To the Right honourable, Francis, Earl of Bedford, Lord Russel, Baron Russel of Thournhaughe, Lord Lieutenant of the County of Devon, and City of EXETER.

Right Honourable,

Sit hath pleased the sovereign Fountain of Light to shine upon the World in these later Times, by a more clear manifestation of those heavenly Mysteries, that concern

Eternal life and blessedness; so he hath also enlightned the minds of Men with knowledge in humane Arts and Sciences, and discovered many profitable Inventions unknown to former Ages. To speak of all, were a subject deserving of it self a peculiar Treatise. To speak of those that have reference to the Mathematicks, would require a larger Discourse than becomes this place. Amongst the rest, and of the highest rank, is that admirable Invention of Logarithms, by the famous

The Epistle Dedicatory.

John Nepair, late Baron of Marchiston: which hath been further perfected by the labours of Mr. Henry Briggs. And although the maturity of this Invention was prevented in them both, by their feveral and most happy changes, from this life to a better: yet they proceeded so far, as to lay a very good foundation for sundry conclusions Mathematical. Upon which foundation chiefly, I have grounded this present Treatise of the Dostrine of Plain and Spherical Triangles; annexing an application thereof, in the three principal kinds of Sailing. And howfoever (being rudely composed) it may feem unworthy the protection of one so eminent in place, and of fuch ripeness and judgement in all kind of Learning: Yet I am bold to present it to your Lordship, in confidence of your favourable acceptance according to that noble respect you are accustomed to manifest towards all good endeavours. The most High God, and Lord of all things, increase and continue unto your Lordship, all his bleffings, Temporal and Eternal.

Your Honours most devted,

Richard Norwood.

TO THE READER.

ARGAST SETOI

Ow necessary, and of what excellent use the Dostrine of Triangles is in Astronomy, Geography, Navigation, Fortification; and other parts of Architecture, in all the kinds of Perspective, in Dialing, and in the practice of other parts of the Mathematicks: is so much the better known unto every Man, by how much he hath been more exercised in these Arts.

For which cause there hath been for many former Ages, much time and diligence bestowed by most industrious and learned Men, to reduce it to as great perfection as they could; and much hath been done to this purpose of late years. But all that hath been done these many hundred years, is not comparable to that which hath been effected in our Times by the Honourable Lord John Nepair, Baron of Marchiston; who, by an Invention of Logarithms, takes away those Difficulties that were in the practice thereof. Which Invention hath been illustrated, and much perfected, by the labours of Mr. Henry Briggs. Neither is Mr. Edward Wright to be forgotten, though his Endeavours were soonest prevented. And these were the first that communicated their labours on this Subject to the World, being Men, as of singular Piety and Integrity of Life, so of that excellent knowledge in the Mathematicks, as few Ages afford the like. Of the construction and diverse application of Logarithms, Mr. Briggs bath written a Book called Arithmetica Logarithmica. And fince again, began another excellent work of like nature, entituled, Trigonometria Britannica. I have only seen (in the hands of a Friend of his) a printed Copy of so much as he had done, namely the Tables, and some part of the Treatise, touching the construction of those Tables : but whilest he was in hand with the rest, he departed this life. Wherefore having my self some years past (but especially this last Winter) bestowed more than ordinary pains in conforming the Doctrine of Triangles, to the nature of Logarithms now in use; and yet so, as the Rules might likewise be applied to natural Sines, Tangents and Secants, and also to instrumental Operations: and confidering the present mant of directions, and of ordinary Tables in this kind, I have thought good to publish these. If any man think it

TOTHE READER.

should be a hindrance to them who have been at the charge to print that which Mr. Briggs hath begun to write upon this Subject, he may be pleased to take notice. That though we both handle the same thing, yet it is in such a different manner, that there is scarce any one Proposition handled by us both; besides, his in Latin, mine in English: So that though his were finished, according to his intent and method, the one would little or nothing prejudice the other. I rather hope, as the case now stands, that this will further the sale of his; for asmuch as the Rules here delivered, may very aptly be applied to his Tables, and almost to any other. And they are such (especially for Spherical Triangles) as I doubt not will be found more easie for memory, and more ready for practice, than those that have been formerly used. If in some things you find me too brief, or otherwise faulty, I hope you will pardon it; so much the rather, because all this Summer, whilest this Work was printing, I was absent upon necessary occasions, above an Hundred miles. And to make some part of amends, I shall (God willing) be ready to give further satisfaction herein, by word of mouth, or otherwise, to those that desire it. As touching others that are bent to Detraction, and will be glad to snatch at every occasion for that purpose; I could wish them of a better mind, and to remember, That it is much easier to find faults in another Mans Work, than without the light thereof to make the like. I have detracted no Man, but have freely attributed to them whose Works I have used, that which is due unto them; defiring so to be dealt withal, as I deal by others, It may haply be expected, that I should have shewed the application of the Doctrine of Triangles, in the Mathematical Arts before mentioned, &c. But other necessary occasions withdrawing me, I had rather leave that untouched, than by making an imperfect application in every of them, heap together many titles, with little or no profit to the Reader. Yet I have been persuaded to annex hereunto certain Problems, touching the three principal kinds of Sailing. Which, with the rest, I commend to your friendly acceptance. Farewell.

og the profest mast of directions, and of ardinary Tables. I have doing't good to publish their thinks man think

1. The right lines applied to a Circle are Chorde, Sines,

CHAP. I. a a Circle, from one nore

Of the Line used in measuring Plain and Spherical Triangles.

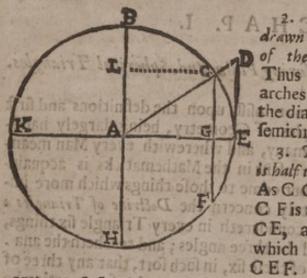

namely, the three fides, and the three angles; and teacheth the ana. logy and proportionality of these six, in such fort, that any three of them being known, the other three may by the rule of proportion be discovered: But seeing the sides of a Spherical Triangle are arches of a Circle, and the angles both of plain and Spherical Triangles are meafured by arches of a Circle, therefore the proportions of all these estrage Sine to them both. parts one to another cannot be declared, unless these arches be after a fort reduced to right lines; because the proportions of arches one to another, and of an arch to a right line, is not to this day found out.

These arches of a Circle are after a sort reduced to right lines, by defining the quantity which the right lines to them applied have, in respect of Radius, or the Semidiameter of the Circle. And it is to be understood, that every arch of a Circle is measured by degrees, minutes, seconds, thirds &c. a degree being such a part of a Circle as the whole circumference, whether great or little, contains 360. A degree is measured by minutes, and every degree is supposed to contain 60 minutes. In like fort, every minute contains 60 feconds, and every second 60 thirds, &c.

And although the measure of every arch cannot be exactly expressed by these parts, yet may it be so nearly expressed, that all sensible Error in ordinary use and application shall be avoided,

which is esteemed sufficient.

I. The right lines applied to a Circle are Chords, Sines, Tangents, and Secants.

A 12. A Chord is a right line drawn in a Circle, from one part D of the circumference to another. Thus C F is the Chord of the arches CEF, and CKF, also BH the diameter, is the Chord of the femicircles B E H, and B K H.

3. The right Sine of an arch, is half the Chord of twice that arch. As C G being half the Chord, C Fis the right Sine of the arch CE, also of thearch CB K: which arch CE is the half of

Whence first it is manifest, that the right Sine of an arch less than a Quadrant, is also the right Sine of an arch as much greater than a Quadrant: for as the arch C E is less than a Quadrant by the arch BC, fo the arch CK doth as much exceed a Quadrant, CG being the right Sine to them both.

So that properly the fine complement of an arch is the fine of the complement of a lesser arch unto a quadrant. As the complement of the lesser arch CE, unto a quadrant, is the arch CB, the sine whereof is CL, wherefore CL is properly said to be the sine of the complement of the arch CE.

Secondly, that the right fine of any arch, is a line falling from one end of that arch perpendicularly upon the diameter drawn to the

other end of that arch. As CG, is perpendicular to KE.

Thirdly, that the right fine of the Complement of an arch, is equal to that part of the diameter, which lieth between the right fine of that arch and the center. As CL, the fine of the complement of CE, is equal to A G.

4. The versed sine of an arch, is that part of the Diameter which lyeth between the right sine of that arch, and the circumference. Thus G E is the versed sine of the arch C E: and G K the versed sine of

the arch CBK.

5. If unto one end of an arch there be drawn a diameter, and to the other end a right line from the center cutting the circle; and if from the end of the diameter be raised a perpendicular till it concur with the line cutting the circle, that perpendicular is the tangent of that arch. As DE is the tangent of the arch CE.

6. The foresaid right line cutting the circle, is the secant of that arch?

Thus A D is the fecant of the arch CE.

7. Now to define or express in numbers, the quantity that these right lines have in respect of the semidiameter of the circle, is the construction

ons of the tables of natural sines, tangents and secants.

Thus supposing the semidiameter of the circle A Eto be 1000000 parts, and the arch C E to be 30 degrees, the right sine of that arch C G will be 500000 parts, the tangent E D 577350 parts, and the secant A D 1154701 such parts. The quantities of versed sines, and of the chords of arches, are not usually expressed in the Tables, because they are easily found by the right sines: As the versed sine of the arch C E, namely G E, is found by substracting the sine complement of C E, namely A G from the semidiameter A E: also the versed sine of the arch K BC, is found by adding the same A G, to the semidiameter A K. Also the chord of the arch C E F namely C F, is found by doubling the sine of half that arch, namely, by doubling

Tangents, and Secants of every arch of a circle not exceeding a quadrant. Which how to find is largely shewed by Lansbergius, Petificus, Mr. Henry Briggs, (which I have not yet read) and by others, therefore we pass over that. And intending to shew the resolution of plain and spherical triangles, after a more easie and compendious way, by Logarithms lately invented by the Honourable Lord John Nepair, Baron of Marchiston, and since surther perfected by the late learned Mathematician Mr. Henry Briggs, (both of ever worthy memory (we come in the next place to speak something of the nature and affections of those numbers, wherein I shall (as occasion requiteth) follow Mr. Briggs in his Arithmetica Logarithmica.

CHAP. II.

Of the nature and affections of Logarithms.

I Ogarithms are numbers, so fitted to proportional numbers, that themselves retain equal differences:

As let there be a rank of numbers how many foever in continual proportion, namely, 1. 2.

0014: 8. 16. 32. 64. 128. 256. and Numb. let there be as many other numproport. bers in any progression arithmeti-0 3 cal, as 3.5. 7. 9. 11. 13. 15. 17.19. 1 5 then forafmuch as these later are 7 equi-different (for every one dif-8 3 9 fers from his next by 2) therefore 16 11 12 they are logarithms to the former, 4 32 13 each to his correspondent. As 3 18 being the Logarithm of 1, and 5 64 8 15 128 17 21 of 2: 7 is the Logarithm of 4, and 24 9. of 8: and the like is to be understood of the rest.

So likewise 0.1.2.3.4.5.6.7.8 are Logarithms to the same numbers, and so are 0.3.6.9.12.15. 18.21. 24. And so infinite others

others might be found, observing that where numbers are in like proportion, the differences of their logarithms must be equal.

And as any of these three rows may be logarithms to the first, so they may be logarith to any other numbers in continual proportion.

If of four numbers, the first exceed the second as much as the third exceeds the fourth: then the sum of the first and fourth is equal to the

sum of the second and third, and the contrary.

As 8, 5, 5, 3, here 8 exceeds 5, as much as 6 exceeds 3, therefore the fum of the first and fourth, namely, of 8 and 3 is equal to the fum of the fecond and third, namely, of 5 and 6. And fo 9, 18, 15,24, where the fum of the extreams is 33, and so of the two middle ones. Bachetus in Diophantum.

3. If four numbers be proportional, the Logarithm of the first substracted from the sum of the Logarithms of the second and third, leaves

the Logarithms of the fourth.

As if the proportion be. As 256 to 32: fo 64 to a fourth num. ber : here adding 5 and 6 the logarithms of the second and third, the fum is 11, from which fub- Absolute agarith. stracting 8, the logarithm of the Numbers. 8 first, the remainder is 3. the lo-256 32 garithm of the fourth proporti-64 onal 8. II

For feeing (by supposition) the first number is in proportion to the fecond, as the third is to the fourth, therefore (by the firstdefinition of this second chapter) the logarithms of the first and second differ as much as the logarithms of the third and fourth, therefore (by the second proposition) the sum of the logarithms of the first and fourth, is equal to the sum of the logarithms of the fecond and third; therefore if from the fum of the logarithms of the fecond and third, be taken, the logarithm of the first, there remains the logarithm of the fourth.

Corollary. Hence it is evident, that if four numbers be proportional, the sum of the Logarithms of the first and fourth is equal to the sum of the Logarithms of the second and third. And if the sum of the Logarithms of the first and fourth, be equal to the sum of the Logarithms of the second and third, then is the first in proportion to the second, as

the third is to the fourth.

Let the proportion be

As 256 to 32 Logar. 8 Here the sum of the Logarithms of the first and fourth, namely, 8 +3 that is 11, is equal to the sum of the Logarithms of the second and third, namely, of 5+6 that is 11.

4. If instead of substracting the foresaid Logarithms of the first, we add his complement arithmetical to any number: the total abating that

number, is as much as the remainer would have been.

The complement arithmetical of one number to another (as here we take it:) is that, which makes that first number equal to the other; thus the complement arithmetical of 8 to 10 is 2, because 8 and 2 are 10. And so the complement arith. of 9, 76144 to 20,00000 is 10,23856, because 10,23856 and 9,76144 added together, are 20,00000.

Now then whereas (in the example of the third proposition before going) substracting 8 from 11, there remained 3; if instead of substracting 8, we add his complement arithmetical to 10, which is 2, the total is 13, from which abating 10, there remains 3 as be-

fore, and the like is to be understood of any other.

The reason is manifest, for whereas we should have abated 8 out of 11 we did not only not abate it, but added moreover his complement to 10, which is 2, wherefore the total is more than it should be by 8 and 2, that is by 10; wherefore abating 10 from it, we have the Logarithm desired.

Which rule although it be general, yet we shall seldom have occasion to use any other complements, than such as are complements of the Logarithms given, either to 10,0000000, or to 20,0000000,

as shall hereafter appear in due place.

And thus much of Logarithms in general, whereof (as is before noted) there might be fitted divers kinds, but we intend to use only that kind which were framed by Mr. Henry Briggs, at the request of the Baron of Marchiston; where a cypher is made the Logarithm of Unite or 1, and an Unite with many Cyphers the Logarithm of 10, and the rest fitted accordingly: these being the best kind, and the ground of all the best Tables of Logarithms historic put forth by any.

And of this kind are the Tables to this Book annexed, which want-

ing leasure to calculate my felf, I conferred together such as were formerly extant, and out of them have drawn thefe. It is true, that the first of these differs in form from all others, but I have ordered it thus, esteeming it most convenient and ready for ordinary use. The later shewerh the Logarithms of absolute numbers from 1 to 10000, and may be used for numbers far greater; the first sheweth the Logarithms of the Sines and Tangents of every degree and minute of the Quadrant, and also the Complements Arithmetical of the Logarithm of every Sine, which may serve as a Table of Secants. Which Logarithms of absolute numbers, Sines and Tangents, we may call Logarithmetical numbers, Sines and Tangents, or (with their first Inventour) Artificial Sines and Tangents, as being used for and instead of the natural. And thus if you enter the later of these Tables with any absolute number, you find against it his Logarithm, if you enter the first with any number of degrees and minutes, you find against it his artificialSine & Tangent, each under his proper title. As entring the Table with an arch of 30 degrees oo minutes, I find the artificial Sine thereto answering to be 9, 6989700, and the tangent 9, 761 4394, which are the Logarithms of the natural fine 500000, and of the natural tangent, 577350. And contrariwife a Logarithm being given, you may find the arch theretoanswering.

Of artificial fecants we make little use, but if you desire the artificial secant of an arch, substract the artificial sine of the complement of that arch from twice radius, or 20,000000, the remainer is the secant required. As if I desire the secant of 22 deg. 37': I find the sine of his complement to be 9,9652480, which substracted from 20,0000000, there remains 10,0347520, the secant of 22 deg. 37': the reason whereof is evident by the Corollary of the first Theoreme of Variety hereaster following, Chap. 4. instead of these secants we have set in the two last columns of the second Table the complements arithmetical of the sines, to every of which if you add radius or 10,0000000, they become secants: these being more necessary than the secants, and by which the secant of any arch is most readily found; for if the sine of an arch be in the sinft column, his secant is in the last, (adding as aforesaid radius) if the sine be in the second, the secant is in the last but one. As if I would have the secant

of 22 deg. 37', the fine thereof is in the first column, therefore I look for the secants in the last, where I find 0347520, to which adding 10,0000000 or 10, it is 10, 0347520, the secant of 22 deg. 37'.

5. Of the Character of Logarithms.

The Character or Characteristical note of every Logarithm in these tables is the first figure or figures towards the lest hand, distinguished from the rest by a Comma: and it sheweth of how many places above the place of unites, the absolute number to that logarithm belonging doth consist. And thus the character of the logarithms of every number less than 10 is 0, but the character of the logarithm of 10 is 1, and so of all other numbers to 100: but the character of the logarithm of 100 is 2, and so of the rest to 1000 and the character of the logarithm of 1000 is 3 and so of the rest to 1000; and so forward. Wherefore, by the character of a logarithm you may know of how many places the absolute number answering to that logarithm doth consist.

6. To find readily, the complement arithmetical of a logarithm.

The complement arithmetical of a logarithm (as it is most usually taken) is the residue of that logarithm unto 10,00000. As the complement arithmetical of 7, 1079054 is that which makes it up 10,0000000: if therefore 7, 1079054 be substracted from 10.00000000 the remainer is his complement arithmetical.

But to substract it readily, I begin (contrary to the ordinary course) with the first figure toward the left hand, and write the complement or residue thereof unto 9, and so I do with the rest, till I come to the last figure towards the right hand, and thereof I set down the residue unto 10. Thus for the complement arithmetical of 7, 1079054 I write, for 7 his residue unto 9, which is 2; for 1, 8; for 0, 9; for 7, 2; for 9, 0; for 0, 9; for 5, 4; and for 4, 6; and so I have this number 2, 8920946, which is the complement arithmetical of 7, 1079054 unto 10,0000000.

So if I desire the complement arithmetical of 9, 9652480 unto 20, 0000000: I write for 9, 0: for 9, again 0; for 6, 3 for 5,4; for 2, 7; for 4, 5; for 8,2; and the cypher: and so I have 0,0347520; and before all putting an unite it is 10,0347520, the complement

arithmetical required.

The complements ar ithmetical of the artificial fines are expressed

angents of their complements arithmetical of the tangents are the angents of their complements: as we shall further shew hereafter.

7. To find the Logarithm of a number that hath a fraction annexed,

as also of a proper fraction.

Reduce your number that hath a fraction annexed into an improper fraction, and substract the logarithm of the denominator from the logarithm of the numerator, the remainer is the Logarithm of the whole number and fraction proposed. As if I desire the logarithm of 13 3, I reduce it into an impro-

per fraction making it 3 and find. Numerator 40 1,6020900 ing the logarithm of 40 to be Denominator 3. 0,4771212 1,6020600, and the logarithm of 3 13 1,1249388 to be 0, 4771212, I substract the

later from the former, the remainer is, 1,1249388, which is the loga-

rithm of 13 1, required.

The reason is, for that every fraction (whether proper or improper) signifies some part or parts of an unite, the denominator shewing into how many parts the unite is divided, and the numerator shewing how many of those parts are by that fraction signified: Wherefore, as the denominator is in proportion to the numerator, so is 1 to the value of that fraction; therefore (by the corr. of 3 propochap. 2.) the sum of the logarithms of the denominator and of the fraction, is equal to the sum of the logarithms of the numerator and of 1; but the logarithm of 1 being 0, the logarithm of the numerator and of the fraction. Therefore if from the logarithm of the numerator be substracted the logarithm of the denominator, the remainer is the logarithm of the fraction. Thus in the foregoing examples.

As the Denominator 3. 0, 4771212 to the Numerator 40. 1, 6020600 So is 0,0000000 to 40: or to 13 \frac{1}{2}. 1, 1249383

And for the same reason we may in like manner find the logarithm of a proper fraction. Where it is to be noted, that seeing the logarithm of the unite 1, is 0, and every proper fraction is less than an unite; therefore the Logarithm of every proper fraction is less than o. As if we desire the logarithm of this proper fraction ; I find the logarithm of its numerator 2 to be

0, 3010300, and of its denominator 3 to be
0, 4771213, and substracting the later from
the former, there remains—0, 1760913,

3. 0,4771213 3. 0,1760913

for the logarithm of \(^2\) that is 0, 1760913, less than 0: which though it may seem strange to some, yet being a thing well understood by the skilful in Arithmetick, and of no great use here, I pass it over without further explanation.

8. To correct any number found in these Tables by the

part proportional

I put these things here at the beginning as the fittest place for them, not that I esteem it necessary for young beginners to have them all perfectly before they pass any further; for, for ordinary occasions the numbers in the Tables may (for the most part) satisfie without correction by the part proportional; especially if in plain triangles you reduce the measures of the sides into their smallest parts : as if a fide be given in paces, you may reduce it into feet or inches, (keeping within the compass of the Table:) if in poles you may reduce it into yards or feet: if in miles, you may reduce it into furlongs, poles or paces. Or, which is most easie and ready, you may reduce all meafures into decimal parts, as into tenthsand hundredth parts, putting behind the number given a cypher or two. As if a side of a plain triangle be 57 leagues, if we put a cypher behind, it will be 570 tenths of a league: if two cyphers it will be 5700 centesmes or hundredths of a league; and so for any other measures. And the question being wrought, the answer will come forth in the like parts, which are eafily reduced again to integers with their parts.

As suppose the side of a plain triangle given be 57 leagues, and we desire to find one of the other sides to the hundredth part of a league: I put behind it two cyphers, and so it becomes 5700, and working as you shall hereafter be directed, admit there come forth for the side required 3475, then I say, that the side required is 3475 centesmes or hundredth parts of a league, that is 3475

leagues, or 34 leagues and 75 centesmes of a league.

If there be a fraction annexed to your number given. As if you would reduce 57 leagues to centesmes, I put behind 57 two cyphers (that

(that is, I multiplyit by 100) and so it becomes 500: also I put behind the numerator of the Fraction, namely, behind 1, two Cyphers, and so it becomes 100, which divided by the denominator 3, the quotient is 33 (omitting the Fraction) which added to 5700, the sum is 5733: And so much is 57 1 leagues in centesmes of a league. If you would have it only in tenths, you put behind the whole number, and likewise behind the numerator of the Fraction, only one Cypher, and in all things else do as before: which being ease and common, I forbear to be large therein.

But when more exactness is required, you may attain to it by the part proportional, after the form of these examples following.

Example 1.

Let there be required the absolute number answering to this Logarithm 1, 9369826. Looking for this Logarithm in the Chiliads, I find not the same, but the nearest less than it is, 1,9344984, against which I find 86, which you may correct by the part proportional, thus. I change the Character given, making it to be 3, and so it becomes 3,9369826, for this I look in the Chiliads, but not finding the same, I find the nearest less than it to be 3,9369659, and against it this absolute number 8649; whence it appears, that the number answering to the Logarithm proposed, is 86,29, and something more.

But if you desire more exactness, as to correct it two places further; substract 3,9369659, the nearest lesser Logarithm from 3,9370161, the 3.9369826 differ. 167

which is here 502: Also substract the 3.9369659 differ. 502 lesser 3,9369659, out of the Logarithm

given 3,9369826, noting the difference which is here 167. Then fay by the Rule of proportion,

As the greater difference 502, is to the lesser 176:

So is 100 to 33 (and somewhat more, which we omit) which put behind 8649 towards the right hand, shews the number required to be 864933, and so is it verified to 6 places.

Example 2.

Let there be required the absolute number answering to this Logarithm 5,9369826.

Because the Character or Characteristick is here 5, therefore the absolute

absolute number answering to this Logarithm, must consist of fix places: whereas the absolute numbers in these Chiliads, confist but of four places: therefore changing the Character to 3, I look for 3,9369826, and find the nearest in the Table less than it to be

3,9369659, differing from it 167, and 3,9369826 differ. 167 against it I find the absolute number 8649, which I note: and the nearest 3,9369659 3 differ. 502 greater than the Logarithm given is 3,9370161, differing from his next before

found 502; therefore, I fay, by the Rule of proportion, As the greater difference 502, is to the lesser 167:

So is 100 to 33, which put behind 8649 towards the right hand, shews the number answering to the Logarithm given to be 864933: and so may you find any number not exceeding fix places, answering

to any Logarithm proposed.

If in either of these Examples you desire it but to five places, then for the third Number in the Rule of proportion (which is here 100) put 10, and so the Quotient will come out in one Figure, which put towards the right hand as before.

Example 3-

Let it be required to ifind the Logarithm answering to this abso-

lute Number 864933.

I find in the Chiliads the Logarithm of the first four Figures 8649, to be 3, 936659, and because the Number given consists of 6 places, the Characteristick must be 5, therefore 5,9369659, is the Logarithm of 864900. But to find the part proportional to be added to this Logarithm for the 33 remaining: I substract the Logarithm of 8649, from the Logarithm 8650, and find the difference to be 502: therefore, I fay, by the Rule of proportion,

As 100 is in proportion to 33: So is the difference 502 to 166 feré.

Which 166 added to 5, 9369659, the fum is 5.9369825, the Logarithm of the absolute Number 864933 required: if the absolute Number confift but of 5 places; then for the first Number in the Rule of proportion (which here is 100) put 10, and proceed as before.

And although in these three Examples, we have verified but to the fixth place of the absolute Number ; yet might we by these Tables

proceed

Proceed to the seventh place, seldom erring one whole Unite; the operation is after the same manner, save only instead of 100 used in the Rule of proportion, we put 1000.

And thus much touching the part proportional in the use of the first Table of Chiliads. Now for the second Table of Artificial Sines

and Tangents.

Example 4.

Let there be required the arch answering to this Artificial Tan-

gent 9, 6197888.

Looking in the Column of Tangents, I find not exactly the same, but the nearest less than it is 9, 6197205, being the Tangent of 22 deg. 37': therefore the arch required is 22 deg. 37', and some part of a minute more. Now if you desire to know what part of a minute, namely, how many seconds it is more, we may find it thus, I find the next greater than the Tangent given to be 9,6200762, from which substracting the 9,6197888 differ.683 next lesser, namely,9,6197205, the difference is 3557, also substracting this least 9,6200762 diff. 3557. from the Tangent given 9,6197888 the

difference is 683: I say therefore, by the Rule of proportion,

As the greater difference 3557, to the lesser 683: So is 60 seconds, to 11 seconds and something more.

Therefore the arch required, answering to this Tangent given 9,6198888, is 22 deg. 37', 11" and some part of a second more; but thus it is verified to a second.

And in like fort you may deal with any other, whether it be Sine

or Tangent.

Example 5.

Let there be required the artificial Tangent for this arch 22 deg. 37', 11". I find in the table the Tangent 22 deg. 37' to be 9,6197205, and the Tangent of 22 deg. 38' to be 9,6200762, the difference of these two is 3557, for one minute, or 60 seconds: therefore by the Rule of proportion,

As 60 feconds to 11 feconds: so the difference 3557, to 652; which added to the lesser 9, 6197205, the sum is 9,6197857, the artificial Tangent of 22 deg. 37'. 11". And in like fort you may find the artifical Sines or Tangents of other arches consisting of degrees,

minutes, and feconds.

The

The general Rule and reason for all these Examples, may briefly be this.

As the difference of any two next Logarithms in the Tables is to any part of that difference,

So is the difference of the two numbers to which they belong, to

the proportional part of that difference; and the contrary.

But because this holds truer in the latter part of the Chiliads where the numbers are great, than in the former; therefore we have shewed in the Examples (as occasion requires) how to bring the numbers proposed to the latter part of the Chiliads. And thus much touching the part proportional.

9. If one number multiply another, the Sum of their Logarithms is equal

to the Logarithm of their product.

As let the two numbers multiplyed together

be 36 and 15, the product is 540. I say then, 36. 1. 5563025 that the sum of the Logarithms of 36 and 15, 15. 1. 1760913 is equal to the Logarithm of 540, as here you 540. 2. 7323038

may fee.

The Reason is, for that (by the ground of Multiplication) As a Unite is in proportion to the Multiplier; so is the Multiplicand, to the product: therefore (by the Coroll. of the 3 Prop. Chap. 2.) the sum of the Logarithms of Unite and of the Product, is equal to the sum of the Logarithms of the Multiplier and Multiplicand: but the Logarithm of Unite is 0; therefore the Logarithm of the Product alone, is equal to the sum of the Logarithms of the Multiplier and Multiplicand.

And by the like Reason, if three or more numbers be multiplied together, the sum of all their Logarithms is equal to the Logarithm

of the Product of them all.

Corollary. Whence it is manifest, That the Logarithm of a number doubled, is the Logarithm of the square of that number: and the Logarithm of a number trebled is the Logarithm of the Cube of the same number, &c.

Thus the Logarithm of 4 being doubled, is the Logarithm of 16, which is the square of 4; and being trebled, it is the Logarithm of 64, which is the Cube of 4; as is here to be seen.

Logarithms.

4. 0.6020600
16. 1.2041200
16. 1.8061800

10. If one number divide another, the Logarithm of the Divisor Substracted from the Logarithm of the Dividend, leaves the Logarithm of the Quotient.

Logarithms. 540.2.7323938 be 15. I say then, if the Logarithm of 36, be substracted from the Logarithm of 540, there will re-

main the Logarithm of 15, as is here to be feen.

For seeing the Quotient multiplied by the Divisor produceth the Dividend, therefore by the last Prop. the sum of the Logarithms of the Quotient, and of the Divisor, is equal to the Logarithm of the Dividend: if therefore from the Logarithm of the Dividend, be substracted the Logarithm of the Divisor, there remains the Logarithm of the Quotient.

And by the like Reason, if the first Quotient be divided by a second Divisor, and the second Quotient by a third Divisor, &c. the sum of the Logarithms of all the Divisors, substracted from the Logarithm of the first Dividend, leaves the Logarithm of the last Quotient.

As if 540 be divided by 36, the Quotient is 15, which again divided by 5, the Quotient is 3: I say then, that if the sum of the Logarithms of the Divisors 36 and 5, be substracted from the Logarithm of the Dividend 540, there will remain the Logarithm of the last Quotient 3.

Corol. Hence it is manifest, that the half of the Logarithm of any number, is the Logarithm of the square root of that number; and that the third part of the Logarithm of any number, is the Logarithm of the cubique root of the same number.

Thus half the Logarithm of 64, is the Logarithm 64.1.8061800 of 8, which is the square root of 64: and the third 8.0.9030900 part of the Logarithm of 64, is the Logarithm of 4, 4.0.6020600 which is the cubique Root of 64, as by this Example may be seen.

And thus much for a taste of the nature and affections of Logarithms, sufficing for our present occasion: he that desires to be surther acquainted with the construction and diverse applications of them, may read Mr. Briggs in his Arithmetica Logarithmica.

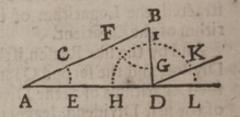

CHAP. III.

Of the Four fundamental Axioms of the Doctrine of Plain Triangles, and of the Cases deduced from them.

LEMMA.

The Three Angles of a Right lined Triangle, are equal to two right Angles: Euclid, Lib. 1. Prop. 32.

The Angles of a Triangle are measured (as we have said) by arches of a circle, the arch being described on an angular point as on a center: thus the Arch CE is the measure of the Angle at A; so that look how many degrees, mi-

nutes, seconds, &c. are in the arch CE, so much is the measure of the Angle at A. In like fort, the arch FG is the measure of the Angle at B, and IH the measure of the Angle BDA: and these three arches CE, FG, and IH, are 180 degrees, which is the measure of two right Angles (90 degrees being the measure of one right Angle) for these thee arches CE, FG, and IH, are equal to the semicircle HIKL: FG being equal to IK, and CE, to KL.

If therefore a Triangle be right angled, one of its acute Angles, is

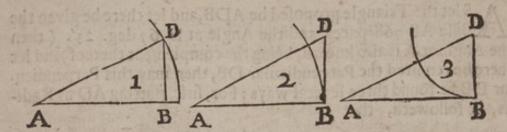

the complement of the other to 90 degrees.

If it be an oblique angled Triangle, yet one of his Angles substracted from two right Angles (that is, from 180 degrees) the remainer is the sum of the other two; or if the sum of two of its Angles be substracted from 180 degrees, the remainer is the third Angle.

AXIOM

AXIOM I. Of right angled Triangles.

In a plain right angled Triangle, any of the three sides may be put as Radius: and the other sides will be as Sines, Tangents or Secants.

A S if AD be Radius, or the semidiameter of the circle, or the whole Sine (for by these several names it is called) then BD is the Sine of the Angle at A, and AB the Sine of the Angle at D.

If AB be Radius (as in the second Figure) then BD is the Tangent, and AD the Secant of the Angle at A.

If DB be Radius (as in the third Figure) then AB is the Tan-

gent, and AD the Secant of the Angle at D.

And what proportion the side put as Radius, hath unto Radius: the same proportion have the other sides, unto the Sines, Tangents, or Secants by them represented.

As in the third Figure, look what proportion DB hath unto Radius: the same proportion hath AB, to the Tangent of the Angle at D, and the same hath AD to the Secant of that Angle: and the like is to be understood of the rest.

And from this ground are deduced the Corollaries or Cases following, for the resolution of plain right angled Triangles, by three

things known several wayes.

And for distinction sake, we call the side subtending the right Angle, the Hypothenusal: and one of the sides containing the right Angle, we call the Base, and the other side the Perpendicular. As in these Triangles, the Hypothenusal is marked with AD, the Base with AB, and the perpendicular with DB: and it will not be amiss to mark them always so. The right Angle is always one of the three things given.

In the Examples, s stands for sine: t for tangent: se. for sine complement: tc. for tangent complement: sec. for secant.

CASE I.

The Angles and Base given, to find the Perpendicular.

A Slet the Triangle proposed be ADB, and let there be given the Base AB 768 paces, and the Angle at D 67 deg. 23'. (then the Angle at A is also known, being the complement thereof) and let there be required the Perpendicular DB, then may this Perpendicular DB be found three several ways: For, first, putting AD as Radius, it followeth, that

As Sine the Angle at the Perpendicular s.D 67 deg. 23' 9.9652480 is in proportion to the Base:
AB 768 paces 2.8853612 so is Sine the Angle at the Base,
s. A 22-37. 9.5849685

In proportion to the Perpendicular, DB 320 paces, 2.5050817

Here (according to the 3 Prop. Ch. 2.) I add the Logarithms of the second and third, and from that sum substract the Logarithm of the first, and the remainer, which is 2,5050817 is the Logarithm of the fourth: Wherefore looking in the Table for the absolute number answering thereto, I find the nearest to be 320, which is the fourth number required. It is something more than 320, but for brevity, and the ease of the Learner, I omit the Fraction, having before shewed how to find it: And if (according to the Corol. of 3 Prop. Cap 2.) instead of substracting the Logarithm of the first, I add his complement Arith-

metical, that total abating s, D 67 deg. 23' comp.ar. 0.0347520 Radius is also 2,5050817 as AB 768 paces. 2.8853612 before, And the work stands s, A 22-37 9.5849685 in this manner. DB 320 paces 2.5050817

Thus having sufficiently explained the operation in this first Example, we shall be briefer in the rest that follow, understanding the like in them also.

2. If

2. If we make AB Radius, the proportion holds thus.

As Radius,	rad. f. 90 deg. cc. ar.
to the base:	AB 768 paces.

to the bale:
AB 768 paces.

2.8853612

fo tang. the angle at the base tA 22-37.

to the perpendicular:

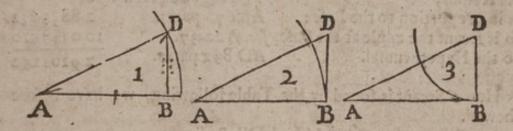

DB 320 paces.

2.8853612

9.6197205

2.5050817

Here because the compl. arith, of Radius (which is in the first place) is 0, therefore I set down in the first place only Cyphers or nothing,

3. If we make DB Radiue, then

As tange the angle at the perpent t D 67 deg. 23' co. 47. 9.6197205 is to the base:

AB 768 paces.

Solve to the perpendicular.

AB 768 paces.

DB 320 paces.

2.8853612

2.5050817

Because the Arithmetical complement of a tangent to twice Radius or 20.000000. is the targent of his complement (as hereafter shall be shewed) therefore in the former Example we have put for the complement Arithmetical of tang. D. his tangent complement, and so abate twice Radius: and the like you may always do when you have a tangent in the first place.

CASE 2.

The Angles and Base given, to find the Hypothenusal

L Et there be given AB 768 paces, and the angle D 67 deg. 23', and let there be required the Hypothenusal AD.

As fine the angle at the perpen. is in proportion to the Base: fo is Radius,	AD Radius. sD 67 deg. 23' co. ar. AB 768 paces.	0.0347520 2.8853612

i, in proportion to to is tang. the angle at the base, t A 22-37 DB 320 paces. to the perpendicular 2. 5050817

Mr. Briggs in his Arithmetica Logarithmica C. 19. but in the fe-

cond edit. C. 17. resolves this Case more readily thus.

Take the Logarithms of the sum and difference of the Hypothenusal and side given, half the sum of those two Logarithms, is the Logarighm of the perpendicular or side required. As, let

		Logarithm.
the fide given be 768 } the Hypothenusal 832 } di	e summ 1600 fference 64	3. 2041200 1. 8061800
the side require 320	fum åfum	5.0103000
the fide require 520	A	- 100,-100

The difference between this Logarithm here found, and that which was found by the former operation, ariseth chiefly by neglecting certain Seconds in the angle D, and consequently in the angle A; for the angle A is indeed 22 deg. 37' 11", and somewhat more:

And thus may right angled Triangles be distinguished into 7 Cases, though the resolution of all these Cases depends upon one Rule, which is the Axiom before put.

The three Axioms following are true in all plain Triangles, but are chiefly intended for the oblique angled; which now we come

to handle.

AXIOME II.

In all plain Triangles, the sides are in such proportion one to another, as are the sines of their opposite angles.

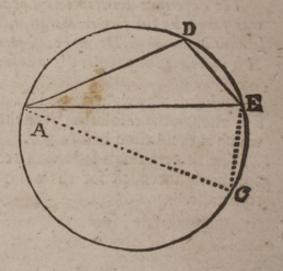

A Sin the Triangle ADE. As the side AD is in proportion to ED so is the sine of the angle at E, to the sine of the angle at A. And so of the rest.

Const. About the Triangle ADE, describe the Circle ADEC, by

5. 4 Euclid.

Demonst. Then are the sides of the Triangle ADE, as subtendents or chords in the Circle ADEC. So that as the chord of the arch AD is in proportion to the chord of the arch ED; so is the side of the Triangle AD, to the side ED; (and the like is to be understood of AE) But the half chords are sines of half the arches subtended by those chords; and as the whole is to the whole, so is the half to the half: Therefore as the sine of half the arch AD, is in proportion to the sine of half the

arch ED: so is the side AD, to the side ED. But half the arch AD, is the measure of the angle at E; and half the arch ED is the measure of the angle at A (by 20. 3. Euclid. therefore as the sine of the Angle at E, is in proportion to the sine of the angle at A; so is the side AD to the side ED: And the like is to be understood of the side AE, and his opposite angle at D. Therefore in all plain Triangles, &c. which was to be proved.

And seeing as the sine of E to the sine of A: so is AD to ED, therefore also alternately (by 16.5. Euclid.) As the sine of the angle at E, is in proportion to AD; so is the sine of the angle at A to the side ED, &c. Therefore,

CASE

CASE 8.

The angles of a Triangle, with one of the sides being given, to find any of the other two sides.

Et there be given the angle at A, 22 degrees 37'. and the angle at E 53 degrees 08'. and the fide AD 780 paces.

And let there be required the fide ED. Then by this Axiom

As the fine of an angle, sE 33 deg. 08'. to ar.
is to his opposite side given: AD 780 paces.
fo is the fine of another angle, sA 22-37
to his opposite side required. ED 375 paces fere.

0.0968917
2.8920946
9.5849685

Here it is not full 375 paces, but wants about four inches, but 375 is the number in the Table nearest agreeing to the Logarithm 2.5739548 without a fraction, and I would not trouble Beginners with fractions at sirst, having spoken sufficiently of them, Cap. 2. Sect. 7, and 8.

CASE 9.

Two sides being given, with an angle opposite to one of them:
to find an angle opposite to the other of them.

Dat. AD 780, ED 375, the angle at E 53 deg. 08'.

Required the angle at A.

As one of the fides given,

AD 780 par. c. a.

7.1079054

to the fine of his opposite ang.given,

fo is the other fide given,

to the fine of his opposite angle req.

\$AD 780 par. c. a.

7.1079054

9.903 1083

ED 375 parts.

2.57403 13

9.5850450

In the use of this last Case, the angle opposite to the greatest side being required, it will be sometimes doubtful whether it be acute or obtuse; for in the Triangle ADE, in the scheme of the second Axiom.

As ED 375 parts, to s A 22 deg. 37'. So AE 945 parts, to s D 104 deg. 15'. And in the Triangle AEC.

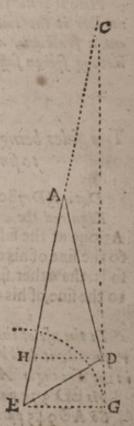

As EC 375 parts, tos FAC, 22 deg. 37

In either of which the operation is one and the same, and the sine found all one, though the angle in the one exceed a quadrant by 14 deg. 15', and in the other comes as much short: Because every sine of an arch less than a quadrant, is also the sine of the complement of that arch to 180 deg. Now this doubt cannot sometimes be otherwise cleared, but by delineating the Triangle as exactly as you can.

AXIOM III.

In all plain Triangles, as the sum of two sides, is to their difference: so is the tangent of the half sum of their two opposite angles, to the tangent of the difference of either of them, above or under the half sum.

Let ADE be an oblique Triangle, Conft. Make AC and AH each equal to AD, and draw DH, and parallel thereto draw EG; and draw a line from C-to D, extending it to G. Demonst. And for asmuch as AH is equal to AD. therefore (by 5.1. Euclid. the angle AHD is equal to ADH, and by the like reason the angle ACD, is equal to ADC, therefore the whole angle HDC is equal to both these angles CHD and HCD; therefore (by the corr. 31. 3. Euclid.) the angle HDC is a right angle. And for a much as EG is parallel to HD, therefore (by 29. 1. Euclid.) the angle EGC is also a right angle: for it is equal to HDC, and (by the same) the angle CEG is equal to CHD, and EDH to DEG. But (by 32. 1. Euclid.) the oneward angle AHD is equil to the two inward angles HED and EDH, but ADH common to both; then these two angles AHD and ADH, are equal to these two AED and ADE; therefore either of these two angles AHD and ADH is half the sum of those two angles AED and ADE, therefore also the angle CEG is half the sum of the same angles AED and ADE.

Now

Now if to one of the sides of a triangle there be drawn a parallel, it divides the other sides proportionally (by 2. 6. Euclid.) therefore as CH is in proportion to HE, so is CD to DG: therefore also composed (by 18.5. Euclid.) As CE to HE, so is CG to DG: that is,

As CE the sum of the sides AE and AD, is in proportion to HE their difference:

so is CG the tangent of half the sum of the angles AED and ADE, to DG the tangent of the angle DEG, being that which the angle AED comes short of the half sum: as HDE is the excess of the angle ADE, above the half sum.

Therefore in all plain triangles, as the sum of two sides, is to their dif-

ference; so, &c. which was to be proved.

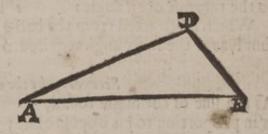

Therefore in any plain oblique triangle:

CASE 10.

Two sides, with their contained angle being given: to find the other angles.

AXIOM IV.

In oblique Triangles, as the true base is in proportion to the sum of the sides: so is the difference of the sides, to the alternate base.

As in the oblique Triangle ADE.

Case 1.

Admit AE to be the true base, Const. Upon the point D, and distance DE, (DE not exceeding DA) describe the circle IEFG; and producing AD to C, let fall the perpendicular DB, and draw the tough line AG. Then DC and DF, being each of them equal to DE; AC is the sum, and AF the dif-

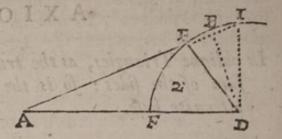

I say then, as the true base AE, as to the sum of the sides AC. So is the difference of the sides AE, to the alternate base AI.

Demonst. For seeing that from a point without the circle A, there is drawn the line AC cutting the circle, and the line AG touching the circle, therefore (by 36. Prop. 3. Euclid.) the rectangle signre of AC and AF, is equal to the square of AG: and by the like reason, the rectangle of AE, and AI, is equal to the square of AG. Therefore the rectangle of AC and AF, is equal to the rectangle of AI and AE. But equal rectangles have their sides reciprocally proportional (by 14 Prop. 6. Euclid.) Therefore as AE is in proportion to AC, so is AF to AI. Which was to be proved.

And this Case might suffice, there are two others, which are as fel-

Case 2.

The like demonstration serves for the other two cases in this Axiom, namely, if we let fall the perpendicular from E, making AD the base. For then upon the center E and distance ED. (ED not exceeding EA) describe the

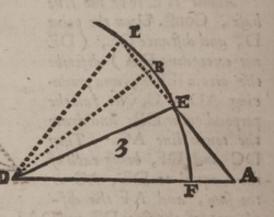

circle, &c. proceeding as before: and if you place the letters as in this second figure, it will be agreeable to the words of the former demonstration: Supposing AD extended to C.

Or if the perpendicular be let fall from A, making DE the base, then on the center A, and distance AD (AD not exceeding AE) describe a circle, and so proceed as before. And if you place the letters as in the third figure, it will be agreeable to the former demonstration: Supposing AD extended to C.

alternate base.

CASE 12. Three sides of an oblique triangle being given: to find an angle

Dat. AE 189 paces, AD 156 paces, In the first triangle.

First, (by this fourth Axiom) I resolve it into two right angled triangles, thus.

As the true base, AE 189 pac. co. ar. 7.7235382 is to the fum of the fides (AD+ED) 23 1 pac. 2.3636120 fo is the difference of the sides (AD-ED) 81 pac. 1.9084850 to the alternate base 99 pac.

Having thus the true and alternate base, substract the lesser from the 1.9956352 greater, and in the middle of the remainer falls the perpendicular: (by 3 Prop. 3. Euclid.) resolving the oblique triangle into two right angled triangles, in either of which the hypothenusal and base is known. As the difference of the true and alternate base being 90 paces, the half is EB 45 paces (serving to find the angle at E) being the base in the right angled triangle EBD.

Which half here substratted from the true base AE 189 paces, leaves the base in the other right angled triangle ABD, namely, AB 14+ paces;

ferving to find the angle at A.

Then in the right angled triangle ADB, having the base AB 144 paces, and the hypothenusal AD 156 paces; we may find the angle at A (by the 6 Case before going) thus.

As the hypothenusal, AD 156 parts, co. ar. 7.8068754 is in proportion to Radius: 500 deg. 00'. fo is the base sound, AB 144 parts. 2.1583625

to the fine of the complement 3sc. A 67 23 9.9652375 of the angle at the base. 3sc. A 67 23 9.9652375 the complement whereof 22 deg. 37' is the angle at A required.

In like manner might be found the angle at E.

In fetting down this fourth Axiom, I have followed the Lord Ne-

pair: Pitiscus and others have it thus.

As the greatest side is to the sum of the other two sides; so is the difference of these two, to a part of the greatest: which taken from the great-

est, the perpendicular falls in the middle of the remainer.

As in the first figure before going; as the greatest side AE, is to the sum of the other sides AD and ED (that is AC:) so is the difference of those sides AF, to a part of the greatest AI: which taken from the greatest, the remainer is IE, in the middle whereof at B, salls the perpendicular.

Which differs little from the former, and is demonstrated in the

fame manner.

Now that you may at once have a view of that which we have before in this Chapter more largely handled, I have digested into this
Table the things given and required in the example of every Case,
expressing also briefly their proportion and operation; so that hereby you may be sufficiently directed for the resolution of plain triang es. Though I would rather advise every man to commit to memory the four Axioms before going, and to ground his practice thereon.

CHAP. IV:

PITISICUS in his Trigonometria, hath four Theorems for the varying of proportions, and for the finding out the thing required in a plain or sperical triangle several ways: which briefly are in effect as followeth.

The Grounds or Theorems for varying the terms of the proportions of Sines, Tangents and Secants.

Theorem i.

The proportion of Radius to a sine, tangent or secant; and contrariwise the proportion of a sine, tangent or secant to Radius: may be varied three wayes, by the first Axiom of plain Triangles.

As sine DB, to Radius AD; in the first triangle, And the confo Rad. DB, to secant AD; in the third triangle, S verse. So tang. DB, to secant AD; in the second triangle.

As tangent DB, to Rad. AB; in the second triangle, And the confo is Radius DB, to tang. AB; in the third triangle, verse. So verse.

And the like is to be understood of secants, but this may suffice.
Hence then,

As the sine of an arch or angle, is to Radius: 3 And the converse; and so is the tangent of that arch, to his secant; 5.

Alfo

As the tangent of an arch or angle, is to Radius: S And the convers. fo is Radius, to the tangent complement thereof: And the convers. and so is the sine thereof, to the sine of its compl.

Hence it is evident, that Radius a mean proportional between the fine of an arch, and the secant of the complement of the same arch: also between the tangent of an arch, and the tangent of the complement of the same arch.

And hence it is, that the complement arithmetical of the artificial fine of an arch; is the artificial fecant of that arches complement. And the complement arithmetical of the artificial tangent of an arch, is the tangent of the complement of that arch. (Here you are to understand the complement arithmetical to twice Radius, or to 20.0000000.)

For seeing the to Radius:
proportion is fo is Radius

Therefore (by 3 Prop. Chap. 2.) an artificial tangent substracted from twice Radius, leaves the tangent of its compl.

Or (by the Corollary of the 3. Prop. Ch. 2.) a tangent added to

the tangent of his complement, is equal to twice Radius.

And the like is to be understood of the fine of an arch, and the secant of the complement thereof.

Theorem 2.

The sines of several arches, and the secants of their complements are reciprocally proportional. That is,

As the fine of an arch or angle, is to the fine of another arch or angle: fo is the secant of the complement of that other, to the secant of the complement of the former.

Demonst. For (by the foregoing Corollary) Radius is the mean proportional between the fine of any arch, and the secant of the complement of the same arch.

Therefore

Therefore the rectangle of any fine, and of the secant of his complement, is equal to the square of Radius (by 17. 6. Euclid.) so that all rectangles made of the sines of arches, and of the secants of their complements, are equal one to another.

But equal rectangles have their fides reciprocally proportional

(by 14.6. Euclid.) Therefore, &c.

Theorem 3.

The tangents of several arches, and the tangents of their complements, are reciprocally proportional. That is,

As the tangent of an arch or angle, is to the tangent of another arch or angle:

So is the tangent of the complement of that other, to the tangent of the complement of the former.

Demonst. For (by the foregoing Corollary (Radius is the mean proportional between the tangent of every arch, and the tangent of

his complement.

Therefore the rectangle made of any tangent, and of the tangent of his complement, is equal to the square of Radius (by 17.6. Euclid. so that all rectangles made of the tangent of arches, and of the tangents of their complements, are equal one to another.

But equal rectangles, &c. as before.

Theorem. 4.

If four magnitudes be proportional: then alternately also they are proportional: 16 Pro. 5. Euclid.

And the like is to be understood of Numbers.

As if 3 be in proportion to 4; as 9 to 12, then also,

As 3 is in proportion to 9; fc is 4 to 12.

And hence (whereas we have before throughout this book compared fides, to the fines and tangents of angles, &c.) we may compare fides to fides, and angles to angles, as in the exemplary Table we have done.

And thus much touching the doctrine of Plain Triangles.

THE

THE

DOCTRINE

OF

SPHERICAL TRIANGLES.

CHAP. I

Of circles of the Sphere, and their Intersections; and of the kinds and affections of Spherical Triangles in general.

O define in this place the several circles of the Sphere, were superfluous, because they are best understood in the use of the Sphere or Globe, wherewith it is requisite the Reader should be acquainted (at least in part) before he apply himself to the Dostrine of Spherical Triangles. Therefore passing by these, we come to those things which more immediately concern our present purpose.

Prop. 1. The sides of a Spherical Triangle are three arches of

great circles, every arch being less than a semicircle.

Therefore the arches of parallels, or other lesser circles of the Sphere, are not to be taken as the sides of a Spherical triangle.

2. A great circle of the Sphere, is that which divides the Sphere equally into two Hemispheres: and is every where distant from its own poles, by a quadrant, or fourth part of a great circle.

Thus the Equinoctial is a great circle of the Sphere, dividing it equally into the Northern and Southern Hemispheres; and it is every where distant from its own poles (namely, from the North and South poles of the world) by a quadrant, or 90 degrees. The like is to be understood of the Ecliptick, and of all Horizons, Meridians, Azimuths, and of all other great circles of the Sphere.

3. A spherical angle is measured by the arch of a great circle, described on the angular points as a center, between the sides being extended to quadrants.

Thus in the Scheam next following, the angle ADE is not measured by the arch A E, but by the arch I B: because I B is described on the angular point D, as a center between the fides DA and DE,

being extended to quadrants.

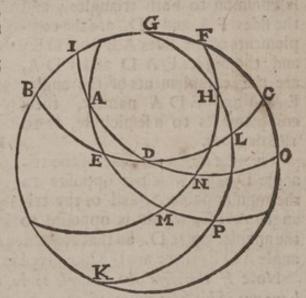

4. Any two great circles of the Sphere, intersect one another in two opposite points, making the angles at those points equal one to another and either of them equal to the distance of the poles of the same circle.

As the Equinoctial and Ecliptick intersect one another in the points of Aries and Libra, which points are directly opposite one to another, being distant a semicircle or 180 degrees; and the an-

gle by them comprehended at the beginning of Aries, is equal to that by them comprehended at the beginning of Libra: and eia ther of these angles is equal to the distance of their poles,

namely, 23 deg. 31'.

Thus also in this Scheam the azimuth G L K interfects the meridian G CK in the opposite points G andK(that is in the Zenith and Nadir) the angle of their interfection at G, being equal to that at K3 either of which angles is measured by the

arch of the Horizon CL, which is equal to ED, the distance of

the poles of the fame circles.

Corol. Therefore if a great circle of the Sphere pass by the poles of another great circle, it divides the same at right angles; and the converse.

5. Every

5. Every spherical triangle hath opposite to each angular point another triangle, having the same base with the former, and the angle opposite thereto equal, the other parts of it are the complements of the several parts of the former to a semi-circle.

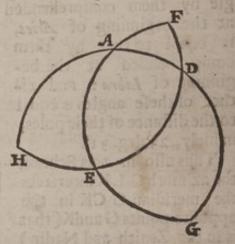

Let ADE be a spherical triangle, and extend the sides thereof DA and DE, till they concur at H, also AD and AE, till they concur at G; and lastly, EA and ED, till they concur at F. Then are the arches DAH, DEH, AEG, ADG, EDF, and EAF, semicircles (by the fourth Proposition.) And thus to each angular point of the triangle ADE, there is opposite another triangle having the same base with the former, &c. As to the angular point E, there is opposite the triangle AFD; whose angle at F is equal

to the angle at E, and the base AD is common to both triangles; and the sides F A and FD, are the complements of the sides A E and DE; and the angles F A D and FD A, are the complements of the angles E AD and E D A namely, their complements to a semicircle, or to 180 degrees.

The like might be faid of the triangle D G E, which is opposite to the angular point A, and of the triangle A H E, which is opposite to

the angular point D. So that any three things being given in the triangle ADE, there are the like given in every of these triangles.

Note If therefore the triangle to be refolved be obtuse angled, or have two of his sides either of them greater than a quadrant: though you might sind out the thing required in that, yet it will be more convenient to resolve one of the least of the three triangles opposite to his angular points. As if a question were proposed in the triangle ADE, it may more conveniently be wrought in the triangle AFD.

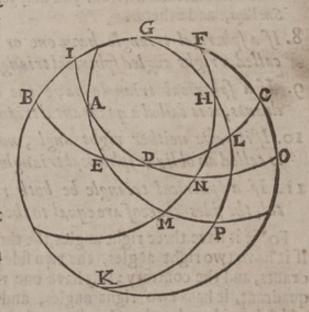

6. If three great circles make by their intersections a spherical triangle; and if the poles of those circles be the angular points of another spherical triangle: the angles of the sirst triangle shall be equal to the sides of the second, and the sides of the sirst, to the angles of the second. If only instead of the greatest side, or greatest angle, you take the complement thereof to a semicircle.

This is apparent by the fourth Proposition of this Chapter; and both this, and the latter part of that may be surther manifested thus.

Let AD be an arch of the Equinoctial, A E an arch of the Ecliptick, E D an arch of the Horizon, making the triangle ADE; and let G be the pole of the Horizon, F the pole of the Equinoctial, and H the pole of the Ecliptick. Then on the point A as a center, and at the distance of a quadrant or 90 degrees A M or AN, describe the arch MN which (by the third Proposition) is the measure of the

angle at A, and in like fort OC, the measure of the angle at D, and P L, the measure of the complement of the greatest angle AED to a semicircle. And forasmuch as the arch M N is distant from A 93 degrees, and the poles of the arches AD and AE, namely, F and H, are also (by the fecond Proposition) distant from the same point A 90 degrees; therefore the arch M N being produced, will pass by the poles H and F. And for the like reason, the

arch OC, will pass by the poles F and G. And P L by the poles H and G, so making the triangle GHF. I say then, that the sides of the triangle GHF, are equal to the angles of the triangle AED.

For the quadrant F N is equal to the quadrant M H, and taking away

way N H, which is common to them both, there remains the side F H, equal to M N; which arch M N is the measure of the angle at A. And by the like reason GF is equal to CO, the measure of the angle at D, and G H is equal to LP, the measure of the complement of the greatest angle A E D to the two right angles. And in like fort we may prove that the side A E, is equal to MP, the measure of the angle at H; and E D equal to LC, the measure of the angle at G; and A D equal to NO, the measure of the complement of the greatest angle GF H to 180 degrees. Therefore, If three great circles make by their intersections a triangle, &c. which was to be proved.

Corollary.

Hence it is evident, that the angles of a spherical triangle, may be changed into sides, and the sides into angles.

7. The three angles of every spherical triangle, are greater than two right angles.

The demonstration hereof you may see in Regiomontanus, Pitiscus, Snellius, and others.

- 8. If a spherical triangle have one or more right angles, it is called a right angled spherical triangle.
- 9. If a spherical triangle have one or more of his sides quadrants, it is called a quadrantal triangle.
- 10. If it have neither right angle, nor any side a quadrant, it is called an oblique spherical triangle.
- 11. If a spherical triangle be both right angled, and quadrantal, the sides thereof are equal to the opposite angles.

For if it have three right angles, the three sides of it are quadrants; if it have two right angles, the two sides subtending them are quadrants, and the contrary; If it have one right angle, and one side a quadrant, it hath two right angles, and two quadrantal sides: all which is evident by the Corollary of the fourth Proposition. But if two sides be quadrants, the third measureth their contained angle by the third Proposition. Therefore for the solution of these kinds of triangles, there needs no surther Rule.

To these, we may add three Propositions set down by the Baron of

Merchistone, in his Book of the use of the admirable Table of Logarithms: being as followeth.

12. Two oblique angles of a spherical triangle, are either of them of the same kind of which their opposite sides are.

Therefore knowing of what kind the one is, itappeare thalfo of what kind the other is.

13. If any angle of a triangle be nearer to a quadrant than his opposite side: two sides of that triangle shall be of one kind, and the third less than a quadrant.

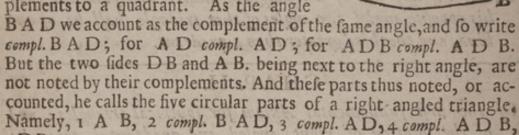

14. But if any side of a triangle be nearer to a quadrant than bis opposite angle, two angles of that triangle shall be of one kind, and the third greater than a quadrant.

CHAP. II.

Of the first fundamental Axiom for spherical triangles: and of the solution of right angled and quadrantal triangles thereby.

ITISCUS, and others to these times, for the solution of right angled spherical triangles (not medling with quadrantals) have delivered two Axioms; by help whereof, two things given (besides the right angle) a third may be found. But for the most part, the sides of the triangle must be produced, that so there may be divers triangles made by their interfections, confifting of the parts of the first, or. of the complements of those parts diversly. And then it must be confidered, to which of all those triangles one of the said Axioms may aptly and immediately be applied, for finding the thing required, or the complement thereof. But the honourable Lord Nepair, amongst many excellent Propositions by him framed in the Doctrine of Triangles, hath two, which we intend to make use of, as fundamental Axioms for the folution of all the cases of spherical triangles. The first ferving for the folution of right angled and quadrantal triangles, without producing any fide, which after some preparation thereunto, we will let down with some little alteration, answerable to the nature of the Logarithms now in ule.

It is first to be understood, that a right angled spherical triangle hath five parts besides the right angle; which he calls the natural parts: as the triangle A B D, right angled at B, hath the side A B, the angle at A, and the Hypothenusal A D, the angle A D B, and the side D B. Three of these parts which are farthest from the right angle, namely, the angle B A D, the Hypothenusal A D, and the angle A D B, we mark or note by their complements to a quadrant. As the angle

Likewise the quadrantal triangle A D G (whose side D G is a quadrant (hath five parts besides the quadrantal side. Namely, the side A G, the angle at G, the angle G D A, the side A D, and the angle D A G, which we may call his natural parts. But three of these parts, which are furthest from the quadrantal side, namely, the side G A, and the angle G A D, and the side A D; we account as the complements of the same parts, and so note them by their complements. As complement G A, complement G A D, or D A B (which is all one) complement A D. The other two angles A D G and D G A, being next to the quadrantal side, are not noted by their complements. And these five parts thus noted or accounted, he calls the five circular parts of a quadrantal triangle. Namely, 1 complement A G, 2 A G D, 3 G D A, 4 complement A D, 5 complement D A G or D A B.

Now of these five parts, two are always given to find a third; and of these three one is in the middle, and the other two are extreams, either adjacent to that middle one, or opposite to it. As in the triangle ADB, AB and ADI ying next to the angle DAB, are said to be adjacent extreams to A; and for the like reason, the an-

gles

gles BDA and BAD, are extreams adjacent to the hypothenusal AD, and so are AD, and DB, to D; and D and AB, to DB: and lastly, DB and A, to AB; for the right angle at B, is not reckoned amongst the five circular parts. So also AB and A, are said to be opposite extreams to the angle ADB, because neither of them are adjoining to it: also A and AD, are opposite extreams to DB; AD and D, to AB; D and DB, to A; DB and AB to AD.

And the like is to be understood in the quadrantal Triangle DAG; namely, that the angles at D and A, are extreams adjacent to AD; AD and AG, to A; A and G, to AG; AG and D, to G; G and DA, to D, and in like manner AG and G are opposite extreams to AD; G and D to A; D and AD, to AG; AD and A, to G; A and

AG to D.

I. Fundamental A XIOM.

Of the five circular parts in a spherical Triangle, right angled or quadrantal.

THE sine of a middle part with Radius, is equal to the tangents of the extreams adjacent; or to the sines complement of the opposite extreams.

Understanding by fines and tangents, the artificial fines and tangents, that is, the Logarithms of the natural fines and tangents.

As Radius, to the tangent of one of the extreams adjacent is fo is the Tangent of the other extream adjacent, to the fine of the middle part.

As Radius, to fine complement of one of the opposite extreams: so is sine complement the other opposite extream, to the sine of the

middle part.

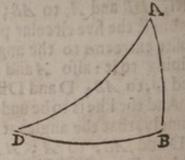

The demonstration hereof, he hath briefly shewed in his Book of the use of the admirable Table of the Logarithms: and we more sulve ly at the end of this Book. Therefore we will here only illustrate it by Examples, as followeth.

In the right angled Triangle ABD, we have shewed before how AB and AD are extreams adjacent to the angle at A: and that AD, as also the angle A, are noted by their complements. Therefore by

Book II.

this Axiom, the fine of the complement of the angle at A. added to Radius, is equal to the tangent of the complement of AD, ad-

ded to the tangent AB, which we may briefly express thus: sc. A - Radius == tc. AD+t AB: which is as much as to fay, fine complement A, more Radius, is equal to tangent complement AD, more tangent AB; this fign + fignifying more, or addition, this == equality, this -less, or substraction; as we have before noted upon the third Axiom of plain triangles.

Now admit AD 74 deg. 50'; tc 9.4330804,__A70 deg.03' 03" sc. 9.5329939 AB 51 32; t 10.0999135;

19.5329939 Here the tangent of the complement of AD, being added to the tangent of AB, the fum is 19.5329939; so also the fine of the complement of A, added to Radius, the total is 19. 5329939, as the other : and here the angle A is 70 deg. 03', 02", 35", but we neglect the thirds. Again (by the later part of this Axiom) the fine of the complement of the angle ADB, more Radius, is equal to the fine of the angle at A, more the fine of the complement of the fide AB, which we express thus: fc D-|- Rad == sA -|- fc AB; which may thus ap-

Then is A70 deg. 03' 03" 5 9.973 1255 __ D 54 deg. 12' 58". sc 9.7669572

AB 51 32 00" sc 9.79383 17 Radius 10.0000000

19.7669572 19.7669572 So also (by this Axiom) in the quadrantal triangle ADG, the fine of the complement of the angle at A more Radius, is equal to the tangent of the complement of AG, more the tangent of the complement of AD; which we express thus: fc A + Rad. == 10 AG + se AD which may thus appear. simbAneangle A are noted b

Admit

AG 38-d. 28'; \$\tau 10.0999135 = A 70 deg. 03' 03" \(\text{fc} \) 9.5329939 \\

19.5329939

And the like is to be understood of the rest, as by this Table following may appear.

1 s $DB \mid Rad = s AD \mid s A$ 2 fc $D \mid Rad = fc AB \mid s A$ 3 fc $AD \mid Rad = fc DB \mid fc AB$ 4 fc $AD \mid Rad = tc D \mid tc A$ 5 fc $A \mid Rad = t AB \mid tc AD$ 6 s $AB \mid Rad = tc A \mid t DB$ Or in stead of the second, we may say 2 so A - Rad = so DB - s D And in like fort he that list-eth, may set down the equality of the sines and tangents of the other sides and angles; and so there will be 10 of these, of every of which, according to the things

given and required he may make 3 cases, and so 30 in all, answerable to the several positions of the letters; as is done by the Honourable Lord Nepair: If instead of the equality of the two terms on the one side of the Equation, to the two terms on the other, you would express the proportion of the four terms, it sufficeth to put the terms reciprocally: As whereas in the first it is said s DB-+ Radius == s AD+ s A, we may put the terms reciprocally, and say, as Radius, to sine AD, so is s A to s DB, or as Radius to s A, so is s AD to s DB, putting alwayes the term which is sined with the term required, for the first number in the rule of proportion, and the two terms that are on the other side of the Equation, the one in the second place, and the other in the third place of the Rule of Three. But this may here suffice; for to these may the sixteen cases of a right angled spherical triangle be reduced, namely, 3 to the first, 3 to the second, 2 to the third, 2 to the fourth, 3 to the fifth, and 3 to the sixth.

As admit there were given the hypothenusal AD, and the angle at A and required the side DB; then by the first, seeing that AD - A is equal to AD - A and AD - A is equal to AD - A and AD - AD and AD and AD we substract Radius, the remainer is the sine of AD and AD an

Secondly, admit there were given AD and DB, and required the angle at A, then feeing sDB +Rad. == sAD + sA; therefore if from sDB + Radius, we substract sAD, the remainer is A.

Or thirdly, if there were given DB, and the angle at A, and required the hypothenusal AD; then forafmuch as s DB - Rad. = sAD - sA; therefore if from the fum of sDB - Rad. we fubstract s A, the remainer is s AD; and the like is to be understood of the rest.

For if from equal things, we take equal things, the remainers are

equal.

Asif 6 -1 10 be equal to 9 + 7; then if from 6 + 10, that is, from 16, we take 9, the remainer is 7; or if we take away 7, the re-

mainer is 9 &c.

So also in the quadrantal Triangle ADG (whose fide DG is a quadrant) the equality of the artificial fines and tangents of the parts, is fuch as here appeareth,

15 G-Rad = 5 A- 5 AD 2 sc AG - Rad = sc D - s AD 16 cases of a quadrantal Tri-A -- Rad = 10 G -- fo D G--Rad =tc AG--t D 5 fc AG -- Rad = tc A -- t G 6 fc A -- Rad = tc AG -- tc AD

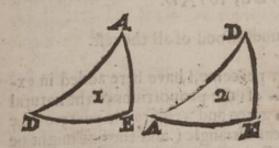

And to these 6. may the angle be reduced, in fuch fort as we have before touched in right angled Triangles, and shall further manifest in the Table following, though

we do not in all places retain the fame letters.

But because the work being thus ordered, would for the most part be performed by substraction, whereas it is something easier to add, than to substract; therefore you may instead of substracting a fine or tangent, add his complement arithmetical, whereof we have before spoken, and so the work may be conformable to these Tables following; whereof one ferveth for right angled Triangles, the other for quadrantal.

In the use of these Tables, you are to mark the things given and required, with the letters in that Case given and required; and you must cut off from every sum, Radius or 1 in the first place towards the left hand; for indeed & AB - t A, is equal t DB - Radius. and so of the rest; except where you have the complement arith. of a fine, as your own reason in the use of this Table will direct An Exemplary Table of the resolution of the several Cases of right angled spherical Triangles.

in all these Cases, the quadrantal side is marked with DG, and the opposite angle with A.

And thus we have shewed in these Tables, the Equality of the artificial Sines and Tangents of the things given and required in all such spherical Triangles as have either a right angle, or one of their sides a quadrant: But if you desire the proportion of their natural sines and tangents; it is

As Radius, to the first of the three, to is the second to the third.

Except there be the complement arithmetical of a fine, for then

As that fine is to Radius:

fo is the fecond in these Tables to the third.

Example of right angled Triangles.

1 Case. s AB; + t A == t D B.

Therefore, as Radius, to s AB; for A to t DB.

5 Cafe. Compl. Arith. s. A- s DB == s AD.

Therefore, as s A to Radius; fos DB, tos AD.

And the like is to be understood of all the rest.

Which that you may the better perceive, I have here added in express words, the Canons or Rulal of the proportions of the natural Sines and Tangents of the things given and required in every of the 16 Cases of a right angled spherical Triangle (and the like might be done for quadrantals) all which Rules (as may easily be perceived) depend upon the fundamental Axiom before going, and the Corollary of the third Proposition of the second Chapter of plain Triangles; and here the side subtending the right angle, we call the hypothenusal, the other two containing the right angle, we may call simply the sides; but for farther distinction, we call one of these containing sides (it matters not which) the base, and the other the perpendicular.

The bafe and angle at the bafe given: to find dicular. the perpendic. thenusal.

1. The perpe- As Radius, to the sine of the base: so is the tangent of the angle at the base, to the tangent of the perpendicular. 12. The angle at As Radius, to fine compl. the base : so is fine the angle at the base, to sine compl. the angle at the perpendic. 3. The hypo- As Radius, to fine complethe angle at the base : so is tang. compl. the base, to tang. compl. the hypothenusal.

The bangle at the perpendicular the perpendicula 6. The base.

4. The angle at As fine compl. the perpendicular, to Radius : so fine compl. the perpendic. the angle at the base, to sine the angle at the perpend. 15. The hypo- As sine the angle at the base, to Radius: So is the sine of the perpendicular, to the sine of the hypothenusal. As Radius to tang. compl. the angle at the base: so is the tangent of the perpendicular, to the fine of the base.

The hypothenufal, & angle at the bafe given: to find 7. The base As Radius to sine compl. the angle at the base: so is the tangent of the hypothenusal, to the tangent of the base. 18. The perpen- A: Radius, to the fine of the hypothenusal: so is the sine dicular. of the angle at the base, to the sine of the perpendic. o. The angle at As Radius, to fine compl. the hypothenufal: fo tang. the the perpendic. angle at the base, to tang. compl. the angle at the perp.

The hypothe base, to sine compl. the perpendicular: so sine compl.
the base, to sine compl. the hypothenusal:

A. Radius to the sine of the base: so the tangent compl.

at the base.

of the perpendic. to tang. compl. the angle at the base.

12. The per- As sine compl. the base, to Radius; so sine compl. the bypendicular. pothenusal, to sine compl. the perpendicular. pothenufal g 13. The angle A: Radius, to the tangent of the base: so tangent compl. the hypothenusal, to sine compl. the angle at the base. at the bafe. 14. The angle As the fine of the hypothenufal, to Radius : fo is the fine at the perpend. of the base, to sine the angle at the perpendicular.

The angles thebase & po given : to fine pendicular. 16. The hypothenulal.

15. The per- As sine the angle at the perpendicular, is to Radius: so sine compl. the angle at the base, to sine compl. the perpendic. As Radius, to tangent compl. the angle at the perpendicular : fo tangent complement the angle at the base, to (ine complement the hypothenusal.

And

And because by the third Prop. Chap. 4 of plain Triangles,

Asthetangent of an arch,

is to the tagent of another arch:

- So is the tangent of the complement of that other, to the tangent of the complement of the former.

And by the Corollary of the first Proposition of the same Chape.

Radius is a mean proportional between the tangent of an arch,

and the tangent complement of the same arch:

so that as Radius, is to the tangent of an arch:

so is the tangent complement of that arch, to Radius

Therefore if any man defire either for variety, or conveniency, to alter the Propositions wherein there are Tangents, he may easily do it.

As instead of the first he may fay,

As the fine of the base, is to Radius: so is the tangent complement of the angle at the base, to the tangent complement of the perpendicular.

For the third.

As fine complement the angle at the base, to Radius: so is the tangent of the base, to the tangent of the hypothenusal.

For the fixth.

As tangent the angle at the base, to tangent the perpendicular: so is Radius, to the sine of the base.

For the seventh.

As sine complement the angle at the base, to Radius: so tangent complement the hypothenusal, to tangent complement the base.

For the ninth.

As sine complement the hypothenusal, to Radius: so tangent complement the angle at the base, to tangent the angle at the perpendicular.

For the eleventh.

As the fine of the base is to Radius: so is the tangent of the perpendicular, to tangent the angle at the base.

For the thirteenth.

As the tangent of the hypothenusal, to the tangent of the base: so is Radius, to sine complement the angle at the base.

For the fixteenth.

As tangent the angle at the base, to tangent complement the angle at the perpendicular: so is Radius, to sine complement the hypothenusal.

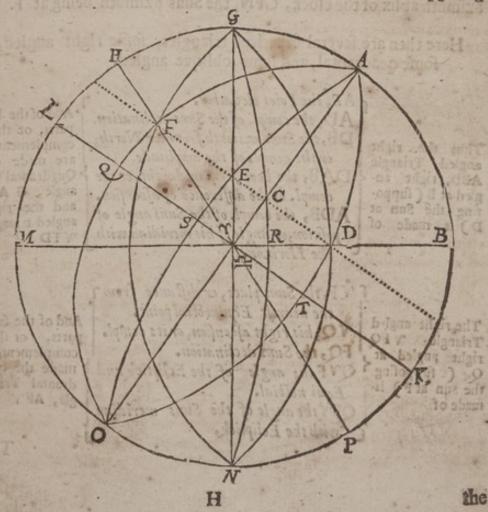

Many other ways might these Propositions be varied, by the fore-

faid Corollary, and third and fourth Proposition of the fourth Chapter of plain Triangles; and not only these, but the rest wherein there are only sines, are varied by these, and by the second proposition of the same Chapter; the varieties thence, arising being very abundant, and of no great use, I rather leave to your own practice at your leisure than bestow further time therein.

CHAP. III.

Of the Cases and Questions incident in every spherical triangle, right angled or quadrantal in general. And of the examples of the sixteen cases of a right angled triangle in particular.

WE come now to give examples of every of these cases in the resolution of some Problems of the Sphere. And supposing

the Reader to be already acquainted with the principal circles of

the Sphere or Globe, we will forbear their definitions.

Let GMNB, represent the meridian of the place, LK the Equis noctial, HP the Ecliptick, V = the points of Aries and Libra; A the North-pole, O the South-pole, A O the axis of the World, or meridian of the Sun at fix a clock, MB, the Horizon, G, the Zenith, N, the Nadir, GN, the azimuth of East, and West, or the first vertical, FD

Note. All the inward arches are indeed (in this kind of projection) Elliptical, though for readiness sake we describe them circular, and so also they do sufficiently represent the things intended. a parallel of declination, ADO, an arch of a meridian passing by the center of the Sun at his rising or setting. AEO, the meridian of the Sun being in the East or West azimuth. AFO the Suns meridian

being at F,GDN, the Suns azimuth at his rising, GCN, the Suns azimuth at six of the clock, GFN, the Suns azimuth being at F.

Here then are several spherical triangles, some right angled, some quadrantal, and some oblique angled.

Thus the right angled Triangle ABD, right angled at B (supposing the Sun at D) is made of

AB, the Poles elevation.

AD, the compl. of the Suns declination.

DB, the Suns azimuth from the North;

or the compl. of the amplitude.

DAB, the hour from midnight, or the

compl. of the difference of ascension.

ADB, the compl. of the Suns angle of

position, or angle of his meridian with

the Horizon.

And of the like parts, or their complements, are made the Quadrantal triangle, G A D, and the right angled triangle, VID

The right angled
Triangle VFQ
right angled at
Q (supposing the Sun at F) is
made of

the nearest Equinoctial point.

VQ, his right ascension, or its compl.

FQ, the Suns declination.

QVF the angle of the Ecliptick and

Equi noctial.

QFV the angle of the Suns meridian

with the Ecliptick.

And of the same parts, or their complements is made the quadrantal Triangle, AFY

The

The right angled CR, the Suns declination.

CR, the Suns height at the hour of 6. Parts, or their complements, is made the Sun at C) is CYR, the Poles elevation.

CR, the Suns azimuth from East or complements, is made the quaprantal triangle, west at the hour of 6.

CYR, the Poles elevation.

CR, the Poles elevation.

CR, the Poles elevation.

The right angled SE, the Suns declination.

Triangle VSE, SV the hour from 6.

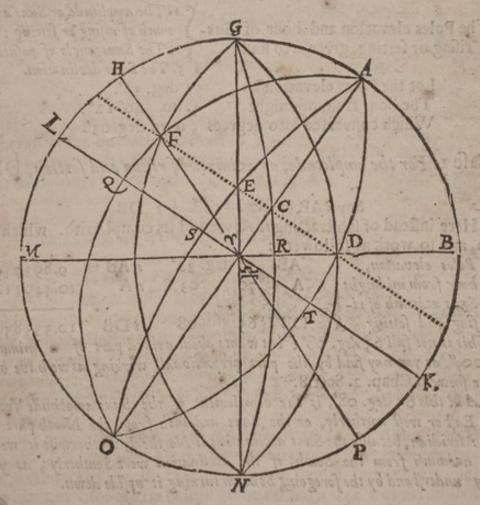

right angled at S VE, the Suns height being East or West.

SVE, the Suns height being East or West.

SVE, the Latitude.

SEV, the angle of the Suns position.

SEV, the angle of the Suns position.

The oblique angled GA, the complement of the Poles elevation, triangle AGF, having FA, the complement of the Suns declination, neither right angle, GF, the complement of the Suns height, nop any side a quadrant (if we suppose AFG, the angle of the hour from Noon, the Sun at F) is made FGA, the azimuth of the Sun from the north of part of the Meridian.

Other triangles are represented in this Scheam, but these I thought good to note, to give occasion to young Beginners to ex-

ercise themselves.

Now we will shew the solution of one of the right angled triangles, namely, ADB, also of the oblique angled triangle AGF, whereby you may understand the like operation in all others.

The Poles elevation and hour of Sunrising or setting, given ; to find

1. The amplitude, or Suns azimuth of rising or setting:
2. The Suns angle of position.
3. The Suns declination.

Let the Poles elevation be 51 deg. 32'.

The hour from midnight 4. ho. 40' 12".

Which converted into degrees, is 70 deg. 03'.

Case 1. For the amplitude, or azimuth of rising and setting, DB.

Say s AB + Rad = to A - t DB

Here instead of substracting to A, we add its compl. arith. which is A, and so work as followeth:

Poles elevation,
AB 51 deg. 32' s AB 9.8937452
hour from midnight A 70 03 t A 10.4401146

Suns azimuth of ri
Sing and setting S DB 65 08 t DB 10.3338598
This is not full 65 deg. 08' but wants about a third part of

This is not full 65 deg. 08'; but wants about a third part of a minute, or 20," as you may find by the part proportional, working as we have be-

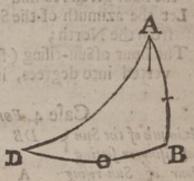

fore shewed, Chap. 2. Sect. 8.

And this 65 deg. 08', is the complement of the Suns amplitude from the East or west northerly, or the Suns azimuth from the North part of the Meridian, because the Suns declination is Northerly: otherwise it were his azimuth from the South, if the declination were Southerly; as you may understand by the foregoing Scheam turning it upside down.

And

And where it is said Hour from midnight 70 deg 3, it is take understood, the hour converted into deg, and min. which is done by allowing 15 degrees for an hour, and one degree for four minutes of time, and 15 minutes of a degree for one minute of time, &c. Or saying by the Rule of Three, If one hour, or 60 minutes give 15 degrees, what gives the time proposed? and so the contrary: if you would convert degrees into hours, say, If 15 degrees give one hour, or 60 minutes of time, what give the degrees proposed?

Note, that for your ease in resolving questions, whether in plain or spherical Triangles it will be expedient to mark the things given and required, as in this example, where the side AB, and the angle A being given, are each marked with a dash thus , and the side required DB, with an o, or cypher thus, o.

Case 2. For the Suns angle of position.

Say sc D - Rad - s A - sc AB.

Therefore the operation is thus.

Poles elevation,

AB 51 deg. 32' sc AB 9.7938317

Hour from midnight A 70 03 s A 9.9731236

Suns angle of position 35 the complement of S D 35 47 sc D 9.7669553

Which 35 deg. 47 is the angle of the Suns position.

Case 3. For the Suns declination.

Say sc A + Rad = t AB + tc AD.

Here instead of substracting t AB, we add its compl. arith, which is to AB, and the like is to be understood in the rest that follow.

which 15 deg. 10' is the Suns declination towards the North pole (or elevated pole) because the hour from midnight is less than six; if it were more than six, the declination should be southerly; as is evident by the Scheam before going turned upside down.

After

After the form of these three examples: If there were given the amplitude, and angle of the Suns position, we might find the Poles elevation, the hour of Sun-rising or setting, and the Suns declination: and if you use the exemplary Table, you may use the second Triangle under the Table.

The amplitude, or azimuth of 54. The angle of position. the Suns rising or setting, with 5. The Suns declination. the hour given: to find .9. The Poles elevation.

Let the azimuth of the Sun at his rising or setting be 65 deg. of

The hour of Sun-rising (from midnight) 4 ho. 40' 12", which converted into degrees, is 70 deg, 03'.

Case 4. For the angle of position.

Azimuth of the Sun \ DB 65 deg. 08' co. ar. sc. DB 0.3762257

Hour of Sun-rising A 70 03 sc A 9.5330090

Angle of position compl. D 35 46 s D 9.9092347

This s D,9.9092347, gives an arch or angle of 54 deg. 14'; which is the angle that the Suns meridian makes with the horizon; but the angle of the Suns position is the complement thereof, namely,

35 deg. 46'.

Case 5. For the Suns declination.

Hour of Suns-rising A 70 deg. 03'. co. ar.s A. 0.0268764
Azimuth of rising DB 65 08 s DB 9.9577455
Suns declination compl. AD 15 10 s AD 9.9846219
Here (as we noted before) the arch answering to s AD 9.9846219
is 74 deg. 50. but the Suns declination is the complement there.
of, that is 15 deg. 10', and so of others.

Case 6. For the Poles elevation.

Hour of Sun-rising A 70 deg. 03' to A
Suns azimuth of rising DB 65 08 t DB 9.5589854

Poles elevation AB 51 33 s AB 9.8938566
Thus

Thus DB being 65 deg. 08', we find AB to be 51 deg. 33' but, if we should take DB to be but 65 deg. 07' 40" as before we found it, then AB the poles elevation would be but 51 deg. 32', as before.

And (after the form of these three examples) if there were given the Poles elevation, and the angle of the Suns position, we might find the hour of Sun-rising, the Suns declination, and the amplitude or azimuth of rising and setting.

The Suns declination, and the hour of 8. The amplitude, or the Suns the Suns rising or setting given to find azimuth.

Let the Suns declination be 15 deg. 10' northerly.

The hour of Sun rising 4 ho. 40' 12",

Which converted into degrees, is 70 deg. 03'.

Case 7. For the Poles elevation.

Hour of Sun-rising, A 70 deg. 03' sc A 9.5330090 Suns declination compl. AD 15 10 t AD 10.5669196

Poles elevation. AB 51. 32 t AB 10.0999286

Case 8. To find the Suns azimuth.

Suns declination compl.

Hour of Sun-rising

A 70 03's A 9.9731236

Suns azimuth from the north

part of the meridian

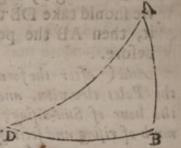

DB 65 08 s DB 9.9577269

The complement hereof 24 deg. 52', is the amplitude of the Suns rising and setting from the East and West northerly, because the declination is northerly.

Case 9. to find the angle of the Suns position.

Suns declination compl. Hour of Sun-rising		deg. 10'sc AD.	9.4176837
The angle of position comple	Karn Res	47 tc D.	9.857798s

And (after the form of these three examples (if there were given the Suns declination, and the angle of the Suns position at his rising, we might find the Suns azimuth, the Poles elevation, and the hour of Sun-rising.

The Poles elevation, and am- \$10. The funs declination.

plitude of Sun-rising or set \$11. The hour of Sun-rising, or setting given: to find ting.

Let the Poles elevation be 31 deg 32'.
Suns amplitude of rising and setting 24 deg. 52' northerly.

Case 10. To find the Suns declination.

The amplitude is the }	DB	24	deg.	52'	sc DB	9.6237743

Suns declination compl.	AD	15	.17	10	se AD	9.4176060

This declination 15 deg. 10' is northerly, because the amplitude given is northerly; and when the one is southerly, so is the other.

Case II. To find the hour of Sun-rising and setting.

Suns amplitude compl.	AB 51 deg.	32' s AB 24 52 tc DB	9.8937452 9.6660287
Hour of Sun-rising	A 28 70	93 16 A	8.9.5597730

Which 70 deg. 03' converted into time, is 4 ho. 40' 12", which is the time of Sun.rising; but if the amplitude had been southerly, the arch thus found had been the hour of Sun setting, as is evident by the first general Scheam turned upside down.

And after the form of this last example, we might by the same things given, find the angle of the Suns position.

The elevation of the Pole, and 7 12. The amplitude? declination of the Sun given: 13. The bour of Sun rifing and fetting. to find

Let the elevation of the Pole be 51 deg. 32', Suns declination northerly 15 deg. 10'.

Case 12. To find the Amplitude.

AB 51 deg. 32' co ar. sc AB 0.2061683 The Poles elevation, sc AD 9.4176837 Suns declination compl. The amplitude, the com- } DB 9.6238520 DB 24 plement of

And this amplitude 24 deg. 52' is northerly, because the Suns declination is northerly: That is, the Sun rifeth 24 deg. 52' to the northwards of the East, and iets as much to the northwards of the West. When the declination is fouther; ly, the amplitude thus found is foutherly, as may appear by the first general Scheam turned upfide down.

is done after this manner, if you do it by the Compais.

Supposing the circumference or outermost edge of the card or flie of the Compass to be divided into 360 degrees, and the points of the Needles to be placed directly under the Flower-de luce or North and South points: you are to observe at Sun-rising or setting, how many degrees the Sun is from the East or West points of the Compass, which number of degrees, if they agree with the amplitude found by this Proposition, as is before shewed, and be on the same side, then hath the Compass no variation: but if they differ, look how many degrees that difference is, so much is the variation.

As for example, admit I find the amplitude (as before) to be 24 degrees, 52 minutes northerly, then I know that the Sun should set almost 25 degrees from the West to the Northwards, but observing at sun-setting with my compass, admit I find it to set but 19 degrees from the West point of my compass to the North wards, then hereby I gather that the variation of my Compass is almost six degrees. And thus you may find how much the variation of the Compass is. Now,

To find which way the Compass varieth.

If the degree of the Compass, which should directly respect the Sun at his rising or setting (namely, the degree of amplitude found as before) be more towards the right hand, than the Sun-rising or setting, the variation is Easterly; but if it be more towards the left hand, the variation is Westerly; because, when a mans face is towards the North, the East is on his right hand, and the West on his left.

As in this Example, I find by the amplitude, that the Sun should fet almost 25 degrees from the West point of my Compass, northerIy; but setting the Sun, I see that the 25 degrees of my Compass is more towards the right hand, than the place of Sun-set; therefore

I conclude, that the variation is Easterly.

And thus is the variation of the Compass found to be almost 6 degrees Easterly, so that the North point of the Compass shews not the true North, but points almost 6 degrees to the Eastward of the North, and consequently all the other points of the Compass direct more towards the right hand than they should do, almost by 6 degrees; and the like in all points is to be understood, if the observation had been made at Sun rising.

Note. It is fittest to make these observations when the Sun seems to be a little above the horizon, namely, when the lower edge of the Sun seems almost to touch the horizon, for then the Sun is in the horizon, though by reason of his refraction and parallax he seem to be above it.

Case 13. To find the hour of Sun-rising and setting.

Poles elevation Suus declination compl.		510	leg.32'		AB AD	10.0999135
Hour of Sun-rising	4	70	03	sc	A	9.5329939

This 70 deg. 03' converted into time, is 4 ho. 40' 12", which is the time of Sun-rising after midnight; but if the declination had been foutherly

foutherly, this 4ho. 40' 12", thus found, had been the time of Sunfetting after Noon, as may appear by the general Scheam turned uplide down.

And after the form of this last example, if there were given the azimuth of the Suns rising or setting, and the Suns declination, we might find the angle of the Suns meridian with the horizon: or the Poles ele-

vation, after the form of the last but one.

Case 14. The Declination of the Sun, and his azimuth of rising and setting given: to find the hour.

Let the Suns declination be 15 deg. 10', northerly, His azimuth at his rising or setting 65 deg. 08', from the North.

To find the hour. 15 deg. 10'.co. ar. s AD 0.0153967 Suns declinat. compl. 9.9577455 Suns azimuth

9.9731422 Hour of Sun rising A 70 03 Which 70 deg. 03' converted into time, is 4 ho. 40' 12", the hour of Sun rising: but if the declination had been southerly, this arch thus found had been the hour of Sun-fetting.

And after the form of this example, if there were given (as in the thirteenth Case) the latitude, and Suns declination, we might find the angle of the Suns position, or the complement thereof, which is the angle of the Suns meridian with the horizon.

The hour of Sun-rising or setting, and the angle (15. The amplitude. of the Suns meridian, with the horizon given: 2 16. The Suns declination. to find

Let the hour of Sun-rising be 4 ho. 40', 12", Which converted into degrees, is 70 deg. 03'.

The angle of the Suns meridian with the horizon 54 deg. 13'.

Cafe 15. To find the Amplitude.

54 deg. 13' co.ar.s Do.0908539 Angle of meridian and horizon, D sc A 9.5330060 70 03 Hour of Sun rising in deg. tcDB 2.6938629 DB 52 Amplitude compl. Cale I 2

Case 16. To find the Suns declination.

Angle of merid. and horizon D	54 deg.	13'tc	D	9.8578031
Hour of Sun-rising A		03 tc	A	9.5598854
Suns dealination count AD			10	700

Which declination 15 deg. 10 min. is northerly, because the hour of Sun-rising is before six: otherwise the said hour being after six, the declination should be foutherly.

And after the form of the last Case but one, we may by the same things

given find the Poles elevation.

And thus it is evident, that of the five circular parts of this right angled spherical triangle, namely, of the two oblique angles, the two sides, and the hypothenusal, there may be framed 30 Problems or Questions of the Sphere, and these 30 Problems are reduced to 16 Cases, and these 16 Cases to that one fundamental Axiom before set down 3 and the like is to be understood in other right angled spherical triangles.

The same 30 questions might also have been moved and resolved in the quadrantal triangle AGD, and they are also reduced to 16 Cases, and these 16 Cases to the aforesaid fundamental Axiom. Of which things having before given sufficient light, we will leave the practice thereof to

the industrious Reader.

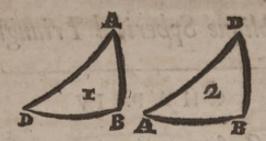

And it will not be amiss, when there is a question proposed in a right angled Spherical triangle, to mark it with the Letters ABD; setting B' at the right angle, and AD to the hypothenusal; or if it be a quadrantal triangle, set D6 to the quadrantal side, and A at angle thereto opposite.

As if (in the general Scheam of the Sphere before going) I would resolve the triangle V QF, right angled at Q. I put for V, A, for Q, B, and for F, D, as in the first of these triangles: or I put for F,

A, for Q, B, and for Y, D, as in this second triangle.

as mediantem. D seeder 1st course Do. 0008530 osc A 9.5330000

at DE 2.6038619

A, is the Equinoctial point of V and =, which in this second D.

AB, is an arch of the Equinoctial, which in the second is DB. DB, is an arch of the Suns meridian, which in the second is AB.

And thus,

AD, is the Suns place or distance from the nearest Equinoctial DA.

point, which in the second triangle is also

AB, is the Suns right ascension from the nearest Equinoctial 3D B. point, which in the second triangle is

DB, is the Suns declination, which in the second triangle is

AB.

A, is the angle of the Ecliptick with the Equinoctial, which in the D.

second triangle is

D, is the angle of the Suns Meridian with the Ecliptick, which in A. the second triangle is

And any two of these being given, we may find any third required; and so frame 30 several questions, every of which in one of these triangles will be conformable to the exemplary table of right angled triangles before set down.

And the like is to be understood in the other two triangles before mentioned R V C, and V S E: so that in these four right angled triangles, you may frame 120 questions of the sphere, and their resolutions. And the like you may do in their quadrantals: all which I leave to your own pra-

And thus much touching the resolution of such spherical triangles as are either right angled or quadrantal: Now we come to those that are oblique, which have 12 Cases, ten whereof do also depend upon the sirst general axiome afore-going, and might be thence deduced. But that all things may be the more easie and perspicuous, we will lay down two Consectaries sollowing of the said sirst Axiom, after we have declared in general the Cases of an oblique triangle.

Of Oblique Spherical Triangles,

CHAP. IV

Of the Cases and Questions incident in every oblique spherical Triangle in general: and particularly of those two Cases wherein the things given and required are opposites.

To the intent the application of the Doctrine of Spherical Triangles may be the better understood, we will here (as we have before in right angled Triangles) give examples of the several Cases of an oblique Triangle in the actual resolution of some known Triangle of the Sphere. And we have before noted in the general Scheam of the Sphere, Chap. 3. that AGF is an oblique angled Triangle. Let us suppose the first of these Triangles following marked with ADE to be the same (where we change the Letters, not of any necessity, but sor the better conformity of all the examples.) So that A here may be in place of A there: namely, at the Pole of the world: D here, in place of G there, namely, at the Zenith; and E here, in place of F there, namely, at the Sun. Then is,

AD, the complement of the Poles elevation, or the distance of the Pole from the Zenith.

AE the complement of the Suns declination, or the distance of the Sun from the Pole.

ED, the complement of the Suns height, or the Suns diftance from the Zenith.

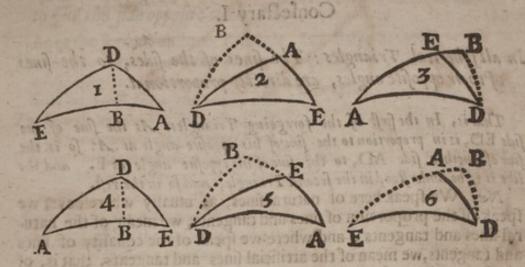

A, the angle of the hour from Noon, or the angle of the meridian of the Sun, with the meridian of the place.

E, the angle of the Suns position in respect of the Pole and Zenith.

D, the Suns azimuth from the North part of the meridian.

ere early and ner greenes, we will fav done two Cont cherce fully

And

And any three of these being given, the other three may be found. So that of these six parts conferred together there arise in this Triangle, and so in others, Sixty Questions or Problems of the Sphere: which are all reduced to 12 Cases, the resolution whereof we intend now to shew, and exemplifie in this Triangle, and withall to point out the said Sixty Questions here incident, referring every of them to their proper Cases.

And that these Sixty Problems may be the more conformable to the 12 Cases whereunto they are referred, I have marked this Triangle six several ways: that so the things given and required in every of these Triangles be noted by the same Letters, as are used in the Case and Example whereunto that Problem is referred; whereunto I am the rather induced, by the example of the honourable Lord Nepair in his 12 Cases of an oblique Triangle, set forth in his Book of the Construction of Logarithms.

But every man is at liberty to do herein as he thinks good, for the Rules are general, howfoever the Triangles or their parts are marked.

And thus having shewed in general, what Cases and Questions are incident in an oblique spherical Triangle, we come now to handle them particularly, laying for the two first Cases this ground.

may two Cafes in an oblique triangle be respliced. At

Confectary

Confectary I.

In all spherical Triangles: The sines of the sides, to the sines of their opposite angles, are directly proportional.

That is, In the first of the foregoing Triangles. As the sine of one side ED, is in proportion to the sine of his opposite angle at A: so is the sine of another side AD, to the sine of his opposite angle at E. and the like is to be understood in the second Triangle, and so in the rest.

Note. We speak here of natural sines, as usually wheresoever we speak of the proportion of sines and tangents, we mean of the natural sines and tangents; and where we speak of the equality of sines and tangents, we mean of the artificial sines and tangents, that is, of the Logarithms of the natural sines and tangents: For where there is an equality of the artificial, there is a reciprocal proportionality of the natural, as is evident by the Corol. of 3 Prop. of 2 Chap. of Plain Triangles.

Construct. Now touching this Consectary, let AD E be an oblique angled triangle; If then we let fall the perpendicular DB, it is refolved into two right angled triangles, ADB, and EDB.

Demonst. wherefore by the fundamental Axiom of right angled triangles, if we take the perpendicular BD for the middle part, and AD and A for his opposite extreams, in the triangle ADB; and ED, and E, for his opposite extreams, in the triangle EDB, then

Rad - s DB, is equal to s AD - s A, also Rad - s DB is equal to s ED - s E.

But things that are equal to one and the same thing, are equal one to another; therefore s AD - s A, is equal to s ED + s E. Therefore by the Corol. of 3 Prop. 2 Chap. of Plain Triangles the proportion of their natural sines is reciprocal, thus:

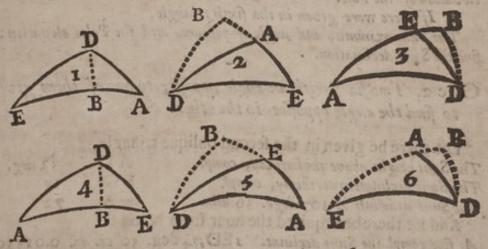

As the sine of ED, is to the sine of the angle A: so is the sine of AD, to the sine of the angle at E.

And the like is to be understood in the second triangle. Therefore in

And hence may two Cases in an oblique triangle be resolved. As Case

Case 1. Two angles, with a side opposite to one of them given; to find the side opposite to the other.

A STATE OF THE PARTY OF THE PAR

So the fine of the ho. from noon, s A 50	9.9207717

to sine compl. the Suns height. s ED 57 32 9.9261952

Whereby the Suns height appears to be 32 deg. 28 min. Note. By the imitation of either of these examples, there may four

other questions in this Triangle, and so of any other, be resolved.

As 3. If (in the first triangle) there be given,

The hour of the day, the angle of the Suns position, and the height of the Pole: to find the height of the Sun.

4. If there were given in the fourth Triangle,

The hour of the day, the angle of the Suns position, and the height of the Sun: to find the height of the Pole.

5. If there were given in the third triangle,

The Suns azimuth, and angle of position, and declination, to find the elevation of the Pole.

6. If there were given in the fixth triangle,

The Suns azimuth, and angle of position, and the Poles elevation: to find the Suns declination.

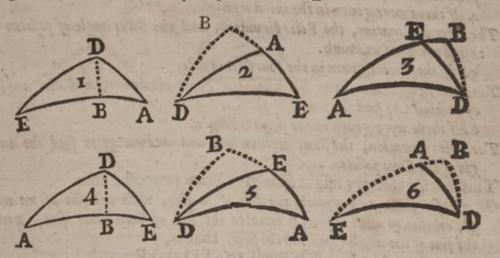

Case 2. Two sides with an angle opposite to one of them given: to find the angle opposite to the other.

Let there be given in the second oblique	ne triangle,
The Suns height above the horizon, compl.	AD 32 deg. 28'
The Suns declination northerly, compl.	ED 15 10
The Suns azimuth A 107 degr. 36 min.	or A 72 24
And let there be required the hour from	n Noon E.
As fine compl. the Suns declinat. sED 740	deg. 50' co. ar. 0.0133967
to the sine of the azimuth; sA 72	24 9.9791798
So fine compl. the Suns height, s AD 57	32 9.9261900

which 56 deg. 26 min. converted into time, is 3 ho. 45' 44", which in the forenoon is 14' 16" after 8 of the clock, but in the afternoon 45' 44" after three of the clock.

Note.

Note. The arch or angle answering to 9.9207665, is not full 56 deg. 26 min. but wants almost a sifteenth part of a minute, or four seconds; but for the more facility and readiness, it shall suffice to give the examples to a minute; such as desire more preciseness, may do as we have Shewed in the second Chapter of Plain Triangles, Sca. 8.

Another Example of this second Case.

Let there be given in the fifth triangle, The Suns declination northerly, complement The Suns height above the horizon, complement	ED	15	deg.	10'
The ho. from noon, 3 ho, 45' 44", which in deg. is And let there be required the Suns azimuth I	A E.	56	1000	26

Proportion.

As fine compl. the Suns height,	s ED	57 deg.	32"	ce. ar.	0.0738100
to the line of the hour:	SA	56	26		9.9207717
So sine compl. the Suns declinat.	s AD	74	50		9.9846933
the sea will be the first that the season of				-VIII	0

to the sine of the azimuth s E Which 72 deg. 24 min. is here the Suns azimuth from the South, the complement whereof to 180 degrees, is 107 deg. 36 min. the Suns azimuth from the north.

K 2 Vd) stolerent man & By

By imitation of either of these examples, there may four other que: stions in this triangle, and so of any other be resolved: As,

3. If there were given in the first triangle,

The Poles elevation, the Suns height above the horizon, and the hour from noon: to find the Suns angle of position.

4. If there were given in the third triangle,

The Suns declination, the Poles elevation, and the Suns angle of position; to find the Suns azimuth.

5. If there were given in the fourth triangle,

The Suns height above the horizon, the Poles elevation, and the angle of position: to find the hour.

6. If there were given in the fixth triangle,

The Poles elevation, the Suns declination, and azimuth: to find the angle of the Suns position.

This first Consectary might also have been proposed thus.

Of opposite sides and angles, the sine of a side, with the sine of an angle opposite to another side, is equal to the sine of that other side, with the sine of the angle opposite to the sirst. that is,

which in effect is the same with the former, and in like fort demonftrated. But the former is to be preferred, being brief, perspicuous,
and well known to such as have been conversant in spherical tri-

angles.

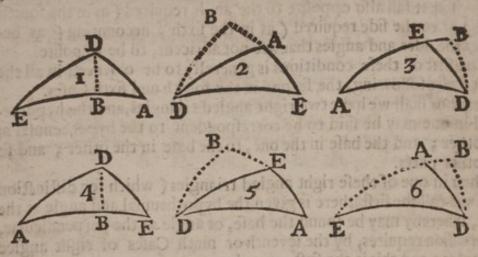

But in the use of this Consectary, and of the two last Cases, there happens the like doubt, as we have noted upon the ninth Case of Plain Triangles. Namely, in spherical triangles it is doubtful, whether the angle nearest to a right angle, and his opposite sides be both of one and the same, or of divers kinds, unless you discover it by your work, or that it be a thing given by supposition.

This doubt may (for the most part) be removed by the exact delineation of the scheam or figure: whereby you shall perceive whether a spherical angle be acute or obtuse, and a side greater or less than a quadrant. But you may be further directed herein, by the three Propositions of the Baron of Marchiston, which I have for that

purpose set down in the first Chapter of spherical triangles.

As in this last example, seeing the side AD 74 deg. 50 min. is nearer to a quadrant than his opposite angle at Ebeing 72 deg. 24 min. or 107 deg. 36 min. therefore (by the last of those three) two angles of that triangle

triangle are of one kind, and the third greater than a quadrant. That is, the two angles at A and D, are acute, and the third at E, namely, AED is greater than a quadrant: therefore the angle there found AED is 107 deg. 36 min. and the like judgment is to be given of others.

CHAP. VALETT ON A PORTE OF THE COLUMN

Of eight other Cases of an oblique Spherical Triangle, resolved at two operations by a perpendicular let fall.

Ore. If this way of refolving these eight Cases at two operation ons feem hard, you may more eafily refolve them at three operations, as is shewed in the fixth Chapter next following; but here we

shew their resolution at two operations only, thus;

In the eight Cases next following there are also three things (in an oblique triangle) given to find a fourth ; for the finding whereof it is requifite, that this triangle proposed be reduced to two right angled triangles, by a perpendicular let fall from one of the angles to his opposite side; which perpendicular falls sometimes within the triangle, fometimes without.

If the angles at the base be both of one kind (that is, both obtuse, or both acute) the perpendicular falls within the triangle, if of

divers kinds, without : and the converse.

the given and required)

In letting fall the perpendicular, observe, that forasmuch as in every of these Cases there is given a side with an angle adjoyning,

1. Let fall the perpendicular from the end of that side opposite to

that adjacent angle:

And further when that fufficeth not,

2. Let it fall also opposite to the angle required (as in the fourth Case) or to the side required (as in the sixth) accounting (as before) the sides and angles that are not adjacent, to be opposite.

The first of these conditions is generally to be observed in all the

eight Cases following, the second in the fourth and sixth Cases.

And thus shall we have two right angled triangles, and the hypothe-

and thus half we have two right angled triangles, and the hypothenufal in one may be faid to be correspondent to the hypothenusal in the other; and the base in the one, to the base in the other; and so

the other parts.

Then in one of these right angled triangles (which for distinction sake we call the sirft) there is given the hypothenusal and angle at the base, whereby may be found the base, or angle at the perpendicular, as occasion requires, by the seventh or ninth Cases of right angled

triangles; and this is the first operation.

For the second, there must (of the things thus given and required) two things in one triangle, be compared to two correspondent things in the other triangle, which two in each, with the perpendicular, make three things in each triangle, either adjacent (that is lying together) or opposite; of which three, the perpendicular is always one of the extreams, and the thing required, one of the other extreams; all which may appear in every of these six triangles.

So that by the first general Axiom of right angled spherical trian-

gles.

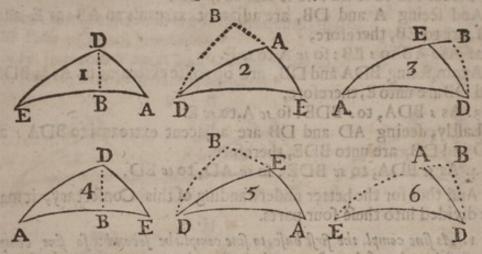

But if from equal things we take away equal things, the things remaining are equal; therefore from either fide taking t or so DB and Radius, it follows, that.

1 sc AD + sc EB is equal to sc ED = sc AB.

2 s AB - tc E is equal to t BE - tc A.

3 sc A - s BDE is equal to sc E+s BDA.

4 se BDA + to ED is equal to se BDE + to AD.

Wherefore in each right angled triangle, supposing the three parts more remote from the right angle, to be noted, as is aforesaid, with their complements; and using (as is expressed in the sundamental Axiom) the sines of the middle parts, and the tangents of the extreams adjacent, or the sines compl. of the opposite extreams, you may observe that

The middle part in the first triangle, with the extream in the second: is equal to the middle part in the second, with the extream in the first.

And by help of this Confectary might these eight Cases be resolved, which also by the Corollary of 3 Prop. Chap. 2. of Plain Triangles, may be proposed as followeth; in which from we intend to use it.

Confectary II.

As the middle part in the first Triangle, is in proportion to the middle part in the second: so is the extream in the first, to the extream in the second.

Though

Though the perpendicular be always one of the extreams in either triangle (as is before noted) yet we use not that, but the other extream in both.

Wherefore in any of the fix oblique triangles, seeing AB and DB. are opposite extreams to AD, as EB and DB are to ED, there-

fore,

1. As so AB to so EB: fo so AD to so ED.

And seeing A and DB, are adjacent extreams to AB: as E and DB, are to EB, therefore,

2. As s AB to s EB: fo to A to to E.

Again, seeing BDA and DB, are opposite extreams to A, as BDE and DB are unto E, therefore,

3. As s BDA, to s BDE: fo sc A, to sc E.

Lastly, seeing AD and DB are adjacent extreams to BDA: as ED and DB, are unto BDE, therefore,

4. As sc BDA, to sc BDE: fo tc AD, to tc ED.

And thus for the better understanding of this Consectary, it may be divided into these four parts.

1. As fine compl. the first base, to sine compl. the second: so sine compl. the first hypothenusal, to sine compl. the second.

And this serves for the 3 and 7. Cases following.

2. As the sine of the first base to the sine of the second: so tangent

which serves for the 4 and 10. Cases,

3. As the fine of the first angle at the perpendicular, to the fine of the second: Jo sine compl. the sirst angle at the base, to sine complement the second.

Which serves for the 5 and 9. Cases.

4. As sine compl. the first angle at the perpendicular, to sine complement the second: so tangent compl. the first hypothenusal, to tangent compl. the second.

And this serves for the 6 and 8. Cales following.

The words (first and second) we here use, to distinguish the two

right angled triangles.

This Confectary might have been otherwise demonstrated, as by producing the sides of the oblique triangle to Quadrants, &c. But I have the rather used this form, that so the deduction thereof from

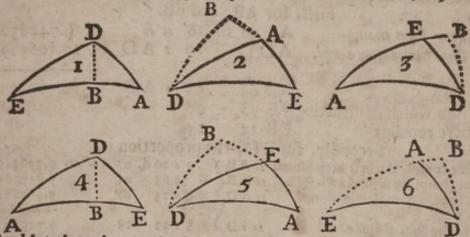

10

56

the first fundamental Axiom before going might the better appear; and this ground thus laid, we come now to the eight Cases thereon depending.

Case 3. Two sides, and their contained angle given: to find the third side.

Let there be given in the first oblique triangle, The Poles elevation, complement AD, 51 deg. 32". The ho. from noon 3 ho. 45' . 44", which in degrees is A The Suns declination northerly, complement AE, 15

And let there be required the Suns height, complement ED. First, by the seventh Case of right angled triangles, to find AB and EB.

The hour from noon, A 56 deg. 26' sc A 9.7426 420 The Poles elevation compl. AD SI 32 t AD 9.9000865

The arch AD 23 43 t AB 9.64.27385 The fum or remainer of AB and AE is EB.

But here from AE 74 d. 50' | Or if to compl. AE 15 deg. 10 min. Substracting AB 23 43 AB 23 weadd 43

There remains EB 51 07 | we have compl. EB 53 and fo of the rest. Secondly,

16 Crigonomicary.
Secondly, for ED, by the second Consectary, the proportion is, As fine compl. the first arch found, so AB to sine compl. the second arch found, so EB so 38 so 38 so 38 so 39.7977775
fo is the fine of the Poles elevation, se AD = 32 9.8937452
to the fine of the Suns altitude. sc ED \$ (\$ 32 28 9.7298427 2 Example.
Let there be given in the fifth Triangle,
The Suns declination northerly, compl.
The hour from noon, 3 ho. 45 44, which \ A 56 26
And let there be required the Suns height, compl. ED. First, for AB, and EB.
The hour from noon, A 56 d. 26' sc A 9.7426520
The Suns declination compl. AD 15 10 t AD 10.5669195
The arch AB63 53 t AB 10.3095715
From which substracting AE 38 28
Secondly, for ED, the proportion is,
As fine compl. the first arch sound, so AB) 8 26 d. 07' co. ar. 0.3563496
As fine compl. the first arch sound, so AB to fine complete second arch sound, so EB 5 64 35 9.9557890
fo is fine the Suns declination, se AD 3 15 10 9.4176837
to fine the Suns altitude. sc ED) (5 32 28 9.7298223
Note Although there he a difference between the artificial line here
found and the former; yet the difference of their arches is little more than
one tenth part of a min. which ariseth, by neglecting the seconds and thirds in the arch first found A B. He that desires to work to seconds may do it as
we have shewed, Chap. 2. Sect. 8. of Plain Triangles. But in these ex-
amples, we would not trouble Beginners with them at the first, it being suf-
ficient for ordinary occasions, if the work be true to a minute.

ficient for ordinary occasions, if the work be true to a minute.

And after the form of either of these examples, we may calculate Tables of the Suns height for every hour and minute of the day; by which Tables may be made the Quadrams and Ring-Dials, and other instrumental and fixed Dials, that give the hour of the day by the Suns

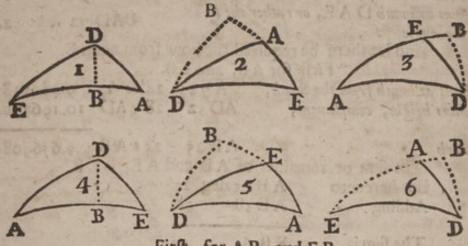

height.

3. Example.

Let there be given in the second oblique triangle, The Suns height above the horizon, complement AD 32 deg. 28° The Suns azimuth DAE, or rather the acute ang. BAD 72

The Poles elevation complement, AE SI

And let there be required the Suns declin. compl. ED.

First, for AB, and EB.

The Suns azimuth from the South, A 72 d. 24' sc A 9.4805385 The Suns height, complement, AD 32 28 10.1963704

The arch Whereto adding AB 25 9.6769080 AE 38

The fum is

EB 63 53 Secondly, for E D, the proportion is,

As fine compl. the first arch found, sc AB \ (\$64 d. 35' co. ar. 0.0442110 to fine compl. the second arch found, sc EB (\$26 07 9.6436504 9.6436504 so is the fine of the Suns height, sc AD = 32 9.7298197

to the fine of the Suns declination, The same might be found by the same things given in the sixth triangle,

where the perpendicular falls from the Pole.

And after the form of any of these three examples, there may a third question in this triangle, and so in any other be resolved:

As 3. If in the third or fourth triangle there be given,

The Suns declination, the Suns height above the horizon, and the angle of the Suns position: to find the Poles elevation.

Case

Case 4. Two sides, and their contained angle given: to find one of the other angles.

Let there be given in the fecond oblique tri	angle,	4
The Suns height above the horizon complement	AD, 32 deg. :	28'
The Poles elevation complement	AE, 51	32
The Suns azimuth DAE, or rather the	4.5	24
And let there be required the hour l	rom noon E.	

The Suns azimuth from the South, A 72 d. 24'sc A 9.4805385 The Suns height, complement, AD 32 28 t AD 10.1963704

The arch
The fum or remainer of AB and AE, is EB.

But hereunto AB 25 deg. 25' Adding AE 38 28

The fum is EB 63 53

Secondly, for E, by the fecond Confectary, the proportion is,

As the fine of the first arch found, sAB to fine the second arch found: sEB 25 63 52 9.9532277

fo tang. compl. the azimuth to A 25 17 36 9.5013588

Whose compl. 56 deg. 26 min. converted into time, is 3 ho. 45' 44" before or after noon.

Or the proto the fine of the second arch found: portion is so is the tang. of the azimuth from East or West,

Or by the 3. As the sine of the second arch found; Theorem of is to the sine of the sirst arch found:

ch.4. of plain So is the tang. of the azimuth from the Meridian,

Triangles. (to the tangent of the hour from noon.

Note. The like variety may be used in the next example, and also in the examples of the 6, 8, and 10 Cases, and partly in every Case; which having here briefly noted, we shall leave to your own practice, as your occasion requires.

2. Exami

10

2.6

32

2. Example.

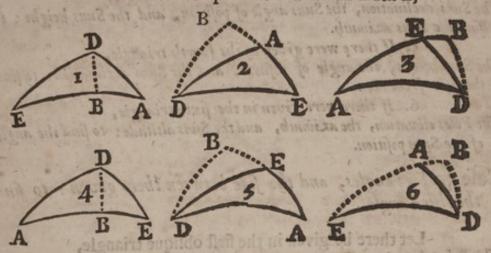

Let there be given in the fifth Triangle,

The Suns declination northerly, complement AD 15 deg

The ho.from noon 3 bo. 45' 44", which in deg. is A 56

The Poles elevation, complement AE 51

And let there be required the Suns azimuth E,

First, for AB and EB.

The ho. from noon in degr.	A	56 deg	. 26'	sc A	9.7426520
The Suns declinat. compl.	AD	15	10	t AD	10.5669195

AE 57 32

Whose compl. 32 d. 28' is the Suns height required.

Note. You add AB 13 302

You have compl. A E 32 28 the Suns height required.

I should digress too much, if I should shew all the uses whereunto the questions falling out in this one triangle might be applied: some of the principal I thought good to point at, that I might give occasion of exercise, especially in these latter Cases, being something harder than the rest.

Thus by this Proposition you may for one day, in any Latitude, find how many degrees above the Horizon the Sun will be upon any point of the

Compass; and thereby the variation of the Compass.

As admit, being in the Latitude of 51 deg. 32 min. Northerly, I find by the Tables for that purpose the Suns declination Northerly, for some day, to be 15 deg. 10 min. And I would know how high the Sun will be that day being upon the East South-East point of the Compass, that is 67 deg. 30 min. from the Meridian. Here working according to the former example, I find the Suns height to be about 35 deg. 33. min. therefore I observe with Staff, Quadrant, or other Instrument, till I find the Sun to be 35 deg. 33. min. high, and then is the Sun East South-East. Wherefore at that instant setting the Sun with my Compass, if I find it to be upon the East South-East point, then hath it no variation: if it differ, look how much that difference is, so much is the variation. Which whether it be Easterly, or Westerly, may be known by the Rule before given after the 12 Case of the third Chapter of right angled spherical Triangles.

By this Proposition also are the azimuths drawn on those quadrants that gives the Suns azimuth by his altitude, and so on those Dyals that do the like.

And after the form of either of these Examples, there may four other Questions in this oblique Triangle, and so in any other, be resolved. As,

3 If there were given in the first oblique Triangle,

The Poles elevation, the hour from Noon, and the Suns height: to find the Suns declination.

4 If there were given in the third Triangle,

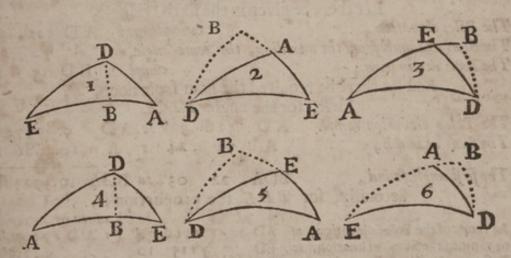

The Suns declination, the Suns Angle of position, and the Poles elevation: to find the Suns height.

5 If in the fourth Triangle there were given,

The Suns height, the Angle of the Suns position, and the Poles elevation: to find the Suns declination.

6 If in the fifth Triangle there were given,

The Suns declination, the hour from Noon, and the Suns height above the Horizon: to find the Poles elevation.

Case 8. Two sides, with an angle opposite to one of them given: to find their contained angle.

Let there be given in the first oblique Triangle,

The Poleselevation,

The ko. from noon 3 ho.45'-44", which in degr. is

The Suns altitude above the Horizon,

M 2

Compl. AD, 51 deg. 32'

A, 56

26

The Suns altitude above the Horizon,

M 2

And

And let there be required the Suns azimuth from the North, D.
First, for the angle BD A. The Poles elevation compl. AD 51d 22' 55 AD 20-2-
The Poles elevation compl. AD 51 d. 32' sc AD 9.8937452 The hour from noon, A 56 26 t A 10.1781197
The first angle found BDA 40 17 tcBDA 10.0718649
Secondly, for BDE the proportion is,
As tang. of the Poles elevation, to AD to tang. of the Suns altitude, to ED 5.25 132 28 9.8036196 fo fine comp. the first ang. found, so BDA 5.49 43 9.8824428
lo line comp. the first ang. found, se BDA 5 to 5 49 43 9.8824428
to fine comp. the fecond, se BDE 522 41 9.5861589
The sum or remainer of the first and second angles found, namely of BDA and BDE, is the angle required D.
But here to BD A 40 d. 17'
Adding BD E 67 19
The fum is D 107 36 the Suns azimuth required. 2. Example.
Let there be given in the fixth triangle,
The Poles elevation . complement A D and 22'
The Suns azimuth from the meridian, the acute angle, A 72 24 The Suns declination; compl. ED 15 10
And let there be required the hour from noon, D.
First, for the angle BDA.
The Poles elevation compl. AD 51d. 32' sc AD 9.8937452 The Suns azimuth, A 72 24 t A 10.4986412
The first angle found, BDA 22- 03 to BDA 10.3923864. Secondly, for BDE the proportion is,
CO dr. or
As tang. of the Poles elevation, to AD 25 total 32' (1 A D 9.9000865 to tang. of the Suns declination, to ED 15 10 9.4330804

			30	9,9686529

The fum or remainer of the first and second angle found BDA and

BDE, is the angle D required.
But in this Example, from BDE 68 d. 30'
fubstracting BDA 30 35

The remainer is D 37 55 the angle of polition re-

After the form of this Example, there may five other questions in this oblique Triangle, and so in any other, be resolved.

2 If in the first oblique Triangle there be given, The Poles elevation, the hour from noon, and the angle of the Suns position:

to find the Suns azimuth.

3 If there were given in the third Triangle, The Suns declination, angle of position, and the Suns azimuth: to find the hour from noon.

4 If there were given in the fourth Triangle,

The Suns altitude, the angle of position, and the hour from noon: to find the Suns azimuth.

5 If in the fifth Triangle there be given,

The Suns declination, the hour from noon, and the Suns azimuth: to find the angle of the Suns position.

6 If there were given in the fixth Triangle,

The Poles elevation, the Suns azimuth, and the angle of the Suns position: to find the hour from noon.

let there be required the angle of pointing

Chap. V.

Trigonometry.

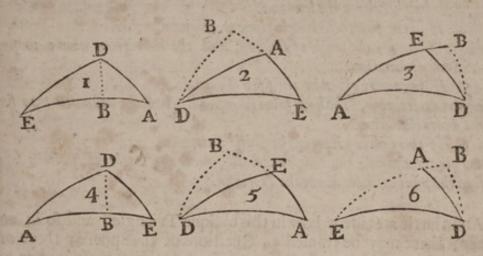

89

Case 10. Two angles, and a side opposite to one of them given: to find the side between them.

Let there be given in the second oblique Triangle,

The Suns height above the horizon complement AD, 32 deg. 28'
The Suns azimuth from the merid. the acute angle A, 72 24
The ho. from noon 3 ho.45'-44", which in degr. is E, 56 26

And let there be required the Poles elevation compl. A E.

First, for the Arch A B.

The Suns height, complement, AD 32 deg. 28' t AD 10.19637c4
The Suns azimuth, A 72 24 sc A 9.4805385
The arch first found, AB 25 25 t AB 9.6769089

Secondly, for EB

As tang. compl. the Suns azimuth, to A to tang. compl. the hour, to E to tang. compl. the hour, to E to tang. compl. the hour, to E to the fine of the first arch found, s A B to the fine of the 2d arch found, s E B to the 2d arch

The fum or remainer of the first and second arch found (A B and

E B) is the fide required A E.

But here from E B 63 deg. 53'

Substracting A B 25
The remainer is AE 38
25

Which is the complement of the Poles height required, 51 deg.32'.

By initation of this Example, there may five other Questions in this oblique Triangle, and so of any other be resolved. As,

2. If in the first oblique Triangle there were given

The Poles elevation, the hour from noon, and the angle of the Suns position: to find the Suns declination.

3. If in the third Triangle there were given,

The Suns declination, the angle of position, and the azimuth: to find the Suns height above the horizon.

4. If in the fourth Triangle there were given,

The Suns altitude, the angle of position, and the hour from noon: to find the Suns declination.

5. If there were given in the fifth Triangle,
The Suns declination, the hour from noon, and the Suns azimuth: to find
the Poles elevation.

6. If there were given in the fixth Triangle,
The Poles elevation, the Suns azimuth, and the angle of position: to
find the Suns altitude above the Horizon.

And thus it is evident how in this oblique Triangle, and fo in any other, there may be framed 54 Questions of the Sphere; there are also six more, which we shall touch hereafter; but these 54 are reduced, as we have shewed to ten Cases, and those ten Cases to two Consectaries, which two Consectaries are deduced from the first sundamental Axiom; so that the resolution of all the Cases and Questions hitherto handled, whether in right or oblique angled spherical triangles, depend upon that one Axiom, and may be thereunto reduced. There remain (as is faid) six other Questions in this oblique triangle (and the like in any other) which are reduced to two Cases, namely, when three sides are given, to find an angle; or three angles given, to find a side. And these also might well be resolved by the grounds before laid, without adding any more; but because the ways devised by the Lord Nepair are more apt for this purpose, we will make use of them.

And as we have shewed the resolution of the 8 Cases last beforegoing, by help of a perpendicular; the same might have been done by drawing instead of the perpendicular, a quadrantal side: so reducing the triangle given to two quadrantal triangles. But this we must now leave to your practice.

CHAP.

CHAP. VI.

The eight last Cases of an oblique Triangle, resolved by finding the perpendicular.

The refolution of these eight Cases, hath usually been at three operations, though (as we have shewed) they may be done at two; yet because the way at three operations is more easily understood, and is more immediately performed by the first general Axiom, without respect to the second Consectary; and because in many questions you have occasion to know the quantity of the perpendicular: therefore we shall here shew the resolution of these eight Cases at three operations, briefly and plainly; to the satisfaction (I hope) of such as complain of obscurity in the former.

First then, the oblique triangle is to be resolved into two right angled triangles by a perpendicular as (before) namely, that whereas in every of these eight Cases there is given an angle, and a side adjacent

to that angle, you are to

I. Let fall the perpendicular from the end of that side given, opposite to that angle.

And further, when that fufficeth not,

2. Let it fall also opposite to the angle required: (as in the fourth Case) or opposite to the side required (as in the sixth.)

Accounting (as before) the fides and angles that are not adjacent,

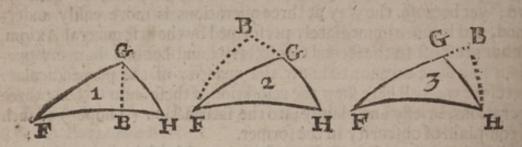

to be opposite.

And for helping your memory, you may (as is aforefaid in the first Case of Spherical Triangles) mark the sides or angles given with a dash thus ____, and that required with an o, or cypher, or with three

pricks thus:

And here we might mark the triangles with the same letters as before, namely, that whereas there is always (as I have said) an angle given; and a side adjacent to that angle, you may mark the said angle given with A, and the adjacent side given with A D, and the angle remaining with E, and the perpendicular with DB. but because there is no necessity that a man should hold himself always to that form (as I have before noted) we will here mark the same triangle with other letters at adventure, as

with FGH, then the perpendicular falling from G, or F, or H (as the Proposition in hand shall require) resolves it into two right angled triangles, in one of which there is given the hypothenusal and angle at the base, whereby you may find first the perpendicular; secondly, the base or angle of the perpendicular: Or you may first find the base or angle at the perpendicular; secondly, the perpendicular.

The first fundamental Axiom we will here again repeat, being as followeth:

Of the five circular parts in a right angled Spherical triangle.

The sine of a middle part, with Radius, is equal to the tangent of the adjacent extreams, or to the sines Complement of the opposite extreams.

Hence we refolve these eight Cases in manner following.

Case 3. Two sides, and their contained angle being given: 10 find the third side.

Dat. GH 38 d. 28', FH 74 d. 50', H 56 d. 26', required FG. Here in the first triangle, from G the end of the side GH given being adjacent to an angle given H, I let fall the perpendicular GB opposite to that angle: and so we have two right angled triangles, GBH, and GBF; and in the first there is given the hypothenusal HG, and the angle at the base H, by which to find the perpendicular GB, I say by this Axiom.

sGB-|-Rad = sGH-|-sH, therefore from sGH -|- sH substracting Radius, the remainer is sGB; or to avoid substraction, add unto sGH-|-sH the complement arithmetical, (which for Radius

Thirdly, for the fide required FG, having GB and FB fay scFG + Rad. = scGB-|-scFB, and fo the operation stands thus.

GB 31 deg. 13' sc GB 9.9320746 FB 51 07 sc FB 9.7977775

FG 57 32 sc FG 9.7298521 Which 57, 32, is the fide F G required.

And as in this first Example, the perpendicular was let fall from the angle at G, so it might in this Case have been let fall from the angle at F, as in the second Triangle, and in this second Example.

Thirdly, for the side required F G say, so F G-|-Rad = so F B-|-so BG.

The Operations are as followeth.

I. FH 74 d. 50' s FH 9.9846033 II. FH 7450 t FH 10.5669195 H 56 26 s H 9.9207717 H 56 26 sc H 9.7426520

FB 53 32 7 EB 9.9053750 BH 63 53 t BH 10.3097516 — GH 38 28

BG 25 25 1000

III. F B 53 deg. 32' scF B 9.7740459

BG 25 25 sc BG 9.9557090

Which 37 32' is the fide required as before.

N 2

Third

Third Example.

Dat. F G 57 d. 32', GH 38 d. 28'; G, or rather the acute angle BGF 72 d. 24' required F H.

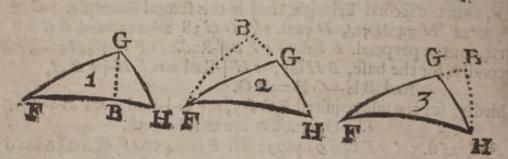

The perpendicular may fall from F or H, but here we let it fall from F as in the fecond triangle.

Then for the perpendicular F B, fay, FB+Rad= sFG+sG. Secondly, for the base BG, say, so G--Rad=to FG-+ t BG.

Thirdly, for the fide required FH, fay, so FH-Rad = so BFsc B H.

The Operations are as followeth.						
s F G 9.9261901	tFG	10.1963704	sc B F	9.7740459		
s G 9.9791798	sc G	9.4805385	sc B H	9.6436504		
sFB 9.9053699	TBG	9.6769089	sc F H	9.4176963		
FB 53 d. 32'	BG	25 d. 25'	FH7	4 degrees, 50		
	GH	38 28	min.	the fide re-		
	ВН	63 53	quir			

In this, and the other Cases following, having by the first Operation. found the Perpendicular, you may use it in the second Operation as one of the two things given, which we shall not need to exemplifie,

Case 4. Two sides, and their contained angle given: to find one of the other angles.

Dat. FG 57 d. 32', GH 38 d. 28', G 107 d. 36', or G acute

72 d. 24' required the angle H.

In this Case the perpendicular falls only from F (as in the second triangle) and so is opposite to the angle given G, and to the angle required H.

First, then for the perpend. FB, say sFB-Rad = sFG-sG. Secondly, for the base BG, say scG-Rad=tcFG-tBG, The sum or remainer of BG and GH, is BH.

Thirdly, for the angle required H, fay, BH + Rad = t FB +

tc H.

And accordingly we order the Operations as followeth.

I. FG 57 d. 32's FG 9. 261901 II. FG 57 d. 32't FG 10.1963704 G 72 24 5 G 9.9791798 G 72 24 56 G 9.4805385

BH63 53

III. FB 53 32 tcFB 9.8686804 BH 63 53 5 BH 9.9532278

H 56 26 tc H 9.8219082, which 56 deg. 26.min. is the angle required.

Second Example.

Dat F H 74 d. 50', G H 38 d. 28', H 56 d. 26', required G, here in the second triangle as before.

First, for the perpendicular, FB. say, sFB--Rad = sFH-+sH. Secondly, for the base, BH, say, scH+Rad=tcFH-+tBH,

And BH-GH=BG.

Thirdly, for the angle required G, fay s B G-+ Rad = t F B-ft c G.

And accordinglythe Operations are as followeth.

I. s F H 9.9846037 II. t F H 10.5669196 s H 9.9207717 sc H 9.7426520

s F B 9.9053750 So is F B 53 d. 32'

10.3095716

10.3095716

10.3095716

10.3095716

10.3095716

10.3095716

III. tc F B 9.8686804 s BG 9.6326576

so is G 72 d. 24', or G obtuse 107 d. 36' the angle required.

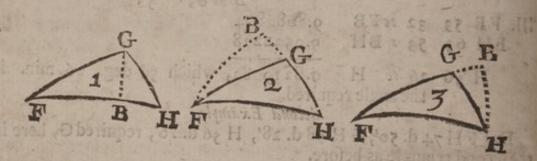

Case 5. Two angles, and the side between them given: to find the third angle.

Dat H. 56. d. 26', G 107 d. 36, G H 38 d. 28', required the angle F. In this Case the perpendicular may fall from G or H, as here from G. First then, for the perpend. G B, say 5 G B-Rad= 5 G H + 5 H. Secondly, for the angles at { say 5 G H-Rad= to H-to BGH. the perpend. B G H and B G F } say 5 G H-Rad= to H-to BGH.

The sum or remainer of G and B G H, is B G F.

Thirdly, for the angle required F, say, so F--Rad= s BGF--so BG.

The Operations are as followeth.

** BH 63 53 9.9532999 -BG 25 25 BH 38 28, the fide required.	The angle USEL for	The fun of I

And this may suffice touching these eight Cases of an oblique spherical triangle, there remain two other Cafes, namely, when the three fides are given to find an angle, or the three angles to find a fide. The first of which is of frequent use, and therefore (though in the former Editions of this Book) we have shewed the resolution thereof three feveral ways, as may appear in the Chapter following; yet I conceive it will not be superfluous, to give here an Example or two more in that third way of application; which as it is easily wrought arithmetically, foit is the aptest for instrumental operations, whether you use Mr. Gunters's Logarithmical Ruler, or Mr. Wingates, or any other right lined, or other circular, or serpentine projection of the Logarithms, or the Sector, &c.

Case II. Three sides of an oblique triangle given: to find an angle.

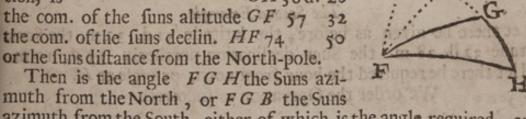

The Rule and ground for the solution of this Problem, is shewed in the Chapter following, therefore we come to Examples.

The first Example may be this.

Let there be given the latitude of the place, or Poles elevation & 1 d. 32 m. the Suns altitude 32 d. 28. min. the Suns declination northerly 15. d. 10. min. and let there be required the Suns azimuth.

In this triangle FGH, let Grepresent the Zenith, H the North-pole, F the Sun, then the complement of the Poles elevation, is GH38d. 28 the com. of the funs altitude GF 57 32 the com. of the funs declin. HF 74 or the funs diftance from the North-pole.

Then is the angle FG Hthe Suns azi-

azimuth from the South, either of which is the angle required, and therefore opposite thereto I let fall the perpendicular F B, and make B I equal to BG. ordering the work as followeth.

Poles elev. 51 32 whose com. GH 38 d. 28'g 19d. 14' tc 10.4573123

Suns altitu. 32 28 whose com. FG 57 32 28 46 Suns decli. 15 10 whose com. FH 74 50 37 25

the sum of half the sides, 66 11 t 10.3551676 the difference of half the sides 08 39 t 9.1822106

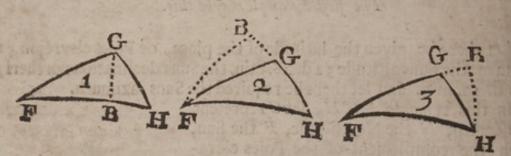

gives the half of the alternate base from which take half the true base there remains $\frac{1}{2}HI_{44} = 399.9946905$ $\frac{1}{2}GH_{19} = 14$ $BG_{25} = 25$

Thus in the right angled triangle BGF, having found the base BG, and the hypothenusal FG, being before at first given, we may find the angle at G, saying,

sc G - Rad=t BG-tc FG, that is, t BG 25d. 25' 9.6768686

tc F G 57 32 sc G 72 24

And thus have we found the acute angle at G, namely, BG F, to be 72 deg. 24 m. which is the Suns azimuth from the South, which was required.

The Second Example.

Let there be given as before, the latitude 51 d. 32 m. the Suns altitude 32 d. 28 m. the Suns declination northerly 15 d. 10 m. And let there be required the hour from noon, or angle at H.

We order the Operation as followeth.

Latitude 51 d. 32' whose com. is GH 38 d. 28'- 19d. 14'tc10.4573123

Suns altit. 32 28 whose com. is F G 57 32 28 46 Suns decl. 15 10 whose com. is FH 74 50 37 25

the fum of half the fides 66 11 \$ 10.3551676 the difference of half the fide 08 39 t 9.1822106

gives the half of the alternate base 1 HI 44 39 t 9.9946905 to which adding half the true base 1 GH 19 14

the fum is the base BH

Thus in the right angled triangle BHF, having the base BH 63 d. 53 m. and hypothenusal F H, being before at first given 74 d. 50 m. we may find the angle at H, faying,

sc. H-|-Rad= tBH-|-tc FH, that is, t BH 63 53 10.3095777 to FH 74.50 9.4330804

sc H 56 26 9.7426581

And thus have we found the angle of the hour from noon H, to be 56 d. 26 min. which converted into time, is 3 ho. 45' 44", before or.

after noon. In like fort you may find the hour of night by any known ftar, for: the fame things being given, namely, the latitude of the place, the altitude of the star, and its declination, you may find the angle at H, as before, and so the true hour and minute (if it were the Sun) which note. Then from that stars right ascension, substract the Suns right afcension, and the remainer converted into time, add to the hour and. minute before noted, that total is the true hour and minute of the night.

But in gathering the Suns right ascension, you must remember that it differs every day about one degree or four minutes of time (as more exactly in the Table appears) and fo you must allow proportionably, for the time that the Sun is past the meridian of the place for which your Tables were made: as if it be fix hours past it, the right ascenfion is increased by about one minute of time; if twelve hours, then about two minutes; if eighteen hours, then about three minutes of ers and G Toke force of but f the angle at D. I fay then

CHAP. VII.

Of the second Fundamental Axiom, and of the Cases thereon depending: with two other Axioms to the same purpose.

2 Fundamental Axiom.

IN afpherical triangle, if half the difference of the fides containing an angle, be added to half the fide opposite to that angle, and likewise substracted from the same, and the sum and remainer noted: Then as the rectangle of the sines of the containing sides, is to the square of Radius:

So is the rectangle of the sines of the foresaid sum and remainer to the

square of the sine of half the contained angle.

As in the triangle ADE. Let D be the contained angle, and let AB be the difference of the containing sides AD and ED (for DB is equal to ED) and let AE, that is, AS, be the side opposite to the angle at D. Then making SK equal to AB, draw the subtendents AK and BS; and dividing the arch AK or BS equally in R, draw from the center the line HR. Then drawing Q X parallel to HP, and BL and GO to AH, OE.

GQ is the versed sine of the angle ADE, as also of the arch GX. Therefore the arch G X, is the measure of the angle ADE: But Q X is the right fine of the arch GX, therefore QX is also the right sine of the

angle ADE.

And seeing AS is equal to the opposite side AE, and SK to AB, the difference of the containing sides, therefore the whole arch A K, is equal to AE and AB; therefore the half thereof AR, is the sum of the halves of AE and AB, that is, of half the opposite side, and of half the difference of the containing sides, the sine whereof is AW. And if the difference A B, be taken from the side A E, that is from A S, the remainer is BS, the half whereof is BR: So that if the half of A Bbe substracted from the balf of A E or AS, the remainer is BR. And seeing G N is equal to AD, GO the sine of GN, is also the sine of AD and BC is the sine of DE or DB. So that BC and GO are the sines of the containing sides AD and ED, and AW and BR are the sines of the aforesaid sum and remainer, and G Y the sine of half the angle at D. I say then that,

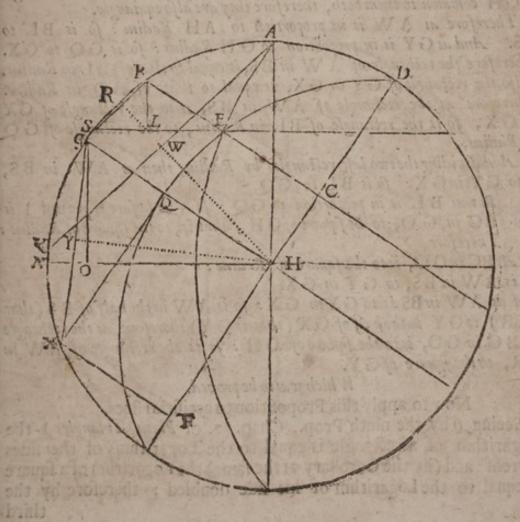

As the rectangle of the sines of the containing sides AD and ED, is to the square of Radius:

So is the rectangle of the sines of the sum and remain: AR and BR, to the square of the sine of half the angle ADE, namely, to the square of the sine of half the arch, GX.

That is,

As the rectangle of GO and BC, is to the square of GH: So is the rectangle of AW and BR, to the square of GY.

Demonstr. For as GH, the semidiameter of a great circle, is in proportion to BC the semidiameter of a lesser: so is QH the sine of a certain arch in the greater, to EC the sine of the like arch in the less; and so is GQ the versed sine in the one, to BE the versed sine in the other. Which is more largely demonstrated by Pitiscus, lib. 5. and by others.

Therefore as GH is in proportion to BC, so is GQ to BE.

And as GH is in proportion to GO, so is BE to BL. For the triangles GOH and BLE are equiangled. Therefore as the square of GH, is to the rectangle of BC in GO: so is the rectangle of GQ in BE, to the rectangle of BL in BE.

And dividing the two last rectangles by BE, then as the square of GH,

is to BC in GO: sois GQ to BL.

Or the Converse, namely,

As BC in GO, is to the square of GH: so is BL to GQ.

Again, seeing that AK is parallel to BS, and BL to AH:
therefore the angle SBL, is equal to the angle HAW: therefore the
right angled triangles SBL and HAW, are equiangled. Likewise
seeing the right angled triangles YGH, and QGX, have the angle

YGH common to them both, therefore they are also equiangle.

Therefore as AW is in proportion to AH Radius: so is BL to BS. And as GY is in proportion to GH Radius: so is GQ to GX. Therefore the rectangle of AW in BS, is equal to that of BL in Radius. Also the rectangle of GY in GX, is equal to that of GQ in Radius. Therefore as the rectangle of AW in BS, is to the rectangle of GY in GX, so is the rectangle of GY in Radius, to the rectangle of GQ in Radius.

And dividing the two last rectangles by Radius, then as AW in BS,

is to GY in GX: fo is BL to GQ.

But as BL is in proportion to GQ: so (as before is proved) is BC in GO, to the square of GH; that is, to the square of Radius: Therefore,

As BC in GO, is to the Square of Radius :

fo is AW in BS, to GY in GX.

But as AW in BS is to GY in GX: so is AW in the half of BS (that is BR) to GY in the half of GX (that is GY) therefore as the rectangle of BC in GO, is to the square of GH: so is the rectangle of AW in BR, to the square of GY.

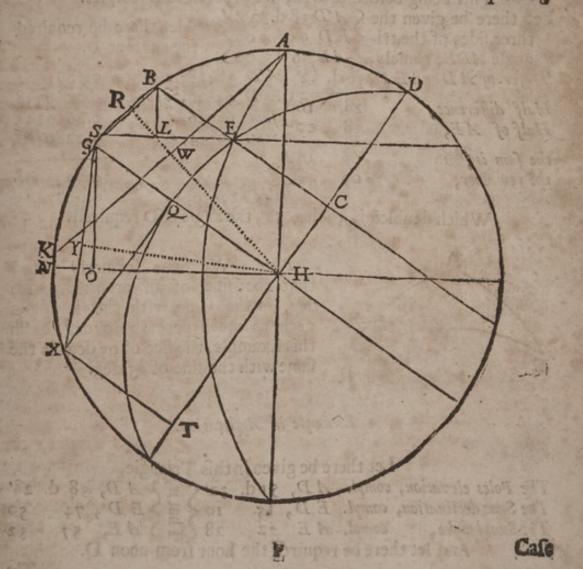

Which was to be proved.

Now to apply this Proposition to artificial sines.

Seeing (by the ninth Prop. Chap. 2. of Plain Triangles) the Logarithm of a rectangle is equal to the Logarithms of the sides thereof: and (by the Corollary of the same) the Logarithm of a square is equal to the Logarithm of his side doubled: therefore by the

third Prop. of the same Chap. If unto the artificial sines of the fore-faid sum and remainer, be added twice Radius; and from that tota be substracted the sines of the containing sides: half the remainer is the sine of half the contained angle required. Or, (by the 4 Prop. of that Chap.) If instead of substracting the sines of the containing sides, we add their several Complements arithmetical, the total is more than the remainer would have been by twice Radius. Therefore leaving out twice Radius: if to the several Complements arithmetical of the sines of the containing sides, be added the sines of the afore-said sum and remainer, half that total is the sine of half the contained angle required.

This ground thus laid, we come to that two Cafes thereon depending

Case 11. The three sides of a Spherical Triangle being given:

Take half the difference of the fides containing the angle required, and add it to half the fide opposite to that angle; and likewise sub-

stract it from the fame, noting the fum and remainer.

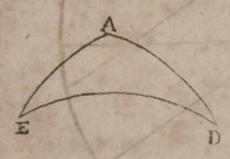

Then to the complements arithmetical of the artificial sines of the containing sides, add the artificial sines of the foresaid sum and remainer, and the half of that total is the artificial sine of half the angle required.

This being before proved, we proceed to Examples.

Let there be given the SAD 38 d. 28' And let there be required three fides of the triangle ADE, namely, SAE 76 of the angle at D.

Differ. of A Dana E	0,50 a.	32 12	30-28, 5 00.	ar. 0.2001683
Half difference	28	16\E D	95-00, 500.4	1. 0.0016558
Half of AE,	38	co) Jum	66-16, 5	9.9616244 9.2280481
the sum is,	66	16)	09-44, 3	9.2280481
the remainer,	09	446		19.3974966
	-	balf [29-50.5	9.6987482

Which doubled is 59 deg. 58', the angle at D required.

Note. We have formerly noted that the fine of an arch above 90 deg. is the same with the fine of an arch as much beneath 90 deg. as in this Example, the sine of 95 deg. is the same with the sine of 85 deg.

1 Example in Application.

Let there be given in this Triangle,

The Poles elevation, compl. AD, 51 d. 32' S. AD, 38 d. 28'

The Suns declination, compl. ED, 15 10 ED, 74 50

The Suns height, compl. AE 32 28 ES AE, 57 32

And let there be required the hour from noon D.

ch doubled, is	122	25,	the	Suns	azimuth from (the North.

Note. And after the form of either of these Examples, we may by the same things given, find the angle of the same position.

3 As if there were given the Poles elevation, the Suns declination, and the Suns height: to find the angle of the Suns position.

This eleventh Proposition is often used by Sea-men, especially the fecond Example, for finding the azimuth, whereby the variation of

the Compass may be known at Sea, after this manner.

About the middle of the forenoon, or afternoon, the height of the Sun above the Horizon is to be taken by some Instrument for that purpose, which being noted down, you are at the same instant (so near as may be) to set the Sun with your Compass (fitted for that purpose, the outward circumference of the Fly or Card divided into degrees, and the Needle placed under the North and South points of the Card) and note down likewise upon what degree of the Compass (reckoning from the North) you found the Sun. Then knowing by your former observations and reckoning, your Latitude, and by your Tables for that purpose, the Suns declination, there is given the Poles elevati-

on, the Suns declination, and the Suns height above the Horizon, where-by, according to the fecond Example last before going, you may find the Suns true azimuth in degrees and minutes from the North; which compared with the degrees before found by the Compass, if both agree,

the Compass hath no variation; if there be any difference, that difference is the variation: Which variation, whether it be Easterly or Westerly; westerly, may be known by the Rule before given upon the twelfth

Case of the third Chapter of right angled triangles.

As in the second Example last before going. Admit that at the same instant, when I observed the height of the Sun in the morning to be 32 d.28 min. I set the Sun by my Compass, and sound it to be from the East point towards the South 12 deg. that is, from the North 102 d. But the Suns true azimuth from the North sound by calculation, is 107 deg. 36 min. the difference between these two is 5 deg. 36 m.

which is the variation of the Compass.

But to know whether this variation be Easterly or Westerly, I consider that by the Sunstrue azimuth found by calculation, the Sun should have been from the North 107 deg. 36 m. that is, from the East point of the Compass to the Southwards 17 deg. 36 m. Whereas setting it with my Compass, it was from the East to the Southwards but 12 deg. So that the degree whereon the Sun should have been, was more toward the right hand, than the degr. whereon it was: therefore I affirm the variation to be Easterly 5 deg. 36 min. By the same Problem, may the variation of a Needle be found on the land.

Case 12. The three angles of a spherical Triangle given: to find a side.

This is performed by the last Axiom, the angles being converted into sides, and the sides into angles (as we have shewed Chap. 1 Of Spherical Triangles) taking instead of the greatest angle his complement to 180 deg.

Wherefore having taken instead of the greatest angle his comple-

ment to 180 deg. and all things else remaining as before.

Take half the difference of the angles that are adjacent to the fide required, and add it to half the angle opposite to that side; and likewise substract it from the same, noting the sum and remainer.

Then to the complements arithmetical of the artificial sines of the adjacent angles, add the artificial sines of the foresaid sum and remainer, and the

half of that total is the artificial line of half the lide required.

The like reason serves for this, as for the last Case before going.

We come therefore to Examples.

Let there be given the A107d. 36', that is 72d.24' And let there three angles of the tri- D 56 26 be required the angle ADE, namely, E 37 55 fide ED.

)] + (rem.10-58 5	9.2796227
The Sum, 96 5821		-
The remainer, 10 372)		19.5674749
	37-25	9:7837374

Which doubled, is 74-50, the side E D required.

He hath another way very little inferiour to the former, for the folution of the two last Cases, which Mr. Gunter makes use of, Asis Three sides be given to find an angle.

Add the three sides together, noting half that sum, and from that half, substract the side opposite to the angle required, and note the

remainer. Then

As the rectangle of the sines of the containing sides,

is to the Square of Radius;

fo is the rectangle of the sines of the foresaid sum and remainer, to the square of a sine, whose arches compl. doubled is the angle sought. By containing sides, we mean the sides containing the angle required.

Therefore working by artificial fines,

Add to the complements arithmetical of the fines of the contain-

ing sides, the sines of the foresaid sum and remainer, half that total is the sine of an arch, whose complement doubled, is the angle sought.

Let the Example be here as before namely.

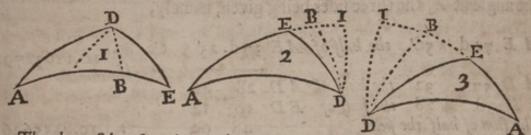

Dec ene	CAE	72 d.32	', and let there be	required the angle
Let there be given	ZAD	38 28	s Compl. arith.	0.2061683
	/ED	74 50	s Compl. arith.	0.0153967

The half sum The remainer	170 50 85 25 s	9.9986090
1 ne remainer	72 53 5	9.6699420

The complement of this sines arch, is 28 deg. 13 m. 9.9450580 Which doubled, is 56 26 the angle at D required. If the three angles be given to find a fide, you may convert the an-

gles into sides, &c. as before is shewed.

Although either of these two last Axioms are very sufficient for the solution of the two last Cases of an oblique spherical triangle arithmetically; yet neither of them can so aptly be applied instrumentally. We will therefore here set down the third Axiom, which he hath to the same purpose.

The three sides of a triangle being given, and an angle required, let fall a perpendicular opposite to that angle, the side whereon that perpendicular falls, we call, for distinction sake, the base, and the other two the sides, thus in every of these triangles A E is the base, AD and ED the sides: DB the perpendicular, B being placed at the right angle, and BI alwayes made equal to BE: Thus in every of them AE being the true base, AI is the alternate base, whose end I is as far from the perpendicular B one way, as the end of the true base E, is from the perpendicular the other way. Which things thus conceived, I say,

As the tangent of the true semibase given,

is to the tangent of half the sum of the sides: So is the tangent of half the difference of the sides, to the tangent of the alternate semibase.

That is,

As the tangent of the half of AE,

to the tangent of half the sum of AD and ED.

So is the tangent of half the difference of A D and ED, to the tangent of the half of A I.

The demonstration whereof, you may see in his second Book of

Triangles.

Therefore adding the half of the true base AE, to the half of the alternate base AI; the sum is AB, the base of the right angled triangle ABD: also the difference of the halves of AE and AI, is EB, the base of the other right angled triangle EBD.

Q

And

And thus in either of the right angled triangles ABD and EBD, We have the base and hypothenusal, whereby at one other operation either of the angles opposite to the perpendicular, namely, the angle at A, or that at E, may be found by the 13 Case of right angled triangles. Therefore, the three sides being given, we may find an angle.

As for Example, in the first of these triangles, let there be required the angle at A, the three fides being given, namely,

A E 74d. 50' the half of AE 37d.	25' 5 Co. ar. 10.1163279
A D 57 32 the half of A D 28 E D 38 28 the half of E D 19	46
The sum of half the sides The difference of half the sides 48	00 t 10.0455626 32 t 9.2251560
The half of AI To which adding half of AE The sum is AB 13 7 51	42 t 9.3847065 25
AB 51 deg. 07' the tangent of AB AD 57 32 tan. compl. of AD	10.0934397 9.8036296
A 37 55 make sine compl. A	9.8970693

And thus we have found the angle at A to be 37 deg. 55 min. and

in like manner we might have found any of the other angles.

Note. For the resolution of questions of this nature instrumentally, Mr. Gunter (an ingenious man in contriving and applying of Instruments) makes use of the right and versed sines, and so resolves them at two operations, and fometimes he useth the right fines only, but then he hath three operations. Notwithstanding they may also be performed at two operations without versed fines, using only the tangents, as we have here shewed.

Now, as we have before for right angled triangles, fo we will here for oblique, represent in a Table the operations used in every Case, by the view of which Table you may be directed in the resolution of any

oblique spherical triangle.

This last Table might be proposed in other terms; as the first Case we might express thus co. ar. s E-|-s A D-|-s A, makes ED, cutting off an unite or 1 in the first place toward the lest hand, which thing being before sufficiently explained, we shall not here need to insist thereon.

Here I intended to conclude this work: but because the demonstration of the first fundamental Axiom for spherical triangles, as it is delivered by the Lord of Marchiston, is very brief, and by him applied to another kind of Logarithms, so that it may seem obscure, I have thought good here (though something out of place) to illustrate the same, first premising certain Lemma's serving to that purpose.

LEMMA I.

In a right angled spherical triangle,

As the sine of the base, is in proportion to Radius: so is
the tangent of the perpendicular, to the tangent of the angle
at the base.

As in this Diagram,

Let ADB represent a spherical Triangle, right angled at B; so that AD is the sine of the hypothenusal, AB the sine of the base, and DB is the perpendicular.

Then is DAB the angle at the base, and IH the sine, and LM the tangent thereof. Also DF is the sine, and KB the tangent of the perpendicular DB.

I fay

I fay then,

As AB the sine of the base,
is in proportion to AM Radius:
so is BK the tangent of the perpendicular,
to ML the tangent of the angle at the base.

LEMMA 2.

In a right angled spherical Triangle,

As the sine of the hypothenusal, is in proportion to Radius: so
is the sine of the perpendicular, to the sine of the angle at the
base.

That is, in the foregoing figure,

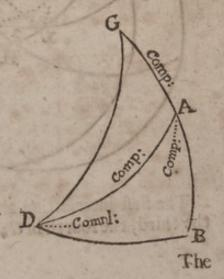

As AD the fine of the hypothenusal,
is in proportion to AI Radius:
fo is DF the sine of the perpendicular,
to IH the fine of the angle at the base.

These two Lemma's might be demonstrated in this Diagram, but because the same in effect are at large demonstrated by Lansbergius, Pitiscu, Snellius, and others, we let that pass.

LEMMA 3.

The circular parts of a right angled Triangle, are the same with the circular parts of a quadrantal Triangle adjoyning.

As let ABD be a triangle right angled at B: and let one of the sides thereof, namely, AB, be extended, till it become a quadrant, that is to G, and draw an arch from G to D. Then is GAD a quadrantal triangle, adjoyning to the right angled triangle ABD. I say therefore that the circular parts of the quadrantal triangle GAD, are the same with the circular parts of the right angled triangle ABD. For the circular parts of either of them are, as here appeareth.

The five cir- SABD, are AB. DB com. BDA. com. AD. com. A. cular parts of

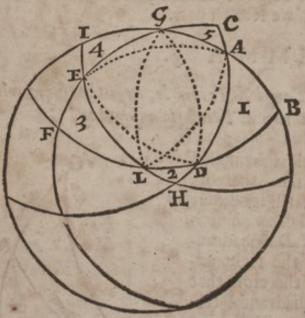

the triangle. 2GAD, are com. AG. AGD. GDA. com. AD. com. A.

Where it is evident, GB and GD being quadrants GDB is a right angle, and DB is the measure of the angle at G: so that the side AB in the one is equal to compl. AG in the other; and the side BD in the one, equal to the angle AGD in the other, and compl. BDA in the one is GDA in the other, and compl. AD in the one is the same with compl. AD in the other; and lastly, that compl. A in the one, is the same with compl. A in the other, for the complement of the acute angle DAB unto a quadrant, is also the compl. of the obtuse angle GAD.

LEMMA 4.

If five circles of the Sphere be so ordered, that the first intersect the second, the second the third, the third the fourth, the fourth the fifth, and the fifth the first, at right angles: the right angled triangles made by their intersections, do all consist of the same circular parts.

As in this Scheme,

Let G represent the Zenith, Athe North Pole, and D the Sun being in the Horizon. So that IGB is an arch of the meridian of the place.

BDF an arch of the Horizon.

FEC, an arch of the circle describ'd about the Sun.

CAH, an arch of the meridian of the Sun.

HLI, an arch of the Equinoctial.

Then do these five arches retain the conditions re-

The first intersecting the second in B; the second, the third in F; the third, the sourth in C; the sourth, the fifth in H; and the fifth,

the first in I, and these intersections at B, E, CH, I, are at right angles; therefore I say the right angled triangles made by the intersections of these circles, namely, ABD, DHL, LFE, EGI, and GCA, do all consist of the same circular parts, for the circular parts in every of them are as here appeareth.

The five ABD, are AB, BD, com. BDA, com. AD, com. DAB circular DHL, are com. HLD. com. LD, com. LDH, DH, HL parts in LFE, are com. ELF, LF, FE. com. FEL, com. EL the Triangle. GCA, are com. GA, com. AGC, GC CA, com. CAG

Where you may observe, that to the side A B in the first triangle, is equal compl. H L D in the second, or compl. ELF in the third, or I G in the fourth, or compl. A G in the fifth. In like fort, to the side DB in the first triangle, is equal compl. L D in the second, the side LF in the third, compl. I G E in the fourth, or compl. A G C in the fifth: and the like is to be seen in the rest, taken in such order as they are placed.

To express this more plainly: AB, the Poles elevation in the first triangle, is the complement of the angle HLD in the second, or the complement of the angle ELF in the third, or the side IG in the fourth, or the complement of the hypothenusal GA in the fifth; and

the like is to be understood of the rest.

The same uniformity of the circular parts is also apparent in quadrantal

triangles.

As in the fame Scheme G from D, D from E, E from A, A from L, and L from G, are distant by arches each equal to a quadrant; but the arches GA, AD, DL, LE, and EG, are not quadrants. Here are therefore five quadrantal triangles GAD, ADL, DLE, LEG, and EGA: whose circular parts are, as here appearth,

The five GAD, are com. AG, AGD, GDA, com. AD, com. DAG circular ADL, are ALD, com. LD, com. ADL, com. AD DAL parrs in DLE. are com. DLE, com. LD, EDL, DEL, com. LE the Tri-LEG, are GLE, LGE com. EG, com. LEG, com. LE angle. EGA, are com. AG, com. EGA, com. EGA, GAE

Where you may observe, that the circular parts in every of them remain the same unchangeable; and not only in these ten triangles, but in all others which do arise of the other intersections of these ten arches drawn forth to whole circles: which because they are many and confused, we here let them pass, this being sufficient for our purpose.

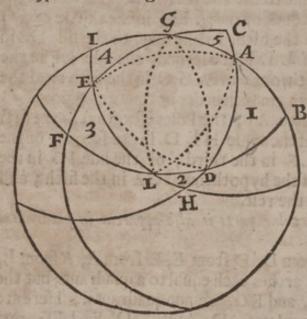

1. Fun-

I Fundamental AXIOM.

Of the five circular parts in a spherical Triangle, right angled or quadrantal.

The sine of a middle part with Radius, is equal to the tangents of the extreams adjacent, or to the sines complement of the opposite extreams.

What a middle part, and what the extreams are, whether adjacent or opposite thereto, we have before shewed Chap. 2. of spherical Triangles.

Part 1. Now touching the first part of this Axiom in right angled triangles; the middle part is either one of the oblique angles, or the hypothenusal.

Part be a side; as in the triangle ABD, let AB be the middle part, and DB, and compl. A the extreams adjacent; then I say, that the sine of AB with Radius, is equal to the tangent of DB, with the tangent of the complement of DAB.

For (by the first Lemma) as the sine of AB, is in proportion to Radius: so is the tangent of DB, to the tangent of the angle at A; to tangent AB, to tangent AB; so Radius

But (by the Corollary of the first Theorem of the fourth Chapter of Plain Tringles) Radius is a mean proportional between the tangent of an arch, and the tangent of the complement of the same arch; so that fore as s AB, to t DB: so is tang. compl. A, to Radius: therefore as s AB, to t DB: so is tang. a to Radius: therefore (by the Corollary of 3 Prop. Chap. 2. of Plain Triangles) s AB--Radius, is equal to DB--to A.

Case 2. Let the middle part be arrangle, as in the triangle DHL; let compl. HL D be the middle part, and HL and compl. L D the extreams adjacent, then I say, that the sine complement of HL D, with Radius, is equal to the tangent of HL, with the tangent of the complement of LD.

For (by Lemma 4.) compl. HLD is equal to AB, and compl. LD to DB, and HL to compl. DAB, and here before we have proved, that AB—Radius, is equal to DB—to A, therefore also

sc HLD-Radius, is equal to to LD-t HL.

Case 3. Let the middle part be the Hypothenusal; as in the triangle G C A, let complement AG be the middle part, and complement AGC, and complement CAG, the extreams adjacent; Then also I

fay, se AG+ Radius, is equal to to AGC+to C AG.

For we have before proved, that AB+Radius, is equal to AB+te A, but (by the 4 Lemma) complement AG, is equal to AB, and compl. AGC to DB, and compl. CAG to compl. DAB, therefore also se AG+Radius, is equal to to AGC+te CAG.

Therefore in a right angled triangle, the sine of a middle part with Radius, is equal to the tangents of the extreams adjacent.

I fay further, that

Part'z. The sine of a middle part with Radius, is equal to the sines complement of the opposite extreams.

For here also the middle part is either one of the sides, or the hypo-

thenufal, or one of the oblique angles.

Case 1. Let the middle part be a side, as in the triangle ABD let DB be the middle part, and compl. AD, and compl. A the opposite extreams. Then I say, that the sine of BD with Radius, is equal to the sine of AD with the sine of A.

For (by Lemma 2.) as A D to Radius: fo B B to fine A, therefore (by Corol. 3 Prop. 2. Chap. of plain triangles) D B

-Radius, is equal to s A D- s A.

Case 2. Let the Hypothenusal be the middle part, as in the triangle 'D H L, let compl. L D be the middle part, and D H and H L the opposite extreams; then I say, that sc L D + Radius, is equal to so DH-+ sc H L.

For comp. L. D is equal to DB, and DH is equal to compl. AD; and HL to compl. D. AB (by the 4 Lemma) therefore, &c.

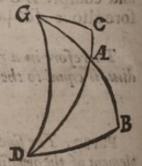

Case 3. Let one of the oblique angles, be the middle part. As in the triangle E IG let compl. IG E be the middle part. Then I fay that sc I G E-Radius, is equal to s G E I-sc E I. For compl. IG E is equal to D B, and G E I is equal to A D, and E I to compl. D A B.

Therefore in a right angled triangle, The fines of a middle part with

Radius, is equal to the fines compl. of the opposite extreams.

And feeing (by the third Lemma) the circular parts of a right angled triangle, are the same with the circular parts of the quadrantal triangle adjoyning; therefore that which is here proved touching right angled triangles, is also true of quadrantals, Therefore in a spherical triangle, right angled or quadrantal, &c. Which was to be proved.

The same might also have been demonstrated in this Diagram without the fourth Lemma beforegoing, but because that sourth Lemma is of singular invention, and of it self worthy to be known, I have chosen rather to sollow herein the invention of the noble Author and Inventer of this Prop. and of that third and sourth Lemma, than otherwise.

And thus have we shewed the resolution of Plain and Spherical Triangles, by this late invention of Logarithms, not excluding the ways formerly used by natural sines, tangents, and secants; but delivering the Rules in such fort, as they may be applyed to either. What hath been largely handled by others I have lightly passed over; other things I have more insisted upon. In all I have endeavoured so much brevity, as might stand with perspicuity. Now touching the application hereof, I doubt not but he that is exercised in the Mathematicks, will be able to apply it divers ways, especially to those parts wherein he is conversant; yet for their help that are but newly entered, I hope to do something in that kind hereafter, as it shall please God to give opportunity. To whom alone is due all Glory in all things.

the opposite extremes; then K. T. T. Radius, is equal to se

NA NA

AN APPENDIX.

a s & of G moft had I harbs we

Touching the application of the Doctrine of Triangles in the three principal kinds of Sailing.

A intent was here to have annexed a Treatife of Navigation, and especially of such Points therein as have reference to the Dollrine of Plain and Spherical Triangles: Being the rather thereunto induced, because I had my first breeding in Mathematical Studies and Practices at Sea; whereby I stand the more indebted, as to that excellent Art, so to the worthy Professors and Practicers thereof. But wanting time for the accomplishing of that according to my desire, by reason of my necessary absence and employment far from home all this Summer, I have here, instead thereof, shewed the resolution of certain Problems, touching the three principal kinds of Sailing.

Questions of sailing by the plain or ordinary Sea-Chart.

Although the ground of the Projection of the ordinary Sea-Chart being false (as supposing the Earth and Sea to be a plain superficies) and so the conclusions thence derived must also for the most part be Erroneous: yet because it is most easie, and much used, and the Errors in small distances not so evident, we will not wholly neglect it.

Quest. 1. Sailing 100 Leagues upon the fixth Rumb: how much shall I altermy Parallel or Latitude?

Note. The angle that any Point of the Compais makes with the Meridian, we call the Rumb but the angle that it makes with any

Parallel, we call the complement of the Rumb. to sono to be and to

And forasmuch as to every Point of the Compass there answers 11 deg. 15', therefore the fixth Rumb from the Meridian (namely, ene, ese, wsw, or wnm) makes an angle therewith of 67 deg. 30', whose complement 22 deg. 30', is the angle of the same Rumb with every Parallel.

NOW

Now admit I fail from D to A. e n e 100 Leagues; I demand the difference of Latitude DB.

By the third Case of plain triangles.

As Radius, to the distance run: fo fine compl. the Rumb.

AD 100 Leagues s A 22 deg. 30 m. 9.58284

to the difference of Latitude, DB 38787 Leagues 1.58284
In like manner you may find the difference of Latitude for any distance run upon any other point of the Compass.

2 Sailing 100 Leagues upon the fixth Rumb: how far am I departed from the Meridian of the place from which I came?

That is by the same things, as before I demand AB.

By the third Case of plain triangles.

As Radius, to the distance run: fo is the fine of the Rumb,

AD 100 Leagues 5 D 67 deg. 30 m.

2.00000 9.96562

to the departure from the Merid. A B 927 2 Leagues. 1.96562

3 Sailing upon the sixth Rumb, till I alter my Latitude one degree, I demand how far I have failed?

As failing from D to A, e ne, till the difference of Latitude DB. be 20 Leagues; I demand the distance run A D.

Say by the second Case of plain triangles.

As fine complethe Rumb, s A22 deg. 30 m. co. ar. to the difference of latit.

DB 20 Leagues

0.41716 1.30103

fo is Radius,

to the distance run, AD 52 700 Leagues 1.71819 The like question might be moved by the departure from the Meridian given. A Sailing

4 Sailing upon the fixth Rumb, till I have altered my latitude one degree : how much am I departed from my first Meridian?

As failing from D to A, en e, till the difference of latitude D B be 20 leagues; I demand AB, my departure from the Meridian.

By the first Case of plain triangles.

As Radius,		
to the difference of latitude :	DB 20 leagues	1.30103
fo is the tangent of the Rumb,	t D 67 deg. 30'	10.38278

to the departure from the Merid. AB 48 700 1.68381
In like manner by the departure from the Meridian given, you might find the difference of latitude.

5. Sailing upon some Rumb, between the North and East 52 \(\frac{1}{2}\) leagues, and finding that I have altered my latitude one degree: I demand upon what Point I have sailed?

As if I fail from D to A (being some Rumb between the East and North) 52 \(^1_4\) Leagues, and then find the difference of Latitude DB, to be 20 Leagues; I demand the angle ADB.

Say by the fixth Cafe,

As the distance run, AD 52 1 Leag. co. ar.	8.28191
is to Radius: fo is the difference of Latitude, D B. 20 Leag.	1.30103
to fine compl. the Rumb, s A 22 deg. 30 m.	9.58294

Whose complement D 67 deg. 30 m. is the sixth Point from the Meridian, namely, ene. Here we neglect some part of a minute (as in these things not to be regarded) and so in other places.

6 Sailing upon some Rumb between the North and the East 52 Leagues; and finding that I have altered my Latitude one degree, I would know my departure from my first Meridian.

By

By the seventh Case.

To the distance run, add the distance of Latitude, and also substract it from the same, noting the sum and remainer. Then add together the Logarithms of this sum and remainer, and half the total is the Logarithm of the distance from the first meridian.

Distance run D A, 52 \(\frac{1}{4}\) leagues \(\frac{5}{4}\) Sum \(\frac{72}{4}\) leagues.

Distance run D A, 52 \(\frac{1}{4}\) leagues \(\frac{5}{4}\) leagues.

1.85884

1.50853

3.36737

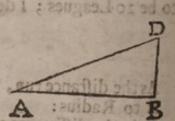

Departure from the meridian AB, $48\frac{1}{100}$ leagues. The same may be otherwise found by the same Case.

And in like fort might the difference of latitude be found, the departure from the meridian being known.

The distance of the meridians of two places, and the difference of the Latitudes of the same places being given, to find the Rumb and distance.

As let A represent the Lizard in the West-Part of England, and AB the parallel thereof, and let D represent St. Mary's Island, being one of the Azores, DB the meridian thereof.

Then is AB, the distance of the Lizard from the meridian of St. Mary's, which let be 272 leagues; and DB the distance of their parallels, or difference of their latitudes 256 leagues. I demand the Rumb: namely, the angle at D, and the distance in the Rumb, AD.

First, for the Rumb, say by the fourth Case.

As the difference of Latitude, DB 256 Leagues, com. ar. 7.59176 is in proportion to Radius:

fo is the distance of the meri. AB 272 leagues, 2.43457

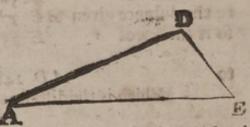

Which is the fourth Rumb from the meridian, and 1 deg. 44 m. more, which shews the course from St. Mary's to the Lizard, to be North-East 1 deg. 44 m. easterly: or from the Lizard, to St. Mary's South-West 1 deg. 44 m. westerly. And thus it should be by the plain Chart.

Secondly,

As the fine of the Rumb, 5 D 46 deg. 44' co. ar. 0.13776 to the distance of the Meridians AB 272 leagues, 2.43457
fo is Radius, to the distance of the places, $AD_{373} \stackrel{1}{\stackrel{1}{\stackrel{1}{\stackrel{1}{\stackrel{1}{\stackrel{1}{\stackrel{1}{1$
As fine compl. the Rumb, 5 A 43 d. 16 co. ar. 0.164c6 to the difference of latitudes: DB 256 leagues, 2.40824
to the distance of the places, AD 373 \frac{1}{2} leagues, 2.57230
And fuch should be the distance by the plain Chart. 8 Sailing away ws w. I see a Point of Land, which I set, and find to

bear from me w by n; and having sailed six Leagues further, I find it bears from me n w by w: I would know how far it is distant.

As let E be a point of Land, which when the Ship is at A, I fet and find to bear from me w by n, but I hold on my course from A to D ws w 18 miles, and at D, I fet the same Point of Land again, and find it to

bear from me n w by w: I demand the distance thereof DE, that is,

how far it was from me in my last observation.

First, I consider that between A E the w by n, and AD the w s w is three Points of the Compass, that is, 33 deg. 45 m. which is the angle at A: also between E A, the e by s, and E D the se by e, are two Points, that is, 22 deg. 30 m.

Therefore by the 8 Case of Plain Triangles.

As sine the angle at the point \{ \int_{22} \deg. 30 \text{ m. com. ar.} \quad 0.41716 \\
feen, \quad is to the distance run \quad \text{AD 18 miles,} \quad \text{1.25527} \\
fo \text{ fine the angle at the first } \{ \lambda_{33} \deg. 45 \text{ m.} \quad \text{9.74474} \\
to the distance of the Point seen \text{ED 26 \frac{1}{8} miles,} \quad \text{1.41717}

Whereby it appears, that the distance of the Point seen from the place of your last observation, is 26 miles, and a surlong. In like manner, you may find the distance thereof from the place of your first observation A.

Admit

Admit the course from the Lizard to St. Mary's be SW the distance 3732 Leagues. A certain Ship bound from the Lizard to St. Mary's, steers away SSW, and afterwards W by S, and so sometimes upon one of these points, sometimes upon the other, till she arrives at St. Mary's; now I demand how many Leagues she hath sailed upon one of these Points, and how many upon the other?

Let A be the Lizard, ESt. Mary's, and feeing s s w being from swtwo points, makes an angle therewith of 22 degr. 30 m. which let be A; also w by s makes with s wan angle of 33 degr. 45 m. which let be E; also ssw makes with w by san angle of 56 degr. 15 m. which let

be the complement of D to 180 degr.

Therefore by the & Cafe,

As the fine of D 56 degr. 15 m. co. ar. to the distance given AE 373 ½ Leagues fo is the fine of E 33 degr. 45 m.	0.08015 2:57113 9:74474
Which is the diffance run upon the ssw point.	2.39602
As the fine of to the distance given fo is the sine of Again, D 56 degr. 15 m. co. ar. AE 373 ½ Leagues A 22 degr. 30 m.	0.08015 2.57113 9.58284
Which is the distance run upon the m by Doing	2.23412

10. A Merchant-Man being in the Latitude of 43 degrees, falls into the hands of Pyrats; who, among st other things, take away his Sea-compass: But when he is gotten clear, he sails away as directly as he can, and after two days meets with a Man of War, who also had been the day before in the Latitude of 43 degr. and had sailed thence se by \$37 leagues: He desirous tofind these Pyrates, the Merchant-Man tells him, he left them lying to and fro where they took him, and he had sailed since at least 64 leagues between the South and West: what course shall the man of War shape to find the se Pyrats?

Let AE be the parallel of 43 degr. D the place where the Ships meet. Then is there given AD 64 leagues, ED 37 leagues, and the

angle D E A five points, or 56 degr. 15 m.

Therefore

Therefore by the 9 Case of plain triangles.

As the distance run by the AD 64 leagues co. ar. 8.19382 Merchant-Man, s 56 d. 15 m. 9.91985 to fine the angle given : So is the distance run by ED 37 leagues, 1.56820 the Man of War, s A 28 d. 44 m. 9.68187 to fine an angle required,

That is w s w 6 d. 14 m. Southerly, and fo hath the Merchant-Man failed; therefore to return to the same place, he must shape his course

ene 6 d. 14 m. Northerly.

11 There are two Ports lying ne, and sw one of another, a ship sails from the westermost of these Ports ese, 45 leag. another departing from the eastermost Porti, Sails 66 leag. and then meets with the former; what course bath this second ship kept and how fax are these Ports asunder?

Let the North-east Port be A, the South-west E, and the place where these ships meet at D; and for a smuch as from E to A, the course is ne, and from E to D East South-east: therefore the angle at E is 67 deg.

30 m. and the fide ED 47 leagues, and AD 66 leagues.

Therefore by the 9 Case of plain triangles.

And feeing from A to E, the As A D 66 leag. co. ar. 8.18046 course is South-west, and from to fine E 67 deg. 30 m. 9.96561 Ato D, 41 d. 08 m. more Sou-1.67210 therly; therefore the course fo E D47 leag. from A to D, is South 3 di 152

to fine A41 d. 08 m. 9.81817 m. westerly. 111 2011 10 m.

Secondly, for the distance of these Ports AE, the angle at A, being 41 d. 08 m. and the angle at E 67 d. 30. m. the fum of them both is 108 d. 38. m. which substracted from 180d. leaves the angle at D 71 d. 22 m.

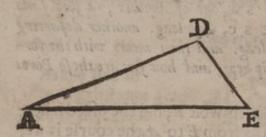

Therefore by the 8 Case of plain triangles.

As fine E 67 deg. 30 min. co. ar. 0.03439 So that the distance between 1.81954 to AD 66 leag. the two Ports, fo fine D 71 degr. 22. min. 9.97662 is 67 7 leagues. to AE 6773 leagues and en half diffance.

1.83055 out ai flib odisome

Some may think it requisite, that the latter part of this Problem should have been a distinct Case in plain Triangles: but because the same things are here given as in the 9 Case, and the operation manifest by the 8 and 9, I thought it not necessary to make another Case of it.

12 Coasting along towards the Evening, I have sight of a Cape or Headland, beyond which I desire to steer in the next Morning; it bears from me s se, and is distant by estimation 11 leagues; but I steer away South, till two of the Clock in the Morning, about 12 leagues; and then would know how the Cape bears from me, and how far it is off?

As admit at A, I observe the Cape D to bear from me ss e 11 leagues; but I steer away South, to E 12 leagues. I have then AD 11 leagues, AE 12 leagues, the angle at A 22 degr. 30 m.

First then for the angle at E by the 10 Case.

As AE+AD 23 leagues compl. ar.

to AE+AD or league,

for $\frac{1}{2}(E-D)$ t 78 degr. 45 m.

compl. ar. 8.63828

10.70134

to tang. an angle F 12 degr. 20 m.

9-33962

Which substracted, & E 66 degr. 25 m.

In working this Example, because the angle given A is 22 degr. 35 therefore the other two & and D are 157 d. 30 m. (by the 1 Lemma of the 3 Chapter of Plain Triangles) the half whereof is 78 d. 45', whereby we find an angle at F, 12 d. 20 m. which substracted from 78 d. 45 m. there remains the angle at E 66 d. 25 m. Wherefore seeing EA is a North line, ED is almost ene, namely, ene 1 d. 5' Northerly.

Secondly, for the distance of the Cape ED by the 8 Case.

As sign the angle found, s E 66 d. 25 m. co. ar. 0.03788 to the dist.in the evening: A D 11 leagues, 1.04139

So the sine of the ang. given, s A 22 degr. 30 9.58284

That is above 4 leagues and an half distance.

0.66211

13 Admit

Admit I sail away from a certain Port SSW 50 leagues, and thence again w by S 30 leagues; upon what point have I made my way good, and

how far am I come from that Port?

As admit I fail from A to D s s w 50 leagues, and from D to E w by s 30 leagues, there is required the course A, or E, and distance AE. From the s s w to the w by s, are five points, that is 56 d. 15 m. which is the complement of the angle at D, to 180 degr. So that the angle at D is 123 d. 45 m. Wherefore here are given the two sides AD and ED, and their contained angle at D: Therefore,

As AD + ED 80 leagues co. ax. 8.09691 to AD - ED 20 leagues 1.30103 for $\frac{1}{2}(A + E)$ t 28 d. 08', 9.72810

to tF 07d. 37 m. 9.12604

Which substracted, A 20 degr. 31 m.

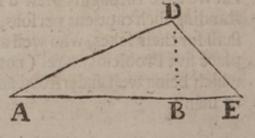

Wherefore seeing the course from A to D is ssw, the course from A to E is 20 d. 31 m. more Westerly, that is sw 2 deg. southerly; so that I have made my way good sw2.degr. southerly.

Secondly, for the distance upon that Point.

As fine the angle found,	s A 20 degr. 31 m. co. ar.	0.45534
to his opposite side given:	ED 30 leagues	1.47712
fo sine the angle given,	s D 56 degr. 15 m.	9.91985
to his opposite side requir. Which is the dista	AE 71 6 leagues nce from that Port.	1.85231

14 There are two Ports in one and the same parallel or latitude, distant 64 leagues; and there is a certain Island more Southerly, distant from the Eastermost of these Ports 47 leagues, and from the Westermost of them 34 leagues: I demand the course from the Eastermost Port to that Island?

Let the Eastermost Port be A, the Westermost E, both in one and the same parallel AE, distant 64 leag. and let the Island be D, distant from A 47 leag. and from E 34 leag. there is required the course from A to D, that is the angle at A, or the complement thereof.

By the 12 Case of plain triangles.	
As the distance of the Ports AE 64 leag. co. ar. to the sum of AD and ED 81 leag. so is the difference of AD and ED 13 leag.	1.90848
to a certain line which added to AE is the half whereof is AI_{167000}^{414} 807000 AB_{407000}^{422}	1.21624
As AD 47 leag. comp. arith.	8.32790
So AB 40 7000	1.60452
to se A, s 58 d. 51 m. That is South-west and by West 2 d. 26 m. westerly.	9.93242 which is the

That is South-west and by West 2 d. 36 m. westerly, which is the course from the Eastermost Port of the Island.

15 A Ship sails from one Port to a second sse 76 leag. and from thence to a third 54 leag. and from that third to the first 85 leag. I demand the course from the second Port to the third, and from the third to the first?

This and the like are to be wrought as the former, which therefore

we leave to your own practice.

Some (as I have understood) who do little of themselves, but carp at others, and yet borrow of them, blame me for setting down so many Problems; but he that knows how to number aright the Questions that might be moved, knows that I leave untouched a far greater number of the same kind than those I handle, for I desire not to be tedious at any time. Yet he that learns no more than sneeds must, will never be able to learn all that; for we do not fully understand a thing till we have throughly view'd it on every side. Therefore notwithstanding such captious persons, as take offence without just cause; I shall for their sakes, who well accepted my former labours, add in this place sive Problems more (not handled by any other that I know) which being well understood and considered, may be as an introduction to many.

First,

First, Then it is be understood, that a Ship sailing to windward, will (as I remember) usually lie within 5½ points of the wind (if it be something more or less, it matters not) yet by reason of her Leeward way, she will scarce make her way good within 6½ points of the wind, sometimes more, sometimes less, according as the Sea is rougher, or smoother, and according to the mould of the Ship, and sail she bears: So that in sailing to a place directly to windward, she sails usually three or four times the distance of that place before she arrive at it. But if the place to which she sails be not directly to windward, but within a point, two, three, sour, sive or six points of the wind, then though she turn to windward, as before, yet she will some arrive at the place than before: but how, and in what proportion, for the one, and for the other, may appear by these ensuing Problems. As,

and the wind at South, and admit the Ship intending to suil from A to B, make her way good within 75 d. 31 m. of the wind (which is almost 6 points of the Compass) I demand how far she must sail upon one tack, and how far upon the other, before she arrive at B?

Then AC being the Ships way, so near the wind as she can make her way good, the angle BAC is 75 d. 31 m. whereto is equal the angle ABC (for AC and BC cross the south line AB alike, or at equal angles) the sum of these two angles at A and B is 151 d. 02' which substracted from 180 d. leaves the angle at C 28 d. 58 m. and thus we have the angles of the triangle ABC, and the side AB 100 miles: Say then,

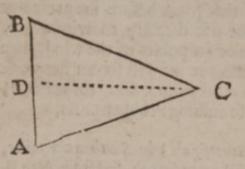

As fine the angle C 28 d. 58 m. to the fide A B 100 miles fo s the angle A 75, 32	compl. arith.	0.31488 2.00000 9.98597
to the fide BC 200 miles fere		2.30085

Whereto is equal the fide AC (because the angles at A and B are equal) therefore I say, she must fail with her Larboard tack abourd 200 miles (whether at one or many boards) and as much with her Star-

Star-Boord tack a boord, in all 400 miles to come to B, being from A

only 100 miles, but directly to wind-ward. But,

Let the position from A to B be (as before) South 100 miles, and the wind at South; and ndmit a Ship sailing from A to B (making one or many boords) doth run 300 miles before she can reach B, that is 150 with the Lar-boord tack aboord, and 150 with the Star-boord tack aboard. I demand how neer to the wind she makes her way good?

As the side AC 150 to Radius: fothe side AD 50

Let fall from C a perpendicular to AB, namely, AD, which divides the fide AB into two equal parts, fo that AD, and DB are each 50 miles, and AC and BC each 150 miles; therefore in the right angled triangle ACD, fay,

compl. arith.

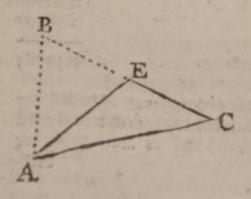

7.82391

1.69897

to s the angle DC A 19. degr. 28 m.

Whose compl. 72 degr. 32 m. is the angle DAC, shewing that she makes her way good within 70 degr. 32 m. of the wind.

18 Let the distance from A to E, in this next Diagram, be 100 miles South-west, the wind at South; and let the Ship make her way good within 70 degr. 32 m. of the wind: I demand the distances A C and C E, that is the Ships way by dead reckoning upon the one tack and upon the other.

Then AB being a South line (or point upon which the wind is) the angle BAC is 70 d. 32 m. from which substracting BAE 4 points, or 45 d. there remains the angle EAC 25 d. 32 m. Again, the complement of 70 d. 32 m. is 19 d. 28 m. which doubled is 38 d. 56. m. the angle at C, and adding these two, namely 25 d. 32. m. and 38 d. 56 m. the Sum

is 64 d. 28 m. the outward angle at E. Thus have we the angles of the triangle AEC, and the fide AE 100 miles. Say then,

to AF too miles	2.00000€	As s C 38 d. 56' co. ar. to AE 100 miles fo s EAC 25 d. 32'	0.2019 5 2.00000 9.63451
	1	to E C 68 1 6	1.83626

Thus it appears, that to fail from A to E, which is Southwest 100 miles with the wind at South, and making her way good within 70 d. 32 m. of the wind, she must fail with her Larboord tack aboord neer 143 16 miles, and with her Star-boord tack aboord near 68 16 miles: In all 212 16 miles that is near ws w a quarter point Westerly 143 16 miles, and e se a quarter of a Point Easterly 68 76 miles.

South: a Ship sails from A to E be 100 miles Southwest, the wind at South: a Ship sails from A to C, so near the wind as she can by 143 75 miles, and from C to E 68 75 miles: I demand how near the wind she makes her way good?

Here from AC 143.6 fubstract EC 68.6 there rests EB 75 miles.

As the fide to the angle fois the fide	Then lay, EB 75 miles BAE 45 d. 00 m. AE 100 miles	compl. ar.	8.12494 9.84948 2.00000
to sthe angle at	B 70 d. 32 m.		9.97442

Whereto is equal the angle BAC, whence I conclude, that she makes her way good within 70 degrees, 32 minutes of the wind; so that the wind being at South, she makes her way good upon the one tack near wsw 1 Point Westerly, and upon the other ese 1 Point Easterly.

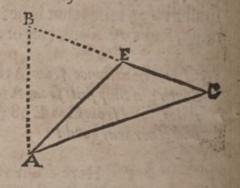

I have about 22 years past, in my Book entituled, The Sea-Man's Practice, shewed (first I think of any man, though some have touched upon it since) the resolution of about a dozen questions touching Currents.

Currents, I have added only this one in this place, leaving the rest (which are many) that might be moved (touching a ship failing in a Current, or out of a Current, by a wind or large) to our ingenious young men at Sea, for their exercise at their leisure; having elsewhere opened curforily the method for framing fuch Questions or Problems, in Subjects Mathematical, or otherwise.

Let the distance from A to E be (as before) 100 miles Southwest, the wind at South, and a Current under the Lee-bow fetting almost ese, namely, South easterly 70d. 32 m. And admit a ship which will make her way good within 70 d. 32 m.of the wind, fails close by the wind from A towards C three dayes, and then arrives at E : I demand how far she

sails by dead reckoning, and how fast that Current sets?

Here then the angle BAC is 70 d. 32. m. from which fubstracting BAE 4 points, or 45 d. there remains the angle EAC 25 d. 32 m. And feeing the Current fets according to the line CEB, East South-east eafterly, namely, South eafterly 70 d. 32 m. therefore the angle at B, is also 70. d. 32 m. to which adding BAC, the fum is 141 deg. 04 min.

which taken from two right angles, or 180 d. leaves the angle ACBor ACE 38 d56 m. to which adding EAC 25 d. 32. the fum is the outward angle BEA 64 d. 28 m. And thus we have the three angles of the triangle A & C, and the fide A E 100 miles, whereby we may find AC the distance run by dead reckoning, and CE the drift of the Current, in manner following.

As s ACE 38 d. 56' co. ar. 20175 | As s ACE, 38 d. 56' co. ar. 20175 to the fide AE 100 mil. 2.00000 to the fide AE 100 mil. 200000

fo & B E A 64 d. 28 m. 9.95537 fo & E AC 25, 32 9.63451

to the fide AC 143 76 2. 15712 to the fide C E 68 76

Which 143 76 is the distance run | Which 68 76 miles, is the drift by dead reckoning. of the Current in 3 dayes, which is almost a mile an hour, namely, 125 of a mile, or 95 centesimes of a mile hourly.

Of Sailing by Mercator's Chart.

And thus much of the plain Chart, which as it hath this commodity that it is most easie: so it hath some discommodities intollerable. For there be very few places that can therein be expressed according to their true situation and distance one from another. Which as it is a great impediment in the practice of Navigation, fo it hath caused much confusion in the Geographical and Hydrographical descriptions of places, infomuch as there are scarce extant any defcriptions of the World, or the parts thereof, that are not pestered with notorious Errors, the greatest part of them hence arising. It is indeed ancient, and till the Sea-Compass was known, it was the aptest Chart that could be used, because till then Men were Coasters, and for the most part returned back the same way they went forth. And it may still serve without any great Error, in such places as are near the Equinoctial, also in many other places for short Voyages, and even for long Voyages, provided that a Man be fure to return the fame way that he went, or near the same. Otherwise if he trust to the plain Chart, he will be most grossly deceived many times in his Course a Point or two of the Compass, and in his distance many hundred Miles. But in this Sea-Chart called Mercator's, all or any parts of the World may be fet down, according to their Longitudes, Latitudes, Courses, and Distances, as truly and far more convenient-Iy for the Mariners use, than upon the Globe it self. So that it will truly shew the direction and distance from place to place, which way foever a Man goes or returns.

Some Men will fay, that in divers reckonings by Mercator's Chart, they have found as little certainty as by the plain Chart, which I deny not; but the reason is, because there are sew or no Charts made directly according to this projection. It will be said, yes, there are many, and that a Man may have of them when soever he will be speak them. I grant, a Man may have those which are so called; but that which is such indeed, must not only have the Meridians, Parallels, and Rumbs drawn according to this projection; but the Sea-Coasts must be inserted by the like art and means as they have formerly been inserted into the common Sea-Chart; otherwise, he that shall transfer places out of the common Sea-Chart into Mercator's, without due knowledge and respect upon what occasion, or for what reason they were so placed in the common-Sea-Chart, he shall transfer the

Errors of the one into the other, and that fometimes with increase. Wherefore it requires more than an ordinary Judgment, to draw a Plot directly according to this projection, for any place or places; and he must further know, or be made acquainted with the reckonings of Mariners frequenting those places; and that truly whether with allowance, or without; and whether agreeing, or difagreeing with their Plots; and so comparing one thing with another, and weighing all in the ballance of a good judgment, he shall be able to doir. The ground of the projection of this kind of Charts was pointed at by Ptolomy, many hundred years fince, and according to that ground, Mercator did of late years fet forth an universal Map of the World, whereupon these have been called Mercators Charts. But the way how to describe them, was first taught by that learned Navigator of our times, M. Ed. Wright, in his Book of the Corrections of Errors in Navigation. From whence also the grounds and reasons of these ensuing Problems are to be taken: and if we would be as grateful to our own Countreymen, as to Strangers, I fee not, but we may afcribe as much to him in this, as to any other Man. Now that which he hath shewed to perform by the Chart it self, we will here flew to work by the doctrine of plain Triangles, using the help of his Table of Latitudes; of which, as M. Gunter's Table for the division of the Meridian Line, is an abridgment; confifting of the quotients of every fixth number, divided by 6, and two figures cut off: fo this which I here exhibit, and call a Table of Meridional parts, is also an abridgment of that Table of M. Wrights: namely, every fixth number, cutting off 4 figures. So that this Table sheweth how many parts every degree, and every tenth part of a degree of Latitude in this Chart, is from the Equinoctial: namely, of fuch parts as a degree of the Equinoctial contains 60; he that desires a larger Table, may use M. Wright's extant in his Book before mentioned.

web is such indeed, mast not only have the Meridians, Parallels, a Rumbs drawn according to this projection; but the Sea-Couffs of the inderestable and means as they have for merly been the function common Sea-Chart; otherwise, he then hall transfer in other wife, he then hall transfer is on at the common Sea-Chart into Mercura 's, without due that is on at the common Sea-Chart into Mercura 's, without due

Mondaire and respect upon what occasion, or for what reason

The property of the property of the control of the

The use of this Table shall partly appear in the Problems following, and may first be illustrated thus.

Probl. 1. To find by this Table, what Meridional parts are contained in any difference of Latitude.

Take the Meridional parts answering to each Latitude, substract the lesser from the greater; the remainer is the number of Meridional parts, contained in the difference of Latitude proposed.

As let the one Latitude be 50 deg.00' 3475 \ Merid. parts.

The other 32 25 2058; Merid. parts.

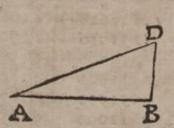

The Merid. parts contained in the 3 1417 Difference.

Probl. 2. The Latitudes and Difference of Longitude of two places given; to find the Rumb and Distance.

To the intent the application may be the more evident, we will

give Examples of two places expressed in the Chart.

As admit the Latitude of the Lizard to be 50 deg.00', the Latitude of Summers Islands, sometimes called the Bermudas, 32 deg. 25', and the difference of Longitude to be 70 deg.00'; the Summers Islands being so much to the Westward of the Lizard: I demand the course and the distance from the one to the other?

As in this right angled triangle ADB, let A represent the Lizard, and AB the parallel thereof, D Summers Islands, and DB the Meridian thereof.

Then is there given D B the difference of Latitude 17 deg. 35', and AB, the difference of Longitude 70 deg. 00'; where-

by the angles and hypothenusal should be found, by the 4 and 2 Cafes of plain Triangles. But because in this kind of projection, the degrees of Longitude and Latitude are not equal (except in places near the Equinoctial) the degrees of Latitude at every parallel exceeding the degrees of Longitude, in such proportion as the Equinoctial exceeds that parallel: Therefore these differences of Longitude and Latitude must first be expressed by some one common measure. And for that purpose serves the foregoing Table, which sheweth how ma-

ny equal parts are from the Equinoctial to every degree of Latitude; namely, of fuch equal parts as a degree of Longitude contains 60'.

Wherefore multiplying 70. d. oo m. the difference of Longitude, by 60, I have 4200 for the Meridional parts contained in the difference of Longitude; also (by the last Problem) I find the meridional parts contained in the difference of Latitude to be 1417; fo that DB is 1417 parts, and AB 4200 fuch parts.

Therefore by the 4 Case of Plain Triangles.

As the diff. of Latitude in parts. DB 1417 parts. co. ar. 6.84863

is in proportion to Radius:

So is the diff. of Longit. in parts, AB 4200 parts. 3.62325

to the tangent of the Rumb, tD 71 d. 21 m. 10.47188 Which sheweth the course from the Summers Islands to the Lizard to be enegd. 51 m. easterly; or from the Lizard to the Summers Mands, w swo3 d. 51 m. westerly.

Secondly, for the distance in the Rumb.

Reduce the difference of Latitude into Miles (multiplying the degrees by 60, and to the product adding the minutes.)

Then by the 2 Case of Plain Triangles.

As sine complement the Rumb, 5A 18d. 39' co. ar. 0.49514 to the difference of Latitude: DB 1055 Miles 3.02325

So is Radius to the distance

AD 3299 Miles 3.51839

Which is almost 1100 Leagues, and this is the distance measured in the Rumb; there is a nearer Cut between these two places, whereof we shall speak hereafter in Great Circle Sailing; but here, when soever we speak of the distance of two places, we mean their distance meafured in their Rumb.

Prob. 3. The Latitudes of two places, and their distance given, to find the Rumb, and difference of Longitude.

Admit I fail from the Lizard, being in the Latitude of 50 degrees. upon some point to the Westward, 3299 Miles; and then find my felf in the Latitude of 32 d. 25 m. I would know upon what point I have made my way good, and how much I have altered my Longitude?

The difference of Latitude D Bis 17 d. 35 m. which reduced in-

to Miles, is 1055 Miles.

As the distance sailed, AD 3299 miles, co. ar. 6.48161 is in proportion to Radius:

fo is the differ. of latitude, DB 1055 miles, 3.02325 to sine compl. the Rumb, s A 18 deg. 39' 9.50486

That is w s w 3 deg. 51 min. westerly. Secondly, for the difference of Longitude.

Find by the first Problem what meridional parts are contained in the difference of latitude, which are here 1417, then fay,

As Radius

to the differ. of latitude in parts: DB 1417 parts 3.15137
So is the tangent of the Rumb, t D 71 deg. 21' 10.47188
to the differ. of longitude of parts, AB 4200 parts 3.62325
Which parts reduced into degrees, dividing them by 60, the quo-

tient is 70 deg. the difference of longitude required.

Probl. 4. By the Rumb, and latitude of two places given: to find their distance and difference of longitude.

Admit I fail from the Lizard, being in the latitude of 50 d. ws w 3 deg. 51 min. westerly, till I find my self in the latitude of 32 deg. 25 min. I demand how far I have sailed, and how much I have altered my longitude?

The difference is found, as in the latter part of the second Problem, thus. The difference of latitude converted into miles, is 1055 miles.

Say then,

As fine compl. the Rumb, s A 18 d. 39' co. ar. 0.495#4
to the difference of latitude, D B 1055 miles 3.02325
So is Radius

to the distance:

AD 3299 miles

3.51839

And so much is the distance: the difference of longitude may be

found, as in the latter part of the third Problem, faying,

As Radius, to the difference of latitude in meridional parts:
fo is the tangent of the Rumb, to the difference of longitude in minutes.

Probl. 5. By the difference of longitude, Rumb, and one latitude: to find the other latitude, and the distance.

Admit I sail from the Lizard, being in the latitude of 50 deg.

deg

deg. how much have I laid the Pole, and how far am I from the

Reduce the difference of Longitude into minutes, by 60, and foit

makes 4200; then fay,

As the tangent of the Rumb, t D71d. 21'co. ar. 9.52829 to the differ. of longitude in parts: AB 4200 parts 3.62325
So is Radius,

to the differ. of latitude in parts. DB 1417 3.15154

Now the meridional parts answering the latitude of 50 d. 00 m. are 3475, from which substracting 1417 here found, there remains 2058, against which I find in the first Column of the Table 32 deg. 25 min. which is the latitude required of that other place to which I am come; so that the difference of latitude is 17 d. 35 m.

Secondly for the distance.

Having already the Rumb, and difference of latitude, it may be

found, as in the fecond and fourth Problems, faying,

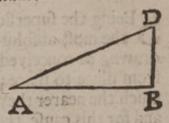

As fine compl. the Rumb, s A 18 d. 39' co. ar. 0.49514 to the difference of latitude, DB 1055 miles 3.02325

to the distance AD 3299 miles.

Probl. 6. By the Rumb, the distance, and one latitude given: to find the

other latitude, and the difference of longitude.

Admit I fail wsw 3 d. 51' westerly, 3299 miles, and then find my self in the latitude of 32 d. 25 m. I demand the latitude of the place from which I came, and the difference of longitude between that and this?

First, for the difference of latitude.

As Radius,
to the differ of latitude,

AD 3299 miles
3.51838
So fine compl. the Rumb,
s A 18d. 39 m.
9.50486
to the differ of latitude,
D B 1055 miles
3.02324

Which 1055 miles converted into degrees, is 17 deg. 35' the difference of latitude required: which added to 32 deg. 25', makes 50 deg. 00' the latitude of the first place.

The difference of longitude is found as before in the third Problem,

A nough never fo easie; alice is cride wouring to make the way of

divis

As Radius to the difference of Latitude in meridional parts : So is the tangent of the Rumb, to the differ. of Longit. in minutes. And thus the difference of Longitude will be found as in this Example to be 70 d. oo'.

If at any time you defire to convert this difference of Longitude found in any parallel into miles, you may do it after this Example.

7. Admit there be two places, both in the parallel of 50 deg. which differ in Longitude 70 deg. co': I demand the distance of these

two places?

First, it is to be understood, that the minutes of Longitude in any parallel, are in proportion to the distance in Miles, as the Æquinoctial is to that parallel; or as the Semidiameter of the one is to the Semidiameter of the other. That is,

to fine compl. the Latitude; se 50 deg, 00' So is the differ. of Longitude, 4200 minutes,	9.80807
to the distance in that parallel, 2700 miles,	3.43132

3.43132

Problems of Sailing by a great Circle.

Eeing the superficies of the Earth and Sea is spherical, therefore the most absolute way of Sailing is by the arch of a great Circle, drawn, or conceived to be drawn on the spherical surface of the Sea from place to place; and other wayes are fo much the better, by how much the nearer they approach thereto, or may be thereunto reduced; and for this cause, the Sailing according to Mercator's Chart, is to be preferred before the Sailing according to the common Sea-Chart, being more reducible to the spherical superficies of the Earth and Sea. Neither have I at any time faid otherwise, whatsoever some in Print would make me fay without any affent or knowledge of mine. It will be faid, that there is some more difficulty in Sailing according to Mercator's Chart, than by the common Sea-Chart; and fomewhat more difficult Sailing by the arch of a great Circle, than by either of them: No doubt, fince the fall of Man, there are thorns and briars, or difficulties encountring our best endeavours : But truth and exactness, though joyned with some difficulty, is to be preferred before Error, though never fo easie; alwayes endeavouring to make the way of truth

truth as case as we can. Therefore we come now briefly, to shew the way of Sailing by the arch of a great Circle, by help of the Doctrine of Spherical Triangles, for a smuch as there is no way discovered to the World more absolute.

In the former Problems of Sailing, whether by the plain Chart, or that called Mercator's, we have used Meridians, Parallels, and Rumbs, as the sides of every Triangle. But here we use not the Rumbs so because they are not Circles, but helispherical lines; nor the Parallels, because they are not great Circles: whereas the sides of every spherical Triangle, must be arches of great Circles: But here we use arches of the Meridians, and of the Acquinoctial, and of other great Circles drawn, or imagined to be drawn from one place to another, upon the spherical superficies of the Earth and Sea. First, therefore,

If two places lie under the Aquinottial, their position is East and West, and the degrees of their difference of Longitudes converted into

Leagues or Miles, is their distance in Leagues or Miles.

If two places be in the same Meridian, their position is North and South, and the degrees of their difference of Latitude, converted into

Leagues or Miles, is their distance.

And thus far doth this kind of Sailing agree with the two former; the difference between this and them, may appear in the Problems following.

Prob. 1. Two places being proposed, the one under the Aquinostial, the other in any Latitude given: and the difference of the Longitude of the same places being also known: to find,

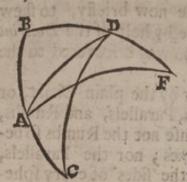

1. The nearest distance in a great Circle:

2. The direct position of the first place from the second:

3. And of the second place from the first.

The angle that the Rumb leading from one place to another, makes with the Meridians, is sometimes called the position of those places: But because the arch of a great Circle, drawn between two places, is the most direct way, and nearest distance from one place to the other: therefore the angles which that arch makes with the Meridians of those places we here call the angles of the direct position of those places one from another.

it falls into the 11 Onfe, and is thus wrought.

Now in this Diagram, let D represent that part of the entrance of the River of Amazones, which lieth under the Equinoctial; and let A represent the Lizard, lying in the latitude of 50 d. com. northerly, and AB the meridian thereof; and admit their difference of longitude DB to be 51 deg. com.

Then in this triangle ADB, right angled at B, there is required AD, the nearest distance of these places in the arch of a great Circle, the angle BAD, which is the angle of the direct position of the A-mazones from the Lizard, and the angle BDA, being the compl. of the angle of the direct position of the Lizard from the Amazones.

1. For the nearest distance A D. Seeing there are given the sides AB and DB: therefore by the first fundamental Axiom of spherical

triangles.

sc AD +Rad. = sc AB + sc DB, therefore sc AB + sc DB -Rad. = sc AD, and so it falls into the 10 Case, thus.

The difference of longitude is DB 51 d. co' sc DB 9.79887.

The difference of latitude is AB 50 co sc AB 9.80807

The distance is

AD 66 08 sc. AD 9.60694
Which 66 d. 08' converted into leagues, is 1322 3 leagues, which is the nearest distance between these two places.

2. For the direct position from the Lizard to the Amazones, namely,

the angle BAD by the same things given.

s AB+Rad. = tDB+tcBAD; therefore s AB+Rad.-tDB=tcBAD, that is s AB+tcDB=tcBAD, abating Radius, and thus it falls into the 11 Case, and is wrought thus.

The difference of latitude is

AB 50 d. 00' 5 AB 9.88425

The difference of longitude is

DB 51 00 tc DB 9.90837

The angle of position is BAD 58 11 to A 9.79262 3. For the direct position from the Amazones towards the Lizard, namely, the complement of the angle BDA.

 $sDB \rightarrow Rad. = tAB \rightarrow tcD$, therefore $sDB \rightarrow Rad. = tAB$ = tcD, therefore $sDB \rightarrow tcAB = tcD$, still abating Radius, and so it falls into the 11 Case, and is thus wrought. The difference of longitude is DB 51 d. 00' sDB 9.89050 The difference of latitude is AB 50 00 tc AB 9.9238 t

The angle of position is compl. BDA 33 c7 to A 98143 t If you would have the letters in all Examples to agree with the exemplary Tables, you must mark your right angled triangle two ways, and the oblique six wayes, as we have before shewed; and it will not be amiss to do so, especially if you use those Tables. But as I have before said, I would rather wish every man to deduce his operations from the two sundamental Axioms, and their Consectaries, in such fort as I have here shewed in these three Examples, for the like is to be conceived in all others, though it be not expressed. Yet I have set down those Exemplary Tables for all the Cases in all kinds of triangles, as well because some others have in part done the like before (though in a different manner) as because a man may by them readily examine the form of his work.

The three parts of this Problem, and so the rest that sollow, might have been as well resolved in the quadrantal triangle ADG: where G represents the North-Pole; the angle at G, the difference of longitude, AG the complement of the latitude of the Lizard; ADG the angle of direct position from the Amazones to the Lizard, &c. As admitthis last angle ADG were required: Then for smuch as there is given the angle G, being the difference of longitude, and AG, the complement of the latitude: therefore by the first fundamental Axiom.

sG + Rad. = tc AG + t ADG, therefore sG + t AG = t ADG, and thus it falls into the 7 Case of quadrantal triangles, and is wrought, as in this Example.

The difference of longitude is G 51 d. oc' 56 9.89050.

The latitude is compt.

AG 50 co t AG 9.92381

The angle of position is ADG 33 07 t ADG 9.81431. The same might have been found in the quadrantal triangle, ADF, all which to haudle particularly would be too tedious; therefore it shall suffice hereafter to shew this application only in right angled triangles; for by this one example of Quadrantals, you may conceive the rest.

And thus it appears, that he which would fail the nearest way from the

as much brovity as I may.

the Amazones to the Lizard, should at first shape his course 33 degr.07 m. from the Meridian to the Eastward, that is almost 3 points of the Compass, namely, ne by n. Now admit the wind should so serve, that he might come away ne by n, yet it is to be understood, that in this kind of Sailing, he is not to continue this course long, but to shift it as often as occasion requires, still inclining more and more to the Eastwards; which how it may be done, we shall more expressly shew hereafter. Probl. 2. Two places being proposed, the one under the Equinostial, the other

in any Latitude given; and the nearest distance in a great Circle of the

same places being also known: to find,

Their difference of Longitude,

2 The direct position from the first place to the second,

3 And from the second place to the first.

Let the places be the same as before, and let there be given the difference of Latitude AB 50 d. 00 m. and their nearest distance AD 1322 3 Leagues, that is 66 d. 08 m. in the arch of a great Circle.

First, then for the difference of Longitude DB, by the 12 Case of right angled Triangles.

The latitude is AB 50 d. 00' co. ar. s AB 0.19193 The nearest distance is AD 66 08 se AD 9.60704

The diff. of longitude is DB 51 00. sc DB

Secondly, for the direct position from A to D, by the 13 Case.

The latitude is

AB 50 d. 00' t AB

The nearest distance is

AD 66 68 to AD

The position is

BAD 58 II sc A

9.64586

Thirdly for the direct position 6. D 58 II sc A

9.72205

Thirdly, for the direct position from D to A, by the 14 Case.

The nearest distance is

AD 66 d. 08' co. ar. s AD

O.03882

The latitude is

AB 50 00 s AB

9.72205

The position is compl. BDA 33 07 sBDA 9.92307 In like fort, if there were given the Latitude AB, and the angle of direct position BAD: we might find the difference of longitude BD, by the first Case of spherical triangles; the direct position BDA, by the second Case, and the nearest distance AD by the third Case. And thus we might proceed to frame in all 30 Questions touching these 2 places, as we have before shewed in handling right angled spherical triangles; which things I leave to your own practice, desiring to use as much brevity as I may.

Probl. 3. Two places proposed both in one and the same latitude given, and their difference of longitude being also known: to find

1 The nearest distance of those two places.

2 The direct position of the one place from the other.

Admit there be two places, both in the latitude of 50 degrees op', Northerly, and differing in longitude 70 deg. 00' I demand their nearest distance in the arch of a great Circle, and the direct position

of the one from the other?

In the 7 problem of failing by Mercators Chart, there was required the distance of these two places measured in their parallel: but here is required their nearest distance in the arch of a great Circle.

As in this example $E \stackrel{\frown}{A} D$, let the two places be E and $\stackrel{\frown}{A}$, and let D be the North

Pole, then AD and ED are either of them 40 deg. 00': namely, the complement of the latitude, and the angle EDA is the difference of longit. 70 deg. 00'; there is required the nearest distance EBA: and the direct position from the one to the other, DEA or DAE, for in this Case those two angles are equal.

And seeing E D is equal to A D, therefore letting fall the perpendicular D B, the Triangle E D A is divided into two right angled triangles E D B and A D B, which are every wayes equal. Wherefore,

First, For the nearest distance EA; there is given in the right angled Triangle ADB, the complement of the latitude AD 40 deg. 00', and half the difference of longitude ADB 35 deg. 00'; whereby I find AB agreeable to the 8 Case thus:

The compl. of the latitude is AD 40 d. 00' s AD 9.80807 Half the differ of longitude is ADB 35 00 s ADB 9.75859

Half the distance is

AB 21 38 s AB 9.56666

Which doubled is

AE 43 16 And this converted into miles, is 2596 miles, the nearest distance of these two places in the arch of a great Circle, being less than their distance measured in their parallel by 104 miles.

Secondly, For the direct position DAB by the 9 Case.

The compl. of the latitude is AD 40 d. 00'. se AD 9.88425

Half the differ. of longit. is ADB 35 00 t ADB 9.84523

The angle of position is DAB 61 48 tc DAB 9.72948
Which

Which sheweth, that he which would go the nearest way from A to E, must not go West, though both be under one parallel; but he is at first to shape his course from A w n w half a point northerly; afterwards w n w, and so by little and little w by n; then West, then w by s, afterwards w s w, and at last w s w = 1 a point Southerly.

Prob. 4. Two places proposed, both in one and the same latitude given, and their nearest distance being also known: to find,

1 Their difference of Longitude.

2 The direct position of the one place from the other.

Admit there be two places, as A and E, both in the latitude of 50 degrees Northerly; and let their nearest distance be ABE 2596 miles, that is 43 deg. 16': I demand their difference of longitude,

which is the angle ADE, and the direct position of the one from the other, namely, the

angle DAE, or DEA?

First, For the difference of Longitude, ADE.
Seeing that ABE is 43 deg. 16'. therefore
AB is 21 deg. 38': wherefore by the 14 Gase
of right angled spherical triangles, I find
ADE thus:

The compl. of the latit. is AD 40 deg. oo' co. ar. s AD. 0.19193 Half the distance is AB 21 38 s AB 9.56663

Half the differ. of long. ADB 35 00 s ADB 9.75856 Which doubled is ADE 70 00, the difference of longitude required.

Secondly, for the direct position DAE or DAB by the 13 Case.

The latitude is the compl. of AD 50 deg. 00', to AD 10.07619. Half the distance is AB 21 38 t AB 9.59835

The angle of Position is DAB 61 48 sc DAB 9.67454

Probl. 5. Two places proposed, both in one and the same latitude given;
and the distance of those places in their parallel being also known: to find,

1 Their difference of longitude.

2 Their nearest distance in the arch of a great Circle.

3 The direct position of the one from the other.

Admit there be two places, both in the latitude of 50 degrees, oo minutes northerly; and let the distance of these places in their parallel

parallel be 2700 miles; there is required their difference of Longi-

tude, &c.

We have noted before, that as the semidiameter of a parallel is in proportion to the semidiameter of the equinoctial: so is any number of miles in that parallel, to the minutes of longitude, answering to those miles: and if we suppose the semidiameter of the equinoctial to be Radius, then the semidiameter of any parallel is the sine of that parallels distance from the Pole, that is the sine of the complement of the latitude of that parallel. Therefore,

As sine complement the latitude, so 50 deg. 00', co. ar. 0.19193

to Radius:

So the distance in that parallel, 2700 miles,

which converted into degrees, is 70 deg. oo' the difference of

longitude required.

And thus having found the difference of longitude, the nearest distance, and the direct position may be found as in the third Problem before going, which with such other questions as might be moved in this Triangle A E D, I leave to your own practice.

Probl. 6. The latitudes of two places being given, together with their difference of longitude: to find,

1 Their nearest distance in the arch of a great Circle.
2 The direct position from the sirst place to the second.

3 And from the second place to the first.

As in the Triangle ADE. Let A represent the North pole, D the Lizard lying in the latitude of 50 deg. 00 min. the complement whereof is AD 40 deg. 00 min. and let E represent the Summers Islands, lying in the latitude of 32 degrees, 25 min. the complement whereof is AE 57 degrees, 35 minutes; and let their difference of longitude be 70 deg. 00 min. namely, the contained angle DAE: there is required the nearest distance of these two places ED,

and the several positions of the one from the other; namely, the angles ADE, and AED. So that here are given two sides AD and AE with

with their contained angle D A E: and first there is required the third side E D.

Wherefore according to the directions, Chap. 5. of Spherical Triangles, I let fall a perpendicular from E or D, for so it will fall from the end of a side given, and opposite to an angle given, &c. As first, let it fall from the point of the Lizard represented here by D, upon the meridian of Summers Islands AE: and because the angles at A and E are both of one kind, namely, both acute; therefore the perpendicular falls within the Triangle.

Then for the nearest distance required ED, the way hath been

formerly to find itat three operations, thus:

1. For the perpend. DB, by the 8 Case of right angled triangles. The compl. of latitude ADis 40d. 00m. sAD 9.80807 The differ. of longitude DABis 70 00 sA 9.97298

The perpendicular DB is 37 10 sDB 9.78105 2. For the dist. of the perpend. from the pole AB by the 7 Case. The differ. of longitude DAB is 70 d. 00 m. sc DAB 9.53405 The compl. of latitude AD is 40 01 t AD 9.92381

The first arch AB is 16 O1 t AB 9.45786
Which substracted from AE 57 35, there remains

the fecond arch EB 41 34

3. Having found DB, and EB, we may find ED by the 10 Case, thus, The perpendicular DB is 37 d. 10 m. sc DB 9.90139
The second arch EB is 41 34 sc EB 9.87401

The nearest distance ED is 53 24 sc ED 9.77540 Which 53 d. 24 m. converted into miles, is 3204 miles, or 1068 leagues; and this is the nearest distance required in the arch of a great Circle.

Note. And thus in any oblique spherical triangle, when the question is such, that it requires the perpendicular to be let fall, you may resolve it at three operations, by the Cases of a right angled triangle only; the manner how, is of it self so manifest, that it seemed superfluous to handle it particularly. Wherefore, as before in the Cases and Problems of this nature, so in those which follow, it shall suffice to shew their resolution at two operations; which, as it is much readier being well understood, so it is something harder to be understood than the former.

First, Therefore the complement of the one latitude being $AD 4^{\circ}$ d. and of the other AE 57 d. 35 m. and the difference of longitude DAE 70d. we may find the nearest distance ED at two operations agreeable to the 3 Case of oblique spherical triangles; thus,

The difference of longitude DAB is 70 d. 00' sc DAB 9.53405 The complem. of latitude AD is 40 00 t AD 9.92381

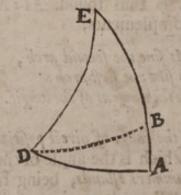

AB 15 16 OI. t 9.45786 The first arch there remains which fubstracted from AE 35 the fecond arch 34 As fine complethe first arch, so AB so 16 d. 0.01719 or m. 9.8-401 to sine compl. the second: sc EB sc 41 34 9.88425 So the fine of the latitude, sc ADs 50 00

Therefore the arch ED is 53 deg. 24 m. which is the distance of these two places in the arch of a great Circle; and this converted into leagues, is 1063 leagues, as before.

Secondly, By the same things given: to find the direct position of the one place from the other.

As first, to find the position from Summers Islands, which suppose to be at E, to the Lizard at D.

Here according to the second condition of letting fall a perpendicular, Chap. 5. Ilet it fall from the Lizard at D, that so it may be opposite, not only to the angle given at A, but also to the angle required at E. And then agreeable to the fourth Case of oblique spherical triangles, I first find as before AB to be almost 16 d. 1 m. and EB 41 d. 34 m. then I say, Ass AB to s & B, so to A to to E. Or if you would not work by their comple-

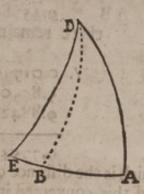

As fine the second arch, s EB 41d. 34' co. ar. 0.17816 to sine the first arch, s AB 16 01 9.44044
So the tang. of the longit. t DAE 70 00 10.43893

whereby it appears, that the angle of polition from E towards D,

is 48 deg. 47', that is, from the North part of the Meridian E A 4 points 3 deg. 47', namely, ne 3 deg. 47' easterly.

Thirdly, By the same things given, to find the direct position from the second place to the first. As from the Lizard to Summers

Illands.

Here the work differs not from the former, provided, that you let fall the perpendicular so, as it may be opposite to the angles given and required. As in this Triangle, let Abe the Pole, E the Lizard, D Summers Islands, the perpendicular I let fall from D to B, that so it may be opposite to the angle given at A, and to the angle required at E. Then is AD 57 degrees 35', AE 40 deg. co', DAE 70 deg. co', therefore I say,

The differ of longitude DAB is 70 d. 00', sc DAB The compl. of latitude AD is 57 35 t AD	9.53405
The first arch AB is 28 Which taken from AE 40 oo there remains The found and FB	A TOTAL
The fecond arch EB 11 42, whereby the E is thus found. As AB, to EB: fo to A, to to E, or t complements,	o shun the

So the tangent of the longit.	t A 70 00	10.43895

Which is the angle of the direct position from the Lizard toward Summers Islands, being from the North part of the Meridian to the Westwards 7 points of the Compass, and almost a quarter, that is, wby n 2 deg. 23' westerly.

And thus it appears, that he which would fail the nearest way from Summers Islands to the Lizard, must at first shape his course ne Easterly, afterwards by degrees ne by e, then ene, then e by n, then East, then East Southerly, &c. as we shall more particularly shew hereafter, and the like is to be understood of other places. But

But here, after the first part of this Problem was wrought, namely, after the distance of the two places & and D was found, the angles of position from the one to the other, might have been more readily found, either of them at a fingle operation, as in this following problem.

Prob. 7. The nearest distance of two places, with their difference of longitude, and one of their latitudes given : to find the direct position thereof from the other.

As admit the distance in a great Circle from the Lizard to Summers Islands, namely, from E to D, to be as it was before found 1068 leagues, or \$3 deg. 24'; and let their difference of longitude EAD be 70 deg. 00'; and let the latitude of the Lizard be 50 deg. 00', whose complement E A is 40 deg. 00'; there is required the direct position from Summers Islands to the Lizard, namely the angle ADE. Then doth this Problem come under the second Case of oblique spherical Triangles, and is thus refolved.

As the sine of the distance	SED 53 d. 24', co. ar.	0.09538

To the sine of the direct posi- } s ADE 48 48,

Whereas there is a minute difference between the arch before found, and this; it may arise by neglecting some seconds or parts of a minute in the work, which here we regard not.

Inlike manner, by the complement of the other latitude given, AD, we might find the direct position from the Lizard to Summers

Islands, namely, the angle AED.

And thus we might proceed to frame many other questions in this Triangle, to the number of 60, touching the distance, difference of longitude, latitudes and angles of position of these two places which will not be hard to him that understandeth what we have before delivered touching oblique spherical Triangles.

And what hath been faid touching these two places, the same is to be conceived of any other two places differing in their longitudes Northerly, and the other Southerly, yet is the operation little different, for still the arches of their Meridians intercepted between them and the nearest Pole, are two sides of the triangle, the arch of a great Circle intercepted between the two places is the third side; the angles contained between that arch and the Meridian of either place, are the angles of position; and the angle comprehended between their two Meridians, is their difference of longitude. Therefore passing over these, we haste to such things as more necessarily concern the practice of sailing by a great Circle.

Probl. 8. To find by what longitudes and latitudes the arch of a great Circle doth pass.

We have shewed before how to find the distance of two places in the arch of a great Circle, as also the angles of direct position from the one to the other; here is required the longitudes and latitudes, by which that archof a great Circle doth pass.

As in this Triangle, Let A be Summers Islands, E the Lizard, A E an arch of the great Circle passing by these places; it is required to shew the longitudes and latitudes by which this arch A E doth pass.

Here it is requisite to let fall a perpendicular from the pole D, to the arch AE (extended if need so require) which let be DB; then first to find the length of that perpendicular; Secondly, the parts of the vertical angle ADB and EDB, for these being had, every other question will fall

in right angled Triangles, and so be resolved by the addition of two numbers only.

First then for the perpendicular DB, there are given the hypothenufal AD 57d. 35', and the angle of position at A was before found 48 d. 48': therefore by the 8 Case,

The

The complement of latitude AD is 57 d. 35' s AD 9.92643 The angle of position A is 48 48 s A 9.87645

The perpendicular DB is 39 26 5 DB 9.80288 And this 29 d. 26 min. is the complement of the greatest latitude,

by which the great Circle A BE doth pass, therefore the greatest obliquity or latitude from the Equinoctial of that Circle is 50 d. 34'.

Secondly, for the angles ADB and EDB, by the Ninth Cafe.

The latitude is the compl. of AD 32 d. 25' so AD 9.72922

The angle of direct position is A 48 48 t A 10.05778

The angle at the perpend. is ADB 58 31 to ADB 9.78700

And feeing the whole ADE is 70 d. 00', therefore the angle EDB is 11 d. 29'. So that for the greatest latitude of this Circle, which is B, we have found the difference of longitude from E to EDB 11 d. 29 m. and from A the angle ADB 58 d. 31 m.

Now the difference of longitude from A to E, namely, the angle ADE being 70 d. 00 m. let it be required to find by what latitudes the arch AE doth pass for every tenth degree of longitude from A. As supposing the point I, to differ in longitude from A 10 d. I would

know the latitude of the fame point 1.

Here seeing we have before found the angle ADB to be $58 \, d$.

31 m. and the angle ADI, being by supposition 10 deg. therefore the angle IDB is $48 \, deg$. 31 m. and the perpendicular DB we found before to be 39 deg. 26 m. by which we may find the complement of the latitude DI according to the third Case, thus.

The angle IDB 48 d. 31' sc IDB 9.82112
The perpendicular DB 39 26 tc DB 10.08492

The latitude is the compl. of DI 38 51 tc DI 9.90604
In like manner supposing the point 0, to differ in longitude from A
20 deg. 00 m. V 30 deg. M 40 deg. N 50 deg. we shall find the latitude of the point O to be 43 deg. 34 m. the latitude of V 46 deg.
34 m. the latitude of M 49 deg. 04 m. and the latitude of N 50 deg. 15 m.

Note. For every of these differences of longitude proposed, we might also find the distances and angles of position; contrariwise, for any difference of latitude given, we might find the difference of longitude, the distance and angle of position: and for any distance given,

we might find the difference of longitude and latitude, and the angle of position. All which will be easily performed by him that is a little exercifed in spherical triangles.

Probl. 9. To find how far a man fails by the arch of agreat Circle, and how much he shall alter his longitude and latitude, before he atter

his course any number of degrees proposed.

We found before that the angle of polition at A was 48 d. 48 m. shewing, that he which would fail from Summers Islands, here repreiented by A, to the Lizard at E, the directest and nearest way, must at hrit shape his course from A North-East 3 d. 48 m. Easterly. Yet he is not to continue this course, but to incline by degrees more and more to the Fastwards, &c. Now then I demand, how far a man fails from Ain the arch of a great Circle, before he alters his course 7 d. 27 m. that is, before he may steer away ne by e, and how much ihall he first alter his longitude and latitude?

Suppose he must first come to I, before he alter his course 7d. 27 m. then is there required the distance AI, and the longitude and latitude

of the point I.

Here it is requifite, that the perpendicular DB be known, which we before found to be 39 d. 26 m. also the parts of the base AB and EB, which we may find by the feventh Cafe, thus,

The angle of position given A is 48 d. 48' sc A

The complement of latitude AD is 57 35 t AD 10.19720

The base AB is 46 03 t AB 10.01583

Which taken from AE 53 24

there remains EB 67 23

These things premised, we come to resolve the question. And con-

fidering that the course given at I, is ne by e, which Rumb makes with the meridian an angle of 56 d. 15 m. therefore in the triangle DIB. the angle at Lis 56 d. 15 m. and the perpendicular D B is 39 d. 26 m.

whereby we may find LB by the fixth Case, thus,
The angle of position given T 56 d. 15' to DIB 9.82489
The perpendicular is DB 39 26 t DB 9.91507

The bale is not not into the same of the bale is not into the same of the same

Which converted into leagues, is 254 1 leagues, and fo far you are to fail from A in the arch of a great Circle, before you alter your course 7 deg. 27 min. And in like fort you may find it for every single degree to be fuch, as by this Table appeareth.

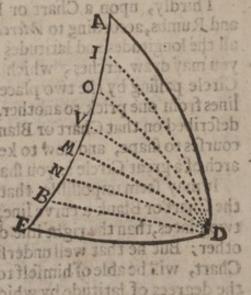

Angle of Dift. in	Where you may perceive, that having run from

any of these points, 51-48 of-43 the perpendicular, and angle of position given. 52-4 07-25 As if there were required the longitude and lati-53-4 9-03 tude of the point I, there is given in the triangle 54-4: 10-35 IDB, the angle of position at I, and the perpen-55-4 12-04 dicular DB, wherefore by the 5 Case I find the 156-15 2-43 complement of the latitude DI, and by the 4

Case the difference of longitude BDI, the angle BDA being be-

fore known.

But notwithstanding all that hath a to trado a good wibrid? hitherto been faid, it may feem hard to direct a ship, and to keep such a reckoning as may be agreeable to this method of failing by a great Circle. And indeed, as it is in a manner imposfible, fo neither is it necessary, that alas a to the thip should alwayes persevere exactly and the in the arch of a great Circle. It may fuffice, and is almost the same in effect, if a ship be so directed that she go near this arch. Which, how it may be done, and that with facility, we had an is a second come now to flew in this next Pro- or Holmid to olds od Tiw , trado the degrees of latitude by which the arch doth pass, are greate-mald the degrees of latertide by which the right line doth fals : whence it

mined in the right line; therefore to proceed. .

is, that the degrees contained in the arch, are fewer than thole con-

Probl. 10. How a man may direct his courses, and keep his reckoning, that would Sail near the arch of a great Circle.

That this may be the more plain, we will briefly repeat some things before handled, serving for this purpose; and first, suppose the latitudes, and the difference of longitude of the two places to be given; then may you find their nearest distance in the arch of a great Circle, and the angles of position of the one from the other, as we have shewed in the sixth and seventh Problems before going. And thus all the parts of the Triangle proposed are known, namely, the three angles and the three sides.

Secondly, you may find (as we have before shewed in the eighth Problem) by what longitudes and latitudes this arch of a great Circle doth pass, namely, the arch that goes by the two places proposed; and this you may do for every fifth degree of longitude, or for every single degree, if you will take that pains: or if your difference of latitude be more than your difference of longitude, you may do it for every fifth degree of difference of latitude, or for every single degree.

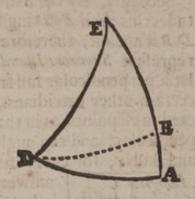

Thirdly, upon a Chart or Blank lined with Meridians, Parallels, and Rumbs, according to Mercator's Projection; you may prick down all the longitudes and latitudes found as aforefaid, by which pricks you may draw arches, which shall represent the arch or the great Circle passing by the two places proposed: or if you only draw right lines from one prick to another, it may suffice. Which arch being thus described on that Chart or Blank, you shall easily see thereby what courses to shape, and how to keep your reckoning, sailing so near that arch of a great Circle as you shall think convenient.

It may feem impossible, that this arch of a great Circle, being upon the Chart or Blank a curve line, should be a shorter passage between two places, than the right line drawn on the Chart from the one to the other: But he that well understands the ground and projection of this Chart, will be able of himself to resolve this Paradox; for a smuch as the degrees of latitude by which the arch doth pass, are greater than the degrees of latitude by which the right line doth pass: whence it is, that the degrees contained in the arch, are fewer than those contained in the right line; therefore to proceed.

Let

Let us take for Example the two places before mentioned, namely, Summers Islands, lying in the latitude of 32 d. 25 m. and the Lizard in the latitude of 50 d. 00 m. and let their difference of longitude be 70

deg. As in this Diagram, let E represent Summers Islands, D the Lizard, A the North-pole: Then is AE the complement of the latitude of Summers Islands 57 d. 35 m. AD the complement of the latitude of the Lizard 4 d. D AE their difference of longitude 70 d. 00 m. By which things given, we may find their nearest distance E D, as in the fixth Problem

er C - complement	DAB that is, to fine compl.	70	d. 00'

- Which is the distance of the Lizard from Summers Islands, in the arch of a great Circle, namely, 1068 leagues. This done, we may find their politions one from another, namely,

the angles at E and D, by the seventh Problem, saying,

As sine & D 53 d. 24 m. to sine DA & 70 d. 00 m.
So sine AE 57 d. 35 m. to sine AD E & d. 08 m. the direct position from the Lizard to Summers Islands. Adegrees, 51 minutes of latitude; and lol profted with all ther As fine ED 53 deg. 24 min. to fine DAE 70 deg. 00 min.

So fine A D 40 deg. 00 min. to fine A E D 48 deg. 48 feconds, the direct position from Summers Islands to the Lizard. And thus are all

the sides and angles of this triangle discovered.

Secondly, By the 8 Problem, I find by what longitudes and latitudes this arch & D must pass; for which the former perpendicular D B is not apt, therefore in the foregoing triangle, page 165. Let A represent Summers Islands, E the Lizard, D the North-Pole, and let a perpendicular fall from the pole D, which let be D B: and draw certain other meridians, as D I, D O, D V, &c. And so proceed in all points, as in the 8 Problem, to find the length of this perpendicular, and the angles at the perpendicular AD B and EDB: and lastly, for every several longitude from A, find the latitude

answerable. Thus supposing the point I to differ in longitude from the point A, 5 degrees, that is, supposing the angle ADI to be 5 degrees, we shall find the latitude of that point I to be 35 degrees, 52 min. or supposing that angle ADI to be 10 degrees, we shall find the latitude of that point I to be 38 degrees, we shall find the latitude of that point I to be 38 degrees, i min. and so of the rest, as by this

Table appears.

from 1	2	uu.

Longit.

Thirdly, I draw a blank according to Mercator's projection (which may be done either by Mr. Wrights own Tables, as he hath shewed in his Book of the Correction of Errors in Navigation, Chap. 5. or by the abridgment thereof, which I have before placed, and call a Table of meridional parts) so as there may a meridian be drawn by every fifth degree of longitude. In which blank, I set down Summers Islands, and the Lizard, according to their latitudes, and difference of longitude before given, and in the meridian, that is 5 degrees to the Eastwards of Summers Islands, I make a prick or mark at 35 deg. 52 min. of latitude; likewise in the meridian that

is 10 deg. to the Eastwards of Summers Islands, I make a mark at 38 degrees, 51 minutes of latitude; and so I proceed with all the rest,

as by this Table I am directed. Then by these pricks or marks thus made on the Blank, Idraw the arches of Circles or right lines from one to another, and to that I delctibe a curve line on the Blank, reprefenting fo near as Thall be necessary, an arch of the great Chicle passing from Summers Islands to the Lizard. And if it were done for every fingle degree (as here it is for every fifth degree) it wen!d come nearer the exact truth. Which curve line being thus described on your Blank, you shall thereby see what courses to shape, to keep as near it as you think good; and you may fet down your reckening on that Blank accordingly. The service stone stones weside and the

leagunes.

As having drawn the aforefaid curve line upon the Blank, according to the feveral longitudes and latitudes expressed in the foregoing Table; I fee by that Blank, that I may first shape my course from Summers Islands, ne half a point Easterly about 200 leagues; fo shall I have run my self into the latitude of 38 degrees, 45 minutes; and have altered my longitude 9 degrees, 30 minutes: From thence again, I fee I may fail away ne by e; or if I would not come near the Bank of New-Found-Land, I may shape a more Easterly course; but suppose I still defire to keep near the arch of a great Circle, then I fay I may fail away no by e 200 leagues, and fo should be in the latitude of 41 degrees 32 minutes, and have altered my longitude 14 degrees 56 minutes. From thence again I may fail ene half a point Northerly 165 leagues, and then should be in the latitude of 45 degrees 25 minutes, having altered my. longitude 24 degrees, 58 minutes. From thence again failing ene 130 leagues, I shall be in the latitude of 47 degrees, 54 minutes, and have altered my longitude 33 degrees 42 minutes. From thence enturnal a point eafterly 88 leagues, into the latitude of 49 degrees, 11 Minand difference of longitude 40 deg. 5 min. From thence again if I faile bn 70 leagues, I shall be in the latitude of 49 degrees, 52 min. and have altered my longitude from Summers Islands to the Eastward 45. deg. 22 n inutes. And thus being near the parallel of the Lizard, I keep in the same parallel, failing East, till I come right off from it, which by this reckoning should be 317 leagues; and so the whole distance from Summers Islands to the Lizard, according to these courses, should be about 1070 leagues, going over the Bank of New-Found-Land. Now, I fay, coming into the latitude of 49 degrees, 32 minutes, or there abouts, the plain Chart, he flould be thore of the fixed about 160

abouts, though by my reckoning, well rectified by observations, I find my self to be still short of the Lizard, about 317 leagues: yet I follow not the great Circle any surther, but that I may the more certainly sall with the place intended, whether Selly or the Lizard, I keep my self in that parallel; and the rather, because the reckonings outward and homeward, of Voyages made to this and other places of the West-Indies, do for the most part disagree much. Which disagreement ariseth partly by the currant setting homeward from those parts; but chiefly because those reckonings are kept upon the plain or common Sea-Chart; which Chart, except a man return the same way home that he went out, is commonly subject to gross Errors.

And whereas I know, that the most part are wholly addicted to the use of this Chart; some also despising all others, and may happily be offended that I should thus tax it with gross Errors; I shall make it appear (partly in this present Example) that I do it not without just

cause.

In failing from the Lizard to these Islands, and so to other parts of the West-Indies; Men commonly run far to the Southwards, as fometimes into the latitude of 30 degrees, fometimes more Southerly, to get a wind; but coming homewards, their courses are commonly more Northerly than the Rumb leading from thence But in this Example following, let us keep a mean; and home. to make fhort, suppose a man should sail from the Lizard Southwest 500 leagues, and then find himself in the latitude of 32 degrees, 20 minutes, and from thence West 782 leagues, till he find himself directly South from Summers Islands, and about two leagues off: Then by this reckoning on the plain Chart, Summers Islands should be distant from the Lizard 1180 leagues in a straight course. admitting this reckoning outward bound to be true, and thefe places to be thus lituated on the common Chart; let us suppose the reckoning homewards to be also kept on the same Chart. And because coming home men keep to the Northwards, let us suppose that he iteers a way * e half a point easterly 200 leagues; then ne by e 100 leagues, ene half a point Northerly 165 leagues, ene 130 leagues, East-North-East half a point Easterly 88 leagues; East and by North 70 leagues; and e 317 leagues. Then by this reckening upon the plain Chart, he should be short of the Lizard about 160 leagues. leagues. Whereas by a true reckoning, he should be as far short as the Lizard. And hence it is that they which come from thence, and other parts of the West-Indies (making no allowance) are at home before their reckoning sometimes 200 leagues and more. For a mans reckoning by the plain Chart, makes him shorter than he should be by 160 leagues; sometimes more, and sometimes less; and the current may put him forwards 50 or 60 leagues more, so that his Ship may be above 200 leagues before his reckoning.

And thus much at prefent, touching the three principal kinds of Sailing: which I hope, I shall have opportunity to handle more fully hereafter, with some other things of like nature; and to correct such

faults, as may peradventure be here committed through haste.

checome from ricence, and ocher

Of the Declination of the Sun, and fixed Stars.

ECAUSE in the practice and application of the doctrine of Triangles, it is often requisite, that the Suns declination be known, I have thought good here to place four Tables thereof: The first, shewing the Suns declinations for every day of the first four years after the Leap-years; namely, for the years 1677,

1681, 1689, 1689, 1693, 1697. The fecond, for the fecond years after the Leap-years; namely, for 1678, 1682, 1686, 1690, 1694, 1698. The third, for the third years after the Leap-years; namely, for 1679, 1683, 1687, 1691, 1695, 1699. And the fourth, for these Leap-years 1680, 1684, 1688, 1692, 1696, 1700, according as they are expressed in the head of each Table. And because the observations of our Countreyman Mr. Edward Wright, are not (as I take it) inferior to any other at this day extant, therefore I have drawn these Tables out of his, rectifying them by Prosthapheresis for these

next enfuing times.

To these I have added (chiefly for theuse of Sea-men) Rules for finding the latitudes of places by the declination and meridian altitude of the Sun or Stars; and a Table of the right afcentions and declinations of about 7+ principal fixed Stars, calculated according to their Longitudes and Latitudes fet down by Tycho Brabe, Anno 1600, with allowance for their motion of Longitude, or for the procession of the Aquinoxes for some time to come. I have also noted at what times of the year these Stars will be upon the Meridian at four of the Clock in the Morning, whereby you may readily fee when they are in feafon to be observed for finding the Latitude; by which also you may conjecture their other times of being upon the Meridian. For the Star which in any day proposed is upon the Meridian at Four of the Clock in the Morning, will about fifteen days after be on the Meridian at Three of the Clock in the Morning, and about a Month after at Two, &c. Wherein also Mariners ofe to help themselves by their Compass, whereby they see when the Sun or Star is near the Meridian. Such as desire the exact time of a Stars coming to the Meridian for any day, may Substract the right ascension of the Sun for that day from the right ascension of the Star (adding thereto, if need require, twenty four hours) the remainer shews how many hours it will be after Noon, before the Star be upon the Meridian.

The Suns right ascension for any day, may be found by his declination for that day, by the resolution of a right angled spherical Triangle, as of the Triangle Y FQ in the general Scheam of the third Chapter of Spherical Triangles. But I have annexed an exact Table of the Suns

right afcension at the end.

Also for the Stars near the Æquinoctial, I have set down (in this fourth Edition) their Longitudes and Latitudes, that fo the Moons place may be discovered by her Longitude from any of them, especially being in her Ninetieth degree; whereby the Longitude of places on sea or Land may be nearly gathered. For the performance whereof, I intended to have handled the Moons motion, and to have fet down the best ways I have thought upon; but other urgent occasions have hindred me. Notwithstanding, if you find by some exact Ephemerides the Moons true Longitude at the time of observation, and observing with meet instruments her Longitude from some of those Stars, and withal the hour and minute of the Night (which by the right afcensions and declinations of the Sun and Stars may be known) you may nearly gather the difference of Longitude : For which causes I thought it not superfluous to set down their Longitudes and Latitudes, and an exact Table of the Suns right afcension, though I cannot profecute the rest at present; also by the Longitudes and Latitudes of these Stars, their right ascensions and declinations may be examined.

The Table of the Suns Declination for 1677 1681 1685 1689 1693 1697

Rules for finding the Latitude or Poles elevation by the meridian altitudes of the Sun or Stars, and by the Table of their Declinations before-going. Case 1. If the Sun or Stars be on the Meridian to the Southwards, and have South declination.

Add the Suns declination to his meridian altitude, and taking that total from 90 degrees, the remainder is the Latitude, or the Poles

elevation Northerly.

As admit upon the 100f January, 1649, I find by the foregoing Tables, The Suns declination Southerly

The Suns meridian altitude by observation

The sum or total is

37 55.

There remains the Latitude Northerly 52 05

68

60.

But when you have added the Suns declination to his meridian altitude, if the total exceed 90 deg. substract from it 90 deg. and the

remainder is your Latitude to the Southwards.

Which substracted from

As admit the Suns declination to be Southerly
The meridian altitude by observation
The fum or total is
From which substracting
There remains the Latitude Southerly
Case 2. If the Sun or Starbe on the Meridian to the Southwards, and

have North declination.

Substract the Suns declination from his meridian altitude, and that which remains, substract from 90 deg. then that which remains, is your Latitude or Elevation Northerly.

As admit upon the 20 of April, 1649, I find

The Suns declination Northerly
The meridian altitude by observation
The remainder, substracting the declination, is
Which substracted from

There remains the Latitude Northerly

40
38.

Case 3. If the Sun or Star be on the Meridian to the Northwards, and

have North declination.

Add the Suns declination to his meridian altitude, that total take from 90 deg. and the remainer is your Latitude Southerly, or the Elevation of the South Pole.

But

But when you have added the Suns declination to his meridian altitude, if it exceed 90 degrees, substract from it 90 degrees, and the remainer is your Latitude Northerly.

Case 4. If the Sun be to the Northwards at Noon, and have South de-

clination.

Substract the Suns declination from his meridian altitude, and that which remains, substract from 90 degrees, then that which remains

is your Latitude Southerly.

These Rules might have been set down divers other ways, but let this suffice. And what is here said of the Sun, is also to be understood of the Stars being upon the Meridian.

5. If you chance to observe when the Sun hath no declination.

Substract his meridian altitude from 90 degrees, and the remainer is your Latitude.

6. If you chance to observe when the Sun or Star is in the Zenith, that

is 90 degrees above the Horizon.

Look in the Table for the declination of the Sun, or of that Star, and the fame is your Latitude.

7. If the Sun come to the Meridian beneath the Pole.

If you be within the artick or antartick circle, and observe the Sun upon the Meridian under the Pole, substract the Suns declination from 90 degrees, the remainer is the Suns distance from the Pole, which distance added to his meridian altitude, the sum or total is your Latitude or Poles elevation.

And the like is to be understood of the Stars; for which cause touching those Stars that are near the Pole, we have expressed in the foregoing Table, the complements of their Declination, that is their di-

stances from the North-pole.

If therefore you observe any of these Stars upon the Meridian beneath the Pole: add to its meridian altitude found by observation, his distance from the Pole, the total is the elevation of the North-

pole, or your Latitude Northerly.

If you observe any of those Stars upon the meridian above the Pole then from the meridian altitude of that Star substract his distance from the Pole; the remainer is the height of the North pole. Or out of the Stars distance from the Pole, substract his meridian altitude, the remainer is your Latitude Southerly.

The Epilogue, or Conclusion.

N handling the Doctrine of Triangles, I have not set down all that I might, but this I have chiefly endeavoured according to my stender ability, namely, to found it upon such Axioms, as might be few in namber, easie for memory, ready in practice, and consonant to the nature of Logarithms: yet so, as they might also direct the operations by natural sines, tangents and secants, and likewise by instruments. In the demonstration of these Axioms, I have laboured to be brief and perspicuous. In deducing the cases from them, I have opened the method how it is done, and of all the questions incident in every case, whereby the Reader may conceive the like in any triangle proposed. The Examples I have set down in such sort as might best manifest the Operation, and be a most ready way of practice. The application I have partly shewed, in handling the cases, but further in a subject wherein all the problems of plain and spherical triangles may aptly, ordinarily, and to good purpose be used. The Tables I have so ordered, as I thought might be most easie and ready for ordinary use, according to the method I have used. Many varieties that might have been shewed, I have purposely omitted, that I might not seem tedious. As I have shewed from one ground how to resolve all the cases and questions of a plain right angled triangle as hath been usual before. Whereas for the fifth case where the base and perpendicular are given; to find the hypothenufal : Mr. Briggs hath shewed a more peculiar way, in his Arithmetica Logarithmica, chap. 19. So likewise I have shewed the resolution of the twelfth case, (where three sides of an oblique triangle are given : to find an angle) by an Axiom brief, easie, and the same in effect that hath been long used for that purpose: whereas it might have been done, and that peradventure a little more speedily, by such a way as may be gathered from Mr. Bridgs his Arithmetica Logarithmica, chap. 18. though he do not expresty handle it. But then I conceived the rule would not have been so easie for memory, nor so applyable to instrumental operations, which I intended briefly to touch, if other occasions had not hindred. Yet since understanding it would have been acceptable to divers, and being very apt for the Arithmetical work, I have thought good here to place

Mr.

The Epilogue.

Mr. Briggs hath shewed Chap. 18. Sect. 3 and 5 having the three fides of a triangle, how to find the Semidiameter of the infcribed circle, and any of the angles thus, or to this effect.

Substract the three fides feverally from half the perimeter, and

note the remainers then, first,

B. As half the perimeter. C. to one of the remainers;

DF. fo is the rectangle of the other two

GG. to the square of the semidiameter of the inscribed circle.

Secondly, C. As one of the forefaid remainers

G. to the Semidiameter of the inscribed circle;

R. fo is Radius

A. to the tangent of half the angle opposite to that remainer,

these he hath there demonstrated.

By the first of these it is evident, that As B to C, so is DF to &G; and multiplying the first and second by the second, As BC to CC, fois DF to GG: And alternately as BC to DF, fois CC to G G.

Again, by the fecond, As Cto G; fo R to A, and fquaring them, as C C to GG; fo is R R to AA: But as CC to GG; fo is BC to D F as before was proved. Therefore as B C to DF; fois RR to AA.

that is, B C. As the rectangle of half the perimeter in one of the forefaid remainers;

DF. is to the rectangle of the other two remainers;

R R. fo is the square of Radius,

A A. to the square of the tangent of half the angle opposite to

that first remainer.

Thus being limited, that I cannot conveniently in this. place demonstrate by words at large, this Algebraical deduction and demonstration may suffice, which to the learned in that kind will not be obscure: Hence then,

The three sides of a plain triangle being given; we may find any of the angles.

The Epilogue.

Substract the three sides severally from half the perimeter, noting the remainers. Then to the complements arithmetical of half the perimeter, and of the remainer opposite to the angle required; Add the Logarithms of the other two remainers, half the sum of these four is the tangent of half the angle opposite to that first remainer.

Now whereas I have here, and in sundry places of this Book, cited

Mr. Briggs his Arithmetica Logarithmica, (lest I may seem to
abuse the Reader) you are to understand not the Book put forth
about

The Epiloque.

about a month since in English, as a translation of his, and with the same Title; being nothing like his, nor worthy his name; but the Book which himself put forth with this Title in Latin, being printed at London, Anno 1624. And here I have just occasion to blame the ill dealing of these men, both in the matter before mentioned, and in printing a second Edition of his Arithmetica Logarithmica in Latin, whilst he lived, against his mind and liking; and brought them over to sell, when the sirst were unsold; so frustrating those additions which Mr. Briggs intended in his second Edition, and moreover leaving out some things that were in the first Edition, of special moment. A practice of very ill consequence, and tending to the great disparagement of such as take pains in this kind.

TRIANGULAR CANON Logarithmical:

OR,

ATABLE

OF

Artificial SINES, TANGENTS, and the Complements Arithmetical of Sines, supplying the use of Secants, the Radius 10.0000000. And to every Degree and Minute of the Quadrant.

Mathematical and Sea-Books printed for, and Sold by William Fisher, Book-seller, at the antient Shop by the Postern on Tower-Hill, Thomas Passenger, at the Three Bibles on London Bridge, and Ralph Smith, at the Bible in Cornhill, near the Royal Exchange.

THE Mariners Magazine, containing the Art of Navigation, Surveying, Gauging, Gunnery, Aftronomy, Dialling, and Fortification. By Capt. Sam. Sturmy, Folio.

The Coasting Pilot, with new Sand draughts, by J. Seller.

The Mariners New Kalendar; by Nathaniel Colfon.

The Sea-Mans Kalendar; by Henry Philips. The Sea-mans Practice; by Richard Norwood.

Norwood's Doctrine of Triangles with Logarithms, exactly Corrected, and much enlarged by the Author.

Practical Navigation, being an Introduction to the whole Art; the third Edition

carefully Corrected by J. Seller.

The Sea-mans Diffionary, or the Exposition and Demonstration of all the parts and things belonging to a Ship; by Sir Henry Manwaring.

The Sea-mans Glaß, shewing the use of the Plain Scale in Navigation, Astronomy,

and Dialling.

The Sea-mans Companion, teaching Arithmetick, Geometry, Trigonometry, Navigation and Aftronomy; by Matthew, Norwood.

The Compleat Canoneer, shewing the Principles and Grounds of the Art of Gun-

nery; as also several Fire-works for sea and Land.

The Safeguard of Sailers, and Pilots Sea-Mirror, describing the Sea-Coasts of England, Scotland, Ireland, France, Holland, Denmark, Norway, &c. according to the newest Waggoner, with new Sea-Charts. A Book very useful.

The Compleat Modalist, shewing how to raise the Model of any Ship or Vessel either in Proportion or out of Proportion, and to find the length and bigness of every Rope in all Vessels exactly, with the weight of their Anchors and Cables. Also the Boat-Swains Art; by H. Bond.

The Compleat Ship-wright, teaching the proportions used by experienc'd Shipwrights according to their cuftom of Building with the drawing of a draught, the making and marking of a bend of Moulds, both by Arithmetick and Geometry; by

Ed. Bulbnel.

The Geometrical Sea-man, shewing the three kinds of Sailing by the true Sea-Chart. Mercator's Chart, and by a Great Circle, with two Traverse Tables added; by H. Philips. Norwood's Epitome, applyed to Plain and Mercator's Sailing, with useful Tables in Navigation, carefully Corrected, &c.

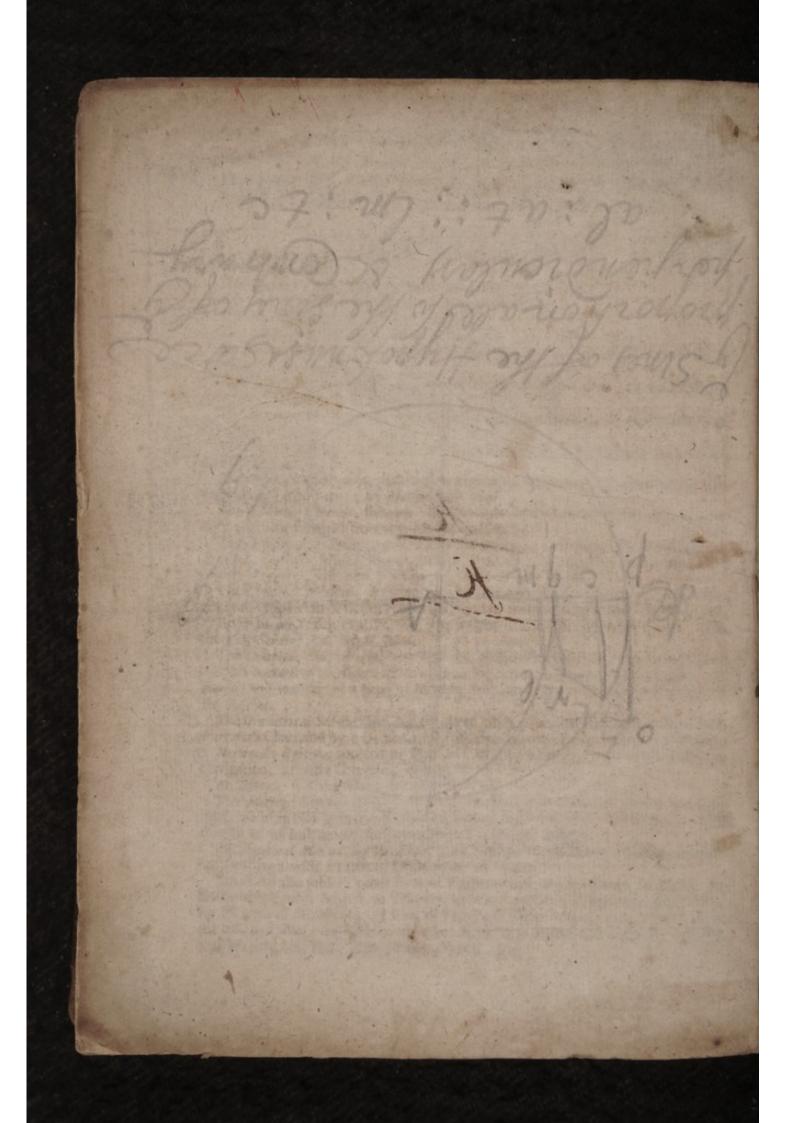

An Epitome of Navigation; by H. Gillebrand.
The Mariners Compass rectified; A Book furnished with Tables of Hours and Azimuth, useful in Nav gation; Calculated from o deg. to 60 deg. of Latitude: with the Use of all Instruments in Navigation: By Andrew Wakeley.

Mathematical Manual, by Mr. Philips, of Navigation, Gunnery, Dialling, Survey-

ing, Gauging; with a Table of Logarithms, to 10000.

There are also sold all other forts of Mathematical and Sea-Books in English, or Books of any other Subject, as Divinity, History, Poetry, &c. Waggoners, Sea-Charts, for all parts of the World, all forts of Paper and Paper-Books, rul'd or unrul'd, at the cheapest Rate: Also Bibles, or other Books new Bound and Clasp'd; and the best Writing-Ink, Pens, Wax, Wafers, Pencils, &c.
