gardens, but especially the white and the bluish of both kindes, for that they are more tender, and often perish for want of due regard.

The Time.

The common kindes, which are first expressed, flower about the middle of February, if the weather bee milde, and the other kindes sometimes a fortnight after, that is, in March, but ordinarily much about the same time with the former.

The Names.

The first is called in Latine *Hyacinthus Stellatus vulgaris*, and *Hyacinthus Stellatus bifolius*, and *Hyacinthus Stellaris Fuchsi*, and of some *Hyacinthus Stellatus Germanicus*; wee might very well call the other kinde, *Hyacinthus Stellatus vulgaris alter*, but diuers call it *Praecox*, and some *Martius*, as it is in the title. In English they may bee seuerally called: the first, The common, and the other, The early Starry Iacynth (notwithstanding the first flowreth before the other) for distinction sake.

The *Hyacinthus* seemeth to be called *Vacinium* of Virgil in his Eclogues, for hee alwayes reckoneth it among the flowers that were vsed to decke Garlands, and neuer among fruits, as some would haue it. But in that hee calleth it *Vacinium nigrum*, in seuerall places, that doth very fitly answer the common

common received custome of those times, that called all deepe blew colours, such as are purples, and the like, blacke; for the Violet it selfe is likewise called blacke in the same place, where he calleth the *Vacinium* blacke; so that it seemeth thereby, that he reckoned them to be both of one colour, and we know the colour of the Violet is not blacke, as we doe distinguish of blacke in these dayes. But the colour of this Starry Iacynth, being both of so deepe a purple sometimes, so neare vnto a Violet colour, and also more frequent, then any other Iacynth with them, in those places where Virgil liued, perswadeth me to thinke, that Virgil vnderstood this Starry Iacynth by *Vacinium*: Let others iudge otherwise, if they can shew greater probability.

1. *Hyacinthus Stellatus Byzantinus nigra radice.*

The Starry Iacynth of Turkie with the blacke roote.

This Starry Iacynth of Constantinople hath three or foure fresh Greene, thinne, and long leaues, of the bignesse of the English Iacynth, but not so long, betwene which riseth vp a slender lowe stalke, bearing five or six small flowers, disperedly set thereon, spreading open like a starre, of a pale or bleake blew colour: the leaues of the flowers are somewhat long, and stand as it were somewhat loosely, one off from another, and not so compactly together, as the flowers of other kindes: it seldome beareth ripe feede with vs, because the heads are so heauie, that lying vpon the ground, they rotte with the wet, or are bitten with the frosts, or both, so that they seldome come to good: the roote is small in some, and reasonable bigge in others, round, and long, white within, but couered with deepe reddish or purplish peelings, neat vnto it, and darker and blacker purple on the outside, with some long and thicke white fibres, like fingers hanging at the bottome of them, as is to be seene in many other Iacynths: the roote it selfe for the most part doth runne downewards, somewhat deep into the ground.

2. *Hyacinthus Stellatus Byzantinus maior.*

The greater Starry Iacynth of Constantinople.

This Iacynth may rightly be referred to the former Iacynth of Constantinople, and called the greater, it is so like thereunto, that any one that knoweth that, will soone say, that this is another of that sort, but greater as it is in all his parts, bearing larger leaues by much, and more store, lying vpon the ground round about the roote: it beareth many lowe stalkes of flowers, as bleake, and standing as loosely as the former: onely the roote of this, is not black on the outside, as the other, but three times bigger.

3. *Hyacinthus Stellatus Byzantinus alter, sine flore boraginis.*

The other Starry Iacynth of Constantinople.

This other Iacynth hath for the most part onely foure leaues, broader and greener then the first, but not so large or long as the second: the stalke hath five or six flowers vpon it, bigger and rounder set, like other starry Iacynths, of a more perfect or deeper blew then either of the former, hauing a whitish Greene head or vmbone in the middle, beset with six blew chiues or threeds, tipt with blacke, so closely compassing the vmbone, that the threeds seeme so many prickes stucke into a clubbe or head; some therefore haue likened it to the flower of Borage, and so haue called it: after the flowers are past, come vp round white heads, wherein is contained round and white feede: the roote is of a darke whitish colour on the outside, and sometimes a little reddish withall.

The Places

The first and the last haue beene brought from Constantinople; the first among many other rootes, and the last by the Lord Zouch, as Lobel witnesseth. The second hath been sent vs out of the Lowe Countries, but from whence they had it, we do not certainly know. They growe with vs in our Gardens sufficiently.

The

The Time.

These flower in April, but the first is the earliest of the rest, and is in flower presently after the early Starry Iacynth, before described.

The Names.

The former haue their names in their titles, and are not knowne vnto vs by any other names that I know; but as I said before, the last is called by some, *Hyacinthus Boraginis flore*. The first was sent out of Turkie, by the name of *Susangiu*, by which name likewise diuers other things haue beene sent, so barren and barbarous is the Turkish tongue.

Hyacinthus Stellatus Aestivus maior. The greater Summer Starry Iacynth.

This late Iacynth hath diuers narrow Greene leaues, lying vpon the ground, somewhat like the leaues of the English Iacynth, but stiffer and stronger; among which riseth vp a round stiffe stalke, bearing many flowers at the toppe thereof, and at every foote-stalke of the flowers a small short leafe, of a purplish colour: the flowers are starre-like, of a fine delayed purplish colour, tending to a pale blew or ash colour, striped on the backe of every leafe, and hauing a pointed ymbone in the middle, with some whitish purple threeds about it, tipped with blew: the seede is blacke, round, and shining, like vnto the seede of the English Iacynth, but not so bigge: the roote is round and white, hauing some long thicke rootes vnder it, besides the fibres, as is vsuall in many other Iacynths.

Hyacinthus Stellatus Aestivus minor. The lesser Summer Starry Iacynth.

This lesser Iacynth hath diuers very long, narrow, and shining Greene leaues, spread vpon the ground round about the roote, among which riseth vp a very short round stalke, not aboue two inches high, carrying six or seuen small flowers thereon, on each side of the stalke, like both in forme and colour vnto the greater before described, but lesser by farre: the seede is blacke, contained in three square heads: the roote is small and white, couered with a browne coate, and hauing some such thicke rootes among the fibres, as are among the other.

The Place.

Both these Iacynths grow naturally in Portugall, and from thence haue been brought, by such as seeke out for rare plants, to make a gaine and profit by them.

The Time.

They both flower in May, and not before: and their seed is ripe in Iuly.

The Names.

Some doe call these *Hyacinthus Lusitanicus*, The Portugall Iacynth. Clusius, who first set out the descriptions of them, called them as is expressed in their titles; and therefore we haue after the Latine name giuen their English, according as is set downe. Or if you please, you may call them, The greater and the lesser Portugall Iacynth.

Hyacinthus Stellaris flore cinereo. The ash coloured Starry Iacynth.

This ash coloured Iacynth, hath his leaues very like vnto the leaues of the English Iacynth, and spreading vpon the ground in the same manner, among which rise vp one or two stalkes, set at the toppe with a number of small starre-like flowers, bushing bigger

ger below then above, of a very pale or white blew, tending to an ash colour, and very sweete in smell: the seede is blacke and round, like vnto the seede of the English Iacynth, and so is the roote, being great, round, and white; so like, I say, that it is hard to know the one from the other.

The Place.

The certaine originall place of growing thereof, is not knowne to vs.

The Time.

It flowreth in Aprill.

The Names.

Some doe call this *Hyacinthus Someri*, Somers Iacynth, because as Lobel saith, he brought it first into the Lowe-Countries, eyther from Constanti-nople, or out of Italy.

Hyacinthus Stellatus Lilifolio & radice caruleo.

The blew Lilly leaved Starre Iacynth.

This Iacynth hath six or seuen broad Greene leaues, somewhat like vnto Lilly leaues, but shorter (whereof it tooke his name as well as from the roote) spread vpon the ground, and lying close and round: before the stalke riseth out from the middle of these leaues, there doth appeare a deepe hollow place, like a hole, to bee seene a good while, which at length is filled vp with the stalke, rising thence vnto a foote or more high, bearing many starre-like flowers at the toppe, of a perfect blew colour, neare vnto a Violet, and sometimes of paler or bleake blew colour, hauing as it were a small cuppe in the middle, diuided into six peeces, without any threds therein: the seede is blacke and round, but not shining: the roote is somewhat long, bigge belowe, and small above, like vnto the small roote of a Lilly, and composed of yellow scales, as a Lilly, but the scales are greater, and fewer in number.

Hyacinthus Stellatus Lilifolius albus. The white Lilly leaved Starre Iacynth.

The likenesse of this Iacynth with the former, causeth me to be brieve, and not to repeate the same things againe, that haue already been expressed: You may therefore vnderstand, that except in the colour of the flower, which in this is white, there is no difference betweene them.

I heare of one that should beare bluish coloured flowers, but I haue not yet seene any such.

The Place.

These Iacynths haue been gathered on the Pyrenæan Hills, in that part of France that is called Aquitaine, and in some other places.

The Time.

These flower in Aprill, and sometimes later.

The Names.

Because the roote is so like vnto a Lilly, as the leafe is also, it hath most properly beene called *Hyacinthus Stellatus Lilifolio & radice*, or for breuity *Lilifolius*, that is, The Starry Lilly leaved Iacynth. It is called *Sarabug* by the Inhabitants where it groweth, as Clusius maketh the report from Venerius, who further saith, that by experience they haue found the cattell to swell and dye, that haue eaten of the leaues thereof.

Hyacinthus

1 *Hyacinthus bellus parviflorus*. The early blue starry hyacinth. 2 *Hyacinthus bellus parviflorus*. The early white starry hyacinth. 3 *Hyacinthus bellus*. The early blue starry hyacinth. 4 *Hyacinthus bellus*. The early white starry hyacinth. 5 *Hyacinthus bellus*. The early blue starry hyacinth. 6 *Hyacinthus bellus*. The early white starry hyacinth. 7 *Hyacinthus bellus*. The early blue starry hyacinth. 8 *Hyacinthus bellus*. The early white starry hyacinth. 9 *Hyacinthus bellus*. The early blue starry hyacinth.

Hyacinthus Autumnalis maior. The greater Autumne Iacinth.

The greater Autumne Iacinth hath fide or six very long and narrow Greene leaues, lying vpon the ground; the stalkes are set at the toppe with many starre-like flowers, of a pale blewish purple colour, with some pale coloured threeds, tipt with blew, standing about the head in the middle, which in time growing ripe, containeth therein small blacke seede, and roundish: the roote is great and white on the outside.

Hyacinthus Autumnalis minor. The lesser Autumne Iacinth.

This lesser Iacinth hath such like long and small leaues, but narrower then the former: the stalke is not full so high, but beareth as many flowers on it as the other, which are of a pale or bleake purple colour, very like vnto it also: the roote and seed are like the former, but smaller. These both for the most part, beare their flowers and seede before the Greene leaues rise vp much about the ground.

Floris alba,

There is a kinde hereof found that beareth white flowers, not differing in any other thing from the smaller purple kinde last mentioned.

The Place.

The first and last are onely kept in Gardens, and not knowne to vs where their naturall place of growing wilde may be.

The second groweth wilde in many places of England. I gathered diuers rootes for my Garden, from the foote of a high banke by the Thames side, at the hither end of Chelsey, before you come at the Kings Barge-house.

The Time.

The greatest flowreth in the end of Iuly, and in August.

The other in August and September, you shall seldome see this plant with flowers and Greene leaues at one time together.

The Names.

They haue their names giuen them, as they are expressed in their titles, by all former Writers, except Dalechampius, or hee that set forth that great worke printed at Lyons; for hee contendeth with many words, that these plants can bee no Iacincths, because their flowers appeare before their leaues in Autumne, contrary to the true Iacincth, as he saith: and therefore he would faine haue it referred to *Theophrastus bulbis in libro primo cap. 12.* and calleth it his *Tiphyum* mentioned in that place, as also *Bulbus asivus Dalechampij.* Howsoever these things may carry some probability in them, yet the likenesse both of rootes, and flowers especially, hath caused very learned Writers to entitle them as is set downe, and therefore I may not but let them passe in the like manner.

The Vertues.

Both the rootes and the leaues of the Iacincths are somewhat cold and drying, but the seede much more. It stayeth the loosenesse of the belly. It is likewise said to hinder young persons from growing ripe too soone, the roote being drunke in wine. It helpeth them also whose vrine is stoppt, and is auailable for the yellow Iaudise; but as you heare some are deadly to cattell, I therefore wishall to bee well aduised which of these they will vse in any inward physicke.

Scilla alba. The Sea Onion or Squill.

As I ended the discourse of both the true and the bastard Daffodils, with the Sea kippes

kindes of both sorts; so I thinke it not amisse, to finish this of the Iacynth with the description of a Sea Iacynth, which (as you see) I take to be the *Scilla*, or Sea Onion, all his parts so nearly resembling a Iacynth, that I know not where to ranke him better then in this place, or rather not any where but here. You shall haue the description thereof, and then let the iudicious passe their sentence, as they thinke meetest.

The Squill or Sea Onion (as many doe call it) hath diuers thicke leaues, broad, long, Greene, and hollo wish in the middle, and with an eminent or swelling ribbe all along the backe of the leafe, (I relate it as I haue seene it, hauing shot forth his leaues in the ship by the way, as the Mariners that brought diuers rootes from out of the Straights, did sell them to mee and others for our vse) lying vpon the ground, somewhat like vnto the leaues of a Lilly: these spring vp after the flowers are past, and the seed ripe, they abiding all the Winter, and the next Spring, vntill the heate of the Summer hath spent and consumed them; and then about the end of August, or beginning of September, the stalke with flowers ariseth out of the ground a foote and a halfe high, bearing many fire-like flowers on the toppes, in a long spike one aboue another, flowring by degrees, the lowest first, and so vpwards, whereby it is long in flowring, very like, as we see in forme as bignesse, to the flowers of the great Starre of Bethlehem (these flowers I haue likewise seene shooting out of some of the rootes, that haue been brought in the like manner:) after the flowers are past, there come vp in their places thicke and three square heads, wherein is contained such like flat, black, and round seed, as the Spanish duskie Iacynth before described did beare, but greater: the root is great & white, couered with many peelings or couerings, as is plainly enough seen to any that know them, and that sometimes wee haue had rootes, that haue beene as bigge as a pretty childes head, and sometimes two growing together, each whereof was no lesse then is said of the other.

Scilla rubra sine Pancratium verum. The red Sea Onion.

The roote of this Squill, is greater oftentimes then of the former, the outer coates or peelings being reddish, bearing greater, longer, stiffer, and more hollow leaues, in a manner vpright: this bringeth such a like stalke and flowers, as the former doth, as Fabianus Ilges, Apothecary to the Duke of Briga, did signifie by the figure thereof drawne and sent to Clusius.

The Place.

They grow alwayes neare the Sea, and neuer farre off from it, but often on the very baich of the Sea; where it washeth ouer them all along the coasts of Spaine, Portugal, and Italy, and within the Straights in many places: it will not abide in any Garden farre from the Sea, no not in Italy, as it is related.

The Time.

The time wherein they flower, is expressed to be in August and September: the seede to be ripe in October and Nouember, and the Greene leaues to spring vp in Nouember and December.

The Names.

These are certainly the true kindes of *Scilla* that should bee vsed in medicines, although (as Clusius reporteth) the Spaniards forbade him to taste of the red Squill, as of a most strong and present poison. Pliny hath made more sorts then can be found out yet to this day with vs: that *Scilla* that is called *Epimenidia*, because it might be eaten, is thought to be the great *Ornithogalum*, or Starre of Bethlehem. *Pancratium* is, I know, and as I said before, referred to that kinde of bastard Sea Daffodill, which is set forth before in the end of the history of the bastard Daffodils; and diuers also would make the *Narcissus tertius Matthioli*, which I call the true Sea Daffodill, to be a *Pancratium*, but seeing Dioscorides (and no other is against him)

maketh *Pancratium* to be a kinde of Squill with reddish rootes, I dare not vphold their opinion against such manifest truth.

The Vertues.

The Squill or Sea Onion is wholly vsed physically with vs, because wee can receiue no pleasure from the sight of the flowers. Pliny writeth, that Pithagoras wrote a volume or booke of the properties thereof, for the singular effects it wrought; which booke is lost, yet the diuers vertues it hath is recorded by others, to be effectuell for the spleene, lungs, stomach, liuer, head and heart; and for dropsies, old coughs, laundise, and the wormes; that it cleareth the sight, helpeth the tooth-ache, cleanseth the head of scurfe, and running sores; and is an especiall Antidote against poison: and therefore is vsed as a principall ingredient into the *Theriaca Andromachi*, which we vsually call Venice Treakle. The Apothecaries prepare hereof, both Wine, Vinegar, and Oxy-mel or Syrupe, which is singular to extenuate and expectorate tough flegme, which is the cause of much disquiet in the body, and an hinderer of concoction, or digestion in the stomach, besides diuers other wayes, wherein the scales of the rootes, being dryed, are vsed. And Galen hath sufficiently explained the qualities and properties thereof, in his eight Booke of Simples.

CHAP. XII.

Ornithogalum. Starre of Bethlehem.

AFTER the Family of the Iacincths, must needs follow the kindes of Starre-flowers, or Starres of Bethlehem, as they are called, for that they doe so nearly resemble them, that diuers haue named some of them Iacincths, and referred them to that kindred: all of them, both in roote, leafe, and flower, come nearer vnto the Iacincths, then vnto any other plant. They shall therefore bee next described, euery one in their order, the greatest first, and the rest following.

Ornithogalum Arabicum. The great Starre-flower of Arabia.

This Arabian Starre-flower hath many broad, and long Greene leaues, very like vnto the leaues of the Orientall Iacincth, but lying for the most part vpon the ground, among which riseth vp a round Greene stalke, almost two foote high, bearing at the toppe diuers large flowers, standing vpon long foote-stalkes, and at the bottome of euery one of them a small short pointed Greene leafe: these flowers are made of six pure white leaues a peece, laid open as large as an ordinary Daffodill, but of the forme of a Starre Iacincth, or Starre of Bethlehem, which close as they doe euery night, and open themselues in the day time, especially in the Sunne, the finell whereof is pretty sweete, but weake: in the middle of the flower is a blackish head, composed with six white threds, tipped with yellow pendants: the feede hath not bene obserued with vs: the roote is great and white, with a flat bottome, very impatient of our cold Winters, so that it seldome prospereth or abideth with vs; for although sometimes it doe abide a Winter in the ground, yet it often lyeth without springing blade, or any thing else a whole yeare, and then perisheth: or if it doe spring, yet many doe not beare, and most after their first bearing doe decay and perish. But if any be desirous, to know how to preserue the roote of this plant, or of many other bulbous rootes that are tender, such as the great double white Daffodill of Constantinople, and other fine Daffodills, that come from hot Countries, let them keepe this rule: Let either the roote be planted in a large pot, or tubbe of earth, and housed all the Winter, that so it may bee defended from the frosts; Or else (which is the easier way) keepe the roote out of the ground euery yeare, from September, after the leaues and stalkes are past, vntill February, in
some

some dry, but not hot or windy place, and then plant it in the ground vnder a South wall, or such like defended place, which will spring, and no doubt prosper well there, in regard the greatest and deepest frosts are past after February, so that seldome any great frosts come after, to pierce so deepe as the roote is to be set, or thereby to doe any great harme to it in such a place.

The Place.

This hath been often sent out of Turkie, and likewise out of Italy; I had likewise two rootes sent mee out of Spaine by Guillaume Boel before remembred, which (as hee said) hee gathered there, but they prospered not with me, for want of the knowledge of the former rule. It may be likely that Arabia is the place, from whence they of Constantinople receiue it.

The Time.

It flowreth in May, if it be of the first yeares bringing, or in Iune, if it haue been ordered after the manner before set downe.

The Names.

It hath been sent out of Italy by the name of *Lilium Alexandrinum*, The Lilly of Alexandria, but it hath no affinity with any Lilly. Others call it *Hyacinthus Arabicus*, and the Italians, *Iacinto del pater nostro*: but it is no Iacinth neither, although the flowers be like some of them. Some also would referre it to a *Narcissus* or Daffodill, and it doth as little agree with it, as with a Lilly, although his flowers in largenesse and whitenesse resemble a Daffodill. Clusius hath most fitly referred it to the stocke or kindred of *Ornithogala*, or Starres of Bethlehem, as wee call them in English, and from the Turkish name, *Zumbul Arabi*, entituled it *Ornithogalum Arabicum*, although *Zumbul*, as I haue before declared, is with them, a Iacinth, wee may call it in English, The Arabian Starre-flower, or Starre of Bethlehem, or the great Starre-flower of Arabia.

1. *Ornithogalum maximum album*.

The greatest white Starre-flower, or Starre of Bethlehem.

This great Starre-flower hath many faire, broad, long, and very fresh green leaues, rising vp very early, and are greater, longer, and greener then the leaues of any Orientall Iacinth, which doe abide greene, from the beginning or middle of Ianuary, or before sometimes, vntill the end of May; at which time they begin to fade, and the stalke with the head of flowers beginneth to rise, so that it will haue either few or no leaues at all, when the flowers are blowne: the stalke is strong, round, and firme, rising two foote high or more, bearing at the toppe a great bush of flowers, seeming at the first to be a great Greene eare of corne, for it is made spike-fashion, which when the flowers are blowne, doth rise to be very high, slender or small at the head aboue, and broad spread and bushing below, so that it is long in flowring; for they flower below first, and so vpwards by degrees: these flowers are snow white, without any line on the backside, and is therein like vnto the former, as also in whitenesse, but nothing so large, with a white vmbone or head in the middle, beset with many white threds, tipt with yellow: the seede is blacke and round, contained in three square heads: the roote is great, thicke, and short, and somewhat yellowish on the outside, with a flat bottome, both like the former, and the next that followeth.

2. *Ornithogalum maius spicatum album*.

The great white spiked Starre-flower.

This spiked Starre-flower in his growing, is somewhat like vnto the last described,

but springeth not vp so early, nor hath his leaues so greene, or large, but hath broad, long, whitish greene hollow leaues, pointed at the end, among which riseth vp the stalke, which is strong and high, as the former, hauing a great bush of flowers at the toppe, standing spike-fashion, somewhat like the former, flowering in the same maner by degrees, first below, and so vpwards; but it is not so thicke set with flowers, nor so farre spread at the bottome as it, the flowers also are not so white, and each of the leaues of them haue a greene line downe the backe, leauing the edges on both sides white: after the flowers are past, the heads for seede grow three square, like the other, bearing such like blacke seed therein; the roote hereof is vsually bigger then the last, and whiter on the outside.

3. *Ornithogalum Pannonicum*. The Hungarian Starre-flower.

This Hungarian Starre-flower shooteth out diuers narrow, long, whitish greene leaues, spread vpon the ground before Winter, which are very like vnto the leaues of Gilloflowers, and so abide aboue ground, hauing a stalke rising in the middle of them the next Spring, about halfe a foote high or thereabouts, bearing many white flowers at the toppe, with greene lines downe the backe of them, very like vnto the ordinary Starres of Bethlechem: the roote is greater, thicker, and longer then the ordinary Starres, and for the most part, two ioyned together, somewhat grayish on the out side.

4. *Ornithogalum vulgare*. The Starre of Bethlechem.

The ordinary Starre of Bethlechem is so common, and well knowne in all countries and places, that it is almost needlesse to describe it, hauing many greene leaues with white lines therein, and a few white flowers set about the toppe of the stalke, with greenish lines downe the backe: the roote is whitish, and encreaseth abundantly.

5. *Asphodelus bulbosus Galeni, sine Ornithogalum maius flore subnirescente*. The bulbous Asphodill, or greene Starre-flower.

Diuers haue referred this plant vnto the Asphodils, because (as I thinke) the flowers hereof are straked on the backe, and the leaues long and narrow, like vnto the Asphodils; but the roote of this being bulbous, I rather (as some others doe) ioyne it with the *Ornithogala*, for they also haue strakes on the backe of the flowers. It hath many whitish greene leaues, long and narrow, spread vpon the ground, which spring vp in the beginning of the yeare, and abide vntill May, and then they withering, the stalke springeth vp almost as high as the first, hauing many pale yellowish greene flowers, but smaller, and growing more sparsedly about the stalke vpon short foot-stalkes, but in a reasonable long head spike-fashion: the seede is like vnto the second kinde, but smaller: the roote is somewhat yellowish, like the first great white kinde.

The Place.

The first is onely nursed in Gardens, his originall being not well knowne, yet some attribute it vnto *Pannonia* or Hungary. The second hath been found neare vnto *Barcinone*, and *Toledo* in *Spaine*. The third was found in Hungary by *Clusius*. Our ordinary euery where in the fields of Italy and France, and (as it is said) in England also. And the last groweth likewise by the corne fields in the vpper Hungary.

The Time.

They flower in Aprill and May, and sometimes in Iune.

The Names.

The first is called by *Clusius* *Ornithogalum maximum album*, because it is greater

1. *Ornithogalum arabicum*, The great Starc-flower of Arabia. 2. *Ornithogalum maximum* alias The great white Starc-flower. 3. *Ornithogalum minus* *sphaeranthum* alias The great white Spiced Starc-flower. 4. *Ornithogalum paniculatum* alias The Hungarian Starc-flower. 5. *Ornithogalum minus* *subuliferum* alias The bulbous Alphahill, or green Starc-flower. 6. *Ornithogalum hispanicum* alias The little Starc-flower of Spain. 7. *Ornithogalum italicum*, The yellow Starc-flower of Bethlehem. 8. *Ornithogalum Neapolitanum*, The Starc-flower of Naples.

greater then the next, which hee tooke formerly for the greatest: but it might more fitly, in my iudgement, bee called *Asphodelus bulbosus albus* (if there be any *Asphodelus bulbosus* at all) because this doth so nearly resemble that, both in the early springing, and the decay of the greene leaues, when the stalkes of flowers doe rise vp. Diuers also doe call it *Ornithogalum Pannonicum maximum album*.

The second hath his name in his title, as most authors doe set it downe, yet in the great Herball referred to Dalechampi, it is called *Ornithogalum magnum Atyoni*.

The third hath his name from the place of his birth, and the other from his popularity, yet Dodonæus calleth it *Bulbus Lencanthes*.

The last is called by diuers *Asphodelo-hyacinthinus*, and *Hyacintho-asphodelus Galeni*. Dodonæus calleth it *Asphodelus femina*, and *Asphodelus bulbosus*. But Lobel, and Gerrard from him, and Dodonæus, doe make this to haue white flowers, whereas all that I haue seene, both in mine owne, and in others Gardens, bore greenish flowers, as Clusius setteth it truely downe. Lobel seemeth in the description of this, to confound the *Ornithogalum* of Mompelien with it, and calleth it *Asphodelus hyacinthinus forte Galeni*, and saith that some would call it *Pancratium Monspeliense*, and *Asphodelus Galeni*. But as I haue shewed, the *Ornithogalum spicatum* and this, doe plainly differ the one from the other, and are not both to be called by one name, nor to be reckoned one, but two distinct plants.

Ornithogalum Ethiopicum. The Starre-flower of Æthiopia.

The leaues of this plant are a foote long, and at the least an inch broad, which being broken, are no lesse woolly then the woolly Iacinth: the stalke is a cubit high, strong and greene, from the middle whereof vnto the toppe, stand large snow white flowers, vpon long, greene, thicke foot-stalkes, and yellowish at the bottome of the flower; in the middle whereof stand six white threads, tipt with yellow chiuces, compassing the head, which is three square, and long containing the seede: the roote is thicke and round, somewhat like the *Asphodelus Galeni*.

The Place.

This plant was gathered by some Hollanders, on the West side of the Cape of good Hope.

The Time.

It flowered about the end of August with those that had it.

The Names.

Because it came from that part of the continent beyond the line, which is reckoned a part of Æthiopia, it is thereupon so called as it is set downe.

Ornithogalum Neopolitanum. The Starre-flower of Naples.

This beautifull plant riseth out of the ground very early, with foure or fise hollow pointed leaues, standing round together, of a whitish greene colour, with a white line downe the middle of euery leafe on the inside, somewhat narrow, but long, (Fabius Columna saith, three foot long in Italy, but it is not so with vs) in the middle of these leaues riseth vp the stalke, a foote and a halfe high, bearing diuers flowers at the toppe, every one standing in a little cuppe or huske, which is diuided into three or foure parts, hanging downe very long about the heads for seede: after the flower is past, these flowers doe all hang downe their heads, and open one way, although their little foot-stalkes come forth on all sides of the greater stalke, being large, and composed of six long leaues, of a pure white on the inside, and of a blewish or whitish greene colour on

on the outside, leauing the edges of euery leafe white on both sides: in the middle of these flowers stand other small flowers, each of them also made of six small white leaues a peece, which meeting together, seeme to make the shew of a cuppe, within which are contained six white threeds, tipt with yellow, and a long white pointell in the middle of them, being without any sent at all: after the flowers are past, come vp great round heads, which are too heauie for the stalke to beare, and therefore lye downe vpon the leaues or ground, hauing certaine lines or stripes on the outside, wherein is contained round, blacke, rough seede: the roote is great and white, and somewhat flat at the bottome, as diuers of these kindes are, and doe multiply as plentifully into small bulbes as the common or any other.

The Place.

This Starre-flower groweth in the Medowes in diuers places of Naples, as Fabius Columna, and Ferrantes Imperatus doe testifie, from whence they haue been sent. And Matthiolus, who setteth out the figure thereof among his Daffodils, had (it should seeme) scene it grow with him.

The Time.

It flowreth in May, although it begin to spring out of the ground oftentimes in Nouember, but most vsually in Ianuary: the seede is ripe in Iuly.

The Names.

Matthiolus reckoneth this (as is said) among the Daffodils, for no other respect, as I conceiue, then that he accounted the middle flower to bee the cuppe or trunke of a Daffodill, which it doth somewhat resemble, and setteth it forth in the fourth place, whereupon many doe call it *Narcissus quartus Matthioli*, The fourth Daffodill of Matthiolus. Fabius Columna calleth it *Hyacinthus aruorum Ornithogali flore*. Clusius (to whom Imperatus sent it, in stead of the Arabian which hee desired) calleth it of the place from whence he receiued it, *Ornithogalum Neopolitanum*, and we thereafter call it in English, The Starre-flower of Naples.

Ornithogalum Hispanicum minus. The little Starre-flower of Spaine.

Clusius hath set forth this plant among his *Ornithogala* or Starre-flowers, and although it doth in my minde come nearer to a *Hyacinthus*, then to *Ornithogalum*, yet pardon it, and let it passe as he doth. From a little round whitish roote, springeth vp in the beginning of the yeare, siue or six small long green leaues, without any white line in the middle of them, among which rise vp one or two small stalkes, an hand length high or better, bearing seuen or eight, or more flowers, growing as it were in a tuft or vmbell, with small long leaues at the foote of euery stalke, the lower flowers being equall in length with the vppermost, of a pale whitish blew or ash colour, with a strake or line downe the backe of euery leafe of them, with some white threeds standing about a blewish head in the middle: these flowers passe away quickly, and giue no seed, so that it is not knowne what seede it beareth.

The Place.

This groweth in Spaine, and from thence hath been brought to vs.

The Time.

It flowreth in May.

The Names.

It hath no other name then is set down in the title, being but lately found out.

I. Orni-

1. Ornithogalum album unifolium. The white starre-flower with one blade.

This little starre-flower I bring into this place, as the fittest in my opinion where to place it, vntill my minde change to alter it. It hath a very small round white roote, from whence springeth vp one very long and round Greene leafe, like vnto a rusli, but that for about two or three inches aboue the ground, it is a litle flat, and from thence springeth forth a small stalke not aboue three or foure inches high, bearing at the top thereof three or foure small white flowers, consisting of six leaues a peece, within which are six white chiues, tipt with yellow pendants, standing about a small three square head, that hath a white pointell sticking as it were in the middest thereof: the flower is pretty and sweete, but not heady.

Ornithogalum luteum. The yellow Starre of Bethlehem.

This yellow Starre-flower riseth vp at the first, with one long round greenish leafe, which openeth it selfe somewhat aboue the ground, and giueth out another small leafe, lesser and shorter then the first, and afterward the stalke riseth from thence also, being foure or fise inches high, bearing at the toppe three or foure small green leaues, and among them foure or fise small yellow starre-like flowers, with a greenish line or streake downe the backe of euery leafe, and some small reddish yellow threads in the middle: it seldome giueth feede: the roote is round, whitish, and somewhat cleare, very apt to perish, if it bee any little while kept dry out of the ground, as I haue twice tried to my losse.

The Place.

The first grew in Portugall, and Clusius first of all others desciphers it. The other is found in many places both of Germany and Hungary, in the moister grounds.

The Time.

The first flowreth in May: the other in Aprill, and sometimes in March.

The Names.

Carolus Clusius calleth the first *Bulbus unifolius*, or *Balbina*, but referreth it not to the stocke or kindred of any plant; but (as you see) I haue ranked it with the small sorts of *Ornithogalum*, and giue it the name accordingly.

The other is referred for likenesse of forme, and not for colour, vnto the *Ornithogala*, or Starres of Bethlehem. It is called by Tragus and Fuchsius *Bulbus siluestris*, because of the obtiousnesse. Cordus taketh it to be *Sisyrinchium*. Lacuna calleth it *Bulbus esculentus*. Lobel and others in these dayes generally, *Ornithogalum luteum*, and wee thereafter in English, The yellow Starre-flower, or Starre of Bethlehem.

The Vertues.

The first kinde being but lately found out, is not knowne to be vsed. The rootes of the common or vulgar, are (as Matthiolus saith) much eaten by poore people in Italy, either rawe or roasted, being sweeter in taste then any Chestnut, and seruing as well for a necessary food as for delight. It is doubtfull whether any of the rest may be so vsed; for I know not any in our Land hath made any experience.

There are many other sorts of Starre-flowers, which are fitter for a generall then this History, and therefore I referre them thereunto.

CHAP. XIII.

Moly. Wilde Garlicke.

VNto the former Starre-flowers, must needes bee ioyned another tribe or kindred, which carry their straked flowers Starre-fashion, not spikewise, but in a tuft or vmbell thicke thrust or set together. And although diuers of them smell not as the former, but most of their first Grandfathers house, yet all doe not so; for some of them are of an excellent sent. Of the whole Family, there are a great many which I must leaue, I will onely select out a few for this our Garden, whose flowers for their beauty of stateliness, forme, or colour, are fit to bee entertained, and take place therein, euery one according to his worth, and are accepted of with the louers of these delights.

1. *Moly Homericum*, vel *petium Theophrasti*.The greatest *Moly* of Homer.

Homers *Moly* (for so it is most vsually called with vs) riseth vp most commonly with two, and sometimes with three great, thicke, long, and hollow guttured leaues, of a whitish Greene colour, very neare the colour of the Tulipa leafe, hauing sometimes at the end of some of the leaues, and sometimes apart by it selfe, a whitish round small button, like vnto a small bulbe, the like whereof also, but greater, doth grow betweene the bottome of the leaues and the stalke neare the ground, which being planted when it is ripe, will grow into a roote of the same kinde: among these leaues riseth vp a round, strong, and tall stalke, a yard high or better, bare or naked vnto the toppe, where it beareth a great tuft or vmbell of pale purplish flowers, all of them almost standing vpon equall foot-stalkes, or not one much higher then another, consisting of five leaues a peece, striped downe the backe with a small pale line, hauing a round head or vmbone with some threeds about it in the midst: These flowers doe abide a great while blowne before they vade, which smell not very strong, like any Onion or Garlicke, but of a faint smell: and after they are past cometh the seede, which is blacke, wrapped in white close huskes: the roote groweth very great, sometimes bigger then any mans closed fist, smelling strong like Garlicke, whitish on the outside, and Greene at the toppe, if it be but a while bare from the earth about it.

2. *Moly Indicum* sive *Caucasum*. The Indian *Moly*.

The Indian *Moly* hath such like thicke large leaues, as the Homers *Moly* hath, but shorter and broader, in the middle whereof riseth vp a short weake stalke, almost flat, not hauing any flowers vpon it, but a head or cluster of greenish scaly bulbes, inclosed at the first in a large thinne skinne, which being open, euery bulbe sheweth it selfe, standing close one vnto another vpon his foot-stalke, of the bignesse of an Acorne, which being planted, will grow to bee a plant of his owne kinde: the roote is white and great, couered with a darke coate or skinne, which encreaseth but little vnder ground; but besides that head, it beareth small bulbes about the ground, at the bottome of the leaues next vnto the stalke, like vnto the former.

The Place.

Both these doe grow in diuers places of Spaine, Italy, and Greece; for the last hath been sent out of Turkie among other rootes. Ferrantes Imperatus a learned Apothecary of Naples, sent it to diuers of his friends in these parts, and hath described it in his naturall history among other plants, printed in the Italian tongue. It grew also with Iohn Tradescante at Canterbury, who sent me the head of bulbes to see, and afterwards a roote, to plant it in my Garden.

The

The Time.

The first flowreth in the end of May, and abideth vnto the midft of Iuly, and fometimes longer. The other beareth his head of bulbes in Iune and Iuly.

The Names.

We haue receiued them by their names expreffed in their titles; yet the laft hath alfo been fent by the name of *Ornithogalum Italicum*, but as all may eafily fee, it is not of that kindred.

1. *Moly montanum Pannonicum bulbiferum primum.*

The first bulbed Moly of Hungary.

This first Hungarian Moly hath three or foure broad and long greene leaues, folded together at the firft, which after open themfelues; and are carried vp with the ftalke, ftanding thereon one aboue another, which is a foote high; at the toppe whereof doe grow a few fad reddifh bulbes, and betweene them long foot-ftalkes, bearing flowers of a pale purplifh colour; after which followeth blacke feede, inclofed in roundifh heads: the roote is not great, but white on the outside, very like vnto the roote of Serpents Moly, hereafter defcribed, encreafing much vnder ground, & fmelling ftrong.

2. *Moly montanum Pannonicum bulbiferum fecundum.*

The second bulbed Moly of Hungary.

The fecond Moly hath narrower greene leaues then the former: the ftalke is about the fame height, and beareth at the toppe a great clufter of fmall greene bulbes, which after turne of a darker colour, from among which come forth long foot-ftalkes, whereon ftand purplifh flowers: the roote is couered with a blackifh purple coate or skinne.

3. *Moly Serpentinum. Serpents Moly.*

This Moly muft alfo be ioyned vnto the bulbous Molyes, as of kindred with them; yet of greater beauty and delight, becaufe the bulbes on the heads of the fmall ftalkes are redder, and more pleasant to behold: the ftalke is lower, and his graffie winding leaues, which turne themfelues (whereof it tooke the name) are fmall, and of a whiter greene colour: it beareth among the bulbes purplifh flowers alfo, but more beautifull, the fent whereof is nothing fo ftrong: the roote is fmall, round, and whitifh, encreafing into a number of fmall rootes, no bigger then peafe round about the greater roote.

4. *Molycaule & folijs triangularibus.* The three cornered Moly.

This three fquare Moly hath foure or fiue long, and fomewhat broad pale greene leaues, flat on the vpper fide, and with a ridge downe the backe of the leafe, which maketh it feeme three fquare: the ftalke which rifeth vp a foote and a halfe high or better, is three fquare or three cornered alfo, bearing at the toppe out of a skinnie huske diuers white flowers, fomewhat large and long, almoft bell-fafhion, with ftipes of greene downe the middle of euery leafe, and a few chiuces tipt with yellow in the middle about the head, wherein when it is ripe, is inclofed fmall blacke feede: the roote is white on the outside, and very like the yellow Moly; both roote, leafe, and flower hath a fmacke, but not very ftrong of Garlicke.

5. *Moly Narcissifolij.* Daffodill leaved Moly.

This Moly hath many long, narrow, and flat greene leaues, very like vnto the leaues of a Daffodill, from whence it tooke his name (or rather of the early greater *Leucoium bulbosum*,

1 *Moly Homerum* vel *perum Theropaei*. The greatest Moly of Homer. 2 *Moly Indicum* sive *Cassia*. The Indian Moly. 3 *Moly Tannanicum* *indisferum*. The bulbed Moly of Hungary. 4 *Moly Serpentinum*. Serpents Moly. 5 *Moly purpureum Neapolitanum*. The purplish Moly of Naples. 6 *Moly caule de folijs triangularibus*. The three cornered Moly. 7 *Moly latifolium sive luteum*. The yellow Moly. 8 *Moly Dissectum Hispanicum*. The Spanish Moly of Dissectides. 9 *Moly Zibethicum* vel *Majestatum*. The sweet smelling Moly of Mompeller. 10 *Moly fruticosum Cuscorum*. The late Pineapple Moly.

bulbosum, or bulbed Violet before described, ioyned next vnto the Daffodils, because it is so like them) among which riseth vp two or three stalkes sometimes, each of a foot and a halfe high, bearing at the toppe, inclosed in a skinny hose, as all the Molyes haue, a number of small purplish flowers, which doe not long abide, but quickly fade: the seede is blacke as others are; the roote is sometimes knobbed, and more often bulbed, hauing in the knobs some markes of the old stalkes to be seene in them, and smelleth somewhat like Garlicke, whereby it may be knowne.

6. *Moly montanum latifolium lateo flore.* The yellow Moly.

The yellow Moly hath but one long and broad leafe when it doth not beare flower, but when it will beare flower, it hath two long and broad leaues, yet one alwaies longer and broader then the other, which are both of the same colour, and neare the bignesse of a reasonable Tulipa leafe: betweene these leaues groweth a slender stalke, bearing at the toppe a tuft or vmbell of yellow flowers out of a skinnie hose, which parteth three wayes, made of six leaues a peece, laid open like a Starre, with a greenish backe or outside, and with some yellow threds in the middle: the seede is blacke, like vnto others: the roote is whitish, two for the most part ioyned together, which encreaseth quickly, and smelleth very strong of Garlicke, as both flowers and leaues doe also.

7. *Moly Pyrenaum purpureum.* The purple mountaine Moly.

This purple Moly hath two or three leaues, somewhat like the former yellow Moly, but not so broad, nor so white: the stalke hath not so many flowers thereon, but more sparingly, and of an vnpleasant purple colour: the roote is whitish, smelling somewhat strongly of Garlicke, but quickly perisheth with the extremity of our cold Winters, which it will not abide vnlesse it be defended.

8. *Moly montanum latifolium purpureum Hispanicum.*
The purple Spanish Moly.

This Moly hath two broad and very long Greene leaues, like vnto the yellow Moly, in this, that they doe compasse one another at the bottome of them, between which riseth vp a strong round stalke, two foote high or more, bearing at the toppe, out of a thinne huske, a number of faire large flowers vpon long foot-stalkes, consisting of six leaues a peece, spread open like a Starre, of a fine delayed purple or bluish colour, with diuers threds of the same colour, tipt with yellow, standing about the middle head: betweene the stalke and the bottome of the leaues it hath some small bulbes growing, which being planted, will soone spring and encrease: the roote also being small and round, with many fibres thereat, hath many small bulbes shooting from them; but neither roote, leafe, nor flower, hath any ill sent of Garlicke at all.

9. *Moly purpureum Neapolitanum.* The purple Moly of Naples.

The Neapolitane Moly hath three or foure small long Greene leaues set vpon the stalke after it is risen vp, which beareth a round head of very fine purple flowers, made of six leaues a peece, but so closing together at the edge, that they seeme like vnto small cuppes, neuer laying themselves open, as the other doe; this hath some sent of his originall, but the roote more then any part else, which is white and round, quickly encreasing as most of the Molyes doe.

10. *Moly pyxidatum argenteum Hispanicum.*
The Spanish siluer cupped Moly.

This Spanish Moly hath two or three very long rush like leaues, which rise vp with the stalke, or rather vanish away when the stalke is risen vp to bee three foote high or more, bearing a great head of flowers, standing close at the first, but afterwards spreading much one from another, euery flower vpon a long foote-stalke, being of a white
siluer

siluer colour, with stripes or lines on euery side, and fashioned small and hollow, like a cuppe or boxe: the feede I could neuer obserue, because it flowreth so late, that the Winter hindereth it from bearing seede with vs: the roote is small and round, white, and in a manner transparent, at least so shining, as if it were so, and encreaseth nothing so much, as many of the other sorts: this hath no ill sent at all, but rather a pretty smell, not to bee misliked.

11. *Moly serotinum Coniferum*. The late Pineapple Moly.

This late Moly that was sent me with the last described, and others also from Spain, riseth vp with one long Greene leafe, hollow and round vnto the end, towards this end on the one side, breaketh out a head of flowers, enclosed in a thinne skinne, which after it hath so stood a good while, the leafe in the meane time rising higher, and growing harder, becommeth the stalke) breakerth, and sheweth a great bush or head of buds for flowers, thicke thrust together, fashioned very like vnto the forme of a Pineapple (from whence I gaue it the name) of the bignesse of a Walnut: after this head hath stood in this manner a moneth or thereabouts, the flowers shew themselves to bee of a fine delayed or whitish purple colour, with diuers stripes in euery of them, of the same cup-fashion with the former, but not opening so plainly, so that they cannot bee discerned to bee open, without good heede and obseruation. It flowreth so late in Autumne, that the early frosts doe quickly spoile the beauty of it, and soone cause it to roote: the roote is small and round, and shining like the last, very tender also, as not able to abide our sharpe Winters, which hath caused it vnto to perish with me.

12. *Moly Dioscoridum*. Dioscorides his Moly.

The roote of this small Moly is transparent within, but couered with a thicke yellowish skinne, of the bignesse of an Hasell Nut, or somewhat bigger, which sendeth forth three or foure narrow grassie leaues, long and hollow, and a little bending downwards, of a whitish Greene colour, among which riseth vp a slender weake stalke, a foot and a halfe high, bearing at the toppe, out of a thinne skinne, a tuft of milke white flowers, very like vnto those of Ramsons, which stand a pretty while in their beauty, and then passe away for the most part without giuing any seede: this hath little or no sent of Garlike.

We haue another of this sort that is lesser, and the flowers rounder pointed.

13. *Moly Dioscoridum Hispanicum*. The Spanish Moly of Dioscorides.

This Moly came vnto me among other Molyes from Spaine, and is in all things like vnto the last described, but fairer, larger, and of much more beauty, as hauing his white flowers twice as great as the former; but (as it seemeth) very impatient of our Winters, which it could not at any hand endure, but quickly perished, as some others that came with it also.

14. *Moly Moschatinum vel Zibetinum Mompeliense*.

The sweete smelling Moly of Mompelier.

This sweete Moly, which I haue kept for the last, to close vp your senses, is the smallest, and the finest of all the rest, hauing foure or fve small Greene leaues, almost as fine as haire, or like the leaues of the Feather-grasse: the stalke is about a foote high, bearing fve or six or more small white flowers, laid open like Starres, made of six leaues a peece, of an excellent sweete sent, resembling Muske or Ciuet; for diuers haue diuersly censured of it. It flowreth late in the year, so that if the precedent Summer bee either ouer moist, or the Autumne ouer early cold, this will not haue that sweete sent, that it will haue in a hot drie time, and besides must be carefully respected: for it will hardly abide the extremity of our sharpe Winters.

The Place.

The places of these Molyes, are for the most part expressed in their titles, or in their descriptions.

The Time.

The time is set downe, for the most part to bee in Iune and Iuly, the rest later.

The Names.

To make further relation of names then are expressed in their titles, were needlesse; let these therefore suffice.

The Vertues.

All these sorts of Molyes are small kindes of wilde Garlicke, and are to be vsed for the same purposes that the great Garden Garlicke is, although much weaker in their effects. For any other especiall property is in any of these, more than to furnish a Garden of variety, I haue not heard at all.

And thus much may suffice of these kindes for our Garden, reseruing manie others that might be spoken of, to a generall worke, or to my Garden of Simples, which as God shall enable me, and time giue leaue, may shew it selfe to the world, to abide the iudicious and criticke censures of all.

CHAP. XIII.

Asphodelus. The Asphodill.

Here remaine some other flowers, like vnto the last described, to be specified, which although they haue no bulbous rootes; yet I thinke them fittest to bee here mentioned, that so I may ioine those of neereft similitude together, vntill I haue finished the rest that are to follow.

1. *Asphodelus maior albus ramosus*. The great white branched Asphodill.

The great white Asphodill hath many long, and narrow, hollow three square leaues, sharpe pointed, lying vpon the ground round about the roote: the stalke is smooth, round, and naked without leaues, which riseth from the midst of them, diuided at the toppe into diuers branches, if the plant bee of any long continuance, or else but into two or three small branches; from the sides of the maine great one, whereon doe stand many large flowers Starre-fashion, made of six leaues a peece, whitish on the inside, and straked with a purplish line downe the backside of euery leafe, hauing in the middle of the flowers some small yellow threds: the seede is blacke, and three square, greater then the seede of Bucke wheate, contained in roundish heads, which open into three parts: the roote is composed of many tuberous long clogges, thickest in the middle, and smaller at both ends, fastened together at the head, of a darke grayish colour on the outside, and yellow within.

2. *Asphodelus albus non ramosus*. The white vnbranched Asphodill.

The vnbranched Asphodill is like vnto the former, both in leaues and flowers, but that the flowers of this are whiter, and without any line or strake on the backe side, and

and the stalkes are without branches: the rootes likewise are smaller, and fewer, but made after the same fashion.

3. *Asphodelus maior flore carneo*. The blush coloured Asphodill.

This Asphodill is like to the last in forme of leaues and branches, and differeth in this, that his leaues are marked with some spots, and the flowers are of a blush or flesh colour, in all other things alike.

4. *Asphodelus minimus albus*. The least white Asphodill.

This least Asphodill hath foure or five very narrow long leaues, yet seeming three square like the greatest, bearing a small stalke, of about a foote high among them, without any branches, and at the toppe a few white flowers, straked both within and without, with a purplish line in the middle of euery leafe. The rootes are such like tuberous clogges as are in the former, but much lesser.

5. *Asphodelus albus minor sive Fistulosus*. The little hollow white Asphodill.

This little white Asphodill hath a number of leaues growing thicke together, thicker and greener then those of the small yellow Asphodill, or Kings Speare next following, among which riseth vp diuers round stalkes, bearing flowers from the middle to the toppe, Starre-fashion, with small Greene leaues among them, which are white on the inside, and striped on the backe with purple lines, like vnto the first described: the seede, and heads containing them, are three square, like the seede of the little yellow Asphodill: the rootes of this kinde are not glandulous, as the former, but stringie, long and white: the whole plant is very impatient of our cold Winters, and quickly perisheth, if it be not carefully preserued, both from the cold, and much wet in the Winter, by housing it, and then it will abide many yeares: for it is not an annual plant, as many haue thought.

6. *Asphodelus luteus minor, sive Hastula regia*.
The small yellow Asphodill, or Kings speare.

This small yellow Asphodill, which is vsually called the Kings speare, hath many long narrow edged leaues, which make them seeme three square, of a blewish or whitish Greene colour: the stalke riseth vp three foote high oftentimes, beset with small long leaues vp vnto the very flowers, which grow thicke together spike-fashion one about another, for a great length, and wholly yellow, laid open like a Starre, somewhat greater then the last white Asphodill, and smaller then the first, which when they are past yeeld round heads, containing blacke cornered seede, almost three square: the rootes are many long yellow strings, which spreading in the ground, doe much encrease.

The Place.

All these Asphodils doe grow naturally in Spaine and France, and from thence were first brought vnto vs, to furnish our Gardens.

The Time.

All the glandulous rooted Asphodils doe flower some in May, and some in Iune; but the two last doe flower, the yellow or last of them in Iuly, and the former white one in August and September, and vntill the cold and winter hinder it.

The Names.

Their severall names are giuen them in their titles, as much as is fit for this

this discourse. For to shew you that the Greekes doe call the stalke of the great Asphodill *Asphodelos*, and the Latines *Albucum*, or what else belongeth to them, is fitter for another worke, vnto which I leaue them.

The bastard Asphodils should follow next in place, if this worke were fit for them; but because I haue tyed my selfe to expresse onely those flowers and plants, that for their beauty, or sent, or both, doe furnish a Garden of Pleasure, and they haue none, I leaue them to a generall History of plants, or that Garden of Simples before spoken of, and will describe the Lilly Asphodils, and the *Phalangia* or Spider-wortes, which are remaining of those, that ioine in name or fashion, and are to be here inserted, before I passe to the rest of the bulbous rootes.

1. *Liliasphodelus phanicus*. The gold red Day Lilly.

Because the rootes of this and the next, doe so nearely agree with the two last recited Asphodils, I haue set them in this place, although some doe place them next after the Lillies, because their flowers doe come nearest in forme vnto Lillies; but whether you will call them Asphodils with Lilly flowers, as I thinke it fittest, or Lillies with Asphodill rootes, or Lillies without bulbous rootes, as others doe, I will not contend.

The red Day Lilly hath diuers broad and long fresh greene leaues, folded at the first as it were double, which after open, and remaine a little hollow in the middle; among which riseth vp a naked stalke three foot high, bearing at the toppe many flowers, one not much distant from another, and flowring one after another, not hauing lightly about one flower blown open in a day, & that but for a day, not lasting longer, but closing at night, and not opening againe; whereupon it had his English name, The Lilly for a day: these flowers are almost as large as the flowers of the white Lilly, and made after the same fashion, but of a faire gold red, or Orange tawny colour. I could neuer obserue any seede to follow these flowers; for they seeme the next day after they haue flowred, (except the time be faire and dry) to bee so rotten, as if they had lyen in wet to rotte them, whereby I thinke no seede can follow: the rootes are many thicke and long yellow knobbed strings, like vnto the small yellow Asphodill rootes, but somewhat greater, running vnder ground in like sort, and shooting young heads round about.

2. *Liliasphodelus luteus*. The yellow Day Lilly.

I shall not neede to make a repetition of the description of this Day Lilly, hauing giuen you one so amply before, because this doth agree therewith so nearely, as that it might seeme the same; these differences onely it hath, the leaues are not fully so large, nor the flower so great or spread open, and the colour thereof is of a faire yellow wholly, and very sweet, which abideth blowne many daies before it fade, and hath giuen blacke round feede, growing in round heads, like the heads of the small yellow Asphodill, but not so great.

Clusius hath set downe, that it was reported, that there should be another *Liliasphodill* with a white flower, but we can heare of none such as yet; but I rather thinke, that they that gaue that report might be mistaken, in thinking the Sauoye Spider-wort to be a white *Liliasphodill*, which inderde is so like, that one not well experienced, or not well regarding it, may soone take one for another.

The Place.

Their originall is many moyst places in Germany.

The Times.

They flower in May and Iune.

The Names.

They are called by some *Liliago*, and *Lilium non bulbosum*, and *Liliasphodelus*.

1. *Asphodelus major albus ramosus*. The great white branched Asphodill. 2. *Asphodelus minor albus seu fistulosus*. The little hollow white Asphodill. 3. *Asphodelus minor luteus, sine Hallu's regia*. The small yellow Asphodill, or Kings pipe. 4. *Liliasphodelus luteus*. The yellow Day Lilly. 5. *Liliasphodelus phaeus*. The gold red Day Lilly.

delm. In English we call them both Day Lillies, but the name doth not so well agree with the last, as with the first, for the causes about specified.

The Vertues.

The rootes of Asphodill hath formerly beene had in great account, but now is vtterly neglected; yet by reason of their sharpenesse they open and cleanse, and therefore some haue of late vsed them for the yellow Iaudise. The Day Lillies haue no physicall vse that I know, or haue heard.

CHAP. XV.

Phalangium. Spider-wort.

THese plants doe so nearely resemble those that are last set forth, that I thinke none that knowes them, will doubt, but that they must follow next vnto them, being so like vnto them, and therefore of the fairest of this kinde first.

1. *Phalangium Allobrogicum*. The Sauoye Spider-wort.

The Sauoye Spider-wort springeth vp with foure or fise Greene leaues, long and narrow, yet broader at the bottome, narrower pointed at the end, and a little hollow in the middle; among which riseth vp a round stiffe stalke, a foote and a halfe high, bearing at the toppe one about another, seuen or eight, or more flowers, euery one as large almost as the yellow Day Lilly last described, but much greater then in any other of the Spider-worts, of a pure white colour, with some threds in the middle, ript with yellow, and a small forked pointell: after the flowers are past, the heads or seede vessels grow almost three square, yet somewhat round, wherein is contained blackish seede: the rootes are many white, round, thicke, brittle strings, ioyned together at the head, but are nothing so long, as the rootes of the other *Phalangia* or Spider-worts.

2. *Phalangium maius italicum album*. The great Italian Spider-wort.

This great Spider-wort hath diuers long and narrow leaues spread vpon the ground, and not rising vp as the former, and not so broad also as the former, but somewhat larger then those that follow: the stalke is bigger, but seldome riseth vp so high as the next, whereof this is a larger kinde, hauing a long vnbranched stalke of white flowers, laid open like starres as it hath, but somewhat greater: the rootes are long and white, like the next, but somewhat larger.

3. *Phalangium non ramosum vulgare*. Vnbranched Spider-wort.

The leaues of this Spider-wort doe seeme to bee little bigger or longer then the leaues of grasse, but of a more grayish green colour, rising immediately from the head or tuft of rootes; among which rise vp one or two stalkes, sometimes two or three foote long, besettoward the toppe with many white Starre-like flowers, which after they are past turne into small round heads, containing blacke seede, like vnto the seed of the little yellow Asphodill, but lesser: the rootes are long white strings, running vnder ground.

4. *Phalangium ramosum*. Branched Spider-wort.

The branched Spider-wort hath his leaues somewhat broader then the former, and of a more yellowish Greene colour: the stalke hereof is diuersly branched at the top, bearing many white flowers, like vnto the former, but smaller: the seedes and rootes are like the former in all things.

1 *Phalangium Allobrogicum*. The Sauoye Spider-wort. 2 *Phalangium non ramosum*. Un-branched Spider-wort. 3 *Phalangium ramosum*. Branched Spider-wort. 4 *Phalangium Ephemerum Virginianum*. Iohn Tradescante's Spider-wort.

The Place.

The first groweth on the Hills neare vnto Sauoye, from whence diuers, allured with the beauty of the flower, haue brought it into these parts.

The second came vp in my Garden, from the seede receiued out of Italy. The others grow in Spaine, France, &c.

The Time.

The vnbranched Spider-wort most commonly flowreth before all the other, and the branched a moneth after it: the other two about one time, that is, towards the end of May, and not much after the vnbranched kinde.

The Names.

The first (as I said before) hath beene taken to be a white Lilliasphodill, and called *Liliasphodelus flore albo*; but Clusius hath more properly entituled it a *Phalangium*, and from the place of his originall, gaue him his other denomination, and so is called of most, as is set downe in the title.

The other haue no other names then are expressed in their titles, but only that Cordus calleth them *Liliago*; and Dodonaus, *lib. 4. hist. plant.* would make the branched kinde to bee *Moly alterum Plinij*, but without any good ground.

The Vertues.

The names *Phalangium* and *Phalangites* were imposed on these plants, because they were found effectually, to cure the poyson of that kinde of Spider, called *Phalangium*, as also of Scorpions and other Serpents. Wee doe not know, that any Physitian hath vsed them to any such, or any other purpose in our dayes.

5. *Phalangium Ephemenum Virginianum Ioannis Tradescant.*

The soon fading Spider-wort of Virginia, or Tradescant his Spider-wort.

This Spider-wort is of late knowledge, and for it the Christian world is indebted vnto that painfull industrious searcher, and louer of all natures varieties, Iohn Tradescant (sometimes belonging to the right Honourable Lord Robert Earle of Salisbury, Lord Treasurer of England in his time, and then vnto the right Honourable the Lord Wotton at Canterbury in Kent, and lastly vnto the late Duke of Buckingham) who first receiued it of a friend, that brought it out of Virginia, thinking it to bee the Silke Grasse that groweth there, and hath imparted hereof, as of many other things, both to me and others; the description whereof is as followeth:

From a stringie roote, creeping farre vnder ground, and rising vp againe in many places, springeth vp diuers heads of long folded leaues, of a grayish ouer-worne greene colour, two or three for the most part together, and not about, compassing one another at the bottome, and abiding greene in many places all the Winter; otherwise perishing, and rising anew in the Spring, which leaues rise vp with the great round stalke, being set thereon at the ioynts, vsually but one at a ioynt, broad at the bottome where they compasse the stalke, and smaller and smaller to the end: at the vpper ioynt, which is the toppe of the stalke, there stand two or three such like leaues, but smaller, from among which breaketh out a dozen, sixtene, or twenty, or more round green heads, hanging downe their heads by little foot-stalkes, which when the flower beginneth to blow open, groweth longer, and standeth vp right, hauing three small pale greene leaues for a huske, and three other leaues within them for the flower, which lay themselues open flat, of a deepe blew purple colour, hauing an vmbone or small head in the middle, closely set about with six reddish, hairy, or feathered threeds, tipped with yellow pendants: this flower openeth it selfe in the day, & shutteth vsually at night;

night, and neuer openeth againe, but perisheth, and then hangeth downe his head againe; the greene huske of three leaues, closing it selfe againe into the forme of a head, but greater, as it was before, the middle ymbone growing to bee the feede vessell, wherein is contained small, blackish, long feede: Seldome shall any man see aboue one, or two at the most of these flowers blowne open at one time vpon the stalke; whereby it standeth in flowring a long time, before all the heads haue giuen out their flowers.

The Place.

This plant groweth in some parts of Virginia, and was deliuered to Iohn Tradescant.

The Time.

It flowreth from the end of May vntill Iuly, if it haue had greene leaues all the Winter, or otherwise, vntill the Winter checke his luxuriousnesse.

The Names.

Vnto this plant I confesse I first imposed the name, by considering duely all the parts thereof, which vntill some can finde a more proper, I desire may still continue, and to call it *Ephemerum Virginianum Tradescanti*, Iohn Tradescant's Spider-wort of Virginia, or *Phalangium Ephemerum Virginianum*, The soone fading or Day Spider-wort of Virginia.

The Vertues.

There hath not beene any tryall made of the properties since wee had it, nor doe we know whether the Indians haue any vse thereof.

CHAP. XVI.

Colchicum. Medowe Saffron.

TO retorne to the rest of the bulbous and tuberous rooted plants, that remaine to bee entreated of, the *Colchica* or Medowe Saffrons are first to bee handled, whereof these later dayes haue found out more varieties, then formerly were knowne, some flowring in the Spring, but the most in Autumne, and some bearing double, but the greatest part single flowers: whereof euery one in their order, and first of our owne Country kindes.

1. *Colchicum Anglicum album*. The white English Medowe Saffron.

It is common to all the Medowe Saffrons, except that of the Spring, and one other, to beare their flowers alone in Autumne or later, without any green leaues with them, and afterwards in February, their greene leaues: So that I shall not neede to make manie descriptions, but to shew you the differences that consist in the leaues, and colours of the flowers; and briefly to passe (after I haue giuen you a full description of the first) from one vnto another, touching onely those things that are note worthy. The white English Medowe Saffron then doth beare in Autumne three or foure flowers at the most, standing seuerally vpon weake foote-stalkes, a fingers length or more aboue the ground, made of six white leaues, somewhat long and narrow, and not so large as most of the other kindes, with some threds or chues in the middle, like vnto the Saffron flowers of the Spring, wherein there is no colour of Saffron, nor vertue to that effect: after the flowers are past and gone, the leaues doe not presently follow, but the roote remaineth in the ground without shew of leafe aboue ground, most part of the Winter, and then in February there spring vp three or foure large and long greene leaues,

leaves, when they are fully growne vp, standing on the toppe of a round, weake, green, and short foote-stalke, somewhat like the leaves of white Lillies, but not so large, and in the middest of these leaves, after they haue been vp sometime, appeare two or three loose skinny heads, standing in the middle of the leaves vpon short, thicke, Greene stalkes, and being ripe, containe in them round small brownish seede, that lye as it were loose therein, and when the head is dry, may bee heard to rattle being shaken: the roote is white within, but couered with a thicke blackish skinne or coat, hauing one side thereof at the bottome longer then the other, with an hollownesse also on the one side of that long eminence, where the flowers rise from the bottome, and shooting downe from thence a number of white fibres, whereby it is fastened in the ground: the Greene leaves afterwards rising from the top or head of the roote.

2. *Colchicum Anglicum purpureum*. The purple English Medowe Saffron.

There is no difference at all in this Medowe Saffron from the former, but only in the colour of the flowers, which as they were wholly white in the former, so in this they are of a delayed purple colour, with a small shew of veines therein.

3. *Colchicum Pannonicum album*. The white Hungary Medowe Saffron.

The greatest difference in this *Colchicum* from the former English white one, is, that it is larger both in roote, leafe, and flower, and besides, hath more store of flowers together, and continuing longer in beauty, without fading so soone as the former, and are also somewhat of a fairer white colour.

4. *Colchicum Pannonicum purpureum*. The purple Hungary Medowe Saffron.

This purple Medowe Saffron is somewhat like vnto the white of this kinde, but that it beareth not so plentifully as the white, nor doth the roote grow so great, but the flowers are in a manner as large as they, and of the like pale delayed purple colour, or somewhat deeper, as is in the purple English, with some veines or markes vpon the flowers, making some shew of a checker on the out side, but not so conspicuous, as in the true checkerd kindes. Wee haue a kinde hereof is party coloured with white streakes and edges, which abide constant, and hath been raised from the seede of the former.

5. *Colchicum Byzantinum*. Medowe Saffron of Constantinople.

This Medowe Saffron of Constantinople hath his leaves so broad and large, that hardly could any that neuer saw it before, iudge it to be a *Colchicum*, for they are much larger then any Lilly leaves, and of a darke Greene colour: the flowers are correspondent to the leaves, larger and more in number then in any of the former purple kindes, of the same colour with the last purple kinde, but of a little deeper purple on the inside, with diuers markes running through the flowers, like vnto it, or vnto checkers, but yet somewhat more apparantly: the roote is in the middle greater and rounder then the others, with a longer eminence, whereby it may easily be knowne from all other sorts.

6. *Colchicum Lasicanicum Fritillarium*.

The checkerd Medowe Saffron of Portugal.

The flowers of this Medowe Saffron are larger and longer then the flowers of either the English or Hungarian, and almost as large as the last before mentioned, and of the same colour, but a little deeper, the spots and markes whereof are somewhat more easie to be seene euen a farre off, like vnto the flower of a *Fritillaria*, from whence it tooke his significative name: the leaves of this Medowe Saffron doe rise vp sooner then in any other of the Autumne kindes, for they are alwayes vp before Winter, and are foure or five in number, short rather then long, broad belowe, and pointed at the end, canaled or hollow, and standing round about the ground, one encompassing another at the bottome, like the great Spanish Starre Iacynth, called the Iacynth of Peru, but

1 *Colchicum Pannonicum*. The Hungarian Meadow Saffron. 2 *Colchicum Byzantinum*. Meadow Saffron of Constantinople. 3 *Colchicum Lusitanicum Fritillarium*. The checkerd Meadow Saffron of Portugall. 4 *Colchicum Neapolitanum Fritillarium*. The checkerd Meadow Saffron of Naples. 5 *Colchicum Fritillarium Chienſe*. The checkerd Meadow Saffron of Chio or Sio. 6 *Colchicum Hermodactylum*. Physicall Meadow Saffron.

but shorter, and of a pale or grayish Greene colour, differing from the colour of all the other Medowe Saffrons: the roote is like the roote of the English or Hungarian without any difference, but that it groweth somewhat greater. It is one of the first Medowe Saffrons that flower in the Autumne.

7. *Colchicum Neapolitanum Fritillarium.*

The checkerd Medowe Saffron of Naples.

This checkerd Medowe Saffron of Naples, is very like vnto the last recited checkerd Saffron of Portugall, but that the flower is somewhat larger, yet sometimes very little, or not at all: the greatest marke to distinguish them is, that the flowers of this are of a deeper colour, and so are the spots on the flowers likewise, which are so conspicuous, that they are discerned a great way off, more like vnto the flowers of a deepe Fritillaria, then the former, and make a goodlier and a more glorious shew: the leaues of this doe rise vp early after the flowers, and are somewhat longer, of a darker Greene colour, yet bending to a grayish colour as the other, not lying so neatly or round, but stand vp one by another, being as it were folded together: neither of both these last named checkerd Medowe Saffrons haue giuen any seede in this Countrey, that euer I could learne or heare of, but are encreased by the roote, which in this is like the former, but a little bigger.

8. *Colchicum Fritillarium Chienfe.*

The checkerd Medowe Saffron of Chio or Sio.

This most beautifull Saffron flower riseth vp with his flowers in the Autumne, as the others before specified doe, although not of so large a size, yet farre more pleasant and delightfull in the thicke, deepe blew, or purple coloured beautifull spots therein, which make it excell all others whatsoever: the leaues rise vp in the Spring, being smaller then the former, for the most part three in number, and of a paler or fresher Greene colour, lying close vpon the ground, broad at the bottome, a little pointed at the end, and twining or folding themselves in and out at the edges, as if they were indented. I haue not seene any seede it hath borne: the roote is like vnto the others of this kinde, but small and long, and not so great: it flowreth later for the most part then any of the other, euen not vntill Nouember, and is very hard to be preserued with vs, in that for the most part the roote waxeth lesse and lesse euery yeare, our cold Countrey being so contrary vnto his naturall, that it will scarce shew his flower; yet when it flowreth any thing early, that it may haue any comfort of a warme Sunne, it is the glorie of all these kindes.

9. *Colchicum versicolor.* The party coloured Medowe Saffron.

The flowers of this Medowe Saffron most vsually doe not appeare, vntill most of the other Autumne sorts are past, except the last, which are very lowe, scarce rising with their stalkes three fingers breadth aboue the ground, but oftentimes halfe hid within the ground: the leaues whereof are smaller, shorter, and rounder, then in any of the other before specified, some being altogether white, and others wholly of a very pale purple, or flesh colour; and some againe parted, the one halfe of a leafe white, and the other halfe of the same purple, and sometimes striped purple and white, in diuers leaues of one and the same flower: and againe, some will be the most part of the leafe white, and the bottome purple, thus varying as nature list, that many times from one roote may be seene to arise all these varieties before mentioned: these flowers doe stand long before they fade and passe away; for I haue obserued in my Garden some that haue kept their flower faire vntill the beginning of Ianuary, vntill the extremitie of the Winter frosts and snowes haue made them hide their heads: the leaues therefore accordingly doe rise vp after all other, and are of a brownish or darke Greene colour at their first springing vp, which after grow to be of a deepe Greene colour: the roote is like the former English or Hungarian kindes, but thicker and greater for the most part, and shorter also.

10. *Colchicum*

10. *Colchicum variegatum alterum*. Another party coloured Medowe Saffron.

There is another, whose party coloured flowers rise a little higher, diuerfly striped and marked, with a deeper purple colour, and a pale or whitish bluish throughout all the leaues of the flower.

11. *Colchicum montanum Hispanicum minus*. The little Spanish Medowe Saffron.

The flowers of this little Medowe Saffron are narrower and smaller then any of the former, and of a deeper reddish purple colour then either the English or Hungarian kindes: the Greene leaues also are smaller then any other, lying on the ground, of a deepe or sad Greene colour, rising vp within a while after the flowers are past, and doe abide Greene all the Winter long: the roote is small and long, according to the rest of the plant, and like in forme to the others.

12. *Colchicum montanum minus versicolore flore*.

The small party coloured Medowe Saffron.

This little kinde differeth not from the Spanish kinde last set forth, but in the varietie of the flower, which is as small as the former, the three inner leaues being almost all white, and the three outer leaues some of them pale or bluish, and some party coloured, with a little Greene on the backe of some of them.

13. *Colchicum Hermodactylum*. Physicall Medowe Saffron.

This Physicall Medowe Saffron springeth vp with his leaues in Autumne, before his flowers appeare beyond the nature of all the former kindes; yet the flower doth, after they are vp, shew it selfe in the middle of the Greene leaues, consisting of six white leaues, with diuers chiuies in the middle, and passeth away without giuing any seede that euer I could obserue: the Greene leaues abide all the Winter and Spring following, decaying about May, and appeare not vntill September, when (as I said) the flowers shew themselves presently after the leaues are sprung vp.

14. *Colchicum atropurpureum*. The darke purple Medowe Saffron.

The greatest difference in this kinde consisteth in the flower, which at the first appearing is as pale a purple, as the flower of the former Hungarian kinde: but after it hath stood in flower two or three dayes, it beginneth to change, and will after a while become to bee of a very deepe reddish purple colour, as also the little foote-stalke whereon it doth stand: the flower is of the bignesse of the Hungarian purple, and so is the Greene leafe: the seede and roote is like the English purple kinde.

15. *Colchicum atropurpureum variegatum*.

The party coloured darke purple Medowe Saffron.

We haue of late gained another sort of this kinde, differing chiefly in the flower, which is diuerfly striped thorough euery leafe of the flower, with a paler purple colour, whereby the flower is of great beauty: this might seeme to bee a degeneration from the former, yet it hath abiden constant with me diuers yeares, and giueth seede as plentifully as the former.

16. *Colchicum flore pleno*. Double flowered Medowe Saffron.

The double Medowe Saffron is in roote and leafe very like vnto the English kinde: the flowers are of a fine pale or delayed purple colour, consisting of many leaues set thicke together, which are somewhat smaller, as in the English flower, being narrow and long, and as it were round at the points, which make a very double flower, hauing
O some

some chiuces with their yellow tips, disperfed as it were among the leaues in the middle: it flowreth in September; a little after the first shew of the earlier Medowe Saffrons are past.

17. *Colchicum variegatum pleno flore.*

The party coloured double Medowe Saffron.

We haue another of these double kinds (if it be not the very same with the former, varying in the flower as nature pleaseth oftentimes; for I haue this flower in my garden, as I here set it forth, euery year) whose flowers are diuersified in the partition of the colours; as is to be seene in the single party coloured Medowe Saffron before described, hauing some leaues white, and others pale purple, and some leaues halfe white and halfe purple; diuersly set or placed in the double flower, which doth consist of as many leaues as the former, yet sometime this party coloured flower doth not shew it selfe double like the former, but hath two flowers, one rising out of another, making each of them to be almost but single flowers, consisting of eight or ten leaues a peece: but this diuersity is not constant; for the same roote that this year appeareth in that manner, the next year will returne to his former kinde of double flowers againe.

18. *Colchicum Vernal. Medowe Saffron of the Spring.*

This Medowe Saffron riseth vp very early in the year, that is, in the end of Ianuarie sometimes, or beginning, or at the furthest the middle of February, presently after the deepe Frosts and Snowes are past, with his flowers inclosed within three greene leaues, which opening themselues as soone almost as they are out of the ground, shew their buds for flowers within them very white oftentimes, before they open farre, and sometimes also purplish at their first appearing, which neuer shew about two at the most vpon one roote, and neuer rise aboue the leaues, nor the leaues much higher then they, while they last: the flower consisteth of six leaues, long and narrow, euery leafe being diuided, both at the bottome and toppe, each from other, and ioyned together onely in the middle, hauing also six chiuces, tipt with yellow in the middle, euery chiuce being ioyned to a leafe, of a pale red or deepe bluish colour, when it hath stood a while blowne, and is a smaller flower then any Medowe Saffron, except the small Spanish kindes onely, but continueth in his beauty a good while, if the extremity of sharpe Frosts and Windes doe not spoile it: the leaues wherein these flowers are enclosed, at their first coming vp, are of a brownish greene colour, which so abide for a while, especially on the outside, but on the inside they are hollow, and of a whitish or grayish greene colour, which after the flowers are past, grow to bee of the length of a mans longest finger, and narrow withall: there riseth vp likewise in the middle of them the head or seede vessell, which is smaller and shorter, and harder then any of the former, wherein is contained small round browne seede: the roote is small, somewhat like vnto the rootes of the former, but shorter, and not hauing so long an eminence on the one side of the bottome.

19. *Colchicum Vernal atropurpureum. Purple Medowe Saffron of the Spring.*

The flower of this Medowe Saffron, is in the rising vp of his leaues and flowers together, and in all things else, like vnto the former, onely the flowers of this sort are at their first appearing of a deeper purple colour, and when they are blowne also are much deeper then the former, diuided in like manner, both at the bottome and toppe as the other, so that they seeme, like as if six loose leaues were ioyned in the middle part, to make one flower, and hath his small chiuces tipt with yellow, cleauing in like manner to euery leafe.

The Place.

All these Medowe Saffrons, or the most part of them, haue their places expressed in their titles; for some grow in the fields and medowes of the champion grounds, others on the mountaines and hilly grounds. The English kindes grow in the West parts, as about Bathe, Bristow, Warminster,

1 *Crocus montanum Hispanicum*. The little Spanish Medow Saffron. 2 *Crocus montanum minus var. flore albo*. The small party coloured Medow Saffron. 3 *Crocus vesiculifer*. The party coloured Medow Saffron. 4 *Crocus variegatus alterum*. Another party coloured Medow Saffron. 5 *Crocus atropurpureus*. The darke purple Medow Saffron. 6 *Crocus atropurpureus variegatus*. The variable darke purple Medow Saffron. 7 *Crocus vernus*. Medow Saffron of the spring. 8 *Crocus fere plene*. Double Medow Saffron.

ster, and other places also. The double kindes are thought to come out of Germany.

The Time.

Their times likewise are declared in their severall descriptions: those that are earliest in Autumne, flower in August and September, the later in October, and the latest in the end of October, and in November. The other are said to bee of the Spring, in regard they come after the deepe of Winter (which is most vsually in December and Ianuary) is past.

The Names.

The generall name to all these plants is *Colchicum*, whereunto some haue added *Ephemerum*, because it killeth within one dayes space; and some *Strangulatorium*. Some haue called them also *Bulbus agrestis*, and *Filius ante Patrem*, The Sonne before the Father, because (as they thinke) it giueth seede before the flower: but that is without due consideration; for the root of this (as of most other bulbous plants) after the stalke of leaues and seede are dry, and past, may be transplanted, and then it beginneth to spring and giue flowers before leaues, (and therein onely it is differing from other plants) but the leaues and seede follow successiuelly after the flowers, before it may be remoued againe; so that here is not seede before flowers, but contrarily flowers vpon the first planting or springing, and seede after, as in all other plants, though in a diuers manner.

The *Colchicum Hermodactylum* may seeme very likely to bee the *Colchicum Orientale* of Matthiolus, or the *Colchicum Alexandrinum* of Lobelius: And some thinke it to be the true *Hermodactylum*, and so call it, but it is not so. We doe generally call them all in English Medowe Saffrons, or *Colchicum*, according to the Latine, giuing to euery one his other adiunct to know it by.

The Vertues.

None of these are vsed for any Physicall respect, being generally held to be deadly, or dangerous at the least. Only the true *Hermodactile* (if it be of this tribe, and not this which is here expressed) is of great vse, for paines in the ioynts, and of the 'ippes, as the *Sciatica*, and the like, to be taken inwardly. Costæus in his Booke of the nature of plants, saith, that the rootes of our common kindes are very bitter in the Spring of the yeare, and sweet in Autumne, which Camerarius contradicteth, saying, that he found them bitter in Autumne, which were (as he saith) giuen by some imposters to diuers, as an antidote against the Plague.

CHAP. XVII.

Crocus. Saffron.

THere are diuers sorts of Saffrons, whereof many doe flower in the Spring time, and some in Autumne, among whom there is but one onely kinde, that is called tame or of the Garden, which yeeldeth those blades or chiues that are vsed in meates and medicines, and many wayes profitable for other respects, none of the rest, which are all wilde kindes, giuing any blade equall vnto those of the tame kinde, or for any other vse, then in regard of their beautifull flowers of severall varieties, and as they haue been carefully sought out, and preserued by diuers, to furnish a Garden of dainty curiosity. To entreate therefore of these, I must, to obserue an orderly declaration, diuide them into two primary families: the former shall be of those that yeeld their pleasant flowers in the Spring of the yeare, and the other that send out their

their colours in the Autumne, among whom that *Rex pomarij* (as I may so call it) the tame or manured kinde, properly called of the Garden, is to be comprehended, for that it giueth his pleasant flowers at that time among others. I shall againe distribute those of the Spring time into three chiefe colours, that is, into white, purple, and yellow, and vnder euery one of them, comprehend the seuerall varieties that doe belong vnto them; which course I will also hold with those of the Autumne, that thus being rightly ranked, they may the more orderly be described.

1. *Crocus vernus albus purus minor.*

The smaller pure white Saffron flower of the Spring.

This small Saffron flower springeth vp in the beginning of the year, with three or foure small greene leaues, somewhat broader, but much shorter then the true Saffron leaues, with a white line downe the middle of euery leafe: betweene these leaues, out of a white skinne, riseth vp one or two small flowers, made of six leaues a peece, as all the rest in generall are, of a pure white colour, without any mixture in it, which abide not in flower aboue a weeke, or rather lesse, so sodainly is the pleasure of this, and the purple lost: it floweth not for the most part, vntill a moneth after the yellow Crocus appeareth in flower, and the ordinary stript Crocus is past: the seede is small, round, and reddish, yet not so red as the seede of the yellow, contained in three square heads, yet seldome beareth, but encreaseth by the roote plentifully enough, which is small, round, and flat at the bottome, somewhat white on the outside, but whiter within, shooting out small sprouts on euery side of the roote, which is the best note to know this kinde and the lesser purple, which are both alike, from all other rootes of Saffron flowers.

2. *Crocus albus maior multiflorus.* The great snow white Crocus.

This greater Saffron flower riseth vp vsually with three or foure greene leaues, larger then the former, with a white line in euery one of them: the flowers are greater, and more in number, rising together, but flowering one after another, of a pure snow white colour, and abiding but little longer in flower then the former.

3. *Crocus albus maior alter dictus Messiacus.*

The great white Saffron flower or Crocus of Mesia.

This great white Crocus of Mesia, riseth vp out of the ground, almost as early as the first sort of the yellow, with foure or five leaues, being very like vnto the leaues of the yellow Crocus, and as large, with white lines in them: the flowers also are as large as the flowers of the yellow, and many also rising one after another like vnto it, but not of so pure a white colour, as the former or last described, but rather tending to a Milky or Creame colour: the roote is not couered with any reddish, but rather pale skinned or coates.

4. *Crocus albus Messiacus fundo violaceo.*

The great white Crocus of Mesia with a blew bottome.

There is another of this kinde, like vnto the former in all things, sauing that the bottomes of the flowers of this kinde, with some part of the stalke next the flower, are of a pale shining purple colour, and rising vp a pretty way into the flower, whereas another also of this kind, hath a little shew or marke of blew, and not purple, at the bottome of the flower onely, which maketh a difference.

5. *Crocus albus fundo purpureo.* The white Crocus with a purple bottome.

This Saffron flower is of the same kinde with the first, both in roote, leafe, and flower, in none of them differing from it, but in that the bottome of this flower, with that part of the short foote-stalke next vnto it, is of a violet or purple colour, and sometimes hauing here and there some purple small lines, or spots on the white leaues: it floweth also with the first white, or somewhat later.

6. *Crocus vernus albus striatus*. The white stript Crocus.

This stript Saffron flower is likewise neare the same first kind, or first white Crocus, hauing the like leaues and flowers, somewhat larger, but as soone fading almost as it: but herein this flower differeth, that it hath pale blewish lines and spots in all the leaues thereof, and more principally in the three outer leaues: the roote is also white on the outside, like the first white, but greater, with young ones growing round about it.

7. *Crocus vernus albus polyanthos versicolor*.

The greater party coloured white Crocus.

The greater party coloured Saffron flower, hath his greene leaues like vnto the second great white Crocus before mentioned, hauing more flowers then any of the former, except the first great white, the leaues whereof haue greater stripes then the last recited Crocus, but of a purple Violet colour, making each leafe seeme oftentimes to haue as much purple as white in them: the roote hereof is somewhat like the second white, but of a little more duskie colour on the outside, and not budding out on the sides at all, or very little.

8. *Crocus vernus albus versicolor*. The lesser party coloured white Crocus.

The leaues and flowers of this other party coloured Crocus, are for bignesse in a manner equall with the last, but hath not so many flowers rising together from the roote: the flower is finely marked with blew strakes on the white flower, but nothing so much as in the former: the roote also is like the last.

9. *Crocus Episcopalis*. The Bishops Crocus.

This party coloured or Bishops Saffron flower, is very like both in leaues and rootes vnto the Neapolitane blew Crocus, but somewhat greater: the flowers doe abide not so long time blowne, and hath all the leaues either wholly white, with blew stripes on both sides of them, or wholly of a fine delayed blew Violet colour, and the three innermost more blew and finely striped, both on the inside and outside of them, and sometimes it hath been seen to haue three leaues white, and three leaues of a pale blew.

10. *Crocus vernus striatus vulgaris*. The ordinary stript Crocus.

There is another sort of stript Saffron flower, which is most common and plentiful in most Gardens, which I must needs bring vnder the ranke of these white kinds, although it differre very notably, both in roote, leafe, and flower, from all of them: the leaues of this rise vp sooner then the yellow or white Crocus, lying spread vpon the ground for the most part, but narrower then any of the former: among these leaues spring vp diuers flowers, almost as large as the former great white Crocus, of a very bleake or pale purple colour, tending to white on the inside, and in many almost white, with some small whitish chiues tipt with yellow in the middle: the three outer leaues are of a yellowish white colour on the backe side of them, stript euery one of them with three broad stripes, of a darke murrey or purple colour, and a little sprinkled with some small purple lines, on both sides of those stripes, but on the inside, of the same pale purple or white colour with the rest: the seede hereof is somewhat darker coloured then of the white, and is more liberall in bearing: the roote is differing from all the former, being rounder and bigger then any of them, except the kindes of Misia, yet somewhat flat withall, not hauing any shootes from the sides, but setting off into rootes plentifully, hauing a round circle compassing the bottome of the roote, which easily falleth away, when it is taken vp out of the ground, and couered with a browne coate, somewhat neare the colour of the yellow Crocus, but not altogether so bright: it flowreth vsually the first of all these sorts, or with the first of the early yellowes.

1 *Crocus vernus albus minimus*. The small white Saffron flower of the spring. 2 *Crocus vernus Maffius albus*. The great white Crocus of Misia. 3 *Crocus vernus albus striatus*. The white striped Crocus. 4 *Crocus vernus albus pulegiatus variegatus*. The party coloured white Crocus. 5 *Crocus albus fimbriatus*. The white Crocus with a purple bottom. 6 *Crocus vernus Neapolitanus*. The great blue Crocus of Naples. 7 *Crocus vernus purpureus maximus*. The great purple Crocus. 8 *Crocus vernus purpureus striatus*. The purple striped Crocus. 9 *Crocus vernus purpureus Cap-Ricifolius*. The purple Crocus with small leaves. 10 *Crocus vernus flavus striatus*. The yellow striped Crocus. 11 *Crocus vernus luteus variegatus*. The cloth of gold Crocus. 12

11. *Crocus vernus striatus Turcicus*. The Turkie stript Crocus.

There is another of this kinde, whose flower is a little larger, and of a deeper purple colour, both on the inside and outside; the greene leafe also is bigger, and of a more whitish colour.

12. *Crocus vernus Capillarifolius albus*. The white Crocus with small leaues.

This white Crocus is in all things like vnto the purple of the same kinde, but that the flower of this is wholly white: the full description therefore hereof, you shall haue in that purple with small leaues, of this kinde hereafter set downe, whereunto I referre you.

13. *Crocus vernus purpureus minor*. The smaller purple Crocus.

The smaller purple Saffron flower of the Spring, hath his greene leaues so like vnto the first white flowred Saffron, that they can hardly be distinguished, onely they seem to bee a little narrower: the flower is also much about the same bignesse, or a little bigger, and seldome beareth aboue one flower from a roote, euen as the first doth, of a deepe purple Violet colour, the bottome of the flower, with the vpper part of the stalke next thereunto, being of a deeper or blacker purple; in the middle of the flower are some pale chiues tipt with yellow pendants, and a longer pointell, diuided or forked at the toppe: the roote of this is in all things so like vnto the first white, that it is impossible for the most cunning and conuersant in them, to know the one from the other. This beareth seede very sparingly, as the white doth, and is reddish like vnto it, but recompenseth that defect with a plentifull encrease by the roote: it likewise flowreth at the very same time with the white, and endureth as small a time.

14. *Crocus vernus purpureus maximus*. The greatest purple Crocus.

This great purple Crocus is of the same kinde with the next described, as well in roote as leafe, but greater; for the greene leaues hereof are the greatest and broadest of all other Crocus, with a large white line in the middle of euery one: it springeth vp much later then the former, and doth not shew his flower vntill the other bee past a good while: the flowers also are the largest of all these Crocus of the Spring time, and equalling, if not surpassing that purple kinde that flowreth in Autumne, hereafter set forth, of a very faire and deepe Violet colour, almost as deepe as the former: the seed vessels are large also and white, wherein is contained pale reddish seede, like vnto the next blew kinde, but somewhat greater: the roote is (as I said before) like vnto the next, that is, flat and round, with a duskie coloured outside, whose head for springing in it is as hardly discerned.

Alter Apichon
abidit.

We haue one of this kinde, the toppes onely of whose purple flower are whitish, for the breadth of halfe the naile of a mans hand, which abideth constant euery yeare in that manner, and therefore is a difference fit to be remembred.

15. *Crocus vernus Neapolitanus sine caeruleus maior*.
The greater blew Crocus of Naples.

This great blew Crocus riseth vp with diuers greene leaues, broader then any of the former (except the last) with a white line running downe the inside of euery leafe, as in the former, among which riseth vp, out of diuers great long white skinned, diuers large flowers, but not fully so great as the former, consisting of six leaues, of a paler blew or Violet colour then in the former, hauing in the middle of the flowers a few pale threds, tipt with yellow, and a longer pointell of a gold yellow colour, forked or diuided at the toppe, smelling sweeter then in the former, and abiding a great while longer, being in flower vsually euen with the stript yellow Crocus, or before the former purple, and yeelding more plenty of seede: the roote hereof is not very great, but a little darke on the outside, being round and flat withall, that one can hardly know which is the vpperside thereof.

This

This kinde differeth very little from the former, either in roote, leafe, or flower, for the bignesse or colour, but that it seemeth to be a little bleaker or paler blew, because it flowreth a little earlier.

16. *Crocus vernus purpureus striatus*. The stript purple Crocus.

The leaues of this stript purple Saffron flower, are as large and broad as the last, or rather a little longer: the flowers also are as plentifull, and as large, of a fine delayed purple colour on the outside, with three broad strakes or lines downe the backe of the three outer leaues, and of a little deeper purple on the inside, as the other three leaues are also of a deeper purple colour, and are striped with the same deepe purple about the ground, or bottom of the leaues: this sometimes yeeldeth three square heads, containing in them brownish seede: the roote is like vnto the last, and flowreth much about the time of the former.

17. *Crocus vernus purpureus versicolor*. The siluer stript purple Crocus.

This stript Saffron flower, is in leaues and flowers somewhat like vnto the last stript purple, but a little smaller: the flowers are of a little deeper purple through the whole leaues, striped with white lines, both on the leaues, and towards the edges, which maketh a peculiar difference from all the rest: the roote of this is not so flat, though like it, and couered with a darke ash coloured skinne: it flowreth about the same time.

18. *Crocus purpureus flammens maior*. The greater purple flame coloured Crocus.

The greene leaues of this Crocus or Saffron flower, are of a reasonable breadth and length, and of a pleasant fresh greenesse, with a faire broad white line downe the middle of them, but rising not out of the ground so early as the next described Crocus: the flowers are likewise of a meane bignesse, of a pale purple on the outside, somewhat whitish, especially the three outer leaues; but on the inside of a deeper purple, and striped with great stripes like flames, hauing some chiues in the middle, and a longer one also feathered a little at the toppe: the roote is white on the outside, somewhat flat and round, but not so flat as the Neapolitane Crocus before described.

19. *Crocus purpureus flammens minor*. The lesser purple flame coloured Crocus.

This Crocus hath almost as broad and long greene leaues as the former, and of the same verdure, which rise vp earlier then it, and is in flower likewise somewhat before it, being smaller for size by a little, but of as deepe a purple on the outside, as on the inside, flamed with faire broad stripes from the middle of the leaues, or somewhat lower vnto the edges: each of these giue seed that is of a pale reddish colour: the root is very like vnto the former, but a little lesser.

20. *Crocus vernus purpureus Capillaris folio*. The purple Crocus with small leaues.

This small kinde of Saffron flower riseth out of the ground, with two or three long and small green leaues, very like vnto the leaues of the fine Fether-Grasse hereafter described, standing vpright at the first, but afterwards lying vpon the ground; among which come the flowers, sometimes three, but most vsually two vpon one stalke, if the roote be not young, which then will beare but one on a stalke, which is very short, so that the flowers scarce arise aboue the ground, yet laying themselues open in the day time, if it be faire, and the Sunne doe shine, otherwise they keepe close, and doe not open at all: and after one flower is past, which doth not last aboue three or foure dayes at the most, the others follow, which are of a bleake blewish purple in the middle of the flower, and of a deeper purple towards the ends or points of the leaues, but of a more fullen or darke purple on the outside of them, and yellowish at the bottome, with some yellow chiues in the middle: the seede is small and darker coloured then any of the former Crocus, contained also in smaller heads, standing one by another vpon

upon the same short foote-stalke, which then riseth vp a little higher, shewing the manner of the standing of the flowers, which in their flowring time could not so easily be discerned: the roote is very small and round, hauing one side at the bottome lower then the other, very like the roote of a *Colchicum* or Medowe Saffron, and somewhat neare resembling also the hoofe of an horse foote, couered with a very thicke skinne, of a darke or blackish browne colour: this flowreth the last of all the former sorts of Saffron flowers, euen when they are all past.

21. *Crocus vernus purpureus striatus Capillarisfolio.*

The stript purple Crocus with small leaues.

This small stript purple Saffron flower hath such like leaues, as the last described hath, betweene which riseth the flower vpon as short a foote-stalke, consisting of six leaues like the former, of a faire purple colour on the outside of the three outer leaues, with three lines or strakes downe euery leafe, of a deeper purple colour, and on the inside of a paler purple, as the other three leaues are also, with some chiues tipt with yellow pendants, and a forked pointell in the middle: the roote of this is somewhat bigger then the former, and rounder, but couered with as thicke and as browne a skinne: it flowreth about the same time with the former.

22. *Crocus vernus luteus sine Maculatu.* The yellow Crocus.

The yellow Crocus or Saffron flower, riseth vp with three or foure leaues out of the ground, being somewhat neare the breadth of the great purple kindes, with a white line in them, as in most of the rest: the flowers stand in the middle of these leaues, and are very large, of a gold yellow colour, with some chiues, and a forked point in the middle: the seede hereof is of a brighter colour then in any of the other: the roote is great and round, as great or greater then a Wall Nut sometimes, and couered with reddish skinnies or coates, yeelding more store of flowers then most of the former, and beginning to blowe with the first sorts, or presently after, but outlast many of them, and are of a pleasant good sent.

Flore aureo.

Of this kinde we haue some, whose flowers are of a deeper gold yellow colour then others, so that they appeare reddish withall.

Flore pallido.

And we haue also another sort, whose flowers are very pale, betweene a white and a yellow, not differing in any thing else.

*Flore viridante
luteo.*

And another smaller, whose flower hath a shew of greenesse in the yellow, and more Greene at the bottome.

23. *Crocus vernus flavus striatus.* The yellow stript Crocus.

This kinde of yellow stript Crocus or Saffron flower, riseth vp with more store of narrower and greener leaues then the former, and after the leaues are spread, there rise vp many yellow flowers from among them, which are not of so faire and bright a yellow colour, but more dead and fullen, hauing on the backside of each of the three outermost leaues, three small stripes, of an ouer-worne or dull purple colour, with some chiues and a pointell in the middle: the roote of this kinde, is very like the roote of the former yellow, but somewhat smaller and shorter, and couered with the like reddish skinnies, but a little sadder: it flowreth not so early as the former yellow, but abideth almost as long as it.

24. *Crocus vernus luteus versicolor primus.* The best cloth of gold Crocus.

The fairest cloth of gold Crocus or Saffron flower, riseth vp very early, euen with the first, or the first of all other Crocus, with three or foure very narrow and short leaues, of a whiter colour then any of the former, which by and by after doe shew forth the flowers, rising from among them out of the same white skinne, which includeth the leaues, but are not so plentifull as the former yellow, being but two or three at the most, of a faire gold yellow colour, yet somewhat paler then the first, hauing

uing on the backe of euery of the three outer leaues, three faire and great stripes, of a faire deepe purple colour, with some small lines at the sides or edges of these purple stripes; on the inside of these flowers, there is no signe or shew of any line or spot, but wholly of a faire gold yellow, with chiues and a fether topt pointell in the middle: the seede hereof is like the former, but not so red: the roote of this kinde is easily knowne from the roote of any other Saffron flower, because the outer peelings or shels being hard, are as it were netted on the outside, hauing certaine ribbes, rising vp higher then the rest of the skinnies, diuided in the forme of a net worke, of a darke browne colour, and is smaller and rounder then the former yellow, and not encreasing so plentifully by the roote.

25. *Crocus vernus luteus versicolor aler.* The second cloth of gold, or Duke Crocus.

There is no difference either in roote, leafe, or colour of flower, or time of flowering in this sort from the last before mentioned; for the flower of this is of the same bignesse and colour, the only note of difference is in the marking of the three outer leaues, which haue not three stripes like the former, but are wholly of the same deepe purple colour on the backe of them, leauing that the edges of them are yellow, which is the forme of a Duke Tulipa, and from thence it tooke the name of a Duke Crocus.

26. *Crocus vernus versicolor pallidoluteus.* The pale cloth of gold Crocus.

We haue a third sort of this kinde of cloth of gold Crocus, which hath leaues and flowers like the former, but differeth in this, that the colour of the flower is of a paler yellow by much, but stript in the same manner as the first, but with a fainter purple colour: the roote also is netted like them, to shew that this is but a variation of the same kinde.

27. *Crocus vernus versicolor albidoluteus.* The cloth of siluer Crocus.

The chiefest note of difference in this Saffron flower is, that being as large a flower as any of the former of this kinde, it is of so pale a yellowish white, that it is more white then yellow, which some doe call a butter colour: the three outer leaues are striped on the backe of them, with a paler purple blew shining colour, the bottome of the flower, and the ypper part of the stalke, being of the same purple blew colour: the roote of this is also netted as the other, to shew it is a variety of the same kinde.

And thus much for thole Saffron flowers that come in the Spring time, now to those that flower in Autumne onely: and first of the true Saffron.

1. *Crocus vernus sativus Autumnalis.* The true Saffron.

The true Saffron that is vsed in meates and medicines, shooteth out his narrow long greene leaues first, and after a while the flowers in the middle of them appeare about the end of August, in September and October, according to the soile, and climate where they growe; these flowers are as large as any of the other former or later sorts, composed of six leaues a peece, of a murrey or reddish purple colour, hauing a shew of blew in them: in the middle of these flowers there are some small yellow chiues standing vpright, which are as vnprofitable, as the chiues in any other of the wilde Saffrons, before or hereafter specified; but besides these, each flower hath two, three, or foure greater and longer chiues, hanging downe vpon or betweene the leaues, which are of a fierie red colour, and are the true blades of Saffron, which are vsed physically or otherwise, and no other: All these blades being pickt from the severall flowers, are laid and pressed together into cakes, and afterwards dryed very warily on a Kill to preserue them; as they are to be seene in the shops where they are sold. I neuer heard that euer it gaue seede with any: the roote groweth often to be as great, or greater then a green Wall Nut, with the outer shell on it, covered with a grayish or ash-coloured skin, which breaketh into long hairie threeds, otherwife then in any other roote of Crocus.

2. *Crocus Byzantinus argenteus*. The siluer coloured Autumne Crocus.

This Saffron flower springeth vp in October, and seldome before; with three or foure short greene leaues at the first, but growing longer afterwards; and in the midst of them, presently after they haue appeared, one flower for the most part, and seldome two, consisting of six leaues, the three outermost whereof are somewhat larger then the other three within, and are of a pale bleake blew colour, almost white, which many call a siluer colour, the three innermost being of a purer white, with some yellow chiues in the middle, and a longer pointell ragged or fethered at the toppe: this very seldome beareth seede, but when the yeare falleth out to bee very milde; it is small, round, and of a darke colour: the roote is pretty bigge, and rounder then any other Crocus, without any flat bottome, and couered with a darke russet skinne.

3. *Crocus Pyrenaeus purpureus*. The purple mountaine Crocus.

This purple Saffron flower of the Autumne, riseth vp but with one flower vsually, yet sometimes with two one after another, without any leaues at all, in September, or sometimes in August, standing vpon a longer foote-stalke then any kinde of Saffron flower, either of the Spring or Autumne, and is as large as the flower of the greatest purple Saffron flower of the Spring, of a very deepe Violet purple colour, which decayeth after it hath stood blowne three or foure dayes, and becommeth more pale, hauing in the middle some yellow chiues, and a long fether topt pointell, branched, and rising sometimes aboue the edges of the flowers: about a moneth after the flowers are past, and sometimes not vntill the first of the Spring, there riseth vp three or foure long and broad greene leaues, with a white line in euery one of them, like vnto the first purple Vernall kindes, which abide vntill the end of May or Iune: the roote is small and white on the outside, so like vnto the roote of the lesser Vernall purple or white Crocus, that it cannot be distinguished, vntill about the end of August, when it doth begin to shoot, and then by the early shooting vp a long white sprout for flower, it may be knownc. I neuer could obserue it to giue any seede, the Winter (as I thinke) comming on it so quickly after the flowering, being the cause to hinder it.

4. *Crocus montanus Autumnalis*. The Autumne mountaine Crocus.

The mountaine Saffron flower springeth vp later then any of the former, and doth not appeare vntill the middle or end of October, when all the flowers of the former are past, appearing first with three or foure short greene leaues, like vnto the Byzantine Crocus, and afterwards the flowers betweene them, which are of a pale or bleake blew tending to a purple, the foote-stalkes of them being so short, that they scarce appeare aboue ground at the first, but after two or three dayes they grow a little higher: the roote is very great and flat bottomed, couered with a grayish duskie coate or skinne, and encreaseth very little or seldome.

The Place.

The seuerall places of these Saffron flowers, are in part set downe in their titles; the others haue beene found out, some in one Countrey, and some in another, as the small purple and white, and stript white in Spaine: the yellow in Mesia about Belgrade, the great purple in Italy; and now by such friends helpees as haue sent them, they prosper as well in our Gardens, as in their naturall places. Yet I must giue you this to vnderstand, that some of these formerly expressed, haue been raised vp vnto vs by the sowing of their seede.

The Time.

Their seuerall times are likewise expressed in their descriptions; for some shew forth their pleasant flowers in the Spring, wherein for the three first moneths,

1. *Crocus vernus luteus vulgaris*. The common yellow spring Crocus. 2. *Crocus vernus silius autumnalis*. The true Saffron. 3. *Crocus byzantinus argenteus*. The silver coloured Autumn Crocus. 4. *Crocus pyreneus purpureus*. The purple mountain Crocus. 5. *Crocus montanus autumnalis*. The Autumn mountain Crocus. 6. *Sisymbrium irio*. The greater Spanish Nut.

moneths, our Gardens are furnished with the varietie of one sort or another; the rest in Autumne, that so they might procure the more delight, in yeelding their beauty both early and late, when scarce any other flowers are found to adorne them.

The Names.

I shall not neede to trouble you with an idle tale of the name of Crocus, which were to little purpose, nor to reiterate the former names imposed vpon them; let it suffice that the fittest names are given them, that may distinguish them one from another; onely this I must giue you to vnderstand, that the gold yellow *Crocus* or Saffron flower, is the true *Crocus-Masiacus*, as I shewed before; and that neither the yellow stript, or cloth of gold (which wee so call after the Dutch name *Gaud Laken*) is the true *Masiacus*, as some suppose; and that the great white Saffron flower, by reason of his likenesse vnto the gold yellow, is called *Crocus albus Masiaci facie*, or *facie lutei*, that is, The white Saffron flower that is like the *Masiacus* or yellow.

The Vertues.

The true Saffron (for the others are of no vse) which wee call English Saffron, is of very great vse both for inward and outward diseases, and is very cordiall, vsed to expell any hurtfull or venomous vapours from the heart, both in the small Pockes, Measels, Plague, Iaundise, and many other diseases, as also to strengthen and comfort any cold or weake members.

CHAP. XVIII.

Sisyrinchium. The Spanish Nut.

I Can doe no otherwise then make a peculiar Chapter of this plant, because it is neither a *Crocus*, although in the roote it come somewhat neate vnto that kinde that is netted; but in no other part agreeing with any the delineaments of a Saffron flower, and therefore could not be thrust into the Chapter amongst them: neither can I place it in the forefront of the Chapter of the *Iris bulbosa*, or bulbous Flowerdeluces, because it doth not belong to that Family: and although the flower thereof doth most resemble a Flowerdeluce, yet in that no other parts thereof doe fitly agree thereunto, I haue rather chosen to seate it by it selfe betweene them both, as partaking of both natures, and so may serue in stead of a bridge, to passe from the one to the other, that is, from the *Crocus* or Saffron flower, to the *Iris bulbosa* or bulbous rooted Flowerdeluce, which shall follow in the next Chapter by themselves.

The Spanish Nut hath two long and narrow, soft and smooth greene leaues, lying for the most part vpon the ground, and sometimes standing vp, yet bending downwards; betweene these leaues riseth vp a small stalke, halfe a foote high, hauing diuers smooth soft greene leaues vpon it, as if they were skinned, through which the stalke passeth; at the toppe whereof stand diuers flowers, rising one after another, and not all flowring at once: for seldome shall you haue about one flower blowne at a time, each whereof doth so quickly passe and fade away, that one may well say, that it is but one dayes flower, or rather the flower of a few houres: the flower it selfe hath nine leaues, like vnto a Flowerdeluce, whereof the three that fall downe, haue in each of them a yellow spot: the other three, which in the Flowerdeluces are hollow and ridged, couering the other three that fall downe, in this stand vpright, and are parted at the ends: the three that stand vp in the middle are small and short: the whole flower is smaller then any Flowerdeluce, but of sundry colours; for some are of an excellent skie colour blew, others of a Violet purple, others of a darker purple colour, and some white, and many others mixed, either pale blew and deepe purple, or white and blew mixed

mixed or striped together very variably, quickly fading as I said before: the seede is enclosed in small cods, so thinn and transparent, that one may easily see, and tell the seeds as they lye, which are of a brownish red colour: the roote is small, blackish and round, wrapped in a thicke skinne or huske, made like vnto a net, or somewhat like vnto the roote of the cloth of gold Crocus: when the plant is in flower, it is found to haue two rootes one aboue another, whercof the vppermost is firme and sound, and the vndermost loose and spongie, in like manner as is found in the rootes of diuers Orchides or Satyrions, Bee-flowers and the like, and without any good taste, or sweetness at all, although Clusius saith otherwise.

Sisyrinchium Aauritanicum. The Barbary Nut.

There is another of this kinde, not differing from the former in any other notable part, but in the flower, which in this is of a delayed purplish red colour, hauing in each of the three lower leaues a white spot, in stead of the yellow in the former, but are as soone fading as they.

The Place.

The former doe grow very plentifully in many parts both of Spaine and Portugall, where Guillaume Boel, a Dutch man heretofore remembred often in this Booke, found them; of the sundry colours specified, whereas Clusius maketh mention but of one colour that he found.

The other was found in that part of Barbary, where Fez and Morocco do stand, and brought first into the Lowe-Countries: but they are both very tender, and will hardly abide the hard Winters of these colder regions.

The Time.

The first flowreth in May and Iune, the last not vntill August.

The Names.

The name *Sisyrinchium* is generally imposed vpon this plant, by all authors that haue written thereof, thinking it to bee the right *Sisyrinchium* of Theophrastus: but concerning the Spanish name *Nozelba*, which Clusius saith it is called by in Spaine, I haue bene credibly enformed by the aforementioned Boel, that this roote is not so called in those parts; but that the small or common stript Crocus is called *Nozelba*, which is sweete in taste, and desired very greedily by the Shepheards and Children, and that the roote of this *Sisyrinchium* or Spanish Nut, is without any taste, and is not eaten. And againe, that there is not two kindes, although it grow greater, and with more flowers, in those places that are neare the Sea, where both the washing of the Sea water, and the moisture and ayre of the Sea, causeth the ground to bee more fertile. This I thought good, from the true relation of a friend, to giue the world to vnderstand, that truth might expell error.

The Vertues.

These haue not been knowne to bee vsed to any Physicall purpose, but wholly neglected, vnlesse some may eate them, as Clusius reporteth.

CHAP. XIX.

Iris bulbosa. The bulbous Flowerdeluce.

THe Flowerdeluces that haue bulbous rootes are of two sorts, the one greater then the other: the greater bearing larger and broader leaues and flowers, and the lesser narrower. But before I giue you the descriptions of the vsuall greater kindes, I must needs place one or two in the fore-front that haue no fellowes; the one is called of Clusius, his broad leaved Flowerdeluce, and the other a Persian, somewhat like vnto it, which although they differ notably from the rest, yet they haue the nearest resemblance vnto those greater kindes, that come next after them.

Iris bulbosa prima latifolia Clusij.

Clusius his first great bulbous Flowerdeluce.

This Flowerdeluce hath diuers long and broad leaues, not stiffe, like all the other, but soft and greenish on the vpper side, and whitish vnderneath; among which rise vp sometimes seuerall small, short, slender stalkes, and sometimes but one, not aboue halfe a foote high, bearing at the top one flower a peece; somewhat like vnto a Flowerdeluce, consisting of nine leaues, whereof those three that stand vp right, are shorter and more closed together, then in other sorts of Flowerdeluces; the other three that fall downe, turne vp their ends a little; and those three, that in other Flowerdeluces doe couer them at the bottome, stand like the vp right leaues of other Flowerdeluces, but are parted into two ends, like vnto two small eares: the whole flower is of a faire blew, or pale skie colour in most, with a long stripe in the middle of each of the three falling leaues, and in some white, but more seldome: the roote is reasonable great, round and white, vnder the blackish coates wherewith it is couered, hauing many long thicke white rootes in stead of fibres, which make them seeme to be Asphodill rootes. The flower is very sweete.

Iris bulbosa Persica. The Persian bulbous Flowerdeluce.

This Persian Flowerdeluce is somewhat like vnto the former, both in roote and in leafe, but that the leaues are shorter and narrower, and the flower being much about the same fashion, is of a pale blew russetish colour, each of the three lower falling leaues are almost wholly of a browne purple colour, with a yellow spot in the middle of them: this as it is very rare, so it seldome beareth flowers with vs.

The Place.

The first groweth in many places of Spaine and Portugall, from whence I and others haue often had it for our Gardens, but by reason of the tender-nesse thereof, it doth hardly endure the sharpnesse of our cold Winters, vnlesse it be carefully preserued.

The other is said to come from Persia, and therefore it is so entituled, and is as tender to be kept as the other.

The Time.

The first flowreth most vsuall not vntill May with vs, yet many times sooner: but in Ianuary and February, as Clusius saith, in the naturall places thereof.

The other is as early oftentimes when it doth flower with vs.

The Names.

Because Clusius by good iudgement referreth the first to the greater kindes

kindes of Flowerdeluces, and placeth it in the fore ranke, calling it *Iris bulbosa latifolia prima*, that is, The first broadleaved Flowerdeluce, and all others doe the like, I haue (as you see) in the like manner put it before all the other, and keepe the same name. The Spaniards, as he saith, called it *Lirio espadanal*, and they of Corduba, *Lirios azules*.

The other hath no other name then as it is in the title.

1. *Iris bulbosa maior siue Anglica cerulea.*

The blew English bulbous Flowerdeluce.

This bulbous Flowerdeluce riseth vp early, euen in January oftentimes, with five or six long and (narrow, in comparison of any great breadth, but in regard of the other kinde) broad whitish green leaues, crested or straked on the backside, and halfe round, the inside being hollow like a trough or gutter, white all along the inside of the leafe, and blunt at the end; among which riseth vp a stiffe round stalke, a cubit or two foot high, at the toppe whereof, out of a skinnie huske, commeth forth one or two flowers, consisting of nine leaues a peece, three whereof that are turned downewards, are larger and broader then the other, hauing in each of them a yellow spot, about the middle of the leafe, other three are small, hollow, ridged or arched, couering the lower part next the stalke of those falling leaues, turning vp their ends, which are diuided into two parts, other three stand vp right, and are very small at the bottome of them, and broader toward the toppe: the whole flower is of a faire blew colour; after the flowers are past, come vp three square heads, somewhat long, and lanke, or loose, containing in them round yellowish seede, which when it is ripe, will rattle by the shaking of the winde in the dry huskes: the roote of this kinde is greater and longer then any of the smaller kindes with narrow leaues, couered with diuers browne skinned, which seeme to be fraught with long threeds like haire, especially at the small or vpper end of the roote, which thing you shall not finde in any of the smaller kindes.

2. *Iris bulbosa maior purpurea & purpureo violacea.*

The paler or deeper purple great bulbous Flowerdeluce.

These purple Flowerdeluces differ not from the last described, either in roote or leafe: the chiefe difference consisteth in the flowers, which in these are somewhat larger then in the former, and in the one of a deepe blew or Violet purple colour, and in the other of a deepe purple colour, in all other things alike.

There is also another, in all other things like vnto the former, but only in the flower, which is of a pale or bleake blew, which we call an ash-colour.

3. *Iris bulbosa maior purpurea variegata siue striata.*

The great purple stript bulbous Flowerdeluce.

There is another of the purple kinde, whose flower is purple, but with some veines or stripes of a deeper Violet colour, diuersly running through the whole leaues of the flower.

And another of that bleake blew or ash-colour, with lines and veines of purple in the leaues of the flowers, some more or lesse then other.

And againe another, whose flower is of a purple colour like vnto the second, but that round about that yellow spot, in the middle of each of the three falling leaues (as is vsuall in all the bulbous Flowerdeluces) there is a circle of a pale blew or ash-colour, the rest of the leafe remaining purple, as the other parts of the flower is.

4. *Iris bulbosa maior flore rubente.*

The great peach coloured bulbous Flowerdeluce.

There is another of these greater kindes, more rare then any of the former, not differing in roote, leafe, or flower, from the former, but onely that the flower in this is of a pale reddish purple colour, comming somewhat neare vnto the colour of a peach blossome.

5. *Iris bulbosa maior sine latifolia alba.*

The great white bulbous Flowerdeluce.

The great white bulbous Flowerdeluce, riseth not vp so early out of the ground as the blew or purple doth, but about a moneth or more after, whose leaues are somewhat larger, and broader then of the others: the stalke is thicker and shorter, bearing vsually two very large and great flowers, one flowring a little before the other, yet oftentimes both in flower together in the end, of a bleake blewish white colour, which wee call a siluer colour, while they are in the budde, and before they be blowne open, but then of a purer white, yet with an eye or shew of that siluer colour remaining in them, the three falling leaues being very large, and hauing that yellow spot in the middle of each of them: the feedes are likewise inclosed in heads, like vnto the blew or purple kindes, but larger, and are of a reddish yellow colour like them: the roote likewise is not differing, but greater.

6. *Iris bulbosa maior alba variegata.*

The great white stript bulbous Flowerdeluce.

This white stript Flowerdeluce, is in roote, leafe, and flower, and in manner of growing, like vnto the former white Flowerdeluce, the onely difference is in the marking of the flower, being diuers from it: for this hath in the white flower great veines, stripes, or markes, of a Violet blew colour, disperfed through the leaues of the flower very variably, which addeth a superexcellent beauty to the flower.

7. *Iris bulbosa maior sine latifolia versicolor.*

The great party coloured bulbous Flowerdeluce.

There is no difference in this from the former, but in the flower, which is of a whitish colour in the three falling leaues, hauing a circle of ash-colour about the yellow spot, the three rigged leaues being likewise whitish, but ridged and edged with that ash-colour, and the three vpright leaues of a pale blewish white colour, with some veines therein of a blewish purple.

Varietas.

There hath beene brought vnto vs diuers rootes of these kindes, with the dried flowers remaining on them, wherein there hath beene seene more varieties, then I can well remember to expresse, which variety it is very probable, hath risen by the sowing of the feedes, as is truly obserued in the narrower leaved kinde of Flowerdeluce, in the Tulipa, and in some other plants.

Flare lutea.

Wee haue heard of one of this kinde of broad leaved Flowerdeluces, that should beare a yellow flower, in the like manner as is to be seene in the narrow leaved ones: but I haue not seene any such, and therefore I dare report no further of it, vntill time hath discovered the truth or falshood of the report.

The Place.

Lobelius is the first reporter, that the blew Flowerdeluce or first kinde of these broad leaved Flowerdeluces, groweth naturally in the West parts of England; but I am in some doubt of the truth of that report: for I rather thinke, that some in their trauels through Spaine, or other parts where it groweth, being delighted with the beauty of the flower, did gather the rootes, and bring them ouer with them, and dwelling in some of the West parts of England, planted them, and there encreasing so plentifully as they doe, they were imparted to many, thereby in time growing common in all Countrey folkes Gardens thereabouts. They grow also, and all the other, and many more varieties, about Tholouse, from whence Plantinianus Gassanus both sent and brought vs them, with many other bulbous rootes, and rare plants gathered thereabouts.

The

1. *Iris bulbosa latifolia prima Clusii*. Clusius his first great bulbous Flowerdeluce. 2. *Iris bulbosa major carnea pro Anglica*. The great blew or English bulbous Flowerdeluce. 3. *Iris bulbosa major purpurea variegata*. The great purple fringed bulbous Flowerdeluce. 4. *Iris bulbosa angustifolia maior alba*. The greater white narrow leaved bulbous Flowerdeluce. 5. *Iris bulbosa angustifolia variegata*. The party coloured narrow leaved bulbous Flowerdeluce. 6. *Iris bulbosa angustifolia africana*. The purple African bulbous narrow leaved Flowerdeluce.

The Time.

These doe flower vsually in the end of May, or beginning of Iune, and their seede is ripe in the end of Iuly or August.

The Names.

Lobel calleth the first English blew Flowerdeluce, *Hyacinthus Poetarum flore Iridis*, & propter *Hyacinthinum colorem*, id est *violaceum dictus*: but I know not any great good ground for it, more then the very colour; for it is neither of the forme of a Lilly, neither hath it those mourning marks imprinted in it, which the Poet faineth to bee in his Hyacinth. It is most truly called an *Iris*, or Flowerdeluce (and there is great difference betweene a Lilly and a Flowerdeluce, for the formes of their flowers) because it answereth thereunto very exactly, for the flower, and is therefore called vsually by most, either *Iris bulbosa Anglica*, or *Iris bulbosa maior sine latifolia*, for a difference betweene it, and the lesser with narrow leaues: In English, cyther The great English bulbous Flowerdeluce, or the great broad leaved bulbous Flowerdeluce, which you will, adding the other name, according to the colour.

And thus much for these broad leaved bulbous Flowerdeluces, so much as hath come to our knowledge. Now to the seuerall varieties of the narrow leaved bulbous Flowerdeluces, so much likewise as we haue been acquainted with.

Iris bulbosa minor sine angustifolia alba.

The smaller white or narrow leaved bulbous Flowerdeluce.

This first Flowerdeluce, which beareth the smaller flower of the two white ones, that are here to bee described, springeth out of the ground alwaies before Winter, which after breaketh forth into foure or fve small and narrow leaues, a foote long or more, of a whitish Greene on the inside, which is hollow and chanalled, and of a blewish Greene colour on the outside, and round withall: the stalke of this kinde is longer and slenderer then the former, with some shorter leaues vpon it, at the toppe whereof, out of short skinny leaues, stand one or two flowers, smaller, shorter, and rounder then the flowers of the former broad leaved Flowerdeluces, but made after the same proportion with nine leaues, three falling downwards, with a yellow spot in the middle, other three are made like a long arch, which couer the lower part next the stalke of those falling leaues, and turne vp at the ends of them, where they are diuided into two parts: the other three stand vpright, betweene each of the three falling leaues, being somewhat long and narrow: the flower is wholly (sauing the yellow spot) of a pure white colour, yet in some hauing a shew of some blew throughout, and in others towards the bottome of the three vpright leaues: after the flowers are past, there rise vp so many long cods or seede vessels, as there were flowers, which are longer and smaller then in the former, and a little bending like a Corner, with three round squares, and round pointed also, which diuiding it selfe when the seede is ripe into three parts, doe shew six seuerall cells or places, wherein is contained such like round reddish yellow seedes, but smaller then the former: the iroote is smaller and shorter then the former, and without any haire or threads, couered with browne thin skinned, and more plentifull in giuing encrease.

Iris bulbosa angustifolia alba flore maiore.

The greater white narrow leaved bulbous Flowerdeluce.

I shall not neede to make a seuerall description to euery one of these Flowerdeluces that follow, for that were but to make often repetition of one thing, which being once done, as it is, may well serue to expresse all the rest, and but onely to adde the especiall

ciall differences, either in leafe or flower, for bignesse, colour, or forme, as is expedient to expresse and distinguish them feuerally. This greater white bulbous Flower deluce is like vnto the last described in all parts, saving that it is a little larger and higher, both in leafe, stalke, and flower, and much whiter then any of these mixed sorts that follow, yet not so white as the former: the roote hereof is likewise a little bigger and rounder in the middle.

Albescent.
Milke white.
There is another, whose falling leaues haue a little shew of yellownesse in them, and so are the middle ridges of the arched leaues, but the vpright leaues are more white, not differing in roote or leafe from the first white.

Argentea.
Siluer colour.
And another, whose falls are of a yellowish white, like the last, the arched leaues are whiter, and the vpright leaues of a blewish white, which we call a siluer colour.

Albida.
Whitish.
Another hath the falls yellowish, and sometimes with a little edge of white about them, and sometimes without, the vpright leaues are whitish, as the arched leaues are, yet the ridge yellower.

Albida labris.
White with yellow fals.
Another hath his falls yellow, and the vpright leaues white, all these flowers are about the same bignesse with the first.

Albida angustifolia.
The narrow white.
But we haue another, whose flower is smaller, and almost as white as the second, the lower leaues are small, and doe as it were stand outright, not hauing almost any fal at all, so that the yellow spot seemeth to be the whole leafe, the arched leaues are not halfe so large as in the former, and the vpright leaues bowe themselves in the middle, so that the tops doe as it were meete together.

And another of the same, whose falling leaues are a little more eminent and yellow, with a yellower spot.

Aurea fua lutea Hispanica.
The Spanish yellow.
We haue another kinde that is called the Spanish yellow, which riseth not vp so high, as ordinarily most of the rest doe, and is wholly of a gold yellow colour.

Pallide lutea.
Straw colour.
There is another, that vsually riseth higher then the former yellow, and is wholly of a pale yellow, but deeper at the spot.

Albida lutea.
Pale Straw colour.
There is also another like vnto the pale yellow, but that the falling leaues are whiter then all the rest of the flower.

Mauritanica flaua srotina minor.
The small Barbary yellow.
There is a smaller or dwarfe kinde, brought from the backe parts of Barbary, neare the Sea, like vnto the yellow, but smaller and lower, and in stead of vpright leaues, hath small short leaues like haire: it flowreth very late, after all others haue almost giuen their seede.

Vericolor Hispanica capula labris albis.
The party coloured Spanish.
We haue another sort is called the party coloured Spanish bulbous Flower deluce, whose falling leaues are white, the arched leaues of a whitish siluer colour, and the vpright leaues of a fine blewish purple.

Yet sometimes this doth vary, for the falling leaues will haue either an edge of blew, circling the white leaues, the arched leaues being a little blower, and the vpright leaues more purple.

Diversiflora.
The diversity or variation of this flower.
Or the falls will be almost wholly blew, edged with a blower colour, the arched leaues pale blew, and the vpright leaues of a purplish blew Violet colour.

Or the falls white, the arched leaues pale white, as the vpright leaues are. Or not of so faire a blewish purple, as the first sort is.

Some of them also will haue larger flowers then others, and be more liberrall in bearing flowers: for the first sort, which is the most ordinary, seldome beareth aboue one flower on a stalke, yet sometimes two. And of the others there are some that wil beare vsually two and three flowers, yet some againe will beare but one. All these kindes smell sweeter then many of the other, although the most part be without sent.

Cerulea fua purpurea minor Lusitanica portensis.
The small early purple Portugal.
There is another kinde, that is smaller in all the parts thereof then the former, the stalke is slender, and not so high, bearing at the toppe one or two small flowers, all wholly of a faire blewish purple, with a yellow spot in

in euery one of the three falling leaues, this vsually flowreth early, euen with the first bulbous Flowerdeluces.

Purpurea maior.
The greater purple.
We haue another purple, whose flower is larger, and stalke higher, and is of a very reddish purple colour, a little about the ground, at the foote or bottome of the leaues and stalke: this flowreth with the later sort of Flowerdeluces.

Purpurea serotina.
The late purple.
There is another, whose flower is wholly purple, except the yellow spot, and flowreth later then any of the other purples.

Purpurea rubescens.
A reddish purple.
There is yet another purple, whose vpright leaues are of a reddish purple, and the falling leaues of a blew colour.

Purpurea rubescens.
A reddish purple.
And another of a reddish purple, whose falling leaues are of a whitish blew colour, in nothing else differing from the last.

Purpurea rubescens.
A reddish purple.
Another hath his falling leaues of a faire gold yellow, without any stripe, yet in some there are veines running through the yellow leaues, and some haue an edge of a fullen darke colour about them: the vpright leaues in euery of these, are of a Violet purple.

Purpurea rubescens.
A reddish purple.
Another is altogether like this last, but that the falling leaues are of a pale blew and yellow, trauersing one the other, and the arched leaues of a pale purplish colour.

Purpurea rubescens.
A reddish purple.
Another hath his vpright leaues of a paler purple, and the falling leaues yellow.

Purpurea rubescens.
A reddish purple.
And another little differing from it, but that the arched leaues are whitish.

Purpurea rubescens.
A reddish purple.
Another whose vpright leaues are of a pale blew, and the falling leaues yellow.

Purpurea rubescens.
A reddish purple.
And another of the same sort, but of a little paler blew.

Purpurea rubescens.
A reddish purple.
We haue another sort, whose vpright leaues are of a faire brownish yellow colour, which some call a *Fuisse mort*, and others an haire colour; the falling leaues yellow.

Purpurea rubescens.
A reddish purple.
And another of the same colour, but somewhat deader.

Iris bulbosa Africana serpentaria caule.

The purple or murrey bulbous Barbary Flowerdeluce.

This Flowerdeluce as it is more strange (that is, but lately knowne and possessed by a few) so it is both more desired, and of more beauty then others. It is in all respects, of roote, leafe, and flower, for the forme like vnto the middle sort of these Flowerdeluces, onely the lowest part of the leaues and stalke, for an inch or thereabouts, next vnto the ground, are of a reddish colour, spotted with many spots, and the flower, being of a meane size, is of a deepe purplish red or murrey colour the whole flower throughout, except the yellow spot in the middle of the three lower or falling leaues, as is in all others.

Purpurea cerulea obsoleta.
The dusky purple.
And lastly, there is another sort, which is the greatest of all these narrow leaved Flowerdeluces, in all the parts of it; for the roote is greater then any of the other, being thicke and short: the leaues are broader and longer, but of the same colour: the stalke is stronger and higher then any of them, bearing two or three flowers, larger also then any of the rest, whose falling leaues are of a duskie yellow, and sometimes with veines and borders about the brimmes, of another dunne colour, yet hauing that yellow spot that is in all: the arched leaues are of a fullen pale purplish yellow, and the vpright leaues of a dull or duskie blewish purple colour: the heads or hornes for seede are likewise greater, and so is the seede also a little.

The Place.

These Flowerdeluces haue had their originall out of Spaine and Portugall, as it is thought, except those that haue risen by the sowing, and those which are named of Africa.

The

The Time.

These flower in Iune, and sometimes abide vnto Iuly, but vsually not so early as the former broad leaved kindes, and are soone spoiled with wet in their flowing.

The Names.

The seuerall names, both in Latine and English, are sufficient for them as they are set downe; for we know no better.

The Vertues.

There is not any thing extant or to be heard, that any of these kindes of Flowerdeluces hath been vsed to any Physicall purposes, and serue onely to decke vp the Gardens of the curious.

And thus much for these sorts of bulbous Flowerdeluces, and yet I doubt not, but that there are many differences, which haue risen by the sowing of the seede, as many may obserue from their owne labours, for that euery yeare doth shew forth some variety that is not scene before. And now I will conuert my discourse a while likewise, to passe through the seuerall rankes of the other kindes of tuberous rooted Flowerdeluces, called Flagges.

CHAP. XX.

Iris latifolia tuberosa. The Flagge or Flowerdeluce.

Here are two principall kindes of tuberous or knobby rooted Flowerdeluces, that is, the tall and the dwarfe, or the greater and the lesser; the former called *Iris maior* or *latifolia*, and the other *Iris minor*, or rather *Chamaeiris*; and each of these haue their lesser or narrow leaved kindes to bee comprehended vnder them: Of all which in their order. And first of that Flowerdeluce, which for his excellent beautie and raritie, deserueth the first place.

Iris Chalcedonica sine Susiana maior. The great Turkie Flowerdeluce.

The great Turkie Flowerdeluce, hath diuers heads of long and broad fresh greene leaues, yet not so broad as many other of those that follow, one folded within another at the bottome, as all other of these Flowerdeluces are: from the middle of some one of those heads (for euery head of leaues beareth not a flower) riseth vp a round stiffe stalke, two foote high, at the toppe whereof standeth one flower (for I neuer obserued it to beare two) the largest almost, but rarest of all the rest, consisting of nine leaues, like the others that follow, but of the colour almost of a Snakes skinne, it is so diuersly spotted; for the three lower falling leaues are very large, of a deepe or darke purple colour, almost blacke, full of grayish spots, strakes, and lines through the whole leaues, with a blacke thrume or freeze in the middle of each of them: the three arched leaues that couer them, are of the same darke purple colour, yet a little paler at the sides, the three vpper leaues are very large also, and of the same colour with the lower leaues, but a little more liuely and fresh, being speckled and straked with whiter spots and lines, which leaues being laid in water, will colour the water into a Violet colour, but if a little Allome be put therein, and then wrung or pressed, and the iuice of these leaues dried in the shadow, will giue a colour almost as deepe as Indico, and may serue for shadowes in limming excellent well: the flower hath no sent that can be perceived, but is onely commendable for the beauty and rarity thereof: it feldome beareth seedes in these cold Countries, but when it doth, it is contained in great heads, being

being brownish and round, but not so flat as in other sorts, the roots are more browne on the outside, and growing tuberous thicke, as all other that are kept in Gardens.

Iris Chalcedonica sine Sufiana minor. The lesser Turkie Flowerdeluce.

There is another hereof little differing, but that the leafe is of a more yellowish Greene colour, and the flower neither so large or faire, nor of so perspicuous markes and spots, nor the colour of that liuely (though darke) lustre.

The Place.

These haue been sent out of Turkie diuers times among other things, and it should seeme, that they haue had their originall from about Sufis, a chiefe Citie of Persia.

The Time.

They flower in May most vsually, before any of the other kindes.

The Names.

They haue been sent vnto vs, and vnto diuers other in other parts, from Constantinople vnder the name of *Alia Sufiana*, and thereupon it hath been called, both of them and vs, either *Iris Chalcedonica*, or *Sufiana*, and for distinction *maior* or *minor*: In English, The Turkie Flowerdeluce, or the Ginnie Hen Flowerdeluce, the greater or the lesser.

Iris alba Florentina. The white Flowerdeluce.

The great white Flowerdeluce, hath many heads of very broad and flat long leaues, enclosing or folding one within another at the bottome, and after a little diuided one from another toward the top, thin edged, like a sword on both sides, and thicker in the middle: from the middle of some of these heads of leaues, riseth vp a round stiffe stalk, two or three foot high, bearing at the top one, two, or three large flowers, out of seuerall huskes or skins, consisting of nine leaues, as all the other do, of a faire white colour, hauing in the middle of each of the three falling leaues, a small long yellow frize or thrume, as is most vsuall in all the sorts of the following Flowerdeluces, both of the greater and smaller kindes: after the flowers are past, come the seed, inclosed in thicke short pods, full fraught or stored with red roundish and flat seede, lying close one vpon another: the roote is tuberous or knobby, shooting out from euery side such like tuberous heads, lying for the most part vpon or aboue the ground, and fastened within the ground with long white strings or fibres, which hold them strongly, and encrease fast. There is another like vnto this last in all things, sauing that the colour of the flower is of a more yellowish white, which we vsually call a Straw colour.

Flora pallida.

Iris alba maior Versicolor. The white party coloured Flowerdeluce.

This variable Flowerdeluce is like vnto the former, but that the leaues are not so large and broad, the flower hereof is as large almost, and as white as the former, but it hath a faire list or line of a blewish purple downe the backe of every one of the three vpright leaues, and likewise round about the edges, both of the vpper and lower leaues, and also a little more purplish vpon the ridge of the arched leaues, that couer the falling leaues: the roote hereof is not so great as of the former white, but a little slenderer and browner.

Iris Dalmatica maior. The great Dalmatian Flowerdeluce.

This greater Flowerdeluce of Dalmatia, hath his leaues as large and broad as any of the Flowerdeluces whatsoeuer, his stalke and flower doe equall his other proportion,

tion, onely the colour of the flower is differing, being of a faire watchet or bleake blew colour wholly, with the yellow frize or thrum downe the middle of the lower or falling leaues, as before is said to be common to all these sorts of Flowerdeluces; in all other parts it little differeth, sauing onely this is obserued to haue a small shew of a purplish red about the bottome of the greene leaues.

Iris purpurea sine vulgaris. The common purple Flowerdeluce.

This Flowerdeluce, which is most common in Gardens, differeth nothing at all from those that are formerly described, either in roote, leafe, or flower for the forme of them, but onely that the leaues of this are not so large as the last, and the flower it selfe is of a deep purple or Violet colour, and sometimes a little declining to rednesse, especially in some places.

Sometimes this kinde of Flowerdeluce will haue flowers of a paler purple colour, *Purpurea pal-*
comming neare vnto a blew, and sometimes it will haue veines or stripes of a deeper *lidior versico-*
blew, or purple, or ash-colour, running through all the vpper and lower leaues. *lor.*

There is another like vnto this, but more purple in the fals, and more pale in the *carulea labris*
vpright leaues. *purpureis.*

Iris Asiatica carulea. The blew Flowerdeluce of Asia.

This Flowerdeluce of Asia, is in largenesse of leaues like vnto the Dalmatian, but beareth more store of flowers on feuerall branches, which are of a deeper blew colour, and the arched leaues whitish on the side, and purplish on the ridges, but in other things like vnto it.

There is another neare vnto this, but that his leaues are a little narrower, and his *Purpurea*
flowers a little more purple, especially the vpper leaues.

Iris Damascena. The Flowerdeluce of Damasco.

This is likewise altogether like the Flowerdeluce of Asia, but that it hath some white veines in the vpright leaues.

Iris Lusitanica biflora. The Portugall Flowerdeluce.

This Portugall Flowerdeluce is very like the common purple Flowerdeluce, but that this is not so large in leaues, or flowers, and that it doth often flower twice in a yeare, that is, both in the Spring, and in the Autumne againe, and besides, the flowers haue a better or sweeter sent, but of the like purple or Violet colour as it is, and coming forth out of purplish skins or huskes.

Iris Camerarij sine purpurea versicolor maior.

The greater variable coloured purple Flowerdeluce.

The greater of the variable purple Flowerdeluces, hath very broad leaues, like vnto the leaues of the common purple Flowerdeluce, and so is the flower also, but differing in colour, for the three lower leaues are of a deepe purple colour tending to rednesse, the three arched leaues are of the colour with the vpper leaues, which are of a pale or bleake colour tending to yellownesse, shadowed ouer with a smoakie purplish colour, except the ridges of the arched leaues, which are of a more liuely purple colour.

Iris purpurea versicolor minor. The lesser variable purple Flowerdeluce.

This Flowerdeluce differeth not in any thing from the last, but onely that it hath narrower greene leaues, and smaller and narrower flowers, else if they be both conferred together, the colours will not seeme to varie the one from the other any whit at all.

There is another somewhat neare vnto these two last kindes, whose huskes from *Altera minor*
whence *fuliginosa.*

whence the flowers doe shoote forth, haue purple veines in them, and so haue the falling purplish leaues, and the three vpright leaues are not so smoakie, yet of a dun purple colour.

Iris carulea versicolor. The blew party coloured Flowerdeluce.

This party coloured Flowerdeluce hath his leaues of the same largenesse, with the lesser variable purple Flowerdeluce last described, and his flowers diuersly marked: for some haue the fals blew at the edges, and whitish at the bottome, the arched leaues of a yellowish white, and the vpright leaues of a whitish blew, with yellowish edges. Some againe are of a darker blew, with brownish spots in them. And some are so pale a blew, that we may well call it an ash colour: And lastly, there is another of this sort, whose vpright leaues are of a faire pale blew, with yellowish edges, and the falling leaues parted into two colours, sometimes equally in the halfe, each side suitable to the other in colour: And sometimes hauing the one leafe in that manner: And sometimes but with a diuers coloured list in them; in the other parts both of flower and leafe, like vnto the other.

Iris lutea variegata. The yellow variable Flowerdeluce.

This yellow variable Flowerdeluce loseth his leaues in Winter, contrary to all the former Flowerdeluces, so that his roote remaineth vnder ground without any shew of leafe vpon it: but in the beginning of the Spring it shooteth out faire broad leaues, falling downwards at the points or ends, but shorter many times then any of the former, and so is the stalke likewise, not rising much about a foote high, whereon are set two or three large flowers, whose falling leaues are of a reddish purple colour, the three that stand vpright of a smoakie yellow, the arched leaues hauing their ridges of a bleake colour tending to purple, the sides being of the former smoakie yellow colour, with some purplish veines at the foote or bottome of all the leaues: the roote groweth somewhat more slender and long vnder ground, and of a darker colour then manie of the other.

Varietas.

Another sort hath the vpright leaues of a reasonable faire yellow, and stand more vpright, not bowing downe as most of the other, and the purple fals haue pale edges. Some haue their Greene leaues party coloured, white and Greene, more or lesse, and so are the huskes of the flowers, the arched leaues yellow, as the vpright leaues are, with purplish veines at the bottome. And some haue both the arched and vpright leaues of so pale a yellow, that we may almost call it a straw colour, but yellower at the bottome, with purple veines, and the falling leaues purple, with two purple spots in them.

And these are the sorts of the greater tuberous or Flagge Flowerdeluces that haue come to our knowledge: the next hereunto are the lesser or narrow leaved kindes to be described; and first of the greatest of them.

1. *Iris angustifolia Tripolitana aurea.* The yellow Flowerdeluce of Tripoly.

This Flowerdeluce I place in the forefront of the narrow leaved Flowerdeluces, for the length of the leaues, compared with the breadth of them; it may fitly bee called a narrow leaved Flowerdeluce, although they be an inch broad, which is broader then any of them that follow, or some of those are set downe before, but as I said, the length make them seem narrow, and therefore let it take vp his roome in this place, with the description that followeth. It beareth leaues a yard long, or not much lesse, and an inch broad, as is said before, or more, of a sad Greene colour, but not shining: the stalke riseth vp to be foure or fife foote high, being strong and round, but not very great, bearing at the toppe two or three long and narrow gold yellow flowers, of the fashion of the bulbous Flowerdeluces, as the next to bee described is, without any mixture or variation therein: the heads for seede are three square, containing within them many flat cornered feedes: the roote is long and blackish, like vnto the rest that follow, but greater and fuller.

2. *Iris*

1 *Iris Chalcedonica* sive *Sofiana maior*. The great Turkie Flowerdeluce. 2 *Iris alba Florentina*. The white Flowerdeluce. 3 *Iris latifolia variegata*. The variable Flowerdeluce. 4 *Chalcidiris latifolia minor*. The greater dwarf Flowerdeluce.

2. *Iris angustifolia maior caerulea.*

The greater blew Flowerdeluce with narrow leaues.

This kinde of Flowerdeluce hath his leaues very long and narrow, of a whitish greene colour, but neither so long or broad as the last, yet broader, thicker and stiffer then any of the rest with narrow leaues that follow: the stalke riseth sometimes no higher then the leaues, and sometimes a little higher, bearing diuers flowers at the top, successiuelly flowring one after another, and are like vnto the flowers of the bulbous Flowerdeluces, but of a light blew colour, and sometimes deeper: after the flowers are past, rise vp six cornered heads, which open into three parts, wherein is contained browne seede, almost round: the roote is small, blackish and hard, spreading into many long heads, and more closely growing or matting together.

3. *Iris angustifolia purpurea marina.* The purple narrow leaved Sea Flowerdeluce.

This Sea Flowerdeluce hath many narrow hard leaues as long as the former, and of a darke greene colour, which doe smell a little strong: the stalke beareth two or three flowers like the former, but somewhat lesse, and of a darke purple or Violet colour: in seede and roote it is like the former.

4. *Iris angustifolia purpurea versicolor.*

The variable purple narrow leaved Flowerdeluce.

The leaues of this Flowerdeluce are very like the former Sea Flowerdeluce, and do a little stinke like them; the flowers are differing, in that the vpper leaues are wholly purple or violet, and the lower leaues haue white veines, and purple running one among another: the seede and rootes differ not from the former purple Sea kinde.

5. *Iris angustifolia minor Pannonica sine versicolor Clusij.*

The small variable Hungarian Flowerdeluce of Clusius.

This Hungarian Flowerdeluce (first found out by Clusius, by him described, and of him tooke the name) riseth vp with diuers small tufts of leaues, very long, narrow, and greene, growing thicke together, especially if it abide any time in a place; among which riseth vp many long round stalkes, higher then the leaues, bearing two or three, or foure small flowers, one aboue another, like the former, but smaller and of greater beauty: for the lower leaues are variably striped with white and purple, without any thrume or fringe at all; the vpper leaues are of a blewish fine purple or Violet colour, & so are the arched leaues, yet hauing the edges a little paler: the heads for seede are smaller, and not so cornered as the other, containing seedes much like the former, but smaller: the roote is blacke and small, growing thicker and closer together then any other, and strongly fastened in the ground, with a number of hard stringie rootes: the flowers are of a reasonable good sent.

6. *Iris angustifolia maior flore duplici.* The greater double blew Flowerdeluce.

This Flowerdeluce, differeth not either in roote or leafe from the first great blew Flowerdeluce of Clusius, but onely in that the leaues grow thicker together, and that the flowers of this kinde are as it were double with many leaues confusedly set together, without any distinct parts of a Flowerdeluce, and of a faire blew colour with many white veines and lines running in the leaues; yet oftentimes the stalke of flowers hath but two or three small flowers distinctly set together, rising as it were out of one huske.

7. *Iris angustifolia minor alba Clusij.*

The small white Flowerdeluce of Hungary.

This likewise differeth little from the former Hungarian Flowerdeluce of Clusius, but

1. *Iris angustifolia Tripolitana*. The yellow Flowerdeuce of Tripoli. 2. *Iris angustifolia major caerulea*. The greater blue Flowerdeuce with narrow leaves. 3. *Iris angustifolia minor Patavica sine varietate Clusii*. The small variable Hungarian Flowerdeuce of Clusius. 4. *Iris angustifolia major flore duplici*. The greater double blue Flowerdeuce. 5. *Chamaeiris angustifolia minor*. The lesser Grass Flowerdeuce. 6. *Iris latifolia*. The violet Flowerdeuce.

but that the leafe is of a little paler Greene colour, and the flower is of a faire whitish colour, with some purple at the bottome of the leaues.

Next after these narrow leaved Flowerdeluces, are the greater and smaller sorts of dwarfe kindes to follow; and lastly, the narrow or grasse leaved dwarfe kindes, which will finish this Chapter of Flowerdeluces.

1. *Chamaeiris latifolia maior alba*. The greater white dwarfe Flowerdeluce.

This dwarfe Flowerdeluce hath his leaues as broad as some of the lesser kindes last mentioned, but not shorter; the stalke is very short, not aboue halfe a foote high or thereabouts, bearing most commonly but one flower, seldome two, which are in some of a pure white, in others paler, or somewhat yellowish through the whole flower, except the yellow frize or thrume in the middle of euery one of the falling leaues: after the flowers are past, come forth great heads, containing within them round pale seed: the roote is small, according to the proportion of the plant aboue ground, but made after the fashion of the greater kindes, with tuberous peeces spreading from the sides, and strong fibres or strings, whereby they are fastened in the ground.

2. *Chamaeiris latifolia maior purpurea*. The greater purple dwarfe Flowerdeluce.

There is no difference either in roote, leafe, or forme of flower in this from the former dwarfe kinde, but onely in the colour of the flower, which in some is of a very deepe or blacke Violet purple, both the toppes and the fals: in others the Violet purple is more liuely, and in some the vpper leaues are blew, and the lower leaues purple, yet all of them haue that yellow frize or thrume in the middle of the falling leaues, that the other kindes haue.

There is another that beareth purple flowers, that might be reckoned, for the smallnesse and shortnesse of his stalke, to the next kinde, but that the flowers and leaues of this are as large as any of the former kindes of the smaller Flowerdeluces.

3. *Chamaeiris latifolia minor alba*. The lesser white dwarfe Flowerdeluce.

There is also another sort of these Flowerdeluces, whose leaues and flowers are lesse, and wherein there is much variety. The leaues of this kinde, are all for the most part somewhat smaller, narrower, and shorter then the former: the stalke with the flower vpon it scarce riseth aboue the leaues, so that in most of them it may be rather called a foote-stalke, such as the Saffron flowers haue, and are therefore called of manie *Anglais*, without stalkes; the flowers are like vnto the first described of the dwarfe kindes, and of a whitish colour, with a few purplish lines at the bottome of the vpper leaues, and a list of Greene in the falling leaues.

Another hath the flowers of a pale yellow, called a Straw colour, with whitish stripes and veines in the fals, and purplish lines at the bottome of the vpper leaues.

4. *Chamaeiris latifolia minor purpurea*. The lesser purple dwarfe Flowerdeluce.

The difference of this from the former, consisteth more in the colour then forme of the flower, which is of a deep Violet purple, sometimes paler, and sometimes so deep, that it almost seemeth blacke: And sometimes the fals purplish, and the vpper leaues blew. Some of these haue a sweete sent, and some none.

There is another of a fine pale or delayed blew colour throughout the whole flower.

5. *Chamaeiris latifolia minor sauerbens*.
The lesser bluish coloured dwarfe Flowerdeluce.

This Flowerdeluce hath the falling leaues of the flower of a reddish colour, and the thrumes blew: the vpper and arched leaues of a fine pale red or flesh colour, called a bluish colour; in all other things it differeth not, and smelleth little or nothing at all.

6. *Chamaeiris*

6. *Chamaeiris latifolia minor lutea versicolor.*

The lesser yellow variable dwarfe Flowerdeluce.

The falling leaues of this Flowerdeluce are yellowish, with purple lines from the middle downewards, sometimes of a deeper, and sometimes of a paler colour, and white thrumes in the middle, the vpper leaues are likewise of a yellowish colour, with purple lines in them: And sometimes the yellow colour is paler, and the lines both in the vpper and lower leaues of a dull or dead purple colour.

3. *Chamaeiris latifolia minor caerulea versicolor.*

The lesser blew variable dwarfe Flowerdeluce.

The vpper leaues of this flower are of a blewish yellow colour, spotted with purple in the broad part, and at the bottome very narrow: the falling leaues are spread ouer with pale purplish lines, and a small shew of blew about the brimmes: the thrume is yellow at the bottome, and blewish aboue: the arched leaues are of a blewish white, being a little deeper on the ridge.

And sometimes the vpper leaues are of a paler blew rather whitish, with the yellow: both these haue no sent at all.

8. *Chamaeiris marina purpurea.* The purple dwarfe Sea Flowerdeluce.

This small Flowerdeluce is like vnto the narrow leaved Sea Flowerdeluce before described, both in roote, leafe, and flower, hauing no other difference, but in the smallnesse and lownesse of the growing, being of the same purple colour with it.

9. *Chamaeiris angustifolia maior.* The greater Grasse Flowerdeluce.

This Grasse Flowerdeluce hath many long and narrow darke green leaues, not so stiffe as the former, but lither, and bending their ends downe againe, among which rise vp diuers stalks, bearing at the toppe two or three sweete flowers, as small as any of them set downe before, of a reddish purple colour, with whitish yellow and purple strakes downe the middle of the falling leaues: the arched leaues are of a horse flesh colour all along the edges, and purple vpon the ridges and tips that turne vp againe: vnder these appeare three browne aglets, like vnto birds tongues: the three vpper leaues are small and narrow, of a perfect purple or Violet colour: the heads for seede haue sharper and harder cornered edges then the former: the seedes are somewhat grayish like the former, and so are the rootes, being small, blacke, and hard, growing thicke together, fastened in the ground with small blackish hard strings, which hardly shoote againe if the roote be remoued.

10. *Chamaeiris angustifolia minor.* The lesser Grasse Flowerdeluce.

This Flowerdeluce is in leaues, flowers, and rootes so like the last described, that but onely it is smaller and lower, it is not to be distinguished from the other. And this may suffice for these sorts of Flowerdeluces, that furnish the Gardens of the curious louers of these varieties of nature, so farre forth as hath passed vnder our knowledge. There are some other that may be referred hereunto, but they belong to another history, and therefore I make no mention of them in this place.

The Place.

The places of most of these are set downe in their severall titles; for some are out of Turkie, others out of Hungaria, Dalmacia, Illyria, &c. as their names doe import. Those that grow by the Sea, are found in Spaine and France.

The

The Time.

Some of these do flower in Aprill, some in May, and some not vntill Iune.

The Names.

The names expressed are the fittest agreeing vnto them, and therefore it is needlesse againe to repeatethem. Many of the rootes of the former or greater kindes, being dryed are sweete, yet some more then other, and some haue no sent at all: but aboue all the rest, that with the white flower, called of Florence, is accounted of all to be the sweetest root, fit to be vsed to make sweete powders, &c. calling it by the name of *Orris* rootes.

Iris tuberosa. The Veluet Flowerdeluce.

Vnto the Family of Flowerdeluces, I must needs ioynethis peculiarkinde, because of the neare resemblance of the flower, although it differ both in roote and leafe; lest therefore it should haue no place, let it take vp a roome here in the end of the Flowerdeluces, with this description following. It hath many small and foure square leaues, two foote long and aboue sometimes, of a grayish Greene colour, stiffe at the first, but afterwards growing to their full length, they are weak and bend downe to the ground: out of the middle, as it were of one of these leaues, breaketh out the stalke, a foot high and better, with some leaues thereon; at the toppe whereof, out of a huske riseth one flower, (I neuer saw more on a stalke) consisting of nine leaues, whereof the three that fall downe are of a yellowish Greene colour round about the edges, and in the middle of so deepe a purple, that it seemeth to be blacke, resembling blacke Veluet: the three arched leaues, that couer the lower leaues to the halfe, are of the same greenish colour that the edges and backside of the lower leaues are: the three vppermost leaues, if they may be called leaues, or rather short peeces like eares, are green also, but wherein a glimpse of purple may be seene in them: after the flower is past, there followeth a round knob or whitish seede vessell, hanging downe by a small foote-stalke, from betweene the huske, which is diuided as it were into two leaues, wherein is contained round white seede. The roote is bunched or knobbed out into long round rootes, like vnto fingers, two or three from one peece, one distant from another, and one longer then another, for the most part of a darkish gray colour, and reddish withall on the outside, and somewhat yellowish within.

The Place.

It hath beene sent out of Turkie oftentimes (as growing naturally thereabouts) and not knowne to grow naturally any where else.

The Time.

It flowreth in Aprill or May, sometimes earlier or later, as the Spring falleth out to be milde or sharpe.

The Names.

Matthiolus contendeth to make it the true *Hermodactylus*, rather from the shew of the rootes, which (as is said) are like vnto fingers, then from any other good reason: for the rootes hereof cyther dry or Greene, do nothing resemble the true *Hermodactylus* that are vsed in Physicke, as any that knoweth them may easily perceiue, either in forme or vertue. It is more truly referred to the Flowerdeluces, and because of the tuberos rootes, called *Iris tuberosa*, although all the Flowerdeluces in this Chapter haue tuberos

rootes,

rootes, yet this much differing from them all: In English it is vsually called, The Velvet Flowerdeluce, because the three falling leaues seeme to be like smooth blacke Velvet.

The Vertues.

Both the rootes and the flowers of the great Flowerdeluces, are of great vse for the purging and cleansing of many inward, as well as outward diseases, as all Authors in Physicke doe record. Some haue vsed also the greene rootes to cleanse the skinne, but they had neede to be carefull that vsed them, lest they take more harme then good by the vse of them. The dried rootes called *Orris* (as is said) is of much vse to make sweete powders, or other things to perfume apparrell or linnen. The iuice or decoction of the green roots doth procure both neezing to be snufft vp into the nostrils, and vomiting very strongly being taken inwardly.

CHAP. XXI.

Gladiolus. Corne Flagge.

NExt vnto the Flagges or Flowerdeluces, come the *Gladioli* or Corne Flagges to bee entreated of, for some resemblance of the leaues with them. There are hereof diuers sorts, some bigger and some lesser, but the chiefe difference is in the colour of the flowers, and one in the order of the flowers. Of them all in their seuerall orders.

Gladiolus Narbonensis. The French Corne Flagge.

The French Corne Flagge riseth vp with three or foure broad, long, and stiffe greene leaues, one as it were out of the side of another, being ioyned together at the bottome, somewhat like vnto the leaues of Flowerdeluces, but stiffer, more full of ribbes, and longer then many of them, and sharper pointed: the stalke riseth vp from among the leaues, bearing them on it as it riseth, hauing at the toppe diuers huskes, out of which come the flowers one aboue another, all of them turning and opening themselves one way, which are long and gaping, like vnto the flowers of Foxegloue, a little arched or bunching vp in the middle, of a faire reddish purple colour, with two white spots within the mouth thereof, one on each side, made like vnto a Lozenge that is square and long pointed: after the flowers are past, come vp round heads or feede vessels, wherein is contained reddish flat seede, like vnto the seede of the Fritillaria, but thicker and fuller: the roote is somewhat great, round, flat, and hard, with a shew as if it were netted, hauing another short spongie one vnder it, which when it hath done bearing, and the stalke dry, that the roote may be taken vp, sticketh close to the bottome, but may be easily taken away, hauing vsually a number of small rootes encreased about it, the least whereof will quickly grow, so that if it be suffered any long time in a Garden, it will rather choake and peester it, then be an ornament vnto it.

Gladiolus Italicus bimis floribus ordinibus. The Italian Corne Flagge.

The Italian Corne Flagge is like vnto the French in roote, leafe, and flower, without any other difference, then that the roote is smaller and browner, the leafe and stalke of a darker colour, and the flowers (being of a little darker colour like the former, and somewhat smaller) stand out on both sides of the stalke.

Gladiolus Byzantinus. Corne Flagge of Constantinople.

This Corne Flagge that came first from Constantinople, is in all things like vnto the French Corne Flagge last described, but that it is larger, both in rootes, leaues, and flowers,

flowers, and likewise that the Flowers of this, which stand not on both sides, are of a deeper red colour, and flower later; after all the rest are past: the roote hereof being netted as plainly as any of the former, is as plentifull also to giue encrease, but is more tender and lesse able to abide our sharpe cold Winters.

Gladiolus flore rubente. Blush Corne Flagge.

This blush kinde is like vnto the French Corne Flagge in all respects, sauing onely that the flowers are of a pale red colour, tending to whitenesse, which wee usually call a blush colour.

Gladiolus flore albo. White Corne Flagge.

This white Corne Flagge also differeth not from the last, but onely that the rootes are whiter on the outside, the leaues are greener, without any brownesse or darknesse as in the former, and the flowers are snow white.

Gladiolus purpureus minor. The small purple Corne Flagge.

This also differeth not from any of the former, but onely in the smalnesse both of leafe, stalke, and flowers, which stand all on the one side, like vnto the French kinde, and of the same colour: the roote of this kinde is netted more then any other.

The Place.

They grow in France and Italy, the least in Spaine, and the Byzantine, as it is thought, about Constantinople, being (as is said) first sent from thence. Iohn Tradescante assured mee, that hee saw many acres of ground in Barbary spread ouer with them.

The Time.

They all flower in Iune and Iuly, and the Byzantine latest, as is said before.

The Names.

It hath diuers names; for the Latines call it *Gladiolus*, of the forme of a sword, which the leafe doth resemble. The Romanes *Segetalis*, because it groweth in the Corne fields. Some call it *Victorialis rotunda*, to put a difference between it, and the *longa*, which is a kinde of Garlick. Plinie saith, that *Gladiolus* is *Cyprius*, but to decide that controuersie, and many others, belongeth to another discourse, this being intended only for pleasure. Gerard mistaketh the French kinde for the Italian.

The Vertues.

The roote being bruised, and applyed with Frankinsense (and often of it selfe without it) in the manner of a pultis or plaister, is held of diuers to be singular good to draw out splinters, thornes, and broken bones out of the flesh. Sometime it is to be effectuall to stirre vp Venerie, but I somewhat doubt thereof: For Galen in his eighth Booke of Simples, giueth vnto it a drawing, digesting, and drying faculty.

1 *Gladiolus Narbonensis*. The French Corne Flagg. 2 *Gladiolus Italicus*. The Italian Corne Flagg. 3 *Gladiolus Byzantinus*. Corne Flagg of Constantinople. 4. *Palma Christi* mar. The great male banded Satyrion. 5. *Orchis Hermaphrodites candida*. The white Butterfliſſe Orchis. 6 *Orchis Melitica fusca* spina. The Bee flower or Bee Orchis. 7 *Dent Canina flore purpurea*. Dogges tooth Violet with a pale purpliſh flower. 8 *Dent Canina flore alba*. Dogges tooth Violet with a white flower.

CHAP. XXII.

Orchis sine Satyrium. Bee flowers.

Although it is not my purpose in this place, to giue a generall history of all the sorts of Orchides, Satyrions, and the rest of that kinde; yet because many of them are very pleasant to behold, and, if they be planted in a conuenient place, will abide some time in Gardens, so that there is much pleasure taken in them: I shall intrude some of them for curiosities sake, to make vp the prospect of natures beautifull variety, and only entreate of a few, leauing the rest to a more ample declaration.

1. *Satyrium Basilicum sine Palma Christi mas.*

The greater male handed Satyrion.

This handed Satyrion hath for the most part but three faire large Greene leaues, neare vnto the ground, spotted with small blackish marks: from among which riseth vp a stalke, with some smaller leaues thereon, bearing at the toppe a bush or spike of flowers, thicke set together, euery one whereof is made like a body, with the belly broader belowe then aboue, where it hath small peeces adioyned vnto it: the flower is of a faire purple colour, spotted with deeper purple spots, and hauing small peeces like hornes hanging at the backes of the flowers, and a small leafe at the bottome of the foote-stalke of euery flower: the rootes are not round, like the other Orchides, but somewhat long and flat, like a hand, with small diuisions belowe, hanging downe like the fingers of a hand, cut short off by the knockles, two alwayes growing together, with some small fibres or strings about the heads of these rootes, at the bottome of the stalke.

2. *Satyrium Basilicum sine Palma Christi femina.*

The female handed Satyrion.

This female Satyrion hath longer and narrower leaues then the former, and spotted with more and greater spots, compassing the stalke at the bottome like the other: this beareth likewise a bush of flowers, like vnto the other, but that each of these haue heads like hoods, whereas the former haue none: in some they are white with purple spots, and in others of a reddish purple, with deep or darke coloured spots: the roots are alike,

3. *Orchis Hermaphroditica candida.* The white Butterflie Orchis.

The rootes of this kinde take part with both the sorts of *Orchis* and *Satyrium*, being neither altogether round, nor fully handed, and thereupon it tooke the name, to signifie both kindes: the leaues are two in number, seldome more, being faire and broad, like vnto the leaues of Lillies, without any spot at all in them: at the toppe of the stalke stand many white flowers, not so thicke set as the first or second, euery one being fashioned like vnto a white Butterflie, with the wings spread abroad.

4. *Orchis Melitias sine apifera.* The Bee flower or Bee Orchis.

This is a small and lowe plant for the most part, with three or foure small narrow leaues at the bottome: the stalke is seldome aboue halfe a foote high, with foure or five flowers thereon one aboue another, hauing round bodies, and somewhat flat, of a kind of yellowish colour, with purple wings about them, so like vnto an honey Bee, that it might soone deceiue one that neuer had seene such a flower before: the roots are two together, round and white, hauing a certaine *mucilaginesse* or clamminesse within them, without any taste almost at all, as all or the most part of these kindes haue.

5. *Orchis Sphegodes.* Gnats Satyrion.

The leaues of this Orchis are somewhat larger then of the Bee flower, the stalke also somewhat

somewhat higher: the flowers are fewer on the toppe, but somewhat larger then of the Bee flowers, made to the resemblance of a Gnat or great long Flie: the rootes are two round bulbes, as the other are.

6. *Orchis Myodes*. Flie Orchis.

The Flie Orchis is like vnto the last described, both in leafe and roote; the difference is in the flower, which is neither so long as the Gnat Satyrion, nor so great as the Bee Orchis, but the neather part of the Flie is blacke, with a list of ash-colour crossing the backe, with a shew of legges hanging at it: the naturall Flie seemeth so to bee in loue with it, that you shall seldome come in the heate of the day, but you shall finde one sitting close thereon.

The Place.

These grow in many places of England, some in the Woods, as the Butterfic, and the two former handed Satyrions: others on dry bankes and barren balkes in Kent, and many other places.

The Time.

They flower for the most part in the beginning or middle of May, or thereabouts.

The Names.

Their severall names are expressed in their titles, so much as may suffice for this discourse.

The Vertues.

All the kindes of Orchis are accounted to procure bodily lust, as well the flowers distilled, as the rootes prepared.

The rootes boyled in red Wine, and afterwards dried, are held to bee a singular good remedie against the bloody Flix.

CHAP. XXIII.

Dens Caninus. Dogs tooth Violet.

Vnto the kindes of Orchides, may fitly be ioyned another plant, which by many is reckoned to be a *Satyrion*, both from the forme of roote and leafe, and from the efficacy or vertue correspondent thereunto. And although it cannot be the *Satyrion Erythronium* of Dioscorides, as some would entitle it, for that as I haue shewed before, his *Satyrion tryphillum* is the Tulipa without all doubt; yet because it differeth very notably, and carrieth more beauty and respect in his flower then they, I shall entreate thereof in a Chapter by it selfe, and set it next vnto them.

Dens Caninus flore albo. Dogs tooth Violet with a white flower.

The white Dogs tooth hath for his roote a white bulbe, long and small, yet vsually greater then either of the other that follow, bigger belowe then aboue, with a small peece adioyning to the bottome of it, from whence rise vp in the beginning of the Spring, after the Winter frosts are past, two leaues for the most part (when it will flower, or else but one, and neuer three together that euer I saw) closed together when they first come vp out of the ground, which inclose the flower betweene them: the leaues when they are opened do lay themselues flat on the ground, or not much aboue it, one opposite vnto the other, with the stalke and the flower on it standing betweene them, which leaues are of a whitish Greene colour, long and narrow, yet broader in the

middle then at both ends, growing lesse by degrees each way, spotted and striped all over the leaues with white lines and spots: the stalke riseth vp halfe a foote high or more, bearing at the toppe one flower and no more, hanging downe the head, larger then any of the other of this kinde that follow, made or consisting of six white long and narrow leaues, turning themselves vp againe, after it hath felt the comfort of the Sunne, that they doe almost touch the stalke againe, very like vnto the flowers of *Cyclamen* or *Sowebread*: it hath in the middle of the flower six white chiues, tipt with darke purple pendants, and a white three forked stile in the middle of them: the flower hath no sent at all, but commendable onely for the beauty and forme thereof: after the flower is past, commeth in the place a round head seeming three square, containing therein small and yellowish seede.

Dens Caninus flore purpurascens. Dogs tooth with a pale purple flower.

This other Dogs tooth is like vnto the former, but lesser in all parts, the leafe whereof is not so long, but broad and short, spotted with darker lines and spots: the flower is like the other, but smaller, and of a delayed purple colour, very pale sometimes, and sometimes a little deeper, turning it selfe as the other, with a circle round about the vmbone or middle, the chiues hereof are not white, but declining to purple: the roote is white, and like vnto the former, but lesser, as is said before.

Dens Caninus flore rubro. Dogs tooth with a red flower.

This is in all things like vnto the last, both for forme and bignesse of flower and leafe: the chiefe difference consisteth in this, that the leaues hereof are of a yellowish mealy Greene colour, spotted and streaked with redder spots and stripes, and the flower of a deeper reddish purple colour, and the chiues also more purplish then the last, in all other things it is alike.

The Place.

The sorts of *Dens Caninus* doe growe in diuers places; some in Italy on the Euganean Hills, others on the Apenine, and some about Gratz, the chiefe Citie of Stiria, and also about Bayonne, and in other places.

The Time.

They flower in March most vsually, and many times in Aprill, according to the seasonableness of the yeare.

The Names.

Clusius did call it first *Dentali*, and Lobel, and from him some others *Satyrium*, and *Erythranium*, but I haue said enough hereof in the beginning of the Chapter. It is most commonly called *Dens Caninus*, and we in English, either Dogs tooth, or Dogs tooth Violet. Gesner called it *Hermodactylus*, and Matthiolus *Pseudohermodactylus*.

The Vertues.

The roote hereof is held to bee of more efficacy for venereous effects, then any of the Orchides and Satyrions.

They of Stiria vse the rootes for the falling sicknesse.

We haue had from Virginia a roote sent vnto vs, that wee might well iudge, by the forme and colour thereof being dry, to be either the roote of this, or of an Orchis, which the naturall people hold not onely to be singular to procure lust, but hold it as a secret, loth to reueale it.

CHAP. XXIIII.

Cyclamen. Sowebread.

THe likenesse of the flowers, and the spotting of the leaues of the *Dens Caninus*, with these of the *Cyclamen* or Sowebread, maketh mee ioyne it next thereunto: as also that after the bulbous rooted plants I might begin with the tuberos that remaine, and make this plant the beginning of them. Of this kinde there are diuers sorts, differing both in forme of leaues and time of flowring: for some doe flower in the Spring of the yeare, others afterwards in the beginning of Summer: but the most number in the end of Summer, or beginning of Autumne or Haruest, whereof some haue round leaues, others cornered like vnto Iuie, longer or shorter, greater or smaller. Of them all in order, and first of those that come in the Spring.

1. *Cyclamen Vernum flore purpureo*. Purple flowred Sowebread of the Spring.

This Sowebread hath a smaller roote then most of the others, yet round and blackish on the outside, as all or most of the rest are (I speake of them that I haue seene; for Clusius and others doe report to haue had very great ones) from whence rise vp diuers round, yet pointed leaues, and somewhat cornered withall, Greene aboue, and spotted with white spots circlewise about the leafe, and reddish vnderneath, which at their first comming vp are folded together; among which come the flowers, of a reddish purple colour and very sweete, euery one vpon a small, long, and slender reddish foote-stalke, which hanging downe their heads, turne vp their leaues againe: after the flowers are past, the head or seede vessell shrinketh downe, winding his foote-stalke, and coyling it selfe like a cable, which when it toucheth the ground, there abideth hid among the leaues, till it be growne great and ripe, wherein are contained a few small round seedes, which being presently sowne, will growe first into round rootes; and afterwards from them shoote forth leaues.

2. *Cyclamen Vernum flore albo*. White flowred Sowebread of the Spring.

The white flowring Sowebread hath his leaues like the former, but not fully so much cornered, bearing small snow white flowers, as sweete as the other: and herein consisteth the chiefest difference, in all other things it is alike.

3. *Cyclamen Vernum Creticum flore albo*. White Candy Sowebread of the Spring.

This Sowebread is somewhat like the former white kinde, but that the leaues grow much larger and longer, with more corners at the edges, and more eminent spots on them: the flowers also somewhat longer and larger, and herein consisteth the whole difference.

4. *Cyclamen Aestivum*. Summer Sowebread.

Summer Sowebread hath round leaues like vnto the Romane Sowebread, but somewhat cornered, yet with shorter corners then the Iuie leaved Sowebread, full of white spots on the vpper side of the leaues, and very purple vnderneath, sometimes they haue fewer spots, and little or no purple vnderneath: the flowers hereof are as small, as purple, and as sweete, as the purple Sowebread of the Springtime: the roote hereof is likewise small, blacke, and round.

5. *Cyclamen Romanum rotundifolium*. Romane Sowebread with round leaues.

The Romane Sowebread hath round leaues, somewhat like vnto the common Sowebread, but not fully so round pointed at the ends, a little cornered sometimes also, or as it were indented, with white spots round about the middle of the leaues.

and very conspicuous, which make it seeme the more beautifull: the flowers appeare in Autumne, and are shorter, and of a deeper purplish red colour then the Iuie Sowebread, rising vp before the leaues for the most part, or at least with them, and little or nothing sweete: the roote is round and blacke, vsually not so flat as it, but growing sometimes to bee greater then any other kinde of Sowebread. There is sometimes some variety to be seene, both in the leaues and flowers of this kinde; for that sometime the leaues haue more corners, and either more or lesse spotted with white: the flowers likewise of some are larger or lesser, longer or rounder, paler or deeper coloured one then another. This happeneth most likely from the sowing of the seede, causing the like variety as is seene in the Iuie leaved Sowebread. It doth also many times happen from the diuersity of soyles and countries where they grow: the seed of this, as of all the rest, is small and round, contained in such like heads as the former, standing almost like the head of a Snake that is twined or folded within the body thereof. This and the other Autumneall kindes, presently after their sowing in Autumne, shoote forth leaues, and so abide all the Winter, according to their kinde.

Varietas.

6. *Cyclamen folio hederae autumnale*. Iuie leaved Sowebread.

The Iuie leaved Sowebread groweth in the same manner that the former doth, that is, bringeth forth flowers with the leaues sometimes, or most commonly before them, whose flowers are greater then the common round leaved Sowebread, somewhat longer then the former Romane or Italian Sowebreads, and of a paler purple colour, almost bluish, without that sweete sent as is in the first kinde of the Spring: the greene leaues hereof are more long then round, pointed at the ends, and hauing also one or two corners on each side, sometimes much spotted on the vpper side with white spots and marks, and sometimes but a little or not at all; and so likewise sometimes more or lesse purple vnderneath: all the leaues and flowers doe stand vsually euery one seuerally by themselves, vpon their owne slender foote-stalkes, as most of all the other kindes doe: but sometimes it happeneth, that both leaues and flowers are found growing from one and the same stalke, which I rather take to be accidentall, then naturall so to continue: the seede hereof is like the former kindes, which being sowne produceth variety, both in the forme of the leaues, and colour and smell of the flowers: some being paler or deeper, and some more or lesse sweete then others: the leaues also, some more or lesse cornered then others: the root groweth to be great, being round and flat, and of a blackish browne colour on the outside.

Varietas.

7. *Cyclamen autumnale hederaefolio flore albo*.
Iuie leaved Sowebread with white flowers.

There is one of this kinde, whose leaues are rounder, and not so much cornered as the former, flowering in Autumne as the last doth, and whose flowers are wholly white, not hauing any other notable difference therein.

8. *Cyclamen autumnale angustifolium*. Long leaved Sowebread.

This kinde of Sowebread may easily be knowne from all the other kindes, because his leafe is longer and narrower then others, fashioned at the bottome thereof with points, somewhat like vnto *Arum* or Wake Robin leaues: the flowers are like the former sorts for forme, but of a purple colour. There is also another of this kinde in all things like the former, but that the flowers are white.

9. *Cyclamen Antiochenum Autumnale flore purpureo duplici*.
Double flowred Sowebread of Antioch.

This Sowebread of Antioch with double flowers, hath his leanes somewhat round, like vnto the leaues of the Summer Sowebread, but with lesse notches or corners, & full of white spots on them: it beareth flowers on stalks, like vnto others, & likewise some stalks that haue two or three flowers on them, which are very large, with ten or twelue leaues

1. *Cyclamen Vernum flore purpurea* Purple flowered Sowbread of the Spring. 2. *Cyclamen africanum* Summer Sowbread. 3. *Folium Cyclaminis* (Creticum) *nalis boreocandida*. A leaf of Candie Sowbread. 4. *Cyclamen Romanum Autumnale* Roman Sowbread of the Autumn. 5. *Cyclamen hederifolium* *Autumnale* long leaved Autumn Sowbread. 6. *Folium Cyclaminis Autumnalis* *var. alba*. A leaf of the white flowered Autumn Sowbread. 7. *Folium Cyclaminis angustifolium* *Autumnale*. A leaf of the long leaved Sowbread. 8. *Cyclamen Antiochenum* *Autumnale* fine ample purple double flowered. The double flowered Sowbread of Antioch. 9. *Cyclamen virens* *discolor*. The common round leaved Sowbread.

leaves a peece, of a faire Peach colour, like vnto the flowers of purple Sowebread of the Spring, and deeper at the bottome.

There are of this kinde some, whose flowers appeare in the Spring, and are as large and double as the former, but of a pure white colour.

There are of these Sowebreads of Antioch, that haue but single flowers, some appearing in the Spring, and others in Autumne.

10. *Cyclamen vulgare folio rotundo*. The common Sowebread.

The common Sowebread (which is most vsed in the Apothecaries Shops) hath many leaves spread vpon the ground, rising from certaine small long heads, that are on the greater round rootes, as vsually most of the former sorts doe, being in the like manner folded together, and after spread themselves into round Greene leaves, somewhat like vnto the leaves of *Asarum*, but not shining, without any white spots on the vpper side for the most part, or but very seldome, and reddish or purplish vnderneath, and very seldome greener: the flowers stand vpon small foot-stalkes, and shew themselves open for the most part, before any leaves doe appeare, being smaller and shorter then those with liue leaves, and of a pale purple colour, yet sometimes deeper, hanging downe their heads, and turning vp their leaves againe, as all others doe, but more sweete then many other of the Autumne flowers: after the flowers are past, come the heads turning or winding themselves downe in like manner as the other do, hauing such like seede, but somewhat larger, and more vneuen, or not so round at the least: the roote is round, and not flat, of a browner colour, and not so blacke on the outside as many of the others.

The Place.

The Sowebreads of the Spring doe both grow on the Pyrenæan Mountaines in Italy, and in Candy, and about Mompelier in France; Antioch in Syria also hath yeelded some both of the Spring and Autumne. Those with round and liue leaves grow in diuers places both of France and Italy: and the common in Germany, and the Lowe-Countries. But that Autumne Sowebread with white flowers, is reported to grow in the Kingdome of Naples. I haue very curiously enquired of many, if euer they found them in any parts of England, neare or farther off from the places where they dwell: but they haue all affirmed, that they neuer found, or euer heard of any that haue found of any of them. This onely they haue assured, that there groweth none in the places, where some haue reported them to grow.

The Time.

Those of the Spring doe flower about the end of Aprill, or beginning of May. The other of the Summer, about the end of Iune or in Iuly. The rest some in August, and September, others in October.

The Names.

The Common Sowebread is called by most Writers in Latine, *Pania Porcinus*, and by that name it is knowne in the Apothecaries shops, as also by the name *Arbanita*, according to which name, they haue an ointment so called, which is to be made with the iuice hereof. It is also called by diuers other names, not pertinent for this discourse. The most vsuall name, whereby it is knowne to most Herbarists, is *Cyclamen* (which is the Greeke word) or as some call it *Cyclaminus*, adding thereunto their other seuerall titles. In English, Sowebread.

The Vertues.

The leaves and rootes are very effectuell for the spleene, as the Ointment before remembred plainly proueth, being vsed for the same purpose, and

and that to good effect. It is vsed also for women in long and hard trauels, where there is danger, to accelerate the birth, either the roote or the leafe being applyed. But for any amorous effects, I hold it meere fabulous.

CHAP. XXV.

Anemone. Windflower and his kindes.

THe next tuberous rooted plants that are to follow (of right in my opinion) are the *Anemones* or Windflowers, and although some tuberous rooted plants, that is, the *Asphodils*, *Spiderworts*, and *Flower deluces* haue bene before inserted, it was, both because they were in name or forme of flowers sutable to them whom they were ioyned vnto, and also that they should not be seuered and entreated of in two seuerall places: the rest are now to follow, at the least so many of them as be beautifull flowers, fit to furnish a Florists Garden, for natures delightfull varieties and excellencies. To distinguish the Family of *Anemones* I may, that is, into the wilde kindes, and into the tame or mannured, as they are called, and both of them nourished vp in Gardens; and of them into those that haue broader leaues, and into those that haue thinner or more jagged leaues: and of each of them, into those that beare single flowers, and those that beare double flowers. But to describe the infinire (as I may so say) variety of the colours of the flowers, and to giue to each his true distinction and denomination, *Hic labor, hoc opus est*, it farre passeth my ability I confesse, and I thinke would grauell the best experienced this day in Europe (and the like I said concerning Tulipas, it being as contingent to this plant, as is before said of the Tulipa, to be without end in yeelding varieties:) for who can see all the varieties that haue sprung from the sowing of the seede in all places, feeling the variety of colours risen from thence, is according to the variety of ayres & grounds wherein they are sowne, skill also helping nature in ordering them aright. For the seede of one and the same plant sowne in diuers ayres and grounds, doe produce that variety of colours that is much differing one from another; who then can display all the mixtures of colours in them, to set them downe in so small a roome as this Book? Yet as I haue done (in the former part of this Treatise) my good will, to expresse as many of each kinde haue come to my knowledge, so if I endeavour the like in this, I hope the courteous will accept it, and hold me excused for the rest: otherwise, if I were or could be absolute, I should take from my self and others the hope of future augmentation, or addition of any new, which neuer will be wanting. To begin therefore with the wilde kindes (as they are so accounted) I shall first entreate of the *Pulsatillas* or Pasque flowers, which are certainly kindes of wilde *Anemones*, both in leafe and flower, as may well be discerned by them that are iudicious (although some learned men haue not so thought, as appeareth by their writings) the rootes of them making one speciall note of difference, from the other sorts of wilde *Anemones*.

1. *Pulsatilla Anglica purpurea*. The purple Pasque flower.

The Pasque or Passe flower which is of our owne Country, hath many leaues lying on the ground, somewhat rough or hairie, hard in feeling, and finely cut into many small leaues, of a darke Greene colour, almost like the leaues of Carrets, but finer and smaller, from among which rise vp naked stalkes, rough or hairie also, set about the middle thereof with some small diuided leaues compassing them, and rising aboue these leaues about a spanne, bearing euery one of them one pendulous flower, made of six leaues, of a fine Violet purple colour, but somewhat deepe withall, in the middle whereof stand many yellow threds, set about a middle purple pointell: after the flower is past, there commeth vp in the stead thereof a bushie head of long seedes, which are small and hoarie, hauing at the end of euery one a small haire, which is gray likewise: the roote is small and long, growing downewards into the ground, with a tuft of haire at the head thereof, and not lying or running vnder the vpper crust thereof, as the other wilde *Anemones* doe.

2. *Pulsatilla Danica*. The Passe flower of Denmarke.

There is another that was brought out of Denmarke, very like vnto the former, but that it is larger both in roote and leafe, and flower also, which is of a fairer purple colour, not so deepe, and besides, will better abide to bee mannured then our English kinde will, as my selfe haue often proued.

*Viridique flore
albo & flore
duplex.*

Of both these sorts it is said, that some plants haue bin found, that haue borne white flowers. And likewise one that bore double flowers, that is, with two rowes of leaues.

3. *Pulsatilla flore rubro*. The red Passe flower.

Lobel, as I take it, did first set forth this kinde, being brought him from Syria, the leaues whereof are finer cut, the flower smaller, and with longer leaues, and of a red colour.

4. *Pulsatilla flore luteo*. The yellow Passe flower.

The yellow Passe flower hath his leaues cut and diuided, very like vnto the leaues of the first kinde, but somewhat more hairie, Greene on the vpper side, and hairie vnderneath: the stalke is round and hoary, the middle whereof is beset with some small leaues, as in the other, from among which riseth vp the stalke of the flower, consisting of six leaues of a very faire yellow colour on the inside, and of a hoary pale yellow on the outside, after which followeth such an head of hairie thrummes as in the former: the roote is of the bignesse of a mans finger.

5. *Pulsatilla flore albo*. The white Passe flower.

The white Passe flower (which Clusius maketh a kinde of *Anemone*, and yet as hee saith himselfe, doth more nearely resemble the *Pulsatilla*) hath, from amongst a tuft or head of haire, which grow at the toppe of a long blacke roote, many leaues standing vpon long stalkes, which are diuided as it were into three wings or parts, and each part finely cut and diuided, like vnto the Passe flower of Denmarke, but somewhat harder in handling, greenish on the vpper side, and somewhat gray vnderneath, and very hairie all ouer: among these leaues rise vp the stalkes, beset at the middle of them with three leaues, as finely cut and diuided as those belowe, from aboue which standeth the flower, being smaller, and not so pendulous as the former, but in the like manner consisting of six leaues, of a snow white colour on the inside, and a little browner on the outside, with many yellow thrums in the middle: after the flower is past, riseth vp such a like hoary head, composed as it were of many haire, each whereof hath a small seede fastened vnto it, like as the former Passe flowers haue.

The Place.

The first is found in many places of England, vpon dry bankes that lye open to the Sunne.

The second was first brought, as I take it, by Doctor Lobel from Denmarke, & is one of the two kinds, that Clusius saith are common in Germanie, this bearing a paler purple flower, and more early then the other, which is the same with our English, whose flower is so darke, that it almost seemeth blacke.

The red kinde, as Lobel saith, came from Syria.

The yellow Passe flower, which Clusius maketh his third wilde *Anemone*, was found very plentifully growing at the foote of St. Bernards Hill, neare vnto the Cantons of the Switzers.

The white one groweth on the Alpes neare Austria, in France likewise, and other places.

The Time.

All of them doe flower early in the yeare, that is, in the beginning of Aprill, about which time most commonly Easter doth fall.

The Names.

Their proper names are giuen to each in their senerall titles, being all of them kindes of wilde *Anemones*, as I said in the beginning of the Chapter, and so for the most part all Authors doe acknowledge them. We call them in English, because they flower about Easter, Pasque Flower, which is the French name for Easter, or *Enphonia gratia*, Passe Flower, which may passe currant, without any further descant on the name, or else *Pulsatilla*, if you will, being growne old by custome.

The Vertues.

The sharpe biting and exulcerating quality of this plant, causeth it to be of little vse, notwithstanding Ioachimus Camerarius saith in his *Hortus Medicus*, that in Borussia, which is a place in Italy, as I take it, the distilled water hereof is vsed with good successe, to be giuen to them that are troubled with a Tertian Ague; for he saith that it is *medicamentum inapertum*, that is, a medicine of force to helpe obstructions.

Anemone siluestris latifolia alba sine tertia Matthioli.

The white wilde broad leaved Windflower.

This Windflower hath diuers broad greene leaues, cut into diuisions, and dented about, very like vnto a broad leaved Crowfoote, among which riseth vp a stalke, hauing some such like cut leaues in the middle thereof, as growe below, but smaller; on the toppe whereof standeth one large white flower, consisting of fise leaues for the most part, with some yellow threads in the middle, standing about such a greene head as is in the tame or garden *Anemones*, which growing greater after the flower is past, is composed of many small feedes, wrapped in white wooll, which as soone as they are ripe, raise themselves vp from the bottome of the head, and flye away with the winde, as the other tame or garden kindes doe: the roote is made of a number of long blacke strings, encreasing very much by running vnderground, and shooting vp in diuers places.

Anemone siluestris tenuifolia lutea. The yellow wilde thin leaved Windflower.

The yellow wilde *Anemone* riseth vp with one or two small round naked stalkes, bearing about the middle of them, small, soft, and tender jagged leaues, deeply cut in and indented on the edges about, from aboue which doth grow the stalke, bearing small yellow flowers, standing vpon weake foote-stalkes, like vnto a small Crowfoot, with some threads in the middle: the roote is long and small, somewhat like vnto the roote of Pollipodie, creeping vnder the vpper crust of the earth: this kinde is lower, and springeth somewhat earlier then the other wilde kindes that follow.

Anemone siluestris tenuifolia alba simplex.

The single white thin leaved wilde Windflower.

This white wilde *Anemone* riseth vp with diuers leaues vpon seuerall long stalkes, which are somewhat like vnto the former, but that they are somewhat harder, and not so long; nor the diuisions of the leaues so finely snipt about the edges, but a little broader, and deeper cut in on euery side: the flowers hereof are larger and broader then the former, white on the inside, and a little purplish on the outside, especially at the

the bottome of the flower next vnto the stalke: the roote of this is very like vnto the last.

There is another of this kinde, whose flowers are purple; in all other things it is like vnto the white.

And likewise another, with a blush or carnation coloured flower.

*Cotonea sine
stamine rubens.*

There is one that is onely nursed vp with vs in Gardens, that is somewhat like vnto these former wilde *Anemones* in roote and leafe, but that the flower of this, being pure white within, and a little purplish without, consisting of eight or nine small round pointed leaues, hath sometimes some leaues vnder the flower, party coloured white and Greene: the flower hath likewise a Greene head, like a Strawberry, compassed about with white threads, tipped with yellow pendants.

Peregrina alba.

And another of the same kinde with the last, whose flower consisting of eight or nine leaues, is of a greenish colour, except the foure outermost leaues, which are a little purplish, and diuided at the points into three parts; the middle part is of a greenish white colour, with a Greene head in the middle as the other.

*Peregrina viri-
dis.*

Anemone siluestris trifolia Dodonai. The three leaved wilde Windflower.

This wilde *Anemone* hath his rootes very like vnto the former kindes; the leaues are alwaies three set together at the toppe of slender stalkes, being small and indented about, very like vnto a three leaved Grasse, but smaller: the flower consisteth of eight small leaues, somewhat like vnto a Crowfoote, but of a whitish purple or blush colour, with some white threads, and a Greene rough head in the middle.

Anemone siluestris flore pleno albo. The double white wilde Windflower.

This double kinde is very like vnto the single white kinde before described, both in his long running rootes, and thin leaues, but somewhat larger: the flowers hercof are very thicke and double, although they be small, and of a faint sweete sent; very white after it is full blowne for five or six dayes, but afterwards it becommeth a little purplish on the inside, but more on the outside: this neuer giueth seede (although it haue a small head in the middle) like as many other double flowers doe.

Anemone siluestris flore pleno purpureo. The double purple wilde Windflower.

This double purple kinde hath such like iagged leaues as the last described hath, but more hoarie vnderneath: the flower is of a fine light purple toward the points of the leaues, the bottomes being of a deeper purple, but as thicke, and full of leaues as the former, with a Greene head in the middle, like vnto the former: this kinde hath small Greene leaues on the stalkes vnder the flowers, cut and diuided like the lower leaues.

The Place.

The first broad leaved *Anemone* groweth in diuers places of Austria and Hungary. The yellow in diuers woods in Germany, but not in this Countrey that euer I could learne. The other single wilde kindes, some of them are very frequent throughout the most places of England, in Woods, Groues, and Orchards. The double kindes were found, as Clusius saith, in the Lowe-Countries, in a Wood neare Louaine.

The Time.

They flower from the end of March (that is the earliest) and the beginning of Aprill, vntill May, and the double kindes begin within a while after the single kinds are past.

The Names.

They are called *Ranunculi siluarnum*, and *Ranunculi nemorosum*, and as Clusius

sius would haue them, *Leimonia* of Theophrastus; they are generally called of most Herbarists *Anemones fluefres*, Wilde *Anemones* or Windflowers. The Italians call them *Gengeno saluatico*; that is, Wilde Ginger, because the rootes are, besides the forme, being somewhat like small Ginger, of a biting hot and sharpe taste.

Anemone Lusitanica sine hortensis latifolia flore simplici luteo.

The single Garden yellow Windflower or Anemone.

This single yellow Anemone or Windflower hath diuers broad round leaues, somewhat diuided and endented withall on the edges, brownish at the first rising vp out of the ground, and almost folded together, and after of a sad Greene on the vpper side, and reddish vnderneath; among which rise vp small slender stalkes, beset at the middle of them with two or three leaues, more cut and diuided then those belowe, with small yellow flowers at the toppe of them, consisting of ten or twelue leaues a peece, hauing a few yellow threads in the middle of them, standing about a small Greene head, which in time growing ripe hath small flat seede, inclosed within a soft wooll or downe, which is easily blowne away with the winde: the roote groweth downward into the ground, diuersly spread with branches here and there, of a brownish yellow on the outside, and whitish within, so brittle, that it can hardly bee touched without breaking.

Anemone latifolia flore luteo duplici. The double yellow Anemone or Windflower.

This double yellow Anemone hath such broad round leaues as the single kinde hath, but somewhat larger or ranker: the stalkes are beset with larger leaues, more deeply cut in on the edges: the flowers are of a more pale yellow, with some purplish veines on the outside, and a little round, pointed; but they are all on the inside of a faire yellow colour, consisting of two rowes of leaues, whereof the innermost is the narrower, with a small Greene head in the middle, compassed with yellow threads as in the former: the roote is like the roote of the single; neither of these haue any good sent, and this springeth vp and flowreth later then the single kinde.

Anemone latifolia purpurea stellata sine papaveracea.

The purple Starre Anemone or Windflower.

The first leaues of this purple Anemone, which alwayes spring vp before Winter, (if the roote be not kept too long out of the ground,) are somewhat like the leaues of *Sanicle* or *Selfe-heale*, but the rest that follow are more deeply cut in and jagged; among which rise vp diuers round stalkes, beset with jagged leaues as all other Anemones are, about which leaues, the stalkes rising two or three inches high, beare one flower a peece, composed of twelue leaues or more, narrow and pointed, of a bleake purple or whitish ash-colour, somewhat shining on the outside, and of a fine purple colour tending to a murrey on the inside, with many blackish blew threads or thrummes in the middle of the flower, set about a head, whereon groweth the seede, which is small and blacke, inclosed in soft wooll or downe, which flieth away with the winde, carrying the seede with it, if it be not carefully gathered: the roote is blackish on the outside, and white within, tuberous or knobby, with many fibres growing at it.

Anemone purpurea Stellata altera. Another purple Starre Anemone.

There is so great diuersity in the colours of the flowers of these broad leaved kinds of Anemones or Windflowers, that they can very hardly be expressed, although in their leaues there is but little or no difference. I shall not neede therefore to make seuerall descriptions of euery one that shall be set downe, but it will be sufficient, I thinke, to giue you the distinctions of the flowers: for as I said, therein is the greatest and chiefest difference. This other Starre Anemone differeth not from the former in leaf or flower, but onely that this is of a more pale fullen colour on the outside, and of a paler purple colour on the inside.

There

1. *Anemone latifolia flore luteo simplici*. The single yellow Anemone. 2. *Anemone latifolia flore luteo duplici*. The double yellow Anemone. 3. *Anemone latifolia flore purpureo stellato*. The purple Starre Anemone. 4. *Anemone latifolia purpurea dilutior*. The pale purple Starre Anemone. 5. *Anemone latifolia flore miniata diluta*. The pale red Anemone. 6. *Anemone latifolia encincta Cardinali diluta*. The Cardinall Anemone. 7. *Anemone latifolia incarnata Hispanica*. The Spanish incarnate Anemone. 8. *Anemone latifolia Pans simplex diluta*. The lesser Orange tawney Anemone. 9. *Anemone latifolia flore carnosa*. The carnation Anemone. 10. *Anemone latifolia Arantica flore pleno major*. The double Orange tawney Anemone. 11. *Anemone latifolia flore pleno albicante*. The double pale bluish Anemone. 12. *Anemone latifolia flore pleno albicante*. The double pale bluish Anemone. 13. *Anemone Chalcidica maxima*. The great Spanish Marigold Anemone. 14. *Anemone Coccinea flore pleno*. The double Persian Anemone. 15. *Anemone latifolia a radice*. The roots of a great Anemone.

- Viola purpurea* There is another, whose flower hath eight leaues, as many of them that follow haue (although diuers sorts haue but six leaues in a flower) and is of a Violet purple, and therefore is called, The Violet purple Anemone.
- Varietas.* Of all these three sorts last described, there be other that differ only in hauing white bottomes, some smaller and some larger.
- Purpurea striata.* There is also another of the same Violet purple colour with the former, but a little paler, tending more to rednesse, whose flowers haue many white lines and stripes through the leaues, and is called, The purple stript Anemone.
- Carnea vivaciissima simplex.* There is another, whose greene leaues are somewhat larger, and so is the flower likewise, consisting of eight leaues, and sometimes of more, of the colour of Carnation silke, sometimes pale and sometimes deeper, with a whitish circle about the bottome of the leaues, which circle in some is larger, and more to be seene then in others, when the flower layeth it selfe open with the heate of the Sunne, hauing blewish threads in the middle. This may be called, the Carnation Anemone.
- Persiciviolacea.* We haue another, whose flower is betweene a Peach colour and a Violet, which is vsually called a Gredeline colour.
- Cochinilla.* And another of a fine reddish Violet or purple, which we call, The Cochenille Anemone.
- Cardinalis.* And another of a rich crimson red colour, and may be called, The Cardinall Anemone.
- Sanguinea.* Another of a deeper, but not so liuely a red, called, The blood red Anemone.
- Criminea.* Another of an ordinary crimson colour, called, The crimson Anemone.
- Coccinea.* Another of a Stamell colour, neere vnto a Scarlet.
- Incarnata.* Another of a fine delayed red or flesh colour, and may bee called, The Incarnadine Anemone.
- Incarnata Hispanica.* Another whose flower is of a liuely flesh colour, shadowed with yellow, and may be called, The Spanish Incarnate Anemone.
- Rubescens.* Another of a faire whitish red, which we call, The Blush Anemone.
- Stochitella.* Another whose flower consisteth of eight leaues, of a darke whitish colour, stript all ouer with veines of a fine blush colour, the bottomes being white, this may be called, The Nutmegge Anemone.
- Esfumata.* Another whose flower is of a pale whitish colour, tending to a gray, such as the Monkes and Friers were wont to weare with vs, and is called, A Monkes gray.
- Pauo maior simplici flore.* There is another, whose leafe is somewhat broader then many or most of the Anemones, comming neare vnto the leafe of the great double Orenge coloured Anemone; the flower whereof is single, consisting of eight large or broad leaues, very neare vnto the same Orenge colour, that is in the double flower hereafter described, but somewhat deeper. This is vsually called in Latine, *Pauo maior simplici flore*, and we in English, The great single Orenge tawne Anemone.
- Pauo minor.* There is likewise of this kinde another, whose flower is lesser, and called, The lesser Orenge tawne Anemone.
- Varietas maxima ex semine.* There is besides these expressed, so great a variety of mixt colours in the flowers of this kinde of Anemone with broad leaues, arising euery yeare from the sowing of the seede of some of the choicest and fittest for that purpose, that it is wonderfull to obserue, not onely the variety of single colours, but the mixture of two or three colours in one flower, besides the diuersity of the bottomes of the flowers, some hauing white or yellowish bottomes, and some none, and yet both of the same colour; and likewise in the thrums or threads in the middle: But the greatest wonder of beauty is in variety of double flowers, that arise from among the other single ones, some hauing two or three rowes of leaues in the flowers, and some so thicke of leaues as a double Marigold, or double Crowfoote, and of the same seuerall colours that are in the single flowers, that it is almost impossible to expresse them seuerally, and (as is said before) some falling out to bee double in one yeare, which will proue single or lesse double in another,

other, yet very many abiding constant double as at the first; and therefore let this briefe recitall be sufficient in stead of a particular of all the colours.

Anemone Chalcedonica maxima versicolor.

The great double Windflower of Constantinople.

This great Anemone of Constantinople hath broader and greener leaues then any of the former kindes, and not so much diuided or cut in at the edges, among which rise vp one or two stalkes, (seldome more from one roote) hauing some leaues about the middle of the stalke, as other Anemones haue, and bearing at the toppes of the stalkes one large flower a peece, very double, whose outermost leaues being broadest, are greenish at the first, but afterwards red, hauing sometimes some Greene abiding still in the leaues, and the red striped through it: the other leaues which are within these are smaller, and of a perfect red colour; the innermost being smallest, are of the same red colour, but turned somewhat inward, hauing no thrummes or threads in the middle, as the former haue, and bearing no feede: the roote is blackish on the outside, and white within, thicke and tuberous as the other kindes, but thicker set and close together, not shooting any long slender rootes as others doe. Some Gentlewomen call this Anemone, The Spanish Marigold.

Anemone Chalcedonica altera sive Pano maior flore duplici.

The great double Orange tawney Anemone.

This other great Anemone of Constantinople hath his large leaues so like vnto the last, that one can hardly distinguish them asunder; the stalke hath also such like leaues set vpon it, bearing at the toppe a faire large flower, consisting of many leaues set in two or three rowes at the most, but not so thicke or double as the last, yet seeming to be but one thicke rowe of many small and long leaues, of an excellent red or crimson colour, wherein some yellow is mixed, which maketh that colour is called an Orange tawney; the bottomes of the leaues are red, compassed with a whitish circle, the thrumme head in the middle being beset with many darke blackish threads: the roote is like the former.

Anemone Superitica sive Cyparissia. The double Anemone of Cyprus.

This Anemone (which the Dutchmen call Superitz, and as I haue beene enformed, came from the Isle of Cyprus) hath leaues very like the last double Anemone, but not altogether so large: the flower consisteth of smaller leaues, of colour very neare vnto the last double Orange coloured Anemone, but more thicke of leaues, and as double as the first, although not so great a flower, without any head in the middle, or thrums about it as is in the last, and differeth not in the roote from either of them both.

Somewhat like vnto this kinde, or as it were betwene this and the first kinde of these great double Anemones, we haue diuers other sorts, bearing flowers very thicke and double; some of them being white, or whitish, or purple, deeper or paler, and some of a reddish colour tending to Scarlet or a Carnation colour, and some also of a blush or flesh colour, and diuers other colours, and all of them continue constant in their colours.

Anemone Cacumeni Maringi sive Persica. The double Persian Anemone.

This rare Anemone, which is said to come out of Persia to Constantinople, and from thence to vs, is in leafe and roote very like vnto the former double Anemones before described; onely the flower hereof is rather like vnto the second great double Orange coloured Anemone, vsually called *Pano maior flore pleno*, being composed of three rowes of leaues, the outermost rowe consisting of ten or twelue larger leaues, and those more inward lesser and more in number, but all of them variably mixed with white, red, and yellow, hauing the bottomes of the leaues white: but instead of a middle head with thrums about it, as the other hath, this hath a few narrow leaues, of a deepe yellow colour in the middle of the flower, standing vp right,

Having thus farre proceeded in the two parts of the kindes of Anemones or Wind-flowers, it remaineth to entreate of the rest, which is those Anemones which haue thin cut leaues, whereof some haue reckoned vp thirty sorts with single flowers, which I confesse I haue not seene, but so many as haue come to my knowledge, I shall here set downe.

Anemone tenuifolia sine Geranifolia caerulea.

The Watchet Anemone or Storkes bill leaved Windflower.

This first Windflower with thin cut leaues, riseth not out of the ground vntil the great Winter frosts be past, that is, about the middle or end of February, and are somewhat brownish at their first appearing, but afterwards spread into wings of greene leaues, somewhat broader then the rest that follow, diuided into three parts, & each part into three leaues, euery one cut in about the edges, one standing against another vpon a long slender foote-stalke, and the end leafe by it selfe: among these riseth vp two or three greene stalkes, garnished with such like thin leaues as are at the bottome, from about which rise the flowers, but one vpon a stalke, consisting of fourteene or fifteene small pale blew or watchet leaues, lesser then any of the single kindes that follow, compassing many whitish threads, and a small greene head in the middle, somewhat like the head of the wilde Crowfoote, wherein is contained such like seede: the roote is blackish without, thrusting out into long tuberous peeces, somewhat like vnto some of the broad leaved Anemones.

Of this kinde there is another, whose leaues are not browne at their first rising, but greene, and the flowers are white, in other things not differing.

Anemone tenuifolia purpurea vulgaris.

The ordinary purple Anemone with thin leaues.

This purple Anemone which is most common, and therefore the lesse regarded, hath many winged leaues standing vpon seuerall stalkes, cut and diuided into diuers leaues, much like vnto the leaues of a Carrot; among which rise vp stalkes with some leaues thereon (as is vsuall to the whole Family of Anemones, both wilde and tame, as is before said;) at the toppes whereof stand the flowers, made of six leaues most vsuall, but sometimes they will haue seuen or eight, being very large, and of a perfect purple Violet colour, very faire and liuely: the middle head hath many blackish thrums or threads about it, which I could neuer obserue in my Gardens to beare seed: the roote is smaller, and more spreading euery way into small long flat tuberous parts, then any other kindes of single or double Anemones.

carnea pallida. There is another very like in leafe and roote vnto the former, but the flower is nothing so large, and is whitish, tending to a blush colour, and of a deeper blush colour toward the bottome of the flower, with blackish blew thrums in the middle, and giueth no seede that I could euer obserue.

carnea virida
viridibus alba. There is likewise another like vnto the last in leafe and flower, but that the flower is larger then it, and is of a liuely blush colour, the leaues hauing white bottomes.

Alba venis pur-
pureis. And another, whose flower is white, with purple coloured veines and stripes through euery leafe, and is a lesser flower then the other.

Anemone tenuifolia coccinea simplex. The single Scarlet Anemone with thin leaues.

The leaues of this Scarlet Windflower are somewhat like vnto the former, but a little broader, and not so finely cut and diuided: the flower consisteth of six reasonable large leaues, of an excellent red colour, which we call a Scarlet; the bottomes of the leaues are large and white, and the thrums or threads in the middle of a blackish purple colour: the roote is tuberous, but consisting of thicker peeces, somewhat like vnto the rootes of the broad leaved Anemones, but somewhat browne, and not so blacke, and most like vnto the roote of the double Scarlet Anemone.

Coccinea absqz
viridibus. There is another of this kinde, whose flower is neare vnto the same colour, but this hath no white bottomes at all in his leaues.

Flora holosericea.

We haue another which hath as large a flower as any single, and is of an Orient deepe red crimson Veluet colour.

Sanguinea.

There is another of a deeper red colour, and is called, The bloud red single Anemone.

Eubrafando lutea.

And another, whose flower is red with the bottomes yellow.

Coccinea dilutior.

Another of a perfect crimson colour, whereof some haue round pointed leaues, and others sharpe pointed, and some a little lighter or deeper then others.

Alba flaminibus purpureis.

There is also one, whose flower is pure white with blewish purple thrums in the middle.

Cerulea hispida.

And another, whose flower is very great, of a kinde of fullen blush colour, but yet pleasant, with blewish threads in the middle.

Alba carnea uena.

And another with blush veines in euery leafe of the white flower.

Alba purpurea uenibus.

And another, the flower whereof is white, the bottomes of the leaues being purple.

Purpurascens.

Another whose flower consisteth of many small narrow leaues, of a pale purple or blush colour on the outside, and somewhat deeper within.

Facie florum pomi simplex.

There is another like in leafe and roote vnto the first Scarlet Anemone, but the flower hereof consisteth of seuen large leaues without any bottomes, of a white colour, hauing edges, and some large stripes also of a carnation or flesh colour to bee scene in them, marked somewhat like an Apple blossome, and thereupon it is called in Latine, *Anemone tenuifolia simplex alba instar florum pomi*, or *facie florum pomi*, that is to say in English, The single thin leaved Anemone with Apple blossome flowers.

Multiplex.

I haue heard that there is one of this kinde with double flowers.

1. *Anemone tenuifolia flore coccineo pleno vulgaris.*

The common double red or Scarlet Anemone.

The leaues of this double Anemone are very like vnto the leaues of the single Scarlet Anemone, but not so thin cut and diuided as that with the purple flower: the flower hereof when it first openeth it selfe, consisteth of six and sometimes of seuen or eight broad leaues, of a deepe red, or excellent Scarlet colour, the middle head being thick closed, and of a greenish colour, which after the flower hath stood blowne some time, doth gather colour, and openeth it selfe into many small leaues, very thicke, of a more pale red colour, and more Stamell like then the outer leaues: the root of this is thicke and tuberous, very like vnto the root of the single Scarlet Anemone.

2. *Anemone tenuifolia flore coccineo pleno variegata.*

The party coloured double Crimson Anemone.

We haue a kinde hereof, varying neither in roote, leafe, or forme of flower from the former, but in the colour, in that this will haue sometimes the outer broad leaues party coloured, with whitish or blush coloured great streakes in the red leaues both inside and outside, as also diuers of the middle or inner leaues striped in the same manner: the roote hereof giueth fairer flowers in some yeares then in others, and sometimes giue flowers all red againe.

3. *Anemone tenuifolia flore coccineo saturo pleno.*

The double crimson Veluet Anemone.

We haue another also, whose flower is of a deepe Orenge tawny crimson colour, neare vnto the colour of the outer leaues, of the lesser French Marigold, and not differing from the former in any thing else.

4. *Anemone tenuifolia flore pleno suauerbente.* The greater double blush Anemone.

There is small difference to be discerned, either in the roote or leaues of this from

the former double Scarlet Anemone, sauing that the leaues hereof are a little broader, and seeme to bee of a little fresher Greene colour: the flower of this is as large almost, and as double as the former, and the inner leaues likewise almost as large as they, being of a whitish or flesh colour at the first opening of them, but afterwards become of a most liuely bluish colour; the bottomes of the leaues abiding of a deeper bluish, and with long standing, the tops of the leaues will turne almost wholly white againe.

5. *Anemone tenuifolia flore albo pleno.* The double white Anemone.

This double white Anemone differeth little from the former bluish Anemone, but in that it is smaller in all the parts thereof, and also that the flower hereof being wholly of a pure white colour, without any shew of bluish therein, hath the middle thrummes much smaller and shorter then it, and not rising vp so high, but seeme as if they were chipped off euen at the toppes.

6. *Anemone tenuifolia flore pleno albicante.* The lesser double bluish Anemone.

This small double bluish Anemone differeth very little from the double white last recited, but onely in the colour of the flower: for they are both much about the bignesse one of another, the middle thrums likewise being as small and short, and as euen aboue, onely the flower at the first opening is almost white, but afterwards the outer leaues haue a more shew of bluish in them, and the middle part a little deeper then they.

7. *Anemone tenuifolia flore pleno purpureo violaceo.* The double purple Anemone.

This double purple Anemone is also of the same kindred with the first double red or Scarlet Anemone for the form or doublenesse of the flower, consisting but of six or seuen leaues at the most in this our Country, although in the hotter it hath ten or twelue, or more as large leaues for the outer border, and as large small leaues for the inner middle also, and almost as double, but of a deepe purple tending toward a Violet colour; the outer leaues being not so deepe as the inner: the roote and leafe cometh neare vnto the single purple Anemone before described, but that the roote spreadeth not so small and so much.

8. *Anemone tenuifolia flore pleno purpureo carneo.*
The double blew Anemone.

This Anemone differeth not in any thing from the former double purple, but onely that the flower is paler, and more tending to a blew colour.

9. *Anemone tenuifolia flore pleno roseo.* The double Rose coloured Anemone.

The double Rose coloured Anemone differeth also in nothing from the former double purple, but onely in the flower, which is somewhat smaller, and not so thicke and double, and that it is of a reddish colour, neare vnto the colour of a pale red Rose, or of a deepe coloured Damaske.

10. *Anemone tenuifolia flore pleno carneo vinacissimo.*
The double Carnation Anemone.

This Anemone, both in roote, leafe, and flower, cometh nearest vnto the former double white Anemone, for the largenesse and doublenesse of the flower, and in the smalnesse of the middle thrums, and euennesse at the toppes of them, being not so large and great a flower as the double purple, either in the inner or outer leaues, but yet is very faire, thicke and double, and of a most liuely Carnation silke colour, very deepe, both the outer leaues and middle thrums also so bright, that it doth as it were amaze, and yet delight the minde of the beholder, but by long standing in the Sun, waxe a little paler, and so passe away as all the most beautifull flowers doe.

1. *Anemone tenuifolia simplex purpurea*. The single purple Anemone with thin cut leaves. 2. *Anemone tenuifolia simplex alba pura*. The single pure white Anemone. 3. *Anemone tenuifolia simplex chrysina*. The single bright Crimson Anemone. 4. *Anemone tenuifolia simplex sanguinea*. The single blood red Anemone. 5. *Anemone tenuifolia simplex variegatum purp.* The single Apple blossom Anemone. 6. *Anemone tenuifolia simplex purpurea*. The single purple Anemone. 7. *Anemone tenuifolia simplex alba variegata carnea*. The single white Anemone with bluish bottom. 8. *Anemone tenuifolia flore plena carnea*. The double red or ordinary Scarlet Anemone. 9. *Anemone tenuifolia flore plena rubro-purpurea*. The double purple Anemone. 10. *Anemone tenuifolia flore plena purpureo violaceo*. The double blue with purple Anemone. 11. *Anemone tenuifolia flore plena incarnadina ceteris ferè vivacissimi*. The double Carnation Anemone, or of a lively Carnation like colour.

11. *Anemone tenuifolia flore rubrofusco pleno coma Amarantina.*
The double purple Veluet Anemone.

This double Veluet Anemone is in all things like the last described Carnation Anemone, but somewhat larger, the difference consisteth in the colour of the flower, which in this is of a deep or sad crimson red colour for the outer leaues, and of a deep purple Veluet colour in the middle thrums, resembling the colour of the lesser *Amaranthum purpureum*, or Purple flower gentle hereafter described, whereof it tooke the name, which middle thrums are as fine and small, and as euen at the toppes as the white or last Carnation Anemones.

12. *Anemone tenuifolia flore pleno tricolor.*
The double purple Veluet Anemone of three colours.

This double Anemone also is very like the last described Anemone, but that in the middle of the purple thrums, there thrusteth forth a tuft of threads or leaues of a more light crimson colour.

And thus much for the kindes of Anemones or Windflowers, so farre forth as haue hitherto come to our knowledge; yet I doubt not, but that more varieties haue beene elsewhere collected, and will be also in our Countrey daily and yearly obserued by diuers, that raise them vp from sowing the seede, wherein lyeth a pretty art, not yet familiarly knowne to our Nation, although it be very frequent in the Lowe-Countries, where their industry hath bred and nourished vp such diuersities and varieties, that they haue valued some Anemones at such high rates, as most would wonder at, and none of our Nation would purchase, as I thinke. And I doubt not, if wee would be as curious as they, but that both our ayre and soyle would produce as great variety, as euer hath been seene in the Lowe-Countries; which to procure, if any of our Nation will take so much paines in sowing the seedes of Anemones, as diuers haue done of Tulipas: I will set them downe the best directions for that purpose that I haue learned, or could by much search and tryall attaine vnto; yet I must let them vnderstand thus much also, that there is not so great variety of double flowers raised from the seede of the thin leaved Anemones, as from the broad leaved ones.

First therefore (as I said before) concerning Tulipas, there is some speciall choice to be made of such flowers, whose seed is fittest to be taken. Of the *Latifolias*, the double Orenge tawney seede being sowne, yeeldeth pretty varieties, but the purples, and reds, or crimsons, either *Latifolias* or *Tenuifolias*, yeeld small variety, but such as draw nearest to their originall, although some be a little deeper or lighter then others. But the light colours be they which are the chiefe for choice, as white, ash-colour, bluish or carnation, light orange, simple or party coloured, single or double, if they beare seede, which must bee carefully gathered, and that not before it bee thorough ripe, which you shall know by the head; for when the seede with the woollinesse beginneth to rise a little of it selfe at the lower end, it must bee then quickly gathered, lest the winde carry it all away. After it is thus carefully gathered, it must be laid to dry for a weeke or more, which then being gently rubbed with a little dry sand or earth, will cause the seede to be somewhat better separated, although not thoroughly from the woollinesse or downe that compasseth it.

Within a moneth at the most after the seede is thus gathered and prepared, it must be sowne; for by that meanes you shall gaine a yeare in the growing, ouer that you should doe if you sowed it in the next Spring.

If there remaine any woollinesse in the seede, pull it in sunder as well as you can, and then sowe your seede reasonable thin, and not too thicke, vpon a plaine smooth bed of fine earth, or rather in pots or tubbes, and after the sowing, sift or gently straw ouer them some fine good fresh mould, about one fingers thickeesse at the most for the first time: And about a moneth after their first springing vp, sift or straw ouer them in like manner another fingers thickeesse of fine earth, and in the meane time if the weather proue dry, you must water them gently and often, but not to ouerglut them with moisture; and thus doing, you shall haue them spring vp before Winter, and grow

grow pretty strong, able to abide the sharpe Winter in their nonage, in vsing some little care to couer them loosely with some fearn, or furse, or beane hame, or straw, or any such, which yet must not lye close vpon them, nor too farre from them neither.

The next Spring after the sowing, if you will, but it is better if you stay vntill August, you may then remoue them, and set them in order by rowes, with sufficient distance one from another, where they may abide, vntill you see what manner of flower each plant will beare, which you may dispose of according to your minde.

Many of them being thus ordered (if your mould be fine, loose, and fresh, not stonie, clayish, or from a middin) will beare flowers the second yeare after the sowing, and most or all of them the third yeare, if the place where you sowe them, be not annoyed with the smoake of Brewers, Dyers, or Maultkils, which if it be, then will they neuer thriue well.

Thus much haue I thought good to set downe, to incite some of our owne Nation to be industrious; and to helpe them forward, haue giuen such rules of directions, that I doubt not, but they will vpon the tryall and view of the variety, proceede as well in the sowing of Anemones as of Tulipas.

I cannot (Gentlewomen) withhold one other secret from you, which is to informe you how you may so order Anemones, that after all others ordinarily are past, you may haue them in flower for two or three moneths longer then are to be seene with any other, that vseth not this course I direct you.

The ordinary time to plant Anemones, is most commonly in August, which will beare flower some peraduenture before Winter, but most vsually in February, March, and Aprill, few or none of them abiding vntill May; but if you will keepe some roots out of the ground vnplanted, vntill February, March, and Aprill, and plant some at one time, and some at another, you shall haue them beare flower according to their planting, those that shall be planted in February, will flower about the middle or end of May, and so the rest accordingly after that manner: And thus may you haue the pleasure of these plants out of their naturall seasons, which is not permitted to be enjoyed in any other that I know, Nature being not so prone to bee furthered by art in other things as in this. Yet regard, that in keeping your Anemone rootes out of the ground for this purpose, you neither keep them too dry, nor yet too moist, for sprouting or rotting; and in planting them, that you set them not in too open a sunny place, but where they may be somewhat shadowed.

The Place.

I shall not need to spend much time in relating the seuerall places of these Anemones, but onely to declare that the most of them that haue not bene raised from seed, haue come from Constantinople to vs; yet the first broad leaved or yellow Anemone, was first found in Portugall, and from thence brought into these parts. And the first purple Starre Anemone in Germanie, yet was the same sent among others from Constantinople also: And the first thin cut leaved Anemone came first out of Italy, although many of that sort haue come likewise from Constantinople. And so haue the double red or Scarlet Anemones, and the great double bluish, which I first had by the gift of M^r. Humfrey Packington of Worcestershire Esquire, at Haruington.

The Time.

The times of their flowring are sufficiently expressed in the descriptions, or in the rules for planting.

The Names.

The Turkish names whereby the great double broad leaved kindes haue bene sent vnto vs, were *Giul Catamer*, and *Giul Catamer lale*; And *Binizade*, *Binizante*, and *Galipoli lale* for the thinne cut leaved Anemones. All Authors haue called them *Anemones*, and are the true *Herba venti*.

We

Wee call them in English eyther Anemones, after the Greeke name, or Windflowers, after the Latine.

The Vertues.

There is little vse of these in Physicke in our dayes, eyther for inward or outward diseases; onely the leaues are vsed in the Ointment called *Marcia- sum*, which is composed of many other hot herbes, and is vsed in cold griefes, to warme and comfort the parts. The roote, by reason of the sharpenesse, is apt to drawe downe rheume, if it be tasted or chewed in the mouth.

CHAP. XXVI.

Aconitum. Wolfesbane.

THere be diuers sorts of Wolfesbanes which are not fit for this booke, but are reserued for a generall History or Garden of Simples, yet among them there are some, that notwithstanding their euill quality, may for the beauty of their flowers take vp a roome in this Garden, of whom I meane to entreate in this place: And first of the Winter Wolfesbane, which for the beauty, as well as the earlinesse of his flowers, being the first of all other, that shew themselves after Christmas, deserueth a prime place; and therefore for the likenesse of the rootes vnto the Anemones, I ioyned it next vnto them.

1. *Aconitum Hyemale*. The Winters Wolfesbane.

This little plant thrusteth vp diuers leaues out of the ground, in the deepe of Winter oftentimes, if there be any milde weather in January, but most commonly after the deepe frosts, bearing vp many times the snow vpon the heads of the leaues, which like vnto the Anemone, doe euery leafe rise from the roote vpon seuerall short foote-stalkes, not aboue foure fingers high, some hauing flowers in the middle of them, (which come vp first most vsually) and some none, which leaues stand as it were round, the stalke rising vp vnder the middle of the leafe, deeply cut in and gashed to the middle stalke almost, of a very faire deepe Greene colour, in the middle whereof, close vnto the leafe, standeth a small yellow flower, made of six leaues, very like a Crowfoote, with yellow threads in the middle: after the flower is fallen, there rise vp diuers small hornes or cods set together, wherein are contained whitish yellow round feede. The roote is tuberous, so like both for shape and colour vnto the rootes of Anemones, that they will easily deceiue one not well experienced, but that it is browner and smother without, and yellow within, if it be broken.

2. *Aconitum flore albio, sine Aconitum latente Ponticum*. The whitish yellow Wolfesbane.

This Wolfesbane shooteth not out of the ground vntill the Spring be well begun, and then it sendeth forth great broad Greene leaues, deeply cut in about the edges, not much vnlike the leaues of the great wilde Crowfoote, but much greater; from among which leaues riseth vp a strong stiffe stalke, three foote high, hauing here and there leaues set vpon it, like vnto the lowest, but smaller; the toppe of the stalke is diuided into three or foure branches, whereon are set diuers pale yellow flowers, which turne at the last to be almost white, in fashion like almost vnto the flowers of the Helmet flower, but much smaller, and not gaping so wide open: after the flowers are past come vp diuers short poddes, wherein is contained blacke feede: the roote is made of a number of darke browne strings, which spread and fasten themselves strongly in the ground.

3. *Napellus*

3. *Napellus verus flore ceruleo*. Blew Helmet flower or Monkes hood.

The Helmet flower hath diuers leaues of a fresh greene colour on the vpperfide, and grayish vnderneath, much spread abroad and cut into many flits and notches, more then any of the Wolfebanes; the stalke riseth vp two or three foot high, beset to the top with the like leaues, but smaller: the toppe is sometimes diuided in two or three branches, but more vsually without, whereon stand many large flowers one aboue another, in forme very like vnto a Hood or open Helmet, being composed of five leaues, the vppermost of which and the greatest, is hollow, like vnto an Helmet or Headpeece, two other small leaues are at the sides of the Helmet, closing it like cheekes, and come somewhat vnder, and two other which are the smallest hang down like labels, or as if a close Helmet were opened, and some peeces hung by, of a perfect or faire blew colour, (but grow darker hauing stood long) which caueth it be so nourished vp in Gardens, that their flowers, as was vsual in former times, and yet is in many Countrey places, may be laid among greene herbes in windowes and roomes for the Summer time: but although their beauty may be entertained for the vses afore-said, yet beware they come not neare your tongue or lippes, lest they tell you to your cost, they are not so good as they seeme to be: in the midst of the flower, when it is open and gapeth wide, are seene certaine small threads like beards, standing about a middle head, which when the flower is past, groweth into three or foure, or more small blackish pods, containing in them blacke seede: the rootes are brownish on the outside, and white within, somewhat bigge and round aboue, and small downewards, somewhat like vnto a small short Carrot roote, sometimes two being ioyned at the head together. But the name *Napellus* anciently giuen vnto it, doth shew they referred the forme of the roote vnto a small Turnep.

Anthora. The wholsome Helmet flower, or counterpoison Monkes hood.

This wholsome plant I thought good to insert, not onely for the forme of the flower, but also for the excellent properties thereof, as you shall haue them related hereafter. The rootes hereof are small and tuberous, round and somewhat long, ending for the most part in a long fibre, and with some other small threads from the head downeward: from the head whereof riseth vp diuers greene leaues, euery one seuerally vpon a stalke, very much diuided, as finely almost as the leaues of Larkes heeles or spurres: among which riseth vp a hard round stalke, a foote high and better, with some such leaues thereon as grow belowe, at the toppe whereof stand many small yellowish flowers, formed very like vnto the former whitish Wolfesbane, bearing many blacke feedes in pods afterwards in the like manner.

Many more sorts of varieties of these kindes there are, but these onely, as the most specious, are nourished vp in Florists Gardens for pleasure; the other are kept by such as are Catholicke obseruers of all natures store.

The Place.

All these grow naturally on Mountaines, in many shadowie places of the Alpes, in Germany, and elsewhere.

The Time.

The first flowreth (as is said) in Ianuary, and February, and sometimes vntill March be well spent, and the seede is soone ripe after.

The other three flower not vntill Iune and Iuly.

The Names.

The first is vsually called *Aconitum byemale Belgarum*. Lobelius calleth it *Bulbosus*.

Bulbosus unifolius Batrachoides, *Aconitum Elæboraceum*, and *Ranunculus Monophyllus*, and some by other names. Most Herbarists call it *Aconitum hyemale*, and we in English thereafter, Winters Wolfesbane; and of some, Yellow Aconite.

The second is called by most Writers, *Aconitum latum Ponticum*: Some also *Lupicida*, *Luparia*, and *Canicida*, of the effect in killing Wolves and Dogs: And some, because the flower is more white then yellow, doe call it *Aconitum flore albido*, we call it in English, The whitish yellow Aconite, or Wolfesbane, but some after the Latine name, The yellow Wolfesbane.

The third is called generally *Napellus*, and *Vernus*, because it is the true *Napellus* of the ancient Writers, which they so termed from the forme of a Turnep, called *Napus* in Latine.

The fourth is called *Aconitum Salutiferum*, *Napellus Moysis*, *Antora* and *Anthora*, quæst *Antithora*, that is, the remedy against the poisonfull herbe *Thora*, in English according to the title, cyther wholsome Helmet flower, or counterpoison Monkes hood.

The Vertues.

Although the first three sorts of plants be very poisonfull and deadly, yet there may bee very good vse made of them for sore eyes (being carefully applyed, yet not to all sorts of sore eyes neither without discretion) if the distilled water be dropped therein.

The rootes of the counterpoison Monkes hood are effectuall not onely against the poison of the poisonfull Helmet flower, and all others of that kinde, but also against the poison of all venemous beasts, the plague or pestilence, and other infectious diseases, which raise spots, pockes, or markes in the outward skinne, by expelling the poison from within, and defending the heart as a most soueraigne Cordiall. It is vsed also with good successe against the wormes of the belly, and against the paines of the Wind collick.

CHAP. XXVII.

Ranunculus. The Crowfoote.

NExt vnto the Aconites, of right are to follow the *Ranunculi*, or Crowfeete, for the nearenesse both of forme, of leaues, and nature of the plants, although lesse hurtfull, yet all of them for the most part being sharpe and exulcerating, and not without some danger, if any would be too bold with them. The whole Family of the *Ranunculi* is of a very large extent, and I am constrained within the limits of a Garden of Pleasure; I must therefore select out onely such as are fit for this purpose, and set them here downe for your knowledge, leauing the rest for that other generall worke, which time may perfect and bring to light, if the couetous mindes of some that should be most affected towards it, doe not hinder it: or if the helpe of generous spirits would forward it.

1. *Ranunculus montanus albus humilior*. The lowe white mountaine Crowfoot.

This lowe Crowfoote hath three or foure broad and thicke leaues, almost round, yeta little cut in and notched about the edges, of a fine Greene and shining colour on the vpper side, and not so green vnderneath, among which riseth a small short stalke, bearing one snow white flower on the toppe, made of fise round pointed leaues, with diuers yellow threads in the middle, standing about a Greene head, which in time groweth to be full of seede, in forme like vnto a small Greene Strawberry: the roote is composed of many white strings.

Duplici flore.

There is another of this lowe kinde, whose leaues are somewhat more deeply cut in on the edges, and the flower larger, and sometimes a little double, as it were with two rowes of leaues, in other things not differing from the former.

2. *Ranunculus*

2. *Ranunculus montanus albus maior vel elatior.*
The great single white mountaine Crowfoote.

The leaues of this Crowfoote are large and Greene, cut into three, and sometimes into five speciall diuisions, and each of them besides cut or notched about the edges, somewhat resembling the leaues of the Globe Crowfoote, but larger: the stalke is two foote and a halfe high, hauing three small leaues set at the ioynt of the stalke, where it brancheth out into flowers, which stand foure or five together vpon long foote-stalkes, made of five white leaues a peece, very sweete, and somewhat larger, then the next white Crowfoote, with some yellow threads in the middle compassing a Greene head, which bringeth feede like vnto other wilde Crowfoete: the roote hath many long thicke whitish strings, comming from a thicke head.

3. *Ranunculus montanus albus minor.* The lesser single white Crowfoote.

This Crowfoote hath faire large spread leaues, cut into five diuisions, and somewhat notched about the edges, Greene on the vpper side, and paler vnderneath, hauing many veines running through the leaues: the stalke of this riseth not so high as the former, although this be reasonable tall, as being neare two foote high, spread into many branches, bearing such like white flowers, as in the former, but smaller: the feede of this is like the former, and so are the rootes likewise.

4. *Ranunculus albus flore pleno.* The double white Crowfoot.

The double white Crowfoote is of the same kinde with the last single white Crowfoote, hauing such like leaues in all respects: the onely difference is in the flowers, which in this are very thicke and double. Some doe make mention of two sorts of double white Crowfoete, one somewhat lower then another, and the lower likewise bearing more store of flowers, and more double then the higher, but I confesse, I haue neuer seene but one sort of double, which is the same here expressed, not growing very high, and reasonably well stored with flowers.

5. *Ranunculus præcox Rutefolius sive Coriandris folio.*

The early Coriander leaved Crowfoote.

This Crowfoote hath three or foure very Greene leaues, cut and diuided into many small peece, like vnto the wing of leaues of Rue, or rather like the lower leaues of the Coriander (for they well resemble either of them) euery of them standing vpon a long purplish stalke, at the toppe whereof groweth the flower alone, being composed or made of twelue small white leaues, broad pointed, and a little indented at the ends, somewhat purplish on the outside, and white on the inside, sustained by diuers small Greene leaues, which are in stead of a cup or huske: in the middle of the flower are many small white threads, tipped with yellow pendants, standing about a small Greene head, which after groweth to bee full of feedes like a Strawberry, which knobs giue small blackish feede: the roote is white and fibrous.

6. *Ranunculus Thalictris folio maior.* The great colombine leaved Crowfoot.

The lower leaues of this Crowfoote haue long stalkes, and are very like vnto the smaller leaues of Colombyne, or the great Spanish *Thalictrum*, which hath his leaues very like vnto a Colombyne, foure or five rising from the roote: the stalke riseth about a foote and a halfe high, somewhat reddish, beset here and there with the like leaues, at the toppe whereof stand diuers small white flowers, made of five leaues a peece, with some pale white threads in the middle: the feede is round and reddish, contained in small huskes or hornes: the roote is made of a bush or tuft of white strings.

7. *Ranunculus Thalictrifolius minor Asphodeli radice.*
The small white Colombine leaved Crowfoote.

This small Crowfoote hath three or foure winged leaues spread vpon the ground, standing vpon long stalkes, and consisting of many small leaues set together, spreading from the middle ribbe, every leafe somewhat resembling both in shape and colour the smallest and youngest leaues of Colombines: the flowers are white, standing at the toppe of the stalkes, made of five round leaues: the root hath three or foure thick, short, and round yellowish clogs hanging at the head, like vnto the Asphodill roote. The great Herball of Lyons, that goeth vnder the name of *Dalechampsius*, saith, that Dr. Myconus found it in Spaine, and sent it vnder the name of *Oenanthe*; and therefore Ioannes Molineus who is thought to haue composed that booke, set it among the umbelliferous plants, because the *Oenanthes* beare vmbels of flowers and seede, and haue tuberous or cloggy rootes; but with what iudgement, let others say, when they haue compared the vmbels of flowers and seede of the *Oenanthes*, with the flowers and seede of this plant, and whether I haue not more properly placed it among the *Ranunculi* or Crowfeete, and giuen it a denomination agreeable to his forme.

8. *Ranunculus Globosus.* The Globe Crowfoot.

This Crowfoote (which in the Northerne countries of England where it groweth plentifully, is called Locker goulous) hath many faire, broad, darke greene leaues next the ground, cut into five, sixe, or seuen diuisions, and iagged besides at the edges, among which riseth vp a stalke, whereon are set such like leaues as are belowe, but smaller, diuided toward the toppe into some branches, on the which stand seuerall large yellow flowers, alwayes folded inward, or as a close flower neuer blowing open, as other flowers doe, consisting of eleuen leaues for the most part, set or placed in three rowes, with many yellow threads in the middle, standing about a greene rough head, which in time groweth to be small knops, wherein are contained blacke seede: the roote is composed of many blackish strings.

9. *Ranunculus pratensis flore multiplici.* The double yellow field Crowfoot.

There is little or no difference in the leaues of this double Crowfoot, from these of the single kinds that growe in euery medowe, being large and diuided into foure or five parts, and indented about the edges, but they are somewhat smaller, and of a fresher greene: the flowers stand on many branches, much diuided or separated, being not very great, but very thicke and double: the roote runneth and creeperth vnder ground like as the single doth.

10. *Ranunculus Anglicus maximus multiplex.*

The Garden double yellow Crowfoot or Batchelours buttons.

This great double Crowfoote, which is common in euery Garden through England, hath many great blackish greene leaues, iagged and cut into three diuisions, each to the middle ribbe: the stalkes haue some smaller leaues on them, and those next vnder the branches long and narrow: the flowers are of a greenish yellow colour, very thicke and double of leaues, in the middle whereof riseth vp a small stalke, bearing another double flower, like to the other, but smaller: the roote is round, like vnto a small white Turnep, with diuers other fibres annexed vnto it.

11. *Ranunculus Gramineus.* Grasse leaved Crowfoot.

The leaues of this Crowfoote are long and narrow, somewhat like vnto Grasse, or rather like the leaues of single Gilloflowers or Pinckes, being small and sharpe pointed, a little hollow, and of a whitish greene colour: among these leaues rise vp diuers slender stalkes, bearing one small flower at the toppe of each, consisting of five yellow leaues,

1. *Asclepias Hyemalis*. Winter Wolfshane. 2. *Asclepias flos albidus flos latum* Ponticum. The whitish yellow Wolfshane. 3. *Asclepias verna*. Blue Helmers or Monks hood. 4. *Asclepias*. The counterpoison Monks hood. 5. *Ranunculus acris* albus simplex. The single white Crow foot. 6. *Ranunculus acris* albus duplex. The double white Crow foot. 7. *Ranunculus acris* albus simplex. The single white Crow foot. 8. *Ranunculus montanus* albus. The great single white mountain Crow foot. 9. *Ranunculus montanus* albus simplex. The double white mountain Crow foot. 10. *Ranunculus Thalictrum* minor. The lesser Colchicine leaved Crow foot. 11. *Ranunculus flammula*. The globe Crow foot.

leaves, with some threads in the middle: the roote is composed of many thicke, long, round white strings.

There is another of this kinde that beareth flowers with two rowes of leaves, as if it were double, differing in nothing else.

12. *Ranunculus Lusitanicus Autumnalis*. The Portugall Autumne Crowfoote.

This Autumne Crowfoote hath diuers broad round leaves lying on the ground, set vpon short foote-stalkes, of a faire Greene colour aboue, and grayish vnderneath, snipt all about the edges, hauing many veines in them, and sometimes swelling as with blisters or bladders on them; from among which rise vp two or three slender and hairy stalkes, bearing but one small yellow flower a peece, consisting of fve and sometimes of six leaves, and sometimes of seuen or eight, hauing a few threads in the middle, set about a small Greene head, like vnto many of the former Crowfeete, which bringeth small blacke feede: the roote is made of many thicke short white strings, which seeme to be grumous or kernelly rootes, but that they are somewhat smaller, and longer then any other of that kinde.

13. *Ranunculus Creticus latifolius*. The broad leaved Candy Crowfoote.

This Crowfoote of Candy, hath the greatest and broadest leaves of all the sorts of Crowfeete, being almost round, and without any great diuisions, but onely a few notches about the edges here and there, as large or larger sometimes then the palme of a mans hand; among which riseth vp the stalke, not very high when it doth first flower, but afterwards, as the other flowers doe open themselues, the stalke groweth to be a foote and a halfe high, or thereabouts, hauing some leaves on it, deeply cut in or diuided, and bearing many faire yellow flowers, consisting of fve leaves a peece, being somewhat whitish in the middle, when the flower hath stood blowne a little time: the roote is composed of a number of small kernelly knobs, or long graines, set thicke together. This flowreth very early, being vsually in flower before the end of March, and oftentimes about the middle thereof.

14. *Ranunculus Creticus albus*. The white Candy Crowfoote.

The leaves of this Crowfoote are very like vnto the leaves of the red Crowfoote of Tripoli or Asia, hereafter set downe, being somewhat broad and indented about the edges, some of the leaves being also cut in or gashed, thereby making it as it were three diuisions, of a pale Greene colour, with many white spots in them: the stalke riseth vp a foote high, with some leaves on it, more diuided then the lower, and diuided at the toppe into two and sometimes into three branches, each of them bearing a faire snow white flower, somewhat large, included at the first in a brownish huske or cup of leaves, which after wards stand vnder the flowers, consisting of fve white large round pointed leaves, in the middle whereof is set many blackish purple thrums, compassing a small long Greene head, composed of many scales or chaffe whitish huskes, when they are ripe, which are the feede, but vnprofitable in all that euer I could obserue: the rootes are many small graines or kernels, set together as in the former, and much about the same colour, that is, of a darke or duskie grayish colour, but much smaller.

*Alba purpureis
orbis & venis.*

There is another of this kinde, whose flowers haue purple edges, and sometimes some veines of the same purple in the leaves of the flowers, not differing in any other thing from the former.

*Alba orbis ru-
bric.*

And another, whose edges of the flowers are of a bright red colour.

15. *Ranunculus Creticus flore argenteo*. The Argentine, or cloth of siluer Crowfoote.

The Greene leaves of this Crowfoote are as small and thinne, cut in or diuided on the edges, as the last two sorts; the stalke riseth vp somewhat higher, and diuided into some branches, bearing at the toppe of euery of them one flower, somewhat smaller then the former, composed of six, seuen, and sometimes of eight small round pointed leaves,

1 *Ranunculus acris* flore simplici & duplici. The single and the double yellow Crowfoot. 2 *Ranunculus Lufitanicus autumnalis*. The Portugal Autumn Crowfoot. 3 *Ranunculus creticus latifolius*. The broad leaved Candy Crowfoot. 4 *Ranunculus Anglicus maximus multiplex*. The double English Crowfoot. 5 *Ranunculus praeniflorus multiplex*. The double yellow field Crowfoot. 6 *Ranunculus creticus albus*. The white Candy Crowfoot. 7 *Ranunculus Asiaticus flore albo vel pallido variegato*. The white or the straw coloured Crowfoot with red top or edge. 8 *Ranunculus Tripolitani* flore rubro simplici. The single red Crowfoot of Tripoli. 9 *Ranunculus Asiaticus flore rubra ample*. The large single red Crowfoot of Asia. 10 *Ranunculus Asiaticus flore rubra pleno*. The double red Crowfoot of Asia. 11 *Caltha palustris flore pleno*. Double Marsh Marigold or Batchelours buttons.

leaves, of a whitish yellow bluish colour on the inside wholly, except sometimes a little stript about the edges: but the outside of every leafe is finely stript with crimson stripes, very thicke, somewhat like vnto a Gilloflower: in the middle riseth vp a small blacke head, compassed about with blackish blew threads or thrums, which head is as vnfruitfull for seede in our Countrey as the former. This flower hath no such Greene leaues vnder it, or to enclose it before it be blowne open as the former: the rootes are in all things like the former.

16. *Ranunculus Asiaticus sine Tripolitanus flore rubro.*
The single red Crowfoote of Asia or Tripoli.

The lower leaues of this red Crowfoote are alwayes whole without diuisions, being onely somewhat deeply indented about the edges, but the other that rise after them are more cut in, sometimes into three, and sometimes into five diuisions, and notched also about the edges: the stalke riseth higher then any of the former, and hath on it two or three smaller leaues, more cut in and diuided then those belowe: at the toppe whereof standeth one large flower, made of five leaues, every one being narrower at the bottome then at the toppe, and not standing close and round one to another, but with a certaine distance betweene, of a duskie yellowish red colour on the outside, and of a deepe red on the inside, the middle being set with many thrums of a darke purple colour: the head for seede is long, and scaly or chaffie, and idle in like manner as the rest: the roote is made of many graines or small kernels set together, and closing at the head, but spreading it selfe, if it like the ground, vnder the vpper crust of the earth into many rootes, encreasing from long strings, that runne from the middle of the small head of graines, as well as at the head it selfe.

17. *Ranunculus Asiaticus flore amplo rubro.* The large single red Crowfoot of Asia.

There hath come to vs out of Turkie, together with the former, among many other rootes, vnder the same title, a differing sort of this Crowfoote, whose leaues weare broader, and much goaler; the flower also larger, and the leaues thereof broader, sometimes eight in a flower, standing round and close one to another, which maketh the fairer shew: in all other things it is like the former.

18. *Ranunculus Asiaticus flore rubro vario simplici.*
The red stript single Crowfoote of Asia.

This party coloured Crowfoote differeth not eyther in roote or leafe from the former, the chiefest difference is in the flower, which being red, somewhat like the former, hath yet some yellow stripes or veines through every leafe, sometimes but little, and sometimes so much, that it seemeth to bee party coloured red and yellow: this sort is very tender; for we haue twice had it, and yet perished with vs.

19. *Ranunculus Asiaticus flore luteo vario simplici.*
The yellow stript single Crowfoote of Asia.

There is little difference in the roote of this Crowfoote from the last described, but the leaues are much different, being very much diuided, and the flower is large, of a fine pale greenish yellow colour, consisting of six and seuen, and sometimes of eight or nine round leaues; the toppes whereof haue reddish spots, and the edges sometimes also, with such purplish thrums in the middle that the other haue. None of these former Crowfoote with kernelly rootes, haue euer beene found to haue giuen so good seed in England, as that being sowne, any of them would spring vp; for hercof tryall hath been often made, but all they haue lost their labour, that haue bestowed their paines therein, as farre as I know.

20. *Ranunculus Asiaticus flore rubro pleno.*
The double red Crowfoote of Asia.

The double red Crowfoote hath his rootes and leaues so like vnto the single red kinde, that none can perceiue any difference, or know the one from the other, vntill the budde of the flower doe appeare, which after it is any thing forward, may be perceiued to be greater and fuller then the budde of the single kinde. This kinde beareth most vsually but one faire large double flower on the toppe of the stalke, composed of many leaues, set close together in three or foure rowes, of an excellent crimson colour, declining to Scarlet, the outter leaues being larger then the inner; and in stead of thrummes, hath many small leaues set together: it hath likewise six small narrow Greene leaues on the backside of the flower, where the stalke is fastened to the flower.

There is of this double kinde another sort, whose flower is of the same colour with the former, but out of the middle of the flower ariseth another double flower, but smaller. *Polifero flore.*

The Place.

These plants grow naturally in diuers Countries; some in France, and Germany, and some in England, some in Spaine, Portugall, and Italy, and some have been sent out of Turkie from Constantinople, and some from other parts, their titles for the most part descrying their Countries.

The Time.

Some of them flower early, as is set downe in their descriptions, or titles. The others in Aprill and May. The white Candy Crowfoote, and the other single and double sorts of Asia, about the same time, or somewhat later, and one in Autumne, as it is set downe.

The Names.

The names that are giuen severally to them may well serue this worke, that thereby they may bee distinguished one from another: For to set downe any further controuersie of names, how fitly or vnfitly they haue beene called, and how variably by diuers former Writers, is fitter for a generall History, vnto which I leaue what may be said, both concerning these and the rest: Onely this I would giue you to vnderstand, that the Turkie kindes haue been sent to vs vnder the names of *Terabolas* for the single, and *Terabolas Catamerale* for the double, and yet oftentimes, those that haue been sent for double, haue proued single, so little fidelity it to bee found among them.

The Vertues.

All or most of these plants are very sharpe and exulcerating, yet the care and industry of diuers learned men haue found many good effects in many of them. For the rootes and leaues both of the wilde kindes, and of some of these of the Garden, stamped and applyed to the wrists, haue driuen away the fits in Feuers. The roote likewise of the double English kinde is applyed for pestilent sores, to helpe to breake them, by drawing the venome to the place. They helpe likewise to take away scarres and markes in diuers places of the body.

CHAP. XXVIII.

Caltha palustris flore pleno. Double Marsh Marigold.

AS an appendix to the Crowfeete, I must needs adde this plant, yet severally by it selfe, because both it and his single kinde are by most adioyned thereunto, for the neare resemblance both in shape and sharpnesse of quality. The single kinde I leaue to the Ditch sides, and moist grounds about them, as the fittest places for it, and onely bring the double kinde into my Garden, as fittest for his goodly proportion and beauty to be entertained, and haue place therein.

The double Marsh Marigold hath many broad and round greene leaues, a little indented about the edges, like vnto the single kinde, but not altogether so large, especially in a Garden where it standeth not very moist: the stalkes are weake, round, hollow, and greene, diuided into three or foure branches at the toppe, with leaues at the feuerall ioyns, whereon stand very double flowers, of a gold yellow colour: the five outer leaues being larger then any of the rest that are encompassed by them, which fall away after they haue stood blowne a great while (for it endureth in flower a month or more, especially if it stand in a shadowie place) without bearing any seed: the rootes are composed of many thicke, long, and round whitish strings, which runne downe deep into the ground, and there are fastened very strongly.

The Place.

This plant groweth naturally in diuers Marshes, and moist grounds in Germany, yet in some more double then in others; it hath long agoe beene cherished in our Gardens.

The Time.

It flowreth in Aprill or May, as the yeare proueth earlier or later: all his leaues doe in a manner quite perish in Winter, and spring anew in the end of February, or thereabouts.

The Names.

There is great controuersie among the learned about the single kinde, but thereof I shall not neede to speake in this place, if God permit I may in a fitter. This is called generally in Latine, *Caltha palustris multiplex*, or *flore pleno*. And wee in English (after the Latine, which take *Caltha* to be that which wee vsually call *Calendula*, a Marigold) The double Marsh Marigold.

The Vertues.

The roote hercof is sharpe, comming neare vnto the quality of the Crowfeete, but for any speciall property, I haue not heard or found any.

CHAP. XXIX.

Hepatica nobilis sine trifolia. Noble Liverwort.

NExt vnto the Crowfeete are to follow the Hepaticas, because of the likenesse with them, seeming to be small Crowfeete in all their parts, but of another and more wholsome kinde. Their diuersity among themselves consisteth chiefly in the colour of the flowers, all of them being single, except one which is very thicke and double.

1. *Hepatica flore caruleo simplici maior.*

The great single blew Hepatica or noble Liverwort.

The flowers of this Hepatica doe spring vp, blow open, and sometimes shed and fall away, before any leaues appeare or spread open. The rootes are composed of a bush of blackish strings, from the centre all heads or buttons whereof, after the flowers are risen and blowne, arise many fresh Greene leaues, each seuerally standing vpon his foot-stalke, folded together, and somewhat browne and hairy at their first coming, which after are broad, and diuided at the edges into three parts: the flowers likewise stand every one vpon his owne seuerall foote-stalke, of the same height with the leaues for the most part, which is about foure or fve fingers breadth high, made of six leaues most vsually, but sometimes it will haue seuen or eight, of a faire blew colour, with many white chiuies or threads in the middle, standing about a middle green head or vmbone, which after the flower is fallen groweth greater, and sheweth many small graines or feedes set close together (with three small Greene leaues compassing them vnderneath, as they did the flower at the bottome) very like the head of seed of manie Crowfeete.

2. *Hepatica minor flore pallido caruleo.* The small blew Hepatica.

The leaues of this Hepatica are smaller by the halfe then the former, and grow more abundantly, or bushing thicke together: the flowers (when it sheweth them, for I haue had the plant halfe a score yeares, and yet neuer saw it beare flower aboue once or twice) are of a pale or bleake blew colour, not so large as the flowers of the former.

3. *Hepatica flore purpurea.* Purple Hepatica or noble Liverwort.

This Hepatica is in all things like vnto the first, but onely the flowers are of a deeper blew tending to a Violet purple: and therefore I shall not neede to reiterate the former description.

4. *Hepatica flore albo minor.* The lesser white Hepatica.

The flowers of this Hepatica are wholly white, of the bignesse of the red or purple, and the leaues somewhat smaller, and of a little whiter or paler Greene colour, else in all other things agreeing with the former.

5. *Hepatica alba magno flore.* The great white Hepatica.

There is no other difference herein from the last, but that the flower being as white, is as large as the next.

6. *Hepatica albida sine argentea.* Ash-coloured or Argentine Hepatica.

Both the leaues and the flowers of this Hepatica are larger then any of the former, except the last: the flowers hereof at the first opening seeme to bee of a of bluish ash-colour, which doe so abide three or foure dayes, decaying still vntill it turne almost white,

white, hauing yet still a shew of that bluish ash-colour in them, till the very last.

7. *Hepatica alba straminibus rubris*. White Hepatica with red threads.

There is no difference between this Hepatica and the first white one, sauing that the threads in the middle of the flower, being white, as in the former, are tipped at the ends with a pale reddish colour, which adde a great beauty to the flowers.

8. *Hepatica flore rubra*. Red Hepatica or noble Liuerwort.

The leaues of this Hepatica are of a little browner red colour, both at their first comming vp, and afterwards, especially in the middle of the leafe more then any of the former: the flowers are in forme like vnto the rest, but of a bright bluish, or pale red colour, very pleasant to behold, with white threads or chiuies in the middle of them.

9. *Hepatica flore purpurea multiplici sine pleno*. The double purple Hepatica.

The double Hepatica is in all things like vnto the single purple kinde, sauing onely that the leaues are larger, and stand vpon longer foote-stalkes; and that the flowers are small buttons, but very thicke of leaues, and as double as a flower can be, like vnto the double white Crowfoote before described, but not so bigge, of a deepe blew or purple colour, without any threads, or head in the middle, which fall away without giuing any seede.

10. *Hepatica flore caruleo pleno*. The double blew Hepatica.

In the colour of this flower, consisteth the chiefest difference from the last, except one may say it is a little lesse in the bignesse of the flower, but not in doubleness of leaues.

The Place.

All these plants with single flowers grow naturally in the Woods, and shadowie Mountaines of Germany in many places, and some of them in Italy also. The double kinde likewise hath been sent from Alphonsus Pantius out of Italy, as Clusius reporteth, and was also found in the Woods, neare the Castle of Starnbeg in Austria, the Lady Heusenstains possession, as the same Clusius reporteth also.

The Time.

These plants doe flower very early, and are of the first flowers that shew themselves presently after the deepe frosts in Ianuary, so that next vnto the Winter Wolfeshane, these making their pride appeare in Winter, are the more welcome early guests. The double kinde flowreth not altogether so early, but sheweth his flower, and abideth when the others are past.

The Names.

They haue obtained diuers names; some calling them *Hepatica*, *Hepatica nobilis*, *Hepaticum trifolium*, *Trifolium nobile*, *Trifolium aureum*, and some *Trinitas*, and *Herba Trinitatis*. In English you may call them either Hepatica, after the Latine name, as most doe, or Noble Liuerwort, which you please.

The Vertues.

These are thought to coole and strengthen the liuer, the name importing as much; but I neuer saw any great vse of them by any the Physitians of our London Colledge, or effect by them that haue vsed them in Physicke in our Country.

1 *Hepatica flore albo amplex simplicis*. The large white Hepatica. 2 *Hepatica flore rubro simplicis*. The red Hepatica. 3 *Hepatica flore purpureo pleno*. The double purple Hepatica. 4 *Geranium tuberosum*. Knobbed Cranes bill. 5 *Geranium pinnatifidum*. The blue or white Crowfoot Cranes bill. 6 *Geranium Hematodes*. The red Rose Cranes bill. 7 *Geranium Romanum striatum*. The variable stripe Cranes bill. 8 *Geranium Creticum*. Candy Cranes bill.

CHAP. XXX.

Geranium. Storkes bill or Cranes bill.

AS was said before concerning the Crowfeet, of their large extent and restraint, the like may be said of the Storkes bills or Cranes bills; for euen of these as of them, I must for this worke set forth the descriptions but of a few, and leaue the rest to a generall worke.

1. *Geranium tuberosum vel bulbosum*. Bulbous or knobbed Cranes bill.

The knobbed Cranes hath three or foure large leaues spread vpon the ground, of a grayish or rather dusty greene colour, euery one of them being as it were of a round forme, but diuided or cut into six or seuen long parts or diuisions, euen vnto the middle, which maketh it seeme to be so many leaues, each of the cuts or diuisions being deeply notched or indented on both sides; among which riseth vp a stalke a foote high or better, bearing thereon diuers pale but bright purple flowers, made of five leaues a peece, after which come small heads with long pointed beakes, resembling the long bill of a Storke or Crane, or such like bird, which after it is ripe, parteth at the bottome where it is biggest, into foure or five seedes, euery one whereof hath a peece of the beake head fastened vnto it, and falleth away if it bee not gathered: the roote is tuberous and round, like vnto the roote of the *Cyclamen* or ordinary Sowbread almost, but smaller, and of a darke russet colour on the outside, and white within, which doth encrease vnder ground, by certaine strings running from the mother roote into small round bulbes, like vnto the rootes of the earth Chestnut, and will presently shoote leaues, and quickly grow to beare flowers, but will not abide to be kept long dry out of the ground, without danger to be vtterly spoiled.

Geranium Batrachoides flore caeruleo. The blew Crowfoote Cranes bill.

This Crowfoote Cranes bill hath many large leaues, cut into five or six parts or diuisions, euen to the bottome, and iagged besides on the edges, set vpon very long slender foote-stalkes, very like the leaues of the wilde Crowfoot; from among which rise vp diuers stalkes with great ioynts, somewhat reddish, set with leaues like the former: the toppes of the stalkes are spread into many branches, whereon stand diuers flowers, made of five leaues a peece, as large as any of the wilde or field Crowfeete, round pointed, of a faire blew or watchet colour, which being past, there doe arise such heads or bills, as other of the Cranes bills haue: the roote is composed of many reddish strings, spreading in the ground, from a head made of diuers red heads, which lye oftentimes eminent aboue the ground.

Geranium Batrachoides flore albo. The white Crowfoote Cranes bill.

This Cranes bill is in leafe and flower altogether like the former, the onely difference betweene them consisteth in the colour of the flower, which in this is wholly white, and as large as the former: but the roote of this hath not such red heads as the other hath.

Geranium Batrachoides flore albo & caeruleo vario.
The party coloured Crowfoote Cranes bill.

The flowers of this Cranes bill are variably striped and spotted, and sometimes diuided, the one halfe of euery leafe being white, and the other halfe blew, sometimes with lesser or greater spots of blew in the white leafe, very variably, and more in some years then in others, that it is very hard to expresse all the varieties that may be obserued in the flowers, that blow at one time. In all other parts of the plant, it is so like vnto the former, that vntill it be in flower, the one cannot be knowne from the other.

Geranium

5. *Geranium Batrachoides alterum flore purpureo.*

Purple Crowfoote Cranes bill.

This purple Cranes bill hath many leaues rising from the roote, set vpon long foot-stalkes, somewhat like vnto the other, yet not so broad, but more diuided or cut, that is, into seuen or more slits, euen to the middle, each whereof is likewise cut in on the edges more deeply then the former; the stalkes are somewhat knobbed at the ioynts, set with leaues like vnto the lower, and bearing a great tuft of buds at the toppes of the branches, which breake out into faire large flowers, made of five purple leaues, which doe somewhat resemble the flower of a Mallow, before it be too full blowne, each whereof hath a reddish pointell in the middle, and many small threads compassing it, this vmbell or tuft of buds doe flower by degrees, and not all at once, and euery flower abideth open little more then one day, and then sheddeth, so that euery day yeeldeth fresh flowers, which because they are so many, are a long while before they are all past or spent: after the flowers are past, there arise small beake heads or bills, like vnto the other Cranes bills, with small turning feede: the roote is composed of a great tuft of strings, fastened to a knobby head.

6. *Geranium Romanum versicolor sine striatum.* The variable stript Cranes bill.

This beautifull Cranes bill hath many broad yellowish Greene leaues arising from the roote, diuided into five or six parts, but not vnto the middle as the first kindes are: each of these leaues hath a blackish spot at the bottome corners of the diuisions, the whole leafe as well in forme as colour and spots, is very like vnto the leafe of the *Geranium fuscum*, or spotted Cranes bill, next following to be described, but that the leaues of this are not so large as the other: from among these leaues spring vp sundry stalkes a foote high and better, ioynted and knobbed here and there, bearing at the tops two or three small white flowers, consisting of five leaues a peece, so thickly & variably striped with fine small reddish veines, that no green leafe that is of that bignesse can shew so many veines in it, nor so thick running as euery leafe of this flower doth: in the middle of the flower standeth a small pointell, which when the flower is past doth grow to be the seed vessell, wheron is set diuers small seeds, like vnto the small seedes of other Cranes bills: the root is made of many small yellow threads or strings.

7. *Geranium fuscum sine maculatum.* Swart tawny or spotted Cranes bill.

The leaues of this Cranes bill are in all points like the last described, as well in the forme and diuisions as colour of the leaues, being of a yellowish Greene colour, but larger and stronger by much: the stalkes of this rise much higher, and are ioynted or knobbed with reddish knees or ioynts, on the tops whereof stand not many although large flowers, consisting of five leaues a peece, each whereof is round at the end, and a little snipt round about, and doe bend or turne themselves backe to the stalkewards, making the middle to be highest or most eminent; the colour of the flower is of a darke or deepe blackish purple, the bottome of euery leafe being whiter then the rest; it hath also a middle pointell standing out, which afterwards bring forth feede like vnto others of his kinde: the roote consisteth of diuers great strings, ioynted to a knobby head.

8. *Geranium Hematodes.* The red Rose Cranes bill.

This Cranes bill hath diuers leaues spread vpon the ground, very much cut in or diuided into many parts, and each of them againe slit or cut into two or three peeces, standing vpon slender long foote-stalkes, of a faire Greene colour all the Spring and Summer, but reddish in Autumne: among these leaues spring vp slender and weake stalkes, beset at euery ioynt (which is somewhat reddish) with two leaues for the most part, like vnto the lower: the flowers grow seuerally on the toppe of the stalkes, and not many together in bunches or branches, as in all other of the Cranes bills, euery flower being as large as a single Rose Campion flower, consisting of five large leaues,

of a deeper red colour then in any other Cranes bill at the first opening, and will change more blewish afterwards: when the flower is past, there doth arise such like beakes as are in others of the same kinde, but small: the roote is hard, long, and thicke, with diuers branches spreading from it, of a reddish yellow colour on the outside, and whitish within, which abideth and perisheth not, but shooteth forth some new Greene leaues, which abide all the Winter, although those that turne red doe fall away.

Geranium Creticum. Candy Cranes bill.

Candy Cranes bill beareth long and tender stalkes, whereon growe diuers broad and long leaues, cut in or iagged on the edges: the toppes of the stalkes are branched into many flowers, made of fise leaues of a reasonable bignesse, and of a faire blew or watchet colour, with a purplish pointell in the middle, which being past, there follow beake heads like other Cranes bills, but greater, containing larger, greater, and sharper pointed feede, able to pierce the skinne, if one be not warie of it: the roote is white and long, with some fibres at it, and perisheth when it hath perfected his feede, and will spring of it owne sowing many times, if the Winter be not too sharpe, otherwise (being annuall) it must be sowne in the Spring of the yeare.

The Place.

Most of these Cranes bills are strangers vnto vs by nature, but endenizond in our English Gardens. It hath beene reported vnto mee by some of good credit, that the second or Crowfoot Cranes bill hath been found naturally growing in England, but yet I neuer saw it, although I haue seen many sorts of wilde kindes in many places. Matthiolus saith that the first groweth in Dalmatia and Illyria very plentifully. Camerarius, Clusius, and others, that most of the rest grow in Germany, Bohemia, Austria, &c. The last hath his place recorded in his title.

The Time.

All these Cranes bills doe for the most part flower in Aprill, and May, and vntill the middle of Iune. The variable or stript Cranes bill is vsually the latest of all the rest.

The Names.

The first is vsually called *Geranium tuberosum*, of some *Geranium bulbosum*, of the likenesse of the roote vnto a bulbe: It is without controuersie *Geranium primum* of Dioscorides. The second is called *Geranium Gratia Dei*, of others, *Geranium caruleum*. The blew Cranes bill Lobel calleth it *Batrachoides*, because both leafe and flower are like vnto a Crowfoote; and the affinity with the Cranes bills in the seede causeth it rather to be referred to them then to the Crowfoete. The stript Cranes bill is called by some *Geranium Romanum*. The last sauing one is called *Geranium Hematodes*, or *Sanguineum*, of Lobel *Geranium Gruiuale Hematodes spinum radice repente*. In English it may be called after the Greek and Latine, The bloudy Cranes bill, but I rather call it, The Rose Cranes bill, because the flowers are as large as single Roses, or as the Rose Campion. Some of them are called in many places of England Bassinets.

The Vertues.

All the kindes of Cranes bills are accounted great wound herbes, and effectually to stay bleedings, yet some more then others. The Emperickes of Germanie, as Camerarius saith, extoll it wonderfully, for a singular remedie against the Stone, both in the reins and bladder.

CHAP. XXXI.

GROWN *Sanicula guttata maior*. Spotted Sanicle.

Having long debated with my selfe, where to place this & the other plants that follow in the two next Chapters, I have thought it not amisse for this worke to set them downe here, both before the Beares eares, which are kindes of Sanicle, as the best Authors doe hold, and after the Cranes bills, both for some qualities somewhat resembling them, and for some affinity of the flowers with the former.

The spotted Sanicle hath many small round leaues, bluntly ended about the edges, somewhat like vnto the leaues of our white Saxifrage, of a full Greene colour aboue, and whitish hairy, and somewhat reddish withall vnderneath: the stalkes are set here and there with the like leaues, rising a foote and a halfe high or more, very much diuided at the toppe into sundry small branches, bearing many very small white flowers, consisting of five small leaues, wherein are many small red spots to be seene, as small as pins points, of a pretty sweete sent, almost like Hawthorne flowers, in the middle whereof are many small threads compassing a head, which when it is ripe containeth small blacke feede: the roote is scaly, or couered with a chaffie matter, hauing many small white fibres vnderneath, whereby it is fastened in the ground.

There is another of this kinde, like both in roote, leafe, and flower to the former, ^{Minor non guttata.} the onely difference is, that this is lesse then the former, and hath no spots in the flower, as the other hath.

We haue also another smaller kinde then the last, both in leafe and flower, the leaues ^{Minor guttata.} whereof are smaller, but rounder, and more finely snipt or indented about the edges, like the teeth of a fine sawe: the stalke is little aboue a span high, hauing many small white flowers spotted as the first, but with fewer spots.

The Place.

These growe in the shadowie Woods of the Alpes, in diuers places, and with vs they more delight in the shade then the sunne.

The Time.

All these Sanicles doe flower in May, and continue flowring vtill Iune, and the seede soone ripeneth after: the rootes abide all the Winter, with some leaues on them, springing a fresh in the beginning of the yeare.

The Names.

The former two are called by Clusius *Sanicula montana*, and by others *Sanicula guttata*: by Lobel *Genm Alpinum*. The third or last hath been sent vs vnder the name of *Sanicula montana altera minor*.

The Vertues.

The name imposed on these plants doe certainly assure vs of their vertues, from the first founders, that they are great healers, and from their taste, that they are great binders.

The Place.

All these growe in Germany, Hungary, Austria, the Alpes, and other high places, where the climate is cold, and the soil is rocky, and the wind is strong. They will growe in Garden, and in the field, and in the wood, and in the mountain.

CHAP.

CHAP. XXXII.

Cotyledon altera Matthioli. Spotted Naueiwort.

THis spotted Naueiwort, as many doe call it, hath many thicke small leaues, not so broad as long, of a whitish Greene colour, lying on the ground in circles, after the manner of the heads of Houfelecke, and dented about the edges, from the middle whereof sometimes (for it doth not flower euery yeare in many places) ariseth vp a stalke, scarce a foote high, beset with such like leaues as are belowe, but somewhat longer: from the middle of the stalke vp to the top it brancheth forth diuersly, with a leafe at euery ioynt, bearing three or foure flowers on euery branch, consisting of fine white leaues, spotted with small red spots, like vnto the spotted Sanicle, but with fewer and greater spots, hauing a yellowish circle or eye in the bottome of euery flower, and many whitish threads with yellowish tips in it: the seede is small and blacke, contained in small round heads: the roote is small, long, and threadie, shooting out such heads of leaues, which abide all the Winter, those that beare flower perishing.

Cotyledon altera minor. Small dented Naueiwort.

There is another like vnto that before described in most things, the differences be these: It hath shorter leaues then the former, and dented about the edges in the like manner: the flowers hereof are white, but greater, made of six leaues, and most vsually without any spots at all in them, some are seene to haue spots also: the heads or seede vessels are more cornered then the former.

Cotyledon altera flore rubro stellato. Small red flowered Naueiwort.

This hath also many heads of leaues, but more open, which are longer, greener, and sharper pointed then eyther of the former, somewhat reddish also, and not dented about the edges, but yet a little rough in handling: the stalke ariseth from among the leaues, being somewhat reddish, and the leaues thereon are reddish pointed, diuided at the toppe into many branches, with diuers flowers thereon, made of twelue small long leaues, standing like a starre, of a reddish purple colour, with many threads therein, set about the middle head, which is diuided at the toppe into many small ends, like pods or hornes, containing therein very small seede: the root is small like the former.

Sedum serratum flore rubente maculato. The Princes Feather.

This kinde of Sengreene is composed of heads of larger, broader, and thinner leaues then any of the former, of a fadder Greene colour, somewhat vneuenly cindented about the edges, and not so close set together, but spreading forth into seuerall heads like as the former sorts doe, although not so plentifully, from the middle of diuers of which heads rise vp brownish or reddish stalkes, set with smaller leaues thereon to the middle thereof, and then brancheth forth into seuerall sprigs, set with diuers small reddish flowers consisting of fine leaues a peece, the inner side of which are of a pale red, somewhat whitish, spotted with many small bloud red spots, as small almost as pins points, with some small threads in the middle, standing about a small Greene head, which turneth into the seede vessell, parted foure wayes at the head, wherein is contained small blackish seede: the rootes are small threads, which spread vnder the ground, and shoote vp seuerall heads round about it.

The Place.

All these growe in Germany, Hungarie, Austria, the Alpes, and other such like places, where they cleaue to the rocke it selfe, that hath but a crust of earth on it to nourish them. They will abide in Gardens reasonable well, if they be planted in shadowie places, and not in the sun.

The

1 *Sanicula guttata*. Spotted Sanicle. 2 *Cotyledon altera Matthioli*. Spotted Naueiwort. 3 *Cotyledon altera minor*. Small dens-
 seed Naueiwort. 4 *Cotyledon altera flore rubro bellata*. Small red flowered Naueiwort. 5 *Sedum serratum flore rubente macu-
 lata*. The Princess Feather. 6 *Soldanella Asping*. Blew Moonwort.

The Time.

They flower for the most part in the end of May, and sometimes sooner or later, as the yeare falleth out.

The Names.

The first is called by Matthiolus, *Cotyledon altera Dioscoridis*, and *Umbilicus alter*, but it is not the true *Cotyledon altera* of Dioscorides; for *Sedum vulgare matius*, Our common Houfeleeke, by the consent of the best moderne Writers, is the true *Cotyledon altera* of Dioscorides; or *Umbilicus Veneris alter*. I hold it rather to bee a kinde of small Houfeleeke, as the other two likewise are. The second is called by some *Aizoon* or *Sedum minus serratum*. The third hath his name in his title. Wee doe call them Naelewort in English rather then Houfeleeke, *Euphonia gratia*. The last may be called dented Sengreene with reddish spotted flowers, but some of our English Gentlewomen haue called it, The Princes Feather, which although it be but a by-name, may well serue for this plant to distinguish it, and whereby to be knowne.

The Vertues.

They are all held to be cold and moist; like vnto other Houfeleeke.

CHAP. XXXIII.

Soldanella Alpina. Mountaine Soldanella or blew Moonewort.

THis beautifull plant hath many round and hard leaues, set vpon long foote-stalkes, a little vneuenly cut about the edges, greene on the vpper side, and of a grayish greene vnderneath, and sometime reddish like the leaues of Sowbread, which because they doe somewhat resemble the leaues of *Soldanella marina*, which is the Sea Bindweede, tooke the name thereof: the stalkes are slender, small, round, and reddish, about a span high, bearing foure or fve flowers at the toppe, euery one hanging downe their heads, like vnto a Bell flower, consisting but of one leafe (as most of the Bindweeds doe) plated into fve folds, each of them ending in a long point, which maketh the flower seem to haue fve leaues, each whereof is deeply cut in on the edges, and hauing a round greene head in the middle, with a pricke or pointell at the end thereof: the flower is of a faire blew colour, sometimes deeper or paler, or white, as nature listeth without any smell at all: the middle head, after the flower is fallen, riseth to be a long round pod, bearing that pricke it had at the end thereof, wherein is contained small greenish seede: the roote hath many fibres shooting from a long round head or roote.

The Place.

This groweth on the Alpes, which are couered with snow the greatest part of the yeare, and will hardly abide transplanting.

The Time.

In the naturall places it flowreth not vntill the Summer moneths, Iune, Iuly, and August, after the snow is melted from the Hills, but being brought into Gardens, it flowreth in the beginning of Aprill, or thereabouts.

The

The Names.

This plant, by reason of the likehess of leaues with *Soldanella*, as was before said, is called by many *Soldanella*, but yet is no Bind veede; and therefore I rather call it in English a Mountaine *Soldanella*, then as Gerrard doth, Mountaine Bindweede. It is likewise called by some, *Lunaria minor* or *auricula*. The lesser blew Lunary or Moonwort, and so I would rather haue it called.

The Vertues.

They that imposed the name of *Lunaria* vpon this plant, seeme to referre it to the wound or consolidating herbes, but because I haue no further relation or experience, I can say no more thereof, until tryall hath taught it. Some also from the name *Soldanella*, which is giuen it, because of the likehess of the leaues, haue vsed it to help the Dropfie, for which the Sea plant is thought to be effectually.

CHAP. XXXIII.

Auricula Vrsi. Beares eares.

Here are so many sundry and seuerall sorts of Beares eares, the variety consisting as well in the differing colours of the flowers, as the forme and colour of the leaues, that I shall not comprehend and set downe vnto you all the diuersities by many, that are risen vnto those that haue bene industrious in the sowing of the seedes of the seuerall sorts of them; yet if you accept of these that I doe here offer vnto you, I shall giue you the knowledge of others, as time, occasion, and the view of them shall enable mee. And because they are without all question kinds of Cowslips, I haue set them downe before them in the first place, as being of more beautie and greater respect, or at the least of more rarity vnto vs. To dispose them therefore into order, I shall ranke them vnder three principall colours, that is to say, Red or Purple, White, and Yellow, and shew you the varieties of each of them (for so many as are come to my knowledge) apart by themselves, and not promiscuously as many others haue done.

1. *Auricula Vrsi flore purpureo*. Purple Beares eare, or The Murrey Cowslip.

This purple Beares eare or Cowslip hath many greene leaues, somewhat long and smooth, narrow from the bottome of the leafe to the middle, and broad from thence to the end, being round pointed, and somewhat snipt or endented about the edges; in the middle of these leaues, and sometimes at the sides also, doe spring round greene stalkes foure or five fingers high, bearing at the top many flowers, the buds whereof, before they are blowne, are of a very deepe purple colour, and being open, are of a bright, but deepe purple, vsually called a Murrey colour, consisting of five leaues a peece, cut in at the end as it were into two, with a whitish ring or circle at the bottome of each flower, standing in small greene cups, wherein after the flowers are fallen, are contained very small heads, not rising to the height of the cups, bearing a small pricke or pointell at the toppe of them, wherein is little blackish seede: the roote hath many whitish strings fastened to the maine long roote, which is very like vnto a Primrose or Cowslip roote, as it is in all other parts besides.

2. *Auricula Vrsi purpurea absq. orbe*. The murrey Cowslip without eyes.

There is another of this kinde, whose leafe is somewhat lesse, as the flower is also, but

but of the same colour, and sometimes somewhat redder, tending to a Scarlet, without any circle at the bottome of the flower, in no other things differing from it.

3. *Auricula Vrsi minor flore tawneyo.* Tawney Beares eares.

The leaues of this kinde haue a greater shew of mealiness to be seene in them, and not much smaller then the former; yet snipt or cindented about the ends like vnto them: the flowers are many, of the same fashion with the former; but smaller, each whereof is of as deepe a murrey or tawney colour when it is blowne, as the buds of the former are before they are blowne, hauing a white circle at the bottome of the flower, and yellowish in the middle belowe the circle.

4. *Auricula Vrsi flore rubro saturo orbato.*
Deepe or bloud red Beares eares with eyes.

This kinde hath small and long greene leaues, nothing mealy, but snipt about the edges, from the middle of the leaues forwards to the ends: the flowers hereof are of a deepe red colour, tending to a bloud red, with a deepe yellow circle, or rather bottome in the middle.

*Auricula Vrsi
flore rubro sa-
turo absque
orbato.*

There is another of this kinde, whose leaues are somewhat mealy, and smaller then any (that I haue scene) that haue mealy leaues: the flowers are of the same deepe red colour with the last described, yet hath no circle or bottome of any other colour at all.

5. *Auricula Vrsi flore purpureo caruleo.* The Violet coloured Beares eare.

We haue another, whose leaues are somewhat mealy and large; the flowers whereof are of a paler purple then the first, somewhat tending to a blew.

6. *Auricula Vrsi flore obsoleto magno.* The Spaniards bluish Beares eare.

This great Beares eare hath as large leaues as any other of this kindred whatsoeuer, and whitish or mealy withall, somewhat snipt about the edges, as many other of them are: the flowers stand at the toppe of a strong and tall stalke, larger then any of the other that I haue seene, being of a duskie bluish colour, resembling the bluish of a Spaniard, whose tawney skinne cannot declare so pure a bluish as the English can; and therefore I haue called it the Spaniards bluish.

7. *Auricula Vrsi flore rubello.* Scarlet or light red Beares eares.

The leaues of this kinde are very like the leaues of the first purple kinde, but that they are not so thicke, of a little paler greene colour, and little or nothing snipt about the edges: the flowers are of a bright, but pale reddish colour, not halfe so deepe as the two last with white circles in the bottomes of them, in other things this differeth not from others.

8. *Auricula Vrsi flore roseo colore.* The Rose coloured Beares eare.

We haue another, whose leafe is a little mealy, almost as large as any of the former, whose flowers are of a light red colour, very neare the colour of an ordinary Damaske Rose, with a white eye at the bottome.

9. *Auricula Vrsi flore caruleo folio Boraginis.*

Blew Beares eares with Borage leaues.

This plant is referred to the kindred or family of the Beares eares, onely for the forme of the flower sake, which euen therein it doth not assimilate to the halfe; but because it hath passed others with that title, I am content to insert it here, to giue you the

1. *Auricula Vrii* flore purpurea. Purple Cowslips or Beares eares. 2. *Auricula Vrii* flore lannotta. Tawney Beares eare. 3. *Auricula Vrii* flore & folio Boraginis. Blew Beares eares with Borage leaues. 4. *Auricula Vrii* flore ednice. Blissh Beares eare. 5. *Auricula Vrii* maxima lutea flore eleganti. The greatest faine yellow Beares eares with eyes. 6. *Auricula Vrii* altera flore luteo. The yellow Beares eare. 7. *Auricula Vrii* crinis coloris sue flore fusca. The haire coloured Beares eare. 8. *Cortusa Matthioli*. Beares eare Sanicle.

the knowledge thereof, and rather to satisfie others then my selfe with the place thereof: the description whereof is as followeth: It hath diuers broad rough hairy leaues spread vpon the ground, somewhat like vnto the leaues of Borage for the roughnesse, but not for the largenesse, the leaues hereof being somewhat rent in some places at the edges: from among these leaues rise vp one, or two, or more brownish, round, and hairy stalkes, a span high or thereabouts, bearing at the toppes three or foure flowers a peece, consisting of fise large pointed leaues, of a faire blew or light azur colour, with some small yellow threads in the middle, standing in small greene cups: the roote is long and brownish, hauing many small fibres annexed vnto it.

10. *Auricula Vrsi maior flore albo.* The great white Beares eare.

This white Beares eare hath many faire whitish greene leaues, somewhat paler then the leaues of any of the kindes of Beares eares, and a little snipt about the ends, as manie other are: among these leaues rise vp stalkes foure or fise inches high, bearing at the toppe many flowers like vnto the small yellow Beares eare hereafter set downe, of a pale whitish colour, tending to yellow at the first opening of the flower, which after two or three dayes change into a faire white colour, and so continue all the while it flowreth: the roote is like the purple kinde, as all or most of the rest are, or very little differing.

11. *Auricula Vrsi minor flore albo.* The lesser white Beares eare.

The lesser Beares eare hath smaller leaues, of a little darker green colour: the stalke and flowers are likewise lesser then the former, and haue no shew of yellownesse at all, cyther in budde or flower, but is pure white, differing not in other things from the rest.

12. *Auricula Vrsi maxima lutea flore eleganti.*
The greatest faire yellow Beares eare with eyes.

This yellow Beares eare hath many faire large thicke leaues, somewhat mealy or hoary vpon the greenesse, being larger then any other kinde, except the sixth, and the next yellow that followeth, smooth about the edges, and without any endenting at all: the stalke is great, round, and not higher then in other of the former, but bearing manie more flowers thereon then in any other kinde, to the number of thirty many times, standing so round and close together, that they seeme to be a Nosegay alone, of the same fashion with the former, but that the leaues are shorter and rounder, yet with a notch in the middle like the rest, of a faire yellow colour, neither very pale nor deepe, with a white eye or circle in the bottome, about the middle of euery flower, which giueth it the greater grace: the seede is of a blackish browne colour, like vnto others, but contained in greater round heads then any other, with a small pointell sticking in the middle: the roote is greater and thicker then any other, with long strings or fibres like vnto the other sorts, but greater.

13. *Auricula Vrsi maior lutea folio in cano.* The greater yellow Beares eare.

This greater yellow Beares eare hath his leaues larger, and more mealy or hoarie then the last, or any other of these kindes: the flowers are not so many, but longer, and not so thicke thrusting together as the first, but of a deeper yellow colour, without any eye or circle in the middle.

14. *Auricula Vrsi maior flore pallido.* The great Straw coloured Beares eare.

This hath almost as mealy leaues as the last, but nothing so large; the flowers are of a faire strawe colour, with a white circle at the bottome of them, these three last haue no shew or shadow of any other colour in any part of the edge, as some others that follow haue.

15. *Auricula*

15. *Auricula Vrſi minor flore pallente.* The leſſer ſtraw coloured Beares eare.

We haue another, whoſe leafe is leſſe mealy, or rather pale green, and a little mealy withall; the flowers whereof are of a paler yellow colour then the laſt, and beareth almoſt as many vpon a ſtalke as the firſt great yellow.

16. *Auricula Vrſi minor lutea.* The leſſer yellow Beares eares.

The leaues of this Beares eare are nothing ſo large as either of the three former yellow kindes, but rather of the bigneſſe of the firſt white kinde, but yet a little larger, thicker, and longer then it, hauing vnder the greennesse a ſmall ſhew of mealineſſe, and ſomewhat ſnipt about the edges: the flowers are of a pale yellow colour, with a little white bottome in them: the ſeed and rootes are like vnto the other kindes.

17. *Auricula Vrſi flore flauo.* The deepe yellow or Cowſlip Beares eare.

This kinde hath ſomewhat larger leaues then the laſt, of a yellowiſh Greene colour, without any mealineſſe on them, or endenting about the edges, but ſmooth and whole: the flowers are not larger but longer, and not laide open ſo fully as the former, but of as deepe a yellow colour as any Cowſlip almoſt, without any circle in the bottome: neither of theſe two laſt haue any ſhew of other colour then yellow in them, ſauing the white in the eye.

18. *Auricula Vrſi verſicolor prima ſive flore rubefcente.* The bluſh Beares eare.

The bluſh Beares eare hath his leaues as large, and as hoary or mealy as the third greater yellow, or ſtraw coloured Beares eare; among which riſeth vp a ſtalke about foure inches high, bearing from ſix to twelue, or more faire flowers, ſomewhat larger then the ſmaller yellow Beares eare before deſcribed, hauing the ground of the flower of a darke or dunne yellow colour, ſhadowed ouer a little with a ſhew of light purple, which therefore we call a bluſh colour, the edges of the flower being ripe with a little deeper ſhew of that purple colour, the bottome of the flower abiding wholly yellow, without any circle, and is of very great beauty, which hath cauſed me to place it in the forefront of the variable coloured Beares eares. And although ſome might thinke it ſhould be placed among the firſt ranke of Beares eares, becauſe it is of a bluſh colour, yet ſeeing it is aſſuredly gained from ſome of the yellow kindes by ſowing the ſeede, as many other ſorts are, as may be ſeene plainly in the ground of the flower, which is yellow, and but ſhadowed ouer with purple, yet more then any of the reſt that follow; I thinke I haue giuen it his right place: let others of ſkill & experience be iudges herein.

19. *Auricula Vrſi crinis coloris.* Haire coloured Beares eares.

The leaues of this kinde are more mealy like then the laſt bluſh kinde, but ſomewhat longer and larger, and ſnipt about the edges in the ſame manner, from the middle of the leafe forwards: the flower is vſually of a fine light browne yellow colour, which wee doe vſually call an Haire colour, and ſometimes browner, the edges of the flower haue a ſhew or ſhadow of a light purple or bluſh about them, but more on the outſide then on the inſide.

20. *Auricula Vrſi verſicolor lutea.* The yellow variable Beares eare.

This variable Beares eare hath his Greene leaues ſomewhat like vnto the deepe yellow, or Cowſlip Beares eare before deſcribed, but ſomewhat of a freſher Greene, more ſhining and ſmaller, and ſnipt about the edges towards the ends, as many of thoſe before are: the flowers are of a faire yellow colour, much laid open when it is full blowne, that it ſeemeth almoſt flat, daſht about the edges onely with purple, being more yellow in the bottome of the flower, then in any other part.

21. *Auricula Vrsi* variegata lutescente viridi flore. The variable green Beares eare.

This kinde of Beares eare hath Greene leaues, very like vnto the last described, and snipt in the like manner about the edges, but in this it differeth, that his leaues do turne or fold themselues a little backwards: the flowers are of a yellowish Greene colour, more closed then the former, hauing purplish edges, especially after they haue stood blowne some time, and haue little or none at the first opening: these haue no circles at all in them.

Many other varieties are to be found, with those that are curious conseruers of these delights of nature, either naturally growing on the mountaines in severall places, from whence they (being searched out by diuers) haue been taken and brought, or else raised from the seede of some of them, as it is more probable: for severall varieties haue bene obserued (and no doubt many of these before specified) to bee gotten by sowing of the feedes, euery yeare lightly shewing a diuersity, not obserued before, either in the leafe, diuers from that from whence it was taken, or in the flowers. I haue onely set downe those that haue come vnder mine owne view, and not any by relation, euen as I doe with all or most of the things contained in this worke.

The Place.

Many of these goodly plants growe naturally on mountaines, especially the Alpes, in diuers places; for some kinde that growe in some places, doe not in others, but farre distant one from the other. There hath likewise some bene found on the Pyrenean mountaines, but that kinde with the blew flower and Borage leafe, hath bene gathered on the mountaines in Spaine; and on the Pyrenians next vnto Spaine.

The Time.

They all flower in Aprill and May, and the seede is ripe in the end of Iune, or beginning of Iuly, and sometimes they will flower againe in the end of Summer, or in Autumne, if the yeare proue temperate, moist, and rainie.

The Names.

It is very probable, that none of these plants were euer knowne vnto the ancient Writers, because we cannot be assured, that they may be truly referred vnto any plant that they name, vnlesse we beleue Fabius Columna, that it should be *Alisma* of Dioscorides, for thereunto hee doth referre it. Diuers of the later Writers haue giuen vnto them diuers names, euery one according to his owne conceit. For Gesner calleth it *Lunaria arthritica*, and *Paralytica Alpina*. Matthioli accounteth it to bee of the kindred of the *Sanicles*, and saith, that in his time it was called by diuers Herbarists, *Auricula Vrsi*, which name hath since bin receiued as most vsuall. We in English call them Beares eares, according to the Latine, or as they are called by diuers women, French Cowslips; they may be called Mountaine Cowslips, if you will, for to distinguish betweene them and other Cowslips, whereof these are severall kinde.

Sanicula Alpina sine *Cortusa* Matthioli. Beares eare Sanicle.

I cannot chuse but insert this delicate plant in the end of the Beares eares, for that it is of so neare affinity, although it differ much in the forme of the leaues, the description whereof is in this manner: The leaues that spring vp first are much crumpled, and as it were folded together, which afterwards open themselues into faire, broad, and roundish leaues, somewhat rough or hairy, not onely cut into fine diuisions, but somewhat notched also about the edges, of a darke Greene colour on the vpper side, and more

more whitish greene underneath; amongst these leaues riseth vp one or two naked round stalkes, five or six inches high, bearing at the toppes diuers small flowers, somewhat sweete, like vnto the first purple Beares eare; hanging downe their heads, consisting of five small pointed leaues a peece, of a darke reddish purple colour, with a white circle or bottome in the middle, and some small threads therein: after the flowers are past, there come small round heads, somewhat longer then any of the Beares eares, standing ypright vpon their small foot-stalkes, wherein is contained small round and blackish seede: the roote consisteth of a thicke tuft of small whitish threads, rather then rootes, much entrelaced one among another: the leaues of this plant dye downe euery yeare, and spring vp a new in the beginning of the yeare, whereas all the Beares eares doe hold their leaues greene all the Winter, especially the middlemost, which stand like a close head, the outermost for the most part perishing after seed time.

The Place.

This groweth in many shadowie Woods both of Italy and Germany: for both Clusius hath described it, finding it in the Woods of Austria and Stiria; and Matthiolus setteth it downe, hauing receiued it from Anthonius Cortusius, who was President of the Garden at Padua, and found it in the woody mountaines of Vicenza, neare ynto Villestagna, whereon (as Matthiolus saith) there is found both with white flowers as well as with blew, but such with white flowers or blew we neuer could see or heare further of.

The Time.

It flowreth much about the time of the Beares eares, or rather a little later, and the seede is ripe with them.

The Names.

Clusius calleth it *Sanicula montana*, and *Sanicula Alpina*, and referreth it to the *Auricula Vrsi*, or Beares eare, which it doth most nearly resemble: but Matthiolus referreth it to the *Cariophyllata* or *Auens*, making it to be of that tribe or family, and calleth it *Cortusia* of him that first sent it him. Wee may call it eyther *Cortusia*, as for the most part all Herbarists doe; or Beares eare *Sanicle* as Gerrard doth.

The Vertues.

All the sorts of Beares eares are Cephalicall, that is, conducing helpe for the paines in the head, and for the giddinesse thereof, which may happen, eyther by the sight of steepe places subiect to danger, or otherwise. They are accounted also to be helping for the Palsey, and shaking of the ioynts; and also as a *Sanicle* or wound-herbe. The leaues of the *Cortusia* taste a little hot, and if one of them bee laide whole, without bruising, on the cheeke of any tender skind woman, it will raise an orient red colour, as if some *fucus* had bene laide thereon, which will passe away without any manner of harme, or marke where it lay: This is Cortusius his obseruation. Camerarius in his *Hortus Medicus* saith, that an oyle is made thereof, that is admirable for to cure wounds.

CHAP. XXXV.

Primula veris & *Paralysis*. Primroses and Cowslips.

WE haue so great variety of Primroses and Cowslips of our owne Country breeding, that strangers being much delighted with them, haue beene often furnished into diuers Countries, to their good content: And that I may set them downe in some methodicall manner, as I haue done other things, I will first set downe all the sorts of those we call Primroses, both single and double, and afterwards the Cowslips with their diuersities, in as ample manner as my knowledge can direct me. And yet I know, that the name of *Primula veris* or Primrose, is indifferently conferred vpon those that I distinguish for *Paralyses* or Cowslips. I doe therefore for your better vnderstanding of my distinction betweene Primroses and Cowslips, call those onely Primroses that carry but one flower vpon a stalke, be they single or double, except that of Master Hesketh, and that with double flowers many vpon a stalke, set out in Gerards Herball, which is his onely, not found (as I thinke) *in verum natura*, I am sure, such a one I could neuer heare of: And those Cowslips, that beare many flowers vpon a stalke together constantly, be they single or double also. I might otherwise distinguish them also by the leafe; that all the Primroses beare their long and large broad yellowish Greene leaues, without stalkes most vsually; and all the Cowslips haue small stalkes vnder the leaues, which are smaller, and of a darker Greene, as vsually, but that this distinction is neither so certaine and generall, nor so well knowne.

1. *Primula veris flore albo*. The single white Primrose.

The Primrose that groweth vnder euery bush or hedge, in all or most of the Woods, Groues, and Orchards of this Kingdome, I may well leaue to his wilde habitation, being not so fit for a Garden, and so well knowne, that I meane not to giue you any further relation thereof: But we haue a kinde hereof which is somewhat smaller, and beareth milke white flowers, without any shew of yellownesse in them, and is more vsually brought into Gardens for the rarity, and differeth not from the wilde or ordinary kinde, either in roote or leafe, or any thing else, yet hauing those yellow spots, but smaller, and not so deepe, as are in the other wilde kinde.

2. *Primula veris flore viridi simplici*. The single Greene Primrose.

The single Greene Primrose hath his leaues very like vnto the greater double Primrose, but smaller, and of a sadder Greene colour: the flowers stand seuerally vpon long foot-stalkes, as the first single kinde doth, but larger then they, and more laide open, of the same, or very neare the same yellowish Greene colour that the huske is of, so that at the first opening, the huske and the flower seeme to make one double Greene flower, which afterwards separating themselues, the single flower groweth about the huske, and spreadeth it selfe open much more then any other single Primrose doth, growing in the end to be of a paler Greene colour.

3. *Primula veris flore viridante & albo simplici*.
The single Greene and white Primrose.

The leaues of this differ in a manner nothing from the former, neither doth the flower but only in this, that out of the large yellowish green huskes, which contain the flowers of the former, there commeth forth out of the middle of each of them either a small peece of a whitish flower, or else a larger, sometimes making vp a whole flower, like an ordinary Primrose.

4. *Primula veris flore viridi duplici*. The double Greene Primrose.

This double Primrose is in his leaues so like the former single Greene kinds, that the

1 *Primula verna flore albo*, The white Primrose. 2 *Primula verna flore viridi & alba simpliciter*, The green and white Primrose. 3 *Primula verna flore viridi dupliciter*, The double green Primrose. 4 *Primula verna flore viridi & alba dupliciter*, The double green and white Primrose. 5 *Primula verna flore viridi simplici*, The single green Cowslip. 6 *Paralyfia verna flore viridi simplici*, The single green Cowslip. 7 *Paralyfia flore geminata educta*, Double Cowslips or hots in hots. 8 *Paralyfia verna flore geminata*, Double Cowslips hots in hots. 9 *Paralyfia flore & calice crispis*, Curled Cowslips or Gaskins. 10 *Paralyfia minor angustifolia flore viridi*, Red Birds eyes. 11 *Paralyfia hirsuta flore plene vulgaris*, Double Paisley. 12 *Paralyfia fana*, The foolish Cowslip, or lacke an Ape on hots backe. 13 *Paralyfia flore viridi & alba calaminata*, The double green feathered Cowslip.

the one cannot be knowne from the other vntill it come to flower, and then it beareth vpon euery stalke a double green flower, of a little deeper green colour then the flower of the former single kinde consisting but of two rowes of short leaues most vsually, and both of an equall height about the huske, abiding a pretty time in flower, especially if it stand in any shadowed place, or where the Sun may come but a while vnto it.

5. *Primula veris Hesketi flore multiplici separatiu diuiso.*

Master Heskets double Primrose.

Master Heskets double Primrose is very like vnto the small double Primrose, both in leafe, roote, and heighth of growing, the stalke not rising much higher then it, but bearing flowers in a farre different manner; for this beareth not only single flowers vpon seuerall stalkes, but sometimes two or three single flowers vpon one stalk, and also at the same time a bigger stalke, and somewhat higher, hauing one greene huske at the toppe thereof, sometimes broken on the one side, and sometimes whole, in the middle whereof standeth sometimes diuers single flowers, thrust together, euery flower to be seene in his proper forme, and sometimes there appeare with some whole flowers others that are but parts of flowers, as if the flowers were broken in peeces, and thrust into one huske, the leaues of the flowers (being of a white or pale Primrose colour, but a little deeper) seldome rising about the height of the very huske it selfe; and sometimes, as I haue obserued in this plant, it will haue vpon the same stalke, that beareth such flowers as I haue here described vnto you, a small flower or two, making the stalke seeme branched into many flowers, whereby you may perceiue, that it will vary into many formes, not abiding constant in any yeare, as all the other sorts doe.

6. *Primula hortensis flore pleno vulgaris.* The ordinary double Primrose.

The leaues of this Primrose are very large, and like vnto the single kind, but somewhat larger, because it groweth in gardens: the flowers doe stand euery one seuerally vpon slender long footestalkes, as the single kinde doth, in greenish huskes of a pale yellow colour, like vnto the field Primrose, but very thicke and double, and of the same sweete sent with them.

7. *Primula veris flore duplici.* The small double Primrose.

This Primrose is both in leafe, roote, and flower, altogether like vnto the last double Primrose, but that it is smaller in all things; for the flower riseth not about two or three fingers high, and but twice double, that is, with two rowes of leaues, yet of the very same Primrose colour that the former is of.

8. *Paralysus vulgaris pratensis flore flauo simplici odorato.*

The Common field Cowslip.

The common fiede Cowslip Imight well forbear to set downe, being so plentifull in the fields: but because many take delight in it, and plant it in their gardens, I will giue you the description of it here. It hath diuers green leaues, very like vnto the wilde Primrose, but shorter, rounder, stiffer, rougher, more crumpled about the edges, and of a sadder greene colour, euery one standing vpon his stalke, which is an inch or two long: among the leaues rise vp diuers round stalkes, a foote or more high, bearing at the toppe many faire yellow single flowers, with spots of a deeper yellow, at the but-tome of each leafe, smelling very sweete. The rootes are like to the other Primroses, hauing many fibres annexed to the great roote.

9. *Paralysus altera odorata flore pallido polyanthos.* The Primrose Cowslip.

The leaues of this Cowslip are larger then the ordinary fiede Cowslip, and of a darke yellowish greene colour: the flowers are many standing together, vpon the toppes of the stalkes, to the number of thirty sometimes vpon one stalke, as I haue counted them in mine owne Garden, and sometimes more, euery one hauing a longer foote

foote stalker then the former, and of as pale a yellowish colour almost as the field Primrose, with yellow spots at the bottome of the leaues, as the ordinary hath, and of as sweet a sent.

10. *Paralysus flore viridante simplici.* The single Greene Cowslip.

There is little difference in leafe or roote of this from the first Cowslip, the chiefest varietie in this kinde is this, that the leaues are somewhat greener, and the flowers being in all respects like in forme vnto the first kinde, but somewhat larger, are of the same colour with the Greene huskes, or rather a little yellower, and of a very small sent; in all other things I finde no diuersitie, but that it standeth much longer in flower before it fadeth, especially if it stand out of the Sunne.

11. *Paralysus flore & calice crispo.* Curl'd Cowslips or Gallegaskins.

There is another kinde, whose flowers are folded or crumpled at the edges, and the huskes of the flowers bigger than any of the former, more swelling out in the middle, as it were ribbes, and crumpled on the sides of the huskes, which doe somewhat resemble mens hose that they did weare, and tooke the name of Gallegaskins from thence.

12. *Paralysus flore geminato odorato.*

Double Cowslips one within another, or Hose in Hose.

The only difference of this kinde from the ordinary field Cowslip is, that it beareth one single flower out of another, which is as a Greene huske, of the like sent that the first hath, or somewhat weaker.

13. *Paralysus flore flauo simplici inodoro absque calicibus.* Single Oxelippes.

This kinde of Cowslip hath leaues much like the ordinary kinde, but somewhat smaller; the flowers are yellow like the Cowslip, but smaller, standing many vpon a stalke, but bare or naked, that is, without any huske to containe them, hauing but little or no sent at all; nor differing in any thing else from the ordinary Cowslip.

14. *Paralysus flore geminato inodora.* Double Oxelips Hose in Hose.

As the former double Cowslip had his flowers one within another, in the very like manner hath this kinde of Cowslip or Oxelippe, sauing that this hath no huske to containe them, no more then the former single Oxelippe hath, standing bare or naked, of the very same bignesse each of them, and of the same deepe yellow colour with it, hauing as small a sent as the former likewise.

Wee haue another of this kinde, whose leaues are somewhat larger, and so are the flowers also, but of a paler yellow colour.

15. *Paralysus inodora calicibus dissectis.* Oxelips with iagged huskes.

This kinde differeth not from the first Oxelip in the smalnesse of the Greene leaues, but in the flower, which standing many together on a reasonable high stalke, and being very small and yellow, scarce opening themselves or layde abroad as it, hath a Greene huske vnder each flower, but diuided into fixe seuerall small long peeces.

16. *Paralysus flore satuo.* The Franticke, or Foolish Cowslip:

Or Iacke an apes on horse backe.

Wee haue in our gardens another kinde, not much differing in leaues from the former Cowslip, and is called Fantasticke or Foolish, because it beareth at the toppe of the stalke a bush or tuft of small long Greene leaues, with some yellow leaues, as it were peeces of flowers broken, and standing among the Greene leaues. And sometimes

some stalkes among those greene leaues at the toppe (which are a little larger then when it hath but broken peeces of flowers) doe carry whole flowers in huskes like the single kinde.

17. *Paralysia minor flore rubro.* Red Birds eyes.

This little Cowslippe (which will hardly endure in our gardens, for all the care and industrie we can vse to keepe it) hath all the Winter long, and vntill the Spring begin to come on, his leaues so closed together, that it seemeth a small white head of leaues, which afterwards opening it selfe, spreadeth round vpon the ground, and hath small long and narrow leaues, snipt about the edges, of a pale greene colour on the vpper-side, & very white or mealy vnderneath, among these leaues rise vp one or two stalks, small & hoary, halfe a foot high, bearing at the top a bush or tuft of much smaller flowers, standing vpon short foot stalkes, somewhat like vnto Cowslips, but more like vnto the Beares eares, of a fine reddish purple colour, in some deeper, in others paler, with a yellowish circle in the bottomes of the flowers, like vnto many of the Beares eares, of a faint or small sent: the seede is smaller than in any of the former kindes, and so are the rootes likewise, being small, white and threddy.

18. *Paralysia minor flore albo.* White Birds eyes.

This kinde differeth very little or nothing from the former, sauing that it seemeth a little larger both in leafe and flower, and that the flowers hereof are wholly white, without any great appearance of any circle in the bottome of them, vnlesse it be well obserued, or at least being nothing so conspicuous, as in the former.

Flore geminata. These two kindes haue sometimes, but very seldome, from among the middle of the flowers on the stalke, sent out another small stalke, bearing flowers thereon likewise.

19. *Paralysia hortenensis flore pleno.* Double Paigles or Cowslips.

The double Paigle or Cowslip hath smaller and darker greene leaues then the single kinde hath, and longer stalkes also whereon the leaues doe stand: it beareth diuers flowers vpon a stalke, but not so many as the single kinde, euery one whereof is of a deeper and fairer yellow colour then any of the former, standing not much about the brimmes of the huskes that hold them, consisting of two or three rowes of leaues set round together, which maketh it shew very thicke and double, of a prettie small sent, but not heady.

20. *Paralysia flore viridante pleno.* Double greene Cowslips.

This double greene Cowslip is so like vnto the single greene kinde formerly expressed, that vntill they be neare flowring, they can hardly be distinguished; but when it is in flower, it hath large double flowers, of the same yellowish greene colour with the single, and more laid open then the former double Paigle.

21. *Paralysia flore viridante siue calamistrato.*

The greene Rose Cowslip, or double greene feathered Cowslip.

There is small difference in the leaues of this double kinde from the last, but that they are not of so darke a greene: the chiefest difference consisteth in the flowers, which are many, standing together at the toppes of the stalkes, but farre differing from all other of these kindes: for euery flower standing vpon his owne stalke, is composed of many very small and narrow leaues, without any huske to containe them, but spreading open like a little Rose, of a pale yellowish greene colour, and without any sent at all, abiding in flower, especially if it stand in a shadowie place out of the sunne, about two moneths, almost in as perfect beauty, as in the first weeke.

The Place.

All these kindes as they haue been found wilde, growing in diuers places in

in England, so they haue been transplanted into Gardens, to be there nourished for the delight of their louers, where they all abide, and grow fairer then in their naturall places, except the small Birds eyes, which will (as I said) hardly abide any culture, but groweth plentifully in all the North Countries, in their squally or wet grounds.

The Time.

These doe all flower in the Spring of the yeare, some earliet and some later, and some in the midst of Winter, as they are defended from the colds and frosts, and the mildnesse of the time will permit: yet the Cowslips doe alwayes flower later then the Primroses, and both the single and double greene Cowslips latest, as I said in their descriptions, and abide much after all the rest.

The Names.

All these plants are called most vsually in Latine, *Primula veris*, *Primula pratensis*, and *Primula siluaram*, because they shew by their flowering the new Spring to bee comming on, they being as it were the first Embassadours thereof. They haue also diuers other names, as *Herba Paralysis*, *Arthritica*, *Herba Sancti Petri*, *Clauus Sancti Petri*, *Verbasculum odoratum*, *Lunaria arthritica*, *Phlomis*, *Alisma siluarum*, and *Alismatis alterum genus*, as Fabius Columna calleth them. The Birds eyes are called of Lobel in Latine, *Paralytica Alpina*, *Sanicula angustifolia*, but generally they are called *Primula veris minor*. I haue (as you see) placed them with the Cowslips, putting a difference betweene Primroses and Cowslips. And some haue distinguished them, by calling the Cowslips, *Primula veris Elatior*, that is, the Taller Primrose, and the other *Humilis*, Lowe or Dwarfed Primroses. In English they haue in like manner diuers names, according to seuerall Countries, as Primroses, Cowslips, Oxelips, Palsieworts, and Petty Mulleins. The first kindes, which are lower then the rest, are generally called by the name of Primroses (as I thinke) throughout England. The other are diuersly named; for in some Countries they call them Paigles, or Palsieworts, or Petty Mulleins, which are called Cowslips in others. Those are vsually called Oxelips, whose flowers are naked, or bare without huskes to containe them, being not so sweete as the Cowslip, yet haue they some little sent, although the Latine name doth make them to haue none. The Franticke, Fantasticke, or Foolish Cowslip, in some places is called by Country people, Iacke an Apes on horse-backe, which is an vsuall name with them, giuen to many other plants, as Daiesies, Marigolds, &c. if they be strange or fantastickall, differing in the forme from the ordinary kinde of the single ones. The smallest are vsually called through all the North Country, Birds eye, because of the small yellow circle in the bottomes of the flowers, resembling the eye of a bird.

The Vertues.

Primroses and Cowslips are in a manner wholly vsed in Cephalicall diseases, either among other herbes or flowers, or of themselues alone, to ease paines in the head, and is accounted next vnto Betony, the best for that purpose. Experience likewise hath shewed, that they are profitable both for the Palsie, and paines of the ioynts, euen as the Beares eares are, which hath caused the names of *Arthritica*, *Paralysis*, and *Paralytica*, to bee giuen them. The iuice of the flowers is commended to cleanse the spots or marks of the face, whereof some Gentlewomen haue found good experience.

CHAP. XXXVI.

Pulmonaria. Lungwort, or Cowslips of Ierusalem.

Although these plants are generally more vsed as Pot-herbes for the Kitchen, then as flowers for delight, yet because they are both called Cowslips, and are of like forme, but of much lesse beauty, I haue ioyned them next vnto them, in a distinct Chapter by themselves, and so may passe at this time.

1. *Pulmonaria maculosa*. Common spotted Cowslips of Ierusalem.

The Cowslip of Ierusalem hath many rough, large, and round leaues, but pointed at the ends, standing vpon long foot-stalkes, spotted with many round white spots on the vpper sides of the sad Greene or browne leaues, and of a grayer Greene vnderneath: among the leaues spring vp diuers browne stalkes, a foote high, bearing many flowers at the toppe, very neare resembling the flowers of Cowslips, being of a purple or reddish colour while they are buds, and of a darke blewish colour when they are blowne, standing in brownish Greene huskes, and sometimes it hath bene found with white flowers: when the flowers are past, there come vp small round heads, containing blacke seed: the roote is composed of many long and thicke blacke strings.

2. *Pulmonaria altera non maculosa*. Vnspotted Cowslips of Ierusalem.

The leaues of this other kinde are not much vnlike the former, being rough as they are, but smaller, of a fairer Greene colour aboue, and of a whiter Greene vnderneath, without any spots at all vpon the leaues: the flowers also are like the former, and of the same colour, but a little more branched vpon the stalkes then the former: the rootes also are blacke like vnto them.

3. *Pulmonaria angustifolia*. Narrow leaved Cowslips of Ierusalem.

The leaues hereof are somewhat longer, but not so broad, and spotted with whitish spots also as the former: the stalke hereof is set with the like long hairy leaues, but smaller, being a foote high or better, bearing at the toppe many flowers, standing in huskes like the first, being somewhat reddish in the bud, and of a darke purplish blew colour when they are blowne open: the seede is like the former, all of them doe well resemble Buglosse and Comfrey in most parts, except the roote, which is not like them, but stringie, like vnto Cowslips, yet blacke.

The Place.

The Cowslips of Ierusalem grow naturally in the Woods of Germany, in diuers places, and the first kinde in England also, found out by Iohn Goodier, a great searcher and louer of plants, dwelling at Maple-durham in Hampshire.

The Time.

They flower for the most part very early, that is, in the beginning of Aprill.

The Names.

They are generally called in Latine, *Pulmonaria*, and *maculosa*, or *non maculosa*, is added for distinctions sake. Of some it is called *Symphitum maculosum*, that is, spotted Comfrey. In English it is diuersly called, as spotted Cowslips of Ierusalem, Sage of Ierusalem, Sage of Bethlehem, Lungwort, and

and spotted Comfrey, and it might bee as fitly called spotted Buglosse, whereunto it is as like as vnto Comfrey, as I said before.

The Vertues.

It is much commended of some, to bee singular good for vlcered lungs, that are full of rotten matter. As also for them that spit bloud, being boyled and drunke. It is of greatest vse for the pot, being generally held to be good, both for the lungs and the heart.

CHAP. XXXVII.

1. *Buglossum & Borrage*. Buglosse and Borage.

Although Borage and Buglosse might as fitly haue been placed, I confesse, in the Kitchen Garden, in regard they are wholly in a manner spent for Physicall properties, or for the Pot, yet because anciently they haue been entertained into Gardens of pleasure, their flowers hauing been in some respect, in that they haue alwaies been enterposed among the flowers of womens needle-worke, I am more willing to giue them place here, then thrust them into obscurity, and take such of their tribe with them also as may fit for this place, either for beauty or rarity.

The Garden Buglosse and Borage are so well knowne vnto all, that I shall (I doubt) but spend time in waste to describe them; yet not vsing to passe ouer any thing I name and appropriate to this Garden so sleightly, they are thus to be knowne: Buglosse hath many long, narrow, hairy, or rough sad greene leaues, among which rise vptwo or three very high stalks, branched at the top, whereon stand many blew flowers, consisting of fise small round pointed leaues, with a small pointell in the middle, which are very smooth, shining, and of a reddish purple while they are buds, and not blowne open, which being fallen, there groweth in the greene huske, wherein the flower stood, three or foure roundish blacke seedes, hauing that thread or pointell standing still in the middle of them: the roote is blacke without, and whitish within, long, thicke, and full of slimie iuice (as the leaues are also) and perisheth not euery yeare, as the roote of Borage doth.

2. *Borrage*. Borage.

Borage hath broader, shorter, greener, and rougher leaues then Buglosse, the stalkes hereof are not so high, but branched into many parts, whereon stand larger flowers, and more pointed at the end then Buglosse, and of a paler blew colour for the most part (yet sometimes the flowers are reddish, and sometimes pure white) each of the flowers consisting of fise leaues, standing in a round hairy whitish huske, diuided into fise parts, and haue a small ymbone of fise blackish threads in the middle, standing out pointed at the end, and broad at the bottome: the seed is like the other: the root is thicker and shorter then the roote of Buglosse, somewhat blackish without also, and whitish within, and perisheth after seedetime, but riseth of it owne seede fallen, and springeth in the beginning of the yeare.

3. *Borrage semper virens*. Euerliuing Borage.

Euerliuing Borage hath many broad greene leaues, and somewhat rough, more resembling Comfrey then Borage, yet not so large as either; the stalkes are not so high as Borage, and haue many small blew flowers on them, very like to the flowers of Buglosse for the forme, and Borage for the colour: the rootes are blacke, thicker then either of them, somewhat more spreading, and not perishing, hauing greene leaues all the Winter long, and thereupon tooke his name.

4. *Anchusa*.

4. *Anchusa*. Sea Buglosse or Alkanet.

The Sea Buglosse or Alkanet hath many long, rough, narrow, and darke greene leaues; spread vpon the ground (yet some that growe by the Sea side are rather hoarie and whitish) among these leaues riseth vp a stalke, spread at the toppe into many branches, whereon stand the flowers in tufts, like vnto the Garden Buglosse, or rather Comfrey, but lesser; in some plants of a reddish blew colour, and in others more red or purplish, and in others of a yellowish colour: after which cometh the seedes, very like vnto Buglosse, but somewhat longer and paler: the roote of most of them being transplanted, are somewhat blackish on the outside, vntill the later end of Summer, and then become more red: for those that grow wilde, will be then so red, that they will giue a very deepe red colour to those that handle them, which being dried keepe that red colour, which is vsed to many purposes, the roote within being white, and hauing no red colour at all.

5. *Limonium Rauwolfij*. Marsh Buglosse.

This Limonium (which I referre here to the kindes of Buglosse, as presuming it is the fittest place where to insert it) hath many long, narrow, and somewhat rough leaues lying vpon the ground, waued or cut in on both sides, like an Indenture, somewhat like the leaues of Ceterach or Miltwaft, among which rise vp two or three stalkes, somewhat rough also, and with thin skinned like wings, indented on both sides thereof also, like the leaues, hauing three small, long, rough, and three square leaues at euery ioynct where it brancheth forth; at the toppe whereof stand many flowers vpon their foote stalkes, in such a manner, as is not seene in any other plant, that I know: for although that some of the small winged foot stalkes are shorter, and some longer, standing as it were flatwise, or all on one side, and not round like an vmbell, yet are they euen at the toppe, and not one higher than another; each of which small foote stalkes doe beare foure or fve greenish heads or huskes, ioyned together, out of each of which doe arise other pale or bleake blew stiffe huskes, as if they were flowers, made as it were of parchment, which hold their colour after they are dry a long time; and out of these huskes likewise, doe come (at seuerall times one after another, and not all at one time or together) white flowers, consisting of fve small round leaues, with some white threds in the middle: after these flowers are past, there come in their places small long feede, inclosed in many huskes, many of those heads being idle, not yeelding any good feede, but chaffe, especially in our Countrey, for the want of sufficient heate of the Sunne, as I take it: the roote is small, long, and blackish on the outside, and perisheth at the first approach of Winter.

The Place.

Borage and Buglosse grow onely in Gardens with vs, and so doth the *Semper virens*, his originall being vknowne vnto vs. Alkanet or Sea Buglosse groweth neare the Sea, in many places of France, and Spaine, and some of the kindes also in England. But the Limonium or Marsh Buglosse groweth in Cales, and Malacca in Spaine; and is found also in Syria, as Rauwolfius relateth: and in other places also no doubt; for it hath bene sent vs out of Italie, many years before eyther Guillaume Boel found it in Cales, or Clusius in Malacca.

The Time.

Borage and Buglosse doe flower in Iune, and Iuly, and sometimes sooner, and so doth the cuer-living or neuer dying Borage, but not as Gerrard saith, flowering Winter and Summer, whereupon it should take his name, but leaue it flowering in Autumne, and abideth greene with his leaues all the Winter,

1 *Pulmonaria latifolia maculosa*. Cowslips of Ierusalem. 2 *Pulmonaria angustifolia*. Narrow leaved Cowslips of Ierusalem. 3 *Borrago*. Borage. 4 *Borrago semper virens*. Everlasting Borage. 5 *Anchusa*. Sea Bugloss or Alkanet. 6 *Limonium Ranunculij*. Marsh Bugloss.

ter, flowering the next Spring following. The other flower not vntill Iuly, and so continue, especially the Marthe Buglosse vntill September bee well spent, and then giueth seede, if early frosts ouertake it not; for it seldome commeth to be ripe.

The Names.

Our ordinary Borage by the consent of all the best moderne Writers, is the true *Buglossum* of Dioscorides, and that our Buglosse was vnkowne to the ancients. The *Borago semper virens*, Lobel calleth *Buglossum semper virens*, that is, Euer-liuing, or greene Buglosse: but it more resembleth Borage then Buglosse; yet because Buglosse abideth greene, to auoyde that there should not be two *Buglossa semper virentia*, I had rather call it Borage then Buglosse. *Anchusa* hath diuers names, as Dioscorides setteth downe. And some doe call it *Fucus herba*, from the Greeke word, because the roote giuing so deepe a colour, was vsed to dye or paint the skinne. Others call it *Buglossum Hispanicum*, in English Alkanet, and of some Orchanet, after the French. Limonium was found by Leonhartus Rauwolfius, neere vnto Ioppa, which he setteth downe in the second Chapter of the third booke of his trauayles, and from him first knowne to these parts: I haue, as you see, referred it to the kindes of Buglosse, for that the flowers haue some resemblance vnto them, although I know that *Limonium genuinum* is referred to the Beetes. Let it therefore here finde a place of residence, vntill you or I can finde a fitter; and call it as you thinke best, eyther Limonium as Rauwolfius doth, or Marthe Buglosse as I doe, or if you can adde a more proper name, I shall not be offended.

The Vertues.

Borage and Buglosse are held to bee both temperate herbes, beeing vsed both in the pot and in drinckes that are cordiall, especially the flowers, which of Gentlewomen are candid for comfits. The Alkanet is drying, and held to be good for wounds, and if a peece of the roote be put into a little oyle of Peter or Petroleum, it giueth as deepe a colour to the oyle, as the Hypericon doth or can to his oyle, and accounted to be singular good for a cut or greene wound.

The Limonium hath no vse that wee know, more then for a Garden; yet as Rauwolfius saith, the Syrians vse the leaues as sallats at the Table.

CHAP. XXXVIII.

Lychnis. Campions.

THere bee diuers sorts of Campions, as well tame as wilde, and although some of them that I shall here entreate of, may peraduenture be found wilde in our owne Countrey, yet in regard of their beautifull flowers, they are to bee respected, and nourished vp with the rest, to furnish a garden of pleasure; as for the wilde kindes, I will leaue them for another discourse.

1. *Lychnis Coronaria rubra simplex*. The single red Rose Champion.

The single red Rose Champion hath diuers thicke, hoary, or woolly long greene leaues, abiding greene all the winter, and in the end of the spring or beginning of summer, shooteth forth two or three hard round woolly stalkes, with some ioynts thereon, and at euery ioynt two such like hoary greene leaues as those below, but smaller, diuersly branched at the toppe, hauing one flower vpon each seuerall long foot stalk, consisting

consisting of five leaues, somewhat broade and round pointed, of a perfect red crimson colour, standing out of a hard long round huske, ridged or crested in foure or five places; after the flowers are fallen there come vp round hard heads, wherein is contained small blackish seed: the roote is small, long and wooddy, with many fibres annexed vnto it, and shooteth forth anew oftentimes, yet perissheth often also.

2. *Lychnis Coronaria alba simplex.* The white Rose Campion.

The white Rose Campion is in all things like the red, but in the colour of the flower, which in this is of a pure white colour.

3. *Lychnis Coronaria albescent sine incarnata maculata & non maculata.*

The bluish Rose Campion spotted and not spotted.

Like vnto the former also are these other sorts, having no other difference to distinguish them, but the flowers, which are of a pale or bleake whitish bluish colour, especially about the brims, as if a very little red were mixed with a great deale of white, the middle of the flower being more white; the one being spotted all ouer the flower, with small spots and streakes, the other not having any spot at all.

4. *Lychnis Coronaria rubra multiplex.* The double red Rose Campion.

The double red Rose Campion is in all respects like vnto the single red kinde, but that this beareth double flowers, consisting of two or three rowes of leaues; at the most, which are not so large as the single; and the whole plant is more tender, that is, more apt to perish, then any of the single kindes.

5. *Lychnis Chalcedonica flore simplici miniat.* Single Nonesuch,
or Flower of Bristow, or Constantinople.

This Campion of Constantinople hath many broad and long Greene leaues, among which rise vp sundry stiffe round hairy ioyned stalks three foot high, with two leaues euery ioyn: the flowers stand at the toppes of them, very many together, in a large tuft or vmbell, consisting of five small long leaues, broade pointed, and notched in the middle, of a bright red orange colour, which being past, there come in their places small hard whitish heads or seede vessels, containing blacke seede, like vnto the seede of sweet Williams, and hauing but a small sent; the roote is very stringie, fastening it selfe very strongly in the ground, whereby it is much encreased.

Of the single kinde there is also two or three other sorts, differing chiefly in the colour of the flowers. The one is pure white. Another is of a bluish colour wholly, without variation. And a third is very variable, for at the first it is of a pale red, and after a while groweth paler, vntill in the end it become almost fully white; and all these diuersities of the flowers are sometimes to be seene on one stalk at one and the same time.

6. *Lychnis Chalcedonica flore miniat plena.*

Double Flower of Bristow, or Nonesuch.

This glorious flower being as rare as it is beautifull, is for rootes being stringie, for leaues and stalkes being hairy and high, and for the flowers growing in tufts, altogether like the first single kinde; but herein consisteth the chiefest difference, that this beareth a larger vmbell or tuft of flowers at the toppe of the stalk, euery flower consisting of three or foure rowes of leaues; of a deeper orange colour then it, which addeth the more grace vnto it, but passeth away without bearing seede, as most other double flowers doe, yet recompenceth that defect with encrease from the roote.

7. *Lychnis plumaria siluestris simplex & multiplex.*

The teatherd wilde Campion single and double.

The leaues of this wilde Campion are somewhat like the ordinary white wilde

Campion, but not so large, or rather resembling the leaues of sweete Williams, but that they grow not so close, nor so many together: the stalkes haue smaller leaues at the ioynts then those belowe, and branched at the toppe, with many pale, but bright red flowers, iagged or cut in on the edges, like the feathered Pinke, whereof some haue taken it to be a kinde, and some for a kinde of wilde William, but yet is but a wilde Champion, as may be obserued, both by his huske that beareth the flowers, and by the grayish roundish seede, being not of the Family of Pinkes and Gillowers, but (as I said) of the Campions: the roote is full of strings or fibres.

flore pleno

The double kinde is very like vnto the single kinde, but that it is lower and smaller, and the flowers very double.

8. *Lychnis filuestris flore pleno rubro*. Red Batchelours buttons.

The double wilde Champion (which of our Countrey Gentlewomen is called Batchelours buttons) is very like both in rootes, leaues, stalkes, and flowers vnto the ordinary wilde red Champion, but somewhat lesser, his flowers are not iagged, but smooth, and very thicke and double, so that most commonly it breaketh his short huske, wherein the flower standeth on the one side, seldome hauing a whole huske, and are of a reddish colour.

9. *Lychnis filuestris flore albo pleno*. White Batchelours buttons.

As the leaues of the former double Champion was like vnto the single kinde that had red flowers, so this hath his leaues like vnto the single white kinde, differing in no other thing from it, but in the doubleness of the flowers, which by reason of the multiplicity of leaues in them thrusting forth together, breaketh his huskes wherein the flowers doe stand, as the other doth, and hath scarce one flower in many that is whole.

10. *Ocymoides arborea semper virens*. Strange Bassil Champion.

This Strange Champion (for therunto it must bee referred) shooteth forth many round, whitish, woody, but brittle stalkes, whereon stand diuers long, and somewhat thicke leaues, set by couples, narrow at the bottome, and broader toward the point, of a very faire Greene and shining colour, so that there is more beauty in the Greene leaues, which doe so alwaies abide, then in the flowers, which are of a pale red or blush colour, consisting of fine small long broad pointed leaues, notched in the middle, which doe not lye close, but loosely as it were hanging ouer the huskes: after the flowers are past, there come heads that containe blackish seede: the roote is small, hard, white, and threadie.

11. *Muscipula Lobely sine Ben rubrum Monspeliensum*. Lobels Catch Flie.

I must needes insert this small plant, to finish this part of the Campions, whereunto it belongeth, being a pretty toye to furnish and decke out a Garden. It springeth vp (if it haue beene once sowne and suffered to shed) in the later end of the yeare most commonly, or else in the Spring with fine or six small leaues, very like vnto the leaues of Pinkes, and of the same grayish colour, but a little broader and shorter, and when it beginneth to shoote vp for flower, it beareth smaller leaues on the clammy or viscous stalkes (fit to hold any small thing that lighteth on it) being broad at the bottome compassing them, and standing two at a ioynt one against another: the toppes of the stalkes are diuersly branched into seuerall parts, euery branch hauing diuers small red flowers, not notched, but smooth, standing out of small, long, round, stript huskes, which after the flowers are past, containe small grayish seede: the roote is small, and perisheth after it hath giuen seede, but riseth (as is before said) of its owne seede, if it be suffered to shed.

The Place.

The Rose Campions, Flowers of Bristow, or None such, the Bassil Champion,

1 *Lychnis Coronaria simplex*. Single Rose Campion. 2 *Lychnis Coronaria rubra multiplex*. The double red Rose Campion. 3 *Lychnis Chalcidonica simplex*. Single Nont such, or flower of Bristow. 4 *Lychnis Chalcidonica flore pleno*. Double Nont such, or flower of Bristow. 5 *Lychnis pinnaria multiplex*. Pleasant in sight. 6 *Lychnis flugstra flore pleno rubra*. Red Bachelours Buttons. 7 *Lychnis flugstra flore pleno alba*. White Bachelours Buttons. 8 *Atropisula Lobely*. Lobels Catch Fly.

pion, and the Catch Flie, haue been sent vs from beyond the Seas, and are onely nourished vp in Gardens with vs; the other Campions that are double, haue been naturally so found double wilde (for no art or industry of man, that euer I could be assured of to be true, be it by neuer so many repetitions of transplantations, and planeticall obseruations (as I haue said in the beginning of this worke) could bring any flower, single by nature, to become double, notwithstanding many affirmations to that purpose, but whatsoever hath been found wilde to be double, nature her selfe, and not art hath so produced it) and being brought into Gardens, are there encreased by slipping, and parting the roote, because they giue no seede.

The Time.

All of them doe flower in the Summer, yet none before May.

The Names.

The first kindes are called *Lychnides satina*, and *coronaria*, in English generally Rose Campions. The next is called *Lychnis Chalcedonica*, and *Byzantina*; in English, of some Nonesuch, and of others Flower of Bristow, and after the Latine, Flower of Constantinople, because it is thought the seede was first brought from thence; but from whence the double of this kinde came, we cannot tell. The names of the others of this kinde, both single and double, are set downe with their descriptions. The feathered Campions are called *Armoraria pratensis*, and *Flos Cuculi*, and of Clusius and others thought to be *Odontitis Plinij*. Some call them in English Crow-flowers, and Cuckowe-Flowers; and some call the double hereof, The faire Maide of France. The Bassil Campions were sent ouer among many other seedes out of Italy, by the name of *Ocimoïdes arborea semper virens*, *Arborea*, because the stalke is more woody and durable then other Campions: And *semper virens*, because the leaues abide greene Winter and Summer. Clusius calleth it *Lychnis semper virens*, because it is certainly a Champion. The last is diuersly called of Authors; Lobel calleth it *Muscipula*: Others *Armoraria altera*: Dodonæus *Armerius flos quartus*. Clusius *Lychnis filacris altera*, in his Spanish obseruations, and *prima* in his History of plants, and saith, the learned of Salmantica in Spaine called it, *Bemrabrum*, as Lobel saith, they of Mompelier doe also: and by that name I receiued it first out of Italy. It hath the name of Catch Flie, of *Muscipula* the Latine word, because the stalkes in the hot Summer dayes haue a certaine viscous or clammy humour vpon them, whereby it easily holdeth (as I said before) whatsoever small thing, as Flies, &c. lighteth vpon it.

The Vertues.

We know none in these dayes, that putteth any of these to any Physicall vse, although some haue in former times.

CHAP. XXXIX.

Keiri sine Leucojum luteum. Wall-flowers, or Wall Gilloflowers.

THere are two sorts of Wall-flowers, the one single, the other double, and of each of them there is likewise some differences, as shall be shewed in their descriptions.

1. *Keiri sine Leucoium luteum simplex vulgare*. Common single Wall-flowers.

The common single Wall-flower which groweth wilde abroad, and yet is brought into Gardens, hath sundry small, narrow, long, and darke greene leaues, set without order vpon small round whitish wooddy stalkes, which beare at the tops diuers single yellow flowers one about another, euery one hauing foure leaues a peece, and of a very sweete sent: after which come long pods, containing reddish seede: the roote is white, hard and thready.

2. *Keiri sine Leucoium luteum simplex maius*. The great single Wall-flower.

There is another sort of single Wall-flower, whose leaues as well as flowers are much larger then the former: the leaues being of a darker and shining greene colour, and the flowers of a very deepe gold yellow colour, and vsually broader then a twentie shilling peece of gold can couer: the spike or toppe of flowers also much longer, and abiding longer in flower, and much sweeter likewise in sent: the pods for seede are thicker and shorter, with a small point at the end: this is flower to encrease into branches, as also to be encreased by the branches, and more tender to be preferred; for the hard frosts doe cause it to perish, if it be not defended from them.

3. *Keiri simplex flore albo*. White Wall-flower.

This Wall-flower hath his leaues as greene as the great kinde, but nothing so large: the flowers stand at the toppe, but not in so long a spike, and consisteth of foure leaues, of a very white colour, not much larger then the common kinde, and of a faint or weaker sent: the pods are nothing so great as the former great one: this is more easie to be propagated and encreased also, but yet will require some care in defending it from the colds of the Winter.

4. *Keiri sine Leucoium luteum vulgare flore pleno*. Common double Wall-flowers.

This ordinary double Wall-flower is in leaues and stalke very like vnto the first single kinde, but that the leaues hereof are not of so deepe a greene colour: the flowers stand at the top of the stalkes one about another, as it were a long spike, which flower by degrees, the lowest first, and so yppwards, by which it is a long time in flowering, and is very double, of a gold yellow colour, and very sweete.

5. *Keiri sine Leucoium luteum alterum flore pleno*. Pale double Wall-flowers.

Wee haue another sort of this kinde of double Wall-flower, whose double flowers stand not spike-fashion as the former, but more open spread, and doe all of them blowe open at one time almost, and not by degrees as the other doth, and is of a paler yellow colour, not differing in any thing else, except that the greene leaues hereof are of a little paler greene then it.

6. *Keiri sine Leucoium luteum maius flore pleno ferrugineo*.
Double red Wall-flowers.

We haue also another sort of double Wall-flower, whose leaues are as greene, and almost as large as the great single yellow kinde, or full as bigge as the leaues of the white Wall-flower: the flowers hereof are not much larger then the ordinary, but are of a darker yellow colour then the great single kinde, and of a more brownish or red colour on the vnder side of the leaues, and is as it were striped.

7. *Keiri sine Leucoium maximum luteum flore pleno*.
The greatest double yellow Wall-flower.

This great double Wall-flower is as yet a stranger in England, and therefore what I
here

here write is more vpon relation (which yet I beleue to be most true) then vpon sight and speculation. The leaues of this Wall-flower are as greene and as large, if not larger then the great single kinde: the flowers also are of the same deepe gold yellow colour with it, but much larger then any of the former double kindes, and of as sweet a sent as any, which addeth delight vnto beauty.

The Place.

The first single kind is often found growing vpon old wals of Churches, and other houses in many places of England, and also among rubbish and stones. The single white and great yellow, as well as all the other double kindes, are nourled vp in Gardens onely with vs.

The Time.

All the single kindes doe flower many times in the end of Autumne, and if the Winter be milde all the Winter long, but especially in the moneths of February, March, and Aprill, and vntill the heate of the Spring doe spend them: but the other double kindes doe not continue flowering in that manner the yeare throughout, although very early sometimes, and very late also in some places.

The Names.

They are called by diuers names, as *Viola latea*, *Leucoium luteum*, and *Keiri*, or *Cheiri*, by which name it is chiefly knowne in our Apothecaries shops, because there is an oyle made thereof called *Cheirinum*: In English they are vsually called in these parts, Wall-flowers: Others doe call them Bee-flowers; others Wall-Gilloflowers, Winter-Gilloflowers, and yellow Srocke-Gilloflowers; but we haue a kinde of Stocke-Gilloflower that more fitly deserueth that name, as shall be shewed in the Chapter following

The Vertues.

The sweetnesse of the flowers causeth them to be generally vsed in Nose-gayes, and to decke vp houses; but physically they are vsed in diuers manners: As a Conserue made of the flowers, is vsed for a remedy both for the Appoplexie and Palsie. The distilled water helpeth well in the like manner. The oyle made of the flowers is heating and resoluing, good to ease paines of strained and pained sinewes.

CHAP. XL.

Leucoium. Stocke-Gilloflower.

THere are very many sorts of Stocke-Gilloflowers both single and double, some of the fields and mountaines, others of the Sea marshes and medowes; and some nourled vp in Gardens, and there preferred by seede or slippe, as each kinde is aptest to bee ordered. But because some of these are fitter for a generall History then for this our Garden of Pleasure, both for that diuers haue no good sent, others little or no beauty, and to be entreated of onely for the variety, I shall spare so many of them as are not fit for this worke, and onely set downe the rest.

1. *Leucoium simplex sativum diuersorum colorum*.
Garden Stocke-Gilloflowers single of diuers colours.

These single Stocke-Gilloflowers, although they differ in the colour of their flowers,

1 *Keiri sine Leucoium luteum vulgare*. Common Wall-flowers. 2 *Keiri sine Leucoium luteum minus simplex*. The great single Wall flower. 3 *Keiri sine Leucoium luteum flore pleno vulgare*. Ordinary double Wall-flowers. 4 *Keiri minus flore pleno serotino*. The great double red Wall-flower. 5 *Leucoium sativum simplex*. Single Stocke-Gilliflowers. 6 *Leucoium sativum simplex flore striato*. Single striped Stocke-Gilliflowers.

ers, yet are in leafe and manner of growing, one so like vnto another, that vntill they cometo flower, the one cannot be well knowne that beareth red flowers, from another that beareth purple; and therefore one description of the plant shall serue, with a declaration of the sundry colours of the flowers. It riseth vp with round whitish woody stalkes, two, three, or foure foot high, whereon are set many long, and not very broad, soft, and whitish or grayish Greene leaues, somewhat round pointed, and parted into diuers branches, at the toppes whereof grow many flowers, one aboue another, smelling very sweet, consisting of foure small, long, and round pointed leaues, standing in small long huskes, which turne into long and flat pods, sometimes halfe a foote long, wherein is contained flat, round, reddish seedes, with grayish ringes or circles about them, lying flat all along the middle rib of the pod on both sides: the roote is long, white, and woody, spreading diuers wayes. There is great variety in the colours of the flowers: for some are wholly of a pure white colour, others of a most excellent crimson red colour, others againe of a faire red colour, but not so bright or liuely as the other, some also of a purplish or violet colour, without any spot, marke, or line in them at all. There are againe of all these colours, mixed very variably, as white mixed with small or great spotted, strakes or lines of pure or bright red, or darke red, and white with purple spots and lines; and of cyther of them whose flowers are almost halfe white, and halfe red, or halfe white, and halfe purple. The red of both sorts, and the purple also, in the like manner spotted, striped, and marked with white, differing neyther in forme, nor substance, in any other point.

2. *Leucoium satium albido luteum simplex.*

The single pale yellow Stocke-Gilloflower.

There is very little difference in this kind from the former, for the manner of growing, or forme of leaues or flower. Only this hath greener leaues, and pale yellow almost white flowers, in all other things alike: this is of no great regard, but only for rarity, and diuersity from the rest.

3. *Leucoium Melancholicum.* The Melancholick Gentleman.

This wilde kinde of stocke gilloflower hath larger, longer and greener leaues then any of the former kindes, vneuenly gashed or sinuated on both edges lying on the ground, and a little rough or hairy withall: from among which rise vp the stalks, a yard high or more, and hairy likewise, bearing thereon here and there some such like leaues as are below, but smaller, and at the top a great number of flowers, as large or larger then any of the former single kindes, made of 4. large leaues a peece also, standing in such like long huskes, but of a darke or sullen yellowish colour: after which come long roundish pods, wherein lye somewhat long but rounder and greater seede then any stocke gilloflower, and nearer both in pod and seede vnto the *Hesperis* or Dames Violet: this perisheth not vsually after seede bearing, although sometimes it doth.

4. *Leucoium maritimum Syriacum.* Leuant stocke gilloflowers.

This kind of stocke gilloflower riseth vp at the first with diuers long and somewhat broad leaues, a little vneuenly dented or waued on the edges, which so continue the first yeare after the sowing: the stalke riseth vp the next yeare to bee two foot high or more, bearing all those leaues on it that it first had, which then do grow lesse sinuated or waued then before: at the top whereof stand many flowers, made of foure leaues a peece, of a delayed purple colour, but of a small sent which turne into very long and narrow flat pods, wherein are contained flat seed like the ordinary stocke gilloflowers, but much larger and of a darke or blackish browne colour: the roote is white, and groweth deepe, spreading in the ground, but growing woody when it is in seede, and perisheth afterwards.

5. *Leucoj alterum genus, flore tam multiplici quam simplici ex semine oriundum.*

Another sort of Stocke gilliflowers bearing as well double
as single flowers from seede.

This kinde of Stocke gilliflower differeth neyther in forme of leaues, stalkes, nor flowers from the former, but that it oftentimes groweth much larger and taller; so that whofoever shall see both these growing together, shall scarce discern the difference, onely it beareth flowers, eyther white, red or purple, wholly or entire, that is, of one colour, without mixture of other colour in them (for so much as euer I haue obserued, or could vnderstand by others) which are eyther single, like vnto the former, or very thicke and double, like vnto the next that followeth; but larger, and growing with more store of flowers on the long stalke. But this you must vnderstand withall, that those plants that beare double flowers, doe beare no seede at all, and is very seldome encreased by slipping or cutting, as the next kinde of double is: but the onely way to haue double flowers any yeare, (for this kinde dyeth euery winter, for the most part, after it hath borne flowers, and seldome is preferred) is to saue the seedes of those plants of this kinde that beare single flowers, for from that seede will rise, some that will beare single, and some double flowers, which cannot bee distinguished one from another, I meane which will be single and which double, vntill you see them in flower, or budde at the least. And this is the only way to preferue this kinde: but of the seed of the former kinde was neuer known any double flowers to arise, and therefore you must be carefull to marke this kinde from the former.

6. *Leucoium flore pleno diuersorum colorum.*

Double Stocke Gilliflowers of diuers colours.

This other kinde of Stock gilliflower that beareth onely double flowers, groweth not so great, nor spreadeth his branches so farre, nor are his leaues so large, but is in all things smaller, and lower, and yet is woody, or shrubby, like the former, bearing his flowers in the like manner, many vpon a long stalke, one aboue another, and very double, but not so large as the former double, although it grow in fertile soyle, which are eyther white, or red, or purple wholly, without any mixture, or else mixed with spots and stripes, as the single flowers of the first kinde, but more variably, and not in all places alike, neuer bearing seede, but must be encreased, only by the cutting of the young sproutes or branches, taken in a fit season: this kinde perisheth not, as the former double kinde doth, so as it bee defended in the winter from the extreame frosts, but especially from the snow falling, or at the least remaining vpon it.

7. *Leucoium satium luteum flore pleno.*

The double yellow Stocke Gilliflower.

This double yellow Stock gilliflower is a stranger in England, as far as I can learne, neyther haue I any further familiaritie with him, then by relation from Germany, where it is affirmed to grow only in some of their gardens, that are curious louers of these delights, bearing long leaues somewhat hoary or white, (and not greene like vnto the Wallflower, whereunto else it might be thought to be referred) like vnto the Stock gilliflowers, as the stalkes and branches also are, and bearing faire double flowers, of a faire, but pale yellow colour. The whole plant is tender, as the double Stock gilliflowers are, and must be carefully preferred in the winter from the coldes, or rather more then the last double, lest it perish.

The Place.

The single kindes, especially some of them, grow in Italie, and some in Greece, Candy, and the Isles adiacent, as may be gathered out of the verses in Plutarches Booke *De Amore fraterno*:

Inter

Inter Echinopodas velut, asperam & inter Ononim,

Interdam crescunt mollia Leucoia.

Which sheweth, that the soft or gentle stocke gilliflowers doe sometimes grow among rough or prickely Furse and Cammocke. The other sorts are only to be found in gardens.

The Time.

They flower in a manner all the yeare throughout in some places, especially some of the single kindes, if they stand warme, and defended from the windes and cold: the double kindes flower sometimes in Aprill, and more plentifully in May, and Iune; but the double of seed, flowreth usually late, and keepeth flowring vnto the winter, that the frostes and colde mistes doe pull it downe.

The Names.

It is called *Leucoium*, & *Viola alba*: but the name *Leucoium* (which is in English the white Violet) is referred to diuers plants; we call it in English generally, Stocke gilliflower, (or as others doe, Stocke gillouer) to put a difference betweene them, and the Gilliflowers and Carnations, which are quite of another kindred, as shall be shewne in place conuenient.

The Vertues.

These haue no great vse in Physick that I know: only some haue vsed the leaues of the single white flowred kinde with salt, to be laid to the wrests of them that haue agues, but with what good successe I cannot say, if it happen well I thinke in one (as many such things else will) it will fayle in a number.

CHAP. XLI.

1. *Hesperis, siue Viola Matronalis.* Dames Violets,
or Queenes Gilliflowers.

The ordinary Dames Violets, or Queene Gilliflowers, hath his leaues broader, greener, and sharper pointed, then the Stocke gilliflowers, and a little endented about the edges: the stalkes grow two foot high, bearing many greene leaues vpon them, smaller then those at the bottome, and branched at the toppe, bearing many flowers, in fashion much like the flowers of stocke gilliflowers, consisting of foure leaues in like manner, but not so large; of a faint purplish colour in some, and in others white, and of a pretty sweet sent, especially towards night, but in the day time little or none at all: after the flowers are past, there doe come small long and round pods, wherein is contained, in two rowes, small and long blacke seede: the roote is wholly composed of stringes or fibres, which abide many yeares, and springeth fresh stalks euery yeare; the leaues abiding all the Winter.

2. *Hesperis Pannonica.* Dames Violets of Hungary.

The leaues of this Violet are very like the former, but smoother and thicker, and not at all indented, or cut in on the edges: the flowers are like the former, but of a fullen pale colour, turning themselues, and seldome lying plaine open, hauing many purple veines, and streakes running through the leaues of the flowers, of little or no sent in the day time, but of a very sweete sent in the euening and morning; the seedes are alike also, but a little browner.

3 *Lysimachia*

1 *Leucoium Melancholicum*. Sullen Stocke-Gilliflowers. 2 *Leucoium sativum flore pleno*. Double Stocke-Gilliflowers. 3 *Leucoium sativum flore pleno*. Party coloured Stocke-Gilliflowers. 4 *Leucoium mureum Syriacum* v. *Leuane* Stocke-Gilliflowers. 5 *Hesperis vulgaris*. Dames Violets or Winter Gilliflowers. 6 *Lysimachia inter filiqua Virginiana*. The tree Primrose of Virginia. 7 *Viola Linnaria* sive *Balthasch*. The white Sattin flower.

3. *Lyfimachia lutea filiquosa Virginia*. The tree Primrose of Virginia.

Vnto what tribe or kindred I might referre this plant, I haue stood long in suspence, in regard I make no mention of any other *Lyfimachia* in this work: left therefore it should lose all place, let me ranke it here next vnto the Dames Violets, although I confesse it hath little affinity with them. The first yeare of the sowing the seede it abideth without any stalke or flowers lying vpon the ground, with diuers long and narrow pale greene leaues, spread oftentimes round almost like a Rose, the largest leaues being outermost, and very small in the middle: about May the next yeare the stalke riseth, which will be in Summer of the height of a man, and of a strong bigge size almost to a mans thumbe, round from the bottome to the middle, where it groweth crested vp to the toppe, into as many parts as there are branches of flowers, euery one hauing a small leafe at the foot thereof: the flowers stand in order one aboue another, round about the tops of the stalks, euery one vpon a short foot-stalke, consisting of foure pale yellow leaues, smelling somewhat like vnto a Primrose, as the colour is also (which hath caused the name) and standing in a greene huske, which parterth it selfe at the toppe into foure parts or leaues, and turne themselues downewards, lying close to the stalke: the flower hath some chiuies in the middle, which being past, there come in their places long and cornered pods, sharpe pointed at the vpper end, and round belowe, opening at the toppe when it is ripe into fise parts, wherein is contained small brownish seed: the roote is somewhat great at the head, and woody, and branched forth diuersly, which perisheth after it hath borne seede.

The Place.

The two first grow for the most part on Hills and in Woods, but with vs in Gardens onely.

The last, as may be well vnderstood by the title, came out of Virginia.

The Time.

They flower in May, Iune, and Iuly.

The Names.

The name of *Hesperis* is imposed by most Herbarists vpon the two first plants, although it is not certainly knowne to be the same that Theophrastus doth make mention of, in his sixth Booke and twenty fise Chapter *de causis plantarum*: but because this hath the like effectis to smell best in the euening, it is (as I said) imposed vpon it. It is also called *Viola Marina Matronalis, Hyemalis, Damascena* and *Muschatella*: In English, Dames Violets, Queens Gilloflowers, and Winter Gilloflowers.

The last hath his Latine name in the title as is best agreeing with it, and for the English, although it be too foolish I confesse, yet it may passe for this time till a fitter be giuen, vnlesse you please to follow the Latine, and call it Virginia Loose-strife.

The Vertues.

I neuer knew any among vs to vse these kindes of Violets in Physicke, although by reason of the sharpe biting taste, Dodonæus accounteth the ordinary sort to be a kinde of Rocket, and saith it prouoketh sweating, and vrine: and others affirme it to cut, digest, and cleanse tough flegme. The Virginian hath not beene vsed by any that I know, either inwardly or outwardly.

CHAP. XLII.

Viola Lunaris sine *Bolbonach*. The Sattin flower.

Vnto the kindes of Stocke-Gilloflowers I thinke fittest to adioyne these kindes of Sattin-flowers, whereof there are two sorts, one frequent though in all our Countrey, the other is not so common.

1. *Viola Lunaris vulgaris*. The common white Sattin flower.

The first of these Sattin flowers, which is the most common, hath his leaues broad belowe, and pointed at the end, snipt about the edges, and of a darke greene colour: the stalkes are round and hard, two foot high, or higher, diuided into many branches, set with the like leaues, but smaller: the tops of the branches are beset with many purplish flowers, like vnto Dames Violets, or Stocke-Gilloflowers, but larger, being of little sent: after the flowers are past, there come in their places round flat thin cods, of a darke colour on the outside, but hauing a thinne middle skinne, that is white and cleare shining, like vnto very pure white Sattin it selfe, whereon lye flat and round brownish seede, somewhat thicke and great: the rootes perish when they haue giuen their seede, and are somewhat round, long, and thicke, resembling the rootes of *Lilium non bulbosum*, or Day Lilly, which are eaten (as diuers other rootes are) for Sallets, both in our owne Countrey, and in many places beside.

2. *Viola Lunaris altera seu peregrina*. Long liuing Sattin flower.

This second kinde hath broader and longer leaues then the former, the stalkes also are greener and higher, branching into flowers, of a paler purple colour, almost white, consisting of foure leaues in like manner, and smelling pretty sweete, bearing such like pods, but longer and slenderer then they: the rootes are composed of many long strings, which dye not as the former, but abide, and shoot out new stalkes euery yeare.

The Place.

The first is (as is said) frequent enough in Gardens, and is found wilde in some places of our owne Countrey, as Master Gerard reporteth, whereof I neuer could be certainly assured, but I haue had it often sent mee among other feedes from Italy, and other places. The other is not so common in Gardens, but found about Watford, as he saith also.

The Time.

They flower in Aprill or May, and sometimes more early.

The Names.

It hath diuers names, as well in English as in Latine, for it is called most vsually *Bolbonach*, and *Viola Lunaris*: Of some *Viola latifolia*, and of others *Viola Peregrina*, and *Lunaria Græca*, *Lunaria maior*, and *Lunaria odorata*, and is thought to be *Thlaspi Cratæna*: In English, White Satten, or Satten flower: Of some it is called Honesty, and Penny-flower.

The Vertues.

Some doe vse to eate the young rootes hereof, before they runne vnto flower, as Rampions are eaten with Vinegar and Oyle, but wee know no Physicall vse they haue.

CHAP. XLIII.

Linum filueſtre & Linaria. Wilde Flaxe and Tode Flaxe.

Although neither the manured Line or Flaxe is a plant fit for our Garden, nor many of the wilde ſorts; yet there are ſome, whoſe pleaſant and delightfull aſpect doth entertaine the beholders eyes with good content, and thoſe I will ſet downe here for varietie, and adioyne vnto them ſome of the *Linarias*, or Tode Flaxe, for the neare affinity with them.

1. *Linum filueſtre flore albo.* Wilde Flaxe with a white flower.

This kinde of wilde Flaxe riſeth vp with diuers ſlender branches, a foote high or better, full of leaues, ſtanding without order, being broader and longer then the manured Flaxe: the tops of the branches haue diuers faire white flowers on them, compoſed of ſiue large leaues a peece, with many purple lines or ſtrikes in them: the ſeede yeſſell as well as the ſeede, is like vnto the heads and ſeede of the manured Flaxe: the rootes are white ſtrings, and abide diuers yeares, ſpringing freſh branches and leaues euery yeare, but not vntill the Spring of the yeare.

2. *Linum filueſtre lateum.* Wilde Flaxe with a yellow flower.

This wilde Flaxe doth ſo well reſemble a kinde of St. Iohns wort, that it will ſoone deceiue one that doth not aduifedly regard it: For it hath many reddiſh ſtalkes, and ſmall leaues on them, broader then the former wilde Flaxe, but not ſo long, which are well ſtored with yellow flowers, as large as the former, made of ſiue leaues a peece, which being paſt, there come ſmall flattiſh heads, containing blackiſh ſeede, but not ſhining like the former: the rootes hereof dye not euery yeare, as many other of the wilde kindes doe, but abide and ſhoote out euery yeare.

3. *Linaria purpurea.* Purple Tode Flaxe.

This purple Tode Flaxe hath diuers thicke, ſmall, long, and ſomewhat narrowiſh leaues, ſnipt about the edges, of a whitish Greene colour, from among which riſe vp diuers ſtalkes, replenished at the tops with many ſmall flowers, ſtanding together one aboue another ſpike-ſaſhion, which are ſmall and ſomewhat ſweete, while they are freſh, faſhioned ſomewhat like the common Tode flaxe that groweth wilde abroad almoſt euery where, but much ſmaller, with a gaping mouth, but without any crooked ſpurre behinde, like vnto them, ſometimes of a ſad purple neare vnto a Violet, and ſometimes of a paler blew colour, hauing a yellow ſpot in the middle or gaping place: after the flowers are paſt, there come ſmall, hard, round heads, wherein are contained ſmall, flat, and grayiſh ſeede: the roote is ſmall, and periiſheth for the moſt part euery yeare, and will ſpring againe of it owne ſowing, if it be ſuffered to ſhed it ſelfe, yet ſome hard Winters haue killed the ſeede it ſhould ſeeme, in that ſometimes it faileth to ſpring againe, and therefore had neede to be ſowne anew in the Spring.

4. *Linaria purpurea odorata.* Sweete purple Tode Flaxe.

The lower leaues of this purple Tode Flaxe are nothing like any of the reſt, but are long and broad, endented about the edges, ſomewhat reſembling the leaues of the greater wilde white Daiſie: the ſtalke is ſet at the bottome with ſuch like leaues, but a little more diuided and cut in, and ſtill ſmaller and ſmaller vpward, ſo that the vppermoſt leaues are very like the common Tode Flaxe, the toppe whereof is branched, hauing diuers ſmall flowers growing along vpon them, in faſhion and colour almoſt like the laſt deſcribed Tode Flaxe, but not altogether ſo deepe a purple: the heads and ſeedes are very like the former, but that the ſeede of this is reddiſh: the flowers

1 *Linum filustre flore albo*. Wilde Flaxe with a white flower. 2 *Linaria purpurea sine carulea*. Purple Tode Flaxe. 3 *Linaria purpurea odorata*. Sweete purple Tode Flaxe. 4 *Scoparia sine Beluidere Italorum* Broome Tode Flaxe. 5 *Antirrhinum mame*. The greater Snapdragon. 6 *Chamenerium flore delphiny*. The willowe flower.

in their naturall hot Countries haue a fine sent, but in these colder, little or none at all: the rootes are small and threadie, and perish after they haue flowred and seeded.

5. *Linaria Valentina*. Tode Flaxe of Valentia.

This Spanish Tode Flaxe hath three or foure thicker and bigger stalkes then the former, bearing small broad leaues, like vnto the small Centory, two or three together at a ioynt, round about the lower end of the stalkes, but without any order vpwards, at the toppes whereof stand many flowers, in fashion like vnto the common kinde, and almost as large, of a faire yellow colour, but the gaping mouth is downie, and the spurre behinde of a purplish colour.

6. *Scoparia sine Beluidere Italarum*. Broome Tode Flaxe.

Although this plant haue no beautifull flowers, yet because the greene plant full of leaues is so delightfull to behold, being in Italy and other places planted not onely in their Gardens, but set likewise in pots to furnish their Windowes, and euen with vs also hath growne to be so dainty a greene bush, that I haue thought it worthy to be among the delights of my Garden; the description whereof is as followeth: This pleasant Broome Flaxe riseth vp most vsually with one straight vpriht square stalke, three foote and a halfe high or better in our Gardens, branching it selfe out diuers waies, bearing thereon many long narrow leaues, like the Garden Line or Flaxe, very thicke set together, like vnto a bush, or rather like vnto a faire greene Cypresse tree, growing broad belowe, and spire-fashion vpwards, of a very faire greene colour: at the seuerall ioynts of the branches, towards the tops, and among the leaues, there come forth small reddish flowers, not easily seene nor much regarded, being of no beauty, which turne into small round blackish gray feede: the rootes are a number of blackish strings set together, and the whole plant perisheth euery yeare at the first approach of any cold ayre, as if it neuer had beene so faire a greene bush.

The Place.

These kindes of wilde Flaxe doe growe naturally in diuers places, some in Germany, some in Spaine, and some in Italy. Those that delight in the beauty of natures variety, doe preferue them, to furnish vp the number of pleasant aspects.

The Time.

They all flower in the Summer moneths, and soone after perfect their feede.

The Names.

Their names are sufficiently expressed in their titles, yet I must giue you to vnderstand, that the last is called of some *Linaria magna*, and of others *Osyris*.

The Vertues.

The wilde Flaxe hath no medecinable vertue appropriate vnto it that is knowne. The Tode Flaxe is accounted to be good, to cause one to make water.

CHAP. XLIIII.

Antirrhinum. Snapdragon.

THere is some diuersity in the Snapdragons, some being of a larger, and others of a lesser stature and bignesse; and of the larger, some of one, and some of another colour, but because the small kindes are of no beautie, I shall at this time onely entreate of the greater sorts.

1. *Antirrhinum album*. White Snapdragon.

The leaues of these Snapdragons (for I doe vnder one description comprehend the rest) are broader, longer, and greener then the leaues of the Garden Flaxe, or of the wilde Flaxe set confusedly vpon the tender greene branches, which are spread on all sides, from the very bottome, bearing at the toppes many flowers, somewhat resembling the former Tode Flaxe, but much larger, and without any heele or spur, of a faire white colour, with a yellow spot in the mouth or gaping place: after the flowers are past, there come vp in their places hard round seede vessels, fashioned somewhat like vnto a Calues head, the snout being cut off, wherein is contained small blacke seede: the rootes are many white strings, which perish in most places after they haue giuen seede, notwithstanding any care or paines taken with them to preferue them aliue, and yet they will abide in some places where they are defended in the Winter.

2. *Antirrhinum purpureum sine roscum*. Purple Snapdragon.

The purple Snapdragon is in stalkes, leaues, and flowers altogether like the former, and as large and great in euery part, or greater; the only difference is, that this beareth pale Stammell, or Rose coloured flowers, with a yellow spot in the mouth, and sometimes of a paler colour, almost blush.

3. *Antirrhinum variegatum*. Variable Snapdragon.

This variable kinde is somewhat lesse, and tenderer then the last described, hauing also a reddish or blush coloured flower, lesser then the former, but much bigger then the middle kinde of Snapdragon (which is not set downe in this worke) the yellow spot in the mouth of it hath some white about it, and extending to both sides of the spot: the heads and seede are like the former: the rootes are smaller, but neuer will abide after they haue giuen flowers and seede.

4. *Antirrhinum luteum*. Yellow Snapdragon.

There is likewise another of these kindes, that beareth leaues as large as any of the former, & very faire yellow flowers, as large likewise as they, not differing in any thing else from the first; let not any therefore imagine this to be a *Linaria* or Tode Flaxe: for all parts are answerable vnto the Snapdragons.

The Place.

All these are nourished with vs in our Gardens, although in Spaine and Italy they are found growing wilde.

The Time.

They flower for the most part the second year after the sowing, from Aprill vntill Iuly, and the seede is quickly ripe after.

The Names.

The name *Antirrhinum* is vsually giuen to this plant, although it fully agreeth not eyther with the description of Dioscorides, or Theophrastus: It hath also diuers other names in Latine, as *Orontium*, *Canis cerebrum* Or *Leonis*, *Leo herba*, &c. In English Calues snout, from the forme of the seede vessels, and Snapdragon, or Lyons mouth, from the forme of the flowers.

The Vertues.

They are seldome or neuer vsed in Physicke by any in our dayes.

CHAP. XLV.

Chamaenerium flore delphinij. The Willowe flower.

THis plant riseth vp with many strong, woddy, round, brownish great stalkes, three or foure foote high, beset here and there without order, with one broad and long whitish Greene leafe at a ioynt, somewhat like vnto a *Lysimachia*, or Willow herbe, as also vnto a Peach leafe, but larger and longer: at the toppe of the branches stand many flowers one about another, of a pale reddish purple colour, consisting of five leaues, spread open with an heele or spurre behind them, with many yellow threads in the middle, much larger then any flower of the Larkes spurres, and smelling somewhat sweete withall; it beareth a shew of long pods with seede, but I could neuer obserue the seede: the rootes are like the rootes of *Lysimachia*, or the ordinary yellow Loose-strife, or Willowe herbe, but greater: running and spreading vnder ground, and shooting vp in many places, whereby it filleth a ground that it likes quickly: the stalkes dye downe euery yeare, and spring againe in many places farre asunder.

The Place.

Wee haue not knowne where this Willowe flower groweth naturally, but we haue it standing in an out corner of our Gardens, to fill vp the number of delightfull flowers.

The Time.

It flowreth not vntill May, and abideth a long while flowring.

The Names.

It may seeme to diuers, that this is that plant that Dodonæus called *Pseudolysimachium purpureum minus*, and Lobel seemeth by the name of *Delphinium buccinum* to aime at this plant, but withall calleth it *Chamaenerium Gesneri*, and giueth the same figure that Dodonæus hath for his *Pseudolysimachium*: But that is one kinde of plant (which hath smaller and shorter stalkes, and very narrow long leaues, whose flowers stand vpon long slender cods, full of downe, with reddish seede, like vnto the *Lysimachia filiquosa siluestris*, and rootes that abide many yeares, but creepe not) and this is another, much greater, whose true figure is not extant in any Author that I know. It is vsually called *Chamaenerium flore delphinij*; but the name of *Delphinium buccinum* in my minde may not so conueniently be applyed vnto it. It is called in English, The Willowe flower, for the likenesse of the leaues, and the beauty and respect of the flowers.

The

The Vertues.

There is no vse hereof in Physicke that euer I could learne, but is onely cherished among other sorts of flowers, that serue to decke and set forth a Garden of varieties.

CHAP. XLVI.

Aquilegia. Colombrines.

THere are many sorts of Colombrines, as well differing in forme as colour of the flowers, and of them both single and double carefully nourished vp in our Gardens, for the delight both of their forme and colours.

1. *Aquilegia vulgaris flore simplici*. Single Colombrines.

Because the whole difference of these Colombrines standeth in the varieties of the forme, and colour of the flowers, and little in the leaues, I shall not neede to make any repetitions of the description of them, seeing one onely shall suffice for each peculiar kinde. The Colombrine hath diuers large spread leaues, standing on long stalkes: euery one diuided in seuerall partitions, and roundly ended about the edges, in colour somewhat like the leaues of Celondine, that is, of a darke blewish Greene colour: the stalkes rise vp sometimes two or three foote high, diuided vsually into many branches, bearing one long diuided leafe at the lower ioynt, aboue which the flowers growe, euery one standing on a long stalke, consisting of fine hollow leaues, crooked or horned at the ends, turning backward, the open flower shewing almost like vnto a Cinquefoile, but more hollow: after the flowers are past, there arise small long cods, foure or fine together, wherein are contained blacke shining seede: the rootes are thicke and round, for a little space within the ground, and then diuided into branches, ending in many small fibres, abiding many yeares, and shooting a fresh euery Spring from the round heads, that abide all the Winter. The variety of the colours of these flowers are very much, for some are wholly white, some of a blew or violet colour, others of a bluish or flesh colour, or deepe or palered, or of a dead purple, or dead murrey colour, as nature listeth to shew it selfe.

2. *Aquilegia vulgaris flore pleno*. Double Colombrines.

The double Colombrines differ not in leafe or manner of growing from the single, so that vntill they come to flower, they cannot bee discerned one from another; the onely difference is, it beareth very thicke and double flowers, that is, many horned or crooked hollow leaues set together, and are not so large as the leaues of the single flowers. The variety of colours in this double kinde is as plentifull, or rather more then in the single; for of these there is party coloured, blew and white, and spotted very variably, which are not in the single kinde, and also a very deepe red, very thicke and double, but a smaller flower, and lesse plentifull in bearing then many of the other double sorts. These double kindes doe giue as good seede as the single kindes doe, which is not obserued in many other plants.

3. *Aquilegia innerfis corniculis*. Double inuerted Colombrines.

These Colombrines are not to be distinguished eyther in roote, leaues, or seed from the former, the flowers onely make the difference, which are as double as the former, but that the heeles or hornes of these are turned inward, and stand out in the middle of the flowers together: there is not that plentifull variety of colours in this kinde, as there is in the former: for I neuer saw aboue three or foure seuerall colours in this kinde,

kinde, that is, white, purplish, reddish, and a dun or darke ouerworne purplish colour. These double flowers doe likewise turne into pods, bearing seede, continuing his kind, and not varying into the former.

4. *Aquilegia Rosea*. Rose Colombine.

F. The leaues and other parts of this kinde of Colombine, differ little or nothing from the former, the diuersitie consisteth likewise in the flowers, which although they stand in the same manner seuerally vpon their small stalkes, somewhat more sparingly then the former doe, yet they haue no heeles or hornes, eyther inward or outward, or very seldome, but stand sometimes but with eight or tenne smooth small plaine leaues, set in order one by one in a compasse, in a double rowe, and sometimes with foure or fiue rowes of them, euery one directly before the other, like vnto a small thick double Roselayd open, or a spread Marigold: yet sometimes it happeneth, that some of these flowers will haue two or three of the first rowes of leaues without any heele, and the rest that are inward with each of them a peece of a small horne at them, as the former haue: the colours of these flowers are almost as variable, and as variably mixed as the former double kindes. This likewise giueth seede, preserving his owne kinde for the most part.

5. *Aquilegia degener*. Degenerate Colombine.

This kinde of Colombine might seeme to some, to bee but a casuall degeneration, and no true naturall kinde, happening by some cause of transplanting, or otherwise by the art of man: but I haue not so found it, in that it keepeth, and holdeth his own proper forme, which is like vnto the double Rose Colombine, but that the outermost row of leaues are larger then any of the rest inwardes, and is of a greenish, or else of a purplish Greene colour, and is not altogether so apt to giue good seed like the former.

The Place.

The single kindes haue beene often found in some of the wooddy mountaines of Germany, as Clusius saith, but the double kindes are chiefly cherished in gardens.

The Time.

They flower not vntill May, and abide not for the most part when Iune is past, and in the meane time perfecteth their seede.

The Names.

Costaeus doth call this plant *Pathos* of Theophrastus, which Gaza translates *Desiderium*. Dalechampius vpon Athenæus, calleth it *Diosanthos*, or *Iouis flos* of Theophrastus, who in his sixth Booke and senenth Chapter reckoneth them both, that is, *Diosanthos* and *Pathos*, to be Summer flowers, but seuerally. Dodonæus *Leoberba*, and Gesner *Leontostomium*. Fabius Columna in his *Phytobasanos*, vnto whom Clusius giueth the greatest approbation, referreth it to the *Isohyrum* of Dioscorides. All later Writers doe generally call it, eyther *Aquileia*, *Aquilina*, or *Aquilegia*; and we in English, generally (I thinke) through the whole Countrey, Colombine. Some doe call the *Aquilegia rosea*, *Aquilegia stellata*, The starre Colombine, because the leaues of the flowers doe stand so directly one by another, besides the doubleness, that they somewhat represent eyther a Rose or a Starre, and thereupon they giue it the name eyther of a Starre or Rose.

The Vertues.

Some in Spaine, as Camerarius saith, vse to eate a peece of the roote here-
of

1 *Aquilegia simplex*. The single Colombine. 2 *Aquilegia flore multiplici*. The double Colombine. 3 *Aquilegia versicolor*. The party coloured Colombine. 4 *Aquilegia inuervis corniculis*. The double inuervt Colombine. 5 *Aquilegia Rosa sine Stellata*. The Rose or the Starre Colombine. 6 *Thalictrum Hispanicum album*. White Spanish tufts.

of fasting, many dayes together, to helpe them that are troubled with the stone in the kidneyes. Others vse the decoction, of both herbe and roote in wine, with a little Ambargrife, against those kinds of swoonings, which the Greekes call *adynamia*. The seede is vsed for the iaundise, and other obstructions of the liuer. Clusius writeth from the experience of Franciscus Rapard, a chiefe Physician of Bruges in Flanders, that the seede beaten and drunke is effectuall to women in trauell of childe, to procure a speedy deliuerie, and aduiseeth a second draught thereof should betaken if the first succede not sufficiently.

CHAP. XLVII.

Thalictrum Hispanicum. Spanish Tufts, or Tufted Colombines.

FROM among the diuersities of this plant, I haue selected out two sorts for this my garden, as hauing more beautie then all the rest; leauing the other to be entreated of, where all in generall may be included. I haue in this place inserted them, for the likenesse of the leaues only, being in no other part correspondent, and in a Chapter by themselves, as it is most fit.

Thalictrum Hispanicum album. White Spanish tufted Colombines.

These plants haue both one forme, in roote, leafe and flower, and therefore neede but one description. The leaues are both for colour and forme so like vnto Colombines leaues (although lesser and darker, yet more spread, and on larger stalkes) that they may easily deceiue one, that doth not marke them aduisedly; for the leaues are much more diuided, and in smaller parts, and not so round at the ends: the stalkes are round, strong, and three foote high at the least, branching out into two or three parts, with leaues at the seuerall ioynts of them, at the toppes whereof stand many flowers, which are nothing but a number of threads, made like vnto a small round tuft, breaking out of a white skinne, or leafe, which incloseth them, and being vnblowne, shew like vnto little buttons: the colour of these threds or tufts in this are whitish with yellow tips on them, and somewhat purplish at the bottome, hauing a strong but no good sent, and abiding in their beautie (especially if they grow in the shade, and not too hot in the sun) a great while, and then fall away, like short downe or threds: the seed vessels are three square, containing small, long, and round seede; the rootes are many long yellow stringes, which endure and encrease much.

Thalictrum Montanum purpureum. Purple tufted Colombines.

This purple tufted Colombine differeth onely from the former, in that it is not so high nor so large, and that the colour of the flower or tuft is of a blewish purple colour with yellow tips, and is much more rare then the other.

The Place.

These grow both in Spaine and Italie.

The Time.

They flower in the end of May, or in Iune, and sometime later.

The Names.

Some doe call them *Thaliotrum*, and some *Thalictrum*. Others *Ruta palustris*, and *Ruta pratensis*, and some *Rhabarbarum Adonachorum*, or *Pseudorhabarbarum*.

rhubarbarum, by reason that the rootes being yellow, haue an opening qualitie, and drying as Rubarbe. In English what other fit Names to giue these then I haue expressed in the titles, I know not.

The Vertues.

The are a little hot and drying withall, good for old Vicers, as Dioscorides saith, to bring them to cicatrising: in Italy they are vsed against the Plague, and in Saxony against the Jaundise, as Camerarius saith.

CHAP. XLVIII.

Radix cana. Hollow roote.

The likenesse of the leaues likewise of this plant with Colombine, hath caused mee to insert it next the other, and although some of this kinde bee of small respect, being accounted but foolish, yet let it fill vp a waste corner, that so no place be vnfurnished.

1. *Radix Cana maior flore albo*. The white Hollow roote.

The leaues of this hollow roote breake not out of the ground, vntill the end of March, or seldome before, and are both for proportion and colour somewhat like vnto the leaues of Colombine, diuided into fise parts, indented about the edges, standing on small long footestalkes of a whitish Greene colour, among which rise vp the stalkes, without any leaues from the bottome to the middle, where the flowers shoote forth one aboue another, with euery one a small short leafe at the foote thereof, which are long and hollow, with a spurre behinde it, somewhat like vnto the flowers of Larckes spurres, but hauing their bellies somewhat bigger, and the mouth not so open, being all of a pure white colour: after the flowers are past, arise small long and round cods, wherein are contained round blackish seede: the roote is round and great, of a yellowish browne colour on the outside, and more yellow within, and hollow vnderneath, so that it seemeth but a shell: yet being broken, euery part will grow: it abideth Greene aboue ground but a small time.

2. *Radix Cana maior flore carneo*. Blush coloured Hollow roote.

The blush Hollow roote is in all things like vnto the former, but onely that the flowers hereof are of a delayed red or purple colour, which we call blush: and sometimes of a very deepe red or purple colour; but very rare to meete with.

3. *Radix Cana minor, seu Capnos fabacea radice*. Small hollow roote.

This small kinde hath his leaues of a blewish Greene colour, yet greener and smaller then the former, growing more thicke together: the flowers are like in proportion vnto the former in all respects, but lesser, hauing purplish backs, and white bellies: standing closer and thicker together vpon the short stalkes: the roote is solid or firme, round and a little long withall, two being vsually ioyned together, yellowish both within and without: but I haue seene the dry roots that came from beyond Sea hither, that haue beene as small as hasell nuts, and somewhat flat with the roundnesse, differing from those that growe with vs, whether the nature thereof is to alter by manuring, I know not.

The Place.

The greater kinds Clusius reporteth he found in many places of Hungarie,

rie, and the other parts neere thereunto: the lesser in the lower Germany, or Low Countries, as we call them.

The Time.

These are most truly to bee reckoned Vernall plants, for that they rise not out of the ground vntill the Spring bee come in, and are gone likewise before it be past, remaining vnder ground all the rest of the yeare, yet the lesser abideth longer above ground then the greater.

The Names.

Concerning the formier of these, there is a controuersie among diuers, whether it should be *Thesium* of Theophrastus, or *Eriphium* of Galen, but here is no fit place to trauesse those opinions. Some would haue it to bee *Corydalis*, and some referre it to Plinie his *Capnos Cheledonia*, for the likenesse it hath both with Fumeterie and Celandine. It is generally called of all moderne Writers, *Radix Cana*, and we in English thereafter, Hollow roote. The lesser for the firmenesse of his round roote, is vsually called, *Capus fabacea radice*, and the Dutch men thereafter, *Boonkens Hollwortel*: we of the likenesse with the former, doe call it the lesse Hollow roote.

The Vertues.

Some by the bitternesse doe coniecture (for little prooffe hath beene had thereof, but in outward cases) that it clenseth, purgeth, and dryeth withall.

CHAP. XLIX.

Delphinium. Larkes heeles.

OF Larkes heeles there are two principall kindes, the wilde kinde, and the tame or garden; the wilde kinde is of two sorts, one which is with vs nourished vp chiefly in gardens, and is the greatest; the other which is smaller and lower, often found in our plowed landes, and elsewhere: of the former of these wilde sorts, there are double as well as single: and of the tame or more vpright, double also and single: and of each of diuers colours, as shall be set downe.

1. *Delphinium maius sine vulgare*. The ordinary Larkes heeles.

Varietas.

The common Larkes heele spreadeth with many branches much more ground then the other, rather leaning or bending downe to the ground, then standing vpright, whereon are set many small long Greene leaues, finely cut, almost like Fennell leaues: the branches end in a long spike of hollow flowers, with a long spurre behinde them, very like vnto the flowers of the Hollow roote last described, and are of diuers seuerall colours, as of a blewish purple colour, or white, or ash colour or red, paler or deeper, as also party coloured of two colours in a flower: after the flowers are past, (which in this kinde abide longer then in the other) there come long round cods, containing very blacke seede: the root is hard after it groweth vp to seede, spreading both abroad and deepe, and perisheth euery yeare, vsually raising it selfe from it own sowing, as well as from the seede sown in the spring time.

2. *Delphinium vulgare flore pleno*. Double common Larkes heeles.

Of this vulgar kinde there is some difference in the flower, although in nothing else: the flowers stand many vpon a stalke like the former, but euery one of them are as if three

three or foure small flowers were ioyned together, with euery one his spurre behinde, the greatest flower being outermost, and as it were containing the rest, which are of a pale red, or deepe bluish colour: Another of this kinde will beare his flowers with three or foure rowes of leaues in the middle, making a double flower with one spurre behinde onely: and of this kinde there is both with purple, blew, bluish, and white flowers, and party coloured also; these doe all beare seed like the single, wherby it is encreased euery yeare.

3. *Delphinium arnense*. Wilde Larkes spurres.

This wilde Larkes spurre hath smaller and shorter leaues, smaller and lower branches, and more thinly or sparsedly growing vpon them, then any of the former: the flowers likewise are neyther so large as any of the former, nor so many growing together, the cods likewise haue smaller feede, and is harder to grow in gardens then any of the former, the most vsuall colour hereof is a pale reddish or bluish colour; yet sometimes they are found both white and blew, and sometimes mixt of blew and bluish, variably disposed, as nature can when she listeth; but are much more rare.

4. *Delphinium elatius flore simplici diuersorum colorum*.

Single vpright bearing Larkes heeles of many colours.

The difference betwene this and the last is, that the leaues of this are not fully so Greene, nor so large; the stalkes grow vpright, to the height of a man, and sometimes higher, hauing some branches thereon, but fewer then the former, and standing likewise vpright, and not leaning downe as the former: the toppes of the stalkes are better stored with flowers then the other, being sometimes two foote long and aboue, of the same fashion, but not altogether so large, but of more diuers and several colours, as white, pale, bluish, redde deeper or paler, aske coloured, purple or violet, and of an ouerworne blewish purple, or iron colour: for of all these we haue simple, without any mixture or spot: but we haue other sorts, among the simple colours, that rise from the same feede, and will haue flowers that wil be halfe white, and halfe bluish or purple, or one leafe white, and another bluish or purple, or else variably mixed and spotted: the feede and feede vessels are like the former but larger and harder.

5. *Delphinium elatius flore pleno diuersorum colorum*.

Double vpright Larkes heeles of many colours.

These double Larkes heeles cannot bee knowne from the single of the same kinde, vntill they come towards flowering; for there appeare many flowers vpon the stalkes, in the same manner, and of as many colours almost as of the single, except the party coloured, which stand like little double Roses, layd or spread broad open, as the Rose Colombine without any heeles behinde them, very delightfull to behold, consisting of many small leaues growing together, and after they are fallen there come vp in their places three or foure small cods set together, wherein is contained here and there (for all are not full of feede, as the single kindes) blacke feede, like vnto all the rest, but smaller, which being sown will bring plants that will beare both single and double flowers againe, and it often happeneth, that it variably altereth in colours from it owne sowing: for none of them hold constantly his owne colour, (so farre as euer I could obserue) but fall into others as nature pleaseth.

6. *Delphinium Hispanicum paruum*. Spanish wilde Larkes spurres.

This small Larkes spurre of Spaine, hath diuers long and broad leaues next the ground, cut-in on both sides, somewhat like vnto the leafe of a Scabious, or rather that kinde of Stoebe, which Lobel calleth *Crupina*, for it doth somewhat neerly resemble the same, but that this is smooth on the edges, and not indented besides the cuts, as the *Crupina* is, being of a whitish Greene colour, and somewhat smooth and soft in handling: among the leaues riseth vp a whitish Greene stalke, hauing many smaller
Aa leaues

leaves vpon it that grow belowe, but not diuided, branching out into many small stalkes, bearing flowers like vnto the wilde Larkes heeles, but smaller, and of a bleake blewish colour, which being past, there come vp two or three small cods ioyned together, wherein is blacke seede, smaller and rounder then any of the former: the roote is small and thready, quickly perishing with the first cold that ouertaketh the plant.

The Place.

The greatest or first wilde kinde growe among corne in many countries beyond the Seas, and where corne hath bene sowne, and for his beauty brought and nourished in our Gardens: the lesser wilde kinde in some fields of our owne Country. The Spanish kinde likewise in the like places, which I had among many seedes that Guillaume Boel brought mee out of Spaine. The first double and single haue been common for many yeares in all countries of this Land, but the tall or vpright single kinde haue been entertained but of late yeares. The double kinde are more rare.

The Time.

These flower in the Summer onely, but the Spanish wilde kinde flowreth very late, so that oftentimes in our Country, the Winter taketh it before it can giue ripe seede: the double kinde, as well the vpright as the ordinary or wilde, are very choise and dainty many times, not yeelding good seede.

The Names.

They are called diuersly by diuers Writers, as *Consolida regalis*, *Calcaris flos*, *Flos regius*, *Buccinum Romanorum*, and of Matthiolus, *Cuminum siluestre alterum Dioscoridis*: but the most vsuall name with vs is *Delphinium*: but whether it be the true *Delphinium* of Dioscorides, or the Poets Hyacinth, or the flower of Ajax, another place is fitter to discusse then this. Wee call them in English Larkes heeles, Larkes spurres, Larkes toes or clawes, and Monkes hoods. The last or Spanish kinde came to mee vnder the name of *Delphinium latifolium trigonum*, so stiled eyther from the diuision of the leaves, or from the pods, which come vsually three together. Bauhinus vpon Matthiolus calleth it, *Consolida regalis peregrina parua flore*.

The Vertues.

There is no vse of any of these in Physicke in these dayes that I know, but are wholly spent for their flowers sake.

CHAP. L.

Balsamina femina. The Female Balsam Apple.

I haue set this plant in this place, for some likenesse of the flower, rather then for any other comparison, euen as I must also with the next that followeth. This plant riseth vp with a thicke round reddish stalke, with great and bunched ioynts, being tender and full of iuice, much like to the stalke of Purflane, but much greater, which brancheth it selfe forth from the very ground, into many stalkes, bearing thereon manie long Greene leaves, snipt about the edges, very like vnto the Almond or Peach tree leaves; among which from the middle of the stalkes vpwards round about them, come forth vpon seuerall small short foot-stalkes many faire purplish flowers, of two or three colours in them, fashioned somewhat like the former Larkes heeles, or Monkes hoods, but that they are larger open at the mouth, and the spurres behinde crooke or bend downewards; after the flowers are past, there come in their places round rough heads,

1 *Radix Cane maior flore albo*. The white flowered Hollow rocer. 2 *Cepus sabaccaradix*. The small Hollow rocer. 3 *Delphinium flore simpliciter*. Single Larkspur. 4 *Delphinium vulgare flore medio duplici*. Larkspurs double in the middle. 5 *Delphinium vulgare flore pleno*. Common Larkspurs double. 6 *Delphinium elatum flore pleno*. Double upright Larkspurs. 7 *Delphinium Hispanicum parvum*. Small Spanish Larkspurs. 8 *Balsamina fœmina*. The Female Balsam apple. 9 *Nesfartium Indicum*. Indian Crecks, or yellow Larkspurs.

heads, pointed at the end, greene at the first, and a little yellower when they bee ripe, containing within them small round blackish seede, which will soone skippe out of the heads, if they be but a little hardly pressed betweene the fingers: the rootes spread themselues vnder ground very much from the toppe, with a number of small fibres annexed thereunto: this is a very tender plant, dying euery yeare, and must bee sowne carefully in a pot of earth, and tended and watered in the heate of Summer, and all little enough to bring it to perfection.

The Place.

Wee haue alwaies had the seede of this plant sent vs out of Italy, not knowing his originall place.

The Time.

It flowreth from the middle of Iuly, to the end of August: the seed doth seldome ripen with vs, especially if the Summer be backward, so that wee are oftentimes to seeke for new and good seede from our friends againe.

The Names.

Some vse to call it *Charantia femina*, *Balsamina femina*, *Balsamella*, and *Anguillara*, *Herba Sancta Katharina*. We haue no other English name to call it by, then the Female Balsame Apple, or *Balsamina*.

The Vertues.

Some by reason of the name, would attribute the property of Balme vnto this plant, but it is not sufficiently knowne to haue any such; yet I am well perswaded, there may bee some extraordinary quality in so beautifull a plant, which yet lyeth hid from vs.

CHAP. LI.

Nasturtium Indicum. Indian Cresses, or yellow Larkes heeles.

THe likenesse (as I said before) of this flower likewise, hauing spurres or heeles maketh me ioyne it with the rest, which is of so great beauty and sweetnesse withall, that my Garden of delight cannot bee vnfurnished of it. This faire plant spreadeth it selfe into very many long trayling branches, enterlaced one within another very confusedly (yet doth it not winde it selfe with any claspers about either pole or any other thing, but if you will haue it abide close thereunto, you must tye it, or else it will lye vpon the ground) foure or fise foot in length at the least, whereby it taketh vp a great deale of ground: the leaues are smooth, greene, and as round as the Penniwort that groweth on the ground, without any cut or incisure therein at all in any part, the stalkes whereof stand in the middle of each leafe, and stand at euery ioynt of the stalke, where they are a little reddish, and knobbed or bunched out: the flowers are of an excellent gold yellow colour, and grow all along these stalkes, almost at euery ioynt with the leaues, vpon pretty long foote-stalkes, which are composed of fise leaues, not hollow or gaping, but standing open each leafe apart by it selfe, two of them, that be larger and longer then the other, stand aboue, and the other two that are lesser belowe, which are a little iagged or bearded on both sides, and the fift lowest: in the middle of each of the three lower leaues (yet sometimes it is but in two of them) there is a little long spot or streake, of an excellent crimson colour, with a long heele or spurre behinde hanging downe: the whole flower hath a fine small sent, very pleasing, which being placed in the middle of some Carnations or Gillo-
flowers

flowers (for they are in flower at the same time) make a delicate Tussimuffie, as they call it, or Nosegay, both for sight and sent: After the flower is past, come the seede, which are rough or vneuen, round, greenish yellow heads, sometimes but one, and sometimes two or three standing together vpon one stalke, bare or naked of themselves, without any huske, containing a white pulpy kernell: the footes are small, and spreading vnder ground, which perish with the first frosts, and must be sowne a new euery yeare, yet there needeth no bed of horse-dung for the matter: the naturall ground will be sufficient, so as you defend it a little from those frosts, that may spoile it when it is newly sprung vp, or being yet tender.

The Place. This goodly plant was first found in the West Indies, and from thence sent into Spaine vnto Monardus and others, from whence all other parts haue receiued it. It is now very familiar in most Gardens of any curiosity, where it yearly giueth ripe seed, except the yeare be very vnkindly.

The Time. It flowreth sometimes in Iune, but vsually in Iuly (if it be well defended and in any good ground) and so continueth flowring, vntill the cold frosts and mists in the middle or end of October, doe checke the luxurious nature thereof, and in the meane timeth the seede is ripe, which will quickly fall downe on the ground, where for the most part the best is gathered.

The Names. Some doe reckon this plant among the *Clematides* or *Convolvuli*, the Clamberers or Bindweedes, but (as I said) it hath no claspers, neither doth it winde it selfe: but by reason of the number of his branches, that run one within another, it may seeme to climbe vp by a pole or sticke, which yet doth but onely close it, as hauing something whereon to leane or rest his branches. Monardus and others call it *Flos sanguineus*, of the red spots in the flowers, as also *Mastuerzo de las Indias*, which is *Nasturtium Indicum*, by which name it is now generally knowne and called, and wee thereafter in English, Indian Cresses, yet it may bee called from the forme of the flowers onely, Yellow Larkes heeles.

The Vertues. The Spaniards and others vse the leaues hereof in stead of ordinary Cresses, because the taste is somewhat sharpe agreeing thereunto, but other Physicall properties I haue heard of none attributed to it.

CHAP. LII.

Viola. Violets.

THe Garden Violets (for the Wilde I leaue to their owne place) are so well knowne vnto all, that either keepe a Garden, or hath but once come into it, that I shall (I thinke) but lose labour and time to describe that which is so common. Yet because it is not onely a choise flower of delight, notwithstanding the popularity, and that I let not passe any thing without his particular description, I must also doe so by this. And hereunto I must adde that kinde of Violet, which, although it want that smell of the other, goeth beyond it in variety of dainty colours, called *Viola tricolor* & *flammea*, or Harts eases.

1. *Viola simplex Martia*. Single March Violets.

The single Garden Violet hath many round greene leaues, finely snipt or dented about the edges, standing vpon seuerall small stalkes, set at diuers places of the many creeping branches, which as they runne, doe here and there take roote in the ground, bearing thereon many flowers seuerally at the ioynts of the leaues, which consist of five small leaues, with a short round tayle or spur behind, of a perfect blew purple colour, and of a very sweete sent, it bringeth forth round seede vessels, standing likewise vpon their seuerall small stalkes, wherein is contained round white seede: but these heads rise not from where the flowers grew, as in all other plants that I know, but apart by themselves, and being sowne, will produce others like vnto it selfe, whereby there may be made a more speedy encrease to plant a Garden (as I haue done) or any other place, then by slipping, as is the vsuall manner: the rootes spread both deepe and wide, taking strong hold in the ground.

Flore albo.

Of this kinde there is another that beareth white flowers, not differing in smell or any thing else from the former.

Flare obsoleto.

And also another, that beareth flowers of a dead or sad reddish colour, in all other things alike, sauing that this hath not altogether so good a sent as the other.

2. *Viola Martia flore multiplici*. Double March Violets.

There is no difference betwene this Violet and the former, in any other thing then in the doublenesse of the flowers, which haue so many leaues set and thrust together, that they are like vnto hard buttons. There is of this double kinde both white and purple, as in the single; but the white sort is seldome so thicke and double as the purple: but of the red colour to be double I neuer heard.

3. *Viola flammea sine tricolor*. Harts eases or Pansies.

The Harts ease hath his leaues longer, and more endented or cut in on the edges then the Violet hath, and somewhat round withall: the stalkes are vpright, yet weake, and ready to fall downe, and lye vpon the ground, set here and there with the like leaues, from whence come forth the flowers, of little or no sent at all, made like vnto a Violet, yet more open, and with larger leaues; but so variably mixed with blew or purple, white and yellow, that it is hard to set downe all the varieties: For some flowers will be more white, and but some spots of purple or blew in the two vpper leaues, and the lower leaues with some stripes of yellow in the middle: others will haue more purple in them then any other colour, both in the vpper and lower leaues, the side leaues blew, and the middle yellow, and others white and blew with yellow stripes, as nature listeth to distribute their colours: the seede is small, whitish, and round, contained in small round heads: the roote perisheth euery yeare, and raiseth it selfe vpon plentifully by it owne sowing, if it be suffered.

4. *Viola tricolor flore duplici*. Double Harts ease.

We haue in our Gardens another sort, that beareth flowers with more leaues then the former, making it seeme to be twice double, and that onely in Autumne; for the first flowers are single that come in Summer: This is of that sort that beareth purple flowers: And it is to be obserued, that the seed of this kinde will not all bring double flowers, but only some, if the ground be fit and liking, so that if you haue once had of this double kinde, you shall seldome misse to haue double flowers againe euery yeare of it owne growing or sowing.

5. *Viola flammea lutea maxima*. The great yellow Pansie.

There is one other kinde of Harts ease, that decketh vpon our Gardens not to be forgotten, whose leaues and flowers are like the former, but more plentifull in stalkes and branches, and better abideth our Winters: the flowers are larger then any of the former,

former, of a faire pale yellow colour, with some yellower stripes now and then about the middle; for it is sometimes without any stripes, and also of a little deeper yellow colour: this is to bee encreased by slips, which will soone comprehend in a moist or moistened ground, for that I neuer could obserue that it bore seede.

The Place.

These plants were first wilde, and by manuring brought to be both fairer in colour, and peradventure of a better sent then when they grew wilde.

The Time.

The Violets flower in March, and sometimes earlier, and if the yeare be temperate and milde, in Autumne againe. The double Violets, as they are later before they flower then the single, so they hold their flowers longer. The Harts ease flowreth seldome vntill May; but then some will abide to flower vntill the end of Autumne almost, especially if the frosts be not early.

The Names.

The Violet is called *Viola nigra*, *purpurea*, and *Martia*: In English, Violets, March Violets, and purple Violets. The Harts ease is called *Viola flamma*, *Viola tricolor*, *Viola multicolor*, and of some, *Iacea*, *Flas trinitatis*, and *Herba clauellata*: In English, Harts ease, and Pansies, of the French name *Penfees*. Some giue it foolish names, as Loue in idlenesse, Cull mee to you, and Three faces in a hood. The great yellow Harts ease is so called, because it is like in forme, and is the greatest of all other, although it haue not that diuersity of colours in it that the other haue.

The Vertues.

The properties of Violets are sufficiently knowne to all, to coole and moisten: I shall forbear to recite the many vertues that may be set downe, and onely let you know, that they haue in them an opening or purging quality, being taken either fresh and greene, or dryed, and made into powder, especially the flowers; the dryed leaues will doe the like, but in greater quantity. Costus in his booke of the nature of all plants saith, that the distilled water of Harts ease, is commended in the French disease, to be profitable, being taken for nine dayes or more, and sweating vpon it, which how true it is, I know not, and wish some better experience were made of it, before we put any great confidence in that assertion.

CHAP. LIII.

Epimedium. Barrenwort.

THis pretty plant riseth vp out of the ground with vpright, hard, round, small stalkes, a foote and a halfe high, or not two foote high at the highest, diuided into three branches for the most part, each branch whereof is againe diuided for the most part into three other branches, and each of them beare three leaues (seldome either more or lesse) set together, yet each vpon his owne foote-stalke, each leafe being broad, round, and pointed at the end, somewhat hard or dry in feeling, hayric, or as it were prickly about the edges, but very tenderly, without harme, of a light greene colour on the vpper side, and a little whiter vnderneath: from the middle of the stemme or stalke of leaues doth likewise come forth another long stalke, not much higher then those with the leaues on them, diuided into other branches, each whereof

whereof hath likewise three flowers, each vpon his owne foote stalk, consisting of eight small leaues a peece, yet seeming to be but of foure leaues spread or layd open flat, for that the foure vppermost, which are the smaller and being yellow, doe lye so close on the foure vndermost, which are a little broader and red, that they shew as if they were yellow flowers with red edges, hauing yellow threds tipt with greene, standing in the middle of the flowers: the vnder side of the lower leaues are of a pale yellowish red, striped with white lines: after the flowers are past, there come small long pods, wherein are contained six red dish feede: the rootes are small, reddish and hard, spreading, branching and enterlacing themselves very much, and is fit to be placed on some shady side of a garden: the whole plant is rather of a strong then any good sent, yet is cherished for the pleasant varietie of the flowers.

The Place.

Casalpini saith it groweth on the mountaines of Liguria, that is nigh vnto Ligorne, in the Florentine Dominion. Camerarius saith, nigh vnto Vicenza in Italie. Bauhinus on the Euganian hills, nigh vnto Padoa, and in Romania in shadowie wet grounds.

The Time.

It flowreth from Iune vntill the end of Iuly, and to the middle of August, if it stand, as I said it is fittest, in a shadowie place.

The Names.

It is of most Writers accepted for the true *Epimedium* of Dioscorides, though he saith it is without flower or feede, being therein cyther mistaken, or mis-informed, as he was also in *Difflammas* of Candy, and diuers other plants. From the triple triplicitie of the standing of the stalkes and leaues, and quadriplicitie of the flowers, it might receiue another name in English then is already imposed vpon it: but lest I might be thought to be singular or full of noueltie, let it passe with the name Barrenwort, as it is in the title.

The Vertues.

It is thought of diuers to agree in the propertie of causing barrennesse, as the ancients doe record of *Epimedium*.

CHAP. LIIII.

Papauer sativum. Garden Poppies.

OF Poppies there are a great many sorts, both wilde and tame, but because our Garden doth entertaine none, but those of beautie and respect, I wil onely giue you here a few double ones, and leaue the rest to a general suruey.

Papauer multiplex album. Double white Poppies.

The double white Poppy hath diuers broad, and long whitish greene leaues, giuing milke (as all the rest of the plant aboue ground doth, wherefoeuer it is broken) very much rent or torne in on the sides, and notched or indented besides, compassing at the bottome of them a hard round brittle whitish greene stalke, branched towards the toppe, bearing one faire large great flower on the head of euery branch, which before it breaketh out, is contained within a thin skinne, and being blowne open is very thick of leaues, and double, somewhat jagged at the ends, and of a white colour, in the middle

1. *Viola Martia* simple. Single March Violets. 2. *Viola Martia* multiplex. Double March Violets. 3. *Viola flammula* var. *tricolor*. Ordinary garden Pansy or Hart's ease. 4. *Viola flammula* var. *canina*. Grey yellow Pansy. 5. *Viola tricolor* double. Double Pansy or Hart's ease. 6. *Eranthis*. Barrenwort. 7. *Papaver latifolium* var. *double*. Double garden Poppies. 8. *Papaver latifolium* var. *double*. Double feathered Poppies. 9. *Nigella arvensis* var. *double*. Spanish Nigella or Fenell flower. 10. *Nigella multiplex* var. *double*. Double blue Nigella or Fenell flower. 11. *Nigella duplex* var. *double*. Double white Nigella. 12. *Perennia* var. *double*. Double white Pelletory.

middle whereof standeth a round head or bowle, with a striped crowne on the heade of it, very like a starre, compassed about with some threds, wherein when it is ripe, is contained small, round, white seede, disposed into severall cels : the roote is hard, woody, and long, perishing every yeare, and must bee new sowne every Spring, if they doe not spring of their own sowing, which if it doe, the flowers are seldome so faire and double as they that are sowne in the Spring : the whole plant is of a strong heady smell.

2. *Papauer multiplex rubescens*. Double red or bluish Poppies.

This other kind of double Poppy differeth not in any other thing from the former, but only in the colour of the flowers, which are of a bright red, tending to a bluish colour, parted, paned or striped in many places with white, and exceedingly more jagged then the former, almost like a feather at the ends, the bottomes of all the leaues being white : the seede hereof is white as the former, which is not so in any other Poppie, that beareth not a full white flower.

3. *Papauer multiplex nigrum sine purpureum*.
Double purple or murrey Poppies.

This kinde varyeth both in flowers and seede, although neyther in leaues or any other thing from the first : the flowers are thicke and double, and somewhat jagged at the ends, in some more, in some lesse, eyther red or bluish, or purplish red, more or lesse, or of a sad murrey or tawney, with browne, or blacke, or tawny bottomes : the seede is eyther of a grayish blew colour, or in others more blackish.

4. *Papauer Rhaas flore multiplici*. The double red field Poppie.

This double Poppie is like the wilde or fildie Poppie, which is well knowne to all to haue longer, narrower, and more jagged Greene leaues then the former, the stalkes more hairy, and the flower of a deepe yellowish red colour, knowne to all. Now this differeth in nothing from it, but in the doublenesse of the flower, which is very thicke and double, but not so large as the former. This riseth of seede in the like manner as they doe, and so to bee preferred.

The Place.

From what place they haue bene first gathered naturally I cannot assure you, but we haue had them often and long time in our gardens, being sent from Italie and other places. The double wilde kindes came from Constantinople, which whether it groweth neere vnto it or further off, we cannot tell as yet.

The Time.

They flower in the beginning or middle of Iune at the furthest, the seede is ripe within a small while after.

The Names.

The generall knowne name to all, is *Papauer*, Poppie : the severall distinctions are according to their colours. Yet our English Gentlewomen in some places, call it by a by-name, Ione siluer pinne : *subauditur*, Faire without and fowle within.

The Vertues.

It is not vnknowne, I suppose to any, that Poppie procureth sleepe, for which cause it is wholly and onely vsed, as I thinke : but the water of the wilde

wilde Poppies, besides that it is of great vse in Pleuresies, and Rheumatick- or thinne Distillations, is found by daily experience, to bee a soueraigne remedy against surfeits; yet some doe attribute this propertie to the water of the wilde Poppies.

CHAP. LV.

Nigella. The Fenell flower, or *Nigella*.

AMong the many sorts of *Nigella*, both wilde and tame, both single and double, I will onely set downe three sorts, to be nourled vp in this garden, referring the rest to a Physicke garden, or a generall Historie, which may comprehend all.

1. *Nigella Hispanica flore simplici*. The great Spanish *Nigella*.

Spanish *Nigella* riseth vp with diuers greene leaues, so finely cut, and into so many parts, that they are finer then Fenell, and diuided somewhat like the leaues of Larkes heeles, among which rise vp stalkes, with many such like leaues vpon them, branched into three or foure parts, at the toppe of each whereof standeth one faire large flower, like vnto other single *Nigella*'s, consisting of fve or six leaues sometimes, of a bleake blew, or of a purplish blew colour, with a greene head in the middle, compassed about with seuen or eight small blewish greene flowers, or peeces of flowers rather, made like gaping hoodes, with euery of them a yellowish line thwart or crosse the middle of them, with somethreds also standing by them: after the flower is past the head groweth greater, hauing fixe, seuen or eight hornes as it were at the toppe, greater and longer, and standing clost together then any other *Nigella*, spreading very like a starre, or the crowne of the Poppy head, but larger and longer, each whereof being folded together, openeth a little when the head is ripe, which is greater aboue, and smaller below, and not so round as the others are, containing within them small yellowish greene seede, or not so blacke as the other sorts: the rootes are small and yellow, perishing euery yeare as the others likewise doe.

2. *Nigella Damascena flore multiplici*.Double blew *Nigella*, or The Fenell flower.

The double *Nigella* is in leaues, stalkes and rootes, very like vnto the former *Nigella*, so that the one can very hardly bee discerned from the other before this rise vp to flower, except it be that the leaues hereof are not fully so large as they: the flower consisteth of three or foure rowes of leaues, layde one vpon another, of a pale blew colour, with a greene round head compassed with diuers short threads in the middle, and hauing fve or sixe such small greene Fenell-like leaues vnder the flower, to beare it vp (as it were) below, which adde a greater grace to the flowers, which at the first sheweth sometimes white, but changeth quickly after: the horned heads hereof are like vnto the heads of the other wilde kinde, which are somewhat rounder and greater, hauing within them blacke vneuen feedes, but without any sent.

3. *Nigella Catrina flore albo multiplici*. Double white *Nigella*.

This double white *Nigella* hath such like leaues as the last hath, but somewhat larger, of a yellower greene colour, and not so finely cut and iagged: the flowers are somewhat lesse, and lesser double then the former, and in colour white, hauing no greene leaues vnder the flower, as the former hath, the head whereof in the middle is very like the head of the last double kinde, but not so great, wherein is contained black seede for the most part, and sweete like the Romane *Nigella*, which only is sweet besides this: yet sometimes it is not so blacke, but rather a little more white or yellowish; the roote is yellow, and perisheth as the others euery yeare.

The

The Place.

All these, and the rest be found wilde in diuers Countreyes, as France, Spaine, Italie, &c. but wee onely cherish them in our Gardens for our delight.

The Time.

They flower in the end of Iune, and in Iuly, or thereabouts.

The Names.

They are called *Melanthium*, *Gith*, and *Nigella*, and of some *Flos Dine Catherine*. We may either call them *Nigella* according to the Latine name, or the Fenell flower, as some doe, because the double blew *Nigella* hath small Fenell-like leaues bearing vp the flower, as I shewed before in the description.

The Vertues.

These *Nigella*'s are nothing so hot in qualitie as the single Romane kind is, as may well be knowne by the smell of the seede thereof, and therefore are not fit to be vsed in the steed of it, as many ignorant persons vse to doe: for the single Romane seede is vsed to helpe paines, and cold distillations in the head, and to dry vp the rheume. Pena saith, that the pressed oyle of the seede as well taken inwardly as vsed outwardly is an excellent remedy for the hardnesse and swelling of the spleene.

CHAP. LVI.

Parmica siluestris flore pleno. Double wilde Pelletory.

THe double wilde Pelletorie hath straight and slender stalkes, beset with long and narrow leaues, snipt round about the edges, in all points like vnto the single wilde kinde, that groweth common with vs almost euery where: on the toppes of the stalkes stand foure or fise, or more white flowers, one aboue another, with a Greene leafe at the bottome of the footestalke of euery one of them, beeing small, thicke, and very double, with a little yellowishnesse in the middle of euery flower, like both for forme and colour vnto the flower of the double Featherfew, but smaller: the rootes are many long strings, running here and there in the ground: this hath no smell at all, but is delightfome only for the double white flowers.

The Place.

It is only cherished in some few Gardens, for it is very rare.

The Time.

It flowreth in the end of Iune or thereabouts.

The Names.

It is called of most *Parmica*, or *Sternutamentoria*, of his qualitie to prouoke needling; and of some *Pyrethrum*, of the hot biting taste. We vsually call it Double wilde Pelletorie, and some Sneefewort, but *Elleborus albus* is vsually so called, and I would not two things should be called by one name, for the mistaking and mis-using of them.

The

The Vertues.

The properties hereof, no doubt, may well bee referred to the single kinde, beeing of the same qualitie, yet as I take it, a little more milde and temperate.

CHAP. LVII.

Parthenium flore pleno. Double Featherfew.

Featherfew that beareth double flowers is so like vnto the single kinde, that the one cannot be discerned from the other, vntill it come to flower, bearing broad, pale or fresh Greene leaues, much cut in on the sides: the stalkes haue such like leaues on them as grow below, from the toppes whereof come forth many double white flowers, like vnto the flowers of the former wilde Pellitory, but larger, and like also vnto the flowers of the double Camomill: the sent whereof is as strong as of the single.

The Place.

We haue this kinde only in Gardens, and as it is thought by others, is peculiar only to our owne Countrey.

The Time.

It flowreth in the end of May, and in Iune and Iuly.

The Names.

It is called diuersly by diuers: Some thinke it to be *Parthenium* of Dioscorides, but not of Galen, for his *Parthenium* is a sweet herbe, and is thought to bee *Amaracus*, that is Marierome: others call it *Matricaria*; and some *Amarella*. Gaza translateth it *Muraleum*, *Theoph. lib. 7. cap. 7.* It is generally in these parts of our Countrey called Double Feaverfew, or Featherfew.

The Vertues.

It is answerable to all the properties of the single kinde which is vsed for womens diseases, to procure their monthly courses chiefly. It is held to bee a speciall remedy to helpe those that haue taken *Opium* too liberally. In Italy some vse to eate the single kinde among other Greene herbes, as Camerarius saith, but especially fryed with egges, and so it wholly loseth his strong and bitter taste.

CHAP. LVIII.

Chamaelum. Camomill.

Our ordinary Camomill is well knowne to all, to haue many smal trayling branches, set with very fine smal leaues, bushing and spreading thicke ouer the ground, taking roote still as it spreadeth: the toppes of the branches haue white flowers, with yellow thrummes in the middle, very like vnto the Featherfew, before described, but somewhat greater, not so hard, but more soft and gentle in handling, and the whole herbe to be of a very sweet sent.

1. *Chamamalum nudum*. Naked Camomill.

We haue another sort of Camomill in some Gardens, but very rare, like vnto the former, but that it is whiter, finer, and smaller, and raiseth it selfe vp a little higher, and beareth naked flowers; that is, without that border of white leaues that is in the former, and consisteth onely of a yellow round thrummie head, smelling almost as sweete as the former.

2. *Chamamalum flore pleno*. Double flowred Camomill.

The double Camomill groweth with his leaues vpon the ground, as the other single kinde doth, but of a little fresher Greene colour, and larger withall: the stalkes with the flowers on them, doe raise themselves vp a little higher then the ordinary, and bearing one or two flowers vpon a stalk, which are composed of many white leaues set together in diuers rowes, which make a fine double flower, with a little yellow spot in the middle for the most part of euery one, and are much larger then any single kinde, smelling better, and more pleasing then the ordinary: this doth creepe vpon the ground as the other, but is more tender to be kept in the Winter. Yet if you saue the flowers hereof (and so will the double Featherfew also) when they haue stood long, and ready to fade, and keepe them dry vntill the Spring, and then breaking them or pulling them to peeces, sowe them, there will spring vp from them Camomill, and also Featherfew, that will againe beare double flowers.

The Place.

Our ordinary Camomill groweth wilde in many places of our Country, and as well neare London as in other places. The others are onely found in our Gardens, where they are cherished. Bauhinus saith, that the double flowred Camomill is found wilde about Orleance in France.

The Time.

The double kinde is vsually in flower in Iune, before the ordinary kinde, and most commonly past before it flowreth, which is not vntill Iuly or August. The naked Camomill flowreth betweene them both, or later.

The Names.

Camomill is called *Anthemis*, *Leucanthesis*, and *Leucanthesum*, of the whitenesse of the flowers; and *Chamamalum* of the corrupted Italian name *Camomilla*. Some call the naked Camomill, *Chrysanthemum odoratum*. The double Camomill is called by some *Chamamalum Romanum flore multiplici*.

The Vertues.

Camomill is put to diuers and sundry vses, both for pleasure and profit, both for inward and outward diseases, both for the sicke and the sound, in bathings to comfort and strengthen the sound, and to ease paines in the diseased, as also in many other formes applyed outwardly. The flowers boyled in Posset drinke prouoketh sweat, and helpeth to expell colds, aches, and other griefes. A Syrupe made of the iuice of the double Camomill, with the flowers and white wine, as Bauhinus saith, is vsed by some against the laundise and Dropsie, caused by the euill disposition of the spleene.

1 Parthenium flore pleno. Double Featherfew. 2 Chamamalum nudum. Naked Camomill. 3 Chamamalum flore pleno. Double Camomill. 4 Pyrethrum officinarum. Pelletory of Spaine. 5 Flos Adonis flore rubro & flore albo. Adonis flower both red & yellow. 6 Helleborus niger ferulaceus sine Euphorbium. The great Oxe eye or the great yellow Anemone. 7 Euphorbium vulgare. The common yellow Oxe eye.

CHAP. LIX.

Pyrethrum officinarum. Pelletory of Spaine.

I Must needs adioyne vnto the Camomils this fine and tender plant, for some neare resemblance it hath with them in face, though not in quality. It is a small and lowe plant, bearing many fine Greene leaues vpon his slender branches, which leane or lye down vpon the ground, diuided into many parts, yet somewhat larger and broader then Camomill, the stalkes whereof are bigger, and more iuicie then it: the flowers that stand at the toppes of the stalkes are single, but much larger then any Camomill flower, hauing a pale or border of many leaues, white on the vpper side, and reddish vnderneath, set about the yellow middle thrumme; but not standing so close together ioyning at the bottome, as the Camomill flowers doe; but more seuered one from another: it beareth small whitish seede, which is hardly found and discerned from the chaffe: the roote is long, and growing downeright, of the bignesse of a mans finger or thumbe in our Countrey, but not halfe so great where it groweth naturally, with some fibres and branches from the sides thereof, of a very hot, sharpe, and biting taste, drawing much water into the mouth, after it hath been chewed a while: the plant with vs is very tender, and will hardly or not at all endure the hardnesse and extremities of our Winters, vnlesse it be very carefully preserued.

The Place.

It groweth in Spaine wilde in many places, and in other hot Countries, where it may feele no frosts to cause it perish.

The Time.

It flowreth so late with vs, that it is not vntill August, that oftentimes we cannot gather ripe seedes from it, before it perish.

The Names.

The name *Pyrethrum* (taken from *πῦρ*, that is, *ignis*, fire) is giuen to this plant, because of the heate thereof, and that the roote is somewhat like in shew, but specially in property vnto the true *Pyrethrum* of Dioscorides, which is an vmbelliferous plant, whose rootes are greater, and more seruent a great deale, and haue a hayrie bush or toppe as *Menum*, and many other vmbelliferous plants haue. It is also called in Latine, *Salinaris*, of the effect in drawing much moisture into the mouth, to be spit out. We doe vsually call it Pelletory of Spaine.

The Vertues.

It is in a manner wholly spent to draw rheume from the teeth, by chewing it in the mouth, thereby to ease the tooth-ach, and likewise from the head, in the paines thereof.

CHAP. LX.

Flos Adonis flore rubro. Red Adonis flower.

Adonis flower may well be accounted a kinde of Camomill, although it hath some especiall differences, hauing many long branches of leaues lying vpon the ground, and some rising vp with the stalke, so finely cut and iagged, that they much resemble the leaues of Mayweed, or of the former *Nigella*: at the top of the stalkes, which rise a foote high or better, stand small red flowers, consisting of six or eight round leaues, hauing a Greene head in the middle, set about with many blackish threads, without any smell at all: after the flowers are past, there grow vp heads with many roundish white feedes at the toppes of them, set close together, very like vnto the heads of seede of the great Oxe eye, set downe in the next Chapter, but smaller: the rootes are small and thready, perishing euery yeare, but rising of his owne seede againe, many times before Winter, which will abide vntill the next yeare.

Yellow Adonis flower is like vnto the red, but that the flower is somewhat larger, *Flore lutea* and of a faire yellow colour.

The Place.

The first groweth wilde in the corn fields in many places of our own country, as well as in others, and is brought into Gardens for the beauties sake of the flower. The yellow is a stranger, but nourfed in our Gardens with other rarities.

The Time.

They flower in May or Iune, as the yeare falleth out to be early or late: the seed is soone ripe after, and will quickly fall away, if it be not gathered.

The Names.

Some hauetaken the red kinde to be a kinde of Anemone; other to be *Eranthemum* of Dioscorides: the most vsuall name now with vs is *Flos Adonis*, and *Flos Adonidis*: In English, where it groweth wilde, they call it red Maythes, as they call the Mayweede, white Maythes; and some of our English Gentlewomen call it Rosarubie: we vsually call it Adonis flower.

The Vertues.

It hath been certainly tryed by experience, that the seed of red Adonis flower drunke in wine, is good to ease the paines of the Collicke and Stone;

CHAP. LXI.

Buphtalmum. Oxe eye.

Vnder the name *Buphtalmum*, or Oxe eye, are comprehended two or three severall plants, each differing from other, both in face and property, yet because they all beare one generall name, I thinke fittest to comprise them all in one Chapter, and first of that which in leafe & seed commeth nearest to the Adonis flower.

1. *Buphtalmum maius* sive *Helleborus niger ferulaceus*.

Great Oxe eye, or the yellow Anemone.

This great Oxe eye is a beautifull plant, hauing many branches of Greene leaues leaning

leaning or lying vpon the ground for the most part, yet some standing vpright, which are as fine, but shorter then Fenell; some of them ending in a small tuft of green leaues, and some hauing at the toppes of them one large flower apeece, somewhat reddish or brownish on the outside, while they are in bud, and a while after, and being open, shew themselves to consist of twelue or foueteene long leaues, of a faire shining yellow colour, set in order round about a Greene head, with yellow thrums in the middle, laying themselves open in the sunne, or a faire day, but else remaining close: after the flower is past, the head growing greater, sheweth it selfe compact of many round whitish feede, very like vnto the head of feede of the Adonis flower last described, but much greater: the rootes are many long blackish fibres or strings, set together at the head, very like vnto the rootes of the lesser blacke Hellebor or Bearefoote, but somewhat harder, stiffer, or more brittle, and seeming without moisture in them, which abide and encrease euery yeare.

2. *Bupthalmum minus, seu Anthemis flore luteo.* Small Oxe eye.

This plant might seeme to be referred to the Camomils, but that it is not sweete, or to the Corne-Marigolds, but that the stalkes and leaues are not edible: it is therefore put vnder the Oxe eyes, and so we will describe it; hauing many weake branches lying vpon the ground, beset with winged leaues, very finely cut and iagged, somewhat like vnto Mayweede, but a little larger: the flowers are like vnto the Corne Marigold, and larger then any Camomill, being wholly yellow, as well the pale or border of leaues, as the middle thrummes: the rootes are somewhat tough and long.

3. *Bupthalmum vulgare.* Common Oxe eye.

This Oxe eye riseth vp with hard round stalkes, a foote and a halfe high, hauing many winged leaues vpon them, made of diuers long and something broad leaues, snipt about the edges, set together somewhat like vnto Tansie, but smaller, and not so much winged: the flowers stand at the toppes of the stalkes, of a full yellow colour, both the outer leaues and the middle thrum, and not altogether so large as the last: the rootes of this kinde perish euery yeare, and require a new sowing againe.

The Place.

The first groweth in diuers places of Austria, Bohemia, and those parts, it hath beene likewise brought out of Spaine. The second in Prouence, a country in France. The last in diuers places, as well of Austria as Morauia, and about Mentz and Norimberg, as Clusius setteth downe. We haue them in our Gardens, but the first is of the greatest respect and beauty.

The Time.

The first flowreth betimes, oftentimes in March, or at the furthest in April; the feede is ripe in May, and must be quickly gathered, lest it bee lost. The other two flower not yntill Iune.

The Names.

The first is called *Bupthalmum* of Dodonæus, *Pseudohelleborus* of Matthioli, *Helleborus niger serulaceus* Theophrasti by Lobel, of some others *Elleborus niger verus*, vnting it for the true blacke Ellebor; but it is much differing, as well in face as properties. Of others *Sesamoides minus*. Some haue thought it to be a yellow Anemone, that haue looked on it without further judgement, and by that name is most usually knowne to most of our English Gentlewomen that know it. But it may most fitly be called a *Bupthalmum*, as Dodonæus doth, and *Hispanicum* or *Austriacum*, for distinctions sake. We doe most usually call it *Helleborus niger serulaceus*, as Lobel doth; Bauhinus calleth

callet it *Helleborus niger tenuifolius Buphtalmi flore*. The second is called *Buphtalmum Narbonense*: In English, The French, or lesser Oxe eye, as the first is called, The great Oxe eye. The last, The common Oxe eye.

The Vertues.

The first hath been vsed in diuers places for the true blacke Ellebor, but now is sufficiently knowne to haue been an errour; but what Physicall property it hath, other then Matthiolus hath exprest, to be vsed as Setterswort for cattell, when they rowell them, to put or draw the rootes hereof through the hole they make in the dewe lappe, or other places, for their coughes or other diseases, I know not, or haue heard or read of any. The others likewise haue little or no vse in Physicke now a dayes that I know.

CHAP. LXII.

Chrysanthemum. Corne Marigold.

Although the sorts of Corne Marigolds, which are many, are fitter for another then this worke, and for a Catholicke Garden of Simples, then this of Pleasure and Delight for faire Flowers; yet giue me leaue to bring in a couple: the one for a corner or by-place, the other for your choicest, or vnder a defended wall, in regard of his stateliness.

1. *Chrysanthemum Creticum*. Corne Marigold of Candy.

This faire Corne Marigold hath for the most part one vpright stalke, two foote high, whereon are set many winged leaues, at euery ioynt one, diuided and cut into diuers parts, and they againe parted into feuerall peeces or leaues: the flowers growe at the toppes of the stalkes, rising out of a scaly head, composed of ten or twelue large leaues, of a faire, but pale yellow colour, and more pale almost white at the bottome of the leaues, round about the yellow thrumme in the middle, being both larger and sweeter then any of the other Corne Marigolds: the seede is whitish and chaffie: the roote perisheth euery yeare.

2. *Chrysanthemum Peruvianum, sine Flos Solis*.

The golden flower of Peru, or the Flower of the Sunne.

This goodly and stately plant, wherewith euery one is now adayes familiar, being of many sorts, both higher and lower (with one stalke, without branches, or with many branches, with a blacke, or with a white seede, yet differing not in forme of leaues or flowers one from another, but in the greatnesse or smalnesse) riseth vp at the first like vnto a Pompion with two leaues, and after two, or foure more leaues are come forth, it riseth vp into a great stalke, bearing the leaues on it at feuerall distances on all sides thereof, one aboue another vnto the very toppe, being sometimes, and in some places, seuen, eight, or ten foote high, which leaues standing out from the stemme or stalke vpon their feuerall great ribbed foote-stalkes, are very large, broad belowe, and pointed at the end, round, hard, rough, of a sad Greene colour, and bending downwards: at the toppe of the stalke standeth one great, large, and broad flower, bowing downe the head vnto the Sunne, and breaking forth from a great head, made of scaly Greene leaues, like vnto a great single Marigold, hauing a border of many long yellow leaues, set about a great round yellow thrumme, as it were in the middle, which are very like vnto short heads of flowers, vnder euery one whereof there is a seede, larger then any seede of the Thistles, yet somewhat like, and lesser, and rounder then any Gourd seede, set in so close and curious a manner, that when the seede is taken out, the head with the hollow places or cels thereof, seemeth very like vnto an hony combe, which seede is in some plants very blacke, in the hotter countries, or very white.

white, and great, or large, but with vs is neither so large, blacke, or white; but sometimes blackish or grayish. Some sort riseth not vp halfe the height that others doe, and some againe beare but one stemme or stalke, with a flower at the toppe thereof; and others two or three, or more small branches, with euery one his flower at the end; and some so full of branches from the very ground almost, that I haue accounted threescore branches round about the middle stalke of one plant, the lowest neare two yards long, others aboue them a yard and a halfe, or a yard long, with euery one his flower thereon; but all smaller then those that beare but one or two flowers, and lesser also for the most part then the flower on the middle stalke it selfe. The whole plant, and euery part thereof aboue ground hath a strong resinous sent of Turpentine, and the heads and middle parts of the flowers doe oftentimes (and sometimes the ioynts of the stalke where the leaues stand) sweat out a most fine thin & cleare Rosin or Turpentine, but in small quantity, and as it were in drops, in the heate and dry time of the year, so like both in colour, smell, and taste vnto cleare Venice Turpentine, that it cannot be knowne from it: the roote is strongly fastened in the ground by some greater roots branching out, and a number of small strings, which growe not deepe, but keepe vnder the vpper crust of the earth, and desireth much moisture, yet dyeth euery yeare with the first frosts, and must be new sowne in the beginning of the Spring.

The Place.

Their places are set downe in their titles, the one to come out of Candy, the other out of Peru, a Prouince in the West Indies.

The Time.

The first flowreth in Iune, the other later, as not vntill August, and sometimes so late, that the early frosts taking it, neuer suffer it to come to ripeness.

The Names.

The first hath his name in his title. The second, besides the names set downe, is called of some *Plant maxima*, *Flos maximus*, *Sol Indianus*, but the most vsuall with vs is, *Flos Solis*: In English, The Sunne Flower, or Flower of the Sunne.

The Vertues.

There is no vse of either in Physicke with vs, but that sometimes the heads of the Sunne Flower are dressed, and eaten as Hartichokes are, and are accounted of some to be good meate, but they are too strong for my taste.

CHAP. LXIII.

Calendula. Marigolds.

Some haue reckoned vp many sorts of Marigolds, I had rather make but two, the single and the double; for doubtlesse, those that be most double, rise from the best seede, which are the middlemost of the great double, and some will be lesse double, whose seede is greater then the rest, according to the ground where it groweth; as also those that be of a paler colour, doe come of the seed of the yellower sort.

1. *Calendula maxima*. The great Garden Marigold.

The Garden Marigold hath round greene stalkes, branching out from the ground into many parts, whereon are set long flat greene leaues, broader and rounder at the point

1 *Chrysanthemum Creticum*. Corne Marigolds of Candy. 2 *Flis Solis*. The Flower of the Sunne. 3 *Calendula*. Marigolds. 4 *Aster Atticus* *sive* *italorum*. The purple Marigold. 5 *Pulsilla maior*. Golden Mouse-eare. 6 *Scorpanera Hispanica*. Spanish Vipers grasse. 7 *Tragopogon*. Goates beard, or goe to bed at noone.

point then any where else, and smaller also at the setting to of the stalke, where it compasseth it about: the flowers are sometimes very thicke and double (breaking out of a scaly clammy Greene head) composed of many rowes of leaues, set so close together one within another, that no middle thrume can bee seene, and sometimes lesse double, hauing a small browne spot of a thrume in the middle: and sometimes but of two or three rowes of leaues, with a large browne thrume in the middle; euery one whereof is somewhat broader at the point, and nicked into two or three corners, of an excellent faire deepe gold yellow colour in some, and paler in others, and of a pretty strong and refinous sweete sent: after the flowers are past, there succede heads of crooked seede, turning inward, the outermost biggest, and the innermost least: the roote is white, and spreadeth in the ground, and in some places will abide after the feeding, but for the most part perisheth, and riseth againe of his owne seede. Sometimes this Marigold doth degenerate, and beareth many small flowers vpon short stalkes, compassing the middle flower: but this happeneth but seldome, and therefore accounted but *lusus naturæ*, a play of nature, which she worketh in diuers other plants besides.

2. *Calendula simplex*. The single Marigold.

There is no difference betweene this and the former, but that the flowers are single, consisting of one rowe of leaues, of the same colour, eyther paler or deeper yellow, standing about a great browne thrume in the middle: the seed likewise is alike, but for the most part greater then in the double kindes.

The Place.

Our Gardens are the chiefe places for the double flowers to grow in; for we know not of any other naturall place: but the single kinde hath beene found wilde in Spaine, from whence I receiued seede, gathered by Guillaume Boel, in his time a very curious, and cunning searcher of simples.

The Time.

They flower all the Summer long, and sometimes euén in winter, if it be milde, and chiefly at the beginning of those monethes, as it is thought.

The Names.

They are called *Caltha* of diuers, and taken to be that *Caltha*, wherof both Virgil and Columella haue written. Others doe call them *Calendula*, of the Kalendes, that is the first day of the monethes, wherein they are thought chiefly to flower; and thereupon the Italians call them, *Fiori di ogni mese*, that is, The Flowers of euery moneth: We call them in English generally, eyther Golds, or Marigolds.

The Vertues.

The herbe and flowers are of great vse with vs among other pot-herbes; and the flowers eyther Greene or dried, are often vsed in possets, broths, and drinckes, as a comforter of the heart and spirits, and to expel any malignant or pestilential quality, gathered neere thereunto. The Syrupe and Conserue made of the fresh flowers, are vsed for the same purposes to good effect.

CHAP. LXIII.

Aster. Starre-wort.

Dioscorides and other of the ancient Writers, haue set forth but one kinde of Starre-wort, which they call *Aster Atticus*, of the place no doubt, where the greatest plentie was found, which was the Countrey of Athens: the later Writers haue found out many other plants which they referre to this kinde, calling them by the same name. It is not my purpose to entreate of them all, neyther doth this garden fitly agree with them: I shall therefore select out one or two from the rest, and giue you the knowledge of them, leauing the rest to their proper place.

1. *Aster Atticus flore luteo*. Yellow Starre-wort.

This Starre-wort riseth vp with two or three rough hairy stalkes, a foote and a halfe high, with long, rough or hairie, brownish, darke greene leaues on them, diuided into two or three branches: at the toppe of euery one whereof standeth a flat scaly head, compassed vnderneath with finge or sixe long, browne, rough greene leaues, standing like a Starre, the flower it selfe standing in the middle thereof, made as a border of narrow, long, pale yellow leaues, set with a brownish yellow thrume: the roote dyeth euery yeare, hauing giuen his flower.

2. *Aster Atticus Italorum flore purpureo*. Purple Italian Starre-wort.

This Italian Starre-wort hath many woody, round brittle stalkes, rising from the roote, somewhat higher then the former, sometimes standing vp right, and other-whiles leaning downwards, whereon are set many somewhat hard, and rough long leaues, round pointed, without order vp to the toppe, where it is diuided into feuerall branches, whereon stand the flowers, made like vnto a single Marigold, with a border of blewish purple leaues, set about a browne middle thrume, the heads sustaining the flowers, are composed of diuers scaly greene leaues, as is to be seene in the Knapweedes or Matfelons, which after the flowers are past yeelde a certaine downe, wherein lye small blacke and flat seedes, somewhat like vnto Lettice seede, which are carried away with the winde: the roote is composed of many white strings, which perisheth not as the former, but abideth, and springeth afresh euery yeare.

The Place.

The first is found in Spaine, as Clusius, and in France, as Lobel say. The other hath beene found in many places in Germany, and Austria: in Italie also, and other places; we haue it plentifully in our Gardens.

The Time.

The first flowreth in Summer. And the other not vntill August or September.

The Names.

The first is called *Aster Atticus flore luteo*, *Bubonium*, & *Inguinalis*, and of many is taken to be the true *Aster Atticus* of Dioscorides: yet Matthioli thinketh not so, for diuers good reasons, which hee setteth downe in the Chapter of *Aster Atticus*, as any man may vnderstand, if they will but reade the place, which is too long to bee inserted here. The other is thought by Matthioli, to be the true *Aster Atticus*, (vnto whom I must also consent) and constantly also affirmed to be the *Amellus Virgilij*, as may be seene in the same place: but it is vsually called at this day, *Aster Italorum flore caruleo* or *purpureo*.

purpureo. Their English names are sufficiently expressed in their titles, yet some call the last, The purple Marigold, because it is so like vnto one in form.

The Vertues.

They are held, if they bee the right, to bee good for the biting of a mad dogge, the greene herbe being beaten with old hogs grease, and applyed; as also for swolne throats: It is likewise vsed for botches that happen in the groine, as the name doth import.

CHAP. LXV.

Pilosella maior. Golden Mouse-eare.

Some resemblance that the flowers of this plant hath with the former Golds, maketh me to insert it in this place, although I know it agreeth not in any other part; yet for the pleasant aspect thereof, it must bee in this my garden, whose description is as followeth: It hath many broade greene leaues spread vpon the ground, spotted with pale spots, yet more conspicuous at sometimes then at other; somewhat hairy both on the vpper and vnder side, in the middle of these leaues rise vp one, two or more blackish hairy stalkes, two foote high at the least, bare or naked vp to the top, where it beareth an umbell, or short tuft of flowers, set close together vpon short stalkes, of the forme or fashion of the Haukeweedes, or common Mouse-eare, but somewhat smaller, of a deep gold yellow, or orange tawney colour, with some yellow threds in the middle, of little or no sent at all: after the flowers are past, the heads carry small, short, blacke seede, with a light downie matter on them, ready to bee carried away with the winde, as many other plants are, when they be ripe: the rootes spread vnder ground, and shoote vp in diuers other places, whereby it much encreaseth, especially if it be set in any moist or shadowie place.

The Place.

It groweth in the shadowie woods of France, by Lions, and Mompelier, as Lobell testifieth: we keepe it in our gardens, and rather in a shadowie then sunnie place.

The Time.

It flowreth in Sommer, and sometimes againe in September.

The Names.

It is called by Lobell, *Pulmonaria Gallorum Hieratij facie*: and the Herbarists of France take it to be the true *Pulmonaria* of Tragus. Others call it *Hieratium flore aureo*. Pelletierius *Hieratium Indicum*. Some *Pilosella*, or *Auricula muris maior flore aureo*. And some *Chondrilla flore aureo*. Dalechamptus would haue it to bee *Cerchornis*, but farre vnfitly. The fittest English name we can giue it, is Golden Mouse-eare, which may endure vntill a fitter bee imposed on it: for the name of Grim the Collier, whereby it is called of many, is both idle and foolish.

The Vertues.

The French according to the name vse it for the defects of the lunges, but with what good successe I know not.

CHAP. LXVI.

Scorfonera. Vipers grasse.

Although there be foure or five sorts of *Scorfonera*, yet I shall here desire you to be content with the knowledge only of a couple.

1. *Scorfonera Hispanica maior*. The greater Spanish Vipers grasse.

This Spanish Vipers grasse hath diuers long, and somewhat broad leaues, hard and crumpled on the edges, and sometimes vneuenly cut in or indented also, of a blewish Greene colour: among which riseth vp one stalke, and no more for the most part, two foote high or thereabouts, hauing here and there some narrower long leaues thereon then those below: the toppe of the stalke brancheth it selfe forth into other parts, euery one bearing a long scaly head, from out of the toppe whereof riseth a faire large double flower, of a pale yellow colour, much like vnto the flower of yellow Goates beard, but a little lesser, which being past, the seede succeedeth, being long, whitish and rough, inclosed with much downe, and among them many other long smooth feedes, which are limber and idle, and are carryed away at the will of the winde: the roote is long, thicke and round, brittle and blacke, with a certaine roughnesse on the outside: but very white within, yeelding a milkie liquor being broken, as euery other part of the plant doth besides, yet the roote more then any other part, and abideth many yeares without perishing.

2. *Scorfonera Pannonica purpurea*. Purple flowred Vipers grasse.

This purple flowred Vipers grasse hath long and narrow leaues, of the same blewish Greene colour with the former: the stalke riseth vp a foote and a halfe high, with a few such like leaues but shorter thereon, breaking at the toppe into two or three parts, bearing on each of them one flower, fashioned like the former, and standing in the like scaly knoppe or head, but of a blewish purple colour, not fully so large, of the sweetest sent of any of this kinde, comming neere vnto the smell of a delicate perfume.

The Place.

The first is of Spaine. The other of Hungarie and Austrich: which now furnish our gardens.

The Time.

They flower in the beginning of May: the seede is soone ripe after, and then perishing downe to the roote for that yeare, springeth afresh before Winter againe.

The Names.

They are called after the Spanish name *Scorfonera*, which is in Latine *Viperaria*, of some *Viperina*, and *Serpentina*: Wee call them in English Vipers grasse, or *Scorfonera*.

The Vertues.

Manardus as I thinke first wrote hereof, and saith that it hath been found to cure them that are bitten of a Viper, or other such like venomous Creature. The rootes hereof being preferued with sugar, as I haue done often, doe eate almost as delicate as the Eringus roote, and no doubt is good to comfort and strengthen the heart, and vitall spirits. Some that haue vsed the preferued roote haue found it effectually to expelling winde out of the stomacke, and to helpe swoonings and faintnesse of the heart.

CHAP. LXVII.

Tragopogon. Goates beard.

I Must in this place set downe but two sorts of Goates beards; the one blew or ash-colour, the other red or purple, and leaue the other kindes: some to bee spoken of in the Kitchin Garden, and others in a Physicall Garden.

1. *Tragopogon flore caruleo*. Blew Goates beard.

All the Goates beards haue long, narrow, and somewhat hollow whitish Greene leaves, with a white line downe the middle of euery one on the vpper side: the stalke riseth vp greater and stronger then the Vipers grasle, bearing at the toppe a great long head or huske, composed of nine or ten long narrow leaues, the sharpe points or ends whereof rise vp about the flower in the middle, which is thicke and double, somewhat broad and large spread, of a blewish ash-colour, with some whitish threads among them, shutting or closing it selfe within the Greene huske euery day, that it abideth blowing, vntill about noone, and opening not it selfe againe vntill the next morning: the head or huske, after the flower is past, and the seede neare ripe, openeth it selfe; the long leaues thereof, which closed not before now, falling downe round about the stalke, and shewing the seede, standing at the first close together, and the doune at the toppe of them: but after they haue stood a while, it spreadeth it selfe round, and is ready to be carried away with the winde, if it be not gathered: the seede it selfe is long, round, and rough, like the seede of the Vipers grasle, but greater and blacker: the roote is long, and not very great, but perisheth as soone as it hath borne seede, and springeth of the fallen seede, that yeare remaining Greene all Winter, and flowering the next yeare following: the whole yeeldeth milke as the former, but somewhat more bitter and binding.

2. *Tragopogon purpureum*. Purple Goates beard.

There is little difference in this kind from the former, but that it is a little larger, both in the leafe, and head that beareth the seed: the flowers also are a little larger, and spread more, of a darke reddish purple colour, with some yellow dust as it were cast vpon it, especially about the ends: the roote perisheth in the like manner as the other.

The Place.

Both these haue been sent vs from the parts beyond the Seas, I haue had them from Italy, where no doubt they grow naturally wilde, as the yellow doth with vs: they are kept in our Gardens for their pleasant flowers.

The Time.

They flower in May and Iune: the seede is ripe in Iuly.

The Names.

Their generall name is after the Greeke word *Tragopogon*, which is in Latine, *Barba hirci*: In English, Goates beard; the head of seede when it is ready to bee carried away with the winde, causing that name for the resemblance: and because the flower doth euery day close it selfe at noone (as I said before) and openeth not againe vntill the next Sunne, some haue fitly called it, Goe to bed at noone.

The Vertues.

The rootes of these kindes are a little more bitter and more binding also then

then the yellow kinde expressed in the Kitchin Garden; and therefore fitter for medicine then for meate, but yet is vsed as the yellow kinde is, which is more fit for meate then medicine. The distilled water is good to wash old sores and wounds.

CHAP. LXVIII.

Flos Africanus. The French Marigold.

OF the French or African Marigolds there are three kindes as principall, and of each of them both with single and double flowers: of these, some diuersity is obserued in the colour of the flowers, as well as in the forme or largenesse, so that as you may here see, I haue expressed eight differences, and Fabius Columna nine or ten, in regard hee maketh a diuersity of the paler and deeper yellow colour: and although the lesser kinde, because of its euill sent, is held dangerous, yet for the beauty of the flower it findeth roome in Gardens.

1. *Flos Africanus maior siue maximus multiplex.*

The great double French Marigold.

This goodly double flower, which is the grace and glory of a Garden in the time of his beauty, riseth vp with a straight and hard round greene stalke, hauing some crests or edges all along the stalke, beset with long winged leaues, euery one whereof is like vnto the leafe of an Ash, being composed of many long and narrow leaues, snipt about the edges, standing by couples one against another, with an odde one at the end, of a darke or full greene colour: the stalke riseth to be three or foure foote high, and diuideth it selfe from the middle thereof into many branches, set with such like leaues to the toppes of them, euery one bearing one great double flower, of a gold yellow colour aboue, and paler vnderneath, yet some are of a pale yellow, and some betweene both; and all these rising from one and the same seede: the flower, before it be blowne open, hath all the leaues hollow; but when it is full blowne open, it spreadeth it selfe larger then any Prouince Rose, or equall vnto it at the least, if it be in good earth, and riseth out of a long greene huske, striped or furrowed, wherein after the flower is past, (which standeth in his full beauty a moneth, and oftentimes more, and being gathered, may be preferued in his full beauty for two moneths after, if it be set in water) standeth the seede, set thicke and close together vpright, which is blacke, somewhat flat and long: the roote is full of small strings, whereby it strongly comprehendeth in the ground: the flower of this, as well as the single, is of the very smell of new waxe, or of an honie combe, and not of that poisonfull sent of the smaller kindes.

2. *Flos Africanus maior simplex.* The great single French Marigold.

This single Marigold is in all things so like vnto the former, that it is hard to discern it from the double, but by the flowers, onely the stalke will be browner then the double; and to my best obseruation, hath and doth euery yeare rise from the seede of the double flower: so that when they are in flower, you may see the difference (or not much before, when they are in bud) this single flower euer appearing with thrums in the middle, and the leaues, which are the border or pale standing about them, shewing hollow or fistulous, which after lay themselves flat and open (and the double flower appearing with all his leaues folded close together, without any thrum at all) and are of a deeper or paler colour, as in the double.

3. *Flos Africanus fistuloso flore simplex & multiplex.*

Single and double French Marigolds with hollow leaved flowers.

As the former two greatest sorts haue risen from the seede of one and the same

meane the pod of double flowers) so doe these also, not differing from it in any thing, but that they are lower, and haue smaller Greene leaues, and that the flower also being smaller, hath euery leafe abiding hollow, like vnto an hollow pipe, broad open at the mouth, and is of as deepe a yellow colour for the most part as the deepest of the former, yet sometimes pale also.

4. *Flos Africanus minor multiplex*. The lesser double French Marigold.

The lesser double French Marigold hath his leaues in all things like vnto the former, but somewhat lesser, which are set vpon round browne stalkes, not so stiffe or vpright, but bowing and bending diuers wayes, and sometimes leaning or lying vpon the ground: the stalkes are branched out diuersly, whereon are set very faire double flowers like the former, and in the like Greene huskes, but smaller, and in some the outermost leaues will be larger then any of the rest, and of a deeper Orenge colour, almost crimson, the innermost being of a deepe gold yellow colour, tending to crimson: the whole flower is smaller, and of a stronger and more vnpleasant saour, so that but for the beautifull colour, and doublenesse of the flower, pleasant to the eye, and not to any other sense, this kinde would finde roome in few Gardens: the rootes and seedes are like the former, but lesser.

5. *Flos Africanus minor simplex*. The small single French Marigold.

This single kinde, doth follow after the last in all manner of proportion, both of stalkes, leaues, seedes, and rootes: the flowers onely of this are single, hauing five or six broad leaues, of a deepe yellow crimson colour, with deepe yellow thrummes in the middle, and of as strong a stinking sent, or more then the last.

The Place.

They growe naturally in Africa, and especially in the parts about Tunis, and where old Carthage stood, from whence long agoe they were brought into Europe, where they are onely kept in Gardens, being sowne for the most part euery yeare, vnlesse in some milde Winters. The last single and double kindes (as being more hardy) haue sometimes endured: but that kinde with hollow leaved flowers, as Fabius Columna setteth it downe, is accounted to come from Mexico in America.

The Time.

They flower not vntill the end of Summer, especially the greater kindes: but the lesser, if they abide all the Winter, doe flower more early.

The Names.

They haue been diuersly named by diuers men: Some calling them *Caryophyllus Indicus*, that is, Indian Gilloflowers; and *Tanacetum Peruvianum*, Tanse of Peru, as if it grew in Peru, a Prouince of America; and *Flos Indicus*, as a flower of the Indies; but it hath not beene knowne to haue beene brought from thence. Others would haue it to be *Othonna* of Plinie, and others, some to be *Lycopersicum* of Galen. It is called, and that more truely, *Flos Tanetensis*, *Flos Africanus*, and *Caltha Africana*, that is, the flower of Tunis, the flower of Africa, the Marigold of Africa, and peraduenture *Pedna Penorum*. We in English most vsually call them, French Marigolds, with their seuerall distinctions of greater or smaller, double or single. To that with hollow leaved flowers, Fabius Columna giueth the name of *Filifloa flore*, and I so continue it.

1. *Tagetes maximus multiplex*. The greatest double French Marigold. 2. *Tagetes maximus multiplex*. The greater double French Marigold. 3. *Tagetes maximus multiplex*. The greatest double French Marigold. 4. *Tagetes maximus multiplex*. The greater double French Marigold. 5. *Tagetes simplex*. The single hollow French Marigold. 6. *Tagetes simplex*. The single hollow French Marigold. 7. *Tagetes simplex*. The single hollow French Marigold. 8. *Tagetes simplex*. The single hollow French Marigold.

The Vertues.

We know no vse they haue in Physicke, but are cherished in Gardens for their beautifull flowers sake.

CHAP. LXIX.

Caryophyllus hortensis. Carnations and Gilloflowers.

TO auoide confusion, I must diuide Gilloflowers from Pinkes, and intreate of them in seuerall Chapters. Of those that are called Carnations or Gilloflowers, as of the greater kinde, in this Chapter; and of Pinkes, as well double as single, in the next. But the number of them is so great, that to giue seuerall descriptions to them all were endlesse, at the least needlesse. I will therefore set downe onely the descriptions of three (for vnto these three may be referred all the other sorts) for their fashion and manner of growing, and giue you the seuerall names (as they are vsually called with vs) of the rest, with their variety and mixture of colours in the flowers, wherein consisteth a chiefe difference. I account those that are called Carnations to be the greatest, both for leafe and flower, and Gilloflowers, for the most part to be lesser in both; and therefore will giue you each description apart, and the Orange tawne or yellow Gilloflower likewise by it selfe, as differing very notably from all the rest.

1. *Caryophyllus maximus Hartweensis sive Anglicus*.
The great Hartwich or old English Carnation.

I take this goodly great old English Carnation, as a president for the description of all the rest of the greatest sorts, which for his beauty and statelinesse is worthy of a prime place, hauing bene alwayes very hardly preserued in the Winter, and therefore not so frequent as the other Carnations or Gilloflowers. It riseth vp with a great thicke round stalke, diuided into seuerall branches, somewhat thickly set with ioynts, and at every ioynt two long Greene rather then whitish leaues, somewhat broader then Gilloflower leaues, turning or winding two or three times round (in some other sorts of Carnations they are plaine, but bending the points downewards, and in some also of a darke reddish Greene colour, and in others not so darke, but rather of a whitish Greene colour:) the flowers stand at the toppes of the stalkes in long, great, and round Greene huskes, which are diuided into five points, out of which rise many long and broad pointed leaues, deeply iagged at the ends, set in order round and comely, making a gallant great double flower, of a deepe Carnation colour, almost red, spotted with many bluish spots and strakes, some greater and some lesser, of an excellent soft sweete sent, neither too quicke as many others of these kinds are, nor yet too dull, and with two whitish crooked threads like hornes in the middle: this kinde neuer beareth many flowers, but as it is slow in growing, so in bearing, nor to be often handled, which sheweth a kinde of statelinesse, fit to preserue the opinion of magnificence: the roote is branched into diuers great, long, woody rootes, with many small fibres annexed vnto them.

2. *Caryophyllus hortensis flore pleno rubro*. The red or Cloue Gilloflower.

The red Cloue Gilloflower, which I take as a president for the second sort, which are Gilloflowers, grow like vnto the Carnations, but not so thicke set with ioynts and leaues: the stalkes are more, the leaues are narrower and whiter for the most part, and in some doe as well a little turne: the flowers are smaller, yet very thicke and double in most, and the Greene huskes wherein they stand are smaller likewise then the former: the ends of the leaues in this flower, as in all the rest, are dented or iagged, yet in some more then in others, some also hauing two small white threads, crooked at the ends like hornes, in the middle of the flower, when as diuers other haue none. These kinds,

1 *Caryophyllus maximus ruber* var. *varius*. The great old Carnation or gray Hullo. 2 *Caryophyllus majestabilis* & *also varius*. The white Carnation. 3 *Caryophyllus albus ruber*. The Cambrides or the Peckflower. 4 *Caryophyllus Cary Aratus*. The late grade of Kent. 5 *Caryophyllus Sabaudicus carnosus*. The white fringed. 6 *Caryophyllus Xerampelinos*. The Gredeline Carnation. 7 *Caryophyllus albus Grims*. The Grimsle or Prince. 8 *Caryophyllus albus major*. The great white Gillsflower. 9 *Elegans Herina* Bradbury. Muller Bradbury's daisy Lady.

kindes, and especially this that hath a deepe red crimson coloured flower, doe endure the cold of our winters, and with lesse care is preserved: these sorts as well as the former doe very seldome giue any seede, as far as I could euer obserue or learne.

3. *Caryophyllus Silesiacus flore pleno miniato.*

The yellow or Orange tawny Gilloflower.

This Gilloflower hath his stalkes next vnto the ground, thicker set, and with smaller or narrower leaues then the former for the most part: the flowers are like vnto the Cloue Gilloflowers, and about the same bignesse and doubleness most vsually, yet in some much greater then in others; but of a pale yellowish Carnation colour, tending to an Orange, with two small white threads, crooked at the ends in the middle, yet some haue none, of a weaker sent then the Cloue Gilloflower: this kinde is more apt to beare seede then any other, which is small, black, flat, and long, and being sown, yeelde wonderfull varieties both of single and double flowers: some being of a lighter or deeper colour then the mother plants: some with stripes in most of the leaues: Others are striped or spotted, like a speckled Carnation or Gilloflower, in diuers sorts, both single and double: Some againe are wholly of the same colour, like the mother plant, and are eyther more or lesse double then it, or else are single with one row of leaues, like vnto a Pinck; and some of these likewise eyther wholly of a crimson red, deeper or lighter, or variably spotted, double or single as a Pinck, or bluish eyther single or double, and but very seldome white: yet all of them in their Greene leaues little or nothing varying or differing.

Caryophylli maximi.

CARNATIONS.

*Caryophyllus maximus distans
Hulo rubro-varius.*

*Caryophyllus maximus distans
Hulo ruber non variatus.*

*Caryophyllus maximus distans
Hulo caruleo purpureus.*

*Caryophyllus maximus distans
Grimele siue Princeps.*

*Caryophyllus maximus distans
Hedius albus.*

*Caryophyllus maximus distans
Hedius Gallicus.*

*Caryophyllus maximus distans
Hedius grandis.*

THe gray *Hulo* hath as large leaues as the former old Carnation, and as deeply iagged on the edges: it hath a great high stalke, whereon stand the flowers, of a deepe red colour, striped and speckled very close together with a darkish white colour.

The red *Hulo* is also a faire great flower, of a stamell colour, deeply iagged as the former, and groweth very comely without any spot at all in it, so that it seemeth to bee but a stamell Gilloflower, saue that it is much greater.

The blew *Hulo* is a goodly faire flower, being of a faire purplish murrey colour, curiously marbled with white, but so small to be discerned, that it seemeth only purple, it hath so much the Mastrie in it; it resembleth the Brassill, but that it is much bigger.

The *Grimele* or Prince is a faire flower also, as large as any Chrystall or larger, being of a faire crimson colour, equally for the most part striped with white, or rather more white then red, thorough euery leafe from the bottome, and standeth comely.

The white Carnation or Delicate, is a goodly delightfull fair flower in his pride and perfection, that is, when it is both marbled and flaked, or striped and speckled with white vpon an incarnate crimson colour, beeing a very comely flower, but abideth not constant, changing oftentimes to haue no flakes or strakes of white, but marbled or speckled wholly.

The French Carnation is very like vnto the white Carnation, but that it hath more specks, and fewer stripes or flakes of white in the red, which hath the mastrie of the white.

The ground Carnation (if it be not the same with the ground or great old Carnation first set downe, as the alteration but of one letter giueth the coniecture) is a thicke flower, but spreadeth

not his leaues abroade as others doe, hauing the middle standing higher then the outer leaues, and turning vp their brimmes or edges; it is a sad flower, with few stripes or spots in it: it is very subiect to breake the pod, that the flower seldome commeth faire and right; the greene leaues are as great as the *Hulo* or Lombard red.

Caryophyllus maximus Chry-
stallus.

The Chrystall or Chrystalline (for they are both one, howsoeuer some would make them differ) is a very delicate flower when it is well marked, but it is inconstant in the markes, being sometimes more striped with white and crimson red, and sometimes lesse or little or nothing at all, and changing also sometimes to be wholly red, or wholly bluish.

Caryophyllus maximus flore
tubus.

The red Chrystall, which is the red hereof changed, is the most orient flower of all other red Gilloflowers, because it is both the greatest, as comming from the Chrystall, as also that the red hereof is a most excellent crimson.

Caryophyllus maximus discus
Eragranis.

The Fragrant is a faire flower, and thought to come from the Chrystall, being as large, but of a bluish red colour, spotted with small speckes, no bigger then pinnes points, but not so thicke as in the Pageant.

Caryophyllus maximus Sabau-
dicus varius.

The stript Sauadge is for forme and bignesse equall with the Chrystall or White Carnation, but as inconstant as eyther of them, changing into red or bluish; so that few branches with flowers containe their true mixtures, which are a whitish bluish, fairely striped with a crimson red colour, thicke and short, with some spots also among.

Caryophyllus maximus Sabau-
dicus carneus.

The bluish Sauadge is the same with the former, the same roote of the stript Sauadge, as I said before, yeelding one side or part whose flowers will be eyther wholly bluish, or hauing some small spots, or sometimes few or none in them.

Caryophyllus maximus Sabau-
dicus ruber.

The red Sauadge is as the bluish, when the colour of the flower is wholly red without any stripes or spots in them, and so abideth long; yet it is sometimes seene, that the same side, or part, or roote being separate from the first or mother plant, will giue striped and well marked flowers againe.

Caryophyllus maximus Oxoni-
ensis.

The Oxford Carnation is very like vnto the French Carnation, both for forme, largenesse and colour: but that this is of a fadder red colour, so finely marbled with white thereon, that the red hauing the maistry, sheweth a very sad flower, not hauing any flakes or stripes at all in it.

Caryophyllus maximus Regius,
sive Bristolensis maior.

The Kings Carnation or ordinary Bristow, is a reasonable great flower, deeply iagged, of a sad red, very smally striped and speckled with white: some of the leaues of the flower on the one side will turne vp their brimmes or edges: the greene leafe is very large.

Caryophyllus maximus Granada-
ensis.

The greatest *Granado* is a very faire large flower, bigger then the Chrystall, and almost as bigge as the blew *Hulo*: it is almost equally diuided and stript with purple and white, but the purple is fadder then in the ordinary *Granado* Gilloflower, else it might bee said it were the same, but greater. Diuers haue taken this flower to bee the *Gran Pere*, but you shall haue the difference shewed you in the next ensuing flower.

Caryophyllus maximus Gran-
Pere discus.

The *Gran Pere* is a fair great flower, and comely for the forme, but of no great beautie for colour, because although it be stript red and white like the *Queenes* Gilloflower, yet the red is so sad that it taketh away all the delight to the flower.

Caryophyllus maximus Camber-
sine discus.

The Camberfine is a great flower and a faire, beeing a redde flower, well marked or striped with white, somewhat like vnto a Sauadge

*Caryophyllus maximus Longi-
bardicus ruber.*

Sauadge, say some, but that the red is not crimson as the Sauadges, others say the Daintie, but not so comely: the leaues of the flowers are many, and thrust together, without any due forme of spreading.

The great Lombard red is a great sad red flower, so double and thick of leaues, that it most vsually breaketh the pod, and seldome sheweth one flower among twenty perfect: the blades or greene leaues are as large as the *Halo*.

Caryophylli majores.

GILLOFLOWERS.

*Caryophyllus maior Westminster
flavescens.*

THe lustie Gallant or Westminster (some make them to be one flower, and others to bee two, one bigger then the other) at the first blowing open of the flower sheweth to be of a reasonable size and comeliness, but after it hath stood blown some time it sheweth smaller and thinner: it is of a bright red colour, much striped and speckled with white.

*Caryophyllus maior Bristow
fls purpurei.*

The Bristow blew hath greene leaues, so large, that it would seeme to bring a greater flower then it doth, yet the flower is of a reasonable size, and very like vnto the ordinary *Granado* Gilloflower, striped and flaked in the same manner, but that the white of this is purer then that, and the purple is more light, and tending to a blew: this doth not abide constant, but changeth into purple or bluish.

*Caryophyllus maior Bristow
fls carnei.*

The Bristow bluish is very like the last both in leafe and flower, the colour only sheweth the difference, which seldome varyeth to be spotted, or change colour.

*Caryophyllus maior Douerborni-
ensis ruber.*

The red Douer is a reasonable great Gilloflower and constant, being of a faire red thicke powdered with white spots, and seemeth somewhat like vnto the ground Carnation.

*Caryophyllus maior Douerborni-
ensis dilutus sine albis.*

The light or white Douer is for forme and all other things more comely then the former, the colour of the flower is bluish, thicke spotted with very small spots, that it seemeth all gray, and is very delightfull.

Caryophyllus maior Cantii.

The faire maide of Kent, or Ruffling Robin is a very beautiful flower, and as large as the white Carnation almost: the flower is white, thicke powdered with purple, wherein the white hath the mastrie by much, which maketh it the more pleasant.

Caryophyllus maior Regius.

The Queenes Gilloflower is a reasonable faire Gilloflower although very common, striped red and white, some great and some small with long stripes.

Caryophyllus maior elegant.

The Daintie is a comely fine flower, although it be not great, and for the smallnesse and thinnesse of the flower being red so finely marked, striped and speckled, that for the liuelinesse of the colours it is much desired, being inferiour to very few Gilloflowers.

Caryophyllus maior Brasiliensis.

The Brasill Gilloflower is but of a meane size, being of a sad purple colour, thicke powdered and speckled with white, the purple herein hath the mastrie, which maketh it shew the sadder, it is vnconstant, varying much and often to bee all purple: the greene leaues lye matting on the ground.

*Caryophyllus maior Granado
sensu.*

The *Granado* Gilloflower is purple and white, flaked and striped very much: this is also much subiect to change purple. There is a greater and a lesser of this kinde, besides the greatest that is formerly described.

The

Caryophyllus Turicens.

The Turkie Gilloflower is but a small flower, but of great delight, by reason of the well marking of the flower, being most vually equally striped with red and white.

Caryophyllus Cambricus Poole.

The Poole flower, growing naturally vpon the rockes neare Cogshot Castle in the Isle of Wight, is a small flower, but very pleasant to the eye, by reason of the comely proportion thereof; it is of a bright pale red, thicke speckled, and very small with white, that it seemeth to bee but one colour, the leaues of the flower are but smally iagged about: it is constant.

Caryophyllus Pegma dilutior.

The light or pale Pageant is a flower of a middle size, very pleasant to behold, and is both constant and comely, and but that it is so common, would be of much more respect then it is: the flower is of a pale bright purple, thicke powdered, and very euenly with white, which hath the mastery, and maketh it the more gracefull.

Caryophyllus Pegma saturatior.

The sad Pageant is the same with the former in forme and bignesse, the difference in colour is, that the purple hath the mastery, which maketh it so sad, that it doth resemble the Brassill for colour, but is not so bigge by halfe.

*Caryophyllus Heroica dilutior
elegans Magistri Bradshawy.*

Master Bradshawe his dainty Lady may bee well reckoned among these sorts of Gilloflowers, and compare for neatnesse with most of them: the flower is very neate, though small, with a fine small iagge, and of a fine white colour on the vnder side of all the leaues, as also all the whole iagge for a pretty compasse, and the bottome or middle part of the flower on the vpper side also: but each leafe is of a fine bright pale red colour on the vpper side, from the edge to the middle, which mixture is of wonderfull great delight.

*Caryophyllus albus optimus
maior Londinensis & alius.*

The best white Gilloflower groweth vpright, and very double, the blades growe vpright also, and crawle not on the ground.

The London white is greater and whiter then the other ordinary white, being wholly of one colour.

*Caryophyllus maior rubens
& minor.*

The stamell Gilloflower is well knowne to all, not to differ from the ordinary red or cloue Gilloflower, but only in being of a brighter or light red colour: there is both a greater and a lesser of this kinde.

*Caryophyllus purpureus maior
& minor.*

The purple Gilloflower a greater and a lesse: the stalke is so slender, and the leaues vpon them so many and thicke, that they lye and traile on the ground: the greatest is almost as bigge as a Chrystall, but not so double: the lesse hath a smaller flower.

Caryophyllus Persicus violaceus.

The Gredeline Gilloflower is a very neate and handsome flower, of the bignesse of the Cloue red Gilloflower, of a fine pale reddish purple or peach colour, enclining to a blew or violet, which is that colour is vsually called a gredeline colour: it hath no affinity with eyther Purple, Granado, or Pageant.

Caryophyllus purpureo caeruleus.

The blew Gilloflower is neither very double nor great, yet round and handsome, with a deepe iagge at the edge, and is of an exceeding deepe purple colour, tending to a tawnie: this differeth from all other sorts, in that the leafe is as greene as grasse, and the stalkes many times red or purple: by the greene leaues it may be knowne in the Winter, as well as in the Summer.

Caryophyllus carneus.

The blush Gilloflower differeth not from the red or stamell, but only in the colour of the flower, which is blush.

*Caryophyllus Silesiacus
maximus Wittie.*

Iohn Wittie his great tawny Gilloflower is for forme of growing, in leafe and flower altogether like vnto the ordinary tawny, the flower onely, because it is the fairest and greatest that any other

ther hath nourished vp, maketh the difference, as also that it is of a faire deepe scarlet colour.

There are also diuers other Tawnies, either lighter or sadder, either lesse or more double, that they cannot be numbered, and all rising (as I said before) from sowing the seede of some of them: besides the diuersities of other colours both simple and mixed, euery yeare and place yeelding some variety was not seen with them before: I shall neede but onely to giue you the names of some of them we haue abiding with vs, I meane such as haue receiued names, and leaue the rest to euery ones particular denomination.

Of Blushes there are many sorts, as the deepe blush, the pale blush, the Infanta blush, a blush enclining to a red, a great blush, the fairest and most double of all the other blushes, and many others both single and double.

Of Reds likewise there are some varieties, but not so many as of the other colours; for they are most dead or deepe reds, and few of a bright red or stamell colour; and they are single like Pinkes, either striped or speckled, or more double striped and speckled variably, or else

There are neither purple nor white that rise from this seede that I haue obserued, except one white in one place.

Caryophyllus Silesiacus striatus.

The striped Tawny are either greater or lesser, deeper or lighter flowers twenty sorts and aboue, and all striped with smaller or larger stripes, or equally diuided, of a deeper or lighter colour: and some also for the very shape or forme will bee more neate, close, and round; others more loose, vnequall, and sparfed.

*Caryophyllus Silesiacus
mar morumulus.*

The marbled Tawny hath not so many varieties as the striped, but is of as great beauty and delight as it, or more: the flowers are greater or smaller, deeper or lighter coloured one then another, and the veines or markes more conspicuous, or more frequent in some then in others: but the most beautifull that euer I did see was with Master Ralph Truggie, which I must needes therefore call

*Heroina Rodolphi florum
Imperatoris.*

Master Tuggies Princeesse, which is the greatest and fairest of all these sorts of variable tawnies, or seed flowers, being as large fully as the Prince or Chrystall, or something greater, standing comely and round, not loose or shaken; or breaking the pod as some other sorts will; the marking of the flower is in this manner: It is of a stamell colour, striped and marbled with white stripes and veines quite through euery leafe, which are as deeply iagged as the Hulo: sometimes it hath more red then white, and sometimes more white then red, and sometimes so equally marked, that you cannot discern which hath the mastery, yet which of these hath the predominance, still the flower is very beautifull, and exceeding delightfome.

Caryophyllus Silesiacus affusus.

The Flaked Tawny is another diversity of these variable or mixt coloured flowers, being of a pale reddish colour, flaked with white, not alwaies downeright, but often thwart the leaues, some more or lesse then others; the marking of them is much like vnto the Chrystall: these also as well as others will be greater or smaller, and of greater or lesse beauty then others.

*Caryophyllus Silesiacus
plumatus.*

The Feathered Tawny is more rare to meete with then many of the other; for most vsually it is a faire large flower and double, equalling the Lumbard red in his perfection: the colour hereof is vsually a scarlet, little deeper or paler, most curiously feathered and streamed with white through the whole leafe.

*Caryophyllus Silesiacus
punctatus.*

The Speckled Tawny is of diuers sorts, some bigger, some lesse,

1. *Narcissus Tardus* var. *Princesse d'Orléans*. The French or Oxford Carnation. 2. *Caryophyllus Oxoniensis*. The French or Oxford Carnation. 3. *Caryophyllus Wilsonianus*. The Gallant or Westminster Gillyflower. 4. *Caryophyllus Tridactylus*. The Britton. 5. *Caryophyllus Chrysellus*. The Chrysell or Chrysellian. 6. *Caryophyllus Sabaudicus*. The Briot Savadge. 7. *Caryophyllus Granatensis*. The Granpers or greatest Granada. 8. *Caryophyllus pauciflorus*. The Dainty. 9. *Caryophyllus Silesiacus*. The Watty his great away Gillyflower. 10. *Caryophyllus Silesiacus*. The Watty his great away Gillyflower. 11. *Caryophyllus Silesiacus*. The Watty his great away Gillyflower. 12. *Caryophyllus Silesiacus*. The Watty his great away Gillyflower.

Caryophyllus roseus rotundus
Magistri Tuggie.

lesse, some more, and some lesse spotted then others: Vsuallly it is a deepe scarlet, speckled or spotted with white, hauing also some stripes among the leaues.

Master Tuggie his Rose Gilloflower is of the kindred of these Tawnies, being raised from the seede of some of them, and onely possessed by him that is the most industrious pr eseruer of all natures beauties, being a different sort from all other, in that it hath round leaues, without any iagge at all on the edges, of a fine stamell full colour, without any spot or strake therin, very like vnto a small Rose, or rather much like vnto the red Rose Campion, both for forme, colour, and roundnesse, but larger for size.

The Place.

All these are nourished with vs in Gardens, none of their naturall places being knowne, except one before recited, and the yellow which is *Silesia*, many of them being hardly preserued and encreased.

The Time.

They flower not vntill the heate of the yeare, which is in Iuly (vnlesse it be an extraordinary occasion) and continue flowering, vntill the colds of the Autumne checke them, or vntill they haue wholly out spent themselves, and are vsuallly encreased by the slips.

The Names.

Most of our later Writers doe call them by one generall name, *Caryophyllus sativus*, and *flos Caryophyllus*, adding thereunto *maximus*, when wee meane Carnations, and *maior* when we would expresse Gilloflowers, which name is taken from Cloues, in that the sent of the ordinary red Gilloflower especially doth resemble them. Diuers other seuerall names haue bene formerly giuen them, as *Vetonica*, or *Betonica altera*, or *Vetonica altissima*, and *coronaria*. *Herba Tunica*, *Viola Damascena*, *Ocellus Damascenus*, and *Barbaricus*. Of some *Cantabrica Plinij*. Some thinke they were vnknowne to the Ancients, and some would haue them to be *Ispium* of Theophrastus, whereof he maketh mention in his sixth and seuenth Chapters of his sixth booke, among Garland and Summer flowers; others to be his *Dios anthos*, or *Iouis flos*, mentioned in the former, and in other places. We call them in English (as I said before) the greatest kindes, Carnations, and the others Gilloflowers (*quasi* Iuly flowers) as they are seuerally expressed.

The Vertues.

The red or Cloue Gilloflower is most vsed in Physicke in our Apothecaries shops, none of the other being accepted of or vsed (and yet I doubt not, but all of them might serue, and to good purpose, although not to giue so gallant a tincture to a Syrupe as the ordinary red will doe) and is accounted to be very Cordiall.

CHAP. LXX.

Caryophylli siluestres. Pinkes.

THere remaine diuers sorts of wilde or small Gilloflowers (which wee vsuallly call Pinkes) to be entreated of, some bearing single, and some double flowers, some smooth, almost without any deepe dents on the edges, and some iagged, or as it were feathered. Some growing ypright like vnto Gilloflowers, others cree-
ping

1. *Caryophyllus siluestris simplex*. The usuall single Pinke. 2. *Caryophyllus multiplex siluestris*. Double Pinkes. 3. *Caryophyllus siluestris plumosus*. Feathered or jagged Pinkes. 4. *Caryophyllus stellaris*. Starre Pinkes. 5. *Caryophyllus repens*. Matted Pinkes. 6. *Caryophyllus maritimus*. The great Thistle or Sea Galliflower. 7. *Caryophyllus maritimus*. The ordinary Thistle or Sea Cushion.

ping or spreading vnder the toppe or crust of the ground, some of one colour, some of another, and many of diuers colours: As I haue formerly done with the Gilloflowers, so must I doe with these that are entertained in our Gardens, onely giue you the descriptions of some three or foure of them, according to their variety, and the names of the rest, with their distinctions.

1. *Caryophyllus minor siluestris multiplex & simplex.*
Double and single Pinkes.

The single and double Pinkes are for forme and manner of growing, in all parts like vnto the Gilloflowers before described, sauing onely that their leaues are smaller and shorter, in some more or lesse then in others, and so are the flowers also: the single kindes consisting of fise leaues vsually (seldome six) round pointed, and a little snipt for the most part about the edges, with some threads in the middle, either crooked or straight: the double kindes being lesser, and lesse double then the Gilloflowers, hauing their leaues a little snipt or endented about the edges, and of diuers seuerall colours, as shall hereafter be set downe, and of as fragrant a sent, especially some of them as they: the rootes are long and spreading, somewhat hard and woody.

2. *Caryophyllus plumarius.* Feathered or iagged Pinkes.

The iagged Pinkes haue such like stalkes and leaues as the former haue, but somewhat shorter and smaller, or grasse-like, and of a whitish or grayish greene colour likewise: the flowers stand in the like manner at the toppes of the stalkes, in long, round, slender, greene huskes, consisting of fise leaues, very much cut in on the edges, and iagged almost like a feather, of a light red, or bright purple colour, with two white threads standing in the middle, crooked like a horne at the end, and are of a very good sent. Some of these haue not those two crooked threads or hornes in the middle, but haue in their stead many small threads, not crooked at all: the feedes of them all are like vnto the feedes of Gilloflowers, or the other Pinkes, that is, small, blacke, long, and flat: the rootes are small and woody likewise.

3. *Caryophyllus plumarius albus orbis rubro sine Stellatus.* Starre Pinkes.

Of this kinde there is another sort, bearing flowers almost as deeply cut or iagged as the former, of a faire white colour, hauing a ring or circle of red about the bottome or lower part of the leaues, and are as sweete as the former: this being sowne of seede doth not giue the starre of so bright a red colour, but becommeth more dunne.

4. *Caryophyllus plumarius Austriacus sine Superba Austriaca.*
The feathered Pinke of Austria.

This kinde of Pinke hath his first or lower leaues, somewhat broader and greener then any of the former Pinkes, being both for breadth and greenesse more like vnto the Sweete Iohns, which shall bee described in the next Chapter: the leaues on the stalkes are smaller, standing by couples at euery ioynt, at the toppes whereof stand such like iagged flowers as the last described, and as large, but more deeply cut in or iagged round about, some of them of a purplish colour, but the most ordinary with vs are pure white, and of a most fragrant sent, comforting the spirits and senses a farre off: the feedes and rootes are like vnto the former. Some haue mistaken a kinde of wilde Campion, growing in our Woods, and by the paths sides in Hornie Parke, and other places, to be this feathered Pinke: but the flowers declare the difference sufficiently.

5. *Caryophyllus minor repens simplex & multiplex.*
Single and double matted Pinkes.

The matted Pinke is the smallest, both for leafe and flower of all other Pinkes that are nourished in Gardens, hauing many short and small grasse greene leaues vpon the stalkes,

stalkes, which as they grow and lye vpon the ground (and not standing so vpright as the former) doe take roote againe, whereby it quickly spreadeth, and couereth a great deale of ground in a little space: the flowers are small and round, a little snipt about the edges, whereof some are white, and some red, and some are white spotted with red, and some red spotted with white, all of them being single flowers. But there is another of this kinde, not differing in leafe, but in flower: for that the first flowers are but once double, or of two rowes of leaues, of a fine reddish colour, spotted with siluer spots: but those that follow, are so thicke and double, that they oftentimes doe breake the pod or huske, being not altogether of so deepe a red colour, but more pale.

6. *Caryophyllus Mediterraneus sine Marinus maior.*
Great Sea Gilloflower or Great Thrift.

Vnto these kindes of Pinkes I must needs adde, not only our ordinary Thrift (which is more frequent in gardens, to empale or border a knot, because it abideth greene Winter and Summer, and that by cutting, it may grow thick, and be kept in what form one list, rather then for any beaurie of the flowers) but another greater kinde, which is of as great beaurie and delight almost as any of the former Pinkes, as well for that the leaues are like vnto Gilloflowers, being longer and larger then any Pinkes, and of a whitish greene colour like vnto them, not growing long or by couples vpon the stalkes as Pinkes and Gilloflowers doe, but tufting close vpon the ground, like vnto the common Thrift: as also that the stalkes, rising from among the leaues (being sometimes two foote high (as I haue obserued in my garden) are yet so slender and weake, that they are scarce able to beare the heads of flowers, naked or bare, both of leaues and ioynts, sauing only in one place, where at the ioynt each stalke hath two small and very short leaues, not rising vpwards as in all other Gilloflowers, Pinkes, and other herbes, but growing downwards) and doe beare each of them a tuft or vmbell of small purplish, or bluish coloured flowers, at the toppes of them standing somewhat like vnto sweete Williams, but more roundly together, each flower consisting of five small, round, stiffe or hardish leaues, as if they were made of paper, the bottome or middle being hollow, not blowing all at once as the ordinary Thrift, but for the most part one after another, not shewing vsually above foure or five flowers open at one time (so farre as I could obserue in the plants that I kept) so that it was long before the whole tuft of flowers were past; but yet the hotter and dryer the time was, the sooner it would be gone: the seede I haue not perfectly obserued, but as I remember, it was somewhat like vnto the seede of Scabious; I am sure nothing like vnto Gilloflowers or Pinkes: the roote is somewhat great, long and hard, and not so much spreading in the ground as Gilloflowers or Pinkes.

Caryophyllus Marinus. Thrift, or Sea Cushion.

Our common Thrift is well knowne vnto all, to haue many short and hard greene leaues, smaller then many of the grasses, growing thicke together, and spreading vpon the ground: the stalkes are naked of leaues a spanne high, bearing a small tuft of light purple, or bluish coloured flowers, standing round and close thrusting together.

Double Pinkes.

THe double white Pinke is onely with more leaues in it then the single, which maketh the difference.

The double red Pinke is in the same manner double, differing from the single of the same colour.

The double purple Pinke differeth not

Single Pinkes.

THe single white ordinary Pinke hath a single white flower of five leaues, finely iagged about the edges.

The single red Pink is like the white, but that the leaues are not so much iagged, and the flower is of a pale purplish red colour.

from the single purple for colour, but only in the doubleness of the flower.

The *Granado* Pinke differeth not from the Gilloflower of the same name, but in the smallness both of leaues and flower.

The double Matted Pinke is before described.

The double bluish Pinke is almost as great as the ordinary bluish Gilloflower, and some haue taken it for one, but the greene leaues are almost as small as Pinks, and therefore I referre it to them.

The single purple Pinke is of a faire purple colour, like almost vnto the purple Gilloflower.

The great bluish Pinke hath broader and larger leaues in the flower then any other Pinke, and of a faire bluish colour.

The white Featherd Pinke hath the edges of the flower more finely and deeply cut in then the former.

The red or light purple featherd Pinke is like the former featherd Pinke, but only differeth in colour.

The Starre Pinke is a faire flower, finely jagged on the edges, with a faire red circle at the lower end of the leaues on the inside.

The white featherd Pinke of Austria is described before. The purple featherd Pinke of Austria is so likewise. The single matted Pinke is before described. The speckled Pinke is a small flower hauing small spots of red here and there dispersed over the white flower.

Those single flowers being like vnto Pinks that rise from the sowing of the orange tawney, I bring not into this *classis*, hauing already spoken of them in the precedent Chapter.

The Place.

These are all like as the former, nourished in Gardens with vs, although many of them are found wilde in many places of Austria, Hungarie, and Germany, on the mountaines, and in many other places, as Clusius recordeth. The ordinary Thrift groweth in the salt Marshes at Chattam by Rochester, and in many other places in England: but the great kinde was gathered in Spaine, by Guillaume Boel that painefull searcher of simples, and the seed thereof imparted to me, from whence I had diuers plants, but one yeare after another they all perished,

The Time.

Many of these Pinks both single and double, doe flower before any Gilloflower, and so continue vntill August, and some, most of the Summer and Autumne.

The Names.

The seuerall titles that are giuen to these Pinks, may suffice for their particular names: and for their generall they haue beene expressed in the former Chapter, beeing of the same kindred, but that they are smaller, and more frequently found wilde. The two sorts of Thrift are called *Caryophyllus Marinus*. The greater, *Maior & Mediterraneus*; In English, The greater or Leuant Thrift, or Sea Gilloflower. The lesser *Minimus*, and is accounted of some to be a grasse, and therefore called *Gramen Marinum & Polyanthemum*; In English, Thrift, Sea grasse, and our Ladies Cushion, or Sea Cushion.

The Vertues.

It is thought by diuers, that their vertues are answerable to the Gilloflowers, yet as they are of little vse with vs, so I thinke of as small effect.

CHAP.

CHAP. LXXI.

Armerius. Sweet Iohns, and sweet Williams.

THese kindes of flowers as they come neereſt vnto Pinkes and Gilloflowers, though manifeſtly differing, ſo it is fitteſt to place them next vnto them in a peculiar Chapter.

1. *Armerius anguſtifolius rubens ſimplex*. Single red ſweete Iohns.

The ſweete Iohn hath his leaues broader, ſhorter and greener then any of the former Gilloflowers, but narrower then ſweete Williams, ſet by couples, at the ioyns of the ſtalke, which are ſhorter then moſt of the former, and not aboue a foote and a halfe high, at the tops whereof ſtand many ſmall flowers, like vnto ſmall Pinkes, but ſtanding cloſer together, and in ſhorter huſkes, made of ſiue leaues, ſmaller then moſt of them, and more deepeſly iagged then the Williams, of a red colour in the middle, and white at the edges, but of a ſmall or ſoft ſent, and not all flowing at once, but by degrees: the ſeede is blacke, ſomewhat like vnto the ſeede of Pinkes, the roote is diſperſed diuerſly, with many ſmall fibres annexed vnto it.

2. *Armerius anguſtifolius albus ſimplex*. Single white ſweet Iohns.

This white Iohn differeth not in any thing from the former, but onely that the leaſe doth neuer change browniſh, and that the flower is of a faire white colour, without any mixture.

3. *Armerius anguſtifolius duplex*. Double ſweet Iohns.

There is of both thoſe former kindes, ſome whole flowers are once double, that is, conſiſting of two or three rowes of leaues, and the edges not ſo deepeſly iagged; not differing in any thing elſe.

4. *Armerius latifolius ſimplex flore rubro*.

Single red ſweet Williams.

The ſweet Williams doe all of them ſpread into many very long trayling branches, with leaues lying on the ground, in the very like manner that the ſweete Iohns doe: the chiefe differences betweene them are, that theſe haue broader, and darker greene leaues, ſomewhat browniſh, eſpecially towards the points, and that the flowers ſtand thicker and cloſer, and more in number together, in the head or tuft, hauing many ſmall pointed leaues among them, but harmleſſe, as all men know, the colour of the flower is of a deep red, without any mixture or ſpot at all.

5. *Armerius latifolius flore rubro multiplici*.

Double red ſweete Williams.

The double kinde differeth not from the ſingle kinde of the ſame colour, but only in the doubleneſſe of the flowers, which are with two rowes of leaues in euery flower.

6. *Armerius latifolius variegatus ſive verſicolor*.

Speckled ſweete Williams, or London pride.

Theſe ſpotted Williams are very like the firſt red Williams, in the forme or manner of growing, hauing leaues as broad, and browne ſometimes as they, the flowers ſtand as thicke or thicker, cluſtring together, but of very variable colours: for ſome flowers will be of a fine delayed red, with few markes or ſpots vpon them, and others

will

will bee full peckled or sprinkled with white or siluer spots, circlewise about the middle of the flowers, and some will haue many specks or spots vpon them disperfed: all these flowers are not blowne at one time, but some are flowring, when others are decaying, so that abiding long in their pride, they become of the more respect: The feede is blacke, as all the rest, and not to be distinguished one from another: the roots are some long, and some small and threddy, running vnder the vpper crust of the earth.

7. *Armerius latifolius flore rubro saturo holosericeo.*

Sweet Williams of a deepered or murrey colour.

The leaues of this kinde seeme to be a little larger, and the ioints a little redder then the former, but in the flower consisteth the chiefeft difference, which is of a deepered, or murrey purple colour, like vnto veluet of that colour, without any spots, but smooth, and as it were soft in handling, hauing an eye or circle in the middle, at the bottome of the leaues.

8. *Armerius latifolius simplex flore albo.*

Single white sweete Williams.

The white kinde differeth not in forme, but in colour from the former, the leaues are not browne at all, but of a fresh Greene colour, and the flowers are wholly white, or else they are all one.

The Place.

These for the most part grow wilde in Italie, and other places: we haue them in our Gardens, where they are cherished for their beautifull varietie.

The Time.

They all generally doe flower before the Gilloflowers or Pinkes, or with the first of them: their feede is ripe in Iune and Iuly, and doe all well abide the extremitie of our coldest winters.

The Names.

They all generally are called *Armerius*, or *Armeria*, as some doe write, and distinguished as they are in their titles: Yet some haue called them *Vesonica agrestis*, and others *Herba Tunica*, *Scarlatea*, & *Caryophyllus siluestris*: Wee doe in English in most places, call the first or narrower leaved kindes, Sweet Iohns, and all the rest Sweete Williams; yet in some places they call the broader leaved kindes that are not spotted, Tolmeiners, and London tufts: but the speckled kinde is termed by our English Gentlewomen, for the most part, London pride.

The Vertues.

We haue not knowne any of these vsed in Physicke.

CHAP. LXXII.

Bellis. Daisie.

THere be diuers sorts of Daisies, both great and small, both single and double, both wilde growing abroad in the fieldes, and elsewhere, and manured growing only in Gardens: of all which I intend not to entreate, but of those that are of most beautie and respect, and leaue the rest to their proper place.

1. *Artemisia arguta* simplex, single flowered. 2. *Artemisia arguta* multiplex, Double sweet labrum. 3. *Artemisia biennis* simplex, Single flowered. 4. *Artemisia biennis* multiplex, Double flowered. 5. *Artemisia biennis* multiplex, Double flowered. 6. *Bellis perennis* simplex, Single flowered. 7. *Bellis perennis* multiplex, Double flowered. 8. *Bellis perennis* multiplex, Double flowered. 9. *Bellis perennis* multiplex, Double flowered. 10. *Bellis perennis* multiplex, Double flowered.

1. *Bellis maior flore albo pleno*. The great double white Daisie.

The great Daisie with the double white flower, is in all things so like vnto the great single kinde, that groweth by the high wayes, and in diuers meadowes and fields, that there is no difference but in the flower, which is double. It hath many long, and somewhat broad leaues lying vpon the ground, deeply cut in on both sides, somewhat like vnto an oaken leafe; but those that are on the stalkes are shorter, narrower, and not so deeply cut in, but onely notched on the edges: the flowers at the toppe are (as I said) white and double, consisting of diuers rowes of leaues, being greater in compasse then any of the double Daiesies that follow, but nothing so double of leaues.

2. *Bellis minor flore rubro simplioi*. Single red Daiesies.

This single Daisie (like as all the rest of the small Daiesies) hath many smooth, Greene, round pointed leaues lying on the ground, a little snipt about the edges; from among which rise many slender round foote-stalkes, rather then stalkes or stems, about an hand breadth high at the most, and oftentimes not halfe so high, bearing one flower a peece, consisting of many small leaues, as a pale or border set about a middle thrumme: the leaues of this kinde are almost wholly red, whereas in the wilde they are white or whitish, enclining to red on the edges, the middle being yellow in both sorts: the rootes are many small white threads or strings.

3. *Bellis minor hortensis flore pleno variorum colorum*.
Double Garden Daiesies of diuers colours.

The leaues of all the double Daiesies are in forme like vnto the single ones, but that they are smaller, and little or nothing snipt or notched about the edges: the small stalkes likewise are smaller and lower, but bearing as double flowers as any that growe on the ground, being composed of many small leaues, thicke thrust together, of diuers colours; for some are wholly of a pure white, others haue a little red, either dispersed vpon the white leaues, or on the edges, and sometimes on the backes of the leaues: some againe seeme to be of a whitish red, or more red then white, when as indeede they are white leaues dispersed among the red; others of a deepe or darke red colour, and some are speckled or striped with white and red through the whole flower: and some the leaues will bee red on the vpperside, and white vnderneath, and some also (but those are very rare) are of a greenish colour.

4. *Bellis minor hortensis prolifera*. Double double Daiesies or childing Daiesies.

There is no difference either in leafe or roote in this kinde from the former double Daiesies: the chiefe variety consisteth in this, that it beareth many small double flowers, standing vpon very short stalkes round about the middle flower, which is vsually as great and double as any of the other double kindes, and is either wholly of a deepe red colour, or speckled white and red as in some of the former kindes, or else greenish, all the small flowers about it being of the same colour with the middlemost.

5. *Bellis carulea siue Globularia*. Blew Daiesies.

The likenesse and affinity that this plant hath with the former, both in the forme of leafe and flower, as also in the name, hath caused me to insert it, and another rare plant of the same kinde, in this place, although they be very rare to be met with in our English Gardens. This beareth many narrower, shorter, and blacker Greene leaues then the former, lying round about vpon the ground; among which rise vp slender, but stiffe and hard stalkes, halfe a foot high or more, set here and there with small leaues, and at the top a small round head, composed of many small blew leaues, somewhat like vnto the head of a Scabious: It hath bin found likewise with a white head of flowers: the roote is hard and stringie: the whole plant is of a bitter taste.

6. *Globularia*.

6. *Globularia lutea montana*. Yellow Daiesies.

This mountaine yellow Daiese or Globe-flower hath many thicke, smooth, round pointed leaues, spread vpon the ground like the former; among which spring diuers small round rushie stalkes, a foote high, bearing about the middle of them two small leaues at the ioynts, and at the toppes round heads of flowers thrust thicketogether, standing in purplish huskes, euery of which flowers do blow or spread into six leaues, starre-fashion, and of a faire yellow colour, smelling like vnto broome flowers, with many small threads in the middle compassing a flat pointell; horned or bended two wayes: after the flowers are past rise vp the seede vessels, which are round, swelling out in the middle, and diuided into foure parts at the toppes, containing within them round, flat, blacke seede, with a small cut or notch in them: the roote is a finger long, round and hard, with a thicke barke, and a woddy pith in the middle, of a sharpe drying taste and strong sent: the leaues are also sharpe, but bitter.

The Place.

The small Daiesies are all planted, and found onely in Gardens, and will require to be replanted often, lest they degenerate into single flowers, or at least into lesse double. The blew Daiese is naturall of Mompelier in France, and on the mountaines in many places of Italy, as also the yellow kinde in the Kingdome of Naples.

The Time.

The Daiesies flower betimes in the Spring, and last vntill May, but the last two flower not vntill August or September.

The Names.

They are vsually called in Latine *Bellides*, and in English Daiesies. Some call them *Herba Margarita*, and *Primula veris*, as it is likely after the Italian names, of *Marguerite*, and *Fior di prima vera gentile*. The French call them *Pasquettes*, and *Marguerites*, and the Fruitfull sort, or those that beare small flowers about the middle one, *Margueritons*: our English women call them lacke an Apes on horse-backe, as they doe Marigolds before recited, or childing Daiesies: but the Physicians and Apothecaries doe in generall call them, especially the single or Field kinde, *Consolida minor*. The blew Daiese is called *Bellis carnlea*, and *Globularia*, of some *Scabiosa pumilum* genus: The Italians call it *Botanaria*, because the heads are found like buttons. The yellow, *Globularia montana*, is onely described by Fabius Columna, in his last part of *Phytobasanos*, and by him referred vnto the former *Globularia*, although it differ in some notable points from it.

The Vertues.

The properties of Daiesies are certainly to binde, and the roote especially being dried, they are vsed in medicines to that purpose. They are also of speciall account among those herbes, that are vsed for wounds in the head.

CHAP. LXXIII.

Scabiosa. Scabious.

THe sorts of Scabious being many, yeeld not flowers of beauty or respect, fit to bee cherished in this our Garden of delight; and therefore I leaue them to the Fields and Woods, there to abide. I haue onely two or three strangers to bring to your acquaintance, which are worthy this place.

1. *Scabiosa flore albo*. White flowred Scabious.

This white Scabious hath many long leaues, very much iagged or gasht in on both sides, of a meane bignesse, being neither so large as many of the field, nor so small as any of the small kindes: the stalkes rise about a foote and a halfe high, or somewhat higher, at the tops whereof grow round heads, thicke set with flowers, like in all points vnto the field Scabious, but of a milke white colour.

2. *Scabiosa rubra Austriaca*. Red Scabious of Austria.

This red Scabious hath many leaues lying vpon the ground, very like vnto Devils bit, but not so large, being shorter and snipt, not gashed about the edges, of a light greene colour; yet (there is another of a darker greene colour, whose flower is of a deeper red) the stalkes haue diuers such leaues on them, set by couples at the ioynts as grow belowe, and at the tops small heads of flowers, each consisting of fiew leaues, the biggest flowers standing round about in the outer compasse, as is vsuall almost in all the kinds of Scabious, of a fine light purple or red colour: after the flowers are past, cometh the seede, which is somewhat long and round, set with certaine haire at the head thereof, like vnto a Starre: the roote is composed of a number of slender strings, fastened at the head.

3. *Scabiosa rubra Indica*. Red flowred Indian Scabious.

This (reputed Indian) Scabious hath many large faire greene leaues lying on the ground, iagged or cut in on both sides to the middle ribbe, euery peece whereof is narrower then that at the end, which is the broadest: among these leaues rise vp sundry slender and weake stalkes, yet standing vpright for the most part, set with smaller and more iagged leaues at certaine distances, two or three at euery ioynt, branching forth at the toppe into other smaller branches, bearing euery one head of flowers, like in forme vnto other Scabiouses, but of an excellent deepe red crimson colour (and sometimes more pale or delayed) of no sent at all: after which doe come small roundish seede, like vnto the field Scabious: the roote is long and round, compassed with a great many small strings, and perisheth vsuall as soone as it hath borne out his flowers and seede: otherwise if it doe not flower the first yeare of the sowing, if it be carefully defended from the extremity of Winter, it will flower the sooner the next yeare, as I my selfe haue often found by experience.

The Place.

The first is sometimes found wilde in our owne Countrey, but it is very geason, and hath been sent among other rare seedes from Italy.

The second was first found and written of by Clusius, in Pannonia and Austria, where it is very plentifull.

The third hath been sent both from Spaine & Italy, and is verily thought to grow naturally in both those parts.

1 Scabiosa flore albo. White flowered Scabious. 2 Scabiosa rubra Austriaca. Red Scabious of Austria. 3 Scabiosa rubra Indica. Red flowered Indian Scabious. 4 Cyanus vulgaris minor. Corn-flower of divers colours. 5 Cyanus latifolius. Spanish Corn-flower. 6 Cyanus floribus Turcicus. The brave Sultans flower. 7 Certhium sativum. Spanish Saffron.

The Time.

The first and second flower earlier then the last, for that it flowreth not vntill September or October, (vnlesse it be not apt to beare the first yeare as I before said) so that many times (if none be more forward) it perisheth without bearing ripe seede, whereby we are oftentimes to seeke new seede from our friends in other parts.

The Names.

They haue all one generall name of Scabious, distinguished eyther by their flower, or place of growing, as in their titles: yet the last is called of diuers *Scabiosa exotica*, because they thinke the name *Indica*, is not truly imposed vpon it.

The Vertues.

Whether these kinds haue any of the vertues of the other wilde kinds, I know none haue made any experience, and therefore I can say no more of them.

CHAP. LXXIII.

Cyanus. Corne flower, or blew Bottles.

VNder the name of *Cyanus* are comprehended, not onely those plants which from the excellent blew colour of their flowers (furnishing or rather pestering the Corne fieldes) haue peculiarly obtained that name, and which doth much vary also, in the colour of the flowers, as shall be shewed; but some other plants also for their neere resemblance, but with severall distinctions. The *Cyanus maior*, *Plarmica Austriaca*, *Plarmica Imperati*, and many others which may be adioyned vnto them, do more fitly belong to the Garden of Simples, whereunto I leaue them, and will here only entreate of those that may most please the delight of our Gentle Florists, in that I labour and strue, to furnish this our garden, with the chiefeest choyse of natures beauties and delights.

1. *Cyanus vulgaris diuerforuncolorum*. Corne flower of diuers colours.

All these sorts of Corne flowers are for the most part alike, both in leaues and flowers one vnto another for the forme: the difference betweene them consisteth in the varying colour of the flowers: For the leaues are long, and of a whitish Greene colour, deeply cut in on the edges in some places, somewhat like vnto the leaues of a Scabious: the stalkes are two foote high or better, beset with such like leaues but smaller, and little or nothing slit on the edges: the toppes are branched, bearing many small Greene scaly heads, out of which rise flowers, consisting of siue or sixe, or more long and hollow leaues, small at the bottome, and opening wider and greater at the brims, notched or cut in on the edges, and standing round about many small threds in the middle: the colours of these flowers are diuers, and very variable; for some are wholly blew, or white, or bluish, or of a sad, or light purple, or of a light or dead red, or of an ouerworne purple colour, or else mixed of these colours, as some, the edges white, and the rest blew or purple, or the edges blew or purple, and the rest of the flower white, or striped, spotted, or halfed, the one part of one colour, and the other of another, the threds likewise in the middle varying in many of them; for some will haue the middle thrume of a deeper purple then the outer leaues, and some haue white or bluish leaues, the middle thrume being reddish, deeper or paler: After the flowers are past, there come small, hard, white and shining seede in those heads, wrapped

ped or set among a deale of flockie matter, as is most vsuall, in all plants that beare scaly heads: the rootes are long and hard, perishing euery yeare when it hath giuen seede.

2. *Cyanus floridus Turcicus*. The Sultans flower.

As a kinde of these Corne flowers, I must needs adioyne another stranger, of much beautie, and but lately obtained from Constantinople, where, because (as it is said) the great Turke, as we call him, saw it abroad, liked it, and wore it himselfe; all his vassals haue had it in great regard, and hath been obtained from them, by some that haue sent it into these parts. The leaves whereof are greener, and not only gashed, but finely snipt on the edges: the stalkes are three foote high, garnished with the like leaves as are below, and branched as the former, bearing large scaly heads, and such like flowers but larger, hauing eight or nine of those hollow gaping leaues in euery flower, standing about the middle threds (if it be planted in good and fertile ground and be well watered, for it soone starueth and perisheth with drought) the circling leaues are of a fine delayed purple or bluish colour, very beautifull to behold; the seede of this is smaller and blacker, and not enclosed in so much dounie substance, as the former (yet in our Countrey the seede is not so blacke, as it came vnto vs, but more gray) the roote perisheth likewise euery yeere.

3. *Cyanus patiens supinus*. The Spanish Corne flower.

This Spanish kinde hath many square low bending or creeping stalkes, not standing so vpright as the former, but branching out more diuersly; so that one plant will take vp a great deale of ground: the leaues are broader then any of the rest, softer also, of a pale or whitish Greene colour, and not much gashed on the edges: the flowers stand in bigger heads, with foure or five leaues vnder euery head, and are of a light pale purple or bluish colour; after which come seede, but not so plentifully, yet wrapped in a great deale of flockie matter, more then any: the roote groweth downe deepe into the ground, but perisheth euery yeare as they doe.

The Place.

The first or former kinde, grow many times in the Corne fields of our own Countrey, as well as of others, especially that sort with a blew flower: but the other sorts or colours are not so frequent, but are nourished in gardens, where they will vary wonderfully.

The second as is before set downe, groweth in Turkie: and the last in Spaine, found out and first sent to vs by that industrious searcher of simples,

Guillaume Boel before remembred.

The Time.

The first doe flower in the end of Iune, and in Iuly, and somtimes sooner. The other two later, and not vntill August most commonly, and the seede is soone ripe after.

The Names.

The first is generally called *Cyanus*, and some following the Ditch name, call it *Flos frumenti*. The olde Writers gaue it the name of *Bapti secuba*, which is almost worn out. We doe call them in English, Blew Bottles, and in some places, Corne flowers, after the Ditch names. The second hath beene sent by the name of *Ambreboi*, which whether it be a Turke or Arabian name, I know not. I haue called it from the place, from whence we had it, *Turcicus*, and for his beauty, *Floridas*. The Turkes themselves as I vnderstand, doe call it *The Sultans flower*, and I haue done so likewise, that it may bee distinguished from all the other kinde, or else you may call it,

The Turkey bluish Corne flower, which you please. The last was sent by the name of *Jacea Batica*, but I had rather to referre it to the *Cyanus*, or Corne flowers, because the flowers are like vnto the Corne flowers, and not vnto the laceas or Knapweedes.

The Vertues.

These had no vse in Physicke in Galen and Dioscorides time, in that (as it is thought) they haue made no mention of them: We in these dayes doe chiefly vse the first kindes (as also the greater sort) as a cooling Cordiall, and commended by some to be a remedy, not onely against the plague and pestilentiall diseases, but against the poison of Scorpions and Spiders.

CHAP. LXXV.

Jacea Marina Batica. Spanish Sea Knapweede.

THere are a great many sorts of Knapweedes, yet none of them all fit for this our Garden, but this only stranger, which I haue beene bold to thrust in here, for that it hath such like gaping or open flowers, as the former Corne flowers haue, but notably differing, and therefore deserueth a peculiar Chapter, as partaking both with *Cyanus* and *Jacea*. It hath many long and narrow leaues vncuenly dented or waued on both edges (and not notched, gashed or indented, as many other herbes are) being thicke, fleshie and brittle, a little hairy, and of an ouerworne darke Greene colour, among which rise lowe weake stalkes, with such like leaues as grow at the bottom, but smaller, bearing but here and there a flower, of a bright reddish purple colour, like in forme vnto the Corne flowers, but much larger, with many threds or thrums in the middle of the same colour, standing vp higher then any of the former: this flower riseth out of a large scaly head, all set ouer with small sharpe (but harmelesse) white prickles: the feedes are blackish, like vnto the Knapweedes, and larger then any of the former Corne flowers: the roote is great and thicke, growing deepe into the ground, fleshie and full of a slimie or clammy iuice, and easie to bee broken, blackish on the outside, and whitish within, enduring many yeares, like as the other Knapweedes, or Matfelons doe, growing in time to be very thicke and great.

The Place.

It groweth naturally by the Sea side in Spaine, from whence I receiued the feedes of Guillaume Boel, and did abide well in my garden a long time, but is now perished.

The Time.

It flowreth in the beginning of Iuly, or thereabouts, and continueth not long in flower: but the head abideth a great while, and is of some beauty after the flower is past, yet seldome giueth good seed with vs.

The Names.

It hath no other name then is set down in the title, being altogether a Nouelist, and not now to be seene with any sauing my selfe.

The Vertues.

We haue not yet known any vse hereof in Physick.

CHAP. LXXVI.

Cnicus sine Carthamus sativus. Bastard or Spanish Saffron.

THere are two or three sorts of *Cnicus* or bastard Saffrons which I passe over, as not fit for this Garden, and onely set downe this kinde, whose flowers are of a fairer and more liuely colour in our Country, then any hath come ouer from Spaine, where they manure it for the profit they make thereof; seruing for the dying of Silke especially, and transporting great quantities to diuers Countries. It hath large broad leaues, without any prickles at all vpon them in our Country, growing vpon the stalke, which is strong, hard, and round, with shorter leaues thereon vnto the toppe, where they are a litle sharpe pointed, and prickly about the edges somerimes, which stalke riseth three or foure foote high, and brancheth it selfe toward the toppe, bearing at the end of euery branch one great open scaly head, out of which thrusteth out many gold yellow threads, of a most orient shining colour, which being gathered in a dry time, and kept dry, will abide in the same delicate colour that it bare when it was fresh, for a very long time after: when the flowers are past, the seede when it is come to maturity, which is very seldome with vs, is white and hard, somewhat long, round, and a litle cornered: the roote is long, great, and woody, and perisheth quickly with the first frosts.

The Place.

It groweth in Spaine, and other hot Countries, but not wilde, for that it is accounted of the old Writers, Theophrastus and Dioscorides, to be a manured plant.

The Time.

It flowreth with vs not vntill August, or September sometimes, so that it hardly giueth ripe seede (as I said) neither is it of that force to purge, which groweth in these colder Countries, as that which commeth from Spaine, and other places.

The Names.

The name *Cnicus* is deriued from the Greekes, and *Carthamus* from the Arabians, yet still *sativus* is added vnto it, to shew it is no wilde, but a manured plant, and sowne euery where that wee know. Of some it is called *Crocus hortensis*, and *Sarsenicus*, from the Italians which so call it. We call it in English Bastard Saffron, Spanish Saffron, and Catalonia Saffron.

The Vertues.

The flowers are vsed in colouring meates, where it groweth beyond Sea, and also for the dying of Silkes: the kernels of the seede are onely vsed in Physicke with vs, and serueth well to purge melancholicke humours.

CHAP. LXXVII.

Carduus. Thistles.

You may somewhat maruaile, to see mee curious to plant Thistles in my Garden, when as you might well say, they are rather plagues then pleasures, and more trouble to weede them out, then to cherish them vp, if I made therein no distinction or choise; but when you haue viewed them well which I bring in, I will

then abide your censure, if they be not worthy of some place, although it be but a corner of the Garden, where something must needs be to fill vp roome. Some of them are smooth, and without prickles at all, some at the heads onely, and some all ouer; but yet not without some especiall note or marke worthy of respect: Out of this discourse I leaue the Artichoke, with all his kindes, and referue them for our Kitchin Garden, because (as all know) they are for the pleasure of the taste, and not of the smell or sight.

1. *Acanthus sativus*. Garden Beares breech.

The leaues of this kinde of smooth thistle (as it is accounted) are almost as large as the leaues of the Artichoke, but not so sharp pointed, very deeply cut in and gashed on both edges, of a sad green & shining colour on the vpper side, and of a yellowish green vnderneath, with a great thicke rib in the middle, which spread themselves about the root, taking vp a great deale of ground. After this plant hath stood long in one place, and well defended from the iniury of the cold, it sendeth forth from among the leaues one or more great and strong stalkes, three or foure foote high, without any branch at all, bearing from the middle to the top many flowers one about another, spike-fashion round about the stalke, with smaller but not diuided greene leaues at euery flower, which is white, and fashioned somewhat like vnto a gaping mouth; after which come broad, flat, thicke, round, brownish yellow seede (as I haue well obserued by them haue bene sent me out of Spaine, and which haue sprung vp, and doe grow with me; for in our Countrey I could neuer obserue any seede to haue growne ripe) the rootes are composed of many great and thicke long strings, which spread farre in and vnder the ground, somewhat darkish on the outside, and whitish within, full of a clammy moisture (whereby it sheweth to haue much life) and doe endure our Winters, if they be not too much exposed to the sharpe violence thereof, which then it will not endure, as I haue often found by experience.

2. *Acanthus siluestris*. Wilde or prickly Beares breech.

This prickly Thistle hath diuers long greenish leaues lying on the ground, much narrower then the former, but cut in on both sides, thicke set with many white prickles and thornes on the edges: the stalke riseth not vp-so high, bearing diuers such like thornie leaues on them, with such a like head of flowers on it as the former hath: but the seede hereof (as it hath come to vs from Italy and other places, for I neuer saw it beare seed here in this Countrey) is blacke and round, of the bignesse of a small pease: the roote abideth reasonable well, if it be defended somewhat from the extremity of our Winters, or else it will perish.

3. *Eringium Pannonicum* siue *Montanum*. Hungary Sea Holly.

The lower leaues of this Thistle that lye on the ground, are somewhat large, round, and broad, hard in handling, and a little snipt about the edges, euery one standing vp on a long foote-stalke: but those that growe vpon the stalke, which is stiffe, two or three foote high, haue no foote-stalke, but encompasse it, two being set at euery ioynr, the toppe whereof is diuided into diuers branches, bearing small round rough heads, with smaller and more prickly leaues vnder them, and more cut in on the sides then those belowe: out of these heads rise many blew flowers, the foote-stalkes of the flowers, together with the toppes of the branches, are likewise blew and transparent, or shining.

Flere albo.

We haue another of this kinde, the whole toppes of the stalkes, with the heads and branches, are more white then blew; the seede contained in these heads are white, flat, and as it were chaffie: the roote is great and whitish, spreading farre into many branches, and somewhat sweete in taste, like the ordinary Sea Holly rootes.

4. *Cardus mollis*. The gentle Thistle.

The leaues of this soft and gentle Thistle that are next vnto the ground, are greene

1. *Acanthus latifolius*, Garden Beares breech. 2. *Acanthus filifolius*, Wilde Beares breech. 3. *Eriogonum Pannonicum*, Mountain Sea Holly. 4. *Carlina humilis*, The lowe Carlina Thistle. 5. *Carduus sphaerocephalus maior*, The greater Globe-Thistle. 6. *Carduus sphaerocephalus minor*, The lesser Globe-Thistle. 7. *Carduus Eriogonifolius*, The Friars crowne. 8. *Fraxinella*, Ballard Dittanie.

on the vpperfide, and hoary vnderneath, broad at the bottome, somewhat long pointed, and vneuenly notched about the edges, with some soft hairie prickles, not hurting the handler, euery one standing vpon a short foote-ftalke; those that growe about the middle stalke are like the former, but smaller and narrower, and those next the toppe smallest, where it diuideth it selfe into small branches, bearing long and scaly heads, out of which breake many reddish purple threads: the seede is whitish and hard, almost as great as the seede of the greater Centory: the roote is blackish, spreading vnder the ground, with many small fibres fastened vnto it, and abideth a great while.

5. *Carlina humilis*. The lowe Carline Thistle.

This lowe Thistle hath many iagged leaues, of a whitish Greene colour, armed with small sharp white prickles round about the edges, lying round about the root vpon the ground, in the middle whereof riseth vp a large head, without any stalke vnder it, compassed about with many small and long prickly leaues, from among which the flower sheweth it selfe, composed of many thin, long, whitish, hard shining leaues, standing about the middle, which is flat and yellow, made of many thrums or threads like small flowers, wherein lye small long seede, of a whitish or siluer colour: the roote is somewhat aromaticall, blackish on the outside, small and long, growing downewards into the ground. There is another of this kinde that beareth a higher stalke, and a redder flower, but there is a manifest difference betweene them.

6. *Carduus Sphaerocephalus sine Globosus maior*. The greater Globe Thistle.

The greatest of these beautifull Thistles, hath at the first many large and long leaues lying on the ground, very much cut in and diuided in many places, euen to the middle ribbe, set with small sharpe (but not very strong) thornes or prickles at euery corner of the edges, Greene on the vpperfide, and whitish vnderneath: from the middle of these leaues riseth vp a round stiffe stalke, three foote and a halfe high, or more, set without order with such like leaues, bearing at the toppe of euery branch a round hard great head, consisting of a number of sharpe bearded huskes, compact or set close together, of a blewish Greene colour, out of euery one of which huskes start small whitish blew flowers, with white threads in the middle of them, and rising aboue them, so that the heads when they are in full flower, make a fine shew, much delighting the spectators: after the flowers are past, the seede encreaseth in euery one, or the most part of the bearded huskes, which doe still hold their round forme, vntill that being ripe it openeth it selfe, and the huskes easily fall away one from another, containing within them a long whitish kernell: the roote is great and long, blackish on the outside, and dyeth euery yeare when it hath borne seede.

7. *Carduus Globosus minor*. The lesser Globe Thistle.

The lesser kinde hath long narrow leaues, whiter then the former, but cut in and gashed on the edges very much with some small prickles on them; the stalke is not halfe so long, nor the heads halfe so great, but as round, and with as blew flowers as the greater: this seldome giueth ripe seede, but recompenseth that fault, in that the roote perisheth not as the former, but abideth many yeares.

8. *Carduus Erioccephalus sine Tomentosus*. The Friers Crowne.

This woolly Thistle hath many large and long leaues lying on the ground, cut in on both sides into many diuisions, which are likewise somewhat vnequally cut in or diuided againe, hauing sharpe white prickles at euery corner of the diuisions, of a dead or sad Greene colour on the vpperfide, and somewhat woolly withall, and grayish vnderneath: the stalke is strong and tall, foure or fise foote high at the least, branching out into diuers parts, euery where beset with such like leaues as growe below; at the toppe of euery branch there breaketh out a great whitish round prickly head, flattish at the toppe, so thicke set with wooll, that the prickles seeme but small spots or haire, and

and doth so well resemble the bald crowne of a Frier, not onely before it be in flower, but especially after it hath done flowring; that thereupon it deservedly receiued the name of the Friers Crowne Thistle: out of these heads riseth forth a purple thurme, such as is to be seene in many other wilde Thistles, which when they are ripe, are full of a flockie or woolly substance, which breake at the toppe shedding it, and the seede which is blackish, flat, and smooth: the roote is great and thicke, enduring for some yeares, yet sometimes perishing, if it be too much exposed to the violence of the frosts in Winter.

The Place.

The first groweth naturally in Spaine, Italy, and France, and in many other hot Countries, and growe onely in Gardens in these colder climates, and there cherished for the beautifull aspect both of the greene plants, and of the stalkes when they are in flower. The Carline Thistle is found both in Germany and Italy in many places, and as it is reported, in some places of the West parts in England. The others are found some in France, some in Hungary, and on the Alpes, and the last in Spaine.

The Time.

They doe all flower in the Summer moneths, some a little earlier or later then others.

The Names.

The first is called *Acanthus sativus* (because the other that is prickly, is called *siluestris* or *spinosus*) and *Branca ursina*; In English, Branck vrsine, and Beares breech. The third is called *Eringium montanum*, *Alpinum*, and *Pannonicum latifolium*: In English, Mountaine or Hungary Sea Holly. The fourth is called *Carduus mollis*, The gentle Thistle, because it hath no harmful prickles, although it seeme at the first shew to be a Thistle. The fifth is called of diuers *Chamaeleo albus*, and *Carlina*, as if they were both but one plant; but Fabius Columna hath in my iudgement very learnedly descided that controuersie, making *Carlina* to be *Ixine* of Theophrastus, and *Chamaeleo* another differing Thistle, which Gaza translateth *Vernilago*. We call it in English, The Carline Thistle. The other haue their names in their titles, as much as is conuenient for this discourse.

The Vertues.

The first hath alwaies been vsed Physically, as a mollifying herbe among others of the like slimie matter in Glisters, to open the body; yet Lobel seemeth to make no difference in the vse of them both (that is, the prickly as well as the smooth.) The Carline Thistle is thought to be good against poysons and infection. The rest are not vsed by any that I know.

CHAP. LXXVIII.

Fraxinella. Bastard Dittany.

HAuing finished those pleasing Thistles, I come to other plants of more gentle handling, and first bring to your consideration this bastard Dittany, whereof there are found out two especiall kindes, the one with a reddish, the other with a whitish flower, and each of these hath his diuersity, as shall be presently declared.

1. *Fraxinella flore rubente*. Bastard Dittany with a reddish flower.

This goodly plant riseth vp with diuers round, hard, brownish stalkes, neare two foote

foote high, the lower parts whereof are furnished with many winged leaues, somewhat like vnto Liquerice, or a small young Ashe tree, consisting of seuen, nine, or eleuen leaues set together, which are somewhat large and long, hard and rough in handling, of a darkish Greene colour, and of an vnpleasant strong resinous sent: the vpper parts of the stalkes are furnished with many flowers, growing spike fashion, at certaine distances one about another, consisting of fise long leaues a peece, whereof foure stand on the two sides, are somewhat bending vpwards, and the fift hanging downe, but turning vp the end of the leafe a little againe, of a faint or pale red colour, striped through euery leafe with a deeper red colour, and hauing in the middle a tassell of fise or six long purplish threds, that bowe downe with the lower leafe, and turne vp also the ends againe, with a little freefe or thrume at the ends of euery one, after the flowers are past, arise hard, stiffe, rough, clammy huskes, horned or pointed at the end, foure or fise standing together, somewhat like the seede vessels of the Wolfes-banes, or Colombines, but greater, thicker and harder, wherein is contained round shining blacke seedes, greater then any Colombine seede by much, and smaller then Peony seede: the roote is white, large, and spreading many wayes vnder ground, it stand long: the whole plant, as well roots as leaues and flowers, are of a strong sent, not so pleasing for the smell, as the flowers are beautifull to the sight.

2. *Fraxinella flore rubro*. Bastard Dittaine with a red flower.

This differeth not from the former cyther in roote, leafe or flower, for the forme, but that the stalkes and leaues are of a darker Greene colour, and that the flowers are of a deeper red colour, (and growing in a little longer spike) wherein the difference chiefly consisteth, which is sufficient to distinguish them.

3. *Fraxinella flore albo*. Bastard Dittanie with a white flower.

The white flowered *Fraxinella* hath his leaues and stalkes of a fresher Greene colour then any of the former; and the flowers are of a pure white colour, in forme differing nothing at all from the other.

4. *Fraxinella flore albo caruleo*.

Bastard Dittanie with an ash coloured flower.

The colour of the flower of this *Fraxinella* onely putteth the difference betweene this, and the last recited with a white flower: for this beareth a very pale, or whitish blew flower, tending to an ash colour.

The Place.

All these kindes are found growing naturally, in many places both of Germany, and Italie: and that with the white flower, about Franckford, which being sent me, perished by the way by long and euill carriage.

The Time.

They flower in Iune and Iuly, and the seede is ripe in August.

The Names.

The name *Fraxinella* is most generally imposed on those plants, because of the resemblance of them vnto young Ashes, in their winged leaues. Yet some doe call them *Diellamus albus*, or *Diellamus albus*, and *Diptamus albus*, as a difference from the *Diellamus Creticus*, which is a farre differing plant. Some would haue it to be *Tragium* of Dioscorides, but beside other things wherein this differeth from *Tragium*, this yeeldeth no milkie iuice, as Dioscorides saith *Tragium* doth: We in English doe cyther call it *Fraxinella*, or after the other corrupted name of *Diellamus*, Bastard Dittanie.

The Vertues.

It is held to be profitable against the stings of Serpents, against contagious and pestilent diseases, to bring downe the feminine courtes, for the paines of the belly and the stone, and in Epilepticall diseases, and other cold paines of the braines: the roote is the most effectuall for all these, yet the seede is sometimes vsed.

CHAP. LX XIX.

Legumina. Pulse.

IF I should describe vnto you all the kindes of Pulse, I should vnfold a little world of varieties therein, more knowne and found out in these dayes, then at any time before, but that must bee a part of a greater worke, which will abide a longer time before it see the light. I shall only select those that are fit for this garden, and set them downe for your consideration. All sorts of Pulse may be reduced vnder two generall heads, that is, of Beanes and Pease, of each whereof there is both tame and wilde: Of Beanes, besides the tame or vsuall garden Beane, and the French or Kidney Beane, (whereof I meane to entreate in my Kitchen garden, as pertinent thereto) there is the Lupine or flat Beane, whereof I meane to entreate here, and the blacke Beane and others which must bee referued for the Physicke Garden. And of the kindes of Pease some are fit for this Garden, (whereunto I will adioyne two or three other plants as neere of affinitie, the flowers of some, and the fruit of others being delightfull to many, and therefore fit for this garden) some for the Kitchen, the rest for the Physicke garden. And first of Lupines or flat Beanes, accepted as delightfull to many, and therefore fit for this garden.

1. *Lupinus sativus albus*. The white garden Lupine.

The garden Lupine riseth vp with a great round stalke, hollow and somewhat woolly, with diuers branches, whereon grow vpon long foote stalkes many broade leaues, diuided into seuen or nine parts, or smaller leaues, equally standing round about, as it were in a circle, of a whitish greene colour on the vpper side, and more woolly vnderneath: the flowers stand many together at severall ioyns, both of the greater stalke, and the branches, like vnto beanes, and of a white colour in some places, and in others of a very bleake blew tending to white: after the flowers are past, there come in their places, long, broade, and flat rough cods, wherein are contained round and flat seede, yellowish on the inside, and couered with a tough white skin, and very bitter in taste: the rootes are not very great, but full of small fibres, whereby it fasteneth it selfe strongly in the ground, yet perisheth euery yeare, as all therest of these kindes doe.

2. *Lupinus ceruleus maximus*. The greater blew Lupine.

The Stemme or stalke of this Lupine is greater then the last before recited, as also the leaues more soft and woolly, and the flowers are of a most perfect blew colour, with some white spots in the middle: the long rough greenish cods are very great and large, wherein are contained hard, flat and round seede, not so white on the outside as the former, but somewhat yellower, greater also, and more rough or hard in handling.

3. *Lupinus ceruleus minor*. The lesser blew Lupine.

This kinde of wilde Lupine differeth not in the forme of leafe, or flower from the former, but only that it is much smaller, the leaues are greener, and haue fewer diuisions in them: the flower is of as deepe a blew colour as the last, the cods likewise are small and long, containing small round seede, not so flat as the former, but more discoloured

Mimus.

discoloured or spotted on the outside, then the greater kinde is. There is a lesser kind then this, not differing in any thing from this, but that it is lesser.

4. *Lupinus flore luteo.* The yellow Lupine.

The yellow Lupine groweth not vsually so high, but with larger leaues then the small blew Lupine; the flowers grow in two or three rundles or tufts, round about the stalke and the branches at the ioynts, of a delicate fine yellow colour, like in fashion vnto the other kindes, being larger then the last, but nothing so large as the greater kindes, and of a fine small sent: the seede is round, and not flat, but much about the forme and bignesse of the small blew, or somewhat bigger, of a whitish colour on the outside, spotted with many spots.

The Place.

The first groweth in many places of Greece, and the Easterne Countries beyond it, where it hath bene anciently cherished for their foode, being often watered to take away the bitternesse. It groweth also in these Western parts, but still where it is planted. The great blew Lupine is thought to come from beyond the parts of Persia, in Caramania. The lesser blew is found very plentifully wilde, in many places both of Spaine and Italy. The last hath bene brought vs likewise out of Spaine, whereas it is thought it groweth naturally. They all grow now in the gardens of those, that are curious lovers of these delights.

The Time.

They flower in Summer, and their seede is ripe quickly after.

The Names.

They are generally called *Lupini*. Plantus in his time saith, they were vsed in Comedies in stead of money, when in any Scene thereof there was any shew of payment, and therefore he calleth them *Aurum Comicum*. And Horace hath this Verse,

Nec tamen ignorant, quid dissent ara Lupinis,
to shew that counterfeit money (such as counters are with vs, or as these Lupins were vsed in those times) was easily knowne from true and currant coine. In English wee vsually call them after the Latine name, Lupines; and some after the Dutch name, Figge-beanes, because they are flat and round as a Figge that is pressed; and some Flat-beanes for the same reason. Some haue called the yellow Lupine, Spanish Violets: but other foolish names haue bene giuen it, as Virginia Roses, and the like, by knauish Gardiners and others, to deceiue men, and make them beleue they were the finders out, or great preseruers of rarities, of no other purpose, but to cheate men of their money: as you would therefore auoyde knaues and deceiuers, beware of these manner of people, whereof the skirts of our towne are too pitifully pestered.

The Vertues.

The first or ordinary Lupine doth scoure and cleanse the skin from spots, morpew, blew markes, and other discolourings thereof, being vsed eyther in a decoction or poultice. Wee seldome vse it in inward medicines, nor that it is dangerous, but of neglect, for formerly it hath bene much vsed for the wormes, &c.

1. *Lupinus major*. The great Lupine. 2. *Lupinus luteus*. The yellow Lupine. 3. *Lupinus latifolius* seu *Pisum sativum*. Pease currelading. 4. *Pisum sativum*. The crimson blossom or square Pease. 5. *Medicago sativa* vulgaris. Snailey or Barbary huttonia. 6. *Medicago sativa*. Prickly Snailie. 7. *Medicago sativa*. Another sort of prickly Snailie. 8. *Medicago sativa*. Broad bottomed Snailie. 9. *Medicago sativa*. Half Moon. 10. *Medicago sativa*. The red Satin flower, or French Honeyuckle. 11. *Scorpioides rubra*. The lesser Caterpillar. 12. *Scorpioides rubra*. The greater Caterpillar. 13. *Orobus vernus*. High upright Pease currelading.

1. *Lathyrus latifolius, sine Pisum perenne.* Pease cuerlasting.

This kinde of wilde Pease that abideth long, and groweth euery yeare greater then other, springeth vp with many broade trayling branches, winged as it were on both the sides, diuersly diuided into other smaller branches, at the seuerall ioynts whereof stand two hard, not broad, but somewhat long Greene leaues, and diuers twining claspers, in sundry places with the leaues, from betweene the branches and the leaues, at the ioynts towards the toppes, come forth diuers purplish pease like blossomes, standing on a long stemme or stalke, very beautifull to behold, and of a pretty sent or smell: after which come small, long, thin, flat, hard skind cods, containing small round blackish seede: the roote is great and thicke, growing downe deepe into the ground, of the thickeesse sometimes of a mans arme, blackish on the outside, and whitish within, with some branches and a few fibres annexed thereunto.

2. *Orobis Venetus.* Blew vpright cuerlasting Pease.

This pretty kinde of Pease blossome beareth diuers slender, but vpright Greene branches somewhat cornered, two foote high or thereabouts, hauing at seuerall distances on both sides of them certaine winged leaues, set together vpon long foote-stalkes one against another, consisting of six or eight leaues, somewhat broade and pointed, and without any odde one at the end: at the ioynts toward the toppes, between the leaues and the stalkes, come forth many flowers set together at the end of a pretty long foote-stalke, of the fashion of the former Pease blossome, but somewhat smaller, and of a purplish violet colour: after which come slender and long pointed pods rounder then they, wherein is contained small round grayish pease: the roote is blacke, hard or woody, abiding after seede bearing as the former doth, and shooting afresh euery yeare.

3. *Lathyrus annuus siliquis orobi.* Partie coloured Cichelings.

This small Pulse or wild Pease, hath two or three long slender winged branches, with smaller leaues thereon then the former, and without any claspers at all on them: the flowers stand single, euery one by it selfe, or two at the most together, the middle leaues whereof that close together are white, and the vpper leaues of a reddish purple colour: after which come long round flattish cods, bunched out in the seuerall places where the seedes lye, like vnto the cods of *Orobis* or the bitter Vetch, but greater: the roote is small and dyeth euery yeare.

4. *Pisum quadratum.* The crimson blossomed or square codded Pease.

This pretty kinde of Pulse might very well for the forme of the leaues, be referred to the Kindes of *Lotus* or Trefoiles: but because I haue none of that kindred to en-treate of in this Worke, I haue thought fittest to place it here before the Medica's, because both pods and seedes are like also. It hath three or foure small weake stalkes, diuided into many branches, hauing two stalkes of leaues at euery ioynt, and three small soft leaues standing on a very small stalke, comming from the ioynts: the flowers stand for the most part two together, of a perfect red or crimson colour, like in forme almost vnto a Pease blossome, after which come long thicke and round cods, with two skinnies or filmes, running all along the cod at the backe or vpper side, and two other such like filmes, all along the belly or vnder side, which make it seeme foure square, wherein there lye round discoloured Pease, somewhat smaller and harder then ordinary Pease: the roote is small and perisheth euery yeare.

5. *Medica Cochleata vulgaris.* Snailles or Barbary buttons.

The plant that beareth these pretty toyes for Gentlewomen, is somewhat like vnto a Threelafed grasse or Trefoile, hauing many long trayling branches lying vpon the ground, whereon at diuers places are three small Greene leaues, set together at the end of a little foote-stalke, each of them a little snipt about the edges: at seuerall distances, from

from the middle of these branches to the ends of them, come forth the flowers, two for the most part standing together vpon a little footstake, which are of a pale yellow colour, very small, and of the forme of a Pease blossom: after which come smooth heads, which are turned or writhen round, almost like a Snail, hard and Greene at the first, somewhat like a Greene button (from the formes of both which came their names) but afterwards growing whiter, more soft and open, wherein lyeth yellowish round and flat seede, somewhat like vnto the Kidney beane: the roote is small and stringie, dying downe euery yeare, and must be new sowne in the spring, if you desire to haue it.

6. *Medica spinosa maior*. Prickly or thorny Snail, or Buttons.

This kinde of *Medica* is in all things very like vnto the former, both in the long trailing branches, & three leaues alwaies growing together, but a little greater pale yellow flowers, and crooked or winding heads: but herein chiefly consisteth the difference, that this kinde hath his heads or buttons harder, a little greater, more closed together, and set with short and somewhat hard prickles, all the head ouer, which being pulled open, haue those prickles standing on each side of the filme or skinne, whereof the head consisteth, somewhat like vnto a fish bone, and in this kinde goeth all one way, in which are contained such like seedes for the forme, as are in the former, but great and blacke, and shining withall.

7. *Medica spinosa altera*. Small thorney Buttons, or Snail.

This other kinde is also like vnto the last described in all other things, except in the heads or buttons, which are a little smaller, but set with longer and softer prickles vpon the filmes, and may easily bee discerned to goe both forwards and backwards, one enterlacing within another, wherein are contained such like flat and blacke shining seede, made after the fashion of a kidney, as are in the former, but somewhat smaller: the roote perisheth in like manner euery yeare.

8. *Medica lata*. Broade Buttons.

This kinde differeth not from the first in leafe or flower, the fruite onely hereof is broade and flat, and not so much twined as it.

9. *Medica Lunata*. Halfe Moones.

This is also a kinde of these Medicke fodders, hauing a trefoyle leafe and yellow flowers like the former sorts, but both somewhat larger, the chiefest difference consisteth in the head or fruite, which is broade and flat, and not twined like the rest, but abideth halfe closed, resembling a halfe Moone (and thereupon hath assumed both the Latine and English name) wherein is contained flat seede, kidney fashion like the former.

10. *Hedysarum clypeatum*. The red Sattin flower.

This red flowred Fitchling, hath many stalkes of winged faire Greene leaues, that is, of many set on both sides a middle ribbe, whereof that at the end is the greatest of the rest: from the ioynts where the leaues stand, come forth pretty long small stalkes, bearing on them very many flowers, vp to the toppe one aboue another, of an excellent shining red or crimson colour, very like vnto Sattin of that colour, and sometimes of a white colour, (as Master William Coys, a Gentleman of good respect in Essex, a great and ancient louer and cherisher of these delights, and of all other rare plants, in his life time assured me, he had growing in his garden at Stubbers by North Okenden) which are somewhat large, and more closed together, almost flat and not open, as in most of the other sorts: after the flowers are past, there come rough, flat, round huskes, somewhat like vnto the old fashioned round bucklers without pikes, three or foure standing one vpon or aboue another, wherein are contained small

small brownish seede : the roote perisheth the same yeare it beareth seede, for oftentimes it floweth not the first yeare it is sowne.

11. *Scorpioides maius & minus.*

Great and small Caterpillers.

Vnder one description I comprehend both these sorts of Scorpions grasse, or Caterpillers, or Wormes, as they are called by many, whereof the greater hath been known but of late yeares; and ioyned them to these pulses, not hauing a fitter place where to insert them. It is but a small low plant, with branches lying vpon the ground, and somewhat long, broad, and hard leaues thereon, among which comeforth small stalkes, bearing at the end for the most part, two small pale yellowish flowers, like vnto Tares or Vetches, but smaller, which turne into writhed or crooked tough cods; in the greater sort they are much thicker, rounder and whiter, and lesser wound or turned together then in the smaller, which are slenderer, more winding, yet not closing like vnto the Snailles, and blacker more like vnto a Caterpillar then the other, wherein are contained brownish yellow seede, much like vnto a *Medica*: the rootes of both are small and fibrous, perishing euery yeare.

The Place.

These are found seuerally in diuers and seuerall places, but wee sow and plant them vsually to furnish our gardens.

The Time.

They doe all flower about the moneths of Iune and Iuly, and their seede is ripe soone after: but the second is earlier then the rest.

The Names.

The first is called *Clymenum* of Matthioli, and *Lathyrus* of Lobel and others: but *Lathyrus* in Greeke is *Cataputia* in Latine, which is our Spurge, farre differing from this Pulse; and therefore *Lathyrus* is more proper to distinguish them asunder, that two plants so farre vnlike should not be called by one name: this is also called *Lathyrus latifolius*, because there is another called *angustifolius*, that differeth from it also: It is most vsually called with vs, *Pisum perenne*, and in English Pease blossome, or Pease euerslasting. The second is called by Clusius, *Orobis venetus*, because it was sent him from Venice, with another of the same kinde that bore white flowers; yet differeth but little or nothing from that kinde he found in Hungary, that I thinke the seuerall places of their growing only cause them to beare seuerall names, and to be the same in deede. Although I yeeld vnto Clusius the Latine name which doth not sufficiently content mee; yet I haue thought good to giue it a differing English name, according as it is in the title. The third, because I first receiued it among other seeds from Spaine, I haue giuen it the name as it is entituled. The fourth is called of some *Sandalida Cretica*, of others *Lotus siliquosus flore rubello*, *Lotus tetragonolobus*, *Pisum rubrum*, or *Pisum quadratum*: We vsually call it in English, Crimson Pease, or square Pease. The *Medica Cochleata* is called of Dodonaeus *Trifolium Cochleatum*, but not iudged to be the true *Medica*. Wee call it in English, Medick fodder Snailles Clauer, or as it is in the title, and so the rest of the *Medica*'s accordingly. The *Hedysarum clypeatum*, or *Securidaca* is called of Dodonaeus *Orobis altera*, and we in English for the likenesse, The red Sartin flower, although some foolishly call it, the red or French Honysuckle. The last is called by Lobel, *Scorpioides bupleurifolia*, I haue called it *minus*, because the greatest sort which came to me out of Spaine was not knowne vnto him; in English they are generally called Caterpillers.

The Vertues.

The Medica's are generally thought to feede cattell fat much more then the Medow Trefoile, or Clauer grasse, and therefore I haue known diuers Gentlemen that haue plowed vp some of their pasture grounds, and sowed them with the seedes of some Medica's to make the experience. All the other sorts are pleasures to delight the curious, and not any way profitable in Physicke that I know.

CHAP. LXXX.

Paonia. Peonic.

THere are two principall kindes of Peonic, that is to say, the Male and the Female. Of the male kinde, I haue onely known one sort, but of the Female a great many; which are thus to be distinguished. The Male his leafe is whole, without any particular diuision, notch or dent on the edge, & his rootes long & round, diuided into many branches, somewhat like to the rootes of Gentian or Elecampane, and not tuberous at all. The Female of all sorts hath the leaues diuided or cut in on the edges, more or lesse, and hath alwaies tuberous rootes, that is, like clogs or Asphodill rootes, with many great thick round peeces hanging, or growing at the end of smaller strings, and all ioyned to the toppe of the maine roote.

1. *Paonia mas. The Male Peonic.*

The Male Peonic riseth vp with many brownish stalkes, whereon doe grow winged leaues, that is, many faire Greene, and sometimes reddish leaues, one set against another vpon a stalke, without any particular diuision in the leafe at all: the flowers stand at the toppes of the stalkes, consisting of five or six broade leaues, of a faire purplish red colour, with many yellow threds in the middle, standing about the head, which after riseth to be the seede vessels, diuided into two, three or foure rough crooked pods like hornes, which when they are full ripe, open and turn themselues down one edge to another backward, shewing within them diuers round black shining seede, which are the true seede, being full and good, and hauing also many red or crimson graines, which are lancke and idle, intermixed among the blacke, as if they were good seede, whereby it maketh a very pretty shew: the roots are great, thick and long, spreading in the ground, and running downe reasonable deepe.

2. *Paonia femina vulgaris flore simplici.*

The ordinary single Female Peonic.

This ordinary Female Peonic hath many stalkes, with more store of leaues on them then the Male kinde hath, the leaues also are not so large, but diuided or nicked diuersly on the edges, some with great and deepe, and others with smaller cuts or diuisions, and of a darke or dead Greene colour: the flowers are of a strong heady sent, most vsually smaller then the male, and of a more purple tending to a murrey colour, with yellow thrums about the head in the middle, as the male kinde hath: the heads or hornes with seed are like also but smaller, the seede also is blacke, but lesse shining: the rootes consist, as I said, of many thicke and short tuberous clogs, fastened at the ends of long strings, and all from the head of the roote, which is thicke and short, and tuberous also, of the same or the like sent with the male.

3. *Paonia femina vulgaris flore pleno rubro.*

The double red Peonic.

This double Peonic as well as the former single, is so frequent in euerie Garden of note, through euerie Countrey, that it is almost labour in vaine

to describe it: but yet because I use not to passe ouer any plant so slightly, I will set down the description briefly, in regard it is so common. It is very like vnto the former single female Peony, both in stalkes and leaues, but that it groweth somewhat higher, and the leaues are of a fresher Greene colour: the flowers at the tops of the stalkes are very large, thicke, and double (no flower that I know so faire, great, and double, but not abiding blowne about eight or ten daies) of a more reddish purple colour then the former female kinde, and of a sweeter sent: after these flowers are past, sometimes come good seed, which being sowne, bring forth some single flowers, and some double: the rootes are tuberous, like vnto the former female.

4. *Peonia femina flore carneo simplici.* The single bluish Peony.

The single bluish Peony hath his stalkes higher, and his leaues of a paler or whiter Greene colour then the double bluish, and more white vnderneath (so that it is very probable it is of another kinde, and not risen from the seede of the double bluish, as some might thinke) with many veines, that are somewhat discoloured from the colour of the leafe running through them: the flowers are very large and single, consisting of five leaues for the most part, of a pale flesh or bluish colour, with an eye of yellow dispersed or mixed therewith, hauing many whitish threads, tipt with yellow pendants standing about the middle head: the rootes are like the other female Peonies.

5. *Peonia femina flore pleno albicante.* The double bluish Peony.

The double bluish Peony hath not his stalkes so high as the double red, but somewhat lower and stiffer, bearing such like winged leaues, cut in or diuided here and there in the edges, as all these female kindes here, but not so large as the last: the flowers are smaller, and lesse double by a good deale then the former double red, of a faint shining crimson colour at the first opening, but decaying or waxing paler euery day: so that after it hath stood long (for this flower sheddeth not his leaues in a great while) it will change somewhat whitish; and therefore diuers haue ignorantly called it, the double white Peony: the seedes, which sometimes it beareth, and rootes, are like vnto the former female kindes, but somewhat longer, and of a brighter colour on the outside.

6. *Peonia femina Byzantina.* The single red Peony of Constantinople.

This red Peony of Constantinople is very like in all things vnto the double red Peonie, but that the flowers hereof are single, and as large as the last, and that is larger then either the single female, or the male kinde, consisting of eight leaues, of a deeper red colour then either the single or double Peonies, and not purplish at all, but rather of the colour of an ordinary red Tulipa, standing close and round together: the roots of this kinde haue longer clogs, and not so short as of the ordinary female kinde, and of a paler colour on the outside.

The Place.

All these Peonies haue beene sent or brought from diuers parts beyond the Seas; they are endehized in our Gardens, where wee cherish them for the beauty and delight of their goodly flowers, as well as for their Physicall vertues.

The Time. They all flower in May, but some (as I said) abide a small time, and others many weekes.

The Names.

The name *Peonia* is of all the later Writers generally giuen to these plants, although they haue had diuers other names giuen by the elder Writers, as *Rosa farinosa*, *Idem dactylus*, *aglaophotis*, and others, whereof to set downe

1 *Paeonia moutan* semine. The male Peony & the seed. 2 *Paeonia officinalis* byzantina. The female red Peony of Constantinople. 3 *Paeonia officinalis* flore pleno vulgaris. The ordinary double Peony. 4 *Paeonia flore pleno albicante*. The double white Peony. 5 *Helicoborus vernus atrovirens* flore. The early white Elcchor with a darker red flower. 6 *Helicoborus niger* veris. The Christmas flower. 7 *Calceolus Mariae*. Our Ladies Slipper.

downe the causes, reasons, and errors, were to spend more time then I intend for this worke. Wee call them in English, Peonie, and distinguish them according to their titles.

The Vertues.

The male Peony roote is farre above all the rest a most singular approved remedy for all Epilepticall diseases, in English, The falling sicknesse (and more especially the greene roote then the dry) if the disease be not too inueterate, to be boyled and drunke, as also to hang about the neckes of the younger sort that are troubled herewith, as I haue found it sufficiently experimented on many by diuers. The seede likewise is of especiall vse for women, for the rising of the mother. The seede of the female kinde, as well as the rootes, are most vsually sold, and may in want of the other be (and so are generally) vsed.

CHAP. LXXXI.

Helleborus niger. Beares foote.

THere are three sorts of blacke Hellebor or Beares foote, one that is the true and right kinde, whose flowers haue the most beautifull aspect, and the time of his flowing most rare, that is, in the deepe of Winter about Christmas, when no other can bee seene vpon the ground: and two other that are wilde or bastard kinds, brought into many Gardens for their Physicall properties, but I will only ioyne one of them with the true kinde in this worke, and leaue the other for another.

1. *Helleborus niger verus.* The true blacke Hellebor, or Christmas flower.

The true blacke Hellebor (or Beare foote as some would call it, but that name doth more fitly agree with the other two bastard kinds) hath many faire greene leaues rising from the roote, each of them standing on a thicke round fleshy stiffe green stalke, about an hand breadth high from the ground, diuided into seven, eight, or nine parts or leaues, and each of them nicked or dented, from the middle of the leafe to the pointward on both sides, abiding all the Winter, at which time the flowers rise vp on such short thicke stalkes as the leaues stand on, euery one by it selfe, without any leafe thereon for the most part, or very seldome hauing one small short leafe not much vnder the flower, and very little higher then the leaues themselves, consisting of five broad white leaues, like vnto a great white single Rose (which sometimes change to be either lesse or more purple about the edges, as the weather or time of continuance doth effect) with many pale yellow thrummes in the middle, standing about a greene head, which after groweth to haue diuers cods set together, pointed at the ends like hornes, somewhat like the seede vessels of the *Aconitum hyemale*, but greater & thicker, wherein is contained long, round, and blackish seede, like the seede of the bastard kinds: the rootes are a number of brownish strings running downe deepe into the ground, and fastened to a thicke head, of the bignesse of a finger at the toppe manie times, and smaller still downewards.

2. *Helleboraster minor.* The lesser bastard blacke Hellebor, or Beare foote.

The smaller Beare foote is in most things like vnto the former true blacke Hellebor, for it beareth also many leaues vpon short stalkes, diuided into many leaues also, but each of them are long and narrow, of a blacker greene colour, snipt or dented on both edges, which feele somewhat hard or sharpe like prickles, and perish euery yeare, but rise againe the next Spring: the flowers hereof stand on higher stalkes, with some leaues on them also, although but very few, and are of a pale greene colour like in

forme vnto the flowers of the former, but smaller, hauing also many greenish yellow threads or thrums in the middle, and such like heads or seede vessels, and blackish seed: the rootes are stringie and blackish like the former.

The Place.

The first groweth onely in the Gardens of those that are curious, and delight in all sorts of beautifull flowers in our Countrey, but wilde in many places of Germany, Italy, Greece, &c.

The other groweth wilde in many places of England, as well as the other greater sort, which is not here described; for besides diuers places within eight or ten miles from London, I haue seen it in the Woods of Northamptonshire, and in other places.

The Time.

The first of these plants doth flower in the end of December, and beginning of Ianuary most vsually, and the other a moneth or two after, and sometime more.

The Names.

The first is called *Helleborus*, or *Elleborus niger verus*, and is the same that both Theophrastus and Dioscorides haue written of, and which was called *Melampodium*, of Melampus the Goatsheard, that purged and cured the mad or melancholicke daughters of Praxus with the rootes thereof. Dodonaus calleth it *Peratrum nigrum primum*, and the other *secundum*: Wee call it in English, The true blacke Hellebor, or the Christmas flower, because (as I said) it is most commonly in flower at or before Christmas. The second is a bastard or wilde kinde thereof, it so nearely resembleth the true, and is called of most of the later Writers, *Pseudoelleborus niger minor*, or *Helleboraster minor*, for a distinction betwene it and the greater, which is not here described; and is called in English, The smaller or lesser Beare foote, and most vied in Physicke, because it is more plentifull, yet is more churlish and strong in operation then the true or former kinde.

The Vertues.

The rootes of both these kindes are safe medecines, being rightly prepared, to be vsed for all Melancholicke diseases, whatsoeuer others may feare or write, and may be without danger applied, so as care and skill, and not temerary rashnesse doe order and dispose of them.

The powder of the dryed leaues, especially of the bastard kinde, is a sure remedy to kill the wormes in children, moderately taken.

CHAP. LXXXII.

Elleborus albus. White Ellebor or Neefewort.

THere are two sorts of great white Ellebors or Neefeworts, whereas there was but one kinde knowne to the Ancients; the other being found out of later dayes: And although neither of both these haue any beauty in their flowers, yet because their leaues, being faire and large, haue a goodly prospect, I haue inserted them in this place; that this Garden should not be vnfurnished of them, and you not vnacquainted with them.

1. *Elleborus albus vulgaris*. White Ellebor or Neefing roote.

The first great white Ellebor riseth at the first out of the ground, with a whitish greene great round head, which growing vp, openeth it selfe into many goodly faire large greene leaues, plaited or ribbed with eminent ribbes all along the leaues, compassing one another at the bottome, in the middle whereof riseth vp a stalke three foot high or better, with diuers such like leaues thereon, but smaller to the middle thereof, from whence to the toppe it is diuided into many branches, hauing many small yellowish, or whitish greene starre-like flowers all along vpon them, which after turne into small, long, three square whitish seede, standing naked, without any huske to containe them, although some haue written otherwise: the roote is thicke and reasonable great at the head, hauing a number of great white strings running downe deepe into the ground, whereby it is strongly fastened.

2. *Elleborus albus pracox sine atrorubente flore*.

The early white Ellebor with reddish flowers.

This other Ellebor is very like the former, but that it springeth vp a moneth at the least before it, and that the leaues are not fully so thicke or so much plaited, but as large or larger, and doe sooner perish and fall away from the plant: the stalke hereof is as high as the former, bearing such like starry flowers, but of a darke or blackish red colour: the seede is like the other: the roote hath no such head as the other (so farre as I haue obserued, both by mine own and others plants) but hath many long white strings fastened to the top, which is as it were a long bulbous scaly head, out of which spring the leaues.

The Place.

The first groweth in many places of Germany, as also in some parts of Russia, in that abundance, by the relation of that worthy, curious, and diligent searcher and preseruer of all natures rarities and varieties, my very good friend, Iohn Tradescante, often heretofore remembred, that, as hee said, a good ship might be loaden with the rootes hereof, which hee saw in an Island there.

The other likewise groweth in the vpland wooddy grounds of Germanie, and other the parts thereabouts.

The Time.

The first springeth vp in the end or middle of March, and flowreth in Iune. The second springeth in February, but flowreth not vntill Iune.

The Names.

The first is called *Elleborus albus*, or *Helleborus albus*, the letter *H*, as all Schollers know, being but *aspirationis nota*: and *Veratrum album flore viridante*, of some *Sanguis Herculis*. The other is called *Elleborus albus pracox*, and *flore atrorubente*, or *atropurpurante*. We call the first in English, White Ellebor, Neefewort, or Neefing roote, because the powder of the roote is vsed to procure neefing; and I call it the greater, in regard of those in the next Chapter. The other hath his name according to the Latine title, most proper for it.

The Vertues.

The force of purging is farre greater in the roote of this Ellebor, then in the former, and therefore is not carelesly to bee vsed, without extreame danger; yet in contumacious and stubborn diseases it may bee vsed with

good

good caution and aduise. There is a Syrupe of Oxymel made hereof in the Apothecaries shops, which as it is dangerous for gentle and tender bodies, so it may be very effectually in stronger constitutions. Pausanias in *Phocis*, recordeth a notable stratagem that Solon vsed in besieging the Citie of Cirrheus, viz. That hauing cut off the riuer Plistus from running into the Citie, he caused a great many of these rootes to be put into a quantity thereof, which after they had steeped long enough therein, and was sufficiently infected therewith, he let passe into the Citie againe: whereof when they had greedily drunke, they grew so weake and feeble by the superpurgation thereof, that they were forced to leaue their wals vnmand, and not guarded, whereby the Amphyctions their enemies became masters of their Citie. The like stratagems are set downe by diuers other Authors, performed by the helpe of other herbes.

CHAP. LXXXIII.

Elleborine. Small or wilde white Ellebor.

THe likenesse of the leaues of these plants, rather then any other faculty with the former white Ellebor, hath caused them to be called *Elleborine*, as if they were smaller white Ellebors. And for the same cause haue ioyned them next, whereof there are found many sorts: One which is the greater kinde, is of greatest beauty; the other which are lesser differ not much one from another, more then in the colour of the flowers, whereof I will onely take three, being of the most beautie, and leaue the rest to another worke.

1. *Elleborine vel Elleborine maior, siue Calceolum Maria.*

Our Ladies Slipper.

This most beautifull plant of all these kindes, riseth vp with diuers stalkes, a foote and a halfe high at the most, bearing on each side of them broad Greene leaues, somewhat like in forme vnto the leaues of the white Ellebor, but smaller and not so ribbed, compassing the stalke at the lower end; at the tops of the stalkes come forth one, or two, or three flowers at the most, one aboue another, vpon small short foote-stalkes, with a small leafe at the foote of euery stalke: each of these flowers are of a long ouall forme, that is, more long then round, and hollow withall, especially at the vpper part, the lower being round and swelling like a belly: at the hollow part there are two small peeces like eares or slippers, that at the first doe couer the hollow part, and after stand apart one from another, all which are of a fine pale yellow colour, in all that I haue seene (yet it is said there are some found, that are more browne or tending to purple) there are likewise foure long, narrow, darke coloured leaues at the setting on of the flower vnto the stalke, wherein as it were the flower at the first standeth; the whole flower is of a pretty small sent: the seede is very small, very like vnto the seede of the *Orchides* or *Satyrions*, and contained in such like long pods, but bigger: the roots are composed of a number of strings enterlacing themselues one within another, lying within the vpper crust of the earth, & not spreading deep, of a darke brownish colour.

2. *Elleborine minor flore albo.*

The smaller wilde white Ellebor with a white flower.

This smaller wilde white Ellebor riseth vp in the like manner vnto the former, and not much lower, bearing such like leaues, but smaller, and of a whiter Greene colour, almost of the colour and fashion of the leaues of Lilly Conually; the top of the stalke hath many more flowers, but lesser, growing together, spike-fashion, with small short leaues at the stalke of euery flower, which consisteth of five small white leaues, with a small close hood in the middle, without any sent at all: the seede and seede vessels are

like

like vnto the former, but smaller: the rootes are many small strings, dispersing themselves in the ground.

3. *Elleborine minor flore purpurante.*

The small or wilde white Ellebor with bluish flowers.

The leaues of this kinde are like vnto the last described, but somewhat narrower: the stalkes and flowers are alike, but smaller also, and of a pale purplish or bluish colour, which causeth the difference.

The Place.

The first groweth in very many places of Germany, and in other Countries also. It groweth likewise in Lancashire, neare vpon the border of Yorkshire, in a wood or place called the Helkes, which is three miles from Ingleborough, the highest Hill in England, and not farre from Ingleton, as I am enformed by a courteous Gentlewoman, a great louer of these delights, called Mistris Thomasin Tunstall, who dwelleth at Bull-banke, neare Hornby Castle in those parts, and who hath often sent mee vpon the rootes to London, which haue borne faire flowers in my Garden. The second groweth in many places of England, and with the same Gentlewoman also before remembred, who sent me one plant of this kinde with the other. The last I haue not yet knowne to growe in England; but no doubt many things doe lye hid, and not obserued, which in time may bee discovered, if our Country Gentlemen and women, and others, in their seuerall places where they dwell, would be more carefull and diligent, and be aduertised either by themselves, or by others capable and fit to be employed, as occasion and time might serue, to finde out such plants as growe in any the circuits or limits of their habitations, or in their trauels, as their pleasures or affaires leade them. And because ignorance is the chiefe cause of neglect of many rare things, which happen to their view at sometimes, which are not to be seene againe peraduenture, or not in many yeares after, I would heartily aduise all men of meanes, to be stirred vp to bend their mindes, and spend a little more time and trauell in these delights of herbes and flowers, then they haue formerly done, which are not onely harmlesse, but pleasurable in their time, and profitable in their vse. And if any would be better enformed, and certified of such things they know not, I would be willing and ready to my best skill to aduertise them, that shall send any thing vp to me where I dwell in London. Thus farre I haue digressed from the matter in hand, and yet not without some good vse I hope, that others may make of it.

The Time.

The two first flower earlier then the last, and both the first about one time, that is, in the end of Aprill, or beginning of May. The last in the end of May, or in Iune.

The Names.

The first is called *Elleborine recentiorum maior*, and *Calceolus Mariae*: Of some thought to be *Cosmosandalos*, because it is *Sandalis forma*. In English we call it our Ladies Slipper, after the Dutch name. The other two lesser kinds haue their names in their titles: I haue thought it fit to adde the title of small white Ellebors vnto these, for the forme sake, as is before said.

The Vertues.

There is no vse of these in Physicke in our dayes that I know.

CHAP. LXXXIII.

Lilium Conuallium. Lilly Conuallly.

THe remembrance of the Conuall Lilly, spoken of in the precedent Chapter, hath caused me to insert these plants among the rest, although differing both in face and properties, but lest it should lose all place, let it keepeth this. It is of two sorts, differing chiefly in the colour of the flowers, the one being white, and the other reddish, as shall be shewed in their descriptions following.

1. *Lilium Conuallium flore albo*. The white Lilly Conuallly.

The white Conuall or May Lilly, hath three or foure leaues rising together from the roote, one enclosed within another, each whereof when it is open is long and broad, of a grayish shining Greene colour, somewhat resembling the leaues of the former wilde Neesewort, at the side whereof, and sometime from the middle of them, riseth vp a small short naked foote-stalke, an hand breadth high or somewhat more, bearing at the toppe one above another many small white flowers, like little hollow bottles with open mouths, ticked or cut into five or six notches, turning all downwards one way, or on one side of the stalke, of a very strong sweete sent, and comfortable for the memory and senses, which turne into small red berries, like vnto Alparagus, wherein is contained hard white seede: the rootes runne vnder ground, creeping euery way, consisting of many small white strings.

2. *Lilium Conuallium flore rubente*. May Lillies with red flowers.

This other May Lilly differeth neither in roote, leafe, nor forme of flower from that before, but onely in the colour of the flower, which is of a fine pale red colour, being in my iudgement not altogether so sweet as the former.

The Place.

The first groweth abundantly in many places of England. The other is a stranger, and groweth only in the Gardens of those that are curious louers of rarities.

The Time.

They both flower in May, and the berries are ripe in August.

The Names.

The Latines haue no other name for this plant but *Lilium Conuallium*, although some would haue it to be *Lilium vernum* of Theophrastus, and others *Oenanthe* of the same Author. Gesner thinketh it to be *Callionymus*, Lonicerus to be *Cacalia*, and Fuchsius to be *Ephemerum non lethale*: but they are all for the most part mistaken. We call it in English Lilly Conuallly, May Lilly, and of some Liriconfancie.

The Vertues.

The flowers of the white kinde are often vsed with those things that help to strengthen the memory, and to procure ease to Apoplecticke persons. Camerarius setteth downe the manner of making an oyle of the flowers hereof, which he saith is very effectually to ease the paines of the Goute, and such like diseases, to be vsed outwardly, which is thus: Hauing filled a glasse with the flowers, and being well stopped, set it for a moneths space in an Ants hill, and after being drayned cleare, set it by to vse.

CHAP. LXXXV.

Gentiana. Gentian or Fell-wort.

THere are diuers sorts of Gentians or Fell-wortes, some greater, others lesser, and some very small; many of them haue very beautifull flowers, but because some are very suddenly past, before one would thinke they were blowne open, and others will abide no culture and manuring, I will onely set forth vnto you two of the greater sorts, and three of the lesser kindes, as fittest, and more familiarly furnishing our gardens, leauing the rest to their wilde habitations, and to bee comprehended in a generall Worke.

1. *Gentiana maior flore flauo.* The great Gentian.

The great Gentian riseth vp at the first, with a long, round and pointed head of leaues, closing one another, which after opening themselues, lye vpon the ground, and are faire, long and broad, somewhat plaited or ribbed like vnto the leaues of white Ellebor or Neeseworte, but not so fairely or eminently plaited, neyther so stiffe, but rather resembling the leaues of a great Plantane: from among which riseth vp a stiffe round stalke, three foote high or better, full of ioynts, hauing two such leaues, but narrower and smaller at euery ioynt, so compassing about the stalke at the lower end of them, that they will almost hold water that falleth into them: from the middle of the stalke to the toppe, it is garnished with many coronets or rundles of flowers, with two such Greene leaues likewise at euery ioynt, and wherein the flowers doe stand, which are yellow, layd open like starres, and rising out of small greenish huskes, with some threds in the middle of them, but of no sent at all, yet starely to behold, both for the order, height and proportion of the plant: the seede is browne and flat, contained in round heads, somewhat like vnto the seede of the *Fritillaria*, or checkerd Daffodill, but browner: the rootes are great, thicke and long, yellow, and exceeding bitter.

2. *Gentiana maior folio Asclepiadis.* Swallow-wort Gentian.

This kinde of Gentian hath many stalkes rising from the roote, neere two foote high, whereon grow many faire pale Greene leaues, set by couples, with three ribs in euery one of them, and doe somewhat resemble the leaues of *Asclepias* or Swallow-wort, that is, broade at the bottome, and sharpe at the point: the flowers grow at the seuerall ioynts of the stalkes, from the middle vpwards, two or three together, which are long and hollow, like vnto a bell flower, ending in five corners, or pointed leaues, and folded before they are open, as the flowers of the Bindweedes are, of a faire blew colour, sometimes deeper, and sometimes paler: the heads or seede vessels haue two points or hornes at the toppes, and containe within them flat grayish seed, like vnto the former, but lesse: the rootes hereof are nothing so great as the former, but are yellow, small and long, of the bignesse of a mans thumbe.

3. *Gentiana minor Crucata.* Crosse-wort Gentian.

This small Gentian hath many branches lying vpon the ground, scarce lifting themselves vp right, and full of ioynts, whereat grow vsually foure leaues, one opposite vnto another, in manner of a Crosse, from whence it tooke his name, in shape very like vnto *Saponaria*, or Sopenwort, but shorter, and of a darker Greene colour: at the tops of the stalkes stand many flowers, thick thrusting together, and likewise at the next ioynt vnderneath, euery one of them standing in a darke blewish Greene huske, and consisting of five small leaues, the points or ends whereof only appeare aboue the huskes wherein they stand, and are hardly to be seene, but that they are of a fine pale blew colour, and that many grow together: the seed is small and brown, hard, and somewhat like

1. *Lilium Convallium*. Lirioconce or Lilly Conully. 2. *Gentiana verna*. The green Gentian. 3. *Gentiana verna*. Small Gentian of the Spring. 4. *Gentiana cruciata*. Crosswort Gentian. 5. *Pneumonanthe* or *Gentiana autumnalis*. Autumnal Gentian. 6. *Saxifraga* *flora duplici*. Double flowered Sopewort. 7. *Plantago Rofea*. Rose Platane.

like vnto the seed of the Marian Violets, or Couentry bels: the roots are small and whitish, dispersing themselues diuerly in the ground, of as bitter a taste almost as the rest.

4. *Gentianella Verna.* Small Gentian of the Spring.

The small Gentian of the Spring hath diuers small hard Greene leaues, lying vpon the ground, as it were in heads or tufts, somewhat broad below, and pointed at the end, with five ribs or veines therein, as conspicuous as in the former Gentians, among which riseth vp a small short stalke, with some smaller leaues thereon, at the toppe whereof standeth one faire, large, hollow flower, made bell fashion, with wide open brimmes, ending in five corners or diuisions, of the most excellent deepe blew colour that can be seene in any flower, with some white spots in the bottome on the inside: after the flower is past, there appeare long and round pods, wherein are contained small blackish seede: the rootes are small, long, pale yellow strings, which shoot forth here and there diuers heads of leaues, and thereby encrease reasonable well, if it finde a fit place, and ground to grow, or else will not be nourished vp, with all the care and diligence can be vsed: the whole plant is bitter, but not so strong as the former.

5. *Gentiana Autumnalis* sine *Pneumonanthe.*
Calathian Violet or Autumne Gentian.

This Gentian that flowreth in Autumne, hath in some places higher stalkes then in others, with many leaues thereon, set by couples as in other Gentians, but long and narrow, yet shewing the three ribbes or veines that are in each of them: the toppes of the stalkes are furnished euery one with a flower or two, of an excellent blew purple colour, ending in five corners, and standing in long huskes: the rootes are somewhat great at the top, and spreading into many small yellow strings, bitter as the rest are.

6. *Saponaria flore duplici.* Double flowred Sopeworte.

Vnto these kinds of Gentians, I must needes adde these following plants, for that the former is of some neere resemblance in leafe with some of the former. And because the ordinary Sopeworte or Bruiseworte with single flowers is often planted in Gardens, and the flowers serue to decke both the garden and the house; I may vnder the one describe them both: for this with double flowers is farre more rare, and of greater beautie. It hath many long and slender round stalkes, scarce able to sustaine themselues, and stand vp right, being full of ioyns and ribbed leaues at them, euery one somewhat like a small Gentian or Plantane leafe: at the toppes of the stalkes stand many flowers, consisting of two or three rowes of leaues, of a whitish or pale purple colour, and of a strong sweet sent, somewhat like the smell of Iasmin flowers, standing in long and thicke pale Greene huskes, which fall away without giuing any seede, as most other double flowers doe that encrease by the roote, which spreadeth within the ground, and riseth vp in sundry distant places like the single.

7. *Plantago Rofea.* Rose Plantane.

This other plant is in all things like vnto the ordinary Plantane or Ribworthe, that groweth wilde abroad in many places, whose leaues are very large: but in stead of the long slender spike, or eare that the ordinary hath, this hath cyther a thicke long spike of small Greene leaues vpon short stalkes, or else a number of such small Greene leaues layd round-wise like vnto a Rose, and sometimes both these may be seene vpon one and the same roote, at one and the same time, which abide a great while fresh vpon the roote, and sometimes also giueth seede, especially from the more long and slender spikes.

The Place.

Some of these Gentians grow on the toppes of hills, and some on the sides and foote of them in Germany and other Countreyes: some of them also vpon barren heaths in those places, as also in our owne Countrey, especially

ly the Autumne Gentian, and as it is reported, the Vernall likewise. The single or ordinary Sopeworte is found wilde in many places with vs, but the double came to vs from beyond the Sea, and is scarce known or heard of in England. The Rose Plantaine hath beene long in England, but whether naturall thereof or no, I am not assured.

The Time.

They flower for the most part in Iune and Iuly, but the small Gentian of the Spring flowreth somewhat earlier, and that of the Autumne in August and September.

The Names.

Gentiana is the generall name giuen to the Gentians. We call them in English Gentian, Fellworte, Bitterwort, and Baldmoney. *Saponaria* taketh his name from the scouring qualitie it hath: Wee call it in English Sopewort, and in some places Bruisewort. Some haue thought it to bee *Struthium* of Dioscorides, or at least haue vsed it for the same causes, but therein they are greatly deceiued, as Matthiolus hath very well obserued thereon, and so is Dodonæus, that thought it to be *Alisma*. The Rose Plantaine is so called of the double spikes it carrieth.

The Vertues.

The wonderfull wholsomnesse of Gentian cannot bee easily knowne to vs, by reason our daintie tastes refuse to take thereof, for the bitternesse sake: but otherwise it would vndoubtedly worke admirable cures, both for the liuer, stomacke and lunges. It is also a speciall counterpoison against any infection, as also against the violence of a mad dogges tooth: wilde Sopewort is vsed in many places, to scour the countrey womens treen, and pewter vessels, and physically some make great boast to performe admirable cures in Hydropicall diseases, because it is diureticall, and in *Lue Venerea*, when other Mercuriall medicines haue failed. The Rose Plantaine no doubt hath the same qualities that the ordinary hath.

CHAP. LXXXVI.

Campanula. Bell-flowers.

VNder the title of Bell-flowers are to bee comprehended in this Chapter, not only those that are ordinarily called *Campanula*, but *Viola Mariana*, and *Trachelium* also, whereof the one is called Couentry, the other Canterbury Bells.

1. *Campanula Persicifolia alba, vel cerulea.*
Peach-leaved Bell-flowers white or blew.

The Peach-leaved Bell-flower hath many tufts, or branches of leaues lying vpon the ground, which are long and narrow, somewhat like vnto the leafe of an Almond or Peach tree, being finely nicked about the edges, and of a sad Greene colour, from among which rise vp diuers stalkes, two foote high or more, set with leaues to the middle, and from thence vpwards, with many flowers standing on seuerall small foote-stalkes, one aboue another, with a small leafe at the foote of euery one: the flowers stand in small Greene huskes, being small and round at the bottome, but wider open at the brimme, and ending in five corners, with a three forked clapper in the middle, set about with some small threds tipt with yellow, which flowers in some plants are pure white

white, and in others of a pale blew or watchet colour, hauing little or no sent at all : the seede is small, and contained in round flat heads, or seede vessels : the roote is very small, white and threddy, creeping vnder the vpper crust of the ground, so that oftentimes the heat and drought of the Summer wil goe near to parch and wither it viterly: it requireth therefore to be planted in some shadowie place.

2. *Campanula maior, sine Pyramidalis.*

The great or steeple Bell-flower.

This great Bell-flower hath diuers stalkes, three foote high or better, whereon grow diuers smooth, darke, greene leaues, broade at the bottome, and small at the point, somewhat vneuenly notched about the edges, and standing vpon longer footestalkes below then those aboue : the flowers are blew, and in some white, not so great or large as the former, but neare of the same fashion, growing thicker and more plentifully together, with smaller leaues among them, bushing thicke below, and rising smaller and thinner vp to the toppe, in fashion of a *Pyramis* or spere Steeple : the roote is thicke and whitish, yeelding more store of milke being broken (as the leaues and stalks also doe) then any other of the Bell-flowers, euery one whereof doe yeelde milke, some more and some lesse.

3. *Viola Mariana flore albido vel purpureo.*

Couentry Bels white or purple.

The leaues of Couentry Bels are of a pale or fresh greene colour, long, and narrow next vnto the bottome, and broader from the middle to the end, and somewhat round pointed, a little hairy all ouer, and snipt about the edges : the stalkes rise vp the yeare after the sowing, being somewhat hairy also, and branching forth from the roote, into diuers parts, whereon stand diuers leaues, smaller then the former, and of a darker greene colour : at the end of euery branch stand the flowers, in greene huskes, from whence come large, round, hollow Bels, swelling out in the middle, and rising somewhat aboue it, like the necke of a pot, and then ending in five corners, which are either of a faire or faint white, or of a pale blew purplish colour, and sometimes of a deeper purple or violet: after the flowers are past, there rise vp great square, or cornered seede vessels, wherein is contained in diuers diuisions, small, hard, shining, browne, flat seeds: the roote is white, and being young as in the first yeares sowing, is tender, and often eaten as other Rampions are ; but the next yeare, when it runneth vp to seede, it groweth hard, and perisheth : so that it is to be continued by euery other yeares sowing.

4. *Trachelium maius flore albo vel purpureo.*

Great Canterbury Bels white or purple.

The greater Canterbury Bels, or Throateworte, hath many large rough leaues, somewhat like vnto Nettle leaues, being broad and round at the bottome, and pointed at the end, notched or dented on the edges, and euery one standing on a long footstalk: among these leaues rise vp diuers square rough stalkes, diuided at the toppe into diuers branches, whereon grow the like leaues as grow below, but lesser ; toward the ends of the branches stand the flowers, mixed with some longer leaues, euery one in his seuerall huske, which are hollow, long and round, like a bell or cup, wide open at the mouth, and cut at the brimme into five corners, or diuisions, somewhat lesser then the Couentry Bels, in some of a pure white, and others of a faire deepe purple violet colour, and sometimes paler : after the flowers are past, come smaller and rounder heades then in the former, containing flat seede, but blacker, and not so redde as the last : the roote is hard and white, dispersing it selfe into many branches vnder ground, not perishing euery yeare as the former (although it loseth all the leaues in winter) but abiding many yeares, and encreasing into diuers heades or knobs, from whence spring new leaues and branches.

1 *Campanula persicifolia*. Peach leaved Bell-flower. 2 *Trachelium majus simplex*. Canterbury Bells. * *Trachelium flore duplici*. Double Canterbury Bells. 3 *Viola Maritima*. Coventry Bells. 4 *Trachelium Gigantum*. Giants Throatwort. 5 *Trachelium minus*. The lesser Throatwort. 6 *Trachelium Americanum* sive *Cardinalis plantula*. The rich crimson Cardinals flower.

5. *Trachelium minus flore duplici albo & caeruleo.*
 Canterbury Bels with double flowers both white and blew.

Of this kinde of Throateworte or Canterbury Bels, there is another sort, not differing in any thing from the former, but in the doublenesse of the flower: For there is of both the kindes, one that beareth double white flowers, and the other blew: Of each whereof I receiued plants from friends beyond the Sea, which grow well with me.

6. *Trachelium Giganteum flore purpurante.*
 Pale purple Giants Throateworte.

This Bell-flower, although it hath a Gigantine name, yet did I neuer perceiue it in my Garden, to rise vp higher then the former, the epithite beeing in my perswasion, only giuen for difference sake: the leaues whereof are not so rough, but as large, and dented about the edges, somewhat larger pointed, and of a fresher greene colour: the stalkes beare such like leaues on them, but more thinly or dispersedly set, hauing a flower at the setting on of euery one of the leaues, from the middle vpwards, and are somewhat like the great Throateworte in forme, but of a pale or bleake reddish purple colour, turning the brims or corners a little backwards, with a forked clapper in the middle, sufficient eminent and yellow: the seede hereof is white, and plentifull in the heads, which will abide all the winter vpon the stalkes, vntill all the seede being shed, the heads remaining seeme like torne rags, or like thin peeces of skin, eaten with wormes: the roote is great, thicke and white, abiding long without perishing.

Flore albo.

There is another which differeth not any thing but in the flower, which is white.

7. *Trachelium minus flore albo & purpureo.*
 Small Throateworte or Canterbury Bells both white and purple.

The lesser Throateworte hath smaller leaues, nothing so broad or hard as the former great kinde, but long, and little or nothing dented about the edges: the stalkes are square and brownish, if it beare purple flowers, and greene if it beare white flowers, which in forme are alike, and grow in a bush or tuft, thicke set together, more then any of the former, and smaller also, being not much bigger then the flowers of the fildes, or garden Rampions: the roote is lasting, and shooteth afresh euery yeare.

8. *Trachelium Americanum flore ruberrimo, sine Planta Cardinalis.*
 The rich crimson Cardinals flower.

This braue plant, from a white roote spreading diuers wayes vnder ground, sendeth forth many greene leaues, spread round about the head thereof, each whereof is somewhat broad and long, and pointed at the end, finely also snipt about the edges: from the middle whereof ariseth vp a round hollow stalke, two foote high at the least, beset with diuers such leaues as grow below, but longer below then aboue, and branching out at the toppe abundantly, euery branch bearing diuers greene leaues on them, and one at the foote of euery of them also, the toppes whereof doe end in a great large tuft of flowers, with a small greene leafe at the foote of the stalke of euery flower, each foote stalke being about an inch long, bearing a round greene huske, diuided into five long leaues or points turned downwards, and in the midst of euery of them a most rich crimson coloured flower, ending in five long narrow leaues, standing all of them foreright, but three of them falling downe, with a long ymbone set as it were at the backe of them, bigger below, and smaller aboue, and at the toppe a small head, being of a little paler colour then the flower, but of no sent or smell at all, commendable only for the great bush of so orient red crimson flowers: after the flowers are past, the seede commeth in small heads, closed within those greene husks that held the flowers, which is very like vnto the seede vessels of the *Viola Mariana*, or Couentry Bels, and is small and brownish.

The Place.

All these Bell-flowers do grow in our Gardens, where they are cherished for the beautie of their flowers. The Couentry Bels doe not grow wilde in any of the parts about Couentry, as I am credibly informed by a faithfull Apothecary dwelling there, called Master Brian Ball, but are nourished in Gardens with them, as they are in other places. The last groweth neere the riuer of Canada, where the French plantation in America is seated.

The Time.

They flower from May vntill the end of Iuly or August, and in the meantime the seed is ripe: But the Peache-leaved Bell-flowers, for the most part, flower earlier then the other.

The Names.

The first is generally called *Campanula Persicifolia*, in English Peach-leaved Bell-flower. The second is called *Campanula maior*, *Campanula lactescens* *Pyramidalis*, and *Pyramidalis Lutea* of Lobel, in English, Great or Steeple Bell-flower. The third is vsually called *Viola Mariana*, and of some *Viola Marina*. Lobel putteth a doubt whether it be not *Medium* of Dioscorides, as Matthioli and others doe thinke; but in my opinion the thicknesse of the roote, as the text hath it, contradicteth all the rest. We call it generally in English Couentry Bels. Some call it Marian, and some Mercuries Violets. The fourth and fift are called *Trachelium* or *Cernicaria*, of some *Vulvaria*, because many haue vsed it to good purpose, for the paines of the Throat, or Throate: Yet there is another plant, called also by some *Vulvaria*, which is *Hippoglossum*, Horse tongue, or Doubletongue. The sixt hath his title to descipher it out sufficiently, as is declared. The seuenth is called *Trachelium minus*, and *Cerniaria minor*, of some *Saponaria altera*; in English, Small Throatewort, or Small Canterbury Bels. The last hath his name in the title, as it is called in France, from whence I receiued plants for my Garden with the Latine name: but I haue giuen it in English.

The Vertues.

The Peach-Bels as well as the others may safely bee vsed in gargles and lotions for the mouth, throate, or other parts, as occasion serueth. The rootes of many of them, while they are young, are often eaten in sallets by diuers beyond the Seas.

CHAP. LXXXVII.

Campana Cerulea siue *Convolvulus Ceruleus*.
Blew Bell flowers, or blew Bindeweede.

There are two other kindes of Bell-flowers, much differing from the Tribe or Familie of the former, because of their climbing or winding qualitie, which I must needs place next them, for the likenesse of the flowers, although otherwise they might haue beene placed with the other clamberers that follow. Of these there is a greater, and a lesser, and of each likewise some difference, as shall be declared.

1. *Convolvulus caeruleus maior rotundifolius.*

The greater blew Bindweede, or Bell-flower with round leaues.

This goodly plant riseth vp with many long and winding branches, whereby it climbeth and windeth vpon any poles, herbes, or trees; that stand neare it within a great compasse, alwaies winding it selfe contrary to the course of the Sunne: on these branches doe growe many faire great round leaues, and pointed at the end, like vnto a Violet leafe in shape, but much greater, of a sad Greene colour: at the ioynts of the branches, where the leaues are set, come forth flowers on pretty long stalkes, two or three together at a place, which are long, and pointed almost like a finger, while they are buds, and not blowne open, and of a pale whitish blew colour, but being blowne open, are great and large bells, with broad open mouths or brims ending in five corners, and small at the bottome, standing in small Greene huskes of fine leaues: these flowers are of a very deepe azure or blew colour, tending to a purple, very glorious to behold, opening for the most part in the euening, abiding so all the night and the next morning, vntill the Sunne begin to growe somewhat hot vpon them, and then doe close, neuer opening more: the plant carrieth so many flowers, if it stand in a warme place, that it will be replenished plentifully, vntill the cold ayres and eueninges stay the luxury thereof: after the flowers are past, the stalkes whereon the flowers did stand, bend down wards, and beare within the huskes three or foure blacke seedes, of the bignesse of a Tare or thereabouts: the rootes are stringy, and perish euery yeare.

2. *Convolvulus trifolius sine hederaceus purpureus.*

The greater purple Bindeweede, or Bell-flower with cornered leaues.

The growing and forme of this Bindeweede or Bell-flower, is all one with the former, the chiefest differences consisting in the forme of the leafe, which in this is three cornered, like vnto an Iuie leafe with corners; and in the flower, which is of a deeper blew, tending more to a deepe purple Violet, and somewhat more reddish in the five plaits of each flower, as also in the bottomes of the flowers.

3. *Convolvulus tenuifolius Americanus.* The red Bell-flower of America.

Although this rare plant (because wee seldome haue it, and can as hardly keepe it) be scarce knowne in these cold Countries, yet I could not but make mention of it, to incite those that haue conueniencie to keepe it, to be furnished of it. It springeth vp at the first from the seede with two leaues, with two long forked ends, which abide a long time before they perish, betweene which riseth vp the stalke or stemme, branching forth diuers waies, being of a brownish colour, which windeth it selfe as the former great Bell-flower doth, whereon are set at seuerall ioynts diuers winged leaues, that is to say, many small narrow and long leaues set on both sides of the middle ribbe, and one at the end: from these ioynts arise long stalkes, at the ends whereof stand two or three small, long, hollow flowers, fashioned very like vnto the flowers of a Bindeweede, or the flowers of Tabacco, and ending in the like manner in five points, but not so much laide open, being of a bright red colour, plaited as the Bindeweedes or Bell-flowers before they be open, with some few threads in the middle, which turne into long pointed cods, wherein is contained long and blacke seede, tasting hot like Pepper: the roote is small and stringy, perishing euery yeare, and with vs will seldome come to flower, because our cold nights and frosts come so soone, before it can not haue comfort enough of the Sun to ripen it.

4. *Convolvulus caeruleus minor Hispanicus.*

The Spanish small blew Bindeweede.

This small Bindeweede hath small long leaues, somewhat broader then the next that followeth, and not so broad as the common small Bindeweede (that groweth euery

euery where wilde on the bankes of fields abroad) set vpon the small trayling branches, which growe about two or three foote high: from the middle of these branches, and so vnto the toppes of them, come forth the flowers at the ioynts with the leaues, folded together at the first into five plaies, which open into so many corners, of a most excellent faire skie coloured blew (so pleasant to behold, that often it amazeth the spectator) with white bottomes, and yellowish in the middle, which turne into small round white heads, wherein are contained small blackish cornered seede, somewhat like the former, but smaller: the roote is small and threddy, perishing as the former euery yeare: this neuer windeth it selfe about any thing, but leaneth by reason of the weaknesse of the branches, and dyeth euery yeare after seedetime, and not to be sowne againe vntill the next Spring.

5. *Convolvulus purpureus spicifolius*. Lauander leaved Bindeweede.

This small purple Bindeweede, where it naturally groweth, is rather a plague then a pleasure, to whatsoeuer groweth with it in the fields; yet the beauty of the flower hath caused it to be receiued into Gardens, bearing longer and smaller leaues then the last, and such like small Bell-flowers, but of a sad purple colour: the roote is liuing, as the common kinds are, and springeth againe where it hath been once sowne, without feare of perishing.

The Place.

The first two greater kinds haue beene sent vs out of Italy, but whether they had them from the East Indies, or from some of the Easterne Countries on this side, wee know not: but they thriue reasonable well in our Country, if the yeare be anything kindly. The next came out of America, as his name testifieth. The lesser blew kinde groweth naturally in many places both of Spaine and Portugall (from whence I first receiued seedes from Guillaume Boel, heretofore remembred.) The last groweth wilde in the fields, about Dunmowe in Essex, and in many other places of our owne Countrey likewise.

The Time.

The three first greater kinds flower not vntill the end of August, or thereabouts, and the seede ripeneth in September, if the colds and frosts come not on too speedily. The lesser kinds flower in Iune and Iuly.

The Names.

The first is called of some *Campana Lazara*, as the Italians doe call it, or *Campana cerulea*, of others *Convolvulus ceruleus maior*, *sive Indicus*, and *Flos noctis*. Of some *Nil Auicenna*. The second is called *Convolvulus trifolius*, or *hederaceus*, for the distinction of the leaues. In English wee call them eyther Great blew Bell-flowers, or more vsually, Great blew Bindeweedes. That of America is diuersly called by diuers. It is called *Quamoclit* of the Indians, and by that name it was sent to Ioachinus Camerarius out of Italy, where it is so called still, as Fabius Columna setteth it downe, and as my selfe also can witness it, from thence being so sent vnto mee: but Andreas Cæsalius calleth it, *Isoselinum folio Millefolij*, supposing it to be a *Isoselinum*. Camerarius saith, it may not vnfitly be called *Convolvulus tenuifolius*, accounting it a kinde of Bindeweede. Columna entitleth it *Convolvulus pennatus exotiens rarior*, and saith it cannot bee referred to any other kinde of plant then to the Bindeweedes. Hee that published the *Cura posterior* of Clusius, giueth it the name of *Isoselinum Americanum*, which I would doe also, if I thought it might belong to that Family; but seeing the face and forme of the plant better agreeing with the Bindeweedes or Bell-flowers,

I haue

I haue (as you see) inserted it among them, and giuen it that name may bee most fit for it, especially because it is but an annuall plant. The lesser kindes haue their names sufficiently expressed in their titles.

The Vertues.

We know of no vse these haue in Physicke with vs, although if the first be *Nil* of Auicen, both he and Serapio say it purgeth strongly.

CHAP. LXXXVIII.

Stramonium. Thorne-Apple.

VNto the Bell-flowers, I must adioyne three other plants; in the three seuerall Chapters following, for some affinity of the flowers: and first of the Thorne-Apples, whereof there are two especiall kindes; that is, a greater and a lesser, and of each some diuersity, as shall be set downe.

1. *Stramonium maius album*. The great white flowred Thorne-Apple.

The greater Thorne-Apple hath a great, strong, round greene stalke, as high as any man, if it be planted in good ground, and of the bignesse of a mans wrest almost at the bottome, spreading out at the toppe into many branches, whereon stand many very large and broad darke greene leaues, cut in very deeply on the edges, and hauing manie points or corners therein: the flowers come forth at the ioynts, betweene two branches towards the toppe of them, being very large, long, and wide open, ending in five points or corners, longer and larger then any other Bell-flowers whatsoeuer: after the flowers are past, come the fruit, which are thorny long heads, more prickly and greene then the lesser kindes, which being ripe openeth it selfe into three or foure parts, hauing a number of flat blackish seede within them: the roote is abundant in fibres, whereby it strongly taketh hold in the ground, but perisheth with the first frosts; yet the seede that is shed when the fruit is ripe, commeth vp the next yeare.

2. *Stramonium maius purpureum*. The great purple flowred Thorne-Apple.

This purple Thorne-Apple is in largenesse of leaues, thicknesse and height of stalke, greatnesse and forme of flowers and fruit, euery way equall and correspondent vnto the former, the chiefe differences be these: the stalke is of a darke purple colour; the leaues are of a darker greene, somewhat purplish, and the flowers are of light purple or pale Doue colour, enclining to white, and whiter at the bottome.

3. *Stramonium minus seu Nux Metel flore albo*.

The smaller Thorne-Apple with a white flower.

The smaller Thorne-Apple riseth vp with one round stalke, of the bignesse of a mans finger, and neuer much aboue two foote high with vs, bearing a few large, broad, smooth leaues thereon, without any branches at all, which are vneuenly rent or torne about the edges, with many ribs, and smaller yeines running through them, yet lesser by much then the greater kinde: at the ioynts where the leaues stand, come forth long and large white flowers, with broad or wide open brims, folded together before their opening, as the other former Bell-flowers or Bindweedes, but hauing their five corners more pointed or horned then either they, or the former Thorne-Apples: after the flowers are past, succeed small fruit, rounder and harder, set with harder, but blunt prickles then the former, wherein is contained brownish yellow flat seede, sticking

1 *Cecropulus major caruleus*, The greater blew Bindweed or Bell flower. 2 *Cucurbitaria trifida seu hederacea*, The great purple Bindweed. 3 *Cucurbitaria minor carulea Hispanica*, The Spanish small blew Bindweed. 4 *Stramonium majus seu Pannum spinosum*, The great Thorne Apple. 5 *Datura seu Stramonium minus*, The small Thorne Apple. 6 *Stramonium flore duplex*, The Double flowered Thorne Apple. 7 *Stramonium flore geminato*, Double Thorne Apple one out of another. 8 *Tabacco latifolius*, Broad leaved Tobacco. 9 *Morabilla Peruana*, The Morabilla of the world.

sticking to the inward pulpe: the roote is not very great, but full of strings, and quickly perisheth with the first frosts.

4. *Stramonium minus flore geminato purpurante.*
The small double flowred purple Thorne-Apple.

In the flower of this plant, consisteth the chiefeft difference from the former, which is as large as the last, pointed into more hornes or corners, and beareth two flowers, standing in one huske, one of them rising out from the middle of the other, like vnto those kindes of Cowslips and Oxelips, called double, or Hose in hose, before described, which are of a pale purplish colour on the outside, and almost white within: the fruit is round like the last, and beareth such like seede, so that vntill it bee in flower, their difference can hardly bee discerned: this is more tender then the last, although euen it is so tender, that it seldome beareth ripe seede with vs.

Flora duplicis. Sometimes (for I think it is not another kind) the flower will haue as it were double rowes of leaues, close set together, and not consisting of two, rising so distinctly one about another.

The Place.

All these kindes haue been brought or sent vs out of Turkie and Egypt; but Garcias, and Christopherus Acofta, with others, affirme that they grow in the East Indies. The lesser kindes are very rare with vs, because they seldome come to maturity; and therefore we are still to seeke of new seede to sowe. The greater kindes are plentiful enough in our Gardens, and will well abide, and giue ripe fruit.

The Time.

The smaller kindes flower later then the greater; and therefore their fruit are the sooner spoiled with the cold ayres, dewes, and frosts, that come at the latter end of the yeare: but the greater kinds neuer misse lightly to ripen.

The Names.

Both the greater and smaller kindes are generally called *Stramonium*, *Stramonia*, *Pomum spinosum*, and *Datura*. Bauhinus vpon Matthiolus his Comentaries on Dioscorides, calleth it *Solanum fetidum spinosum*. Some learned men haue referred it to *Nux Metel*, of the Arabian Authors. Wee call them generally in English, Thorne-Apples, and distinguish them by their titles of greater and lesser, single and double.

The Vertues.

The East Indian lasciuious women performe strange acts with the seed (of the smaller kinde, as I suppose, or it may be of either) giuing it their husbands to drinke. The whole plant, but especially the seed, is of a very cold and soporiferous quality, procuring sleep and distraction of senses. A few of the seeds steeped and giuen in drinke, will cause them that take it to seem starke drunke or dead drunke, which fit will within a few houres weare away, and they recouer their senses againe, as a drunken man rayfed after sleep from his wine. It may therefore (in my opinion) be of safe and good vse to one, that is to haue a legge or an arme cut off, or to be cut for the stone, or some other such like cure to be performed, to take away the sense of paine for the time of doing it; otherwise I hold it not fit to be vsed without great caution. But the Greene leaues of the greater kindes (as also of the lesser, but that with vs they are not so plentiful) are by tryed experience, found to be excellent good for any scalded or burned part, as also to take away any hot inflammations, being made vp into a salue or ointment with suet, waxe, and rosin, &c. or with *Axungia*, that is, Hogs larde.

CHAP. LXXXIX.

Tabacco. Indian Henbane, or Tabacco.

There hath beene formerly but three kindes of Tabacco knowen vnto vs, two of them called Indian, and the third English Tabacco. In these later years, we haue had in our gardens about London (before the suppressing of the planting) three or foure other sorts at the least, and all of the Indian kinde, hauing some especial difference, eyther in leafe, or flower, or both: And in regard the flowers of some of these carry a pretty shew, I shall only entreate of them, and not of the English kind.

Tabacco latifolium. Broade leaved Tabacco.

The great Indian Tabacco hath many very large, long, thicke, fat and faire Greene leaues, standing foreright for the most part, and compassing the stalkes at the bottome of them, being somewhat pointed at the end: the stalke is Greene and round, fixe or seuen foote high at sometimes, and in some places, in others not past three or foure foote high, diuided towards the toppe into many branches, with leaues at euery ioynt, and at the toppes of the branches many flowers, the bottomes hereof are long and hollow, and the toppes plaited or folded before they are open, but being open, are diuided sometimes into foure, or more vsually into fise corners, somewhat like vnto other of the Bell-flowers, but lying a little flatter open, of a light carnation colour. The seede is very small and browne, contained in round heads, that are clammy while they are Greene, and pointed at the end: the roote is great, whitish, and woody at the head, dispersing many long branches, and small fibres vnder the ground, whereby it is strongly fastened, but perissheth with our violent frosts in the winter, if it be left abroad in the garden, but if it be housed, or safely provided for against the frostes, the rootes will liue, and spring afresh the next year.

There is of this kinde another sort, whose leaues are as large and long as the former, but thicker, and of a more dead Greene colour, hanging downe to the ground-ward, and scarce any standing forth-right, as the former, vnlesse they bee very young: the flowers of this kinde are almost whole, without any great shew of corners at the brims or edges, in all other things there is no difference.

There is another, whose large and thicke flat leaues doe compasse the stalke at the bottome, and are as it were folded together one side vnto another: the flowers are of a deeper bluish, or carnation colour, and with longer points and corners then in any of the former; and in these two things consisteth the difference from the others, and is called Verines Tabacco.

Another hath his leaues not so large and long as the first, and these haue short footestalkes, whereon they stand, and doe not compasse the stalke as the other doe: the flower hereof is like the first, but smaller, and of a little paler colour.

Tabacco angustifolium. Narrow leaved Tabacco.

This kinde of Tabacco hath somewhat lower, and smaller stalkes, then any of the former: the leaues hereof are smaller and narrower, and not altogether so thicke, but more pointed, and euery one standing vpon a footestalke, an inch and a halfe long at the least: the flowers hereof stand thicker together, vpon the small branches, somewhat larger, of a deeper bluish colour, and more eminent corners then in any the former: the seed and roots are alike, and perissh in like manner, vnlesse it be brought into a cellar, or other such covert, to defend it from the extremitie of the Winter.

The Place.

America or the West Indies is the place where all these kindes doe grow naturally, some in one place, and some in another, as in Peru, Trinidado, Hispani-

Hispaniola, and almost in euery Iland and Countrey of the continent thereof: with vs they are cherished in gardens, as well for the medicinable qualities, as for the beauty of the flowers.

The Time.

It flowreth in August, seldome before, and the seede is ripe quickly after. If it once sowe it selfe in a Garden, it will giue next year after young plants: but for the most part they will spring vp late, and therefore they that would haue them more early, haue sown the seede vpon a bed of dung, and transplanted them afterwards.

The Names.

This plant hath gotten many names. The Indians call it in some places *Petum*, in others *Picielt*, and *Perebecenne*, as Quietus and others doe relate. The Spaniards in the Indies first called it *Tabacco*, of an Iland where plenty of it grew. It hath in Christendom receiued diuers other names, as *Nicotiana*, of one Nicot a French man, who seeing it in Portugall, sent it to the French Queene, from whom it received the name of *Herba Regina*. Lobel calleth it *Sancta herba*, & *Sana sancta Indorum*. Some haue adiudged it to be an *Hisseyamus*, and therefore call it *Peruvianus*. The most vsuall name whereby we call it in English, is *Tabacco*.

The Vertues.

The herbe is, out of question, an excellent helpe and remedy for diuers diseases, if it were rightly ordered and applyed, but the continuall abuse thereof in so many, doth almost abolish all good vse in any. Notwithstanding if men would apply their wits to the finding out of the vertues, I make no doubt but many strange cures would bee performed by it, both inward and outward. For outward application, a Salue made hereof (as is before recited of the Thorne apple leaues) cureth vlcers, and wounds of hard curation: And for inward helpe, a Syrupe made of the iuice and sugar, or honey, procureth a gentle vomit (but the dried leafe infused in wine much more) and is effectuell in astmaticall diseases, if it bee carefully given. And likewise cleanseth cankers and fistulae admirably, as hath bene found by late experience. The ashes of *Tabacco* is often vied, and with good success, for cuts in the hands, or other places, and for other small Greene wounds.

CHAP. XC.

Mirabilia Peruviana. The Meruaile of Peru.

THis plant yeeldeth in our Gardens fise or sixe seuerall varieties of beautifull flowers, as pure white, pure yellow, pure red, white and red spotted, and red and yellow spotted. But besides these, I haue had some other sorts, among which was one, of a pale purple or peach colour: all which, comming vnto mee out of Spaine with many other, seedes in an vnkindly year (an early winter following a cold summer) perished with mee; yet I plainly might discern by their leaues, and manner of growing, to be diuers from them that we now haue and keepe. I shall need therefore (because the chiefe difference consisteth almost in the flowers) to giue only one description of the plant, and therein shew the varieties as is before declared.

Admirabilis. The Meruaile of the World.

The stalke of this meruellous plant is great and thick, bigger then any mans thumbe, bunched

bunched out or swelling at every ioynt, in some the stalkes will bee of a faire Greene colour, and those will bring white, or white and red flowers : in others they will bee reddish, and more at the ioynts, and those giue red flowers ; and in some of a darker Greene colour, which giue yellow flowers : the stalkes and ioynts of those that will giue red and yellow flowers spotted, are somewhat brownish, but not so red as those that giue wholly red flowers : vpon these stalkes that spread into many branches, doe grow at the ioynts vpon seuerall footestalkes, faire Greene leaues, broad at the stalke, and pointed at the end : at the ioynts likewise toward the vpper part of the branches, at the foote of the leaues, come forth seuerall flowers vpon short footestalkes, euery one being small, long and hollow from the bottome to the brimme, which is broade spread open, and round, and consist but of one leafe without diuision, like vnto a Bell flower, but not cornered at all : which flowers, as I said, are of diuers colours, and diuersly marked and spotted, some being wholly white, without any spot in them for the most part, through all the flowers of the plant ; so likewise some being yellow, and some wholly red ; some plants againe being mixed and spotted, so variably either white and red, or purple, (except here and there some may chance to be wholly white, or red or purple among the rest) or red and yellow through the whole plant, (except as before some may chance in this kinde to be cyther wholly red, or wholly yellow) that you shall hardly finde two or three flowers in a hundred, that will bee alike spotted and marked without some diuersitie, and so likewise euery day as long as they blow, which is vntill the winters, or rather autumnes cold blastes do stay their willing pronenesse to flower : And I haue often also obserued, that one side of a plant will giue fairer varieties then another, which is most commonly the Easterne, as the more temperate and shadowie side. All these flowers doe open for the most part, in the euening, or in the night time, and so stand blowne open, vntill the next mornings sun beginne to grow warme vpon them, which then close themselues together, all the brims of the flowers shrinking into the middle of the long necke, much like vnto the blew Bindeweede, which in a manner doth so close vp at the sunnes warme heate : or else if the day be temperate and milde, without any sunne shining vpon them, the flowers will not close vp for the most part of that day, or vntill toward night : after the flowers are past, come seuerall seedes, that is, but one at a place as the flowers stood before, of the bignesse (sometimes) of small pease, but not so round, standing within the Greene huskes, wherein the flowers stood before, being a little flat at the topp, like a crowne or head, and round where it is fastened in the cup, of a blacke colour when it is ripe, but else Greene all the while it groweth on the stalke, and being ripe is soone shaken downe with the wind, or any other light shaking : the roote is long and round, greater at the head, and smaller downwards to the end, like vnto a Reddish, spreading into two or three, or more branches, blackish on the outside and whitish within. These rootes I haue often preserued by art a winter, two or three (for they will perish if they be left out in the garden, vnlesse it be vnder a house side) because many times, the yeare not falling out kindly, the plants giue not ripe seede, and so we should be to seeke both of seede to sow, and of rootes to set, if this or the like art to keep them, were not vsed ; which is in this manner : Within a while after the first frosts haue taken the plants, that the leaues wither and fall, digge vp the rootes whole, and lay them in a dry place for three or foure dayes, that the superfluous moysture on the outside, may be spent and dried, which done, wrap them vp seuerally in two or three browne papers, and lay them by in a boxe, chest or tub, in some conuenient place of the house all the winter time, where no winde or moist ayre may come vnto them, and thus you shall haue these rootes to spring a fresh the next yeare, if you plant them in the beginning of March, as I haue sufficiently tryed. But some haue tryed to put them vp into a barrell or firkin of sand, or ashes, which is also good if the sand and ashes be thorough dry, but if it bee any thing moist, or if they giue againe in the winter, as it is vsuall, they haue found the moisture of the rootes, or of the sand, or both, to putrefie the rootes, that they haue beene nothing worth, when they haue taken them forth. Take this note also for the sowing of your seede, that if you would haue variable flowers, and not all of one colour, you must choose out such flowers as be variable while they grow, that you may haue the seede of them : for if the flowers bee of one entire colour, you shall haue for the most part from those seedes, plants that will bring flowers all of that colour, whether it be white, red or yellow.

The Place.

These plants grow naturally in the West Indies, where there is a perpetual summer, or at the least no cold frosty winters, from whence the seed hath been sent into these parts of Europe; and are dispersed into euery garden almost of note.

The Time.

These plants flower from the end of Iuly sometimes, or August, vntill the frosts, and cold ayres of the euenings in October, pull them down, and in the meane time the seed is ripe.

The Names.

Wee haue not receiued the seedes of this plant vnder any other name, then *Mirabilia Peruviana*, or *Admirabilis planta*. In English wee call them, The meruaile of Peru, or the meruaile of the world: yet some Authors haue called it *Gelseminum*, or *Jasminum rubrum*, & *Indicum*: and Bauhinus *Solanum Mexicocanum flore magno*.

The Vertues.

We haue not knowne any vse hereof in Physicke.

CHAP. XCI.

Malua. Mallowes.

OF the kindred of Mallowes there are a great number, some of the gardens, others wilde, some with single flowers, others with double, some with whole leaues, others with cut or diuided: to entreate of them all is not my purpose, nor the scope of this worke, but onely of such whose flowers, hauing beautie and respect, are fit to furnish this garden, as ornaments thereunto. And first of those single kindes, whose flowers come neereft vnto the fashion of the former Bell-flowers, and after to the double ones, which for their brauery, are entertained euery where into euery Countrey womans garden.

1. *Malua Hispanica flore carneo amplo*.

The Spanish bluish Mallow.

The Spanish Mallow is in forme and manner of growing, very like vnto our common fildes Mallow, hauing ypright stalkes two or three foote high, spread into diuers branches, and from the bottome to the toppe, beset with round leaues, like vnto our Mallowes, but somewhat smaller, rounder, and lesse diuided, yet larger below then aboue: the flowers are plentifully growing vpon the small branches, folding or writhing their leaues one about another before they bee blowne, and being open consist of five leaues, with a long forked clapper therein, of the same colour with the flower: the chiefest difference from the common consisteth in this, that the leaues of these flowers are longer, and more wide open at the brimmes (almost like a Bell-flower) and of a faire bluish or light carnation colour, closing at night, and opening all the day: after the flowers are past, there come such like round heads, with small blacke seede, like vnto the common kinde, but somewhat smaller: the roote is small and long, and perisheth euery yeare.

2. *Alcea vulgaris flore carneo*. Vervaine Mallow with bluish flowers.

There is a Mallow that hath long stalkes, and flowers like vnto the common wilde Mal-

1 *Malva Hispanica flore carneo amplo*. The Spanish Mallow. 2 *Alcea Veneta*. The Venice Mallow. 3 *Alcea Americana*. Thorney Mallow. 4 *Alcea Aegyptia*. The Mallow of Egypt. 5 *Althaea frutex*. The shrubby Mallow. 6 *Malva hortensis simplex*. Single Hollihocks. 7 *Malva rosea multiplex*. Double Hollihocks.

Mallow, and of the same deepe colour with it, so that you can hardly know it from the ordinary kinde, which is found growing wilde together with it, but onely by the leafe, which is as round and as large as the former, but cut into many fine diuisions, euen to the stalke that vpholdeth it, that it seemeth to consist onely of ragges, or peeces of leaues: Of this kinde I take a plante for this garden, growing in all respects like vnto it, but differing onely in the colour of the flowers, which are of the same blush or light carnation colour, or not much differing from the former Spanish kinde, with some veines therein of a deeper colour: the root hereof liueth, as the root of the common wilde kinde doth.

3. *Alcea peregrina sine vesicaria.*

Venice Mallow, or Good night at noone.

The Venice Mallow hath long and weake stalkes, most vsually lying or leaning vpon the ground, hauing here and there vpon them long leaues and somewhat broad, cut in or gashed very deeply on both edges, that it seemeth as if they were diuers leaues set together, euery one standing on a long footestalke: at the ioynts of these stalkes, where the leaues are set, come forth seuerall flowers, standing vpon long footestalkes, which are somewhat larger then any of the former flowers, consisting of five leaues, small at the bottome, and wide at the brimmes, of a whitish colour tending to a blush, and sometimes all white, with spots at the bottomes of the leaues on the inside, of a very deepe purple or murrey colour, which addeth a great grace to the flower, and hauing also a long pestle or clapper in the middle, as yellow as gold: these flowers are so quickly faded and gone, that you shall hardly see any of them blowne open, vnlesse it bee betimes in the morning before the Sunne doe grow warme vpon them, for as soone as it feeleth the Sunnes warme heate, it closeth vp and neuer openeth againe, so that you shall very seldome see a flower blowne open in the day time, after nine a clocke in the morning: after these flowers are past, there rise vp in their places thinne, round, shining or transparent bladders, pointed at the toppe, and ribbed down all along, wherein are contained small, round, blackish seede: the roote is long and small, and perisheth euery yeare.

4. *Alcea fruticosa pentaphylla.* Cinquefoile Mallow.

The stalkes of this Mallow are very long, hard or wooddy, more then of any of the other Mallows: at the lower part whereof, and vp to the middle, stand diuers leaues vpon long footestalkes, parted or diuided into five parts or leaues, and dented about the edges; but vpwards from the middle to the toppe, the leaues haue but three diuisions: among these leaues stand large wide open flowers, of the colour of the common Mallow: the seede is smaller then in any other Mallow, but the rootes are great and long, spreading in the ground like vnto the roots of Marsh Mallows, springing vp afresh euery yeare from the roote.

5. *Sabdarifa seu Alcea Americana.* Thorney Mallowe.

This Thorney Mallowe hath greene leaues next vnto the ground, that are almost round, but pointed at the end, and dented very much about the edges; the other leaues that growe vpon the stalke are diuided into three parts, like vnto a trefoile, and some of them into five diuisions, all of them dented about the edges: the stalke is reddish, with some harmelesse prickles in sundry places thereon, and riseth vp three or foure foote high in a good ground, a fit place, and a kindly yeare, bearing plenty of flowers vpon the stalkes, one at the foote of euery leafe, the toppe it selfe ending in a long spike, as it were of buddes and leaues together: the flowers are of a very pale yellow, tending to a white colour, spotted in the bottome of each of the five leaues, with a deepe purple spot, broad at the lower part, and ending in a point about the middle of the leafe, which are quickly fading, and not abiding about one day, with a long pestle in the middle diuided at the toppe: after the flower is past, commeth vp a short prickly podde, set within a small greene huske or cup that bore the flower, wherein is contained

ned whitish, or rather brownish yellow seede, flat and somewhat round, like vnto the feedes of Hollyhocke: the roote is stringie, and quickly perissheth; for it will hardly endure in our cold Country to giue flowers, much lesse seede, vnlesse (as I said before) it happen in a kindly yeare, and be well planted and tended.

6. *Bamia seu Alcea Egyptia.* The Mallow of Egypt.

This Mallow is also as tender to nourse vp as the last, hauing the lower leaues broad like a Marsh Mallow, and of a fresh Greene colour; but those that growe vpon the stalke, and vnto the toppe, are diuided into five parts or points, but are not cut in to the middle ribbe, like the former Thorney Mallow, yet dented about the edges like vnto them: the flowers growe at the setting to of the leaues, like vnto a Mallow for forme, but of a whitish colour; after which come long five square pointed pods, with hard shels, wherein are contained round blackish gray seede, as bigge as a Vetch or bigger: the roote perissheth quickly with vs; euen with the first frosts.

7. *Althaa frutex flore albo vel purpureo.*
Shrubbe Mallow with a white or purple flower.

There are diuers sorts of shrubbe Mallows, whereof some that haue their stemmes or stalkes lesse woody, dye downe to the ground euery yeare, and others that abide alwayes, are more woody: Of the former sorts I intend not to speake, referring them to a fitter place; and of the other, I will onely giue you the knowledge of one or two in this place, although I doe acknowledge their fittest place had been to be among the shrubbes; but because they are Mallows, I pray let them passe with the rest of their kindred, and their descriptions in this manner: These woody kindes of shrub Mallows haue somewhat large, long, and diuided leaues, of a whitish Greene colour, soft also, and as it were woolly in handling, set dispersedly on the whitish hard or woody stalkes: their flowers are large, like vnto a single Rose or Hollyhocke, in the one being white with purple spots in the bottome; in the other either of a deepe red colour, or else of a paler purple, with a deeper bottome, and with veines running in euery leafe: they are somewhat tender, and would not be suffered to be vncovered in the Winter time, or yet abroad in the Garden, but kept in a large pot or tubbe, in the house or in a warme cellar, if you would haue them to thrive.

8. *Malua hortensis rosea simplex & multiplex diuersorum colorum.*
Hollihockes single and double of severall colours.

I shall not neede to make many descriptions of Hollihockes, in regard the greatest difference consisteth in the flowers, which are in some single, in some double, in some of one colour, and in others of other colours: for the lowest leaues of Hollihockes are all round, and somewhat large, with many corners, but not cut in or diuided, soft in handling; but those that growe vp higher are much more diuided into many corners: the stalkes sometimes growe like a tree, at the least higher then any man, with diuers such diuided leaues on them, and flowers from the middle to the toppe, where they stand as it were a long spike of leaues and buds for flowers together: the flowers are of diuers colours, both single and double, as pure white, and pale bluish, almost like a white, and more bluish, fresh and liuely, of a Rose colour, Scarlet, and a deeper red like a crimson, and of a darke red like blacke blood; these are the most especiall colours both of single and double flowers that I haue seene: the single flowers consist of five broad and round leaues, standing round like vnto single Roses, with a middle long stile, and some chiuies about them: the double flowers are like vnto double Roses, very thicke, so that no stile or vmbone is seene in the middle, and the outermost rowe of leaues in the flowers are largest, the innermost being smaller and thicke set together: after the flowers are past, there come vp as well in the double as single, flat round heads, like flat cakes, round about the bottomes whereof growe flat whitish seede: the roote is long and great at the head, white and rough, like the roote of the common Mallows, but greater, and will reasonably well abide the Winter.

The

The Place.

The first groweth wilde in Spaine. The second in our owne Countrey. The third is thought to growe in Italy and Venice; but Lobel denieth it, saying, that it is there onely in Gardens, and is more plentifull in these parts then with them. The fourth Clusius saith he found in many places of Germany. The fifth is supposed to be first brought out of the West Indies, but an Arabicke name being giuen it, maketh me somewhat doubtfull how to beleeue it. The sixth groweth in Egypt, where it is of great vse, as Prosper Alpinus hath set downe in his Booke of Egyptian plants. The seventh groweth in some parts both of Spaine and France. The last is not found but in Gardens euery where.

The Time.

The first, second, third, fourth, and last, doe flower from Iune vntill the end of Iuly and August. The rest flower very late, many times not vntill September or October.

The Names.

The first and second haue their names sufficiently expressed in their titles. The third is diuersly called, as *Malua horaria*, *Alcea vesicaria*, *Alcea Veneta*, *Alcea Peregrina*, and of Matthiolus, *Hypocoum*. The most vsuall English name is Venice Mallow. The fourth is called *Alcea fruticosa pentaphylla*, and *Cambinifolia*, or *Pentaphyllifolia*: In English, Cinquefoile Mallow. The fifth hath been sent vnder the name of *Sabdarifa*, and *Sabdariffa*, and (as I said) is thought to be brought from America, and therefore it beareth the name of that Country. The sixth is called in Egypt, *Bamia*, or *Bammia*, and by that name sent with the addition *del Cayro* vnto it: In English, Egyptian Mallow, or Mallow of Egypt. The seventh is called *Althea frutex*, and of some *Althea arborea*: In English, Shrubbe Mallow, because his stemme is wooddie, and abideth as shrubbes and trees, doe. The eight and last is called *Malua hortensis*, *Malua Rosea*, and of some *Rosa ultra marina*: In English, of some Hockes, and vsuall Hollihockes.

The Vertues.

All sorts of Mallows, by reason of their viscus, or slimie quality, doe helpe to make the body soluble, being vsed inwardly, and thereby helpe also to ease the paines of the stone and grauell, causing them to be the more easily voided: being outwardly applyed, they mollifie hard tumors, and helpe to ease paines in diuers parts of the body; yet those that are of most vse, are most common. The rest are but taken vpon credit.

CHAP. XCII.

Amaranthus. Flower-gentle.

WE haue foure or fve sorts of Flower-gentle to trimme vp this our Garden withall, which doe differ very notably one from another, as shall be declared in their seuerall descriptions; some of which are very tender, and must be carefully regarded, and all little enough to cause them beare seede with vs, or else wee shall bee to seeke euery yeare: others are hardy enough, and will hardly be lost out of the Garden.

1. *Amaranthus purpureus minor*. The small purple Flower-gentle.

This gallant purple Veluet flower, or Flower-gentle, hath a crested stalke two foote high or more, purplish at the bottome, but Greene to the toppe, whereout groweth many small branches, the leaues on the stalkes and branches are somewhat broad at the bottome, and sharpe pointed, of a full Greene colour, and often somewhat reddish withall, like in forme vnto the leaues of Blites (whereof this and the rest are accounted species, or sorts) or small Beetes: the flowers are long, spikie, soft, and gentle tufts of haire, many as it were growing together, broad at the bottome, and small vp at the toppe, pyramis or steeple-fashion, of so excellent a shining deepe purple colour, tending to a murrey, that in the most excellent coloured Veluet, cannot be scene a more orient colour, (and I thinke from this respect, the French call it *Passé velours*, that is to say, passing Veluet in colour) without any smell at all, which being bruised giueth the same excellent purple colour on paper, and being gathered in his full strength and beauty, will abide a great time (if it be kept out of the winde and sunne in a dry place) in the same grace and colour: among these tufts lye the seede scattered, which is small, very blacke, and shining: the rootes are a few threddy strings, which quickly perish, as the whole plant doth, at the first approach of Winter weather.

2. *Amaranthus Coccineus*. Scarlet Flower-gentle.

The leaues of this Flower-gentle are longer, and somewhat narrower then the former; the stalke groweth somewhat higher, bearing his long tufts at seuerall leaues, as also at the toppe of the stalkes, many being set together, but separate one from another, and each bowing or bending downe his head, like vnto a Feather, such as is worn in our Gallants and Gentlewomens heads, of an excellent bloody Scarlet colour: the seede is blacke, like vnto the former: the roote perisheth quicklier, because it is more tender.

3. *Amaranthus tricolor*. Spotted or variable Flower-gentle.

The chiefe beauty of this plant consisteth in the leaues, and not in the flowers; for they are small tufts growing all along the stalke, which is nothing so high as the former, especially with vs, and at the ioynts with the leaues: the leaues hereof are of the same fashion that the former are, and pointed also; but every leafe is to be scene parted into Greene, red, and yellow, very orient and fresh (especially if it come to his full perfection, which is in hot and dry weather) diuided not all alike, but in some leaues, where the red or yellow is, there will be Greene, and so varying, that it is very pleasant to behold: the seede hereof is blacke and shining, not to bee knowne from the former.

4. *Amaranthus Carneaspica*. Carnation Flower-gentle.

There is another more rare then all the rest, whose leaues are somewhat longer, and narrower then the first, and like vnto the second kinde: the spikes are short, many set together, like branches full of heads or eares of corne, euery one whereof hath some long haire sticking out from them, of a deep blush, tending to a carnation colour.

5. *Amaranthus purpureus maior panniculis sparsis*. Great Floramour, or purple Flower-gentle.

The great Floramour hath one thicke, tall, crested, browne red stalke, five or six foote high, from whence spring many great broad leaues, like vnto the former for the forme, but much larger & redder for the most part, especially the lowest, which brancheth forth into diuers parts, & from between these leaues, & the stalks or branches, as also at the tops of them, stand long, spikie, round, & somewhat flat tufts, of a more reddish purple colour then the first, and diuided also into seuerall parts, wherein when they

are

are full ripe, are to be seen an innumerable company of white seed, standing out among the short thrums, and do then easily fall away with a little touching; every one of these white seed hath as it were an hole halfe bored through therein: the root is a great bush of strings, spreading in the ground, whereby it is strongly fastened, yet perisheth every year, after it hath given his seede.

The Place.

All these plants growe in the Easterne Countries, as Persia, Syria, Arabia, &c. except the greatest, which hath been brought out of the West Indies, where it is much vsed, especially the seede: they are all, except it, nourished vp with much care in our Gardens, and yet in a backward or cold year they will not thrive, for that they desire much heate: but the greatest doth alwayes giue ripe seede every year.

The Time.

They beare their gallant tufts or spikes for the most part in August, and some not vntill September.

The Names.

The name *Amaranthus* is giuen to all these plants, taken from the Greeke word *ἀμαρῆντι*, *non marcescens*, or *non senescens*, that is, neuer waxing old, and is often also imposed on other plants, who haue the same property, that is, that their flowers being gathered in a fit season, will retaine their natiue colour a long time, as shall be shewed in the Chapter following. Diuers do thinke the first to be *Phlox*, or *Flamma* of Theophrastus. The third is called *Gelosia*, or *Celosia* of Tragus. Spigelius in his *Isagoges* saith, it is generally taken to be *Sophonia*, whereof Plinie maketh mention; and Lobel, to bee the Persians, *Theombroton* of Plinie. The Italians, from whom I had it (by the meanes of M^r. Doctor Iohn More, as I haue had many other rare similes) call it, *Bliss à tre colors*; A three coloured Bliee. The fifth, which is the greatest, hath been sent from the West Indies by the name of *Quinia*, as Clusius reporteth. The name Flower-gentle in English, and *Floramour*, which is the French, of *Flos amoris*, and *Passe velours*, as is before said, or Veluet flower, according to the Italian, *Fior veluto*, are equally giuen to all these plants, with their seuerall distinctions, as they are expressed in their titles.

The Vertues.

Diuers suppose the flowers of these plants doe helpe to stay the fluxe of bloud in man or woman, because that other things that are red or purple doe performe the same. But Galen disproueth that opinion very notably, in lib. 2. & 4. de simpl. medicament. facultatibus.

CHAP. XCIII.

Helichrysum, siue Amaranthus luteus.

Golden Flower-gentle, Goldilockes, or Gold-flower.

THE propinquity of property (as I before said) hath caused the affinity in name, and so in neighbourhood in these plants, wherein there are some diuersity; and although they differ from them before in many notable points, yet they all agree with themselves in the golden, or siluer heads or tufts they beare; and therefore I haue

1. *Amaranthus peruvicus* major. The great purple Flower-gentle. 2. *Amaranthus purpureus* minor. The lesser purple Flower-gentle. 3. *Amaranthus*
viridis. Variable Flower-gentle. 4. *Amaranthus caudatus*. Scarlet Flower-gentle. 5. *Amaranthus caudatus* (var.) Garnation Flower-gentle. 6. *Chy-*
santhus Golden Cassia. 7. *Helianthus* Crested. Candy Goldilocks. 8. *Onopordum* Americanum. Lion's tongue or Lion's ear. 9. *Gua-*
phalium Americanum. Cotton Rose. 10. *Gnaphalium* Americanum. The Cotton Rose.

haue comprised them in one Chapter, and will begin with that which commeth nearest vnto the *Helichrysum* of Dioscorides, or *Aurelia* (as Gaza translateth it) of Theophrastus.

1. *Helichrysum*. The Golden flower of life.

This first Golden tuft riseth vp with many hard, round, white stalkes, a foote and a halfe high, whereon at certaine distances stand many fine cut leaues, or rather one leafe cut into many small fine parts, almost as small as Fenell, but grayish, like vnto the Cudweedes or Cotton-weedes (whereof certainly these are speciall kindes) at the toppes of the stalkes stand many round flowers, of a pale gold colour, in an ymbell close together, yet euery flower vpon his owne stalke, and all of an euen height, which will keepe the colour, being gathered, and kept dry for a long time after, and are of a hot and quicke sent: the roote is small and woody, spreading vnder the vpper crust of the earth, and liueth long in his owne naturall place, but very hardly endureth the cold of our Winters, vnlesse they be milde, or it be well defended.

2. *Helichrysum Creticum*. Candy Goldilockes.

Candy Goldilockes hath two or three small slender white branches, set here and there very scatteringly, with small, long, and narrow hoary leaues, hauing yellow heads of flowers at the tops made into ymbells or tufts, not so round and euen as the former, but longwise one aboue another, the heads being made as it were of scales, loosely, and not so closely set together, as in the next following, which when they are full ripe, doe passe into doune, and are blowne away with the winde, hauing a small reddish seede at the end; but will abide a long time, as the other in his beauty, being gathered in time, as the rest will doe.

3. *Helichrysum Orientale* sine *Amaranthus luteus*.
Golden Flower-gentle.

This most beautifull plant is very like vnto the former Candy Goldilockes last described, but growing vp higher, with many more branches, and more hoary, white, and woolly, hauing also long and narrow white leaues, but somewhat broader, and thicker set on the branches: the tufts of flowers or ymbells likewise doe consist of longer and larger heads, more scaly, and closer compact together, of an excellent pale gold yellow colour, and shining, with some yellow threads or thrummes in the middle: the roote dyeth not euery yeare, but liueth long, especially in the South and East Countries, where no colds or frosts are felt; but will require extraordinary care and keeping, and yet scarce sufficient to preferue it in these cold Countries.

4. *Chrysocome* sine *Stachas Citrina*. Golden tufts or Golden Cassidony.

This Golden flower is somewhat like the former of these two last described, hauing hoary stalkes and leaues, standing confusedly on them, being long, and narrower then any of the former: the tops of the stalkes are diuided into many parts, each bearing a small long yellow head or flower at the toppe, with some yellow thrummes in them, which heads being many, are diffusedly set together, like a loole or sparfed ymbell, keeping their colour long before they wither, and when they are ripe, haue thinne small reddish seede, like Mariorome seede, but smaller; the roote is small and blacke: the whole plant, as well leaues and flowers, as rootes, are of a strong sharpe sent, yet pleasant.

5. *Argyrocome* sine *Gnaphalium Americanum*.
Liue long or Life cuerlasting.

This siluer tuft or Indian Cotton weede, hath many white heads of leaues at their first springing out of the ground, couered with a hoary woolliness like cotton, which rising into hard, thicke round stalkes, containe still the same hoariness vpon them, as also vpon the long and narrow leaues which are set thereon, especially on the vnder side,

side, for the vpper sides are of a darke shining Greene colour: the stalkes are diuided at the toppe into many small branches, each whereof haue many scaly tufted heads set together, couered ouer with cotton before their opening, and then disscuering one from another, abiding very white on the outside, when they are fully growne, but with a small yellow thrume in the midde of euery flower, which in time turne into yellow doune, apt to be blowne away with euery winde: the roots are long and black on the outside, creeping vnder ground very much.

6. *Gnaphalium montanum flore albo & flore purpureo.*

White and purple Catsfoote.

This small Cudweede or Cottonweede, hath many small white woolly leaues growing from the roote, which is composed of a few small blackish threds, and lying vpon the ground somewhat like vnto the leaues of a small Mouse-eare, but smaller; from among which riseth vp a small stalke of halfe a foote high or thereabouts, beset here and there with some few leaues, at the top whereof commeth forth a tuft of small flowers, set close together, in some of a pure white, in others of a purple or reddish colour, in some of a pale red or blush, and in others of a white and purple mixt together, which for the beauty is much commended and desired, but will hardly abide to be kept in Gardens, so vnwilling they are to leaue their naturall abiding.

7. *Gnaphalium Roseum.* The Cotton Rose.

This little rose Cotton weede hath many such like woolly leaues, growing as the former from the roote vpon small short branches, not full an hand breadth high, in fashion somewhat like vnto Dayisie leaues, but lesser, and round pointed: at the toppe of euery stalke or branch, standeth one flower, composed of two rowes of small white leaues, layd open like a Starre or a Rose, as it beareth the name, hauing a round head in the middle made of many yellow threds or thrumes, which falling away, there riseth vp a small round head, full of small seedes: the root is small, long and threddy.

The Place.

The foure first plants doe grow naturallly in many of the hot Countries of Europe, as Spaine, Italie, and Prouince in France; as also in Candy, Barbary, and other places, and must be carefully kept with vs in the winter time. The Liue long was brought out of the West Indies, and groweth plentifully in our gardens. The two last doe grow as well in the colder Countries of Germany, as in France and other places.

The Time.

They all flower in the end of September, if they will shew out their beauty at all with vs, for sometimes it is so late, that they haue no faire colour at all, especially the foure first sorts.

The Names.

Variable and many are the names that seuerall Writers do call these foure first sorts of plants, as *Helichrysum*, *Heliochrysum*, or *Elichrylum*, *Elioehrysum*, *Chrysocome*, *Coma aurea*, *Amaranthus luteus*, *Stoechas Citrina*, and *Aurelia*, with others, needlesse here to be recited: it is sufficient for this worke, to giue you knowledge that their names are sufficient as they are expressed in their titles: The first is called *Gnaphalium* by Carolus Clusius, from the likenesse of the ymbels or tufts of heads, though greater and white: for as I said before, the Cotton weedes are of kindred with the golden tufts: It hath been called by our English Gentlewomen, Liue long, and Life euerlasting, because of the durabilitie of the flowers in their beautie. The two last are cal-

led *Gnaphalium*, according to their titles; and in English they may passe vnder those names are set downe with them.

The Vertues.

The foure first are accounted to bee hot and dry, and the three last to bee cold and dry: yet all of them may to some good purpose bee applyed to rheumaticke heads. The former foure are likewise vsed to cause vrine, and in baths to comfort and heate cold parts. They are also layd in chefts and wardrobes, to keepe garments from moths; and are worne in the heads and armes of Gentiles and others, for their beautifull aspect.

CHAP. XCIIII.

Canna Indica. The Indian flowering Reede.

THere are two kindes or sorts of this beautifull plant, the one with a red flower, the other with a yellow, spotted with reddish spots, both which in some kindly yeares haue borne their braue flowers, but neuer any ripe seede, and doth not abide the extremities of our winters, eyther abroade or vnder couert, vnlesse it meete with a stoue or hot-house, such as are vsed in Germany, or such other like place: For neyther house nor cellar will preferue it, for want of heate.

Canna Indica flore rubro. Red flowered Indian Reede.

This beautifull plant riseth vp with faire Greene, large, broade leaues, euery one rising out of the middle of the other, and are folded together, or writhed like vnto a paper Coffin (as they call it) such as Comfitmakers and Grocers vse, to put in their Comfits and Spices, and being spread open, another riseth from the bottome thereof, folded in the same manner, which are set at the ioynts of the stalke when it is risen vp, like vnto our water Reede, and growing (if it runne vp for flower) to be three or foure foote high, as I haue obserued in mine owne garden: the flowers grow at the toppe of the stalke one aboue another, which before their opening are long, small, round, and pointed at the end, very like vnto the claw of a Crauise or Sea-Crab, and of the same red or crimson colour, but being open, are very like vnto the flower of *Gladiolus* or Corne-flagge, but of a more orient colour then at the first, and standing in a rough huske, wherein afterwards standeth a three square head, containing therein round blacke seede, of the bignesse of a pease: the roote is white and tuberous, growing into many knobs, from whence arise such other leaues and stalkes, whereby it encreaseth very much, if it be rightly kept and defended.

Canna Indica flore flavo punctato. Yellow spotted Indian Reede.

This Reede groweth vp with leaues and flowers, in all points so like vnto the former, that it cannot bee knowne from it, vntill it come to flower, which is of a yellow colour, spotted with reddish spots, without any other difference.

The Place.

These plants grow naturally in the West Indies, from whence they were first sent into Spaine, and Portugall, where Clusius saith he saw them planted by the houses sides, flowering in winter, which might be in those warme Countreyes. We preferue them with great care in our gardens, for the beautifull aspect of their flowers.

The

The Time.

They flower not with vs vntill the end, or middle of August, at the foot-
nest.

The Names.

They are called of some *Canna Indica*, and *Arundo Indica*, of others *Canna-
corus*, and of some *Flor Cancræ*, because the colour of the flowers, as well as
the forme of the buds, are so like vnto a Sea-Crabs cle, or claw.

The Vertues.

There is not any vse of these in Physicke that I know.

CHAP. XCV.

Mandragoras. Mandrake.

THe Mandrake is distinguished into two kindes, the male and the female; the
male hath two sorts, the one differing from the other, as shall be shewed; but of
the female I know but one: The male is frequent in many gardens, but the fe-
male, in that it is more tender and rare, is nourished vp but in a few.

Manadragoras mas. The male Mandrake.

The male Mandrake thrusteth vp many leaues together out of the ground, which
being full growne, are faire, large and Greene, lying round about the roote, and are lar-
ger and longer then the greatest leaues of any Lettice, whereunto it is likened by Dio-
scorides and others: from the middle, among these leaues, rise vp many flowers, every
one vpon a long slender stalke, standing in a whitish Greene huske, consisting of five
pretty large round pointed leaues, of a greenish white colour, which turne into small
round apples, Greene at the first, and of a pale red colour when they are ripe, very
smooth and shining on the outside, and of a heady or strong stuffing smell, wherein is
contained round whitish flat seede: the roote is long and thicke, blackish on the out-
side, and white within, consisting many times but of one long roote, and sometimes
diuided into two branches a little below the head, and sometimes into three or more,
as nature listeth to bestow vpon it, as my selfe haue often seene, by the transplanting of
many, as also by breaking and cutting off of many parts of the rootes, but neuer found
harm by so doing, as many idle tales haue bene set downe in writing, and deliuered
also by report, of much danger to happen to such, as should digge them vp or breake
them; neyther haue I euer seene any forme of man-like or woman-like parts, in the
rootes of any: but as I said, it hath oftentimes two maine rootes running down-right
into the ground, and sometimes three, and sometimes but one, as it likewise often hap-
peneth to Parsneps, Carrots, or the like. But many cunning counterfeit rootes haue bin
shaped to such formes, and publickly exposed to the view of all that would see them,
and haue been tolerated by the chiefe Magistrates of the Citie, notwithstanding that
they haue bene informed that such practices were increasement of deceit, and vsufferable;
whether this happened through their ouercredulitie of the thing, or of the persons,
or through an opinion that the information of the truth rose vpon enuy, I know not,
I leaue that to the seacher of all hearts: But this you may bee bold to rest vpon, and
assure your selues, that such formes as haue bin publickly exposed to be seene, were ne-
uer so formed by nature, but only by the art and cunning of knaues and deceiuers, and
let this be your *Galathea* against all such vaine, idle and ridiculous toyes of mens in-
uentions.

There is likewise another sort of these male Mandrakes, which I first saw at Canterbury, with my very louing and kinde friende Iohn Tradescante, in the garden of the Lord Wotton, whose gardiner he was at that time; the leaues whereof were of a more grayish Greene colour, and somewhat folded together, when as the former kind that grew hard by it, was of the same forme that is before described, and ordinary in all others: but whether the apples were differing from the other, I know not, nor did they remember that euer it had borne any.

Mandragoras fœmina. The female Mandrake.

The female Mandrake doth likewise put vp many leaues together, from the head of the roote, but they are nothing so large, and are of a darker Greene colour, narrower also and shining, more crumpled, and of a stronger sent: the flowers are many, rising vp in the middle of the leaues, vpon slender stalkes, as in the male kind, but of a blewish purple colour, which turne into small round fruite or apples, and not long like a pearce (as Clusius reporteth that saw them naturally growing in Spaine) Greene at the first, and of a pale yellowish colour, when they are full ripe; of a more pleasing, or if you will, of a lesse heady sent then the apples of the male, wherein is contained such like seede, but smaller and blacker: the rootes are like the former, blacke without and white within, and diuided in the same manner as the male is, sometimes with more, and sometimes with fewer parts or branches.

The Place.

They grow in many places of Italie, as Matthiolus reporteth, but especially on Mount Garganus in Apulia. Clusius saith hee found the female in many wet grounds of Spaine, as also in the borders of those medowes that lye neere vnto rivers and water courses. The male is cherished in many Gardens, for pleasure as well as for vse: but the female as is said, is both very rare, and farre more tender.

The Time.

The Male flowreth in March, and the fruit is ripe in Iuly. The Female, if it be well preserued, flowreth not vntill August, or September; so that without extraordinary care, we neuer see the fruite thereof in our gardens.

The Names.

Mandragoras mas is called *albus*, as the *Fœmina* is called *niger*, which titles of blacke and white, are referred vnto the colour of the leaues: the female is called also *Thridacius*, from the likenesse of Lettice, whereunto they say in forme it doth carry some similitude. Dioscorides saith, that in his time the male was called *Morion*, and both of them *Antimelum*, and *Circæa*. Wee call them in English, The male, and the female Mandrake.

The Vertues.

The leaues haue a cooling and drying qualitie; fit for the oyntment *Papuleum*, wherein it is put. But the Apples haue a soporiferous propertie, as Levinus Lemnius maketh mention in his Herball to the Bible, of an experiment of his owne. Besides, as Dioscorides first, and then Serapio, Auicenna, Paulus Aegineta, and others also do declare, they conduce much to the cooling and cleansing of an hot *matrix*. And it is probable, that Rachel knowing that they might be profitable for her hot and dry body, was the more earnest with Leah for her Sonne Rubens Apples, as it is set downe *Genesis* 30. *verse* 14. The strong sent of these apples is remembred also, *Cant.* 7. 13. although some would diuert the signification of the Hebrew word, *דמיון*, vnto

vnto Violets, or some other sweet flowers, in the former place of *Genesis*; and the fruit of *Musa*, or Adams Apples in this place of the *Canticles*. Hamilear the Carthaginian Captaine is said to haue infected the wine of the Lybians (his enemies against whom he fought) with the apples of Mandrake, whereby they being made exceeding drowfie, he obtained a famous victory ouer them.

CHAP. XCVI.

Pomum Amoris. Loue Apples.

Although the beautie of this plant consisteth not in the flower, but fruit, yet giue me leaue to insert it here, lest otherwise it haue no place : whereof there are two speciall sorts, which wee comprehend in one Chapter, and distinguish them by *maius* and *minus*, greater and smaller : yet of the greater kinde, we haue nourished vp in our Gardens two sorts, that differ only in the colour of the fruite, and in nothing else.

Pomum Amoris maius fructu rubro.

Great Apple of Loue the ordinary red sort.

This greater kinde of Loue Apples, which hath beene most frequently cherished with vs, hath diuers long and trayling branches, leaning or spreading vpon the ground, not able to sustaine themselves, whereon doe grow many long winged leaues, that is, many leaues set on both sides, and all along a middle ribbe, some being greater, and others lesse, iagged also and dented about the edges, of a grayish ouer-worne greene colour, somewhat rough or hairy in handling, from among the leaues and the branches come forth long stalkes, with diuers flowers set thereon, vpon seuerall short footstalks, consisting of sixe, and sometimes of eight small long yellow leaues, with a middle pricke or vmbone, which after the flowers are fallen, riseth to be the fruite, which are of the bignesse of a small or meane Pippin, vneuenly bunched out in diuers places, and scarce any full round without bunches, of a faire pale reddish colour, or somewhat deeper, like vnto an Orenge, full of a slimie iuice and watery pulpe, wherein the seede lyeth, which is white, flat and somewhat rough : the roote shooteth with many small strings and bigger branches vnder ground, but perissheth at the first feeling of our winter weather. The fruite hereof by often sowing it in our Land, is become much smaller then I haue here described it : but was at the first, and so for two or three yeares after, as bigge as I haue related it.

Pomum Amoris maius fructu luteo. Yellow Amorous Apples.

Of the same kinde is this other sort of Amorous Apples, differing in nothing but the colour of the fruite, which is of a pale yellow colour, hauing bunches or lobes in the same manner, and seede also like the former.

Pomum Amoris minus, siue Mala Ethiopica parua.

Small Loue Apples.

The small Apples of Loue in the very like manner, haue long weake trayling branches, beset with such like leaues as the greater kinde hath, but smaller in euery part : the flowers also stand many together on a long stalke, and yellow as the former, but much smaller : the fruite are small, round, yellowish red berries, not much bigger then great grapes, wherein are contained white flat seede, like the other, but smaller : the roote perissheth in like manner euery yeare, and therefore must bee new sown euery spring, if you will haue the pleasure of their sight in the garden ; yet some yeares I haue knowne them rise of their owne sowing in my garden.

The

The Place.

They growe naturally in the hot Countries of Barbary, and Ethiopia; yet some report them to be first brought from Peru, a Prouince of the West Indies. Wee onely haue them for curiosity in our Gardens, and for the amorous aspect or beauty of the fruit.

The Time.

They flower in Iuly and August, and their fruit is ripe in the middle or end of September for the most part.

The Names.

The first is named diuersly by diuers Authors; for Lobel, Camerarius, and others, call them *Poma amoris*. Dodonæus *Aurea Mala*. Gesnerus first, and Bauhinus after him, make it to be a kinde of *Solanum Pomiferum*. Anguillara taketh it to be *Lycopersicum* of Galen. Others thinke it to bee *Glaucium* of Dioscorides. The last is called *Mala Ethiopica parua*, and by that title was first sent vnto vs, as if the former were of the same kinde and country. We call them in English, Apples of Loue, Loue-Apples, Golden Apples, or Amorous Apples, and all as much to one purpose as another, more then for their beautifull aspect.

The Vertues.

In the hot Countries where they naturally growe, they are much eaten of the people, to coole and quench the heate and thirst of their hot stomaches. The Apples also boyled, or infused in oyle in the sunne, is thought to be good to cure the itch, assuredly it will allay the heate thereof.

CHAP. XCVII.

Digitalis. Foxegloue.

Here are three principall sorts of Foxegloues; a greater, a middle or meane sort, and a lesser, and of them, three especiall colours; that is, purple, white, and yellow; the common purple kinde that groweth abroad in the fields, I leaue to his wilde habitation: and of the rest as followeth.

1. *Digitalis maxima ferruginea*. Dye coloured Foxegloues.

The leaues of this Foxegloue are long and large, of a grayish green colour, finely cut or dented about the edges, like the teeth of a fine sawe; among which commeth vp a strong tall stalke, which when it was full growne, and with ripe seede thereon, I haue measured to be seuen foot high at the least, wherupon grow an innumerable company (as I may so say, in respect of the abundance) of flowers, nothing so large as the common purple kinde, that groweth wilde euery where in our owne Countrey; and of a kinde of browne or yellowish duine colour, with a long lippe at euery flower; after them come seede, like the common kinde, but in smaller heads: the rootes are stringie like the ordinary, but doe vsually perish, or seldome abide after it hath giuen seed.

2. *Digitalis maior flore carnea*. Blush coloured Foxegloues.

This kinde of Foxegloues hath reasonable large leaues, yet not altogether so large

1 *Canna Indica*, The Indian Reed. 2 *Mandragora* *mar.* The male Mandrake. 3 *Punica* *amara* *major*, Great Apples of Sodom. 4 *Digitalis* *major* *flore* *luteo* *amplo*, The great yellow Foxglove. 5 *Digitalis* *media* *flore* *luteo* *rubente*, Orange tawny Foxgloves. 6 *Digitalis* *maxima* *ferruginea*, Dun coloured Foxgloves.

as the common field kinde : the flowers are also smaller then the common sort, but of a bluish colour.

3. *Digitalis media flore luteo rubente.* Orenge tawnie Foxeglouc.

As this Foxeglouc is none of the greatest, so also is it none of the smallest; but a sort betwene both, hauing leaues in some proportion correspondent to the lesser yellow Foxeglouc, but not so large as the lesser white: the flowers are long and narrow, almost as large as the last white, but nothing so large as the first white, of a faire yellow with browne colour, as if the yellow were ouershadowed with a reddish colour, and is that colour wee vsually call an Orenge tawnie colour: the seede is like the former: the rootes perish euery yeare that they beare seede, which is vsually the second yeare of the springing.

4. *Digitalis maior alba.* The greater white Foxeglouc.

This white Foxeglouc is in all things so like vnto the purple wilde kinde, that it can hardly be distinguished from it, vnlesse it be in the fresher greenesse and largenesse of the leaues: the flowers are as great in a manner as the purple, but wholly white, without any spot in them: the seed and other things agree in all points.

5. *Digitalis alba altera seu minor.* The lesser white Foxeglouc.

We haue in our Gardens another sort of white Foxeglouc, whose leaues are like vnto the last described, but not altogether so long or large, and of a darker greene colour: the stalke groweth not so high, as not full three foote: the flowers are pure white, fashioned like vnto the former, but not so great or large, in all other things alike: the rootes hereof did abide sometime in our Gardens, but since perished, and the seede also, since when we neuer could obtaine from any our friends of that kinde againe.

6. *Digitalis maior lutea flore amplo.*
The great yellow Foxeglouc.

The leaues of this greater yellow Foxeglouc, are in forme somewhat like vnto the common purple kinde, but not altogether so large: the stalke groweth to bee three or foure foote high, whereon stand many long hollow pendulous flowers, in shape like the ordinary purple: but somewhat shorter, and more large and open at the brimmes, of a faire yellow colour, wherein are long threads, like as in the others: the roote hereof is greater at the head, and more woody then any of the rest, with many smaller fibres, spreading themselves in the ground, and abideth almost as well as our common purple kinde.

7. *Digitalis minor lutea sine pallida.*
The small pale yellow Foxeglouc.

This small pale yellow Foxeglouc hath somewhat short, broad, smooth and darke greene leaues, snipt or dented about the edges very finely: the stalke is two foot high, beset with such like leaues, but lesser: the flowers are moe in number then in any of the rest, except the first and greatest, and growe along the vpper part of the stalke, being long and hollow, like the other, but very small, and of a pale yellow colour almost white: the seede vessels are small like the former, wherein are contained seede like the rest, but smaller: the rootes are stringy, but durable, and seldome perish with any iniury of the extreamest frosts.

The Place.

The great white kinde hath been often, and in many places found wilde in our owne Country, among or hard by the common purple kinde. All the rest are strangers, but cherished in our Gardens.

The Time.

They flower in Iune and Iuly, and some in August, their seede becoming ripe quickly after.

The Names.

Onely the name *Digitalis*, is of all Writers giuen vnto these plants; for it is not knowne to bee remembred of any of the old Authors. Wee call them generally in English, Foxegloue; but some (as thinking it to bee too foolish a name) doe call them Finger-flowers, because they are like vnto the fingers of a glove, the ends cut off.

The Vertues.

Foxegloues are not vsed in Physicke by any iudicious man that I know; yet some Italians of Bononia, as Camerarius saith, in his time vsed it as a wound herbe.

CHAP. XCVIII.

Verbascum. Mullein.

THere be diuers kinde of Mullein, as white Mullein, blacke Mullein, wooddy Mullein, base Mullein; Moth Mullein, and Ethiopian Mullein, all which to distinguish or to describe, is neither my purpose, nor the intent of this worke, which is to store a Garden with flowers of delight, and sequester others not worthy of that honour. Those that are fit to bee brought to your consideration in this place, are first, the *Blattarias*, or Moth Mulleins, and then the wooddy Mullein, which otherwise is called French Sage, and lastly, the Ethiopian Mullein, whose beauty consisteth not in the flower, but in the whole plant; yet if it please you not, take it according to his Country for a Moore, an Infidell, a Slaue, and so vse it.

1. *Blattaria lutea odorata*. Sweete yellow Moth Mullein.

The yellow Moth Mullein whose flower is sweete, hath many hard grayish Greene leaues lying on the ground, somewhat long and broad, and pointed at the end: the stalks are two or three foot high, with some leaues on them, & branching out from the middle vpwards into many long branches, stored with many small pale yellow flowers, of a pretty sweete sent, somewhat stronger then in the other sorts, which seldome giueh seede, but abideth in the roote, lining many yeares, which few or none of the others doe.

2. *Blattaria lutea maior sine Hispanica*. The great yellow Moth Mullein.

This Spanish kinde hath larger and greener leaues then the former, and rounder and larger then the next that followeth: the stalke is higher then in any of the Moth Mulleins, being for the most part foure or fise foote high, whereon toward the toppe growe many goodly yellow flowers, consisting of fise leaues, as all the rest doe, not so thicke set as the former, but much larger; with some small purplish threads in the middle: the ends whereof are fashioned somewhat like as if a Flie were creeping vp the flower, which turne into round heads, sometimes two or three or more standing together, but vsually one, wherein lye small duskie seed: the roote is not great nor full of threads, and doth perish most vsually hauing giuen seede, except the Winter bee very milde.

3. *Blattaria*

3. *Blattaria lutea altera vulgarior*. The ordinary yellow Moth Mullein.

This yellow Moth Mullein (which is the most frequent in our Gardens) hath longer, and narrower leaues then any of the former, and roundly notched or dented on the edges, of a darke greene colour: the stalke is sometimes branched, but most vsually single, whereon stand many gold yellow flowers, not fully so large as the Spanish kinde, but with the like purple threads in the middle: the seede is small, and contained in the like round heads, but alwaies euery one single by it selfe: the roote perisheth euery yeare that it beareth seede.

4. *Blattaria flore luteo purpurascens*. Cloth of gold Moth Mullein.

The greatest point of difference betwene this and the last described, consisteth chiefly in the colour of the flower, which in this is of the colour of cloth of gold, that is, the ground yellow, and ouershadowed with a bright crimson colour, which is a fine colour of much delight: the threads in the middle are not so purple red as in the former, but much about the colour of the flower: this is not so willing to giue seede, and will as hardly abide in the roote, and hath out of question risen from the seede of the former.

5. *Blattaria flore albo*. White Moth Mullein.

The leaues of the white Moth Mullein are somewhat like vnto the yellow, yet not altogether so much roundly notched about the edges, but rather a little dented, with sharper notches: the stalke riseth as high as the yellow, and hath now and then some branches about it: the flowers hereof are pure white, as large and great as the ordinary yellow, or somewhat larger, with the like purple threads in the middle, as are in the yellow: the seed is like the other, the roote perisheth in like maner, and will not endure.

6. *Blattaria flore purpureo*. Purple Moth Mullein.

The Purple Moth Mullein hath his leaues lying on the ground, broader and shorter then any of the other, of a more grayish greene colour, and without any denting for the most part about the edges, sharpe pointed also at the end of the leafe; among the leaues riseth vp the stalke, not so high as either the white or the yellow, and many times branched, bearing many flowers thereon, of the same fashion, and no whit smaller, of a faire deepe blewish colour tending to rednesse, the threads in the middle of the flowers being yellow: the seede vessels hereof are somewhat smaller then any of the former, except the first sweete yellow kinde: the roote hereof is long, thicke, and blackish on the outside, abiding very well from yeare to yeare, and riseth well also from the sowing of the seede.

7. *Blattaria flore caeruleo*. Blew Moth Mullein.

This blew Moth Mullein is in all respects like vnto the former purple kinde, sauing onely in the colour of the flower, which is of a blewish violet colour, and is not much inferiour either in greatnesse of the plant, or in the largenesse of the flower, vnto the former purple kinde, and endureth many yeares in the like manner. And these be all the sorts of this kinde of Moth Mullein, that I haue seene and nourished vp for this my Garden, without interposing any vnknowne, not seene, or vnworthy.

8. *Verbascum filuestre sine quantum Matthioli*.

Woody Mullein or French Sage.

Woody Mullein or French Sage, hath diuers woody branches two or three foot high, very hoary or white, whereon at seuerall ioyns stand diuers thicke leaues, white also and hoary, long, somewhat broad, round pointed, and rough, somewhat resembling the leaues of Sage in the forme and roughnesse, but not in the sent, whereof our people

people gaue it the name of Sage, calling it French Sage (when as it is as great a stranger in France as in England, yet they doe with this as with many other things, calling them French, which come from beyond the Seas, as for example, all or most of our bulbous flowers, they call French flowers, &c.) at the toppes of the stalkes and branches, at certaine distances, are placed round about them many gaping flowers, like vnto the flowers of Sage, but yellow: after which now and then come seede, somewhat bigger then the Moth Mulleins, and lesse then the next Mullein of Ethiopia: the roote is wooddy at the toppe, with diuers blackish strings growing from it, and endureth as well about ground with his leaues, as vnder it with his rootes.

9. *Ethiopia*. Ethiopian Mullein.

This Mullein of Ethiopia hath many great, broad, and large leaues lying on the ground, rent or torne in diuers of them very much on the sides, of so hoary a white greene colour, that it farre passeth any of the white Mulleins, that growe wilde abroad in our owne Country, for they are of a yellowish white hoarinesse, nothing so pleasant to looke on as this: in the middle of these leaues riseth vp a square strong stalke, foure or fise foote high, set full of such like leaues as growe belowe, but much lesse, and lesse still vp to the toppe, all hoary and woolly, as the rest, and diuided into manie branches, spreading farre, and taking vp a great compasse of ground, more then any one roote of Garden Clary, or other such like plant: at each of the stalkes and branches are set two small leaues, and with them, round about the stalkes, stand many small gaping flowers, of a pale bleake blew colour: the seede is almost as large as Garden Clary seede, and of the same forme and colour: the roote is wooddy, and perisheth as soone as it hath borne seede, which is vsually the second yeare after the sowing; for the first yeare it seldome runneth vp to flower.

10. *Lamium Pannonicum* sine *Galeopsis Pannonica*.

Hungary dead Nettle or the Dragon flower.

Let mee thrust this plant into this place, rather then make a peculiar Chapter, because I haue no other of the same stocke or kindred to be ioyned with it, and is a pretty ornament in a Garden. The leaues whereof are very large, round, and great, rough or full of veines, which make it seeme crumpled, dented or deeply notched about the edges, and of a very darke greene colour, and sometimes brownish, or of a darke reddish colour withall, euery one standing on a long foote-stalke, very like in forme vnto the great white Arch-Angell leaues, but farre larger and blacker: the stalkes are great and foure square, hauing leaues and flowers standing round about them at the ioyns like coronets, which flowers are very great, long, and wide gaping open, of a darke red or purple colour, with some whitnesse or spots in the iawes, and some hairinesse also on the sides, which stand in full flower two or three moneths most vsually, and sometimes longer, after which come brownish seede: the roote is a great tuft or bush of long whitish strings, and encreaseth euery yeare, not fearing the greatest iniuries of our coldest and extreamest Winters.

The Place.

All these plants are strangers in our Country, and onely preferred in Gardens, to furnish them with variety, but (as I said) the cloth of gold Moth Mullein hath been raised from seed in our owne Country.

The Time.

The last flowreth first, before all the rest, beginning in Aprill. The Moth Mulleins in May and Iune. The French Sage in Iuly.

The Names.

All the sorts of *Blattaria* may bee comprehended vnder the kindes of

Kk

Verbascum

Verbascum nigrum, as any one but meanelly exercised in the knowledge of plants, may discern. And although Plinie saith, that Moths doe most frequently haunt where *Blattaria* either groweth, or is laid, yet it is not observed sufficiently in our Country so to doe, notwithstanding the name of Moth Mullein is generally giuen them. The last is generally called with vs *Laminum Pannonicum*, but certainly it is the *Galeosif maxima Pannonica* of Clusius.

The Vertues.

Other qualities I haue not found hath been allotted vnto the *Blattaria* or Moth Mullein, then those of Plinie, to engender Moths. Wee vse none of these plants in Physicke in these daies.

CHAP. XCIX.

Valeriana. Valerian.

THe many sorts of Valerian (or Set-wall as many doe call them) are fitter for a generall worke, or a generall Physicall Garden of Simples, then this of delightfull flowers. I will therefore select out a few, worthy of the place, and offer them to your considerations.

1. *Valeriana rubra Dodonai*. Red Valerian.

This Valerian hath diuers hard, but brittle whitish Greene stalkes, rising from the roote, full of tuberos or swelling ioynts, whereat stand two leaues, on each side one, and now and then some small leaues from betweene them, which are somewhat long and narrow, broadest in the middle, and small at both ends, without either diuision or incisure on the edges, of a pale Greene colour: the stalkes are branched at the top into diuers parts, at the ends whereof stand many flowers together, as it were in an ymbell or tuft, somewhat like vnto the flowers of our ordinary Valerian, but with longer neckes, and of a fine red colour, very pleasant to behold, but of no sent of any Valerian: after these flowers haue stood blowne a very great while, they sodainely fall away, and the seede is ripe very quickly after, which is whitish, standing vpon the branches naked, as the Valerians doe, and very like vnto them, with a little white doune at the end of euery one of them, whereby they are soone carried away with the winde: the roote is great, thicke, and white, continuing long, and shooting out new branches euery yeare, and smelling somewhat like a Valerian.

2. *Nardus Montana tuberosa*. Knobbed Mountaine Valerian.

This kinde of Valerian or Spiknard, if you will so call it, hath his first leaues lying on the ground, without any diuision in them at all, being smooth, and of a dark Greene colour, which so abide all the winter, but those that spring vp after, and when it runneth vp to flower, are cut in on the edges, very like vnto the iagged leaues of the great garden Valerian, and so the elder they grow, the more cut and iagged they are: the stalke and flowers are very like the stalke with flowers of the garden Valerian, but of a darke or deepe red colour, and more store of them thrust together, by double the number almost: the seede is like the seede of the great Valerian: the root is tuberos, or knobbed in many parts, round about, aboue and below also, with some fibres shooting from them, whereby it is encreased, and smelleth very like the roote of the garden Setwall, or not altogether so strong.

1. *Blattaria flore albo*. Moth Mullein with a white flower. 2. *Blattaria flore purpureo*. Moth Mullein with a purple flower. 3. *Verbascum thapsus*. French Sage. 4. *Verbascum thapsus*. Ethiopian Mullein. 5. *Valeriana rubra* Dalenai. Red Valerian. 6. *Valeriana Græca*. Greek Valerian. 7. *Lamium Palmarum*. Hungary dead Nettle. 8. *Cardamine flore pleno*. Double Cuckow flower or Ladies Smocks.

3. *Valeriana Græca*. Greeke Valerian.

The Greeke Valerian hath many winged leaues lying vpon the ground, that is, many small leaues set on both sides of a middle ribbe, very like vnto the wilde Valerian, that groweth by the ditch sides, but much smaller and tenderer, among which rise vp one or two round brittle stalkes, two foote high or thereabouts, whereon are set at the ioynts, such like leaues as grow below, but smaller: the toppes of the stalkes are diuided into many small branches, thicke set together, full with flowers, consisting of five small round leaues a peece, layd open like vnto the Cinquefoile flower, with some white threds in the middle, tipped with yellow pendants: the colour of these flowers in some plants, is of a faire bleake blew colour, and in others pure white: And I doe heare of one beyond the Seas (if the report bee true, for I haue not seene such a one) which should beare red flowers: after the flowers are past, there come vp in their places small hard huskes or heads, containing small blackish seedes: the roote is composed of a number of small long blackish threds, fastened together at the head, without any sent at all of a Valerian, eyther in roote or leafe; and why it should bee called a Valerian I see no great reason, for it agreeth with none of them, in flower or seede, and but onely with the wilde Valerian in leafe, as I said before: but as it is, we so giue it you, and for the flowers sake is receiued into our gardens, to helpe to fill vp the number of natures rarities and varieties.

The Place.

All these Valerians are strangers, but endenizond for their beauties sake in our Gardens. The Mountaine Valerian I had of the liberalitie of my louing friend Iohn Tradescante, who in his trauaile, and search of natures varieties, met with it, and imparted thereof vnto me.

The Time.

They flower in the Summer moneths, and seed quickly after.

The Names.

The first is generally called of most, *Valeriana rubra Dodonæi*, who saith also that some would haue it to be *Behen rubrum*. Some call it *Valerianthion*, others make it a kinde of *Ocimum*, and some *Saponaria altera*, with other names, which are to no great purpose to set downe in this place, it being fitter for a generall worke to discusse of names, wherein both reading, knowledge and iudgement must bee shewen, to correct errors, and set downe the truth, that one may rest thereon. The others haue their names in their titles sufficient to distinguish them.

The Vertues.

The Mountaine Valerian is of all the the rest here set downe of most vse in Physicke, the rest hauing little or none that I know, although it be much weaker then the great garden kinde, or the Indian Nardus, in whose steed anciently it was vsed, in oyles, oyntments, &c.

CHAP. C.

Cardamine. Cuckow flowers, or Ladies smockes.

OF the common sorts of Cuckow flowers that grow by ditch-sides, or in moist meadowes, & wet grounds, it is not my purpose hereto write, but of one or two other, the most specious or faire of all the tribe, that doe best besit this garden.

1. *Cardamine*

1. *Cardamine flore pleno*. Double Cuckow flowers.

The double *Cardamine* hath a few winged leaues, weake and tender, lying on the ground, very like vnto the single meadow kinde; from among which riseth vp a round Greene stalke, set here and there, with the like leaues that grow below, the top wherof hath a few branches, whereon stand diuers flowers, every one vpon a small footstalk, consisting of many small whitish round leaues, a little dasht ouer with a shew of bluish, set round together, which make a double flower: the roote creepeth vnder ground, sending forth small white fibres, and shooteth vp in diuers places.

2. *Cardamine trifolia*. Trefoile Ladies smockes.

This small plant hath diuers hard, darke round Greene leaues, somewhat vneuen about the edges, alwayes three set together on a blackish small footstalk, among which rise vp small round blackish stalkes, halfe a foote high, with three small leaues at the ioynts, wherethey branch forth, at the toppes whereof stand many flowers, consisting of foure leaues a peece, of a whitish or bluish colour very pale: after which come vp small, thicke and long pods, wherein is contained small round seede: the root is composed of many white threads, from the heads whereof runne out small strings, of a dark purple colour, whereby it encreaseth.

The Place.

The first with the double flower is found in diuers places of our owne Countrey, as neere Micham about eight miles from London; also in Lancashire, from whence I receiued a plant, which perished, but was found by the industrie of a worthy Gentlewoman, dwelling in those parts heretofore remembred, called Mistresse Thomasin Tunstall, a great louer of these delights. The other was sent me by my especial good friend Iohn Tradescante, who brought it among other dainty plants from beyond the Seas, and imparted thereof a roote to me.

The Time.

The last most vsually flowreth before the former, yet not much differing, that is, in the end of Aprill or in May.

The Names.

The first is a double kinde of that plant, that growing wilde abroad, is vsually called *Cardamine altera*, and *Sisymbrium alterum* of Dioscorides, and of some *Flos cuculi*, but not firly; for that name is more vsually giuen vnto the wilde featherd Campions, both single and double, as is before expressed: yet for want of a fitter name, wee may call it in English, eyther Cuckowe flower, or Ladyes smockes, which you will. The second hath beene sent vnder the name of *Sanicula trifolia*, but the most frequent name now receiued, is *Cardamine trifolia*, and in English Trefoile Ladies spockes.

The Vertues.

The double Ladies smockes are of the same qualitie with the single, and is thought to be as effectuall as Watercresses. The propertie of the other I thinke is not much knowne, although some would make it a wound herbe.

CHAP. CL.

OF the many sorts of *Thlaspi* it is not the scope of this worke to relate, I will select but onely two or three, which for their beautie are fit to bee inserted into this garden.

Thlaspi Creticum umbellatum flore albo & purpureo.
Candy Tufts white and purple.

This small plant riseth seldome aboue a foote and a halfe high, hauing small, narrow, long and whitish Greene leaves, notched or dented with three or foure notches on each side, from the middle to the point-wards; from among which rise vp the stalkes, branched from the bottome almost into diuers small branches, at the toppes whereof stand many small flowers, thick thrust together in an vmbell or tuft, making them seeme to be small, round, double flowers of many leaues, when as euery flower is single, and standeth a part by it selfe, of a faire white colour in some plants, without any spot, and in others with a purplish spot in the centre or middle, as if some of the middle leaues were purple, in others againe the whole flower is purplish all ouer, which make a pretty shew in a garden: the seede is contained in many small and flat seed vessels, which stand together in an vmbell, as the flowers did, in which are contained somewhat reddish seede, like vnto some other sorts of *Thlaspi*, called Treakle Mustards: the roote is small and hard, and perisheth euery yeare hauing giuen seede.

*Thlaspi Mari-
num Batium*

We haue another sort, whose leaues before it sendeth forth any stalke, are a little toothed, or finely dented about the edges, and brancheth not so much out, but carryeth an vmbell of purplish flowers like vnto the former, and paler yellow seede.

The Place.

These doe grow in Spaine and Candie, not farre from the Sea side.

The Time.

These *Thlaspi* giue not their flowers vntill the end of Iune, or beginning of Iuly, and the seed is ripe soone after.

The Names.

The first is named by some, *Draba*, or *Arabis*, as Dodonæus, but *Draba* is another plant differing much from this. Wee call one sort, *Thlaspi Creticum*, and the other *Thlaspi Batium maritimum*, because the one came from Spaine, and the other from Candy: we giue it in English, the name of Tufts, because it doth fit the forme of the flowers best, although ordinarily all the *Thlaspi* are Englished Wilde Mustardes.

The Vertues.

Candy, or Spanish Tufts, is not so sharpe biting in taste, as some other of the *Thlaspi*es are, and therefore is not to be vsed in medicines, where *Thlaspi* should be in the stead thereof.

CHAP. CII.

Clematis. Clamberers, or Creepers.

HAving shewed you all my store of herbes bearing fine flowers, let mee now bring to your consideration the rest of those plants, be they Shrubs or Trees, that are cherished in our garden, for the beauty of their flowers chiefly, or for some other beautifull respect: and first I will begin with such as creepe on the ground, without climbing, and then such as clime vp by poles, or other things, that are set or grow neere them, fit to make Bowers, and Arbours, or else are like them in forme, in name, or some other such qualitie or propertie.

1. *Clematis Daphnoides, sine Vinca peruinca simplex minor diuersorum colorum.*

Single Perwinkle of diuers colours.

The smaller Perwinkle which not onely groweth wilde in many places, but is most vsuall in our Gardens, hath diuers creeping branches, trayling or running vpon the ground, shooting out small fibres at the ioynts, as it creepeth, taking thereby hold in the ground, and rooeth in diuers places: at the ioynts of these branches stand two small darke Greene shining leaues, somewhat like vnto small Baye leaues, but smaller, and at the ioynts likewise with the leaues, come forth the flowers, one at a ioynt, standing vpon a tender footstalk, being somewhat long and hollow, parted at the brims, sometimes into foure leaues, and sometimes into fise, the most ordinary sort is of a pale or bleake blew colour, but some are pure white, and some of a darke reddish purple colour: the roote is in the body of it, little bigger then a rush, bushing in the ground, and creeping with his branches farre about, taking roote in many places, whereby it quickly possesseth a great compasse; and is therefore most vsuall planted vnder hedges, or where it may haue roome to runne.

2. *Vinca peruinca flore duplici purpureo.*

Double purple Perwinkle.

The double Perwinkle is like vnto the former single kinde, in all things except in the flower, which is of that darke reddish purple colour that is in one of the single Kindes; but this hath another row of leaues within the flower, so that the two rowes of leaues causeth it to be called double, but the leaues of these are lesser then the single. I haue heard of one with a double white flower, but I haue not yet seene it.

3. *Clematis Daphnoides sine Peruinca maior.*

The greater Perwinkle.

This greater Perwinkle is somewhat like the former, but greater, yet his branches creepe not in that manner, but stand more vpright, or lesse creeping at the least: the leaues also hereof stand by couples at the ioynts, but they are broader and larger by the halfe: the flowers are larger, consisting of fise leaues that are blew, a little deeper then the former blew: this plant is farre tenderer to keepe then the other, and therefore would stand warme, as well as in a moist shadowie place.

4. *Clematis altera sine vrens flore albo.*

Burning Clamberer, or Virgins Bower.

This Causticke or burning Climer, hath very long and climbing tender branches, yet somewhat woody below, which winde about those things that stand neere it, couered with a brownish Greene barke, from the ioynts whereof shoote forth many winged leaues, consisting for the most part of fise single leaues, that is, two and two together, and one at the end, which are a little cut in or notched on the edges here and there,

there, but every part of them is lesser then the leaues of the next following Climer, without any clasping tendrels to winde about any thing at all: towards the vpper part of the branches, with the said leaues, come forth long stalks, wheron stand many white flowers clustering together, opening the brims into fixe or eight small leaues, spreading like a starre, very sweet of smell; or rather of a strong heady sent, which after turne into flattish and blackish seede, plumed at the head, which plume or feather flyeth away with the winde after it hath stood long; and leaueth the seede naked or bare: the roote is white and thicke, fleshie and tender, or easie to be broken, as my selfe can well testifie, in that desiring to take a sucker from the roote, I could not handle it so tenderly, but that it broke notwithstanding all my care. Master Gerard in his Herball maketh mention of one of this kinde with double white flowers, which hee saith he recovered from the seede was sent him from Argentine, that is Strasborough, whereof hee setteth forth the figure with double flowers: but I neuer saw any such with him, neither did I euer heare of any of this kinde with double flowers. Clusius indeed saith, that hee receiued from a friend some seede vnder the name of *Clematis flore albo pleno*: but he doubteth whether there bee any such: the plants that sprang with him from that seede, were like vnto the vpright kinde called *Flammula Matthioli*, or *louis cresta*, as he there saith: but assuredly I haue bene informed from some of my especiall friends beyond Sea, that they haue a double white *Clematis*, and haue promised to send it, but whether it will be of the climbing or vpright sort, I cannot tell vntill I see it: but surely I doe much doubt whether the double will giue any good seede.

5. *Clematis altera siue peregrina flore rubro*. Red Ladies Bower.

This Climer hath many limber and weake climbing branches like the former, covered with a browne thin outer barke, and greene vnderneath: the leaues stand at the ioynts, consisting but of three leaues or parts, whereof some are notched on one side, and some on both, without any clasping tendrels also, but winding with his branches about any thing standeth next vnto it: the flowers in like manner come from the same ioynts with the leaues, but not so many together as the former vpon long footstalkes, consisting of foure leaues a peece, standing like a crosse, of a darke red colour; the seed is flat and round, and pointed at the end, three or foure or more standing close together vpon one stalk, without any doune vpon them at all, as in the former: the roots are a bundell of brownish yellow strong strings, running down deep into the ground, from a bigge head about.

6. *Clematis peregrina flore purpureo simplici*.
Single purple Ladies Bower.

This Ladies Bower differeth in nothing from the last described, but onely in the colour of the flower, which is of a sad blewish purple colour; so that the one is not possible to be known from the other, vntill they be in flower.

7. *Clematis peregrina flore purpureo pleno*.
Double flowred purple Ladies Bower.

This double *Clematis* hath branches and leaues so neere resembling the single kinds, that there can be knowne no difference, vnlesse it be, that this groweth more goale and great, and yeeldeth both more store of branches from the ground, and more spreading about: the chieftest marke to distinguish it is the flower, which in this is very thicke and double, consisting of a number of smaller leaues, set close together in order in the middle, the foure outermost leaues that encompasse them, being much broader and larger then any of the inward, but all of a dull or sad blewish purple colour, the points or ends of the leaues seeming a little darker then the middle of them: this beareth no seede that euer I could see, heare of, or learne by any of credit, that haue nourished it a great while; and therefore the tales of false deceitfull gardeners, and others, that diluier such for truth, to deceiue persons ignorant thereof, must not be credulously entertained.

In the great booke of the Garden of the Bishop of Eystot (which place is neere vnto Norimberg) in Germany, I reade of a *Clematis* of this former kinde, whose figure is thereto also annexed, with double flowers of an incarnate, or pale purple tending to a bluish colour, whereof I haue not heard from any other place.

8. *Flammula lous erecta*. Vpright Virgins Bower.

This kinde of *Clematis* hath diuers more vpright stalkes then any of the foure last described, sometimes foure or five foote high, or more; yet leaning or bending a little, so that it had some neede of sustaining, couered with a brownish barke; from whence come forth on all sides diuers winged leaues, consisting of five or seuen leaues, set on both sides of a middle ribbe, whereof one is at the end: the tops of the stalkes are diuided into many branches, bearing many white sweet smelling flowers on them, like in fashion vnto the white Virgins Bower; after which come such like feather toppe seede, which remaine and shew themselves, being flat like the other, when the plumes are blowne abroad: the roote spreadeth in the ground from a thicke head, into many long strings, and fasteneth it selfe strongly in the earth; but all the stalkes dye downe euery yeare, and spring afresh in the beginning of the next.

9. *Clematis cerulea Pannonica*. The Hungarian Climber.

The stalks of this plant stand vpright, & are foure square, bearing at euery ioynnt two leaues, which at the first are closed together, and after they are open, are somewhat like vnto the leaues of *Aselepias*, or Swallow-wort: from the tops of the stalks, and sometimes also from the sides by the leaues commeth forth one flower, bending the head downward, consisting of foure leaues, somewhat long & narrow, standing like a crosse, and turning vp their ends a little againe, of a faire blew or skie colour, with a thicke pale yellow short thrumme, made like a head in the middle: after the flower is past, the head turneth into such a like round feather toppe ball, as is to be seene in the Trauellers ioy, or *Viorna* (as it is called) that groweth plentifully in Kent, and in other places by the way sides, and in the hedges, wherein is included such like flat seede. These stalkes (like as the last) dye downe to the ground euery yeare, and rise againe in the Spring following, shooting out new branches, and thereby encrease in the roote.

10. *Maracoe sine Clematis Virginiana*. The Virginia Climber.

Because this braue and too much desired plant doth in some things resemble the former Climbers, so that vnto what other family or kindred I might better conioyne it I know not; let me I pray insert it in the end of their Chapter, with this description. It riseth out of the ground (very late in the yeare, about the beginning of May, if it be a plant hath risen from the seed of our owne sowing, and if it be an old one, such as hath been brought to vs from Virginia, not till the end thereof) with a round stalke, not aboue a yard and a halfe high (in any that I haue seene) but in hotter Countries, as some Authors haue set it downe, much higher, bearing one leafe at euery ioynnt, which from the ground to the middle thereof hath no clasps, but from thence vpwards hath at the same ioynnt with the leafe both a small twining clasper, like vnto a Vine, and a flower also: euery leafe is broad at the stalke thereof, and diuided about the middle on both sides, making it somewhat resemble a Figge leafe, ending in three points, whereof the middlemost is longest: the bud of the flower, before it doe open, is very like vnto the head or seede vessell of the ordinary single *Nigella*, hauing at the head or top five small crooked hornes, which when this bud openeth, are the ends or points of five leaues, that are white on the inside, and lay themselves flat, like vnto an Anemone, and are a little hollow like a scoope at the end, with five other smaller leaues, and whiter then they lying betweene them, which were hid in the bud before it opened, so that this flower being full blowne open, consisteth of ten white leaues, laide in order round one by another: from the bottome of these leaues on the inside, rise diuers twined threads, which spread and lay themselves all ouer these white leaues, reaching beyond the points of them a little, and are of a reddish peach colour: towards the bot-

comes likewise of these white leaues there are two red circles, about the breadth of an Oten strawe, one distant from another (and in some flowers there is but one circle seen) which add a great grace vnto the flower, for the white leaues shew their colour through the peach coloured threads, and these red circles or rings vpon them being also perspicuous, make a tripartite shew of colours most delightfull: the middle part of this flower is hollow, and yellowish; in the botome whereof riseth vp an vmbone, or round stile, some what bigge, of a whitish Greene colour, spotted with reddish spots like the stalkes of Dragons, with fine round threads or chiues, spotted in the like manner, and tipt at the ends with yellow pendants, standing about the middle part of the said vmbone, and from thence rising higher, endeth in three long crooked hornes most vsually (but sometimes in foure, as hath beene obserued in Rome by Dr. Aldine, that set forth some principall things of Cardinall Farnesius his Garden) spotted like the rest, hauing three round Greene buttons at their ends: these flowers are of a comfortable sweete sent, very acceptable, which perish without yeelding fruit with vs, because it flowreth so late: but in the naturall place, and in hot Countries, it beareth a small round whitish fruit, with a crowne at the toppe thereof, wherein is contained (while it is fresh, and before it be ouer dried) a sweet liquor, but when it is dry, the seede within it, which is small, flat, somewhat rough and blacke, will make a rattling noise: the rootes are composed of a number of exceeding long and round yellowish browne strings, spreading farre abroad vnder the ground (I haue seene some rootes that haue beene brought ouer, that were as long as any rootes of *Sarsa parilla*, and a great deale bigger, which to be handsomely laid into the ground, were faine to be coyled like a cable) and shooting vp in seuerall places a good distance one from another, whereby it may be well encreased.

The Iesuities Figure of the Maracoc.

GRANADILLVS FRUTEX INDIGVS
CHRISTI PASSIONIS IMAGO.

The Place.

The first blew Perwinkle groweth in many Woods and Orchards, by the hedge sides in England, and so doth the white here and there, but the other single and double purple are in our Gardens onely. The great Perwinkle groweth in Prouence of France, in Spaine, and Italy, and other hot Countries, where also growe all the twining Clamberers, as well single as double: but both the vpright ones doe growe in Hungary and thereabouts. The surpassing delight of all flowers came from Virginia. Wee preferue them all in our Gardens.

The Time.

The Perwinkles doe flower in March and Aprill. The Climbers not vntill the end of Iune, or in Iuly, and sometimes in August. The Virginian somewhat later in August; yet sometimes I haue knowne the flower to shew it selfe in Iuly.

The Names.

The first is out of question the first *Clematis* of Dioscorides, and called of many

1 *Thalysia cretica*. Candy tufts. 2 *Vinca peruviana* flore simplici. Single Periwinkle. 3 *Vinca peruviana* flore duplici. Double Periwinkle. 4 *Phloxia Matthioli*. Upright Virgins Bower. 5 *Clematis pergrina* flore simplici. The Single Ladies Bower. 6 *Clematis pergrina* flore pleno purpureo. Double flowered Ladies Bower. 7 *Muracoc* sine *Clematis virginiana*. The Virginian Climber.

many *Clematis Daphnoides* (but not that plant that is simply called *Daphnoides*, for that is *Laurcola*) and is vsually called *Vinca peruinca*: but it is not *Chamadaphne*, for that is another plant, as shall be shewed in his place; some call it *Centunculus*: In English wee call it Perwinkle. The other is *Clematis altera* of Dioscorides, and is called also *Clematis peregrina*, whose distinctions are set downe in their titles: In English, Ladies Bower, or Virgins Bower, because they are fit to growe by Arbours, to couer them. The first vpright Clamberer is called, and that rightly of some, *Clematis erecta*, or *sarcelia*. Of others, *Flammula frutex*, and *Flammula lauis*, or *sarcelia*: In English, Vpright Virgins Bower. The next is called by Clusius, *Clematis Paumonica cerulea*, who thought it to be *Climeni species*, by the relation of others, at the first, but after entituled it, *Clematis*: In English, the Hungarian Climer. The last may be called in Latine, *Clematis Virginiana*: In English, The Virgin or Virginian Climer; of the Virginians, *Maracoe*: of the Spaniards in the West Indies *Granadillo*, because the fruit (as is before said) is in some fashion like a small Pomegranate on the outside; yet the seede within is flattish, round, and blackish. Some superstitious Iesu-ite would faine make men belecue, that in the flower of this plant are to be seene all the markes of our Sauours Passion; and therefore call it *Flos Passionis*: and to that end haue caused figures to be drawne, and printed, with all the parts proportioned out, as thornes, nailes, speare, whippe, pillar, &c. in it, and all as true as the Sea burnes, which you may well perceiue by the true figure, taken to the life of the plant, compared with the figures set forth by the Iesuites, which I haue placed here likewise for euery one to see: but these bee their aduantageous lies (which with them are tolerable, or rather pious and meritorious) wherewith they vse to instruct their people; but I dare say, God neuer willed his Priests to instruct his people with lyes: for they come from the Diuell, the author of them. But you may say I am beside my Text, and I am in doubt you will thinke, I am in this besides my selfe, and so nothing to be beleeued herein that I say. For, for the most part, it is an inherent error in all of that side, to beleue nothing, be it neuer so true, that any of our side shall affirme, that contrarieth the assertions of any of their Fathers, as they call them: but I must referre them to God, and hee knoweth the truth, and will reforme or deforme them in his time. In regard whereof I could not but speake (the occasion being thus offered) against such an erroneous opinion (which euen Dr. Aldine at Rome, before remembred, disproued, and contraried both the said figures and name) and seek to disproue it, as doth (I say not almost, but I am affraid altogether) leade many to adore the very picture of such things, as are but the fictions of superstitious brains: for the flower it selfe is farre differing from their figure, as both Aldine in the aforesaid booke, and Robinus at Paris in his *Theatrum Florae*, doe set forth; the flowers and leaues being drawne to the life, and there exhibited, which I hope may satisfie all men, that will not be perpetually obstinate and contentious.

The Vertues.

Costæus saith hee hath often seene, that the leaues of Perwinkle held in the mouth, hath stayed the bleeding at the nose. The French doe vse it to stay the menstruall fluxes. The other are causticke plants, that is, fiery hot, and blistering the skinne; and therefore (as Dioscorides saith) is profitable to take away the scurfe, leprye, or such like deformities of the skin. What property that of Virginia hath, is not knowne to any with vs I thinke, more then that the liquor in the greene fruit is pleasant in taste; but assuredly it cannot be without some speciall properties, if they were knowne.

CHAP. CIII.

Chamaelea Dwarf Spurge Olive, or Dwarf Baye.

I have three sorts of *Chamaelea* to bring to your consideration, every one differing notably from other; two of them of great beauty in their flowers, as well as in the whole plant: the third abiding with greene leaues, although it haue no beauty in the flower, yet worthy of the place it holds. And vnto these I must adioyne another plant, as comming nearest vnto them in the brauery of the flowers.

1. *Chamaelea Germanica* sive *Mezerion floribus dilutioris coloris & saturatioris.**Dwarf Baye, or flowering Spurge Olive.*

We haue two sorts of this *Spurge Olive* or *Dwarf Baye*; differing onely in the colour of the flowers. They both rise vp with a thicke woody stemme, five or six foot high sometimes, or more, and of the thicknesse (if they be very old) of a mans wrest at the ground, spreading into many flexible long branches, couered with a tough grayish barke, beset with small long leaues, somewhat like vnto *Priuet* leaues, but smaller and paler, and in a manner round pointed: the flowers are small, consisting of foure leaues, many growing together sometimes, and breaking out of the branches by themselves: in the one sort of a pale red at the first blowing; and more white afterwards; the other of a deeper red in the blossome, and continuing of a deeper red colour all the time of the flowering, both of them very sweete in smell: after the flowers are past, come the berries, which are greene at the first, and very red afterwards, turning blackish red, if they stand too long vpon the branches: the rootes spread into many tough long branches, couered with a yellowish barke.

2. *Chamaelea Alpina*. Mountain Spurge Olive.

This Mountain *Laurell* riseth vp with a small woody stemme, three or foure foot high, or more, branching forth towards the vpper parts into many slender and tough branches, couered with a rough hoary greene barke, beset at the ends thereof with flatter, fuller, and smaller round pointed leaues then the former, of a grayish greene colour on the vpperside, and hoary vnderneath, which abide on the branches in Winter, and fall not away as the former: the flowers are many set together at the ends of the branches, greater then the former, and consisting of foure leaues a peece, of a light bluish colour, standing in small grayish huskes, of little or no scent at all: the fruit followeth, which are small long graines or berries, of an excellent red colour, which afterwards turne blacke: the roote is long, and spreadeth about vnder the vpper part of the earth.

3. *Chamaelea tricoelos*. Widowe Wayles.

This three berried *Spurge Olive* hath no great stemme at all, but the whole plant spreadeth from the ground into many flexible tough greene branches, whereon are set diuers narrow, long, darke greene leaues all along the branches, which abide greene all the Winter: the flowers are very small, scarce to be seene, and come forth between the leaues and the stalke, of a pale yellow colour, made of three leaues; after which come small blackish berries, three vsually set together: the roote spreadeth it selfe in the ground not very farre, being hard and woody, and often dyeth, if it bee not well defended from the extremity of our sharpe Winters.

4. *Cneorum Matthioli*. Small Rocke Roses.

I was long in doubt, in what place I should dispose of this plant, whether among the *Campions*, as *Bauhinus*, or among these, as *Clusius* doth; but lest my Garden should want it wholly, let it take vp room for this time here. This gallant plant hath diuers

long, weake, slender, but yet tough branches lying vpon the ground, diuided vsually into other smaller branches, whereon growe many, small, long, and somewhat thicke leaues, somewhat like vnto the leaues of the former *Mexereon*, set without any order to the very tops, from whence doe come forth a tuft of many small flowers together, made or consisting of foure leaues a peece, of a bright red or carnation colour, and very sweete withall, which turne into small round whitish berries, wherein is contained small round seede, couered with a grayish coate or skinne: the roote is long and yellowish, spreading diuers wayes vnder the ground, and abideth many yeares shooting forth new branches.

Plare also.

It hath beene obserued in some of these plants, to bring forth white flowers, not differing in any thing else.

The Place.

The first sorts growe plentifully in many places of Germany. The second in the mountaines by Sauoye. The third in Prouence and Spaine. The last in diuers parts of Germany, Bohemia, and Austria, and about Franckford.

The Time.

The two first sorts are most vsually in flower about Christmas, or in Ianuary, if the weather be not violent, and sometimes not vntill February. The second flowreth not vntill Aprill. The third in May. The berries of them ripen some in Iune and Iuly; some in August and September, as their flowering is earlier or later. The last flowreth as well in the Spring as in Autumne, so apt and plentifull it is in bearing, and the seede at both times doth ripen soone after.

The Names.

The first is called of some *Chamalea*, with this addition *Germanica*, that it may differ from the third, which is the true *Chamalea* of Dioscorides, as all the best Authors doe agree, and is also called *Piper montanum* of the Italians. It is generally called *Mexereon*, and is indeede the true *Mexereon* of the Arabians, and so vsed in our Apothecaries shops, wheresoeuer the Arabians *Mexereon* is appointed, although the Arabians are so intricate and vncertaine in the descriptions of their plants, confounding *Chamalea* and *Thymalea* together. Matthioli maketh it to be *Daphnoides* of Dioscorides, but in my opinion he is therein mistaken: for all our best moderne Writers doe account our *Laureola*, which hath blacke berries, to bee the true *Daphnoides*; the error of his Countrey might peraduenture drawe him thereunto; but if hee had better considered the text of Dioscorides, that giueth black berries to *Daphnoides*, and red to *Chamedaphne*, he would not so haue writtē; and truly, I should thinke (as Lobel doth) with better reason, that this *Chamalea* were Dioscorides *Chamedaphne*, then hee to say it were *Daphnoides*; for the description of *Chamedaphne*, may in all parts be very fitly applyed to this *Chamalea*; and euen these words, *Semen annexum folijs*, wherein may be the greatest doubt in the description, may not vnsensibly be construed, that as is seene in the plant, the berries growe at the foote of the leaues, about the branches: the faculties indeede that Dioscorides giueth to *Chamedaphne*, are (if any repugnancie be) the greatest let or hinderance, that this *Chamalea* should not be it: but I leaue the discussing of these and others of the like nature, to our learned Physitians, for I deale not so much with vertues as with descriptions. The second is called of Lobel *Chamalea Alpina incana*, of Clusius *Chamalea secunda*, and faith hee had it out of Italy. Wee may call it in English, Mountaine Spurge Oliue, as it is in the description, or Mountaine Laurell, which you will. The last hath the name of *Cnicum*, first giuen it by Matthioli, which since is continued by all others. Bauhinus (as I said) referreth it to the Mountaine Campions, but Clusius

1. *Chamaelea Germanica* seu *Méxédon*. Mexican or Dwarf Bay. 2. *Chamaelea Alpina*. Mountain Spurge Olive. 3. *Cneorum Mattheoli*. Small Rock Rose. 4. *Laurus Tinus* sine *fluctis*. The wild Bay tree. 5. *Oleander* sine *Laurus Kisten*. The Rock Bay tree. 6. *Laurecerasus*. The Bay Cherry tree.

(as I doe) to the kindes of *Chamaela* or *Thymalea*. For want of an English name I haue (as you see, and that is according to the name the Germane women, as Clusius saith, doe call it) entituled it the Small Rocke Rose; which may abide vntill a fitter may be conferred vpon it.

The Vertues.

All these plants except the last, as well leaues as berries, are violent purgers, and therefore great caution is to bee had in the vse of them. The last hath not bene applyed for any disease that I know.

CHAP. CIII.

Laurus. The Bay Tree.

MY meaning is not to make any description of our ordinary Bayes in this place (for as all may very well know, they may be for an Orchard or Courtyard, and not for this Garden) but of two or three other kindes, whose beautifull aspect haue caused them to be worthy of a place therein: the one is called *Laurus Tinus*, The wilde Baye: the other *Laurus Rosea* or *Oleander*, The Rose Bay: and a third is *Laurocerasus*, The Cherry Bay; which may haue not onely some respect for his long bush of sweet smelling flowers, but especially for the comely stateliness of his gallant euer fresh Greene leaues; and the rather, because with vs in most places, it doth but *frutescere*, vse to bee Shrub high, not *arborescere*, Tree high, which is the more fit for this Garden.

1. *Laurus Tinus* sine *filuestris*. The wilde Bay tree.

This wilde Baye groweth seldome to bee a tree of any height, but abideth for the most part low, shooting forth diuers slender branches, whereon at euery ioynt stand two leaues, long, smooth, and of a darke Greene colour, somewhat like vnto the leaues of the Female Cornell tree, or between that and Baye leaues: at the toppes of the branches stand many small white sweete smelling flowers, thrusting together, as it were in an vmbell or tuft, consisting of fise leaues a peece, the edges whereof haue a shew of a wash purple, or light bluish in them, which for the most part fall away without bearing any perfect ripe fruit in our Countrey: Yet sometimes it hath small black berries, as if they were good, but are not. In his naturall place it beareth small, round, hard and pointed berries, of a shining blacke colour, for such haue come often to my hands (yet Clusius writeth they are blew); but I could neuer see any spring that I put into the ground. This that I here describe, seemeth to me to be neither of both those that Clusius saw growing in Spain and Potugall, but that other, that (as he saith) sprang in the low Countreyes of Italian seede.

2. *Laurus Rosea* sine *Oleander*. The Rose Bay.

Of the Rose Bay there are two sorts, one bearing crimson coloured flowers, which is more frequent, and the other white, which is more rare. They are so like in all other things, that they neede but one description for both. The stemme or trunke is many times with vs as bigge at the bottome as a good mans thumb, but growing vp smaller, it diuideth it selfe into branches, three for the most part comming from one ioynt or place, and those branches againe doe likewise diuide themselves into three other, and so by degrees from three to three, as long as it groweth: the lowest of these are bare of leaues, hauing shed or lost them by the cold of winters, keeping onely leaues on the vppermost branches, which are long, and somewhat narrow, like in forme vnto Peach leaues, but thicker, harder, and of a darke Greene colour on the vpperside, and yellowish

yellowish Greene vnderneath: at the tops of the young branches come forth the flowers, which in the one sort before they are open, are of an excellent bright crimson colour, and being blowen, consist of foure long and narrow leaues, round pointed, somewhat twining themselves, of a paler red colour, almost tending to bluish, and in the other are white, the Greene leaues also being of a little fresher colour: after the flowers are past, in the hot countries, but neuer in ours, there come vp long bending or crooked flat pods, whose outward shell is hard, almost woody, and of a browne colour, wherein is contained small flat brownish seede, wrapped in a great deale of a brownish yellow doune, as fine almost as silke, somewhat like vnto the huskes of *Asclepias*, or *Periploca*, but larger, flatter and harder; as my selfe can testifie, who had some of the pods of this Rose bay, brought mee out of Spaine, by Master Doctor Iohn More, the seedes whereof I sowed, and had diuers plants that I raised vp vnto a reasonable height, but they require, as well old as young, to bee defended from the colde of our winters.

3. *Lavrocerasus*. The Bay Cherry.

This beautifull Bay in his naturall place of growing, groweth to bee a tree of a reasonable bignesse and height, and oftentimes with vs also if it bee pruned from the lower branches; but more vsually in these colder Countries, it groweth as a shrub or hedge bush, shooting forth many branches, whereof the greater and lower are couered with a darke grayish Greene barke, but the young ones are very Greene, whereon are set many goodly, faire, large, thicke and long leaues, a little dented about the edges, of a more excellent fresh shining Greene colour, and farre larger then any Bay leafe, and compared by many to the leaues of the *Pomeritron* tree (which because wee haue none in our Countrey, cannot be so well known) both for colour and largenesse, which yeeld a most gracefull aspect: it beareth long stalkes of whitish flowers, at the ioyns of the leaues both along the branches and towards the ends of them also, like vnto the Birds Cherry or *Padus Theophrasti*, which the French men call *Putier* & *Cerifier blanc*, but larger and greater, consisting of five leaues with many threds in the middle: after which cometh the fruite or berries, as large or great as Flanders Cherries, many growing together one by another on a long stalke, as the flowers did, which are very blacke and shining on the outside, with a little point at the end, and reasonable sweete in taste, wherein is contained a hard round stone, very like vnto a Cherry stone, as I haue obserued as well by those I receiued out of Italie, as by them I had of Master James Cole a Merchant of London lately deceased, which grew at his house in Highgate, where there is a faire tree which hee defended from the bitterness of the weather in winter by casting a blanket ouer the toppe thereof euery yeare, thereby the better to preferue it.

The Place.

The first is not certainly knowne from whence it came, and is communicated by the suckers it yeeldeth. The second groweth in Spaine, Italie, Greece, and many other places: that with white flowers is recorded by Belonius, to grow in Candy. The last, as Matthiolus, and after him Clusius report, came first from Constantinople: I had a plant hereof by the friendly gift of Master James Cole, the Merchant before remembred, a great lover of all rarities, who had it growing with him at his countrey house in Highgate aforesaid, where it hath flowered diuers times, and borne ripe fruit also.

The Time.

The first flowereth many times in the end of the yeare before Christmas, and often also in Ianuary, but the most kindly time is in March and Aprill, when the flowers are sweetest. The second flowereth not vntill Iuly. The last in May, and the fruit is ripe in August and September.

The Names.

The first is called *Laurus filuestris*, and *Laurus Tinus* : in English Wilde Bay, or Sweete flowring Bay. The second is called *Laurus Rosea*, *Oleander*, *Nerium*, and *Rhododendros* : in English The Rose Bay, and Oleander. The last was sent by the name of *Trebezon Curmasi*, that is to say, *Dactylus Trapezuntina*, but not hauing any affinitie with any kinde of Bay. Bellonius as I thinke first named it *Laurocerasus*, and *Cerasus Trapezuntina*. Dalechampius thinketh it to bee *Lotus Aphricana*, but Clusius refuteth it. Those stones or kernels that were sent me out of Italie, came by the name of *Laurus Regia*, The Kings Bay. Wee may most properly call it according to the Latine name in the title, The Cherry bay, or Bay Cherry, because his leaues are like vnto Bay-leaues, and both flowers and fruit like vnto the Birdes Cherry or Cluster Cherry, for the manner of the growing ; and therfore I might more fitly I confesse haue placed it in my Orchard among the sorts of Cherries : but the beautifullnesse of the plant caused mee rather to insert it here.

The Vertues.

The wilde Bay hath no propertie allotted vnto it in Physicke, but that it is not to be endured, the berries being chewed declare it to be so violent hot and choking. The Rose Bay is said by Dioscorides, to be death to all foure footed beasts, but contrariwise to man it is a remedie against the poison of Serpents, but especially if Rue bee added vnto it. The Cherry Bay is not knowne with vs to what physicke vse it may be applied.

CHAP. CIIII.

Cerasus flore multiplici. The Rose or double blossomed Cherry.
Malus flore multiplici. The double blossomed Apple tree. And
Malus Persica flore multiplici. The double blossomed Peach tree.

THe beautifull shew of these three sorts of flowers, hath made me to insert them into this garden, in that for their worthinesse I am vnwilling to bee without them, although the rest of their kindes I haue transferred into the Orchard, where among other fruit trees, they shall be remembered : for all these here set downe, seldome or neuer beare any fruite, and therefore more fit for a Garden of flowers, then an Orchard of fruite.

Cerasus flore pleno vel multiplici.

The Rose Cherry, or double blossomed Cherry.

The double blossomed Cherry tree is of two sorts for the flower, but not differing in any other part, from the ordinary English or Flanders Cherry tree, growing in the very like manner : the difference consisteth in this, that the one of these two sorts hath white flowers lesse double, that is, of two rowes or more of leaues, and the other more double, or with more rowes of leaues, and besides I haue obserued in this greater double blossomed Cherry, that some yeares most of the flowers haue had another smaller and double flower, rising vp out of the middle of the other, like as is to bee seene in the double English Crow-foote, and double redde *Ranunculus* or Crowfoote, before described : this I say doth not happen euery yeare, but sometimes. Sometimes also these trees will giue a few berries, here and there scattered, and that with lesse double flowers more often, which are like vnto our English Cherries both for taste and bignesse. These be very fit to be set by Arbours.

Malus

1. *Cerasus flore pleno*. The double blossomed Cherry tree. 2. *Malus flore multiplici*. The double blossomed Apple tree. 3. *Malus Persica flore pleno*. The double blossomed Peach tree. 4. *Perilymenum perfoliatum*. Double Honeysuckle. 5. *Perilymenum rectum*. Upright Honeysuckle.

Malus flore multiplici. The double blossomd Apple tree.

This double blossomd Apple tree is altogether like vnto our ordinary Pippin tree in body, branch and leafe, the only difference is in the flower, which is altogether whitish, sauing that the inner leaues towards the middle are more reddish, but as double and thicke as our double Damaske Roses, which fall away without bearing fruit.

Malus Persica flore multiplici. The double blossomd Peach tree.

This Peach tree for the manner of growing, is so like vnto an ordinary Peach tree, that vntill you see it in blossome you can perceiue no difference: the flower is of the same colour with the blossomes of the Peach, but consisting of three or foure, or more rowes of leaues, which fall often away likewise without bearing any fruite; but after it hath abiden some yeares in a place doth forme into fruite, especially being planted against a wall.

The Place.

Both the Cherry trees are frequent in many places of England, nourfed for their pleasant flowers. The Apple is as yet a stranger. And the Peach hath not been seen or knowne, long before the writing hereof.

The Time.

They all flower in April & May, which are the times of their other kinds.

The Names.

Their names are also sufficiently expressed to know them by.

The Vertues.

Cherries, Peaches and Apples, are recorded in our Orchard, and there you shall finde the properties of their fruit: for in that these beare none or very few, their blossomes are of most vse to grace and decke the persons of those that will weare or beare them.

CHAP. CV.

Periclymenum. Honyfuckles.

THe Honifuckle that groweth wilde in euery hedge, although it be very sweete, yet doe I not bring into my garden, but let it rest in his owne place, to serue their senses that trauell by it, or haue no garden. I haue three other that furnish my Garden, one that is called double, whose branches spreade far, and being very fit for an arbour will soone couer it: the other two stand vpright, and spreade not any way far, yet their flowers declaring them to be Honifuckles, but of lesse delight, I comfort them with the other.

Periclymenum persiliatum siue Italicum. The double Honifuckle.

The truncke or body of the double Honifuckle, is oftentimes of the bignesse of a good staffe, running out into many long spreading branches, couered with a whitish barke, which had neede of some thing to sustaine them, or else they will fall down to the ground (and therefore it is vsually planted at an arbour, that it may run thercon,

or

or against a house wall, and fastened thereto in diuers places with nailes, from whence spring forth at seuerall distances, and at the ioynts, two leaues, being like in forme vnto the wilde Honisuckles, and round pointed for the most part; these branches diuiding themselues diuers wayes, haue at the toppes of them many flowers, set at certaine distances one aboue another, with two greene leaues at euery place, where the flowers doe stand, ioyned so close at the bottome, and so round and hollow in the middle, that it seemeth like a hollow cuppe or lawcer of flowers: the flowers stand round about the middle of these cuppes or lawcers, being long, hollow, and of a whitish yellow colour, with open mouthes dalt out with a light shew of purple, and some threds within them, very sweet in smell, like both in forme and colour vnto the common Honisuckles, but that these cuppes with the flowers in them are two or three standing one aboue another (which make a far better shew then the common, which come forth all at the heade of the branches, without any greene leaues or cuppes vnder them) and therefore these were called double Honisuckles.

Periclymenum rectum fructu rubro. Red Honisuckles.

This vpright Woodbinde hath a straight woody stemme, diuided into seuerall branches, about three or foure foote high, couered with a very thinne whitish barke, whereon stand two leaues together at the ioynts, being lesser then the former, smooth and plaine, and a little pointed: the flowers come forth vpon slender long footstalks at the ioynts where the leaues stand, alwayes two set together, and neuer more, but seldome one alone, which are much smaller then the former, but of the same fashion, with a little button at the foote of the flower; the buds of the flowers before they are open are very reddish, but being open are not so red, but tending to a kinde of yellowish bluish colour: after which come in their places two small red berries, the one withered for the most part, or at least smaller then the other, but (as Clusius saith) in their naturall places they are both full and of one bignesse.

Periclymenum rectum fructu ceruleo. Blew berried Honisuckles.

This other vpright Woodbinde groweth vp as high as the former, or rather somewhat higher, couered with a blackish rugged barke, chapping in diuers places, the younger branches whereof are somewhat reddish, and couered with an hoary downe: the leaues stand two together at the ioynts, somewhat larger then the former, and more whitish vnderneath: the flowers are likewise two standing together, at the end of a slender footstalk, of a pale yellowish colour when they are blowne, but more reddish in the bud: the berries stand two together as the former, of a darke blewish colour when they are fully ripe, and full of a red liquour or iuice, of a pleasant taste, which doth not only dye the hands of them that gather them, but serueth for a dying colour to the inhabitants where they grow plentifully, wherein are contained many flat seede: The roote is woody as the former is.

The Place.

The first groweth in Italie, Spaine, and Prouence of France, but not in the colder countreyes, vnlesse it be there planted, as is most frequent in our country. The others grow in Austria, and Stiria, as Clusius saith, and are entertained into their gardens onely that are curious.

The Time.

The first bloweth vsually in Aprill, the rest in May.

The Names.

The first is called *Periclymenum*, *Caprifolium persoliatum*, and *Italicum*, as a difference from the common kinde: In English Double Woodbinde,

or double Honifuckles. The others, as they are rare, and little knowne, so are their names also: yet according to their Latine, I haue giuen them English names.

The Vertues.

The double Honifuckle is as effectuell in all things, as the single wilde kinde, and besides, is an especiall good wound herbe for the head or other parts. I haue not knowne the vpright kindes vsed in Physicke.

CHAP. CVI.

Iasminum sine Gelsaminum. Iasmine or Gelsmine.

WE haue but one sort of true Iasmine ordinarily in our Gardens throughout the whole Land; but there is another greater sort, which is farre more tender, brought out of Spaine, and will hardly endure any long time with vs, vnlesse it be very carefully preferred. Wee haue a third kinde called a yellow Iasmine, but differeth much from their tribe in many notable points: but because the flowers haue some likenesse with the flowers of the true Iasmine, it hath been vsually called a Iasmine; and therefore I am content for this Garden to conioyne them in one Chapter.

Iasminum album. The white Iasmine.

The white Iasmine hath many twiggy flexible Greene branches, comming forth of the sundry bigger boughes or stems, that rise from the roote, which are couered with a grayish darke coloured barke, hauing a white pith within it like the Elder, but not so much: the winged leaues stand alwaies two together at the ioynts, being made of manie small and pointed leaues, set on each side of a middle ribbe, six most vsually on both sides, with one at the end, which is larger, more pointed then any of the rest, and of a darke Greene colour: at the toppes of the young branches stand diuers flowers together, as it were in an ymbell or rust, each whereof standeth on a long Greene stalke, comming out of a small huske, being small, long, and hollow belowe, opening into five white small, pointed leaues, of a very strong sweete smell, which fall away without bearing any fruit at all, that euer I could learne in our Country; but in the hot Countries where it is naturall, it is said to beare flat fruit, like Lupines: the rootes spread farre and deepe, and are long and hard to growe, vntill they haue taken strong hold in the ground.

Iasminum Catalanicum. The Spanish Iasmine.

This Catalonia Iasmine groweth lower then the former, neuer rising halfe so high, and hath slender long Greene branches, rising from the toppes of the wooddy stemme, with such like leaues set on them as the former, but somewhat shorter and larger: the flowers also are like vnto the former, and stand in the same manner at the end of the branches, but are much larger, being of a bluish colour before they are blowne, and white with bluish edges when they are open, exceeding sweete of smell, more strong then the former.

Iasminum luteum, sine Trifolium fruticosum, alijs Polemonium.

The yellow Iasmine.

This that is called the yellow Iasmine, hath many long slender twiggy branches rising from the roote, Greene at the first, and couered with a darke grayish barke afterwards, whereon are set at certaine distances, three small darke Greene leaues together, the end leafe being alwaies the biggest: at the ioynts where the leaues come forth, stand

stand long stalkes, bearing long hollow flowers, ending in five, and some in six leaues, very like vnto the flowers of the first Iasmine, but yellow, whereupon it is vsually called the Yellow Iasmine: after the flowers are past, there come in their places round blacke shining berries, of the bignesse of a great Pease, or bigger, full of a purplish iuyce, which will dye ones fingers that bruise them but a little: the roote is tough, and white, creeping farre about vnder the ground, shooting forth plentifully, whereby it greatly encreaseth.

The Place.

The first is verily thought to haue been first brought to Spaine out of Syria, or thereabouts, and from Spaine to vs, and is to be seene very often, and in many of our Country Gardens. The second hath his breeding in Spaine also, but whether it be his originall place we know not, and is scarce yet made well acquainted with our English ayre. The third groweth plentifully about Mompelier, and will well abide in our London Gardens, and any where else.

The Time.

The first flowreth not vntill the end of Iuly. The second somewhat earlier. The third in Iuly also.

The Names.

The first is generally called *Iasminum album*, and *Gelsminum album*: In English, The white Iasmine. The second hath his name in his title, as much as may be said of it. The third hath been taken of some to be a *Cyrtus*, others iudge it to be *Polemonium*, but the truest name is *Trifolium fruticans*, although many call it *Iasminum luteum*: In English most vsually, The yellow Iasmine, for the reasons aforesaid; or else after the Latine name, Shrubbie Trefoile, or Make-bate.

The Vertues.

The white Iasmines haue beene in all times accepted into outward medicines, cyther for the pleasure of the sweete sent, or profit of the warming properties. And is in these dayes onely vsed as an ornament in Gardens, or for sent of the flowers in the house, &c. The yellow Iasmine, although some haue adiudged it to be the *Polemonium* of Dioscorides, yet it is not vsed to those purposes by any that I know.

CHAP. CVII.

Syringa. The Pipe tree.

Vnder the name of *Syringa*, is contained two speciall kinds of Shrubs or Trees, differing one from another; namely, the *Lilac* of Matthiolus, which is called *Syringa carulea*, and is of two or three sorts: And the *Syringa alba*, which also is of two sorts, as shall bee declared.

1. *Lilac* sive *Syringa carulea*. The blew Pipe tree.

The blew Pipetree riseth sometimes to be a great tree, as high and bigge in the bodie as a reasonable Apple tree (as I haue in some places seene and obserued) but most vsually groweth lower, with many twigs or branches rising from the roote, hauing as much pith in the middle of them as the Elder hath, couered with a grayish greene barke,

harke, but darker in the elder branches, with ioynts set at a good distance one from another, and two leaues at euery ioynt, which are large, broad, and pointed at the ends, many of them turning or folding both the sides inward, and standing on long foote stalkes: at the toppes of the branches come forth many flowers, growing spike-fashion, that is, a long branch of flowers vpon a stalke, each of these flowers are small, long, and hollow belowe, ending aboue in a pale blewish flower, consisting of foure small leaues, of a pretty small sent: after the flowers are past, there come sometimes (but it is not often in our Country, vnlesse the tree haue stood long, and is grown great, the suckers being continually taken away, that it may growe the better) long and flat cods, consisting as it were of two sides, a thin skinne being in the midst, wherein are contained two long flattish red seede: the rootes are strong, and growe deepe in the ground.

2. *Syringa flore lacteo sine argenteo.*

The siluer coloured Pipe tree.

This Pipe tree differeth not from the former blew Pipe tree, either in stemme or branches, either in leaues or flowers, or manner of growing, but onely in the colour of the flower, which in this is of a milke, or siluer colour, which is a kinde of white, wherein there is a thinn wash, or light shew of blew shed therein, comming somewhat neare vnto an ash-colour.

3. *Lilac lacimatis folijs.* The blew Pipe tree with cut leaues.

This Pipe tree should not differ from the first in any other thing then in the leaues, which are said to be cut in on the edges into seuerall parts, as the relation is giuen *à viris fide dignis*: for as yet I neuer saw any such, but I here am bold to set it downe, to induce and prouoke some louer of plants to obtaine it for his pleasure, and others also.

4. *Syringa flore albo simplici.* The single white Pipe tree.

The single white Pipe tree or bush, neuer commeth to that height of the former, but abideth alwaies like a hedge tree or bush, full of shootes or suckers from the roote, much more then the former: the young shootes hereof are reddish on the outside, and afterward reddish at the ioynts, and grayish all the rest ouer: the young as well as the old branches, haue some pith in the middle of them, like as the Elder hath: the leaues stand two at a ioynt, somewhat like the former, but more rugged or crumpled, as also a little pointed, and dented about the edges: the flowers growe at the toppes of the branches, diuers standing together, consisting of foure white leaues, like vnto small Muske Roses, and of the same creame colour, as I may call it, with many small yellowish threads in the middle, and are of a strong, full, or heady sent, not pleasing to a great many, by reason of the strange quicknesse of the sent: the fruit followeth, being flat at the head, with many leafe shels or scales compassing it, wherein is enclosed small long seede: the rootes runne not deepe, but spread vnder the ground, with many fibres annexed vnto them.

5. *Syringa Arabica flore albo duplici.*

The double white Pipe tree.

This Pipe tree hath diuers long and slender branches, whereon growe large leaues, somewhat like vnto the leaues of the former single white kinde, but not so rough or hard, and not at all dented about the edges, two alwaies standing one against another at euery ioynt of the stalke, but set or disposed on contrary sides, and not all vpon one side; at the ends whereof come forth diuers flowers, euery one standing on his owne foote stalke, the hose or huske being long and hollow, like vnto the white Iasmine, and the flowers therein consisting of a double rowe of white and round pointed leaues, five or six in a rowe, with some yellowesse in the middle, which is hollow, of a very strong and heady, sweet sent, and abiding a long time flowering, especially in the hotter Countries, but is very tender, and not able to abide any the least cold weather with vs.

for

1 *Jasminum album vulgare*. The ordinary white Jasmine. 2 *Jasminum Americanum* sive *Carolinense Americanum*. The Jasmine or Bindweed of America. 3 *Jasminum flavum vulgare*. The yellow Jasmine. 4 *Lonicera fr. Syringa carolin.* The blue Viper tree. 5 *Syringa alba vulgare*. The single white Syringa or Spice tree. 6 *Syringa flava alba dupli.* The double white Syringa. 7 *Sambucus racem.* The Elder or Gekler Role.

for the cold windes will (as I vnderstand) greatly molest it : and therefore must as charily be kept as Orenge trees with vs, if wee will haue it to abide.

The Place.

The first groweth in Arabia (as Matthiolus thinketh, that had it from Constantinople.) We haue it plentifully in our Gardens. The second and third are strangers with vs as yet. The fourth is as frequent as the first, or rather more, but his originall is not knowne. The last hath his originall from Arabia, as his name importeth.

The Time.

The first, second, and third flower in Aprill, the other two not vntill May.

The Names.

The first is called of Matthiolus *Lilac*, and by that name is most vsually called in all parts. It is also called *Syringa carulea*, because it commeth nearest vnto those woods, which for their pithy substance, were made hollow into pipes. It is called of all in English, The blew Pipe tree. It seemeth likely, that Petrus Bellonius in his third Booke and fiftieth Chapter of his obseruations (making mention of a shrubbe that the Turkes haue, with Iuie leaues alwaies greene, bearing blew or violet coloured flowers on a long stalke, of the bignesse and fashion of a Foxe taile, and thereupon called in their language a Foxe taile) doth vnderstand this plant here expressed. The certainty whereof might easily be knowne, if any of our Merchants there residing, would but call for such a shrubbe, by the name of a Foxe taile in the Turkish tongue, and take care to send a young roote, in a small tubbe or basket with earth by Sea, vnto vs here at London, which would be performed with a very little paines and cost. The second and third, as kindes thereof, haue their names in their titles. The fourth is called by Clusius and others, *Frutex Coronarius*; some doe call it *Lilac flore albo*, but that name is not proper, in that it doth confound both kindes together. Lobel calleth it *Syringa Italica*. It is now generally called of all *Syringa alba*, that is in English, The white Pipe tree. Some would haue it to bee *Ostrya* of Theophrastus, but Clusius hath sufficiently cleared that doubt. Of others *Ligustrum Orientale*, which it cannot be neither; for the *Cyprus* of Plinie is Dioscorides his *Ligustrum*, which may be called *Orientale*, in that it is most proper to the Easterne Countries, and is very sweete, whose seede is like vnto Coriander seede. The last is called by diuers *Syringa Arabica flore albo duplici*, as most fitly agreeing thereunto. Of Basilius Besslerus that set forth the great booke of the Bishop of Eystot in Germany his Garden, *Syringa Italica flore albo pleno*, because, as it is likely, hee had it from Italy. It is very likely, that Prosper Alpinus in his booke of Egyptian plants, doth meane this plant, which hee there calleth *Sambach*, *sive lasminum Arabicum*. Matthæus Caccini of Florence in his letter to Clusius entitleth it *Syringa Arabica*, *sive lasminum Arabicum*, *sive lasminum ex Gine*, whereby hee declareth that it may not vnfitly be referred to either of them both. We may call it in English as it is in the title, The double white Pipe tree.

The Vertues.

We haue no vse of these in Physicke that I know, although Prosper Alpinus saith, the double white Pipe tree is much vsed in Egypt, to help women in their trauailes of childbirth.

CHAP. CVIII.

Sambucus Rosea. The Elder or Gelder Rose.

Although there be diuers kindes of Elders, yet there is but one kinde of Elder Rose, whereof I meane to intreate in this Chapter, being of neare affinity in some things vnto the former Pipe trees, and which for the beauty of it deserueth to be remembred among the delights of a Garden.

Sambucus Rosea. The Gelder Rose.

The Gelder Rose (as it is called) groweth to a reasonable height, standing like a tree, with a trunk as bigge as any mans arme, couered with a darke grayish barke, somewhat rugged and very knotty: the younger branches are smooth and white, with a pithy substance in the middle, as the Elders haue, to shew that it is a kind thereof, whereon are set broad leaues, diuided into three parts or diuisions, somewhat like vnto a Vine leafe, but smaller, and more rugged or crumpled, iagged or cut also about the edges: at the toppes of euery one of the young branches, most vsually commeth forth a great tuft, or ball as it were, of many white flowers, set so close together, that there can be no distinction of any seuerall flower scene, nor doth it seeme like the double flower of any other plant, that hath many rowes of leaues set together, but is a cluster of white leaued flowers set together vpon the stalke that vpholdeth them, of a small sent, which fall away without bearing any fruit in our Country, that euer I could obserue or learne: The roote spreadeth neither farre nor deepe, but shooreth many small rootes and fibres, whereby it is fastened in the ground, and draweth nourishment to it, and sometimes yeeldeth suckers from it.

The Place.

It should seeme, that the naturall place of this Elder is wet and moist grounds, because it is so like vnto the Marsh Elder, which is the single kind hercof. It is onely nourished vp in Gardens in all our Country.

The Time.

It flowreth in May, much about the time of the double Peony flower, both which being set together, make a pleasant variety, to decke vp the windowes of a house.

The Names.

It is generally called *Sambucus Rosea*: In English, The Elder Rose, and more commonly after the Dutch name, the Gelder Rose. Dalechamplus seemeth to make it *Thraupalus* of Theophrastus, or rather the single Marsh Elder, for I thinke this double kinde was not knowne in Theophrastus his time.

The Vertues.

It is not applyed to any Physicall vse that I know.

Mm 3

CHAP

CHAP. CIX.

Rosa. The Rose tree or bush.

THe great varietie of Roses is much to be admired, being more then is to be seen in any other shrubby plant that I know, both for colour, forme and smell. I haue to furnish this garden thirty sorts at the least, every one notably differing from the other, and all fit to be here entertained: for there are some other, that being wilde and of no beautie or smell, we forbear, and leaue to their wilde habitations. To distinguish them by their colours, as white, red, incarnate, and yellow, were a way that many might take, but I hold it not so conuenient for diuers respects: for so I should confound those of diuers sorts one among another, and I should not keepe that methode which to me seemeth most conuenient, which is, to place and ranke every kinde, whether single or double, one next vnto the other, that so you may the better vnderstand their varieties and differences: I will therefore beginne with the most ancient, and knowne Roses to our Countrey, whether naturall or no I know not, but assumed by our precedent Kings of all others, to bee cognisances of their dignitie, the white Rose and the red, whom shall follow the damaske, of the finest sent, and most vse of all the other sorts, and the rest in their order.

1. *Rosa Anglica alba.* The English white Rose.

The white Rose is of two kinds, the one more thicke and double then the other: The one riseth vp in some shadowie places, vnto eight or ten foote high, with a stocke of a great bignesse for a Rose. The other growing seldome higher then a Damaske Rose. Some doe iudge both these to be but one kinde, the diuersitie happening by the ayre, or ground, or both. Both these Roses haue somewhat smaller and whiter greene leaues then in many other Roses, five most vsually set on a stalke, and more white vnderneath, as also a whiter greene barke, armed with sharpe thornes or prickles, whereby they are soone known from other Roses, although the one not so easily from the other: the flowers in the one are whitish, with an eye or shew of a blush, especially towards the ground or bottome of the flower, very thicke double, and close set together, and for the most part not opening it selfe so largely and fully as eyther the Red or Damaske Rose. The other more white, lesse thicke and double, and opening it selfe more, and some so little double as but of two or three rowes, that they might be held to be single, yet all of little or no smell at all. To describe you all the seuerall parts of the Rose, as the bud, the beards, the threds &c. were needlesse, they are so conuersant in euery ones hand, that I shall not neede but to touch the most speciall parts of the varieties of them, and leaue a more exact relation of all things incident vnto them, vnto a generall worke.

2. *Rosa Incarnata.* The Carnation Rose.

The Carnation Rose is in most things like vnto the lesser white rose, both for the growing of the stocke, and bignesse of the flower; but that it is more spreade abroad when it is blown then the white is, and is of a pale blush colour all the flower thoroughout, of as small a sent as the white one is almost.

*Rosa Belgica
Sue Vitrea.*

This kinde of Rose is not very great, but very thicke and double, and is very variable in the flowers, in that they will be so different one from another: some being paler then others, and some as it were blasted, which commeth not casually, but naturally to this rose: but the best flowers (whereof there will bee still some) will be of a bright pale murrey colour, neere vnto the Veluet rose, but nothing so darke a colour.

3. *Rosa Anglica rubra.* The English red Rose.

The red Rose (which I call English, not only for the reason before expressed, but because

cause (as I take it) this Rose is more frequent and vsed in England, then in other places) neuer groweth so high as the damaske Rose bush, but most vsually abideth low, and shooteth forth many branches from the roote (and is but seldome suffered to grow vp as the damaske Rose into standards) with a greene barke, thinner set with prickles, and larger and greener leaues on the vpper side then in the white, yet with an eye of white vpon them, fine likewise most vsually set vpon a stalke, and grayish or whitish vnderneath. The Roses or Flowers doe very much vary, according to their site and abiding; for some are of an orient, red or deepe crimson colour, and very double (although neuer so double as the white) which when it is full blowne hath the largest leaues of any other Rose, some of them againe are paler, tending somewhat to a damaske; and some are of so pale a red, as that it is rather of the colour of the canker Rose, yet all for the most part with larger leaues then the damaske, and with many more yellow threds in the middle: the sent hereof is much better then in the white, but not comparable to the excellencie of the damaske Rose, yet this Rose being well dryed and well kept, will hold both colour and sent longer then the damaske, bee it neuer so well kept.

4. *Rosa Damascena*. The Damaske Rose.

The Damaske Rose bush is more vsually nourished vp to a competent height to stand alone, (which we call Standards) then any other Rose: the barke both of the stocke and branches, is not fully so greene as the red or white Rose: the leaues are greene with an eye of white vpon them, so like vnto the red Rose, that there is no great difference betweene them, but that the leaues of the red Rose seeme to bee of a darker greene. The flowers are of a fine deepe bluish colour, as all know, with some pale yellow threds in the middle, and are not so thicke and double as the white, nor being blowne, with so large and great leaues as the red, but of the most excellent sweet pleasant sent, far surpassing all other Roses or Flowers, being neyther heady nor too strong, nor stuffing or vnpleasant sweet, as many other flowers.

5. *Rosa Provincialis sine Hollandica Damascena*.

The great double Damaske Prouince or Holland Rose.

This Rose (that some call *Centifolia Batanica incarnata*) hath his barke of a reddish or browne colour, whereby it is soone discerned from other Roses. The leaues are likewise more reddish then in others, and somewhat larger, it vsually groweth very like the Damaske rose, and much to the same height: the flowers or roses are of the same deepe bluish colour that the damaske roses are, or rather somewhat deeper, but much thicker, broader, and more double, or fuller of leaues by three parts almost, the outer leaues turning themselues backe, when the flower hath stood long blowne, the middle part it selfe (which in all other roses almost haue some yellow threds in them to be seene) being folded hard with small leaues, without any yellow almost at all to be seene, the sent whereof commeth neere vnto the damaske rose, but yet is short of it by much, howsoeuer many doe thinke it as good as the damask, and to that end I haue known some Gentlewomen haue caused all their damaske stockes to bee grafted with prouince Roses, hoping to haue as good water, and more store of them then of damask Roses; but in my opinion it is not of halfe so good a sent as the water of damaske Roses: let euery one follow their own fancie.

6. *Rosa Provincialis rubra*. The red Prouince Rose.

As the former was called *incarnata*, so this is called *Batanica centifolia rubra*, the difference being not very great: the stemme or stocke, and the branches also in this, seeming not to be so great but greener, the barke being not so red; the leaues of the same largenesse with the former damaske Prouince. The flowers are not altogether so large, thicke and double, and of a little deeper damaske or bluish colour, turning to a red Rose, but not comming neere the full colour of the best red Rose, of a sent not so sweete as the damaske Prouince, but comming somewhat neere the sent of the ordinary

dinary red rose, yet exceeding it. This rose is not so pleatfull in bearing as the damaske Prouince.

7. *Rosa Prouincialis alba*. The white Prouince Rose.

It is said of diuers, that there is a white Prouince Rose, whereof I am not *oculus testis*, and therefore I dare not giue it you for a certaintie, and indeed I haue some doubt, that it is the greater and more double white rose, whereof I gaue you the knowledge in the beginning: when I am my selfe better satisfied, I shall bee ready to satisfie others.

8. *Rosa versicolor*. The party coloured Rose, of some Yorke and Lancaster.

This Rose in the forme and order of the growing, is neereft vnto the ordinary damaske rose, both for stemme, branch, leafe and flower: the difference consisting in this, that the flower (being of the same largenesse and doublenesse as the damask rose) hath the one halfe of it, sometimes of a pale whitish colour, and the other halfe, of a paler damaske colour then the ordinary; this happeneth so many times, and sometimes also the flower hath diuers stripes, and markes in it, as one leafe white, or striped with white, and the other halfe bluish, or striped with bluish, sometimes also all striped, or spotted ouer, and other times little or no stripes or markes at all, as nature listeth to play with varieties, in this as in other flowers: yet this I haue obserued, that the longer it abideth blowen open in the sun, the paler and the fewer stripes, markes or spots will be seene in it: the smell whereof is of a weake damaske rose sent.

9. *Rosa Chrystallina*. The Chrystall Rose.

This Rose is very like vnto the last described, both for stocke, branch and leafe: the flower hereof is not much different from it, being no great large or double Rose, but of a meane size, striped and marked with a deeper bluish or red, vpon the pale coloured leafe, that it seemeth in the marking and beauty thereof, to bee of as much delight as the Chrystall Gilloflower: this, euen like the former, soone fadeth and passeth away, not yeelding any great store of flowers any yeare.

10. *Rosa rubra humilis sine pamilio*.

The dwarfe red Rose, or Gilloflower Rose.

This Rose groweth alwayes low and small, otherwise in most respects like vnto the ordinary redde Rose, and with few or no thornes vpon it: the Flowers or Roses are double, thicke, small and close, not so much spread open as the ordinary red, but somewhat like vnto the first double white Rose before expressed, yet in some places I haue seene them more layde open then these, as they grew in my garden, being so euen at the toppes of the leaues, as if they had been clipt off with a paire of sheeres, and are not fully of so red a colour as the red Prouince Rose, and of as small or weak sent as the ordinary red Rose, or not so much.

11. *Rosa Francafurtensis*. The Franckford Rose.

The young shootes of this Rose are couered with a pale purplish barke, set with a number of small prickles like haire, and the elder haue but very few thornes: the flower or rose it selfe hath a very great bud or button vnder it, more then in any other rose, and is thicke and double as a red rose, but so strongly swelling in the bud, that many of them breake before they can be full blowen, and then they are of a pale red rose colour, that is, betweene a red and a damaske, with a very thicke broade and hard vmbone of short yellow threds or thrumes in the middle, the huske of the flower hauing long ends, which are called the beards of the rose, which in all other are jagged in some of them, in this hath no jagge at all: the smell is neereft vnto a red Rose.

1 *Rosa Damascena*. The Damask Rose. 2 *Rosa Provensalis* sine *Hollandica*. The great Provence Rose. 3 *Rosa Frankfurtensis*. The Frankfort Rose. 4 *Rosa rubra humilis*. The dwarfed Rose. 5 *Rosa Hungarica*. The Hungarian Rose. 6 *Rosa lucia multiplex*. The great double yellow Rose.

12. *Rosa Hungarica.* The Hungarian Rose.

The Hungarian Rose hath greene shootes slenderly set with prickes, and seldome groweth higher then ordinarily the red Rose doth; the stemme or stocke being much about that bignesse: the flower or rose is as great, thicke and double, as the ordinary red Rose, and of the same fashion, of a paler red colour, and beeing neerely looked vpon is finely spotted with faint spots, as it were spreade ouer the red; the smell wherof is somewhat better then the smell of the ordinary red Rose of the best kinde.

13. *Rosa Holoserica simplex & multiplex.*

The Veluet Rose single and double.

The old stemme or stock of the veluet Rose is couered with a dark coloured barke, and the young shootes of a sad greene with very few or no thornes at all vpon them: the leaues are of a sadder greene colour then in most sorts of Roses, and very often seuen on a stalke, many of the rest hauing but fiae: the Rose is eyther single or double: the single is a broad spread flower, consisting of fiae or sixe broad leaues with many yellow threds in the middle: the double hath two rowes of leaues, the one large, which are outermost, the other smaller within, of a very deepe red crimson colour like vnto crimson veluet, with many yellow threds also in the middle; and yet for all the double rowe of leaues, these Roses stand but like single flowers: but there is another double kinde that is more double then this last, consisting oftentimes of sixteene leaues or more in a flower, and most of them of an equall bignesse, of the colour of the first single rose of this kinde, or somewhat fresher; but all of them of a smaller sent then the ordinary red Rose.

14. *Rosa sine spinis simplex & multiplex.*

The Rose without thornes single and double.

The Rose without thornes hath diuers greene smooth shootes, rising from the root, without any pricke or thorne at all vpon them, eyther young or old: the leaues are not fully so large as of the red rose: the flowers or roses are not much bigger then those of the double Cinamon Rose, thicke set together and short, of a pale red Rose colour, with diuers pale coloured veines through euery leafe of the flower, which hath caused some to call it The marbled Rose, and is of a small sent, not fully equall to the red Rose. The single of this kinde differeth not in any other thing from the former, then in the doublenesse or singlenesse of the flowers, which in this are not halfe so double, nor yet fully single, and are of a paler red colour.

*Rosa sine spinis
flore albo.*

I haue heard likewise of a white Rose of this kinde, but I haue seene none such as yet, and therefore I can say no more thereof.

15. *Rosa Cinamomea simplex & multiplex.*

The Cinamon Rose single and double.

The single Cinamon Rose hath his shootes somewhat red, yet not so red as the double kinde, armed with great thornes, like almost vnto the Eglantine bush, thereby showing, as well by the multiplicite of his shootes, as the quicknesse and height of his shooting, his wilde nature: On the stemme and branches stand winged leaues, sometimes seuen or more together, which are small and greene, yet like vnto other Roses. The Roses are single, of fiae leaues a peece, somewhat large, and of a pale red colour, like vnto the double kinde, which is in shootes redder, and in all other things like vnto the single, but bearing small, short, thicke and double Roses, somewhat like vnto the Rose without thornes, but a little lesser, of a paler red colour at the end of the leaues, and somewhat redder and brighter toward the middle of them, with many yellow short thrumes; the small sent of Cinamon that is found in the flowers hath caused it to beare the name.

16. *Rosa*

16. *Rosa lutea simplex*. The single yellow Rose.

This single yellow Rose is planted rather for variety then any other good vse. It often groweth to a good height, his stemme being great and woody, with few or no prickles vpon the old wood, but with a number of small prickles like haire, thicke set, vpon the younger branches, of a darke colour somewhat reddish, the barke of the young shootes being of a sad Greene reddish colour: the leaues of this Rose bush are smaller, rounder pointed, of a paler Greene colour, yet finely snipt about the edges, and more in number, that is, seuen or nine on a stalke or ribbe, then in any other Garden kinde, except the double of the same kinde that followeth next: the flower is a small single Rose, consisting of fve leaues, not so large as the single Spanish Muske Rose, but somewhat bigger then the Eglantine or sweete Briar Rose, of a fine pale yellow colour, without any great sent at all while it is fresh, but a little more, yet small and weake when it is dried.

17. *Rosa lutea multiplex sine flore pleno*.
The double yellow Rose.

The double yellow Rose is of great account, both for the rarity, and doublenesse of the flower, and had it sent to the rest, would of all other be of highest esteeme. The stemme or stocke, the young shoots or branches, the small hairy prickles, and the small winged leaues, are in all parts like vnto the former single kinde; the chiefest difference consisteth in the doublenesse of the flower or Rose, which is so thicke and double, that very often it breaketh out on one side or another, and but a few of them abiding whole and faire in our Countrey, the cause whereof wee doe imagine to bee the much moisture of our Countrey, and the time of flowering being subiect to much raine and showers, many therefore doe either plant it against a wall, or other wayes defend it by couering: againe, it is so plentiful in young shootes or branches, as also in flowers at the toppe of euery branch, which are small and weake for the most part, that they are not able to bring all the flowers to ripenesse; and therefore most of them fall or wither away without comming to perfection (the remedy that many doe vse for this inconuenience last recited is, that they nippe away most of the buds, leauing but some few vpon it, that so the vigour of the plant may be collected into a few flowers, whereby they may the better come to perfection, and yet euen thus it is hardly effected) which are of a yellowish Greene colour in the bud, and before they be blowne open, but then are of a faire yellow colour, very full of leaues, with many short haire, rather then leaues in the middle, and hauing short, round, Greene, smooth buttons, almost flat vnder them: the flower being faire blowne open, doth scarce giue place for largenesse, thicknesse, and doublenesse, vnto the great Prouence or Holland Rose. This Rose bush or plant is very tender, with vs here about London, and will require some more care and keeping then the single of this kinde, which is hardy enough; for I haue lost many my selfe, and I know but a few about this towne that can nourse it vp kindly, to beare or scarce to abide without perishing; but abideth well in euery free aire of all or the most parts of this Kingdome: but (as I heare) not so well in the North,

18. *Rosa Moschata simplex & multiplex*.
The Muske Rose single and double.

The Muske Rose both single and double, rise vp oftentimes to a very great height, that it ouergroweth any arbour in a Garden, or being set by an house side, to bee ten or twelue foote high, or more, but more especially the single kinde, with many green farre spread branches, armed with a few sharpe great thornes, as the wilder sorts of Roses are, whereof these are accounted to be kindes, hauing small darke Greene leaues on them, not much bigger then the leaues of Eglantine: the flowers come forth at the toppes of the branches, many together as it were in an vmbell or tuft, which for the most part doe flower all at a time, or not long one after another, euery one standing on a pretty long stalke, and are of a pale whitish or creame colour, both the single and
the

the double; the single being small flowers, consisting of five leaues, with many yellow threads in the middle: and the double bearing more double flowers, as if they were once or twice more double then the single, with yellow thrummes also in the middle, both of them of a very sweete and pleasing smell, resembling Muske: some there be that haue auouched, that the chiefest sent of these Roses consisteth not in the leaues, but in the threads of the flowers.

19. *Rosa Moschata multiplex altera: alijs Damascena alba, vel verisimilior Cinamomea flore pleno albo.*

The double white Damaske Muske Rose.

This other kinde of Muske Rose (which with some is called the white Damaske Muske, but more truely the double white Cinamon Rose) hath his stemme and branches also shorter then the former, but as Greene: the leaues are somewhat larger, and of a whiter Greene colour; the flowers also are somewhat larger then the former double kinde, but standing in umbels after the same manner, or somewhat thicker, and of the same whitish colour, or a little whiter, and somewhat, although but a little, neare the smell of the other, but nothing so strong. This flowreth at the time of other Roses, or somewhat later, yet much before the former two sorts of Muske Roses, which flower not vntill the end of Summer, and in Autumne; both which things, that is, the time of the flowering, and the sent being both different, shew plainly it cannot be of the tribe of Muske Roses.

20. *Rosa Hispanica Moschata simplex.* The Spanish Muske Rose.

This Spanish Rose riseth to the height of the Eglantine, and sometimes higher, with diuers great Greene branches, the leaues whereof are larger and greener then of the former kindes: the flowers are single Roses, consisting of five whiter leaues then in any of the former Muske Roses, and much larger, hauing sometimes an eye of a blush in the white, of a very sweete smell, comming nearest vnto the last recited Muske Rose, as also for the time of the flowering.

21. *Rosa Pomifera maior.* The great Apple Rose.

The stemme or stocke of this Rose is great, couered with a darke grayish barke, but the younger branches are somewhat reddish, armed here and there with great and sharpe thornes, but nothing so great or plentifull as in the Eglantine, although it be a wilde kinde: the leaues are of a whitish Greene colour, almost like vnto the first white Rose, and five alwaies set together, but seldome seuen: the flowers are small and single, consisting of five leaues, without any sent, or very little, and little bigger then those of the Eglantine bush, and of the very same deepe blush colour, euery one standing vpon a rough or prickly button, bearded in the manner of other Roses, which when the flowers are fallen growe great, somewhat long and round, pearce-fashion, bearing the beards on the tops of them; and being full ripe are very red, keeping the small prickles still on them, wherein are many white, hard, and roundish seedes, very like vnto the seede of the Heppes or Eglantine berries, lying in a soft pulpe, like vnto the Hawthorne berries or Hawes: the whole beauty of this plant consisteth more in the gracefull aspect of the red apples or fruit hanging vpon the bushes, then in the flowers, or any other thing. It seemeth to be the same that Clusius calleth *Rosa Pumila*, but that with me it groweth much higher and greater then he saith his doth.

22. *Rosa siluestris odora sine Eglentaria simplex.*

The single Eglantine or sweete Briar bush.

The sweete Briar or Eglantine Rose is so well knowne, being not onely planted in Gardens, for the sweetenesse of the leaues, but growing wilde in many woods and hedges, that I thinke it lost time to describe it, for that all know it hath exceeding long, Greene shootes, armed with the cruellst sharpe and strong thornes, and thicker set then

1 *Rosa sine spinis* multiplex. The double Rose without thorns. 2 *Rosa chinensis* flore pleno. The double Cinnamon Rose. 3 *Rosa laurifolia* simplex. The single Velvet Rose. 4 *Rosa Hispanica* duplex. The double Velvet Rose. 5 *Rosa Moschata* multiplex. The double Muske Rose. 6 *Rosa Moschata Hispanica* simplex. The single Spanish Muske Rose. 7 *Rosa Pinnifera* major. The great Apple Rose. 8 *Rosa filix* sive *Rosa Eglantina* duplex. The double Eglantine Rose.

then is in any Rose either wilde or tame : the leaues are smaller then in most of those that are nourished vp in Gardens, seuen or nine most vsually set together on a ribbe or stalke, very greene and sweete in smell, aboue the leaues of any other kinde of Rose : the flowers are small single bluish Roses, of little or no sent at all, which turne into reddish berries, stuffed within with a dounie or flocky matter or substance, wherein doth lye white hard seede.

23. *Rosa siluestris odora siue Eglanteria flore duplici.*

The double Eglantine.

The double Eglantine is in all the places that I haue seene it a grafted Rose, (but I doubt not, but that his originall was naturall, and that it may be made naturall againe, as diuers other Roses are.) It groweth and spreadeth very well, and with a great head of branches, whereon stand such like leaues as are in the single kinde, but a little larger, not smelling fully so sweete as it : the flowers are somewhat bigger then the single, but not much, hauing but one other rowe of leaues onely more then the former, which are smaller, and the outer leaues larger, but of the same pale reddish purple colour, and smelleth somewhat better then the single.

24. *Rosa semper virens.* The euer greene Rose bush.

This Rose or bush is very like vnto a wilde single Eglantine bush in many respects, hauing many very long greene branches, but more slender and weake, so that many times they bend downe againe, not able to sustaine themselues without some helpe, and armed with hooked thornes as other Roses be; the winged leaues consist of seuen for the most part, whereof those two that are lowest and opposite, are smallest, the next two bigger then they, the third couple bigger then any of the rest belowe, and the end leafe biggest of all: this proportion generally it holdeth in euery winged leafe through the whole plant, which at the first comming forth are somewhat reddish, with the young branch that shooteth out with them, but being full growne, are of a deepe greene colour, and somewhat shining, dented about the edges, and fall not away from the branches as other Roses doe, but abide thereon for the most part all the Winter: the flowers stand foure or fise together at the tops of the branches, being single Roses, made of fise leaues a peece, of a pure white colour, much larger then the ordinary Muske Rose, and of a fine sent, comming nearest thereunto, with many yellow chiues or threads in the middle.

The Place.

Some of these Roses had their originall, as is thought in England, as the first and second; for these dried red Roses that come ouer to vs from beyond the Seas, are not of the kinde of our red Rose, as may well be perceiued by them that will compare our English dried leaues with those. Some in Germany, Spaine, and Italy. Some againe in Turkie, as the double yellow Rose, which first was procured to be brought into England, by Master Nicholas Lete, a worthy Merchant of London, and a great louer of flowers, from Constantinople, which (as wee heare) was first brought thither from Syria; but perished quickly both with him, and with all other to whom hee imparted it: yet afterwards it was sent to Master Iohn de Franqueuille, a Merchant also of London, and a great louer of all rare plants, as well as flowers, from which is sprung the greatest store, that is now flourishing in this Kingdome.

The Time.

The Cinamon Rose is the earliest for the most part, which flowreth with vs about the middle of May, and sometimes in the beginning. The ordinary Muske Roses both single and double flower latest, as is said. All the other flower much about one time, in the beginning of Iune, or thereabouts, and continue flowring all that moneth, and the next throughout for the most part, and the red vntill August be halfe past.

The

The Names.

The severall names, whereby they are most commonly knowne vnto vs in this Countrey, are expresed in their titles; but they are much differing from what they are called in other Countries neare vnto vs, which to compare, conferre, and agree together, were a worke of more paines then vs: But to proportion them vnto the names set downe by Theophrastus, Pliny, and the rest of the ancient Authors, were a worke, wherein I might be sure not to escape without falling into errour, as I verily belecue many others have done, that have vnderaken to doe it: I will therefore for this worke desire that you will rest contented, with so much as hath already been deliuered, and expect an exact definition and complete satisfaction by such a methodicall course as a generall History will require, to be performed by them that shall publish it.

The Vertues.

The Rose is of exceeding great vse with vs; for the Damaske Rose (besides the superexcellence sweete water it yeeldeth being distilled, or the perfume of the leaues being dried, seruing to fill sweete bags) serueth to cause solublenesse of the body, made into a Syrupe, or preserued with Sugar moist or dry candid. The Damaske Prouince Rose, is not onely for sent nearest of all other Roses vnto the Damaske, but in the operation of solubility also. The red Rose hath many Physicall vses much more then any other, seruing for many sorts of compositions, both cordiall and cooling, both binding and loosing. The white Rose is much vsed for the cooling of heate in the eyes: diuers doe make an excellent yellow colour of the iuyce of white Roses, wherein some Allome is dissolved, to paint or colour flowers or pictures, or any other such things. There is little vse of any other sort of Roses; yet some affirme, that the Muske Roses are as strong in operation to open or loosen the belly as the Damaske Rose or Prouince.

CHAP. CXI.

Cistus. The Holly Rose or Sage Rose.

There are three principall kindes of *Cistus*, the male, the female, and the gumme or sweete smelling *Cistus* bearing *Ladanum*, called *Ledon*. Of each of these three there are also diuers sorts: Of them all to intreate in this worke is not my minde, I will onely select out of the multitude some few that are fit for this our Garden, and leaue the rest to a greater.

1. *Cistus mas*. The male Holly Rose or Sage Rose.

The male *Cistus* that is most familiar vnto our Countrey, I meane that will best abide, is a small shrubby plant, growing seldome aboue three or foure foote high with vs, hauing many slender brittle wooddy branches, couered with a whitish barke, whereon are set many whitish greene leaues, long and somewhat narrow, crumpled or wrinkled as it were with veines, and somewhat hard in handling, especially the old ones; for the young ones are softer, somewhat like vnto Sage leaues for the forme and colour, but much smaller, two alwaies set together at a ioynt: the flowers stand at the toppe of the branches, three or foure together vpon severall slender foot-stalkes, consisting of fine small round leaues a peece, somewhat like vnto a small single Rose, of a fine reddish purple colour, with many yellow threads in the middle, with-

out any sent at all, and quickly fading or falling away, abiding seldome one whole day blowne at the most: after the flowers are past, there come vp round hard hairie heads in their places, containing small brownish seede: the roote is woody, and will abide some yeares with vs, if there be some care had to keepe it from the extremity of our Winters frostes, which both this, and many of the other sorts and kinds, will not abide doe what we can.

2. *Cistus femina*. The female Holly Rose.

The female Holly Rose groweth lower, and smaller then the former male kinde, hauing blackish branches, lesse woody, but not lesse brittle then it: the leaues are somewhat rounder and greener, but a little hard or rough withall, growing in the same manner vpon the branches by couples: the flowers grow at the toppes of the branches, like vnto the former, consisting of fve leaues, but somewhat lesser, and wholly white, with yellow threds in the middle, as quickly fading, and of as little sent as the former: the heads and seede are somewhat bigger then in the former.

3. *Coamecistus Friscus*. The dwarfe Holly Rose of Friseland.

This dwarfe Cistus is a small low plant, hauing diuers shootes from the rootes, full of leaues that are long and narrow, very like vnto the leaues of the French Spikenard or *Spica Celtica*; from among which leaues shoote forth short stalkes, not aboue a span high, with a few smaller leaues thereon; and at the toppes diuers small flowers one aboue another, consisting of six small round leaues, of a yellow colour, hauing two circles of reddish spots round about the bottome of the leaues, a little distant one from another, which adde much grace to the flower: after the flowers are past, there come in their places small round heads, being two forked at the end, containing within them small brownish chaffe seede: the roote is small and slender, with many fibres thereat creeping vnder ground, and shooting forth in diuers places, whereby it much encreaseth: the whole plant, and euery part of it, smelleth strong without any pleasant sent.

4. *Cistus annuus*. The Holly Rose of a yeare.

This small Cistus that endureth but a yeare (and will require to be sowne euery yeare, if ye will haue it riseth vp with straight, but slender hard stalkes, set here and there confusedly with long and narrow greenish leaues, very like vnto the leaues of the Gum Cistus or Ledon, being a little clammy withall: at the toppe of the stalkes, and at the ioynts with the leaues, stand two or three pale yellow flowers, consisting of fve leaues a peece, with a reddish spot neere the bottome of euery leafe of the flower, as quickly fading as any of the former: after which follow small three square heades, containing small seede, like vnto the first female kinde, but somewhat paler or yellower: the root is small and woody, and perisheth as soone as it hath borne seede.

5. *Cistus Ledon*. The Gum Cistus, or Sweete Holly Rose.

This sweete Holly Rose or Gum Cistus, riseth higher, and spreadeth larger then the former male kind doth, with many blackish woody branches, whercon are set diuers long and narrow darke greene leaues, but whitish vnderneath, two alwayes standing together at a ioint, both stalks and leaues bedewd as it were continually with a clammy sweete moisture (which in the hot Countries is both more plentifull, and more sweet then in ours) almost transparent, and which being gathered by the inhabitants, with certaine instruments for that purpose (which in some places are leather thongs, drawne ouer the bushes, and after scraped off from the thongs againe, and put together) is that kind of blacke sweet gum, which is called *Ladanum* in the Apothecaries shops: at the tops of the branches stand single white flowers, like vnto single Roses, being larger then in any of the former kindes, consisting of fve leaues, whereof euery one hath at the bottome a dark purplish spot, broad below, and small pointed vpwards, with some yellow threds in the middle: after which are past, there arise cornered heads,

1 *Cistus* *mar*. The male Holly Rose. 2 *Chamaecistus* *Frisicus*. The dwarf Holly Rose of Frisia. 3 *Cistus* *Ledon*. The sweet Holly Rose or gumme Cistus. 4 *Ledum* *Alpinum*. The mountain Holly Rose. 5 *Ledum* *Silvestre*. The sweet Mary Rose of Silesia. 6 *Rosmarinum* *argenteum*. Gilded Rosemary.

heads, containing such small brownish seede as is in the former male kinde: the roote is woody, and spreadeth vnder ground, abiding some yeares, if it be placed vnder a wall, where it may bee defended from the windes that often breake it, and from the extremitie of our winters, and especially the snow, if it lye vpon it, which quickly causeth it to perish.

6. *Ledum Alpinum* seu *Rosa Alpina*. The Mountaine sweet Holly Rose.

The fragrant smell with properties correspondent of two other plants, causeth me to insert them in this Chapter, and to bring them to your knowledge, as well worthy a fit place in our Garden. The first of them hath diuers slender woody branches, two foote high or thereabouts, couered with a grayish coloured barke, and many times leaning downe to the ground, whereby it taketh roote againe: vpon these branches grow many thicke, short, hard Greene leaues, thicke set together, confusedly without order, sometimes whirish vnderneath, and sometimes yellowish: the toppes of the branches are laden with many flowers, which cause them to bend downwards, being long, hollow and reddish, opening into fve corners, spotted on the outside with many white spots, and of a paler red colour on the inside, of a fine sweet sent: after the flowers are past, there follow small heads, containing small brownish seede: the root is long, hard and woody, abiding better if it comprehend in the ground, then some of the former, because his originall is out of a colder country.

7. *Ledum Silesiacum*. The sweete Mary Rose, or Rosemary of Silesia.

This other sweete plante riseth vp with woody ash-coloured branches two foote high or more, which shoote forth other branches, of a reddish or purplish colour, couered with a brownish yellow hoarinesse, on which are set many narrow long Greene leaues, like vnto Rosemary leaues, but couered with the like hoarinesse as the stalks are (especially in the naturall places, but not so much being transplanted) and folding the sides of the leaues so close together, that they seeme nothing but ribbes, or stalkes, of an excellent sweet and pleasant sent; at the ends of the branches there grow certaine brownish scaly heads, made of many small leaues set thicke together, out of which breake forth many flowers, standing in a tuft together, yet seuerally euery one vpon his owne footstake, consisting of fve white leaues, with certaine white threds in the middle, smelling very sweete: after which rise small Greene heads, spotted with brownish spots, wherein is contained very small, long, yellowish seede: the roote is hard and woodie.

The Place.

The first, second, fourth and fifth, grow in the hot Countries, as Italie, Spaine, &c. The third, and the two last in the colder Countries, as Friseland, Germanie, Bohemia.

The Time.

They do all flower in the Summer moneths of Iune, Iuly and August, and their seede is ripe quickly after.

The Names.

The first, second, fourth and fifth, haue their names sufficiently expressed in their descriptions. The third was sent vnto Clusius, vnder the name of *Herculus Frisicus*, because of the strong sent: but he referreth it to the kinds of *Chamecisus*, that is, dwarfe or low *Cistus*, both for the low growth, and for the flowers and seede sake. The sixt is diuersly called; for Clusius calleth it *Ledum Alpinum*: others, *Nerium Alpinum*, making it to bee a Rose Bay.

Gesner

Gesner according to the Countrey peoples name, *Rosa Alpina*, and *Rosa Montana*. Lobel calleth it *Balsamum Alpinum*, of the fragrant smell in bath, and *Chamberhodendros*, *Chamaelea folia*. And some haue called it *Eunymus*, without all manner of iudgement. In English wee may call it, The Mountaine Rose, vntill a fitter name be giuen it. The last is called of Matthiolus, *Rosmarinum siluestre*, but of Cluius *Ledum*, referring it to their kindred; and *Silesiacum*, because he found it in that Countrey; or for distinction sake, as he saith; it may bee called; *Ledum folijs Rosmarini*, or *Ledum Bohemicum*. Cordus, as it seemeth in his History of Plants, calleth it *Chamaepence*, as though he did account it a kinde of low Pine, or Pitch tree.

The Vertues.

The first, second, and fift, are very astringent, effectually for all sorts of fluxes of humours. The sweet Gum called *Ladanum*, made artificially into oyle, is of singular vse for *Alopecia*, or falling of the haire. The seed of the fourth is much commended against the stone of the Kidneys. The sweet Rosemary of Silesia is vsed of the inhabitants, where it naturally groweth, against the shrinking of sinewes, crampes, or other such like diseases, whereof their daily experience makes it familiar, being vsed in bathing or otherwise.

CHAP. CXII.

Rosmarinum. Rosemary.

Here hath beene vsually knowne but one sort of Rosemary, which is frequent through all this Countrey; but there are some other sorts not so well known, the one is called Gilded Rosemary; the other broad leaved Rosemary; a third I will adioyne, as more rare then all the other, called Double flowred Rosemary, because few haue heard thereof, much lesse seene it, and my selfe am not well acquainted with it, but am bold to deliuer it vpon credit.

1. *Libanotis Coronaria sine Rosmarinum vulgare*.

Our Common Rosemary.

This common Rosemary is so well knowne through all our Land, being in euery womans garden, that it were sufficient but to name it as an ornament among other sweete herbes and flowers in our Garden, seeing euery one can describe it: but that I may say something of it, It is well obserued, as well in this our Land (where it hath been planted in Noblemens, and great mens gardens against bricke wals, and there continued long) as beyond the Seas, in the naturall places where it groweth, that it riseth vp in time vnto a very great height, with a great and woody stemme (of that compasse, that (being clouen out into thin boards) it hath serued to make lutes, or such like instruments, and here with vs Carpenters rules, and to diuers other purposes) branching out into diuers and sundry armes that extend a great way, and from them againe into many other smaller branches, wheron are set at seuerall distances, at the ioyns, many very narrow long leaues, greene aboue, and whitish vnderneath; among which come forth towards the toppes of the stalkes, diuers sweet gaping flowers, of a pale or bleake blewish colour, many set together, standing in whitish huskes; the seed is small and red, but thereof seldome doth any plants arise that will abide without extraordinary care; for although it will spring of the seede reasonable well, yet it is so small and tender the first yeare, that a sharpe winter killeth it quickly, vnlesse it be very well defended: the whole plant as well leaues as flowers, smelleth exceeding sweete.

2. *Rosmarinum striatum, sine aureum*. Gilded Rosemary.

This Rosemary differeth not from the former, in forme or manner of growing, nor

in the forme or colour of the flower, but only in the leaues, which are edged, or striped, or pointed with a faire gold yellow colour, which so continueth all the yeare throughout, yet fresher and fairer in Summer then in Winter; for then it will looke of a deader colour, yet so, that it may be discerned to be of two colours, green & yellow.

Rosmarinum latifolium. Broade leaved Rosemary.

This broad leaved Rosemary groweth in the same manner that the former doth, but that we haue not seene it in our Countrey since we had it to grow so great, or with such woody stemmes: the leaues stand together vpon the long branches after the same fashion, but larger, broader and greener then the other, and little or nothing whitish vnderneath: the flowers likewise are of the same forme and colour with the ordinary, but larger, and herein consisteth the difference.

Rosmarinum flore duplici. Double flowred Rosemary.

The double flowred Rosemary thus far differeth from the former, that it hath stronger stalkes, not so easie to breake, fairer, bigger and larger leaues, of a faire greene colour, and the flowers are double, as the Larkes heele or spur: This I haue onely by relation, which I pray you accept, vntill I may by sight better enforme you.

The Place.

Our ordinary Rosemary groweth in Spaine, and Prouence of France, and in others of those hot Countreys, neere the Sea side. It will not abide (vnlesse kept in stoues) in many places of Germany, Denmarke, and those colder Countreys. And in some extreame hard winters, it hath well neere perished here in England with vs, at the least in many places: but by slipping it is vsually, and yearly encreased, to replenish any garden.

The Time.

It flowreth oftentimes twice in the yeare; in the Spring first, from April vntill the end of May or Iune, and in August and September after, if the yeare before haue been temperate.

The Names.

Rosemary is called of the ancient Writers, *Libanotis*, but with this distinction, *Stephanomatica*, that is, *Coronaria*, because there were other plants called *Libanotis*, that were for other vses, as this for garlands, where flowers and sweete herbes were put together. The Latines call it *Rosmarinum*. Some would make it to be *Cnecorum nigrum* of Theophrastus, as they would make Lauander to bee his *Cnecorum album*, but Matthiolus hath sufficiently confuted that errour.

The Vertues.

Rosemary is almost of as great vse as Bayes, or any other herbe both for inward and outward remedies, and as well for ciuill as physcally purposes. Inwardly for the head and heart; outwardly for the sinewes and ioynts: for ciuill vses, as all doe know, at weddings, funerals, &c. to bestow among friends: and the physcally are so many, that you might bee as well tyred in the reading, as I in the writing, if I should set down all that might be said of it. I will therefore onely giue you a taste of some, desiring you will be content therewith. There is an excellent oyle drawne from the flowers alone by the heate of the Sunne, auailable for many diseases both inward and outward, and accounted a soueraigne Balsame: it is also good to helpe dimness

nesse of sight, and to take away spots, markes and scarres from the skin, and is made in this manner. Take a quantitie of the flowers of Rosemary, according to your owne will eyther more or lesse, put them into a strong glasse close stopped, set them in hot horse dung to digest for fourteene dayes, which then being taken forth of the dung, and vnstopped, tye a fine linnen cloth ouer the mouth, and turne downe the mouth thereof into the mouth of another strong glasse, which being set in the hot Sun, an oyle will distill downe into the lower glasse; which preferue as precious for the vses before recited, and many more, as experience by practice may enforme diuers.

There is another oyle Chymically drawne, auailable in the like manner for many the same inward and outward diseases, viz. for the heart, rheumaticke braines, and to strengthen the memory, outwardly to warme and comfort cold benumbed sinewes, whereof many of good iudgement haue had much experience.

CHAP. CXIII.

Myrtus. The Mirtle tree or bush.

IN the hot Countreyes, there haue been many sorts of Mirtles found out, naturally growing there, which will not fructifie in this of ours, nor yet abide without extraordinary care, and conueniencie withall, to preferue them from the sharpenesse of our winters. I shall only bring you to view three sorts in this my Garden, the one with a greater, the other two with lesser leaues, as the remainder of others which wee haue had, and which are preferued from time to time, not without much paine and trouble.

1. *Myrtus latifolia*. The greater leaved Mirtle.

The broader leaved Mirtle riseth vp to the height of foure or five foote at the most with vs, full of branches and leaues growing like a small bush, the stemme and elder branches whereof are couered with a dark coloured bark, but the young with a green, and some with a red, especially vpon the first shooting forth, whereon are set many fresh Greene leaues, very sweet in smell, and very pleasant to behold, so neer resembling the leaues of the Pomegranate tree that groweth with vs, that they soone deceiue many that are not expert therein, being somewhat broade and long, and pointed at the ends, abiding alwaies green: at the ioynts of the branches where the leaues stand, come forth the flowers vpon small foote stalkes, euery one by it selfe consisting of five small white leaues, with white threds in the middle, smelling also very sweet: after the flowers are past, there doe arise in the hot Countreies, where they are naturall, round blacke berries, when they are ripe, wherein are contained many hard white crooked feedes, but neuer in this Countrey, as I said before: the roote disperfeth it selfe into many branches, with many fibres annexed thereto.

2. *Myrtus minor, seu minore folio*. The smaller leaved Mirtle.

The smaller leaved Mirtle is a low shrub or bush, like vnto the former, but scarce rising so high, with branches spreading about the stemme, much thicker set with leaues than the former, smaller also, and pointed at the ends, of a little deeper Greene colour, abiding Greene also winter and summer, and very sweete likewise: the flowers are white like vnto the former, and as sweete, but shew not themselues so plentifull on the branches: the fruit is blacke in his naturall places, with feedes therein as the former.

3. *Myrtus minor rotundiore folio*. Boxe Mirtle.

Wee haue another sort of this small kinde of Mirtle, so like vnto the former both for smalnesse, deepe Greene colour of the leaues, and thicke growing of the branches, that

that it will be thought of most; without good heede, and comparing the one with the other, to be the very same with the former: but if it bee well viewed, it will shew, by the roundnesse at the ends of the leaues very like vnto the small Boxe leaues, to be another differing kinde, although in nothing else. Wee nourish them with great care, for the beautifull aspect, (weete sent and raritie, as delights and ornaments for a garden of pleasure, wherein nothing should be wanting that art, care and cost might produce and preserve: as also to set among other euer greene plants to sort with them.

The Place.

These, and many other sorts of Mirtles grow in Spaine, Portugall, Italie, and other hot Countries in great abundance, where they make their hedges of them: wee (as I said) keepe them in this Countrey, with very great care and diligence.

The Time.

The Mirtles doe flower very late with vs, not vntill August at the soonest, which is the cause of their not fructifying.

The Names.

They are called in Latine *Myrtus*, and in English Mirtle tree, without any other diuersitie of names, for the generall title. Yet the severall kindes haue had severall denominations, in Plinies time, and others, as *Romana*, *Coniugala*, *Terentina*, *Egyptia*, *alba*, *nigra*, &c. which haue noted the differences, euen then well obserued.

The Vertues.

The Mirtle is of an astringent qualitie, and wholly vsed for such purposes.

CHAP. CXIII.

Malus Punica siue *Granata*. The Pomegranet tree.

THERE are two kindes of Pomegranet trees, The one tame or manured, bearing fruit, which is distinguished of some into two sorts, of others into three, that is, into sower, and sweet, and into sower sweete. The other wilde, which beareth no fruit, because it beareth double flowers, like as the Cherry, Apple, and Peach tree with double blossomes, before described, and is also distinguished into two sorts, the one bearing larger, the other lesser flowers. Of the manured kinde wee haue onely one sort (so farre as we know) for it neuer beareth ripe fruit in this our Countrey) which for the beautifull aspect, both of the greene verdure of the leaues, and faire proportion and colour of the flowers, as also for the raritie, are nourished in some few of their gardens that delight in such rarities: for in regard of the tendernesse, there is neede of diligent care, that is, to plant it against a brick wall, and defend it conveniently from the sharpenesse of our winters, to giue his Master some pleasure in seeing it beare flowers: And of the double kinde we haue as yet obtained but one sort, although I shall giue you the knowledge and description of another.

1. *Malus Punica satina*. The tame Pomegranet tree.

This Pomegranet tree groweth not very high in his naturall places, and with vs sometimes it shooteth forth from the roote many brownish twigges or branches, or if it bee pruned from them, and suffered to grow vp, it riseth to bee seuen or eight foote high, spreading

1. *Myrtus latifolia* minor. The broad leaved Myrtle. 2. *Myrtus angustifolia* minor. The small leaved Myrtle. 3. *Myrtus brevifolia* minor. The Box leafed Myrtle. 4. *Malus Granata* floribunda flore. The ordinary Pomegranet tree. 5. *Balanifera Romanica* fruticosa. The lesser double flowered Pomegranet tree. 6. *Balanifera maxima* flore cypria. The greater double flowered Pomegranet. 7. *Pseudocaryocarpus* frut. American Plant. The Winter Cherry tree. 8. *Ficus Indica* cum suo fructu. The Indian Figgetree and his fruit.

spreading into many small and slender branches, here and there set with thornes, and with many very faire Greene shining leaues, like in forme and bignesse vnto the leaues of the larger Myrtle before described, euery one hauing a small reddish foote-stalke vpon these branches: among the leaues come forth here and there, long, hard, and hollow reddish cups, diuided at the brimmes, wherein doe stand large single flowers, euery one consisting of one whole leafe, smaller at the bottome then at the brimme, like bells, diuided as it were at the edges into fise or six parts, of an orient red or crimson colour in the hotter Countries; but in this it is much more delayed, and tenderer neare vnto a blush, with diuers threads in the middle. The fruit is great and round, hauing as it were a crowne on the head of it, with a thicke tough hard skinne or rinde, of a brownish red colour on the outside, and yellow within, stuffed or packt full of small graines, euery one encompassed with a thin skin, wherein is contained a cleare red iuyce or liquor, either of a sweet (as I said before) or sower taste, or betweene them both of a winie taste: the roote disperfeth it selfe very much vnder ground.

2. *Balaustium maius sine Malus Punica siluestris maior.*

The greater wilde or double blossomed Pomegranet tree.

The wilde Pomegranet is like vnto the tame in the number of purplish branches, hauing thornes, and shining faire Greene leaues, somewhat larger then the former: from the branches likewise shoote forth flowers, farre more beautifull then those of the tame or manured sort, because they are double, and as large as a double Prouince Rose, or rather more double, of an excellent bright crimson colour, tending to a silken carnation, standing in brownish cups or huskes, diuided at the brims vsually into foure or fise seuerall points, like vnto the former, but that in this kinde there neuer followeth any fruit, no not in the Country, where it is naturally wilde.

3. *Balaustium minus.* The smaller wilde Pomegranet tree.

This smaller kinde differeth from the former in his leanes, being of a darker Greene colour, but not in the height of the stemme, or purplishnesse of his branches, or thornes vpon them; for this doth shew it selfe more like vnto a wilde kind then it: the flowers hereof are much smaller, and not so thicke and double, of a deeper or sadder red Orrenge tawny colour, set also in such like cups or huskes.

The Place.

The tame or manured kinde groweth plentifully in Spaine, Portugall, and Italy, and other in other warme and hot countries. Wee (as I said before) preserue it with great care. The wilde I thinke was neuer seene in England, before Iohn Tradescante my very louing good friend brought it from the parts beyond the Seas, and planted it in his Lords Garden at Canterbury.

The Time.

They flower very late with vs, that is, not vntill the middle or end of August, and the cold euenings or frosts comming so soone vpon it, doth not onely hinder it from bearing, but many times the sharpe winters so pinch it, that it withereth it downe to the ground, so that oftentimes it hardly springeth againe.

The Names.

The name *Malus Punica* for the tree, and *Malum Punicum* for the fruit, or *Malus Granata*, and *Malum Granatum*, is the common name giuen vnto this tree, which is called in English the Pomegranet or Pomegranet tree. The flowers of the tame kinde are called *Cytini*, as Dioscorides saith, although Plinie seemeth either to make *Cytinus* to be the flower of the wilde kinde, or

Balaustium

Balanium to be the flower of both tame and wilde kinde: but properly, as I take it, *Cytinus* is the cup wherein the flower as well of the tame as wilde kinde doth stand; for vnto the similitude of them, both the flowers of *Asarum*, and the seede vessels of *Hyosciamus* are compared and resembled, and not vnto the whole flower: the barke or rinde of the fruit is called of diuers *Sidon*, and in the Apothecaries shops *Psidium*, and *cortex Granatorum*. The wilde kinde is called *Malus Punica siluestris*: In English, The wilde Pomegranet tree; the flower thereof is properly called *Balanium*. The lesser kind is vsually called *Balanium Romanum*, as the greater is called *Creticum* and *Cyprium*, because they growe in Candy and Cyprus.

The Vertues.

The vse of all these Pomegranets is very much in Physicke, to coole and binde all fluxibility both of body and humours: they are also of singular effect in all vlcers of the mouth, and other parts of the body, both of man and woman. There is no part of them but is applyed for some of these respects. The rinde also of the Pomegranet is vsed of diuers in stead of Gaules, to make the best sort of writing Inke, which is durable to the worlds end.

CHAP. CXV.

Arnonum Pliny seu Pseudocapsicum.

Tree Night shade or the Winter Cherry tree.

I Have adioyned this plant, for the pleasurable beauty of the greene leaues, and red berries. It groweth vp to be a yard or foure foote high at the most, hauing a small woody stemme or stocke, as bigge as ones finger or thumb, couered with a whitish greene barke, set full of greene branches, and faire greene leaues, somewhat vneuen sometimes on the edges, narrower then any Night shade leaues, and very neare resembling the leaues of the *Capsicum*, or Ginny pepper, but smaller and narrower, falling away in the Winter, and shooting fresh in the Spring of the yeare: the flowers growe often two or three together, at the ioynts of the branches with the leaues, being white, opening starre-fashion, and sometimes turning themselues backe, with a yellow pointell in the middle, very like vnto the flowers of Night shade: after the flowers are past, come forth in their stead small greene buttons, which after turne to be pleasant round red berries, of the bignesse of small Cherries when they are ripe, which with vs vsually ripen not vntill the Winter, or about Christmas, wherein are contained many small whitish seede that are flat: all the whole plant, as well leaues and flowers as seede, are without either smell or taste: the roote hath many yellowish strings and fibres annexed vnto it.

The Place.

The originall place hereof is not well knowne, but is thought to be the West Indies. It hath been planted of long time in most of these Countries, where it abideth reasonable well, so that some care bee had thereof in the extremitie of the Winter.

The Time.

It flowreth sometimes in Iune, but vsually in Iuly and August, and the fruit is not ripe (as is said) vntill the Winter.

The

The Names.

This plant hath diuers names; for it is thought to be that kinde of *Annonum* that Plinie setteth downe. Dodonæus calleth it *Pseudocapsicum*, for some likenesse in the leafe and fruit vnto the small *Capsicum* or Ginnie Pepper, although much vnlike in the taste and property. Others doe call it *Strichmodendron*, that is, *Solanum arborescens*, and wee in English according therunto, Tree Night shade. But some Latine asses corrupting the Latine word *Annonum*, doe call it the Mumme tree. Dalechampiuss calleth it *Solanum Americum*, seu *Indicum*, and saith the Spaniards call it in their tongue, *Guindas de las Indias*, that is, *Cerasa Indiana*, Indian Cherries, which if any would follow, I would not bee much against it: but many Gentlewomen doe call them Winter Cherries, because the fruit is not throughly ripe vntill Winter.

The Vertues.

I finde no Physicall property allotted vnto it, more then that by reason of the insipidity, it is held to be cooling.

CHAP. CXVI.

Ficus Indica minor. The smaller Indian Figgetree.

THis Indian Figgetree, if you will call it a tree (because in our Country it is not so, although it groweth in the naturall hot Countries from a wooddy stemme or body into leaues) is a plant consisting only of leaues, one springing out of another, into many branches of leaues, and all of them growing out of one leafe, put into the ground halfe way, which taking roote, all the rest rise out thereof, those belowe for the most part being larger then those aboue; yet all of them somewhat long, flat, and round pointed, of the thicknesse of a finger vsually, and smallest at the lower end, where they are ioyned or spring out of the other leaues, hauing at their first breaking out a shew of small, red, or browne prickes, thicke set ouer all the vpper side of the leaues, but with vs falling away quickly, leauing onely the markes where they stood: but they haue besides this shew of great prickes, a few very fine, and small, hard, white, and sharpe, almost insensible prickes, being not so bigge as haire on the vnder side, which will often sticke in their fingers that handle them vnadvisedly, neither are they to be discerned vnlesse one look precisely for them: the leaues on the vnder side hauing none of those other great prickes or marks at all, being of a faire fresh pale green colour: out of the yppermost leaues breake forth certaine Greene heads, very like vnto leaues (so that many are deceiued, thinking them to be leaues, vntill they marke them better, and be better experienced in them) but that they growe round and not flat, and are broad at the toppe; for that out of the tops of euery of them shooteth out a pale yellow flower, consisting of two rowes of leaues, each containing fise leaues a peece, laid open with certaine yellow threads, tipt with red in the middle: this Greene head, vntill the flower be past, is not of halfe that bignesse that it attaineth vnto after, yet seldome or neuer cometh vnto perfection with vs, being long and round, like vnto a Figge, small belowe, and greater aboue, bearing vpon the flat or broad head the marke of the flower, some holding still on them the dried leaues, and others hauing lost them, shew the hollownesse which they haue in the toppe or middle of the head, the sides round about being raised or standing vp higher: this head or figge in our Country abideth Greene on the outside, and little or nothing reddish within (although it abideth all the Winter, and the Summer following, as sometimes it doth) for want of that heate and comfort of the Sunne it hath in his naturall place, where it groweth reddish

reddish on the outside, and containing within it a bloudy red clammy iuyce, making the vrine of them that eate of them as red as bloud, which many seeing, were in doubt of themselves, lest their vrine were not very bloud; of what sweetnesse, like a figge, in the naturall places, I am not well assured, yet affirmed: but those that haue beene brought vnto me, whose colour on the outside was greenish, were of a reddish purple within, and contained within them round, small, hard seede, the taste was flat, waterish, or insipide: the roote is neither great, nor disperfeth it selfe very deepe or farre, but shooteth many small rootes vnder the vpper crust of the earth.

There is a greater kinde hereof, whose leaues are twice or thrice as bigge, which ha-ving been often brought vs, will seldome abide more then one Summer with vs, our Winters alwaies rotting the leaues, that it could not be longer kept.

The Place.

This Indian Figgetree groweth disperfedly in many places of Ame-rica, generally called the West Indies: The greater kinde in the more re-mote and hot Countries, as Mexico, Florida, &c. and in the Bermudas of Summer Islands, from whence wee haue often had it. The lesser in Virgi-nia, and those other Countreies that are nearer vnto vs, which better endu-
reth with vs.

The Time.

It flowreth with vs sometimes in May, or Iune; but (as I said) the fruit ne-uer commeth to perfection in this Country.

The Names.

Diners doe take it to bee *Opuntia Pliny*, whereof hee speaketh in the 21. Booke and 17. Chapter of his Naturall History: but he there saith, *Opun-tia* is an herbe, sweete and pleasant to be eaten, and that it is a wonder that the roote should come from the leafe, and so to growe; which words al-though they descipher out the manner of the growing of this plant, yet be-cause this is a kinde of tree, and not an herbe, nor to be eaten, it cannot bee the same: but especially because there is an herbe which groweth in the same manner, or very neare vnto it, one leafe standing on the toppe or side of another, being a Sea plant, fit to be eaten with vinegar and oyle (as many other herbes are that growe in the salt marshes, or neare the Sea, whereof Sea Purslane is one) which Clusius calleth *Lychen Marinus*; and (as Clusius saith) Cortusius very fitly called *Opuntia marina*; and out of doubt is the ve-rie same *Opuntia* that Theophrastus maketh mention of, and Plinie out of him. Our English people in Virginia, and the Bermuda Island, where it groweth plentifully, because of the form of the fruit, which is somewhat like to a Pearce, & not being so familiarly acquainted with the growing of Figs, sent it vnto vs by the name of the prickly Pearce, from which name many haue supposed it to be a Pearce indeede, but were therein deceiued.

The Vertues.

There is no other especiall property giuen hereunto, by any that haue written of the West Indies, then of the colouring of the vrine, as is be-fore said.

CHAP. CXVII.

Xucca sine Iucca. The supposed Indian Iucca.

THis rare Indian plant hath a great thicketuberos roote (spreading in time into many tuberous heads) from the head whereof shooteth forth many long, hard, and guttured leaues, very sharpe pointed, compassing as it were one another at the bottome, of a grayish Greene colour, which doe not fall away, but abide euer Greene on the plant; from the middle whereof springeth forth (now and then, but not euery yeare) a strong round stalke, diuided into diuers branches, whereon stand diuers white, and somewhat large flowers, hanging downe their heads, consisting of six leaues, with diuers veines, of a weake reddish or bluish colour, spread on the backe of the three outer leaues, especially from the middle of the leaues to the bottome, and not rising to the edge of the leafe of any flower, which fall away without bearing any seede in our Country, as farre as euer could be obserued either in the plant that Master Gerard kept a long time by him, or by Robinus at Paris his plant, which Master Gerard sent vnto him, or yet by that plant, that Vespasian Robin the sonne of old Robin sent vnto Master Iohn de Franqueuille, and now abideth and flourisheth in my Garden.

The Place.

It was first brought into England (as Master Gerard saith) from the West Indies, by a seruant of Master Thomas Edwards, an Apothecary of Exeter, and imparted to him, who kept it vnto his death: but perished with him that got it from his widow, intending to send it to his Country house.

The Time.

It flowreth not vntill Iuly, and the flowers fall away sodainely, after they haue beene blowne open a while.

The Names.

Master Gerard first as I thinke called it *Iucca*, supposing it to bee the true *Iuca of Theuet*, wherewith the Indians make bread, called *Cassana*: but the true *Iucca* is described to haue a leafe diuided into seuen or nine parts, which this hath not: Yet not knowing by what better name to call it, let it hold still his first imposition, vntill a fitter may be giuen it.

The Vertues.

Wee haue not heard of any, that hath either read, heard, or experimented the faculties hereof, nor yet whether it hath good or euill taste; for being rare, and possessed but by a few, they that haue it are loth to cut any thereof, for feare of spoiling and losing the whole roote.

Some haue affirmed, that in some parts of Turkie, where as they say this plant groweth, they make a kinde of cloth from the threads are found running through the leaues; but I finde the threads are so strong and hard, that this cannot be that plant the relators meane is vsed in that manner.

1 *Yucca sine Iucca*. The Indian Iucca. 2 *Arbor vita*. The tree of life. 3 *Arbor Indæ*. Iudæa tree. 4 *Lathyrum*. Beane Trefole. 5 *Cytisus*. Tree Trefole.

CHAP. CXVIII.

Arbor vite. The tree of life.

THe tree of life riseth vp in some places where it hath stood long, to be a tree of a reasonable great bignesse and height, couered with a redder barke then any other tree in our Country that I know, the wood whereof is firme and hard, and spreadeth abroad many armes and branches, which againe send forth many smaller twigges, bending downewards; from which twiggy or slender branches, being flat themselues like the leaues, come forth on both sides many flat winged leaues, somewhat like vnto Sauine, being short and small, but not pricking, seeming as if they were brayded or folded like vnto a lace or point, of a darke yellowish Greene colour, abiding Greene on the branches Winter and Summer, of a strong resinous taste, not pleasing to most, but in some ready to procure casting, yet very cordiall and pectorall also to them that can endure it: at the toppes of the branches stand small yellowish downie flowers, set in small scaly heads, wherein lye small, long, brownish seede, which ripen well in many places, and being sowne, doe spring and bring forth plants, which with some small care will abide the extreamest Winters we haue.

The Place.

The first or originall place where it naturally groweth, as farre as I can learne or vnderstand, is that part of America which the French doe inhabit, about the riuer of Canada, which is at the backe of Virginia Northward, and as it seemeth, first brought by them from thence into Europe, in the time of Francis the first French King, where it hath so plentifully increased, and so largely beene distributed, that now few Gardens of respect, either in France, Germany, the Lowe Countries, or England, are without it.

The Time.

It flowreth in the end of May, and in Iune; the fruit is ripe in the end of August and September.

The Names.

All the Writers that haue written of it, since it was first knowne, haue made it to be *Thuya genus*, a kinde of Thuya, which Theophrastus compareth vnto a Cypress tree, in his fifth Book and fifth Chapter: but *Omne simile non est idem*, and although it haue some likenesse, yet I verily beleue it is *proprium sui genus*, a proper kinde of it owne, not to bee paralleld with any other. For wee finde but very few trees, herbes, or plants in America, like vnto those that growe in Europe, the hither part of Africa, or in the lesser Asia, as experience testifieth. Some would make it to be *Cedrus Lycia*, but so it cannot be. The French that first brought it, called it *Arbor vite*, with what reason or vpon what ground I know not: but euer since it hath continued vnder the title of the Tree of life.

The Vertues.

It hath beene found by often experience, that the leaues hereof chewed in the morning fasting, for some few dayes together, haue done much good to diuers, that haue beene troubled with shortnesse of breath, and to helpe to expectorate thinne purulentous matter stuffing the lungs. Other properties I haue not heard that it hath; but doubtlesse, the hot, resinous smell and taste

taste it hath, both while it is fresh, and after it hath beene long kept dry, doth evidently declare his tenuity of parts, a digesting and cleansing quality it is possessed with, which if any industrious would make tryall, hee should finde the effects.

CHAP. CXIX.

Arbor luda, Iudas tree.

Iudas tree riseth vp in some places, where it standeth open from a wall, and alone free from other trees (as in a Garden at Battersey, which sometimes agoe belonged to Master Morgan, Apothecary to the late Queene Elizabeth of famous memory) to be a very great and tall tree, exceeding any Apple tree in height, and equall in bignesse of body thereunto (as my selfe can testifie, being an eye witnesse thereof) when as it had many stalkes of flowers, being in the bud, breaking out of the body of the tree through the bark in diuers places, when as there was no bough or branch near them by a yard at the least, or yet any leafe vpon the tree, which they gathered to put among other flowers, for Nosegayes) and in other places it groweth to bee but an hedge bush, or plant, with many suckers and shootes from belowe, couered with a darke reddish barke, the young branches being more red or purplish: the flowers on the branches come forth before any shew or budding of leanes, three or foure standing together vpon a small foote-stalke, which are in fashion like vnto Pease blossomes, but of an excellent deepe purplish crimson colour: after which come in their places so many long, flat, large, and thinne cods, of a brownish colour, wherein are contained small, blackish browne, flat, and hard seede: the roote is great, and runneth both deepe, and farre spreading in the earth: the leaues come forth by themselves, euery one standing on a long stalke, being hard & very round, like vnto the leafe of the largest *Asarum*, but not so thick, of a whitish green on the vpper side, and grayish vnderneath, which fall away euery yeare, and spring a fresh after the Spring is well come in, and the buds of flowers are sprung.

There is another of this kinde, growing in some places very high, somewhat like the former, and in other places also full of twiggy branches, which are greener then the former, as the leanes are likewise: the flowers of this kinde are wholly white, and the cods nothing so red or browne, in all other things agreeing together.

The Place.

The former groweth plentifully in many places of Spaine, Italy, Provence in France, and in many other places. The other hath beene sent vs out of Italy many times, and the seede hath sprung very well with vs, but it is somewhat tender to keepe in the Winter.

The Time.

The flowers (as I said) appeare before the leaues, and come forth in Aprill and May, and often sooner also, the leaues following shortly after, but neither of them beareth perfect seede in our Country, that euer I could learne, or know by mine owne or others experience.

The Names.

Some would referre this to *Cercis*, whereof Theophrastus maketh mention in his first Booke and eighteenth Chapter, among those trees that beare their fruit in cods, like as Pulse doe: and hee remembreth it againe in the fourteenth Chapter of his third Booke, and maketh it not vnlike the white

Poplar tree, both in greatnesse and whitenesse of the branches, with the leafe of an Iuic, without corners on the one part, cornered on the other, and sharpe pointed, greene on both sides almost alike, hauing so slender long footestalkes that the leaues cannot stand forthright, but bend downwards, with a more rugged barke then the white Poplar tree. Clusius thinketh this large description is but an ample description of the third kinde of Poplar, called *Lybica*, the Aspen tree, which Gaza translatheth *Alpina*: but who so will well consider it, shall finde it neyther answerable to any Poplar tree, in that it beareth not cods as *Cercus* doth; nor vnto this *Arbor Iuda*, because it beareth not white branches. Clusius saith also, that the learned of Mompelier in his time, referred it to *Colytea* of Theophrastus in his third booke and seuenteenth chapter, where he doth liken it to the leaues of the broadest leaved Bay tree, but larger and rounder, green on the vpper side, and whitish vnderneath, and whereunto (as he saith) Theophrastus giueth cods in the fourteenth chapter of the same third booke: and by the contracting of their descriptions both together, saith, they agree vnto this Iudas tree. But I find some doubts and differences in these places: for the *Colutea* that Dioscorides mentioneth in the said fourteenth chapter of his third booke, hath (as he saith there) a leafe like vnto the Willow, and therefore cannot bee the same *Colutea* mentioned in the seuenteenth chapter of the same third booke, which hath a broad Bay leafe: indeede hee giueth seele in cods: but that with broad Bay leaues is (as he saith) without eyther flower or fruite, and besides all this, he saith the rootes are very yellow, which is not to bee found in this *Arbor Iuda*, or Iudas tree: let others now iudge if these things can bee well reconciled together. Some haue for the likenesse of the cods vnto Beane cods, called it *Fabago*. And Clusius called it *Siligna siluestre*. It is generally in these dayes called *Arbor Iuda*, and in English after the Latine name, vntill a fitter may be had, Iudas tree.

The Vertues.

There is nothing extant in any Author of any Physicall vse it hath, neyther hath any later experience found out any.

CHAP. CXX.

Laburnum. Beane Trefoile.

There be three sorts of these coddred trees or plants, one neere resembling another, whereof *Anagyris* of Dioscorides is one. The other two are called *Laburnum*; the larger whereof Matthiolus calleth *Anagyris altera*, and so doe some others also: the third is of the same kinde with the second, but smaller. I shall not for this our Garden trouble you or my selfe with any more of them then one, which is the lesser of the two *Laburnum*; in that it is more frequent, and that it will far better abide then the *Anagyris*, which is so tender, that it will hardly endure the winters of our Countrey: and the greater *Laburnum* is not so easily to be had.

Laburnum. Beane Trefoile.

This coddred tree riseth vp with vs like vnto a tall tree, with a reasonable great body, if it abide any long time in a place, couered with a smooth greene barke, the branches are very long, greene, pliant, and bending any way, whereon are set here and there diuers leaues, three alwaies standing together vpon a long stalk, being somewhat long, and not very narrow, pointed at the ends, greene on the vpper side, and of a siluer shining colour vnderneath, without any smell at all: at the ioyns of these branches, where the leaues stand, come forth many flowers, much like vnto Broome flowers, but not so large

large or open, growing about a very long branch or stalk, sometimes a good span or more in length, and of a faire yellow colour, but not very deepe: after which come flutthin cods, not very long or brad, but as tough and hard as the cods of Broomey wherein are contained blackish seede, like, but much lesse then the seede of *Anagyris vera* (which are as big as a kidney beane, purplish and spotted): the roote thrusteth down deepe into the ground, spreading also farre, and is of a yellowish colour.

The Place.

This tree groweth naturally in many of the woods of Italie, and upon the Alpes also, and is therefore still accounted to be that *Laburnum* that Pliny callith *Arbor Alpina*. It groweth in many gardens with the blacke cods wherein there is small blackish seede.

The Time.

It flowreth in May, the fruit or cods, and the seedes therein are ripe in the end of August, or in September.

The Names.

This tree (as I said before) is called of Matthiolus *Anagyris altera*, *sive secundula*, of Cordus, Gesner and others, especially of most now adayes, *Laburnum*. It is probable in my opinion, that this should bee that *Colutea* of Theophrastus, mentioned in the fourteenth Chapter of his third book with the leafe of a Willow; for if you take any one leafe by it selfe, it may well resemble a Willow leafe both for forme and colour, and beareth small seed in cods like vnto pulse as that doth. Of some it hath beene taken for a kinde of *Cytisus*, but not truly. We call it in English, Beane Trefoile, in regard of his cods and seede therein, somewhat like vnto Kidney Beanes, and of the leaues, three alwayes standing together, vntill a more proper name may bee giuen it.

The Vertues.

There is no vse hereof in Physicke with vs, nor in the naturall place of the growing, saue only to prouoke a vomit, which it will doe very strongly.

CHAP. CXXI.

Cytisus. Tree Trefoile.

There are so many sorts of *Cytisus* or Treetrefoiles, that if I should relate them all, I should weary the Reader to ouerlook them, whereof the most part pertaine rather to a generall worke then to this abstract. I shall not therefore trouble you with any superfluous, but only with two, which we haue nourished vp to furnish waste places in a garden.

Cytisus Marantha. Hoined Tree Trefoile.

This Tree Trefoile which is held of most Herbarists to be the true *Cytisus* of Dioscorides, riseth vp to the height of a man at the most, with a body of the bignesse of a mans thumbe, couered with a whitish bark, breaking forth into many whitish branches spreading farre, beset in many places with small leaues, three alwayes set together vpon a small short foote stalk, which are rounder, and whiter then the leaues of Beane Trefoile: at the ends of the branches for the most part, come forth the flowers, three or foure together, of a fine gold colour, and of the fashion of Broome flowers, but not

not so large: after the flowers are past, there come in their places crooked flat thinn
cods, of the fashion of a halfe moone, or crooked horne, whirish when they are ripe,
wherein are contained blackish seede: the roote is hard and woody, spreading diuers
wayes vnder the ground: the whole plant hath a pretty small hot sent.

Cytisus vulgaris. The common Tree Trefoile.

This *Cytisus* is the most common in this Land, of any the other sorts of tree trefoiles,
hauing a blackish colourd barke, the stemme or body whereof is larger then the for-
mer, both for height and spreading, bearing also three leaues together, but smaller and
greener then the former: the flowers are smaller, but of the same fashion and colour:
the cods blackish and thin, and not very long, or great, but lesser then Broome cods,
wherein there lyeth small blackish hard seede: the roote is diuersly disperfed in the
ground.

The Place.

The first groweth in the kingdome of Naples, and no doubt in many
other places of Italie, as Matthiolus saith. The other groweth in diuers
places of France.

The Time.

They flower for the most part in May or Iune: the seede is ripe in Au-
gust, or September.

The Names.

The first (as I said) is thought of most to be the true *Cytisus* of Dioscori-
des, and as is thought, was in these later dayes first found by Bartholomæus
Maranta of Naples, who sent it first to Matthiolus, and thereupon hath euer
since bene called after his name, *Cytisus Marantæ*. Some doe call it *Cytisus*
Lunatus, because the cods are made somewhat like vnto an halfe Moone.
We call it in English, Horned Tree Trefoile. The other is called *Cytisus vul-*
garis or *vulgaris*; in English, The common Tree Trefoile, because we haue
not any other so common.

The Vertues.

The chiefeft vertues that are appropriate to these plants, are to procure
milke in womens breasts, to fatten pulles, sheep &c. and to be good for bees.

Cytisus Tree Trefoile.

CHAP. CXXII

Colutea. The Bastard Sena Tree.

WE haue in our Gardens two or three sorts of the Bastard Sena tree; a
greater as I may so call it, and two lesser: the one with round thin tran-
sparent skins like bladders, wherein are the seede: the others with long
round cods, the one bunched out or swelling in diuers places, like vnto a Scorpions
taile, wherein is the seede, and the other very like vnto it, but smaller.

Colutea Vesicaria. The greater Bastard Sena with bladders.

This shrub or tree, or shrubby tree, which you please to call it, riseth vp to the height
of a pretty tree, the stemme or stock being sometimes of the bignesse of a mans arme,
cohered with a blackish Greene rugged barke, the wood whereof is harder then of an
Elder,

Elder, but with an hollownesse like a pith in the heart or middle of the branches, which are diuided many wayes, and whereon are set at seuerall distances, diuers winged leaues, composed of many small round pointed, or rather flat pointed leaues, one set against another, like vnto Licoris, or the Hatchet Fitch; among these leaues come forth the flowers, in fashion like vnto Broome flowers, and as large, of a very yellow colour: after which appeare cleare thynne swelling cods like vnto thynne transparent bladders, wherein are contained blacke feede, set vpon a middle ribbe or sinew in the middle of the bladder, which if it be a little crushed betwene the fingers, will giue a cracke, like as a bladder full of winde. The roote groweth branched and woody.

2. *Colutaa Scorpioides maior*. The greater Scorpion podded Bastard Sena.

This Bastard Sena groweth nothing so great or tall, but shooteth out diuersly, like vnto a shrub, with many shoots springing from the root: the branches are greener, but more rugged, hauing a white barke on the best part of the elder growne branches; for the young are greene, and haue such like winged leaues set on them as are to be seen in the former, but smaller, greener, and more pointed: the flowers are yellow, but much smaller, fashioned somewhat like vnto the former, with a reddish stripe downe the backe of the vpper most leafe: the long cods that follow are small, long and round, distinguished into many diuisions or dents, like vnto a Scorpions tayle, from whence hath risen the name: in these seuerall diuisions lye seuerall blacke feede, like vnto the feede of Fenigreeke: the roote is white and long, but not so woody as the former.

3. *Colutaa Scorpioides minor*. The lesser Scorpion Bastard Sena.

This lesser Bastard Sena is in all things like the former, but somewhat lower, and smaller both in leafe, flower, and cods of feede, which haue not such eminent bunches on the cods to be scene as the former.

The Place.

They grow as Matthioli faith about Trent in Italie, and in other places: the former is frequent enough through all our Countrey, but the others are more rare.

The Time.

They flower about the middle or end of May, and their feede is ripe in August. The bladders of the first will abide a great while on the tree, if they be suffered, and vntill the winde cause them to rattle, and afterwards the skins opening, the seed will fall away.

The Names.

The name *Colutaa* is imposed on them, and by the iudgement of most writers, the first is taken to bee that *Colutaa* of *Lipara* that Theophrastus maketh mention of, in the seuenteenth chapter of his third booke. But I should rather thinke that the *Scorpioides* were the truer *Colutaa* of Theophrastus, because the long pods thereof are more properly to bee accounted *siliqua*, then the former which are *vesicæ tumentes*, windy bladders, and not *siliqua*: and no doubt but Theophrastus would haue giuen some peculiar note of difference if he had meant those bladders, and not these cods. Let others of iudgement be vmpeeres in this case; although I know the errant of writers since Matthioli, doe all hold the former *Colutaa vesicaria* to be the true *Colutaa Lipara* of Theophrastus. Wee call it in English, Bastard Sena, from Ruellius, who as I thinke first called it Sena, from the forme of the leaues. The second and third (as I said before) from the forme of the cods receiued their names, as it is in the titles and descriptions; yet they may as properly be called *Siliquosa*, for that their fruite are long cods.

The

The Vertues.

Theophrastus saith it doth wonderfully helpe to fatten sheepe: But sure it is found by experience, that if it be giuen to man it causeth strong castings both vpwards and downwards; and therefore let euery one beware that they vse not this in steede of good Sena, lest they feele to their cost the force thereof.

CHAP. CXII.

Spartum Hispanicum frutex. Spanish Broome.

Although Clusius and others haue found diuers sorts of this shrubby *Spartum* or Spanish Broome, yet because our Climate will nourse vp none of them, and cuen this very hardly, I shall leaue all others, and describe vnto you this one only in this manner: Spanish Broome groweth to bee five or sixe foote high, with a woody stemme below, couered with a darke gray, or ash-coloured barke, and hauing aboue many pliant, long and slender greene twigs, whereon in the beginning of the yeare are set many small long greene leaues, which fall away quickly, not abiding long on; towards the tops of these branches grow the flowers, fashioned like vnto Broom flowers, but larger, as yellow as they, and smelling very well; after which come small long cods, crested at the backe, wherein is contained blackish flat seede, fashioned very like vnto the Kidney beanes: the roote is woody, dispersing it selfe diuers waies,

The Place.

This groweth naturally in many places of France, Spaine and Italie, wee haue it as an ornament in our Gardens, among other delightfull plants, to please the senses of sight and smelling.

The Time.

It flowreth in the end of May, or beginning of Iune, and beareth seede, which ripeneth not with vs vntill it be late.

The Names.

It is called *Spartium Graecorum*, and *Spartum frutex*, to distinguish it from the sedge or rush, that is so called also. Of some it is called *Genista*, and thought not to differ from the other *Genista*, but they are much deceiued; for cuen in Spaine and Italie, the ordinary *Genista* or Broome groweth with it, which is not pliant, and fit to binde Vines, or such like things withall as this is.

The Vertues.

There is little vse hereof in Physicke, by reason of the dangerous qualitie of vomiting, which it doth procure to them that take it inwardly: but being applyed outwardly, it is found to helpe the *Sciatica*, or paine of the hippes.

1. *Colutea vulgaris*. Ordinary bastard Sene. 2. *Periplovella Virginiana*. Virginian Silke. 3. *Colutea scorpioides*. Scorpion bastard Sene. 4. *Spartum Hispanicum*. Spanish Broome. 5. *Ligustrum Prunifolium*. 6. *Salvia viridiflora*. Parry coloured Sage. 7. *Matricaria aurea*. Gilded Marierome.

CHAP. CXXIIII.

Periplocarecta Virginiana. Virginian Silke.

Lest this stranger should finde no hospitality with vs, being so beautifull a plant, or not finde place in this Garden, let him be here receiued, although with the last, rather then not at all. It riseth vp with one or more strong and round stalkes, three or foure foote high, whereon are set at the seuerall ioynts thereof two faire, long, and broad leaues, round pointed, with many veines therein, growing close to the stemme, without any foote-stalke: at the tops of the stalkes, and sometimes at the ioynts of the leaues, groweth forth a great bush of flowers out of a thinne skinne, to the number of twenty, and sometimes thirty or forty, euery one with a long foote-stalke, hanging downe their heads for the most part, especially those that are outermost, euery one standing within a small huske of greene leaues, turned to the stalkeward, like vnto the *Lysimachia* flower of Virginia before described, and each of them consisting of fise small leaues a peece, of a pale purplish colour on the vpper side, and of a pale yellowish purple vnderneath, both sides of each leafe being as it were folded together, making them seeme hollow and pointed, with a few short chiues in the middle: after which come long and crooked pointed cods standing vp right, wherein are contained flat brownish seede, dispersedly lying within a great deale of fine, soft, and whitish browne silke, very like vnto the cods, seede, and silke of *Asclepias*, or Swallow-wort, but that the cods are greater and more crooked, and harder also in the outer shell: the roote is long and white, of the bignesse of a mans thumbe, running vnder ground very far, and shooting vp in diuers places, the heads being set full of small white grumes or knots, yeelding forth many branches, if it stand any time in a place: the whole plant, as well leaues as stalkes, being broken, yeeld a pale milke.

The Place.

It came to me from Virginia, where it groweth abundantly, being raised vp from the seede I receiued.

The Time.

It flowreth in Iuly, and the seede is ripe in August.

The Names.

It may seeme very probable to many, that this plant is the same that Prosper Alpinus in the twenty fift Chapter of his Booke of Egyptian plants, nameth *Beidelfar*; and Honorius Bellus in his third and fourth Epistles vnto Clusius (which are at the end of his History of plants) calleth *Offar frutex*: And Clusius himselfe in the same Booke calleth *Apocynum Syriacum*, *Palatinum*, and *Aegyptiacum*, because this agreeth with theirs in very many and notable parts; yet verily I thinke this plant is not the same, but rather another kinde of it selfe: First, because it is not *frutex*, a shrub or wooddy plant, nor keepeth his leaues all the yeare, but loseth both leaues and stalkes, dying down to the ground euery yeare: Secondly, the milke is not causticke or violent, as Alpinus and Bellus say *Offar* is: Thirdly, the cods are more crooked then those of Clusius, or of Alpinus, which Honorius Bellus acknowledgeth to be right, although greater then those he had out of Egypt: And lastly, the rootes of these doe runne, whereof none of them make any mention. Gerard in his Herball giueth a rude figure of the plant, but a very true figure of the cods with seede, and saith the Virginians call it *wisanck*, and referreth it to the *Asclepias*, for the likenesse of the cods stuffed with

silken

filken dounce. But what reason Gaspar Bauhinus in his *Pinnax Tugatri Bota-*
nica had, to call it (for it is Clusius his *Apocynum Syriacum*) by the name of
Lapathum Aegyptiacum, I know none in the world: for but that he would shew an extreme singularity in giving names
 to plants, contrary to all others (which is very frequent with him) how
 could he thinke, that this plant could have any likenesse or corresponden-
 cie, with any of the kinds of Doekts, that euen he had seene, read, or heard
 of, in fact; or shew of leaues, flowers, or seede; but especially in giuing
 milke. I haue you see (and that not without iust and euident cause) giuen it
 a differing Latine name from Gerard, because the *Asclepias* giueth no milke,
 but the *Periploca* or *Apocynum* doth, and therefore fitter to be referred to
 this then to that. And because it should not want an English name answerable
 to some peculiar property thereof, I haue from the filken dounce called
 it Virginian Silke: but I know there is another plant growing in Virginia,
 called Silke Grasse, which is much differing from this.

The Vertues. I know not of any in our Land hath made any tryall of the properties
 hereof. Captaine Iohn Smith in his booke of the discovery and descrip-
 tion of Virginia, saith, that the Virginians vse the rootes hereof (if his be
 the same with this) being bruised and applyed to cure their hurts & diseases.

The Vertues.

CHAP. CXXV. *Lignum. Primme or Priuet.*

BEcause the vse of this plant is so much, and so frequent throughout all this Land,
 although for no other purpose but to make hedges or arbours in Gardens, &c.
 whereunto it is so apt, that no other can be like vnto it, to bee cut, lead, and
 drawne into what forme one will, either of beasts, birds, or men armed, or otherwise:
 I could not forget it, although it be so well knowne vnto all, to be an hedge bush grow-
 ing from a woody white roote, spreading much within the ground, and bearing ma-
 nie long, tough, and plyant sprigs and branches, whereon are set long, narrow, and
 pointed sad Greene leaues by couples at euery ioynt; at the tops whereof breake forth
 great tufts of sweete smelling white flowers, which when they are fallen, turne into
 small blacke berries, hauing a purple iuyce within them, and small seede, flat on the
 one side, with an hole or dent therein: this is seene in those branches that are not cut,
 but suffered to beare out their flowers and fruit.

The Place.

This bush groweth as plentifully in the Woods of our owne Countrey,
 as in any other beyond the Seas.

The Time.

It flowreth sometimes in Iune, and in Iuly; the fruit is ripe in August and
 September.

The Names.

There is great controuersie among the moderne Writers concerning this
 plant, some taking it to be *xylop* of Dioscorides, other to be *Phillyrea* of Di-
 oscorides, which followeth next after *Cyprus*. Plinie maketh mention of
Cyprus in two places; in the one he saith, *Cyprus* hath the leafe of *Ziziphus*,

or the Iuiube trees: in the other he saith, that certain do affirme, that the *Cyprus* of the East Country, and the *Lignstrum* of Italy is one and the same plant: whereby you may plainly see, that our Priuet which is *Lignstrum*, cannot be that *Cyprus* of Plinie with Iuiube leaues: Besides, both Dioscorides & Plinie wold (mis) say, that *Cyprus* is a tree; but all know that *Lignstrum*, Priuet, is but an hedge bush: Againe, Dioscorides saith, that the leaues of *Cyprus* giue a red colour, but Priuet giueth none. Bellonius and Prosper Alpinus haue both recorded; that the true *Cyprus* of Dioscorides groweth plentifully in Egypt, Syria, and those Easterne Countries, and nourished vp also in Constantinople, and other parts of Greece, being a merchandise of much worth, in that they transport the leaues, and young branches dried, which laid in water giue a yellow colour, wherewith the Turkish women colour the nails of their hands, and some other parts of their bodies likewise, delighting much therein: and that it is not our *Lignstrum*, or Priuet, because *Cyprus* beareth round white seede, like Coriander seede, and the leaues abide greene alwaies vpon the tree, which groweth (if it bee not cut or pruned) to the height of the Pomegranet tree: I haue (I confesse) beyond the limits I set for this worke spoken concerning our Priuet, because I haue had the seede of the true *Cyprus* of Dioscorides sent mee, which was much differing from our Priuet, and although it sprang vp, yet would not abide any time, whereas if it had bene our Priuet, it would haue bene familiar enough to our Country.

The Vertues.

It is of small vse in physicke, yet some doe vse the leaues in Lotions, that serue to coole and dry fluxes or sores in diuers parts.

CHAP. CXXXVI.

Salvia variegata. Party coloured Sage. And
Maiorana versicolor sine aurea. Yellow or golden Marierome.

VNto all these flowers of beauty and rarity, I must adioyne two other plants, whose beauty consisteth in their leaues, and not in their flowers: as also to separate them from the others of their tribe, to place them here in one Chapter, before the sweete herbes that shall follow, as is fittest to furnish this our Garden of pleasure. This kinde of Sage groweth with branches and leaues, very like the ordinary Sage, but somewhat smaller, the chiefest difference consisteth in the colour of the leaues, being diuersly marked and spotted with white and red among the greene: for vpon one branch you shall haue the leaues seuerally marked one from another, as the one halfe of the leafe white, and the other halfe greene, with red shadowed ouer them both, or more white then greene, with some red in it, either parted or shadowed, or dasht here and there, or more greene then white, and red therein, cyther in the middle or end of the leafe, or more or lesse parted or striped with white and red in the greene, or else sometimes wholly greene the whole branch together, as nature listeth to play with such varieties: which manner of growing rising from one and the same plant, because it is the more variable, is the more delightfull and much respected.

There is another speckled Sage parted with white and greene, but it is nothing of that beauty to this, because this hath three colours evidently to bee discerned in euery leafe almost, the red adding a superabundant grace to the rest.

Maiorana aurea sine versicolor. Yellow or golden Marierome.

This kinde of Marierome belongeth to that sort is called in Latine *Maiorana latifolia*.

lia, which Lobel setteth forth for *Hyssopus Gracorum genuina*: In English Winter Marierome, or pot Marierome: for it hath broader and greater leaues then the sweete Marierome, and a different vmbell or tuft of flowers. The difference of this from that set forth in the Kitchen Garden, consisteth chiefly in the leaues, which are in Summer wholly yellow in some, or but a little Greene, or parted with yellow and Greene more or lesse, as nature listeth to play: but in Winter they are of a darke or dead Greene colour, yet recouering it selfe againe: the sent hereof is all one with the pot Marierome.

Wee haue another parted with white and Greene, much after the manner with the former.

The Place, Time, Names, and Vertues of both these plants, shall be declared where the others of their kindes are specified hereafter, and in the Kitchen Garden, for they differ not in properties.

CHAP. CXXVII.

Lauendula. Lauender Spike.

After all these faire and sweete flowers before specified, I must needes adde a few sweete herbes, both to accomplish this Garden, and to please your senses, by placing them in your Nosegayes, or else where, as you list. And although I bring them in the end or last place, yet are they not of the least account.

1. *Lauendula maior*. Garden Lauender.

Our ordinary Garden Lauender riseth vp with a hard woody stemme aboue the ground, parted into many small branches, whereon are set whitish, long, and narrow leaues, by couples one against another, from among which riseth vp naked square stalkes, with two leaues at a ioynt, and at the toppe diuers small huskes standing round about them, formed in long and round heads or spikes, with purple gaping flowers springing out of each of them: the roote is woody, and spreadeth in the ground: The whole plant is of a strong sweete sent, but the heads of flowers much more, and more piercing the senses, which are much vsed to bee put among linnen and apparel.

There is a kinde hereof that beareth white flowers, and somewhat broader leaues, *Flora alba*, but it is very rare, and seene but in few places with vs, because it is more tender, and will not so well endure our cold Winters.

2. *Lauendula minor seu Spica*. Small Lauender or Spike.

The Spike or small Lauender is very like vnto the former, but groweth not so high, neither is the head or spike so great and long, but shorter and smaller, and of a more purplish colour in the flower: the leaues also are a little harder, whiter, and shorter then the former, the sent also is somewhat sharper and stronger. This is not so frequent as the first, and is nourished but in some places that are warme, and where they delight in rare herbes and plants.

The Place.

Lauender groweth in Spaine abundantly, in many places so wilde, and little regarded, that many haue gone, and abiden there to distill the oyle thereof whereof great quantity now commeth ouer from thence vnto vs: and also in Lanquedocke, and Prouence in France.

The Time.

It flowreth early in those hot Countries, but with vs not vntill Iune and Iuly.

The Names.

It is called of some *Nardus Italica*, and *Lauendula*, the greater is called *Femina*, and the lesser *Mas*. We doe call them generally Lauender, or Lauender Spike, and the lesser Spike, without any other addition.

The Vertues.

Lauender is little vsed in inward physicke, but outwardly; the oyle for cold and benumbed parts, and is almost wholly spent with vs, for to perfume linnen, apparrell, gloues, leather, &c. and the dried flowers to comfort and dry vp the moisture of a cold braine.

CHAP. CXXVIII.

Stachas. Sticadoue, Cassidony, or French Lauender.

Cassidony that groweth in the Gardens of our Countrey, may peraduenture somewhat differ in colour, as well as in strength, from that which groweth in hotter Countries; but as it is with vs, it is more tender a great deale then Lauender, and groweth rather like an herbe then a bush or shrub, not about a foote and a halfe high, or thereabouts, hauing many narrow long Greene leaues like Lauender, but softer and smaller, set at feuerall distances together about the stalkes, which spread abroad into branches: at the tops whereof stand long and round, and sometimes foure square heads, of a darke greenish purple colour, compact of many scales set together; from among which come forth the flowers, of a blewish purple colour, after which follow seede vessels, which are somewhat whitish when they are ripe, containing blackish browne seede within them: the roote is somewhat woody, and will hardly abide the iniuries of our cold Winters, except in some places onely, or before it haue flowered: The whole plant is somewhat sweete, but nothing so much as Lauender.

The Place.

Cassidony groweth in the Islands *Stachades*, which are ouer against *Martelles*, and in *Arabia* also: we keep it with great care in our Gardens.

The Time.

It flowreth the next yeare after it is sowne, in the end of May, which is a moneth before any Lauender.

The Names.

It is called of some *Lauendula siluestris*, but most vsually *Stachas*; in English, of some *Stickadoue*, or French Lauender; and in many parts of England, *Cassidony*.

The Vertues.

It is of much more vse in physicke then Lauender, and is much vsed for old paines in the head. It is also held to be good for to open obstructions, to expell melancholy, to cleanse and strengthen the liuer, and other inward parts, and to be a *Pectorall* also.

CHAP. CXXIX.

Abrotanum femina sine Santolina. Lauander Cotton.

THis Lauander Cotton hath many wooddy, but brittle branches, hoary or of a whitish colour, whereon are set many leaues, which are little, long, and foure square, dented or notched on all edges, and whitish also: at the tops of these branchess stand naked stalkes, bearing on euery one of them a larger yellow head or flower, then cyther Tansie or Mandeline, whereunto they are somewhat like, wherein is contained small darke coloured seede: the roote is hard, and spreadeth abroad with many fibres: the whole plant is of a strong sweete sent, but not vnpleasant, and is in many places planted in Gardens, to border knots with, for which it will abide to be cut into what forme you thinke best, for it groweth thicke and bushy, very fit for such workes, besides the comely shew: the plant it selfe thus wrought, doth yeeld, being alwayes greene, and of a sweet sent; but because it quickly groweth great, and will soon runne out of forme, it must be euery second or third yeare taken vp, and new planted.

The Place.

It is onely planted in Gardens with vs, for the vses aforesaid especially.

The Time.

It flowreth in Iuly, and standeth long in the hot time of the yeare in his colour, and so will doe, if it be gathered before it haue stood ouer long.

The Names.

Diuers doe call it as Matthiolus doth, *Abrotana femina*, and *Santolina*; and some call it *Chamaecyparissus*, because the leaues thereof, are somewhat like the leaues of the Cypresse tree: Wee call it in English generally Lauander Cotton.

The Vertues.

This is vsually put among other hot herbes, cyther into bathes, ointments, or other things, that are vsed for cold causes. The seede also is much vsed for the wormes.

CHAP. CXXX.

Ocimum. Bassill.

Bassill is of two sorts (besides other kindes) for this our Garden, the one whereof is greater, the other lesse in euery part thereof, as shall be shewed.

1. *Ocimum Citratum.* Common Bassill.

Our ordinary Garden Bassill hath one stalke rising from the root, diuersly branched out, whereon are set two leaues alwayes at a ioynt, which are broad, somewhat round, and pointed, of a pale greene colour, but fresh, a little snipt or dented about the edges, and of a strong or heady sent, somewhat like a Pomecitron, as many haue compared it, and thereof called *Citratum*: the flowers are small and white, standing at the tops of the branches, with two small leaues at euery ioynt, in some plants greene, in others

thers browne vnder them : after which commeth blackish seede : the roote perisheth at the first approach of winter weather, and is to be new sown euery yeare.

2. *Ocimum minimum* siue *Gariophyllatum*. Bush Basill.

The bush Basill groweth not altogether so high, but is thicker spreade out into branches, whereon grow smaller leaues, and thicker set then the former, but of a more excellent and pleasant smell by much : the flowers are white like the former, and the seede blacke also like it, and perisheth as suddenly, or rather sooner then it, so that it requirerth more paines to get it, and more care to nourish it, because we seldome or neuer haue any seede of it.

Ocimum Indicum. Indian Basill.

The Indian Basill hath a square reddish Greene stalke, a foote high or better, from the ioynts whereof spreade out many branches, with broade fat leaues set thereon, two alwayes together at the ioynt, one against another, as other Basills haue, but somewhat deeply cut in on the edges, and oftentimes a little crumpled, standing vpon long reddish foote stalkes, of a darke purple colour, spotted with deeper purple spots, in some greater, in others lesser: the flowers stand at the tops of the stalkes spike-fashion, which are of a white colour, with reddish stripes and veines running through them, set or placed in darke purple coloured huskes : the seede is greater and rounder then the former, and somewhat long withall : the roote perisheth in like manner as the other former doe. The whole plant smelleth strong, like vnto the other Basills.

The Place.

The two last sorts of Basills are greater strangers in our Country then the first which is frequent, and only sown and planted in curious gardens. The last came first out of the West Indies.

The Time.

They all flower in August, or Iuly at the soonest, and that but by degrees; and not all at once.

The Names.

The first is vsually called *Ocimum vulgare*, or *vulgatum*, and *Ocimum Citratum*. In English, Common or Garden Basill. The other is called *Ocimum minimum*, or *Gariophyllatum*, Cloue Basill, or Bush Basill. The last eyther of his place, or forme of his leaues, being spotted and curled, or all, is called *Ocimum Indicum maculatum, latifolium & crispum*. In English according to the Latine, Indian Basill, broade leaved Basill, spotted or curled Basill, which you please.

The Vertues.

The ordinary Basill is in a manner wholly spent to make sweet, or washing waters, among other sweet herbes, yet sometimes it is put into nosegayes. The Physicall properties are, to procure a cheerefull and merry heart, wher-vnto the seede is chiefly vsed in powder, &c. and is most vsed to that, and to no other purpose.

1. *Santolina*. Lavender Cotton. 2. *Lawendula*. Lavender Spike. 3. *Stachys*. Cassidony. 4. *Chamaedry*. Germander. 5. *Ocimum minus*.
Fine Basil. 6. *Marum*. Herbe Maſtiche. 7. *Majorana*. Sweete Marjorome.

CHAP. CXXXI.

Maierana. Sweete Marierome.

WE haue many sorts of Marierome ; some that are sweete, and but Summer plants ; others that are greater and not so sweet ; and some also that are wilde. Of all these I will onely select some of the choicest that are fit for this place, and leaue the other for the next garden, and the garden of simples, or a generall worke : yet hereunto I will adioyne another sweete plant called Masticke, as participating neerer with them then with Time, whereunto many doe referre it.

1. *Maierana maior asina.* Common sweet Marierome.

The sweet Marierome that is most frequently sown in our Country, is a low herbe little aboue a foote high when it is at the highest, full of branches, and small whitish soft roundish leaues, smelling very sweet : at the toppes of the branches stand diuers small scaly heads, like vnto knots, (and therefore of some called knotted Marierome) of a whitish Greene colour, out of which come here and there small white flowers, and afterwards small reddish seede : the roote is composed of many small threds or strings, which perish with the whole plant euery yeare.

2. *Maierana tenuifolia.* Marierome gentle.

This Marierome hath likewise diuers small branches, growing low, and not higher then the former, but hauing finer and smaller leaues, hoary and soft, but much sweeter: the heads are like vnto the former, and so are the flowers and seede, and the whole plant abiding but a Summer in the like manner.

3. *Marrum.* Herbe Masticke.

The neerer resemblance that this herbe hath with Marierome then with Tyme (as I said before) hath made me place it next vnto the small sweet Marierome. It riseth vp with a greater, and a more woody stalke then Marierome, two foote high or better in some places, where it liketh the ground and ayre, branching out on all sides towards the vpper part, leauing the stemme bare below, if it bee old, otherwise being young, thinly furnishing the branches from the bottome with small Greene leaues, bigger then the leaues of any Tyme, and comming neere vnto the bignesse and forme of the last recited finer Marierome, but of a greener colour : at the toppes of the branches stand small white flowers on a head, which afterwards turne into a loose tuft of a long white hoary matter, like vnto soft downe, with some leaues vnderneath and about it, which abide not long on the stalkes, but are blowne away with the winde : the seede is so small if it haue any, that I haue not obserued it : the roote is threddy : the whole plant is of a sweete resinous sent, stronger then the Marierome, and abideth our winters, if it be carefully planted and regarded.

The Place.

The sweete Marieromes grow naturally in hot Countreyes : the first in Spaine &c. the second is thought to come out of Syria, or Persia first into Italic, where they much esteeme it, and plant it curiously and carefully in pots, and set them in their windowes, beeing much delighted therewith for the sweet sent it hath. The first is vsually sown euery yeare in most gardens with vs : but the second is very rare and daintie, and must as daintely be preserved, being more tender then the former. The herbe Masticke is thought to be first brought out of Candie, Clusius saith he found it in Spaine : It is planted by slippes, (and not sown) in many gardens, and is much replanted for

for increase, but prospereth onely, or more frequently, in loamie or clay grounds then in any other soyle.

The Time.

The sweete Marieromes beare their knots or sealy heads in the end of Iuly, or in August. Herbe Masticke in Iune many times, or in the beginning of Iuly.

The Names.

The first of the two sweet Marieromes called *Maiorana* in Latine & *maiorana* in Italian, is taken of most writers to be the *Amaracus* or *Sampuchum* of Dioscorides, Theophrastus and Plinie, although Galen doth seem a little to differ therefrom. The other sweet Marierome hath his name in his title as much as can be said of it. The next is thought by the best of the moderne Writers to be the true *Marum* that Galen preferreth for the excellent sweetnesse, before the former Marierome in making the *Oleum*, or *unguentum Amaricinum*, and seemeth to incline to their opinion that thought *Amaracus* was deriued from *Marum*. It is the same also that Galen and others of the ancient Writers make mention of, to go into the composition of the *Trochisci Medychor*, as well as *Amaracus* among the ingredients of the *Theriaca Andromachi*. In English we call it Masticke simply, or Herbe Mastick, both to distinguish it from that Tyme that is called Masticke Tyme, and from the Masticke Tree, or Gum, so called. Some of later times, and Clusius with them, haue thought this to be Dioscorides his *Tragoriganum*, which doth somewhat resemble it: but there is another plant that Matthiolus setteth forth for *Marum*, that in Lobels opinion and mine is the truest *Tragoriganum*, and this the truest *Marum*.

The Vertues.

The sweete Marieromes are not onely much vsed to please the outward senses in nosegayes, and in the windowes of houses, as also in sweete powders, sweetebags, and sweete washing waters, but are also of much vse in Physicke, both to comfort the outward members, or parts of the body, and the inward also: to prouoke vrine being stopped, and to ease the paines thereof, and to cause the feminine courses. Herbe Masticke is of greater forceto helpe the stopping of vrine, then the Marierome, and is put into Antidotes, as a remedie against the poyson of venomous Beasts.

CHAP. CXXXI.

Thymum. Tyme.

THere are many kindes of Tyme, as they are vsually called with vs, some are called of the garden, and others wilde, which yet for their sweetnesse are brought into gardens, as Muske Tyme, and Lemon Tyme; and some for their beauty, as embroidered or gold yellow Tyme, and white Tyme. But the true Tyme of the ancient Writers, called *Capitatum*, as a speciall note of distinction from all other kindes of Tyme, is very rare to be seene with vs here in England, by reason of the tendernesse, that it will not abide our Winters. And all the other sorts that with vs are called garden Tymes, are indeede but kindes of wilde Tyme, although in the defect or want of the true Tyme, they are vsed in the stead of it. With the Tymes I must doe as I did with the Marieromes in the Chapter before, that is, reserue the most common in vse, for the common vse of the Kitchen, and shew you only those here, that are not put to that vse: and first with the true Tyme, because it is knowne but to a few.

1, *Thymum*

1. *Thymum legitimum capitatum*. The true Tyme.

The true Tyme is a very tender plant, hauing hard and hoary brittle branches, spreading from a small woody stemme, about a foote and a halfe high, whereon are set at seuerall ioyns, and by spaces, many small, long, whitish, or hoary Greene leaues, of a quicke sent and taste: at the tops of the branches stand small long whitish Greene heads, somewhat like vnto the heads of *Stachas*, made as it were of many leaues or scales, out of which start forth small purplish flowers (and in some white, as Bellonius saith) after which commeth small seede, that soone falleth out, and if it be not carefully gathered, is soone lost, which made (I thinke) Theophrastus to write, that this Tyme was to be sowne of the flowers, as not hauing any other seede: the root is small and woody. This holdeth not his leaues in Winter, no not about Scuill in Spaine, where it groweth abundantly, as Clusius recordeth, finding it there naked or spoiled of leaues. And will not abide our Winters, but perisheth wholly, roote and all.

2. *Serpillum hortense siue mains*. Garden wilde Tyme.

The wilde Tyme that is cherished in gardens groweth vpright, but yet is lowe, with diuers slender branches, and small round Greene leaues, somewhat like vnto small fine Marierome, and smelling somewhat like vnto it: the flowers growe in roundels at the toppes of the branches, of a purplish colour: And in another of this kinde they are of a pure white colour.

There is another also like hereunto, that smelleth somewhat like vnto Muske; and therefore called Muske Tyme, whose Greene leaues are not so small as the former, but larger and longer.

3. *Serpillum Citratum*. Lemon Tyme.

The wilde Tyme that smelleth like vnto a Pomecitron or Lemon, hath many weake branches trayling on the ground, like vnto the first described wilde Tyme, with small darke Greene leaues, thinly or sparsely set on them, and smelling like vnto a Lemon, with whitish flowers at the toppes in roundels or spikes.

4. *Serpillum aureum siue versicolor*. Guilded or embroidered Tyme.

This kinde of wilde Tyme hath small hard branches lying or leaning to the ground, with small party coloured leaues vpon them, diuided into stripes or edges, of a gold yellow colour, the rest of the leafe abiding Greene, which for the variable mixture or placing of the yellow, hath caused it to be called embroidered or guilded Tyme.

The Place.

The first groweth as is said before, about Scuill in Spaine, in very great abundance as Clusius saith; and as Bellonius saith, very plentifully on the mountaines through all Greece. The others growe some in this Country, and some in others: but wee preserue them with all the care wee can in our gardens, for the sweete and pleasant sents and varieties they yeeld.

The Time.

The first flowreth not vntill August; the rest in Iune and Iuly.

The Names.

Their names are seuerally set downe in their titles, as is sufficient to distinguish them; and therefore I shall not neede to trouble you any further with them.

The Vertues

The true Tyme is a speciall helpe to melancholicke and spleneticke diseases, as also to flatulent humours, either in the vpper or lower parts of the body. The oyle that is Chymically drawne out of ordinary Tyme, is vsed (as the whole herbe is, in the steed of the true) in pills for the head and stomach. It is also much vsed for the toothach, as many other such like hot oyles are.

CHAP. CXXXII.

Hyssopus. Hyssope.

THere are many varieties of Hyssope, beside the common or ordinary, which I reserue for the Kitchen garden, and intend onely in this place to giue you the knowledge of some more rare: viz. of such as are nourished vp by those that are curious, and fit for this garden: for there are some other, that must be remembered in the Physicke garden, or garden of Simples, or else in a generall worke.

1. *Hyssopus folijs nincis*. White Hyssope.

This white Hyssope is of the same kinde and smell with the common Hyssope; but differeth, in that this many times hath diuers leaues, that are wholly of a white colour, with part of the stalke also: others are parted, the one halfe white, the other halfe Greene, and some are wholly Greene, or with some spots or stripes of white within the Greene, which makes it delightfull to most Gentlewomen.

2. *Hyssopus folijs cinereis*. Russet Hyssope.

As the last hath party coloured leaues, white and Greene, so this hath his leaues of an ash-colour, which of some is called russet; and hath no other difference either in forme or smell.

3. *Hyssopus aureus*. Yellow or golden Hyssope.

All the leaues of this Hyssope are wholly yellow, or but a little Greene in them, and are of so pleasant a colour, especially in Summer, that they prouoke many Gentlewomen to wear them in their heads, and on their armes, with as much delight as many fine flowers can giue: but in Winter their beautifull colour is much decayed, being of a whitish Greene, yet recouer themselves againe the next Summer.

4. *Hyssopus sarculis densis*. Double Hyssope.

As this kinde of Hyssope groweth lower then the former or ordinary kinde, so it hath more branches, slenderer, and not so woody, leaning somewhat downe toward the ground, so wonderfully thicke set with leaues, that are like vnto the other, but of a darker Greene colour, and somewhat thicker withall, that it is the onely fine sweete herbe, that I know fittest (if any be minded to plant herbes) to set or border a knot of herbes or flowers, because it will well abide, and not growe too woody or great, nor be thinne of leaues in one part, when it is thicke in another, so that it may be kept with cutting as smooth and plaine as a table. If it be suffered to growe vp of it selfe alone, it riseth with leaues as before is specified, and flowreth as the common doth, and of the same sent also, not differing in any thing, but in the thicknesse of the leaues on the stalkes and branches, and the aptnesse to be ordered as the keeper pleaseth.

Chamedrys. Germander.

Left Germander should be utterly forgotten, as not worthy of our Garden, seeing many (as I said in my treatise or introduction to this Garden) doe border knots therewith: let me at the least giue it a place, although the last, being more vsed as a strewing herbe for the house, then for any other vse. It is (I thinke) sufficiently knowne to haue many branches, with small and somewhat round ended leaues on them, and purplish gaping flowers: the rootes spreading far abroad, and rising vp againe in many places.

The Place.

These Hyssopes haue beene most of them nourfed vp of long time in our English Gardens, but from whence their first originall should be, is not well knowne. The Germander also is onely in Gardens, and not wilde.

The Time.

They flower in Iune and Iuly.

The Names.

The seuerall names whereby they are knowne to vs, are set forth in their titles; and therefore I neede not here say more of them then onely this, that neyther they here set downe, nor the common or ordinary sort, nor any of the rest not here expressed, are any of them the true Hyssope of the ancient Greeke Writers, but *supposititia*, vsed in the stead thereof. The Germander, from the forme of the leaues like vnto small oaken leaues, had the name *Chamedrys* giuen it, which signifieth a dwarfe Oake.

The Vertues.

The common Hyssope is much vsed in all pectorall medicines, to cut fleagme, and to cause it easily to be auoided. It is vsed of many people in the Country, to be laid vnto cuts or fresh wounds, being bruised, and applied cyther alone, or with a little Sugar. It is much vsed as a sweet herbe, to be in the windowes of an house. I finde it much commended against the Falling Sicknesse, especially being made into Pils after this manner: Of Hyssope, Horhound, and Castor, of each halfe a dramme, of Peony rootes (the male kinde is onely fit to be vsed for this purpose) two drams, of *Asses fetida* one scruple: Let them be beaten, and made into pils with the iuyce of Hyssope, which being taken for seuen dayes together at night going to bed, is held to be effectual to giue much ease, if not thoroughly to cure those that are troubled with that disease. The vse of Germander ordinarily is as Tyme, Hyssope, and other such herbes, to border a knot, whereunto it is often appropriate, and the rather, that it might be cut to serue (as I said) for a strewing herbe for the house among others. For the physcally vse it serueth in diseales of the spleene, and the stopping of vrine, and to procure womens courses.

Thus haue I led you through all my Garden of Pleasure, and shewed you all the varieties of nature nourfed therein, pointing vnto them, and describing them one after another. And now lastly (according to the vse of our old ancient Fathers) I bring you to rest on the Grasse, which yet shall not be without some delight, and that not the least of all the rest.

1. *Thymum legitimum*. The true Tyme. 2. *Serpillum maini bortenst*. Garden wilde Tyme. 3. *Serpillum Citratum*. Lemon Tyme. 4. *Hyssopus*. Golden Hyssope. 5. *Chamaedry*. Germandee. 6. *Spartum Austriacum* sine *Gramen plumarium minus*. The lesser ita-
ther Grasse. 7. *Gramen striatum vel sulcatum*. Painted Grasse or Ladies Laces.

CHAP. CXXXIII.

Gramina. Grasses.

THere are among an infinite number (as I may so say) of Grasses, a few onely which I thinke fit to be planted in this Garden, both for the rarity of them, and also for your delight, and the excellent beauty that is in them about many other plants. One of them hath long agoe bin respected, and cherished in the country gardens of many Gentlewomen, and others. The others are knowne but vnto a few.

1. *Gramen striatum.* Painted Grasse or Ladies laces.

This kinde of Grasse hath many stiffe, hard, round stalkes, full of ioynts, whereon are set at euery ioynt one long leafe, somewhat broad at the bottome, where it compasseth the stalke, and smaller to the end, where it is sharpe pointed, hard or rough in handling, and striped all the length of the leafe with white streakes or lines, that they seeme party coloured laces of white and Greene: the tops of the stalkes are furnished with long spikie tufts, like vnto the tufts of Couch Grasse: the rootes are small, white, and threddy, like the rootes of other Grasses.

2. *Gramen Plumarium minus.* The lesser Feather-Grasse.

This lesser Feather-Grasse hath many small, round, and very long leaues or blades, growing in tufts, much finer and smaller then any other Grasse that I know, being almost like vnto haire, and of a fresh Greene colour in Summer, but changing into gray, like old hay in Winter, being indeede all dead, and neuer reuiuing; yet hardly to be plucked away vntill the Spring, and then other Greene leaues or rushes rise vp by them, and in their stead, and are about a foote in length: from the middle of these tufts come forth rounder and bigger rushes, which are the stalkes, and which haue a chaffie round care about the middle thereof, which when it is full growne, is somewhat higher then the toppes of the leaues or rushes, opening it selfe (being before close) at the top, and shewing forth three or foure long ayles or beards, one about another, which bend themselves a little downewards (if they stand ouer long before they are gathered, and will fall off, and be blowne away with the winde) being so finely feathered on both sides, all the length of the beard, and of a pale or grayish colour, that no feather in the taile of the Bird of Paradise can be finer, or to be compared with them, hauing sticking at the end of euery one of them, within the care, a small, long, whitish, round, hard, and very sharpe pointed graine, like vnto an oaten graine, that part of the stalke of the feather that is next vnder it, and about the seede for some two or three inches, being stiffe and hard, and twining or curling it selfe, if it be suffered to stand too long, or to fall away, otherwise being straight as the feather it selfe: the roote is composed of many long, hard, small threddy strings, which runne deepe and far, and will not willingly be remoued, in that it gaineth strength euery yeare by standing.

3. *Gramen Plumarium maius.* The greater Feather-Grasse.

The greater Feather-Grasse is like vnto the lesser, but that both the leaues and the feathers are greater, and nothing so fine, grosser also, and of lesse beauty and respect, though whiter then it; and therefore is not so much regarded: for I haue knowne, that many Gentlewomen haue vsed the former lesser kinde, being tyed in tufts, to set them in stead of feathers about their beds, where they haue lyen after childe-bearing, and at other times also, when as they haue been much admired of the Ladies and Gentles that haue come to visit them.

The Place.

The first of these Grasses, as Lobel saith, groweth naturally in the woods and hils of Sauoy. It hath long agoe bene receiued into our English gardens.

dens. The second, as Clusius saith, in Austria, from whence also (as I take it) the greater came, and are both in the gardens of those, that are curious obseruers of these delights.

The Time.

The first is in its pride for the leaues all the Spring and Summer, yeelding his bush in Iune. The other giue their feather-like sprigs in Iuly and August, and quickly (as I said) are shed, if they be not carefully gathered.

The Names.

The first is called by Lobel *Gramen sulcatum*, or *striatum album*; of others *Gramen pictum*. The French call it *Aiguillettes d'armes*, of the fashion that their Ensignes, Pennons, or Streamers vsed in wars were of, that is, like vnto a party coloured curtaine. In English vsually Ladies laces, and Painted Grasse. The first of the other two is called *Gramen plumarium* or *plumosum*, and *minus* is added for the distinction of it. Clusius calleth it *Spartum Austriacum*, of the likenesse and place where he found it. The last is called *Gramen plumarium*, or *plumosum mains*, The greater Feather-Grasse.

The Vertues.

These kindes of Grasses are not in any time or place that I doe heare of applied to any Physicall vse; and therefore of them I will say no more: but here I will end the prime part of this worke.

The first is called by the Latins, *Chamaeae*, from *Chama*, which signifies low, as I have already said, and is now in the Garden of the Academy, and is the most curious object of the kind.

The Time.

The first is said to have been found in the Spring and Summer, Year 1600, in the Garden of the Academy, and is now in the Garden of the Academy, and is the most curious object of the kind.

The Place.

The first is said to have been found in the Spring and Summer, Year 1600, in the Garden of the Academy, and is now in the Garden of the Academy, and is the most curious object of the kind.

The Virtue.

The first is said to have been found in the Spring and Summer, Year 1600, in the Garden of the Academy, and is now in the Garden of the Academy, and is the most curious object of the kind.

THE ORDERING OF THE KITCHEN GARDEN.

CHAP. I.

The situation of a Kitchen Garden, or Garden of Herbes, and what sort of manure is fittest to helpe the decaying of the soyle thereof.

HAVING giuen you the best rules and instructions that I can for your flower Garden, and all the flowers that are fit to furnish it, I now proceede to your herbe garden, which is not of the least respect belonging to any mans house; nor vterly to bee neglected for the many vtillities are to be had from it, both for the Masters profit and pleasure, and the meynies content and nourishment: all which if I should here set down, I had a large field to wander in, and matter sufficient to entreat of, but this worke permitteth not that libertie: and I thinke there are but few but eyther know it already, or conceine it sufficiently in their minds. Passing therefore no further in such discourses, I come to the matter in hand, which is to shew you where the fittest place is for an herbe garden. As before I shewed you that the beautie of any worthy house is much the more commended for the pleasant situation of the garden of flowers, or of pleasure, to be in the sight and full prospect of all the chiefe and choicest roomes of the house; so contrariwise, your herbe garden should bee on the one or other side of the house, and those best and choysed roomes: for the many different scents that arise from the herbes, as Cabbages, Onions, &c. are scarce well pleasing to perfume the lodgings of any house; and the many outures and breaches as it were of many of the beds thereof, which must necessarily bee, are also as little pleasant to the sight. But for priuate mens houses, who must like their habitations as they fall vnto them, and cannot haue time or meanes to alter them, they must make a vertue of necessity, and conuert their places to their best aduantage, by making their profit their chiefeest pleasure, and making one place serue for all vses. The choyce of ground for this Garden, is (as I said before) where it is fat, fertill and good; there needeth the lesse labour and cost: and contrariwise, where it is cold, wet, dry or barren, there must bee the more helpes still added to keepe it in heart. For this Garden by reason of the much and continuall stirring therein, the herbes and rootes drawing out the substance of the fertilitie thereof more abundantly then in the former, must be continually holpen with soyle, or else few things of goodnesse or worth will come forward therein. The stable soyle of horses is best and more proper for any colde grounds, for being the hottest, it will cause any the seedes for this Garden to prosper well, and be more forward then in any other ground that is not so holpen. The stable soyle of Cattell is of a colder and moister nature, and is therefore more proper for

the hot sandy or grauelly grounds, and although it bee longer before it bee brought to mould then that of horses, yet it will outlast it more then twice so long. Let euery one therefore take according to the nature of the ground such helps as are most fit and conuenient, as I haue here and before shewed. But I doe here ingenuously confesse my opinion of these forcings and helpings of ground, that howsoeuer it doth much good to some particular things, which because they delight in heate, and cannot be brought to perfection without it in this our Countrey, which is colder then their naturall from whence they are brought, must therefore haue artificiall helps to forward them; yet for many other things the compost doth much alter and abate the naturall vigour, and quickenesse of taste, that is perceiued in them that grow in a naturall fat or sandy soile that is not so holpen.

CHAP. II.

*The forme of a Garden of herbes for necessary uses,
with the ordering thereof.*

AS our former Garden of pleasure is wholly formable in euery part with squares, trayles, and knots, and to bee still maintained in their due forme and beautie: so on the contrary side this Garden cannot long conserue any forme, for that euery part thereof is subiect to mutation and alteration. For although it is conuenient that many herbes doe grow by themselves on beds, cast out into some proportion fit for them, as Tyme, Hissope, Sage, &c. yet many others may bee sown together on a plot of ground of that largeness that may serue euery mans particular vse as he shall haue occasion to employ it, as Reddish, Lettice and Onions, which after they are growne vp together may be drawne vp and taken away, as there is occasion to spend them: but Carrots or Parsneps being sown with others must bee suffered to grow last, because they require a longer time before they be fit to be taken vp. Other herbes require some large compasse of ground whereon they may grow of themselves without any other herbes growing among them, as Artichokes, Cowcumbers, Melons, Pompions. And some will doe so with their Cabbages also, but the best and most frugall way now vsed, is to plant them round about the border of your plot or ground whereon you plant Cowcumbers, Pompions, or other things, in that by this meanes so much ground will be well saued, and the other things be no whit hindered thereby, which else a great deale of ground must be employed for them apart. So that by this that I haue here said, you may perceiue the forme of this Garden is for the most part, to bee still out of forme and order, in that the continuall taking vp of the herbes and rootes that are sown and planted, causeth the beds or parts of this Garden to lye broken, dismembred, and out of the order that at the first it was put into. Remember herewithall that (as I said before) this Garden requireth the continuall helpe of soyle to be brought into it, in that the plenty of these manner of herbes and rootes doe so much waste the fertilitie and fatnesse of the ground, that without continuall refreshing it would quickly become so poore and barren, that it would not yeelde the worth of the seede. The ordinary time to sayle a Garden, is to bring in manure or dung before Christmas, and eyther bury it some small depth, not too deepe, or else to lay it vpon the ground that the winter frostes may pierce it, and then turne it shallow into the ground to sow your seeds in the Spring.

CHAP. III.
The forme of a Garden of herbes for necessary uses, with the ordering thereof.

CHAP. III.

How to order diuers Garden herbes, both for their sowing, spending, and gathering of the seede.

Our chiefest and greatest Gardiners now adaies, doe so prouide for themselves euery yeare, that from their owne grounds they gather the seede of many herbes that they sowe againe: for hauing gained the best kind of diuers herbes, they will be still furnished with the same, and be not to seeke euery yeare for new that oftentimes will not yeeldethem halfe the profit that their choyce seede will: I say of many herbes, but not of all; for the best of them all hath not ground sufficient for all sorts, nor will our climate bring some to that perfection that other forraine doth, and therefore the seede of some things are continually brought from beyond Sea vnto vs. And againe although our chiefe Gardiners doe still prouide their owne seede of diuers things from their owne ground, because as I said it is of the best kinde, yet you must vnderstand also, that good store of the same sortes of seeds are brought from beyond the Seas, for that which is gathered in this Land is not sufficient to serue euery mans vse in the whole Kingdome by many parts; yet still it is true, that our English seede of many things is better then any that cometh from beyond the Seas: as for example, Reddish, Lettice, Carrots, Parsneps, Turneps, Cabbages, and Leekes, of all which I intend to write in this place; for these are by them so husbanded, that they doe not sow their owne grounds with any other seede of these sorts but their owne: which that you may know the manner how to doe, I will here set it downe, that euery one may haue the best directions if they will follow them. Of Reddish there are two sorts, one more early then the other: they vsetherfore to sow their early Reddish first, that they may haue the earliest profit of them, which is more worth in one fortnight, then in a moneth after. And to effect this they haue some artificiall helps also; which are these: They vse to digge vp a large plot of ground wherethey intend to sow their seede a little before or after Christmas, casting it into high balkes or ridges fise or sixe foote asunder, which they suffer to lye and take all the extreame frosts in Ianuary to mellow the earth, and when the frostes are past, they then beginne to bring into it good store of fresh stable dung, which they laye neyther too deepe nor too thicke, and couer it with the mould a hand breadth thickenesse aboue the dung, which doth giue such a warmth and comfort to whatsoeuer is sowed thereon, that it forceth it forward much sooner then any other way can doe: And to preuent both the frostes, and the cold bitter windes which often spoyle their seede new sprung vp, they vse to set great high and large mattes made of reedes, tyed together, and fastened vnto strong stakes, thrust into the ground to keepe them vp from falling, or being blowne down with the winde, which mattes they place on the North and East side to breake the force of these winds, and are so sure and safe a defence, that a bricke wall cannot better defend any thing vnder it, then this fence will. In this manner they doe euery yeare to bring forward their seede to gaine the more by them, and they that will haue Reddish early, must take the same course. The other sort of Reddish for the most part is sowed in Februarie, a fortnight after the other at the least, and likewise euery moneth after vnto September, that they may haue young continually. For the blacke Reddish, although many in many places doe sowe it in the same time, and in the same manner that the ordinary is sowed, yet the nature thereof is to runne vp to seede more speedily then the other, if it haue so rich ground to grow vpon, and therefore the best time to sow it is in August, that so it may abide all winter, wherein is the chiefest time for the spending thereof, and to keepe it vntill the beginning of the next yeare from running vp to seede: the gathering whereof, as also of the other sort, is all after one manner, that is, to be pulled vp when the pods change whitish, and then hanged vpon bushes, pales, or such other thing, vntill they bee thorough dry, and then beaten or thrashed out vpon a smooth plancher, or vpon clothes, as euery ones store is, and their conueniencie. Lettice is sowed oftentimes with the early Reddish, in the same manner before said, that they may haue Lettice likewise as early as the time of the year will permit them, which they

they pull vp where they grow too thicke, spending them first, and so taking vp from time to time, vntill they stand two foote in sunder one from another, and beginne to spindle and shoote vp for seede. In this is vfed some arte to make the plants strong to giue the better seede without danger of rotting or spoyling with the wet, which often happeneth to those about whom this caution is not obserued: Before your Lettice is shot vp, marke out the choysest and strongest plantes which are fittest to grow for seede, and from those when they are a foote high, strippe away with your hand the leaues that grow lowest vpon the stalke next the ground, which might rot, spoyle or hinder them from bearing so good seede, which when it is neere to be ripe, the stalkes must be cut off about the middle, and layde vpon mats or clothes in the Sunne, that it may there fully ripen and be gathered; for it would be blowne away with the winde if it should be suffered to abide on the stalkes long. Parsneps must be sown on a deep trenched mellow ground, otherwise they may run to seede the first yeare, which then are nothing worth: or else the rootes will be small staruelings and short, and runne into many spires or branches, whereby they will not bee of halfe the worth. Some vse to sow them in August and September, that so they may bee well growne to serue to spend in Lent following, but their best time is in February, that the Summers growth may make them the fairer and greater. When they runne vp to seede, you shall take the principall or middle heades, for those carry the Master seede, which is the best, and will produce the fairest rootes againe. You shall hardly haue all the seede ripe at one instant, for vsually the chiefeest heads will be fallen before the other are ripe: you must therefore still looke them ouer, and cut them as they ripen. Carrots are vsually sown in March and Aprill, and if it chance that some of them doe runne vp for seede the same year, they are to be weeded out, for neyther the seed nor roots of them are good: You must likewise pull them vp when they are too thicke, if you will haue them grow fair, or for seed, that they may grow at the least three or foure foot in sunder: the stalkes of Carrots are limber, and fall downe to the ground; they must therefore be sustained by poles layde acrosse on stalkes thrust into the ground, and tyed to the poles and stalkes to keepe them vp from rotting or spoyling vpon the ground: the seed hereof is not all ripe at once, but must be tended and gathered as it ripeneth, and layd to dry in some dry chamber or floore, and then beaten out with a stick, and winnowed from the refuse. Turneps are sowne by themselves vpon a good ground in the end of Iuly, and beginning of August, to haue their rootes best to spend in winter; for it often happeneth that those seedes of Turneps that are sown in the Spring, runne vp to seede the same yeare, and then it is not accounted good. Many doe vse to sow Turneps on those grounds from whence the same yeare they haue taken off Reddish and Lettice, to make the greater profit of the ground, by hauing two crops of increase in one yeare. The stalkes of Turneps will bend downe to the ground, as Carrots doe, but yet must not be bound or ordered in that manner, but suffered to grow without staking or binding, so as they grow of some good distance in sunder: when the seede beginneth to grow ripe, be very carefull to preserue it from the birds, which will be most busie to deuour them. You shall vnderstand likewise that many doe account the best way to haue the fairest and most principall seede from all these fore-recited herbes, that after they are sown, and risen to a reasonable growth, they be transplanted into fresh ground. Cabbages also are not only sown for the vse of their heads to spend for meat, but to gather their seede likewise, which howsoeuer some haue endeauoured to doe, yet few haue gained good seede, because our sharpe hard frostes in winter haue spoyled and rotted their stockes they preserued for the purpose; but others haue found out a better and a more sure way, which is, to take vp your stockes that are fittest to be preserued, and bring them into the house, and there wrap them eyther in clothes, or other things to defend them from the cold, and hang them vp in a dry place, vntill the beginning of March following, then planting them in the ground, and a little defend them at the first with straw cast ouer them from the cold nights, thereby you may be sure to haue perfect good seede, if your kinde be of the best: Sowe your seed in the moneths of February or March, and transplant them in May where they may stand to grow for your vse, but be carefull to kill the wormes or Caterpillers that else will deuoure all your leaues, and be carefull also that none of the leaues bee broken in the planting, or otherwise rubbed, for that oftentimes hindereth the well closing of them. Leekes are

for the most part wholly nourfed vp from the feede that is here gathered; and because there is not so much ftore of them either sowne or spent, as there is of Onions by the twentieth part, we are still the more carefull to be provided from our owne labours; yet there be diuers Gardiners in this Kingdome, that doe gather some small quantity of Onion feede also for their owne or their priuate friends spending. The sowing of them both is much about one time and manner, yet most vsually Leeks are sowne later then Onions, and both before the end of March at the furthest; yet some sowe Onions from the end of Iuly to the beginning of September, for their Winter prouision. Those that are sowne in the Spring, are to be taken vp and transplanted on a fresh bed prepared for the purpose, or else they will hardly abide a Winter; but hauing taken roote before Winter, they will beare good feede in the Summer following: You must stake both your Leekes and your Onion beds, and with poles laida crosse, binde your lopple headed stalkes vnto them, on high as well as belowe, or else the winde and their owne weight will beare them downe to the ground, and spoile your feede. You must thinne them, that is, pull vp continually after they are first sprung vp those that growe too thicke, as you doe with all the other herbes before spoken of, that they may haue the more roome to thriue. Of all these herbes and rootes before spoken of, you must take the likeliest and fairest to keepe for your feede; for if you should not take the best, what hope of good feede can you expect? The time for the spending of these herbes and rootes, not particularly mentioned, is vntill they begin to ruine vp for feede, or vntill they are to be transplanted for feede, or else vntill Winter, while they are good, as euery one shall see cause.

CHAP. IIII.

*How to order Artichokes, Melons, Cowcumberſ,
and Pumpions.*

THere are certaine other herbes to be spoken of, which are wholly nourfed vp for their fruit sake, of whom I shall not need to say much, being they are so frequent in euery place. Artichokes being planted of faire and large slips, taken from the roote in September and October (yet not too late) will most of them beare fruit the next yeare, so that they be planted in well dunged ground, and the earth raised vp like vnto an Anthill round about each roote, to defend them the better from the extreame frosts in Winter. Others plant slips in March and Aprill, or sooner, but although some of them will beare fruit the same yeare, yet all will not. And indeede many doe rather choose to plant in the spring then in the fall, for that oftentimes an extreame hard Winter following the new setting of slips, when they haue not taken sufficient heart and roote in the ground, doth vtterly pierce and perishe them, when as they that are set in the Spring haue the whole Summers growth, to make them strong before they feele any sharpe frosts, which by that time they are the better able to beare. Muske Melons haue beene begun to bee nourfed vp but of late dayes in this Land, wherein although many haue tryed and endeauoured to bring them to perfection, yet few haue attained vnto it: but those rules and orders which the best and skilfullest haue vsed, I will here set downe, that who so will, may haue as good and ripe Melons as any other in this Land. The first thing you are to looke vnto, is to prouide you a peece of ground fit for the purpose, which is either a sloping or sheluing banke, lying open and opposite to the South Sunne, or some other fit place not sheluing, and this ground also you must so prepare, that all the art you can vse about it to make it rich is little enough; and therefore you must raise it with meere stable soyle, thorough rotten & well turned vp, that it may be at the least three foote deepe thereof, which you must cast also into high beds or balkes, with deepe trenches or furrowes betweene, so as the ridges may be at the least a foot and a halfe higher then the furrowes; for otherwise it is not possible to haue good Melons growe ripe. The choise of your feede also is another thing of especiall regard, and the best is held to be Spanishe, and not French, which hauing once gained, be sure to haue still of the same while they last good,

good, that you may haue the seede of your owne ripe Melons from them that haue eaten them, or saue some of the best your selfe for the purpose. I say while they last good; for many are of opinion, that no seede of Muske Melons gathered in England, will endure good to sowe againe here aboue the third yeare, but still they must be renewed from whence you had your choicest before. Then hauing prepared a hot bed of dung in Aprill, set your seedes therein to raise them vp, and couer them, and order them with as great care or greater then Cowcumbers, &c. are vsed, that when they are ready, they may be transplanted vpon the beds or balkes of that ground you had before prepared for them, and set them at the least two yards in sunder, euery one as it were in a hole, with a circle of dung about them, which vpon the setting being watered with water that hath stood in the Sunne a day or two, and so as often as neede is to water, couer them with strawe (some vse great hollow glasses like vnto bell heads) or some such other things, to defend them both from the cold euenings or dayes, and the heate of the Sunne, while they are young and new planted. There are some that take vpon them great skill, that mislike of the raising vp of Melons, as they doe also of Cowcumbers, on a hot bed of horse dung, but will put two or three seedes in a place in the very ground where they shall stand and growe, and thinke without that former manner of forcing them forwards, that this their manner of planting will bring them on fast and sure enough, in that they will plucke away some of the worst and weakest, if too many rise vp together in a place; but let them know for certaine, that howsoeuer for Cowcumbers their purpose and order may doe reasonable well, where the ground is rich and good, and where they strue not to haue them so early, as they that vse the other way, for Muske Melons, which are a more tender fruit, requiring greater care and trouble in the nourishing, and greater and stronger heate for the ripening, they must in our cold climate haue all the art vsed vnto them that may be, to bring them on the more early, and haue the more comfort of the Sunne to ripen them kindly, or else they will not bee worth the labour and ground. After you haue planted them as aforesaid, some of good skill doe aduise, that you be carefull in any dry season, to giue them water twice or thrice euery weeke while they are young, but more afterward when they are more growne, and that in the morning especially, yea and when the fruit is growne somewhat great, to water the fruit it selfe with a watering pot in the heate of the day, is of so good effect, that it ripeneth them much faster, and will giue them the better taste and smell, as they say. To take likewise the fruit, and gather it at the full time of his ripenesse is no small art; for if it be gathered before his due time to be presently eaten, it will be hard and greene, and not eate kindly; and likewise if it be suffered too long, the whole goodnesse will be lost: You shall therefore know, that it is full time to gather them to spend presently, when they begin to looke a little yellowish on the outside, and doe smell full and strong; but if you be to send them farre off, or keepe them long vpon any occasion, you shall then gather them so much the earlier, that according to the time of the carriage and spending, they may ripen in the lying, being kept dry, and couered with woollen clothes: When you cut one to eate, you shall know it to be ripe and good, if the seede and pulpe about them in the middle be very waterish, and will easily be separated from the meate, and likewise if the meate looke yellow, and be mellow, and not hard or greene, and taste full and pleasant, and not waterish: The vsuall manner to eate them is with pepper and salt, being pared and sliced, and to drowne them in wine, for feare of doing more harme. Cowcumbers and Pompions, after they are nourished vp in the bed of hot dung, are to be seuerally transplanted, each of them on a large plot of ground, a good distance in sunder: but the Pompions more, because their branches take vp a great deale more ground, & besides, will require a great deale more watering, because the fruit is greater. And thus haue you the ordering of those fruits which are of much esteeme, especially the two former, with all the better sort of persons; and the third kinde is not wholly refused of any, although it serueth most vually for the meaner and poorer sort of people, after the first early ripe are spent.

CHAP. V.

The ordering of diuers sorts of herbes for the pot, for meate,
and for the table.

Tyme, Sauory, and Hyssope, are vsually sowne in the Spring on beds by themselves, euery one a part; but they that make a gaine by selling to others the young rootes, to set the knots or borders of Gardens, doe for the most part sowe them in Iuly and August, that so being sprung vp before Winter, they will be the fitter to be taken vp in the Spring following, to serue any mans vse that would haue them. Sage, Lauender, and Rosemary, are altogether set in the Spring, by slipping the old stalkes, and taking the youngest and likeliest of them, thrusting them either twined or otherwise halfe a foote deepe into the ground, and well watered vpon the setting; if any seasonable weather doe follow, there is no doubt of their well thriving: the hot Sunne and piercing drying Windes are the greatest hinderances to them; and therefore I doe aduise none to set too soone in the Spring, nor yet in Autumne, as many doe practise: for I could neuer see such come to good, for the extremity of the Winter coming vpon them so soone after their setting, will not suffer their young shootes to abide, nor hauing taken sufficient strength in the ground, to maintain themselves against such violence, which doth often pierce the strongest plants. Marierome and Bassill are sowne in the Spring, yet not too early; for they are tender plants, and doe not spring vntill the weather bee somewhat warme: but Bassill would bee sowne dry, and not haue any water of two or three daies after the sowing, else the seede will turne to a gelly in the ground. Somewhile to sowe the seed of Rosemary, but it seldome abideth the first Winter, because the young plants being small, and not of sufficient strength, cannot abide the sharpnesse of some Winters, notwithstanding the couering of them, which killeth many old plants; but the vsuall way is to slippe and set, and so they thriue well. Many doe vse to sowe all or the most sorts of Pot-herbes together on one plot of ground, that they neede not to goe farre to gather all the sorts they would vse. There are many sorts of them well knowne vnto all, yet few or none doe vse all sorts, but as euery one liketh, some vse those that others refuse, and some esteeme those not to bee wholefome and of a good relish, which others make no scruple of. The names of them are as followeth, and a short relation of their sowing or planting.

- Rosemary, Tyme, and Sauorie are spoken of before, and Onions and Leekes.
- Mints are to bee set with their rootes in some by-place, for that their rootes doe creepe so farre vnder ground, that they quickly fill vp the places neare adioyning, if they be not puld vp.
- Clarie is to be sowne, and seedeth and dyeth the next yeare, the herbe is strong, and therefore a little thereof is sufficient.
- Nep is sowne, and dyeth often after seeding, few doe vse it, and that but a little at a time: both it and Clarie are more vsed in Tanfies then in Broths.
- Costmarie is to be set of rootes, the leaues are vsed with some in their Broths, but with more in their Ale.
- Pot Marierome is set of rootes, being separated in sunder.
- Pennirovall is to be set of the small heads that haue rootes, it creepeth and spreadeth quickly.
- Allisanders are to be sowne of seede, the tops of the rootes with the greene leaues are vsed in Lent especially.
- Parsley is a common herbe, and is sowne of seede, it seedeth the next yeare and dyeth: the rootes are more vsed in broths then the leaues, and the leaues almost with all sorts of meates.
- Fennell is sowne of seede, and abideth many yeares yeelding seede: the rootes also are vsed in broths, and the leaues more seldome, yet serue to trimme vp many fish meates.
- Borage is sowne of seede, and dyeth the next yeare after, yet once being suffered to seede in a Garden, will still come of it owne shedding.

Buglosse commeth of seede, but abideth many yeares after it hath giuen seede, if it stand not in the coldest place of the Garden.

Marigolds are sowne of seede, and may be after transplanted, they abidetwo or three yeares, if they be not set in too cold a place: the leaues and flowers are both vsed.

Langedebee is sowne of seede, which shedding it selfe will hardly be destroyed in a Garden.

Arrach is to be sowne of seede, this likewise will rise euery yeare of it owne seed, if it be suffered to shed it selfe.

Beetes are sowne of seede, and abideth some yeares after, still giuing seede.

Blites are vsed but in some places; for there is a generall opinion held of them, that they are naught for the eyes: they are sowne euery yeare of seede.

Bloodwort once sowne abideth many yeares, if the extremity of the frosts kill it not, and seedeth plentifully.

Patience is of the same nature, and vsed in the same manner.

French Mallows are to be sowne of seede, and will come of it owne sowing, if it be suffered to shed it selfe.

Ciues are planted onely by parting the rootes; for it neuer giueth any seede at all.

Garlicke is ordered in the same manner, by parting and planting the rootes euery yeare.

These be all the sorts are vsed with vs for that purpose, whereas I said before, none vseth all, but euery one will vse those they like best: and so much shall suffice for pot-herbes.

CHAP. VI.

The manner and ordering of many sorts of herbes and rootes for Sallets.

IF I should set downe all the sorts of herbes that are vsually gathered for Sallets, I should not onely speake of Garden herbes, but of many herbes, &c. that growe wilde in the fields, or else be but weedes in a Garden; for the vsuall manner with many, is to take the young buds and leaues of euery thing almost that groweth, as well in the Garden as in the Fields, and put them all together, that the taste of the one may amend the relish of the other: But I will only shew you those that are sown or planted in gardens for that purpose. Asparagus is a principall & delectable Sallet herbe, whose young shootes when they are a good handfull high aboue the ground, are cut an inch within the ground, which being boyled, are eaten with a little vinegar and butter, as a Sallet of great delight. Their ordering with the best Gardiners is on this wise: When you haue provided seede of the best kinde, you must sowe it either before Christmas, as most doe, or before the end of February; the later you sowe, the later and the more hardly will they spring: after they are growne vp, they are to be transplanted in Autumne on a bed well trenched in with dung; for else they will not bee worth your labour, and set about a foote distance in sunder, and looke that the more carefull you are in the replanting of them, the better they will thriue, and the sooner growe great: after five or six yeares standing they vsually doe decay; and therefore they that striue to haue continually faire and great heads, doe from seede raise vp young for their store. You must likewise see that you cut not your heads or young shoote too nigh, or too much, that is, to take away too many heads from a roote, but to leaue a sufficient number vncut, otherwise it will kill the heart of your rootes the sooner, causing them to dye; or to giue very small heads or shootes; for you may well consider with your selfe, that if the roote haue not head enough left it aboue the ground to shoote Greene this yeare, it will not, nor cannot prosper vnder ground to giue increase the next yeare. The ordering of Lettice I haue spoken of before, and shall not neede here to repeate what hath beene already said, but referre you thereunto for the sowing, planting, &c. onely I will here shew you the manner of ordering them for Sallets. There are some sorts of Lettice that growe very great, and close their heads, which are called Cabbage

bage Lettice, both ordinary and extraordinary, and there are other sorts of great Lettice that are open, and close not, nor cabbage not at all, which yet are of an excellent kinde, if they be vsed after that special manner is fit for them, which is, That when they are planted (for after they are sowne, they must be transplanted) of a reasonable distance in sunder, and growne to be of some bignesse, euery one of them must be tyed together with bast or thread toward the toppes of the leaues, that by this meanes all the inner leaues may growe whitish, which then are to be cut vp and vsed: for the keeping of the leaues close doth make them taste delicately, and to bee very tender. And these sorts of Lettice for the most part are spent after Summer is past, when other Lettice are not to be had. Lambes Lettice or Corne Sallet is an herbe, which abiding all Winter, is the first Sallet herbe of the yeare that is vsed before any ordinary Lettice is ready; it is therefore vsually sowne in August, when the seede thereof is ripe. Purslane is a Summer Sallet herbe, and is to be sowne in the Spring; yet somewhat late, because it is tender, and ioyleth in warmth; and therefore diuers haue sowne it vpon those beddes of dung, whereon they nourished vp their Cowcumbers, &c. after they are taken away, which being well and often watered, hath yeelded Sallet vntill the end of the yeare. Spinach is sowne in the Spring, of all for the most part that vse it, but yet if it be sowne in Summer it will abide greene all the Winter, and then seedeth quickly: it is a Sallet that hath little or no taste at all therein, like as Lettice and Purslane, and therefore Cookes know how to make many a good dish of meate with it, by putting Sugar and Spice thereto. Coleworts are of diuers kinds, and although some of them are wholly spent among the poorer sort of people, yet some kindes of them may be dressed and ordered as may delight a curious palate, which is, that being boyled tender, the middle ribs are taken cold, and laid in dishes, and vinegar and oyle poured thereon, and so eaten. Coleflowers are to be had in this Countrey but very seldom, for that it is hard to meete with good seede: it must be sowne on beds of dung to force it forward, or else it would perish with the frost before it had giuen his head of flowers, and transplanted into verie good and rich ground, lest you lose the benefit of your labours. Endiue is of two sorts, the ordinary, and another that hath the edges of the leaues curld or crumpled; it is to be whited, to make it the more dainty Sallet, which is vsually done in this manner: After they are grown to some reasonable greatnesse (but in any case before they shoote forth a stalke in the midst for seede) they are to be taken vp, and the rootes being cut away, lay them to dry or wither for three or foure houres, and then bury them in sand, so as none of them lye one vpon another, or if you can, one to touch another, which by this meanes will change whitish, and thereby become verie tender, and is a Sallet both for Autumne and Winter. Succorie is vsed by some in the same manner, but because it is more bitter then Endiue, it is not so generally vsed, or rather vsed but of a verie few: and whereas Endiue will seede the same yeare it is sowne, and then dye, Succorie abideth manie yeares, the bitterness thereof causing it to be more Physicall to open obstructions, and therefore the flowers pickled vp, as diuers other flowers are vsed to be now adaies, make a delicate Sallet at all times when there is occasion to vse them. Of red Beetes, the rootes are onely vsed both boyled and eaten cold with vinegar and oyle, and is also vsed to trimme vp or garnish forth manie sorts of dishes of meate: the seede of the best kinde will not abide good with vs about three yeares, but will degenerate and growe worse; and therefore those that delight therein must be curious, to be provided from beyond Sea, that they may haue such as will giue delight. Sorrell is an herbe so common, and the vse so well knowne, both for sawce, and to season broths and meates for the sound as well as sicke persons, that I shall not neede to say anie more thereof. Cheruill is a Sallet herbe of much vse, both with French and Dutch, who doe much more delight in herbes of stronger taste then the English doe: it is sowne early, and vsed but a while, because it quickly runneth vp to seede. Sweete Cheruill, or as some call it, Sweete Cis, is so like in taste vnto Anise seede, that it much delighteth the taste among other herbes in a Sallet: the seede is long, thicke, blacke, and cornered, and must be sowne in the end of Autumne, that it may lye in the ground all the Winter, and then it will shoote out in the Spring, or else if it be sowne in the Spring, it will not spring vp that yeare vntill the next: the leaues (as I said before) are vsed among other herbes: the rootes likewise are not onely cordiall, but also held to be preseruatiue against the Plague, either greene, dryed, or preserued

with sugar. Rampion rootes are a kinde of Sallet with a great many, being boyled tender, and eaten cold with vinegar and pepper. Cresses is an herbe of easie and quick growth, and while it is young eaten eyther alone, or with parsley and other herbes: it is of a strong taste to them that are not accustomed thereunto, but it is much vsed of strangers. Rocket is of the same nature and qualitie, but somewhat stronger in taste: they are both sown in the Spring, and rise, seede and dye the same yeare. Tarragon is an herbe of as strong a taste as eyther Rocket or Cresses, it abideth and dyeth not euery yeare, nor yet giueth ripe seede (as far as euer could bee found with vs) any yeare, but maketh sufficient increase within the ground, spreading his roots all abroad a great way off. Mustard is a common sawce both with fish and flesh, and the seed thereof (and no part of the plant besides) is well knowne how to be vsed being grownded, as euery one I thinke knoweth. The rootes of horse Radish likewise beeing grownd like Mustard, is vsed both of strangers and our owne nation, as sawce for fish. Tansie is of great vse, almost with all manner of persons in the Spring of the yeare: it is more vsuall planted of the rootes then otherwise; for in that the rootes spread far and neere they may be easily taken away, without any hurt to the rest of the rootes. Burnet, although it be more vsed in wine in the Summer time then any way else, yet it is likewise made a sallet herbe with many, to amend the harsh or weak rellish of some other herbes. Skirrets are better to be sown of the seed then planted from the roots, and will come on more speedily, and be fairer rootes: they are as often eaten cold as a Sallet, being boyled and the pith taken out, as stewed with butter and eaten warme. Let not Parsley and Fenell be forgotten among your other Sallet herbes, wherof I haue spoken before, and therefore need say no more of them. The flowers of Marigolds pickt cleane from the heads, and pickled vp against winter, make an excellent Sallet when no flowers are to be had in a garden. Cloue Gilloflowers likewise preserued or pickled vp in the same manner (which is *stratum super stratum*, a lay of flowers, and then strawed ouer with fine dry and poudered Sugar, and so lay after lay strawed ouer, vntill the pot bee full you meane to keepe them in, and after filled vp or couered ouer with vinegar) make a Sallet now adayes in the highest esteeme with Gentles and Ladies of the greatest note: the planting and ordering of them both is spoken of feuerally in their proper places. Goates beareth that groweth in Gardens only, as well as that which groweth wilde in Medowes, &c. bearing a yellow flower, are vsed as a Sallet, the rootes beeing boyled and pared are eaten cold with vinegar, oyle and pepper, or else stewed with butter and eaten warme as Skirrets, Parsneps &c. And thus haue you here set downe all those most vsuall Sallets are vsed in this Kingdome: I say the most vsuall, or that are nourfed vp in Gardens; for I know there are some other wilde herbes and rootes, as Dandelion &c. but they are vsed onely of strangers, and of those whose curiositie searcheth out the whole worke of nature to satisfie their desires.

CHAP. VII.

Of diuers Physicall herbes fit to be planted in Gardens, to serue for the especiall uses of a familie.

HAuing thus shewed you all the herbes that are most vsuall planted in Kitchen Gardens for ordinary vses, let mee also adde a few other that are also nourfed vp by many in their Gardens, to preserue health, and helpe to cure such small diseases as are often within the compasse of the Gentlewomens skills, who, to helpe their owne familie, and their poore neighbours that are farre remote from Physitians and Chirurgions, take much paines both to doe good vnto them, and to plant those herbes that are conducing to their desires. And although I doe recite some that are mentioned in other places, yet I thought it meete to remember them altogether in one place. Angelica, the garden kinde, is so good an herbe, that there is no part thereof but is of much vse, and all cordiall and preseruatiue from infectious or contagious diseases, whether you will distill the water of the herbe, or preserue or candie the rootes or the greene stalkes, or vse the seede in pouder or in distillations, or decoctions with other things: it is sown of seede, and will abide vntill

it giue seede, and then dyeth. Rue or Herbe grace is a strong herbe, yet vsed inwardly against the plague as an Antidote with Figs and Wall-nuts, and helpeth much against windy bodies: outwardly it is vsed to bee layde to the wrestles of the hands, to driue away agues: it is more vsually planted of slips then raised from seede, and abideth long if sharpe frostes kill it not: Dragons being distilled are held to be good to expell any euill thing from the heart: they are altogether planted of the rootes. Setwall, Valerian, or Capons tayle, the herbe often, but the roote much better, is vsed to prouoke sweating, thereby to expell euill vapours that might annoy the heart: it is only planted of the rootes when they are taken vp, and the young replanted. Asarabacca, the leaues are often vsed to procure vomiting being stamped, and the strained iuice to a little quantitie, put into a draught of ale and drunke, thereby to ease the stomacke of many euill and grosse humours that there lye and offend it: diuers also take the leaues and rootes a little boyled in wine, with a little spice added thereunto, to expell both tertian and quartan agues: the rootes of our English growing is more auailable for these purposes then any outlandish: it is planted by the roote, for I could neuer see it spring of seede. Masterwort commeth somewhat neere in propertie vnto Angelica, and besides very effectuell to disperse winde in the bodie, whether of the collicke or otherwise; as also very profitable to comfort in all cold causes: it yeeldeth seede, but yet is more vsually planted from the rootes being parted. Balme is a cordiall herbe both in smell and taste, and is wholly vsed for those purposes, that is, to comfort the heart being distilled into water either simple or compound, or the herbe dried and vsed: it is set of the rootes being parted, because it giueth no seede that euer I could obserue. Camomill is a common herbe well knowne, and is planted of the rootes in alleys, in walkes, and on bankes to sit on, for that the more it is troden on, and pressed downe in dry weather, the closer it groweth, and the better it will thriue: the vse thereof is very much, both to warme and comfort, and to ease paines being applyed outwardly after many fashions: the decoction also of the flowers prouoketh sweat, and they are much vsed against agues. Featherfew is an herbe of greater vse for women then for men, to dissolue flatulent or windy humours, which causeth the paines of the mother: some vse to take the iuice thereof in drinke for agues: it is as well sown of the seede as planted of the rootes. Costmary is vsed among those herbes that are put into ale to cause it haue a good rellish, and to be somewhat physcally in the moneth of May, and doth helpe to prouoke vrine: it is set of the rootes being parted. Maudlin is held to be a principall good herbe to open and cleanse the liuer, and for that purpose is vsed many wayes, as in ale, in tanfies, and in broths &c. the seed also is vsed, and so is the herbe also sometimes, to kill the wormes in children: it is sown of the seede, and planted also of the separated rootes. Cassidonic is a small kinde of Lauender, but differing both in forme and qualitie: it is much vsed for the head to ease paines thereof, as also put among other things to purge melancholick diseases: it is sown of seede, and abideth not a winter vnlesse it bee well defended, and yet hardly giueth ripe seede againe with vs. Smallage is a great opening herbe, and much more then eyther Parsley or Fenell, and the rootes of them all are often vsed together in medicines: it is sown of seede, and will not bee wanting in a Garden if once you suffer it to sow it selfe. Cardus Benedictus, or the Blessed Thistle, is much vsed in the time of any infection or plague, as also to expell any euill symptome from the heart at all other times. It is vsed likewise to be boyled in posset drink, & giuen to them that haue an ague, to help to cure it by sweating or otherwise. It is vsually sown of seede, and dyeth when it hath giuen seed. Winter Cherries are likewise nursed vp in diuers gardens, for that their propertie is to giue helpe to them that are troubled eyther with the stopping or heate of their vrine: the herbe and berries are often distilled, but the berries alone are more often vsed: after it is once planted in a garden it will runne vnder ground, & abide well enough. Celondine is held to bee good for the iaundise, it is much vsed for to cleere dim eyes, eyther the iuice or the water dropped into them: it is sown of seede, and being once brought into a garden, will hardly be weeded out: the seede that sheddeth will so sow it selfe, and therefore some corner in a garden is the fittest place for it. Tabacco is of two sorts, and both vsed to be planted in Gardens, yet the English kinde (as it is called) is more to be found in our Countrey Gardens then the Indian sort: the leaues of both sorts indifferently, that is, of eyther of which is next at hand, being stamped and boy-

led eyther by it selfe, or with other herbes in oyle or hogs suet, doe make an excellent salve for greene wounds, and also to clense old vlcers or sores; the iuice of the greene leaues drunke in ale, or a dried leafe steeped in wine or ale for a night, and the wine or ale drunke in the morning, prouoketh to cast, but the dried leafe much stronger then the greene: they are sown of seede, but the Indian kinde is more tender, and will not abide a winter with vs abroade. Spurge that vsually groweth in Gardens, is a violent purger, and therefore it is needfull to be very carefull how it is vsed: the seede is more ordinarily vsed then any other part of the plant, which purgeth by vomiting in some, and both vpwards and downwards in many; the iuice of the herbe, but especially the milke thereof, is vsed to kill wartes: it is sown of seede, and when it doth once shed it selfe, it will still continue springing of the fallen seede. Bearefoote is sown of seed, and will hardly abide transplanting vnlesse it bee while it is young; yet abideth diuers yeares, if it stand not in too cold a place. This I speake of the greater kinde; for the lower small wilde kind (which is the most ordinary in this land) will neuer decay: the leaues are sometimes vsed greene, but most vsually dried and poudered, and giuen in drinke to them that haue the wormes: it purgeth melancholy, but especially the roots. In many Countries of this Land, and el sewhere, they vse to thrust the stalk of the great kinde through the eare or dewlap of Kine and Cattell, to cure them of many diseases. Salomons Seale, or (as some call it) Ladder to heauen, although it doth grow wilde in many places of this Land, yet is planted in Gardens: it is accounted an excellent wound herbe to consolidate, and binde, insomuch that many vse it with good successe to cure ruptures, and to stay both the white and the red fluxe in women: it is planted altogether of the rootes, for I could neuer finde it spring from the seede, it is so strong. Comfry likewise is found growing wilde in many places by ditch sides, and in moist places, and therefore requireth some moist places of the garden: it is wholly vsed for knitting, binding, and consolidating fluxes and wounds, to be applyed either inwardly or outwardly: The rootes are stronger for those purposes then any other parts of the plant. Licoris is much vsed now adaies to bee planted in great quantitie, euen to fill many acres of ground, whereof riseth a great deale of profit to those that know how to order it, and haue fit grounds for it to thrue in; for euery ground will not be aduantageous: It will require a very rich, deepe and mellow ground, cyther naturall or artificiall; but for a priuate house where a small quantitie will serue, there needeth not so much curiositie: it is vsually planted of the top heads, when the lower rootes (which are the Licoris that is vsed) and the runners are cut from them. Some vse to make an ordinary drinke or beuerage of Licoris, boyled in water as our vsuall ale or beere is with malt, which fermented with barme in the same manner, and tunned vp, serueth in stead thereof, as I am credibly informed: It is otherwise in a manner wholly spent for colds, coughes and rheumes, to expectorate flegme, but vsed in diners formes, as in iuice, in decoctions, syrups, roubles, trochiscs, and the greene or dried roote of it selfe.

And these are the most ordinary Physicall herbes that are vsed to be planted in gardens for the vse of any Country familie, that is (as I said before) farre remote from Physitians or Cbirurgions abidings, that they may vse as occasion serueth for themselves or their neighbours, and by a little care and paines in the applying may doe a great deale of good, and sometimes to them that haue not wherewith to spend on themselves, much lesse on Physitians or Chirurgions, or if they haue, may oftentimes receiue lesse good at their hands then at others that are taught by experience in their owne families, to be the more able to giue helpe to others.

THE KITCHEN GARDEN.

THE SECOND PART.

Containing as well all sorts of herbes, as rootes and fruits, that are vsually planted in Gardens, to serue for the vse of the Table whether of the poore or rich of our Countrey: but herein I intend not to bring any fruite bearing trees, shrubbes, or bushes; for I reserue them for my Orchard, wherein they shal be set forth. So that in these three parts, I suppose the exquisite ornament of any worthy house is consummate for the exterior bounds, the benefit of their riches extending also to the furnishing of the most worthy inward parts thereof: but because many take pleasure in the sight and knowledge of other herbes that are Physicall, and much more in their properties and vertues, if vnto these three I should adde a Physicke Garden, or Garden of Simples, there would be a quadripartite complement, of whatsoeuer arte or nature, necessitie or delight could affect: which to effect (as many my friends haue intreated it at my hands) will require more paines and time then all this worke together: yet to satisfie their desires and all others herein, that would bee enformed in the truth, and reformed of the many errors and slips set forth and published heretofore of plants by diuers, I shall (God assisting and granting life) labour to performe, that it may shew it selfe to the light in due conueniencie, if these bee well and gratefully accepted. And because I ended with some sweete herbes in the former part, I will in this part begiue with the rest, which I reserued for this place, as fitter for the pot and kitchen then for the hand or bosome, and so descend to other herbes that are for meat or sallets: and after them to those rootes that are to be eaten, as meate or as sallets: and lastly the fruits that grow neere, or vpon the ground, or not much aboue it, as the Artichoke, &c. in which I make a shorter description then I did in the former, rather endeauiouring to shew what they are, and whereunto they are vsed, then the whole varietie or any exact declaration: which methode, although in some sort it may bee fitting for this purpose, yet it is not for an history or herball: I shall therefore require their good acceptance for whose sake I doe it, not doubting, but that I, or others, if they write againe of this subiect, may polish and amende what formerly hath beene cyther mis set, or not so thoroughly expressed, besides some additions of new conceits, seeing I treade out a new path, and therefore those that follow may the easilier see the Meanders, and so goe on in a direct line.

CHAP. I.

Maierana latifolia, sine maior Anglica. Winter, or pot Marierome.

Winter Marierome is a small bushie herbe like unto sweete Marierome, being parted or divided into many branches, whereon doe grow broader and greener leaues, set by couples, with some small leaues likewise at the feuerall ioynts all along the branches: at the tops whereof grow a number of small purplish white flowers set together in a tuft, which turne into small and round seed, bigger then sweet Marierome seede: the whole plant is of a small and fine sent, but much inferiour to the other, and is nothing so bitter as the sweete Marierome, and thereby both the fitter and more willingly vsed for meates: the roote is white and threddy, and perissheth not as the former, but abideth many yeares.

The Vse of winter Marierome.

The vse of this Marierome is more frequent in our Land then in others, being put among other pot-herbes and farling (or fasting herbes as they are called) and may to good profit bee applied in inward as well as outward griefes for to comfort the parts, although weaker in effect then sweete Marieromes.

CHAP. II.

Thymum vulgatum sine durius. Ordinary Garden Tyme.

The ordinary Garden Tyme is a small low wooddy plant with brittle branches, and small hard Greene leaues, as euery one knoweth, hauing small white purplish flowers, standing round about the tops of the stalkes: the seed is small and browne, darker then Marierome seed: the root is woody, and abideth well diuers Winters.

Thymum latifolium. Masticke Tyme.

This Tyme hath neyther so wooddy branches, nor so hard leaues, but groweth lower, more spreading, and with somewhat broader leaues: the flowers are of a purplish white colour, standing in roundles round about the stalkes, at the ioynts with leaues at them likewise. This Tyme endureth better and longer then the former, and by spreading it selfe more then the former, is the more apt to bee propagated by slipping, because it hath beene seldome seene to giue seede: It is not so quicke in sent or taste as the former, but is fitter to set any border or knot in a garden, and is for the most part wholly employed to such vses.

The Vse of Tyme.

To set downe all the particular vses whereunto Tyme is applyed, were to weary both the Writer and Reader, I will but only note out a few: for besides the physcally vses to many purposes, for the head, stomacke, spleene, &c. there is no herbe almost of more vse, in the houses both of high and low, rich and poore, both for inward and outward occasions: outwardly for bathings among other hot herbes, and among other sweete herbes for strewings: inwardly in most sorts of broths, with Rosmary, as also with other fasting (or rather farling) herbes, and to make sawce for diuers sorts both fish and flesh, as to stuffe the belly of a Goose to bee roasted, and after put into the sawce, and the poulder with breade to strew on meate when it

1 *Majorana major* Anglica. Pot Marigold. 2 *Thymum vulgatum*. Garden Thyme. 3 *Satureia*. Savourie. 4 *Hyssopus*. Hyssop. 5 *Pulegium*. Penniroyal. 6 *Salvia major*. Common Sage. 7 *Salvia minor* *pratensis*. Sage of virtue.

is roasted, and so likewise on roasted or fryed fish. It is held by diuers to bee a speedy remedy against the sting of a Bee, being bruised and layd thereon.

CHAP. III.

Satureia sine Thymbra. Sauorie.

THere are two sorts of of Sauory, the one called Summer, and the other Winter Sauorie: The Summer Sauorie is a small tender herbe, growing not aboue a foote and a halfe high, or thereabouts, rising vp with diuers brittle branches, slenderly or sparsedly set with small long leaues, soft in handling, at euery ioynt a couple, one against another, of a pleasant strong and quicke sent and taste: the flowers are small and purplish, growing at the toppes of the stalkes, with two small long leaues at the ioynts vnder them: the seede is small, and of a darke colour, bigger then Tyme seede by the halfe: the roote is woody, and hath many strings, perishing euery yeare wholly, and must bee new sowed againe, if any will haue it.

The Winter Sauorie is a small low bushie herbe, very like vnto Hyssope, but not aboue a foote high, with diuers small hard branches, and hard darke green leaues thereon, thicker set together then the former by much, and as thicke as common Hyssope, sometimes with foure leaues or more at a ioynt, of a reasonable strong sent, yet not so strong or quicke as the former: the flowers are of a pale purplish colour, set at seuerall distances at the toppes of the stalkes, with leaues at the ioynts also with them, like the former: the roote is woody, with diuers small strings thereat, and abideth all the winter with his greene leaues: it is more vsually encreased by slipping or diuiding the roote, and new setting it seuerally againe in the Spring, then by sowing the seed.

The Vse of Sauorie.

The Summer Sauorie is vsed in other Countreyes much more then with vs in their ordinary diets, as condiment or sawce to their meates, sometimes of it selfe, and sometimes with other herbes, and sometimes strewed or layde vpon the dishes as we doe Parsley, as also with beanes and pease, rise and wheate; and sometimes the dried herbe boyled among pease to make portage.

The Winter Sauorie is one of the (sarling) fastening herbes as they call them, and so is the Summer Sauorie also sometimes. This is vsed also in the same manner that the Summer Sauorie is, set downe before, and to the same purposes: as also to put into puddings, sawfages, and such like kindes of meates. Some doe vie the ponder of the herbe dried (as I sayd before of Tyme) to mixe with grated bread, to breade their meate, be it fish or flesh, to giue it the quicker relish. They are both effectuell to expell winde.

CHAP. IIII.

Hyssopus. Hyssope.

Garden Hyssope is so well knowne to all that haue bene in a Garden, that I shall but *actum agere*, to bestow any time thereon, being a small bushie plant, not rising aboue two foote high, with many branches, woody below, and tender aboue, whereon are set at certaine distances, sundry small, long and narrow greene leaues: at the toppe of euery stalke stand blewish purple gaping flowers, one aboue another in a long spike or eare: after which followeth the seede, which is small and blackish: the rootes are composed of many threddy strings, the whole plant is of a strong sweet sent.

The

The Use of Hyssope.

Hyssope is much vsed in Prisans and other drinkes, to help to expectorate flegme. It is many Countrey peoples medicine for a cut or greene wound, being bruised with sugar and applyed. I finde it is also much commended against the falling sicknesse, especially being made into pils after the manner before rehearsed. It is accounted a speciall remedy against the sting or biting of an Adder, if the place be rubbed with Hyssope, bruised and mixed with honey, salt and cummin seede. A decoction thereof with oyle, and annointed, taketh away the itching and tingling of the head, and vermine also breeding therein. An oyle made of the herbe and flowers, being annointed, doth comfort benumbed sinewes and ioynts.

CHAP. V.

Pulegium. Pennyroyall.

Pennyroyall also is an herbe so well knowne, that I shall not neede to spend much time in the description of it: hauing many weake round stalkes, diuided into sundry branches, rather leaning or lying vpon the ground then standing vpright, whereon are set at seuerall ioynts, small roundish darke greene leaues: the flowers are purplish that grow in gardens, yet some that grow wilde are white, or more white then purple, set in roundles about the tops of the branches; the stalkes shoote forth small fibres or rootes at the ioynts, as it lyeth vpon the ground, thereby fastening it selfe therein, and quickly increaseth, and ouer-runneeth any ground, especially in the shade or any moist place, and is replanted by breaking the sprouted stalkes, and so quickly groweth.

Other sorts of Pennyroyall are fit for the Physicke Garden, or Garden of Simples.

The Use of Pennyroyall.

It is very good and wholesome for the lunges, to expell cold thin flegme, and afterwards to warme and dry it vp: and is also of the like propertie as Mintes, to comfort the stomacke, and stay vomiting. It is also vsed in womens baths and washings; and in mens also to comfort the sinewes. It is yet to this day, as it hath bene in former times, vsed to bee put into puddings, and such like meates of all sorts, and therefore in diuers places they know it by no other name then Pudding-grasse.

The former age of our great Grandfathers, had all these hot herbes in much and familiar vse, both for their meates and medicines, and therewith preserued themselues in long life and much health: but this delicate age of ours, which is not pleased with any thing almost, be it meat or medicine, that is not pleasant to the palate, doth wholly refuse these almost, and therefore cannot be partaker of the benefit of them.

CHAP. VI.

Salvia. Sage.

THere are two especiall kindes of Sage noursed vp in our Gardens, for our ordinary vse, whereof I intend to write in this place, leauing the rest to his fitter place. Our ordinary Sage is reckoned to bee of two sorts, white and red,
both

both of them bearing many foure square woody stalkes, in some whiter, in others redder; as the leaues are also, standing by couples at the ioynts, being long, rough, and wrinkled, of a strong sweete sent: at the tops of the stalkes come forth the flowers, set at certaine spaces one aboue another, which are long and gaping, like vnto the flowers of Clary, or dead Nettles, but of a blewish purple colour; after which come small round feede in the huske that bore the flower: the roote is woody; with diuers strings at it: It is more vsually planted of the slips, pricked in the Spring time into the ground, then of the seed.

Salvia minor sine pinnata. Small Sage or Sage of vertue.

The lesser Sage is in all things like vnto the former white Sage, but that his branches are long and slender, and the leaues much smaller, hauing for the most part at the bottome of each side of the leafe a peece of a leafe, which maketh it shew like finns or eares: the flowers also are of a blewish purple colour, but lesser. Of this kinde there is one that beareth white flowers.

The Vse of Sage.

Sage is much vsed of many in the moneth of May fasting, with butter and Parsley, and is held of most much to conduce to the health of mans body.

It is also much vsed among other good herbes to bee tuncd vp with Ale, which thereupon is termed Sage Ale, whereof many barrells full are made, and drunke in the said moneth chiefly for the purpose afore recited: and also for teeming women, to helpe them the better forward in their childebearing, if there be feare of abortion or miscarrying.

It is also vsed to be boyled among other herbes, to make Gargles or waters to wash sore mouths and throates: As also among other herbes, that serue as bathings, to wash mens legs or bodies in the Summer time, to comfort nature, and warme and strengthen aged cold sinewes, and lengthen the strength of the younger.

The Kitchen vse is either to boyle it with a Calues head, and being minced, to be put with the braines, vinegar and pepper, to serue as an ordinary sawce thereunto: Or being beaten and iuyced (rather then minced as manie doe) is put to a roasted Pigges braines, with Currans for sawce thereunto. It is in small quantity (in regard of the strong taste thereof) put among other fasting herbes, to serue as sawce for peeces of Veale, when they are farfed or stuffed therewith, and roasted, which they call Olliues.

For all the purposes aforesaid, the small Sage is accounted to be of the more force and vertue.

CHAP. VII.

Horminum sativum. Garden Clary.

THere is but one sort of Garden Clary, though many wilde, which hath foure squares stalks, with broad rough wrinkled whitish leaues, somewhat vneuenly cut in on the edges, and of a strong sweete sent, growing some next the ground, & some by couples vpon the stalkes: the flowers growe at certaine distances, with two small leaues at the ioynts vnder them, somewhat like vnto the flowers of Sage, but lesser, and of a very whitish or bleake blew colour: the feede is of a blackish browne colour, somewhat flat, and not so round as the wilde: the rootes spread not farre, and perish euery yeare that they beare flowers and feede. It is altogether to bee sowne of seed in the Spring time, yet sometimes it will rise of it owne sowing.

The

The Use of Clary.

The most frequent and common use of Clary, is for men or women that haue weake backs, to helpe to comfort and strengthen the raines, being made into Tanlies and eaten, or otherwise. The seede is used of some to be put into the corner of the eye, if any mote or other thing haue happened into it: but assuredly although this may peradventure doe some good, yet the seede of the wilde will doe much more. The leaues taken dry, and dipped into a batter made of the yolkes of egges, flower, and a little milke, and then fryed with butter varill they be crispe, serue for a dish of meate accepted with manie, vnpleasant to none.

CHAP. VIII.

Nepeta. Nep.

Although those that are Herbarists do know three sorts of Nep, a greater & two lesser, yet because the lesser are not vsuall, but in the Gardens of those that delight in natures varieties, I do not here shew you them. That which is vsuall (and called of manie Cat Mint) beareth square stalkes, but not so great as Clarie, hauing two leaues at euery ioynt, somewhat like vnto Balme or Speare Mintes, but whiter, softer, and longer, and nicked about the edges, of a strong sent, but nothing so strong as Clary: the flowers growe at the toppes of the stalkes, as it were in long spikes or heads, somewhat close together, yet compassing the stalkes at certaine ioyns, of a whitish colour, for forme and bignesse like vnto Balme, or somewhat bigger: the rootes are composed of a number of strings, which dye not, but keepe greene leaues vpon them all the Winter, and shoote anew in the Spring. It is propagated both by the seede, and by slipping the rootes.

The Use of Nep.

Nep is much used of women either in baths or drinckes to procure their feminine courses: as also with Clarie, being fryed into Tanlies, to strengthen their backs. It is much commended of some, if the iuyce thereof be drunke with wine, to helpe those that are bruised by some fall, or other accident. A decoction of Nep is auailable to cure the scabbe in the head, or other places of the body.

CHAP. IX.

Melissa. Baulme.

The Garden Baulme which is of common knowne use, hath diuers square blackish greene stalkes, and round, hard, darke, greene pointed leaues, growing thereon by couples, a little notched about the edges, of a pleasant sweete sent, drawing nearest to the sent of a Lemon or Citron; and therefore of some called *Citrage*: the flowers growe about the toppes of the stalkes at certaine distances, being small and gaping, of a pale carnation colour, almost white: the rootes fasten themselves strongly in the ground, and endure many yeares, and is encreased by diuiding the rootes; for the leaues dye downe to the ground euery yeare, leauing no shew of leafe or stalke in the Winter.

The

The Use of Baulme.

Baulme is often vsed among other hot and sweete herbes, to make baths and washings for mens bodies or legges, in the Summer time, to warme and comfort the veines and sinewes, to very good purpose and effect, and hath in former ages beene of much more vse then now adaies. It is also vsed by diuers to be stilled, being steeped in Ale, to make a Baulme water, after the manner they haue beene taught, which they keepe by them, to vse in the stead of *Aqua vite*, when they haue any occasion for their owne or their neighbours Families, in suddaine qualmes or passions of the heart: but if they had a little better direction (for this is somewhat too rude) it would doe them more good that take it: For the herbe without all question is an excellent helpe to comfort the heart, as the very smell may induce any so to beleue. It is also good to heale greene wounds, being made into salues: and I verily thinke, that our forefathers hearing of the healing and comfortable properties of the true naturall Baulme, and finding this herbe to be so effectuell, gaue it the name of Baulme, in imitation of his properties and vertues. It is also an herbe wherein Bees doe much delight, as hath beene found by experience of those that haue kept great store, if the Hiuies bee rubbed on the inside with some thereof, and as they thinke it draweth others by the smell thereof to resort thither. Plinie saith, it is a present remedy against the stinging of Bees.

CHAP. X.

Mentha, Mintes.

THere are diuers sorts of Mints, both of the garden, and wilde, of the woods, mountaines, and standing pooles or waters: but I will onely in this place bring to your remembrance two or three sorts of the most vsuall that are kept in gardens, for the vses whereunto they are proper.

Red Mint or browne Mint hath square brownish stalkes, with somewhat long and round pointed leaues, nicked about the edges, of a darke greene colour, set by couples at euery ioynt, and of a reasonable good sent: the flowers of this kinde are reddish, standing about the toppes of the stalkes at distances: the rootes runne creeping in the ground, and as the rest, will hardly be cleared out of a garden, being once therein, in that the smallest peece thereof will growe and encrease apace.

Speare Mint hath a square greene stalke, with longer and greener leaues then the former, set by couples, of a better and more comfortable sent, and therefore of much more vse then any other: the flowers hereof growe in long eares or spikes, of a pale red or bluish colour: the rootes creepe in the ground like the other.

Party coloured or white Mint hath square greene stalkes and leaues, somewhat larger then Speare Mint, and more nicked in the edges, whereof many are parted, halfe white and halfe greene, and some more white then greene, or more green then white, as nature listeth: the flowers stand in long heads close set together, of a bluish colour: the rootes creepe as the rest doe.

The Use of Mintes.

Mintes are oftentimes vsed in baths, with Baulme and other herbes, as a helpe to comfort and strengthen the nerues and sinewes.

It is much vsed either outwardly applyed, or inwardly drunke, to strengthen and comfort weake stomackes, that are much giuen to casting: as also for feminine fluxes. It is boyled in milke for those whose stomackes are

1 *Horminum sativum*, Garden Clary. 2 *Nepeta*, Nep. 3 *Melissa*, Baulme. 4 *Mentha sativa*, Garden Mintes.
5 *Balsamita mac*, *sen Cestus horiorem*, Costmary. 6 *Ageratum*, Mauldeline.

apt to cause it to curdle. And applyed with salt, is a good helpe for the biting of a mad dogge.

It is vsed to be boyled with Mackarell, and other fish.

Being dried, is often and much vsed with Penniroyall, to bee put into puddings: as also among pease that are boyled for pottage.

Where Dockes are not ready at hand, they vse to bruise Mintes, and lay them vpon any place that is stung with Bees, Wasps, or such like, and that to good purpose.

CHAP. XI.

Balsamita mas & femina, seu Costus hortorum maior & minor.
Costmary and Maudeline.

Costmary or Alecoast is a sweet herbe, bearing many broad and long pale green leaues, snipped about the edges, euery one vpon a long foote-stalke, among which rise vp many round greene stalkes, with such like leaues on them, but lesser vp to the toppe, where it spreadeth it selfe into three or foure branches, euery one bearing an vmbell or tuft of gold yellow flowers, somewhat like vnto Tanisie flowers, but lesser, which turne into small heads, containing small flat long seede: the roote is somewhat hard and stringy, and being diuided, is replanted in the Spring of the yeare for increase.

Maudeline hath somewhat long and narrow leaues, snipt about the edges: the stalks are two foot high, bearing many yellow flowers on the tops of the branches, in an vmbell or tuft like vnto Tanisie: the whole herbe is sweete, and somewhat bitter, and is replanted by slipping.

The Vse of Costmary and Maudeline.

Costmary is of especiall vse in the Spring of the yeare, among other such like herbes, to make Sage Ale, and thereupon I thinke it tooke the name of Alecoast.

It is also vsed to be put among other sweete herbes, to make sweete washing water, whereof there is great store spent.

The leaues haue an especiall vertue to comfort both the stomack and heart, and to warme and dry a moist braine. The seede is much vsed in the Country, to be giuen to children for the wormes, in the stead of wormseed, and so is the seede of Maudeline also.

Maudeline is much vsed with Costmary and other sweet herbes, to make sweete washing water: the flowers also are tyed vp with small bundels of Lauender toppes, these being put in the middle of them, to lye vpon the toppes of beds, presses, &c. for the sweete sent and sauour it casteth. It is generally accounted of our Apothecaries to be the true *Eupatorium* of Auicenna, and the true *Ageratum* of Dioscorides; but Dodonaeus seemeth to contradict both.

CHAP. XII.

Tanacetum vulgare & crispum. Tanisie.

Our Garden Tanisie hath many hard greene leaues, or rather wings of leaues, for they are many small ones, set one against another all along a middle ribbe or stalke, and snipt about the edges: in some the leaues stand closer and thicker, and somewhat crumpled, which hath caused it to be called double or curld Tanisie,

fic, in others thinner and more sparsely: It riseth vp with many hard stalks, whereon growe at the tops vpon the seuerall small branches gold yellow flowers like buttons, which being gathered in their prime, will hold the colour fresh a long time: the seede is small, and as it were chaffie: the roote creepeth vnder ground, and shooteth vp againe in diuers places: the whole herbe, both leaues and flowers, are of a sharpe, strong, bitter smell and taste, but yet pleasant, and well to be endured.

The Vse of Tanfie.

The leaues of Tanfie are vsed while they are young, either shred small with other herbes, or else the iuyce of it and other herbes fit for the purpose, beaten with egges, and fryed into cakes (in Lent and the Spring of the yeare) which are vsually called Tanfies, and are often eaten, being taken to be very good for the stomack, to helpe to digest from thence bad humours that cleaue thereunto: As also for weak raines and kidneyes, when the vrine passeth away by drops: This is thought to be of more vse for men then for women. The seede is much commended against all sorts of wormes in children.

CHAP. XIII.

Pimpinella sive Sanguisorba. Burnet.

Burnet hath many winged leaues lying vpon the ground, made of many small, round, yet pointed greene leaues, finely nicked on the edges, one set against another all along a middle ribbe, and one at the end thereof; from among which rise vp diuers round, and sometimes crested browne stalkes, with some few such like leaues on them as growe belowe, but smaller: at the toppes of the stalkes growe small browne heads or knaps, which shoote forth small purplish flowers, turning into long and brownish, but a little cornered seede: the roote groweth downe deepe, being small and brownish: the whole plant is of a stipticke or binding taste or quality, but of a fine quicke sent, almost like Baulme.

The Vse of Burnet.

The greatest vse that Burnet is commonly put vnto, is to put a few leaues into a cup with Claret wine, which is presently to be drunke, and giueth a pleasant quicke taste thereunto, very delightfull to the palate, and is accounted a helpe to make the heart merrie. It is sometimes also while it is young, put among other Sallet herbes, to giue a finer rellish thereunto. It is also vsed in vulnerary drinkes, and to stay fluxes and bleedings, for which purposes it is much commended. It hath beene also much commended in contagious and pestilentiall agues.

CHAP. XIII.

Hippolapathum sativum, sive Rhabarbarum Monachorum.

Monkes Rubarbe or Patience.

Garden Patience is a kinde of Docke in all the parts thereof, but that it is larger and taller then many others, with large and long greene leaues, a great, strong, and high stalke, with reddish or purplish flowers, and three square seede, like as all other Dockes haue: the roote is great and yellow, not hauing any shew of fleshy coloured veines therein, no more then the other kinde with great round thin leaues,

commonly called *Hippelapathum rotundifolium*, Bastard Rubarbe, or Monkes Rubarbe, the properties of both which are of very weake effect: but I haue a kinde of round leaved Dock growing in my Garden, which was sent me from beyond Sea by a worthy Gentleman, M^r. D^r. Matth. Lister, one of the Kings Physitians, with this title, *Rhaponticum verum*, and first grew with me, before it was euer seen or known elsewhere in England, w^{ch} by proof I haue found to be so like vnto the true Rubarbe, or the Rha of Pontus, both for forme and colour, that I dare say it is the very true Rubarbe, our climate only making it lesse strong in working, lesse heavy, and lesse bitter in taste: For this hath great and thicke rootes, as diuersly discoloured with flesh coloured veines as the true Rubarbe, as I haue to shew to any that are desirous to see and know it; and also other smaller sprays or branches of rootes, spreading from the maine great roote, which smaller branches may well be compared to the *Rhaponticum* which the Merchants haue brought vs, which we haue seene to be longer and slenderer then Rubarbe, but of the very same colour: this beareth so goodly large leaues, that it is a great beauty in a garden to behold them: for I haue measured the stalke of the leafe at the bottome next the roote to bee of the bignesse of any mans thumbe; and from the roote to the leafe it selfe, to bee two foote in length, and sometimes more; and likewise the leafe it selfe, from the lower end where it is ioyned to the stalke, to the end or point thereof, to bee also two foote in length, and sometimes more; and also in the broadest part of the leafe, to be two foote or more ouer in breadth: it beareth whitish flowers, contrary to all other Dockes, and three square brownish seede as other Dockes doe, but bigger, and therefore assuredly it is a Docks, and the true Rubarbe of the Arabians, or at the least the true *Rhaponticum* of the Ancients. The figure of the whole plant I haue caused to be cut, with a dryed roote as it grew in my garden by it selfe, and haue inserted it here, both because Matthiolus giueth a false figure of the true Rubarbe, and that this hath not been expressed and set forth by any before.

The Vse of Patience, and of the Rubarbe.

The leaues of Patience are often, and of many vsed for a pot-herbe, and seldome to any other purpose: the roote is often vsed in Diet-beere, or ale, or in other drinkes made by decoction, to helpe to purge the liuer, and cleanse the blood. The other Rubarbe or *Rhaponticum*, whereof I make mention, and giue you here the figure, I haue tryed, and found by experience to purge gently, without that astringtion that is in the true Rubarbe is brought vs from the East Indies, or China, and is also lesse bitter in taste; whereby I coniecture it may bee vsed in hot and feauerish bodies more effectually, because it doth not binde after the purging, as the East India Rubarbe doth: but this must bee giuen in double quantitie to the other, and then no doubt it will doe as well: The leaues haue a fine acide taste: A syrupe therefore made with the iuice and sugar, cannot but be very effectually in delected appetites, and hot fits of agues, as also to helpe to open obstructions of the liuer, as diuers haue often tryed, and found auailable by experience.

CHAP. XV.

Lapathum sanguineum. Blood-wort.

AMong the sorts of pot-herbes Blood-worte hath alwayes beene accounted a principall one, although I doe not see any great reason therein, especially seeing there is a greater efficacie of binding in this Docks, then in any of the other: but as common vse hath receiued it, so I here set it downe. Blood-worte is one of the sorts of Dockes, and hath long leaues like vnto the smaller yellow Docks, but striped with red veines, and ouer-shadowed with red vpon the Greene leafe, that it seemeth almost wholly red sometimes: the stalke is reddish, bearing such like leaues, but smaller

1 *Tanacetum*. Tansie. 2 *Pimpinella*. Burnet. 3 *Rheum*. True Rhenish or rather true Rubarbe. 4 *Lapathum*. Monks Rubarbe or Patience. 5 *Lapathum*. Bloudwort. 6 *Acetosa*. Sorrell.

smaller vp to the toppe, where it is diuided into diuers small branches, whereon grow purplish flowers, and three square darke red seede, like vnto others: the roots are not great, but somewhat long, and very red, abiding many yeares, yet sometimes spoiled with the extremitie of winter.

The Vse of Blood-wort.

The whole and onely vse of the herbe almost, serueth for the pot, among other herbes, and, as I said before, is accounted a most especiall one for that purpose. The seede therof is much commended for any fluxe in man or woman, to be inwardly taken, and so no doubt is the roote, being of a stipticke qualitie.

CHAP. XVI.

Oxalis sine Acetosa. Sorrell.

Sorrell must needs bee reckoned with the Dockes, for that it is so like vnto them in all things, and is of many called the sower Docks. Of Sorrells there are many sorts, but I shall not trouble you with any other in this place, then the common Garden Sorrell, which is most knowne, and of greatest vse with vs; which hath tender Greene long leaues full of iuice, broade, and bicorned as it were, next vnto the stalke, like as Arrach, Spinach, and our English Mercurie haue, of a sharpe sower taste: the stalkes are slender, bearing purplish long heads, wherein lye three square shining browne seede, like, but lesser then the other: the root is smaller then any of the other Dockes, but browne, and full of strings, and abideth without decaying, hauing Greene leaues all the winter, except in the very extremitie thereof, which often taketh away all or most of his leaues.

The Vse of Sorrell.

Sorrell is much vsed in sawces, both for the whole, and the sicke, cooling the hot liuers, and stomackes of the sicke, and procuring vnto them an appetite vnto meate, when their spirits are almost spent with the violence of their furious or fierie fits; and is also of a pleasant rellish for the whole, in quickning vp a dull stomacke that is ouer-loaden with euery daies plenty of dishes. It is diuers waies dressed by Cooks, to please their Masters stomacks.

CHAP. XVII.

Buglossum latens, sine Lingua Bonis. Langdebeefe.

VNto this place may well bee referred our ordinary Borage and Buglosse, set forth in the former Booke, in regard of the properties whereunto they are much employed, that is, to serue the pot among other herbes, as is sufficiently knowne vnto all. And yet I confesse, that this herbe (although it bee called *Buglossum latens*, as if it were a kind of Buglosse) hath no correspondency with Buglosse or Borage in any part, sauing only a little in the leafe; & our Borage or Buglosse might more fitly, according to the Greeke name, bee called Oxe tongue or Langdebeefe, and this might in my iudgement more aptly be referred to the kinds of *Hieracium* Hawkeweed, whereunto it neere approacheth: but as it is commonly receiued, so take it in this place, vntill it come to receiue the place is proper for it. It hath diuers broad and long darke green leaues, lying vpon the ground, very rough in handling, full of small haire or prickles, ready to enter into the hands of any that handle it; among which riseth

1 *Lingua bonis* sine *Buglossum luteum*. Langdebeete. 2 *Atriplex* sine *Oler aureum*. Arrach. 3 *Blitum*. Blites.
4 *Beta*. Beetes. 5 *Hippoeselinum* sine *Oler atrum*. Allifanders. 6 *Selinum dulce*. Sweete Parsley.

vp a round greene hairy or prickly stalk, bearing at the toppe, among a few small green leaues, diuers small yellow flowers in rough heads, which turne into doune, containing within them browne yellowish small long seedes, somewhat like vnto the seede of Hawkeweede: the roote is wooddy, which perisheth quickly after it hath borne seed; but is tender while it is young.

The Vse of Langdebeefe.

The leaues are onely vsed in all places that I know, or euer could learne, for an herbe for the pot among others, and is thought to bee good to loosen the belly.

CHAP. XVIII.

Atriplex sine Olus Aureum. Arrach.

THere be diuers kindes of Arrach, or Orach, as some doe call them; some of the Garden, whereof I meane to entreate in this place; others wilde of the Fieldes, &c. and others of the Sea, which are notto bee spoken of in this worke, but referred to a generall historie. The white garden Arrach, or Orach, hath diuers leaues, standing vpon their feuerall footestalkes, broade at the bottome, ending in two points like an arrow, with two feathers at the head, and small pointed at the end of the leafe, of a whitish yellow greene colour, and as it were strewed ouer with flower or meale, especially while they are young: the stalke likewise is mealy, bearing many branches with small yellow flowers on them, which turne into small leafie seeds: the roote groweth somewhat deepe in the ground, with many small threds fastened thereto: it quickly springeth vp of the seede, groweth great, and fadeth away as soon as it hath borne seede.

The purple Arrach is in all things like vnto the white, sauing onely in the colour of the leafe, stalke, seede, &c. which are all of a mealy dusky purplish colour.

The Vse of Arrach.

Arrach is cold and moist, and of a lubricke or slippery qualitie, whereby it quickly passeth through the stomacke and belly, and maketh it soluble, and is of many vsed for that purpose, being boyled and buttered, or put among other herbes into the pot to make pottage.

There are many dishes of meate made with them while they are young, for being almost without saour of themselues, they are the more conuertible into what relish any one will make them with Sugar, Spice &c.

CHAP. XIX.

Blitum. Blites.

THere be diuers sorts of Blites, some whereof I haue entreated in the former part of this worke, vnder the title of *Amaranthus*, Flower gentle: others that are nourished vp in Gardens, I will set forth in this place, which are onely two, that haue come to my knowledge, that is, the white and the red, and are of a qualitie as neere vnto Arrach as vnto Beetes, participating of both, and therefore I haue placed them betwixt them. The white Blite hath leaues somewhat like vnto Beetes, but smaller, rounder, and of a whitish greene colour, euery one standing vpon a small long footestalke: the stalke riseth vp two or three foote high, with many such like leaues thereon: the flowers grow at the top in long round tufts or clusters, wherein are contained

tained small round seede: the roote is very full of threds or strings.

The red Blite is in all things like the white, but that his leaues and tufted heades are exceeding red at the first, and after turne more purplish.

The Vse of Blites.

Blites are vsed as Arrach, cyther boyled of it selfe or stewed, which they call Loblolly, or among other herbes to bee put into the pot; and yet some doe viterly refuse it, because in diuers it prouoketh castings. It is altogether insipide or without taste, but yet by reason of the moist slipperie qualitie it hath, it helpeth to loosen the belly. The vnfauorinesse whereof hath in many Countries growne into a prouerbe, or by-word, to call dull, slow, or lazic persons by that name: They are accounted more hurtfull to the stomacke, and so to the head and eyes, then other herbes, and therefore they are the lesse vsed.

CHAP. XX.

Beta. Beetes.

THere are many diuersities of Beetes, some growing naturally in our own Country, others brought from beyond Sea; whereof some are white, some greene, some yellow, some red: the leaues of some are of vse only, and the root not vsed: others the roote is only vsed, and not the leaues: and some againe, both roote and leafe. The ancient Authors, as by their workes appeare, knew but two sorts, the white and the blacke Beete, whereof the white is sufficiently known, and was of them termed *Sicula*, of the later Physitians *Sicla*, because it was thought first to be brought from Sicillie: the blacke abideth some controuersie, some thinking that our common greene Beete, because it is of a darke greene colour, was that they called the blacke Beete; others that our small red Beete, which is of a darke red colour, was their black Beete, which in my opinion is the more likely: But to come to the matter in hand, and giue you the descriptions of them which are in vse with vs, and leaue controuersies to such a worke as is fit for them, wherein all such matters may be discusled at large.

The common white Beete hath many great leaues next the ground (in some hot Countries growing to be three foote long, and very broad, in our Countrey they are very large, but nothing neere that proportion) of a whitish greene colour; the stalke is great, strong, and ribbed or crested, bearing great store of leaues vpon it vp to the very toppe almost: the flowers grow in very long tufts, small at the ends, and turning down their heads, which are small pale greenish yellow burres, giuing cornered prickly seede: the roote is great, long and hard, when it hath giuen seede, of no vse at all, but abideth a former winter with his leaues vpon it, as all other sorts following doe.

The common red Beet differeth not from the white Beete, but only that it is not so great, and both the leaues and rootes are somewhat red: the leaues bee in some more red then in others, which haue but red veines or strakes in them, in some also of a fresh red, in others very darke red: the roote hereof is red, spongy, and not vsed to bee eaten.

The common greene Beete is also like vnto the white Beete, but of a darke greene colour. This hath beene found neere the late Marshes by Rochester, in the foore-way going from the Lady Levelons house thither, by a worthy, diligent and painefull obseruer and preseruer both of plants and all other natures varieties, often remembred before in this worke, called Iohn Tradescante, who there finding it, gaue me the knowledge thereof, and I haue vpon his report set it here down in this manner:

The Romane red Beete, called *Beta raposa*, is both for leafe and roote the most excellent Beete of all others: his rootes bee as great as the greatest Cartot, exceeding red both within and without, very sweete and good, fit to bee eaten: this Beete groweth higher then the last red Beete, whose rootes are not vsed to bee eaten: the leaues like-

wife

wife are better of taste, and of as red a colour as the former red Beete : the roote is sometimes short like a Turnep, whereof it took the name of *Rapa* or *raposa*; and sometimes as I said before, like a Carrot and long : the seede is all one with the lesser red Beete.

The Italian Beete is of much respect, whose faire Greene leaues are very large and great, with great white ribbes and veines therein: the stalke in the Summer time, when it is growen vp to any height, is six square in shew, and yellowish withall, as the heades with seede vpon them seeme likewise.

The great red Beete that Master Lete a Merchant of London gaue vnto Master Gerard, as he setteth it downe in his Herball, seemeth to bee the red kinde of, the last remembred Beete, whose great ribbes as he saith, are as great as the middle ribbe of the Cabbage leafe, and as good to bee eaten, whose stalke rose with him to the height of eight cubits, and bore plenty of seede.

The Vse of Beetes.

Beetes, both white, Greene and red, are put into the pot among other herbes, to make pottage, as is commonly known vnto all, and are also boyled whole, both in France vsually with most of their boyled meates, and in our Countrey, with diuers that delight in eating of herbes.

The Italian Beete, and so likewise the last red Beete with great ribbes, are boyled, and the ribbes eaten in sallets with oyle, vinegar and pepper, and is accounted a rare kinde of sallet, and very delicate.

The roote of the common red Beete with some, but more especially the Romane red Beete, is of much vse among Cookes to trimme or set out their dishes of meate, being cut out into diuers formes and fashions, and is grown of late dayes into a great custome of seruice, both for fish and flesh.

The rootes of the Romane red Beete being boyled, are eaten of diuers while they are hot with a little oyle and vinegar, and is accounted a delicate sallet for the winter, and being cold they are so vsed and eaten likewise.

The leaues are much vsed to mollifie and open the belly, being vsed in the decoction of Glisters. The roote of the white kinde scraped, and made vp with a little honey and salt, rubbed on and layd on the belly, prouoketh to the stoole. The vse of eating Beetes is likewise held to bee helpfull to splenetick persons.

CHAP. XXI.

Hippofelinum, sive Olus atrum. Alifanders.

Alifanders hath beene in former times thought to be the true Macedonian Parsley, and in that error many doe yet continue : but this place giueth no leaue to discusse that doubt : but I must here only shew you, what it is, and to what vse it is put ordinarily for the Kitchen. The leaues of Alifanders are winged or cut into many parts, somewhat resembling Smalage, but greater, broader, and more cut in about the edges : the stalke are round and great, two foote high or better, bearing diuers leaues on them, and at the toppe spokie roundles of white flowers on seuerall small branches, which turne into blacke seede, somewhat cornered or crested, of an aromaticall bitter taste : the roote is blacke without, and white within, and abideth well the first year of the sowing, perishing after it hath borne seede.

The Vse of Alifanders.

The tops of the rootes, with the lower part of the stalke of Alifanders, are vsed in Lent especially, and Spring of the yeare, to make broth, which although it be a little bitter, yet it is both wholsome, and pleasing to a great many,

many, by reason of the aromaticall or spicie taste, warming and comforting the stomack, and helping it digest the many waterish and flegmaticke meates are in those times much eaten. The rootes also either rawe or boyled are often eaten with oyle and vinegar. The seede is more vsed physically then the roote, or any other part, and is effectually to prouoke plenty of urine in them that pisse by drops, or haue the Strangury: It helpeth womens courses, and warmeth their benumbed bodies or members, that haue endured fierce cold daies and nights, being boyled and drunke.

CHAP. XXII.

Selinum dulce. Sweete Parsley or sweete Smallage.

THis kinde of sweete Parsley or Smallage, which soeuer you please to call it, for it resembleth Smallage as well in the largenesse of the leaues, as in the taste, yet sweeter and pleasanter, is (as I take it) in this like vnto sweete Fennell (that hath his sweetnesse from his naturall soyle and clymate; for howsoeuer it bee reasonable sweete the first yeare it is sowne with vs, yet it quickly doth degenerate, and becommeth no better then our ordinarie Fennell afterwards). The first yeare it is sowne and planted with vs (and the first that euer I saw, was in a Venetian Ambassadors Garden in the Spittle yard, neare Bishops gate streete) is so sweete and pleasant, especially while it is young, as if Sugar had beene mingled with it: but after it is growne vp high and large, it hath a stronger taste of Smallage, and so likewise much more the next yeare, that it groweth from the seed was gathered here: the leaues are many, spreading farre about the roote, broader and of a fresher Greene colour then our ordinary Smallage, and vpon longer stalkes: the seed is as plentifull as Parsley, being small and very like vnto it, but darker of colour.

The Vse of sweete Parsley.

The Venetians vse to prepare it for meate many waies, both the herbe and the roote eaten rawe, as many other herbes and rootes are, or boyled or fryed to be eaten with meate, or the dried herbe poudered and strewed vpon meate; but most vsually either whited, and so eaten rawe with pepper and oyle, as a dainty Sallet of it selfe, or a little boyled or stewed: the taste of the herbe being a little warming, but the seede much more, helpeth cold windy stomackes to digest their meate, and to expell winde.

CHAP. XXIII.

Petroselinum & Apium. Parsley and Smalledge.

WE haue three sorts of Parsley in our Gardens, and but one of Smalledge: Our common Parsley, Curld Parsley, and Virginia Parsley, which last, although it be but of late knowne, yet it is now almost growne common, and of as good vse as the other with diuers. Our common Parsley is so well knowne, that it is almost needlesse to describe it, hauing diuers fresh Greene leaues, three alwaies placed together on a stalke, and snipt about the edges, and three stalkes of leaues for the most part growing together: the stalkes growe three or foure foote high or better, bearing spikie heads of white flowers, which turne into small seede, somewhat sharpe and hot in taste: the roote is long and white.

Curld Parsley hath his leaues curled or crumpled on the edges, and therein is the onely difference from the former.

Virginia

Virginia Parsley is in his leafe altogether like vnto common Parsley for the forme, consisting of three leaues set together, but that the leaues are as large as Smallage leaues, but of a pale or whitish Greene colour, and of the same taste of our common Parsley: the seede hereof is as the leaues, twice if not thrice as bigge as the ordinary Parsley, and perisheth when it hath giuen seede, abiding vsually the first yeare of the sowing.

Smallage is in forme somewhat like vnto Parsley, but greater and greener, and lesse pleasant, or rather more bitter in taste: the seede is smaller, and the root more stringy.

The Vse of Parsley.

Parsley is much vsed in all sorts of meates, both boyled, roasted, fryed, stewed, &c. and being Greene it serueth to lay vpon sundry meates, as also to draw meate withall. It is also shred and stopped into poudered beefe, as also into legges of Mutton, with a little beefe suet among it, &c.

The rootes are often vsed to be put into broth, to helpe to open obstructions of the liuer, reines, and other parts, helping much to procure vrine.

The rootes likewise boyled or stewed with a legge of Mutton, stopped with Parsley as aforesaid, is very good meate, and of very good rellish, as I haue proued by the taste, but the rootes must bee young, and of the first yeares growth, and they will haue their operation to caule vrine.

The seed also is vsed for the same cause, when any are troubled with the stone, or grauell, to open the passages of vrine.

Although Smallage groweth in many places wilde in moist grounds, yet it is also much planted in Gardens, and although his euill taste and sauour doth cause it not to be accepted into meates as Parsley, yet it is not without many speciall good properties, both for outward and inward diseases, to helpe to open obstructions, and prouoke vrine. The iuyce cleanseth vlcers, and the leaues boyled with Hogs grease, healeth felons on the ioynts of the fingers.

CHAP. XXIII.

Feniculum. Fenell.

THere are three sorts of Fenell, whereof two are sweete. The one of them is the ordinary sweete Fenell, whose feedes are larger and yellower then the common, and which (as I said before in the Chapter of sweete Parsley) doth soone degenerate in this our Country into the common. The other sweete Fenell is not much knowne, and called Cardus Fenell by those that sent it out of Italy, whose leaues are more thicke and bushie then any of the other. Our common Fenell, whereof there is Greene and red, hath many faire and large spread leaues, finely cut and diuided into many small, long, Greene, or reddish leaues, yet the thicker tufted the branches be, the shorter are the leaues: the stalkes are round, with diuers ioynts and leaues at them, growing siue or six foot high, bearing at the top many spoakie rundels of yellow flowers: the Common, I meane, doth turne into a darke grayish flat seede, and the Sweete into larger and yellower: the roote is great, long, and white, and endureth diuers yeares.

The Vse of Fenell.

Fenell is of great vse to trimme vp, and strowe vpon fish, as also to boyle or put among fish of diuers sorts, Cowcumbers pickled, and other fruits, &c. The rootes are vsed with Parsley rootes, to be boyled in broths and drinckes to open obstructions. The seed is of much vse with other things to expell winde. The seede also is much vsed to be put into Pippin pies, and diuers other

1 Petroselinum. Parsley. 2 Anisum. Smallage. 3 Foeniculum. Fennel. 4 Anthrum. Dill. 5 Hybridum sive Cerefolium ragwort.
Sweet Chervil. 6 Cerefolium vulgare. Common Chervil.

other such baked fruits, as also into bread, to giue it the better rellish.

The sweete Cardus Fenell being sent by Sir Henry Wotton to Iohn Tradescante, had likewise a large direction with it how to dresse it, for they vse to white it after it hath been transplanted for their vses, which by reason of the sweetnesse by nature, and the tendernesse by art, causeth it to be the more delightfull to the taste, especially with them that are accustomed to feede on greene herbes.

CHAP. XXV.

Anethum. Dill.

Dill doth much growe wilde, but because in many places it cannot be had, it is therefore sowne in Gardens for the vses whereunto it serueth. It is a smaller herbe then Fenell, but very like, hauing fine cut leaues, not so large, but shorter, smaller, and of a stronger and quicker taste: the stalke is smaller also, and with few ioynts and leaues on them, bearing spoakie tufts of yellow flowers, which turne into thinne, small, and flat seedes: the roote perisheth euery yeare, and riseth againe for the most part of it owne sowing.

The Vse of Dill.

The leaues of Dill are much vsed in some places with Fish, as they doe Fenell, but because it is so strong many doe refuse it.

It is also put among pickled Cowcumbers, wherewith it doth very well agree, giuing vnto the cold fruit a pretty spicie taste or rellish.

It being stronger then Fenell, is of the more force to expell winde in the body. Some vse to eate the seed to stay the Hickocke.

CHAP. XXVI.

Myrrhis (sine *Cerfolium maini* & *vulgare*.
Sweet Cherruill and ordinary Cherruill.

The great or sweete Cherruill (which of some is called Sweete Cicely) hath diuers great and faire spread winged leaues, consisting of many leaues set together, deeply cut in the edges, and euery one also dented about, very like, and resembling the leaues of Hemlockes, but of so pleasant a taste, that one would verily thinke, he chewed the leaues or seedes of Aniseedes in his mouth: The stalke is reasonable great, and somewhat cornered or crested about three or foure foote high, at the toppe whereof stand many white spoakie tufts of flowers, which change into browne long cornered great seede, two alwaies ioyned together: the roote is great, blackish on the outside, and white within, with diuers fibres annexed vnto it, and perisheth not, but abideth many yeares, and is of a sweete, pleasant, and spicie hot taste, delightfull vnto many.

The common Cherruill is a small herbe, with slender leaues, finely cut into long peeces, at the first of a pale yellowish Greene colour, but when the stalke is growne vp to seede, both stalkes and leaues become of a darke red colour: the flowers are white, standing vpon scattered or thin spread tufts, which turne into small, long, round, and sharpe pointed seedes, of a brownish blacke colour: the roote is small, with diuers long slender white strings, and perisheth euery yeare.

The

The Vses of these Cheruils.

The common Cheruill is much vsed of the French and Dutch people, to bee boyled or stewed in a pipkin, cyther by it selfe, or with other herbes, whereof they make a Loblolly, and so eate it. It is vsed as a pot-herbe with vs.

Sweete Cheruill, gathered while it is young, and put among other herbes for a sallet, addeth a metuellous good rellish to all the rest. Some commend the greene feedes sliced and put in a sallet of herbes, and eaten with vinegar and oyle, to comfort the cold stomacke of the aged. The roots are vsed by diuers, being boyled, and after eaten with oyle and vinegar, as an excellent sallet for the same purpose. The preserued or candid rootes are of singular good vse to warme and comfort a cold flegmaticke stomack, and is thought to be a good preseruatiue in the time of the plague.

CHAP. XXVII.

Malua Crispa. French Mallowes.

THe curld or French Mallow groweth vp with an vpright greene round stalke, as high vsually as any man, whereon from all sides grow forth round whitish greene leaues, curld or crumpled about the edges, like a ruffe, else very like vnto an ordinary great Mallow leafe: the flowers grow both vpon the stalke, and on the other branches that spring from them, being small and white, after which come small cases with blacke feede like the other Mallowes: the roote perisheth when it hath borne feede, but abideth vsually the first yeare, and the second runneth vp to flower and feede.

The Vse of French Mallowes.

It is much vsed as a pot-herbe, especially when there is cause to moue the belly downward, which by his slippery qualitie it doth helpe forward. It hath beene in times past, and so is to this day in some places, vsed to be boyled or stewed, cyther by it selfe with butter, or with other herbes, and so eaten.

CHAP. XXVIII.

Intubum. Succorie and Endiue.

IPut both Succorie and Endiue into one chapter and description, because they are both of one kindred, and although they differ a little the one from the other, yet they agree both in this, that they are eaten cyther greene or whited, of many.

Endiue, the smooth as well as the curld, beareth a longer and a larger leafe then Succorie, and abideth but one yeare, quickly running vp to stalke and feede, and then perisheth: whereas Succorie abideth many yeares, and hath long and narrower leaues, somewhat more cut in, or torne on the edges: both of them haue blew flowers, and the feede of the smooth or ordinary Endiue is so like vnto the Succorie, that it is very hard to distinguish them asunder by sight, but the curld Endiue giueth blackish and flat feede, very like vnto blacke Lettice feede: the rootes of the Endiue perish, but the Succorie abideth.

The Vse of Succory and Endiue.

Although Succorie bee somewhat more bitter in taste then the Endiues,

yet it is oftentimes, and of many eaten greene, but more vsually being buried a while in sand, that it may grow white, which causeth it to lose both some part of the bitternesse, as also to bee the more tender in the eating; and Horace sheweth it to be vsed in his time, in the 3. Ode of his first Book, where he saith,

Me pascunt Olinæ, me Cithorea leuesq. Maluæ.

Endiue being whited in the same, or any other manner, is much vsed in winter, as a salliet herbe with great delight; but the curld Endiue is both farre the fairer, and the tenderer for that purpose.

CHAP. XXIX.

Spinachia, sine Oculis Hispanicum. Spinach.

Spinach or Spinage is of three sorts (yet some doe reckon of foure, accounting that herbe that beareth no seede to be a sort of it selfe, when it is but an accident of nature, as it falleth out in Hempe, Mercury, and diuers other herbes) two that bear prickly seed, the one much greater then the other: the third that beareth a smooth seede, which is more daintie, and nourfed vp but in few Gardens: The common Spinach which is the lesser of the two prickly sorts, hath long greene leaues, broad at the stalke, and rent, or torne as it were into foure corners, and sharpe pointed at the ends: it quickly runneth vp to stalke, if it be sowed in the Spring time; but else, if at the end of Summer, it will abide all the winter green, and then suddenly in the very beginning of the Spring, runne vp to stalke, bearing many leaues both below and at the toppe, where there doth appeare many smal greenish flowers in clusters, and after them prickly seede: The other greater sort that hath prickly seede, is in all things like the former, but larger both in stalke, leafe and seede. The smooth Spinach hath broader, and a little rounder pointed leaues then the first, especially the lower leaues; for those that grow vpwards vpon the stalke, are more pointed, and as it were three square, of as darke a greene colour as the former: at the seuerall ioynts of the stalkes and branches, stand clustering many small greenish flowers, which turne into clusters of round whitish seede, without any prickles at all vpon them: the roote is long, white and small, like vnto the other, with many fibres at it: If it be often cut, it will grow the thicker, or else spindle vp very thinly, and with but few leaues vpon the stalke.

The Vse of Spinage.

Spinage is an herbe fit for salliets, and for diuers other purposes for the table only; for it is not knowne to bee vsed Physically at all. Many English that haue learned it of the Dutch people, doe stew the herbe in a pot or pipkin, without any other moisture then it owne, and after the moisture is a little pressed from it, they put butter, and a little spice vnto it, and make therewith a dish that many delight to eate of. It is vsed likewise to be made into Tartes, and many other varieties of dishes, as Gentlewomen and their Cookes can better tell then my selfe; vnto whom I leaue the further ordering of these herbes, and all other fruits and rootes of this Garden: For I intend only to giue you the knowledge of them, with some brieue notes for their vse, and no more.

1. *Malastrispa*. French Malvoes. 2. *Endiva*. Endive. 3. *Cichorium*. Succory. 4. *Spinachia*. Spinach. 5. *Lactuca scariola*. Curd Lettice. 6. *Lactuca perula*. An open Lettice. 7. *Lactuca capitata vulgaris*. Ordinary cabbage Lettice. 8. *Lactuca capitata Romana*. The great Roman cabbage Lettice. 9. *Lactuca scariola*. Corne Sallet or Lamb's Lettice.

CHAP. XXX.

Lactuca. Lettice.

THere are so many sorts, and so great diuersitie of Lettice, that I doubt I shall scarce be beleueed of a great many. For I doe in this Chapter reckon vp vnto you eleauen or twelue differing sorts; some of little vse, others of more, being more common and vulgar; and some that are of excellent vse and seruice, which are more rare, and require more knowledge and care for the ordering of them, as also for their time of spending, as some in the spring, some in summer, others in autumn, and some being whited for the winter. For all these sorts I shall not neede many descriptions, but only shew you which doe cabbage, and which are loose, which of them are great or small, white, Greene or red, and which of them beare white seeds, and which of them blacke. And lastly I haue thought good to adde another Sallet herbe, which because it is called Lambes Lettice of many, or Corne Sallet of others, is put in only to fill vp a number in this Chapter, and that I must speake of it, and not that I thinke it to be any of the kindes of Lettice.

All sorts of Lettice, after a while that they haue closed themselues, if they bee of the Cabbage kindes, or otherwise being loose, and neuer closing, send forth from among the middle of their leaues a round stalke (in some greater, in others lesser, according to their kinde) full of leaues like vnto the lower, branching at the toppe into sundry parts, whereon grow diuers small star-like flowers, of a pale yellowish colour; after which come seede, cyther white or blackish, as the plant yeeldeth, whereat hangeth some small peece of a cottony doune, wherewith the whole head is stored, and is carried away with the winde, if it be not gathered in time: the roote is somewhat long and white, with some fibres at it, and perisheth quickly after the seede is ripe.

The Romane red Lettice is the best and greatest of all the rest. For Iohn Tradescante that first, as I thinke, brought it into England, and sowed it, did write vnto mee, that after one of them had been bound and whited, when the refuse was cut away, the rest weighed feventeene ounces: this hath blacke seede.

The white Romane Lettice is like vnto it, hauing long leaues like a Teasell, it is in goodnesse next vnto the red, but must be whited, that it may eate kindly: the seede hereof is white.

The Virginia Lettice hath single and very broad reddish leaues, and is not of any great regard, and therefore is kept but of a few: it beareth blacke seede.

The common Lumbar Lettice that is loose, and another kinde thereof that doth somewhat cabbage, haue both white seedes.

The Venice Lettice is an excellent Cabbage Lettice, and is best to bee sown after Midsummer for lateward Lettice; they be sometimes as great as the crowne of a mans hatt: the seede hereof is white, and groweth to be of a meane height.

Our common Cabbage Lettice is well known, and beareth blacke seede.

The curld Lettice which is open, and differeth but little from Endiue, beareth blacke seede.

Another sort of curld Lettice doth cabbage, and is called Flanders Cropers, or Cropers of Bruges; this groweth lowest, and hath the smallest head, but very hard and round, and white while it groweth: the seed is blacke.

A kinde of Romane Lettice is of a darke green colour, growing as low as the Venice Lettice, and is an excellent kinde, bearing blacke seede.

And lastly our winter Lettice is wonderfull hardy to endure our cold: It is but single, and must be sown at Michaelmas, but will be very good, before any of the other good sorts sown in the Spring, will be ready to be vsed, and beareth white seed.

To instruct a nouice (for I teach not a Gardiner of knowledge) how to gather his seede that it may be good, is in this manner: Let him marke out those plants that hee meaneth shall run vp for seede, which must be the most likely; & after they haue begun to shoote forth stalkes, strip away the lower leaues, for two or three hands breadth above the ground, that thereby in taking away the lowest leaues, the stalke doe not rot, nor the seed be hindered in the ripening.

There

There are two manner of wayes to whiten Lettice to make them eate the more tender : the one is by rayfing vp earth like moale hils, round about the plants while they are growing, which will make them grow white : the other is by tying vp all the loote leaues round together while it groweth, that so the close tying may make it grow white, and thereby be the more tender.

Lambes Lettice or Corne Sallet is a small plant while it is young, growing close vp. on the ground, with many whitish Greene, long and narrow, round pointed leaues, all the winter, and in the beginning of the spring (if it bee sown in autumn, as it is vsuall to serue for an early sallet) riseth vp with small round stalkes, with two leaues at euery ioynt, branching forth at the toppe, and bearing tufts of small bleake blew flowers, which turne into small round whitish seede : the roote is small and long, with some small threds hanging thereat : the whole plant is of a waterish taste, almost insipide.

The Vse of Lettice.

All sorts of Lettice are spent in sallets, with oyle and vinegar, or as euery one please, for the most part, while they are fresh and Greene, or whited, as is declared of some of the sorts before, to cause them to eate the more delicate and tender. They are also boyled, to serue for many sorts of dishes of meate, as the Cookes know best.

They all coole a hot and fainting stomacke.

The iuice of Lettice applyed with oyle of Roses to the foreheads of the sicke and weake wanting sleepe, procureth rest, and taketh away paines in the head : bound likewise to the cods, it helpeth those that are troubled with the Colts euill. If a little camphire be added, it restraineth immoderate lust : but it is hurtfull to such as are troubled with the shortnesse of breath.

Lambes Lettice is wholly spent for sallets, in the beginning of the yeare, as I said, before any almost of the other sorts of Lettice are to be had.

CHAP. XXXI.

Portulaca. Purslane.

Purslane hath many thicke round shining red stalkes, full of iuice, lying vpon the ground for the most part, whereon are set diuers long, thicke, pale green leaues, sometimes alone by themselves, and sometimes many small ones together with them, among which grow small yellow flowers, which stand in little Greene huskes, containing blacke seede: the roote is small, and perisheth euery yeare, and must be new sown in Aprill, in the alleyes of the Garden betweene the beds, as some haue heretofore vsed, where it may haue the more moisture, or, as I haue seene in some Gardens, vpon those beds of dung that Gardiners haue vsed, to nourse vp their Cowcumbers, Melons, and Pompions, whereon after they haue bene taken away, they haue sown Purslane, where if it be much watered, the warmth of the dung, and the water giuen it, the Purslane hath grown great and large, and continued vntill winter.

The Vse of Purslane.

It is vsed as Lettice in sallets, to coole hot and faint stomackes in the hot time of the yeare, but afterwards if only for delight, it is not good to bee too prodigall in the vse thereof.

The seede of Purslane doth coole much any inflammation inward or outward, and doth a little binde withall.

CHAP. XXXII.

Dracopis sine Tarchon & Dracunculus hortensis. Tarragon.

TArragon hath long and narrow darke greene leaues, growing on slender and brittle round stalkes, two or three foote high, at the tops whereof grow forth long slender spikes of small yellowish flowers, which seldome giue any good feede, but a dustie or chaffie matter, which flieth away with the winde: the roote is white, and creepeth about vnder ground, whereby it much encreaseth: the whole herbe is of a hot and biting taste.

The Vse of Tarragon.

It is altogether vsed among other cold herbes, to temper their coldnesse, and they to temper its heate, so to giue the better relish vnto the Sallet; but many doe not like the taste thereof, and so refuse it.

There are some Authors that haue held Tarragon not to be an herbe of it owne kinde, but that it was first produced, by putting the seede of Lin or Flaxe into the roote of an Onion, being opened and so set into the ground, which when it hath sprung, hath brought forth this herbe Tarragon, which absurd and idle opinion, Matthiolus by certaine experience saith, hath been found false.

CHAP. XXXIII.

Nasturtium hortense. Garden Cresses.

Garden Cresses growe vp to the height of two foote or thereabouts, hauing many small, whitish, broad, endented, torne leaues, set together vpon a middle ribbe next the ground, but those that growe higher vpon the stalkes are smaller and longer: the tops of the stalkes are stored with white flowers, which turne into flat pods or pouches, like vnto Shepheard purse, wherein is contained flat reddish feede: the roote perisheth euery yeare: the taste both of leaues and feedes are somewhat strong, hot, and bitter.

The Vse of Cresses.

The Dutchmen and others vse to eate Cresses familiarly with their butter and bread, as also stewed or boyled, either alone or with other herbes, whereof they make a Hotch potch, and so eate it. Wee doe eate it mixed among Lettice or Purslane, and sometimes with Tarragon or Rocket, with oyle and vinegar and a little salt, and in that manner it is very saueury to some mens stomackes.

The vse of Cresses physically is, it helpeth to expectorate tough siegme, as also for the paines of the breast, and as it is thought taketh away spots, being laid to with vinegar. The seede is giuen of many to children for the wormes.

1 *Portulaca*, Pusillane. 2 *Brachyherba seu Tarchon*, Tarragon. 3 *Eruca sativa*, Garden Rocket. 4 *Nasturtium sativum*, Garden Cress.
5 *Sinapi*, Mustard. 6 *Asparagus*, Asparagus or Spetage.

CHAP. XXXIIII.

Eruca sativa. Garden Rocket.

Our Garden Rocket is but a wilde kinde brought into Gardens; for the true Romane Rocket hath larger leaues; this hath many long leaues, much torne or rent on the edges, smaller and narrower then the Romane kinde: the flowers hereof are of a pale yellowish colour, whereas the true is whitish, consisting of foure leaues: the seede of this is reddish, contained in smaller and longer pods then the true, which are shorter and thicker, and the seede of a whitish yellow colour: the rootes of both perish as soone as they haue giuen seede. Some haue taken one sort of the wilde kinde for Mustard, and haue vsed the seede for the same purpose.

The Vse of Rocket.

It is for the most part eaten with Lettice, Purslane, or such cold herbes, and not alone, because of its heate and strength; but that with the white seede is milder. The seede of Rocket is good to prouoke vrine, and to stirre vp bodily lust.

The seede bruised, and mixed with a little vinegar, and of the gall of an Oxe, cleanseth the face of freckles, spots, and blew marks, that come by beatings, fells, or other waies.

Matthiolus saith, that the leaues boyled, and giuen with some Sugar to little children, cureth them of the cough.

The seede is held to be helpfull to splenetick persons; as also to kill the wormes of the belly.

CHAP. XXXV.

Sinapi sativum. Garden Mustard.

The Mustard that is most vsuall in this Country, howsoeuer diuers doe for their priuate vses sowe it in their Gardens or Orchards, in some conuenient corner, yet the same is found wilde also abroad in many places. It hath many rough long diuided leaues, of an ouerworne greene colour: the stalke is diuided at the toppe into diuers branches, whereon growe diuers pale yellow flowers, in a great length, which turne into small long pods, wherein is contained blackish seede, inclining to rednesse, of a fiery sharpe taste: the roote is tough and white, running deepe into the ground, with many small fibres at it.

The Vse of Mustard.

The seede hereof grownd between two stones, fitted for the purpose, and called a Querne, with some good vinegar added vnto it, to make it liquid and running, is that kinde of Mustard that is vsuall made of all sorts, to serue as sawce both for fish and flesh.

The same liquid Mustard is of good vse, being fresh, for Epilepticke persons, to warme and quicken those dull spirits that are sopite and scarce appeare, if it be applyed both inwardly and outwardly.

It is with good successe also giuen to those that haue short breathes, and troubled with a cough in the lungs.

CHAP. XXXVI.

Asparagus. Sperage or Asparagus.

Asparagus riseth vp at the first with diuers whitish Greene scaly heads, very brittle or easie to breake while they are young, which afterwards rise vp into very long and slender Greene stalkes, of the bignesse of an ordinary riding wand at the bottome of most, or bigger or lesser, as the rootes are of growth, on which are set diuers branches of Greene leaues, shorter and smaller then Fennell vp to the toppe, at the ioynts whereof come forth small mossie yellowish flowers, which turne into round berries, Greene at the first, and of an excellent red colour when they are ripe, shewing as if they were beades of Corral, wherein are contained exceeding hard and blacke seede: the rootes are disperfed from a spongiouse head into many long, thicke, and round strings, whereby it sucketh much nourishment out of the ground, and encreaseh plentifully thereby.

We haue another kinde hereof that is of much greater account, because the shootes are larger, whiter, and being dressed taste more sweete and pleasant, without any other difference.

The Vse of Asparagus.

The first shootes or heads of Asparagus are a Sallet of as much esteeme with all sorts of persons, as any other whatsoeuer; being boyled tender, and eaten with butter, vinegar, and pepper, or oyle and vinegar, or as euery ones manner doth please; and are almost wholly spent for the pleasure of the pallate. It is specially good to prouoke vrine, and for those that are troubled with the stone or grauell in the reins or kidneyes, because it doth a little open and cleanse those parts.

CHAP. XXXVII.

Brassica. Cabbages and Coleworts.

There is greater diuersity in the forme and colour of the leaues of this plant, then there is in any other that I know groweth vpon the ground. But this place requireth not the knowledge of all sorts which might be shewen, many of them being of no vse with vs for the table; but for delight, to behold the wonderfull variety of the workes of God herein. I will here therefore shew you onely those sorts that are ordinary in most Gardens, and some that are rare, receiued into some speciall Gardens: And first of Cabbages, and then of Coleworts.

Our ordinary Cabbage that closeth hard and round, hath at the first great large thicke leaues, of a grayish Greene colour, with thicke great ribbes, and lye open most part of the Summer without closing, but toward the end of Summer, being growne to haue many leaues, it then beginneth to growe close and round in the middle, and as it closeth, the leaues growe white inward; yet there be some kindes that will neuer be so close as these, but will remaine halfe open, which wee doe not account to be so good as the other: in the middle of this head, the next yeare after the sowing, in other Countries especially, and sometimes in ours, if the Winter be milde, as may be seene in diuers Gardens (but to prevent the danger of our Winter frosts, our Gardiners now doe vse to take vp diuers Cabbages with their rootes, and tying a cloth or some such thing about the rootes, doe hang them vp in their houses, where they may be defended from cold, and then set them againe after the frosts are past) and then there shooteth out a great thicke stalke, diuided at the toppe into many branches, bearing thereon diuers small flowers, sometime white, but most commonly yellow; made of foure leaues, which turne into long, round, and pointed pods, containing therein small round

round feede, like vnto Turnep feede : the roote spreadeth not farre nor deepe, and dyeth vsually in any great froste ; for a small frost maketh the Cabbage cate the tenderer.

The red Cabbage is like vnto the white, last spoken of, but differing in colour and greatnesse ; for it is seldome found so great as the white, and the colour of the leaues is very variable, as being in some stript with red, in others more red, or very deepe red or purple.

The sugar loafe Cabbage, so called because it is smaller at the toppe then it is at the bottome, and is of two sorts, the one white, the other Greene.

The Sauoy Cabbadge, one is of a deepe Greene coloured leafe, and curld when it is to be gathered ; the other is yellowish : neyther of both these doe close so well as the first, but yet are vsed of some, and accounted good.

The Cole flower is a kinde of Coleworte, whose leaues are large, and like the Cabbage leaues, but somewhat smaller, and endented about the edges, in the middle whereof, sometimes in the beginning of Autumne, and sometimes much sooner, there appeareth a hard head of whitish yellow tufts of flowers, closely thrust together, but neuer open, nor spreading much with vs, which then is fittest to be vsed, the green leaues being cut away close to the head : this hath a much pleasanter taste then eyther the Coleworte, or Cabbage of any kinde, and is therefore of the more regard and respect at good mens tables.

The ordinary Coleworte is sufficiently knowne not to close or cabbage, and giueth feede plentifully enough.

The other Colewortes that are nourished vp with those that delight in curiosities, besides the aforesaid ordinary Greene, which is much vsed of Dutchmen, and other strangers, are these : The Curld Coleworte eyther wholly of a Greene colour, or of diuers colours in one plant, as white, yellow, red, purple or crimson, so variably mixed, the leaues being curld on the edges, like a russe band, that it is very beautifull to behold.

There is also another curld Colewort of lesse beauty and respect, being but a little curld on the edges, whose leaues are white, edged with red, or green edged with white.

Two other there are, the one of a poppingaye Greene colour : the other of a fine deepe Greene, like vnto the Sauoyes.

Then there is the Cole rape, which is also a kinde of Coleworte, that beareth a white heade, or headed stalke aboue the ground, as bigge as a reasonable Turnep, but longer, and from the toppe thereof springeth out diuers great leaues, like vnto Colewortes ; among which rise diuers stalkes that beare yellow flowers, and feede in pods, almost as small as Mustard feede : the roote is somewhat long, and very bushie with chreds.

The Vse of Cabbages and Colewortes.

They are most vsually boyled in poudred beefe broth vntil they be tender, and then eaten with much fat put among them.

The great ribs of the Poppingay, and deepe Greene Colewortes, beeing boyled and layde into dishes, are serued to the table with oyle and vinegar in the Lent time for very good sallets.

In the cold Countries of Russia and Muscouia, they poudre vp a number of Cabbages, which serueth them, especially the poorer sort, for their most ordinary foode in winter ; and although they stinke most gricuously, yet to be eaten they are accounted good meate.

It is thought, that the vse of them doth hinder the milke in Nurfes breasts, causing it to dry vp quickly : but many women that haue giuen sucke to my knowledge, haue denyed that assertion, affirming that they haue often eaten them, and found no such effect. How it might proue in more delicate bodies then theirs that thus said, I cannot tell : but Matthiolus auereth it to encrease milke in Nurfes breastes ; so differing are the opinions of many.

The feede grossely bruised and boyled a little in fish broth, is a present remedie for the Collicke ; the feede and the broth being taken together, easing them that are troubled therewith of all griping paines : as also for the stone in the kidneyes. A Lohoc or licking Electuary made of the pulpe of the

1 *Brassica capitata*. Cole Cabbage. 2 *Brassica patula*. Open Cabbage. 3 *Brassica sabaudica*. Cauliflower. 4 *Caulis*
florula. Cole flower. 5 *Caulis crispus*. Cauliflower. 6 *Caulis crispus*. Cauliflower. 7 *Rapifera*. Cole rape.
 8 *Caulis crispus*. Cauliflower.

the boyled stalkes, and a little honey and Almond milke, is very profitable for shortnesse of breath, and those that are entring into a Consumption of the lunges. It hath beene formerly held to be helpfull in all diseases: for Crisippus, an ancient Physitian, wrote a whole Volume of the vertues, applying it to all the parts of the body: which thing neede not seeme wonderfull, in that it is recorded by writers, that the old Romanes hauing expelled Physitians out of their Common-wealth, did for many hundred of yeares maintaine their health by the vse of Cabbages, taking them for euery disease.

CHAP. XXXVIII.

Sisyrinchium. Skirrets.

After all the herbes before rehearsed, fit for fallets, or otherwiseto bee eaten, there must follow such rootes as are vsed to the same purpose: and first, Skirrets haue many leaues next the ground, composed of many small smooth green leaues, set each against other vpon a middle ribbe, and every one snipt about the edges: the stalke riseth vp two or three foote high, set with the like leaues, hauing at the toppe spoakie tufts of white flowers, which turne into small seede, somewhat bigger and darker then Parsley seede: the rootes be many growing together at one head, beeing long, slender, & rugged or vneuen, of a whitish colour on the outside, and more white within, hauing in the middle of the roote a long small hard pith or string: these heads are vsually taken vp in February and March, or sooner if any so please, the greater number of them being broken off to bee vsed, the rest are planted againe after the heads are separated, and hereby they are encreased euery yeare by many; but it is now adayes more sowne of the seed, which come forwards well enough if the ground be fat and good.

The Vse of Skirrets.

The rootes being boyled, peeled and pithed, are stewed with butter, pepper and salt, and so eaten; or as others vse them, to roule them in flower, and fry them with butter, after they haue beene boyled, peeled and pithed: each way, or any way that men please to vse them, they may finde their taste to be very pleasant, far beyond any Parsnep, as all agree that taste them.

Some doe vse also to cate them as a faller, colde with vinegar, oyle, &c. being first boyled and dressed as before said. They doe helpe to prouoke yrine, and as is thought, to procure bodily lust, in that they are a little windy.

CHAP. XXXIX.

Pastinaca sativa latifolia. Parsneps.

THe common garden Parsnep hath diuers large winged leaues lying vpon the ground, that is, many leaues set one by another on both sides of a middle stalk, somewhat like as the Skirret hath, but much larger, and closer set: the stalke riseth vp great and tall, fise or six foote high somtimes, with many such leaues thereon at seuerall ioynts; the top whereof is spread into diuers branches, whereon stand spoakie rundles of yellow flowers, which turne into brownish flat seede: the root is long, great and white, very pleasant to bee eaten, and the more pleasant if it grow in a fat sandy soyle.

There is another sort of garden Parsnep, called the Pine Parsnep, that is not common in euery Garden, and differeth from the former in three notable parts. The root is not so long, but thicker at the head and smaller below; the stalke is neither so bigge,

1 *Sisyrinchium*. Skirret. 2 *Pastinaca latifolia*. Parsneps. 3 *Pastinaca tenuifolia*. Carrots. 4 *Brassica*. Turneps. 5 *Raphanistrum*. Naveweg.
6 *Raphanus niger*. Blacke Raddish. 7 *Raphanus vulgare*. Common Raddish.

nor so high; and the seede is smaller: yet as Iohn Tradescante saith (who hath giuen me the relation of this, and many other of these garden plants, to whom euery one is a debtor) the roote hereof is not altogether so pleasant as the other.

Moreouer the wilde kinde, which groweth in many places of England (and wherof in some places there might be gathered a quarter sacke full of the seede) if it be sown in Gardens, and there well ordered, will proue as good as the former kinde of Garden Parsneps.

The Vse of Parsneps.

The Parsnep root is a great nourisher, and is much more vsed in the time of Lent, being boyled and stewed with butter, then in any other time of the yeare; yet it is very good all the winter long. The seede helpeth to dissolue winde, and to prouoke vrine.

CHAP. XL.

Pastinaca sativa tenuifolia. Carrots.

THe Carror hath many winged leaues, rising from the head of the roote, which are much cut and diuided into many other leaues, and they also cut and diuided into many parts, of a deepe Greene colour, some whereof in Autumne will turne to be of a fine red or purple (the beautie whereof allureth many Gentlewomen oftentimes to gather the leaues, and sticke them in their hats or heads, or pin them on their armes in stead of feathers): the stalke riseth vp among the leaues, bearing many likewise vpon it, but nothing so high as the Parsnep, being about three foote high, bearing many spoakie tufts of white flowers, which turne into small rough seede, as if it were hairy, smelling reasonable well if it bee rubbed: the roote is round and long, thicke aboue and small below, eyther red or yellow, eyther shorter or longer, according to his kinde; for there is one kinde, whose roote is wholly red quite thorough-out; another whose roote is red without for a pretty way inward, but the middle is yellow.

Then there is the yellow, which is of two sorts, both long and short: One of the long yellow sorts, which is of a pale yellow, hath the greatest and longest roote, and likewise the greatest head of Greene, and is for the most part the worst, being spongy, and not firme.

The other is of a deepe gold yellow colour, and is the best, hauing a smaller head, or tuft of Greene leaues vpon it.

The shorte rootes are likewise distinguished, into pale and deepe yellow colours.

The Vse of Carrots.

All these sorts being boyled in the broth of beefe, eyther fresh or salt, but more vsually of salted beefe, are eaten with great pleasure, because of the sweetenesse of them: but they nourish lesse then Parsneps or Skirrets.

I haue not often knowne the seede of this Garden kinde to bee vsed in Physicke: but the wilde kinde is often and much vsed to expell winde, &c.

CHAP. XLI.

Rapum hortense. Turneps.

THere are diuers sorts of Turneps, as white, yellow, and red: the white are the most common, and they are of two kinds, the one much sweeter then the other. The yellow and the red are more rare, and nourished vp only by those that are curious: as also the Navewe, which is seene but with very few.

The

The ordinary Garden Turnep hath many large, and long rough Greene leaues, with deepe and vneuen gashes on both sides of them: the stalke riseth vp among the leaues about two foote high, spread at the toppe into many branches, bearing thereon yellow flowers, which turne into long pods, with blackish round seede in them: the roote is round and white, some greater, some smaller, the best kinde is knowne to be flat, with a small pigges tale-like roote vnderneath it, the worser kinde which is more common in many places of this land, both North and West, is round, and not flat, with a greater pigges tale-like roote vnderneath.

The yellow kinde doth often grow very great, it is hardly discerned from the ordinary kinde while it groweth, but by the greatnesse and spreading of the leaues beeing boyled, the roote changeth more yellow, somewhat neare the colour of a Carrot.

The red Turnep groweth vsually greater then any of the other, especially in a good ground, being of a faire red colour on the outside, but being pared, as white as any other on the inside. This, as Matthiolus saith, doth grow in the Countrey of Anania, where hee hath seene an infinite number of them that haue waighed fifty pound a peece, and in some places hee saith, a hundred pound a peece, both which we would thinke to be incredible, but that we see the kind is greatly giuen to grow, and in warme Countries they may so thrive, that the bulke or bignesse of the roote may so farre passe the growth of our Countrey, as that it may rise to that quantity aboue specified.

The Navew gentle is of two kindes, a smaller and a greater: the smaller is vsually called in France, *Naveau de Cane*, the roote is somewhat long with the roundnesse; this kinde is twice as bigge as a mans thumbe, and many of them lesse: The other is long and great, almost as big as the short Carrot, but for the most part of an vneuen length, and roundnesse vnto the very end, where it spreadeth into diuers small long fibres: neyther of them doth differ much from the Turnep, in leafe, flower or seed.

The Vse of Turneps.

Being boyled in salt broth, they all of them eate most kindly, and by reason of their sweetnesse are much esteemed, and often seene as a dish at good mens tables: but the greater quantitie of them are spent at poore mens feasts. They nourish much, and engender moist and loose flesh, and are very windy. The seede of the Navew gentle is (as I take it) called of Andromachus in the composition of his Treacle, *Bunias dulcis*: for Dioscorides and Plinie doe both say, that the seede of the tame Bunias or Napus is put into Antidotes, and not the seede of the wilde, which is more sharpe and bitter; neyther the seede of the Turnep, which is called in Greeke *ραψαν*, in Latine *Rapum*, because the seede is not sweete.

CHAP. XLII.

Raphanus. Raddish.

THere are two principall kindes of Garden Raddish, the one is blackish on the outside, and the other white; and of both these there is some diuision againe, as shall be shewed. Dittander and horse Raddish be reckoned kinds thereof.

The ordinary Raddish hath long leaues, vneuenly gashed on both sides, the stalke riseth vp to the height of three or foure foote, bearing many purplish flowers at the top, made of foure leaues a peece, which turne into thicke and short pods, wherein are contained round seede, greater then Turnep or Coleworte seede, and of a pale reddish colour: the roote is long, white, and of a reddish purple colour on the outside toward the toppe of it, and of a sharpe biting taste.

There is a small kind of Raddish that commeth earlier then the former, that we haue had out of the low Countries, not differing in any thing else.

The blacke Raddish I haue had brought me out of the lowe Countries, where they sell them in some places by the pound, and is accounted with them a rare winter sallet:

the roote of the best kinde is blackish on the outside (and yet the seede gathered from such an one, hath after the sowing againe, giuen rootes, whereof some haue beene blacke, but the most part white on the outside) and white within, great and round at the head, almost like a Turnep, but ending shorter then a Raddish, and longer then a Turnep, almost pearce-fashion, of a firmer and harder substance then the ordinary Raddish, but no lesse sharpe and biting, and somewhat strong withall; the leaues are somewhat smaller, and with deeper gashes, the flower and seede are like the former, but smaller.

Another sort of blacke Raddish is like in leafe and seede to the former, but the flower is of a lighter purple colour: the roote is longer and smaller, and changeth also to bee white as the former doth, so that I thinke they haue both risen from one kinde.

The Horse Raddish is a kinde of wilde Raddish, but brought into Gardens for the vse of it, and hath great large and long greene leaues, which are not so much diided, but dented about the edges: the roote is long and great, much stronger in taste then the former, and abideth diuers yeares, spreading with branches vnder ground.

Dittander is likewise a wilde kinde hereof, hauing long pointed blewish greene leaues, and a roote that creepeth much vnder ground: I confesse this might haue bin placed among the herbes, because the leaues and not the rootes are vsed; but let it passe now with the kindes of Raddish.

The Vse of these Raddishes.

Raddishes doe serue vsually as a *stimulum* before meat, giuing an appetite thereunto; the poore eate them alone with bread and salt. Some that are early sown, are eaten in Aprill, or sooner if the season permit; others come later, and some are sown late to serue for the end of Summer: but (as of all things else) the earlier are the more accepted.

The blacke Raddishes are most vsed in the winter, (yet some in their naturall and not forc'd grounds, haue their rootes good most part of the Summer) and therefore must bee sown after Midsomer; for if they should bee sown earlier, they would presently runne vp to stalke and seed, and so lose the benefit of the roote. The Physicall propertie is, it is often vsed in medicines that helpe to breake the stone, and to auoyde grauell.

The Horse Raddish is vsed Physically, very much in Melancholicke, Spleneticke and Scorbuticke diseases. And some vse to make a kinde of Mustard with the rootes, and eate it with fish.

Dittander or Pepperworthe is vsed of some cold churlish stomackes, as a sawce or fallet sometimes to their meate, but it is too hot, bitter and strong for weake and tender stomackes.

Our Gardiners about London vse great fences of reede tyed together, which seemeth to bee a mat set vpright, and is as good as a wall to defend the cold from those things that would be defended, and to bring them forwards the earlier.

CHAP. XLIII.

Cepa. Onions.

WE haue diuers sorts of Onions, both white and red, flat, round and long, as shall be presently shewed: but I will doe with these as I doe with the rest, only giue you one description for them all, and afterwards their seuerall names and varieties, as they are to be known by.

Our common Garden Onion hath diuers long greene hollow leaues, seeming halfe flat; among which riseth vp a great round hollow stalke, bigger in the middle then any where else, at the toppe whereof standeth a close round head, couered at the first with a thin skinne, which breaketh when the head is growne, and sheweth forth a great ym-

bell

1 *Raphanistrifolius*. Horfe Raddish. 2 *Lepidium piperitis*. Dittander. 3 *Cepa rotunda*. Round Onions. 4 *Cepa longae*. Long Onions. 5 *Furum*. Leekes. 6 *Allium*. Garlick. 7 *Raphanus*. Rampions. 8 *Tragopogon*. Goates beard.

bell of white flowers, which turne into blacke seede : but then the head is so heauie that the stalke cannot sustaine it, but must be vpheld from falling to the ground, lest it rot and perish : the roote as all know is round, in some greater, in others lesser, or flat, in some red on the outside only, in others quite thorough out, in some white, and very sharpe and strong, in others milder, and more pleasant, and some so pleasant that they may be eaten as an Apple : All these kindes of Onions, contrary to the nature of all other bulbous rootes, haue no off-set, or other roote growing to it, but are euery one alone single by themselues ; and therefore it seemeth, the Latines, as Columella recordeth, haue giuen it the name *Vnio*, and the French it should seeme following the Latine, and the English the French, do call it *Oignon* and *Onion*, as an vnite, or as if they were but one and one, and dye euery yeare after seed bearing.

The red flat kinde is most vsually with vs the strongest of them all, yet I haue had a great red Onion brought mee from beyond Sea, that was as great almost as two mens fistes, flat and red quite thoroughout, and very pleasant both to smell vnto, and to cate, but did quickly degenerate, so that we plainly see, that the soyle and climate doth giue great alteration to plants of all sorts.

The long kinde wee call St. Omers Onions, and corruptly among the vulgar, St. Thomas Onions.

The other red kinde we call Strasborough Onions, whose outside onely is red, and are very sharpe and fierce.

The white Onions both long and flat, are like vnto Chalke-stones lying vpon the ground, when they are ripe and fit to be gathered.

And lastly, there is the Spanish Onion, both long and flat, very sweete, and eaten by many like an apple, but as Iohn Tradescante saith, who hath bene in Spaine, that the Spaniards themselues doe not cate them so familiarly, as they doe those white Onions that come out of our owne Countrey, which they haue there more plentifully then their sweete Onions.

The Vse of Onions.

Onions are vsed many wayes, as sliced and put into pottage, or boyled and peeled and layde in dishes for sallets at supper, or sliced and put into water, for a sawce for mutton or oysters, or into meate roasted being stuffed with Parsly, and so many waies that I cannot recount them, euery one pleasing themselues, according to their order, manner or delight.

The iuice of Onions is much vsed to be applied to any burnings with fire, or with Gun-powder, or to any scaldings with water or oyle, and is most familiar for the Country, where vpon such sudden occasions they haue not a more fit or speedy remedie at hand : The strong smell of Onions, and so also of Garlicke and Leekes, is quite taken away from offending the head or eyes, by the eating of Parsley leaues after them.

CHAP. XLIIII.

Porrum. Leekes.

THere be likewise sundry sorts of Leekes, both great and small. Leekes are very like vnto Onions, hauing long green hollow-like leaues, flattish on the one side, and with a ridge or crest on the backe side : if they bee suffered to grow vncut, then in the second or third yeare after the sowing, they will send forth a round and slender stalke, euen quite thoroughout, and not swollen or bigger in the middle like the Onion, bearing at the toppe a head of purplish flowers, and blacke seede after them, very like vnto Onion seede, that it is hard to distinguish them : the root is long and white, with a great bush of fibres hanging at it, which they call the beards.

The vnset Lecke hath longer and slenderer roots then the other, which being transplanted, groweth thicker and greater.

The

The French Leeke, which is called the Vine Leeke, is the best of all others. Our common kinde is of two sorts, one greater then another.

Another sort encreaseth altogether by the roote, as Garlick doth. And then Ciues, which are the smallest, and encrease abundantly only by the roote.

Some doe account Scalions to be rather a kinde of Onions then Leekes, and call them *Cepa Ascalonica*, or *Ascalonitides*, which will quickly spend it selfe, if it be suffered to be vncut; but all Authors affirme, that there is no wilde kinde of Onion, vnlesse they would haue it to be *Gethyum*, whereof Theophrastus maketh mention, saying, that it hath a long necke (and so these Scalions haue) and was also of some called *Gethyllides*, which antiquity accounted to be dedicated to Latona, the mother of Apollo, because when she was bigge with childe of Apollo, she longed for these Leekes.

The Vse of Leekes.

The old World, as wee finde in Scripture, in the time of the children of Israels being in Egypt, and no doubt long before, fed much vpon Leekes, Onions, and Garlick boyled with flesh; and the antiquity of the Gentiles relate the same manner of feeding on them, to be in all Countries the like, which howsoeuer our dainty age now refuseth wholly, in all sorts except the poorest; yet Muscouia and Russia vse them, and the Turkes to this day, (as Bellonius writeth) obserue to haue them among their dishes at their tables, yea although they be *Basbas*, *Cades*, or *Vainodas*, that is to say, Lords, Iudges, or Gouvernours of countries and places. They are vsed with vs also sometimes in Lent to make portage, and is a great and generall feeding in Wales with the vulgar Gentlemen.

Onions boyled or roasted vnder the embers, and mixed with sugar and butter, are good for those that are troubled with coughes, shortnesse of breath, and wheezing. An Onion made hollow at the bottome, and some good Treacle put into it, with a little iuyce of Citrons (or Lemons in the stead thereof) being well baked together vnder the embers, after the hole is stopped againe, and then strained forth, and giuen to one that hath the plague, is very helpfull, so as hee be laid to sweate vpon it.

Ciues are vsed as well to be shred among other herbes for the pot, as to be put into a Sallet among other herbes, to giue it a quicker relish.

Leekes are held to free the chest and lungs from much corruption and rotten flegme, that sticketh fast therein, and hard to be auoided, as also for them that through hoarsenesse haue lost their voice, if they be eyther taken rawe, or boyled with broth of barley, or some such other supping, fit and conducing thereunto. And baked vnder hot embers is a remedy against a surfeit of Mushromes.

The greene blades of Leekes being boyled and applyed warme to the *Hemorrhoides* or piles, when they are swolne and painfull, giue a great deale of ease.

CHAP. XLV.

Allium. Garlick.

I haue spoken of diuers sorts of Garlick called Moly, in the former booke: I shall neede in this place to shew onely those kindes, that this Garden nourisheth vpon, and leaue the rest to his fittime and place.

Garlick hath many long greene leaues, like vnto Onions, but much larger, and not hollow at all as Onions are: the stalke riseth vp to be about three foote high, bearing such a head at the topp thereof as Onions and Leekes doe, with purplish flowers, and blacke seede like Leekes: the roote is white within, couered ouer with many purplish

plish skins, and is diuided into many parts or cloues, which serue both to set againe for increase, and also to vse as neede shall require, and is of a very strong smell and taste, as euery one knoweth, passing either Onions or Leekes, but exceeding wholesome withall for them that can take it.

Allium Prasinum. Ramsons.

Ramsons are another kinde of Garlicke, and hath two or three faire broad leaues, of a fresh or light Greene colour, pointed at the end: the stalke groweth about an hand length high, bearing many small and pure white starre-like flowers at the toppe, and afterwards small, blacke, and smooth round seede: the roote is also diuided into many parts, whereby it is much encreased, and is much milder then the former, both in smell and taste.

The Vse of Garlicke.

It being well boyled in salt broth, is often eaten of them that haue strong stomackes, but will not brooke in a weake and tender stomacke.

It is accounted, and so called in diuers Countries, The poore mans Treacle, that is, a remedy for all diseases. It is neuer eaten rawe of any man that I know, as other of the rootes aforesaid, but foddren alwaies and so taken.

Ramsons are oftentimes eaten with bread and butter, and otherwise also, as euery mans affection and course of life leadeth him to vse.

CHAP. XLVI.

Rapunculus siue Rapantium. Rampions.

Garden Rampions are of two sorts, the one greater, the other lesser: the leaues of Rampions are in the one somewhat broad like a Beete, in the other somewhat long and narrow, and a little broader at the end, of a light Greene colour, lying flat vpon the ground all the first winter, or yeare of the springing, and the next Spring shooteth forth stalkes two or three foote high, bearing at the toppe, in the bigger sort, a long slender spike of small horned or crooked flowers, which open their brimmes into foure leaues; in the lesser many small purplish bells, standing vpon seuerall small foote-stalkes, which turne into heads, bearing small blackish seede: the root is white, branched into two or three rootes, of the bignesse and length of a mans finger or thumbe.

The Vse of Rampions.

The rootes of both are vsed for Sallets, being boyled, and then eaten with oyle and vinegar, a little salt and pepper.

CHAP. XLVII.

Tragopogon. Goates beard.

Goates beard hath many long and narrow leaues, broader at the bottome, and sharper at the end, with a ridge downe the backe of the leafe, and of a pale Greene colour; among which riseth vp a stalke of two or three foote high, smooth and hollow, bearing thereon many such like leaues, but smaller and shorter, and at the toppe thereof on euery branch a great double yellow flower, like almost vnto the flower of a Dandelion, which turneth into a head, stored with downe, and long whitish seede therein, hauing on the head of euery one some part of the downe, and

and is carried away with the winde if it bee neglected: the roote is long and round, somewhat like vnto a Parsnep, but farre smaller, blackish on the outside, and white within, yeelding a milkie iuyce being broken, as all the rest of the plant doth, and of a very good and pleasant taste. This kinde, as also another with narrower leaues, almost like grasse, growe wilde abroad in many places, but are brought into diuers Gardens. The other two kinde formerly described in the first part, the one with a purple flower, and the other with an ash-coloured, haue such rootes as these here described, and may serue also to the same purpose, being of equall goodnesse, if any will vse them in the same manner; that is, while they are young, and of the first yeares sowing, else they all growe hard, in running yp to seede.

The Vse of Goates beard.

If the rootes of any of these kinde being young, be boyled and dressed as a Parsnep, they make a pleasant dish of meate, farre passing the Parsnep in many mens iudgements, and that with yellow flowers to be the best. They are of excellent vse being in this manner prepared, or after any other fit and conuenient way, to strengthen those that are macilent, or groweing into any consumption.

CHAP. XLVIII.

Carum. Carawayes.

Carawayes hath many very fine cut and diuided leaues lying on the ground, being alwaies greene, somewhat resembling the leaues of Carrots, but thinner, and more finely cut, of a quicke, hot, and spicie taste: the stalke riseth not much higher then the Carrot stalke, bearing some leaues at the ioyns along the stalke to the toppe, where it brancheth into three or foure parts, bearing spoakie vmbels of white flowers, which turne into small blackish seede, smaller then Aniseede, and of a hotter and quicker taste: the roote is whitish, like vnto a Parsnep, but much smaller, more spreading vnder ground, and a little quicke in taste, as all the rest of the plant is, and abideth long after it hath giuen seede.

The Vse of Carawayes.

The rootes of Carawayes being boyled may be eaten as Carrots, and by reason of the spicie taste doth warme and comfort a cold weak stomacke, helping to dissolue winde (whereas Carrots engender it) and to prouoke vrine, and is a very welcome and delightfull dish to a great many, yet they are somewhat stronger in taste then Parsneps.

The seede is much vsed to bee put among baked fruit, or into bread, cakes, &c. to giue them a relish, and to helpe to digest winde in them are subiect thereunto.

It is also made into Comfits, and put into Trageas, or as we call them in English, Dredges, that are taken for the cold and winde in the body, as also are serued to the table with fruit.

CHAP.

CHAP. XLIX.

Pappas sine Battatas. Potatoes.

THree sorts of Potatoes are well knowne vnto vs, but the fourth I rest doubtfull of, and dare not affirme it vpon such termes as are giuen vnto it, vntill I may be better informed by mine owne sight.

The Spanish kinde hath (in the Islands where they growe, either naturally, or planted for increase, profit, and vse of the Spaniards that nourse them) many firme and verie sweete rootes, like in shape and forme vnto Asphodill rootes, but much greater and longer, of a pale browne on the outside, and white within, set together at one head; from whence rise vp many long branches, which by reason of their weight and weaknesse, cannot stand of themselves, but traile on the ground a yard and a halfe in length at the least (I relate it, as it hath growne with vs, but in what other forme, for flower or fruit, we know not) whereon are set at seuerall distances, broad and in a manner three square leaues, somewhat like triangled luie leaues, of a darke greene colour, the two sides whereof are broad and round, and the middle pointed at the end, standing reasonable close together: thus much we haue scene growe with vs, and no more: the roote rather decaying then increasing in our country.

The Potatoes of Virginia, which some foolishly call the Apples of youth, is another kinde of plant, differing much from the former, sauing in the colour and taste of the roote, hauing many weake and somewhat flexible branches, leaning a little downwards, or easily borne downe with the winde or other thing, beset with many winged leaues, of a darke grayish greene colour, whereof diuers are smaller, and some greater then others: the flowers growe many together vpon a long stalke, coming forth from betweene the leaues and the great stalkes, euery one seuerally vpon a short foot-stalke, somewhat like the flower of Tabacco for the forme, being one whole leafe six cornered at the brimmes, but somewhat larger, and of a pale blewish purple colour, or pale dove colour, and in some almost white, with some red threads in the middle, standing about a thicke gold yellow pointell, tipped with greene at the end: after the flowers are past, there come vp in their places small round fruit, as bigge as a Damson or Bullais, greene at the first, and somewhat whitish afterwards, with many white feedes therein, like vnto Nightshade: the rootes are rounder and much smaller then the former, and some much greater then others, disperfed vnder ground by many small threads or strings from the rootes, of the same light browne colour on the outside, and white within, as they, and neare of the same taste, but not altogether so pleasant.

The Potatos of Canada, (which hath diuers names giuen it by diuers men, as Bauhinus vpon Matthioli callet it, *Solanum tuberosum esculentum*, Pelleterius of Middleborough in his *Plantarum Synonymia*, *Heliotropium indicum tuberosum*, Fabius Columna in the second part of his *Phytobasanos*, *Flos Solis Farnesianus*, sine *Aster Peruanus tuberosus*: We in England, from some ignorant and idle head, haue called them Artichokes of Ierusalem, only because the roote, being boyled, is in taste like the bottome of an Artichoke head: but they may most fitly be called, Potatos of Canada, because their rootes are in forme, colour and taste, like vnto the Potatos of Virginia, but greater, and the French brought them first from Canada into these parts) riseth vp with diuers stiffe, round stalkes, eight or tenne foote high in our Country, where they haue scarce shewed their flowers, whereas the very head of flowers in other Countries, as Fabius Columna expresth it, being of a Pyramis or Sugar loafe fashion, broad spreading below, and smaller pointed vpwads towards the toppe, is neere of the same length, whereon are set large and broad rough greene leaues, very like vnto the leaues of the flower of the Sunne, but smaller, yet growing in the very same manner, round about the stalkes: at the very later end of Summer, or the beginning of Autumne, if the roote bee well planted and defended, it will giue a shew of a few small yellow flowers at the top, like vnto the flowers of *Aster* or *Starre worte*, and much smaller then any flower of the Sunne, which come to no perfection with vs: the roote, while the plant

1 *Carum*, Carawayes. 2 *Battatas Hispanorum*, Spanish Potatoes. 3 *Papas seu Battatas Virginianorum*, Virginia Potatoes. 4 *Battatas de Canada*, Potatoes of Canada, or Artichokes of Jerusalem.

is growing aboue ground, encreaseth not to his full growth, but when the Summer is well spent, and the springing of the stalk is past, which is about the end of August, or in September, then the root is perceiued to be encreased in the earth, and will before Autumne be spent, that is, in October, swell like a mound or hillocke, round about the foote of the stalkes, and will not haue his rootes fit to be taken vp, vntill the stalkes be halfe withered at the soonest; but after they be withered, and so all the winter long vntill the Spring againe, they are good, and fit to bee taken vp and vsed, which are a number of tuberous round rootes, growing close together, so that it hath bene obserued, that from one roote, being set in the Spring, there hath been forty or more taken vp againe, and to haue ouer-filled a pecke measure, and are of a pleasant good taste as many haue tryed.

The Vse of all these Potato's.

The Spanish Potato's are roasted vnder the embers, and being pared or peeled and sliced, are put into sacke with a little sugar, or without, and is delicate to be eaten.

They are vsed to be baked with Marrow, Sugar, Spice, and other things in Pyes, which are a daintie and costly dish for the table.

The Confit-makers preferue them, and candy them as diuers other things, and so ordered, is very delicate, fit to accompany such other banquetting dishes.

The Virginia Potato's being dressed after all these waies before specified, maketh almost as delicate meate as the former.

The Potato's of Canada are by reason of their great increasing, growne to be so common here with vs at London, that euen the most vulgar begin to despise them, whereas when they were first receiued among vs, they were dainties for a Queene.

Being put into seething water they are soone boyled tender, which after they bee peeled, sliced and stewed with butter, and a little wine, was a dish for a Queene, beeing as pleasant as the bottome of an Artichoke: but the too frequent vse, especially being so plentifull and cheape, hath rather bred a loathing then a liking of them.

CHAP. L.

Cinara. Artichokes.

THe fruits that grow vpon or neere the ground, are next to be entreated of, and first of Artichokes, whereof there be diuers kindes, some accounted tame and of the Garden, others wilde and of late planted in Gardens, Orchards or Fieldes, of purpose to be meate for men.

The Artichoke hath diuers great, large, and long hollowed leaues, much cut in or torne on both edges, without any great shew of prickles on them, of a kinde of whitish Greene, like vnto an ash colour, whereof it tooke the Latine name *Cinara*: the stalke is strong, thicke and round, with some skins as it were downe all the length of them, bearing at the toppe one scaly head, made at the first like a Pine-apple, but after growing greater, the scales are more separate, yet in the best kindes lying close, and not staring, as some other kindes doe, which are eyther of a reddish browne, whitish, or greenish colour, and in some broad at the ends, in others sharpe or prickly: after the head hath stood a great while, if it bee suffered, and the Summer proue hot and kindly, in some there will breake forth at the toppe thereof, a tuft of blewish purple thrunes or threds, vnder which grow the seede, wrapped in a great deale of dounie substance: but that roote that yeeldeth flowers will hardly abide the next winter; but else being cut off when it is well growne, that dounie matter abideth close in the middle of the head, hauing the bottome thereof flat and round, which is that matter or substance that is vsed to be eaten: the roote spreadeth it selfe in the ground reasona-

ble

1 *Cynara sativum rubra*. The red Artichoke. 2 *Cynara sativa alba*. The white Artichoke. 3 *Cynara scolymus*. The French Artichoke. 4 *Cynara latifolia*. The Thistle Artichoke. 5 *Cordans esculenta*. The Chardon.

ble well, yeelding diuers heads of leaues or suckers, whereby it is increased.

The white Artichoke is in all things like the red, but that the head is of a whitish ashe colour, like the leaues, whereas the former is reddish.

We haue also another, whose head is greene, and very sharpe vpwards, and is common in many places.

Wee haue had also another kinde in former times that grew as high as any man, and branched into diuers stalkes, euery one bearing a head thereon, almost as bigge as the first.

There is another kinde, called the Muske Artichoke, which groweth like the French kinde, but is much better in spending, although it haue a lesser bottome.

The French Artichoke hath a white head, the scales whereof stand staring far asunder one from another at the ends, which are sharpe: this is well known by this qualitie, that while it is hot after it is boyled, it swelleth so strong, that one would verily thinke it had bin boyled in flinking water, which was brought ouer after a great frost that had well nigh consumed our best kindes, and are now almost cleane cast out again, none being willing to haue it take vp the roome of better.

There is a lowe kinde that groweth much about Paris, which the French esteeme more then any other, and is lower then the former French kinde, the head whereof as well as the leaues, is of a fresher greene colour, almost yellowish.

Then there is the Thistle Artichoke, which is almost a wilde kinde, and groweth smaller, with a more open and prickly head then any of the former.

And lastly, the Chardon as they call it, because it is almost of the forme and nature of a Thistle, or wilde Artichoke. This groweth high, and full of sharpe prickles, of a grayish colour. Iohn Tradescante assured mee, hee saw three acres of Land about Brussels planted with this kinde, which the owner whited like Endiue, and then sold them in the winter: Wee cannot yet finde the true manner of dressing them, that our Countrey may take delight therein.

All these kindes are encreased by slipping the young shootes from the root, which being replanted in February, March, or Aprill, haue the same yeare many times, but the next at the most, borne good heads.

Wee finde by dayly experience, that our English red Artichoke is in our Countrey the most delicate meate of any of the other, and therefore diuers thinking it to bee a feuerall kinde, haue sent them into Italie, France, and the Lowe Countreies, where they haue not abode in their goodnesse about two yeare, but that they haue degenerated: so that it seemeth, that our soyle and climate hath the preheminence to nourish vp this plant to his highest excellencie.

The Vse of Artichokes.

The manner of preparing them for the Table is well knowne to the youngest Housewife I thinke, to bee boyled in faire water, and a little salt, vntill they bee tender, and afterwarde a little vinegar and pepper, put to the butter, poured vpon them for the sawce, and so are serued to the Table.

They vse likewise to take the boyled bottomes to make Pyes, which is a delicate kinde of baked meate.

The Chardon is eaten rawe of diuers, with vinegar and oyle, pepper and salt, all of them, or some, as euery one liketh for their delight.

CHAP. LI.

Faba & Phaseoli. Garden and French Beanes.

THe Garden Beane is of two colours, red or blacke, and white, yet both rise from one; the small or fiede Beanes I make no mention of in this place; but the French or Kidney Beane is almost of infinite sorts and colours: we doe not for all that intend to trouble you in this place, with the knowledge or relation of any more then is fit for a Garden of that nature, that I haue propounded it in the beginning.

Our ordinary Beanes, seruing for foode for the poorer sort for the most part, are planted as well in fieldes as in gardens, because the quantity of them that are spent taketh vp many acres of land to be planted in, and rise vp with one, two or three stalks, according to the fertilitie of the soyle, being smooth and square, higher then any man oftentimes, whereon are set at certaine distances, from the very bottome almost to the toppe, two long smooth fleshy and thicke leaues almost round, one standing by another at the end of a small footestalke: betweene these leaues and the stalke, come forth diuers flowers, all of them looking one way for the most part, which are close a little turned vp at the brimmes, white and spotted with a blackish spot in the middle of them, and somewhat purplish at the foot or bottome, of the forme almost of Broome or Pease flowers, many of which that grow vpward toward the toppe, doe seldome beare fruit, and therefore are gathered to distill, and the toppes of the stalkes cut off, to cause the rest to thriue the better; after which grow vp long great smooth greene pods, greater then in any other kinde of Pulse, which grow blacke when they are ripe, and containe within them two, three or foure Beanes, which are somewhat flat and round, eyther white or reddish, which being full ripe grow blackish: the roote hath diuers fibres annexed vnto the maine roote, which dyeth euery yeare.

The French or Kidney Beane riseth vp at the first but with one stalke, which afterwards diuideth it selfe into many armes or branches, euery one of them being so weak, that without they be sustained with stickes or poles, whereon with their winding and clasping they take hold, they would lye fruitlesse vpon the ground; vpon these branches grow forth at severall places long footestalkes, with euery of them three broad, round and pointed greene leaues at the end of them, towards the top whereof come forth diuers flowers, made like vnto Pease blossomes, of the same colour for the most part that the fruit will be of, that is to say, eyther white, or yellow, or red, or blackish, or of a deepe purple &c. but white is most vsuall for our Garden; after which come long and slender flat pods, some crooked, and some straight, with a string as it were running downe the backe thereof, wherein are contained flattish round fruit, made to the fashion of a kidney: the roote is long, and spreadeth with many fibres annexed vnto it, perishing euery yeare.

The Vse of these Beanes.

The Garden Beanes serue (as I said before) more for the vse of the poore then of the rich: I shall therefore only shew you the order the poore take with them, and leaue curiosity to them that will bestow time vpon them. They are only boyled in faire water and a little salt, and afterwards stewed with some butter, a little vinegar and pepper being put vnto them, and so eaten; or else eaten alone after they are boyled without any other sawce. The water of the blossomes distilled, is vsed to take away spots, and to cleer the skin. The water of the greene huskes or cods is good for the stone.

The Kidney Beanes boyled in water huske and all, onely the ends cut off, and the string taken away, and stewed with butter &c. are esteemed more sauory meate to many mens pallates, then the former, and are a dish more oftentimes at rich mens Tables then at the poore.

CHAP. LIII.

Pisum. Pease.

THere is a very great variety of manured Pease known to vs, and I think more in our Country then in others, whereof some prosper better in one ground and country, and some in others: I shall give you the description of one alone for all the rest, and recite vnto you the names of the rest.

Garden Pease are for the most part the greatest and sweetest kinds, and are sustained with stakes or bushes. The Field Pease are not so vsed, but growe without any such adoe. They spring vp with long, weake, hollow, and brittle (while they are young and Greene) whitish Greene stalkes, branched into diuers parts, and at euery ioynt where it parteth one broad round leafe compassing the stalke about, so that it cometh as it were thorough it: the leaues are winged, made of diuers small leaues set to a middle ribbe, of a whitish Greene colour, with claspers at the ends of the leaues, whereby it taketh hold of whatsoeuer standeth next vnto it: betweene the leaues and the stalkes come forth the flowers, standing two or three together, euery one by it selfe on his owne scuerall stalke, which are either wholly white, or purple, or mixed white and purple, or purple and blew: the fruit are long, and somewhat round cods, whereof some are greater, others lesser, some thicke and short, some plaine and smooth, others a little crooked at the ends; wherein also are contained diuers formes of fruit or pease; some being round, others cornered, some small, some great, some white, others gray, and some spotted: the roote is small, and quickly perisheth.

The kinds of Pease are these:

The Rounciuall.

The Greene Hasting.

The Sugar Pease.

The Spotted Pease.

The Scottish or tufted Pease, which some call the Rose Pease, is a good white Pease fit to be eaten.

The early or French Pease, which some call Fulham Pease, because those ground: thereabouts doe bring them soonest forward for any quantity, although sometimes they miscarry by their haste and earliness.

The gray Pease.

The white Hasting.

The Pease without skins.

Cicer Arietinum. Rams Ciches.

This is a kinde of Pulse, so much vsed in Spaine, that it is vually one of their daintie dishes at all their feasts: They are of two sorts, white and red; the white is onely vsed for meate, the other for medicine. It beareth many vpright branches with winged leaues, many set together, being small, almost round, and dented about the edges: the flowers are either white or purple, according to the colour of the Pease which follow, and are somewhat round at the head, but cornered and pointed at the end, one or two at the most in a small roundish cod.

The Vse of Pease.

Pease of all or the most of these sorts, are either vsed when they are Greene, and be a dish of meate for the table of the rich as well as the poore, yet euery one obseruing his time, and the kinde: the fairest, sweetest, youngest, and earliest for the better sort, the later and meaner kinds for the meaner, who doe not giue the deere price: Or

Being dry, they serue to boyle into a kinde of broth or pottage, wherein many doe put Tyme, Mints, Sauory, or some other such hot herbes, to giue it the better rellish, and is much vsed in Towne and Countrey in the Lent time,

1 *Faba sativa* Garden Beans. 2 *Phaseolus sativus* French Beans. 3 *Pisum vulgare* Garden Pease. 4 *Pisum umbellatum* *sive* Roseum. Pease or Scottish Pease. 5 *Pisum sativum* Sugar Pease. 6 *Pisum maculatum* Spotted Pease. 7 *Cicer Achetinum* Roma Chickes or Cicers.

time, especially of the poorer sort of people.

It is much vsed likewise at Sea for them that goe long voyages, and is for change, because it is fresh, a welcome diet to most persons therein.

The Rams Ciches the Spaniards call *Grauanco*, and *Garauancillo*, and eate them boyled and stewed as the most dainty kinde of Pease that are, they are of a very good relish, and doe nourish much; but yet are not without that windy quality that all sorts of Pulse are subiect vnto: they increase bodily lust much more then any other sorts, and as it is thought, doth helpe to encrease seede.

CHAP. LIII.

Cucumber. The Cowcumber.

OF Cowcubers there are diuers sorts, differing chiefly in the forme and colour of the fruit, and not in the forme of the plant; therefore one description shall serue in stead of all the rest.

The Cowcumber bringeth forth many trailing rough greene branches lying on the ground, all along whereof growe seuerall leaues, which are rough, broad, vneuen at the edges, and pointed at the ends, with long crooked tendrels comming forth at the same ioynt with the leafe, but on the other side therof: between the stalks & the leaues at the ioynts come forth the flowers seuerally, euery one standing on a short foot-stalke, opening it selfe into fiae leaues, of a yellowish colour, at the bottome whereof groweth the fruit, long and greene at the first, but when it is thorough ripe, a little yellowish, hauing many furrowes, and vneuen bunches all the length of it, wherein is a white firme substance next vnto the skin, and a cleare pulpe or watery substance, with white flat seede lying dispersed through it: the roote is long and white, with diuers fibres at it.

The kindes.

The first described is called, The long greene Cowcumber.

There is another is called, The short Cowcumber, being short, and of an equall bignesse in the body thereof, and of an vnequall bignesse at both ends.

The long Yellow, which is yellowish from the beginning, and more yellow when it is ripe, and hath beene measured to be thirteene inches long: but this is not that small long Cowcumber, called of the Latines, *Cucumis anguinus*.

Another kinde is early ripe, called The French kinde.

The Dantsicke kinde beareth but small fruit, growing on short branches or runners: the pickled Cowcubers that are vsually sold are of this kind.

The Muscouie kinde is the smallest of all other, yet knowne, and beareth not aboue foure or fiae at the most on a roote, which are no bigger then small Lemons.

The Vse of Cowcubers.

Some vse to cast a little salt on their sliced Cowcubers, and let them stand halfe an houre or more in a dish, and then poure away the water that commeth from them by the salt, and after put vinegar, oyle, &c. thereon, as euery one liketh: this is done, to take away the ouermuch waterishnesse and coldnesse of the Cowcubers.

In many countries they vse to eate Cowcubers as wee doe Apples or Peares, paring and giuing slices of them, as we would to our friends of some dainty Apple or Pear.

The pickled Cowcubers that come from beyond Sea, are much vsed with

with vs for sawce to meate all the Winter long. Some haue striuen to equall them, by pickling vp our Cowcumbers at the later end of the yeare, when they are cheapest, taking the little bones and scalding them thoroughly well, which after they put in brine, with some Dill or Fenell leaues and stalkes: but these are nothing comparable to the former, wee either missing of the right and orderly pickling of them, or the kinde it selfe differing much from ours (as I said of the Dantseke kinde) for ours are neither so tender and firme, nor so sauioury as the other.

The rawe or greene Cowcumbers are fittest for the hotter time of the yeare, and for hot stomackes, and not to be vsed in colder weather or cold stomackes, by reason of the coldnesse, whereby many haue been ouertaken.

The seede is vsed physically in many medicines that serue to coole, and a little to make the passages of vrine slippery, and to giue ease to hot diseases,

which is very great, sometimes of the pibelle of a mans body, and sometimes of the pibelle of a mans body, and sometimes of the pibelle of a mans body.

CWAB. LIII. *Mela. Milions or Muske Melons.*

Mela. Milions or Muske Melons.

Here bee diuers sorts of Melons found out at this day, differing much in the goodnesse of taste one from another. This Countrey hath not had vntill of late yeares the skill to nourse them vp kindly, but now there are many that are so well experienced therein, and haue their ground so well prepared, as that they will not misse any yeare, if it be not too extreme vnkindly, to haue many ripe ones in a reasonable time: yet some will be later then others alwayes.

The Melon is certainly a kinde of Cowcumber, it doth so neare resemble it, both in the manner of his growing, hauing tough trailing branches, rough yreuen leaues, and yellow flowers: after which come the fruit, which is rounder, thicker, bigger, more rugged, and spotted on the outside then the Cowcumber, of a rufser colour, and greene vnderneath, which when it groweth full ripe, will change a little yellowish, being as deepe furrowed and ribbed as they, and besides hauing chaps or rifts in diuers places of the rinde: the inward hard substance is yellow, which onely is eaten: the seede which is bigger, and a little yellower then the Cowcumber, lying in the middle onely among the moister pulpe: the sinell and changing of his colour, fore-shew their ripenesse to them that are experienced: the roote is long, with many fibres at it. The fruit requireth much watering in the hot time of the day, to cause them to ripen the sooner, as I haue obserued by diuers of the best skill therein.

The Vse of the kindes of Melons.

The best Melon seede doe come to vs out of Spaine, some haue come out of Turkie, but they haue been nothing so good and kindly.

Some are called Sugar Melons, others Pear Melons, and others Muske Melons.

They haue beene formerly onely eaten by great personages, because the fruit was not onely delicate but rare, and therefore diuers were brought from France, and since were noursed vp by the Kings or Noblemens Gardiniers onely, to serue for their Masters delight: but now diuers others that haue skill and conueniencie of ground for them, doe plante them and make them more common.

They paire away the outer rinde, and cut out the inward pulpe where the seede lyeth, slice the yellow firme inward rinde of substance, & so eat it with salt and pepper (and good store of wine, or else it will hardly digest) for this is firmer, & hath in it that moisture in it that the Cowcumbers haue.

It is also more delicate, and of more worth, which recompenseth the paine. The seede of these Melons are vsed as Cowcumbers physically, and together with them in most vntually.

CHAP. LV.

Pope. Pumpions.

WE haue but one kinde of Pumpion (as I take it) in all our Gardens, notwithstanding the diuersities of bignesse and colour.

The Pumpion or great Melon (or as some call it Milion) creepeth vpon the ground (if nothing bee by it whereon it may take hold and climbe) with very great, ribbed, rough, and prickly branches, whereon are set very large rough leaves, cut in on the edges with deepe gashes, and dented besides, with many claspers also, which winde about euery thing they meete withall: the flowers are great and large, hollow and yellow, diuided at the brims into five parts, at the bottome of which, as it is in the rest, groweth the fruit, which is very great, sometimes of the bignesse of a mans body, and oftentimes lesse, in some ribbed or bunched, in others plaine, and either long or round, either green or yellow, or gray, as Nature listeth to shew her selfe; for it is but waste time, to recite all the formes and colours may be obserued in them: the inner rinde next vnto the outer is yellowish and firme: the seede is great, flat, and white, lying in the middle of the watery pulpe: the roote is of the bignesse of a mans thumbe or greater, dispersed vnder ground with many small fibres ioyned thereunto. Gourds are kinde of Melons; but because wee haue no vse of them, wee leaue them vnto their fit place.

The Vse of Pumpions.

They are boyled in faire water and salt, or in powdered beefe broth, or sometimes in milke, and so eaten, or else buttered. They vse likewise to take out the inner watery substance with the seedes, and fill vp the place with Pippins, and hauing laid on the couer which they cut off from the toppe, to take out the pulpe, they bake them together, and the poore of the Citie, as well as the Country people, doe eat thereof, as of a dainty dish. The seede hereof, as well as of Coweumbers and Melons, are cooling, and serue for emulsions in the like manner for Almond milke, &c. for those are troubled with the stone.

CHAP. LVI.

Fragaria. Strawberries.

THERE be diuers sorts of Strawberries, whereof those that are nourished vp in Gardens or Orchards I intend to giue you the knowledge in this place, and leaue the other to a siter; yet I must needs shew you of one of the wilde sorts, which for his strangenesse is worthy of this Garden: And I must also enforme you, that the wilde Strawberry that groweth in the Woods is our Garden Strawberry, but bettered by the soyle and transplanting.

The Strawberry hath his leaues closed together at the first springing vp; which afterwards spread themselues into three diuided parts or leaues, euery one standing vpon a small long foote-stalke; greene on the vpper side, grayish vnderneath, and snipped or dented about the edges; among which rise vp diuers small stalkes, bearing foure or five flowers at the tops, consisting of five white round pointed leaues, somewhat yellowish in the bottome, with some yellow threads therein; after which cometh the fruit, made of many small graines set together, like vnto a small Mulberry or Raspis, reddish when it is ripe, and of a pleasaunt winy taste, wherein is enclosed diuers small blackish seede: the roote is reddish and long, with diuers small threads at it, and sendeth forth

1 *Cucumis longus vulgaris*. The ordinary Cucumber. 2 *Cucumis Hispanicus*. The long yellow Spanish Cucumber. 3 *Melo vulgaris*. The ordinary Melon. 4 *Melo maximus optimus*. The greatest Muske Melon. 5 *Papa*. The Pompon. 6 *Fraga vulgaris*. Common Strawberries. 7 *Fraga Bohemica maxima*. The great Bohemia Strawberries. 8 *Fraga aculeata*. The prickly Strawberry.

forth from the head thereof long reddish strings running vpon the ground, which shoot forth leaues in many places, whereby it is much encreased.

The white Strawberry differeth not from the red, but in the colour of the fruite, which is whiter then the former when it is thorough ripe, enclining to rednesse.

The Greene Strawberry likewise differeth not, but that the fruit is green on all sides when it is ripe, save on that side the Sun lyeth vpon it, and there it is somewhat red.

The Virginia Strawberry carryeth the greatest leafe of any other, except the Bohemian, but scarce can one Strawberry be leene ripe among a number of plants; I thinke the reason thereof to be the want of skill, or industry to order it aright. For the Bohemia, and all other Strawberries will not beare kindly, if you suffer them to grow with many strings, and therefore they are still cut away.

There is another very like vnto this, that Iohn Tradescante brought with him from Bruffels long agoe, and in seuen yeares could neuer see one berry ripe on all sides, but still the better part rotten, although it would euery yeare flower abundantly, and beare very large leaues.

The Bohemia Strawberry hath bene with vs but of late dayes, but is the goodliest and greatest, both for leafe next to the Virginian, and for beauty farre surpassing all; for some of the berries haue bene measured to bee neere five inches about. Master Querster the Postmaster first brought them ouer into our Country, as I vnderstand, but I know no man so industrious in the carefull planting and bringing them to perfection in that plentifull maner, as Master Vincent Sion who dwelt on the Banck side, neer the old Paris garden staires, who from seuen rootes, as hee affirmed to me, in one year and a halfe, planted halfe an acre of ground with the increase from them, besides those he gaue away to his friends, and with him I haue scene such, and of that bignesse before mentioned.

One Strawberry more I promised to shew you, which although it be a wilde kinde, and of no vse for meate, yet I would not let this discourse passe, without giuing you the knowledge of it. It is in leafe much like vnto the ordinary, but differeth in that the flower, if it haue any, is greene, or rather it beareth a small head of greene leaues, many setthicke together like vnto a double ruffe, in the midst whereof standeth the fruit, which when it is ripe, sheweth to be soft and somewhat reddish, like vnto a Strawberry, but with many small harmlesse prickles on them, which may be eaten and chewed in the mouth without any maner of offence, and is somewhat pleasant like a Strawberry: it is no great bearer, but those it doth beare, are set at the toppes of the stalks close together, pleasant to behold, and fit for a Gentlewoman to weare on her arme, &c. as a raritie in stead of a flower.

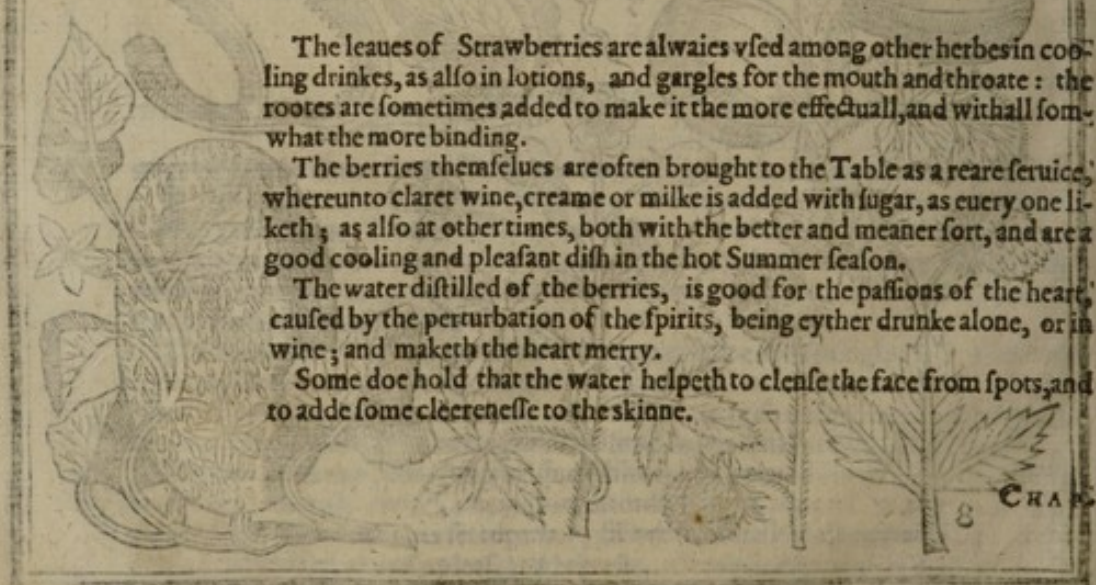

The Use of Strawberries.

The leaues of Strawberries are alwaies vsed among other herbes in cooling drinks, as also in lotions, and gargles for the mouth and throate: the rootes are sometimes added to make it the more effectuall, and withall somewhat the more binding.

The berries themselves are often brought to the Table as a reare seruice, whereunto claret wine, creame or milke is added with sugar, as euery one liketh; as also at other times, both with the better and meaner sort, and are a good cooling and pleasant dish in the hot Summer season.

The water distilled of the berries, is good for the passions of the heart, caused by the perturbation of the spirits, being cyther drunke alone, or in wine: and maketh the heart merry.

Some doe hold that the water helpeth to clenſe the face from ſpots, and to adde ſome cleereſſe to the ſkinne.

The Vse of Dragons.
CHAP. LVII.

Having thus furnished you out a Kitchen Garden with all sorts of herbes, roots & fruits fit for it, and for any mans priuate vse, as I did at the first appropriate it, let me a little transcend, and for the profit & vse of Country Gentlewomen and others, furnish them with some few other herbes, of the most especiall vse for those shall need them, to be planted at hand in their Gardens, to spend as occasion shall serue, and first of Angelica.

Angelica hath great and long winged leaues, made of many broad greene ones, diuided one from another vpon the stalk, which is three foot long or better sometimes, among which rise vp great thicke and hollow stalkes with some few ioynts, whereat doth alwayes stand two long leaues compassing the stalke at the bottome, in some places at the ioynts spring out other stalkes or branches, bearing such like leaues but smaller, and at the tops very large vmbels of white flowers, that turne into whitish seede somewhat thicke: the roote groweth great with many branches at it, but quickly perissheth after it hath borne seede: to preserue the roote therefore the better, they vse to cut it often in the yeare, thereby to hinder the running vp to seede: the whole plant, both leafe, roote and seede, is of an excellent comfortable sent, sauour and taste.

The Vse of Angelica. The distilled water of Angelica, cyther simple or compoud, is of especiall vse in *deliquium animi, vel cordis tremores & passionēs*, that is, swoonings, when the spirits are overcome and faint, or tremblings and passions of the heart, to expell any windy or noy some vapours from it. The green stalkes or the young rootes being preserued or candied, are very effectually to comfort and warme a colde and weake stomacke: and in the time of infection is of excellent good vse to preserue the spirits and heart from infection. The dried roote made into pouder, and taken in wine or other drinke, will abate the rage of lust in young persons, as I haue it related vnto me vpon credit: A Syrupe made thereof in this manner, is very profitable to expectorate flegme out of the chest and lunges, and to procure a sweete breath. Into the greene stalke of Angelica as it standeth growing, make a great gashe or incision, wherein put a quantitie of fine white Sugar, letting it there abide for three dayes, and after take it forth by cutting a hole at the next ioynt vnder the cut, where the Syrupe resteth, or cut off the stalke, and turne it downe, that the Syrupe may drayne forth; which keepe for a most delicate medicine.

CHAP. LVIII.

Dracunculus hortensis sine Serpentaria. Dragons.

Dragons riseth out of the ground with a bare or naked round whitish stalke, spotted very much with purplish spots and strakes, bearing at the toppe thereof a few greene leaues very much diuided on all sides, standing vpon long foote-stalkes, in the middle whereof (if the roote be old enough) commeth forth a great long huske or hose, green on the outside, and of a darke purplish colour on the inside, with a slender long reddish pestell or clapper in the middle: the roote is great, round, flat and whitish on the outside, and whiter within, very like vnto the rootes of *Aram*, or *Wakrobin*, and tasting somewhat sharpe like it.

The Use of Dragons.

The chiefe vse whereunto Dragons are applyed, is, that according to an old receiued custome and tradition (and not the iudgement of any learned Author) the distilled water is giuen with Mithridatum or Treakle to expell noysome and pestilentiall vapours from the heart.

CHAP. LIX.

Ruta. Garden Rue, or Herbe Grace.

Garden Rue or Herbe Grace groweth vp with hard whitish woody stalkes, whereon are set diuers branches of leaues, being diuided into many small ones, which are somewhat thicke and round pointed, of a blewish greene colour: the flowers stand at the tops of the stalkes consisting of foure small yellow leaues, with a greene button in the middle, and diuers small yellow threds about it, which growing ripe, containe within them small blacke feede: the roote is white and woody, spreading farre in the ground.

The Use of Rue.

The many good properties whereunto Rue serueth, hath I thinke in former times caused the English name of Herbe Grace to be giuen vnto it. For without doubt it is a most wholesome herbe, although bitter and strong, and could our dainty stomackes brooke the vse thereof, it would worke admirable effects being carefully and skilfully applyed, as time and occasion did require: but not vndiscreetly or hand ouer head, as many vse to doe that haue no skill. Some doe rippe vp a beade rowle of the vertues of Rue, as Macer the Poet and others, in whom yu shall finde them set downe, to be good for the head, eyes, breast, liuer, heart, spleene, &c. In some places they vse to boyle the leaues of Rue, and keep them in pickle, to eat them as Sam-pite for the helpe of weake eyes. It is very auailable in glisters or drinkes against the winde or the collicke, and to procure vrine that is stayed by the paines therof. The distilled water is often vsed for the same purposes afore-said: but beware of the too frequent or ouermuch vse thereof, because it heateth exceedingly, and wasteth nature mightily.

CHAP. LX.

Carduus Benedictus. The Blessed Thistle.

Carduus benedictus or the blessed Thistle, hath many weake tender branches lying for the most part on the ground, whereon are set long and narrow leaues, much cut in or waued about the edges, hairy or rough in handling, yet without any hard or sharpe thornes or prickles at all, that the tenderest hand may touch them without harme: but those that grow toward the toppes of the stalkes are somewhat more prickly, and the heads which grow on the tops of the seuerall branches are somewhat sharpe, set with prickles like a Thistle: the flower is yellow, and the feede lying within the woolly or flocky doune like to all other thistles, are blackish, long and round, with a few haire on the head of them: the roote is white, and perisheth euery yeare after it hath giuen feede.

The Use of the blessed Thistle.

The distilled water hereof is much vsed to be drunke against agues of all sortes, cyther pestilentiall or humorall, of long continuance or of lesse: but

1 *Angelica*. *Angelica*. 2 *Dracunculus hortensis*. Dragons. 3 *Ruta hortensis*. Garden Rue, or Hebe-grace. 4 *Carduus benedictus*. The blessed Thistle. 5 *Alkanna* *sive Solanum Haicatabum & Vojentum*. Winter Cherries. 6 *Asarum*. *Asarabacca*. 7 *Liquoritia*. *Licoria*.
Yy 1

but the decoction of the herbe giuen in due time, hath the more forcible operation: it helpeth to expell wormes, because of the bitternesse, and is thereby also a friend to the stomack ouercharged with chollar, and to cleanse the liuer: it prouoketh sweate and vrine, is helpfull to them are troubled with the stone, and to ease paines in the sides.

CHAP. LXI.

Solanum vesicarium, sine Alkakengi. Winter Cherries.

THe Winter Cherry hath a running or creeping roote in the ground, of the bignesse many times of ones little finger, shooting forth at seuerall ioynts in seuerall places, whereby it quickly spreadeth a great compasse of ground: the stalke riseth not aboue a yard high, whereon are set many broade and long Greene leaues, somewhat like vnto the leaues of Nightshade, but larger: at the ioynts whereof come forth whitish flowers made of fise leaues a peece, which after turne into green berries, inclosed with thin skins or bladders, which change to bee reddish when they grow ripe, the berry likewise being reddish, and as large as a Cherry, wherein are contained many flat and yellowish seed lying within the pulpe: which being gathered and strung vp, are kept all the yeare to be vsed vpon occasion.

The Vse of Winter Cherries.

The distilled water of the herbe and fruit together, is often taken of them that are troubled with the sharpnesse or difficultie of vrine, and with the stone in the kidneyes, or grauel in the bladder: but the berries themselues either Greene or dried boyled eyther in broth, in wine, or in water, is much more effectuell: It is likewise conducing to open obstructions of the liuer, &c. and thereby to helpe the yellow Iaudise.

CHAP. LXII.

Asarum. Asarabacca.

ASarabacca, from a small creeping roote set with many fibres, shooteth forth diuers heads, and from euery of them sundry leaues, euery one standing vpon a long Greene stalke, which are round, thicke, and of a very sad or darke Greene colour, and shining withall: from the rootes likewise spring vp short stalkes, not fully foure fingers high, at the toppe of euery one of which standeth the flower, in fashion very like the seede vessell of Henbane seede, of a greenish purple colour, which changeth not his forme, but groweth in time to containe therein small cornered seed: the Greene leaues abide all the winter many times, but vsually sheddeth them in winter, and recouereth fresh in the spring.

The Vse of Asarabacca.

The leaues are much and often vsed to procure vomits, fise or seuen of them bruised, and the iuice of them drunke in ale or wine. An extract made of the leaues with wine artificially performed, might bee kept all the yeare thorough, to bee vsed vpon any present occasion, the quantitie to bee proportioned according to the constitution of the patient. The roote worketh not so strongly by vomit, as the leaues, yet is often vsed for the same purpose, and besides is held auailable to prouoke vrine, to open obstructions in the liuer and spleene, and is put among diuers other simples, both into Mithridatum and Andromachus Treakle, which is vsually called Venice Treakle. A dram of the dried roots in powder giuen in white wine a little before the fit of an ague, taketh away the shaking fit, & therby cause the hot fit to be the more remisse, and in twice taking expell it quite.

CHAP. LXIII.

Glycyrrhiza sine Liqueritia. Licorice.

Although there are two sorts of Licorice set downe by diuers Authors, yet because this Land familiarly is acquainted but with one sort, I shall not neede for this Garden, to make any further relation of that is vnknowne, but onely of that sort which is sufficiently frequent with vs. It riseth vp with diuers wooddy stalks, whereon are set at seuerall distances many winged leaues, that is to say, many narrow long Greene leaues set together on both sides of the stalke, and an odde one at the end, very well resembling a young Ashe tree sprung vp from the seede: this by many yeares continuance in a place without remouing, and not else, will bring forth flowers many standing together spike-fashion one about another vpon the stalkes, of the forme of Pease blossomes, but of a very pale or bleake blew colour, which turne into long somewhat flat and smooth cods, wherein is contained small round hard seede: the roote runneth downe exceeding deep into the ground, with diuers other smaller roots and fibres growing with them, and shoote out suckers from the maine rootes all about, whereby it is much encreased, of a brownish colour on the outside, and yellow within, of a farre more weake sweete taste, yet far more pleasing to vs then that Licorice that is brought vs from beyond Sea; because that, being of a stronger sweet taste hath a bitternesse ioyned with it, which maketh it the lesse pleasing and acceptable to most.

The Vse of Licorice.

Our English Licorice is now adaies of more familiar vse (as I said before) then the outlandish, and is wholly spent and vsed to helpe to digest and expectorate flegme out of the cheft and lunges, and doth allay the sharpenesse or saltnesse thereof. It is good also for those are troubled with shortnesse of breath, and for all sorts of coughes. The iuice of Licorice artificially made with Hyssope water, serueth very well for all the purposes aforesaid. It being dissolued with Gum Tragacanth in Rose water, is an excellent Lohoc or licking medicine to breake flegme, and to expectorate it, as also to avoyde thin frothy matter, or thin salt flegme, which often fretteth the lunges. It doth also lenifie exulcerated kidneyes, or the bladder, and helpeth to heale them. It is held also good for those that cannot make their water but by drops, or a small deale at a time.

The dryed root finely minced, is a speciall ingredient into all Trageas or Dredges, seruing for the purposes aforesaid, but the vse of them is almost wholly left now adaies with all sorts.

Thus haue I shewed you not only the herbes, rootes and fruites, nourfed vp in this Garden, but such herbes as are of most necessary vses for the Country Gentlewomens houses: And now I will shew you the Orchard also.

THE ORDERING OF THE ORCHARD.

The third part, or ORCHARD.

CHAP. I.

The situation of an Orchard for fruit-bearing trees, and how to amend the defects of many grounds.

AS I haue done in the two former parts of this Treatise, so I meane to proceede in this; first to set downe the situation of an Orchard, and then other things in order: And first, I hold that an Orchard which is, or should bee of some reasonable large extent, should be so placed, that the house should haue the Garden of flowers iust before it open vpon the South, and the Kitchen Garden on the one side thereof, should also haue the Orchard on the other side of the Garden of Pleasure, for many good reasons: First, for that the fruit trees being grown great and tall, will be a great shelter from the North and East windes, which may offend your chiefeft Garden, and although that your Orchard stand a little bleake vpon the windes, yet trees rather endure these strong bitter blasts, then other smaller and more tender shrubs and herbes can doe. Secondly, if your Orchard should stand behinde your Garden of flowers more Southward, it would shadow too much of the Garden, and besides, would so binde in the North and East, and North and West windes vpon the Garden, that it would spoile many tender things therein, and so much abate the edge of your pleasure thereof, that you would willingly wish to haue no Orchard, rather then that it should so much annoy you by the so ill standing thereof. Thirdly, the falling leaues being still blowne with the winde so abundantly into the Garden, would either spoile many things, or haue one daily and continuall attending thereon, to cleanse and sweepe them away. Or else to auoide these great inconueniences, appoint out an Orchard the farther off, and set a greater distance of ground betweene. For the ground or soile of the Orchard, what I haue spoken concerning the former Garden for the bettering of the seuerall grounds, may very well serue and be applyed to this purpose. But obserue this, that whereas your Gardens before spoken of may be turned vp, manured, and bettered with soile if they growe out of heart, your Orchard is not so easily done, but must abide many yeares without altering; and therefore if the ground be barren, or not good, it had the more neede to bee amended, or wholly made good, before you make an Orchard of it, yet some there be that

that doe appoint, that where euery tree should bee set, you onely digge that place to make it good: but you must know, that the rootes of trees runne further after a little times standing, then the first compasse they are set in; and therefore a little compasse of ground can maintaine them but a little while, and that when the rootes are runne beyond that small compasse wherein they were first set, and that they are come to the barren or bad ground, they can thriue no better then if they had beene set in that ground at the first, and if you should afterwards digge beyond that compasse, intending to make the ground better further off, you should much hurt the spreading rootes, and put your trees in danger: the situation of hils in many places is grauelly or chalky, which is not good for trees, becaule they are both too stonie, and lacke mellow earth, wherein a tree doth most ioy and prosper, and want moisture also (which is the life of all trees) because of the quicke descent of raine to the lower grounds: and besides all these inconueniences there is one more, your trees planted either on hils or hill sides, are more subiect to the fury and force of windes to be ouerturned, then those that growe in the lower grounds; for the strongest and most forcible windes come not vually out of the North East parts, where you prouide best defence, but from the South and West, whence you looke for the best comfort of the Sunne. To helpe therefore manie of the inconueniences of the hils sides, it were fit to cause manie leauels to bee made thereon, by raising the lower grounds with good earth, and sustaining them with bricke or stone wals, which although chargeable, will counteruaile your cost, beside the pleasure of the walkes, and prospect of so worthy a worke. The plaine or leuell grounds as they are the most frequent, so they are the most commendable for an Orchard, because the moulds or earths are more rich, or may better and sooner be made so; and therefore the profits are the more may be raised from them. A stiffe clay doth nourish trees well, by reason it containeth moisture; but in regard of the coldnesse thereof, it killeth for the most part all tender and early things therein: sea-cole ashes therefore, bucke ashes, streete soyle, chaulke after it hath lye abroad and been broken with many yeares frosts and raine, and sheepes dung, are the most proper and fittest manure to helpe this kinde of soyle. The dry sandy soyle, and grauelly ground are on the contrary side as bad, by reason of too much heate and lacke of moisture: the dung of kine or cattell in good quantity bestowed thereon, will much helpe them. The amending or bettering of other sorts of grounds is set down toward the end of the first Chapter of the first part of this worke, wherevnto I will referre you, not willing to repeate againe the same things there set downe. The best way to auoide and amend the inconueniences of high, boisterous, and cold windes, is to plant Walnut trees, Elmes, Oakes or Ashes, a good distance without the compasse of your Orchard, which after they are growne great, will bee a great safeguard thereunto, by breaking the violence of the windes from it. And if the soyle of your Orchard want moisture, the conueying of the sinke of the house, as also any other draine of water thereinto, if it may be, will much helpe it.

CHAP. II.

The forme of an Orchard, both ordinary, and of more grace and rarity.

According to the situation of mens grounds, so must the plantation of them of necessitie be also; and if the ground be in forme, you shall haue a formall Orchard: if otherwise, it can haue little grace or forme. And indeed in the elder ages there was small care or heede taken for the formality; for euery tree for the most part was planted without order, euen where the master or keeper found a vacant place to plant them in, so that oftentimes the ill placing of trees without sufficient space betweene them, and negligence in not looking to vphold them, procured more waste and spoile of fruit, then any accident of winde or weather could doe. Orchards in most places haue not bricke or stone wals to secure them, because the extent thereof being larger

larger then of a Garden, would require more cost, which every one cannot vndergoe; and therefore mud wals, or at the best a quicke set hedge, is the ordinary and most vsuall defence it findeth almost in all places: but with those that are of ability to compass it with bricke or stone wals, the gaining of ground, and profit of the fruit trees planted there against, will in short time recompense that charge. If you make a doubt how to be sure that your Orchard wall shall haue sufficient comfort of the Sunne to ripen the fruits, in regard the trees in the Orchard being so nigh thereunto, and so high withall, will so much shadow the wall, that nothing will ripen well, because it will want the comfort of the Sunne: you may follow this rule and aduice, to remedy those inconueniences. Hauing an Orchard containing one acre of ground, two, three, or more, or lesse, walled about, you may so order it, by leauing a broad and large walke betweene the wall and it, containing twenty or twenty foure foote (or yards if you will) that the wall shall not be hindered of the Sun, but haue sufficient comfort for your trees, notwithstanding the height of them, the distance betweene them and the wall being a sufficient space for their shadow to fall into: and by compassing your Orchard on the inside with a hedge

(wherein may bee planted all sorts of low shrubs or bushes, as Roses, Cornelian Cherry trees plashed lowe, Gooseberries, Curran trees, or the like) you may enclose your walke, and keepe both it and your Orchard in better forme and manner, then if it lay open. For the placing of your trees in this Orchard, first for the wals: Those sides that lye open to the South & Southwest Sunne, are fittest to bee planted with your tenderest and earliest fruits, as Apricockes, Peaches, Nectarius, and May or early Cherries: the East, North and West, for Plums and Quinces, as you shall like best to place them. And for the Orchard it selfe, the ordinary manner is to place them without regard of measure or difference, as Peares among Apples, and Plums among Cherries promiscuously; but some keepe both a distance and a diuision for

every sort, without intermingling: yet the most gracefull Orchard containeth them all, with some others, so as they be placed that one doe not hinder or spoile another; and therefore to describe you the modell of an Orchard, both rare for comelinesse in the proportion, and pleasing for the profitableness in the vie, and also durable for continuance, regard this figure is here placed for your direction, where you must obserue, that your trees are here set in such an equall distance one from another every way, & as is fittest for them, that when they are grown great, the greater branches shall not gall or rubbe one against another; for which purpose twenty or sixteene foot is the least to be allowed for the distance every way of your trees, & being set in rowes equall one in the middle distance, will be the most gracefull for the plantation, and besides giue you way sufficient to passe through them, to prune, loppe, or dresse them, as need shall require, and may also bee brought (if you please) to that gracefull delight, that every alley or distance may be formed like an arch, the branches of either side to be enterlaced together. Now for the seuerall sorts of fruit trees that you shall set in this modell, your best direction is to set Damsons, Bulleis, and your lower Plums on the outside, and your lower Plums, Cherries, and Apples in the middle, and your Peares in the inward part, hauing regard, that you place no Pear tree to the Sunward, of any other.

shadow them : Let your Peare trees therefore be placed behinde, or on the one side of your lower trees, that they may be as it were a shelter or defence on the North & East side. Thus may you also plant Apples among Plums and Cherries, so as you suffer not one to ouer-growe or ouer-toppe another; for by pruning, lopping, and shred-ding those that growe too fast for their fellowes, you may still keepe your trees in such a conformity, as may be both most comely for the sight, and most profitable for the yeelding of greater and better store of fruit. Other sorts of fruit trees you may mixe among these, if you please, as Filberds, Cornelian Cherries in standers, and Med-lers : but Seruice trees, Baye trees, and others of that high sort, must be set to guard therest. Thus haue I giuen you the fairest forme could as yet be deuised; and from this patterne, if you doe not follow it precisely, yet by it you may proportion your Orchard, be it large or little, be it walled or hedged.

CHAP. III.

*Of a nursery for trees, both from sowing the kernels, and planting
fit stockes to graft vpon.*

ALthough I know the greater sort (I meane the Nobility and better part of the Gentry of this Land) doe not intend to keepe a Nursery, to raise vp those trees that they meane to plant their wals or Orchards withall, but to buy them already grafted to their hands of them that make their liuing of it: yet because many Gentlemen and others are much delighted to bestowe their paines in grafting themselves, and esteeme their owne labours and handie worke farre aboue other mens: for their encouragement and satisfaction, I will here set downe some conuenient directions, to enable them to raise an Orchard of all sorts of fruits quickly, both by sowing the kernels or stones of fruit, and by making choise of the best sorts of stockes to graft on : First therefore to begin with Cherries, If you will make a Nursery, wherein you may bee stored with plenty of stockes in a little space, take what quantitie you thinke good of ordinarie wilde blacke Cherrie stones, cleansed from the berries, and sowe them, or pricke them in one by one on a peece of ground well turned vp, and large enough for the quantitie of stones you will bestowe thereon, from the midst of August vnto the end of September, which when they are two or three yeares old, according to their growth, you may remoue them, and set them anew in some orderly rowes, hauing pruned their tops and their rootes, which at the next yeares growth after the new planting in any good ground, or at the second, will be of sufficient bignesse to graft vpon in the bud what sorts of Cherries you thinke best : and it is fittest to graft them thus young, that pruning your stockes to raise them high, you may graft them at five or six foote high, or higher, or lower, as you shall see good, and being thus grafted in the bud, will both more speedily and safely bring forward your grafts, and with lesse danger of losing your stockes, then by grafting them in the stocke : for if the bud take not by inoculating the first yeare, yet your tree is not lost, nor put in any hazzard of losse; but may be grafted anew the yeare following, if you will, in another place thereof, whereas if you graft in the stocke, and it doe not take, it is a great chance if the stocke dye not wholly, or at least be not so weakened both in strength and height, that it will not bee fit to bee grafted a yeare or two after. In the same manner as you doe with the blacke, you may deal with the ordinary English red Cherrie stones, or kernels, but they are not so apt to growe so straight and high, nor in so short time as the blacke Cherrie stones are, and besides are subiect in time to bring out suckes from the rootes, to the hinderance of the stockes and grafts, or at the least to the detriment of your Orchard, and more trouble to the Gardiner, to pull or digge them out. Plumme stones may bee ordered in this manner likewise, but you must make choise of your Plums; for although euery Plumme is not so fit for this purpose, as the blacke Plumme, because it groweth the goalest and freeest, the barke being smooth and without fissures, that they may be grafted vpon; yet diuers other Plummes may be had at hand, or to be had, as the blacke and red Peare Plumme, the white

white and red Wheate Plumme, because they are nearest in goodnesse vnto it. Peach stones will be soone raised vp to graft other sorts of Peaches or Nectorins vpon, but the nature of the Peach roote being spongie, is not to abide long. As for Almonds, they will be raised from their stones to be trees of themselves; but they will hardly abide the remouing, and lesse to be grafted vpon. Apricocke stones are the worst to deale withall of any sort of stone fruit; for although the Apricocke branches are the fittest stockes to graft Nectorins of the best sorts vpon, yet those that are raised from the kernels or stones will neuer thrive to be brought on for this purpose, but will starue and dye, or hardly grow in a long time to be a straight and fit stocke to be grafted, if it be once remoued. Your Cornelian Cherrie trees are wholly, or for the most part raised from the stones or kernels; yet I know diuers doe increase them, by laying in their lowest branches to take roote: and thus much for stone fruits. Now for Apples and Peares, to be dealt withall in the same manner as aforesaid. They vse to take the pressing of Crabs whereas Veriuyce is made, as also of Cedar and Perry where they are made, and sowing them, doe raise vp great store of stockes; for although the beating of the fruit doth spoile many kernels, yet there will bee enough left that were neuer toucht, and that will spring: the Crabbe stockes some preferre for the fittest, but I am sure, that the better Apple and Pear kernels will growe fairer, straighter, quicker, and better to be grafted on. You must remember, that after two or three yeares you take vp these stockes, and when you haue pruned both toppes and rootes, to set them againe in a thinner and fitter order, to be afterwards grafted in the bud while they are young, as I shall shew you by and by, or in the stocke if you will suffer them to growe greater. Now likewise to know which are the fittest stockes of all sorts to choose, thereon to graft euery of these sorts of fruits, is a point of some skill indeede, and therefore obserue them as I doe here set them downe: for bee you assured, that they are certaine rules, and knowne experiences, wherunto you may trust without being deceiued. Your blacke Cherrie stockes (as I said before) are the fittest and best for all sorts of Cherries long to abide and prosper, and euen May or early Cherry will abide or line longer, being grafted thereon, either in the budde or in the stocke, then on the ordinary red Cherry stocke; but the red Cherry stocke is in a manner the onely tree that most Nursery men doe take to graft May Cherries on in the stocke (for it is but a late experience of many, to graft May Cherries in the bud) many also doe graft May Cherries on Gascoigne Cherry stockes, which doe not onely thrive well, but endure longer then vpon any ordinary Cherry stocke: For indeede the May Cherries that are grafted vpon ordinary red Cherrie stockes, will hardly hold about a dozen yeares bearing well, although they come forwarder at the first, that is, doe beare sooner then those that are grafted on Gascoigne or blacke Cherry stockes; but as they are earlier in bearing, so they are sooner spent, and the Gascoigne and blacke Cherry stockes that are longer in comming forward, will last twice or thrice their time; but many more grafts will misse in grafting of these, then of those red Cherry stockes, and besides, the natures of the Gascoigne and blacke Cherry stockes are to rise higher, and make a goodlier tree then the ordinary red stocke will, which for the most part spreadeth wide, but riseth not very high. The English red Cherry stocke will serue very well to graft any other sort of Cherry vpon, and is vsed in most places of this Land, and I know no other greater inconuenience in it, then that it shooteth out many suckers from the roote, which yet by looking vnto may soone bee remoued from doing any harme, and that it will not last so long as the Gascoigne or blacke Cherry stocke will. May Cherries thus grafted lowe, doe most vsually serue to be planted against a wall, to bring on the fruit the earlier; yet some graft them high vpon standards, although not many, and it is, I thinke, rather curiosity (if they that doe it haue any wals) then anie other matter that causeth them thus to doe: for the fruit is naturally small, though early, and the standard Cherries are alwaies later then the wall Cherries, so that if they can spare any roome for them at their wals, they will not plant many in standards. Now concerning Plummies (as I said before) for the sowing or setting of the stones, so I say here for their choise in grafting of them, either in the budde or stocke. The white Pear Plumme stocke, and the other there mentioned, but especially the white Pear Plumme is the goodliest, freest, and fittest of all the rest, as well to graft all sort of Plummies vpon, as also to graft Apricockes; which can be handsomely, and to any good

good purpose grafted vpon no other Plum stocke, to rise to beeworth the labour and paine. All sorts of Plums may be grafted in the stocke, and so may they also in the bud; for I know none of them that will refuse to be grafted in the bud, if a cunning hand performe it well; that is, to take off your bud cleanelly and well, when you haue made choice of a fit cyon: for, as I shal shew you anon, it is no small peece of cunning to chuse your cyon that it may yeeld fit buds to graft withall, for euery plum is not of a like aptnes to yeeld them. But Apricocks cannot be grafted in the stock for any thing that euer I could heare or learne, but only in the bud, and therefore let your Plum stocke bee of a reasonable size for Apricockes especially, and not too small, that the graft ouer-grow not the stocke, and that the stocke bee large enough to nourish the graft. As your Plum stockes serue to graft both Apricockes and Plummes, so doe they serue also very well to graft Peaches of all sorts; and although Peach stockes will serue to be grafted with Peaches againe, yet the Peach stocke (as I said before) will not endure so long as the Plumme stocke, and therefore serueth but for necessity if Plum stocks be not ready, or at hand, or for the present time, or that they afterwards may graft that sort of Peach on a Plumme stocke: for many might lose a good fruit, if when they meete with it, and haue not Plumme stockes ready to graft it on, they could not be assured that it would take vpon another Peach stocke or branch, or on the branch of an Apricocke eyther. Plumme stockes will serue likewise very well for some sorts of Nectorins, I say, for some sorts, and not for all: the greene and the yellow Nectorin will best thriue to be grafted immediately on a Plumme stocke, but the other two sorts of red Nectorins must not be immediately grafted on the Plumme stocke, but vpon a branch of an Apricocke that hath bene formerly grafted on a Plumme stocke, the nature of these Nectorins being found by experience to be so contrary to the Plum stocke, that it will sterue it, and both dye within a yeare, two or three at the most: Diuers haue tryed to graft these red Nectorins vpon Peach stockes, and they haue endured well a while, but seeing the Peach stocke will not last long it selfe, being overweake, how can it hold so strong a nature as these red Nectorins, which will (as I said before) sterue a Plum stocke that is sufficient durable for any other Plumme?

Apricocke stockes from the stones are hardly nursed vp, and worse to be remoued, and if a red Nectorin should be grafted on an Apricock rayfed from the stone, and not remoued, I doubt it might happen with it as it doth with many other trees raised from stones or kernels, and not remoued, that they would hardly beare fruit: for the nature of most trees raised from stones or kernels, and not remoued, is to send great downe-right rootes, and not to spread many forwards; so that if they be not cut away that others may spreade abroad, I haue seldome scene or known any of them to beare in any reasonable time; and therefore in remouing, these great downe-right rootes are alwayes shred away, and thereby made fit to shoote others forwards. Hereby you may perceiue, that these red Nectorins will not abide to bee grafted vpon any other stocke well, then vpon an Apricocke branch, although the green and the yellow (as I said before) will well endure and thriue vpon Plums. The suckers or shootes both of Plums and Cherries that rise from their rootes, eyther neare their stockes, or farther off, so that they bee taken with some small rootes to them, will serue to bee stockes, and will come forward quickly; but if the suckers haue no small roots whereby they may comprehend in the ground, it is almost impossible it should hold or abide. There is another way to rayse vp eyther stockes to graft on, or trees without grafting, which is, by circumcising a faire and fit branch in this manner: About Midsummer, when the sappe is thoroughly risen (or before if the yeare be forward) they vse to binde a good quantity of clay round about a faire and straight branch, of a reasonable good size or bignesse, with some conuenient bands, whether it be ropes of hey, or of any other thing, about an handfull about the ioynt, where the branch spreadeth from the tree, and cutting the barke thereof round about vnder the place where the clay is bound, the sap is hereby hindered from rising, or descending further then that place so circumcised, whereby it will shoote out small knubs and rootes into the clay, which they suffer so to abide vntill the beginning of winter, whenas with a fine Sawe they cut off that branch where it was circumcised, and afterwarde place it in the ground where they would haue it to grow, and stake it, and binde it fast, which will shoote forth rootes, and will become eyther a faire tree to beare fruit without grafting, or else a fit stocke to graft on according

ding to the kinde: but oftentimes this kinde of propagation misleth, in that it sendeth not forth rootes sufficient to cause it to abide any long time. Let me yet before I leaue this narration of Plummes, giue you one admonition more, that vpon whatsoever Plumme stocke you doe graft, yet vpon a Damson stocke that you neuer strue to graft, for it (about all other sorts of Plumme stockes) will neuer giue you a tree worth your labour. It remaineth only of stone fruit, that I speake of Cornelles, which as yet I neuer saw grafted vpon any stocke, being as it should seeme vtterly repugnant to the nature thereof, to abide grafting; but is wholly rayfed vp (as I said before) eyther from the stones, or from the suckers or layers. For Peares and Apples your vsuall stockes to graft on are (as I said before, speaking of the nursing vp of trees from the kernels) your Crabbe stockes, and they bee accepted in euery Countrey of this Land as they may conveniently be had, yet many doe take the stockes of better fruit, whether they bee suckers, or stockes rayfed from the kernels (and the most common and knowne way of grafting, is in the stocke for all sorts of them, although some doe vse whipping, packing on, or incising, as euery one list to call it: but now we doe in many places begin to deale with Peares and Apples as with other stone fruit, that is, graft them all in the bud, which is found the most compendious and safest way both to preserue your stocke from perishing, and to bring them the sooner to couer the stock, as also to make the goodlier and straighter tree, being grafted at what height you please:) for those stockes that are rayfed from the kernels of good fruit (which are for the most part easily knowne from others, in that they want those thornes or prickles the wilde kinds are armed withall:) I say for the most part, for I know that the kernels of some good fruit hath giuen stockes with prickles on them (which, as I thinke, was because that good fruit was taken from a wilde stocke that had not bene long enough grafted to alter his wilde nature; for the longer a tree is grafted, the more strength the fruit taketh from the graft, and the lesse still from the stocke) being smother and fairer then the wilde kinds, must needs make a goodlier tree, and will not alter any whit the taste of your fruit that is grafted thereon, but rather adde some better rellish thereunto; for the Crabbe stockes yeelding harsh fruit, must giue part of their nature to the grafts are set thereon, and therefore the taste or rellish, as well as some other naturall properties of most fruits, are somewhat altered by the stocke. Another thing I would willingly giue you to vnderstand concerning your fruits and stockes, that whereas diuers for curiosity and to try experiments haue grafted Cherries vpon Plumme stockes, or Plums on Cherry stockes, Apples vpon Peare stockes, and Peares vpon Apple stockes, some of these haue held the graft a yeare, two or three peraduenture, but I neuer knew that euer they held long, or to beare fruit, much lesse to abide or doe well: bestow not therefore your paines and time on such contrary natures, vnlesse it be for curiositie, as others haue done: Yet I know that they that graft peares on a white thorne stocke haue had their grafts seeme to thriue well, and continue long, but I haue seldome seene the fruit thereof answerable to the naturall wilde Peare stocke; yet the Medlar is knowne to thriue best on a white thorne. And lastly, whereas diuers doe affirme that they may haue not only good stockes to graft vpon, but also faire trees to bear store of fruit from the kernels of Peares or Apples being prickt into the ground, and suffered to grow without remouing, and then eyther grafted or suffered to grow into great trees vngrafted; and for their bearing of fruit, assigne a dozen or twenty yeares from the first setting of the kernels, and abiding vngrafted, I haue not seene or heard that experience to hold certaine, or if it should be so, yet it is too long time lost, and too much fruit also, to waite twenty yeares for that profit may be gained in a great deale of lesse time, and with more certainty. Vnto these instructions let mee adde also one more, which is not much known and vsed, and that is, to haue fruit within foure or fise yeares from the first sowing of your stones or kernels in this manner: After your stones or kernels are two or three yeares old, take the fairest toppe or branch, and graft it as you would doe any other cyon taken from a bearing tree, and looke what rare fruit, eyther Peare or Apple, the kernell was of that you sowed, or Peach or Plum &c. the stone was set, such fruit shall you haue within two or three yeares at the most after the grafting, if it take, and the stocke be good. And thus may you see fruit in farre lesse time then to stay vntill the tree from a kernell or stone beareth fruit of it selfe.

CHAP. IIIL.

*The diuers manners of grafting all sorts of fruits
used in our Land.*

THe most vsuall manner of grafting in the stocke is so common and well known in this Land to euery one that hath any thing to doe with trees or an Orchard, that I think I shall take vpon mee a needlesse worke to set downe that is so well knowne to most; yet how common soeuer it is, some directions may profit euery one, without which it is not easily learned. And I doe not so much spend my time and paines herein for their sakes that haue knowledge, but for such as not knowing would faine be taught priuately, I meane, to read the rules of the arte set downe in priuate, when they would refuse to learne of a Gardiner, or other by sight: and yet I discommend not that way vnto them to learne by sight; for one may see more in an instant by sight, then he shall learn by his own practice in a great while, especially if he be a little practised before he see a cunning hand to doe it. There are many other kindes of grafting, which shall be spoken of hereafter, and peraduenture euen they that know it well, may learne something they knew not before.

1. The grafting in the stocke, is, to set the sprigge of a good fruit into the body or stocke of another tree, bee it wilde or other, bee it young or old, to cause that tree to bring forth such fruit as the tree bore from whence you took the sprigge, and not such as the stocke or tree would haue borne, if it had not bene grafted, and is performed in this manner: Looke what tree or stocke you will chuse to graft on, you must with a small fine sawe and very sharpe, whip off, or cut off the head or toppes thereof at what height you eyther thinke best for your purpose, or conuenient for the tree: for if you graft a great tree, you cannot without endangering the whole, cut it downe so low to the ground, as you may without danger doe a small tree, or one that is of a reasonable size; and yet the lower or neerer the ground you graft a young tree, the safer it is both for your stocke and graft, because the sappe shall not ascend high, but soone giue vigour to the graft to take and shoote quickly: After you haue cut off the toppes of your stocke, cut or smooth the head thereof with a sharpe knife, that it may be as plaine and smooth as you can, and then cleaue it with a hammer or mallet, and with a strong knife, cleauer or chesell, either in the middle of it if it be small, or of a reasonable size, or on the sides an inch or more within the barke, if it be great: into both sides of the cleft put your grafts, or into one if the stocke bee smaller; which grafts must bee made fit for the purpose on this fashion: Hauing made choise of your grafts from the toppes branches especially, or from the sides of that tree wherof you would haue the fruit, and that they be of a reasonable good size, not too small or too great for your stockes, and of one or the same yeares shoote; (and yet many doe cut an inch or more of the olde wood with the sprigge of the last yeares growth, and so graft the old and young together (but both are good, and the old wood no better then the young) cut your graft not too long, but with two, three or foure eyes or buds at the most, which at the lower or bigger end for an inch long or more (for the greater stockes, and an inch or lesse for the lesser sort) must be so cut, that it be very thin on the one side from the shoulders downward, and thicker on the other, and thin also at the end, that it may goe downe close into the cleft, and rest at the shoulders on the head of the stocke: but take heede that in cutting your grafts your knife bee very sharpe that you doe not raise any of the barke, eyther at the sides or the end, for feare of losing both your paines and graft, and stocke too peraduenture; and let not your grafts bee made long before you set them, or else put the ends of them in water to keepe them fresh and cleane: when you set them you must open the cleft of your stocke with a wedge or chesell as most doe, that the graft may goe easily into it, and that the barke of both graft and stocke may ioine close the one to the other, which without stirring or displacing must bee so left in the cleft, and the wedge or chesell gently pulled forth; but because in the doing hereof consisteth in a manner the whole losse or gaine of your paines, graft and stocke, to prevent which inconuenience I doe vse an iron Instrument, the forme whereof is showne in the following

lowing page, marked with the letter A, crooked at both ends, and broad like vnto a cheffell. the one bigger, and the other lesser, to fit all sorts of stockes, and the iron handle somewhat long betweene them both, that being thrust or knocked downe into the cleft, you may with your left hand open it as wide as is fit to let in your graft, without straying, which being placed, this iron may bee pulled or knocked vp againe without any mouing of your graft : when you haue thus done, you must lay a good handfull or more (according to the bignesse of your stocke) of soft and well moistned clay or loame, well tempered together with short cut hey or horse dung, vpon the head of your stocke, as lowe or somewhat lower then the cleft, to keepe out all winde, raine or ayre from your graft vntill Midsummer at the least, that the graft be shot forth somewhat strongly, which then if you please may be removed, and the cleft at the head only filled with a little clay to keepe out carewigs, or other things that may hurt your graft.

A. The Iron Instrument with cheffels at each end, the one bigger and the other lesser, to keepe the cleft of the Tree open vntill the graft bee placed in the stocke, which with a knock vpwards will be easily taken away.

B. The small Penne-knife with a broad and thinne ended haffe, to raise the sides both of the bud and the down-right flir in the body or arme of a Tree to be grafted in the bud.

C. A pen or quill cut halfe round to take off a bud from the branch.

D. An Iuory Instrument made to the same fashion.

E. A shilde of brasse made hollow before to be put into the slit, to keepe it open vntill the bud be put into its place.

F. The manner of grafting called incising or splicing.

G. A Ladder made with a stoole at the toppe, to serue both to graft higher or lower, and also to gather fruit without spoiling, or hurting any budde or branches of Trees.

1. The first slit in the body or arme of a Tree to be grafted in the bud with the crosse cut at the head.

2. The same slit opened on both sides, ready to receiue the budde should be put there in : these small peeces serue as well as trees to shew the manner and order of the grafting.

3. The branch of a Tree with one budde cut ready to be taken off, and another not yet touched.

4. The bud cleane taken off from the branch, both the foreside and backside.

5. The graft or bud now put into the stocke or tree you intend to be grafted : but the binding thereof is omitted.

2. Inarching is another manner of grafting in the stocke, and is more troublesome, and more casuall also then the former, and is rather a curiosity then any way of good speede, certainty or profit, and therefore vsed but of a few. Yet to shew you, the

manner thereof, it is thus: Having a tree well growne, bee it high or low, yet the lower the better, with young branches well spread, they vse to set stockes round about it, or on the one side as you please; into which stockes they ingraft the young branches of the well growne tree as they are growing (before they cut them from the tree) by bowing downe the branch they intend to graft, and putting it into the stocke, having first cut off the head thereof, and cut a notch in the middle of the head a little slope on both sides, wherein the branch must be fitted: let the branch be cut thinne on the vnder side, only of that length as may suffice to fit the notch in the stocke, leauing about halfe a yarde length of the branch, to rise aboue or beyond the stocke, which beeing bound on, and clayed ouer or couered with red or greene soft waxe, they let so abide, that if it take in the stocke they cut off the branch a little below the grafting place in Nouember following, and remouing the stocke, they haue thus gained a grafted and growne tree the first yeare: but it is vsually seene, that where one branch taketh, three doe misse: yet this manner of grafting was much in vse for May Cherries, when they were first known to vs, and the way thought to be a rare manner of grafting to encrease them, vntill a better way was found out, which now is so common and good also, that this is not now scarce thought vpon.

3. Another kinde of grafting in the stocke is called of some whipping, of some splicing, of others incising, and of others packing on (and as I heare, is much vsed in the West parts especially, and also in the North parts of this Land) and is performed in this manner: Take and slice the branch of a tree (so as the branch be not too bigge) or else a young tree of two, or three, or foure yeares growth at the most, quite off slope wise, about an inch and a halfe long or more, and cut a deep notch in the middle thereof, then fit into it a graft iust of that size or bignesse, cut on both sides with shoulders, and thin at the end, that it may ioyne close in the notch, and neyther bigger or lesser, but that the barke of the one may bee fitted iust to the barke of the other, the figure wherof is expressed at the letters E.F. which shew the one to be with a shoulder & the other without; binde them gently together with bast, and put clay or waxe ouer the place, vntill it be taken: this is much vsed of late dayes for such young trees as are risen of stones or kernels after the second or third yeares growth, and thriue very well in that it not only saueh much time, but diuers checks by remouing and grafting.

4. Inoculating or grafting in the budde is another manner of grafting, which is the taking of a budde from one tree, and putting it into the barke of another tree, to the end, that thereby you may haue of the same kinde of fruit the tree bare from whence the budde was taken; and although it bee sufficiently knowne in many places of this Land, yet as I vnderstand, good Gardiners in the North parts, and likewise in some other places, can scarce tell what it meaneth, or at the least how to doe it well. It is performed after a different fashio from the former, although they all tend vnto one end, which is the propagating of trees. You must for this purpose obserue, that for those trees you would graft, either with, or vpon, you choose a fit time in Summer, when the sappe is well risen, and your graft well shot, that the barke will rise easily and cleanly, both of stocke and graft, which time I cannot appoint, because both the yeares doe differ in earliness, and the seuerall parts or countries of this Land likewise one from another, but most vsually in these Southerne parts, from the beginning of Iune vnto the end of it, or to the middle of Iuly, or either somewhat before or after. First (as I said) having taken the fittest time of the yeare, you must take especiall care, that your grafts be well growne, and of the same yeares shoote, and also that the buds or eyes haue but single leaues at them, as neare as you can: for I would vterly refuse those buds that haue about two leaues as vnprofitable, either in Peaches or any other fruit; and therefore see that your grafts or cyons be taken from the chiefest place of the tree, that is, either from the toppe, or from a sunnie side thereof, and not from the contrarie side if you may oitherwise, nor from any vnder-boughes; for seeing your graft is so small a thing, you had neede take the more care that it be the best and fairest. You must to take off this eye or budde from the sprigge, haue a small sharpe pen-knife, the end of the haft being made flat and thinne, like a chessell or wedge, the figure wherof is set forth at the letter B, and a pen or goose quill cut, to be leise then halfe round, and to be broad at the end, but not sharpe pointed like a penne, or else such a peece of bone or Iuorie made in that fashio as the quill is, to bee thinne, hollow, or
halfe

halfe round, the figures of both which are marked with the letters C, D. with your knife cut the barke of the bud (having first cut off the leafe, leauing onely the short foote-stalke thereof at the bud) about a strawes breadth about the eye thereof halfe round, and then from that round or ouerthwart cut, with your knife cut it downe on both sides of the eye, close to the bud slopewise about an inch long or thereabouts, that it bee broad at the head about the eye, and pointing at the end like a sheild or scutcheon; and then cutting away the rest of the barke from about it, with the thinne flat end of the haft of your knife raise vp both sides of your bud a little, and with your quill or bone put vnder the barke, raise your budde, and thrust it quite off, beginning at the toppe or head of your eye; but see that you thrust it off close to the wood of the branch or sprigge, and that you doe not leaue the eye of the budde behinde sticking vpon the branch; for if that eye be left or lost, your bud is worth nothing; you must cast it away, and cut another that may haue that eye abiding within the budde on the inside: you may perceiue if that eye be wanting, if you see an emptie hole in the place where the eye should be, to fill it vp on the inside thereof; thus hauing taken off your bud well and cleanly, which is set forth vnto you at the figures 3 and 4. presently set it on the tree you would graft (for your small bud can abide no delay, lest by taking the ayre too long it become dry, and nothing worth) in this manner: Cut the barke of your tree you would graft in a smooth place, at what height you please, first aboue or ouerthwart, and then downe right in the middle thereof, more then an inch long, the figure whereof you shall haue at the figure 1. and then raise vp both sides of the barke, first one, and then another, with the flat and thinne haft end of your knife, a prettie way inwards (for if the barke will not rise easily, the stocke is not then fit to graft vpon) put in your budde into the cleft with the point downewards, holding the stalke of the leafe that is with the budde betweene your fingers of the one hand, and opening the cleft with the flat end of your knife with the other hand; that the head of your bud may be put close vnder the ouerthwart cut in the stocke or tree (which must not be raised or stirred as the sides are) & the eye of the bud stand iust in the middle of the slit that is downeright, and then closing the barke of the stocke or tree softly vnto the bud thus put in with your fingers, let it be bound gently with a small long peece of baste, or other such like soft thing, first about the eye, & then compassing it belowe as close as you can, but not too hard in any case, vntil you haue bound it all ouer the slit you made, especially the lower end, lest any winde get in to dry and spoile it; and hauing tyed both ends thereof fast, leaue it so for a fortnight or somewhat more, in which space it will take and hold, if it be well done, which you shall perceiue, if the bud abide green, and turne not blacke, when you haue vnloosed the tying; for if it hold fast to the tree, and be fresh and good, tie it vp gently againe, and so leaue it for a fortnight longer, or a moneth if you will, and then you may take away your binding cleane: this budde will (if no other mischance happen vnto it) spring and shoote forth the next yeare, (and sometimes the same yeare, but that is seldome) and therefore in the beginning of the yeare, cut off the head of the grafted tree about an handfull aboue the grafted place, vntill the graft be growne strong, and then cut it off close, that the head may be couered with the graft, and doe not suffer any buds to sprout besides the graft, either aboue or belowe it. If you graft diuers buds vpon one stocke (which is the best way) let that onely remaine and abide that shooteth best forth, and rubbe off, or take away the other: the seuerall parts of this grafting I haue caused to be exprest for your further information.

5. Grafting in the scutcheon is accounted another kinde of grafting, and differeth verie little from grafting in the budde: the difference chiefly consisteth in this, that in stead of the downeright slit, and that aboue ouerthwart, they take away iust so much barke of the great tree, as your bud is in bignesse, which vsually is a little larger then the former, and placing it therein, they binde it as formerly is said: some vse for this purpose a paire of compasses, to giue the true measure both of bud and stocke; this manner of grafting is most vsed vpon greater trees, whose young branches are too high to graft vpon in the former maner, and whose tops they cut off (for the most part) at the latter end of the next yeare after the bud is taken: both these waies were inuented to saue the losse of trees, which are more endangered by grafting in the stocke,

then any of these waies; and besides, by these waies you may graft at a farre greater height without losse.

CHAP. V.

Of the manner of grafting and propagating all sorts of Roses.

HAuing now spoken of the grafting of trees, let mee adioyne the properties of Roses, which although they better fit a Garden then an Orchard, yet I could not in a fitter place expresse them then here, both for the name and affinity of grafting, & because I do not expresse it in the first part. All sorts of Roses may be grafted (although all sorts are not, some seruing rather for stockes for others to be grafted on) as easily as any other tree, & is only performed, by inoculating in the same maner I haue set downe in the former Chapter of grafting trees in the bud; for both stocke and budde must bee dealt with after the same fashion. And although some haue boasted of grafting Roses by slicing or whipping, as they call it, or in the stocke, after the first manner, set downe in the former Chapter, yet I thinke it rather a bragge, not hauing seene or heard any true effect proceede from that relation. The sweete Briar or Eglantine, the white and the Damaske Roses, are the chiefeft stockes to graft vpon. And if you graft lowe or neare the ground, you may by laying downe that graft within the ground, after it hath bin shot out well, and of a years growth, by pinning it fast downe with short stickes, a thwart or acrosse, cause that grafted branch, by taking roote, to become a naturall Rose, such as the graft was, which being separated and transplanted after it hath taken root wel, will prosper as well as any naturall sucker. And in this manner, by laying downe branchese at length into the ground, if they be full of spreading small branches, you may increase all sorts of Roses quickly and plentifully; for they will shoote forth rootes at the ioynt of euery branch: But as for the manner of grafting white Roses or Damaske vpon Broome stalkes or Barbary bushes, to cause them to bring forth double yellow Roses, or vpon a Willowe, to beare greene Roses, they are all idle conceits, as impossible to be effected, as other things, whereof I haue spoken in the ninth Chapter of my first part, concerning a Garden of flowers, vnto which I referre you to be satisfied with the reasons there alledged. And it is the more needlesse, because we haue a naturall double yellow Rose of it owne growing. The sowing of the seedes of Roses (which are sometimes found vpon most sorts of Roses, although not euery yeare, and in euerie place) hath bin formerly much vsed; but now the laying downe of the young shootes is a way for increase so much vsed, being safe and verie speedie to take, especially for those Roses that are not so apt to giue suckers, that it hath almost taken quite away the vse of sowing of the seedes of Roses, which yet if anie one bee disposed to make the triall, they must gather the seede out of the round heads, from amongst the doune, wherein they lye verie like vnto the berries of the Eglantine or sweete Briar bush, and especially of those Roses that bee of the more single kindes, which are more apt to giue berries for seed then the more double, although sometimes the double Roses yeeld the like heads or berries. Their time of sowing is in the end of September (yet some reserue them vntill February) and their manner of nourfing is to bee transplanted, after the first or second yeares growth, and tended carefully, that while they are young they be not lost for want of moisture in the dry time of Summer.

CHAP.

CHAP. VI.

Certaine rules and observations in and after grafting, not remembered in the former Chapter.

THe time of some manners of grafting being not mentioned before, must here be spoken of. For the grafting of all sorts of trees in the stocke, the most vsuall time is from the middle of February vntill the middle of March, as the yeare and the countrie is more forward or backward, with vs about London wee neuer passe midde March: but because the May Cherrie is first ripe, and therefore of a very forward nature, it doth require to be grafted somewhat sooner then others. The time of gathering likewise, or cutting your grafts for grafting in the stocke, is to be obserued, that they bee not long gathered before they bee grafted, for feare of being too dry, which I commend, howsoeuer diuers say, if they be long kept they are not the worse, and therefore if you be forced to haue your grafts from farre, or by some other chance to keepe them long, be carefull to keepe them moist, by keeping their ends sticke in moist clay; but if neare hand, neglect no time I say after the cutting of them for their grafting, but either the same, or the next day, or verie speedily after, in the meane time being put into the ground to keepe them fresh. The grafts taken from old trees, because they are stronger, and shoote forth sooner, are to bee sooner grafted then those that are taken from younger trees: of a good branch may bee made two, and sometimes three grafts sufficient for anie reasonable stocke. For whipping, the time is somewhat later then grafting in the stocke, because it is performed on younger trees, which (as I said before) doe not so early bud or shoote forth as the elder. Inarching likewise is performed much about the later end of the grafting time in the stocke, for being both kindes thereof they require the same time of the yeare. The times of the other manners of graftings are before expressed, to bee when they haue shot forth young branches, from whence your buds must be taken; and therefore need not here againe to be repeated. If a graft in the stocke doth happen not to shoote forth when others do (so as it holdeth green) it may perchance shoot out a moneth or two after, & do well, or else after Midsummer, when a second time of shooting, or the after Spring appeareth: but haue an especiall care, that you take not such a graft that shal haue nothing but buds for flowers vpon it, and not an eye or bud for leaues (which you must be carefull to distinguish) for such a graft after it hath shot out the flowers must of necessitie dye, not hauing wherewith to maintaine it selfe. Also if your good graft doe misse, and not take, it doth hazzard your stocke at the first time, yet manie stockes doe recouer to be grafted the second time; but twice to faile is deadly, which is not so in the inoculating of buds in the greene tree: for if you faile therein three, or three times three, yet euerie wound being small, and the tree still growing greene, will quickly recouer it, and not be afterwards seen. Some vse to graft in the stocke the same yeare they remoue the stocke, to saue time, & a second checke by grafting; but I like better both in grafting in the stocke, and in the bud also, that your trees might be planted in the places where you would haue them growe, for a yeare or two at the least before you graft them, that after grafting there should be no remouall, I neede not be tedious, nor yet I hope verie sollicitous to remember many other triuiall, or at the least common knowne things in this matter. First, for the time to remoue trees, young or old, grafted or vngrafted, to be from a fortnight after Michaelmas vntill Candlemas, or if neede be, somewhat after, yet the sooner your remoue is, the better your trees will thriue, except it be in a very moist ground. For the manner or way to set them: *viz.* in the high and dry grounds set them deeper, both to haue the more moisture, and to be the better defended from windes; and in the lower and moister grounds shallower, and that the earth be mellow, well turned vp, and that the finer earth bee put among the small rootes, wherein they may spread, and afterwards gently troden downe, that no hollownesse remaine among the rootes: as also that after setting (if the time be not ouer moist) there may be some water powred to the rootes, to moisten and fasten them the better, and in the dry time of Summer, after the setting, let them not want moisture, if you will haue

haue them thrive and prosper; for the want thereof at that time, hath often killed manie a likely tree. To stake and fence them also if neede bee after they are new set, and so to continue for two or three yeares after, is verie expedient, lest windes or other casualties spoile your paines, and ouerthrow your hopes. And likewise to defend your grafts from birds lighting on them, to breake or displace them, to sticke some prickes or sharpe pointed stickes longer then your graft into your clay, that so they may be a sure defence of it: As also to tye some woollen cloathes about the lower end of your stockes, or thrust in some thornes into the ground about the rootes, to defend them from hauing their barks eaten by Conies, or hurt by some other noisome vermine.

CHAP. VII.

Observations for the dressing and well keeping of Trees and an Orchard in good order.

THere are two manner of waies to dresse and keepe trees in good order, that they may bee both gracefull and fruitfull; the one is for wall trees, the other is for standards: for as their formes are different, so is their keeping or ordering. Wall trees, because they are grafted lowe, and that their branches must be plasht or tackt vnto the wall to fasten them, are to be so kept, that all their branches may be suffered to growe, that shoote forth on eithet side of the bodie, and led either along the wall, or vpright, and one to lappe ouer or vnder another as is conuenient, and still with peeces of lists, parings of felt, peeces of soft leather, or other such like soft thing compassing the armes or branches, fastened with small or great nailles, as neede requireth, to the wals, onely those buds or branches are to be nipped or cut off, that shoot forward, and will not so handsomely be brought into conformity, as is fitting; yet if the branches growe too thicke, to hinder the good of the rest, or too high for the wall, they may, nay they must be cut away or lopped off: and if anie dead branches also happen to be on the trees, they must be cut away, that the rest may haue the more libertie to thrive. Diuers also by carefully nipping away the waste and superfluous buds, doe keepe their trees in conformity, without much cutting. The time to prune or plash, or tye vp wall trees, is vsually from the fall of the leafe, to the beginning of the yeare, when they begin to blossome, and most especially a little before or after Christmas: but in any case not too late, for feare of rubbing off their buds. Some I know doe plash and tye vp their wall trees after bearing time, while the leaues are Greene, and their reason is, the buds are not so easie or apt to bee rubbed from the branches at that time, as at Christmas, when they are more growne: but the leaues must needes be very cumbersome, to hinder much both the orderly placing, and close fastening of them to the wall. This labour you must performe euery yeare in its due time; for if you shall neglect and iouerslip it, you shall haue much more trouble, to bring them into a fit order againe, then at the first. The standard trees in an Orchard must be kept in another order; for whereas the former are suffered to spread at large, these must be pruned both from superfluous branches that ouerload the trees, & make them lesse fruitfull, as well as lesse sightly, and the vnder or water boughes likewise, that drawe much nourishment from the trees, and yet themselues little the better for it, I meane to giue fruit. If therefore your Orchard consist of young trees, with a little care and paines it may bee kept in that comely order and proportion it was first destined vnto; but if it consist of old growne trees, they will not without a great deale of care and paines be brought into such conformitie, as is besitting good and comely trees: for the marke of those boughes or branches that are cut off from young trees, will quickly be healed againe, the barke growing quickly ouer them, whereby they are not worse for their cutting; but an old tree if you cut off a bough, you must cut it close and cleanly, and lay a scarcloth of tallow, waxe, and a little pitch melted together vpon the place, to keepe off both the winde, sunne, and raine, vntill the barke haue couered it ouer againe: and in this manner you must deale with all such short stumps of branches, as are either broken short off with the winde, or by carelesnesse or want

want of skill, or else such aimes or branches as are broken off close, or sluied from the body of the tree: for the raine beating and falling into such a place, will in short time rotte your tree, or put it in danger, besides the deformity. Some vse to fill vp such an hole with well tempered clay, and tacked a cloth or a peece of leather ouer it vntill it be recouered, and this is also not amisse. Your young trees, if they stand in anie good ground, will bee plentiful enough in shooting forth branches; bee carefull therefore if they growe too thicke, that you prune away such as growe too close (and will, if they be suffered, spoile one another) as they may be best spared, that so the sunne, ayre, and raine may haue free access to all your branches, which will make them beare the more plentifully, and ripen them the sooner and the more kindly. If anie boughes growe at the toppe too high, cut them also away, that your trees may rather spread then growe too high. And so likewise for the vnder boughes, or anie other that by the weight of fruit fall or hang downe, cut them off at the halfe, and they will afterwards rise and shoote vpwards. You shall obserue, that at all those places where anie branches haue been cut away, the sappe will euer bee readie to put forth: if therefore you would haue no more branches rise from that place, rubbe off or nippe off such buddes as are not to your minde, when they are new shot: and thus you may keep your trees in good order with a little paines, after you haue thus pruned and dressed them. One other thing I would aduertise you of, and that is how to preserue a fainting or decaying tree which is readie to perish, if it be not gone too farre or past cure, take a good quantitie of oxen or horse blood, mixe therewith a reasonable quantitie of sheepe or pigeons dung, which being laid to the roote, will by the often raines and much watering recouer it selfe, if there bee anie possibilitie; but this must bee done in Ianuarie or Februarie at the furthest.

CHAP. VIII.

Diuers other obseruations to be remembered in the well keeping of an Orchard.

THere be diuers other things to be mentioned, whereof care must be had, either to doe or auoide, which I thinke fit in this Chapter promiscuously to set downe, that there may be nothing wanting to furnish you with sufficient knowledge of the care, paines, and casualties that befall an Orchard: for it hath many enemies, and euery one laboureth as much as in them lye, to spoile you of your pleasure, or profit, or both, which must bee both speedily and carefully prevented and helped; and they are these: Mosse, Caterpillars, Ants, Earwigs, Snails, Moales, and Birds. If Mosse begin to ouergrowe your trees, looke to it betimes, lest it make your trees barren: Some vse to hacke, and crossehacke, or cut the barke of the bodies of their trees, to cause it fall away; but I feare it may endanger your trees. Others doe either rubbe it off with a haire cloth, or with a long peece of wood formed like a knife, at the end of a long sticke or pole, which if it bee vsed cautelously without hurting the buds, I like better. Caterpillars, some smoake them with burning wet strawe or hay, or such like stufte vnder the trees; but I doe not greatly like of that way: others cut off the boughes whereon they breed, and tread them vnder their fecte, but that will spoile too manie branches; and some kill them with their hands: but some doe vse a new deuised way, that is, a pompe made of latten or tin, spout-fashion, which being set in a tubbe of water vnder or neare your trees, they will cause the water to rise through it with such a force, and through the branches, that it will wash them off quickly. To destroy Ants, that eate your fruit before and when it is ripe, some vse to annoint the bodies of their trees with tarre, that they may not creepe vp on the branches; but if that doe not helpe, or you will not vse it, you must be carefull to finde out their hill, and turne it vp, pouring in scalding water, either in Summer, but especially if you can in Winter, and that will surely destroy them. I haue spoken of Earwigs in the first part of this worke, entreating of the annoyances of Gilloflowers, and therefore I referre you thereunto: yet one way more I will

will here relate which some doe vse, and that is with hollow canes of halfe a yard long or more, open at both ends for them to creepe in, and sticke or laid among the branches of your trees, will soone drawe into them many Earwigs, which you may soone kill, by knocking the cane a little vpon the ground, and treading on them with your foote. Snailes must be taken with your hands, and that euerie day, especially in the morning when they will be creeping abroad. Moales by running vnder your trees make them lesse fruitfull, and also put them in danger to be blowne downe, by leauing the ground hollow, that thereby the rootes haue not that strength in the ground, both to shoote and to hold, that otherwise they might haue. Some haue vsed to put Garlick, and other such like things into their holes, thinking thereby to driue them away, but to no purpose: others haue tryed manie other waies; but no way doth auaille anie thing, but killing them either with a Moale spade, or a trappe made for the purpose as manie doe know: and they must bee watched at their principall hill, and trenched round, and so to be caught. Birds are another enimie both to your trees and fruit; for the Bullfinch will destroy all your stone fruit in the budde, before they flower, if you suffer them, and Crows, &c. when your Cherries are ripe: for the smaller birds, Lime twigs set either neare your trees, or at the next water where they drinke, will helpe to catch them and destroy them. And for the greater birds, a stone bowe, a birding or fowling peece will helpe to lessen their number, and make the rest more quiet: or a mill with a clacke to scare them away, vntill your fruit be gathered. Some other annoyances there are, as suckers that rise from the rootes of your trees, which must be taken away euerie yeare, and not suffered to growe anie thing great, for feare of robbing your trees of their liuelihood. Barke bound, is when a tree doth not shoote and encrease, by reason the barke is as it were drie, and will not suffer the sappe to passe vnto the branches: take a knife therefore, and slit the barke downe almost all the length of the tree in two or three places, and it will remedy that euill, and the tree will thriue and come forward the better after. Barke pilled is another euill that happeneth to some trees, as well young as old, either by reason of casuall hurts, or by the gnawing of beasts, howsoeuer it bee, if it bee anie great hurt, lay a plaister thereon made of tallow, tarre, and a little pitch, and binde it thereto, letting it so abide vntill the wound bee healed: yet some doe only apply a little clay or loame bound on with ropes of hay. The Canker is a shrewd disease when it happeneth to a tree; for it will eate the barke round, and so kill the very heart in a little space. It must be looked vnto in time before it hath runne too farre; most men doe wholly cut away as much as is fretted with the Canker, and then dresse it, or wet it with vinegar or Cowes pisse, or Cowes dung and vrine, &c. vntill it be destroyed, and after healed againe with your salve before appointed. There are yet some other enemies to an Orchard: for if your fence be not of bricke or stone, but either a mudde wall, or a quicke set or dead hedge, then looke to it the more carefully, and preuent the comming in of either horse, or kine, sheepe, goates, or deere, hare, or conie; for some of them will breake through or ouer to barke your trees, and the least hole almost in the hedge will giue admittance to hares and conies to doe the like. To preuent all which, your care must be continuall to watch them or auoide them, and to stoppe vp their entrance. A dogge is a good seruant for many such purposes, and so is a stone bowe, and a peece to make vse of as occasion shall serue. But if you will take that medicine for a Canker spoken of before, which is Cowes dung and vrine mixed together, and with a brush wash your trees often to a reasonable height, will keepe hares and conies from eating or barking your trees. Great and cold windes doe often make a great spoile in an Orchard, but great trees planted without the compasse thereof, as Wall-nuts, Oakes, Elmes, Ashes, and the like, will stand it in great stead, to defend it both early and late. Thus haue I shewed you most of the euils that may happen to an Orchard, and the meanes to helpe them, and because the number is great and daily growing, the care and paines must be continuall, the more earnest and diligent, lest you lose that in a moment that hath been growing many yeares, or at the least the profit or beauty of some yeares fruit.

CHAP. IX.

The manner and way how to plant, order, and keepe other trees that beare greene leaues continually.

THe way to order those trees that beare their leaues greene continually, is differing from all others that doe not so : for neyther are they to bee planted or remoued at the time that all other trees are set, nor doe they require that manner of dressing, pruning and keeping, that others doe. And although many ignorant persons and Gardiners doe remoue Bay trees, and are so likewise perswaded that all other trees of that nature, that is, that carry their greene leaues continually, may bee remoued in Autumne or Winter, as well as all other trees may bee; yet it is certaine it is a great chance if they doe thriue and prosper that are set at that time, or rather it is found by experience, that scarce one of ten prospereth well that are so ordered. Now in regard that there be diuers trees and shrubs mentioned here in this booke that beare euer greene leaues, wherein there is very great beauty, and many take pleasure in them; as the ordinary Bay, the Rose Bay, and the Cherry Bay trees, the Indian Figge, the Cypresse, the Pinetree, the Mirtle and dwarfe Boxe, and many others; I will here shew you how to plant and order them, as is fittest for them. For in that they doe not shed their greene leaues in winter as other trees doe, you may in reason be perswaded that they are of another nature; and so they are indeede: for seeing they all grow naturally in warme Countries, and are from thence brought vnto vs, we must both plant them in a warmer place, and transplant them in a warmer time then other trees be, or else it is a great hazzard if they doe not perish and dye, the cold and frosts in the winter being able to pierce them through, if they should bee transplanted in winter, before they haue taken roote. You must obserue and take this therefore for a certaine rule, that you alwaies remoue such trees or shrubbes as are euer greene in the spring of the yeare, and at no time else if you will doe well, that is, from the end of March, or beginning of Aprill, vnto the middle or end of May, especially your more dainty and tender plants, shadowing them also for a while from the heate of the Sun, and giuing them a little water vpon their planting or transplanting; but such water as hath not presently been drawn from a Well or Pumpe, for that will go neer to kill any plant, but such water as hath stood in the open ayre for a day at the least, if not two or three. Yet for dwarfe Boxe I confesse it may endure one moneth to be earlier planted then the rest, because it is both a more hardy and lowe plant, and thereby not so much subiect to the extremitie of the colde: but if you should plant it before winter, the frosts would raise it out of the ground, because it cannot so soone at that time of the yeare take roote, and thereby put it in danger to be lost. Moreover all of them will not abide the extremitie of our winter frosts, and therefore you must of necessity house some of them, as the Rose Bay, Mirtle, and some others, but the other sorts being set where they may bee somewhat defended from the cold windes, frostes, and snow in winter, with some couering or shelter for the time, will reasonably well endure and beare their fruit, or the most of them. If any be desirous to be furnished with store of these kinds of trees that will be nourshed vp in our Country, he may by sowing the seed of them in square or long wooden boxes or chests made for that purpose, gaine plenty of them: but hee must be carefull to couer them in winter with some straw or fearne, or beane hame, or such like thing layd vpon crosse sticks to beare it vp from the plants, and after two or three yeares that they are growne somewhat great and strong, they may bee transplanted into such places you meane they shall abide: yet it is not amisse to defend them the first yeare after they are transplanted, for their more securitie: the feedes that are most vsually sown with vs, are, the Cypresse tree, the Pine tree, the Baye, the Pyracantha or prickly Corall tree, and the Mirtle: the Rose Bay I haue had also risen from the seede that was fresh, and brought me from Spaine. But as for Orange trees, because they are so hardly preserued in this our cold climate (vnlesse it bee with some that doe bestow the housing of them, besides a great deale more of care and respect vnto them) from the bitterness of our cold long winter weather (although their

kernels

kernels being put into the ground in the Spring or Summer, and if care bee had of them and conuenient keeping, will abide, and by grafting the good fruit on the crab stocke they may bee in time nursed vp) I doe not make any other especiall account of them, nor giue you any further relation of their ordering. Now for the ordering of these trees after they are cyther planted of young sets, or transplanted from the seede, it is thus : First for Bay trees, the most vsuall way is to let them grow vp high to bee trees, and many plant them on the North or East side of their houses that they may not bee scorched with the Sunne; but the bitter winters which we often haue, doe pinch them shrewdly, insomuch that it killeth euen well growne trees sometimes downe to the roote : but some doe make a hedge of them being planted in order, and keep them low by lopping of them continually, which will make them bush and spread. The Cypress tree is neuer lopped, but suffered to grow with all the branches from a foote aboue the ground, if it may be, straight vp right, for that is his natieue grace and greatest beautie, and therefore the more branches doe dye that they must bee cut away, the more you deforme his propertie. The Pine tree may be vsed in the same manner, but yet it will better endure to sustaine pruning then the Cypress, without any such deformitie. The Laurocerasus or Cherry Bay may be diuersly formed, that is, it may be either made to grow into a tall tree by shredding still away the vnder branches, or else by suffering all the branches to grow to be a low or hedge bush, & both by the suckers and by laying downe the lower branches into the earth, you may soone haue much increase; but this way will cause it to bee the longer before it beare anie fruit. The Rose Baye will verie hardlie bee encreased either by suckers or by layers, but must bee suffered to grow without lopping, topping or cutting. The Pyracantha or Prickly Corall tree may bee made to grow into a reasonable tall tree by shredding away the lower branches, or it may be suffered to grow lowe into an hedge bush, by suffering all the branches to grow continually, you may also propagate it by the suckers, or by laying downe the lower branches. The Myrtle of all sorts abideth a low bush spreading his branches full of sweete leaues and flowers, without anie great encrease of it selfe, yet sometimes it giueth suckers or shootes from the rootes : but for the more speedie propagating of them, some doe put the cuttings of them into the earth, and thereby increase them. There are some other trees that are not of any great respect, as the Yew tree, and the Savine bush, both which may be encreased by the cuttings, and therefore I need not make any further relation or amplification of them, and to say thus much of them all, is (I thinke) sufficient for this Worke.

CHAP. X.

The ordering, curing, and propagating Vines of all sorts.

IN most places of this countrie there is small care or paines taken about the ordering of Vines : it sufficeth for the most part with them that haue anie, to make a frame for it to spread vpon aboue a mans height, or to tacke it to a wall or window, &c. and so to let it hang downe with the branches and fruit, vntill the weight thereof, and the force of windes doe teare it downe oftentimes, and spoile the grapes : and this way doth somewhat resemble that course that the Vineyard keepers obserue in the hot countries of Syria, Spaine, and Italy, and in the furthest parts of France as I hear likewise : for in most of these hot countries they vse to plant an Oliue betweene two Vines, and let them runne thereupon. But manie of the other parts of France, &c. doe not suffer anie trees to growe among their Vines; and therefore they plant them thicke, and prune them much and often, and keepe them lowe in comparison of the other way, fastening them to pearches or poles to hold them vp. And according to that fashion many haue aduentured to make Vineyards in England, not onely in these later daies, but in ancient times, as may wel witnesse the sundrie places in this Land, entituled by the name of Vineyards; and I haue read, that manie Monasteries in this Kingdome hauing Vineyards, had as much wine made therefrom, as sufficed their couents yeare by yeare : but long since they haue been destroyed, and the knowledge how to order a Vineyard is also vterly perished with them. For although diuers, both Nobles

bles and Gentlemen, haue in these later times endeauoured to plant and make Vineyards, and to that purpose haue caused French men, being skilfull in keeping and dressing of Vines, to be brought ouer to performe it, yet either their skill failed them, or their Vines were not good, or (the most likely) the soile was not fitting; for they could neuer make anie wine that was worth the drinking, being so small and heartlesse, that they soone gaue ouer their practice. And indeede the soile is a maine matter to bee chiefly considered to seate a Vineyard vpon: for euen in France and other hot countries, according to the nature of the soile, so is the rellish, strength, and durabilitie of the wine. Now although I think it a fruitlesse labour for any man to strue in these daies to make a good Vineyard in England, in regard not only of the want of knowledge, to make choise of the fittest ground for such Vines as you would plant therupon, but also of the true maner of ordering them in our country; but most chiefly & aboue all others, that our years in these times do not fal out to be so kindly and hot, to ripen the grapes, to make anie good wine as formerly they haue done; yet I thinke it not amisse, to giue you instructions how to order such Vines as you may nourse vp for the pleasure of the fruit, to eate the grapes being ripe, or to preserue and keepe them to bee eaten almost all the winter following: And this may be done without any great or extraordinarie paines. Some doe make a lowe wall, and plant their Vines against it, and keepe them much about the height thereof, not suffering them to rise much higher: but if the high bricke or stonewalls of your Garden or Orchard haue buttresses thereat, or if you canse such to bee made, that they bee somewhat broade forwards, you may the more conueniently plant Vines of diuers sorts at them, and by sticking down a couple of good stakes at euery buttresse, of eight or ten foot high aboue ground, tacking a few lathes acrosse vpon those stakes, you may therunto tye your Vines, & carry them thereon at your pleasure: but you must be carefull to cut them euery year, but not too late, and so keepe them downe, and from farre spreading, that they neuer runne much beyond the frame which you set at the buttresses: as also in your cutting you neuer leaue too many ioynts, nor yet too few, but at the third or fourth ioint at the most cut them off. I doe aduise you to these frames made with stakes and lathes, for the better ripening of your grapes: for in the blooming time, if the branches of your vines bee too neare the wall, the reflection of the Sunne in the day time, and the colde in the night, doe oftentimes spoile a great deale of fruit, by piercing and withering the tender footstalkes of the grapes, before they are formed, whereas when the blossomes are past, and the fruit growing of some bignesse, then all the heate and reflection you can giue them is fit, and therefore cut away some of the branches with the leaues, to admit the more Sunne to ripen the fruit. For the diuers sorts of grapes I haue set them downe in the Booke following, with brieue notes vpon euerie of them, whether white or blacke, small or great, early or late ripe; so that I neede not here make the same relation again. There doth happen some diseases to Vines sometimes, which that you may helpe, I thinke it conuenient to informe you what they are, and how to remedy them when you shall be troubled with any such. The first is a luxurious spreading of branches and but little or no fruit: for remedie whereof, cut the branches somewhat more neere then vsuall, and bare the roote, but take heed of wounding or hurting it, and in the hole put either some good old rotten stable dung of Horses, or else some Oxe blood new taken from the beasts, and that in the middle of Januarie or beginning of Februarie, which being well tempered and turned in with the earth, let it so abide, which no doubt, when the comfort of the blood or dung is well soaked to the bottome by the raine that fall thereon, will cause your Vine to fructifie againe. Another fault is, when a Vine doth not bring the fruit to ripenesse, but either it withereth before it be growne of any bignesse, or presently after the blooming: the place or the earth where such a Vine standeth, assuredly is too colde, and therefore if the fault bee not in the place, which cannot bee helped without remouing to a better, digge out a good quantity of that earth, and put into the place thereof some good fresh ground well heartned with dung, and some sand mixed therewith (but not salt or salt water, as some doe aduise, nor yet vrine, as others would haue) and this will hearten and strengthen your Vine to beare out the fruit vnto maturitie. When the leaues of a Vine in the end of Summer or in Autumne, vntimely doe turne either yellow or red, it is a great signe the earth is

too hot and drie; you must therefore in stead of dung and sand, as in the former defect is said, put in some fresh loame or short clay, well mixed together with some of the earth, and so let them abide, that the frosts may mellow them. And lastly, a Vine sometimes beareth some store of grapes, but they are too many for it to bring to ripeness; you shall therefore helpe such a Vine (which no doubt is of some excellent kinde, for they are most vsually subiect to this fault) by nipping away the blossomes from the branches, and leauing but one or two bunches at the most vpon a branch, vntill the Vine be growne older, and thereby stronger, and by this meane inured to beare out all the grapes to ripeness. These be all the diseases I know doe happen to Vines: for the bleeding of a Vine it seldome happeneth of it selfe, but commeth either by cutting it vntimely, that is, too late in the yeare, (for after Ianuarie, if you will be well aduised, cut not any Vine) or by some casuall or wilfull breaking of an arme or a branch. This bleeding in some is vnto death, in others it stayeth after a certaine space of it selfe: To helpe this inconuenience, some haue scared the place where it bleedeth with an hot iron, which in many haue done but a little good; others haue bound the barke close with packe-thred to stay it; and some haue tied ouer the place, being first dried as well as may bee, a plaister made with waxe rossen and turpentine while it is warme. Now for the propagating of them: You must take the fairest and goalest shot branches of one yeares growth, and cut them off with a peece of the old wood vnto it, and these being put into the ground before the end of Ianuarie at the furthest, will shoote forth, and take roote, and so become Vines of the same kinde from whence you tooke them. This is the most speedy way to haue increase: for the laying downe of branches to take roote, doth not yeelde such store so plentifully, nor doe suckers rise from the rootes so abundantly; yet both these waies doe yeelde Vines, that being taken from the old stockes will become young plants, fit to bee disposed of as any shall thinke meete.

CHAP. XI.
The way to order and preserue grapes, fit to eaten almost all the winter long, and sometimes vnto the Spring.

Although it bee common and vsuall in the parts beyond the Sea to dry their grapes in the Sunne, thereby to preserue them all the yeare, as the Raisins of the Sunne are, which cannot bee done in our Countrey for the want of sufficient heate thereof at that time: or otherwise to scald them in hot water (as I heare) and afterwards to dry them, and so keepe them all the yeare, as our Malaga Raisins are prepared that are packed vp into Frayles: yet I doe intend to shew you some other waies to preserue the grapes of our Countrey fresh, that they may be eaten in the winter both before and after Christmas with as much delight and pleasure almost, as when they were new gathered. One way is, when you haue gathered your grapes you intend to keepe, which must be in a dry time, and that all the shrunke, dried, or euill grapes in euery bunch be picked away, and hauing provided a vessell to hold them, be it of wood or stone which you will, and a sufficient quantitie of faire and cleane drie sand, make *stratum super stratum* of your grapes and the sand, that is, a lay of sand in the bottome first, and a lay of grapes vpon them, and a lay or strowing againe of sand vpon those grapes, so that the sand may couer euery lay of grapes a fingers breadth in thickness, which being done one vpon another vntill the vessell be full, and a lay of sand vppermost, let the vessell be stopped close, and set by vntill you please to spend them, being kept in some drie place and in no sellar: let them bee washed cleane in faire water to take away the sand from so many you will spend at a time. Another way is (which Camerarius setteth downe he was informed the Turkes vse to keepe grapes all the winter vnto the next summer) to take so much meale of Mustard seede, as will serue to strow vpon grapes, vntill they haue filled their vessels, whereon afterwards they poure new wine before it hath boiled, to fill vp their vessels therewith, and being stopped vp close, they keepe them a certaine time, and selling them with their liquour to them that will

vse them, they doe wash the seedes or meale from them when they vse them. Another way is, that hauing gathered the fairest ripe grapes, they are to be cast vpon threds of strings that are fastened at both ends to the side walks of a chamber, neere vnto the ceiling thereof, that no one bunch touch another, which will bee so kept a great while, yet the chamber must be well defended from the frosts, and cold windes that pierce in at the windowes, lest they perish the sooner: and some will dippe the ends of the branches they hang vp first in molten pitch, thinking by searing vp the ends to keepe the bunches the better; but I doe not see any great likelihood therein. Your chamber or closet you appoint out for this purpose must also bee kept somewhat warme, but especially in the more cold and frostie time of the yeare, lest it spoile all your cost and paines, and frustrate you of all your hopes: but although the frosts should pierce and spoile some of the grapes on a bunch, yet if you be carefull to keepe the place warme, the fewer will be spoiled. And thus haue I shewed you the best directions to order this Orchard rightly, and all the waies I know are vsed in our Countrie to keep grapes good anie long time after the gathering, in regard wee haue not that comfort of a hotter Sun to preserue them by its heate.

The fruits themselues shall follow euerie one in their order; the lower shrubbes or bushes first, and the greater afterwards.

THE THIRD PART CALLED THE ORCHARD,

Containing all sorts of trees bearing fruit for mans vse to eate, proper and fit for to plant an Orchard in our climate and cuntry: I bound it with this limitation, because both Dates, Oliues, and other fruits, are planted in the Orchards of Spaine, Italy, and other hot countries, which will not abide in ours. Yet herein I will declare whatsoeuer Art, struiuing with Nature, can cause to prosper with vs, that whosoever will, may see what can bee effected in our cuntry. And first to begin with the lower shrubbes or bushes, and after ascend to the higher trees.

CHAP. I.

Rubus Idæus. Raspis.

THe Raspis berrie is of two sorts, white and red, not differing in the forme either of bush, leafe, or berry, but onely in the colour and taste of the fruit. The Raspis bush hath tender whitish stemmes, with reddish small prickles like haire set round about them, especially at the first when they are young; but when they grow old they become more woody and firme, without any shew of thornes or prickles vpon them, and hath onely a little hairinesse that couereth them: the leaues are somewhat rough or rugged, and wrinkled, standing three or fve vpon a stalke, somewhat like vnto Roses, but greater, and of a grayer Greene colour: the flowers are small, made of fine whitish round leaues, with a dash as it were of bluish cast ouer them, many standing together, yet euery one vpon his owne stalke, at the tops of the branches, after which come vp small berries, somewhat bigger then Strawberries, and longer, either red or white, made of many graines, more eminent then in the Strawberry, with a kinde of downinesse cast ouer them, of a pleasant taste, yet somewhat sowre, and nothing so pleasant as the Strawberry. The white Raspis is a little more pleasant then the red, wherein there is small seede inclosed: the rootes creepe vnder ground verie farre, and shoote vp againe in many places, much encreasing thereby.

There is another whose stemme and branches are wholly without prickles: the fruit is red, and somewhat longer, and a little more sharpe.

The Vse of Raspis.

The leaues of Raspis may be vled for want of Bramble leaues in gargles, and other decoctions that are cooling and drying, although not fully to that effect.

The Conserue or Syrupe made of the berries, is effectuell to coole an hot stomacke, helping to refresh and quicken vp those that are ouercome with faintnesse.

The berries are eaten in the Summertime, as an afternoones dish, to please the taste of the sicke as well as the sound.

The iuyce and the distilled water of the berries are verie comfortable and cordiall.

It is generally held of many, but how true I know not, that the red wine that is vsually sold at the Vintners, is made of the berries of Raspis that grow in colder countries, which giueth it a kinde of harshnesse: And also that of the same berries growing in hotter climates, which giueth vnto the wine a more pleasant sweetnesse, is made that wine which the Vintners call Alligant: but we haue a Vine or Grape come to vs vnder the name of the Alligant Grape, as you shall finde it set downe hereafter among the Grapes; and therefore it is likely to be but an opinion, and no truth in this, as it may be also in the other.

CHAP. II.

Ribes rubra, alba, nigra. Currans red, white, and blacke.

THe bushes that beare those berries, which are vsually called red Currans, are not those Currans either blew or red, that are sold at the Grocers, nor any kind thereof; for that they are the grapes of a certaine Vine, as shall be shewed by and by: but a farre differing kinde of berry, whereof there are three sorts, red, white, and blacke.

The red Curran bush is of two sorts, and groweth to the height of a man, hauing sometimes a stemme of two inches thicknesse, and diuers armes and branches, couered with a smooth, darke, brownish barke, without anie pricke or thorne at all vpon anie part thereof, whereon doe growe large cornered blackish greene leaues, cut in on the edges, seeming to be made of five parts, almost like a Vine leafe, the ends a little pointing out, and standing one aboue another on both sides of the branches: the flowers are little and hollow, comming forth at the ioynts of the leaues, growing many together on a long stalke, hanging downe aboue a fingers length, and of an herbie colour: after which come small round fruit or berries, greene at the first, and red as a Cherry when they are ripe, of a pleasant and rare taste: the other differeth not in anie other thing then in the berries, being twice as bigge as the former: the roote is woody, and spreadeth diuersly.

The white Curran bush riseth vsually both higher then the red, and straighter or more vp right, bigger also in the stemme, and couered with a whiter barke: the leaues are cornered, somewhat like the former, but not so large: the flowers are small and hollow like the other, hanging downe in the same manner on long stalkes, being of a whiter colour: the berries likewise growe on the long stalkes, somewhat thicker set together, and of a cleare white colour, with a little blacke head, so transparent that the seedes may be easily seene thorough them, and of a more pleasant white taste then the red by much.

The blacke Curran bush riseth higher then the white, with more plentifull branches, and more pliant and twiggie: the stemme and the elder branches being conered with a brownish barke, and the younger with a paler: the flowers are also like vnto little bottles as the others be, of a greenish purple colour, which turne into blacke berries, of the bignesse of the smaller red Currans: the leaues are somewhat like vnto the leaues of the red Currans, but not so large: both branches, leaues, and fruit haue a kind of stinking sent with them, yet they are not vnwholsome, but the berries are eaten of many, without offending either taste or smell.

The Use of Currans.

The red Currans are vsually eaten when they are ripe, as a refreshing to an hot

1 *Rubus idaeus*. The Raspis. 2 *Ribes fruticosum rubro vel albo*. White or red Currant. 3 *Grossularia vulgaris*. The ordinary Gooseberry. 4 *Grossularia fruticosa*. The great red Gooseberry. 5 *Grossularia adscendens*. The prickly Gooseberry. 6 *Oxycantha* (or *Barberry*). The Barbary bush. 7 *Aethana byzantina*. The Filbert of Constantinople. 8 *Aethana rubra*. The best red Filbert.

hot stomacks in the heate of the yeare, which by the tartnesse is much delighted. Some preferue them, and conserue them also as other fruits, and spend them at neede.

The white Currans, by reason of the more pleasant winie taste, are more accepted and desired, as also because they are more daintie, and lesse common.

Some vse both the leaues and berries of the blacke Currans in sawces, and other meates, and are well pleased both with the saueur and taste thereof, although many mislike it.

CHAP. III.

Vva Crispa sine Grossularia. Gooseberries or Feaberries.

WE haue diuers sorts of Gooseberries, besides the common kinde, which is of three sorts, small, great, and long. For wee haue three red Gooseberries, a blew and a greene.

The common Gooseberrie, or Feaberrie bush, as it is called in diuers Countries of England, hath oftentimes a great stemme, couered with a smooth darke coloured bark, without anie thorne thereon, but the elder branches haue here and there some on them, and the younger are whitish, armed with verie sharpe and cruell crooked thorns, which no mans hand can well auoide that doth handle them, whereon are set verie greene and small cornered leaues cut in, of the fashion almost of Smallage, or Hawthorne leaues, but broad at the stalke: the flowers come forth single, at euerie ioynt of the leafe one or two, of a purplish greene colour, hollow and turning vp the brims a little: the berries follow, bearing the flowers on the heads of them, which are of a pale greene at the first, and of a greenish yellow colour when they are ripe, striped in diuers places, and cleare, almost transparent, in which the seede lyeth. In some these berries are small and round; in others much greater; a third is great, but longer then the other: all of them haue a pleasant winie taste, acceptable to the stomacke of anie (but the long kinde hath both the thicker skin, and the worser taste of the other) and none haue been distempered by the eating of them, that euer I could heare of.

The first of the red Gooseberries is better knowne I thinke then the rest, and by reason of the small bearing not much regarded; the stemme is somewhat bigge, and couered with a smooth darke coloured barke, the younger branches are whiter, and without anie thorne or pricke at all, so long, weake, small, and slender, that they lye vpon the ground, and will there roote againe: the leaues are like vnto the former Gooseberries, but larger: the flowers and berries stand single, and not manie to bee found anie yeare vpon them, but are somewhat long, and are as great as the ordinarie Gooseberry, of a darke brownish red colour, almost blackish when they are ripe, and of a sweetish taste, but without any great delight.

The second red Gooseberry riseth vp with a more straight stemme, couered with a brownish barke; the young branches are straight likewise, and whitish, and grow not so thicke vpon it as the former red kinde, and without any thorne also vpon them: the leaues are like vnto the former red, but smaller: the berries stand singly at the leaues as Gooseberries doe, and are of a fine red colour when they are ripe, but change with standing to be of a darker red colour, of the bignesse of the small ordinary Gooseberry, of a pretty tart taste, and somewhat sweete withall.

The third red Gooseberry which is the greatest, and knowne but vnto few, is so like vnto the common great Gooseberry, that it is hardly distinguished: the fruit or berries grow as plentifully on the branches as the ordinary, and are as great & round as the great ordinary kinde, but reddish, and some of them paler, with red stripes.

The blew Gooseberry riseth vp to bee a bush like vnto the red Curran, and of the same bignesse and height, with broader and redder leaues at the first shooting out, then the second red Gooseberry: the berries are more sparingly set on the branches, then on the small red, and much about the same bignesse; or rather lesser, of the colour of a Damson, with an ouershadowing of a blewish colour vpon them, as the Damson hath, before it be handled or wiped away.

The greene prickly Gooseberry is very like vnto the ordinary Gooseberry in stemme and branches, but that they are not stored with so many sharpe prickles; but the young shootes are more plentiful in small prickles about, and the greene leafe is a little smaller: the flowers are alike, and so are the berries, being of a middle size, and not very great, greene when they are thoroughripe as well as before, but mellow, and hauing a few small short prickles, like small short haire vpon them, which are harmlesse, and without danger to anie the most dainty and tender palate that is, and of a verie good pleasant taste. The seede hereof hath produced bushes bearing berries, hauing few or no prickles vpon them.

The Vse of Gooseberries.

The berries of the ordinary Gooseberries, while they are small, greene, and hard, are much vsed to bee boyled or scalded to make sawce, both for fish and flesh of diuers sorts, for the sicke sometimes as well as the sound, as also before they be neere ripe, to bake into tarts, or otherwise, after manie fashions, as the cunning of the Cooke, or the pleasure of his commanders will appoint. They are a fit disli for women with childe to stay their longings, and to procure an appetite vnto meate.

The other sorts are not vsed in Cookery that I know, but serue to bee eaten at pleasure; but in regard they are not so tart before maturity as the former, they are not put to those vses they be.

CHAP. IIII.

Oxyacantha, sed potius Berberis. Barberries.

THe Barberry bush groweth oftentimes with very high stemmes, almost two mens height, but vsually somewhat lower, with manie shootes from the roote, couered with a whitish rinde or barke, and yellow vnderneath, the wood being white and pithy in the middle: the leaues are small, long, and very greene, nicked or finely dented about the edges, with three small white sharpe thornes, for the most part set together at the setting on of the leaues: the flowers doe growe vpon long clustering stalkes, small, round, and yellow, sweete in smell while they are fresh, which turne into small, long, and round berries, white at the first, and very red when they are ripe, of a sharpe sowre taste, fit to set their teeth on edge that eat them: the roote is yellow, spreading far vnder the vpper part of the ground, but not very deepe.

There is (as it is thought) another kinde, whose berries are thrice as bigge as the former, which I confesse I haue not seene, and know not whether it be true or no: for it may peraduenture be but the same, the goodnesse of the ground and ayre where they growe, and the youngnesse of the bushes causing that largenesse, as I haue obserued in the same kinde, to yeeld greater berries.

There is said to be also another kinde, whose berries should be without stones or feede within them, not differing else in anie thing from the former: but because I haue long heard of it, and cannot vnderstand by all the inquirie I haue made, that any hath seene such a fruit, I rest doubtfull of it.

The Vse of Barberries.

Some doe vse the leaues of Barberries in the stead of Sorrell, to make sawce for meate, and by reason of their sowrenesse are of the same quality.

The berries are vsed to be pickled, to serue to trimme or set out dishes of fish and flesh in broth, or otherwise, as also sometime to bee boyled in the broth, to giue it a sharpe rellish, and many other wayes, as a Master Cooke can better tell then my selfe.

The

The berries are preserved and conserved to give to sicke bodies, to helpe to coole any heate in the stomacke or mouth, and quicken the appetite.

The depurate iuyce is a fine menstrue to dissolue many things, and to varie good purpose, if it be cunningly handled by an Artist.

The yellow inner barke of the branches, or of the rootes, are vsed to be boyled in Ale, or other drinckes, to be giuen to those that haue the yellow jaundise: As also for them that haue anie fluxes of choller, to helpe to stay and binde.

Clusius setteth downe a secret that hee had of a friend, of a cleane differing propertie, which was, that if the yellow barke were laid in steepe in white wine for the space of three houres, and afterwards drunke, it would purge one very wonderfully.

CHAP. V.

Nux Auellana. The Filberd.

THe Filberd tree that is planted in Orchards, is very like vnto the Hasell nut tree that groweth wilde in the woods, growing vpright, parted into many boughes and tough plyable twiggges, without knots, couered with a brownish, speckled, smooth, thinne rinde, and Greene vnderneath: the leaues are broad, large, wrinkled, and full of veines, cut in on the edges into deepe dents, but not into any gashes, of a darke Greene colour on the vpper side, and of a grayish ash colour vnderneath: it hath small and long catkins in stead of flowers, that come forth in the Winter, when as they are firme and close, and in the Spring open themselues somewhat more, growing longer, and of a brownish yellow colour: the nuts come not vpon those stalkes that bore those catkins, but by themselues, and are wholly inclosed in long, thicke, rough huskes, bearded as it were at the vpper ends, or cut into diuers long iaggges, much more then the wood nut: the nut hath a thinne and somewhat hard shell, but not so thicke and hard as the wood nut, in some longer then in other, and in the long kinde, one hath the skinne white that couereth the kernels, and another red.

There is another sort of the round kinde that came from Constantinople, whose huske is more cut, torne, or iagged, both aboue and belowe, then any of our country; the barke also is whiter, and more rugged then ours, and the leaues somewhat larger.

We haue had from Virginia Hasell nuts, that haue beene smaller, rounder, browner, thinner sheld, and more pointed at the end then ours: I know not if any hath planted of them, or if they differ in leafe or any thing else.

The Vse of Filberds.

Filberds are eaten as the best kinde of Hasell nuts, at bankets among other dainty fruits, according to the season of the yeare, or otherwise, as euery one please: But Macer hath a Verse, expressing prettily the nature of these nuts, which is,

Ex minimis nucibus nulli datur esca salubris.

that is, There is no wholesome food or nourishment had from these small kinde of nuts.

Yet they are vsed sometime physically to be roasted, and made into a Lo-hoc or Electuary, that is vsed for the cough or cold. And it is thought of some, that Mithridates meant the kernels of these nuts, to be vsed with Figs and Rue for his Antidote, and not of Walnuts.

CHAP. VI.

Vitis. The Vine.

THere is so great diuersities of Grapes, and so consequently of Vines that bear them, that I cannot giue you names to all that here grow with vs: for Iohn Tradescante my verie good friend, so often before remembred, hath assured me, that he hath twentie sorts growing with him, that hee neuer knew how or by what name to call them. One description therefore shall serue (as I vse to doe in such varieties) for all the rest, with the names afterwards, of as many as we can giue, and the severall formes, colours and proportions of the grapes.

The manured Vine, in the places where it hath abiden long time, groweth to haue a great bodie, stemme or trunk, sometimes of the bignesse of a mans arme, fleecue and all, spreading branches if it bee suffered without end or measure, but vsually stored with many armes or branches, both old and new, but weake, and therefore must bee sustained; whereof the old are couered with a thin scaly rinde, which will often chap and peelee off of it selfe; the youngest being of a reddish colour, smooth and firme, with a hollownesse or pith in the middle: from the ioints of the young branches, and sometimes from the bodie of the elder, breake out on euerie side broad greene leaues, cut on the edges into five diuisions for the most part, and besides notched or dented about: right against the leafe, and likewise at other ioynts of the branches, come forth long twining or clasping tendrels, winding themselues about any thing standeth next vnto them: at the bottome of these leaues come forth clusters of small greenish yellow bloomes or flowers, and after them the berries growing in the same manner in clusters, but of diuers formes, colours, tastes and greatnesse. For some grapes are great, others lesse, some very small (as the Currans that the Grocers sell) some white, some red, blew, blacke, or partie-coloured, some are as it were square, others round: some the clusters are close, others open, some are sweete, others sower or harsh, or of some other mixed taste; euerie one differing from others, verie notably either in taste, colour or forme, within euerie one of which grapes, (and yet there is a grape without stones) are contained one, two, or more kernels or stones, some of them being smal, others greater: the rootes spread far and deepe. They that keepe their Vines in the best order, doe cut them low, not suffering them to grow high, or with too many branches, whereby they grow the better, take vp the lesse roome, and bring their grapes fairer and sweeter.

The kinds of Vines and Grapes.

Our ordinarie Grape both white and red, which excelleth Crabs for verjuice, and is not fit for wine with vs.

The white Muscadine Grape is a verie great Grape, sweete and firme, some of the bunches haue weighed sixe pound, and some of the grapes halfe an ounce.

The redde Muscadine is as great as the white, and chiefly differeth in colour.

The Burlet is a very great white Grape, but fitter for verjuice then wine for the most part: yet when a hot yeare happeneth fit for it, the Grape is pleasant.

The little blacke Grape that is ripe very early.

The Raisin of the Sunne Grape is a very great Grape, and very great clusters, of a reddish colour when it is ripe with vs, yet in an extraordinarie hot yeare, it hath got a little blewnesse cast ouer it by the heat: but naturally verie blew.

The Curran Grape (or the Grape of Corinth) is the least Grape of all, and beareth both few, and verie seldome with vs, but in reasonable great clusters, and of a blackish blew colour, when they are ripe with vs, and very sweet

sweete. There is another sort of them that are red or browne, and of a softer taste, nothing so sweete.

The Greeke wine Grape is a blackish Grape, and very sweete.

The Frontignack is a white Grape, of a verie sweete and delicate taste, as the wine declareth, that smelleth as it were of Muske.

The square Grape is reported to bear a Grape not fully round, but sided, or as it were square, whereby it became so called.

The Damasco Grape is a great white grape, very sweete, and is the true *Vua Zibeba*, that the Apothecaries should vse in the *Trochisci Ciphi*: and such wee haue had in former times come ouer vnto vs in great, long and round white boxes, containing halfe an hundred weight a peece.

The Russet Grape is a reasonable faire grape, exceeding sweet and whitish, with a thicke skinne, cruisted ouer with a shew of ash colour.

The white long Grape is like vnto a Pigeons egge, or as it were pointed pendent like a Pearle.

The partie-coloured Grape is a reasonable great Grape, and discoloured when it is ripe, sometimes the whole bunches, and sometimes but some of the grapes being parted whitish, and blacke halfe through, verie variably.

The Rhenish wine Grape is a white Grape, and endureth the cold of winter when it commeth early, more then the Muscadine before set downe, and is nothing so sweete.

The White wine Grape is verie like vnto the Rhine Grape, the soile only and climate adding more sweetnesse vnto the one then to the other.

The Claret wine Grape is altogether like the white Grape, but that it is not white, but of a reddish colour, which lying bruised vpon the skins before they are pressed, giue that Claret tincture to the wine.

The Teint is a Grape of a deeper or darker colour, whose iuice is of so deepe a colour, that it serueth to colour other wine.

The Burlarobe is a faire sweete white Grape of much esteeme about Paris.

The Alligant is a verie sweete Grape, giuing so deep and liuely a coloured red wine, that no other whatsoeuer is comparable to it, and therefore vsually called Spaniards blood.

The blew or blacke Grape of Orleans is another blacke Grape, giuing a darke coloured sweete wine much commended in those parts.

The Grape without stones is also a kinde by it selfe, and groweth naturally neere Ascalon, as Brochard affirmeth, the wine whereof is redde, and of a good taste.

The Virginia Vine, whereof I must needs make mention among other Vines, beareth small Grapes without any great store of iuice therein, and the stone within it bigger then in any other Grape: naturally it runneth on the ground, and beareth little.

The Vse of Vines, Grapes, and other parts that come of them.

The greene leaues of the Vine are cooling and binding, and therefore good to put among other herbes that make gargles and lotions for sore mouthes.

And also to put into the broths and drinke of those that haue hot burning feauers, or any other inflammation.

They stay (as it is held for true) womens longings, if they be either taken inwardly, or applyed outwardly.

Wine is vsually taken both for drinke and medicine, and is often put into sawces, broths, cawdles, and gellies that are giuen to the sicke. As also into diuers Physicall drinckes, to be as a *vehiculum* for the properties of the ingredients.

It is distilled likewise after diuers manners, with diuers things, for diuers & sundry waters to drinke, & for diuers purposes both inward and outward.

As

1. *Vitis nigra minor*, The small blacke Grape. 2. *Vitis californica*, The great blew Grape. 3. *Vitis rotundifolia*, The Muscadine Grape. 4. *Vitis vulpina*, The Winter Grape. 5. *Vitis rotundifolia*, The Rayns of the sunne Grape. 6. *Ficus*, The Figge tree.
Bob

Also distilled of it selfe, is called Spirit of wine, which serueth to dissolue, and to draw out the tincture of diuers things, and for many other purposes.

The iuice or veruicethat is made of greene hard grapes, before they be ripe, is vsed of the Apothecaries to be made into a Syrupe, that is very good to coole and refresh a faint stomacke.

And being made of the riper grapes is the best veruice, farre exceeding that which is made of crabs, to be kept all the yeare, to be put both into meates and medicines.

The grapes of the best sorts of Vines are pressed into wine by some in these dayes with vs, and much more as I verily beleue in times past, as by the name of Vineyard giuen to many places in this Kingdome, especially where Abbies and Monasteries stood, may bee coniectured: but the wine of late made hath bene but small, and not durable, like that which cometh from beyond Sea, whether our vnkindly yeares, or the want of skill, or a conuenient place for a Vineyard be the cause, I cannot well tell you.

Grapes of all sorts are familiarly eaten when they are ripe, of the sicke sometimes as well as the sound.

The dried grapes which we call great Rayfins, and the Currans which we call small Rayfins, are much vsed both for meates, broths, and sawces, in diuers manners, as this Countrey in generall aboue any other, wherein many thousands of Frailesfull, Pipes, Hogs-heads, and Buts full are spent yearly, that it breedeth a wonder in them of those parts where they growe and prouide them, how we could spend so many.

The Rayfins of the Sunne are the best dried grapes, next vnto the Damasco, and are very wholsome to eate fasting, both to nourish, and to helpe to loosen the belly.

The dried Lees of wine called Argoll or Tartar, is put to the vse of the Goldsmith, Dyer, and Apothecary, who doe all vse it in seuerall manners, very one in his art.

Of it the Apothecaries make *Cremor Tartari*, a fine medicine to bee vsed, as the Physitian can best appoint, and doth helpe to purge humours by the stoole.

Thereof likewise they make a kinde of water or oyle, fit to bee vsed, to take away freckles, spots, or any such deformities of the face or skinne, and to make it smooth. It causeth likewise haire to growe more abundantly in those places where it naturally should growe.

The liquor of the Vine that runneth forth when it is cut, is commended to be good against the stone wheresoeuer it be; but that liquor that is taken from the end of the branches when they are burnt, is most effectuall to take away spots and markes, ring-wormes and tetter in any place.

CHAP. VII.

Ficus. The Figge tree.

THe Figge trees that are noursed vp in our country are of three sorts, whereof two are high, the one bearing against a wall goodly sweete and delicate Figs, called Figs of Algarua, and is blewish when it is ripe: the other tall kinde is nothing so good, neither doth beare ripe Figges so kindly and well, and peradventure may be the white ordinary kinde that cometh from Spaine. The third is a dwarfe kinde of Figge tree, not growing much higher then to a mans body or shoulders, bearing excellent good Figges and blew, but not so large as the first kinde.

The Figge trees of all these three kinds are in leaues and growing one like vnto another, sauing for their height, colour, and sweetnesse of the fruit, hauing many armes or branches, hollow or pithy in the middle, bearing very large leaues, and somewhat thicke, diuided sometimes into three, but vsually into five sections, of a darke greene colour on the vpper side, and whitish vnderneath, yeelding a milkie iuyce when it is broken,

broken, as the branches also, or the figges when they are greene: the fruit breaketh out from the branches without anie blossome, contrary to all other trees of our Orchard, being round and long, fashioned very like vnto a small Peare, full of small white grains or kernels within it, of a very sweete taste when it is ripe, and very mellow or soft, that it can hardly be carried farre without bruising.

The other two sorts you may easily know and vnderstand, by so much as hath been said of them. Take only this more of the Figge tree, That if you plant it not against a bricke wall, or the wall of an house, &c. it will not ripen so kindly. The dwarte Figge tree is more tender, and is therefore planted in great square tubs, to be remoued into the sunne in the Summer time, and into the house in Winter.

The Vse of Figges.

Figges are serued to the table with Rayfins of the Sunne, and blanched Almonds, for a Lenten dish.

The Figs that growe with vs when they are ripe, and fresh gathered, are eaten of diuers with a little salt and pepper, as a dainty banquet to entertaine a freind, which seldome passeth without a cup of wine to wash them downe.

In Italy (as I haue beene enformed by diuers Gentlemen that haue liued there to study physicke) they eate them in the same manner, but dare not eate many for feare of a feuer to follow; they doe account them to be such breeders of blood, and heaters of it likewise.

The Figges that are brought vs from Spaine, are vsed to make Ptisan drinks, and diuers other things, that are giuen them that haue coughes or colds.

It is one of the ingredients also, with Nuts and Rice, into Mithridates counterpoison.

The small Figges that growe with vs, and will not ripen, are preserved by the Comfitmakers, and candid also, to serue as other moist or candid banquetting stuffe.

CHAP. VIII.

Serbus. The Seruicetree.

THere are two kinde of Seruice trees that are planted in Orchards with vs, and there is also a wilde kinde like vnto the later of them, with Ashen leaues, found in the woods growing of it selfe, whose fruit is not gathered, nor vsed to be eaten of any but birds. And there is another kinde also growing wilde abroad in many places, taken by the Country people where it groweth, to be a Seruice tree, and is called in Latine, *Aria Theophrasti*, whose leaues are large, somewhat like Nut tree leaues, but greene aboue, and grayish vnderneath: some doe vse the fruit as Seruices, and for the same purposes to good effect, yet both of these wilde kinde wee leaue for another worke, and here declare vnto you onely those two sorts are nourshed vp in our Orchards.

The more common or ordinary Seruice tree with vs, is a reasonable great tree, couered with a smooth barke, spread into many great armes, whereon are set large leaues, very much cut in on the edges, almost like vnto a Vine leafe, or rather like vnto that kind of Maple, that is vsually called the Sycomore tree with vs: the flowers are white, and growe many clustering together, which after bring forth small browne berries when they are ripe, of the bignesse almost of Hasell nuts, with a small tuft, as if it were a crowne on the head, wherein are small blacke kernels.

The other kinde, which is more rare with vs, and brought into this Land by Iohn Tradescante, heretofore often remembred, hath diuers winged leaues, many set together like vnto an Ashen leafe, but smaller, and euery one endented about the edges: the flowers growe in long clusters, but nothing so many, or so close set as the wilde kinde: the fruit of this tree is in some round like an Apple, and in others a little longer

like a Peare, but of a more pleasant taste then the ordinarie kinde, when they are ripe and mellowed, as they vse to doe with both these kindes, and with Medlars.

The Vse of Seruices.

They are gathered when they growe to be neare ripe (and that is neuer before they haue felt some frosts) and being tyed together, are either hung vp in some warme roome, to ripen them thoroughly, that they may bee eaten, or (as some vse to doe) lay them in strawe, chaffe, or branne, to ripen them.

They are binding, fit to be taken of them that haue any scouring or laske, to helpe to stay the fluxe; but take heed, lest if you binde too much, more paine and danger may come thereof then of the scouring.

CHAP. IX.

Mespilus. The Medlar tree.

THere are three sorts of Medlers: The greater and the lesser English, and the Neapolitan.

The great and the small English Medlar differ not one from the other in any thing, but in the size of the fruit, except that the small kinde hath some prickles or thornes vpon it, which the great one hath not, bearing diuers boughes or armes, from whence breake forth diuers branches, whereon are set long and somewhat narrow leaues, many standing together; in the middle whereof, at the end of the branch, commeth the flower, which is great and white, made of siue leaues, broad at the ends, with a nicke in the middle of euery one; after which commeth the fruit, being round, and of a pale brownish colour, bearing a crowne of those small leaues at the toppe, which were the huske of the flower before, the middle thereof being somewhat hollow, and is harsh, able to choake any that shall eat it before it be made mellow, wherein there are certaine flat and hard kernels.

The Medlar of Naples groweth likewise to bee a reasonable great tree, spreading forth armes and branches, whereon are set many gashed leaues, somewhat like vnto Hawthorne leaues, but greater, and likewise diuers thornes in many places: the flowers are of an herbie Greene colour, and small, which turne into smaller fruit then the former, and rounder also, but with a small head or crowne at the toppe like vnto it, and is of a more sweete and pleasant taste then the other, with three seeds only therein ordinarily.

The Vse of Medlars.

Medlars are vsed in the same manner that Seruices are, that is, to be eaten when they are mellowed, and are for the same purposes to binde the body when there is a cause: yet they as well as the Seruices, are often eaten by them that haue no neede of binding, and but onely for the pleasant sweetnesse of them when they are made mellow, and sometimes come as a dish of ripe fruit at their fit season, to be serued with other sorts of the table.

CHAP. X.

Lotus. The Lote or Nettle tree.

THe first kinde of Lote tree, whereof Dioscorides maketh mention, is but of one kinde; but there are some other trees spoken of by Theophrastus, that may be referred thereunto, which may bee accounted as bastard kindes thereof, of which I meane to entreate in this Chapter, hauing giuen you before the description of

1. *Sorbus legitima*. The true Service tree. 2. *Sorbus vulgaris* *fructu Terminata*. The ordinary Service tree. 3. *Malus vulgaris*. The common Medlar tree. 4. *Malus sylvestris*. The Medlar of Naples. 5. *Lonicera xylosteum*. The Nettle tree. 6. *Lonicera Virginiana*. The Patharia or Virginia Plum. 7. *Cornus mas*. The Cornell Cherry tree.

of another kinde hereof (by the opinion of good Authors) vnder the name of *Lauro-cerasus*.

The first or true Lote tree groweth to be a tree of a great height, whose bodie and elder branches are couered with a smooth darke greene barke, the leaues are somewhat rough in handling, of a darke greene colour, long pointed, and somewhat deepe dented about the edges, somewhat like vnto a Nettle leafe, and oftentimes growe yellow toward Autumne: the flowers stand here and there scattered vpon the branches, after which come round berries like vnto Cherries, hanging downewards vpon long foot-stalkes, greene at the first, and whitish afterwards, but when they are ripe they become reddish, and if they be suffered to hang too long on the branches, they grow blackish, of a pleasant austere taste, not to be misliked, wherein is a hard round stone.

The second, which is a bastard kinde, and called *Guaiacum Pataninum*, groweth to bee a faire tree, with a smooth darke greene barke, shooting out many faire great boughes, and also slender greene branches, beset with faire broad greene leaues, almost like vnto the leaues of the Cornell tree, but larger: the flowers growe along the branches close vnto them, without any or with a very short foote-stalke consisting of foure greene leaues, which are as the huske, containing within it a purplish flower, made of foure leaues somewhat reddish: the fruit standeth in the middle of the green huske, greene at the first, and very harsh, but red and round when it is ripe, and somewhat like a Plumme, with a small point or pricke at the head thereof, and of a reasonable pleasant taste or rellish, wherein are contained flat and thicke browne seeds or kernels, like vnto the kernels of *Cassia Fistula*, somewhat hard, and not so stonie, but that it may somewhat easily be cut with a knife.

The third is called in Virginia *Pijbamin*, The Virginia Plumme (if it be not all one with the former Guaiacana, whereof I am more then halfe perswaded) hath growne with vs of the kernels that were sent out of Virginia, into great trees, whose wood is very hard and brittle, and somewhat white withall: the branches are many, and grow slender to the end, couered with a very thinne greenish bark, whereon doe grow many faire broad greene leaues, without dent or notch on the edges, and so like vnto the former *Guaiacum*, that I verily thinke it (as I before said) to bee the same. It hath not yet borne flower or fruit in our Countrey that I can vnderstand: but the fruit, as it was sent to vs, is in forme and bignesse like vnto a Date, couered with a blackish skinne, set in a huske of foure hard leaues, very firme like vnto a Date, and almost as sweete, with great flat and thicke kernels within them, very like vnto the former, but larger.

The Vse of these Lote trees.

The first sort is eaten as an helper to coole and binde the body: the last, as Captaine Smith relateth in the discouery of Virginia, if the fruit be eaten while it is greene, and not ripe, is able by the harsh and binding taste and quality to draw ones mouth awry (euen as it is said of the former Guaiacana) but when it is thorough ripe it is pleasant, as I said before.

CHAP. XI.

Cornus mas. The Cornell tree.

THe Cornell tree that is planted in Orchards, being the male (for the female is an hedge bush) is of two sorts, the one bearing red, the other whiter berries, which is very rare yet in our country, and not differing else.

It groweth to a reasonable bignesse and height, yet neuer to any great tree, the wood whereof is very hard, like vnto horne, and thereof it obtained the name: the body and branches are couered with a rugged barke, and spreadeth reasonable well, hauing somewhat smooth leaues, full of veines, plaine, and not dented on the edges: the flowers are many small yellow tufts, as it were of short haire or threads set together, which come forth before any leafe, and fall away likewise before any leafe bee much open: the fruit are long and round berries, of the bignesse of small Oliues, with an hard

hard round stone within them, like vnto an Oliue stone, and are of a yellowish red when they are ripe, of a reasonable pleasant taste, yet somewhat austere withall.

The white (as I said) is like vnto the red, but onely that his fruit is more white when it is ripe.

The Vse of the Cornelles.

They helpe to binde the body, and to stay laskes, and by reason of the pleasantnesse in them when they are ripe, they are much desired.

They are also preserved and eaten, both for rarity and delight, and for the purpose aforelaid.

CHAP. XII.

Cerasus. The Cherry tree.

THere are so many varieties and differences of Cherries, that I know not well how to expresse them vnto you, without a large relation of their severall formes. I will therefore endeavour after one generall description (as my custome is in many other the like variable fruits) to giue as bricfe and short notes vpon all the rest, as I can both for leafe and fruit, that so you may the better know what the fruit is, when you haue the name.

The English Cherrie tree groweth in time to be of a reasonable bignesse and height, spreading great armes, and also small twiggy branches plentifully; the leaues whereof are not verie large or long, but nicked or dented about the edges: the flowers come forth two or three or foure at the most together, at a knot or ioynt, euerie one by it selfe, vpon his owne small and long foote stalk, consisting of five white leaues, with some threds in the middle; after which come round berries, greene at the first, and red when they are through ripe, of a meane bignesse, and of a pleasant sweet taste, somewhat tart withall, with a hard white stone within it, whose kernell is somewhat bitter, but not vnpleasant.

The Flanders Cherrie differeth not from the English, but that it is somewhat larger, and the Cherry somewhat greater and sweeter, and not so sower.

The early Flanders Cherry is more rathe or early ripe, almost as soone as the May Cherry, especially planted against a wall, and of many false knaues or Gardiners are sold for May Cherrie trees.

The May Cherrie in a standard beareth ripe fruit later then planted against a wall, where the berries will be red in the verie beginning of May sometimes.

The Arch-Dukes Cherrie is one of the fairest and best cherries wee haue, being of a very red colour when it is ripe, and a little long more then round, and somewhat pointed at the end, of the best relish of any Cherrie whatsoeuer, and of a firme substance, scarce one of twentie of our Nurserie men doe sell the right, but giue one for another: for it is an inherent qualitie almost hereditarie with most of them, to sell any man an ordinary fruit for whatsoeuer rare fruit he shall aske for: so little they are to be trusted.

The ounce Cherrie hath the greatest and broadest leafe of any other cherrie, but beareth the smallest store of cherries euerie yeare that any doth, and yet blossometh well: the fruit also is nothing answerable to the name being not verie great, of a pale yellowish red, neere the colour of Amber, and therefore some haue called it, the Amber Cherrie.

The great leaved Cherrie is thought of diuers to bee the Ounce Cherrie, because it hath almost as great a leafe as the former: but the fruit of this also doth not answer the expectation of so great a leafe, being but of a meane bignesse, and a small bearer, yet of a pale reddish colour.

The true Gascoign Cherry is known but to a few, for our Nurserie men do so change the names of most fruits they sell, that they deliuer but very few true names to any: In former times before our wilde blacke Cherrie was found to grow plentifully in our owne woods in many places of this Land, the French continually stored vs with wilde stockes to graft vpon, which then were called Gascoigne stocks, but since they haue so

termed

termed another red Cherrie, and obtruded it vpon their customers: but the true is one of our late ripe white Cherries, euen as Gerard saith, it is a great cherrie and spotted: and this is that Cherrie I so commend to be a fit stocke to graft May cherries vpon.

The Morello Cherrie is of a reasonable bignesse, of a darke red colour when they are full ripe, and hang long on, of a sweetish sower taste, the pulpe or substance is red, and somewhat firme: if they be dryed they will haue a fine sharpe or sower taste very delectable.

The Hartlippe Cherrie is so called of the place where the best of this kinde is nourished vp, being betweene Sittingbourne and Chattam in Kent, and is the biggest of our English kindes.

The smaller Lacure or Hart Cherrie is a reasonable faire Cherrie, full aboue, and a little pointing downward, after the fashion of an heart, as it is vsually painted, blackish when it is full ripe, and lesler then the next.

The great Lacure or Hart Cherrie differeth not in forme, but in greatnesse, being vsually twice as great as the former, and of a reddish blacke colour also: both of them are of a firme substance, and reasonable sweete. Some doe call the white cherrie, the White hart cherrie.

The Luke Wardes Cherrie hath a reasonable large leafe, and a larger flower then many other: the cherries grow with long stalkes, and a stone of a meane size within them, of a darke reddish colour when they are full ripe, of a reasonable good rellish, and beareth well.

The Corone Cherrie hath a leafe little differing from the Luke Wardes cherrie, the fruit when it is ripe, is of a faire deepe red colour, of a good bignesse, and of a verie good taste, neither verie sweete or sower: the pulpe or iuice will staine the hands.

The Vrinall Cherrie in a most fruitfull yeare is a small bearer, hauing many yeares pone, and the best but a few; yet doth blossome plentifully euery yeare for the most part: the cherrie is long and round, like vnto an Vrinall, from whence it tooke his name; reddish when it is full ripe, and of an indifferent sweete rellish.

The Agriot Cherrie is but a small Cherrie, of a deepe redde colour when it is ripe, which is late; of a fine sharpe taste, most pleasant and wholsome to the stomacke of all other cherries, as well while they are fresh as being dryed, which manner they much vse in France, and keepe them for the vse both of the sicke and sound at all times.

The Biguarre Cherrie is a fair cherrie, much spotted with white spots vpon the pale red berry, and sometimes discoloured halfe white and halfe reddish, of a reasonable good rellish.

The Morocco Cherrie hath a large white blossome, and an indifferent big berrie, long and round, with a long stalke of a darke reddish purple colour, a little tending to a blew when it is full ripe, of a firme substance: the iuice is of a blackish red, discolouring the hands or lips, and of a pleasant taste: Some doe thinke that this and the Morello be both one.

The Naples Cherrie is also thought to bee all one with the Morello or Morocco.

The white Spanish Cherrie is an indifferent good bearer, the leafe and blossome somewhat large, and like the Luke Wardes cherrie: the cherries are reasonable faire berries, with long stalkes and great stones, white on the outside, with some rednesse, on the one side of a firme substance, and reasonable sweet, but with a little aciditie, and is one of the late ripe ones: But there is another late ripe white Cherry, which some call the Gascoigne, before remembred.

The Flanders cluster Cherrie is of two sorts, one greater then another: the greater kinde hath an indifferent large leafe; the blossomes haue many threds within them, shewing as it were many parts, which after turne into clusters of berries, foure, fise or sixe together, and but with one stalke vnder them, as if they grew one out of another, and sometimes they will beare but two or three, and most of them but one cherry on a stalke, which are red when they are ripe, very tender, and waterish sweete in eating.

The lesser is in all things like the greater, but smaller, which maketh the difference.

The wilde cluster or birds cluster Cherry beareth many blossomes set all along the stalkes, and cherries after them in the same maner, like a long thinne bunch of grapes, and therefore called of some the Grape cherry: there are of them both red and blacke.

1 *Cerasus praecox*. The May Cherry. 2 *Cerasus Bataviae*. The Flanders Cherry. 3 *Cerasus Hispanica fructu alba*. The white Cherry. 4 *Cerasus platyphyllos*. The great leaved Cherry. 5 *Cerasus Luca Wardi*. Luke Ward's Cherry. 6 *Cerasus Neapolitana*. The Naples Cherry. 7 *Cerasus Cordata*. The Heart Cherry. 8 *Cerasus maculata*. The bigarrée or spotted Cherry. 9 *Cerasus asiatica racemosa*. The wild cluster Cherry. 10 *Cerasus corymbifera*. The Flanders cluster Cherry. 11 *Cerasus Archiducis*. The Archdukes Cherry. 12 *Chamaecerasus*. The dwarf cherry.

The soft shield Cherrie is a small red cherrie when it is ripe, hauing the stone within it so soft and tender, that it may easily be broken in the eating of the cherrie.

Iohn Tradescantes Cherrie is most vsually sold by our Nursery Gardiners, for the Archdukes cherrie, because they haue more plenty thereof, and will better be increased, and because it is so faire and good a cherrie that it may be obruded without much discontent: it is a reasonable good bearer, a faire great berrie, deepe coloured, and a little pointed.

The Baccalaos or New-found-land Cherrie hath a shining long leafe, most like vnto a Peach leafe, the blossomes come very many together as it were in an vmbell, which is such a cluster as is neither like the Flanders cluster, nor the wilde cluster cherrie blossom: it bringeth forth berries standing in the same manner euerie one vpon his own footestalke, being no bigger then the largest berrie of the red Curran tree or bush, of a pale or waterish red colour when it is ripe.

The strange long cluster Cherrie, or *Padus Theophrasti Dalechampia* is reckoned by the Author of that great Herball that goeth vnder his name, among the sorts of cherries; and so must I vntill a fitter place be found for it. It groweth in time to be a great tree, with a sad coloured barke both on the bodie and branches, whereon doe grow many leaues, somewhat broade, shorter, harder, and a little more crumpled then any cherrie leafe: the blossomes are very small, and of a pale or whitish colour, smelling very sweete and strong, or rather heady, like Orenge flowers, growing on small long branches, very like the toppe of flowers vpon the Laburnum or Beane trefoile trees: after which come small blacke berries, growing together all along the long stalke, like vnto the wilde cluster or birds cherrie mentioned before, but not much bigger then tares, with small stones within them, and little or no sustance vpon them: the French call the tree *Putier*, because the wood thereof stinketh, and make it to be wonderfull that the blossomes of the tree should be so sweete, and the wood so stinking.

The Cullen Cherrie is a darke red cherrie like the Agriot, which they of those parts neere Cullen and Vtrecht &c. vse to put into their drinke, to giue it the deeper colour.

The great Hungarian Cherrie of *Zweris* is like both in leafe and fruite vnto the Morello cherrie, but much greater and fairer, and a far better bearer: for from a small branch hath beene gathered a pound of cherries, and this is vsuall continually, and not accidentally, most of them foure inches in compasse about, and very many of them more of a faire deepe red colour, and very sweete, excelling the Arch-Dukes cherry, or any other whatsoeuer.

The Cameleon or strange changeable Cherry deseruedly hath this name, although of mine owne imposition, not only because it beareth vsually both blossomes, greene and ripe fruit at one time thereupon, but that the fruit will be of many formes; some round, some as it were square, and some bunched forth on one side or another, abiding constant in no fashion, but for the most part shewing forth all these diuersities euerie yeare growing vpon it: the fruit is of a very red colour, and good taste.

The great Rose Cherry, or double blossomd Cherry differeth not in any thing from the English Cherrie, but only in the blossomes, which are very thicke of white leaues, as great and double as the double white Crowfoote, before remembred, and sometimes out of the middle of them will spring another smaller flower, but double also; this seldom beareth fruit, but when it doth I suppose it cometh from those blossomes are the least double, and is red, no bigger then our ordinary English cherrie.

The lesser Rose or double blossomd Cherrie beareth double flowers also, but not so thicke and double as the former; but beareth fruit more plentifully, of the same colour and bignesse with the former.

The Dwarf Cherrie is of two sorts; one whose branches fall downe low, round about the body of it, with small greene leaues, and fruit as small, of a deep red colour.

The other, whose branches, although small, grow more vpright, hauing greener shining leaues: the fruit is little bigger then the former, red also when it is ripe, with a little point at the end: both of them of a sweetish rellish, but more sower.

The great bearing Cherry of Master Millen is a reasonable great red cherry, bearing very plentifully, although it bee planted against a North wall, yet it will bee late ripe, but of an indifferent sweet and good rellish.

The long finger Cherry is another small long red one, being long & round like a finger, wherof it took the name: this is not the Vrinall cherry before, but differing from it.

The Use of Cherries.

All these sorts of Cherries serue wholly to please the palate, and are eaten at all times, both before and after meales.

All Cherries are cold, yet the sower more then the sweete; and although the sweete doe most please, yet the sower are more wholsome, if there bee regard taken in the vsing.

The Agriot or sower Cherries are in France much vsed to bee dried (as is said before) as Prunes are; and so serue to minister to be the sick in all hot diseases, as feuers &c. being both boyled in their drinckes, and taken now and then of themselves, which by reason of their tartnesse, doe please the stomacke passing well.

The Gum of the Cherrie tree is commended to bee good for those are troubled with the grauell or stone. It is also good for the cough being dissolved in liquour, and stirreth vp an appetite. The distilled water of the blacke Cherries, the stones being broken among them, is vsed for the same purpose, for the grauell, stone, and winde.

CHAP. XIII.

Prunus. The Plumme tree.

THere are many more varieties of Plummes then of Cherries, so that I must follow the same order with these that I did with them, euen giue you their names apart, with brieue notes vpon them, and one description to serue for all the rest. And in this recital I shall leaue out the Apricoakes which are certainly a kind of Plum, of an especiall difference, and not of a Peach, as Galen and some others haue thought, and set them in a chapter by themselves, and only in this set down those fruits are vsually called Plums.

The Plum tree (especially diuers of them) riseth in time to bee a reasonable tall and great tree, whose bodie and greater armes are couered with a more rugged barke, yet in some more or lesse, the younger branches being smooth in all, the leaues are somewhat rounder then those of the Cherrie tree, and much differing among themselves, some being longer, or larger, or rounder then others, and many that are exercised herein, can tell by the leafe what Plum the tree beareth (I speake this of many, not of all) as in many Cherries they can doe the like: the flowers are white, consisting of five leaues: the fruit is as variable in forme, as in taste or colour, some being ovall, or Pearre fashion or Almond like, or sphericall or round, some firme, some soft and waterish, some sweete, some sower or harsh, or differing from all these tastes: and some white, others blacke, some red, others yellow, some purple, others blew, as they shall bee briefly set downe vnto you in the following lines, where I meane not to insert any the wilde or hedge fruit, but those only are fit for an Orchard, to be stored with good fruit: and of all which sorts, the choysest for goodnesse, and rarest for knowledge, are to be had of my very good friend Master Iohn Tradescante, who hath wondrously laboured to obtaine all the rarest fruits hee can heare off in any place of Christendome, Turky, yea or the whole world; as also with Master Iohn Millen, dwelling in Olde streete, who from Iohn Tradescante and all others that haue had good fruit, hath stored himselfe with the best only, and he can sufficiently furnish any.

The Amber Primordian Plumme is an indifferent faire Plumme, early ripe, of a pale yellowish colour, and of a waterish taste, not pleasing.

The red Primordian Plumme is of a reasonable size, long and round, reddish on the outside, of a more dry taste, and ripe with the first sorts in the beginning of August.

The blew Primordian is a small plumme, almost like the Damascene, and is subiect to drop off from the tree before it be ripe.

The white Date Plum is no very good plum.

The

The red Date plumme is a great long red pointed plumme, and late ripe, little better then the white.

The blacke Mussell plumme is a good plumme, reasonable drye, and tasteth well.

The red Mussell Plumme is somewhat flat as well as round, of a very good taste, and is ripe about the middle of August.

The white Mussell plumme is like the redde, but somewhat smaller, and of a whitish Greene colour, but not so well tasted.

The Imperiall plum is a great long reddish plum, very waterish, and ripeneth somewhat late.

The Gaunt plum is a great round reddish plum, ripe somewhat late, and eateth waterish.

The red Pescod plum is a reasonable good plum.

The white Pescod plum is a reasonable good rellished plumme, but somewhat waterish.

The Greene Pescod plum is a reasonable big and long pointed plum, and ripe in the beginning of September.

The Orange plum is a yellowish plum, moist, and somewhat sweetish.

The Morocco plumme is blacke like a Damson, well tasted, and somewhat drye in eating.

The Dine plum is a late ripe plum, great and whitish, speckled all ouer.

The Turkie plum is a large long blackish plum, and somewhat flat like the Mussell plum, a well rellished dry plum.

The Nutmeg plumme is no bigger then a Damson, and is of a greenish yellow colour when it is ripe, which is with vs about Bartholmew tide, and is a good plum.

The Perdigon plumme is a dainty good plumme, early blackish, and well rellished.

The Verdoch plum is a great fine Greene shining plum fit to preferue.

The Ienua plum is the white Date plum, before remembred.

The Barberry plum is a great early blacke plum, and well tasted.

The Pruneola plum is a small white plum, of a fine taste: it was wont to be usually brought ouer in small round boxes, and sold most commonly at the Confit-makers, (cut in twaine, the stone cast away) at a very deere rate: the tree groweth and beareth well with vs.

The Shepway Bulleis is of a darke blewish brown colour, of a larger size then the ordinary, and of a sharpe taste, but not so good as the common.

The white and the blacke Bulleis are common in most Countries, being small round plums, lesser then Damsons, sharper in taste, and later ripe.

The Flushing Bulleis groweth with his fruite thicke clustring together like grapes.

The Winter Creke is the latest ripe plum of all sorts, it groweth plentifully about Bishops Hatfield.

The white Peare plum early ripe, is of a pale yellowish Greene colour.

The late ripe white Peare plum is a greater and longer plum, greenish white, and is not ripe vntill it be neere the end of September, both waterish plums.

The blacke Peare plum is like vnto the white Peare plumme, but that the colour is blackish when it is ripe, and is of a very good rellish, more firme and drye then the other.

The red Peare plumme is of the same fashion and goodnesse, but is the worst of the three.

The white Wheate plum is a waterish fulsome plum.

The red Wheate plum is like the other for taste.

The Bowle plum is flat and round, yet flatter on the one side then on the other, which caused the name, and is a very good rellished blacke plum.

The Friars plumme is a very good plum, well tasted, and coming cleane from the stone, being blacke when it is ripe, and some whitish spots ypon it.

The Catalonia plum is a very good plum.

The don Alteza is also a very good plum.

The Muscadine plum, some call the Quene mother plumme, and some the Cherry plum, is a faire red plum, of a reasonable bignesse, and ripe about Bartholmew tide.

The Christian plum, called also the Nutmeg plum, the tree groweth very shrubby, and

1. *Prunus Imperialis*. The Imperial Plum. 2. *Prunus Turca*. The Turkey Plum. 3. *Prunus pissinaria*. The red Primordian Plum. 4. *Prunus Myrtilina*. The Mistle Plum. 5. *Prunus Anabarsina*. The Amber Plum. 6. *Prunus Regia*. The Queen's Plum. 7. *Prunus viridis*. The green Oylerly Plum. 8. *Prunus Arbutifolia*. The Orange Plum. 9. *Prunus Myrica*. The Nutmeg Plum. 10. *Prunus Siliqua*. The Peach Plum. 11. *Prunus Gageana*. The Gage Plum. 12. *Prunus Dufrenoyi*. The Dufrenoy Plum. 13. *Prunus Myrica*. The early Pear Plum.

and will abide good for six weekes at the least after it is gathered, and after all other plums are spent.

The Cherry plum remembred before, speaking of the Muscadine plum, is a very good plum, but small.

The Amber plum is a round plum, as yellow on the outside almost as yellow waxe, of a sower vnpleasant taste that which I tasted, but I thinke it was not the right; for I haue seene and tasted another of the same bignesse, of a paler colour, farre better rellished, and a firmer substance, coming cleane from the stone like an Apricocke.

The Apricocke plum is a good plum when it is in its perfection, but that is seldome; for it doth most vsually cracke, thereby diminishing much of its goodnesse, and besides yeeldeth gumme at the crackes.

The Eason plum is a little red plum, but very good in taste.

The Violet plum is a small and long blackish blew plum, ripe about Bartholmew tide, a very good dry eating fruit.

The Grape plum is the Flushing Bulleis before remembred

The Dennie plum is called also the Cheston, or the Friars plum before remembred.

The Damaske Violet plum, or Queen mother plum spoken of before.

The blacke Damascene plum is a very good dry plum, and of a darke blew colour when it is ripe.

The white Damson is nothing so well rellished as the other.

The great Danison or Damaske plum is greater then the ordinary Damson, and sweeter in taste.

The blew Damson well knowne, a good fruit.

The Cofersers plum is flat, like vnto a Peare plum, it is early ripe and blacke, of a very good rellish.

The Margate plum the worst of an hundred.

The green Oysterly plum is a reasonable great plum, of a whitish green colour when it is ripe, of a moist and sweete taste, reasonable good.

The red Mirobalane plum groweth to be a great tree quickly, spreading very thicke and farre, very like the blacke Thorne or Sloe bush: the fruit is red, earlier ripe, and of a better taste then the white.

The white Mirobalane plum is in most things like the former red, but the fruit is of a whitish yellow colour, and very pleasant, especially if it be not ouer ripe: both these had need to be plashed against a wall, or else they will hardly beare ripe fruit.

The Oliue plum is very like a greene Oliue, both for colour and bignesse, and groweth lowe on a small bushing tree, and ripeneth late, but is the best of all the sorts of greene plums.

The white diapred plum of Malta, scarce knowne to any in our Land but Iohn Tradescante, is a very good plum, and striped all ouer like diaper, and thereby so called.

The blacke diapred plum is like the Damascene plum, being blacke with spots, as small as pins points vpon it, of a very good rellish.

The Peake plum is a long whitish plum, and very good.

The Pishamin or Virginia plum is called a plum, but vnterly differeth from all sorts of plums, the description whereof may truely enforme you, as it is set downe in the tenth Chapter going before, whereunto I referre you.

The Vse of Plums.

The great Damaske or Damson Plummes are dried in France in great quantities, and brought ouer vnto vs in Hogs-heads, and other great vessels, and are those Prunes that are vsually sold at the Grocers, vnder the name of Damaske Prunes: the blacke Bulleis also are those (being dried in the same manner) that they call French Prunes, and by their tartnesse are thought to binde, as the other, being sweet, to loosen the body.

The Bruneola Plumme, by reason of his pleasant tartnesse, is much accounted of, and being dried, the stones taken from them, are brought ouer to vs in small boxes, and sold deere at the Confectioners, where they very often accompany all other sorts of banquetting stuffes.

Some of these Plums, because of their firmnesse, are vndoubtedly more wholesomer then others that are sweete and waterish; and cause lesse offence in their stomackes that eat them; and therefore are preferred with Sugar, to be kept all the yeare. None of them all is vsed in medicines so much as the great Damson or Damaske Prune, although all of them for the most part doe coole, lenifie, and draw forth choller; and thereby are fittest to be vsed of such as haue chollericke Agues.

CHAP. XIII.

Mala Armeniaca siue Præcoxia. Apricockes.

THe Apricocke (as I said) is without question a kinde of Plumme, rather then a Peach, both the flower being white, and the stone of the fruit smooth also, like a Plumme, and yet because of the excellencie of the fruit, and the difference therein from all other Plummies, I haue thought it meete to entreate thereof by it selfe, and shew you the varieties haue been obserued in thesetimes.

The Apricocke tree riseth vp to a very great height, either standing by it selfe (where it beareth not so kindly, and very little in our country) or planted against a wall, as it is most vsuall, hauing a great stemme or body, and likewise many great armes or branches, couered with a smooth barke: the leaues are large, broad, and almost round, but pointed at the ends, and finely dented about the edges: the flowers are white, as the Plumme tree blossomes, but somewhat larger, and rounder set: the fruit is round, with a cleft on the one side, somewhat like vnto a Peach, being of a yellowish colour as well on the inside as outside, of a firme or fast substance, and dry, not overmoist in the eating, and very pleasant in taste, containing within it a broad and flat stone, somewhat round and smooth, not rugged as the Peach stone, with a pleasant sweete kernell (yet some haue reported, that there is such as haue their kernels bitter, which I did neuer see or know) and is ripe almost with our first or earliest Plummies, and thereof it tooke the name of *Præcox*, and it may bee was the earliest of all others was then knowne, when that name was giuen.

The great Apricocke, which some call the long Apricocke, is the greatest and fairest of all the rest.

The smaller Apricocke, which some call the small round Apricocke, is thought to be small, because it first sprang from a stone: but that is not so, for the kinde it selfe being inoculated, will bee alwaies small, and neuer halfe so faire and great as the former.

The white Apricocke hath his leaues more folded together, as if it were halfe double: it beareth but seldome, and very few, which differ not from the ordinary, but in being more white, without any red when it is ripe.

The Masculine Apricocke hath a finer Greene leafe, and thinner then the former, and beareth very seldome any store of fruit, which differeth in nothing from the first, but that it is a little more delicate.

The long Masculine Apricocke hath his fruit growing a little longer then the former, and differeth in nothing else.

The Argier Apricocke is a smaller fruit then any of the other, and yellow, but as sweete and delicate as any of them, hauing a blackish stone within it, little bigger then a Lacure Cherry stone: this with many other sorts Iohn Tradescante brought with him returning from the Argier voyage, whither hee went voluntary with the Fleete, that went against the Pyrates in the yeare 1620.

The Vse of Apricockes.

Apricockes are eaten oftentimes in the same manner that other dainty Plummies are, betweene meales of themselues, or among other fruit at banquets.

They are also preserved and candid, as it pleaseth Gentlewomen to bestowe their time and charge, or the Confitmaker to sort among other candid fruits.

Some likewise dry them, like vnto Peares, Apples, Damsons, and other Plummes.

Matthiolus doth wonderfully commend the oyle drawne from the kernels of the stones, to annoint the inflamed *hemorrhoides* or piles, the swellings of vlcers, the roughnesse of the tongue and throate, and likewise the paines of the eares.

CHAP. XV.

Mala Persica. Peaches.

AS I ordered the Cherries and Plummes, so I intend to deale with Peaches, because their varieties are many, and more knowne in these dayes then in former times: but because the Nectarin is a differing kinde of Peach, I must deale with it as I did with the Apricocke among the Plummes, that is, place it in a Chapter by it selfe.

The Peach tree of it selfe groweth not vsually altogether so great, or high as the Apricocke, because it is lesse durable, but yet spreadeth with faire great branches, from whence spring smaller and slenderer reddish twigges, whereon are set long narrow greene leaues, dented about the edges: the blossomes are greater then of any Plumme, of a deepe blush or light purple colour: after which commeth the fruit, which is round, and sometimes as great as a reasonable Apple or Pippin (I speake of some sorts; for there be some kindes that are much smaller) with a furrow or cleft on the one side, and couered with a freese or cotton on the outside; of colour either russet, or red, or yellow, or of a blackish red colour; of differing substances and tastes also, some being firme, others waterish, some cleauing fast to the stone on the inside, others parting from it more or lesse easily, one excelling another very farre, wherein is contained a rugged stone, with many chinkes or clefts in it, the kernell whereof is bitter: the roots growe neither deepe nor farre, and therefore are subiect to the winds, standing alone, and not against a wall. It sooner waxeth old and decayeth, being sprung of a stone, then being inoculated on a Plumme stocke, whereby it is more durable.

The great white Peach is white on the outside as the meate is also, and is a good well relished fruit.

The small white Peach is all one with the greater, but differeth in size.

The Carnation Peach is of three sorts, two are round, and the third long; they are all of a whitish colour, shadowed ouer with red, and more red on the side is next the funne: the lesser round is the more common, and the later ripe.

The grand Carnation Peach is like the former round Peach, but greater, and is as late ripe, that is, in the beginning of September.

The red Peach is an exceeding well relished fruit.

The russet Peach is one of the most ordinary Peaches in the Kingdome, being of a russet colour on the outside, and but of a reasonable relish, farre meaner then many other.

The Island Peach is a faire Peach, and of a very good relish.

The Newington Peach is a very good Peach, and of an excellent good relish, being of a whitish greene colour on the outside, yet halfe reddish, and is ripe about Bartholmew tide.

The yellow Peach is of a deepe yellow colour; there be hereof diuers sorts, some good and some bad.

The St. Iames Peach is the same with the Queenes Peach, here belowe set downe, although some would make them differing.

The Melocotone Peach is a yellow faire Peach, but differing from the former yellow both in forme and taste, in that this hath a small crooked end or point for the most part, it is ripe before them, and better relished then any of them.

1. *Malus Armeriaea* sive *Prunella*. The Apricocke. 2. *Malus Persia Melastoma*. The Melocotone Peach. 3. *Persia Mesitacolia*. The Narmg Peach.
 4. *Persia nigra*. The blacke Peach. 5. *Persia Carniolana*. The long Carnation Peach. 6. *Persia Korina*. The Quince Peach. 7. *Amygdalus*. The Al-
 mond. 8. *Persia du Trier*. The Peach du Trier. 9. *Nucupersia rubra sylvatica*. The best Romane red Nectarine. 10. *Nucupersia cathartica sylvatica*. The battard
 and Nectarine with a plucking blow.

The Peach *du Troas* is a long and great whitish yellow Peach, red on the outside, early ripe, and is another kinde of Nutmeg Peach.

The *Queenes* Peach is a faire great yellowish browne Peach, shadowed as it were ouer with deepe red, and is ripe at Bartholmew tide, of a very pleasant good taste.

The *Romane* Peach is a very good Peach, and well relished.

The *Durafme* or *Spanish* Peach is of a darke yellowish red colour on the outside, and white within.

The *blacke* Peach is a great large Peach, of a very darke browne colour on the outside, it is of a waterish taste, and late ripe.

The *Alberza* Peach is late ripe, and of a reasonable good taste.

The *Almond* Peach, so called, because the kernell of the stone is sweete, like the Almond, and the fruit also somewhat pointed like the Almond in the huske, it is early ripe, and like the *Newington* Peach, but lesser.

The *Man* Peach is of two sorts, the one longer then the other, both of them are good Peaches, but the shorter is the better relished.

The *Cherry* Peach is a small Peach, but well tasted.

The *Nutmeg* Peach is of two sorts, one that will be hard when it is ripe, and eateth not so pleasantly as the other, which will bee soft and mellow; they are both small Peaches, hauing very little or no resemblance at all to a Nutmeg, except in being a little longer then round, and are early ripe.

Many other sorts of Peaches there are, whereunto wee can giue no especiall name; and therefore I passe them ouer in silence.

The Vse of Peaches.

Those Peaches that are very moist and waterish (as many of them are) and not firme, doe soone putrefie in the stomacke, causing surfeits oftentimes; and therefore euery one had neede bee carefull, what and in what manner they ate them: yet they are much and often well accepted with all the Gentry of the Kingdome.

The leaues, because of their bitternesse, serue well being boyled in Ale or Milke, to be giuen vnto children that haue wormes, to help to kill them, and doe gently open the belly, if there be a sufficient quantity vsed.

The flowers haue the like operation, that is, to purge the body somewhat more forceably then *Damaske* Roses; a Syrupe therefore made of the flowers is very good.

The kernells of the Peach stones are oftentimes vsed to be giuen to them that cannot well make water, or are troubled with the stone; for it openeth the stoppings of the vritory passages, whereby much ease ensueth.

CHAP. XVI.

Nucipersica. Nectorins.

I Presume that the name *Nucipersica* doth most rightly belong vnto that kinde of Peach, which we call *Nectorins*, and although they haue beene with vs not many yeares, yet haue they beene knowne both in Italy to *Matthiolus*, and others before him, who it seemeth knew no other then the yellow *Nectorin*, as *Dalechampius* also: But we at this day doe know fise seuerall sorts of *Nectorins*, as they shall be presently set downe; and as in the former fruits, so in this, I will giue you the description of one, and brieue notes of the rest.

The *Nectorin* is a tree of no great bignesse, most vsually lesser then the Peach tree, his body and elder boughes being whitish, the younger branches very red, whereon grow narrow long Greene leaues, so like vnto Peach leaues, that none can well distinguish them, vnlesse it be in this, that they are somewhat lesser: the blossomes are all reddish, as the Peach, but one of a differing fashion from all the other, as I shall shew you by and by: the fruit that followeth is smaller, rounder, and smooother then Peaches, without any cleft on the side, and without any downy cotton or freeze at all; and herein

herein is like vnto the outer greene rinde of the Walnut, whereofas I am perswaded it tooke the name, of a fast and firme meate, and very delicate in taste, especially the best kindes, with a rugged stone within it, and a bitter kernell.

The Muske Nectorin, so called, because it being a kinde of the best red Nectorins, both smelleth and eateth as if the fruit were steeped in Muske: some thinke that this and the next Romane Nectorin are all one.

The Romane red Nectorin, or cluster Nectorin, hath a large or great purplish blossome, like vnto a Peach, reddish at the bottome on the outside, and greenish within: the fruit is of a fine red colour on the outside, and groweth in clusters, two or three at a ioynt together, of an excellent good taste.

The bassard red Nectorin hath a smaller or pincking blossome, more like threads then leaues, neither so large nor open as the former, and yellowish within at the bottome: the fruit is red on the outside, and groweth neuer but one at a ioynt, it is a good fruit, but eateth a little more rawish then the other, euen when it is full ripe.

The yellow Nectorin is of two sorts, the one an excellent fruit, mellow, and of a very good rellish; the other hard, and no way comparable to it.

The greene Nectorin, great and small, for such I haue seene abiding constant, although both planted in one ground: they are both of one goodnesse, and accounted with most to be the best rellished Nectorin of all others.

The white Nectorin is said to bee differing from the other, in that it will bee more white on the outside when it is ripe, then either the yellow or greene: but I haue not yet seene it.

The Vse of Nectorins.

The fruit is more firme then the Peach, and more delectable in taste; and is therefore of more esteeme, and that worthily.

CHAP. XVII.

Amygdala. Almonds.

THe Almond also may be reckoned vnto the stock or kindred of the Peaches, it is so like both in leafe and blossome, and somewhat also in the fruit, for the outward forme, although it hath onely a dry skinne, and no pulpe or meate to bee eaten: but the kernell of the stone or shell, which is called the Almond, maketh recompense of that defect, whereof some are sweete, some bitter, some great, some small, some long, and some short.

The Almond tree groweth vpright, higher and greater then any Peach; and is therefore vsually planted by it selfe, and not against a wall, whose body sometime exceedeth any mans sadome, whereby it sheweth to be of longer continuance, bearing large armes, and smaller branches also, but brittle, whereon are set long and narrow leaues, like vnto the Peach tree: the blossomes are purplish, like vnto Peach blossoms, but paler: the fruit is somewhat like a Peach for the forme of the skinne or outside, which is rough, but not with any such cleft therein, or with any pulpe or meate fit to bee eaten, but is a thicke dry skinne when it is ripe, couering the stone or shell, which is smooth and not rugged, and is either long and great, or small, or thicke and short, according as the nut or kernell within it is, which is sweete both in the greater and smaller, and onely one smaller kinde which is bitter: yet this I haue obserued, that all the Almond trees that I haue seene growe in England, both of the sweete and bitter kindes, beare Almonds thicke and short, and not long, as that sort which is called the Iorden Almond.

The Vse of Almonds.

They are vsed many wayes, and for many purposes, either eaten alone with Figges, or Rayfins of the Sunne, or made into paste with Sugar and Rosewater for Marchpanes, or put among Floure, Egges, and Sugar, to make

make Mackerons, or cruſted ouer with Sugar, to make Comfits, or mixed with Roſewater and Sugar, to make Butter, or with Barley water, to make Milke, and many other waies, as euery one liſt, that hath ſkill in ſuch things.

The oyle alſo of Almonds is vſed many waies, both inwardly and outwardly, for many purpoſes, as the oyle of ſweete Almonds mixt with powdered white Sugar Candy, for coughes and hoarſeneſſe, and to be drunk alone, or with ſome other thing (as the Syrupe of Maſh Mallowes) for the ſtone, to open and lenifie the paſſages, and make them ſlipperie, that the ſtone may paſſe the eaſier. And alſo for women in Child bed after their ſore trauell. And outwardly either by it ſelfe, or with oyle of Tartar to make a creame, to lenifie the ſkin, parched with the winde or otherwiſe, or to anoint the ſtomacke either alone, or with other things to helpe a cold.

The oyle of bitter Almonds is much vſed to be dropped into their eares that are hard of hearing, to helpe to open them. And as it is thought, doth more ſcoure and cleaſe the ſkin then the ſweet oyle doth, and is therefore more vſed of many for that purpoſe, as the Almonds themſelues are.

CHAP. XVIII.

Mala Arantia. Oreniges.

I Bring here to your conſideration, as you ſee, the Orange tree alone, without mentioning the Citron or Lemmon trees, in regard of the experience we haue ſeen made of them in diuers places: For the Orange tree hath abiden with ſome extraordinary looking and tending of it, when as neither of the other would by any meanes be preſerued any long time. If therefore any be deſirous to keepe this tree, he muſt ſo provide for it, that it be preſerued from any cold, either in the winter or ſpring, and expoſed to the comfort of the ſunne in ſummer. And for that purpoſe ſome keepe them in great ſquare boxes, and liſt them to and fro by iron hooks on the ſides, or cauſe them to be rowled by trundels, or ſmall wheelles vnder them, to place them in an houſe, or cloſe gallerie for the winter time: others plant them againſt a bricke wall in the ground, and defend them by a ſhed of boardes, couered ouer with ſcare-cloth in the winter, and by the warmth of a ſtoue, or other ſuch thing, giue them ſome comfort in the colder times: but no rent or meane prouiſion will preſerue them.

The Orange tree in the warme Countries groweth very high, but with vs (or elſe it is a dwarfe kinde thereof) riſeth not very high: the barke of the elder ſtemmes being of a darke colour, and the young branches very greene, whereon grow here and there ſome few thornes: the leaues are faire, large, and very greene, in forme almoſt like a Bay leafe, but that it hath a ſmall eare, or peece of a leafe, faſhioned like vnto an heart vnder euery one of them, with many ſmall holes to be ſcene in them, if you hold them vp betweene you and the light, of a ſweet but ſtrong ſmell, naturally not falling away, but alwaies abiding on, or vntill new be come vp, bearing greene leaues continually: the flowers are whitish, of a very ſtrong and heady ſcent, after which come ſmall round fruit, greene at the firſt, while they are ſmall, and not neere maturitie, but being grown and ripe, are (as all men know) red on the out ſide, ſome more pale then others, and ſome kindes of a deeper yellowiſh red, according to the climate, and as it receiueth the heate of the ſunne, wherein is contained ſower or ſweete iuice, and thicke white kernels among it: it beareth in the warme Countries both bloſſomes and greene fruit continually vpon it, and ripe fruit alſo with them for the beſt part of the yeare, but eſpecially in Autumne and Winter.

The Vſe of Oreniges.

Oreniges are vſed as ſawce for many ſorts of meates, in reſpect of their ſweete ſowerneſſe, giuing a relliſh of delight, whereinſoeuer they are vſed. The inner pulpe or iuice doth ſerue in agues and hot diſeaſes, and in Summer to coole the heate of deiected ſtomackes, or fainting ſpirits.

The

1 *Malus Acaulis*, The Orange tree. 2 *Malus*, The Apple tree. 3 *Malus Coccinea*, The Pomegranate. 4 *Malus Cydonioides*, The golden Pippin. 5 *Malus*, The Pearmain. 6 *Malus Regium*, The Queen Apple. 7 *Malus prima maturna*, The Genneting. 8 *Malus fregala*, The poul Roy. 9 *Malus Korymbosa*, The Kew Apple. 10 *Malus Regium*, The Bardfield Quince.

The dried rinde, by reason of the sweete and strong sent, serueth to bee put among other things to make sweet pouthers.

The outer rindes, when they are clesed from all the inner pulpe and skins, are preserued in Sugar, after the bitternesse by often steepings hath been taken away, & do serue either as Succots, and banquetting stufes, or as ornaments to set out dishes for the table, or to giue a rellish vnto meats, whether baked or boyled: Physically they helpe to warme a cold stomack, and to digest or breake winde therein: or they are candid with Sugar, and serue with other dried Iunquets.

The water of Orange flowers is oftentimes vsed as a great perfume for glones, to washe them, or in stead of Rose-water to mixe with other things.

It is vsed to bee drunke by some, to preuent or to helpe any pestilentiall feuer.

The oyntment that is made of the flowers, is very comfortable both for the stomache, against the could or cough, or for the head, for paines and disinesse.

The kernels or seede beeing cast into the ground in the springtime, will quickly grow vp, (but will not abide the winter with vs, to bee kept for growing trees) and when they are of a finger length high, being pluckt vp, and put among sallats, will giue them a maruellous fine aromaticke or spicy taste, very acceptable.

The seed or kernels are a little cordiall, although nothing so much as the kernels of the Pomecitron.

CHAP. XIX.

Poma. Apples.

THe sorts of Apples are so many, and infinite almost as I may say, that I cannot giue you the names of all, though I haue endeaoured to giue a great many, and I thinke it almost impossible for any one, to attaine to the full perfection of knowledge herein, not onely in regard of the multiplicite of fashions, colours and tastes, but in that some are more familiar to one Countrey then to another, being of a better or worse taste in one place then in another, and therefore diuersly called: I will therefore as I haue done before, giue you the description of the Tree in generall, as also of the Paradise or dwarfe Apple, because of some especiall difference, and afterwards the names of as many, with their fashions, as haue come to my knowledge, either by sight or relation: for I doe confesse I haue not seene all that I here set downe, but vse the helpe of some friends, and therefore if it happen that the seuerall names doe not answer vnto seuerall sorts, but that the same fruit may bee called by one name in one Country, that is called by another elsewhere, excuse it I pray you; for in such a number, such a fault may escape vnknowne.

The Apple tree for the most part is neyther very high, great or straight, but rather vsually boweth and spreadeth (although in some places it groweth fairer and straighter then in others) hauing long and great armes or boughes, and from them smaller branches, whereon doe grow somewhat broade, and long greene leaues, nicked about the edges: the flowers are large and white, with bluish coloured sides, consisting of five leaues: the fruit (as I said) is of diuers formes, colours and tastes, and likewise of a very variable durabilitie; for some must be eaten presently after they are gathered, and they are for the most part the earliest ripe; others will abide longer vpon the trees, before they bee fit to be gathered; some also will be so hard when others are gathered, that they will not be fit to be eaten, for one, two or three months after they bee gathered; and some will abide good but one, two or three moneths, and no more; and some will be best, after a quarter or halfe a yeares lying, vnto the end of that yeare or the next.

The Paradise or dwarfe Apple tree groweth nothing so high as the former, and many times not much higher then a man may reach, hauing leaues and flowers altogether like the other, the fruit is a faire yellow Apple, and reasonable great, but very light and spongy or loose, and of a bitterish sweet taste, nothing pleasant. And these faults al-

so are incident vnto this tree, that both bodie and branches are much subiect vnto cancker, which will quickly eate it round, and kill it; besides it will haue many bunches, or tuberos swellings in many places, which grow as it were scabby or rough, and will soone cause it to perish: the roote sendeth forth many shootes and suckers, whereby it may be much increased. But this benefit may be had of it, to recompence the former faults, That being a dwarfe Tree, whatsoeuer fruit shall bee grafted on it, will keepe the graft low like vnto it selfe, and yet beare fruit reasonable well. And this is a pretty way to haue Pippins, Pomewaters, or any other sort of Apples (as I haue had my selfe, and also seene with others) growing low, that if any will, they may make a hedge rowe of these low fruits, planted in an Orchard all along by a walke side: but take this Caueat, if you will auoide the danger of the cancker and knots, which spoile the tree, to graft it hard vnto the ground, that therby you may giue as little of the nature of the stock thereunto as possibly you can, which wil vndoubtedly help it very much.

The Kindes or sorts of Apples.

The Summer pippin is a very good apple first ripe, and therefore to bee first spent, because it will not abide so long as the other.

The French pippin is also a good fruit and yellow.

The Golding pippin is the greatest and best of all sorts of pippins.

The Russet pippin is as good an apple as most of the other sorts of pippins.

The spotted pippin is the most durable pippin of all the other sorts.

The ordinary yellow pippin is like the other, and as good; for indeed I know no sort of pippins but are excellent good well relished fruites.

The great pearemaine differeth little either in taste or durabilitie from the pippin, and therefore next vnto it is accounted the best of all apples.

The summer pearemaine is of equall goodnesse with the former, or rather a little more pleasing, especially for the time of its eating, which will not bee so long lasting, but is spent and gone when the other beginneth to be good to eate.

The Russetring is also a firme and a very good apple, not so waterish as the pippin or pearemaine, and will last the best part of the year, but will be very mellow at the last, or rather halfe dried.

The Brooding is a very good apple.

The Pomewater is an excellent good and great whitish apple; full of sap or moisture, somewhat pleasant sharpe, but a little bitter withall: it will not last long, the winter frosts soone causing it to rot, and perish.

The Flower of Kent is a faire yellowish Greene apple both good and great.

The Gilloflower apple is a fine apple, and finely spotted.

The Marlgo is the same, that is called the Marigold apple, it is a middle sized apple, very yellow on the outside, shadowed ouer as it were with red, and more red on one side, a reasonable well relished fruit.

The Bländrill is a good apple.

The Daue Gentle is a very good apple.

The Gruntlin is somewhat a long apple, smaller at the crowne then at the stalke, and is a reasonable good apple.

The gray Costerd is a good great apple, somewhat whitish on the outside, and abideth the winter.

The Greene Costerd is like the other, but greener on the outside continually.

The Haruy apple is a faire great goodly apple, and very well relished.

The Dowse apple is a sweetish apple not much accounted of.

The Pome-paris is a very good apple.

The Belle boon of two sorts winter and summer, both of them good apples, and fair fruit to look on, being yellow and of a meane bignesse.

The pound Royall is a very great apple, of a very good and sharpe taste.

The Doues Bill a small apple.

The Deusan or apple Iohn is a delicate fine fruit, well relished when it beginneth to be fit to be eaten, and endureth good longer then any other apple.

The Master William is greater then a pippin, but of no very good relish.

The Master Iohn is a better tasted apple then the other by much.

The Spicing is a well tasted fruite.

Pome de Rambures

Pome de Capanda

Pome de Calual

all faire and good apples brought from France.

The Queene apple is of two sorts, both of them great faire red apples, and well relished, but the greater is the best.

The Bastard Queene apple is like the other for forme and colour, but not so good in taste: some call this the bardfield Queening.

The Boughton or greening is a very good and well tasted apple.

The Leathercoate apple is a good winter apple, of no great bignesse, but of a very good and sharpe taste.

The Pot apple is a plaine Country apple.

The Cowshout is no very good fruit.

The Gildiling apple is a yellow one, not much accounted.

The Cats head apple tooke the name of the likenesse, and is a reasonable good apple and great.

The Kentish Codlin is a faire great greenish apple, very good to cate when it is ripe, but the best to coddle of all other apples.

The Stoken apple is a reasonable good apple.

The Geneting apple is a very pleasant and good apple.

The Worcester apple is a very good apple, as bigge as a Pomewater.

Donime Couadis is a French apple, and of a good rellish.

The French Goodwin is a very good apple.

The old wife is a very good, and well relished apple.

The towne Crab is an hard apple, not so good to be eaten rawe as roasted, but excellent to make Cider.

The Virgilling apple is a reasonable good apple.

The Crowes egge is no good relished fruit, but nourfed vp in some places of the common people.

The Sugar apple is so called of the sweetnesse.

Sops in wine is so named both of the pleasantnesse of the fruit, and beautie of the apple.

The womans breast apple is a great apple.

The blacke apple or pippin is a very good eating apple, and very like a Pearemaine, both for forme and bignesse, but of a blacke sooty colour.

Twentye sorts of Sweetings and none good.

The Peare apple is a small fruit, but well relished being ripe, and is for shape very like vnto a small short Peare, and greene.

The Paradise apple is a faire goodly yellow apple, but light and spongy, and of a bitterish sweet taste, not to be commended.

The apple without blossome, so called because although it haue a small shew of a blossome, yet they are but small threds rather than leaues, neuer shewing to be like a flower, and therefore termed without blossome: the apple is neyther good eating nor baking fruit.

Wildings and Crabs are without number or vse in our Orchard, being to be had out of the woods, fields and hedges rather then any where else.

The Vse of Apples.

The best sorts of Apples serue at the last course for the table, in most mens houses of account, where, if there grow any rare or excellent fruit, it is then set forth to be seene and tasted.

Diuers other sorts serue to bake, either for the Masters Table, or the meynes sustenance, either in pyes or pans, or else stewed in dishes with Rosewater and Sugar, and Cinamon or Ginger cast vpon.

Some kinds are fittest to roast in the winter time, to warme a cup of wine, ale or beere, or to be eaten alone, for the nature of some fruit is neuer so good, or worth the eating, as when they are roasted.

Some

Some sorts are fittest to be leald for Godlins, and are taken to coole the stomacke, as well as to please the taste, hauing Rosewater and Sugar put to them.

Some sorts are best to make Cider of, as in the West Countrey of England great quantities, yea many Hogsheads and Tunnes full are made, especially to bee carried to the Sea in long voyages, and is found by experience to bee of excellent vse, to mixe with water for beuerage. It is vsually seene that those fruits that are neither fit to eate raw, roasted, nor baked, are fittest for Cider, and make the best.

The iuice of Apples likewise, as of pippins, and pearemaines, is of very good vse in Melancholicke diseases, helping to procure mirth, and to expell heauinesse.

The distilled water of the same Apples is of the like effect.

There is a fine sweet oyntment made of Apples called *Pomatum*, which is much vsed to helpe chapt lips, or hands, or for the face, or any other part of the skinne that is rough with winde, or any other accident, to supple them, and make them smooth.

CHAP. XX.

Cydonia. Quinces.

WE haue some diuersities of Quinces, although not many, yet more then our elder times were acquainted with, which shall be here expressed.

The Quince tree groweth oftentimes to the height and bignesse of a good Apple tree, but more vsually lower, with crooked and spreading armes and branches farre abroad, the leaues are somewhat round, and like the leaues of the Apple tree, but thicker, harder, fuller of veines, and white on the vnder side: the blossomes or flowers are white, now and then dasht ouer with blush, being large and open, like vnto a single Rose: the fruit followeth, which when it is ripe is yellow, and couered with a white cotton or freeze, which in the younger is thicker and more plentiful, but waxeth lesse and lesse, as the fruit ripeneth, being bunched out many times in seuerall places, and round, especially about the head, some greater, others smaller, some round like an Apple, others long like a Peare, of a strong heady sent, accounted not wholesome or long to be endured, and of no durabilitie to keepe, in the middle whereof is a core, with many blackish seedes or kernels therein, lying close together in cels, and compassed with a kinde of cleare gelly, which is easier seene in the scalded fruit, then in the raw.

The English Quince is the ordinarie Apple Quince, set downe before, and is of so harsh a taste being greene, that no man can endure to eate it rawe, but eyther boyled, stewed, roasted or baked; all which waies it is very good.

The Portingall Apple Quince is a great yellow Quince, seldome comming to bee whole and faire without chapping; this is so pleasant being fresh gathered, that it may be eaten like vnto an Apple without offence.

The Portingall Peare Quince is not fit to be eaten rawe like the former, but must be vsed after some of the waies the English Quince is appointed, and so it will make more dainty dishes then the English, because it is lesse harsh, will bee more tender, and take lesse sugar for the ordering then the English kinde.

The Barbary Quince is like in goodnesse vnto the Portingall Quince last spoken of, but lesser in bignesse.

The Lyons Quince.

The Brunswicke Quince.

The Vse of Quinces.

There is no fruit growing in this Land that is of so many excellent vses as this, seruing as well to make many dishes of meate for the table, as for

banquets, and much more for the Physicall vertues, whereof to write at large is neither convenient for mee, nor for this worke: I will onely briefly recite some, as it were to giue you a taste of that plenty remaineth therein, to bee conuerted into sundry formes: as first for the table, while they are fresh (and all the yeare long after being pickled vp) to be baked, as a dainty dish, being well and orderly cookt. And being preserued whole in Sugar, either white or red, serue likewise, not onely as an after dish to close vp the stomacke, but is placed among other Preserues by Ladies and Gentlewomen, and bestowed on their friends to entertaine them, and among other sorts of Preserues at Banquets. Codiniacke also and Marmilade, Jelly and Paste, are all made of Quinces, chiefly for delight and pleasure, although they haue also with them some physicall properties.

We haue for the vse of physicke, both Iuyce and Syrupe, both Conserue and Condite, both binding and loosening medicines, both inward and outward, and all made of Quinces.

The Jelly or Muccilage of the seedes, is often vsed to be laid vpon womens breasts, to heale them being sore or rawe, by their childrens default giuing them sucke.

Athenæus reciteth in his third booke, that one Philarchus found, that the smell of Quinces tooke away the strength of a certaine poison, called *Phariacum*. And the Spaniards haue also found, that the strength of the iuyce of white Ellebor (which the Hunters vse as a poyson to dippe their arrow heads in, that they shoote at wilde beasts to kill them) is quite taken away, if it stand within the compasse of the smell of Quinces. And also that Grapes, being hung vp to bee kept, and spent in Winter, doe quickly rot with the smell of a Quince.

CHAP. XXI.

Pyra. Peares.

THe variety of peares is as much or more then of apples, and I thinke it is as hard in this, as before in apples, for any to be so exquisite, as that hee could number vp all the sorts that are to be had: for wee haue in our country so manie, as I shall giue you the names of by and by, and are hitherto come to our knowledge: but I verily belecue that there be many, both in our country, and in others, that we haue not yet knowne or heard of; for euery yeare almost wee attaine to the knowledge of some, we knew not of before. Take therefore, according to the manner before held, the description of one, with the seuerall names of the rest, vntill a more exact discourse be had of them, euery one apart.

The Peare tree groweth more slowly, but higher, and more vpright then the apple tree, and not lesse in the bulke of the body: his branches spread not so farre or wide, but growe vprighter and closer: the leaues are somewhat broader and rounder, greene aboue, and whiter vnderneath then those of the apple tree: the flowers are whiter and greater: the fruit is longer then round for the most part, smaller at the stalke, and greater at the head, of so many differing formes, colours, and tastes, that hardly can one distinguish rightly between them, the times also being as variable in the gathering and spending of them, as in apples: the roote groweth deeper then the apple tree, and therefore abideth longer, and giueth a faster, closer, & smother gentle wood, easie to be wrought vpon.

The kindes of Peares.

The Summer bon Chretien is somewhat a long pear, with a greene and yellow russetish coate, and will haue sometimes red sides; it is ripe at Michaelmas: some vse to dry them as they doe Prunes, and keepe them all the yeare after. I haue not seene or heard any more Summer kindes hercof then this one, and needeth no wall to nourish it as the other.

The Winter bon Chretien is of many sorts, some greater, others lesser, and all good, but the greatest and best is that kinde that groweth at Syon: All the kinds of this Winter fruit must be planted against a wall, or else they will both seldome beare, and bring fewer also to ripenesse, comparable to the wall fruit: the kinds also are according to their lasting; for some will endure good much longer then others.

The Summer Bergomot is an excellent well relished peare, flattish, & short, not long like others, of a meane bignesse, and of a darke yellowish Greene colour on the outside.

The Winter Bergomot is of two or three sorts, being all of them small fruit, somewhat greener on the outside then the Summer kinds, all of them very delicate and good in their due time: for some will not be fit to bee eaten when others are well nigh spent, euery of them outlasting another by a moneth or more.

The Diego peare is but a small peare, but an excellent well relished fruit, tasting as if Muske had been put among it; many of them growe together, as it were in clusters.

The Duetete or double headed peare, so called of the forme, is a very good peare, not very great, of a rustetish browne colour on the outside.

The Primating peare is a good moist peare, and early ripe.

The Geneting peare is a very good early ripe peare.

The Greene Chefill is a delicate mellow peare, euen melting as it were in the mouth of the eater, although greenish on the outside.

The Catherine peare is knowne to all I thinke to be a yellow red sided peare, of a full waterish sweete taste, and ripe with the foremost.

The King Catherine is greater then the other, and of the same goodnesse, or rather better.

The Russet Catherine is a very good middle sized peare.

The Windsor peare is an excellent good peare, well knowne to most persons, and of a reasonable greatnesse: it will beare fruit some times twice in a yeare (and as it is said) three times in some places.

The Norwich peare is of two sorts, Summer and Winter, both of them good fruit, each in their season.

The Worster peare is blackish, a farre better peare to bake (when as it will be like a Warden, and as good) then to eate rawe; yet so it is not to be misliked.

The Muske peare is like vnto a Catherine peare for bignesse, colour, and forme, but farre more excellent in taste, as the very name importeth.

The Rosewater peare is a goodly faire peare, and of a delicate taste.

The Sugar peare is an early peare, very sweete, but waterish.

The Summer Popperin { both of them are very good firme dry peares, somewhat

The Winter Popperin { spotted, and brownish on the outside.

The Greene Popperin is a winter fruit, of equall goodnesse with the former.

The Soueraingne peare, that which I haue seene and tasted, and so termed vnto me, was a small brownish yellow peare, but of a most dainty taste; but some doe take a kind of Bon Chretien, called the Elizabeth peare, to be the Soueraingne peare; how truly let others iudge.

The Kings peare is a very good and well tasted peare.

The peare Royall is a great peare, and of a good relish.

The Warwicke peare is a reasonable faire and good peare.

The Greenfield peare is a very good peare, of a middle size.

The Lewes peare is a brownish Greene peare, ripe about the end of September; a reasonable well relished fruit, and very moist.

The Bishop peare is a middle sized peare, of a reasonable good taste, not very waterish; but this property is oftentimes seene in it, that before the fruit is gathered, (but more vsually those that fall of themselves, and the rest within a while after they are gathered) it will be rotten at the core, when there wil not be a spot or blemish to be seene on the outside, or in all the peare, vntill you come neare the core.

The Wilford peare is a good and a faire peare.

The Bell peare a very good Greene peare.

The Portingall peare is a great peare, but more goodly in shew then good indeed.

The Gratiola peare is a kinde of Bon Chretien, called the Cowcumber peare, or Spinola's peare.

The Rowling peare is a good peare, but hard, and not good before it bee a little rowled or bruised, to make it eate the more mellow.

The Pimpe peare is as great as the Windsor peare, but rounder, and of a very good relish.

The Turnep peare is a hard winter peare, not so good to eate rawe, as it is to bake.

The Arundell peare is most plentiful in Suffolke, and there commended to be a verie good peare.

The Berry peare is a Summer peare, reasonable faire and great, and of so good and wholsome a taste, that few or none take harme by eating neuer so many of them.

The Sand peare is a reasonable good peare, but small.

The Morley peare is a very good peare, like in forme and colour vnto the Windsor, but somewhat grayer.

The peare pricke is very like vnto the Greenfield peare, being both faire, great, and good.

The good Rewell is a reasonable great peare, as good to bake as to eate rawe, and both wayes it is a good fruit.

The Hawkes bill peare is of a middle size, somewhat like vnto the Rowling peare.

The Petworth peare is a winter peare, and is great, somewhat long, faire, and good.

The Slipper peare is a reasonable good peare.

The Robert peare is a very good peare, plentiful in Suffolke and Norfolke.

The pound peare is a reasonable good peare, both to eate rawe, and to bake.

The ten pound peare, or the hundred pound peare, the truest and best, is the best Bon Chretien of Syon, so called, because the grafts cost the Master so much the fetching by the messengers expences, when he brought nothing else.

The Gilloflower peare is a winter peare, faire in shew, but hard, and not fit to bee eaten rawe, but very good to bake.

The peare Couteau is neither good one way nor other.

The Binsee peare is a reasonable good winter peare, of a russetish colour, and a small fruit: but will abide good a long while.

The Pucell is a greene peare, of an indifferent good taste.

The blacke Sorrell is a reasonable great long peare, of a darke red colour on the outside.

The red Sorrell is of a redder colour, else like the other.

The Surrine is no very good peare.

The Summer Halting is a little greene peare, of an indifferent good relish.

Peare Gergonell is an early peare, somewhat long, and of a very pleasant taste.

The white Genneting is a reasonable good peare, yet not equall to the other.

The Sweater is somewhat like the Windsor for colour and bignesse, but nothing neare of so good a taste.

The blood red peare is of a darke red colour on the outside, but piercing very little into the inner pulpe.

The Hony peare is a long greene Summer peare.

The Winter peare is of many sorts, but this is onely so called, to bee distinguished from all other Winter peares, which haue severall names giuen them, and is a very good peare.

The Warden or Luke Wards peare of two sorts, both white and red, both great and small.

The Spanish Warden is greater then either of both the former, and better also.

The peare of Ierusalem, or the stript peare, whose barke while it is young, is as plainly seene to be stript with greene, red, and yellow, as the fruit it selfe is also, and is of a very good taste: being baked also, it is as red as the best Warden, whereof Master William Ward of Essex hath assured mee, who is the chiefe keeper of the Kings Granary at Whitehall.

Hereof likewise there is a wilde kinde no bigger then ones thumbe, and striped in the like manner, but much more.

The Choke peares, and other wilde peares, both great and small, as they are not to furnish our Orchard, but the Woods, Forrests, Fields, and Hedges, so wee leaue them to their naturall places, and to them that keep them, and make good vse of them.

The Use of Peares.

The most excellent sorts of Peares, serue (as I said before of Apples) to

make an after-course for their masters table, where the goodnesse of his Orchard is tryed. They are dryed also, and so are an excellent repaste, if they be of the best kindes, fit for the purpose.

They are eaten familiarly of all sorts of people, of some for delight, and of others for nourishment, being baked, stewed, or scalded.

The red Warden and the Spanish Warden are reckoned among the most excellent of Peares, either to bake or to roast, for the sicke or for the sound: And indeede, the Quince and the Warden are the two onely fruits are permitted to the sicke, to eat at any time.

Perry, which is the iuyce of Peares pressed out, is a drinke much esteemed as well as Cyder, to be both drunke at home, and carried to the Sea, and found to be of good vse in long voyages.

The Perry made of Choke Peares, notwithstanding the harshnesse, and euill taste, both of the fruit when it is Greene, as also of the iuyce when it is new made, doth yet after a few moneths become as milde and pleasant as wine, and will hardly bee knowne by the sight or taste from it: this hath beene found true by often experience, and therefore wee may admire the goodnesse of God, that hath giuen such facility to so wilde fruits, altogether thought vselesse, to become vsefull, and apply the benefit thereof both to the comfort of our soules and bodies.

For the Physicall properties, if we doe as Galen teacheth vs, in *secundo Alimentorum*, referre the qualities of Peares to their seuerall tastes, as before he had done in Apples, we shall not neede to make a new worke; those that are harsh and sowre doe coole and binde, sweet do nourish and warme, and those betweene these, to haue middle vertues, answerable to their temperatures, &c.

Much more might be said, both of this and the other kinds of fruits; but let this suffice for this place and worke, vntill a more exact be accomplished.

CHAP. XXII.

Nux Juglans. The Wallnut.

Although the Wallnut tree bee often planted in the middle of great Courtyards, where by reason of his great spreading armes it taketh vp a great deale of roome, his shadow-reaching farre, so that scarce any thing can well grow neare it; yet because it is likewise planted in fit places or corners of Orchards, and that it beareth fruit or nuts, often brought to the table, especially while they are freshest, sweetest, and fittest to be eaten, let not my Orchard want his company, or you the knowledge of it. Some doe thinke that there are many sorts of them, because some are much greater then others, and some longer then others, and some haue a more frangible shell then others; but I am certainly perswaded, that the soyle and climate where they grow, are the whole and onely cause of the varieties and differences. Indeed Virginia hath sent vnto vs two sorts of Wallnuts, the one blacke, the other white, whereof as yet wee haue no further knowledge. And I know that Clusius reporteth, he tooke vp at a banquet a long Wallnut, differing in forme and tendernes of shell from others, which being set, grew and bore farre tenderer leaues then the other, and a little snipt about the edges, which (as I said) might alter with the soyle and climate: and besides you may obserue, that many of Clusius differences are very nice, and so I leaue it.

The Wallnut tree groweth very high and great, with a large and thicke body or trunke, couered with a thicke clouen whitish Greene barke, tending to an ash-colour, the armes are great, and spread farre, breaking out into smaller branches, whereon doe grow long & large leaues, five or seuen set together one against another, with an odde one at the end, somewhat like vnto Ashen leaues, but farre larger, and not so many on a stalke, smooth, and somewhat reddish at the first springing, and tender also, of a reasonable good sent, but more strong and headie when they growe old: the fruit or nut is great and round, growing close to the stalkes of the leaues, either by couples or by three

three set together, couered with a double shell, that is to say, with a greene thicke and soft outer rinde, and an inner hard shell, within which the white kernell is contained, couered with a thinne yellow rinde or peeling, which is more easily peeled away while it is greene then afterwards, and is as it were parted into foure quarters, with a thinne wooddy peece parting it at the head, very sweete and pleasant while it is fresh, and for a while after the gathering; but the elder they growe, the harder and more oily: the catkins or blowings are long and yellow, made of many scaly leaues set close together, which come forth early in the Spring, and when they open and fall away, vpon their stalkes arise certaine small flowers, which turne into so many nuts.

The Vse of Wallnuts.

They are often serued to the table with other fruits while they abide fresh and sweete; and therefore many to keepe them fresh a long time haue deuised many wayes, as to put them into great pots, and bury them in the ground, and so take them out as they spend them, which is a very good way, and will keepe them long.

The small young nuts while they are tender, being preserued or candid, are vsed among other sorts of candid fruits, that serue at banquets.

The iuyce of the outer greene huskes are held to be a soueraigne remedy against either poyson, or plague, or pestilentiall feuer.

The distilled water of the huskes drunke with a little vinegar, if the fits growe hot and tedious, is an approued remedy for the same.

The water distilled from the leaues, is effectually to be applyed to fluent or running vlcers, to dry and binde the humours.

Some haue vsed the poulder of the catkins in white wine, for the suffocation or strangling of the mother.

The oyle of Wallnuts is vsed to varnish Ioyners workes. As also is accounted farre to excell Linseede oyle, to mixe a white colour withall, that the colour bee not dimmed. It is of excellent vse for the coldnesse, hardnesse and contracting of the sinewes and ioynts, to warme, supple, and to extend them.

CHAP. XXIII.

Castanea Equina. The Horse Chesnut.

Although the ordinary Chesnut is not a tree planted in Orchards, but left to Woods, Parkes, and other such like places; yet wee haue another sort which wee haue nourished vp from the nuts sent vs from Turkey, of a greater and more pleasant aspect for the faire leaues, and of as good vse for the fruit. It groweth in time to be a great tree, spreading with great armes and branches, whereon are set at seuerall distances goodly faire great greene leaues, diuided into six, seuen, or nine parts or leaues, euery one of them nicked about the edges, very like vnto the leaues of *Ricinus*, or *Palma Christi*, and almost as great: it beareth at the ends of the branches many flowers set together vpon a long stalke, consisting of foure white leaues a peece, with many threads in the middle, which afterwards turne into nuts, like vnto the ordinary Chesnuts, but set in rougher and more prickly huskes: the nuts themselves being rounder and blacker, with a white spot at the head of each, formed somewhat like an heart, and of a little sweeter taste.

The Vse of this Chesnut.

It serueth to binde and stop any manner of fluxe, be it of bloud or humours, either of the belly or stomacke; as also the much spitting of bloud. They are roasted and eaten as the ordinary sort, to make them taste the better.

They are vsually in Turkie given to horses in their prouender, to cure them of coughes, and helpe them being broken winded.

CHAP. XXIIII.

Morus. The Mulberrie.

THere are two sorts of Mulberries sufficiently known to most, the blackish and the white : but wee haue had brought vs from Virginia another sort, which is of greater respect then eyther of the other two, not onely in regard of the raritie, but of the vse, as you shall presently vnderstand.

1. *Morus nigra*. The blacke Mulberrie.

The blacke Mulberrie tree groweth oftentimes tall and great, and oftentimes also crooked, and spreading abroad, rather then high; for it is subiect to abide what forme you will conformance it vnto : if by suffering it to grow, it will mount vp, and if you will binde it, or plash the boughes, they will so abide, and be carried ouer arbours, or other things as you will haue it. The bodie groweth in time to bee very great, couered with a rugged or thicke barke, the armes or branches being smoother, whereon doe grow round thicke leaues pointed at the ends, and nicked about the edges, and in some there are to be seene deep gashes, making it seeme somewhat like the Vine leafe: the flowers are certaine short dounie catkings, which turne into greene berries at the first, afterwards red, and when they are full ripe blacke, made of many graines set together, like vnto the blacke berrie, but longer and greater : before they are ripe, they haue an austere and harsh taste, but when they are full ripe, they are more sweete and pleasant; the iuice whereof is so red, that it will staine the hands of them that handle and eate them.

2. *Morus alba*. The white Mulberrie.

The white Mulberrie tree groweth not with vs to that greatnesse or bulke of bodie that the blacke doth, but runneth vp higher, slenderer, more knotty, hard and brittle, with thinner spreade armes and branches : the leaues are like the former, but not so thicke set on the branches, nor so hard in handling, a little paler also, hauing somewhat longer stalkes: the fruit is smaller and closer set together, greene, and somewhat harsh before they be ripe, but of a wonderfull sweetnesse, almost ready to procure loathing when they are thorough ripe, and white, with such like seede in them as in the former, but smaller.

3. *Morus Virginiana*. The Virginia Mulberrie.

The Virginia Mulberry tree groweth quickly with vs to be a very great tree, spreading many armes and branches, whereon grow faire great leaues, very like vnto the leaues of the white Mulberrie tree: the berry or fruit is longer and redder then either of the other, and of a very pleasant taste.

The Vse of Mulberries.

The greatest and most especiall vse of the planting of white Mulberries, is for the feeding of Silke wormes, for which purpose all the Easterne Countries, as Persia, Syria, Armenia, Arabia &c. and also the hither part of Turkie, Spaine also and Italie, and many other hot Countries doe nourish them, because it is best for that purpose, the wormes feeding thereon, giuing the finest and best silke; yet some are confident that the leaues of the blacke will doe as much good as the white: but that respect must be had to change your seede, because therein lyeth the greatest mysterie. But there is a Booke or Tractate printed, declaring the whole vse of whatsoeuer can belong vnto them: I will therefore referre them thereunto, that would

1 *Nux Ingians*. The Walnut. 2 *Aesculus equina*. The horse Chestnut. 3 *Morus nigra vel alba*. The Mulberry. 4 *Morus Virginiana*. The Virginia Mulberry. 5 *Laurus vulgaris*. The ordinary Bay tree, 6 *Lawsonia cerifolia Virginiana*. The Virginia Cherry Bay.

would further vnderstand of that matter.

Mulberries are not much desired to be eaten, although they be somewhat pleasant, both for that they staine their fingers and lips that eate them, and doe quickly putrefie in the stomacke, if they bee not taken before meate.

They haue yet a Physicall vse, which is by reason of the astringent quality while they are red, and before they bee ripe, for sore mouthes and throats, or the like, whereunto also the Syrup, called Diamoron, is effectuell.

Corollarium.

A COROLLARIE
To this Orchard.

Here are certaine other trees that beare no fruit fit to bee eaten, which yet are often seene planted in Orchards, and other fit and conuenient places bout an house, whereof some are of especiall vse, as the Bay tree &c. others for their beauty and shadow are fit for walkes or arbours, some being euer green are most fit for hedge-rows; and some others more for their raritie then for any other great vse, wherof I thought good to entreat apart by themselves, and bring them after the fruit trees of this Orchard, as an ornament to accomplish the same.

1. Laurus. The Bay tree.

There are to bee reckoned vp five kindes of Bay trees, three whereof haue been entreated of in the first part, a fourth wee will only bring here to your consideration, which is that kinde that is vsually planted in euery mans yard or orchard, for their vse throughout the whole land, the other we will leaue to bee considered of in that place is fit for it.

The Bay tree riseth vp oftentimes to carry the face of a tree of a meane bignesse in our Countrey (although much greater in the hotter) and oftentimes shooteth vp with many suckers from the roote, shewing it selfe more like to a tall shrubbe or hedge-bush, then a tree, hauing many branches, the young ones whereof are sometimes reddish, but most vsually of a light or fresh Greene colour, when the stemme and elder boughes are couered with a darke Greene barke: the leaues are somewhat broad, and long pointed as it were at both the ends, hard and sometimes crumpled on the edges, of a darke Greene colour aboue, and of a yellowish Greene vnderneath, in smell sweet, in taste bitter, and abiding euer Greene: the flowers are yellow and mossie, which turne into berries that are a little long as well as round, whose shell or outermost peeble is Greene at the first, and blacke when it is ripe, wherein is contained an hard bitter kernell, which cleaueth in two parts.

The Vse of Bayes.

The Bay leaues are of as necessary vse as any other in Garden or Orchard, for they serue both for pleasure and profit, both for ornament and for vse, both for honest Ciuill vses, and for Physicke, yea both for the sicke and for the sound, both for the liuing and for the dead: And so much might be said of this one tree, that if it were all told, would as well weary the Reader, as the Relater: but to explaine my selfe; It serueth to adorne the house of God as well as of man: to procure warmth, comfort and strength to the limmes of men and women, by bathings and annoyntings outward, and by drinckes &c. inward to the stomacke, and other parts: to season vessels &c. wherein are preserved our meates, as well as our drinckes: to crowne or encircle

circle as with a garland, the heads of the liuing, and to sticke and décke forth the bodies of the dead : so that from the cradle to the graue we haue still vse of it, we haue still neede of it.

The berries likewise serue for stiches inward, and for paines outward, that come of cold eyther in the ioynts, sinewes, or other places.

2. *Laurea Cerasus, sine Laurus Virginiana.* The Virginian Bay,
or Cherry Baye.

THis Virginian (whether you will call it a Baye, or a Cherrie, or a Cherrie Bay, I leaue it to euery ones free will and iudgement, but yet I thinke I may as well call it a Bay as others a Cherrie, neither of them being answerable to the tree, which neyther beareth such berries as are like Cherries, neither beareth euer greene leaues like the Bay : if it may therefore bee called the Virginia Cherry Bay, for a distinction from the former Bay Cherry that beareth faire blacke Cherries, it will more fitly agree thereunto, vntill a more proper may be imposed) riseth vp to be a tree of a reasonable height, the stemme or bodie thereof being almost as great as a mans legge, spreading forth into diuers armes or boughes, and they againe into diuers small branches, whereon are set without order diuers faire broade greene leaues, somewhat like vnto the former Bay leaues, but more limber and gentle, and not so hard in handling, broader also, and for the most part ending in a point, but in many somewhat round pointed, very finely notched or toothed about the edges, of a bitter taste, very neere resembling the taste of the Bay leafe, but of little or no sent at all, either greene or dryed, which fall away euery autumn; and spring afresh euery yeare : the blossomes are small and white, many growing together vpon a long stalke, somewhat like the Bird Cherry blossomes, but smaller, and come forth at the ends of the young branches, which after turne into small berries, euery one set in a small cup or huske, greene at the first, and blacke when they are ripe, of the bignesse of a small pease, of a strong bitter taste, and somewhat aromaticall withall, but without any fleshy substance like a Cherry at all vpon it; for it is altogether like a berry.

The Vse of this Virginia Cherry Bay.

Being a stranger in our Land, and possessed but of a very few, I doe not heare that there hath beene any triall made thereof what properties are in it : let this therefore suffice for this present, to haue shewed you the description and forme thereof, vntill we can learne further of his vses.

3. *Pinus.* The Pine tree.

MY purpose in this place is not to shew you all the diuersities of Pine trees, or of the rest that follow, but of that one kinde is planted in many places of our Land for ornament and delight, and there doth reasonably well abide : take it therefore into this Orchard, for the raritie and beautie of it, though we haue little other vse of it.

The Pine tree groweth with vs, though slowly, to a very great height in many places, with a great straight bodie, couered with a grayish greene barke, the younger branches are set round about, with very narrow long whitish greene leaues, which fall away from the elder, but abide on the younger, being both winter and summer alwaies greene. It hath growing in sundry places on the branches, certaine great hard woody clogs (called of some apples, of others nuts) composed of many hard woody scales, or tuberos knobs, which abide for the most part alwaies greene in our Countrey, and hardly become brownish, as in other Countreies, where they haue more heat and comfort of the Sun, and where the scales open themselues, wherein are contained white long and round kernels, very sweete while they are fresh, but quickly growing oylely and rancide.

The

The Vse of the Pine apples and kernels.

The Cones or Apples are vsed of diuers Vintners in this City, being painted, to expresse a bunch of grapes, whereunto they are very like, and are hung vp in their bushes, as also to fasten keyes vnto them, as is seene in many places.

The kernels within the hard shels, while they are fresh or newly taken out, are vsed many waies, both with Apothecaries, Comfit-makers, and Cookes : for of them are made medicines, good to lenifie the pipes and passages of the lungs and throate, when it is hoarse. Of them are made Comfits, Pastes, Marchpanes, and diuers other such like : And with them a cunning Cooke can make diuers Keck shoses for his Masters table.

Matthiolus commendeth the water of the greene apples distilled, to take away the wrinkles in the face, to abate the ouer-swelling breasts of Maidens, by fomenting them after with linnen clothes, wet in the water; and to restore such as are rasiht into better termes.

4. *Abies*. The Firre tree.

THe Firre tree groweth naturally higher then any other tree in these parts of Christendome where no Cedars grow, and euen equalling or ouer-topping the Pine : the stemme or bodie is bare without branches for a great height, if they bee elder trees, and then branching forth at one place of the bodie foure wayes in manner of a crosse, those boughes againe hauing two branches at euery ioynt, on which are set on all sides very thicke together many small narrow long hard whitish greene leaues, and while they are young tending to yellowesse, but nothing so long or hard or sharpe pointed as the Pine tree leaues, growing smaller and shorter to the end of the branches : the bloomings are certaine small long scaly catkins, of a yellowish colour, comming forth at the ioynts of the branches, which fall away : the cones are smaller and longer then of the Pine tree, wherein are small three square feede contained, not halfe so big as the Pine kernels,

The Vse of the Firre tree.

The vse of this tree is growne with vs of late daies to bee more frequent for the building of houses then euer before : for hereof (namely of Deale timber and Deale boords) are framed many houses, and their floores, without the helpe of any other timber or boord of any other tree almost ; as also for many other workes and purposes. The yellow Rosin that is vsed as well to make salues as for many other common vses, is taken from this tree, as the Pitch is both from the Pitch and Pine trees, and is boyled to make it to bee hard, but was at the first a yellow thin cleere Turpentine, and is that best sort of common Turpentine is altogether in vse with vs, as also another more thicke, whitish, and troubled, both which are vsed in salues, both for man and beast (but not inwardly as the cleere white Venice Turpentine is) and serueth both to draw, cleanse and heale. Dodonæus seemeth to say, that the cleere white Turpentine, called Venice Turpentine, is drawn from the Firre : but Matthiolus confuteth that opinion, which Fulsius also held before him.

5. *Ilex arbor*. The euer-greene Oake.

THe *Ilex* or euer-greene Oake riseth in time to be a very great tree, but very long and slow in growing (as is to be seene in the Kings priuy Garden at Whitehall, growing iust against the backe gate that openeth into the way going to Westminster, and in some other places) spreading many fair large great armes and branches, whereon are set small and hard greene leaues, somewhat ended or cornered, and prickly

1 *Pinus* The Pine tree. 2 *Abies*. The Firre tree. 3 *Ilex*. The ever greene Oake. 4 *Cupressus*. The Aprasse tree. 5 *Arbutus*. The Strawberry tree. 6 *Alaternus*. The ever greene Prinet.

prickly on the edges, especially in the young trees, and sometimes on those branches that are young and newly sprung forth from the elder rootes, but else in a manner all smooth in the elder growne, abiding greene all the winter as well as summer, and are of a grayish greene on the vnder side. It beareth in the spring time certaine slender long branches (like as other Oakes doe) with small yellowish mossie flowers on them, which fall away, and are vnprofitable, the acornes not growing from those places, but from others which are like vnto those of our ordinary Oake, but smaller and blacker, and set in a more rugged huske or cuppe. This and no other kinde of *Ilex* doe I know to grow in all our land in any Garden or Orchard: for that kind with long and narrower leaues, and not prickly, growing so plentifully as Matthiolus saith in Tulcane, I haue not seen: and it is very probable to bee the same that Plinie remembreth to haue the leafe of an Oliue; but not as some would haue it, that *Smilax* Theophrastus maketh mention of in his third Booke and sixteenth Chapter of his Historie of Plants, which the Arcadians so called, and had the leafe of the *Ilex*, but not prickly: for Theophrastus saith, the timber of *Smilax* is smooth and soft, and this of the *Ilex* is harder, and stronger then an Oake.

The Vse of the *Ilex* or euer-greene Oake.

Seeing this is to be accounted among the kindes of Oake (and all Oakes by Dioscorides his opinion are binding) it is also of the same qualitie, but a little weaker, and may serue to strengthen weake members. The young tops and leaues are also vsed in gargles for the mouth and throate.

6 *Cupressus*. The Cypresse tree.

THe Cypresse tree that is nourfed v^p by vs, in our Country, doth grow in those places where it hath bene long planted, to a very great height, whose bodie and boughes are couered with a reddish ash-coloured bark; the branches grow not spreading, but vpright close vnto the bodie, bushing thicke below, and small v^pwards, spire fashion, those below reaching neere halfe the way to them aboue, whereon doe grow euer greene leaues, small, long and flat, of a resinous sweete smell, and strong taste, somewhat bitter: the fruit, which are called nuts, grow here and there among the boughes, sticking close vnto them, which are small, and clouen into diuers parts, but close while they are young, of a russetish browne colour; wherein are contained small browne seede, but not so small as moles in the Sunne, as Matthiolus and others make them to be.

The Vse of the Cypresse tree.

For the goodly proportion this tree beareth, as also for his euer-greene head, it is and hath bene of great account with all Princes, both beyond, and on this side of the Sea, to plant them in rowes on both sides of some spacious walke, which by reason of their high growing, and little spreading, must be planted the thicker together, and so they giue a goodly, pleasant and sweet shadow: or else alone, if they haue not many, in the middle of some quarter, or as they thinke meete. The wood thereof is firme and durable, or neuer decaying, of a brown yellow colour, and of a strong sweete smell, whereof Chests or Boxes are made to keepe apparell, linnen, furrer, and other things, to preferue them from moths, and to giue them a good smell.

Many Physicall properties, both wood, leaues and nuts haue, which here is not my purpose to vnfold, but only to tell you, that the leaues being boyled in wine, and drunke, helpe the difficultie of making vrine, and that the nuts are binding, fit to bee vsed to stay fluxes or laskes, and good also for ruptures.

7. *Arbutus*. The Strawberry tree.

THe Strawberry tree groweth but slowly, and riseth not to the height of any great tree, no not in France, Italy, or Spaine: and with vs the coldnesse of our country doth the more abate his vigour, so that it seldome riseth to the height of a man: the barke of the body is rough, and smooth in the younger branches: the leaues are faire and Greene, very like vnto Baye leaues, finely dented or snipped about the edges, abiding alwayes Greene thereon both Winter and Summer: the flowers come forth at the end of the branches vpon long stalkes, not clustering thicke together, but in long bunches, and are small, white, and hollow, like a little bottle, or the flower of Lilly Conually, which after turne into rough or rugged berries, most like vnto Strawberries (which hath giuen the name to the tree) somewhat reddish when they are ripe, of a harsh taste, nothing pleasant, wherein are contained many small seedes: It hardly bringeth his fruit to ripenesse in our countrey, for in their naturall places they ripen not vntill Winter, which there is much milder then with vs.

The Vse of the Strawberry tree.

Amatus Lusitanus I thinke is the first that euer recorded, that the water distilled from the leaues and flowers hereof, should bee very powerfull against the plague and poysons: for all the ancient Writers doe report, that the fruit hereof being eaten, is an enemy to the stomacke and head. And Clusius likewise setteth downe, that at Lisbon, and other places in Portingall where they are frequent, they are chiefly eaten, but of the poorer sort, women and boyes. They are somewhat astringent or binding, and therefore may well serue for fluxes. It is chiefly nourished with vs for the beauty and rarenesse of the tree, for that it beareth his leaues alwayes green.

8. *Alaternus*. The euer Greene Priuet.

THe tree which we haue growing in our country called *Alaternus*, groweth not to be a tree of any height; but abiding lowe, spreadeth forth many branches, whereon are set diuers small and hard Greene leaues, somewhat round for the forme, and endented a little by the edges: it beareth many small whitish Greene flowers at the ioynts of the stalkes, and setting on of the lower leaues clustering thicke together, which after turne into small blacke berries, wherein are contained many small graines or seedes: the beauty and verdure of these leaues abiding so fresh all the yeare, doth cause it to be of the greater respect, and therefore findeth place in their Gardens onely, that are curious conseruers of all natures beauties.

The Vse of the euer Greene Priuet.

It is seldome vsed for any Physicall property, neither with vs, nor in the places where it is naturall and plentiful: but as Clusius reporteth, hee learned that the Portingall Fishermen do dye their nets red with the decoction of the barke hereof, and that the Dyers in those parts doe vse the small peeces of the wood to strike a blackish blew colour.

9. *Celastrus Theophrasti* Clusio. Clusius his Celastrus.

ALthough the Collectour (who is thought to be Ioannes Molineus of the great Herball or History of plants, and generally bearing Dalechampius name, because the finding and relation of diuers herbes therein exprest, is appropriate to him, and printed at Lyons) of all our moderne Writers doth first of all others appoint the *Celastrus*, whereof Theophrastus onely among all the ancient Writers of plants

plants maketh mention, to be the first *Alaternus* that Clusius hath set forth in his History of rarer plants: yet I finde, that Clusius himselfe before his death doth appropriate that *Celastrus* of Theophrastus to another plant, growing in the Garden at Leyden, which formerly of diuers had beene taken to be a kinde of *Laurus Tinus*, or the wilde Baye; but he impugning that opinion for diuers respects, decyphreth out that Leyden tree in the same manner that I doe: and because it is not onely faire, in bearing his leaues alwayes greene, but rare also, being nourshed vp in our Land in very few places, but principally with a good old Lady, the widow of Sir Iohn Leuson, dwelling neere Rochester in Kent; I thought it fit to commend it for an ornament, to adorne this our Garden and Orchard. It groweth vp to the height of a reasonable tree, the body whereof is couered with a darke coloured barke, as the elder branches are in like manner; the younger branches being greene, whereon are set diuers leaues thicke together, two alwayes at a ioynt, one against another, of a sad but faire greene colour on the vpper side, and paler vnderneath, which are little or nothing at all snipped about the edges, as large as the leaues of the *Laurus Tinus*, or wilde Baye tree: at the end of the young branches breake forth between the leaues diuers small stalkes, with foure or fve flowers on each of them, of a yellowish greene colour, which turne into small berries, of the bignesse of blacke Cherries, greene at the first, and red when they begin to be ripe, but growing blacke if they hang too long vpon the branches, wherein is contained a hard shell, and a white hard kernell within it, couered with a yellowish skin. This abideth (as I said before) with greene leaues as well Winter as Summer; and therefore fittest to be planted among other of the same nature, to make an euer greene hedge.

The Vse of Clusius his *Celastrus*.

Being so great a stranger in this part of the Christian world, I know none hath made tryall of what property it is, but that the taste of the leaues is somewhat bitter.

10. *Pyracantha*. The euer greene Hawthorne,
or prickly Corall tree.

THis euer greene shrubbe is so fine an ornament to a Garden or Orchard, either to be nourshed vp into a small tree by it selfe, by pruning and taking away the suckers and vnder branches, or by suffering it to grow with suckers, thicke and plashing the branches into a hedge, for that it is plyable to be ordered either way; that I could not but giue you the knowledge thereof, with the description in this manner. The younger branches are couered with a smooth darke blewish greene barke, and the elder with a more ash coloured, thicke set with leaues without order, some greater and others smaller, somewhat like both in forme and bignesse vnto the leaues of the Barberry tree, but somewhat larger, and more snipt about the edges, of a deeper green colour also, and with small long thornes scattered here & there vpon the branches: the flowers come forth as well at the ends of the branches, as at diuers places at the ioynts of the leaues, standing thicke together, of a pale whitish colour, a little dasht ouer with a shew of blush, consisting of fve leaues a peece, with some small threads in the middle, which turne into berries, very like vnto Hawthorne berries, but much redder and dryer, almost like polished Corall, wherein are contained foure or fve small yellowish white three square seede, somewhat shining. It is thought to be the *Oxyacantha* of Dioscorides, but seeing Dioscorides doth explaine the forme of the leafe in his Chapter of Medlars, which he concealed in the Chapter of *Oxyacantha*, it cannot be the same: for *Mespilus Anthedon* of Theophrastus, or *Aronia* of Dioscorides, hath the leafe of *Oxyacantha*, as Dioscorides saith, or of Smalladge, as Theophrastus, which cannot agree to this Thorne; but doth most liuely delineate out our white Thorne or Hawthorne, that now there is no doubt, but that *Oxyacantha* of Dioscorides is the Hawthorne tree or bush.

The Vse of this Corall tree.

Although Lobel maketh mention of this tree to grow both in Italy, and Prouince

1 *Celastrus Theophrasti* Cusco. *Cladus* huc *Celastrus*. 2 *Pyracantha*. The ever green prickly Corall tree. 3 *Yucca*. The Yewe tree. 4 *Buxus* arbo. The Boxe tree. 5 *Buxus* humilis. The lowe or dwarf Boxe. 6 *Sabina*. The Saune tree. 7 *Palin* m. *Christi* thorne. 8 *Larix*. The Larch tree.

Prouence in France, in some of their hedges, yet he saith it is neglected in the naturall places, and to be of no vse with them: neither doe I heare, that it is applyed to any Physicall vse with vs, but (as I before said) it is preferred with diuers as an ornament to a Garden or Orchard, by reason of his euer greene leaues, and red berries among them, being a pleasant spectacle, and fit to be brought into the forme of an hedge, as one please to lead it.

11. *Taxus*. The Yewetree.

THe Yewe tree groweth with vs in many places to bee a reasonable great tree, but in hotter countries much bigger, covered with a reddish gray scaly barke; the younger branches are reddish likewise, whereon grow many winged leaues, that is, many narrow long darke greene leaues, set on both sides of a long stalke or branch, neuer dying or falling away, but abiding on perpetually, except it be on the elder boughes: the flowers are small, growing by the leaues, which turne into round red berries, like vnto red Asparagus berries, in taste sweetish, with a little bitternesse, and causing no harme to them for any thing hath been knowne in our country,

The Vse of the Yewe tree.

It is found planted both in the corners of Orchards, and against the windowes of Houses, to be both a shadow and an ornament, in being alwayes greene, and to decke vp Houses in Winter: but ancient Writers haue euer reckoned it to be dangerous at the least, if not deadly.

12. *Buxus*. The Boxe tree.

THe Boxe tree in some places is a reasonable tall tree, yet growing slowly; the trunke or body whereof is of the bignesse of a mans thigh, which is the biggest that euer I saw: but sometimes, and in other places it groweth much lower, vsually not aboue a yard, or a yard and a halfe high, on the backe sides of many Houses, and in the Orchards likewise: the leaues are small, thicke and hard, and still the greater or lesser the tree is, the greater or lesser are the leaues, round pointed, and of a fresh shining greene colour: the flowers are small and greenish, which turne into heads or berries, with foure hornes, whittish on the outside, and with reddish seede within them.

Buxus aurea.
Gilded Boxe.

There is another kinde hereof but lately come to our knowledge, which differeth not in any thing from the former, but onely that all the leaues haue a yellow list or gard about the edge of them on the vpper side, and none on the lower, which maketh it seeme very beautifull, and is therefore called gilded Boxe.

Buxus humilis.
Dwarfe Boxe.

We haue yet another kinde of Boxe, growing small and lowe, not aboue halfe a foote, or a foote high at the most, vlesse it be neglected, which then doth grow a little more shrubby, bearing the like leaues, but smaller, according to the growth, and of a deeper greene colour: I could neuer know that this kinde euer bore flower or seede, but is propagated by slipping the roote, which encreaseth very much.

The Vse of Boxe.

The wood of the Boxe tree is vsed in many kindes of small works among Turners, because it is hard, close, and firme, and as some haue said, the roots much more, in regard of the diuers waues and crooked veines running through it. It hath no Physicall vse among the most and best Physicians, although some haue reported it to stay fluxes, and to be as good as the wood of *Guaiaicum*, or *Lignum vite* for the French disease. The leaues and branches serue both Summer and Winter to decke vp houses, and are many times giuen to horses for the bots.

The lowe or dwarfe Boxe is of excellent vse to border vp a knot, or the lon

long beds in a Garden, being a maruailous fine ornament thereunto, in regard it both groweth lowe, is euer greene, and by cutting may bee kept in what maner euery one please, as I haue before spoken more largely.

15. *Sauina*. The Sauiue tree or bush.

The Sauiue tree or bush that is most vsuall in our country, is a small lowe bush, not so high as a man in any place, nor so bigge in the stemme or trunk as a mans arme, with many crooked bending boughes and branches, whereon are set many small, short, hard, and prickly leaues, of a darke green colour, fresh and green both Winter and Summer: it is reported, that in the naturall places it beareth small blacke berries, like vnto Iuniper, but with vs it was neuer knowne to beare any.

The Vse of Sauiue.

It is planted in out-yards, backfides, or voide places of Orchards, as well to cast clothes thereon to dry, as for medicines both for men and horses: being made into an oyle, it is good to annoint childrens bellies for to kill the Wormes: and the powder thereof mixed with Hogs greafe, to annoint the running sores or scabs in their heads: but beware how you giue it inwardly to men, women, or children. It is often put into horses drenches, to helpe to cure them of the bots, and other diseases.

16. *Palmarum*. Christs thorne.

This thorny shrubbe (where with as it is thought, our Sauiour Christ was crowned, because as those that haue trauelled through Palestina and Iudæa, doe report no other thorne doth grow therein so frequent, or so apt to be writhed) riseth in some places to a reasonable height, but in our country seldome exceedeth the height of a man, bearing many slender branches, full of leaues, set on either side thereof one by one, which are somewhat broad and round, yet pointed, and full of veines, thicke set also with small thornes, euen at the foote of euery branch, and at the foote of euery leafe one or two, some standing vpright, others a little bending downe: the flowers are small and yellow, standing for the most part at the end of the branches, many growing ypon a long stalke, which after turne into round, flat, and hard shelly fruit, yet couered with a soft fleshy skinne, within which are included two or three hard, small, and browne flat seeds, lying in feuerall partitions. The leaues hereof fall away euery yeare, and spring forth afresh againe the next May following. The rarity and beauty of this shrubbe, but chiefly (as I thinke) the name hath caused this to be much accounted of with all louers of plants.

The Vse of Christs thorne.

Wee haue so few of these shrubbes growing in our country, and those that are, doe, for any thing I can vnderstand, neuer beare fruit with vs, that giued forth there is no other vse made hereof then to delight the owners: but this is certainly receiued for the *Palmarum* of Dioscoridds and Theophrastus, and thought also by Matthiolas to be the very true *Rhamnus terrens* of Dioscoridds. Matthiolas also seemeth to contradict the opinion is held by the Physicians of Mompelier, and others, that it cannot be the *Palmarum* of Theophrastus. It is held to be effectual to helpe to breake the stone, both in the bladder, reines, and kidneies: the leaues and young branches haue an astringent quality; and good against poysons and the bitings of serpents.

15. *Larix*. The Larch tree.

THe Larch tree, where it naturally groweth, riseth vp to be as tall as the Pine or Firre tree, but in our Land being rare, and nourished vp but with a few, and those onely louers of rarities, it groweth both slowly, and becommeth not high: the barke hereof is very rugged and thicke, the boughes and branches grow one about another in a very comely order, hauing diuers small yellowish knobs or bunches set thereon at seuerall distances; from whence doe yearly shoote forth many small, long, and narrow smooth leaues together, both shorter and smaller, and not so hard or sharpe pointed as either the Pine or Firre tree leaues, which doe not abide the Winter as they doe, but fall away every yeare; as other trees which shed their leaues, and gaine fresh euery Spring: the blossomes are very beautifull and delectable, being of an excellent fine crimson colour, which standing among the Greene leaues, allure the eyes of the beholders to regard it with the more desire: it also beareth in the naturall places (but not in our Land that I could heare) small soft cones or fruit, somewhat like vnto Cypresse nuts, when they are Greene and close.

The Use of the Larch tree.

The coles of the wood hereof (because it is so hard and durable as none more) is held to be of most force being fired, to cause the Iron oare to melt, which none other would doe so well. Matthiolus contesteth against Fuchsius, for deeming the Venice Turpentine to be the liquid Rosse of the Firre tree, which he assureth vpon his owne experience and certaine knowledge, to be drawne from this Larch tree, and none other; which cleere Turpentine is altogether vsed inwardly, and no other, except that of the true Turpentine tree, and is very effectually to cleanse the reins, kidneyes, and bladder, both of grauell and the stone, and to prouoke vrine: it is also of especiall property for the *gonorrhoea*, or running of the reins, as it is called, with some powder of white Amber mixed therewith, taken for certaine dayes together. Taken also in an Electuary, it is singular good for to expectorate rotten flegme, and to helpe the consumption of the lungs. It is vsed in plaisters and salues, as the best sort of Turpentine. The Agaricke that is vsed in physicke, is taken from the bodies and armes of this tree. And Matthiolus doth much insist against Brasauolus, that thought other trees had produced Agaricke, affirming them to be hard *Fungi*, or Mushrooms (such as wee call Touch-wood) wherewith many vse to take fire, strookethereinto from Steele.

16. *Tilia*. The Line or Linden tree.

THere are two sorts of Line trees, the male and the female; but because the male is rare to be seene, and the female is more familiar, I will onely giue you the description of the female, and leaue the other.

The female Line tree groweth exceeding high and great, like vnto an Elme, with many large spreading boughies, couered with a smooth barke, the innermost being very plyant and bending from whence come smaller branches, all of them so plyable, that they may bee led or carried into any forme you please: the leaues thereon are very faire, broad, and round, somewhat like vnto Elme leaues, but fairer, smoother, and of a fresher Greene colour, dented finely about the edges, and ending in a sharpe point: the flowers are white, and of a good sinell, many standing together at the top of a stalke, which runneth all along the middle ribbe of a small long whitish leafe; after which come small round berries, wherein is contained small blackish seede: this tree is wholly neglected by those that haue them, or dwell neere them, because they suppose it to be fruitlesse, in regard it beareth chaffie huskes, which in many places fall away, without giuing ripe seede.

1 *Tilia fœmina*. The Lime or Linden tree. 2 *Tamariscus*. The Tamarisk tree. 3 *Acer maia latifolium*. The Sycamore tree. 4 *Staphyle trifolia*. The bladder nut. 5 *Rhus Myrtifolia*. The Mistle leaved Sumach. 6 *Rhus Virginiana*. The Buck's horn tree. 7 *Vitis setacea*. The Virginia Vine or rather Iule.

The Vse of the Linetree.

It is planted both to make goodly Arbours, and Summer banquetting houses, either belowe vpon the ground, the boughes seruing very handsomely to plash round about it, or vp higher, for a second aboue it, and a third also: for the more it is depressed, the better it will grow. And I haue seene at Cobham in Kent, a tall or great bodied Line tree, bare without boughes for eight foote high, and then the branches were spread round about so orderly, as if it were done by art, and brought to compasse that middle Arbour: And from those boughes the body was bare againe for eight or nine foote (wherein might bee placed halfe an hundred men at the least, as there might be likewise in that vnderneath this) & then another rowe of branches to encompassse a third Arbour, with stayres made for the purpose to this and that vnderneath it: vpon the boughes were laid boards to tread vpon, which was the goodliest spectacle mine eyes euer beheld for one tree to carry.

The coles of the wood are the best to make Gunpowder. And being kindled, and quenched in vinegar, are good to dissolue clotted bloud in those that are bruised with a fall. The inner barke being steeped in water yeeldeth a slimie iuyce, which is found by experience, to be very profitable for them that haue been burnt with fire.

17. *Tamarix*. Tamariske tree.

THe Tamariske tree that is common in our country, although in some places it doth not grow great, yet I haue seene it in some other, to be as great as a great apple tree in the body, bearing great arms; from whose smaller branches spring forth young slender red shootes, set with many very fine, small, and short leaues, a little crisped, like vnto the leaues of Sauiue, not hard or rough, but soft and Greene: the flowers be white mossie threads, which turne into dounie seede, that is carried away with the winde.

Tamariscus fo-
ljs. abridis.
Wine Tama-
riske,

There is another kinde hereof very beautifull and rare, not to be seene in this Land I thinke, but with M^r. William Ward, the Kings seruant in his Granary, before remembred, who brought me a small twigge to see from his house at Boram in Essex, whose branches are all red while they are young, and all the leaues white, abiding so all the Summer long, without changing into any shew of Greene like the other, and so abideth constant yeare after yeare, yet shedding the leaues in Winter like the other.

The Vse of Tamariske.

The greatest vse of Tamariske is for splenetick diseases, either the leaues or the barke made into drinckes, or the wood made into small Cans or Cups to drinke in.

18. *Acer mains latifolium*. The great Maple or Sycomore tree.

THe Sycomore tree, as we vsually call it (and is the greatest kind of Maple, cherished in our Land onely in Orchards, or elsewhere for shade and walkes, both here in England, and in some other countries also) groweth quickly to bee a faire spreading great tree, with many boughes and branches, whose barke is somewhat smooth: the leaues are very great, large, and smooth, cut into foure or fise diuisions, and ending into so many corners, euery one standing on a long reddish stalke: the bloomings are of a yellowish Greene colour, growing many together on each side of a long stalke, which after turne into long and broad winged seede, two alwaies standing together on a stalke, and bunched out in the middle, where the seed or kernell lyeth, very like vnto the common Maple growing wilde abroad, but many more together, and larger.

The

The Vse of the Sycomore tree.

It is altogether planted for shady walkes, and hath no other vse with vs that I know.

19. *Nux Fescaria*. The bladder Nut.

THis tree groweth not very high, but is of a meane stature, when it is preserved and pruned to grow vpright, or else it shooteth forth many twiggess from the rootes, and so is fit to plant in a hedge rowe, as it is vsed in some places: the body and armes are couered with a whitish Greene barke: the branches and leaues on them are like vnto the Elder, hauing three or fiue leaues set one against another, with one of them at the end, each whereof is nicked or dented about the edges: the flowers are sweete and white, many growing together on a long stalke, hanging downeward, in forme resembling a small Daffodill, hauing a small round cup in the middle, and leaues about it: after which come the fruit, inclosed in russetish Greene bladders, containing one or two brownish nuts, lesser then Hasell nuts, whose outer shell is not hard and woody, like the shell of a nut, but tough, and hard withall, not easie to breake, within which is a Greene kernell, sweetish at the first, but lothsome afterwards, ready to procure casting, and yet liked of some people, who can well endure to cate them.

The Vse of the Bladder Nut.

The greatest vse that I know the tree or his fruit is put vnto, is, that it is receiued into an Orchard, either for the rarity of the kinde, being suffered to grow into a tree, or (as I said before) to make an hedge, being let grow into suckers.

Some Quacksaluers haue vsed these nuts as a medicine of rare vertue for the stone, but what good they haue done, I neuer yet could learne.

20. *Rhus Myrtifolia*. The Mirtle leaved Sumach.

THis lowe shrubbe groweth seldome to the height of a man, hauing many slender branches, and long winged leaues set thereon, euery one whereof is of the bignesse of the broad or large Mirtle leafe, and set by couples all the length of the ribbe, running through the middle of them. It beareth diuers flowers at the tops of the branches, made of many purple threads, which turne into small blacke berries, wherein are contained small, white, and rough seed, somewhat like vnto Grape kernels or stones. This vseth to dye down to the ground in my Garden euery Winter, and rise vp again euery Spring, whether the nature thereof were so, or the coldnesse of our climate the cause thereof, I am not well assured. It is also rare, and to be seen but with a few.

The Vse of this Sumach.

It is vsed to thicken or tanne leather or hides, in the same manner that the ordinary Sumach doth; as also to stay fluxes both in men and women.

21. *Rhus Virginiana*. The Virginia Sumach, or Buckes horne tree of Virginia.

THis strange tree becommeth in some places to bee of a reasonable height and bignesse, the wood whereof is white, soft, and pithy in the middle, like vnto an Elder, couered with a darke coloured barke, somewhat smooth: the young branches that are of the last yeares growth are somewhat reddish or browne, very soft and

and smooth in handling, and so like vnto the Veluet head of a Deere, that if one were cut off from the tree, and shewed by it selfe, it might soone deceiue a right good Woodman, and as they grow seeme most like thereunto, yeelding a yellowish milke when it is broken, which in a small time becommeth thicke like a gumme: the leaues grow without order on the branches, but are themselues set in a seemly order on each side of a middle ribbe, seuen, nine, ten, or more on a side, and one at the end, each whereof are somewhat broad and long, of a darke greene colour on the vpper side, and paler greene vnderneath, finely snipped or toothed round about the edges: at the ends of the branches come forth long and thicke browne tufts, very soft, and as it were woolly in handling, made all of short threads or thrums, from among which appeare many small flowers, much more red or crimson then the tufts, which turne into a very small seede: the roote shooteth forth young suckers farre away, and round about, whereby it is mightily encreased.

The Vse of this Sumach.

It is onely kept as a rarity and ornament to a Garden or Orchard, no bodie, that I can heare of, hauing made any tryall of the Physicall properties.

22. *Vitis, seu potius Hedera Virginensis*. The Virginia Vine, or rather Iuie.

THis slender, but tall climbing Virginia Vine (as it was first called; but Iuie, as it doth better resemble) riseth out of the ground with diuers stems, none much bigger then a mans thumbe, many lesse, from whence shoote forth many long weake branches, not able to stand vpright, vnlesse they be sustained: yet planted neere vnto a wall or pale, the branches at seuerall distances of the leaues will shoote forth small short tendrels, not twining themselues about any thing, but ending into foure, fiue, or six, or more small short and somewhat broad clawes, which will fasten like a hand with fingers so close thereunto, that it will bring part of the wall, mortar, or board away with it, if it be pulled from it, and thereby stay it selfe, to climbe vp to the toppe of the highest chimney of a house, being planted thereat: the leaues are crumpled, or rather folded together at the first comming forth, and very red, which after growing forth, are very faire, large, and greene, diuided into foure, fiue, six, or seuen leaues, standing together vpon a small foote-stalke, set without order on the branches, at the ends whereof, as also at other places sometime, come forth diuers short tufts of buds for flowers; but we could neuer see them open themselues, to shew what manner of flower it would be, or what fruit would follow in our country: the roote spreadeth here and there, and not very deepe.

The Vse of this Virginian.

We know of no other vse, but to furnish a Garden, and to encrease the number of rarities.

And thus haue I finished this worke, and furnished it with whatsoeuer Art and Nature concurring, could effect to bring delight to those that liue in our Climate, and take pleasure in such things; which how well or ill done, I must abide euery ones censure: the iudicious and courteous I onely respect, let Momus bite his lips, and cate his heart, and so Farewell.

FINIS.

*A Table of the English names of such Plants
as are contained in this Booke.*

A.

W HITE Aconite	214
Yellow Aconite, or winter Welfesbane, ibid.	
Adonis flower	293
Alkanet, or Sea Buglosse	250
Anemone, or winde-flower, & the kinds	199 to 214
Yellow Anemone	194

Alisanders	490
Almond, and the kinds	583
Angelica	529
Apricocks	579
Apples, and the severall sorts	585
Double blossomed Apple tree	404
Apples of Loie	379
Thorne Apple	360
Arrach white and purple	488
Asarabacca	532
Asparagus	503
Asphodill and his kinds	146
Asphodill withilly flowers	148

B.

B Almony or Bentian	350
Balme	479
The Balsame apple	278
Barberies	561
Barbery Buttons, and Thorny Buttons	339
Barrenwort	283
Batchelours Button, double, white and red	254
Batchelours Buttons, yellow	218 & 224
The Bay tree	598
The Cherry Bay tree, or Bay Cherry	401
The dwarfe Bay	397
The Kings Bay, that is, the Cherry Bay	400
The Rose Bay	599
The Virginia Bay Cherry	400
The wilde Bay	192 & 258
The Bee-flower	330
Beares breech	235 & c.
Beares eares, and the sets	240
Beares eare Sanicle	344
Beares foote	489
Beets, and the kinds	521
Garden Beanes and French Beanes	353
Beil flowers, and the kiils	354 & 356
Canterburie Bels	354
Couentry Bels	

Blites	488
Bloodwort	484
The great blew Bindweed	359
The small blew Bindweed	360
Blew Bottles	326
Borrage, and euerliving Borage	249
Ladies Bower, and Virgins Bower single and dou- ble	393
Dwarfe Boxe and guiled Boxe	606
Flower of Brisson, or None such	253
Spanish Broome	442
Double flowred Brnifewort or Sopewort	352
Garden Buglosse	249
Marth buglosse and Sea buglosse	250
Burnet	483
Butterflie Orchis	192

C.

C abbage, and his kinds	503
Calues snout or Snapdragon	269
Double Camomill and naked Camomill	290
Rose Camion	252
Featherd wilde Camion single and double	253
The Crimson Cardinals flower	356
Carawayes	515
Caruations and Gilloflowers	306
Caterpillers great and small	340
Cassidemie	443
Lobels Catch flye	254
Clusius his Celastrus	604
Sweete Chernill or great Chernill	494
Garden Chernill	ib.
Party coloured Chickling	338
The Christma flower	344
The Cherry tree, and the kinds thereof	572
The double blossomed Cherry tree	402
The Cypresse tree	602
The sweet gum Cistus	422
Burning Clamberer or Climer	391
Hungarian Climer	393
Virginian Climer or Maracog	ibid
Coleflower, Colewort, Colerape	504
Columbines	271
Tufted Colembines	274
The prickly euer greene Corall tree	604
Corneflower	326
Corne sallies or Lambes Lettice	428
The Cornell tree	570
Costmary	487
Cotton weedes	375

Camomilla

The Table.
