MALIGNITAS. MALIGNITY. Very different are the definitions of malignity, or the different accounts of what constitutes it. The fevers termed malignant, upon examining their symptoms, seem to proceed from coagula-tion or from dissolution of the juices; volatile and attenuating medicines relieve in the first case, and mild acids, cooling emulions, and agglutinants, are useful in the latter. And as these medicines act by manifest qualities, it may reasonably be inferred that malignant disorders arise from manifest causes; so that the notion of malignant disorders arise from manifest causes; so that the notion of malignant disorders arise from manifest causes; so that the notion of malignant disorders arise from manifest causes; so that the notion of malignant disorders arise from manifest causes in the notion of malignant disorders. nity from a fecret fomething, falls to the ground. The fevers that are malignant proceed from fome particular contagious qualities of the air, not cognizable perhaps by the fenses; corrupt and putrified matters diffused in the air may both cause and continue them.

The figns of malignity are, a flight coldness and shiver-ing, a great loss of strength immediately ensuing, a small, quick, and contracted pulse, fainting, if an erect posture is long continued, drowfinefs without any (at least re-freshing) sleep, and if sleep comes on it is followed by a greater decay of strength and a delirium; there is no great complaint from pain, thirst, or other troublesome fymptoms, and yet the patient is uneasy; at length the extremities are cold, the pulse intermits, and death soon

Those disorders in general may be called malignant which fuddenly destroy the strength of the patient, and quenched.

MALIS. A pungent pain from an animalcule lodged in an ulcerous tumor; or pain from an infect lodged in any part without ulcer or tumor, called also escyta.

MALLAM-TODDALI. The name of a tree in Malabar, whose root, bark, leaves, and fruit, are esteemed as specific in the epilesy. Raii Hist.

MALLEAMOTHE, called also pavette, pavate. It is a shrub which grows in Malabar. The leaves boiled in palm oil, cures the impetigo; the root powdered and mixed with ginger is diuretic. Raii Hist. mixed with ginger is diuretic. Raii Hift. MALLEI MUSC. EXTERN. vel Superior, fee

TENSOR MEMBRANA TYMPANI.

MALLEOLI. The ANKLES.

MALLEOLUS. A MALLET. In botany the cutting of vines, which are taken with joints of the old wood to their bottom, fo as to refemble a little mallet, are thus termed; these cuttings most certainly take root, and make the best plants.

MALLEOLUS EXTERNUS. By some taken for the talus or ankle bone, where it means the inferior extremities of the tibia and fibula, or the protuberances there. See FIBULA.

MALLEI MUSC. INTERN. See LAXATOR MEMBRANÆ

MALLEUS. A hammer or mallet, also one of the bones in the ears, fee AURIS: this bone hath a large round head, which contracts all the way of the neck, from whence the processus Ravianus jets out like a fish bone, and on the outfide a fhort process projects outward, and points against the membrana tympani; from thence the manubrium is continued down, and its extremity is fixed to the membrana tympani, and pulls it inwards. When to the membrana tympani, and pulls it inwards. the malleus is in its proper fituation, the neck and head of it are turned upwards, and inwards, and the manubrium downwards, the fhort process of the handle upwards and outwards near the upper part of the edge of the sympanum, and the proceffus Ravianus forwards, reaching to the articular fiffure in the os temporis, whence we may diftinguish the malleus of one ear from that of the other. The handle of the malleus is tied to the membrana tympani by a fine membranous duplicature. This bone hath three muscles, viz. the laxator membranze tympani, the tensor membranæ tympani, and the musculus externus auris Du Vernii.

MAL-NAREGAM. See NAREGAM.

MALPIGHIA. BARBADOES CHERRY-TREE. So named in honour of Malpighius. It is not noted for any medicinal powers. It is also called Cerasus Americanus, and is a genus of the decandria trigynia class, there are eight species, natives of the West Indies, where the fruit is eaten by the natives.

MALTHEORUM, fee GEMMÆ SAL.

MALUM. A DISEASE, also an APPLE. In a strict fense it is the disease called procidentia oculi: it is when the eyes exceed the bounds of the eye-lids.

- CITREUM. See CITREUM.

GRANATUM. See GRANATA MALA.

MORTUUM. A malignant species of lepra or feab, which renders the body livid, with crusty ulcers, void of fanies and of pain.

TERRÆ, fee RAD. ARISTOL. R.

MALUS. The APPLE-TREE. The many fortsof apples that are known in this and other countries are but varieties of one species in the opinion of some. Though we have more than fourfcore forts, yet the crab is the only one proper to this ifle. It is a term applied to differ-

MALUS SYLVESTRIS, five Agrestis, malis acido fructu fylveftris. The CRAB TREE, the WILDING, or the WELD-

ING. It is the pyrus malus of Linnæus.

AURANTIA. See AURANTIA HISPAN.

CITREA. See CITREUM.
CYDONIA. See Cydonia.
HORTENSIS, Malus Sativa. The APPLE-TREE.

The first of these is too four to be eaten; their juice is called verjuice, that is, green juice, as the French call it, and is often used as vinegar, called also agressa. In most instances its usefulness, both with respect to food and phylic, is the fame as that of vinegar.

The fecond may be confidered as including all the varicty of apples which by culture are improved. They

in which the flame of life feems at first to be almost have the common qualities of cooling and abating thirst; the more acid kinds are fornewhat laxative; the auftere have rather a contrary effect. The juice of fome of themafter being prefled out, is left a little time to ferment, and then is the liquor called eyder.

MALUS ADAMI. A species of lemon. - INDICA. See BILIMBI.

MALABARICA. See CANIRAM.

- MEDICA. The CITRON, LEMON, and PEACH. Persica. The Peach and Lemon.
- Punica. The Pomegranate. See Balaus-

TIUM, and GRANATA MALA.

MALVA, of μαλαχε, from μαλασσε, to mollify. The MALLOW. Boerhave enumerates fifteen species; but the common mailow being more frequently found, and poffeffed of the largest share of useful qualities, is justly used for them all. It is the malva sylvestris, or malva caule erecto herbacco, soliis septemboatis acutis, pedunculis petiolisque pilosis, Lian. It is sufficiently known not to need description. Its leaves and flowers are a little mucilaginous, have no remarkable fmell, and are rather emollient and laxative. A conferve is made with the flowers; the leaves are used in decoctions for clysters and fomentations of the emollient kind. The roots have been used more as a pectoral than they are at present; they have a foft fweet tafte, fomewhat like liquorice, but have no remarkable fmell. An extract from them, made with fpirit of wine, is very fweet. See Raii Hift. Lewis's Mat. Med. This term is applied to different plants, as

MALVA ARBOREA MARITIMA, also called althea arborea maritima. The MALLOW-TREE. It agrees in vir-

tues with the common mallows.

BETONICE FOLIO. See MALACOIDES.

- ROSEA FOLIO SUBROTUNDO, called also malva arborescens, maiva hortensis, dendro malache. TREE or GARDEN MALLOW, and the HOLLYHOCK. Of this kind Boerhaave enumerates thirteen species. They are chiefly noticed as ornamental in gardens. Their medical virtues of the statement of the stateme tues are fimilar to, but less in degree than those of the common mallow. And

--- VERBENACEA, called also alcea, alcea vulgaris major. VERVAIN MALLOW. It is diffinguished from the common mallow by its leaves being jagged or cut in about the edges. It grows in hedges, and flowers most of the summer. It agrees in virtues with the other mallows, but is the least mucilaginous of any. Miller enu-

merates eight species of the vervain mallow.

MALVA-VISCUS. MARSHMALLOWS. See ALTHEA.

MALVASIA, MALMSEY, also called marvifum. It

MALVISIUM, is a generous kind of wine. It is

fupposed to be the arvisium of the island of Scio.

MAMÆRA FÆMINA. See PAPAYA FÆMINA.

MAMANGA FRUTEX. An arborescent shrub in Brafil. The Portuguese call it lavapratas. Its leaves are applied to wounds and ulcers. The pods yield an oil by expression, which is used in maturating poultices. Raii-

MAMEI. The mammoe, momin, or TODDY-TREE. It is a fine tall tree, appearing always of a fine green co-lour, and fomewhat refembles the walnut tree; the fruit is as large as a man's two fifts, and is very agreeable. This tree is found in different parts of the West Indies, but those on the island of Hispaniola are the best. From incisions made in the branches a copious discharge of pellucid liquor is obtained, which is called momin or toddywine; but it must be drank very sparingly, because of its very diuretic quality: it is effected as an effectual prefervative from the stone, as also a solvent of it when generated. There are two species. See Raii Hist.

MAMIRA. It is faid by Paulus Ægineta to be the

root of a plant which is of a detergent quality. Some think it is the root of the doronicum; but what it really

is, cannot be afcertained.

MAMIRAAN. It is a plant which grows in the wa-

and bitter: the feed refembles that of fefamum. It is in use amongst the Arabians.

MAMITHA, Rhazes mentions it as being in use MAMITHZA, amongst the Arabians. It is a plant like the papaver maritimum or corniculatum. At the lower part of it is a moisture that sticks to the hand; the flower resembles that of the papaver, and is of a yellow

a strong offensive smell.

MAMMA. The NIPPLE. See PAPILLA.

MAMM.E. The BREAST'S, from uauua, mother, mamma, plural mamma. In the breasts are, the mamma or nipples, the areola, the body of the breaft, and the lactiferous veffels. The fubitance of the breaft is deferibed as lying between two membranes, one before, the other behind; but this is not true. The breafts are composed of a glandular substance and fat; the glandular part is hard, white, and irregularly mixed with fat; but the ftructure of the breafts are very little understood. The whole mass of the glandular part seems made up of tubes called tubi lactiferi. See LACTIFERI DUCTUS.

The glands in the breafts of old women are very promi-

nent, and may be taken for fcirrhufes.

The arteries and veins are ramifications from the arteriæ and venæ fubclaviæ, and from the axilliares. The nerves are principally from the coftales, which communi-cate with the nervi lympathetici.

MAMMARIA EXTERNA, ARTERIA. See MAM-

MARIA ARTERIA.

— VASA. The MAMMARY VESSELS. They are the arteries and veins of the breaft.

MAMMARIÆ ARTERIÆ. The ARTERIES of the BREAST. The external are branches from the axiliary arteries, and are called the superior thoracic arteries. The internal proceed from the anterior and lower fide of the fubclaviz, near the middle of the claviculæ, and run down, for about one finger's breadth, behind the cartilages of the for about one finger's breadth, behind the cartuages of the true ribs, an inch diftant from the sternum; in their passage they send branches to the breasts and to several of the adjacent parts; they afterwards go out of the thorax on one side of the appendix ensistems, and are lost in the muscul. abdom. recti.

—— VENÆ INTERN. The right springs from the vena cava, a little below the bifurcation, runs along the internal edge of the sternum. See, as does its correspond-

internal edge of the sternum, &c. as does its corresponding artery. The left fprings from the fubclavian, or from the axillary vein.

MAMMIFORMES, or MAMMILLARES PROCESSUS. The maftoid processes. In (forma) the shape of (mamma)

MAMILLA. See Papilla.
MAMOERA. See Ambapaia.
MANACA. The name of a bacciferous fhrub in Brafil. The root is powerfully emetic and cathartic, and is used on some occasions by the natives. See Raii Hist.

MANANAOG. The plant which bears the St. Igna-

tius's bean.

MANATEA LAPIS, also called manati Indorum, MANATI, manati phocæ genus, vacca MANATI,

marina. The SEA-cow.

The part of this animal which hath been used in medicine is the os petrofum of the head; it is of various forms, hard, and white, refembling ivory. It being harder than bones are in general, hath obtained it the name of stone. MANCANILLA. The MANCHINEAL-TREE. There

are three species in the West Indies; they are as large as the oak-tree; the juice from their bark, whilst fresh, is caustie; the fruit and leaves have the same effect, yet are eaten by goats. The wood is sawn into planks, and brought into England. See Raii Hist.

MANCORON. According to Oribafius's account is a kind of fugar which is found in a fort of cane.

MANCURANA. MARJORAM. See MARJORANA. MANDARU. Affitra. The pod-bearing Malabarian tree with bifid leaves. Ray mentions the following species :

1. Chovanna mandaru prima, also called arbor St. Th ma, &c. 2. Chovanna mandaru fecunda, &c. 3. Vo-lutta mandaru, &c. 4. Canfehena pou, &c. The flowers purge. The roots, if chewed, relieve

pains in the teeth.

MANDIBULA, from mands, to chew, A JAW.

MANDIHOCA, (Mandiibabura, Mandiibparata, MaMANDIBA, S diibumana, Mandiipeba, Mandiipuca, Mandioca, Mandiopiba. All these are names for the preparations of the root of the cassada plant, in order

to make it into bread. See Cassada.

MANDRAGORA, also called Canina malus dudaim.

colour; the feeds are like those of the sefamum both in Linn. This plant hath monopetalous, multifid, bell-colour and fize. The plant is very succulent, and hath sefamous offensive security finding offensive security se common in Spain, Italy, and other hot countries. It is anodyne, narcotic, and cathartic; but is only used internally as a discutient.

Boerhaave mentions three species. The roots of marshmallow, of the arundo, and of bryony, are made to refemble the male mandrake roots; the latter is very com-

monly imposed for them.

MANDRAGORITES. The MANDRARE WINE, or wine in which the bark of the roots of the male mandrake are infused. Half a pound of this bark is put to nine gallons of wine, and are to stand together during three

MANDSJADI. The name of a pod-bearing tree in Malabar and other parts of the East Indies; the pods contain fearlet-coloured beans, which are fo exactly to the fame weight, as to be used as weights. See Raii Hist.

MANDUCATORES MUSC. from manduco, to chew.

See MASSETER MUSCULUS.

MANGA, also called mangas, amba, ambo, ambalam, mao, mau, conchifolia. The MANGO-TREE. It is a large tree, a native of the East Indies; the fruit is larger than a goofe's egg, and shaped like a kidney, and of a gold yellow colour. This fruit is pickled and fent to

gold yellow colour. This fruit is pickled and lent to most parts of the world. See Raii Hist.

MANGAIBA. A species of plum-tree in Brasil.

MANGANESE, called also magnesia, magnese, magalaise, maganaize, sape vitri, soAP of GLASS, &c. It is commonly considered as an iron ore, but it contains little or none of this metal. Mr. Cronstadt makes it a particular earth, and calls it terra magnefia. It is of various colours, as red, dark grey, black, white, &c. It is not used in medicine. The blacker fort, which bears a diftant refemblance to antimony, is used by potters; it is mixed with lead for glazing their coarsest wares. The glass-makers add a little to their frit, and by continuing them in suffice, the glass is rendered colourless. The darker coloured is called Perigord stone by the French. Manganese is found about lead mines. See Dict. of Chem. Neumann's Chem. Works.
MANGARATIA. GINGER. See ZINGIBER.

MANGLE. See GUAPARAIBA.

MANGOSTAN. A tree which has been transplanted from the Molucca islands to Java, and at Batavia is admired as an ornament in gardens. The bark is aftrin-

MANGOSTANS. It is an Indian fruit, of the fize of a small orange. It is cardiac and stomachic; its rind

or peel is aftringent. See Lemery de Drogues.

MANIA, also Delirium Maniacum, Melancholia; Paraphrosyne; PHRENITIS apyreta. MADNESS. This diforder receives different appellations, according to its greater or lefs violence, and the varieties of its causes and attending circumstances. Melancholy is the primary disorder, and madne/s is the higher degree. Alexander Trallian fays that madness is nothing but melancholy arrived to a higher degree, and that the connection be-tween these two disorders is so great, that a transition from one to the other eafily happens. Aretæus alfo fays that melancholy is the beginning and origin of madness, which is brought on by the increase of melancholy, rather than by any other cause.

These two disorders agree in their being accompanied with constant delirium without sever. And it is also certain that he who can lessen or remove one of these complaints, is equally able to afford relief against the other.

Madness, in all its species, is a chronical disorder, and

of the tribe usually denominated nervous: it is defined by some to be, "The perception of objects not existing, or at least not corresponding to the senses." Hence it will be described as being a preternatural state of senses. Dr. Cullen defines it to be an universal infanity. As a genus of disease he places it in the class neuroses and order vefaniæ. He points out three species. 1. Mania mentalis when wholly from the affections of the mind. 2. Mania corporea, when evidently from a fault in the body. 3. Mania obscura, when not preceded by any evident mental affection or disorder of the body, called

also phrenitis inanitorum.

The dull, stupid, or forgetful; the very ingenious and MANDRAGORA, allo called Canna manas anadam.

The MALE MANDRAKE. It is the atropa mandragera, penetrating; those of a melancholico-choleric tempera-

it appears that a congestion of blood in the vessels of the brain is a principal cause of these disorders. According to the different nature and condition of the blood, and its motion though the veffels of the brain, both the rational and fenfitive powers are fo altered, that the difference of inclinations and appetites is to be accounted for from them. And the immediate cause of madness or of melancholy is a preternatural congestion of fluids in the veffels of the brain, or fuch an impress, on some part of this organ of fense, as excites the preternatural fensations which more particularly work on the imagination. The mediate causes, are a certain weakness, or at least a pe-culiar disposition to irritations of a peculiar kind. The remote causes are, violent commotions of mind, such as long-continued or excellive grief, dread, terror, fear, &c. intenfe thought, an excels of love, narcotic drugs, exposing the feet and legs to too much cold; and among the causes a callous pia mater is mentioned as one in the Edinb. Med. Essays, vol. iv. art. 26, and to these many others might be added.

ness of the eyes, a tremulous motion of the eye-lids, a change of disposition and behaviour, a pride which discovers itself in the countenance, voice, and gestures, a grinding of the teeth, an uncommon hatred to particular persons, little sleep, a violent cephalalgia, a quickness of hearing, a ringing and a fort of musical noise in the ears, increaled firength, and capacity of bearing cold; and in women, an accumulation of blood in the breafts as the disorder increases. As to the figns in the beginning, progrefs, and declension of the diforder, Aretæus excellently lays them down as follow: "Those who are affected with melancholy are fad, dejected, and dull, without apparent They tremble for fear, are destitute of courage, affected with watchings, and fond of folitude. They are prone to anger, changeable in their tempers, and alk a reason for the most trisling and inconsiderable occurrences. They are at some seasons so covetous that they will not part with any thing, but foon become filly and prodigal. They are generally coffive, fometimes discharge no fieces at all, at other times their excrements are dry, round, and covered with a black and bilious humour; they discharge a fmall quantity of urine, which is acrid and bilious. A large quantity of flatulencies are discharged from their mouths; fometimes they vomit a certain acrid humour with the bile. Their countenances become pale, their pulse is flow. They are lazy and weak, but discover a preternatural voracity in eating their aliments. When the diforder advances to madnefs, the patient, when provoked to anger, becomes raging mad. Some wander far from home; fome cry out in a hideous manner; fome thun the fight of men, betake themselves to solitude, and only converse with themselves; others tear and mangle their bodies. In the highest degree of this disorder, they perceive red images before their eyes, so that they in a manner think themselves struck by lightning. They are immoderately inclined to venery, so that they carefs published to the control of the contro licly, without either dread or shame. But when the difeafe is in its decline, they become flupid, calm, and mournful; and coming to the knowledge of their misfor-tune, they are dejected, on account of their calamitous and miferable fituation."

Hoffman observes that maduess sometimes remits for a long time, but returns at certain periods, especially about the solfices, the times at which they first appeared. Dr. Tyson, physician of the Bethlehem hospital, observes that the raving sits of mad people, which keep the lunar periods, are generally accompanied with epileptic fymptoms.

Madnels should be distinguished from an acute delirium or phrenitis; also that resemblance of madness which is

produced by narcotic drugs.

If this diforder is symptomatic a recovery may be more readily expected; but when idiopathic, or when violent or disappointed love, excess of venery, great agitation or uncafiness of mind, were the cause, a cure will be diffi-cult, and not foon to be expected. If the paroxysms are flight and thort, the cure may be reasonably expected. If demned.

ment, of a lean habit, with tenfe fibres, and a quick after fleep the patient is delirious and infenfible of cold, pulse; those who are prone to anger, particularly those who are easily provoked to anger at meal times, are, above all other, subject to madness.

From diffection of those who died mad or melancholy, thargy come on, death is not far off.

As in other nervous diforders, fo in this, the fame method of cure is not to be indifcriminately used in every case.

As the immediate cause appears to be a preternatural state of sensation, so whatever produces an opposite one, may be conducive to a cure, whence moderate exercise continued within the compass of the patient's strength, and travelling in temperate climes are found ufeful; keeping the patient's mind diverted with any amusement that turns his thoughts directly contrary to those which he possessed before; if this can be duly continued, the cure is both facilitated and expedited. But feverity in beating, terrifying, &c. is very rarely necessary, and never in a great degree, for all mad people are great cowards, and after a few instances of smart rather than severe discipline, the most frantic are easily governed.

When the diforder is fymptomatic, or the confequence of other difeases having long continued, or being ill managed, the cure will much depend on the removal of the original diforders. As when it happens in confequence any others might be added.

The preceding figns of madness are, in general, a redrate exercise in a dry warm air, with the bark, cordials, and ferrugineous preparations are most proper. When it happens to weakly women affected with the nervous fever, particularly in child-bed, bleeding and all cooling methods are to be avoided, the patient must be kept in bed, and free from every diffurbance; gentle cordials and per-fpiratives must be given, and the extract of the bark with the ferrum ammoniacale should accompany the cordial

perspiratives.

In the young, fanguine, and robust, bleeding is an effential step towards relief; as to the quantity to be dif-charged, and the frequency with which it is to be repeat-

ed, they are best determined by the pulse.

Anodynes. These, in general, such as camphor, cam-Anodynes. There, in general, such as camphor, camphor with nitre, musk, &c. are proper; for though evacuations are required, medicines to strengthen the brain and spirits are necessary too: and, after due evacuations, strong opiates may be used with advantage. If musk is given, the doses should consist of from 9 i. to 3 fs. Opium may be given to two grains. Camphor hath been given with great advantage from 3 i. to 3 i. fs. at a dofe, and repeated every night, and fometimes morning and night. Dr. Kenneir used to begin with an antimonial vomit, the next day he gave a large dose of camphor, and repeated next day he gave a large dole of camphor, and repeated it at night, and thus continued a few days: then in the day he gave pills of Æthiops, gum guaiacum, &c. and at night the camphor until a cure was effected; in which he often foon succeeded. Dr. Monro gives borax to 3 ii. at a dose, for procuring sleep.

Emetics are often highly useful by their stimuli; of these the antimonial are generally used; but when they fail the injure of the leaves of assaying a granual of

fail, the juice of the leaves of affarabacca or groundfel may be given, from one to two table-spoons-full for a dose; though the flor. antimonii are celebrated as being specific, if a specific is known for maniaes: some have disputed the utility of emetics, as they determine the fluids too much to the brain, and by increasing its energy, may be considered rather as medicines of some doubt-

ful effect.

Diuretics. Dr. Mead observes that, in the cure of maniacs, evacuations by the kidneys are of greater confequence than is generally fupposed, especially if the mania is of the furious kind, and accompanied with febrile heat. Alkaline salts in large doses are here the most effectual diuretics.

Purges. Though the ancients used hellebore, they rendered it mild before they administered it for purging and it was because they knew not of any of the milder forts which now are in use, that they employed this. Al-exander Trallian observes that, in these disorders, "gentle purging, a moistening diet, and the interposition of the bath, are necessary; for those who prescribe hot antidotes and purgatives, render their patients more furious." Such purges as gently evacuate, and that with the least irritation, are the best, of which number the kali tartari-tatum is in the highest estimation.

Blifters are rarely uleful, though not wholly to be con-

would always be both more fafe and effectual after a due use of the warm. The ancients both used and highly ex-tol the use of bathing in warm light water, in which sweet herbs are insused. Celsus advises to "wash the patient's head with cold water, and then to lay a folded cloth, gently fqueezed out of the fame, upon it, when going in-to the warm bath: for thus (he fays) the veffels in the head are strengthened, and more forcibly drive their contained blood from them, and the warm bath enlarging the veffels in the body, fits them for receiving more, and fo leffening the quantity in the head." Trallian and Arctreus both urge the use of hot baths, because, they say, "the flesh of those patients is dry and tense, and that softening it tends much to relieve." When baths are made for this purpose, their heat should be only such as excites a pleasing sensation. Hossman is a great advocate for warm bathing; but he first directs to due evacuations, a liquid diet, and nitrous medicines.

Some, confidering melancholy and madnefs only as the higher degrees of the hypochondriac diforders, proceed and advise as directed in the cure thereof.

Dr. Muzzel of Berlin, in his Treatife of Melancholy, highly extols the kali acetatum; he directs a dram (the Germans reckon twenty-four grains in 3 i. hence there are twelvegrainsmore than in our 3 i.) to be given three times a day in a draught of warm water, which is to be fweetened with honey: this, with a thin moiltening diet, the warm bath every night, and the flesh-brush every morn-

ing, hath great efficacy.

It should be observed that every kind of madness it attended with a diminished perspiration, and that the custom

of confining these patients in close apartments increases this morbid symptom. See AMENTIA.

See Aretæus, Alex. Trallian, Celsus, Sennertus, Hoffman, Sydenham, and Boerhaave, Dr. Battie's Treatife on Madnefs, and Dr. Muzzel's Treatife on Melancholy.

Arnold on Madnefs. Cullen's First Lines, vol. iv. p. 144.

MANIGUETTA. GRAINS of PARADISE. See PA-

RAD. GRANA.

MANIHOT, See Cassada.

MANIBA, MANIACAL. See FERINA.

MANIPUERA. See Cassada.

MANIPULUS. A HANDFUL. The fame as define; as much as can be contained at once in the hand, which

alfo fasciculus means.

MANJAPUMERAM. It is a large tree, which is common in the West Indies: its slowers are distilled, and the water is used against inflammations of the eyes, &c. See Raii Hift.

MANJELLA KUA. See Curcuma. MANNA, alfo called manna Calabrina, res Calabrinus, and AEROMELI. It is called manna from the supposition that it descended in dew from heaven; but it is inconteffibly proved to be the juice of the trees on the leaves of which it is found.

Juices of a like nature, but inferior both in quality and quantity, are obtained from feveral shrubs and trees in the warm eastern countries; but the officinal mannas transude during the dog-days from the fraxinus rotundiore folio & fraxinus humilior minore & tenuiore folio, C. B. in Calabria and Sicily. Fraxinus ornus, vel fraxinus foliolis ferratis, floribus, corollatis, Linn.. It exudes from every part of the tree; but, for a more abundant fupply, incifions are made through the bark, whence it flows more freely, and is foon infpiffated by the fun's heat. The quality of the manna will often vary much, though the produce of the fame tree.

Manna is a juice of the same nature with honey and fugar, being, like them, fweet, inflammable, foluble in water and in spirit; fermentable so as to yield a vinous spirit, a vinegar, tartar, &c. It possesses, like them, a laxative quality, but in a greater degree. The finer manna is in oblong, roundish, single pieces; or in slakes, moderately dry, friable, of a whitish or pale yellowish colour, light and somewhat transparent; internally it is composed as it were of sine capillary crystals. The inferior kinds are moift, unctuous, brown, mixed with fmall pieces of

Bathing. Cold bathing is commended, but perhaps. The flake manna is generally preferred; but the smaller ould always be both more safe and effectual after a due pieces are as good, if white or of a pale yellow colour, very light, of a fweet not unpleasing taste, and free from impurities. Some chuse the fat honey-like manna, but very injudiciously, for it hath either been exposed to moult air, or is damaged by means of fea-water, or fome other fluid.

Manna is often adulterated by compositions of coarse fugar, flarch, and fome purgative ing-edients, fuch as fcammony; but they are discovered by their taste, weight, compactness, untransparency, their habitude to certain menstrua. The adulterated forts generally render the fluid in which they are diffolved more or lefs glutinous.

This concreted juice liquefies in a moift air, diffolves readily in water, and by the help of heat in rectified spirit also, the impurities only being left by both menstrua. From the saturated spirituous solution great part of it separates as the liquor cools, concreting into a flaky mass, of a fnowy whiteness, and a very grateful sweetness: the liquor remaining after the separation of this pure sweet part, on being inspissated, is uncluous, dark-coloured, and disagreeable.

Manna is one of the mildest and safest purgatives, and is effected a good and pleafant auxiliary to the purgative neutral falts. It is excellently adapted for discharging the intestinal contents in children and very weakly people; it sheathes acrimony, and is useful in coughs, diforders of the breast, and such as are attended with sever and inflammation, as in pleurifies, &c. It is particularly ufeful in bilious complaints; and helps the discharge of mi-neral waters when they are not of themselves sufficiently active. It is apt to create flatulencies and gripes, both which are prevented by a fmall addition of some warm carminative. It purges in doses of from 3 i. to 3 ii. but its purgative quality is much increased by a small addition of cassa. When it is administered in bilious diforders, Geoffroy recommends quickning it with a few grains of antimonium tatarifatum, thus he fays the bilious ferum will be plentifully evacuated, without any naufea or gripes. Sydenham recommends the addition of lemonjuice to manna, as a remedy for the gravel, and fays, that the acid renders the purgative quality of the manna quicker, and also causes the manna to fit easy on the sto-mach. In bilious cases tamarinds are usefully joined with manna. In the gravel, the hooping cough, and when all possible irritation should be avoided, give the nanna in milk. See Raii Hift. Tournefort's Mat. Med. Neumann's Chem. Works, Lewis's Mat. Med.

MANNA THURIS. The coarfer powder that olibanum

broken into by carriage is thus named.

MANNIFERA ARBOR. The ASH-TREE which pro-

MANSORIUS MUSCULUS. Maffeter mufculus.

MANTILE. The name of a bandage.

MANUS. The HAND. It is divided into the carpus, metacarpus, and fingers. All the posterior part is convex for greater firmness, and the internal part concave, for the greater convenience of grafping. The concave fide is called the palm of the band.

MANUS CHRISTI SIMPLICES. A name given to cer-

tain troches made of the fugar of rofes.

- CHRISTI PERLATE. When pearls are added to the manus Christi simplices they are thus named.

— Der. A name for a resolvent plaster which is

described by Lemery. Also for opium.

MANYL-RARA. A tall tree, growing in the East Indies. Its fruit refembles an olive, and is eaten to promote an appetite and digeftion.

MANZIZANION. Colocafia.

MAO, } See MANGA.

MAON. A species of African Marigold.

MARANDA. A species of myrtle, growing in the island of Zeylon, a decoction of the leaves of which is

faid to be excellent against the venereal disease.

MURANTA GALANGA. See GALANGA.

MURANTHA DIOSCORIDIS. See CHAMALEON

MARASMODES. A hectic fever in its worft stagewood and other impurities, and irregular lumps.

Chuse the whitest, driest, lightest, purest, and that which hath a crystalline appearance upon breaking, a street taste, and which is rather biting to the tongue.

MARASMUS, from uappare, to render lean, or tabid. An atrophy, or a consumption, is thus called, when in its last or worst state. Linnaus defines it to be a wasting swithout loss of strength, hectic, or expectoration. Cullen MARASMUS, from papano, to render lean, or tabid.

prescribed in the Leyden Dispensatory. It is designed as an anti-epileptic, and confifts of peony roots, mifleto, elk's-hoof, coral, ivory, &c.

MALCOR. A preternatural drowfinefs.

MARCORES. Difeases that are attended with wasting of the body. Cullen's First Lines, vol. iv.

MARGACANDIA. See Lac Lunæ.

MARGARITÆ, also called perla, uniones. PEARLS. They may be ranked as a species of bezoar-stones. They are small morbid excrescences, of a calculous kind, of a bright femi-transparent whiteness, formed on the inside of the shell of the concha margaritisera, or mother of pearl fifth; as also of certain oysters, mucles, and other shell fifthes. The finest pearls are brought from the East Indies; the next from the West. The oriental have a more shining silver-like hue than the occidental; the last are fomewhat milky. Inferior forts are found in the shell on our own shores- Those which are not fit for ornamental uses, are called rag pearls and feed pearls, and are

employed in medicine.

True pearls calcine in the fire, and become quicklime, and readily diffolve in acids, the vitriolic excepted. These properties shew, that they are an earth of the same kind with crab's-claws, oyfter-shells, and other calcareous ani-mal abforbents. Pearls have no virtues but what are common to other fubstances of the same class, nor yet do they possess them in any greater degree. See Lewis's Mat. Med. Neumann's Chem. Works.

MARGARITTA. See STAPHYLOMA and ALBUGO

OCULORUM.

MARGINATUS. BORDERED. The feeds of plants which have a thin leafy border round them, are faid to be marginated, 2s those of the stock-gilly-flower, &c.
MARINUS PLATYPHYLLOS. Oyster green.

MARINUM, vel MARINUS SAL. SEA-SALT. It is also called communis fal, COMMON SALT; fal arti-

The falt is not only extracted from the sea-water by evaporation, but is also found in immense quantities in the earth. That which is found in the earth is usually diftinguished by the name of fal gemma. See GEMMA SAL. This falt is perfectly neutral, but differs from all other neutral falts, in its occasioning thirst if fwallow-ed. It is composed of a peculiar acid, denominated marine acid, and of the mineral alkali, called natron. It diffolves in about thrice its weight of cold water;

and, if the water is hot, it disloves very little more.

The folution of this falt in water, if gently evaporated, first assorted certain cubical crystals, these are the common or alimentary falt; after this, by farther evaporation, a quantity of the fal cathartic. amar. is produced; the remaining part of the folution can hardly be crystallized, it confists of the marine acid, and a calcareous earth.

When the fea-water is thrown upon rocks, &c. in warm climes, it is gradually evaporated by the fun's heat, and the remaining falt receives the name of bay-falt; this is formed into large crystals, it does not liquely in a moift air, and, being ftronger, it preserves provisions better.

The common alimentary falt lofes part of its acid in the process for preparing it; for fea-falt, contrary to other neutral ones, loses part of its acid in boiling down a folution of it to dryness; and hence its disposition to liquify in air; but this is prevented by adding a fmall quantity

of acid just when it begins to concrete.

Sea-falt is fixed and unchangeable in our bodies; it passes through us unaltered. It checks fermentation, and prevents putrefaction in the prime vize. It readily joins with volatile urinous falts, and changes them into a fal ammoniae, and fo fits the fluids for running off by urine. It flimulates the folids, and increases their ofcillatory motion; and on these foundations are built all the virtues afcribed to fea-falt, of drying, heating, deterging, digeft-

defines it a wasting with loss of strength, but without the hectic fever, &c.

That species of hectic fever which is common and fatal to old persons, was by the Greeks called marasmus.

MARATHRITES. Wine impregnated with fennel. MARATHROPHYLLUM. See Peucedanum.

MARATHROPHYLLUM. See Peucedanum.

MARATHRUM. See Peucedanum.

MARCHED. LITHARGE.

MARCHIONIS PULVIS. MARQUIS'S POWDER, prescribed in the Leyden Dispensatory. It is designed as Common-salt hath many peculiar qualities, some of

Common-falt hath many peculiar qualities, fome of which are as follow:

1. The fmallest crystals are cubic.
2. Fire applied to it makes it crackle; this crackling is called decrepitating, and feems to proceed from the air contained in it, which, being rarefied, burfts its way with a noise.

3. Muriatic acid is the only known folvent of gold, but not without being joined with the nitrous.

4. It is anti-putrescent from its acid.

5. A larger quantity is foluble in a given quantity of water than of any known falt; fix ounces of common falt may be diffolved in fixteen ounces of water.

6. Salt diffolved in water, of a heat nearly equal to that of the atmosphere, renders the water colder by

much.

7. Notwithstanding the coldness, the water in which falt is, will not freeze so soon as the fresher water.

8. If falt is made very dry, it attracts the moisture of the air considerably in the driest seasons; so that its gain in weight allows of profit enough, if bought dry, to fell it as it coft.

Salt is decrepitated by placing it over a charcoal fire in an earthen veffel, and ftirring it continually with a fpatula; as foon as it is hot it crackles, and when the noise

is over, it is decrepitated, dried, calcined, or burnt.

To depurate folt, diffolve it in fix times its quantity of rain-water, strain the folution hot through a close linen bag so often as to render it limpid, then exhale in a glass veilel one fixth part of the water, and fet it in a cool place, covered from the duft; if in three days a fediment is observed, pour off the water by decantation: if there is no fediment, the liquor is fit for proceeding with; and in this case evaporate to a pellicle, then set it in a cool place for twenty-four hours, in which time it will shoot into cubic crystals. Keep the first for chemical uses; evaporate the remainder, and proceed as before.

Spiritus Salis Marini Glauberi. Glauber's Spirit of SEA-SALT, now called Acidum Muriatica, MURIATIC ACID.

Take of dry fea-falt, ten pounds; vitriolic acid, fix pounds; water, five pounds; add by degrees the vitriolic acid, first mixed with the water, to the falt; then distil.

The specific gravity of this, is to that of distilled water, 1.170, to 1000. Ph. Lond. 1788.

The acid of the fea-falt is completely disengaged from it aliane basis by the more powerful acid of vitriol, and may now be called at it. may now be collected in a concentrated flate by diffillation; but as in this concentrated flate its fumes very difficultly condense, a little water must be added to pro-mote that effect. The marine acid rises in white sumes. mote that effect. The marine acid rifes in white fumes. The muriatic is the weakest of the mineral acids, but stronger than any of the vegetable kind; it requires a greater fire to distil it than that of nitre, yet it is more

readily diffipated by the action of the air.

It is chiefly used as a menstruum for other prepara-tions; but, when given as a medicine, the dose may be from ten to fixty drops, in water, or any other convenient liquor. It is an useful antiphlogistic, aperient, antiseptic, and diuretic. In putrid fevers it powerfully corrects the putrid state of the blood; so great it is subtilty that when taken internally it diffuses its efficacy to remote parts, especially the membranous. To its subtilty it is owing that it acts on the nervous coats of the flo-mach so as to be the best exciter of the appetite of all the mineral acids. In billious fevers this spirit corrects the faulty disposition of the bile. In dropsies, a few drops in each draught of the patient's drink, agreeably allays thirst, and promotes the discharge of urine. Linnaus says that if it is properly diluted and applied to chilblains, it radically cures them. If half an ounce of good bay-falt is dissolved in four ounces of water, and two drams of the muriatic acid well rectified be added, of this mixture a tea-spoonful given in a glass of water, will im- tions nine species; but they are not all in use as medi-

prove the appetite, and frequently ftop vomiting.

The muriatic acid combined with volatile alkalies, produces the officinal fal ammoniae; with the mineral fixed alkali it regenerates common fea-falt, called, fal marinus regeneratus febrifugus fal; with fixed vegetable alkali it produces the

Spiritus SALIS Marini Coagulatus.

Drop into the muriatic acid a ley of any fixed alkaline falt until all effervescence ceases; then evaporate the mixture to drynefs.

This is fomewhat sharper than the fea-falt; it also melts in water, and is fufed in the fire with more difficulty. Some call it fal marin. regenerat. fal digeflipum fylvii but very improperly, as its basis is not the same.

The acidum muriaticum combined with calcareous

earths, forms a very pungent faline composition, which difficultly assumes a crystalline form, deliquates in the air, diffolves both in water and in rectified fpirit of wine; this is called fal ammon. fixum, and fal muriatic. calca-reum. This falt is contained in a confiderable quantity in fea-water, and remains fluid after the crystallifation of its other faline matter; and is far more antifeptic than the perfect marine falt. It is faid to be diuretic and lithontriptic. The medicine commonly fold under the name of liquid shell, appears to be no other than a combination of this kind, confifting of calcined shells dif-folved in the marine acid. These combinations are made by mixing the calcareous earth with fal ammoniac, and urging the mixture with a gradual fire, until the volatile alkali of the fal ammoniac is either diffipated in the air or collected by distillation, and only its acid left incor-porated with the earth; so much of the earth as is faturated with the acid may be separated from the rest by clixation with water.

See Lewis's Mat. Med. Neuman's Chem. Works.

Dict. of Chem.

MARIPENDAM. It is a plant in the island of St. Domingo; its tops are distilled, and thus a water is obtained which is held in great effecm there against

pains in the stomach, &c. See Raii Hist.

MARISCA. An excrescence about the anus. See
Condylomæ. The piles in a state of tumor. The hæmorrhois tumens, of Cullen.

MARISCUM. See MERCURIALIS FRUCTICOSA, &c.

MARITUS. Authors who have wrote about the philosopher's stone, call sulphur the maritus or busband, and

mercury the uxor or wife.

MARJORANA. See Origanum.

MARMARYGÆ, from μαςμαιρω, resplendes. It is a variety of pseudoblepsis-imaginaria. Sparks or coruscations which seem to slash before the eyes, in some disorders of the head.

MARMOLARIA, i. c. Branca urfina. See Acan-

MARMOR. MARBLE is a genus in the order of cal-careous stones. The characters are, a calcareous stone, neither transparent, or figured, but capable of a fine polish, and beautifully coloured. When calcined, they become quick-lime; to which we refer for its medical uses.

MARMORATA AURIUM. EAR-WAX. See CERU-

MARMOREUS TARTARUS. The hardeft species

of human calculus

MARMORACEA VENENA. Such poisonous sub-flances are thus named which are fatal in doses not ex-

ceeding the quantity of a grain of wheat.

MAROCOSTINUM. An epithet for a cathartic extract originally made by Mindererus: marum and coftus are two of the ingredients in it, and those from which it is named. Lemery and Bates have named it piluke ma-recoflina. It was defigned particularly for purging off fe-rous humours, but is now neglected. See Pharmacop.

MAROTTI. Atall tree in Malabar, with leaves like those of the bay-tree, and a fruit which contains an oily kernel. The oil expressed from the kernel is variously used by the natives, and often medicinally. See Raii Hift.
MARRULLIUM. LETTUCE. See LACTUCA.

MARRUBIASTRUM. Boerhaave takes notice of fix species of this plant; but not any of them are remarkable for medical virtue. See BALLOTTE.

MARRUBIUM. HOREHOUND. Boerhaave mencines. It is alice a name for a species sage, of bastard dittany, Cardiaca, mother-wort, and some other plants.

MARRUBIUM ALBUM, also called prassum album.

Common white horehound. Marrubium vulgare,

or marrubium album, dentibus calycinis, fetaceis unci-natis, floribus albis, Linn. It is a hoary plant, with fquare ftalks and roundish unwrinkled leaves, fet in pairs on long pedicles, in the bosoms of which come forth thick clusters of whitish labiated flowers, in striated cups, whose divisions terminate in sharp points or prickles. It is perennial, grows wild in uncultivated grounds, and

flowers in June.

The leaves have a kind of aromatic fmell, but not an agreeable one; however, the difagreeable part is wholly diffipated after a few months keeping; their tafte is bitter, penetrating, diffusive, and durable in the mouth. Taken in large doses, they prove laxative. This plant is deserving of more attention than is given to it, for it is a very useful aperient and corroborant; in humoral afthmas, cachexies, mentitual suppressions, and several other chronical disorders, where is is not alone a cure, it is important in its assistance. Dr. Cullen disputes its virtues as a pectoral, and says in several cases it has been judged to prove hurtful, for its use in asthma and phthisis, and power in resolving indurations of the liver. The authorities of FORRESTUS, ZACUTUS, LUSITANUS, and CHOMEL he thinks very infusficient. Mat. Medica. A dram of the dried leaves in powder, two or three ounces of the expressed juice, or an insusion of half a handful of fresh leaves, are commonly directed as a

The dry herb gives out its virtue both to water and to fpirit. The expressed juice, gently inspissated to an extract, is the best preparation; the dole is from gr. x. to 3 is.

TER HOREHOUND. This is found on the fides of brooks, but is inferior in virtue to the white fort.

- NIGRUM FOETIDUM. See BALLOTTE. - VERTICILLATUM, called also marrubium Hispanicum. Galen's MAD-WORT. Stackys. The BASE HOREHOUND.

These are not in much esteem. See Lewis's Mat. Med. Neumann's Chem. Works.

MARS. So the chemifts call FERRUM, which fee.
MARS SACCHARATUS. See FERRUM. SOLUBILIS.

MARSAAS. See Bonduch Indorum.
MARSUPIALIS. See OBTURATOR externus and internus; though by fome, the two Gemini are fo named, as they refemble marfupium, a purfe. Hence marfupialis

MARTIS ESSENTIA, MARTIS OL. PER DELIQ. & See FERRUM.

MARTYNIA. This name was given by Dr. Houftoun to a plant, in honour of Mr. John Martyn, profeffor of botany in Cambridge. Miller mentions three fpecies; but they are not noted for any medical virtues.

MARUM, called also fampsuchus, clinepodium, mafticbina Gallorum, thymbra Hispanica. Jaca indica,
MASTICH THYME, or COMMON MARUM. It is the
thymus massichina, Linn. It is a low shrubby plant, with
small oblong leaves, pointed at both ends, set in pairs
without pedicles; at the tops of the branches stand woolly heads, containing small white labiated flowers, whose
upper lip is creek and cloven, the lower divided into upper lip is erect and cloven, the lower divided into three fegments; each flower is followed by four feeds, three legments; each nower is followed by four feeds, inclosed in the cup; it grows fpontaneously on dry gravelly grounds in Spain, and in such like foils it bears the ordinary winters in England. Its virtues are similar to those of the Syrian marum, but less powerful.

MARUM SYRYACUM, vel CRETICUM, also called majorana

jerana Syriaca vel Cretica, marum Coottufi, chamædrys the fternum, and is inferted into the maftoid process. This last portion Albinus makes to be a distinct muscle, and calls it clino-massionate, but is not divisible from the other without pedicles, of a dilute green colour above and hoary beneath; in their bosoms appear folitary, purple, labiated flowers, each of which are followed by four roundish feeds, inclosed in the cup. It is said to be a native of Syria. In our climate it does not well bear the native of Syria. In our climate it does not well bear the winters without shelter.

The leaves are bitter, pungent, and aromatic to the tafte; they yield a quick smell which excites sneezing. They are chiefly used in sternutatory powders; though they are attenuant, stimulating, deobstruent, and antisep-tic. It agrees very much with the canella alba in its

This plant lofes but little in drying; it gives out its active matter partially to water, but completely to fpirit; the watery infusions imell strong, but talle weak of the marum; the spirituous tastes strong, but smells weak. Distilled with water, it yields an highly pungent, volatile, effential oil, fimilar to that of feurvy-grafs, but stronger, and of a less perishable pungency; the remaining decoction is bitterish. Rectified spirit carries off only a part of the smell and pungency of the marum. See Raii Hist. Lewis's Mat. Med.

MARVISIUM. See MALVUSIA.

MASARANDIBA. A tree which grows in Brafil, which refembles our cherries in all respects, except that the fruit is not fo round, and appears milky.

MASCHALE. The ARM-PIT.

MASCHALISTER. A name for the fecond vertebra of the back.

MASLACH. A medicine of the opiate kind, in use among the Turks.

MASPETA, the leaves, or, according to fome, MASPETUM. the stalks of filphium.

MASSALIS, and Massariam. Mercury.
MASSÆ AD FORNACEM. See CANDELA FU-

MASSETER MUSCULUS, from μασισασμαι, to chew, or eat. The maffeter mufele. It rifes, on each fide, from the cheek-bone, and the interior part of the zygomatic process of the os temporis; and is inserted into the whole length of the lower jaw, particularly the angle. These muscles are also called, laterales musculi, manducatores,

mansarius musculus.
MASSICOT vel Masticot. It is calcined ceruss.

MASSICUT vel MASTICOT. It is CALCINED CERUSS.
There are three forts, viz. the white, yellow, and gold
coloured. Their difference is from the different heat to
which they are exposed. They are used by painters.
MASSOY. It is a species of bark mentioned by Ray.
It belongs to a tree. It is gratefully fragant and heating.
MASTICATIO. MASTICATION. The more we
chew our aliment the more agreeable it is to our ftomachs, and the more easily it is digested. Our food
being ground betwixt the teeth, and intermixed with
fally a and air, does by the action of the latter undergo faliva and air, does by the action of the latter undergo a farther diffolution; the warmth of the parts exciting the elafticity of the air, to expand and burit afunder the confining particles of the food, betwixt which it is ineluded. In the act of mastication the oily, aqueous, and faline parts of the food are intermixed the one with the

in one, which, by the folution of the faline parts with faliva, renders the food flavourable; but fuch particles as are more volatile and penetrating, being directly abforbed by the bibulous veffels of the tongue and checks, enters straight into the blood-veffels and nerves, so as to cause an mediate recruit. MASTICATORIUM. A MASTICATORY An apo-phlegmatifm in a folid form. See Apophlegma-

other; the fmell and tafte of different ingredients are loft

MASTICHE, Mastich, See Lentiscus MASTICHIA Odorata fundens, See Nux

VIRGINIANA MASTICHINA GALLORUM. See MARUM.

MASTICOT. See Massicot. MASTOIDÆUM FORAMEN. See STYLO-MAS-

TOID EUM FORAMEN.

MASTOIDÆUS MUSCULUS. The maffoid mufele. Dr. Hunter calls it sterno-mastoides, sterno-mastoidaus, and fays it rifes by two distinct portions from the sternum and that part of the clavicle which is articulated to

MASTOIDYNIA, from uaros, a nipple, or breast, and odure, pain. Sore or pained nipples. But more commonly pain in the breast from inflammation, and terminating in abscess. Dr. Cullen places it as a variety of phlogosis phlegmone. See INFLAMMATIO MAMMARUM MULIERUM.
MATALISTA. It is faid to be the third species of

jalap, called by the Indians matbaliftic.

MATER. MOTHER. In anatomy two membranes take this name, viz. the dura mater and pia mater. They are fo called by the Arabians, because they thought them the origin of all the other membranes of the body. See MATRES. In botany the herb artemifia is called mater herbarum. In chemistry, quicksilver is known by the name of mater metallorum.

MATER PERLARUM, called also concha margaritifera, concha mater unionum, concha valvis aqualibis. Mother of pearl. This is not the shell in which pearls are sound; but the pure pearl-like part, which possesses all the properties of pearls.

MATERIA MEDICA. By this is not only understood the materials afforded by nature, but also those which are prepared by art, such as minium, soap, potash, &c. with which a physician quebt to be acquainted. ash, &c. with which a physician ought to be acquainted as well as what relates to diet, medicines, and surgery, which are the three plentiful springs that furnish all the practical medicines requifite to the prefervation and refloration of health. Writers on the materia medica have endeavoured health. Writers on the materia medica have endeavoured to arrange the various articles of which it is composed into different classes; but a slight investigation will convince us of the inaccuracy of the plans that have been presented us, particularly some of the best, Cartheuser, Newman, Lewis, Gleditsch, Linnæus, Alston, and Vogel. Dr. Cullen has lately supplied us with a materia medica, the most judiciously arranged on which subject he says, "That as the study of the materia medica, is truly the study of the medicanal the materia medica, is truly the fludy of the medicinal virtues, fo the plan that arranges the feveral fubltances, according to their agreeing in fome general virtues, will be the best adapted to acquiring the knowledge of these, and will most readily inform the practitioner what different means he can employ for his general purpofe. It will also inform him how far the several similar substances may differ in their degree of power, and how far from the particular qualities affigned to each he may be directed, or limited in his choice. As it feems proper that every practitioner ought as far as possible to practife upon general indications; fo it is evident that his study of the materia medica is especially to know, the several means that can answer there. Such a plan must be most proper for giving instruction, and if while medicines are arranged, according as they answer general indications, the particulars be likewise thrown together, as far as posfible according to their fenfible qualities, and botanical affinities, this plan will have the advantage of any other that has been proposed for presenting together the subject, that ought to be considered at one and the same time and give the best means of recollecting every thing that relates to them." Mat. Med. Hence the whole of the fubstances are arranged under different heads, making the materia medica confift of fuch things, as supply nourishment, which are folid food and liquids, and such things as are taken along with them viz. condiments. MEDICINES which act upon the fimple folids, viz. aftringents, tonics, emollients, and erodents.—Upon the living folids, viz. ftimulants, fedatives, narcoties, refrigerants and antifpafmodics.—Those which act upon the fluids, viz. fuch as alter their fluidity.—Attenuants and infpifriz. Juch as alter their fluidity.—Attenuants and infili-fants,—THEIR MIXTURE; Correctors of acrimony in general, viz. demulcents; in particular, viz. antacids, ant-alkalines and antifeptics.—And laftly evacuants, viz. errhines, fialagogues, expectorants, emetics, cathartics, diuretics, diaphoretics, and menagogues.

MATERIATURA CAGENER CRECULATUM.

MATERIATURA

MATERIATURA. Caftellus explains morbi mate-riatura to be difeafes of intemperature.

MATHÆI PILULÆ. MATHEWS'S PILL. Starkey

was its author, but it was fold by Mathews for him as an universal medicine. It consisted of the soap of tartar, the JAW.

MAXILLA INFERIOR. The LOWER JAW, called also
MAXILLA INFERIOR. The LOWER JAW, called also

black hellebore, opium, &c MATLOCK WATERS. These are found at a place from whence they take their name in the county of Derby, where there are a number of warm fprings; Dr. Short fays they acquire their heat by passing through a bed of lime-stone, and another fort of stone which he calls croil-stone. The water of the bath, and all the other tepid fprings are exceeding clear, and has no fleam except in cold weather, neither does it throw up great bubbles of air like the Buxton water; and is about a dram in the pint lighter than common water.

On being mixed with fome drops of infusion of galls,

it ftruck a fine purple colour; fpirit of vitriol dropt into it caufed an effervefcence, and it became clearer; alkalies made it cloudy, and milky; a gallon of this water contains about 37 or 38 grains of folid matter, 12 or 13 grains of which are a faline matter composed of fea-falt, and calcarrous nitre (viriolated processes). and calcareous nitre (vitriolated magnefia), the reft calcareous earth, which, after calcination, had fome particles mixed with it which were attracted by the load-stone. This water feems to be a light chalybeate of a tepid temperature, which contains but a small portion of folid matter.

In most diseases for which the Bristol waters have

been prescribed, this water has been recommended: and its baths have been used for gout, rheumatism, and other complaints, where a tepid bath has been found fer-viceable. It is drank from one to five pints or six in the

day. Monro's Med. and Pharm. Chemistry, vol. ii.
MATRACIUM. A MATRASS. It is a bottle with a long neck, used in chemistry for macerating and digelling various ingredients in proper menstruums; they are also used as receivers, &c. and take different names from their different shapes. See CUCURBITA.

MATRES. So fome call the meninges of the brain, because they supposed them to be the origin, and as it were the mother, of all the other membranes of the body.

See DURA MATER.

MATRICALIA. Medicines appropriated to diforders

of the uterus

MATRICARIA, also called parthenium, febrifuga. Common feverfew, (or febrifuge), and often, but very improperly, FEATHERFEW. It is called matricaria, from matrix, because of its usefulness to the womb. It is called parthenium from wasβινος, a virgin, for the fame reason. It is the matricaria parthenium, Linn.

This plant hath firm branched stalks and roughish leaves, each of which is composed of two or three pairs of indented oval fegments, fet on a middle rib, with an odd one at the end, cut into three lobes; the flowers frand on the tops in the form of an umbel, confifting each of a number of short white petala fet round a yel-low disk, which is followed by small striated seeds. It is perennial, grows wild in hedges, uncultivated places, and flowers in June.

The leaves and flowers have a strong not agreeable fmell, with a bitterish taste, both which they communicate to water and to spirit. On distilling a large quantity of the herb a yellowish strong-scented effential oil is found on the furface of the water; rectified spirit carries off but little of the flavour of this plant in evaporation. The fpi-rituous extract is strong of the virtues of the plant.

The herb is warm, aperient, carminative, and bitter, and feems to deserve to be more employed than it is at present. It is in some degree similar to camomile; it favours a little of camphor and caftor. It keeps it virtues

for feveral years. An oil is made from it which is called ol. parthenia-cum. See Raii Hift. Lewis's Mat. Med. Neumann's Chem. Works. See also LEUCANTHEMUM TANACETI

MATRICARIA MARITIMA, i. e. Chamæmelum ma-

MATRISYLVA. WOODEINE, also ASPERULA, which

fee, and CAPRIFOLIUM.

MATRIX, from mater, the mother. See UTERUS. In botany it fometimes fignifies the pith of a plant.

MATURANTIA. MATURATIVES, or fuch medi-

cines as promote the suppuration of tumors.

MAUROMARSON. A name for HOREHOUND, most probably the black fort.

MAUZ. See MUSA.

MAXILLA, from pageau, to chew. The CHEEK or

mola. It is fituated at the lower part of the face : it is divided into the chin, fides, and processes. The chin is the anterior middle part; the fides are continued beyond that, till the bone bending upwards, forms the proceeds. On the middle part of the chin externally there is a transverse ridge, on each side of which the quadrati, or de-pressores labii inferiores, and the elevatores labii in-feriores, make a depression for their lodgment. On the internal part of the chin are three protuberances, to the uppermost of which the franum is tied. From the middle protuberance the geniogloffi have their origin, and from the lowest, the genio-hyoidei; below the last likewise the digastric muscles are attached to two sinuosities: at the lower and anterior external part of each fide of the maxilla inferior there is a small protuberance, whence the depressor labiorum communis has its rife; and nearer the upper edge is a longitudinal ridge, where the buccinator is inferted; inwardly, towards the superior edge of each fide, is a ridge, whence the mylo-hyoidei rife. The lower edge of the chin and sides are smooth, and are called the base of the lower jaw, the extremities of which are called the angles; the outer furface of these angles hath several inequalities where the maffeter is inferted, as the inner furface has where the pterygoideus internus is attached.

The processes on each side are two, viz. the anterior tharp process, called coronoidus apophylis maxillæ, round which the temporal muscle is inserted, and the posterior procefs, called condyloid, which is received into the glenoid cavity of the os temporis. The upper part, where the teeth are inferted, is called the alveolar

The foramina are two on each fide, one near the root of the proceffus internally, where a branch of the fifth pair of nerves with an artery and a vein enters; the other, external, at the edge of the chin, where the nerve

and the veffels come out.

—— Superior. The upper jaw, called also mala. It is composed of thirteen bones, viz. the offa nasi, offa unguis, offa malarum, offa maxillaria, offa palati, offa spongiosa inferiora, called also offa turbinata in-

feriora, and the vomer.

MAXILLARES SINUS. The MAXILLARY SI-NUSES are lined with a glandulous membrane, which feparates a mucilage very different from that of the joints.

- GLANDULE. The MAXILLARY GLANDS. Each is placed between the angle of the lower jaw and the os hyoides, and fills up the space between the belly of the digastric muscle, and the pterygoideus internus at the angle of the jaw. The anterior edge lies over the muscle called mylo-hyoideus, from whence comes off its duct, running close under the membrane of the mouth, and by the fide of the sublingual; and both comes as an and by the fide of the fublingual; and both open at an angle, close by the frænum of the tongue, just behind the incifor teeth. The duck runs from its upper anterior part, on the outfide of the genio-gloffi, and the infide

of the fublingual, and opens at the frænum linguæ.

MAXILIARIA SUPERIORA OSSA. These MAXILIARIA SUPERIORA OSSA. These form the greatest part of the upper jaws. That long process, which, rising from its superior and anterior part, grows smaller as it proceeds upwards, to make the side of the nose, is called nasais processus the nasal process. The alveolar process is that spongy part where the sockets for the teeth are formed. The palatinus process, palatine process, forms a great part of the basis of the nostrils, and the roof of the mouth. The orbiter process is very irregular, from the superior and anterior part of which, to near the extremity of the nasal process, a ridge protregular, from the tuperior and anterior part of which, to near the extremity of the nafal process, a ridge proceeds which forms about one third part of the outward circumference of the orbit. The bodies of the offa maxillaria superiora are entirely hollow, and form in each a large finus, called ANTRUM HIGHMORIANUM, which see.

MAXILLARIÆ ARTERIÆ. The MAXILLARY

ARTERIES.

The external maxillary artery is also called the genialis, genial, and the angular artery; it is a branch from the external carotid. It runs to the basis of the lower jaw, just close to the attachment of the masseter; it gives a a branch to the maxillary gland; it passes over the lower jaw; it goes up upon the buccinator; it gives off a branch

terie, labial arteries. The external maxillary then gives off branches to the nose, goes to the inner canthus of the eye, is lost upon the forchead, and communicates

with the temporal artery.

The internal maxillary artery is a branch from the external carotid; it rifes there from just at the origin of the temporal, and is diffributed to both the jaws; it is very much convoluted, and gives branches to all the deep-feated parts; one branch of it runs through the lower jaw, which is called the inferior maxillary artery, whilft the main trunk of it runs up to the bottom of the orbit, to the foramen, or orbitale lacerum inferius, winds about the antrum, and finks into the nofe behind the upper maxillary bone, and before the pterygoid process of the os sphenoides, to be spent upon the inside of the nose. MAXILLARIS INFERIOR NERV. The LOWER

MAXILLARY NERVE. It is the third branch of the fifth pair of nerves which pass from the head. It passes through the foramen ovale of the os sphenoides, where it gives off several branches to the muscles of the lower jaw, then throws a remarkable branch through the lower jaw to supply the teeth, which comes out at the anterior part of the channel, and branches upon the lip; from this, a capital branch is detached to the tongue, called the lingual, which runs between the two pterygoid mufcles, and passes to the top of the tongue, going along with the duct of the maxillary gland. It is this which gives off the chorda tympani. See Tricemini. gives off the chords tympani. See TRIGEMINI.

—— SUPERIOR NERV. The UPPER MAXILLARY

NERVE. It is the fecond branch of the fifth part of nerves which pass from the head. It passes through the foramen rotundum of the os iphenoides, where it throws off a branch to the palate, but the trunk paffes on in the fulcus of the upper maxillary bone, and goes to the upper jaw, and to the antrum there, when, having given off these branches, it comes out below the orbit, and is dis-

fused upon the face, particularly upon the nose, the upper lip, and cheek. See Trigemini.

MAYS. It is a kind of Indian wheat, of which Boerhaave mentions three species, but they are only varieties.

haave mentions three species, but they are only varieties from the fame feed, call Frumentum Indicum Turcicum.

MEATUS. A DUCT, OF PASSAGE. Any canal which conveys a fluid is a meatus. The auditory paffage is called meatus auditorius. The Eustachian tube is called meatus a palato ad aurem. The urethra is called meatus urinarius. The duct which conveys the bile from the gall-bladder to the duodenum is the meatur cyfticus.

MEATUS AUDITORIUS EXTERNUS. It is the exter-

nal passage to the ear. It begins at the hollow of the outer ear, and ends at the membrane of the drum. It was formerly a name for the Euftachian tube. See

AURICULA.

- Cæcus, i. e. Aquæductus. See Tuba Eusta-CHIANA.

MECAPATLI. Hernandus mentions four forts of farfaparilla, of which this one.

MECAXOCHITL. It is the fmall AMERICAN LONG-

MECCHA, BALS. BALM OF GILEAD. See BAL-SAMUM.

MECHOACANA ALBA. Called also rhabarbarum album, convolvulus Americanus, jalapa alba, bryonia alba Peruviana, MECHOACAN. Convolvulus mecheacanna, Linn. It is the root of an American species of convolvulus, chiefly brought from a province in Mexico of the fame name. It is cut into thin transverse slices like jalap, but it is larger, whiter, and fofter. This root was first brought into Europe in 1524, as a mild cathartic, which having but little taste or smell, was thought not to offend the stomach, but the black jalap hath superfeded its use. See Raii Hist. Tournefort's Mat. Med.

IBecac

MECON. The Greek name for a poppy.

MECONIS and MECONIUM. See PEP-

to the lower lip, which anaftomoses with the other on ninm is the juice of the whole plant, which is first the other side, and is continued to the upper lip, where it anastomoses likewise; there they are called labiales arin the guts of an infant as its birth. If this matter is not foon purged off, it occasions gripes, &c. A tea-fpoonful of true castor oil is an excellent purge in this case; but the first milk from the mother's breast is usually fufficient, if it flows in due time.

MEDENA. In Paracelfus it is a species of ulcer. MEDENA VENA. According to Castellus it is the

fame as Medinensis

MEDIA SUBSTANTIA VINI BECCHERI, i. e.

Tartar. See VINUM.

MEDIANA VENA. A remarkable vein on the infide of the flexure of the cubit, betwixt the cephalic and basilic veins, called by the Arabian funis brachii. It is

frequently opened in bleeding.

MEDIANUM. See MEDIASTINUM.

MEDIANUS. The MEDIAN NERVE. See CERVI-

MEDIASTINA. Inflammation of the mediastinum.

MEDIASTINÆ ARTERIÆ. The arteries of the mediastinum. They arise from the subclavian arteries, and are spread about the mediastinum.

— VENJE. The veins of the mediastinum. The

right comes out from the trunk of the superior vena case va anteriore, a little above the azygos; the left from the

fubclavia.

MEDIASTINUM, called also Medianum. It is the membrane called the pleura, which when it goes to the fpine, it proceeds therefrom, covers the lungs, paffes to the sternum, and makes a complete bag on each side; this duplicature forms the mediassimum. It is commonly faid, that at the sternum there is a cavity betwixt the laming of the mediastinum, and that any matter may be discharged, if lodged there, by a perforation through the middle of this bone; but this operation, if really required would be very uncertain; for the mediafinum does not commonly terminate along the middle of the infide of the sternum, but from above, all the way down it, inclines to the left-fide, fo that if an inftrument was thrust through the middle of the sternum, it would pass near an inch on one fide of this membrane.

The mediastinum contains in its duplicature, the heart, the pericardium, the vena cava, and the œsophagus.

MEDICA. The French call it St. Foine, and Foine de

Bourgogne. It is also called medica major, cochleata trifolium Burgundicum, falcata filiqua cornuta, fænum Burgundiacum, MEDIC FODDER. Pliny fays it is called medica, because it came from Media into Greece, when Darius Hystaspis invaded it. Boerhaave mentions twenty-eight species, but they are not noted for medical virtues. This kind of plant grows plentifully in Spain and the fouth of France, and is used as fodder for cattle.

MEDICA LUNATA. A species of medicago. MEDICAGO. SHRUB TREFOIL, called also citifus incanus filiquis falcatis Iunaria. Boerhaave mentions three fpecies of this plant, but they are not noted in medicine.

MEDICAMENTARIA. PHARMACY. It is the art

of making and preparing medicines. In an ill fense of of making and preparing medicines. In an ill fense of the word, it is the art of preparing poison. Pharmacy hath been distinguished into chemical and Galenical. The first consisted in many operations, in most of which fire was a principal medium, whereby extractions were made of the elementary parts of simples, which, in their separate state, had qualities different from those of the entire body, of which they were a part, and combinations of different simples formed, with qualities not found in any of the constituents. The second consisted in altering the form, or texture of simples, so as to in altering the form, or texture of fimples, fo as to render them fit to be taken, or applied, without at-tempting any change in their qualities; and in conjointo offend the stomach, but the black jalap hath supering them in compositions of various forms, wherein, seded its use. See Raii Hist. Tournesort's Mat. Med.

MECHOACAN NIGRA. A name of the jalap in common use. See JALAPPA. The Brasilians call it

The operations in pharmacy may be reduced to these

four kinds :

 Commensuration, or the adjustment of quantities.
 This is necessary, both for the due administration of sim-MECONIO, (Syr. e.) See Papaver Album.

MECONITES. See Ammites.

MECONIUM. Opium is the juice of the poppy head, emitted through incifions made therein. Meco-

administering of simples, and forming compounds. The instances in which this is practifed, are for the reduction rious significations. The white substance of the brain is of folid cohering bodies to powder, and of these that par-take both of solid and sluid, into pulp; for converting salts, and other soluble bodies, to sluidity, and, in other cases, the restoring them when sluid to their solid state. The feveral particular operations, by which thefe changes

are produced, are trituration, calcination, folution, exfic-cation, and cryftallization.

3. Extraction, or separation. This is here to be un-derstood in a general sense of the word, and not confined to the making extracts of the gums and refins of veget-ables. The different elements of many compound bodies having qualities and powers when separate and pure, which they are incapable of exerting when their force is supfied by the quantity, or counteracted by the repugnant qualities of other species with which they are conjoined, are by this means obtained; fuch are the acid spirits,

teflaceous earths, &c.
4. Composition. This is of two kinds; first, simple commixture. Secondly, menstrual combination. The first is where the different species are intended to act, each according to its proper nature, affording only an auxiliary, and independent power, to the execution of the final intention, without producing any mutual change of, or al-teration in each other. But this is the lefs important kind of composition, as fingle simples mostly will answer the end of fuch composition. The second of these produces many efficacious remedies, which have no adequate sub-fitutes, obtained by other means; such as the preparations of quickfilver, antimony, faline fubftances, &c. Its conftituent species which are commixed, acting on each other, so as to produce a new compound species, differing in its nature and efficacy from any of these of which it is composed.

To execute these several intentions, a variety of methods and their proper instruments are employed, and a number of lesser subservient intentions arise occasionally, and are furnished with their correspondent names, as calcination, crystallization, corrosion, depuration, digestion, distillation, expression, exsiccation, fermentation, fusion, incorporation, precipitation, pulverization, folution, fublima-

tion, &c.

The means of effecting pharmaceutic operations are of two kinds, viz. chemical and mechanical. By the che-mical is meant the natural media by which bodies can act on, and produce a change in each other, not explicable from the known general properties of matter, or laws of motion; these are the menstrual powers, and fire. By mechanical is meant artificial instruments. For brevity fake in speaking of these two kinds, the first is called media, the latter instruments.

MEDICAMENTOSUS LAPIS. The MEDICINAL

STONE.

R Litharg. bol. Gallic. alum. aa th fs. colcoth. vitra 3 iij. acet. acerrim. fb ij. m. & evaporet donec durus eft. This was formerly used in collyriums, &c. as an aftrin-

MEDICINA. MEDICINE. It is the art of preferving prefent, and reftoring loft health; more properly the last. It is usually divided into Physiologia, Hygiene, Pathologia, Semeiotica, and Therapeutica.

MEDICINA TRISTITIA. An epithet given to faf-

fron, on account of its cheering effects. See CROCUS.
MEDICINALES DIES, are those days in fevers which are neither critical nor indicatory, and on which it is pro-

per to administer powerful remedies, &c.

MEDINENSIS VENA, also Mediana vena. So the Arabians called the worm, which is known by the name of dracunculus. They called it vena, because they doubted its being a living animal, and Medianssis, from its being frequent at Median; and therefore Avicenna treats of it amongst abscesses. The vena Medianssis is mistaken by Le Clere, and many others, for another distemper described by the Arabians, viz. the Affectio Boylna. described by the Arabians, viz. the AFFECTIO BOYINA, which fee; but Actius plainly separates them; and Albucasis hath two chapters which distinguish them.

MEDITULLIUM, from medium, the middle, fee DI-Sometimes it fignifies the pith of vegetables.

MEDIUM. The SYRIAN BELL-FLOWER. Scc CER-

MEDIUM TESTÆ. See BREGMA.

called medulla, or the medullary part, to diftinguish it from the cortical: The continuation of the brain, &c. in the fpine, is called medulla spinalis; but properly medulla is the marrow in the bones.

The best time for collecting marrow is about autumn,

for at other times it is bloody and brittle.

If the marrow is viewed through a microscope, it seems a mass of small globules joined together like the roe of a herring. The dittinction which fome authors make betwixt a medulla and the fuccus medullaris is ufclefs, the marrow in human bones being always fluid. The membrana medulle not only lines the internal furface of the bones, but also divides the marrow into vesicles, or membranous bags, which are furnished with very fine minute vessels. The marrow is secured into these little membranes by the arteries, and the superfluous part is occa-sionally carried into the mass of blood by bibulous absorbent veins. The use of the marrow is to keep the bones firm and flexible, and from becoming brittle, which would foon be the case without it, as is often seen in pocky and feorbutic habits, where it is feparated in too fmall a quantity, and is, befide, bad in itfelf. The membrana medullæ hath a nerve which enters with the artery, and makes it fenfible.

Mr. Sheldon observes, that the marrow is never sensible but in a diseased state. The dropfy hath the power of removing it. No marrow is found in the fœtus, but a kind of gelatinous fluid in its place. Animal oil never transludes in the living body from the bones, nor does mararow prevent their brittleness, as it is merely adventiti-The bones of birds contain no marrow, but air.

MEDULLA CASSIÆ. The pulp of the caffia fifiula-

OBLONGATA. It is a continuation of the medul-lary fubiliance of the cerebrum and cerebellum, which passes downwards, and a little backwards to the foramen magnum occipitale, where it assumes the name of medulla fpinalis. It is rather of a depressed pyriform figure, though it is called oblong. It rises by two crura from the cerebrum, and two peduncles from the cerebellum; the enlargement formed by the union of these is called pons varolii, or tuberculum annulare, behind which is a stricture upon the medulla sblongata, and then an en-From the medulla oblongata, fprings the medulla fpinalis, and all the nerves that pals from the head, except the first and second pairs. If the medulla oblongata is injured, death is the consequence immediately. See Ce-REBRUM.

- SAXI. See LAC LUNZ. Also termed cerebrum oblongatum. It is the continuation of the medulla oblongata, from the foramen magnum occipitale, through the vertebræ of the neck, back, and loins. It is of different fizes: in the neck it is flat and broad, in the back, fmall; in the loins, large; and at last it becomes a bundle of nerves, which have the name of cauda equina, because when taken out, and extended in water, they refemble a horfe's tail. See Cerebrum.

MEGALOSPLANCHNOS, from μεγας, great, and σπλαίχτος, a bowel. It is a perfon who hath fome of the vifeera enlarged from a feirrhus, or other caufe.

MEGRIM. See Hemicrania.

MEIBOMI GLANDULÆ. Sec CILIARES GLAN-DULÆ.

MEL. } Honey. The first who is said to have ga-MELI. } thered beney, was Aristæus, a pupil of Chi-ron's. It is a sweet vegetable juice, collected by the bee from the flowers of various plants, and deposited in the cells of the comb; from which it is extracted either by spontaneous percolation through a sieve in a warm place, the comb being separated, and laid thereon, or by expression. That which runs spontaneously is purer than that which is expressed, a quantity of the wax, and other matters, being spored out along with it by the profiles. matters, being forced out along with it by the preffure. The best fort of honey is of a thick confistence, a whitish colour inclined to yellow, an agreeable finell and pleafant tafte; both the colour and flavour are faid to differ in fome degree, according to the plants which the bees col-lect it from. It is generally supposed that boney is merely the juice of the flower, perspiring and becoming inspis-6 L

proboscis, and carries it to be deposited in their waxen cells, to feed their young at prefent, and themfelves in winter; but it is certain that no other method of collecting this juice, befides that of the bees, affords us honey. The honey wrought by young bees, and that is permitted to run from the comb without heat or preffure, is white and pure, and called virgins beney. The beney of old bees, or that which is forced from the comb by heat or pressure from the wax, is yellow. Honey produced where the air is clear and hot, is better than that where the air is variable and cold. Where the bee-hives are fixed, there should be plenty of rofe-mary, thyme, lavender, violets, primrofes, marjoram, baum, fage, marygolds, &c.
Mel Despumatum. Clarified Honey.

Liquefy the boney in a water-bath, and as the feum arifes take it off. Thus the boney is purified from wax and all foreign matters. On continuing the heat, there arifes a confiderable quantity of aqueous fluid, impreg-nated with the fineft fmell of beney; the infpiffated refiduum diffolves in water and in spirit; and if treated with moift clay, as practifed by fugar-bakers for purifying fugar from its treacly matter, the uncluous parts of the boney may be feparated, and its pure fweet matter obtained in the form of a folid, faline, white concrete.

Hency is a natural foap, more aperient and detergent than the juice of the fugar-cane; it diffolves viscid phlegm, promotes expectoration; in which intention it is much affifted by acids; it gripes and purges fome, but this effect is prevented by boiling it; it is detergent, antiacrid, antifeptic, and laxative. But when heat and inflammation are confiderable, it is hurtful. It has been faid to be beneficial in some asthmatic cases, taken in the

quantity of fome ounces in the day.

The more fixed parts of vegetables, diffolved in watery liquors, may be thence transferred into boney, by mixing the boney with the watery decoction, or juice of the plant, and then boiling them until the aqueous parts hath exhaled, and the honey remains of its original confiftence, and hence the feveral mels and oxymels.

### Oxymel Simplex. Simple OXYMEL.

Take of clarified boney, two pounds; of diffilled vine-gar, a pint. Boil them in a glass vessel, with a gentle fire, to the consistence of a syrup. Pharm. Lond. 1788.

Honey yields by distillation an acid spirit, a brownish empyreumatic oil, and a caput mortuum. See Lewis's Mat. Med. Neumann's Chem. Works.

There are other compositions where boncy from the basis, as the mel scille, exymel scille. See Scilla. Mel Rose. See Rosa. Oxymel Colchici. See Colchicum. Mel Ægyptiacum. See Ægyptiacum unguen-

MELÆNA. BLACK BILE, or the disease, the mat-MELAINA. Ster of which is black bile. Also MELAINA NOSOS. The BLACK DISEASE, Hippo-

crates applies this name to two difeafes. In the first, the patient vomits black bile, which is fometimes bloody and four; fometimes he throws up a thin faliva, and at others a green bile; fometimes the mouth is inflamed with the matter that is thrown up, the teeth are fet on edge, and then what is vomited ferments on the ground. After vomiting the patient is easier, but he can neither fast, nor eat freely; for in the first case he is troubled with rumbling in the belly, and fourness of the faliva, and, after eating, he feels a weight and oppression of the viscera. with a pungent pain of the breast and back, as if inflicted by pins thrust therein; there is a pain in the side, a slow fever, head-ach, dim-fight, heaviness in the legs, and blackness in the skin. In the second, the patient is as described in the article MORBUS NIGER.

MELAMPODIUM. BLACK HELLEBORE. See HEL-

MELAMPYRO. A species of cryngo. See ERYN-

MELAMPYRUM. This name is compounded of μενας, black, and συρες, wheat, because it most resembles wheat. It is also called triticum vaccinum, cratæogonum. PURPLE COW-WHEAT. It is called cow-wheat, because it is very grateful to black cattle. It is found among corn in many countries, particularly Friefland and Flanders. Those who cat it are affected as if they had caten

fated thereon; and that the bee takes it up with its | darnel; but by use it is eaten without any such ill effect. There is a wild fpecies, which is called fatureia lutea fylveftris. See Raii Hift.

MELANAGOGA. Medicines which purge off black

MELANCHOLIA, from μελαινα, black, and χελη, bile.
MELANCHOLY; also delirium melanebolicum, erotomania, panopholia. It is the lesser degrees, or beginning of madness; or the highest degree of the hypochondriae disorder. See Mania. Dr. Cullen places it as a genus in the class neuroses, and order vesanize. It is but of one species, but he enumerates fix varieties, as arising from different circumstances, or attended with different states of mind, as groundless fear, a joyous spirit, love, religion, indisposition to action, impatience, weariness of life, notions of the nature of his species. The doctor defines it to be a partial infanity without a bad digestion. Cullen's First Lines, vol. iv.

MELANOPIPER. BLACK-PEPPER. See PIPER NI-

MELANTHIUM. Called also nigella, gith, Roman MELASPERMUM. Called also nigella, or FENNEL FLOWER. Boerhaave enumerates ten species, but they are not noted for their medicinal qualities.

MELANTORIA. See ATRAMENTUM SUTORUM.
MELAS. BLACK. An epithet applied to the colour,
and the skin, and also to some particular medicines. So
the vitilige is called when of a dark black colour. See alfo ALPHUS.

MELASMA. A fugillation or bruife which turns black. Black blotches on the legs, or other parts not exposed to the air. It is an ecchymosis when black. See

SUGILLATIO.

MELAZZO. See SACCHARUM.

MELCA. Galen fays it is a Roman word: and Constantine, in lib. xviii. De Agricultura, says, " It is nothing but milk reposited in an earthen pot, first well sea-foned with boiling-hot vinegar, by which means there was a separation of the thicker substance of the milk from the whey."
MELEGETA, or MELEGUETTA. GRAINS OF PA-

MELEIOS. A species of alum, which is made in the ifland Melos.

MELI. HONEY. See MEL.

MELIANTHUS, from LEA, boney, and and a forcer, because in Africa it transludes boney. Boerhaave takes notice of two species, but they are not noted for any medical quality.

MELICA. See MILIUM INDICUM.

MELICERIOLA. A fmall meliceris.

MELICERIS, from win, honey, and wises, wax. See Nevus. It is an encyfled tumor, whose contents re-semble honey and wax. Also called mellifavium. It is a fpecies of wen.

MELICRATON. See Hydromel. MELIGEION. Blancard fays it is a foetid oleous humor of the confiftence of honey, difcharged from ulcers complicated with a caries of the fubjacent bone.

MELILOTUS, from μιλι, boney, and λωθος, a kind of lotus. It is also called lotus fylvessiris, sertula campana, trifolium odoratum, trifolium caballinum. Com-MON MELILOT. It is the trifolium melilotus, Linn. It is a plant with fmooth, oval, striated leaves, standing three together on slender pedicles, and round striated branched stalks, terminated by long spikes of papilionaceous slowers drooping downwards, which are followed by short, thick, wrinkled pods, containing each one or two roundish feeds. It is annual, or biennial, and found in some in heart annual or biennial, and found in flower in hedges and corn-fields the greatest part of the fummer.

It is esteemed as resolvent, emollient, and anodyne, and participates of the virtue of camomile. Its tafte is unpleafant, fubacrid, fubfaline, but not bitter; when fresh it hath not much fmell, but in drying it acquires a ftrong one, of the aromatic kind, but not agreeable. The diffilled water of meliler, though of little fmell itfelf, remarkably heightens that of other substances. It formerly gave name to a plaster, to which its juice gave a green colour; but it is now feldom used. Boerhaave mentions twelve species, and Dale adds another, but none of them are now in much use.

me of them are now in mochanic.
Melilotus Major. See Lotus Ureana.
Melilo-

ALCHIMELECH. MELYPHYLLON. BAUM or BALM, or it is called MELISSA. I melissa, from μιλι, honey, because bees gather much honey from it. It is called aprastrum, from apis, a bee, because bees love it; erotion, mellifolium, melisophylium, from μελι, honey, and φολλος, a leaf; citrage, citraria, and cedronella, because its co-lour resembles that of a citron. It is the melissa officinalis, or meliffa Italica hortenis, racemis axillaribus ver-ticillatis, pedicellis fimplicibus, floribus exalis inferiori-bus fubiefilibus, Linn. It is a well known plant in our gardens; the stalks are fquare, the leaves are oblong, pointed, dark green, fomewhat hairy, and fet in pairs, in the bosoms of which come forth pale, reddish, labiated flowers, standing several together on one pedicle, with the upper-lip roundish, erect, and cloven, and the lower divided into three fegments. It is perennial, a native of mountainous places in the northern parts of

Europe, and flowers in June in our gardens. It is one of the mildest cordials and corroborants; hath a pleafant fmell, fomewhat of the lemon kind, and a weak aromatic tafte, of both which it lofes much in drying; a flight roughness, which the fresh herb is accompanied with, becoming at the fame time more fensible; the young shoots are stronger than the full grown stems. Infusions of the leaves in water smell agreeably of the herb, but have not much taile, though on being inspirated, they have a considerable quantity of a bitterifh auftere extract. Infusions of baum do not, like other aromatics, offend the head, as is complained of from fage, &c. Cold infusions in water, or spirit, are far better than the cohobated diffilled water, and are

the best preparations from the plant.
On distilling the fresh herb with water, it impregnates the first running pretty strongly with its grateful flavour. When large quantities are subjected to the operation at once, there separates and rifes to the furface of the aqueous fluid, a fmall portion of effential oil, which fome call ol. Syriæ, and others ol. Germanis. It is of a yellowish colour, and a very fragrant smell. It is a name alfo for feveral species of plants. See Moldavica, Molucca, Calamintha napeta, and Angelica.

MELISSA TURICA, called also meliffa Americana trifolia odore gravi, Campborafma, and Moldavica. TUR-KEY, or other CANARY BAUM, commonly called balm of Gilead. This species of baum is a native in the Canary ifles, and fearce bears the cold of our climes without shelter. It is commended as a strengthener of the stomach and the nervous system, if insusions of it are frequently drank.

Boerhaave takes notice of feven species, but these two are the most useful.

MELISSOPHYLLON. A name for meliffa, and black horehound. See BALLOTE.

MELISSO-PHAGUS. See MEROTIS.

MELITÆA, or Melitea Terra. Earth of Malta. It is a kind of white marle.

MELITISMOS. A linetus prepared with honey.

MELITITES. HONEY-STONE. It differs from the

galactites only in fweetness and colour. MELLAGO. Any medicine is thus called which hath the confiftence and fweetness of honey.

MELEGUETTA. GRAINS of PARADISE. See PA-

RADISE GRAINS. MELLIFAVIUM. See MELICERIS. MELIFOLIUM. BAUM. See MELISSA. MELLILOTUS. BIRD'S-FOOT-TREFOIL.

MELO. The MUSK MELON. It is called melon from Boerhave mentions seven species. They are only used in deserts. They come near to the qualities of the fermentable fruits called acids dulceis, and from the firmness of their texture, show the effects of too great acefcency; they should, therefore, be used mo-derately, especially by those who have weak digestive powers, and are best eat with fugar and some aromatics,

as ginger.
MELO INDICUS. See JACE BRASIL.

MELILOTUS MINOR CORNICULIS REFLEXIS. See called ficeides, ficus Americana. Miller mentions two species, but they are not remarked for any medical vir-

MELOCHIA, See Corchorus. MELOCIA.

MELOE VESICATORIUS. See CANTHARIDES. MELON. It fignifies an apple, the cheek, or a fheep, It is also a disorder of the eye, and is when it protube-rates out of the socket. Also the name of the MUSK-MELON. See MELO.

MELONGENA, called also mala insana, solanum po-miserum. MAD APPLE. It is through mistake that they have been thought to have been injurious, and fo to have been thus named. The Spaniards and Italians cat them both in fauce and in fweet-meats: their tafte fomewhat

refembles citron.

MELOPEPO. The squash. It agrees in all things with the pompion, except that its fruit is roundish, ftriated, angulous, cut into five parts, and full of flat feeds, which are affixed to a spungy placenta. It is called melopepo, because its fruits is nearly of the fize of a melon, and it partakes of the nature of a pompion. Boerhaave

mentions five species.

MELOSIS, from unan, a probe. The searching of any part with a probe; hence the name melotris. See

APYSOMELE.

MELOTHRUM. See BRYONIA ALBA.
MEMBRANA. A MEMBRANE. So called because it covers membrum, a limb. Winflow deferibes a mem-brane to be a pliable texture of fibres, difpofed or interwoven together in the fame place. They differ in thick-nefs, according to the fmallnefs of their fibres, and the number of their planes. These planes are called laminæ.

The cellular membrane. See CELLULOSA MEMBRANA. The mucous membrane is that covering of the furface of any part, whether within the body or more externally, which is exposed to any extraneous matter, such as the ikin, internal membrane of the mouth, noie, lungs, fto-

mach, cesophagus, intestines, urinary passage, &c.

The common membranes, called the common teguments, are the featf-skin, the true skin, and the cellular membrane: those which cover particular parts are, the dura mater, pia mater, pleura, peritonæum, pericardium, periofteum, membrana propria mufculorum, a vafeular those which form the tubes, as the flomach, inteffines, arteries, veins, gall-bladder, urinary bladder, &c.

MEMBRANACEI. Inflammation of membranous

parts.

MEMBRANÆ. The MEMBRANES. Those so called in midwifery. See Involucera.

MEMBRANOLOGIA. MEMBRANOLOGY. It treats

of the common integuments, and of particular mem-

MENDONI. See METHONICA.

MEMBRANOSUS MUSCULUS. So called from its large membranous extrusion. See Fascia Lata.

MENDOSA SATURA. The squamous suture in
the skull: or bastard sutures, from mendax, counterfeit.

MENDOSÆ COSTÆ. The spurious Ribs.

MENINGÆ ARTERIÆ, h. s. Arteriæ duræ matris. MENINGES. The membranes of the brain, which are two; the dura mater, and the pia mater; called also cilamides. They are called meninges, or matres, from being the supposed origin of all the other membranes. See DURA MATER

MENINGÆÆ ARTERIÆ. See DURÆ MATRIS

MENINGOPHYLAX, from μπιγξ, a membrane, and 2020 aorsu, to guard. An inftrument deferibed by Celfus, ib. viii. cap. 3. contrived for guarding the membranes of the brain, whilft the bone is rasped, or cut, after the operation of the trepan.

MENINX. A MEMBRANE. But in anatomy it fig-

nifies the dura and pia mater.

MENORRHAGIA. Excessive or extraordi-NARY DISCHARGE of the MENSES. called also metror-rhagia. Dr. Cullen places this genus of difease in the class pyrexiæ, and order hæmorrhagiæ. He distinguishes six species. I. Menorrhagia rubra. See MENORRHAGIA under MELOCCATUS, I from melo, an opp'e, and cac-MELOCCARDUUS. It tus, a thifile, because it re-fembles an apple, and is nourished with spines. It is also Menorrhagia abortus. When sloodings happen to pregnant women, or miscarriage, called also merequired for its own nourishment, in order that there may be a provision for the preservation of health; therefore, lochialis. See Lochia. 4. Menorabagia vitiorum. When the appearances of the menfes are unufual, as by an ulcer, &c. 5. Menorrhagia alba. See Fluor Al-Bus. 6. Monorrhagia nabothi. When there is a ferous discharge from the vagina in pregnant women.

MENORRHAGIA DIFFICILIS. Difficult mensiruation, as when attended with pain, &c. See MENSES DEFI-

MENSA JOVIS. See VERBENA.

MENSES, from mensis, a month, called also catamenia, mensis ua. They are the periodical discharges of blood from the uterus, from about the age of fourteen to about fifty. In warm climes they appear at about eight or nine years of age; but, with us, not until after twenty in many inftances, although ufually at the age of from thirteen to fifieen. The quantity is supposed to be from about four to ten ounces; however, in this there is not much certainty. In some women this discharge continues to flow two days, in others three or four, or perhaps a week. In warm climes the quantity of the difcharge may be from two to twenty-four ounces. About their first eruption the quantity is small; but in women arrived to maturity it is more. Thus the more lax the constitution, the larger the discharge is, other circumftances favouring. Lean women, and those who abound with blood, evacuate more than such as are fat, and of a colder temperament; and those who are addicted to luxury and idlenefs, lofe a larger quantity than those who use much exercise, and live on a poor, or a spare diet. Usually, the sooner they appear, the sooner they disappear. Commonly this evacuation continues in this country to return until from the forty to the forty-eighth, or fometimes the fiftieth year.

The menses slow chiefly from the uterus, and some-times from the vagina. Some have the slux by other passages, at by periodical vomiting, coughing of blood from the lungs, bleeding from the hamorrhoidal veins, nofe, &c. But when the menstrual blood passes by these preternatural passages, it is generally productive of va-

rious diforders.

The phænomena of the menfes feems to depend on this. The arteries of the uterus are large, and their areas are to the thickness of their membranes, beyond the usual proportion; on the contrary, the veins in the uterus are fmall, and their coats stronger in this part than in many others. This mechanism, and the increase of blood, generated in a month, will explain the phænomena. The heat of the body is in proportion to the craffamentum of the blood; this craffamentum increasing adds to the vital heat, which diftending the veffels of the whole body, those arteries which are the weakest, will be diffended in the greatest proportion, and thus pores, that before only admitted of ferum to fill the cellular membrane, may now admit of red blood. Thus the increased blood mechanically discharges itself, which being done, the heat of the body is diminished, the arterial coat contracts fufficiently to reftrain the blood from passing any longer that way. Drs. Friend and Haller, both affert that this discharge is from a plethora, and support their opinion with proper anatomical remarks. Boerhaave joins them in the fame, as does many other phyficians of the greatest eminence; though others confider it only as a law of the animal economy, and do not pretend to account for it any further. As they think it inexplicable, however, the theory is attempted to be fupported by anatomical observations, the symptoms that precede, and those that follow this evacuation. Before the discharge the breafts swell, the head achs, the eyes have their veins full of blood, the back achs, and there are other symptoms of a febrile state; the due quantity being excreted, nature is reduced a little below a state of health, as is evident by the languor and dispiritedness. The symptoms of defective menses are the same as are confequent in an inert state of the fluids.

Dr. Hunter observes, that the immediate cause is al-lowed to be an accumulation of blood, which bursting the fides of the veffels, is discharged; that after the discharge, the veffels collapse and unite again, till the next accumulation, and fo on every month. And, the final cause seems plainly to be this: that the female constitution is fitted for making more chyle and blood than is

perfluity becomes necessary; and though this is commonly by the uterus, yet it hath happened by other passages. Again, that the redundancy of blood which makes the catamenia, was, by nature, designed for the foetus, appearas still more probable from their first appearance when women are fit to bear children, and their ceafing when they are

One of the latest opinions respecting the cause of the menses is, that they depend upon a topical congestion. Dr. Cullen adopts this opinion, and in his lectures observes as follows. "The growth of the body depends upon the increase of the quantity of fluids giving occasion to the distension of the vessels, and thus producing the gradual evolution and full growth of the whole system. This evolution does not happen equally in every part of the body at the fame time, but fuccessively, according to the different fize and density of the several vessels determined by the original stamina. Thus the upper parts of the body first acquire their natural fize, and then the lower extremities. By the fame constitution it seems to be determined, that the uterus of the human species should not be considerably evolved, till the rest of the body is nearly arrived at its full bulk. But as the veffels of every part, by their diftention and growth, increase in dentity, and give thereby more resistance to their further growth, at the fame time, by the fame reliftance, they determine the blood in greater quantity in the parts not yet equally evolved. By this means the whole of the fystem must be fuccessively evolved, till every part is brought to that degree of diffension which is necessary to bring them to a balance with respect to density and resistance with one another. Upon these principles, there will be a period in the growth of the body, whence the vessels of the uterus will be distended till they are in balance with the rest of the fostern, and their acquiring many he shall be the fostern. the fystem; and their constitution may be such, that their diftention may proceed to far as to open their extremities, terminating in the cavity of the uterus, fo as to pour out blood there; or it may happen, that a certain degree of diffension may be sufficient to irritate and increase the action of the veffels, and thereby to produce an hæmor-rhagic effort, which may force the extremities of the veffels with the fame effect of pouring out blood. In either way, he accounts for the first appearance of a flow of blood from the uterus in women. In order to this, he does not suppose any more of a general plethora in the fystem, than what is constantly necessary to the successive evolution of the several parts of it; and he proceeds upon the supposition that the evolution of each particular part. must especially depend, upon the plethora, or increased congestion, in its proper vessels. Thus he supposes it to happen with respect to the uterus; but as its plethoric flate, he observes, produces an evacuation of blood from its veffels, this evacuation must empty those veffels more especially, and put them again into a relaxed state with respect to the rest of the system. This emptied and relaxed state of the vessels of the uterus will give occasion to a new congestion of blood in them, till they are again brought to that degree of distension, that may either force their extremities, or produce a new hamorrhagic effort, that may have the same effect. Thus, an evacuation of blood from the uterus being once begun by the caufes before mentioned, it must, by the operation of the same causes, return after a certain period, and must continue to do so till particular circumstances occasion a consider-able change in the constitution of the uterus. What determines the periods of these returns to be nearly in the space of a month, he cannot exactly explain; but supposes it to depend upon a certain balance between the vessels of the uterus and those of the other parts of the body. This must determine the first periods; and when it does so, it can be understood, that a considerable increase or diminution of the quantity of the blood in the whole fyftem will have but little effect in increasing or diminishing the quantity distributed to the uterus. It may also be further observed, that when the evacuation has been repeated for fome time at regular periods, it may be sup-posed that the power of habit, which so readily takes place in the animal fystem, may have a great share in de-termining the periodical motions of the uterus to be with great regularity, though in the mean time confiderable

changes may have happened with respect to the whole that nature should discharge that whereof she needs a

MENSES deficientes. Defective MENSES, vel Dyfme-

When during the age in which the returns of the menfer are regular, they approach with difficulty, and are dif-charged sparingly, they are faid to be obstructed; but when they do not appear at all, they are suppressed. See

At the approach, as well as at the exit of the menfes, the body is fingularly fusceptible of unnatural and uneasy impreflions, and fuffers much from them. The menfes are retarded by cold, poor blood, forrow, fudden frights, exceffive evacuations of any fort, aftringents, violent thocks, as by a fall, &c. after which last they fometimes never In general, the cause is, a defect of crassamentum in the blood, or a stricture of the uterine vessels. This difcharge is interrupted naturally during pregnancy, but this is not always the case, for some have them three months, fome fix months, and fome the whole time of gestation, but in less quantity than at other times, except it be in the few instances of women who never have them but during their being pregnant. For the most part, the menfes are interrupted during the time of giving fuck, though many women have a return about the third or fourth month after delivery, and almost all have them

again by the ninth or tenth.

Befides the undue discharge, most of the symptoms of a chlorosis attend also, both when the menses are obstructed and suppressed. In many instances the blood hath difcharged itself by other outlets. Sometimes an epilepsy is an attendant symptom, a loss of memory, a dropsy of the womb, or a scirrhous tumor there, and innumerable other

The intestines and the uterus receive their nerves from the fame pair; it thence happens that if the one is discased the other fuffers; hence the naufea, fickness, vomiting, bad digeftion, &c. when the uterus is difordered.

It is a general received opinion, that many of the difeafes of women are owing to a suppression of the menses, but it may, perhaps, be doubted whether this will so often prove the cause, as the consequence of other disorders; as in general, for the removal of obstructions, there is little more to do than to remedy the particular indisposition of body under which the patient may labour. Hence different and opposite methods of cure will be required, ac-cording to the habit of body and nature of the symptoms.

The indications of cure will then be as the caule, e. g. r. If a fanguine plethora produces the diforder, lesen it. 2. If there is a defect of good blood, it must be improved. 2. If there is a detect of good blood, it must be improved.

3. If fpasms in the uterine vessels are present, they must be remedied.

4. If there is a natural ill conformation of the vessels, palliatives only can be proposed; but in every other case, one indication may suffice, viz. in other respects restore the body to its healthy state, and this evacuation will spontaneously slow; if a sinal cessels hath not arrived and which will manifest no morbid effects.

If a viscidity, or too great a cohesion in the blood, be the

If a viscidity, or too great a cohesion in the blood, be the cause, bleeding and attenuants will be necessary; the heat in this case may occasion a stricture in the vessels great enough to resist the discharge, and here the kali acetatum is an admirable affiftant; it may be given from 3 fs. to 3 ii. three times a day; if the larger dose runs off by stool, it must be lessened. Nitre, borax, and black hellebore, are

alfo proper in these circumstances.

The most frequent cause is a defect in the quantity of good blood, an attendant of which is generally a redundancy of vapid serum. Here antimonial romits, repeated as frequently as this kind of evacuants is required; aloetic purges, joined with calomel, the tinct. aloes, or pilul. ex aloe cum myrrha, are excellent both as alteratives and evacuants; bitters, aromatics, and ferrugineous preparations, finish the cure, if moderate and duly repeated exercise, and a cordial nourishing diet accompany them. In every inflance of obtructed menfes, if the woman is weakly, endeavour first to increase her strength; when that is effected these natural discharges will usually return; if they then do not, a prudent use of emmenagogues, that is, of stimulating forcers, may be admitted; but until the constitution is filled with good juices, it would be absurd to force away what is already very deficient; or to expect

fupply.

A fluggish viscid ferum may be corrected by repeated doses of tinct. aloes, or pilula ex aloe cum myrrha, given so doses of tinch. aloes, or pilula ex aloe cum myrrha, given so as to keep the bowels free from costiveness, or by pills of foap and aloes. If these promote the piles instead of what is intended, their effect is falutary, as this is the best substitute for the uterine flux: but, quitting the aloes on this account, the best deobstruent will be some preparation of iron; or if it heats too much, the black hellebore may be chosen. The breathing of some patients, is affected by the use of iron, but the addition of a little gum ammoniacum seldom fails to relieve: the following form in general will succeed. R Limat. mart. 3 vi. gum. ammon. sapon. Venet. ad 3 ii. pulveris aromat. 3 i. aloes ammon, fapon. Venet. ad 3 ii. pulveris aromat. 3 i. aloes

5 fs. fyr. q. f. f. p. mediocres. When the head-ach and fickness in the stomach affects these patients, Dr. Alfton extols the use of borax; but advifes it to be given in a fluid state, for he thinks that the

ftomach cannot diffolve it.

The rubia tinctorum in powder, from half a feruple to half a dram twice a day, has by fome been efteened in these cases, very efficacious.

Bleeding is almost universally the first step taken in these cases; but except there is a manifest redundance of good blood, this evacuation is rarely to be admitted. If the operation is performed, the best time for it is just before the expected approach of the menses.

Vomits are best administered just before the menstrual return; and if a tenseness of the uterine vessels is suf-

pected to concur to this difcafe, the patient should fit fo as to receive the vapours of warm water up the vagina, during the operation of vomiting medicines.

Pedilaves are often of peculiar efficacy as affiftants to other means, and may be used during bleeding whilft a vomit is working off, or two or three times a day during the symptoms of the menses approach.

Volatile falts diluted with water, and received in the

form of vapour up the vagina, powerfully promote the menfes if prudently used.

Opiates are often very ufeful to promote those spalms which are excited by a painful approach of the menfes, and which too often retard or obstruct their course; it is and which too often retard or obstruct their course; it is true that little is to be expected when there is a natural ill conformation of the vessels; but when pain, or spas-modic symptoms are attendant, ten grains of the pil. sa-ponac. or five of the pilula opii, may be repeated, as the urgency of the case requires, until the difficulty is sur-mounted. When spassins increase, convulsions fometimes come on, and increase both difficulty and dangers, here come on, and increase both difficulty and danger; here, befides gentle opiates, the use of galbanum, camphor, ballam of Peru, and other antispassmodies, are required. Cullen's First Lines, vol iii. p. 32. 48.

MENORRHAGIA. An IMMODERATE FLUX of the

MENSES, called also menorrhagia rubra. A too long continued, or a too frequent return of the menses, or any such discharge as reduces the patient's strength during the inter-

vals of their return, is called immoderate.

Women with foft lax habits, those who have frequently miscarried, and those with whom are ease and plenty, are the most frequent subjects of this complaint; not but more

vigorous conflitutions may fuffer this way, and do, when fubjected to violent exercise, &c.

Among the variety of causes, the chief is, a weakness of the vessels, particularly of those through which this discharge is made; in some instances the morbid cause is, an acrimony and thinners of the blood; in others the occafional caufes are, violent exercife, fudden violent paf-fion, abortion, a plethoric habit, particular medicines or diet, &c.

An approaching hamorrhage of this kind is usually attended with a lassifue of the whole body, a pain in the back and loins, tension of the hypochondria, paleness of the face, horripilation of the skin, constriction of the pores, &c. And the companions of this flux, are all those symptoms which are the consequents of impoverished

Whilst the pulse is good, bleeding in the arm may be advised, and the greatest advantage attends this operation if performed on the first day of the menses appearing. But if the strength is greatly reduced, the same means must be read to check a second of the same means must be used to check as were used to promote this evacuation

As to the means of relief during the prefent excellive flux, what is faid in the article ABORTUS may ferve as a

full direction here:

If the menles are too copious in pregnant women, the true and only remedy is opium, which must be given until the end is obtained; if the pulse require it, blood may be taken from the arm; or, if great pains attend in the belly, and it is evident that they are of the spasmodic kind, clyfters, in each of which is a dram or more of the tinct. opii, will be the most proper means of relief.

MENSES coffantes. The MENSES departing.

It usually happens that this periodical discharge ceases betwixt the age of forty and fifty; with fome women it happens earlier. Sometimes it quits them all at once, but generally its departure is gradual, and this time is often critical with the fex. Pains in the head and about the loins, nausea, the fluor albus, and many other troublesome and fometimes dangerous fymptoms, are attendant; but they generally yield to frequent bleeding in fmall quantities, and aloetic purges with chalybeates. The diet should now be rather sparing, except the strength of the person is remarkably diminished, and the exercise should be fomewhat increased. See Medical Obs. and Inq. vol. v.

MENSIS PHILOSOPHICUS. A PHILOSOPHICAL OF CHEMICAL MONTH. This is not one determined space of time, for, according to some, it is three days and nights, others fay it is ten, and there are who reckon it thirty and

even forty days.

MENSTRUA. The menfes in women, and the bleed-

ing piles in men.

MENSTRUUM. This is a barbarous term, and denotes a body which, when artificially applied to another, divides it fubtily, fo that the particles of the folvent re-mains thoroughly intermixed with those of the folvend. This folvent was called a menstruum, because the chemists in its application to the folvend first used a moderate fire for a philosophical month, or forty days; hence arose the name of a menstrual solvent, and at length was called barely a menstruum. It is fynonymous with the word

Many bodies are called menstruums that are hard, and cannot act in that state as folvents; and hence menstruums are divided into the folid and fluid kinds; and however these may be subdivided, all the kown mensiruums may be divided into four kinds. I. Those which act by a mechanical power. 2. Those which act by a mechanical, mixed with a repellent power. 3. Such as act by a mutual attraction between the parts of the solvent and solvend: of this kind there are many. 4. Those which act by the joint concurrence of the several properties included in the three preceding: of this kind there are the largest num-

It is supposed by many, that the solution of bodies is principally affected by their pores, and that to the diffe-rent form or size, or both, of these pores, it is owing that different menstruums diffolve, or are required for different bodies. But not to mention the various errors which attend this notion, the following appears to be the more probable, if not real cause of solution. The solvent probable, if not real cause of foldation. The leavest putting the parts of the folvend in motion, hurries them along with itself: in the same motion of fluidity, unites itself with them, as water puts salt into a like motion of fluidity, and so unites itself. And as a solution is effected by a union of the solvent with the solvend, so, when this union is destroyed, and the solvent forfakes the solvend, the fluidity ceases, and the solvend is separated from the mensiruum or solvent, and thus precipitation is effected. In short, the whole of solution and precipitation arises from the greater or lefs disposition to unite or recede, that is in respective bodies, to each other; thus gold is dissolved in aqua regia, but not by spirit of nitre; not because it is

when its defect is owing to a defect of good blood; disposed to unite with the one and not with the other: for these are vitriolic acids, the bark, bitters, aromatics, and chalybeates, which must be given in the intervals of the other solvend, to which the said solvent is more powerfully disposed to unite be added, the solvent quits its solvend, and unites itself to the added one, leaving the first to pre-

The principal menstrua in pharmacy are water, acid fpirits, vinous spirits, alkaline salts, and oils. See the Dict. of Chem. article Solution. Boerhaave's Che-

MENTAGRA; called also impetigo. An obstinate tetter which appeared in Italy during the reign of Claudius Cæsar. It began upon the chin, and extended itself over the face, even to the eyes, and descended to the neck, breast, and hands. In order to the cure, a cautery was applied to some convenient part, and made to penetrate the bone. It is also the name for the museus pulmomatical.

MENTALES. Alienation of the judgment, in which

the functions of the mind are diffurbed.

MENTASTRUM. See MENTHA PALUSTRIS.

MENTHA. MINT. It is a perennial herb with fquare stalks, ferrated leaves fet in pairs; and spikes of monope-talous flowers, each of which is cut into sour sections, and followed by four feeds inclosed in the cup. Boerhaave enumerates thirteen species; Dale adds four more to them: and of these we have fixteen which grow naturally in England. It is also a name given to many plants. See CALAMINTHA PALUSTRIS AGERATUM, BALSA-

MITE PULEGIUM VULGARE, and CERVINUM.

MENTHA AQUATICA, also called filimbrium, menthafirum, mentha rotundisolia palustris. Red water-mint. Its leaves are fomewhat oval, and are fet on pedicles; the

flamina are long, flanding out from the flowers.

— CATARIA, called also mepta cattaria, cataria, gattaria, mentha felina, NEP, or CAT-MINT. It is the nepta cataria, Linn. It grows wild in hedges and on dry banks; it is moderately aromatic, of a ftrong smell, refembles a mixture of the cataria. bles a mixture of mint and pennyroyal, and participates of their virtues. Cats are fond of it when it is a little withered; whence its name. See Raii Hift. Plant. Cullen's Mat. Med. Tournefort's Mat. Med. Lewis's Mat. Med. See CALAMINTHA PALUSTRIS.

- CORIMBIFERA MINOR. See AGORATUM.

- PALUSTRIS FOLIO OBLONGO, called alfo mentaffrum birfutum, auricularia. HAIRY WATER-MINT. It has long hairy leaves, which have no pedicles, and broad fpikes of flowers. Both these species, which are called water-mints, grow on mountainous grounds and marfhes, and on the banks of rivers, and flower towards the end of fummer; their fmell is lefs agreeable than that of spear-mint, their taste more bitter and pungent; the fecond fort approaches a little towards pennyroyal; they yield much less effential oil than the spear-mint, and their virtues, though similar to it, are much inferior in

The bairy water-mint is supposed to be auricularia, planta Zeylanica, or EAR-WORT; celebrated by Marloe

for the cure of deafnefs.

- PIPERITIS. PEPPER-MINT. Mentha piperita, or mentha floribus capitatis, foliis ovatis petiolatis, staminibus corolla brevioribus, Linn. It hath acuminated leaves on very fhort pedicles, and the flowers fet in fhort thick fpikes or heads; it is a native of this kingdom, and, fo far as is known, of this kingdom only; it is plentifully raifed in gardens on account of its ufefulness; its natural foil is a watery one, but it does not, like the other species, lofe much by being cultivated in any other.

It hath a more penetrating fmell than the other mints, a stronger and a warmer taste; it is pungent and glowing, like pepper, and finks, as it were, into the tongue; at first its taste is hot, and afterwards it feems to be cold and fomewhat nitrous. It is of great use in statulent com-plaints, hysteric depressions, &c. it exerts its activity as soon as it is in the stomach, disfuses a glowing warmth through the whole system, yet is not liable to heat the constitution near so much as might be expected from the great warmth and pungency of its tafte. Its qualities are with great probability afcribed to the camphor, the experiments of Gaubius have proved to be largely contained in it.

It readily and ftrongly impregnates either water or spirit

by infusion; in distillation with water, it gives over a large quantity of essential oil, of a pale greenish yellow colour, growing darker-coloured by age, and possesses a great degree of the smell and pungency of the herb; as much of this oil as can be suspended in rectified spirit of wine is fold under the name of the essence of pepper-mint.

The decoction which remains after distillation, like that of the other mints, is a bitterish substituting out. For the the other mints, is a bitterish subastringent. For the water, spirit, and oil, see MENTHA SPICATA.

MENTHA SPICATA, called also mentha fativa; mentha wulgaris, HART-MINT, and common spears mentha vulgaris, HART-MINT, and common spears. Weston. Mentha stiva, Pharm. Edinb: Mentha spicata. Weston. Mentha viridis, Linn. or mentha spicis oblongis, soliis lanceolatis nudis ferratis sessibilities; staminibus corolla longioribus, Linn. It hath oblong, narrow-pointed leaves, joined close to the stalk, and small purplish slowers, standing on long spikes on the tops. It is a native of warmer climes, it is common in our gardens, and sowers in June. climes; it is common in our gardens, and flowers in June

It hath a strong, agreeable, aromatic fmell, and a bitterifh, roughish, moderately warm taste; it is restringent, carminative, and stomachic; in vomitings and weakness of the stomach few simples have an equal efficacy. If an infusion of mint in water is drank with milk when acidity prevails in the stomach, the milk will not coagulate there.

Mint is faid to act very powerfully upon the part to which it is immediately applied, and therefore confiderably to the stomach, invigorating all its functions. It acts particularly as an antispasmodic, hence relieves pains, and colic depending upon spasm. In cases though dependance in the control of the ing on inflammatory irritation in the ftomach itself, or in other parts of the body, it aggravates the disease, and though in some cases it relieves vomiting, it here contributes to increase it. The best mode of giving it is in in-

The juice expressed from the leaves retains the bitter-ness and restringency, but not the aroma of the mint, in which its chief virtues lies. This herb is very little hurt by keeping, drying, or being exposed to any moderate de-gree of heat. In five or fix hours cold water extracts a rich tincture from the mint; a longer maceration extracts the groffer parts, and fo is lefs agreeable. Hot water more readily extracts its virtues, but boiling diffipates the aroma. Infusions and tinctures contain the whole virtue of the mint, the oil and the distilled water only the

That water is the most agreeable that is distilled from newly dried mint; and it is further improved by the method below for making a tincture of mint. In diffillation with water an effential oil arifes, which is of a pale yellowish colour, changing by age to a reddish one; and in quantity about an ounce from ten pounds of mint, which for this purpose should be gathered when the flower is put out: this oil is strong of the mint, but not so agreeable.

Dry mint digested in spirit of wine, either with or with-

out heat, gives out all its virtue, without its difagreeable parts. Spirit takes up very little in diffillation. An extract made with spirit possesses the concentrated virtues of a large portion of dried leaves. Fifteen grains of the refinous extract obtained from either the common mint. or pepper-mint, by means of spirit of wine is equivalent to fix drams of the dried herb. The spirituous tincture mingles with watery liquors without precipitation or turbid nefs; but spirituous liquors impregnated with its pure volatile parts by distillation, turn milky on the admixture of water.

# Tindure of MINT.

To a pint of mint water, add half an ounce of the dried leaves of mint; let them stand four hours in a warm place, and then strain.

MENTULA. A name for the penis.
MENTULA ALATA. A fubmarine plant which grows

on rocks, and refembles a bird's wing. See Penna.

MENTULAGRA. A diforder of the penis, induced
by a contraction of the erectores mufculi, and caufing impotence.

MENTUM. The CHIN. It is the anterior protube-rance which terminates the lower part of the face, from whence it runs to the neck; the under part of the chin is termed its balls, and it is diftinguished from the throat by a transverse fold, which reaches from ear to ear; in the middle of the chin is a dimple.

MENTZ. An abbreviation of Index Nom. Plant. Mul-

tilinguis Opera Christ. Mentzelii.

MENTZELIA. A plant growing in Jamaica, but of no medical virtue. It is so called by Father Plumier, in MENYANTHES. MARSH-TREFOIL, OF BUCK-BEAN. See TRIFOLIUM PALUDOSUM:

MEPHITIS. A POISONOUS EXHALATION, or what what the Latins call by this name. The word mephiticus mephitic, fignifies flinking, particularly fuch an ill fmell as arifes from brimftone and water, or a damp or ftrong fmell from corrupted water mixed with earth and brimfund stone. And as the word mephitic is used to signify noxious, hurtful, injurious, &c. it is applied to fixed air. See

MERCURIALIS. MERCURIAL. An epithet of all preparations of mercury. But the atra bilis is also called the mercurial humour; and the diseases thence generated are named mercurial diseases. In botany it is the name for bonus Henricus, tota bona, lapathum unclusium falia triangulo, blitum, chenopodium, ALT-GOOD, ENGLISH MERCURY. It is a plant with triangular leaves, covered underneath with a whitish uncluous meal; it hathstriated hollow stalks, partly erect and partly procumbent, bear-ing on the tops spikes of small imperfect flowers, each of which is followed by a small black feed, inclosed in the cup; it is perennial, grows by the road fides and in wafte grounds, and flowers in August. The leaves are mucilaginous and a little fubfaline, are used as emollients in clysters and fomentations. The young shoots are eaten in spring; they loosen the belly and promote urine. See Raii Hist.

Mercurialis fruticosa incana testiculata, called marificum thelygonon. Children's Mercury.

This is only met with in the gardens of the curious;

and flowers in fummer. In Barbary it is used against difeafes peculiar to women.

— Mas, called also mercurialis testiculata, merc. spicata, merc. femina. French mercury. It is the mercurialis annua, Linn. This plant hath smooth glossy leaves, and branched stalks. The slowering plants called female, and those which produce seeds, are both annual, and grow wild together in shady uncultivated grounds.

The leaves have no remarkable finell, and very little tafte; they possess a small degree of mucilage, and a little faline matter, but are not much used.

- Sylvestris, called also cynocrambe, caning braffica, perficaria filiquefa, merc. montana, WILD MERCURY, DOG'S MERCURY. It is the mercurialis perennis of Linnæus. It is one of the poisonous plants found in Great

The diffilled water contains as much of the volatile part of the herb as it can retain: however, by infusion it takes any of the simple diffilled waters may be much improved, and when required the waters distilled from one vegetable may be the menstraum for a different one.

The College of Physicians order from the mentha fativa, and mentha piperitis, a water and a spirit, which they make as follows. Take of spear-min, or pepper-min dried, one pound and a half, water sufficient to prevent an empyreuma: this forms the aqua. To make the spirit, to the same quantity of the herb they order one that it is perennial, being larger, having rough leaves, and the stakes not at all branched.

The root is creeping, light-coloured, and sibrous: The stake is a foot high, erect, green, juicy, and unbranched. The leaves are oval, ferrated, pointed at the extremity, placed in pairs opposite to each other. The slowers grow at the tops of the stake, and in thin stender spikes out of the alæ of the leaves, and are of a light green. The slowers are of two kinds, male and semale. The storems are of two kinds, male and semale. The slowers are of two kinds, male and semale. The slowers are of two kinds, male and semale. The slowers are of two kinds, male and semale. The slowers are of two kinds, and in thin slender spikes out of the leaves, and in thin slender spikes out of the leaves, and The root is creeping, light-coloured, and fibrous. The

This plant is faid by many writers to be injurous both to man and beaft. Dr. Withering fays, in his Botanical Arrangement, that it is dreffed like fpinach; it is very good eating early in the fpring; that, probably, when the feafon is more advanced, and the plant is become more acrimonious, its ill qualities takes place.

The fymptoms that are faid to be produced by it are a naufea, vomiting, and afterwards comatofe fymptoms.

Its ill effects are removed as in the cafes of poisonous

mulhrooms. See AMANITA and VENENUM.
Wilmot's Observations on poisonous Vegetables.
MERCURIUS. QUICKSILVER. See ARGENTUM

MERCURIUS ALE. SUBLIMAT. See MERC. COR. ALB. - ALKALIZATUS. ALKALIZATED MERCURY, now called bydrargyrus cum creta. QUICKSILVER with CHALK; called also Ethiopus albus. R Hydrargyri pur. 3 iij. powdered chalk, 3 v. rub them together until the globules difappear. Ph. Lond. 1788. It is observed that mercurials prepared without a faline ftimulus, are most efficacious in intermittents, rheumatisms, pleurisies, and peripneumonies, after due bleeding and purging. In other cases it operates more gently than when reduced to a calx by fire, or is prepared with acids; but is less certain in its effects. In general it is an excellent method of adminiftering mercury as an alterative; its dose may be from three grains to as much as the patient can bear, without pro-moting any sensible excretion. If it runs off by stool,

opium is better than aftringents for reftraining it.

— CALCINATUS, merc. præcip. per fe. CALCINED QUICKSILVER, now called hydrargyrus calcinatus.

This preparation is directed by the London College to

This preparation is directed by the London Conege to be prepared by exposing a pound of quickfilver in a slat-bottomed glass cucurbit, to a heat of about 600 degrees, in a fand bath, till it becomes a red powder. By agitation, or by triture, similar effects are produced on the mercury, and in much less time. This red powder gripes more than the calomel, than which it does not appear to be a better medicine, though, in some few instances, it agrees better with the patient. The dose is from gr. ss. to gr. ii. mixed with opium.

CHEMICORUM. See ARGENT. VIV.

CINNABARINUS. See CINNAB. FACTITIA.

COR. SUB. See MERC. CORROS. ALB.

CORALLINUS, arcanum corallinum. This was a preparation in the Difpenfatory of the London College, directed with a view to render the merc. nitratus ruber a more mild internal medicine; but no confiderable advantage is obtained by the process, it is therefore re-

jected. — CORROSIVUS ALBUS. The WHITE CORROSIVE MERCURY, called also merc. cor. sublim. filum senicale, gas siccum sublimatum; now hydrargyrus muriatus, MURIATED QUICKSILVER. The modes of preparing this medicine are various; but the College of London direct quickfilver and vitriolated acid, two pounds of each; dried fea-falt, three pounds and a half; mix the quickfilver with the acid in a glass vessel, and boil in a fand heat, till the matter is dried; mix the matter when cold, with the fea-falt in a glass vessel; then fublime in a glass cucurbit, with a heat gradually raised;

laftly, let the fublimed matter be separated from the scorize. Pharm. Lond. 1788.

The greatest part of this mercurial preparation that is used in England, is brought from Holland and Venice; and, as many suspect its being adulterated with arfenic, Dr. Lewis gives the following method of detecting the fraud: "take any quantity of the fuspected subite correfive mercury, powder it in a glass mortar, and mix it well with twice its weight of black flux and a little filings of iron; put the mixture into a crucible capable of holding four or five times as much; give a gradual fire until the ebullition ceases, then hastily increase it to a white heat; if no fumes of a garlic smell be perceived during the procels, and if the particles of iron retain their form, without any of them being melted, we may be fure that the mix-ture contains no arfenic." Neumann denies the poffibility of this preparation being adulterated with arfenic, and observes that instead of their fubliming together, the arfe-nic will attract the marine acid to itself, and the mercury will be revived, instead of sublimed, into the form which this preparation is found in.

The white correstve mercury is a violent medicine; it

corrupts and destroys all parts of the body that it touches

more speedily than white arsenic does.

Aq. Phagedenica. R Hydrargyri muriati 3 fs. aq. calcis. f. lib. i. m. The lime renders it more mild.

Internally taken, it produces the most violent symptoms, such as thirst, sickness, vomiting, pain, dejections of blood and mucus, swoonings, convulsions, gangrene, and death. When an imprudent dose hath been given, a vomit of the zincum vitriolat. fublimatum should be inftantly given, to promote the fpeedieft difcharge; after puking two or three times, give a folution of fixed alka-line falt in pure water, and let it be copiously drank; then folutions of gum arabic may be plentifully given with pro-per doses of opiates; for opium is the best corrector of the active preparations of mercury

Notwithstanding the ill effects of imprudent doses of this medicine, its usefulness is not equalled by any other known means for relief in many disorders. In the venereal difease it is one of the most useful preparations of morcury, if not the most so: in carcinomatous or phagedenic ulcers, in cancers and cancerous indispositions, obstinate cutaneous disorders, eachectic ulcers, dimness of fight, and glandular fwellings, it hath fucceded in many instances when all other known methods of cure have failed but, as its power is great, fo it must be long continued in very small doses. The following solution of it may ferve as a general form, and the dose may be proportioned to the nature of the cafe and the conflitution of the patient.

R Hydrargyri muriati, gr. xvi. fpt. vini rect. fb i. m. From half a table spoonful the dose may be increased as diferetion will admit, and may be repeated two or three times a day. The best vehicles are watery and mucilagi-nous liquors; the most common in venereal complaints is the decoct, farfaparil, but, in want of it, folutions of gum arabic will be very useful; these and such like may be used in all other cases, if the prescriber directs no other as more particularly adapted to relieve. See Dict. of Chem. Lewis's Mat. Med. Neumann's Chem. Works. Lond. Med. Obs. and Inq. vol. i. p. 365, &c. vol. ii. p. 70, &c. MERCURIUS COR. SUB. See MERC. CORROS. ALE.

- DULCIS SUBLIMATUS. DULCIFIED MERCURY SUBLIMATE. Now called CALOMELAS, and when the fublimation hath been repeated to ten or twelve times, it

hath been called panacea mercurii.

It is the merc. cor. alb. dulcified by the addition of crude mercury. The London College directs the proportion of nine ounces of purified quickfilver to twelve ounces of the muriated quickfilver; rub them together, till the globules difappear, and fublime; in the fame manner re-peat the fublimation four times, afterwards rub the matter into the finest powder, and wash it by pouring on boiling distilled water. Ph. Lond. 1788. And in the Augustan Dispensatory one sublimation only is required.

The dulcification intended in this process is wholly ef-

feeled by the combination of fo much fresh mercury as may fully fatiate the acid of the white corrolive mercury, and therefore, though triture and digeftion promote the union of the two, they are not properly the cause of the dulcilication; and, as to sublimation, it rather tends to difunite these substances, so need not be so often repeated as according to some directions is required.

By whatever method this medicine is prepared, if it proves too acrid, by boiling it in water the acrid parts will be diffolved and feparated; after the boiling, let the water be poured off, the powder dried, and then sublimed again. To every ten ounces a quart of water may be al-

lowed for boiling it in.

The marks of sufficient duscification are, its being perfectly insipid to the taste, and indissoluble by long boiling in water; and whether or not that the water hath taken up any part of the mercury, may be known by dropping into the liquor a ley of any fixt alkaline falt, or any volatile alkaline fpirit; if the decoction hath any mercurial impregnation, it will grow turbid on this addition; if otherwife, it will continue limpid. To prevent deception here, let diffilled water be always used. If this calentel is rubbed on gold, and it turns pale only, and not white, the dulcification is sufficient; or if the dulcified mercury turns black on being mixed with lime-water, it is duly averaged. prepared.

Calonel is very subject to confiderable variation in its efficacy, &c. as a medicine, from the different management in its preparation. The disadvantages, which attend

it, which Dr. Swediar hath favoured us with, by translating it from the Acta Stockholm, where it was inferted by Mr. Scheele, to whose ingenuity the world is indebted both for it and other chemical materials. Mr. Scheele's

process and observations on it are as follow:

" Half a pound of quick/ilver, and the fame quantity of nitrous acid are to be put into a fmall veffel with a long neck, the mouth of which is to be covered with paper. The veffel is then to be placed in a warm fand-bath; and after a few hours, when the acid affords no figns of its acting any longer on the quickfilver, the fire is to be increased to fuch a degree that the folution may nearly boil. This heat is to be continued for three or four hours, taking care to move the veffel from time to time, and at last the folution is to be fuffered to boil gently for about a quarter of an hour. In the mean while we are to diffolve four ounces and a half of fine common falt in fix or eight pints of water. This folution is to be poured boiling into a glafs veffel, in which the above mentioned folution of quickfilver is to be mixed with it, gradually, and in a boiling state also, taking care to keep the mixture in constant motion. When the precipitate is settled, the clear liquor is to be drained from it, after which it is to be repeatedly washed with hot water till it ceases to impart any talke to the water. The precipitate obtained by this method is to be filtered, and afterwards dried by a gentle heat. This is the hydrargyrus muriatus mitis of the London Pharmacopecia, only they order four ounces of fea-falt, inflead of four ounces and a half.

"It might be supposed, that when the nitrous acid ceases to effervesce with the mercury, it is saturated with it: but this is far from being the case; the acid, when the heat is increased, being still able to dissolve a quantity of it; with this difference, however, that the quickfilver at the beginning of the process is calcined by the acid, but afterwards is dislolved by it in a metallic form. In proof afterwards is diffolved by it in a metallic form. In proof of this we may observe, that not only more elastic vapour arises, but also that by adding either fixed or volatile caustic alkali, we obtain a black precipitate; whereas, when the folution contains only calcined quickfilver, the precipitate becomes yellow by such an addition. If this black precipitate is gently distilled, it rises in the form of quickfilver, leaving a yellow powder, which is in fact that part of the mercury that in the beginning of the operation was calcined by the nitrous acid.

"The boiling of the folution for about a quarter of an

hour is necessary, in order to keep the hydrargyrum nitra-tum in a diffolved state, it being much disposed to crystal-lize. In general, some of the mercury remains undiffolved; but it is always better to take too much than too little of it, because the more metallic substance the solu-

tion contains, the more hydrargyrus muriatus mitis will be obtained.

" It is necessary to pour the mercurial folution into the folution of falt by a little at a time, and cautioufly, fo that no part of the undiffolved quickfilver may pass along with it. Two ounces of common falt are fufficient to precipitate all the mercury; but then it may eafily happen that fome fuperfluous mercurius corrofivus attaches it-felf to this precipitate, which the water alone is inca-pable of feparating complelely. This is undoubtedly the reason why mercurius precipitatus albus is always corrofive. I have found that common falt possesses the same quality as fal ammoniae, viz. that of dissolving a great quantity of mercurius corrolivus. I therefore employ four ounces and a half of common falt, in order to get the mercurius corrofivus entirely separated.

" If we confider the manner in which hydrargyrus muriatus mitis is obtained in the dry way, by fublimation, we shall not find it difficult to give the rationale of this

new process.
"Mercurius corrosivus albus is a middle falt, consisting, as is well known, of marine acid combined with calx of mercury. This falt is capable of diffolying a good deal of quickfilver in a metallic form; but for this purpose the most minute particles of each must be reciprocally mixed. This happens, when by means of heat they are both converted into vapour. The fame thing occurs in the above mentioned process. The folution first spoken of contains the calx mercurii and quickfilver divided into the most minute particles. If to this folution we add marine acid,

it are greatly removed by the following method of making | or (to fave the expence) common falt, the marine acid will unite with the calx of mercury, and the refult of this union will be a true mercurius corrofivus albus; and as the folution contains quickfilver in its metallic flate, this will immediately attract as much of the mercurius corrofivus as is necessary to faturate it, and by this means a real mercurius dulcis will be produced, which, from its being infoluble, will be immediately precipitated."

"The following facts are proofs that this precipitate is a good mercurius dulcis: 1ft. It is entirely tafteless. 2dly. I have fublimed it, and examined what afcended in the beginning, and which ought to have been corrofive, if the precipitate had contained any thing of the nature, it being well known that mercurius corrolivus afcends fooner than mercurius dulcis; whereas, through the whole of the fublimation, what arose was a pure mercurius duleis, exactly like that which is obtained in the common manner. 3dly. I have mixed this precipitate with one fourth part of quickfilver, and fublimed it, upon a fuppolition that if it contained too much mercurius corrofivus, it would be able to unite with more quickfilver; but so far was this from being the case, that the quickfilver was not diminished in weight by the experiment. 4thly. It is known that caustic alkali and lime-water give mercurius dulcis a black colour: the fame thing happened with mine. The black colour is no other than quickfilver, divided into very fine particles.

"That the process I have been describing, is more advantageous than that which is ufually adopted, I cannot doubt; because, 1st, this mercurius dulcis can be prepared with less difficulty, with less expence, and without em-ploying corrosive sublimates. 2dly. As there can be no danger of its being in any degree corrofive, provided it be fufficiently edulcorated, it may always be given with fafety. 3dly. The operator is not exposed to that noxious duft, which in the old method arises during the trituration of the corrolive fublimate and quickfilver. 4thly. This is much finer than the common mercurius dulcis, it being impossible to make the latter equal to it in this re-

fpect, however long it may be triturated."

Of all the preparations of mercury calomelis the most frequently used; it is attenuant, and powerfully dissolves the sluids; it gently stimulates the folids; and all the virtues attributed to the simple mercury, this preparation of it eminently possesses; none of the mercurials that enter the blood are fo little disposed to affect the first passages. The dose is from gr. i. to 3 i. according to the intention; but

five or eight grains are rarely exceeded.

MERCURIUS DUPLICATUS PHILOSOPHICUS. See

- EMETICUS FLAVUS. The YELLOW MER-CURIAL EMETIC, now called bydrargyrus vitriolatus, vitriolated quickfilver; also called turpethum minerale:
TURBITH MINERAL. This is another preparation of
mercury, which is given in the London Dispensatory.

Take of purified quickfilver, vitriolic acid, of each a
pound; mix in a glass vessel, and heat them by degrees,

until they unite into a white mass, which is to be per-fectly dried with a strong fire. This matter on the affufectly dried with a trong fire. This matter on the affu-fion of a large quantity of hot diffilled water immediately becomes yellow, and falls to powder. Rub the powder carefully with this water in a glass mortar, after the powder has subsided, pour off the water; and adding more distilled water several times, wash the matter till it becomes inspid. Pharm. Lond. 1788.

But to the direction given there, it may be added that the best method of edulcorating it is by impregnating the water intended to be used in its ablution, with a determined proportion of fixed alkaline falt; for by this means the washed turbith will not only turn out greater in quantity,

but will be more equal in strength.

The yellow emetic mercury is a powerful emetic; it, like other mercurials, will excite a falivation: in robust habits it hath been used in leprous disorders and glandular obstructions. As an emetic it hath been given to ten grains, but it is best if given in smaller quantities, and joined with ipecacuanha. Half a grain, or a grain, given every or every other night, hath been productive of the best effects in the worst degrees of the venereal disease, in obstinate rheumatisms, and ulcers that were difficult of cure. It is a powerful medicine, but yet does not appear to exceed the other less violent mercurials, except in par-

6 N

ticular inftances; tuch as where, from a peculiarly in the patient's conflitution, it is particularly favoured in its ef-MERGEN. CORAL. fects:

MERCURIUS MORTIS. See MERCURIUS VIT A.

· PRÆCIPITATUS, also called corrosivus, and coralatum, though now named HYDRARGYRUS NITRATRUS RUBER. Red nitrated quickfilver. Pharm. Lond. 1788.
RUBER. RED PRECIPITATE. The London College directs to take of purified quickfilver and nitrous acid each a pound; muriatic acid, one dram by weight; mix in a glass veffel, and diffolve the quickfilver in a fandbath; then raise the fire, till the matter is formed into red cryftals. Pharm. Lond. 1788. It may be observed that the marine acid disposes the

mercurial calx to affume the bright fparkling red appearance which is admired in it, and which, though no advantage as a medicine, is efteemed a mark of its goodness and firength. As foon as it hath acquired this colour, it should be immediately removed from the fire, or it will

foon lofe it again.

This preparation is fometimes mixed with minium and vermilion, but then the bright colour is destroyed. If only minium is added, it may be detected by laying a little of the suspected correstive mercury on a very hot iron, for thus the mercury will pass off in fumes, and the lead will be left behind.

The red nitrated quickfilver is only used externally; it destroys sungous slesh, and if finely powdered and mixed with the unguentum refinæ slavæ, it is an excellent digestive for soul ill-conditioned ulcers; it brings on a laudable digestion when a thin fanies is discharged from them: from one to two feruples may be mixed with an

ounce of the ointment.

TATE MERCURY, now called CALX HYDRARGYRI WHITE CALX OF QUICKSILVER. The London College directs the following method of preparing it: take of muriated quickfilver, fal ammoniac, water of kali, each half a pound; diffolve first the fal ammoniac, afterwards the muriated quickfilver in diffilled water, and add the water of kali; wash the precipitated powder until it becomes insipid. Phar. Lond. 1788.

Great care is required left more of the fixed alkali be added than is necessary, for then the precipitate, instead of being white will be yellow. This preparation is al-most constantly confined to external uses. Half a dram or two fcruples of it, added to an ounce of pomatum, is used as an elegant cure for the itch; the fame quantity may be diffolved in two ounces of a thick decoction of linfeed, as a liniment for curing chancres when fituated on the glans penis, or on the infide of the prepuce; a rag being dipped in it may be applied to the glans, and then the pre-

puce may be drawn over it.

This precipitate is adulterated with ftarch, and with white lead. The first is discovered by its being gluey on being diffolved in a fmall quantity of water; the fecond may be detected by putting a little into a crucible with one third of its weight of alkaline falt; make them red-hot, and continue until no fumes arife; then take in the refiduum, and if it does not melt in water, it is bad.

PRÆCIPITATUS DULCIS. Ph. Lond. 1721.

HYDRARGYRUS MURIAT. MITIS.

--- PRECIPITATUS PERTSE. See MERC. CALCIN. - SACCHARATUS. SUGARED MERCURY.

Take of pure quickfilver and brown fugar-candy of each half an ounce; of the oil of juniper, fixteen drops; grind them well in a mortar, until the quickfilver disappears. The defign of this feems to be for the convenience

of giving mercury in a draught.

VITE, also called angelicus pulvis, mercurius mertis, pulvis Algarothi. The MERCURY of LIFE.

Take any quantity of the butter of antimony, dilute it

plentifully with pure water, and thus the reguline part of the antimony will be precipitated in the state of a white powder, thus named.

After the precipitation of this powder, and duly washing it in several waters, it possesses no degree of the marine acid; but is a calx of antimony, that is constantly of the fame strength, and therefore preferable to the glass of antimony for making the emetic tartar with.

See these and several other preparations under the ar-

ticular instances; such as where, from a peculiarity in the ticle Mercurius, in the Dict. of Chem. Lewis's Mat.

MESANG DE VACCA. See Bezoar Bovinus. MESAR FON, perapaion, from peras, medius and apaia, belly. The mesentery. Hence its arteries and veins are called mesaraic vessels.

MESARAICA, vel MESARAICA MAJOR VENA. The MESARAIC OF MESENTERIC VEIN. It is the continuation of the vena portæ ventralis. See PORTÆ VENA. It bends towards the fuperior mesenteric artery, sends off two veins, then runs up over that artery, and accompa-nies it in those portions of the mesentery and mesocolon which belong to the small intestines, the coccum and right portion of the colon; as it runs down it forms an arch obliquely, like that of the artery, which is also ramified on the convex and concave sides. It very much accompanies the mesenteric artery, and is branched out in somewhat the fame manner.

MESARAICA MINOR VENA. See HAMORRHOI-

DALIS INTERNA VENA.

MESENTERICÆ ARTERIÆ. The MESARAIC OF

MESENTERIC ARTERIES.

The upper mefenteric artery rifes very little below the coeliac. The aorta, a little above its division, gives off the inferior mesenteric to the left side upon the mesocolon, the lowest branch of which goes to the extremity of the anus, and forms the hamorrhoidal artery. The upper branches anastromose with the superior mesenteric. These two are azygous. The upper mesenteric branch forms a large arch in its course from the right side to the left of the mefentery, and from its convex fide there goes out many branches to the intellines, where they communicate by reciprocal arches, &c. The branches which go out from the concave fide are but few; they spread themselves in the mefocolon, colon, &c.

— GLANDULÆ. The MESENTERIC GLANDS The

lymphatic glands in the melentery are larger in young than in old subjects; and, if not the proper seat of the evil, they are always affected in that disease.

MESENTERIUM. The MESENTERY, from prose, middle, and essen, an intestine. It is thus named from its being, as it were, in the middle of the intestines, called also epichordis; mesaraeon. It is a duplicature of the peritonæum, connected by a cellular membrane, expanding and receiving the guts as in a fling. It begins loofely upon the loins, extending to all the inteflines except the duodenum; but that part of it which belongs to the great guts is called mesocolon. It prevents the intestines from twifting, and keeps them in their proper places. It fuftains the arteries, veins, lymphæducts, and nerves, in their paffage to and from the inteffines.

Many diforders are spoken of by different writers, as taking their rise from the mesentery; but Dr. Hunter says, that it is rarely diseased, and then its glands, which are fometimes difordered in children, are not affected fo frequently as is suspected. Riverius, in his Prax. Med. lib. xiii. hath a chapter on obstructions in the glands of this membrane, in which he observes that the causes and cure are the same as when this disorder happens in the liver-

MESENTERITIS, called also enteritis mesenterica. In-FLAMMATION of the MESENTERY; see INFLAMMATION. Dr. Cullen makes it a species of Peritonitis, which see; and calls it Peritonitis Mesenterica. See In-FLAMMATIO.

MESERION. See LAUREOLA FOEMINA.

MESIRE. A disorder of the liver, mentioned by Avicenna, accompanied with a fenfe of heaviness, tumor, in-flammation, pungent pain, and blackness of the tongue. MESOCOLON, from passes, the middle, and xanso, the colon. See Mesenterium.

MESOGASTRION. It is the fubftance on the con-cave part of the ftomach, between the orifices, which attaches it to the adjacent parts. See OMENTUM.

MESO-

MESOGLOSSI. The mufcles called geniogleffi.
MESOMERIA. So Ruffus Ephefius calls all that part
of the body which lies betwirt the thighs.

MESOMPALION, from parcy, middle, and eupants,

MESOPHYRON, From passes, madate, and engages, movel. The middle of the navel.

MESOPHYRON. So Ruffus Ephefius calls that part of the face which lies between the eye-brows.

MESOPLEURIOS. An epithet of the intercostal

mufcles. See INTERCOSTALES.

MESO-RECTUM. It is a production of the peritonæum, which invests the intestinum rectum. About the middle of the fore-fide of this intestine it forms a semicircular fold, which appears when the intestine is empty,

but is loft when it is full.

MESOTHENAR. It is a flat and near a triangular muscle, lying between the first phalanx of the thumb and the bottom of the palm of the hand; it is inferted into the ligament which connects the os magnum of the carpus to that which supports the thumb, and it is inserted too into that bone of the metacarpus which supports the middle finger, as well as to that which answers to the index; from thence, the fibres contracting to an angle, form a tendon, which is inferted into the head of the first pha-

lanx of the thumb. See Winflow's Anatomy.

MESPILUS. The MEDLAR. The common medlar is a tree about the fize of an apple-tree; the leaves are ftrong and fharp pointed; its flowers appear in May, and the fruit ripen in September. In Germany these trees are found in the woods, but with us they are only in gardens. The fruit hath an auftere aftringent tafte, and cannot be eaten before long keeping; this fruit is more aftringent than that of the quince-tree. The aria bears the name

alfo.

Boerhaave mentions thirteen species of medlars, but with us they are not in use. Some of these are as follow.

MESPILUS ACULEATA PYRIFOLIA; also called pyracantha, EVERGREEN THORN.

- APH FOLIO, &c. called also spina alba, expa-

eantha, WHITE-THORN, OF HAWTHORN.

ARONIA, alfo called aronia, azarolus, the LAZA-

ROLE, OF NEAPOLITAN MEDLAR.

— FOLIO SUBROTUNDO FRUCTU RUBRO, called

chamamefpilus Gefneri, COLONEASTER.

— FRUCTU NIGRO, &c. also called vaccinia alba, dyopfyrus, idea tertia Clufii; WHITE WHORTLES, &c. The fruit of all these have similar virtues, but differ in

MESOUTTE. An American tree, like the oak-tree, but bearing a pod like the kidney-bean. It is not used in

METACARPIUS. A fmall fleshy muscle, situated obliquely between the large internal angular or transverse ligament of the carpus, and the whole inside of the fourth metacarpal bone. It is fixed by a tendon to the os orbiculare, and to the neighbouring part of the large ligament of the carpus, and at its other end in the outer edge of the

fourth metacarpal bone.

METACARPION, from μετα, after, and καφπος, METACARPUS, fibe toriff. It is that part of the hand which is fituated between the wrift and the fingers. The ancients called the carpus by the name of brachiale, and the metacarpus they called post-brachiale. The metacorpus on its infide forms the palm of the hand, and on its outfide the back of the hand. The first phalanx of the thumb is not, as formerly, thought a part of the meta-carpus. The first metacarpal bone supports the fore-singer, the fourth or last the little singer.

METACINEMA. A removal of the pupil of the eye

from its proper fituation.

METACONDYLI, from pers, after, and \*\*ord\*vase, a knuckle, the last joints of the fingers next the nails.

METALLA. METALS. They are generally reckon-

ed fix in number, and are ranked according to their fpecific gravity; but fince the experiment of professor Braun hath proved that mercury is malleable when in a due degree of cold, it may also be ranked as a seventh. The characteristies of metali are, they are the heaviest of all fossils, fusible in the fire; but when cold again are ductile and malleable as before.

In point of gravity the first is gold, then platina (if ranked among metals), mercury, lead, filver, copper, iron,

Sulphur is the bond of union in all metals. Metals are bituminous substances which have undergone a long di- short-sightedness.

gestion, for by depriving them of their sulphur they are reduced to ashes, and then to glass; and by restoring the sulphur this glass is converted into metal again. Ores are the compositions in which metals are found, or the bed? in which they are produced: metals and minerals mostly abound with fulphur and arfenic, which are separated in the imelting furnace, and the body does not become truly metallic until they are separated; and sulphur and arsenic added to metals bring them to ores again.

Metals are diffinguished into the noble and perfect, the base and impersect. Gold and filver are noble or persect; but the others are called base or impersect, because they are liable to rust; and to lose of their weight if continued

long in the fire.

All the metals diffolve in acids, fome in one and fome in another; and in most of these solutions the inflammable principle of the metals is abforbed or expelled. Gold, filver, and mercury, fuffer no refolution or diffipation of their parts from any known power; if changed into the appearance of calx they are recoverable without any lofs.

Semimetals are metallic substances joined with some heterogeneous particles, as fulphur, falt, flone, or earth. Such are antimony, calamine frone, blood-frone, &c. to Dict of Chem. Neuman's Chem. Works. Boyle See Dict of Chem.

on the Growth of Metals.

METALLUM FLUIDUM: See ARGENT VIV. METALLURGIA. METALLURGY. It is that part of chemistry which is concerned in the separation, depuration, and preparation of metals. Sometimes it implies the digging them out of the mines.

METAPEDIUM. See METATARSUS.

METAPHRENON. The BACK; properly the part

betwixt the shoulders.

METASTASIS, from μετατιθεμι, to transfer. It fig-nifies a transposition and settlement of some humour or difease on some other part. It makes its way through the cellular membrane. It is also called diadexis, and

METASYNCRISIS, from uera, importing change, and συγκριτω, to collect, or mix together. The word is applied differently by different authors; but they all mean a change in the part to which the word is applied. Afclepiades thought every thing was formed by a concourfe of atoms, for which reafon he called all bodies finerimata or fynerifeis, mixtures; and alterations in the congeries of atoms he calls metafyncrinesthai.

METATARSIUS. A fleshy mass lying under the fole of the foot; it is fixed by one end in the fore part of the great tuberofity of the os calcis, and running forward from thence it terminates in a kind of short tendon, which is fixed in the tuberofity and posterior part of the lower fide of the fifth bone of the metatarsus. It moves the last bone of the metatarsus, and draws the fourth bone along with it, and contracts the fole of the foot, increafing the convexity of the upper fide.

METATARSUS, from μετα, after, and ταρσος, the tarfus. It is composed of five bones, but these bones and the bones of the toes being fo fimilar to the metacarpus and fingers, need no farther description. The metatarssus is also called planta, planum, vestigium, solium, metapéd dium, pessus, precordium, and pessus lum.

METEORISMUS. See TYMPANITES:

METELLA. A fort of nux vomica. See RaiiHift.

METEOROS, from usra, and ace, to elevate. Elevated, fuspended, erect, sublime, tumid. Galen expounds pains of this fort as being those that affect the periods. ritonæum, or other more superficial parts of the body;

these are opposed to more deep-seated ones.

METHEMERINOS. A QUOTIDIAN FEVER. METHONICA, also called menghala, mendoni, lili- 10 um Zeylanicum fuperbum. The SUPERB LILY. It is only valued for its beauty. METL. A name of feveral species of American

METOPION. An oil, or an ointment described by METOPIUM. Dioscorides; it is thus named, because it hath galbanum in it; galbanum was the produce of a plant called metopium. Metopium is also a name of the oil of bitter almonds.

METOPON or METOPUM, from uera, poft, and ad,

METRA. The WOMB. See UTERUS.

METRENCHYTA, from untpa, the uterus, and ey-

METRENCHYTES. A WOMB SYRINGE. METRITIS. INFLAMMATION of the WOMB. See

INFLAMMATIO.

METROCELIDES, from μετρε, a mother, and χε-MS, a fost or mole. A MOLE or MARK impressed upon the child by the mother's imagination or otherwise on the

feetus. See Bell's Surgery, vol. v. p. 528.

METROPROPTOSIS, from μητρα, the womb, and προτιπίω, to fall down. A DESCENT of the UTERUS.

See PROCIDENTIA UTERI,

METRORRHAGIA. Excessive Menses. See

MENORRHAGIA.

MEU, from μετον, lefs, because of the extreme MEUM, tenderness of the leaves. Spigner, BAUD-MONEY, OF BAULD-MONEY. Acting Meum, Linn. Also called faniculum alpinum. It is a perennial plant, whose leaves are capillaceous and much smaller than those of fennel, but its feeds are bigger and broader than the feeds of fennel. The root is of the same nature as that of fennel or lovage, but finells more agreeably, and taftes warmer and fweeter. The plant hath an aromatic pungency, borders on the fetid, and abounds with volatile falt. It is more pungent than fennel, and milder than lovage.

MEUM ALPINUM GERMANICUM. GERMAN OF MOUNTAIN SPIGNEL. It is also called mutellina and phellandryum. It possesses virtues similar to those of the

common fort.

— LATIFOLIUM ADULTERINUM, called alfo fefeli perenne folio glauco breviori, famiculum fylvestre, ferula folio breviori, faxifraga montana minor, &c. BASTARD SPIGNEL. Boerhaave makes this a species of sefeli. It grows on dry hills, and flowers in June. The root is of a drying burning quality.

MEXICANUM BALS. See Bals. Peruv.

MEXICANAVA. See Borneys Mexicana.

MEXICANAVA. See BOTRYS MEXICANA.

MEZERION. See LAUREOLA FORMINA. MIASMA. MIASMATA, as they relate to difeafes, are productive of fome of the febrile kinds, and of them only, which are also produced by contagion. They are generally floating in the atmosphere when they are injurious to mankind; but they are not observed to act but when they are near the fources from whence they arife; that is, near to the bodies of men from which they immediately iffue, or near to fome fubstances, which, as having been near to the bodies of men, are imbued with their effluvia, and in which fubstances these effluvia are fometimes retained in an active state for a very long time. But the notion of contagion properly implies a matter arifing from the body of man under disease; and

that of mia/ma, a matter arising from other substances.

Dr. Cullen remarks, that the substances imbued with the effluyia from the bodies of diseased men, may be called fomites; and that it is probable that contagions, as they arise from fomites, are more powerful than as they arife immediately from the human body. Further, that though the fomites are poffeffed of matter from the human body, yet this matter passing from the fomites is called miajma; which requires further to be diftinguished from the mia/mata arising from marthes, &c. by the epi-

thets human and marsh miasmata.

On this subject of contagion and miasma, Dr. Cullen observes as follows. - As fevers are so generally epidemic, it is probable that fome matter floating in the atmosphere, and applied to the bodies of men, ought to be confidered as the remote cause of severs. Contagions have been supposed to be of great variety; and it is possible that they may be fo; but that they truly are, does not appear clearly from any thing that we know at prefent. The number of genera and species of contagious diseases, of the class pyrexiæ, at present known, is not very great. They belong to the order of fevers, of exanthemata, or of profluvia. Whether there be any belonging to the order of phlegmafiæ, is doubtful; and, though it should be supposed, it will not much increase the number of contagious pyrexia. Of the contagious exanthemata and profluvia, the number of fpecies is nearly afcertained; and each of them is fo far of a determined nature, that, though they have now been observed and diftinguished or many ages, and in many different partsof the earth,

they have been always found to retain the fame general character, and to differ only in circumstances, which Xuu, to infuse or pour into. Injections for the may be imputed to season, climate, and other external causes, or to the peculiar constitution of the several perfons affected. It is, therefore, probable, that, in each of these species, the contagion is of one specific nature, and that the number of the contagious exanthemata, or profluvia, is hardly greater than the number of species taken notice of in our fystems of nosology. While the contagious exanthemata and profluvia are thus limited, it is probable that the contagions which produce the continued fevers are not many; nay, it is not evident, that there are more than one common fource of them. It is well known that the effluvia constantly arising from the living human body, if long retained in the fame place, without being diffused in the atmosphere, acquire a fingular virulence, and, in that state, applied to the bodies of men, become the cause of a sever which is very contagious. The late observations on jail and hospital severs have fully proved the existence of such a cause; and it is fufficiently obvious, that the fame virulent matter may be produced in many other places. At the fame time, the nature of the fevers arising, render it probable, that the virulent state of human essuria is the common cause of fuch fevers, as they differ only in a ftate of their fymptoms, which may be imputed to the circumftances of feafon, climate, &c. concurring with the contagion, and modifying its force.

Miasmata arise from various sources, and are of different kinds; but we know little of their variety or of their feveral effects. We know with certainty only one fpecies of miasma, which can be considered as the cause of fever; and from the univerfality of this, it may be doubted if there be any other. The miasina, so universally the cause of fever, is that which arises from marshes or moist ground, acted upon by heat. So many observations have now been made with respect to this, in so many differ-ent regions of the earth, that there is neither any doubt of its being in general a cause of severs, nor of its being very universally the cause of intermittent severs in all their different forms. The similarity of the climate, feafon, and foil, in which intermittents arise, and the fimilarity of the difeases, arising in different regions, con-cur in proving that there is one common cause of these diseases, and that this is the marsh miasma. What is the particular nature of this mia/ma, we know not; nor do we certainly know whether or not it differs in kind : but it is probable that it does not, and that it differs only in the degree of its power, or perhaps in its quality, in a

given space.

It remains most probable, that the remote causes of fevers are chiefly contagions or miasmata, and neither of them of great variety. Miasmata are supposed to cause intermittents, and contagions to cause continued severs strictly so named. It may further be added, that both contagion and miasmata are of a debilitating or sedative quality. They arise from a putrescent matter. Their production is favoured, and their power increased, by circumstances which favour putresaction; and they often prove putrefactive ferments with respect to the animal fluids. Though fevers generally arise from marsh or human effluvia, other remote causes of severs, which have been commonly supposed, cannot with any certainty be ex-cluded. See Cullen's First Lines, vol. i.—and Contago.

MICA. See TALCUM.
MICA THURIS. See OLIBANUM.
MICROLEUCONYMPHÆA, alfo called nymphæs,

morfus rana, firatistes. FROG-BIT. It grows in muddy waters, and flowers in July. It is not much ufed, but is faid to agree in virtues with the leuconympha. MICRONYMPHÆA. It is lefs than the nymphæa; it grows in ditches, and is faid to possess the fame virtues

with the nymphæa.

MIGRANA. See HEMICRANIA.

MILIARES GLANDULÆ. See SEBACEÆ GLAN-

MILIARIA, vel
MILIARIS FEBRIS. The MILIARY FEVER, called
MILIARIS FEBRIS. by the Germans Friefel. Dr.
Cullen places this genus of difease in the class pyrexiz,

It is so called from the small pustules or vesicles which appear in the fkin, principally on the upper parts of the body, and in some measure resemble a millet-feed. At first these pustules are small vesicles, full of a limpid and excessive, hysteric symptoms, an internal heat, languar, afterwards of a whitish and almost pearl-coloured serum; and loss of appetite follow; and when these happen, a sometimes they are reddish, or red and white ones mixed. fatal heckic is not rare. Many writers term the difease when the pustules are white, purpura alba, and when they are red purpura

It is generally supposed to be a child-bed disease, but except the woman is kept too hot and in a fweating state too long, it rarely happens at this time, and when it does it is produced by causes which would have been followed by the fame effect had the patient not been a child-bed

This diforder is denominated fimple when none but mi-liary puffules are accompanied with red ones, which,

when appearing alone, are called a rash.

The causes are generally said to be an excessive serosity and an acid acrimony in the blood, with a preternatural commotion of the spirits. These causes seem evident from the large quantities of pale-coloured urine ufually dif-charged in these severs, the plentiful flux of faliva, the almost total absence of thirst, the usefulness of absorbents, the injury received from acids in many inflances of this diforder, the moderate degree of heat, &c.

Sometimes a degree of bilious acrimony attends this diforder. Great diffurbance in the mind, efpecially

from the depreffing paffions, brings on this diforder where there is the leaft tendency to it already in the confti-

tution.

It is preceded by a weakly habit of body, a ferous flate of the blood, a weakness in the mind, which disposes it to be ruffled by external impressions, close thinking, some tedious and painful disorder, a sour smell in the sweat, an internal heat, with a dull sense of thirst; and if the patient is a woman at or near the time of bringing forth a child, the complains of a great oppression in her breasts, and is often sighing. The sever approaches with pains resembling the colie, or the gravel, or the rheumatism, and sometimes like those of labour; after a few days the pains abate, an alternate cold and heat is felt all over the body, the palms of the hand are very hot, but the heat elfewhere is far lefs in proportion; the pulie is frequent but weak, the fpirits are ufually much funk, the breaft feems as if opprefied with a great weight, frequent and deep fights occur, and, as an infeparable companion, the patient's fleep is fuddenly interrupted at the first onset of the companion and the companion without fleep during which the plaint, and the continues without fleep during whole days and nights, and at the fame time is neither feized with pain in the head, nor a delirium; a whitish crust sometimes appears on the tongue, at others its appearance is like that of a person in health; the urine is thin and pale, though or a perion in health; the urine is thin and pale, though fometimes it is nearly as in health; fometimes a pain is complained of in the flomach after fleep; a trennor often accompanies this fever; and, in the world degrees, and last flages of the diforder, delirium, convultions, difficulty of breathing, &c. come on. The exacerbations in these fevers recur like the paroxymns of an intermittent. The oppression in the breast, which is productive of fights, the uncommon finking of the spirits without any evident cause, watchings, and the tumultuous agitation of fpirits, com-monly called a hurry of the head when the patient endeayours to compose himself to rest, as also the frequent and weak pulse, may be confidered as pathognomonic figns of the miliary puffules being about to appear, and they continue until the puffules become prominent, after which they mostly disappear. For the most part the pustules are only on the neck, breast, and interstices of the singers, though sometimes they are also sound all over the body, and after increasing to their full fize they gradually difappear, the cuticle remaining rough on those parts where they were feated. In the compound fort these pultules itch more or lefs.

It fometimes happens that this fever begins with fymp-toms fo mild that it is neglected, and thus becomes very dangerous before help is demanded; the time of the puftules appearing is not easily to be determined; they fome-times are observed on the third day, and so on to the

In the decline of the diforder, the upper parts of the hands are often moift with a cold fweat; and after the eruptions are abated, a fwelling of the feet, legs, and thighs come on, a tumor or abicefs in the breatt, a defeet in the memory, an immoderate discharge of urine, and if the patient is a child-bed woman, the lochia become

The puftules are most numerous where the sweat is

most copious; they are about the fize of millet or poppy feeds, at first are filled with a pellucid ferum, and some-times they have a disagreeable smell; but, happen when they will, they do not appear to be critical; from a pellucid fluid the contents of the pustules change to a pearl, or a pale yellow colour.

When reddish pullules appear without a fever, they are chronical, and appear at stated seasons; but the white ones rarely appear without a fever. The red fort itch

the most.

The different states and kinds of the miliary fever should be diftinguished from the synochus, the nervous fever,

and the catharrhal fever.

In the beginning, though the fymptoms were mild, if heating medicines, or an heating regimen were used, and a diaphoresis not brought on, the diforder will be dangerous. If from the beginning of the fever any particular part is affected with pain; if the patient is hot without any sense of pain; if he labours under a sickness of the ftomach; and if these symptoms are succeeded by alternate heats and colds recurring at unequal intervals, a defect of the spirits, an oppression of the breast, accompanied with fighs, and uneafy respiration, and, at last, if the pultules make their eruption with a gentle and continual diaphorefis, the patient is, for the most part, in a hopeful condition. If a delirium, convulsions, &c. appear in the beginning, they may more eafily be removed by proper care and medicines; but in the progress or decline of the diforder their presence is much to be dreaded. If a diarrhea comes on, and is fuddenly checked, whether this happens fpontaneously, or by art, it en-dangers an apoplexy. The urine changing suddenly from a yellow to a pale colour is a threatening fymptom. In child-bed women a diarrhoea is a very dangerous fymptom. Much fleepiness is a favourable symptom, red pus-tules are less dangerous than white ones. When pustules

tom. Much fleepiness is a favourable symptom, red pustules are less dangerous than white ones. When pustules appear and vanish by turns, much danger is threatened. The principal intentions of cure are, 1. To correct the peculiar acrimony. 2. To relax the strictures occasioned by the acrimony. 3. To evacuate the offending matter by the skin; and, 4. To prevent the return of that which is already excreted through it.

According to the patient's strength let him continue in bed, or be raised a few hours in the day. The linen and bed cloths may be changed as oft as the nauseous sweat-

bed cloths may be changed as oft as the naufeous fweat-

ing may require.

Fresh air may be admitted into the room as much as is agreeable to the sensations of the patient. The bedcloaths should not be more numerous than when in

health:

The patient's constant drink may be Schzer water, a decoction of farfaparilla, or other fuch like liquors, which should be always given warm.

Medicines of the cordial and perspirative kind are pro-

per, but avoid all heating ones.

In the red kind, a little nitre may be added to the medicines, if the heat is confiderable, or rather the fp. ætheris nitrofi fpt. fcb. D. Clutton:

The bowels should be kept casy, and as near to a na-

Very frequently this fever tends much to that of the nervous kind, in which case a similar treatment with what is there recommended will be proper; but if a putrid disposition manifests itself, the duclisted mineral acids, with cordials and the bark, will be required.

When the eruptions appear and retire, camphor will be an important addition to whatever other medicines the

state of the case may require.

Sometimes in the beginning of the disorder, the nature of the case is mistaken; and from mistaken management, the morbid matter, instead of palling through the skin, is determined to some other part, and there produces symptoms which are various as are the parts affected; in the ftomach a vomiting, in the bowels a purging is excited, &c. but when under these circumstances, the complaint is discovered to be a miliary fever, gentle continued diaphoretics alone will be the properest remedies, and opiates, as well as aftringents, should be admitted.

Bleeding can very rarely, if ever, be admitted in this difease

this operation, rarely if ever attend.

Blifters fhould hardly ever be omitted; they are best applied one after another, that is, a fresh one should be applied as foon as the former one begins to cease from difcharging; and, except fome violent fymptoms require, more than one at once is not convenient. It may be obferved, that when a blifter begins to dry, the fymptoms become worfe, but are relieved by the operation of the next; hence the propriety of fucceeding one by one. Apply the blifters on the most sensible parts, as on the infide of the legs and thighs; though if inflammation, or any other symptom in any particular part, should require it, a blister may be usefully applied there.

As to diaphoretics, the cool ones, joined with fuch cor-dials as in the judgment of the preferiber may be indi-

cated, will be the best.

All the variety of symptoms attendant on miliary fevers, taken collectively, are to be removed by the fame medi-cines which would be proper if they each appeared fepa-rately; and a gentle diaphorefis is the proper remedy.

If convultions come on from a translation of the morbific matter, let a clyfter be given, and afterward the pa-tient flould fwallow repeated dofes of volatile fpirits in what he drinks. By the fame means, afthmatic fymp-toms are removed if they appear.

A vomiting and diarrheea are mitigated by the faline

draughts, with faffron and crab's eyes.

See Hoffman, Mead, Buchan's Domestic Medicine, and fir David Hamilton's Treatife on the Miliary Fever. Cullen's First Lines, edit. 4. vol. ii.

MILIARIS NAUTICA. A kind of typhus, called by
Huxham febris nautica pestilentialis.

— PURPURATA. It is a kind of typhus.

MILIARIUM. See ALEMBICUS.

MILIOLUM. A finall tumor in the eyelids, of the fize of a millet feed.

MILITARIS AIZOIDES. See ALOIDES.
MILLITARIS HERBA. See MILEFOLIUM AI-

MILLEFOLIUM, also called firatiotes lentibularia; Achillea, supercilium veneris, lumbus veneris, myriophyllon, chiliophillon, militaris berba. COMMON YARROW MILL-FOIL. It is called millefolium, from its numerous leaves; and Achillea, because Achilles first discovered its efficacy in curing wounds; and stratiotes, from rpx705, an army, on account of its usefulness in healing wounds. It is the Achillea millefolium of Linn. Achillea foliis bipennatis nudis: laciniis linearibus dentatis, caulibus sulcatis,

It is a plant with rough stiff leaves, divided into small fegments, fet in pairs, along a middle rib, like feathers; the little flowers stand thick together in the form of an umbel on the top of the stiff stalk, and consist each of feveral whitish, or pale purplish petala, set round a kind of loose disk of the same colour, followed by small crooked feeds. It is perennial, grows plentifully on the fides of fields, and on fandy commons, and it flowers almost all the summer.

The leaves and flowers are mild corroborants, and antifpalmodics; their fenfible qualities promife confiderable activity; they have a weak, but agrecable aromatic fmell, a bitterish, roughish, pungent taste; the leaves are most bitter, the slowers have most smell, and the young roots having a glowing warm tafte like that of contrayerva, but they lofe much of their fmell in drying.

Both water and spirit take up the virtue of the leaves and flowers; but water extracts the aftringency, and fpirit the aromatic, in the greatest degree. If the flowers are diftilled with water, they yield an effential oil; and if the plant was gathered from a rich foil, the oil will appear of

A firong decoction of the root and leaves hath cured a dyfentery. See Raii Hift. Lewis's Mat. Med. The Potamogifion bears also this name.

MILLEGRANA MAJOR. See HERNIARIA.

MILLEOMORBIA. See SCORPHULARIA MAJOR. MILLEPEDES, also MULTIPED E. See ASELLI.

MILLIUM, from mille, a thousand, because of its numerous feeds. Miller, called also cencbros. It hath large, broad, grass-like, somewhat hairy leaves; they encompass the stalk, which grows to be three or four feet

difeafe; for those inflammatory symptoms, which require high, bearing on the top a large paniele, hanging down this operation, rarely if ever attend. the head, composed of many slender stalks, with many finall glumes growing on them, including finall, white, hard, thining grain. It grows plentifully in Poland, &c. It is fown in April, and reaped in August or September, and is used as food. It is nutritious and very easily di-It is nutritious and very cafily digefted. See Raii Hift.

MILLIUM INDICUM. Called also forgo, forghum, melica, Holcus. Indian Miller. It is sown in Spain, Italy, and other warm countries. This species binds the belly very much. In Turkey they feed their hogs and poultry

- ARUNDINACEUM, The lachryma Jobi, and So-

lis; the lithospermum.

MILPHOSIS. A Greek primitive. A BALDNESS of the EYL-BROWS: also an increase of the slesh in the corners of the eyes.
MILZADELLA. See LAMIUM MACULATUM.

MIMOSA. Boerhaave enumerates feven species of this plant, but none of them are used in medicine. For the MIMOSA NILOTICA, fee ACACIA.

— JAPONICA and CATECHU. See TERRA JAPONICA.
MINÆA. See ANIME.
MINERALIA. MINERALS. In the mineral kingdom are found, I. An oil called petroleum; this differs in confiftence, &c. and thence receives different names. 2. Earths: these are of different kinds, and include all the flones, they being only indurated earths. 3. Metals, And, 4. The acids known by the name of mineral acids.
MINIUM. RED LEAD. See PLUMBUM.

MINIUM GRÆCORUM and PURUM. NATIVE CIN-

NABAR. See CINNABARIS.

MINUTA. An epithet for a violent fever, accompanied with a fyncope, which is faid to reduce the patient fo, that he cannot support it more than four days.

MIRABILIS PERUVIANA. See JALAPA.

MIRABILIS SAL. See GLAUBERI SAL.

MIRACULAM CHEMICUM. See MAGNESIA

MISERERE MEI. See Passio ILIACA.

MISTURA. A MIXTURE. It differs from juleps in not being transparent, having some powder, or other sub-stance, dissolved or mixed with it, as a part of the

MITELLA. A fearf for fulpending the arm. In bo-tany it is the name of fome plants, of which Boerhaave

enumerates four species.
MITHRIDATUM. MITHRIDATE. See Confec-

TIO DAMOCRATIS.

MITRALES VALVULÆ, vel Epifcspales. The MITRAL VALVES. See Cor. So called from refembling a

MIVA CYDONIORUM. MARMELADE of QUINCES. See CYDONIA.

MIXTIO. MIXTION. Stahl used this expression to fignify the union of the first principles in the most simple compounds. In the English language, those principles of bodies are emphatically called a maxt, which are so intimately united to each other, as hardly to manifest themselves on the severest trials (as in case of alkaline fait in glafs, acid in flint, fulphur or mercury in metals, &c.) the texture is loofe, and the parts more castly separated.

MNIUM. It is a fertile kind of moss, furnished with

little flowery heads, or feminal ones, if they may be fo efteemed, which are of two forts; for fome are naked and dufty, having neither capfule nor cover, nor are they furrounded with a membrane; but the others are like the relt of the floriferous kinds of mofs, particularly the hypna and the brya; and the different manner of flowering is what diftinguishes this kind from all the rest. There is ufually a variety in the little heads, fometimes in the fame, fometimes in different plants; and the pedicles which support membranaceous heads are pretty long and bare; but those which have their heads naked are obferved to be much shorter than the others, and furrounded with very fmall leaves.

MOCHLIA, from μοχλος, a lever. A reduction of the bones from an unnatural to a natural fituation.

MOCHLICA. Violent purges.

MODERNI. MODERNS. The revival of learning in
Europe was caused by the destruction of the Greek em-

pire at the taking of Constantinople, by Mahomet the side; these have four points at the basis of their bodies, tired from that city, and brought with them the feiences into Italy. The day, therefore, on which Constantino-ple was taken, may be called the birth-day of learning, with respect to the western parts of Europe, and this was on the 27th of May, 1453. All before this are ancients, all fince are moderns.

MODIOLUS, from modus, a measure, being contrived to enter only to a certain depth. The crown or faw of the trepan; or a circular trepan, refembling in shape the nave of a wheel, which is its true fignification. See

MODIRA CANIRAM. See COLUBRINUM.

MOGILALIA, from usys, difficulty, and habes, to fpeak, a difficulty of speech. It is the pfellismus acheilos of Dr. Collen.

MOKEL. See BRELLIUM.
MOLA. A name for the patella, KNEE-PAN, for the dentes molares, and for the maxille. If also fignifies a grinder and a FALSE CONCEPTION, a shapeless mass in the uterus, without a placenta. If the symptoms of a miscarriage happen in the first, or beginning of the fecond month, the feetus being then very tender, and lying in the os internum two or three days, will diffolve it into a kind of jelly, which coming away, is called a false conception; and, if during the time of child-bearing, a flooding comes on, after its being restrained, a large coagulum of blood is formed, which after more or less time is discharged; it hath a fibrous appearance from the compretion of the womb, and is called a male. This coaguium is only fibrous on the outfide, whereas the placenta is equally so both within and without, and thus they are perfectly diftinguished.

The figns of a mole are, in general, the fame as pregnancy, except that in pregnancy the belly often becomes flat, and lefs, until the end of the fecond month; on the contrary, when there is a mole, the belly increases from the first, and so continues to the second or third month, at which time is generally comes away. If it continues longer, it often proves troublesome by the slooding it occasions; and if the woman is weakly, its consequence

may be death.

During the first four months, a mole is not cafily diftinguished from pregnancy; but after this period it may be observed, that the mole excites no motions in the womb like those of a living child; besides, a mole distends the belly equally, but a child makes it most prominent towards the navel, or on one side; a mole changes in female changes in female in the like according to the change of the its fituation in the belly according to the posture of the mother, but this never is known to happen whilft the fœtus is alive; and in case of a mole, the general health is commonly worse, but in pregnancy it usually improves

after the fourth month.

When a mole occasions no ill symptoms in the mother, no violence should be used to bring it away, but it may continue many years without creating any remarkable incovenience. If it comes away by the end of the third month, it rarely happens that any affiftance is necessary, though it usually occasions more or less of a flooding. When a istance is necessary, let the finger be gradually introduced into the uterus, and, if that fuffice not, intro-duce, another, and thus the mole will generally be ex-cluded by the pains which attend on these occasions. As there is no placenta, fo if after the discharge of the mole the flooding ceafes, the whole is at an end; but if it continues, another mole may be suspected, and, with a little patience and care, it being also brought away, the woman will foon recover. See La Motte, Mauriceau, Smellie, and other practical authors on midwifery.

MOLAGO CODI. BLACK-PEPPER. She PIPER

MOLARES. GRINDERS. So the large teeth on each fide the dentes canini are called, by Cicero, genuini,

by some gamphisi, mola, momisci.

Dr. Hunter observes that the two first are smaller than the reft; at the basis of their body they terminate in two points, and therefore Mr. John Hunter thinks the name bicuspides is more proper for these than molares. These, i. e. the two first on each side, have short sangs, but are double at their extremities: he (Mr. J. Hunter) thinks the name malares is very proper for the other three on each

Great; for on that occasion, many learned Greeks re- two anteriorly, and two posteriorly; these have generally two fangs in the lower jaw, and three fangs in the upper. Mr. John Hunter, in his Natural Hiftory of the Human Teeth, which fee, observes, that the first and second of the grinders (commonly to called) are nearly alike; thefe two ftand next behind the canini or eye-teeth; they are, as above noticed, called bicuspides; the first of these two is frequently the fmalleft, and hath rather the longest fang; this, as well as the eye-teeth, hath in many inflances their point bent. In the upper jaw, the bicufpides are rather thicker than in the lower. The bicufpides, and especially the feeond of them, in both jaws, are oftener naturally wanting than any of the teeth, except the dentes sapienties. The bicuspides and the grinders alter very little in shape on their grinding furfaces, by use; their points only wear and become obtuse. The two first grinders differ from the bicuspides in being much longer, and in having more points upon their body, and more fangs. The body forms almost a fquare, with rounded angles. The grinding furface has commonly four points or protuberancies, two of which are of the inner, and three on the outer edge or part of the tooth, and generally fome fmaller points at the roots of these longer protuberancies. The body towards its necks divides into two flat fangs, one forward, the other backward; thefe fangs are often bifurward, the other backward; there rangs are often backward; cated. The first grinder is somewhat larger and stronger than the second; both the first and second grinders have shorter sangs than the bicuspides have. In the upper jaw, they have three sangs. The first and second in the upper jaw are placed directly under the maxillary sinus. The third grinder is the dens fapientize. See DENs.

MOLARES GLANDULE. Thefe are two glands, nearly of the fame kind with the fublingual glands, each of them being fituated between the maffeter and buccinator, and in some subjects they may be easily mistaken for two small lumps of fat. They fend out small ducts, which perforate the buccinator, and open into the cavity of the mouth, almost opposite to the last dentes molares, and from thence Heister, who first described them, called

them thus.

MOLDAVICA. Melissa. Turkey baum or BALM. Boerhaave mentions fix species, but they are not remarkable for their virtues. See MELISSA TURCICA.

MOLL. INDIAN MASTICH.

MOLLITIES OSSIUM. A SOFTNESS of the BONES. In children this is called the rickets. Mr. Sharp think it is caused by a redundance of oil, or from a bad quality in the juices. Dr. Hunter is of opinion, that an excess of oil or marrow hath no fhare in the cause, but that a defect of boney matter is the immediate cause, and this defect of boney matter. is the immediate cause; and this defect is occasioned by a scorbutic, venereal, or other taint in the juices. Howeever, they both agree with most practical writers, that in order to a cure, cleanlines, a change of air, frictions, a good diet, cold-bathing, exercise, and chalybeate medicines are proper. See DISTORTIO SPINÆ.

MOLLIFICATIO. A barbarous term for a palfy of

the muscles, in any particular part.

MOLLUGO. BASTARD MEDLAR. See RUBIA
SYLVATICA LÆVIS. Boerhaave mentions three species,

and Dale adds a fourth. See ALYSSUM

MOLUCCA MELISSA. MOLUCCA BAUM or BALM.
Boerhave names two species. Their qualities agree

with those of melissa.

MOLUCCENSE LIGNUM. It is the wood of the tree that produces the Molucca grains. This wood hath a burning, acrid, caustic taste, it is called, cadel avanacu and guajapala.

MOLVA. See Asellus MAJOR.

MOLY, called also allium latifolium lilistorum. MOLY of THEOPHRASTUS, or HOMER'S MOLY. Boerhaave mentions feven species, and gives the following as the character of it. It resembles garlie in every respect, except that it hath a sweet taste, or at least not a disagreeable one.

Some take it to be a species of rue; but as some un-certainty attends the description of what it is, the cu-rious are referred to Ray's History of Plants, to James's Med. Dict. &c. for an account of what it does. MOLY ALPINUM. SPOTTED RAMSONS.

MOLYBDÆNA, named alfo eler fna; galena. In phar-

macy it is the metallic recrement, called plumbago. It kius, Parcy, and fome other writers, abound. See fometimes fignifies BLACK LEAD; and, in botany, it is ACEPHALOS. and PRESENTATIO. the name of a plant which is also called plumbago.

MOLYBDOS. LEAD.

MOLYZA. An HEAD of GARLIC, or GARLIC which hath a head not divisible into cloves.

MOMIN. See MAMEI.

MOMISCUS. The part of any of the dentes molares
next the gum. The dentes molares themselves are also

MOMORDICA, called also balfamina mas, pomum Hisrafolymitanum, cucumerina Indica, pomum mirabile, ballia, mucca, pira, balfamella charantia, cucummeraria, cucumis, Punica cordi, impatiens berba. The MALE BALSAM-APPLE. It is cultivated in the gardens of the curious, but is not used in medicine. The fruit is somewhat cooling. Boerhaave takes notice of five species.

MOMORDICA ELATERIUM. See CUCUMIS AGRES-

MONBIN. The HOG PLUM-TREE. It grows in the favannahs, in low marfhy grounds. Its wood ferves as cork to ftop bottles with. See Miller's Dict.

MONERES. It is properly a boat with a fingle oar; but is figuratively applied to a melancholy perion, because of his love of folitude.

MONOCEROS. See Unicornu.

MONOCOCOS GERMANICA. SPELT WHEAT.

MONOCOLON. In Paracelfus it is the intestinum

MONOCULUS. It is a roller of ten or twelve MONOPTHALMUS. If feet in length, and two or three fingers breath. It retains the dreffings on the eye-lids or eyes. To apply it, fix it on the occiput, letting about a foot hang down, and from thence carry it obliquely round the head, across the wound, &c. to where it began; having carried it thrice round, the remainder goes circularly about the temples, occiput, and forehead; the end han-ing behind, is then to be brought over the vertex to the forehead, and the whole fecured. A napkin, or an hand-kerchief, does as well. It also fignifies a person with only one eye, or with one eye less than the other. See Mo-

MONOMACHON. The intestinum cacum

MONOPAGIA. A pain in the head which affects MONOPEGIA. S only one point.

MONOPHYLLON, called also smilax unifolia humil-lima, unifolium, ophrys unifolia, lilium convallium minus. One blade. It grows in woods and thickets, and flowers in May and June. The flowers are faid to be alexipharmic and vulnerary. See Raii Hift. MONOPIA, from 100005, solut, alone, or one, o4, oculus, an eye. Thus the Greeks called those who were said to have only one case: the Latins called them manaculi, and

have only one eye: the Latins called them monoculi, and in the Scythian language they were called arimaspes; ari, in that tongue, fignifying alone, and mafoe, the eye. According to fabulous history, the ancient Scythians had but one eye, which was placed in the middle of the forehead. This fiction took its rife as follows: the Scythians were great archers, and as one eye, in shooting, is shut while the other is open, they were so accustomed to look with one eye, that the other was rarely feen. But thefe words also are applied to those who have one eye less than the other. When this deformity of a larger and a lesser eye is observed in infancy, it is recommended to keep such children from fuch exercises as require the use of only one eye, as looking through microfeopes, perspective glasses, tele-scopes, &c. See Orthopædia, translated from the French of M. Andrée.

MONOPS. So the perfon is called who hath but one

eye, or who hath one eye lefs than the other.

MONORCHIS, from uores, and exte, a tefficle. A person is thus named who hath but one testicle.

MONOSPERMALTHÆA. A kind of plant of which they are two species, but they are not of any use

MONS VENERIS. The HILL or MOUNT of VENUS. It lies before and on the upper part of the symphysis of the ossa pubis; it is on eminence formed by fat in the fubjacent cellular membrane, and in adults is generally covered with hair.

MONTA PANNA. See PALMA JAPONICA.

MONTIA. A plant in New Spain was thus named by Dr. Houstoun, in honour of Dr. Monti, professor of

botany at Bononia. Is is of no medical ufe.

MORBI ORGANICI. Difeafes of particular organs
of the body. It is fynonymous with Dr. Cullen's locales.

Sec LOCALES.

MORBILLI. The MEASLES. Avicenna calls them variola cholerica. They are also named rubeola. Dr. Cullen places this genus of difease under the name ra brola, in the class pyrexize, and order exanthematze. He diftinguishes two species. 1. Rubeola vulgaris. When the cruptions are very small, consluent, and corymbose, hardly rising above the skin. 2. Rubeola variolares. When the cruptions are distinct and elevated. This diforder appeared in Europe about the time that the small-pox appeared and hath great affinity to it. They both come from the East, are both infectious, and only attack the fame person once, though some fay this is not

The meafles is an acute diforder; Dr. Mead fays it is of the peripneumonic kind; fome call it an eruptive fever of a fimple, inflammatory nature; others rank it as an eruptive catarrhal fever; Dr. Morton fays, that the fearlet fever is the confluent meafles; and Dr. Watfon observes, that in the fmall-pox the eruption is critical, but not fo in the meafles; there the eruption is merely fymptomatic, as it is well known that the cough, the peripneumony, &c. are not relieved by the eruption, but most generally con-tinue after it is over; and further he observes, that it is a common notion that the measses are a good preparative for the fmall-pox, but that the opinion is false, and that from experience, he observes, it is most prudent not to inoculate for the small-pox, until at least fix months after a bad kind of the measses.

All ages are subject to this difease, but it for the most part attacks children. In great towns it is more

fatal than in villages.

In some constitutions the measses give notice of their approach many days before an evident invasion, by a small, frequent, and dry cough, without any other sensible comfrequent, and dry cough, without any other fensible com-plaint, though more frequently by a general uneafinefs, by fuccessions of shivering and heat, and by a severe head-ach in grown persons, a heavines in children, and often hoarseness, and by what more particularly charac-terises this distemper, an inflammation, and a considerable heat in the eyes, attended with a swelling in the eye-lids, a dessurion of sharp tears, and so acute a sensation in the eyes that they cannot bear the light, by very fre-quent sneezing, and a dripping from the nose. Sooner or later a severishness is manifest, and then it soon in-creases, a cough comes on, a stussing, with a degree of creases, a cough comes on, a stuffing, with a degree of anguish, and continual retching to vomit; violent pain feizes the loins, and fometimes a loofeness, in which case the vomiting is less troublesome. In some a considerable sweating chiefly prevails. The symptoms are generally more violent than in the milder kind of small-pox; they usually increase to the fourth day, at which time little red spots, like slea-bites, begin to appear in the time little red fpots, like flea-bites, begin to appear in the forchead, and other parts of the face, which being increased in number and bigness, run together, and form large red spots of different figures; on the third day these spots appear in some, but in others not until the fifth; these spots are composed of small red pimples, seated next each other, and rising a little higher than the surface of the skin, so that they may be felt upon pressing them slightly with the singer, though they can read streaks or sufficience be seen; many of these spots soon joining, form red streaks or sufficience, larger or smaller, which inred fireaks or fuffusions, larger or finaller, which in-flame the fkin, and produce a fwelling of the face, whence the eyes are fometimes closed; each spot or suffusion is elevated a little above the face; in the other parts of the body this elevation is not perceptible by any circumstance but the roughness of the skin; this cruption first appearing in the face, is afterwards extended to the breast, back, arms, thighs, and legs, and they generally spread plentifully over the breast and back, and fometimes red effusions are feen on the breast, before any MONSTROSTRAS, Monster. It is generally apMONSTRUM. Plied to preternatural productions amongst animals, with instances of which Schenthing appears on the face. The eruption is not followed by fo fentible an abatement of the fymptoms in the meafler,

totally abate, but the cough, fever, head-ach, &c. grow more violent; the difficulty of breathing, the weaknets of, and defluxion upon the eyes, the confirmt drowfinefs and lofs of appetite, perfift in their former flate. Sometimes a bilious vomiting is observed a day or two after the eruption, which is considerably useful. Sometimes the patient is relieved by a copious discharge of blood from the nose, and of the dulcified mineral acids, will be absolutely negative every by a copious discharge of blood from the nose, after the discongraph of the complete of the cruption, which is considerably useful. Sometimes the patient or any of the dulcified mineral acids, will be absolutely negative every abates, the complaints in the head, every which greatly abates the complaints in the head, eyes, and throat. On the third or fourth day after the eruptions first appear, the reduces diminishes, the spots dry up and fall off in branny scales, the forehead and face grow rough, but, in the other parts of the body, the spots appear very large and red; in about another day, fooner or later, ac cording to the malignity of the symptoms attending, all spots are vanished in the face, and but few remain elsewhere; the face and limbs, and sometimes the whole body, is, as it were, covered with bran fprinkled over them; but in fome feafons, this branny appearance is not attendant. On the ninth day from the beginning, when the progress hath been speedy, and on the eleventh when it hath been flow, no trace of redness is to be found, and the furface of the tkin foon refumes its usual appearand the luriace of the fkin foon returnes its ulual appearance. At the going off of the fpots, the defluxion on the eyes increase, the fever and difficulty of breathing increase, the cough becomes more troublesome from the defluxion on the lungs, so that the patient can get no rest in the day, and very little in the night; this bad symptom is worst after too heating a regimen, and too warming medicines, which are often used to promote the eruptions; from these circumstances arises a peripacumonia, which destroys a great number of patients. The bad symptoms are often followed by a looseness, which immediately succeeds the disease, and continues several weeks after all other symptoms are quite removed. This looseness is often stall. Sometimes it happens that after an hot regimenthe eruptions turn livid, and then black; but this occurs only in grown persons, and except due bleeding and cooling antisepties prevent, it is stall. If during the course of the disease, or immediately after it, some considerable evacuation, such as the vomiting of a bilious matter, a bilious looseness, a considerable discharge by urine, or plentiful sweating comes on, the patient recovers soon after the spots disappear from the skin; but sometimes for want of these evacuations, the venom of the disease is not duly expelled, but is translated to the lungs, occasioning inflammation there, with a fever, anguish, cough, or other symptoms, and along with them no small danger of life. This outrage is usually less vehement than what attends the measures, but it proves tedious and chronical, and the cough resembles the hooping-cough; but when a cool regimen hath been used, these consequences are rare. ceeds the difease, and continues several weeks after all

quences are rare.

The measles in their dangerous state may be considered. as a peripneumonia. The favourable fymptoms are, a moderate loofenefs, a moift fkin, and a plentiful difcharge of urine. If the pain in the head, which attends in the beginning, continues through the various stages, it generally leaves some bad complaint, and, not feldom, a gutta serena. When the measses are over, if a cough and hoarseness remain, a consumption is likely to follow. The dangerous fymptoms are, a fudden disappearance of the fpots, a delirium, great loss of strength, coldness of the extremities, reftlessness, violent vomiting, a continual cough, profuse sweats, convulsions, a distinculty of swal-

lowing, the fpots turning pale, or livid.

The regimen should be the same as in the small-pox; but when the fpots are gone, do not expose the patient too suddenly to a cold, or a damp air, for thus an asthma

may be brought on. Bleeding very rarely fails to be a first step towards re-lief in this disorder. If the symptoms are very mild, this operation is not necessary; but if the heat is considerable, the breathing much affected, or the breast seems oppressed, blood must immediately be taken away, and bleeding may be repeated at any time of the disease, if the pulse is hard, and other symptoms seem to require it. When symptoms are violent, there is danger of an influence in the pulse is a second or seems to be a second or seems to require it. inflammation of the lungs; therefore, whether the erup-tions have not appeared, are already out, or on the decline, the lancet must not be spared.

The regimen, and other means, being of the cooling kind, the cough will demand attention; it, with the hoarfeness, are best relieved by vapours of warm water re-

coming on of bad fymptoms, after the difappearing of the measles, is owing to the retrocession of the morbid acrimony; and that they may be prevented by giving finall dofes of the bark in substance, with a little watery extract of myrrh in fmall cinnamon water; thus, he fays, the fever and the cough will cease on the seventh day, but the efflorescence stays on the face until the twelfth, because the bark prevents the retrocession of the morbid

If hæmorrhages happen, avoid aftringents, and ftrong opiates; but gentle opiates may be uled, with vitriolic acids and the bark.

A looseness coming on in the beginning, or any other period of this disease, is useful if it is moderate, but if it feems to affect the strength of the patient, it must not totally be neglected, nor yet checked very fuddenly; bleeding is generally necessary in this case, and small doses of rhubarb may be given with the testaceous powders. If the loofenels attends after the meafles are past, a few grains of the cort. eleuther, may be added to each dose of other medicines; rhubarb may be given every

morning, and a gentle opiate at night.

If fymptoms of a peripueumony come on, treat the case as a peripueumony in its first state: e. g. bleed, apply a blister between the shoulders, and give the antimonial powder as is usual in that fever.

If convultions proceed from the meafles, immediately

apply a blifter.

If the puftules fink fuddenly, proceed as in the fmallpox under the same kind of circumstance.

When the meafles go off, gentle purging should be re-

When the measures of oir, gentle purging thould be repeated, or perfpiration kept up for fome days.

Those who die of the measures, are usually taken off on the ninth or tenth day by a suffication, or by an inflammation in the lungs. Some, when the disease is ended, have a looseness, which continues several weeks, and brings on a mortal tabes; and others have a flow sever, with an atrophy, and a swelling of the belly, which are

The measter may be inoculated by means of the hot sharp rheum, which distils from the eyes, or from the blood, or by means of slannels placed under the arm-pits, where the effluvia may be imbibed, and this applied where a small puncture is made. Tissot assures us, that he practiced the incomplation of the measter for twelve years, and tifed the inoculation of the meafles for twelve years, and the more he inoculated, the more he faw reason for encouraging others to do the fame. Dr. Home of Edin-burgh proposed, by inoculating the measles, to prevent its mortality, to prevent the cough, and to prevent the dif-orders which in the natural way are confequents of this dif-cafe: and his experience manifelts the advantage of in-

oculating the meafles, to exceed even those which are ob-ferved from inoculating the small pox.

See Hossman, Mead, Wallis's Sydenham, and Hux-ham on the Measles. Dr. Homes's Medical Facts and Experiments. Tissor's Advice to the People. Lond. Med. Obf. and Inq. vol. iv. p. 132-135. and p. 247-260. Brooke's and the London Practice of Physic. Med. Mus. vol. ii. p. 46-48. Cullen's First Lines, edit. 4. vol. ii.

p. 173.
MORBILLOSA. Belonging to the Measles.
MORBUS. A DISEASE. Galen defines it to be "fuch a preternatural disposition or affection of the parts of the body, as primarily, and of itfelf, hindered their natural and proper action." Hippocrates fays, "a difease is that which afflicts a man." Dr. Geo. Fordyce, in his Elem. of the Pr. of Phys. fays, "A difease is such an alteration of the chemical properties of the fluids or folials, or of their creamization, or of the afficient of the fluids or folials. folids, or of their organization, or of the action of the moving power, as produces an inability or difficulty of performing the functions of the whole, or any part of the fystem, or pain, or preternatural evacuation. Some define diseases one way, and some another; some describe diseases by their cause, and others by their effect, so that much perplexity and uncertainty is met with on this fubject.

Dr. Wallis, in his comments on the works of Syden-ham, attempting to obviate these difficulties, has given a definition of discase, which seems to comprehend the more violent, and fainting, which last is more frequent, more violent, and when the blood, which is evacuated, is whole. He says, "Discase is a practer, or super-patural affection of some part or parts, or the whole of the machine, by which the system is injured and disturbed; This disorder seems to differ not from a vomiting of the action of a part impossed as destroyed. or the action of a part impeded, perverted or destroyed, attended with peculiar fymptoms, adapted to the nature of the affection, and parts affected; or appearances deviating from health, from fome general or partial affection, by which the fyllem in general, or in part, is oppreffed, or disfigured."

As to particular difeafes, that immediate and constant effect of the immediate cause which in all cases occurs, constitutes the difease, and the relation of this with refpect to any particular difease, is its definition; e. gr. an inflammation is a too rapid afflux of humour through the part. If it is faid, that this is not different from a congestion of blood, it is answered, that a congestion of blood is too great an afflux of fluid to the part: the one is too rapid, the other too great; in the one the humour flows through, in the other it slows to the part: and further to diftinguish them, it may be observed, that inflammation is too rapid an influx from an erethifm as the immediate cause; and a congestion is too copious au influx, from a

relaxation of the part, as its immediate cause.

Discases are divided into acute and chronical; but, perhaps, the division would be better, if the distinction was

into febrile and not febrile.

Several professors of medicine have arranged difeofes under their respective classes, orders, genera, &c. The following is according to the method purfued by that celebrated teacher of the healing art, Dr. Cullen. See his Synopsis Nosologiæ Methodicæ, edit. 5.

Ordo I. Febres. II. Phlegmafiæ, III. Exanthemata. Classis I. Pyrexize, IV. Hæmorrhagiæ. V. Profluvia. Ordo I. Comata. II. Adynamiæ. Cl. II. Neuroses, III. Spaimi. IV. Vefaniæ. Ordo I. Marcores. Cl. III. Cachexize, II. Intumescentize. III. Impetigines. Ordo I. Dyfæsthesiæ. II. Dyforexiæ. Cl. IV. Locales, III. Dyscinesize. V. Apocenofes. V. Epifchefes. VI. Tumores. VII. Ectopiæ. VIII. Dialyfes.

These orders are again subdivided into near 150 genera.

Anatomy, by J. B. Morgagni, M. D. translated into Engglish by B. Alexander, M. D. Ramazini's Treatise on the
Disorders of Artificers, translated into English by Dr.
James. Essay on the Disorders of People of Fashion, by M. Tiffot, M. D.

MORBUS is a term belonging to a variety of difeafes,

MORBUS IS a term belonging to a variety of difales, which are specifically distinguished by the terms with which they are conjoined viz. Morbus arouatus, regius. The jaundice. See seterus.

Attonitus, caducus, comitialis, herculeus, infantilis, interlunius magnus, sacer. The epilepsy, see Epilepsia. Coxarius, see Arthropuosis; Gallicus Indicus, see Lues Vetera. Hungarius called life and control terms. NEREA. HUNGARICUS, called alfo aphemerina Hunga-rica, and languor Panonicus. A kind of tertian remittent fever, which Juncker calls Hungarica Febris, five Cafrenfis; STRANGULATORIUS TRUCULENTUS IN-FANTUM. See SUFFOCATIO, STRIDULA, and NA-RIONANUS. A kind of remittent tertian fever. Puli-CARIS. See PETECHIA.

NIGER, the BLACK DISEASE. So Hippocrates named this difease. It is a concrete blood of a blackiff red co-

blood, any other than as one inftance of the fame differs from another in proceeding from a different cause.

The pains attending this diforder are fpafmodic, and-must be distinguished from an inflammation in the stomach.

The fpleen is often enlarged, or the liver much difordered in this difafe: when fymptoms indicating these attend, a cure is hardly to be expected, but great danger attends when fainting is frequent and considerable; but the worst prognostic arises from a discharge of black, pitchlike fetid matter by ftool. The patients subject to this terrible discharge of black matter by stool, are either hypochondriac or disposed to hamorrhoidal discharges; hence the spasmodic pains which are felt in this disorder, for the blood passes with difficulty through the mesaraic vessels and when in the piles a black blood is discharged, it will be easy to distinguish the piles from the black disease, by the absence of those pains in the former which constantly attend in the latter.

The fainting, which is fo confiderable in this diforder, is supposed to be owing to the putrescence of the blood, which is thrown out into the bowels, and mixes with the

During the fit, if the body is plethorie, bleed; if the pulse is quick and strong, a draught of water should be gradually swallowed, in which is a dram of nitre, and half an ounce of the fyrup of poppy heads; this may be re-peated as required. When there is great thirfl, pungent and vellicating pains, with fpafmodic ftrictures in the fide, almond emulfions, with a little nitre and fyrup of poppy heads, should be frequently drank; emollient clyf-ters with nitre should also be injected frequently.

To check the spaims, the following liniment is recom-

mended;

R Camphor. 3 i. ol. amygd. 3 i. ol. thodii, gut. xx. m. After rubbing the region of the flomach, and the left hypochondrium with this, a bladder of warm water may be

applied thereto.

After the fit, to prevent a return, give half a dram of rhubarb, in a glass of water, at bed-time, twice a week. If any other disorder is attendant, endeavour to remove it, and let a mucilaginous nutritive kind of diet be used,

but avoid oily kinds of aliment.

See Hippocrates, lib. ii. De Morbis, fect. v. Hoffman Rat. Med. Syst. Edinb. Med. Comm. vol. iv. London Med. Journal, vol. i. p. 10.

MORDEHI. Thus the East Indians call a disease to which they are subject. In it the stomach is disordered, whence arises a perpetual heat, copious sweats, and su-pervening cold, which weaken it still more. See F. Host-man, De Morb. Epid.

MORDEXYN. At Goa, in the East Indies, a dif-order is very common which feizes the patient suddenly and unexpectedly; it is attended with a continual nausea and vomiting. It often proves satal. F. Hossman, De

Morb. Epid. MORHUA.

Sec ASELLUS MAJOR.

MORILLE. See AMANITA.

MORINA. A plant to which Tournefort gives this name, in honour of Dr. Morin of Paris. It is cordial

and perfpirative. MORINGA.

A large tree in Malabar, and other parts of the East Indies, whose fruit is a foot long, as thick as a carrot, with eight corners, and delicious to the taste. The leaves, roots, bark, and fruit, are antispasmodic and sudorific. See Raii Hist.

MORO. An abicels in the fieth, refembling a mul-

MOROSIS, from a, priv. and mens, the mind; or autos, fultus, folly, flupidity, also fatuitas. STUPIDITY, IDIOTISM, DEFECT OF IMAGINATION. The Greek word merefis, corresponds most with our English word FOOLISH-NESS (in the common acceptation of it), which is, when reason is rendered somewhat defective. The immediate lour, and mixed with a large quantity of infipid acid, or viscid phlegm, which is thrown up by vomit. This evacuation is generally preteded by a pungent, tentive pain, in both the hypochondria, and the appearance of the cuerous of the cuerous tentive pain, in both the hypochondria, and the appearance of the cuerous of the cuerous continues to the age of puberty, it is hardly in both the hypochondria, and the appearance of the MOR

MORPHEA. MORPHEW, SCURF. It is ranked as a species of leprosy, though differing from it in this, that the seat of the leprosy is in the slesh, but that of the morphese in the skin. The alphus is sometimes thus

named.

MORPIONES. CRAB-LICE. They are fo called from their refembling crab-fish. They are in the armpits, eye-lids, eye-brows, and pudenda of grown perfors. They are flattish, and slick so close to the skin as with difficulty to be dislodged. They are also called plattule, perole, perfolate, and, from their often insesting the pubes, they are called pediculi inguinales. They are destroyed either with black soap, or mercurial ointments, or a solution of sublimate in rose-water, of which last the proportion may be 3i. of sublimate to this of the water.

MORS. MORZ. See HIPPOPOTAMUS.

MORSELLUS, or Morsulus. A LOZENGE OF

MORSURA. A BITE, generally understood to be venomous, as of a mad dog, a viper, &c.

MORSUS. A BITE. Figuratively it is used to express a fort of pain resembling that which is excited by a bite,

or by gnawing.

MORSUS DIABOLI. The Devil's Bite. In anatomy it is the jagged extremity of the Fallopian tubes of the uterus. See Tubæ Fallopianæ In botany, it is a species of scabius; viz. the scabiosa succisa, Linn. Devil's Bit. See Succisa.

DEVIL'S RIT. See SUCCISA.

— GALLINE. See ALSINE.

— RANE. See MICROLEUCONYMPHEA.

MORTA. The fame as pumphigus.

MORTARIOLUM. In chemistry, it is a fort of mould for making cupels with. In anatomy, it is the fockets of the teeth.

MORTIFICATIO. A MORTIFICATION. From mers, death, and facto to make. The Greek word sphacellus is very ambiguous in its use among the ancients.

Hippograpes uses this term in different senses; sometimes Hippocrates uses this term in different senses; sometimes he confines it to a corruption of the bone, and in this fense Celfus uses the verb vitiari; but these words were afterwards, and now are used in general to express the corruption of the siesh at well as bones, as Galen in many places expresses, and the present use of the word in places expresses, and the present use of the word in practice testifies. For a mortification of the soft parts only, Hippocrates often uses the word sapran, mydosan, and sepomenen. The word sphacesus was used by the ancients to express violent pains, violent inflammations which tended to mortify the part where they were seated, a mortification in part, or in general, and also the withering of any part. Galen says, in Com. iv. Lib. de Art. & Com. vii. Aph. I. that sphaces is taken for an incinient gangener. incipient gangrene.

Boerhaave fays, that a gangrene is a beginning mortifi-cation. Mr. Pott observes, that a gangrene is in the cel-lular membrane and the skin; but that a sphacelus, or mortification, is deeper, attacking the muscles. When a mortification is in the bone, it is called a caries. Dr. Cul-len considers the mortification (which he names sphacelus), not as a genus of disease, but as a mode of inflammation

terminating.

A mortification is, when all vital action ceases in a part, or is the putrefaction thereof, whilst a principle of life remains in the rest of the body. Celsus describes the progress of a gangrene and sphacelus thus: "In this species of ulcer, the flesh is black, or livid, also dry or parched, and the external skin is generally full of blackish pustules; then that which is next to it is pale or livid, and almost extraoringues, and without tensation. It is full worse almost æruginous, and without sensation. It is still worse in a inflammation, fince all the symptoms spread at once the ulcer into the puffulous place, the puffules into that which is pale and livid, the pale or livid into that which is inflamed, and that which is inflamed into that which

an injury done to the head, or other evident cause, if it continues long, it becomes incurable. But the flupidity which consists in a loss of memory, and succeeds a lethargy, spontaneously ceases when the lethargy is cured. See AMENTIA.

MOROSITATES. Diseases which render it dissipult to please, to gratify, or to satisfy. Dr. Cullen makes it spontaneous with dysorexize. Appetites erroneous and desective.

Monantem a course that it is very proper to distinguish betwirt local gangrenes inclining to spread, and gangrenes from a bad habit; on which he observes as follows:

"When the martification arises simply from injury done to the limb, it is not preceded by a gangrene, but comes on in consequence of an absolute stagnation of the blood and justices alone, and accordingly the skin, and all the injured parts, become dead and putrid at the same time, without any necessary and accordingly the skin, and all the injured parts, become dead and putrid at the same the injured parts, become dead and putrid at the fame time, without any previous emphysema. A mortification arising indeed from a weakness, and deficiency of native heat, comes on in the same manner, only more gradual, with the same appearances; but the state of the patient will easily lead to the nature of the disease. When external injury is the cause, if an incision is early made, the part is insensible, and no other than extravastated blood is discharged. In this kind of mortification, the counterparts is stronge, now does any other sever supergraph but nance is ferene, nor does any other fever supervene, but such as is common to contusted wounds; and, unless the affected part is very near the body, the disease slowly extends itself by the acrid sluids corroding the neighbouring parts in the manner of a caustic, till matter enough is ab-forbed to contaminate (unless prevented) the whole mass of blood. But a ftop may be always put to local fphacelus; for a mortification rarely arries merely from the injury done to the part, which would not give way

to proper management.
"When a mortification (fuppose when a compound fracture hath happened) arises from an internal cause, that is, from a gangrenous disposition of the juices; soon after the injury is received, whether a large wound is made by external violence, or a small wound by protrusion of the broken bone, the lymph which stagnates about the wound immediately inflames and corrodes the veffels which contain it; when air-bubbles in the adipofe and other membranes are inflantly fet at liberty, which air-bubbles, by increasing the inflammation, are increased, and extended immediately upon the smallest degree of obstruction taking place, all over the limb, &c. an emphysema often first ing place, all over the limb, &c. an emphyfema often first discovering the tragedy that is acting under the skin, not yet apparently diseased. A fever at this time frequently comes on, accompanied with a delirium, great dejection of spirits, and often a particular wildness in the looks; the pulse is either quick, low, weak, and fluttering, or quick, unequal, and hard, and the scene is frequently closed with a rapidity that will not admit of affistance. If an incision is made into the affected part, when the air-bubbles are first formed, it is sensible, and blood is discharged from the arteries, in a florid state, as free as usual; the adipose membrane is of a darkish yellow coufual; the adipofe membrane is of a darkish yellow co-lour, and the muscles only appear browner than common. Afterwards the skin becomes instated, and the muscles, Afterwards the ikin becomes inflated, and the mulcles, not yet having loft their fhape, frequently force themfelves out immediately upon making an incifion, with a large difcharge of wind, and a quantity of frothy matter; the blood in the veffels is now turned to a black coagulated mafs, the adipofe membrane, and the membranes in the interflices of the mufcles and fibres, and the mufcles themfelves, putrefy; and, laftly, the fkin also becomes livid and putrid; from all which it is evident that a garging brings on a subseclus, while the blood is a gangrene brings on a sphacelus, while the blood is yet circulating in the vessels."

The usual figus of a present gangrene are, the sudden

removal of inflammation (when inflammation attends); the leffened fensation of the part, the skin does not so the feliened feniation of the part, the fkin does not fo fpeedily mortify as the cellular membrane; hence, till the fkin is deftroyed, there is a little feeling. A pale, cineritious, dark, livid, or black colour, which is always worfe as it recedes from the pale to the black. Softness and flaccidity of the parts, so as to retain the impression made by the finger; pustules or blisters, full of lymphatic, yellowish, or reddish ichor; this is generally accounted the mathematonic sign of a gangrene on the extendi the pathognomonic fign of a gangrene on the external part of the body. When a gangrene is induced by cold, an itching and a violent fense of puncture, together with intense redness, soon succeeded by blackness, which indicates mortification: the cold produces first a paleness, which is succeeded by redness accompanied by a trouble-fome pungent pain, or an uneasy itching. Then the redness is increased to a purple colour, and then the part

becomes black.

The immediate cause is, the reduction of the vital

heat in the part to a certain degree below that which occurred, no time should be unnecessarily lost in having

health requires.

The mediate causes are, violent inflammation, which, by the heat attending, so diftends the cellular membrane as to compress the vessels, stop the circulation in the adjacent parts, and deftroy the vital action there. The acrimony of the juices by rupturing the veffels in an inflam-ed part, occasions an extravafation of blood, which putrelying, produces a mortification. A contusion or wound of the ipinal marrow, by preventing any further influx of the vital heat to the parts below where the injury is reecived, causes a mortification there. External compresfion, intenfe cold, compression from tumors internally, poifons, &c.

The prognostics are to be taken from the patient's age, the attending diforder (if there is any), the circumftances of the mortification, the strength of the patient, a know-

ledge of the caufe, the feason of the year, &c.

The indications of cure are, to confirm the strength, or to raife and maintain the vital heat a little above the natural healthy degree, to prevent the ingress of the putrid matter into the veins, to check and remove the putre-

faction formed.

The bark is the only known specific, but yet its use is not to be indifcriminately admitted of in every cafe; in habits that are lax and feeble, no objections can occur to prohibit it; but in inflammatory habits nitre, or mineral acids, fhould accompany it if given, and great caution is necef-fary before it is directed. If the inflammation is confiderable, the mineral acids are more proper than the bark.

If the pulse is strong, large, and hard, and the extre-mities of the body are warm, the urine red and high co-loured, the circulation is sufficiently strong, so need not be increased; but, if the pulse is weak, and the symptoms indicate a defective vital heat, cordials will be necessary.

The following preparation of the bark will be advifeable, R aq. fontan & aq. cinnam. fort. \$\overline{a}\$ 3 4. pulv. cort. Peruv. 3 fs. m. cochl. ij. omni femihora fumend.

agitata phiala.

Mr. Pott's observes, that a mortification proceeds from a circulation that is too rapid or too languid; that, in the first case, bleeding and diluters, and in the second, cordials and invigorating medicines, must be prescribed. When a mortification is from an internal cause, there is ufually great pain, and opium is directed to be freely ufed. This should be done whether the cause is internal or external; in these cases opium is the greatest cordial

If a putrid scurvy affects the patient, administer such medicines as will oppose it; or if any other disorder at-tends, the proper means must be made use of, by which it

may most speedily be removed.

The external applications should be removed as often as they feem to have acquired a putrid fmell, which will be in three or four hours, while the diforder is in its pro-grefs; but when it abates, the dreffings may continue pro-

portionably longer.

As an external application, Heister recommends the following: R Aq. calcis f. h i. fp. vini camph. 3 iii. aquæ ammon. 3 fs. m. Apply it frequently and warm; it is powerfully antiputrescent, it stimulates and digests. As a cataplasm, the cataple cumini is most commonly di-rected, and rarely need be set aside for any other. When a mortified part is scarified, immediately soment it with a proper antiseptic somentation made warm, and after somenting it for some time, apply a warm antiseptic cata-plasm. If emollients are mixed with antiseptics, they affift in separating the putrid parts, and stopping the farther progress of the mortification.

When the eschar or the mortified parts begin to sepa-

rate, remove no more at each dreffing than comes away without pain or lofs of blood. Bladders of warm water may be laid over the dreffings; they continue the heat

much longer and more equally.

That species of mortification which arises from cold, see in the article Congelatus.

Some inflances of mortification require that the limb be amputated. When this misfortune happens to the extremities, and penetrates to the bones, deftroying the whole furrounding foft parts, amputation is often necessary. However, in general, amputation should not take place until a separation of the mortissed part from the sound is perceptible. But as soon as this separation hath

recourse to the operation; for so long as any of the cor-rupted parts remain in contact with the sound, the system must still be suffering by the constant absorption of putres-cent particles. For instances of deviation from this gene-ral rule, see the articles FRACTURA, ARTERIA, &c. It formetimes happens that the arteries of the lower extremities offify, which, by destroying the elasticity, produces a mortification, which appears first at the toes, and afterwards in the limb, nearly as high as the offification terminates: so that in mortifications from this cause, we feet the state of the limb. why the amputation, during their increase, is of so little service, unless performed above the offisication; but we have no way to judge where the offification ends, except by the inference we make from the gangrene flopping. It may be further added, that, at the point of alteration

from a meetification, the adjacent part is yet in a bad flate, and should be still left quietly, until, with the assistance of cordial, &c. medicines, granulations of good sless appear on the found part; and discover the healthy state of the blood. Until this appearance, amputation is but rarely to

be admitted.

be admitted.

MORUM. An excrescence on the surface of the skin in many parts of the body, refembling a mulberry.
When this happens on the eye-lids, the Arabians call it alchute.

alchute.

MORUS. The MULBERRY-TREE. The morus nigra, Linn. Its fruit hath the common quality of all other fweet fruits, abating heat, quenching thirft, and promoting the groffer feerctions. A fyrup is made of the juice of this fruit, but otherwise it is of very little use in medicine. See Raii Hist. See also Lignum Fla-

MORXI. A peftilential diftemper very common in Malabar and other parts of the East Indies.

MOSA. A fort of liniment such used in some parts of Germany; it is made of wheat-flour and milk, and is of no greater confiftence than what requires a spoon for eat-MOSCH.

Castellus says they are a fort of roriferous

veffels, which Billius discovered in the kidneys.

MOSCHATELLINA, called also ranunculus nemore-

MOSCHATELLINA, called also ranunculus nemorofus, arifiolochia rotunda concava, &c. denticulata. It is
called moschatellina, as, diminutive from moschus; that
is to say, it is a small plant which smells like musk. Its
root is resolvent and detergent. See Raii Hist.
MOSCHUS. Musk. It is an odoriferous grumous
substance. The animal which affords this odoriferous
drug, is the capreolus moschi of Gesner, animal moschiferum of Ray, &c. the Musk animal of Le Brun, &c.
the capra moschi, cervus odoratus, the moschus moschi
ferus of Linnæus, and the TIBET MUSK of Pennant.
This animal is a quadruped, with cloven hoofs, somewhat of the form of a roebuck, according to Mr. This animal is a quadruped, with cloven hoofs, fomewhat of the form of a roebuck, according to Mr. Pennant's description of it, who further informs us, that the noted drug which bears the same name with this animal, is found in a bag or tumor of the size of a hen's egg, on the belly of the male only; this bag is kidney-shaped and pendulous, furnished with two small orifices; the largest is oblong; the other is round the one is naked, the other is covered with long hairs. The musk is contained in this. The hunters cut off the bag, and tie it up for sale. The Tibet musk is the best, and is the strongest in rutting time. See Pennant's Hist. of Quadrupeds. of Quadrupeds.

Pomet gives a good figure of this animal in his Hiftory of Drugs. The best mu/k is brought from Tonquin in China; it is in thin bags that have brownish hairs; an inferior fort comes from the East Indies in bags that have white hairs in them. Neuman says, the quality of one is not inferior to that of the other.

is not inferior to that of the other.

or rufty blackish colour, in small round grains, with very few hard black clots, perfectly free from any fandy or other visible foreign matter. Chewed and rubbed with a other viable toreign matter. Chewed and rubbed with a knife on paper it is bright, yellowish, smooth, and free from grittiness. Laid on a red-hot iron it catches slame, and burns almost entirely away, leaving only an exceeding small quantity of light greyish ashes. It hath a bitterish subscrid taste, and a tragrant smell, agreeable at a distance, but disagreeable if nearly smelt to, unless weakened by a large admixture of other substances.

A small quantity macerated in rectified spirit of wine impacts a deep timely and a strong impacts and continued to it.

imparts a deep tincture and a strong impregnation to it; the spirit so covers the slavour of the mu/k, that this tincture discovers but little smell, but on dilution the full fra-grance of the musk is manifested: a drop or two communicates to a quart of wine, or to watery liquors, a rich musky fcent. The quantity of liquor which may thus be flavoured by a certain known proportion of mu/k, is the best criterion of the genuineness and goodness of it.

Rectified spirit of wine takes up completely the active

matter of the musk; watery liquors take it only in part, though, by the intervention of a mucilage, the whole quantity of the mu/k mixes with the water, as in the following mixture.

Mijiura Mofebata. Musk Mixture, formerly Jule-pum e Mofebo, Musk Julep.

Take of rose-water, fix ounces; of mu/k, two scruples; of the mucilage of gum arabic, and of double refined fu-gar, of each one dram; grind the mu/k with fugar, then with the gum, and add the rose-water by degrees. Volatile fpirits are, in many cases, a useful addition to musk, and enables the water to keep more of it dissolved; two drams of the volative spirit may be added to the above

By distillation, water becomes strongly impregnated with the fcent of mu/k, and fcems to elevate all its odoriferous matter, while the rectified spirit, on the contrary, brings over little or nothing of it.

The principal use of musk is in nervous disorders. Its impressions of the organs of smell sometimes disorders perfons who are hyfterically disposed, or whose constitutions are possessed by the state of great sensibility; yet, when taken inwardly, it abates symptoms of that kind which its smell produces. It is one of the principal of the antispassmode class of medicines. But much of the advantage of this medi-cine is loft by giving it in too fmall dofes. Dr. Wall, of cine is lost by giving it in too small doses. Dr. Wall, of Worcester, relates, that two persons, who were labouring under a subsultus tendinum, extreme anxiety, and want of sleep, occasioned by the bite of a mad dog, were perfectly relieved by two doses of musk of sixteen grains each; he surther observes, that convulsive hiccoughs, at tended with the worst symptoms, were removed by a dose or two of ten grains; that where, on account of convulfions, no medicine could be given at the mouth, mufk answered the end, when administered by way of clyster; that those who are averse to perfumes take it very well by way of bolus; that under six grains he never faw any benefit by its use, but that ten grains and upward promotes a diaphoresis without heating or giving any uneasing neis; but, on the contrary, abates pain, railes the fpirits, and, after the fweat begins, it promotes fleep; and that in maniac cases it hath afforded a temporary relief. Dr. Owen, of Shrewsbury, relates a singular instance of success from yet larger doses, in a convulsive disorder; after all other usual methods failing, he gave doses of half a dram every four hours. See Lond. Med. Obs. and Inq.

vol. iii.

Musk is best given in substance, in large doses, from half a scruple to half a dram, and these must be quickly repeated till the disease is conquered. We are to form our judgment of its goodness by the strength of its odour, our judgment of having it genuine, much of its and always be careful of having it genuine, much of its efficacy depends upon that. It is a powerful remedy in many convulfive and spasmodic affections, and has been extremely beneficial in the hydrophobia, in the gout in the ftomach, in large dofes; head-ach, and delirium, spasm of the pharynx. See Cullen's Mat. Medica, where, in large dofes, it is faid to procure fleep, and as certainly occasioning a profuse sweat, hence properly confidered

as a fudorific.

When musk occasions hysteric symptoms by its smell,

MOSCH. ARABUM. See ABELMOSCHUS. - Mose HAZUANIA. See ENDICA.

MOSQUITÆ. It is a cutaneous diforder in the Eaft Indies, which fometimes is produced by fweating, and fometimes by the bite of an infect which the Portuguese call mosqueta; whence the name of the disease. the pimples rife on the ikin, an itching immediately follows, which, if fcratched, is foon followed by an ulcer. When fweating is the cause, perspirative medicines are taken inwardly, and the itching is allayed by washing the skin with vinegar in which nitre is dissolved. See Bontius de Med. Ind.

MOSYLETICUS BLASTUS. The name of a species of cassia mentioned by Oribasius.

MOSYLLON An epithet for the choiceft cinnamon. See CINNAMOMUM.

MOTA. See CASTANEA.
MOTORES OCULORUM. These nerves are also called motores oculorum communes, oculares communes, and oculo-mufculares. These are the third pair of nerves from the head; they pierce the dura mater by the fides of the cella rurcica, run through the foramen lacerum orbitale superius, and go to all the muscles of the eyes, except the obliquus superior and abductor of each. They go likewife to the levator palpebræ superioris, and send twigs to form the ciliary nerves; fome twigs are also fent to the choroides and iris.

- OCULORUM EXTERNI. These nerves are also called oculares externi, ophthalmici externi, orbitarii, and sculo-mufculares-externi. They are the fixth pair of nerves that go out from the head. They lie between the fifth, go to the abductores oculorum, run forward on the fide of the fella turcica, and get into the orbit by the foramen lacerum orbitale fuperius; by the fide of the fella turcica they give off what is called the beginning of the intercostal nerves, but are more properly branches of

the intercoftal, which join these nerves.

MOTORII. Diseases from clonic spasm. See Spas-MUS CLONICUS. Also the MOTORES OCULORUM.

MOUL-ELAVOU, also called arber lanigera, spinosa, gossipium arbereum caule spinose. It is a tall cotton-bearing tree; of the bark of the root an emetic is prepared.

MOUL-ILA, feu MOUL-ELAVOU. The INDIAN LEMON-TREE, the fruit of which is both acid and aromatic like the pepper. See Raii Hift.

MOULLAVA. A podded Indian plant; but it is not noted for any medical virtue. See Raii

Hift.

MOUROUVE. Ray mentions this as refembling a

MOUNT-Ston Water, by T. Houlfton, M. D.

MOXA, or MUGWORT of CHINA. It is a follance, and more called a tremping Chinage.

nous fubstance, prepared in Japan from the young leaves of a species of mugwort, by beating then together when thoroughly dried, and rubbing them betwixt the hands, till only the fine fibres are left.

The down on the leaves of mullein, cotton, hemp, &c. do as well as mexa.

In the eaftern countries it is used by burning it on the fkin: a little cone of the mona is laid upon the part, previously moistened, and set on fire at the top; it burns down with a temperate glowing heat, and produces a dark-coloured fpot, the exulceration of which is promoted by applying a little garlic; the ulcer is left to discharge, or is soon healed, according to the intention in using the

MUCAGO. See MUCILAGO.
MUCHARUM. A barbarous word, fignifying an infusion of roses, made with warm water, and with sugar

reduced to a fyrup.

MUCILAGO. A MUCILAGE, also mucago. It is any viscid glutinous liquor made with warm water, as the mucilage of gum arabic, or of quince-feeds, which are made by diffolving the gum, or the foluble part on the hulk of the feed in water.

glands about the joints, in order to the easy motion there-See SYNOVIA.

MUCILAGINOSA LIGAMENTA. See CAPSU-

LARIA LIGAMENTA.

MUCOCARNEUS. In M. A. Severinus it is an epithet for a tumor, or abfeefs, which is partly fleshy, and partly mucous, called also myxo farcoma.

MUCOSÆ GLANDULÆ. The glands discovered

by Cowper in the penis, commonly called Cowper's

MUCOSUM LIGAMENTUM. It is betwixt the nature of a ligament and a cartilage, and full of glairy matter. It is fituated betwixt each of the vertebræ, and admits them to recede from, or approach nearer to each other. To this it is owing, that at night a man is half an inch fhorter than in a morning.

MUCRO. A SHARP POINT. Those leaves or fruits of plants which are terminated in a sharp point, are termed mucronated. Mucro is also the sharp-point of the

MUCRONATUM, Os, from mucro, a point of a fword, or more properly mucronata cartilago. i. e. the ENSIFORM

MUCUNA GUACU. The largest and most beautiful kind of phaseolus in Brasil. It grows on a tree of the fame name. The beans are poisonous, but easily ren-

dered fit for food. See Raii Hift.

MUCUS. By it is usually understood that viscid fluid which is fecreted in the membrana pituitaria, and dif-charged from the nose upon blowing. But mucus is the covering for the furfaces of all the membranes in the body that are exposed to any extraneous matter; such as the fkin, internal membrane of the mouth, nofe, lungs, cefophagus, stomach, intestines, urinary passages, &c. It is a compound of coagulable matter and water. It defends the membranes from being too much ftimulated by what is applied to them. It is colourlefs, infipid, inodorous, and incapable of ftimulating; but if its fecretion is fuddenly increased, instead of a simple mucus, it becomes a watery kind of sluid, containing the salts of the blood, and, in consequence of them, is capable of stimulating, loses its quality of defending the membranes from acrimony, and further, its colour often is changed to a whitish, or a greenish yellow, and now and then it acquires a smell, and puts on in some respects the appearance of pus, but to diftinguish one from the other see Pus. See Fordyce's Elements, part i. p. 21, &c.
MUGILIS. MULLET. This in the proper fense is

the mugil, or cephalus of the generality of authors, called also cephalos, the cephalus of Aristotle and the Greeks, and the cestreus, or cestreus of Oppian, and others. It feems to be of a species between the carp and had-dock; less dry than the one, and more succulent than the other. It is sufficiently soluble, and nutritious. The Romans valued a fifh of this name highly for its exqui-

fite relish, but whether this be the same is uncertain.

MUGO. A name for the mountain-pine.

MULÆ. Pustules contracted either by heat or

MULIERATUS. See MALAZISSATUS.

MULLA. A name for feveral species of jeffamy. MULSUM Hydromeli, HONEY and WATER, called also acratomeli, from angaror, vinum, and 1492, mel; but then fignifies wine sweetened with honey. See Con-DITUM.

MULTICAPSULARES PLANTÆ. They are fuch as have feveral pods of feeds fucceeding each flower, as

the celandine, &c. Musculus. This mufcle lies under the fpinalis. It rifes from the roots of the transverse processes, and runs to the roots of the spinal processes; it is commonly called transversalis, and is distinguished into the transversalis collis, dessis, and lumberum. The transversalis lumborum is also called sacer.

MULTIFORME Os. See Os CUBOIDES.

MULTIPEDÆ. MULTIPEDS. They are fuch as have more feet than four. It is the fame as millepedes.

MULTIPES. POLYPUS.

MULTISILIQUÆ PLANTÆ. They are fuch as

have after each flower many diffinet, long, flender, and many times crooked cases, or filique, in which their feed

Mucilage is also that humour which is separated from is contained; and which, when they ripen, open of them-ands about the joints, in order to the easy motion there-

houfleek, &c.

MUMIA. MUMMY. This name is variously applied. It fignifies piffa/phaltum, or bitumen, or a certain liqua-men found in fepulchres, in which the bodies of men which have been enbalmed with spices, have been preferved many years, and is also given to a carease that is dried by the sun and sands. These bodies by drying are of the consistence of horn, and light, and are called white mummies. Other careases are embalmed, and then are called mummies; of this kind are those which are called Egyptian. Mumia medullæ is the marrow of the bones. Mumia elementorum; so Paracelfus and Helmont name a balfam, which is defined to be the balfam of the external elements. Munia transmarina; thus some have called manna. Munia; thus water is called which is collected in a phial from the breath of a man received therein, after washing his mouth with water. Mumia; it is a fubtil, spirituous, zetherial substance, innate in every body, and remaining therein in fome mea-fure after death. Mumia, that which is taken from a human body is a refinous matter, hath an hardened, black, shining surface, is acrid and bitter to the taste, and of fragrant finell. Mumia, that which is particularly called mummy of the Arabians, is a concreted liquor, obtained in fepulchres by exudation from carcaffes embalmed with aloes, myrth, and balfam.

MUNDICATIVA. Cleaning, deterging, purifyMUNDIFICATIVA. Sing.

CATAPUTIA MINOR.

MUNTINGIA. It is a rofe-shaped flower, of which Miller enumerates three species. Father Plumier difcovered it, and gave it this name in honour of Dr. Mun-

tingius, professor of botany at Groningen, in Holland.
MUOIDES. See PLATYSMA MYOIDES.
MURALIS. PELLITORY of the WALL. See PA-

MURARIA. SEMPER VIRENS VULGARIS. See ADIANTHUM ALBUM.

MURECI. A berry-bearing tree in Brasil; the berries are purging. See Raii Hist.

MURIA. BRINE. It is made of common falt, and fo of the fame nature and use. An acrimony in the juices refembling that of brine, is called a muriatic acrimony.

MURUCUIA. A name of fome species of grana-

MUSA, also called muza, mauz, palma bumilis, ficus Indica, bala, banana, platanus. The PLANTAIN-TREE.

Mufa is the Arabic name; bala is the Malabarian name. Though called a tree, it hardly deferves the name of a fhrub, fince it hath an annual stalk, which is like a reed. The leaves are an ell long, and three spans broad; of these leaves it is supposed that Adam and Eve made aprons. The fruit is a delicous food, and resembles meal and butter. It is found in all the eastern countries, and in Africa. See Raii Hift.

MUSADI. SAL AMMONIAC.
MUSAM. CASSADA, called alfo bulbus vomitorius.
MUSCARI. MUSK or GRAPE HYACINTH; DIP-CADI. Boerhaave enumerates twelve species, but no

MUSCIPULA, also called lychnis viscosa rubra, viftivated in gardens, but not used in medicine, though some say its feeds are warm and diuretic. See Raii Hist.

—— PRATENSIS. See BEHEN ALB. VULG.

MUSCO-FUNGO. A name of feveral species of lych-

nis and lychnoides.

MUSCOSÆ GLANDULÆ. Some of the conglobate glands are thus called, to diftinguish them from the conglomerate, which are called glandula vasculosa.

MUSCULARIS ARTERIA. See SCAPULARIA

ARTERIA.

VENA. A branch of the posterior or upper branch of the external jugular; it spreads in the muscles, which cover the scapula and joint of the humerus. Winflow speaks of its rising also from the axillaris MUSCULI

Winflow denies its existence, but others describe it as consisting of some small sibres glued together, a proper quantity of which is connected by the cellular membrane, hich fills up the interstices of muscles. Winslow says, that the elongations of the lamina of the cellular membrane may have given rife to the notion of a muse. com. memb. for in fome places this membrane is closely united

to the proper membrane of the mufeles.

MUSCULOSI. External or mufeular inflammations. MUSCULUS, from  $\mu \nu \tau$ , either a moufe or mufele.

The shell fish called MUSCLE, or MUSSEL. See MYTILUS. The WHALE, according to Pliny, see CETUS.

Also those bundless of fleshy fibres by which the motions of all animal bodies are performed; or, as fome defcribe it, "it is a bundle of thin and parallel plates of fleshy threads or fibres inclosed by one membrane; an original part of an animal body, framed of its proper membrane, fibrous flesh, a tendon, vein, artery, and nerve: it hath the power of contracting and lengthening, and is the chief inftrument of voluntary motion."

Generally the word mufculus is faid to be derived from mus, a moufe; but the true derivation is from posts, to draw or contract.

A mufcle is divided into the head, belly, and tail. The head is the tendinous part which is fixed on the im-movable joint, and is called its origin. The belly is the middle, fleshy part, whose fibres are the true muscular fibres, and have the power of motion. The tail is the tendinous part, which is inserted into the part to be moved by it, and is called the infertion.

A mufele is composed of the same number of fibres in all its parts, only those of the tendon are more compact than those of the belly.

The use of the tendon is, 1st. To avoid a large quantity of slesh, near the joint, which would have obstructed the motion of the limb. 2dly. To prevent clumsiness in particular places, for slesh in the hand would have been inconvenient. 3dly. That the sleshy part of the muscle might be nearer the center of motion. 4thly. For the better admitting of that friction, which in less compact parts would have been injurious.

parts would have been injurious.

The arteries, veins, and nerves, generally enter the middle of muscles, but this is not certain or constant; they ramify alike throughout their whole fubstance. large arteries and veins run according to the direction of the muscular fibres; the less, anastomose and run transverse. The use of the nerve in a muscle, is to bring the immediate cause of motion thereto; that of the arteries is to distribute the blood throughout the part: but a mufele hath more blood conveyed to it than is required for its nourishment, and, therefore, the free influx of blood feems necessary to the contraction of the mufele. Albinus fays, that the arteries in the mufcles terminate in the cellular membrane and the muscular fibres; but this latter termination is not to be proved.

Those mufeles which are deftined for the most action,

have the larger quantity of nerves imparted to them, and

vice veria.

The mufeles are commonly attached to the bones, and the tendons are inferted into the fubftance of the bone. When a mufele is fleshy at its insertion, it is only fixed to the periosteum. Some mufeles are fixed to cartilages, but do not fink into them, being only attached to the perichondrium. Some are fixed to ligaments; as those in the fore-arm; others into membranes, as those of the eye;

and others again into fleshy parts, as those of the torgue.

There are many divisions of muscles, such as the oblong, hollow, and mixt; the oblong are subdivided into the rectilinear, half penniform, the penniform, the complex penniform, the radiated &ce.

The appendicles of muscles, are, 1st. The fascia, or aponeurosis. 2d. The franum, or annular ligament, by which the tendons of some muscles are confined.

3d. The facculi muscosi.

Amongst the many phoenomena relating to mufcles, the following are a few which deferve fome attention. 1. A following are a few which deferve fome attention. I. A MUTITAS. DUMBNESS. The want of power to mufcle in action grows tense and shorters it can contract articulate words. Dr. Cullen places this genus of difease

MUSCULI OBLIQUI SUPERIORES NERVI, itself to as to be fhortened one third. 2. The diameter i. c. PATRETICUS.

MUSCULO CUTANEUS NERVUS. See CERvicales.

MUSCULORUM COMMUNIS MEMBRANA. 

Jured, all the involuntary motions cease. 5. If a nerve, or parties, maine to a muscle, is tied, or deftroyed, the an artery, going to a mufcle, is tied, or deffroyed, the mufele becomes paralytic. 6. Irritation upon the mufele produces motion. 7. Some mufeles continue to act, af-ter all communication with the nerves and blood-veffels is taken away. 8. The action of mufcles is inftantaneous, and, in most parts of the body, subservient to the will. This last phænomenon alone, Dr. Hunter observes, is fufficient to confute the various hypothefes of Crowne, Mayow, Borelli, Keil, Boerhaave, Baglivi, Cowper, Nichols, Vernoulli, &c. as the numerous apparatus which they suppose necessary, can never account for that instantaneous exertion which is observable in muscular motion. See Brown on the Muscles. Winflow's Anatomy.

Cooper's and Albinus's Tables of the Muscles.

Musculus Anterior Mallet. It is placed

Externus Auris Du Vernii. in a fiffure

on the temporal bone, above the glenoid cavity, where the lower jaw plays, runs inward, and is inferted into the Ravian process of the malleus irregularly forwards from the incus, and by taking off from the vibratory motion of the bones, it is supposed to fit the ear for receiving weaker

founds.

EXTERIOR. See ABDUCTOR OCULI.

See MEUM ALP. GERM.

in the class locales, and order dyscinesiae. He distinguishes affects the muscles of the limbs proceeding from the three species.

1. Mutitas organica; as when the tongue joints. See RHEUMATISMUS. is taken away, or fomewhat injured: 2. mutitas atonica; as when the nerves of the tongue are wounded, or become paralytic: 3. mutitas furdorum; as when children are born

MUZA. See Musa.

MYACANTHA. BUTCHERS-BROOM. See Rus-

MYAGRO. A name for the rapifirum, and turritis. MYAGRUM. This plant hath a turbinated fruit, like an inverted pear, unicapfular, preffing in the stalk, mentions two species. Their virtues are the same as those of rapisfrum. It is also a name for a species of turritis, of alysson, and raphanistrum.

MYCE, from www, to wink, shut up, or obstruct. A winking, closing, or obstruction. It is applied to the core.

to the eyes, to ulcers, and to the vifcera, especially the fpleen where it imports obstruction. In botany it imports a fungus. In furgery it is a fungus, fuch as rifes in ulcers or wounds. Some writers fpeak of a yellow vitriol which is called myce

MYCHTHISMOS, from augu, to mutter or gream. In Hippocrates it is a fort of fighing or groaning during respiration, whilst the air is forced out of the lungs.

MYCONOIDES. An epithet for an ulcer which is

full of mucus.

MYCTER. The NOSE.
MYCTERES. The NOSTRILS, purplus. A Greek

MYDESIS, from unian, to abound with meiflure. It imports in general, a corruption of any part from a re-dundant moisture. But Galen applies it particularly to the eye-lids, MYDON.

MYDRIASIS. A preternatural dilatation of the pupil of the eye. The fame as AMAUROSIS, which fee.

MYLACRIS. The KNEE-PAN. See PATELLA. MYLE. The KNEE-PAN, or a mole in the uterus.

MYLO-GLOSSI, from μωλη, dens molares, and γλωσσα, MYLO-GLOSSI, from μωλη, dens molares, and γλωσσα, ngua. These muscles are often wanting. They are fmall fleshy planes, fituated transversely on each fide, between the ramus of the lower jaw and the basis of the tongue; they rife from near the inner fide of the dentes molares, and thence run to the basis of the tongue.

— Hyordes. These muscles rise with a large

basis from the inferior part of the lower jaw, and are in-

ferted at the basis of the os hyoides.

- PHARYNGÆI. So Dr. Douglas calls the geniopharyngæi. So also the cephalo-phryngæi are called. See PHARYNX.

MYOCEPHALON, from uvez, a fly, and sepans, the bead. A tumor in the uvez tunica, of the eye, which re-

fembles the head of a fly. See STAPHYLOMA.

MYOCOILITIS. So Vogel names inflammation of the muscles of the belly. See INFLAMMATIO MUSC.

MYODES PLATYSMA, from μυς, a muscle, and πλαθος, broad. See PLATYSMA MYOIDES.

MYOLOGIA, from μυς, a muscle, and λογος, a dis-

course on the muscles.

MYOPIA. I from uve, to fout, and w.l., the eye.
MYOPIASIS. SHORT SIGHT, called also nuccofitas.
Because people to affected generally half shut their eyes when they intenfely look at an object. The fight of guish objects without concave glasses; this is owing to the too great convexity of the crystalline humor of the eye, whereby the rays, unless the object is placed close to the eye, are united before they reach the retina; confequently vision must be indistinct in such. The concavity of the spectacles must be proportioned to the sight, and myopes should begin with the least concave glasses, and when they read they should use them as little as they conveniently can. It is the dysopia diffitorum Culleni. See AMBLYOPIA. MYOPS. A pe

MYOSOTIS, from  $\mu \omega_s$ , a monfe, and  $\omega_s$ , an ear. MOUSE-EAR CHICKWEED. Because it hath hairy leaves, and grows longitudinally like a moufe's ear. It is called auricula muris. It refembles the alline in every respect, only the flowers are larger, and the fruit, which is like the horn of an ox, opens at the apex. Boerhaave mentions fix species, but they are not remarkable for any medical properties. See Raii Hist.

MYOSUROS, called also cauda muris, holosteum, holostes, ranunculus. MOUSE-TAIL. The leaves are gra-

mineous; it flowers in May; it grows on the way-fides;

its virtues are like those of plantain.

MYOTOMIA, from pus, a mufcle, and reure, to cut. A diffection of the mufcles.

MYREPSICA OLEUM. The oil of BEN NUT.

MYRICA. A species of TAMARISK. See TAMA-

MYRINGA. A barbarous word for the membrane MYRINX. Sof the ear called the drum.

MYRINX. Sof the car called the drum.
MYROPHYLLON, called also millefolium aquaticum. WATER-FENNEL. It grows in marthy foils, flowers in April, and is faid to be vulnerary. See Raii Hift.
MYRISTICA NUX. NUTMEG. See NUX MOS.

MYRMECIA. A fort of wart about the fize of a lu-pine, with a broad base, deeply rooted, and very painful. It grows on the palms of the hands, or on the soles of the

It is a foft and often moift fort of wart.

MYROBALANI. MYROBALANS. See ADIPSOS. They are a dried fruit of the plum kind, and are brought from the East Indies. There are four kinds, and are brought from Bengal, called faba Bengalensis, Cambaia, and Malabar. They have been recommended as somewhat astringent and strengtheners of the stomach, but are not now in use. Myrobolanss is in the Greek the fame as nux or glans unguentaria in the Latin, which, in plain English, is a NUT or ACORN sit for making pre-cious ointments. Out of the myrobalans described by Discorides, Pliny, and Galen, they used to express a fra-grant oil, which was used in ointments. Of the myro-

bolons there are different kinds, viz.

MYROBALANI BELLIRICI, called also by the Arabians Belleregi, Bellilez, Bellegu. BELLIRICK MYRO-BALANS. They are of a yellowish grey colour, and an irregularly roundish or oblong figure, about an inch long, and three quarters of an inch thick.

—— CHEBULÆ. CHEBUL MYROBALANS. These resembles the rellow fort in figure and their ridges. but

refemble the yellow fort in figure and their ridges, but

are larger and darker coloured, inclining to brown or blackish, and with a thicker pulp.

— CITRINI, vel FLAVI. CITRON, or YELLOW MYROBALANS. They are somewhat longer than the Belliric fort, have generally five large longitudinal ridges, and as many smaller between them, somewhat pointed at both ends.

EMBLICI, called also by the Arabians, embelgi, embleg, or ambegu. EMBLIC MYROBALANS. They are of a dark blackish grey colour, roundish, about half an inch thick, with fix hexagonal faces opening from one another.

INDICI, vel NIGRI, also called by the Arabians asuar. INDIAN of BLACK MYROBALANS. They are of a deep black colour, oblong, octangular, differing from all the others in having no ftone, or only the rudiments of one, from whence they are supposed to have been gathered

before maturity.

All the forts have an unpleafant, bitterifh, auftere tafte, and strike a black colour with a folution of vitriol. They are gently purgative and aftringent. The dose in sub-stance is from 3 i. to 3 ss. m. in insusion or decoction from 3 ss. to 3 i. ss. Water extracts their styptic virtue, and the extract is aftringent. The Indians tan leather with them. The false Beautiful Standard Control of the Property of the Proper with them. The faba Bengalensis, or the BENGAL BEAN, is a vitiated fruit of the myrsbalan kind; it is round, flattifh, wrinkled, and of the fize of a fmall fig, hollow in MYOPS. A person who is short sighted. the middle, of an irregular shape, hard, tough, brown MYORESHALON. A growing of the tunica uvea outwardly, and blackish within, of but little smell, and over the fight.

MYOSITIS. In Sagar's System of Nosology this word is used to signify the rheumatism, particularly when it gall. It is a powerful aftringent, it also incrassates and aftringent taste. It is vitiated by the puncture of an infect, by which it is often hollowed like a gall. It is a powerful aftringent, it also incrassates and

#### MYR [ 529 ] MYR

MYROBALANUS ZEYLANICUS. The GUM MYRON. An ointment, medicated oil, or un-

MYROXYLON. See PERUVIANUM BALSAMUM.
MYRRHA. MYRRH. It is also called flatte. It is a gummy refinous concrete. It is brought immediately from Alexandria, Smyrna, and Aleppo; but from what plant it is obtained is uncertain. It is faid to be a produce of the feandix odorata, or feandix feminibus fulcatis duce of the Jeandix odorata, or leandix teminibus fulcatis angulatis, floribus albis, Linn. Sweet-fern, or Myrrh. Curtis, in his Catalogue of the Medicinal, &c. Plants, in the London Botanic Garden, calls it myrrha. It is brought to us in globes or drops of various colours and fizes. That of a reddish brown colour, not verging too much to yellowish or blackish, which is uniform on the outside, internally speckled or streaked with white, clear and bright, somewhat unctuous to the touch, but not tenacious so as to sick to the sungers is the helf cious fo as to flick to the fingers, is the beft.

with hard, thining, yellow pieces of a gum which refembles gum arabic, and is void of fmell or taite. Pieces of bdelium are mixed with it, and are known by their darker colour, and their being foft within, which myrrb never is, also by their different smell and taste. Sometimes an unctuous gummy refin, of a moderately ftrong, fome-what ungrateful finell, and a bitterifh, very durable tafte, obviously different both from those of bdellium and myrrh. Also pieces of a hard, compact, dark-coloured kind of tears, lefs unctuous than myrrb, of an offensive smell, a most ungrateful bitterness, and of a very resinous nature. The myrrb itself is either, 1. Blackish, which is gathered from old trees, and being more refinous, is fitter for tinctures. 2. Yellow, which is from young trees; this fort contains much gum; it eafily diffolves in the mouth, hath a much more agreeable aromatic fmell, and is what should be used for pills, powders, and watery folutions.

Myrrb is efteemed as being balfamic, vulnerary, anti-feptic, attenuant, deobstruent, powerfully promoting the fluid fecretions, &c. Its dose may be from gr. v. to 3 fs.

It manifeftly ftimulates the stomach, and promotes, in small doses, appetite and digestion; but in doses of 3 is. or 3 ij. it heats the stomach, creates a frequency of the pulse, and a heat over the whole body. It may be a useful medicine in that slaceidity of the system, which is often connected with a retention of the menses, on these accounted with a retention of the menses, on these accounted with a retention of the menses, on these accounted with a retention of the menses, on these accounted with a retention of the menses, on these accounted with a retention of the menses, on these accounted with a retention of the menses, on these accounted with a retention of the menses, on these accounted with the second state of the second stat counts, though in phthifical cases in which it has been much recommended, it seems not so proper, for harm has been found to arise from it in complaints of this fort.

It diffolves almost totally in boiling water, but as the Equor cools, the refinous part subsides; and if the solu-tion is evaporated to an extract, the bitter of this drug only remains. By distillation with a boiling heat in water, the whole of its flavour arises, partly impregnating the distilled water, and partly collected and concentrated in the form of an essential oil, which is in smell extremely fragrant, and rather more agreeable than the myrrh in fubitance; in tafte remarkably mild, and so ponderous as to fink in water. From 3 ii. to 3 iii. of this oil are obtained from 3 xvi. of the gum. Rectified spirit dissolves less myrrb than water does; but it extracts more perfeelly that in which its bitterness, flavour, and virtue con-fift. The spirituous solution contains all the active matter; in distillation nothing is carried away by the spirit, fo that the extract obtained from a spirituous solution is a very fragrant bitter, tenacious refin, and possesses all the virtue of the myrrb.

The London College directs the tincture of myrrb to be prepared in the following manner. Take myrrb, bruiled, three ounces by weight; proof spirit of wine, one pint and a half; rectified spirit of wine, half a pint; digest with a gentle heat for eight days, and strain. Pharm. Lond. 1788.

Elinir Myrrhæ Compositum. The Compound Elinir of Myrrh. Now called Tinesura Sabinæ Composita. Compound Tinesure of Savin.

allays acrimony. See Raii Hift. Tournefort's Mat. 2 pint. Digest until the extract is dissolved, and strain. Med. Pharm Lond. 1788. This was formerly called elixir uterinum.

## Tinel. MYRRHE & Aloes

R Myrrb. pulv. 3 i. fs. aloes hepat. 3 i. fp. vini. r. fb i. m. This is frequently used externally as a vulnerary.

Pulv. c MYRRHA Comp. Compound Powder of MYRRH.

Take of the leaves of dried rue, favin, myrrh, and Russia castor, of each an ounce, mix and beat them into a powder. Pharm. Lond. 1788.

## Oleum MYRRHE per Deliquium.

Boil an egg very hard, take out the yolk, and fill the cavity with myrrb, bind the divided fides together, fet it in a cool moift cellar, and it will all run into a liquid.

It is used for removing freckles on the face. It possesses all the finell and tafte of the myrrb; it may be precipitated and coagulated by fpirit of wine; and this coagulam is again diffolved by water. See Raii Hift. Miller's Bot. Offic. Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

MYRRHA. See ANIME. MYRRHINE. The MYRTLE. See MYRTUS. MYRRHIS, called also cerefolium Hispanicum, conile, cicutaria odorata, SWEET CICELY, GREAT CHERVIL. It is the feandix odorata, Linn. Boerhaave enumerates fifteen species, and gives the following as characters; the petals are unequal, the feed striated, refembling the beak of a bird. This plant is cultivated in gardens, and agrees in virtues with chærefolium. It also hath something of the tafte of cloves, and, like them, is useful in the scurvy. The branches resemble those of fern, have a pleasant aromatic finell, the stalks are hairy, the flowers are white, and appear in May or June. It is more an esculent than a medicinal plant, though it is somewhat diuretic. See Raii Hift.

MYRRHIS ANNUA. See DAUCUS CRETICUS.

— SYLVESTRIS. A name of the caucalis fylvestris folio charophilli; also charophillum sytvestre, &c.

MYRTACANTHA. See Ruscus.

MYRTIDANON. By this Hippocrates means the berries of the Indicon, which he says the Indians call peppers.

per. But Disocorides means by it an excrescence which grows on the trunk of the myrtle, and which is more aftringent than the myrtle itself.

MYRTILLA. See MYRTUS.

MYRTOCHEILIDES. A name for the nymphæ of

the female pudenda.

MYRTON. The CLITORIS.

MYRTUS. The MYRTLE, called also myrrhine. Some derive the name from myrrba, because it smells like myrrh; others from Myrtha, a virgin, faid to be turned into this tree after her death; the was beloved by Pallas.

MYRTUS BRABANTICA, and ANGLICA, called alfo rhus myrtifolia Belgica, gale, frutex odoratus septentriona-lium, elaagnus, elaagnus cordo, chamalaagnus Dodonao. Gaule, sweet-willow, Dutch Myrtle.

It is a fmall fhrub, much branched, with oblong, fmooth, whitiful green leaves, formewhat pointed or converging at eachend; amongft which arifepedicles bearing fealy cones, which include the feeds, one little feed being lodged in each feale. It grows wild in wafte watery places in many parts of England. It flowers in May or June, ripens its feeds in August, and loses its leaves in winter. The leaves, flowers, and foles its leaves in winter. The leaves, flowers, and feeds, have a flrong fragrant flavour, and a bitter tafte; they are used to destroy moths and cutaneous insects, of which they are reckoned destructive of all kinds. An insusion of them, taken inwardly, destroys worms, and strengthens the stomach. They are a good substitute for hops, as they preserve malt liquor very well, but render it very inebriating. See Raii Hift. Plant. Lewis's Mat. Med.

Plant. Lewis's Mat. Med.

— Communis Italica. Common Myrtle.

The myrtus communis, Linn. It is an evergreen fhrub, with oblong leaves, pointed at both ends, in the bosoms of which spring solitary white pentapetalous flowers, followed by black oblong umbilicated berries, full of white pentapetalous flowers. Take of the extract of favin, one ounce; of the tinc-ture of caftor, one pint; of the tincture of myrrh, half to perfection with us.

The berries are recommended in alvine and uterine's fluxes, and diforders from laxity and debility; they have a roughish not unpleasant taste, and are accompanied with a sweetish aromatic slavour. The leaves are astringent, and if rubbed they yield an aromatic flavour. See Raii Hift. Lewis's Mat. Med.

MYRTUS PIMENTA VOL JAMAICENSIS. See PIPER

JAMAICENSIS.

MYSTICETUS. See CETUS. MYSTUS FLUVIATILIS. See BARBUS.

MYTILUS. The MUSSEL. As from mushrooms, fo from this shell-fish very alarming symptoms are often produced. Some attribute these effects to a quality in the nuaffels, either proper to this fish, in general, or accidentally acquired from the situation in which they derive their nourishment: others charge the pea-crab, which is often found in them, as the injurious cause; but as similar effects are observed to arise from various other causes besides mushrooms and muffels, the peculiarity of the person's conflitution feems to be that to which the whole is owing. On undoubted evidence it appears, that fimilar complaints On undoubted evidence it appears, that initiar complaints have often been produced by eating falmon, by taking the Peruvian bark, by washing the hands in water after fish hath been boiled in it, bathing in the sea, cantharides applied to the skin, the internal use of wild valerian root, &c. When an itching, &c. affects the skin from external applications, it may be said that such effects arise from a mechanical cause. When the same symptoms arise in the same parts from various kinds of aliment and median the fame parts from various kinds of aliment and medicine received into the stomach, is it not from the influence of fympathy that they are produced? This idea feems to be firongly confirmed by the relief that foon follows from discharging those aliments or medicines by an active emetic.

The symptoms confequent on eating muffels, are accurately described in the second volume of the Memoirs of the Academy at Bruffels; a translation of which, the editor of the Lond. Med. Journal hath inferted in that ufeful Work; fee vol. iii. p. 134. It is as follows. "The figns which announce the noxious effects of boiled muffels, are an universal uncafiness or numbness, that commonly takes place three or four hours after they have been eaten. These symptoms are succeeded by a tight-ness of the throat, a sense of heat about the head and eyes, immoderate thirst, nausea, and sometimes vomiting. If the patient hath the good fortune to vomit up the whole of the offensive matter, this evacuation is generally sufficient to stop the progress of the complaint; but if he brings up none, or only a part of the noxious substance, the diforder becomes more or less alarming, according to the quantity of deleterious matter in the first passages, and according to the particular conflitution of the patient. mucocarnens.

The want of a fufficient evacuation by vomit increases the tightness of the throat, and the swelling of the face, eyes, and tongue; all the parts within the mouth appear inflamed, and as it were excoriated, and the rednefs foon fpreads to the outer furface, appearing first in the face, and extending from thence to the neck, breast, and abdomen, and by degrees over the whole body. This particular eruption is the symptom the most diffinguishing and cular eruption is the symptom the most distinguishing and characteristic of the malignancy of mussels; it is constantly accompanied with a kind of delirium, with a singular uneasines, and an insupportable itching; it has no affinity with the eruption produced by the eryspelatous sever, with the scarlatina, measles, purpura urticata, or any other known species of red eruption: it has these particularities, viz. that it never appears unless mussels have been eaten; that it is not preceded by sever; that it is accompanied by symptoms which appear united in no other discase; and lastly, that the whole surface of the body, though redder than in any other cruptive discase, appears as it were spotted with an infinite number of red spots of a deeper red than the rest of the skin. These points are infinitely smaller than a millet seed; if we examine them through a lens, we see distinctly that they are the openthrough a lens, we fee diffinelly that they are the open-ings or pores of the cuticle, which leaves minute spots of the cutis exposed to our view, while the redness which is feen only through the epidermis, appears of a paler huc."

In general, when people are thus affected by eating muffels, the fame treatment will be proper that is directed when mushrooms are the offending cause. See AMANITA. The itching is considerably allayed by washing the whole surface of the body with vinegar and water for

about half an hour.

The author of the above account of the fymptoms that are the effect of eating muffels, advices, as a preventive of their injuries, to wash them with water, and afterwards with vinegar, and then to boil them for use in an earthen

pot with vinegar and water, and a few grains of Jamaica

mytrotum. A kind of food made of garlic, onions, and cheefe, bruifed together.

Myurus. An epithet for a fort of finking pulfe, when the fecond stroke is less than the first, the third than the second, &c. Of this there are two kinds; the first is when the pulse so links as not to rife again; the when it returns again and rifes in some degree. nett is when the pulle to links as not to rife again; the other, when it returns again and rifes in fome degree. Both are efteemed bad prefages.

MYXA vel MYXARTA. Mucus. But in botany it is a plant which is also called febesten, sebestina domestica, myxas. See Seresten and Jujuba.

MYXOSARCOMA. A fort of tumor, also called mucocarpeus.

# NEN

In prescription signifies number.
NABIA. See ENOPLIA.
NABIT. POWDERED SUGAR-CANDY. NACTA. An apostemation of the breasts, particu-

larly those of women.
NADUCEM. So Avicenna calls a mole in the womb. NÆVUS. A MOLE ON THE SKIN, generally called nevus maternus, a mether's mark, or macula matricis; fee Macula. Alfo the tumor known by the name of a WEN. Dr Cullen gives the wen as the general name lupio, and, confidering it as a genus, he places it in the class locales, and order tumores.

All preternatural tumors on the fkin, in the form of a wart or tubercle, are called excrescences; by the Greeks they are called aerothymia, and when they are born with a person they are called nevi materni, or MARKS FROM THE MOTHER. A large tumor depending from the fkin is denominated farcoma. These appear on any part of the body; some of them differ in their colour from the rest of the skin, whilst others are red, black, &c. Their shapes are various, some resembling strawberries, others grapes, &c. Heister advises their removal by means of a ligature, a cautery or a knife, as circumstances best

As to the tumor called a wen, its different species are diffinguished by their contents. Dr. Aitken, in his Elements of Surgery, divides the wen into the following fpe-cies. 1. Atheroma. 2. Meliceris. 3. Steatoma. They are encyfted tumors; the matter contained in the first three following is inspirifated lymph, and that in the fourth is only fat. Mons. Littre is the first who hath particularly described the fourth kind; and to the following purpose he fpeaks of them all. A wen is faid to be of three forts, according to the kind of matter it contains; that whose contents refemble boiled rice, or curds, or a bread poul-tice, is called atheroma; if it refembles honey, it is named meliceris; and if it is like fuet it is denominated STEA-TOMA, which see: but there is a fourth fort, which may be called LIPOME, because of its fat contents resembling greafe. He fays, that he hath feen one on the thoulders of a man which was a thin bag, of tender texture, full of a foft fat, that it had all the qualities of common greafe; and though the fat in the lipsone refembles the state of the factors and though the fat in the lipsone refembles the state of the factors and though the fat in the lipsone refembles the state of the factors and the factors are they cannot be the factors. common greate; and though the far in the lipsone retem-bles that in the fleatoma, yet they cannot be the fame, for the matter of the fleatoma is not inflammable, nor does it melt, or if it does, it is with great difficulty, and im-perfectly; whereas it is the contrary with the lipsone. When the man who had the above-named lipsone was fatigued, or had drank freely of ftrong liquors, his lipsome was inflamed for fome days after, and its contents rarifying increased the fize of the tumor. See Mem. de l'Acad. Roy. des Sciences, l'Ann. 1709.

The lipsome feems to be no other than an enlargement of one or more of the cells of the adispose membrane, which is filled only with its natural contents. Its soft-ness and largeness diffinguish it in general from the

# NAK

other species, though sometimes the fatty contents will be so hard as to deceive. As this kind of wen does not run between the muscles, nor is possessed of any considerable blood-veffels, it may always be cut off with eafe

and fafety.

As to the other kind of wens, their extirpation may or may not be attempted, according as their fituation is with respect to adjacent vessels, the wounding of which would

endanger the patient's life.

Mr. Bell speaks of these tumors in his Surgery; he observes that they each have various degrees of confiftence. In judging of the nature of these tumors, some ence. In judging of the nature of these tumors, some advantage may be derived from attending to their situation. Thus, in some parts, sat is more apt to be secreted and deposited in the cellular substance than in others. In some parts, indeed, sat is searcely ever found, as over a great part of the head; while in others, particularly over the prominent part of the belly, we commonly meet with it even in the leanest subjects. And, I believe, that the stansmarsus tumors are seldom if ever met with in those parts of the body, which are not usually in a state of health supplied with fat. The head, indeed, is more liable than any part of the body to head, indeed, is more liable than any part of the body to encyfted tumors, but they are very univerfally of the atheromatous or melicerous kinds. I have never met with the fleatomatous tumors but where fat is usually deposited in the contiguous cellular fubitance.

As to the cure, if they appear to be of the thin melicerous kind, which for the most part will be the case, if a diffinct fluctuation be discovered through the whole body of the tumor, treat it as a common abfcefs, or as directed in the article HYDROCELE, for the hydrocele

of the tunica vaginalis.

When a cylt containing matter adheres so firmly to the contiguous parts, as to require much time to remove it by diffection, it should never be attempted. It will be fusionent to lay it freely open through its whole extent by an incision, and to remove any loose portion of it. The contents of the tumor will in this manner be complettely removed, and the cure may either be effected in the utual way, by preferving the wound open till it fills up with granulations from the bottom; or it may be at-tempted by drawing the divided edges of the skin together, and trufting to moderate preffure and the ordinary effects of inflammation for producing a complete cure.

See also the article STEATOMA, for the method of diffecting the whole tumor out; which, when the tumor

diffecting the whole tumor out; which, when the tumor is not very large, may be fubmitted to.

NAGAM. A pod-bearing tree in the East Indian

islands.

NAI CORONA. COURAGE. See PHASEOLUS. NAKIR. According to Schenkius it is a violent fla-

labar, and flowers twice a year. Its different parts are used by the natives in flatulent and some spasmodic diforders, &c. See Raii Hift.

NANA, The PINE-APPLE. See ANANAS.

NANDI-ERVATAM. A fmall East Indian shrub, the whole of which is lactescent; the juice destroys worms, and is used with many other intentions. See

NANDIA. See Lycium. NAP, or NAPECA. A species of jujube. See Exo-

NAPELLUS. See ACONITUM.

NAPHA. ORANGE-FLOWER WATER.

NAPHTHA, vel NAPTA. This is the fame that the Arabians call amber. See AMBRA; named also naida, terræ oleum. It is the thinnest of the liquid bitumens; it is a perfectly fluid thin bitumen or mineral oil, clear and colourless as crystal, of a strong smell, extremely subtil, so light as to swim on all known liquors, spreading to a vait furface on water, exhibiting rainbow-co-lours, and is highly inflammable. This name is given to this kind of thin oil, whether it is feparated by nature or art from petroleum or other bituminous matter. Petroleum is a groffer oil of this kind. The true napththa is useful as an external application for removing old pains, nervous disorders, such as cramps, contractions of the limbs, paralytic affections, &c. See Petro-

NAPIFOLIA. BORE-COLE. NAPIUM. See LAMPSANA.

NAPTA. See NAPHTHA. It is a name also for the tumor called nata or natta.

NAPUS. See BUNIAS, ACTINE. NAPY. MUSTARD.

NARCE, from vagers, the torpedo fifb, which is faid to flupefy in its touching, whence narcotica. A torpor, ftupor, or dulness of sensation. It also signifies a stupefaction of the fenses by medicines, in order to render a

perfon lefs fensible of pain.

NARCISSO-COLCHICUM. A species of lilio-narciffus, remarkable for nothing but the beauty of its flower.

Boerhaave calls it lilio-narciffus luteus autumnalis minor.

NARCISSO-LEUCOIUM. The flowers confift of fix
leaves, in the form of a lily, and the root is bulbous. Boerhaave mentions fix species; but they are not noted branch from the fifth pair is also sent here. for any medical virtue.

NARCISSUS. The DAFFODIL. Botanists enumerate many fpecies; Boerhaave mentions forty-feven; but their virtues as a medicine hath not gained them a place

in practice.

NARCISSUS LUTÆUS SYLVESTRIS, also called bulboeodium, codianum, codiaminum flore codii, bulbus fylvestris, pseudo-narcissus Anglicus. WILD DAFFODIL. The roots of these are somewhat purgative and emetic;

the dofe is two drams in infusion.

- PALLIDUS CIRCULO LUTEO. COMMON PALE

DAFFODIL, OF PRIMROSE-PEERLESS.
NARCOSIS, from 102 par, torpor, flupor, numbnefs. A

STUPEFACTION.

NARCOTICA. NARCOTICS, from saprae, to affelt with a flupor or torper, or vares, torpedo, a fift which flupifies what it touches. Narcotics are foporiferous medicines which induce flupefaction. See ANDYNA.

NARDUS CELTICA, also called fpica Celtica, faliunca, Celtic spikenard. It is the valeriana Celtica, Linn.

It is a fmall fpecies of valerian, with uncut, oblong, ob-tufe, oval leaves; it is a native of the Alps, from whence we have the dry roots, confifting of a number of blackish fibres, with the lower parts of the stalks adhering, which last are covered with thin yellow scales, the remains of the withered leaves. Its virtues refemble those of vale-

There is a mountain nard, but it is only the root of the large valerian. None of these are in much esteem in practice. See Raii Hift.

The wild nard, fee ASSARABACCA, is chiefly used amongst farriers; but it is used as a sternutatory in medical practice.

NABDUS INDICA, called alfo Spica, Spica Indica,

tulence which passes from one limb to another, and is attended with pain.

NALUGN. A bacciferous shrub which grows in Ma
Dioscorides makes the Indian and the Syrian nard to be different, but they are the fame. They are the buffy top of the root, or the remains of the withered stalks and riba of the leaves of an Indian graffy-leaved plant, of which we have no particular account. The nard, as brought to us, is a congeries of small, tough, reddish, brown sibres, cohering close together, but not interwoven, fo as to form a bunch or spike about the fize of a finger: sometimes two or three bunches issue from one head, and sometimes bits of leaves and stalks in substance are found among them, The spikenard of India and Syria alike refemble valerian in their virtues; but the Indian is warmer and more fpicy than the Syrian; it is also somewhat pungent and bitterish. It also agrees very nearly in its virtues with

NAREGAM. A name of two forts of Indian lemon-

1. Mal-Naregam. A fort of dwarf LEMON-TREE growing in Zeylon and Malabar. It differs from a lemon only in its having but one feed.

2. Tijeron-katou-naregam. This species hath always flowers and fruit upon it. It is found in the same countries with the first kind. See Raii Hist.

NARES. The NOSTRILS. The internal nares, or

cavity of the nofe, comprehend the whole space between the external nares, and the posterior openings immediately above the arch of the palate, by which a probe may be paffed from the nose to the fauces, from whence those cavities reach upward as far as the lamina cribrofa of the os ethmoides, where they communicate forward with the finus frontales, and backward with the finus fphenoidales. Into the noftrils, the two frontal finufes, the two antra Highmoriana, the cellulæ of the os cunciforme under the upper spongeous bone of the nose, open into the nostrils, and excrete the mucus thereinto. The fpongeous bones, which are two in each noftril, are covered with the mucous membrane also; whence mucus is collected and discharged, and thus the surface of the mucous membrane of the nostrils is enlarged. The olfactory nerves, without their duramatral covering, pierce through the holes in the os ethmoides, and spread themselves on the mucous membrane of the nostrils; a

In Heister's Surgery is an instance of cure, when the nostrils, after the small-pox, were closed up. An open-ing was made into them with a small knife, and kept dis-

tended until the wound was healed.

NARIFUSORIA. Medicines which are inftilled inte

NARUETH. See AURIPIGMENTUM.

NASALE. AN ERRHINE. NASALIS ARTERIA. See Maxillaria Ar-

NASALIS, also called compressor naris, and rineus. It rises fleshy from the extremity of the os mass, and adjacent parts of the os maxillare, and is inserted into all the cartilages of the ala. It dilates the nostrils.

NASO PALATINI DUCTUS. See INCISORIE

NASTOS. The WALKING-CANE. Arundo fartla

NASTURTIUM. Quafi nafi tormentum, to be the whilf it is bruifing, excites fneezing. In all respects it resembles the mithridate mustard with a less soliaceous margin, and multiful leaves to diffinguish it. Boerhaave enumerates eleven species. It is also a name for a special content of the content of the

cies of thiaspi, of araliastrum, barbarea, cardamines, sophia, and several other plants.

NASTURTIUM AQUATICUM, called also laver edoratum, sisymbrium, cardamines. WATER-CRESSES. Sisymprominences of the brain, which are also called glutia and tum, julymbrium, cardamines. WATER-CRESSES. Silymbrium nasturium. Or silymbrium aquaticum, foliis pinnatis, foliolis, subcordatis, sloribus albis tetrapetalis, siliquis declinatis, Linn. A juicy plant with brownish, oblong, obtuse leaves, set nearly in pairs, without pedicles, on a middle rib, which is terminated by an odd one, larger and longer pointed than the rest. The stalks are hollow, pretty thick, channelled, and crooked; on the tops grow tusts of small tetrapetalous white slowers followed by tufts of fmall tetrapetalous white flowers followed by oblong pods, which burfting, throw out a number of roundish feeds. It grows in rivulets, and the clearest standing waters, and slowers in June. The leaves remain green all the winter, but are in the greatest perfection. tion in fpring.

The leaves are, to the tafte, moderately pungent; when rubbed betwirt the fingers, they emit a quick penetrating fmell like that of mustard, but weaker. This herb is a mild, acrid, aperient antifcorbutie, of the fame herb is a mild, acrie, aperient antifeorbutic, of the fame general virtues with the garden feurvy-grafs, but much lefs pungent, and, in a great measure, free from the peculiar flavour thereof. The expressed juice carries with it all the virtue of the plant; but whether the leaves are eaten as a fallad, or the juice taken alone, their use should be continued some time, and the quantity of either not sparing, if much benefit is expected. This has chiefly been employed as an antiscorbutic, and forms one of the inercedients for the success cochlearing composities. ingredients for the fuccus cochlearize compositus.

- HORTENSE. COMMON GARDEN CRESSES.
A low plant, with variously-cut winged leaves, hearing on the top of the round stalk and branches tufts of tetrapetalous white flowers, which are followed by roundish capfules, flatted on one fide, and full of red-dish round feeds. It is annual, and raised in gardens. It is an useful dietetic herb in scorbutic cases, when vis-cid juices are the fault in the constitution, and when the chylopoetic organs are weak. It is nearly of the fame qualities as water-creffes, but fomewhat milder. The feeds are more pungent than the leaves, and agree in their general qualities with those of mustard.

- INDICUM, also called acriviola, flos fanguineus Menardi, naflurtium Peruvianum, cardamindum minus.
INDIAN CRESS, or YELLOW LARK-SPUR. The leaves are round and umbilicated, and placed alternately; the flaks are trailing, the flowers confift of fine leaves, formed like violets; the feeds are round and rough, three of them fucceed in each flower. It is a native of Peru. Miller enumerates five species. Their young shoots are used as pickles. Their medical virtues are similar to those of the common fort with us. See Raii Hist. Lewis's Mat. Med. Sylvestre, &c. See Cornu Cervi.

NASUS. The Nose. The external parts of the mose are the root, the arch, the back or spine, the sides, the tip, the wings, the external nares, and the part under the septum. The internal parts are, the internal nares, septum narium, the circumvolutions, the conche superiores, the conche inferiores, the posterior openings of the internal nares, the finus frontales, finus maxillares, finus febenoidales, ductus lachrymalis, and ductus palatini. The nerves are the olfactory, and a branch from the fifth pair. The cartilaginous part of the mole keeps always open to admit of respiration. It grows narrower a little above like a funnel. The membrana pituitaria, which lines the mole, is very vascular and papillous at those parts where it is most exposed to the stream of the air. The whole membrane is full of small glands which feparate mucus; and this membrane gives rife to poly-

pous exerefeences.
The nourils of infants are fometimes obstructed, and it is common to greafe the usfe in order to relief in this cafe; but three or four grains of white vitriol diffolved in

half an ounce of water, answers much better for soliciting a discharge of the too viscid mucus.

NATA or NATTA. A fort of tumor of the wen kind, called naphtha; it hath a narrow bass, but a much larger body. Linnaus speaks of it as rooted in a

NATATIO. Swimming. It is uleful in fummer, it promotes perspiration, and attenuates the sluids, but

NATSIATAM. The tree which bears the coculus Indicus. See Cocculus Indus.

NATURA. NATURE. There have been few defi-nitions amought the variety which have been given, which feems perfectly fatisfactory on this fubject. This defect is attempted to be fupplied by the last commentator on Sydenham's Works; who, after reciting what HIPPO-CRATES, VAN SWIETEN, HOFFMAN, VAN HEL-MONT, and MEAD, fay on this fubject, and proving the infufficiency of what they advance; afferts, "That the human body is neither more nor lefs than an inflrument upon which nature performs her various operations, for the purposes for which the machine was created, and that diffease is nothing but a defect or imperfection in that instrument, occasioned by some matter and the purpose of the pur rial or mental caute, inherent or accidental, and not to a deficiency of nature, which, univerfally confidered, we take to be an agent of Divine Providence, endowed with limited powers, which she exercises for the formation of bodies, and other particular purposes, in order to promote the ends for which they were ordained; that fhe cannot transgress those bounds, and that in herself she is cannot transgress those bounds, and that in herieff the is ever perfect; and when any imperfections happen in bodies in the animal, vegetable, or mineral kingdoms, they are owing to fome circumftances in which those bodies are placed, or with which they are connected, and not to any defect in nature. This is nature confidered in its most general sense; but when we apply the term to particular bodies, fomething elfe feems neceffarily in-cluded in the definitions respecting and peculiar to those bodies. Thus then, applied to the human machine, we would fay, that nature is the powers inherent in the fystem, put into, and continued in action by the force of the living or vital principle; and when difeafe occurs, it is owing to some circumstances happening to the folids or fluids of the human machine, or to fome fituation into which they are thrown, from whence they cannot per-fectly exercise those powers, or feel the impulses of the vital principle, and not to any defects in those powers or principle. We shall offer one instance in proof: a man walking in apparent health, shall, from the bursting of some large blood-vessel, drop dead instantaneously; here appears no previous defect of the constitutional powers or the vital principle, the action only ceases in confequence of the vafcular rupture, because the circulation of the blood, for want of vafcular continuation, is destroyed by this accident; the defect lies then in the inftrument in which these inherent powers reside, and on which this principle afferts its action, and not in the powers or principles themselves; and this will apply to every other species of disease. See Dr. Wallis's Sydenham, vol. i. p. 147, 148. NATURALIA. The PUDENDA.

NAUSEA, from page, a flip. This is properly the fickness perceived on failing; but it is used to express all forts of fickness, and propensities to vomit, whether called

fickness, nauson, quality, loathing, or whatever eise.

Nauson may be defined to be an approach to fickness.

It is such a subversion of the stomach, as that it rests not in its natural, easy flate. Sickness is that affection of the flomach, whence there is an inclination of the actual

ejection of its contents.

Sea-fickness depends on nervous irritability and spasm; it is a disease of the brain from the unusual motion which the ship gives it, and from thence, by confern of parts, it is carried to the stomach, where it occasions vomiting. Long voyages usually overcome this diforder, but there ones feldom do. Keeping the bowe s folutive is always found to relieve a and drinking fea-water with wine is a preventive from fea-fickness in many. A naufes

the cesophagus, accompanied with an inversion of its periftaltic motion, and producing an inclination to vomit-Others again fay, it is the idea of fome ungrateful fubstance, accompanied with spasms of the celophagus and stomach. Generally it is an attendant on dyspepsia.

The lips are covered with the continuation of the inner coat of the stomach, whence whatever vellicates this coat, either in the stomach, or cesophagus, and often in the mouth, occasions a nausta, or a sickness.

A nausea always precedes a vomiting, and then it is attended with a tremulous motion of the lips. It attends all inclinations to vomit, and cardialgias. It is often attended with a discharge of a limpid mucus from the stomach, or cefophagus, or both, when no inclination to vomiting is prefent; and this happens from the fpafms affecting the glands there. It often indicates worms in the prime viee. It generally fucceeds crudities in the ftomach, which, as they are actid, when the ftomach is empty, they then particularly excite a nausea, which, however, is alleviated by taking any kind of aliment. It precedes violent diforders in the head, especially such as derive their origin from the upper orifice of the ftomach. It attends hypochondriac diforders, and others, the fomes of which lodge in the primæ viæ; and in the beginning of malignant fevers it is generally attendant.

According to the variety of causes, the remedies will be; when acrid fordes in the primæ viæ produce a nausea, prefent relief is obtained from a fresh supply of food, and a gentle emetic, or a few aloetic purges will often remove the diforder. Indeed, in common, after thefe general evacuants, warm, ftrengthening, ftomach medicines,

feldom fail to cure.

If an excellive use of spirituous liquors is the cause, the warmth of the bed, riding, and the elixir of vitriol, suc-

ceeds the best.

In the beginning of fevers, when bile regurgitates into the stomach, and in many other instances of naufea, and even of vomiting, the columbo root is almost a specific.

A naufea may be relieved, in general, by the fame means

NEPHRALGIA, Pain in the kidneys or ureters;

alfo inflammation there.

NEPHRALGIA CALCULOSA. Nephralgy, PAIN from a STONE in the KIDNIES. This differs from a nephritia from the want of fever, and is confidered as a difease whose principal fymptom confifts in a fixed pain in the region of principal lymptom conflits in a fixed pain in the region of of the kidneys and ureters, without any acute febrile affections, and is thought to depend on a rather large flone fixed in the kidneys, or ureters, which is discoverable by pain and very severe uneafiness in either lumbar region, seldom happening in both, and that fixed and permanent; which pain extends itself along the duct of the ureter in the abdomen towards the bladder, attended in men with a mainful drawing up of the testicle of the same men with a painful drawing up of the tefticle of the same side; in women, with a stupor, or numbres of the thigh, and pain, if the sit should be intense. In the violence of the pain a naufea and frequent vomiting are oc-casioned; by laying on the pained side the uncasiness is mitigated, but on that which is opposite, increased; and laftly, the urine has different appearance in the beginning, it is watery, and finall in quantity, afterwards tur-bid and copious, often extremely hot and bloody. The chief relief in these cases is to be expected from bleeding, reft, diluting mucilaginous liquids, decoctions of in-fusions of linesced, marth-mallows, barley, gum-arabic, &c.; narcotics, oily medicines, warm bath, and a thin cooling diet, &c. See Calculus and Nephroto-MIA.

RHEUMATICA. The rheumatism in the mus-cles of the loins. The same as lumbago. NEPHRELMINTICA ISCHURIA.

A fuppression of urine from worms.

NEPHRITICA. A suppression of urine from inflammation in the kidneys.

NEPHRITICA AQUA. See Nux Moschata.

NEPHRITICA AQUA. See Nux Moschata.

NEPHRITICUM LIGNUM, also called lign. pere-grinum, NEPHRITIC WOOD. Dale thinks it to be the wood of the tree which bears the ben-nut. It is the guilandina moringa, Linn. It is brought from America in large compact pieces; the out-part is of a whitish, or pale yellow colour; the medullary substance is of a dark brownish, or reddish colour. If it is bruised, and macerated in water for half an hour, or an hour, it imparts a deep tincture, appearing, when placed betwixt the eye and the light, of a golden colour, but, in other fituations, of a fine blue colour; a property in which it differs from all other known woods. Pieces of other woods are often mixed with it, which only give a yellow tincture. If this wood is steeped in rectified spirit of wine, the same

blue tincture is observed as when water is the menstruum; | be discharged into the pelvis of the kidney, the abdoif an acid is joined to the tincture, it becomes yellow, but the blue is again reftored by an alcali. It is the only

vegetable blue its again rettored by an alcali. It is the only vegetable blue that is deftroyed by acids.

To the tafte it is flightly bitter, and the rafpings have a faint aromatic smell. A strong insuson of it in water is gently astringent, and is recommended in disorders of the urinary passages, It does not, like the warmer diuretics, heat, or otherwise offend the parts; but its efficacy hath not obtained it a place in general practice. See Raii Hift. Lewis's Mat. Med.

NEPHRITICUS, from 140pos, a kidney. Belonging to the kidneys. It is used with respect to disorders of these

parts, or to medicines adapted to their cure.

NEPHRITIS. Any diftemper in the kidneys, from viones, a kidney, inflammatio renum. An INFLAMMAquent, for a determination of the fluids to the kidneys occasions an increased secretion of urine, sometimes mixed with blood, which prevents inflammation. Dr. Cullen places this genus of difease in the class pyrexize, and order phlegmanize.

The general causes are, whatever hinders the extremities of the arteries from transmitting their fluid; as a wound, contusion, abfcefs, a tumor, a long continued defluxion, a fmall stone, &c. whatever hinders the condefluxion, a small stone, &c. whatever hinders the conveyance of the urine into the pelvis, ureters, and bladder; such as forcibly convey the thicker parts of the blood into the urinary ducks, as running, violent riding, excefive heat, an effort of the body, a plethora, acrid diuretics, poisons, &c. a long continued spasmodic contraction of these vessels. When these vessels are seized with a violent inflammation, they are often fo constricted, that no urine can be discharged; or if a small quantity is evacuated, it is pellucid, thin, and aqueous, which is an unpromiting fign; the nerves cohering to these vessels, and lying contiguous to them, being often irritated, pains and convulsions are produced in the stomach, mesentery, invomiting, fluxes, iliac passions, retentions of urine, stu-por, immobility of the legs, &c. preternatural heat in the loins.

A stone in the kidney usually excites inflammation in the internal membrane thereof, and in the tubuli uri-

niferi.

The inflammation begins with a pungent burning pain in the region of the kidney, that is in the back, near the articulation of the fhort ribs, higher up on the left-fide than on the right, often shooting down by the ureters to the bladder, and by the spermatic cord to the testicle; a fever; the urine is fometimes red at the first, but foon becomes pale, and is frequently discharged in small quantities, and that with difficulty, pain, and heat. Some-times a redness appears externally; the thigh and leg of the affected fide is feized with a ftupor; the pain is inereafed upon standing, walking, couching, lying on the opposite side, or in any other case where the kidney is moved, or the furrounding part extended; there is pain in the groin, and in the tefficle next adjacent; the pulse is hard and frequent, and, as the pain increases, it often-becomes small, quick, and sometimes intermittent, with coldness of the extremities, cold fweats, fickness, bilious vomitings, fainting, delirium, convulsions, &c. The pavomitings, fainting, delirium, convultions, &c. tient lies with the most ease on the affected side.

An inflammation in the kidneys, should be distinguished from the gravel, a stone obstructing the ureter, an inflammation of the ploas mufcle, or other adjacent parts, from the colic, and other inflammatory and fpalmodic

pains in the intestines.

If the difease is protracted beyond the seventh or eighth day, and there is a stupor or heaviness of the part, with frequent returns of chilliness and shivering, &cc.

with frequent returns of chilliness and shivering, &c. there is reason to suspect that matter is forming in the kidney, and that an absecs will ensue.

If the urine becomes higher coloured, is secreted in a larger quantity, and at last is copious, thick, and mixed with mucus, a gradual relief follows, and thus the cure is effected. It may go off by a metastasis, or terminate in an absecs, mortification, or a feirrhus. Inflammations in this part often suppurate on the fourth day, if not prevented by either a natural, or an artificial attempt towards a cure; but yet these failing, an absecs may be towards a cure; but yet these failing, an abscess may be begun so late as the sourteenth day. This abscess may

men, or externally through the integuments and the ikin; in the first case, if the matter is kindly, a cure may follow, but otherwise an hectic destroys the patient; in the fecond case it is fatal; and, in the third, an ulcer, of very uncertain cure, is formed.

When the prefence of this diforder is once manifested, immediately bleed, and in general proceed as in other in-

ternal imflammations.

Decoctions of partley-roots, infusions of line-feed, or the Arabic emulsion, with a double quantity of the gum, are convenient as common drink; and to prevent their palling the appetite, a little lemon juice and fugar may be added to render them grateful.

A moderately warm femicupium, and laxative clyfters frequently injected, contribute much to promote the fe-

cretion of urine.

If inflammation appears externally, apply fomentations and poultices to the part so affected.

In case of a suppuration, the treatment is nearly the same as in a suppuration of the liver. After the abscess is burst, the patient should drink freely of a decoction of marshmallow-roots, or such like liquors, and take the bark freely. In this case the bark is preserable to the usual method of administering balfamics.

If pains are exceffive, give opiates to moderate them; and if vomiting is troublefome, give tepid water, fweetened with honey, and let the patient drink small quan-

tities frequently.

If a gangrene takes place, it is known by the violence of the caule, of the symptoms, the want of relief by re-medies, and the sudden remission of the pain without apparent cause, cold sweats, a weak intermittent pulse, hiccoughs, either no discharge of urine, or such as is li-vid, black, full of hairs, fetid, and foul, with a sudden and considerable loss of strength. In those cases, no cure can be expected.

fpalm in the kidneys.
NEPHROTHROMBOIDES. A suppression of urine from grumous blood in the kidneys.

NEPHROPYICA. A suppression of urine from purulent matter in the kidneys.

NEPHROPHLEGMATICA. A suppression of urine from pituitous or mucous matter in the kidneys.

NEPHROPLEGICA. A suppression of urine from a paralytic state of the kidneys. See ISCHURIA.

NEPHROS. A KIDNEY.

NEPHROTOMIA. NEPHROTOMY. It is the extracting of a ftone from the kidneys by a wound made for that end. Roufet was the first who advised this operation. In Mezeray's Hiftory of France is the following narrative : "The doctors of the faculty of physic at Paris, knowing that an archer of Bagnolet, who had been very much afflicted with the stone, lay under sentence of death, begged of the king that he might be put into their hands, to make an experiment whether they could open the kid-ney, and take out the stone. They obtained their request, and the operation succeeded so well, that the man lived many years after in good health: so says the historian. And many writers speak in favour of this operation, and affert that it is practicable with fafety; but from the course of the renal artery it does not appear to be possible, without destroying the patient. See Renes. Belides the objection from the renal artery, there are others apparently infurmountable. See Avicenna, Serapion, Wedelius, Meckren, Heister, Med. Must. vol. ii. p. 370. Bell's Surgery, vol. ii. p. 144. White's Surgery, p. 368.

NEPONES. See BARONES.

NERANTIA. An ORANGE. See AURANTIA Hys-

NERION, called also rhododaphne, rhododendron ole-NERIUM ander, laurus rosea, ROSE-BAY. It is called ealled nerion, from re, a privative particle, and escapas, to love; that is to fay, a plant not to be loved. Nerium, from reso, bumid, because it grows in moilt places. Rhododaphne, from its flowers refembling a rofe, and its leaves a bay-tree. Rhododendron, because it sometimes grows to the fize of a little tree, and hath a flower like a rofe. The branches are divided and fubdivided by threes, and the leaves grow three together. It grows in mari-time places. The leaves and flowers are poisonous; if any of them are fwallowed, deglutition is immediately flopped, but vomiting and purging foon come onnegar is an antidote in this poilon. See Raii Hift. NERVI. The NERVES, are those productions of the brain, which are the means of fenfe and motion in every part. They are continuations of the medullary substance of the brain; and, like the brain, they have an infinite number of blood-veffels difperfed about them. They receive their strength from the membranes that furround them. They have two coats, at least as far as the eye can trace them, one from the pia mater, the other from the dura mater. The nerves are supposed to deposit their coats when they arrive at the place of office. In their rise and progress from the brain they are supposed to decuffate each other, that is, those which rise on the right fide of the brain pass out on the left, and those which rife on the left pass out on the right; their origin, however accurately traced, cannot be found out: that they decuffate each other, is fuggested at least from a concul-sion of the brain, in which case, a blow is received on one fide, and the injury done is on the other; but again, there are many exceptions to this. Frequently the nerves form plexues in their course, in which they become one. In their course through the body they commonly branch with the blood-vessels, but ramify more regularly. That junction which in the arterial and venal fyftem is called anaflomofis, in the nerves is denominated communication. From this communication of nerves some instances of fympathy are accounted for; but how far this is the truth is not easy to affert, as there is hardly a nerve but in its passage communicates with some branch of almost there is always a particular reducts, on which conjectures are formed by different anatomists, but their opinions are not well supported: Lancis says, that these ganglions are only on those nerves which are governed by the will.

All the nerves in the body originally proceed from the terebrum or cerebellum, by means of the medulla oblongata, or medulla fpinalis. They go out in pairs, and are afterwards divided into branches to be distributed on all

parts of the body.

From the head there goes out ten pair of nerves; the first and second pair proceed from the cerebrum, and are called the olfactory or first pair; and the optic nerves, or fecond pair. The rest proceed from the cerebellum, and are called motores oculorum, or third pair; pathetici, or fourth pair; trigemini, or fifth pair; motores oculorum externi, or fixth pair; auditorius, or feventh pair; par vagum, or cighth pair; hypogloss externi, or ninth pair; suboccipitales, or tenth pair.

From the ipinal marrow there goes out about twenty-four pair, which have the general name of vertebrales; feven of which paffing through the vertebrae of the neck, are called cervicales; twelve pass through those of the back, and are called dorsales; five pass through those of the loins, and are called lumbares; and there are five or fix pair which, passing through the os facrum, are called

facti west

The nerves that ferre the vital functions arise from the cerebellum; those that are subservient to the senses proceed chiefly from the basis of the brain; and those that are deftined to the voluntary motions of the touch, are

principally from the fpinal marrow. In many instances, if the nerve is cut, compressed, or destroyed, all motion, fensation, and nutrition in that part to which the nerve is distributed is lost; yet this nated the nervens fever, LITTLE FEVER does not always happen, for if all, or at least the prin-

cipal wortes in the part are not destroyed, it recovers its health and vigour. This is evident in performing the operation for the aneurism, in which case, if the nerve is tied with the brachial artery, a temporal numbness only is felt, and fentation in any degree below the ligature is not loft. If a ligature is made on the nove on the fide of the windpipe, the animal will be dumb. If a pointed inftrument is pushed between the occiput and atlas of a dog, he dies inftantly. The same symptoms happen in wounds of the cerebrum, cerebellum, and medulla fpinalis. All nerves which have their origin from below an injury of the medulla fpinalis, lofe their fenfe and motion. A member may be deprived of its motion, and yet not lofe its fensation, or it may lose its fensation, and retain its motion. Sensation remains some time aster the limb is amputated. Preffure makes a part paralytic. As the nerves are continuations of the medullary part of the brain and fpinal marrow, it is probable that they are partly nourifhed by those vessels which are spread on that production of the pia mater which furrounds them, in like manner as the brain derives its nouriflment from the arteries of the pia mater; if this be the cafe, we may readily fee why the narres lofe their powers when they are wholly deprived of the arterial blood, and also retain them, in fome meafure, after the brain is offified and petrified.

The nervous fluid is often fpoken of as fynonymous with the animal fpirits, &c. But Dr. Kirkland observes, in his Inquiry, vol. i. p. 433. that, by nervous fluid, we mean what we discover upon diffecting the brain or nerves; and which a rupture in the tumor, accompany-ing the bifid fpine, difcovers to be effentially necessary to life: for we may easily suppose a fluid residing in the nerves, of such high importance to life as it evidently appears to be, to bring on (when both the nerves and itself are diseased) the nervess symptoms we discover before the gouty matter is thrown off into the extremities,

&c. in other inftances of difeafe.

There are many classes of nerves differing in smallness, and it is supposed that one class may remain entire, while another is somewhat hurt, and perhaps this is the cause

of a gradual decline of the fenfes.

It is also to be observed that some nerves are susceptible of one impression only, or with such at least as many others are not affected by; e. g. the femen Rimulates the nerves of the tefticles and veliculæ feminales, but of no other part; fome affift in vision, others fmell, &c. The ancients, not only gave the name of nerve to these produc-tions of the brain, but also to the tendons, and ligaments.

On the nerves, their use, &c. see Winslow's Anatomy, on the nerves, their tile, &c. lee Winflow's Anatomy, where the nerves are very accurately deferibed; Monro's Diff. on the Nerves; it is annexed at the end of his Ofteology; befides thefe, the curious may confult Steno, Vicuilens, Willis, Ridley, Leuwenhoeck, and Ruyfch-See alfo Hales's Stat. Sympathy of the Nerves. Monro on the Structure, &c.

of the Nerv

NERVOSA FEBRIS. The NERVOUS FEVER. Under this name we may confider nervous difeases in general; they are a numerous kind of complaints. Sydenham says that fevers make two thirds of the diforders to which men are fubject, and the hysteric (or, as we may fay, nervous disorders) one half of the rest. From difference in degrees, or other circumstances, the different denomina-tions arise, and from a simple yawning to the outmost extreme of madness is the extent in which these varieties are manifested. In some the fever is latent, in others it is less obscure, so that with its epithet it denominates the discase; whence some have defined nervous disorders in their opposite extremes to be, the habitual or chronical, and the acute, nervous fever. Dr. Cullen places the nervous fever under the name of typhus, in the class pyrexize, and order febres.

When these disorders are chronical, though the stomach, or intestines, or other particular part may most be complained of, the cellular membrane is probably their immediate feat. When the cafe is acute, a contaminated lymph is the fource of every morbid symptom.

The chronical kinds are called vapours, hysteries, hypochondriac diforder, &c. The acute is ufually denominated the servous fover, LITTLE FEVER, SLOW-PEVER,

Those who have disordered viscera, lead sedentary lives, are studious, oppressed with long anxiety, who are easily affected by external occurrences, &c. are the most sub-

ject to nervous complaints.

The symptoms attendant on nervous complaints refemble almost every disorder to which the human body is fubject : according to the part more immediately affected, and the peculiarities of the part more immediately affected, and the peculiarities of the patient's confitution, the different diseases proper to that part, will seem to present themselves. As the occasional cause then is, and the part in which its influence is exerted, the symptoms will be, wind in the stomach and bowels, heart-burning, sour belching, squeamishness, and ejection of a watery fluid or other kind of matter from the stomach, a want of appetite, and indigettion, or an uncommon craving of food, and quick digettion, debility, faintnefs, a fense of emp-tiness about the stomach when hungry, a strong desire for uncommon food, instations of the stomach, pain and cramp in the ftomach, oppression about the pracordia, uneasy though not painful sensations about the stomach, low spiritedness, anxiety, timidity, strong pulsations within the belly, spasms in the bowels, distensions of portions of the bowels, colic pains, a grumbling noise in the bowels from wind, the belly often lax, but more fre-quently costive, pains in the back and belly refembling the gravel, a sense of irritation and heat in the neck of the urethra, with a frequent defire of making water, a copious discharge of limpid urine, frequent spitting, sudden sushes of heat all over the body, shiverings, a sense of cold in certain parts as if water was poured on them, and at other times an universal glow, slying pains in the limbs, pain in the back and between the shoulders, pains attended with a hot sensation, shifting often from the fides or back to the interior parts of the shdomen, cramps fides or back to the interior parts of the abdomen, cramps or convultive motions of the muscles, or of a few of or convuliive motions of the mufcles, or of a few of their fibres, fudden flartings of the legs or arms, frequent involuntary motion of the nufcles of the neck, or head, or arms, or legs; a general convulion affecting at once the ftomach, bowels, throat, legs, arms, and almost the whole body, in which the patient ftruggles as in an epileptic fit; long faintings, which, in fome inflances, follow one another after fhort intervals, palpitation of the heart, pulle variable, a dry cough, with difficult breathing or a constriction of the lungs, which in some persons return periodically; yawning, hiccough, fighing, a sense of suffocation as if from a ball or a lump in the throat, crying, laughing; in the day the patient is mostly cool, crying, laughing; in the day the patient is mostly cool, with a slow or natural pulse, but in the time of sleep hot slushes often spread over the whole body; the pulse is quicker and stronger, and faintness or sickness is felt; a giddiness, especially after rising up hastily; pains in the head, which in many return periodically; pain in a small part of the head, which generally sixes on the crown, as if a nill was dross in a snall part of the head, which generally sixes on the crown, as if a nail was drove in; finging in the ears, dimnels of fight, mift before the eyes, objects feen double, unufual fmells perceived, obstinate watchings, fometimes attended with uneafiness which is not to be described, but which is leffened by getting out of bed; diffurbed fleep, fright-ful dreams, night-mare, drowfinefs, fear, peevifinefs, fadnefs, defpair; at intervals the spirits are too active and gay, wandering thoughts, impaired memory, ridiculous fancies, strange persuasions of their labouring under

difeases of which they are free, and imagining their com-plaints as dangerous as they find them troublesome.

After being long afflicted with some of these (for they never are all attendant in the same person), the patient fometimes becomes melancholy or mad, or goes into the black jaundice, a dropfy, the phthifis pulmonalis, palfy, apoplexy, or other fatal diffemper.

After coming on in patients much affected with thefe

fymptoms, or that is the effect of causes which will also produce them, form the acute species of nervous difor-ders, and the patient is then said to labour under a ner-Those who are liable to the above symptoms are distin-

I hole who are hable to the above lymptoms are diffinguished into the following classes.

1. Such as, though usually in good health, are yet on account of a preternatural irritability of the nerves, apt to be affected frequently with violent tremors, palpitations, faintings, and convulsions, from fear and grief, surprize or other passions, and from whatever disagreeably affects the more sensible parts of the body. These may be called simply nerves. be called fimply nervous.

2. Such as, befides being liable to the fymptoms men-tioned in the first class, from the same causes, are always troubled with indigeftion, flatulence, &c. may be faid to be hysteric.

3. Those who from a less delicate feeling are scarce ever affected with palpitation of the heart, fainting, &c. from diffurbed paffions; but, on account of the diferdered state of their stomach and bowels, are feldom free from indigetion, flatulence, want of appetite, or too great craving, and fuch fymptoms as therefrom arife; luch as belching, coftiveness, oppression about the pre-cordia, low spirits, disagreeable thoughts, disturbed sleep,

&cc. may be ranked as hypochondriac.

4. When a fever is manifest in a patient attended with acause which induces nervous symptoms, the disorder is called a nervous fever. The symptoms of which are well described by Hippocrates as follow: "There are frequent transfert chillinesses in the day; a giddiness or mit before the eyes; a listlessness, with great lassitude and wearings all over the body. rinefs all over the body; frequent yawnings, with little flying pains; dozing, inappetency; drynels of the lips and tongue; fighings, with great and unaccountable an-xiety; delirioutness and forgetfulness by fits; oppression and pain about the region of the heart and stomach; difficulty of breathing by intervals; the tongue generally white, but fometimes redder than ordinary, together with a heat in it; a low, quick, unequal pulse; heat and thirst, but moderate; pale urine, often and suddenly made; frequent nauseas and slushings; faintings on every the least motion and surprize; cold clammy sweats by turns; these, more or less, usually accompany the ner-vous fever, and will continue thirty or forty days, unless stupors, syncopes, and death, end the scene before." Huxham describes the nervous fever admirably; and fir Richard Manningham, in his Febricula, is very particular in his description of it, and to the above symptoms he adds, that the pathognomonic figns are:

1. A low, quick, and unequal pulse, that is, it is swift, frequent, and large, then presently it becomes low and quick, &c. alternately; this, he observes, is its greatest inequality, and is a characteristic of this sever.

2. A heat in the tongue, without much thirst. In all difeases the nerves suffer more or less; but nervous discases are such as arise first from a peculiar or preternatural irritability of the nerves in general, or of those in any part in particular, whence, what is applied to them, whether of a morbid quality or not, may alike be productive of that variety of fymptoms which form the description above given; or, secondly, from the peculiar quality of such morbid humours, &c. whose most manifest effects are from the disorders which they excite in the nervous fystem. But, perhaps, the first may more strictly be called nervous, though the second enlarge the lists of diforders so called, considerably.

The remote causes are numerous; they are violent pasfions; long continued ones in lefs degrees, fuch as grief, fear, &c. indolence; exercise beyond the supplies received for a due support; eager pursuits, whether of pleasure or business, irregularity in diet, or in the general manner of living, a cold damp, or a hot and moift air, fudden and great changes in the climate, defective perfpiration, excessive evacuations, and indeed whatever much

leffens the vis vitæ.

The immediate causes are a defect of vital heat, an acrimony from contagion, or from fome other cause; and fometimes the remote caufe, viz. the peculiar or preter-natural fensibility of the nerves is the immediate caufe, as when nervous affections are excited by what in a natural or healthy state of the nerves would be unperceived.

Many circumstances occur to, or are attendant on, per-fons subject to nervous disorders, which prove occasional causes; such are flatulence in the stomach and bowels, worms, &c. there; fcirrhous obstructions in any of the

abdominal viscera, &c.

And as to the acute species, or nervous fever, if what-ever can excite sever, is attendant on any of the immediate causes of nervous disorders in general, there will

no more be required to produce it.

Nervous difeases, it is already observed, resemble almost every other disease which affect the human frame, and oftentimes it is very difficult to diffinguish those sem-blances from those which are resembled; for, as searce 6 T when they themselves, or the brain, or the spinal mar-row are primarily affected, but also when the other parts are diseased; and hence the difficulty, perhaps impossi-bility, of fixing a certain criterion by which nervous dis-orders may at once be distinguished from all those not so called; though, in fome infrances, a fmall degree of at-

tention will enable us fo to do.

The prognostics in nervous disorders, of the chronical as well as of the acute, are both difficultly formed and uncertain; in the first, if the disease is recent and left to itfelf, it is rather troublefome than dangerous; but a faulty treatment may be productive of other complaints, that are both difficult of cure and dangerous. In the fecond, the favourable figns are, the fymptoms being flight; the pulse becoming fuller on the use of cardiacs; if to-ward the end of the disease a gentle sweat or diarrhoza, but particularly if a salivation without aphthæ break out; or if miliary eruptions appear, without any preceding profuse sweat: the less favourable ones are, a coldness of the extremities, whilst the rest of the body is warm and perspires; the fauces becoming livid; and reddish or purple spots appearing on the skin; but the following are fatal, viz. a trembling of the tongue, the nails becoming livid, the fight failing or being nearly loft, the delirium changing to a coma, the excrements discharged involun-

tarily, and the tendons twitching.

However troublesome nervous disorders are, they have this advantage, viz. that their subjects are not very liable to those of the inflammatory kind, and rarely, if ever, fuffer much from them. But, before a cure is attempted, the patient should be informed that his disorder admits of relief, but hardly of a radical cure; for the remaining disposition to be strongly affected by slight causes, not being changed, relapfes are so easily occasioned, that a continuance of health, when all manifest symptoms are removed, cannot be promifed. Secondly, that without perfeverance in the use of means, no advantage can be

The general indications of cure will be,

1. To palliate the fymptoms.

2. To lesien or remove the morbid irritability of the

3. To correct the occasional causes, especially the morbid ones.

1. To PALLIATE the SYMPTOMS, the most remarkable of which, with the method of relief, are as follow:

Convulsive motions, or fixed spasses. In these cases, if slight, a gentle opiate given an hour before the approach of the sit, when its return can be guessed at, will often prevent it; but, in the more violent inftances, bleeding thould fometimes precede, and then opiates must be given freely, both as to the largeness of the dose and the fre-quency of the repetition. Besides this, which of all others is the most powerful, the following in different degrees, and on different occasions, afford the wished-for relief; they are camphor, caftor, musk, fetid gums, æther, vo-latile alkaline spirits, &c. To these may be added, the warm bath, semicupiums, pedilaves, emollient clysters, and warm fomentations. Sometimes the spasms in one part are relieved by painful applications on another, fuch as blifters, acrid cataplasms, and frictions; sear or sur-prize, when they can be prudently excited, may produce the most desirable effect. Bandages tightly applied to the part affected, and continued for a fhort time, will often procure relief. The particular cause being discovered, and the particular disposition of the patient being attended to, will assist in determining which of these methods may most likely be successful.

Fainting with convulpens. If the pulse admits of it, bleeding should be the first means used; the strongest acid spirits should be held to the nose, or, in want of them, take the fetid and volatile alkaline spirits; hot bricks may be applied to the feet, and the legs, arms, and belly may be firongly rubbed; or, if convenient, the legs may be put into water that is blood warm, or rather more fo; and as foon as the patient can fwallow, if the conflitution is fanguine and plethoric, give a draught of water, with a large spoonful or more of sharp vinegar in it; but if the habit is lax and seeble, a gentle cordial is to be preferred.

Pain with cramps in the stomach. If there is a tendency to somit, wash the stomach with a few draughts of cha-

any part of the body is without nerves, and very few altogether without feeling, the nerves must not only suffer, of the tinct. opii, in six ounces of warm water, by way when they themselves, or the brain, or the spinal marrepeated; musk should be given in large doses with some cordial liquid, the anodyne balfam may be rubbed on the region of the stonach, or the patient may be put into a warm half-bath. Except great weakness forbids, bleeding should be used, if the pain is violent.

Indigestion and vemiting, with pains in the stemach. When these happen from faulty humours in the stomach, vomits, gentle bitter purges, the testacea, elixir of vitriol, &c. are proper. If too great fenfibility in the ftomach is the cause, besides strengthening the stomach with the bark, bitters, &c. from five to thirty drops of laudanum may be taken an hour before dinner and supper. In some instances, a draught of warm water with a little brandy,

after the principal meals, prevents those symptoms.

An bylieric or flatulant colic. If there is coffiveness, give a laxative clyster with a dram or two of affa feetida diffolved in it; and if there are troublefome vomitings, after feveral draughts of water in which toufted bread hath been boiled, give the fame draughts, with pepper-mint water, and a few drops of tincture of opium in each: or, if the tincture was given clyster-wife in warm-water, and the faline mixture (wallowed whilft in the act of effervescence, the effects will be more certain and speedy; besides, if a thorough passage can be procured by means of a few pills with calonel and aloes, this opera-tion will be much favoured by the opiate clyfters, and thus the fymptom is, for the most part, effectually removed.

Flatulence in the flomach and bowels. Besides keeping the body solutive, draughts of warm water may be taken, in which is a small quantity of pepper-mint water, brandy, spirit of nitre, or spirit of harthorn, according as one or other are observed to be most generally useful; with some a little acidum vitrioli dilutum answers this purpose, and others require a few drops of tincture of opium.

The nervous or spasmodic assistance. Bleeding according to the state of the pulse, and repeated doses of the tinct. opii camphorata usually succeed. Or if the wind in the stomach causes or increases this symptom, a solution of affa fœtida with a little spirit of hartshorn will be a usefructions of the lungs, or a confiderable accumulation of phlegm, opiates must be omitted, and bleeding, with bliffers, used in their stead; the lae ammon with affa foetida, will also be proper. To prevent returns, be careful to supply the patient with every proper means for recovering and establishing the strength of the constitution in general. ful help. But if the afthma is attended with fixed ob-

A palpitation of the heart. If this symptom arises from sympathy when the stomach is weak and disordered, for present relief give an opiate; and then go on to recover the healthy state of the stomach. If the matter of the gout, &c. be repelled, and occasions this disorder, the proper means of relief will be warm stomachies, laxatives, camphor, volatile falts, warm fedures, blifters on the legs, finapifm on the feet, and, if plethoric, bleeding. If suppressed evacuations are the cause, they are not to be restored; or if polypi, &c. produce it, the best palliatives are, frequent small bleedings, gentle purges, cooling attenuants, a light diet, and the avoiding of all that hurries either body or mind.

with any convenient vehicle, gives the speediest relief.

Periodical head-achi. After those general methods which usually remove disorders in the stomach, such as crudities and indigestion, give the bark in an infusion of valerian root; but if the case is symptomatic, regard much he had to the original disease.

must be had to the original disease.

Low-sprittedness. The cold-bath is, in general, the best help in this case; but, besides this, the particular cause of the nervous disorders in general which affect the patient, should be adverted to, and also of this symptom in particular; such as a disordered stomach, grief, obstructed usual evacutions, &c. each of which must be remedied before success can be expected.

2. To LESSEN OF REMOVE the MORBID IRRITABLE.

LITY of the NERVES.

The medicines adapted to this end are, fuch as not only strengthen the stomach in particular, but also the whole constitution; and also those which, by their pecu-

Far action on the nerves to which they are applied, leffen | cifing is engaged in, the last meal should be nearly digest-for a time the too great sensibility of the general system; ed before attempting it. and of this kind are,

Bitters. Of which the properest are gentian root, the tops of the leffer centaury, and the yellow rinds of Seville oranges; these may be insused in strong white wine; but if the stomach is disturbed with acidities, in which case a peculiar coldness is also selt there, an infusion in boil-ing water will be the best, and to this a proper quantity of brandy may be added: if these heat too much, add a little of the acidum vitrioli dilutum to each dose. The lignum quassize is here an admirable medicine. Sometimes it happens that bitters lie heavy on the ftomach, and lessen the appetite, in this case vomit and proceed with

Bark. This strengthens more and heats less than any of the bitter kind of medicines. It may be given in fuch forms and in conjunction with any other means as present circumstances render necessary. Joined with bitters, and given in a spirituous vehicle, it generally answers the in-

tention of prescribing it.

Diluted vitriolic acid. When this kind of preparation agrees with the stomach, twenty or thirty drops may be taken twice a day in a glass of water, or brandy and water. It strengthens the stomach, restores a decayed apperite, and both allays flatulence, and helps digeftion. When the tongue is white, and fome degree of thirst attends, from a heat in the flomach, it moderates the fame,

and relieves all its confequent fymptoms.

Iron. Few, if any, medicines fo remarkably strengthen the stomach and bowels, and indeed the whole habit, as preparations of this kind. The best preparation is the simple filings, just as they fall from under the file, if they can be complied with, notwithstanding the symptoms which they fornetimes excite. From five to twenty grains or more may be taken three times a day; but if the filings offend, the tincture, or other preparations, may be tried. If there is a strong acidity upon the stomach, the iron is by much the best remedy given in substance, for it assists in immediately correcting the acid, and forms a very active chalybeate falt. Preparations of iron fometimes succeed best in conjunction with the bark and bitters. The Bath waters excel in diforders of the nervous kind.

As these medicines require a long continued use before any good can be expected from them, the bark and bitters may be taken during the winter and fpring, now and then intermitting their use for a week or two; and in fummer use such preparations of iron as are found most convenient; this direction is principally to be regarded when

the waters are drank from ferrugineous fprings.

Cold bathing. This should be regularly continued during the fpring, fummer, and autumn quarters. Those with spare habits may go into the bath twice or thrice a week; but the more corpulent or fleshy may go in

It should be noted that, though all these are recommended, they are not all to be used at once, but fingly or in conjunction, at the diferetion of the preferiber; and further, when the patient hath a quick pulse and a pre-ternatural heat, initead of bitters and iron, the bark with

the diluted vitriolic acid will be most proper.

Air. If the air is hot, whether from the fun or a fire, it injures nervous patients; and, whether hot or cold, if it is moift, the worst nervous symptoms will thereby be produced; so that a dry air is always to be chosen, and a cool or warm one, as the fenfations of the patient may

direct.

The folid part of diet should be fuch as affords a due degree of nourifhment with the leaft trouble to the Romach. All excesses are hurtful, so are fat meats, and

rich fauces.

Wine. Much wine, and indeed of any liquid, after cating, retards digeftion in weak flomachs. The best time to take wine or other cordials is when the ftomach is nearly empty. If those whose ftomachs are weak, and upon motion, have hot qualms, are languid and apt to fweat, were, on such occasions, to cat a morfel of bread and drink a glass or two of wine, their strength would be speedily recruited, and every disagreeable affection

would vanifu.

Exercise. Without this the best remedies may fail.

Riding shakes the body equally, and more than walking does, and fatigues it less: and, whatever mode of exer-

Amusement. As nothing injures the stomach more than depressing passions, chearfulness must be obtained.
3. To correct the occasional causes, Espe-

CIALLY the MORBID ONES; fuch as

Morbid matter in the blood. In many instances we cannot discover this; but when it is manifest, as when a wandering gout attends, fuch means as leffen its increase, or determine it to the extreme parts, are immediately to be prescribed, and steadily persisted in. If there is a fcorbutic, or other kind of acrimony, means adapted to each respectively will be the proper method for removing those nervous symptoms depending on it.

A diminution or suppression of natural evacuations. When these are observed to give rise to nervous disorders, they must be recalled; and in the mean time the nervous

fymptoms must be palliated.

The drying up of old ulcers, and the fudden retiring of pimples on the face. In these cases gentle purging, perpetual blifters, and issues, are the only means, except the ulcers can be made to discharge afresh, and the pimples to return.

A defect of craffamentum in the blood. In this case, whilst troublesome nervous symptoms are palliated by means of cordial and anodyne medicines, whatever attend-ing diforder can conduce to the diminishing of the crassamentum, must be removed: and by means of such medicines and aliments as are best adapted to this end, the blood must be replenished. Besides a light cordial and nourishing diet, moderate exercise, a dry air, the bark, aromatics, and preparations of iron, will be the beft.

Tough phlegm in the flomach and betvels. Gentle but repeated emetics, after which, to strengthen the stomach, bitters, chalybeates, and exercise, will be necessary; and to restore the secretory vessels to an healthy state, give the tinct. aloes frequently in fmall dofes. According as the phlegm abounds, more or lefs, repeat the emetic every fecond or third week, and work it off with warm water, in which is a little flower of mustard. Besides these, as limewater diffolves phlegm in the stomach, a quart at least should be drank at three times every day; the first draught may be taken an hour before breakfast, the second as long before dinner, and the third the fame distance of time before fupper.

Aliments noxious from their quality or quantity. Whether a habit is formed of eating too freely or too spar-ingly, let the error be gradually avoided. Valetudinarians should never eat fo much at a time as to incommode them either for business or study. As to the quality of what is caten, such things should be avoided as rest uneasily on the stomach, create flatulence, or are very fat.

Violent affections of the mind. Besides other general

methods recommended in nervous diforders, diverting the mind by proper objects in the day, and an opiate at night, are the most proper, except it be the fruition of the ob-

ject in cases of disappointment.

When a fever attends, or in the nervous fever. Blifters thould be applied early; by their stimulus and the drain they occasion, their advantage overbalances their inconveniences; the patient should be kept in bed: light cordials, with diaphoretics, volatiles, and as early a ufe of the bark as possible, are the principal remedies. To moderate the feverish heat, Clutton's febrifuge spirit, joined with any proper cordial, and taken in all the patient's drink, is a most agreeable medicine. The sp. etheris nitrofi very effectually abates the fickness which often attends.

In this kind of fever there is rarely any extraordinary degree of plethora, fo there is as rarely any remarkable critical discharge observed. In giving the cordial, diaphoretic medicines with volatiles, as above directed, their too free use will produce a sweating, which keeps up the sever; therefore, to secure the proper medium, observe the urine; if from being pale, it affumes an amber colour, the dofes are duly proportioned, and that more especially if when in bed a kindly moifture comes-on without restlessness. As foon as a turbidness appears in the urine, give the bark with cordials. For procuring fleep in nervous fevers, a few grains of ferrum ammoniacale are by many preferred to every other means. A fymptom of all others the most to be dreaded in this diforder, is madnefs, which fometimes comes on when women are much reduced in child-bed; phoretic method in general used to remove the nervous fever, and to these add the extract of bark with the ferrum ammoniacale.

On nervous diforders, amongst the ancients, see Hippocrates, Aretæus, Fernelius, Duretus, Hellerius, Mer-curialis, &c. Among those of later date, see Wallis's Sydenham, Hoffman, Shebbear's Practice of Physic, Smith's Differtation on the Nervosus Difeases, Whytt on Nervous Difeases, Huxham, Hume, and fir Richard Manningham on the Nervous Fever.

NERVORUM RESOLUTIONES. See COMATA.

NESTIS. The Intestinum jejunum.

NEUROCHONDRODES, from veupes, a nerve, and xosepos, a cartilage. A hard kind of cartilaginous ligament, partly broad, partly round; a certain middle substance between cartilage and ligament; harder than the latter, but softer than the former. Castelli.

NEUROLOGIA. Neurology. A description of

the nerves

NEUROMETERES. The PSOAS MUSCLES.

NEURON. A NERVE. NEUROSES, from stopes, a nerve. Nervous Dis-EASES. These form a class in Dr. Cullen's Nosology; and under this title he comprehends those preternatural affections of fense or motion, which are without fever, as a part of the primary disease; and all those which do not depend upon a topical affection of the organs, but upon a more general affection of the nervous system, and of those powers on which sense and motion more especially

depend.

NEUROTICA. NERVOUS MEDICINES.

NEUROTOMIA, from verper, a nerve. An anatomi-

cal diffection of the nerve.

NEUROTROTOS, from νευρω, α nerve, and τίφωσχα, to wound. A person who labours under a wound of a

NEUTER. NEUTRAL. In chemistry this word is applied to fuch falts as are formed of fuch proportions of acid and alkalies that neither of them predominate in the compound. There are many falts of this kind, which yet have different qualities from each other; some of them are natural, and others are artificial. They have a more extensive use in medicine than any other kind. In general they are cathartic, and when mixed with human fluids, they produce no change there. NEUTHA. Thus that part of the membrane is called

which is torn away, and covers a part of the whole face of a child at its birth.

NHAMBI BRASILIENSIBUS. A plant in Brafil, whose leaves, when chewed, taste like mustard or nasturtium, and, if rubbed on a bubo, presently remove it. See

NHAMBUGUACU. See CATAPUTIA.

NHANDU, also called piper candatum. It is a small shrub which grows in the woods in Brasil, and bears a species of katkins, full of round blackish seeds, as large as those of the poppy, and with a taste much resembling that of pepper. See Raii Hist.

NICON. A name for hellebore.

NICOTIANA, called also petum, tabacum, byosciamus Peruvianus, picelt. Tobacco. It is the nicotiana tabacum, Linn. It is a plant with alternate leaves and monopetalous tubulous flowers, divided into five fections; the flowers are followed by an oval capfule, which open-ing longitudinally, fheds numerous fmall feeds. Its root is annual. It is fown in fpring and flowers in July. Bo-erhaave mentions four species, but there are several

AMERICANA. AMERICAN TOBACCO. It hath large sharp-pointed pale green short leaves, about two feet in length, joined immediately to the stalk without pedicles. It was brought into Europe by M. Nicott, a Frenchman, from whom it is called Nicotiana; he brought it from the illand of Tobago in America, about the year 1560; but it is now cultivated in many parts of Europe. Sir Francis Drake first brought it into England, and fir Walter Raleigh first made its use a fort of fashion amongst

The leaves have a ftrong difagreeable fmell, and a burning acrid tafte; they give out their active parts both to

in this case carefully avoid bleeding and all else that can water and to spirit, but most perfectly to the latter, but lessen the vis vitæ, and steadily adhere to the cordial dia- yield nothing considerable by distillation with either; nevertheless their acrimony is much abated in inspillation of the tincture, the watery extract being less pungent than the leaves themselves, and the spirituous not much more so. The American tobacco is stronger than that which is raifed in England, and affords a more fiery extract, though in less quantity.

If tobacco is taken inwardly in too large a dofe, or if a ftrong decoction of it is used as a clyster, it proves violently cathartic and emetic, occasioning extreme anxiety, vertigoes, stupors, and disorders of the senses; however, in proper quantities, it has been employed as a purgative in clysters, and as generally very effectual. It is em-ployed in all cases of more obstinate costiveness; and in this, the ileus, and incarcerated hernia the fmoke of burning tobacco, has been thrown into the anus with great advantage. It has been lately recommended as a power-ful diuretic; but from the fickness and vomiting it occafioned before it became efficacious, from the increase of the dofes, it has been in some degree laid aside. By long boiling in water its deleterious power is abated, and at length destroyed. The smoke of tobacco received by the anus is of fingular efficacy in obstinate constipations of the belly, for destroying ascarides, and for recovering men that feem to be drowned.

Tobacco is fometimes used in lotions and unquents for cleanfing foul ulcers, and deftroying cutaneous infects; it is deftructive to all infects whether in the vegetable or animal world. Best into a poultice with vinegar, and ap-plied to the hypochondres, it hath discussed tumors there-Bergius recommends a fomentation of it in paraphy-

A conftant chewing of tobacco destroys the appetite by depriving the constitution of too much saliva; however, though it is improper for lean, dry, and hectic habits, it is useful to the more gross, to those of very moist temperaments, and those who are subject to diseases of the colder kind. When the gums are furcharged with rheum, or when the huns are redemators. when the lungs are cedematous, tobacco may be useful as an errhine. Snuff never hurts, if not fwallowed, but is better omitted by those who are inclined to an apoplexy. The oil of the tobacco which afcends in the fmoak, blackens the teeth, and decays them. Cullen's Mat. Med.

NICOTIANA MINOR, called also byosciamus luteus priapeia. YELLOW HENBANE. ENGLISH TOBACCO. Its leaves are short, and somewhat oval, and set on pedicles; by these three characters it is distinguished from the American forts, with which it agrees in their qualities, but is weaker. See Raii Hift. Lewis's Mat. Med. Neumann's Chem. Works. Edinb. Med. Effays, vol. ii art. 5.

NIDOR. The fmell of burnt animal fubstances;

hence eructations, which have a favour like putrefied

flesh, are called nidorous.

NEINGHALA. See METHONICA.

NIGELLA. It is a plant whose root is annual, leaves capillaceous, and flower rosaceous. Boerhaave enumerates ten species. The fort formerly used as a medicine, was the nigella fativa, Lin.

- ARVENSIS, also called melanthium. WILD FEN-

NEL-FLOWER.

- CRETICA FOLIO FÆNICULI. See GARIDELLA. ROMANA, also called gith, melanthium. FEN-

It is called nigella, as it were nigrella, from the black colour of the feeds; also melanthium, i. c. BLACK FLOWER, though the flowers are not black; and melaspermum, BLACK SEED.

This plant, in none of its species are in use with us;

This plant, in none of its species are in use with us; they are faid to be aperitive, resolvent, diuretic, and carminative. The feeds possess similar virtues, but are also expectorant. See Raii Hist.

NIGELLASTRUM, called also pseudomelanthium, sychnis segetum major, nigelia officin. sychnosides segetum, cockle, or corn-campion. It is Boerhaave's sixth species of sychnis; the seeds are useful in statulent disorders, but are rarely given. The plant grows amongst corn, and slowers in June and July. See Raii Hist.

NIGRA VITIS. The BLACK VINE.

— FABRILIS. BLACK LEAD. See PLUMBUM NIGRUM.

NIGRITIES Os. So the ancients called a caries. NIGUAS. NIGUAS. So the Spaniards call the worms which get true, that common waters, both atmospherical and sub-under the toes of the Indians, and which are destroyed by terraneous, often contain a little of this acid in combithe oil from the shells of cashew-nuts.

NIHIL ALBUM, See Album Gracum.

— GRISEUM, See Album Gracum.

NIIR-NOTSJIL. A kind of tree or fhrub, in Malabar; the leaves of which when eaten with rue, are faid to

cure the lues venerea. See Raii Hift.

—— Pongellon. A tree which refembles the peartree, and grows in Malabar. The fruit is eaten by parrots; the feeds are used, with other ingredients, for making an antispasmodic liniment. See Raii Hift.

an antispasmodic liniment. See Raii Hist.

NIL. See Indicum.

NILA HUMMATU. A name for two species of the datura Malabarica. Both these species very much resemble the stramonium. See Raii Hist.

NILENT SIUNDA. COMMON NIGHTSHADE.

NILICA-MARAM. A kind of Indian plum.

NIMBÆ ACOSTÆ, called also aria bepon; azedarach. It is a tall tree in the island of Zeylon, and other casts of the East Indies. It resembles an ass, the fruit

parts of the East Indies. It resembles an ash; the fruit is like an olive, and from it an oil is expressed, for staining cottons with. The leaves are used to destroy worms. See Raii Hist.

NINDSIN. See GINSENG.

NINZIN. So the measles are called in the north parts of Great Britain.

NIRUALA. A large tree in Malabar, whose leaves rovoke urine, though only externally applied. See Raii

NIRURI. An Indian bacciferous shrub, of which there are two kinds.

NISI. Blancard fays, it is ginfeng.

NISSOLIA. CRIMSON GRASS-VETCH. It refembles hisoulta. Crimson Grass-vetch. It retembles that you in every thing, except that the leaves ftand fingle, and have no tendrils, but are like the leaves of the genifta fagittales. It is also called lathyris filvestris minor, eroum filvestre, and catanance leguminosa.

NITRIALES. All things capable of reducing to a calyx, as nitre, supplied, &c.

NITRUM. NITRE. Called also fal petrae aucusto, belinitrum, and salt Petree. It is a neutral salt, formed by the coalition of the common vegetable fixed alkaline.

by the coalition of the common vegetable fixed alkaline falt, with a peculiar acid; it hath a fharp penetrating tafte; it is composed of near equal quantities of volatile and fixed nitrous aerial falts; it is foluble in eight times its weight of very cold water; and in less than three times its weight of water which is temperately warm; and in one third its weight of boiling water. Dr. Alfton observes, that when the atmosphere is temperate, two ounces of water diffolves half a dram of nitre. A faturate solution of nitre, fet to crystallize, shoots into crystals like sprig crystals; but on evaporating part of the sluid first, it concretes into transparent colourless crystals, of an hexagonal prismatic shape, terminating in pyramids of the same num-ber of sides. In a moderate heat it melts as thin as water, and when heated to ignition, it deflagrates on the contact of any inflammable fubfitance, with a bright flame, and a confiderable hiffing noise; and leaving after deto-nation, its fixt alkaline falt, the acid being deftroyed by the act of accension, and thus is produced the

#### NITRUM FIXUM.

Take of powdered nitre, four ounces; of powdered charcoal, five drams; mix them well by rubbing in a mortar; then inject the mixture by a little at a time, in a red-hot crucible. A deflagration, with a hiffing noife, happens on each injection; the whole quantity being thus deflagrated, continue the fire firong for half an hour. Thus the acid of the nitre is either destroyed, or changed to another nature, and the remaining falt differs not from the falt of tartar, except that a very minute portion of the nitre generally remains unchanged. This nitrum fixum is purified by folution in water, filtration, and evaporation. It must be kept close from the air. Dr. Aliton fays, it is a styptic, and of the nature of alum; but it is rarely used, except for the making of the tinctuitri, which does not appear to differ from the tinctual extent.

The origin of the acid of nitre is unknown. It is

terraneous, often contain a little of this acid in combi-nation with earthy and other bodies, fo as to yield by crystallization, on supplying the vegetable fixed alkali, a perfect nitre; and that when animal and vegetable substances, mixed with porous and absorbent earths, have been exposed to the air till they are thoroughly rotted, they are found in like manner to contain a finall portion of nitre, or of nitrous acid, fo as to give out a little mitre to water, either without addition, or on being fupplied with the proper alkine basis. On this foundation nitre is prepared in several parts of Europe; where they expose earth, wet with urine, or animal dung, to ab-forb the aerial acid; on fea-coasts, sheds are made over heaps of vegetable substances, both the marine and others; of animal substances, as the entrails, &c. of beatts and fifles, the rubbith of old buildings, &c. promifcuoully jumbled together, and open to the air, but covered from rain; on the furface of these heaps, a nitrous crust is found. The greatest quantities are brought to us from Persia and the East Indies; but whether it is there a natural or artificial production, is not known. It is brought to us crude, and of different complexions, as grey, black-ish, &c. but that which is of a blackish cast is the best, as it requires only a bare folution, colation, and cryftal-lization for purifying it. Very often it is mixed with fea-falt, from which it is purified as follows:

#### NITRUM PURIFICATUM.

Boil nitre in water until it is dissolved; filtre the folution through paper, evaporate, and fet it to cryftallize in a cool place. The liquor which remains after cryftallization may be further evaporated, and fet to shoot as before; but this process must not be too long protracted. The usual method of evaporating for crystallization, is till a pellicle appears; but this direction fails in nitre, fill a pellicle appears; but this direction fails in nitre, for it does not contract a pellicle: here, when the liquor is become ready for shooting, a little should be taken up in a spoon; as it cools, the falt will begin to shew itself in threads. In this process, the sea-falt is all separated, for it remains dissolved, after the greatest part of the nitre hath crystallized. The crystals which shoot after the second evaporation, are not totally free from the sea-falt; but the refiners purify it to well, that such as its falt; but the refiners purify it so well, that such as is found in the shops is perfectly fit for use.

Geoffroy fays, that nitre loses in melting half its weight watery moisture, and recovers this again on being diffolved and crystallized; whence, it feems, that one part of melted nitre is equal to two parts of the cryftals; but on making the experiment, his observation is not found true.

To improve the virtue of nitre, it is deflagrated with fulphur; by which a portion of the nitrous acid passes off with the fulphur; and, as Dr. Alston observes, the nitre is thus rendered a little less cooling. The process is as follows, and when finished, the preparation is called

SAL PRUNELLE. Called also Ansalynum Minerale, Cryfiallum Minerale.

Take two pounds of pure nitre; melt it in a crucible, or in an iron pot; then fprinkle into it, by little and little, the flowers of fulphur, waiting each time until the deflagration is over, and then add more, until an ounce hath been thus confumed; then with an iron ladle take it out, and east it into moulds of what shape you please. If the fulphur is in a larger proportion, its effects will be to change the nitre into a different medicine; as is inftanced in the

### SAL POLYCHRESTUM. Salt of many Virtues.

Take of pure nitre, melt it in an iron pan, and then add, by little and little, an equal weight of the flowers of fulphur, waiting until the deflagration of one portion is over before another is added; when all the lulphur is expended, continue the nitre over the fire for an hour. Thus the acid of the nitre, and the inflammable principle of the sulphur, detonate together, and are diffipated; whill the acid of the sulphur (which is the same as the vitriolic acid) remains combined with the askaline basis of the nitre. For this fal polychrestum, the nitrum vi-triolatum is substituted. Dr. Alston says, that this falt much refembles the tart, vitr. but is rather more acrid, and that a dose of half a dram is diaphoretic; a dram, is diuretic; and two drams, cathartic. The falt may be

obtained by pouring gradually on nitre, the pure acid of retort. The making of this is a diffinct trade, on ac-vitriol, or fulphur; this acid decomposes the nitrous acid, count of the large demand for it amongst the dvers, and which flies off immediately in yellow or red fumes, and may be collected in a retort, with a moderate heat, and

Spiritus Nitri, or Spiritus Nitri Glauberi, now called Aci-

Take of nitre, fixty ounces; vitriolic acid, twenty-nine ounces; mix, and diffil. Ph. Lond. 1788. If two parts of nitre are taken to one of oil of vitriol, the remaining alkaline basis of the nitre, is completely faturated with the vitriolic acid; and the refult is a neutral falt, the same as the vitriolated tartar: if no more nitre is used, a part of the nitrs, in fubftance, will remain behind, blended with this vitriolated falt; if lefs nitre, it cannot afford alcali enough to faturate the vitriolic acid, and the refiduum will not be a neutral, but a very acid. In this laft cafe, one advantage attends; the acid falt is readily diffolved in water, fo as to be got out without breaking the retort, which the other cannot. The fpecific gravity of the nitrous acid is to that of diffilled water as

1,550 to 1,000. Pharm. Lond. 1788.

The acid of nitre is next in strength to the vitriolic, and dislodges all but that from the alkaline falts and earths. It differs from all the other acids, in deflagrating with inflammable matters; if it is dropped on ol. carui, it will flash, and make an ebullition as strong as though on the fire, and will yield fuch fumes as, by mixing with air, will be fenfible for three or four hours. If a folution of any inflammable fubflance, as hartflorn, &c. in this acid, be fet to evaporate, as foon as the matter approaches to dryness a violent detonation ensues. This acid is chiefly used as a menstruum, and as the basis of fome other preparations. Diluted in water it hath been

given as a diuretic from ten to fifty drops.

If three parts of nitre be used to one of the vitriolic acid, a part of the nitre remains unchanged, after the fpirit is diffilled from it. On diffolying the whole refiduum in hot water, and fetting the filtered folution to crystallize, the vitriolated falt shoots first, the greatest part

of the nitre continuing diffolved; and this is the
NITRUM VITRIOLATUM. Vitriolated Nitre, called
also ducis Holstaia sal, sal de ducbus; areanum duplex;
now kali vitriolatum, vitriolated kali.

Take the salt which remains after the distillation of the

nitrous acid, two pounds; diffilled water two gallons; burn out the fuperfluous acid, with a ftrong fire in an open veffel; then boil it a little while in the water; ftrain and fet the liquor afide to crystallize; this, as already observed differs not from the tart. vitr. except in being a little more acrid; nor is its difference from the fal polychrestum considerable. Vitriolated tartar in small dofes as, 9 i. is. or 5fs. is an ufeful aperient; in larger ones, as four or five drams, a mild cathartic which does not pass off so hastily as the fal amarus, or natron vitriolatum.

#### Aqua Fortis Simplex.

Take of nitre, and of green vitriol, not calcined, of each three pounds; of calcined green vitriol, a pound and a half; mix them well, and dittill them with a ftrong and a half; mix them well, and distill them with a ftrong fire, as long as any red vapours arife. The ingredients should be perfectly well mixed together before they are put to be distilled, or else but a small quantity of the aqua fortis will be obtained. Mixing the vitriol requires somewhat more heat than when the oil of vitriol is used, for its aerid spirit must be separated before it can act on the mitre; but then, too much heat may force over some of the metallic part of the vitriol. The produce of the process is, a spirit of mitre, containing so much more phlegm, or watery mossfure than Glauber's spirit, as the vitriol employed does more than an equivalent quantity of the oil of vitriol, and is liable to an admixture tity of the oil of vitriol, and is liable to an admixture with the vitriolic acid, more or less of which is generally forced over. For this the College order nitrous acid and diffilled water, a pound of each, to be mixed together, and call it acidum nitrofum. dilutum. Ph. Lond. 1788.

#### Aqua Fortis Duplex.

Take equal parts of nitre, green vitriol calcined to redness, and of dried clay. Diffill them in an earthen

count of the large demand for it amongh the dyers, and other artifts. But when this is intended for medicinal uses, or for the nicer chemical experiments, it requires to be purified; for the rough nitre is used, and a great heat, whence both the spirit of falt and a solution of iron are contained in it.

#### Aqua Fortis Purificata.

Drop into the impure aqua fortis, a fmall quantity of the tincture of filver, and when the cloudiness or milkinefs, which it occasions, subsides, drop in more, and thus continue until a fresh addition occasions no farther change; then pour the liquor into a glass retort, and dif-till it in a fand-heat to drynes. The filver absorbs both the marine and the vitriolic acids, and forming a concrete with them, they all fall together.

Good aqua fortis dissolves about half its weight of filver.

#### Aqua Fortis Composita.

Take of aqua fortis fixteen ounces in weight, of feafalt one dram, diftill to drynefs. This is deligned as a menstruum for quick-silver, for the preparation of hy-drargyrus nitratus rub. which the marine acid in this composition renders of a more sparkling appearance, and more beautiful to the eye, than when made with the nitrous acid alone.

## Aqua Regia .- Regalis Regis.

Put an ounce of crude fal ammoniac powder, into a large cucurbit, and add to it, by little and little, four ounces of the spirit of nitre, or of double aqua fortis; let them stand in a fand heat until the salt is entirely diffolved. Or, the falt may be powdered fine, and gradually added to the acrid spirit, which should be of a middle strength, between single aqua fortis and strong spirit of nitre.

The nitrous spirit obtained from rough nitre contains fome of the marine acid, as well as the vitriolic; the first is discovered and separated by dropping in a little solution of silver; the latter by a solution of chalk, or any other calcareous earth, made in the pure nitrous acid; the silver absorbing the marine acid, and the chalk the vitriolic, and forming, with those acids, indisfoluble concretes, which immediately render the liquor milky, and then fall to the bottom. The solutions may be slowly dropped in, until no more milkiness appears; and in case of an excess of their quantity, and the spirit is required pure, it must be re-distilled.

The nitrous spirit, combined with vegetable fixed al-calles, reproduces common nitre; with the mineral fixed

alcali it produces

#### NITRUM Cubicum.

Diffolve chalk or lime in purified aqua fortis, and add the folution, by degrees, to a folution of natron vitriola-tum in water, fo long as a fresh addition produces any milkness; a white powder will precipitate; after which, the liquor is to be filtered, and after due evaporation, set to crystallize. Thus a species of nitre is formed, not much different from the common fort; it crystallizes into eubical, instead of prismatic figures; but as a medicine, this, and the common fort, may be indifferently used.

## NITRUM Flammans,

Is a combination of the nitrous acid and volatile alcaline falt. It is also called nitrum volatile, and nitrum ammoniacale; it is very fubtil, pungent and diffolves in

rectified fpirit of wine.

The nitrous acid in its most concentrated state, saturates about sive-fixths its weight of vegetable fixt alcali. Solutions of calcareous earths in this acid are bitterish and pungent, dissionally assume a crystalline appearance. and when evaporated, and exfected by heat, it foon deliquates again in the air. The nitrous acid diffolves zinc, iron, copper, lead, bifmuth, mercury, and filver, the most readily of all the acids; it dissolves tin imperfectly, and it only corrodes the regulus of antimony. Aqua fortis dissolves silver, mercury, iron (and that belt when mixed with equal parts of common water), copper, lead, regulus of antimony, bifmuth, zinc, tin imperfectly, gold not at all: but by the addition of fal ammon. crud. it

lofes this name, and becomes aqua regia, fo called because is administered, no such effects are observed; and far-it disloves gold, which chemists call the king of me-ther, that when nitre has excited a nausea, &c. it may aftals; it also dissolves iron, copper, tin, mercury, regulus of antimony, bismuth, zinc, and lead more than the spirit of sea-salt does; but does not dissolve silver.

The concentrated acid combined with spirit of wine loses its acidity, the coalition of the two producing a new compound called,

Spiritus NITRI Dulcis, now Spiritus Ætheris Nitrofi.

Take of rectified spirit of wine one quart, of nitrous acid half a pound. Mix them by pouring the nitrous acid on the other, and distil one pound ten cunces. Ph.

Lond. 1788.

This dulcified spirit is held in just esteem for quenching thirst, promoting, the natural secretions, expelling statulencies, and moderately strengthening the stomach; it is strongly antiseptic. Mixed with a small quantity of light quor c. c. or fp. ammoniæ comp. or any volatile alca-line fpirit, it proves mild, yet efficacious, diaphoretic, and diuretic, especially in fevers. The sp. ætheris ni-trosi allays vomiting when saline mixtures fail. It is often adulterated with water, which diminifles its grateful fcent. A fmall proportion of fp. ætheris nitrofi gives a French brandy flavour to malt ipirits.

Nitre makes no impression on blue paper, nor tincture of turnsol, nor syrup of violets; a violent fire is necessary, to draw the spirit from this salt; it sames upon the fire, and kindles readily, though its spirit extinguishes fire; it does not curdle milk; nitre and oil of tartar make an almost insensible coullition. It is one of the principal of the antiphlogiftics, of general use where inflammaantifpafmodic, when irritation or inflammation is excited by flimulating drugs; for if mixed with regulus of anti-mony, gamboge, feammony, &c. their usual ill effects are prevented. When used in gargarisms for inflammations of the fauces, in acute severs, it thickens the falival fluids into a mucus, which keeps the part moist for some time, whereas if mire is not added, a dryness of the mouth prefently enfues. It promotes urine, tends to loofen the belly in hot difpositions, and checks diarrheeas from the acrimony of the bile; it is of fingular fervice in the cholera morbus when accompanied with anxiety, and in the cardialgia of hypochondriacs; its virtues are fimilar to those of neutral salts in general, but exceed them in de-gree in many instances; in the small-pox, if the sever runs too high, mitre foon reduces it; fometimes it is af-fifted in its efficacy by a conjunction with volatile falts, or camphor, at the fame time that it is often by this means rendered more grateful to the ftomach; thus managed it is ufeful in removing pains in the limbs; it checks bloody urine from an inflammatory cause; hæmorrhages from parefaction, and inflammations are restrained by its internal use; in hamoptoes and other disorders of the lungs, mire is generally useful; as an alterative, it hath been useful, by a long continuance of it, in the leprofy, and particularly so in the cure of old users in the legs; joined with warm carminatives, it carries their efficacy through the istellines, which otherwise would be confined to the stomach.

Nitre, lowever, should not be given without caution; though ujeful in most disorders of the lungs, if the vis site is defective it is better omitted; the fame may be observed in almost all other cases. It often occasions a naufea, c. a pain in the ftomach if taken in a folid form; in this c. fe, plentiful dilution, or warm medicines accompanying its use, these are prevented, or removed, if they

The dose of nitre may be from three grains to two feruples, or more, every hour or two. And if each dose is given as foon as it is diffolved, its efficacy will be greater, and thus it also rests more easy on the stomach,

#### Decoclum NITROSUM.

Take half an ounce of nitre, one scruple of cochineal, boil them in a quart of water until the nitre is diffolved, then add two ounces of fugar; and when cold, ftrain off the clear liquor. This is palatable, and agreeable to the eye. Three or four table-spoonsfull may be taken for a dole, and repeated according to the intention of giving it. In some instances nitre produces pain, nausea, and even sickness. It is faid that, when it is boiled before it conveniences thereof.

ther, that when nitre has excited a nausea, &cc. it may afterwards be given as above preferibed, and it will remove

the fickness previously excited.

a mixture of cochlearia with acctoia. See Ran FintLewis's Mat. Med.

NUSCITIOSUS. See NYCTALOPS.

NUTRICATIO. Accretio. NUTRITION, ACCRETION, or GROWTH. It hath generally been thought
that nutrition is chiefly performed by means of the neryous fluid, because those parts whose nerves are destroyed,
or wholly deprived of their usual power, are observed to the throat, not fo naufeous. This water will not ferment with the vitriolic, or muriatic acid, though it contains, a little lime-ftone, fome calcareous rites with the fluids in when this is wanting, the fluids either do not in the fluids when this is wanting, the fluids either do not in the fluids either do n become smaller; but this is without foundation, for, from at all through the vehels, or at least in a very languad manner; whence the parts to which they belong collapse, and are not properly nourished. See Whytr's Physicological Essays, edit. 2. p. 22, &c. p. 49. and 50. The standard of nutrition varies in persons of different ages; for, during infancy, more is added to the body than is thrown off from it; but to old age, the consumption is greater than the addition. The first of these is the growth, the latter the decrease, and so decay of the body. growth, the latter the decrease, and so decay of the body. In infancy and youth the sibres are extensible; and the force of the circulation proportionably greater than in later life: on the arrival of maturity, the last lessens, and the first is totally at an end. See Haller's Physiol.

NUTRITUM UNGUENTUM. It was formerly made by mixing certain proportions of vinegar, oil, and

litharge; but the London College fubflituted, as a neater application, the ungt. faturainum, which they neater application, the ungt. faturainum, which they now call unguentum ceruff accetate, OINTMENT of ACE-TATED CERUSSE, and make in the following mode: take of acetated ceruffe, two drams by weight; white wax, two ounces by weight; olive oil, half a pint; rub the acetated ceruffe, previously powdered, with fome part of the olive oil; then add it to the wax, melted with the remaining oil. Stir the mixture until it is cold. Ph. Lond. 1788.

NUX CATHARTICA. See CATAPUTIA MINOR.

--- INDICA. The COCOA-NUT, See Coccus DE MALDIVIA.

MEDICA. The MALDIVA MALDIVIA.

NUT. — Moschata; also called nux myristica, nucista, pala, chrysbalanus Galeni, unguentaria, nux aromatica, the NUTMEG. Weston, in his Universal Botanist, names the tree, myristica moschata, and describes it myristica arbor nuces mofehatas, & macem gerens. The NUT-MEG and MACE-TREE. Linnzeus in his Suppl. 265, names the tree myriftica officinalis.

It is the aromatic kernel of a large nut, produced by tree, faid to resemble the pear-tree; it grows in the East Indies, principally on the isle of Banda, and in the Mo-lucca Isles. The outer part of the fruit which is the size of a peach, is a soft slessly substance like that of the wal-nut, which spontaneously opens when ripe; under this lies a red membrane, called macis, mace, forming a kind. lies a red membrane, called macis, mace, forming a kind of reticular covering, through the fiffures of which is feen the hard woody shell that includes the nutmeg. C. Bauhine speaks of three forts; but there are two which are frequently enough met with; one of them is of an oblong figure, called male, the other roundish called female; this last is the officinal species, being preferred to the other, on account of its stronger; and more agreeable slavour, and its being, as is said, less swoject to become carious. The Dutch monopolize this part of trade, as well as the rest of the spices in general, whence we seldom have them genuine. we feldom have them genuine.

The nutmeg is moderately warm, grateful to the tafte, and unctuous. It is confidered as antifeptic, flomachic, cordial, and carminative, in dofes of from fix grains to half a dram; but in larger doses it has been proved to be possessed of a strong hypnotic power. See Cullen's

Mat. Med.

The London College directs a gallon of proof spirit, to be drawn by distillation, from two ounces of nutmegs, and this is called spiritus nucis moschatæ; but when a few hawthorn flowers are added, it is called aq. nephritica. Tincture made from the nutmeg in proof spirit, is a more excellent medicine.

By distillation with water, natmegs yield nearly one vous system. See Raii Hist. Lewis's Mat. Med. Neutenth their weight of a limpid effential oil, which is very mann's Chemical Works. grateful, and possesses the flavour of the spice in perfec-tion; it is recommended as antispasmodic and hypnotic. It is fimilar in quality to the oil of mace, but not quite so grateful.

On the furface of the remaining liquor in the still, after the afcent of the effential oil, called oleum nucis mofchatæ effentiale, is found floating an unctuous concrete, like tallow, of a white colour, nearly infipid, not eafily corruptible, and hence commended as a basis for odoriferous ballams; the decoction, freed from this febaceous matter, and inspissated, leaves a weakly bitter sub-astrin-

gent extract.

Rectified spirit takes up the whole smell and taste of the nutmegs, and receives from them a deep bright yellow colour; the spirit drawn off from the filtered tincture is very flightly impregnated with their flavour; the greatest part of the specific smell, as well as the aromatic warmth, bitterness, and subastringency of the spice, remaining concentrated in the extract.

Both the oil, the fpirituous tincture, and extracts, agree better with weak ftomachs than the natmeg itself.

Ol. N. M. per Expr. common'y called Ol. Macis per Expr.

When nutmegs are heated, and strongly pressed, they give out a sluid yellow oil, which concretes on growing cold, into a febaceous confiftence. We are informed, that in the Spice Islands, the imperfect and damaged nuts are separated for obtaining this expressed oil. thops we find three forts, under the name of oil of mace. The best is brought from the East Indies in stone jars; it is foftish, of a yellowish colour, an agreeable fragrant finell greatly refembling that of the nutmeg itself; it is of the colour of mace. The next comes from Holland in fold colour of mace. The next comes from Holland in folid maffes, generally flat, and of a square figure; it is paler coloured, weaker in its finell, and inferior in its quality to that of India. The last is the worst; it seems to be a composition of suet, palm-oil, and such like expressed ones, shavoured with a little of the genuine oil of nut-The best is the sebaceous matter of the nutmeg and its effential oil; by diffillation in water, and macera-tion in rectified spirit of wine, the effential oil is separated and the febaceous matter is left quite infipid. The chief use of these are for liniments, &c. to be applied to the

the of thele are for infiments, &c. to be applied to the feomach, or as a part in anodyne and nervous ointments. See Tournefort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

NUX VIRGINIANA, called also prunifera, nucifera, nucife

but a little pulp.

The fruit is of the shape and fize of a filbert, smooth, of a brown colour, with an eye near one end, containing

of a brown colour, with an eye near one end, containing a hard ftone, with a white globular kernel, of a bitterish taste and an aromatic smell. It is antiscorbutic, deobstruent, and warming. See Raii Dendr.

— VOMICA, called also nux metella, caniram saba sebrifuga, gedbahadura, igasur, vomic nurs. It is a sat roundish seed, or kernel, about an inch broad, and a quarter of an inch thick, with a prominence in the middle, on both sides of a grey colour covered with a kind of woolly matter, internally hard and tough like horn. It is the produce of a large tree growing in the horn. It is the produce of a large tree growing in the East Indies, which Plukenet calls cucurbitifera Malabariensis cenoplize folis rotundis fructu orbiculari rubro cujus grana funt nuces vomice officinarum. The nun vomice is the fruit of the ftrychnos nun vomice, vel strychnos Indi-ca, foliis ovatis quinque nervis, cauli interni, Linn.

They have no place in the prefent practice; to the They have no place in the present practice; to the taste they are bitter, but have no smell. Fallopius says, in doses to 3 ss. they procure sweat; but Hossman informs us, that two doses of seven or eight grains each, were fatal to a girl of ten years old. They posson dogs. crows, &c. When imprudently swallowed by men, they produce great anxiety, convulsions, paralytic symptoms, retching, an increased motion of the heart and of the lungs. The possonous matter is probably the same as that of bitter almonds, which are chiefly on the nerthe lungs. The polionous matter is probably as that of bitter almonds, which are chiefly on the ner-

Dr. Hagstrom, a Swedish physician, commends the usefulness of the nuw vomica in the dysentery. See the Lond. Med. Journal, vol. iii. p. 189, &c.

However, they appear to be too dangerous to be admitted into practice, especially where other medicines,

less deleterious, are equally efficacious.

Nux Serapionis, called alfo faba faceli Ignatii, nux pepita igafur, faba Indica. St. Ignatius's BEAN. It is the produce of a tree of the same kind as that on which the nax vomica grows. It is met with in the East Indies and the Philippine islands. The fruit refembles a gourd, in each of which is from twenty to thirty feeds, improperly called beans. They are of a roundish figure, irregular, and uneven, the fize of a middling nutmeg, femi-transparent, of a horny texture, and of a colour betwirt white and a sky-blue. These feeds have a bitter taste, but no smell, except a degree of a musty scent whilst fresh. The inhabitants of the Philippine islands use them as a medicine, but they affect the Europeans violently, producing the same effect as do the vomic nuts. See Act. Phil. Lond. No. 249, p. 44. Med. Mus. vol. iii.

Nux is a term added to many vegetable productions, viz. Nun basilica, euboica, Persica, & regia. See Ju-GLANS.—Ben, & unguentaria. See BEN.—Barbadensis & cathartica. See CATAPUTIA MINOR. - Indica & medica. See PALMA COCCIFERA, & COCCUS DE MALDIVIA .- Malabarica. See CUMBULU .- Vomica. See COLUBRINUM.

NYCTALOPIA. See AMBLYOPIA.

NYCTALOPS, from rot, night, and wt, an eye, NIGHT-BLINDNESS. Celfus calls the discase imbecillitas oculorum. Sometimes these patients are called luscitiosi, or nuscitiofi, but improperly; for lufcitiofus is one who fees but little through fome defect of the eye, and fees better in the evening than at noon. But amongst both the Greek and Latin writers, there is a direct opposition in the use of the word nystalops, some faying it fignifies those who see by night, and others express by it those who cannot fee during the night. However, at prefent, it is understood to fignify that disorder, in which, as the night approaches, the patient lofes his fight, he remains blind until the morning, at which time the fight returning, it continues all the day, and fo continues to return with the

day, and to depart at night.

The words hemerolopia, in Vogel's Genera of Difeafea frands for blindness in the night, and fight in the day; and nyelalopia, in Linneus's and Vogel's, it and for blind-

neis in the day, and fight in the night.

The difference in the account of this diforder, as to its appearing in the night, or in the day, is reconciled by confidering it as of the intermitting kind; the difference then will confift in the different times of its approach, fo may be called periodical blindness. Intermittents appear in a variety of modes, and the fuccess of the bark, in fome instances of this fort of blindness, both favour the opinion of its being an intermittent disease of the eyes. See Lond. Med. Trans. vol. i. and Lond. Med. Obs. and Inq. vol. i. p. 111, &c. Wallis's Sauvages's Nofology of the Eyes, p. 265.

NYMPHÆ, called also alæ internæ minores, clitoridis, colliculum, collicula. They run down on each side of the

clitoris, and with the frænum of the perinæum they form what fome call the foffa magna, or entrance into the vagina. In midwifery this is called os enternum. Sometimes the nympha are large, and appear cancerous; when this happens, the part may be cut off with feiffars, and it will then heal as a common wound. Galen, and other ancient writers, fometimes call the clitoris, and fometimes the hymen, by the name of nymphe; but what the moderns call nymphæ, or criftæ clitoridis, or alæ minores five internæ, are two prominent folds of the inner skin of the greater or external alæ, reaching from the præputium of the clitoris, to the two sides of the great orifice of the uterus: they begin narrow, grow broader, then at their

the orifice of the vagina, in the labia externa.

NYMPHEA, called also nenupbar, leucosymphea, mi croleuco-symphea. The GREAT WHITE WATER-LILY Nymphea alba, Linn. It is called nymphea, because it

lives in waters where the nymphs are feigned by the poets to inhabit. There are feveral species, distinguished by their white and yellow slowers, &c. but their virtues, white and to be anodyne and demulcent, are too infignificant to demand any notice in medical practice. See Raii Hift. It is also the name of a preternatural excrescence on the nymphæ, also of the plant called FROG-BIT.

NYMPHÆA GLANDIFERA.

— INDICA.

— MADRASPASTANA.

See FABA ÆGYPTIA.

NYMPHOIDES, also called nymphan luten miner, When a country and nymphan alba miner. It is thus named from its vullion. resemblance to the nymphæs, both in its form and virtues.

NYMPHOMANIA PRURIGINOSA. A variety of the

nymphomania.

NYMPHOTOMIA. A fection of the clitoris when too large; for the ancients called the clitoris by the name of nympha.

NYSTAGMOS. A WINKING OF TWINKLING with the eyes, such as happens when a person is very sleepy. When a disease, it is an instance of the clonic kind of con-

# OBL

voice fo low, as not often to be diffinelly heard.

OBELÆA, from Serses, a dart or a fpit. Obelæa futurus or fagittalis. An epithet for the fagittal future of the fkull, also called the strait suture of the head.

OBELCHERA. A CUCURBIT.

OBELISCOTHECA. DWARF AMERICAN SUNTY.

PLOWER. There are two species, one from Virginia, the other from Carolina. They are of no medical use.

See Miller's Dict.

OBESITAS. Corpulentia. Corpulence, or FATNESS. See POLYSARCIA. It is observed that for one RESS. See POLYSARCIA. It is observed that for one fat person in France or Spain, there are an hundred in England and Holland. This is supposed to be from the use of new malt liquors, more than from the difference of climes, or degrees of perspiration. Indolence may cause fatness in some constitutions; but, in general, those who are disposed to this habit will be fat in spite of every endeavour to the contrary, but that of destroying health. Vinegar never prevents fatness, but by inducing a worse disorder. One of the best methods of emptying the cel-Iular membrane of its oil, feems to be a gentle mercurial Iular membrane of its oil, feems to be a gentle mercurial falivation, and decoctions of guaiacum wood at proper intervals. See a remarkable instance of fatness in the Lond. Med. Obs. and Inq. p. 69 – 84.

OBLATES PURGANTES. They are figured purging cakes, made of flour, sugar, and purging ingredients.

OBLIQUI SUPERIORES. See PATHETICUS.

OBLIQUIS. A name for several pairs of muscles; also a name of the pronator, teres.

OBLIQUIS ASCENDENS, called also ACCLIVIS.

———INTERNUS, These muscles of the belly receive their name from the oblique ascent of their fibres. They lay under the obliques descendens. The

fibres. They lay under the soliquus descendens. The same error which many anatomists have taught with respect to the soliquus descendens, they have committed with respect to these muscles; they have no communication with the lumbal vertebra; they arise sleshy from the spine with the lumbal vertebra; they arife fleshy from the spine of the os ilium and ligamentum pubis, and the upper edge of the os facrum, according to Dr. Hunter; but some others say, that there is no part of them that comes from the os facrum, but passing forward and upward from the ossilium, but passing forward and upward from the offa pubis and illi, they form a broad membraneous thin tendon, implanted into the whole length of the linea alba, and the cartilages of the eighth, ninth, tenth, eleventh, and twelfth ribs. Their tendons divide into two lamellæ, one of which joins the rectus on each side, and the other the transversalis. These muscles are not perforated by the spermatic cord. Besides their use in compressing of the belly, that part which arises sleshy towards the back part of the edge of the os ilium, and goes upward and outward, and is inserted into the transversalism, and specific them, and straitens the thorax in expiration,

# OBL

B. Selden fays that Ob was usually translated Python, or magician. This Ob is as a spirit, or demon, that gave answers which seemed to come from the pudenda, the head, or the arm-pits, but with a voice so low, as not often to be distinctly heard.

OBELEA, from stars, a deet or a thir. Obelea for ing on the opposite side, may act in concurrence with them in discharging of their office.

OBLIQUUS DESCENDENS. This pair of mufcles is \_\_\_\_\_ Externus. also called declivis. They are the external muscles of the belly, and derive their are the external muscles of the belly, and derive their name from the progress of their fibres, which run obliquely downwards. They arise by productions partly sleshy, and partly tendinous, from the lower edge of the fifth, fixth, seventh, and most of the inferior ribs, which indent themselves into the sleshy dentiform processes of the ferratus anticus major. Their fibres run forward and downward, terminating in the spine of the slium, os pubis, and linea alba. Part of these fibres, which run toward the ilium, are lost in the fascia of the thigh, and those which run toward the os pubis, are doubled under ward the ilium, are loft in the fascia of the thigh, and those which run toward the os pubis, are doubled under themselves. This duplication (being supposed to be a ligament) goes by the name of ligamentum Poupartii, and through it the spermatic vessels of men, and the round ligaments of the womb in women, perforate. The ring through which these pass, is formed by the tendinous fibres parting. From their origin, which are mostly slessly, their oblique descending slessy parts expand themselves into a broad membranous tendon, before they go over the rectus to their insertion in the linea alba and os over the rectus to their infertion in the linea alba and os pubis, from whence ftill defeending, they end partly tendinous in the ligamentum pubis, but chiefly flefhy on the fuperior and forepart of the circular edge of the os ilium. They do not adhere to the transverse processes of the vertebræ lumbares, but their largest, last, and most fleshy digitation, leaving the lowest bastard rib at its extreme point, in their oblique defeent going forwards, ftill re-cedes gradually from the vertebræ, forming a triangular interfice, which is taken up by the facrolumbus, os ili-um, and its lower fide; in this area the fibres of the subjacent muscles plainly appear. These muscles give strength to the parieties of the belly, sustain and comtrength to the parietes of the belly, fultain and compress the viscera, propel the faces, urine, and the foctus; that part of them which is interjacent, between the linea alba, os pebis, and the spine of the os ilium, bearing an analogy in its position to the massicus of the head, serves for the circumrotation of the trunk, upon the axis of the vertebre, when we turn the body to the contrary

OBLIQUUS

Obliques Major oculi, also called fuperior trock-learis amatorius; longissimus oculi. It is called trochlearis from its tendon passing through a cartilaginous pulley, that is situated in the orbit of the eye to the inside of the internal angular process of the os frontis near the inner angle. This muscle rises tendinous from the bottom of the socket near the entrance of the optic nerve, and passi-ing towards the upper part of the socket near the great ing towards the upper part of the focket near the great angle of the eye, its round tendon runs through a cartilaginous pulley, which is there fixed to a depreffure in the os frontis, from thence it is reflected, and runs obliquely backward, inclosed in a ligamentous sheath, and is inferted tendinous into the sclerotica, upon the upper part of the globe of the eye, a little more backward than the infertion of the rectus fuperior. When it acts fingly, it rolls the eye about its axis, drawing the globe forward and the pupil downward; when it acts in conjunction with the obliquus minor, the eye is drawn outward or forward.

- MINOR. See RECTUS MINOR. - MINOR vel INFERIOR OCULI. It rifes chiefly, fleshy, just within the edge of the lower and anterior part of the focket, near the caruncula lachrymalis, and paffing obliquely backwards under the globe, it is inferted into the felerotica on the external fide of the eye, near the optic nerve. It is also called amatorius.

—— NASI, called also laterales muse. These are thin

muscles running along the sides of the pyramidales nasi; they are fixed to the apophysis nasalis of the osia maxillaria, and are inserted into the alse narium.

—— PALPEBRARUM. The muscles of the eye-lids

thus named, are all that extent of fleshy fibres, which by a thin stratum furrounds the edge of each orbit, and from thence, without any interruption, covers the two eye-lids all the way to the cilia. These fibres are mostly trans-versely oval. They adhere to the skin of the eye-lids and wrinkle them.

SUPERIOR. These muscles are on each side, covered by the head of the trachelo-mastoideus, they each rife from the transverse process of the atlas, and have their infertion into the os petrofum and os occipitalis, near the proceffus maftoideus; they ferve to bend the head backward; called also capitis obliquus superior.

—— Superior oculi. See Obliquus Major

OCULI.

OBLIVIO. FORGETFULNESS. Synonymous with

OBOLUS. A weight of about nine grains.
OBSIDIANUM. Pliny fays, that it was a fort of colour with which veffels were glazed. Hence the name is applied by Libavius to glafs of antimony.
OBSIDIANUS LAPIS CANAL COAL. See AM-

OBSONIORUM RHUS. See RHUS.
OBSTETRICATIO. MIDWIFERY. The first mention that is made of this is in Gen. xxxv. 16, 17. And then it appears to have been in the hands of women. mongit medical writers, Hippocrates was the first who gave any account of it, either as a branch of science, or gave any account of it, either as a branch of ictence, or of art; after Hippocrates, Celfus, Moschion, Rufus Ephefius, Galen, Oribasus, Actius, Paulus Ægineta, Avicenna, Albersis, and others, have enlarged on this subject; but the last improvers are Mauriceau, the Chamberlains, Chapman, Daventer, La Motte, Gissard, Heisters, Chapman, Daventer, La Motte, Gissard, Heisters, Hei ter, Smellie, Hamilton, Leake, &c.
It may here be observed, that the English and the

French are not peculiar nor unprecedent, in calling in the affiftance of men. When women fell in labour, it appears in hiftory, that the Athenians had a law to for-bid flaves and women to practice midwifery; afterwards, indeed, a law was made, by which free-women were al-

lowed to practife it.

Midwifery, at prefent, is taught and practifed as a diftinct branch of art; and in order to a proficiency therein, the practitioner is supposed to possess a competent knowledge of the following particulars, most of which are, more or less, noticed in the respective parts of this work. They are as follow.

The parts of the pelvis, its dimensions, the depth of its cavity, its various diffortions, &c. The parts of women, subservient to generation. The state of the womb and its neck, in the different periods of gestation. Twins. Monsters. Superfectations. Extra-uterine foctuses. Moles.

bed women. The management of the child and its mo-ther during the time of lying-in, &c. on which fee the articles Pelvis, Parturitio, Gestatio, Involu-

See Treatifes of Midwifery, by Chapman, Mauriceau, Dionis, La Motte, Smellie, Memis, &c. Cafes of Midwifery, by Giffard and Smellie, Hamilton, &c. OBSTIPATIO. COSTIVENESS. Thus Dr. Cullen

OBSTIPATIO. COSTIVENESS. Thus Dr. Callen names this genus of difeafe. He places it in the class locales, and order epischeses. Its species are, I. Obstipatio debilium; it happens in lax and weakly men who have generally but a weak digestion. 2. Obstipatio rigidorum; it happens to men who have rigid fibres, who often are hypochondriae. 3. Obstipatio obstructorum; when there are symptoms of the spalmodic colic, the colic of Poictiers, the accidental colic, or the colic from stony concretions in the bowels. See Constipatio.

OBSTIPITAS. The same as contractura primaria. See Contractura. This word, with any other annexed, is only one or other variety of contracting; this

See CONTRACTURA. This word, with any other annexed, is only one or other variety of contracting; this is the inftance known by the name of WRY-NECK.

OBSTRUCTIO. OBSTRUCTION. It is when the fluids can no longer pass through the vessels of a particular part; and may happen from the increased viscidity of the fluid; a diminution of the capacity of the vessels or a concurrence of both these causes. These are more that distinguish appears according to the age. or lefs difficultly removed, according to the age, confli-tution, &c. of the patient.

OBTUNDENTIA. Medicines which leffen the acri-

mony of the humours.

OBTURATOR EXTERNUS. Some call it marfupialir. This muscle covers the foramen magnum is chii, and rifing from the bone before the foramen, runs backwards under the head of the os femoris, covered by the quadratus femoris, and is inferted into the trochanter ma-

jor, contiguous to the internus, and is, like it, a rotator. OBTURATOR INTERNUS, or MARSUPIALIS. This muscle takes its origin from the inner circumference of the foramen magnum ischii, and goes out playing round the ischium as on a pulley, and is inferted into the trochanter major, contiguous to the pyriformis, and is a rotator of the thigh. The tendon of this muscle plainly grooves the bone in its passage.

Nervus. This nerve is a branch of the cru-

ral; it passes through the foramen ovale, and is lost in the inner muscles of the thigh.

OBTURATRIX ARTERIA. It is a branch of the hypogastric. It perforates the obturator muscle, whence its name; and goes out of the pelvis, at the upper part of the ligament of the foramen ovale, having first tent a branch over the fymphysis of the os ilium, and os pubis, to the inguinal glands and integuments. It fends out a branch which communicates with a branch of the sciatica arteria; and gives out branches to the adjacent mufcles, and fends many fmall ones by the neck of the thigh-

- VENA. It is a branch from the hypogastric vein, and receives this name, where it enters into the internal obturator muscle.

OCCA. See CETE ADMIRABILE.

OCCIPITALIS ARTERIA. It is the first external, or posterior branch of the external carotid. It passes obliquely before the internal jugular vein; and having fent out twigs to the adjacent mufcles, it runs between the ftyloid and maftoid apophyses, along the mastoid groove, and goes to the muscles and integuments, which cover the occipital bone. It communicates with the temporal, vertebral, and cervical arteries.

OCCIPITALIS MUSCULUS. It is one of the quadration This is mentioned by Columbus, and accurately described by Fallopius. There are two of them; they are fhort, broad, thin, and fleshy; they are fituated on the occiput, where the maftoideus and iplenius mufcles are inferted; they foon become tendinous, join with the pericranium, which firmly adheres to the hairy fealp on the finciput. When they act the pull the hairy fealp backwards.

OCCIPITALIS

head.

- POSTERIOR ARTERIA. It is a branch from the vertebral. It fpreads on the occiput.

- VENA. A branch from the posterior, or upper external jugular; but it fornetimes proceeds from the vertebralis, or axillaris. It spreads on the occiput.

OCCIPITIS OS. This bone is of a rhomboidal figure, a transverse ridge running from the malloid process of one side to that of the other, divides it into two parts. Its external furface is convex, except at the cuniform process, at the base of which, on each side of the foramen magnum, are the condyles which connect the head to the spine; on the outside of these condyles the bone makes a projection, and there is a notch where the internal jugular vein passes. The bone is divided into four eavities in its infide, by a crucial fpine, which hath four canals in it; the superior, for the longitudinal finus; the inferior frequently hath the occipital finus; these on each fide, for the lateral finuses, which are continuations of the longitudinal. There are five foramina proper to this boar; the first is the foramen magnum; just above the condyle there is a hole on each side for the ninth pair of nerves, and generally there are two holes which pierce from behind the condyles to the fosse of the lateral sinuses. Besides these, there are two common foramina which are one on each side, between the processus cunciformis and of petrofum.

OCCIPITO-FRONTALIS. Albinus calls it epicra-

goes over the upper part of the occiput, goes over the upper part of the os parietale and os frontis, and is loft in the eye-brows. It is a very thin mufcle, its office is, to raife the eye-brows, and wrinkle the forehead. It is antagonift to the corrugator Coiterii.

OCHEUS. See SCROTUM.

OCHLAGOGI. See AGYRTA.

OCHRA, called also virtislum absortivum. Yellow

OCHRE. Some is found of a brown colour; and fome is red. The darkest red fort is called red oter, rubrica fabrilis; Creta rubra, MARKING STONE, RUDD, and RUDDLE. They are an argillaceous earth, lefs tenacious when moif-tened than the clays and the boles; impregnated with a finall portion of iron, and thence their colour. burning, their argillaceous nature is discovered; and by digefting in aqua regia their iron is extracted, and then the schre remains white. Their chief difference from bole is in their being less viscid. See Lewis's Mat. Med. Neuman's Chem. Works.

---- NIGRA. BLACK-LEAD. See PLUMBUM NI-

GRUM.

OCHREA. The fore-part of the tibia.
OCHRUS, also called lathyris, and ervilia. Boerhaave
mentions this plant. It bears cylindrical pods with round feeds as large as peas, which are eatable, but not very eafily digested.

OCHTHODES, from «χθ», importing the callous tunid lips of ulcers; or from «χθ», a bank. It is an epithet for ulcers which are difficult to heal.

OCIMASTRUM, also called ocymoides, lychnis sylvesis, also simplex. WILD WHITE CAMPION.

It is Boerhaave's fourteenth species of lychnis. It is found in hedges and borders of fields; it flowers in May. The flower is faid to check the fluor albus, and inward bleedings; the herb boiled in posset, is said to cure conrulfions in children; but its virtues hath not obtained it a place in practice. See Raii Hift.

OCOLOXOCHITL. See TIGRIDIS FLOS.

OCTANA. An erratic intermitting fever, which returns every eighth day.

OCTAVUS HUMERI MUSC.

HUMERI PLACENTINI MUSC.

See TERES

OCULARES COMMUNES. A name for the nerves,

which are also called motores oculorum.

OCULARIA. Eye-BRIGHT.
OCULI CANCRORUM. CRABS EYES. Called conerorum lapides. They are stony concretions, of what, at first, was but a milky juice, found in the head of the eflacus fluviatilis, or river craw-fish; they are lodged in \_\_\_\_CHRIS a bag no each fide the flomach, which also is in the head sylvestre;

Occipitalis Nervus. A branch from the tenth of this fifth, two of them are lodged in the head of each pair of nerves which proceed from within the skull; it These stones are roundish, statted on one side, in colour spreads and runs on the upper and lateral parts of the white, having sometimes a reddish, and at others, a bluish cast; the blue are the best, the white are taken out after the fifti hath been boiled; they are internally of a leafy texture. The largest quantities are the produce of Mus-covy, particularly of the river Don; great quantities are also found in other parts of the Russian empire.

They are used as an absorbent of acid humours in the prime viz, and are supposed, when combined with the acid, to be more aperient and resolvent than most of the other absorbent earths; however this may be, it is certain that the earth of crabs-eyes, differs much from the earth of crabs-claws, for the first is not convertible into quick-lime: The medical difference of their earths, diffeolved in any acid of the vegetable or animal kingdom, do not appear to be great; the folutions of the two are alike in taite. The earth of crabs-eyes, as to its chemical cha-racters, is the fame as the earth of hartshorn.

These stones are counterfeited with pipe clay, or with chalk, mixed with glutinous materials, or with the shells of fishes; but these compositions are easily distinguished from true crabs-eyes, by their texture being uniform, and not leafy; by their flicking to the tongue, which crabs-eyes will not do; by their foftening with water, which crabs-eyes will not do; by their diffolving in acids, while crabs-eyes fleeped in vinegar retain their form; but when the artificial fort are made with shells, the want of the lamellated coats is the best method of distinguishing them. See Tournefort's Mat. Med. Lewis's Mat. Med. OCULO MUSCULARES. The nerves called mo-

tores oculorum.

OCULO MUSCULARES EXTERNI. The nerves called

OCULUS. The EYE. The external parts are, the eye-brows, the eye-lids, the cilia, the forepart of the globe, the membrana conjunctiva, the cornea lucida, the iris, the pupilla, the carunculæ lachrymales, and angles of the eye-lids, &c. The internal parts are the globe of the eye, the adnata or albuginea, the felerotica, the choroides, the retina, the aqueous humour, the vitreous humour, the

retina, the aqueous humour, the vitreous humour, the muscles that move the eye, and the optic nerve, &c. for an account of these, see the respective parts described under each head specifically.

A new-born child shall be observed, perhaps, never to keep its eyes fixed on any one object, but continually changing from one to another, and if you put your hand before them, the children will not wink; hence some have thought, that new-horn infants have no sight; but this thought, that new-born infants have no fight; but this is a mistake, and the true reason why their eyes are in perpetual motion is, that they have not yet acquired the habit of examining one thing at once with their eyes; their not winking at the approach of the hand arises from their want of experience how easily their eyes may be hurt; but in a few days, they get the habit of winking, so that afterwards their eyes do it spontaneously at the

fo that afterwards their eyes do it ipontaneously at the approach of danger

See a Description of the Eye, and its adjacent parts by J. Warner, Surgeon. Remarks on the Ophthalmy, &c. by J. Ware, Surgeon. Winslow's Anatomy. Chefelden's Anatomy, &c.

Artificial eyes are made of concave plates of gold, filver, or glass, and are stained so as to resemble the natural eye. They must, when fixed in the orbit, be taken out eye. They must, when fixed in the orbit, be taken out and cleaned every night, and replaced in the morning. If no more of a difeased eye is removed, than what is preternaturally projected, or if enough is left, to leave the muscles unburt, the artificial eye will have a little motion from the muscles that remain. If the eye does not fit well, it irritates and inflames the other eye in which cafe, lay it afide, until one can be had that fits

better.

- LACHRYMANS. See EPIPHORA.

OCYMASTRUM. See OCIMASTRUM. It is a name for the circaa Lutetiana; and of feveral species of lychnis.
OCYMASTRUM VERRUCCARIUM. The INCHAN-OCYMASTRUM VERRUCCARIUM. TER'S NIGHT-SHADE. See CIRCEA.

OCYMOIDES, also called lychnis fylvesiris five aqua-

tica purpurea fimplex. RED WILD CAMPION.

It is Boerhaave's twentieth species of lychnis. It grows in hedges, and slowers in summer. The feeds are purging, but it is not known in prefent practice. See Raii Hift.

- It is a name for feveral species of lychnis, of the

ocymastrum, and a species of themyosotis.

OCYMUM, warm, fwiftly. It is thus called from its fudden growth. It is also called basilicum, because of its excellent smell. It is the ocymum basilicum, Linn. Boerhaave enumerates twenty-four species. The chief use of ecymum is for improving the flavour of sp. vol. arom.

OCYMUM AQUATICUM. A fort of water-thiftle. See Echinos. For that called, - Coryaphillatum, -MINIMUM, - VULGARIUS, - MEDIUM, - CITRA-

TUM,-fee BASILICUM.

ODAXISMOS, from ofee, a tooth. A biting fensation, pain, or itching in the gums. Hippocrates uses this word principally with respect to the gums when the teeth

are forcing a passage through them. See DENTITIO.

ODONTAGOGOS, from aya, to draw, and ofer, a testb, and anya, pain. An instrument for drawing the

ODONTAGRA. It is either an instrument for draw-

ing the teeth with, or the gout in the teeth.

ODONTALGIA, from of sp, a tooth, and anyos, pain.

The TOOTH-ACH. Dr. Cullen places this genus of difease in the class pyrexiæ, and order phlegmasiæ. This happens either from external or from internal causes. The external are fuch as rot the teeth, by destroying their enamel, and thus procuring an access of air to their bony part. Hot liquors, frequent picking of the teeth with hard inftruments, as pins, &c. foon destroy this enamel; and when once the tooth is carious, the only cure is to extract it. The internal causes are acrid particles ex-creted from the blood, in which case an emollient gargarifm fhould be frequently held in the mouth as warm as is convenient; blifters behind the ears are also useful, and if the gums fwell, leeches may be applied, or fmall fearifications made in them with a lancet. Bell's Surgery, vol. iv. p. 248. Dr. Cullen's First Lines, edit. 4. vol. ii.

p. 38.

ODONTIASIS, from of a tooth. DENTITION.

ODONTICA. Remedies for pains in the teeth.

ODONTIRRHOEA. Bleeding from the focket of

the jaw after tooth-drawing.

ODONTIS Names for feveral species of ODONTITIS. lychnis.

ODONTOGLYPHON, from of st, a tooth, and yhupu, to scrape. An instrument for rubbing or scaling the teeth.
ODONTOIDES, from of us, a tooth, and sides, form. The tooth-like process of the second vertebra of the neck. ODONTOPHYIA, from ofe, a tooth, and qua, to grow. DENTITION.

ODONTOTRIMMA, from ofes, a tooth, and Tolkes,

to wear away. A dentrifice.
ODORATA VIOLAREA. See LOTUS URBANA. ODORATUS. The fenfe of fmell. See OLFACTUS. ODORIFERÆ GLANDULÆ. Thefe are about the pudenda, arm-pits, &c. They are of the fame kind as the febaceous glands. Dr. Hunter fays he never could discover the orifices of these in the axilla, therefore he fupposes the discharge to be from innumerable small pores that are imperceptible.

The SERVICE-TREE.

ŒCONOMIA, from owos, an house, and rouse, a law, or rule. Hippocrates uses this word to express the ma-nagement of a fick person. The animal accomony is the duct of nature in preferving animal bodies.

ŒDEMA, from or Jew, tumes. See Tumor. It fignifies properly any tumor, but is now generally confined to ferous tumors that are feated in the cellular membrane, and form partial anafarcous fwellings. See ANASARCA.
When the glands are difeafed, the lymph cannot pass

towards the heart, but goes to the lower extremities

merely from gravitation; and for want of a due abformtion the limbs fwell.

When the veffels are not too much debilitated, rollers, or laced stockings, are sometimes useful. See Bell's Surgery, vol. v. p. 499-

EDEMA ERYSIPELATOIDES. It is that cedematous tumor which is white, pellucid, and accompanied with heat, called also erysipelas bullatum.—inflammatorium.

Dr. Kirkland, in the first volume of his Inquiry, speaks,

of an inflammatory adema which comes on fuddenly, and is fometimes accompanied with an eryfipelas, or more commonly a simple inflammation of the skin. He describes it as a cold, indolent, doughy humour; and, in order to its cure, requiring difcussion. He observes, that an adema is always local; it is always confined to one place, or member.

It is fometimes caused by a metastasis of inactive mat-ter from the blood and other juices; sometimes from nervous affection.

Diftinguish this disease from the anafarca.

In an adema, which comes on fuddenly, and is of fhort duration, the fluids have not had time to become vifcid in the cellular membrane; they are therefore eafily fet at liberty, and the inflammation difappears as the fwelling fubfides.

As an external application, a cerate may be made of the empl. e min. fusc. cera slav. & ol. oliv. As soon as the swelling begins to subside, apply a bandage, and gradually increase its tightness as circumstances will permit. Over night give small doses of calomel, and next morning a purging draught, in which is diffolved a proper quantity of the foluble tartar. Sudorifics, or diuretics, may be given to haften the cure; which, when tolerably advanced, will require the bark; this at first should be accompanied with the fal diuret, but when evacuation is no longer required, the bark may be given alone.

See Kirkland's Med. Surgery, vol. i, p. 468.

—— ŒDEMATODES. It is that ferous tumor which

is fimply called adema, or, according to fome, the cold

LACTEUM. See LYMPH & DUCTUS. Though it has been named latteum by feveral authors, it does not appear at all a proper appellation; it might more de-feriptively be denominated ecchymonia lymphatica, of which the account under the title referred to will evidently con-

vince the enquirer.

EDEMOSARCA. A species of tumor mentioned by M. A. Severinus, of a middle nature, betwixt an adema

and farcoma, called uteriformis abfceffus.

ŒLNIZIUM. called also elfenichium, Thysfellinum ŒLSNITIUM. Plinii, apium sylvesire. MILKY-PARSLEY. The root of this plant is perennial, large, and full of milky juice, as in the whole plant. The leaves refemble those of the ferula; the feed is oval, flat, large, firiated, marginated, and fometimes casts it huks. There is another species called thysselinum palustre, and seed in alustre. fefeli palustre. They are both hot and acrid, the roots are aperient and detergent, their milky juice is of the nature of feammony. See Raii Hift.

CENANTHARÍA. SWEET-SCENTED OINTMENTS. Paulus Ægineta fays they are not thus named because they have ananthe in their composition, but because they are sweet-scented and fragrant, or on account of the wine

and lilies which are ingredients in them.

CENANTHE, from ours, a vine, and autos, a flower. VINE-FLOWER. So the ancients called some plant which was in flower at the fame time as the vine, or whofe flower had the fame fmell as those of the vine, OENANTHE.

CENANTHE AQUATICA, called also filipendula aquatica. WATER DROP-WORT. It grows in meadows, and on the fides of brooks. It it bitterish, and slightly aftringent, hot, dry, and diuretic.

These plants are not in use; instances are recorded of their positionous quality.

- CHEROPHYLLI FOLIIS, Ocnanthe petrofe-lidi folio venenofa, Ocnanthe cicutæ facie Lobelii, Filipendula cicutæ facie. G. HEMLOCK DROP-WORT. DEAD-TONGUE. It is the ananthe crocata of Linn-Near Clonmell, in Ireland, it is called TAHOW.

The root is long, thick, tuberous, extremely fucculent, and on exposure to the external air, the juice becomes of a yellow complexion. The stalk is striated, round, branched, of a yellowish red colour, about three seet high. The leaves are of a pale green, some are winged, but more are doubly winged; the little leaves are wedge-shaped, smooth, streaked, and jagged at the edges. The flowers are very small and white; disposed in umbels, placed among the principal stalks, with short ones at the subdivisions: each slower is composed of sive petals, some of them are bent inwards and heart-sashioned; tips, purple or brown; fruit-stalks angular, feored; the general sence not always present. The seeds are striated on one side, and dented on the other. dented on the other.

It is found on the banks of rivers; is perennial; flow-

The whole of this plant is poisonous. It is faid that the root is the most virulent of all the vegetable poisons that Great Britain produces. It is one of the class of poisons which produces epileptic symptoms, &c. See VENENUM. The general effects of this poison are convul-fions, locked-jaws, giddiness, some instances of furious madness have occurred, loss of hair and nails, violent heat in the throat and flomach, vertigo, fickness, purging one or more of these symptoms soon attack after swallowing any part of this plant, and the confequence is often fatal in a few hours.

This herb hath been miftaken for wild celery, water-refinen, fmallage, and for Macedonian parfley. The root parfnep, finallage, and for Macedonian parfley. The root hath no ill tafte; hence the more apt to be unfufpected.

In Pembrokeshire the root is called FIVE-FINGERED.

ROOT; and is much used in cataplasms for whitlows, &c. In Cumberland it is called dead-tongue, and applied in ca-taplasms to some diseases of horses. An infusion of the leaves, or three tea-spoonfuls of the juice of the root taken every morning, hath been effectual in curing some obstinate cutaneous difeafes, but not without greatly diffurb-

On sufficient of this poisonous plant being swallowed, give an active emetic as speedily as possible, and aid its operation with warm water and oil. If the spassing prevent the patient's swallowing, there is no hope.

Withering's Bot. Arrang. Wilmer's Obs. on poisonous

Vegetables; a case of a boy possioned by the root of hom-leck-dropwort, related by Dr. Houlston, in the Lond. Med. Journal, vol. ii. p. 40, &c. This is the name also for WATER-HEMLOCK, and a species of thalictrum.

CENAREA. The ashes prepared of the twigs, &c.

of vines.

ENELEUM. A mixture of oil and wine.

ENOGALA, from erres, wine. and γαλα, milk. A fort of portion made of wine and milk; but according to fome, it is wine as warm as new milk.

CENOPLIA, also called nabea, palineus, nap, and the GREAT JUJUBE. This fruit is produced in Egypt and Crete; it is aftringent before it is ripe. When ripe it is Crete; it is aftringent before it is ripe. When ripe it is agreeable to the palate, and like cherries is subject to corrupt in the stomach. They are eaten as delicacies in

ENUS. WINE. From the Greek word once vimam, a term also by which different wines are distinguished by the adddition of some epithet, viz.

CENUS ANDRIUS. Generous' wine, or else wine of

the island of Andros.

- Anthinos. Flowery wine. Galen fays it is either anus anthofmias, or wine impregnated with flowers, in which fense it is an epithet for the cyceon.

- ANTHOSMIAS, from ereos, a flower, and orun,

a fmell. Sweet-scented wines.

APODÆDUS. Wine in which the dais or tæda hath been boiled.

APEZESMENUS. A wine heated to a great degree, and preferibed among other things, as garlie, falt, milk, and vinegar.

- DEUTERUS. Wines of the fecond preffing. - DIACHEOMENUS. Wine diffused in larger vessels, cooled, and strained from the lees, to render it thinner and weaker. Wines thus drawn off are called facus, and faccata, from the bag through which they

are ftrained. Wine with milk, or wine - GALACTODES.

made as warm as new milk.

MALACUS, five MALTHACUS. Sometimes it means weak and thin, opposed to strong wine; or mild, in opposition to austere.

MELICHROOS. Wine in which is honey.

ENUS ENODES. Strong wine. SIRROS. See SAPA.

- STRAPHIDIOS LEUCOS. White soine made

TETHALASMENOS. Wine mixed with fea water.

CENOSTAGMA. SPIRIT of WINE. CENOTHERA. See Lysimachia.

CEPATA. The anacardium. Also a tall tree in China, the kernels of whose fruit are used in a dish which is called caril by the Indians. The cardium. See Raii Hift. This fruit much refembles the ana-

ŒSOPHAGÆÆ ARTERIÆ. These are generally two or three, and sometimes but one. They rise anteriorly from the aorta descendens, and are distributed to the cefophagus. Sometimes the uppermost cefophagua produce a bronchial artery. CESOPHAGÆUS. The sphincter cefophagi. See

Œ SOPH AGUS

ŒSOPHAGISMUS. IMPEDED DEGLUTITION, OF

fpalm of the cefophagus.

fpalm of the cetophagus.

CESOPHAGUS, from είσε, the future tense of φερω to carry, and φαγω, to cat, because it carries the meat into the stomach, called also Gula. The GULLET. It is the contracted continuation of the pharynx. The α/σ-phagus beginning at the last part of the sauces, has, at its beginning, a large cavity, called by the Greeks pharynx, and by the Latins infundibulum. Its anterior part is connected with the root of the tongue, the cas byoides, and the largnx; and its posterior part closely os hyoides, and the larynx; and its posterior part closely adheres to the vertebra of the neck. It is moved by various muscles, which elevate and dilate the pharynx, and by their constrictory muscles, which shu it. There is one pair of these muscles, which arising by three origins from the os hyoides, the cartilago cricoides, and the cartilago thyroides, totally surrounds the pharynx, and is called a sophagas us the sphintler of the a sophagas. There are principally three pair of these muscles, viz. the cephalo-pharena chains and also have a some and also have a some and also have a some and a some a some and a some ryngæus, spheno-pharingæus, and stylo-pharyngæus. At the end of the pharynx the @sopbagus begins, which first of all runs strait between the aspera arteria, and the ver-tebræ of the neck and back, but turns to the right about the fifth vertebra of the back, and to the left about the ninth; then proceeding through the middle of the thorax, and the mufcular part of the diaphragm, behind the little lobe of the liver, it is united with the superior orifice of the stomach. The asphagus itself consists of four coats, the outermost coat of which being membranaceous, thin, vascular, and cellular, derives its origin from the pleura, and joins the gullet to the adjacent parts. Some reckon the cellular membrane in the number of its coats, but this is not peculiar to it. The coat next to the outer is mufcular, furnished with annular or orbicular fibres, and above these with longitutinal ones. The third coat is nervous, common to the mouth and fauces, and reaching three fingers breadth within the fto-mach; it is thick-fet with glands, to which, on the oppo-fite fide, are diffributed fome veficls, from which they receive a certain liquor, more pinguious than the faliva, and which drops into the cavity of the gullet. The fourth coat or innermost, is covered with a slippery mucus, villous, and every where perforated like a sieve, with many emunctories. The cuticle lines the æsepbagus, but is too thin to be demonstrated. The asperbagus is furnished with numberless glands, partly those which being smaller than the eggs of silkworms, are lodged in the nervous coat, and are easily perceived, if upon taking off the nervous coat, the sleshy coat is exposed to the sight, or the gullet is macerated in water; and partly with other glands placed without the æsepbagus, amongst which the most considerable are the dorsal glands about the fifth vertebra of the back, adhering to the gullet, and the thyroid gland situated between the thyro-cricoide cartilage and the æsepbagus. Its upper part receives arteries from the internal receive a certain liquor, more pinguious than the faliva, fituated between the thyro-cricoide cartilage and the afo-phagus. Its upper part receives arteries from the internal carotids, its middle part from the aorta and intercoftal, and its inferior part from the gastric arteries. The supe-nior part receives veins from the jugulars, its middle from the vena sine pari, and its inferior from the coronary veins of the stomach. The nerves proceed from the par vagum. The function of the asphagus is, swallowing; obstruc-tions to which may happen from various causes. See Dz-GLUTITIO. It is also subject to inflammation. See In-Standard CE sophagus. FLAMMATIO ESOPHAGI.

Spafins in the afophagus fometimes prevent deglutition,

cularly the feet; tremor of the limbs, suppression of the alvine evacuations, regurgitation of flatulencies upwards, frictures pains, and rumbling of the belly, straitness of frictures pains, and rumbling of the belly, ftraitness of the precordia, retchings to vomit, cardialgia, thin watery urine, and a hard and large pulfe. The symptoms pecu-liar to sapsims of the pharynx, are, a difficulty, or a total inability of deglutition; a rigid constriction and pain of the parts cohering with the pharynx, as the tongue, the larynx, and the whole neck; a suffocative uncasiness; a sensation, as of a stake thrust into the sauces, or of some-thing endeavouring to get out; and a loss of voice. These complaints return at intervals, and sometimes terminate in convulsions of the whole nervous system. In spassins in convultions of the whole nervous fystem. In spasms of the afophagus itself, the aliment is swallowed freely, but a kind of resistance is perceived to its descent, about the upper orisice of the stomach: cold liquors are particularly refitted, and increase the constriction, whilst warm ones often pass freely into the stomach. A pain is selt on the spine, between the scapulæ; often anxious retchings or vomiting are joined with naufen, and a discharge of limpid mucus from the mouth, distinct from the vomitings. A combination of these symptoms with those above enumerated, denote the whole canal to be affected. Spafms of the pharynx are diftinguished from a paralysis or relaxation of the part, by the difficulty of fwallowing being in the latter continual, in the former intermitting in the paralysis, folids are more easily swallowed than limit to the paralysis of the life of the latter of the life of the latter of the life of the latter of the quids; in fpafms the difficulty of fwallowing folids and hquids is equal: fpafms of the pharynx are diffinguished from inflammations, by the latter being accompanied with fwelling, reducis, heat in the fauces, thirft, and fever. Spaims of the gullet have also one symptom, the resistance to the descent of food, in common with some other difto the detect of food, in common with some other dif-orders, as an obstruction of the afophogus from some so-lid bodies sticking in if, tumors, excrescences, swellings of the glands joined to the afophogus, about the fifth vertebra of the back. But in these cases, though solid soods stop, and are thrown up again, liquids, both cold and hot, pass down with a greater or less degree of freedom; whilst, in spasmodic strictures, cold liquors pass with remarkably greater difficulty than such as are warm: spasms in the aspagas are also accompanied with pains in the fcapulæ.

Idiopathic fpafins of the pharynx are apt, from impro-per treatment, to become obstinate and habitual. Those which arife from acrid fubstances threaten an instammation; from hysteric passions, an apoplexy. Etnuller observes, that a difficulty of swallowing from a convulsion, in wounds is dangerous; and Hippocrates, that a sudden contortion of the neck, obstructing deglutition, without any swelling in fevers, is mortal. Spassns of the gullet from passion at meals, are apt to lay the foundation of cholera, and bilious fevers. The general indications of cure are, to alleviate the spassns and remove their causes. The first is answered by antispassmodies and anodynes, mixed with discutients, both given internally, and applied externally. The more violent the constriction, the more necessary it is to begin with externals. Emollient glysters, with the addition of corroborants, are to be two or three which arife from acrid fubstances threaten an inflammawith the addition of corroborants, are to be two or three times repeated; and the feet bathed in pretty warm water, to invite the humours downwards; when pediluvia are called in aid, be careful that the feet be not too cold; if they are, they must first be warmed by frictions, and bot-tles of hot water. To the part affected apply paregoric nervine liniments, composed of vinous spirit, aq. ammo-niæ; essent. croci; ess. nucis Moschat. camphor. liquor. minor. anod. &c. The ball. vitæ, and the spt. ætheris witriol. comp. may be dropped on fugar, and kept in the mouth, to be flowly fwallowed. A bladder of warm water may be applied to the throat. If the face is red, the veffels inflated, with ftrong pulfation in the arteries of the head, and at the fame time there are confirictions of the fauces, a vein may be opened to prevent an apoplexy. The fpafms allayed by means of antifpafmodies externally and internally used, proceed to subdue the cause. If acrid fubstances, draftic purgatives, or emetics, have given rise to the disease, their acrimony must be immediately obtunded by mucilages, oils, milk, fat broths, warm water drank plentifully, so as to promote a gentle vomiting. In spasms of the assignment of the olea, or garden olive, only in culture.

Hoffman observes, that spasms of the assumers are accompanied with the general symptoms of other distensions of the upper parts; a coldness of the extremities, particularly the feet; tremor of the limbs, suppression of the wards evacuate by means of manna, or rhubarb, or other gentle laxatives; or emetics, as antimonium tartarifatum gr. i. vel ij. with one of these laxatives. But never give either emetic or purgative immediately after passion: in case of statulencies offending, oily and carminative glysters are to be preferred. In chronical spasses of the gullet, from a general bad habit, or from crudities in the stomach and bowels; the first must be obviated by fuitable alteratives and abforbents, the latter by manna, rhubarb, &c. In very obstinate cases mineral waters are extelled. In hypochondriacal cafes, where uterine or hamorrhoidal ha-morrhages are obstructed, the sulphureous mineral wamorrhages are obstructed, the sulphureous mineral waters, with bleeding and proper exercise, are the principal remedies. Chronical spassures of the assembler, from a debility of the nervous system, are chiefly to be cured by dietetics; a light slender sood; ballamic clixirs to strengthen the stomach; moderate, but frequent exercise, occasional bleedings, the hot sulphureous waters both for drinking and bathing in. In spassure of the lower gullet, externals are best applied to the spine, with which the assemble spassure is immediately connected. If the spassure so violent that the patient cannot swallow, he must be

fo violent that the patient cannot fwallow, he must be supported by nourishing glysters.

See Hossman's Practice of Physic, translated by Lewis, vol. ii. p. 147, &c. Percival's Essays, Medical and Experimental, vol. ii. p. 141, &c. Lond. Med. Trans. vol.

ESTROMANIA. The furer utarile.

ŒSYPE, ŒSYPOS, or ŒSYPUM. The great fordes of wool.

fordes of wool.

OFFA ALBA HELMONTH. If rectified fpirit of wine be poured gentle into a fully faturated volatile alkaline fpirit, the fpirit of wine running on the fide of the glafs, which must stand in a cold place, immediately an opake dense coagulum is formed, which on gently shaking falls into a confistent mass; this mass soon resolves, by warmth, into a folid and sluid part; the folid part is called offa alba. It is supposed to be a volatile sary, composed of the volatile salt of one spirit and the off of the other; but it is no more than the alkaline salt dislodged by the vinous spirit. by the vinous spirit.

OLECRANON, from and source, cubitus, and source, the bead. The elbow, also called ancon. It is the largest of the two apophyses at the upper end of the ulna; it ends act upon, or unite with the gummy or mucilage, yet they do not act upon, or unite with the gummy or mucilaginous parts in a rough tuberofity and an obtufe point. The tubero-fity makes the corner of the elbow, called acrolenion; the point is lodged in the posterior cavity of the lower extremity of the os humeri, when the fore-arm is extended.

Also the head of the humerus.

OLENE. The CUBIT.

OLEOSACCHARUM. Effential oils, ground with eight or ten times their weight of fugar, become foluble in water, and may be diluted to any alligned degree; and thus oleofacchara are formed, and kept in well flopped bottles for making extemporaneous distilled waters, either fimple or compound. Mucilages render them miscible with water into a milky liquor; they dissolve also in a little more than their weight of rectified spirit of wine. The extemporaneous waters which are made by means of the elessacebara, are not fo grateful as those that are dis-tilled, for want of the volatile saline parts which remain in distillation.

on distribution.

OLEUM. OIL. Oils are animal, vegetable, and mineral. Animal oils are the fat of animals. All animal fubstances yield this oil by distillation. Vegetable oils are principally procured by expression, distillation, and by boiling. The mineral ones are obtained spontaneously, and by distillation.

Among the fubstances naturally contained in vegetables, and feparable by art, without alteration of their native qualities, are the following.

1. Gross, or expressed sils. These abound chiefly in

the kernels of fruits, and in certain feeds, are commonly extracted by expression, and hence are distinguished by the name of expression, and hence are distinguished by the name of expression. This oil is contained in all parts of a vegetable, and may be forced out by the action of fire, but thus their qualities are altered. Expressed oils are not difficultie in water, nor in fairit of wine, without first being mixed with some suitable medium. If exposed to the cold they lose much of their fluidity, some of them congealing into a confiftent mass with a small degree of If they are kept fome time in a warm air, they becond. If they are kept fome time in a warm air, they become thin and rancid, their foftening quality is changed
into an acrid one; and in this flate, inflead of allaying
irritation, they occasion it: this rancidity is attracted even
in the kernels, &c. in which this oil resides before its being expressed; yet on triturating those seeds, &c. with
water into an emulsion, this emulsion, instead of growing
rancid, turns four. In such a degree of heat as will occasson a small evaporation from these oils, a pungent vacafion a fmall evaporation from these oils, a pungent va-pour arises, seemingly of the acid kind; and when suffered to grow cold again, they are found to have acquired a greater degree of confiltence than they had before, together with an acrid tafte. In a heat approaching to ignition, in close yesfels, greatest part of the sil arises in an empyreumatic state, a black coal remaining behind.

In order to obtain these oils, the seeds, &c. which contain them, must be ground or powdered fmall, then intain them, must be ground or powdered small, then included in proper bags, and wrapped in hair-cloths, then committed to the press, by which the sil is forced out. To facilitate the expression, it is usual to warm either the press, or the plates betwixt which the feeds, &c. are squeezed; or to heat the subject which is to be pressed. But heat occasions rancidity, so should only be admitted when this circumstance interferes not with the use for which the sil is designed. Many are the different seeds, &c. which afford sil by this treatment, but the present practice attends but to few, viz. the olive, almond, linpractice attends but to few, viz. the olive, almond, lin-feed, and mustard-feed. Indeed, there is not much dif-ference betwixt the expressed oil of one and another, the diferiminating quality of the subjects not reliding in the oil which is thus obtained; the oil of multard is as foft, infipid, and void of pungency as that of fweet almonds, the pungency of the mustard remaining in the cake left behind after expression; it is true, that there are certain behind after expression; it is true, that there are certain specific differences betwixt them, but, as medicines, they are so nearly a like, that they may generally be indiscriminately used; they are emollient, they soften and relax the solids, they are supposed to obtund acrimony in the humours, and thus may be used internally when such disorders attend as arise from rigidity and acrimony,

act upon, or unite with the gummy or mucilaginous parts of vegetables; hence the ol. e mucilaginibus, does not contain any of the mucilage with which its ingredients fo much abound. Expressed oils may be tinged by vegetable matters of almost all colours; in making the officinal oils by decoction, in order to have the colour clear and firong, the best method is to strain off the oil as soon as it hath acquired a fufficient depth of colour, and then again to boil it until no aqueous vapours exhale. If the water is not all exhaled, the oil will have a dingy colour, and foon be mouldy; and if the leaves that are boiled in the oil, continue after they are crifp, they occasion a difagreeable blacknefs.

2. A gross sebaceous matter. From the kernels of fome fruits, as that of the chocolate-nut, instead of a fluid oil, a substance is obtained which is of a butyraceous confiftence. These are most commodiously extracted by boiling the subject in water; this sebaceous matter, liquefied by heat, separates and arises to the surface, and resumes its proper consistence as the liquor cools: The refumes its proper confiftence as the liquor cools. The fubfiances of this clafs have the fame general properties with expressed oils, but are less disposed to become rancid than most of the common fluid oils. It is supposed that their thicker consistence is owing to a larger admixthat their thicker confinence is owing to a larger admix-ture of an acid principle; for in their resolution by fire, they yield a vapour more sensibly acid than the fluid oils; and fluid oils, by the admixture of concentrated acids, are reduced to a thick and a solid mass.

3. Effential oils. They are obtained only from those

odorous. They are obtained only from those vegetables, or parts of vegetables, that are confiderably odorous. They are the direct principle in which the odour, and oftentimes the warmth and pungency, and other active powers of the subject, reside, whence their names of essences and essential sits. Essential sits unite with rechific fairir of wine though rectified fpirit of wine, though fome of them require for this purpose a much larger proportion of the spirit than others; water also, though it does not dissolve their whole fubstance, may be made to imbibe some portion of their more fubtile matter, fo as to become confiderably impregnated with their flavour, as happens in diftillation; by the admixture of fugar, gum, &c. they are totally dif-folved with water. Digested with volatile alkalies, they undergo various changes of colour, and fome of the lets odorous acquire confiderable degrees of fragrancy, whilft fixed alkalies univerfally impair their odour. In the heat of boiling water these sils totally exhale, and on this principle they are commonly extracted from subjects that contain them; for no other fluid that naturally exists in vegetables is exhalable by that degree of heat except the aqueous moisture, from which greatest part of the oil is easily separated. Some of these oils rise with much less heat than others. In their resolution by a burning heat, they differ little from expressed oils. When exposed for some time to a warm air, they suffer an alteration very different from that which the expressed undergo; instead of growing thin, rancid, and acrimonious, they gradual-ly become thick, and at length harden into a folid, brittle concrete, with a remarkable diminution of their volatility; fragrancy, pungency, and warm flimulating quality. In this state they are found to consist of two kinds of matter, a sluid oil, volatile in the heat of boiling water, and nearly of the fame quality as the original sil, and of a groffer fubstance, which remains belvind, not exhalable without a burning heat, or fuch a one as changes its nature, and refolves it into an acid, an empyreumatic oil, and a black coal. The admixture of a concentrated acid, inflantly produces in effectial oils a change nearly fimilar to that which time effects.

The sils expressed from aromatic fubstances differ from those which are thus obtained from olives, almonds, &ca those which are thus obtained from olives, almonds, &c.
These retain for the most part an admixture of the aromatic matter of the subject; thus aniseed, mace, and
nutmegs, yield, upon expression, an sil impregnated with
the slavour of the spices, and an sil expressed from aniseed hath a great share of the peculiar smell of the seeds.
A purgative sil is expressed from the seeds of the ricinus.
The rinds of oranges, lemons, and citrons, yield, by a
kind of expression, their effential oils, almost as pure, and
6 Z
nearly distillation. The effential oils, in which the fragrance, and aromatic warmth of these fruits reside, are contained in numerous cells, or vesicles, which may be distinguished by the naked eye, and are spread all over the surface of the peel; it is most conveniently obtained by rubbing a piece of lump-fugar on the furface of the fresh peel; the veficles are thus burft, and the fugar imbibes the oil; when the furface of the fugar is fufficiently moistened therewith, fcrape it into a phial, and keep it close until it is used.

Most effential oils are drawn by distillation. A quantity of water is added to the fubject, fufficient to prevent its burning, and in this water it is macerated a little be-fore the diffillation; the oil comes over with the water, and either floats on its furface, or falls to the bottom. The water employed in diffilling effential oils imbibes fome portion of them; it cannot, however, retain above a certain quantity, and therefore fuch as have been already used, and almost saturated itself, may be advantageously employed instead of common water in future distillations

of the fame fubject.

Effential oils are very often adulterated. If the mixture is with an expressed oil the fraud is discovered by adding a little rectified spirit of wine to a few drops of the sufpected effential oil, and, shaking them together, the spirit dissolves all the effential oil, and leaves the expressed untouched; or if it is the heavier effential oils, the fuspected one may be dropped into water, and the effential oil, after a brisk agitation, falls to the bottom, and the expreffed oil fwims at the top; or evaporate a little in a filver fpoon, by which the effectial oil will leave the expressed behind. If the adulteration is with rectified spirit of wine, drop a little of the suspected sil into water, or into spirit of turpentine; and if a milkiness appears on the mixture being shaken, there is spirit of wine in the oil. If the effential sil is mixed with other cheaper effential sils, dip a rag into the supected sil, and then hold it before the fire; thus the flavour of the genuine oil paffes off, and leaves that of the added one sufficiently diffinct behind. The cheap effential oils that are added are usually those of the

cheap ejential sits that are added are utually those of the turpentine kind, which are also discovered by dropping the suspected sit into spirit of wine, for then a milkiness is produced, but not if the sit is genuine.

Essential sits, medically considered, agree in the general qualities of pungency and heat, though in these they differ in their degrees; in particular virtues they differ, as the subjects do from which they are obtained. Some of these sits are used to correct resinous purges; they of these oils are used to correct resinous purges; they make them eafy in the ftomach at the first, but so far from abating their irritating quality, they add a fresh stimulus. These oils are best administered with powders, pills, bo-

luffes, or electaries.

4. Concrete effential sil. Some vegetables, fuch as rofes and the roots of elecampane, inftead of a fluid effential sil, yield a fubftance possessing the fame general properties, but of a thicker and sebaceous consistence. This substance appears of as great volatility, and subtility as the shuid sils; it equally exhales in the heat of boiling water, and concrete upon the surface of the collected vapour. and concretes upon the furface of the collected vapour. The total exhalation of this matter, and its concreting again in its original confiftent state, without any separation of it into a fluid and a folid part, diftinguishes it from effential oils that have been thickened or indurated by age or by acids. See Hoffman's Obf. Phyf. Chem. lib. i.

OLEUM, is a term for the product of feveral fubstances, viz. Oleum balfami, fee Balsamum. Salis, fee Circulatum. Myrrhæ per deliq. fee Myrrha. OLFACTORII NERVI. The OLFACTORY NERVES. They were formerly called processis mammil-

lares. They are the first pair of nerves from the brain. They feem to approach nearer each other as they pass to-wards the crifts galli. They divide into many small filaments, which pass through the foramina of the os eth-moides. On these nerves no covering from the dura mater can be traced. See OLFACTUS.

OLFACTUS. The sense of smelling, called

also odoratus. The mucous membrane which lines the nostrils, hath its surface greatly enlarged by its spreading into the two frontal snuses, the antra of Highmore, the cells in the sphenoid bone, and on the spongy bones of the nostrils. The olfactory nerves, without their dura matral cells in the sphenoid bone, and on the spongy bones of the nostrils. The olfactory nerves, without their dura matral coat, pierce the holes in the ethmoid bone, and spread ruminating animal. See Abomasum.

themselves in the mucous membrane of the nostril. These nerves are widely expanded, and no where are the nerves so soft, naked, and consequently so easily affected and injured as in this; yet an inspid mucus is constantly separated in the membrane of the nose to defend the nerves. A branch from the fifth pair is also sent to this membrane, by the irritation of which sneezing is excited when the mucus is not duly discharged. The objects of smell are those parts of substances which are lodged in their spirit, oil, salt, or soap, if they are so divided as to become capable of floating in the atmosphere; but from experiments it is plain, that the spirit lodged in the sil, is that which excites the sense of smelling; for when this spirit is separated, the subject is inodorous, and to whatever subject this spirit is communicated, there the odour is also. The sense of smell is only excited when the odorous effluvia contained in the air, and attracted through the nostrils, are impressed on the olfactory nerves. The nearly fimilar to those which are obtained from them by themselves in the mucous membrane of the nostril. These

odorous effluvia contained in the air, and attracted through the nostrils, are impressed on the olfactory nerves. The longer the nostrils, the more the surface thereof, and if the spongy bones there are enlarged, the more acute is the sense of swelling.

OLIBANUM, called Thus conder, Thus masculinum, FRANKINCENSE. It is a gummy resin brought from Turkey and the East Indies. Dale says he found a species of cedar in Carolina which afforded a gum so like this, that he could not perceive any difference in it. The tree is the improvement string or impresses solice termis undience in the juniperus lycia, or juniperus foliis ternis undique imbri-catis ovatis obtufis, Linn. It is ufually in drops or tears, like those of mastich, but larger, of a pale yellowish co-lour, which by age becomes reddish. It hath several names, according to its different appearances; the fingle tears are called fimply olibanum, or Thus; when two are joined together, they have been called Thus mafculinum; and when two were very large, Thus forminium; fometimes four or five have adhered together, about as big as filberts, and, perhaps, found on the bark of the tree; these have been

and, perhaps, found on the bark of the tree; the sen hamed Thus corticosum; the siner powder which rubs off from tears in carriage is called Mica Thuris. This drug, however, is not in any of its states what is now called Thus, or frankincense, in the shops.

This gummy refin hath a moderately strong, not very agreeable smell, and a bitterish pungent taste. In chewing it slicks to the teeth, becomes white, and renders the saliva milky. Laid on a red-hot iron it readily catches shame, and burns with a strong dissussive smell, which is not unpleasant. It is supposed to have been the incense used by the ancients in their religious ceremonies. On trituration with water, the greatest part of it dissolves into trituration with water, the greatest part of it dissolves into a milky liquor, which on standing deposits a portion of refinous matter, and being now gently inspissated, leaves a yellow extract, which retains greatest part of the smell as well as taste, of the slibanum, the odorous matter appearing to be of a less volatile kind than that of most other gummy refins. Rectified spirit of wine dissolves less than water, but it takes up nearly all the active matter. It is recommended in disorders of the head and breast, in hamoptoes, and in alvine and uterine sluxes by some authors: its dofe from 3 i. to 3 i. though Dr. Cullen thinks it has no medicinal virtues, therefore takes no notice of it. See Lewis's Mat. Med. Neumann's Chem. Works.

OLIDA. See ABRUS.

OLISTHEMA, from excotages, to fall out. A LUXA-

OLIVARIA CORPORA. Two eminences on the lower part of the medulla oblongata, near where it com-mences medulla fpinalis. Many tables place these higher,

OPHIASIS. See ALOPECIA.

OPHIOGLOSSOIDES. NIGER. A fort of fun-

gus of no medical efficacy.

OPHIOGLOSSUM, from opis, a ferpent, and phasea, a tongue, because the fruit of the plant resembles a tongue.

ADDER'S TONGUE, called also brassadella, or brassatella; lingua ferpentis. It is the ophiogloffum vulgatum, Linn. This plant hath only one leaf, with a flender flalk arifing from the bottom of it, dented about the edges, and supposed to resemble the tongue of a ferpent. It grows in meadows; the leaf is thick, of a fresh green colour, and in the feed is in a green faile.

juicy; the feed is in a green spike.

OPHIOSCORDON; or OPHIOSCORDON: also
OPHIOSCORDON also
OPHIOSCORD called victorialis; allium agninum, allium montanum latifolium maculatum; allium alpinum; spotted RAMsons; BROAD-LEAVED MOUNTAIN GARLIC. It is a species of garlick, kept in the gardens of the curious, but

grows wild in most countries. Its virtues are similar to the common garlic. See Raii Hist. OPHIOSTAPHYLON: WHITE BRYONY. See BRYONIA ALBA.

OPHRIS, and OPHRIS MAJOR. See BIFOLIUM. OPHRYS. The lowest part of the forehead, where the eye-brows grow; and the hair of the eye-brows.

OPHTHALMIA, from «φθανω», an cyc. Inflam-MATIO OCULI, also ophthalmites. An INFLAM-TION OF THE MEMBRANES WHICH INVEST THE

EYES; particularly the ADNATA.

Monf. de St. Yves diftinguishes this diforder into fourteen or fifteen different kinds, according to their different

causes, or other circumstances.

Dr. Cullen places this genus of difeafe in the class pyrexiæ, and order phlegmafiæ. He diftinguishes two species. 1. The ophthalmia membranarum; that is, when the coats of the eyes are the feat of the inflammation. 2. Ophthalmia tarfi, when the inflammation is in the febaceous glands in the edges of the eye-lids. The first he confiders as varying according to the degree of inflamma-tion, and according to which of the tunics are principally affected. The fecond includes but two varieties. He further diftinguishes betwixt the idiopathic and the symptomatic: in the first are included the above named species; in the last, he forms the varieties from the difease that

causes the inflammation, being in the eye itself, or in the avoided; a cooling liquid diet will be necessary; a freegeneral habit, or fome other part of the body separate from the eye. Here, the different distinctions in the ophthalmie are feen at one view: and as much perplexity attends the inquirer in this particular, if unpolleded of this valuable work, his arrangement is here interted as follows.

Of the first species, and which varies according to the degree of external inflammation, are the

Ophthalmia Taraxis Humida Chemofis Ophthalmia Eryfipelatofa Puftulofa Phlyctænodes.

Of the fame species, but which vary according to which coat of the eye is affected, are the

Ophthalmia Choroeidea

Tenebricosa.

Of the fecond species which are seated in the tarfus, also affecting the eye-lids, are the Ophthalmia Trachoma

Of the varieties that are fymptomatic; those that take their rife from fome other disease of the eye or the eyelid, are the

Angularis Tuberculofa Ophthalmia

Trichiafis Cancrofa a Synechia Ophthalmia a Lagophthalmo ab Elcomate ab Ungue a Corneæ fiftula Uvez.

Those varieties that are symptomatic, and take their rife from difeases in another part of the body, or of the whole habit, are the

Ophthalmia Metastatica Scrophulofa Ophthalmia Syphilitiea Febricofa.

For the most part this disorder is in the adnata; but fometimes the interior coats are affected: indeed the inner ones are fometimes the feat of the inflammation.

Any of the causes of external inflammation, may produce the fame in the external coat of the eye; and the fame causes which produce this disorder in other internal part, may also produce it in the inner membranes of this organ. Accidents from without, as cold air, duft, too much exposure to vivid colours, blows, wounds, &c. and as internal causes, the measles, and small-pox, scrophula, &c. are all occasionally the causes of this complaint. The red veffels in the eye are increased in their fize, and there appears many more than did in their natural state. There is pain which is increased on the least motion, which produces tears from the lachrymal glands. When the affection of the adnata is confiderable, it is communicated to the subjacent membranes, even to the retina, which thereby increases in sensibility and the least degree of light is painful.

Dr. Cullen confiders all the cases of ophthalmia mem-

branarum as the fame disease, differing only in situation or degree, and as being to be cured by the same means,

more or lefs employed.

The ophthalmia subsequent to blows on the head, by which the meninges are hurt, is a sign of death. When which the meninges are furt, is a light of death. When in the beginning of the small-pox, this disorder is attendant, the consequence is generally fatal. When attended with long and violent head-achs, blindness is to be seared. When opthalmia is an original disease, when the temples ach, the forehead itches, and the body sweats at nights, there is danger even of life. The humid species, the erysteric life is the state of the same and the same are stated to the same and the same are same at the same are same as a same are same are same as a same are same are same as a same are same fipelatous and venereal kinds, that of the choroides, and the chemofis, all greatly tend to deftroy the fight.

In the cure of the above species of inflammation in the eye, the diffinctions may very well be loft in most of them. When a flux of humours attends, it usually abates by whatever relieves the inflammation, and in general to confider and treat these disorders under the simple idea of inflammations will be the most proper and easy; as to particular circumstances, they may be attended to, and treated according to their respective natures, as directed here and in other articles, or as the preferiber's particular experience may direct. It is happily observed by Dr. Kirkland, in the first volume of his Inquiry, p. 480. that is like all other inflammations, it gives way to 46c the first which remove the inflammations. dies which remove the irritating cause, and lessen the fenfibility of the parts."

All heating, spirituous, and aromatic food must be

dom from all forcible exercise must be enjoined; and the eye may be shaded from the light, and all glaring objects by means of a stiff paper, lined with black silk. Bleeding according to the strength and quickness of the

pulse: besides taking blood from the arms, leeches may be applied to the external angles of the eyes. Opening the temporal artery is very generally advifed; Mr. Ware ob-ferves, that the two following difficulties attend it. 1ft. It frequently will not yield a quantity of blood fufficient to answer the intended purpole. 2d. The troublesome and dangerous hæmorrhages which have sometimes burst from the orifice, at the diltance of many hours from the operation. He farther observes, that considerable advantage hath followed a complete transvere division of this artery; whereby the patient not only received benefit from the fudden derivation of a large quantity of blood, but one principal fource from which the blood circulated to the inflamed part, was cut off. The external jugular vein has also sometimes been opened in this complaint; but as it does not come from the eye itself, it does not yield a very direct derivation. As to leeches, when they are applied to or near the eye-lids, they have fometimes occasioned them to fwell to a large fize, and have increased for a time the irritation of the eye; to prevent which, when they are applied near the eye, confine them as near as possible, in the hollow of the temple, about an inch and a half from the outer orbit. Dr. Kirkland thinks that any other bleedings than that from the arm, are not attended with fuperior advantage; as to leeches, he fays they leave an inflammation behind, and occasion a greater irritability in the neighbouring parts. Dr. Cullen says that in many cases, a very effectual remedy is, that of fcarifying the internal furface of the inferior eye-lid; and more fo still, is cutting the turgid veilels upon the adnata itself. As foon as blood is taken away, let a cooling purge be given; and fmall doses of the nitron vitriolatum may be repeated every day after, so as to procure a few stools, until the violence of the fymptoms give way. Particularly be careful to avoid ftrong purges. A blifter, when applied to relieve inflammation in the eyes, is most effectual when laid upon the fore part of the head, and kept open a few days; apply the plafter from the crown to the forehead, having first shaved the part. Dr. Kirkland is of opinion that blifters like leeches, are prejudicial by increasing irri-tability where they are applied, and to fome extent around them. The feet and legs may be placed in moderately warm water every night. A feton, if necessary, is belt fixed under the lower jaw, in the fide where the affected eye is, or if both eyes are bad, it may be placed under the chin; when it is fixed in the fide of the jaw, let it be betwixt the external jugular vein, and the larynx.

As an external remedy, the vegeto mineral water of Goulard is almost the only one needful; begin with it very mild and increase its strength so as to avoid irritation. Whether inflammations are phlegmonous, fcrofulous, cancerous, or eryfipelatous, from bruifes, &c. this water is of fingular efficacy. Vitriolated zine is the ufual remedy in these cases; it cools, dries, and restringes; it is very useful when there is a defluxion, or an inflamma-tion in the eyes, but the diforder should be giving way before its use is begun with: some prefer alum; bleeding, purging, and every proper evacuation, should also have preceded; from 9 i. to 3 i. of vitriolated zine may be dissolved in two ounces of water, beginning with the weaker and gradually proceeding to the stronger; if it is too weak, the redundant tears will wash it away before it produces any effect. Blue vitriol is useful when the humours are thick, and formed into fordes; and when they begin to form fmall membranes in the tunica albugine which frequently happens after the fmall-pox and the measles; in such cases, a grain or more may be added to an ounce of water; but it should be omitted in all instances of inflammation attended with faline, hot, acrid defluxions, with redness and itching, because it increases these symptoms. When the inflammation is deep, violent, and dangerous, the eye being almost deprived of fight and fensibility, happy effects have been found from the use of tepid camphorated spirit of wine mixed with the Peruvian balsam. Weak solutions of camphor abate these inflammations, but a free use of it increases them. Dr. Kirkland recommends a fmall quantity of natron vitriolatum, in fine powder, to be blown into the inflamed

eye:

eye: he observes, that at first the inslammation feems to other diseases with which this ophthalmia may be conseincreased by it, but soon a discharge of lymph follows, and the next day the inslammation is much abated or gone. tained, mercury may be tried. Opium is faid by fome not to case pain in the eye; but that this symptom is relieved by the external use of aloes; however, it is clear from experience, that small quantities of opium, mixed with any cooling liniment, speedily abates inflammation in this organ. Mr. Ware strongly recom-mends a few drops of the tinet. Theb. Ph. Lond. to be dropped into the eye, once every day; and supports his affertions in its favour, with narratives of facts which admit of no doubt. Dr. Kirkland observes, with respect to it, that, "with due prefeverance, it fufficiently answers our intention, where it can possibly do service, without occafioning pain. It may be used with advantage where the fensibility in the beginning is often exquisite, and where few other remedies can be applied without giving offence." When a corroding acrimony is observed in the humour that is discharged, the eye may now and then be washed with a thin folution of gum arabic; or the mucilage of quince-feed. If the eye remains very weak, after the inflammation abates, the best applications are, the aluminflammation abotes, the best applications are, the atumcurd which may be spread thin on a rag, and applied over
the eyes every night; and a solution of alum in the proportion of a dram to half a pint of water, to which may
be added the white of one egg; and to finish the cure,
the patient may bathe in the sea, or cold water may be
poured upon his head every morning for some time.

When films attend, or are followed by defluxions on the

eyes, or when the transparency of the cornea is dimi-nished, borax proves an admirable means of relief, and may be used as follows. R Boracis opt. 3 is. facch. alb. 3 i. aq. rofar. 3 ii. m. f. collyr. Let a little of this be frequently dropped into the affected eye. When pimples on the eye attend an inflammation, the follution of vitrical and the state of th on the eye attend an inflammation, the folution of vitri-olated zinc ufually fucceeds; when matter is formed in these pimples, pierce them with the point of a lancet, and then wash them with the just named folution, or, R Ungt. sperm. cete, 3 v. cerusia acetata, 3 i. quibus super porphyrite simul tritis instillentur tinct. benzoin comp. 3 ii. hujus paululum, linteo exceptum, oculo dolenti omni. nocte imponatur. In Gooch's Cafes and Remarks, page 44, &c. is an inftance of relief, when the tunica albuginea was inflaman initiance of relief, when the tunica albuginea was inflamed to asto refemble, if not conflitute the chemofis. A gouty aphthalmia requires that the gout, if possible, should be brought into the extremities, and then the disorder in the eye immediately vanishes; if the inflammation is violent, bleed, purge with aloetics, and wash the eye with a mixture of tepid water two parts, and brandy one part. When a translation of rheumatic matter from the hip, or elsewhere, is the cause, blifters may be applied to, or near elsewhere, is the cause, blisters may be applied to, or near the part whence the rheumatism receded; a seton may be fixed under the lower jaw, and the bark with guaiacum may be given. In the fcrofulous inflammation of this organ, the bark is the fovereign remedy; if in this cafe, the glands under the ears are affected, apply a caustic on one of them, and then another, if there are more than one, and the confequent discharge will soon remove the inflammation. inflammation; proper alteratives, as required, may ac-company the bark; and the head should be washed every morning with cold water. Nitre, given to a scruple three times a day, hath been found to be remarkably efficacious in this as well as with the common ophthalmias. The venereal sphthalmia admits not of vitriolic collyriums; it calls for the speediest aid, which should consist of bleeding in the foot; an inward use of mercurials; the warm bath night and morning, purges repeated every day from the first day of bathing, until the inflammation abates, if other circumstances do not forbid; compresses squeezed out of brandy and water may be constantly kept on the

The ophthalmia tarfi, fo far as it is produced by the ephthalmia membranarum, the same remedies may be ne-cessary. Some ulcerations are often formed on the tarfus; these require the application of mercury or copper, either of which often entirely cure the disorder. It often depends on an acrimony deposited in the sebaceous glands of the part, and will require various remedies according to the nature of the acrimony in fault, as ferofulous, or

tained, mercury may be tried.

OPHTHALMIA MUCOZA. The MUCOUS OPH-THALMY. It is a variety of ophthalmy of the mem-branes of the eye, though not in Dr. Cullen's Nofologi-cal Arrangement. Mr. Ware calls it the purulent eye, but owns that the term is not to be ftrictly understood; he fays, " the discharge from the eye is not real pus, but only mucus increased in quantity, and altered in colour." See his Remarks on the Ophthalmy, &c. p. 114.

Dr. Wallis, in notes to histranslation of Sauvages's Nofology of the Eyes, places it amongst the discases of the eye-lids, in the inner membrane of which the inflammation begins, and when it extends, the cyc becomes more or lefs affected, and calls it ophthalmia mucofa puriformis, because there is a discharge of mucus, discolured like pus; though not possessing the properties of pus.

This diforder rarely happens, except to new-born chil-dren; in whom Mr. Ware observes, that it first discovere itself by a redness in the eye-lids, which quickly swell to a fize so large as to prevent their being separated, with-out the utmost difficulty; after which a constant difcharge of thick yellow matter foon succeeds; which, if the charge of thick yellow matter foon fucceeds; which, if the lids can be feparated, will appear to fpread over the eye, fo as entirely to cover it. In common, both eyes are affected nearly in the fame manner; and in bad cafes, when ever the child cries, the infide of the lid is turned outwards; which is also the case, whenever an attempt is made to separate them with the singers; this is sometimes the constant flate of the lids, and though they are restored by the fingers to their proper states. by the fingers to their proper fituation, yet on being left to themselves, they immediately return to their former

Occasionally this complaint is accompanied with erup-tions on the head and other parts of the body; and sometimes is attended with fymptoms of a ferofulous habit.

The swelling of the eye-lids necessarily occasions a tightness, or constriction of their ciliary edges, by means of which the matter, which is formed on the inside of them, is prevented from wholly running off; and its con-tinuing between the lids and the globe, ferves still farther to increase the inflammations, and is also the frequent to increase the inflammations, and is also the frequent cause of ulcers and specks, which very often partially, and sometimes totally, cover the pupil. These effects may, in a great measure, be produced by the acrimony of the matter; but even allowing, that the retained sluid is perfectly bland and mild, its continual lodgment on the eye is sufficient, by maceration only, to destroy the transparency of the cornea, and when it has been joined with the pressure of the swollen eye-lids, it has been known to cause the cornea to burst, the humours to be partially or wholly discharged, and the eye, of course, to sink in the orbit. To this accurate description of Mr. Ware's, it may be added, that usually, it left to nature, the quantity of macas gradually increases until about a tea-spoon full of mucus gradually increases until about a tea-spoon full of it may be squeezed from each eye every day; soon after this; if no extraordinary symptoms attend, the mucus decreases, and without art a cure is effected.

This kind of inflammation may arife from any of the caufes that produce external phlegmonous inflammations. Mr. Ware observes, that the tunica conjunctiva is defend-Mr. Ware observes, that the tunica conjunctiva is defended from the acrimony of the tears by a soft, thin, mucous fluid, which is supposed to exhale from innumerable small perforations dispersed all over its surface. This sluid, as it naturally exists, is very small in quantity; on which account, as it is pellucid, it is undiscernible by the naked eye; nevertheless it is liable, by an irritation or inflammation of the parts which furnish it, not only to be increased greatly in quantity, but to be so altered and changed in quality, as very much to resemble pus itself, both in consistence and colour. This inflammation is not ofquently fupposed to arise from the child's being impru-dently exposed to the cold air.

When early affiftance hath been given, its confequences was generally fuccefsful; but when neglected, a partial blindness at least, and too often a total one, hath been the consequence. Like all inflammations of the eye, it is

apt to terminate in an opacity of the cornea.

In order to the cure, it is recommended by fome to wash the mucus out of the eye, whilft in a tender inflamed flate, with a collyrium of equal parts of the common emultion and julep of campher. Others with a fyringe wash out the mucus, but prefer mild fluids, such as warm barley-water; and until the fwelling of the eye-lids fubfide, they apply to them cooling ointments and emollient eataplasms; at the same time, they repeat gentle purga-tives as often as the patient's strength, &c. seems to require. Leeches are applied to the temples, and a blifter between the shoulders is kept open as long as a tendency to a discharge of mucus in the eye appears. When the turgidness of the eye-lids abates, and the inflammation of the conjunctiva disappears, the decock cort. Peruv. is given inwardly, and collyriums directed that are of an aftringent kind, and used three or four times a-day. Though blifters are generally applied fome have, from an extensive prac-tice, concluded that their constant omission would be no disadvantage to the patient. Mr. Ware proposes on the first attack to begin with resisting the discharge of mucus, by strengthening the external coat of the eye. To this by itrengthening the external coat of the eye. To this end he directs the eye to be cleared of the morbid mucus, by injecting into it by a fyringe, a gentle aftringent collyrium; in particular he prefers the aq. camph. Bat. diluted with common water, in the proportion of a dram, lefs or more, to two ounces. This practice he uses in all the stages of the disease. As the matter increases, the colliniary of the collection of the stages of the disease. As the matter increases, the col-lyrium may be used more frequently, and gradually in-creased in its strength: in a slight case it may be used two or three times a day, but in the more malignant ones it may be repeated every hour, and the stypticity of the col-lyrium may be increased in proportion; as the disorder gives way, the strength of the medicine, and the frequency of using it, may both be decreased. To abate the swelling of the eye-lids, Mr. Ware prefers a cataplasm of the coagulum aluminos. & ungt. stor. samb. an. p. æq. this should be applied cold. When the eye-lids adhere strong-ly, they will be best separated by washing their edges with ly, they will be best separated by washing their edges with fresh butter dissolved in warm milk. If the inside of the eye-lids turn outward, only when the child cries, and returns as foon as it ceases so to do, nothing more need be done than what is already recommended; but if this fymptom is constant, it will require a more frequent rerymptom is containt, it will require a more frequent repetition of the injection, and to employ a perfon immediately after the use of it, to return the lids, and to keep a
compress dipped in the diluted aq. camph. constantly upon them with his finger, in order that the habit may be removed, and the eye-lids may recover their proper tone and
strength. When the inside of the eye-lid is much instanted,
the tinct. opii may be dropped on them with advantage
every day; and when the quantity of mucus is so dimisissed as that the tincture may come in contact with the nished as that the tincture may come in contact with the eye, it may be applied there also once a day. If there is reason to suspect any particular humour in the habit, give such alteratives as their nature may appear to require.

Mr. Ware gives an instance of a case in which blood instead of macus was discharged, and which gave way to

the same treatment as is here recommended; on account of which, with many other important particulars, his publi-

cation deferves the attention of every practitioner.

THALMIA.

OPHTHALMICI EXTERNI See MOTORES

OPHTHALMICI EXTERNIC See Motores occulorum externic.

OPHTHALMICUS WILLISH. The ophthalmic branch of the fifth pair of nerves. This is the first branch of the fifth pair of nerves, which runs through the foramen lacerum to the orbit, having from its passage thickness. Purified opium should be kept under two forms; one fost, proper for forming into pills, the other hard, which may be reduced into powder. Pharm. Lond. 1788.

The particular matter in which its virtues depend hath note along with the olfactory, which the branch of the fifth that passes through the foramen orbitarium internum joins. This ophthalmic branch likewise supplies the from

ten connected with any other diforder, and is most fre- parts at the internal canthus of the orbit; the glandula lachrymalis, fat, membranes, muscles, and teguments of the eye-lids; its farthest extended branch passing through the foramen superciliare of the os frontis, to be distri-buted to the forehead. See TRIGEMINI. OPHTHALMITES. See OPHTHALMIA! OPHTHALMOPONIA. An intense pain in the eye,

whence the light is intolerable.

OPHTHALMOXYSIS. A brushing of the eye.

OPHTHALMORRHAGIA. Bleeding from the eye

or the eye-lid.

OPHTHALMOXYSTRUM. A BRUSH FOR THE
EYE; it was formerly made of the beards from barley or rye. It was fo drawn acrofs the infide of the eye-lids, to make them bleed. It is also called blepharaxysis.

OPHYLLON. GREAT TOOTH-WORT.

OPIATA. Properly medicines in which are opium;

but foft electaries are also so called.

OPII. TINCTURA CAMPHORATA. See PARE-

GORICUM ELIXIR

OPISTHOTONOS, from omoties, backward, and reses, from ress, to firetch. It is a species of spasm, in which the whole trunk is rigid and drawn backwards in a curve, with the head bent towards the shoulders. See TE-

OPION. Probably from επος, jnice, called by the OPION. Arabians AFFION, ASIUN; anfian, also named manus Dei. This name feems to be by way of eminence, as by cortex is understood the cortex Peruv. eminence, as by cortex is underflood the cortex Peruv. Galen is the first among the Greeks who used the word to express this drug. Opium is the milky juice which exudes from the heads of poppies when incisions are made in them; this juice is gradually dried in the sun, to a proper consistence. The species of poppy, is the papaver formiferum, or papaver calycibus capsulsque glabris folijis amplexicaulibus incisis, Linn. It is brought from Turkey, Egypt, the East Indies, and other parts of Asia. Neumann says, that the opium we receive from all the just named places, is obtained by the

receive from all the just named places, is obtained by the pressing the juice from the heads of the poppies.

Opium is brought into Europe in flat cakes, or irregular masses, from four to fixteen ounces in weight; covered with leaves to prevent their flicking together. It is a gummy refinous substance, softish, and tenacious, especially when warm or much handled; of a dark reddish brown colour in the mass, and yellow when reduced to powder. It hath a faint disagreeable smell, and a bitter taste. If chewed a little it assects the tongue with a sense of heat, which spreads to the palate, and then in a less degree to the lips, and provokes a discharge of faliva. It heats the nose, and so invitates it as to excite a specime.

nose, and so irritates it as to excite a sneezing. Choose that in which, when sliced, no visible impurities are lodged; when broken, appears brightifh, of a dark red, blackifh colour; that is dry, not uncluous, but moderately ponderous and compact; that is inflammable, of an acrid bitter tafte, a faint imell refembling that of unripe poppy heads, and without any empyreumatic flavour; and that communicates to water, not yellow, but a reddiff tincture.

Hippocrates feems not to have been a ftranger to its narcotic quality. The ancients rarely used it. Sylvius de la Boe first brought it into vogue. Sydenham first used it in the small-pox; but now it obtains very extensively

in practice.

Bellonius observes, that it is so adulterated, that sometimes a pound does but contain about four ounces that is puregenuine opium; but fuch faulty forts are not brought amongft us. Sand is added to increase its weight, and many foreign bodies are found mixed with it; but that the juices of other plants are added does not appear clear. However it is ordered to be purified in the following manner—OPIUM PURIFICATUM, PURIFIED OPIUM. Take of opium, cut into finall piece;, one pound; proof fpirit of wine, twelve pints; digelt the opium with a gentle heat, ftirring now and then till it is diffolved, and filter through paper. Diffill the tincture fo prepared to a proper thickness. Purified opium should be kept under two forms; one soft, proper for forming into pills, the other hard, which may be reduced into powder. Pharm. Lond. 1788

agree in that this foft refin, or thick oil, chiefly contains the active matter of opium, that is its narcotic quality, though the other parts are still mildly anodyne after the separation of the soft resin. Besides this resin there is a gummy part, a faline one, which Dr. Aliton fays is of the nature of fal ammoniae, and an earth. In distillation with rectified spirit little or nothing rises from the spinm, but with water its particular smell is brought over. The most active parts of opium are so fixed, that it keeps many years without any fenfible wis; a drain of epium was kept rears without any tennote sots; a dram of optum was kept in the heat of boiling water during five hours, and it scarce loft a grain and a half thereby. It disfolved but partially in rectified spirit of wine, or in water; but in proof spirit, wine, or vinegar, dissolves all that is good, the impurities only being left. Dr. Alston says, that twelve parts of opium contain five parts of gum, four of resin, and three of earthy, with other indissoluble impurities. The sum is a mild anodyne, but free from the narcotic and gum is a mild anodyne, but free from the narcotic and other difagrecable qualities of the crude spium. The refin is almost tasteless, but hath a very musty smell.

Opium enters into feveral of the compositions of the fhop; as in confectio opiata, pulv. e creta comp. c. opio; pulvis ipecae. c. tinct. opii; but the two following are the principal.

PILULE EX OPIO. Opium Pills, made in the following manner.

Take of hard purified opium, by weight, two drams; extract of liquorice, by weight, one ounce. Beat them until they are perfectly united. And is also added the fubfequent powder.

## PULVIS OPIATUS. Opiate Powders

Take of hard purified opium, one dram; burnt or pre-pared hartfhorn, nine drams. Mix them. The former of these preparations in five grains, and the latter in ten grains, contain one of opium. Pharm. Lond. 1788.

TINCTURE OPIL. Tincture of Opium.

Take hard purified spium, ten drams; proof spirit of wine, one pint. Digest for ten days, and strain. Pharm. Lond 1788.

The medical properties of this drug are both numerous and valuable; even fo that fome have denominated it and valuable; even to that fome have denominated it manus Dei. Its operation is generally accompanied with a flow but strong and full pulse, a slight redness, heat, and itching in the skin; it is followed by a weak and languid pulse, low spirits, some difficulty in breathing, or a sense of tightness about the breast, a slight giddiness of the head, dryness of the mouth and fauces, some degree of careful her and only in the strength. of naufea, heat, and pain in the ftomach; but thefe fymptoms are to be understood of a full dose when no particular difeafe requires it; for very large dofes are taken in violent diforders, and no difagreeable effects are observed

Perhaps all the effects produced by opium depends on its power in diminishing the mobility, and in a certain manner suspending the motion of the nervous fluids. In proper doles, and repeated at due intervals, it is narcotic, anodyne, antispasmodic; it abates inflammation both internally and externally; it moderates the heat in fevers, and affifts other medicines in producing a more speedy effect; it discusses stagnating sluids, whether externally applied, or internally administered; it removes obstructions arising from for the content of the content tions arifing from spains; abates preternatural irritabi-lity, and removes convulsions which arife therefrom; it promotes the discharges through the skin, but retards all other evacuations; abates all kinds of pains, and totally removes some; as a carminative it exceeds all of the aromatic tribe, for its efficacy extends through the whole

One grain of pure opium is generally a full dose; three grains can hardly ever be taken by an healthy man who is not accustomed to it; but by habit an ounce in a day may be taken. Garcias says he knew a person who took ten drams a day. In Turkey, at this day, sober people take a dram, and drunken ones take five or fix. When violent pains, or other fymptoms require it, Sydenham observes, the dose and its repetition may be proportioned to the urgency of the symptoms. Frequent experience manifests the propriety of large doses; in spatmodic complaints

from opium, are, a refin, which Neumann fays is of two twenty-two grains of pure opium, befides three hundred kinds, viz. a hard and a foft one. Mr. Awster seems drops of landanum, have been given in the space of thirty-to call this fost refin, its thick effential oil; they both fix hours; and afterwards no remarkable inconveniences were observed.

When imprudent doses have been taken through mis-When impredent dofes have been taken through mit-take, or with an ill defign, there follows immoderate mirth, or elfe flupidity, giddinefs, a rednefs of the face, fwelling of the lips, troublefome dreams, flarting, con-vulfions, cold fweats, a confiderable dilatation of the pupil, imperfect speech, flow full pulse, quick breathing, nausea, itching in the skin, vomiting, madnefs, hiccough, fainting, &c. Immediately on the happening of such an accident, give a vomit of vitriolated zinc, purified, and repeat it four, five, or fix times; if the constitution is vigorous, bleed, and after this frequently a spoonful of sharp vinebleed, and after this frequently a fpoonful of fharp vine-gar; befides thefe, finapifms may be applied to the feet, blifters to the arms, clyfters of tobacco fmoak may be given, frictions may be ufed, as the cafe feems to require. Vinegar is the antidote, yet cordials should formetimes accompany it. When opium is given in a folid form, the pure epium or the pills above mentioned, will be the best; when a liquid form is required, folutions in wine; or proof spirit, are to be preferred.

fpirit, are to be preferred.

Alkaline falts diminish the foporific effect of apium; the fixed alkaline falts render it diuretic; the volatile carries it through the fkin; and acids almost entirely destroy its powers. See Kæmpfer's Amænitates Exoticæ. Wedelius's Opiologia. Lewis's Mat. Med. Mead on Poifons. Newmann's Chem. Works. Dr. Alfton's Diff. on Opium in the Edinb. Med. Effays, vol. v. Med. Opoponax-wort. It is the paftinaca opopona. OPOPONAX-WORT. It is the pastinaca opoponax, Linn.
The medicine kept under the name of opoponax, is a

The medicine kept under the name of opoponax, is a gummy refinous juice, obtained from the roots of the opoponax-wort, which grows wild in warm countries, and bears the cold of our own. This gum is brought from Turkey and the East Indies, sometimes in little round drops, but generally in irregular lumps, of a reddish yellow colour on the outside, with specks of white, internally of a paler colour, and often variegated with large white pieces; they have a difagreeable smell, and a bitter acrid nauseous taste; they diffolve in water, and in spirit. As a medicine, this gummy refin is sometimes used as an attenuant, and deobstruent; in large doses it is laxative: doses from 3 i. to 3i. are given with the fame intentions as the galbanum and ammoniacum are used. This is the least disagreable of the fetid gums, and therefore of the least diagreable of the tend gums, and therefore of the least virtue, and retained in practice merely to assord a necessary variety. See Raii Hist. Lewis's Mat. Mad. Neumann's Chem. Works. Cullen's Mat. Med. OPPILATIO, from oppilo, of pilo, to condense. OPPILATION is a close kind of obstruction; for, according to Rhodius, it signifies, not only to shut out, but also to sill. OPPILOSIO. The CATALEPSIS. See CATALEPSIS. OPULUS. The GELDER-ROSE. ORCHEA. Galen fays it is the fcrotum.
ORCHIS. A TESTICLE; also the name of a plant with a testiculated root; of which Boerhaave enumerates

fourteen species; and Dale adds five more.

The chief of these are the following species; orchis, alfo called fatyrion; cynoforchis; testiculus caninus; ferapias; male fatyrion; DOGS STONES; FOOLS STONES. It is the orchis mafcula, or orchis foliis fessilibus maculatis, bulbis indivisis nectarii labio quadrilobo crenulato, cornu obtuso petalis dorfalibus reflexis, flore purpureo, Linn. MALE FOOL STONES.

This plant hath fix or feven long, narrow, fmooth leaves, variegated with dark-coloured fpots or ftreaks, iffuing from the root, and one or two embracing the stalk, which is single, roundish, and striated. On its top appears a long loose spike of irregular, naked, purplish, red slowers, consisting each of six petala, one of which is large, cut into three sections, hanging downward; the other smaller, forming a kind of hood above it, with a control of the stalk of the sta tail behind. The root confifts of two roundish, whitish, tubercles about the fize of nutmegs; one plump and juicy, the other fungous and fomewhat shrivelled, with a few large fibres at the top. It is perennial, grows wild in shady grounds and moist meadows, and slowers in May or fooner

The plump roots or bulbs are the only parts used in medicine; they have a faint finell, and fweetish viscid taste. Their properties are fimilar in general to those of the rad. althese. The dried roots are brought from Turkey, under the name of falep, and faleb, formed from the root of the orchis moriobul. Mr. Moult, in the Philosophical Transactions says it may be formed from several other species of the same genus, but those of our own growth are as good. Those that are brought from Turkey are in a price of a rolling that are brought from Turkey are in oval pieces, of a yellowish white colour, clear, and pellucid, very hard and horny, of little or no finell, tafting like gum tragacanth. Our orchis roots, when robbed of their fkin by boiling in water, and then dried in the air, gain exactly the fame appearance. Reduced to powder,

which is of a very nourifhing quality; more fo than any other known vegetable, though Dr. Cullen thinks, as a nutritious root, it has been greatly over-rated. Sometimes it occasions costiveness, but this is remedied by a little of any vegetable acid mixed with it, or a little fea-falt. Half an ounce of the powder is fufficient for a gallon of thick mucilage. The powder should be sprinkled with a little boiling water, then flirred well into it, and af-terwards mixed with the water in which it is to be boiled. If this powder is kept dry it never spoils, so would be an excellent part of seamen's diet, particularly when they are in warm countries. A dram and a half of salt in a pint of portable falep, is not difagreeable, whence, when fresh water fails at fea, this powder would be an excellent expedient for lessening that inconvenience. As a diet, it far exceeds rice in every point of view, and for children particularly it is peculiarly proper. As a medicine, the falep is mucilaginous, demulcent, obtunds the acrimony of the fea-scurvy; in diarrhœas and dysenthe acrimony of the fea-leury; in diarrheeas and dylen-teries it is of fingular efficacy by lubricating the bowels, and correcting putrefaction. In fymptomatic fevers, from the abforption of pus, a plentiful ule of falep is very demulcent. In the firangury and dyfury it is of fervice by its mucilage. See Lewis's Mat. Med. Percival's Effays, Med. and Exper. Georgical Effays, vol. iv. Cullen's Mat. Medica.

ORCHIS BIFOLIA. See BIFOLIUM. Dr. Cullen fays he has feen the falep made from this as pure, and as per-fect as any that comes from Turkey. Mat. Medica. fect as any that comes from Turkey. Mat. Medica. ORCHOS. The extremities of the eye-lids, where

orchotomia, from open, teflicle, and Tsuve, to

OREILLONS, i. c. Mumps. See CYNANCHE PA-ROTIDÆA.

ORELLANA. See ORLEANA.
OREOSELINUM. The galbanum plant. Boerhaave mentions three species, but the two following are those which afford the gum galbanum.

Orcoselinum Africanum galbaniferum frutescens anasi

folio.

Oreofelinum anisoides arborescens ligustici soliis & facie flore luteo Capitis Bonze Spzi. It is also a name for opium; petroselinum montanum; apium montanum nigrum; oreoselinum apii folio minus. MOUNTAIN-PARSLEY.

Of this and the two following species, the roots are flenderer than those of the daucus, and not lactescent; the leaves are like those of the apium or cicuta; the seeds are oval, flat, large, striated, marginated, and sometimes cast off their husks.

The mountain-parfley grows on the mountainous parts of Germany and other countries. It heats and is diuretic. OREOSELINUM PRATENSE CICUTÆ FOLIO, alfo

called daucus Alfaticus; angelica pratenfis apii folio.
—— APII FOLIO MAJUS, also called libanotis nigra; gentiana nigra; daucus montanus, cervaria nigra; daucus felinsides major; laferpitium minus paludapii folio femine criffato; MOUNTAIN-DAUKE; OT BLACK HERO-FRAN-KINCENSE.

It grows on mountains in Italy, and flowers in July. The feeds are opening, inciding, diuretic, and emmena-

ORESTION. In Dioscorides it is the helenium. See Raii Hift.

ORGANE CELLULAIRE. See CELLULOSA

ORGASMUS, from opyau, to defire vehemently, to be turgid, or properly to be in beat, as fome female animals are at particular feafons of the year. An orgafm; that is a violent turgescence, and motion of the humours. As Linnæus expresses, a substitution of the arteries.

ORICIA. A fort of turpentine-tree, fo called from

Oricus, a city of Epirus, near which it grows.
ORICOLA. See AURICULA URSI.
ORIENTALIA FOLIA. The leaves of fena.
ORIENTALE GUMMI. See GUM. SENEGA-

ORIGANO COGNATA. A fpecies of marjoram. ORIGANUM. WILD MARJORAM. Origamm vulgare, Linn. Boerhaave enumerates eleven species, but the two following are the chief that are in use. Also a name for a species of basil.

fpontaneum; majorana sylvestris; acapnon; sampsuchum; agrioriganum; onitis major; origanum; common wild

MARJORAM. Origanion vulgare, Linn.

It is a plant with firm round stalks, and oval acuminated leaves, that are uncut, and fomewhat hairy. It is fet in pairs on fhort pedicles; on the tops grow fealy heads of pale-red labiated flowers, whose upper lips are entire, and the lower cut into three fegments, fet in form of a convex umbel, intermixed with roundish purplish leaves; each flower is followed by four minute feeds inclosed in the cup. It is perennial, grows wild on dry chalky hills, and gravelly grounds in feveral parts of England, and

flowers in June.

The leaves and flowery tops have an agreeable aromatic fmell, and a pungent taffe, warmer than that of the gar-den-marjoram, and much refembling thyme, with which they agree in medicinal virtue, as also with marjoram: infusions of them are drank as tea in weakness of the stomach, diforders of the breaft, to promote perspiration and the fluid fecretions in general; they are used in nervine and anti-rheumatic baths; the dry leaves powdered are a good errhine. For internal use, an infusion of half an ounce of the leaves in a pint of water, is the best preparation. In distillation with water they yield a moderate quantity of a very acrid penetrating effential oil, fmelling strongly of the origanum, but less agreeable than the herb; this oil is called oil of thyme, and is often put into hollow teeth to allay the pain of them. See Lewis's Mat. Med. Neumann's Chem. Works.

- CRETICUM, called also onitis; ORIGANY, or CANDY WILD MARJORAM. The flowery tops were formerly brought from Crete, and are indeed fomewhat ftronger than ours; but instead of them those of our own growth are now always used. See also DICTAM-

NUS CRETICUS.

ORLEANA, called also arbor Mexicana; orellana,

the ARNOTTO-TREE. See ACHIOTL.

The arnotto-tree is the bixa orellana of Linnzeus. Dr. Brown, in his History of Jamaica, gives the following

account of it:

Bixa foliis cordatis cum acumine floribus racemolis terminalibus. The ROUCOU or arnotto-tree. This curious fhrub is frequently met with in the cooler vales in Jamaica; it rifes commonly to the height of eight or nine feet or more; it thrives best in a cool rich foll, and shoots most luxuriantly near springs and rivulets. All the seeds of this plant are covered with a kind of wax, which is carefully gathered in many parts of America, and is what generally goes by the name of terra oreliana, roucou, and arnotto. This commodity is manufactured in the following manner, viz. when the feed-veffels are full grown, and in a perfect state of maturity, they are picked off and opened, and the feeds gathered and put into convenient jars. When they have a quantity of these, proportioned to their vessels and design, they throw in as much hot water as may be fufficient to dilute and fufpend the wax or pulp, with eafe, which is gradually washed away from the feeds, both with the hand and the spatula. When all the wax is washed off, and the seeds appear quite naked, they are taken out, and the wash left to settle: but when the wax is thoroughly subsided, the clear incumbent waters are decanted off, and the sediment put into shal-low vessels to be dried gradually in the shade. When this mass acquires a due consistence, it is made into balls or cakes, and left to dry in fome open airy place, until it grows firm and hard, and then it is fit for use, or the market. The wax is a cool agreeable rich cordial, and hath been long in use amongst the Indians and Spaniards in America, who still mix it with their chocolate, both to heighten the flavour, and raise the colour. It is faid to be a fuccefsful remedy against the bloody-flux. It is used as a pigment. It is often mixed with other ingredients both by painters and dyers. The roots have much the same properties as the wax, but the roots are somewhat more diuretic.

This American shrub is retained in hot-houses in Great Britain. It is propagated by feeds from America; fown in pots in fpring, and plunged in a bark bed; the plants are to be transplanted into separate pots, and always re-

tained in the stoves.

Father Labat fays, that the Indians prepare an arnotto of a bright shining red colour, almost equal to carmine.

DRIGANUM ANGLICUM, called also orig. vulgare | The arnotto is difficultly diffolved in water, which it folves in fpirit of wine, rectified, to which it gives an orange-red colour, and is ufed in varnithes to give an orange hue to the fimple yellows: Alkaline falt renders it foluble in hoiling water, without altering its colour.

ORNITHOGALUM: Boerhaave enumerates eleven

species; but only the following hath any medical properties attributed to it, viz. the ornithogalum umbellatum medium angustifolium; called also ornithigalare. The STAR OF BETHLEHEM. It is cultivated in gardens; it flowers in May; the root is bulbous or tuberous, and is fometimes, though very rarely, ufed, as are also the feeds. See Raii Hift. It is also a name for fquills. See SCILLA

ORNITHOGLOSSUM. BIRD's-TONGUE. So the

feeds of the common ash-tree-are called from their shape; ORNITHOPODIUM. BIRD's-FOOT. There is another species called telephium; feorpioides; scorpiona wort. They grow on fandy and gravelly places; they flower in fummer. Their feeds deftroy the flone in the kidneys; but are very rarely used. Boerhaave mentions four more species, but they are not noted as medicinal.

See Raii Hift.
ORNUS. The ASH-TREE which affords manna. It is also a name for the forbus aucuparia. Sec SORBUS SYL-

VESTRIS.

OROBANCHE, also called fquamaria; amblatum; dentaria majer; aphyllon; MATHIOLUS'S GREAT TOOTHWORT. It grows in lanes and shady places, and slowers in April or May. There is another species called rapum genitire, BROOM-RAPE. It grows to the roots of broom, whence its name, and amongst corn; it flowers in June. See Raii Hist. It is also a name for the bypocifis.

OROBUS, also called aftragalus; aftragaloides; aftragalo; chamebalano; WOOD-PEASE; HEATH-PEASE. It grows in woody places; flowers in April; ripens its feeds in May; the tubera of the root taftes like liquorice, and in Scotland is used as liquorice is with us. They call

the plant karemyle. See Raii Hift.

OROBRYCHIS PEREGRINA. See ERVUM.

ORPIMENT. It is a cryptometalline fossil; a species of arsenic stos, of a bright yellow colour, and a scaly structure. Edward's Elements of Fossilogy. See Auri-

ORTHOCOLON, from ogbot, firait, and muster, a limb. It is a species of stiff joint, and is when it cannot be bend-

ed, but remains strait. See ANCHYLOSIS.

ORTHOPNŒA. This discase, when neither a species of afthma nor of dyspnæa, is only a symptom of some other disease. It is a sighing suffocating respiration, and the patient must be erect to breathe; of this there are many species, viz.

ORTHOPNOBA SPASMODICA, ASTHMA SPON-HYSTERIA. See

ASTRMA.

ncea thoracica.

- A VAPORIBUS. - A DEGLUTITIS.

h. f. Dysphoea ex-- A FUNGIS. -- AB ANTIPATHIA. A BRONCHOCELE.

ORVALA. A name for feveral species of sclaria.

ORVALA. A name for teveral species of leasts.

ORVIETANUM. ORVIETAN. A celebrated antidote, fo called from Orvieto, a city of Italy, where it
was first used; though some say its inventor was one
H. F. Orvietanus, and that it is named after him. It is
an electary, made up of many ingredients mixed with

honey.

ORYZA. RICE. Also called ARAC. It hath its grains disposed into a panicle, which are almost of an oval figure, and covered with a thick husk, like barley. Among the common kinds of grain, rice is the mildest. It is less viscous than wheat, but it is also less nourishing.

grows even in water. In China they ferment the rice, and diftil from it the liquor called arrack.

ORYZA GERMANICA. A fpecies of barley.

OS. A BONE. Bones conflit of a mucilage and an earthy matter. Acids dissolve this earthy matter, leaving the bone of its original shape, but fost. The earthy matter forming bone, is deposited by the exhaling arteries.

The number of bones are 304.

The bones are composed of fibres, disposed in laminæ, which laminæ laid over each other, compose the substance of the bone. In the foctus the bones feem a net-work of threads, but when offification is farther advanced, these threads are not so apparent, the interstices being filled up with others. The bones are composed of a hard, folid, of a cellular, and of a reticular part. The cellular part is formed by the inner laminæ of the folid part, departing towards the axis of the bone. The reticular part lies in the cavity of the bone, and by degrees, at it approaches the extremities, unites, feeming partly to form the cellular part. There are no nails to join the laminæ as fome have described; they are rather connected by transverse fibres. The cavity of the bones serves not only to contain the marrow, but by the increase of the diameter, the strength of the bone is augmented. The bones have numerous blood-veffels, but especially in the spongy and reticular parts, though the solid part is not without them; these vessels run according to the direction of the fibres of the bone; thus, in the long bones they run longitudinally. In the round bones, as in the os bregmatis, they run radiated, becoming less and less visible as they approach to the centre of the bone, because there the laminæ are the thickeft. The benes are full of pores for the admission of veffels; in the middle these pores are more large and conspicuous, in the extremities they are smaller. In every cylin-drical bone there is a hole about its middle for the admisfion of an artery and its vein, which paffes flanting through the fubstance of the bone, and branches through the internal periosteum, or membrana medullæ, which lies betwixt the medulla and the internal furface of the bone, and even branch externally again through the bone. These branches frequently anaftomose, whence the bone may be nourished from within outwards, as well as from without inwards. This internal periofteum is liable to the diforders of other valcular fubitances, as inflammation, obstruction, suppuration, &c. with their confequences: but where thefe happen, the structure of the bone is frequently quite destroy-ed, as in the spina ventosa. It is supposed that bones are furnished with nerves, and yet they mostly feem infensible; though the granulations from them are extremely fensible. It is probable that there are velicls fui generis, whose office is to carry beny matter, and occasionally to absorb it; as a proof of this, the mollities offium, from a scorbutic, or a venereal cause, seems rather a desect of this bony matter, than of marrow. The membrana medullæ, not only lines the furface of the bone internally, but also divides the mar-row into vesicles or membranous bags, which are furnished with very fine minute vessels. The middle part of the larger bones, is much less in diameter than the extremity, to give a greater firmness to the joint, and to allow a greater space for the fleshy belly of the muscles. The middle part of the bones is not fmaller than the extremities merely by preffure, as we may observe in the fœtus; it is their original conformation, though pressure feems to have some effect in this case, as we may observe in a weakly consti-tution, and in women of a sedentary life. The bones are entirely smooth, though in a robust habit there are cavities and furrows on their furface formed by the action of the muscles. The bones are, cæteris paribus, weaker in their middle part, from their diameter being lefs; whence in this part they are more exposed to fractures; but to compenfate this, there are more lamellæ in the middle than in the extremities, and they are more compactly joined; there is a cavity also there which contains the marrow, and thus the strength in this part is greater than otherwise it would be. Many bones have protuberances rifing out of them, which are called processes; and in many there are eavities; if these are deep, with large brims, they are called cotyle; if fuperficial, glenæ or glenoid; which general claffes are divided into feveral species, of which, pits are

It is used as a diet in diarrhoeas, but the salep is to be bone; furrows are long narrow canals, formed in the surpreferred. The idea of its being hurtful to the eyes is face; niches are fmall breaches in the bone; finuofities are without foundation. Rice delights in a moift foil, and broad but fuperficial depressions without brims; fossie are large deep cavities, which are not equally furrounded by high brims; finuses are large cavities within the bones with fmall openings; foramina, or holes, are canals that pierce through the fubitance of the bones. The use of these ca-vities are to allow room for heads of bones to play in; to defend and lodge fofter parts; and to afford a paffage for veffels, muscles, &c. The bones are destroyed in the living subjects, by the excess of air, or by blood lodging up-on them. The classes into which the bones are divided are usually as follow. 1st, The cylindrical; these are compact in the middle, and fpongy in their extremities. 2dly, Spherical; these are entirely spongy, except a thin plate on the external surface. 3dly, The stat; they are compact on the outside and inside, but between the plates are pongy. 4thly, The irregular, which when thick, are like the round, and when thin are like the flat one

Mr. Sheldon observes, that hones are composed of fibres connected by cellular substance; there are two portions in bone, one the living vafcular or organized part; the other dead calcareous earth, which, though a dead matter trea-fured up in a living fubitance, yet does not ftimulate or irritate. If bone is foaked in fpirit of falt and water, it will leave nothing but veffels and membranes; it appears to be an inorganic concrete, but it is very much organized. The fource of blood to the bone, is from the internal and external periofteum, whose vessels copiously anastomose with each other in the substance of the bone. In the slat bones the vessels anastomose in the diploe or meditullium. The arteries, veins, nerves, and absorbents, are all in like The arteries, veins, nerves, and absorbents, are all in like manner. All the spongy bones, as the sternum, vertebræ, facrum, &c. are covered with a strong ligamentous substance. The earth of bones is considered by the chemists as the purest; they call it virgin earth. The whole sensibility of the bone does not reside in the periosteum; bone becomes most exquisitely sensible, in the diseased instance round them being inelastic.

See Havers on the Bones; Monro's Ofteology; Thomp-fon on the Bones; Chefelden and Albinus's Ofteography; Nefbit's and Kerckringius's Ofteology; Monsieur Cour-tial's Obf. Anat. fur les Os. On the Difeases of the Bones;

fee Petit.

Os. The MOUTH. Its internal parts are the lips, the angles of the mouth, the border or edge of each lip; the foffula which runs from the feptum narium to the edge of the upper lip, and the transverse fold which separates the under lip from the chin. The internal parts are the palate, the feptum palati, the uvula, the amygdalæ, the gums, the fræna of the lips, and the tongue with its apex, root, fides, and frænum.

Os EXTERNUM. In midwifery, the entrance into the vagina is thus called, in opposition to the mouth of the

womb which is called the os internum.

INTERNUM. Called also os tincæ, and amphideon. In midwifery, the orifice into, or mouth of the womb, is thus called in opposition to the entrance into the vagina, which is called the os externum. If the os internum is long and hard, when pains like labour come on, a clyster and an anodyne may be given, for the pains are not labour-pains. The os tincæ is sometimes open, a month or two before the time for labour; but it should be remembered that its thickness and foftness undergoes not fuch alterations, but remains the fame whether open or thut, until labour comes on. Nor does it always point in one direction during pregnancy, nor in the beginning of labour. If the os internum is rigid, scooping is bad. When opened by the membranes, it is soft, and then if contracted again from the discharge of the waters, it is easily dilated. It sometimes is hardened and thickened by age, or by frequent labours, and then the birth, though natural, is fomewhat retarded. The manner of dilating the os externum and internum is thus; having the hand well greafed, begin to dilate the external parts gradually, introducing the fingers one after the other, and moving them in a rotatory manner; when the hand is in the vagina, begin gradually to dilate the as internum, refting at intervals, both for your own case and that of the woman, who suffers much from this practice; pro-ceed with the more care and patience, in proportion to finall roundish channels, funk perpendicularly into the the rigidity of the parts. When the hand can be intro-

ferotal rupture.
OSCHEOCELE. OSCHEOCELE. HYDROCELE. By the former OSCHEOPHYMA. of these names Vogel calls the

rupture which descends into the scrotum.
OSCHEON. The scrotum. Gal Galen gives this

name to the os uteri.
OSCITANS. The YAWNING FEVER.
OSCITATIO, also chasme. YAWNING. Boerhaave fays, "the effects of yawning (he speaks of it in the healthy) is to move, accelerate, and equally distribute all the humours through all the vessels of the body, consequently to qualify the muscles and organs of sensation for their various functions." Just after sleep, a person is most inclined to yawn, and stretch his limbs, because a most inclined to yawn, and stretch his limbs, because a greater quantity going off by the pores at this time than at any other, whenever a person awakes, the increased contraction that then happens, closes much of the perfpirable matter in the cutaneous passages, which will continually give fuch irritations as excite yatuning and firetching; and fuch motions, by flaking the membranes of the whole body, and fhifting the contacts of their fibres, and the inclosed matter, by degrees throws it off. Hence we see the reason why healthful strong people are most inclined to such motions; they perfpire most in time of sleep, and, therefore have more of the perspirable matter to lodge in the pores, and hence great irritations thereunto. The advantages of some little exercise just after waking in a morning are confiderable, as it throws off all the perspirable matter that is ready for its exit out of the

When yawning is troublesome, Hippocrates says, that long deep respiration, or drawing in the air at long inter-

vals, cures it OSCULATORIUS MUSCULUS. See SPHINCTER

LABIORUM.

OSMUNDA VULGARIS & PALUSTRIS. It is a lant which bears no flowers, but its fruit in clufters. See FILIX FLORIDA, and LUNARIA.

OSMUNDA REGALIS. See FILIX FLORIDA.

OSSA BATUS. See BOROZAIL.

OSSA E'CORDE CERVI. The BONE of a STAG'S HEART. It is flat, oblong, and without fmell or tafte. It is formed by the offification of the arteries.

OSSERVAZIONI, i. e. MUMPS. See CYNANCHE

OSSICULUM. In botany, it is the shell, or hard

covering of feeds, like bony lamella.

OSSIFICATIO. OSSIFICATION. Dr. Nesbit says, that in the blood, or a fluid fecreted from it, there is an offifing juice, confifting of particles, that are not apparent; that whenever nature defigns an offification between membranes, or within a cartilage, she occasions a more than usual afflux of this fluid, which so distends the veffels that were before invifible, as to make them capable of receiving the red globules of blood, which are always to be feen near the place where offification is begun. In this blood, gritty bony particles are to be felt by the point of a knife, which have been formed by the attraction and cohesion of the particles of the offifying juice obstructed, along with the other grosser sluids in the beginning of the veilels prepared to receive the refluent juices. The blood being capable of forming fine membranes, the membranous parts of a bone, which act as a gluten to keep these particles and fibres together, if there be any fuch that do not arise from the coats of its vessels, are produced by a cohesion round the cretaceous particles of a part of the fluid, in which they were generated and con-tained. Thus the membranes of cartilages ferve as a bed between, or within which the bony particles are depo-fited, or fhoot; but without any intermixture of the par-ticles of the bone and cartilage, or continuation of the fibres of the one substance to those of the other, as is evident in cartilages containing bones kept long enough in water, and then flit; for the bone will, as foon as the veffels that enter its fubstance are divided, slip as ealily from it as an agorn does out of its cup; and there

duced into the uterus, let it enter with its back to the is a smoothness and a polish of the parts of both cartiuterus, and the palm towards the membranes.

Os LEONIS. See ANTIRRHINUM the side of the two substances. While the bones are increasing within cartilages, the cartilages are extended and spread out, by which, with the pressure which they fuffer, and the great influx of various fluids, and the nutritious matter being hindered from flowing freely into them, they decrease continually, and, at last, may truly be faid to be entirely destroyed.

Dr. Hunter, in his Lectures, fupports Dr. Nefbit's opinion, by curious anatomical preparations, which oppose Kerkringius and others, who say that bones are car-

tilages in their original state.

Mr. Cruikshank observes respecting offification, that Dr. Hunter used to fend round, at lectures, a preparation of the patella, in which he demonstrated, that the offification of that bone began by the arteries offifying in the centre of the cartilage, which, in young subjects, supplies the place of bony patella. Mr. Cruikshank adds, that he hath profecuted that subject, from the first appearance of an offifying artery, to the perfect formation of the patella. He supposed that the same thing took place in all other bones, and accordingly made preparations to demonstrate it in every bone of the body; and can show that offifica-tion is not only begun, but carried on by the offifying of the arteries.

Offifications frequently happen in the aorta, lungs, pericardium, and other parts, and advances in infants in proportion to the vis vitæ: thus women judge of a child's

strength by the dimensions of its fontanel.

In flat bones, it begins in the centre, and fhoots towards the circumference. In long bones it begins in the middle, shooting towards the extremities

See Kerckringius, Coiterus, Eyffonius, Ruysch, Nef-

bit, Albinus, and Monro.

OSSIFRAGA. See OSTEOCOLLA.

OSTAGRA, from ories, a bone, and ayea, a laying hold

A forceps to take out bones with.

of. A lonces, OSTEITES, { called also offifraga, ofteolithos, OSTEOCOLLA, } bolofteus, omosteus, oftracites, flelochites, GLUE-BONE; STONE, BONE-BINDER. It is the petrified root of a tree, as of the poplar, pine, &c. It is found in fandy places in feveral parts of Germany; the fand in which it is met with hath a large mixture of fine, white, calcareous earth, which flicks to the fingers, looks like meal, and when washed by the rains into any cavity, hath the appearance of an emulsion. Of this fand and calcareous earth, fo infinuated into the roots of the trees as to make them have a ftony appearance, is the officecolla formed. In foffilogy it is placed amongst the calcareous stones. It hath been famed for its virtue of promoting a coalition of fractured bones. See Lewis's Mat. Med. Neumann's Chem. Works. Philof. Tranf.

OSTEOCOPI, from octor, a bone, and xorros, uncastnefs. Pain in the bones caused by the acrimony of the humours in the fpina ventofa; there pains are in the internal periosteum of the bone; they resemble that of

great wearinefs.

OSTEOGENEIA, from ores, a bone, and yesesa, generation. OSTEOGENY. It treats of the genesis or production of a bone under its feveral original states.

OSTEOGENICA. Medicines which promote the

generation of a callus.

OSTEOGRAPHIA. OSTEOGRAPHY, from orest, a bone, and ypage, to describe. It describes a skeleton, and all the bones which compose the several parts thereof; or it is the doctrine which describes the bones.

OSTEOLITHOS. See OSTEOCOLLA.
OSTEOSARCOSIS, Is when the bones becomes foft, and flexible, as fometimes happens in the fcurvy, and is faid to be relieved by the catapl. antiparalyt. OSTIARUS. The pylorus.

OSTIOLA. SMALL DOORS. So Mundinus calls the

valves in the veffels of the heart.

OSTIOLOGIA, from octor, a bone, and horos, a difcourse on offeology. A DESCRIPTION of the BONES. The doctrine relative to the bones. It includes offeogeny, ofteography, and fynosteography. See Monro's Ofteology.
OSTRACITES, also called oftrea labris non crenatis;

ofiracite. HOBGOBLIN'S-CLAW. It is a ftony fubitance, of the shape of an oyster-shell petrified by sparry matter. It is used instead of the pumice-stone to take off hairs.

A name

which is thin, and generally earthy and black. It is also

a name of the betryites.

OSTREA. The OYSTER. It is an excellent diet if eaten raw, for those who digest slowly, and whose stomachs abound with acidities. It feems to be confiderably nutritious, and more fo, because it is not readily perspired; besides, it prevents the perspiration of other aliments. The shells are excellent absorbents, and are generally used to correct acidity in the primæ viæ. Be-fore they are taken into the stomach they should be calcined in the fun; or if burnt in the fire, they become a better kind of lime than the stone-lime for calculous complaints; and after being feveral times used for making the lime-water with, they may be used as absorbents. The hollow shells contain most of the fine white earth. The rough matter of the shell contains much fea-falt. See Neumann's Chem. Works. Lewis's Mat. Med.

OSTRITIUM, or OSTRUTIUM. MASTER-WORT. OSTRUTHIUM. See IMPERATORIA.

OSTRYA, or OSTRYS, called also tragus, carpenus, betulus. The HORN-BEAM. It is a tree which is found in woods and hedges. It is not noted for any medical See Raii Hift.

OSYRIS, called also cassia poetica, cassia Latinorum, cassia lignea Monspeliensium. Poets Rosemany. The whole fhrub is aftringent. It grows in the fouthern parts of Europe.

OSYRIS, Linaria, TOAD-FLAX, and Chenopodium,

SUMMER CYPRESS.

OTALGIA, from ws, an ear, and anyos, pain. A PAIN in the BAR. This diforder affects the concha, and the whole meatus auditorius. It is attended with inflammation, tumors, punction, erofion, tenfion, pulfation, and a fenfe of weight. Dr. Cullen places it as a variety

of phlogolis phlegmone.

Extraneous bodies falling into the meatus auditorius, or whatever excites pain in other parts, may cause it here. The quality of the wax may be faulty, and be a cause;

but the most frequent causes are heat and cold, fometimes an acrid ferum is fecreted in the glands of the ear.

When the wax or other humours are faline, they ex-cite a pricking pain; when the falts in thefe humours are corrosive, they excite a gnawing pain; when the wax ferments whilst it is yet in the glands, it causes a tensive pain; when the glands are very turgid, there is a sense of weight; and when there is a tumor, a pulfation is perceived, especially if it tends to suppurate.

If the pain is violent it feldom fails to bring on a fever, then called otites which is early attended with great restleffness, and a delirium, fainting, and often convulsions are the confequence; for the membrane that lines the ear is exquisitely sensible, and fully stored with nerves; besides membranes which adhere to bones have a more

than ordinary fenfibility.

In the beginning, whilft the pain is not very confiderable, a little warm olive-oil dropped into the ear will often relieve. If cold is the cause, keep the head warm. If there is inflammation and tumor, which will be known by the throbbing pain, a fuppuration may be encouraged by cataplasms applied warm on the outer ear; but if the state of suppuration is not manifestly near, endeavour by bleeding, purging, and discutients applied to the ear, to remove the inflammation and pain; if external heat was the cause, bleed, and give daily a moderate dose of Glauber's falt as a purge, until the pain abates, or until there is reason to suspect a suppuration; an opiate may be given at night when the pain is violent. When acrid defluxions are the cause, inject a warm insusion of poppy-heads in water. When fiving infects have crept into the ear, blow the fmoak of tobacco therein, and then pour in warm oil. If purulent matter discharges itself inject tepid water, mixed with a little foap, or honey of rofes. Besides the above mentioned, blifters behind the ears, bladders of warm water laid on the affected ear, and the pediluvium, are occasionally useful.

See James's Med. Dict. Lobb on painful Diftempers.

Brooke's, and the London Practice of Physic.

OTENCHYTES, from wros, the genitive of we, an or, and eygen, to pour in. A syringe for the EARS. gar, and xpaner, faffron. It is a platter, OTHONNA. A species of celandine; some say it is tion of which there is saffron and vinegar.

A name of the ofteocolla; also a species of cadmia, the juice of celandine. A name also of a species of the Africanus flos.
OTITIS. Inflammation in the internal ear.

OTOPLATOS. A ftinking discharge behind the cars.
OTOPUOSIS. A purulent discharge from the car.
OTORRHŒA. A discharge of blood, or of bloody

matter from the car.

OURLES, i. c. Mumps. See Cynanche Paro-

OVA ZEPHYRIA. Eggs which are not impregnated by the tread of the cock.

OVALE FORAMEN. See COR.

OVARIA. The OVARIES. They were formerly called the female teflicles; but fince anatomists have thought that they perceived clusters of eggs in them, they have named them ovaria. Dr. Hunter thinks they are properly testicles secreting semale seed, which is taken up and conveyed by the Fallopian tube to the uterrus. The ovaries are two finall bodies fituated behind each Fallopian tube; they are of a different fize and figure sometimes in the same body. At the age of puberty they are of a proper fize, and continue plump and full until the menses are about to depart. They receive veffels from the spermatics, which run on to the uterus, and anastomose with the hypogastrics. The nerves are from the intercostals, lumbal, and facral. Besides the liquor which resembles the white of egg, they contain two or three vafcular bodies called corpora lutea, and which by fome are called the eggs.

The ovaries are taked the eggs.

The ovaries are fubject to great diffention from water, which conflitutes what is called a dropfy therein, of which fee a fingular Cafe in Gooch's Obf. and Remarks.

OVATUS, or OVIFORMIS HUMOR. The aqueous

humour of the eye.

OVI ALBOR,

The WHITE of EGG. OVI CANDIDUM,

OVI CANDIDUM,

— ALBUS LIQUOR.

OVUM. An EGG. The shells of eggs are prepared by boiling them in water, to separate the membrane which lines their inner surface, and then powdering them by levigation. They bind the belly the least of all the testaceous absorbents. Eggs are nutritious, but if hard boiled are difficultly digested. They seem to be a less alcalescent food than almost any other animal substance, and during digestion to be less stimulants that stance, and during digestion to be less stimulant; but they should be eat as foon as possible after their being laid, as the nearer they approach to a putrescent state, the more offensive they become to the stomach; nor is it material from what birds they are acquired, as they are very nearly, if not altogether fimilar in their nature. The yolk is used as a medium for uniting balfams with water, but the white is preferable, as it is less difgustful to many ftomachs. Weak ftomachs digeft the white more eafily than the yolk. Betwixt the ferum of the blood and the white of egg there is great analogy. See Neumann's Chem. Works. Cullen's Mat. Med.

Ovum Philosophorum. A glass whose belly is of an oval figure, by which a liquor may be diffilled by

circulation.

SUBLIMATORIUM. See BOCIA.

OXALIS. See ACETOSELLA.

OXALME. A mixture of vinegar and falt. OXELÆUM. A mixture of vinegar and oil.

OXYAS, See FAGUS.
OXYACANTHA. The BARBERRY. Also a name of fome species of thorns. See BERBERIS. Mespilus apii folio, fpina alba.

OXYCEDRUS. A name for the cedrus folio cuproffi, which is also called cedrus Lycia. The BERRY-BEAR-

ING OF CYPRESS-LEAVED CEDAR.

OXYCOCCUS, called also vaccinia palustria, vitis Idea palufiris. MOOR of CRANE-BERRIES. This plant grows in marfly and putrid foils, and flowers in June. The fruit is cooling and aftringent. See Dale, and Raii Hift.

OXYCRATUM. OXYCRATE. It is vinegar mixed with fuch a portion of water as is required, and rendered

ftill milder by the addition of a little honey.

OXYCROCEUM EMPLASTRUM, from eggs, winegar, and xpexos, faffron. It is a platter, in the composiOXYDORCIA. See DACNERON.

OXYGALA. SOUR MILK.
OXYGARUM. A composition of garum and vinegar. OXYCLICI.

OXYCLICI. See Apomeli.
OXYGLICUM. Sharp-pointed bock, also the common sorrel. See Lapathum acutum.

OXYMEL, from stor, vinegar, and usu, honey. Honey and vinegar, boiled together so as to form a syrup, is called simple OXYMEL. See MEL. Oxymels of different denominations are made by macerating some medicinal ingredients in vinegar, and then boiling them up with honey. OXYMYRRHINE, or OXYMYRSINE. See Rus-

OXYPHLEGMASIA. An acute inflammation. OXYPHŒNICIA, or OXYPHOENICON. See TA-

MARINDUS.

OXYPHYLLON. According to Oribafius it is the enicus; but he feems to intend by it a different plant from that which we call by that name,

OXYPHONIA. The fame as paraphonia clangens: It is a howling kind of noife.

OXYREGMIA, from eges, acid, and eperge, to break wind. An ACID ERUCTATION.

OXYRRHODINON. A composition of vinegar and

oil of rofes. OXYS. WOOD-SORREL.

OXYSACCHARUM. A composition of vinegar and

fugar.
OXYSAL DIAPHORETICUM. It is a preparation of Angelus Sala. It is a fixt falt loaded with more acid than is necessary to faturate it. The falt of juniper is of

OXYSCHŒNOS. A name for the juncus acutus ca-

OXYTOCA, from oξυς, quick, and τωτω, to bring forth.
Medicines which promote delivery.
OXYTRIPHYLLUM. WOOD-SORREL. See Ace-

TOSELLA, also the PILE-TREFOIL.

OZ ÆNA, from ogn, a flench. A fetid ulcer in the nose is thus named. See Abscessus Narium.

P AE ID

## PÆD

OZÆ

In prescription it sometimes fignifies a pugil, and fometimes parts. PACAL. A tree in Peru, the ashes of which

are mixed with foap for the cure of leprous diforders; the mixture is used as an ointment. See Raii Hift.

PACHYS. THICK. The name of a diforder which is not only unknown to us, but which has never been deferibed by any physician fince Hippocrates. It is supposed that the Chidian physicians are the authors of the description; Hippocrates condemns them for multiply-ing the species of diseases without necessity; in this they make four species, and the symptoms are very incompatible too. The curious may see the description in James's Med. Dict. or in Le Clerc's Hist. Med. lib. iii. c. 11.

PACO-CAATINGA. A coniferous species of Brasilian canna. The stalk of this plant, if chewed, occasions a faiting a life the faller is swallowed when this stalk is

lian canna. The stalk of this plant, if chewed, occasions a spitting; if the saliva is swallowed when this stalk is it cures a gonorrhœa in a few days; it is also a fort of lithontriptic. Ray takes notice of three species.

See his Hift. Plant.

PACOEIRA. The musa or PLANTAIN-TREE. See

PACO-SEROCA. A species of Brasilian canna. See Raii Hift.

PACOURII. A very large tree in the island of Maragnan, belonging to Brasil. See Raii Hist.

PADRI. A filiquous tree in Malabar. The juice of the leaves is a cure for the mania; the juice of the bark, mixed with the fruit of the pera, restrains the menses. See Raii Hift.

PADUS, called also cerasus avium nigra, cerasus race-mosa. The WILD CLUSTER-CHERRY, the BIRD's CHERRY.

It grows on rocky mountainous places, and the fruit is used to hang about the necks of children, as a cure for the epilepsy. See Dale, and Raii Hist. Also a name for the LAURO CERASUS, which fee.

PÆDANCHONE, from wass, a child, and arrow, to firangulate. A species of quinfy common among children. PÆDARTHROCACE, from wass, a boy, approx, a joint, and wasses, an evil. The JOINT-EVIL; intimating that this diforder frequently appears about the joints of chil-dren, and oftener in them than in adults, because the bones of children are more foft and spongious, and so more eafily corroded by peccant humours, and diftended into tumors, fometimes of a very furprifing deformity. Severinus calls the spina ventosa by this name, as also doth Dr. Cullen; he also makes another distinction between the spina ventosa and the padarthrocaee, for the tumors of the sirft kind are frequently attended with pain, redness, and all the appearances of inflammation; but the padarthrocaee has little or no pain in the beginning, as is observed in ricketty children; but these names are used very promiseuously; by some it is used to express a fort of anasarca. See M. A. Severinus's Treatife De Recondita Absceffuum Natura.

## PAL

PÆDOPHLEBOTOMIA. The bleeding of chil-

PÆNOE. A large tree in Malabar. The root, bark, fruit, and all the parts yield a refin, which is burnt in-flead of incense in their facrifices. The kernels of the fruit, made into an emulsion with warm water, strengthen the ftomach, relieve from naufeas, allay pain in the belly, and cure the cholera. See Raii Hift.

PÆONIA. PIONY. From Paran, the phylician who with this plant cured Pluto when he was wounded by

Hercules; called also ephialtia, idaus daetylus. Boerhaave enumerates twelve species, of which the following

are fometimes, though very rarely used.

PRONIA MAS. MALE PRONY. The provide offi-

cinalis, Linn. FEMALE PRONY. The paonia

officinalis, Linn.

These plants are so common in gardens as to need no description. The male fort hath dark-green leaves, paledescription. The male fort hath dark-green leaves, palered fingle flowers, long thick roots, with red streaks in
the stalks and pedicles; the female hath longer, pale,
and narrower leaves, deep-red, double flowers, and irregular roots, composed of several tuberous pieces, hanging by rough filaments from one head. They are perennial, and flower in May. The male is preferred; but
so little is the difference, that the semale is most frequently used. The roots, flowers, and seeds, are anodyne, but their efficacy is very inconsiderable. The slowers impart their colour to water and to spirit. See
Lewis's Mat. Med. Lewis's Mat. Med.

PAGANICA. A ball used by the Latins to exercise with. It was so called because used only in villages.

PAGARUS. See CANCER MARINUS.
PAHAZAR. See BEZOAR.
PAHUATLANICA. See CHINA OCCIDENTALIS. PAIANELI, called also ceuracli. A tall pod-bearing tree in Malabar. There are two species, the different parts of which are used by the natives against feveral diforders. See Raii Hist.

PAIDATROPHIA. The atrophy in children.
PAIDION. So Hippocrates calls the child in the
womb when perfected there. See Cuema, Concep-

PAIDOPOIETIC. An epithet applicable to those who

have children, from ran, puer, and wonn, facio.
PAIN DE MADAGASCAR. See CASSADA.

PAIOMIRIOBA. A name for the fenna orientalis

PAI-PAROCA 'A bacciferous shrub in Malabar.
An apozem prepared of the leaves, fruit, and roots in water, is useful against the gout. See Raii Hist.
PALA. NUTMEG. See Nux Moschata. Also a tall pod-bearing tree in Malabar. The natives use it in various disorders. See Pail List.

various diforders. See Raii Hift.
PALÆTYRUS. OLD CHEESE.
PALATI OSSA. BONES of the PALATE. They

are two irregular fquare bones, fituated in the roof of the fingle and individual trunk. The species are numerous; mouth, which join each other backwards, and the maxillary bones forward; backward there is a lunated edge, creases the number by twenty more. Some of the whence the velum pendulum palati hangs. The ptery-goid process of this bone passes between the os maxillare superius, and the pterygoid process of the os sphenoides: it is of a triangular shape, broad at its basis, and small above. The nasal process is very thin, it rifes upwards, and covers a large part of the aperture of the maxillary finus. At the superior part of the nafal process, the or palati divides into two processes called the orbitar. The anterior is the larger, and its fore part is contiguous to the back part of the maxillary finus; its posterior furface is cellular, and is contiguous to the ethmoid cells. It is placed likewise on the opening of the sphenoidal finus, so as to leave a fmall hole above

PALATINÆ GLANDULÆ. They are conglomerated glands, fituated in the feptum and arch of the pa-

late, near the tonfils.

PALATINUS. It is a branch of the upper maxillary branch of the fifth pair of nerves; it runs before the pte-rygoid apophyses of the os sphenoides in the canal formed by the os maxillare and os palati, and through the foramen palatinum posterius, it spreads in the glandular coat of the palate, and parts adjacent.

PALATINUS DUCTUS See TUBA EUSTACHIANA. - PROCESSUS. See MAXILLARIA SUPERIORA

PALATO-PHARYNGÆUS. See Constrictor ISTHMI FAUCIUM, PERISTAPHILO PHARYNG ÆI, and

PALATO-SALPING/EUS. Also called musculus tuber name Valsalve. Innes describes it under the name of circumstexus palati. It arises broad and tendinous from the edge of all the lunated part of the os palati, several of its fibres being foread upon the membrane that covers the foramen narium; then growing into a fmall thin tendon, it is reflected about the hook-like process of the inner ala of the proceffus pterygoides; but foon turning into a narrow, thin, flefhy belly, it runs close along the infide of the muf-culus pterygoidæus internus, and is inferted carnous into all the fleihy membranous and cartilaginous part of the tuba Eustachiana. Valfalva discovered it, and first observed that its use is to dilate and keep this channel open.

PALATUM. The PALATE, fometimes called, cere bri basis. It is that arch of the mouth which is furrounded before by the teeth and gums, and extending
backward the whole breadth of the upper part of the
mouth, as far as the great opening of the pharynx. This
arch is partly hard and immoveable, and partly foft and
moveable. The folid part is formed by the two offa
maxillaria, and the two offa palati. The foft part lies
behind the other. The membrane that lines the palate is
full of forall glands. It fornetimes havens when a child full of small glands. It sometimes happens when a child is born with the hare-lip, the sleshy and the long parts of the palate are desective, from a sissue, or a division through into the nostrils; the uvula also is sometimes divided as into two. In this case, the child cannot fuck,

PALATUM MOLLE, called also feptum, and valvula palati. Behind the bony palate lies the foft palate, from the middle of which the uvula hangs down.

PALEA DE MECHA. See JUNCTUS ODORATUS. PALLIMPISSA, from παλιν, fignifying repetition, and αισσα, pitch. Diofeorides fays that dry pitch is thus named, because it is prepared of pitch twice boiled. See PIX NIGRA.

PALIURUS. CHRIST'S THORN, OF WILD-JUJUBE, also called, enoplia ramnus. It is a species of thorn met with in the fouthern part of Europe. The leaves and roots are moderately aftringent; but on account of the length of its spines, it is the best of all other bushes for making hedges.

PALLIUM PURPUREUM. A PURPLE CLOAK. So Bafii Valentine calls a certain powder, prepared of an amalgama of gold and mercury put into a retort, where the mercury being separated, what remains is calcined with fulphur, and turned a purple colour.

PALMA. The PALM of the HAND. Also

this may be added, that the palm-tree tiles up with one often as it is repeated. The decoction is thus prepared,

most noted are the

PALMA ADY. See ABANGA.

- AMERICANA AYRI.
- AMERICANA SPINOSA.
- BRASILIENSISSEXEA AIRI. THIOPICA.

- CHRISTI, also called ficus infernalis pentadattylon, and alkerva, by the Arabians. It produces an oil, called caftor oil See CATAPUTIA.

- CHRISTI MAS. Male fatyrion royal.

- Coccifer A, also called cocos, palma Indica coccigera angulosa, eoccus de Maldivia, ampana, eoccos coeccira Indica, coccys, suris palma Indica nucifera, palma nucifera arbor, nux Indica, inaja-guacuiba, tenga, polgaba.
The coco, or cocker-nut tree.

From this tree the Indians extract a liquot called furi,

and diffil the liquor called arrae from it; also a species of fugar called jagra. The milk in the shell of the nut is grateful and cooling. The exterior covering of the nuts are at first edible, and are gratefully acid, and gently reftringent. By boiling, an oil like that from almonds is obtained from the kernel of the nut.

- COCCIFERA FIGURA OVALL. The MALDI-VIA NUT. Palma Maldivica. See Coccus DE MAL DIVIA.

— DACTYLIFERA. See DACTYLUS PALMULA.
— HUMILIS. See MURA.

JAPONICA, also called fagou, palma Indica, arbor farinifera, zagu, todda panna, monta panna. The LIBBY-TREE, INDIAN BREAD, or SAGO-TREE. It is the cycas circinalis, or cycas Indica, frondibus pinnatis circinalibus, foliolis linearibus planis, Linn. The pith of these trees being well beat in a mortar with water, forms an emulsion, the facula of which when dried is sago.

The fruit of this tree is fomewhat aftringent, though

not fo when eaten with fugara

The fage is very nourithing, and is used by the Indians when rice is scarce; when boiled in water it is resolved when rice is icarce; when solved in water it is reloved into an infipid almost transparent jelly. It is readily foluble, and properly given in this country as an aliment to weakly persons. It is demuleent, and never ferments in the stomach, whence it is properly preferred by many to wheat-flour for the food of infants; its being easily discountry to wheat-flour for the food of infants; its being easily discountry to wheat-flour for the food of infants; its being easily discountry to wheat-flour for the food of infants; its being easily discountry to wheat-flour for the food of infants; its being easily discountry to wheat-flour for the food of infants; its being easily discountry to the food of infants; it is food for the food of infants. gested, and its demulcent quality, renders it useful for the diet of hectic patients.

- MAJOR. See DACTYLUS PALMULA.

&c. palma humilis Hifpanica fpinofa & non fpinofa, atti-tara, palmites, chamarhiphes. The DWARF PALM. Its

fruit is aftringent.

— Nobilis, also called regulis Jamaicensis & Barbadensis, palmiste, palmeto royal. The CABBAGE-TREE.

The cabbages of which are called chou de palmiste. It is a tall strait tree, between two hundred and sifty and three hundred feet high. On the top is a white tender, fa-voury, medullary fubilitance, which, if eaten raw, is to the tafte like a wallnut, but boiled and pickled with the white leaves which furround it, it is one of the greatest delicacies in the Leeward islands. This fruit is called the cabbage of the palm-tree. On the top of the trunk grows the involucrum of the flower and fruits called /patha, the fruits are round, and the fize of an egg. See Raii Hift.

In Jamaica the wild cabbage-tree bark (which is also called WORM-BARK of JAMAICA,) is much used for the de-ftruction of worms in human subjects. The following is the account which is given by Mr. Anderson, a medical practitioner there for some years. He mentions two sorts of this bark, the one much paler than the other. The paler fort he observes is more rugged in its operation, occafforing naufea, and great uneafiness in the belly. The darker coloured bark, he says, resembles much the cassia lignea in colour, though it is of a much coarfer texture. But this last is the kind commonly used in the West Indies: it may be used with safety in any case where an an-thelmintic is necessary. The hazardous symptoms a-feribed to it, have most probably followed either an over PALMA. The PALM-TREE. Boerhaave's characters dose or the use of the paler fort instead of the darker. of this tree are, that its fruit, under an edible pulp, hath an hard strong nucleus, like the stone of a plum. But to tea-spoonful of the decoction, and gradually increase it as

and keep it for use, in a bottle well corked. Of this decoction a table-spoonful is usually given the first morning for a dofe to a grown perfon; one and a half the fecond, continuing to increase it gradually to four or five table-fpoonfuls, and giving it for eight or nine mornings suc-eessively. After this, I commonly give a dose of jalap, with a few grains of calomel, which seldom fails to bring away the worms, fome dead fome alive. If at any time I have found the decoction produce more than one or two loose stools, I have added to each dose a few drops of tinet. 

palm and the pine tree.

—— SANCTA. See GUAIACUM.
PALMÆ OLEUM. It is the produce of the palma foliorum pediculis fpinofis fructu pruniformi luteo oleofo. Sloane, Jam.—Dr. Brown in his Nat. Hift. of Jamaica takes notice of the palma spinosa minor fructu pruniformi, &c. Slo. Cat. 178. called in Jamaica the MAKAW-TREE. He observes that the rind of the fruit is thick and yields a fattish fubstance, not unlike, or inferior to the real palm-oil. He also mentions the palma tota spinosa major, &c. Slo. Cat. 177. and H. ii. 119. called the great mackaw-tree, the fruit of which differs but little from that of the little mackaw-tree, the hufks of the fruit is also full of oil. He adds in his account of the great mackaw-tree, that the ne-groes fay it is the tree which yields the true PALM-OIL. In the Pharmacopæia of the Edinb. Coll. This species of tree is described as being the palma foliorum pediculis spinosis, fructu pruniformi luteo oleoso. Sloane's Jamaic. and Adanson Seneg. Mr. Curtis, in his Catalogue of Medicinal, &c. Plants in the London Botanical Garden, Medicinal, &c. Plants in the London Botanical Garden, calls the tree palma oleofa, Linn. The tree is tall and unbranched, with long reed-like leaves elegantly disposed on the top. Several species of it are met with in the warmer countries. The fruit is pressed, or first bruised, and then boiled in water; by either of these methods the oil is obtained, which is of the consistence of butter, and is eaten as such by the inhabitants in Guinea, and in the Cane Verd islands. It is of a strong, but not disparseable Cape Verd islands. It is of a strong, but not disagreeable smell, and hath but very little taste. The colour, whilst good, is of a deep yellow inclined to red, but by long keeping it becomes pale, and is then to be rejected. This oil is used when mixed with some warm penetrating ingredients, to rub on parts affected with old pains, and in fome nervous disorders.

PALMARIS BREVIS. 7 Joannes Baptista Cannanus - CUTANEUS. communicated this mufcle to Fallopius, and it was first published in Valverda, in his Anatomy written in Spanish. It rifes from the fascia of the annular ligament, it runs across the ball of the little finger, and is loft in the skin to pull it inwards.

Brown calls it care mufculofa quadrata.

Longus. This mufcle lies on the infide of the extenfor carpi radialis, and rifing tendinous from the inner condyle of the os humeri, it runs under the annular ligament, makes a radiated expansion on the palm, and is attached to the heads of the metacarpal bones, and the first joint of the fingers. It is also called ulnaris gracilis.

A name of feveral species of orchis. PALMATA. PALMEIRA BRAVA. Ray ranks it as a palm-tree.

PALMISTE. See PALMA NOBILIS.
PALMOS. A PALPITATION of the HEART, from wanne, to beat. See PALPITATIO.

PALMULA. A DATE. Also a name for the broad

and flat end of a rib.

PALPEBRÆ. The EYE-LIDS. They are connected to the circumference of the focket by the tunica conjunctiva, fee Adnata. They are composed of the common teguments, a cartilage called tarfus, and an external membrane. They have two angles or corners, one the fmall or external, the other the large or internal; these angles are called canthuses. The form of each eye-lid is that of a fegment of a circle, and in regard to the eye, is fuch, that when both eye-lids are shut, they make an uniform arch, adapted to the convexity of the eye, and in contact with it; but in regard to one another when thut, their

and administered: take of the bruifed bark, two ounces edges are so contrived, that they leave a fort of groove, and a half; of water, two quarts; let it be boiled over a gentle fire to a pint and a half. Strain off the decoction, outer angle, and wider toward the inner, and serves to conduct the tears as they come from the upper part of the eye to what are called the lachrymal points. The margin, or basis of each eye-lid, being a cartilage of a confiderable thickness, is divided into the outer and inner edges; it is the outer edge only of each lid that is fupposed to join when the enclids are shut, the inner edge being formed oblique or flanting, makes the groove, or channel, above mentioned, for the passage of the tears to the lachrymal points. This margin is the tears and that in the years are life in the beautiful. and that in the upper eye-lids is the broadest. The cutis is very thin on the eye-lids. The outer edge of each eye-lid is furnished with a row of hairs called cilia. On the internal edge of each fid in the tarfus, is a row of fmall holes, which are the excretory ducts of the ciliary glands. From the upper edge of the upper tarfus, and the inferior of the lower, is contained a membranous expansion to the neighbouring edges of the orbit: each of those membranes, together with its respective tarfus, has the form of the eye-lid to which it belongs, and is called ligamentum tarfi. The ligaments of the eye-lids are reckoned to be three; from the inner angle, to the nasal process of the os maxillare superius we see one, which is the tendon of the orbicularis; at the external angle we fee another ligament, more diffused on the boney brim, blended with the cellular membrane; a third goes all round, proceeding out of the brim of the orbit from the periodteum. The infide of the eye-lids are lined by the ADNATA, which fee. The muscles which subserve the motions of the eye-lids, are the orbicularis, and levator palpebræ superioris. The eye-lids, and their muscles are furnished with branches from the angular, temporal, and frontal arteries, and these communicate with those fent to the internal membrane of the eye-lide. The levator palpebra receives a branch from the internal maxillary artery. The veins correspond very nearly with the arteries, and carry their blood into external jugulars, by means of the veins in the temples and face. The nerves proceed from the ophthalmic branch of the fifth pair, from the fuperior maxillary branch of the fifth pair, and from the portio dura of the feventh pair; the levator palpebrae superioris receives a branch from the third pair. The eye-lids defend the eyes from the light during fleep; they preferve the eye from becoming dry by their frequent motion, which spreads the tears over the external surface of the globe. See Lachrymales Glandula, Lachry-malia Puncta.

PALPITATIO. So the Latins call the palpitation of the heart. The Greeks called it palmos, a vibration or trembling of the heart. Some confound the palpication cordis with the cardialgia and cardiaca paffio. Dr. Cul-len places this genus of difcase in the class neuroses, and order spasmi. The only one species he calls palpitatio

cardiaca.

There is a morbid painful palpitation of the heart, which is chronical. There is a kind of this diforder which happens to persons otherwise healthy, and is occasioned by strong passions, surprize, strong exercise, &c. Actuarius fays there are two forts, one from plentitude or heat in the blood, and that this is the most frequent; the other is from vapours. In the first he fays, there is an unequal pulfe; in the latter, the pulfe is unaffected.

Those are the most subject to this disorder who are of a firm habit, of a fanguine, melancholy temperament, of delicate minds, and subject to frights; also the young, who abound in blood and juices, and those whose eva-cuations of blood, whether natural or artificial, are neg-

lected or fuppreffed.

A palpitation of the heart may arife, either from a quick influx of the nervous fluid into the external furface of the heart about its basis, or from a defect thereof into fome of the nerves in this vifcus. The formal caufe is alwa's fo violent a contraction and convulsion of the heart, that it is moved out of its natural flate: but the material or proximate cause is a certain stagnation of the blood, especially in the right ventricle of the heart, and a too great congestion of it to the same part; on account of which there happens, an impetuous influx of the nervous kind into the cardiac nerves and fibres of the heart, and a preternatural contraction of them. The mediate cause

are polypous concretions, which are always fibrous and membranous, generated principally in the ventricles and auricles of the heart, then reaching into the veins, and thence frequently forced into the arteries; some fault in the fluids; a delect in the usual evacuations of blood; tight flays are not an unfrequent cause of this disorder in young women; costiveness; a difficult passage of the blood through the abdominal viscera; a subtle acrid matter in the blood; as when the itch, &c. is repelled; a defect of blood; great diffurbance in the mind; intense thought produces it in many hypocondriac patients, and particular odours have the same effect in hysteric women; flatulent aliment; Hippocrates afferts, that all palpitations of the heart are accompanied with flatulencies, strictures of the belly, thighs, and legs; too tight cloaths; hectic heats; ancurifms, &c.

During this diforder it often happens, that the arteries are every where affected with a violent pullation, especially those above the clavicles; the disease frequently intermits especially during the body's being at rest; but after the occurence of any of the causes it returns, the pulsations are fo great that fometimes its motions may be perceived on the outfide of the cloaths; it is fometimes more violent, and femetimes lefs fo; fometimes continues a longer, and at others a lefs time; fometimes it attacks during fleep, and awakes fuddenly; fometimes it only happens in the day, and is worst after eating; sometimes anxiety, or uneafiness in the pracordia, precedes; in the paroxysm of palpitation, the breathing is difficult; though the pulse is intermitting, it does not correspond with the motion of the heart, but is languid and diminished; in a violent paroxysm, a great uneasiness is perceived in the re-gion of the precordia, and a considerable languor of the body, with a tremor of the joints, remain after the palpitation is over. When polypous concretions in the heart are the cause, the following signs usually attend: the palpitation is immediately increased after violent exercise, going up flairs, or the lightest commotions of the blood; great anxiety about the precordia, with a weak, unequal, and fometimes intermitting pulle; the patient breathes with fo much difficulty that fometimes there is danger of fuffocation; fainting frequently comes on, and fometimes is fatal; the pulse is fometimes strong, at others more feeble. When the polypus continues fixed, no palpitation happens; but when it is removed, it fluctuates in the ventricles of the heart, and partially or fully ftopping the paffages of the blood through fome or other of the velicis, a palpitation, or speedy death is the confequence.

When a redundance of blood causes a palpitation, the signs are, the countenance is florid, the vessels turgid with blood, and the pulse is large : in a fit of very strong palpitation, the diffance between the pulfations is greater, and the longer the intervals, the more violent they are.

A palpitation of the heart should be diffinguished from that which is perceived in women, about the last months of pregnancy, in the epigaftric region, and which is only a pullation of the coeline arteries, in confequence of too much blood being hurried through them.

One remarkable fymptom attending a violent palpitation of the heart, is a pain which is acute and pungent, and feated immediately above the right orifice of the stomach. The third pair of cervical nerves pals out between the third and fourth vertebræ, foon communicates with the fecond, and fending down a large branch, which being joined by another from the fourth, forms the phrenic nerve that runs along the pericardium to be loft in the diaphragm; in this course the right phrenic is obliged to make a small turn round that part of the pericardium which covers the apex of the heart; hence it is, that fuch as have strong palpitations have this kind of pain.

A palpitation of the heart, when it frequently re-turns, continues long, or is violent, is always to be feared, as it often ends in a fatal fwooning, or a fuffocation. An unequal pulse, or difficulty of breathing at-tending, are dangerous circumstances. When the dif-order is idiopathic, there is very little dependence on any means made use of for relief; but when it is fymptomatic, its cure is effected by the removal of the original diforder. When it proceeds from terror, and returns often, it produces polypufes, which again may MINOR.

are either in the heart, about it, or in parts remote from prove a cause of the worst kind. Palpitations attend it. Among the first, the most frequent and considerable various diseases, and increase the number of disagreeable

prognostics.

The indications of cure are, to allay the preternatural commotions of the nervous parts and fibres of the heart and vessels; to hinder the stagnation of the blood about the heart and lungs, by deriving its afflux to parts elfe-where, and rendering the circulation more free. And, thirdly, out of the paroxyfm, to remove the causes which excite the diforder.

To prevent the returns of the diforder, avoid every known occasional cause, and carefully adhere to regularity respecting the non-naturals. If there are any symptoms of a polypus all violent motions are to be avoided, lest the polypus should be loofened. All tight ligatures should be made easy, and the cloaths should be equally so; the patient should never continue long in the cold; and when the sit approaches, a clyster should be instantly administered, and the extremities rubbed; as to the patients of the mind, endeavour to keep them free from every degree of excels.

During the paroxylm, enquire for the cause. Bleeding is the principal remedy, except the cause be weak nerves, or lax habit, in which last case give the bark, with neryous and ferrugineous medicines. If the cause be in an ebullition, or ferment in the fluids, nitre, antimonium tartarifatum as a perspirative. Hossmann's mineral anodyne liquor, &c. in a glafs of water. If flatulence produces the fit, or when the patient is coffive, ikin dry, the feet cold, befides the above medicines, give oily and carminative clyffers, tub the feet with warm cloths, and then put them into warm water. If hemorrhages have preceded, to the above add analeptics and cordials; the effence of amber is particularly proper; bladders of warm water may be applied to the ftomach. If an afthma attends, blifter, and give the volatile tincture of valerian at proper intervals. If gouty spasms are the cause, bleed, blifter intervals. blifter, give volatiles, and put the feet into warm water.

Out of the fit, the whole intention of cure confits in

removing, or at least diminishing the cause; thus, if there is a plethora, reduce it by proper evacuations; if a deficiency of good blood, endeavour to improve and increase it; if the palpitation is symptomatic, remove the original disorder; if a bilious acrimony gives rife to it, lemon juice, or other agreeable vegetable acids, will be proper; if the pulse begins to be affected, bleed; opiates are often very useful; pedilaves should not be used until the feet begin to grow warm by rubbing them, nor until the fit is going off.

PANCRATIUM. A name for the feilla vulgaris radice rubra. It was also the name of an exercise which was used by the ancients, and confifted of a mixture of

wreftling and boxing.

PANCREAS, from was, all, and xpess, fiesh; called also callicreas; pancrene. The sweet-Bread. See Thy-MUS. It is fituated transversely under the stomach, in the duplicature of the posterior portion of the mesocolon, and reaches from the duodenum to the spleen. Its shape resembles a dog's-tongue. It hath two edges, one anterior, the other posterior; and two sides, one superior, and the other inferior. Its head lies in the first curvature of the duodenum, thence it runs acrofs the fpine to the fpleen behind and below the ftomach. There is a natural cavity into the epipleon, between the lower fide of the ftomach, and the upper fide of the mefocolon. It is here that the arteries, veins, and nerves enter, and the cyftic and hepatic ducts come out to form the ductus communis cholidochus, which goes into the duodenum near the pancreatic duct. The veffels of the puncreas come from those of the spleen, which run along it. That head next the duodenum hath vessels from the mesenterica and gaftrica dextra. The fubstance of this viscus is that of a conglomerate gland; in the whole length of it is a duct called ductus Wirtfungii, from its discoverer, but generally it is spoken of by the name of ductus pancreaticus: its beginning is towards the spleen, as it goes on it receives branches, grows larger, and proceeds into the duodenum, in the same canal as the biliary duct; the panereatic duct is very thin, and without valves; it does not always go out jointly with the biliary duct, but it is feldom that we meet with it otherwise. Malpighi makes the panereas a cluster of vesiculæ; Ruysch brings it out to be vascular, as injections prove it to be. The nerves come from the plexus hepaticus, plexus splenicus, plexus mesentericus, &c. The pamereatic juice resembles the saliva, but is less viscid, and contains a larger proportion of the falts of the blood; it is probably a menitruum for the folution of our aliment, but that it acts as a ferment, as some have afferted, is doubtful. All the pancreation juice is fent into the duodenum, and is fecreted most when the stomach is fullest. This viscus is subject, like the fpleen, to inflammation, called PANCREATICA; and

must in the same manner be treated.

PANCREAS MINUS. Where the great extremity of the pancreas is connected to the duodenum, it sends out an clongation, with a diffinct duct in it, which opens

into the duodenum.

PANCREATICE ARTERIÆ. The splenic artery runs from the cocliac artery, under the stomach and pan-creas, to the spleen; it adheres to the lower posterior part of the pancreas, to which it gives several branches called panereatien arteria.

PANCREATICE VENE. They are feveral branches from the fplenica, which run to the pancreas along its lower fide. There are other fmall pancreatic veins which do not arise from the splenica

PANCREATIS ABSCESSUS. ABSCESS of the PANCREAS. See Abscessus.
PANCRENE. See PANCREA

See PANCREAS.

PANDALITIUM. See PARONYCHIA.

PANDEMIUS. EPIDEMICAL.

PANDICULATIO, PANDICULATION, of STRETCHcompany the cold fit of an intermitting fever.

PANEM-PALKA. A spurious species of nutmeg-tree. PANICULA. A PANICLE. A stalk diffused into feveral pedicles, fuftaining the flowers or fruits. Of this kind are the oat, millet, &c. Panicula is also a diminutive of panus, a species of tubercle. It is a name for a fort of crude bile.

PANICULA MINOR, called also elymos.

PANICUM, linagraftis; elymageoftis. A plant fo called from its panicle. Common panic. The fpike confifts of innumerable thick feeds disposed in leffer fpikes, so as to appear like a cluster. It is cultivated in Germany. The seeds have been used as food, but are not regarded in medicine. There are several species. See Raii Hist.

PANIS. BREAD. From war, all in all; also called artos; cerealia; farinacea panis. Good bread should be composed of flour well kneaded with the lightest water, feafoned with a little falt, fermented with the finest yeast, and fufficiently baked. Unfermented bread is viscid and glutinous; fermentation destroys this viscidity, and renders it more easily digestible, but at the same time in-clines the substances fermented to acidity, whence unfermented bread only can be proper where acidity abounds in the ftomach. That bread which is the lightest, and most easily dissolved in water, is the most wholesome, di-gested with the greatest facility, and soonest converted to laudable nutrition: the additions of lime, chalk, and alum, oppose dissolution. The best bread for general use is made with good wheat, all ground down together. For bran, confifting chiefly of the hufks of the grain, is supposed to have a laxative and detergent quality. Bread made with the whole of the grain, viz. the bran and flour, was called by the ancients, autopyros.

PANIS FURFURACEUS. - IMPURUS

ATER.

PAPAGA & PAPAGALLI. Names for the feeds of baftard-faffron. They are also called from the magpies PAPAS. POTATOES. See BATTATAS.

PAPAVER, from pappa, that is PAP; because for-merly nurses mixed this plant with the children's pap-

meat, as a remedy against the pains of the colic.

PAPAVER ALBUM, called also papaver hortense semine albo, ches boul; WHITE GARDEN POPPY, papaver somiferum album, or papaver calycibus, capsulisque glabris foliis amplexi caulabus incisis, Linn. This species is called white, because its flower-feeds are white.

As this species affects the largest quantity of a Committee of the largest quantity of a Committee of the largest quantity.

As this fpecies affords the largest quantity of active powers, it is always cultivated when the intention is for medicinal uses above. A decoction of the heads in water strongly pressed out, depurated by settling, then clarified with the white of an egg, and inspissated, yields an extract amounting to 1-5th or 1-6th the weight of the heads. This extract is faid not to produce a naufea or giddinefs, which generally follows the use of foreign ING. It is that reftlefs firetching and uneafinefs that ac- opium. Its dose is about double that of the opium from

sbroad; it checks a diarrhea as well as any other opium, but does not fo powerfully check expectoration. The feeds without a portion of farinaceous, contain a great is used as a cooling external medicine. quantity of oily matter, which is produced copioully by expression. It has the same properties of other expressed cils, and has been employed both in diet, and medicine. In the former also the seeds have in considerable quantity, nor have they discovered the least of a narcotic quality, but have been fimilar to the tribe of the nuces oleofie.

A fyrup is made from the white poppy heads. The-mifon first takes notice of it; he made it with the juice and decoction of these heads, and used honey for giving it the fyrup-confiftence. The London College directs

the following :

Syrupus e Meconio five Diacodion, now called Syrupus Pa-paveris Albi. Syrup of WHITE POPPY.

Take of the heads of dried white poppies, without their feeds, three pounds and a half; of water, eight gallons. Slice and bruife the heads, and boil them in the water, to three gallons; in a water-bath faturated with fea-falt; reduce by boiling to about four pints, and ftrain whilft hot, first through a fieve, and then through a thin flan-nel: set it by for a night, that the fæces may subside; boil the liquor poured from the fæces to three pints, and diffolve fix pounds of double refined fugar in it, that it may make a fyrup. Pharm. Lond. 1788.

This fyrup is given to children in doses of two drams, to adults an ounce and a half. In general an ounce of this fyrup is equal to one grain of opium; but it is fubject to great variation in point of strength from the different degrees of maturity, and the foil and feafons in which the poppy heads are produced, varying according to these in the quantity they coutain of the narcotic pro-

perty. See OPIUM. See CHELIDONIUM MA JOR, SEA-POPPY, or YELLOW HORNED POPPY. It is a name for feveral species of glaucium.

— HERACLEUM. See CYANUS MINOR.

— NIGRUM, called also papaver hortensis nigro see

BLACK GARDEN-POPPY.

This species is thus named because its feeds are black. This species is thus named becaute its feeds are black.

These plants are found wild in some parts of Europe, and several varieties, as to their slowers, are produced by culture in our gardens. The head, stalks, and leaves have an unpleasant smell, and a bitterish biting taste, of the same kind with those of opium. This smell and taste are lodged in a milky juice, which abounds chiefly in the cortical part of the heads, which may be collected in confiderable quantities by slightly wounding them when almost rine, and when the juice is run out, pressing out most ripe, and when the juice is run out, pressing out what did not run, and which, on being exposed for a little time to a warm air, thickens into a tenacious darkcoloured mass, similar to the opium brought from Turkey, &c. it is weaker as a medicine, one grain of foreign opium is often equal to two of ours, yet is stronger in smell and taste. The juices obtained from the white or the black poppy differ no other than in quantity afforded by each; the white affording the largest quantity. The seeds contain an inspid oil, used for the same purposes as the olive oil; it is obtained by expression, and is void of the

narcotic quality of the poppy head.

— RUBRUM, called also papaver rhoras, papaver erraticum. Corn-rose, wild poppy. It is the pafour rhaas, Linn. This plant hath deep red flowers, dark-coloured feeds, hairy leaves and stalks. It is common in corn-fields, and is fometimes, like the others, made to vary its flowers by culture. The heads contain the same kind of narcotic juice with those of the preceding, but in fo fmall a quantity that they are wholly neg-lected. The leaves of the flowers, on expression, yield a deep red juice, and impart the fame to watery liquors, and a bright though pale red to rectified spirit. The London College of Physicians order a syrup to be made

in the following manner.

Take of the fresh flowers of the wild or red po four pounds; boiling diffilled water, four pints and an half: put the flowers by degrees into the boiling water, in a water-bath, conftantly flirring them. Afterward, the veffel being taken out of the bath, macerate them for twelve hours; then press out the liquor, and set it aside that the seces may subside. Lastly, make it into a syrup with double refined sugar. Pharm. Lond. 1788.

- SPUMEUM. See LYCHNIS SYLVESTRIS, BEL

HEN ALBUM.

Boerhaave enumerates thirty-four species: See Lewis's Mat. Med. Neumann's Chem. Works:

PAPAYA. A kind of tree, two species of which are described by Ray.

PAPAYA MAS, called also mammera mas. The MALE PAPA-TREE.

- FOEMINA, called also papaya Peruvianis, papayamarum, platanus, mamara famina. FEMALE PA-PA-TREE.

The fruit refembles a melon; it is eaten raw or prepared with fugar, and is faid to ftrengthen the ftomach.
PAPILIONACEA. PAPILIONACEOUS. Flowers are

thus called from their refemblance to the wings of a but-terfly when expanded; they always confift of these four parts, viz. the vexillum or standard, the alse or two wings, and the carina or keel. The keel is fometimes entire, and fometimes it confifts of two petals or fegments adhering together. Of this tribe are peas, beans, kidney-beans, vetches, and other leguminous plants. See Mil-ler's Dict.

PAPILLA. The NIPPLE, also called mamma and ma-milla. Thus the little eminences on the breast, are called. In children of both fexes, and in males of all ages, they are commonly no more than cutaneous tubercles. males arrived at the age of puperty, the nipple begins to increase, in pregnant women and those who give suck it is large, in old age it decreases and becomes slabby. The body of the nipple contains the terminations of the tubuli lactiferi, where they are tortuous, and act as valves; but as they are diffentible, as the nipple is handled they become straight, and thus the milk hath a free passage.—
By this term Peyer calls the intestinal glands.

PAPILLÆ MEDULLARES. Small eminences on

the medulla oblongata, called by Winflow tubercula ma-

millaria.

PAPILLÆ PYRAMIDALES. On the furface of the fkin these are observed. They are longer in some parts, as in the fingers, where they are called villi, and appear in rows, each having two ranks contiguous. They are the organs of touch, being the terminations of the cutaneous nerves, each of which are inclosed in two or three co-See CUTIS.

PAPILLARE OS. See SPHENOIDES OS.

PAPILLARES CARUNCULÆ. See CARUNCULA. PAPILLARES PROCESSUS. The extremities of olfactory nerves inferted into the mucous membrane of the nose are thus named.

PAPILLARIS HERBA. NIPPLE-WORT. See LAM-

PAPPOS. The downy hairs upon the chin.
PAPPUS. POTATOES, also the down of the seeds
of plants: hence plants, whose feeds, when ripe, are furnished with down, are called pappose or pappescent. See BATTATAS.

PAPULA. A PIMPLE OF ULCEROUS TUBERCLE. Dr. Cullen places it as a variety of phlogofis phlegmone.

PAPYRUS. The PAPER-TREE; called also papyrus Nilotica Alpina, Egyptiaca, Cyperus Niloticus vel Syriacus. This tree afforded to the Egyptians food, furniture for beds, and other utenfils in houtes, fails for fhips, thoes

for priefts, and paper.

PAR. When applied to days it fignifies even, when PAR. When applied to days it fignifies even, when used in prescriptions it signifies a pair, or two. Some medicines and vessels are called sine pari, without an

equal.

PAR CUCULLARE. So Cafferius calls the musculus erico-arytamoides.

- LINGUALE. The ninth pair of nerves from the head.

- MENTALE. See LEVATORES LABII INFE-

- VACUM The eighth pair of nerves from the head, which are also called nervi vagi, nervi sympathetici medii. This pair is made up of icveral small chords which come from almost the whole length of the medulla oblongata, and being joined with the accefforius Willifii, which is a small rope running up laterally from the medulla fpinalis, paffes through the foramen to join this eighth pair, which goes out by that common hole between the temporal and occipital bones, where likewife the internal jugular vein goes out of the cranium. The par vagum goes down the neck, by the fide of the carotid arteries, and behind the internal jugular, and is accompanied by the intercoftal nerve to the last cervical vertebræ, thence paffes down into the thorax, gives branches to the pharynx, larynx, &c. and join many nerves. As they enter the thorax they go across the subclavian arte-ries, and as the right trunk passes before the subclavian, it fends off a twig, which bends backwards under the ar-tery, and runs up the fide of the aspera arteria; this is called the recurrent nerve. Afterwards the par vagum runs down behind the lungs, to which they give a plexus, and then form two ropes, one anterior the other posterior, which are called nervi flomachici, which pass along with the cesophagus through the aperture in the dia-phragm, and are dispersed on the stomach, &c.

PARA. A Greek preposition which, when prefixed to the name of a disorder denotes its slightness, as para-

plexia, a flight apoplexy, &c.

PARACENTESIS, from #apanifica, to make a perforation, called also compandio. This operation is commonly called TAPPING, and is used for discharging water through the integuments of the belly from the cavity thereof. The place appointed for the perforation is a-bout four fingers breadth from the navel, or rather in the middle betwixt the navel and the upper part of the os ilium. The left fide is usually preferred, on account of not running any risque of injuring the liver. Mr. Sharp observes that, if the navel protuberates, independent of the intestines or omentum, but from water only lodged there, a fmall puncture made in that with a lancet will discharge the water, without endangering a rupture of the part.

In the young and robust, or if the constitution is not too much enfecbled, this operation may be performed; but when there is a fever, a feirrhus in any of the vifcera, an internal abfcefs, a confumption, &c. this operation,

should be omitted.

If the extravalated fluid remains in the fame proportion for feveral years, particularly if the health in other respects is good, the evacuation is a radical cure, provided that the health is otherwise unaffected; but whilft the bulk of the water increases, there is not that confidence of a radical cure.

Upon a fudden evacuation of the waters in a hydrops pectoris, or in an afcites, a violent deliquium may, and often does enfue, because the pressure of the water is taken off from the arteries, whence they dilate, and the blood ruftes into them from the upper parts of the body too fuddenly, and leaves the brain not fufficiently fup-plied, with that fluid.

In order, therefore, to the easy and fase performance of this operation, it is proper to have in readines, 1. A roller of flannel, or a flannel laced about the belly, after the evacuation of the water; whether a roller or the laced flannel are used, begin with fastening them tight about the lower part of the belly, and continuing the fame upwards, that the bowels may be duly preffed against the diaphragm. 2. A piece of sannel, which, when doubled four-fold, will be about a foot fquare. 3. A quart or thereabouts of proof spirit, to dip the roller and flannel cloth in before applying them to the belly. 4. A piece of flicking-platter about two inches square, in the middle of which should be laid three pledgets of lint, one larger than the other, the least being about the fize of a fix-pence. 5. The trochar with its canula, the point dipped in oil; and a probe to thrust back the intestines if they obstruct the mouth of the canula when the water is nearly evacuated. 6. Two or three large basons, to receive the water, and a pail to empty them into. 7. Four perfons besides the operator, one of whom should stand on each fide, to keep a proper preffure on the patient's fides, obferving to prefs from behind rather forward, and continuing this preffure during the time that the water is paffing off, and also until the roller or the laced flannel are fecurely applied. One affiftant will be employed in tak-ing the basons away when full, and providing the operator with empty ones; and the fourth affiftant will be ready to supply the patient with a little wine or other cordial if he faints.

When the water is drawn off, lay the pledgets upon the wound, and fecure them with the plafter; over them lay the flannel cloth, and then begin with the bandage or laced flanel, as already mentioned. See Heister's Surgery. Le Dran's Operations. Sharp's Operations. Bell's Surgery, vol. ii. p. 337, 354. White's Surgery, p. 298, 306.
PARACMASTICI. See ACMASTICOS.

PARACOE, from mapanova, difficult bearing. DULL-

PARACOPE. In Hippocrates it is a flight delirium.
PARACYNANCHE, from παρα, de, and κοων, a dog,
PARAKYNANCHE, and αγχω, to flrangle. A species of quinfy; it being a diftemper to which dogs are

PARACUSIS. DEPRAVED OF FAULTY HEARING. Dr. Cullen places this genus of difease in the class locales, and order dyfæfthefiæ. He diftinguishes two species. I. Paracufis imperfecta; in which founds are difficultly diftinguished. See SUNDITAS. 2. Paracufis imaginaria; as when the found perceived is not from without, but is excited within the ear; called also fusar-

PARADISAICA ARBOR, i. e. ARBOR VITZ. See

THUYA.

PARADISI GRANA. GRAINS of PARADISE. The have erroncoully been supposed to be the feeds of the larger cardamoms, whence they are called by some cardamum maximum; by others, inalagueta, malaguetta, melegeta, melleguetta, maniguetta, and cardamum pipera-tum. They are brought from Guinea and the East In-dies. They are angular, of a reddish brown colour without, and white within; fmaller than pepper; in appearance fomewhat refembling cardamom feeds. They grow in pods, shaped like unripe figs, and about the fize of one. This pod is divided internally into three cells, in each of which is contained two rows of feeds. They have the flavour of cardamoms, and the pungency of pepper: their pungency does not refide like that of car-damoms in their effential oil, but in their refin. The diffilled oil poffeffes their fmell, but is mild; the remaining decoction inspirated to an extract retains all the pungency. In some parts, these grains are used instead of pepper. Dr. Trew thinks, that the ol. cajeput. is extracted from them. As to their medicinal virtue, they are precifely of the fame nature with the femina carda momi, though rather more pungent. See Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

PARAGLOSSA. A PROLAPSUS of the TONGUE.

A SWELLED TONGUE.

PARAGUA. See CASSINE.

PARALAMPSIS. See ALBUGO OCULORUM.

PARALLELA. A fort of feurf or leprofy, affecting only the palms of the hands; it happens fometimes in

PARALOPHIA, from waga, near, and nopia, the emi-nence of the back. Keil fays it is the lower and lateral

PARALYSIS, from magazou, to diffolve or weakers. A PALSY; often it fignifies a pally of a particular part. Celfus and Ceelius Aurelianus fay that the most ancient writers give the name of attenitus merbus to that species which follows an apoplexy. Dr. Cullen places this genus of difease in the class neuroses, and order comata. He distinguishes four species. 1. Paralysis partialis; when some particular muscles are affected. 2. Paralysis hemiplegica; when one side of the body is affected longitudinally. 3. Paralysis paraplegica; when one half of the body is affected, transversely, as both legs and thighs. 4. Paralysis venenata; when too powerful sedatives are

The apoplexy, hemiplegy, and palfy, are fo nearly connected, that they may be confidered in one view. In the beginning, the palfy, which is caused by an excels of good blood, is acute; but it foon becomes chronical; the other palfies are all, and at all times, chronical.

A palfy is when there is an abolition of voluntary motion, or of feeling, or both. Befides the particular species mentioned above, when both fides are feized, and reason

is loft, it is then an apoplexy.

When the muscles of the face are paralytic, the fource of the diforder is in the brain; but if these be free, the nerves only of the spine, or medula oblongatata are affected. ed. Dr. Cullen defines the polly to be a loss or diminuparts of the body only; and it is often accompanied with tion of the power of voluntary motion, but affecting certain | may lacerate the parts of the brain, in which those nerves

Dr. Shebbeare confiders this diforder as the effect either of too much vital heat or too little, and that as the fame effect follows from opposite causes, so the same diforder will require different remedies, according to the entoreer will require different remedies, according to the varieties of its origin. Occasionally the pally may proceed from an apoplexy, an epilepsy, violent pains, suppression of usual evacuations, a translation of the morbific matter of acute diseases, whatever distends, disturbs, compresses, or contracts the nerves, strong ligatures, luxations, fractures, wounds, gangrenes, inflammatory or other tumors in the coats of the nerves, extreme heat, violent gold, mineral effluxing a too frequent use of hot violent cold, mineral effluvia, a too frequent use of hot Dr. Cullen observes, that the power of voluntary motion may be owing either to a morbid affection of the muscles, or organs of motion, by which they are rendered unfit for motion, or to an interruption of the influx of the nervous power into them, which is always necessary to the motion of those that are under the power of the will. The disease, from the first of these causes, as consisting in an organic and local affection, is to be referred entirely to the class of local diseases. As the pally, that disease only, is to be considered, which depends upon the interrupted influx of the nervous power;

and to this alone the appellation of pally should be given.

From anatomy we see that the nerves destined for the vital functions arise from the cerebellum, those subservient to the fenfes from the base of the brain, and those fubfervient to the voluntary motions and the touch, principally from the spinal marrow; we may then readily infer, that in all apoplexies the cause compressing the nerves is within the brain; in a palfy, within the spinal marrow. The palfy, or loss of motion thus named, Dr. Cullen obferves, may be diftinguished into two kinds; one, depending upon an affection of the origin of the nerves in the brain, and the other depending upon an affection of the nerves in fome part of their course between the brain and the organ of motion. He further adds, that whatever is necessary to be observed of the first, will readily apply

to the latter, both in pathology and practice.

A palfy fometimes attacks suddenly without any previous fymptoms by which it might be expected; but fometimes an hemiplexy fucceeds an apoplectic fit, and begins with a refrigeration of the fide to be affected, and a preceding vertigo, and gradually terminates in an abo-lition of fensation and motion; the found fide is often racked with spasmodic and convulsive motions; the mouth is frequently distorted like that of a dog, and, as the disorder proceeds, the functions of the mind, and especially the memory, begin to be weakened. A particular pally is formetimes preceded by a fenfation of weight in the part about to fuffer, a flow motion, accompanied with flupor, paleness, and torpor; the part affected is lax, flaccid, foft to the touch, and cold, like as it is affected in an atrophy or an ordematous tumor. When the pharynx is affected with a paify, the patient cannot fwallow. A paify in the eye-lids is attended with a discharge of tears. A paify of the spincter and is discovered by the descent of the rectum, and the involuntary discharge of the faces. A pally in the bladder is known by the involuntary emission of urine. In most other cases the eye discovers the nature of the disorder; or, when it consists of a loss of sense, the patient's complaint determines it. The parts affected some times appear puffy, at others they are shrunk and shrivelled; in these respects, as well as in those of sense being lost in some instances, and motion in others, Dr. Shebbeare ingeniously accounts for them as follows. He supposes these disorders to have an excess of vital heat for their cause; in this case, as the body receives its heat from the earth in greater or less abundance, accord-ing to the quantity of red globules in the blood; and as this heat is conveyed by means of the nerves, as required for the respective motions, whether voluntary or involuntary; various circumítances may occasion a too fudden and abundant heat to be conveyed to any part, or through the whole frame, in any instant of time; whence, by the return of the same from the brain, to and through the respective parts, the cellular membrane is so dilated as that many cells are ruptured into one, and in proportion as this accident is extensive, so will be the defect of motion; or the excellive motion, as well as quantity of fire,

take their rife, and then passing down by those nerves that are destined to motion, the action of the part or parts are at an end; or passing by those destined for fensation, senfibility is leffened or deftroyed; and in this latter cafe, by the laceration of the cellular membrane, the nerves are separated from contact with the skin, so that it is not as usual confined, but rifes so far as to produce the appearance of unusual fullness. Dr. Cullen observes, that in the pally the loss of motion is often accompanied with a loss of sense; but as this is not constantly the case, and as, therefore, the loss of sense is not an effential symptom of palfy, he does not take it into his definition. He fur-ther observes that, fo far as it is in any case a part of the paralytic affection, it must depend upon the same causes, and will be cured by the fame remedies.

The prognoftics are generally to be cautiously pronounced, at least when delivered with respect to a recovery. A spasmodic apoplexy and sanguineous hemiplegy, are often removed, but they are apt to return and end in a satal hamorrhage in the brain: the other species of palfies, and a ferous hemiplegy do not fuddenly prove mor-tal; but the cure is more difficult and intricate, the more the fenses are injured, and these disorders frequently continue during life. When infants become paralytic, they are fometimes relieved at or about the years of puberty, but fuch favourable changes rarely are observed in adults. A pally in the belly and lower limbs is generally mortal, and often accompanied with a gangrene of the affected parts. If convulsions and great heat are per-ceived in the parts opposite to those that are paralytic, the danger is great. When a palfy follows an apoplexy, or comes on in old age, it is rarely cured. If the seat is in the membranes of the medulla spinalis, the theca vertebrarum, &c. the cafe is out of the reach of art, death is unavoidable, but will only gradually approach. If the part affected is yet painful, capable of fenfation, not too cold, nor extenuated, there are fome hopes of a recovery, which is still more to be expected, if there is a fenfation of formication and puncture in it.

The indications are the fame as in the apoplexy, and are 1. To remove the proximate and remote causes, which contribute to interrupt the influx of the nervous fluid in-

to the nerves.
2. To ftrengthen the parts affected, and the whole

nervous fystem.

When a fanguine plethora is attendant, the principal cause is the excess of vital heat : bleed to reduce the heat, which must be brought and preserved as near as may be to the standard of health. And as, in this case, a lace-ration of the cellular membrane is the cause of motion being defective, as well as of the fense of feeling being diminished, a tight stocking, &c. according to the part affected, should be applied, if possible, to affist the reunion of the parts that are torn asunder. In this species of pals the Bath waters, and all heating medicines, are quite contrary to the curative indication : instead of them, cooling medicines, fubtepid baths, and lenient purges, should be used. But though this method may be proper in a recent case; yet, if it is of long standing, and the blood is impoverished, though the cause was too much vital heat, the cure now will be the same when a defect of heat gave rise to the disorder.

When there is too little heat in the constitution, bleeding, and a cooling method, is evidently injurious; here the Bath water is useful both for bathing and inward use. The fhrunk muscle is restored and motion recovered, in curable cases, by means of eletricity. In this species of pals, the cellular membrane not receiving its due degree of heat for keeping its cells distended, they gradually cling together, and thus destroy the power of action: warm bathing conduces much to the recovery of these patients. In the fit apply bottles or bladders filled with hot water to the feet; let the body be well rubbed with rectified fpirit of wine: if the lungs have ceafed to play, breathe warm breath forcibly into them, and as foon as the patient can fwallow, give him cordial medicines. After recovery from the fit attend to what affections may have agitated the patient, and then proceed with warm, nervous, corroborant medicines, not neglecting blifters, and fuch other evacuants as the kind of plethora may require.

In both the above species of palfy, a stimulating clyster may be given with all convenient speed; for thus the

head will be in some measure relieved; the best stimulant !

is the fal gem, or in want of it common falt.

Blifters are not fo well applied on the nape of the neck as on remoter parts; for in some instances they have produced convultive twitchings when placed on the neck or back. In general palfies, blifters are useful by their stimulus; but they are most so when only particular parts are affected, and then the properest place of application is where the nerves of the respective part have their origin; for example, when a palfy seizes the upper extremities, blisters should be applied to the vertebrae of the neck, and obliquely towards the shoulders; if the lower extremities are affected, the region of the facrum is the properest part. When in a palfy there is a plethoric state of the fystem, blisters do not seem to be a safe means to be applied; but in all inftances connected with, or that feem to depend upon a relaxed fet of fibres, a moift atmosphere, or the presence of too much serum in the system, blisters are then the principal remedies to be depended on. They are also of service in such species of pally as are produced by possons of different kinds, especially those of a metallic nature; but in these cases, the use of strong emetics and purgatives must always be pre-

After bleeding in the fanguine species, spasms of the internal parts and a febrile ebullition, often remains; in which cases nitre, Clutton's febrifuge spirit, &c. will be

Diuretics of the warm and stimulating kind are proper in the ferous kind of palfy; multard, horse-radish, and such like, prove highly beneficial.

If other diforders attend, a due regard must be had to

their removal.

Baths of rain water, or any other that is light, and in which aromatic ingredients are boiled or infuled, may be used when circumstances do not admit of the patient's going to Bath.

As to liniments, the linim. faponis perhaps equals any

other in its efficacy and usefulnels.

When mineral exhalations have been the cause, the cure is difficult: lead particularly destroys fenfation, whence often in palfies, purging medicines are required in very increased doses.

A palfy from the colic requires perspiratives inwardly, and warm applications outwardly. In this case, the Bath

water is a fpecific.

When a pal/y follows an epilepfy, after proper evacuations, apply blifters, and give affa feetida with falt of am-

A pally in the belly is, in some measure, relieved by a fomentation of hot wine, in which aromatics have been boiled, and by drinking a little of the fame when the pulse will admit of it. When the tongue is affected,

rub it with mustard, or mustard and brandy.

Dr. Cullen observes, that in the apoplexy, so in the pally, the causes are, a compression, preventing the slow of the nervous power from the brain into the organs of motion; or, the application of narcotic powers, which render the nervous power unfit to flow in the ufual and proper manner. Compression may be from tumor, over-diffension, or effusion. The same means that are useful in preventing apoplexy, are useful for the fame end in cales of pally. The same may be said respecting the cure; in the beginning, pally proceeds as in the apoplexy. What is said when the cause is from compression, may be repeated respecting the application of narcotic powers being the cause. When the palfy hath continued for some time, be the cause what it may, some little deviations from the treatment of apoplexy may be proper. As to the use of stimulants, both in the apoplexy and palfy arising from compression, it is true, that they may, and often do, so excite the energy of the brain, as to over-come the compression on the nerves; but then they so act on the fanguiferous system, and if this happens in a considerable degree, they may be productive of the cause which they were given to oppose: a circumstance that calls for careful attention. As to externals, they have occasionally been useful in slight cases, but much cannot be expected from them. Heat, cold, and electricity, are the most powerful external applications for relieving general affections. Heat is employed in warm bathing, and thus is a powerful ftimulant; but as it both ftimulates the folids, and rarefies the fluids, it will be unfafe when compression may be produced by the congestion in the brain, which may follow the use of warm bathing. Warm bathing is most proper when the cause was the application of narcotic powers. Cold is a useful stimulant, if the power of reaction in the body is equal to the action of the cold upon it: if otherwife, cold is extremely hurtful to the paralytic. Electricity acts very powerfully on the nervous fystem; but as it stimulates the fanguiferous, as well as the nervous fystem, it requires caution, for its use hath sometimes been more injurious than beneficial. The efficacy of electricity is more from its repeti-tion than from its force: it is also better adapted to relieve when the cause was from narcotic applications to the nerves. Exercise, such as circumstances will admit, are beneficial. Internally, the volatile alkaline falts and spirits, if given in repeated and fmall dofes, inflead of large ones, are useful and fafe. In many instances of serous pulsies, those vegetables of the class of tetradynamia, are feveral of them very ufeful. Some refinous fubstances, as guaiacum, &c. also some of the feetid antispasmodic medicines have been employed, but without that advantage that is often attributed to them.

Obf. and Inq. vol iii. p. 160, &c. p. 257, &c. For many ufeful elegant forms of medicine; fee Brooke's and the London Practice of Physic. See Cullen's First Lines, vol. iii. edit. 4. Edinb. Med. Comment. vol. iii. p. q.

PARALYSIS, in botany, the term for a flower, called primula veris, Linn. Verbafeulum pratense odoratum, primula veris odorato, flore luteo simplici, primula veris major, PAIGLES, COMMON COWSLIPS. This plant is fushciently known not to need any description. It is valued for its flowers, which have an agreeable fmell, and used to give flavour to a fermented liquor, known by the name of cowflip wine. The flowers are gently anodyne and antifpafmodic.

Boerhaave enumerates twenty species of the primula veris, and of these there are the two following:

Primula veris minor. The PRIMROSE. It grows

in hedges and woods; its flowers are weaker than those of the cowflip; the leaves and roots partake in some degree of the nature of afarum, and are powerful errhines and emetics.

Primula veris, called also berba petri, primula in-odore lutea verbasculum pretenses. Orslips, or great COWSLIPS. The flowers are diuretic.
None of these are now used in medicine.

PARANOIÆ. DELIRIUM; ALIENATION of MIND;

defective judgment.

PARAPHIMOSIS, from παρα, de, and εμωω, to tie with a bridle. Φιμω fignifies properly a firiture, fuch as the neck of a purie; called also periphymofis. It is when the prepuce is drawn back behind the glans penis, and cannot be drawn over it. See Lues Venerea. Dr. Cullen places it as a variety of the phlogofis phleg-mone. See Bell's Surgery, vol. i. p. 534. White's Sur-

gery, p. 345.
PARAPHONIA. Cacophonia, cacaphonia. DE-PRAVED VOICE. Dr. Cullen places this genus of dif-ease in the class locales, and order dyfenelize. He and fines it to be a depravity of the found of the voice, and diftinguishes fix species. I. Paraphonia puberum; it is that change of voice so remarkable in boys about sourteen years of age, which from acute and agreeable, becomes grave and very disagreeable. 2. Paraphonia rauca; when the voice becomes hoarse and rough. See RAUCEDO. 3. Paraphonia refouans, called also Renophonia; when from obstruction in the nostrils, the voice is rough, and the found feems to come whitling through them. 4. Paraphonia palatina; when from a defect of the lip, the palate, or uvula, the voice is rough, obscure, and confused. See Asaphia. 5. Paraphonia clangens, called by some Leptophonia; when the sound is shrill or squalling, or like that of geese. See Clangor. 6. Paraphonia

comatofa; when the voice is fent out during infpiration, and fomewhat refembles the fnorting of people affeep.

PARAPHRENESIS. Delirium; also the Paraphrenitis. An inflammation of the Diaphragm. Its causes are the same as those of the pleurify.

The pain is very violent and deep feated in the lower part of the breaft, or under the short ribs, or striking be-

tween them and the back; the fever is very acute, and the delirium constant; the belly is drawn up, and kept as much at rest as possible; the respiration is excessively auch, erect, small, suffocating, and difficult, and performed principally by the muscles of the breast; the particle of the breast, and give greater liberty of breathing. It is given to children against the chincough, from 5 drops to 20; as much at reft as possible; the respiration is excessively quick, erect, small, suspecting, and difficult, and performed principally by the muscles of the breast; the patient is frequently affected with fickness and hiccough, and often with involuntary laughter, convulsions, and madness; the pulse is usually very frequent and small, often irregular; there is great anxiety; and fymptoms of irritation come on, and death frequently enfues: if this does not happen, the progress, termination, and manner of treatment are much the fame as in the pleurify. The pain is greatly augmented during infpiration, coughing fneezing, repletion of the ftomach, naufea, vomiting, and a compression of the belly in discharging the frees and urine. The risus fardonicus, convulsions, madness, abfeefs, and gangrene, often terminate the difeafe. Sometimes a purulent ascites is a consequence.

The cure is generally the fame as in the pleurify.

Emollient clyfters are peculiarly ufeful. See Boerhaave's

Aphorifms. Fordyce's Elem. part ii.

PARAPHROSYNE. It is fynonymous with mania.

It is a transitory infanity without a fever. A DELIRIUM.

A symptomatic madnels. See Mania.

PARAPLEGIA, I from παρα, signifying something PARAPLYXIA, injurious, and πλεσσω, to strike. A parapelgy, or a pally of all the parts below the neck, thus it is now understood; but in Hippocrates it seems to significant in the parts below the neck, thus it is now understood; but in Hippocrates it seems to significant in the parts below the neck, thus nify a palfy in any particular part, in confequence of an apoplexy or epilepty. Dr. Cullen makes it that species of palfy which divides the body horizontally, or transpart beginning below the neck. See PARALYSIS.

PARAPOPLEXIA. A SLIGHT APOPLEXY.
PARATTHMUS. See ARYTHMUS.
PARATTHEMA. A SLIGHT LUXATION. A tu-

mor from protrution; as an hernia.

PARASITICALES PLANTÆ. PARASITICAL

FLANTS. They are fuch as are produced out of the
trunk or branches of other plants, from whence they receive their nourithment, and will not grow upon the ground, as the mifleto, &c.
PARASPHAGIS. The part of the neck contiguous

to the clavicles.

PARASTATA. It fignifies any thing fituated near

PARASTATÆ, from παρετημι, to fland near. Affi-tentes, aftites glandulofi. In Hippocrates it fignifies the epididymis. Herophilus and Galen called thete the vari-cole paraflatæ, to diftinguish them from the glandulose paraflatæ, now called prostatæ. Rusus Ephesius called the tubæ Fallopianæ by the name of paraflatæ va-

PARASTREMMA, from wapassion, to differt or per-ture. A pervertion, or a convultive differtion of the mouth, or any part of the face. PARASYNANCHE. A species of QUINSY, called

PARATHENAR MAJOR. This muscle in each foot is fixed backward by a fleshy body, to the outer part of the lower fide of the os calcis, from the small posterior external tuberofity, all the way to the anterior tuberofity there it joins the metatarfus, and at the basis of the fifth metatarial bone, separates from it again, and forms a tendon, which is inserted in the outside of the first phalanx of the little toe, near its basis, and near the insertion of the parathenar minor. It separates the little toe from

- MINOR. This muscle in each foot is fixed along the posterior half of the outer and lower side of the fifth the potterior half of the outer and lower ade of the fifth bone of the metatarfus. It terminates under the head of the bone in a tendon, which is inferted in the lower part of the bafis of the first phalanx of the little toe. Some call these muscles, transversales pedis.

PARDIALANCHES. See APOCYNON.

PAREGORICA, from wapnyoque, to console or mitigate. An epithet for medicines which relieve pain. See ANODYNA.

PAREGORICUM ELIXIR; now called TINCTURA OFIL CAMPHORATA. CAMPHORATED TINCTURE of OPIUM. Take of hard purified opium, flowers of Benjamin, of each one dram; camphor, two fcruples; effential oil of anifeeds, one dram, by weight; proof to adults from 20 to 100.

PAREIRA BRAVA, vel PAREYRA; also called ambutua, caapeba, convolvulus colobrinus, botou, boutua, beutua. WILD VINE. It is the cistampelos pareira,

It is the root of an American climbing plant. brought from Brafil, generally in crooked pieces of differ-ent fizes, from that of a man's finger up to that of a child's-arm; the outfide is brownifh, and variously wrinkled; the internal substance is of a pale, dull, yellowish hue, and interwoven, as it were, with woody sibres, so that on a transverse section there appears a number of concentric circles, crossed with strix, running from the centre to the circumference. There is a white species; the bark of the root of it is white, and the substance within appears like the root of liquorice.

This root is in high efteem as an attenuant and diuretic, in fuppreflions of urine, in nephritic and calculous complaints, in ulcers of the kidnies and bladders where the urine is mucous and purulent, and can fcarce be voided without pain; in afthmatic cases, when thick phlegm hath been very troublesome, an infusion of this root hath brought on expectoration. It gives out its virtue to water or to fpirit. See Lewis's Mat. Med. Neumann's

Chem. Works.

PARENCEPHALIS, from Taps, near, sympales, the ain. See Cerebellum.

PARENCHYMA, from wapry xum, to pour into. Era-fiftratus is faid to have introduced this term to fignify all that fubfiance which is contained in the interflices betwirt the blood-vetfels of the vifcera, which he imagined to be extravafated and concreted blood. According to fome, any of the vifcera through which the blood is strained.

PARENCHYMATICI. VISCERAL INFLAMMA-

PARESIS. Areticus fays it is a palfy of the bladder, when the urine is either fuppreffed or difcharged involun-tarily. It is now generally understood to be an imperfect paralyfis.

PARETUVIER. See GUAPARAIBA.
PARIETARIA. COMMON PELLITORY of the WALL. cause partridges love to seed on it; vitriaria, and urceolaris, because by its mucousness it is of service for seouring pots and glass. This plant hath tender reddish
stalks, rough, uncut, oblong leaves, pointed at both ends,
and imperfect rough flowers growing in clusters along
the stalks, followed each by a small shining seed. It is
perennial, common on old walls, and amongst rubbish.
It slowers in May.

The leaves have been used externally for cooling; and
internally as diurctic and emollient; but their esseacy
hath not preserved them a place in the present practice.
See Raii Hist.

PARIETARIA OSSA, from paries, walls; they defend the brain like walls. So the bones of the sincipus
are called. See Bregma.

PARIN CHAKKA. Bastard China. See China

PARIN CHAKKA. BASTARD CHINA. See CHINA

PARIS QUADRIFOLIA. See HEBBA PARIS.
PARISTHMIA, from mapa, near, and 176,440 a part of the throat fo called. The TONSILS, or diforders of

PARISTHMIOTOMUS. An inftrument with which

PARISTHMIOTOMUS. An instrument with which the tonfils were formerly fearified.

PARKINSONIA. Father Plumier discovered this plant in America, and named it thus in honour of Mr. John Parkinson, an English botanist. See Miller's Dict.

PARNASSIA, called also bepatica alba, gramen Parnassis, ciflus bumilis; ppola retundi-folia. Grass of Parnassus, or white Liver-wort. The leaves are roundish, and disposed in a circle; it grows in flowery marshy places, and flowers in August. The whole plant

is faid to be cooling and diuretic; but it is not in use at present. See Raii Hist.

PARONYCHIA. A WHITLOE, or WHITEFLAW, from #apa, near, and orue, a naid. It is also called a FELON. Le Dran calls it panaris: amongst the Arabians dogga, also named pandalitium. It is an abscess at the end of the singers, abscession digitorum, &c. It differs not from any abscess in any other part. According as it is situated more or less deep, it is differently denominated, or divided into species by some writers. Dr. Cullen places it as a

variety of the phlogofis phlogmone.

It begins with a flow, heavy pain, attended with a flight pulfation without fwelling, rednefs, or heat; but foon the pain, heat, and throbbing are intolerable; the part grows large and red, the adjoining fingers and the whole hand fwells up; in fome cafes, a kind of red and inflated fuse or streak may be observed, which beginning at the affected part, is continued almost to the elbow; nor is it unusual for the patient to complain of a very tharp pain under the thoulder; and fometimes the whole arm is excellively inflamed and fwelled; the patient cannot fleep, the fever, &c. increasing, and fometimes delirium or convulsions follow.

When it is feated in the fkin or fat, in the back or the fore part of the finger, or under or near the nail, the pain is fevere, but ends well. When the periofteum is in-flamed or corroded, the pain is tormenting. When the nervous coats of the flexor tendons of the fingers or nerves near them are feized, the worst fymptoms attend. The fecond fpecies proves very troublesome, and some-times ends in a caries of the subjacent bone. The third fpecies is very tedious in the cure, and ufually the phalanx

on which it is, is deftroyed.

If the first kind suppurates, it must be opened and treated as abscesses in general; but the best method of treating the other two species, is, on the first, or at farthest the second day, to cut the part, where the pain is seated. quite to the bone; if this operation is longer deferred, a fuppuration will come on; in which case, suppuration should be speedily promoted, and as early a discharge given to the matter as possible. As the pain is so considerable as to occasion a fever, and sometimes convulsions,

derable as to occasion a fever, and sometimes convulnous, the tinct. opii may be added to the fuppurating applications, and also given in a draught at bed-time.

See Le Dran's Operations. Heister's Surgery. Kirkland's Med. Surgery, vol. ii. p. 269. Beil's Surgery, vol. v. p. 431. Pearson's Principles of Surgery, vol. i. p. 82 &c. White's Surgery, p. 18.

PARONYCHIA, called also fedam, saxifraga, alsine

rne, WHITLOW-GRASS. It is faid to be emollient; but it is of too little efficacy to maintain a place in practice. It is also a name for some species of adianthum and ber-

PAROPIÆ. The external angles of the eye.

PAROPTESIS, from en au, to reaft. A provocation of sweat, by making a patient approach a fire, or by placing him in a bagnio. PARORASIS. An i

An IMBECILITY of SIGHT.

PARORCHIDIUM. A DETENTION of the TESTIeles, as when they have not yet descended into the scro-tum. The testicles are sometimes detained in the body; this case is called *crypforchis*; or concealed *testicles*. Sometimes the *testicles* (one or both) are detained in the groin; usually about the time of the child's birth they defeend into the ferotum, in fome inftances a little before birth, in others foon after. But this is very uncertain with respect to different persons; also in the same person the two testicles will considerably vary as to the time of their defcent. Sometimes one, at others both, are de-tained in the belly, or flick in paffing through the groin. These accidents happen and continue a longer or lesser time after the birth; and in fome instances never pass down into the fcrotum. Mr. Pott takes notice of this cafe, and gives feveral inflances of it in the quarto edition of his works; where he fays, that he knows not of any particular inconvenience arising from the detention of a testicle within the cavity of the belly; but the lodgment of it in the groin, renders it liable to be hurt by accidental preffure, &c. When it is fo hurt, it may be miftaken for a different difeafe, and thereby occasion its being very improperly treated. To which confiderations he adds, that there is no kind of difeafe to which the tefficle is liable in its natural fituation, but what may also

affect it in any or all its unnatural ones. In the first cafe related by Mr. Pott, a teflicle being detained in the groin of a young healthy feaman, who hurt the part by hitting it against a piece of timber; the humour there became extremely painful, and was miftaken for a bubonocele, from which it might have been more readily diftinguished by the following circumstances, had not the extreme tenderness of the injured testicle absolutely prevented any examination there by the touch; and the very hard fwelling of the scrotum, which prevented any certainty of a teflicle being there or not. But Mr. Pott here says, that the tumor in the groin did not, like the bubonocele, point obliquely from the ilium towards the pubes, but lay as it were acrofs the groin: also, as necessarily must happen, that when the scrotum became foft, no testicle could be felt in it. Two ftriking circumstances by which to dif-tinguish the detained testicle from the bubonocele, and also to determine the nature of the cafe. In the earlier part of this young man's life, this detained tefficle had been mistaken for a rupture, and a trus had been applied to it.

The second case, the testicle was detained in the groin; this patient had also been advised to wear a trus on the supposition that the case was a rupture; but he could not wear it, because of the pain it occasioned. At length getting a clap, this detained tefficle inflamed, forming an hernia humoralis, which was miftaken for a bubo. In this case, the humour was moveable, and the scrotum on that fide had no tefficle in it : two circumstances sufficient for diftinction and determination. Both the above cases were cured as inflammations of the tefficles are, when their fituation is in the ferotum.

PAROTIDÆA. The MUMPS. See CYNANCHE

PAROTIDÆA.

PAROTIS, from ways, near, and s;, the ear, or from ways, and set , genitive of s;, the ear. The PAROTID GLAND. It is feated on each fide, in a cavity below and before the ear, between the maxillary process, the zygomatic process, and the angle of the lower jaw; and the duct passes over the buccinator to pierce the membrane of the mouth, near the third dens molares of the upper of the mouth, near the third dens molares of the upper jaw. It is a conglomerate gland, and hath veffels from the temporal artery. It hath an appendicle at the tendinous beginning of the maffeter mufele. It is one of the fairval glands. The parotides are called diofeuri. It is also an inflammation, or an abscess of the parotid gland. Dr. Cullen makes it synonymous with bubo. A bubo here is called thus. See Abscessus Parotidis.

PAROXYSMUS, from Tapoffure, to irritate or render sharp. A Paroxysm; access, or fit of a difease; thyled also exacerbatic.

PARTHENIASTRUM. BASTARD PEVERFEW.

PARTHENIASTRUM. BASTARD FEVERFEW. Miller takes notice of two species, one of which grows in Jamaica, where it is called WILD WORMWOOD, and is used as a vulnerary. The other is found in the Spanish West Indies.

PARTHENIUM. A name for the tanacetum, matri-

caria, and artemesia.

PARTURITIO, from partus, a birth. LABOUR, of the bringing forth of a child.

Women are generally delivered of their burden about the end of the ninth month, or very early in the tenth: instances have occurred of nature's deviating, and of healthy children, which became vigorous men, being brought forth at different periods, from feven to eleven

months, after conception. The cause and mechanism of labour is as follows: fome days before the labour commences, the belly feems less; by its contents finking lower down; soon after this certain efforts are made by nature, which from their ex-citing pain, are ufually called pains; in the beginning, these pains are slight, and the intervals considerable; after some of these efforts, the uterus begins to contract, and a glary mucus discharges from the vagina; after this, the pains become more severe, return more quick, and continue longer; the pulse is now affected, the skin is hotter, the face reddens, and a general agitation follows; the mucus is tinged with blood; the os tincæ opens, its edges grow thin, the membranes protrude with the waters; di-late and widen the orifice; the child, at the inftant of pain, is raifed by the compressed waters from the os in-ternum, towards the fundus, whilst the uterus itself advances and descends by degrees into the inferior bason. When the pain ceases each time, the womb rifes, but not

fo high as before; the tumor formed by the membranes difappears; the ostince is relaxed, and the diameter diminified; the child falls, by its gravity, upon the lower part of the womb; and may be easily distinguished through the relaxed membranes, as also what part of its body prefents to the passage. Towards the end of labsur, the succession of pains are rapid, and the efforts violent: at first the pains usually begin in the small of the back, and terminate about the pudenda; but now they are perceived in the regio umbilicalis, and die away towards the fundament, where, in most instances, they leave a fensibility of weight. The tumor formed by the waters distending the membranes below the mouth of the womb, dilates the parts, until at length it burfts and difcharges the waters. If the child's head prefents fairly, it ftops the discharge of the remaining waters. Sometimes the same effort which bursts the membranes, expels the infant, and terminates labour; at others, the interval is long before the delivery of the child. The head of the child having passed the os internum, enters the vagina, which widens in proportion as it shortens; the perinæum is vastly ftretched, and the frenulum fometimes torn in the paffage; the nymphæ are obliterated, and the labia pudendi are turned inward, and confounded in the general diftension. At length the head forces the os externum, and the body readily follows, with the rest of the waters, mixed with blood. At this last period, the woman trembles and is convulsed, but is soon relieved by the expulsion of the child; after which there is a calm, until returning efforts are exerted for the exclusion of the placenta. Hence it appears, that parturition demands the concurrence of feveral agents. The cause and determination of labour is the first, and this is in the womb itself; the womb contracts, and compreffes whatever it contains, in fuch a manner as forces it to escape by the part which makes the least resistance, which is constantly by the vagina. The womb is muscular, and reticulated; some of its sibres run uniformly parallel upon the inner furface of the womb, from the fundus to the neck; others diagonally croffing upon thefe, and others again horizontally interlaced, and fo closely wove towards the fundus, as to have been miftaken for a muscle destined for the separation of the placenta. The uterus, in short, is capable of dilatation and contraction, analogous to the bladder, and acts in the same manner; the diaphragm and the abdominal muscles co-operating to exclude the urine. The irritation which the womb fuffers at the end of pregnancy, is what deter-mines its action, and is the true cause of labours, as will thus appear. Before conception, the cavity of the womb is triangular and flattish; the fides of the triangle are curved, with their convexity inward; this renders the angles very pointed, and leaves the uterus more thick in the middle, and at the fundus, where eminences are formed; the neck of the womb also is thick, and equals one third of its length, which, together with the above eminences, may be justly confidered as the magazine or store, in which nature hath thut up, and closely flowed the folded fibres, coiled and doubled, as it were, in referve, to expand with the gradual development of this organ: as in the buds of trees are lodged the leaves and flowers, which to expand and blow, need only the juices of the circulating fap. In the first months the retained menses moiften, and penetrate the tiffue of the uterus, swell and diftend the fibres, to the end of the fifth month, when, and rarely fooner, the cervix begins to florten, and dimi-nifhes daily. The expansion once begun, continues with the growth of the fœtus, until the whole stock of fibres are unbent and exhausted. At this period, the volume of the fœtus still augmenting, the womb stretches beyond its limited dimensions, becomes irritated, susceptible of pain, and hence labour proceeds. The prelude to labeur confifts of gentle efforts of thort duration; the womb effays its force, as it were, exactly filled, and meets with equal refiftance on every fide, except towards the orifice, where the fenfation of the first pain begins. The contraction of the womb acting on the orifice, different pains of the womb acting on the orifice, different pains of the womb acting on the orifice, different pains of the womb acting on the orifice, different pains of the womb acting on the orifice, different pains of the womb acting on the orifice of the womb acting on the orifice, different pains of the womb acting on the orifice tends its fibres, and causes pain; when the orifice is fufficiently dilated to let the head pass, the pain ceases, but it is renewed when the head enters the vagina, and firetches the fibres of these parts. Hence the degrees of pain may be accounted for, by the more or less extension of the orifice, &c. As the neck of the womb hath neither an equal length, nor equal thickness in different women,

be protruded before the ordinary time of nine months, or their birth be protracted until after this term. However fmall the dilatation of the os internum may be, it will occasion a separation of the chorion from the uterus, and break the communicating veffels, fo that the fluid, &c. that circulated between them, will translude, and become the fource of that mucous discharge by the vagina in the beginning of labour; and this separation, affected by gradation, will explain why the placenta retains its ad-herence until the laft. If the membranes are ftrong, their progressive separation continues until it arrives at the borders of the placenta, where the fubitance, adhe-fion and refiftance being greater, the bag generally burfts.

In a natural labour, the progress of the child's head through different parts, is as follows. The head of the child, if it hath not fuffered much by preffure, is near an inch narrower from ear to ear, than it is from the fore-head to the vertex. The vertex is the part which prefents in a natural birth. The bones that are preffed together at the prefentation, are the two parietal and the occipital; fometimes the frontal bones will be the fuffering parts. When the vertex fir? prefents, one ear is to the pubis, the other to the facrum, fo that the forehead must be to one fide of the pelvis, and the hind head to the other; thus the broadest part of the head is here in the widest part of the pelvis; so that being squeezed by labour-pains, the vertex descends into the lower part of the ischia, where the pelvis becomes narrower at the fides, and here is the advantage of the facrum being concave; for the forehead now turns round into it, and the vertex towards the pubis, which ftill takes the advantage of the width of the pelvis; it is then pushed forwards, turning as on a fulcrum, un-til the forehead rises gradually from under the peri-

With respect to preternatural presentations, see PRA-SENTATIO.

Labours are usually divided into natural, laborious, and preternatural.

Natural labours are, when the head prefents, and is de-Natural labours are, when the head prefents, and is delivered by common pains, requiring no other affiftance than what is needful in faving the perinzum from being lacerated. Laborious labours, called also lingering, nonatural, and difficult. They are when the head prefents, but labour-pains being infusincent, some fase contrivance becomes necessary to bring the head forward; and these are of two kinds; sirst, when delivery is effected without destroying the child; and secondly, when, in order to delivery, the head of the child must be opened, that its fize may be lessened, and the mother's life saved. Preternatural labours are when the legs or breech are delivered first, the body and head last, or when different parts ed first, the body and head last, or when different parts of the body present, except the head, or when the head presents in such a situation that the child is forced to be turned and delivered by the feet.

Some pains which come on about the time of labour, and fuch as refemble labour-pains, are not always real labour-pains, and therefore should be distinguished. False pains, as they are ufually called, which are not the effect pains, as they are utually called, which are not the effect of labour, are caused by coftiveness, a purging or a plethora. If the os tincæ is shut during the pains, they are false, and if the woman is costive, give her a clyster; if a purging attends, gentle opiates will relieve; and if she is plethoric, bleed. True labour-pains are promoted by opium much more than by stimulating cordials. Giffard says, that clysters to provoke too languist throws, an opiate to put away false pains, and a cordial after delivery. ate to put away false pains, and a cordial after deliver ate to put away faile pains, and a cordial after delivery (if the woman was low), were all the medicines he used. False and true pains sometimes attend at the same time; in this case an opiate should be given.

Until the woman is likely to be soon delivered, she may be up or in bed; but in order to delivery, the most

convenient posture for herself and her affistant is when laid on her left side upon a bed, with the knees drawn up towards the belly. Short-breathed people may be laid high with their heads, or delivered in a fitting posture, with their knees raised towards their bellies.

The affifting powers in a natural labour are particularly

the diaphragm, abdominal muscles, seet resting against fomething to keep the abdominal muscles tense, holding fomething to pull with the hands, that the muscles of fomething to pull with the hands, that the muscles of respiration may be tightened; a strong inspiration at the beginning of each pain, and a retention of the breath during its violence, and as the pain abates, a leisurely passing out of the breath. The practice of crying out and of drawing up the breath as the pain goes off, retracts the foctus, and lessens its force in distending the parts.

When the child's head presses against the perinacum, it should be supported by gently pressing with the hollow of the hand during the pain, to prevent its tearing.

Laborious labsurs may be caused by previous weakness, unskilful management, convulsions, passions of the

nefs, unfkilful management, convultions, pallions of the mind, rigidity of the os internum, especially when an inflammation is brought on by dilating it with the fingers, inflammation is brought on by dilating it with the fingers, and the head being got through, it contracts about the neck; narrowness of the pelvis, largeness of the head, a distorted pelvis, &c. Lingering labours will sometimes exhaust the woman's strength, when the head is in a right position, notwithstanding all our care. The head being long confined in the pelvis, is equally dangerous to the mother and the child; for by its pressure against the soft parts it may stop the circulation, and bring on inflammation and gangrene, which would prove certain death to the mother, and to the child by its affecting the brain; when danger of these kinds attend, the forceps are to be used. used.

Preternatural labours are more or less difficult, according to the position of the child and the contraction of the uterus; therefore are divided into there classes. I. When the lower parts of the child, as the feet, knees, or breech, prefent. 2. When it is known that the prefentation is wrong, and we have the advantage of turning the child immediately on breaking the membranes, by means of the waters. 3. When the child prefents wrong, and the uterus is closely contracted, the advantage of the waters

being loft.

When it is known that the breaft, belly, fhoulders or any part but the head, feet, knees, or buttocks prefent, when the membranes have fomewhat protruded, break them, and immediately introducing the hand, bring the

ret into the passage, and so deliver, as when the seet prefent. See PRESENTATIO.

PARTUS. The BIRTH.

PARULIS, from wags, near, and was, a gum. An
INFLAMMATION, boil, or abscess in the GUMS. See ABSCESSUS GINGIVARUM. Dr. Cullen places it as a variety of phlogosis phlegmone.
PARVOS MEATOS. The cellular membrane of the

ancients.

PASMA. See CATAPASMA.
PASPIER. See CRITHMUM.
PASSA. In Paracellus it is a WHITLOE.

PASSERINA. SPARROW'S TOAD-FLAX. Some PASSIO A PASSION, AFFECTION, OF DISEASE: hence passio hypochondriaca, bovina. See AFFECTIO, and Hypochondralcus Moreus.

PASSULÆ. RAISINS.
PASSUM. RAISINS.
PASTA REGIA. A LOZENGE.
PASTILLUS. A TROCH OF PASTIL.
PASTINACA. PARSNEP. The root is thick, flefby, and juicy; the leaves are large and broad, and strengthened by a thick rib; the seed is oval, large, thin, marginated, and calls its hufk. Boerhaave enumerates eight species. The name is given to feveral vegetable products, viz. Branca urfina Germanica, fpondylium, Cow-Parfnep. It grows in meadows, and on the borders of fields, flowers in July and is chiefly noted as a food most agreeable to rabbits. It is likewise a name for a species of fium,

to rabbits. It is likewife a name for a species of fium, dancus, tordilium, and cuminum.

— OLUSATRA, called also opoponax pseudocossius, panax beracleum majus, panax patinacea, spondylio vel possinace Germanice affinis panax, panax Herculcum. HERCULES'S ALL-HEAL, or WOUND WORT. It hath uncut leaves, and heart-shaped, but with one of the sides lower than the other; the middle ribs bearing the several sets of leaves, which stand in pairs along a larger rib. It is a native of the warm climes, and bears the cold of our's. The gum opponax of the shops is the concreted juice of this plant. The seeds are much warmer than the wild

or the garden parsaep. The roots and the stalks smell like opponax. Beerhaave says, that on wounding the stalk of one of these plants, he obtained a juice, which, being inspissated, agree in all respects with the gum called

Oppoponax.

PASTINACA SATIVA, called also possinaca hortensis:
GARDEN PARSNEP. The leaves are paler coloured than
the wild fort; they are smooth and indented. The roots
have a considerable sweetness in their taste, contain a great deal of mucilage, and are very nutritious; they yield with rectified fipirit of wine a fweetish extract, and in distillation with water they yield a small portion of effential oil with the flavour of the root; the seeds are aromatic, but those of the wild species are more so.

These roots are chiefly used as a part of diet.

—— sylvestris, also called elaphshoscum, elaphicon, batcia, banica, and wild parsner.

It hath dark green, indented leaves, and slender woody roots; it is common about the sides of fields, flowers in June and July, and ripens its feeds in September. On eat-June and July, and ripens its feeds in September. On eating the roots a heat is complained of in the mouth, which is foon followed by thirft; then the pupil gradually dilates, and the fight is loft; a delirium comes on, but on a difcharge by vomit, these symptoms soon abate; the dilatation of the pupil is the last that disappears. Among the garden fort a faulty one is sometimes met with, but wild parsness are harder when boiled than the garden fort, at least than the good ones, and thus the bad may easily be known.

PATELLA. A diminutive of patina. The KNEE-PAN, called also rotula, mola, genu, sentiforme os, cartilaginosum, disciforme, oculus genu, caucaloides, epigonatis, epimulis, mylacris, and CAP of the KNEE. It is a flattened bone, situated at the anterior part of the joint of the knee, with its broad part upwards, and the pointed part downwards. Its anterior furface is fmooth; its posterior furface is also smooth, and covered with a cartilage; it is divided internally by a longitudinal ridge, and transversely likewise, fo that there are four cavities, the two lower of which move upon the semur in the extension, the two upper in the flexion of the leg. The tendons of the extensions per in the flexion of the leg. The tendons of the extentors are inferted into the upper part of the patella, and a ligament runs from the lower part, to be connected to the tibia. The patella fuffers the leg to have some degree of rotation, which if it had been a fixed process like the olecranum, it would not: it likewise is less incident to fraction. tures than if it had been one folid bone with the tibia. At the time of birth it is cartilaginous.

- DOCUMASTICA. A CUPEL OF TEST. See

PATETÆ UVÆ, OF PATETHEISÆ. GRAPES

that dry on the vines.

PATHECA. See Jace Brasiliensibus.

PATHEMA. An affection of disorder. See

AFFECTIO.

PATHETICI. Diseases in which the appetites and passions are principally affected by excess or defect. Dr. Cullen places it as synonymous with his dysorexiae.

PATHETICUS, from \$\pi\text{2}\text{p}\$, passion. An epithet of the fourth pair of nerves, because they direct the eyes to intimate the passions of the mind. They are also called trechleares, and obliqui superiores. They are the smallest pair in the body, and appear below the edge of the transverse processes; they pass by the side of the sella turcica, and go through the foramen lacerum orbitale superius, to the superior oblique muscle.

PATHOGNOMONICUS, from \$\pi\text{8}\text{8}\text{6}\$, a discass, a discass, and \$\pi\text{mersus}\$, to know. An epithet for a symptom or a course of symptoms that are inseparable from a distemper, and are found in that only, and in no other. Quod convenit omni, soli, & semper.

found in that only, and in no other. Quod convenit omni, foli, & femper.

PATHOLOGIA, from \$\pia\gamma

PATOR NARIUM. 'The finus, cavity, or chasm of

PATRAPIUM. See APIUM.

PATRIMONIUM. A name for the genitals. PATRUM CORTEX, vel PULVIS. See CORTEX PERUVIANUS.

PATURSA. The VENEREAL DISEASE,
PAU DE SANGUE. See GUM. RUB. ASTRING.
PAULADADUM, also called terra figillata S. Pauli.
PAULINA. CONFECTIO. The CONFECTION called PAULINA. This is a warm opiate. It is the paulina of Ariftarchus, which is the fame with the confectio Archi-

genis. The London College have rejected it from their Pharmacopecia of the year 1788, and not improperly. PAVANA, i. e. MOLLUCCENSE LIGNUM. See

CATAPUTIA MINOR, under GRANA TIGLIA.

PAVATE, PAVETTE. See MALLEAMOTHE. PAVIA. See HIPPOCASTANUM.

PAVOR. FEAR; but fometimes it fignifies the ITCH. PAYES HERBA. A species of plantain in Peru. See Raii Hift.

PECHEDION. The PERINAUM.
PECHYAGRA. The GOUT in the ELBOW.

PECHYS. The ELBOW.
PECHYTYRBE. An epithet for the SCURVY.
PECTEN. The pubes, or SHARE-BONE, also ceis.
In zoology it is a shell-fish called a SCALLOP.

PECTEN VENERIS. SHEPHERD'S NEEDLE, or VE-

PECTINATIO: COMBING. It is a species of fric-

PECTINÆUS vel PECTINALIS Musc. From petten, the os pubis. It rifes from the upper part of the os pubis, on the outfide of Poupart's ligament, runs downwards, backwards, and outwards, and is inferted into the linea afpera below the little trochanter: Brown fays it is called pettinaus, because it rifes from the os pectinis (pubis); it is also called lividus, from its colour:

PECTORALIS: PECTORAL. An epithet for medicines which are appropriated to disorders of the breast

and lungs.

MAjor: manner from the anterior and inferior part of the clavicle, then from the fternum, and at the lower part from the third, fourth, and fifth ribs, from the cartilage, and partly from the bony portion of the fixth rib; then paffes towards the arm, with its upper edge contiguous to the deltoid, betwixt which two the cephalic vein has its courfe; near its infertion the pectoralis doubles in, on its lower edge, and forms a posterior and anterior lamella; then it runs to be inserted into the anterior part of the biceps groove. This muscle is partly a rotator of the arm, but its great use is to bring the arm forward, close to the body; it is also called adducens bumeri.

MINOR. Some call it servatus anticus minor:

it lies beneath the pectoralis major. It rifes by three digitations from the third, fourth, and fifth ribs, then digitations from the third, fourth, and fifth ribs, them paffes obliquely upwards and outwards, and joins with the fhort head of the biceps, to be inferted into the carotid process of the feapula. Some make this a muscle of the feapula, others of respiration, according as they make one or the other termination the fixed point.

—— INTERNUS. See TRIANGULARIS STERNI.

PECTORIS OS. See STERNIM.

PECTORIS OS. See STERNUM.
PECTUS. The BREAST; also the metatarsus.
PECTUSCULUM. The Metatarsus.
PEDECELLI. See PHTHIRIASIS.
PEDIBUS BOVIUM, OLE. NEAT'S FOOT OIL.
It is prepared by boiling the joints of horned cattle in

PEDICULI INGUINALES. CRAB-LICE. See MOR-

PEDICULARIA. STAVES-ACRE. See STAPHIS

PEDICULARIS. A fpecies of EYE-BRIGHT; also the herb YELLOW-RATTLE, and flaphis agria.
PEDICULATIO. The LOUSY EVIL.

PEDICULUS also PEDUNCULUS. A LOUSE; also a PEDICLE, or that part of a stalk which immediately fustains a leaf, a flower, or a fruit, and is generally called a foot-stalk.

the colic, affects it; the fkin is rough, perspiration defective, and the falutary evacuations from the uterus and hamorrhoides checked; hence the pedilave is extensively ufeful. Baths for the feet should be used at bed-time, and thus a general perspiration is produced. If used a few days before the mentrual discharge, they are said to pro-

PEDION, and PELMA. The SOLE of the FOOT. PEDORA. The SORDES of the eyes, ears, and fee The sordes of the eyes, ears, and feet PEDRO DEL COBRA. See Cobra de Capello.
PEDRO DEL PORCO. See BEZOAR HYSTRICIS.
PEDUNCULUS: The fame as pediculus, in both its

fignifications.

PEGANON. RUE.

PEGE. A FOUNTAIN. The internal angles of the eyes are called pegæ.

PELADA. A shedding of the hair from a venereal

PELECANUS. A PELECAN. The name of an instrument for drawing the teeth; also a glass vessel for-merly used in chemistry for the digestion and circulation of liquors poured in at their narrow necks, which were afterwards hermetically fealed: at prefent two matraffes

are used instead of a pelecan, the neck of one being en-tered into the neck of the other.

PELECINUM. The characters are, in all respects, like the astragatus, except that the pod is stat, long, bi-capsular, bivaive, and full of kidney-shaped seeds. It is also called securidaca peregrina. See ERVUM.

PELIOMA. An ecchymosis when livid coloured.

See SUGILLATIO.

PELLICULA MEMBRANACEA. It is in general

any thin membrane.

PELLIS. A SKIN of a BEAST. It is also called corium and tergus:

PELMA. The sole of the FOOT, or a sock adapted to the fole of the foot.

PELTATIS CARTILAGO, from pelta, a buckler.

The feutiform cartilage of the larynx. PELVIS: A name for the inferior part of the cavity of the belly. It is bounded forward by the os pubis, backward by the os facrum above, and coccygis below, laterally by the illia above, and ifchia below.

In midwifery, the knowledge of the structure, and pe-culiarities of the pelvis, is an important circumstance. The brim of a well shaped pelvis represents an irregular oval, or fomething that approaches to a triangle; if confidered as an oval, its greatest axis is from fide to fide; if we confider it as a triangle, the posterior part is far longer, and the offa pubis constitute the other two sides of the triangle, the lower circumference is formed behind by the facrum and os coccygis, on each side by the lower circumstant and before by the ischium and saero sciatic ligaments, and before by the lower part of the pubis; when the body is reclined, or half-fitting, as it were, the brim of the pelvis is horizontal, and a line would pass from the navel through the middle of the cavity; but when a woman is in labour, or near her time, this imaginary line must take place higher, and accordingly we find, that the first of the external parts; which the head of the child presses against, is behind the anus, and from thence it gradually advances up the perineum, until it comes to the lower part of the lymphyfis of the offa pubis. The chief uses we are to make of this supposed line, are; first, by it we place the woman in a good position during labour; for then she can act more strongly with her abdominal muscles, and the child's head will fall directly into the middle of the pelvis; secondly, it will be a direction for us to introduce the forceps upon the child's head, and the hand into the uterus, when

necessary.

In considering the pelvis, we should observe its width, the depth and form of its cavity, and the extent of its brim from the fore to the back part, which, in a well-formed pelvis, is an inch less than it is from fide to fide, four inches and a half from the fore to the back part,

and five inches and a half from fide to fide.

The lower circumference of the pelvis is nearly equal, but when we allow for the os coccygis being moveable, it makes a quarter of an inch more in its longer direction PEDICUS. See EXTENSOR DIGITORUM BREVIS.

PEDILUVIUM. A BATH for the FEET. The feet are very fensible, and a bath of warm water removes their spasm, and, by consent, spasms and pains in the belly. It is lumbarum, to the lower part of the coccygis, is about If the feet are cold, the belly is costive; pain, such as five inches in a strait line. When the os coccygis is prelois, to the lower part of the symphysis of the os pu-bis, is only two inches: whereas, from the under part of the ischium, it is four inches. The brim is concave

internally all round.

A strait pelvis will cause a difficult labour; its straitness is known as follows: introduce your finger up the vagina, and if you can feel the os facrum, the pelvis is first, or touch the offs pubis with your fore-finger, and firive to touch the vertebræ of the loins with your middle finger; if you can reach them, it is confidered as narrow, and vice verfa. It is also the name for a cavity in the kidneys; for the cochlea of the ear; and hence pelvis renum, aurium, & cerebri.
Pervis. The infundibulum in the brain.

PEMPHIGODES, or PEMPHINGODES. Fevers dif-tinguished by flatulencies, and inflations, in which we tinguished by flatulencies, and inflations, in which we feel a fort of aerial effluvia paffing through the skin of the patient in the manner of an exhalation, and striking upon the touch. Galen's Com. on 6 Epid. feet. i. aph. xvii. Others say it is a fever, by the intensens of whose heat pustules are excited in the mouth, called aphonæ, or thrush. Foesius says, that some will have it to be a synochus, in which, by the heat, the blood-vessels are inflated, whence some call it an inflative sever.

PEMPHIGUS. The vessels are severed also solves.

PEMPHIGUS. The veficular fever, called also febris bullofa, exanthemata serosa; morta. Dr. Cullen places this genus of disease in the class pyrexiae, and order exanthematæ. He defines it to be a contagious typhus. It is a rare disease in this country. On the first, second, or third day of the disease, little vesselse, the fize of a nut, appear on different parts of the body; they continue a

few days, and at last exude in the form of a thin ichor.

Dr. Withers, in his Treatife on the Asthma, p. 154, 155, fays, "In the case of E. P. the vesicular eruption, which was very fore and painful, was preceded and accompanied with some severish symptoms evidently of the low kind. It continued only for a few days, and then gradually went off. As it was fo mild, it did not require any particular treatment; but had it been violent, and attended with a malignant, nervous, or putrid fever, the bark, clixir of vitriol, red wine, and stimulants, would have been highly necessary. By that method of treatment, not entered upon too hastily, nor delayed too long, I cured two patients a few years ago of the pem-phigus, in which the fever was extremely putrid, and a great many gangrenous floughs, of a fetid fmell and most dreadful appearance, followed the eruption of the blif-ters, attended with a low delirium for many nights, and the greatest dejection of countenance and prostration of ftrength." See Acta Helvetica, vol. ii. p. 260. Cullen's First Lines, ed. 4. vol. ii. p. 254. Edinb. Med. Commentaries, vol. vi. p. 79.
PEMPTÆUS. An ague, the paroxylm of which re-

PEMPTINUS. An ague, the paroxyme of the returns every fifth day.

PENICILLUS. A TENT or PLEDGIT.

PENGUIN. See KARATAS.

PENIS, from pendo vel pendendo, to bang, because it hangs without the belly. It is also called causes, coles, the composed of three parts, viz. the colis, priapus; and is composed of three parts, viz. the two corpora cavernosa, and the corpus spongiosum urethræ. Its skin, which is thin, and without fat, hath a reduplication, which makes a hood to the glans, called fraputium; the small ligament, by which it is tied to the under-side of the glans, is called franum; the use of the prepuce is to keep the glans fost and most, and to preserve its sensibility. The penis hath a small ligament, which arises from its back, a little from its root, and which ties it to the upper part of the os pubis. It receives two branches of veins from the hypogastric vessels, and its arteries from the hypogastric and pudicæ; the colis, priapus; and is composed of three parts, viz. the and its arteries from the hypogastric and pudicæ; the two veins unite towards its root, and make one trunk which runs on the back of the penis. It hath two nerves from the facrum, and feveral lymphatics, which empty themselves into the inguinal glands. It hath three pair of muscles, viz. the erectores, acceleratores, and transversales. Cowper observes, that the cuticula on the glans penis is villous or downy, and that the cutis is thinner here, and on the scrotum, than any where else. Regnerus de Graaf accurately describes the penis. Ruysch describes the glans penis better than de Graaf. See also Cowper's Observations on the Penis.

PENNA. A FEATHER. It also signifies a subman

PENNA. A FEATHER. It also fignifies a subma- culus.

preffed back, it is then fix inches; from the brim of the | rine plant which grows on rocks, and refembles a bird'swing, which is also called mentula alata. If a feather is swallowed, it should, if possible, be extracted. In the third vol. of the Lond. Med. Obs. and Inq. p. 7, &c. is an account of a successful attempt to recover a quill from the stomach, by means of a whalebone with a sponge at each end, to each of which was a thread loosely connected, and by which the quill was entangled, and so brought

PENO-ABSOU. A tree in America, whose bark is very fragrant, and whose fruit, which is the fize of an orange, contains from fix to ten nuts, from which an oil is expressed. The fruit is possonous, but the oil is used to cure the wounds received by possoned arrows.

PENTADACTYLON. A name for the palma Christis. PENTANEURON, i. e. Plantago angustifolia major. See PLANTAGO MINOR.

PENTAPHARMACUM. A medicine confifting of five ingredients

PENTAPHYLLOIDES. BARREN STRAWBERRY. PENTAPHYLLUM. CINQUEFOIL, i. c. Potentilla reptans, Linn. A name also for several species of quinquefolium, and pentaphylloides, also a species of finapit-trum, and of hermodactyls.

PENTAPLEURUM, i. c. Plantago angustifolia ma-

PENTOROBUS. PEONY.

PENTOROBOS. FEORI.

PEPASTICA. DIGESTIVE MEDICINES.

PEPITA NUX. IGNATIUS'S BEAN.

PEPLION, or PEPLOS. They were purging medicines for evacuating bile and phlegm. Sometimes it is fpoken of under the names of mecon, meconis, and meconistic for the part of the second for the se iium; also wild andrachne, chamæfyce, papaver spumeum, ytum, and tithymalus.

fymphytum, and httpymatus.
PEPLIOS LUTETIANORUM. See FABAGO.
Rooghaave enumer PEPO. COMMON POMPION. Boerhaave enumerates fifteen species. They are not easily digested. By pref-fure an oil is obtained from their pulp, which softens the fkin. See Raii Hift.

PEPTICOS. DIGESTIVE, or that promotes digeftion. PEQUETI RECEPTACULUM. PEQUET'S RE-CEPTACLE, OF RESERVOIR. See RECEPTACULUM

PERAGU. A fhrub in Malabar, whose juice kills worms, and its roots cure the lientery, colic, &c. See Raii Hift.

PERCEPIER, also called charophyllo, alchimilla mon-tana minima, polygonum felinoides. PARSLEY-BREAK-STONE, OT PARSLEY-PIERT. It is a low plant; and lies chiefly on the ground; its branches are hairy,-full of fmall leaves, fet alternately at the points. It grows in dry places, and fallow fields, and also among corn. It is faid to be diuretic, but it is of too little efficacy to deferve much notice. Raii Hilt.

PERDETUM. In Paracelfus it is the root of fkirret.

PERDICIUM. See PARIETARIA.

PEREGRINUM LIGNUM. See NEPHRITICUM

PERESKIA. A plant with a rose-shaped slower, which is met with in the Spanish West Indies. In the English American settlements it is called a GOOSEBERRY. The Dutch call it a BLAD-APPLE. See Miller's Dict.

PERETERION, from aspau, transfodie, to dig through.
The perforating part of the trepan.
PEREXYL LUSITANIS. See CAAPONGA.
PERFECTI MAGISTERII. OIL of BRICKS.

PERFOLIATA, called also bupleurum, THOROUGHwax. It is a plant with a fmall fibrous flicky root, from which fprings fmooth, and often reddiff stalks. The leaves are oval-shaped, of a blue green colour; the flowers are of a yellow colour. It grows amongst corn, is faid to be vulnerary, but of little note in practice. See Raii Hist. PERFORANS MANUS. See FLEXOR TERTII IN-

TERNODII DIGITORUM MANUS; called also profundus

PEDIS. See FLEXOR LONGUS PEDIS. PERFORATIO. Sometimes it fignifies a feton. PERFORATUS MANUS. Sec FLEXOR INTER-NODII SECUNDI DIGITORUM MANUS.

- PEDIS. See FLEXOR SUBLIMIS PEDIS.

- CASSERII. See CORACO-BRACHIÆUS MUS-

PER-

PERFRICTIO. SHIVERING, or COLDNESS. See | the place of bone in an adult, as the trachea; or in fuch

PERIAMMA. See PERIAPTA.

PERIADYSMIA. PAIN in the STOMACH.
PERIANTHIUM. It is the outermost part of a flower, which furrounds it before it is blown, and forms a kind of support for it afterwards. Dr. Grew calls it the empalement, some improperly call it the calyx or cup, for the calix is properly the hollow cup formed by the empalement, out of which the other parts of the flower grow. Some flowers, whose petals, or flower-leaves, have a firm and strong basis, sufficient to support themselves, therefore stand in need of an empalement, as the tulip, &c. which have none; these, however, have a calyx.

PERIAPTA, called also amuleta, periama. People on whom amulets were fixed for the removal of a disease. Blanchard says, it is a medicine which being tied about the neck, is believed to expel diseases, especially the plague. PERIAPTON. See DRIFF.

PERIBLEPSIS, from ωιμέλατω, to stare about. That kind of staring look which is observed in delirious persons.

PERIBOLE, from πιαθαλίω, to surround Some.

PERIBOLE, from wigiCaxxon, to furround. Some-times it fignifies the drefs of a person; at other, a trans-lation of the morbise humours to the surface of the

PERICARDII ARTERIA. The ARTERY of the PERICARDIUM. This arifes from the anterior middle part of the common trunk of the fubclavian, or the carotid; it runs down upon the pericardium all the way to

the diaphragm, to which it fends fome branches.

— VENA. The VEIN of the PERICARDIUM. It fometimes fprings from the trunk of the superior cava, at others from the origin of the right subclavian. The left vena pericardii comes fometimes from the left fubclavian before the mammaria, fometimes from the mammaria or diaphragmatica fuperior on the fame fide.

PERICARDITIS. INFLAMMATION of the PERI-CARDIUM. Dr. Cullen places this discase in the genus carditis, which see.

PERICARDIUM, from west, about, and xapsir, the beart, called also capsula, involucrum, and facculus cordis. The first membrane of the pericardium is formed by the pleura, which is connected to the pericardium by a cel-lular membrane, but this is only an occasional covering, leaving the pericardium, where it adheres to the diaphragm. The fubstance of the pericardium is a strong tough mem-brane, composed of two lamellæ, the external of which is by much the stronger; the internal is a complete bag, without perforation, being reflected over the beart itself. This internal coat contains the fluid called liquor pericardii, which was supposed to be secreted by glands lodged there, but is certainly fecerned by the fmall continua-tions of the arteries. In found habits this liquor is found in a fmall quantity; in unfound habits we find a larger quantity: its appearance is like ferum, a little tinged with blood. The redness is owing to the transudation of the blood in the muscular cavities of the beart; and the longer the body is kept, the redder the liquor grows. The use of the pericardium is to afford the liquor, and to confine the beart; and as it is connected by a great furface of the diaphragm, perhaps it keeps the beart unmoved by the motions of the diaphragm in infpiration: but there is not much motion in inspiration and expiration. The pericardium is much larger than the beart; it is not fixed to the basis of the beart, but round the large veins above the auricles before they fend off the ramifications, and very little in this, as the middle of the diaphragm hath round the large arteries before their divisions. membrane is subject to different affections, particularly dropfy, inflammation, and suppuration, which see under HYDROPS PERICARDII, INFLAMMATIO, and AB-

PERICARDIO-DIAPHRAGMATICÆ VENÆ.

See DIAPHRAGMATICAE superiores.
PERICARPIUM, from stee, about, and καςπος, the

as fupplies the place of bone in infants, as epiphyles; but on the cartilages that are expanded over the extremites of articulating joints, the perichandrium is the inner layer of the capfular ligament, reflected over the cartilage ex-tremely fine. This is not discoverable in adults, but in young subjects, where the parts are separable, it is easily difcernible.

PERICHRISIS. A LINIMENT.
PERICHRISTA. Any medicine with which the eyelids are anointed in an ophthalmia.

PERICLASIS, from wife, about, and wan, to break. A fracture with a great wound, wherein the bone is laid

PERICLIMENUM. A name for feveral forts of ca-

PERICLYMENUM PARVUM. See IPECACUANHA. PERICRANIUM, from meet, about, and spares, the bead. The membrane which immediately invefts the bones of the skull, or under the hairy scalp. It is made up of two lamina, closely united; the external lamina parts from the internal at the semicircular plane surrounding the templace and becomes a part from ples, and becomes a very strong aponeurotic, or ligamen-tary expansion, which covers the temporal muscle, and is afterwards fixed in the external angular apophysis of the os frontis, in the posterior edge of the superior apophysis of the os malæ, and in the superior edge of the zygomatic arch, as far as the root of the mastoid apophysis. At this place the aponeurotic coif feems to form the external lamina of the pericranium, and they both communicate with particular aponeurotic expansions of the mastoid, masseter,

zygomatic, and other neighbouring muscles.

PERIDESMICA, ISCHURIA. A suppression urine from fricture in the urethra. See Ischuria. A fuppression of

FERIDROMOS. The extreme circumference of the hairs of the head.

PERIESTECOS, from wequested, to farround, or guard. An epithet for difeases, signs, or symptoms, importing their being salutary, and that they prognosticate the reco-

very of the patient.
PERIGRAPHE. An inaccurate description or delineation. In Vefalius, perigraphae are certain white lines and impressions, observable in the museulus rectus of the

PERIGUA. See Cassine. PERIN. A TESTICLE. Some explain it the perinæum, others fay it is the anus.

PERINÆOCELE. A rupture in the perinæum. PERINÆUM, from wegnen, to flow round. Because that part is generally moist, called also interfaminium. It is the space between the anus and the parts of generation; it is divided into two equal lateral portions by a diffinct

line, which is longer in males than in females. In midwifery it is observed, that when the os externum the delivery of the fame, it is generally firetched to the length of three, and fometimes of four inches; whence at this time delivery should not be precipitated, left a laceration in this part should be the confequence. Instead of stretching back the perinaum with the finger, as is the practice of some, it should be supported with the palm of the hand, and the head of the child, at the same time, moderately opposed in its force against it, that its distension may be made gradually, until difficiently dilated for delivery. Inflammations and lacerations of the perineum, if they occasion vomiting, are fatal in a few days. If a laceration happens, keep the woman long in bed, and advise her to keep her knees close, as constantly as possible; her bowels should be kept soluble.

The puncture of the perineum, is an operation which was used to be performed when the bladder was under such a fuppression of urine as could not be relieved by any gen-tler method. The operation was performed by pushing a trochar from the place where the external wound in the old way of cutting for the ftone was made, into the cavity of the bladder, and so procuring the iffue of the water through the canula. At prefent instead of this method, the water is evacuated by pushing the trochar into the bladder, from a little above the os pubis. The is method of discharging the urine hath succeeded, but when the suppressions of any considerable shading the second care of the considerable shading the second care in the suppression. PERICARPIUM, from στει, about, and καςπος, the way of cutting to the iffue of the water wegetable kingdom, it is whatever furrounds the fruit of regetables, whether membrane, huſk, or pulp. Some restrain it to the fost and moist pulp which covers the feeds, as in apples, &c.

PERICHONDRIUM. The pericondrium is faid to be only a continuation of the periosteum. This Dr. Hunter fays may be true of that fort of cartilage which supplies

Sharp's Critical Enquiry. White's Surgery, p. 466.

There are also abscesses formed in this part. See AB- | oppressive than acute; sometimes this pain is felt in one, SCESSUS PERINÆI.

PERINÆALIS ISCHURIA. A fuppression of urine from a tumor in the perinæum.

PERIN-KARA. A wild olive-tree of vast growth in Malabar. See Raii Hift.

PERINENE NEUCOS. See EPINENEUCOS. PERIN-NIROURI. A bacciferous fhrub in Malabar. See Raii Hift.

PERIN-PANEL. A bacciferous Indian shrub, the leaves of which are used in suffumigations against hysteric fymptoms. See Raii Hift.
PERINYCTIDES. Pustules, or PIMPLES, which

break out in the night.

PERIOSTEUM, from weet, about, and oreov, the bone. It is that membrane which covers the bone. It is divided by authors into two layers; the internal layer (or peris-fleum itself) lies close to the bone, and appears furrowed, as the bone is: this is one of the finest, thinnest membranes imaginable, and appears upon a fuccefsful injection to be extremely vafcular; the reason of which is, that the vessels which run to the bone play a while upon the furface of this membrane, before they enter into the fubstance of the bone. The external layer is of a white gliftening appear-ance. It is merely adventitious, being composed of the fibrous expansions of membranes, ligaments, and tendons; wherefore it runs in various directions, according as these tendons, &c. are variously inserted. The perioseum is not elastic; Dr. Hunter thinks it is not very sensible, and advifes in amputations not to scrape it, but only to pass the knife about it, a little above the place where you intend to faw. The periofleum is wanting on those parts of a bone where strong tendons enter, as in the trochanter. uses of the periofleum are, to prevent the bad effect of friction on the bones, to protect the vessels running into the bones; to connect epiphyles; and to give origin to muscles. See Abscessus Periostei and Inflam-MATIO.

PERIPHYMOSIS. See PARAPHYMOSIS.

PERIPLOCA. A name for VIRGINIA SILK. Alfo Italian and French SCAMMONY, called also feammonia Monfpeliaca retundioribus foliis, apocynum latifolium. Its concreted juice purges in fomewhat larger dofes than the

feammony of the shops. Boerhave takes notice of four other species, but they are not purging.

PERIPNEUMONIA. A PERIPNEUMONY, from PERIPLEUMONIA. στος, about, and στοιμαν, the lungs. Dr. Cullen places it as a species of pneumonia, or rather inflammation of the thorax and its contents.

Three kinds of peripreumonies are diftinguished, as follows: the true, or inflammation in the lungs; the fpuri-ous, or when a pituitous matter obstructs the vessels of the lungs; the catarrhous, or when a thin acrid defluxion on

the lungs is the cause.

The true peripreumony is produced by cold applied to the skin, or mouth, or stomach by an inflammatory diathelis; an over diftention of the lungs; or by any of the general causes of inflammation. Such causes as particularly affect the lungs, are a faulty air, caustic matter in the atmosphere, or other faulty exhalations, violent exercise of the lungs by running, wreftling, &cc. violent difturb-ances of the mind, a quinfy, accompanied with an orthopnoca, a violent pleurify, or an excessive paraphrenitis. The diforder excited, various effects will be produced, according to the divertity of the part affected; for a bronchial inflammation by compression and contagion inflames the contiguous extremities of the pulmonary artery. When the extremities of the pulmonary artery are inflamed, the blood becomes flagnant, the veffel is extended, the thinneft part of the fluids is expreffed, as it were, by transudation, and the thicker parts are accumulated: and all the blood, as yet capable of circulation, is collected between the right ventricle of the heart, and the extremities of the pulmo-nary arteries: hence the *lungs* become oppreffed, incapa-ble of expanding, and are livid, the left ventricle of the heart is deprived of blood, a great weakness is brought on, with a variety of other fymptoms, as follow.

Inflammation of the cheft or of its contents, is always

known by the following fymptoms, fever, difficult breathing, cough, and pain in one part of the breaft or

This fever is of the inflammatory kind, and begins with an obtuse pain in the breast, which is rather tensive and

nd fometimes in both fides; fometimes it extends along the reins, at others it shoots to the back and to the scapulæ; the breathing is difficult, and affected with a kind of fnoring; a cough usually attends; it is fometimes dry, at others the matter discharged is bloody, or chiefly blood; this cough is more acute than that which attends in the pleurify, the air from the lungs being particularly hot: the mouth, tongue, and fkin are very dry; there is a fenfe of fulness in the thorax, anxiety about the pracordia, with reftlefiness and toffing in bed continually; this reftlefiness never fails to attend, and that even in the beginning; fleep becomes a stranger; the pulse is commonly hard, always quick, but feldom strong or regularly full; it is sometimes fort, slender, and intermitting; before bleeding it is hardly to be perceived in some cases, but after bleeding it is tronger; the urine is often turbid; the difficulty of breathing and the fenfe of fulnefs increase; and a quantity of thick mucus being secreted, occasions a found as the air passes through the branches of the trachea: if the symptoms are violent at the first, the patient is not able to lie down; when he does, it is only on his back, for he can hardly breathe if not erect, and the passage of the blood through the lungs is obstructed, so that he fears suffocation; the veins of the neck fwell, the pulse becomes every way irregular; one arm is often affected as if with a palfy; the face fwells, is of a dark colour, especially about the cheeks and the eye-lids; and if the weather is fultry, livid fpots appear on the neck and breaft, the tongue fwells, and is of a dark-red colour; the eyes are dull; a flupor, and a low delirium fucceed, in which the patient raves, and feems neither afleep nor awake; fometimes there is a degree of palenets, and an air of aftonishment at the beginning of the difease, the eyes staring wildly, and this por-tends much danger. The best expectoration resembles what is fpit up with a cold, but rather more yellow and ftreaked with blood; but becoming lefs fo, inexpreffible anguish is felt, and at last the patient is sussociated. If the fymptoms do not arise to fo great a height, and at the same time no means of resolution have been applied before the fourth day, as if these means are not sufficiently powerful, or if they are not continued until the difease is totally carried off, a suppuration takes place, and is indicated by flight and frequent shiverings; the pain at the same time going off gradually, the fense of fulness, and the cough, with the other symptoms diminishing, and the patient being only able to lie on that side which was most affected.

This diforder should be distinguished from a pleurify; from a difficulty of breathing in fevers; from the spurious peripneumony; inflammation in the mediaftinum, or in the intercostal muscles; from the catarrh, the asthma, and other difficulties of breathing which happen in chronical

A white fediment in the urine, or a red fediment changing to a white, promife a fafe and fpeedy recovery. If the peripneumony takes place after a cold fit of a fever, and the fever continues along with the inflammation, which hath been relieved either naturally or artificially, a crifis in the fecond week fometimes carries off both difeafes. If in the young and robust, a bloody spit appears on the fourth day, it is a good sign; and if on the seventh day the same patient fweats fpontaneously, the difease is ended. If in phlegmatic and languid constitutions, when the disorder hath a deep feat in the lungs, there is a termination of the discase on the eleventh or fourteenth day, partly by expectoration, and partly by sweat, the pulse becoming softer, the sleep calmer, and the strength being increased, the discase ends well. If the disorder continues to the twentyfirst day, an abscess will be the consequence. It is most dangerous in flat-breafted and in afthmatic perfons. Frequent stools, and urine without any sediment, are bad figns. If the pulse is small, foft, and irregular, the danger is great. If the disease rushes on at once with a violent attack; if the horror, coldness, and shivering, lasts many hours, and are followed with nearly a feorehing heat; if the brain is affected at the first onset; if there is a small purging with a tenefmus; if the patient abhors the bed; if either excellive fweating, or excellive dryness of the skin attend; if the natural countenance is greatly changed, there is reason to apprehend the most fatal consequences. Suppuration generally proves fatal.

Avoid the extremes of heat and of cold where the pa-

tient lies.

Dr. Fordyce, in the fecond part of his Elements, speaks of a natural cure. He says, that this may happen by a secretion of mucus from the lungs, which at first is spit up thin, and with uneafines, becoming gradually thicker, and of a yellowish or greenish east; it is often mixed with blood, relieving, and gradually diminishing the symptoms, fo as to carry off the difease before the fourteenth day. Or, this disorder may depart by an hæmorrhage, or by an inflammation arising in some other part of the body, as the

The artificial cure, the fame author observes, is effected by simple resolution, or by evacuation from the mucous glands. The first method is to be purfued in the robust, the fecond in the more infirm. Thus, in all cases, on due bleeding, or expectoration, the cure chiefly depends.

When the cure is attempted by refolution, the first step will be to bleed freely. This operation must be used in point of frequency, according to the ftrength of the pulse, or its fulnets and hardness. A large orifice should be made to discharge the blood. The sooner blood is taken away, the more beneficial the evacuation proves. When from the violence of the inflammation, the pulse is fmall, very frequent, and irregular, it often rifes, and becomes regular after the operation; and from the difeafe increasing, or recurring, it is frequently necessary to re-peat this evacuation two or three times. As foon as the preceding cold fit is over, take from a large orifice from 3 xii. to 3 xvi. of blood; this large bleeding gives more relief than twice the quantity taken at three times; and, except fymptoms promife well after the first bleeding, take from 3 vii. to 3 xii. more in four hours after; and, as required, repeat it in fomewhat lefs quantities in fix or eight hours. If florid frothy blood is fpit up, bleed as far as the patient's ftrength will admit; but if the blood which is taken from a vein appears pale, and jelly-like, without the true buff; or if a fpitting is already come on, bleeding will be injurious. The air in the room should be kept moderately warm. The vin. antim. and kali acctatum should be given in the usual doses as in instammatory fevers; and if they are repeated every hour, or at least every two hours, their efficacy will be more fuited to the intention. Emollient elysters, in which nitre is dissolved, should be frequently injected. Nitre may be mixed in every draught of the patient's drink, or it may be rendered agreeably acid by the addition of Clut-ton's febrifuge spirit. Blifter the back and sides, especially after bleeding: if in the course of the disorder expectoration stops too suddenly, and is not immediately followed by some other evacuation, blifter both the legs. A decoction of the rad. ferpent. feneka, given in proper dofes, and at due intervals, is of fingular advantage.

If expectoration is attempted as the means of relief, bleeding is rarely admitted. If the expectorated matter be yellowish, or streaked with blood, by keeping it up, the most desirable ends will be answered. The gum ammoniacum is usually prescribed in this case, but the antimonium tartarifatum, or the vin. antim. given in fuch dofes as will keep up a naufea, are of more extensive efficacy. But expectorating medicines, as fuch, must not be given before the matter to be discharged becomes fit for excreto the lungs. Vapours from warm water may be frequently received into the lungs with the breath. From the beginning give the decoct. rad. seneke, besides which few other medicines will be required. If the disease feems to be of a mixed kind, or if the lungs are not fo much inflamed, as they are loaded with a viscid or pituitous matter, apply blifters between the floulders, and on the fides. When the mucus that is fpit up is very thin, opiates may be used in small doses, to moderate the pain; and, to eafe the cough, let mucilages be frequently fwal-lowed. A fharp fudden cold air, too hot an air, exceffive fweating, imprudent purging, and diffurbed paf-fions of the mind, may any of them check expectoration, in which case proceed as already directed. This disorder, though generally carried off by expectoration, is fometimes removed by urine, which on the feventh, ninth, or eleventh day, or, fometimes, in the intermediate days begins to let fall a plentiful fediment of a pale red colour, and fometimes real pus; these discharges are succeeded by falutary fweats, but are preceded by anguish, palpitations,

All the drink and medicines should be milk an irregular pulse, &c. If the pulse slags, give a few grains of the fal. c. c. with the conf. aromatica. If when blood is taken away from a vein, it appears of a loofe or broken texture, immediately defift from any discharge of it, and begin with the use of cooling antiputrescents, as the acet. camphorat. the juice of oranges or lemons in the patient's drink, or let his drink be acidulated with Clutton's febrifuge spirit, joined with some proper cordial, &c.

A peripneumony is very apt to return on a little irregularity of diet. It terminates variously, as by a resolution, a fuppuration, a fcirrhus, a copious spitting, a bilious flux, or by a copious thick urine, in which is either a sediment of a pale red colour, or of a purulent quality. When the patient dies, he is carried off by a fuffocation, from the

difficulty of coughing up the matter which is lodged in the langs. See Cullen's First Lines, edit. 4. vol. i. p. 306.
PERIPNEUMONIA NOTHA. The SPURIOUS, OF BASTARD-PERIPNEUMONY. This diforder may appear at any time in the year, but for the most part it approaches early in the fpring, particularly after a very fharp winter. This kind of perspacement is chiefly diffinguished from a dry afthma, by the degree of fever, and figns of inflammation which are manifest in it; in most symptoms, the spurious peripueumony also refembles the true, but the heat, pain, and thirst are not so considerable in the first as in the laft.

Those advanced in years, and those of any age who have a gross habit of body, and are addicted to spirituous liquors, also those who are subject to catarrhs are most subject to this kind of diforder.

It is often caufed by cold north and north-east winds. Bodies that are loaded in the winter with grofs and fluggiffa humours, which at the approach of fpring are rarefied, the lungs becoming turgid therewith, a bad cough is produced, and then the peripneumony is foon introduced. A redundant vifeid ferum, or even a putrid tendency in the juices, may induce this difeafe. The drying up of an old ulcer or an iffue may, in some circumstances, be a cause. A weakened state of the lungs, as when an cedema forms itself there, may also occasionally be productive of this difeafe.

Boerhaave observes, that the bastard peripseumony steals upon the patient unawares with a flight wearinels, weakness, a general proftration of the faculties of the mind, thick and fhort breathing, and an oppression of the breast. The commotions it excites are fo fmall, that the heat and fever are scarce sufficient to make the patient sensible of his diforder, afterwards flight shiverings, which come on by fits, and the attacks of a gentle fever appear, whence dif-ficulty of breathing, and weakness suddenly increasing, bring on death, of which there was scarce any sign by the pulse or urine. Sydenham was one of the first who diftinguished this disorder from a catarrh, and he gives the following account of its manner of invalion, and its progrefs. The patient is hot and cold alternately, giddy, complains of an acute pain in the head, when the cough is most troublesome; he vomits up all liquids, sometimes with, and at others without coughing; the urine is turbid and intenfely red; the blood taken away refembles pleuritic blood; the patient breathes quick and with difficulty; if he is advised to cough his head achs as if it would burit; a pain is felt in the whole breaft; a wheezing is observed by the attendants whenever the patient coughs. To what Sydenham hath faid it may be added, that the patient's cheeks and eyes often appear red and inflamed, the pulse is fmall, a low fever attends, and the urine is generally pale-coloured.

If the strength does not return after the disease is removed; if the pulse is still quick, though soft; if the breathing is difficult and oppressed; if there is at times a cold shivering, with flushing in the cheeks, the lips are dry, and the appetite defective, a phthilis may be expect-

The indications of cure will be to expel the pituitous colluvies. 2dly, To strengthen the habit in general, and the lungs in particular.

Attenuating stimulating expectorants, stomach purges, emetics, blifters, both by their ftimulus and discharge, and iffues in the infide and bottom of the knee, are all thought useful. For common drink, mustard-whey, or a decoction of madder-root, will be very convenient; bleeding, except in a fmall quantity, when comatous fymptoms

appear, is not to be practifed, but blifters applied to the appear, is not to be practiced, but binters applied to the back, fides, and arms, with gentle puking at proper intervals, and fuitable expectorants may be much depended all parts of the body, to the proper emunctories, in order on. The decoct. rad. fenek. is also useful in this difference.

A copious flux of the humours, or morbific matter, from all parts of the body, to the proper emunctories, in order to their discharge, or rather the discharge itself.

PERIRRHEXIS. A spitting of blood from a rupture

If the cough is violent, opiates will be very ufeful, and may be given as foon as expectoration is become tolerably free; a mixture of the pil. e styrace & pil. ex aloe cum myrrha may be fafely given in dofes as circumftances may require. To keep the bowels lax is a necessary point in order to relief, and the opiate may be given to any quantity, not to interfere wholly with the usual esseace of the purgative which it accompanies.

As expectoration is a principal means of relief, to the faline draughts, made with the aq. ammoniæ acetatæ, add as much of vin. antim. as will excite and keep up a naufea, thus every ufeful fecretion and excretion will be pro-

When the breathing is eafy, and expectoration free, begin to ftrengthen the habit by means of the bark, to each ounce of which a dram, or more, of the balfam of Tolu may be added; mild chalybeates may also be used.

This diforder terminates by a spitting, a bilious flux of the belly, or by plenty of thick urine, with a thick sedi-ment. Dr. Macbride arranges this discase amongst althmatic complaints, which he fays commonly feizes the old and phlegmatic; the weak and lax; the fat and unweildy; and is most rife in wet and slabby fituations; in foggy weather, and winter feafons. All which circumstances point out, as the cause, an accumulation of ferum in the cellular cavities of the lungs, whence great appression on the air-ressels, and some degree of obstruc-tion in the pulmonic and bronchial arteries, thereby hindering the free and regular circulation of the blood. This difease is always extremely dangerous; and requires the utmost circumspection in our prognostics as the mildness of the symptoms, at the beginning, are too apt to missead both the patient and attendant. For, as it arifes from a vifeid accumulation among the inert folids of the lungs, the symptoms do not appear very dif-trefling, till it is generally too late for relief, and there can be no hope of a resolution of the offending matter, fince there is no way for it to be carried from the cells wherein it flagnates, but by the absorbent system, and it is generally too viscid to be taken up by such slender veffels. Writers, from not making the necessary diffinetion between the cellular and tubular part of the lungs, and by supposing the offending matter in the peripueumsnia notha chokes up the extremities of the pulmonary artery, have confounded the theory of this difease, fince the symptoms cannot be fatisfactorily accounted for, on the fuppolition that the morbific matter is lodged in any other place than the cellular interitices, whereby it preffes both upon the air-veffels and blood-veffels, hindering the first from being fully distended with air, and the last from transmitting blood. In this disease, therefore, bleeding is of no fervice, but does harm, and our only hope is founded on repeated emetics and blifters; the most proper emetics are those of the antimonial class, nor thould the patient drink much after a vomit is given, in order that the agitation from puking may be ftronger, and the blifters are to be laid on the back, fides, and arms, which are also to be bathed, and the body kept open by glyfters. But all this will very rarely answer, and we may foresee the death of the patient, from the perpetual laborious wheezing, great anxiety, and intolerable oppreffion of the pracordia, together with a constant doing, coldness of the extremities, and a livid colour in the hands and face. People advanced in years, who are of a gross habit and flabby texture may perhaps be prevented from falling into their difease, by suffering issues to be made between the shoulders, as these will prevent the accumulation of lymph in the cellular part of the lungs, and probably prolong life.

On inflammations of the lungs, fee Trallian, Coclius Aurelianus, and Aretaeus; and on both the kinds of periptument, fee Hoffmann, Boerhaave, Wallis's Sydenham, Shebbeare's Theory and Practice of Physic, Fordyce's Elements; part ii. PERITONÆORIXIS. A burfting of the peritonæum,

and confequent hernia.

PERITONÆUM, from wipiters, to extend round. Dr. Douglas is the first who hath given us any true idea of this membrane, which lines the belly, and invefts all the vicera contained therein. It is of a close texture, and yet very pliable; it is capable of great extension, after which it can recover itself, and be contracted to its ordinary size, as appears in pregnancy, &cc. It is connected to all the circumambient parts by a cellular membrane; it is this cellular membrane (which is generally called the external la-mella of the peritonaum) which forms what we call the processes of the peritonaum. The peritonaum, neverthe-less, hath productions of his own; but they are different from those of the cellular membrane, for they run from without inwards, and give an external covering to the

contained parts.
PERITONITIS. INFLAMMATION of the PERITONEUM, including the mefentery and omentum, hence inflammatio mesenterii. Dr. Cullen defines it to be a fever, with pain in the belly, which is increased when the body is creet; but without other proper figns of abdominal inflammations, &c. places this genus of difease in the class pyrexize, and order phlegmafiæ; and diftinguishes three species. 1. Peritoni tis propria; that is, when the peritonæum, firicity fo called, is inflamed. 2. Peritonitis omentalis, or epiploitis. See Puerperillis Februs. 3. Peritonitis melenterica.

PERLE. See Albugo Oculorum.
PERLÆ. See Margarittæ.
PERNIO, from whoma, beel, chimethlon crithema a fri-

gore. A KIBE or CHILBLAIN. This diforder attacks the hands, feet, heels, ears, nofe, and lips; all ages are subject to it, but children of a fanguine habit, and a delicate complexion are the most so. Dr. Cullen places this disorder as a variety of phlogosis erythema.

When the parts subject to this complaint are suddenly exposed to cold, or from being cold are too speedily heated, they are somewhat inflated, afterwards come on heat, reduces, pain, and itching. These symptoms increasing, small blitters are formed, which soon burst, leaving a slight excoriation, which speedily ulcerates; this ulcer soon becomes deep and obstinate, discharging a sharp ill-condi-tioned matter; in the last, and worst degree, a gangrene is formed.

Besides a fulness of the humours, and a tenderness in the tkin, which are the most frequent causes disposing to chilblains, the wearing of woollen gloves, or those of furr

Subfequent applications are made use of.

When winter approaches, let the parts usually affected be frequently put into cold water, avoiding every occafion of subjecting them to warm. Iffues, or frequent gentle purges, will drain off a redundancy of humours. As to a faulty quality in the blood, of whatever kind it may be, proper alteratives are not to be neglected; but when the diforder is prefent, whilft in its lowest degree, dip the part into water that is cold, and as near to freezing as may be, and there continue it during a minute or two; or if the cold chills or benumbs the part very much, dip it in, and take it out two or three times, at fhort intervals; after this it may be gently dried; the same process being repeated, at least every morning and evening, un-til all uneasiness is removed. The most troublesome itching is removed by dipping the part in cold water, or by applying frow to it, though in fome few inftances the fnow rather increases than diminishes the disorder. When the patient cannot bear the cold, when a cough attends, or other circumstances which forbid the application of cold to the extremities, the best substitute is, to wear dog-skin socks, or gloves, day and night, until the inflammation is removed. Linnaus recommends the diluted marine acid for bathing the part affected with. In greater degrees, as when the part may be faid to be frost bitten, the treatment will be as directed in the article CONGELATUS; in this case dog-skin gloves or focks, should be worn. Vapours sometimes agree better than baths, in which case the vapours from vinegar are the best; but as their vapour foftens the fkin, it should afterwards be often washed with a mixture, water two parts, and camphorated fpirit of wine one part. If the parts are ulcerated, gentle purges may be used, the swelled parts exposed to the steams of vinegar, and digestive ointments applied to the fore. When a gangrene comes on, treat it as when the same happens from any other cause, attendance being given to the circumstances of the constitution.

TING FEVER, the paroxylms of which return at constant and flated hours.

PERSOLATA. | See BARDANA MAJOR, and BAR-PERSONATA. | DANA ARCTICUM.

PERSPIRATIO. PERSPIRATION, also transpiratio, dilatis. Without a free perfpiration no animal nor plant can continue in a healthy state. The matter of perfpiration is separated through the skin, and also from the lungs; it is simply serum. This discharge is usually less in women than in men; if in either women or men, the perfpiratory vessels are obstructed, the circulation of the blood meets with great relistance.

Perspiration is of two kinds, viz. that which is conti-nually transuding and is called insensible; the other is the sensible, called sweat. It hath been supposed that different vessels throw off these discharges, but that is not the truth; the fame veffels which throw out the infenfible, upon being more strongly acted on, throw out the fensible per-

All animals have an absorptive power, similar to that of a sponge, which is evident from the speedy penetration of fea-falt and falt-petre into the most interior parts of the largest pieces of butcher's meat; it is most probable that the pores, &c. through which the falt passes, are those through which the perspiration is carried on in living animals. The pores are sometimes so enlarged as to transfer the perspiration of the perspiration mit particles of red blood, as happens in the muriatic fcurvy; and fometimes are fo contracted that the neceffary evacuation can no longer be continued, whence a va-riety of diforders proceeds. The fat under the fkin is sup-posed to prevent a too free exhalation of the serum from the body; and want of fat in the lungs, to be a reason why fo free a discharge is made therefrom. The coats of all the vessels are perforated by the pores through which the matter of perforation passes; hence, when morbid hu-mours are attenuated they pass through the skin, and are exhaled with the matter of perforation, or they may, and often are, absorbed into the blood, and then excreted with the urine, &co

PERTURBATIO ALVI. A DIARRHOEA.

PERTUSSIS. HOOPING-COUGH, also called tuffis ferina, and convulsiva, the rheumatic cough, and convulsive cough. Dr. Butter says it is an opidemic, contagious, spasmodic disease. It seems to be analogous to an intermittent fever in the periodic return of the fits; they both prevail in the fame feafons, arise from the same cause, and are cured by the same remedies. See Huxham de Aere, &c. Morb. Epid. p. 76, 77. Farther, the autumnal booping-cough and intermittents are analogous, in that they renew their attacks in the returning spring, PERSICARIA, URENS, called also hydropiper, CUL- though feemingly cured, long before. The hosping-cough 7 H

refembles the small-pox, in not usually returning, in be-ing insectious to the predisposed, and in that it must have cantharides have been used with advantage. Dr. Lett-

It is originally fymptomatic; is often a fymptom in the afthma. Sydenham fays that the cough is excited by vapours which are thrown into the lungs from the blood. Dr. Butter fays its feat is in the intestines; that neither the ftomach nor the lungs are concerned in it; that the primary affection is a morbid irritability of the mucous glands; and that an infectious miasma is the occasional cause. Again, whilst some affert that the disorder is a convulsive one, occasioned by irritating matter lodged about the bronchia trachea, and fauces; others fay, and indeed with greater feeming probability, that it is a convulsion in the diaphragm, excited by sharp humours in the primæ viæ, and which cause a spalmodic stricture in the glottis. Walschmeid says, it proceeds from a disorder of the stomach. Dolæus says it is caused by tough viscid matter lodged in the coats of the stomach. Hosman attributes it to thin and acrid juices in the ducts deftined to respiration, as the aspera arteria, &c.
Dr. Cullen places this genus of disease in the class

neurofes, and order spasmi.

This diforder begins with a hoarfenefs, but usually with a dry cough, which continues about two weeks, and then becomes convultive, and fome phlegm is discharged; its increase and state takes up about four weeks more, and in fix weeks after it generally goes off, though fometimes it continues eighteen or twenty weeks: fometimes the phlegm is ropy, at others it is mixed with fharp ferum, but always is thrown up with difficulty: at the height the phlegm is more concocted, and as the cough declines the expectorated matter is whitish. After recovery a relapse may eafily happen from taking cold; but these relapses are flight and short. Some have only the antecedent short dry cough: these get well in two or three weeks, but if phlegm begins to appear, the patient is not so foon quit of this disorder. When the cough is in any degree violent, the blood is so obstructed in the face as to occasion blackness there, and, according as the vessels of the nose are more or less able to resist, so an harmorrhage from thence is more or less copious and frequent.

The booping-cough is most fatal to children under two cars of age. Older children usually swallow the phlegm years of age. and then puke it. After three years of age it feldom proves fatal; though, in fome inflances wherein great weakness attends, and the bark hath been neglected, a

Confumption follows, and the patient is carried off.

As opinions vary with respect to the feat, &c. of this complaint, so the methods of relief that are proposed are also various; but, in general, gentle antimonial emetics administered about half an hour before the return of each fit, when the periods can be gueffed, are the principal, affiftants that hitherto have been observed. Particular fymptoms are relieved by bleeding, blifters, gentle laxatives, &c. In the beginning, if the face is very black during the fit, or if the blood is discharged with the cough, bleed. If the breathing is difficult the lac. ammon. will be proper. To moderate the violence of the cough give, now and then the fyr. papaveris albi in fmall doses, or rather mix opiates with purgatives, and give them in such doses as whilft the violence of the cough is moderated, the bowels may also be kept solutive. Dr. Butter extols the use of hemlock as a cure. He directs to begin with a fmall dofe, and gradually to increase until the symptoms of relief appear, and then continue that dofe as long as it produces good effects; when this medicine begins to lofe its effects, then augment the quantity gradually until its advantages are again manifest. For a child from fix months to two years old he advises to begin with gr. j. which when diffused in an ounce and a half of water may he given in the course of one day. From two years to four years of age two grains may be mixed in two ounces of water to be taken in the day. From four years upward to twenty the first daily dose may be increased half a grain for each year. If a liquid form is diffiked, a pill or a bolus may be given. And Dr. Mor-ris declares the most successful efforts from castor one part, and the bark two parts; the dose from 3 i. to 3 fs. and repeated every four hours. If there is much fever, the bark is not convenient, expectorants fometimes should

fom in his Medical Memoirs, from his own as well as other experience, fays, "From the efficacy of the fol-lowing composition, the action of vomiting is less neces-fary to be frequently excited, as the discase usually termi-mates in a few days after the exhibition of this remedy; hence, he adds, I have rarely had occasion to give the anti-monial powder more than two or three times." The composition was communicated to the Doctor by his friend Mr. Sutcliff, a surgeon and apothecary in York-thire. R TR. cort. Peruv. si. 3 i. ss. tinct. opii camphoratæ 3 ss. TR. cantharidis. 3 j. m. This is to be given in small doses three or four times a day, and to be gradually increased until a flight strangury is excited; and then the dose must either be diminished, or repeated at longer intervals. It is then observed that, the strangury usually comes on about the third day, and the booping-cough feldom continues above fix days after giving this medicine.

Dr. Cullen confiders this difease under two periods: the first is when the contagion which caused it is recent, and continues to act; the second is when the contagion ceases to act and the disease continues by the power of haceafes to act and the difease continues by the power of habit. The indication of cure under the first period is, to obviate the violent effects of the disease and its fatal tendency. To this end, in plethoric habits, or where the blood is difficultly transmitted through the lungs, bleeding will be necessary; but its repetition must be admitted with caution. The belly must be kept lax. If there is any inflammatory tendency in the lungs, blisters should be applied to the thorax, and repeated if required. Emetics should be duly repeated, they interrupt the return of the spassmodic affections; and by determining to the surface of the body, take off the determination to the lungs. The indication of cure under the second period is effected by antispasmodics or tonics. Of these, a variety effected by antifpafmodics or tonics. Of thefe, a variety have been proposed, and occasionally with success, as cattor, musk, hemlock, cupmos, opium, Peruvian bark, &c. When neither sever nor difficulty of breathing forbid, opium is powerful in abating, but it is not efficacious in removing the cough. In this last stage of the disease, the bark,

or fome proper preparation of it, will be fingularly useful. In the Med. Comment. of Edinburgh, vol. x. p. 272, it is observed that the hooping-cough was relieved by vomits, and laxatives; till every fymptom of pyrexia was gone; then the bark, and cold bathing proved a certain and effectual remedy. The same person gave the bark and camphor, as a preventive, and observes that sew were attacked that persevered in taking it, for any length of time.

The late Dr. Rutherford of Edinburgh, observes that when convultions attend, the application of blifters will be necessary, but as to their fituation in this case, he prefers the fide of the neck behind the ears, because in that part there is the nearest communication with the nerves

of the glottis. See Wallis's Sydenham. Huxham de Aer. & Morb. Epid. p. 76, 77. Lond. Med. Obf. and Inq. vol. iii. p. 281—286, 319—325. a Treatife on Kinkesugh, by W. Butter, M. D. Dr. Cullen's First Lines, vol. iii.

lit. 4. London Med. Journal, vol. ii. p. 398. PERUVIANUM BALSAMUM. PERUVIAN BAL-PERUVIANUM BALSAMUM. PERUVIAN BALSAM, OF BALSAM OF PERU: it is also called Mexican balfam; Indicum balfamum, balfamum Americanum, cabureiba The tree which afford it, balfamifera, balfamifera arber Indica. See CABUREIBA. Peruisera, vel meroxylon peruiserum, Linn. There are three kinds of this balfam, viz. the white; it is of a pale yellowish colour (though called white); it is the native balfam, preserved as it issues out from the tree; this is the best fort, but very rarely met with. The dry balfam; this is the white fort inspissated by the sun's heat in gourd shells, in which it is sometimes brought to Europe; it is of a reddish coit is fometimes brought to Europe; it is of a reddift co-lour, and a very agreeable fmell; it is feldom to be met with. The common or black Peruvian balfam; this is artificially extracted from the bark, branches, and leaves of the tree, by cutting them in pieces, and boiling them in water; it is of the confiftence of honey, of a dark black colour in the mass; but, when spread thin, it is of a clear reddish or yellowish brown, of an agreeable strong accompany this remedy, and often its efficacy is only ad-wantageous in the decline of the difease: the fever is no benjamin and storax, and of a bitterish pungent taste,

nor rendered white nor turbid on being agitated there-

with. It is brought from Peru and Mexico.

Distilled in a retort with an open fire, it yields a butter like that of benzoine, and sometimes a considerable quantity of concrete faline flowers fimilar to those from the fame refin. If this balfam is rubbed with fugar, the white of an egg, or with the mucilage of gum arabic, it is rendered millible with water, but is longest suspended

It is used for the cure of wounds in nervous and tendinous parts: it strengthens the stomach, is useful in asthmas, and as an antifpaimodic, though not fo immediately useful or so powerful at present as opium, yet it is far more lasting in its efficacy. It cures, according to Sy-denham, the colica pictonum, and a tincture of it, in spirit of wine, is warmly recommended by Hoffman.

PESSARIUM. A PESSARY. Among other external

remedies used by Hippocrates pessary. Among other external remedies used by Hippocrates pessaries were one; they were a kind of suppositories which they introduced into the exterior neck of the matrix: they were prepared of wool, lint, or linen, mixed with powders, oils, wax, &c. and made round like a singer. Pessaries were in much use amongst the ancients, and were formed of different ingredients, according as the different diseases, &c. of the womb required them. See P. Æginet. lib. vii. c. 24. At present their use is chiefly confined to the support of the falling vagina or uterus. They are useful to women who labour under an incontinence of urine. Sponges of such a fize as, when expanded, fill up the cavity of the vagina, are very good pessaries; they may be dipped in any liquor that will assist in the intention of using them. They support the uterus; at the same time, by putting a string through them, the end of which is to be left hanging out of the os externum, the woman can take them away and

apply them herfelf.

Commodious peffaries are described in Heister's Surgery, in the article Procedentia Uteri. Dr. Simson inented one, and described it in the Edinb. Med. Essays,

vol. iii. p. 313. Dr. Leake, in the 5th edition of his Medical Instructions, afferts that the use of peffaries, by the pain and irritation they occasion, are apt to produce the whites. He observes, that in cases of bearing down and descent of the womb, to direct the curative method to the feat of the disorder is in every respect preserable to the application of those painful and indelicate instruments, so often made use of with bad effect; for instead of strengthening the weak part, they lay additional stress upon it, and conse-

eafily inflammable, not in the leaft millible with water, quently are highly improper. It is evident that pijlaries only prevent the defcent of the womb, by obstructing the passage; therefore, so long as part is kept in a state of continual diftention, it never can be braced up or ftrengthened by the power of art or nature. If the peffary is introduced too fmall, it will foon be forced away by the first fit of coughing, or straining, &c. And if it is too large it will bring on the fluor albus in a high degree; befide, it generally becomes fo painful as not to be endured, and being a pernicious application, ought to be rejected from practice. It never can answer any good purpole; but, on the contrary, will always increase the disease, by over-straining and weakening that part which was too weak be-fore. As a further diffusive from the use of these instruments, the Doctor gives the two following cases.

First, A woman advanced in years, had worn a peffory for fome time; the complained of great heat and inflam-mation at the lower region of the belly, attended with violent colic pains, and frequent but ineffectual endeavours to avoid her urine; she had much fever, and at last became delirious, from want of fleep and violence of pain, which threatened a mortification in the bowels. The peffary was made of cork, was very large, and closely confin-ed by means of the inflammation of the part, confiderable force was required to extract it, which occasioned much pain and discharge of blood; however, by proper care the recovered and remained well.

Second, A peffary was extracted from the fundament of a woman, after making its way through the vagina into

the rectum, by a mortification of the parts. PESSOLATE. See MORPIONES.

PESTILENTIALIS. Belonging to the plague.

PESTIS. The PLAGUE. Many writers have observed that the plague visits England once in thirty or forty years; but happily for us this does not happen: a period of more than 120 years has elapfed fince to melancholy and lamentable a vilitation.

Dr. Cullen places this genus of difease in the class py-

rexia and order exanthemata.

The plague is the world degree of putrid fever, the most violent, rapid, and suddenly fatal. In the beginning it is fometimes attended with inflammatory symptoms when it happens in cold climes but it speedily becomes most putrid. It is called pestilential when the patient falls into fudden weakness, and is affected with the worst fymptoms, and in the greatest degree at once. It is called lague when the worst symptoms attend, but the loss of ftrength is not quite fo fudden; and all the other species are called putrid fevers; they are all of the fame general nature, but denominated from their most remarkable symptoms, or other attending circumstances.

Whatever be the nature of the peltilential mialmata, the effects are immediately to diminish, and, according to the degree of its power, to extinguish the vital heat. It breaks the fibres of the blood, and diffolves its texture,

whence the purple fpots.

The plague approaches with a chilline's and thivering, foon after, a violent vomiting, a painful opprellion of the breaft, and a burning fever; all which continue till death changes the feene, or till the eruption of a bubo or a pa-rotis discharges the morbific matter, and cures the patient. If the morbific matter is not thus thrown out upon the furface of the body, it proves mortal. Sometimes, though rarely, the difease is mortal before the figns of fever approach; the broad purple spots, which denote immediate death, coming out even whilst the person is abroad about his business: these spots go in and out before death's approach. Sometimes fwellings appear, without having been preceded by a fever, or any other confiderable fymptom. The breath and fweat are very offenfive. The athognomonic fymptoms are, the buboes and carbundes which appear in various parts of the body.

The plague and the cryfipelas fo refemble one another, that in time of plague they are not always duly diffinguish-

ed at the first.

The air does not feem capable of carrying infection far. Heat and moisture aggravate, but cold deftroys the infectious nature of the plague; so that in these northern climates the insection must be received at first from some person, or from some subject in which it is lodged. The pestilential seminium readily adheres to spongy and porous bodies, and thus may be conveyed to a great diffa ice, without any lofs of its pernicious quality.

From the general nature of the plague, bleeding feems to

ceffary with respect to this operation; however, if symptoms of inflammation run high, by leffening the quantity of blood, the propulsion of the virulent matter to the glands may perhaps be promoted; and this more particularly if the course of the blood to the external parts be afterwards affifted by mild fudorifies. One, two, or at most three days, will effect all that is proposed by taking away blood, so that great difficulty will attend the deter-mination, for depriving the patient of what he will so soon fland in the greatest need.

Mixtures with acids are peculiarly beneficial, and mild ordials should accompany them. The juice of oranges cordials should accompany them. may be fqueezed in all the patient's drink, fweet spirit of nitre, Clutton's feb. fpt. are very powerful remedies. Perfpiration may also be promoted by means of antimonials; as soon as the pulse will admit, the bark should be

given.

The air in the patient's room should be as cool as is most agreeable to the fensations of the patient: his linen fhould be often changed: and excrements immediately buried.

The earlier the tumors appear on the furface of the body, the better; for thus all other fymptoms are removed. Thefe tumors are BUBOEs and CARBUNCLES, which fee.

When the plague is fatal, some die of a fainting the first or second day; others, in whom the poison is not thrown off upon the external surface, or, if thrown off, returning back, brings on a mortification of the nervous coats of the noble parts, as the cefophagus, pleura, fto-mach, intestines, &c. whence the corpse swell, and have an intolerable stench. Sometimes, when the tumors are too numerous, the patient des of a symptomatic sever,

from the inflammation, pain, and heat.

See Mindererus on the Plague, Johannes Langius, lib.
i. epift. 18. Hoffmann, Lobb on the Plague, Fordyce's Elements, part ii. Cullen's First Lines, edit. 4. p. 200. vol. ii. Wallis's Sydenham, vol. iii.

PETALA. PETALS. The tender fine-coloured leaves, which are generally the most conspicuous parts of the flowers, are thus named, to diftinguish them from the leaves of the plants, which are termed folian, from foliam a leaf. Flowers, with one leaf are called monopetalous flowers; with two, bipetalous; with three, tripetalous; with four, tetrapetalous; with five, pentapetalous; with fix, hexapetalous; with more than fix, polypetalous.

PETALODES. An epithet for the fediment of urine,

importing that it is fealy or refembling leaves. It is fometimes observed when there is an ulcer in the bladder.

In botany petalodes is an epithet for those plants which are furnished with flower-leaves or petala.

PETASITES, from πεταπ, to extend, or from πετασος, a bat, or bonnet; fo called because the leaves are large, have a hollow in the middle, and then extend horizontally round the hollow. It is a species of tushlago called tustilago major, galerita, PESTILENT-WORT, BUTTER-BUR; and tustilago petasites by Linnaus. It is a peren-nial plant, found wild by the sides of ditches and in meadows, producing, early in the fpring, a thick naked round-ish stalk, with a spike of small naked purplish sloculous flowers on the top; the flowers and stalks soon wither, and are succeeded about May with very large roundish and heart-flaped leaves, ftanding on long pedicles, fome-what hollowed in the middle, fo as to refemble a bonnet; the root is long, thick, of a dark brown or black colour on the outfide, and white within.

cealed by a large admixture of other fubstances. Their virtue is in a refinous matter, diftinguished by the eye in the dried root, and which is readily extracted by spirit of

wine. See Lewis's Mat. Med.

PETECHIÆ. Red or purple spots on the skin, which frequently appear in the small-pox, &c. The Italians gave them this name from the word petechie, because they resemble the bites of sleas. The French call them purpaths rate; the Spaniards call them taberdillo; the Germans

he an improper method for relief; yet it is strongly advif-ed by many practitioners of note, and amongst the rest Sydenham is one. Great circumspection is doubtless nein the skin without ever raising its surface. Usually they are reddish, purple, or blackish spots in the skin, like small points, but soon spread and gradually grow broader. These petablic go by various other names, some call them punctula, others lenticula, others call the discase in which punctula, others lenticulæ, others call the difease in which they are one of the symptoms, merbus pulicaris. They cannot, with any propriety, be called lenticulæ, for in Celsus the lenticulæ were pimples or blotches, rising above the skin: he compares the scales of the worst fort of impetigo with those of the lenticulæ, lib. v. cap. 28. The term pulicaris, from their resemblance to slea-bites, is not very applicable; for a slea-bite is not at all like a petechia; the slea-bite causes in most people, when recently inflicted, a little whitish tumor, encircled with red, which rises above the skin; it hath a puncture in the middle rifes above the skin; it hath a puncture in the middle, which only is perceptible when closely examined; this tumor subsides by degrees, and disappears: the second or third day a small yellow or brownish spot appears in its

place, and this is not unlike a petechia.

A female patient of Dr. Withers (fee his Treatife on the Afthma, p. 421.) after various other complaints, had a violent rash make its appearance, consisting of small red pimples, dispersed in different places over her body, followed by a great number of purple spots, which were evidently petechial, attended with bleedings at the nose and gums, certain fymptoms of a diffolution of the blood-The first eruption was critical and falutary, and follow-ed by an alleviation of other complaints; but the latter was fymptomatic of the putrid tendency of the fluids. As there was little or no fever along with the peterbial fpots, and as all her other complaints were nearly remov-ed, he was not alarmed at this new disease. Fevers of ed, he was not alarmed at this new diseate. Fevers of different forts, and intermittents among the reft, are often observed to injure the texture of the blood in this way, (see Pringle's Obs. p. 287. Monro on the Difeases of Military Hospitals, p. 1. Cleghorn on the Difeases of Minorca, p. 147.) though sometimes indeed petechial spots, as he has seen in several instances, will appear without any evident sever having preceded. (see Duncan's Casesand Obs. p. 00.) Had says he approached the few Cafesand Obf. p. 90.) I had, fays he, an example of this 2 few months ago, in a young lady about eleven years of age, in whom there were hundreds of purple fpots, which all came out nearly in one night. Her nose too at times, bled profusely. Another patients had a profusely bled profusely. Another patient, had a great number of bled profilely. Another patient, had a great number of peterbiæ of a very obflinate nature, when the was pregnant of her last child, along with a most severe pain in one side of her upper jaw. This pain returned every four or sive minutes both day and night without intermission, although every tooth in the discassed part had been drawn before I saw her. She had too a very dangerous discharge of blood from her nose; and at another time a great quantity of the lochia after delivery. The time a great quantity of the lochia after delivery. The homorrhages and peterbial spots arose from the dissolved ftate of her blood. For the complaint first mentioned, I prescribed a strong decoction of bark, and recommended chiefly a vegetable diet (though as her stomach was very weak, and the was accustomed to have a little fresh meat at noon, and as it was evident the diffolved flate of her blood did not arise from her diet, but from the sever and diminished tone of her fibres, I was not strict in forbidding it, nor perhaps could the have followed my advice if I had), along with the moderate use of cordial antiputrescent liquors. She could not take the bark again in fubitance, otherwise I should have prescribed the pow-der in preserence to the decoction. The decoction be-The roots are aperient, alexipharmic, and promife to be of confiderable activity; they have a ftrong fmell and a bitterish acrid taste, of the aromatic kind, but not agreeable, very durable and diffusive, scarcely to be confrom being much in the open air. Many of the poorer fort of people injured their health very materially by living in a close confined atmosphere. They err even in this respect, much more than they are obliged to from necessity; for they absurdly think it dangerous to have a door or window open during any illness; and thus, to shun a less evil, they fall into a greater, and in no complaint more certainly than in those in which the blood is in a diffolved and putrid state. It is worth observing that, one day fine was feveriff, and had a lax upon her, after which there was a fresh appearance of purple spots, so great was the effect, even of that short return of sever-PETECHIA. Dr. Schotte observes, that this word is fo great was the effect, even of that short return of sever not Latin but Italian, signifying a small-pox of a purple It was near two months from first to last, before those

purple fpots were entirely removed; for as fome died away, others appeared. I have feen feveral cafes in which they have continued three or four four weeks. In of vitriol, and many other powerful antifcorbutic re-

PETECHIALIS FEBRIS. The PETECHIAL FEVER, also called lenticularis febris, peticulas. In most writers it is treated of as a distinct species, but it is only the low or the putrid sever attended with purple spots. The purple fpots are a fymptom only, and are very common in putrid diforders, whether of the acute or chronical kind. See PUTRIDA FEBRIS. See Hoffman, Pringle, and Huxham on Petechial Fevers

PETICOLAS. See PETECHIALIS FEBRIS.

PETIGO. See LICHEN. PETIVERIA. GUINEA HEN-WEED. Father Plumier called it Petiveria in honour of Mr. James Petiver, who was a curious botanist. It is common in the West Indies, but is not noted for its medicinal qualities, though it gives the milkof cows a garlick fmell if they eat it. PETOLE. CRAB-LICE. See MORPIONES.

PETROLEUM. It is fo called because it is an oil which diffils from rocks. It is the only bitumen liquidum, liquid bitumen, that is known: Neumann reckons the naphtha to be another liquid bitumen, and fays that in confiltence next to the naphtha is the petroleum, which is groffer and thicker than the *naphtha*, of a yellowish, red-dish, or brownish colour, but very light, so as to swim on spirit of wine; he also says that the *petroleum* in the shops is all fictitious. Mr. Edwards in his Elements of Fossilogy, ranks it as a genus in the class of inflammables. He describes it as being an inflammable, which, when pure, is in a fluid form; very inflammable, and burning like oil; and generally of so little specific gravity, as to swim almost in all stuids. It is also called terrae steum, allicola.

PETROLEUM ALBUM. WHITE PETROLEUM. It is nearly colourless almost as fluid and limpid as water, of a strong penetrating smell, not disagreeable, somewhat resembling that of the rectified oil of amber. It is found

only in the duchy of Modena.

- BARBADENSE, called also piffelaum Indicum, bitumen Barbadense, pissaum Indicum. BARBADOES TAR. It is of a reddish black colour, and a thick consistence, approaching to that of treacle or common tar; it is found in the American islands, particularly in Barbadoes, but we rarely have it genuine. It is a species of petroleum.

These different kinds are met with, issuing from the clifts of rocks, or are obtained by distillation from bituminous fubstance, but we rarely meet with any of them genuine. Fine petroleum catches fire at the approach of a flame, even without the contact of one with the other, and it burns entirely away; concentrated acids make great conflict on being mixed with petroleum, but thus its confiftence is thickened, and its fragrance increased; it does not readily mix with the spirit of wine, but is rea-

dily united with the effential oil of vegetables.

The finer petrolea are more agreeable than oil of amber, and more mild than oil of turpentine, they have been used in nervous complaints, and as diurctics, but chiefly in external applications against the rheumatism, palfy, chilblains, &c. In these intentions, the British oil and fuch other productions of our own are equally effi-cacious. The Americans use the Barbadoes tar internally as a fudorific, and externally as a difcutient and antiparalytic. On diffillation the Barbadoes tar yields an empyreumatic oil, which, when placed betwixt the cye and the light, appears of an orange colour, but in other positions of a blue one; but by long keeping it appears yellow in all fituations.

See Dict. of Chem. Neumann's Chem. Works, and

Lewis's Mat.Med.

- FLAVUM, called naphtha Italica, ITALIAN OIL of PETRE, OF ROCK OIL, OF YELLOW OIL OF PETRE. It is of a clear yellow colour, lefs fluid than the white fort, in fmell lefs penetrating, lefs agreeable, and more nearly allied to that of the oil of amber. It is found in the duchy of Modena, but does not very materially differ from the white fort.

PETROLEUM SULPHURATUM. See SULPHURIS BALSAMUM BARBADENSE.

-- VULGARE, called also oleum petræ, petroleum rubrum, petroleum gabianum, oleum gabianum, common Rock oil, RED PETROLEUM. It is of a blackish red colour, of a thicker confittence, and a lefs penetrating, and more difagreeable smell than either the white or the yellow forts. It is found in Italy, and about the village Gabian in Languedoc

PETRO-PHARYNGÆI. These muscles rise from the lower part of the extremity of the apophysis petrofa, and run backwards, to be interted into the linea alba of

PETROSA APOPHYSIS. The rock or harder portion of the temple bones; in children it is easily sepa-rable from the other parts, viz. the mastoid, and squa-

PETRO SALPINGO-STAPHYLINI, called also peristaphylini interni. Each of these muscles are fixed by one extremity, partly to the inner side of the bony portion of the Eustachian tube, or to that next the apophysis petrofa partly along the cartilaginous portion of the fame tube; thence it passes a little way under the fost membranous part, and then turns towards the feptum palati. - OREOSELINUM AMOMUM, Sec APIUM MA-- Macedonicum, Schonicum. PETUM. Tobacco. The Indians call it petun.

Sec NICOTIANA.
PEUCE. The PINE-TREE.

PEUCEDANUM, from peuce, a pine-tree, which it resembles in its leaves. It is also called faniculum porcinum, cauda percina, pinastellum, agrion, agrisophyllon, marathrophyllum; sulphun-wort, and hog's-fennel. It is the peucedanum officinale, Linn.

Boerhaave mentions three species. See Lewis's Mat.

PEUCEDANUM SILAUS. See SAXIFRAGA AN-

PEYERI GLANDULÆ. PEYER'S GLANDS. See

PEZA. The SOLE of the FOOT or the ANKLE. Ac-

cording to fome, it is all under the tibia.

PEZIZA. A fpecies of fungus; fometimes it is without pedicles, and fometimes with them, having, its edges divided so as to form a remarkable cavity between them. It is of an uniform substance like the fungoides, and neither diftinguished by lamellee, nor pores.

PEZIZA AURICULA. See AURICULA JUDA. PHACE, or Phacos. A LENTIL.

PHACOIDES. Of the form of a lentil. An epithet for the crystaline humour of the eye.

PHACOSIS. A black spot in the eye refembling a

PHACEDÆNA, from eays, to eat, feed upon. It is an ulcer that corrodes, and fo fpreads; called ulcus depafcens. Sometimes it fignifies a particular fpecies of ulcer, as the herpes phagedæna. Some deferibe it as only destroying the skin. It is also used to express the canine appetite. See BOULIMUS.

PHALACRA. In Hippocrates they are blunt and

fmooth furgical inftruments as a probe, or any other, with a button at the end. They are called also calvata. PHALACROTIS. A DECAY of the HAIR. PHALANGIUM. It is a plant, of which kind Boerhaave enumerates fix species, but not in repute as a methics of the property of t dicine; also a name for feveral forts of ephemerum.

Phalangium allobrogicum. See Liliastrum

ALPINUM MINUS

PHALANGOSIS. According to fome it is when there are two more rows of hairs in the eye-lids. A dif-PHALANGOSIS. ease of the eye-lid turns inwards, so that the hairs stimu-late the eye, so fays P. Ægineta, lib. vi. c. 8. The eye-lid is tumested or relaxed, so as to appear unseemly or to of-fend the fight; it proceeds either from a paralytic disorder or the musculus elevator palpebrae, or from the relaxation of the skin above; sometimes an ordematous tumor is formed in the eye-lids, but it should be diffinguished from that phalangosis, which, when it proceeds from relaxation, requires an excision of the relaxed skin, though 7 I

phalanges.
PHALARIS, also called Gramen Spicatum. CANARY-GRASS. Boerhaave takes notice of eight species. It grows amongst corn, and is found in many places besides the Canaries. The seeds are diuretic. See Raii Hist.

PHANTASMA. The fame as pfeudoblepfis.
PHARMACEIA. Purgation of the belly by the exhibition of a cathartic.

PHARMACEUTICA. PHARMACEUTICS. part of medicine which gives the description of remedies,

and teaches the method of rightly exhibiting them.

PHARMACEUTICE, caspanerum, medicine. The art of healing was carried on down to the time of Herophilus and Erafistratus, in an union of all its branches; and then, Celfus informs us, medicine was divided into three parts; one cured by diet, another by medicaments, a third by manual operation. The first was named in Greek διατητία», the fecond φαρασιώντικη, the third χειρουρία»; each deriving its appellation from the principal method taken to effect a cure; therefore, as that method which cures chiefly by diet, fometimes admits medicaments, fo that which chiefly opposes the disease by medicaments, ought also to attend to diet. Celsus's General Preface, and Preface to his Fifth Book. From whence it is evident, that it was a separation in the different branches of medicine, and not in prefcribing diet and medicines, which was intended: for though they had different appellations, each feet had the whole management in those disorders which fell properly under their cure. Accordingly, if we take a view of the several chapters in which each of these subjects are treated, we shall discover that one set of practitioners undertook the cure of internal, and the other of external diforders; and whether they were of that class which cure principally by diet, or principally by medicaments; yet each party took in every necessary for his purpose, both from diet and medicines. The first four books evince, that the dietetic branch were to have the entire management of all diforders, which confined themselves to the inward parts of the body, and originated internally. Areteus and Coelius Aurelianus, confined themselves to this line. The fifth and fixth books flew, that the pharmaceutifts had the whole direction of diet and medicines in all the external diforders, where the principal part was not conducted by the hand, whether arising from an external or an internal cause, being the sect which are said to have prescribed medicines; and surgeons cured the wounds they had made, both by diet and medicine. Those who cured internal, and those who cured external disorders, without manual operation, had the appellation of iatros among the Greeks, and medici among the Latins; nor was it intended that they should interfere with each other in their different departments. See Kirkland's Inquiry, vol. i. p. 64, &c.
PHARMACITIS. See AMPELITES.

PHARMACOCHYMIA. That part of the chemical art which teaches the preparation of chemical medicines, by way of distinction from the spagirical part, which

treats of the transmutation of metals.

PHARMACOPŒIA, from paquanos, a medicine, πειευ, to make. A Pharmacopæia, or Dispensatory. Pharmacopæias are compilations of medicines approved of by medical practitioners. About the middle, or the latter end of the fifteenth century, Nicolaus Præpofitus of Tours wrote a general Dispensatory, and it was the first. The compositions in it were principally taken from Mesue, and from Nicolaus de Salerno. The first Pharmacaparia which was fet forth by public authority was that of Valerius Cordus, under the fanction of the fenate of Norimberg, anno 1542.
PHARMACOPOLÆ. See/AGYRTÆ.

PHARYNGÆA, (CYNANCHE.) Quinfy of the ocfophagus and pharynx. Dr. Cullen adopts the name in his Nofology, and in his First Lines of the Practice of Physic, but never having seen a case of the kind, he refers the subject to those who have. In the Edinb. Medical Commentaries, vol iii. p. 192. a cafe is mentioned of the cynanche cefophagea, and the following very fhort narrative of it is given. A girl, twenty-two years old, had a pain

he diforder fometimes returns notwithstanding the operation. See Hippocrat. lib. de Vict. Rat. in Ocul. and Celfus, lib. vii. c. 7. See Prosts and Trichia.

PHALANX. The bones of the fingers are called the cattempted to swallow any thing, and then she referred the attempted to swallow any thing, and then she referred it still to the same place. She had no ccush, nor any dyspness; but her pulse was hard, full, and frequent; she had not the least redness nor swelling in the tonsils.

She was cured by bleeding, and the antiphlogiftic regimen.

PHARYNGÆUM SAL. It is of ute in quinfies, and thence fo called. It is thus prepared: R Cryftal. tart. fal nitri a 3 j. alum. uft. 3 fs. diffolve in diffilled vinegar, and coagulate the folution. This falt is diffolved

in water for gargarifms.

PHARYNGETHRON. The pharynx or fauces.

PHARYNGO-STAPHYLINI. They are two fmall mufcles fixed to the lateral part of the mufculi thro-pharynx. ryngæi, as if they were portions detached from these muscles; thence they run up obliquely forward, along the two posterior half arches of the septum, and terminate in the feptum above the uvula, where they meet together; the thickness of the posterior half arches is made up by these muscles. See Winslow's Anatomy.

PHARYNX. Thus the Greeks name what the Latins call infundibulum, also pharyngethron. It is a mulcular bag, fixed behind to the basis of the skull, laterally to the bottom of the face, and below that to the largax. See CESOPHAGUS. The muscles of this part are sufficiently described by their names, they are the crico-pharyngeus, from the cricoid cartilage to the pharynx; thyro-pharyngaus, from the thyroid cartilage to the pharynx; thyro-pharyngaus, from the os hyoides to the pharynx; hypopharyngaus, from the flyloid process to the pharynx; pterrygo-pharyngaus, from the pterygoid process to the pharynx; mylo-pharyngaus, from the dentes molares to the pharynx; falpingo-pharyngæus, from the Euflachian tube to the pharynx; cephale-pharyngæus, from the basis of the skull to the pharynx; fyndefmo-pharyngæus, from the white ligament to the pharynx; chondre-pharyngæus, from the cartilaginous appendage of the os hyoides; gloffo-pharyngæus, from the cartilaginous appendage of the os hyoides; gloffo-pharyngæus, from the root or upper part of the toppur less than the root or upper part of the toppur less than the root or upper part of the toppur less than the root or upper part of the toppur less than the root or upper part of the toppur less than the root or upper part of the toppur less than the root or upper part of the toppur less than the root or upper part of the toppur less than the pharynx; falpingo-pharyngæus, from the white ligament to the pharynx; compared to the pharynx is considered to the pharynx is ryngæns, from the root or upper part of the tongue late-rally. Some have reckoned the muscles of the pharyna to be but two or three, whilst others have multiplied them to thirteen or fourteen on each fide. Albinus divides to thirteen or fourteen on each fide. Albinus divides them into fix pair, viz. Siylo-pharyngæus, which is the fame as deferibed by Douglas under that name; confiritior inferior, i. e. the crico-pharyngæus, and thyro-pharyngæus of Douglas; the confiritior medius, i. e. the hye-pharyngæus of Douglas; the confiritior fuperior, i. e. the gloffe-pharyngæus of Douglas; the confiritior fuperior, i. e. the gloffe-pharyngæus, mylo-pharyngæus, and pterigo-pharyngæus of Douglas; the palate-pharyngæus, i. e. thyro-flaphilinus of Douglas; and the falpingo-pharyngæus of Douglas. In their various actions they enlarge and comprefs the gullet, fo as to forward the aliment into the flomach.

The space is all the vacuity behind the yelum pendulum.

The space is all the vacuity behind the velum pendulum

The pharynx is made up partly of feveral diffinct flefly portions, which are looked upon as fo many diffinct mulcles, fo disposed as to form a large cavity, and partly of a membrane which lines the inner furface of this whole cavity, and is a continuation of that of the nares and pa-late. This membrane is wholly glandular, and it is thicker on the fuperior and middle portions of the pharyna, and on the bottom, or lower portion. Immediately above the first vertebræ, it forms several longitudinal rugæ, very thick, deep, and fhort, and we generally find therein a collection of mucus, in dead bodies. In the great cavity there are no rugæ, the membrane there adhering, as well as in the upper part, very closely to the muscles. At the lower part where it is the thinnest, it covers the posterior part of the larynx, and is very loofe, and formed into irregular folds.

In the Lond. Med. Obf. and Inq. vol. iii. p. 85, &c.

is a cafe, in which, from a dilatation of the pharynx, a dif-ficulty of fwallowing was occasioned. PHASEOLUS. The KIDNEY-BEAN. It hathalong pod, full of kidney-thaped or oval feeds; the plant, as to its outward appearance, is flexible, scandent, and mostly trisolated, or hath its leaves growing by threes. Botanists enumerate thirty species, or more. It is the name of the kidner-bean tree. See Abrus of the similar bertensis, phaseolus major. French beans, or common kidney-beans. They are cultivated in gardens, they flower in

leis flatulent than beans or peas.

PHASEOLUS ZURRATENSIS, called also phoseolus pruritus excitans, deliches, nai corona, phafeelus Bra-flianus, cadjuel, COW-HACE, COW-ITCH, and STINK-ING BEAN. The deliches urens, vel deliches pruriens, vel deliches volubilis, leguminibus racemofis hirtis, valvulis fubcarinatis pedunculis ternis, Linn. This is a species of the kidney-beans; it is brought from both the Indies. The hairy part upon the pods, if scraped off, and mixed with iyrup to the confistence of a fost electary, may be given to children in doses of a teaspoonful, and two to adults, for destroying the long round worms. If ten or twelve pods are steeped in a quart of beer, and 3 iv. of the infusion are taken every morning, it acts as a diuretic, and gives great relief in dropsies. See Raii Hist. Lond.

Med Journal, vol. vi. p. 313.

PHASEOLUS. See CAJAN, and FABA.

PHAUSING/IS. Red circles in the legs, excited by fire. It fometimes is used to fignify other kinds of spots, as well as red ones caused by the fire.

PHELLAMDRIUM. Sec MEUM ALPININUM GER-

MANICUM.

PHELLANDRIUM AQUATICUM, Linn. WATER-HEM-tock, FINE-LEAVED. It is generally called water-hemlack, and thus is often confounded with the cicuta virofa. See CICUTA AQUATICA. Withering, in his Bot. Arrang. vol. i. p. 176. describes the phellandrium aquaticum as fol-lows: the rundle with many spokes; rundlets, the same; lows: The rundle with many ipoxes; rundlets, the lame; general fence, none; the empalement, a partial fence of feven leaves, tharp, as long as the runlet; cup, of five teeth, permanent; the bloiloms general, nearly uniform; florets, all fertile, individually unequal; petals, five, tapering, heart-shaped, bent inwards; chives; threads; five, hair-like, longer than the petals; tips roundish; pointal; feed-bud beneath; shafts two, awl-shaped, upfight, permanent; summits, blunt; feed-vessels, none; feuit ears shaped, smooth, crowned with the cup and the fruit egg-shaped, smooth, crowned with the cup and the pointals, divisible into two parts; seeds, two, egg-shaped, and fmooth. The florets in the centre are fmailer than the others. The branchings of the leaves are straddling, the ftem is very thick, hollow, fcored, and the petals are

It is the phellandrium aquaticum, Linn. Phellandrium, vel cicutaria aquatica quorundum. Ray's Syn. 215. Cicutaria paluftris. Gerard. 1063. Cicutaria paluftris tenui-B. p. 161. SKELETON WATERWORT; Withering's Bot. Arrang. which laft author fays, the feeds are recommended in intermittent fevers; the leaves are fometimes added to discutient cataplasms: the plant is generally efteemed a fatal poifon to horfes, occasioning them to become paralytic; but this effect is owing to an infect,

(curculio paraplecticus) which generally inhabits within the stems: the usual antidote is pig's dung.

PHELLODRYS. 'The LAUREL OAK; called also corrs. It grows in Dalmatia and Greece. The leaves, bark, and acorns, agree in virtues with the common oak.

See Raii Hift.

PHENION. See ANEMONE.

PHIALA. A glass vessel, with a big belly, and long neck. It is often used for chemical coagulations and folutions. Also the common PHIAL of the apothe-

PHILADYNAMOS. An epithet of water, expressing the property of it, by which it diminishes the strength.
PILLANTHROPOS. The name of a compound an-

ti-nephritic medicine.

PHILANTHROPUS. See APARINE.

PHILLTIS. See LINGUA CERVINA.
PHILLYREA. MOCK PRIVET. See LIGUSTRUM

PHILONIUM. An opiate fo called from its inventor Philo. Galen fays, that the antidote of Philo is one of the oldest of its kind, but the Mithridate is much older. The philonium Romanum is originally a prescript of N. Myrepsus. There are different prescriptions for this compound in different pharmacopæiæ, that of London, 1788, is made in the following manner, and now called confection opiata; confection of opium. Take of hard purified opium, powdered, fix drams; long pepper, ginger, and carraway feeds, of each two ounces; fyrup of white poppy, boiled to the confiftence of honey, three times

in July, the pods are used as aliment, they are opening, the weight of the whole. Mix the purified opium care-digestive, and provoke turine. They are less nutrient, and fully with the heated fyrup; then add the rest rubbed to

PHILOSOPHORUM. LAC vel MERCURIUS. See

PHILTRON, from \$\phi\_{1240}\$, to kifs. A love potion, or a medicine to excite love. It also fignifies the cavity, or depreffure on the upper-lip, which is fituated immediately under the feptum of the nofe.

PHIMOSIS. It is when the prepuce cannot be drawn over the glans penis, fo as to uncover it. It is also called capifiratio. Dr. Cullen places it as a variety of the phlogodis phlegmone. See LUES VENEREA, and Bell's Sur-

PHLASMA. A CONTUSION or COLLISION.
PHLEBOPALIE. The pulfation of an artery.

PHLEBORRHAGIA, from part, a vein, and julious,

to break. A RUPTURE of a vein.

PHLEBOTOMIA, from ond, a vein, and reason, to cut. Phlebotomy. It is the fame as venæ fectio. The

cutting, or opening a vein.

BLEEDING, or the taking away blood, is only proper when there it too much craffamentum in the veilels, or when it is to avoid a worfe inconvenience than that of leffening the already too little quantity of blood. In general, the pulse is the best guide, both as to when to bleed, and the quantity to be taken away. When the pulse is full, strong, or tense, bleeding will always be proper, provided that a plethora be the cause, and not rarefaction; indeed, in old people, the pulfe feems hard from the rigidity of the coats of the arteries.

Bleeding is not only useful when actual inflammation attends, but also in fanguine habits which tend to be ple-

thoric. In the small-pox, if the heat demands, and the pulse will allow of bleeding, the operation may be performed at any period of the disorder. In intermitting severs when the heat is great and there is pain in the bowels, or if a delirium comes on, bleed in the interval of the fit, or on the access of the hot fit. In the measles, blood for the most part should be taken away, both in the beginning and at the decline of the diforder. In the bilious colic, blood is taken away in the beginning, to prevent an inflammation in the part where the pain is urgent. In the gout, when the fever runs high, bleeding is found uleful; and if the patient is plethotic, or comatous, repeat the operation. In pregnancy, bleeding is generally required in the first three months, and its repetition in the last three. In the hemorrhoids, where there is a fulness of the blood-veffels, empty them by this operation. When the lochia are suppressed, bleeding is rarely to be omitted. In a concussion of the brain from a blow or a fall, bleeding is more frequently useful than the trepanfall, bleeding is more frequently useful than the trepan. In apoplexies from a fanguine plethora, bleeding is the principal means of relief. When bleeding is and is not convenient, would require a particular treatife to relate; but its proper use, or ill effects, are generally noted in these sheets, in treating of each disease respectively. On the subject of blood-letting, see Galen de Sang. Mission. Botallus de Venasses. M. A. Severinus on Bleeding. An Essay concerning Blood-letting, by R. Butler, M. D. Bell's Surgery, vol. i. p. 63, &c. White's Surgery, p. 167.

gery, p. 167.

The first instance of bleeding on record, is that of Podalirius's; Hippocrates did not often direct this operation; Aretæus, Celfus, and Galen, used it more freely than Hippocrates; but at different periods, and by different professors, it was encouraged, or nearly prohibited. In-deed until the circulation of the blood was demonstrated, the principles for this practice did not feem so clear as they are at present; and even now, there is great diver-sity of opinions respecting bleeding in many particulars. PHLEBOTOMUS. A LANCET, or a FLEAM for

bleeding with.
PHLEGMA. PHLEGM. Galen fays, every humour that is cold comes under this denomination. In Hippocrates this word often fignifies an inflammation.

In chemistry the word phlegm fignifies the most watery part obtained from bodies by distillation or otherwise. PHLEGMASIA. An inflammation. See In-

AMMATIO. PHLEGMATIA. A beginning anafarea.
PHLEGMATITIA. A beginning anafarea.
PHLEGMATORRHAGIA. The name of a diforder,

in which a flux of thin phlegm was discharged from the | PHCENIX. See LOLIUM.

PHLEPS. A VEIN. But among the ancients, it was

both an artery, and a vein.

PHLOGISTICI. Inflammations, and fevers, with a

hard pulse and topical pain.

PHLOGISTON. INFLAMMABLE PRINCIPLE on which the ignition of all bodies depends. The existence of this element was first affected by STABL, and from him the opinion has been adopted by other chemifts, but of late a new doctrine has been broached by M. LAVO-

The greatest objection to the belief of which principle was, that it could neither be seen nor felt by our senses, directly; nor discover itself indirectly by the weight it communicated to bodies, with which it was united; on the contrary, the latter always became lighter, in proportion to the quantity, they contained. So that it was imagined instead of being possessed of any specific gravity of its own, to be a principle of positive levity, such as that of heat, and light may be supposed. This objection is now however removed, and phlogiston in the abiltract, is found to be no fubtile principle, capable of eluding our refearches, but one very common and eafily met with, being no other than COMMON CHARCOAL.

In proof of the existence of which phlorisson, made evident to our fenses, we are presented with several experiments by Dr. PRIESTLEY, one the most conclusive we

shall recite.

"By the loss of one grain of charcoal of copper, formed by the union of spirit of wine with that metal, and which like common charcoal was consumed without having any refiduum, he reduced four ounce measures of blogisticated air, till only one ninth remained unabforbed by water, and again, with the lofs of one grain and a half of charcoal, fix and a half measures of dephlogisticated air were reduced, till five and a half measures were pure fixed air." Here then is an absolute and undeniable evidence, that fixed air, is composed of depblogifticated air, and charcoal, or PHLOGISTON, and elemen-

PHLOGOSIS. An INFLAMMATION, or an heat in any part without tumor; a flushing. See INFLAMMA-

ÆSTUS VOLATICUS.

PHLOMIS. YELLOW SAGE. See SALVIA SYL-

PHLONITIS. See BUCLOSSUM SYLVESTRE.

PHLYCTANAE, from exogu, to be bot, or to boil, called also bolopblyelides, olopblyelides; sometimes the same as phlyxacion, or phlyzacion. Linnæus and Vogel ufe this term, as fynonymous with hydatis; generally what is understood by it, are little watery pustules, on any part of the body. Small eruptions of the skin, arising from an hot acrid humour. Also pussules which appear on the tunica cornea of the eye, of which there are two forts, viz. the unguis or pussules, properly so called, and phlyttana. The pussules are deep, and are filled with purulent matter; when they arise in the conjunctiva, they are reddish at the first, and afterwards white; but when on the transparent comea, they are dusky at the first, and, in time, turn white. The phlycdufky at the first, and, in time, turn white. The phlyctono are small vesicles, full of a transparent humour; they are feated on the cornea, and fometimes on the con-junctiva; their feat is usually under the external coat of the cornea, and hath been cured by taking off fome of the cornea, and fo removing the stagnating matter. A preceding inflammation is the caufe of both puftules and phlyelana. The only danger is, left they become ill-conditioned ulcers. Whether they are pultules or phlye-tana, drefs them three or four times a-day with fix or eight grains of ceruffa acetata, in aq. rof. 3 iii. and when they give way, wash them with equal parts of brandy and water; but if they neither disperse nor break speed dily, open with a lancet, and, when opened, drefs with

the aq. fappharina.
PHLYXACION, or PHLYZACION. A puftule, or vesication on the skin, excited by fire or heat. Sometimes

it is the fame a phistiana.

PHENICIUS MORBUS. The ELEPHANTIASIS. PHŒNIGMI, See EPISPASTICA.

in which a flux of thin paregraphs. See Salmuthus, obf. 37.

PHLEGMONE, from φλεγω, to burn. A PHLEGMON or INFLAMMATIO.

PHOSPHORUS, from φως, li, ght, and φερω, to bring. It is called also, autophosphorus. It is the name of a collyrium in Galen. It is also the n ame of some chemical preparations which shine in the dark. The phosphorus igneus differs from other naturally shining bodies in this, that it is nothing but a kind of con cealed fire, which difcovers itself by light and smoak, sout if it is rubbed, it breaks out into a slame. This discovery appeared about the year 1677; but was preceded by Baldwin's phosphorus, which is an artificial Bolognian stone. After this discovery of Baldwin's, one Brand, a chemist in Hamdicovery of Baldwin's, one Brand, a chemift in Ham-burgh, made a phosphorus of urine, which was first called phosphorus igneus, then pyropus, then phosphorus. The matter which fixes and increases the phosphorus is alum, which of itself is prepared of urine, and yields the same acid which phosphorus yields on burning; for upon ana-lysis, phosphorus appears to be a composition of strong acid, and an instammable matter, exactly in the manner of common himssone, and may properly be called animal of common brimftone, and may properly be called animal fulphur. If phosphorus is burnt under a be,", a fp. fulph. per camp, is produced. See Dict. of Chem. Neumann's Chem. Works-

PHOSPHORUS BONONIENSIS. | See BON ONIENSIS LAPIS.

- KERCHERI. LAPIS. - LIQUIDA. LIQUID PHOSPHORUS. Powder one grain of the phosphorus of urine, and ten grains of camphor; then mix them well together by trituration. These dissolved in the ol. caryoph make a liquid phes, borns, with which any part may be rubbed without danger of

inflammation.

PHOXOS. The fugar-loaf fhaped head.

PHRAGMOS, from opassu, to inclose as with an bea'ge.

An anatomical term for the double feries of teeth.

PHRASIUM VIRIDE. See FLOS ÆRIS.

PHRENES. A name by wants
ancients, called the diaphragma.
PHRENESIS, or PHRENETIASIS. See PHRENITIS.
PHRENICÆ ARTERIÆ. See DIAPHRAGMA-

PHRENISMUS. See PHRENITIS.
PHRENITICI NERVI. The nerves which run in

PHRENITIS, from open, the mind, also cephalitis. PHRENETIC. came phrenetic in confequence of an inflammation of the diaphragm, and for this reason called the diaphragm by the name of phrenes, as though it were assistant to the intelligent parts. It is also a PHRENSY, or an inflamma-tion in the brain, or its membrane, with a continual fierce delirium and an acute continual fever, and named cephalagia inflammatoria, by the Arabians karabitus, alfo phrenesis, phrenetiasis, phrenismus, sphacelismus. Dr. Cullen places this genus of disease in the class pyrexiæ, and order phlegmafiæ.

It is idiopathic, as when the head is primarily affected; and fymptomatic, as when the morbid affection is translated to the head from fome other part; thus, in a pleurify, the pain is fometimes removed from the fide to the head, whence the phrenfy that generally proves mortal. The idiopathic and lymptomatic also differ thus; the former is infeparably accompanied with an acute fever, the

latter is followed by the fever.

The idiopathic rarely happens in temperate climes; the fymptomatic is fometimes met with, and most frequently appears about the crifis of other fevers, attended with a rigor, a tremor of the joints, tenfion of the precordia, coldness of the extremities, thin urine, which is discharged either in too sparing or too large a quantity; but because of the weakness previously induced by the preceding disease, it proves almost always mortal. It is often dishcult to determine positively, whether the idiopathic, or the symptomatic phrensy is the attending disease. Sometimes the sever begins at the first very violent, head-ach deep-seated and violent, great redness in the sace and eyes, light and noise prove very troublesome, watching is constant, and delirium furious.

Those in the vigour of life, the passionate, the studious, and those with a weak nervous system, are subject to this

diforder.

The causes are, a too great afflux of blood, from an in-creased action of the vessels in the system: the more re-vitriolatum, or manna with nitre, or crystals of tartar; or mote causes are, excessive drinking, anger, an exposure of the head to the fun, an inflammatory diathefis happening at the beginning of a fever, long watching, attention of the mind, any thing that forces the blood up into the head, a suppression of natural periodical evacuations, &c.

According to Alex. Trallian the figns of an approaching phrenitis are as follow: "Intenfe continual watchings, or if the patient fleeps, his fleep is interrupted and troubled, he flarts, and is affected with terrible dreams; he foon forgets what is faid to him; if at any time he returns an answer to a question, he appears more sierce and angry than he seemed to be just before; the pulse is small and hard, and a pain is constantly felt in the occiput; as the diforder increases, the eyes become more fixed and red, tears at the same time flowing from both of them." The figns of a prefent phrenitis are, according to Ceelius Aure-lianus: an acute fever; a pulse hardly perceptible on the furface of the body, or if it is, it is low and tense; the pa-tient's face is inflated or full; blood drops from his nos-trils; continual watching, or disturbed sleep attend; he is feized with a kind of turbulent madness, a preternatural folicitude of mind, and a privation of reason; he frequently changes his posture in bed, and his head is in a continual commotion; he is fometimes chearful without any apparent cause; his eyes are red; he weeps gently, tosses his arms about him, but hath no pain in his head; toffes his arms about him, but hath no pain in his head; his joints are cold, but without any tremor; his urine is copious, yellow, aqueous, thin, and difcharged by little and little. Some phrenitic patients are afflicted with a noife in their heads, a ringing in their ears, an inceffant head-ach; their looks are fixed and ftern, and their eyes frequently wink." Aretœus fays, that these patients are rarely thirsty, and this is true, for though the tongue is black, drink is refused; an extraordinary throbbing is observable in the arteries of the temples and neck in many parients; and from fullen filence, a fudden outrage arises. patients; and from fullen filence, a fudden outrage arifes; except the inflammation foon abates, it proves fatal. Sometimes the inflammation ends in suppuration, especially if the substance of the brain is affected; in this case, the fymptoms abate, a ftupor only being left; but in time, if the pus is not abforbed, the whole pain is deftroyed. The delirium always goes off flowly.

The phrenitis thould be diftinguished from a mania, and from the deliriums attendant on other acute fevers; also

from that inconftancy and foolifhness observable after fome fevers, and that is owing to weakness.

Green vomiting, frequent fpitting, fhiverings, crude aqueous pale urine, convulsions, and no thirst, are bad figns. When external violence is the cause, the disease is usually statal. A constant trembling, starting of the tendons, suppression of urine, total want of sleep, constant fpitting, a grinding of the teeth when the inflammation is from the lungs or inteftines, are generally fatal. The more favourable fymptoms are, hamorrhages, the piles coming on, a diarrhæa, a pain in the breaft, or lower parts, a ftrong cough, free perspiration, a plentiful discharge of urine which drops a copious sediment.

The indications of cure are, to remove the inflammation in the breast parts of the property of

in the meninges; in order to which, it should be known whether the antecedent cause is the repulsion of acrid mat-ter from the skin, &c. or obstructed blood, as in suppresfion of the menfes, &c. or whatever other caufe may have

An agreeable friend may be admitted, but, in general, every thing should be guarded against by which the imagination can be affected; the room should be kept dark as is convenient. The patient should be as little contradicted as possible, and should even be complied with, though in a small degree to his hurt.

This inflammation only admits of one falutary termination, and that is by refolution; therefore the most powerful means for that end are needful, and that without delay. Bleed as freely as the strength will admit of, and repeat the operation as it may appear needful; bleeding from a large orrifice, and supporting the patient in a standing posture, that he may some faint with the loss of blood, will have their advantages. If the jugular vein can be opened, it is usually preferred, and if obstructed menses or lochia were the cause, bleed in the foot, after having taken away a portion of blood as above directed.

As soon as the natient is bled, give him a brist but

As foon as the patient is bled, give him a brifk but

vitriolatum, or manna with nitre, or crystals of tartar; or if it can be had, the ol. ricini. Repeat the purging medicine, as well as the bleeding, at proper intervals, until the inflammation abates in its violence at least.

In the intervals of purging, give the vin. antim. vel pulv-antim. every two hours, in fuch dofes as the flomach will

retain.

Nitre, crude fal ammoniae, or Clutton's febrifuge spirit, may be freely mixed in all that the patient drinks

Cooling laxative clyfters should also be frequently injected, at least let one be administered every night and moun-

The head may be shared, and cloths dipped in vinegar and water may be laid thereon, as oft as they dry or grow

When thus the ftrength is somewhat reduced, let a large

blifter be applied to the flaved head. Sinapifms may be applied to the feet before blifters are admitted.

When there is hope of a mild refolution, opiates may be admitted to abate the watchfulnefs, and then omit the clyfters; indeed, if the patient is very outrageous, opintes

must not be forborn.

Some use tepid water for putting the legs into twice a day, and others prefer a bath for the whole body. If a continual phrenitis comes on in confequence of obliructed

continual phrentis comes on in contequence of obstructed menses, piles, or lochia and spasms are thereby produced, they are the best alleviated by baths.

If the hæmorthoids swell, apply leeches to them

When the disorder is symptomatic, if the pulse will bear it, a vein may be opened; but if the patient is too low, leeches may be applied to the temples, blisters to the head and arms, and snapisms to the feet. Camphor and nitre, in proper doles, well mixed by trituration, or and nitre in proper dofes, well mixed by trituration, or diffolved together in an emulsion should be often given.

The phrenitis goes off by resolution, or suppuration. Sometimes a diarrhoea, or in women an excellive flow of the menses, carries off the disorder from the brain. By bad management it fometimes ends in stupidity, or mad-

nefs, which continues during life. See Alex. Trallian, Cœlius Aurelianus, Actius, Willis's Pathol. Cerebri, cap. x. Hoffmann, Boerhaave, Baglivi, Fordyce's Elements, part ii. Cullen's First Lines, vol. i. p. 272, edit. 4. Bell's Surgery, vol. iii. p. 147. PHRENITIS APPRETA. See MANIA.

—— INANITORUM. See MANIA CORPOREA.

- Vogelii. See Synochus. PHRICASMUS. SHIVERING.

PHRICODES, called also, carrares, quercera. A fort of fever mentioned by the ancients, in which the patient trembled at the least breath of air. According to some it is a kind of femitertian fever.

PHRYCTE. In Latin, friela, fimply, without its proper fubstantive, is refina colophonia, BLACK RE-SIN, fo called in distinction from the liquid fort, called

PHRYGIUS LAPIS. The PHRYGIAN STONE. It is fo called because the dyers in Phrygia used it much. It is produced in Cappadocia; the best is pale and ponderous. When calcined, it becomes reddish. Its uses are the same as those of the lapis calaminaris.

PHTHARTICOS, from φθειςω, το corrupt. Delete-

PHTHEIROCTONON. A name for the STAVES-

PHTHEIRIOCTONON. A name for the STAVESACRE, so called from φθειρ, a loufe, and εξεινω, to kill, because it destroys lice.

PHTHEIRIASIS. The LOUSY EVIL, from φθειρ, a
PHTHIRIASIS. louse. It is a lousy distemper,
children are frequently its subjects, and adults are sometimes troubled with it. The increase of lice, when in a
warm moist situation, is very great, but a cold and
dry one soon destroys them. On the human body sour kinds of lice are diftinguished: 1. The pediculi, so called because they are more troublesome with their feet than by their bite. These are in the heads of children, especially if fore or scabby: and often in those of adults, if they are flothful and nafty. 2. Crab lice. See MORPI-ONES. 3. Body lice; these insest the body, and breed in the cloaths of the nasty and slothful. 4. A fort which breed under the cuticle, and are found in the hands and feet; they are of a round form, and fo minute as often to escape the fight; by creeping under the scarf-skin they cause an intolerable itching; and when the skin bursts 7 K where

authors call them acari, cyrones, and pedecelli.

A good diet and cleanliness conduce much to the defirmation of lier. When they are in the head, comb it every day, and, after each combing, wash it with the following: R Staph. agr. vel coc. Ind. contast. 3 i. aq. font. 16 ifs. & colature adde cinner. clavel. 3 fs. or, inftead of this decoction, fprinkle the puly, fem. ftaph. agr. vel cocul. Ind. among the hairs every night, and confine it with a tight cap.

Codrochius, in his Treatife of Lice, fays, that the powdered coc. Ind. exceeds all other means, and that it may be mixed in the pulp of apple, or in lard, and applied every night to the hair. Some writers affert, that if the pul. cort. rad. faffafr. is fprinkled on the head, and confined with a handkerchief, it defroys the lice in

The body lice are deftroyed by any bitter, four, falt, or mercurial medicine, if applied to the fkin. See Turner's

Difeafes of the Skin.

The black foap, and the flowers called cardamine, or lady's fmock, are faid to be specifics in all cases of lice on the human body. See Sennertus, Codrochius, Mercuria-

lis, and Turner, in his Difeafes of the Skin.

PHTHISIS, from other, to grow lean, confumptio. A

CONSUMPTION. The Greek word, phthisis, fignifies

corruption; but it is used only to express that kind which causes a consumption of the whole body; and generally only that consumption of the body which had for its cause an absorption of purulent matter from the lungs: hence is diftinguished by the term, phthifis pulmonalis, or tubes pulmonalis.

This diforder is chronical, yet inflammatory; and the only chronical disease that is so. Dr. Cullen does not rank the phthis as an original disease, but as a mode of some other disease being terminated; but he distinguishes two species, or at least two states. 1. Phthis incipiens, called sicca also: 2. Phthis confirmata, or humida: both these vary according to their remote causes, and, according to De Haen, the second varies according to the source of the purulence is from the lungs. generally, if not always, the purulence is from the lungs

only.

Confumptions are reckoned phthisical, when obstructions of any kind are the causes; and atrophical, when produced by an excess in any kind of the natural secretions, or excretions; and when an ulcer in the lungs gives rife to it, it is called the confumption of the lungs. Dr. Reid observes, that confumptions arising from various causes, have been differently denominated, symptomatic, scorphulous, scorbutic, asthmatic, &c. But the phthis pulmonalis he defines to be, "an expectoration of purulent matter from the lungs, by means of frequent coughing, attended with a fever, having morning fweats, and remiffions in the forenoon, occasioning a wasting of the slesh and ftrength.

The feat of the true phibifis or consumption is in the lungs; not in the blood-veffels there, but the air-veffels. Sometimes one lobe is affected, and fometimes both. Dr. Cullen fays, it is only when the matter is poured into the cavity of the bronchiæ, that it properly conflitutes the

PHTHISIS PULMONALIS.

Those are most subject to a consumption to whom any

of the remote causes thereof belong

The remote causes are, an hereditary disposition, weak and flaccid lungs, laxity of the fibres, an ill conformation of the breaft or its contained parts, a narrow depressed cheft, with prominent scapula, protuberant ribs, long necks, crookedness, a too free use of spirituous liquors, obstructed perspiration and respiration, or the obstruction of any natural fecretion, cold winds, a vapid putrid air, a plethora, a defect of blood, exanthematous, &c. diforders, grief, intense study, a sedentary life, small and tender blood-vessels, &c.

The mediate causes are, congestions of humours to parts of the lungs already too weak to return by the veins what they received by the arteries; the humours there stagnating lose their former quality, and become the beginning

of tubercles.

It appears in persons of every age: but most commonly from about the age of fifteen, up to that of thirty-five, the fervor of the blood is the greatest, and then an ill for-

where they lodge, clusters of them are found there; fome acrimony in the juices, concurring with the mediate causes the immediate cause; which is an ulcer in the lungs, half every circumstance favouring its appearance and progress. The ulcer is formed by the rupture of the suppurated cells in the lobes of the lungs, and the acrimony of the matter

lodged there. Celius Aurelianus in lib. ii. cap. 14. describes a con-fumption as follows: a phibifis is frequently produced by a previous spitting of blood, and sometimes by a gentle, but long continued catarrh, or cough, by which the lungs are at first gently lacerated, and then ulcerated. It is acare at first gently lacerated, and then ulcerated. It is accompanied by a latent fever, which begins in the evening, and is alleviated in the morning, and attended with a violent cough at those times. At first a small, but afterwards a large quantity of fanious spit, is expectorated. Those who fall into a phibis, in consequence of an hamorrhage, discharge, at first, a bloody spit, which becomes seculent, and then livid or green, and last of all white and purulent, sometimes falt, and at others sweets the voice is hoarse and shrill, the breathing difficult, the charter red, and the set of the body of a concritious cocheeks red, and the reft of the body of a cineritious co-lour. It is accompanied with a loathing of food, and a preternatural thirst. Some patients have a sense of a a preternatural third. Some patients have a lerie of a wound in their lungs, and even exp florate fibres of them. The pulse is weak, hard, and formicular. A phibifis is also accompanied with an inflammation of the feet. As the disorder increases, a flux is brought on; and the phlegm discharged, when thrown upon a live coal, is of a settled and disagreeable smell." Dr. Reid describes this disease as follows: "The first stage of this disease as follows: "The first stage of this difease begins with a cough, which is more or less trou-blesome at night, usually dry, causing pain and stitches in the breat, sides, and head; slight rigors, and some degree of severish heat, with pain in the back, joints, and limbs, the usual effects of taking cold. These symp-toms increase; the cough becomes more violent, hard, dry, and incellant; reftless at night; the pains in the thorax more lancinating and fixed; the difficulty and quickness of breathing confiderable; expectoration little and frothy; the pulse quick, hard, and sometimes like a small cord, at others full and laborious; the tongue white, and the back part timed with wellows the cree dull the and the back part tinged with yellow; the eyes dull; the countenance pale and fickly. Some difficulty attends the fixing on fymptoms that may be called figus of the first frage of a confumption; the above symptoms, if not speedily removed, may be faid to tend to, and too frequently end in it; and as the hard, dry cough, and dyspnesa, indicate the existence of tubercles, however small, it may be called the inflammatory or first period. In a short time the fever becomes more intense, with slight remissions in the morning; when a sewest breaks out upon the breaft and upper parts of the body, which fentibly re-lieves every fymptom. The cough continues, and is ag-gravated in a recumbent posture, keeping the patient from sleep till towards morning. The expectoration increases in quantity, is frothy, formetimes streaked with blood. During the fever, the cheeks have a circumferibed spot of pure florid red; the lips and tubercles in the canthus of the eyes are also brighter than when in health. The fever is augmented after eating, particularly folids, with flushing in the face, and burning heat in the palms of the hands and soles of the feet. As the difease advances, the fever comes on about the middle of the day, increases until the evening, and is violent most part of the night, until the fweat breaks out, and the patient gets fome reft. In the morning they find themselves relieved; but get up languid, pale, and unrefreshed by their sleep. Though the pulse is always quicker than natural, yet there is a remission of the sever for some hours in the forenoon. The expectoration becomes more copious, mixed with pus in finall globular maffes; fometimes difagreeable to the tafte; yellow, greenish, and as the difease advances, of an ash colour. The cough becomes less hard and loose; the pains in the chest and head abate. At this period, when the hectic fever hath regular remissions, when the fweats come on every morning, and when the patient spits up matter freely, the disease may be said to be confirmed. The countenance now gives evident signs of washing, the eyes are hollow and languid, the checks prominent, the nose sharp; the patient's slesh wears a way, and the strength fails; the cough is more distressing in the first part of the night; the breathing short, quick, mation of the body, or of the breast in particular, and an and offensive; their sleep lefs, and disturbed; morning

Iweats more profuse and melting; the interval from fe-ver less distinct. The spiting is more loaded with matter, and, although they should every morning expectorate a brought up more eafily, and in greater quantity, fometimes a pint in twenty-four hours: this is the fecond period of the difeafe; in which there remains some degree of firength, and the flomach is capable of digefting food. From the beginning, the body is supposed to be costive, particularly after the morning-sweats take place. The menses usually cease about this time. The third and last flage commences by the appearance of the loofeness. From being coffive, they have frequent motions in a day, which foon become a confirmed diarrhea; every thing taken into the flomach, quickly running off by the bowels. The fever, heat, and cough abate of their violence, and the morning-fweats become lefs profuse. The diarrheea increases; the strength totally fails; frequent fainting comes on; fometimes a flight delirium fucceeds; the lower extremities fwell; and, at laft, death clofes the feene. When the fymptoms hurry the patient off quickly, the diforder is commonly called a galloping confumption. It should not be unnoticed, that the above symptoms will be rarely met with exactly in the order above related."

The hectic fever attending the pulmonary confumption, Dr. Reid thinks it different from that produced by suppurations, in or about any part of the body. See HECTICA.

The pulmonary confumption, or true phibifis, should be distinguished from all those other disorders which are demonstrated confumptions, but, in which the lungs are not

diftinguished from all those other disorders which are de-nominated consumptions, but in which the lungs are not remarkably assected; such as the consumption from a sim-ple gonorrhoea, the sluor albus, the scurvy, scirrhous in-durations in the mesentery, an abscess or ulcer in the mesentery, a chronical cough, &c.

It is remarkable that consumptive patients are often chearful to the last, in the intervals of the sever, and flatter themselves with the hopes of recovery. When the nerves are affected, as in the hypochondriac disorder, there is always a sinking redness; but, in consumptions, the muscular fleshy parts decay, and suffer first; and that the muscular fleshy parts decay, and suffer first; and that decay coming on gradually, scarce gives the mind notice of it, and thence the patient funcies himself in no great

danger.

The matter expectorated engages the attention in this diforder, particularly fince Sydenham has faid, that if in this particular fixes out the phlegm into water, it a morning the patient spits out the phlegm into water, it will fink if the lungs are ulcerzted, but, if not, it will fwim. But it may be observed, that if a small quantity of mucus is mixed with the matter that is expectorated, it will always fwim, let the lungs be in whatever flate they may. The most remarkable forts of spit are the bluish, the rust-coloured, the blackish, and the cineritibuilth, the rult-coloured, the blackith, and the cincriti-ous; when any of the three first are thrown up, there is a taint in some of the viscera, and the last indicates death's approach; it is the least adhesive, and yet the heaviest of any that such patients exercte. The bluish spit is never thin, and is increased by things that cool the breast, as apples, &c. but lessened by mercurials and su-dorsises. dorifics.

The prognostics are rarely favourable, for it mostly happens that the disorder is too far advanced before the patient is so incommoded by it as to apply for relief; and often the first manifestation of the lungs being affected, uthers in death. Arctæus fays, that when phthifical pa-tients begin to grow better, the cough is lefs frequent, a larger quantity of farious and more moist spit is expecto-rated, much aqueous matter is evacuated by stool, the urine is copiously evacuated, though, as yet, it hatheno fediment, the voice becomes more clear and sonorous, the sleeps are sufficiently long, the praccordia is much rethe fleeps are fufficiently long, the præcordia is much re-lieved, and the pain remitting, is sometimes transferred to the scapulæ, the difficulty of breathing is gentle and less frequent, but accompanied with an asperity of the voice, and when these things happen the patient recovers. But besides the obscurity of the diagnostics in some, and the late application of others, it is observed by Kirkrin-gius, Willis, &c. that some have been thought to labour under a consumption during thirty or forty years, without any evidence of the disorder having any influence on their lives; but then the state of the case hath not been rightly understood. Willis says that it sometimes happens, that understood. Willis fays that it fometimes happens, that a cavity or two are formed in the lungs, with callous fides, so that matter collected in them is not conveyed to the mass of blood, but is every day totally expectorated, though its quantity is very large: persons in this fitua-

large quantity of thick or yellow, and even, as it were, purulent spit, and a small quantity of the same through-out the day, yet in other respects they enjoy sufficient health, breathe easy, eat and steep well, have a duc quantity of slesh, or, at least, have a good habit of body, and, at length, this discharge from the lungs abating, the patient is cured. So that on the whole, the favour-able prognostics may only be considered as intimations that death is not so immediately to be expected, as when that death is not fo immediately to be expected, as when the more threatening fymptoms attend. While the appetite is good, and the fleep refreshing, the disorder does not appear to have made any dangerous progress; however in other instances this disorder may be circumstanced. It does not appear that a consumption of the lungs is in its own nature so fatal as it usually proves to be: wounds in the lungs are healed as soon as those of be: wounds in the lungs are healed as foon as those of any other of the vifcera; abfeeffes are formed in the lungs, which foon disappear without inconvenience; and inflances have occurred of patients recovering from all the stages of the pulmonary confumption. To neglect, or mismanagement, or both, for the most part, the usual fatality is to be attributed. Dr. Geo. Fordyce observes, that there are two cases in which an user of the lungs is constituted. fometimes cured: 1. From an abfecs in a peripneumony.
2. From a wound in the lungs. But from any other cause he sears that it will ever prove fatal; for in an ulcer of the lungs, their constant motion, and the quantity of

air constantly taken into them, prevents it from healing.

The origin of the genuine phihifis pulmonalis may generally be traced from hæmoptysis; from what is called taking cold; and fometimes from external injuries. When the discase hath made a certain progress, the symptoms may have differed in their incipient state. The general intentions of cure are, 1. To obviate the occasional causes of fever. 2. To evacuate the purulent matter from the lungs. 3. To palliate the most urgent symptoms. 4. To regulate the air, exercise, diet, and passions of the mind.

The diet should be light, nourishing, and acescent; a little may be often taken, but full meals should never be allowed.

allowed.

When ulcers are formed, and pus discharged, mild balfamics conveyed into the lungs with the breath, the bark taken freely into the lungs with the breath, the bark taken freely into the flomach, a good air and proper exercife, are adapted for healing the ulcers. The bark, demulcent and acefeent diet and medicines, are ufeful to prevent putrefeency. The columbo-root both mends the appetite, and blunts the acrimony of the juices; and may be ufed inftead of the bark, when it does not agree with the patient; myrrh given with the faline mixture, and ferrum ammoniacale has been efteemed a very beneficial medicine, and as to particular formations, many of them. medicine, and as to particular fymptoms, many of them are relieved as follows.

Dr. Fothergill observes, that the most benefit is obtained from medicine in the very beginning of the disorder; a cough is first excited by acrid serum, or by an inflar-mation; the acrid serum, if not soon diverted, will cause an inflammation; and if this inflammation terminates any way than by a timely refolution, though the immediate confequences are feemingly fmall, they prove infurmount-able, and proceed to a fatal iffue. Though the inflam-mation ends in fmall tubercles, which with much caution may not difturb for many years, yet fmall irregularities, and that want of care which is observed in most until too late, fubject them to the worst effects.

If inflammation and heat are confiderable, bleeding is useful in the beginning, and may prove a principal means of cure; but, in the future stages, it only palliates for the present, and as it reduces the patient's strength, the

the prefent, and as it reduces the patient's strength, the disorder soon overcomes him.

Dr. Reid observes, that the recent effects of a cold are easily removed by bleeding, diluting drinks, abstinence, and the usual antiphlogistic plan. That when from a bad habit of body, or from neglect, the cough remains obstinate and dry; with pain in the breast; stitches in different parts of the thorax, increased upon coughing, and attended with a considerable degree of heat and sever; bleeding should be occasionally repeated, in moderate quantities, according as the pulse, &c. will permit, and until these symptoms abate. The bowels should be kept lax by means of gentle faline purgatives; and if the cough prevents sleeping, suitable doses of the tinctura opii camphorata

fers in every kind of cough, and in every period of the pulmonary confumption, is fuch a dofe of pulv. ipecac. as will excite vomiting once or twice; this he repeats morning and evening, as the strength of the patient and vio-lence of the complaint may indicate. The Doctor obferves, that the lungs are peculiarly affected by the fto-mach and its contents, and if the lungs are difeafed they will be the more influenced thereby; further, that if any of the hypochondriac viscera are in a difeased state, the lungs, if inflamed, will be affected by them. It is well known, indeed, that when the lungs are found, acrid matter in the flomach and bowels hath caufed and kept up an obstinate cough. Hence the advantage of those frequent but gentle emetics. By giving emetics as above recommended, not only the contents of the stomach are evacuated, accumulation of the viscid phlegm and acrid bilious matter prevented; but the lungs being compressed during the action of vomiting, whatever mucus and purulent matter are in the ramifications of the afpera arteria, and air-veficles, in tubercles or vomicæ, will be forced out and discharged; by which means an infinity of laborious coughing is prevented; the patient feels greatly relieved, and the tender lungs remain at reft, till a fresh accumulation of matter is formed, which requires fome time. By the univerfal concussion and agitation caused by vomiting, obstructions in the liver, biliary veffels, and in other hypochondriac vifcera, are attenuated and removed: and in all complaints arising from these causes, it is the most powerful and certain alterative that can be found in the whole materia medica. Puking once or twice does not fatigue even very enfecbled patients. Through every stage of the disease this method of puking with the ipecac. morning and evening, or every morning at leaft, may be continued with great advantage. The firength of the patient, and the urgency of the fymptoms, will determine the frequency of the dofe. In the morning it should be taken fasting, and if the patient is weak, it should be taken in bed, but he must not sleep after it, as that fometimes prevents its action on the fto-mach. If it is required in the evening, its operation must be over before bed-time. Though emetics are fo peculiarly infifted on, there are inftances in which attention is required before they are administered, and indeed in which it will be proper to forbid their use; e. g. some cases of pregnancy in which abortion may be endangered; in scirrhous affections of the stomach, they cannot be allowed of, with others that will occur to the attention of the judicious.

Vapours from demulcent balfamic medicines received into the lungs may be of use to moderate the cough, difpole the ulcers for healing, and to affift expectoration; but the taking of balfamics into the stomach, rather counteracts than expedites the ufual intentions of preferibing them. In applying vapours to the lungs by infpiration, the ingredients should be adapted to the state of the dif-ease, and it should be observed whether the trachea or its branches are inflamed; whether or no there is an increafed fecretion of acrid mucus from the lungs; or whether or not they are ulcerated; in all these states, whatever is conveyed into the lungs, must be affished by proper perspiratives. Antiseptics, or antispasmodic, attenuant, and balfamic medicines, may all be conveyed by means of vapours into the lungs, and fo applied im-mediately to the feat of the difease, and thus principally the attempts to cure should be made. But if the cough is fo troublesome as to prevent sleep, proper opiates will be neceffary. See below. It is effentially requisite to keep the lungs quiet, for the agitation of coughing fatigues the patient, increases the inflammation, and hastens the suppuration of the tubercles. Repeated emetics greatly conduce to prevent thefe; but the additional af-fiftance of anodynes are also fometimes necessary. When the cough is prevented, or even considerably alleviated, the inflammation will readily disperse; the immediate

cause of its continuance being removed.

Riding is indiscriminately directed by Sydenham in all consumptive cases; and that the best physician in confumptions is a horse, and the best apothecary is an ass, become a common-place witticism; but, if a patient is enseebled, and rides in cold wet weather, he will be rather injured by it: if, in other more favourable feafons,

phorata may be given in the evening, and repeated in the he is fatigued after riding, his breathing is thereby reanight if required. But the remedy which he chiefly predered more frequent and difficult, his ikin parched and dry, the palms of his hands hot, his cheeks flushed, his tongue dry, and if he perceives a greater inclination to drink than to eat, a more gentle exercife must be used, riding on horse-back must no longer be continued. In all cases riding should be over before dinner. Old peo-ple should take longer journeys than young ones. In nerv-ous consumptions it is always useful. But in the true ous conjumptions it is always ulcius. But in the true phtbifis, if in the beginning, especially if the patient is plethoric, it endangers an hemoptoe; and when there is a vomica, the brilk motion of a horse may occasion an inflammation. Again, consumptive patients should ride gently, only in a morning, and no longer than whilst the pulse continues calm. If after this exercise the patient's spirits are more gay, his appetite somewhat excited, his breathing is easy, his skin cool and soft, he may continue to ride whenever the weather will appear.

to ride whenever the weather will permit.

The bark is an important medicine after an ulcer is formed in the lungs, and an infusion of it in cold water is an agreeable method of administering it. If it affects the breathing, three drams of the ballam of Tolu may be diffolved with the mucilage of gum arabic, and added to each pint of the infusion. The acidum vitriolicum dilutum may be added to each dose. Thus the hectic heats, night-fweats, and every fymptom that can be attributed to the abforption of purulent matter, are checked and kept moderate. It may here be remarked that, ac-cording to the experiences of different phylicians, success hath been various. Some extol the bark, the vitriolic di-lute acid, &c. whilst others declare them useless. It is well known to all, that difeafes of the fame denomination are variously circumstanced in different patients, and hence the feeming contradiction in the experiences re-lated. If in one inftance or more, the hectic fever attending, may be produced, as supposed by Dr. Reid, without the presence of pus as an agent, in other instances the absorption thereof may be an attendant; befides, the various conflitutions confidered as natural, the different accidental disorders in the habit, producing or accompanying the phthisis pulmonalis, may sufficiently reconcile the feeming different practices in this complaint, concile the feeming different practices in this complaint, and render each an object not unworthy our attention. In many inflances the calomel hath been the principal fource of relief, according to the relations on this subject by Dr. Sims, who suspecting a latent veneral cause, very happily proceeded on a mercurial plan, accompanied with such other aids as his judgment in this, and fagacity in that case, enabled him to differen as the needful.

that case, enabled him to discern as the needful.

From small blisters, when there is a fixed pain in the breasts or sides, increased by coughing that does not yield readily to bleeding, and the antiphlogistic medicines usually given, good effects are often produced applied upon the part, and repeated as soon as the skin is healed. This method is better than applying blistering ointment to continue the running, which is rarely sufficiently effectual. But in some instances neither nitre, the bark, nor blisters, can be complied with by the patient; in which cases, such other means as the seracity of the attending physician other means as the fagacity of the attending physician

fuggefts must be substituted.

Mercurials are extolled for their efficacy in diffolving the tubercles which are formed as foon as the inflamma tion terminates that laid the foundation of the difeafes The hydrargyrus è creta given in small doses as an alterative, is preferred by some to all other preparations of this kind.

Milk hath been the diet proposed in every age, at least ever fince Hippocrates's time. Women's milk, especially if drawn from the breast by the patient, is to be preferred to all other; in want of it, assemilk is preferred, because it abounds with sweet ferum, and possesses but little of the colorus part with which more reprossible milks. tle of the caseous part with which more nourishing milks abound; next to the milk of affes, that of goats may be used; and if cows milk is drank, let it be mixed with an equal quantity of barley water. Milk affords a mild nourithment, and blunts the acrimony of the juices. Whey is also of fingular advantage: and milk may be mixed with infusions of such herbs, as feem falutary in these cafes.

Columbo-root. It may be substituted for the bark, if that purges or otherwise offends.

Issues. These should never be omitted where there is a ferofulous disposition, or a faline catarrh: they are most effectual

case two or three grains of ipecacuanha may be taken when required, and worked off with eamomile tea.

Night-fweats are relieved by going early to bed, rifing foon in the morning, and taking the bark, as above di-rected. Frequently the dilute vitriolic acid, is a ufeful addition; it should be given over-night, and joined with the opiate when that is required. The fp. ætheris vitriolici, in the quantity of two or three drams to a pint of water, with a little of the fyr. papav. rubr. is grateful and ufeful, if a glass of it is taken as often as is agreeable. As a falutary means of relief, in this inflance, Dr. Sims recommends the wearing of a flannel thirt next the fkin. He supposes that the morning perspirations may arise, at least in part, from that discharge being checked during the day, and nature making a push to relieve herfelf, and open the closed pores at night. Whatever, therefore, tends tokeep up an equable discharge, prevents the necessity of a struggle. He further adds, that the evening sever, and violent paroxysm of coughing, which commences frequently on the patient's going into bed, may also arise from the same cause; the latter however feems connected with the exposure of the skin to the air, when the patient throws off his wearing apparel; as on causing a patient to make the experiment, he found that when he went into bed, without taking off his cloaths, he escaped the paroxysm; whereas, whenever he put them off, although the bed was carefully warmed, he always had as violent a one as is ever observed in any. The shortness of breath is relieved by proper vapours

received with the breath, amongst which those from a mixture of wax and refin are ufeful; the wax and refin may be laid on an iron that is hot enough to fend up vapours from them. Sterne's balfamic æther is much ap-

proved for this purpofe.

Hectic heats are relieved by moderate bleedings, a free use of butter-milk, milk-whey, and in the intervals, the bark with dilute vitriolic acid. Two or three times a day give the following draught, and at bed-time, add tinet. opii gr. vi. vel x. to the dofe; R mucil. e fem. cydon. 3 i. ammoniæ acetatæ 3 ii. fyr. papaveris albi, 3 ii. m. f. hauft. Baths of foft water, with a little milk, and a fmall quantity of nitre, are useful, and should be daily used.

Spitting of blood. This fymptom calls for repeated bleeding until it is overcome; and, to prevent returns, continue to bleed at proper intervals, and keep the mind

free from all violent agitations.

A diarrhea may be moderated, perhaps removed, by the decoct. vel extr. Campechensis, or the pulv. e creta compositus cum opio & pulv. trag. c. p. æq. If it is attended with griping pains and bloody stools, give the enem. ex amylo, cum opio. The columbo-root is ferviceable in this case, and also small doses of the lythargyrum acetatum. As this symptom usually attends the last stages of a consumption, when it is abated, the night-sweats and hectic heats will be increased, and vice versa; so that little good is doze by any means. fo that little good is done by any means.

A vomiting may be generally relieved in the fame man-ner as a naufea; but, in case of failure, give the tinc-tura benzoes composita, gt. xl. cum tinct. opii, gut. v. in

The cough, when attended with pain in the breaft, requires repeated fmall bleedings; the pil. fcillæ. Ph. Edinb. or, when proceeding from foorbutic ulcers or ferofulous ones in the lungs, are much relieved with the pulv. hydrolapathi; but perhaps, in general, the beft kind of remedy is fuch dofes of a mixture of the pil. fapon. pil. ex aloe cum myrrha, as the urgency of this fymptom may require; the proportion of each may be fuch as while the cough is moderated by the opiate, the bowels may be moved by the purgative. In general their proportion may be from one to two parts of the pil. fapon. to two parts of the pil. sayon. of the pil. ex aloe cum myrrha, as a laxative, and almost a specific for the cough. Dr. Sims recommends the use of fulphur; he observes that it neither heats, nor checks

felphur; he observes that it neither heats, not cheek perspiration; and is peculiarly efficacious in relieving, almost in the worst stage of this disease.

PHU. A name for feveral fpecies of valerian, but in

general the garden valerian is understood by it. See VALERIANA.

PHYGETHLON, from our. It is represented varioully; some describe it as a broad, but not much elevated tumor, in which there is some resemblance of a pustule; it is attended with violent pain, fo as fometimes to excite a fever. It is flow in ripening, and is not much of it con-verted into pus. Its general feat is in the arm-pits, neck, and groins. Celfus fays that fome of his countrymen call and grouns. Cellus tays that some of his countrymen can't panus. Both Galen and Celfus fay that an eryfipelatous inflammation is called phygethion. Celfus, in fome places, ranks it among glandular fwellings. Some fix its feat in the glands under the jaw.

PHYLACTERIA. See AMULETA.

PHYLICA. See ALATERNUS.

PHYMA, from \$\phi\_{\text{op}}\text{and produce}\$, or to be generated from, or from \$\phi\_{\text{op}}\text{a}\$, to produce. All kinds of preternatural tumors from any part of the body, and especially such as affect the superficies of the skin, and arise without any external cause, and are generated, increased, inflamed, and suppurated in a short time. See Galen's Com. in 6 Epid. Phymata are also inflammations of the glands, which suddenly break forth and haften to suppuration. Paulus fuddenly break forth, and haften to suppuration. Paulus, lib. iii. c. 22. Sometimes by phymata, fome fort of fcrofulous tumors met with in children, are thus called; and fometimes this word fignifies abfeefs in the inward parts, as when there is a vomica in the lungs, &c. It is fometimes used to fignify a tubercle, a caruncle, &c. According to fome, phyma is a diminutive of phygethlon. It is also a little swelling like a boil, fornewhat round and flatter.

PHYMATA. INFLAMMATIONS. Also the name of a kind of beaft, which if a man looks at, he looks pale for some days after.

PHYMOSICA, ISCHURIA. A suppression of urine from a phymosis. See Ischuria.

PHYSALIS ALKEKENGI. See ALKEKENGI.

PHYSALUS. A ROAD.

PHYSCONIA. A PHYSCONY. It is a hardish tu-

mor, occupying a large portion of the abominal cavities; it increases very gradually, is not fonorous; nor is there any fluctuation observed in it. Dr. Aitken defines it to be a feirrbus of one or more of the abdominal organs. Dr. Cullen places this genus of difease in the class cachexize, and order intumescentize, and makes it a synonyme with bypofarca. Its species are various as the parts affected; e. g. the liver, kidneys, womb, ovaries, mefentery, in-tellines, omentum, &c. Other tumors on the skin, &c. are called by the name of physconia. This disease admits not

PHYSOMETRA. A TYMPANY of the WOMB. Dr. Cullen places this genus of difeafe in the class cachexize, and order intumescentiae. It is formed by air, &c. which diftend the womb, and is called also hylierophyse. It may be discharged by rendering the os uteri internum per-

PHYSIOLOGIA. PHYSIOLOGY, from \$10515, nature, and \$2470, to treat of. That branch of medicine which confiders nature with respect to the cure of diseases, and particularly the human body, its parts, structure, health, life, functions, and ecconomy; and depends much on the knowlege of anatomy. See Sauvages, Pemberton, or

Haller, on this subject.
PHYSOCELE, from quon, a flatus, and xxxx, a tumor, A wind rupture, or a windy tumor. See EMPHY-

PHYTEUMA. See ERUCA.
PHYTOLACCA, from puror, a plant, and lacca, because of its red colour like lacca. The flowers are re-

Americanm, PORK-PHYSIC, PORK-WEED, POKE-WEED, RED-WEED of VIRGINIA, RED-NIGHTSHADE. It is found every where in North America, from Virginia to New York. It is a large plant, with a ftrong ftem: it fends forth many branches. The leaves are large, fmooth, juicy, oval, and entire, without indentations on the edge, and placed alternately. The root is large and perennial, runs deep into the ground, and divides into many branches. It is raifed in our gardens.

The leaves are anodyne. The juice of the whole plant is tharp and corrofive: it is not used inwardly; but inspissated to the consistence of an ointment, by setting it in the fun, it is applied to cancers and to ulcers for re-moving their callofity. The corrofive part is fo volatile, that, if the juice is quite dry, it is inactive and useless. If the roots are roasted and beat into a poultice, then applied to ulcers with hard tumors and callofities, it diffolves them. See Med. Muf. vol. i. p. 85.

The other species is diffinguished by its having leffer fruit, and is also called folanum Barbadense.

PIA MATER. Quia cerebrum accurate, ficut mater infantem, involvit fic ab Arabibus dicta, also called localis membrana. The thin membrane which immediately involves the brain. It is so thin that it would be invisible but for its vessels; where they do not enter it is quite transparent. The brain is divided into lobes, which form convolutions, fomething of the appearance of the intestines. The pia mater covers the whole external furface, and fends processes between the convolu-tions of the brain. The principal vessels that go to the brain pass on the pia mater: so that its use is to connect the lobuli of the brain, and to support the vessels. Some describe a third covering of the brain, and call it arachnoides, and place it betwixt the pia mater and the dura mater; others make this the external lamella of the pia mater, but it is not of that fignification which it is reckoned. See MATER.

PICA, called also picatio, malacia, allstriophagia, citta. Longing. It is a preternatural appetite in pregnant women, and fome fick perfons when about to recover. It is called pica from the bird of that name, which is faid to be fubject to the fame diforder. The diforder confifts of a defire of unufual things both to eat and drink, and in being tired of one and wanting another, and the state of the particularly things that are accidentally finelled. It is called malocia, from panaxos, weakness. Dr. Cullen places this genus of disease in the class locales, and order dysorexize. In pregnant women it is somewhat relieved by bleeding, and in about the fourth month of their pregnancy it leaves them. Chlorotic girls, and men who labour under suppressed hæmorrhoides, are very subject to this complaint, and are relieved by promoting the respective evacuations. In general, whether this diforder is observed in pregnant women, in perfons recovering from an acute lever, or in those who labour under obstruction of the natural evacuations, this craving of the appetite should be indulged.

PICEA. See ABIES. PICELT. See NICOTIANA.

PICHROCHOLOS, from wixpor, bitter, and xoxm, bile. A person abounding with bitter bile, or a person subject

to anger.

PICTONUM COLICA. See Colica.

PIEDRA DI COBRA. See Cobra DE CAPELLO.

The pierres de cobras are discovered by Felix Fontana, to be artificial productions, and to consist only of calcined hartshorn.

PIERRE NOIRE. See Ampelitis.
PILA HYSTRICIS. The BEZOAR of the PORCU-

PINE. See BEZOAR HYSTRICIS.

MARINA. A species of alcyonium, or a round fpherical ball found on fea-coafts amongst wrack. Lemery describes it as being about the fize of a man's fist, fometimes larger, fometimes less: it is lanuginous, of a dark colour, formed by a collection of hairs, fand, and other impurities of the sea, united by means of some glutinous liquor. It is faid to kill worms. Zwelfer says that when it is calcined it is useful in scrofula.

PILEUS. See CUCUFHA. In anatomy it is the coif with which fome children are born; it is called pileslus, galca, and vitta.

PILEOLUS. See PILEUS; CUCUPHA.

PILMICTIO. A discharge of substances resembling hairs with the urine.

PILOSELLA. See AURICULA MURIS. A fpecies

of pulmonaria, bieracium, gnaphalium, and turritis.
PILULA. A PILL. Pills are a form well adapted for those medicines that operate in small doses, and that are offensive in taking, or so heavy that are not easily fufpended in, or mixed mechanically with any fluid. They diffolve the most difficultly, and produce the most gradual and lafting effects of any other form; this, in fome cases, is a disadvantage, in others an advantage. Emetics, if they are retained long in the stomach, usually pass off by stool; but stomachics are proper for this

Refins should be beat up with spirituous mixtures, such as the fyr. alb. 3 viii. sp. vini. r. 3 i. m. gums with water, dry powders with the conf. cynofb. or mucilag. e gum arab.

Gold and filver leaf do not diffolve in the ftomach, and often hinder the pills from diffolving, therefore should never be used.

What cannot be included in four or five pills, for one dofe, is not fit for this form. It is a term given to feveral compounds, many of which will be found under fome one of the principal ingredients, as Pilulæ e gummi. See Asa FOETIDA. PILUS. A HAIR.

PIMENTA, vel PIMENTO. ALL-SPICE, or JA-MAICA PEPPER. See PIPER JAMAICENSIS.

PIMPERNELLA. See ANAGALLIS.

PIMPILIM. LONG PEPPER. See PIPER LONGUM. PIMPINELLA. BURNET or SAXIFRAGE, and BURNET SAXIFRAGE. It is called faxifraga because it grows out of the rocks, as if it broke through them; and not because of its efficacy in breaking the stone in the hunot because of its esticacy in breaking the stone in the human bladder. Boerhaave reckons up eight species. The species ordered by the Edinburgh College, is the pimpinella sanifraga, or pimpinella sanguisorbassia, folius pinnatis, solious radicalibus subrotundis, storibus umbellatis albis, Linn. It is called also sanguisorba, pimpinella minor, tragoselinum, smaller burnet saxifrage. A perennial umbelliserous plant: grows in dry pasture grounds, and is the poterium sanguisorba, Linn. Likewise it is a name for agrimonoides; and a species of melianthus. melianthus.

PIMPINELLA ALBA GERMANORUM, called alfo pimpinella faxifraga major. GREATER or WHITE BUR-NET, or SAXIFRAGE. Some of its leaves are deeply cut, the odd one into three fections. It is common in Ger-

many, but rarely met with in England.

All the species are joined into one by Linnæus: their qualities are also similar. The roots have a hot pungent taste, which is not durable. When fresh they affect the eyes like mustard and horseradish. In drying they lose all their subtil matter; water partially extracts their virtue, but spirit completely. When distilled with water they afford a small portion of oil, which is acrid and siery. These roots are warm and stimulating, aperient and diurctic, and are useful when tenacious humours offend.

There is a fpecies which is called nigra, from its being externally of a bright black colour, whilft those of others are whitish; it is remarkable for yielding a bluish oil: it grows wild in Germany and Switzerland. Whatever has been faid of the value of these as medicines by Sthal and others, they are not considered of any repute in the present practice.

ANISUM. ANISE. The annifeeds of the shops are the feeds of the pimpinella anifum, or pimpinella Egyptiaca, foliis radicalibus trifidis incifis floribus flave-feentibus. Linn. See Anisum, and Anisum Indi-CUM.

PINASTELLUM. See PEUSEDANUM.

PINEALIS GLANDULA, from pinea, a pine apple, to which it hath fome refemblance, also called conarium. The RINEAL GLAND. It is a foft greyish body, about the fize of a pea; it is covered by the plexus choroides, and is fituated on the cella turcica of the os sphenoides. Its use, or that it is a gland, are alike uncertain. See

PINEUS PURGANS. See CATAPUTIA MINOR. PINGUEDINOSA MEMBRANA. The CELLU-

LAR MEMBRANE is fo called, where the oily matter is given in small quantities, as one of the highest stimutcontained in it almost dissolves spontaneously. PINGUEDO. FAT. See Adeps.

PINGUICULA. A plant fo called by Gefner, be-eause its leaves are fat to the touch. See SANICULA

PINGULUM. See ARTEMESIA. PINHONES. The BARBADOES NUT-TREE. See

CATAPUTIA MINOR.

PINNA. A WING. The lateral and inferior parts of the nofe are called pinna and also nafi; and the superior broad parts of the ears are also so called, and ALE AURIS. See AURICULA.

PINNA, or PINNA MARINA. A fea shell of a conical form, and of which there are many species. Large pearls are fornetimes found in them. See Lemery de Drogues.

PINNACULUM FORNICIS GUTTURALIS. The

UVULA.

PINO. The name of a species of nettle in Brasil.
PINUS. The PINE-TREE. It differs from the fir-tree in having its leaves standing in pairs, those of the firs being folitary. The pine abounds with the fame kind of refin-ous juice as does the fir-tree. The cones taste agreeably, and are similar in quality to the sweet almonds. The refin of the pine-tree is called frankincenfe. Some fay it is the refin of the pinaster, which grows in Sweden, Norway, and Germany; others fay it is only produced in Arabia. It is a folid brittle refin, brought to us in globes of a brownish colour on the outlide, internally whitish, or variegated with whitith specks; it hath a bitterish acrid tafte, but no confiderable fmell: it totally diffolves in rectified spirit of wine, but water scarcely affects it. is a mild corroborant, though rarely used, except in plasters.

There are many species of pine-trees; among the rest are the tada, which grows in the country of the Grisons.

The bark of all the pine-trees is astringent, and the tops are antiscorbutic; but the virtues of all the pine-trees feem to depend upon the turpentine they contain. See Raii Hift. It is also a name for the CATAPUTIA MI-

NOR, and feveral species of ABIES, which see.
PIPER. Pepper. Arum moschatum. It is the small round aromatic fruit of a trailing plant, which grows in Sumatra, Java, and Malabar. There is variety of fub-

flances of this name, which are diftinguished by particular epithets annexed to the term, viz.

PIPER ALBUM, also called piper maturum, decorticatum, leucopiper, WHITE PEPPER. The black-pepper, when ripe, is macerated and decorticated, and then fold

as another species.

The black-pepper is hotter and stronger than the white; they both feem to heat the constitution more than some other spices that are of equal pungency upon the palate; and from these spices they differ in this, that their pungency does not reside in the volatile parts or essential oil, but in a substance of a more fixed kind, which does not arise in the heat of boiling water. Pepper insused in water impregnates it very strongly with its flavour, but not the whole its spice as the part of the proper of with its tafte; by boiling a little while, a little more of its pungent matter is extracted, and its flavour diffipated. Distilled with water, a thin, light, and limpid oil is obtained, which is very mild, for if a drop falls on the tongue, it only excites a grateful moderate warmth. Rectified spirit completely extracts the pungent part of the pepper; the tincture is hot and fiery, and when evaporated, a still more fiery extract is left behind. The quantity of extract it nearly the fame from both the forts of pepper, but that from the white is the weakest.

- Indicum, called also capsicum, capo molago, piper Hispanicum, piper Lusitanicum, folanum urens, filiquastrum Plinii, piper Brasilianum, piper Guincense, piper Calecuticum, Guinea Pepper. It is the capsicum annuam; or capticum caule herbacco, pedunculis foli-tariis, Linn. It is in long, roundish, taper pods, divided into two or three cells full of small whitish seeds. It is a native of the East and West Indies. When this fruit is fresh it hath a penetrating acrid smell: to the taste it is pungent and acrid; it produces a painful burning in the mouth, like that from arum-root. Rectified fpirit takes up its pungency, and if the tincture is evaporated, the re-maining extract is excellively fiery. This kind of pepper

lants in cold, fluggish, phlegmatic temperaments, in some paralytic cases, in relaxations and insensibility of the stomach, and for promoting the efficacy of aloetic medicines, and the deobstruent gums in uterine diforders. This is without odour, or particular tafte, and is fo readily diffufible that it joins agreeably and conveniently with any other condiment, or fauce. It feems to stimulate the stomach, and promote digeftion; and taken in largely is certainly the most heating of the condiments. Bergius fays he has very often feen long protracted intermittents cured by the following powder, without any relapfe. Six grains of Indian pepper, and two feruples of bay berries, in powder, divided into three portions, one of which was given on the approach of the first rigor, another the day following at the fame hour, and the last on the third day. Cullen's Mat. Med. A species of this is called in the West Indies BIRD-PEPPER, and is the base of a powder. West Indies BIRD-PEPPER, and is the basis of a powder brought from thence under the name of Cayenne, or CAYAN-PEPPER. There are four species of Guinea-pepper, viz. the chilchotes, chilterpin, tenalchiles, and chilpelagua. There is a fifth species, which grows in Peru and is call-

PIPER JAMAICENSE, also called piper caryophyllatum, amonum, caryophillus aromaticus Americanus, pimenta, piper odoratum Jamaicense, pimento, ALL-SPICE, and JAMAICA PEPPER. The dried unripe aromatic berry of a large tree, growing in the mountainous parts of Jamaica, reckoned a species of myrtle, called by Linnæus myrtus pimenta, or myrtus Jamaicensis, fol. oblongo-ovatis clabris alternia, racemis terminalibus & lateralibus, fructu glabris alternis, racemis terminalibus & lateralibus, fructu orbiculari. This kind of pepper is moderately warm, of an agreeable flavour, fomewhat refembling a mixture of cloves, cinnamon, and nutmegs, whence its name of all-fpice. Diftilled with water it yields an elegant effential oil, which finks in water; it is moderately pungent, in fmell and flavour approaching to oil of cloves, or rather a mixture of those of cloves and nutmegs; the remain-ing decoction, inspiffated, leaves an extract somewhat ungrateful, but not pungent, and the berry itself is wholly deprived of its taste as well as slavour, the warmth of this spice residing rather in the volatile than in the fixed part. Rectified spirit takes up all its virtue, but gives over little or nothing with it in distillation. The spirituous extract possesses the whole of the virtues of this pe per; it is very warm and pungent, but not fiery, like those of the black and white peppers.

The Jamaica pepper is often substituted for the black and white forts.

Half a pound of this pepper is put into three gallons of proof spirit, and distilled. This water is substituted for the aq. arematica, and the aqua mirabilis of former dispen-

The London College order a water to be made from half a pound of the berries of piments bruifed, put into a fufficient quantity of water to avoid an empyreuma, from which, after maceration for twenty-four hours, one gallon is to be distilled, and this is called AQUA PIMENTO.

Ph. Lond. 1788.

The oil of Jamaica pepper is generally fubflituted for the oil of cloves, and is very little inferior to the oil of

LONGUM, called also macropiper, catu-tirpali pimpilim. LONG PEPPER. Piper longum, or piper Indi-cum longum, fol. cordatis petiolatis feffilibulque, Linn. INDIAN LONG PEPPER TREE. Of this there are three fpecies, They are produced in the East Indies. The pods are round, about an inch long, or rather more, with numerous minute grains within them. This is hotter and more pungent than any of the other forts of pepper; in its pharmaceutic properties it agrees with them in its pharmaceutic properties it agrees with them entirely. Dr. Cullen fays it has precifely the fame qualities, only in a weaker degree, and therefore thinks the piper nigrum should be employed in its stead, in various compositions where it enters. Mat. Med.

The black pepper is most agreeable to the palate, and is most used in food. The long is the strongest and most used in medicine: the white is weakest, and feldom used in either. Their warmth and punnency reside chiefly in

in either. Their warmth and pungency refide chiefly in

their refin; their aroma in an effential oil.

The general virtues of all the peppers, are, they are sto-machic, carminative, and useful in low phlegmatic and leucophlegmatic habits, and heating to the constitution;

ten grains may be taken three times a day to affift digeftion. When astringents have failed, a diarrhoea hath been cured by 9 i. of pepper with 3 fs. of a diacodium, twice a day.
PIPER LONGUM FOLIORUM NERVIS, &c. See

BETLE.

- MURALE. See SEDUM.

- NIGRUM, called also molago-codi, melano-piper, lada, molanga, piper aromaticum, spice, Black Pep-Per. It is the piper nigrum, or piper rotundum nigrum, foliis ovatis fubleptemnerviis glabris, petiolis simplicissi-mis, Linn. The BLACK-PEPPER TREE.

This is probably gathered before it is ripe; it is the fruit of a plant which grows in Java, Malabar, &c.

There are other species of peppers, but they are of but little note in medicine. See Neumann's Chem. Works; Lowis's Mat. Med.

PISIFORME, Os. See LENTICULARE, and CAR-

PISLOTHRA. Medicines which take off the hair. PISONIA. It is a plant which is found in the West Indies; the natives call it fingrigo. Father Plumier called it Pifonia, in honour of Dr. Wm. Pifo.

PISSÆUM INDICUM. See PETROLEUM. BARB.

PISSASPHALTOS. COMMON FOSSILE PITCH.

See BITUMEN

See BITUMEN.

PISSELÆUM, from wison, pitch, and exasor, sil.

OIL of PITCH. Bitumen Barbadense. It is of the same nature as tar. It is prepared by boiling pitch; wool is said to be spread over the boiling pitch, and when it is soaked with the rising vapour it is rung into a vessel, and this is repeated as long as the pitch is boiling: but the common method of distilling to obtain essential sil is more repeated. PISSELAION. OIL of CEDAR. See PIX LIQUIDA.
PISSINUM OLEUM. See BRUTIA.

PISTACHIA. LENTISCUS. See LENTISCUS.

PISTACHIA. JAMAICA BIRCH.
PISTACIA, called also terebintbus Indica Theophrafti,
Pistachium. The SISTIC NUT-TREE, or the PISTA-CHIO NUT-TREE.

Pistachio nuts are oblong and pointed, about the fize and shape of a filbert, including a kernel of a pale green-ish colour covered with a yellow or a red skin. They are brought from the Levant. The kernels are agreeable to the tafte, are fweetish and uncluous, and of the same general nature as almonds. See Raii Hist. Miller's Bot. Off.

PISTILLUM. The POINTAL or STYLE. It is that column which occupies the centre of the flower, rifing on the top of the embryo, and is generally furrounded with the chives. These differ greatly in their form, for in some flowers they are roundish, in others triangular, oval, or

PISTOLOCHIA. See ARISTOLOCHIA; also called

ferpentaria Virginiana.
PISTOLOCHIA CONCAVA. See FUMARIA BUL-

PISUM. The PEA. Of these there are various species, but they are not noted for their medical virtues. They are foftening and laxative. They are lefs nutrient and lefs flatulent than the bean, and generally more tender, the fweeter and more mucilaginous they are, the more nutritive.

PISUM ARBORESCENS. Sec CAJAN.

PITHA. A name for the cereus feandens minor tri-

gonus, &c.
PITTONIA. A plant mentioned by Miller. are seven species in the warm parts of America.

PITUITA. So some call the water which comes form the ftomach of fome patients while fafting in a morning. See PITUITARIA MEMBRANA.

PITUITA ALBA. The fame as ANASARCA.

PITUITA ALBA. It is that species of diarrhea called diarrhea mucosa. See DIARRHOEA.

PITUITARIA GLANDULA. The PITUITARY GLAND. It is a small spongy body, lodged in the fella sphenoidalis, between the sphenoidal folds of the dura mater it is of a fingular fubstance, not appearing to be either medullary or glandular; on the outside it is partly greyish and partly reddish, and white within. It is transversely oval, and on the lower part, in some subjects, it is divided by a small notch into two lobes, like a kidney-bean. It is covered by the pia mater as by a bag, the opening of which is the extremity of the infundibulum, and it is furrounded by the small circular finuses, which communicate with the finus cavernofi.

- MEMBRANA. The PITUITARY MEMBRANE. It is that which lines the whole internal nares, the cellular convolutions, the conchæ, the fides of the feptum narium, and, by an uninterrupted continuation, the inner furface of the finus frontales and maxillares, and of the ductus lachrymales, palatini, and sphenoidales., It is also continued down from the nares of the pharynx, feptum palati, &c. It is termed pituitaria, because that through the greatest part of its extent it separates a mucilaginous lymph, called pituita by the ancients. This mem-brane is of different structures in different parts; sometimes it is thin, in other places it is thick and fpongy; it is thickest on the septum narium, the lower portion of the inner nares, and the conchæ; in the finuses it is thinner; on the fide next the periofteum and perichondrium, it is plentifully stored with small glands. See CEREBRUM

PITUITOSUS MORBUS. So the ancients called the

PITYRIASIS. A feorbutic diforder of the head, chin,

and eye-brows; called also porrigo.

PITYROIDES. An epithet for a fort of fediment in

the urine, which refembles bran.
PITYUSA. See TITHYMALUS.

PIX. PITCH.

PIX BURGUNDICA. BURGUNDY PITCH. It is the refin of fome turpentine-trees, lefs divefted of its oil than is the common refin. Some fay it is from the mountain-pine. It is also called WHITE PITCH. It is from the oinus abies, or pinus foliis folitariis subulatis macronatis

levibus bifariam verfis, Linn.

LIQUIDA. TAR. Diofcorides calls it piffelaion.
It is the produce of all refinous trees; it was first got from cedar, larch, fir, pitch, but now it is chiefly from pine-trees. It is chiefly obtained from the pinus (fylvestris) foliis geminis: primordialibus folitariis glabris, Linn. & pinus (abies) foliis folitariis fubulatis muclosatis lævibus bifariam versis, Linn. The wood is inclosed in a large oven, which stands within another oven; the space betwixt them receives the fire; from the bottom of the inner oven runs a gutter, by which the tar is conveyed off in proportion as it melts out from the wood.

Tar differs from turpentine in having received a dif-agreeable empyreumatic impression from the fire, and in containing along with the pungent, bitter, terebinthinate matter, a portion of the acid which is extricated from the wood by the heat, and likewise of its gummy or mucila-ginous matter: by the mediation of these principles, a part of the terebinthinate oil and resin becomes dissolv-able in watery liquors, which extract nothing from the

purer turpentines.

Distilled in a common still it affords the common black pitch, an effential oil, called from the name of the tree whence the tar is obtained ol. pini, or ol. tædæ, and an acid fpirit. This oil hath the fame general nature as the oil of turpentine, but is impregnated with the empyreumatic flavour of the tar: a leg of mutton, whilst roafting, basted with tar instead of butter, and a sharp skewer frequently thrust into its substance, in order to let out the gravy, affords in the dripping-pan a composition which has been said to cure the lepra icthyosis, by the body being anointed with it all over for three or four nights fuecellively. Dr. Cullen has in one inftance employed it with great fuccefs. Mat. Medica.

Water in which tar hath been steeped is an useful re-

medy in many diforders. It may be drank either warm it adheres to fome other body fo as to draw from it it or cold. In acute difeases it is taken as freely as the nourishments propagating itself by feed. Under this thirst may demand it; and in chronical diforders, from a pint to a quart may be taken every day, at three or four times, beginning with the first draught whilst the stomach is empty. It is a good deobstruent; it is warming and stimulating; it raises the pulse, increases perspiration, and the grosser evacuations.

Tar-water is made by putting two pounds of Norway tar to a gallon of water, ftirring them well together for clear liquor must be poured off. Of this a pint or more may be taken every day. Those who are curious to see the variety of disorders against which this water is said to be a specific, may consult the bishop of Cloyne's Trea-tise on Tar-Water. In many instances this preparation, says Dr. Cullen, has appeared to strengthen the tone of the flomach, to excite appetite, promote digestion, and to cure all the fymptoms of dyspepsia. At the same time it manifeftly promotes the excretions, particularly that of urine; and the fame may be prefumed to happen in that of others. From all these operations, it will be obvious, that in many disorders of the system, this medicine may be highly useful. Materia. Medica.

PIX NIGRA, called all pix ficco, pix arida, palimpiffa Dioscoridi. COMMON BLACK PITCH, DRY OF STONE

PITCH.

It is tar dried by heat, or what remains of tar after diffilling the effential oil from it; thus pitch is freed from the greatest part of the effential oil, and the acid and

aqueous parts of tar.

PLACEBO. A common place method or medicine. PLACENTA, from whatever, a cake. In BOTANY it is that part of the pod or hulk of a plant to which the feeds are fastened, and by which they are nourished until they are ripe. In ANATOMY, it is a congeries of bloodveffels which adhere to the uterus during gestation, and is called bepar uterinum, which, together with the mem-branes and funis umbilicalis, is excluded generally after the fœtus; they are all altogether called the after-bur-den, the after-birth, and the fecundines. The placenta is a round cake, thick in the middle, And thinner towards the edges; fometimes it is oval, at others it is divided into two, as it were, adhering to each other by the mem-branes. It hath an internal convex furface, where the funis is inferted, and an external concave furface, which feems composed of lobes. When there are two children there are two placenta; and when they are to appear as one, they are really two for the most part, for they have one, they are really two for the most part, for they have no communication of vessels. The placenta hath generally been supposed to stick to the fundus, but that is uncertain; it adheres to that part of the uterus which it happens to fall upon. The placenta is made up of one vein, and of two arteries, which ramify together, the largest being on the internal surface; and even the parts. renchymatous fubstance appears by injections to be quite vascular. No nerves were ever found in the placenta.

In midwifery, many are in a hurry to bring away the placenta, and to that end introduce their hands into the uterus to separate it therefrom; but, if left to itself a little while, fresh pains will separate it, and during their action it is easily drawn away by gently pulling at the fu-nis; and again, as by introducing the hand an inflammation in the uterus is fometimes excited, patience is always to be exercifed in this affair. It hath long fince been observed, that hastening the placenta was one cause of difficulty in delivering it. Many of the most eminent practitioners agree, that a flooding only can justify the speedy separation of the placenta. When necessary obliges the practitioner to introduce a hand into the uterus, the back of the hand thould be toward the uterus, and the hollow of the hand kept as close to the placenta as possible. in feparating it, that the womb may not be injured. Befides the publications on the practice of midwifery, fee Tolver's Prefent State of Midwifery in Paris.

PLACTULÆ. See MORIONES.

PLADAROTIS. A fungous tubercle in the infide of the evalid.

the eye-lid.

PLAGÆ. Solutions of continuity, wounds, stripes, blows, &c. It is synonymous with locales.
PLANCUS. See LEIOPODES.

generical name are included trees, thrubs, under-thrubs, and herbs. Most plants are hermaphrodite, having the male and female parts in the same flower; others bear flowers on the fame stem, some of which are male and others female; of this fort are the melon and cucumber! Some whole plants bear flowers, which are never fol-lowed by any fruit; whilft others of the fame species bear fruit without flowers, and hence are diftinguished into male and female plants; of this fort are the hop, hemp, poplar tree, &c. The female flowers are only followed by fruit; the hermaphrodites are reckoned among the female in this refer to the female in this respect. Instances are well authenti-cated of the secundating farina, from the male flower, being carried to the female of the fame species to the distance of fifteen leagues.

Plants can no more exist without nourishment and air, than animals can. Their nourithment is from oil rendered miscible with water, by the intervention of alkaline salts, or alkaline earth: hence all good foils contain fome pro-portion of one or the other of these; and the oily matter is attracted from the air, which is by putrefactions, exhala-tions, &c. abundantly supplied therewith. The radical fibres attract a part, and the leaves imbibe another portion of nourithment; the first from the earth, the latter from

To a portion of iron in plants, their green colour is attributed; and this opinion is confirmed by all the acci-dents that happen to them from an exclusion of the fun and air, or their free admission, from putrefaction, &c.

On the structure and nourishment of plants, see Dr. Grew; and on the sleep of plants, see Dr. Hill. It is also a name for the metatorfus, and some vegetable

product, viz.

PLANTA MIRABILIS. Sec NEPENTHES.

- MIRABILIS DISTILLATORIA. See BANDARU. ZEYLANICA. See MENTHA PALUSTRIS.

PLANTAGO. PLANTAIN. It is a fmall perennial plant, common in fields, or by road-fides; the leaves lie on the ground, have naked unbranched stalks, bearing on the top a spike of small, imperfect, four-leaved flowers, which are followed by little capfules, which opening horizontally, fhed numerous crooked feeds It is also a name for a species of coronopus, and of pfyllium.

PLANTAGO LATIFOLIA, called also septimervia, bepta-

pleuren arnegioffum. BBOAD-LEAVED PLANTAIN, COM-MON GREATER PLANTAIN, WAY-BREAD. Plantage major, or plantago latifolia major, foliis ovatis glabris, feapo tereti, fpica flosculis imbricatis, Linn. It hath oval leaves, feven ribs which are prominent on the lower fide, running from end to end. It flowers in May.

- Minor, called also angustisolia, quinque nervia, bipemulla, penta neuron, pentapleurum. Rib-wort the GREATER NARROW-LEAVED PLANTAIN. It hath ob-

long, five-ribbed leaves, and fhort thick fpikes.

The leaves of both these forts are ranked amongst vulneraries, and are mildly aftringent; they may be used indifferently, but they are rarely noticed in the prefent practice. Boerhaave enumerates feventeen species.

PLANTARES. Branches of the nerves called popli-

PLANTARES VENÆ. The tibialis posterior having descended to the sole of the soot, forms these veints, by dividing into several transverse arches, which communicate with one another, and with the faphena, and fend ramifi-

cations to the toes.

PLANTARIS ARTERIA EXTERNA. It is one of the divisions of the posterior tibial artery. It passes on the concave fide of the os calcis, obliquely under the fole of the foot, to the basis of the fifth metatarfal bone, and from thence it runs in a kind of arch toward the great toe, communicating there with the tibialis anterior, which perforates the interoffeous mufcles. The convex fide of this arch supplies both sides of the last three toes, and the outside of the fecond toe, forming fmall communicating arches at the end, and fometimes at the middle of each toe, as in the hand. The concave fide of the arch furnishes the

PLAGE. Solutions of continuity, wounds, stripes, blows, &c. It is synonymous with locales.

PLANCUS. See Leiopodes.

PLANTA. A PLANT or VEGETABLE. It is an organical body, destitute of sense and spontaneous motions; is divided into two, one of which goes to the great toe.

7 M

the other is distributed to the first phalanges of the other toes, communicating with the ramifications from the

arch already mentioned.

PLANTARIS MUSCULUS. The mufcle whose tendon covers the planta, the fole of the foot. It is also called tibialis gracilis. It rifes from the outer condyl; it passes down between the gastrocnemius and the soleus, and is united by a cellular membrane to the tendo Achillis. Winslow thinks that as it is attached to the capfular ligament, it ferves to keep it from being pinched in the motions of the joint. Dr. Hunter thinks it hath fome action with which we are not acquainted, feeing it is always diffinct.
PLANTULA MARILANDICA. See GENSING &

ARALIASTRUM.

PLANUM. Metatarfus.
PLANUM os. It is the external lateral portion of the ethmoides. Its outfide, next the orbit of the eye of which it is a part, is smooth; whence its name. See ETH-

PLASTICUS, PLASTIC, from whatow, to form. For-

mative, or endued with a faculty of forming.

PLATÆ. The fcapula.

PLATANUS. The PLANE-TREE. The leaves are large and laciniated; the flower is amentaceous, formed in a globular figure, and confifting of a multitude of flamina. The fruit, which is produced at a diffance from the flower, is fpherical, and contains vaft numbers of long apiculated feeds, intermixed with much down. The Oriental species is called platanus latus, because it extends its branches fo as to cover an hundred men under The leaves cool and repel. See Raii Hift. its shade.

It is also a name for the musa, the female papaya, a species of acer, and the styrax or liquid amber-tree.

PLATYOPHTHALMON. See ANTIMONIUM.

PLATYSMA. Any thing which is flat and broad; thus a piece of cloth, of platter, or of metal, is called

PLATYSMA MYOIDES, also called muoides, quadratus genæ, detrabens quadratus, tetragonus, subcutaneus, de-

preffor maxilla inferior, cutaneus mufculus.

This mufcle rifes from the skin insensibly below the claviculæ, and is inferted into the basis of the lower jaw; it then runs up, and joins the triangularis, and is inferted into the angle of the mouth, and the skin of the cheek. It depresses the lower jaw.

PLAUTUS. See LEIOPODES.

PLECTANÆ. The cornua of the uterus.

PLECTRUM. A name for the styloide process of

the os petrofum, for the uvula, and, in fome authors,

for the TONGUE.

PLETHORA, from whates, plenitude. A plethora is when the vessels are too much loaded with sluids. The pleibora may be sanguine or serous; in the first, there is too much crassamentum in the blood, in the latter, too little. In a fanguine plethera there is danger of a fever, inflammation, apoplexy, rupture of the blood-veffels, obstructed fecretions, &c. in a serous, a dropfy, &c. A rarefaction of the blood produces all the effects of a plethora; it may accompany a plethora, and should be dif-tinguished therefrom. Mr. Bromfield observes, that a sanguine plethora may thus be known to be present by the pulfe. An artery overcharged with blood is as incapable of producing a ftrong full pulse, as one that contains a deficient quantity; in both cases there will be a low and weak pulse; to distinguish rightly, the pulse must not be felt with one or two singers on the carpal artery; but if three or four fingers cover a confiderable length of the artery, and we press hard for some time on it, and then suddenly raise all these singers, except that which is near-est to the patient's hand, the influx of the blood, if there is a plethora, will be fo rapid, as to raife the other fin-ger, and make us fensible of the fulness. See his Obs. and Cafes, vol. i. Linnæus obsérves, that in the fan-guine plethora there is a redness of the skin from the fullness of blood, attended with a dyspnæa. The sanguine pletbsra is relieved by bleeding; the ferous by purging,

diuretics, and sweating.

PLEURA, vel PLEURON, from PARPER, the fide. The breaft is lined with a membrane thus called; it is smooth inwardly, but rough outwardly, where it is attached by a cellular membrane to the adjoining parts; it covers the diaphragm, as the peritoneum covers it on the under- other than fatal.

communicating with the branch of the tibialis anterior; | fide; where it goes to the fpine, it covers the lungs, and makes a complete bag on each fide, which duplicature forms the mediaftinum. The use of the pleura is to give the contained viscera a smooth surface, and to confine a lubricating juice, which is supposed to be secreted by the extremities of the arteries; and the mediaftinum ferves to keep the heart more fixed in the centre of the body, and prevent wounds of one fide the thorax from affecting the other. The pleura is of a firm texture, and hath many blood-veffels and nerves running in it. It is subject to inflammation and abscess. See PLEURITIS and

PLEURITICA. A PAIN in the SIDE.

PLEURITIS, from wheeper. A PLEURISY, or inflam-

mation of the pleura.

mation of the pleura.

Three kinds of pleurifies are spoken of by different writers, viz. the true or inflammatory, the false, and the spassmodic or statulent. Dr. Cullen places it as a species of pneumonia, or inflammation of the contents of the thorax: and distinguishes four varities.

1. Pleuritides idiopathicæ simplices. 2. Pleuritides complicatæ. 3. Pleuritides symptomaticæ. 4. Pleuritides falsæ.

The true pleurify is when a pain and sever attends an inflammation of the pleura.

Some have disputed whether the seat of this disorder be the pleura, or the external coat of the lungs, but it is generally supposed to begin in the pleura, and so to extend to the lungs, as by dissecting those who die of pleurifies, the outer coat of the lungs is found affected.

Its causes are whatever can excite internal inflamma-

Its causes are whatever can excite internal inflammation in general: also suddenly drinking of cold water af-

ter being heated with exercife.

Aretæus gives the following fhort, but excellent de-feription of a pleurify: "An acute pain accompanies it, which reaches to the throat, in some to the back, and in others to the shoulders; it is succeeded by a difficulty of breathing, watching, nausea, redness of the cheeks, phlegm, breathing, watching, naufea, redness of the cheeks, phlegm, and very yellow and bloody matter. It is worle if the fpit be not bloody, or a delirium, or a coma, comes on." The pulse is remarkably hard, vibrating, and strong; but the pluris is principally known to be present by the pain in the side with a high sever, a difficulty of breathing, and a cough. The pain is usually just above the short ribs; it is increased by inspiration, and lessens on expiration; thence the breathing is difficult: if the pain this its seat, a favourable prognostic thence arises; the inspirations are short. The cough is short, suppressed, and sometions are fhort. The cough is fhort, suppressed, and sometimes dry; but at others, a mucus is spit up from the lungs; at first it is thin, but growing more like pus and bloody. The difficulty of breathing sometimes so increases as to check the blood in its passage through the lungs; and the patient is presently sufficeated. If a mortifications takes place, the pain ceases suddenly, the pulse as suddenly becomes weak and small, though it be quick, and it is often irregular; a delirium and convulsion then presently comes on, and the patient is destroyed. If the disorder does not on, and the patient is deftroyed. If the diforder does not prove fatal by any of these ways, nor yet is relieved by the spitting, or by some other natural or artificial method, a fuppuration comes on, which is known by an irregular coldness and shiverings, and the pain becoming a dull one; if the suppurated part points externally, a suctuation may be felt by pressing it with the singer; and if the pus is emptied into the cavity of the thorax, an empyema is formed, and is known as remarked in that cafe. times this suppuration is twelve or fourteen days before it is formed; and whether it happens sooner or later, it is usually satal. There is no disease wherein the critical fymptoms are more violent, and more strongly marked than in this, and a perfect cure instantly follows, when death is often the most expected.

The pleurify should be distinguished from inflammation

of the lungs, of the diaphragm, of the mediastinum, an of the intercostal muscles; from the bastard-pleurify, and

peripneumony, and from rheumatic pains in the fide.

If the fever is violent, the heat burning, the cough and tongue very dry, a gangrene may be expected which does not often happen, if a suppuration does not take place. If the stitch abates suddenly without any manifest cause, but at the same time the countenance changes, grows pale and sad, the eyes appear dull and heavy, and the pulse feeble, it denotes a translation to the brain, and is mostly satal. If purple spots appear, they are rarely other than satal.

Let the air in the patient's room be cool, but not cold; and, except the heat is very great, let all that is drank be falfe plearify, or an inflammation of the liver, with pleutepid. A spoonful of linseed, unbruised, and half an ounce ritic symptoms. of liquorice root infused in a quart of boiling water, is

an excellent common drink.

In this, as in all other imflammatory fevers, bleeding is a principal remedy. The quantity of blood which may be taken away, and the repetitions of the operation, are best determined by the continued hardness of the pulse. A free bleeding at the first is always more useful than feveral leffer ones afterwards; therefore, as a repetition is not often convenient, bleed at the first until the patient faints, or till the pulse is manifestly altered. If before affiftance is called in, the expectorated matter is bloody, and fomewhat digested, bleeding must be forborn.

Blifters are rarely to be omitted; generally they are ap-plied on the pained part, immediately after a free bleeding; but fome prefer the application of them to the legs, and that when the violence of the fever is fomewhat abated. Before a blifter is applied, bladders of warm water may be tried by laying them over the part com-plained of, and the volatile liniment may be rubbed thereon. If the pain is obstinate, when the blifter on one fide ceases to discharge freely, apply another to the other

Cooling clyfters frequently injected during the first three or four days, render the loss of much blood less necessary.

Antimonial preparations given in fuch dofes as will keep up a naufea, are of fingular advantage both with

respect to the fever, and to expectoration.

Nitre and camphor, with small quantities of opium to moderate the violence of the pain, are powerful affiftants. If the opium feems to affect the head, add a little fal c. c.

If what is fpit up be yellow, or streaked with blood, the gum, ammon, will be a proper addition to the other

A cooling purge may be given as foon as the first bleeding is over, and if the heat and inflammation are violent, it may be repeated every second day, notwithstanding the clysters; for, if possible, a resolution of the inflammation must be aimed at.

If the menses appear in female patients, they must not interfere with the necessary repeated bleeding, nor occafion any alteration in the treatment of the difeafe.

If after taking away blood the pulfe finks, and becomes languid, the fal c. c. in doses of fix or eight grains may

be repeated every three or four hours.

In the very beginning of the diforder, having premifed due evacuations, the decoct. rad. fenek. is almost a specific. An ounce of the root may be hoiled in water to a

fic. An ounce of the root may be hoiled in water to a pint, and two or three spoonfuls may be given three or four times a day. If it excites a vomiting, give smaller doses. See Peripheumonia,

Also Wallis's Sydenham; Shebbeare's Theory and Practice of Physic; Hossians's Med. Rat. Syst. Fordyce's Elem. part ii. Cullen's First Lines, vol. i. p. 311.

The bastard pleurify is an inflammation of the intercostal muscles. The causes are nearly similar to those of the true pleurify. The symptoms and cure are also nearly alike. It differs from the true pleurify in that the pain is more external; where the pain is, there a swelling is perceived, and if the part is touched, the pain becomes very pungent, and the patient cannot lay on the pained side. There is less pain on inspiration, and of consequence not so great a difficulty of breathing. The cough is generally dry, the general instammation is less violent, and the lungs are less apt to be affected; a mortification selthe lungs are less apt to be affected; a mortification feldom takes place, and suppuration hath but little danger attending it.

In order to the cure, bleed in proportion to the hard-

nefs of the pulse; purge at proper intervals; bladders of warm water may be applied to the part complained of, and it may also be rubbed with the volatile liniment: fometimes when the part is acute a blifter is applied, and the decoction of rad. feneka given as in a true pleurify. If a fuppuration threatens, encourage it by means of

fomentations and poultices.

This diforder fometimes terminates in a fweat, and rarely continues more than feven or eight days, See Fordyce's Elements, part ii. Tiffot's Advice to the

People. This term is given to other discases, viz.

PLEURITIS HEPTICA. A variety of plearify called & ritic fymptoms.

- SPURIA. When the rheumatism is seated in

the mufcles of the thorax.

—— SPLENICA. INFLAMMATION of the SPLEEN. PLEURODYNE. Pains in the pleura. PLEURODYNE RHEUMATICA. The RHEUMATISM

PLEURODYNE RHEUMATICA. n the muscles of the thorax, or bastard pleurify. See RHEUMATISMUS.
PLEURON. See PLEURA.

PLEURONEUMONIA. A distemper confisting of

a pleurify and peripneumony.

PLEURORTHOPNŒA. According to Blancard it is a pleurify, in which the patient cannot breathe without keeping his neck erect.

PLEUROSTHOTONOS, also called tetanus lateralis. It is when from a tetanus the body is bent to one fide.

See TETANUS.

PLEXUS. In anatomy, is a kind of network, or complication of veffels. A plexus of nerves, is an union of two or more nerves forming a fort of ganglion or

PLEXUS CARDIACUS, or PULMONARIS. It is formed of the reciprocal ramifications of both trunks of the eighth pair, and their mutual communications with the filaments of the intercoftal or great fympathetic nerve. It is fituated above the lungs, on the forefide of the bronchia, and it distributes to the pericardium, &c.

—— CHOROIDES, also called plexus reticularis, or

retiformis. The fornix cut off, and removed, we fee a vafeular web, called the plexus choroides, with faveral eminences which it covers. The first two great eminences are called corpora striata, and the other two are called thalami nervorum opticorum. The first fmall eminences are clearly united together, the anterior are called nates, and the posterior testes. Le Dran explains it to be a folding of the carotid artery in the brain. See CEREBRUM.

- PAMPINIFORMIS. The spermatic vessel. See

SPERMATICA CORDA.

PLICA POLONICA, or PLAITED HAIR. called PLICA, Salio belotis, kolto, rhopolofis. Dr. Cullen places this genus of difease under the name of tricoma, in the class cachexiæ, and order impetigines. This diforder is only met with in Poland and Lithuania, and confifts of feveral blood-veffels running from the head into fome of the bairs, which cleave together, and hang from the head in broad flat pieces, generally about an ell in length, but fometimes they are five or fix yards long; one patient hath more or lefs of thefe, up to twenty, and fometimes thirty. They are painful to the wearer, and odious to every spectator. At the approach of winter, an eruptive fever happens to many in these countries; the eruptions principally inself the head, and when at the height an ichorous humany flows from them. In this height an ichorous humour flows from them. In this state they are too tender to admit of being touched, and the matter running down the bairs, mats them together; the fkin by degrees breaking, the ramifications of the capillary veffels following the course of the bair, or prolonged out of the fkin, at length are increased to a vast

No method of relief is known; for if the discharge is checked, or the veffels cut off, the confequence is an inchecked, or the venes cut on, the confequence is an in-crease of more miserable symptoms, and in the issue, death; though some affert that there is no danger in cut-ting them off. Sennertus says, when all the morbid mat-ter is thrown out of the body, the plice fall off spontane-ously. He further observes, that the only safe practice in this case is, to solicit the peccant matter to the hairs, to which it naturally tends, and that this is best answered by lotions of bear's breech. Some say that a decoction of the herb club-mofs, and its feeds, with which the head is to be washed, is specific. See Sennertus, Hoffmann de Morb. cert. Reg. propr. Gehema in Epist. ad Bontokoe

de Plica Polonica.

PLICARIA. See Lycopodium.

PLICATIO. A violent shock and bending of a long bone without breaking it.

PLINTHIUS LAQUEUS. See CIRCUS QUADRU-

PLUMBAGO. PLUMBAGE. Called also Melyb-dena and Galena. The best is like litharge, yellow, fining, and of a pale red under levigation, but boiled in oil it takes an ash colour; that which is of a leaden colour is not good. It is generated in the refining furnace of gold and filver. There is a fofil fort. They are of the fame

nature as litharge.

In the vegetable kingdom it is a name for dentaria, dentellaria, lepidium Monspelliacum, LEAD-WORT, or FRENCH DITTANDER. It is a plant whose root is sibrous, thick, fleshy, hot, and perennial; the leaves are alternate and entire; the calyx is very hairy; the flower is monopetalous, and they are placed on spikes. Boerhaave men-tions two species of them, and notes the whole plants as being hot and biting like the pellitory of Spain, and as proper substitutes for it. It is also a name of the perficaria.

PLUMBUM. LEAD. Also called faturnus, aabam abartamen. Greek writers often use the same name for lead and tin; and many of their Latin translators interpret \*\*22011765; both by lead and tin. Geo. Agricola mentions three kinds, viz. the white, by which he means tin; ash-coloured, or bismuth; and livid coloured, or lead.

Common lead is a pale, livid, foft, flexible metal, easily ductile, not at all elastic, or sonorous, and if mixed with any metal prevents its found; it is about eleven times specifically heavier than water, fulible in a fmall heat, foon calcined, and thereby increased in its weight; it does not ruft; if continued in fusion it contracts a various-coloured pellicle on the furface, and, if kept stirring, so as that fresh surfaces may be exposed to the air, it changes by degrees partly into a fume, and partly into a dufky-coloured calx; when fufed it paffes through any veffel yet made to hold it, and with it takes all mixtures except gold or filver, or it diffipares them in vapour, or carries them with it as it is formed into fcoria, and thrown off at the fides of the cupel. If the calcination of lead is continued fome time, and the heat is increafed to different degrees, it becomes yellow, and is called mafticot, or painters yellow; afterwards it becomes red, and is called minium. These calces hastily heated to a confiderable degree, melt into the appearance of oil, and, on cooling, form a foft flakey fubftance called lythargyrus, litharge, which is yellow, or reddiff, according as the lead was more or less calcined. If the calces are urged with a pretty ftrong fire, they run into a yellowish glafs, which whilst in fusion, corrodes the common cru-cibles until it hath faturated itself with their earth. These feveral fubstances, by the addition of charcoal, iron-filings, or any oily matter, becomes lead again. Lead diffolves most in the weaker acids, fuch as aqua fortis and water, vinegar, &c.

The ores of lead, in colour, commonly refemble the lead itself, and are of a cubical, or parallelopipedal structure. Sometimes the ore is black, red, yellow-coloured, &c. English ores are reckoned of three classes; that which, affords of good metal betwixt thirty to forty pounds from every hundred weight; that which yields from forty-five to fixty; and that which gives out from fixty to eighty. The metal extracted from the ore by fusion, often contains filver enough to pay for its fepa-

ration from the lead.

Cerussa. White LEAD. This is called Dulcedo Saturni. Gensa. Abit, Abost. Assidra, Albotat, Alfidas, Arsi-ora, Baiac. Blattara, Blanca, Essides.

Put fome vinegar into the bottom of an earthen veffel, and suspend over it very thin plates of lead, so that the ascending vapour may circulate about the plates; fet the containing velfel in the heat of horse dung for three weeks, then ferape off the white powder, and expose what re-mains of the plates to the fleams of the vinegar again, until all the lead is corroded.

White lead is used as a cosmetic, but it spoils both the colour and the fmoothness of the skin, injures the constitution, and makes the teeth carious. It is adulterated with chalk, lime, whiting, &c. The entire flakey maffes, called flake lead, or white flake should be chofen. To discover adulterations, compare pieces of equal fize; the genuine will be the heaviest; or take an ounce of the suspected cerus, of charcoal-dust, two drams; suspected ceruse, or any fixed alkaline falt, half ounce of the suspected cerusa; of charcoal-dust, two drams; suspected ceruse, or any fixed alkaline salt, half an ounce; put them in a crucible, and in a heat strong enough to suspected the suspected will be reduced to its metalic state, which being weighed, distinct successful and suspected to suspect the suspected suspected with any other. The best mode of applying it is as prescribed by Mr. Bell, in his Treatise on Ulcers, edit. iii. p. 43. Solutio saturnina: R Cerusa acetatæ 3 solved duced to its metalic state, which being weighed, distinct successful suspects are suspected.

covers the proportion of the adulteration, one tenth part being allowed for the corroding acid of the cerufs.

Pulvis e ceruffa compositus, now called PULVIS E CERUSSA; powder of cerus, is thus prepared. Take of ceruffa, five ounces; farcocol, one ounce and an half; tragacanth, half an ounce. Rub them together into a powder. Ph. Lond. 1788.

This is a reformation of the white troches of Rhazi; it is used to expel hot rheum on the eyes, and is called fic.

album, and collyrium ficcum.

Acetum Lythargiritis. VINEGAR of LITHARGE.

Take four ounces of lytharge, and the strongest vine-gar a pint. Digest in a fand-heat for three days, shaking

the mixture now and then.

This vinegar of lead is of the fame nature as folutions of ceruffa acetata. The calces of lead diffolve more freely than lead in its metalic state. When a faturate folution is required, the cerufe is preferred to litharge. When this vinegar of lead is diluted with a large quantity of water, it abates external inflammations, the itching and other uneafineffes in cancerous ulcers; and before Mr. Goulard's practice, it was used for bathing inflammations in scirrhous tumors, to prevent their becoming cancerous. Inflammations, and inflammatory tumors in general, are difperfed by it.

Plumbum Uftum. Burnt, or calcined LEAD.

Melt lead with a gentle fire, and keep it continually stirring with an iron spatula, until it changes into a powder.

Minium. Red LEAD.

Melt any quantity of lead in an unglazed earthen veffel, and keep ftirring it with an iron spatula until it falls into a powder, at first blackish, then yellow, and at last red, taking care not to raise the fire so as to run the lead into a vitreous mass.

The making of red lead is a diftinct buliness, and its makers melt large quantities of lead at once upon the bottom of a reverberatory furnace built for the purpose, and fo contrived, that the flame acts upon a large furface of the metal, which is continually changed by raking it with an iron rake, drawn backward and forward until the fluidity of the lead is destroyed; after which, the calx is only now and then turned. The reverberation of the flame upon the furface is absolutely necessary for this effect. Red lead is often adulterated with red oker, which is discovered by melting it as directed for discovering adulterations in white lead, only in this the falt may be omitted.

Saccharum Saturni. Sugar of LEAD; now called Ceruf-fa Acetata. Acetated Ceruffe.

Take of ceruffe, a pound; distilled vinegar, one gal-lon and an half; boil the cerufs with the vinegar, until the vinegar is faturated; then filter through paper; and after proper evaporation fet it aside to crystallize. Pharm-Lond. 1788. Afterwards exhale the remaining siquot, and fet it to shoot again, &c. until no more falt will shoot. The ceruse should be freely powdered before the vinegar is put to it; and during the boiling, it should every now and then be stirred with a wooden spatula. The ftrong acid which remains after diffilling the diffilled vinegar, is the most proper for this use. If the heat is considerable in the boiling of the vinegar and lead together, the acid will be dissipated before it can be fixed by its combination with the lead; the vinegar may be made hot, and that will fuffice. When the folution is exhaled for crystallization, let a small quantity of rectified spirit of wine be added to it, and the mixture suffered to cool gradually; the fugar will then concrete into very large transparent crystals.

In all the intentions of the aqua lithargyri acetati-the fugar of lead may be used; of all the preparations of lead for external use, ceruffa acetata is perhaps superior to any; it hath all the advantages of the others, with this difference, that in it we are much more certain of the

be kept for use, and on all occasions supply the place of Goulard's extract and water.

Entratlum Saturni. Extratt of LEAD, now called, aqua lithargyri accetati. Water of acetated Litharge.

Take as many pounds of the litharge of gold as quarts of vinegar; fimmer them together for an hour and a quarter, and often ftir them during their fimmering; then taking it from the fire, as foon as it is cool enough pour the clear liquor into bottles to be kept for use. If this li-quor is made into the common confidence of an extract, it must boil yet longer after its separation from the mass; it will then be of a reddish colour. This is Goulard's method of preparing it, on which the same things may be observed that are related of the acetum lythargiritis. This extract is the basis of all Mr. Goulard's preparations of extract is the basis of all Mr. Goulard's preparations of lead. See Bell on Ulcers, edit. 3. p. 38—48. The College of physicians London prepare it in a different manner, and under a different name. They call it, aqua lithargyri acctati, water of acctated litharge; to make which, they order two pounds four ounces of litharge to be mixed with one gallon of diffilled vinegar, and boiled to fix pints, conftantly ftirring, then to be fet afide, and after the fæces have fubfided, to be ftrained, Pharm. Lond. 1788.

### Aqua Saturni. Water of SATURN.

Mr. Goulard also calls this by the name of vegeto-mi-neral water, and makes it by dropping into a quart of pure water, an hundred drops of the extract of Saturn, and then adding to them four tea-spoonfuls of brandy. This is his fpecific in external inflammations, particularly of the eye, for washing ulcers, cancers, scrofulas, contusions, phlegmons, erysipelas, piles, chilblains, tetters, gangrenes, &c. A solution of the cerusia acctata will have the same

Lead is of so poisonous a quality, that no dog nor cat will come near the place where the ore is washed; if they do, they foon die. Lead is fo fatal, that all who work in mines, and other places where it is a principal subject of their operations, suffer much from it. If it is received into the conflitution, it produces the colie, palfy, general dif-ders of the netves, &c. but externally applied it is not only fafe, but powerfully discutient, astringent, antiseptic, and fedative. It is observed that all the preparations of lead, and the vapours exhaled from the metal itself or its calces introduced into the body, difcover a fedative power extremely noxious to the human fystem. It is therefore disficult to fay, how far we can employ the aftringent and tonic operation of this metal, and be at the fame time fecure against its deleterious powers, especially as the deleterious powers do not always immediately discover their operation, and very often only after they have long remained latent, and unheeded in the body. CULLEN'S MATERIA MEDICA. However, the body. CULLEN'S MATERIA MEDICA. However, fome of the preparations have been given with fucces, particularly in hæmorrhages, phthifis pulmonalis, &c. See Medical Commentaries of Edinburgh.

Lead is fometimes diffolved in acid liquors to prevent or remove their too great acidity; but those liquors are thereby rendered unfit for internal use: to discover when this is the case, drop into the suspected liquor a few drops of a solution of orpiment, or of common sulphur, in limewater, and the liquor in which lead is dissolved becomes brown; and if on droping into this a few drops of the fpirit of falt, this brown colour does not disappear, it is lead, and not any other substance that is dissolved in the acid or acefcent liquor.

See Dictionary of Chem. Neumann's Chem. Works. Lewis's Mat. Med. Goulard's Treatife on the Effects and various Preparations of Lead. Aitken's Observations on the external Use of Preparations of Lead. Bell on Ulcers, edit. 3. p. 36. London Med. Transactions, vol. i.

P. 257.
PLUMBUM NIGRUM. BLACK LEAD. It is also called nigrica fabrilis; ochra nigra; wadt; kello; black lead. It hath none of the properties of common lead, except that of colouring in drawing lines. It will calcine, but not fuse. It is not now used in medicine, though formerly it was reckoned drying and repellent. See Dict. of Chem.

Befides there are others which bear this name, viz.

— CANDIDUM. See STANNUM.—CINEREUM.

See BISMUTHUM .- RUBEUM. See ADROP.

PLUMMERI PILULÆ. PLUMMER'S PILLS. Les vigate caloinel, and the precipitated fulphur of antimony, of each two drams together; when they are well levigated, add three drams, of the gum-guaiacum, and one dram of the refin; mix them well, and make them into a pill, with the balfam capivi, and of each dram make twelve pills.

Its uses are the fame as those of the acthiops antimonialis.

PNEUMA. Spirit, air, vapour, or the breath. Hip-pocrates often uses the word pneuma, to fignify a difficult or fbort breath: it is also a divine water called Scythicus

PNEUMATOCELE, from wravya, wind, and wan, a tumor, bernia flatulenta; ventofa; pneumatofis. A FLATU-LENT HERNIA, OF WINDY RUPTURE. It is when wind only is the contents of a rupture; but it rarely, if ever, happens. In fome putrid fevers, in the fmall-pox, and gangrenes, fome parts of the skin frequently crackle like parchment under the finger. When carcases begin to corrupt, air evidently begins to generate in the veffels and cavities, from which it may be prefumed that, in a very corrupted flate of the fluids, the pneumatocele may be formed. Mr. Bell observes, that the term pneumatocele, is applied to fignify a diftention of the fcrotum by a collec-tion of air. This hath been deferibed by most of the ancient writers as a very frequent occurrence; but there is much reason to think, that a great proportion of all the tumors they take notice of as containing air, were either formed by collections of water, or by a protrusion of some of the bowels. That species of hernia, to which young children are liable, is to this day by our common people termed a wind-rupture; as are all those collections of water in the serotum, with which the new-born infants are affected: but we know well, that none of these tumors are formed merely by wind; their contents being of a very different nature. In wounds of the lungs, air is fometimes extravafated into the furrounding cellular fubstance, and in that way passes into the scrotum, as it does in particular inflances over the whole body: and in high degrees of putrid difeases, so much air may be separated from the blood, as to distend the cellular substance of the ferotum, as well as of other parts; but a real pneumatocele has never, probably, existed as a mere local affection of the scrotum. In the case of air diffused into the cellular subferotum. In the case of air diffused into the cellular sub-flance of these parts, in consequence of a wound or any other affection of the lungs producing an extravalation of it, the fame method of cure will answer for its removal that is recommended for anafarcous fwellings formed by water, viz. fmall punctures with the point of a lancet, which are found to be fully fufficient for evacuating great quantities of air. But whenever the difease is induced by such a great degree of putrescency in the system as is neceffary for affecting a separation of air from the blood. there can be little reason to expect any advantage to refult from whatever means may be employed for relief; though when the putrid degeneracy of the humors is the cause, a plentiful use of antiseptics and corroborants are indicated.

Mr. Pott positively afferts the pneumatocele to be a mistake. He fays, that there is no tumor of this kind, and in this fituation, in a living animal: it is indeed particularly described by many writers, both ancient and modern, and said to be a disorder to which infants are particularly liable: but the complaint so described, and which nurses, and the state of the said &c. do still call a wind-rupture, is not what they take it for; neither is it produced by wind; it is either a true intestinal hernia, or a species of hydrocele. There is no hernia produced by mere wind; the two difeafes which in new born children and infants are taken for, and called windruptures are, a tumor produced by a fmall quantity of fluid remaining in the lower part of the tunica vaginalis, after its communication above with the cavity of the belly is closed; and a true, but small intestinal hernia. The natural communication between the cavity of the tunica vaginalis and the belly not being that until fome fpace of time after birth; it may become close at its upper part, while there is a quantity of fluid on the lower, too large for the abforbent veilels to take up immediately; and con-fequently that fuch infant will, until that office be executed, labour under a true hydrocele of the tunica vaginalis teltis; a case which is very frequent, though generally mistaken for a wind-rupture.

Some late writers miftake the encyfted hydrocele of

the tunica communis which connects the fpermatic vef-fels for the wind-rupture; though it differs from the wind-rupture in its fituation; but unfortunately, the encyfted leaves, the two larger of which continue after the flower hydrocele of the tunica communis, may be accompanied with a hydrocele of the tunica vaginalis, or with a true hernia, and then the case is somewhat disticult to afcertain.

See Bell's System of Surgery, vol. i. p. 496. Pott's Chirurgical Works, quarto edit. Cullen's First Lines,

PNEUMATOSIS. See EMPHYSEMA; pneumatocele.

Also a pain in the stomach from wind.

PNEUMATOMPHALOS, from wreque, wind, and eupanes, the navel. An umbilical flatulent rupture.

PNEUMONIA. In general, an inflammation in the

thorax, and of the membrane that lines it: but in particular, an inflammation of the lungs. Dr. Cullen places this genus of difease in the class pyrexize, and order phlegmaline. He distinguishes two species. 1. Pneumonia peripneumonia. See PERIPNEUMONIA. 2. Pneumonia pleuritis. See PLEURITIS.

PNEUMONICA. A fense of weight, or a load on

the cheft.

PODAGRA, from wee, a fost, and slass, a prey. The GOUT in the FEET. Dr. Cullen uses this term for the

gout as a genus. See ARTHRITIS.

PODAGRARIA. See ANGELICA SYLVESTRIS.

PODOPHILLUM PELTATUM. See ACONIT See ACONITI

PODOTHECA. See CHIROTHECA. POEGEREBA. An American root, used in Paris as

an aftringent in dyfenteries.

POINCIANA. FLOWER-FENCE. It is also called frutex pavoninus; crista pavonis; acacia orbis Americani; erythroxylon, &c. It grows in the Spanish West Indies; its feed-pods, infused with galls, affords the best black ink. See Raii Hift.

POLEMONIUM, also called valeriana Graca; valeriana cavulca; GREEK VALERIAN; and JACOB'S LADDER. It is difficult to afcertain what plant this is. See Raii Hift. Plant.

POLENTA. See ALPHITON. POLGAHA. See PALMA COCCIFERA.

POLIUM. POLEY. Of this plant botanists enumerate twelve species: it is the teucrium, Linn. The two

following have been noted in medicine.
POLIUM MONTANUM LUTEUM. YELLOW MOUN-TAIN-POLEY; it is also called SMALL UPRIGHT POLEY-MOUNTAIN; and POLEY-MOUNTAIN OF MONTPE-LIER. It is a fmall plant, with fquare stalks, oblong woolly leaves fet in pairs, and with labiated flowers.

- CRETICUM, also called rofmarinum fleechadis facie; teucrium frutescens; TREE-GERMANDER; POLEY OF CANDIA. The leaves are set on short pedicles, and are not indented; the flowers fland in loofe clufters, each

on separate foot-stalks.

Both these forts have the same qualities; the leaves and tops have a moderately strong aromatic smell, and dif-agreeable bitter taste. Distilled with water, they yield a fmall quantity of yellow effential oil; an extract from the remaining decoction is very bitter. The leaves and tops are corroborant, aperient, and antifpafmodic. See Lewis's

POLLEX. The THUMB of the hand. See DIGITUS.

POLLICI-PEDES. See BALANI.

POLLINICIO. See CONDIO.

POLYCHRESTUS, from wohoe, much, and xporce, ufeful. An epithet of feveral medicines, denoting that they have many virtues. The same as polypharmacos.

POLYCHRESTUM, from 2000, much, and 200705,

virtues. The balfamum guaiaei. \_\_\_\_ SAL. SALT of many VIRTUES. TRUM.

POLYDIPSIA. Excess of THIRST. Dr. Cullen places it as a genus in the class locales, and order dyforexiae: but he feems to think it is always fymptoma-See SITIS.

POLYGALA, also called fles ambarvalis; amarella; common blue milk-wort. It is a small perennial plant, with the leaves alternate; uncut, and those on the upper parts of the stalk larger than those on the lower; the

hath fallen, and embrace like wings, a flat bicellular feedveffel. The stalks of this common fort are procumbent; the lower leaves are roundifh, the upper are oblong, nar-row, or pointed; the flowers are blue, purplifh, or red; fometimes white, with a kind of fringed appendix on the lower lip; the roots are flender and hard. It grows wild in dry pastures, and slowers in July. The roots are some-what similar in taste to the Senegal milk-wort, but much weaker; and in a lefs degree they have the fame effect in pleurifies .- See alfo MARILANDICA, SENEGA, SE-NEKA.

POLYGALA INDICA MINOR. See COLINIL.

- VERA, called also polygala major massiliotica; polygala valentina maritima; colutca caule genista fungojo; An infusion of this herb hath been used for increasing

the milk in women's breafts.

POLYGALON. See ORNOBRYCHIS.

POLYGALON. See ORNORRYCHIS.

POLYGONATUM, also called figillum Solomonis; SoLOMON'S SEAL. It is the convallaria polygonatum, or the
convallaria foliis alternis, amplexicaulibus, caule ancipiti,
pedunculis axillaribus subunisloris, Line. It is a plant
with unbranched stalks, oval narrow leaves, ribbed like those of plantain, generally all on one fide; on the other fide hang oblong monopetalous white flowers, two or more together on long pedicles, followed each by a black berry; the root, the part ufed, is white, thick, flefly, with feveral joints, and fome flat circular deprefions, fupposed to resemble the stamp of a seal. It is perennial, grows in woods, and slowers in May. Boerhaaye mentions seven species. The roots are restringent, increassant, and corroborant; if bruised and applied by way of poulties, it diffipates blackness from contusions speedily. See Rail Hift

POLYGONUM. KNOT-GRASS, called also callige num centinodia. That used in medicine is the polygonum aviculare, Linn. The root is creeping and fibrous; the stalk and branches are full of joints; the stalks recline towards the earth, are smooth, finely channelled, slender, and branched, full of knots or joints, at which grow long oval sharp-pointed leaves. The root is cooling and binding, and hath been used against hæmorrhages inwardly, and against inflammations outwardly. See Raii Hist. It is also a term added to many substances in the vegetable world, viz. POLYGONUM bifforta. See Bis-TORTA .- Bacciferum &c. See CAUDA EQUINA ;- HY-DROPIPER; and perficaria. See Persicaria.—Mas, and lanifolium. See Gramen Polygonium.—Selimoides. See Percipier.—Minus. See Herniaria.

POLIMERISMA. Supernumerary limbs or parts. POLYMORPHOS. MULTIFORM. An epithet for the os fphenoides.
POLYNEURON. PLANTAIN.

POLYOSTEON. That part of the foot which con-

fifts of many bones.

POLYPETALUS. MANY-LEAVES. Those plants are so called whose flowers have many leaves. See

PETALA.

POLYPHARMACOS. See POLYCHRESTOS.

POLYPODES. WOOD-LICE.

POLYPODIUM. POLYPODY. It is generally called polypody of the oak. The species used in medicine is the polypodium vulgare, Linn. It is a plant with long leaves iffuing from the root, divided on both sides, down to the other polypodium of chloride segments. rib, into a number of oblong fegments, broadest at the base; it hath no stalk or manifest flower; the feeds are a fine dust lying on the backs of the leaves in roundish specks, which are disposed in rows parallel to the rib; the roots are long and flender, of a reddish brown colour on the outfide, greenish within, full of small tubercles, which are refembled to the feet of an infect; whence the name of the plant. It grows in the clefts of old walls, rocks, and decayed trees. That produced on the oak is usually preferred, though no better than the other forts. It is found green all the year. The leaves have a weak ungrateful fmell, a naufeous fweet tafte, a roughness and a flight acrimony. Its virtues are the same as those of fern.

POLYPODIUM TENERUM MINUS, also called dryopteris, filix querna repens. OAK-FERN. It grows in marshy

POLYPODIUM FILIX FAMINIA. Sec FELIX FEMINIA.

- ANGUSTIFOLIUM, also called lonchitis afpera, filix folis polypodis. ROUGH SPLEENWORT. It grows in rough uncultivated places. The root is aperient and

FILIX MAS. See FILIX MAS.

POLYPUS, from woke many, and was, feet, also called multipes. MANY-FEET. This name is generally ap-plied to a large fea-fifth, which hath eight claws or legs which ferve it to fwim with, and to convey aliment to its mouth; the four middle claws are the largest; the other four are called brachia, crura, cirri, and barba. Its mouth is in the middle of its body. It is found in the Adriatic fea. See Lemery Traité des Drogues.

- When applied to the human body, coagulations and concretions of blood in the blood-veffels are thus called, because they fend off many ramifications into the called, because they tend on many raminications into the adjacent vessels. The true polypus is only such a concretion of blood as consists of a whitish, sibrous, and pretty compact substance, and differs widely from grumous or coagulated blood, which, when found, is called the bastard-polypus; it is a folid sibrous concretion, formed of of the more viscid parts of the lymph.

The feat of thefe is in the finuses of the brain, the ventricles of the heart, the jugular veins, the veins in the uterus, and in any artery or vein. According to Dr. Hunter, in his lecture on the blood, this is no difeafe in the living body, for the polypus found in the blood-veffels are not formed till the body is dying. Those that are the subjects of manual operations, their feat is in the nose, the uterus, and the vagina. These are inflances of the

The matter of the polypuses is the more weighty fixed

viscid particles of the chyle and lymph.

The remote cause of a polypus in the blood-vessels are various; as, a redundance of the blood, or its deficiency, may alike be the occasional causes of this disorder; a tall flature, large draughts of cold water fuddenly drank after being heated with exercise, a too free use of acids and of spirituous liquors, terror, sudden frights, and long continued grief, the apoplexy, epilepsy, hysteric fits, a peripneumony, a spasmodic asthma, a pleurify and other acute as well as feveral chronical diforders.

If a polypus is in the pracordia, the principal fign is a long-continued palpitation of the heart, often excited by a flight cause; such as the commotions of the mind, flatulent aliment, or fuch as renders the patient coffive; another fign is, an unequal intermitting pulfe, which is often accompa-nied with fainting, and difficulty of breathing without any manifest cause, a compression of the praccordia, and what most generally accompanies this is a fixt pain about the heart: each of these, if they are almost perpetual, are palpable figus, that the circulation of the blood is ob-

structed by some foreign body.

The palpitation of the heart, fo troublesome and frequent, as also the anxiety which so often attends, are caused by passions of the mind, flatulent diet, costivenefs, &c. which by difturbing the equable circulation of the blood, produce a greater impetus thereof to the heart, where, being preternaturally congested and accumulated, on account of the obstructing polypus, it cannot find a sufficient space for expanding itself: but violently distends the heart and its vessels, so produces these symptoms. The inequality and intermission of the pulse is occasioned by the bulk of the polypus intercepting or preventing the due conftriction of the heart and other vessels on which the circulation of the blood depends. The compression complained of in the pracordia is owing to fpaims there. Polypufer happen more frequently in the right auricle and ventricle than in the left, and oftener in the veins than in the arteries: for fince the chyle, which by means of the fubclavian vein is conveyed to the vena cava and the right ventricle of the heart, is full of grofs particles which move flowly, it eafily deposits its heavy parts, by which the co-lumnæ of the heart, being embraced, one substance or body, as it were, is produced. Then the blood conveyed to the veins by means of their too weak contractile force, circulated more flowly, is of a thicker confiftence, and more weighty than the arterial blood: hence it cafily deposits its thick parts; but especially when these, not being extremities, for the better hold, an inch and an half up intimately mixed, cohere slightly, they, by the force of the nostril, to secure the polypus as near the roots as may

places. If the root is bruifed and applied to the fkin, their gravity, tend most to the bottoms and sides of the when the body is in a sweat, it takes off the hairs. vessels. But it is otherwise with the arterial blood, for its courfe is promoted more effectually by the force of the arteries, and by its passage through the lungs is freed from a part which was unfit for circulation, if it hath not received fomething from the inspired air to fit it more effectually for its progrefs.

Polypufer, by intercepting the circulation, are often the causes of sudden death; this may happen either from their bulk or from the force of the circulation separating one of them from its feat, and forcing it into the mouth of fome principal vessel, and fixing it there. Polypules hasten some other diseases to an unhappy termination, as is observed in peripneumonies, pleurifies, afthmas, suffo-

cative catarrhs, confumptions, &c.

The indications of cure, are to prevent their increase, and to diffolve that which is already formed. At best the cure is not less difficult than dubious; however, means being used, and success having followed them, acquits

from the charge of neglect, and juftifies hope.

The patient should avoid entering suddenly into vigorous exercife, but moderate degrees should frequently be engaged in. Dilute the blood, and reduce its quantity, if redundant. If frights, or other great commotions of mind, should occur, administer such medicines immediately as allay violent commotions, and as render the circulation equable, that are gently resolvent, and promote perspiration; let moderate exercise also be used, for thereby the heart is better enabled to free itself from the congested blood. The bowels must always be kept soluble. If the habit is robuft, alcaline falts, either fixed or volatile, and bleeding in the foot, fo as to refolve the texture of the blood to the greatest thinness that consists with health. Spirituous liquors must be avoided; also all strong exercise, and every disturbance of mind.

POLPYPUS NARIUM. A POLYPUS in the NOSE. It

hath been called noli me tangere, fearcoma, and hyperfarcoma; but the polypus is always foft, and hangs by one or more flender roots; the farcoma is fometimes foft, but generally hard, and is fixed on a large immoveable

The polypus of the nose is an excrescence whose branches spread among the laminæ of the os ethmoides and through the whole cavity of one or both noftrils. All these polypuses spread on the laminæ spongiosæ, pretty nearly in the fame manner as the hydatids of the belly in one kind of dropfy do on the furface of the liver. They proceed from any part of the nostrils, or those sinuses of the cranium that are lined with the same membrane as that with which the nostrils are; being no other than an enlargement of one or more of the glands thereof.

The causes may be external or internal; the external are chiefly fome violence done to the pituitary membrane, the application of ftimulating drugs thereto, and blows, feratches, &c. Internal causes are, acrid defluxions, fre-

quent or profuse hamorrhages, &c.

Different polypufes, and the fame at different times, appear of different fizes and confidences; their elongation is femetimes fo quick that they appear below the noftrils in two or three days; for the most part they are free from pain, yet fometimes they are attended with both pain and hardness, and then they generally are disposed to a cancer, in which case they are of a livid colour, and apt to bleed by the slightest touch.

When a polypus appears foft, and of a pale colour like the ferum of the blood, being also free from pain, it then is the best kind, and in the most proper state to extract; these have rarely more than one attachment, from which they hang, and it is very small; this must be brought away with the polypus, which commonly happens in the extraction of it if the forceps take hold, high enough. If it is hard, and appears scirrhous, it will in general be found to have a broad basis, and be unfit in every respect to meddle with: but if it is of that innocent kind just mentioned, its attachment is usually in the anterior parts of the nose, let the polypus appear where it will, it will be best extracted anteriorly, for few can bear the introduction of the forceps up behind the uvula.

Mr. Sharp directs the following method of extracting a

polypus: "Introduce a pair of forceps with a flit at their

be; then twift them a little from one fide to the other, and continue this action while you pull gradually down-wards; if it breaks, repeat the extraction as long as any remains, unless it is attended with a violent hæmorrhage, which is an accident that fometimes happens, and rarely fails, if the polypus is become feirrhous; this hæmorrhage is foon abated by the contraction of the veffels, or the application of lint dipped in fome ftyptic." It may be known that the polypus, is removed, 1ft. By the fight; 2dly, By the voice; and 3dly, By the freedom of refpiration through the rofe. In introducing the forces it is difficult to avoid the nofe. In introducing the forceps it is difficult to avoid the offa fpongiofa; but to fhun them, keep the beak of the forceps as near as possible to the os palati. When the operator draws away the polypus, he may generally bring it away whole, if he draws and moves it very gently. If any of the polypus remains, touch it with the lunar caustic.

Iunar caustic.

See Poterius, Rulandus, Wedelius, Celsus, Ægineta, Albucasis, Sennertus, Glendorp, Malpighi, Hossmann, Levret, Le Dran, Sharp, and Heister. Bell's Surgery, vol. iv. p. 90. London Med. Transactions, vol. i. p. 407. London Med. Journal, vol. vi. p. 252. Pott's Works, 4to. White's Surgery, p. 253.

POLYSARCIA, from 2004, much, and 504, flesh. Obesitas corpulentia. Corpulence. It may be called a species of cachexy, for many disagreeable symptoms attend; such as an excess of slesh and fat, slowness of motion, oppression, weakness, disficulty of breathing, sweating on the least exercise, and all the missortunes that attend voracious animals, or those fattened for use, that attend voracious animals, or those fattened for use, fuch as inflation, diffension, &c. Dr. Cullen places this genus of difease in the class locales and order intumescentiæ.

Dr. Withers, in his treatife on the afthma, p. 182, &c. relates the following case as a striking example of the pernicious effects of corpulency in afthmatical diforders

Mrs. —, aged 49, of low flature, and yet weighed fifteen stone. A weight which if any thing but her own felf-indulgence in eating and drinking could have brought upon her, would have been insupportable. If we examine a little into the effects of corpulency on her confti-tution, we shall find them very pernicious and alarming. The bones and joints of corpulent people remain nearly in the fame state, however preposterously the other parts may be increased in size. But if Providence made the may be increated in fize. But it Providence made the bones and joints strong enough to bear with ease the weight of ten stone, they are feldom sufficient to bear well the addition of fixty-three pound more, but sooner or later they will fink under their burden, and become weak and painful. This patient was very lame and weak in her ankles and knees. The time required to affect the joints is different in different people, according to the natural strength and soundness of the bones; on which account fome will be lame much earlier in life than others, though of the fame degree of corpulency. This lameness and weakness in the joints renders all motion and exercise painful and troublesome, and so contri-butes greatly to increase the evil. But as the bones of adults can admit of little or no addition to their fize, we must have recourse to the other parts of the body to estimate the increase of weight in corpulency: and we find that the chief increase of weight is in the additional quantity of blood, and of oily matter or fat which is deposited in the cellular membrane. The muscular fibres, it is agreed among anatomists, have fixed limitations both in fize and number. They may, perhaps, be better filled up with the ultimate particles of matter in a state of corpulency than in a state of leaness; but this will make very little increase of bulk. Whereas the great increase of blood that in corpulent people, is evident to the fenfes. Morgagni men-tions a case in which the fat on the muscles of the belly was above fix inches in thickness, and it was in a proportionate quantity in other parts of the body. Vide Morgagni de Caul. & Sed. Morb. The increased quantity of blood too, in such cases, is likewife very manifest. But the confequence of fuch an increased quantity of fat and blood mult be very terrible indeed to the animal frame. In Quincy's Sanct. Aphor. it is observed, the greatest healthy standard the body is capable of, differs from the least, as it more hastens old age: suppose one enjoys health at two bundred, equally with another of sive pound more. The excess of the latter has been observed to haften old age five times as faft.

Now if we examine the fymptoms which this patient complained of, we shall find that the cause or increase of them may evidently be attributed in great measure to her corpulent state. "Her head often akes, and feels heavy corpulent state. "Her head often akes, and feels heavy and dizzy." These are very common effects of corpulency and sulness of blood; and when ever pain, heaviness, and giddiness of the head arise from that cause, they ought never to be neglected, but always confidered in the most ferious light by every one who wishes to enjoy health and life. From inattention to those symptoms, many dangerous complaints occur, fuch as palfy, apo-plexy, epilepfy, inflammation of the brain, &c. "Her nerves are in a very irritable and relaxed flate." Corpus lency and great tention of the blood-veffels, generally increase irritability; and the want of bodily exercise along with confinement within doors, favours general relaxation. Hence the danger of the case is greater; for a superabundant quantity of blood will certainly be more hurtful in an irritable and relaxed, than in a firm and vigorous ftate of the veffels. "She is very much ftuffed in her breaft, and has a bad cough." How feldom do we fee a very corpulent person, who can breathe with ease and fredom? Shortness of breath and stuffing in the breast, greatly increased by motion, are almost constant attendants on excessive fatness. The vessels of the lungs are greatly overloaded with blood, and a more frequent respiration is necessary for the circulation of it. The heart, the midriff, mediastinum, and large vessels are often leaded with an appropriate of fat which diministrated with an appropriate of fat which diministrated and the contract of the the contra loaded with an unnatural quantity of fat, which dimi-nishes the capacity of the cheft, considered with a view to the dilatation of the lungs and the admission of air into the air-veffels. Her cough too, which is a very trouble-fome fymptom of the afthma, is greatly increased by the fame cause. Hence, as the case proceeds, "she is often attacked suddenly with a stoppage in her breast, with wheezing and great difficulty of breathing, so that she is afraid even of instant suffocation." This is a very dreadafraid even of initiant fuffocation." This is a very dread-ful fymptom of the afthmas, and one which is particularly frequent and fatal to corpulent people. "Her body is much fwelled with wind. Her nights are uneafy and diffurbed." Corpulent people, from indulgence in eating or drinking, are very liable to be troubled with wind in the fromach and bowels. Their fleep too is feldom na-tural and compofed. Many very corpulent people, when afleep, breathe with fo much noife and difficulty, flart fo violently, and have so many floppages and interrunfo violently, and have fo many stoppages and interrup-tions of respiration, that one, not accustomed to see them in that state, would suppose that they were not sleeping, but threatened with immediate suffocation. "She is at times subject to a nervous complaint, in which her head trembles and her mouth is drawn to one side." This is evidently a dangerous paralytic affection, arifing in all probability from her corpulent state and the fullness of the veffels of the brain.

Her diet was regulated in fuch a manner, that it might not be reduced on a fudden too low, nor yet continued by indulgence to an excefs, which might increase her disease, and soon render it statal. Very corpulent people, who have long been in the habits of gratifying their appetite, like nothing less than to be restrained in what they eat and drink. The idea, however, of a natural or as it is called a constitutional states which tural, or, as it is called, a constitutional satness, which (we are taught to believe) comes on and is continued through life, independent of the quantity of nutriment with which the body is daily fupplied, is a chimera too ridiculous to be feriously refuted; and indeed nobody was ever fo absurd as to suppose, that the same thing could take place in any other living creature. Yet it is readily admitted on all hands, that some people will grow fat with a moderate diet, and that others will continue lean though they feem to eat immederately. But this dif-ference arises from a better and more perfect digeftion in the one cafe than in the other. Yet the matter re-mains equally certain, that the perfon, who grows very fat, takes in more nourishment than he ought to do; while fat, takes in more nourishment than he ought to do; while the other only follows nature, and prudently endeavours, as far as he is able, to supply her daily wants. It is not the quantity that we cat and drink, but the effects of it on our bodies, which, with a view to the preservation of health, ought to be chiefly regarded. The just proportion of the ingested and egested, should be strictly preserved. But if what we take in exceeds what passes from us by the different outlets of the body, it is manifest that

that we take in more than nature requires. Corpulent | people have no chance to diminish their corpulency, but by moderating their diet; for they are seldom able to use exercise sufficient for that purpose. At the same time gentle exercise of all kinds, when it can be admitted, is very adviscable, and it ought to be increased, as they lose weight and become stronger and more active.

TIA SINENSIS.

POMACEUM. CYDER. It is the juice pressed from apples, which hath stood to ferment in hogsheads. The more harth cyders are the strongest, and keep longest.

Cyder is a useful drink in scorbutic and melancholic habits; but if drank to excess, it occasions drunkenness of a longer continuance, and more pernicious consequences than is produced by wine. It does not intoxicate fo foon as wine, for its spirit conveys along with it many viscous particles, which hinder both its speedy effect and sudden dillipation. Moderately used, eyder is more falutary than wine; and whey that is made by turning the milk with eyder, is a

much more agreeable drink for patients who labour under fevers than that which is made with wine.

POMAMBRA. APPLES of AMBER. They are made of odoriferous powders, to which oils may be added, and these powders are made into balls, &c. with wax or much the powders are made into balls, &c. with wax or much the powders are made into balls, &c. cilage of gum arabic. &c. E. g. take of mace and cin-namon, of each two drams; musk, civet, and gum arabic, of each one dram; gum tragacanth, two drams. Mix and make into balls. They are agreeable to fmell to.

POMATICÆ. See COCHLÆÆ.

POMATUM. It is the unguentum fimplex. It

was formerly made with lard, fuet, and a species of apples called pome-waters; but at prefent it is only lard beat up into a curd, with the addition of a little rofewater, or other fweet-water, to give it an agreeable fcent. POMIFERA and PRUNIFERA INDICA. See

POMPHOLYX, πομφολυξ. A bubble excited in a liquid fubstance by some flatulent spirit or air contained therein. This name is given to the matter which is found adhering to the covers of the crucibles, &c. in the form of thin crusts or light downy powder, of a white or whitish yellow colour, and is the produce of zine, which sublimes from the lapis calaminaris in making of brass. It is also

called nihil album, white tutty, colamitis.

POMUM. An APPLE. It is any fleshy vessel, containing more feeds than one; so that all plants which produce fuch fruit are termed pomiferous, that is, applebearing. Anapodophyllon is called pomum maiale, and momordica, pomum mirabile, Hierafolymitanum. See alfo BACCA. It is alfo a term given to the flaphyloma.

POMUM ADAMI. A name for the LEMON, fructu Aurantii; alfo for the protuberance in the fore part of the neck formed by the thyroid cartilage.

PONDO, or PONDUS. A WEIGHT. The medical or true record is left than the averdunoife, but the owner.

or troy pound is less than the averdupoife, but the ounce and the dram are greater. The troy pound contains 5760 grains, the avoirdupoife pound contains 7000 fuch grains. The troy ounce contains 480 grains; the avoirdupoife ounce contains only 437! grains. The troy dram contains 60, the avoirdupoife rather more than 27. So that attention hereto should be had in the making up what is

Preferibed with a view to the troy weights.

The pound and the pint are called libra by the Latins. But there is not any known liquor, of which a pint in

measure answers to a pound in weight.

Rectified spirit of wine, a pint in measure, exceeds a pound weight by half an ounce.

PONS VAROLII. Varolius, an Italian anatomist, gave this name to a fort of arch in the cerebellum. first observed it. See MEDULIA OBLONGATA.

PONTICA VINA. ACID, FECULENT, and TAR-

PONTICUM MEL. A fort of poisonous honey.

POPLES. The HAM or JOINT of the KNEE. POPLITEA ARTERIA. The arteria cruralis, in

passing the ham, takes the name of poplitea, which, whilst in the ham, is covered only by the integuments. It ends by dividing into the tibialis anterior and tibialis posterior. Surprising as it may appear, it is a fact, that though the artery in the middle of the thigh may be tied with impunity, and the blood be distributed as usual to the leg and foot, yet the popliteal artery in the ham never can. An aneu-rism in this artery seldom lasts long enough to cause a caries in the adjacent bones. When this difeafe happens it admits of no relief, except from amputation of the limb. The artery in this part, when dilated, will increase, and at length prefs upon the parts below, fo as to make them become ædematous, painful, and hard; the confequence of which will be the deftruction of the patient, by a mortification of the limb if tification of the limb, if amputation is not complied with

The crural vein takes this name, just above the ham, and at the lower part of the musculus popliteus it divides into the tibialis anterior, tibialis pof-POPLITEUS. The feiatic nerve having reached the

ham, takes this name: it divides into two branches, which

fpread about the whole leg, called plantares.

POPLITEUS MUSCULUS, from poples, the bam, called also fubpopliteus. The place of its fituation. This muscle rifes tendinous from the external condyle of the femur, within the capfular ligament; it passes tendinous under the ham inwards; plays upon the head of the tibia, and is inferted into the fuperior, and inner part thereof, ferving to turn the toes inwards.
POPULAGO. MARSH-MARIGOLD. The flower re-

fembles that of the ranunculus. The plant is fo cauftic, that cattle avoid it though grafs be ever fo fearee. It is not noted for its medicinal qualities; it is also called ca-

POPULARIS. ENDEMICAL OF EPIDEMICAL. POPULUS. The POPLAR. Boerhaave takes notice of five species.

POPULUS ALBA. WHITE POPLAR. It grows in moift places; a decoction of its bark is given to remove

the ftrangury and the fciatica.

- NIGRA, Linn. BLACK POPLAR. It is a tall tree, with dark green, rhomboidal, acuminated leaves, producing imperfect flowers in catkins. In fome of the individuals called male, the flowers are barren; in others, called female, they are followed by membranous pods, containing a number of feeds winged with down. It is indigenous in watery places, and quick of growth. The young buds of the leaves are made into an ointment; they abound with a yellow unctuous odorous juice, which they readily impart to rectified fpirit of wine. The tincture yields a fragrant refin, which approaches to the nature of

itorax. See Raii Hift.

— TREMULA. The ASP, or ASPIN-TREE. Its qualities are fimilar to those of the black poplar. It grows

qualities are limilar to thole of the black poplar. It grows in woods and marfhy places.

PORCUS. Swine. In Greek be, xoless, the fame which is meant by sus, and scropha; it is called hoc, a well known quadruped, in common use as sood. Concerning it in this light, and as a medicine, Aldrovandus has written very prolixly, in his Differtation on bifulcated Animals. Its flesh, when prepared for culinary purposes, is called PORK. It is not easy of digestion, and considered by Sanctorius, and others, to have the strongest dered by SANCTORIUS, and others, to have the strongest tendency to retard perspiration; consequently in general unwholesome. Perhaps it is owing to this that the Jews, who were troubled much with eruptive or leprous complaints, were forbid its use. The name porcus, and porcellus, is given to some fishes, particularly the dolphin, and others, because they are said to rout up the earth after the manner of swine, with their snouts. Porcus also from the Greek word xospes, is a name for the pudendum muliebre

As this animal, called porcus, is generally extremely fat, it is confidered as highly nutritious, to fuch conftitutions as can digeft it easily. The flesh of the young animal of this fpecies, is more readily digeftible than that of the adult, as its fibres are more tender, and it is top-loaded with fat, so that it is an agreeable food to some who can by no means attempt to eat those of larger growth.

PORI. PORES. It is supposed that one grain of fand 70

will cover one hundred and twenty-five thousand of the spect to what the means were by which the curd and pores in our fkin, and that each pore is the orifice of a diffinct gland; but this is only a supposition, founded on the authority of Lewenhoek, who with aged eyes, and bad glaffes, faw what younger eyes, affifted with better glaffes than he ever poffeffed, could never discover. Plants perspire as well as men; but notwithstanding the great perspiration of both, pores cannot be discovered either in the cuticle of a man, or in the fine membrane that covers the external furface of the leaves.

PORRIGO. See PITYRIASIS.

OF COM!

PORRUM. PORRET, or COMMON LEEK. It differs from garlic only in being weaker. Botanitts enumerate feven or eight species.
PORRUS. The same as SARCOMA.

PORRUS. The fame as SARCOMA.
PORTÆ VENA, vel PORTARUM VENA. The fplenic, mesenteric, and mesocolic veins, uniting at the root of the mesentery, form the vena porta, called also janatrix. It may be confidered as two veins joined endwife, and that fend out branches in opposite directions to each other; that one of these veins is ramified in the liver, the other lying without the liver, and fending its branches to the vifcera of the belly; that in the liver may be called vena portæ, hepatica superior, or minor; the other vena portæ ventralis inferior, or major. The particular trunk of the vena porta hepatica forms what is called the finus of the vena porte; from this finus five principal branches go out, which are divided and spread through the whole substance of the liver; the extremities of these branches end in the pulpy friable corpuscules, which seem to be thick villous soliculi. In these folliculi the bile is secret. ed, and collected by as many veffels of another kind, which again unite in one common trunk; thefe ramifications are termed pori biliarii, and the trunk duelus hepaticus. The vena porta ventralis is fituated under the lower, or concave fide of the liver, and joined by anaftomofis to the finus of the vena porta hepatica, between the middle and right extremity of that finus; from thence it runs down from right to left under the trunk of the arteria hepatica, bending behind the beginning of the duodenum, and under the head of the pancreas its length being about five fingers breadth. At the head of the pancreas it lofes its name, and divides into the meferaica major and minor, and the fplenica. See Winflow's

PORTAIGUILLE. See Acutenaculum.
PORTIO DURA. Winflow calls it nervus fympatheticus minor. It is one of the two divisions of the feventh pair of nerves from the head, which runs into the os petrofum, and there divides into the portio dura and portio mollis. The portio dura goes out between the fly-loid and mastoid processes, passes through the parotid, becomes a cutaneous nerve upon the face, and communi-

cates with the upper maxillary nerve.

— Mollis. The feventh pair of nerves go out from within the head, into the os petrofum, and there divides into two branches called partio dura, and partio mallis. The partio mallis is spent upon the labyrinth in the ear; it enters the meatus auditorius internus, and

pailes to the veftibulum and cochlea.

PORTORARIUM. The duodenum, or the pylorus. PORTULACA, also called andrachne; allium Gallicum. PURPIE, or GARDEN-PURSLANE. It is chiefly used in the kitchen. Boerhaave enumerates fix species; the leaves are cooling, antifcorbutic, and moderately aftringent. The feeds are the fame.

PORTULACA MARITIMA. Alfo called balimus, atriples maritima. COMMON SEA-PURSLANE. It is found in falt marshes; it flowers in July and August. It is a hot plant, and, pickled in vinegar, helps the appetite.
The exigua is the alfineformis.

PORUS BILARIUS. The BILE DUCT, from #0906,

a peffage.

Opticus. It is also called the blind point. It is the point on the retina where no object is feen.

- RETICULATUS. A species of submarine plant

called efcbara.

POSCA. Vinegar and water mixed.

POSSETUM. POSSET. Milk curdled with wine, treacle, or any acid. This is by foreigners reckoned peculiar to the English. The serum of a posset, called posset drink, is like the whey of milk, only differing with re-

whey were made to feparate.

POSTERACHIALE. The METACARPUS.

POSTERIOR MUSCULUS AURIS. See ABDUC-

POSTHE. The PREPUCE. See PREPUTIUM.

POSTPOSITIO. Postposition. When the paroxylin of a fever comes on later than it is expected, it is called the possition of the paroxysm. When it begins fooner, it is called the anticipation.

POTAMOGEITON, from #07a406, river, and 74ster,

adjacent. BROAD-LEAVED POND-WEED. It is also called millefolium, from the fmallness of the leaves; and viola aquatica, from the colour of its flower.

This plant is found in stagnant waters, it flowers in June and July. Boerhaave enumerates eleven species,

but they are not noted in medicine.
POTASSA. See CLAVELLATI CINERES. POTENTILLA. See ARGENTINA.

REPTONS. See PENTAPHYLLUM.

POTERIUM. SANGUI-SORBA. See PIMPINELLA. POTIO. A POTION. It is a liquid form of medicine, calculated for one dose or draught. Potions are diftinguish-

ed into carthartic, cardiac, and alterative.
PRÆCIPITANTIA. PRECIPITATING MEDICINES,

which moderate the motion and heat of the blood, as was supposed, by absorbing and correcting the acid contained therein.

PRÆCIPITANS MAGNUM. A name for the of

PRÆCIPITATIO. PRECIPITATION. It is the featurating of folid bodies from any fluid menstrum wherein they are dissolved, by the addition of a third body, which having a greater affinity with the menstruum than that already dissolved, causes that solvend, to regain its solid form, and to subside in the state of a powder. Or precipitation takes place if the folvend has a greater affinity, with the third body added than that with which it is already joined.

Precipitation is of two kinds: first, where the snbstance superadded, unites with the menstruum, and occasions that which was before dissolved to be thrown down. Secondly, where the fubflance fuperadded unites with the diffolved body, and falls along with it to the bottom. Of the first we have an example in the precipitation of fulphur from alkaline lixivia by the means of acids; of the second, in the precipitation of mercury from aqua fortis by fea-falt, or its acid.

When the matter to be precipitated is all at the bottom of the veffel, the fluid being poured off, or filtered, what remains behind is all to be dried in the fame manner as

levigated powders are.

Precipitation may also be effected by dropping in a liquor fpecifically lighter than the menftruum by which the pre-cipitate matter was diffolved. Thus the spirit of fal am-moniac precipitates plentifully the solutions of metals in acid menstrua; the same is effected by rectified spirit of wine, which also precipitates all falts from water. Acids poured upon heavier acids will precipitate whatever fwims in them; thus the fpirit of falt precipitates lead, copper, and tin, diffolved in oil of vitriol. Precipitation also succeeds if an heavier body be added to the dissolving menftruum: thus acids, or water alone, will carry down all the folid corpuscles which they meet with in tinctures of vegetables extracted by fpirit of wine; and the fame tinc-tures extracted by water, or wine, are precipitated by means of acid fpirits.

When a third body is added to any folution, for precipitating one part thereof, it produces its effect by uniting with the diffolving liquor, or with the matter which is diffolved, and as one or the other happen. That which is precipitated is either fimple or compound; if the pre-cipitating matter joins with the diffolving liquor, the precipitate is fimple; if it unites with the precipitated matter, the precipitate is compound. This should be observed, and the respective precipitates distinguished by the words

fimple or compound.

Sometimes an advantage may be made of the liquor which remains after the precipitation performed: thus, when fixt alkaline falt is diffolved in water, and fulphur is diffolved in this lixivium, the addition of acids separates and throws down the fulphur, only in confequence of the

acid uniting with, and neutralizing the alcali, by which the fulphur was held diffolved; of course, if the precipitation is made with the vitriolic acid, and the acid gradually dropt in till the alkali is completely fatiated, that is, fo long as it continues to occasion any precipitation, or tur-bidness, the liquor will yield by proper evaporation and crystallization, a neutral salt, composed of the vitriolic acid and fixed vegetable alcali, viz. the vitriolated kali; in like manner, if the precipitation is made with the nitrous acid, a true nitre may be recovered from the liquor; if with the marine, the falt called spiritus salis marini coagulatus; and if the acid of vinegar, the kali acetatum. See the Dict. of Chemistry.

PRÆCOCIA, or PRÆCOQUA. APRICOTS. See

ARMENIACA MALA.

PRÆCORDIA. DIAPHRAGMA. The DIAPHRAGM. Sometimes it fignifies the hypochondria. Fernelius, in lib. iv. de Febr. comprehends under this term the region above the stomach, the diaphragm, the cavity of the liver and biliary ducts included therein, the pancreas, the stomach in particular, and its upper wrifice, with whatever is contained under the inflections of the spurious ribs, towards the foreparts, and the sternum. Some have given this name to the metatarfus.
PRÆPARANTIA MEDICAMENTA. Preparing

medicines; that is, fuch as prepare the morbid hu-mours, and difpose them to separate from the healthy,

and to pass off by the help of evacuants.

- VASA. It was formerly supposed that the feed was prepared in them; whence the name spermatic ves-fels. See Spermatica corda.

PRÆPARATA VENA. An ancient name for the

frontal veins.

PRÆPUTIUM, from præputo, to lop off before. The PREPUCE or FORESKIN, called by Diofcorides

epagogion, posibe. See PENIS.
PRÆSAGIA. PRESAGES. Fred. Hoffmann observes, that three things are requisite to a right presage, viz. Ist. That from due observation we are able to trace and investigate the origins and causes of disorders, in order to oppose them in the beginning, by proper remedies, or give salutary directions. 2dly. That we accurately know the various natures of diseases, and their differences with respect to different constitutions, that we may the better be able to give medicines that are capable of removing them. 3d. That we be able to form a right judgment of the operation of medicines, and the event of diforders. This lait, though it does not directly obtain the end of the healing art, yet it promotes the certainty of medicine and the reputation of the physician.

PRÆSENTATIO. A PRESENTATION. In mid-

wifery it is the manner in which a child offers itself in its paffage into the world; and the different prefentations are denominated, according to that part of the child which is perceived at the mouth of the womb, when a

woman begins to be in labour.

In a natural labour, the child prefents with its vertex.

Sec PARTURITIO.

The cause of wrong presentations is not exactly known; but in different writers on midwifery, various opinions

Preternatural presentations are thus known. The membranes push out in a round form, in a right prefentation; but when any other part offers, the membranes protrude, for the most part, in a lengthened form; and when the pain is off, no part of the child can be perceived, but the membranes only, as in the beginning of labour; after fome time indeed, from the quantity of water, the membranes have a round form but then the orifice of the womb is but little opened thereby. If the head prefents, it is diffinguished by bringing the finger round, fo as to take in a large space of the head, we then feel an uniform head to large space of the head; we then feel an uniform hard sub-stance and often find a suture. When a shoulder, or a hip presents, they have not that uniform hard feel which is observed when the head offers itself. If the back pre-fents, the vertebræ are felt. If the belly presents, the funis umbilicalis discovers it. The breast presenting, is known by feeling the ribs. When the breech offers itself, the private parts are easily perceived there, and the meconium is fqueezed out at each pain. The hand, or foot presenting, requires, in order to expedite delivery when proper, that we feel for the heel, that we may determine how to proceed.

BOTH FEET PRESENTING. When this happens, the toes are generally towards the pubis, inclining a little to the right or to the left; draw the child gently downward whilft the pains continue to increase, and are in their full force; and as you draw the child downwards gradu-ally incline it to the fide towards which its toes turn; for when the breech is delivered, the child must be turned with its face to the facrum of the mother. And if the navel appears, draw down an inch or two of the funis, to prevent its being torn or too much firetched; when the body of the child is fo far delivered, that its fhoulders check its progress, introduce a finger to the elbow of the child; and gently draw the arm down, not perpen-dicularly, but by inclining it across the breast of the child; this done, bring down the other arm with the fame care. The arms brought down, place the fore and middle fingers of one hand, one on each fide of the neck, with the thumb in one, and the fingers in the other axilla; then introduce the fore and middle fingers of the other hand into the mouth of the child, pulling the chin of the child close to its breaft, turn the face into the hollow of the facrum, and fo finish the delivery.

ONE FOOT PRESENTING. In this case the toes are

to the ifchium. If the leg is low in the vagina, fo that the knee appears, it is too late to bring down the other foot, which may continue until, the breech is delivered, and the child's face turned to the ifchium: then proceed as when

the breech prefents.

BREECH PRESENTING. When this is the prefenting part, if it is very high, and the os internum folt and open, break the membranes, and bring away the child by the feet; but if these circumstances do not attend, leave the business a while to nature, the pains will push forward the present-ing part, and the labour will be as easy and safe as when the head prefents. In these cases, the sace of the child is usually towards the belly of the mother, but sometimes it is with its sides towards her pubis and sacrum, and as it inclines a little with its face to one or the other, in the course of the labour it will turn thereto. As it prefents, fo let it defeend, and keep the membranes whole as long as possible, for the more easy dilatation of the parts. When the hams of the child are from under the pubis, and the perineum freed from the breech preffing on it, take hold of the child with both hands, and turn it with its face to the mother's back, and then bring down one leg after the other; if the child is very large, the legs must be brought down whilst they are next the os pubis, and then the child's face is to be turned towards the mother's back. When the legs are free, proceed as when both feet present. When it is ne-ceffary to turn the child's face to the back of the mother,

do it whilft the pains are departing.

BACK PRESENTING. When this fituation is known, and the orifice of the womb is fufficiently dilated, break the membranes, introduce the hand into the uterus, and carefully feek for the feet. When the child is in a lengthened form, and prefents with its back, neck, shoulders, or face, if at the fame time the waters are gone, the case may prove a very difficult one. In transverse situations of the child, the orifice of the womb does not open so soon

as when the head prefents.

BELLY PRESENTING. In this case the child is seldom living. The method of delivery is the same as when the back presents. If the feet cannot be reached, get the knees to the belly, and then the feet are foon fecured.

AN ARM PRESENTING IN THE VAGINA, and THE MEMBRANES BROKE. This is one of the most difficult cases that occurs in midwifery, especially when the waters are gone, and the uterus contracts upon its burden forcibly. To proceed, push up the fore parts of the child to-wards the fundus uteri with one hand, whilst with the wards the fundus uters with one hand, whilst with the other the feet are fought for. But here carefully observe, should a pain come on during the effort, cease to act till it is over, left the uterus should be hurt, and always rather act from the womb, than against it where possible. Thus, if the waters are all run off, begin with seeking for the feet; when they are found, draw them gently towards the vagina, at the same time push up the body of the child. When the feet are brought into the vagina, the case becomes the same as when the feet prefert. case becomes the same as when the feet present. When the arm presents, and the os internum is very rigid, before any attempts are made, wait for the dilatation of the part by the force of the pains.
In the London Medical Journal, vol. v. p. 64, &c. are

the woman had been in labour during the whole night, and one of the child's arms was the prefenting part; on attempting to turn the child, the pains were too violent to admit the introduction of the hand into the uterus. Imagining the child was fmall, fo that it might pass, doubled, through the pelvis, farther endeavours to turn were omitted, and on waiting a little the breech prefented, and the head was the last part that was delivered. In the second case, the presentation was the same as in the first, and it was agreed on to turn the child; but the pains were strong and frequent, fo that the action of the uterus was fuch as to forbid all endeavours that way. It was then agreed on to wait for the effect, which a continuance of the pains might produce, or till they were abated, when the child might be turned with lefs difficulty. The pains continued, and propelled the child lower into the pelvis, and in little more than an hour it was born; the breech being expelled, as in the first case. In the third case; the arm presenting, and labour gone on for some time, after which attempts were made during several hours to turn the child, whose shoulder strongly pressed upon the perinaum; at length, by the action of the uterus, the child was doubled, and the breech expelled; after which, the shoulders and head were extracted. In all these cases the Doctor observes, that the women were at the full period of utero-gestation, and the children were of the usual fize. More cases might be related, but these sufficiently prove the fact, that in cases in which children present with the arm, women will not necessarily die undelivered, though they are not affifted by art. With respect to the benefit we can in practice derive from the knowledge of this fact, it may be observed, that the custom of turning and delivering by the feet in presentations of the arm, will remain necessary and proper, in all eases, in which the operation can be performed with safety to the mother, or give a chance of preserving the life of the child. But when the child is dead, and when we have no other view but merely to extract the child, to remove the danger thence arising to the mother, it is of great importance to know that the child may be turned spontaneously, by the action of the uterus. If we avail ourselves of that knowledge, the pain and danger which fometimes attend the operation of turning a child, may be avoided. Nor would any person versed in practice, fixing upon a case of preternatural presentation, in which he might expect the child to be turned spontaneously, be involved in difficulty, if, from a defect of the pains or any other cause, he should be discovered in his account. be disappointed in his expectations. Nor would the suf-fering or chance of danger to the patient be increased by fuch proceeding. About thirty of these cases have lately occurred, in two of which the children where born alive.

Some propose bleeding ad deliquium for abating the too ftrong contraction of the uterus; and, at the moment of

fainting, to attempt delivery.

THE HEAD LOCKED FAST AT THE BRIM OF THE PELVIS. In this case, and the seven next following, the membranes are broke, and the uterus is contracted about the body of the child. In this case, if the child be living, a tumor will be formed on its head, which will so increase, as to reach to the os externum; but when the child dies, this tumor becomes foft, and gradually disappears. What-ever part of the head prefents, it may be locked fast, though generally the face is towards the facrum; care is, however, required to know the part which presents, and the situation of the child. In order to delivery, the curved forceps are necessary.

THE MIDDLE OF THE SACITTAL SUTURE REST-ING ON THE PUBES, AND THE FACE OF THE CHILD TURNED UP TOWARDS THE FUNDUS UTERI. In this case the chin is pressed upon the breast. Mr. Levret of Paris directs the following procedure in this cafe. "Be-fore the first branch of the forceps is introduced, a fillet must be passed through the perforated blade, and likewise through the second before it is passed; and after fixing the handles, tie the ends of the fillets together so as to hang down in a noose about fix or seven inches; then taking the forceps in the righthand, raife the handles, and bearing down at the fame time with the left hand in the garter, the forceps will be converted into a lever of the

related, by Dr. Denman, three cases of the upper extremities presenting; and the delivery being partly effected by the spontaneous evolutions of the child. In the first case, head of the child, which will be made to descend into the hollow of the facrum, and be delivered afterwards with

> THE HEAD PRESENTING WITH THE EARS TO THE PUBIS AND OS SACRUM. This is known by the fagittal future running from ischium to ischium, or oblique. And to know which way the face is turned, the ear should be felt at the pubes. Sometimes the head may ear should be felt at the pubes. Sometimes the head may be removed from this position with our singers; but when this cannot be done, the forceps must be used. If the face is to the left side, turn the woman on her left side; if to the right, lay her on her right fide. In general, when the ears are to the fides of the pelvis, and the forceps are to be applied, the woman should be on her back, and her breech over the bed; but when the ears are to the pubes or groin it is better to lay her on her fide, and generally on the left. If the blade of the forceps cannot be introduced by the os pubis, the ear laying close to it, intro-duce the blade a little to one fide, the flip it over the ear under the pubis, and as the blade goes up, withdraw the hand. Over the ear is the best situation for the forceps, but if this cannot be, put one blade before one ear, and the other behind the other.

> The forceps fecured, pull gently when the pains are prefent, until the vertex is as low as the lowest part of the ischium; then turn the forehead into the concave part of the facrum, and give it a quarter turn more to bring the body into the fame position, or, perhaps, the shoulders may catch against the pubis; then reverse the quarter turn, and the forchead will be in its proper situation. The delivery will now be finished, as when the head is low, and

the pains gone.

THE FACE PRESENTING WITH THE CHIN TO THE PUBES. In any fafe cafe, if the pains are strong, use no forceps, but take time, and nature will do her own business. If the face presents with the chin to the pubes, if the woman hath had children before, and the pelvis is good, the child will come forward very well by the force of the pains; for when it hath got below the pubis, the fore part of the neck will turn on it as on a fulcrum, and the vertex will rife from under the perineum, and delivery will be effected without extraordinary difficulty, provided the perineum is well fupported.

If called in time, and the os tince is dilated, it is usually recommended to introduce the hand, and bring away the child by the feet; but if the pelvis is difforted, it is better to make the vertex prefent, by turning it with the hands. But be the pelvis as it will, if the face prefents with the chin to the pubes, if the waters are run off, the head low, and the pains very languid, apply the forceps. When the chin is cleared the difficulty is over. After the forceps are fixed, be careful to prevent the chin from

catching against the os pubis.

THE FACE PRESENTING WITH THE CHIN TO THE os sacrum. When the waters are run off, and the head is strongly detained, delivery is extremely difficult. The head must be raised and turned with the chin to the pubis before delivery can be effected. In this case trust to nature rather than begin too soon with the forceps; when the forceps are applied, force them upwards until you can turn the chin to the os pubis, and then proceed as when the chin at first presented this way.

THE FACE PRESENTING, AND THE CHIN TO ONE SIDE. If the woman is laid on her left fide, the child may often be turned fo as for the chin to pass under the pubis. If this cannot be done, introduce one blade of the forceps under the pubis, the other at the facrum; then bring the chin under the pubis, and proceed as in that

THE FACE TO THE OS PUBIS. When the fontanel prefents, the face is generally to the pubis. In this cafe, if the pelvis is good, and the parts dilated, the child will pass by the force of pains; but if the parts are rigid, the perineum will be endangered. If the child is finall, and the pelvis large, pains may fuffice to deliver the child; but if otherwise, as foon as the prefer are broken introduced. if otherwise, as soon as the waters are broke, introduce the hand, and deliver by the feet. If this opportunity does not favour us, the forceps must be used. In order to feel the ear, push up the head, that the finger may pass to the ear, and the forceps follow it; then fixing the

PRI

other fide of the forceps, and when the head is pulled delivered: this done, and the forceps removed, the pro-fufficiently low, turn the forehead into the cavity of the cedure will be as when the labour is natural. facrum, and deliver as when the head is low, but pains

wanting.

THE SHOULDERS LOCKED. In this case the head is moveable in the vagina; the face is on one fide, one fhoulder refts on the upper and lateral part of the os facrum, the other paffes over the fides of the os pubis, fo that the fcapulæ and back of the child refts in the ploas and iliac muscles on one side, and the knees and elbows prefs the fame parts on the other fide. The intention here is, to remove the shoulder on the side of the factum, to bring them both to the widest part of the pelvis; to do this, flide a blade of the forceps under the thoulder of the child, and as with a lever raise that which rest on the facrum, and carry it over the projections, which when properly executed, the head will defeend, and the delivery be almost spontaneous.

THE HEAD SEPARATED AND LEFT IN THE UTE-Rus. In order to delivery, introduce a hand, and turn the chin to the os pubis, then, an affiftant gently preffing the belly to keep the head from rolling about, the operator must introduce the long curved forceps, and fix them on the head; having thus done, draw the head down until it is fixed in the pelvis; turn the handles up to the os pubis, and introduce a pair of feiffars; open the head, and deftroy the structure of the brain; after this, give the forceps a diagonal turn, then proceed as in any other case in which the head is so situated.

TWINS. It is very difficult during pregnancy to know whether or no there will be twins at the birth. When there is but one child, the uterus rarely, if ever, rifes above the brim of the pelvis at an early period; fo if on the third or fourth month it rifes up to the navel, it is very probable that there are twins. If after the delivery of one child the uterus is contracted into a firm hard ball above the os pubis, it is thereby known that there is not another; if, on the contrary, it is much diftended, we shall find a child yet to come forth; and on examin-ing there is another set of membranes. When one child is delivered, tie the funis in two places, then wait for pains coming on, to deliver the next, except it prefents in a bad position, in which case bring it away by the feet. Except the placenta of the first child is loose, and presents itself for exclusion, leave it until the other child or children are delivered. The placentic generally adhere to each other, but they are two diftinct ones; though it fometimes happens that some of their vessels communicate; whence the ecessity of tying the cut end of the funis when the first child is delivered.

MONSTERS. These are when two children are so united as to be one, or when one child hath, in fome remarkable inflances, the parts of two, and but one funis and placenta are found. When these are small, they fometimes pass by the common method of delivery, but when they are large they occasion some difficulty. Rules cannot ealily be laid down, because of the variety of the fubjects; the fagacity and dexterity of the operator must here be wholly left to themselves both in suggesting the method, and in executing the plan for delivery.

THE HEAD LOW AND THE POSITION RIGHT, THE PAINS HAVING CEASED. The head being long confined in the pelvis, is equally dangerous to the mother and the child, as a mortification may be induced in the first, whose influence will extend to the last, and prove fatal to both. To complete the delivery, the operator introduces one hand into the vagina, and pushes them on until the ends of his fingers enter the orifice of the uterus; then with the other hand he passes one blade of the forceps between the introduced hand and the head of the child, withdrawing the hand, and holding the handle of the blade fleady, he introduces the other hand in the fame manner as the first, and after it he introduces the other blade of the forceps, then with both hands he pushes them up until the locking part is within an inch of the child's head; he then locks and ties them fo together that they may be fleady, and proceeds by pulling them gradually from fide to fide, refling a little now and then; when thus the head is brought fo low as confiderably to ftretch the perineum, and to protrude from under the os pubis, the andles of the forceps must be raised gradually towards the woman's belly, and thus the head will be completely

THE HEAD TOO LARGE OR THE PELVIS TOO SMALL. In these cases the head being brought as low as the natural pains can force it, its fize is leffened by boring into it with a pair of stop-scissars contrived for that end, and difcharging the brains; then with the curved crotchets fecured on the head in the fame manner as is directed for the forceps; or with a blunt hook introduced into the perforation made with the feiflars, the head of the child is brought forward. When the pelvis is dif-torted, the child must never be turned with a view of delivering it by the feet; but if it prefents by the feet, endeavours must be made to deliver it that ways

THE OCCIPUT PRESENTING. When this happens, suppose the occiput lays over the os pubis with the face. upwards, the operator must thrust up the child, and press back the facrum, that the vertex may be brought to prefent; but if this cannot be done, fix one fide of the forceps betwixt the os pubis and the occiput, fo as that the point may be in the neck of the child, and ftrive thus to move it; this done fix the blades on the most convenient parts, and deliver. See the authors mentioned under the

article OBSTETRICATIO.

In the operative part of delivery, one direction is absolutely necessary; that is, always to adapt the largest dia-meter of the part to the largest axis of the pelvis; and this observed, will expedite the delivery whether the fault lays in the part prefenting, or the part through which it is to be extracted.

PRASIUM ALBUM. See MARRUBIUM ALBUM. PREHENSIO. The CATALEPSY. See CATA-

PRESBYTE, from aprount, old, because frequent in the aged. Thus those are called whose eyes are to refract the rays fufficiently, so that unless the object is at some distance, the rays coming from it will pass through the retina before their union, confequently vision is confused; old people are usually the subjects of this disease. In order to remedy, or at least to palliate this defect, the person should first use glasses that do not magnify, and from them pass gradually to more convex spectacles, which shorten the focus. It is a species of amblyopeia.

PRESSURA. Inflammation of the ends of the singer,

from the effects of cold. It is an inftance of the phlogofis

erythema of Cullen.

PRIAPÆIA. See NICOTIANA MINOR.
PRIAPISMUS, from Priapus, the beathen god, whose penis is always painted erect. A PRIAPISM. It is an erection of the penis without any concomittant pain, or the confent of other parts. It is thus called, because the person in this state resembles the lewd god Priapus. Coelius Aurelianus says it is a palfy of the seminal vessels, and other nerves distributed to the parts about the penis, by the diftention of which this diforder is produced.

PRIAPUS. See PENIS and NEPENTHES.
PRIMÆ VIÆ. The FIRST PASSAGES; that is, the

flomach and inteffinal tube.

PRIMULA VERIS. The PRIMROSE, i. c. PRI-MULA VULGARIS, Linn. See PARALYSIS. For that

called odorata, fee Auricula ursi.
PRINCIPIA. 'The principles of elements of BODIES. To know the virtues of bedies, or how mixed bodies stand related to the human body, either for preferving, or for restoring it, we must know the principles, and also the mixture and proportion of such principles in which their virtues confiit : fuch simple parts, therefore, as all mixed bodies can be refolved into, are called principlesor elements.

In analyfing mixed bodies, a fpirit, or mercury as the ancients call it, fulphur, that is oil, falt, water, and earth, are obtained. Modern chemists deny that either falt or oil are principles; for fulphur and oil may be reduced to

falt, earth, and water.

On this subject, what Beccher hath advanced, though very obscure, is yet the source of many valuable discove-ries in chemistry. Stahl hath improved on Beccher, and by the aid of these great men it is demonstrated, that fire, water, and earth, enter into the composition of bodies. Sir Robert Boyle and Dr. Hales, have as clearly proved that air is a conflituent of most bedies. Thus, as Aristotle

7 P

water, are now faid to be the principles of all compound bodies. However bidies are decomposed, these constituents are always obtained, and as these cannot be decomposed any farther, they are confidered as simple sub-

flances, and are called primary principles, or elements.

In decomposing bodies that are much compounded they are not by a first analysis reduced to their primary principles. eiples; but substances are obtained from them that are more simple than the original one was; and as these do the office of principles in the composition of bodies less simple than themselves, they have been called principlate principles. Most chemical agents, as acids, alkalies, &c. are of this kind. Principiate principles have very different degrees of simplicity, and so are distinguished into first, second, &c. orders. See the Dict. of Chem.

PRIVATIVI. DIMINUTION of the SENSES. De-

fect of appetites. It is fynonymous with dyfæfthefiæ and dyforexiæ in Cullen's Nofology, particularly in the

instances of deficiency.

PROBOLE. See Apophysis.

PROBANG. See DEGLUTITIO.

PROCARDION. The PIT of the STOMACH.

PROCATARCTICA CAUSA. The PROCATARC-

PROCESSUS. See CAUSA. The pre-existent cause, from enough to the process, from proceeds, to finate out. In CHEMISTRY, it is a series of operations tending to the production of something new.

In ANATOMY it is a process, and is a protuberance or eminence of a bone; called also condule. Many bones have recoller vising out of them. If the process stands have processes rising out of them. If the process stands out in a roundish ball, it is called caput, and the narrow part is called cervix; when the head is rather oblong, and unequally rounded, it acquires the name of a condyle; a rough, unequal protuberance is called a tuberofity; fuch processes as terminate in a sharp point, have the name of corone or coronsid; fuch as form a longitudinal ridge are called fpine, and fometimes crifta, the labia are each fide of a broad fpine; fuch as form brims of cavities are named supercilia. The use of processes is to give bones their necessary shape, and to adapt them for motion; they sometimes serve to give cavities, and generally are useful in allowing a greater surface for the origin, larger attachment, and more advantageous direc-tion of muscles. *Processes* are of two kinds, viz. the APOPHYSIS, and the EPIPHYSIS, which fee.
PROCESSUS CILIARES. See CILIARE LIGAMENTUM.

MAMILLARES. So the olfactory nerves are called. Also the mastoid process. See MAMMIFORMES.

PROCIDENTIA. Se PROLAPSUS.

PROCIDENTIA ANI, from procide, to fall down, called also prolapsus ani, exitus ani, examia. The FALLING DOWN of the FUNDAMENT. It is a relexation of the fpincter to fuch a degree that the internal villous or ru-

gous coat of the inteftine, turneth out and beareth down, making a fwelling proportionably.

The causes are, a weakness in the part, which is aggravated by costiveness, diarrheas, and particularly a tenefimus: an acrid humour falling on this part, the harmorrhoids, hard labour, a stone in the bladder, or what-

ever can occasion a paralysis of the levatores and spincter ani. Hoffman fays the cause is not in a relaxation of the intestine, but of its ligaments.

Infants are the most frequent subjects of this disorder, by reason of the tenderness of their frame and their frequent straining, either from costiveness, or the falling

The figns are evident to the fight; the infide of the inteffine is turned outward; the tumor is of a fleshy colour, fometimes it is wrinkled, at others it is fmooth and thining, and is accompanied with an uneafinefs, and an

ineffectual defire to go to ftool.

Sometimes this diforder is miftaken for the piles; indeed any tumor about the anus, when of a confiderable fize, may be miftaken for the defcent of the part, and vice verfa; therefore attention is not unnecessary. Through mistake, a ligature hath been applied about the prolapsed anus, in order to extirpate it.

The cure is difficult, but less so in children than in grown people. When costiveness, a stone in the bladder,

taught long before chemistry furnished its aids for the estab-lishing this truth, the four elements, viz. earth, air, fire, and very difficult; if succeeded by the hæmorrhoids the diffi-

culty is yet greater.

When acrid matter is observed to occasion fruitless straining, so as to force down the inner coat of the rectum, give a gentle dose of rhubarb every third or fourth day; and in the intervals of purging give abforbents and ftrengtheners, fuch as chalk, in frequent and fmall dofes; if pain is confiderable, give small doses of the tinct. opii, at proper intervals. If the habit is coffive, give laxatives in such doses as will procure a stool or two every day: if a diarrheea attends, it should be gradually checked; if there are ulcers in the intestines, or if by the sharpness of the humanus the second stool of the second sto of the humours the mucus is abraded, the starch clyster, with a few drops of the tinch. opii should be now and then injected. If a tenefimus comes on, let a elyfter be injected. If a tenerimus comes on, let a elyster be injected every night, or oftener, in which is the Venice turpentine diffolved with the yolk of egg. If the prolapfed inteffine is fwelled, apply diffcutients; when the tumor gives way use gentle altringents; then, by gently prefling the part with your fingers, the whole will return to its proper fituation; after the reduction the part may be suspended by the T bandage. It is the most easily reduced by the patient himself lying on his back, and with duced by the patient himfelf lying on his back, and writhing himfelf from one fide to another, croffing his legs, &c. But, as in all other cases, let the cause be first at-tended to. If it goes up and down of its own accord, there is no occasion for furgery; the best method will be to remove the irritation, and strengthen the whole system, which is generally in a relaxed tlate. The irritation is frequently produced by an acrid mucus, which is generally relieved by alkaline medicines. Avoid aftringents, even omit the bark, if it proves aftringent. Sometimes the inteffine is not only thrust forth, but is so bound by the sphincter ani above, that it cannot readily be returned; in such case Mr. Pott advises to bleed, to give opium as required, to foment, and wrap up the part in an ano-dyne and emollient poultice; thus in a little time its flate is fo altered, that it generally is returnable, until which time, the more we handle it the worfe it will be, but now having gently wiped it clean, it may be returned. If extirpation proves necessary, it is best performed by liga-ture; excision is not to be attempted, for fear of ha-morrhage, which should it follow, it would be from veffels that nature must stop, for art could not reach them. If the prolapfus is large, take a ftrong needle, double threaded, and pass it through the intelline, tie it above on one fide, and then below on the other, or above and below properly. If the prelapfus is small, pass a double ligature round its whole diameter; in both cases leave it to drop off. The pain is allayed by poultices, opium, &c. The sphincter afterwards does its office, and this most

roublefome complaint is entirely got rid of.

When the prolapfus ani is caused by stone in the bladder, or other disease, it will be restored when those complaints are relieved on which it depends: therefore, great care should be taken before extirpation is attempted, that the case is simply the relaxed prolapsus. If a gangrene affects the intestinal fold, slightly scarify the discoloured part, apply stupes wrung out of warm red wine, or other part, apply https: wrung out of warm red wine, or other antifeptics; repeat them every two or three hours, and betwixt the use of these continue the catapl. a cumino on the part. When the prolapsed part cannot easily be kept up in grown people, Cheselden recommends to "take away a piece of the prolapsed gut lengthways, for after the cicatrix is formed, the gut will never descend." But on this Mr. Pott remarks, "I am forry for this, less Mr. Cheselden's authority should tenunt any other person. Mr. Chefelden's authority should tempt any other person to make the same trial." Gooch, in his Cases and Remarks, gives the draught of a convenient machine by which the parts may be supported. See Turner's, Wiseman's, and Heister's Surgery. Bell's Surgery, vol. ii. p. 268. White's Surgery, p. 380.

PROCIDENTIA OCULI. See MALUM.

UTERI. The FALLING DOWN or DES-CENT of the WOMB; called also metroproptosis. Dif-ferent species of this disorder are thus diffinguished: I. Relaxatio, a BEARING DOWN of the WOMB; it is when the womb descends down to the middle of the vagina, or even with the meatus urinarius. 2. Procidentia; the PRECIPITATION OF FALLING OUT of the WOMB: grown people. When coffiveners, a frome in the bladder, it is when it descends to the labia pudenda. 3. The pre-or labour, gives rise to this complaint, the cure is somedie. 4. Inversio or perversio, the infide turning out: and the vagina, milk warm, with a womb-fyringe. At the fame

In the leffer degrees of these disorders they are discovered by the touch, and the greater degrees by the eye. rered by the touch, and the greater degrees by the eye. If the woman stands upright, and a singer is introduced into the vagina, the bearing down of the womb is discovered, and by meeting with the os tincæ the case is distinguished from a descent of the vagina; though, in some instances, much difficulty attends the distinction of these accidents. If the woman is pregnant, she finds a weight at the bottom of her belly, and the cervix uteri presses to low that the cannot walk but with pain and stradding; the sound of the tumor prevent the passon walking about, a fine spange way be under the passon walking about, a fine spange wrung out of alumn them and stradding; the sound strengthening mixture. R Cort. Peruv. pulv. 3 i. cort. aurant. 3 iii. aq. bullient. 15 i. colatura & adde spt. lavend. c. 3 iij. cap. cochl. iv. vel vj. bis in die. If the internal parts are free from decay, the cold bath will give great relief. Though the parts bearing down be ulcerated, relief. Though the parts bearing down of the woman is pregnant, stated the internal parts are free from decay, the cold bath will give great relief. Though the parts bearing down of the woman is pregnant, stated to the internal parts are free from decay, the cold bath will give great relief. Though the parts bearing down be ulcerated. Should the descent of the true of the internal parts are free from decay, the cold bath will give great relief. Though the parts bearing down of the woman is pregnant, and the parts are free from decay, the cold bath will give great relief. Though the parts bearing down be ulcerated. at the bottom of her belly, and the cervix uteri preffes fo low that the cannot walk but with pain and ftraddling; towards the latter end of pregnancy, the womb finks to low as to caufe numbnefs in the hips and fleepinefs in the thighs, a difficulty of urine and at going to flool, by prefling the rectum and the neck of the bladder; a con-fiderable pain is also felt in the loins, about the insertions fiderable pain is also felt in the loins, about the infertions of the ligamenta lata. When there is a perversio uteri, it appears like a piece of slesh, and when this is the case, it appears like a piece of slesh, and when this is the case, it is always attended with a precidentia vesice urinariae.

In the Edinb. Med. Commentaries, vol. ii. p. 43. is the it appears like a piece of flesh, and when this is the case, it is always attended with a presidentia vesses urinariae.

Girls are sometimes the subjects of this disease, but it

getting out of bed too foon after delivery, though fome-times it is owing to a weak relaxed habit. A fhort funis umbilicalis, and the placenta adhering, may be the caufe, particularly if force is used in delivering them.

If any species of this disorder is neglected, the woman fuffers much pain, with a difficulty in voiding her urine, and fometimes an inflammation, uleers, or a cancer, will

be formed in the womb.

In general the cure is only palliative, and confifts of introducing a peffary into the vagina, by which the uterus is kept from falling down any lower; fometimes this proves a means towards a radical cure, by giving the reproves a means towards a radical cure, by giving the relaxed parts an opportunity of recovering their tone. Sometimes, when a leffer degree of this diforder hath happened, the ufual confinement in bed during the next lying-in hath effected a cure; a perfary should be introduced as foon as it conveniently can, after delivery being completed, and worn for some time after the woman walks abroad. A round perfary is the best, and should be follarge as to occasion some uneasiness in passing it up, or it will be apt to fall down again. See Pessarium. If a lacerated perineum is the cause of the womb bearing down, a persary will not be very useful; in this case a appears through the pudenda, it may be called a prolapdown, a peffary will not be very useful; in this case a appears through the pudenda, it may be called a prolapfort of cushion may be placed with its convex side to the
os externum, and secured there by the T bandage. If
termed a procidentia; and when not so far, a relaxation. os externum, and fectred there by the I bandage. It termed a precidentia; and when not fo far, a relaxation. Widemannus gives a cafe of a prolapfus vagina which keep the bowels open, and apply fomentations and poulties. If a mortification appears, give the bark, and use the just named applications, until the floughs separate and the parts heal, after which apply a pessary, if the patient can bear it. Whenever a gangrene or a cancer appears, reduction increases the attending symptoms, or produces new and fatal ones; but if there are ulcers, the part seeds of a prolapfus vagina which had all the appearance of a prolapfus vagina which the same not for far, a relaxation. Widemannus gives a case of a prolapsus uteri, and when not so far, a relaxation. Widemannus gives a case of a prolapsus uteri, and which which all the appearance of a prolapsus uteri, and which had all the appearance of a prolapsus uteri, and which had all the appearance of a prolapsus uteri, and which which is the prolapsus uteri, and which which the prolapsus uteri, and which which is the prolapsus uteri, and which will be a prolapsus uteri, and which which all the appearance of a prolapsus uteri, and which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus uteri, and which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus uteri, and which which which all the appearance of a prolapsus the prolapsus the sound of the prolapsus the ostince, which distinguishes the womb from all other cases of a descent, and when not so a prolapsus the ostince, which distinguishes the womb from all other cases of a descent, and when not so a prolapsus the sound all the appearance of a prolapsus the sound all the appe

The inversio is when the uterus not only descends, but is turned inside outward. This never happens but immediately after delivery, the os tincæ then being nearly as large as the fundus; and, befides this, some violence, from a tumor, a fungus, a farcoma, &c. of the part.

The part may be restored with the singers; which when as large as the fundus; and, befides this, some violence, such as pulling the sunis forcibly to bring away the placenta, is used, otherwise the contraction of the womb, after being freed from its principal burden, the child, would absolutely prevent all possibility of this kind of difference. Whatever be the cause, the part must immediately be restored, or the consequence will soon be fatal, for its orifice will contract in this unnatural state, and so prevent the needful relies. First empty the bladder, if it contains much urine; then lay the patient on her back with her hips raised, and with the hand restore the uterus gently return it into the vagina with three singers, proposed to make incisions; or rather search as cort. Peru, acid. virrioli dilutum, cold bath, and avoiding at least all strong exercise. But if these fail, the T bandage must be worn.

with her hips raifed, and with the hand reftore the uterus; gently return it into the vagina with three fingers, and then with the whole hand place it in the belly, after which, clench the fift, and retain it there, until the uterus contract upon it; lastly, support it as in the case of a prolapsus,

Dr. Leak, in his Medical Instructions, advises that after the parts are reduced, the intention of contracting the relaxed vagina, so as to prevent its suture descent, may be effected by the frequent use of the following aftringent injection. R Alum r. & vitriol. alb. \$\frac{3}{2}\$ 3 is all bulb of the bladder being thus prolapsed or forced aq. bullient. It is now no longer exposed to the pressure of the

time endeavour to ftrengthen the whole bodily fystem by nourifhing diet, chalybeate waters, and fuch as the followtient from walking about, a fine fpunge wrung out of alum water may be dried in a compreffed flate, and cut into any convenient form, fo as to be introduced as high as pollible; this will act by its aftringency, and by its preffure, in a gentle and uniform manner; during the use of

Girls are fometimes the fubjects of this difease, but it most frequently happens to women who have had children, in whom it is generally caused by hard labour, or After trying many remedies in vain, and being tired out with the continuance of her complaint, fhe at length cut into the fubitance of the uterus with a common kitchen knife. A confiderable hæmorrhage enfued; after which the uterus gradually contracted, and the had neither a return of the prelapfus, nor was the afflicted with any other fymptoms. Having boafted of her success, many women in the neighbourhood afflicted with the same complaint, applied for her affiltance, and by a fimilar ope-

ration were effectually cured.

In the prolapfus vaginæ the fame method of cure is still more strongly recommended.

It is supposed that scarifications may succeed, instead of incisions with the strong strong

reduction increases the attending symptoms, or produces new and fatal ones; but if there are ulcers, the part should be restored with all convenient speed.

The inverse is when the ulcers are the part should be restored with all convenient speed. there is immediate danger of a fphacelus; if the prolapfed part be affected with little or no fwelling, or if there is no inflammation, the tumor will be very little trouble, and without danger. This diforder should be distinguished

enough in this posture, to contract and press out the urine, the poor woman in this state never makes any water, without first squeezing the bladder with her hands, or between her thighs. When the bladder is thus disposed, if the catheter is to be introduced, it must not be thrust inward, but downward, the bulb of the bladder being below the meatus urinarius. See Lond. Med. bf. and Inq. vol. iii. p. 1. PROCONDYLOS, from upo, after, and word boos, fin-

ger. The first joint of each finger next the metacarpus, ante internodium.

PROCTALGIA; also clunesia and profititis. IN-FLAMMATION of the ANUS, with pain. Dr. Cullen places it as a variety of phlogosis phlegmone. PROCTOLEUCORRHEA, the same as profortheas,

but thus named because of the discharge resembling that

PROCTORRHŒA. A flux, that is fometimes yellowish, or streaked with blood; probably from the exter-nal hæmorrhoidal vessels, or perhaps in some instances from the internal ones; this discharge is accompanied with heat and itching about the anus.

PRODUCTIO. See Apophysis. PRODROMI. See ETESIÆ.

PRŒBIA, PRŒBRA. See AMULETA.

PROEGUMENE. A PRECEDENT CAUSE; OF AN INTERCEDENT, INTERNAL CAUSE of a difease, in the body, occasioned by another cause: it is called by the Latins, antecedens.

PROFLUVIA. An increase of some natural dis-

charge, with fever.

PROFLUVIUM. A FLUX of any kind.

PROFUNDA BRACHII VENA, vel PROFUNDA SUPERIOR. It is a branch from the bafflica vena, fent off from it below the neck of the os humeri; and near the hollow of the axilla: it runs along the fide of the brachial artery, and fpreads in the adjacent muscles.
PROFUNDUS MUSCULUS. A name for the per-

PROFUSIO. Passive HÆMORRHAGES; fuch as happen from wounds, &c. and not the effect of fever. Dr. Cullen places this genus of difease in the class locales,

PROGERMINUS ABSCESSUS. An abicefs ariting

PROGEOSIS. The TIP of the TONGUE.

PROGLOSSIS. The TIP of the TONGUE.

PROGNOSIS, from was, before, and ynesses, to know. The PROGNOSTIC of a DISTEMPER. It is the knowledge of the figns by which we prefage those circumstances that will happen to the patient. In this Hippocrates excelled; his prognossics are at this day effections from the difference of climes and conflictuous. cious from the difference of climes and conftitutions.

In forming prognoflies, attend to, 1. What will be the future event of the disease. 2. From like diseases having proceeded in the same body. 3. And, from a knowledge of the present state of the vital powers, and a comparison thereof with the strength of the morbide course.

thereof with the strength of the morbific cause.

The figns of health, and death, are more fallacious in

acute than in chronical difeases.

See the English translations of Hippocrates's Prognofbies in Acute Diseases; and of Prosper Alpinus's Prefages on Life and Death.
PROHIBENS. The fame as contraindicans. See

ANTENDEIXIS.

PROJECTION. In chemistry, it is PROJECTIO. the casting any substance to be calcined into a crucible, by a spoonful, or a small quantity at a time. Projection is also an addition of a small quantity of something to a greater quantity of a metal, in order to meliorate the metal. See Wilfon's Chemistry.

PROJECTURA. An APOPHYSIS, which fee.
PROLABIUM, pro, before, labium, the lip. The RED
PART of the LIPS. Under the epidermis, which in this
part is called epithelium, is a collection of fine long villous papillæ, closely connected together, and covered not only by the epidermis, but also that pellicle which covers the glandulous membrane of the cavity of the mouth: this villous substance is of exquisite sensibility.

PROLAPSUS. Sec PROCIDENTIA. Dr. Cullen

the abdominal muscles as before, and not having force places this genus of disease in the class locales, and order ectopiæ. A prolopfus, a procedence, or exany, is the misplacing of a fort part, and so that it is generally obvious to the fight; or, it is a tumor arising from the dislo-cation of a foft part, as a membraneous or fleshy part, as is inflanced in the bearing down of the rectum, an intef-tinal hernia, &c. Indeed this term is fynonymous with

> PRONATIO. PRONATION. When fpoken of the hand, it is when the thumb is turned towards the thigh; fo then, if the body is laid on its back, the palm of the

hand will be downwards.

PRONATOR QUADRATUS. This mufele is also called transversus. It arises tendinous from the inner part of the ulna, and is inserted into the inner part of the radius. One end of it is fixed to the lower part of the ulna, and by the other in the concave fide of the lower extremity of the radius.

- TERES. It rifes from the internal infe-RADII TERES. rior part of the os humeri, and -TERES. is inferted into a line at the lower end of the radius.

This mufcle is also called abliguus.

PROPHYLACE. PROPHYLAXIS, from mgs, before, und opensors, to preferve. The method of preferving health, and averting diseases.

PROPOLIS, called also ceranthemus. Bee-bread. It is a wax-like kind of glue, found in the entrance of bee-hives. It foftens indurations; but it is not noticed in the prefent practice.

PROPRIETATIS, ELIXIB, i. e. elix. aloes. See

ALOE.

PROPTOMA. A prolapfus or defect of a part.

PROPTOSIS, from \(\pi\_{\text{port}} = \pi\_{\text{of}} = \pi\_{\text{of}}\) to fall out. The fame as procidentia. It is to fall from its natural fituation. When the eye is fo enlarged that the eye-lids cannot cover it, it fometimes burits; and this difforder is called searcher; it forms to the property and belong a property by lus elephantinus; oculus bovinus, and bubulus proptofis by the Greeks.

In the Medical Communications, vol. i. p. 409, &c. is the following mode of cure of Hydrophthalmia or Proposofis.

The cure of the difease by seton, is to be adopted only

in fuch cases as where vision is intirely loft; the intent of the operation being merely to remedy the inconveni-encies occasioned by the increased bulk of the eye. These inconveniencies are, frequent pain, inflammation of the difeafed eye, head-ach, reftlediness, difficulty of closing the eye-lids, a constant effusion of tears down the check, and a great deformity from the bulk of the tumor. The other eye also frequently becomes liable to inflan-mation, and the patient is commonly incapable of reading,

&c.

The following mode of cure is not very painful, and may be easily performed. To do it with convenience, may be easily performed by patient should be seated in the same manner as for extracting the cataract. The feton needle being armed with fix threads of white fewing-filk, is to be paffed from the external angle, about a quarter of an inch from the edge of the cornea, through the posterior chamber of the eye, and brought out at at the fame distance from the inner edge of the cornea.

I have not lately used the speculum oculi in this opening the cornea in th

ration, as the pain it causes by pressure, seems to overballance the advantage that is gained by its fixing the

globe of the eye.

In faltening the threads, we must be cautious not to draw them tight, left they should cut through the cornea

before the cure is completed.

The external applications should be of the sedative kind; perhaps we have none more proper than the saturnine water of Goulard, applied warm. A certain degree of inflammation and sever come on soon after the operation, but I have found that these readily give way to a cooling regimen, bleeding, and gentle laxatives. A swelling of the eye-lids, and a thickening of the coats of the eye, must likewise be enumerated among the symptoms that follow the operation; but these commonly begin to subside about the eighth or ninth day, at which time I usually take out some of the threads, and the swelling then gradually finking within the orbit, the patient finds a comfortable alleviation of those painful symptoms with which he was before affected.

For a month after the operation I keep in some of the

PROSTATA. See Suppositionium.
PROSTATA, from aps, before, and is nut, to fland, from apsocraum, to be adjacent to. "The PROSTATE GLAND, called also corpus glandulosum. The prostate are fituated at the neck of the bladder, are shaped like an heart, the lower furface is the largest, and the upper ones are both flat. The membranous part of the urethra runs through ift it is about the fize of a wallnut. When cut open, the eminence called caput gallinaginis is feen. The vafa deferentia pass through its substance. When the proflate gland is inflamed from a suppressed gonorrhoea, every means should be used to restore the discharge; for, if this inflammation terminates in fuppuration, whether the abfeefs breaks into the urethra, bladder, intellinum the ablcels breaks into the urethra, bladder, intellinum rectum, or perinaum, it will always be attended with diagreeable confequences. The symptoms of an inflammation or swelling of this gland are known from the pain and difficulty of making water; besides, if we should be doubtful whence they proceed, the singer will clearly teach us. If a suppuration has already taken place, we have only to observe, that mercury internally and extensible will be need force, and afterwards proper injections. nally will be necessary, and afterwards proper injections, the compositions of which must be left to the judgment of the practitioner. The remedies proper for indurated tefticles or buboes, will be fuitable in this cafe; but especially blifters repeatedly applied to the perinaum, and in-ternally hemlock in large dofes. If a total suppression of urine is feared, bring on the fuppuration to prevent worfe

PROTUBERANTIA. See Apophysis.

PRUNA. PRUNES. Botanifts enumerate nine species of prune-trees. It is a name also for carbunclus. It has also different distinguishing epithets joined with it, viz.

- GALLICA, parva fativa. Common or French PRUNES, called by our gardeners, the LITTLE BLACK DAMASK PLUMB. The prunus domestics, Linn.

DAMASK PLUMB. The prunus domestica, Linn.

— BRIGNOLENSIA, called also prunells, or BRIGNOLE PLUM. The prunus domestica, Linn. It is so called from Brignole in Province. It is of a reddish yellow colour, and of a very grateful, sweet, subacid taste.

— DAMASCENA. The DAMASK PRUNE, called DAMSONS. This species is generally supplied by the common prune. Their general qualities are to cool, quench thirst, and render the bowels lax. The prunelless quench thirst more than the others; and the French prunes are most laxative

PRUNELLA. See BRUNELLA and BUGULA. PRUNUS BRAISLIENSIS. See Acaja. Prunus Prumirera. See Nux Virginiana.

- INDICA. See ACUJAIBA.

The BLACK THORN, or SLOE-BUSH. The prunus communis, Linn. It is a prickly bush, very common in hedges, produces an austere fruit, which is smaller than an ordinary cherry. This fruit is too harsh to be eaten before the frosts have softened them. The juice expressed from them before they are ripe, or affected by the frost, if in-spissared by a gentle heat, is called acacia Germanica, and is generally sold for the acacia Egyptiaca, from which it differs in being harder, heavier, darker-coloured, and of a tharper tafte, and yet more remarkable in its giving out

that her tatte, and yet more remarkable in its giving out its aftringency in a good measure to sp. vini r. whereas the Egyptian acacia is not at all dissoluble in spirit. This fruit is an agreeable and useful altringent.

A conserve is made of the sport by steeping them in hot water, care being taken that they do not burst, and when they are soft enough to pulp, they are passed through a hair sieve, and to one part of the pulp, three parts of lump-sugar must be added. Pharm. Lond. 1788. This is never altringent, and is also of use to brace up sonner. is very altringent, and is also of use to brace up spongy punit. The flowers of the flow-bufb are laxative. The bark is useful in intermittents. See Lewis's Mat. Med.

PRURIGO. A VIOLENT ITCHING.

PRURITUS. A VIOLENT ITCHING, or the ITCH,

threads, which, after the first instammation is removed, do not occasion much irritation. See Lond. Med. Journal, vol. i. p. 346.

PRORA. The occupur.

Dr Cullen names this genus of difease plora, amongst the order of impetigines; he places it in the class locales, and order dyalyses. Many are the appearances on the skin, and various the diforders that are accompanied with, or manifested by an itching therein; but the itch is a skin-difease, and hath for its cause a very small kind of animalcula of a whitish colour, and shaped like a tortoile, each having fix feet, and a sharp head, with two small horns on its point. They are very hard, so are not easily destroyed by rubbing them.

This diforder usually appears at first about the wrists and fingers, then on the arms, legs, and thighs, but never affects the head. In the evening, when the patient approaches to the fire, or begins to grow warm in bed, the itching is most troublesome; in some patients there are blotches here and there, in others there is a scursy or fealy kind of eruption; this last is called the dry itch. The most kind most frequently happens to children, and fealy kind of eruption; this last is called the dry itch. The moist kind most frequently happens to children, and the drier fort to adults. The humour in the moist fort is sanious and purulent, and an inflammation is observable about the basis of each eruption; but in the dry kind, the pustules are of a small size, and are filled with a serious ichor, which by irritating the highly tender fibres under the cuticle occasion both heat and itching.

The moist kind of itch is more easily cured than the dry sort; this disarder is obtained in old people, and still

dry fort; this diferder is obstinate in old people, and still

more fo in those whose viscera are unfound.

Whether the cause be a morbid serum in the blood, or the animalculæ above mentioned, fulphur alone is to be depended on for a cure; it should be taken inwardly, so as to keep the bowels lax; but if it agitates the blood, and occasions cruptions to appear on the ikin, it may be mixed with the cream of tartar. As to its external use, it need not be applied like other medicines to every part of the body; but if rubbed on the palms of the hands, and the felte of the feet it follows and the selections are the feet in foles of the feet, it fushees: and thus used there is less objection to the finell, and the uncleanliness complained of, than when the whole fkin is anointed.

Dr. Pringle recommends the following ointment to be

Dr. Pringle recommends the following ointment to be used at four times, each portion to be applied at bed-time; and to prevent any disorder from too many pores being stopped at once, he directs that one fourth part of the body only should be rubbed at once.

R Flor. sulp. 3 i. p. rad. elleb. a 3 ii. vel fal ammon. crud. 3 ii. axung. porc. 3 ii. m.

The sulphur vivum, in fine powder, is always more effectual than the slowers of sulphur; as the sulphur loses much of its strength by the process of sublimation, it should never be employed for any cutaneous cruption.

During the use of sulphureous applications clean linen is necessary; it should often be changed, but not worn again before being well washed and bleached.

Many other applications have been used, and still are

Many other applications have been used, and still are preferred by some. The following are recommended by

minent practitioners.

ung. pomat. 3 ifs. m.

Dr. Turner prefers a folution of the kali in the propor-

tion of a dram to an ounce of water: of this a tea spoonful is to be taken two or three times a day in any fmall drink. The body at the fame time to be washed with a weak ley.

The extr. cicutæ hath been found ufeful in fome obsti-nate cases, which resisted all other common methods. Baths should be used in the dry species particularly; and perspiratives are useful in both forts of this complaint.

The venereal itch requires the use of mercurial alteratives, and the decoction of guaiacum. See Bifs's Effays; Turner on the Difeafes of the Skin; Barbette's Chirurgia, lib. i. c. viii. Wepfer's Obf. 214. Philof. Trans. abr. vol. iv. Bell on Ulcers, p. 371.

PSALLOIDES. So the ancients called the inner furface of the fornix, because it appears as if stringed like a

dulcimer.

PSELLISMUS. ¿STAMMERING, or a faulty articuPSELLOTIS. I lation of words. Dr. Cullen places
this genus of difease in the class locales, and order dyfcinefize. He diftinguishes seven species. 1. Pfellismus hefitans; also called battarismus; ischnophonia, when there
is difficulty to pronounce the first syllable or word, which
is not affected before repeated trials are made. 2. Pfellismus ringens; called also blassita, when there is a fault in

20 70

pronouncing the letter R, trautis. 3. Pfellifmus lallans; when the letter L is founded improperly, or in the place of the letter R. 4. Pfellifmus emolliens; when the hard letters are expressed too soft, as the letter S is too frequently founded. 5. Pfellifmus balbutiens, called also balbuties; when from a large tongue the labial letters are too much heard, and are often founded instead of others. 6. Pfellifmus acheilos; when the labial letters are diffi-cultly founded, or not at all. 7. Pfelifmus lagostomatum; when, from a division in the palate, the guttural letters are not well pronounced.

PSIMMYTHION. CERUSS.

PSOÆ. The name of two pair of muscles in the loins, called also alspees. According to Galen, Pollux, &c. the loins were called \$\delta\sigma\_{al.}\$.

PSOAS, also called lumbalis, and lumbaris internus, psas magnus. It is placed obliquely on the fides of the loins, and runs under Poupart's ligament to that thigh on which fide it is. It rises fleshy from the sides of the upper verses. fide it is. It rifes fleshy from the fides of the upper vertebre lumborum; and from the roots of their transverse procedles passes down under Poupart's ligament, and is there joined by the iliacus internus, which lies upon the concave part of the ilium, and takes its origin from the anterior edge of the bone; it runs down before the psas, and makes one mass with it; they then run over the head of the head and as with it; they then run over the head of the bone, and pass upwards to be inserted, tendinous, into the little trochanter, and sleshy into the bone a little below that process. Its office is to bend the femur, by bringing it forwards, partly to rotate it, and to turn the toes out. The kidneys often press upon this muscle, over which runs a nerve; hence those who have stones therein often feel a numbress in the the thigh of that side.

The pleas abicels receives different names from different writers. Mr. Pott observes, that it receives this name from the matter of it sliding in its fall upon the side of the plaas muscle, or betwixt that and the iliacus internus. Dr. G. Fordyce observes, that between the plaas muscle and the muscle of the back, lies a quantity of loose cellular membranes, from which an inflammation often takes place, which terminating in an abscess forms this disorder.

diforder.

Mr. Pott thinks this diforder originates in the lymphatic glands, near the receptaculum chyli, the vertebræ about which are generally difeafed and carious in these cases. Dr. Hunter again observes, that matter is sometimes lodged in this part at the crisis of a fever, and he hath seen influences of matter aveceding from the liver into this instances of matter proceeding from the liver into this fituation, after making its way through the peritoneum. As there is a great quantity of cellular membrane over the pfors muscle, and a confiderable way toward the fkin, the matter feldom points outwardly on the back, where it is formed, but running down on the course of the muscle, makes its way into the groin, thigh, ham, the inner con-dyle of the os femoris, &c. or when on the right fide, it may penetrate the colon which lays upon it, and there-by occasions a large discharge of matter per anum, and possibly a fiftulous fore.

The pleas ableefs often exists a considerable time before it is suspected.

The eruptions in the beginning are fimilar to those of inflammation of the liver, excepting for the fituation; its progrefs and termination is like that of the liver too. The pains are fituated in the back, for the most part, rather lower than the region of the kidneys. The pain is but flight, and so moderate are the symptoms for a time, that frequently it hath not been attended to until suppuration had taken place. After the abscess is formed, the pain often becomes greater then before; for, the pus ferment-ing in the cellular membrane, fpreads itfelf, and produces a great degree of general inflammation. This cellular membrane communicates itself with the cellular memthrough the peritonæum into the cavity of the abdomen, whence arifes hectic heats, and is fatal. The matter may also pass down the pleas muscle, and make its exit externally a little further than the inguinal glands, or it may pass pass further down the thigh, diffect the muscles, and form finuous abscelles. Sometimes the matter passes through the muscles of the back, but may take its course into the eavity of the back part of the pelvis: thus it appears that the pus is capable of passing several different ways, and may communicate with all the parts at once, which makes it a dangerous abfects, not for much with regard to its fize, as to the parts which it affects. Usually the first symptoms that the patient feels in cases of the pleas abfects, is not where the difease originates, but a pain in the lower part of the thigh of the fide affected; he stands on his toes, &c. and does not complain of the part for some time, but by attending to the circumstances from the beginning, and laying the person affected on his back, lifting up his thigh, then, between infpiration and expiration, carefully examining the part, you will probably feel the tumor near, or in the region where the disease originates. The leg of the affected side seems to be shorter than the other, but it is not so. In some cases the disease proceeds rapidly, in others very flowly; at length it appears in the groin, and the affected fide; the muscles of the thigh become exceedingly emaciated, and the whole body wastes. When it proceeds thus far, the patient rarely, if ever, recovers; the fymptomatic fever that generally attends closes the fcene.

This difease is often confounded with the abscess of the hip-joint, yet they are very diftinct and different in their origin, feat, and progrefs. The plans abfects originates often in the lymphatic glands near the receptaculum chyli, the vertebræ about which are generally difeafed and carious; in other instances it originates in or about the loins, if not higher in the abdomen. The first symptoms men-tioned above continue for some time. At length the diftioned above continue for some time. At length the disease appears in the groin, the limbs waste, and, indeed, the whole body also, &c. The hip-joint abscess originates in the hip-joint; when it attends, the leg of the affected side is shorter than the other; the pain begins in the part where the disease originates, and about the great trochanter. The pisas abscess is a disease of the vertebree of the loins, and of the parts adjacent; the hip-joint abscess, is a distemper of the hip-joint, and its ligaments. To distinguish it from a local external abscess, lay the patient on his back, and squeeze the tumor; if it be a pleas abscess, the matter will be pressed into the cavity of the belly, but if it be in the part itself no alteration takes place; and further, if there be two lumbar abscesses, by compressing, one will fill the other. A stone in the kidneys hath been taken for this disease; but there is this disserned between them, the stone in the kidney will difference between them, the stone in the kidney will fometimes produce but flight inflammation, but at other times very confiderable; befides, the pain reaches from the kidneys down the groin to the bladder, passing stony fymptoms do not exist in the plass absects. See Assesss in the Hip.

If an absorption take places before the abscess hath burst externally, the patient often dies. It is generally of the ftrumous kind, but when not, it is often fatal. The matter is fo deep-feated, and the adjacent bones fo injured by it, before a fluctuation can be discovered, that for want of aid the discharge is made internally, and then the patient dies. If a fetid ichor is discharged, or the bones are affected, little or nothing is to be hoped for. The matter of this abscess sometimes makes its way from the region of the kidneys down to the bottom of the thigh of the affected fide has before this the mischief in the mischief in the second fide. ed fide, but before this, the mischief it hath done is not to be repaired; and if an opening is made, the patient is likely to be destroyed by the excess of the discharge.

A symptomatic sever generally attends this complaint, and closes the scene. But what is very remarkable, this sever does not come on during the time the matter is confined, nor to any great degree for forty-eight hours after the matter is let out; this circumftance is extraordinary, as it cannot arife from the absorption of matter, for that must have been greater before the opening; nor from a waiting in confequence of the evacuation of the matter, as that was before extravalated, and was an extraneous body with respect to the constitution; nor from the admission of air, for that in other cases does not produce such effects: we are therefore at a lofs to know why the fymp tomatic fever does not occur till after the discharge of the

This discase, whilst in its inflammatory state, is gene-

rally neglected or mistaken; otherwise it probably would easily be cured, and that principally by bleeding. Dr. Fordyce observes, that this disorder should be treated in the same manner as inflammation of the liver, except for the fituation, both in the state of inflammation and suppuration. He further adds, that in all internal fuppurations, the lungs become affected; hence hectic heats, &c tions, the lungs become affected; hence hectic heats, &c are produced; thence it is necessary, that if the patient resides in a large town, he should remove into the country for the benefit of air. Correspondent with this, Dr. Hun ter observed, in his Lectures, A. D. 1771, that the most likely means to prevent the fatal effects of this disease are, endeavours to keep up the patient's strength sufficiently to enable him to undergo the discharge, which is most likely to be accomplished by a nourishing diet, and clear air, the bark, dilute acid of vitriol, &c. See Abscess in the BACK and Loins, under Abscessus.

Elements of the Pract. of Phys. part ii. by G. Fordyce, M. D.

dyce, M. D.

PSOAS PARVUS. When there is a little ploas, it is on the anterior part of the great ploas. It arises fleshy from the upper vertebræ of the loins laterally; is inferted by a long, flat, thin tendon, into that part of the os pubis where it joins the ilium. Its use is to affift the recti abdominis in drawing the os pubis upwards, as in raising

ourfelves from a decumbent pollure.

PSOPHOS. Crackling or rattling of the bones.

PSORA. A kind of itch. See PRURITUS.

PSORIASIS. A species of itch which affects the ferotum, from \$\psi\_{apan}\$, feable labors. The ferotum is also provided by hard. unufually hard.

PSORICA. Medicines for the itch.

PSOROPHTHALMIA. An itchy or feurfy diforder of the eye-lids, which renders them fore, and fometimes feabby. See TRACHOMA.

feabby. See TRACHOMA.
PSUCHAGOGICA. Medicines with recal life in an

apoplexy or fyncope.
PSYCHOTRIA EMETICA. See IPECACUANHA. PSYCHOTRIA EMETICA. See IPECACUANHA. PSYDRACIA. A species of pustule, or of small tubercles on the head, which resemble pustules, and corrode the skin. Trallian thus describes them, in lib. i. c. 5. Phlychenæ, or small watery pustules, when seated on the head, are called psydracium. Psydracia a vespis, signifies the humour, &c. from the stinging of wasps. Others describe the psydracia as hydatids, or sanious pustules. PSYLLIUM. FLEA-WORT. It is also called pulicaris berba, by Oribasius crystallion. It is the plantage psyllium, Linn. It is an herb of the plantain kind, agreeing with it and the coronopus, only the stalks are leafy

pfyllium, Linn. It is an herb of the plantain kind, agreeing with it and the coronopus, only the stalks are leafy
and ramous, or divided into a multitude of branches.

It grows wild in the warmer parts of Europe, and is
raised in our gardens. The seeds have formerly been
brought from the fouth of France; they are small,
smooth slippery, of a thining brown colour, of an oblong
statisfin figure, supposed to resemble that of a sea, whence
the name of the plant.

A dram of the seeds renders a pint of water moderately.

A dram of the feeds renders a pint of water moderately flimy, and gently laxative. See Raii Hift. Lewis's Mat.

PTARMICA, called also pseudo-pyrethrum, dracuncu-PTARMICA, called also pseudo-pyrethrum, dracunculus pratins, draco splousers sternutamentoria, sneeze-work, bastard pellutris sternutamentoria, sneeze-mica, of Linn. It is a plant with long, narrow, serrated leaves, and radiated discous slowers, set in form of umbels on the tops of the branches. It is perennial, grows in moist shady grounds, and slowers in June, &c. throughout the summer. The roots have a hot biting taste, much like that of pyrethrum, with which they agree in their pharmaceutic and medical properties. See Lewis's Mat. Med. It is a name also for Xeranthemum aggratum, and a species of millefolium.
PTERIS. FERN.

PTERNA. See Os CALCANEUM.

PTERNA. See OS CALCANEUM.

PTERO-CARPUS. See SANTALUM RUBRUM.

PTERYGION. A film on the eye, called a WEB. In

Celfus, lib. vi. cap. 19. it is a diforder of the fingers,
which he thus deferibes: "In the nails there is a species
of caruncle, accompanied with great pain, which the

Greeks call provygion." To these a mixture of alum and
honcy, in equal parts, is applied. See Unguis.

PTERYGIUM. See Albugo. It is also a name for
the diforder called unguis.

the diforder called unguis.
PTERYGODEES. So Hippocrates calls those people

whole chefts are narrow and flat, fo that their scapulæ are prominent, like wings. Such perfons are subject to con-

PTERYGOIDEUS EXTERNUS, vel MINOR, called also, alare externum. Fallopius first described these muscles. They rise from the ala externa, and from the neighbouring parts of the os sphenoides, and are inserted

neighbouring parts of the os iphenoides, and are interted into the neck of the condyle of the lower jaw, and like-wise into the cartilage of the condyle, which cartilage is hollowed, to move upon the tuberosity of the os temporis.

—— INTERNUS, vel MAJOR. It rises from the cavity between the lamellæ of the processus pterygoidæus, and is inserted into the inside of the angle of the lower jaw. It lies on the inside of the lower jaw, almost as the masset does on the inside, being of the same figure with it, only it is smaller and narrower.

it is fmaller and narrower.

— Processus, from πτιρυξ, a wing, and uδος, form, also called aliformis. See Sphenothes Os.

PTERYGOPALATINUS. See Spheno-pterygo-

PTERIGOPHARING ÆI, from wropet, a wing, and gapuls, the palate. It is a name of the cephalo-pharyn-gaus. In the edge of the internal alw of the apophyles pterygoidæi, these muscles rise, then run backward, and are inserted into the linea alba of the pharynx. See PHARYNX.

- STAPHYLINUS SUPERIOR. The mufcles which bear this name are only the external portions of the

fpheno-falpingo-ftaphylini.

- STAPHILINUS INPERIOR. These muscles are very fmall. They are inferted at one extremity into the uncus pterygoideus, and by the other into the feptum, near the uvula.

PTILOSIS, from what, a person who hath lost his eye-lashes. A baldness of the eye-lashes, from a callous thickening of the edges of the eye-lids, so that it is a complication of a madarosis, and a hard lipitude.

PTISANA, yel PTISSANA, from whose, to decorticate, bruise or pound. PTISANA or PTISSAN. Properly it is barley deprived of its hulls; or pounded barley, because formed by the harlest was decorticated by a counterly after. formerly the barley was decorticated by pounding, after having fleeped it a little in water, and then it was dried-After this psunded barley was ground into meal, it was made into balls by first boiling, and then drying it to a due confiftence for this end.

Ptifan was also made of other kind of grain; but then to ptiffana was added the name of the grain from which it

was made.

A quantity of these ptisans was boiled in from ten to fifteen times their quantity of water, until the meal fwelled very much; then they added a little vinegar, a little oil, and a fprinkling of falt. The ptisan thus boiled is called cremor, the cream, or soup of ptisan; the broth, gruel,

or juice of ptisan.

PTOSES. Tumors caused by protrusion, called also phalangosis trychia.

PTOSIS, from winds, to fall. It is a disorder consisting in the descent of the upper eye-lid, either on account of a palty of the muscles which should elevate it, or a flux of humours which depress it. It is the blepharsptosis genuina, of Sauvages. In the London Medical Journal, nuino, of Sauvages. In the London Medical Journal, vol. iv. p. 340. notice is taken of a patient, afflicted with a periodical complaint of this fort, which returned at irregular intervals. Smoking tobacco never failed to bring it on, and the patient observed, that by putting on a pair of spectacles he instantly god rid of the paroxysm, and prevented its return, so that at last he seldom went without them. After cleaning the prima vize, our author administered affa foetida and valerian, and at the fame time directed a blifter to be applied to the patient's fore-head near his eye-brows. After this the complaint never returned. In another case, the disease was occasioned by an injury done to the mufculus levator palpebræ fupe an injury done to the mulculus levator palpebrae fuperioris, some of the fibres of which were lacerated, so that the patient was unable to raise that portion of the eyelid. The disease was cured by dividing the lacerated fibres with a knife. In a third instance, the complaint was purely spasmodic. The patient was a young woman twenty years of age, who was subject to occasional spasms not only of her eyelids but of the other muscles of her face. In this case the affection gave way to musk and small doses of emetic tartar.

PTYALISMOS, or PTYALISMUS. A frequent and copious discharge of saliva; but at present it is generally

understood to be a falivation excited by mercury. See SA. LIVATIO. Dr. Cullen places this genus of difcase in the class locales, and order apocenoses. It: generally symptomatical. A fingular case of a troblesome psyalism being cured, by chewing dry bread, and swallowing it, is related in the Lond. Med. Trans. vol. ii. p. 34, &c. PUBA: See Cassada.

PUBIS INTEROSSEUM LIGAMENTUM. It is a ftrong triangular membrane, fixed by two of its edges in the inferior branches of these bones, all the way up to their common symphysis; the third edge, which is the lowest, is loose: and this whole membrane, the middle of which is perforated by a particular hole, is stretched very tight between the two bones, and under their cartilage-

nous arch, to which it adheres very closely.

—— Ossa, also pubes; ephabaen; epischion, episcion.

They are fituated in the middle, anterior, and internal part of the os innominatum. On their superior part is a ridge, which runs on a continued line with another of the os ilium: it diftinguishes the cavity of the belly from that of the pelvis. Perwixt the pubis and ifchium, is the foramen magnum ovale, which in the recent fubject is filled up with a ligament. The fymphylis of the os pubis is a composition of two cartilages and one ligament; the two cartilages cover the surface of each bone, and the ligament is betwirt them. On this symphysis, see Dr. Hunter's Obs. in the Lond. Med. Obs. and

Inq. vol. ii. p. 333.

As a fublitute for the Cæfarean operation, the fection of the symphysis of the pubes is substituted by the French, and is thus directed to be performed: the instrument used on this occasion, is a common districting knife with a con-vex edge, a little blunt in the point, left it should injure the bladder, and rather thin, because it cuts the better. The proper lituation for performing this operation, is to place the woman on her back at a height convenient to the accoucheur; the thighs being fomewhat opened, and the mons veneris being shaved, introduce a catheter into the bladder. The inferior part of the integuments must be drawn down, and the incision begun above two or three lines about the pubes, and no higher. The first incision must nor be carried further than the middle of the fym-physis. Another method may be used; viz. take the in-teguments between the singers on each side the symphysis, and make the incision in the middle: this way would be easier for the surgeon, and less painful for the patient; but the tension of the integuments makes it difficult. From this first incision you will have but little hæmorrhage, and the cartilage will be exposed to the sight, so that you may chuse exactly where to proceed with the next incision. By cutting in the middle of the symphysis, the suspensory li-gament of the bladder will be divided, and in procuring the necessary separation, it will be lacerated, which may occasion an incontinence of urine. There are eases, in must nor be carried further than the middle of the fymoccasion an incontinence of urine. There are cases, in which this complaint can be attributed to no other cause than the laceration or relaxation of the ligament of that wifcus; it will therefore be right to avoid cutting in the middle of the cartilage. There are feveral advantages from cutting on either fide: 1ft. Part of the fufpenfory ligament of the bladder will be preferved, and it is likely by fo doing, that the bone on that fide will be touched; the shooting out from it will procure a speedy agglutination and reunion: 2dly. The left puber appearing after the fection to recede more than the right, there will be a greater opening on that fide: besides, 3dly. The neck of the bladder being rather more inclined to the right, and the fundus being fo always, all these reasons ought to determine us rather to chuse the lest side. The integuments being cut as far as the middle of the pubes, the superior part of the cartilage will be exposed; you must then begin the inci-fion, and continue it as far as the symphysis, taking care to direct the catheter to the side opposite that on which the operation is performed; then finish the section of the integuments, and afterwards that of the cartilage. As you are in most danger of wounding the bladder in dividing the upper part of the cartilage, it is very important not to be obstructed by any hamorrhage. This method, on account of its facility and readiness, together with its fuccess, feems hitherto to be the best. The moment the fymphysis is divided, the pubes recedes, and this the more, according as the thighs are kept opened. If the feparation is very fud-den and confiderable, as the posterior articulations act in the nature of hinges, the interior ligaments which cover them will be distended too suddenly, which may be of bad

confequence; it is, therefore, adviseable to keep the thighs moderately opened during the operation; and afterwards, upon raising them, to widen them gradually, until you have obtained the separation necessary to finish the deli-

With regard to the delivery, if the child prefents by the head, some advise to leave it to nature; I hope the following reasons will induce to a different practice. After the fection there is an arterial hæmorrhage, but however trifling it is, we should not difregard it. If, after the operation, we leave delivery entirely to nature, it would probably occasion pains in the posterior articulations, irri-tate and inflame the furrounding parts; hence, we ought not to leave the expulsion of the child to nature. As to the forceps, inafmuch as they are supposed to diminish the fize of the head, they appear to be of fome use, but their preffure is often of fatal consequence, the best way is, to turn the child, and deliver it footling; after which the woman's thighs are to be lowered and placed near one another. The integuments which were greatly diftended during pregnancy, now will subside, so as to cover the fymphysis. A bladder must be fitted to the end of the catheter, in order that the patient may not be obliged to ftir when the wants to difcharge her urine, and also in case the bladder hath been injured, that the wounded part may heal without any inconvenience from urine.

As to the wound, nothing more is necessary than dry lint, moiftened with brandy, beat up with the white of an egg, and discutient embrocations upon the posterior arti-culations of the pelvis. A bandage must be applied to keep the parts in contact, to which there must be two tapes fastened, to be conveyed between the legs, and tied before. The mother should fuckle the child for eight or ten days, to prevent bad confequences from the milk; laxatives, with tonics, may then be directed, according to circumstances. Care must be taken to keep the parts at reit as much as possible, in order to favour a speedy reunion. There is great reason to expect, that by observing the above directions, the cure may be effected in about three weeks in general, and that without any alarming symptoms.

Mr. Sigault, of Paris, is the first who proposed and performed this operation, in which he was affilted by M. le Roy, M. D. of the fame place. They, with fome others, observe, that the bones of the pelvis are connected by a fubstance which, during the latter period of pregnancy, fwells and foftens, fo that it may very easily be cut through; and that by fuch an incition the two fore parts of the pubes recede from each other to the distance of from two inches to two inches and a half, more or lefs according to the fwelling and foftness in the cartilaginous substance : thus the capacity of the pelvis is enlarged; for, in proportion to the separation of the pubes, they also diverge forwards.

When the diameter of the brim of the pelvis from the facrum to the pubes, measures from two inches and a half to three inches and a quarter, this operation is recom-

See Dr. Le Roy's Practical and Historical Enquiries, on the Section of the Symphysis of the Pubes.

On this subject it may be proper to relate something of what has been attempted in England, with a view to establish the practice of it, particularly in such cases as have hitherto demanded the severer operation called the Casfarean fection. To Dr. Leake we are intebted for a case, in which the requifites are afforded, for an encouraging view of this new operation; also for answers to the objections advanced in opposition to it. The reasons for preferring it are as follow: In December, 1778, a woman died in the Westminster Lying-in Hospital about a fortnight after her delivery; after the necessary examinations for the cause of her death, the section of the symphysis pubis was performed in order to afcertain how much space may be gained between the divided bones. The cartilage being laid bare, it was cut through with great eafe, and without wounding the neck of the bladder, or any of the contiguous parts. The offa pubis immediately receded from each other about one inch, and with very gentle force were separated swo inches and an eighth. The contents of the pelvis were afterwards removed, and on examination, the internal posterior ligaments of the bones of the pelvis were neither lacerated, or in the least injured.

The objections, with Dr. Leake's answers, are as follow:

fied, except in a praternatural flate; or in sld age, after the time of child-bearing is past, and where there could be no occasion for the operation. Secondly, the neck of the bladder may be wounded. It is answered, the neck of the bladder being only slightly attached to the symphysis of the pubes, by cellular membranes, and not in close union with the cartilage, there never can be the least danger of wounding it, except through ignorance of the structure and situation of the parts. Thirdly, that the space gained by the fection of the pubes, may not, in a narrow pelvis, be fufficient to allow the child's head to defeend through the cavity. It is answered, in the case of Mrs. Brasier, M. Le Roy found a feparation of two inches and a half: and as the cafe at the Westminster Lying-in hospital affords incontestible proof that, after the section of the cartilage, the bones of the pubes, without violence, receded from each other full two inches and an eighth; there can be no doubt but so much additional space will, in general, be sufficient to let the child's head pass, even in a pelvis so proternaturally narrow, that no other means but the Cæfarean operation could be devised for its birth. It is generally allowed, even by the opponents of this operation, that the fpace gained by the aperture between the divided bones, is nearly two inches and a balf, even in the dead body, which is lefs yielding than the living one; and it may be added, that the space gained from the facrum to the pubes will be equal to the enlargement of the pelvis from fide to fide. Fourthly, that the union of the cartilage may not be effected. It is answered, from observations and unquestionable authority of Petit and De la Faye, we are affured, that cartilages will as firmly unite after division as bones after a fracture. But to put this matter out of doubt, Camper, a fracture. But to put this matter out or doubt, Camper, a Dutch physician, made experiment upon a quadruped, by cutting through the cartilage of the pubes, and after diffecting the parts, he found they were firmly united. Fifthly, that the internal posterior ligaments uniting the facrum and ilia, may be torn asunder, by dividing the bones of the pubes. It is answered, respecting this, we may refer to the case above mentioned at the Westminster hospital, where the section of the pubes was made in the prepital, where the fection of the pubes was made in the prefence of fixteen medical gentlemen, and where, notwith-franding the space gained was two inches and an eighth, no laceration, or the least mark of violence appeared; but, on the contrary, these ligaments were found perfectly firm, and in their natural state.

If a comparative view is taken of the Cæfarean operation, and the section of the pubes, the advantages are consider-ably in favour of the latter. The section of the pubes, which allows the child to be born by the natural paffage, carries not with it those ideas of cruelty which attend the Cæfarean operation, where the patient is, as it were, em-bowelled alive. No formidable apparatus is neceffary, the fection being made with expedition, and without pain or danger; no blood-veffel, nerve, or other parts, effential to life, are wounded: these divided, being only cutis, cellular membrane, and infenfible cartilage, from which neither hæmorrhage, or fymptomatic fever are to be apprehended. These are my reasons for preferring the section of the pubes, by which the mother and the child may probably both be yaved; but where the mother, at least, to whose fafety our principal attention should be directed, would generally be lost by the Caesarean section. See Practical Observations on the Child-bed Fever, by

Dr. Leake, edit. 5. page 238—255. See also Compara-tio inter Sectionem Cæfaream & Diffectionem Cartilaginis & Ligamentorum Pubis in Partu, &c. Auctore, C. C. Siebold, M. D. London Med. Journal, vol. iv. p. 141.

Bell's Surgery, vol. vi. p. 143. Dr. Hunter is less fanguine with respect to this operation. He very early suggested its difficulties and disadvan-tages; and since that, Dr. Walter, of Berlin, disputes its usefulness so much, as to prefer the Cæsarean operation to it. See his work De Diffectione Synchondroseos Offium Pubis in Partu difficili.

PUDENDA, the GENITALS, the same as ÆDOIA. See GENERATIO.

PUDENDÆ ABSCESSUS. See ALÆ.

— ARTERIA. See PUDICA ARTERIA. PUDENDAGRA, also called cedma. So some have 7 R

parts of men or women, fomewhat refembling a diarrhoca, but without a dyfuria. But Dr. Berdoe afferts, in his Essay on the Pudendagra, that it is distinct from the veneral difease, and also that it is proper to women. It is an affection of the uterus alone in the beginning, however other parts may fuffer in time. The pre-difposing cause is a too rigid chastity, or a deprivation of the veneral act; the primary cause is a morbid af-fection in the nerves of the uterus; and the more immediate cause is an indulgence of the venereal appetite, at times when the uterus is fo difordered as to fuffer thereby. An excessive flux of the menses, and the fluor albus aggravate the pudendagra, which is not properly confirmed until the uterine nerves having entirely loft their fenfibility, are no longer capable of distributing the menstrual flux. Excessive venery hastens the insensibility of the uterine nerves.

The pudendagra may affect the conflitution many years without foreading its influence beyond the limits of the uterus.

In this diforder there is a difcharge of a purulent ichorous matter from the uterus, which may produce fome in-flammatory fymptoms in the penis when a man cohabits with a woman who is thus affected; but though the woman is a great fufferer, the infection which the man receives is foon removed by bleeding, and a few dofes of manna, or other more cooling laxatives.

On diffecting those who have died whilst labouring under the pudendagra, it hath been observed, that the parts leading to the uterus were particularly relaxed, and that the uterus itself was enlarged by scirrhous and other tu-

PUDENDUM MULIEBRE See GENERATIO. PUDENDUM VIRILE, called also genitura. Sec GE-

PUDICA ARTERIA. It comes out between the pyriform muscle, and the spine of the ischium; it runs downwards between the two ligaments, the one of which comes from the tuberofity of the ifchium to the facrum, and the other from the spine of the ischium to the facrum, on the infide of the tuberofity: as it goes on, it gives ramifications to the anus, which are called the external homorrhoidal, and then goes to the crura penis.

PUDICA EXTERNA ARTERIA. See CRURALIS. PUDICA EXTERNA VENA. As the crural v As the crural vein passes from under the ligamentum Fallopii, it sends out branches to the inguinal glands, the mufculus pectineus, and the parts of generation; these are called pudica externæ, and they communicate with the pudicæ inernie.

—— INTERNÆ VENÆ. The veins that fpread about the parts of generation are thus called. They are branches from the venæ hypogastricæ.

PUERILIS MORBUS. The EPILEPSY. See EPI-

PUERPERA. A LYING-IN-WOMAN. Much care is usually necessary when women are in this state, for they are liable to many diforders. As foon as delivery is effected, the woman should have every thing that is wet removed; dry warm linen should be in readiness for her use; and as oft as they become very wet with the ufual difcharges, fresh ones should be supplied. If fainting fits come on after de-livery, let the patient be laid with her hips higher than her head. It is generally necessary to keep the breasts warm, by means of slannel cloths, until the milk flows freely. The air in the room should be kept warm or cool, as is most agreeable to the sensations of the lying-in-woman. During the first three or four days, the diet should be thin, but yet not fo as that the strength is not duly supported by The common allowance is caudle, which is oatmeal boiled in water until it is of the confiftence of a thin jelly, and then rendered agreeable to the palate, by the addition of a little fugar, and as much ale as will make it duly cordial; it is then called BROWN CAUDLE; but if instead of ale a quantity of wine is added, it is named WHITE CAUDLE. If the stomach is subject to windiness and acidity, the addition of a little brandy is to be preferred. Reft must by it takes place, yet they foon become perfectly flaccid. Sometimes the belly swells during the course of the disease, be given for this end. Nor should the necessary care to but a foreness and tenderness of it is a never failing attentage up a gentle perspiration be wanting. Costiveness the belly swells during the course of the disease, the swell and the swell of the swell

called the veneral disease; pudenda, from puder, spame. There at this time would be an unfavourable circumstance. Others define it to be, pain or uneasiness in the genital. The child should be applied to the breast in about ten or The child flould be applied to the breaft in about ten or twelve hours after its birth, if the mother intends to fuckle it; for the fooner the fecretion of milk can be promoted, the lefs danger will there be of the fever called a milk-

> PUERPERILIS FEBRIS. The PUERPERAL FEVER, or the CHILD-BED-FEVER. A fever happening from any difease in consequences of pregnancy, or delivery of a child, and happening during the time of lying-in, may properly be called a puerperal fever. This is Dr. Cullen's species of peritonitis, which he distinguishes by the name of peritonitis omentalis. See PERITONITIS, and EPIPLOITIS.

> The causes are various, and sometimes the disorder is inflammatory, but it foon tends to the putrid kind; it of-ten is from the beginning a putrid fever. The omentum and peritonial coat of the intestines are generally the parts inflamed, but other of the abdominal viscera may be also thus affected; but which ever of them is the feat of inflammation, a putrid matter is foon abforbed therefrom, or there is an abforption of putrid matter from without. But notwithstanding that in many instances the womb hath been found, on diffecting the deceafed body, to be free from any appearance of a difease, it is most probable that the origin of this fever is in that viscus. Conception is immediately followed with an increased spasmodic irritability, which produces the fymptoms of pregnancy; this irritability is increased by labour. In the pregnant state the uterus is more irritable than usual, and this circumstance extends itself throughout the whole frame, whence pregnant women are violently affected by any cause that can increase their present preternatural state, and hence the taking of cold, being kept too hot, or any other circumstance that can excite a fever, may now be the cause of that which comes under this denomination. The occasional causes may be a sudden emptying of the womb, when there was a great quantity of water contained in the mem-branes; for then the blood rushing into the emptied parts with too much violence to be returned, excites inflammation there; coagulated blood lodged in the uterus, after delivery, and becoming putrid by the access of air; ob-ftructed lochia, a putrid air, the coming of the milk, in-flammation in the breafts. the absorption of acrid milk, and the retention of the excrements. Dr. Hulme and many others suppose, that an inflammation of the omentum and intestines, is always the cause of this sever, to which they are predisposed by the pressure of the gravid

> In the puerperal state, a quick pulse, and a febrile heat, manifest the presence of this sever, or at least give us reason so suspect its presence, which is more certainly determined by the following diagnostics, which attend according

ing as the causes are various.

If putrid blood inflame the uterus, and is absorbed, the lochia will be diminished or obstructed; whilst any of the lochia is discharged it comes away in small lumps; thus the patient continues for three or four days; at length a fever comes on, being preceded by rigors, which are followed by a quick weak pulfe, thirft, pain in the head, want of fleep, fighing, load at the præcordia, reftleffnefs, great weaknefs, dejection of fpirits, a wildnefs or elfe defepair in the countenance, and often an inflammation in the eyes; fometimes there is a difficulty of breathing, pain in the fide, the fkin is dry, the tongue is of a gloffy brown colour, and also very dry; fometimes in the advanced flage of the fever, if a hand is laid on the patient, one feels the fame kind of prickling fenfation in a lefs degree, as is felt after having the fingers in warm putrid blood. There is nothing to be learnt from the urine, as it is mixed with black putrid blood, which is conftantly drained through the vagina. A diarrhoea foon follows the feverish fymptoms, the stools are fetid, liquid, and blackish; the tongue is brownish, or of a reddish colour; the skin is very dry and hot; often there are aphthæ in the mouth; the breafts are flaccid, and upon drawing them, blood, inftead of milk, is frequently discharged. Milk may indeed appear in the breafts when the putrefaction is feveral days before it takes place wer than from become man of all faccided. should be guarded against, nothwithstanding that a diar- that as the child feems chiefly supported in the abdomen,

by resting upon the brim of the pelvis, the greatest pres- matory state; but if a diarrheea comes on, the putrid or fure will commonly be upon the small intestines, either on the right or left iliac region, or directly in the middle above the os pubis; and from this circumstance he accounts for the pain and tenderness of the hypogastric region, which is the constant and inseparable companion of this disease, and therefore constitutes the chief pathognomonic fymptom: a delirium is common through a great part of the diforder.

It may be observed that a tenderness and foreness in the belly, or flaccidness of the breasts, are not to be feared if

there is not a fever at the fame time.

When an inflammation of the uterus is the cause, the pulse is quick, a fever attends, pains refembling after-pains, and which shoot from the loins and belly into the groin and thighs, without any perfect intermissions; foon after these symptoms the anus and the neck of the bladder sometimes become very fensible; the tongue is white and moift; the belly coftive; the lochia are suppressed, or only a brown ichor is discharged from the uterus. The breafts are flaccid.

When this fever is produced by inflammation of the abdominal viscera, a dull weight and pain at first is felt in the belly, the pulse is not very quick, nor the heat very confiderable; the patient is generally coffive; but sometimes the fever runs higher, and a diarrhoca comes on, and in general the patient is affected like those who die of bruises in the belly.

If putrid effluvia from without are the causes, they at the first occasion symptoms of local inflammation, yet the diforder may be diftinguished from an original disorder of the uterus, unlefs the patient is feized with an epidemic difease previous to, or during labour, by the lochia being at first regular, and the aster-pains, if there are any at the fame time, unaccompanied with fymptoms of inflamma-

These symptoms are generally more or less of them in all these severs, be the cause what it will. They vary also according to the time of feizure, as well as from the difference of caufes. The pulse is commonly more quick in purperal than in other fevers, because of the extraordinary irritability attendant on those patients; and in confequence of the discharges during delivery, it will be generally very weak.

The purperal fever should be distinguished from the milk fever, from after-pains, and from colic pains.

A small degree of fever in lying-in women is more dangerous than in any other state. That state of increased gerous than in any other state. That state of increased irritability, &c. which renders lying-in woman liable to fo many accidents, feems to be much abated after the difcharge of the lochia and the coming of the milk; whence, after thefe, whatever diforders attend, their danger will be confiderable leffened.

In order to the cure, if the patient did not lofe much blood in the time of delivery, and the pulfe is full and quick, take away a little; but if the evacuation when delivered was fufficiently large, though the pulfe is hard, defer bleeding, and proceed with fuch medicines as the cafe requires. If the patient is coffive, a glytler may be given, and after it, a dram of natron vitriolatum every three or four hours, or at greater intervals, according to the effect produced by each dofe; if the falt runs too fast fect produced by each dofe; if the falt runs too fast through the bowels, a few drops of the tinct. opii will restrain it. If the salt is rejected, give two or three grains of calomel, with half a grain of the antimonium tartarisatum. After a few stools, antiphlogistics and sudorifies may be used, e. g. R Kali acetati, 3 fs. vin. antim. gut. xxx. vel antimonii tartarisati, gr. 4. m. f. haust. 4ta vel 5ta quaq. hora. If these run off too freely by stool, add to each dose two or three drops of the tinct. opii. If a sweat comes on, continue these draughts; if not, when there seems to be no farther need of evacuating the intestines, give the following bolus and draught every four or tines, give the following bolus and draught every four or

R Sal ammon, crud, gr. xv. vel 3 î îp. cæti & pulv. e chel. c. ää gr. x. conf. lujulæ q. f. f. bol.

R Aq. ammon. acetat. & aq. menth. fat. aa 3 i. m. f. hauft, these produce a fweat.

The patient's drink may be tepid or cold water, in which toafted bread is fteeped.

A mixture of spiritus ammoniæ compositus and water,

in equal parts, may be rubbed on the belly.

Hitherto the diforder is confidered in its first or inflan-

fecond ftage is commenced. The diarrhora is not to be immediately or fuddenly checked, but nature must be affifted by rendering the matter less active which irritates the inteffines, by correcting the whole flate of the fluids, by leffening the irritability of the habit, that the materia morbi may have the lefs effect, by giving antifeptic diu-reties, and by defending the nerves of the primæ viæ against irritation, so that, whatever putrid matter gets into the intestines, it may pass off without acting as a violent purge. The columbo-root with rhubarb may be given as a cordial, to leffen irritability, and carry off putrid matter from the prime viæ; and the above purpofes are answered where the pulse is full, and the heat great, by giving a powder composed of the pulv. flor. chamomil. & amyi; this may be repeated every four or five hours with a little fp. ach. nitrofi, vel acid. muriaticum in any thing that the patient drinks. But in this fecond stage of the fever the bark is most to be depended on: as soon as the pulse finks, and the heat is lessend, or that the stomach will bear it, it hath relieved both the sever and the diarrhœa, by going off in two or three ftools, and a fweat; but whilft the heat is confiderable, always join a little of the fp. ætheris nitrofi with every dose of the bark, and if two or three drops of the tinct. opii are also added, the heat is more effectually abated, provided it does not wholly suppress the purging. If the diarrhea goes off without the fever abating, instead of tinct. opii give rhubarb with the bark. If the pulse sinks, and the neryous oppression comes on, the mistura camph, will lessen preternatural irtitability, keep the diarrhea within bounds, and by its immediate action on the nerves, revive and support the spirits; an ounce is a sufficient dose, and may be repeated every four or five hours. What the patient drinks may be acidulated with the acid muricticum. When blood pent up in the uterus corrupts there, and gives rife to this diforder, however inflammatory the first fymptoms may appear to be, bleeding mult be omitted; purging and faline medicines are also alike improper; the absorbed matter is more than sufficiently amproper; the absorbed matter is more than lubricently attenuating, and often causes greater discharges by shool than the patient can bear; in this case give a dose or two of rhubarb with the columbo-root to evacuate the bowels, and then supply the patient with antiseptics as above, of which the chief is the bark. If the patient is weak, join the rad, serp. V. with the bark. If the fever is caused by obstructed lochia, from inflammation, give antiphloristics, but, if the lochia is obstructed from the contiphlogiftics, but, if the lochia is obstructed from the coagulated blood choaking up the os uteri, internal medicines are ufelefs. If a putrid air produced this fever, the mucus, the bile, &c. in the primæ viæ will be contaminated, and unless, removed, will be a constant fomes to the difeafe; in this case begin with an emetic, keep the room filled with pure cool air: the emetic should be given be-fore the instammation of the viscera comes on. If it does not give way to this treatment, the difease is deeply seated, and an absorption of putrid matter from the uterus may be fufpected to contribute to the diforder, or that the blood is contaminated, and then the above antifeptics will be required. See Kirkland, Denman, Hulme, Leake, and White, on the Pucerpural, or Child-bed Fever. London Med. Journal, vol. iii. p. 411.

pulegium latifolium, mentha aquatica. Pudding-grass,
pulegium latifolium, mentha aquatica. Pudding-grass,
the injure. It COMMON PENNYROYAL. It hath oval obtuse leaves, and trailing stalks, which strike root at the joints. It grows wild on moist commons, and slowers in June. It is the mentha pulegium vel mentha storibus verticillatis, foliis ovatis obtusis subcrenatis caulibus subteretibus repentibus, staminibus corolla longioribus, Linn.

All the pennyroyals are warm and pungent, formewhat fimilar to mint, but more acrid, and lefs agreeable, both in finell and tafte. They are lefs proper than mint in the common nauseas, but more efficacious as warm carminatives and deobstruents in hysteric cases and disorders of powers as the menthæ, but in weaker degrees, it has been confidered as ufeful in the chincough, as an anti-fpa modic, and emenagogue, but these powers are disput-able. Cullen's Mat. Med.

The active principle of the pennyroyals is their effential oil, which is more valuable than that of mint. It comes over at the beginning of the distillation with water, rifes in great part with spirit of wine; it tastes and smells

ftrongly of the plant. Its dose is from gr. i. to v.
The London College directs a simple water, and a fpirit to be distilled from pennyroyal, from a pound of which they make a gallon of the aqua and spiritus pulegii; besides the effential oil, which they order to be procured by distillation, but an infusion of it is equal, if not superior: and the whole virtue of the herb may be thus ex-tracted, either by water or by spirit. See Lewis's Mat. Med.

Pulegium Cervinum, i. e. Mentha cervina, Linn. PULICARIA. See CONYZA MINOR, &c. PULICARIS HERBA. See PSYLLIUM.

PULMONARIA. A name for the muscus pulmona-

rius, and for the bieracium Alpinum.
PULMONARIA ANGUSTIFOLIA. SAGE of BETH-LEHEM. It is cultivated in gardens, and flowers in May. See Lewis's Mat. Med.

- AUREA, also called pulmonaria Gallica, hieracium murorum, pilosello major. FRENCH or GOLDEN LUNGWORT. It grows on old walls, in woods, and in

fhady places.

- MACULOSA, alfo called pulmonaria fymphitum maculofum, sage of Jerusalem, Jerusalem cowslips, and spotted lungwort. Pulmonaria officinalis, Linn. It is an hairy feabrous plant, with leaves of a dark brownish green colour on the upper fide, and spotted for the most part with white, underneath it is of a paler green; the lower leaves are oval, and set on broad pedicles; those on the stalks are narrower, long-pointed, set alternately without pedicles: the flowers are monopetalous, of a purple or blue colour, and fometimes white, followed each by four feeds inclosed in the cup. It is perennial; it grows wild in many parts of Europe, and flowers in April or May. Their virtues are fimilar to those of the herb tricho-

PULMONARIS ARTERIA. See PULMONES.
PULMONARIÆ VENÆ.
PULMONES. The LUNGS. They are two fpongy bodies, which are reddish in children, greyish in adults and bluish in the aged. They are divided into two principal lobes, which are inclosed in two distinct bags, formed of the pleura; so that the right and the left lobes have not the least communication. On the right side the lobe is divided into three lesser ones, one inferior, one superior, and one anterior, the lowest lying upon the diaphragm. On the less fide there are two lobes divided by a fissure. The space betwixt the lungs is filled up by the heart below; above by the thymus and trachea; behind by the cesophagus and spine. The lungs are narrow above, and broad below, correspondent to the shape of the thorax. The lungs are universal covered on their external surface by the pleura, and an inner lamella of it runs into their by the pleura, and an inner lamella of it runs into their fubstance, as we find in infants.

The whole mass of the lungs is composed of air-vessels, blood-veffels lymphatics, nerves, and cellular mem-

The air-veffels are very fmall branches continued from the wind-pipe, with which in a found flate they have a free communication, so as at every infpiration to be filled with air. See BRONCHIA. The blood-veffels are the pul-monary and the bronchial arteries and veins. The pulmonary artery rifes from the right ventricle, runs upwards to the left of the aorta; on the curvature it divides into two branches, which division lies before that of the trachea, the right branch is longer than the left, for the fame reafon as the trachea is fo; just as it is plunging into the lungs it divides into two or three branches. When this artery hath divided into very small branches, they do not anasto-mose like the small branches of the aorta, but they join again, and form veins, which uniting together go to the left auricle of the heart, commonly in four or five trunks. The bronchial arteries. See ARTERIÆ BRONCHALES. The large veffels run in the large interffices, and in the fible operation of the medicine was naufea and vomiting,

the breast. This species is the strongest, though the small parts the branches still run on in the interstices of least ungrateful. This plant seems to possess the same similar lobuli, and are connected by a cellular membrane, as in the other part of the body; at last the arterial ramifications terminate in a fine net-work, upon the cells called rete Malph. where it is supposed that the blood undergoes the alteration, as there it is nearest to the air; from this net-work the veins begin, and carry the blood back. The pulmonary artery receives and returns the whole mafs of blood which circulates through the lungs before it passes to the rest of the body, to the end that such parts of this fluid should be separated, and carried off by respiration as were unfit to be circulated, or unnecessary in the economy of nature. The bronchial arteries are destined to the nourishment of the lungs. The lymphatic vessels are distri-buted on the surface of the lungs, and convey the lymph which they imbibe to a certain duct, whence it is returned to the mass of blood. The nerves are from the eighth pair chiefly; they are very small branches. The cellular membrane fills up the intermediate spaces between the vessels. See Aspera Arteria, and Bronchia.

As to the use of the lungs, Dr. Rutherford, of Edinburgh, says, that the good state of them seems to have an

influence on fanguification; he fays, that they are of more confequence than any other vicus for making good blood, and that, whenever their action is weakened, the blood grows thinner in proportion. Many other conjectures are made on this fubject, among which the most important are, that, from the air received by infortation, a necessary principle is imbibed in order to life and health; and that with the air carried out from the lungs, a quantity of mat-ter is also carried from the blood, which, if retained, would either be a redundant load, or otherwise injurious.

Dr. Prieftley afferts, that a principal use of the lungs, is to carry off redundant phlogiston from the blood.

The lungs differ from every other part of the body in many respects, particularly in the following: their substance is more vascular, and a greater quantity of blood passes through them in a given time. The aspera arteria minutely ramifying through every part of their fubstance, terminating in air-vesicles, is peculiar to them, and by respiration they are kept in a perpetual motion; these differences subsist through life, in sickness and in health. When the lungs are diseased, their motion is not only increased by the respiration being opicioned b creafed by the respiration being quickened, but they suffer, for the most part, violent concustions by means of cough-This circumstance attending no other viscus, renders fuch diforders more difficult to cure; for all authors agree in this, that rest is absolutely necessary to parts when inflamed. If by any means the cough could be pre-vented, it is most probable that diseases of the lungs would be nearly in the fame state, and admit of a cure as readily as any other internal part, equally inflamed. The increafed frequency of respiration does not appear to be in these cases of great importance, because it is natural and familiar, as it takes place upon any exertion or quick mo-tion of the body.

PULMONIA See PERIPNEUMONIA.

PULPA. PULP. It is a foft fort of fruit which fur-

rounds the feeds.

PULPEZIA. An APOPLEXY. See APOPLEXIA. PULSATILLA. NIGRICANS. Storck, Ph. Edinb. It is the pulfatilla flore minore migricante, C. B. Anemone atenfis, vel anemone pedunculo involucrato, petalis apice reflexis, foliis bipinnatis, Linn. It is a species of ANE-MONE, much refembling the pullatilla vulgaris, or pasque flower, but its flower is less, and of a darker hue. It is a native of the South of Germany, and other neighbouring countries. All the anemones have a considerable degree of acrimony; but this feems to possess the largest share. The whole plant when chewed impresses the tongue with a sharp, burning, durable taste; the root is milder than the other parts. On distilling the plant with water, the liquor which comes over is strongly impregnated with its virtues; and the remaining extract is also considerably active. From numerous trials, Dr. Storck, of Vienna, celebrates the efficacy of this plant in various chronic difeafes of the eye; in venereal nodes and nocturnal pains, in foul ulcers with caries, in ferpigo, and fupprefied menfes; he relates inflances of its curing blindness of many years continuance, by diffipating and diffolying films and obscurities of the cornea. In these cases its good effects were first indicated by confiderable pain excited in the cornea. dicated by confiderable pain excited in the eye. The fencreafed flow of urine, and fometimes gripes and loofeness, with increafed pain at first in the affected parts. From all these circumstances, the pulsatilla seems to be endued with very active and penetrating powers, yet fuch as may be employed with perfect fafety, if proper caution be

Dr. Cullen fays this plant is an acrid fubstance, and therefore capable of being active; and from the fingular matter refembling camphor, which water diffilled from it contains, it may have peculiar powers and virtues. But-notwithflanding from Storck's afcribing to it fo many wonderful virtues, may have hurt it in the opinion of many. Dr. Cullen recommends the trial of it, in that otherwise incurable remedy, the amaurofis; as the difease may depend upon different causes, some of which may yield to remedies, though others do not. Materia Medica.

The dofes of the distilled water to adults is about half an ounce twice or thrice a day; of the extract, reduced to ounce twice or thrice a day; of the extract, reduced to powder, with the addition of fugar, five or fix grains. Bergius fpeaks, in his Materia Medica, p. 49t. of having given the extract copiously, especially in diseases of the eyes, but without any effect. The Edinb. College had adopted the distilled water of pulsatilla, but has now changed it for the extract. See Lewis's Mat. Med.

edit. 3.
PULSUS. The PULSE. Pulfer were not attended to before the time of Hippocrates, fince whom what have been called improvements thereon being more than any one can retain in his memory, they cannot be applied to useful-ness in practice: Celsus calls the pulse res fallacissima: most publications on this subject are in truth to be ar-ranged in the same order. To the different degrees of same ritability, in conflitutions is owing the variety of pulses, with respect to their being quick or flow; every accident that happens to the body, and every affection in the mind hath an influence on them; fo that very little can be determined from them whence conclusions may be made in practice. The hard and the foft pulse are very often owing to a quantity of fat, or of a cellular membrane being fituated betwirt the artery and the finger, or from the almost total absence of these in this situation. The full and the small pulses are owing chiefly to the different diameters of the arteries; and, except the quick, the flow, and irregular pulfes, there are none of the kinds which are fo ingeniously distinguished by authors, but what will, on proper enquiry, be found to be

There are adults in health, whose pulse exceeds nor forty strokes in a minute; others, whilst they are at rest, have a pulse so quick that it may be counted to 120, and during the presence of a sever, the pulse hath been observed in some instances to beat 220 times in the same fhort period.

Schwalbius, of Prague, contented himfelf with three pulfes, viz. the equal and unequal, the quick and flow, and the strong and the weak. Sylvius reduces pulses to three kinds, viz. the strong and weak, the large and small, and the quick and slow. Fernelius observes, that "the ordinary affections of the body change the pulse; so that without duly adverting to these affections, the pulse can-not be certainly understood, nor can it be determined how far it recedes from a natural state in consequence of discafe."

In the Lond. Med. Tranf. vol. ii. p. 18, &c. Dr. Heberden hath inferted fome observations on the pulle, in which it appears how little is to be depended on it alone, or without the conjunction of other symptoms; in how few cases an attention to the pulse is of any consequence: and as to various diffinction's concerning pulses, how groundless they are. The quick and the flow pulses he fixes on, as those on which usefulness and certainty attend, when they are the subjects of our remarks, and leaves for our notice the following observations, viz. That the pulse of a child under two years old should be felt whilst it is affeep, because it is so easily quickened by every new sensation; that the pulse of an healthy infant on the day of its birth, and when it is affeep, is between 130 and 140 in a minute the pulse of the sensation of the minute, the mean rate during the first month is 120, and rarely, if ever, below 108. During the first year the limits may be from 108 to 120, the second year at 90 and

particularly when the diffilled water was used; an infometimes at 72, but generally more; the twelfth about 70; in adults it is usually from a little below 60 to a little

A full meal quickens the pulse to about 10 or 12 strokes in a minute more than its number of pulsations were before the advantage of refreshment.

If the pulse is quickened, so as to exceed the healthy standard by ten pulsations in a minute, there is some disorder; but the irritability of a child is such, that a very flight fever will make the artery beat 140, or even 160, when no danger attends; and as there is much difficulty in counting the pulse when it is at 180 and upwards, we are better enabled to judge of the danger of fevers in children by the thirst, quickness of breathing, aversion to food,

and want of fleep, than by the puife.

A child of two years old will die of an inflammatory fever, though the artery beats only 144 in a minute; yet children of four years sometimes recover from severs when

the pulse is at 156.
If the pulse of a child be 15 or 20 below the healthy standard at its lowest limits, and there be at the same time the figns of confiderable illness, it is a certain indication that the brain is affected, consequently such a quiet pulse should alarm us with the probability of

danger In adults labouring under an inflammatory fever, the danger is generally not very great, where the beats are fewer than one hundred. An hundred and twenty shew the beginning of danger, and they feldom exceed this number, unattended with deliriousness, and where the case does not prove fatal. To this there are two exceptions: first, before some critical swelling begins to shew itself in fevers, then the pulse hath risen to 150. Secondly, in acute rheumatifin, the pulse rises to 120, without danger; but in both these cases the appetite, the senses, sleep, and strength, deviate less from their natural state than when

the life of the patient is in danger. When afthmatic patients are seized with a su den fit, the pulse sometimes beats 120 times in a minute, in which case danger is great, but if this is exceeded, they rarely

When the pulfe from being very quick, fuddenly becomes quiet, all other ill fymptoms continuing, it thews that the patient is become irritable; that the disease is translated to the brain, and that a palfy, an apoplexy, or death, will be the confequence.

In an inflamed fcirrhus feated in any of the vifcera, in a cancer, ulcers in the internal parts, a quick pulse is a more certain fign of danger than a quiet pulse is of fafety. In hectic and rheumatic patients, the appetite continues, and an ability to take small journies, when the pulse is fo quick that in an acute fever, with such a quickness in the pulse, they would be forced to keep in

A good pulse, with a loss of appetite, strength, and sleep, with thirst, and a quickness of breathing, is a dangerous situation; on the contrary, a bad pulse, the appetite, sleep, and strength not much affected, with moderate thirst, and the breathing but little affected, is

PULVINAR. See EPITHEMA.

PULVINARIA. Cushions made with chaff, in which is mixed fome medical ingredients coarfely powdered.

PULVIS. A POWDER. This form receives such materials only as may be reduced and kept in this state a fufficient time without any lofs of their virtues, and yet do not poffess fuch qualities as render them so bulky for a sufficient quantity to be taken in each dose, or to render them very difguftful to the tafte. Bitters, fetids, acrid medicines, alkaline falts, gums, emollients, and mucilaginous fubftances, are generally improper for keeping and giving in this form. The dofe of psuders are from 9 i. to 3 fs.

Compound powders used to be called species. PULVIS ALOETICUS. See HIERA PICRA.

PUMEX, also called lapis bibulus, lapis scyrus. Pu-MICE STONE. It is found in volcanos. It hath been used as a dentifrice, but, if freely used, it wears away the enamel. It is a spongy mass of a stony nature, but light and brittle: the best is of a white or greyish colour.

7 S PUNCTA.

PUNCTA LACHRYMALIA. LACHRYMAL POINTS. They are two fmall holes, one on each upper and one on each lower eye-lid, on their inner edge, near the internal angles, where may be feen a fmall emistence. These orifices are fituated opposite to each other. They convey away the tears when they have answered their purpole on the anterior furface of the eye, and carry them

purpose on the anterior turiace of the eye, and earry them into the lachymal fac, and so into the nose.

PUNCTICULA. PUNCTICULARIS, vel PUNCTULA. See PETECHIÆ.

PUNCTUM AUREUM. It is when an hernia of the PUNCTURA AUREA. Sintestines is reduced, an interior is made through the thin and manhane all. incifion is made through the fkin and membrana adipofa, quite down to the upper part of the spermatic veilels; then a golden wire is to be fixed and twilted so as to prevent the descent of any thing down the tunica vagi-

PUNCTURA. A PUNCTURE. Synonymous with

PUNICA. The POMEGRANATE. See GRANATA MALA.

PUNICA GRANATUM, &c. Sce BALAUSTINUM.

PUNICA GRANATUM, &C. See BALAUSTINUM.
PUORRHŒA. A purulent discharge from the belly.
PUOTURIA. White, mucous, or purulent urine.
PUPILLA. The PUPIL. Because it represents your
image, when looked into, no bigger than the pupilla, a puppet. The choroides is continued on the initial of the conper. The choroldes is continued on the linde of the cornea transparens, of the eye, and forms the iris, but it is
perforated in the middle, and so forms the pupilla, as the
iris contracts or expands, the pupil is larger or less. The
use of the pupil is, to transmit the rays of light to the humours of the eye. See Choroldes.

PUPILLARIS MEMBRANA. In the feetus of five,

fix, and feven months, there is no pupil, but a fine vafcular membrane, with large arteries going quite across the part where the pupil is afterwards feen. It cannot be feen without injecting it; nor is it known what becomes of it after the birth. It is also called velum pu-

PURGAMENTUM STELLARUM. See COELI-

PURGANTIA. PURGATIVE MEDICINES. The first purge on record is Melampus's giving hellebore to the daughter of the king of Argos. Purging medicines are those that facilitate, or increase the natural discharge of the alvine sæces. Those which facilitate the natural discharge called lenients, laxatives, or solutives, and by the Greeks eccoprotics; their action is from a fine faline stimulant quality, which is soon lost in boiling. When these medicines increase the natural discharges, they are these medicines increase the natural discharges, they are called purgatives, or cathartics, &c. They are of different degrees of strength and action: the more rugged are called draftic.

Eccoprotics are fuch as give no disturbance to the body, and expel but little from it; of this kind are foft oils, or they are fuch as are now called lemitives, but by the ancients were called minoratives; they do not evacuate much freeze at once, but by degrees: of this fort is the ol. ricini, which, whilst it stimulates, it also lubricates, and its confiftence is fuch as hinders its eafy paffage into the lac-

Draftic purges act by a fine caustic inflammatory falt, which operates much in the fame manner as poifons do. The refinous extracts of purging vegetables cause vomiting, convulsions, and death; and, on opening the stomach and bowels after their use, they are found instamed, and marked with red fpots, as when arfenic is taken.

For the milder kind of purgatives, we are indebted to

Eccoprotics flould be used in case of costiveness; when women are pregnant; and, in all very irritable habits, for in general purges are unfriendly to the stomach, and to those whose nervous system is subject to disorderly mo-tions. But in dropsies, and when there is a torpid state of the intestinal sibres, drastic purges are necessary; they should be confined to the hydropic, lethargic, paralytic, apoplectic, and fuch like.

Purgatives are excellent alteratives. In order to their

usefulness when given in this character, let such a quanti-ty as would suffice for a purging dose, be divided into lesser doses; all which must be taken at proper periods, in the

space of twenty-four hours.

Diluting drinks are taken during the operation of purg-ing medicines, to affiit the increased fecretion of the intesti-nal juice, in washing off the stimulus, also to soften the feces. See Quinsey's Pharmaceutic Lectures, sect. iii: and iv. Tournesort's Mat. Med. Culien's Materia

PURGATORIUM. In Paracelfus it is a name for

any discase.

PURPURA. A name for the MILIARY FEVER; also the SPOTTED FEVER. The spots are symptomatic

PURPURA ALBA. A species of cruption to which

diftinguished by the eruption of exanthemata, of a very pe-culiar kind on the furface. Sometimes it is accompanied with an acute, and even a malignant fever; on other occasions, it runs its course without fever, continuing for a greater length of time, and diffurbing the functions in a more gentle manner. In this difease, the small papulae which appear on the surface, are sometimes of a red, sometimes of a white colour. In the sormer case, there are vesicles more or less broad, containing a sluid; but the latter confifts of fmall knots, fixed as it were deep in the fkin; thefe are about the fize and figure of millet feed, rough to the touch, and filled with a thick purulent mat-When the eruption first appears, it is attended with corrugation, roughness and dryness of the skin; none of the exanthemata are in their nature apt fo fuddenly to difappear and return again. This return of the eruption is in general attended with a fense of heat or coldness, of itching or pricking in the part; while other exanthemata appear on every part of the body, the purpura is chiefly observable on the neck, breast, back, and arms, very rarely affecting the inferior extremities.

To prevent this difeafe, it is recommended to avoid all kinds of malt liquors. Patients difposed to it are advised to use for their common drink, either mineral water, or pure water, with a mixture of wine. Exercise, change of air, tranquillity of mind, and amusement, are of greater fervice in their prevention. Avoid all that produces coftive-nefs, or that leffens perfpiration. High-feafoned animal food, and pork, are to be avoided. Milk and whey are very ferviceable. After the difease hath taken place, the patient should sleep in a large bed-chamber, of a moderate temperature. He should shun great heat in bed, and not lie in it very long together: thus excessive sweats, which aggravate the disease, are avoided; but though excessive fweating is injurious, a moderate perfpiration is benefi-cial. The mineral anodyne liquor is here of fingular effi-

cacy. See Lewis's Translation of Hoffmann.

--- URTICATA. ACUTE NETTLE-RASH.
PURPURATA. See PETECHIA.
PURULENTIA. PURULENCE, or SUPPURATION.
PUS. MATTER. The matter which appears on the furface of the wounds that are healing; also what is met with on opening well digested abscesses, is called pus. It it is unctuous, yellowish, nearly of the confistence of fresh cream without any particular finell, and of a mild tafte, which resembles that of chyle. See Dr. Gaber's Experiments with respect to the Nature and Formation of Pus, in the Med. Museum, vol. iii. p. 269, &c. and the Tentamen Physiologicum de Secretione Glandulari of Dr. Lames Hards who and secretione Glandulari of Dr. James Hardy, who endeavours to prove that the conclufions drawn from the experiments of Dr. Gaber are not just, and that pus is never formed from putrid ferum.

When mucus is detained in the lungs for a time, and then spit up, it often refembles pus; to diffinguish rightly, if pus (or matter) is mixed with water, let it be slightly agitated with a whisk, it is easily diffused, and after standing a few hours falls to the bottom of the vessel. Mucus is with difficulty diffused in water, requiring strong agita-tion, and then forms with it a permanent ropy fluid. When the matter spit up by consumptive patients is agi-tated in water, it mixes without difficulty; and on standing a fhort time, a matter falls to the bottom, refembling pus; and the fluid above remains ropy, refembling the mucus and water.

See Bell on Ulcers, edit. 3. p. 55, 72. Kirkland's therefore, it is fufficient to point out those fevers

Med. Surgery, vol. ii. p. 53.

But there is another experiment which is confidered as more conclusive. When any one wishes to afcertain the composition of expectorated matter, let it be dissolved in vitriolic acid, or in caustic alkaline lixivium; and then to both folutions add pure water. If there be a fair precipitation in each, it is certain that fome pus is present. If in neither a precipitation occurs, it is a sure test that the matter is entirely mucus; and if it cannot be made to dissolve in the alkaline lixivium, there is also reason to believe that it is pus. Med. Comment. Edinb. vol. vii.

P. 193.

PUSTULA. A PUSTULE, or little pimple, from pus, corruption. These particularly appear in the spring, and are of various kinds; for sometimes a certain roughness appears all over the body, refembling that which is produced by the application of a nettle, or the obstruction of fweat, and are called by the Greeks exanthema. They are red and white, and of different fizes. There are also puffules of a black, livid, or any other colour; they are produced by cold, fire, or medicine, as the epynicitis, &c. Celfus recommends, as the cure of all puffules, a due pro-

portion of exercise, and to lessen the quantity of ali-

PUSTULA ORIS. The THRUSH. See APHTHE. PUTREDO, vel PUTREFACTION. PUTREFACTION. Putrefaction is a species of fermentation, in which the phlogifton and the fixed air of the putrefying subject, are separated, and by which a diffolution of the parts of the same body are not only effected, but a fetor is always induced in it. In order to putrefaction taking place, it is necessary that there should be a degree of heat, moisture, and of atmospheric air; but whenever a small portion of matter is become putrid, it easily disfuses itself through a large quantity, like leaven in paste; this is in nothing more manifest than in the human body, wherein a small portion of putrid matter being absorbed, easily and soon contaminates the whole.

From putrefaction it is that the plague, the spotted fe-ver, the true scurvy, and other disorders of the like kind, take place. In all these disorders the strength is diminished, and fo is the vital heat. In general, if a recovery is within the power of medicine, the bark, acids, fixed air, warm perspiratives, camphor, &c. are the most powerful antiputrescents, and the most successful means for re-

moving these diforders.

On this subject, see the Appendix to Sir John Pringle's Observations on the Diseases of the Army; Bis's Essays;

Machide's Effays.

PUTRIDA FEBRIS. PUTRID FEVER. See SyNOCHUS. Called alfo frigeraria. Under this general
name may be included the plague, footed or petechial fevers, pettilential, malignant, camp, jail fever, &c. The more mild inftances are of the typhus kind. Dr. Cullen observes, in the first volume of his First Lines, that the fynochus feems not fo properly a genus as a variety of ty-phus; that the typhus feems to be a genus comprehending feveral species, but that these are not well ascertained by observation; and in the mean time we can perceive, that many of the different cases observed do not imply any specific difference, seeming to be merely varieties, arising from a different degree of power in the cause, from different circumstances of the climate, or season in which they happen, or from different circumstances in the conflitution of the persons afflicted. One effect arising from these circumstances is, a putrescent state of the fluids. From the diffolved state of the blood, as it appears when drawn out of the veins, or as it appears from the red blood's being disposed to be effused, and run off by various outlets, and feveral other fymptoms, we have no doubt that real putrescency of the fluids takes place in fevers. This putrescenty, however, often attends intermittent as well as continued fevers; and of the continued kind, both the fynochus and typhus, and all of them in very different degrees, fo that whatever attention it may require in practice there is no fixing fuch limits to it as to admit of effa-blishing a species under the title of putrid.

Dr. Cullen thinks that in typhus there is always aprone-

nefs of the humour running into a putrefeent state, but is in different degrees, so that the greater or less putrefaction, can only vary, not change the disease, and bly; after profuse evacuations by stool, the belly becomes

which are particularly called patrid fevers by the term Typhi Gravioris. Nosologia Method. Synop-

These fevers are often inflammatory in their beginning, but they foon become patrid, and they are all of the con-tinued kind. Indeed in fome cases, disorders of a very opposite nature, by continuance, degenerate into patrid

Those who are weakly, who live poorly, and labour hard, the luxurious, those who fit up late, people of cold, of phlegmatic, or of irritable constitutions, the pensive, and those who are oppressed with grief, are most subject

to putrid fevers.

The same causes which produce the plague, if applied in a less degree, produce the other forts of putrid fevers. The remote causes are improper diet, and such as are putrid when caten; corrupted grain, as well as corrupted animal diet, is productive of putrid diforders; a too free use of alkaline salts, and such other medicines as diffolive the blood; a moist south wind long continued, especially if much heat attends it; putrid effluvia; warm, calm, ful-try weather, with a moift atmosphere. The proximate cause is a diffolution of the blood, which is soon produced by putrid miafmata, received either into the lungs by inspiration, into the stomach with the food, or being generated in some part, is absorbed, as from putrid ulcers, &c. According to the quantity of putrid matter received into the constitution, and the different parts which it first impressed, the symptoms excited will be somewhat various; if received from the atmosphere by the lungs, as when pa-trid vapours are diffused in a country where these disorders are epidemical, or in close confined places such as ships, jails, &c. in this case nervous symptoms are first produced. If the ftomach is first disordered thereby, a sicknefs, vomiting or great anxiety, are brought on; when it enters into the blood by abforption, the blood is at first diffolved, then proceed heat, delirium, a diarrhœa, high coloured fetid urine, &c.

Putrid fevers attack with more violence than the ner-vous and Dr. Huxham observes, that "the rigors are greater, the heat fharper and more permanent, yet, at the first, they are sudden, transient, and remitting; the pulse is more tense and hard, though sometimes quick and small, and at others flow and regular, then fluttering and unequal. In the beginning it generally happens, that during the first twenty-four hours the alternate heat and cold are confiderable, and fymptoms of ardency are attendant, but these soon vanish; the fever increases every evening, and in the second week the patient becomes delirious, and, the fymptoms which at first came on, increasing, prove destructive; or gradually decreasing, about the end of the second week, the delirium changes to a stupor, and other symptoms taking place, the patient, from the end of the second, or beginning of the third week, grows better; but in some cases, and under some kinds of management, the putrid symptoms increase from the second week, both in their number and degree, and the patient finks under them. In the beginning, the head-ach and vomiting are violent; there is often a pain in the temples, or over the eyes and in the bottom of the orbit; the eyes are full and heavy, yellowish, a little inflamed, then the countenance becomes bloated; the temporal arteries throb, though at the fame time the pulse at the wrift is fmall; there is a the fame time the pulle at the writt is small; there is a ringing in the ears, great dejection of spirits and faintness, respiration is difficult, mixed with sighing, and the breath is hot and offensive; pains are complained of in the loins and limbs, an universal weariness, and often a load at the stomach, attended with pain and heat there, also a naufea, and often a discharge of blackish or billious matter. In the beginning the tongue is white, then grows drier and darker coloured: in some it is livid, in others black, or of a dark pomegranate colour. In the increase of the fever, the thirst is the greatest, but no liquor pleases; most things are mawkish and bitterish to the taste, but often the sense of thirst is little or none during the whole of the disease; the lips and teeth are furred with a black tenacious fordes; in the beginning the urine is pale and vapid, high coloured in the advance, and at last grows very brown and blackare blackish and very offensive; they often run off insensi-

fwoilen and tenfe; livid fpots appear on the fkin; hæmor-| thefe fevers, and if one is applied as a former one begins thages, and cold clammy fweats, in fome inflances, on to dry, the advantage will be confiderable in every flage.

ardent kind, the nervous and inflammatory, particularly

from the peripneumony.

The vital heat, and the adhesion and quantity of the crassiamentum of the blood, mutually depend on each other; and as the putrid infection both disloves the crassiant. famentum, and repels the vital heat, from those circumftances, most, if not all the symptoms that are observed in putrid diforders, may be accounted for, whether they attack the fanguine or the ferous habit.

The prognostics are generally very uncertain. A red rash, or an inflamed scab below the nose, or about the lips, are favourable for the most part; deafness at the decline is generally effeemed a promiting fymptom; but amongst the unfavourable ones are, a change of voice, wild staring eyes, difficulty of swallowing, inability to put out the tongue, a constant inclination to uncover the breaft, urine that deposits a dark or blackish sediment, no thirst, inslamed fauces, a diarrhœa with a swelled belly, bloody faliva, purple or livid spots on the skin, black aphthæ, laborious respiration, ichorous and fetid stools, cold fweats, convultions, &c.

The indications of cure are, to check the putrefaction, and to recall the vital heat. In order to which, the air in the patient's room, and the linen which is worn by the patient, should be often changed; the stools and urine should be immediately conveyed under ground, to prevent their diffusing their morbid qualities in the air. Acid vapours may be diffused in the apartments of the fick, or fumigations of myrrh and other aromatic and antifeptic ingredients may be used. In the administration of medi-cines, the doses should be so repeated as to support the heat of the patient in as equal a degree as is possible; the medicines and diet may be given in small doses, and pro-portionably frequent, and the heat of the patient should be supported as near to that of health as may be.

The diet should be acid or acescent. The drink should

be acidulated, and often mixed with red wine; whey made with mustard is both agreeable to some and useful to most. The diluted vitriolic acid, or Clutton's febrif. spt. may be used for acidulating what the patient drinks. Beef broth that is boiled long enough to extract the finer parts of the meat, is an excellent part of diet in these cases; but it should not be continued boiling until the grosser parts

of the meats are drawn out.

As to medicines, in many cases, the bark and vitriolic acid, accompanied with the camphor mixture, fucceed

without any other aids.

Bleeding is rarely, if ever, to be admitted, for the putrefaction foon produces all that can be effected by it. Some bleed if the pulse is quick and tense; the pain in the head and back is violent, the breathing difficult, and other fymptoms of ftrength appear; but, as the putrid miasinata foon produce all that bleeding can effect, and as the greatest point is to support or to recover the vital heat, bleeding, as a lesser ill, may probably be sometimes admitted but much caution is required before the account. ted, but much caution is required before the operation is determined on.

In general, an antimonial emetic should begin the cure; or the pulv. ipec. may be given with the antimonium tartarifatum and a cordial draught, or a dofe of the miftura camph. may immediately fucceed its operation.

After the emetic and the fucceding draught have been taken, give frequent fmall dofes of the vin. antim. or of the antimonium tartarifatum with proper antifeptics and cordials. Neutral falts are generally hurtful, and even

the aq. ammonize acetatæ is better omitted.

The bark is a principal means of relief, and should be given very early in the diforder; at the lateft it should be begun with as soon as symptoms of inflammation or of ardency disappear; and, if these do not attend, begin with it immediately after the operation of the emetic. The bark may be given in substance, in a cold insusion with water, and in conjunction with saffron, snake-root, or other fuch like medicines, according to the intention of

the preferiber.

Whilft the pulse is quick and full, blifters are not ad-

the fourth or fifth day, in others not till the eleventh, If a delirium approaches, the head or back may be blifter-but generally they usher in death.

Putrid fevers should be distinguished from those of the stage of a putrid fever, the patient is delirious, and other fymptoms feem to forbid the use of blitters, finapisms may be applied to the feet.

Clysters are convenient, both for carrying off putrid matter from the intestines, and for conveying antiputref-cents there. Though, for simply regulating the shools, perhaps a little antimonium tartarifatum and rhub. may be the most proper; and when any purging medicine is used for carrying off the contents of the bowels, the pa-tient should be supported during their operation with cor-

dial liquors.

Camphor is both useful as an antispasmodic and antiseptic, but is most eminently serviceable in the beginning of the difeafe.

Amongst the antiseptics fixed air is found to be peculiarly uteful, and may be commodiously administered in

clysters.

The vis vitæ must be carefully supported; the principal means of which are, acids, the bark, red wine, and a su-

pine posture.

If a diarrhoca comes on, give gentle opiates, fuch as the pulvis e creta comp. cum opio, &c. Aftringents are useful, but acids are the most so in these kinds of

loofeneffes, especially if accompanied with perspiratives.

If the petechize suddenly disappear, a delirium will come on, and the pulse fink; in this case blister the head or the insides of the thighs, or apply snapisms to the feet. Blisters remarkably relieve the nervous symptoms attendant on these disorders. ant on these diforders.

However defirable a general diaphorefis may be, it should never be forced by the use of medicines; to pro-mote it, when there is the least degree of tendency thereto, and to support it when present, sub-acid diluents, with cordials, may be freely used.

When petechize appear give ftrong red wine negus, well

acidulated

Sometimes a vomiting continues to afflict the patient, after having emptied the flomach by means of an emetic: if in this case the warm opiated cordials, given with the faline draught fail to relieve, apply a cataplasm of the confectio opiata.

If a grain or two of the antimonium tartarifatum with a final quantity of rhubarb is given, whenever a dif-agreeable tafte is perceived in the mouth, or even without this indication, if it is repeated every two or three days, much putrid colluvies will be carried off, which would otherwise prove a pabulum to support the violence of the

See Huxham and fir John Pringle on Putrid Fevers. Fordyce's Elements, part ii. An Enquiry into the Caules, Symptoms, and Cure of Putrid Fevers, by W. Fordyce, M. D. Wallis's Sydenham, p. 201.

PYCNOTICA. INCRASSATING MEDICINES.

PYGÆ: The BUTTOCKS.

PYLORICA ARTERIA. It is a branch of the hepatic artery, which runs and is ramified on the pylorus, and from thence to the cardia, and analtamofes with the arte-

from thence to the cardia, and anastamoses with the arteria gastrica dextra, and terminates on the pylorus by an anastamosis with the coronary artery of the stomach.

—— Vena. It is a branch from the venæ portæ

ventralis. Sometimes it is only a branch of the gastrica recta; it passes over the pylorus to the short arch of the stomach where it anastomoses with the coronary vein

thereof.

PYLORUS, from 'wake, a door, and upon, to guard. The word fignifies a porter, and thus the Greeks called the right orifice of the stomach. It is also called junior

PYOSIS. See Hyporyon.

PYRACANTHA. See LYCIUM BUXIO LIIS; and Mespilus, aculeata pyrifolia.
PYRAMIDALE CORPUS. The spermatic

— Musculi. The Pyramidal Muscles of the Belly, also called fuecenturiati. They present themselves next to the ascending and descending oblique muscles. They were first discovered by Fallopius. They viscable; but generally they are useful in the early stages of are fituated before the extremities of the recti, arising from

the fore part of the os pubis, close to the symphysis. They well phalia, in Germany. The spring is situated at one grow smaller as they proceed; they end in a point, and end of the village of Pyrmont: and the water, as it rises are lost in the linea alba. Their sigure gives them their up from the springs, seems to boil in its basion, and when name. They pull down the linea alba. Fallopius called them fuccenturiati, or auxiliarii, auxiliary mufcles, from a supposition that they are only supplemental to the recti in their action, the order of their sibres in both agreeing; and these being always absent when the recti are continued sleshy to the juncture of the offa pubis.

PYRAMIDALIA CORPORA. A name of two protuberances from the medulla oblongata, and also a name

for the spermatic veffels.

PYRAMIDALIS Nast Musc. It is also called triangularis and anterior. One extremity is inferted in the fynarthrofis of the os frontis, and offa nafi; it runs down the fide of the nofe, and is again inferted into the cartilage

PYRAMIS. See CONUS FUSORIUS.

PYRETHRUM, from sup, fire, because of the fiery heat of the root. It is also called buphtbalmum Creticum. PELLITORY of SPAIN. It is the anthemis pyrethrum, or anthemis caulibus fimplicibus unifloris decumbentibus, foliis pinnato multifidis, radice longe fervida, flore bellidis, Linn. It is a trailing perennial plant, with finely divided leaves like those of fennel or chamomile, and naked thick stalks, bearing each a large flower, with a yellow disk, furrounded with petals of a pure white colour on the upper fide, and of a fine purple underneath. The root finks deep in the ground like a carrot, is of a brownish colour on the outfide and white within. It is a native of the warmer climes, and is brought to us from Italy, but bears the cold of our climate. It flowers from January to May. The roots which grow in England are larger than those from abroad.

The root is hot and pungent to the taste, but has little or no smell. Its pungency is in its resin, which is of a fixed kind. Water extracts but little of the resin, spirit of wine takes up the whole of it. In diffillation, neither water nor spirit takes up any thing with them. The watery extract is the most in quantity, but the spirituous con-

tains most of the active parts.

It is chiefly used as a masticatory. Dr. Lewis recommends a decoction of these roots with the tinct, aloes in elysters for the saturnine colic. It is not certain that the pellitory of the moderns is the fame with that of the ancients. See Newmann's Chem. Works; Lewis's Mat.

PYREXIÆ, wuperings, from wuperes, febris. FEBRILE

PYRIFORMIS MUSCULUS. It rifes from the lower part of the os facrum, where it is joined to the os ilium; it passes through the sciatic notch, and is inserted into the infide of the tip of the trochanter major, ferving as a rotator, an extensor, or an abductor, according to the direc-tion of the thigh. It is called pyriformis from its figure, and illacus externus from is fituation.

PYRITES. FIRE-STONES. They are also called marcasta. They are called fire-stones, because they strike fire with steel. By exposing them to the air they become vitriolic; some are calcined, and then exposed to the air. They vary much in their appearances, being of different colours, thapes, and internal structure. In most parts they are found near the furface of the earth. They confift chiefly of fulphur, iron, and unmetallic earth; in fome there is a little copper; in the yellow fort there is much fulphur; in the white there is but little.

When pyrites are exposed to the air, the inflammable part of their fulphur is diffipated, the ftones become pow-dery, and acquire a vitriolic tafte; the rain now falling on them, washes away the remaining acid of the sul-phureous contents, and vessels are placed underneath to receive it; and from this the green vitriol is generally

Pyrites are not used medicinally in substance, but in Saxony they obtain the common fulphur therefrom; artificial vitriols are prepared from them; and it is supposed that the chalybeate fprings receive their impregnation from them. See Lewis's Mat. Med. Dict. of Chem. Neu-mann's Chem. Works.

PYRMONTANA AQUA. PYRMONT WATER.

is one of the principal of the chalybeate kind.

It is found in the county Pyrmont, in the circle of

taken up in a glafs, spankles like the brightest Champagne, and Dr. Monro favs, to him had something the tatte of old bock, and a spirity chalybeate smell, but it did not strike the least shade of red, or purple, when mixed with syrup of violets. It seems to yield different quantities of folid master, at different times, when evaporated according to the experiments of Dr. Hoffman, Turner, Rutty, and for T. Bergman. Dr. Rutty mentions that Rutty, and fir T. Bergman. Dr. Rutty mentions that the refiduum which he obtained was of a pale brown colour, had a naufeous bitter tafte, and did not moiften in the air; and that about one third of it was calcareous nitre, that is vitriolated magnefia, mixed with a pittance of fea-falt, and that the remainder was made up of felenites, calcareous earth, and ochre. Sir T. Bergman fays that the Swedish Kanneful, containing 42,351 grains of this water, is fometimes impregnated with ninety cubic inches of aerial acid; though in general the quantity is fmaller; which is in the proportion of 1301 cubic inches from the English gallon of 61,440 grains, and the folid contents on his analyzation were, from the English gallon of acrated iron, 42 grains; of acrated lime, 29 t; of vitriolated lime-felenite, 554; of aerated magnefia, 6541; of vitriolated magnetia, 36,3,; of common falt, 10.8. At Pyrmont, the people generally drink this water by glassfuls in a morning, to the quantity of two, three, or more English pints. Its common operation is by urine, but if taken copiously, it generally proves laxative; and when it has not this effect, and that effect is wanted, they commonly mix with the first glass drank in the morning, from one to five or fix drams of some purging falt. Monro's Medical, &c. Chemistry, vol. ii.

PYROPUS. See Phosphorus.

PYROSIS. In Scotland this is called the WATER-BRASH: in English, BLACK-WATER. Dr. Cullen places it as a genus of difease in the class neuroses, and order fpasmi. This disorder is named pyrosis Succica by Sauvages, but Linnaus calls it cardialgia sputatoria. Dr. Cullen considers the pyrosis as an idiopathic disease, and seems to be the first who hath treated of it in a system. He observes, that it is a disease frequent among people in lower life, but occurs also, though more rarely, in people of better condition. It appears, he says, most frequently in persons under middle age, but seldom in any persons before the age of puberty. When it has once taken place, it is ready to recur occasionally for a long time after, but it feldom appears in persons considerably advanced in life. It affects both sexes, but more frequently the female; it fometimes attacks pregnant women, and fome women only when they are in that condition. Of other women, it more frequently affects the unmarried; and of the married, most frequently the barren; it frequently happens to women labouring under the fluor albus. The fits of this difease usually come on in the morning and forenoon, when the stomach is empty. The first symptoms of it is a pain at the pit of the stomach with a sense of constriction, and as if the stomach was drawn towards the back; the pain is increased by raising the body into an creek posture, and, therefore, the body is bended forward. This pain is often very severe; and after continuing for some time, it brings on an eructation of a thin watery fluid in confiderable quantity: this fluid hath fometimes an acid tafte, but very often is without this, and abfolutely infipid. The cructation is for fome time frequently repeated, and does not immediately give relief to the pain which preceded it, but does so at length, and puts an end to the fit. The fits come on without any evident exciting cause; they attack persons using animal food, but more frequently those who live on milk and farinacea. Cold applied to the lower extremities feems often to be an exciting cause, and so is every considerable emotion of mind. The doctor goes on to observe, that the nature of this affection is not very obvious, but he thinks it may be explained as follows: it feems to begin by a fpaim of the mutcular fibres of the ftomach, which is afterwards, in a certain manner, communicated to the blood-veffels and exhalents, fo as to increase the impetus of the fluids in the veffels, while a conftriction takes place on their extremities. The increased impetus pours out a larger quantity of fluid than usual, while the constriction upon their extremities allows only the pure watery parts to be poured out, analogous, as I judge, in every respect to what happens in the diabetes hystericus. As to the cure, little can be done. Optum relieves the paroxysm. The vitriolic exther, volatile alkali, &c. are sometimes of service. Linnæus speaks of the nux vomica being useful, but to prevent the returns of this disorder is not easy. See Cullen's Eight Linner and speaks of the nux vomica being useful, but to prevent the returns of this disorder is not easy. See Cullen's Eight Linner and speaks of the nux vomica being useful, but to prevent the returns of this disorder is not easy. See Cullen's Eight Linner and speaks of the nux vomica being useful, but to prevent the returns of this disorder is not easy.

First Lines, vol. iv.

It is also the name of a disease in the ear, which affects the patient as if a heat was excited there by a burn-

ing coal.

## QUA

UADRAGESIMUS DIES. The fortieth day. The ancients fixed on this day as the laft to which acute diftempers could extend, calling all those chronical which continue longer. But Dr. James obferves, that he hath seen an acute disease which conti-

ned fixty days. QUADRANS.

QUADRANS, A three ounce measure was for-merly thus named. See CYATHUS. QUADRATI MUSCULI. Four-squared muscles. See Occipitalis Musculus. Depressores Labit

QUADRATUM. See CUBOIDES. QUADRATUS BUCCAS DETRAHENS.

ADDUCTOR AURIS.

QUADRATUS FEMORIS. This muscle rises from the outside of the tuberosity of the ischium, and is inserted into the line between the trochanter major and minor,

ferving to rotate the thigh.

— GENÆ. See PLATYSMA MYOIDES.

— LUMBORUM. This muscle rises from the spine

of the ilium, whence it goes to the transverse processes of the four upper lumbar vertebre, and partly from these transverse processes, which part goes to the last rib. This muscle lies between the contained parts of the belly, and the erectors of the back, and serve to pull the body to one side, by bringing the last rib down. This muscle is also called quadrigeminus, and lumbaris externus; underneath it a troublesome abscess is sometimes formed. See ABSCESSUS LUMBORUM.

QUADRIFOLIUM. A name for the trifolium,

QUADRIGA, also CATAPHRACTA. A bandage for the iternum and ribs. It is twenty-four feet long, three or four fingers broad, with two heads; it binds upon the thorax and iternum more firmly when the ribs are fractured. The middle is placed on one fide of the body; the two heads are carried fo as to interfect on the oppofite fhoulder; they are brought back to where they begin, and then pass circularly round the body. QUADRIGEMINI. A name for the following muf-

cles taken together. viz. pyriformis, gemini, and the qua-

dratus femoris.
QUADRIGEMINUS, See QUADRATUS LUMBO-

BUM.

QUANTICAMOTLI. See Cassada. QUAQUARA. See China orientalis. QUARTANA CONTINUA. CONTINUED QUAR-

TAN. The paroxyim returns every fourth day, after previous pandiculations and horripilations, but does not very exactly observe its period; nor when the paroxyim abates does it totally intermit, but is only milder on the intermediate days than in that in which the paroxyim happens. The heat is also preternaturally intense, the pulse increased, the appetite languid, the strength low, the mouth dry, the head giddy, the sleep restless, the urine red, thick, and with a high-coloured sediment.

# QUA

QUARTANA DUPLEX. A DOUBLE QUARTAN. It is when within four days two fucceding paroxyfms happen, in fuch a manner, that each preferves its proper

type, and peculiar time of accession, alternately corresponding to the preceding paroxysm, and the third day only being totally free from the fever.

— Febris, vel Quartana legitima. An Ague, or Quartan intermittent fever It hath two sits in four days, or two days free from the fit, so on the first and the fourth the fever attends, and on the second and third it is free; the accession of the sit is in the afternoon, and returns more exactly the fit is in the afternoon, and returns more exactly than in any other species of sever. Dr. Cullen places this genus of disease in the class pyrexiæ, and order sebres. It is usually both more violent and obstinate than a tertian. Sometimes a quartan fever is double, that is, when the fits come on every other time at different hours, and so that the third day only is free from fever. It is called spurious when the fit begins at any other time of the day than about four or five o'clock in the evening. The cure is as related for intermitting fevers.

- SPURIA. SPURIOUS QUARTAN. It hath no certain period for its returns, which, however, is in the forenoon generally; the heat also is greater, and affects the patient more than the cold fit does.

QUARTARIUS. A measure which contains about

four ounces

QUARTATIO. Quartation. It is an operation QUARTURA. In chemistry, by which the quantity of one thing is made equal to a fourth part of the quantity of another. Thus when gold, allayed with silver, is to be separated, we are obliged to facilitate the action of the aqua fortis by reducing the quantity of the former of these metals to one fourth part of the whole. former of these metals to one fourth part of the whole mass, which is done by sufficiently increasing the quan-

mais, which is done by unicently increasing the quantity of the filver if it be necessary. Some extend this name to the operation of parting called DEPART.

QUASSI LIGNUM. QUASSI WOOD. This wood is so called from a negro who was named Quass; he lived at Surinam; and used it medicinally. He had great successary in the content of the intermittent, malignants. cefs by giving it in fevers of the intermittent, malignant, and putrid kinds. It is the quaffia amara, or the quaffia floribus hermaphroditis, foliis imparipinnatis, foliolis op positis sessibus, petiolo articulato alato, sforibus race-mosis, Linn. The wood hath no smell, is very bitter, and stronger and more concentrated than that of any one medicament yet known; it is totally void of ftypti city. As a bitter, it may be used as is common with bitters in general; it may be given in the form of pills, powders, or infusion. Quassi made a tineture with it in brandy, but an infusion of it in boiling water feems to be the best preparation. A dram may be infused in a pint of boiling water, and an ounce may be given for one dose. When the bark could not be taken, in the intermission of fevers, the quast, with an equal quantity of rad. fer-pent. V. infused in boiling water, answered every end that

that was expected from the bark; it allayed vomiting, fet five together, on long pedicles. It is perennial, grows and appeared powerfully to refift putrefaction. See Me- wild on clay grounds, and flowers in June. The roots and appeared powerfully to refit putrefaction. See Me-moirs of the Medical Society of London, vol. ii. p. 28.

Notwithstanding what has been faid in its favour, it is confidered only as a pure bitter, by those who had much experience in it, and that will only do what any pure and simple bitter will do. Cullen's Mat. Med.

QUASSIA. SIMAROUBA DIOICA. See SIMA-

ROUBA.

QUATRIO. The ASTRAGALUS.

QUERCERA. See EPIALOS. QUERCULA CALAMANDRINA. See CHAMA-

DRYS

QUERCUS. The OAK-TREE. It is the quercus rebur, or quercus foliis deciduis oblongis fuperne latioribus, finubus acutioribus, angulis, obtufis, Linn. The COM-MON ENGLISH OAK-TREE. It is a common forest-tree, and is known in all parts of Europe. The bark is a strong aftringent, moderately bitter, having no particular finell; with a ferruginous folution it strikes an inky blackness. It hath been used with success in intermittent severs, and in gleeting gangrenous wounds and ulcers, in which cases, some say, its extract is as good as the extract of the bark. Both water, and rectified spirit, take up its virtues. It has been much employed as an aftringent medicine, in decoction, in slight tumesactions of the mucous membrane of the fauces; to a prolapfus uvulæ from flight cold, and a cynanche tonfillaris. Alum has been often joined with it, and rendered more efficacious. In powder given to the quantity of half a dram every two or three hours during the intermission of a fever: and both by it-felf, and joined with chamomile flowers, the returns of paroxylins of intermittents have been prevented. All these virtues in a considerable degree, belong to the cupulæ, or scaly cup which embraces the bottom of the acorns. Cullen's Mat. Med.

The bark is more used for tanning than as a medicine.

See GALLE.

QUERCUS ÆGYLOPS. See ÆGYLOPS.

— MARINA. See KALI.

QUERQUERA. A fort of fever called earcaros, and phricodes, from the horror and tremor with which it is attended. See Phricodes.

QUIETALES. Difeafes in which the voluntary and involuntary motions, and the fenfes are diminished.

QUINA QUINA. The PERUVIAN BARK.

CORT. PERUV

QUINCUNX. A five-ounce measure. See CYA-

THUS. QUINQUEFOLIUM, also called pentaphyllon. Com-MON CINQUEFOIL, FIVE-FINGERS, OF FIVE-LEAVED CRASS. It is a trailing plant, with ferrated leaves, are aftringent, they give out their virtue to water and to fpirit. The leaves are of the fame nature as the roots. See Raii Hift.

It was known to Hippocrates, and employed by him and others in the cure of intermittents, but it is not equal

to other plants of the fame class.

It is also a name for a species of tormentilla and argen-

QUINQUINA. The PERUVIAN BARK. See CORT. PERUVIANUS.

QUINQUE NERVIA. See PLANTAGO MINOR.
QUINTA ESSENTIA. QUINTESSENCES. The
chemifts exprefs this by the word forms. They are made
by adding to any effential oil twelve times its quantity of
pure alcohol of wine, and flaking them fo together, that
the oil may not appear. If there are diffilled in a close veffel, with a fire of 90 deg. by Fahrenh, therm, the alcohol will rife with only the prefiding spirit of the oil; and if with care the thinner part is feveral times feparated from the thicker, by repeated gentle cohobation, the alcohol will at length be fo impregnated with those oily fpirits as to appear to be almost pure spirit itself, leaving a gross exhausted oil behind.

Dry quinteffiness are made by diffolying an aromatic oil in alcohol of wine, then adding to them ten times their weight of fugar, finely powdered, the placing them in a proper place and veffel for exhaling the figirit from the fugar, but preferving it from being loft. Thus the fugar will remain dry, but with the virtues of the aromatic oil

in it. 9 i, in a glass of wine is a good cordial.

QUINTANA. An AGUE, the paroxyfin of which returneth every fifth day; the second, third, and sourch are free from fever.

QUISQUILIUM. A GRAIN of CHERMES, QUOTIDIANA CONTINUA. The continued quotidian of Vogel, is the continued quartan of Cullen."

FEBRIS, amplemering, amplemerings. A quoti-DIAN INTERMITTENT FEVER. It intermits, but returns bi AN INTERMITTENT PEVER. It intermits, but returns every day, and that generally early in the morning: when the fit approaches at any other time of the day, it is called fourious or anomalous. Dr. Cullen places this genus of disease in the class pyrexiæ, and order febres, and defines it a questidian fever, wherein fimilar paroxysms attacking in morning. The blood is more dense in this general method. termittents than of any other. For the general mothod of cure, fee INTERMITTENS FEBRIS.

RACHITÆ, or RACHIÆI. The muscles belonging

RACHITIS, fo Dr. Gliffon called it from faxus, the spine of the back, because he supposes a fault in the spinal marrow produces it. The RICKETS. This diforder is also called cyrtonofus. In some countries it is called the English disease, though it is much more frequent elsewhere; it did not appear in England until about the mid-dle of the feventeenth century, from whence it is faid to have fpread all over Europe, and whence it obtained the name of English. Dr. Glisson says, that it was first ob-ferved in the West of England, in the counties of Dorset and Somerfet, betwixt the years 1600 and 1620, and that

afterwards it fpread.

It is a chronical disease, and a species of cachexy. Dr.

Cullen places this genus of disease in the class cachexia, and the order intumescentize. He distinguishes two varieties. 1. Rachitis simplex; when there is no other dis-ease. 2. Rachitis cum aliis morbis conjuncta. The whole habit is affected, but more particularly the heads whole habit is affected, but more particularly the heads of the bones or joints, with their ligaments and cartilages; and also the whole cranium. Bodies that have been diffected after the death of ricketty patients, were found to have pale and flaccid muscles, swelled lungs, enlarged livers, indurated mesenteric glands, spongy bones, the nodes on them were soft, and the marrow within them like bloody ferum. Some observe, that the top of the spinal marrow is uncommonly hard and obstructed, that nal marrow is uncommonly hard and obstructed, that water is lodged between the dura and pia mater, and that the brain is large.

Usually the subjects are children from fix months to fix years of age, though fometimes its attack is not before the fixth year, or even after. Mr. Bromfield gives an instance of a woman being afflicted with; and at length dying under this disorder. See his Chirurg. Obs. vol. ii. c. 2. Children who cut their teeth late are disposed to this

## RAC

Holland, and at Halle in Saxony, this diforder prevails very much, on account of their atmosphere being filled with moift and otherways unfalutary exhalations. Bad nurfing, a too acefeent diet, &c. are also causes of this kind. The immediate causes are, such an indisposition of the spinal marrow as prevents a due passage of the vital heat along it, whence all those parts which receive nerves therefrom are but poorly nourished; whilst a redundance of this necessary principle is conveyed to the head, whence its extraordinary increase, and the florid complexion usually observed in patients thus afflicted; and, as Dr. Hunter observes, a deficiency of the offcous or of the earthy matter of the bones.

The chief differences in this diforder are from the greater or leffer number of the following fymptoms being attendant in one and the fame patient; and from the dif-ferent degrees of their violence. Ufually the first ap-pearance of this kind is in the eighth or minth month of the child's age; by degrees feveral parts of the body be-come disproportioned, the skin grows lax, the belly becomes flaccid, the muscles wear away, particularly those of the neck, the joints of the hands, arms, knees, and feet grow large, so that there seems to be excrescencies on the bones of the wrists and ankles; the bones at length are too weak to support the body, and, as well as the spine, they grow crooked; the child walks with more and more difficulty, until it entirely lofes the use of its feet; the carotids and jugulars swell, but the other blood-vef-fels seem less: the head grows large; the sutures are vifible; the fontenel is often membranous; the neck is too weak to support the head steadily; the countenance is lively; the child is more fentible than is common to chil-dren of the same age; the breast is strait, and compressed on its fide. The sternum rifes up sharp, and in a point, and the extremities of the ribs are knotty; the difease at length increasing, a sever comes on, which is followed by a cough, a difficulty of breathing, and other fymptoms which continue during life; the wrifts are knotty and difforted, fo are the ankles; the ribs protuberate and grow crooked; the hypochondres fwell; other fymptoms refembling the confumption come on, and at length de-ftroy the patient. Children who are old enough to walk, go tottering and waddling along; but they like best to sit still, and as their disorder increases, they would always lay down; the teeth come forward very slowly, and with much uneafinefs, foon decay and fall out: and it is remarkable that most of this time the appetite fails not, nor does the patient feem to digeft with difficulty what

he eats.

The rickets do not often prove fatal; but when an Children who cut their teeth late are disposed to this complaint:

The remote causes are, whatever hinders digestion, generates a viscid chyle, or in general lessens the vis vitæ. A cold moist atmosphere disposes to the rickets, whence the greater frequency thereof in marshy countries. In

pox, the itch, or other cutaneous eruptions, and is not | p. 66. 71. Shaw's Practice of Physic. Zaviani's Treasecompanied with confiderable incurvation of the bones, tife on the Rickets. Edinb. Med. Com. vol. ii. p. 47. and inability to motion, the cure is not very difficult. The bones of the legs, though very crooked, will become nearly and often quite straight during the growth of the child, if it becomes ftrong and healthy.

The intentions of cure are, to dissolve the viscidity of the juices, open obstructions, and promote a free circulation, and then to increase the vital heat and strengthen

the folids.

The diet should be light, cordial, and nutritious; be of broth, in which cray-fishes are boiled; this is excellent, or beef broth alone; spiced meats are useful; rice with wine and a little cinnamon mixed with it will be a proper change. The air should be dry and warm; exercise, gentle, and frequent. To keep the child dry and clean conduces much to relief.

Gentle emetics and lenient purges should begin the cufe, particularly the tinch aloes and tinch rhab. mixed in equal parts, these may be repeated two or three times: or equal parts of calomel and rhubarb may be given, and repeated fo as not to falivate: after thefe, when the children's bellies are (welled, give pills of the gall of ecls, or pikes, as deabstruents; or, if the patient is emaciated, or the viscera are not found, faponaceous medicines should be given, particularly the kali acctatum.

Liniments may be useful both by their efficacy as medicines, and by the friction used in the proper applica-tion of them. R ol. palmæ 3 ii. ball. Peruv. & sp. ammoniæ, aa 3 ii. ol. n. m. per expr. 3 i. ol. carioph. & succin. aa gut. xx. with this or even with sp. vini camph. let the spine and any of the affected joints be rubbed twice a day. If before the use of the liniment, &c. the parts are rubbed before the fire with a large flannel cloth, their efficacy will be more increased. Dry frictions alone

are peculiarly ufeful.

If on trial cold-bathing is found to excite a glowing warmth, it may be continued with advantage; if on the first using the cold bath the child shivers, put it between blankets until it grows warm or fweats a little; afterwards use warm water, and gradually proceed to the use

To warm the constitution and strengthen it, nothing excels the cort. Peruy. and ferrum ammoniacale. The first may be given in powder, or in the form of an infu-fion, and the latter also in substance or tincture. In-stead of these the unrusted fine filings of iron may be mixed with mild aromatics, and washed down with any bitter infusion. Dr. Zaviani gives the ferrum ammoniacale, gr. v. more or lefs, every day for two weeks, interpoling the pulv. rhab. gr. v. once in four or five days; he then omits the medicines during two weeks, after which he repeats them as before. But if the patient is feverish, give him the infus. cort. Peruv. cum acido vitriolico diluto, instead of the iron or any of its

preparations.

The kali pp. is highly extolled in this difeafe. In the fourth vol. of the Edinb. Med. Comm. is the following account of its efficacy: a boy of feven years old, who laboured under rickets to a great degree; his inferior ex-tremities were become stiff and immoveable; the abdomen flaccid; he was emaciated with a diarrhoxa and conftant fweatings, and had five fiftulous ulcers all running at the fame time. The following was preferibed: R decoct. cort. Peruv. 3 viii. kali pp. 3 fs. m. Half of this mix-ture was taken every day. In the course of one month, the patient was so far recovered as to be able to rise from his bed, and to walk with fome support. At that time the bark was changed for the rubia tinctorum; and in less than four months, the boy was fo recovered as to walk with a crutch, and the ulcers by that time were nearly healed. Many ricketty people have been cured by a watery folution of the fixed vegetable alcali, without any other means being used.

The ofmunda regalis, or flowering fern, if given in decoction, powder, or extract, is recommended as of great

efficacy in this diforder.

A grass of claret, with a morfel of bread should be given to the child, an hour before dinner every day, and

again in the evening.

RACHOSIS. Excoriation of the relaxed ferotum.

RANIÆUS MUSCULUS. Sec. RADIALIS.

- EXTERNUS, See EXTENSOR CARPI RADI-

RADIALIS. The nerve fo called. See CERVICALES. RADIALIS VEL RADIMA ARTERIA. It is a branch of the humeral artery. It runs down the fide of the ra-dius, covered by the supinator longus; at the wrist it divides into two, one of which paffing over the palm of the hand, is loft in the fleshy part of the thumb; the other passes on, and between the metacarpal bone of the forefinger, and the first bone of the thumb, plunges into the palm, and forms a fort of arch there. In its course, it fends off branches which run on both fides of the hand, communicate with the cubical branches, and are loft

among the metacarpal bones. - Musculus. See the EXTENSOR and the FLEX-

OR MUSCLES.

- EXTERNA VENA. When the cephalica hath reached the bend of the arm, it divides into two princi-pal branches, one is called the radialis externa; it spreads about, and along the fore-arm.

- INTERNA VENA. It is a long branch from the

mediana cephalica.

RADICULA. A name for the raphanus hortenfis.

RADIUS. RADIUS, a STAFF OF BEAM. It is one of the bones of the fore-arm, which is so called from the refemblance it bears to the fpoke of a wheel; called alfo eereis; fseile. Its upper extremity is formed into a fmall circular head, which is hollowed for an articulation by arthrodia, with the tubercle of the os humeri at the fide of the trochlea and the half of the round circumference of the head, next to the ulna is fmooth, to be re-ceived into the femilunated cavity of that bone. The lower extremity of the radius is much larger than the fu-perior; it is flattened before, and grooved backwards by the tendons of the muscles. The extremity of the radius is hollowed for the reception of the bones of the wrift. The reason why the fibres of the interosseus ligament run obliquely upwards from the ulna to the radius is, that as this fast is very slightly articulated to the os humeri, in a fall the force of it would be communicated to its upper extremity, and eafily diflocate it if this ligament was not to take off the force of the fall. The fibula is alfo fo called.

RADIX. A ROOT. It is that part of a plant by which it naturally receives its nourifliment. Some roots are fleshy, others are fibrous, and others again are woody.

Roots are divided into different species. Linnæus divides them into fibrous, bulbous, and tuberous, which are again subdivided by other distinctions, the chief of which are the following:

RADIX ASPHODELI. ASPHODEL-ROOT. It is that which is composed of several oblong steshy knobs. Of this kind are the king's-spear, and the day-lily.

BRASSILIENSIS. See IPECACUANHA.

BULBOSA. The BULBOUS ROOT. It is that which is composed of several coats, involving one another, or of several scales lying one over another. The first of thefe is called a tunicated root. Of this fort are onions, The last is called a fquamous, or fcaly root. Of

this fort are the lily, &c.

— DULCIS. See GLYCYRRHIZA.

— FIBROSA. A FIBROUS ROOT. Is is one which confifts only of fmall fibres like hairs. Of this fort are those of GRASS and CORN.

- GRANULOSA. A GRANULOUS ROOT. It is a kind of granulous root, confifting of many fmall flefhy knobs, which refemble grains of corn. Of this kind is the white faxifrage.

- GRUMOSA. A GRUMOUS ROOT. It is one which confifts in many oblong fleshy knobs, joined to one centre at the top. Of this fort is the ranunculus.

—— INDICA LOPEZIANA. See RAIS DI JUAN LO-

PEZ, &cc.

--- PALMATA. A HANDED ROOT. It is a tuberous root, divided, as it were, into feveral fingers, so as to refemble a hand. Of this fort is the handed-orchis.

— RHODIA. See RHEDIA.

— RUBRA. See RUBIA,

RABIN TESTICULATA. A TESTICULATED ROOT. It mor of this kind is feated where the falival ducks enters is a double tuberous rost, for it confifts of two knobs, re-

TUBEROSA. A TUREROUS ROOT. It confifts of an uniform fleshy substance, and is generally roundish. Of this kind is the fow-bread. Befides the term RADIX

is used to many other substances, viz.

RAIS DI JUAN LOPEZ LUSITANIS. It is the radix Indica Lopeziana, Pharm. Edinb. Radix Indica, a Jo-anne Lopez, denominata Gaubii Adversar. cap. vi. The root of an unknown tree, growing, as some say, at Goa, others suppose in Malacca, from whence it is sometimes brought to Batavia. It is met with in pieces of different thickness, some at least of two inches diameter. The woody part is whitish and very light; fofter, more spongy, and whiter next the bark, including a denfer, fomewhat reddifh, medullary part. The bark is rough, wrinkled, brown, foft, and as it were woolly, pretty thick, covered with a thin, paler cuticle; neither the woody nor cortical part hath any remarkable finell or tafte, nor any appearance of refinous matter. On boiling in water, no odour is emitted, and the ftrained liquor, which is of a yellow hue, is almost insipid, only impressing the tongue with a very light, obscure bitterishness, and without viscidity. The extract obtained by evaporating the decoction, is equally void of fentible activity. Rectified fpirit is tinged by the root of a brown colour, but acquires no particular tafle. After drawing off the fpirit from the tincture, a matter remains refembling balfam, which bubbles and in flames in the fire, and has a bitterifh tafte, like that of

This root is regarded in the East Indies as a medicine of extraordinary efficacy in diarrhœas. Gaubius, in his Adverfaria, fhews fome experiments made with it, which, in fome degree, confirm its reputation; it appeared remarkably effectual in abating colliquative diarrhoeas, which had relifted the usual remedies, and those attending the last stage of confumptions were particularly relieved by its use. It feems not to act by an aftringent power, but by a faculty of restraining and appearing spasmodic and inordinate motions in the intestines. Gaubius compares its action to that of simarouba, but thinks it more essicacious than this medicine. The powder is given with any proper vehicle, in dofes from fifteen to thirty grains, repeated three or four times a day. A tincture made with common spirit is faid to be equally effectual with the root; of this tincture the dole was a tea-spoonful three times a day. Lewis's Mat. Med. edit. 3. RAMALIS VENA. The vena portæ.

RAMEX. An HERNIA. RAMEX VARICOSUS, i. c. Hernia varicofa. See

RAMUS. A BRANCH. It is the division of a stalk,

or a tree; it is called a sough.

RAMUS INFERIOR. A name of the third maxillary branch of the nerves, which proceed from the fifth pair.

— SUPERIOR. See FRONTALIS NERVUS.

RANA. The FROG, or PADDOCK. The spawn of fregs was formerly used for cooling, but now is wholly neglected; also it is the name of a disease. See RANULA.

RANGIFER. See Bufo. RANGIFER. See CERVUS RANGIFER. RANINÆ ARTERIÆ & VENÆ, vel RANULÆ.

See SUBLINGUALIS. Quia nigræ funt instar ranularum.
RANULA. The name of a tumor which is seated
under the tongue; it hath been thought to resemble a little frog, whence the name of ranula; though some fay that it is thus named, because it alters the voice of the patient, so as to make him croak like a frog. It is also called batrachus, bypoglossis, bypoglossum, ranco. This tumor is formed in the falivary glands under the tongue, and is seated on either side of the freenum; it is generally of the ferofulous kind. The matter varies much in different inflances of this diforder, being formetimes like the white of an egg, at others it is more folid; in forme inflances it is purulent, in others it differs from all thefe. It fometimes grows fuddenly, impedes both the fpeech and fwallowing, and also causes much pain; but generally its growth is more gradual, and its effects not so violent. Instances have occurred of their having degenerated into cancers. They are all of the encysted kind, and are with cancers. They are all of the encysted kind, and are with for foloniensis, eclompsia typhodes, necross offilaginea. It is great difficulty either dispersed or brought to suppuration, a nervous affection, of the spasmodic kind, in which there generally requiring the knife for their removal. If a tu-

fembling a pair of testicles. Of this fort are fome of the of the danger of wounding these ducts, with the nerves or blood-vessels; in this case wait until nature opens a paffage for the contents: if it is feated on either fide, great care is required, left the nerves or the blood-veffels there, should be injured : however, in such cases, hold up the tongue of the patient, and make an incilion transversely into the tumor, the matter being discharged, dress with the honey of roles acidulated with the spirit of vitriol, that the cyft may also be destroyed. See Heister's Surgery. Bell's Surgery, vol. iv. p. 325. White's Surgery. gery, p. 275.
RANUNCULOIDES PRATENSIS. See CALEN-

DULA PRATENSIS.

RANUNCULUS. CROWFOOT. It is a plant with pentapetalous flowers, that are also rofaceous; they are fet in five-leaved cups; they are followed each by a round clufter of naked feeds, and are perennial. Boerhaave enumerates fixty-nine species, some of which are inert, and others are very caustic. It is also a name for the Boerhaave

RANUNCULUS BULBOSUS, vel tuberofus major; ROUND-ROOTED, or BULBOUS CROWFOOT. It hath a round tuberous root, the fize of an olive; the leaves are divided commonly into three fegments, and these are further fubdivided; the stalks are erect : the flowers are of a bright gloffy yellow, their cups turned downwards. is common in pasture-grounds, and flowers in May. This

is one of the cauftic species.

- LONGIFOLIUS PALUSTRIS MINOR, called alfo flammula, SPEARWORT, or SMALLER WATER CROW-FOOT, with fibrous roots, long, narrow leaves, accuminated at both ends, and leaning on procumbent stalks; it grows in watery places or moist meadows, and flowers in June. The roots and leaves have no finell, but have an acrid fiery tafte. Taken internally, they appear to be deleterious, even when so far freed from the caustic matter by boiling in water as to discover no ill quality to the palate. The effluvia of the less acrid species, or varieties, cultivated in gardens, when freely in-fpired, have occasioned head-aches, anxieties, vomitings, and spasms. The leaves applied externally blifter the part, the roots do fo too, and as fuch have been used; their pungency is diminished by drying, and destroyed by long keeping. See Raii Hist. Lewis's Mat. Med.

VIRIDIS. The name of a species of frog; be-

fides the term ranunculus is given to leveral other of the

vegetable class, viz.

RANUNCULUS, ficaria and vermus. See CHELE-DONIUM MINUS.

- NEMOROSUS. See MOSCHATELLINA. - PHRAGMITIS. See CINOMONOIDES.

- TRIDENTATUS VERNUS. Sec HEPATICA NO-BILIS.

RAPA, The TURNIP, commonly called the ROUND-RAPUM. Scotted TURNIP. It is a plant with a round root, with jagged leaves, yellow flowers, with small round, smooth, reddish, or blackish feeds, lodged in long rode. The garlen twent is supposed to be a way. in long pods. The garden turnip is supposed to be a variety produced by culture from the smaller fort, which grows wild in sandy grounds in some parts of England. It is biennial. Botanists enumerate ten species.

Turnips are useful and agreeable food; they are detergent, laxative, and diuretic. They are a watery and tender fubstance, and therefore easily digested, and occasion little flatulency. They have fome fweetness, and do not feem to contain much nourishment in proportion to their bulk. Sugar cannot be extracted from them, and very little anylaceous matter. They are of two kinds, the white and yellow; the latter has a fweeter and more mucilaginous tafte, and therefore apparently the most nutritious, and more hardy in sustaining the winter. Cul. Mat. Med. The liquor pressed from them, after boiling, it takes readiciable in coughs and disorders of the besself. is taken medicinally in coughs and diforders of the breaft; the feeds are alexipharmic and diaphoretic; they have no finell, but to the tafte are mildly acrid. The female species, which are longish, are thought the best; the male species is round. See Raii Hist. Lewis's Mat Med. This term is also applied to the rapisfrum.

RAPHANIA. CRIPPLE DISEASE; called also computational acritical acritica

feeds of the raphanus raphanistrum, Linn. i. e. the bastard radish, or charlock. Dr. Rothman, who wrote on this disease, supposes it to be caused by the raphanus above named, because of its prevalence when the seeds of that plant abounded amongst the corn. Linnæus also having fed some birds with the seeds of the raphanistrum, and finding that they died convulled, he gave this difease the name of raphania. The Germans call this diforder, kriebel krankheit. Sauvages names it, eclampfia typhodes; also convulsio raphania, vel ab ustilagine.

It is defined to be "a spattic contraction of the limbs

or joints, attended with convulfions, and excruciating periodical pains." Dr. Cullen places it in the class neuroses, and order spasmi, in his Nosology.

In the fixth volume of Amœnitat. Academicæ, Dr Rothman gives the history of this disease, and a full description He observes, that it had been frequently epidemical in Sweden, notwithstanding that many physicians think it is a new distemper: he has traced it in the writings of many authors, from the year 1596 to 1727, by which it appears to have been common in other parts of Europe; he adds, that this dreadful diftemper fometimes held the fick for three or four weeks, and those who perished, generally sunk under a diarrhea, or died in convulsions. The poorer people were the chief subjects of this complaint; they were usually attacked in autumn, foon after eating bread made of new corn.

In order to its relief, valerian, caftor, camphor, and other fimilar antifpafmodics were given with fome advan-See Pulteney's View of Linnœus; Memoirs of the Royal Med. Society, at Paris, A. D. 1779, but particularly Dr. E. Rosen, and Dr. Rothman's Differtatio Ra-

RAPHANISTRUM. This plant is fo called from its likenefs to the raphanus minor, with which it also agrees in its medical virtues. It is also a name for some species

of erucago, of rapifirum, and of the miagrum.

RAPHANUS. A term given to many vegetable products, viz. raphanus aquaticus. See Sisymbrium

AQUAT.

RAPHANUS HORTENSIS, called also radicula, raifort. COMMON GARDEN RADISH. It is sufficiently known, not to need a description. Its virtues are similar to those of the cochlearia. The root is attenuating, and occasionally carminative; all the parts of the plant are antifeorbutic. The roots are more acrid after drying than they are whilft fresh, but this acrimony is soon dislipated by boiling. It is commonly eaten with its cortical part, in which its acrimony confifts, and this rather ferves as a condiment to its afcefcent fubstance, and which therefore feldom proves flatulent.

latis crenatis, caulinis incifis floribus albis, Linn. Its flowers and feeds refemble those of scurvy-grafs, the leaves are large and long, and are indented about the edges. It is found wild about the fides of ditches and rivulets, but for medicinal and culinary purposes it is cultivated in gardens. It is perennial, and flowers in June. It rarely perfects its feeds, but is propagated by transverse cuttings

of the roots.

The roots impress both the nose and the palate with a quick penetrating pungency; they also contain in certain vessels a sweet juice, which sometimes exudes in little drops upon the surface. Its pungent matter is a very vo-latile salt, which is all diffipated in drying, and is carried off in diffillation, both by water and by spirit of wine. As the pungency exhales, the sweet matter becomes more senfible, though this also is in a great measure diffipated. It impregnates both water and spirit by infusion or distillation very richly with its active matter; in distillation with water it yields a fmall quantity of effectial oil, exceedingly penetrating and pungent. This root agrees with creffes and feurvy-grafs, and differs from muftard-feed in the volatility of its pungent matter, and its folubility in spirit. It is properly employed as a condiment with animal food, as it stimulates the stomach and promotes digestion. Whether externally, or internally employed it proves a ftimulant, hence a rubefacient useful in palfy, and rheumatism. Its insusion formed into fyrup often cures

tations, and great pain at various periods. Linnaus giveth terrupted fecretion of mucus. It readily proves emetic, this name to this difease, from its supposed cause, viz. the taken in insusion, and a large portion of warm water taken after it, hence it may be given as, or taken with a vomit. Infused in wine, it stimulates the nervous system, and is thereby useful in palfy; and employed in large quantity it proves heating to the body, hence useful in chronic rheumatism, whether arising from scurvy or other causes. Cut down into very small pieces, without bruifing, and fwallowed without chewing, it may be taken in a large quantity to that of a table spoonful. BERGIUS fays, taken in this manner for a month together every morning, it has been extremely useful in arthritic cases," haps of the rheumatic kind. The matter of horfe-radiffs paffes to the kidneys readily, and proves a powerful d.aretic, useful therefore in dropsy; and by promoting urine, and perspiration, it has long been known to be a most powerful antiscorbutic. Held in the mouth it proves a certain and good fialagogue. The fyrup of borfe-radifb is made by infufing one dram of the root, in four ounces of water, and forming that into a fyrup, in a moderate heat with fugar.

If the root is kept in a cool place, and buried in dry-fand, its virtues are retained a long time. Dr. Althon fays, that it may be fo dried as to powder, and flill to re-

tain an useful portion of its virtue.

The London College directs a compound spirit, called SPIRITUS RAPHANI COMPOSITUS. COMPOUND SPI-

RIT of HORSE-RADISH to be thus made.

Take borfe-radish root fresh, the exterior rind of Seville orange dried, of each two pounds; fresh garden-scurvygrafs, four pounds; bruiled nutmegs, an ounce; proof spirit of wine, two gallons; water, a fusficient quantity to avoid an empyreuma, diftil two gallons. Ph. Lond. 1788. See Neumann's Chem. Works; Lewis's and Cullen's Materia Medica.

RAPHANUS SYLVESTRIS. See LEPIDIUM. RHAPHONTICOIDES LUTEA. See BEHEN AL-

RAPISTRUM, called also lampsana, miagro, finapi arvenfe, pracox, femine nigro, CHARLOCK, CHADLOCK, KEDLOCK, or WILD MUSTARD. This plant is called rapa. All the species, of which fix are reckoned by Boerhaave, are antifeorbutic, but their efficacy is too infignifi-

cant te obtain a place in practice.

RAPOCAULIS. See BRASSICA CONGYLODES.

RAPUM GENISTÆ. See OROBANCHE.

RAPUNCULUS. A plant fo called from the refemblance of its root to that of rapum; in other respects, it refembles the campanula. It is not noted for its medical virtues. It is also a name for the cervicaria; a species of rapuntium; for several species of campanula, and vale-

RAPUNTIUM. It is a plant which much refembles the campanula in its external appearance. One species of it bears the flower which is known by the name of cardinalis flos, CARDINAL FLOWER; but they are not remarkable for their medicinal qualities. It is a name also for fmall rampions, and a species of rapunculus. See CER-VICARIA.

RASPATORIUM, from rado, to ferape. RASPA-

TORY. A SURGEON'S RASP.

RAUCEDO, vel RAUCITAS. An HOARSENESS. It is a diminution of the voice, fometimes attended with a preternatural afperity or roughness thereof: the paris affected are, the aspera arteria, and particularly the la-rynx. Dr. Cullen observes, that it is generally a symptom of catarrh, but sometimes it is a species of PARAPHONIA, which fee.

Its causes are, a fort of catarrh, which arises from too great acrimony and viscidity of the lymph: in which case a fmall quantity of horfe-radish juice, mixed with honey, may be swallowed every morning, with a draught of new milk whey. See RAPHANUS RUSTICANUS. 2. A copious effusion of thin lymph upon the larynx and parts adjacent; and when from this cause, relief may be expected from the pulv. e. trag. e. amylo, terr. Japon. &c. 3. In the small-pox, pustules in the membranes of the larynx, &c. produce an boar fenels, which is relieved by the use of attenuants and lubricants, which affift the variolous matter in its paffage through the fkin. 4. A tumor, or inflam-mation, in or about the larynx: to remove the complaint from this cause, let vapours of warm water be received into the throat, or frequently use the following hoarfenefs, when it depends, as it often does, on the in- gargle: R decoct. fol. vel rad. althree Ib i. fp. ammonize compositi, gt. 60 m. 5. A dryness about the small basis, Mr. Pott advises to remove them as speedily larynx and the muscles subservient to speech. Here as possible, for if they continue, they certainly prove satala nitrous and acid attenuants, mixed with diluents, are very ufeful. 6. The spittle becoming thick or aerid, hence a viscid tough matter flicks to, and renders the surface of the larynx, &c. unequal, and confequently the voice bearle; to remove which cause, things that attenuate and dilute the lymph, that render the spittle thin, fost, and copious, and empty the glands, will be the proper means; fuch are emollients and expectorants.

In many inflances the most speedy relief is obtained from continuing the feet in warm water, for the space of

half an hour, about bed-time.

REALGAR, called also ARLADA, or ARLADAS. A composition of sulphur, orpiment, or yellow arsenic, and unquenched lime. It is also a name for the arsenicum Mr. Edwards, in his Elements of Foshlogy, places the realgar, or fandaracha, amongst the cryptome-tallines, as a species of arsenic flos. It is of a red colour always gloffy, but not always transparent. It is some-

times called arfenicum rubrum.

REBIS. The alvine fordes are fo called by fome of the more ancient authors, it also denotes the hair of choleric and plethoric men. Amongst gold refiners it means the femen aurificum, from whence gold is generated; and is the gold, and its own quickfilver.—It is called by the barbarous name rebis, because it is at first composed of two ingredients, which, at length by long coction becomes one in species and number; by some of the more modern authors, the mercurius duplicatus philofopbiens, confifting of folar fulphur and mercury, is called rebis. It is also called Azor it Abesst.

RECEPTACULUM CHYLL. The RECEPTACLE of the CHYLE. It is also called receptaculum Pecqueti, because Pecquet first demonstrated it, diversorium, sacculus chyliferus. Eustachius and Ascilius were in some degree acquainted with it. It lies on the right fide of the aorta, at the union of the last vertebra of the back with the first of the loins. It is a fort of membranous vehicle, of various fhapes in human fubjects. Sometimes it furrounds the aorta like a collar. Its coats are very thin. The upper portion is contracted between the aorta and the the vena azygos, and forms a particular canal which runs up through the thorax, and is called the Ductus Tho-

up through the thorax, and is called the Ductus Thoraxeleus, which fee.

RECIPE. Take. It is usually placed at the beginning of prescriptions, and is generally wrote thus, R, or with the character for tin 2.

RECTIFICATIO. See Depuratio.

RECTOR SPIRITUS. See Spiritus.

RECTUM INTESTINUM, called also apeuthysminos longanon or longana archos. The last of the large intestines, called the return, or the STRAIT GUT, is every where covered by longitudinal muscular fibres, and hath strong circular ones for expelling the faces. It is not furnished with bands as the colon is, nor is it covered with the peritoneum, as are the other inteffines. At the lower extremity of the restum are certain cryptre, which are subpoled to be the feat of worms, and certain valcular ridges between the cryptæ where the piles are fituated, which are external or internal, according to their fituation. This gut is a continuation of the last convolution of the colon, which having passed below the last vertebra of the loins to the infide of the os facrum, is bent backward in the concave fide, to which it is connected, and having reached the os coccygis, it runs in the direction thereof, and bends a little forward, terminating beyond the extremity of the os coccygis. The inner coat is furnished with many glands, which feparate a mucus to keep it supple. The arteries are from the hamorrhoidalis interna, the laft branch of the mesenterica inferior, which communicate with the hypogastrica, and particularly with the hæmorrhoidalis externa. The veins are branches from the
mesaraica minor, or hæmorrhoidalis interna, which
communicate with the hypogastrica. The nerves are from the plexus mesentericus inferior, and the plexus hy-

pogaftricus.

Sometimes, there are hard, feirrhous lumps, without pain, feated at the bottom of the reclum or near the anus; these are thrust out at very effort to void the stool, and then indeed is perceived a degree of uneafiness, but at no other time, except after handling them. If they have a

as polible, for if they continue, they certainly prove fatal-In the inflances that cannot be removed, the beginning lymptoms do not give any light into their nature : the first symptom is a feel as if the patient wanted to void a large ftool; on making the attempt, nothing is voided a this uniavailing needing is frequently returning; at length he tries a glyfter, but when the pipe is about to be introduced into the gut, it is obstructed by a lump there; thus he is alarmed. The judicious furgeon, on introducing a finger, foon perceives the nature of the cafe, but he only offers a palliative remedy.

Another difease of this gut, is a fungous or general re-laxed state of its whole substance. When it is ex-truded through the anus, it is bound by the sphincher muscle, and puts on the appearance of a fungus with a narrow basis; the mere fungus is uniform, and may be got round; it is fost to the touch, yet from the irritation of the part this may be as painful as a cancerous one. It is, therefore, proper juitly to diftinguish them, as the first may be cured, but the latter cannot. The cancerous fungus within the reflum is feldom uniform, but generally unequal, fpreading from a large basis, and discharges an

offensive ichor or gleet.

RECTUS. See PYRAMIDALIS NASI; it is also the name of feveral mufcles as follow; they are so called from

the rectilinear direction of their fibres.

RECTUS ABDOMINIS. The recti muscles of the belly arise from the os pubis, are inserted into the sternum, and are expanded upon the cartilages of the fifth, fixth, feventh, and sometimes of the eighth ribs. In their course they are divided into four or five portions, by three or four tendinous interfections. They lay on the fore-part of the belly, immediately under the integuments, betwixt the linea alba and the lineæ femilunares. The veffels which pafs underneath the upper parts are the mammary artery defeending, and its vein according; those of the lower part are the epigastric artery ascending, and its vein defeending.

from the cartilaginous tip of the acetabulum, and is inferted into the upper part of the patella.

— DEPRIMENS OCULI.

See DEPRESSOR OCULI.

EXTERNUS OCULI. Sec ABDUCTOR OCULI.

- INTERNUS. See GRACILIS.

-INTERNUS MAJOR. It lies before the rectus internus minor. It rifes commonly by fo many ten-dons from the transverse processes of the fifth, fourth, third, and fecond cervical vertebrae, and is inferted in-to the cunciform process of the os occipitis, and bends the neck forward. Winslow calls it, rectus anticus

-Internus Minor, Annuentes. Winflow calls it rectus anticus brevis. It is aifo named, renuans mufculus, and rifes from the root of the transverse process of the atlas, and is inferted into the cuneiform process of the os occipitis, just behind the groove where the la-teral finus forms the beginning of the internal jugu-lar. This muscle gives the head a lateral jerk upon the atlas.

- INTERNUS OCULI. MUSCULUS INTERIOR. IC . rifes from the bottom of the focket near the hole by which the optic nerve passes into the orbit, passes on the fide of the globe next the nofe, and is inferted into the felerotica. It draws the eye towards the nofe. See An-DUCTOR OCULI.

- LATERALIS. It rifes from the transverse procels of the atlas, and is inferted into the os occipitis and os temporis, near the maftoid process. It bends the head to one fide.

- MAJOR. It rifes from the upper part of the fpinal process of the dentata; it runs upwards and out-wards, and is inferted near where the os occipitis is joined to the os temporis, serving to bring the head backwards. It is also partly a rotator of the head, called also capitis positions.

MINOR. This rifes from the knob which answers

called also capitis rectus; obliquus minor

RECTUS SUPERIOR OCULI. See ELEVATOR OCULI. RECURRENS. The RECURRENT NERVE. Sec VAGUM.

REDUC. vel REDUX. A FLUX. It is a powder by which calcined metals, or minerals, are reduced to a reguline form. Fluxes are generally either of the vitre-ous, or of the faline kind; by the vitreous is meant, all those that are of themselves, or that readily assume a glossy form in the fire; the chief of which are the glass of lead, glafs of antimony, and borax; by the faline is meant all those that are composed of falt, whether of nitre, or tartar, or the like. There are fluxes of a yet cheaper kind; such are dried wine-lees, dried cow-dung, dried horfe-dung, dried river-mud; fuller's-earth, iron filings, pot-ash, &c. There are a variety of compound-fluxes, some of which are better adapted for some ores than others are, and, indeed, almost every operator hath his favourite kind. The common black flux, see in the article CALCINATIO.

REFECTIVA. See CARDIACA. REFRIGERATORIUM. A REFRIGERATORY. It is the veffel filled with water, through which the worm passes in distillations: its use is, to condense the vapours as they pais through the worm.

REGALIS REGIS.

See NITRUM.

REGIA AQUA. See JUGLANS.

REGIMEN. The REGIMEN, or the regulation of the diet, with a view to preserve, or to restore health. In chemistry it is the regulation of fires. REGINA PRATI. See ULMARIA.

REGIONALIS MORBUS. An epidemical difeafe.
REGISTERES. REGISTERS. They are openings in different parts of furnaces, which are to be flut occafionally with stoppers or burnt clay. By means of these registers the fire may be governed as we please, for their heat is increased or diminished by the cloting, or opening of these holes. These holes should be from two to four inches wide, if the diameter of the furnace is a foot within.

REGULIS BARBADENSIS vel JAMAICENSIS. See PALMA NOBILIS.

REGULUS. Thus the chemists have called metallic matters when feparated from other fubstances by fusion. The alchemists first invented this name, because they expected to find gold in the metal. At prefent the word is confined to the metallic part of certain femi-metals which have no proper name, as the regulus of antimony, the regulus of cobalt, the regulus of arfenic, &c. It is also a name given to the basilisk. See Basiliscus.

RELAXATIO. See PROCIDENTIA UTERI; and

ATONIA

REMITTENTES. REMITTING DISEASES. They are when a diftemper abates, but does not go quite off before it returns again. This most frequently happens in those fevers which only go near to a distinct intermission, without completely effecting it.

REMORA ARATRI. See Anonis.

RENALES ARTERIÆ, also called arteriæ emulgentes, are generally two in number, and go out laterally from the lower defcending aorta, immediately under the mefenterica fuperior, one to the right hand, the other to the left. The right is fituated more backward, and is longer than the left, because of the vena cava which lies on the right fide, between the aorta and the kidney; they run commonly without division, and almost horizontally to the kidneys, into the depressions of which they enter by feveral branches, which form arches in the inner fub-ftance of the vifcera. From these arches many small branches go out toward the circumference, or furface of the kidneys. Sometimes two arteries go into one kidney. Generally the right renal artery passes behind the vena cava, and the renal vein in the other fide; and the left artery first behind, and then before the vein. Sometimes they fend branches to the glandulæ renales, membrana adipofa of the kidneys, and even to the diaphragm.

RENALES GLANDULE. See CAPSULE ATRA-

BILARIÆ.

- VENE, also called emulgentes vene. These spring

fwers to the fpinal process of the atlas, and passes thence, from the inserior vena cava, when it arrives at the kidato the head. It can only move the head upon the atlas neys, into which these branches are sent. These are the largest veins that go from the vena cava, betwixt the liver and the bifurcation. The right emulgent is the shortest, because of the situation of the kidney; the left is longer, because it hath to cross the trunk of the aorta. Usually the left emulgent vein furnishes the left spermatic vein.

RENELIUS. SNORTING, SNORING. RENES. The KIDNEYS. They are two oblong flattened bodies, extending from the eleventh and twelfth ribs, to the fourth lumbar vertebra. The right kidney lies under the great lobe of the liver, and is lower than the left, which is fituated under the spleen. The kidneys are shaped like a large bean; their circumference is concave on the fide next the vertebræ, and convex on the opposite side. The aorta descendens, and the vena cava inferior, lie between the kidneys, pretty close to the bodies of the vertebræ, and each of them commonly fend off one capital branch, fometimes two or three, which enter into the finuous part of the kidney, and dividing into two or three branches before it enters, ramifies through the whole. With these vessels the nerves enter. The kiawhole. With these vertices the nerves enter. The kinds are covered on one fide by the peritoneum, and the whole substance is invested by a capsula, composed of two lamine connected together by a cellular substance. The external lamina is thin and smooth, and makes the kidacy uniform. In children we may observe this convex substance is divided into little lobules, and we some times find it so in adults. There are two substances observable in the kidney the external or cortical, and the fervable in the hidney, the external or cortical, and the internal, which is called tubular or mammillary, which laft is made up of a number of pyramidal portions, about twelve in each kidney, whose points are received into the pelvis, so that the cortical part not only lays round the outer surface of the kidney, but throws processes into the interstices. The certical part is quite vascular; in miners of the cortical part is quite vascular; and miners of the certical part is quite vasculars. nute injections are observed certain appendages, called by fome corpora lobofa, but which are natural crypties, or cells, where the fmall arteries feem to be expanded. Ruysch says they are arteries coiled up in a little space. The veins have none of these cryptæ; whence it is plain that they are not extravasations; besides, they are uniform, and only in the cortical part. Each mammilia lies in a kind of membranous calix, or infundibulum, which opens into a common cavity, called the pelvis, which is membranous like the infundibula, of which it is a continuation. After the infundibula have contracted into a conical form round the apices of the mammillæ, each of them forms a fmall fhort tube, which uniting at different diffances along the bottom of the finus of the kidney, form three large tubes, which go out from the finus in an ob-lique direction from above downwards, and, immediately

after, unite into one trunk, which is called

The URETER, this runs down obliquely, with a small degree of inflexion, to the lateral parts of the inner-side of the os facrum, and paffing between the rectum and bladder, it terminates in the latter in its inferior part, near the veficulæ feminales; they perforate each coat diffinctly in a flanting manner, fo that their oblique infertion answers the same end as a valve. The internal ligamentary membrane of the ureter does not end with their infertion into the bladder, but is continued toward the proftate gland, where it feems to be inferted; this li-gament keeps the lower part of the bladder from firetch-ing, and keeps the ureters fixed. The fituation of the ureter, with respect to the renal artery and vein, is thus: the artery is in the upper part of the finus of the kidney, and partly before the vein; the vein is about the middle and between the artery and the wester, which is in the lower part, fomething behind the vein, and partly furrounded by a branch of the artery, whence appears the impossibility of nephrotomy, and that the operation, however represented, is no other than opening an abscess in the loin, through which opening the stone passes. See NEPHROTOMIA.

RENES SUCCENTURIATI. See CAPSUL & ATRABI-

RENISUS ANTITYPUS. RESISTANCE. It properly belongs to hardness, which resists contact, hence is it always connected with that which is hard. The renitentes corporis dispesitiones, are the resisting powers or dispositions of the body, which do not easily permit a passage to the morbific miasma, or contagion; and are with difficulty affected or injured. In these senses, Galen, and Linden make use of the word.

RESINA ANIME. See ANIME FLAVA. This re-

RENOVATIO. RENOVATION. In chemistry it is the restoration of a mineral body to a perfect state, from one which is imperfect.

RENUANS MUSCULUS. A name for the reflus

anticus brevis. See RECTUS INTERNUS MINOR.

REPELLENTIA. REPELLENT MEDICINES. these are meant such as prevent such an assux of a sluid to any part as would raife it into a tumor. Whatever other medicines may occasionally produce the effects of repellents, those only are properly of this tribe, which cool, dry, aftringe, and strengthen the parts, and enable them to refift the afflux of fuch matter as is lodged there.

REPULSIO. REPULSION. The cause which opposes itself to absolute attraction bath been acknowledged by all who were converfant in physics, with respect to the celeftial bodies; and it hath been termed repulsion, that is, a power as real as attraction, which repels bodies after they have approached each other to a certain point, and prevents their uniting together. This repulsion, though a second cause, and subject to the laws of attraction, is properly inherent in matter; this properly acts conjointly with attraction in the elements of bodies, and in all the operations of chemistry. It appears that it is from these two essects reunited, and from their different degrees of action, that the variety results, which is observed in the hardness and density of bodies. Many have rejected this repulsion, which fir Isaac Newton had allowed in sublument things. nary things; but if we just glance on many of the opera-tions of chemistry, it is impossible to help admitting a re-

tropulfive property in bodies.

RERATOPHITON ARBOREUM NIGRUM. See

CORALLIUM NIGRUM.

RES NATURALES. The NATURALS. According to Boerhaave, these are life, the cause of life, and its effects. Thefe, he fays, remain in some degree, however

difordered a person may be.

RESEDA. See ERUCA SYLVESTRIS.

RESINÆ. RESINS. All forts of exudations, from evergreens, as turpentine, tar, &c. are in a general accepta-tion included under the name of refin. Effential oils, indurated by age, or by acids, are called refins. When the effential oil of the exudations from ever-green trees is exhaled, the remaining mass is called refin As refin confifts of oil and acid, it is artificially produced by the admixture of vitriolic acid and spirit of wine, or the spirit of turpentine. The refina alba of the Pharm. Edinb. Coll. is from the pinus sylvestris, and the pinus abies. The refina slava is also from the same.

Refins in general diffolve in sp. vin. T. It is chiefly by this means that they are extracted from the subjects in which they are contained. They also diffolve in expressed oils, and in effential ones; and may be united with water by means of the fame intermedia which render fluid oils miscible with water. In a heat less than that of boiling water, they melt into an oily fluid, and in this state they may be incorporated one with another. In their resolution

by fire, in close veffels, they yield a manifest acid, and a large quantity of empyreumatic oil.

The acrid refins exhibited by themselves tenaciously adhere to the coats of the intestines; by their stimulating power they irritate and inflame them, and thus produce fpafms, inflammations, &c. These inconveniences are remedied by alcaline falts, by foap, and in a good meafure by fugar, if they are triturated with the results with results the patient takes it. Some rub effential oils with results are the patient takes it. to correct them, but the oil is foon separated therefrom in the stomach, and the refin is rendered more active, and fo becomes more virulent, or, at leaft, the fame effects being produced in a degree by the oil which is obtained from the refin, the refin will act with more advantage.

Refins act principally by irritating the ftomach and bowels, and by attenuating the fluids; if the irritation is quick they prove emetic; if not fo fudden, they pass off by ftool. They operate more violently in robust conflitutions than on those of a contrary habit; the vessels of the former being more tense, so less capable of bearing irrita-tion. The action of these medicines is extended beyond the prime vize, as is evident from the children being

mains after the diffillation of oil of turpentine, and is the common rolin of the thops, it is chiefly made use of in external application. It forms part of the composition of several platters, and gives the name of one ointment, unguentum refine flave. See Basticon Unguen-TUM. Lewis fays in tafte it is confiderably bitter, and fometimes given as an internal corroborant, in preference to the turpentines themselves, as being divested of their stimulating oils. Maderia Medica, p. 553.

RESINA TOSTA, FRICTA, NIGRA. See COLO-

PHONIA.

RESPIRATIO. BREATHING. It is the action of taking in and discharging the air from the lungs. As foon as the child is born, the air rufhes into its lungs and diftends them, and as heat rarefies the air, its force is fo increased, that by expanding the lungs the whole breast is diffended: thus the rarefying air, diffending the lungs every way by its natural fpring, increased by heat, may be considered as the first mover in the action of respiration. By this first distension of the lungs it happens that the blood which had hitherto passed by the foramen ovale, whilst the sectus continued in the womb, is now obliged to take a different way, and pass by the pulmonary artery and veins; and the former passage, by this means, is rendered useless. This makes it necessary that respiration be continued for ever after during life.

As the fpring of the air is increased by the heat of the lungs, so the same air, when rarefied by the heat it meets with, becomes lighter than the external air, is made to reafcend by the contraction of the diaphragm and intercoftal muscles, which are antagonist powers to the dilating one

of rarefied air.

After the first expiration, a portion of the inspired air remains, which is rarefied by the heat to which it is fub-jected; thus the external or atmospherical air again defeends into the lungs; and as in the first instance of respiration the fame circumstances follow, so inspiration and expiration continue to succeed, until with the last expiration death is ushered in.

Respiration is partly voluntary and partly involuntary; but, as we determine this or the other muscle to action by the influence which our wills have on them, fo we exert a fimilar power on the organs of respiration by the

fame means.

Some affert that the elevation of the breaft by means of the intercostal muscles is necessary to inspiration; but perhaps a due attention to these muscles will discover to us that their action is only during expiration, and if so their

theory falls to nothing.

On particular occasions, as in a difficulty of breathing, other powers are affistant in respiration besides the air, the intercostal muscles, and the diaphragm: and during sleep, the air and the diaphragm are alone, or very nearly the whole that are assistance.

the whole, that are active herein.

The uses of respiration are many, some of which are as follow: by respiration air is duly received into the lungs, in order to the exerting of our voices: by expiration the defect of perspiration through the skin is in a good degree regulated; for much of the perspirable mat-ter is carried off from the body with the air which is exter is carried off from the body with the air which is expired; and in cold weather, &c. when the difcharge is leffened through the fkin, there is a proportionable increase of the fame from the lungs. Again, as the pulse, fo the action of the lungs is accelerated by heat; whence an advantage of infpiration is, the cooling of the blood by the application of cold to that portion of it which is passing through the lungs, as well as by expiration, to carry off a portion of redundant heat along with the matter perspired. Lastly, by the action of the parts subservict to respiration, the progress of the aliment through the stomach, &c. as also of the faces through the intestines, are facilitated and hastened. are facilitated and haftened.

See Haller's Physiology, lect. 10. Hoadley on Respiration. Shebbeare's Theory and Practice of Physic.
RESTA BOVIS. REST-HARROW, See ANONIS.
RESUMPTIVA. RESTORATIVES. They differ not much from agglutinant corroboratives, and their manner of operation in the fame way may be accounted for, only that refloratives are more adhesive and subtil, whereby they enter into the nourishment of the remotest

by this name. See CARDIACA.

RETE MALPIGHI. See PULMONES.

MIRABILE. It is the name of a congeries of blood-verfiels in the brain, called also DICTYOIDES.

- MUCOSUM The true skin on its whole furface is covered with two lamellæ, one is the rete mucofum, the other is the cuticula. The rete mucofum is the principal feat of colour in man; in Europeans it is transparent, in mulattoes it is brown, and in negroes it is black. One use of the rete mucosum is, to keep the papillæ moift, which would otherwise grow rough and unfit for sensation. The rete mucosum is also called corpus mucosum, and corpus reticulare. Mr. Sheldon thinks that the colour of the rete mucosum depends on the blood, which he fays is darker in the Africans than in the Europeans: he was informed by a physician, on whose veracity he had the greatest dependence, that the bile and semen of the Africans are darker than in Europeans. This observation contributes in favour of Mr. Sheldon's opinion. Whereever the cuticle thickens, the rese mucosum thickens in proportion; as is exemplified by those laminæ of integuments in the hand and feet of Africans. It is also observed that in the form of circumstances. ferved, that in the foctus of nine months, the rete mucofum is yellower than the cuticle. In Africans the rete mucofum is more cafily separated from the cuticle than in Eu-

RETICULUM, the fecond stomach of a ruminating

imal. See Abomasum; also the omentum.
RETIFORMIS, called also amphiblestroides is an epithet applicable to any net-like appearance, and is used to express the coat of the eye, called tunica retiformis, encircling the vitreous humour according to Galen. It is the choroides, and forms the plexus choroides, called also plexus reticularis vel retiformis. See CHOROIDES, and PLEXUS CHOROIDES.

RETINA. Thus the expansion of the optic nerve on the interpretation of the optic nerve on the interpretation.

the inner furface of the eye is called. Though this expansion is supposed to be a production of the medullary substance of the optic nerve, which is spread like a membrane, and from its refemblance to a net, is called retina; yet by laying open the coats of the nerve, its medullary fubitance cannot be clearly traced, as continuing on to form it. This inner coat of the eye is most probably the feat of vision, notwithstanding the objections lately made to this opinion.

RETRAHENS AURICULAM. See ABDUCTOR

AURIS

RETROVERSIO UTERI. The RETROVERSION of the UTERUS. This diforder occurs when the womb fo falls, from its natural polition, that the urinary bladder is either prefied by it, or drawn from its usual place, and the fundus uteri presses upon the intestinum rectum; or it may be that the fundus uteri is thrown upon the os pubis, and its orifice towards the rectum. Most of these cases happen in the early stages of pregnancy, seldom so late as the fourth month; they occasion first a difficulty, then by degrees a suppression of urine, and soon after, a suppression of the intestinal discharge. For the most part the following treatment hath been successful. First, the urine is to be drawn of the most of the most of the results. the urine is to be drawn off by means of the catheter, then a stimulating clyster must be injected, that the in-testines may be duly evacuated; these done, place the woman on her knees and elbows, with her head downwards, and by introducing one hand up the vagina, endeavour to draw it forwards, then with two fingers in the anus endeavour to push up the fundus uteri. See an account of some instances of this nature in the Lond. Med. Obf. and Inq. vol. iv. p. 388, &c. and fee Dr. Hunter's Tables of the Gravid Uterus. Denman on the Retrover-fion of the Uterus. White's Surgery, p. 163.

parts. All under this class are rather nutrimental than called it barbaricum, because it was brought to Barbaria, medicinal, and repair the wastes of the constitution more than alter and rectify its disorders. Cordials are known fent to other countries. a country lying on the Sinus Barbaricus, whence it was

Rhubarb is a plant of the dock kind. It is the rheum palmatum, or rheum Chinenfe, foliis palmatis acuminatis feabrinfeulis, foliorum lacinis oblongis acutiufeulis, Linn. The leaves are fomewhat heave-shaped, acuminated, and slightly hairy. The root is the only part in use; it is brought from China, and from Siberia, by way of Russia. As good rbubarb plants have been raised in our physic gardens as any that are met with abroad; they grow with

vigour in open ground.

Two forts of the roots are met with in our flops, viz. one from Turkey, or perhaps much of this is from Ruf-fia; for in the Ruffian territorites the finest rhubarb grows in large quantities. The Turkey rhubarb is generally in flattish pieces, more compact and hard than the Ruf-fian; that which grows in Tartary and Siberia is in round lumps, let's weighty than the Chinese, but of a finer grain, and always perforated; the reason of this difference in weight and form, is owing to the different methods of curing them. In China they cut their roubard into slices, and press it close before drying; in Russia they hang it up to dry without cutting it into flices or preffing it. The Chinese pieces are externally of a yellow colour, and within there is a mixture of bright reddift ftreaks with the yellow. The second fort is brought from the East Indies; it is in longish pieces, harder, heavier, and more compact than that from Turkey. Dr. Aliton thinks this as good as the Turkey fort. The first forts must be kept dry, or they grow mouldy, or are de-ftroyed by worms. The Indian rbubarb is not so subject to these inconveniences, and the finer pieces, after being rubbed with the powder of Turkey rbubarb, are fold

Whether rhubarh is of the Turkey or of the East India kind, chuse that which is of a lively colour when cut, that is firm and folid, but not hard, that is easily pow-dered, and when powdered is of a bright yellow colour; that on being chewed imparts to the spittle the same colour, but that does not grow flimy whilft in the mouth; to the tafte it should be sub-acrid, bitterish, and styptic,

and its fmell lightly aromatic.

Rhubarb gives out its purgative quality most freely to water; after digefting it with water it becomes inactive, but after feveral digeftions with fpirit of wine it retains fome of its purgative virtue. The powder purges the most; the next to it is an infusion in water; the spirituous tincture purges the leaft, but hath more of the aroma and of the aftringency of this root. The watery infusion, when reduced to an extract, hath its virtue much diminished; the spirituous loses less, so that 3 fs. of it will operate moderately, but not more so than an equal quantity of the powder.

The London College directs three tinctures, two of which are spirituous, one vinous, and are thus made.

TINCTURA RHABARBARI. Tincture of Rhubarb.

Take of rhubarb fliced, two ounces; fmaller cardamom feeds, husked and bruised, half an ounce; fasffron, two drams; proof spirit of wine, two pints: digest for eight days and ftrain.

TINCTURA RHABARBARI COMPOSITA. Compound Tineture of Rhubarb.

Take of rhubarb fliced, two ounces; ginger, powdered, faffron, of each two drams; liquorice root bruifed, half an ounce; diffilled water, one pint; proof spirit of wine, twelve ounces by measure. Digest for sourceen days and

### VINUM RHABARBARI. Wine of Rhubarb.

Take of rhubarb fliced, two ounces and an half; fmaller cardamom feeds, bruifed and hufked, half an ounce; faffron, two drams; Spanish white wine, two pints; proof spirit of wine, eight ounces by measure. Digest for ten days, and strain. Pharm. Lond. 1788.

These are intended for stomachies and strengtheners, RHABARBARUM. RHUBARB, also called rheum; lapathum Orientale; lapathum Chiense. The Greeks called it rhabarbarum, from its growing on the banks of the river Rha, i. e. Wolga, in the barbarous country of Russia. But the latter Greeks are faid to have

R Rad. rhab. incif. 3 i. aq. bullient. 16 i. infund. per noct. & colaturæ adde aq. cinnam. fp. 3 i. When rbubarb is given as a purge, this is one of the best prepara-

Whether rbubarb is taken in powder or infused in wa-ter, if the dose is mixed with a dish of cossee, the patient will rarely object to its tafte.

The practice of toatting rhubarb is attended with no real advantage; but if it is not removed from the fire as foon as it is fit for powdering, it will be injured. If, inflead of toufting it, a fmall quantity of any thing aftringent is added, the end of toufting would be better answered.

Rhubarb is a mild cathartic, and also a mild astringent; it strengthens the intestines, leaves the belly costive, and is hence preferred in diarrheas and dysenteries. In the latter of which, it is considered though by some as differviceable from its astringent property. It is often given more with a view to its strengthening than to its purgative quality; with respect to its use in costiveness, given in the common way, it is of no use, but rather hurtful, from its producing opposite effects to its purgative power, when that operation is over. If it can be serviceable in this case, it ought to be only chewed, less of its aftringent and more of its purgative power is obtained by this mode. That which is bright, of a light texture, most fragrant, and found, contains lefs refin, in proportion to its earthy and faline parts, than that which is heavy, tenacious and fetid; and therefore we find it milder in its operation, more grateful to the ftomach, and better to answer the intention of an allringent, a diurette or an alterant: and the other more to nauseate the stomach, and terant: and the other more to nauleate the flomach, and to operate more flrongly as a purge in the first passages. Rhubarb changes the urine to a yellow colour before it operates as a purge: it is a good substitute for aloes when they are productive of the piles, which are feldom occasioned by rhubarb; at the same time, as an attenuant, it is very little inserior to aloes. In acute severs, when there is apprehension of producing a diartheea by purging medicines, rhubarb is safe. In diartheeas and dysenteries, rhubarb is doubly useful; 1st, by carrying off the peccant matter; 2dly, by strengthenby carrying off the peccant matter; 2dly, by strengthening the bowels against a further assume as a further assume that the cellency in rhubarb is, its evacuating visited bile when lodged in the bile-ducts; in this case, next to aloes, it is the best amongst purging medicines; and it hath this advantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. that it may be given where instantage over aloes, viz. In grofs habits, rbubarb is an ufeful affiftant to fecure the efficacy of the bark, if joined with it. See Lewis's Mat. Med. Neumann's Chem. Works.

Other fubstances in the vegetable world receive also

this name, viz.

See MECHOACHANA RHABARBARUM ALBUM. ALBA.

\_\_ DIASCORIDIS. See RHAPONTICUM.

- MONACHORUM. See LAPATHUM HORTENSE. RHABDOIDES, also rabdoides, from jactes, a strait twig, and sides, form. A name for the fagittal future. RHACHIS. The SPINE of the BACK.

RHACHISAGRA, from jazze, the spine of the back, and area, a prep. A species of gout fixed in the spine of the back,

RHACHIEI, or RHACHITE. The muscles belonging to the spine of the back. From jazzs, the spine of the back.

RHACOSIS, also detritio. Excoriation of the relaxed

RHACOSIS, also arrives. Extended of the territorium.

RHAEUM. RHUBARE.

RHAGADES, from sarrous, to break off. Chaps, clefts, or fissures in the skin. If seated in the the anus, and recent, the patient must sit still, and sit over the steam of warm water. The cerat. lapidis calaminaris may also be applied. If the lips of these sites are callous, cut them, or otherwise treat them so that they may become new ulcerations. See Turner's, Wiseman's, and Heister's Surgery. Rhagadia may be caused by extension, contraction, or acrimony; and are amongst by extension, contraction, or acrimony; and are amongst equivocal signs or productions of the first infection of the pox. They are seated about the anus and various parts of the pudendum muliebre, corners of the mouth, nottrils,

The Edinburgh college directs an infusion in water as leve-lids, nipples, &c. These chaps iffue forth formetimes a thin, tharp ichor, which is either venereal, or of other kinds of actimony; and at times are very painful. If they are fresh contracted, they are not difficult to remove, but if their lips are deep, callous, and inflamed, dissiculty increases. See a Treatife on the Veneral Disease, by N. D. Falk, M. D. edit. 2. 1774.

Different from the rhagadia, in appearance, are the chaps in the palms of the hands, and foles of the feet; both proceed from the acrimony of the virus, fearching as it were for the cuticula, by which it is fhrunk

together.

RHAMNUS, also called spina cervina, hyppophas rhamnus catharticus, spina solutiva, spina infectoria, cervi spina. Buckthorn, and purging thorn. It is the rhamnus catharticus, or rhamnus catharticus, foliis, ovatis, fpinis terminalibus, floribus, quadrifidis dioicis, baccis ni gris, Linn. It is a prickly bufh, or a low tree, common in hedges, having pointed leaves; in June it produces fmall green flowers, and in the beginning of October it ripens into black berries, which contain a dark green into black berries, which contain a dark green juice, with four feeds in each.

It is usual to find these berries mixed when brought to the markets, with the berries of the black elder, and also of the dog-berry tree; but they are thus diftinguished; the juice of the buckthorn berries is green; that of the others not fo, the buckthorn berry hath four feeds, that of the

elder hath but two, and the dog-berry hath but one.

Buckthorn berries have a faint unpleafant fmell, and a bitterish, acrid, nauscous taste; they operate briskly by stool, and have frequently been employed as hydragogues, though at the same time they occasion dryness in the mouth and throat, with thirst, and griping in the bowels; but if plenty of warm small liquor is drank during the operation, these effects are not so much observed; they are

confidered as draftic purgatives.

The London College order a fyrup to be made, under the title of SYRUPUS SPINE CERVINE. Syrup of buckthorn, in the following manner. Take of the juice of the berries of bucktbern, ripe, and fresh gathered, one gallon; ginger bruised, one ounce; pimento in powder, one ounce and an half; sugar, seven pounds. Let the juice stand for some days, that the seces may subside, then strain; in a pint of which, macerate the ginger and pimento for sour hours, and strain. Boil down the remaining juice to three pints: then add that part in which the ginger and pimento had been macerated, and put to the whole, the fugar to form the fyrup. Pharm Lond. 1788. From one to two ounces are given for a dofe, but it is rarely used, on account of its nauseous tafte and churlish operation.

Those who sell the juice often mix it with water. See Lewis's Mat. Med. Neumann's Chem. Works. Cullen's

Mat. Med.

It is also a name for the paliurus byppophas, tujuba, al-

nus nigra, and frangula.

RHAPONTICUM. The TRUE RHAPONTIC. It is also called rbean, rheum; rheum ponticum; rha verum anti-quorum; rheum Dioscoridis; rhaponticum Alpini; rhabar-barum Dioscoridis; rhab. forte Dioscoridis; Enolisti RHUBARB. It is, as the true rhubarb, a fpecies of dock, with fmooth, roundish leaves, somewhat channelled pedicles: itgrows wild on the mountains of Thrace, whence Alpinus brought it into Europe about the year 1610. It bears the hardest winters in our climate. The roots are often mixed with those of the true rhubarb, but are detected by their mucilaginous tafte when chewed, and by their not tinging the faliya of so bright a yellow as the true rbubarb does; when the rhapontic is cut through, it appears re-gularly marbled in a radiated manner; it is dufky on its furface, and of a loofe fpongy texture, more aftringent than the modern true rhubarb, and lefs purgative; as a purge, two or three drams are required, but it is a better fromachic than the true rhubarb. See Raii Hift. Tournefort's Mat. Med.

RHAPONTICUM VULGARE, called also rhaponticum folio heleni incano, centaurium majus, centaurium magnum, GREAT CENTAURY. COMMON RHAPONTIC. It is the centaurea centaurium, Linn. It is a large plant, with leaves, composed of oblong, serrated segments, set in pairs on a middle rib, edged in the intermediate spaces with a serrated margin; the stalk divides towards the upper part into

lowed by down, inclosing the feeds. It is perennial, a native of the fouthern parts of Europe, and raifed with us in gardens. The root is of a dark black colour on the out-fide, it is internally reddiff, and yields, when fresh, a juice of a deep red. It hath a slight smell, which is not difagreeable, and in chewing it difcovers a vifcous fweet-nefs, and roughnefs, with fome degree of acrimony. It is reckoned to be an aperient and corroborant, and is supposed to be particularly useful in alvine fluxes. It is very much inferior to the true rhapontic. See Raii Hift. Tournefort's Mat. Med.

RHENCHOS. SNORING, also RHOCHMOS RONis found like that of the cerchnes, but greater and more manifest. A flertor is that found which is supposed to be made betwist the palate and noftrils, by persons afleep: ecrebon, or cerebnos, is that bubbling noise which is made in respiration, from the larynx, or the aspera arteria. These assections are owing to a weakness of nature.

RHEON, and RHEUM. Names for the rhaponticum and also the rhabarb.

RHENOPHONIA, i. e. Paraphonia refonans. PARAPHONIA.

RHEUMA, from jew to flow. A FLUX, or FLUXION. The fame as catarrh. See CA-CATARRHALE, i. c. from cold. TARRHUS.

RHEUMATICA. The RREUMATIC FEVER.
RHEUMATISMUS. The RHEUMATISM, from \$100,

to flow. It is a painful discase, affecting the intermediate spaces between the joints and muscles in different parts of the body; fometimes the vifcera are also attacked. It is with or without a fever; when a fever attends, it is called the acute, and where there is no fever, it is called the chronic rheumatifn. The ancients called all kinds of pains affecting the external parts or joints, by the common name of arthritis; but about the end of the fixteenth, or beginning of the feventeeth century, fome celebrated French phylicians called those that were fituated any where but in the joints, that is in their tendinous and nervous ligaments, by the name of rheumatism. Dr. Cullen places the acute rheumatism as a genus in the class pyrexix, and order phlegmasix. The varieties of the one species take their name from the parts affected; as, 1. Myolitis; when the pain is feated more in the mufcles that proceed from the joints. 2. Lumbago; when the muscles of the loins are the feat of the complaint. 3. Ifebias; when the muf-cles of the hips are the fuffering parts. 4. Pleurodyne and pleuritis spuria; when the muscles of the thorax are

The chronic rheumatism is considered by Dr. Cullen as generally the mode of an acute rheumatism terminating.

Whatever part of the body the rheumatism affects, or whatever species of this disorder is complained of, the cellular membrane is the immediate seat thereof.

Persons of any age may be afflicted with the rheumatism, but usually those in the prime of life, and particularly those of an active disposition, are the subjects of the acute

The causes of which are, whatever may conduce to the production of an inflammation in the part affected. The chronic rheumatism hath for its principal causes, an irri-tating acrimony in the juices secerned into the parts com-

plained of. The acute or inflammatory rheumatism is attended with a fever, pains in the limbs, which are generally in the joints, preventing their motion, and are accompanied with heat, redness, and swelling of the part. When the redness is fixed, the fever abates, though with some it continues many days, always increasing in the evening. After some days, the pain commonly quits one part and affects another, as from the knee to the foot, from thence to the hip, &c. The feet, ankles, knees, hips, loins, nape of the neck, fhoulders, fhoulder-blades, arms, elbows, and wrifts, are the usual feats of the pain. So great is the tenders of the parts of the pain to the parts of the pain. derne's of the parts affected, that the patient complains of the least motion, as when violence is used. The parts in which the pain is usually most afflictive, are, the neck, the loins, and the hips. The violence of the acute rheumatifm feldom continues above fourteen days, though a weakness

to feveral branches, which bear on their tops round, foft, and puffiness, &c. will remain long, or many months, et fealy heads, from which come forth bluish flosculi, folafter the pains are gone off, complain of a laffitude, which does not leave them till an eruption of fome kind appears on the fkin.

The chronical rheumatifm is known by the pains, and the absence of fever, by the long continuance of the pain, and by a few parts only being attacked at once. Generally there is no visible alteration in the affected part, though fometimes it is hot, red, and fwelled.

When the pain is in the hip, and extends down the thigh, it is called fciatica.

When the fymptoms of a fcorbutic habit attend these

pains, the diforder is called a fcorbatic rheumatifm.

When a violent pain is fixed on the loins, reaching fometimes to the os facrum, attended with nephritic fymptoms, it is called a rheumatic lumbage; in this case the patient is forced to sit upright, and to keep is body perpendicular. tually forward.

When the rheumatism is unattended with a sever, it

must be distinguished from the gout; when the loins are the feat of the diforder, care is required to diffinguish it from the gravel, from a stone in the kidneys, and from an inflammation in the ureter; also from an abscess in the parts about the loins. A rheumatifm in the muscles of the belly must be distinguished from the colic. One spe-cies of rheumatifm should also be distinguished from another.

Whilft the feat of the pain is in the external parts there is not great danger; but if the internal organs are the feat thereof, the danger is great. If the brain is attacked, a delirium is the confequence; if the lungs are affected, a delirum is the confequence; if the lungs are anected, a fuffocation diffurbs the patient; if the flomach of the bowels are the feat of the diforder, an inflammation there may be foon expected. If the pain continues long in any joint, its motion will be impaired for life; a wry neck hath fometimes been the confequence of preceding rheumatic pains. Dr. Rutherford, of Edinburgh, observes, that wherever a change in feated, that part never weats. wherever a rheumatifm is feated, that part never fweats, and that as foon as a fweat can be raifed in the pained part, the diforder will be conquered; it may also be obferved, that when in either the acute or chronical rhenmatism the symptoms vanish, and at the same time a free perspiration comes on, and the same is observed on the parts affected, and the urine is turbid and copious, a cure may certainly be expected.

The indications of cure will be, to diminish the fever,

when attendant, and to moderate the pain; to diffoli and eliminate the morbid matter, and to strengthen the

weak parts.

As to the acute rheumatism, an obstructed perspiration and an inflammatory diathefis conflitute the most general causes. This last concurring cause must be immediately removed; for whilst it subsists, a perspiration is not to be expected, and hence, as in other inflammatory diforders,

we are in general to proceed, and have recourse to.

BLEEDING. By this operation the hardness of the pulse is abated, and though the pains still continue, the patient is not so restless, the tension of the vessels is removed, the fever reduced, and makes room for attenuants and diluents. But, as fizy blood is no rule for bleeding in this diforder, fo very free difcharges this way do but lay a foundation for the chronic rheumatifm. When weakly people are attacked with the acute rheumatifm, much care is required before bleeding is prescribed; for, if imprudently admitted of, it produces diforders in them that are not removed but with the greatest difficulty; in fuch patients, a cooling but moderately nourishing diet should be used; whey, for instance, may be substituted instead of bleeding. Bleeding is safe and useful when the symptoms are violent and threatening, as when the fever is violent; when the wandering pains shift suddenly from the extremities to the internal parts, and affect the fides or the breath.

CLYSTERS or PURGES. A laxative clyster may be given, and, if the head is uneasy, repeat the clyster every night and morning: but, in general, a cooling purge, given every other day, or as may feem necessary, is preferable to clysters: when bleeding is required, a purge would be given after each time the blood is taken away. Clysters with nitre, for moderating the fever, are useful; but, for purging, give medicines by the mouth. If purges are duly administered, less blood may be taken away, and opiates can be more freely ufed. Indeed, in conditiutions that are rather ferous than fanguine, purg-

ing is more the proper evacuant than bleeding is.

NITRE. In the inflammatory rheamati/m this falt is peculiarly ufeful; it may be diffolved in every draught of the patient's drink, and given as freely as the flomach will admit it. In the decline of acute, and in every stage of chronical rheumatifms, it may be given to advantage in conjunction with the fal c. c. Imperial water, fo called is an agreeable liquor for common drink, and may be freely taken.

OPIUM. The pains are mostly increased in the night, whence opiates are given, but bleeding should be premifed, and purges administered as above mentioned; otherwife the advantages from opium will not equal the incon-veniences they often occasion. When this medicine is allowed and exeites a fweat, it should be given rather to moderate the pain than to cause sleepiness. Hence Dover's powder, or the compound powder of ipecacuanha, are the best.

GUATACUM. The tincture of this gum may be given from 3 ii. to 3 fs. twice a day in any thing that the patient drinks; if it passes off too freely by stool, add a few drops of the tinct. opii to each dose.

ANTIMONY. The preparations from this drug which pass off by perspiration are never to be omitted; they may

be given at proper intervals, betwixt the doles of fuch other medicines, as circumstances may require.

The BARK. In old chronic rheumatifms, when the blood

is poor, the bark is the principal remedy, if given when free from febrile symptoms. And in the acute rheumatifm, as foon as it puts on the appearance of an intermit-tent, the bark is necessary; and whether it intermits or not, as foon as plentiful fweats break out, and the urine deposits a copious sediment, the bark will shorten the difeafe.

WARM BATHS. They may be made of pure foft water, and heated fo as just to produce an agreeable fen-fation in the skin. In these the patient may be placed for a quarter of an hour, more or less, as circumstances indicate; and then being preferved from cold, he must be rubbed dry, and put between blankets, if possible to excite a peripiration.

BLISTERS, if placed on the part affected are forne-times useful. Dr. Cullen fays, that they feldom fail of fuccess if applied before the swelling comes on. In chro-

nic rbeumatifms their efficacy is more frequently useful.

After the cure, the cold bath is beneficial in preventing returns; and the strength should be confirmed by the use of bitters, aromatics, and chalybeates.

In chronical rheumatisms, mild mercurials given in fuch dofes as not to folicit the excretions too much; daily frictions, with a flannel cloth, particularly on the parts that are, or were pained; blifters on or near the fuffering part; iffues in the infide of the lower parts of the thigh; and a decoction of the rad. feneka, which is called a spe-

cific, are chiefly to be depended on. The tinct. guaiac. in large dofes, is also of fingular efficacy; also the ol. terebinth. &c.

If with rheumatic diforders, there is a fcorbutic habit, the fulphureous water of Harrowgate, &c. should be both drank and bathed in.

In the lumbago, apply iffues and blifters on the thigh, In the lumbago, apply iffues and blifters on the thigh, and then, having premifed proper evacuations, opiates, and mercurial alteratives if properly perfifted in, will most effectually answer the expectations of the patient. See Wallis's Sydenham; Shebbeare's Theory and Practice of Physic; Cullen's First Lines, edit. 4. vol. ii. p. 9—37. London Practice of Physic, edit. 4. Kirkland's Med. Surgery, vol. i. p. 405.

RHICHNOSIS. LEAN and WRINKLED.

RHIGOS. RIGOR. When any fensible part of the body is affected with spasses, all the other parts are readily drawn into consent with it; hence the horror and rigor on the surface of the body, the coldness, &c. Irritation

on the furface of the body, the coldness, &c. Irritation in the primæ via is often the cause. Galen says, a rigor is a strong and urgent sense of a refrigeration of the natural heat. Rigar sometimes signifies an instexible hard-ness and tension of the nervous and muscular parts, but these are better expressed by the word rigiditas. Others define a rigar, as being a general chillyness, with a sense of coldness inwardly, and a contraction of the lower RHOCAS. The WATERY EYE.

RHOCHMOS. SNORING, or thorting through the

RHODACINA RHODACINEA. See PERSICA. RHODIA, dalio called rhodia radix, anacampferes, RHODIOLO, telephium, luteiam minos. Rose-Root; of ROSE-WORT. It is a species of orpine; its dried roos fmell like thedamafk rofe.

RHODINA RADIX. See ASPALATHUS.

RHODIUM, See ASPARATHUS.

RHODODENDRON, The DWARF ROSE-BAY. RODODAPHNE. See NERION.

RODODAPHNE. See Nerion. RHODODENDRON CHRYSANTHEMUM, foliis oblongis impunctatis fuprafcaubris venofiffimis corolla rotata irregulari, gemma florifera ferrugino-tomentofa, Linn.

This species of dwarf rose-bay hath been recommended in rheumatic pains, particularly the chronic kind. Dr. Kolpin, of Alten-stetin, used an insusion of it in water, kept twenty-four hours in nearly a boiling heat. The porportion was, from two drams of the leaves and tops of the plant to half an ounce, to ten ounces of water; the dofe two ounces, to be repeated after a few hours, and continued as required. Dr. Home observes, in his Clinical Experiments, &c. that it is aftringent, and powerfully sedative; he directs it in infusion, from half a dram to three drams for a dose. Dr. Kolpin remarks, with respect to the insusion of this vegetable, that when taken internally, it produces a feverish heat, a kind of intoxication, and fometimes a flupor and lofs of the fenfes; at the fame time the patient feels a fingular pricking fenfation in his limbs, or other parts of his body; the intoxication foon goes off, leaving behind it neither head-ach nor nausea. During the heat produced by this remedy, the patient complains of intense thirst, and if cold water is drank in this state, there ensures a violent but falutary vomiting, especially in complaints of the bowels. Besides the vomiting and purging, this medi-cine produces a sweat on the parts affected with the rheumatim or gout. Large doles produce a stupor and an-xiety. In some instances the pains grow worse on the sirst use of the insussion; but this increase of disease is soon followed by a remarkable degree of relief; inflead of quickening the pulfe, it renders it weaker and flower. In the inftances of venereal rheumatifith, its effects are very confiderable. Many who drank this infusion, complained of a heat and constriction in the fauces; a proof that the plant possesses a little acrimony; but this effect speedily passes off. In robust habits, it operates quickly, and with a degree of violence; in the insure and feeble, it is very flow in its effects, hence in fuch inftances the pa-tient should not be uneasy to increase the dose.

RHOMBOIDES MUSCULUS, from jouces, a four-(quare figure, and tobe, form. It rifes from the ligamentum colli, the spinal processes of the third, fourth, fifth, fixth, and feventh cervical vertebræ; and the first, second, third, and fourth dorfal; and is likewife attached below to some of the ribs: it runs beneath the latislimus dorfi, and is inferted into the whole length of the bafis of the fcapula, to bring it upwards and backwards. Some divide the rhomboides into the major and minor; and, if

fo, the minor is above, the major below.
RHOPALOSIS. See PLICA POLONICA.

RHUS, from jew, to flow, because it stops suxes. It is also called rhus obsoniorum, and coridriorum. Com-MON SUMACH.

It is a fhrub, or low tree, with oval, pointed, ferrated leaves, and clufters of yellowish or greenish flowers, each of which is followed by a fmall, red, flattiff berry, including a roundish, reddish, brown seed. It is a native of the fouth of Europe, and is cultivated in our garders. The berries have an acid, auftere tafte, are cooling and restringent. The leaves and young twigs are restringent; but it is chiefly used by dyers. See Tournesort's Mat. Med. Neumann's Chem. Works.

RHUS MYRTIFOL. BELGICA. See MYRTUS BRAB.

- SYLVEST. See ELOEAGNUS.

RHYAS or RHŒAS, from ¿tw, fluo, to flow. Though the existence of this disease is doubted by some, still we have descriptions given of it by GALEN: he says, it is an affection of the eye, diametrically opposite to ENCANTHIS, consisting of a too great dimension of the lachrymal caruncle, in the larger angle of the eye. RIVERIUS nies a fiftula lachrymalis; according to Foesius, eyes thus affected are denominated by Aetius ροαδιε, vel ρουαδιε, εφβαλμει. WALLIS's Nofologia Methodica Ocu-

RHYSSEMETA. A WRINKLED FACE.

RIBES. The common RED CURRANTS, grof-RIBESIUM. I fularia non spinosa. The different forts have a cool, acidulous, sweet taste, agreeable both to the palate and the stomach; they agree in general with the summer fruits in their medicinal qualities. They have a large proportion of acid, and though they should be more along they should be more than the action of the story of the sto fweet than the gooseberry, the latter is preferable, be-cause they can be taken without the husk.

RICA, pass. A covering on the heads of the Roman and other women during the time of facrifices; hence

rica, the kerchief.

Kerebief (the great). The French call it, le grand couvre chef. It is used after trepanning, &c. It is made of a square cloth, and, when dexterously applied, it keeps the dreffings on. As to the method of applying it, seeing and practifing only can obtain a dexterity therein.

Kerchief (the triangular). The French call it, couvre chef en triangle. It is a fquare cloth, folded in the form of a triangle. The middle of the longest side of which is applied to the forchead, the two ends of the fame tied behind the head, and the angle, which falls behind the head, fecured there to the confined ends of this kerchief. Its use, in general, is to secure the dreslings on the face

White rofes are the weakest, for that when the wante, white rofes are the weakest, for that when the damask rofa pallida vel rofa centifolia, Linn. can be had in sufficient quantities, they only are used. They give out their agreeable scent both to water and to spirit, but most so to the latter. They do not lose much by drying, if carefully managed, nor do they foon lose their qualities by keeping. On distilling large quantities, a small portion keeping. On diffilling large quantities, a finall portion of a fragrant butyraceous oil, of a yellowish colour, is obtained; it concretes in a flight degree of cold: both the water and the oil are chiefly used as perfumes.

The red roses have but little of the fine flavour of the pale fort; to the taste they are bitterish and somewhat astringent. They are the rosa Gallica, or rosa Germanibus ovatis pedunculisque Hispidis, caule petiolisque Hispidis pido accileatis, flore rubro multipliei, Linn. The aftringency is the greatest before the flower opens, and this quality is improved by halty drying in a gentle heat, but by flow drying, both the colour and aftringency are impaired. They give out their virtues to water and to spi-

allows the cause of it to be a consuming, exsecating, or these instances. See Lewis's Mat. Med. The chief vira corrofive matter, and so it either succeeds or accompatue of these slowers is supposed to be slightly aftringent. The London College have feveral preparations of the

#### AQUA ROSE. ROSE-WATER.

Take of the fresh petals of damask roses, the white heels being cut off, fix pounds; water sufficient to pre-vent an empyreuma; draw off one gallon.

CONSERVA ROSÆ RUBRÆ. CONSERVE of RED ROSES

The leaves of the red rofes are here employed, the The leaves of the red rojes are here employed, the heels being taken off, and the flowers gathered before the petals have unfolded themselves, and treated in the same manner as the wormwood; see Absinthii Maritim conserva. The virtue of the rojes is supposed to be found in this composition, and probably their best esseet will be produced when given in substance, and in considerable quantity. In phthisical cases much has been said in favour of these flowers, and it is not improved the faid in favour of these flowers, and it is not improbable that aftringents internally given, may contribute to the cure of certain ulcers. However, where thefe have been confidered as ufeful, they have always been joined with a diet of milk, and farinacea, and gentle exercise in open air. At most two parts of sugar, to one of reses, would be fufficient, and afford a better medicine than when mixed with three.

### MEL ROSE. HONEY of ROSES, formerly MEL ROSACEUM.

Take the petals of the red rofe not yet unfolded, the heels being taken off, first dried, four ounces; boiling distilled water, three pints; clarified honey, five pounds; macerate the petals in the water for fix hours; afterwards with the strained liquor mix the honey, and boil the mixture to the confiftence of a fyrup.

# SYRUPUS ROSE. SYRUP of Roses.

Take of the petals of the damask roses dried, seven ounces; purified fugar, fix pounds; distilled water boiling, four pints; macerate the petals in the water for twelve hours, and strain, evaporate the strained liquor to two pints and an half, and add the sugar to form the syrup. For infants the dofe, as an aperient, from half an ounce to an ounce. Though the purgative effect of this is efteemed very inconfiderable.

INFUSUM ROSE. INFUSION of Roses formerly called TINCTURA.

Take the petals of the red rose in bud, the heels taken off, half an ounce; diluted vitriolic acid, three drams by weight; boiling diffilled water, two pints and an half; purified fugar, one ounce and an half. Pour the water first to the petals in a glass vessel, then add the acid, and macerate them for half an hour; strain the liquor cold, and add the fugar. Pharm. Lond. 1788.

The virtue of this last, though an elegant preparation is considered to consist more in the vitriolic acid than the rofes. See Cullen's Mat. Med.
Rosa Canina & Sylvestris. See Cynosbatos

ROSACEA

ROSACEA. See GUTTA ROSACEA.

ROSMARINUS. Called alfo libanotis coronario. RORISMARINUS. COMMON ROSEMARY. Rof-ROSMARINUS. marinus officinalis latifolia, Linn. The flowers are called anthos in the Edinburgh Difpensary. Rosemary is a large shrubby plant, with long, narrow, stiff leaves set in pairs, of a dark green colour above, and hoary beneath, with slowers of a pale bluish colour. It is a native of the southern parts of Europe, where it grows wild in dry granully ground. It is common in gravelly ground. It is common in our gardens, where it finells ftronger in proportion as the foil is dry and gra-

Rosemary hath a warm, pungent, aromatic, bitter tafte, and a fragrant fmell, approaching to that of lavender, but more of a camphorated kind; the leaves and tender, tops are the strongest; next to these the cup and the slowers. The flowers by themselves are much the weakest, but most pleasant; it is chiefly in the cup that the active matter of the flowers reside; for the bluish petalum, care-fully separated, hath but little either of smell or taste. rit. Water they tinge with a deep red, and spirit with a The calices, or the leaves of the plant, especially those pale one. The extract from a watery insuson is austere, at the extremities of the branches, retain the medicinal bitter, and subfaline; that from spirit more so in each of power in the greatest degree; they are said gently to stimulate ftimulate the nervous, but scarcely to affect the sanguise-

what a dry state.

The leaves and tops give out their virtue completely to rectified fpirit, which, when diffilled from them, be-comes confiderably impregnated with their fragrance, leaving, however, in the extract, the greatest share of

both their flavour and pungency.

The active matter of the flowers is more volatile than that of the leaves, the greatest part of it arising with spin that of the leaves, the greatest part of it arising with spin that of the leaves, the greatest part of it arising with spin than the spin the spin than the spin the spin than the spin the spin than the spin the spin than the spin than the spin t rit; the Hungary water is a strong spirit distilled from the

Spiritus RORISMARINI. Spirit of ROSEMARY.

Take of the fresh tops of rosemary, one pound and an half; proof spirit of wine, one gallon. Distil in a water bath, five pints. Pharm. Lond. 1788.

This is the aqua Hungarica, but to make it in perfection the spirit must be very pure, the leaves at their full growth, gathered without bruising, and committed to distillation. If the slowers were hung in the still, or retort, in a wicker balket, the spirit being first put therein, and a gentle heat applied just sussignment to make the spirit rise, the vapour lightly percolating through the slowers, will imbibe their fine parts, and leave their grosser behind.

Pure fpirit extracts in great perfection all the aroma of the refemery; but in distillation, it leaves so much behind, that the resinous mass left upon abstracting the spirit, proves an elegant aromatic, and very rich in the peculiar

qualities of the plant.

Aqueous liquors extract a useful portion of the virtues of rosemary by insusion, and elevate them by distillation. Along with the water arises a considerable quantity of essential oil, which is light, thin, pale, and almost colourless; it hath a cast of a green and yellow.

See Tournesort's Mat. Med. Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med. ROSMA-RINES is also a name for the himsonotamus.

RINUS is also a name for the hippopotamus.

ROSMARINUM STÆCHADIS FACIE. See

POLIUM CRETICUM.

ROS SOLIS, also called rosa folis, rorella, sponsa folis, rorida. RED-ROT, SUN-DEW. It is a small round. with a little fibrous root, from which fpring fmall, round, hollowish leaves, on foot-stalks of about an inch long, covered with short red hairs, which makes the whole leaf appear red. It grows in boggy ground, and slowers in June and July. Some commend it as a cordial, but it is infurious to cattle if they happen to cat it, and it was injurious to cattle if they happen to eat it, and is very caustic, so it hitherto hath not obtained a place in practice. See Raii Hist.

ROSÆ ODORÆ LIGNUM. See ASPALATHUS.
ROSTRUM LEPORINUM. The piece of flesh
which hangs between division of the hare-lip. The hare's-lip is also thus named.

ROTATOR MINOR. The LESSER TROCHANTER.

MAJOR, The GREATER TROCHANTER.

ROTULA. In anatomy it is the patella. In pharmacy it is a troche. It fignifies a little wheel.

ROTUNDA LIGAMENTA. The ROUND LIGA-

MENTS. On each fide of the womb there is one; they are too vafcular ropes, composed of arteries and veins, lymphatics, and nerves, arifing from the fundus uteri, and running under the duplicature of the broad ligaments to the rings of the abdominal muscles, and passing under Poupart's ligament, are loft on the crural veffels, &c. or vice verfa, they run in a contorted form, and thus are capable of being lengthened. It is probable that the nerves of these ligaments being compressed in time of la-bour between the uterus and abdominal muscles, cause the pain which the patient feels and complains of in the infide of her thighs.

ROTUNDUS MUSCULUS. The ROUND MUSCLE.

ROUCOU. See Achiotl.

RUBIA, alfo called rubia tinctorum, Linns Erythro: rous fystem. For distillation, they are best used in some-

> It is a rough procumbent plant, with fquare jointed falks, and five or fix oblong pointed leaves, fet in form of a ftar at every joint; on the tops come forth greenish yellow flowers, which are followed by two black berries. The root is long, flender, juicy, of a red colour both externally and internally, with a whitish woody pith in the middle. It is perennial, and cultivated in different parts of Europe for the use of dyers.
>
> The roots are bitterish, and concenhat austere: they

The roots are bitterish, and somewhat austere; they have but very little smell. They impart to water a dark red tincture; to rectified spirit and distilled oils a bright red. Both the watery and the spirituous tinctures take strongly of the madder. Taken internally it tinges the urine red and milky; and if sowls, &c. have it mixed with their food, their bones become red and brittle, but the fleth and the cartilages are no way affected by it. The bones thus tinged preferve their colour, though boiled in water, or fleeped in fpirit of wine. The fubtil parts of which this root is possessing before the minently useful as a refolvent and aperient in obstructions of the viscera, particularly the urinary organs; it has been recommended frongly as an emenagogue, but from repeated trials, fome authors doubt its efficacy; in coagulations of blood from falls; in the jaundice, and in the dropfy; it paffes freely by urine. It is also a name for the rubesla; a species of cross-wort; and of borfe-tail.

RUBIA BRASILIEN. See CAAPO TIRAGUA BRAS. --- SYLVATICA LÆVIS, also called gallium, mollu-go, anonymos Americana, and MOUNTAIN WILD-MAD-DER. Its virtues are fimilar to the above kind.

SYNANCHICA, called also rubeola, financhica-Lugdunenfis, asperula, faxifraga, and southancy-wort. It hath a black, thick, woody root, which runs deep into the earth, with many capillary fibrils, divided into a multitude of heads, and shoots up many smooth, flender, ungulous stalks, a span long or more; at every joint of the stalk are four leaves, which are short and broad; the flowers are on the top of the stalks and branches, and form umbels of a red colour, and agreeable finell, like that of the jafmine; each flower is followed by two feeds, which are rough, and when dry of a yellow colour.

It is found on chalky grounds, and is faid to be of use in quincies, but the present practice does not own it.
RUBICAPRA, and RUPICAPRA. See CAPRA

RUBICILLA.

RUBICILLA. See ALP. RUBIGO FERRI. See FERRUM. RUBINUS VERUS. See CARBUNCULUS.

RUMER

ACUTUM.

RUONIA. See GUTTA RUBEA.
RUPELLENSIS SAL. It is also called fal de seignette, and ROCHELLE SALT, now natron tartarisatum. It is a soluble tartar, made with the mineral fixed alkaline falt after its being melted by the heat of the fire, by which it forms more easily into crystals. 3 vi. of this falt is a

gentle cooling purge.

RUPTURA. A RUPTURE. The word bernia is translated by the English word rupture (fee HERNIA); but this translation was in confequence of the idea that the peritoneum was ruptured when the abdominal contents protruded through the teguments. The word rup-tural or rupture, is most properly spoken of a cartilage, a ligament, or a tendon; when they are divided by vio-lence, then a species of wound is produced, viz. the lacerated.

RUSCUS, also called bruscus exymyrrhine, exymyrrine myrtacantha, myacantha, fcopa regia. WILD-MYRTLE, KNEE-HOLLY, BUTCHER'S BROOM. It is the ruscus aculcatus, Linn. It is a low woody plant, with oblong, fliff, prickly leaves, joined immediately to the stalks; from the middle ribs of the leaves on the upper side iffue small yellowish flowers, which are succeeded by red berries. The root is pretty thick, knotty, furnished with long sibres matted together, of a pale brownish colour on the outmatted together, of a pale brownish colour on the out-fide, and white within. It grows wild in woods and heaths, is perennial and evergreen; it flowers in May, and its berries open in August. The root tastes sweet, and is Rightly bitter; it is aperient and diuretic; its virtues are extracted by water and spirit; and on inspissat-ing the tincture, they remain entire behind. The young fhoots are most powerful, and are eaten instead of aspara-gus. See Miller's Bot. Off.

RUSCUS LATIFOLIUS, called also laurus Alexandrina, Alexandrina genuina, bippoglossum. LAUREL of ALEX-

The root of this plant is knotted at the head; the stalks are tough and pliant; the leaves are placed alternately; on the middle of the back part of each grows a finall mostly flower, which is fucceeded by a red berry. This plant grows on the mountainous parts of Italy and Hungary. It is diuretic. See Miller's Bot. Off.

RUTA. RUE. Ruta graveolens, or ruta fylvestris major, fol. decompositis, petalis laceris, storibus lateralibus quadrifidis, Lann. LARGE WILD-RUE. It is a small shrubby plant, with thick bluish green leaves, divided in-

RUMEX, and RUMEX ACUTUS. See LAPATHUM branches come forth yellowish flowers, followed each by a capfule, which is divided into four partitions full of fmall blackifh, rough feeds. It is cultivated in gardens, flowers in June, and holds its leaves all the winter.

Rue hath a ftrong unpleasant smell, and a penetrating pungent bitter taste; if much handled it is apt to inslame pungent bitter tatle; if much handled it is apt to inflame and exulcerate the fkin. It is commended as a powerful ftimulant, aperient, antifeptic, and in fome degree antifpafmodic. In crudities and indigeftion, for preferving against contagious diseases, this last is very doubtful, and the ill effects of corrupted air, in uterine obstructions, and hysteric diseases, its efficacy is faid to be considerable. It is useful in cold phlegmatic habits, for it quickens the circulation, dissolves tenacious juices, and promotes the fluid secretions. Externally it is discutient and antiseptic, if applied by way of somentation.

Huid fecretions. Externally it is discutient and antiseptic, if applied by way of fomentation.

Its virtues are extracted by water and by spirit of wine, but most perfectly by the latter. On inspissing the spirituous tincture, very little of its slavour arises with the menstruum, nearly all the active parts of the rwe remaining in the extract, which impresses the palate with a warm, subtile, durable pungency, and in smell it is rather less unpleasant than the herb in substance. This is the best preparation of rwe. Though the principal virtues reside in the estract.

Distilled with water, a vellowish or brownish offersist.

Diffilled with water, a yellowish or brownish effential oil is obtained; and if the liquor which remains in the ftill is inspiffated by evaporation, a warm, pungent, bitterish extract is obtained.

When rue-leaves are diffilled for their effential oil, they thould be used whilft fresh, should be gathered when the flowers are ready to fall off, and as the feeds and their capfules contain more oil than the leaves, they should be gathered and distilled also. They all require to be macerated some time before they are distilled.

For the mode of making the extract, see Chama-

MELI EXTRACTUM.

RYTHMUS, from [οθμες, measure, a term used by musicians, with respect to time in music; but since Herophilus applied it to the pusse, it is used to express the to numerous roundish fegments; on the tops of the time, motion, or modulation of the pulse. See ARYTHMUS.

# SAC

SABINA, also called SAVINA, sabina sterilis, com-MON or BARREN SAVINE. It is the juniperus sa-bina, or juniperus sol. oppositis erectis decurrentibus oppositinibus pyxidatis, ramis ferratulis, Linn. It is an evergreen shrub, with short narrow leaves, which are so still then, it bears blackish berries, like those of the juniper. It is a native of the southern parts of Europe, and is raised with us in gardens. The leaves and tops have a strong smell of a gardens. The leaves and tops have a strong smell of a disagreeable kind; of a hot, bitter and acrid taste. They give out great part of their active matter to watery li-quors, and the whole to rectified fpirit. Diffilled with water they yield much effential oil, which smells strongly and tastes moderately of the favin: its dose is from two

The decoction which remains after diffilling for the oil, yields an extract, which retains much of the pungency, warmth, and bitterness of the plant. On inspillating the spiritous tincture there remains an extract consisting of two diffinct fubftances; one is yellow, uncluous, or oily, bitterifh, and pungent; the other is black, refinous,

tenacious, lefs pungent, and fub-aftringent.
Savin is flimulant and aperient, ufeful in uterine ob ftructions which proceed from a fluggithness of the hu-mours and a laxity of the vessels. The oil impregnates the urine with its smell, and contains the whole of its virtues. Savin promotes all the glandular fecretions. See Lewis's Mat. Med. For the mode of making the extract, fee Chamemeli extractum; and for the tinctura fabine compolita, fee ELIXIR MYRRHE COM-POSITUM, under MYRRHA. It is also a name for a species of cedar.

cies of cedar.

SACCHARUM. SUGAR. The Arabians call it fuchar, fucchar, futter, xuchar, zuccara, and zozar; the Greeks called it fackchar, fakchari, falcharion, and fpodien. It is the faccharon officinarum, Linn. That which is put into calks unrefined, is called cassonada.

Sugar is the effential falt of the fugar-cane, or of whatever vegetable it is obtained from. It is chiefly the produce of the arando faccharifera, C. B. which grows spontaneously in the East Indies and some of the warmer parts of the West, and is cultivated in many of the American islands: the best canes grow in the Canary and Madeira islands. The expressed juice of the cane is clarified with the addition of lime-water, &c. and boiled down to a the addition of lime-water, &c. and boiled down to a thick confiftence; it is removed from the fire, and then the faecharine part concretes into brown coloured maffes: this is the faccharum rubrum of the Pharm. Lond. and Edinb. It leaves an uncluous liquor, called melazze or molaffes, from its being of an honey-like confidence, and with us is called treacle. This red fugar is clarified in conical moulds, by fpreading on the upper broad fur-

# SAC

face fome moift clay, whose watery part gently percolating through the mass, carries with it a large portion of the treacly matter. This is further refined by diffolying it in water and mixing it with the whites of eggs, then draining off the water, and covering it with clay again in the moulds: this is the facebar. alb. Ph. Edinb. This process again repeated, it is the facebar. purissim. Ph. Lond. Brown fugar boiled to a proper consistence, is placed in a hot room to shoot into crystals upon sticks placed for the purpose, and it is then called facebarum candidum in the Pharm. Edinb.

By the affiftance of heat fagar diffolves in rectified fpirit of wine, but the greatest part separates when cold, and concretes into a crystalline form. On this soundation faccharine concretions are obtained from faturated fpirituous tinctures of several of the sweet plants of our own growth, the faccharine part feparating when the tincture is fet in the cold, whilft the refinous and other matter

separated from the plant remains in the spirit.

On all trials hitherto made, fugar appears to be perfectly neutral, and unites with most kinds of humid bodies without altering their native qualities. It ferves as an intermedium for uniting together fome bodies naturally repugnant; in confequence of this property it is fupposed to unite the unctuous part of our food with our juices. Hence some conclude that it increases fatness, whilft others fay it hath the contrary effect, by preventing the feparation of the oily matter from the blood. Neumann observes, that he hath known very lean people who have eaten great quantities of fugar. Some fay that it thickens the juices, and makes them fluggish; that it results the involved the contract of the tards the circulation, obstructs the natural secretions, and thus occasions or aggravates fcorbutic, cachectic, hypochondriae, and other diforders; but general experience does not manifest that sugar produces any of these effects in a remarkable degree. Its moderate use is innocent, and perhaps, of all others, it is the most inosfensive of the sweets. And when present in any unusual quantity in the mass of blood, Dr. Cullen says, that the medicinal qualities are no other than that of a faline mild fubstance, that will readily pass by the excretions, and probably expede and promote thefe; and that this is the only medicinal virtue he can afcribe to it.

Sugar preferves both animal and vegetable substances from putrefaction, and appears to possess this power in a much greater degree than the common alimentary falt. Animal sless hath been preserved by fugar more than three years from every degree of being tainted or putri-fied. The impure brown fagars are most laxative, in confequence of their oily or treacly matter. The candied fugar diffolying with difficulty, renders it more fit for gradually melting in the mouth to moderate coughs. In other respects, its principal use is to render other medi-cines more palatable, or to give them a proper form. See Neumann's Chem. Works. Lewis's and Cullen's

- VENA. It fometimes proceeds from the bifureation of the vena cava, at others from the origin of the left iliaca, and accompanies the artery of the fame

SACRI ACUMEN OSSIS. See ACUMEN.

SACRO LUMBARIS, vel LUMBALIS. This muscle is one with the longissimus dors at its origin, but soon divides, and is inserted by digitations into the angle of every rib. The uppermost tendon is inserted into the transverse process of the last cervical vertebra.

- LUMBARIS ACCESSORIUS, called also accefforius facro-lumbalis; accessorius facro-lumbaris; cervicalis de-ficendens, and cervicalis dersi. It is a continuation of the cervicalis dors; it lies on the outside of the complexus, and coming down from the transverse processes of the lower vertebæ colli, is continued down under the facro lumbaris to the ribs, which it deprefies, as well as the facro lumbaris.

- NERVI. Five or fix branches of nerves from the spine pass through the os facrum, whence their name, The three first join the fourth and fifth lumbar nerves to form the fciatic nerve. The third facral nerve gives fome branches to the pelvis.

SACRO COCCYGAUS. See COCCYGAUS POSTE-

SACRUM OS. This bone is thus named from its having been offered in facrifices. Some call it os bafillare, from its being, as it were, the support of the whole spine. This bone is of a formewhat triangular shape, broad above, narrow below, convex behind, and concave be-fore. In the feetal state it consists of five distinct bones, but in adults they are united into one. On the outfide there is a ridge, which is called the spine. On the fore part there are four pair of holes for the transmission of the nerves. This bone is connected with the offa innominata by fynchondrofis, and forms the posterior part of the pelvis. Below the os facrum it is connected with the

os coccygis.
SAFFRAN DE TERRA. See CURCUMA.
SAGAPENUM, also called ferapinum, GUM SAGA-PEN. It is the gummy refinous juice of an oriental plant, supposed to be a species of serula. See FERULA MA-JOR, seu FEMINIA. It is brought from Alexandria ei-ther in distinct tears, or run together in large masses; outwardly it is of a yellow colour, internally it is paler, and clear like horn. It grows fort on being handled, fo as to flick to the fingers. Sometimes pieces of bdellium are fold for it, but they may be diffinguished by their weaker fmell. The fmell of fagapenum is strong and diffgreeable, like that of the leck, or of a mixture of affarctida and galbanum. To the taste it is moderately hot and biting. It is one of the strongest of the deobstruent gums; superior to the opoponax galbanum and ammoniacum, coming nearest to the asafoxtida. As an alterative it may be nearest to the asascutida. As an alterative it may be given from gr. iii. to 3 fs. and as a purge 3 i. must be given for a dose. It is generally used as an aperient, an expectorant, or a deobstruent. Neumann says it is used in the same cases as is the ammoniacum. Boiling water dissolves about 4ths of this gummy resm. Rechised spirit takes up about one half. Water brings over with it in distillation much of the slavour of the sayapenum, and a small portion of essential oil, but the distilled spirit is most slavourless. See Lewis's Mat. Med. Neumann's Chem Works. Tournfort's and Cullen's Materia Medica.

SAGITTA. ARROW-HEAD. At first the leaves of this plant resemble those of plantain, but afterwards the bearded head of an arrow; the fruit confilts of a collection of feeds like the straw-berry. It is faid to possels similar virtues with the plantain, but is rarely used.

SAGITTALIS SUTURA, called also virgate. The sagittal suture. It runs from the os frontis to the

os occipitis, betwixt the parietal bones.
SAGITTARIA. A species of sagitta.

SAGITTARIA ALEXIPHARMICA, also called agutiguepoobi Brafilienfis, malacca radix, canna Indica, arundo Indica, ARROW-ROOT, DART-WORT. The root is alexipharmic, and is used by the Indians to remove the poison which they receive from darts when wounded by them. It is found in the West Indian islands, and is two or three inches long, as thick as a man's thumb, jointed and white. See Raii Hist.

SAGOU. See PALMA JAPONICA.

SAL. SALT. It is a body that is more or less hard,

having a remarkable favoury tafte; is entirely foluble in water and does not precipitate, unlefs there is more than the water can diffolve; or, as Geoffroy defines it, "It is a folid, friable, pellucid, fapid, mineral body, foluble in water, fufible by fire, and concrefcible into the form of crystals." This definition agrees with fea-falt, nitre, vitriol, alum, borax, and fal ammoniac. Salts are natural or fimple, and artificial or compound. The fimple are the acid and alkaline; the compound the neutral, metal-lic, and earthy; of the acid kind there are the vitriolic, nitrous, muriatic, vegetable, animal, &c. of the alka-line there are the fixed, both vegetable and folfil; and the volatile, which last are chiefly from animal substances; they are very rarely found in the mineral kingdom. See Tournefort's Mat. Med. Lewis's Mat. Med. Dict. of Chem. Neumann's Chem. Works; and see CRYSTAL-LIZATION. Fourcroy's Chemistry.

SAL VOL. SALIS AMMONIACI. SAL is also a term affixed to several faline substances, viz. Sal absinthii; alk sal marin; alcali, alcali volatile; ammoniacum; cornu cervi; tartari, see Alcali; cyre-

miacus, fee Ammoniacus sal; communis; fossilis; precipitate by the volatile alkali; but this precipitate; we rupeus, fee Gemma sal; atharticus Glauberi; Daubenis; mirabilis; fee Glauberi sal; diureticus; the body; why then may not calomel be absorbed from femerti; fee Diureticus sal; fusionis; fixionis; the inside of the mouth? Mr. Hunter hath frequently rupeus, lec GEMMA SAL; atharticus Glauberi; Dauphiny; mirabilis; fee GLAUBERI SAL; diureticus;
feenerti; fee Diureticus SAL; fufionis; fixionis;
fee ALEMBROTH; gemma; marinus; fee MARINUM
SAL; alkali fixum; fee CLAVELLATI CINERES;

SALAMANDRA. See AMIANTHUS.
SALEP vel SALER See ORGANS.

SALEP, vel SALEB. See Orchis. SALICARIA. SPIKED WILLOW. Boerhaave mentions four species, which are admired for the beauty of their flowers, but are not noticed in medicine. SALICARNIA. See KALL.

SALITRON. See ANATRON.
SALICENCA. See NARDUS CELTICUS.
SALIVA, from σιαλος. It is that fluid by which the mouth and tongue are continually moistened in their natural state, and is supplied by glands which form it, that are called falivary glands. This humour is thin and pellucid, incapable of being concreted by the fire, almost without taste and smell. By chewing, it is expressed from the glands which separate it from the blood, and is intimately mixed with our food, the digeftion of which intimately mixed with our rood, the digettion of which it greatly promotes. In hungry perfons it is acrid and copiously discharged; and in those who have fasted long it is highly acrid, penetrating, and resolvent. A too copious evacuation of it produces thirst, loss of appetite, bad digestion, and an atrophy. See Haller's Physiology in the article of Mastication. Boernaave's Institutes. Fordyce's

Elements, part i. p. 23. SALIVALES GLANDULÆ. The CLANDS. They are commonly reckoned three pair, viz. the parotid, the maxillary, and the fublingual; but Dr. Hunter would reckon the fublingual of another kind.

SALIVALIS DUCTUS STENONIS. Ductus Steno-TILL STENO'S SALIVAL DUCT. It is also called the UPPER SALIVAL DUCT. It is the dust which carries the faliva from the parotid gland into the mouth.

SALIVAN'IA. Medicines which excite a falivation.

SALIVANIS HERBA. The PELLITORY of SPAIN.

SALIVATIO. A SALIVATION. It is that extraordi-mary difcharge of fpitting which is excited by the use of mercury; a practice which is now rarely directed, because all the advantages of mercury are obtained by using it as an alterative; and that without the trouble and danger which attends this method of promoting an evacuation by it.

However, as occasionally it may be needful to excite a
gentle spitting, in general it is best done by rubbing a proper quantity of the ungt. hydrargyri every or every other
night on the thighs. Mr. Clare recommends the application of calomel, gr. iii. vel iv. to the infide of the cheek; he directs the patient to moisten his finger with faliva, then therewith to take up the calomel, and rub it on and around that place where the parotid duct opens into the mouth. He adds that, a grain or two applied behind the preputium, or to the labia, will, when accompanying the application of it to the infide of the cheek, greatly advance the cure. This must be repeated every or every other day as its effect is more or lets. This mode, he observes, is less disagreeable than the usual one of rubbing the ungent. hydrargyri, as is commonly directed. Before the use of the calomel, it is proper to wash the mouth well with warm water, that the mucus spread about on the cheeks may not prevent its abforption. See an Effay on the Cure of Abiceffes, &c. by P. Clare, Surgeon. Mr. Cruikfhank hath added an Appendix to Mr. Clare's publication, well deserving the attention of every practitioner. The following are some of the many valuable instances of information communicated in a few pages. He observes, that there is no doubt of absorption taking place on the inside of the mouth, of the preputium, of the labia, &c. and that any fine powder, capable of being abforbed there, will be more readily taken up when mixed with a watery fluid, as faliva. The particles of the blood, feen in the simple microscope, are at least ten times larger than those of the levigated calomel, yet I have often seen the absorbents turgid with red blood. The particles of quickfilver, in the best prepared mercurial ointment, are, in the fame microfcope, as diffant as the particles of the blood; and it is well known, they are very readily leaves, being hoary on both fides, though most so on the faken up by the absorbents of the skin. The particles of levigated calomel are not much coarser than those of its Plant. Philos. Trans. 1763. It is the fallx fragilis, Linn.

8 A

Dr.

directed calomel to be rubbed on the fkin along with the volatile liniment; and feen it have the effects of the unguent. hydrargyri. It is very probable that the calomel, mixed with fallva might make a good mercurial ointment. The furface on the infide of the cheek, is a better abforbing furface, than perhaps any other acceffible to friction in the body. Though every furface abforbs, they do not all abforb equally. Calonel taken into the ftomach frequently gripes, &c. but this effect is not obferved when it is abforbed by the infide of the cheek: probably it becomes milder in its operation this way, as it is known that the divided quickfilver becomes milder when absorbed by the skin. Friction with calomel on the infide of the check, is a lefs tedious, lefs laborious process, than the common one of rubbing the ungt. hy-drargyri. To rub half a dram of the ungt. hy-drargyri every night on the infide of the thighs for half an hour, is almost intolerable; but what then must it be to rub on a larger quantity? The process always tires the patient before it is half performed, and often on this account he omits it. From this circumftance a cure is often miffed. Let us suppose sifteen grains of the ungt. hydrargyri equal to one grain of calomel, and that we can go on with the calomel for twelve or fifteen days with lenfible advantage: we must acknowledge that when the ungent is used, it becomes necessary long before the end of this period to increase the dose, in order to keep up the effects. Besides the unguent, being more viscid than the calomel mixed with faliva, will require a larger furface and a longer time before it can be fufficiently rubbed in. The calomel is fufficiently rubbed in in a quarter of an hour. The friction of the unguent, hydrargyri on the thighs and arms makes the skin look dirty. It hath an offensive odour whilft it is rubbed; as it is greafy, it does not rub in fo as to be dry, and thence the fkin is clammy, and fticks to everything about it; many fkins are inflamed by it, which retards the cure this way, by being a cause for its omission. Some skins are disagreeably affected with oil, so when the calomel is not admitted as above recommended, the quicksilver may be divided with the synovia of cows or sheep instead of oil or lard, which in some skins produce expinelatous inflammation. See A warm both may be an eryfipelatous inflammation, &c. A warm bath may be en-tered into two or three times before anointing with the unguent. hydrargyri, after which, the patient being kept in warm room, and having on a flannel fhirt, the principal care is not to raife the *falivation* fuddenly, or to any confiderable height. A *falivation* should rife very gradually, and should subside as slowly; inattention to this hath been productive of many inconveniences. The body fhould be prepared by a spare diet for a few days, and bleeding as well as using the warm bath. Except in strong confistutions, from a pint to a quart is a sussicient discharge of the saliva in twenty-four hours. Support the patient's strength with plenty of light but nourifling diet; give him a pint of gruel, or of a decoction of mallows and liquorice in milk and water, almond emulsion, and barley-water, with gum arabic dissolved in it, &c. repeat the above quantity every two or at the most every three hours; and if he is faint with it, give now and then a little wine-whey, maced ale, or mulled wine. If the patient is a woman and expects her menses, defer the procedure until they settle. If the necessary precautions are taken to raise and to carry the falivation on gently, the many bad accidents mentioned by writers on this subject will be prevented; and as to avoid inconveniences is better than to remove them, it may here fusfice to have put the practitioner on his guard against ills which otherwise must occasion him much trouble and anxiety. See a case of ptyalism occasioned by a dimi-nished secretion of urine, in the Med. Communications, vol. i. p. 155.

SALIX. The COMMON WHITE or the DUTCH WILLOW TREE. It is not noticed in general practice;

but fome who have used it in agues have succeeded by giving a dram of its bark in powder, and repeating it every four hours during the intermissions. This species is dif-

Dr. Cullen fays it is as valuable a medicine, and as pro-lifing a fubflitute for the bark as any he knows to have the former, and more so than the latter. mifing a fubilitute for the bark as any he knows to have been offered to the public. The trials he has made have been with the falix pentandra, the bark taken from its branches the third of an inch diameter, and of four or five years growth. Though he adds Bergius declares in intermittent fevers he has always failed with this bark. Materia Medica.

SALPINGO PHARYNGÆUS. It arifes from about the tuba Eustachiana, and is inferted into the pharynx. Valfalva and Douglas fay it is one of the origins of the muscle of the pharynx. See PHARYNX.

SALPINGO STAPHYLINUS. This mufcle arifes fleshy from the bony part of the tube of the ear, and is inferted into the balis of the uvula with its partner muscle on the other fide. They draw the uvula upward and backward.

- STAPHYLINIUS INTERNUS. See PETRO SAL-

PINGO STAPHYLINI.

SALSAPARILLA. See SARSAPARILLA.

SALSOLA. See KALI.
SALVATELLA VENA, from falus, bealth, because it hath been thought that to open this vein, melancholy was cured. This vein runs on the back of the hand; it comes from the little finger and that next to it; or according to some, it proceeds from betwixt the thumb and

the fore finger, and runs up to the ulna.

SALVIA, from falvus, found or bealthy. SAGE. Botanifts enumerate more than twenty species. It is a low shrubby plant, with square stalks, obtuse, wrinkled, dry leaves, and large bluish flowers, which are on loose spikes on the tops of the branches. It is a native of the fouthern parts of Europe, but bears the cold of our clime. It flowers in May and June.

SALVIA BOSCI. WILD OF WOOD-SAGE. Taking its name from befeum or befeus, a wood, the place

where it grows.

ÆTHIOPIS. See ÆTHIOPIS. HORMINUM. See HORMINUM.

- MAJOR. GREATER OF COMMON GARDENsage. It is the falvia officinalis, or falvia major, foliis lanceolato-ovatis integris crenulatis, floribus fpicatis corruleis, calveibus acutis, Linn. Common green fage. The leaves are nearly oval, but pointed; fome are green, others red, but both forts are on the fame plant. leaves and tops are moderately aromatic and corroborant, and are used in debilities and relaxations both of the nervous and vafeular fyftem. From 3 fs. to 3 i. of a conferve made with them cures weak stomachs, if repeated twice a day. Their fmell is strong, but not disagreeable; their taste is warm, bitterish, and sub-astringent; with a folution of chalybeate vitriol they ftrike an inky blacknefs. This fpecies is more agreeable, but not fo ftrong as the leffer fage. The flowers of both are weaker but more agreeable than their leaves. The best preparations are, the watery infusion, and a tincture or extract made of rectified spirit of wine; these contain the whole virtue of the fage. The watery infufion, acidulated with the juice of lemon or of orange, is an agreeable common drink in fevers. By diffillation with water a fmall quantity of effential oil is obtained, which only possession the aromatic part of the herb. See Tournefort's Mat. Med. Lewis's Mat. Med.

- MINOR, also called falvia virtutis. LESSER SAGE, or SAGE of VIRTUE. Salvia auriculata, or falvia minor aurita, & non aurita, Linn. Its leaves are narrower than those of the greater fage, whitish, and never red: they are stronger, but not so agreeable as the above species, but in other respects their qualities are

the fame.

Sage has been much employed as a fudorific and for preventing the recurrence of intermittent paroxylms perhaps it may be fufficiently effectual. But it has also been employed for reftraining improper sweats, infused in spirits, or wine, by Van Swieten; also the improper continuing of the flow of milk into the breasts of nurses, after they had weaned their child, and it is also confidered as a refister of putrefaction. Cullen's Mat. Med.

- Sylvestris, also called scorodonia, scordium, scordotis, chamadrys fruticosa, &c. Germander sage. Wood sage. Tenerium scorodonia, or tenerium sylvestre, foliis cordatis ferratis petiolatis racemis lateralibus fecun dis, floribus herbaccis, Linn. It grows in woods and hedges. In fmell, tafte, and medical virtues, it comes

Among the species of fage is the phlomis, or yellow fage. Boerhaave reckons up eight. It is aftringent and vulnerary. SALVIA VITA, i. c. RUTA MURARIA. See ADI-

ANTHUM ALBUM.

SAMBUCUS, also called acte infelix. COMMON EL-DER. Sambucus nigra, or fambucus cymis quinque par-titis, floribus umbellatis, fructu in umbella nigra, caule arborco, Linn. COMMON BLACK-BERRIED ELDER. It is a tree or shrub whose branches are full of fungus; it is covered with an ash-coloured chap bark, under which lies a thinner green one, and under it is a white one. It

Bowers in May, and ripens its berries in September.

The young leaves, when budding, are faid to purge.

The bark is recommended as a ftrong hydragogue. Sydenham directs three handsful of the inner bark to be boiled in a quart of milk and water to a pint, half of which is to be drank every night and morning; he fays it operates upward and downward. Some confine thefe effects to the ebulus, or dwarf elder; but they have both been used without any remarkable advantage. An infusion of the fresh flowers is gently laxative, and of the dried ones is perspirative. The juice of the berries, when in-fpiffated to a rob, is a good diffolvent and aperient; in colds just received, it gently loosens the belly and promotes urine or perspiration, or both. See Lewis's Mat. Med. Anatomia Sambuci per M. Blockwitz. Wallis's Syden-

SAMBUCUS EBULUS HERBACEA HUMILIS. See EBULUS. SANAMUNDA. See EMPETRUM. THYM. FOL.

SAMPSUCHUM. See ORIGANUM. SAMPSUCHUS. See MARUM and MAJORANA.

MAJ. FOL.
SANCTÆ HELENÆ RAD. Alfo called Cyperus
bootted most, black without and white within; to the taffe it is like the galangal root. It is brought from St. Helena in the province of Florida. It is there used against pains in the stomach and in nephritic diforders.

SANCTUM SEM. See SANTONICUM.
SANDARACHA. SANDARACH. A name for a fort of arfenic; also a gummy refin, of a yellowish white colour faid to flow from the cedrus Lycia major Dodon. It is in small lumps, dry, brittle, of a pleasant smell, of a resinous and gently acrid taste: it is brought from Africa. The gum of the juniper tree is generally fold for it. See REALGAR, JUNIPERUS, and ARSENICUM RUBRUM. SANGUIFLUXUS. See HAMORRHAGIA.

SANGUINARIA. See GRAMEN POLYGONUM. SANGUINIS INOPIA. A rabes from left of blood.

SANGUINARIA. See GRAMEN POLYGONUM.
SANGUINIS INOPIA. A tabes from lofs of blood.
An inflance of the atrophia inanitorum of Cullen.
SANGUIS. BLOOD. The fluid which is contained in

the arteries and veins is called the blood. On a flight examination it may appear homogeneous, but it confifts of very diffimilar parts. When blood is taken from the body immediately it lofes its volatile part, which flies off in the form of a vapour, and is of the nature of fal ammoniac. When this vapour is diffipated the remaining blood quickly congeals into a trembling mafs. The principal part of this coagulated mafs is in the craffamentum, which hath the red colour to itself, and gives it to the other parts; when this crassamentum is freed from its watery part, it is wholly inflammable. In a mass of healthy human blood about one half is craffamentum; in ftrong laborious people the ferum is not much more than one third part. The next part of the blood is the ferum; from this is formed what is called the pleuritic cruft on the furface of the blood, after taking it from a vein by the usual method of bleeding; of this polypuses and artificial membranes are also formed. In this serum, besides the albumen, which hardens like the white of an egg, there is much water, and a small quantity of ropy mucus. Besides these parts, a portion of sea-falt is found in the blood, and is manifest to the taste, and oftentimes to the microscope-By a chemical analysis, a fine chalky earth is also found to exist in the most sluid parts of the blood; a portion of fixed air, to the amount of half a scruple in every ounce; and also a small quantity of iron, which the loadstone will attract. To these may be added the elementary fire.

The natural elements of the blood formed by the animal economy are, the albumen, and the globules. The albumen is the immediate matter of growth and nutrition.

The globules never pass the enunctories, except by excess or disease; as for the faline, acid, morbid, bilious, and other particles that are found in the circulating blood, unctuous leaves which lie on the ground. It is perennial, they are rather heterogeneous than elementary parts of it. In an healthy state the blood is mild and gelatinous, but

by fome diforders it is rendered very acrid.

On viewing the blood with a microfcope, whilst it circulates in the veins, the globules are observed to be elaftic, fo as to change and recover their figure. Mr. Hewson

fays that they are not spherical, but almost flat.

The use of the globules in the blood seems chiefly to be for the prefervation of heat in the body; and that of the ferum for nutrition, and by the various fecretions from it to moisten the several surfaces in the body, to preserve the flexibility of the folids, &c. A due proportion of the re-fpective parts of the blood is necessary to health; a redundance of the globules disposes to acute fevers, inflamma-tions, &c. and their deficiency, to many chronical dis-

As to the red colour of the blood, Dr. Hunter thinks it is chiefly owing to the degree to which it is condenfed; but most writers attribute it to the acid which it receives

from the air in the lungs.

an heterogenous aggregate, confifting chiefly, and especially of red globules, gluten, and ferofity, and if it should be alledged that there are other matters present, that they may be considered as portions of these three principal parts. See MATERIA MEDICA. Dr. Cullen fays, that the mass of blood is every where

That life is a property of the blood fee what Mr. J. Hunter hath taught concerning it. And for an enlargement on what is faid above, befides many other particulars respecting the blood, see Mr. Hewson on the Properties of the Blood; Berdoe on the Nature and Circulation of the Blood. Fordyce's Elements, part i. Haller's Phyfiology, in lect. vii.

SANGUIS DRACONIS, called also cinnabaris Gracorum, draconthema. DRAGON'S BLOOD. It is a refin of a red colour, obtained from certain trees like palm-trees in the East Indies. The Calamus var. Palmijuncus Draco. Rumph. Amb. lib. vii. t. 58. f. 1. & Linn. Sp. Pl. 463.
The Cafamus Rosang. Curtis's Cat. of the Lond. Bot. Garden. One fort is in oval drops, wrapped up in flag-leaves; another fort is in large masses, which are often

impure, but fometimes as good as the first.

This refin is of a deep red colour, and on being powdered is of a crimfon caft. It readily melts, and catches flame from a candle. It almost totally diffolves by the help of heat in rectified spirit of wine, tinging a large quantity of this menstruum of a dead red colour: it is foluble in expressed oils; but it gives out little or nothing to water. The best pieces break smooth, and free from visible appearances; they have no remarkable smell or taste, except when dissolved, and then they seem to be somewhat acrid. The Dutch often adulterate this resin with mixtures of gum arabic, Brasil wood, alum, &c. but these are discovered by their dissolving in water, or by their crackling and not burning in the fire. It is not much used as a medicine, and Cullen thinks it ought to be expunged from the Materia Medica; though it is recommended as a gentle incraffant, deficcative, and restringent. See Lewis's Mat. Med. and GUMMI Rubrum Assringens

DRACONIS HERBA. See LAPATHUM RU-

HERCULIS. See CROCUS.

SANGUI SORBA. See PIMPINELLA.

- SUGA. See HIRUDO. SANICULA. SANICLE. It is so called from famando, bealing, called also cuculiata, dodecatheon symphytum pe-

SANICULA ALPINA LUTEA. See AURICULA URSI.

— MAS, alfo called diapenfia, cortufa, SANICLE, SELFHEAL. It is the fanicula Europæa, Linn. It is an umbelliferous plant, with finining, dark green, roundiff ferrated
leaves; the feeds are rough and flick to one's cloaths. It is perennial and evergreen; it grows wild in woods, on hilly grounds, and flowers in May. It is mildly aftrin-gent, taftes roughish and bitter; and it hath an acrimony which chiefly affects the throat. Both the watery and spi-

rituous extracts possess the virtues of this plant.

EBORACENSIS, called pinguicula, fanicula montana flore calcari donata, visia palufiris. BUTTER-

grows in elevated marfly grounds, and flowers in fpring-lts unctuous glutinous juice is ufed by fome as a liniment for chaps, and as a pomatum for the hair: it is also purgative, but none of the famicles are much noted in general practice.

SANICULA FRMINA. See IMPERATORIA NIGRA.

SANIDODES, alfo, but improperly, Saniodes.
Where the breast is straightened or stattered like (sando), the genitive case of saus) a table. FLAT-CHESTED.

SANKIRA. See CHINA ORIENTALIS.

- SANIES. See ICHOR.
SANTALUM. SAUNDERS. There are three forts

brought from the East Indies.

SANTALUM ALBUM. WHITE SAUNDERS. It is of the fame nature as the yellow, but so weak that it is now neglected. The fantalum citrinum, called fantalum album, by Linnæus, is the medullary part of the same tree, of which the fantalum album is the alburnum, or outward

fappy part.

CITRINUM, also called fantalum palidum. YEL-LOW SAUNDERS. Santalum album, Linn. It is a pale yellowith, or brownish coloured wood, with a close even grain, an agreeable fmell, and a bitterifh aromatic tafte, accompanied with a kind of pungency. Diftilled with water, it affords an oil which thickens into the confiftence of a balfam, and finells like ambergrife; the remaining decoction is bitterifh. Rectified fpirit extracts by digettion more than water does; and an extract from this tincture is fix times flronger than the wood itfelf. Hoffmann fays its virtues are fimilar to those of ambergrise, but he has been too extravagant in his praifes.

- RUBRUM. RED SAUNDERS. fantolinus, vel pterocarpus foliis ternatis fubrotundis retufis glaberrimis petalis crenatis undulatis, Linn. This is of a dull red colour; it is faid to be aftringent; it hath little or no fmell, and as little tafte. It is chiefly ufed as a colouring drug; it tinges water with a yellowish hue, and rectified spirit with a deep red; but it does not disfolve in expressed oil. See Lewis's Mat. Med.

SANTALUS ADULTERINUS. See ABELICEA.

SANTERNA See ROBERS

SANTERNA. See BORAX. SANTOLINA. See SANTONICUM. - CHAMÆCYPARISSUS. See ABROTANUM.

SANTONICUM, also called fem. cina, fem. lumbricorum, femen fanctum, fem. zodoarier, fementina, fantolina, xantolina. WORM-SEED. The plant from which these feeds are obtained is the artemifia fantonicum, or artemifia ablinthium Siberiensis fruticola incana ramosissima, linearibus brevislimis obtusiusculis, Linn. In the Flora Austriaca, it is called artemifia Austriaca. In Curtis's Cat. of the Lond. Bot. Garden, it is called artemifia Judaica, and also absinthium santonicum Indicum; contra vernus Greallo abjustinum fantonicum Indicum; contra vernus Grenette bagiospermon. It is a small, light, oval kind of feed,
of a yellowish green colour, with a cast of brown, easily
friable. They are generally mixed with small bits of
sticks and leaves. They are brought from the Levant,
and are supposed to be the produce of a species of artemifia. Miller fays it is a frecies of wormwood. They have a ftrong, and rather difagreeable fmell, and a bitter fubacrid tafte, and are usually employed for destroying worms in children. They give out their virtue to water and to spirit; the spirituous insusion is the most agreeable. In evaporating the watery infusion, all the ill-fla-vour is carried off, and only a simple bitter remains. As a bitter the watery extract is the best preparation; as an anthelmintic, the spirituous extract should be preferred. These feeds are seldom met with genuine; they are mixed with the feeds of southernwood. The marks of goodness are their full body, their greenish colour, strong smell, their bitter and aromatic taste. See Lewis's Mat. Med. Neumann's Chem Works.

SAPA, also called apochilifma, fuccago, robub, rob, and Oenus Sircos. It is the juice of fome vegetable boiled up with fugar, or honey, into the confiftence of

SAPHENA VENA MAJOR, so called because it is almost saque, i. e. vifible. About an inch below the passage of the cruralis from out of the abdomen, it sends off a large branch, called faphena; in all its course down to

the foot, it is only covered with the integuments. It follows the direction of the fartorius mufcle, until it arrives at the inner condyle of the thigh bone; it then runs on the infide of the tibia, fending off branches as it paffes along; at the lower part of the tibia it fends of a branch, which runs over the joint of the tarfus to the outer ankle. The extremity of the faphena passes on the fore side of the inner ankle and runs betwixt the first two metatarsal bones, to-Wards the great toe. See CRURALIS VENA.
SPAHENA MINOR VENA. It is a branch from the

Saphena major, and separates from it soon after its passing from the inguen; it runs down below the ham, and com municates with the faphena major. Another branch, which proceeds from the cruralis, a little above the ham is thus named; it runs to the outer ankle. Some call it faphena

SAPHERA. ZAFFER. See COBALTUM. SAPIENTLÆ DENTES, called cranteres. The last of the molares are thus called; they do not appear until after puberty, and fometimes not before the twenty-fixth

OLEUM. OIL of BRICKS. See LATER.

SAPO. SOAP. It is a composition of oils and fats, with alkaline salts, so incorporated as to dissolve together in water, into a milky femi-transparent liquid. Soap may also be formed by a combination of oil and acids.

SAPO ALBUS, also called sapo Hispanicus. HARD, or Spanish soap. It is made in Spain, with olive oil and the Spanish barilla, by a like process as is directed for the foap of almonds. Soap is an useful mixture with re-finous pills, for it renders them more easily soluble, and more perfectly miscible with our fluids; it diffolves mu-cous matter in the body, and so is useful to resolve obstructions. It acts in the prime viæ, as well as in the remote and minute vessels, and by dislodging viscid phlegm from the bowels. Cullen thinks this foap is not a laxative, and that if ever it is so, it is owing to the common salt that is in it, and if upon any occasion, it comes to be employed in nephralgic cases, and, by becoming laxative, should thereby limit the use; it may be dissolved in spiritus vini rectif. the salt will be left undissolved, and the disfolved foap, may by evaporation, be recovered in a dry form, and still remain as fit for the cure of this disease as ever; and more useful, perhaps, as it may be taken in much larger quantity. Mat. Med. It also carries off and destroys worms, for which end it may be given either by the mouth or clyster-wife. The ascarides are sometimes rooted by clyfters in which are a dram or two of foap. By the diffolving quality of foot it also proves diuretic, and is useful in gravelly complaints by lubricating, as well as by its gentle stimulus.

The common soft foots are so acrid, that they are only fit for external uses. The whitest of them are made with

tallow, fat, or coarse oils; the blacker or greener forts,

are made of whale oil.

All these foops dissolve in water, but more plentifully in proof spirit; but those spirits have a degree of acidity in them which occasions a milky hue in the folutions of foap. This may be corrected, as observed by Geoffroy, who says, that twenty-eight parts of good proof spirit, with the addition of one part of salt of kali, will dislove ten parts of good bard sop into a perfect limpid liquor.

The College of Physicians of London order a CERA-

TUM SAPONIS. Cerate of foap, made in the following manner. Take of foap, eight ounces; yellow wax, ten ounces; litharge powdered, one pound; olive oil, one pint; vinegar, one gallon. Boil the vinegar with the lisharge, with a flow fire, conftantly ftirring, until the mixture waters and thickens, then mix in the rest, and make ture unites and thickens, then mix in the reft, and make a cerate. Ph. Lond. 1788. And a LINIMENTUM SAPONIS, SOAP LINIMENT; formerly flyled faponaceum, or opodeldoc. See LINIMENTUM SAPONACEUM.

AMYGDALINUS. See AMYGDALUS.

VITRI, i. c. MAGALAIZE. See MANGANESE. - VOLATILIS. VOLATILE/SOAP. Of this there are three kinds; one is composed of fixed alkalies and volatile oils; another of volatile alkalies and grofs oils; the third of falt and oil that are both volatile : but none of these compositions, in which either the alkali or the oil is volatile, are so saponaccous as those in which they are both of the fixed kind. See Dict. of Chem. Neumann's Chem. Works. Lewis's Mat. Med.

SAPONARIA, also colled firuthium, lanaria, lychnis fylvestris, ibinuma. BRUISE-WORT, SOAP-WORT. the saponaria officinalis, Linn.

It is a smooth herb, with plantane like leaves, and clusters of red, purple, and whitish flowers; the root is long, flender, fpreading to a great distance, of a brownish co-lour on the outside, and white within, with a yellowish sibre in the middle. It grows in moist grounds, and

flowers in July.

This plant is called faponaria, because its juice takes out grease from cloaths. The roots and leaves are glutinous and sweet to the taste, but in the roots there is also nous and Iweet to the talte, but in the roots there is allo a flight pungency, and in the leaves a bitterifhness. The foapy matter diflolves either in water or in fpirit of wine. The Germans use the root, and say it is preserable to the sarsaparilla. M. Andry, M. D. of Paris, gives the inspiffated juice of the saponaria officinalis, with great success, in cases of gonorrhea. The patient takes about half an ounce of this medicine daily; and in general a cure is effected in about a fortnight, without the affistance of any other remedy. And —— Seecy, M. D. of Paris, hath other remedy. And - Segey, M. D. of Paris, hath fucceeded with this plant in the most obstinate cases of lucs venerea. He directs it in the following manner: R. rad. faponaria offic. fice. 3 i. fs. fol. ejusdem, fice. 3 fs. coque in aq. pur. 16 vj. ad iv. From two to four pints of this decoction are to be daily taken; and in bad cases, the patient is to take at the fame time the plant in powder, or in the form of an extract. This plant is also faid to be ufeful when applied externally to venereal ulcers, either in fomentation, or in a dry form, by fprinkling it in pow-der over the fores. See Lewis's Mat. Med. Neumann's

SAPONARIÆ NUCULÆ, also called baccæ Bermudenfes. SOAP BERRIES, BERMUDAS BERRIES. This is a fpherical fruit about the fize of a cherry. Its cortical part is yellow, gloffy, and fo transparent as to shew the sphe-rical black part which rattles within, and which includes a white kernel. It is the produce of a fmall tree in Jamaica, and other parts of the Weft Indies. The kernel when

steeped in water, raises a froth like foap suds.

These barries are powerful in removing obstructions in the liver and spleen; they mend an ill habit of body, and are a specific in the chlorosis; they help digestion. The best preparations are, a tincture made with white wine, a tincture in spirit, and the extract from the spirituous tincture. See Lewis's Mat. Med. Med. Mus. vol. iii-

SAPPHIRINA AQUA, also COLLYRIUM COERU-SARACHINUS. See Aco.

SARACHUS.

SARCOCELE, from oage, flesh, and wake, o tumor. It is a firm, fleshy kind of enlargement of the telticle, or the feirthous testicle. The farcocele, or bernia carnosa, Mr. Pott says, taken in a general sense, means any induration or diseased sless, though here confined to the testicle; and further observes that the farcocele, which is distinguished by the ancient writers into the farescele, the hydrofarcocele, the feirrbus, the cancer, the care adnata ad teftem, and the care adnata ad vafa, are really little more than deferiptions of different states and circumstances of the same dilease. The caro adnata ad testem is a seirrhus begun in the epydidymis. The caro adnata ad vasa, is a scirrhus of the epididymis somewhat increased, when it feems as if it fprung from the spermatic vessels. The bydro-farcoccle is when the testicle is enlarged or hardened; there is also a palpable accumulation of fluid in the vaginal coat. The farcocele is a disease of the body of the testicle; and, as the term implies, confifts, in general, in fuch an alteration, made in the structure of it, as produces a refemblance to a hard fleshy substance, instead of that fine fort, vascular texture, of which it is, in a natural and healthy state, composed. Many pass several years with this difease, under its most favourable appearances, and without encountering any of its worst; but, on the other hand, there are many, who, in a very flort time, run through all its stages. Sometimes the first appearance is a mere simple enlargement and induration of the body of the tefficle; void of pain, without inequality of furface, and produc-

producing no uneafiness, nor inconvenience, except what is occasioned by its mere weight. And in some few in-flances it remains thus for a considerable time, without visible or material alteration; but, in other inflances, very foon after its appearance in this mild manner, it fuddenly becomes unequal and knotty; and is attended with very acute pains, darting up to the loins and back; but ftill remains entire; that is, it does not burst through the integuments. In short, such is the variety of the appearances of this difease, that description can hardly afford an adequate idea of it. Sometimes the diforder seems to be merely local, that is, confined to the tefficle; at other times there is a pallid or leaden countenance, indigeflion, naufea, colic pains, fudden purgings, &c. fufficiently in-dicating a vitiated habit and difeafed vifcera. The pro-grefs also which it makes from the testis upward, is very uncertain; the difease affecting the spermatic process, in some subjects, for a great length of time; while, in others, it totally spoils the testicle very foon, and almost as soon seizes the spermatic cord.

Amongst the miltaken causes of a scirrhous testicle, Mr. Pott reckons the hernia humoralis. He does not say that a sarcecese never follows an hernia humoralis, but that it does not at any time necessarily cause or produce it. Mr. Bell, in his System of Surgery, fays, that a hardened state of the teftis and epididymis, produced originally by a venereal taint, does in fome inftances degenerate into the worst species of farescele. However, in general, the hernia humoralis is one of the difeases which should be distin-

humoralis is one of the discascs which should be distinguished from the sarcscele. A quantity of water is sometimes collected in the vaginal coat of a scirrhous testis, and fome have supposed that this water renders the testis scirrhous; but this not being true, the hydrocele and the scirrhous testicle should also be distinguished.

The only remedy from which any advantage is expected, is, the removal of the discased parts by extirpation. But before the operation is attempted, a consideration of the manner of the sarcscele's having been formed, and the state of the spermatic cord from the ring to the testicle, are objects of necessary consideration. When it proceeds from a blow on the part, success is more likely proceeds from a blow on the part, fuccefs is more likely to follow than when it is caused by a cancerous or strumous acrimony; when these last are causes, they will generally be found to exist on other parts also; therefore though the diseased testicle be removed, yet from the same cause existing in the habit, other parts soon after become diseased in the same manner. In strumous habits the glands of the mesentery, the lymphatics &c. are generally obstructed; therefore external applications signify very little; but such medicines must be used as first act on the primæ viæ, and then on the lymphatics; for in children they are feldom feen with this diforder without an enlarged belly, which before any further attempts are made must be lessened.

Mr. Pott observes, that some writers direct with respect to the spermatic cord as follows: first, if it is soft, and of its natural fize, castration may be safely performed; which is right. Secondly, if it is much enlarged, the operation is not vindicable. But this is going too far; for though it may be confiderably enlarged, yet if it has no unequal feel, is not painful, or manifests no tendency to feirrhus; its being enlarged is of no confermence for obtaining its being enlarged is of no confequence, for obstruction in a difeated gland will frequently occasion an enlarged varicous flate of its veffels. Lymphatics also, from the same cause, may be dilated or ruptured, which must consequently occasion an extravalation in the cells of the spermatic process, both which frequently happen in the sarcecele, and must certainly give the spermatic cord an en-larged feel; but it is not either of them that can be the larged feel; but it is not either of them that can be the leaft objection to the operation; the spermatic cord not being diseased, only enlarged, which is a circumstance worth regarding; for when it is only enlarged, the operation may be of use, but, when in an enlarged, cirrhous, painful state, too high to be able to make a ligature fairly above the part diseased, the operation can be of no use, but is most likely to prove fatal. Many advise to defer the operation until such symptoms come on, as darting pains in the testicles, pains in the loins, &c. which, in truth, instead of being a proper time, is too late; the spermatic instead of being a proper time, is too late; the spermatic process becomes affected, when a testicle is become truly scirrhous, so as never possibly after to be of any use to the patient. By carrying scirrhi too long, though at first the

diforder be local, a fcirrhous habit will be brought on \$ for before the fpermatic process becomes affected with feirrhous tefficles, the patient's habit is often found af-fected, and he is attended with colicky pains and other

confequent fymptoms.

After a venereal gonorrhoes, Dr. Swediar observes, that from improper treatment it fornetimes happens that one or both refticles grow hard, i. e. become feirrhous. In fome of these instances the disorder is accompanied with a fensation of a painful preffure; but frequently without any pain at all. He adds, that, in these cases, mercury given internally, or rubbed in externally, into the mercary given internally, or rubbed mexternally, into the perinacum and ferotum, twice a day, with the conflant application of a warm poultice made of the root of atropa mandragora, Linn. are often ufeful. Also that the cicuta, applied internally and externally, may be tried, with prospect of advantage. An emetic has been sometimes sound effectual. The decoction of the bark of the root of Daphne Mezereum, Linn. internally, and a poultice of it externally, has lately been very much recommended; but whatever means are used, it too generally happens that these swellings remain unaffected, except we can bring on the running again from the urethra; one method of effecting which, is to innoculate the venereal virus by means of a bougie introduced a little way into the urethra-However the fingularity of this last proposition may strike, Dr. Swediar affures us, that fuccess hath followed such practice: and we have only to confider, that an undoubted authority bids us to chuse the least evil of two that attend. Mr. Bell fays that, when a hardness of the testicles does not yield to the means commonly employed, fuch as moderate evacuations of blood, when these are indicated; a foft eafy diet, a lax belly; the use of a suf-penfory bandage; and especially when mercury, which, on the chance of the disorder being venereal, is very commonly tried, are all used without any effect; we may in such circumstances always have great cause to suspect that the disease is of a real bad nature; and when to this is joined an accession of more inveterate symptoms, and if the diforder, from the state of an indolent hard tumor, becomes painful, &cc. no farther delay ought then to be advifed: caftration must be proceeded to. See Sharp's Operations. Pott's Chirugical Works. Bell's Surgery, vol. i. p. 498. Lond. Med. Journal, vol. v. p. 32. Edinb. Med. Comment. vol. ix. p. 336. White's Surgery. p. 335. SARCOCOLLA. SARCOCOL, or FLESH GLUE. It

was thus called, because of its supposed power of con-glutinating wounds. It is a gummy resinous juice, from the penza mucronata, Linn. according to Curtis, in his Catalogue of the London Botanic Garden: and from the Catalogue of the London Botanic Garden: and from the pensea farcocolla, according to Weston in his Univ. Bot. and is brought from Persa and Arabia, in small spongy grains of a whitish yellow colour, and a few of a reddish, and sometimes of a deep red colour; these grains, when entire, are about the size of a pea. The whitest and most bitter is preferred as being the best. Its bitterish subacrid taste is followed by a sweetishness; it softens in the mouth, bubbles and catches stame from a candle: it dissolves storely in water, and a great part of it in spirit of folves freely in water, and a great part of it in fpirit of

wine. Its medical qualities are not much known. See Lewis's Mat. Med. Neumann's Chem. Works. SARCOEPIPLOCELE. A kind of compound rup-ture, confifting of a defcent of the epiploon and a farcocele. Or a rupture of the indurated epiploon, either umbilical or ferotal.

SARCOLOGIA. SARCOLOGY. It includes my-ology, fplanchnology, angiology, neurology, and the doc-trine of the integuments.

trine of the integuments.

SARCOMA, from sapt, flesh. Thus a fleshy tumor on any part of the body is named; also called porrus; farcephya. It is occasioned by an effusion of the nutritious juices out of their tubuli. These tumors have no cystis; they do not yield to the impression of a singer, nor are they moveable. Dr. Cullen places this genus of disease in the class locales, and order tumores. Extirpation is the only remedy; and if the basis is narrow, a ligature may be used, but if it is broad, the knife will be necessary. See Turner's Surgery, vol. i. p. 201. It is also a name for a polypus of the nose. See Turner's Surgery, the for a polypus of the nofe.

SARCOMPHALON, from σαρξ, fless, and ομφαλις, the navel. A fleshy excrefeence at the navel.

SARCOPHAGUM. See Assius Lapis.

8 B SARCO-

SARCOPHYIA. A SARCOMA. SARCOTICA. SARCOTICS. Medicines which ge-

SARCOTICA. SARCOTICS. Medicites which generate fieth in wounds. From σαρκου, to beal.

SARDIASIS. Involuntary convultive laughter; or rather the cynic fpafm.

SARDONICUS RISUS, called alfo fpafmus cynicus. SARDONIAN LAUGHTER. A convultive involuntary laughter, and is thus named from the herba fardonia, which is a species of ranunculus, and is faid to produce such convulsive motions in the checks as resemble those motions which are observed in the face during a fit of laughter. This complaint is fometimes speedily fatal. If the ranunculus happens to be the cause, the cure must be attempted by means of a vomit, and frequent draughts of hydromel with milk. See Actius Tetrab. iv. ferm. i. SARE.

See Essera. SARPEDO. See LICHEN.

SARSA,
SARSA,
SARSAPARILLA,
SA call it a species of bind-weed. It is brought from the Spanish West Indies; the slenderer pale fort comes from New Spain, the dark and thick from Honduras, the darkest and thickest from Quito. The fort most esteemed is the smilax aspera Peruviana, C. B. the smilax sorsaparilla, or Imitax alpera Peruviana, C. B. the Imitax [ar]aparilla, or [milax Virginiana bederafolia, foliis inermibus ovatis retufo-mucronatis trinerviis, Linn. VIRGINIAN IVYLEAVED ROUGH BIND-WEED. It is light, white within, but is not eafily powdered. The root confifts of a
number of ftrings, which are as thick as a goofe-quill,
flexible, free from knots, and composed of fibres which
run their whole length so that they may be slipped from
one end to the other. On their outside is a thin brown. one end to the other. On their outfide is a thin, brown, or yellowish ash-coloured skin; under this is a thicker, white, friable substance, and in the midde is a woody

These roots have a farinaceous bitterish taste, and no fmell. In 1563, the Spaniards brought a parcel of them into Europe, as a specific in the lues venerea, and in-deed a decoction of them in water is an excellent auxi-liary to mercury. When children are infected with the pox from their parents or nurses, the powder of this root may be put into their food. It is resolvent, attenuant, restores the appetite and digestion, even when the patient is hectic from a venereal cause. It promotes perspiration, attenuates vifeid humours; it relieves venereal head-achs and nocturnal pains, it is peculiarly ufeful when the bones are carious, or any way difordered from the venereal dif-

cafe.

The best preparation is a decoction as follows; R Rad. farfaparil. 3 iii. aq. fluv. fb vi. coq. ad. fb ii. & cola. If a little liquorice-root is added at the end of the boiling, the decoction will be more palatable. The dofe is half a pint four times in twenty-four hours, or fo as that two pints are taken in at that time; it must be made fresh every fecond day. It is the long ftringy part only that is ufeful. See Lewis's Mat. Med. Neumann's Chem. Works, Lond.

Med. Obf. and Inq. vol. i. p. 149, &c.

Notwithftanding the great virtues here enumerated, and the opinion many authors have had of this root, Dr. Cullen tells us, was he to confult his own experience alone, he would not give it a place in his Materia Medianos, the street of the confult has been aloned to the confult his own experience alone, he would not give it a place in his Materia Medianos. ca; for, tried in every shape, he has never found it an effectual medicine in the lues venerea, nor any other dif-

Mater. Medic.

SARTORIUS. Some call this muscle fascialis. It is called fartorius, or the taylor's muscle, because taylors cross their legs with it. It rises from the anterior superior part of the os ileum, runs inwards contiguous to the blood-veffels, and is inferted into the inner condyle of the

thigh-bone. It partly rotates the thigh.

SASSAFRAS, called also anhuiba. It is the root of a large tree of the bay kind, the laurus sassaffaras, or laurus fol. integris trilobisque floribus slavis, baccis cœruleis, Linn. The sassafras-tree. It is light, and covered with a rough and superposed to a rough a rough a rough a rough and superposed to a rough a ro with a rough and fungous bark, outwardly of an affi-colour and inwardly of the colour of rufty iron. It is brought from Virginia and other parts of America. It bath a fragrant fmell, a fweetish sub-astringent aromatic taste; the bark is stronger than the internal woody part,

and the finall twigs than the larger pieces. Spirit of wine takes up all its virtues, and water extracts a large portion of them. Distilled with water it affords an effential oils which is limpid at the first, but afterwards grows yellow, or of a reddish brown; the remaining decoction when evaporated, affords a bitterish subastringent extract; but an extract made from a spirituous tincture possesses all the virtues of the root.

Saffafras is used chiefly in infusion as a mild diaphor retic and corroborant in fcorbutic, catarrhal, and cacheckie diforders; but for these purposes the spirituous extract is the best preparation. See Tournesort's Mat. Med. Lewis's Mat. Med. Newmann's Chem. Works, Dr. Cullen has found the watery insuson of it taken warm, and pretty largely, very effectual in promoting sweat, but has not been able to determine to what partial cular purpose this sweating was applicable-MATERIA

SATANUS DEVORANS. See ANTIMONIUM. SATUREIA SATIVA, also called cunila sativa; thymbra, and summer's savory. It is the satureia hortentis, Linn. It is a low fhrubby plant, fomewhat hairy, with fmall, oblong, narrow leaves, let in pairs. Its flowers are in clusters in the bofoms of the leaves, and are of a purphin colour. It grows wild in the fouth of Europe, and is fown annually in our gardens. The leaves are warm, aromatic, and to the fmell are like thyme, but much milder. Rectified spirit takes up all their active matter. Water takes up the smell but not the talle. By distillation with water, a small quantity of effential oil is obtained. They are heating, somewhat diuretic, and promote the menses. purplish colour. It grows wild in the fouth of Europe,

SATUREIA LUTEA SYLV. See MELANAPYRUM.

MONTANA, also called thymbra, WINTER SAVORY.

RY. Its virtues are much the fame as those of the above fpecies. See Raii Hift.
SATURNI Extractum. See Plumbum.

SATURNUS. LEAD. Sometimes antimony is thus

named. See PLUMBUM and ADROP.

SATYRIASIS, called by the Arabians, Acrai, also Brachuna, and Satyrifmus. It is a violent defire of venery, even so that reason is deprayed by it. Dr. Cullen places it as a genus of disease in the class locales, and order dyforexize. He diftinguishes two species. I. Saty-riasis juvenilis, when, beside the excess of desire, the body is otherwise but little disturbed. 2. Satyriasis furens, when, with the excess of venereal appetite, the body is much diffurbed, as with fever, &c. The pulse is quick, the breathing short, the patient is sleep-less, thirsty, and loathes his food; the urine is evacuated with difficulty, and a fever soon comes on. The nature and cure are much the fame as are those of the FUROR UTERINUS, which see, and also Coelius Aurelianus, lib.

SATYRICA. See ENTACTICA MEDICAMENTA, SATYRION. A name for feveral species of or-

CHIS, which fee.

SATYRISMUS. 'The fame as SATYRIASIS.

SAUR KRAUT. Pronounced by the English. Sour
Krout. See Brassica.

SAURURUS. A plant called the LIZARD'S TAIL Boerhaave mentions four species. Their virtues are simi-

SAVINA. See Sabina.

SAXIFRAGA, from faxum, a flone, and frango, to break. An epithet for medicines which diffolve or break the ftone in the bladder.

It is also a name for a species of paronychia filipendula, apium.—Meum; Pimpinella, Rubia synanchica; Chry-

opim.—Meam; Pimpinella, Ruola Ijinanchia, Golffofplenicum.

Saxifraga Alba, also called fanicula fedum.

White saxifrage. It is the fanifraga granulata,
Linn. It is a plant with kidney-shaped, yellowish green
leaves, round, purplish, branched stalks, on the tops of
which are short loose spikes of white slowers. The root
is composed of small sibres, intermixed with little tubereless. It is personal, grows wild in sandy pastures, and cles. It is perennial, grows wild in fandy pattures, and flowers in May. The tubercles of the roots have a fweetish and lightly acrid taste, and they are aperient and diuretic. See Lewis's Mat. Med.

- ANGLICA. ENGLISH, OT MEADOW SAXI-FRAGE. Called also Famiculum Erraticum. It is the puccdanum filans, Linn. It is an umbelliferous plant with winged leaves; the flowers are of a yellowith white colour;

the root is long, and about as thick as a finger, brown the root is long, and about as thick as a finger, brown or blackish on the outside, and white within. It is common in meadows and pasture ground, and flowers in June. The root, leaf, and feeds, are diuretic, aperient, and carminative, and are far preferable to those of the white foxifroge. See Lewis's Mat. Med.

SAXUM CALCARIUM. See Cat.x.

SCABIES. The ITCH, see PSORA; also Lichen. Also adisorder of the bladder mentioned by Aetius. If after a paintal discharge of the urine, branuy scales appear in it, with

ful discharge of the urine, branny scales appear in it, with plenty of slender silaments, which subside, the ancients call it a feables, because it indicates a corrosion of the mucous and villous membranes thereof. In order to the cure, Actius orders an abstinence from heating things, and recommends milk, broth, &c. In Linnzus's Nosology, it is an order in the class of vitia, and signifies cutaneous diseases.

SCABIOSA. COMMON FIELD SCABIUS. Scabisfa arventis, Linn. It is a rough hairy plant; it grows wild in pasture-ground; it is of a nauseous bitter taste; and slowers in June. It is aperient, sudorific, and expectorant. Externally it hath been used as a cure for the itch, whence its name scabiosa. Boerhaave enumerates forty-eight species, but they are not noted for medicinal

It is also a name for several other plants. As Echino-

SCADIDACALLI. SCHADIDACALLI. See EUPHORBIUM.

SCALA SACRA. See CLIMAX.

SCALENUS MUSCULUS, (snakers, a figure with three unequal fides.) Some call it triangularis. It takes its origin from the transverse processes of the vertebrae colli; it grows larger as it descends, and is then collected into two masses, the anterior and posterior; the anterior is inferted into the inner edge of the first rib; on each side of this portion, the subclavian vein and artery, and the bronchial nerve pass out; the posterior part is attached to the posterior part of the first rib, and partly runs to the second; its office is to raise those two ribs, and to move the vertebrae colli to one side. and to move the vertebræ colli to one fide.

SCALPO. To scalp. To lay the skull bare is called fealping. The operation is performed by making an incision through the integuments and perioranium equally and at once: in doing this, use the edge of the knife rather than the point, especially if a fracture is suspected. After making the incision raise the perioranium a little from the bone with the edge of the knife, and to clear the bone use the scalenum.

In pursuing a fiffure, a rectilinear incision is the best; and in most other cases, an oval one is to be preferred. Arnaud and Gooch both give instances of their having made a crucial incision upon the temporal muscle with good success, the muscle still continuing its action. See Gooch's Treatife of Wounds, p. 253.

SCALPRUM, from fealpro, to raife or raife. A DEN-TICULAR, or RASPATORY; it is also called a RUGINE. It is any kind of iron inftrument with which you may rafp or ferape a rotten bone, &c. Sometimes the word fealprum

or ferape a rotten bone, &c. Sometimes the word feature means a little chiffel for amputating the fingers.

SCAMMONIA MONSPELICA. See PERIPLOCA.

SCAMMONIUM. SCAMMONY. The natives of Aleppo call it mabmosdy. The best is brought from Aleppo, an inferior fort from Smyrna. It is the produce of the convolvulus foliis fagittatis positive truncatis, pedunculis bisloris, Roy. Lugd. b. 427. Mat. Med. Convolvulus featurements and Switzens, or convolvulus Switzens, feu lus feammonia vel Syriacus, or convolvulus Syriacus, feu feammonia Syriaca, foliis fagittatis postice truncatis, pedunculis teretibus subtrissoris, soribus pallidi luteis, Linn. Syrian BIND-WEED, or feammony. The root is very long, and about three or four inches thick. In the month of June they cut the tops of the roots, as they are in the ground, and from this incifion there flows a milky liquor, which is received in fhells, &c. and which growing hard by its thinner parts being exhaled in the warm air, is the gummy refin, called feammony.

The gummy refin is brought to us in light fpongy maffes, gloffy, of different fluades from a grey or yellow white, almost to a black; when broken it appears bright and shining; it easily crumbles between the singers; if it is touched with a wetted finger it becomes milky; and if it is broken, and put into a glass of water, it dissolves into a milky liquor of a greenish cast. An inferior fort is brought from Smyrna, which burns the mouth more than that from Aleppo does. Though different parcels of feammony vary to much in their colour whilft in the lump, when powdered they are all of them of a brownish white colour.

Chuse such as easily crumbles between the fingers, is pellucid, grows infantly white on being wetted, and that leaves but little fæces when dissolved.

It is adulterated with wheat-flour, fand, afhes, &c. to discover which, the best method is to dissolve it in water and let it ftand a while; thus the feammens will be fuf-pended in the water, and the impurities will fink. The fooner it diffolves, and the less there is of fediment, the purer it is.

It loses its virtue by being carelessly kept.

It is a very brilk purge, and usually given to carry off redundant ferous humours in cold phlegmatic conflitutions. Like aloes, it feems to act more by fufing the hu-

mours than by a stimulus in the first passages.

Instammatory diforders are increased, and very irritable habits are injured by it. It is given from gr. iii. to 3 i. for a dofe. It needs no corrector, though fome expose it to the fumes of burning sulphur, but thus they render it inert. When it has undergone this operation, or any other mode of preparation, it is called diagrydium.

—It consists of about equal parts, resin and gum; whence

it diffolves equally in water and in spirit.

The London College directs a compound powder, and an electary; the last is called elect e feammonio, but formerly it was named elect. caryocsflinum. See Lewis's Mat. Med. Neumann's Chem. Works: Lond. Med. Obf. and Inq. vol. i. p. 13, &c. They are thus made,

ELECTARIUM E SCAMMONIE. Electory of SCAMMONY.

Take of feammony in powder, one ounce and an half; cloves and ginger, of each fix drams; effential oil of carraway, half a dram by weight; role-fyrup, as much as is fulficient. Mix the species, powdered together, with the fyrup; then add the feammony; and laftly the oil of carraway.

PULVIS E SCAMMONIO COMPOSITUS. Compound Powder of SCAMMONY.

Take of feammony, hard extract of jalap, each two ounces; ginger, half an ounce, powder them feparately, and mix them. Befides this there is the

PULVIS E SCAMMONIO CUM ALOE. Powder of SCAM-MONY with Alses.

Take of feammony fix drams; hard extract of jalap; Socotorine aloes of each an ounce and an half; ginger half an ounce, powder them feparately and mix them.

PULVIS E SCAMMONIO CUM CALOMELANE. Powder of SCAMMONY with Calomel.

Take of frammony half an ounce; calomel, double refined fugar, of each two drams; rub them feperately; powder, and mix them .- Ph. Lond. 1788.

The Compound powder of Scammony is also called, Cer-

berus triceps; and cornachini pulvis. SCAMMONIUM GERMANICUM. See CONVOLVULUS

MAJOR.—ORIENTALE. See GAMBOOIA. SCAMNUM. See BATHRON.

SCANDIX, called also, Acus Pastoris. Shepherd's Needle, or Venus' Comb. A genus in Linnaus's botany. He enumerates ten species. It grows in the fields in Europe.-It is oleraceous, and aromatic. Its properties are antiphlogistic, diuretic, and lactiferous—given in dropfics, and vertigo.—See CHAROPHYLLUM.

SCANDIX ODORATA. See MYRRHA, and MYRRHIS.

SCANDIX ODORATA. See MYRRHA, and MYRRHIS. SCAPHA. In anatomy it is the external circumference of the ear, opposite to the helix.

SCAPHA. It is a double-headed roller, of about two fingers breadth, for securing the compress after bleeding any part of the head. It is also a name for one of the cavities of the ear. See Auricula.

SCAPHOIDES, Os, from \$\sigma \alpha \alpha \pi\_t\$, or little \$ves\_{\text{lel}}\$, and \$ust \pi\_t\$, form. The first bone of the first row in the wrist is thus called by the Greeks; the Latins call it navigulars. It is articulated to the thumb. In infants it is culare. It is articulated to the thumb. In infants it is wholly cartilaginous; fome call it os cymbæ, and os cymbiforme; also the third bone of the tarfus. See CARPUS. SCAPULA-

SCAPULA. The shoulder-Blade. It is a triangular bone, fituated on the outfide of the ribs, extendfrom the fecond to the feventh; its fides are unequal; the posterior side or basis is the longest, the inferior colta is thorter, and the fuperior cofta is the thortest. The body of this bone is concave towards the ribs, and convex behind, where it is called dorfum. Three processes proceed from the fcapula: 1. The COROCOIDEUS, which fee. 2. The spina feapulæ, called intra-feapulæ; it arises from the posterior convex surface, and divides it unequally, it begins small at the base, and becomes higher and broader as it advances. The extremities of it are broad and flat, and hang over the cavity of the os hume-ti. To this part of the fpine, which is called acromion or epomis, the clavicle is articulated. 3. The third pro-cess is produced from the neck of the bone; this is hollowed on itsanterior part by a glenoid cavity, which hath an acute extremity above, and an acute one below.

SCAPULARIA. The SCAPULARY. See DELIGATIO.

SCAPULARIÆ ARTERIÆ. The scapulary AR-TERIES. The external feapulary artery, mufcularis arteria, passes through the notch in the superior costa of the scapula, to the mufculus fupra fpinatus & infra fpinatus, teres major & minor, also to the articulation of the sca-

pula with the humerus.

The internal fcapulary artery arifes from the axillary, near the axilla, and runs backward to be diffributed to the

fubscapularis, giving branches to the ferratus major, the axillary glands, the teres major, &c.

The superior scapulary artery is a branch from the sub-clavian; it runs downwards to the inside of the clavicle, follows the tend of the state follows the tract of that bone, and goes to the adja-

SCARIFICATIO, from σχεμφος, a little knife. SCA-RIFICATION. The word generally fignifies those incicater, and which is used in the operation called cupping. See Cucureitula, and Anasarca. SCAPUS. See Caudex.

SCARIOLA. See Endivia and Lactuca sylves-

SCARLATINA ANGINOSA. A fymptomatic kind of QUINSY. By different writers it is named angina mucofa, the mucous quinfy; febris anginofa, cynanche exanthe-matica, angina trypelatefa, amphimerina anginofa, mucofa, cynanche epidemica &c.

It chiefly affects young people, and women; fometimes it attacks the aged of both fexes. In large families and fchools, when it begins, it feldom paffes any one there

except the robust.

In this kind of quinfy the tumor is less than in the inflammatory quinfy; there is great redness in the part; when ulcers appear they are very flight and free from all the malignant symptoms of the putrid fore throat; it is more of the inflammatory kind than of the putrid, and the inflammation is of the crythematous species. Dr. Grant observes, that usually the pain in the throat is a very early fymptom, attending before the rigor, though now and then inftead of pain in the throat there is perhaps a foreness of the tongue, or a degree of fallvation in the course of the disease; an efflorescence often appears on the arms, but fometimes they fwell without the efflorescence. For the most part the appearance of ulcerous floughs, is no more than an inflammatory exudation on the parts about the fauces, and may eafily be washed off. The tongue often appears as if glazed, and is ten-der, fwelled, and affected with pain. Ufually it arrives at its height in about seven days, and in a fortnight the patient is perfectly recovered.

It should be distinguished from a catarrh, from the in-

flammatory quinfy, from the putrid quinfy, and from the

If the pulse is large, foft, and not above one hundred in a minute, the danger is not confiderable. The faliva-tion is very falutary; as foon as it is well established, the danger is over.

This fever is caused and kept up by contagious parti-cles; to attempt their expulsion by opening all the natural emunctories is the principal curative intention.

When the habit is good and fymptoms flight, a few doses of r. rhab and cr. tart, with a draught now and then of weak wine-whey, is all that can be useful. The degree of the distemper demands the first attention. If

Inflammation is confiderable, bleed, more or lefs freely as circumftances determine; and this at any period of the difeafe. Emetics and purgatives are of principal ufe, when the feafon is favourable to bilious and putrid difeafes. In the early part of the difeafe, a kindly perfpiration is peculiarly falutary, which flould if pollible be kept up at least to the fifth day, when it usually is convenient to open the bowels a little. When the salivation commences, improve the diet; a little wine should be added mences, improve the diet; a little wine should be added to the suppings. Mild antiseptics are often now required, which may be accompanied with some light preparation of the bark; it may be proper to be cautious of an early use of the bark, as it checks those discharges that are observed to be so falutary, and rather increases the swelling of the parts affected. At any period of the discase, it the swallowing is difficult, apply a blifter round the throat.

Sometimes bleeding is improper; when warm fuppings, moderate diaphoretics, and gentle purgatives are to be moderate disphoretics, and gentle purgatives are to be preferred. Sometimes the parotid and maxillary glands fwell, and are hard; if bleeding can be admitted, it may be recommended; if not, repeat proper purging once in two or three days. Sometimes the nofe bleeds; in which case, if the head is much affected with pains, the skin hot and dry, the breathing difficult, the pulse hard, and not immoderately quick, bleeding will be a most necessariate.

When from the feafon, &c. bleeding cannot be prudently encouraged, the antimonium tartarifatum is findently encouraged, the antimonium tartaritatum is fingularly ufeful, given so as to vomit and purge. When the pulse is small and fost, the rigor great at the first attack, the consequent heat considerable, be careful early to clear the primæ viæ; thus, the pulse rises, a kindly perspiration comes on, which may be supported to thirty-fix or forty-eight hours, or as required; then give a gentle purge as above noticed, when the salivation appears.

A relanse sometimes approaches with pair in the feet

A relapfe fometimes approaches with pain in the feet and hands; in which case wrap the parts pained in flannels, and promote a gentle perspiration. Antimonials are efficacious when perspiratives are required in any period of this disease: but the aqua ammoniæ acetatæ seems generally to deserve the preference.

Emollient and gently detergent gargles are valuable aids for reliaring the unexpires. So, in the threat

for relieving the uneafiness, &c. in the throat.

Blifters on the throat are often objected to on account of the mark they leave in the fkin; in those cases first apply a blifter between the shoulders, and when its dis-charge begins to decline, apply one behind each ear, and down the sides of the neck.

Huxham treats on this disease, under the name of Febris anginesa. See also Dr. Wm. Fordyce's New Enquiry into the Cause of Fevers; Dr. Wm. Grant's Observations on the Angina maligna Ulcerofa. Cullen's First Lines.

edit. 4. vol. ii. p. 187. &c.

SCARLATINA, vel. SCARLATINA FEBRIS. The sCARLET FEVER, It is so called from the colour of the patient's skin, which appears as if tinged with red wine.
Dr. Cullen places this genus of difease in the class pyrexize, and order exanthemata. He distinguishes two species. I. Scarlatina simplex; that is when not accompanied with any species of quinfy. 2. Scarlatina cynanchia; when accompanied with the ulcerated quinfy, it is the fearlatina anginosa. Sydenham observes, that children are its most frequent subjects, and that when it is epidemical, it is ufually fo at the close of the fummer. It begins with a chilliness and shivering; after which the whole skin is covered with red spots, which are more numerous, larger, and redder, but not fo uniform as those of the measles. These spots continue two or three days, and after they vanish, and the skin is scaled off, there remains a kind of branny scales dispersed over the body, which fall off, and come again, two or three times fucceffively.

It feldom requires much affiftance from art, except there is an approach to that putrid state to which it inclines in the advanced degrees. Bleeding is rarely required. The patient may be kept in his room, but not much in bed; his drink 'may be acidulated with the vitriolic acid, or with Clutton's febrifuge spirit; and if a stool is required, rhubarb will be the most convenient; when the skin peels

off a more active purge may be given.

Sometimes a coma, or an epilepfy, happens in the beginning of the difease, in which case apply a blifter to the back. When it is attended with more malignant symptoms.

SCELETOS, from σκελλω, to make dry. A SKELEments, veilels, mufcles, &c. and properly connected, have the general name of fkeleton. There are two forts, the natural, and the artifical; the first of these is when the bones are kept together by their own ligaments; the fecond is when they are joined with wire.

SCELOTYRBE. It fignifies those pains in the legs

that generally attend feorbutic habits; whence it is frequently used for the seurcy itself, see Scorbutus; and also applied to some medicines contrived against such disorders. It is often expressive of the choica S.

Viti.

SCELOTYRBE FESTINANS Idiopathic convulsion. - VERMINOSA. A kind of symptomatic con-

SCHÆNOPRESSUM. See CEPASTRUM. SCHAGRI-COTTAM. See CORNI.

SCHARTICOTTAM. See CORN.

SCHENANTHUS. See JUNCUS ODORATUS.

SCHENANTHUS. See JUNCUS ODORATUS.

SCHENOLAGUROS. See LINAGROSTIS.

SCIATICA. Corne deleres ifebias; ifebiadicus morbus.

See Rheumatismus. It is the rheumatifm when

feated in the hip.

SCIATICA ARTERIA. It is a branch of the hypogaltrica; it runs under, and gives branches to the mufculus pyriformis, quadrigemini, and the os facrum, and to the inner fide of the os ifchium; it paffes obliquely over the feiatic nerve; and as they both go through the great posterior finus of the os ileum, it detaches fmall articles which are distributed to the inner fisher are di teries, which are distributed to the inner substances of the nerve: afterwards it runs up in a radiated manner, on the outfide of the os ilium, and is diffributed to the inner fubitance of that bone, and to the mufculi glutzei, especially to the medius and minimus.

VENA. When the crural vein hath descended

to about the upper extremity of the mufculus vaftus in-ternus, it produces a branch which runs down on the fide of the trunk, covering the crural artery almost down to the ham, where it is again united to the trunk by an anastomosis; and sometimes it is continued a little way down on the leg. It is called the SCIATIC VEIN, from accompanying the fciatic nerve.

SCIATICUS NERVUS. See Lumbares.

SCILLA. The squill, or sea-onion, called also ornithizalum. Scilla maritima, or feilla Hispanica, foliis lanceolatis strictis, scapo longistimo multisforo, sforibus albis & nudis, bracteis refractis: radice alba, Linn. It is a plant with a large bulbous root, like that of an onion, which is very acrid. The leaves are broad, the flowers are like those of the ornithogalum, and grow in a spike before the leaves appear. There are two species which are used indifferently, viz. the red and the white; Boer-haave mentions a third fort.

Epimenides taught Pythagoras the use of squills, and the vinegar prepared with them; and Pythagoras made

the vinegar into an oxymel.

This plant grows on fandy shores in Spain and the Levant, from whence we have them. Chuse such roots as are Jarge, plump, fresh, and of a clammy juice. To the taste they are nauseous, bitter, and acrid; if much handled they exulcerate the skin. Internally they are a powerful attenuate and aperiors; in a dose of a few grains they promote expectoration and urine; indeed when fquills are given as a diuretic, the dole is a true one that produces not vomiting; for we cannot prefume upon their operation in any manner, without their being upon their operation in any manner, without their being given in fuch a quantity, as to produce naufes, but small doses excite expectoration most effectually; in larger the Nile. The flesh of this animal hath been in much doses it is purgative or emetic. They powerfully diselfeem as a diuretic, alexipharmic, &c. but it is now negfolve tough phlegm, and promote its discharge; whence

toms, its tendency is to the putrid kind of fever, with ulcers, &cc. in the throat. Here blifters, which may be applied to the back and throat, with the bark, are the chief dependencies, and, as in the putrid fore throat, acids and cordial perfpiratives may accompany the bark. Antimonial preparations, which are so generally useful in fewers in this case are apt to occasion a purging.

See Wallis's Sydenham. Obs. on a late particular Searlet Fever, by N. Cotton, M. D. Cullen's First Lines, edit. 4. vol. ii.

SCARLATINA URTICATA. ACUTE NETTLE-RASH See URTICARIA.

SCELETOS, from GREADS, to make dry. A SKELE
SCELETOS, from GREADS, to make dry. A SKELEas we can to the parts we with it to enect, either by proper dofes, or coupling it with fach medicines as may afiff in determining it to them, large dofes will answer
the first purposes and often the second joined with other
purgatives. Expectorants in smaller doses; or diuretics, the
three last. See Cullen's Mat. Medica.

On account of their offensive taste, the best form is

pills; and to prevent the natifea which they excite, when not intended either as an emetic or an expectorant, a few grains of fome agreeable aromatic may be added to each dofe, or it may be made up with the fresh root of elecampane. The best form is in powder fresh, and proper-ly prepared, for age or want of management destroys

Water, wine, proof spirit, rectified spirit, and vinegar, extract the virtues both of the fresh and the dry squills; but none of them carry any thing with them by diffilla-tion; fo that in the extract made from the decoction, the whole of the active parts are retained. Alcalies abate both their bitterness and acrimony; vegetable acids make very little alteration in either, but they improve their expectorating quality.

The College of Physicians, London, order several pre-

parations of fquille, which are made in the following

# CONSERVA SCILLE. Conferve of Squill.

Take of fresh fquills, one ounce; double refined fugar, five ounces. Beat them together in a mortar, into a conferve. Its dole to adults is from half a dram, to one feruple, especially when fresh.

#### SCILLA EXSICCATA. Dried SQUILL.

Cut the fquills transversely, after the outward skin has been taken off, into thin flices, and dry it with a gentle heat. It is given in powder as an expectorant and diuretic, to adults, in dofes of a few grains.

### MEL SCILLE. Honey of SQUILL.

Take of clarified honey, three pounds; tiucture of fquill, two pints. Boil them in a glafs veffel, to the thickness of a syrup.

## OXYMEL SCILLER. Oxymel of SQUILL.

Take of clarified honey, three pounds; vinegar of fquill, two pints. Boil them in a glass vessel, with a flow fire, to the thickness of a syrup.

## PILULE SCILLE. SQUILL-PILLS.

Take of fresh dried fquill, powdered, one dram; ginger powdered, foap, of each three drams; ammoniacum, two drams; fyrup of ginger, as much as is sufficient. Best them together.

# TINCTURA-SCILL M. Tindure of Squill.

Take of fquill fresh dried, four ounces; proof spirits of wine, two pints; digeft for eight days, and pour off the liquor.

ACETUM SCILL R. Vinegar of SQUILL, formerly called Acetum Scilliticum.

Take of fquill, fresh dried, one pound; vinegar, fix pints; proof spirit, half a pint. Macerate the fquill in the vinegar, with a gentle heat, in a glass vessel, for twenty-four hours; then press out the liquor, and set it by, that the seees may subside; lastly pour off the liquor, and add to it the spirit. Pharm. Lond. 1788.

a hard tumor, with little or no fensation remaining in it. the skin, particularly about the face and lips, where Galen Comment. in Aph. xxxiv. feet iv. Dr Cullen it is so very irritable, that whatever is applied occasions places this genus of discase in the class locales and order great pain, and therefore is called noti me tangere. Here tumores. Dr. Aitkin reckons the physicania, a genus in Dr. Cullen's system, a species of scirrbus: the sarcocele he includes as another species. The seat of this kind of tumor is ufually fome glandular part; not but fome other may alfo, and fometimes is thus difordered. Dr. Cullen defines a fcirrbus to be a hard tumor of a part, mostly of a gland, not painful, and difficultly suppurating. The fluids in the glands being inspillated, increase in hardness, and form a scirrbus; or the contents of the lymphatic vessels in the liver, or other parts coagulating, gradually harden, and form the like. It is probable that feirebufes are formed by too free bleeding; for thus the circulation may be fo diminished in its force as not duly

formed, which end in scirrbi. All perfons, and at any age, may be the subject of this diforder; but the fedentary, and more particularly women when their menfes decline, and fometimes indeed at their approach, are most frequently thus disordered.

to affect the finaller veffels, and thus obstructions may be

From the most attentive examination, it appears that the matter of these tumors is inspissated lymph. They often arise without any previous inflammation from the proper fluid stagnating in the gland, or extravasation from contusion, &c. Sometimes it happens when a gland is the seat of an inflammation, and the inflammation terminates without coming to suppuration.

Externally they are perceived by the touch. Internally the evidences are obscure, but if the causes of a scirrbus have occurred, and if some defects attend, to which we may impute a fcirrbus as the cause, the existence of one

may be suspected. Though a feirrhus does not always become cancerous, yet cancers are most frequently only feirrbuses in their be-ginnings. The effects of a seirrbus will be various, and very different, according to the part it affects, and the functions which it injures. By prefling on the yena cava, a mortification in the legs; on certain nerves, epileptic fits have been produced. If all the glands in the neck are indurated, those of the mesentery will be so too, in which case a cure is not to be expected. A feirrbus in the liver produces a jaundice, which is difficult, and often impossible to cure, and this jaundice is followed by a dropfy. A feirrbus may so press upon the thoracic duck as to occasion a fatal atrophy. Whether a feirrbus is feated internally or externally, if it is affected by acrid humours, or inflammation, being thereby heated, it becomes cancerous.

If an attempt is made towards the cure of a feirebus, we should be certain that it is recent and not yet quite hardened, and that it is in its benign state, i. e. that it is free from itching, heat, or pain; for, after the appearance of any of these circumstances, nothing but a palliative cure can be admitted, except the knife can be prudently nsed. In the earlier state of an external fcirrbus, gentle thed. In the earner trate of an external fearners, gentle mercurials are used internally, but with caution not to irritate; externally, cooling and anodyne applications only are to be employed; such as the aq. saturn of Goulard; the scirrbous part should be covered with soft leather to prevent the cloaths from irritating it; whatever heats, softens, or can tend to produce a suppuration must be carefully avoided; a solution of sal ammoniac in vinegar is applied externally as a resolvent. applied externally as a refolvent; fome apply the vapours of vinegar to the tumid part. If a feirrbus is small, and continues of the same size, do nothing; if it suppurates, increases, and is detached, extirpate it with the knife. Some good practitioners advise to extirpate these tumors as soon as they seem to resist the effect of gentle means made use of for refolving them, and that before any fymptoms of their becoming cancerous appear. For correcting the faulty flate of the fluids, and for refolving feirrbous obstructions, the hydragyrus muriatus, given fo as not to falivate, contributes much, if the bark, and the extr. ci-eutæ, accompany it; their united efficacy is fometimes fuch as cannot be produced by any two of them without the third.

What is here faid of a feirrbus in general is applicable to a feirrbus in any external part; however, as there are fome peculiarities from their fituation, it may be proper to take notice of fome of them.

SCIRRHUS, from onigiou, to harden. A feirrbus is A scirreus may affect the SEBACEOUS GLANDS of Mr. Plunket's medicine (fee CANCER) may do well if the case be recent; but it should never be used unless we can remove the whole tumor. If we cannot affect this, we are at first slattered with the hopes of a cure, but the difeafe foon re-appears in another flate, which carries off the patient. In thort, whilst feirrhous tumors are loofe, entirely free from pain, and the figure of the tumid gland is unchanged, whether the caustic or the knife are used, success may reasonably be expected, whether the situation of the disordered gland is in the sace, or any where else in the reach of those means of relief.

A SCIRRHUS IN THE BREAST. Whether the breafts of women are glandular or not, their structure is such, that indurated tumors are formed in them. Some tumors in the breaft refemble a true feirrhus; but in time they inflame, fuppurate, and end favourably; and it is not eafy to give the diferiminating figus with precision enough to be depended on in the beginning. It may be observed that a genuine feirrbus seldom occasions uneasiness, except it becomes cancerous; and when an inveterate scirrbus seizes the breast, the subaxillary glands are generally indurated too. The breaks are fometimes reddered feirrhous by the imprudent application of the spirit of wine to them; about the cellation of the menfes, the breafts of many women are thus affected.

A SCIRRHUS IN THE INTESTINES. After an inflammation in these parts, a scirrbus may be formed, in which case there will be a stupor, a sense of weight, and a conftant distraction perceived where it is feated. There will be a leffening of the cavity of the inteffines as the bulk of the tumor increases; the chyle and the faces stagnate there; at length the iliac passion, or some other violent fymptom, puts an end to the patient's mifery. In fuch a cafe, if any palliative remedy moderates the un-cafiness and retards the growth of the tumor, that will be all that medicine can effect.

A SCIRRHOUS LIVER. A part of the liver, or its whole fystem, may become feirebous. These tumors in this part generally are small in their beginning, and are gradually increased; when they inflame they occasion feverifiness, and the general health is much difordered; but these fymptoms vanish, and for a time the health feems to be reftored; the intervals of these inflammations become fhorter, and then the appetite and fleth fail, a little cough comes on, and a hiccough, fometimes with, fometimes without, and bring on death; in fome all this happens in a few months; in others it takes up feveral years. If the inflammation is in the internal parts of the liver, the pain is fometimes too little to be regarded; but happening on the external parts, it extends to the diaphragm, or other adjacent parts, and in this case the patient generally lies on his right fide. In the advanced state of these scientis, the blood will gush out freely from the nose, stomach, navel, and with the stools; in the worst of these cases, though the countenance is of a leaden colour, yet sometimes there will not be any figns of a jaundice; for this fymptom does not happen except the duchs are com-pressed by the feirrbus, so as to hinder the passage of the secreted gall through the common gall-duch. An indurated liver is often very evidently diffinguishable by applying the hand to the region of it. As to other figns that attend a fcirrhous liver, they also accompany other difor-

ders, fo determine nothing in this cafe.

But whether it happens that a feirrbus is feated in the liver, fpleen, or the pancreas, certainly to diffinguish them feems to be but of little moment, as little or nothing more can be done towards relief than what the common cure of the heclic fever requires, whether it arifes from this, or from any other cause. In the beginning, and whilft the diforder is flight, perhaps a free use of grafe roots, endive, succory, and whey, used as a diet, might be of some use; but in the more advanced degree, no cures are performed, except by an inflammation ending in sup-puration, and the abscess bursting where the matter can be carried directly out of the body, as when the matter is emptied into the hepatic duct, or through the fide of the belly, which laft may happen when the liver adheres thereto. See Lond. Med. Transactions, vol. ii. p. 143, &c.

A SCIRRHUS IN THE TONGUE. A tumor of this

kind fometimes happens in this part, and remains many | tient's life, this should not be a sufficient reason for am years indolent; in which case avoid all attempts to remove it, as it may easily be made to become cancerous. If it should become painful, and is moveable, dissect it out; but if immoveable, cut away a part of the found slesh with it; dress the wound with the honey of roses and balfam of Peru.

A SCIRRHOUS TONSIL. This can no way be managed with advantage, except by means of the ligature, as recommended by Mr. Sharp. See his Operations and his

Critical Enquiry.

A SCIERHOUS WOMB. This is one of the opprobriums of medicine; it always degenerates into a cancer, and destroys the patient. In all cases of scirrhosty the mild preparations of arsenic might be tried, for they have been in some effectual. See Arsenicum Al-num. Arctæus de Method. Medend. l. xiv. c. 4. Galen's Meth. Med. SCLEROTICA. I from σπλαρος, bard. Of the proper SCLEROTIS. I coats, of the eye, the tunica leterotica is the outermost. This, in the posterior and far greater part of its circumference, is white and opake; but in the anterior is transparent, and takes the name of cornea. The remarkable whiteness which this coat appears to have its from the expansion of the tandens of pears to have, is from the expansion of the tendons of the muscles, which move the eye over its fore part; this tendinous expansion, though called tunica albuginea, is not properly a coat of the eye; for it, like the conjunc-tiva, is only partially spread over its forepart. See

SCLOPETOPLAGA, from felopetum, a gun, and plaga, a wound. A gun-shot wound. It is a species of vulnus, though some writers make it a genus of disease. This kind of wound is a contusted wound in the highest degree. The ancient fupposed these to be of a malignant, possonous nature from gunpowder; hence warm antiseptics, &c. were used; but the ill effects of gun-stot awands are owing to contusion, laceration, &c. and require the most senior methods to be pursued; such as relaxing the parts by an emollient cataplasm; and if there is but one small opening, to enlarge it for a free discharge of matter, or to ex-tract foreign bodies, if it can be done easily; but if by endeavours to remove them, you are likely to irritate, or give great pain, it will be best to wait until the inflammation, &c. is gone, and fuppuration established; by which means you will have a larger opening, and extract any extraneous body more easily; for, at first, the orifice of a wound through which a ball hath entered by its contraction, is always exceeding fmall before suppuration

Amongst the many peculiarities from gun-shot wounds, fee a remarkable one in the article FRACTURA, and the

division, a fractured leg.

Most limbs are taken off in the field of battle, and few of them recover. It is best to perform as few operations as possible in these cases; and, if you can, leave those as possible in these cases; and, it you can seave those few until some time after they have been wounded, as most of these, where amputation is performed immediately, die of the operation, as indeed they do in all cases where it is performed in high health. Limbs should not be amputated in the field if they can possibly be avoided. The inflammation should first be allowed to go off; and if ever from the nature of the wound, the inflammation that we suppose should attend it, should be imagined to hazard the pa-

putation, because the operation will more than hazard his life in fuch a fituation, and in fuch a ftate, as experience

The joints having been mashed by external force, or a ball having passed through them, seldom do well with-out amputation, especially if there is a great laceration of the ligaments, and a discharge of the synovia, with the admittion of the external air; for the violent inflamma-tion, floughing, and difcharge, bring on a hectic fever, which with colliquative fweats, from the absorption of

matter, will carry off, the patient.

It may be further observed, that injuries from finall shot are rarely fo prejudicial to the bones as those from larger thot; from these last, the bones are generally split or splintered, and require that amputation be performed above the joint of the part where the injury is received,

if possible.

Those who affert, that amputation should be quickly performed, when rendered necessary from gun-streamed, advance the following reasons: 1. When the injury is from large shot. 2. When violent symptoms come on. 3. When violent fymptoms are overcome by medicines, yet there is still a necessity for amputation. These form the three stages from this kind of injury: and when it happens that a patient passes through the first and second, except perhaps one in one hundred, he is taken off in the third

SCOLOPENDRIUM. HARTS TONQUE. It is the afplenium feologendrium, or afplenium frontibus simplicibus cordato-lingulatis integerrimis, ftipitibus hirfutis. Linn.

See LINGUA CERVINA.

SCLOPETARIA AQUA. See ARQUEBUSADE.

SCOLYMUS, called also cardens crysanthemus; cryngium luteum. Monspeliense; cichorcum luteum. GOLDEN
THISTLE. Itisa genusof the fyngenesia polygania equalis class; there are two species which grow in the fouthern

parts of Europe. It is also a name for the cinara.

SCOPA REGIA. See Ruscus.

SCOPARIA. See CHENOPODIUM.

SCOPULA. A BRUSH. The flesh-brush promotes a brilk circulation, and free perspiration. Persons with weak nerves, the sedentary and paralytic, should supply the want of exercise with half an hour's rubbing every

night and morning.

SCORBUTUS. The scurvy. By the ancients it is called fismacce, and feelstyrbe, because of these symptoms that attend it. Hippocrates describes it under the name of the diseases of the spleen, in his work De Intern. Affect. Dr. Cullen places this genus of difeafe in the class cachexize, and order impetigines.

The fewry is a chronical diforder of the putrid kind; and when a fever attends it, is called the PUTRID FE-

VER, which fee.

The immediate cause is the same with those that produce the putrid fever, that is, putrefeence. The me-diate and more remote causes are whatever lessen the vis vitæ, too little or an improper kind of food, a damp air, living in marfly countries, various kinds of acrid mat-ter in the blood, a long use of mercury; in the navy, a solution of copper from want of care to clean the vessels in which their food is boiled; animal diet which is not well presence of this disorder is known by a pale, or a

yellowish complexion, which gradually grows darker; a melancholy dejection of spirit, a lassitude, a stiffness in the melancholy dejection of ipirit, a lathtude, a littinets in the joints, a feebleness in the knees, and on using the least exercise there is great weakness, with a difficulty of breathing; the gums soon after begin to itch, swell, and bleed on being gently rubbed, and have an unusual livid redness; they are soft, spongy, putrid, and sungous; this change in the gums, Dr. Lind seems to think, is the pathogonomonic symptom of the disease. Hemorrhages also happen in other parts; the skin feels dry, except in the thognomonic symptom of the difference. Are morrhages also last frage of the difference when a cold clammy moisture may be observed on the skin. In some the skin is rough, but generally it is smooth and shining, and covered with many spots, as if bruised; these are of a yellow or reddish colour, and as the difference increases they become blacker. In some the ankles swell towards the evening, and are fettled again in the morning. Many other fymptoms oc-cur, but they are accidental. If a feorbutic diarrheea

comes on, and there is a pain in the breaft, it is generally and become acid. Secondly, they contain a quantity of fatal. Ulcerated lungs are a frequent confequence of the least motion; and on being suddenly moved into the fresh air, it fometimes happens that he expires. Hemorrhages from the lungs, intellines, &c. now are frequently happening: but the appetite is often good, though the fpirits are low. The third stage hath many violent, and usually fatal fymptoms.

The fearty should be distinguished from the ileum eruentum, the black jaundice, hypochondriac and melancholic diforders, fome fymptoms of the lues venerea, and

feorbutic cachexy.

The indications of cure are, to stop the progress of putrefaction, and totally to remove it; secondly to strengthen

the habit in general.

If bad waters are the caufe, or improper food, they must be changed for that which is more faintary; the air in the patient's room must be regulated by such methods as will render it dry and warm. Fixed air communi-cated to the water which the patient drinks; an infusion of malt, as recommended by Dr. Mac Bride; the bark in doses as large as will be easy in the stomach, repeated two or three times a day. The dilute vitriolic acid may be given frequently in the patient's drink; these and other antiputrefeents, or fuch means as are used in the putrid sever, will be the principal ones here. If the patient is cold, pale-faced, and hath swelled legs;

if his thirst is not great, he may take four or fix spoonfuls of the following, three or four times a day: R rad. raph, hort. 3 iv. fol. cochl. trifol. palud. 55 m. ii. falviæ. m. i. vin. alb. ib vi. m.

If, on the contrary, there is a feverish heat, thirst, some difficulty in breathing, and the gums are putrid: R rad. lapath. acut. 3 i. cryftal. tart. 3 iii. coq. per horse fs. in lact. vac. 13 iii. & colature adde mel. Brit. 3 i. m. cap. 3 iii.

The roots of the herba Britannica, or the great water-

dock, is much extolled in this diforder.

Particular care is required to promote the discharges through the fkin, and by the kidneys. And as to particular lymptoms, fome of the chief of which are as follow, they may be managed by thefe or fuch like methods: the spongy gums may be washed with a decoction of the bark acidulated with the muriatic acid, and ulcers spread in the mouth, touch them now and then with the mel rofæ acidulated with the fame acid. If a falivation comes on, divert it by blifters on different parts of the body, fina-plims to the foles of the feet and hams, and, if possible, excite a perspiration; for the stricture of the skin is the chief cause of this symptom, and here boluses of camphor and some cordial mild opiated electary may be repeated every four or fix hours. If the legs are cedematous, ufe gentle frictions. Ulcers in the legs, &c. may be treated as those in the mouth are. In case of hæmorrhages, the mineral acids may be given at proper intervals. When mineral acids may be given at proper intervals. When a fever attends, the dulcified mineral acids, or Clutton's sebrifuge spirit, may be joined with such other medicines as the peculiarity of the case requires. But though some advantage may be obtained by these particular administrafymptoms disappear in proportion as fuccess follows the general method of cure.

Dr. George Fordyce observes, that the feuroy is taken off or prevented by such food as is capable of being digested properly. Putrefaction of the fluids never produces a difease of itself, but only symptoms depending upon this; for when these symptoms are taken off, the patient recovers; and we fometimes fee in putrid fevers, where the patient is confiderably weakened, fo that in all probability he could not furvive many hours, yet there hath been a fud-den alteration take place; the fymptoms of putrefaction immediately fublide, and the patient recovers; if then we could give proper food, we might be able to prevent it, and could always cure it, when it hath taken place. In order to the cure, any fuch lose food that bath no medical property is of great fervice; and the most powerful are those of the tetradynamia class, such as cabbages, turneps, &c.

ferry: the ftools are very offensive: the urine speedily becomes putrid. In the second stage, the patient some-times loses the use of his limbs, the second six or times loses the use of his limbs, the second six or times loses the use of his limbs, the second six or the body. We should then make choice of such food as this. Besides these, there are native vegetable acids or accept fruits to be got, which likewise prove useful; hams are contracted, the patient frequently faints upon the that will give a tendency to become acid, that may be kept on board of a thip for the use of failors: there are but few which we can perferve, and these are oranges, lemons, limes, &c. any of these, given with animal food, will be of use, as will also the use of fauer kraut, and infusion of malt. Sugar is an antiputrescent, though not fo powerful as the vegetables; but it was much used with food, &c. before vegetables came into use. These then are the methods to prevent and to cure putrefaction. Many have used remedies as antiputrescents, to stop putrefaction, hence they have given acids, &c. for that purpofe, but they will not produce that effect. They have a tendency to prevent the peculiar fermentation taking place in the flomach, as well as to check putrefactive fermentation; hence vegetable food will not ftop fermentation, but only tend to alter the mode of the fermen-tation, and rather tend to convert the fubftance into an acid than fuffer it to putrefy. Another method to relieve from the fearey, is to keep up the strength of the sto-mach, which has been of considerable service; hence, bark, &c. have been used, which are powerful reme-dies for that purpose.

Sir John Pringle, in his Difcourfe on the Improvements for preferving the Health of Mariners, fays, that to know the nature and cause of the scarry, is an effectial step to the knowledge of the cure. He says, that on examining all the articles which of old have been used, and approved of, as well as those which of late have been introduced into the navy, however they vary in their mode of operating, they all fome way contribute towards preventing or correcting putrefaction. He directs that the men be put to watch at three watches inflead of two; to this end divide the crew into three companies, and put each companies are also as the watch by twenty four hours at a time, they pany upon the watch by turns, four hours at a time; thus every men hath eight hours free, for four of duty : whereas, when half the men take watch every four hours by turns, they can have but broken fleep; and when expefed to wet, they cannot get dry before they lay down.
2dly, To preferve the men from the injuries of the weather, in hot climes defend them by an awning over the ther, in hot climes defend them by an awning over the deck; in cold ones, allow extraordinary jackets with a hood; and in wet weather proper means for drying and shifting themselves. 3dly, Make a point of cleanliness; this guards from putresaction: keep the men's persons, cloaths, bedding, and births, clean; review the men, and all things belonging to them, and the ship, and see that all is as clean as can well be. 4thly. Ships should have the means of a constant supply of fresh water to wash the men's linen, for salt water neither mixes well with soap nor dries readily. 5thly, Dry and air the hammocks. men's linen, for falt water neither mixes well with foap nor dries readily. 5thly, Dry and air the hammocks, bedding, and all bundles, every day that is fair: by the perspiration of many men, every thing below deck will in twenty-sour hours contract an offensive smell. 6thly, Purify the ship; scrape and wash the decks; purify the holds, and wells of the pumps; and where the bilge-water is, with fire as follows: light a good quantity of wood, and put it into a proper grate, then carry it suc-cessively to every part of the ship below deck. Where-ever size is, the air nearest it being heated, becomes speever fire is, the air nearest it being heated, becomes spe-cifically lighter; and, by being lighter, rifes and passes through the hatch ways into the atmosphere. The vacant space is filled with the cold air around, and that being heated in its turn, in like manner afcends, and is re placed by other air as before. Thus by continuing the fire for fome time in any of the lower apartments, the foul air is in a good meafure driven out, and the fresh admitted. And probably the acid fteams of the wood in burning act here as an antifeptic, and correct the putrid remains of the air. When fire cannot be put down into the well, and carried in other places, it and the ships may be sumigated by gunpowder to remedy the corrup-tion of the air; or burning tar, or other resmous sub**ftances** 

Dr. Hulme communicates fixed air to the stomach, &c. of the tetralynamia class, such as cabbages, turneps, &c. as follows: R kali gr. xv. aq. puræ 3 iij. f. haust. As for, first, they produce a fermentation in the stomach, soon as this is swallowed, mix and take the following:

diftinguishing characteristics are: it assords no good di-gestion, but a thin, fetid, fanious stuff, mixed with blood, which at length hath the true appearance of coagulated gore, lying caked on the surface of the ulcer, and is with difficulty wiped off. The sleth underneath the slough is foft and fpungy; if these sloughs are removed by escharotics, or the knife, they soon return; the edges are generally of a livid colour, and puffed up with excrescences of proud slesh, arising from below under the skin. From compression, the sungues is apt to mortify; and the member always becomes edematous, painful, and for the most part spotted. As the scurvy increases in the general habit, the ulcer shoots out a fost, bloody fungus, which the failors call by the name of bullock's liver which indeed it much refembles when boiled; it often rifes in a night's time to a great fize, and, if destroyed, will be re-produced to the fame fize in twenty-four hours. These ulcers do not speedily affect the bones. The slightest wounds or bruises in serbutic patients degenerate into such ulcers. By their remarkable putridity, they are easily distinguished from all other kinds of fores. In some instances these places are attended with soft forest attended with soft forest

ulcers are attended with foft, fpongy gums.

As an internal medicine when fcorbutic ulcers attend, Dr. Kirkland highly recommends the muriatic acid given in water, or mixed with the bark.

Mr. Bell, in his treatife on ulcers, observes, that the cure of the feerbutic kind depend much upon the correction of the putric kind depend much upon the correction of the putric diathelis in the fyftem: for which purpose, vegetables, particularly the acescent ones, with milk and whey, are almost certain remedies. The different secretions, particularly those of the skin and kidness should be could be compared. In the secretion profession neys, should be gently promoted. In the fearty, perspira-tion is almost quite checked. Gentle laxatives are of use, particularly tamarinds, crystals, of tartar, &c. The best external applications are the ungt. Ægyptiae. vel mel ro-far. cum paucul, vitriol. acid dilut. In the milder instances, fuch as ufually happen in England, the cause is more frequently from the want of due nourishment; hence what quently from the want of due nourithment; hence what is called the antifcorbutic course will not be required; but in its stead, better food and greater plenty of it; a little good wine is a powerful aid. The bark is more useful in this than in any other kind of ulcer; it should be given as freely as the stomach will admit. As a drefling, pledgits of lint dipped in a strong decostion of the bark will be useful in correcting the foctor of the discharge, Sec. though doubtless the carros-poultics by far excels this bark will be useful in correcting the fector of the discharge, &c. though doubtless the carrot-poultice by far excels this decoction as a dressing. When the fector from the discharge is vanished, and the sloughs only are to be removed, the ungt. refinze flav. with hydrargyrus nitratus, will be the most convenient. Generally the cure is simished by means of gentle pressure. Sometimes an issue becomes useful. What is said with regard to the treatment of see but ulcers, is applicable to all such force as are in the the least connected with putrescency of the sluids. From whatever cause: thus such as remain after fluids, from whatever cause: thus such as remain after critical abscesses that succeed to putrid severs, require the

critical abfeeffes that fueceed to putrid fevers, require the fame general method of treatment.

SCORDIUM, also called Triffago Palustris, chamaedrys palustris canescens, water Germander. Tracrium for diams, or teucrium foliis oblongis fessilibus dentato ferratis

paluffris canefeens, WATER GERMANDER. Teacrium feordisum, or teucrium foliis oblongis fessilibus dentato serratis floribus geminis axillaribus pedunculatis, caule dissuffus, odore allii, Linn. Water germander. The flowers are like those of the chammedrys, one or two proceeding from the ala of each leaf. The calyx is tubulated, and the smell is like that of garlie. The plant is a trailing one; the leaves are hoary. If the leaves are rubbed betwixt the singers they yield a moderately strong smell of the garliek kind; they are bitter to the taste; by keeping the herb for some months the garliek smell is dissipated, and the bitter is much improved. When the leaves are moderately dried they give out their virtue to water or to spirit; water is impregnated with this flavour, but no effential oil is ob-

R aq. purse 3 iij. acidui vitriol. q. f. ad faturat. in tained, though a large quantity of the leaves are committed to the fill. An extract made from the spirituous tine-ture is also called the putrid ulcer. Its pharmic, and corroborant in putrid difeafes. See Lewis's pharmic, and corroborant in putrid diteales. See Lewis's Mat. Med. Neumann's Chem. Works: 'This is also a name for Salvia Sylvestris:

SCORDOTIS, See Salvia Sylvestris:

SCORPIOIDES. See Ornithopodium.

SCORPIUS. See Genista Spinosa Major.

SCORZONERA. A plant so called from efers, a Catalonian word for a subry because it is faid to be effectual

talonian word for a viper, because it is said to be effectual against the bite of vipers; and not only so, but that if a person rubs his hands with the root of this plant, and takes a viper in his hands, it cannot hurt him, because of its aversion to it. The plant is also called escarzonera, viperarias servicion to it. The plant is also called escarzonera, viperarias serventaria Hispanica. Common viperarias serventaria Hispanica. Common viperarias serventaria Hispanica. Common viperarias serventaria that harge sharp-pointed leaves, with a large prominent rib in the middle; on the tops of the branches are yellow sociological serventarias serventarias, which are followed by oblong, roundish feeds winged with down: the root is long, single, from the fize of a goose-quill to that of the little singer, of a dark colour on the outside, and white within. It is perennial, and a native of Spain. It grows in our eardens. rennial, and a native of Spain. It grows in our gardens, but the Spanish is far better than ours, and that from the island Amagria is better than either. The roots are alexipharmic, antiseptic, and deobstruent. They are only used as a nutritive aliment. They are lackescent, but with a fingular mildness in their juice, which has a little sweetness; but neither by that, nor by any other sensible quality do they give marks of their being very nourithing.
When boiled, they are sufficiently tender, and do not
prove very flatulent. See Cullen's Mat. Med. Miller's
Bot. Off. Lewis's Mat. Med.

SCOTODINE, or SCOTEDINGS. A vertigo, attended with a dimness of fight. Se VERTIGO.

SCOTOMA, or Scotomia, i. e. Scotodine, from oweres, darkness. It is also fynonymous, according to fome writers, with AMAUROSIS. See VERTIGO.

SCOTOS. DARKNESS, or DIMNESS of SIGHT.

SCROBICULUS CORDIS. Dim. of ferebs, a ditch.

SCROBICULUS CORDIS. Dim. of feross, a sites.
The pit of the stomach.
SCROFA. See PORCUS.
SCROFULA. The KINO'S EVIL. The Latins call
it struma, and scrophula, from scropha, a bog or sow; because this disorder is observed in swine. And also, chose
ras, cheras. The French eccrevelles. It is called the
king's evil, because Edward the Confessor, and other
succeeding kings, both of England and France, have prefucceeding kings, both of England and France, have pre-tended to cure it by the touch. Dr. Cullen places this genus of difeafe in the class cachexies, and order impetigenus of dieale in the clais cachexie, and order impetigines. He diffinguishes four species. I. Scropbula vulgaris, when it is without other disorders, external and permanent. 2. Scropbula mesenterica, when, internal, with loss of appetite, pale countenance, swelling of the belly, an unusual factor of the excrements. 3. Scropbula sugax. This is of the most simple kind; it is seated about the neck, and for the most is caused by the resorption from sores on the head. 4. Scropbula Americans, when it is sound with the yaws.

when it is joined with the yaws.

Almost every part of the body may be affected by this disease; but it is only the lymphatic vessels in any part that is the immediate seat of it. The lymphatic glands of the mesentery are first affected. The conglomerate glands are not affected otherwise than by being diffurbed with the disorder of adjacent concludes. with the diforder of adjacent, conglobate, lymphatic glands. As the diforder attacks this or the other part, a glands. As the diforder attacks this or the other part, a variety of different fymptoms are produced; thus, if the marrow is affected, the heads of the bones will fwell, after which ulcers are formed with an oily fetid difcharge; in the eyes it produces an ophthalmia, which again produces an anchylops and ægilops; in the eylids an epiphora and lippitude, with foreneis and ulcers; the globe of the eye is fometimes thrust out by these tumors; in the canthus of the eye it produces a fistula lachrymalis; in the nofe an ozena; in the lips, the labrifulcium, or thick pouting tumor, especially of the upper lip, with a fifure in the middle: in the throat, turnified tonfils; under the tongue, a ranula; on the wind pipe, a bronchoccle; under the chin, and in the fides of the neck, the firuma, properly to called, which are encyfted tumors, &c. The fixed, immoveable, white fwellings on the joints are of this fort. or perhaps two may pass without its being manifelted in them, but in the next it again revives. Boulton, in his Surgery, says, that the acidity of the pancreatic juice is the cause: be this as it will, it is something that coagulates the coagulable lymph; and very probably fome kinds of diet, and other as yet unknown causes, may produce it. The indurated glands in the necks of children are often

the effect of voracity, or from bad diet.

Children of ferofulous habits have usually a florid comto others; and the usual appearances of the king's evil is that of scirrhous tumors chiefly in glandular parts, and which are rarely affected with pain, or brought to Suppurate. A multiplicity of fymptoms attend different pati-ents, but only a few of them are observed in any individual; but among the most frequent, besides the tumors just named, are a swelled upper lip, foreness in it and about the nose and cheeks; the tumors sometimes break and run for a long time before they heal. The eyes are inflamed, and a very sharp humor runs from them and corrodes the checks; in a morning the eyes are fo glued that they cannot easily be opened; dry crusty scabs on or near the elbows.

The steatoma, atheroma, meliceris, are often com-panions with the ferefula, and should be distinguished

Mr. John Hunter fays, that " the fcrofula is a difeafe fo marked that few can mistake it. That it is hardly proper to class it amongst poisons, as it cannot be said to be catching; yet it hath the power of affimilating other matter into its own likeness. The matter is produced without inflammation. It does not produce any effect on the conflitution, or on the abforbents; or on the lymphatic glands; but only a fingle gland will be affected. Hence the conflitution is not affected. The pre-difpofing Hence the conditution is not affected. The pre-disposing cause, he says, is climate principally; such as cold damps with alternate heats; and between the latitude of forty-five north, and the higher latitudes, are those places where it rages with the most violence. In England, and in Germany, it is common; but whether it is found in the fouthern latitudes, is not known. That cold is a pre-disposing cause of it, is evident from its not being known in the warm, constant climates. Persons are conknown in the warm, constant climates. Persons are continually affected with it, who come from hot to cold climates; and those are cured who go from cold to warm ones. It is generally supposed to be hereditary. The weak and debilitated habits are most likely to have it; they are the most susceptible of the various actions, and the parts the most exposed to it, are the most debilitated, as well as the age that is most disposed to it is the most delicate."

If a strumous humour touches a bone, it becomes carious. Though when this diforder affects children, it ufually difappears when manhood arrives; yet, if it appears after the age of forty, the patient rarely recovers; but other diforders, fuch as the jaundice, faintings, vomitings, a cough, dropfy, &cc. coming on, they ufher in death. If the tumor arifes from a caries in the bones of the fingers or hands, the cure is difficult; but if the caries is in the foot, the discharge generally exhausts the patient. If any of the tumors ulcerate, they cannot be healed whilft any of the cyft remains, or any part by which they are nourished; as to extirpating those tumors, there is but little encouragement thereto. When a scrofulous tumor is unequal, it is apt to become cancerous. If many of the glands of the neck are indurated, those in the melentery are fo too. And the greater the number of the difordered parts are, the greater is the difficulty of

even palliating them.

A great variety of alteratives are mentioned in different writers, each of which, in particular inftances, have been of use; but yet none of them are to be depended on in any case. When the blood is poor, and the fibres lax, the bark is the best known medicine; and though in fome few inftances it cannot be prefcribed, yet in most it is manifestly useful. Dr. Lewis thinks its esticacy is improved by the use of aq. calcis oftr. in conjunction with it. The bark does not succeed where the bones are affected, nor where the ferofulous tumor is fituated fo as to be at-tended with much pain, as in the joints, and under the membranous covers of the mufeles; in those cases it is

This diforder feems to be hereditary, yet a generation observed that the bark rather increases the sever; but, as opium, when given as an alterative, hath been very ufe-ful in ferofulous diforders, fo its accompaniment with the bark may be followed with advantages not to be obtained by either feparately. Narcotic plants that abound with a volatile falt are powerful in refolving the ferrofulous tumors, and amongst these the hemlock hash been found to be eminently uteful, when applied in the form of a cataplaim, and also when the extract hath been taken inwardly; though the internal use is more proper in adults plexion, and a fullness of the face, more than is common than in infancy and youth. The hydrargyrus muriatus, if to others; and the usual appearances of the king's evil is given as is usual in the lues venerea, hath been followed that of scirrhous tumors chiefly in glandular parts, and by the happiest effects. Dr. Smith directs a decoction of the rad, rub, tinch to be drank with it Mr. Pott advises in all ferofulous affections, to produce large artificial purulent discharges, such as issues, and perpetual blisters. With respect to medicines in general, in a scrofula, advantage is slowly obtained. The bark, hemlock, sea-water, &c. should be given as circumstances require. Dr. Saunders, in his Lectures on the Practice of Physic, recommends, that, when the bark is continued two or three weeks, during which time the patient is much better, and a cure feems to advance faft; but afterwards feems to have no farther effect, the difease apparently gaining ground upon the patient; in such a case, to prevent habit from rendering the bark ineffectual, begin immediately with the cicuta, or with sea-water, or such other remedy as at that time may appear most proper, and continuing it a while, return to the bark; and thus alternate the medicines every two or three weeks, or as their efficacy is perceived to abate. The force of habit powerfully def-troys the effect of means: it is therefore necessary to alternate them. He farther advices to avoid all that can suppurate; for it is useless. In general we may say that, to increase the tone of the fibres, and to resolve the tumors, are the principal endeavours towards a cure; to thefe ends, the bark, chalybeares, fea and cold bathing, mercury, hemlock, burnt fponge, &c. contribute. In glandular and ferofulous tumors, the bark does not promote suppuration but resolution; and there are not many symptoms depending on serofula, but what give way to it. Gentle mercurials are often useful as resolvents in sero-fulous swellings. Strong purges, and whatever enseebles the habit, will prove pernicious. Gross habits will require frequent but gentle purging. Externals, are of little or no use. Palliatives should not be omitted, although a cure is not hoped for.

When tumors burit, the ferofulous ulcer is formed.

These never yield a good discharge; on their first appearance there is a viscid, glairy, and sometimes a whitish curdled matter, which afterwards is changed into a more thin, watery fanies. The edges of the fores are frequently, though not always painful; and are at first raised or tumefied, but afterwards are much thinner. So long as the fcrofulous difposition subsists in the habit, these ulcers the ferofulous difposition subsists in the habit, these ulcers generally remain a long time without shewing any disposition either to heal or to grow worse. At other times they heal very quickly, and again break out in some other part of the body. Some observe that serofulous ulcers have their surface rather convex, and with an uniform glossy appearance. Mr. Bell observes in his Treatise on Ulcers, that so long as the general morbid diathesis continues in the system, it is commonly in vain to attempt their cure; nor would it indeed often be safe, as by drying up the fores in one part, they very commonly break ing up the fores in one part, they very commonly break out elsewhere, and just as readily fall upon the lungs, or fome other organ of consequence to life, as on any other. Until the scrofula is removed from the habit, all that should be done to the ulcers which are produced by it, is, to make as free and open vents to the matter as possible, without endangering the formation of finutes. The best applications are faturnine preparations. Mr. Aikin, in his Observations on the External Use of Preparations of Lead, fays, that emollient applications of all forts are highly injurious when applied to ferofulous ulcers: by weakening the foilds, already too much disposed to relaxation, they prevent all endeavours of nature to bring about a firm incarnation; and by giving the fluids an acrimony, to which in this disease they are not remarkably disposed: they occasion a kind of erysipelatous corrosive spreading of the ulcer. The mischiefs occasioned by emolient applications are still more clearly shown,

by the speedy change produced by almost every kind of that the two cellular membranes are observed to commutopics of the opposite classes, the attringent and the stimulant. The most simple of the aftringent and stimulant, viz. cold water, hath frequently a good effect on the with the water, with every kind of faline and mineral impregnation, is also used to advantage, particularly for water, and the form the analysis of the continued from the analysis of the continued mulant. The most simple of the aftringent and the in-hant, viz. cold water, hath frequently a good effect on throwing aside every dressing, and washing the fore with it. Water, with every kind of faline and mineral impreg-nation, is also used to advantage; particularly sea-water, and Goulard's faturnine water. The greaty, faturnine applications are improper in these cases. A continuation of such simple dressings as these, is all that, in general, should be attempted, so long as any disorder of the conflitution may remain; but Mr. Bell observes, that in fome cases, the ulcers are so inveterate as to require other aids also; as when they become swelled, painful, and discharge a corroding, acid matter: when such appearances occur, a carious bone may frequently be suspected to be at the bottom of the sore; and then, nature must be assisted, by freeing her from such parts of it as are most diseased, and that are become loose. This, in some situations. ations may be done, but when the complaint is fixed in any of the large joints, art can rarely afford much affiltance; and as amputation is not often adviseable, from the rifk of the difease returning to some other part, nature alone must often be trusted to. In such a fituation, a continued use of sea-bathing, the bark with hemlock, particularly to promote a proper discharge from the fores. And when by a due use of the necessary means, there is a tendency in the fores to heal, issues should be formed, fo as to produce a discharge as nearly equal to that from the fores as may be; thus the cure is carried on, both more effectually and fafely. These issues are generally required through life. Gentle compression is peculiarly useful in this kind of ulcer: it particularly prevents and removes that thickness in their edges that sometimes is observed. These in general are the means that affift and are most useful, when there is a tendency in nature to overcome the disease: but it being in general an approbrium medicorum, it is difficult to affert with much posi-tiveness concerning it. See Wiseman's Surgery. Heis-ter's Surgery. Boulton's Surgery. Ferne on the King's Evil, Cheyne on the King's Evil. Lond. Med. Obs. and Inq. vol. i. p. 184—200, 303—322. SCROPHULA. See Scrofula.

SCROPHULARIA. So called, not because of its efficacy in curing the ferofula, but because its root hath un-equal tubercles like those in the ferofula. Boerhaave mentions fifteen species. See also CRASSULA, CHELIDO-NIUM MINOR, GUACATANA

Scrophularia Major, also called feroph. nodosa feetida, ficaria, millemorbia. Common knobby-Root-Ed Fig-wort. It is the ferophularia nodosa, Linn.

—— AQUATICA, also called betonica aquatica. WA-TER-BETONY, GREATER WATER-FIG-WORT. This

plant is faid to be the fame as the iquetaia of the Bratilians, which is fo famed for correcting the naufcous qualities of fena. Its other virtues are the fame with the

above species. See Raii Hist. Neum. Chem. Works.

SCROTUM. It is the external covering of the testicles: called also bursa testium, others. It chiefly confists of loose skin and cellular membrane, without any fat. It is composed of the cuticula, the cutis, the membrana cellularis, and perhaps the expanded fibres of the cremafter mufcle on each fide. Betwixt the cuticle and the cutis is the rete mucofum, as in other parts of the body. Adjoining to the internal furface of the skin, is a thin covering of a loofe, hellow texture, void of fat, and is the cellular membrane: next, within this cellular fubstance, is an apparently thin, muscular, or fleshy body, called by the Greeks, dartos: a name which it derives from its raw, or excoriated appearance, and not from its raw, or exconated appearance, and not from its use of contracting the scroum. Immediately within the dartos, is a second cellular substance, which is more considerable than the first-named portion. The membrana cellularis externa scroti admits of a passage to the sleshy fibres of the dartos muscle; which sibres are attached to, or connected with, the internal surface of the artis, the dartos likewise admits of a passage. face of the cutis; the dartos likewife admits of a paffage to the filaments of the internal cellular membrane; fo

nal furface of the ferstess; pretty nearly into two equal portions. The ferstess forms two diffind bags; one for each tellicle, and its immediate tunics, or coats. These bags are formed by a duplicature of the part called the dartos, and they are fituated on each fide of the raphe of the ferstum. The bags being thus formed, are laterally connected to each other, by the intervention of a cellular membrane. This union or connection of the fides of the dartos constitutes that partition, which by anatomifts is denominated feptum feroti: alfo, Diaphrayma. The feptum feroti, on its inferior part, is connected to the internal furface of the cutis, immediately under the raphe; on its fuperior part, this feptum is connected to the inferior and external furface of the urethra, after having been expanded upwards betwixt the tunica vaginalis of each tefficle. Upon a removal of the several parts which unite in forming the servium, the tunics or proper coats of the tefficles, next prefent themselves to

The ferotum is liable to inflammation and abfeefs, which fometimes are attended with a confiderable degree of fever, and that not without danger of life. If possible endeavour to remove the inflammation without permitting fuppuration to take place: to this end, bleeding and other antiphlogiftics must be directed; discutient cataplasms apantiphiogithes must be directed; discutient catapiains applied cold, and renewed as often as they become warm; and, if possible, confine the patient to his bed. The ferotum should be sufpended in a bag-trus, so as that it may be kept near the belly; and if it is thought proper to encourage a suppuration, let a somentation be used warm, at least twice a day, and after each time of somenting, a poultice applied warm, and renewed as often as it becomes cool. In this case the patient must be supported with a generous dist and proper consists, such as the with a generous diet and proper cordials, fuch as the cort. Peruvr.; rad. ferp.; rad. contrayerv. in fubstance or in form of decoction as may feem most eligible, the conf. aromatica is also to be added, and, if pain requires it, an

opiate occasionally.

When by the fize and prominence of the fwelling, the foftness of the integuments, their shining red colour, the peeling off of the cuticle from the cutis, the mitigation of pain in the part itself; an ædematous appearance of the integuments upon being pressed; but above all, the suctuation of matter under the singers, it appears that maturation is perfected, then open the tumor on its most de-pending part. If the tumor be large, and the integu-ments thin and much discoloured, remove an oval piece; thus you will be able more effectually to apply thence the full dreffings. As foon as the matter is discharged, fill the wound with foft lint, and over it apply the poultice, or apply a pledgit of foft tow with fome emollient ointment fpread on it. The future dreffings may be the ungt. refinæ flavæ, or other digestive. At the end of the two first days, the dressing should be renewed twice in twentyfour hours, and thus continue on account of the acrimony and quantity of the difcharge, so long as may be thought necessary, not forgetting to use an emolient fo-mentation, for the space of ten or sisteen minutes previous to each dressing. If the discharge is thin, fanious, or to each drefling. If the discharge is thin, famous, or corrosive, sprinkle some brandy or camphorated spirit of wine upon each somentation cloth. If after the operation any confiderable hardness of the integuments should still remain, continue to apply the fuppurating poultice, at each time of drefling over the pledgits of digeflive, until the hardness is removed. The use of the bark alone, or with the rad, ferp. V. or rad, contrayery, or a decoction of thefe; as also the dilute vitriolic acid, in the patient's

drink, will generally greatly support the patient's strength, and alter the matter in its quality.

Another afflictive disease is too often met with in the feretum, viz. the cancer. It seems peculiar to chimney-sweepers; hence is called the CHIMNEY-SWEEPERS CANCER, the CHIMNEY-SWEEPERS WART, and the SOOT-WART From whatever cause it may be, it is evident beyond a doubt that chimney-fweepers are peculiarly liable to this difease in this part. Mr. Pott feems to be the first writer who

hath noticed it; he thinks it may be owing to a lodgment of foot in the rugge of the ferotum, and at first not be a difease of the habit.

He farther observes, that it always makes its first attack on, and its appearance in, the inferior part of the ferotum; when it produces a fuperficial, painful, ragged, ill-looking fore, with hard and rifing edges. It does not afually appear before, whence it is often taken both by the patient and the furgeon for venereal; and being heated with mercurials, is foon and much exasperated: in no great length of time, it pervades the fkin, dartos, and membranes of the ferotum, and feizes the tefticle, which it enlarges, hardens, and renders truly and thoroughly diftempered; from whence it makes its way up the spermatic process into the abdomen, most frequently indurating and spoiling the inguinal glands: when ar-rived within the abdomen, it affects some of the viscera, and then very foon becomes painfully destructive.

The only chance of putting a ftop to, or of preventing this mischief, is immediately to remove the part afflicted, i. c. that part of the scrotum where the fore is. If it be fuffered to remain until the virus hath feized the tefficle, it is generally too late, even for castration. If ever extirpation bids fair for the cure of a cancer, it feems to be in this case; but then the operation should be immediate, and before the habit is tainted. When it reaches the testicle, it is rapid in its progrefs, and most certainly destructive in its event: fo, early to extirpate is the only cure. Fiftulous ulcers are fometimes met with in the ferstum; if these communicate with the uretha, a particular attention thereto will be required in attempting to relieve. The causes may be an abscess in the serotum; a wound made through the ferotum into the urethra; the venereal disease first affecting the urethra, and from thence producing the ulcer in the scrotum, &c. The external fore is generally very fmall and finuous; the lips grow callous; the difcharge is thin, copious, and almost continual; and if there is a communication with the urethra, the urine will more or less escape through the external wound at the times of making water; it will also infinuate itself into the cellular membrance of the ferotum, and its neighbour-ing parts, and be therein confined; whence many inconveniences arise that cannot be removed until the orifice made through the urethra is healed.

When this diforder originates in the urethra, it may be known by introducing a catheter or bougie; for an ob-fitruction will be met with there: when it is caused by an abfeefs forming itfelf within the cellular membrane near the urethra, or in the corpus cavernofum urethræ, there will be little or no refistance met with from the bougie As to fiftulous fores, callofities, enlargements, and dif-As to hitulous lores, callonties, chiargements, and di-tensions in these parts; it is worth remembering, that although the disease should appear to be not confined to the fersium, but that it extends to the perinaeum and nates, and there be many external fallulous openings through the integuments of these parts, yet these shall in some instances be discoverable only on opening into the urethra; to remove which should be the primary at-tempt of the surgeon, as the cure of the whole very much depends, if not altogether, upon this year circummuch depends, if not altogether, upon this very circum-fiance; and of this be affured, that the permanency or the cure of every wound, however circumstanced, depends upon the roundness and firmness of its foundation

at the bottom.

When a venereal cause gave rise to this disorder, the judicious introduction and use of bougies, made of a proper compositions, size, and stiffness, joined with mercurial frictions, applied near to, or immediately upon, the discount of the compositions applied to the composition of the composition eafed parts, in proper quantities, at proper intervals, and continued for a due length of time, joined with foft oily purges, occasionally administered, and fost, diluting drinks, will often render every severe operation unneceffary; though the circumstances attendant upon the complaint be of a bad and complicated kind.

See Pott's Chirurgical Works. Warner's Cases in Surgery. Warner on the Testicles. White's Surgery, p.

SCRUPULUS. A SCRUPLE. A weight with us, which is equal to twenty grains; but in France, Germany, &c. it contains twenty-four grains. Three feruples, however is a dram, and eight drams an ounce, in all thefe Countries.
SCUTELLARIA. See CASSIDA.

SCUTIFORMEOS. See PATELLA.
SCUTUM. See EPITHEMA.
SCYRUS LAPIS. See PUMEX.
SCYTHICUS LATEX, also called wingues, a divine

SEBACEÆ GLANDULÆ, called also miliares. Many of these are about the nose, where their contents are often hardened, and at the extremities of their ducts there appear black fpots, and when the matter is fqueez-ed out it refembles a worm with a black head. Thefe glands are feated in the cellular membrane, under the glands are reacted in the centuar memorane, under the fkin, and in various parts of the body they are enlarged and form encyfled tumors. These glands are called the miliary glands, by some. But as to miliary glands, distinct from these, the moderns deny their existence, not being able to discover them.

SEBACEUS HUMOR. The febaceous humaur is fup-SEBACEUS HUMOR. The febaceous bumour is supplied by the febaceous glands, to preferve the sensibility of the skin, and to keep it most by preventing too copious a perspiration. When this glutinous bumour is wanting, as in crysspelas, the skin is dry and parched, and little or no swelling can be brought on there by instantian, because the erethysm of the vessels is but small, and the morbisic bumours having nothing in their way to retard their egress, they exhale through the expiring vessels of the skin. All the inner membranes of the body are supplied with an bumour similar to this.

ing veilels of the Ikin. All the inner memoranes of the body are fupplied with an bumour fimilar to this.

SEBADILLA. See CEVADILLA.

SEBESTEN, ¿alfo called myxa, myxara, myxara, SEBESTINA, {cbfien. That ufed in medicine is the cordia febeflina, Linn. It is a fruit the fhape of a plum, black on the outfide, with a flattiff wrinkled flore. It is produced in Egypt and Affivira. It is copiling and moiftproduced in Egypt and Affyria. It is cooling and moift-ening; but is not used as a medicine, though it is faid to obtrude sharp humours which fall on the lungs. See

also Jujuba.

SECALE, also called filigo, rogga. Rye. It is a kind of grain: it nourishes less than wheat, and some people find that the bread made of it gripes and gently purges them; of all the cerealia it is the most readily acescent, to which we may perhaps attribute these effects. Sometimes this grain is corrupted, and then it occasions painful and convulsive disorders, and death. The meal of this grain, mixed with common falt, and dried before this grain, mixed with common falt, and dried before the fire, then applied to an eryfipelas, is an excellent difcutient; mixed with honey it becomes a suppurative

cataplasm.

SECRETIO, from secens, to separate. SECRETION.

The various secretions are all from the blood, but how it thappens that each feeretory vessel at first separated a particular part from the general mass, and always continues to do the same, is perhaps not so clearly understood as is supposed. See Haller's Physiology, lect. 8. Pemberton's Physiology, lect. 7.

SECURIDACA. See ERVUM and PELECINUM.

minish the motions, and power of motion, in the body. They seem to stand opposed to what irritates, and are the lowest class of antipasmodics, as anodynes are the most powerful class. SEDANTIA. SEDATIVES. Medicines fuited to di-

SEDATIVA SAL. SEDATIVE SALT. The acid of borax hath, until very lately, been unknown as to its peculiar nature and origin. Mr. Hæffer found it in an uncombined state, but dissolved in the laguni, or lakes of hot mineral water near Monte Rotundo, Berchiaio, and Caftelnuovo, in Tufcany, in the proportion of nine grains in one hundred of water. Mr. Mafeagni hath found it adhering to schiftus on the borders of the lakes, of a dirty white, yellow, or greenish colour, and crysof a dirty white, yealow, or greening colour, and cryitallized in the form of needles. This acid, i. e. the acid of borax is called fedative falt. Dr. Cullen speaking from experience, says that in large doses, it has no effect on the human body. Mat. Med. See BORAX and TINCAL. Kirwan's Elem. of Mineralogy.

SEDENTARIA OSSA. So Daventer calls the pro-

tuberances of the os coxendicis upon which we fit. See

SEDUM. So called from fedendo, fitting, because of its posture on walls, &c. where it grows; or from fedando, because it allays when applied to parts that are inflamed. It is also called semper vivum, because, as its name expreffes, it is always green; and vermicularis, because its

leaves refemble worms. In English it is called sen-GREEN and HOUSE-LEEK. Boerhaave mentions twentyeight species. The fort used in medicine is the sempervioum tectorum, Linn. The GREATER HOUSE-LEEK, called fedum majus, wichryson, wonion, crassula minor, ille-cebra, cithales. They are small plants, whose short and thick stalks are covered with little sleshy conical leaves, fet thick together in the manner of scales; on the tops appear pentapetalous flowers, which are followed by a pod full of small feeds. They are annual, grow on old walls and dry stony grounds. They flower in June and July The leaves have an acrid taste, but no remarkable smell:

applied externally fome of them vehicate the parts, and if taken internally, in no great quantity, they are fitrongly enertic; whilft the common fort, and fome other species abate external inflammation, and if taken inwardly, are emollient and laxative, and have something of acrid, auftere, and aftringent; but they are not of any note in the

present practice.

It is also a name for several forts of cotyledon faxifraga,

parametria, piper murale; craffula; aizzon.

SEGGRUM. See JACOBEA VULGARIS.

SEIGNETTE, SAL DE. See RUPELLENSIS SAL.

It is thus named from Dr. Seignette, of Rochelle, who

SELENFTES. This name is given to a combination of the vitrolic acid with calcareous carth. See the Dict. of Chem. Neumann's Chem. Works. SELINUM PYREN. See APIUM PYREN. THAP-

SELLA TURCICA. It is a depression between the cilnoid apophyses of the sphenoid bone; called also ephippium; fossa primitara.

SELTZER WATER. This water is got from a spring near to the town of Nieder Seltzer, in the bishoptick of Triers, in Germany. It has a brisk acidulous tatter. as taken up from the fountain, but lofes it on being exposed to the air in an open vessel. HOFFMAN says that by standing, it acquired a lixivial taste, and that he obtained feventy-two grains of refiduum, by evaporating twenty-four ounces of the water, which yielded forty grains of a pure alkaline falt; and Dr. Brocklefby, in the fourth volume of the Medical Observations and Inquiries, published in 1771, mentions his having obtained a refi-duum of the fame nature, but in less quantity. Dr. Ve-nel, from different experiments, that these waters contain no volatile acid, and that what has been called their fpirit, is nothing but a superabundant quantity of fixed air; that it is evident they do not contain any free disengaged fixed alkali, or even alkaline earth, more than common water; and that it is impregnated with nothing but feafalt and a large quantity of fixed air; and also that the air in these and other spiritous mineral waters is truly united, diffolved, and combined with the water in the true fense of the chemists, that is divided into its minutest parts, which do not combine while they remain in that state, but that this union with the water, though real, is very flight. He proposes to impregnate water with aerial acid, by faturating mild alkaline falts with acids in the water itself, either in large vessels close shut, or in vessels which have but a small communication with the external atmosphere, and by letting the vessels remain at rest, without shaking; for motion, the doctor says, pre-vents the union, and disjoins the air from the water that is already united. In this way he imitated the natural Seltzer waters, by faturating with the marine acid, in two pounds of common pure water, that quantity of the mild fosfil alkali, which it required to make a quantity of seafalt, equal to that which two pounds of the natural Seltzer water contained. Sir Tobern Bergman from one hundred cubic inches obtained about one of common air; fixty of aerial acid, or fixed air; of aerated lime, feventeen grains; of aerated magnefia, twenty-nine one-half; of crystalized mineral alkali, twenty-four; of common falt, one hundred and nine one-half. These waters operate chiefly by urine, feldom or never by stool. They are powerful antifeptics, and give a gentle stimulus to the nerves; they allay heat and thirst; and have been much prescribed in feorbutic, phthisseal and nervous cases. Hossman recommends them much for correcting the bad habit of the blood and other juices, in arthritical ryland, and is cultivated in our gardens. This root is and gouty cases, and as powerful deobstrucnts. They are drank from a pint to three or more in a day. They

are often mixed with milk in phthifical and other hectic cases, and agree well. See Dr. Monro's Med. and Pharm-Chem. vol. ii.

SEMEIOTICA. That part of medicine which treats of the figus of health and difeafes. See Dr. Wynter's Translation of Lommius's Obf.

SEMEN. SEED. In botany it is a body perfected by the mutual operation of both fexes, containing the rudi-ment of fuch plant as that from which it was taken, fo may properly be judged to be analogous to the egg of an animal. It is also applied to the prolific fluid of animals. SEMENTINA. See SANTONICUM.

SEMI CUPIUM. Excathifma, infessio, a HALF BATH, where people are generally immersed up the navel. It is usually formed of warm water, or that impregnated with herbs of different forts, adapted to the nature of the complaint, and what are supposed to be productive of some defired effect. It is considered useful in alleviating pain; dispelling flatulent matter; foliciting a flux of humors downwards, and there quickning the circulation; foftening and relaxing the patts, and producing the cata-

SEMIFIBULÆUS. See PERONÆUS SECUNDUS. SEMILUNARES CARTILAGINES. They are placed upon the upper part of the tibia; they are thick on the outfide and ferve to deepen the cavity; they likewife ferve to give fome degree of rotation to the joint, being moveable and variable, to adapt themselves to the condyles in the various motions of the joint.

SEMIMEMBRANOSUS MUSCULUS. It rifes ten-

dinous from the posterior part of the tuberosity of the if-chium, close to the origin of the musculus quadratus femoris, and is inferted into the back part of the internal condyle of the tibia:

SEMINERVOSUS MUSCULUS. It is also called femitendinofus. It lies upon the outfide of the femimembranofus: at its origin is one mass with the head of the biceps; when they have run together a little way they part, and the femitendinosus runs to the internal condyle and upper part of the tibia, making conjointly with the sartorius and the gracilis, a fort of sascia.

SEMI-ORBICULARIS. The orbicular muscle of the

lips, if confidered as two, are called femi-orbicularis fupc-

SEMIRRHOMBUS. See HEMIRHOMBIUM.

SEMIS SEC CYATHUS.
SEMISPINALIS. See SPINALIS DORSI MAJOR.
SEMITENDINOSUS. See SEMINERVOSUS.
SEMITERTIANA FEBRIS. The Greeks call it hemitritions. It is a kind of fever, compounded of an in-termitting tertian and a continual quotidian. Some call it a continual tertian. It is one of those tertians which

return every day. Some rank it as a remittent fever.

There is nothing peculiar in the management of this diforder which the practitioner will not naturally fuggett from his acquaintance with the nature and general methods of relief in fevers. See Spigelius and Hoffman on

SENEGA. also called polygala Marilandica, fenegaw. SENEKA. AMERICAN MILK-WORT, and fenekka, RATTLE-SNAKE ROOT. Polygala finega, or polygala Marilandica, floribus imberbibus spicatis albis, caule erecto simplicissimo, foliis lato-lanceolatis. Linn. Senega, rattle-finake root. The leaves are pointed and somewhat oval; the stalks are upright and branched; the flowers are white; the root is variously bent and jointed; it is about the thickness of a little-singer, and resembles the about the thickness of a little-finger, and resembles the about the thickness of a little-linger, and retembles the tail of a rattle-fnake; it hath a membranous margin, which runs its whole length on each fide; outwardly it is of a yellowish or a pale brownish colour, internally white. It is a native of Virginia, Pensylvania, and Maryland, and is cultivated in our gardens. This root is faid to be a specific against the posion of the rattle-snake;

plasm, is applied outwardly, and a decoction is taken in-wardly. In inflammatory severs it promotes perspiration, and it affifts the expectoration in pleurifies and peripneumonies; it is cathartic, and often proves emetic, to prevent which it is given in weak cinnamon water. In pleurifies, whether inflammatory or fpurious, in the rheumatism, gout, gouty rheumatism, and the humoral asthma, it is singularly useful. The powder is preferred to any other preparation, and the dose is from 3 i. to 3 i. but a decoction of three ounces of the root in water enough to ftrain off a pint, is usually given from two to four spoons-full three or four times a day. See Lewis's Mat. Med. SENNA. It is a shrub with a refaceous slower, which

is followed with a pod with feeds like grape-flones. Botanists enumerate nine forts, but the following is that

which is preferred in practice.

SENNA ALEXANDRINA, alfo called folia Orientalia. ALEXANDRIAN SENNA. Caffia fenna, or caffia Alexandrina, foliis trijugis quadrijugilive acutis floribus luteis Linn. Alexandrian acute, fix-leaved fenna. It is called Alexandrian not because it grows there but because it is from thence chiefly that it is fent into Europe. The leaves, which are the parts in ufe, are of a lively yellow green colour, an oblong fomewhat oval figure, tharppointed at the end, about a quarter of an inch broad, and not an inch long. Choose those which appear bright, fresh, free from stalks and spots, that are well and strongly fcented, fmooth and foft to the touch, thoroughly dry, sharp-pointed, bitterish and somewhat nauscous to the taste. There are inferior forts, but they are generally diftinguished by their not being pointed, but more or less broad at the end.

The Arabians first brought these leaves into use; they are moderately ftrong, and in general a fafe cathartic; they enter the blood and attenuate it. Dr. Alfton preferibed it in ardent fevers, and frequent experience manifefts its fafety and advantage even in the most delicate habits, and on the most robust it operates sufficiently. Largely diluted, as when a dram of these leaves are infused in four ounces of soft cold water, is the most agreeable method of taking it; the addition of acids takes off the nausea which it excites, and as the griping quality depends upon its refin, the dilute infusions will be the freest from this effect. From 3 i. to 3 iii. are usually suf-

ficient for one dofe.

Senna gives out its virtues both to water and to fpirit.

Long boiling destroys the purgative quality. If the fenna
is infused in an insusion of bohea tea, its naufeous quality is as well covered as though the famed fig-wort was used, and if it is insused in a decoction of guaiacum its purging quality will be increased, and the griping which it generally occasions will be prevented.

The London College directs several preparations from

this article, made in the following modes.

ELECTARIUM E SENNA. Electory of SENNA, formerly the Electorium Lenitivum. Lenitive Electory.

Take of fenna, eight ounces; figs, one pound; the pulp of tamarinds, casha, fresh prunes, of each half a pound; coriander feeds, four ounces; root of liquorice, three ounces; clarified fugar, two pounds and an half. Let the fenna and coriander feeds be powdered, and passed through a fine sieve to the weight of ten ounces, and boil the remainder with the figs and liquorice in four pints of diffilled water to two; then prefs off the liquor and ftrain. Evaporate the liquor to about one pint and an half, afterwards add the fugar to make a fyrup. Add the fyrup gradually to the pulp; and mix in the powder

INFUSUM SENNÆ SIMPLEX. Simple Infusion of SENNA.

Take fenna, an ounce and an half; powdered ginger, one dram; boiling diftilled water, one pint. Macerate them for an hour in a close-stopped vessel, and strain the ligner. The date \$\frac{\pi}{2}\$ is to \$\frac{\pi}{2}\$. liquor. The dose 3 i. fs. to 3 ij.

The infufion fenne tartarifatum is made of the fame quantity of fenna and boiling water, to which are added two drams of crystals of tartar, and half an ounce of cori-ander feeds bruised. The crystals of tartar is first dis-folved by boiling in the water, and this powdered upon the other ingredients and managed in a similar manner as above. The dose in the same also as above. The dofe in the fame alfo.

EXTRACTUM SENNE. Extract of SENNA.

A pound of fema is to be boiled in a gallon of distilled, water as in making the other extracts. After the boiling a little rectified fpirit of wine is to be added, and the strained liquor reduced to a proper confistence. The dofe, 3 fs. to 3 ij.

PULVIS E SENNA COMP. Compound Powder of SENNA.

Take of fenna, crystals of tartar, each two ounces; feammony, half an ounce; ginger, two drams. Powder the feammony feparately, the rest together, and mix them. The dofe, gr. 10. to 3 i.

TINCTURA SENNE. Tineflure of SENNA.

TAKE fanna, one pound; carraway feeds, bruifed, 3 i. fs. leffer cardamom feeds, freed from their hufks, 3 fs. raifins floned, 3 xvi. proof spirit of wine, one gallon; dioft for fourteen days, and ftrain. Dose 3 is. to 3 if. Pharm. Lond. 1788.

See Tournefort's Mat. Med. Neumann's Chem. Works. Lewis's Mat. Met. Pharm. Lond. 1783.

SEE COLUTEA.

SCORPIUM. See EMERUS.

SENORIA. See BANANA.
SENSIBILIS. SENSIBLE. It is applied to whatever is capable of making an imprefion on the fenses.
SENSIBILITAS. SENSIBILITY. The quality of being fensible, or the perceiving of any visible thing, affecting or cauling fome alteration in the organ of fenfe. The brain is the only fenible part of the body; all other parts are faid to be fenible, because a portion of the medullary part of the brain is diffused over them, but they lose this quality as soon as it is rubbed off or becomes dry. As the brain is the only fentible part, except the muscu-lar fibres, which feem to have a peculiar degree of irrita-bility independent of the brain, though their active power appear to be increased, and continued by the brain, so that the mufcular fibres contract in confequence of the irritation received by that portion of brain which covers them; these sibres are the only parts which perform their office by shortening themselves, and thus it happens that they are the only parts which contract, and which have tremulous motions upon involuntary irritations. Every part of the body is capable of fensation in a found or in a morbid state. See IRRITABILITY. See also Fordyce's Elements, part i. Medical Commentaries by Dr. Hunter

SENSUS EXTERNI. The EXTERNAL SENSES. There are generally reckoned to be the fenfe of SEEING, HEARING, TASTINO, SMELLING, and FEELING, each of which fee. These five senses agree in the following particular; viz. that nothing is perceived until it makes an impression upon the organ of sense; but they differ as to our confciousness of that impression; in touching, tasting, and smelling, we are conscious of the impression, but not fo in hearing and feeing; on which account thefe latter are confidered as more refined; the former feeming to exist externally at the organ of finfe, are conceived to be merely corporcal. See Haller's Physiology; Shebbeare's Theory and Practice of Physic.

SENSUS INTERNUS. The INTERAL SENSES are those affections of the mind which are excited in it by its perception of ideas; these are generally reduced under these four heads; viz. imagination, memory, attention, and the passions of the mind. Their influence on health is noted

in many particulars mentioned in the different parts of this work. See Haller's Physiology. SEPARATORIUM. A SEPARATORY. Called also bypoclipticum vitrum. The name of an instrument for separating the pericranium from the cranium; also a chemi-cal vessel for separating liquors, but particularly for the separation of the essential oil of any vegetable subject from the water that is distilled therefrom.

the water that is diffused therefrom.

SEPIUM OS, also called septements, praccipitans magnum.

CUTTLE-FISH BONE. The cuttle-fish is a kind of polypus. It hath two bones, one which is like a knife, the other is like a quill; the latter of these, when calcined in the fun, is used as a dentrifice sometimes, but the practice rarely notices it.

SEPTANA. A SEPTINARY FEVER, that is, a fever which performs its neriod in seven days. Also an erratic

which performs its period in feven days. Also an erratic intermitting fever which returns every feventh day. SEPTICA.

SEPTICA: Septics. Medicines which promote stolochia in virtues, but that he prefers the aristolochia putrefaction; also corrosive ones.

SEPFICUS LAPIS. See CAUTERIUM POTENTIALE.

SEPTIFOLIA. See DENTARIA.
SEPTIMANA. It is a kind of febris erratica.
SEPTINERVIA. See PLANTAGO LALTIP.

SEPTINERVIA. See PLANTAGO LALTIF.
SEPTUM CORDIS, vel ventricularum. See Cor.
The partition between the two ventricles of the heart.

Septum, an inclosure, from sepes, a bedge.

SEPTUM LUCIDUM. The thin partition which divides the two lateral ventricles of the brain. It is kind of duplicature of a continuation of the corpus callofum. It is united

on its lower part with the fornix. See CEREBRUM.

—— NARIUM, called interseptum. The partition betwixt the nostrils. It is formed by the descending laminæ of the os ethinoides, and by the vomer, and it is placed in the groove framed by the cristæ of the ossa maxillaria, and rising edges of the ossa palatic. The cartilage which forms the lower part of this figtum, is joined to the anterior edge of the middle portion of the os ethmoides, to the anterior edge of the vomer, and to the anterior part of the groove formed by the offa maxillaria, as far as the nafal fpines of these bones.

SERPENTARIA VIRGINIANA, called also arifio-SERPENTARIA VIRGINIANA, called allo ariflo-lechia, pifelechia, viperina, colubrina Virginiana, contrayerva Virginiana. VIRGINIAN SNAKE-WEED. It is the ari-flolechia ferpentaria, or ariflolechia Virginiana foliis corda-to-oblongis planis, caulibus infernis superne slexuosis teretibus, sloribus recurvis folitariis, fructu pravo pen-tangulari, Linn. It is brought from Virginia and Caro-lina; it is small, light, bushy, and composed of a num-ber of strings or sibres issuing from one head, and matted together, of a brownish colour on the outside, and pale or together, of a brownish colour on the outside, and pale or yellowish within. It hath an aromatic finell, formewhat like that of valerian, but more agreeable, and warm, bitterish pungent taste, not easily covered by a mixture with other subjects.

Snake-root gives out its active matter to water or to fpirit. The greatest part of its slavour is carried off either by water or by fpirit in distillation; and if the quantity distilled be large, there arises with water a pale-coloured effectial oil, of a strong smell, but not a strong taste, the greatest part of the camphorated pungency and bitterness of the root remains in the inspissaed extract. The spirituous extract is stronger than the watery, not from its having lost less by evaporation, but from its containing the active parts of the root concentrated in a fmaller volume, its quantity amounting only to one half of the other.

The Virginian fmake-root is a warm diaphoretic, of ex-

cellent use in low and putrid fevers; it raises the pulse, promotes perspiration, resists putrefaction, and corrects a putrid disposition which is already begun. The stimulant power of the finale-root is especially suited to the low and advanced state of the typhus only, and even then it will be more safely joined with the bark than employed for its stimulant power alone. In the use of this medi-cine, particularly in severs much caution is necessary. See CONTRAYERVA. Dr. Alston says it resembles the ari-

tenuis to the ferpentaria on all accounts. The dose may be from gr. iii. to 3 fs.

The Virginian afarum is fometimes fold for the fnakes

root, but the afarum is blacker.

The London College direct a tincture of fnako-roet to be made of Virginian fnake-root, three ounces; proof spirit of wine, two pints; then digest for eight days, and afterwards strained. Ph. Lond. 1788. In this tincture, if the fnake-rost, with which it is made, be powdered fine, is the whole virtue of the root. It may be taken front two tea-spoonfuls to a table spoonful, three times a day. See Lewis's and Cullen's Mat. Med.

SERPENTIS LAPIS. See COLUBRINUS LAPIS. SERPIGO. This word is used both for the barpes and

impetigo. Linnœus fignifies by it TETTERS and RING-WORMS; also see Lichen and PURPURA SCORBU-

SERPYLLUM. Boerhaave takes notice of fix species

of this plant.

SERPYLLUM CITRATUM, alfo called thymus citratus. LEMON THYME. It differs but little from the mother of thyme in its appearance, except that it is upright and bushy. It is a native of dry mountainous places, common in gardens, and flowers in July. It is less pungent than the common thyme, and more to than the mother of thyme, and more grateful than either. Its finell is like that of temon peel; diftilled with water, it yields a larger quantity of effectial oil than the other forts do. This oil

contains nearly all the medicinal parts of the plant. Spirit of wine also takes up the finer parts.

— VULGARE MINUS. COMMON MOTHER of THYME OF WILD THYME. Thymus ferpyllus, or thymus ferpyllum vulgaris minor, foliis plants obtains basiciliais, forthus contains caulibus repensibus Linn. Comme ciliatis, floribus capitatis caulibus repentibus, Linn. Com-MON SMALL WILD THYME. It grows wild on heaths and dry pasture ground; it sowers in June and July; it is an agreeable aromatic, fimilar to that of the other species, but milder, and in flavour it is rather more grateful. Its effential oil is both in fmaller quantity, and lefs acrid, and its spirituous extract comes short of the penetrating warmth and pungency of that of the common

SERRATUS ANTICUS MAJOR, from ferra, a faw. The FORE, or GREATER SAW-LIKE MUSCLE. It rifes by digitations from the fine fuperior ribs, then paffes backwards, and is inferted into the whole length of the feapula. Its largest portion is inferted into the lower angle of the fcapula, which it rotates and brings forwards. Between every portion of this mufele, there is a quantity of cellular membrane interpoled, especially about the middle, where it feems to divide it into two diffined muscles. If the petteralis minor is called ferratas anticus minor, this muscle is called major, otherwise it is simply called forratus anticus.

SERRATUS ANTICUS MINOR. See SERRATUS AN-

TICUS MAJOR.

- Posticus superior. It rifes by a thin broad tendon, from the two upper vertebræ of the back, and the two lower of the neck, and runs to be inferted into the fecond, third, and fourth ribs.

. POSTICUS INFERIOR. It rifes from the fafcia of the loins, and is inferted into the three last ribs, ferv-

ing to bring them down.
SERTULA CAMPANA. See MELILOTUS. SERUM. WHEY. The thin part of the blood is also called its ferum. The ferum of the blood contains a coagulable matter, which forms what is called the buff upon the blood after taking it from a vein. Dr. Fordyce ob-ferves, in the first part of his Elements, that the ferum is fluid in any degree of heat between thirty and one hundred and fixty of Fahrenheit's thermometer; that it confists che-mically of a coagulable matter and water, in which common fal ammoniac, phosphoric ammoniac, and generally common falt, and frequently felenites, and fixed ammo-niac falt are diffolved; that it contains a superfluous water, which may be separated from it by filtration in the body, but that water which is chemically combined with the other parts cannot; that the separation, or addition of superflu-ous water, does not affect its viscidity so far as it is of any confequence in the circulation; but the feparation of that water which is in chemical combination may render it

more viscid; that the water which is chemically combined | with it is never feparated whilft it is contained in the bloodveffels, confequently this part of the blood is always equally vifeid, so far, at least, as its vifeidity can effect the circulation, or the fecretions; and that it may be coagulated by a juice fecreted in the stomach, or by injections thrown into the blood-veffels:

SERUM ALUMINOSUM. See ALUMEN.

SESAMOIDEA, from onrays, and sife, offa. The SESAMOID BONES These are the little bones most frequently found at the articulations of the toes and fingers; those two at the first joint of the great toe are much larger than any other, and allow the flexors to fend their tendons along this joint secure from compression, and, besides, giving them an angle at their infertion, the force of the muscle is augmented. They have their name from their supposed relemblance to the feed of the fefamum, yet they are of very different figures and magnitudes. They are generally most numerous in old people, and Winslow thinks they are often formed of the ligaments, or tendons, about the articulations where there is much strong compression on them. Chefelden observes that the fesamoid bones are reckoned to be forty-eight in number; but that there is commonly found but two under the ball of each great toe, two at the middle joint of each thumb; and fometimes one at the lower end of each thigh-bone, at the beginning of the plantaris muscle. He adds, that he found in some bodies, the little cartilages at the receiving ends of the bones of the fingers offified; and concludes, that those who enumerate forty-eight fefamoid bones, have mistaken these officiations for them.

The great toe hath the largest fefamoidea; the inner one is the largest.

Dr. James, in his Med. Dict. art. ALBADARA, relates a case of frequent fits troubling a young lady, which after resisting various means of relief, were effectually cured by amputating the great toe: this operation was proposed on a supposition that the fesamoid bone there, was dislocated; and from thence the fits were produced. He further adds a cafe that feems to have been the object of his own attention, and which he apprehends arole from an injury done to the fefameid bone of the great toe. On the patient's first reception of the hurt, he was feized with a fit, and whenever he moved that toe, he fell into another. These fits much resembled the epileptic kind, except that no froth was discharged at the mouth: the injured foot first began to be convulsed, then the leg, and from thence a very uneasy sensation ascended to the head, and then the convulsions began to be universal. This case proved fatal.

SESAMOIDES. See CICHORIUM SYLVESTRE.

SESAMUM VERUM, also called fefamum veterum, digitalis orientalis, gangila. OILY PURGING GRAIN. The fefamsum Orientale, Linn. It is an Egyptian plant, the feeds of which afford a great quantity of oil by expref-tion, but hath no right to the title of purging.

SESQUIUNCIA. See HEMIOLION.

SESCULVILGARE, also called filer montanum, li-gustricum, sermountain. COMMON HARTWORT. It is a small umbelliferous plant, with large leaves set in pairs; the root is large, thick, and branched. It is perennial, grows wild in the fouth of Europe, is raifed in our gar-dens, and flowers in June.

All the parts of this plant are aromatic, of an agreeable fmell, and warm fweetish taste; the roots are the most warm and pungent, the feeds are most pleasant and sweet. A spirituous extract of the seeds is an elegant aromatic sweet. See Lewis's Mat. Med.

For that which is called — PELOPONENSE, fee CICUTARIA; — PYRENNE, &c. fee MEUM LATIFOL. ADULT. — PYRENAICUM, fee APIUM.

- Massiliense, called also famiculum tortuofum. Italian Hartwort, French Hartwort, Hart-WORT of MARSEILLES. It is the fefeli tortuofum, Linn-It is perennial, and a native of the fouth of Europe, from whence the feeds are brought.

The feeds are aromatic, warm, and biting to the tafte, more pungent than those of the common hartwert, but

want their fweetness. See Lewis's Mat. Med.

- ETHIOPICUM, also called bupleurum arborescens falicis folios cervaria, laferpitium vulgatius. SHRUB HART-WORT of ETHIOPIA. This species is met with in the gardens of the curious; it flowers in August; ita feeds are fomewhat acrid.

SETACEUM. A SETOS, so called from fete equine. borfes bairs, because horses hairs were first used for keeping the wound open; but now thread or cord is used, because it is less painful. Camanusali, a physician of Bagdat, who lived before that city was taken by the Tartars in 1258, mentions a fetsh in the cure of a difor-der of the eye: Rhazes also speaks very particularly about fetons. Originally, an actual cautery was used for making a feton with. Holltrius first made it with a needle unheated.

This operation is performed by elevating the fkin with the finger and thumb, an affiftant doing the fame at about an inch from where the operator holds it, and having armed a large broad crooked needle with as many threads as the operator thinks needful, pass the needle through the stretched skin, and bring the threads a little way through; and there leave them; rub a little of the thread, as much as will pass into the feton at each time of drefting, with the ung. refinæ flav. move the thread forward every morning and evening, and thus the discharge will be pro-

moted, and may be continued at pleafure.

What Mr. Bell hath intimated respecting this subject well deserves attention, particularly when tumors in some fituations are large. If empties the swellings, he observes, of whatever size they may be, not suddenly, but very gradually; it effectually prevents a free admission of air; it is not commonly attended with near so much pain and inflammation; nor is the cicatrix occasioned by it ever inconvenient, or unfeemly, which it fre-quently is after a large incition. When the patients are otherwise in good health, they very commonly do well; and with this additional advantage, that a cure is fre-quently obtained in little more than half the time usually found necessary after a large incision has been employed.

Setons are commended in diforders of the head and eyes; but iffues, or perpetual blifters, are more agreeable, and equally useful methods. See Heifter's Surgery, Bell's Surgery, vol. iv. p. 382. Bell on Ulcers, east. 3. p. 83, &c. White's Surgery, p. 184.

SETANIUM. See AMAMELIS.

SEUREN. See BOVINA AFFECTIO. SEVUM OVILLI. See PREPARATIO ADIPIS. SEXTANA. Erratic, intermitting fevers, which re-

turn every fixth day.

SEXTARIUS, also called chift. This term has been used both in liquid and folid measure, and has great variation, concerning which Galen observes, that it was not formerly among the Athenians but received by the Greeks, though different from what it was among the Romans. For amongst them the festarius included the pound, half pound, and a fixth, making together twenty ounces: the Athenians constituted, though, by this a less measure, by fexturius they meant a pound and a half, i. e. eighteen ounces. It yet also meant lefs, a fexturius only weighing three ounces. Rhodius distinguishes it into ponderal, and mensural, that it contained two hemina, hence only thirteen ounces. The same author afferts that the fexturius of dry ingredients was a pound, of limits that the fexturius of dry ingredients was a pound, of liquid half a pound; the fextaria of two hemina, the Arabian panderal was half a dram, the Italian eighteen ounces of oil, twenty of wine and water, feventeen of honey. The fextarium of wine was also fixteen ounces, and as many seruples, of honey sive and twenty ounces, according to some others. Castelli, see also Cya-

SEXTANS. See CYATHUS. SIALOGOGA, medicines which excite a falivation. Of this kind, mercury is the most powerful, and next to

it is the metallic part of antimony.

SIBBENS. This name is given to the venereal difcafe in fome parts of Great Britain. In the year 1773,
Mr. Hill a furgeon in Dumfries, published his Cafes in
Surgery; to which he hath added an account of this diforder, and that with a view to the confutation of a thefis which had been published, and erroneously afferted the fibbens to be different from the pox.

SIBCADI. See BULBUS VOMITORIUS. SICILIANA. See ANDROSAMUM.

SICULA. See BETA. SICULA SEC BETAL SICULA TERRA. SCE BEZOAR FOSSILE. SICULUS ALBUS. SICYEDON. A TRANSVERSE FRACTURE.

SICYOS. SINGLE-SEEDED CUCUMBER. It is of the monoecia fyngenelia class, there are three species, natives of North America, and the West Indies.

SIDERATIO. An APOPLEXY, which fee: a fphacelus, also a species of erysipelas, which is vulgarly called A BLAST.

SIDERATIO OSSIS. See SPINA VENTOSA.
SIDERITIS. See CHAMÆPITYS; MAGNZS; and

SIGILLATA TERRA. SEALED EARTH, called

belus Silefianus, Lempnias, lacune, Levonica terra. Thefe take no place among it folfils, being artificial. Their virtue and uses the same as the terra Lemnia, and other bolar earshs: fome have the name of anungia folis, and

SIGHLUM HERMETICUM. An HERMETIC SEAL.

A glafs veffel is faid to be bermetically fealed, when the

A glafs vefiel is fand to be bermetically scaled, when the glafs is melted, and the veffel by this means is closed.

SIGILLUM SOLOMONIS. See POLYGONATUM.

BEATE MARIE. See BRYONIA NIGRA.

SIGMOIDES PROCESSUS. See PROCESSUS CORRECTION. It is called figmentical from its resemblance to the Greek letter figms. Three valves of the heart have this epithet, viz. of arterize pulmonalis, and aorta. The femicircular cavity of the cubit, at the articulation of the fore-arm with the humerus, is fometimes called the figmeidal cavity; and the cartilages of the afpera arteria have the epithet figmeidal applied to them by some

SIGNUM. Signum, a sIGN. Signs are universal; univocal, or pathognomonic; equivocal or doubtful; commemorative. Galen defines it to be, "that which dif-covers, or makes known, what was formerly unknown."

Signs are those appearances which manifest the loss of health, or the presence of disease, and relate to the general causes thereof. Symptoms are those diforders which are produced by the continuance, or other circumstances of a preceding diforder. Signs shew the nature of the dif-temper, and symptoms point out its effects, or what may be expected as to health, life, or death. Signs always attend a difease, but symptoms do not. Some divide signs into diagnostic, prognostic, commemorative, equivocal, and pathognomonic.

SIGNETIE, SAL DE. See SAL RUPELLENSIS. SILER MONTANUM. See Seseli vulgare.

SILIGO. See SECULA.

SILIOUA. An ancient weight equal to three grains and one twenty-eighth. The CAROB-TREE; also a pod,

which is a membranaceous veffel, containing the feeds of fome plants, and a name of feveral different plants.

SILIQUA HIRSUTA. The COWHAGE.

—— DULCIS, also called careba, carantia, ceratia, ceratiaia, filiqua edulis. The CAROB-TREE. It grows in Sicily and Naples; the fruit is cooling, and moderately leasting. laxative. At Venice they are much used.

- PURGATRIX. It is a large tree, a native of Guinea; its pod is much more purgative than that of the common carob. See Raii Hift.

SILIQUASTRUM. It is the JUDAS-TREE, called Cercis colytea, Judaica arbor. Miller fays there are two species. It is a genus of the decandria monogynia classifethyperia a name given by Dr. Hill to the bony palates of fithes, which are frequently bound fossile at great depth in the earth, and usually immersed in the strata of stone, have been called filiquastra by Mr. Lhuyd, from their resemblance in shape to the pods of lupines, and fome of the other leguminous plants. For that called - PLINII. See PIPER INDICUM.
SILPHIUM. ASSAFORTIDA, also the stalk of the

plant which affords it, named also laserpisium. SIMAROUBA, also called euonymus, and the BARK, which is the part in use, is called fimersuba, fima raba, and GUIANA BARK. It is the bark of an unknown tree in Guiana. Some think it to be the bark of the piffachia terebinthus, Linn. The Edinburgh College, in their Pharmacopoeia, fay, that it is the quaffia foraruba, vel quaffia floribus monoicis, folis abrupte pinnatis; foliolis alternis fubpetiolatis, petiolo nudo, floribus paniculatis,

Linn. Suppl. 234. Curtis, in his Catalogue of the Medi-cinal Plants in the London Botanic Garden, calls it quaffia disica. It is brought to us in long pieces, of a yellow white colour, light, tough, and fibrous. It refembles that which the ancients describe under the name of macer-It was brought into Europe in the year 1713. Dr. James fays, in his Medicinal Dictionary, that it is the bark of a West Indian tree, viz. of the tree from which we have the Cayan wood. It is a specific in dysenteries, particularly the serosobilious, bloody, and mucous kinds; it represents these distorders when there is no sever, and when moves these diforders when there is no fever, and when the ftomach is unburt, without the ufual inconveniencies of affringents; it abates spassus, and hysteric affections. Dr. Cullen looks upon it only as a pure and simple bitter, possessing nearly the same qualities as that of quastia, of which he looks upon it to be a species. If any symp-

toms feem to require an emetic, let it precede the use of this bark. See Macer.

The best preparation is the following decoction, four table spoonfuls of which may be given every three, four or fix hours. R Cort. fimaroub. craff. contuf. 5 ii. coq. in aq. font. fb i. 3 iv. ad. fb i. & cola.

It hath been observed, that if this decoction is made

stronger it excites fickness, but in proportion thereto it fails as an antidysenteric. See Lewis's Mat. Med. Mem.

fails as an antidyfenteric. See Lewis's Mat. Med. Mem. de l'Acad. des Sciences, 1729, par M. d. Juffieu. Cullen's Mat. Med.

SIMPLEX OCULUS. It is a bandage for the eye, being only a fingle-headed roller applied to the cheek, then paffed over the eye, and the offa parietalia, running down behind the head, and paffing by the nape of the neck, it rifes to the place it began at, and so is continued till the whole is taken up. It is called fimplex sculus for both eyes, when it is a little longer, and made to pass over both eyes; for both eyes it is rolled up into two heads, and the middle is applied to the nape of the neck.

SINANCHICÆ. ITALIAN RUSHY HORSE-TAIL.

Sce JUNGARIA.
SINAPELŒON. OIL of MUSTARD-SEED.

SINAPI. MUSTARD. It is an annual plant, with long rough leaves, divided to the rib into irregular fegments, of which the extreme one is the largest, producing at the tops of the branches tetrapetalous yellow slowers, followed each by a short, smooth, quadrangular pod, divided longitudinally by a membrane, which projects at the ends, containing small roundish seeds, of a reddish brown colour. Both the colleges of London and Edinburgh, or large in their Physics Physics of the containing small roundish seeds. der, in their Pharmacopoeias, the finapis alba, or finapis floribus luteis, filiquis hispidis, rostro obliquo longissimo, seminibus albis, Linn. WHITE MUSTARD-SEED. That with the dark brown seeds, is the finapis arvensis, or finapis floribus luteis, filiquis hispidis rostro obliquo longissmo, longioribus, Linn. Commonly called Durbam nuftard, and finapis nigra, Linn. It is a native of England, but commonly cultivated for dietetic and medicinal uses. Botanists enumerate fifteen species.

Mustard-feed yields upon expression much oil; this oil is as infipid as that from olives, the pungency remaining entire in the cake which is left after the expression. For table muftard, this cake is better then the whole muftard. Spirit of wine takes up but very little of the pungency of muftard; but water takes up from the bruifed feeds nearly the whole of their active matter. If muftard is added to boiling milk, the whey will be separated from the curd, and possess much of the virtue of the seeds. Distilled with water, they yield a limpid effential oil, which is extremely pungent and penetrating both to the finell and tafte, and fo ponderous as to fink in water. The emaining decoction, on being inspiffated, becomes a sweetish, britk, mucilaginous extract.

Mujiard is one of the ftrosgeft of the pungent ftimulating diuretics, that operates without exciting much heat. In paralytic, cachecute, and ferous diforders, a large spoonful of the unbrused seeds have been taken two or three times a day. It is not heating to the stomach in this way, but stimulates the intestinal canal and comanonly proves laxative, or at least supports the usual daily secretion. Bergius hath cured vernal intermittents with it, and has found the bark rendered more effectual by mixing the powder of muftard with it. Cullen's Mat. Med. The bruifed feeds prepared as for the table is rubbed with advantage on parts effected with numbnefs, or with rheumatic diforders. In all difeafes where an 8 F acid

acid in the prime viæ attends, muflard should be freely used; if eaten plentifully with the victuals it assists digettion; mixed with horse-radish, it is insused in wine as a flimulant and diuretic in languid conflitutions; and when beaten up with vinegar into a cataplasm, it is applied to the feet to remove deliriums in fevers, and to bring down the gout from the head or the lungs to the feet. These cataplasms act more quickly than blisters; they are also useful applications to the feet for raising the pusse in low fevers, and for relieving the head in those disorders. If mustard is mixed as for the table, and of this mixture a table spoonful or two is added to a pint of tepid water, and drank on an empty flomach, it operates as an emetic; and, if repeated once or twice in a week, is of fervice in nervous diforders. Muftard-whey is a ufeful drink in all low fevers. Lewis's Mat. Med. It is also a name of the turritis, rapistrum, erucago, sisymbrium; erysimum la-

SINAPISMUS. A SINAPISM. It is the fecond degree of irritating external applications. See EPISPAS-TICA. It is so called because of the mustard, which is generally a part of the composition, and which produces

a redness, itching, heat, and tumor in the part to which it is applied. See CATAPLASMA.

SINCIPUT. See BREGMA, and ARCUALIA OSSA.

SINE PARI. The vein fo called, fee Azygos. The

empl. fine pari, or matchless plaster. A pompous name for a plaster, which is now not noticed.

SINENSE LIGNUM. See LITERATUM LIGNUM. SINGULTUS. The HICCOUGH. It is a spasmodic affection in the stomach, cesophagus, and muscles subfervient to deglutition. Hippocrates fays, that the fto-mach is its only feat; Hoffmann fays, that the diaphragm is that part principally affected; but others fince him, affert the itomach to be the principal feat. The diforder is primary, or fymptomatic. The immediate cause is generally allowed to be an irritation in the flomach. When attending acute diforders, it is called the acute; and when a companion of chronical diforders, it is called the chronical biccough. The occasional causes are errors in diet, a wound or other injury done to the stomach, an inflammation there, acrid poifon, inflammation in the dia-phragm, or any of the abdominal vifeera, four juices, and flatulence in the ftomachy &c.

The symptomatic kinds are attended with flatulence, and are usually relieved by the sp. vol. feetid. to which a small quantity of the tinct. opii may be added. The missure mosch, is of excellent relieve. And when this diforder is obstinate, musk should be given in doses from gr. ten to twenty, made up into the form of a bolus. The

fp. atheris nitrof. may be often given in fmall dofes. When it happens in weak stomachs from a full meal, or hard flatulent aliment, relief is generally obtained by a glafs of good wine, or of tepid water, with an equal quan-tity of fome fpirituous liquor.

If acid crudities in the ftomach are the caufe, give ab-

forbents and the bark, with warm bitters.

When irritating poifons are the caufe, befides emetics, plenty of warm milk, and frequent dofes of fweet oil, will be ufcful.

If indigefted aliment is the cause, a table spoonful of

fharp vinegar will often relieve.

Emetics and sternutatories often effect a cure; and blifters fometimes are ufeful.

When the diforder is idiopathic, purgatives mixt with spiates, fo that a moderate dose of the composition may loofen the belly, are the most efficacious.

SINKOO. See AGALLOCHUM.

SINON. SINNON. See AMOMUM.

SINUS. A flows in a bone is a cavity which receives the head of another bene. In furgery, it is a collection of matter with only a fman orifice for its difcharge; and this orifice is not callous. See FISTULA. In anatomy, the vagina is called finus muliebris, or finus pudoris, also SINUS CORE, i. c. ACETABULOM COMENDICIS.

- MAXILLARIS. See ANTRUM HIGHMORIA

· VENÆ PORTARUM. The trunk of the vena ports hepatics fuperior vel minor. SIONANNA. See AMELPODI. SIPHILIS. The POX.

SIPHUNCULUS MARIS. See ENTALIUM. SIRENES. A fort of worms. See BOVINA AF-

SIRIASIS. A diftemper to which children are fubject; it confifts of an inflammation of the brain and its membranes, attended with a depreffure of the fontanella, a cavity of the eyes, a burning fever, a palenefs and drynefs of the whole body, and a lofs of appetite. Dr. Cullen ranks it as fynonymous with phrenitis, it is called adultion.

SIRII BOA. See BETLE.
SIRONES. See BOVINA AFFECTIO.
SISARUM, also ELAPHOBOSCON. SKIRRETS, of their WORTS. They are well known in our gardens, and are chiefly cultivated for culinary purposes. They are considerably nourishing and not very flatulent, and by boiling become very tender. If plentifully eaten they are diuretic. Raii Hift. Plant. For that called —— MONTANUM, see GENSING. —— PERUVIANUM, see BATTATAS HYSPANICUM.

SISON. See AMOUNT

SISON. See AMOMUM.

SISYMBRIUM. It is a plant with thin pods, of which Boerhaave reckons up thirteen species. It is also a name of several species of mint, of water-cresses, and some other plants. See BARBAREA; MENTHA AQUfome other plants. See BARBAREA; MENTHA AQU-

SISYMBRIUM AQUATICUM, also called raphanus aquaticus, armoracia. WATER-RADISH. It grows in marshy ditches, slowers in June and July, and is supposed to agree with the horse-radish in its virtues.

SITIOLOGICE, from \$1705, aliment, and \$270, to fpeak. That part of medicine which treats of aliments.

SITIS. THIRST. It is excited by a defect of moisture; a thickness of the humours; redundant heat, muriatic, alcaline, ammoniacal falts; aromatic, oleous, and rancid acrimony; or from poisons. See POLYDIPSIA.

Thirst is best allayed by acids; water kept a while in the

mouth, then spit out, and repeated as required; a bit of bread chewed with a little water, which latter may be gradually fwallowed; if the person is very hot, brandy is the best for holding in the mouth, but should be spit out again: except in feyers, large draughts of cold water are hurtful.

SIUM, called also LAVER. The root is like that of colewort, fibrous and ligneous; the leaves are pinnated, growing by pairs to one rib, and ending with an odd one; the petals of the flowers are bifid, the feeds are roundish, gibbous, and ftriated. For that called - AROMATI-CUM, fee AMOMUM; - ALTERUM, &c. - MAjus, &c. and - ERUC & FOLIO, fee CICUTA AQUA-

SIUM LATIFOLIUM, also called passinaca aquatica. Great water-parsner. It grows in rivers and marshy places, it flowers in July. The leaves are faid to break the stone in the bladder, and have other virtues attributed to them, but they are not noticed in the present practice.

- Angustifolium, also called berula Gallier, laver verum Matth. apium palustre feliis eblengis. Com-MON UPRIGHT WATER-PARSNEP. It grows in moift wet places, and flowers in June. Its leaves are faid to have the fame effect as those of the great water-parfnep.

SMALTUM. SMALT. It is made of flints and pot-

ash, which are melted into an imperfect kind of glass, coloured with cobalt, and when cold, is reduced to a powder. See Cobaltum.

SMECTIS. See CIMOLIA PURPURASCENS.

SMILAX ASPERA. ROUGH BIND-WEED, called also China prientalis and occidentalis. It is cultivated in gardens, and flowers in fummer. The leaves, tendrils, gardens, and flowers in fummer. The leaves, tendrils, berries, and roots, are used as perspiratives, to cure skindiseases and pains in the joints. It is a succedaneum for sar saparilla, and is celebtated against venereal disorders. See Raii Hist. For that called China, see China Orientalis. — Peruviana, see Sarparilla. — Hortens, see Phaseolus. — Indica, see China Occidents, see Phaseolus. — Indica, see China Occidents. — Lævis officin. and minor, see Convolvelus major and minor. — Virginiana, see Sarsaparilla. — Unifolia humilima, see Monophyla SAPARILLA. -- Unifolia humilima, fee MONOPHYL-LON.

SMYRNION. See IMPERATORIA.
SMYRNIUM. See APIUM and HIPPOSELINUM.

SODA,

rancid or hot cructations, fee CARDIALGIA. It is fynonymous with dyspepsio, and pyrosis. It is used to express the heart-burn; and by some, a fort of head-ach. It is a name for pot-ash, and for the mineral fixt alkaline falt. See Anatron and Clavellati cineres.

SOL. See Aurum.

SOLAMEN. INTESTINORUM. See Anisum.

SOLANOIDES. BASTARD NIGHT-SHADE. It hath a rofe-thaped flower, which is followed by a fort of berry. Miller takes notice of two species, but they are not noted

SOLANUM. NIGHT-SHADE. It is a plant with a monopetalous flower, divided into five fegments, having its cup divided in the same manner, with the same number of stamina in the middle, and followed by a juicy berry.

SOLANUM BARBADENSE. See PHYTOLACCA.

—— LETHALE, called also folanum maniocum, bel-

ladona, folanum fomniferum, folanum furiofion. DEADLY NIGHT-SGADE. It is the atropa belladona of Lin-

It is one of the poisonous plants that are indigenous in

Great Britain; it is poisonous in all its parts.

The root is long, large, and creeping. The ftalks are purplish, upright, firm, numerous, branched, and herbaceous. The leaves are egg-fhaped, entire, very large, fmooth at the edges, pointed a little at the extremities, and of a beautiful green colour, hairy and foft. The flowers fland on fingle foot-stalks: they are formed of one petal; bell-sliaped, and very lightly divided into five feg-ments at the edge. Their colour is a dark dead purple. The berries which succeed the flowers are globular; they are first of a red colour and afterwards become black. This plant flowers in July, and its fruit is ripe about Mi-

It is found in woods and hedges, amongst lime-stone and rubbith; and also where the ground is rich from manure. The plant hath a faint smell, somewhat of the poppy kind, which is loft when it is dry; whether fresh or dry there is no peculiar fensation conveyed when the leaves are applied to the organs of taste.

The symptoms produced by this plant are, giddiness as

if intoxicated, great thirft, pain in, and tightness across the breatt, difficulty of breathing, raving but with short intervals of relief, at times faintness, and instead of raving a kind of foolishness is observed to take place, staring, flabbering, and giving answers foreign to the questions asked. In some a violent strangury comes on. When adults have been injured with this poilon, they have related that they have felt themselves as if drunk, but faw and understoood all that was doing, even when they gave the wildest answers. Some are faid to have continued in a ftate of madness for some days; others lose their fight for a time, the iris being fo much relaxed as to become paralytic, and dilated to a very confiderable fize. In children the belly fwells, and convultions fometimes follow. To children it is generally fatal. When adults die of this poison, it usually proves fatal in less than twenty-four hours. Theophratus called this plant flychosis, and the fymptoms produced by it were called flychosmania.

In case of injury from this plant, use the same means as are recommended in the article AMANITA, which see.

Notwithstanding the above effects of this nightshade, a prudent use of it has been recommended as follows: the leaves applied in the form of a cataplain are useful for relieving cancers; an infusion of the leaves is extolled as an internal medicine in cancerous cases; but on trial it does not appear to deferve the encomiums that have been paffed in its favour. The dofes are very small, and their effects various and uncertain; sometimes it purges, at others runs off by the kidneys, or through the skin, and often no eva-cuation of any kind is observed. Those who took the infusion suffered by giddiness, throbbing pain in the eyes, a discharge of tears, and in all there was a dilatation of the pupil. Mr. Gataker observes that it is a medicine not so much calculated for general use, as for particular cases where the common remedies have failed, and where this feems upon trial, to be free from the principal inconveniences which so often attend the use of it.

Dr. Cullen has feen a cancer in the lip cured by it, and a feirrhofity in a woman's breaft removed by it; and also great service derived from its use in a fore a little be-

SODA. A burning uncafinefs in the throat, with | low the eye which has put on a cancerous appearance.

It is possessed of narcotic and deleterious powers. See Gataker's Essays. Bromfield on Nightshade. Wil-mer's Obf. on Possonous Vegetables. Withering's Bot.

Arrang. Cullen's Mat. Medica.

SOLANUM HORTENSE, also called folatrum, folanum vulgare, folanum officinarum, folanum nigrum, Linn. COMMON, or GARDEN NIGHT-SHADE. Its leaves are oval-pointed, and irregularly indented; the flowers are white, and in clusters; the berries are black. It is annual, grows in uncultivated grounds, and flowers in Au-

Either of these two species may be indifferently used; their leaves have been found to be ufeful in cancerous diforders, foul ulcers accompanied with pain, obstinate pains in particular parts, fcorbutic and fcrophulous diforders. It is faid to be particularly purgative of the bile; in thefe cases it is taken in the form of an infusion. Its usefulness hath been also observed as an external application; beat into a poultice, or mixed with the white-bread poultice, it hath abated the violence of inflammations in the eyes, head-achs, pains in the ears, acrid defluxions, inflammations of the venereal kind, pains from feirrhous tumors, and thus applied on ferophulous and cancerous tumors, it hath been followed with confiderable advantages.

The most common effects observed on taking the infusion of the leaves are, a warmth diffused in a few hours over the body, a plentiful fweat fucceeding this heat, and a lax belly the next day; if a fweat did not break out, a confiderable discharge of urine, or loofe stools, was the confequence. One or other of the excretions are ufually increased by it; if this does not happen, it feldom is of service, and if benefit is not observed soon, its further use will not avail much. In fanguine habits, bleeding and purging thould precede its ute, and if the ftomach feems affected with crudities, an emetic flould be given before the night-shade is used. Feverifiness is no objection to its

The leaves may be used either fresh or dry. Insuse half a grain in an ounce of boiling water to be taken at bedtime; gradually increase the dose, which may be repeated every night, and continue that quantity, which produces giddiness, or fickness, or a lax belly, or fome other fensi-ble effect; fometimes one dose is enough in two or three days. The dofe hath been gradually increased to twelve grains. See Storck on the Solanum.

SOLANUM LIGNOSUM, also called dulcamara, gycypicros; amara dulcis, felanum feandens, BITTER-SWEET, WOODY NIGHT-SHADE. It is called bitter-fweet, because it is first sweet then bitter. It is the folanum dulcamara, or folunum caule inermi frutescente slexuoso, foliis superioribus hastatis, racemis cymosis, Linn. PURPLE FLOWER-ING, WOODY NIGHT-SHADE. Many of its leaves are deeply cut, or are furnished with two small appendages at the bottom. The flowers are in clufters of a blue colour; the berries are red. It grows on the fides of ditches, and in moift hedges, climbing upon the buffles with wind-ing, woody, but brittle ftalks. It is perennial, and flow-

ers in June and July.

Their fensible operation as a medicine is by sweat, urine, or stool. A tincture may be made by digesting four ounces of the twigs into two pints of white wine, and of this the dose will be from \$\frac{3}{2}\$ ii. to \$\frac{3}{2}\$ vi.

This species is not so deleterious as the above two, and it acts more uniformly. Decoctions of it have been fer-viceable in the rheumatifm.

Dr. Hulfe fays it is one of the most powerful discutients; he directs four handfuls of the leaves, and four ounces of linfeed, to be boiled together in wine, or in hog's fat, to a cataplasm, and to be applied warm. Boerhaave enumerates twenty-four species of folanum,

but these are the most noted.

SOLDANELLA MARITIMA MINOR. See BRAS-SICA MARITIMA.

SOLEN, outer, a cradle for a broken limb. Any tube

or channel.

SOLIDA. A south. Haller observes in his Physiology, that the felial elementary parts of our fibres, and fibres constitute all our folials, are a calcareous earth kept together by a gluten. That in a natural state when bones lose their gluten, this earth falls into powder; and that in this earth there is a portion of iron. In a fectus the gluten forms about two thirds of the fubiliance of the bones; and in an adult, nearly half of the bone is gluten. The folids contain much air, and the more folid a part is, the more air it contains: The bones contain a quantity, which, when fet at liberty, is two hundred times the bulk of the bone. Air feems to be the primary band of the elements, for until the air is expelled the other parts do not feparate.

SOLIDAGINE. See DORIA. SOLIDAGO VIRGA AUREA. See VIRGA AUREA. SOLEUS. A mufcle fo called from its likeness to a fole-fifh. This mufcle is a biceps, riting on the outfide from the upper part of the tibia, internally from the outfide of the fibula, it leaves a notch for the paffage of the veffels, it joins the gastroonemius to form the tendo Achillis. Brown calls it gastroenemius internus.

SOLITARII, diseases affecting only one part of the body.

SOLIS AQUÆ. See BATHONIÆ AQUÆ. SOLIUM. See METATARSUS, and VERMES.

SOLIUM. See METATARSUS, an SOLSEQUIA. See CALENDULA.

SOLSEQUIUS. See TITHYMALUS HELIOSCOPIUS. SOLUTIO. SOLUTION. It is the dividing of a folid body into particles small enough to swim in the men-struum, without being visible. The dissolving sluid is called a menstruum, or solvent.

Solution is also defined to be an union formed by the integrant parts of one body with the integrant parts of another body of a different nature. Thus as a new compound is the refult of this union, we hence fee that folution is nothing else than the act of combination.

Solution is an uleful operation in chemistry, and in that art hath various intentions; it is necessary for the producing of new combinations, and thereby obtaining new kinds of medicines, as is inflanced in the union of acid with alkaline falt, in making the kali acetatum, the aq. ammoniæ acetatæ, &cc. it is ufeful for the purifying

and crystallizing of falts, &c. As the nature of folvents and things to be diffolved are different, fo the manner of effecting folutions differ. In fome cases it is effected by simple commixture, and frequent agitation; fometimes the affiftance of heat is re-There is a kind of folution, called folutio per deliquium; it is performed by exposing the matter to the air, from which attracting water, it collects, in time, enough to diffolve itfelf; fome substances not foluble in water will diffolve when exposed to the air, and in those

inflances, the process is called deliquatio. See Dict. of Chem. SOLUTIONES. In Sagar's Nofology, it fignifies

fresh wounds, whilst as yet bleeding. SOLUTIVA. LAXATIVES.

SOMNAMBULISMUS, I alio, hypnobates, hypnobata-SOMNAMBULO, fis, nocambulatio, & fom-nambulatio. One who walks in his fleep. It is a species

of oneirodynia. SOMNIUM, i. e. fomnambula, but more properly

dreams and visions in sleep; so an instance of oneirodynia. SOMNUS. SLEEP. Action is destructive of our frame, and rest repairs its decays. During sleep, the nourishment received from food in our waking hours is applied to the decayed parts, the blood is recruited, and the fecretions perfected; whence the impropriety of difturbing the order of nature by employing the functions with any other work : and hence the necessity of some time for digeftion to be performed before going to reft.

vol. I. p. 11-14.

SONCHUS LÆVIS. MONTANUS PURPUREUS
and REPENS. See CHONDRILLA, and HIERACIUM MAjus.

SONUS. Sound. That air, though concerned in propagating found, is not found itself, is evident from found running almost as fast against the wind as with it.

As the divertity of founds depends on the different na-tures and collifions of fonorous bodies, an acute tone proceeding from a body whose parts are so disposed as to render them fit for producing only the most instantaneous vibrations, which they convey to the ambient air; and a grave tone proceeding from a body which is only capable of flow and protracted vibrations, it must of course follow, that the membrana tympani docs, in its various degrees of tension and relaxation, adapt itself to the several natures and states of sonorous bodies; for instance, it becomes tense for the reception of acute founds, because, in such a state, it is susceptible of quick, and instantaneous tremulous motions; on the contrary, it is relaxed for the admission of grave founds, because, during such relaxa-tion, it is qualified, and disposed, for the reception of the more flow and languid undulations of the air.

The external air imprefies the membrana tympani, moves it with the malleus, which moves the incus, and

this the stapes which impresses the auditory nerve. Further, in order to found being perceived, the spiral laminæ in the cochlea, being composed of fibres of various lengths and fizes, each receives the particles shaken off from founding bodies, which answer in unifon to these fi-bres in the spiral lamine, and the motions in the sibres of these laminæ shake off the same particles which are fent to them, and thence they pass to the sensorium by the nerves. It is probable that all the different organization of the ear was originally designed to put these sibres of the spiral lamine in due tension, and in tune; and from the different degrees of perfection in the formation of this organ, arises the different accuracy which one ear hath above another, in diftinguishing the concord of different instruments, or strings of the same instrument.

SOPHIA, called also fapientia chirurgorum, accipitrina cardamine, daligithron; thalielrum, naffurtium fylvefire, feriphium Germanicum, exfimum, fifymbrium. FLIX-WEED. It is the fifymbrium fophia, Linn. It is a plant with a hard woody root, full of fmall fibres at the bottom; the leaves are long, winged, neatly divided, refembling those of Roman wormwood, and befet with short hairs; the flowers are at the ends of the branches, and are of a yellow colour; they are fucceeded by flender feed-veffels, of about one inch long; the feeds are red. It grows in fandy ground, amongst rubbish, and bears flowers in

June. The feeds only are used; in Paris they are fold under the name of talitron. Boerhaave fays, that their inward use affifts the healing of ill-conditioned ulcers. Their tafte is fomewhat aftringent, but acrid like that of muftard;

they are also saponaceous and disretic. See Miller's B.Off. SOPOR. See CAROS.

SOPORALIS. The SLEEPY VEIN. So the ancients

called the jugular vein.

SOPORARIÆ ARTERIÆ. The CAROTED ARTE-

SOPOROSI. Soporofe affections or diminution of fense and motion.

SORA. See Essera.

SORA. See ESSERA.

SORBUS SYLVESTRIS; called also ornus, cotonafter. The SERVICE-TREE. That used in medicine is the forbus aucuparia, Linn. It resembles the pear and the cratagus in all respects, except that the leaves are pinnated, as in the traxinus. The fruit is restringent before it is ripe, but when ripe it is very agreeable. Raii Hift.

SORDES AURIUM. EAR WAX.

SORGO, or SORGHUM. See METIUM INDICUM. SORY. It is a mineral that is blackish, hard, heavy, of a cavernous fpongy texture, a difagreeable fmell, a naufeous vitriolic tafte; it is composed of vitriol, fulphur, and an earth. It is found in the mines in Devonshire. It contains a cupreous vitriol; hence it is emetic. The Greeks used it as a depilatory.

SOUDE, also called foude blanche. See KALL.-ANA-

SPAE AQUE. WATERS of SPA. These are brought from the bishoprick of Liege, in Germany. At Spa there are a number of different springs, but the waters of two of them, are not drank by the company who refort there; viz. those of Pohun, and Gerontlerre.

They are both of the brifk chalybeate kind, but the last is the weaker chalybeate, though brifker and more spirituous. It is alledged to have more of a sulphurcous finell, to be brifker at the fountain, and more apt to make people giddy than any other of the waters at this place.

The waters of Spa have been analyzed by different me-

dical and chemical men. Dr. Lucas, Dr. Rutty, Monf. Monet, and fir Tobern Bergman; which last lays, that a gallon contains, acrated iron, 4 grains and above \$\frac{1}{2}\$; acrated lime, 12 gallons and above \$\frac{1}{2}\$; acrated magnefia, 29° and above \$\frac{1}{2}\$; mineral alkali crystalized, 12 gr. and above \$\frac{1}{2}\$; of common falt, \$1\frac{1}{2}\frac{1}{2}\$ gr. These waters are diuretic, and fometimes purgative, and like other chalybeate waters, they tinge the ftools black; they exhilirate the spirits much better than wine, or other spirituous liquors; and their general operation is by invigo-rating the fyftem, and strengthening the fibres. They are drank by a glassful, at repeated times in a morning, for the same purposes as other chalybeate waters. See AQUE CHALYBEAT E. These waters are esseemed the best of the chalybeate kind in Europe; and externally applied, as well as internally, in feveral cases they have been attended with fuccess; as injections in the fluor albus; ulcers and cancers of the womb; and in the gonorrhoea. They are useful for washing venereal aphthic and ulcers of the mouth; phagodenic ulcers; and give relief as gargles for relaxed tonfils; for fastening the teeth when loole; and in other cases of relaxation; the itch. Complaints are said to have been relieved by bathing and

washing, observing at the same their internal course.

SPANOPOGON. THINLY BEARDED.

SPARAGUS. See ASPARAGUS.

SPARGONOSIS. A MILK ABSCESS.

SPARTA POLIA. See AMIANTHUS.

SPARTIUM. SCOPARIUM. See GENISTA; for that which is called Arborescens, fee Genista Juncea - Majus, fee Genista Spinosa Ma-

SPASMA, from omas, to draw. A spasm, a convulfion, a strain. A spasm may be said to be present when any part of the human body, by the influence of the mufcular, membranous, or nervous fibres is contracted involuntarily. This spattic affection particularly affects the nervous and membranous parts, fuch as the ftomach, and the whole volume of the inteftines: whence proceed the hysteric and hypochondriac passions. A spasm is also refent when there is an hæmorrhage, congestion of blood, unequal flux of the fluids, anxieties, and suppression ed excretions. A fpasm affecting the dura matter confiderably occasions contractions of the whole nervous and membranous fyftem, whence an epilepfy, or universal con-vulsion. Spajms in the medulla spinalis produce convul-

vultion. Spajons in the medulia ipinalis produce convulfions in particular parts. Many diforders are the effects
of fpajons viz. obstructed perspiration, hamorrhages, costiveness, strangury, althma, &c. See Spasmi. Kirkland's Med. Surgery, vol. i. p. 256.

SPASMI. Spasmodic disease. In Dr. Cullen's
Nosology, this is an order in the class neuroses. The
term spajon hath been variously used; in the most common fease, it hash familiard any preternatural contraction term fpa/m hath been variously used; in the most common sense, it hath signified any preternatural contraction of any particular part of the body, either without any stimulus immediately applied to the part, or which remains after its cause is removed. More properly fpa/ms are those preternatural contractions, which are attended with considerable mobility of the system. Dr. Cullen defines fpa/m to be preternatural motions of the muscles, or of the muscular sibres; and under the title of fpa/modic offschious be includes all the diseases which consist in the affections, he includes all the difeafes which confift in the preternatural flate of the contraction and motion of the muscular or moving fibres in any part of the body. The spasmi have generally been divided into the tonici and clonici, spastici and agitorii, or motorii, and spasmi, strictly so called, and convulsions. But most of the discount of the dis eases called spasmodic, are in respect to tonic or clonic, of for mixed a nature, that it seems preserable to arrange spasmodic disorders according as they effect the several functions, animal, vital, or natural. Cullen's First Lines,

SPASMUS. A SPASM, the CRAMP, or CONVULSION,

from onas, to draw.

SPASMUS CLONICUS. CLONIC SPASM. In a morbid flate, the contraction of the muscles, or of the muscular fibres, are involuntary, and are excited by unusual and un-

natural causes. When the contractions are succeeded by a relaxation, but at the fame time, are repeated without the concurrence of the will, or the repetition of the natural causes, and are, at the same time, repeated more fre-quently, and commonly more violently, than in a healthy state; this state of morbid contraction hath been named clonic spasm, and is what Dr. Cullen, in his Nosology, names convultion. See Cullen's First Lines, vol. iii.

SPASMUS CYNICUS, also called rifus fardonicus. See

cus Risus.

— Tonicus. Tonic spasm. In a morbid flate, the contraction of the muscles, or of the muscular fibres, are involuntary, and are excited by unusual and unnatural causes. When the contractions are to a violent degree, and are neither fucceeded by a spontaneous relaxation, nor readily yield to an extension, either from the action of antagonist muscles, or from other extending powers ap-plied; this state of contractions is what both been called a tonic spain, and what Dr. Cullen names strictly and simply, a pain. See Cullen's First Lines, vol. iii. SPATHA. See PALMA NOBILIS. SPATULA FŒTIDA. See IRIS FOETIDA.

SPECIFICA. Specifics. By specifics is not meant fuch as infallibly and in all patients produce falutary effects. Such medicines are not to be expected, because the operations and effects of remedies are not formally inherent in them, but depend upon the mutual action and reaction of the body and medicine upon each other; hence the various effects of the fame medicine in the fame kind of diforders in different patients, and in the fame patient at different times. By fpecific medicines we underthand fuch medicines are presented to the fame patient at different times. derstand such medicines as are more infallible than any other in any particular diforder. Specifics may either be confidered fuch with refpect to difeases, or to the machine; both which, are much disputed by many, respecting their existence; at least fome medicines have been named such, as act by general, not particular laws, and none that we at present known of, can properly come under fuch an idea; neither bark nor mercury.

SPECILLUM. A PROBE. Æfculapius is faid to have

been the first who invented its use. Quo aliquid speci-

mus, vel observamus.

SPECULUM. Called also diaflometris. A PROBE, or an inflrument for dilating the natural paffages, or ca-

or an inflrument for dilating the natural paffages, or cavities with, of which there are the faculum ani, called catapter, faculum oculis, faculum oris, faculum uteri. Speculum is also a name for the tunica aranea of the eye. SPELTA. See Ador.

SPERMA CETI, improperly called farmy city. Indeed the name facum is not a just one, for this substance is a kind of fat, taken from the head a species of the balance whale, and which is artificially purified by long. bakena whale, and which is artificially purified by long boiling with alkaline ley. This fat is found in other parts of this kind of whale; but the best is in the head. It differs from other animal fats in not being diffoluble by alkalies, or combinable with them in a foap, and in rifing almost totally in distillation, not in form of a fluid oil, but in that of a butyraceous matter, resembling the butter of wax. By long keeping it becomes yellow, or rancid; this rancid part, like other fats, diffolves in alkaline ley, and the remainder is left fweet and white.

This concrete is without any remarkable fmell, and hath abutyraceous tafte. It is much used in coughs, dy-fenteries, erosions of the bowels, and in such cases in general as require that the folids should be relaxed or fostened, also in which acrid humours are to be obtunded. It readily diffolves in oils, and unites with wax, by the affiftance of heat, and thus it is used externally. For internal use, it may be dissolved with water, and so formed into an emulsion, by the intervention of the mucilage of gum arabic, or by the help of almonds, which are to be rubbed with it.

Sperma ceti is an admirable substitute for oils, when they do not rest easy on the stomach. Sir Richard Maningham extols the mixture of sperma ceti with diaphore-tics in the cure of internal inflammations; and he says that when bleeding cannot be prudently ventured on in inflammatory fevers, the *sperma ceti* mixed with contra-yerva root, and the volatile falt of hartshorn, may be de-pended on, if means can be expected to produce any good effect. The College of London, order an ointment to be made of this, called unguent. Spermat. ceti; Sperma ceti sint-ment; formerly the linimentum album; by melting fix 8 G

drams of fpermaceti, two drams of white wax, and three ounces of olive-oil, together over a flow fire, and constantly, and quickly stirring the solution till it cools. See Lewis's Mat. Med. Neumann's Chem. Works. SPERMATICA ARTERIA. The SPERMATIC AR-

TERY. There is one in each fide. Each of the arteries rife from the aorta, but are not, as some affert, small at their origin, and larger in their process, nor do they anastomofe with the fpermatic veins. For the most part thefe arteries rife from the anterior part of the aorta, between the emulgent and the inferior mefenteric arteries; their courfe is obliquely downwards and outwards, they run upon the pfoas mufcle to the brim of the pelvis, and then through the aperture in the external oblique mufcle; they run behind and contiguous to the peritoneum, and do not lie in the cavity of the belly. They are connected by the cellular membrane to each other, and to their correspond-ing veins, all which run in a ferpentine manner, and

form the permatic cord.

SPERMATICA CORDA. The SPERMATIC CORD. It is composed of the *spermatic* artery and vein, of nerves, lymphatics, the vas deferens, the cremaster muscle, and aponeurotic membrane, derived from the opening of the external oblique mufcle of the belly: they are all con-

nected by the cellular membrane.

This cord is also called corpus varicosum, corpus pyra-midale, plexus and corpus pam; iniforme, vasa spermatica, vasa preparantia, capreolaris, and capreolaria. SPERMATICA VENA. SPERMATIC VEINS. A

little below the emulgent veins the vena cava fends out the right vena spermatica. The left spermatic vein com-monly springs from the left emulgent vein, the reason of which is said to be, the avoiding the aorta in its passage, by which the motion thereof might be retarded. But

by which the motion thereof might be retarded. But this does not feem to be the caufe, as the fame caution is not observed with respect to the emulgent.

SPERMATOCELE, from entipue, seems, and xxxx, a tumor. It is a morbid distension of the epididymis and vas deferens, produced by a stagnation of seems. This may be produced by tumors, stricture, or instammation, about the caput gallinaginis, or in the course of the vas deferens; but there is reason to think that it is more freferens; but there is reason to think that it is more frequently induced by the laft, viz. by inflammation, than

by either of the other two.

When an inflammatory affection of the parts is difcovered to be the cause of the disease, general and topical bloodletting, gentle laxatives, a low cooling diet, and reft of body, will commonly be found the most effectual re-medies. And again, when tumors are discovered to press upon the vas deferens, they ought either to be brought to Tuppurate, or their extirpation should be attempted when that can be done with propriety. At other times thefe tumors are found to depend on a venereal cause; and in fuch inflances a well directed course of mercury hath been known to remove them.

On fome occasions, it is faid, that all the other means having failed, castration has at last been found requisite. But this cannot be supposed to be a very necessary step.

See Bell's System of Surgery, vol. i. p. 495.
SPHACELUS. A MORTIFICATION.
IGNIS FRIGIDUS. See MORTIFICATIO. Called alfo

SPRACELUS OSSIS. See SPINA VENTOSA, and CARIES

SPHACELISMUS, the fame as phrenitis.

SPHÆNOIDES 'OS, called also sphenoides azyges; papillare os; basilare os. The sphenoides azyges; papillare os; basilare os. The sphenoid bone, from open, a wedge. It is also called os euneiforme. It is an irregular bone which runs into the basis of the skull, from one temple to the other. Externally it hath five processes, which are all subdivided. The first and second are the two lateral apophyles, called laterales processes, the upper part of each of which is called the temporal process; that part of them which jets out towards the inside, lower than the temporal, and which makes up part of the orbit, is called the orbitar process; the lowest and back part of these processes is called the spinous process. The two external processes which get out nearly perpendicular to the base of the cranium, with each a sosta behind, are called the pterygoid processes. The azygous pracess is that tharp middle ridge which is in the base of the bone.

SPHÆRISTICA. A game, played in the sphæristerium, or tennis-court; some though will have it different from the modern tennis, but it is not known

ferent from the modern tennis, but it is not known

wherein the difference confifted. The Milefians were particularly averse from this exercise. Though the Athenians frequently gave the freedom of their city to the sphæristæ, or masters in this art, by way of compliment: the ball with which they played was called corpous; and it was also the name for balls formed for different purpofes particularly of exercife.

SPH ÆROCEPHALA ELATIOR. See Echinopus.

SPHENO MAXILLARIS ARTERIA. It is the first branch of the maxillaria interna arteria; it goes to the inferior orbitary, or sphere maxillary fiffure, and to the orbit, through the foramen sphere palatinum.

SPHENO MAXILLARIA FISSURA. So Winflow calls the

inferior orbitare fiffures formed by the edges of the maxil-lary notches in the os sphenoides. They are continued in the maxilla superior, and are there called the inferior

orbitary fiffures.

PALATINUS. These muscles rise (one on each fide) from the os fphenoides, and are inferted into the fides of the glandula palati, and back part of the uvula. This also is the name of a branch from the upper maxillary branch of the fifth pair of nerves. It is distributed to the mufculus pterygoideus internus, to the back part of the nares, to the innus iphenoidales, and to the tuba Eustachiana.

— PHARYNG RUS. This muscles rises (one on each fide) from the alary processes of the sphenoid bone, and runs to the fides of the pharynx.

— PTERYGO-PALATINUS. Valsalva discovered

that this muscle does not belong to the uvula, but to the tuba Eustachiana. It rises from the os sphenoides, and

is inferted into the fore-part of the palate.

—— SALPINGO-PHARYNGÆI. These muscles are fixed by one extremity partly to the sphenoidal side of the bony portion of the Eustachian tube, partly to the nearest soft portion of the same tube; thence it runs towards the external wing of the apophysis pterygoides, into which one portion of the muscle is inserted; the other portion runs to the end of the wing, and turns round to the forked extremity thereof as over a pulley, and is afterwards inferted in the feptum palati near the uvula.

- SALPINGO-STAPHILINUS, called also perifiapilinus externus. See CIRCUMFLEXUS PALATI.

- SPINALIS. See DUR & MATRIS ARTERIA. SPHINCTER ANI. Confiriefor ani; cutaneus; cuticulosus. The SPHINCTER of the ANUS, from opening, confirings, to fout. The extremity of the anus is furrounded by the Spineter which arises from the bottom of the os coccygis, and its fibres separating, surrounds the anus, and terminates in the lower part of the bulb of the urethra.

SPHINCTER GULA. See SPHINCTER OESOPHAGE.

SPHINCTER GULÆ. See SPHINCTER OESOPHAGI.

— LABIORUM, called also constrictor labiorum: orbicularis; osculatorius musculus. The sphincter of the LIPS. The muscle surrounds the lips with orbicular fibres, and when it acts it corrugates them. It is an antagonist to all the other muscles of the lips, keeping them in order, and allowing them an equal balance.

— ŒSOPHAGI. The SPHINCTER of the OESOPHAGUS, or GULA. See ŒSOPHAGUS.

— VAGINÆ. The SPHINCTER of the VAGINA. Just within the vagina we observe this sphintler muscle; it is two planes of circular fibres that come partly from the perinæum and partly from the sphintler ani; they furround the vagina, and are lost in the fibres of the crura clitoridis. Its office is to bring the perinæum closer to the bones, and so embrace the penis in coitu.

to the Bones, and so embrace the penis in coitu.

— Vesicæ. The sphincter of the BLADDER is a scries of transverse fibres running cross-wife under the straight fibres of the neck of the bladder in a circular

SPICA. A SPIKE. It is a part of a stalk thick fet with flowers or fruit, fo as to form an acute cone. For that called MAS, fee LAVANDULA LATIFOLIA.—
FÆMINA, and VULGARIS, fee LAVANDULA ANGUSTIFOLIA.—INDICA, and NARDI, fee NARDUS
INDICA.—CELTICA, fee NARDUS CELTICA.—HOR-TULANA, fee STACHAS.—BREVIS, fee ALOPECT-ROS. Spica is also the name of a bandage, which is of three kinds; and so called from their refemblance to an ear of corn.

SPICA INCUINALIS. It is a bandage used for the cure of an inteffinal hernia, a diflocation of the thigh, and a fracture of the os ilei. It is either fingle or double headed; the fingle is twenty-four feet in length and three fingers broad; the end is placed on the os ilei of the found fide; hence the head of the roller paffes round the botthe content had of the roller paties round the bottom of the belly and the hip, then to the black part of the thigh, comes up between the thighs, and is conveyed to the groin, and so over the back where it begun; pin the bandage to the compress on the groin, and finish by a turn or two round the belly. When applied to one groin only it is called spica inguinalis simplex. When the simple fpica hath two heads, place the middle part at the perineum, from whence the heads afcend obliquely to the hip, from whence they pass behind and before to the

SPICA INGUINALIS DUPLEX. The double inguinal SPICA INGUINALIS DUPLEX. The double inguinal fpica. It is used when a rupture, &c. is in both groins. It is double headed, twenty-four feet long, and three inches broad. Its middle is fixed on the loins, and brought round the belly, where the ends are changed; then they go round the outside of the thighs, pass under the buttocks, and ascend on each groin; there, having secured the dressing, they ascend over the offa ilia to their beginning, where the heads are again changed and their beginning, where the heads are again changed and brought round to the belly, where they are again chang-ed, and then they descend on each fide of the scrotum, and go round the buttocks to each groin, and fo to the belly, where they are again changed, and then they afcend to the offa ilia. This direction must be repeated

- SIMPLEX. It is a bandage, so called from its refemblance to an ear of corn. Some call it geranium. If is a common roller, about five ells long, and three fingers in breath, rolled up with one head. When it is rolled up with two heads it is called fpica:duplex.

SPIGELIA. See ANTHELMIA.

SPINA. The SPINE. It is divided into true and false

SPINA. The SPINE. It is divided into true and false pertebra. The true are twenty-four in number, viz. seven of the neck, twelve of the back, and five of the loins. Each vertebra is composed of its body and process. The body is the thick anterior part, which is convex before and concave behind, and most horizontal and plain both above and below. The surfaces of two contiguous vertebra are covered with a cartilage. There is a ligar terms of the process of t ment, composed of concentrical curved fibres, which is firmly attached to the horizontal furface of the vertebra, besides which there is a strong ligament, which lies be-tween the edges of the vertebræ, whose sibres decussate each other in the form of an X. From each side of the body of each vertebra, a bony ridge is produced back-wards and to a fide, from the posterior extremity of which one flanting process arises, and another descends: the smooth side of each of these four processes (which are called the oblique) is covered with a cartilage, and the two inferior oblique processes of each vertebra are articulated with the two superior oblique processes of the vertebra below. From between the fuperior and inferior oblique processes of each fide the vertebra is stretched out laterally, and forms a process called transverse. From the posterior root of the two oblique and of the transverse process, on each side, a broad oblique bony plate is extended backward; where these meet, the spinal process rises, and stands out backwards. These seven processes form the posterior parts of the vertebra, and are hollow at their anterior middle part, which cavity joined with that on the back part of the bodies, make a great canal which answers to another in the vertebra above and below, for the me-dulla *spinalis*. There are two femicircular notches belonging to each vertebra, which coincide with two fimilar notches in the adjoining vertebra; through these foramina, (which are placed immediately behind the body of the

vertebræ) the fpinal nerves pass out.

The cervical vertebræ are concave above and convex below; they are flat forward and behind. Their fpinal processes are bifd to allow a more convenient infertion for the muscles. The transverse processes are short and ge-nerally bifid, the root having a hole for the secure passage of the vertebral artery and vein. The oblique processes are quite horizontal. The rotatory motions of the head are not entirely performed by the first and second vertebrae (as is mostly imagined), but they are greatly affished by the rest of the form: for the rotation of any two vertethe rest of the spine; for the rotation of any two verte-bræ is inconsiderable, yet it is not so when we consider them all together; besides, if this rotation was betwixt the first and second only, as we are capable of rotating

the head a quarter of a circle, fo great a degree of motion

would have destroyed the *spinal* marrow of that part. The dorsal vertebræ are of a middle size betwirt the cervical and lumbal, and are flattened laterally by the preffure of the ribs, which are inferted into fmall cavities in the fides of these vertebræ. The ribs are articulated betwixt two vertebræ, except in the first, eleventh, and twelfth, where the cavity for their reception is entirely

formed in the laid vertebre.

The lumbar vertebræ are larger than the others; the cartilages between them are thicker, and the fpinal and oblique processes stronger, which is necessary as they have a greater quantity of motion, and are the most ex-posed in injuries offered to the fpine.

The falle vertebræ are divided into two bones, viz. the

os facrum and os coccygis.

Upon the fpine, particularly in the cavities of the thorax and abdomen, are found a number of lymphatic veffels

SPINA ALBA. The WHITE-THORN TREE, also called onyacantha, mefpilus apii folio sylvestris spinosa. HAW-THORN. It is the crategus onyacantha, Linn. It is common in hedges: its flowers have an agreeable fragrance, and have been useful in strengthening weak stomachs by using them in the manner of tea or an insusion. For that called -ACIDA. See BERBERIS.

- ARABICA. See CARDUUS SPINOSSISSIMUS.

- HIRCI. See TRAGACANTHA. - PURGATRIX. Sec HIPPOPHÆS.

- SOLSTICIALIS. See CALCITRAPA OFFICI-

NALIS.

—— BIFIDA, also called bydrops medullar spinalis.

Hydrocele spinalis bydrorachitis. Sagar says that it is a true dropsy of the thece spinalis. It is a tumor of the colour of the skin, and is seated upon the vertebree of the neck, back, or loins, or on the sutures of the skull. It receives its name from the processes of the the skull. It receives its name from the processes of the fpine being wanting, where it appears; and is known by its fituation, its being always there at the birth of the patient, its watery contents, and the palfy, which usually attends it. Dr. Cullen names in HYDRORACHITIS,

This diforder is incurable. For the most part those children on whom these tumors are found, die in a day or two. If this tumor is opened, death is speedily the confequence. Dr. Mackenzie, professor of midwifery in London, gave a drawing which was a case of this kind, and with which the child livid four months, but at length died in convultions. Mr. Warner gives an instance of

died in convultions. Mr. Warner gives an instance of this disorder in a young man of twenty years old. See his Cases in Surgery. Bell's Surgery, vol. v. p. 502.

— VENTOSA, called also spine ventositas, sideratio ossis, cancer ossis, gangrana ossis, sphacelus ossis, teredo, fungus articuli, and by some French authors exossis. When children are the subjects of this disease, M. Severinus calls it padarthrocace. With us it is often called a white swelling. Soing some to have been a called a white swelling. Spina seems to have been a term applied by the Arabians to this diforder, because, it occasions a pricking in the flesh like the puncture of thorns, and the epithet ventofa is added, because because upon touching the tumor, it feems to be filled with wind, though this is not the cause of the diffension. The late Mr. Sharp fays, that the fpina ventofa is a caries of a bone, attended with an internal corruption of its whole fubstance, and generally arising from a putrefaction of the marrow, by which the periodteum and ligaments, as well as the bone, are wholly destroyed.

Mr. Pott divides this disorder into the hydrops articuli,

the fungus articuli, or thickening of the ligaments of the joint, and the enlargement of the bone. The first of these, or the hydrops articuli, very often comes on suddenly, is of thort duration, and goes off as fuddenly; it often happens in a relaxed habit, from a want of lymphatic abforption, from relaxation, from an obstruction in the lymphatic circulation in the joint; it fometimes happens in rheumatic habits. The fecond is generally known by the uniform fwelling of the parts growing very hard, fo as destroy all distinction; and lastly, by an inflexibility, this would prode in the appropriation.

lity; this usually ends in the amputation.

Dr. White, in his Present Practice of Surgery, page 64. fays that this diforder is generally understood to be a tu-mor, which takes its rife in the internal parts of the bone, and gradually enlarges its fubitance. It is frequently hard, and without much pain; fometimes it appears as if it were puffed up with air, and is attended with flooting pricking pains, from which indications it has its name. It gradually extends itself to the periofteum and integuments which cover or lie near the part affected, and, in the end, produces an ulcer of the most stubborn kind. It is not confined to the cylindrical bones; it affects also those of the head, face, neck, back, and cheft, though the former are the most frequent feats of the complaint. It is most mischievous when fixed on the heads and processes of bones.

It may be caused by a scorbutic, scrophulous, or vene-real acrimony, affecting the lamellæ, or medullary sub-stance of the bone; or by injury done to the correspond-ing vessels between the periosteum, lamelæ, and medulla,

from external violence.

In the milder species of this complaint, when it proceeds from external injury, cold applications with Gou-lard's water of acetated ammonia, and the like, in its early flage, have been of great fervice. When it arifes from acrimony in a moderate degree, an alterative course, with mercurial ointment, decoction of farfaparilla, or of the woods, together with an acefeent and milk-diet, have been known to reftrain its progrefs. Accidents are generally confined to the external lamellæ, and feldom produce difeases of great depth in the cylindrical bones, unless there is some predisposing cause in the habit, which is the business of the furgeon to attend to. When the superincumbent parts begin to be discoloured, and are troubled with pricking pain and burning heat, an ulcer is certainly forming withoutfide the bone: at that time, an opening should be made sufficient to lay bare the diseased part: if it is of moderate extent, a caustic may be applied; otherwise; the knife will answer better. Perforation, as directed in the carious ulcer, then becomes expedient: and fuch dreflings are to be applied, as will tend to ab-forb the discharge, and restrain the sless from growing over the denuded bone, until the diseased part is separated, or the discharge is dried up. When the whole of the fubstance is diseased, particularly in or near a joint, amputation is the only remedy; but it is justly observed by Monf. Le Dran, that the operation thould not be performed upon the bone which is diffeafed.

SPINACHIA, also called olus Hifpanicum, lapathum SPINACIA, bertenfe. COMMON SPINAGE. It

is only used at the table, and confidered as very tender, containing only a small portion of nutritious matter, but if freely eaten it is laxative, diuretic, and cooling. See Raii Hift. For that called fragifera, fee CHENOPODIO

MORUS MAJOR

SPINÆ VENTOSITAS. See SPINA VENTOSA. SPINALES COLLI MINORES. See INTERSPI-NALES MUSC.

SFINALES LUMBORUM. These are some fasciculi which run up from the superior false spines of the os facrum to the lower spinal apophyses of the loins, which may be looked upon as fo many fpinales lumberum majores. There are also some fpinales minores between the spinal apophyses of the loins, and transversales minores, between the transverse apophyses, which are sometimes of

a confiderable breadth

SPINALIS ARTERIA. There are two fpinal artiteries, one anterior and one posterior, both produced by the vertebrales; each of which, as soon as it enters into the cranium, fends out a finall branch, by the union of which the posterior fpinalis is formed. Afterwards the vertebrales advancing to the apophysis basilaris of the os occipitis, detach backwards two other fmall branches, which likewise meet, and by their union form the spinalis anterior. These spinal arteries run down on the fore and back sides of the medulla spinalis, and by small transverse ramifications communicate with those which the inter-

coftal and lumbar arteries fend to the fame part.

SPINALIS COLLI. This mufcle rifes, one on each fide,
from the spines of the seven uppermost vertebræ of the back, and is inferted into the spines of the five lower vertebræ of the neck. See Spinalis Musculus.

- Dorsi Major. It is a long flender muscle lying on the lateral part of the extremities of the spinal

apophyles of the back. It is commonly called femilia-

SPINALIS DORSI MINOR. These muscles are of two kinds; fome go laterally from the extremity of one fpinal apophysis to another, being often mixed with the short fasciculi of the fpinalis major; the rest lie directly between the extremities of two neighbouring (pinal apophyles, being feparated from their fellows on the other fide by the fpinal ligament. See SPINALIS Mus-CULUS.

Muscutus. This mufele, and its fellow on the opposite fide, rife tendinous from the fpiral proceffes, and run to be inferted into the transverse pro-ceffes. It is distinguished into *spinalis colli*, and *spinalis* dorfi. It goes in this manner as high as the spinal process of the second vertebra.

SPINOSA. See SPINA BIFIDA, and HYDRORA-CHITIS.

SPINOSUM SYRIACUM. See ALHAGI.

SPIRÆA AFRICANA, called also eyenymus Virginia ribefii folio. AFRICAN MEADOW-SWEET. A species

ribefii folio. AFRICAN MEADOW-SWEET. A species of the pentandria monogynia class; several species of which grow naturally at the Cape of Good-Hope. For that called SPIRMA ULMARIA, see ULMARIA.

SPIRITUS. SPIRIT. Any sine volatile substance which exhales from bodies in a given degree of hear is called spirit; hence, by a fort of imaginary analogy, the nervous sluid hath been called spirit, and is generally termed the animal spirit. Spirit in the human body is spoken of under the different characters of natural, vital, and animal. The first are said to preside over the direction. and animal. The first are said to preside over the digestion of the aliment, and the elaboration of chyle, or the na-tural actions. The second over the motion of the lungs and heart, or the vital actions. The third over the animul actions, as fentation, voluntary motion, &c.

This term /piritus is also added to many products, as

In botany it is that volatile part in the effential oil of plants to which their peculiar smell and taste is owing. It is also called restor spiritus.

In pharmacy there are many different subjects to which the name of spirit is given; but they are chiefly the spirits obtained by fermentation, which feem to be the only proper ones; those that are formed of a faturate solution of volatile alkaline falts in water are more properly folutions than fpirits. The fermented vegetable fpirit, commonly called vinous fpirit, is water to impregnated with the oilness of a vegetable, that it will burn all away. See VI-NUM ADUSTUM.

SPIR. ÆTHER. VITRIOL COMP. See LIQUOR MINERALIS ANOD. HOFFMANNI.

- MINDERERI. MINDERERUS'S SPIRIT. Ammoniacus vegetabilis fal, now aqua ammonia acc-tata. Take of ammonia 3 ij. diftilled vinegar, four pints, or quantity fufficient that the ammonia may be faturated. Ph. Lond. 1788.

To hit the neutralized point is difficult; but the best way of trying it is to flain a thick writing paper on one fide with the blue called lachmus or archil, and on the other fide with red, by mixing as much diluted fpirit of falt in the lachmus as will redden it; then dip this paper into the mixture which is to be neutral, and if the alcali is predominant, the red fide will turn blue; if the acid prevails the blue fide will become red, and no change is produced if the mixture is neutral. The fpiritus Mindeveri is analagous to the crude fal ammoniac in its medicinal qualities, but is fomewhat more penetrating. From 3 ii. to 3 fs. is the ufual dofe when perfpiration is to be excited; or it may be taken from 3 fs. to 3 ii.

SPISSAMENTA. See STYMMATA.

SPLANCHNICA, from oglayrer, an entrail or bewel. Medicines appropriated to the diseases of the bowels or

SPLANCHNOLOGIA. SPLANCHNOLOGY. It treats

of all the viscera in the head, breast, or belly.

SPLEN, vel Lien. The spleen, or Milt. Hippocrates calls it the LEFT LIVER. Aristotle calls it the left or BASTARD LIVER. Some of the ancients called it fomes ventriculi, fuel to the ftomach; because they say its office and triculi, fuel to the ftomach; because they say its office and fituation is to the ftomach as a furface to a copper, that it warms the ftomach. The spleen is fituated in the left hypochondrium laterally, in the cavity between the false ribs and the spine. It is of a long oval figure, about seven fingers breadth in length, and sour or five in breadth. It is generally of a livid or a black red colour, and very lax. It is composed of three sides, the convex is next the diaphragm, the concave is divided by a longitudinal sulcus where the splenic vessels enter, and divides the spleen into an under anterior and upper pollurior part. It receives an under anterior and upper policior part. It receives the great extremity of the flomach on its concave part. It takes a coat from the peritoneum. At the fiffure in the inferior edge the wellels enter variously, fome in the middle and others in the extremities; these vessels send branches to the stomach, they are called vafa brevia. Haller fays that it is composed wholly of arteries and veins, and that its use is to afford the liver due supplies of blood. See Haller's Physiology, lect. 26. Casserius, Ruyfch and Winflow.

SPLENALGIA, vel SPLENICA. Pain in the fpleen,

or its region.

SPLENALGIA SUPPURATORIA. Inflammation of

the fpleen, tending to or ending in a suppuration.
SPLENIA. COMPRESSES. The ancients called them fplenia, because they often resembled the spleen in shape. And they are called compresses, because they keep other dreflings tight and firm. They are made of lint, tow, and folded rags. Their principal uses are to cherilia the natural heat of the part, or to keep out the cold: to Tecure the dreffings under them; to convey liquid remedies to the difordered part, and to continue them longer thereon; to fill up inequalities and depressions, so that the dressings may be secured; and, lastly, to prevent the skin from being irritated by the stricture of the bandages.

SPLENICA. See SPLENALGIA.

SPLENICA ARTERIA. The SPLENIC ARTERY paffes downwards and to the left fide, behind the upper edge of the pancreas, to which it gives branches; afterwards it divides into feveral branches, which enter the fiffure in the infide of the fpleen. Before they enter the fpleen they

inside of the spicer. Defore they enter the spicer they give off the vess brevia, and the gastrica sinistra, which is the largest of the vasa brevia.

— VENA. The SPLENIC VEIN isome of the divisions of the vena porte ventralis. It runs transversely from the right to the left, first under the duodenum, and then along the lent, and ander the duodenum, and then along the lower fide of the pancreas near the posterior edge; in its course it gives off several branches. It terminates after by a winding course, in which it sends branches to the spleen. Lastly, it reaches the fisture of the spleen, which it enters, and runs through its whole length by several branches, much in the same manner as the spleens aftery.

the folenic atterv.

SPLENTIS, from only, the spleen, inflammatio splenis well lienis. An inflammation or a TUMOR of the spleen. Splenisis is also a name for the vein in the left hand which is called falvatella, the fellow to which in the right hand is called falvatella, the fellow to which in the right hand is called jecoraria. Dr. Cullen places the foliation, or inflammation of the fpleen, as a genus in the class pyrexiae, and order phlegmatiae. See Inflammatio Splenis.

SPLENIUM. See Asplenium.

SPLENIUM, called also triangularis, and massidaeus superior See Massroideus Muse. It rifes from the

fuperior See MASTOIDEUS Pluster line of ligamentum colli, a little below the first transverse line of the neck, and the os occipitis, from the lower vertebræ of the neck, and five upper dorfal vertebræ, and is inferted into the poste-rior part and whole length of the mastoid process, and into the transverse process of the atlas and dentata, ferving to bend the neck backwards. Albinus divides this into two mufcles, viz. the fplenius capitis, and the fplenius colli, but this division is quite unnecessary.

SPLENOCELE. A rupture of the spleen. SPODION. See SACCHARUM.

SPODIUM ARABUM. BURNT IVORY. Cinerulam,

ebar. Ivery is the turks of elephants, which often grow to feven feet in length, and at their basis are as thick as a man's thigh; one of them will sometimes weigh one hundred and fixty pounds. The African ivery turns yellow with keeping; the Ceylon ivery keeps its whiteness longest. The shavings are boiled in water, and thus a jelly is formed, which hath the same effects as the jelly of hartshorm; the African ivery abounds most with oil. of hartfhorn; the African rosry abounds most with oil and falt, the qualities of which are not different from those obtained from hartshorn. When ivery is burnt to blackness, it is called foury black and velvet black.

It is also applied to burnt ashes, metalline calces, and a composition of white lead and oil, called putty, and is

likewife called abaifir.

SPODIUM GRÆCORUM. See ALBUM GRÆCUM. SPOLIARIUM. See APODYTERIUM. SPONDYLIUM. See PASTINACA.

SPONGIA. SPONGE. It is formewhat like a fungus; it is a plant which grows in the fea; it is very bibulous, of a foft fubstance, full of perforations, and elastic. It is brought from Smyrna and Aleppo: the best is said to be got in the Archipelago. Those pieces which are full of sine personations are called males, and of these the hardest are called tragi; the contrary are called female.

It is used instead of flauncis, in applying fomentations,

for it keeps the heat longer; for tents to dilate wounds, in which case it is dipped in hot bee's wax, then squeezed hard until it is cold, after which it is cut into proper sizes for pledgets, to be applied over the lint which is laid on the stump after amputating a limb. It adheres strongly to the mouths of wounded vessels, and when retained by proper compression it has prevented consider-able bleedings, preservable to agaric, or puss-ball; and in scrosulous disorders, and cutaneous soulnesses, for which end it is reduced, by lightly burning it, to a black powder, which is given in doles from gr. x. to 9 i. two or three times a day: its virtues, which render it useful in these diforders, depend on a volatile, animal, alkaline falt, with

which it abounds, and the oil of the former united.

It has been particularly celebrated for removing that large fwelling of the neck, termed bronchocele, and Derbyshire throat, which is probably of a scrofulous nature.

When Jonge is cut in small pieces and freed from the stony matters which are lodged in it, it is burnt in a close earthen veffel until it is black and friable, and when being powdered in a stone or a glass mortar, it is kept in a close phial for use. The burning should be discontinued as soon as the matter becomes thoroughly black; as the outlide of a large quantity will be fufficiently burnt before the middle is much affected, the best method is, to cut it in fmall pieces, and keep it continually flirring in fuch a machine as coffee is roafted in.

Except the bags of the filkworm, more volatile alkaline falt is obtained from sponge than from any other matter. By boiling the sponge in water, it gives out a portion of fea-falt; by burning it to afhes, it yields a large quantity of fixed alkaline falt, the fame as is obtained from the fea-falt. See Lewis's Mat. Med. Neumann's Chem. Works. SPONGIA SOLIS. See BONONIENSIS LAPIS. SPONGIOSUM OS. A name for the os ethmoides.

The offa spongiosa inferiora are two oblong bones lying loofe between the anterior and posterior nostrils; they are glued to the upper maxillary bones and are convex to-wards the feptum nafi, while on the opposite side, which faces the finus maxillaris, they are concave. They have each two processes on their upper edge; the posterior covers part of the maxillary sinus; the inferior joining with the os unguis, composes part of the ductus lachrymalis. The offa spongiosa superiora, see Ethmoides Os.

SPONSA SOLIS. See Ros solis, and Calen-

SPORADICI. SPORADIC DISEASES. Such difeafes as reign in the fame places and time; here and there one or a very few persons only being their subjects. Such diseases are neither endemic, epidemic, or contagious.

SPUMA ARGENTI. See CATHIMIA.

SPUTUM. SPIT. This name is given to whatever

comes from the mouth; but it is properly confined to what is excreted by coughing Bloody spit is when the blood-veffels in the lungs are eroded, and in this case, a cough attends. Salt acrid spit endangers an erosion in the lungs. Bitter, or salt spit, is from a mixture of bile.

8 H Sweet

Sweet /pit is from concocted phlegm; fetid /pit is from a putrefaction of the humours of which it is compoled; purulent fpit is from a phthilis approaching or begun. See

Prosper Alpinus's Prasages.
SQUALOR. See AUCHMOS.
SQUAMARIA. See OROBANCHE.

SQUILLA CRANGON. See CRANGON. SQUINANTHUM. See JUNCUS ODORATUS.

STACHYS. See MARRUBIUM VERTICILLATUM. For that called foctida, fee GALEOPSIS; -- paluftris, fee PANAX COLONI.

STACTE. See MYRRHA. STACTICON. See Enstacton.

STAGMA. A liquor exposed to distillation; also a name for the vitriolic acid.

STAMINA. Also called chives; they are those slender threads which encompass the style in the centre of flowers, and support the apices or fummits which contain the male duft.

STANNUM. Tin. Also called plumbum candidum, diabolus metallerum, Jupiter. It is the lightest of all the metals; the least simple, being mixed with various heterogene particles, particularly fulphureous or arfenical, whence the inconveniencies to which its effayers are fubjected; it is lefs fixed in the fire than any other of the metals; it is foft, flexible, and malleable, yet it increases the elasticity of some clastic bodies; it is not sonorous, yet when mixed with other metals their found is increased; it melts long before ignition, even with a heat not much exceeding boiling water; in melting it hath this peculiarity, in which it differs from all other metals, that it crackles as it melts; when crude, it diffolves only in aqua regia; but when freed from its fulphur, &c. by calcination, it diffolves even in vinegar. Its ore is found in many parts of the world, but the best is the Malacca

tin, and the next is the English.

Tin hath been extolled as a specific in disorders of the uterus and lungs, and particularly as an antihectic, but experience does not support its character, so that it is almost thrown out of the present practice. Dr. Alston hath given the filings of tin a degree of reputation for destroying worms, particularly the flat one; he directs it to be given in treacle, in doles of from 3 fs. to 3 i. the patient takes it in the morning fasting; the day after three doses are taken, a purging draught should be taken. Some have observed that tin hath been effectual in epilepfies from worms and from frights, and in the chorea fancti Viti; though not in any other nervous diforder. In nervous diforders it should be finely powdered; but as a destroyer of worms, the filings are most effectual.

If tin is heated, it becomes so brittle, that by agitation, when just ready to melt, it falls into a fine powder; but the tin is more eafily powdered by rubbing three parts with

one of coralline, and pounding them together. See Lewis's Mat. Med. Neumann's Chem. Works.

STAPEDIS MUSCULUS. It lies in a little cavity of the os petrofum, and is inferted into the head of the

STAPES. The STIRRUP. It is one of the bones in the ear, and is thus named because it is exactly like a It stands with its basis upwards and inwards upon the fenestra ovalis, and at its narrower part is articulated with the infide of the long process of the incus. See AURIS.

STAPHISAGRIA, called also pedicularis, pedicularia, accuitum urons ricini fore foliis fiore ceruleo magno; delphinum plantani folio. STAVESACRE, and LOUSEWORT. It is the Delphinum flaphifagria, Linn. called by the Arabians alberas. It is a plant with large leaves, and blue flowers, which are followed by pods, containing large, rough, triangular, dark-coloured feeds. It is a native of the fouth parts of Europe, from whence the feeds are brought to us; but they are most plentiful in Dalmatia and Istria.

The feeds have a difagreeable fmell, a naufeous, bitter, burning tafte. If taken in dofes from ten grains to a foruple, they purge and vomit ruggedly, and inflame the throat and flomach; but they are chiefly used to destroy lice. Their acrimony is partially extracted by water, totally by rectified spirit, but not raised by either in distillation. Decoctions of this has been used for curing the itch. The belt method of using them for destroying lice, &c.

is to strew the fine powder on the part, and to secure it with a handkerchier, or other proper bandage; or if a decoction is more convenient, boil an ounce in a pint of water for a few minutes. The powder may be mixed with oatmeal to kill mice and rats. See Neumann's Chem. Works. Lewis's Mat. Med.

STAPHYLINI. Winflow calls by the names flaphystarri Lini. Willow calls by the names //aphylini, and epiflaphylini, two fleshy ropes closely united together, as if they were but one mulck; but in some subjects they are distinguished by a very fine white line.
They are fixed by one extremity in the common point of
the posterior edges of the offa palati, and from thence
they run downwards and backwards along the middle of the feptum, and also along the middle of almost the whole uvula. Morgagni discovered them, and they are called by some azygos Morgagni. STAPHYLINUS EXTERNUS. See CIRCUM-

FLEXUS PALATI.

- GRÆCORUM, and SYLVESTRIS. See DAUCUS VULGARIS.

STAPHYLOMA. This term comprehends two diforders of the eye; one when the tunica cornea is gradually rendered protuberant; the other, when the pupilla breaks forth upon the tunica cornea, and deforms the eye with the tumor, like rasules, a grape, by which the fight is destroyed. These tumors, from their different forms and fizes, affume different names; as margarita, myocephalon, elavaus, mylon, pomum, uva, or acinus; according to the refemblance they bear to the things whence they are named. Sauvages fignifies by this word a dropfy of the cornea. Not only the cornea, but also the felerotica, is also fometimes swelled, and occasions great pain and violent inflammation, which foretimes ends in a fuppuration, or a cancer. Monf. St. Yves propoles to extirpate the tumor, and then drefs with lint dipped in brandy and water; after which the artificial eye may be fixed. If the cafe is flight, compresses of alumwater may be laid on and the patient should lie continually on his back. If a wound is the cause, try to push back the tumor with a probe.

For the most part, the cure is not undertaken to recover the fight, but only to remove the deformity and the bad fymptoms. See Bell's Surgery, vol. iii. p. 313, &c. Wallis's Sauvages' Nofology of the Eye, p. 183. White's

Surgery, p. 232. STAPHYLOSIS. A protuberance or protufion of the

choroides of the eye.

STATIONARIA FEBRIS. A STATIONARY FE-VER. So Sydenham calls those severs which happen when there are certain general constitutions of the years, which owe their origin neither to heat, cold, drynels, nor moifture, but rather depend upon a certain fecret and inexplicable alteration in the bowels of the earth whence the air becomes impregnated with fuch kinds of effluvia, as fubject the body to particular diftempers, fo long as that kind of constitution prevails, which after a certain course of years declines and gives way to another. Each of these general constitutions is attended with its own proper and peculiar kind of fever which never appears in any other.

STEATITES. Vogel uses this word to fignify cor-

STEATOCELE, from seas, fuet, and seas, an hernia. A species of bernia caused by a collection of facty matter in the ferotum.

STEATOMA, from stap, fuet. A fpecies of tumor, commonly called a wen, of which it is a fpecies. Its contents appear like fuet; it does not yield to escharotics; but when convenient, is to be removed with a knife. See NÆVUS.

Mr. Hill, in his Cases in Surgery, p. 56, &c. fays, "So far as I can judge, it is the fleatoma alone (of the encyfled tumors) that can properly be called by that name, i. e. wen, all the rest having something inconsistent with the ideas annexed to that word. The sebaceous humour generally undergoes no alteration for a great number of years, except a gradual increase in fize. In general, all incysted tumors, when small and properly situated, may be turned out entire, without opening the cyft, by a crofs cut through the teguments, and by raifing up the four corners. But when the wen is so large that it cannot be diffected out, another method must be followed, of which I shall give a few examples. Jan. 18, 1733, By a cross

cut, I turned out entire a wen from the fhoulder of Mrs. . It was as large as a child's head. I clipped off the superfluous teguments, brought the rest as close together as I could; and they coalefeed in a very fhort time. She was with child when the operation was performed; has fince bore a great many children, and lived thirty-eight years after it. July 11, 1769. But the above method could not be attempted with another patient of mine, who was feventy-four years of age, and of a weak habit of body. The wen had been increasing for thirtyyears, and weighed above three pounds. I made a cir-cular incision to the cyft, round the body of the tumor, and gradually raifed it up, while I diffected it out of the teguments which were below. Notwithstanding this precaution, the fkin and flesh returned further than I inclined. As foon therefore as the dreffings were taken off, I put two or three stitches into the teguments, which hastened the cure, although the lips were not brought fully into contact. Hence we may learn, that it is not fufficient to make the incifion fome way up on the body of the wen; but it thould be preffed down, and the teguments pulled back as far as possible, before the incision be made, as is practifed in amputations; otherwife they will not cover the wound. I have had the fatisfaction to digeft out fome wens, when so fituated as not to be extirpated, by running a feton cord through the length of them, and continuing it many months. But care must be taken to pierce the cyst at the bottom, otherwise the seton may cut through the top of the wen, and leave the under part untouched. See Bell's Surgery, vol. v. p. 457, &c. STELLA. The name of a bandage used in arterio-

tomy: it is fo called from its many croffings on the temples, or from its refemblance to a ftar: it should be tweaty or twenty-four feet in length, two fingers broad, and double-headed. When this bandage is used, cover it with proper compresses, then place the middle of the roller on the found temple, and bring one head round the occiput, and the other round the forehead, until they meet at the part affected; and there croffing each other, form a kind of knot; carry one end over the vertex, the other under the chin; croffing again, over the found temple, whence they are carried round the forehead and occiput, to the compresses on the wound, &c.

until all the bandage is taken up.

STELLA MARINA. See Aster Thelassius.

TERRÆ. See CORONOPUS.

STELLARIA. See Alchimilla. STELLARIS. | See ASPERULA.

SELLATA. See ASPERULA.
STELOCHITES. See OSTEOCOLLA.
STERILIPAS. BARRENNESS. In this cafe, if medicines prove useful, it is only by refloring the general health. But the cause is for frequently a feirrhus in the uterus or other parts subservient to generation, that it rarely happens that the complaint is removed. It is synonymous with dyspermatismus.

STERNO-CLEIDO-HYOIDÆUS. See STERNO-

HYOIDES.

STERNO COSTALES. SCE TRIANGULARES STERNI. --- Hyordes. This mufcle rifes from the infide of the sternum and the clavicle, and running over the thyroid cartilage, is inferted into the base of the os hyoides to pull it down. Some call it fieres maficideus, but very improperly; also fieres cleids-bysideus.

— MASTOIDÆUS. } See MASTOIDÆUS, and MASTOIDÆIS. THEROIDÆIS for muscles thus named, rife

between the cartilages of the first and second rib; run before and close to the thyroid gland and the trachaea, and are inferted into the knobs of the thyroid cartilage, pull-

ing the whole larynx down.

STERNUM, from signos, the breast, or breast-bone, called also pettoris os. It is the broad, flat bone, at the anterior part of the thorax. In adults of a middle age, it is composed of three bones but frequently the two lower bones are ultimately united. The first bone is the thickest; to this the clavicles and the first ribs are articulated, and half the cavity for the reception of the second rib. The feeded bone is longer, narrower, and thinner than the fecond bone is longer, narrower, and thinner than the first; in the fides of it are complete cavities for the third, fourth, fifth, and fixth ribs, and half pits for the second and the seventh. The third bone is the leaft, and hath only half of the cavity for the feventh rib. It is called

cartilago enfiformis, and in young subjects is always car-

STERNUTATIO. SNEEZING. STERNUTATORIA. STERNUTATORIES. Sce ERRHINA and PTARMICA.

STERNUTATORIUS PULVIS. See ASARUM. STERTOR. SNORING, or what is called a rattling in the throat. See Rhenchos. It is a noify respiration, as in an apoplexy, in which the mucus from the fauces is forced through the nottrils.

STIBUM. ANTIMONY. See ANTIMONIUM. Alfo

the glass of antimony.
STICADORE. See STREHAS.

STIGMA. SCARLET-COLOURED SPOTS, fuch as happen after a blow: also particular marks in the face, or any part of the body, commonly called MOLES. The spots called vibices are sometimes thus named. STILLICIDIUM. In pathology, it signifies the same

as ftrangury. In pharmacy, it fignifies an inftillation of liquor upon some part of the body: the French call it la douche; and we commonly express it by pumping

In pumping upon a difeafed part, three things act at the fame time upon the inspiffated and stagnating sluids: the fame time upon the inipatiated and fragnating fluids; first, the falling fluid, which abrades and comminutes the inspissated juices by its force and compression; secondly, the nature of the water may contribute to this effect, and the fall of it may help it to penetrate; thirdly, the heat of the water, which infinuates itself, and warms the part quite through, it assists, and quickens the motion of the fluids; hence it follows, that a part is transpired through the skin, and the rest assisted in its circumfpired through the fkin, and the rest affisted in its circu-

Le Dran, in his 93d and 94th Obs. gives some account of this operation in the anchylofis, and attempts to account for the action of the pumping; but his reasoning is rather specious than fatisfactory.

STILLICIDIUM URINÆ. See DYSURIA.

STIMMI. See ANTIMONIUM. STIMULANTIA. STIMULANTS. All those substances are confidered fuch as increase the ofcillatory motion of a fibre, or excite the action of the moving fibres in the living animal. Boerhaave fays in order to produce this ofcillatory motion of the fibre; it is required that an increase of motion should be given at that particular point, from whence the increase of oscillation begins; and that the cause producing this effect is two-fold; first by a particle of matter, not annexed to the veffel; rufhing with proper force up a point, or particle, fo as to force it out of its natural fituation; but the impulse of that particle ceafing, the fibre will immediately contract itself, in order that the part fo impelled from its place may again reflore itself; and that its contraction is by so much the more powerful, as the particle has been further removed from its natural state, but that causes of this kind do not long continue, therefore the effect ceases. Secondly, the other cause, and whose effects are more permanent, may arise from a particle being fixed in the side of the veffels, either internally from the circulating fluid, or ex-ternally from external causes. But this is the doc-trine of mechanical reasoning, and may serve to account for the locality of action produced from fome material substance in the part stimulated. But anger, and some other of the active passions cannot act from such causes. How stimulus increases action, we cannot point out the precise mode, but this we know, all those things which can increase the influence of the vital powers, either diffusively or partially, are real frimulants, and as such must be considered. Dr. Cullen concludes them of two kinds. "Those which are indirect, that is those which act on the organs of fense, by which means a perception is excited in the sensorium commune, which acting there, determines the nervous power to flow more copioufly into the whole, or a particular part of the fystem.

" And those which are direct, that is because they are imagined to act directly on the moving fibres." The indirect are the most common and universal, but stimulants do excite motion in the moving fibres themselves, independent of any connexion with the common fenforium, as mufcular action may be promoted by flimuli applied to their fibres, when detached or feparated from the body. Hence then we may fairly conclude that action is produced in two ways, by fympathy, and local ftimulus. And in many of these actions mental power is the first cause, as may be discovered in longings; defire for food which we see others eating with uncommon relish, weeping from forrow; vorniting and fickness from recollection and reflection, &c. General ftimulus seems also to be produced, by all such things as are taken into the stomach, and communicate general affection through the fystem, owing to the connection of that organ with every other part of the machine, and indeed the whole which come under this head may be faid properly to belong to this division, either from their general mode or elective action. Those which are productive of the first effects, are, antispalmodics, fedatives, diaphoretics. Those of the fecond are, errhines, fialagogues, expectorants, cathartics, diuretics, menagogues and emetics, though fome of those last have also a diffusive action.

The utility of which may be derived from the admirable time of distributions of distrib

ministration of flimulants are faid to arife from their affecting the state of the circulation; by facilitating the passage of the blood through parts in which it is morbidly obstructed, by augmenting the force, and celerity of the circulation where it is morbidly flow and weak; from acting on the powers of fenfations; by quickening the fenfes, were morbidly dull; by rouzing the mental fa-culties, when in a lethargic flate; by exhilirating a defpondent condition; from their acting on the moving fibres; by reftoring the power of motion, where mor-bidly deficient; by increasing the strength of motion where morbidly weak; hence have they been divided into,

STIMULANTIA TOPICA. As mustard; cantharides;

preparations of mercury.

— DIFFUSIBILIA. As volatile alcali, electricity, heat.

— CARDIACA. As cinnamon; nutmeg; wine,

In fine, whatever invigorates the fyftem, increases the action of the nervous, or vafeulus power, locally, or univerfally, comes properly under this head.

STOECHAS. FRENCH LAVENDER. It is called floechas, from the island Stoechades; and sleechas Arabica, because from the illand Stoechades; and fiscebas Arabica, because much commended by the Arabian physicians; it is also called fpica bertulana, flicadore, and caffidony. It is the lavandula fiscebas. It is a low shrubby plant, with small, oblong, narrow leaves, bearing on the tops of the branches short thick spikes, or fealy heads, from which issue several small purple labiated slowers, sollowed each by four feeds inclosed in the cup: it is a native of the southern part of Europe, common in our gardens, where. fouthern part of Europe, common in our gardens, where, with a little shelter, it bears the hardest weather; it flowers in May and June. The flowers which are brought from France and Italy are rarely fo good as those of our own growth. The heads should be gathered when firm and hard, which is about the end of July. Distilled with water, it yields a considerable quantity

of a pale-coloured fragrant effential oil; but with rectified fpirit of wine it yields but little. Its virtues agree with those of our lavender, but are inferior. See Neumann's Chem. Works. Lewis's Mat. Med. It is also a name

for fome species of elichryson. STOLONES. The suckers of plants, that is, such shoots as arise from the roots of plants, and may be taken off with fibres to them, so as to propagate the species

thereby.

STOMACACE, from roua, the mouth, and manos, evil. A fymptom of the feury, confifting of a foctor of the mouth, and an crofion and spontaneous hemorrhage of the gums. It is also a name for the scurvy. See Scor-burus. The bleeding of the gums is always sympto-

STOMACHICA PASSIO. In this diforder there is an aversion to food; even the thought of it begets a nau-fea, anxiety, cardialgia, an essuion of faliva, and often a vomiting; falting is more tolerable than eating: if the patient is obliged to eat, he must endure a pain that is worse to him than hunger itself; he is troubled to chew, but more so to swallow his food; there is an aversion to common food, and a defire to what is unufual: often, a pain is complained of between the shoulders, and it is increased after eating; restlessness, dimness of fight, a notice in the ears, a heaviness in the head, numbress in the limbs, a palpitation in the hypochondria, and a fpit-ting of cold watery phlegm: the patient imagines that the spine of his back moves towards his legs, and whether standing, or lying, he seems to be moved like a reed that is thaken by the wind; though not thirsty, he defires to

drink after eating; though drowfy, he keeps walking; is lean, pale, feeble, faint, timid, filent, but foon angry; he is much diffurbed with black bile, and falls into fits of melancholy; the fymptoms during a fit, are fainting, a cold numbness of the joints, an unusual heat which runs through the members, and most perceived in the palms of the hands, with a dewy fweat, restlessness, jaclitation, anxiety, despondency, a change of colour, a small, swift, weak pulse, a wasting of the body, or, on the contrary, an immoderate appetite, with indigestion, and an acrid; acid, or nidorous quality in the contents of the flomach; fometimes the patient is speechless, grinds and elenches his teeth; there is always a cold in the head, with a ringing in the ears; fometimes, though rarely, there is great thirst; a pain in the precordia, which extends between the fcapulæ; and when the inflammation is confiderable, there is a difficulty of fwallowing, and a strangulation, which some have called a stomachic quinty; an hardness of the stomach without pain, with other symptoms, as a windiness, inflation, borborygmi, &c.

The causes are a discharge of pus from the belly upon the flomach, intense thinking, a neglect of proper nou-rishment and rest, forrow, taking cold, continual indi-

gestion, vomiting, &cc.

In order to the cure, the patient's inclinations must be complied with; the juice of quinces are recommended; warm stimulants, such as pepper and ginger, with aloes and other such like bitters, are found to be useful. See Arctæus de Cauf. Sign. diutin. Morb. lib. ii. cap. vi. Cœ-lius Aurelianus Morb. Chron. lib. iii. cap. ii. Aretæus de

Curat. Chron. Morb. lib. ii. cap. vi.
STOMACHICI NERVI. See PAR VAGUM.
STOMACHUS, from coua, a mouth, and zee, to pour Because it sends the food into the orifice of the guts. The word flomachus properly belongs only to the upper orifice of the flomach, though given to the whole vicus. The flomach is fituated under the left fide of the diaphragm, just below the lesser lobe of the liver, passing down a little way, and then turning over the spine to the right side. In shape it much resembles the pouch of a bagpipe; it lies in an oblique direction from left to right, and hath a fubstance called mesogastrion in its concave part, between the orifices attaching it to the fubjacent parts; its fuperior orifice is called the cardiac orifice; it is on the left fide; the inferior orifice is to-ward the right fide, and is called pylorus. The outward coat of the flomach is from the peritoneum; the fecond coat is mulcular; the inner or villous coat appears like a pile of velvet, but short and flat, and it is extremely vafcular; betwixt these coats the cellular membrane runs, and, according to fome, reckoned diftinct coats; to that betwixt the muscular and the villous coat, fome have given the name of nervofa. The mufcular coat of the flomach can contract it to a very small fize, as in vomiting. Dr. Hunter thinks, that the cavity is contracted fo as not be larger than the fize of a nutmeg, when all the contents are thrown out. The arteries are princicipally the coronaria ventriculi, and the two gastrice; the veins are ramifications from the venze portze in general, and, in particular, from the meseraica major, spleanica, and hamorrhoidalis interna; the nerves are from

the eighth pair. See DEGLUTITIO.

STORAX, see STYRAX. For that called RUBRA, see THURIS CORTEX.

STRABILISMUS, STRABISMUS, STRABISMUS, STRABOSITAS, also called differtie. Dr. Cullen places this genus of difeafe in the class locales, and order dyscinesse. He distinguishes three species. I. Strabismus habitualis. When from a custom of using one eye. 2. Strabismus commodus. When one eye in comparison with the other, from greater weakness or mobility, cannot accommodate itself to the other. 3. Strabifmus necessarius. When some change takes place in the fituation or figure of the eye or a part of it. It may be caused from habit contracted by mocking those who fquint; by viewing many agreeable objects at once; by placing the eye of an infant obliquely to a candle, or a window, &c. or this diforder may proceed from a fault in the first conformation of the eye, or some particular part of it; or the weakness of one eye may produce this defect in the other; the muscles of the eye may be too long, or too fhort, preternaturally relaxed or

contracted; a tumor in the orbit, or an adhesion of the eye to some part of the eye-lid, may also be a cause;

fpasm, or an apoplexy, may also produce it.

Those who squint from some accident after they are grown up, see double; but when they squint from their

infancy they do not.

Some attempt to remove this defect in children, by fetting them to look at their faces in a looking-glass, and repeat this attempt for a quarter of an hour, night and morning; and while this method is in use, the eyes should be washed with Hungary water; to strengthen the mufcles wash the temples and the forehead three times a day. See St. Yves on the Diforders of the Eyes. Wallis's Sauvages' Nofology of the Eyes. STRAMEN CAMELORUM. CAMEL'S HAY. See

JUNCUS ODORATUS.

STRAMONIUM. THORN-APPLE, called also ulutray. It is the datura stramonium, or datura seetida pericarpiis spinosis erectis ovatis, soliis ovatis glabris of Linnæus; the stramonium spinosum of Gerard; and

the folding maniacum of Diafoorides.

The root is long, large, and fibrous. The stalk is of a pale green, strong, and near three feet high. The leaves are large, of a lively green, placed on strong peduncles: they are broad, pointed at the extremity, beautifully indented, and are placed without any regular arrangement. At night, the leaves, particularly the upper ones, rise up and inclose the flowers. The shower appears in August, consists of one petal, funnel-shaped, tubular, and folded at the border in five parts; they grow at the bifurcation of the branches, are large, and of a milk-white colour, though fometimes they have a tinge of purple or velvet. The feed-veilel is oval, large, and covered with fhort, fharp, and ftrong thorns. The feeds are brown.

It is a native of America.

The feeds and leaves received into the human stomach produce a vertigo, and afterwards madnefs. Boerhaave relates that fome boys who had caten fome feeds of thorn-apples, were feized with giddiness, horrible imaginations, terrors, and delirium : and that those who did

This plant hath a diffagrecable, naufeous finell, when rubbed between the fingers. According to the relations of fome, the leaves are faid to be cooling, and the feeds narcotic; others observe, that the seeds produce a strange kind of delirium, which continues twenty-four hours; and that the root occasions uneasy sleep and troublesome dreams. Accounts of its effects may be feen in the Edinb. Med. Comm.

In case of injury from the seeds or any other part of this species of datura, proceed as in cases of poison by

mushrooms. See AMANITA and VENENUM.

Dr. Storck took framenium offic. datura pericarpus fpinosis erectis ovatis, Linn. He pressed out the juice from the fresh plant, and inspissated it to an extract, and, in different cases, gave it in doses from gr. is to 3 i. in twenty-four hours. In epileptic diforders, convultions, and madnefs, it proved to be a medicine of fingular efficacy; he cured feveral patients whose diforders were violent, and of long continuance with it. With other practitioners it does not feem to have been fo fuccefsful. See Miller's Bot. Off. Dr. Storck on the Stramsnium. Withering's Bot. Arrang. Med. Mus. vol. i. p. 448, &c. Wilmer's Obs. on Poisonous Vegetables. Cullen's Mat. Medical

STRANGALIDES. Hard tumors in the breafts from

milk.

STRANGURIA, from spays, a drop, and ween, wine. A STRANGURY. It is a discharge of wrine by drops, attended with pain. See Dysuria. STRATIOTES. See Micro-Leuco-NYMPH.EA,

MILLEFOLIUM, ALOIDES, and AIZOON. STREMMA, from spepu, to turn. When a membranous, or tendinous part is stretched be-yond its proper limits, it is said to be firained. This ac-cident happens chiefly about the joints, occasions weaknefs and pain there, with fwelling, and often a total in-ability to move. A firain approaches very nearly to the nature of a contunion, and, as in contunions, reft, with the application of warm vinegar, three or four times a day, will be proper; and when the fymptoms abate, in proportion thereto, let a little spirit be added to the vine-

gar, which now may be used cold, and a bandage may be made use of to support the weakened part, until the natural degree of strength returns. Dr. Lobb advises the use of vinegar, and of rectified spirit of wine alternately, first rubbing in the vinegar, then, two or three hours after, rub in the spirit. Saturnine water is useful in these cases.

Cold water is used by some; but if the strain is deep, it does no fervice; if there is inflammation, it does harm, fo that it is only in flight and fuperficial, and these must be recent cases too, in which it can be of fervice. Bell's Surgery, vol. v. p. 446. STREPSICICEROS. See ANTILOPUS.

STRIDOR. GRINDING of the TEETH. Hippocrates observes, that in acute diseases this symptom is ufually fatal if the patient has not been accustomed to it in his childhood.

STRIGIL. An inftrument to scrape off the STRIGILIS. I sweat during the gymnastic exercises of the ancients; and in their baths: strigils were made of metals, horn, or ivory, and were curved; fome were made of linen.

STRIGMENTUM. The STRIGMENTS, FILTH, or SORDES, feraped from the fkin in baths, and places of exercife; some of these strigments were only the sweat, others were the fweat mixed with the dust raised in the place of exercise, or purposely strewed on the bodies of them who were there engaged. Strigments were of three forts: 1. Sweat. 2. Sweat with the dust and oil which was rubbed on the bodies of the men. 3. Oils and dust feraped from statues, and which often partook of verdegrife, from the oil dissolving the copper.

STRONGYLUS. ROUND WORMS. See VERMES. STRUMA. The fruma of the ancients were those

ferofulous tumors that were encyfted. See ScrofulA.

STRUTHIUM. Sec SAPONARIA LUTEA, IMPE-RATORIA, and LUTEA.

STRYCHNOMANIA. So the ancients called the diforder produced by eating the deadly NIGHT-SHADE. STRYCHNOS. So Theophraftus called the deadly

night-shade. In Linnæus's System of Vegetables, it is a genus of plants in the class pentandria, and order monogynia. Its two species are the strickness nux vomica, and firichnes colubrina. See COLUBRINUM, and NUX VO-

STUM. It is Musr, whose fermentation hath been prevented, or prematurely suppressed, by fumigation with fulphur.

Loss of FEELING. The fame as STUPOR. anashbæsia. Or it is a transitory numbness, such as is

occasioned by accidental pressure, &c.

STUPOR DENTIUM. An affection of the teeth, in which a certain pain is felt in the membrane which furrounds them, and by which fenfation is in some degree destroyed. It is produced by taking acid and austere fubstances into the mouth.

STUPA, A STUPE. It is a piece of cloth, usually STUPPA, of flannel, dipped in some proper liquor, and applied to an affected part.

STYLIFORMIS. See GRAPHOIDES.

STYLO-CERATO-HYOIDEUS. Stylo, from the styloid process, and appara, borns of the bysides.—STYLO-STYLO-STYLO-CHONDRO-HYOIDES.

STYLO-CHONDRO-HYOIDEUS. So. Doubles remove

STYLO-CHONDRO-HYOIDÆUS. So Douglas names one of the muscles called stylo-hyoidæus, because it is inferted into the cartilaginous appendix of the os hy-

- GLOSSI. From flylus, a pencil, and gloffa, a tongue. These muscles rise from the inner part of the styloid process, and go the whole length of the tongue,

ferving to expand it. - HYOIDES, vel cerato-byoideus. It rises from the processus styloides, and runs to the cornu and basis of the os hyoides. Generally its fibres pass on each side of the tendon of the digastric muscle. Called Massidianum

STYLOIDES PROCESSUS, from sunos, a pencil, and esdos, form, called also belemnoides. See TEMPORUM

STYLOIDES RADIALIS LIGAMENTUM. It is fixed round the neighbouring tuberofity of the os fcaphoides.

— ULNÆ LIGAMENTUM. It is fixed in the os

cunciforme, and then in the os unciforme, from whence

STYLO-MASTOIDEUM FORAMEN. This hole is the orifice of the paffage for the portio dura of the auditory nerve, which runs behind the tympanum.

- PHARYNG #1. These muscles rise from the beginning of the styloid processes, and are inserted into the pharynx, and into the thyroid cartilage. See PHA-

STYMMATA. These are called Spiffamenta. Things added to oils, either on account of their odour, or that confects may be preferved a long time; hence also were the thicker, more folid, ointments called, which were at the same time sweet-scented; they are different from the bedyfmata, because these were liquids, those solids. Linden fays those things were called flymmata, which gave confittence or body to ointments; but hedyfmata were the juices from whence those were made. Schröder deferibes flymmata to be the spissamentum or sediments of flowers and other things, which remains when they are macerated in oils and expressed.

STYMATOSIS. A bloody discharge from the penis. STYPTICA, from rops, to aftringe. STYPTICS, or medicines which ftop hæmorrhages. Of flyptics for ftopping hæmorrhages there are few to be depended on; their usefulness is only in very flight cases, and the best of them is the lycoperdon.

STYPTICUS HELVETH PULVIS. Helvetins's Styptic Powder.

R. Aluminis Rupei 3 i. fs. fanguinis draconis, 3 ij. misce, fiat pulvis.

This was the pulvis flypticus of the Edinburgh Pharmacopæia, and was in long repute as an aftringent. But three drams of the gum Thino is judiciously substituted now for the dragon's blood; and being much more powerful, and certain in its aftringent effect. The chief use of this is in hæmorrhages, particularly those of the uterus, and, indeed, in their cure is an excellent remedy; given in doses of from eight grains to half a dram, coupled with pulvis tragacanthæ, gum arabic, and ftarch, to prevent its having too painful an effect upon the ftomach. See Alumen. STYRACIFLUA. See LIQUIDAMBRA.

STYRAX, also called STORAX; and because it was formerly brought to us in reeds or canes, it was named flyrax calamita. Casper Bauhine calls the tree that affords it flyrax folio mali cotonei, because its leaves are like those of the quince-tree. Ray calls the tree from which the liquid flyrax is obtained, flyrax aceris folio, because its leaves resemble those of the maple. It is the

flyrax officinale, or flyrax Syriacum, foliis mali cotonei, floribus albis, Linn. The Syriacum, foliis mali cotonei, floribus albis, Linn. The Syriacum, storax TREE.

Storax is the most fragrant of the folid refins, and, indeed, of all the vegetable fubfitances. There are three kinds: 1. The fine fort, called the red florax; it is the kinds: 1. The line lort, cancer the red horax; it is the pure native juice which flows from incifions made into the trunk of the tree; it is not in tears, but in maffes, fometimes composed of whitish, and pale reddish brown lumps; sometimes it is of an uniform reddish yellow, or brownish appearance, uncluous and soft like wax, and free from visible impurities. With this kind we rarely meet. 2. The common floran: this is supposed to be the thinner juice thickened with faw-duft, for it is more fragrant than the pure fort, both whilft mixed with the faw-duft, and when feparated therefrom by means of rectified fpirit of wine; its flavour is also of the fame kind. It is now brought in large pieces, of a reddish brown colour, foftifh, and, as it were, uncluous to the touch, yet brit-tle and friable. This is the only fort that is generally met with, and its refin is ordered by the London college. 3. Storax in the lump: it is in maffes of an uniform texture, and of a yellowish red, or brownish colour, some-times interspersed with whitish graips. This is called florax in the tear.

It is the produce of Syria, Cilicia, and Pamphilia; fome fay that true florax is also a produce of Italy. There is a fort in America, but it differs much from the above. It exudes from the leaves of the trees in the warm climes where it is produced; but is most abundantly obtained by making incitions through the bark thereof.

Neumann fays, that an ounce of common forax, gave

it is a little thretched over the fourth bone of the metawas faw-dust; and that on heating another ounce with water first, he obtained two drams of gummy, then with spirit half an ounce of resin. Pure spirit raises but little from the florax by distillation, but water takes up much of its flavour; and when it is almost all drawn off, a fine fubtil essential oil rises, in the proportion of about 3.ii. from 3 xvi. The reliduum on being urged with a due degree of heat, afforded 3 ix. of an empyreumatic liquor, then 3 ii. 3 i. of thick butyraceous oil; afterwards 3 ii. 3 i. of an empyreumatic oil, which had nothing of the finell of the flerax, along with 3 v. of an acid fpirit. On washing the butyraccous oil with warm water, then setting the water in a cool place, a small portion of faline matter feparated, which appeared like the flowers of benjamin, and is supposed to be of the same nature with gum benjamin. The fame faline matter is obtained from the pure refin, by boiling it in water. This spirit carries but little from the florax in distillation; yet if twice its weight of the falt of tartar is added, a fairle is obtained which is strongly impregnated with both the taste and smell of this resin. The strongest, and the most fragrant principle, separable from storax, is the subtile, slightly empyreumatic oil which arises first in distilling it.

It is chiefly used as a perfume, but is sometimes used as a medicine, and that both externally and internally; its qualities are to refolve and ftrengthen. See Lewis's

Mat. Med. Neumann's Chem. Works.

STYRAX LIQUIDA. LIQUID STORAX, called also Liquidambar. It is a refinous juice obtained from a tree in Virginia and Mexico, which Ray calls florax a ceris solio. The juice called liquid amber, is said to exude from the leaves of this tree spontaneously, but more freely from incifions made in the trunk of it; and the liquid florax is faid to be obtained by boiling the bark and the small branches in water. Two forts of liquid florax are diffinguished, but the fort which is commonly met with, is of a weak fmell, a grey colour, and is supposed to be artificial. It is not in the present use. Dr. Cullen says, that mixed with fome uncluous fubflances in the proporit has been of remarkable fervice in paralytic cases; and particularly in debility of the limbs following rickets; but this he has from an empirical practice. See Neumann's Chem. Works. Philof. Trant. No. 313. Lewis's and Cullen's Mat. Med.

--- ALBA. The WHITE PERUVIAN BALSAM. SUBALARIS VENA, from fab, under, and ala, the

armpit. The AXILLARY VEIN.

SUBCLAVIÆ ARTERIÆ, from fub, under, and clavicula, the channel-bone. The SUBCLAVIAN ARTERIES. They are so called from their situation being under the clavicles. They arise from the arch of the zorta, on each fide of the left carotid, which commonly lie in the middle between them. The origin of the left fubclavian artery usually terminates the aorta afcendens. These arteries on each side terminate at the upper edge of the first rib between the lower insertions of the first scalenus muscle, and there, as they go out of the thorax,

they take the name of the arterie axillares.

SUBCLAVIUS MUSCULUS. It rifes by a small tendon from the anterior part of the cartilage of the first rib, close to the strong ligament which connects this rib to the clavicle, runs along the whole under side of the clavicle into the coracoid process, where it is articulated to the clavicle. Its use is to bring the clavicle upwards

and forwards.

SUBCOSTALES. These muscles are situated more or less obliquely on the insides of the ribs near their bony angles, and running in the fame direction with the ex-ternal intercoftals. They are fixed by both extremities ternal intercostals. They are fixed by both extremities in the ribs; the inferior being always at a greater distance from the vertebree than the superior, and several ribs lying between the two infertions.

SUBCUTANEUS. See PLATYSMA MYOIDES. SUBER. The CORK-TREE. It is a kind of evergreen oak; it is a native of Italy, France, Spain, and other warm parts of Europe. The bark separates spontaneously from the tree, and a new one follows it. It is this bark

that is cut into corks for stopping of bottles.
SUBHUMERALIS VENA. See ARTICULARIS

SUBLIMAMENTUM. See ENEGREMA.

SUBLIMATIO. Sublimation. It is the con-densing and collecting in a folid form, by means of vef-fels aptly constructed, the sumes of bodies raised from them by the application of a proper heat. Fluids are faid to distil, and folids to sublime. If the subliming matter concretes into a mass, it is commonly called a sublimate; if into a powdery form, flowers. See the Dich. of Chem.

SUBLIMATIO URINE. Pee ENEOREMATA. SUBLIMATUM. SUBLIMATE. See MERC. CO-

SUBLINGUALES GLANDULÆ, vel Bartbslinianæ, vel Riviniance. The SUBLINGUAL GLANDS. They lie between the mylo-hyoidei and the genio-gloffi muscles, and almost always discharge their faliva in the same place with the submaxillary glands under the tongue. SUBLINGUALIS ARTERIA. The sublingual arte-

ry is the fecond branch from the external carotid; it rifes a little above the superior guttural artery; it runs in forwards, upwards, and over the cornu of the os hyoides, and finks into the tongue to supply all the adjacent mus-

cles. It is also called the ranina arteria.

SUBLUXATIO. SUBLUXATION. It is where the head of a bone is not quite out of its focket, but rests

SUBMERSIO. DROWNING. In Dr. Cullen's Nofology it is a variety of the apoplexia fufficata. Sau-vages terms it afphyxia immerforum. Instances have occurred of perfons lying under water for fix hours, and after-wards been reftored to life and health; two hours have been employed in the recovery of those who had lain long under water, before any advantage was observed from en-deavours, and at length success hath followed. Strange are the reports on this subject. Some modern physiologifts affert, that no terrestrial animal can be recovered, if it continues fix minutes under water at one time, without breathing. Very little water is ever fwallowed by drowned persons; they do not attempt to breathe until they are insensible, and then on attempting, a little water is sucked in, and a fmall portion of it passes into the lungs. On taking the body out of the water, it must not be laid on the cold earth, but on a warm bed, the cloaths that are wet being first stripped off; or it may be laid in the hot fun, or any warm place, there to be rubbed with coarse cloths until a glow is perceived in the skin; a strong healthy person may blow his warm breath into the patient's mouth to distend the lungs; or better and more certainly will air be directed into the lungs, if an opening was made into the trachea, as proposed in the article TRACHEOTOMY: because the air blown into the mouth may pass only by the cesophagus into the stomach; or the smoak of tobacco may be conveyed into the patient's mouth, or his throat may be tickled with a feather to excite a vo-miting; after which let him be laid before a warm fire, or on any other warm place, until life appears. The jugular veins may be opened to fet the circulation forward again, the veins in other parts will rarely bleed; the fumes of tobacco may be thrown up the intestines; volatiles and ftimulants may be applied to the nofe and the tongue; these are most useful after bleeding. If these fail, bronchotomy may be performed, and warm breath may be blown in at the aperture, until figns of life appear; not any thing thould be forced down the throat, but as food as the patient can attempt to fwallow, give him a draught of warm water, with a table-spoonful of mustard in it, to drink. Continue these means until life seems to be confirmed. Generally, after recovery, an oppression, a cough, and a fever follow. In the first volume of Dr. Fothergill's Works, Dr. Letsom hath inserted the following method of treatment, found by the Humane Society

to be most fuccessful on these occasions. I. The body should not be rolled on the ground, or over a barrel, nor lifted up by the heels, or be any other way roughly handled, or violently shook; but be removed to a convenient place, lying as on a bed, with the

head a little raifed, in as natural a position as possible.

II. The body, well wiped with a cloth, should be placed in a warm bed or blanket; but not too near a large fire. Bottles of hot water should be laid to the bottoms of the feet, joints of the knees, and under the arm-pits. A warming-pan moderately heated, or hot bricks wrapped in cloths, thould be rubbed over the body, particularly

along the back. The natural warmth of a healthy per-fon, especially a child, lying close to the body, hath been found very esticacious. The room should be kept open and airy, with sew persons in it. The shirt of an attend-ant, or skin of a sheep fresh killed and warm, may be used to advantage. Should the accident happen in the neighbourhood of a warm bath, brew-house, bake-house, sales-house, saltern, foan manusactory, or any solvice glafs-house, faltern, soap manufactory, or any fabric where warm lees, ashes, embers, grains, fand, water, &c. can be easily procured, it will be very proper to place the body in any of these, moderated to a degree of heat, and it is the reaction that of a healthy person.

very little exceeding that of a healthy person.

III. The body being placed in one or other of the above advantageous fituations, various stimulating means should be immediately employed. The most efficacious are, blowing with force into the lungs, by applying the mouth to that of the patient, closing at the fame time his nof-trils; throwing the fmoak of tobacco up the fundament into the bowels, by means of a clyfter-pipe or fumigator; a pair of bellows may be employed until the others can be procured; rubbing the belly, cheft, back and arms, with a coarse cloth, or dry sait, so as not rub off the skin, or with a flannel dipped in brandy, rum, or gin; applying spirit of hartshorn, volatile saits, or the like, to the nottrils, and rubbing them on the temples frequently; tickling the throat with a feather, to excite a propenfity to vomit; and the noftrils also with a feather or faulf to provoke sneezing. The body should at intervals be shaken, and varied in its polition.

IV. If there be any figns of returning life, fuch as fighing, gasping, twitching, beating of the heart, return of natural warmth or colour, a spoonful of water may be administered, to try if the power of swallowing be returned; if it be, a spoonful or two of warm wine, or of brandy and water, may be given to advantage, but not before.

Early bleeding has been found pernicious, and even fatal; it is not always applicable, though it may fometimes be employed by a person of skill, to remove or pre-

vent fymptoms of inflammation.

The above methods of reftoring life are applicable to various other cases of apparent sudden death, whether from hanging, apoplectic and convulsive fits, cold, fusiccation by damps or noxious vapours, proceeding from coal mines, confined air of wells, caves, cifterns, or from

the must of fermenting liquors.

See Tissor's Advice to the People. Med. Musteum, vol. iii. p. 376, &c. Dr. Cullen's Letter to Lord Catherart on this subject.

SUBOCCIPITALES NERVI. So the tenth pair of nerves are called which proceed from the head. They are fmall; they pass out at the foramen magnum, be-tween the basis of the skull, and the transverse process of the atlas where they form a ganglion, and give branches to the adjacent muscles; after which, forming a fort of arch with an afcending twig of the first cervical pair, a branch is fent off, which is called the occipital nerve. SUBORBITARIUS. A branch of the upper maxil-

SUBORDITARIUS. A branch of the upper maxis-lary branch of the fifth pair of nerves; it runs on the lower part of the orbit of the eye, &c. SUBPOPLITEUS. See POPLITEUS. SUBSCAPULARIS MUSCULUS. It rifes from the whole inner furface of the fcapula; paffes under the co-racoid process, and is inferted into the external tubercle of the os humeri, just below its head. It is also called

immersus; infra scapularis.

SUBSULTUS, from sub, under, and salio, to leap; is the same as spasmodic, or a convulsion of the clonic kind, from the fense of leaping which the tendons give to the hand lying upon them. A TWITCHING of the TEN-DONS also an involuntary twitching, or spasmodic contraction of the mufcular parts.

SUCCINUM; called also carabe, or karabe, ambra, and elettrum, edet, edets, aurum elimpium, barpaga; bar-pax, charabe; AMBER. It is found in feveral parts of the world: the most considerable quantities are taken up from regular mines in fome of the inland countries be-longing to the king of Pruffia; but the finest forts are thrown up by the fea, particularly in flormy weather,

There are various conjectures respecting the origin of amber, but the most probable is, that it is instantly formed by the concourse of mineral oil, or petroleum, with vitriolic acid. And thus it is eafy to conceive how infects, of the most tender kind, are enveloped, without injuring them, or altering their natural appearances. Some affert that bitumens are effentially mineral; others, and by far the greatest number, that they proceed originally from vegetable substances. In favour of the latter opinion, fee Macquer's Chemical Dictionary. Dr. Saunders, in his Lectures on the Theory and Practice of Chemistry, fays, all fossil instammable matter is supposed to proceed from animal and vegetable matters, altered by time; he further observes, that sulphur is obtained by mixing vitriolic acid and spirit of wine rectified, or oil. On the other hand, Dr. Lewis observes, that the oil of amber differs from all those of the vegetable kingdom; and agrees with the mineral petroles, in not being foluble, either in its rectified or unrectified state, by spirit of wine, fixt alkaline lixivia, or volatile alkaline spirits; the oil, after long digestion or agitation, separating as freely as common oil does from water: he further observes, that mineral bitumens are different in their qualities from the vegetable refins; and in the mineral kingdom we find a fluid oil, very different from vegetable oils. The mineral oil is changed by mineral acids into a fubstance greatly resembling bitumen; and the vegetable oils are changed by the same acids into substances greatly re-fembling the natural resms. From bitumens we gain by distillation the mineral oil; and from refins the vegetable oil, diftinct in their qualities as at first; vegetable oils and refins have been heated with all known mineral acids, but have never yielded any thing fimilar to the mineral bituments. It feems, therefore, as if the oily products of the two kingdoms were fpecifically and effentially different. The laws of chemical enquiries at least demand that we do not look upon them any otherwise until we are able to produce from one a substance similar to the other: when this is done, and not before, the prefumption that nature effects the fame change in the bowels of the earth, will be of fome weight. See Dr. Lewis's Note in his Translation of Neumann's Chemistry, vol vii. See Dr. Lewis's p. 3. Neumann fays, in speaking of amber, it is most probable, that amber is generated instantly from the concourse of mineral oil, or petroleum with vitriolic acid, in the form of vapours.

The yellow amber should be of a citron yellow, or of a golden colour, bright, transparent, easily taking fire, and

exhaling a pleafant fragrant fmell.

In Holland, a vegetable refin, called GUMMI DE LOOCK is fold under the name of American amber; but it is less electric than amber, wants the peculiar smell thereof when it is burning, dissolves readily in spirit of wine, and when diffilled it does not afford the fame principles as the amber does.

If amber is distilled in a retort by a strong heat, it yields a phlegm, or oil, which grows thicker and thicker as the diffilling continues, and a particular kind of falt. The amber is powdered and mixed with three times its weight of white fand before it is committed to diffillation; a retort is half filled with it, and then the fire is gradually increased until a phlegm rifes, but not more than to make water boil; after this the heat should be greater, but gradually increased, yet not so as to make the amber fmell much; the receiver may be left unluted; thus it can be occasionally removed, and the falt fwept out, and fo hindered from melting with the oil that rifes; the diftillation is continued until no falt is feen to arife. After the diftillation is ended, gather all the falt together, and dry it by preffing it gently between some sheets of spongy paper; then to purify it, boil it in the phlegm that arose in the beginning of the distillation, which is called the spirit of amber, or it may be boiled in common water, then set to crystallize; this may be repeated until it is fufficiently freed from its oil. When this falt is pure, it

is of a white colour, of a pungent, penetrating, grateful acid tafte; it diffolves in rectified spirit of wine with difficulty, though affifted by heat, but readily in water.

The falt of amber is mixed with fal ammoniac; but this it discovered by an urinous smell arising on rubbing it with the falt of tartar; it is mixed with nitre, but this is discovered by the nitrous taste. When mixed with cream of tartar, it is discovered by dissolving it in water, for the falt of amber readily diffolves and leaves the cream of tartar undiffolved. When it is mixed with the falt of coral, it is discovered by laying it on a red-hot iron, on which the falt of amber slies off, but that of the coral remains in the form of a white powder.

This falt is given in doses from gr. Si. to 3 i. Boer-haave extols it as an antihysteric, and other physicians attribute many other virtues to it. Dr. Alston of Edinburgh fays, that when divefted of the oil, it is no better than common falt. Dr. Cullen, that when genuine, and purified, its virtues are little better than that of vegetable acids. At prefent it is rarely used, except to render the operation of alectic and refinous purges more mild, and

also more certain.

The oil which rifes in diffillation may be rectified by diffilling it from pure water. The rectified oil hath a ftrong bituminous fmell, and a pungent acrid tafte; it heats the body, and promotes the fluid fecretions; it is chiefly used as an antihysteric, and an assistant to emmenagogues: externally it is applied to weak, rheumatic, and paralytic limbs. This oil agrees with the mineral oils in refusing to mix with vinous spirits. The London College order the salt and oil to be obtained from two pounds of amber placed in a fand bath, and gradually increafing the heat, whence an acid liquor, oil, and falt mix-ed with the oil will come over. To purify the falt they take half a pound of the falt, one pint of distilled water; the falt is boiled in the water, and then fet by to crystallize. Its dose is from five grains to a scruple. In order to purify the oil they take a pound, and distil it three times. Its dose from five to thirty drops. The Edinburgh College have given fuperior directions for these processes. The oil feems to be the only active medicine as an antifpafmodic, which power is increafed by its purity, acquired by repeated diffillations. It has been found extremely useful in cures of epilepsy, hysteria, and other spasmodic affections, in doses of from ten drops to thirty.

Several preparations have been made from amber, but they are rarely ufed. See Neumann's Chem. Works. Lewis's Mat. Med. Tournefort's Mat. Med. Dict. of

Chem. Cullen's Mat. Med.

SUCCINUM CINERIUM GRISÆUM. See AMBRA-

SUCCISA, also called morfus diaboli, scabroso folio in-tegro. Common Devil's BIT. It is a species of scabius; it grows in meadows and pasture-grounds, and slowers at the end of summer. The roots are faid to be alexipharmic; the leaves are often fold for the leaves of common fcabius, they are alexipharmic, refolvent, bitter, and of the fame qualities as the feabius for which they are fold.

SUCCUBUS. A fpecies of NIGHT-MARE. SUCCUS INDICUS PURGANS. — LAXATIvus. See Gambogia.

SUDAMEN. Transfory, red, stinging spots on the skin. SUDAMINA. HEAT PIMPLES, or an eruption of puftules, which fucceed an inordinate fweat. That kind of fymptomatic miliary fever, that is called BOA, which fee; also Desudatio.
SUDATORUM. See Achicolum.

SUDOR. SWEAT. It is that fluid which transades through the pores of the skin when we use much exercife, or fuch means as may increase its discharge. It confifts of a water, a highly exalted oil, a falt, and a terrestrious matter.

SUDOR ANGLICUS, called also bydronosos, bydropyretos, The SWEATING SICKNESS. Dr. Cullen thinks it a species of typhus. See HELODES. This disorder is thus named from its first appearing in this island. When Henry VII. first landed his foldiers at Milford Haven, in the year 1483, it appeared amongst them. In 1485 it was in London; it soon disappeared, but returned five or six times: the last return was in 1551. It was remarked that Englishmen, whether they refided at home, or fled into other countries, were attack-

ed, whilft foreigners in England were unaffected. Differ- | hand; the breathing is quick, and more or lefs laborious; ent patients are variously affected, but some on the first appearance of the diforder were feized with a pain in the neck, fcapula, legs, and arms, whilst others perceived only a kind of warm vapour, or flatulence, running through those parts; and these symptoms were suddenly succeeded by a profuse sweat, for which the patients could not ac-count. The internal parts became first warm, and were soon after seized with an incredible heat, which thence diffused itself to the extremities. An intolerable thirst, restlessines, and indisposition of the heart, liver, and stomach, were the next symptoms, succeeded by an excessive head-ach, a delirium, in which the patient was trifling and talkative, and after these a kind of extenuation of the body, and an irrestitible necessity of sleeping. In some the sweat stopped in the beginning, and their limbs became moderately cool, but the and their limbs became moderately cool; but this evacu-ation being afterwards promoted, the matter of it was of a difagreeable fmell, of different colours, fometimes more, and fometimes less in quantity, and of a thickish confishence. Some were seized with a nausea, others with a vomiting; all, without exception, were afflicted with a difficulty of respiration. The urine had nothing preternatural, except that it was of a thicker confiftence, and tinged with a fainter colour than ufual. The pulse was rather quicker than natural. In those, however, who breathed in the pureft air, and had the best confitutions the discount man and will. tions, the discase was most mild.

The means that were found to be the most falutary, were to keep up the fivent, after it begun, at least for twenty-four hours, for by that time the difease terminated. During the fucat, no more aliment was taken than the firength required; fleep was forbid; and when the fucating was over, the patient was to be cautious in going abroad. Caius de Ephe. Britannica.

SUDORIFICA. SUDORIFICS. Medicines which ex-

cite fweat. When the fweat is to be excited, it fould be confidered whether the heat of the body is above or below that degree which admits of this evacuation. The usual natural heat in different perfons may fomewhat vary, and for this an allowance is to be made; but whether the de-gree of heat is in a healthy flate, if the person is ten de-grees hotter by Fahrenh. therm, he cannot be made to sweat. It is true, that in striving to raise a sweat by the use of diluting liquors he will be increased above this, and the fweat notwithstanding, follow; but if the diluting drinks were not used, other means would fail. In this drinks were not used, other means would fail. In this case cooling methods must be used, such as cold water for drink, cool air admited to the body, and cooling medicines given internally. If the beat is below the standard of bealth, warm water and cordials must be used, the patient must be kept in a warm room or in bed. As sweating greatly cools the body, it should be cautiously used in low and putrid severs. When the patient is very hot, to affist the effects of cold water, and to hasten it through the skin, stangel cloths may be wrung out of hot water, the tkin, flannel cloths may be wrung out of hot water, and applied round the legs and thighs, and thus a fweat will be produced very fpeedily. When the fweat is once raifed, the drink should be warm, and supplied more or raited, the drink thould be warm, and tuppined more of lefs freely according to the degree and continuance of the fweating. Sweating is tarely of use when bleeding is unfate; though in such cases a gentle perspiration may generally prove falutary. See Dr. Home's Medical Tracts and Experiments, p. 220. Exp. v. Mr. Alexander's Experimental Estay's, Exp. iii.

SUFFIMENTUM. A SUFFUMIGATION. Those

made for pleasure are generally formed of such sweet subftances as are found to be agreeable, and those which are formed for health are generally calculated to affect the mouth, throat, or other part to which they are to be ap-plied, in such manner as to produce some important al-teration for the removal of some disease.

SUFFOCATIO STRIDULA, also called the CROUP, the chock, the stuffing of RISING of the LIGHTS. Angina interna, angina latens & difficilis, angina inflamon the first or second day, the breathing not bad, the pulse that hitherto hath only appeared in children, rarely, if ever, in any after twelve years of age. Dr. Cullen places it as a species of cynanche, and names it cynanche trachealis.

This disorder appears to be present by a peculiar sharp shrill voice, not easily described: a remarkable freedom from all other complaints, though the hour of death be at the same of the pulse that the pulse though frequent, yet is strong and firm, and the voice not altered, some hope may be entertained of a recovery. The cough becoming stronger and less dry, is usually the first sign of amendment.

Though this disease consists in an inflammatory affection, it does not commonly end either in suppuration or gangrene. The troublesome circumstance of it seems to some some commonly end either in suppuration or gangrene. The troublesome circumstance of it seems to some some commonly end either in suppuration or gangrene.

the pulse frequent, fometimes flrong at first, but alway foft and weak towards the end; fometimes there is a dull pain in the trachea, on speaking, or when it is pressed with a finger; and at others an external fwelling in the upper part of the fame tube; the fenses are perfect to the last; the progress of the disorder is rapid, for generally death foon steps in to conclude it. The face is generally flushed, though sometimes it is of a livid colour. Sometimes there is a cough, and when it is attendant, it is short and stilled, and not attended with much expectoration. Dr. Cullen describes it as having for its characteristic symptoms, " a peculiar croaking found of the voice, a difficult respira-tion, a sense of straitness about the larynx, and a sever: or, a hoarfeness with some shrillness and ringing found, both in fpeaking and coughing, as if the noise came from a brazen tube." He further remarks, that "the thick mucus that fills up the trachea may be eafily feparated, and fometimes is found to; in those instances the inner membrane of the trachea is always free from erofion or ulceration, but usually shews the vestiges of inflammation, being covered with a matter of refembling pus, and like to that which is ejected by coughing; and very often a matter of the fame kind is found in the bronchize, in confiderable quantity."

For the most part winter is the season in which this dis-ease occurs; long continued catarrhs from the measles, hooping cough, or the finall pox, are predifponent causes; cold and moift weather is supposed to contribute much as causes. It is most common about the sea coast, and in low marshy countries; yet sometimes met with in midland countries: and its attacks are frequently repeated in

the fame child.

The feat of the diforder is the cavity of the wind-pipe, from a little below the glottis downward; and the diforder itself consists of the mucus separated there, and beder itself consists of the mucus separated there, and become thick, so filling up the passage that the air can no
longer pass freely into the lungs; at first it forms a thick
membranous crust, which thickening fills up the cavity of
the trachea. The back part of the trachea where there
are no cartilages, seems from the inspection of those who
die of this disease, to be its first and principal seat; as this
morbid membrane is often sound there, when it is in no
other part: and indeed, in this part is lodged the greatest
number of glands designed for the secretion of mucus. number of glands defigned for the fecretion of mucus. Dr. Cullen thinks that an inflammation of the mucous membrane of the larynx, and trachea, constitutes this difeafe. In the mucous glands in general, this diftemper should be considered as originally feated; but from particular uses, more directed to those of the trachea; where, from the nature of the part, it becomes visible in a differ-ent way from what would discover it in any other part. It is not evidently contagious.

Some diftinguish the croup from the catarrhus fuffocati-vus of Etmuller; from a fevere cold; from peripneumonic complaints; and from fuch fymptoms as arise from extraneous bodies lodged in the trachea: an inflance of which Dr. Home mentions in his Enquiry into the Nature, &c.

of the Croup.

There are two different fituations of this complaint;

There are two different fituations of this complaint;

inflammatory and lefs dangerous; in this the first is more inflammatory and less dangerous; in this case the pulse is generally strong, the face red, the drought great, and evacuations are useful: the second is less inflammatory and more dangerous; under this the pulse is quick, foft, and weak, the tongue moift, the thirst inconsiderable, there is great anxiety, and death is hastened by evacuations. If this disease comes on with an old habitual cough, or by flow degrees, the inflammatory stage will hardly be perceived. The urine is thin during the inflammatory flage, but in the purulent one it hath a light, ouzy, purulent fediment.

If on the third or fourth day after the first manifest at-

If on the third or fourth day after the fift manifelt at-tack, the breathing is much affected, the pulse is quick and weak, the face red, anxiety great, and the patient tosles himself about, the danger is great; but if it is only on the first or second day, the breathing not bad, the pulse though frequent, yet is strong and firm, and the voice not altered, some hope may be entertained of a recovery. The cough becoming stronger and less dry, is usually the first sign of amendment.

confift in a fpalm of the muscles of the glottis, threatening suffication. When this disease is fatal, it is so from a 1; asim sufficating, or from matter in the bronchiz, or

the mucus in the farynx.

In the inflammatory flate bleeding fhould be used as freely as the pulse will admit; the bowels should be kept lax; a blister must be applied to the throat or round the neck, as foon as bleeding and purging have been used; though if the case is very inflammatory an emollient cataplasm is to be preserred; steams from hot vinegar and water may be received into the throat with the breath. In the purulent state nothing yet attempted seems to have any good effect. Upon the first attack of the disease, vomiting immediately after bleeding, feems to be of confi-derable use; fometimes fuddenly removing the difeafe. Antispasmodics do not evidently appear to be useful. See Cullen's First Lines, edit. 4. vol. i. p. 292. An Enquiry into the Nature, &c. of the Croup, by F. Home, M. D. London Med. Journal, vol. i. p. 217, 226. Edinb. Med.

Commentaries, vol. v. p. 6, 7.

SUFFUSIO. See CATARACTA. It is also fynonymous with pleudoblepfis.

SUFFUSIO AURIGINOSA. A JAUNDICE.

SUGILLATIO, from fugo, to fuck. It is an inflammation in a part. Thus a blood-shot eye is a fugillation in the eye. It is used as fynonymous with ecchymnomator and melyling, words derived from except. or ecchymolis, and melasma, words derived from ergons, to pour out, but by the word sugillation different cause is expressed; an ecchymolis is caused by extravaslation; singillation by suction; as when cupping glasses are applied to a part, which, by removing the pressure of the air, occasion the blood to rush in and different the vessels; even into fuch as do not ufually receive red blood.

Taking the word fugillation in the fame fense with ecchymolis, this diforder, when feated in the eye, takes the name of blood-shot; when the skin is its feat, if the colour is livid, forme writers term it pelioma; and if black, they call it melasma. Mr. Bell, in the first volume of his Surgery, fays, that in blood-letting, it often happens that a fmall tumor is raifed immediately above the orifice in the vein, by the blood infinuating itself into the cellular membrane of the neighbouring parts. Such a tumor (he adds) when round and fmall, is termed a thrembus; and adds) when found and imail, is termed a toremous; and when more diffused, an ecchymosis. Linnæus names it sugillatis. Dr. Cullen defines it to be a diffused tumor, a little elevated, and growing darker coloured. The causes are pressure; bruises; blood-letting, either from the orifice in the skin sliding over that in the vein, or from cutting the vein through. These livid and black spots cutting the vein through. These livid and black spots are sometimes a symptom of the scurvy. The ecchymosis should be distinguished in its different

caufes; as when happening from blows, bleeding, or other external injuries, or from the feuryy, or other in-ternal caufes. It thould be also not mistaken for the spuri-

ous ancurifm.

In flight cases, compresses dipped in vinegar, applied frequently, is all that can be necessary for the cure. If it tends to suppurate, treat it as an abscess. If the quantity

tends to suppurate, treat it as an abscess. If the quantity of coagulated blood is considerable, discharge it by as many incisions as are required for that end; then treat it as an approaching mortification. See Ecchymosis. Bell's Surgery, vol. i. p. 93. vol. iii. p. 334. White's Surgery, p. 172. Heistee's Surgery. Van Swieten's Com. on Boerh. Aphor. sect. 324, and 1151.

SULPHUR. BRIMSTONE. It is a folid brittle concrete, of a yellowish colour, inclining a little to greenish, and is in some degree glossy. It consists of the vitriolic acid, and a small portion of phlogiston. Mr. Edwards, in his Elements of Fossilogy, describes it as a genus in the class of instammables, which in close vessels sublimes in the form of striae; in the open air is decompounded by heat into penetrating, acrid, and suffocating sumes; and when deslagrated with nitre, leaves vitriolated tartar. It is sometimes found native in the earth in pure, bright fometimes found native in the earth in pure, bright yellow, femitransparent masses; but more commonly in opake ones, of a greenish, greyish, or other colours, in-termixed with various earthy or stony matters. The im-pure forts are called fulphur vivum. The native sulphurs are met with chiefly about volcanos in Italy, also in some of the German, Hungarian, and Swedith mines. The largest quantities that are brought into England are from Saxony, from whence we receive it in irregular maffes,

which are afterwards melted and cast into rolls, being first which are afterwards melted and calt into rolls, being first mixed with coarse resin, flour, and such like, whence its pale colour; for before it is thus mixed its colour is deeper. There are sulphurs of a red colour, but they contain a portion of arienic. Sulphur is an ingredient in most kinds of ores. The mineral from which the greatest quantity is extracted is the yellow pyrites, plenty of which is sound in Saxony, where the sulphur is separated by means of heat, and is received in vessels placed for it to run into as it melts. run into as it melts.

This fulphur is purified by fubliming it, and then it is called the flowers of fulphur; this operation is performed by perfons who fublime large quantities in a way of trade, and the fulphur thus fublimed becomes an article in medi-

The flowers of fulphur are used against cutaneous eruptions, particularly the itch; and from its usefulness in some diforders of the lungs, it hath been called anima pulmonum. Pure sulphur loosens the belly, in doses of from 3 ss. to 3 i. and from its gentle action on the great guts, is useful when the piles are troublesome; it promotes perspiration; it passes readily through the whole habit, and transpires through the kin: in coughs, catarrhs, and atthroas, it is found useful, particularly in tarrhs, and afthmas, it is found useful, particularly in feorbutic habits.

Sulphur is an active medicine, it restrains the activity

Sulphur is an active medicine, it restrains the activity of some other very powerful ones; mixed with quicksliver, the regulus of antimony, or with arsenic, they become inert. Various are the preparations of fulphur; but, for internal use, none excels, nor even equals, the flowers, which may be easily contrived for taking, without any disgust to the palate: among other modes, the troches, as directed in the Dispensatory of the London College, is an elegant one, are thus made. Take of slowers of sulphur, two ounces; clarified sugar, four ounces; rub them together, and by the mucilage of quince-seed added gradually, let them be formed into troches. Ph. Lond. 1788.

ally, let them be formed into troches. Ph. Lond. 1788.

From fulphur the chemifts obtain the greatest part of the vitriolic acid which they use. The operation is faid to be performed in leaden vessels, sometimes twenty feet high, and ten broad, with an eighth part of nitre to supply the absence of the external air, and some water to condenfe the fteams; it is concentrated and confiderably purified by evaporation; it is then colourlefs without finell, extremely corrofive, very fixed, and most ponderous of all unmetallic fluids. Its specific gravity in its true state is to that of distilled water, as 1.850 to 1.000. It is powerfully attractive of water from the air, and in maining with water produces a great degree of heat. It It is powerfully attractive of water from the air, and in uniting with water produces a great degree of heat. It possesses the general properties of acids in an eminent degree. On account of its sluidity it is not used as a corrosive; blended with unctuous matter in the proportion of one to eight, it is applied in the itch, and other chronic cruptions; and likewise as a rubefacient in local palfy, and themselfer. Diluted with paper it themselfer. and rheumatism. Diluted with water, it shews confider able action on the human calculus out of the body; and therefore has been proposed internally in that disease, particularly were lithotomy was improper. As checking particularly were lithotomy was improper. As checking fermentation, as well as being allringent, and tonic, it is much used in morbid acidity, relaxation, and weakness of the stomach. Its effects are propagated over the system; and hence its established use, in passive hamorrhages, gleets, and severs of the typhous kind. It is also used internally in itch, and other chronic eruptions; and when given to nurses, having the itch, it is said both to cure themselves and their children. As combined with ardent spirits with different metallic substances, &c. it enters several articles to be found in different phamacoenters several articles to be found in different phamacophaias. SUPERCILIARES MUSCULI. They are flefly fasciculi. They arise from the synarthrous of the offa nasi with the os frontis, and thence run along the direction of the eye-brows, and are loft in the middle of them. They deprets the eye-brows, and contract the fkin over

SUPERFOLILIUM VENERIS. See MILLEFOLIUM.
SUPERFOLITATIO. SUPERFOLITATION is afferted. and denied by different physicians. In the the Lond. Med.

Journal, vol. iii. p. 425, &c. are the following accounts. Haller, in his Opulcula Pathologica, mentions a lady who died, and was found to have two uteri, each of an oval shape, and furnished each with its own peculiar vagina. Hence he observes, that a woman so formed might be liable to one conception upon the back of another. Similar remarks are made by Dr. Purcell, in his account

of a double uterus, published in the Philosoph. Transact.

vol. lxiv.

A cafe of *Juperfactation* lately occurred to Dr. Lobstein, professor of anatomy and furgery, at Strasburgh, in a woman who was delivered of two children, one a month after the other; he has been able to convince himfelf, that this circumstance is owing to her having two
uteri, each of which has a distinct vagima.
SUPERSCAPULARIS INFERIOR, i. e. Infra spi-

natus. See INFRASCAPULARIS.

SUPRASCAPULARIS SUPERIOR. See SUPRA SPINA-

SUPINATOR RADII BREVIS, five MINOR SU-PINATOR, because it makes the hand supine, i. e. when the palm is upwards. It rifes from the outer condyle of the os humeri, goes over the capfular ligament, lies under the longus, and is inferted into the internal ante-rior part of the tubercle of the radius.

SUPINATOR RADII LONGUS, five MAJOR. It rifes fleshy from the outer edge of the os humeri, twifts round it, goes down the fore-arm all along the radius, covering the artery, and becoming tendinous, where we generally feel the pulse, it is inserted into the anterior internal part of

SUPPLETA ISCHURIA. A SUPPRESSION of URINE, from excefs of other evacuations, which require

this defect to supply their loss. See Ischuria.

SUPPOSITORIUM, from fuppons, to lay under. A supposition. The Greeks call them profleta. They are convenient for promoting stools when elysters cannot be administered. The most gentle are made of common falt and honey, which may be boiled to the consistence of a soft pill, and then rolled to the thickness of a goose quill, and an inch or little more in length; these are introduced into the rectum where they remain until they troduced into the rectum where they remain until they are discharged by the effect they produce: aloes, colo-cynth, and other ingredients, may be added, according to

cynth, and other ingredients, may be added, according to the intention of the preferiber.

SUPPRESSIO MENSIUM. See AMENORRHÆA. SUPPRESSORII. Difeases arising from or attended with an oppression of the organs and impeded excretions.

SUPPURANTIA. SUPPURATIVES. There is no universal supparative. As a proper external application, to promote suppuration when there is a considerable heat, a possition of catments, or of bread, with milk, may be appreciated the suppuration of catments. a poultice of oatmeal, or of bread, with milk, may be ap-plied: when the heat of the part is defective and the tem-perament habitually cold, add galbanum, onions, and fuch like materials, to the common bread-poultice. SUPPURATIO. See Abscessus.

SUPPURATORIA. SUPPURATORY FEVER, or

FEVER OF SUPPURATION.

I between the upper edge of the scapula, and the spine thereof, runs under the acromion, and extensors of, the scapula, goes across the capsular ligament, and is inferted into the inner tubercle, near the head of the humerus. It is called also fuper feapularis fuperior and fupra scapularis.

SURA. A name for the sibula; for the gastrocnenii muscles; also a fort of wine.

SURALIS ARTERIA, i. e. Tibialis posterior ar-

teria. See Tibialis.
Suralis vena. It is a branch from the beginning

of the tibialis posterior.

SURDITAS. DEAFNESS. The causes are, the loss of the external ear, wax or other matter lodged in the external ear, a rupture or a relaxation of the membrane of the drum of the ear, a palfy, or a preffure on the auditory nerve, violent noife, obstruction of the Eustachian tube, cold, inflammation, abfects, the lues venerea, &c. The most frequent of these causes is hardened wax in the meatus auditorius, which may be foftened and removed by frequent injections of warm water. See DYSECOEA.

In case of a relaxation of the membrana tympani, a little warm brandy, or spirit of resemary, may be dropped

iato the ear now and then.

If the Euftachian tube is obstructed, relief is sometimes obtained by chewing a cruft every morning and evening. Sometimes fternutatories have relieved when the caule

hath not been known.

When a defluxion of humours are the cause, an injection may be made as follows and used night and morning: R Ceruf. acetat. gut. xxv. fp. vin. C. gut. I. aq. puriff.

15 fs. m.

In the Edinb. Med. Comment. vol. iii. p. 80. is the following case of deafness from bathing. A healthy young man, bathing in the sea, on plunging over head, instantly became perfectly deaf. He complained of a violent pain in his head, of a hiffing noise in his ears, and looked frightened. After various trials to relieve him, but without fuccess, at last it occurred to me to try what mercury would do, and on being put on a mercurial courfe, in about a week, he told me that he had heard fome drums beating, which lie never could do, fince the day he was in the water. Upon speaking to him very loud, he heard me for the first time, since his admission into the heard me for the first time, fince his admission to the heard me for the first time. into the hospital. His mouth was not affected with the mercury until his beginning to hear. The mercurial course, therefore, was continued some time longer. A gentle falivation supervening, his hearing was gradually restored. Bell's Surgery, vol. iv. p. 343, 362. Memoirs of the Medical Society of London, vol. i. p. 94.

founds that are not. See PARACUSIS.

SUTURA. A SUTURE. In ANATOMY it is the particular articulation of the bones which is feen in the head. These futures are divided into common and pro-per. The common are those which join the bones of the cranium with those of the face. The proper are those which connect the bones of the cranium, and are the co-ronal, the faggittal, the lambdoidal, and the two fquamous.

In SURGERY it is the uniting of the lips of a wound

by fewing, and these are of five kinds.

1. The dry future. It is made by two pieces of sticking platter, each the length of the wound, to which very narrow tapes are fixed at due distances. Apply one near one edge of the wound, and the other near the opposite edge, then gently draw the two sides of the wound together, and let the tapes be fied; they should correspond exactly; and the knots must be slip knots. Or, take a

flip of plaster, the length of the wound, and cut longitudinal holes in it; then apply one fide near the edge of the wound, bring the lips close, and then apply the other-After this kind of future is applied, the uniting bandage is convenient to support it.

2. The twifted future. It is also called the circumvo-luted future. This is used for the hare-lip, and in a few other inflances. It is performed by introducing two or more pins through the whole fubflance of the lips of the wound, then twifting a waxed thread about them in the

form of the figure 8.

3. The interrupted future, also called the knotted future. It is performed with any needle armed with a waxed thread, by thrusting it through both lips of the wound, then tying the thread in flip knots, making a number of flitches according to the length of the wound, at an inch from each other. The needle should go to nearly the bottom of the wound. Mr. Justamond advises a particular regard to the direction of the longitudinal fibres of muscles in forming this suture, and not so much to regard the direction of the wound; for, if we do not pals the ligature in the direction of the fibres, it will be a continual ftimulus, it will excite the muscle to action, and occasion a perpetual tugging of the ligature, whence pain, inflammation, &c. will follow. Mr. Bell, in the first volume of his Surgery, advises, in forming this future, to carry the needle and ligature to the bottom of the wound, so as to afford but little chance of matter collecting underneath; and, further, he directs both ends of the thread to be paffed from within outwards; which is readily done by using two needles upon each thread instead of one. A needle being put upon each end of the fame thread, and each needle being inferted at the bottom of the fore, and pushed out-wardly, so as to pass out at a proper distance from the edge of the wound, the needles are then to be taken off, and the threads allowed to remain till all the ligatures are passed, which the extent of the sore seems to require. In passing the ligatures, pierce the skin from near half an inch to near an inch from the lips of the wound; these distances will include all the varieties in the fize of wounds. As foon as the threads are all passed, the lips of the wound ought to be preffed together and supported by an affiftant till all the ligatures are firmly tied.

4. The quilled future, fo called because the knots were tied upon quills, which were laid over the dreffings that

immediately covered the lips of the wound.

5. The glover's, or uninterrupted future, called also the spiral or the continued. It was used in wounds of the intestines and stomach. See Heister's Surgery. Le Dran's and Sharp's Operations. Bell's Surgery, vol. i. p. 1—22. White's Surgery, p. 100.

SYCOMORUS. See Figur ÆGYPTIAGA.

SYCOSIS, from own, a fig. It is a tumor on the anus, which only differs in the fize from the thymus-The Latins call it marifea. Sycofis is also the name of an The Latins call it martica. Sycolis is also the name of an ulcer mentioned in Celfus, lib. vi. c. 3, also in Vogel's Nosology, which is sungous. See also Trachoma. SYMBOLOGICE. That part of pathology which treats of the signs and symptoms of diseases. SYMPASMATA. CATAPASMA; ASPERSIO. SYMPATHETICI NERVI MAJORES. See In-

TERCOSTALES NERVI.

SYMPATHETICI MEDII. See PAR VAGUM.

- MINORES. So the auditory nerves are named.

Some of which are called portio dura.

SYMPATHIA, from our, together, and makes, fuffering. SYMPATHY. Our bodies are, by means of the brain, not only endowed with feeling and a power of mo-tion, but also a remarkable fympathy, which is either ge-neral or particular. That every part of the body hath a fympathy with the whole, is evident from cold water being thrown on any part of us that is warm; this produces a fudden contraction of all the veffels and pores, and thus fometimes puts a stop to small hæmorrhages. The effluvia of things smelled to often communicate new vigour to the whole body. The particular sympathy is manifelt by various instances of diseases complained of in one part when the cause is in a very remote one; for instance, pain in the head occasions sickness in the stomach, and so does pain in the uterus, &c. A sudden bright light entering the eye occasions sneezing. Some particular founds affecting the ears set the teeth on edge. The smell of grateful food makes the saliva flow into the mouth, &c. &c. &c. of things fmelled to often communicate new vigour to the

All fympathy supposes feeling, and therefore must be owing to the brain, which is the only means of fentation. This further appears because the changes in the body, occasioned by the *sympathy* of the parts, are stopped by whatever affects the nervous fystem to strongly as to overcome the fenfations that produced the sympathetic ef-

Though all fympathy is owing to the brain, it is not easy to account fatisfactorily for all the various instances of fympathy in particular cases; for many of them may depend on fuch a state of the brain and other parts as do

not become the object of our fenfes.

A diligent attention to this fubject, whatever difficulties attend it, is followed with confiderable advantage by enabling us to account for many fymptoms of difeafes, and also to proceed so certainly to the cure as by any other known method we could not have arrived at. See the

authors on irritability and fentibility.

SYMPHYSIS, from sur, with or together, and sur, to grow. In Anatomy it is a kind of articulation, which is divided into four species. 1. Synchondrosis. 2. Synneurosis. 3. Syssarcosis. And, 4. The symphysis of offssication, to which epiphysis belongs. See ARTICU-

LATIO.

In SURGERY it is a coalescence of the natural passages, as the anus, vagina, nostrils, &c. It also expresses the first intention of cure when there is a wound, which is to bring together the separated parts, and keep them to-

SYMPHYTUM, from συμφων, to conglutinate. It is a name for most species of comfrey (see Consolida and Perlion), for several of the pulmonaria, for the yellow alkanet, a species of bugle, a species of faxifrage,

and of fome other plants.

Symphytum Minimum. See Bellis Minor.

— Petraum. Heath-pine. It is a plant which is ranked among the aftringent and conglutinant medicines, and may be of fervice in diarrhœas, and dyfenteries, as its root gives out a large proportion of mild mucilaginous juice, more almost than any other root, (fee Cullen's Mat. Med.) but is not in use; it is also a name for the prunella, brunella, fanicula, virga aurea, coris haffopus vulg. and feveral other plants; for that called medium, fee BUOULA.

SYMPTOMA, for our our news to bappen together. A

SYMPTOM. Galen defines it to be a preternatural affec-tion which depends upon a difease, or follows it. Thus, symptoms are difeases produced by an original principal diteate: but fymptems are formetimes the effect of symptems also. A symptem may be a symptem and a diforder at the same time; as when a symptematic sever is produced by a phlegmon. Casus has also the same signifi-

A knowledge of the origin and cause of symptoms conduces to confirm the prognofis, and to the certain removal of the difeafe.

SYNANCHE. A QUINSEY. See CYNANCHE. SYNANCHICA. See RUBRA SYNANCHICA.

SYNARTHROSIS, from en, with, and appear, a joint. It is that species of articulation in which there is no motion, and it is of three kinds; the future, the harmonia,

and the gomphosis.

SYNCHONDROSIS, from our, with, and xorder, a cartilage. It is that species of symphysis in which the bones are connected by a cartilage, and is either moveable or immoveable; the first is instanced in the vertebrae of the neck, back, and loins; the fecond in the os pubis, the two fides of which are ordinarily immoveable. See ARTICULATIO.

SYNCHONDROTOMY. So Dr. Siebold names the

fection of the fymphysis of the os pubis.

SYNCHYSIS, from ouryou, to confound. A difease of the eye, confifting in a confusion of the humours, generally proceeding from a violent blow; sometimes from an inflammation of the uvea, occasioning a rupture of the vessels, and an eruption of the humours. Castel-

It is also when from the violence of an ophthalmia, the transparent cornea is left opaque or corroded, and there is the appearance of confusion in humours of the eye. In Cullen's Nosology it is a variety of his species caligo pupillæ. Kirkland, in his Inquiry, vol. i. p. 473. defines it as being a confusion of the humours of the eye

from a violent inflammation, the chemolis, leaving the [ cornea epaque, or corroded.

SYNCOMMISTON. See COLYPHIUM.

SYNCOPE, from συνωπτω, to cut down, also diffolu-tio, examinatio. See LIPOTYHMIA. SYNCRIMATA SYNCRISEIS. See METASYN-

SYNDERMO-PHARYNGÆUS. See PHARYNX.

SYNDESMOSIS, from gw, with, and Jugues, a chain. See SYNNEUROSIS.

SYNDROME. Concurfus, from oungeres, concurro. This word was introduced by the feet of empiric physicians, to express a concourse, or congeries of symptoms, for instance the concourse of symptoms consequent when difeases arising from plethora, is called a PLETHORIC SYNDROME. So may there be a cacochymic fyndrome, and indeed may be applied lefs generally, as a choloric, phlegmatic, pleuritic, epileptic, findrome, &cc.

SYNECHES. Various are the uses of this word as ap-

plied to fevers. The Greeks use it to fignify the remitting fevers in general. Some later writers have collected under this word, those inftances of remittent fevers that are obscurely described, of whose mode of relief we have no fatisfactory account. Dr. Cullen places it amongst the

tertian intermittents.

SYNEUROSIS. That species of symphysis in which the bones are connected by ligaments, as in all the joints that are deligned for motion. See ARTICULATIO.

SYNIZESIS. Blindness from an obstruction of the pupil of the eye, or from a contraction and coalition of it. It is the fame as the caligo pupillar of Dr. Cullen.

For the cure, fee IRIS.

SYNOCHA. The ARDENT OF INFLAMMATORY FEVER. See FEBRIS, and INFLAMMATORIA FEBRIS. The fynocha, or fever with inflammatory irritation, Dr. Cullen places as a genus in the class fyrexiae, and order

SYNOCHUS. A CONTINUAL FEVER, whether of the ardent or putrid kind, called anabatica and acmaffica, likewife a fever compounded of fynocha, and of typhus, also called putrid, and malignant fever. Dr. Cullen places this genus of difease in the class pyform of the class pyform. rexise, and order febris. In the beginning it is usually of the ardent kind, or fynecha, but foon degenerates into the typhus, and so until it becomes what is called the putified fever, which see, called by Vogel phrenitis. Sometimes it is used for synocha.

SYNOCHUS PLEURITICA. Instances of Synocha.

-- RHEUMATISANS. J SYNOSTEOGRAPHIA. SYNOSTEOGRAPHY. It treats of a bone, its parts, articulations, the nails, and the number and uses of the bones.

SYNOVIA. It is a gluey transparent fluid, which readily mixes with water, and partly jellies when exposed to cold. It is secerned from certain glands in the joints, to preserve their motions easy and free. The spaceta is not found to coagulate in any part of a joint, however long the bone may have been displaced. When there is a deficency of fynevia, there is a crackling of the joint, if the perfon moves much.

SINOVIÆ GLANDULÆ. SYNOVIAL GLANDS. They are fmall conglomerate glands, feated in the outer lamellæ of the capiular ligaments of the joints, and fo as

to be more or lefs prefied, according to the degree of motion. They are also called HAVER'S GLANDS, because first discovered by him. See GENU.

SYPHILIS. See LUES VENEREA.

SYRIGMUS. It is that species of depraved hearSYRINGMOS. In g called paracuss imaginaria. Sec PARACUSIS.

SYRINGA. See LILAC.

SYRUPUS, from the Chaldean word firpi, or the Arabic word firab, a potion. A SYRUP. It is also called julapium. The Arabians first invented this form of medicines. free Arabians first invented this form of medicines. A fyrup is a watery or other liquor, so boiled with fugar, that if a drop is let fall upon a marble it will not spread. If the quantity of sugar is not sufficient, the sprup will soon ferment, and if it exceeds what is needful, the overplus will separate and be formed into crystals. Acids the little of the sufficient thould have a proper quantity of fugar added to them, to make a forup with a fimmering heat, for boiling deftroys the acid in fome measure; this is also be observed when the liquor is flavoured, as that of violets, and fuch as have a fine colour. Syrups are now but little used, and indeed the fyr. alb. may answer every valuable intention of all others, except the fyr. papav. albi, and fpinæ cervinæ. Bruno fays that the Greeks knew not that form of medicine. This term is generally given to the particular

of medicine. This term is generally given to the particular fubstance of which it is made, and may be found under each specific name, as syrupus earyophillorum. See Carrophillorum. See C of new flesh: it also expresses the intention of cure, which

confifts in promoting digeftion and regeneration of the loft fubfiance. See ARTICULATIO.

SYSTOLE, from oursand, to contract. A contraction, or constriction. It is the motion of the heast and arteries by contraction, which is alternate, and contrary to the diaffole. See Kirkland's Med. Surgery, vol. i. p. 306.

TABELLA. A LOZENGE.

TABERDILLO. See PETECHIA.

TABES, from tabesco, to consume, or pine away. It is often taken for an ulcer in the lungs: fometimes used

as fynonymous with atrophia.

Dr. Cullen places the tabes as a genus of difease in the class eachexize, and order marcores. He defines it to be a wasting with extreme debility and heetic fever. He distinguishes three species. 1. Tabes purulenta; from an ulcer either external or internal. 2. Tabes scrophulosa; when it happens in feorphulous habits. 3. Tabes venerata; when it happens from taking fome kind of poifon.

TABES COXARIA, vel PHTEISIS ISCIADICA. A wasting of the thigh and leg from an abfects, or other cause in the him.

cause in the hip.

- Dorsalis, named also lerdosis; lumbage. It is a fymptom of a gleet, and being a principal fymptom it gives name to that diforder. Dr. Cullen ranks it a variety of the atrophia inanitorum. Hippocrates calls it tabes offis facri. What the ancients supposed to be a wasting of the marrow in the back was nothing more than a gonorrhoea simplex, without any virulency in the running, and the pain that this occasioned, mostly affecting the loins; they therefore judged the marrow to be walting. At prefent, by the name of tabes dorfalis is underflood a walting of the body, attended at first with pain in the back and loins, and afterwards also in the neck and head,

caused by a too early or a too frequent use of venery.

Hippocrates describes the tabes describes as follows: "It arises from a disorder in the spinal marrow, and it is principally incident to perfons of a falacious disposition, or such as are newly married. The patient is free from fever, eats and digefts well; when he is asked with refpect to his flate, he fays he perceives as it were ants fall-ing from the fuperior parts of his body, his head for in-flance, into the fpine of his back, and when he difcharges his urine or excrements, there is at the fame time a copi-ous evacuation of liquid femen, in confequence of which the is incapable of propagating his species, or answering the purposes of marriage. He is generally short-breathed and weak, especially after exercise. He perceives a sense of weight in his head, and is affected with a ringing in his ears. The patient is in process of time seized with various species of violent fevers, and at last dies of that kind of sever called lipyria." The seminal matter which Hippocrates mentions as discharged with the urine and stools, is mucus, not semen. Besides the symptoms already mentioned, the memory fails, and the spirits are greatly dejected, the fight fails, or an incurable gutta ferena comes on.

## TÆD

In order to a cure, particular care is required with re-fpect to the non-naturals. The air should be pure and cool; the diet light, moderately cordial, very nourifhing, and frequently supplied in small quantities; sleep should be early fought in the evening, and exercise in a carriage or on horseback may be used. And amongst the different tribes of medicines, cordials, moderately aftringent, and fuch as increase the heat of the body; the bark, fteel, dilute vitriolic acid, &c. according as there is more or less of a severish heat; bitters also and cold bathing have their use towards the end of the cure.

TACAMAHACA. It is a refin obtained from a tree which refembles a poplar-tree. The fagara oftandra, Linn. It is a native of the temperate parts of America, and under shelter it bears the cold of our climate. The hell refin is collected in courted shells, it is unfitteness. best refin is collected in gourd-shells; it is unctuous, fortish, of a pale yellow or green colour, of a bitterish aromatic taste, and a fragrant smell; but this is seldom met with. The sort which is commonly met with is in transparent globes, of a white, yellow, brown, or green colour, and less grateful than the foregoing. The first is said to exude from the fruit of the tree, the latter from incisions in the trunk. It is chiefly used in funigations and plasters, to warm, irritate, and gently blister. It and plasters, to warm, irritate, and gently blifter. It dissolves in rectified spirit of wine, and gives to water its smell and taste. The Indians use it for ripening of tumors. See Lewis's Mat. Med. Neumann's Chem. Works.

TACHE BLANCH. See ALBUGO OCULORUM.

TACHE BLANCH. See ALBUGO OCULORUM.

TACTUS. The TOUCH. Hippocrates uses in this sense the word aphassimmens; in order to discover any diseases of the pudenda; but the sense of teneb is, in the proper acceptation of the word, that change arising in the mind from external bodies applied to the skin, but more especially at the ends of the singers; for by the singers we more accurately distinguish the tangible qualities of things than by other parts of our body. See Haller's Physilogy, lect. xiv.

ler's Phyfilogy, lect. xiv.

TADORNA. See VULPANSER.

TÆDA. DAS a DAIS. Castelli says this is an equivocal term, and in BOTANY means a species of pine; afterwards, a pharmaceutic fignification, and means a certain paste prepared for fumigations, or some composition to be used as a pessary to support the uterus. The term is also made use of by some authors to express certain compofitions, made up in the form of torches; and also torches

that infest the human body, this is the most troublesome and dangerous. The roots of the male and female ferns have long been famed for their efficacy in destroying and expelling this species of werms. The dose of these roots in powder is to half an ounce, to be taken in honey and water, or mead; and if it is accompanied with fcammony enough to purge, its efficacy will be greater. The French phylicians order over-night a glyfter of milk and honey, phylicians order over-ingula a grynter of mink and noney, and a quantity of panada for supper; in the morning the powdered fern-roots are given to detach the worm, of which the patient is faid to be sensible, by a cessation of the pain in the stomach, and by a weight that is selt in the lower belly. Two hours after this, the purgative is given to evacuate the loofened worm.

TAGETES. See AFRICANUS FLOS.

TAHOW. See CENANTHE CHÆROPHYLLI, &c.

TALPA, and TALPARIA. A tumor on the head, of the atheromatous kind, is thus named. The tumors on the face, &c. called tofludo moles, are also thus named, and are a species of wen. See Nævus; Topinaria.

TALUKGHAGHA. See Essula Indica.

TALUS. See Astragalus. The annue Bone. TAMALAPATRUM, Indian Leaves. See Fo-LIUM, and MALABATHRUM.

TAMARINDUS, also called tamarara recla, explora-nicon, balampulli. TAMARIND. Tamarindus Indica, Linn. The tamarind tree. Tamar bendi are Arabian words for Indian fruit. Some call the tamarind tree by the name of Indian dates, and others Indian acacia: but the tree is of the palm kind, and formewhat refembles an ash tree. It grows in Arabia and both the Indies. The fruit is a pod like that of a bean, including several hard feeds, together with a dark-coloured viscid pulp. The East India tamarinds are longer than those of the West, and darker coloured; the former contain fix or feven

feeds in each, the latter only three or four.

The pulp with the feeds are brought into England, without the shell or pod; the oriental have most pulp, the occidental have much fugar mixed with them.

The pulp is an agreeable cooling laxative acid; it was first introduced into practice by the Arabians: it is useful in inflammatory and putrid severs; it abates thirst and heat, and corrects putrefaction. As a laxative the dose is two or three drams. If the pulp of tamarinds is mixed with the laxative fweets, fuch as cassia and manna, it increases their action, and prevents in a degree the slatulence which they occasion. See Tournesort's, Lewis's, and Cullen's Mat. Med.

TAMARISCUS, also called tamarice, myrica, tamarice. TAMARISE. The tamarix Gallica, Linn. It is plentiful in France and Germany. The leaves and bark

of this tree are aftringent, but they are not noticed in the present practice. See Raii Hist.

TAMNUS. See BRIONIA NIGRA.

TANACETUM, also called tanasia, athanasia, Parthenium mas. Common TANSY. Tanacetum vulgare, or tanacetum foliis bipinnatis serratis incisis, floribus lugical. It is a plant with large leaves, divided to the teis, Linn. It is a plant with large leaves, divided to the rib on both fides into deeply indented fegments; on the tops of the stalks are many gold-coloured discous flowers, in umbel-like clusters; the feeds are small and blackish. It is perennial, grows wild by road fides, and about the borders of fields; it flowers in June, July, and August. The leaves and flowers have a strong, not difagreeable smell, and a bitter aromatic taste; the flowers are stronger, though rather less unpleasant than the leaves. The curled leaved and the striped leaved forts, are but varieties of this species. They give out their virtue both to water and to spirit, most perfectly to the latter. Distilled with most perfectly to the latter. ter. Diffilled with water, they yield a greenish, yellow, effential oil, which smells strongly of the herb; the remaining decoction affords a strong, bitter, subfaline ex-tract. The spirituous tincture gives over part of the oil in infpillation, a part remaining with the extract.

This plant is a warm deobstruent bitter, useful in ca-

chectic diforders, and weakness of the stomach; it ex-pels worms from the intestines, for which the feeds are generally used. Many other virtues are attributed to tanfy, such as its curing some colies; and the gout, in which last case, some have said they have been relieved by its

made by cutting mountain pine in proper lengths for that purpose. See also Candela Fumalis and Pinus. it is not much employed in general practice. See Lewis's TANIA. FLAT or TAPE WORMS. Of all the worms and Cullen's Mat. Med.

TANACETUM: It is also a name for a species of milefolium, and of fome other herbs. For that called -

TARACHON. See DRACO.

TARANTISMUS: A DESIRE of DANCING: The diforder faid to be produced by the bite of a tarantula, but this is impolition. Some express by it a kind of St. Vitus's dance

TARANTULA. A species of spider met with in Apulia. Its bite is faid to produce a species of madness, which is cured by music, but not by any other means; but Dr. Cirillo declares, that he never could TARANTULA. make the tarantula bite him, nor any other person, though he often had tried to provoke it. So that this affair seems to be only a fraud practised to obtain

TARAXACON, or TARAXACUM; also called caput monachi. Dandelion. Leontodon taraxacum, Linn. See Dens Leonis.

TARAXIS, from respaces, to diffurb. A diforder of the eye, such as when it is offended by smoak, or too hard rubbing. It is when the eye is offended by attrition, fmoke, duft, or other flight caufe. Galen, in 6 Epid. com. 5. fays, it is a morbid difposition of the eye, preceding an inflammation, and the beginning of an inflammation. Paulus, lib. iii. cap. 22. defines it to be heat and humidity of the eye, attended with a preternatural rednefs, proceeding, not from the body, but fome exter-nal caufe, as the fun, fmoak, duft, and wind; whence the diforder is very speedily remedied, by removing the caufe. Hoffman, in his Practice of Medicine, says, the flighter ophthalmia, occasioned by dust, exposure to cold, air, fun, or other flight external causes, are inflammations of the tunica aduata only, and attended with little danger. the tunica aduata only, and attended with little danger. Perhaps the following, noticed by Mr. Ware, in his Remarks on the Ophthalmy, &c. may be included under this name. He fays, it frequently comes on in the most sudden and unexpected manner, without any preceding or concomitant illness. When it happens in this way, the common people call it a blass in the eyes: and it feems to proceed from some peculiar property in the air which surrounds us: like other epidemic diseases, it often which furrounds us: like other epidemic difeafes, it often affects the whole neighbourhood at the fame time; as was the case during the summer 1778, at Newbury, in Berkthire, and in leveral of the camps, where it was known by the name of the ocular difease. In Dr. Cullen's arrangement of the species and varieties of the ophthalmia, he places this as the least violent, and calls it ophthalmia taraxis. See OPHTHALMIA. This kind of inflamma-

taraxis. See OPHTHALMIA. This kind of inflammation gives way to the gentleft remedies used against inflammations of the eyes.

TARCHON vel TARACHON. The herb TARRAGON, DRACO, also a name of ptarmica.

TAROLI. See CRYSTALLINÆ.

TARSUS, from ταρσος. The CARTILAGINOUS EDGE
of the RYE-LIDS. The edge of each eye-lid is principally
formed by a thin cartilage, called tar fus, which is adapted to the shape and roundness of the eye. The lower
edge of the superior cartilage, and unner edge of the inedge of the superior cartilage, and upper edge of the inferior, meet with each other, and are termed the ciliary edges. These cartilages do not terminate in a line lik the tharp edge of a knife, but rather flat like the back of it; forming two edges, one external, the other inter-nal. When the eyes are flut, the external edges meet; but the internal are preserved at a small distance from each other, leaving a gutter, or groove, through which the tears are supposed to pass from the lachrymal gland to the puncta lachrymalia, while we are asseep. The cilia, or eye-lashes, arise out of the external edge of the termination of this cartilage; and on the internal, at an evident distance from them, is a line of fmall orifices, which are the excretory ducts of small glands that lie in the inner furface of the tarfus, and are called glandulæ ciliares. Also the space between the bones of the leg and the metatarfus. It confifts of feven bones; viz. the aftragalus, calcaneum, naviculare, cubiforme, and the three

TARTARUM, also called ARGOL, TARTAR, WINE-

atone. It is an effential acid concrete falt of grapes, thrown off from wines, after complete fermentation, to the fides and bottoms of the cafks; it is of a red or a white colour, and more or lefs droffy, according to the quality of the wine. Dr. Cullen fays, it confifts of a great part of the vegetable fixed alkali, superfaturated with a quantity of acid, which, though in the main of the nature of vegetable acid, has however fomething peculiar, which is not well afcertained. The white is usually most pure, but in all other respects they are the same. Chuse such as is clean, somewhat transparent, and hath its outside covered with small shining crystals. The Rhemish white wine tartar is the most pure. Its virtues as a medicine are those of a cooling laxative; in doses from 3 i. to 3 iii. it is aperient; from 3 fs. to 3 i. it moderately purges.

If tartar is diffolved in water, it effervesees with fixed alkaline salts, and saturates of the vegetable alkalies near one third of its own weight; the neutral salt formed by this union is more purgative than the tartar itself, as is instanced in the soluble tartar, now called kali tartarisatum, of the London College, for which they order the sollowing process: Take of kali, one pound; crystals of tartar, three pounds; distilled water, boiling, three gallons. To the salt, dissolved in water, throw in gradually the crystals of tartar, powdered. Filtre the liquor when cold through paper; and after due evaporation select a part to crystalize. Pharm. Lond. 1788. The soluble tartar might as well be made with the common white tartar, as its impurities are sufficiently removed by the necessary siltration. To secure the neutralization of the salt, the tartar may be made to prevail at the sirst, and the liquor suffered to cool a little before filtration, that the redundant tartar may concrete and separate from it. The tartar dissolves dissolved in water, and when dissolved therein, it soon concretes again on being removed from the fire, and what the alkali hath not taken up, will remain on the siltre; and, on the other hand, if too much alkali is used, it will remain uncrystalized. The soluble tartar is a mild, cooling aperient in doses from 3 i. to 3 i. it is laxative in doses of 3 ii. or iii. and purges if 3 i. is given; it promotes the operation of resnous purges, and prevents their griping. It has been particularly recommended as a purgative for maniacal and melancholic patients.

Tartar is very difficultly foluble in water: if it is dif-folved in twenty times its weight of boiling water, it continues diffolved long enough to be paffed through a ftrain-er, but when fet in the cool air, it foon begins to run together in the form of crystals on the side of the vessels; these when collected and dried are called crystals of tartar. If this folution of tartar is ftrained and boiled until a thick pellicle appears on the furface, and this pellicle be-ing fkimmed off, it is again boiled until another pellicle appears, and is fkimmed off, &c. until all the tartar is obtained, which is when all the water is confumed; then all these pellicles being mixed together, and dried in the sun, you have the crystals of tartar. But it is the best to have this preparation in the form of crystals, as the powder is so generally adulterated. These are laxative, and gently cathartic, and may be given from 3 j. to 3 ij. according to the constitution of the patients, or the effect wanted to be produced. They are a very ufeful antiphlogiftic; and in moderate dofes, in evacuating the intestines, and in producing all the effects of that, they have all the powers of the neutral falts. In large dofes, without any inflammatory ftimulus applied to the inteftines; they act like a purgative in exciting the action of the absorbents in every part of the system. Either in small or large doses, this medicine passes the urinary pas-sages, and sometimes promote the secretion of urine very copiously, but this more readily by being accompanied by a quantity of watery fluid; hence the most eligible mode of administering the crystals as in a liquid form. See Dr. Home's Clin. Exper. Neumann's Chem. Works. Lewis's and Cullen's Mat. Med.

TARTARUM EMETICUM. EMETIC TARTAR.

Now antimonium tatarifatum. It is also called flibiated

TARTARUM EMETICUM. EMETIC TARTAR. Now antimonium tatarifatum. It is also called flibiated tartar. It is made by boiling one pound and an half of crocus of antimony, powdered in two gallons of diffilled water, in which has been diffolved two pounds of crystals of tartar, in a glass vessel for about a quarter of an hour; then filtered through paper, and the strained liquor set by to chrystallize. Ph. Lond. 1788:

This tartarifed antimony also forms a medicated wine under the character of vinum antimonii tartarifati. See ANTIMONIUM. But a more certain preparation is obtained as follows:

Take of powdered mercurius vitæ, wash it with a little fixed alkali to separate the marine acid from it, then gradually throw it into a glass vessel, in which is a boiling solution of the cream of tartar, continue the boiling and the addition of the mercurius vitæ, until there is no longer any fermentation from the mixture; after this filter the liquor, and set it to cool, and crystals will soon be formed. These crystals are an emetic tartar that is certain in its operation, and equal in its strength. See Neumann's Chem. Works. Lewis's Mat. Med. Dict. of Chem.

Mr. Beaumé affirms from experiment, that the acid of tartar may be eafily faturated with the reguline part of antimony; and the glass of antimony is the most emetic and most soluble of all the antimosial preparations by fire, it should be preferred for making a neutral antimonial soluble tartar; yet reflecting on the nature of the glass of antimony, it is not always of the fame strength. It is made by fufing the grey calx of antimony calcined to an uncertain degree; and we know that if it be too little calcined, we shall obtain an opake matter that resembles the liver more than the glass; if it is too much calcined, it cannot be vitrified, nor even fufed, by the most intense heat: between the degree of calcination which is fufficient to give an opake fuled matter, and the degree in which it begins to be unfulible, there are many intermediate ones; all of which are fufficient to produce glaffes of antimony; but these glasses differ in the degree of transparency, in tensity of colour and fusibility, according as the calcination has been more or lefs complete. We cannot doubt that different glaffes of antimony must be more or less emetic, and that perhaps different quantities of these glasses are required for the perfect faturation of the acid of tartar; besides, we are both ignorant of the degree of calcination which renders the glass of antimony most emetic, and also of the method of obtaining it, if we knew it. Hence we are not certain that tartarifed antimony made with glass of antimony is equally and constantly emetic; therefore, instead of the glass of antimony, we recommend the pulvis algorothi for making the tartarifed antimony. Mr. Beaume further observes, that the pulvis algarothi hath the advantages of the glass of antimony, it being convertible into a neutral salt, by means of the acid of tartar, and is not subject, like the glass of antimony, to give the emetic tartar prepared with it an uncertain degree of ftrength; though of itself it is like the other calces, uncertain; but it is the best preparation of antimony from which to obtain a cer-tain and uniformly effectual medicine. The pulvis algarothi is not faline, and from the quantity of marine acid which it contains, it is fomewhat cauftic, but when it is washed with a little fixed alkali, all the acid is separated, and then it is totally foluble by cream of tartar, and it is thereby convertible into a foluble emetic tartar, perfectly neutral; and for which purpose prepare to use it as follows: mix an equal quantity of cream of tartar, and the powder of algaroth, or as much of the latter as is required to faturate the former; throw this mixture gradually into boiling water, and continue the boiling gently, till there is no effervescence, or till the cream of tartar is well faturated. Filter the liquor, and when this liquor is cool, fine cryftals will be formed in it, which are foluble tartar perfectly faturated with the algaroth's powder: as foon as the cryftals are formed, carefully dry them, and keep them in a well-closed glass vessel.

In preparing the antimony tartarifed, vessels, &c. of glass should be used, for iron, tin, lead, and copper decompose it, by attracting the acid more strongly than the antimony does; whence one cause of inequality in different parcels of this preparation, made at different times. The powder of algaroth is a calx of antimony constantly of the same degree of emetic strength; it is emetic because the regulus of antimony, first dissolved by marine acid, and afterwards separated from that acid, retains the quantity of phlogiston that is necessary to give an emetic quality to the calx of antimony; the quantity of phlogiston which it retains, and therefore its emetic power, must always be the same; for the marine acid of the corrosive sublimate, which afterwards becomes the butter of antimony, is always the same in quantity, and in

its degrees of concentration, and of activity; confequently the calx of antimony separated from it must always contain an equal quantity of phlogiston, and is therefore much preferable to the glass of antimony, which con-tains fometimes more, sometimes less phlogiston. Thus, by using the powder of algaroth instead of the glass of antimony, we obtain an uniform and certain tertainfed antimony, uniformly active. Then physicians will only have to attend to the sensibility or irritability of the constitutions of their patients. This medicine is a safe, and, under proper management, a fufficiently active preparation for every purpose of emetics in general; and after a few trials of any new-made preparation, for it is not always similar, its dose may be pretty certainly ascertain-ed. Cullen's Mat. Med.

In the Hiftory of the Royal Medical Society at Paris, for the year 1776, M. de Lallone prefers the above mode of preparing the tartarifed antimony; but he fays there is an objection to it, as well as to all other methods of preparing it, which is, than when diffolved in a very diluted aqueous vehicle, part of the medicine is constantly preci-pitated, and adheres to the sides of the phial. As this is owing to its not being sufficiently soluble, he recommends the mixing equal quantities of tarterifed antimony and pure fal ammoniac; and after rubbing them together in a mortar, adding a small quantity, three parts or less, of diffilled water. Thus the two salts unite, and are comdiffilled water. pletely diffolved.

TEMPLINUM OL. i. e. ol. templinum verum Germanorum. It is a kind of ol. terebinthinze.
TEMPORALIS ARTERIA. The origin of the semperal artery is covered with the parotid gland. It lies temperal artery is covered with the parotid gland. It hes behind the meatus auditorius externus, and emerging from the parotid, comes, just covered by the skin, to the zygomatic process of the os temporis, it crawls up, and divides into two branches, one of which goes to the frontal, the other to the parietal bone. The frontal part anastomoses with the internal carotid, and the other por-tion with the occipital artery. From the root of the tem-poral an artery passes up to the scalp behind the ear, and is sometimes ordered to be opened instead of the temporal.

TEMPORALIS Musculus, it is also called crotaphites. It rifes broad from the region of the temples,

particularly from the offa frontis, parietalia, temporalis; and iphenoides, where it fpreads like a quarter of a circle; then it forms a tendon, which paffes under the jugum, and is inferted into the coronoid process of the under jaw. and is inferted into the coronisal process of the under jaw.

A ligament from the proceffus zygomaticus braces this tendon down, and imparts fome of the internal fibres to it. It is covered with a ftrong tendinous sheath, which is lost in the epicranium. When matter is formed under this tendinous expansion, it is usually attended with fo great a degree of fever, from the pain, as to occasion de-lirium. The thickness of this tendinous part prevents the matter from pointing outwardly, where it was first formed; and if left without aid, it runs in the direction of the temporal muscle, and opens into the mouth by the coronoid process of the lower jaw. It is usual, therefore, not to wait for this matter pointing outwardly where it is first formed; but, as in other instances of matter under the fascize of tendons, to make an opening directly to it. See Absense of the temporal muscle. TEMPORUM OSSA. The TEMPLE BONES are each

divided into three parts, viz. the maffoid, the fquamous, and the petrous. There are three external processes which arise from each of the temporal bones; on the pothere is a cavity, whence the digathric mustle of the lower jaw arises. At the inner-fide of the lower jaw arises. lower jaw arifes. At the inner-fide of the root of the flyloid process there is a cavity where the internal jugular vein is lodged. Between the mastoid and zygomatic processes the meatus auditorius externus is seated, and between the maftoid and ftyloid processes is the aquæductus Fallopii, whence the portio dura of the feventh pair of nerves makes its exit. Before the flyloid process is a glenoid cavity for the reception of the con-dyle of the lower jaw, near which cavity is an eminence, upon which the condyle fometimes moves. In the pars petrofa, near the flyloid process, is a canal through which the carotid artery enters. Near the last foramen, on the anterior edge of the bone, is the tuba Euftachiana. The internal foramen is the meatus auditorius internus.

TENDO, from Ture, to fireteb. A TENDON. See

Musculus.

Tendo Achillis, chorda magna. This tendon is formed by the union of the folkus, and gaftrocnemius inferted into the os calcis. Some fay is thus named from its action in conducing to fwiftnefs of pace. Homer deferibes this tenden, which was probably thus named by the ancients, from their cuftom

probably thus named by the ancients, from their cuftom of calling every thing thus, that had any extraordinary ftrength or virtue. See Gastroonemii.

TENESMUS, from the first of fretch. A tenefmus is a continual painful urging to go to flool, when little or nothing can be discharged. There is a pain in the anus, and a frequent desire of going to stool, whilst a mucous substance, which is sometimes bloody, is discharged. The causes are a stone in the bladder, an inflammation in the neck of the bladder, acrid humours falling on the resum, a diarrhera, a dyentery, the piles. falling on the rectum, a diarrhoea, a dyfentery, the piles,

pregnancy, &c.
This diforder is very troublesome, but rarely dan-

As the cause varies, the cure will also differ. If a stone in the bladder is the cause, its position should be altered by means of a catheter, if putting the patient into a pro-per posture will not answer the end. If an instammation per posture will not answer the end. If an inflammation in the neck of the bladder is the cause, such means will be necessary as are directed for removing inflammation there. If acrid humours affect the rectum, they should be gently purged off, and then emollicat or balfamic clysters, should be injected, the ol. ricini is particularly useful, both by the mouth and clysterwise. That kind of tenesmus which affects pregnant women is relieved by clysters of sweet oil, and a little of the tinct. opii mixed with it; if other inflances the method of relief will be the same as in a deservery. TEREBINTHINA. TURPENTINES. The produce
of the different species, &c. of pine-trees, and the pistachiae chiesly, if not wholly. The Pharmacopæia of the
Edinb. Col. says it is the produce of the the pinus larinx,
i. e. pinus foliis fasciculatis obtusis, Linn.
The Chip. or Comment of the columns o

The Chio, or Cyprian turpentine. It is generally about the confiftence of thick honey, very tenacious, clear, almost transparent, of a white colour, with a cast of yellow or blue; it hath a warm pungent, bitterifh tafte, a fragrant fmell, more agreeable than that of any of the other turpentines. It is the produce of the tere binthimes yulgaris, C. B. in the island of Cyprus, and the fouthern parts of Europe. The pistacia terebinthus, Linn. This kind of turpentine is said to be the least subject to be adulterated.

Venice turpentine. It is usually thinner than the other forts, of a pale yellow colour, a hot, pungent, bitterish taste, and a strong smell, without any of the fine aromatic slavour of the Chio turpentine. It is the produce of the larix, C. B. pinus larix, Linn. and brought from France, Germany, &c. This is the species of turpentine which Dr. Cullen confines himself to in speaking of their medical virtues: he confiders it as a rubefacient, and too ftimulative to be applied to fresh wounds or when they are in a suppurating state; in the stomach it is also a stimulant, and in the intestines, communicating its ftimulus to the whole fyftem, and proving laxative, the most certain of any given in glysters. In the blood-vef-fels it stimulates the whole fystem, hence useful in chronic rheumatism, and has been also so in prevent-ing the gout. It is also diuretic, diaphoretic, and expectorant, though improper in internal ulcerations, for preventing calculous concretions, and carrying them off. In fome gleets it becomes beneficial.

The whole of the virtues feem to depend upon an ef-

fential oil, except its laxative powers, and hence has been given to answer fimilar purposes. See Cullen's Mat. Med. Home's Clinical Experiments.

Strasburgh turpentine, or tereb. Argentoratensis. It is of a middle consistence between the two foregoing, more transparent, and less tenacious than either, of a yellowish brown colour, more agreeable to the finell than cither the common or the Venice, to the tafte it is the bit-terest, but the least acrid. It is extracted in different parts of Germany from the filver and the red firs, the pinus picea, Linn. by making incisions through the bark. In fome places a refinous juice is collected from certain knots under the bark. This is called lachryma abiegna, and oleum abietanum. See ABIES.

Common surgentine. This is from the wild pine-tree;

the pinus fylvestris, Linn. it is about the confistence of honey, of an opake brownish white colour; the coarfest and heaviest of all the kinds, and its smell and taste are

also the most disagreeable.

All these turpentines dissolve totally in rectified spirit of All these turpentines dissolve totally in rectified spirit of wine, but give out nothing to watery menstrua; by the mediation of mucilages, the white of egg, or of gum arabic, they mix with water into a milky squor. Distilled with water they yield a large quantity of a subtile, penetrating, essential oil, viz. the oil of surpensine, which is called also the spirit of surpensine. The oil is dissicult of solution in spirit of wine, though the surpensine so easily dissolves in it. If this oil is redistissed in a retort by itself, with a gentle heat, it becomes more subtil, and in this state it is called ethereal oil of surpensine; the thicker part which remains behind, is called balsam of surpensine. pentine.

All the turpentines are hot, flimulating, detergent, and corroborant. When inflammatory fymptoms do not forbid, they are given from ten grains to half a dram, for cleanfing the urinary passages, for healing internal ulcera-tions in general, and in laxities of the seminal and uterine veffels; they feem peculiarly to affect the urinary paffages, and give a violet fmell to the urine; they diffolve and and give a violet intent to the urine; they dinore and discharge mucous matter from the urinary passages; but if a stone is in any of the parts, they are not safely administered. The Venice is most diuretic and detergent; the Chio and Strasburg more corroborant; the common is only used externally and for distilling. What remains after diftilling the oil from turpentine, is the yellow and the black rofins.

The oils, both the common and the ethereal, are pow-The oils, both the common and the ethereal, are powerfully flimulating, detergent, and diuretic; they are given in dofes from a few drops to half an ounce in rheumatifms. When a large dofe is directed, it is given in the morning, and an opiate at night. Mixt with fpirit of wine they are used as styptics, to check the discharge of blood from wounds. They are used for rubbing on parts affected with pains. But if too freely used inwardly, they discharge to a dispeter and weaken the urinary passages. difpose to a diabetes, and weaken the urinary passages and the feminal vessels. See Neumann's Chem. Works. Lewis's Mat. Med.

TERES LIGAMENTUM. It rifes from the bottom of the cavity of the acetabulum, and runs obliquely back-wards, to be inferted into the head of the os femoris. It

ferves to confine the rotation of the thigh.

MAJOR. This mufele rifes from the outer part of the lower corner of the fcapula, passes to the os hu-meri forwards, joined by the latissimus dorsi and its ten-don, it is inserted into the posterior ridge of the biceps groove, to bring the arm downwards, backwards, and in-wards to the body. Brown calls this muscle rotundus

- MINOR, also called brevis; oftavus bumeri Placentini, because Placentinus added it to the number of muscles belonging to the arm. It rifes from the lower cofta of the scapula, and runs with the infra spinatus, and is in-ferted with it also.

TERGUS. See Pellis.
TERMES. See Assalin.
TERMINALIA BENZOIN. See BENZOINUM.

TERMINTHUS. Galen describes them as being tumors in the fkin, nearly refembling the fruit of trember, turpentine trees, of a blackish colour, inclining to green. Wiseman reckons the epinyctis to be a species of terminathus, and says that they are both of them painful tubercles, or angry pushules, affecting the skin of the arms, hands, and thighs. Culter places them as a variety of phlorosis releasement. phlogosis phlegmone, and Sauvages ranks them as a fort of furunculus. Bleeding, purging, and a regular diet, is all that is required for their cure: it is also called

TERNA. See IMPETIGO, OF MENTAGRA.
TERRA. See VENTER.
TERRA. EARTH. In chemistry, carth is one of the four fimple fubstances called elements. Earth is not found so pure as the other elements, fire, air, and water; but it is most probable, that as there is only one kind of air, water, and fire, so there is but one kind of earth, however it may vary, from the different fubitances with which it was mixed. The effential properties by which earthy fubitances differ from the other elements, are their much greater weight, hardnefs, fixednefs, and infufibility; and thefe are most eminently united in the vitrifiable kinds of earth.

Neumann divides the mineral earths into five kinds, viz. the crystalline, calcareous, argillaceous, talky, and

Animal earths Dr. Lewis includes under three kinds, viz. that from shells, from calcined bones and horns, and from the blood, slesh, and skins of animals.

Vegetable earths are diftinguished into three kinds by Wallerius, viz. that obtained by burning foft, fpongy, and farinaceous plants; by burning the harder and lefs fuccu-

lent plants; and by burning wood.

The earths that are attended to with a medicinal view are chiefly the infipid ones, which abforb acids; whence they are called absorbent earths. Some of the tenacious adhefive earchs have been used, such as the boles, sealed carths, &c. but are now much neglected. See the Dict. of Chem. Lewis's Mat. Med. Neumann's Chem. Works. TERRA CARIOSA. — JAPONICA. JAPAN EARTH, cachou, faufel. It is called Japan earth, because it was long supposed to be an earthy substance from Japan; but it is a gummy refin, obtained by a decoction of some vegetable substance in water. The plant is called coira or caira, by the natives of Bahar province in the East Indies. The natives of Pegu name the tree kheir or khadira. It is a species of the mimola of Linnæus. In Dr. Fothergill's Works by Dr. Letsom, vol. ii. it is called mimola Japanica: in the Pharmacopæia of the Edinburgh College, is named from Linnæus mimsfa catechu, to which the fol-lowing defeription is added from Linnæus, viz. mimofa-fpinis flipularibus, foliis bipinnatis, multijugis; glan-dulis partialium fingulis, spicis axillaribus geminis. s. ternis pedunculatis, Linn. Suppl. 439. In Dr. Fother-gill's account of the tree, we are told that the wood is extremely hard and heavy, the interior part varies from a pale brown to a dark red, approaching to black in dif-ferent plants, but always covered with one or two inches thick of white wood. It is one of the most common trees is named from Linnœus mimofa catechu, to which the folthick of white wood. It is one of the most common trees to be met with on the uncultivated mountains of Rotas, and Pallamow, districts of Hindostan in the province of Bahar, westward of Bengal, and frequent in many other neighbouring parts. From the interior coloured wood is produced the extract erroneously called terra Japonica. The extract is thus made: after the tree is cut down, all the exterior or white part is pared off and caft away; the interior coloured wood is cut into chips, with which a narrow-mouthed unglazed earthen pot is filled, to this as much water is added as will rife to the upper chips; when this is half evaporated by boiling, the decoction is poured into a flat earthen pot, and boiled to one third part: this is fet in a cool place for one day, and afterwards evaporated by the heat of the fun, ftirring it several times in the day; when it is reduced to a confiderable confiftence, it day; when it is reduced to a confiderable confidence, it is ignead upon a mat or cloth, which had previously been covered with the ashes of cow-dung, this mass is divided into square pieces by a string, and completely dried by turning them frequently in the sun, until they are fit for sale. In making the extract, the pale brown wood is preferred, as it produces the sine whitish extract: the darker the wood is, the blacker the extract, and of less value. The patives call this extract by the page of cutter the The natives call this extract by the name of cutt; the English who relide where it is made, call it curch; authors have named it terra Japonica, catechu, cadtchu, cashow cachou, caitchu, castjoe, cachore, kaath, cate, &c. The preparers of this extract are very careless in keeping it free from foreign matters; in consequence of which it hath a confiderable quantity of ashes, &c. mixed with it. Mr. Kerr, who collected this account, fays that he never could learn that the terra Japonica was produced from the areca, or betel-nut, nor indeed does he think it credible that it should, as its price would be far exceeding that of the terra Japonica, if the preparation was from the areca.

Where the terra Japonica is made, it is used in dying; for painting chintz and other cloth joined with vitriolic falts, a black colour is produced; mixed with oil, they paint the beams and walls of their houses, to preserve them from the destructive white ants. The black physicians divide difeases into the hot and cold, and thus they divide their medicines; to the hot difeases they oppose the cooling medicines, among which the terra Japonica is reckneed powerful. For a more particular account of this production, fee Dr. Lettfom's edition of Dr. Fothergill's Works, vol. ii. p. 191—199. Some specimens of this drug are of a pale reddish brown colour, others are of a dark blackish brown, or black like bitumen; some are ponderous, others light, some compact, others por-ous, some more, others less astringent; and these disferences happen according to the manner of obtaining them, &c. This drug is brought from Coromandel, Cambaya, and other parts of the East Indies. The best of a baya, and other parts of the East Indies. The best of a dark reddish brown colour, dry, heavy, glossy, and compact; if chewed it discovers, at first, a bitterish styptic taste, which is followed by an agreeable sweetness. When pure it is almost totally dissolved both by water and by spirit. An extract made of spirit is the most agreeable and most astringent preparation. Where a strong astringent is required, whether for external or internal purposes, the spirituous tincture, which is called TINCTURA CATECHU, tinflure of catechu, and is thus made. Take of Japan earth, three ounces; cinnamon bruifed, two ounces; proof spirit of wine, two pints: digest for three days and strain. Pharm. Lond. 1788. or the spirutuous extract is the best; for a milder corroborant, the watery tincture, or extract may be chosen. A little of the watery extract held in the mouth, and gradually swallowed, is useful in disorders of the throat: and in diarrhoeas and dyfentories it is a ufeful medicine, whether a fever attends or not. The Japan careb, as it is called, approaches to alum in its aftringent virtue, as to the quickness and the universality of its action. See Neumann's Chem. Works. Lewis's Mat.

TERRÆ FLOS. See COELIFOLIUM.

TERRÆ GLANDES. A Species of CATAPUTIA MINOR. OLEUM. See PETROLEUM and NAPHTHA.

TERROR. A FRIGHT. The general effects of terror are a great contraction of all the small vessels, and a repulfion of the blood in the large and internal ones; hence the fuppression of perspiration, the general operssion, trembling, and anguish, from the heart and lungs being overcharged with blood, &c. After great frights, persons rarely recover their usual vivacity; and epilepsis that are caused by frights are rarely, if ever cured. When a person is affected with terror, or sudden, or great frights, the principal endeavours should be to restore the circulation to its due order, to promote perspiration, and to allay the agitation, or commotion, in which the patient is observed to be. The cuftom of giving cold water in these cases is bad. Place the affrighted person in a quiet situation; a little warm liquor, as camomile tea or fuch like, should be given him to drink; the legs may be put into warm water, and there continue for fome time; the legs should be rubbed, and the camomile tea repeated ever fix or eight minutes; when the fkin becomes warm, and there is a tendency to perspiration, sleep may be promoted by a gentle opiate.

TERTHRA. The middle and lateral parts of the neck. According to Keil, 100 perspective fignishes the parts about the

TERTIANA FEBRIS. A TERTIAN FEVER. This fever is of the intermittent kind; every first and third day it is present, and the second is free. Its access is about noon. Hippocrates calls it \$1756. The management in this cure is the same, in general, as under the article INTERMITTENT FEVER. Dr. Cullen places this genus of disease in the class pyrexize, and order febres.

Tertian fevers are spurious, they are then irregular in their approach, and more mild than the true species: they are called double when the fits return at different times every other day. See the authors on in-

termittent fevers.

In intermitting fevers Dr. Lind recommends opium as almost a specific; he directs it to be given half an hour after the commencement of the hot fit. The draught which he generally prefcribed was as follows: R. aq

font. pur. 3 i.fs. aq. alex. fp. fyr. papav. albi, 22 3 ii. tinct. run in fhort waves, from the tunica albuginea to the axis opii gt. xv-xx. m. He observes, that the effects of opium of the testicles, and there form larger tubes, then are congiven in the hot fit of an intermitting fever, are 10, It shortens and abates the sit, and this with more certainty than an ounce of the bark is found to remove the disease. 2dly, It generally gives a fensible relief to the head, takes off the burning heat of the fever, and occasions a profuse fweat; this sweat is attended with an agreeable softness of the skin, instead of the disagreeable burning sensation which affects patients fweating in the hot fit; and is always much more copious than on those who are not under the influence of opium. 3dly, It often produces a foft and refreshing sleep, to a patient tortured in the agonies of the fever, from which he awakes bathed in universal sweat, and in a great measure free from all complaints. The Dr. further adds, that the effects of opium are more uniform and constant in intermitting fevers than in any other disease, and are then more quick and sensible than those of any other medicine. An opiate thus given, foon after the commencement of the hot fit, by abating the violence, and leffening the duration of the fever, preferves the conflitution fo entirely uninjured, that where it is given in intermittent fevers, a dropfy, or a jaundice rarely follows. In cases where opium does not immediately abate the fymptoms of the fever, it never augmented their violence: on the contrary, most patients reaped fome benefit from an opiate given in the hot fit; and many of them bore a larger dofe of opium at that time than at any other. A delirium in the hot fit is not increased by opium: though opium will not remove it: hence is it not opium: though opium will not remove it: hence is it not propable, that many of the fyrmptoms attending those fevers are spasmodic, but more especially the head-ach. If the patient be delirious in the fit, the administration of the opiate ought to be delayed until he recovers his senses, when an opiate will be found greatly to relieve the weak-ness and faintness which commonly succeed the delirium. Opium feems also in this disease to be the best preparative for the bark, as it not only produces a complete intermiffion, in which case alone that remedy can with safety be administered; but occasions so falutary and profuse an evacuation by fweat, as generally to render a much lefs quantity of the bark requifite. When the patient is cof-tive give the opiate in about two ounces of the tinct. aloes, and this particularly if the bark is to be given immediately after the fit: thus at the fame time, the fit is shortened, and the intestines cleansed, previous to the administration of the bark; the operation of the tinct. aloes not being prevented, though fomewhat retarded by the opiate. The administration of an opiate after an emetic given just before the fit, should be postponed until the hot

TERTIANA DUPLEX, called also DUPLICANA. It is when a tertian fever returns every day; but the paro-xyfms are unequal every other being alike.

— DUPLICATA. A tertian fever returning every

other day; but there are two paroxysms in one day.

—— TRIPLEX. A tertian fever returning every

day, every other day there are two paroxyfms, and but one in the intermediate one.

TERTIANARIA. HOODED LOOSE-STRIFE. See CASSIDA.

TERTIUM SAL. A NEUTRAL SALT. TESSERÆ. The os cusoides, which fee.

TESTA PROBATRIX. See CUPELLA.
TESTES. The TESTICLES, from testis, a witness; they witness that we are men; also called didymi. They are originally seated in the abdomen, just beneath the kidneys, then called cripforchis; they gradually descend near the time of birth through the sheath of the spermanear the time of birth through the Ineath of the Iperma-tic cord into the ferotum, each carrying along with it a peritoneal coat, which makes the tunica vaginalis, called also erythracides. This discovery was made by Dr. Hun-ter, in the year 1755, affished by his brother Mr. John Hunter, and was demonstrated by the doctor in his lec-tures that year. Usually arteries are fent to glands from fome adjacent vessels; however this holds good in the form adjacent venicis; however this holds good in the feetus state, it varies from the general order after the birth of the child, for the spermatic vessels arise from the aorta, the vena cava, and the emulgent veins.

Immediately within the tunica albuginea is the body of the testi, which is of a yellowish white colour, composed of tubuli, betwizt which the blood-vessels run. These tubuli are the secretory organs of the semen: they

tinued through the tunica albugines, and unite into one canal, which by feveral windings, form the epididymis; and thence continuing, form the vafa deferentia. tefficles have many lymphæducts which discharge themfelves into the inguinal glands. The fpermatic arteries bring blood to the tefficles, for the feparation of fpermatic matter, and the spermatic veins re-convey the blood to the vena cava. The semen separated in the tofliels, is further perfected in the epididymis, and then conveyed by the vafa deferentia into the urethra.

The tefticles are fometimes detained in the body, or in the groin. See PARORCHIDIUM. So are named the parts of the brain called notes, also didymi. See CERE-

TESTICULUS CANINUS. See ORCHIS. TESTUDO, i. c. The TALPA OF MOLE. See TALPA.

TETANUS, from vinu, to firetch. It is also called catochus, of which there are feveral species. See CATO-CHUS. Convulfo Indica, bolosonicos, rigor nervofas. There are feveral spasmodic or convulsive disorders, or at least several modes of a convulsive disorders, which are called the emprofibotonos, or epistbolonos, in it the body is rigidly bent forward; pleurosibolonos, in it the body is bent to one side; the opisibolonos, in it the body is pleurosibolonos, in it the body is pleurosibolonos, in which the body is rigidly bent backward; and the tetanus, in which the body is rigidly held in an unright posture.

is rigidly held in an upright posture.

Dr. Cullen places the tetanus as a genus of difease in the class neuroses, and order spasmi. He defines it a spassic rigidity of almost the whole body. Others add, but with fentibility remaining and fometimes increased. This diforder is most frequent in hot climes, but fometimes happens in the milder. The locked-jaw is a kind of teta-nus. Notwithstanding Dr. Cullen's arrangement in his Nosology, he, fince that work, considers the tetanus emprofibotones, opifibotones, and trifinus, or locked-jaw, not as different species, but variety of tetani only. Aretæus, Celfus, and Cœlius Aurelianus say, that cold is a principal cause, and accordingly direct rubbing the difordered parts warm buthing. warm bathing, &c. but there are various other occa-fional causes, such as when diarrhoeas, or dysenteries are imprudently checked, and when nervous and tendinous parts are wounded, &c. The immediate cause is a morbid, or preternatural irritation on the nerves. When it is caufed by a puncture or other injury of the nerves, it is com-monly more violent and more difficult of cure than when proceeding from cold: when it comes on fuddenly, and advances quickly to a violent degree, it is always more dangerous than that which is flower in its process. Accordingly, if the patient passes the fourth day, it may be hoped not to be fatal; and every day adds to the favourable prospect of recovery: not that danger is totally absent during several days after the fourth. When its force is considerably abated, it is apt to return with its former violence. In order to the cure, opium is principally to be depended on as an internal remedy; a grain of opium, or, if required, five grains, may be given every hour, until the fymptoms abate, and then the dofe should be gradually lessened; if it cannot be swallowed, let large doses be dissolved and injected in glysters until the patient can swallow; warm baths much affist the essence of opium; and if a wound, or other such like external injury is the care for large words. or other fuch like external injury is the cause, let the part be dreffed with the Peruvian balfam. It is juftly observed. by Dr. Chalmers, that the quantity of opium can only be limited by the violence of the spaims. Musk and other antifpafmodics have their ufefulnefs in this diforder, but without a free use of opium they avail but little. When the cause is some injury received by a nerve, Dr. Cullen advises, if possible, to cut off that part from all communication with the sensorium, either by cutting through the nerves in their course, or by destroying, to a certain length, their affected part or extremity.

In the West Indies mercury is used with advantage: they preser it early in the disease, and apply it by unc-tion; they endeavour to excite a speedy falivation, and keep it up until the disease is overcome, in its violence

An internal use of the pisselscum Barbadense hath been attended with happy effects. See the Lond. Med. Obs. and Inq. vol. i. p. 51, &c. 87, &c. vol. ii. p. 130, &c. The Lond. Med. Trans. vol. ii. p. 39. Lond. Med. Obs.

and Inq. vol. iii. p. 326, &c. Cullen's First Lines, vol. iii. edit. 4. Lond. Med. Journal, vol. vii. p. 424. Edinb. Med. Comment. vol. vi. p. 386. Mcmoire of the Medical Society of London, vol. i. p. 65.
TETANUS LATERALIS. See PLEUROSTHOTONOS.

TETARTOPHIA. Some reckon this fever among the remittents. It is a continued quartan fever. It is rare and very difficult to diftinguish from the quartan

TETRAGONIA. See Eonismus.
TETRAGONUS. See PLATYSMA MYOIDES.
TETRANGURIA. See CITRULLUS.

TEUCRIUM. SPEEDWELL, MOUNTAIN OF TREE-GERMANDER. It is also a name for the chamedrys frutescens, polium, scordium, sabvia sylvestris, chamapitys, and marium Syriacum. It is native in Germany, Italy, and Sicily; but is not in use with us; though a power-ful antispasmodic and cephalic, because it cannot easily be cultivated in this country, nor got perfect from

Pliny attributes the discovery of the virtues of tenerium against obstructions of the spleen to Teneer, who was one of the Greek heroes in the siege of Troy. See Cullen's Mat. Med.

THALAMI NERVI OPTICORUM. The BED of the OPTIC NERVES. They are little eminences in the

brain, whence the optic nerves arifes. See CEREBRUM. THALICTRUM. See SOPHIA.

THAPSIA. DEADLY CARROT. Thapfia afclepias, Linn. The root of this plant operates violently both upward and downward; it is not used in the present practice; but when imprudently taken, its antidote is vinegar. See Miller's Bot. Off. It is a name also for the ferula glauce, &c. and for a species of laserpitium.

THATSIA ORIENTALIS, also called gingidium.
ORIENTAL PICK-TOOTH. It is a plant found in the

eastern countries, but is not in use with us. THAPSUS. See VERBASCUM.

THEA. TEA. It is the leaf of an oriental shrub. It does not appear that there are more than one kind of tea plant. The variety of teas feems to be owing to the different feafons in which the leaves are gathered, and the different modes of curing them. The tea shrub is cultivated in China and Japan, but principally in the provinces of China, and betwirt the latitudes of 24 and 28.

The best is from Nankin in China, and Fisen in Japan. The green sea thould be chosen fresh, of a fine colour, not inclining to a yellowish, or a brownish colour, which are marks of too great age; it should be well rolled, con-sist of entire leaves, be thoroughly dry, of a bitterish subaftringent tafte, but not ungrateful, and of a pleafant fmell; the fresher the tea, the greener is the infusion that is made of it with water; its prevailing smell is that of violets, or new hay, but if it is strong of these, it is so by art. Bohea tea is of a blackish brown colour; it gives a brown tincture to water, and smells of roses. Of all the substitutes of tea, the male speedwell is the most celebrated. The green colour of tea refides wholly in its refinous part, to does its aftringency.

An infusion of tea in water is a grateful diluent in health and a falutary drink in fickness; it promotes the natural exerctions, excites an appetite, cheeks immode-rate fleepiness, and relieves the head-ach when caused by a debauch. No other plant is known whose infusion more readily passes off by the emunctories, or more speedily excites the spirits. When the stomach is weak, a moderately firong infusion of tea generally provokes a vomiting. Perhaps the principal inconvenience arifing from the use of tea, is its preventing the necessary nourithment being received from more substantial food; it feems better calculated for a supper than for a breakfast. It is certainly fedative, and narcotic, and that in its most odorous state, and therefore less in the bohea, than green tea, and the most so in the most odorous, or what are called the finer kinds of the green. Cullen's Mat. Med. See Lewis's Mat. Med. Neumann's Chem. Works. Lettsom on

THEA GERMANICA. See VERONICA. THEBESII FORAMINA. See Cor.

THELYGONON. See MERCURIALIS FRUCTI-

THENAR, Sepap. The PALM of the HAND, or the

SOLE of the FOOT; also a name of the abduffor pollicis manus, and the abductor pollicis pedis: these are called themar because they make a part of the themar.

THEOBROMA CACAO. See CACAO.
THERAPEUTICA, from 3: partou, to beal or cure.
It is that part of medicine which particularly respects the cure of difeases.

THERIACA, from 219, a viper, on a wild beaft. The medicine called theriaca, and all with this name are intended to cure the bites of venemous animals; they differ from alexipharmics, in that these latter are used as remedies against poison inwardly taken.
THERIACA GERMANORUM. See Ros. BAC. Ju-

- LONDINENSIS, i. c. CATAPL. CUMINI. Sec CUMINUM.

THERIOMA, from 3nc, tera, a wild beaft. This term is applied by some ancient Greek writers to very malignant or ill-conditioned ulcers. See Theriodes. THERMASMA. See Fotus.

THERMA. See ACIDULA and AQUA SUL-PHUREA.

THETLATIAN. See Guao.
THLASPI VERUM. PENNY-CRESS, OF TREACLE-MUSTARD. The thlassi arvense, Linn. It is a plant with roundish-pointed leaves, and broad capsules, containing about four feeds in each cell. It is annual, grows in fields, and flowers in June.

THALAPSI VILGATIUS. MITHRIDATE-MUSTARD IS have been dearly a leave to the cell.

TARD. It hath hoary fharp-pointed leaves, fhaped like an arrow's head, and only one feed in each shell of the pod. It is biennial, grows in open clayey ground, and

flowers in May.

The feeds of thefe two plants have been used, but the common muflard feed is, in all cases, preferable.
For that called — FATUUM, — THLASP

THLASPIS FA-TUI, and - BURSA PASTERIS, fee BURSA PAS-

THOLUS. See Achicolum.
THORA. A species of anthora, and of ranunculus.
THORA PAROU. See CAJAN.
THORACICÆ ARTERIÆ. The THORACIC ARTERIES. The upper one rises from the axillary artery, and runs down in the fides of the thorax, giving out many branches in its paffage. The inferior one arifes also from the axillary artery, and runs along the inferior cofta of the scapula, &c. to several of the neighbouring mufcles.

THORACICUS DUCTUS. See LACTEA VASA. THORAX, from Supat, the breast or chest. It is divided into three regions, viz. the anterior, or the breaft; the posterior, or the back; and the lateral, or the right and left fides. The therax is lined with the pleura; into the therax descends the trachea arteria; behind the sternum is the thymus gland, the heart is seated in the middle of the therax, and on each side of it are the lungs. The pericardium immediately covers the heart.

The therax is formed behind of the twelve dorfal ver-

tebra, on the fides by the ribs, and before by the sternum, THOTH-THOUTH. See HERMES.

THRIPES. See Assalia.
THROMBUS. See Sugillatio.

THURIS CORTEX, also called elutheria, elaterium, cascarilla, thymiama, storax rubra offic. thus Judworum, chaeril, chaearilla, elatheria, elaterii cortex, kina-kina aromatica, Perwoianus grifeus feu fpurius. It is supposed to be the bark of the elathera of Catesby, which is plentiful in the Bahama islands, particularly on one called Elatheria.

Dr. Brown, in his History of Jamaica, fays, that the tree is frequent in the inland woods there; all the parts of the tree, especially the bark, smell strong of musk; and the powder of the bark is used there by the negroes as an emetic. He says it is called there by the name of Alli-gator-wood and musk-wood. He gives as its botanic cha-

gator-wood and maix viz.
racters the following, viz.
Pericarpium. Capfula craffa, fubrotunda, corticofa, dura, quadrilocularis, quadrifaria ab apice dehifeens.
Semina. Nuclei folitarii oblongo-ovati.

8 N

Elutharia. Arborea; folis majoribus, ovatis opposi-

Lauro affinis arbor foliis latioribus, &c. Slo. Cat. 137.

& H. t. 170.

According to the Edinburgh College, it is the croton (cafcarilla) foliis lanceolatis acutis integerrimis petiolatis

fubtus tomentofis, caule arboreo, Linn.

This bark is brought to us in curled pieces, or rolled up in fhort quilts about an inch in width, covered on the outfide with a rough whitish matter, and brownish on the inner fide, exhibiting, when broken, a fmooth, close, blackish brown surface

This bark hath a light agreable fmell, and a moderately bitter tafte, accompanied with a confiderable aromatic warmth: it is eafily inflammable, and yields, while burn-ing, a very fragrant finell, fomewhat like mufk; it is bitter, but less rough and less disagreeable than the Peruvian

bark.

The virtues of the thuris cortex are very fimilar to those of the cort. Peruv. and where the latter is disagreeable the former may be substituted for it. It is considered by some as possessed of slight tonic and stomachic powers, but in no refpect adequate to the bark. The College of London have a TINCTURE CASCARILLE, tincture of cafcarilla in their Pharmacopoeia, made by digefling for eight days, in a moderate heat, four ounces of cascarilla in two pints of proof spirit of wine, and afterward straining. Ph. Lond. 1778. In the gout, and especially in gouty disorders, it may supply the place of the radix ferpentaria, as a perspirative. In disorders of the head the thuris cortex is bruifed and mixed with tobacco for fmoaking.

Water extracts the virtues of this bark, but spirits takes them up more perfectly. Diffilled with water it yields a greenish effential oil. See Lewis's Mat. Med. Hift. de l'Acad. Roy, des Sciences. Cullen's Mat. Med.

THURIS LIGNUM. See ASPALATHUS.
THUS. FRANKINCENSE. The Greeks call it olibayum, from the mountain Libanus in Syria, whence many suppose that it grows there; but true frankincense is not known to grow any where but in Arabia. The common frankincense of the shops is the refin of the pinus fylvestris, Linn.
Thus Corticosum, and Masculinum. See Oli-

BANUM.

JUD MORUM. See THURIS CORTEX.

MYRTIFOLIA BELGICA. See ELEAGNUS. THUYA, called cedrus Americanus, paradifaica arbor, orbor vitee. TREE of LIFE. It is a genus of the monoecica adelphia class. Linneus enumerates four, and Miller two species, oriental and occidental, the latter of which grows naturally in Canada, and other northern countries, and is used for many medical purposes. It is good in rheumatic pains, applied when formed into an ointment to the part affected, and in a short time gives certain relief. Against erratic pains, which are violent, moving up and down the thighs, and fometimes fpreading all over the body, eight ounces of the leaves of polypody, and two of the cones of thuya reduced into a coarse powder and made into a poultice with milk-warm water, are recommended to be spread on linen, and wrapped round the body, though a cloth is generally laid between that and the body, left it should burn and foorch the skin. At Saratoga, the decoction of thura leaves is given in intermittents, and applied also against a cough. For that called — MASSILIENSIUM, fee CEDRUS PHOENICIA.

THUYÆ. See CEDRUS

THYMALEA MONSPELIACA. Spurge FLAX. Dapbne gnidium, Linn. This shrub is cloathed with green leaves, which resemble those of flax; it bears white flowers in clusters on the tops the branches; the flowers are followed with red berries, in each of which is one feed. This feed is supposed to be the real grana cnidia, though the measurem is taken for its coorne is the whole though the mezereon is taken for it: coccus is the whole berry with its feed, and grana is the feed of the berry. These berries are very caustic. The shrub is a native of the south of Europe. It is also called enesson.

THYMBRA. See SATUREIA SATIVA; for that

called — HYSPANICA, fee MARUM.
THYMELÆA LAURI FOLIO, also called Lau-

To his definition, he adds one or two more, as follow: | reola mas, daphnoides. Spunge LAUREL. See LAU-REOLA MAS, & RÆMINA.

Botanists enumerate fix species of thymelan: their

berries are very caustic; they ripen in autumn, but are not in much repute. See ALYPUM.

THYMIAMA. See THUELS CORTEX.

THYMICÆ ARTERIÆ. THE ARTERY of the THYMUS! The arteria thymica, and arteria trachealis on each fide are in force which calls and a series the series of the content of the c on each fide, are in fome subjects only branches of one finall trunk, which spring from the common trunk of the right subclavian and carotid; they are generally small, fometimes running separate, and sometimes partly separate and partly joined.

THYMICA VENA. The right when it rifes feparately goes out from the bifurcation, and when it is wanting the thymus gland is furnished by the gutturalis, or fome other neighbouring vein. The left from the sub-

clavian.

THYMOXALME. A preparation given by Diof-corides, of thyme, vinegar, falt, and fome other ingre-

THYMUS, called also glandium. The name of a finall, indolent, carnous tuberele like a wart, arising about the anus, or the pudenda; it resembles the flowers of thyme, whence its name. When this tubercle is large it is called ficus. They are easily extirpated. See Con-DYLOMA, and ACROTHYMION. Wifeman's and Heifter's Surgery.

It is also the name of a gland which Haller says is a lymphatic one, of the conglobate kind, but divided into lobes. It lies behind the sternum, partly within, and partly without the cavity of the thorax. It is peculiar to the sectus, and is shriveled in adults. This in calves,

&c. is called fweet-bread.

In botany it is named THYME, and a low fhrubby plant, confifting of numerous, flender, tough stalks with little roundish leaves in pairs, and loose spikes on the tops with purplish or whitish flowers on the tops; likewise a name for fatureia. For that called — CITRATUS SERPYL-LUS, fee SERPVLLUM, - ACINOS, fee ACINOS, MASTICHINA, fee MARUM

THYMUS VULGARIS. COMMON THYME. vulgaris, or thymus vulgaris crectus Hispanicus, foliis refolutis ovatis, floribus verticillato-spicatis, Linn. Common broad leaved thyme. It hath upright stalks, and
dark brownish green, somewhat pointed leaves; it is native in the fouth of Europe, but common in our gardens;
it flowers in June and July, is moderately assess it flowers in June and July; is moderately warm, pungent, and aromatic; to water it imparts by infufion its agreeable fmell, but only a weak tafte; in distillation it gives over an effential oil, which possesses the smell of the thyme, but less grateful; to the taste it is not and siery. Spirit of wine take up the whole of its active matter by infusion. A conferve of the leaves, or of the leaves with the flowers, is a good preparation. See Lewis's Mat.
Med. Neumann's Chem. Works.
THYONIANA. See CRINATUM.
THYRO-ADENOIDÆI. See CRICO PHARINGÆI.

THYRO-ARYTENOIDEI. These muscles arise from the infide of the fore-part of the thyroid cartilage, and are inferted into the arytanoid, ferving to compress the glottis. Sanctorini calls these muscles there epiglottici, because they are partly inserted into the membrane of the epiglottis.

- CRICO-PHARYNG EUS. See CRYCO-PHA-

RYNGÆUS.

- EPIGLOTTICI. They are only fome mufcles of the THYRO-ARYT ENOID EL.

- HYOIDES. See HYOTHYROIDES.

- · PHARING ÆI. These muscles are broad, they rife from along the outfide of the ala of the cartilago thyroides, between the edge of that cartilage and the oblique line in which the thyro-hyoidæi are fixed, and they are a little confounded with the crico-hyoidæi; from thence they run up obliquely backward, and meeting under the linea alba of the pharynx, they fometimes appear to be but one muscle, without any middle tendon. See Winslow's Anatomy; CRICO-PHARYNGAI, and PHA-
- PHARINGO-STAPHYLINI. Thefe are two fmall mufcles which accompany the pharynge-flaphylini very closely

through their whole course, except that their posterior extremities are fixed in the thyroid cartilages, near the other mufcles. They are inferted into the feptum palati. Thefe two pair may be reckoned one pair, and called three-pharynge-flaphylini. See PHARYNX.

THYROIDEA vel BRONCHIALIS GLANDULA.

The THYROID GLAND. It furrounds the afpera arteria laterally and before; its use is not known; it is larger in women than in men, whence the fore-part of their neck is not fo hollow as that of men. It is the feat of

the bronchocele.
THYROIDES, from Sugars, a Shield, and eases, likenefs

or shape. The name of a cartilage of the larger.
THYRSUS. A THYRSE. It differs from a spike in having the flowers or fruits fet more loofely on it, fo that there are spaces visible between them. Also a STALK.

THYSSELINUM. See ALSNICIUM. Alfo a name

for the ælfnitium.

TIARA. See CYRBASIA.
TIBERIANUM TORMENTUM. The colic. TIBIA. TIBIA, or HAUTBOY, which this bone refembles, and hence is called by this name. The larger bone in the leg; it is also called by this name. The larger bone in the leg; it is also called fascile majus, arundo major, fascilus, canna major, canna domessica cruris. It is situated in the anterior internal part of the leg; its upper extremity is large, and it is divided into two cavities for the reception of the condyles of the os semoris; between these cavities is a rough irregular protuberance for the attachment of the ligaments; on the posterior part is a small cavity for the reception of the fibula, and below the fore part is a large rough tuberofity, where the ligament of the patella is fixed; the lower extremity is hollow, but so as a small tuberofity rises in the middle; the internal side of this cavity is produced into a process called malleolus internus; the internal side of this extremity hath a cavity for the reception of the fibula; the anterior angle of the tibia is tharp, and is called the thin

It may be proper here to observe a process for relief when bones are carious which may frequently prevent an amputation. If the tibia is carious to a confiderable depth (fee CARIES), remove the carious part as follows: first cut through the skin, the whole length of the part we mean to remove, on each fide, faving as much of it as you can; then cut it acrofs the bone above and below. Having done this diffect off the mufcular flesh, as clear as can be admitted from the bone, still preserving as much as possible; then introduce a thin plate of passeboard, horn, or tin, over the upper part of the bone to be removed, so as to support the skin. After this clear away the periosteum from the parts on which you apply the faw. The saw should be strong, and of a circular form, to prevent wounding the adjacent parts. Having divided the bone above, do the fame on the lower part, taking care to include all that is difeased. The carious part of the bone being removed, the wound will not ap-pear fo large as may be imagined. To give encourage-ment to this operation, it should be remembered, that there have been instances of offcous matter shooting and forming a complete bone, when nine inches or more hath

TIBIALIS. The nerve thus called is the internal branch of the fciatic nerve, and is fent off near the ham; it paffes behind the popliteus muscle, and behind the gaftrocnemii, goes through the upper part of the folcus, then runs between it and the flexores of the toes, and to the malleolus internus, behind which it runs, and paffing betwixt the os calcis and the abductor of the great toe, where it divides into the plantaris internus and ex-ternus, the first of which furnishes the toe with filaments and the latter goes particularly to the little toe, and to

that next to it.

TIBIALIS ANTICUS. This muscle rises from the head of the tibia, and from the outside of the spine of the tibia; it grows tendinous, and winding about the infide of the foot, is inferted into the or canciforme internum, and ferves likewife to turn the fole inwards.

ARTERIA. As the poplitea ends it divides into two principal branches, the first of which runs between the heads of the tibia and fibula, passing from behind forwards on the interosseous ligament, where it is called tibialis anterior; the second branch divides into two

more, the largest of which is the innermost, and is called tibialis posterior, also furalis arteria. The anterior lies between the tibialis anticus muscles and the extensors of the toes; it comes forwards between the head of the tibia and fibula; it paffes on the forefide of the interoffeus ligament, then runs down on the fide of the tibia for about two-thirds of its length, passes down before, under the annular ligament, strait on the instep to the space be-tween the first and second metacarpal bones, and plunges down into the fole of the foot, where it anallamoles with the potterior tibial artery. The potterior runs between the foles, the tibialis politicus, the flexor digitorum communis, and flexor pollicis, and paffes between the bone and interoffeous ligament; in its paffage it gives branches to the tibia; and to its marrow, through a canal in its posterior and upper part; it runs behind the inner ankle, communicates with the tibialis anterior, and, surrounded by the neighbouring veins, passes to the sole of the foot, between the os calcis and the thenar muscle, where it is divided into the plantaris interna, which makes a circle like that in the palm of the hand: from this cir-cle branches are fent to the toes.

The following important circumstance is recited by Mr. Pott, respecting this artery. In the upper part of the calf of the leg, under the gastrocnemius and soleus muscles, a small hard tumor is at first perceived; it is fometimes painful, at others not much fo, but always impeding the patient's exercises; it does not alter the natural colour of the fkin until it hath confiderably in-creafed in the bulk; it enlarges very gradually; it does not foften as it increases, but continues through the greatest part of it incompressibly hard; and when it hath got to a large fize, it feems to contain a fluid which may be felt towards the bottom, or refting as it were on the back part of the bones. If an opening is made for the discharge of the fluid, it must be made very deep, and through a very diftempered mass; this fluid is generally small in quantity, and consists of a sanies mixed with grumous blood: the discharge of it produces very little diminution of the tumor; and in the few cases that have occurred to him, he says that very high symptoms of irritation and inflammation came on, and advanced with great rapidity and exquifite pain, foon destroyed the pagreat rapactry and exquine pair, from destroyed the pat-tient either by the fever which ran high, and was unre-mitting, or by a mortification of the whole leg. If am-putation hath not been performed, and the patient dies after the tumor hath been opened, the mortified state of the parts prevents all fatisfactory examination; but if the limb was removed without any previous operation, the the parts prevents all latisfactory examination; but if the limb was removed without any previous operation, the arteria tibialis postica will be found to be enlarged, distempered, and burst; the muscles of the leg to have been converted into a strangely morbid mass, and the posterior part of both the tibia and the fibula more or less carious. This disease derives its origin from a ruptured artery, or is always accompanied with it, and is remedied by amputa-tion only. See Mr. Pott's Remarks on the Necessity, &c. of Amputation in certain Cases, &c. TIBIALIS GRACILIS MUSCULUS. See PLANTARIS.

- Posticus, called also nauticus. This muscle rifes from the tibia and fibula close to the soleus, and from the interoffcous ligament, runs through the annular ligament; it plays in a groove of the bone, where it is tied down by the annular ligament, then runs acrofs the foot, and is in-ferted into the middle of the os fcaphoides.

- VENA. There is one anterior and posterior; they are divisions of the poplitea. They accompany their respective arteries in their course.

the name. See Raii Hift.

TILBURY WATER. This is found at West 77/bury in Essex. It has at the well a straw-coloured hue,
and covered with a variegated earthy scum; but keeps long clear in bottles; it contains a quantity of air; is foit and fmooth to the taile; though after long agitation in the mouth, it imprefies a fmall degree of roughness on the tongue. Though authors have differed in their account of the proportion of folia maters this water contains, they agree that they confitt of earth and alkali, the

greatest

createst quantity of the latter; but Dr. Rutty thinks also that they have in them a pittance of oily matter. They operate mostly by urine, though they purge fometimes on the first drinking. A quart is reckoned a middle dose. They have been recommended in diarrheeas, and old dyfenteries, in ventricular complaints from acidity, in the gravel, fluor albus, immoderate fluxes of the menses, and several others. Andre alledges, that they are as true a specific for diarrhoeas, and all kind of fluxes, as the bark for intermitting fevers. See Monro's Medi-cal and Pharmaceutical Chemistry, vol. ii.

TILIA. The LIME-TREE, also called the LINE or the LINDEN-TREE. It is the tilia Europea, Linn. It is a tall tree and its branches spread far; the leaves are heart-shaped, serrated, soft, and hairy; the slowers are whitish, followed by a kind of dry berry about the size of siberts. This tree is native in England; it flowers in July.

The flowers have an anodyne and antifpafmodic virtue; when fresh they have a moderately strong smell, and in this their virtue confifts, but it is foon loft in keeping: they have been much efteemed, but are now neglected in

See Raii Hift.

TINCAL. BORAX. It comes to Europe from the TINCAR. East Indies in a very impure flate, in the form of large, flat, hexangular, or irregular cryftals, of a dull white or greenish colour, greafy to the touch; or in fmall crystals, as it were cemented together by a rancid, yellowish, or oily substance, intermixed with marl, gravel, and other impurities. In this state it is called brute bo-

ran, chryscolla, or tincal.

It is purished by folution, filtration, and crystallization; and the crystals thus obtained are calcined to free them still further from greafiness, and then diffolved, filtered, and crystallized a second time; sometimes more mineral alkali is added, as it is faid that tineal contains an excefs of fe-

One hundred parts of purified borax contain thirty-four of real fedative acid, feventeen of mineral alkali, and forty-feven of water; but of the mineral alkali only about five parts are really faturated, the rest is unsaturated; and hence in many cases borax acts as an alkali.

It hath been long thought that borax was a factitious fubstance, but it is now beyond all doubt that it is a natural production, fince Mr. Grill Abrahamson sent some to Sweden in the year 1772, in a crystalline form; as dug out of the earth in the kingdom of Thibet, where it is called pounxa, my poun, and boui poun. As borax is purified also in the East Indies, Mr. Engestrom suspects that the tincal is only the refiduum of the mother liquor of borax evaporated to dryness, and that the greatiness arises from its being mixed withbutter-milk to prevent its efflorescence.

It is faid that borax hath been found in Saxony in some

coal pits. See BORAX, and SEDATIVUS SAL. Kirwan's Elements of Mineralogy.

TINCTORIUS FLOS. See GENESTA TINCTORIA. TINCTURA. A TINCTURE. Tinctures differ from diffilled waters, because waters take out only the lighter parts that will ascend in vapour; but tinestures take up all such parts as are capable of being suspended in a menstruum. Tinestures differ from elixirs as tinestures are watery, fpirituous, or other liquors impregnated with the active parts of fome one fimple; elixirs contain the active parts of more than one ingredient, fo are compound tinelures. Watery extracts from vegetables are indeed called infusions or decoctions, according as they are prepared by macerating, or by boiling the plant in water; the spirituous are named tinelures, effences, and eliminations. cording as the ingredients are numerous, or the menftruum faturated with the virtues thereof; when the tincture is of a thickish consistence it is called a balfam.

Though a number of the tin Hures take this name from the materials which form their basis, and are to be found under their specific appellations, yet some there are which cannot be so discovered, viz. tind. Amara, see Amara, — Martis, see Ferrum; —— Saturnina, see Plumbum; —— Salis Tartari, see Antimonii Tinctura; —— Thebaica, see Opium; —— Veratri, see

HELLEBORUS ALBUS.

TINEA, ABAS. See ACHOR. This ulcer eats like the tinea or moth. Dr. Cullen places the tinea as a genus in his class of locales, and order dialyfes. Bell, in his Treatife on Ulcers, ranks it as a variety amongst cutaneous ulcers.

TINNITUS AURIUM, from tinnio, to ring. A NOISE in the EAR, like that of a bell; all other kinds of noise in this organ have the same appellation. Hostinar attributes this disorder to spasmodic affections in the inner membranes of the cars. It is the species of deprawed hearing which Dr. Cullen calls paraculas imaginaria. And Heister proposes for the cure to give diaphoretical inwardly, and outwardly to funigate the meatus auditorius externus with the vapours of hot wine, in which is rofemary-leaves and those of lavender, and to put the feet into warm water. Etmuller observes, that when this is the effect of chronical disorders it is difficult to care. See Du Verney on the Ear, and its Diforders

TOLE. Toles, and Tolles. The Tonsils. M. A. Severinus applies this word to glandular abfeeffes in the limbs.

TOLUIFERA. See TOLUTANUM. The BALSAM TOLU. It is a refinous juice, flowing from incifions made in the bark of a tree, of which we have various accounts. Neumann fays it is a kind of fir-tree, which is called tolu, and that grows in the province of Tolu. It is the Toluifera balfamum, or the Toluifera Carthaginensis, foliis ceratiae similibus, store lutes, Linn. The balfam is brought to us in gourd-shells, or small callibashes; it is of a yell-ywus in gourd-fhells, or small callibathes; it is of a yell-awish brown colour, inclining to red; its confishence is usually thick and tenacious; by age it grows hard and brittle, without losing any of its odoriferous parts. Its smell
somewhat resembles that of lemons, particularly if rubbed on the hand; it hath an agreeable warm, sweetish,
glutinous taste; it is slightly pungent, and without any
mixture of a nauscous relish. Its virtues are in general
the same with those of the basis. Copaiba, and basism of
Peru, differing only in being milder and more grateful
to the palate and in the stomach. to the palate and in the ftomach.

This balfam totally diffolves in rectified fpirit of wine.

In distillation with water it impregnates the liquor with its fragrance, and if the quantity committed to diffillation be large, a small proportion of very fragrant effential oil is obtained. If distilled in a retort without addition, it fometimes yields a faline concrete like the flowers of

The London College order a fyrup and tinchure of this balfam.

TONICI. Diseases from tonic spasm. See SPASMUS

Tonicus.

TONSILLÆ. The TONSILS, called also amygdalæ, or ALMONDS. TOLÆ, TOLES, and TOLLES. These glands are seated on each side, at the lower part of the space which is left between the lateral half arches of the palatum molle; they are of a reddish colour, and externally have many holes, which communicate with an irregular cavity in their infide, and which contains a vifeid fluid, which is gradually discharged from the holes into the throat. TOPHUS. A TOPH. See GUMMA. Also the con-

cretions in the joints of gouty people, called epiporsma.

TOPICA, from τοπος, a place. Topics, or local ap-

plications.
TOPINARIA. A fpecies of tumor in the skin of the

TORCULAR. The TOURNIQUET. It is a kind of bandage used to check hæmorrhages after wounds or am-putations. The most simple of these is a fillet, long enough to encircle the wounded limb, with a fmall flick to twift it round with, and a small bolster to press upon the prin-cipal vessel. The sillet must be tied loosely above the orifice of the veffel; under this fillet, and over the artery, the bolfter must be placed, and then the fillet must be twisted by means of a stick, until it is sufficiently tight. If a tourniquet is applied on the arm, place it near the armpit, for there the artery is most superficial. The first armpit, for there the artery is most superficial. The first account of this instrument is in a treatise written by Mr. Lowdham, an English surgeon, and published in 1679: that improved by Mr. Crane, of Bartholomew's-hospital, is the most complete. Bell's Surgery, vol. i. p. 26, &c. TORCULAR HEROPHILI, also called Lecheneon; Lenos. It is a sinus of the dura mater; it is so called from Herophilus, who first discovered it. It is the place where the sinuses of the dura mater meet. See CEREBRUM.

TORDILIUM. It is a plant, of which Boerhaave mentions feven forts; the roots of fome of them poffers the same qualities as those of skirret, but they are not much noted in medicine.

TORMENTILLA, also called beptaphillum, consolida nubra, sertfoil, tormentilla erecta, or tormentilla sylvestris, caule erectiusculo, soliis sessilibus, Linn. UPRIGHT SEPTFOIL, or termentil. It is a plant with sender upright stalks, oblong indented leaves, which usually stand seven at a joint. The slowers are small, and of a yellow colour; the root is crooked and knotty, of a dark brown and blackish colour on the outside, and reddish within. It is perennial, grows wild in woods and on commons, and flowers in June.

and on commons, and flowers in June.

The roots are a firong and almost flavourless aftringent; what flavour it hath is highly aromatic. It gives out its aftringency both to water and to spirit, but most perfectly to rectified spirit of wine. It is usually given in a decoction, an ounce and a half of the root being boiled in three parts of water to a quart; at the end of the boiling about a dram of cinnamon is added. Three or four table spoonfuls of this decoction is a dole, both by itself and joined with gentian; it hath cured intermittent fevers, but it must be given in substance and in large quantities. It is one of the strongest of the order senticose amongst the vegetable astringents. This root and that of bistort are so similar, that they are used for one another. See Lewis's Mat. Med. Cullen's Mat. Med.

TORMENTUM. See ILIACA PASSIO.

TORMINA. GRIPES. A DYSENTERY. See DY-

TORNADO. From the Spanish, a HURRICANE, a WHIRLWIND. Dr. Schotte gives the following account of the tornados, which happen at Senegal. The rainy feason there begins about the middle of July, and ends about the middle of October: during this time, the wind is generally between the points of east and south, the quarter from which the tornados come. A tornado is preceded by a difagreeable closeness and weight in the air, which seems to be much hotter than the thermometer thews it to be; and it is known to come on by the riting of the clouds to the fouth-east, which by joining grow

companied with lightning and thunder, at a diffance. The breeze dies away by degrees, as the tornado advances, and an entire calm fucceeds; the air grows yet darker; animals and birds retire and fletter themfelves; every thing is filent, and the afpect of the flky, from whence the tornado approaches, is most dreadful. A violent storm comes on all at once, which is so cold as to occasion the thermometer to fall seven or eight degrees in a sew minutes, and strong enough to overset nears buts, we form minutes, and ftrong enough to overfet negro huts, vef-fels, or drive the latter from their anchors, and throw them on shore. The storm abates, and heavy rain fol-lows, accompanied with much lightning and strong claps of thunder. Sometimes tornados happen without rain, or at leaft a very little, but then the ftorm is more violent, and lafts longer. It hath been imagined by fome, that this kind of ftorm brings fome peftiferious quality with it, because they had observed, that out of a number of people, several fell fick in one night after a ternade. Dr. Schotte thinks, that no such ill quality is thus produced by its analysis to be influenced by its analysis. duced by it; and that the just named phenomenon may be attributed to the change it produces on the air, and of confequence on the body; it may therefore be confidered as the occasional cause of a disorder to which the body was predifposed long before. Schotte's Treatise on the Synochus Atrabiliofa.

TRACHELOPHYMA. See the BRONCHOCELE.

TRACHEOTOMIA. TRACHEOTOMY. It is the making an opening into the trachea. This operation is making an opening into the trachea. I his operation is also called bronebstomia, and laryngstomia. This operation is made by incision, or by puncture, betwixt the third and fourth ring of the trachea; or if this place cannot be chosen, the opening may be made a little lower. When the skin is cut through, a small incision may be made into the wind-pipe, and then a short but crooked canula may be fixed for the air to pass through. See Sharpe's Operations. Bell's Surgery, vol. ii. p. 403. White's Surgery, p. 204.

Surgery, p. 294.
Mr. Sheldon observes, that it is very happy both for the furgeon and the patient, that it is very nappy both for the furgeon and the patient, that this operation is very rarely required. When it is attempted, he advices to perforate below the thyroid gland; to cut cautiously between the two sterno-mastoid muscles longitudinally, being careful to avoid wounding the vein of the thyroid gland, as it will bleed plentifully. Care must also be taken that no blood is permitted to fall into the larynx, as it will undoubtedly suffocate the natient. Lastly, when the trocker doubtedly suffocate the patient. Lastly, when the trocher is introduced, let it not touch the back part of the larynx, because of the irritability of its membrane. It is a difficult operation, but it is best performed on those who have thin long necks.

TRACHOMA, from τραχυς, rengb; called also Da-fymma, if tettery; TYLOSIS, if callous; and sycosis, if the puffules should be thicker, or scabrous. It was epi-demic after the earthquake and fast at Rome. In Cullen's 8 O Nosology Nofology Nofology it is a variety of the ophthalmia taru. A roughneis of the eye-lids, particularly their internal parts. This roughness is from a fort of scabs, which differ much in their appearances in different inflances. These complaints are attended with a weight and heaviness in the eye, a fwelling in the eye-lids, a pain and itching, a heat and redness in the corners and in the conjunctiva, a viscid humour mixed with pungent tears flowing from the ulcers, which, when very glewy, closes the eye-lids together. If this complaint continues long in old people, the lower eye-lid grows thick, and turns downwards, so that the cartilage resembles raw fielh. The original cause is a faline humour, which is thrown on the eye-lids; the immediate cause is little ulcers there. A cure is sometimes performed by touching the part with a caustic; but the caustic is no sooner applied, than the pain which it occasions must be allayed by washing with warm water. Apply the caustic twice a week. St. Yves on the Disorders of the Eves.

Mr. Ware calls this diforder the pforephtbalmia, and describes it as follows. The ducts of the ciliary glands are ulcerated; when it happens that the oily foft sluid, secreted by these glands, being mixed with the discharge from the ulcers, is changed into an acrid humour, which quickly infpiffates into an hard adhefive feab. This feab lodging on the orifice of the ducts, fpreads the complaints, by the irritation which it occasions over the whole internal edge of the eye-lid, and prevents the pollibility of its being relieved, until the local remedies are applied, to prevent the formation of the feab, by curing those ulcers which ferved to produce it. This inflammation of the eye-lids being attended with an ulceration of their edges, a glutinous matter iffues out, and when they have been fome time in contact, as during fleep, they become so closely connected, as to require painful efforts for their separation. Usually, the ulcers are confined to the edges of the eye-lids, but fometimes they spread over the whole external surface, and even excorate the greater part of the cheek: in cases of the latter kind, the inflammation which accompanies, has often much the appearance of an eryfipelas. This diforder is fometimes attended with a contraction of the fkin of the lower eye-lid; in confequence of which, it is drawn down, and the inner part turned outward, fo as to form a red, fleshy, and very disagreeable

appearance.

To form a clear idea of this difease, it should be remembered, that on the infide, and near to the edges of the eye-lids, is fituated a number of fmall glands, fecreting a febaceous fluid, which is excreted by a row of ducts opening immediately on the inner edges of their border. These ducts, and fometimes the glands themselves, ap-These ducts, and sometimes the glands themselves, appear to be the parts principally assected; and the sluid which is secreted by them, instead of being mosts and mild, serving as a desence against the acrimony of the tears, is changed into a sharp, acrid, and adhesive humour; which causes a constant irritation of the eye and eye-lids, ulcerates the inner edges of the latter, and, for want of proper attention, has often perpetuated the disorder for a great number of years. Mons. St. Yves observes, in his chapter on the ophthalmy, subsequent to the small-pox, that "the pustules on the edge of the cartilage of the eye-lids, which penetrate between the cilia, and their inner surface, do not cicatrize, by reason of the and their inner furface, do not cicatrize, by reason of the acrimonious serosity, which incessantly humects the eye; hence follow ulcers, which last sometimes several years, and even during life, if they be not remedied." But though the small-pox and measles are frequent causes of this complaint, they are not the only ones; an inflammation of the globe of the eye, in itself but small, will sometimes affect the lids, so as to cause them to swell and betimes affect the lids, fo as to cause them to swell and become red; in confequence of which, there will be an adhefion of one to the other, and often an univerfal ul-ceration of their edges. The small pustules, also which form on the outer margin of the ciliary edge, where the lashes grow, and are known by the name of styes, have, in some instances, brought on an inflammation, which has been continued to the sebaceous glands, and produced all the consequences above described. This discorder is often spoken of as symptomatic, and the effect of order is often spoken of as symptomatic, and the effect of order is often spoken of as symptomatic, and the effect of order is often spoken of as symptomatic, and the effect of order is often spoken of as symptomatic. fcrophula, fcurvy, or lues venerea; but it is very often, if not most frequently, a local complaint; it cannot be known to be any other, except by such symptoms as evi-

dence the presence of these disorders. Yet, though this difeate most commonly takes place without any other complaint, at least as far can be discovered, it is yet neceffary to be observed, that it is fometimes accompanied with the plainest marks of a scrophulous constitution, and feems evidently to arife from it.

Those ulcerations that appear to be superficial, are not generally tedious to remove; but if they are deep, they are much more difficult to cure than those attended with

fungous flesh.

In order to the cure, it hath been the general custom to touch the edges of the cyc-lids, where the ulcers were fpread, with the lapis infernalis, perhaps two or three times a week; but to moderate the feverity of this method, the part was prefently washed with pure water. However, the pain excited by this application feems much to have deterred from its use; and Mr. Ware hath proposed a method of relief, equally effectual, but by far less exceptionable. He directs, when this kind of inflam-mation extends over the whole furface of the eye-lid, and on the cheek, taking on the appearance of an eryfi-pelas, that it be treated with antiphlogistics and sedatives; and when the extreme irritability is removed by proper applications, to finish the cure by means of the ungt. ci-trinum Ph. Ed. used as hereafter directed.

Sometimes the lower eye-lid turns outward in this difeafe, which then proves obstinate to cure, but with due perseverance it is overcome by the general method only

proposed for the psorhophtalmy.

If, in any instance, other symptoms evidence the pre-If, in any initance, other symptoms evidence the pre-fence of a scurvy, scrophula, or venereal taint, those dis-cases must be relieved, before any benefit can be procured for that of the eye-lid. When a scrophula is the source of this disease, though the patient is perfectly cured, as far as respects the external symptoms, there is skill a dan-ger of its returning; to prevent which, such means as are used in scrophulous cases should be continued for a considerable time after.

considerable time after.

With respect to the psorophthalmia, the first endeavour should be to soften the scabs and remove them, and to use fuch applications to the ulcers, as may correct the acri-mony of the discharge, promote digestion, and bring them into a state of healing. The intention of Mons. St. Yves, mony of the dicharge, promote digettion, and bring them into a ftate of healing. The intention of Monf. St. Yves, in his direction for the cure of the ulcers, on the edges of the eye-lids, subsequent to the small-pox, does not appear to be much unlike that which I have here mentioned, as appears from the following quotation. "Ophthalmic waters, in general, are of very little service; but I have found from my own appearance that the service is the law. found, from my own experience, that, by touching them with the lapis infernalis, they cicatrize eafily. The vio-lent heat of the caustic must be abated as foon as they have been touched, by washing the eye in a small glass full of warm water; you must, above all, take care that the part of the eye-lid, which was cauterized, may not bear against the globe of the eye, till the pain is entirely gone off. They may be touched in this manner, once or twice 2 week, until they seem to require no more use of the causanteed. tic; then lay on these places tutty, finely powdered, to cicatrize them." Monf. St. Yves here recommends a very firong caustic; but on a part so tender, a milder ap-plication will succeed, as is evident from the advantages attending that which I have preferred, viz- the ungt. ci-trin. which may be used as follows. Hold the ointment before a lighted candle, so that its surface may be melted into an oily confiftence; take this oil on the end of the finger, and carefully rub it on the edges of the affected eye-lids. The use of it, once in twenty-four hours, will be sufficient; and that should be when the patient goes to bed: immediately after the application, a foft plafter, fpread with the cerat. fpermatis ceti. Ph. Lond. is to e bound loofely over the eye-lids, which will preferve them moist and supple in the night, and contribute to pre-vent their adhesions to each other. If, notwithstanding this cerate being applied, it should be difficult to open the eye-lids in the morning, they may be washed with milk and fresh butter, well mixed together, and warmed, by which the patient will be able to open them without pain. If the eye-lid is very irritable, the melted ointment may be applied with a camel-hair pencil: indeed, fometimes the irritability is fo great, that before the ointment can be applied, other means must be used to remove that symptom, as is already noticed.

If in confequence of this disease of the eye-lid, the eye itself should be inflamed, the usual methods of relieving an inflamed eye may be used.

See St. Yves on the Difeases of the Eye. Ware's Remarks on the Ophthalmia. Wallis's Sauvages's Nofology

of the Eyes, p. 27.
TRAGACANTHA. GOAT'S THORN, from TPATES, a goat's and αχανδα, a thern, because its pods resemble a goat's beard. It is also called fpina biret, and astrogalus aculeatus. Astragalus-tragacantha, Linn. It grows in the fouth of France, Italy, &c. but it is only those which grow in the caftern countries that yield the gum. See Gummi TRAGACANTHA.

the blood of an animal into the vessels of the human species by means of a canula, and vice versa. This custom first originated amongst the English physicians, afterwards was taken up by those of France, but very soon sell into disrepute: the word insuface is considered as a synonyme.

TRANSPIRATIO. See Persperatio.

TRANSVERSALES MAJORES COLLI. These muscles are long and thin; they are placed along the transverse apophyses of the neck, and the four, sive, or fix upper bones of the back, between the complexus major and minor. They rise from the transverse apophysis, and are inserted into the next nearest apophyses, physis, and are inferted into the next nearest apophyses, and fometimes to other more remote ones.

TRANSVERSALES COLLI MINORES. Sec INTER-

TRANSVERSALES.

- NASI. These muscles rise from the upper-part

of the upper-lip, and run to the ridge of the noie.

Dorsi Minores. Winflow speaks of these as

being fixed to the extremities of the lowermost transverse apophyses of the back.

TRANSVERSALIS. A name for the teres minor.

TRANSVERSALIS ABDOMINIS. The TRANSVERSE MUSCLE of the BELLY. These muscles, one on each fide, take their name from the direction of their fibres. They rife from the transverse processes of the lumbal vertebræ, the fpine of the os ilium, the ligamentum pubis, and the cartilaginous endings of the ribs below the fternum, from whence their fleshy parts run over the peritoneum, and become a broad, expanded tendon, before they run under the rectus, to their infertion into the whole length of the linea alba. When they act, they prefs the belly inwards, deprefs the ribs, &c.

ANTICUS PRIMUS. It is fituated between the basis of the occipitis, and the transverse apophysis of the

first vertebra of the neck.

ANTICUS SECUNDUS. It is fixed by one extremity very near the middle of the transverse apophysis of the fecond vertebra of the neck, and by the other, near the basis of the first.

DIGITORUM. This mufcle lies transversely under the first phalanges of the toes: it is fixed to the first phalanx of the great toe, and its other end is in-ferted into the first phalanx of the little toe.

- PEDIS PLACENTINI. See ADDUCTOR MINI-

— URETHRÆ, called also triangularis. It is a di-gastric muscle: it lies along the lower part, or the loose edge of the ligamentum pubis interoffeum; its two ex-tremities are fixed in the branches of the offa pubis, its middle tendon lying on the middle of the edge of the li-

TRANSVERSUM EXTERNUM CARPI LIGAMENA TUM. It begins by a broad infertion, fixed in the large ex-tremity of the radius, about two fingers breadth above the flyloid apex, it afterwards croffes obliquely, partly over the convex fide of the basis radii, and partly over that of the carpus, and then turning towards the os orbiculare is inferted therein.

TRANSVERSUM INTERNUS CARPI. It is an annular

TRANSVERSUS SPINALIS COLLI, DORSI, & LUMBARES. See MULTIPIDUS SPINÆ.

TRANSVERSUS. See PRONATOR QUADRATUS.
TRAPEZIUM, Os. The first bone of the second row in the wrist. So called from its shape, which is that of a trapezium. See CARPUS.

TRAPEZIUS MUSCULUS. See Cucularis.

TRAPEZOIDES, Os. The fecond bone of the fecond row in the wrift. It is shaped more like a pyramid with its point broken off, than like a trapezium.

TRAULOTIS. The PSEBLIOMUS RINGENS. See PSELLISMUS

TRAUMATICA, from τραυμά, α τυσικά. VULNE-RARY MEDICINES. Thus the Greeks called corobo-rants that were aftringent agglutinants. TRAXINI ARBOR FOLIO FLORE CERULEO.

See AZEDARACH.

TREMOR. See HORROR. Tremers happening from too free a use of spirituous liquors, and other excesses, usually require the same treatment as palities.

Dr. Cullen confiders it as always fymptomatic, and confequent on extreme debility, palfy, or convultion. It is a trembling, without a fentation of cold.

TREPANATIO. The operation of TREPANING.

As much as this operation is commended by fome, there are others among the most eminent modern practitioners, who forbid it in all cases of injury done to the head, ex-

cept when the skull is depressed.

This operation is proposed to relieve the brain from depressed parts of the skull, fragments of the broken bones of the skull, extravasations of matter upon or under the membranes of the brain, and other causes of pressure, of irritation, and of inflammation, &c. Many parts about the skull are objected to, but the operation hath been performed on most of them with the happiest success; and as to the reft, fimilar objections lay against some parts on which custom allows the trepan to be used. The operawhich cuttom allows the trepar to be uted. The opera-tion refolved on, the inftruments, dreffings, &c. must be in readiness; then the head being staved, must be held steady upon a person's knee; with a proper knife and the scalprum, a piece of the scalp, must be removed: enough should be separated at the first to give room for a suffi-cient number of personations. In cutting be careful to cut through to the bone at the first essay, and the edge of the knife should be so inclined as to cut more of the personaknife should be so inclined as to cut more of the periorawith the point of the knife, quite round the incison, and then with the fealprum clear the skull of its membranes. The trephine is the most commodious instrument, for it works both backward and forward. When the saw hatt entered well into the bone, take out the central pin of the trephine, and fometimes take out the faw to examine the depth to which it hath paffed, and to bruth out the fmall portions of bone that might impede the operation; the diploc is fometimes wanting, fo should be attended to; as loon as the piece is loofe, take it out with the forcers, and if the lower edge of the perforation is rough, smooth it with the lenticular; this done, raise the depressed piece of fkull with an elevator, which now is made with fulcra to rest on the found bone; after this, if extravafulera to reit on the found bone; after this, it extrava-fated matter feems lodged under the dura mater, open it with a lancet for its discharge. When the trephine is used on account of a fiffure, it must be applied to as to include part of it, if not directly over it, as is most likely that the extravasated blood or lymph will be found di-rectly under it; and when the fiffure is of a confiderable extent, a perforation must be made at each end, if not more. When feveral perforations are to be made, in order to the removal of feveral depressed fragments of bone that have their internal furface larger than their external, it is necessary to apply the trepan as near the frac-tured parts as they will admit of, making the perforations adjoining to fave the trouble of cutting the intermediate

fpaces with the head-faw. In places where the un-equal thickness of the skull is observed, it is best to elevate the piece that is fawed before it is cut quite through, thus the membrane will be unhurt. When an injury happens on a future, and it is not thought advisable to use the trepan there, make a perforation on each side of it. By the trephine having removed the pieces of bone, and thereby prevented all the present and future ills dependent on their remaining; after this, the dreiling thould accord with the general intention of not irritating, and should be as innocent in quality, and small in quantity as possible; clean dry lint to absorb the matter, is all that can be wanted, this may be kept on by a common woollen cap, which is preferable to all bandages whatever. After dreffing, lay the patient in as easy a posture in bed as possible, and with his shoulders raised high. Perfect quietude, open bowels, and the veffels emptied by venefection, and a low diet, are to the full as necessary before as after removing the pieces of the skull. The air of the patient's room should be temperate. In young people the perforations are in time filled up with a substance that is of a bony hardness; but in adults this does not happen so perfectly. Sometimes a fungus proves trouble-fome, but it is best prevented by applying a plate of lead, as invented and described by Belloste. See his Hospital Surgeon, Heister's Surgery, Sharpe's Opera-tions, Gooch's Cases and Remarks, White's Surgery,

TREPANUM. A TREPAN. An instrument to bore

the skull with, called also terebella.

TREPHINE. An inftrument with which we per-forate a bone; chiefly used in the operation, called tre-panning. It hath been variously formed, and thence re-ceived different names: e. g. Abaptista, abaptista, ana-baptista, mediclus, terebra, terebella, and trepan. Until lately, the trepan was, and still is very generally used on the continent; however, the trephine is more commo-dious, and acts as quickly as the trepan. See TREPA-

TRIANDRIA DIGYNIA. So Linnœus terms the

fecond order of the third class of vegetables.
TRIANGULARES STERNI. These muscles rise from the fide and edge of the sternum and xiphoid cartilage internally, and are inferted into the cartilages of the fixth, fifth, fourth, third, and fecond ribs, to deprefs them, also called pelloralis internue, sterno costales.

TRIANGULARIS. A name of the following muf-

cles, viz. the depressors labit superiores, scalenus, deltoides, transversales uresthree, pyramidalis nass, splenius.

Triangularis Vena. A name for the external jugular vein, where it passes through the musculus trian-

TRIBULUS. See CALTROPS.

TRIBULUS AQUATICUS. WATER CALTROPS. It is a plant which grows in watery places in some parts of Germany and in Italy; but it is not noticed in practice. TRICA LUMBORUM. A species of plica Polo-

TRICEPS AURIS. See ABDUCTOR AURIS.
TRICEPS. Thus it is named in Calen's works. It rifes by its first head from the fore part of the os pubis, and its tendon is inferted into the linea femoris afpera, and is then blended with another head which runs down to the knee. The fecond head rifes from the fore part of the os pubis, and is inferted higher in the linea afpera. The third head takes its origin from the small process of the ischium, close to the obturator externus, and is inferted in the linea afpera behind the little trochanter. The fourth rifes from the ischium and its tuberosity, and it is inferted in the linea afpera, and, joining with the first, forms a tendon which goes to the knee, blended with that of the vastus externus.

They move the thigh-bones inward, according to their different directions, and bring them to each other. Douglas makes this into four muscles, and calls the first, adductor femoris primus; the fecond, adductor fe-moris fecundus; the third adductor femoris tertius; the fourth, adductor femoris quartus. The fourth head he makes by dividing the upper part of the third head into two. The third and fourth are described by Albinus and Winflow, as one muscle, under the adductor magnus femoris, & le troisseme muscle du triceps, it is also called triplex musculus.

TRICHIA, or TRICHIASIS, from Spt, a bair. It isalfo called entropium, diffichiafis, districhiafis, capillitium distri-chia. It is when the cartilage on the edge of the eye-lid is to inverted as to bear upon the conjunctiva and the cornea transparens; then the friction of the eye-lashes excites an inflammation in the eye. According to the author of the Definit. Medicæ, it is, "A falling of the eye-lids and a preternatural generation of hairs on them." He makes three forts, to which he gives the names of phalongofis, ptofis, and hypophylis, and as fome fay, a fourth, vizdifichia. Actuarius calls the trichiasis by the name of trichofis.

The friction of the eye-lashes in this case, brings on defluxions and inflammations, if not prevented by pulling out the hairs, one by one, at fuch distances of time, as may

be necessary for preventing inflammation thereby.

In Dr. Cullen's Nosology this difease is an inflance of

fymptomatic ophthalmy, called ophthalmia trichiafis.

The word entropium, i. e. the turning inward of the eye-lid, is referred to this article, as being occasionally a cause of inflammation in the eye, by directing the eye-lashes against the conjunctiva. Indeed Heister calls the inversion of the eye-lids the trichiasis. Mr. Ware, in his Remarks on the Ophthalmy, &c. distinguishes as follows, betwit the inversion of the upper and under eye-lids, both as to the cause and cure. And speaks,

First, of the inversion of the upper lid.

The upper lid and its ciliary edge, he observes, are preserved, both in motion and rest, in their natural fituation, by the equal, though contrary, actions of the muf-culus orbicularis, and levator palpebræ superioris. The skin of the upper lid is always very thin, slaccid and folded. When therefore the trichiasis affects the upper lid, it ap-pears to be produced by a relaxation of the levator palpebrae fuperioris, and a contraction of the fuperior part of the orbicularis. The cure either in the upper or lower lid, is palliative, or radical. It is only palliative, when, in order to relief, the eye lathes are extracted by their roots. The radical cure is affected by detracting the ciliary edges, and preferving them in their natural fituation. The cause being a relaxation of the levator palpabre superioris mus-cle, an incision must be made through the integuments of the upper eye-lid, from the inner angle of the eye to the outer; then the fibres of the orbicularis mufcle must be fo feparated, as to denudate the expanded fibres of the levator mufcle, as near to their termination in the edge of the lid as possible; which being done, apply a small cauterising iron, adapted to the convexity of the globe of the eye, and made pretty warm, by passing two or three times over the tendino-carneous fibres. Thus, by producing a flight irritation, which occasions the same effect, as is often observed to happen after burns, particularly in the hands, after which the singers often contract, and in many inflances have remained contracted ever after, a cure may be expected.

Secondly, of the invertion of the lower lid.

The lower lid, whose motion is very small, in compa-rison with that of the upper, is preserved in its natural state, by the equal action of the orbicular sibres spread over it, and the thickness and renitency of the skin which covers it. When therefore a trichiafis is produced in the lower lid, it can only arise from a relaxation of the the lower had, it can only ame from a relaxation of the fkin, and a contraction of the inferior part of the orbi-cularis. The cure will necessarily be effected by increasing the renitency of the skin to such a degree, as to prevent the contraction of the musculus orbicularis. When the case is recent, a cure hath sometimes been effected, by forming a fold in the skin before the inverted lid, to draw its edge from the eye, and preferving the fkin in that flate by the application of flicking plafter: or, by means of an inftrument fimilar to that contrived by Bartischius, and represented by Heister, plate 15. fig. 20. to pinels up a small portion of the skin, and hang thereby on the check; which by its weight, answers the same purpose as the platter, and is less liable to lose its hold. In slight cases, the skin may recover its tone by these means; but in others, it will be necessary to cut off a finall transverse portion of the loofe skin below the edge of the lid, and afterwards confine the fides of the wound together by means of a future.

Sometimes there are inflances in which none of the above methods will fusine; as, where the ciliary edges are not only inverted but likewise contracted or shortened

in their length. In this case, the circumference of the ciliary edges must be enlarged either by an incision at the outer angle, or by a complete division of the cartilage, called tarfus, in the middle. The first of these operations is no more than a fimple straight incision, which tions is no more than a fimple straight incision, which may be made with a sharp-pointed curved bistory. The last, which is seldom necessary, will be best performed by the same instrument; only observing, that the point be carefully introduced between the globe and eye-lid, and carried below the cartilage, that is about \(\frac{1}{2}\) of an inch; whence it is to be pushed outward in a horizontal direction, till it hath cut its way through the lid. The cartilage being thus entirely divided, each portion will recede towards the angles, and a separation be left between them, which will not only take off the comtween them, which will not only take off the complaint at prefent, but prevent its return for the future. Bell's Surgery, vol. iii. p. 275. Ware on the Ophthalmy. Wallis's Sauvages' Diforders of the Eyes, p. 1, 18. White's Surgery, p. 247.

TRICHIASIS is a term for an affection of the utine, in which fomething like hairs is feen floating. In

Erotian, it fignifies fiffures, or a roughness in the skin of the breast, though he calls an abscels in a woman's breast

TRICHISMOS. This is a species of fracture of the cranium, which appears like a hair almost imperceptible to the fight, hence it is fometimes the cause of death, because it does not readily discover itself. From its minuteness it derives its name. It is called by the Latins

TRICHOMANES. See ADIANTHUM NIGRUM. TRICORNES. So mufcles are called which have

TRICUSPIDES VALVULÆ. The name of the three valves which are placed at the mouth of the right ventricle of the heart, just at its juncture with the auri-

TRIFOLIUM. TREFOIL. QUADRIFOLIUM, TRINITAS. Boerhaave takes notice of thirty-fix species, feveral of which are called clover, and are used for feeding cattle only. See Raii Hist.

TRIFOLIUM ACETOSUM. WOOD-SORREL. See

ACETOSELLA.
TRIFOLIUM PALUDOSUM. MARSH TREFOIL, OF BUCKBEAN. Menyanthes Trifoliata, or Menyanthes palasfiris latifolia foliis ternatis, Linn. It is a plant with large oval leaves, pointed at each end like those of the garden bean; set three together on long pedicles, which embrace the stalk to some height, and there parting, leave it naked to near the top, where issues forth a short spike of pretty large reddish white monopetalous slowers, each of which is cut into five segments, hairy on the inside, and followed by an oval seed-vessel. It is perennial, grows wild in marthy places, and slowers in May. The leaves are of a penetrating bitter taste, which they impart both to watery and to spirituous menstrua, without any remarkable slavour; they are used as alteratives and aperient, in hydropic and rheumatic cases. They are usually insused in water, with the addition of some grateful aromatic, such as orange peel, or the canella alb. So it is of this insusion should be drank in a day; it passes off by urine, and renders the belly lax. See Lewis's Mat. Med. BUCKBEAN. Menyanthes Trifoliata, or Menyanthes palustris Med.

Med.

Dr. Francus fays, infusions of this, in water, beer, or wine, have been of great fervice in intermitting periodical aches, in old intermitting fevers, in the jaundice, headdropfy, gout, and palpitations of the heart; and that an infusion of this herb proved a good wash in the impetigo, the scales, and tinca. It has been greatly recommended as an antiscorbutic, and used as a strengthening bitter. Monro's Pharmaceutic Chemistry. Dr. Cullen considers it a very pure bitter, of a strong kind, not losing its strength by drying, and has had several instances of its good effects in some cutaneous diseases of the herpetic and seemingly cancerous kind, taken by insusion in tic and feemingly cancerous kind, taken by infusion in manner of tea. Materia Medica.

manner of tea. Materia Medica.

TRIGEMINI NERVI, called also innominati. The fifth pair of nerves, large, rifing from the annular pro-celles, where the medullary proceffes of the cerebellum join, in the formation of that tuber; to enter the dura join, in the formation of that tuber; to enter the dura mater near the point of the petrous process of the temporal bones, and then finking close to the receptacula, at the fides of the sella turcica, each becomes in appearance thicker, and goes out of the skull in three great branches; Opthalmicus, Maxillaris superior and inférior.

TRIGEMINUS MUSCULUS. See COMPLEXUS. TRIGONELLA. FENUGREEK. The species in use, is the trigonally formum or trigonally Monstree.

is the trigonella focuum-gracum, or trigonella Monspeliensis, foliolis obovatis, leguminibus tessilibus strictis erectiusculis subsalcatis acuminatis, caule erecto, Linn. Fenugreek. The seeds only are used. See Fornum

TRINITAS. A name of the trifolium, and for the

TRIORCHIS. A person with three testicles; also a

name for a species of orchis.
TRIPASTRUM APPELLIDIS. An ancient furgeon, imitating the invention of Appellides who framed a machine for launching flips, conftructed a machine for fetting fractured limbs on fimilar principles, which, because it was worked by three cords, was called tri-passirum Appellidis seu Archimedis, as these two last laid equal claim to the invention of launching ships.

TRIPLEX MUSCULUS. See TRICEPS.
TRIQUETRA OSSA. They are also called Wormiana, from Wormius, who first observed them. They are fmall irregularly fliaped pieces, principally betwirt the parietal and occipital bones, and are joined by true futures

parietal and occipital bones, and are joined by true futures to their adjacent bones.

TRISMUS. The LOCKED-JAW. Dr. Cullen places this genus of difeafe in the clafs neurofes and the order fpatmi: he defines it to be a fpatte rigidity of the lower jaw. He observes two species. I. Trifmus Nascentium. To this infants are subject during the first two weeks after their birth. 2. Trifmus Traumaticus. To this perfons of any age are subject, either from a wound or from cold. See Tetanus.

TRISSAGO. See CHAMEDRYS. also Suppose their subjects.

TRISSAGO. See CHAMEDRYS, also Scor-

TRISTITIA. GRIEF or SORROW. Grief relaxes the folids, flackens the motion of the fluids, and deftroys the health; it particularly weakens the flomach and inteftines, occasions flatulence and every fymptom of weakness. Opiates, if not given in large dofes, are good cordials in

this cafe.

TRITÆOPHYA, from 75020, a tertian, and TRITÆOS, rom, importing fimilitude of nature, or original; it is an epithet of a fever, much of a nature with a tertian, and taking its rife from it. This fort of fever is almost continual, its intermissions are obscure or short. Linneus calls it a continued tertian. Erotian and fome others fay, it is a continued tertian. Erotian and fome others fay, it is a fever which gives figns of its approaching paroxyfms, but whose intervals are regular, as it never arrives at perfection; and that it takes its name from its great resemblance of a tertian; and that it is called a small semitertian. See James's Med. Dict. art. TRITEOPHYES.

TRITICUM. WHEAT, called also frumentum triticum Hybernum. Linn. Whether in the form of flour, or of starch, it is the most glutinous of the farinacca. In Italy they make vermicelli of the finest slour of wheat.

This is the farinaccous food most generally used by the

Italy they make vermicelli of the finest flour of wheat.

This is the farinaceous food most generally used by the better fort of people over the whole of Europe, excepting the very northern parts in which it cannot be produced, but even there it is imported. It has this advantage, that it can be formed into a more perfect kind of bread than any other of the cerealia yet known. See Panis, and Cullen's Materia Medica.

For that called — Repens, see Gramen canimum; — Vaccinum, see Melampyrum; — Creticum, see Agriostari.

TRITORIUM. A glass for separating the oil from the water, which is obtained by diffilling. It is also called a separatory glass. See Depuratio.

TROCAR. The name of an instrument used to discharge the water with, in an ascites. The word trecar is a corruption of the French words un trois quart, a three

a corruption of the French words un trois quart, a three 8 P

quarters, from the three fides with which the point is

TROCHANTERES. Two processes of the thighbone, one of which is larger than the other. See FEMO-

RIS OS. From τρεχω, to run, because several muscles that move the thigh are inserted into them.

TROCHISCI. TROCHES. It is a form agreeable enough for children, and those who object to every thing that is not a fweetmeat, and a preparation from the con-fectioner. Trackes are also called tablets and cakes. They are made by mixing the medicine with a proper quantity of fugar, and the mucilage of gum tragacanth; and when formed into a fliff pafte, it is cut into proper portions, and dried.

TROCHITÆ. See ENTROCHUS.
TROCHIEA. Tpoxxxx, a pulley. A kind of cartilaginous pulley, through which the tendon of one of the muscles of the eye passes.
TROCHLEARES. See PATHETICUS.
TROCHLEARES MUSCULUS. See OBLIQUUS

TROCHIEARTS MOSCOLOS. See OBSIGES MAJOR OCULI, or SUPERIOR AMATORIUS.

TROCHOIDES, from \$\tau\_{19\circup\_{0}}\text{c}\_{1}\$ rota, and \$\text{u.b.s.}\text{c}\_{2}\$, forma, fimilar to a wheel; named also axea commissura. It is an epithet to an articulation, or juncture of bones, when one is inferted into the other like an axletree, which has the motion of a wheel, as appears in the first and second

TURBINATUM. The PINEAL OLAND:

TURBITH, also called turpethum and turpetum. It is the cortical part of the root of a species of convolvulus Indicus, which is met with in the East Indies; the convolvulus turpethum, Linn. It is in oblong pieces, of a brown, or an aft colour on the outfide, and whitift within. The beft is ponderous, not wrinkled, eafy to break, and difcovers to the eye a large quantity of refinous matter. The bark is cathartic, but so unequal in its strength, that it is now neglected in practice. See Neumann's Chem Works. Lewis's Mat. Med. It is also a name of some kinds of

feseli.
TURCICA SELLA, i. c. SPHENOIDALIS SELLA.

See Sella Turcica.
TURPETHUM, and Turpetum. See Turbith.
Turpethum minerale. See Merc. emet

TURRITIS. Tower Mustard, called also braffica miagra, sinapi. There are several species of this plant, but they are not noticed in the present practice.

TURUNDÆ. TENTS. They are usually made of lint, and introduced into deep wounds. They are used, 1. To convey medicines to the bottom of a wound. 2. To hinder the external part of a wound from healing before the bottom. 3. The better to clean wounds from what should not be retained in them; but they should be very soft. not be retained in them; but they should be very soft, that they may neither obstruct the discharge of matter, nor hinder the healing of the wound in general. Tents are made of sponge, for dilating the orifices of wounds; they are also made of the dried roots of gentian, turneps,

comfrey, calamus aromaticus, &c.
TUSSILAGO, also called bechium, bechion, calceum equinum, chamæluie, filius anti patrem, farfara, farfarella. COLT'S-VOOT. Tustilage farfara; or, tustilage foliis sub-cordatis angulatis denticulatis scapo imbricato unisloro, floribus radiatis, Linn. It is a low plant, producing early in the fpring fingle stalks, each of which bears a yellow sloculous flower, followed by several seeds winged with floseulous flower, followed by several seeds winged with down; the leaves, which succeed the flowers, are short, broad, angular, slightly indented, green above, and hoary underneath. It is perennial, and grows wild in moift grounds. The leaves and flowers are mucilaginous, bitterish, and roughish; they have little or no smell; insusions of the leaves are sweetened with liquorice for a common drink, when a troublesome cough attends: but if any considerable advantage is expected, a strong decoction should be made, and used freely. This Dr. Cullen says he is afraid has little virtue, as he has often employed it, but never found it either evidently demulcent, or expectorant. However he has employed it in scrotilous cases, and in several with seeming success. The expressed juice of the fresh leaves was taken to some ounces every day, and occasioned the healing up of scrophulous fores; and even a strong decoction of the dried leaves, employed as Fuller proposes, have seemed to answer the same purpose: however in some cases they both have failed, or have not however in some cases they both have failed, or have not been sufficiently effectual. See Cullen's Mat. Med. Lewis's Mat. Med. For that called — Major, see

TUSSIS. BEX. A cough. It is a violent expulsion of fome fort of matter from the bronchia of the lungs, by means of a convulfive force in them, accompanied with a violent expiration. Dr. Cullen observes that it is generally a symptomatic catarrh.

The seat of every cough is in the breast generally, but the remote cause is variously situated. The diversity of

this cause produces a variety in the species of this disorder. The principal feat is the aspera arteria, and the bronchia; thefe are irritated, or the morbid irritation may be in fome part adjacent, as the diaphragm, the ftomach, the cefopha-gus, the pleura; the external furface of the lungs, &c. What in the ftomach caufes a vomiting, in the bronchia will caufe a coughing. Vellications may be produced in the bronchia by content of parts, as happens when coughs attend in pleurifies, wounds about the neck, inflammation of the liver, &c. Exhalations which float in the air, &c. are fometimes a cause; defluxions of rheum, or an acrid mucus falling from about the head, may irritate the afpera arteria, and excite a cough. Acrid matter in the ftomach, or in the duodenum, is a frequent cause of this complaint. Spafmodic diforders are often attended with a cough, the lungs fuffering either by consent from the seat of the spain, or becoming in their turn the seat of that which produced the spain in some distant part; but, perhaps, of all the causes, there are not any so frequent as that of defective perspiration.

A dry cough generally becomes a moift one; which, if of long continuance, destroys the appetite, weakens digestion, induces a cachectic habit, and a hectic fever. Commius observes, that a cough passing into one of a dry kind, and leaving a fense of weight in the breast, subjects the patient to a putrid or to a hectic sever. Coughs which succeed a scirrhus in any of the viscera, are generally incurable. It often happens that when a cough ufhers in a difease, that it ceases as the approaching disorder is more manifest. A moderate heat in the night, an equable moisture all over the body, a copious discharge of urine, a due solubility of body, tranquil sleep, and an easy ex-pectoration, are sure signs that the cough is in a fair way

to be removed. Coughs are generally dry ones at the first, and, whilst in this state, they may usually be cured by chewing, immediately after every fit of coughing, about a fcruple of the bark; the belly must be kept lax, and the feet warm, and perspiration must be promoted. Dry coughs generally become most by spoiling the digestion; though it is proper to observe, that in hypochondriac, and some other habits, the cough is usually dry, and in phlegmatic relaxed habits it is moift.

If the bronchia are obstructed with viscid phlegm, the best resolvents are the rad. scillæ, gum. ammon. or rad.

Thin acrid humours are best carried off by incrassating medicines, such as the rad. glychirr. gum. trag. sperma-

When catarrhous coughs are habitual, and accompa-nied with lofs of appetite, there is danger of a confumption; and the cure must be attempted by asses milk, whey, Seltzer water, &c.

When there is a defluxion and congestion of serum about the lungs, it is necessary to derive the ferum from thence, partly by the anus, and partly by the skin. In all thence, partly by the ands, and partly by the ikin. In all coughs perspiration must be promoted, and the belly kept soluble. As a purge, manna, or the ol. ricini, should be preferred; and to allay the cough in the night, let the following pill be given a little before bed-time. R Pil. styrac. gr. vi. pil. ex aloe, cum myrrha, gr. x. m. As a perspirative, many of the antimonial preparations are peculiarly stefal. ufeful.

When the cough abates, stomachic bitters should not

be neglected.

These general methods, with a due attention to the non-naturals, will, with such peculiarities as circumstances suggest to the practitioner, prove generally efficacious to relieve, and always prove palliative in this violent dif-

Sweet and oily medicines fhould rarely be admitted of, though fo frequently recommended. The tinctura opii camph, is an excellent anodyne, and affifts perfpiration if taken at bed-time. When a blifter cannot eafily be complied with, a plaster of Burgundy pitch may be subfituted for it, a fresh one being used as soon as the old one begins to separate from the skin.

When a bad digestion is the cause, or aerid matter in the stomach, a semit may be directed, and after it a mix-

the stomach, a vomit may be directed, and after it a mix-ture of tinct. rhab. aloes, of each equal parts, may be taken so as to keep the bowels lax, until the disorder is

removed.

Spaintodic toughs are removed by opiates, and nervous medicines, with the bark. See Celfus, Hoffmann, Wal-lis's Sydenham, Brookes's and the London Practice of

Physic.
Tussis CATARRHALIS, i. c. A CATARRH from cold.

See CATARRHUS.

— CONVULSIVA. See PERTUSSIS.

TUTENAG. A name for zinc, also for a white me-

tal which is compounded in China, and is called alfo Chinese copper. See ZINC.

TUTIA. TUTTY, called also eadmia fastitia, cadmia formacum. It is an argillaceous ore of zinc, found in Persia, formed in cylindrical moulds into tubulous pieces like the back of a tree and baled to a modern. pieces like the bark of a tree, and baked to a moderate hardnefs. It is generally of a brownish colour, full of small protuberances on the out-side, smooth and yellowish within, but sometimes whitish, and at others of a bluish

When tutty is finely levigated, it is drying and cicatrifing; it is used in collyriums to repel slight in samma

tions in the eyes. See Lewis's Mat. Med.
TUTSAN. See Andros Emum.
TYLOSIS. See TRACHOMA.
TYLLOMA. A CORN. See CLAVUS.

TYMPANI MEMBRANA. The MEMBRANE of the DRUM of the EAR, is a thin, transparent, flattish pellicle, the edge of which is round, and ftrongly fixed in the circular groove, which divides the bony meatus of the external ear from the tympanum, or barrel: This mem-brane is very tenfe. The modulations of external air, by impressing the membrane, moves the malleus which is fixed to it, and so it proves a means of founds being

readily conveyed to the common fenforium.

TYMPANITES. A TYMPANY, called also meteorifmus, and FLATULENT DROPSY. Notwithstanding what is afferted by many eminent authors and practitioners, there are others who dispute the exist-ence of the disorder described under this name. Dr. Cullen places this genus of difease in the class cachexise and order intumescentiæ. He diftinguishes two species. I. Tympanites intestinalis. 2. Tympanites abdominalis. Its immediate cause is said to be statulencies, which are pent up in the colon, or in the rectum, according to some, and in the smaller intestines according to the description of others. Some fay that the matter is partly water and partly wind.

However opinions may vary in other respects, it is generally agreed that the belly is distended principally with slatus; and as in such circumstances the chief intention is to discharge the flatulencies by the anus, antispasmodies, anodynes, and laxatives, will be indicated to relieve, and aromatic corroborants to prevent a relapfe. The first intention will be probably answered by means of the sp. actheris nitrost cum tinct. opii, and such doses of the pil. ex aloe cum myrrha as may be required, without purging too freely; the second intention will be effected by a proper wied of the rad, sectors, corresponding to the rad. per used of the rad. zedoar. cort. aurant. summit. cen-taur. minor, &c. See Celsus, Junker, Hossman, Heister, Mead, &c. Cullen's First Lines, vol. iv. Wallis Syden-

TYMPANUM. The DRUM, or the BARREL of the EAR. It is the hollow part in the bone, in which the bones of hearing are lodged, and is betwixt the pars petrofa, and the pars fquamofa of the temple bones; it is of an irregular oblong figure. The cavities in the tympanum are, the opening of the mastoid cells, the opening of the Eustachian tube, the bony half canal, the fenestra ovalis, and the fenestra retunda.

TYPHA AROMATICA. See CALAMUS AROMATICA.

MATICUS.

TYPHA PALUSTRIS MAJOR. GREAT CAT'S TAIL, or REED-MACE. It grows in marshy grounds, and the brinks of rivulets. Boerhaave takes notice of three species, but they are not used in medicine.

TYPHODES, τυφωβης, also belodes. A particular kind of fever attended with colliquative sweats, and hath

at the fame time the tongue dry and hard.

TYPHOMANIA, from τυφος, and μακα. In Galen's

Exegefis, it is faid to be "A diforder complicated of a phrenfy and a lethargy," in which the patient is delirious, and labours under a fleepy coma. This affection thus

complicated of a phrenfy and lethargy, may be called a lethargic madness or delirium, or a mad and delirious lethargy, according to the author of the Definitiones Medica.

TYPHONIA. The same as Typhomania.

TYPHOS, 70205. Hippocrates says there are five species of this disorder.

First. A legitimate continual fever, which reduces the flrength; is attended with pains in the belly; heat in the eyes, which hinders the patient from looking steadily on any object; the pain prevents him from answering any questions, though he begins to speak and fix his eyes on

any object when he is at the point of death.

Second. A tertian or a quartan fever, fucceeded with pain in the head; faliva and worms are copiously difcharged by the mouth; the eyes fuffer great pain; the countenance is pale, fo are the feet, and the whole body is fometimes feized with foft fwellings; the breaft and back are now and then painful, the belly rumbles, the eyes are fierce, the faliva adheres to the throat, and renders the voice hoarfe.

Third. There are intense pains in the joints, and some-times all over the body: the blood is hot and stagnates in the limbs; some bile retained in the joints becomes indurated there, and produces lamenefs.

Fourth. There is violent tension, elevation, and heat of the belly, succeeded by a diarrhoea, which sometimes terminates in a dropfy, and is sometimes attended with

fever.

Fifth. There is paleness and a fort of transparency of the whole body, as if it was a bladder full of water, though without any inflation; on the contrary, the body is weak and extenuated. The patient winks his eyes, and feels the bed cloaths as if he wanted to catch something on them, &c.
TYPHUS. A nervous fever. See Nervosa Februs.

Those called carceris and Castronsis, are the gaol and camp-fever, severer kinds of the Typhus. See FEBRIS; for that called Icterodes, see Billosa FEBRIS.

TYROSIS. A disorder of the stomach proceeding

from milk coagulated therein.

# ULC

LA. See ULON. ULCERA SERPENTIA ORIS. See APH-

ULCEROSA. RUBEDO. See GUTTA ROSACEA. ULCUS. An ULCER. It is a folution of continuity in a foft part made by erofion. Wounds degenerate into ulcers, when, by a fault in the humours, there is a further loss of substance. A loss of substance in the bones from erofion, is called a CARIES. Though when an abscess is opened for the discharge of its contents, it is usually spoken of as an ulcer. Dr. Cullen places this genus of disease in the class locales and order dialyses. He defines it to be a purulent or ichorus solution of a soft part.

Ulcers receive different names from their causes, figure,

the parts they affect, &c.

External ulcers are discerned by the eye, but when they are internal they are discovered by what is discharged in one or other of the excretions.

Their danger will be judged of by the quality of the ulcer, the part affected, and the ftrength of the patient.

The fymptoms which attend and retard the healing of

ulters are inflammation, pain, a fluxion of morbid hu-mours, a fpongy flesh, &c.

Mr. Sharpe observes, that except the callous and the finuous ulcer, and the ulcer with a caries in the bone, the cure of all the other kinds depend chiefly on that of the morbid habit of the body in general. If the body is free from every degree of cacochymy, the healing of an ulcer is the work of nature, and all that topical applications have to effect, is the maintenance of the fibres in such a moderate state betwixt laxity and rigidity, as will render them most able to carry on this natural operation. While an inflammatory hardness exists, an emollient poultice laid over the dressings will relieve, after which dry lint generally fuffices, or at the most it may be moistened in some mild astringent, to give a tone to the new flesh. When a too great laxity, or a fponginess is observed in alcers, gently stimulating and bracing applications take place.

The three kinds of alcers which Mr. Sharpe mentions as

more particularly depending on external management, are fo frequently joined with, or arise from a morbid habit of body, that regard is first to be had thereto, and when this kind of obstacle to healing is removed, apply emollients to the callus on the edge of the ulcer; or in many instances fuccefs will follow the use of a mixture of ung. refine flavæ, with a little finely powdered precipitate. As to the finuous ulcer, fee FISTULA; and for the carious, fee CARIES. See Heifter's Surgery. Sharpe's Operation, in

the Introduction.

Mr. Bell, in his Treatife on Ulcers, divides them into two claffes, viz. 1. Such as are merely local, and that do not depend upon any diforder of the fystem. 2. Such as are the confequence of, or connected with any diforder of the constitut on.

The species belonging to the first class, are, 1: The

## ULC

fimple purulent ulcer. 2. The fimple vitiated ulcer. 3. The fungous ulcer. 4. The finuous ulcer. 5. The callous ulcer. 6. The carious ulcer. 7. The cancerous ulcer. 8. The cutaneous ulcer.

The species belonging to the second class are, 1. The venereal ulcer. 2. The scorbutic ulcer. 3. The scorbutic ulcer.

phulous ulcer.

It hath generally been faid, that ulcers are not to be healed, if they have been of long continuance, when they appear to have had any effect, either in carrying off, or preventing, any diforder to which the conflitution may have formerly been liable. It has always been confidered as dangerous to attempt their cure, if of long standing; it is true, all at once to heal old flanding ulcers will be imprudent, but with a small degree of caution, the cure of every uleer may be attempted by the introduction of

fome drain or other, by means of a pea iffue, or of a cord. See Fontanella, and Setaceum.

The SIMPLE PURULENT ULCER, is a local affection; it hath the fymptoms common to all fuch difor-ders, as pain and inflammation, in a very inconfiderable degree, while the difcharge afforded, is always of a mild degree, while the discharge afforded, is always of a mild purulent nature, and of a proper confistence; the granulations which arise in it are of a firm, fresh red, healthy appearance. This ulcer is the most simple that can occur, both in its symptoms and method of cure; and it is to its state, that all others must be reduced before a permanent cure can be expected. In the cure of this species of ulcer, as there is very little inflammation, and no preternal stand supplied to take place, but merely a varieties of the place but merely a varieties. tural fwelling supposed to take place, but merely a va-cuity, either from a real loss of substance, or from a retraction of parts simply divided, the discharge at the same time being of a mild purulent nature, the only indications that appear necessary are, 1st. To diminish, as much as possible, any vacancy the ulcer may have occasioned; to accomplish which, the formation of new granulations, and the decay of such parts immediately contiguous to the ulcer are requisite. To effect the formation of new granules, inflammation and acrimony must be removed, and pledgets of lint spread thinly with the ung. cereum Ph. Edinb. may be applied every twelve or twenty-four hours, to the surface of the sore. If inflammation attends the ulcer, moderate it by the application of warm emollient cataplasms; but as soon as this inflammation subsides, omit the cataplasms, lest an excess of laxity be produced. Thus, by mild dressings irritation is prevented, and by preferving a proper degree of heat in the part, a good matter will be produced and firm granu-lations. To diminish or destroy the parts about the ulcer, fuch as fungous flesh; as foon as the inflammatory state is over, and good matter is induced, flight compression, by means of a roller may be immediately applied, and fhould be continued during all the remainder of the cure. The roller fhould be applied to as not only to act as a gentle preffure upon the parts immediately furrounding the wl-cer, but likewife to ferve as a support to the skin, and other 8 Q.

teguments, so as to prevent their retraction, which other-wise in large ulcers especially is very ready to happen. 2dly. To induce the formation of a cicatrix. This is frequently effected by nature alone; but, in many cafes, when every deficiency appears to be even thoroughly supplied, yet still a cure is tedious in accomplishing; the surface of the fores remaining raw, and, at the same time, discharging considerable quantities of matter. In such cases, the ointment used for the preceding part of the cure must be laid aside, and dressings of a more drying na-ture substituted in its stead. In this view the ung. ceræ ex ceruss. a. &c. is preferable to the cerat. lapidis calmin. Sometimes the cicatrization will be foon perfected, by dabbing the part or parts, twice a day, with aq. calc. fim. and ftill drefling with the ung. e ceruff. If the cicatrization is prevented by fpongy granulations, or even firm ones arifing above the skin, they may be checked by dry lint applied to them, or perhaps a gentle compress may also be required; sometimes a slight application of the vitriol. Roman, may be necessary to check the luxuriancy. It is very rare that a caustic is required. Bell on Ulcers, edit. 3. p. 161, &c. White's Surgery, p. 29.

The SIMPLE VITIATED ULCER differs from the

fimple purulent ulcar, chiefly, in the appearance and nature of the difeharge afforded. The most common appearances of such deviations in the matter afforded by ulcers, from the more natural state of purulent matter are fanies, ichor, or fordes. In every uleer difcharging any of these matters, in consequence of the acrimony that fubfifts in them, the parts, inftead of filling up with firm granulations, wafte away more and more, and instead of a reddish complexion, have either a dark brown, or a blackish, rough, sloughy appearance. The pain in all of them is more or less considerable, according as the matter is more or less corrosive. As the simple purelent ulcer, happens most frequently in the fleshy parts, where the cellular membrane affords a fluid most plentifully that is proper for the formation of pus; fo the simple vitiated nleer is most frequently seated near the tendons or aponeurotic expansions of the muscles, from these parts not naturally affording that species of ferum necessary for the formation of solutions are a Accidental information of solutions are a solutions. formation of falutary pus. Accidental inflammation about the ulcer, or a general ill habit of body, may also be oceasional causes of this species of ulcer, even in parts best disposed to produce the matter formed in the mildest kind of fores. In order to moderate the fymptoms peculiar to this kind of ulcer, and reduce it to the flate of the flaple purulent one, the principal endeavours will be, to eafe pain and to abate irritation; to which end, warm emolient fomentations and cataplasms are essectual; they should be continued until all appearances of instammatory tendency is removed. The part may be somented three or four times a day, for half an hour each time, with an emolient decoction, and then a pledgit spread with the ung. cereum Ph. Ed. may be applied, as the pain is more or less: so a more free use of opiates inwardly, will be necessary to remove irritation. The habit of body demands attention also; if too much exalted it of fores. In order to moderate the fymptoms peculiar to of body demands attention also; if too much exalted it must be lowered, if too low it must be supported and raifed; and generally it is in this latter instance that these nleers are met with. Here a free but prudeut use of the cort. Peruv. is fingularly beneficial; fometimes 5 j. is required fix or eight times a day: in plethoric habits and in inflammatory conflitutions, great caution is required in the use of this medicine. If any general disease attends, its removal must be duly attended to, in order to the cure of this as well as every other uleer. This uleer now reduced to the state of a simple purulent uleer, proceed as in that case directed. Sometimes more difficulty attends the cicatrization of these uleers, when they have been of long standing; but, besides the method proposed for cication and the contraction of the state of the cicatrization of these are the method proposed for cications. long standing; but, besides the method proposed for cicatrizing the simple purulent ulcer, an issue inserted in a proper situation, will generally sinish the cure. Some have extolled the efficacy of nitre, in this species of ulcer. Bell on Ulcers, edit. 3. p. 216, &c.

The fungous ulcer, by some called the spongy ulcer. Fungous excrescences frequently occur in different species of ulcers. By the term sungous, is understood such preternatural risings of the parts in sores as are more soft and spongy than sound healthy granulations are and

foft and spongy than sound healthy granulations are; and though soft at first, by continuance they acquire an ex-traordinary hardness. These excrescences are sometimes very painful alfo. In young and healthy habits the new

granulations which arise in ulcers, often advance too quick, and presently are above the surface of the neighbouring parts; and in other instances, for want of care, wounds and ulcers are permitted to fill up without being found at their bottoms; whence, as causes, this fort of ulcer generally occurs. In order to a cure, the two just named causes are to be regarded. If the fungous arose from luxuriance of health merely, its surface may be slightly touched with the argentum nitratum, once in two or three days, and immediately after, a pledgit of dry lint may be applied. If the basis of the fungous is narrow, it may be best removed by a ligature. The fungous removed, proceed as in cases of the simple puruleit alcer. When the fungous is of that kind which happens when the bottom of the alcer is not found, it rises quickly, and is not tom of the ulcer is not found, it rifes quickly, and is not fo firm as the first mentioned fort; in this case, first give a free vent to any impacted matter, and then attend to the progress of healing from the bottom. This fungous is foft, and wastes away in the progress of the cure, without requiring escharotics. Bell on Ulcers, edit. 3.

p. 232.

The sinuous ulcer. See Fistula.

The callous ulcer; called also the varieous ulcer,

and the proceeded from and from a mistaken opinion that they proceeded from and were nourished by matter from the swelled veins, which seem to open into them. An ulcar is faid to be callous, when its edges instead of contracting, and so diminishing the fize of the fore, kept at a stand, turned ragged, and at last, by acquiring a preternatural thickness, often rise considerably above the level of the neighbouring parts: and as it is generally from neglect or improper treatment that ulcers do turn callous, the discharge afforded by them is commonly a thin vitiated matter. It is in this species of ulcer chiefly that varicous veins occur as a fymptom, especially when the complaint is settled in the lower ex-tremities. This seems to be owing chiefly to the stricture occasioned by the callosities on the course of the different veins, a circumftance, which in extensive fores of this kind, must, no doubt, have a considerable influence. Escharotics have generally been used to destroy callosity on the edges of ulcers, but as they tend to increase the disease by the continual inflammation they excite, they are now much laid afide, and in their flead, emollients with warm emollient poultice, and a reclined posture, where have been healed; though on adopting this method, their state was very unpromising. Yet sometimes the callosities are so hard, as to require their destruction either by the lense, or the causing and if the last is preserved, the the knife, or the caustic; and if the last is preferred, the argent nitratum is the best; with this the hardened parts may be touched, every two or three days, and when they are duly wafted, the ulcer will probably be reduced to the flate of the simple purulent one, and like that may then be treated. To strengthen and restore the veins, that were rendered varicous about the callofities, a tight stocking, or a spiral bandage will be useful, but not before their having been continued for a long time. Cal-lofity frequently attends venereal and cancerous ulcers of in these cases the state of the constitution in general must

be adverted to. Bell on Ulcers, edit. 3. p. 254.

The CARLOUS ULCER. See CARCER.

The CARLOUS ULCER. By this term is intended that pecies of the diforder which is connected with a local affection of a bone. If fuch an accident happens, as bruifes, lacerations, and injuries of the periofteum, it fometimes terminates in a caries; in fuch a cafe, by the end of three, four, or five days, the bone begins to lofe the natural healthy appearance, turns first of a pale white, then gets a slight tinge of a yellow complexion; and whenever this begins to appear, there cannot be a doubt of what will be the confequence. Sometimes it will continue in this state for many days and by described the configuration. for many days, and by degrees acquires a more deep tallow-like appearance, in which way it commonly remains for a longer or a fhorter time, according to the violence of the inflicting cause, and afterwards goes through the stages of brown, light, dark, &c. until it hath acquired a darkness of the deepest dye. The discharge from such ulcers, is never of the consistence of good pus; it is generally thinner, and from the first appearance of caries, acquires a most disagreeable fector, which always increases, as the different stages of the diforder advances, at last it appears blackish, as well as the bone underneath, and the discharge at this time is exceedingly acrid. As the feveral degrees

of blackness go on, finall holes are formed in the diseased | parts, and by degrees increase considerably, until even the most folid bones acquire a kind of spongy appearance. In this situation, the mortified portion of the bone generally becomes loose, and when prefied upon, a quantity of greaty like matter, with a most disagreeable foctor, is generally forced out; this matter so taints the whole discharge from the ulcer, and gives it fuch a peculiar fmell, as to render it fearce possible, after once feeing an instance, ever to mis-take it again. This last circumstance alone, is a certain characteristic of a carious ulcer. Further, in ulcers at-tended with a carious bone, the slefhy parts never have a healthy appearance, are foft and more slabby than in their natural state, and instead of a florid red, have rather a dark brown, together with fomewhat of a glazed complexion. The granulations puth forward too quickly and too far, if they are not prevented by art, which is always necoffary to be done, until the discased part of the bone is either cast off by nature's process, or cut out by the surgeon, so as that the cure may take place with certainty, from the bottom of the fore. And when neglected for any considerable time, these fost productions in carious ulcers frequently increase so remarkably as to form very large and troublesome excrescences. These appearances happen whether a portion of the bone is affected, the progress, and its various frequency are more rapid and progrefs and its various fymptoms are more rapid, and the whole bone must be removed; whereas, when a part of the bone only is affected, perhaps a single lamina to the extent of the difeafed part, is all that will be separated and removed. So long as the caries remains, it effectually prevents the wleer about it from healing; if by chance it appears to be healed, it foon breaks out again. probe can be introduced at any opening, and admillion can be got thereby to the bone, if a roughness of its furface is discovered, the case becomes then altogether evident. Though the bone cannot be reached by the probe, for Though the bone cannot be reached by the probe, for want of an opening, the appearances of the ulcer, and the kind of discharge will rarely fail to determine what kind of ulcer it is; for, if the bone is carious, the ulcer is slabby, and instead of a regular surface, the new granulations, sprout up in different clusters of the fize of small nuts, and instead of a healthy strong appearance, have usually a dark-brown complexion; the discharge is thin, dark-coloured, and greafy, there is also more or lefs of the peculiar fector above named. Before this ulcer can be curred, the carious parts must be separated and taken out. In order to this, make a number of small perforations In order to this, make a number of small perforations all over the furface of the difeafed bone, to fuch a depth as to give the patient a very little pain, and no farther. This operation being, in different parts, renewed every third or fourth day, the difeated portion of the bone, in the course of a short time, not only loses the cohesion of its own parts, but a gentle inflammation being, by the same means, raised and kept up till a free supparation is produced. These perforations are made by a pin or perforator. If the caries goes deeper than the fecond lamella of the bone, then a small head of a trepan may be used, and carried just as deep as to give the patient a very little and carried just as deep as to give the patient a very little pain. Thus, by converting, as it were, a large caries into so many finaller diseased parts, their separation from the found bone, comes to be more easily effected. As soon as any of the parts loosen at the edges, their final separation may be hastened, by daily infinuating below them the end of a spatula, so as to press their edges a very little upwards. The head of a common trepan is often used for taking out a piece entirely when bones happen to be carious through their whole substance. After the use of the above infiruments dress the user, and as long as any of the carious bone remains, the sector of the as any of the carious bone remains, the fector of the matter demands attention; and to moderate it, drefs daily with a firong decoction of bark and walnut-tree leaves: to this end also a folution of camphor in weak brandy powerfully corrects the fector of morbid bones. The carious part of the bone should be dressed with soft lint foaked in either of these, while the rest of the fore is treated as is directed for fimple purulent ulcers. Lime-water powerfully corrects the putrid dicharge from ca-rious ulcers, and the exfoliation of bones is much pro-moted by bathing the part with it. The bark is almost the only medicine which, in cases of caries, should ever be given internally; but in some instances the fost parts which cover the carious bone, becomes fo fwelled and

painful, that opiates are found to be necessary. After the removal of the carious bone, the remaining fore must be treated in the fame manner as directed for that species of ulcer, to which, at the time, it appears to belong. Bell on Ulcers, edit. 3. p. 262.

The CUTANEOUS ULCER. See HERPES and TINEA. The VENEREAL ULCER. See LUES VENEREA.

The SCORBUTIC ULCER. See SCORBUTUS.

The scrophulous ulcer. See Scropula.

However fimilar the general practice may be, there are fome peculiarities proper to ulcers on particular parts, fome inflances of which are as follow.

An ULCER in the BLADDER. It should be distinguished from an ulcer in the kidneys, which fee. Ulcers are not so frequent in any of the urinary passages as they feem to be thought; they are often suspected from a slimy discharge, which is of a yellowish colour, and proceeds from weakness. When an ulcer is formed in the bladder, there is a discharge of feetid matter, or blood, and sometimes a fort of feales, or a membranous pellicle, are feen in the urine. There is also a continual dysuria, and a pain

in the urinary passages. The means of relief are similar to those for an ulcer in the kidneys.

An ulcer with a carles. When a caries in the bone attends an ulcer, the fiesh over the caries in the flaccid, fungous, inflated, and tumid; the lips of the ulcer are inverted, the fanies clear, subtile, hardly at all glutinous, foetid, and full of small black scales; and if the ulcer heals, it is only fuperficially, and it foon breaks out again, never healing firmly before the cure of the faulty bone, and that accomplished, the ulcer becomes a fimple one, and foon filling up with common flesh, is healed. See CARIES.

An ULCER in the KIDNEYS. Dr. Hunter observes, that though the kidneys are often found wasted, they are hardly ever feen ulcerated. Chefelden observes, that it is very rarely that an ulcerated bladder is met with in the bodies that are obtained for diffection. Oribanus observes, that an ulcer in the kidneys may be distinguished by the following circumftances, from the fame diforder in the bladder: 1ft, When the bladder is affected, the pain is bladder: It, when the bladder is affected, the pain is felt in the pubes, and the bottom of the belly; but when the kidneys fuffer, the pain is in the back-part of the loins. 2dly, When the bladder is the feat of the difeafe, there is a difficulty, if not a fufpention of urine; but when the kidneys are in fault, the urine paffes freely. 3dly, From the bladder there is voided membranous feales, but from the kidneys fibrous pieces of flesh arevoided, 4thly, A violent pain is felt in the bladder when it is ulcerated; but when the ulcer is in the kidneys, the pain is of a dull kind.

The urine looks like milk when it is first made from an ulcerated kidney, but is not feetid; but on flanding a while the white matter falls; when the pain is confiderable in the kidneys, it occasions a nausea, and sometimes a vomiting. When an ulcer is suspected in the kidneys, the patient should abstain from acrid, sour, and salt diet; he should live on mild mucilaginous aliments; such as the broths of young animals, whey, milk, sweet butter-milk, &c. Violent exercise must be avoided, chalybeate waters should be drank a long time, and solutions of the mildest balfams may be taken now and then.

ULCERS in the LEGS. In these cases a confinement in bed is ufually demanded as necessary in order to the cure. In some instances amongst labouring people some advantage is obtained from reft: but, in general, these ulcers are most firmly healed when moderate exercise is continued during the cure. Some are asraid of healing ulcers in this part, left an afthma, or other complaint, should follow; but if the general health is not defective, or if it can be reftored, there will rarely, if ever, any ill confequences arise from the healing of them. On this fubject, Mr. Bell observes, in his Treatise on Ulcers, that it has been almost universally recommended never to attempt the cure of fuch as have been of long standing, as, from the very acrid matters which they are frequently known to discharge, it has been commonly imagined that drying up fuch fores might prove dangerous to the conflitution. But he is of opinion, that no fuch acrid mat-ters, as are frequently observed to be discharged from ulcers, ever subfifted in the blood. The acrimony which, in fuch cases, occurs, is produced, he thinks, in a great measure, by some particular affection of the organs, which

terwards formed. He further observes that, ulcers are hurtful or beneficial to the constitution, not by the quatity of matter discharged, but by the quantity; hence he says, the cure of every fore, of whatever continuance, may be rendered perfectly safe by the previous introduction of an iffue, which discharges a quantity of fluids, equal to the discharge occasioned by the fore to be healed up. He afferts, from extensive experience, that no inconveniencies ever refult from the practice; and hence concludes that the cure of every ulcer may be attempted. The general intentions in the cure of ulcers being attended to, and a tight flucking worn over the dreflings, fuch other means may be directed as the experience of the practitioner, and the circumstances of the case may suggest. Mr. Underwood observes that, in the cure of an ulcer, the first object is, to bring it to discharge a laudable pus, and this, he afferts the most inveterate ulcers on the legs may be brought to afford, as freely as fores feated any where elfe. He recommends the merc. nitrat. r. finely levigated, as one of the best applications for this purpose. He adds that, this powder must not be lightly sprinkled on the fore, when its surface is ill conditioned, but the ulcer must be filled with it. This writer speaks of a species of ulcer which is usually small, and particularly affects the parts about, and fometimes below the ancle; it is exqui-fitely painful. In this cafe, as in others, he afferts that rest is not necessary to the cure; but instead of confinement, he carries the roller feveral times over the ancle and foot, fo as to leave no part but the point of the heel uncovered, and thus a tolerable compression is made below the ulcer. He further adds, that cases of this fort, are often found attended with confiderable puffings, and a tetterous appearance of the furrounding fkin, accompanied with a thin acrid discharge, which renders the parts ad-ditionally tender; whilst the little ulcer is almost perfectly dry, and cannot easily be brought to suppuration, until the complaint of the skin is removed; which is most fpeedily effected by drying applications fuch as bol. armen-alumin. pulv. ungt. rub. defic. and in more obstinate cases, a folution of the ceruffa acetata, and zincum vitriolatum purificatum, with one or two ounces of the fp. vini c. in a pint of water. If the fore does not foon change its complexion, on the difappearance of the affection of the skin, he advifeth to fill the ulcer with precipitate, dissolved argentum nitratum, or any fimilar escharotic, and when the slough is come out, to repeat it. Here he says that these caustics are only to be used after active digestives, aided by proper bandages and exercise, prove ineffectual. Lastly, he recommends in the healing of alcers in the legs, particularly those of long standing, that the surgeon pro-ceeds slowly and cautiously, avoiding the too early use of drying applications, and gradually weakening the digeftive. It may be laid down as a general maxim, that the fore fhould rather be fuffered, than invited to fkin over. When the ulcer is healed, temperance, a continuance of the bandage for some time, and occasional purgatives will be necessary. On this particular species of ulcer, see the Lond. Med. Obs. and Inq. vol. iv. p. 347, &c. and Rowley's Essay on the Cure of Ulcerated Legs. Underwood's

ley's Effay on the Cure of the Legs.

Treatife upon Ulcers of the Legs.

This diforder is far lefs ULCERS in the TONSILS. This diforder is far lefs frequent than is supposed. Dr. Hunter observes, that the tonsils open over all their surface, by small orifices which emit a slimy mucus; and that when they are inflamed, the mucus being purulent and white, and the furface irregular, there is the appearance of ulceration, when in reality there is none. Not to be deceived in this case, desire the patient to wash his mouth and throat well with some proper fluid, before you determine whether or no ulcers are here. When ulcers are formed, they may be touched with mixtures of honey, alum, borax, muriatic acid, &c. according as their caule, or attending circum-

flances may require.

ULCERS in the WOMB. Whilft a viscid, yellow, or bloody humour is evacuated, the ulcer is in a mild state; but when it becomes fanious, feetid, and is attended with pain, a cancer is for the most part attendant, and then pal-hatives only can be proposed. In the milder kind keep the belly lax with manna, tamarinds, and fuch like cooling purgarives, and inject an infufion of elder-flowers in milk and water. When the cafe is cancerous, demulcent

which feparate those fluids from the blood, from which and lenitive medicines, with anodynes to moderate the the matter, by its remora in the cavities of ulcer), is af-

ULMARIA, also called regina prati, barba capra. QUEEN of the MEADOW, and MEADOW-SWEET. Spirma ulmaria, Linn. It is a plant with tall, fmooth, reddifh, brittle stalks; on the tops are clusters of white flowers, which are followed by crooked feeds fet in a roundish head. It is perennial, common in moist meadows, and slowers in June. The leaves have an agreeable smell, the whole plant is alexipharmic, but not used in the pre-fent practices See Lewis's Mat. Med.

ULMUS. The ELM-TREE. The ulmus campestris,

i. e. ulmus foliis duplicato ferratis; bafi inequalibus. Linn. It is a tall tree covered with a rough, chapt, brownish, brittle bark, under which lies a white, smooth, tough, coriaceous one. In the spring, before the leaves appear, it produces imperfect flowers, which are followed by flat roundish capsules, containing each a single feed. The inner tough bark hath no smell, but on being chewed, it discovers a copious slimy mucilage; the outer brittle bark

is lefs flimy.

Dr. Monro has given this to a great number of patients for cutaneous complaints, in conjunction either with antimonial, mercurial, faline, or other medicines; and often made his patients go into the tepid bath twice a week. Many were cured, but eruptions of the true leprous kind feldom were completely, though they were greatly mitigated; nay, fometimes feemingly removed; yet returned within the space of a month, or at the longest a

Dr. Lyssons of Bath relates his success, by the use of a decoction of the inner bark of elm, in feveral cases, in which obstinate eruptions appeared on the skin, some of which approached very near to, if they were not of a leprous kind. He made the decoction as follow R Cort. interioris ulmi recent. 3 iv. coq. in aq. sont. 15 iv. ad 15 ii. Ph. Lond. 1788. He observes that if this bark is rich of the juice, and is boiled too long, the decoction will be mucilaginous and not quite agreeable, but that otherwife it hath an agreeable, mild, altringent taffe. As the decoclion was used during the spring and autumn feasons only, the bark was taken from the trees as it was required; in the spring it was stripped from the small, but not the smallest branches; and in autumn from the branching roots, as being at those seasons the fullest of sap. Half a pint of this decocition is to be taken every evening and morning, and continued as long as the con-tinuance of the eruptions may require it. On the first use of this medicine this disorder seems to be somewhat aggravated. See the Lond. Med. Trans. vol. ii. p. 203. Monro's Pharmaceutical Chemistry, &c.
ULNA, from warm, the cubit. It is one of the bones of

the fore-arm, it is also called cubitus; focile. At its upper extremity it hath two processes, the posterior called electronium is the larger. Its concave surface moves upon the trochlea of the os humeri, into its upper-part, all the extensors of the cubit are inserted. The anterior process is not fo large, nor does it reach fo high, but is tharper at its extremity, and therefore named coronoid. Between these two processes, a large sigmoid cavity is left, adapted to the trochlea of the os humeri; on the other part is a cavity, where the extremity of the radius moves. The lower extremity of the ulna terminates in a very fmall head, which internally is received into the femilunar ca-vity of the radius, whilft from its external fide a process jets out called the flyliform, from which a strong ligament is extended to the os piliforme and unciforme of the

UMARI. Sée CAMARIN-BAS.

UMBILICALES VASÆ. UMBILICAL VESSELS. There are four ligamentary ropes called by this name; the uppermost runs from the navel to the fiffure between the two lobes of the liver, and is the remains of a vein, which, in the fectus state, anastomosed with the vena cava hepatica, covered with the falciform process. The cava hepatica, covered with the falciform process. The urachus is another of the ligamentary ropes. The other two ligamentary ropes are the extremities of the umbilical arteries, which at the top of the bladder approach each other, and join the urachus.

UMBILICALIS REGIO. As comprehending the navei. It is the middle external region of the belly in its fore part; it reaches from an imaginary line drawn between the lowest falle ribs, to another imaginary line

betwixt the lowest false ribs, to another imaginary line drawn betwixt the two criftse of the os ilium. This region is divided into three parts, viz. the middle, which is pro-perly the umbilicalis, and the two lateral, called flanks.

UMBILICALIS ARTERIA. It is a continuation of the HYPOGASTRIC ARTERY, which fee. It afcends on the fide of the bladder, and from thence to the navel. It is shriveled in the adult state, being only of use to the

UMBILICUS. The NAVEL, quali umbo ilium. The

middle of the loins. UMBILICUS MARINUS, called alfo Operculum cochleace celatae. This is a small oval body of a shelly matter, resembling the human navel; it is properly the operculum of a fhell-fifth, ferving to close up the aperture of the shell, in the buccinum, and other turbinated shells; and for that purpose it is fixed to the anterior extremity of the body of the animal, fo that when it retracts its body into the fhell, this naturally fills up the mouth of it. It is convex on one fide and flat on the other, the convex fide is plain, and white; the flat is yellowish, or reddish, and marked with a spiral line. It is considered as an absorbent, and aftringent, but not in prefent use. See also Androsace, and Cochlex.

- VENERIS. See COTYLEDON. It is also the

name of a fpecies of faxifrage; called also Acetebulum.

UNCIFORME OS. The fourth bone of the fecond row in the wrift. It hath an apophysis shaped like a claw, whence its name. See CARPUS.

UNEDO. See Arbutus-Papyracea, and Amatz-

UNGUENTARIA. The NUT-MEG. See NUX

MoscH. UNGUENTUM. An OINTMENT. It differs from a plaster only in its confistence; if as much oil is added to a plaster as reduces it to the confistence of stiff honey, it forms an ointment. It is usual to boil the fresh leaves of plants in lard, and other greafy and unctuous matters, but they retain very little of the virtue of the plants, nor indeed do fresh herbs give out much of their virtue to greafy and unctuous substances. Ointments in general take their names from the fubstances of which they are formed, except fome few. For Vesicatorium, see Can-THARIDES; Liliorum, see CRYNOMIRON; Apostolo-rum, see APOTOL. UNG.; Martiatum, see MARTIATUM

UNGUES. The NAILS. They are continuations of the epidermis. Their fubstance is like that of horn; they are composed of several planes of longitudinal fibres foldered together; these strata end at the extremity of each

finger, and are all nearly of an equal thickness, but of different lengths. The principal use of the nails is to flrengthen the fingers and toes.

UNGUIS. Also called pterggion, and by some albugo & ungula. It is a collection of matter in the pupil of the eye, in the shape of a man's nail, whence the name. It is a kind of PHLYCTENE, which fee. Some describe this disorder as a film formed on the external part of the eye, extending over the pupil, and when it hath a red appearance, they call it pannus; and in order to its removal, the vef-fels which run into it being divided near the great angle of the eye, it shrivels and may then be separated. See

Bell's Surgery, vol. iii. p. 300. — So the ancients called that fort of articulation which we call future. In botany, it is the white and inferior part of the leaves of roles, and of some other flowers.

UNGUIS OSSA; called alfo Lachrymalia Offa. Thefe are two thin bones, very brittle, placed at the inner canthi of the eyes, covering fome of the finus ethmoidalis, and are really part of the os ethmoides; their furface is fmooth and hollow, and is divided by a ridge; the hind cavity forms a portion of the orbit, the fore-part is a perpendicular canal which contains the lachrymal fac and duct.—

UNGULA. The diforder in the eye called unguisa

UNICORNU; called also ceratitis, corna unicorni, corna and thur fossile, alicorna. There have been very different opinions relative to the substance which takes this name; by fome it has been thought to be a bony prominence of the animal called unicern, possessing fome medical virtues, but of this there are great doubts; fome think it a lax, and fpongy terrene spar, found of various sizes, and regular forms, from an inch to three feet long, in Germany and other parts of the world, and is in great efteem as a fudorific, and aftringent, and given in fevers attended with diarrhœa, with great fuccess. Dr. EBRENS gives a particular account of this fossile; he says, that it gives a particular account of this folilie; he lays, that it is dug up of different fhapes, fometimes like a ftrait horn, fkull, jaw-bone, fhoulder-blade, &c. and other bones of men, and beafts; and fometimes like an unfhaped mafs, or lump of ftone, having no refemblance to bone. Conrigius, and Offo Guertick have maintained that this foffile is petrified bone; Sennertus, Schroder, Bauschius, &c. reckon it amongft the minerals; Libavius and others think it a bituminous earth; whillt fome fay that it is a kind of agate. But earth; whilft fome fay that it is a kind of agate. But Dr. Ebrens apprehends that it is formed of a clay, or fattish earth, called marga, or marl, hardened by petri-fying water, and affuming different shapes and fizes, according to the fituation in which this earth lies under ground. It operates, he fays, like the terra figillata, as an abforbent, aftringent, and perspiratory, and produces good effects, unlefs coftiveness forbids its use. Externally it serves in pustulary eruptions, and erosions about the pudendum, and fundament in children, and in eye-waters. For a more particular account of this fubiliance, fee Chambers's Encyclopædia, by Rees.
UNICORNU MINERALE. See BOLUS CANDIDUS.

UNIFOLIUM. See Monophillon. UNIO. A PEARL. See MARGARITA. UPSILOIDES. See Os HYOIDES.

URACHUS, from spot, urine, and size, to have, or contain. In the feetus state the urine passes from the bladder into the allantois, through the urachus; but after

bladder into the aliantois, through the uracous; but after the birth it is shrivelled and becomes a ligament.

URANOSCOPUS, from copasos, carlum, and onen jours, video, to look at heaven; called also carli spectator. It is the name of a sea-sish, whose eyes are placed naturally upon the head, by which it looks directly up to the sky, from which particular power it is called callionymus, not from the beauty of its form, for it does not poffers any thare, but is rather difagreeable and painful to look at. It has bile more plentiful than any other fifth, which is by GALEN recommended in affections of the eyes and ears. Caftelli.

URETHRA. From spin, urine. The inner membrane of the urethra or passage for the urine from the bladder is a continuation of that which lines the bladder; it is very smooth and fensible; in it are several lacunze, which are the feat of the clap. In women the urethra is wider than in men, and its length is only from an inch to an inch and an half. Sometimes a stone is fixed in fome part of the urethra, fee CALCULUS. This produces pain, then inflammation, tumefaction of the parts, and always a partial, and frequently a total suppression of urine. In some instances, when the disorder is long neglected, this suppression and consequent tumesaction, terminate in a rupture of the urethra; in consequence of which the urine efcapes into the contiguous cellular fubstance, and very troublesome swellings are produced, not only in the body of the penis, but frequently in the fcrotum, and through the whole course of the perineum, when a stone has been long fixed at one particular part without yielding in any degree, and when the pain and inflammation produced by it are confiderable, a chirur-gical operation ought to be immediately employed for gical operation ought to be immediately employed for removing it; but, in the incipient flages of this diforder, other means of a more gentle nature should be first put in practice. In order to folicit the passage of the stone one important endeavour is, to remove spassin; with this view, if the patient is plethoric, bleed; if he is thin and emaciated a proportionable quantity of blood should be taken by means of leeches, directly from the part affected. A quantity of warm oil should be repeatedly injected into the urethra, to lubricate the passage; the patient should also be immersed into a warm bath; and a full dose of the tinct. opii should be at the same time given. A proper quantity of blood having been discharged; the patient having remained for a sufficient length of time in the warm bath; and the opiate having begun to operate, the parts will thus be as completely relaxed as possible: and this is the period when some attempt should be made for extracting the stone. To this end, instead of any of the instruments recommended for this purpose, which often do harm by increasing irritation, the surgeon should at first endeavour by yery gentle profiter to put has some forms. by very gentle preffure to pulh the stone forward along the course of the urethra: in this manner large stones may be brought off, for the removal of which a very painful opera-tion might otherwise be necessary. When the stone fills up the arethra, or notwithstanding the use of means as above, it will not pass, it will be necessary to proceed to the operation, which is performed by cutting upon the stone, and extracting it either with a scoop, or with a pair of small forceps. When the stone is fixed in the uretbra near the neck of the bladder, lay the patient on a table, secure him as for the operation of lithotomy: an affiftant fulpending the scrotum and penis, the furgeon, after oiling the first and second fingers of his left hand, should introduce them into the anus, and by means of them ought to press firmly upon the parts immediately behind the stone; which will not only enable him to lay it bare with more ease, but will be the furest method of preventing it from being pushed into the bladder by the necessary pressure of the knife; this being done, an inci-fion ought to be made through the common integuments and urethra, so as to lay the stone completely bare; which may now be turned out by a due degree of preffure applied with the fingers in the rectum; or, if this is not found to be fufficient, it may be taken out either with a fcoop or with a pair of forceps. The after-treatment is the fame as after the operation of lithotomy. When the ftone hath paffed further into the urethra, in order to extract it, the fkin fhould be drawn as much as possible past it, either in a backward or a forward direction; and the stone being now secured in its situation by pressure, a longitudinal cut ought to be made directly upon it through the wrethra, of a fufficient fize to allow of its eafy extraction either with the scoop or the forceps. The edges of the wound are now to be completely cleared of sabulous particles and the skin allowed to regain its natural situation; by which means, if the operation has been properly done, the wound in the arethra will be entirely covered by skin that has not been injured; a circumstance which tends to render this operation by far less exceptionable than otherwise it would be, for thus the wound usually heals

URETEROSTOMATICA. ISCHURIA. A suppression of urine from obstruction in the lower orifice of the of the yard, as it sometimes does, if it is so near as to be observed by the eye, it may be frequently taken out with a pair of small diffecting forceps: and in order to with a pair of initial dillecting forceps; and in order to facilitate the extraction, when it cannot be otherwise effected, the urethra may be somewhat dilated from its extremity with the point of a sealpel. But if success still fails us, an incision must be made upon the stone as where the urethra is covered ith skin. Soft dressings should be applied to the wound; and when the cure is markly completed a hellow housing a short short the or nearly completed, a hollow bougie, a fhort filver tube, or a fmall catheter of the elaftic gum, should be introduced into the urethra, in order to preserve it of a proper size. The worst situation in which a stone can be fixed in the streibra, is just below the scrotum; for if the stone either makes its way into the ferotum, or if it is necessary to make an opening into it with a fcalpel, fuch large collections of urine are apt to occur, as commonly occasion much diffrefs. To obviate this, so soon as a stone is discovered in this fituation the greatest attention ought to be given, either to get it carried farther into the wrethra, or, if this cannot be effected, to push it back into the perincum, by means of a staff. If either of these are impracticable, and it is necessary to extract the stone, an incision must be made into the urethra, by beginning the cut at the under part of the ferotum immediately to one fide of the feptum, and continuing it upwards till the stone is distinctly felt, when it is to be laid bare and extracted as above directed. In applying the dreffings after the operation, conduct them so as that the fore may heal first at the bottom; if this is not duly attended to, the parts below will be filled with matter, or perhaps with urine, and thus very troublefome finuses may be formed. In females the urethra is short, and dilates readily, fo that flones rarely are detained in it : but when they do, they generally may be turned out by passing the end of a blunt probe behind them, and then pulling forward: or if this does not succeed, the end of the wethra may be flit a little way so as to admit the in-troduction of a pair of forceps by which the stone may be extracted. Besides this, there are obstructions formed in the urethra from many other causes, such as caruncles, strictures, &c. See Bell's Surgery, vol. ii. p. 140—188. URETHRELMINTHICA. ISCHURIA. A suppres-

grumous blood obstructing the urine. See Ischoria. URINA. The URINE. It is a fluid which is secreted from the blood by the kidneys, conveyed by the ureters to the bladder, and from thence it is difcharged from the body through the urethra. It is fo acrid and difposed to putrify, that if retained long in the bladder it endangers the patient's life. When suppressed, it has been known to pass through the pores of the skin. The sudden discharge of some studies after swallowing them hath caused some to imagine that there is some shorter passage to the bladder than through the kidneys; but though difficulties attend this circumstance, some of the most eminent in their profession are of opinion that all the wrine is fecreted by the fame veffels.

Many are the figns which different authors have pointed out in the wrine, by which to judge of the different flates of the body; but Dr. William Hebberden well observes that this excretion affords the practitioner but little ufeful

information.

The appearances observed in the urine at the crisis of acute diteases are generally included in the three following, viz. the nubes or nubecula: it is when a cloud, as it were, is diffused through the urine after it hath stood a while in a glafs; the enworemata, or, as the Latins call it, the fublimationes, fulpenfa, or fublimia, which is, when the cloud finks a little, leaving the urine above, fomewhat transparent; and laftly, the hypothalis, or as the Latins name it, the fublidentia fubjecta, or fedimenta, Tediment at the bottom.

Urine contains a peculiar falt, called microcofmic falt, and which is found no where but in urines; marine falt; and if diffilled in a retort, it yields not only the volatile but also a peculiar kind of phosphorus. Urine is used in

See Haller's Physiology, le A. 32. Fordyce's Elements, part i. p. 16—18. Profper Alpinus's Prefages. Neumann's Chem. Works. Lewis's Mat. Med.

The arine is fometimes too copiously discharged, see DIABETES; it is also sometimes difficultly passed or totally suppressed, see Ischuria; it is sometimes mixed with blood, and in some instances it is involuntarily dif-

charged. BLOODY URINE. Hamaturia. Hippocrates observes that if pure blood is copiously and suddenly discharged without pain, it flows from the vascular substance of the kidneys; but when the quantity of blood is fmall, of a blackish colour, and especially if there is pain, or heat, or both, during or after the discharge, it proceeds from the bladder. When ruptures of the vessels in the bladder happen, the symptoms are severe, such as intense pains, fainting, difficulty of breathing, a low, fmall, frequent pulle, naufea, anxieties of mind, and cold fweats. If a rough stone wounds the ureters, the pain is felt in the back, and there is a difficulty in making water. A stone in the bladder sometimes causes this disorder, and in the Edinb. Med. Effays, vol. vi. is an instance of a worm in the bladder fometimes producing this difease. Ceelius Aurelianus speaks of a species of hemorrhoids discharging blood with the wrise: and it is sometimes observed both in young and aged men that, on a ceffation of the hæmorrhoids, blood paffes with the urine. Hoffman obferves that fometimes an hæmorrhage happens from the veffels of the bladder, or rather of its fphincter, diffended and opened in the fame manner as from the hæmorrhoidal veffels: in this cafe, the flux is periodical, a retention of the blood occasions a pain about the pubes, the blood drops away fometimes without wrine and is never equally mixed with the urine, as that always is which comes from a higher fource. Some aged women who live luxuriously after the ceffation of their menses, have their urine often mixed with blood. In putrid fevers this is a frequent fymptom, from the diffolution of the blood. Strong purges, too forcing diuretics, or other causes of spalms in the belly, are also causes of bloody arine. Bloody urine is always sympto-

The urine fometimes appears to be bloody when there is no blood difcharged with it; this is known by straining it through a linen cloth, for if it is bloody, the cloth will

be tinged, but otherwise not.

Bloody urine should be distinguished from bloody discharges in a genorrhoza, from that species of piles which slow into the urinary passages; and critical discharges of the blood in the urinary passages should be distinguished from those that are not such.

When blood are in income and with the contract of the state of the state

When bloody urine is mixed with pus, there is an ulcer formewhere in the urinary paffages. All discharges of bloody urine are to be seared, though those from harmorrhoids the least so; but the most dangerous are those from ulcers and from wounds of the kidneys or bladder. Hæmorrhages from the kidneys, and from the sphincler of the bladder are often critical and salutary, and return at certain intervals. In plethoric men, both young and old, from the omission of customary venescition or from hæmorrhoidal obstructions in women of eighty, who were hale and of high life, who had neglected to supply by bleeding, the evacuations which nature had made formerly from the uterus, these discharges continue for a considerable time, in no small quantity, without any ill considerable time, in no imall quantity, without any ill consequence: yet, though at first they may appear falutary, from their supplying other evacuations, they are far from being without danger, from gradually wasting the strength, &c.

When the patient is plethoric, or when a suppressed fanguine exerction is the cause, bleed, and keep the bowels are the cause to examine the cause of a shall information.

lax. If there is any tendency to, or actual inflammation, frequent draughts of an infusion of linfeed may be taken, and fmall portions of nitre may be diffolved in each draught just before it is drank. The uva urs is esteemed a spe-cific, but other medicines of the astringent kind should

which is when the whole cloud falls and makes a thick | not be ventured on. The natron vitriolatum may be repeated in doses, to procure gentle evacuations, every of every other day. When a stone in the bladder is the cause, rest should be indused; as much manna may be taken twice a week in a pint of whey as will pais off rea-dily by ftool, and, if need be, an anodyne may be taken after the operation. When the discharge is from the kid-neys or the ureters, an infusion of the seeds of wild carrot is of fingular benefit. See DAUCUS CRETICUS. If suppressed hamorrhages produce this disorder, bleed and give aloetics. When a putrescence in the blood and juices are attendant, the bark with the dilute vitriolic acid will be the necessary means of relief. When ulcers are fufpected in any of the urinary passages, give such medicines and direct such liquors for the common drink as sheathe acrimony. See Hoffman's Rat. Med. Syft. Cullen's First

Lines, vol. iii. p. 67. edit. 4. London Med. Journal, vol. iv. p. 282. Wallis's Sydenham.

INCONTINENCE of URINE. This diforder may be occasioned by pregnancy, a palfy in the sphincter of the bladder, a weakness in the sphincter of the bladder from hard labour, or from a violent extraction of a stone through the urethra, perforation in the bladder, a itone in the bladder, wounds on the head, a laceration, or a relaxation of the furpenfory ligament of the bladder, &c.

The most frequent causes are, a weakness or palfy in the sphincter of the bladder, in which cases a blifter is generally a fuccefsful remedy; it should be placed on the lumbar vertebræ and the os facrum, and may be kept open fome days by means of the ung. cantharidis. If the sphincter of the bladder is relaxed from the extraction the sphincter of the bladder is relaxed from the extraction of a stone, it usually recovers spontaneously; however, some mildly aftringent medicine may be applied. When this disorder is observed in children, it is sometimes relieved by drinking an infusion of strawberry leaves, and rubbing the pubes with rectified spirits of wine. When pregnancy is the cause, the patient must wait until after delivery. When a stone in the bladder produces this disorder, libertony symptoms relieves, but cannot be trusted. delivery. When a ftone in the bladder produces this dif-order, lithotomy fornetimes relieves, but cannot be trufted to, for fometimes it proves a cause of this disorder when before it had no existence. See Hossman's Rat. Med. Syst. Lond. Med. Obs. and Inq. vol. ii. and iii. Bell's Surgery, vol. ii. p. 163. See ENURESIS. London Med. Journal, vol. vi. p. 417. vol. vii. p. 416. White's Surgery, p. 378.

URINÆ ARDOR, fee Dysuria; — Stimulatores, fee Acceleratores Urinæ.

URINARIA. See Linaria; Dens Leonis.

URORRHŒAS. The urine paffing from the urethra

through fome erofion of the perinaum.

URTICA. The NETTLE. Boerhaave mentions eight species, but none of them obtain in the present practice, though the common ftinging and the species called white Archangel are strongly recommended: the first for checking internal haemorrhages, and the second for moderating the fluor albus. Sometimes they have been used externally to stimulate paralytic limbs, in order to recover fense and motion. The College of Edinburgh orders the artica dioica or artica foliis oppositis oblongo cordatis, racemis geminis, amentis cylindricis, Linn. The COMMON NETTLE. For that called alba-iners mertua, fee Lamium Album; — Iners magna faridifima, fee Galeopsis; — Laftea, fee Lamium Maculatum.

URTICA MARINA. SEA BLUBBER. It fwims on the water, being a round compressed pellucid substance, reresembling jelly, with red veins interspersed. Its virtues are the same with those of the lepus marinus.

URTICARIA. Called also febris porticata uredo. The URTICATA. ACUTE NETTLE-RASH. Dr. Cul-

len places this genus of difeafe, in the class locales, and order exanthemata. He observes that all agree that it is a mild disease, seldom requiring the use of remedies. It is generally fufficient to observe an antiphlogistic regimen, and to keep the patient in a temperature that is neither hot nor cold. Cullen's First Lines, edit. 4. vol. ii. p. 252. URUCU. See ACHIOTL.

USNEA CRANII HUMANI. Moss of a DEAD MAN'S SKULL. It is different from the moss on stones and trees, but is often found on the bones of horses, &c. It is now neglected as a medicine. See Muscus Arboreus. UTERARIA. UTERINE OF HYSTERIC MEDICINES.

These are of three forts, viz. the emmenagoga, aristolechia, and ecbolica.

UTERI

UTERI HÆMORRHAGIA. Excessive MENSES.

See MENORRHAGIA.

UTERUS. The womm; called also ager nature byficra, matrix, metra; utriculus. The uterus is fituated between the bladder and the rectum; it is covered with the peritoneum, which comes from the back part of the bladder, afcends up the fore part of the uterus, from thence over the fundus, down the posterior side, and so to the rectum. On each edge of the uterus this position of the peritoneum forms a broad duplicature, which is extended on each side, more or less directly to the adextended on each fide, more or lefs, directly to the ad-joining lateral parts of the pelvis, forming a fort of membranous partition between the anterior and posterior halves of the cavity of the pelvis; and then is continued loofely with the peritoneum on the fide of the pelvis; thefe two duplicatures are called the ligamenta lata: the laminæ of which are connected by a cellular membrane, and contain the tubæ Fallopianæ, the ovariæ, and part of the fpermatic veffels, and those which go to the uterus, also the ligamenta rotunda, and the nerves. The uterus is rather triangular in its shape, the fundus is almost a strait line, the two fides approaching each other, makes it narrow where the cervix begins, then it grows larger, then narrow again at the os tineze, which is received into the vagina. The infide of the uterus is smooth; at the upper part the uterus is very vafcular, at the fides and below it is white. The cervix uteri, on each fide, is divided into two lateral parts by a ridge, whence the fibres go off in the manner of a feather. At each angle of the fundus we may introduce a brille into the beginning of the Fallopian tubes, which go into a tortuous manner, and terminate at the overies in an integral of the state of the company to the co terminate at the ovaria in an irregular round jagged exterminate at the ovaria in an irregular round jagged extremity, where their diameter is about one third of an inch; this fringe is called morfus diaboli, and is hung upon a membrane like the mesentery, between the doublings of which the vessels run to the tubes. The tubes are not smooth internally, but there are innumerable longitudinal rugæ placed close upon one another. See Ovariæ and Tubæ Fallopianæ. The uterus is surnished with blood-vessels from the hypogastrics and the spermatics. The spermatics rise as in the male, and when they get to the psoas muscle, they pass upon the when they get to the ploas muscle, they pass upon the ligamenta lata, and go to the tubæ Fallopianæ, the ovaria, and the uterus. On the fides of the uterus the hypogaftrics país to the vagina, &c. and these anastomose with the spermatics; they run in a serpentine manner. The spermatics are mostly above, and the hypogastrics below. See De Graaf de Mulierum Organis Generationi Infervientibus. Winslow's Anatomy. Haller's Physology,

lect. 34 and 35.

UTRICARIA. See Nepenthes.

UTRICULUS. See UTERUS.

UTRIFORMIS ABSCESSUS. See EDEMOSARCA.

UVA. See Staphiloma.
Uva Gruina. Crane Berries. They are brought from New-England, and are reckoned antifeorbutic.

URSI. BEAR'S WHORTLE BERRY, BEAR'S whorts, or BEAR'S BILBERRIES. It is the arbutus uva wfi, i. e. arbutus caulibus procumbentibus, fol. integeris also called vaccaria-vaccinis. The plant is an evergreen trailing shrubby one; it hath many small, oblong, oval leaves, monopetalous white flowers, with a sless-coloured edge, cut into five sections; the berries are red. It greatly refembles the common red wort-bush, from which it may be diffinguished by the leaves being more oblong, and by the flower having ten stamina, and the berry five feeds; whereas the flower of the common whortle kath only eight stamina, and the berry often twenty feeds. It is found on the snowy hills in Austria and Styria, but more plentifully in Sweden, and it is cultivated in gardens in Eng-

on the inowy hills in Austria and Styria, but more plentifully in Sweden, and it is cultivated in gardens in England; it is also found in Scotland.

The leaves have a bitterish aftringent taste, without any remarkable smell, at least when dry; they are celebrated by Dr. Haen, in nephritic and calculous complaints, and ulcers in the urinary passages, in which cases 3 is. of the powder was taken sasting, or two or three times in a day. It is very useful to many in moderating the pain which often attends calculous complaints; but in other respects hath not yet been attended with those advantages in England, for which it is so strongly recommended by the just named prosessor. Dr. Cullen has found it very powerful for relieving the symptoms of calculus. Mat. Med. See Med. Mus. vol. i. n. 13.

—— PASSA. A grape dried in the sun, the fruit of the vitis vinifera. Linn. See VITIS. For that called Crispa, see Grossularia,—— Lupina, see Herba Paris;—— Marina, see Cauda Equina.

UVEA. So the posterior lamina of the iris hath been called; some called the charaides by the name of avea, and the coloured part they called iris. The ancients called it uvea, because they observed it to be of the colour of an unripe grape in grazing animals, for they chiefly diffected brutes. Mr. Pott calls the iris a circular muscle. See Aciniformis.

UVERO. See Gualbara.

UVULA. It is also called cion, gargareon, columella, columna oris, gurgusio, interseptum. From the middle part of the palatum molle, the uvula hangs down into the throat, acting as a valve, by means of whose different actions we can breathe either through the mouth or the nose. It is of an irregularly conical shape, and is glandulous.

UVULARIA. See Hippoglossum.

glandulous.

UVULARIA. See Hippoglossum. UZIFUR. See Adrop.

#### VAG

ACCA MARINA. See MANATI. VACCARIA. See Uva ursi.
VACCINIA. A name for feveral forts of the vitis idea, also of the uva uri; for that called Alba, fee Mespilus. Fruct. Nigro; — Nubis vulgaris, fee Chamemorus; — Paluftris, fee Oxycoccus. VAGA. An erratic kind of intermitting fever, returning at more than ten days from each fit.

VAGI NERVI. See PAR VAGUM.

VAGINA. In BOTANY it is the sheath or covering of a bud. In ANATOMY called also caulis. It is the paffage from the external pudenda to the mouth of the uterus. Its course is upward and backward; its infide is very vafeular and villous, and the villi are very full of vef-fels and nerves. The vagina is contracted at its orifice by the fphincter vagina, and in its whole length by the levator ani. Each fide of the anterior portion of the va-gina is covered externally by a thin broad expansion of vessels called the plexus retiforms; these two planes run down each fide of the clitoris behind the nympha, and likewise cover the urethra like a collar before they are fpread on the vagina; this plexus is capable of being crected, and in coitu it is compressed by the sphincter vagina, which is contrived for the greater pleasure. The vagina is a fleshy membranous tube, which lies immediately before the rectum, is incurvated, hath the turn of the bones as the uterus hath, is collapsed and compressed between the bladder and the rectum. The structure of the vagina is very vascular; on its inside it is very rugous. It is commonly reckoned mufcular. The vagina is fome-times too narrow; this may be either natural from original conformation; or accidental, in confequence of difeafe. Cicatrices may be formed from a laceration after fevere labour; in confequence of ulceration, erofion, &c. Prelabour; in confequence of ulceration, croisin, &c. Pre-ternatural conftrictions may be induced from the use of flyptic applications, or fumigations. The cure may be attempted by emollient fomentations, as by the steams of warm water directed to the parts; and by introducing a small tent of compressed spunge. If these fail, recourse must be had to the knife: though, in the simple contrac-tion of the cavity of the vagina, this expedient is seldom necessary, and the attempt is often attended with the utmost danger; therefore should never be determined on until every other method hath failed. The dilatation, which was previous to impregnation, has very often been which was previous to impregnation, has very often been accomplished by labour pains. Sometimes there is a matural defect, so that the vagina is either imperforated altogether, or a foramen only remains sufficient to transmit the menstrual blood. If, from a coalition of the parietes of the vagina, the passage be entirely shut up, an attempt to force it would be vain. The orifice in the latter case will afford a proper direction for the knife, but the operator must be cautious not to mistake the ure-thra for the passage into the vagina. When the vagina is impervious altogether, the uterus has been sometimes found wanting. found wanting.

#### VAL

Flethy, fungous, or polypous tumors arise from all parts of the vagina. They happen to women at every period of life, but most frequently towards the decline. They generally proceed from an obstruction of the small glands of the parts, and are less or more difficult to discover or remove, as their origin is low or high in the vagina. Their texture is various; fometimes they are tender and mucilaginous, like those in the nose; at other times firm and folid, like a wen; fometimes their bases are very considerable; though they generally adhere by a fmall neck. They fometimes, like fcirrhi, continue indolent for many years; and are also liable to degenerate into scirrhus and cancer-In their mildeft state, they are attended with perpetual stillidicium from the vagina, and sometimes with profuse and dangerous shootings. Carefully distinguish betwixt these tumors and hernize, or prolapsus uteri, &c. Polypi, when curable by an operation, may generally be removed by ligature; a fafer method than cutting, as they are often fupplied with large blood-veffels. For fixing the ligature, the fingers of the operator will be formetimes fufficient. When this method fails, Dr. Hunter's needle, or M. Levret's double canula, for applying and fixing the li-gature over the tumor, are the most simple and successful expedients. M. Levret's instrument is a piece of flexible gold or filver wire, paffed through a double hollow probe in the form of a noofe: this is to be conveyed into the vagina, and carried over the tumor, till it reaches the base. The ends of the wire must be gently drawn, or it must be twifted round as tight as the patient can easily bear; the canula must afterwards be fixed to the thigh, and the wire tightened every day as it slackens. Thus the circulation in the tumor is stopped, and in two or three days the polypus will drop off. In fixing the ligature, the operator must be cautious not to mights the subscale of the continuous part to might be cautious par tor must be cautious not to mistake the tubercle of the os tinese for the polypous tumor. See Hamilton's Outlines. This name vagina is given to other parts of the body, as to the eapfula Gliffeni, which is called vagina portse. A coat of the telles is called vaginalis tunica (fee Testes); and this name is given also to a coat of the cesophagus and of the fpinal marrow.

VALANIDA. See BALANDA.

VALERIANA. VALERIAN. Boerhaave enumerates thirteen species. In warmer countries the fort diffinguifhed by the name of SETWALL, or of GREAT-GAR-DEN-VALERIAN, is preferred; but in colder climates the best is the valeriana sylvestris major of Casp. Bauhine; it is also called phu Dioscoridis, and GREAT WILD VALE-RIAN. Valeriana officinalis, vel valeriana phu, vel valeriana major, foliis omnibus pinnatis, floribus triandris, Linn, Great wild valerian. It is a plant with channelled stalks. the leaves in pairs, each leaf is composed of a number of long, narrow, fharp-pointed fegments, indented about the edges, of a dull green colour, fet along a mid-dle rib, which is terminated by an odd one; producing on the tops of the ftalks umbel-like clufters of finall monopetalous flowers, which appear in May, June, and 8 S. Luly. July, each of which is followed by a fingle naked feed, winged with down; the root confilts of tough ftrings, with numerous fmall threads matted together, iffuing from one head, of a dufky brownish colour approaching to olive. It is perennial, and grows wild in dry mountainous places.

Valerian roots when dry have a strong and grateful odour, rather a difagreeable, warm, bitterish, subacrid tafte; the ftrength of their fmell and tafte are the only marks of their genuineness and goodness. These roots have often a disagreeable smell from the urine of cats; and fometimes there are a mixture of the roots of a fpecies of crowfoot amongst them, but on chewing them they are fomewhat caustic, and thus they are discovered. These should be taken up at a proper season; and properly preferved or they become inert.

As a medicine these roots are an excellent antispasmodic in nervous discases, and take a place amongst the mildest of the fetids. The powder hath been extolled in epilepsies for which end 3 ii. of it are given three

times a day.

Dr. Cullen has found it useful in epileptic, hysteric, and other spasmodic affections. It seems most useful when given in substance, and in large doses, seldom so

in infulion.

The powdered root, digefted in water, or in fpirit of wine, impregnates both mentrua strongly with the smell and taste; water diffilled from it smells strong of the root, but no effential oil separates, though several pounds are committed at once to the still. The watery extract. is strong, disagreeably sweetish, and a little bitter; the fpirituous extract is agreeable, and much refembles the root.

The root is the best preparation, and when its flavour difgufts, the mixture of a little mace renders it more agreeable. Next to the powder, a ftrong tincture made with a proof fpirit is to be chosen. The College of Physicians of London order two tinctures of valerian

made in the following manner:

TINCTURA VALERIANA. Tincture of Valerian.

Take of the root of wild valerian in coarse powder four ounces; proof spirit of wine, two pints; digest with a gentle heat for eight days, and strain.

## TINCTURA VALERIAN & VOLATILIS. Volatile Tinc-

Take of the root of wild valerian, four ounces; com-pound fpirit of ammoniec, two pints; digeft for eight days and ftrain. Pharm. Lond. 1788. This tincture, made doubly ftrong with the root, is an excellent remedy in the above cases, and acts suddenly, and effectually. If to lb i. of this tincture, 3 ii. of the diluted vitriolic acid is added, it proves an useful remedy in those headachs which affect the studious, it strengthens the stomach and relieves many flatulent and spalmodic symptoms. See Neumann's Chem. Works. Lewis's Materia Med. Med. Muf. vol i. no. vii. Cullen's Mat. Medica. It is also a name for the lastuca agnina; a species of pole-monium, of the nardus celtica, a species of eruca.

VALERIANELLA. SMALL VALERIAN. It is a plant which refembles the valerian, and grows in warm places. Boerhaave enumerates fix species, but they are not noticed in the present practice. It is also a name for

VALERIANELLOIDES. An American plant deferibed by Boerhaave, but no medicinal properties are attributed to it.

VALERIANTHEMUM. See RAPUNCULUS VALE-RIANOIDES CÆRULEUS UMBELLATUS.

VALGUS. Bow or BANDY-LEGGED. The legs bending outward. Some children are bow-legged from their birth; others become so from setting them on their feet too early. The tibia of some is crooked, the knees of others are difforted from a fault in the ancle; the feet of fome are turned inwards, these are called vari; and in others they turn outwards, they are called valgi. The best method of preventing these disorders in weakly chil-dren, is to exercise them duly, but not violently, by dancing or tofling them about in one's arms, and not fetting them much on their feet, at least not without pro-perly supporting them: if the diforder attends at the birth, or increases after it is begun, apply emollients,

then boots of firong leather, wood, &c. as required, to dispose the crooked legs gradually to a proper form; or other instruments may be used instead of boots, which, when not too coftly, are usually to be preferred. Slighter inflances of these disorders yield to careful nursing without instruments. See Hildanus, Le Clerc, Solingen, and Heister's Surgery. Also the word CYLLOS. VALLONIA see ÆGYLOPS.

VALLUM. SUPERCILIUM. The EVE-BROW.

Also a species of bandage.
VALVA, from valve, folding doors. A VALVE. It is any thing that opens and shuts over the mouth of a ANATOMY it is a membrane which opens certain veffels to admit the blood or other fluid, and which fluts again to prevent is returning.

VALVA NOBILIS. See COR.

VALVULA COECI;—COLI;—ILII. See Coton, VALVULA CONNIVENTES. They are loofe circular folds, chiefly in the fmall intestines towards the stomach, and are productions inwards of the villous coat; their use is to mix the chyle with the bile and pancreatic juice, and to retain the chyle that it may not escape the lac-

VALVULA PALATI. See PALATUM MOLLE. VALVULUS. See ILIACA PASSIO.

VANULLA, also called banilas, banilas, aracus are-maticus. VANELLOES. They are the fruit of a cliftbing plant in the Spanish West Indies. They are only used to give an agreeable slavour to chocolate: but they are greatly extolled for their essence in cheering the spirits of melancholy persons. See Med. Mus. vol. iii. p. 342,

VARACA. See JACA INDICA. VARICELLA. The CHICKEN-POX, called also variola lymphatica. Dr. Cullen places this genus of difease in the class pyrexize and order exanthematic. He defines it to be, a fynocha. After a moderate fever spots break out, which fomewhat refemble the puftules of the smallpox, but hardly advance to suppuration; these eruptions, after a few days, dry away in fcales, without leaving any mark behind them. See Med. Transac. vol. i. art. xvii. Cullen's First Lines, edit. 4. vol. ii. p. 171.

VARICIFORMES PARASTATÆ. They are con-

tiguous to the epididymides, and are veffels to called because they appear full of slexures and contortions, like the varices, for the better elaboration of the semen. VARICOSA CORPORA, see Spermatica Vasa.

VARICOCELE. It is a varicefe differsion of the veins of the ferotum; which in this state form a sumor of hard knotty inequalities, feldom attended with pain, and in general productive of no inconvenience except what arises from its bulk. In order to the relief of this diforder, it may be treated as the cirfocele, which fee; also Bell's Surgery, vol. i. p. 492. Pott's Works, 4to.

White's Surgery, p. 334.

VARICULA. A diminutive of varix. Thus M. A.
Severinus calls an intumescence of the veins in the tunica adnata of the eye, when it is caused by black

blood.

VARIOLA. The SMALL FOX. Dr. Cullen places this genus of difeafe in the class pyrexize and order examthematæ. It is an acute, eruptive, infectious difeafe, of its own kind; it is accompanied with inflammation, which terminates by suppuration, in cuticular pustules; which terminates by tupparation, in centeurar purtures; it is, in a natural way, ufually completed by three diffinct, continual, fymptomatic fevers, viz. the fever of depuration, which is nervous; of fuppuration, which is ardent; and of retroceffion, which is putrid. The first account we have of this disorder was writ by Rhazes, about the end of the ninth, or the beginning of the tenth contrary and his description of its ginning of the tenth. century, and his description of it was so complete, that little or nothing was added to it for five hundred years after: he also used the cool method in the management of it. Rhazes fays that Aaron, an Alexandrian physician, was the first who described it, and that he writ A. D. 622. The next to Rhazes was Sydenham; he observed that the flower the eruption the more favourable the difease was; he admirably describes it, and improved the management of it in the first period, that is, to the fixth or feventh day, when the fecondary fever came on; at this period he observed that on a sudden the pulse became regular, and all the puftules were out all over the body, the urine was well coloured, or thick, the eyes cool and

free from the fiery lustre which was observable before ! | that the fecondary fever came on by degrees at the first, but foon the eyes are inflamed and watery, a delirium comes on, the urine is pale, the pulfe quick and hard, throat fore, &c. and here he takes the patient out of bed, and orders cool air; the patient's feet to be put into warm water, and an opiate to be given and repeated as required until the rage is abated. The next was Helvetius, who observed the usefulness of purging when the fatal symptoms came on, which Sydenham had remarked in the last stage; and Dr. Freind introduced the practice in England. Boerhaave still advances, with respect to the nature and management of the small-pox; he ventured to restrain the too sudden eruption of the pussules, and commends the attempt to cure the small-pox without permitting the suppuration to come on. The next to Boerhaave was Dr. Thompson; he observes the properest method of reckoning the time of the eruptions continuance, their suppuration, and that as circumstances attend, bed, and orders cool air; the patient's feet to be put into ance, their fuppuration, and that as circumftances attend, thele vary; also that the swelling of the face, and the spitting at the turn, are best kept up by moderating the fever. Many other judicious and useful observations have also appeared, but they are almost superfeded by the practice of inoculation.

When the fmall-pox is epidemical, it usually begins about the vernal equinox. Sydenham observes that when about the vernal equinox. Sydenham observes that when it is irregular and dangerous it begins fooner, as in January or February. Boerhaave fays that if it arises in a place where it hath been fix years absent, and makes its appearance in January or February, the following summer will be attended with a fatal kind; but if it first appears

in May, it will be of a gentle kind.

Sydenham divides the fmall-pox into the distinct and the confluent kinds; the distinct is when the pustules do not touch each other: the confluent are when the pultules more or less fun into one another. Dr. Mead divides them into the simple and malignant; the simple is when the fymptoms are mild, the suppuration kindly, and at last the pustules fall off in dry scabs; the malignant is when the sever is great, the pustules advance but slowly, and do not suppurate well, and the other symptoms are violent.

As Sydenham excels in his description of this disease, so as that Boerhaave says, "Sydenham's book is the only one worth reading on the small-pox;" his account of it in its rife, progrefs, species, and termination, here follows. The distinct small-pex begins with a chillines and thivering, which is immmediately followed by extreme heat, violent pain in the head and back, vomiting, and in adults a tendency to sweat; this last is not observed in children; pain just under the scrobiculus cordis, if it is but gently pressed with the hand, sleepiness and stupor particularly in children, and sometimes convulsions, which last, if they happen after dentition is completed, you may always suspect the small-pox to be just approaching; and the cruptions appearing in a few hours afterwards generally verify the prognostic; so that, for instance, if a convulsion fit attacks a child over night, as it usually happens, the small-pox appear in the morning following; and it frequently happens that the small-pox immediately succeeding such fits, throws out large cruptions, but they are of a mild kind, and rarely consuent. These are almost all the symptoms that accompany this disease in the beginning, and they generally precede the cruption of the pustules, but where the blood is of a looser texture, and so easily admits of a change, it sometimes happens that the separation is performed by degrees, without any considerable sickness before the expulsion of the matter shews itself by the cruption of the pustules. heat, violent pain in the head and back, vomiting, and

the puffules.

The diffinct fmall-pox comes out mostly on the fourth day, inclusive from the beginning of the illness, and fometimes a little later, but feldom sooner, at which time the symptoms are usually much abated, or even go quite off, so that the patient thinks himself pretty well; but grown persons are so inclined to sweat, that it can hardly be prevented, however lightly they are covered, and this disposition continues until the pustules begin to ripen, and then vanishes spontaneously; this sweating foreshews a distinct fort. The eruptions proceed nearly as follows: pale red pustules, as large as the head of a small pin, shew themselves here and there on the face form or on the needs and head, of the process and head. first, or on the neck and breast, afterwards on the body,

and during this stage of the disease the throat is affected with a foreness, that increases as the pullules arise, which growing every day fuller, inflame the ikin and fleth of the neighbouring parts; for about the eighth day from about the beginning of the difease, the spaces between the puffules that appeared before of a pale white begin to grow red, and swell in proportion to the number of the puftules, with a throbbing pain of those parts, which, continually increasing, occasions the inflammation and fwelling above mentioned, so that in the progress of the difeafe the eye-lids are fo filled and diffended, as fometimes to make the patient blind; and this tumor looks like a fhining inflated bladder drawn over them. The blindness comes on fooner if a great number of pultules fix on the eyes at the beginning of the eruption; immediately after the face, the hands, and fingers fwell, in proportion to the number of the eruptions. puffules on the face, that until this day were smooth and red, now grow rough and whitifh, which indeed is the first fign of a beginning suppuration, and they likewife gradually discharge a yellow matter, in colour re-sembling a honey-comb. The inflammation of the hands and face, in the mean time, come to its height, causes the spaces between the eruptions to look of a pretty florid colour, like a damaik role; and the more mild and genuine the fmall-pox is, fo much more the eruptions, and their intermediate spaces approach this colour. As the pultules in the face appear rougher and yellower every day as they ripen; fo, on the contrary, those of the hands, and other parts, appear smoother, and not so white. On the eleventh day, the inflammation and swelling manifestly abate, and the eruptions, both of the face and the relt of the body, being come to their ma-turity and just bigness, which is nearly the fize of a pea, they dry and scale off, and in this kind of small-pox, ufually quite disappear on the fourteenth or fifteenth days but the eruptions on the hands being generally more obftinate than those of the other parts, and yet fresh and white, remain a day or two longer. Those on the face and body dry and scale off, but those on the hands burst, and fo vanish. The pustules on the face are succeeded by a feurs, or branny scales, and those sometimes by pits, or marks; for when the pustules first fall off, the skin is fmooth, but those scales coming on and falling off alter-nately, do at length make those pits: yet it often hap-pens that this diffinct fort leaves no marks behind.

The confluent fmall-pox is attended with the fame fymptoms in common with the diffinct fort; but they are all more violent, particularly the fever, anxiety, fick-nefs, vomiting, and the pain in the back, by which you may fotetel that the confluent fort are approaching. patient is not so ready to sweat in this fort, but a loofeness sometimes precedes, and continues a day or two after the eruption, which is not ever observed in the distinct kind. The confluent fort generally comes out on the third day, sometimes earlier, but rarely later; and the fooner the puftules come out before the fourth day, the more they run together: however, though to fpeak in general, the confluent kind fcarce ever appear fo late as the fourth day, yet fometimes the eruption may be deferred by fome violent fymptoms to the fourth or fifth day; e.g. 1st, Sometimes a sharp pain in the loins resembling a sit of the stone. 2d, A pain in the side like that in a pleurisy. 3d, A pain in the limbs like that in a rheumatism. 4th, A pain in the stomach, attended with sickness and vomiting. In these cases, which indeed and because the source retraded and which indeed rarely happen, the fpots are retarded, and they also forestel great danger. Though the symptoms accompanying this disease in the beginning of the distinct kind, go off immediately after cruption, it nevertheless happens much otherwise in the confluent kind, in which the fever, and other fymptoms, afflict the patient for feveral days after the pultules appear. Sometimes this fort comes out like the eryfipelas, and fometimes like the meafles, from which it is next to imposlible directly to diftinguish them by external appearances; but by attend-ing to the different time of the cruption in these diseases, and other circumstances, which from their respective histories will be found to differ greatly, you will be able to distinguish them. As the distemper increases, the pustules, especially those of the face, do not rise so high as those of the diftinct kind, but, running together, appear at first like a red bladder, covering the whole face, and

tnaking it fwell fooner than in the diftinct fort, and at last they appear like a thin white pellicle closely adhering to the face, and rifing a little higher than the furface of the skin. After the eighth day, this pellicle grows gradually tougher, as appears by the touch, and inclines to a brown, and not to a yellow colour, as in the diffinct kind. The roughness and colour of the skin daily increases, until at length the pellicle falls off in large scales; but when the disease hath been severe, it usually sticks to some parts of the face till after the twentieth day. The more violent the fmall-pox proves, the nearer the eruptions, as they ripen, incline to a dark brown colour, and the longer they are in falling off, if left to themfelves; whereas, on the contrary, the lefs they run together, the yellower they grow, and the fooner they feale off. When the pellicle, which covers the face, first falls off, it leaves no roughness behind, but it is immediately fucceeded by branny teales of a very corrofive nature, which not only make larger pits than the diftinct kind generally do, but also much disfigure the face with unfeemly fears; and in the confluent kind, if the difease hath been very violent, the skin of the shoulders and back fometimes scale off, leaving these parts bare. In the confluent fmall-pox, the cruptions on the hands and feet are larger than those of the other parts, and are gradually less, as they approach the body. Peculiar to the confluent fmall-pox is a falivation in adults, and a loofeness in children; the former never fails to attend, the latter rarely. The fpitting begins as foon as the irruption ap-pears, and fometimes a day or two after; the matter is at first thin, and easily and plentifully expectorated; but towards the eleventh day the faliva becomes viscous, and is raifed with difficulty; the patient is thirfty, coughs often while he drinks, and the liquor flies out of his noftrils, and from this day the falivation generally stops, though fometimes but very rarely: after it hath cealed entirely for a day or two, it returns again. On the fame, i. e. the eleventh day, the fwelling of the face, and the fpitting begin to abate, but then the hands commonly fwell, or at least ought so to do. A looseness does not feize children fo foon as a falivation does; but whenever it begins, if it is not flopped by art, it attends through-out the difease. In both the diffinct and the confluent fort, the fever rages most from the beginning to the time of the eruption, after which it abates, and continues much more moderate, until the suppuration begins, which being finished, it goes off entirely. Again, when the disease proves violent, the patient hath a kind of fit towards the evening; at which time, especially, the most dangerous fymptoms arife, and rage most feverely

As to the prognostics of this disorder it is usually obferved, that the danger is proportioned to the number of the pustules on the head, and particularly on the face. If many pustules are on the body, and but few on the face, the danger is small; but though few are on the body, if there are many on the face, the danger is great. If the pain in the head and eyes, which attends in the beginning, but usually goes off at the appearance of the cruption, continues through the several stages of the distemper, it leaves a disorder in the head after the small-pex disappears, and sometimes a gutta serena is the effect. Bloody urine, and a discharge of blood from the lungs, are usually fatal symptoms; but a convulsion sit preceding the eruption in children, and a sweating coming on in adults, are tokens of the distinct and mild fort.

The principal indication in the management of the fmall-pox is, to prevent the too halty affimilation of the warislaus matter in the beginning of the difease; but as the greatest advantages attend the treating of patients who labour under this disorder from natural infection, as those are treated in whom it is artificially introduced, the reader is referred for direction therein to the management of the inoculated fmall-pox, and to the authors referred to in the conclusion of this article.

Of the SMALL-Pox by inoculation. Sydenham practifed in the prefent cool method of treating the fmall-pox, and writ in defence of the fame. Boerhaave proposed, as already observed, to cure the fmall-pox without permitting a suppuration. In 1713, Dr. Woodward received a letter which gave an account of the success of inoculating the fmall-pox in Constantinople. In 1721, George L. king of Great Britain, consented that a trial should be made on seven condemned criminals, and success attending the experiment, some of our nobility were inoculated,

and, in 1722, some of the royal family followed their example. In three years after, 447 people were inoculated in England, of whom only nine died. In 172 7, Neu mann writ in the German language on the small-pox by inoculation; but some favoured and others opposed its progress; and the practice was but little encouraged, until the intrepidity of Mr. Sutton led him into the present improved method of communicating the small-pox, and of treating those who are the subjects of it. But that benevolence which accompanied the sagacity in doctor (now baron) Dimsdale, led him to teach the world the art of relieving themselves from the terrors of that disease which Sydenham describes as above. His present method of inoculating for the small-pox is the standard of practice, and his plan is here pursued as the most complete on the subject.

It hath been questioned by some, whether or no the genuine small pox was conveyed by inoculation? But there is in reality much more difficulty in conceiving, that a contagious substance should propagate, instead of its own, another disease. Dr. De Haen, amidst all his oppositions to inoculation, never supposed that the matter of the small-pox produced any disease but the small-

pox itfelf.

As to whether the matter for inoculation be from patients labouring under this diforder received in the artificial or in the natural way, experience does not manifest any difference; nor does it signify whether the matter is taken from a mild kind, or from the more virulent fort. The crude matter received from the place of inoculation before the patient sickens, suffices for this operation. The advantage of inoculation depends more on the disposition of the constitution than on the kind of matter which may be conveyed by it; and the next advantages to a proper habit are, the mode of the disorder's being communicated, and the manner of treating the patient whilst it is present.

The principal advantages of inoculating the fmall-pox are, that the puffules can be made to be fewer in the face; the marks on the face are not fo deep from the inoculated as from the natural fmall-pox; the fecondary fever rarely follows inoculation; measures can be taken to provide against the violence of the future fever, and other fymptoms; the loathsomeness and the difficulty of managing this disease is greatly lessend, from those which attend in the natural fmall-pox. It is probable that the infection being received in a vital part in the natural way may have more violent effects than when communi-

cated by the extremities.

The fubjects of inoculation are those of every age. If an exception is admitted against any, it is during the first two years after the birth of infants, or until they have cut their teeth; for until then their irritable frames render them susceptible of violent effects from slight causes. Old age is no objection, the aged are usually most secure from danger. Infants are proper subjects, from their birth to the time that their teeth begin to trouble them; and when detention is over, the vigour of the child's health will always determine for or against the operation.

Conflitutions of most kinds admit of inoculation with fafety. The scrophulous, scorbutic, arthritic, the corpulent, and even the intemperate, all do well. Those who labour under acute or critical diseases, or in whom are symptoms of great debility, should be treated with proper means for the recovery of health previous to their

being inoculated.

In general, the temperate feafons are preferred; but the only exceptionable one is, the hot months in furmer, though cold conflictations are fafely inoculated in the warmest weather. When inflammatory or putrid difeases prevail, they are unfriendly, and during their continuance, inoculation should not be admitted.

The best preparation is, to produce a healthy state of the body. If the health is perfect, preparation is useless; if defective, it must be restored. That peculiar disposition on which a mild fmall-pox depends is yet unknown; an healthy one comes the nearest to it; and could that be ascertained, perhaps, that is the quid desideratum.

In the fmall-pox the inflammatory fymptoms are usually the principal fource of our care, and that method which reduces and maintains the vis vitæ near, or rather below

Before the patient is inoculated, a due regard must be had to the state of his body, and to the removal of such fymptoms, &c. as may embarrass or endanger. The diet should be of the cooling vegetable kind, and such as tends to keep the bowels lax and promotes the urinary discharge. Whatever is the particular diet, full meals is not to be w natever is the particular diet, full meals is not to be allowed until fuppuration begins, and then, as well as after the eruptions are fallen off, a gradual return to the ufual diet is most proper. Animal food and cordial liquors are only to be used if needful for supporting the strength and spirits of the patient, and, when admitted, great care is required not to exceed these intentions in their use.

The patient confidered as a proper subject, inoculate him, and in the evening give as much calomel mixed with him, and in the evening give as much calomel mixed with r-16th part of the emetic tartar as will gently move the belly, and in the morning affift its operations with as much natron vitriolatum, or other fuitable purging medicine, as will procure three or four evacuations: repeat these every second night and morning, until the symptoms of eruption appear. Mercury seems to be esteemed, by some, specific in the small-pex, and may be given fo freely as to affect the gums and excite a general ptyalism. When infants at the breast are inoculated, the nurse may take the medicines above prescribed. When the inflammatake the medicines above prescribed. When the inflamma tion at the puncture is too little, increase the dose of the

calomel, for then it both promotes the inflammation there and accelerates the general eruption.

To communicate the infection, the variolous matter must be introduced into a fensible part; and, as the fmallest sensible quantity of varietous matter suffices to produce the small-pex, the point of a needle, or of a lancet may be dipped in the serum that ouzes from a puncture made in any patient for producing the fmall-pox, or in a variolous pultule, and then introduced into the skin, just deep enough to wound it; but it is not necessary that blood should be discharged. The needle, or lancet, dipped in the variolous matter, will suffice several days after for communicating the insection. One puncture may suffice, but generally one is made in each arm, any where above the clbow.

Inflammation about the puncture is a fure fign of in-fection having taken place; but this cannot be discerned if either an incision is made, or any dreflings are applied where the infection was communicated: therefore, the puncture being made, leave it to heal, or to whatever may occur in confequence of the infectious puncture. By making a puncture only we may observe the progress of the infection and subsequent disease; besides, no fore, abiceis, nor mortification, follows the puncture, as is

observed when incisions are made.

If a person happens to receive the infection by inoculation and in the natural way at the fame time; that which was received by a wound, operating foonest, destroys the disposition in the body to be affected by the natural infection. The progress of the infection is observed as follows: about the punctured part, and from thence, a just prognostic is usually formed of the future state of the distemper, and thus future inconveniences may be marded against a formations the effect of the infection. guarded against; fometimes the effect of the infection guarded against; sometimes the elect of the intection is observed in a few hours after the patient is inoculated, by sharp pains darting up the shoulder, when the puncture is made in the arm, a shivering through the body, a red tumor on the arm, or a small rising where the matter was applied; but most frequently it observes the subsequent order. Suppose the infection to have been commissioned in the morning, though it takes effect, nothing municated in the morning, though it takes effect, nothing is observed on that day. On the second day, if the puncture is viewed with a lens, an orange-coloured stain is observed about its edges, and they seem to contract; fometimes the puncture inflames on the first or second day, and then vanishes without any further effect; in day, and then vanishes without any further effect; in this case, if the patient had not the fmall-pox before, except the punctured part becomes tunid as well as inflamed, and also suppurates, or is attended with uneasines in the axillary glands, the efficacy of the infection remains doubtful, and after a few days the operation may be repeated. On the fourth or fifth day, an hardness may be perceived where the puncture was made, an itching is felt there, and generally a slight inflammation

the medium of perfect health, whilft it guards against langer, supports the patient's vigour, and enables him to furmount the morbid attack. til the tenth or eleventh day. This is a favourable fymptom; it foretels the near approach of the eruption, and denotes a favourable progress through the whole of the disease. Pain in the head and limbs, with stiffness under the arms, are among the certain proofs that the in-fection hath taken place: On the feventh or eighth day, the cruptive figuretoms appear, fuch as flight remitting pains in the head and back, fliffness in the arm-pits, transfient shiverings, alternate heats, &c. which continue more or less until cruption is completed: the inflammation in the arm spreads, and little pushules are begun there which increase in fize as the disease advances. tenth or eleventh day an efflorescence furrounds the puncture, and fometimes extends half way round the arm; the larger this efflorescence is, the fewer are the pullules ufually; when it accompanies the eruption, the fever and other uneafy fyrontoms fubfide, and all difficulty and danger is at an end. As foon as the cruptive fyrontoms are perceptible; give a dofe of calomel with the caretic tartar as above, and a few hours after give a dofe of the natron vitriolatum, and thus for the most part all is done that is required from medicine.

It fometimes happens that none of the fymptoms on the arm appear before the eighth day, and then the inflammation, &c. about the puncture rife fuddenly : this late appearance of fymptoms is generally regarded as foretelling an untoward difease, but this is not always the case. Mr. Sutton repeats the evacuations from the time of infection to this time, fo as that no longer appearances of the rigid fibre remains; and observes, that when the skin is hot and dry, repeated doses of falts do much bet-ter than the mercurial medicine.

Among the favourable fymptoms are, an orange-co-loured ftain about the edges of the puncture on the fecond day, an itching there in two or three days, a kind of vesscation, without much inflammation, on the third or fourth days, a pain and stiffiness in the axilla, the sooner the better, but if on the fixth day it is well; the large efflorescence about the puncture on the tenth or eleventh day or fooner; an hardness which spreads from the puncture as from a centre, and to the touch forms star-like points, and when the part inflamed on the arm, rifes as it were to an apex with a little dry feab on it.

The less favourable symptoms are, a purplish instead of a red coloured inflammation about the puncture, a narrow deep red circle surrounding the puncture, and when the incrustation about the puncture becomes de-

preffed and concave in the middle.

The first symptoms of a sever being manifest, a dose of calomel and the purging salts must be given. The higher the sever, the more numerous are the eruptions; at this time, if the sever runs high, give the sebrifuge spirit in cold water, as directed in the article Februs, or give the stibiated nitre in water, for common drink, and let the patient's thirst determine the quantity; expose the patient to the cold air. As soon as by the above means, or by the use of other acidulated, or above means, or by the ute of other acidulated, or cooling liquors, a perfpiration appears on the fkin, let the drink be tepid baum tea, or other agreeable small liquor. This cooling method must be urged more or less according to the constitution of the particular patient. In this situation, though the patient is not able to walk, he may be carried out into the air, whatever be the weather, and this though he be shivering in a rigor, cold water must be given for drink if the patient recold water must be given for drink if the patient re-quires it; the aged and feeble may be allowed white wine whey. Thus either alarming symptoms or a large crop of puftules are prevented. As to the heat or cold to which the patient is subjected, that degree which is most agreeable to his sensation is the proper one. In case of great sickness, langour, delirium, especially if attended with a weak pulse, cordials may be allowed; repeat them as the pulse and other circumstances re-

when the eruption is completed, and the flate of maturation is begun, allow the patient a little broth, veal, mutton, or jelly, and now and then a glafs of fome fmall vinous, or malt liquor. Some tender conflitutions indeed require at this time to be kept in bed, and to be fupplied with a cordial and nourifhing diet.

Whether the cooling or the cordial method is purfued,

8 T

to that of health; the languid may require to have more heat preferved than is necessary in the robust, and it may be observed that, as the cool method is to prevent the too great abundance of eruptions being formed on the skin, so when they are determined there and fixed, a moderate heat is required to perfect them; to a regard to heat, according to the ends expected from it, is to be the rule of management.

During the flate of maturation opiates are not necoffary, except there are great pain and reftleffness; and if an opiate is administered, a clyster should accompany it; for during the whole course of the finall-pox, a lax belly, and a free discharge by urine, are effentially

necessary.

Whether the fmall-pox are produced in the natural or the artificial way, the violent and dangerous fymptoms are from either an ardent or a putrid fever attending; and an attention to the methods proposed in those disorders, as they are applicable here, will enable the practitioner to proceed properly when they attend this com-

VASTUS EXTERNUS. The crureus, the vastus inter-vastus INTERNUS. Sternus, and the vastus inter-uus, may be considered as one muscle, whose outer part rises from the external part of the semur, the inner part from the internal part, and the middle from the anterior part, in fuch a manner as to furround the whole thigh, except the linea afpera, taking its origin likewife from the furface of the bone: these muscles join the tendons with their rectus.

VEGETABILIS. VEGETABLE. Vegetables are those natural productions in the terraqueous globe which have life and growth, but not sense, as trees, berbs, &c. The bodies of vegetables are of a regular organic structure, analogous in some degree to that of animals: they are furnished with a variety of vessels, for receiving, transmitting, and perspiring different fluids; with organs too, by which the aliment they imbibe from the earth, water, or air, is changed into new forms, into juices peculiar to par-ticular plants. The fubftances naturally contained in vegetables, and feparable from them by art, are gum, refin, a fubtil oil, camphor, a grofs oil, a faline matter, phlegm,

the heat of the body should be kept, as nearly as may be, | and an earth: these are called the native principles of vegetables; native, because they naturally exist in plants; and principles, not as being fimple, but as it is by thefe that one plant differs from another, and that each exerts its specific power; and as they cannot be further resolved without totally deftroying their péculiar qualities. Various are the divisions into which vegetables are distinguished, whether considered as the subjects of botany, or of medicine, &c. and numerous also are the preparations they afford to pharmacy and other branches of art, as may have been already observed from what is deligated in the preceding function. vered in the preceding facets. Amongst a variety of other preparations of the vegetable kind, by fermentation we obtain inflammable or vinous spirit, ether, malt liquors, wines, vinegars, tartar, &c. by fire, or burning, are procured empyreumatic oils, fixed vegetable alkaling falts, &c.

VELUM PUPILLAE. See Pupillaris MEM-

VENA. A VEIN. A thin ramifying classic tube, which arifes in the extremities of the body, and termi-nates in the heart or in the liver. The blood is diffributed all over the body by two arteries, the aorta, and the pulmonary artery; and it is returned by three kinds of veins, viz. the vena cava, the pulmonary veins, and the vena portæ.

In general the arteries have their correspondent veins, so the course of the one is known by that of the other.

Veins begin where the arteries end, and proceed from the branches to the trunk, making a conoid figure, in the fame fense that the arteries have been faid to do.

The extremities of the arteries in the brain are continued into their veins, whose trunks vary much in their continued position from the arteries, these entering the brain at its bass, and distributing themselves as noted in speaking of them; whereas the trunks of the veins are extended on the surface of the brain, and discharge their blood into the longitudinal finus; nor do the veins of the brain accompany their arteries at their ingrefs as in other parts, and as the arteries and veins of the dura mater do.

The veins which are subject to frequent compression from the action of the mufcles, have valves which open towards the heart; in all the veins also which are perpendicular to the horizon, excepting those of the uterus and portæ, there are valves with their mouths towards the heart; these valves prevent the return of the blood in

Besides the deep seated veins which accompany the arteries in the extremities, there are other veins more fuperficially feated, the reason of which is, to prevent the circulation being interrupted by the action of the muscles compressing the internal veins.

The coats of the veins are the fame as those of the ar-teries, but they are thinner, being composed of fibres in all directions, they bear stretching better than the artery, whose chief strength is in the circular sibres; the coats of the veins are thicker in the extremities than among the vifcera, particularly the faphæna is of a remarkable thick-

The capacity of the veins is much larger than the arteries, except in the pulmonary vessels, where the four veins taken together are not equal to the artery. See Winslow's Anatomy. Haller's Physiology of the Veins.

Most of the veins will be found under the respective names which they bear—fome not, viz. for those called Splenica brachia, mediana basilica, see Basilica vena; Vena Medinensis, see Dracunculi.

VENÆ LACTEÆ. See Lactea Vasa.

VENÆ-Sectio. See Philebotomia.

VENENUM. Poison. This word feems to be a re-

lative term only; what are called poisons, have, in their respective instances, falutary effects; they injure by mis-application. The ancients made no distinctions between poiss and medicines, they went both by the same name. In our day we are used to consider those articles which have not been employed with any falutary effect, as ab-folute poissn; but in this we do not think duly. Again, we annex the idea of poison to those things which produce their ill effects in very small quantities, and of whose form and action we are little or not at all acquainted. When any thing acts mechanically, though it destroys, we never rank it with poi/ons. Things that kill unavoidably, though not mechanically; things that are of a specific nature, and produce ill effects; those injurious things whose effects are relieved by specifics; and those for which we have no cure, are all called poi/ons. In short, it is difficult to give a definition of the word poi/on, perhaps impossible. Surely that alone could be properly called a poi/on, or be considered as absolutely a poi/onous substance, which at all times, in any quantity, and on all occasions of applying it, would without exception be destructive. Such a substance is unknown.

To fpeak in usual phrase, poisons are the produce of the animal, vegetable, and mineral kingdoms. Their action is either mechanical, when they are not so properly ranked, chemical, or on the principle of life.

The animal poisons act chiefly on the living principle; they are natural or morbid. The natural are found in particular animals for some use or benefit to the individual in which it is sound: the natural poisons do not, like the morbid ones, produce more of their own kind. The natural poisons first affect the part to which they are applied; then, either by absorption, or by sympathy, the whole habit suffers. The morbid animal poisons are various, and many of them appear without our being able to discern the cause of their production. The virus producing the small-pox, measles, &c. are of this class; the cancer also, and the hydrophobia too; all which arise spontaneously. Morbid poisons are produced from a similar disease before affecting, as the small-pox, &c. or they arise spontaneously, from some morbid actions of the parts endowed with life, as the cancer, &c. And these, when produced, have the power of increasing and forming fresh matter of the same kind, and propagating their own species. The morbid animal poisons are less active than the natural ones; they do not produce their effects so rapidly.

Mr. Wilmer, in his Observations on the Poisoness Ve-

Mr. Wilmer, in his Observations on the Poissensia Vegetables found in Great Britain, seems to class them into, 1st, Those from which the maniacal symptoms are to be expected, or the various nervous affections, from a vertigo to a fatal apoplexy. In this class he includes the soporiferous plants. Of these there are the following, very generally met with in our isle, viz. Hyosciamus Niger, Solanum Lethale, Aconitum, Mercurialis Sylvestris, Stramonium, Cicuta Major Foetida, Agaricus Muscarius, Agaricus Piperatus, which see.

And, 2dly, Those which produce epileptic symptoms: a loss of understanding, speech, and all the senses will take place in a few minutes after these sciences in the

And, 2dly, Those which produce epileptic symptoms: a loss of understanding, speech, and all the senses will take place in a few minutes after these positions are in the stomach: the muscles will be convulsed, and death will close the scene in a few hours. Of these there are found in most parts of Great Britain, the following, viz. CENANTHE CHEROPHYLLI FOLIIS, CICUTA AQUATICA, LAURO CERASUS, which see.

The danger of these last is very great; they do not offend the palate, so may pass unsuspected into the stomach; when there, they do not produce any sickness, so are not likely to be discharged without the affistance of art; and they are so quickly active that they scarcely admit of an opportunity for that affistance to be given.

Mr. Wilmer further observes, that, poisonas vegetables appear to act by an oppression upon the nervous system, rather than by an inflammation of the stomach and duodenum, which from the beginning produce those other intervening symptoms that usually end in death. He very judiciously observes, that these vegetable posson, in different constitutions will have various and sometimes opposite effects. The most contrary symptoms are produced in different persons who have taken the same posson. They gave proofs that both the utmost irritation and appearances which indicated that the office of the nerves was destroyed, might arise from the same cause, working its effects in different constitutions.

Mineral poissons are actid or corrolive, as arfenic, cobalt, and muriated quickfilver; or they are fedative, as the preparations of lead, &cc. Mineral poissons act mechanically, chemically, and on the principle of life.

As to the prognostics when poilonous substances are taken, in general it may be observed, that, as to those of the animal kind, little more can be said than to refer to

the particular inflances thereof. Those of the vegetable world have usually but little effect after being speedily evacuated. The mineral policies are sometimes carried off by vomiting, but usually ill effects follow notwithstanding that discharge.

In order to relief, when mineral perfors are taken, if a vomiting does not follow, attempt the expulsion by any quick emetic; zincum vitriolatum purificatum gr. x. vel vitriolum corruleum gr. t. iii. assisted by copious draughts of warm water, and milk, or oil; then endeavour to decompose the perforant article by means of the fixt alkaline salts, diluted in large quantities of water. Thus whether the hydrargyrus muriatus, arsenicum, cerusia acetata, antimonium tartarisatum, or any metallic salt be taken, the same method may be pursued. If the emetic is worked off with a solution of the fixt alkaline salt, the effects may be expected as more agreeable to our distress. In thort, what steps appear to be the most eligible in case of arfenic being swallowed are the same in case of any other poison of the mineral kinds. These kinds of possons act mechanichanically and chemically.

In most instances of the vegetable poisons, their first powerful action when swallowed is on the stomach; an emetic therefore begins the cure. When these possons are evacuated, the danger is over, which is not the case with the minerals; discharge them then with the utmost speed. After due evacuation upwards, vinegar seems to be the best known antidote; in want of i; give the crude juice of acid fruits; but as vinegar is less tharp and contracting, it can be used in larger quantities, and is therefore preferable. Vegetable possons act on the nervous system, and attack the principle of life. If opportunity hath not favoured a discharge by vomiting very soon after this kind of posson has been swallowed, besides an emetic let a laxative by the mouth of glysterwise be administered; then give frequent draughts of cyder, perry, sourish small beer, or vinegar and water: some practitioners of the first rank extol the essicacy of the faline draughts, if given in the act of fermentation. If paralytic symptoms remain, apply snapsisns, blisters, &c. Unhappily, those vegetable possons which produce epileptic symptoms, so affect the stomach as generally to prevent evacuation either upward or downward; on this account there is less hope from the above means; however, they are the only known refources, and, if any discharge is procured, a favourable

Animal poison act very variously, and in order to a proper management in any instance of the kind, see Hydro-PHOBIA, VARIOLA, &c. all which are instances of this kind.

hope may be indulged.

After all, this subject of poisons is very difficult to investigate; abstruse in its nature, and important in its consequences. Many have writ on this subject, but very little hath been said from which any thing satisfactory can be derived. See Mead on Poisons. Grevinus de Venenis. Bell's Surgery, vol. v. p. 312. London Med. Journal, vol. iv. Houlton on Poisons. Wilmer on Poisons. Edinb. Med. Comm vol. iii. p. 121.

VENTER, x37x12, the belly. In the most extensive sense it is taken for a remarkable cavity, in which any one of the principal vicera is contained; in this respect the whole body is divided into three venters, viz. the head, the breast, and belly, see Abdomen. Hippocrates uses the word x202 man formetimes to express only the cavity of the breast and lower belly, and sometimes he calls the thorax the upper and the abdomen the lower belly. But the term venter, or x202, calle, is most generally understood for the lower belly only. But various are the significations of this word, as the stomach, the colon, the excrements of the belly; it is a name also of the sirst stomach in ruminating animals; and amongst the chemists venter is the same as terra, and venter equi is horse-dung.

Venter equi is horic-dung.

VENTRICULOSI. See COELIACA PASSIO.

VENTRICULUS. The STOMACH. Diminutive of venter. See STOMACHUS.—Succenturiatus, fee DUODE-

VENUS. The name of the goddess of beauty and love; it also signifies vonery. On a due regulation of this appetite much of the vigour of constitutions depends; and a too great continency is often productive of diforders similar to those that arise from an excess of indulgence in this inflance; though, in some constitutions, plethoric and inflammatory symptoms are the result.

The delicate and tender should be very cautious in their venereal engagements, as small degrees of excess very sen-fibly injure them. It is also a name for copper. See Æs. VERATRUM. See HELLEBORUS ALBUS.—For

that called nigrum, fee IMPERATORIA NIGRA, &

HELLEBORUS NIGER.

VERBASCUM. MULLEIN. It is also called candela regia, candelaria, & lunaria, and is a large, white, woolly plant. Boerhaave mentions eleven species. The Edinburgh College orders the verbascum thapsus, or verbascum foliis decurrentibus utrinque tomentoss, caule simplici, flor. Linn. The GREAT WHITE MULLEIN, HIGH

VERBENA, called also verbenaca, verbena mas & cecrulea, berba facra, bierobotane, cepbalalgia, berba.

mensa Javis. Common vervain. In Wales it is called cas gangythrel. It is the verbena officinalis, Linn.

The roots are fibrous, of a light brown colour, hard, bitterifh, and irregular; they fend up many stalks half a yard high, squarish, solid, roughish, of a purplish green colour, and branched; the leaves stand on the stalks in capfules opposite to each other, they are hairy on both fides, wrinkled and jagged with deep cuts, and wide at the stalk end, fomething like oak leaves when half grown, of a deeper green above than below; the flowers are ranged in long faikes, of a pale purple colour, divided into five parts at the top, succeeded by four small longish feeds joined together; they blow in July, &c. to Oc-

This herb is found in highways, in chalky, gravelly, and uncultivated grounds. The root is hung at the pit of the ftomach, and a fresh piece is placed there twice in a year, as a cure for the scrosula. An ointment made by boiling the whole plant in lard, as is directed for the green ointment of elder, is recommended as useful in scrosulous ulcers. See Raii Hist.

VERBENA FOEMINA, fee ERYSIMUM.

VERBESINA, fee BIDENS: for that called Acmella, and Lavenia, fee ACMELLA.

VERMES. WORMS. The most frequent feat of worms in the human species is the intestinal tube; but occasionally they have been found in almost every other part of the body.

In the stomach and intestines are the following species of worms: I. The round swarms, called also teres or terestines.

of worms: 1. The round worms, called also teres or teretes, and by Hippocrates strongylus. 2. The tape-toorm, called also the gourd-worm, tania, solium, and intestino-rum lumbrici lati. See TENIE. 3. Ascarides.

The lumbrici, round worms, are about a span long, round and smooth: they are seated for the most part in the upper small intestines, but sometimes they are lodged also in the stomach, and in any part of the intestines, even to the rectum. The tape-warms are from two to forty seet long, according to the testimony of Platerus; they ge-nerally possess the whole track of the intestines, but especially the ileum: they very much refemble a tape in their appearance, whence their name of tape-worm. The afcarides have usually their feat in the rectum. See Asc A-

Worms are rarely found but in persons with weak sto-machs, or where digestion is ill personned. As to cer-tain aliments producing worms, it is objected that all we eat may be expected to generate them, as well as those articles usually specified. It is said that they cannot be hatched in a healthy inside, for the gall in particular would destroy them; in children the gall is generally as inert as it is redundant, and in cases of indigestion, when adults are the subjects of these vermin, the gall is also desective in its quality, and probably hence is the mediate cause of worms in the human intestines.

Numerous are the figns of worms, fuch as colicky pains, a copious discharge of faliva when fasting, a disagreeable breath in the morning, itching in the nose, an irregular appetite, a swelled and hard belly, trouble-some sleep, grinding the teeth during sleep, palses in the limbs, thirst, and severishness; but as these, and all other figns are common to this, and to other disorders, the only one to be depended on is their being discharged; and this may be observed with respect to the round, the tape worm, and those called ascanides. worm, and those called ascarides.

Amongst the variety of remedies proposed for the des struction of surems, none seem more to be depended on than those which purge briskly, in conjunction with those that strengthen the chylopoetic organs. Various are the specifics for destroying them, but their efficacy may be attributed to their purging or corroborating quality, or to both. Mercury, rhubarb, aloes, Indian pink, sea falt, or sall, are thus efficacions, material which ox gall, are thus efficacious; water in which a portion of quickfilver is boiled, is supposed to receive its efficacy from a portion of arsenic which it takes up from this mi-neral; tin, as recommended in the Edinburgh Medical Effays, is supposed to destroy the werms by its mechanical action on them, though, more probably, the arfenic in the tin is that to which the benefit is to be attributed. Dr. Bifs extols the baftard black hellebore as a most certain destroyer of the round tworm; but purging, by lef-fening the slime, always relieves, and probably the tworms, that are not forced away by this quickened motion of the intestines, may, for want of slime, languish and die. It does not appear that one kind of purge is preferable to another, let the kind of tworms be what they will; the worms being always defended from the immediate action of the medicine by the flime, and therefore purges which act brifkly, and of which a frequent repetition can be borne, are the best. Of this fort are purging waters, particularly the sulphureous, jalap, &c. Dr. Storck says that he hath destroyed all forts of tworms, viz. the round, the ascarides, and the tape-tworm, by the following mixture repeated, as here directed. R Sal polychrest, pulv. rad. islan. & rad. valer, filv. pulv. \$3.7 i. ox. scillit. 7 iv. rad. jalap. & rad. valer. filv. pulv. P. 156. The diforder called the WORM-FEVER, Dr. Mufgrave obferves, is generally confined to children, and as it too frequently baffles the best endeavours, he gives the following account of the diforder, with the method of treat-ing it, which in his practice hath been most successful. The difficulty of curing what is called a worm-fever, arifes, according to this author, from its being frequently attributed to tourms, when the cause of the disorder is of a quite different nature. He does not deny that the irritation caused by them doth sometimes produce a fever; but he apprehends these cases to be much more uncom mon than is generally imagined, and that great milchief is done by treating fome of the diforders of children as tworm-cates, which really are not fo. Dr. Hunter, it is observed, was of the same opinion on this point, and he has diffected great numbers of children who have been supposed to die of worm-severs, and whose complaints were of course treated as proceeding from worms, in whom, however, there appeared, upon diffection, to be not only no worms, but evident proofs of the diforder having been of a very different nature. The fpurious worm-fever, as Dr. Mufgrave calls it, has, in all the inflances he has feen of it, arifen evidently from the children having been included with too great appearing of dren having been indulged with too great quantities of fruit; though a poor cold diet may, he thinks, occasio-nally give birth to it. Every fort of fruit eaten to excess will probably produce it; but an immoderate use of cher-ries seems to be the most common cause of it. The approach of this diforder has a different appearance, according as it arifes from a habit of eating fruit in rather cording as it ariles from a habit of eating fruit in rather too large quantities, or from an exceffive quantity taken at one time. In the former case, the patient gradually grows weak and languid; his colour becomes pale and livid; his belly swells and grows hard; his appetite and digestion are destroyed; his nights grow restless, or at least his sleep is much disturbed with startings, and then the fever soon follows; in the progress of which, the patient grows comatose, and at times convulsed; in which thate, when the event is not favourable, he dies. The pulse at the wrist, though quick, is never strong or hard; pulse at the wrift, though quick, is never strong or hard; the carotids, however, beat with great violence, and elevate the skin so as to be distinctly seen at a distance. The heat is at times confiderable, especially in the trunk; though at other times when the brain is much oppreffed,

it is little more than natural. It is fometimes accompanied by a violent pain in the epigaffric region, though more commonly the pain is flight, and terminates in a coma; fome degree of pain, however, feems to be infeparable from it, so as clearly to diffinguish this diforder from other comatose affections. Where a large quantity of fruit has been eaten at once, the attack of the disorder is inflantaneous, and its progress rapid; the patient often passing, in the space of a few hours, from apparently a perfect health, to a stupid, comatose, and almost dying state. The symptoms of the sever, when formed, are in both cases nearly the same, except that, in this large in both cases nearly the same, except that, in this latter fort, a little purulent matter is sometimes discharged, both by vomit and stool, from the very first day. The both by vomit and stool, from the very first day. The stools, in both cases, exhibit sometimes a kind of curd, refembling curdled milk, at other times a floating fub-flance is observed in them, and fometimes a number of little threads and pellicles, and now and then a fingle

Strong purgatives, or purges frequently repeated in this diforder, are greatly condemned by Dr. Mufgrave, as they in general not only aggravate the fymptoms already present, but are sometimes the origin of convul-fions. Blood-letting is not to be thought of in any stage of the disorder. But although frequent purging is not of the diforder. But although frequent purging is not recommended, yet a fingle vomit and purge are advised in the beginning of the diforder, with a view to evacuate fuch indigested matter and mucus as happen to remain in the stomach and bowels. These having operated properly, there is feldom occasion for repeating them; and it is sufficient if the body be costive, to administer every second or third day, a clyster composed of aloe. opt. 3 ss. & infus. flor. chammem. 3 v. The principal part of the cure, however, depends upon external applications to the bowels and stomach; and as the cause of the disorder is of a cold nature, the applications must be warm, cordial. of a cold nature, the applications must be warm, cordial, and invigorating; and their action must be promoted by constant actual heat. In this case, R Fol. abs. & rutz, 22 p. zeq. aq. pur. q. s. f. decoct. saturatissimum, quo calide soveantur regio ventriculi et abdomen, 4ta vel 5ta quaque horze, per horze quadrantem. Magma ex herbis coctis post fotus usum iisdem partibus perpetuo appositum teneatur, et quoties refrixerit, aliud calidum opponatur. For internal use. R Sots. cinnam. & ao. cinnam. 22 7 fe. feneatur, et quoties refrixerit, ahud calidum opponatur. For internal ufe, R Spts. cinnam. & aq. cinnam. az \( \frac{7}{3} \) fs. ol. amygd. d. \( \frac{7}{3} \) fs. fyr. Tol. ziij. m. et tempore ufus fortiter concutiantur in phiala capiat pro ratione \( \text{xtatis, zij.} \) ad \( \frac{7}{3} \) tertia quaque hora. When any nervous fymptoms come on, or remain after the diforder is abated, they are easily removed, by giving a pill of four grains of affafeetida, once or twice a day.

When worms really infest the bowels, Dr. Musgrave

observes, that their diagnostics are very uncertain; but that in real worm cases, the treatment above recommended would, he imagines, be much more efficacious than the practice commonly had recourse to. As worms either find the constitution weakly, or soon make it so, the frequent receiving of purees particularly mecunials he quent repetition of purges, particularly mecurials, he afferts, are injurious. Fomenting the belly, night and morning, with a ftrong decoction of rue and wormwood, is much recommended; for, by invigorating the bowels, it has thereby a confiderable influence in rendering them capable of expelling such worms as they happen to contain. After the fomentation, he advices to anoint the belly with a liniment, composed of one part of effential belly with a liniment, compoled of one part of effential oil of rue, and two parts of a decoction of rue in fweet oil. Of internal medicines, the best is affafoetida, with an aloetic pill or two at proper intervals. The diet of children disposed to worms, he adds, should be warm and nourishing, consisting, in part at least, of animal food, which is not the worse for being a little seasoned. Their drink may be any kind of beer that is well hopped, with now and then a small draught of porter or negus. now and then a finall draught of porter or negus. A total abitinence from butter is not so necessary as is generally thought. Poor cheese must be wholly avoided, but fuch as is rich and pungent may be moderately allowed, for it is peculiarly ufeful. It is equally an error to feed children too well with rich food, rich fauces, and a very free use of wine; and to confine them to too first or too poor a diet, which weakens their digeftion, and renders them liable to diforders in their bowels.

Dr. Butter, in his Treatife on the Infantile Remittment Fever, which he fays is the worm-fever of authors, af-

ferts, that there is not the fmallest rational ground for regarding worms in the cure of this fever. That, though the existence of worms be a sign of disease in children, yet, in his judgment, they are properly neither cause nor fymptom of such disease; and therefore ought not to influence, in any respect, medical practice. It hath long been known that severs destroy worms. As a definition, he fays, that the infantile remittent fever is diftinguished by drowfy exacerbations, wakeful remillions, pain of the head and belly, total loss of appetite, little thirft, and flimy flools. In his description he observes, that this fever is accompanied with a great many fymptoms, but they feldom all occur in the fame cafe. These symptoms he arranges under three different heads, constituting so many varieties of the disease. These varieties he names the acute, the flow, and the low infantile remittent fevers; as causes, the doctor points out irritability and indigeftion; this fe-ver may be accelerated by cold, fatigue, &c. but the prin-cipal causes are crude accumulations in the first passages, which, with a very irritable predifipolition, draw the intestinal canal into spasm, which is soon communicated to the rest of the body, constituting the severe. The two symptoms commonly attributed to worms, he refers to debility as their course. debility as their cause; these symptoms are the loss of voice, and of speech. In order to the cure, Dr. Butter proposes but one indication to be regarded, viz. the re-moval of the febrile irritation. This irritation is owing to a spasmodic affection of the intestinal and other membranes of the body, supported by morbid accumulations in the first passages. The means preferred are, rest, quietness, and stillness. The bed-room should have but little nets, and fillners. The bed-room should have but little light admitted into it. Diluting and nourishing drinks should be frequently given, such as small broth, gruel, and barley-water. Solid food should not be allowed. The neutral salts particularly the sal polychrest. is useful by its abating the intestinal stricture, and rendering the bowels rather lax. For a child of sive years old, a dram of the salt may be dissolved in sour ounces of water, sweetened with any convenient syrup, or with sugar, and fweetened with any convenient fyrup, or with fugar, and two table spoonfuls may be given every four hours. This mixture should be given fo as to keep the bowels open; in general when the fever is low, one stool should be produced every day, two in the flow, and three or four in the acute kind. When the bowels are rendered foluble, nitre may be used instead of the sal polychrest. If a looseness attends, the neutral salts must not be given, loofeness attends, the neutral falts must not be given, but in their stead, the following mixture in the same manner as the above with sal polychrest. In sour ounces of water dissolve sive grains of the extr. cicutæ, and add to it a dram of sugar. In the slow kind of this sever, the mixture with the extr. cicutæ is to be preferred to that with the salt. A grain for every year of the patient's age may be given, dissolved in water as already directed. If required to keep the belly lax, when the extract is used, the sal polychrest, may be given twice a day, or as much rhubarh may be given every night as may be required. much rhubarb may be given every night as may be required. The general treatment takes place in the beginning of the low fever; but after the fymptoms of the lownels abate, the treatment varies a little. In case of costiveness, half a dram of the fal polychrest, may be given, dissolved in two ounces of water sweetened, the one half at night the other in the morning. If the child hath a stool daily, the nitre may be used instead of the fal polychrest. Four drops of the acidum vitrolicum dilutum, may be given every four hours in the patient's drink. Small wine-whey should be used instead of barley-water, by turns with the gruel and broth; fometimes a little wine may be added to the gruel. If this low fever is complicated with loofsness, the extr. cicutæ given as above, should be the only medicine employed, except a drop or two of the tinct.
opii, after each flool. To relieve the vociferation and
reftlefiness, foment the belly with flannel cloths wrung out of a decoction of cammomile, agreeably warm, and repeated as required. See Medical Transactions, vol. i.

VERRUCE. WARTS. A wart begins in the cutis, and feems to be either an efflorescence of the serum hardening on the fkin, or making a dry tumor, or a fmall lux-uriancy of the little arteries of the cutis, making a little farcoma, or foft wart. When it arifes with a broad bafis, it is called verruca feffilis. Sometimes a few capillalength, enlarge themselves into a greater compass, and make the pensile tumor called acrochorden.

Dr. Cullen places this genus of disease in the class locales and order tumors.

cales and order tumores.

Warts are generally removed by incision, or by the use of caustics. The juice of celandine, of essula, the gall of the pike, or of the eel, the mineral acids, the lunar caustic, or an actual cautery, after which last they are faid never to return.

When warts are on the knuckles they are difficult to be feparated, without hurting the tendons, and are generally to be left to themselves. Heister observes, that on rally to be left to themselves. Heister observes, that on the face, lips, or eye-lids, there are sometimes a fort of livid and bluish warts, which in their tendency are next to a cancer. These are best let alone, for if they are disturbed they degenerate into a cancer. See Heister's Surgery. Tissor's Advice to the People. Bell's Surgery, vol. v. p. 532. White's Surgery, p. 80.

VERSICARIA, VULGARIS, see ALKEKENGI.

VERTEX, from verte, to turn. See SPINA.

VERTEX, from verte, to turn. The CROWN of the HEAD, so called because the hairs turn there.

HEAD, fo called because the hairs turn there. VERTIGO, from vertendo, in which the head seems to turn, or at least all things about the patient feem to do fo. It is always fymptomatic. When a mift is also be-fore the eyes, it is called scotidines, or scotedines. When a giddiness, with only a dimness of the fight, or a sparkling before the eyes attend, it is called fcotomia. Etmul-ler divides it into three kinds: 1. A fimple vertige, in which there is only a transfert and short continued gyration of objects. 2. A dark vertigo, or scotomia, when the eyes are darkened, or so affected, as if several colours were before them. 3. The vertigo called caduca, in which the patient presently falls down.

The causes are a compression on the brain from a depression of the skull; an extravasation of matter on the membranes of the brain. Sc. In acute diseases, the

membranes of the brain, &c. In acute diseases, the larger vessels being distended with blood, either from its unufual quantity or its rarefaction preffing the brain. Any cause that can prefs, diftend, or contract the arteries, fuch as fudden furprize, ebriety, voracity, &c. by which the regular influx of the fpirits, and their reflux into the optic nerves are prevented. An acid or other acrimony in the stomach, may affect the nerves, and, by consent of parts, produce this disorder of the head. Dr. de Meza observes that vertige may proceed from fix different causes, viz. 1. From a sanguineous plethora. 2. From a soulness in the prime viz. 3. From debility in consequence of excessive evacuations. 4. From compression. 5. From possons of different kinds; as opium,

mercury, fumes of charcoal, &c. And, 6. From a ferofus colluvies, in confequence of a stoppage of issues, ulcers, or any other habitual drains.

In a vertige, there is generally an apparent rotation of external objects, though fometimes all things feem to afcend, and fometimes they feem to have a contrary tendencend, and iometimes they leem to have a contrary tenden-cy. As the diforder increases, the objects appear of va-rious colours, and soon after follows a tottering of the whole muscular frame; the patient begins to be afraid of falling, and catches hold of every thing near him, to suf-tain himself; the disorder increasing, there comes on a dimness, then a loss of fight, then the nerves fail all at once, and the patient falls to the ground. If the disor-der proceeds surther than this, it terminates in a lipothoder proceeds further than this, it terminates in a lipothomy, epilepfy, or apoplexy. When a lofs of fight attends a vertige, there is also a ringing of the ears.

If the diforder is recent, happens feldom, the patient young, the cure is eafy; if it is original and confirmed, happens frequently, or if it feizes old perfons, and is accompanied with a great dimness of fight, and inability to stand, the cure is difficult; if the ringing of the ears proceeds from a diforder of the brain, it is often troublesome

for many years, and forebodes an epilepfy, or an apoplexy.

If there is a fanguine plethora, bleeding will be necessary, and the taking of blood from the temporal artery hath succeeded, when for a long time all other methods have failed. If there is a naufea, or other diforder of the ftomach, an emetic is generally to be preferibed. This diforder is most frequently fymptomatic, and then purging with the tinct aloes, or the pil. ex aloe cum myrrha, is amongst the most effectual remedies. To these may be added mild chalybeates, and fuch nervous medicines as the peculiarity of the conflitution in general, or fymp-toms in particular may require. When a fymptom of the gout, &c. the original diforder being removed, the fymp-tomatic will of course follow. See Walls's Sydenham, Etmuller, Mead, Hoffman, Heister, &c. VESANIA. MELANCHOLY. DEFECT OF JUDG-

MENT, 2s in delirium, madnefs, idiotifm, &c. Alienation of the mind. In particular atranquil partial melancholy.— Dr. Cullen makes this the fourth order of his class neuroses-and says, it is where the functions of the mind in judging are injured, unattended with pyrexia, or coma. -Nofol. Meth. Synop.

VESICA URINARIA. The URINARY BLADDER. It is of an oblong form, its fundus lies against the os pubis, and its neck upon the os factum, and coccygis. The neck does not come out at the end of the bladder, but at the flat and most depending side, through the prostate gland, which lies slat upon it, so that there is properly no neck, being nothing of that shape. The fundus is the fmallest end; the erect attitude seems to be the principal reason of this difference between this shape and that of quadrupeds. The bladder of a socius is very similar to that of a quadruped. The ureters enter into the bladder, near the vesiculæ seminales. The coats of the bladder are, 1st, a partial one from the peritoneum. 2d, A muf-cular coat, the greatest part of the external sibres of which are longitudinal, arising from the prostate gland. Under these is a stratum principally circular, under which, on the infide, is a very complex net-work of fibres, running in all directions, by which diverfity, and being fixed to the proftrate gland, they, in motion, bring all parts towards the gland, for the expulsion of the urine, and to contract the bladder, lying loofe when empty. The inner coat is a very thin transparent membrane, of a very dense texture, which prevents the transludations of urine. Many describe another coat, but it is nothing more than Many deferibe another coat, but it is nothing more than the cellular membrane. The ligamentous remains of the urachus upon the fundus of the bladder is never pervious. The ureters have small oblique orifices, and pass oblique-ly through the coats, which hath the effect of valves. The urethra arises from the flat surface of the bladder. The arteries are from the hypogastric, or internal iliae, being branches of the arteria sciatica, epigastrica, and umbilicalis, on each fide. The nerves are from the crurales, and the fympathetici maximi, by means of their communication with the crurales; fome branches are from the plexus mefentericus inferior. See Haller's Physiology in the articles Renes. Winflow's Anatomy. VESICÆ RARUS MORBUS, Hoffm. It is a co-

pious discharge of mucus with the urine. It is an instance

of the dyfuria mucofa of Cullen.

VESICARIA MARINA NIGRA. See ALCYO- the fame kind of grape proves greatly different in taffe

NIUM, FARRAGO. VESICATORIUM, fee CATAPLASMA.

VESICULA, vel FOLLICULUS FELLIS. The GALL-BLADDER. Under the great lobe of the liver, a little to the right, we fee the gall-bladder. It is fituated in a fulcus on the under fide of the great lobe, in the fiffure between the the under hole of the great lobe, in the infure between the two lobes, and being attached to the liver, hath a coat from the peritoneum. In a standing posture it lies forwards and downwards. Its fundus is raifed by a fulness, and depressed by the emptying of the stomach; whence that uneasy sensation which attends hunger. Its coats are like those of the intestines, the inner is not villous, nor pa-pillous, but a net-work of plice in all directions. The hepatic and cyllic ducts run almost parallel, and quite contiguous, not as represented in the figures, and uniting, form the ductus communis cholidochus, which going on, joins the ductus pancreaticus, and opens into the duodenum, in the most depending concave part of the intef-tine. See Winflow's Anatomy. Haller's Physiology in the article JECUR.

VESICULÆ DIVÆ BARBARÆ. The conflu-

VESICULAE GINGIVARUM. The THRUSH. See APHTHÆ.

—— SEMINALES. They are two membranaceous cellular tubes, lying on each fide between the bladder and the rectum, on the outfide of the vafa deferentia; they are about three fingers breath long, and one broad; they are convoluted like the inteflines, and kept in their fituation by a ligamentous membrane, the internal fibres of which are mulcular. The infide of the veficulæ feminales is cavernous, and of a villous appearance. VESTIBULUM. It is an irregular round cavity, not

quite so large as the tympanum, and fituated rather more inward and forward. The vestibulum and tympanum are, as it were, fet back to back, with a partition between them, and communicating near the middle of the fenef-

VIBEX. Purple spots, and WHEALS UNDER THE

VIBURNUM, called also LANTANA, camara. PLIant Mealy TREE, WAYFARING-TREE. Boerhaave mentions nine forts. It is an arborefeent thrub; its wood is fungous; the leaves refemble those of alder; the flowers grow in umbellas, fmall like elder flowers, are white, and confift of five petals; the flowers are fucceeded by berries which are green, then red, and at last black; they are sweet and viscous. This shrub is found in hedges, and clayey uncultivated grounds. The leaves and berries are aftringent. See Rail Hist.

VICIA. The TARE or VETCH, called also Bicton, Craca major. The pod is full of roundish or angulated fords, the leaves are properties.

feeds, the leaves are numerous, pinnated, and generally conjugated by pairs to a rib which ends in a tendril. Boerhaave enumerates twenty-two species. The TARES, or

VICTORIALIS, fee OPHIOSCHORDON.
VINCA PERVINCA, called also clematis daphnoides
major, pervinca major. The GREATER PERIWINKLE or PERVINKLE. From a stringy, creeping, fibrous root, springs fmooth flender stalks that are long and creeping. The flower is monopetalous, and is followed by two pods, in which are oblong, fulcated, and almost cylindrical feeds.

This plant grows on banks at the fides of ditches. An infusion of the leaves is commended against the fluor albus, hæmoptoe, hæmorrhoids, and excessive menses. See Raji Hist.

VINCETOXICUM. SWALLOW-WORT, fee ASCLE-VINI SPIRITUS, TENUIOR, & RECTIFICATUS,

fee Vinum adustum.

VINUM. Wine. The juice is of fweet fruits, fuch as grapes, currents, apples, &c. are called wines when they are fermented; but the name is more particularly laids of the grape. One and applied to the fermented juice of the grape. One and

and flavour, according to the climate and exposure of the fun. Those wines which have scarcely been at all fermented, and are boiled, are called MUST, and BOILED WINES. It is the thin watery juices that are extremely prone to ferment, and in which fermentation, when once begun, can fearcely be suppressed, until it hath run be-yond the vinous state, that is thus treated. By boiling, the fermentative quality is reftrained, the liquor becomes richer, and continues fit for drinking at least a year or two; but it is not so wholesome as the fermented wine. MUST relaxes the constitution, and if drank immoderately, it is apt to produce dangerous fluxes; on the contrary, perfect wine constringes and corroborates. Another class of wines is those which have undergone ferm atation, but not a complete one; of these there are two kinds, 1ft, The thin fweet wines which are only must, partially fermented, or whose fermentation is checked before the fweetness is gone off; these wines can scarcely be kept a year. 2d, The strong full-bodied wines that are rich and fweet; these are generally a mixture of fermented and infpissed must, the latter being added to increase the richness of the liquor, and prevent the fermentation from running beyond its due limits. These wines heat the conflitution, and should be sparingly drank; of this kind are Malmiey, Canary, &c. 3d, Those which have been completely fermented, and have thrown off their gross matter. These are the most perfect, and the most

The goodness of swines is judged of by their being bright, clear, and sparkling in the glass, of an agreeable reviving smell and taste, leaving, when in the mouth some reviving smell and taste, seaving, when in the mouth some time, a slight sense of astringency, being moderately strong and spirituous, passing freely by urine, exciting appetite, producing a gentle sweat in the night, and keeping the body open next day, without being sollowed by any headach, heaviness of the limbs, or other uncasiness.

The principles of which wine consists are water, insammable spirit, a fine saline matter which arises in distallation immediately after the spirit, called by Becher media substantia vini; a grosser salt called tartarus, which separates on standing, and adheres to the sides of the

separates on standing, and adheres to the sides of the calks; a gummy or mucilaginous substance; and a gross unctuous or resinous kind of matter. Wineis considered to contain in general three different matters .- 1st, A portion of must, or unassimilated matter. 2d, A portion of a proper wine, or in which, by the fermentation, a quantity of alchohol is produced; and 3dly a portion of vinegar produced by a too active, or a too long protracted fer-mentation.—These different matters will appear more or less copiously at the different periods of the fermentation. Thus in new wine the must will be most abundant; as the fermentation advances, a portion of genuine wine will be more confiderable, and if fermentation has all along been properly managed, a vinegar will not appear but in very old wine; and from the proportion of these several matters, the qualities of wine, depending upon the period, and state of fermentation, may be properly ascertained.

With us the five following kinds of wine only are ore

dered for pharmaceutic and medicinal uses, viz. 1st, The vin. alb. Hispanicum, or mountain wine. 2d, Vin. alb. Gallicum, or French white wine. 3d, Vin. Canarinum, Canary or fack. 4th, Vin. Rhenanum, or Rhenish wine. 5th, Vin. rubrum, or red Port. The first are generally ftrong and fweet, confifting of half-fermented wine and must. The second are moderately spirituous, grateful to the stomach, and pass freely by urine, but some of them affect the head. The third are very rich and strong, their effects are more durable than the thinner, and they are nutritious. The fourth are the most acid, and are also the most diuretic; they also render the bowels lax.

The fifth are the most astringent and strengthening.

Considered as a medicine, wine is a valuable cordial in langours and debilities, more grateful and reviving than the common aromatic infusions and distilled waters; it is particularly ufeful in the low stage of malignant and other fevers; it raifes the pulle, supports the strength, promotes a diaphoresis, and resists putrefaction. Used die-tetically, it is beneficial to the weak and aged, and to those who are exposed to a warm and moist air, or to a corrupted one. Used externally, it cools, strengthens, and relists putrefaction. Dr. Harris, in his Differt. Chirurg. fays, that ulcers should be washed with warm wine; ex-

ternal inflammations are removed by it. In an eryfipelas, and cryfipelatous pains in wounds, warm wine, and fomentations with the spirit of wine, are the most useful-See Neumann's Chem. Works. Dict. of Chem. Lewis's Mat. Med. Cullen's Mat. Medica.

VINUM ADUSTUM, called also vinum ardens spiritus vini. Vinous, inflammable, and vegetable fermented fpirit, SPIRIT of WINE, which last is the general name when it is rectified. It is never applied to that which is of the strength of brandy, and which is called PROOF SPI-RIT. When this 'pirit' is brought to the highest degree of purity from phlegm and oil, it is called ALCOHOL.

This 'pirit' is obtained by distillation of fermented liquors. In France it is all drawn from wines; in Eng-

land and Germany it is drawn from malt liquors. Some is drawn from molaffes; and in America it is distilled from fugar, after fermenting it, and is there called RUM. This fpirit, whatever be the fubject from which it is obtained, if freed from its phlegm and groß oil, is found in

every trial to be the fame.

When this spirit is first drawn from any fermented vegetable liquor, it contains much of the phlegm thereof, and of the effential oil of the respective vegetable which afforded it; it is therefore rectified, or purified, by rediftilling it with a very gentle heat; and when on adding a fmall quantity of this *spirit* to a little cotton, and fetting it on fire, it burns away so perfectly, as that at last the cotton also takes fire, and flames also, it is called rectified spirit of wine. If an equal measure of this rectified firit, and of pure water are mixed, it will be of the strength of what is called BRANDY, or proof spirit. If to the rectified spirit as much well dried, and yet warm alkaline salt be added, as that a part of it remains undifferent at the bottom, it will absorb the remaining aqueous humidity, and the *spirit* may be poured from its furface. After which, if a little calcined vitriol, or burnt alum be added to this dephlegmated fpirit, and it be again diftilled, it will arife pure and free from either fuperfluous phlegm, or any of the alkaline falt that may be detained therein. The spirit after this treatment is called alcohol. The college of physicians direct alcohol to be made from the following process. Take of rectified spirit of wine, one gallon; kali made hot, one pound and an half; pure kali, one ounce: mix the spirit with the pure kali; and afterwards add one pound of the hot kali: shake them and limit for the spirit source. digest for twenty-four hours. Pour off the fpirit, to which add the rest of the kali, and distill in a water-bath. It is to be kept in a veffel well ftopped. The specific gravi-ty of the alcohol is to that of distilled water as 815 to Pure /pirit, even after brought to the flate of alcohol,

is no other than an intimate combination of water with an oil which hath been highly fubtilized by the process of fermentation, and a fmall portion of acid. From the best rectified spirit somewhat more than one half of its quantity of water may yet be extracted from it.

This fpirit is of extensive use in chemistry; it separates the medicinal parts of vegetable and animal fubitances from the inactive matter; it extracts their flavour and colour; it disolves refins and oils for varnishes, &c. and extracts them from woods which contains them; it preferves animal and vegetable bodies from corruption; it diffolves all vegetable refins and diffilled oils, the fubtil oils of aromatic herbs, flowers, feeds, fruit, woods, and roots; it diffolves empyreumatic oils; it mingles with water, and produces much heat by being mixed therewith; it coagulates milk, blood, and the white of egg, and most animal juices, except the urine and bile; mingles with all acids concentrated or diluted, whether of the mineral or vegetable kingdom; on mixing it with the concentrated mineral acids, a strong chullition and heat enfues, the acidity is obtunded or destroyed, and the compound proves a fubtil, volatile, fragrant fluid,

and thus produces the dulcified acid fpirits.

As a medicine, fpirit of wine, when externally applied, strengthens the vessels, and thickens the juices in them, and thus restrains homorrhages; it instantly contracts the extremities of the nerves, and deprives them of fense and motion, thus it eases their pain, but deftroys their use; if received into the stomach in an undiluted flate, it produces the fame effects as when exter-nally applied; and if the quantity taken is confiderable, a paify or apoplexy follows, and foon proves mortal.

Proof Spirit, and such as is diluted below the strength of proof, when externally applied in conjunction with corroborant, anodyne, and antifeptic fomentations, is of confiderable efficacy; if it is inwardly taken in fmall quantities, it ftrengthens lax fibres, incraffates thin fluids, and warms the habit. A moderate internal use of this fpirit is the most serviceable to those who are exposed to heat and moisture, to corrupted air, or other causes of colliquative and putrid diseases. See Neuman's Chem. Works. Dict. of Chem. Lewis's Mat. Med.

VINUM; WINE. This term, befoldes those already

specified, is added to several products, and compositions, which chiefly take their names from the principal material of which they are formed - as Vinum rhabarbari, &c. which may be found under RHABARBARUM, &c. but for that called -Hordeaceum; feptentrionalium, fee Alla; - Falernium, fee Aminaum vinum; --Emeticum; -- Benedictum, fee Antimonium; -- Millipedatum, fee Aselli; - Chalybeatum, fee Ferrum; Ardens, fee Vinum Adustum; - Hippocraticum,

fee CLARETUM.
VIOLA. The VIOLET. Boerhaave takes notice of eighteen forts, but it is only the fweet-feented purple kind that is in use with us. Viola odorata, or viola Viola odorata, or viola acaulis, foliis cordatis, flolonibus reptantibus teretibus, pedunculis, radicalibus, flore fimplici purpureo odorato, Linn. The fingle purple fweet violet. The flowers have a very agreeable finell, and a weak mucilaginous bitterish taste. If taken to the quantity of two drams they are gently laxative; the seeds are somewhat more laxative, and also gently emetic. The flowers give out to water both their virtues and sine colour, but searcely impart any tincture to rectified spirit of wine, though impart any tincture to rectified spirit of wine, though they impregnate the fpirit with their fine flavour. A fyrup is made with the blue flowers, and is used as a laxative for infants.

#### SYRUPUS VIOLE. Syrup of Violet.

Take of the fresh petals of violets, Ih ii. boiling ditailled water, three pints; macerate them for twenty-four hours; afterwards strain the liquor through a fine linen rag without expression, and add the clarified sugar to make a syrup. Ph. Lond. 1788. But both the slowers and the syrup lose their fine colour by long keeping. See Lewis's Mat. Med. For that called AQUATICA, see POTAMOGETTON. POTAMOGEITON.

VIORNA. See ATRAGENE.

VIPEBA. See CASSADA.
VIPERA. The VIPER. The coluber berus, i. e. coluber feutis abdominalibus, 146. fquamis caudæ, 39. Linn. It is a viviparous reptile, about an inch or less in thickness, and from twenty to thirty inches in length. It is diftinguished from the fnake by an undulated black line on its back, and the fmallness of its tail. It is found in the heat of fummer under hedges, and in winter it retires the heat of lummer under hedges, and in winter it retires into holes in the earth. Its poifon is at the bafis of its fangs, or long teeth, through which it is emitted by a flit when the animal bites. A finall portion of this poifon when communicated to the blood by a wound produces dreadful effects, though when taken into the ftomach it is inoffensive. If a viper bites itself or another viper, they die as speedily as any other animal which hath suffered the same accident. The samed cure, when the viter's poifon is received by a wound is immediately to vipers's poifon is received by a wound, is immediately to rub the fat of vipers into the wounded part, and the patient must take as much vinegar in all he drinks for some time after the accident, as is at least agreeable to the palate. See also the famed cure for the bite of a rattlefnake in the article BOICININGA.

As a medicine, the flesh of vipers does not appear to excel that of eels. Notwithstanding the opinion of Dr. Mead, on the efficacy of this reptile as a nutrient.—Dr. Cullen does not allow it to have any peculiar powers as an aliment, nor does he admit that there is the flightest foundation for allowing them as a medicine. - He confiders fuch a supposition of their virtues, existing in any uncommon degree as a mark, among many others, of the weakness and folly of the ancients, and equally of their modern followers.—See Cullen's Mat. Med. Mead

on Poisons. Lewis's Mat. Med. For that called - Indica Pileata, fee Cobra de Capello. VIPERARIA. See Scorzonera. VIPERINA. See Serpentaria Virginiana.

VIRGA AUREA, also called berba doria, conyza, coma aurea, symphytum, petraum, elicbrysum, consolida Saracenica. COMMON GOLDEN-ROD. It is the solidago virga aurea, Linn. It is a plant with long, and somewhat oval leaves, pointed at both ends, flightly, or not at all indented, with upright fpikes of fmall yellow flowers, which are followed by fmall feeds, winged with flowers, which are followed by infant feeds, which are followed by infant feeds, and on heaths, and flowers in August. The leaves and flowers are corroborant, aperient, and diuretic; they commutate their virtues to water and to spirit. The exnicate all their virtues to water and to spirit. The ex-tracts are the best preparations. See Lewis's Mat. Med. For that called — major. See Conyza MasTheophr.

VISCERA. The BOWELS. The vifeera in the head

are the brain, eyes, ears, noie, mouth, tongue, &c. In are the brain, eyes, ears, note, mouth, tongue, &c. In the breaft, they are the heart, lungs, larynx, trachea, pleura, mediaftinum, pericardium, thymus gland, diaphragm, &c. In the belly, they are the peritoneum, omentum, cefophagus, ftomach, inteftines, mefentery, liver, fpleen, pancreas, kidnies, ureters, bladder, and parts of generation.—

A knowledge of the fituation of the abdominal vifeera, is of great advantage to the medical practitioner. The

is of great advantage to the medical practitioner. The abdomen may be confidered as divided into three regions, the fuperior, the middle, and inferior. In the first are comprehended those parts that are bounded by the dia-phragm and ribs; the second extends from the ribs to the elvis; and the pelvis itself constitutes the last. These three regions form one large cavity, in which are con-tained all the vifcera of the lower belly; the extent, however, of these different divisions varies in different ages, in different fubjects, and is altered likewise by difeafe. In new-born infants, the distance between the fterfium and the pelvis is near to a third of their whole length; in adults, the length of the abdomen does not extend to a fifth of the whole. In children of three feet in height, the abdomen measures nearly one foot, and it is not found to exceed that, in adults five feet high. This difference with respect to the abdomen in infants and in adults is confined entirely to the middle region, which, in children, is not only much longer, but, in proportion, much more extensive in every respect, than in people come to their full fize. In the former, it is wider from before backwards, in children the spine being almost entirely straight, whereas, in adults, it be-comes considerably crooked. In children too, it is much wider from one side to the other than in adults, as in them the ribs bend more outwards than they do in the latter. Although this middle abdominal region, howand inferior divisions are not proportionally so; nay, they are even small, in comparison to those of adults. they are even small, in comparison to those of adults. The pelvis is incomparably smaller in the fœtus than in adults; in the former, the under extremity of the os facrum bends considerably over towards the pubis. The horizontal branch of the pubis is both short and stat, and the tuberosities of the ischia are turned backwards. Every circumstance, therefore, concurs to shorten the cavities of both the inferior and superior abdominal regions; insomuch that, in young children, all the viscora

of the lower belly are contained in what we have termed the middle division, and remain there, until, by degrees they infinuate themselves into the other two regions, as these, in course of time, come to be enlarged. Before treating, however, of the changes the viscora undergo in point of situation from the infantine state to that of adults, it will not be improper first to give a more par-ticular description of their several situations in the for-mer. The stomach in infants, instead of being situated transversely, as is the case in adults, hangs almost per-pendicularly. It extends from what is commonly called the epigastric region, to the umbilical, inclining a very little to the left above, and to the right fide below; having its convex fide or great curve turned to the left, and the fmall curvature towards the right. In confequence of this fituation of the flomach, the omentum, which is always attached to its great curvature, lies more towards the left than the right fide; and, from want of knowledge of this circumstance, practitioners have often treated, as diseases of the colon, such complaints in children, as, on opening the bodies after death have been found feated in the omentum only. The liver is very large in the fœtus, in proportion to its fize in adults, and is fituated almost entirely in the middle region of the abdomen; it appears to the touch externally, indeed, much nearer the linea alba than it is ever found to be in a more advanced age. At this period the duodenum is placed almost entirely behind the stomach. The spleen in infants is always easily discovered by the touch, immediately ately below the falle ribs; this, in adults, never can be done, but in a discased state of that viscus. In the former, a confiderable part of it is fituated in the middle region of the abdomen; whereas, in the latter, its feat is always in the left hypochondrium. In very young fubjects, the urinary bladder is fituated entirely without the pelvis, is remarkably large in proportion to the other parts, and extends to within a very small distance of the navel; when full of urine, it makes a very evident prominence near about the middle and inferior part of the midd abdomen. This position of the bladder, above the os pubis, ought to be particularly attended to; for when, in infancy, it is necessary to have recourse to lithotomy the high operation should always be preferred to those where the opening is made in the peringum. This operation, however, has never been favourably looked upon. But, as the shortest and easiest passage to the bladder is, in lithotomy, a principal object, it ought certainly, in children, to be preferred to every other, the bladder in them lying so near to the external teguments above the pubes. In young girls, the womb, with its two ovaria, are confiderably raifed above the os pubis, and when fwelled, a circumftance, which, at this age, feldom occurs, it can easily be diftinguished by the touch externally.

Such are the fituations of the viscera in childhood. In a more advanced age, they are entirely changed; the ribs become lefs crooked, the diaphragm more vaulted, and the liver gets a higher fituation, infomuch that, about the fifteenth year, it is almost entirely covered under the ribs, when the person is in an horizontal posture. der the ribs, when the perion is in an horizontal posture. This change of fituation in the liver occasions a manifest alteration likewise in the position of the stomach. By degrees it deviates from the perpendicular horizontal line; and according as it changes its situation, the omentum recedes entirely from the left side, and proceeds to occupy the middle part of the lower belly. Although the horizontal lobe of the liver can be distinguished by the touch in adults, wet never by any means so evidently. the touch in adults, yet never by any means to evidently as in children; it is fituated almost upon the under extremity of the cefophagus, fo that, when it becomes pre-ternaturally enlarged, it comprefies that canal fo entirely as to prevent the entrance of the aliments into the ftomach: in which case, the person suffers greatly from very violent vomitings with which he is attacked some time before death. In the mean time, the pelvis becomes every way larger; the pubis turns confiderably longer, and acquires a greater height; the os facrum firetches farther back, and the tuberofities of the ischium push outwards, and to a greater distance from the os coccygis. Such a considerable augmentation in the cavity of the lower part of the abdomen, gives rise to such changes in the position of the different viscera, as deferves, from practitioners, very particular attention.

Those which, from their make and nature, have been accustomed to sloat in the middle region of the abdomen, now fall down into the pelvis; this is particularly the case with the bladder, which, in falling down, has its superior part carried forward, and the urachus, which had been attached to the fundus, is torn away, and never again connected with it. This fact was first taken notice of by Mr. Lieutaud, and is not as yet believed by many anatomists. The same cause which produces the change of position in the bladder, occasions also that of the uterus. The womb, which, in childhood, had been the uterus. The womb, which, in childhood, had been placed above the pubis, by degrees falls into the pelvis, infomuch that in adult women who are not pregnant, it is always, in a found ftate at leaft, entirely funk into it. Both the bladder and the uterus acquire an oblique fituation in the pelvis, owing to the defcent of the inteffines; this obliquity, that becomes in a manner natural to both these viscera, was observed by Gunzius, and

See Edinb. Med. Com. vol. ii. p. 152, &c. from M. Portal's paper in l'Histoire de l'Academie Royale des Sciences de Paris, année 1771, 4to. Paris.

VISCUM. BIRD-LIME.
VISCUM. BIRD-LIME.
VISCUS. MISSELTOE. Viscum Album, Linn. It is a buthy evergreen plant, which bears imperfect white flowers, that are followed by transparent whitish berries. It grows only on the trunks and branches of trees. Formerly BIRD-LIME was made of the berries, by boiling them in water until they burst; then they were well beat in a mortar, and after that washed in water, until all the branny husk was washed away; but now bird-lime is made from the holly-bush. See AQUIFOLIUM. The misfeltoe hath been famed for its medicinal virtues, but it is not much noticed in the prefent practice. See Raii Hift. Plant. Sir John Colbatch's Treatife on the Miffeltoe.

VISIO. The SIGHT. The light we have in our atmosphere proceeds either from that of the fun or from

mosphere proceeds either from that of the fun, or from molphere proceeds either from that of the lun, or from forme other lucid body; from whence the rays fpread every way, as from a centre to all points of a large sphere to as to fall upon the surface of bodies, from whence again they are reslected into the eye from the enlightened surfaces in angles, equal to that of their incidence, so as to render the bodies from whence they thus slow to the eye, both visible, and of some colour. The rays of light fall upon the cornea of the eye, where they are refracted, and pass on to the crystalline humour, where they are still more refracted; then proceeding through the vitreous humour, by which they are directed to the retina, where they form the image of the object seen. It is called the focal point, where the images of objects are formed by the crystalline humour on the retina, and there the image of the object feen is painted in an inverted position, or, as it were, upside down, though perceived by the mind according to the situation of the object of fight. See Boerhaave's Med. Instit. Haller's Physiology, lect. xviii. Prictiley on Vision, &c.

VISNAGA, also called gingidium Hispanicum. Spanish picktooth. It is an annual plant, growing in tally, remarkable for the agreeable feent and tilines of the medicles of the slowers, which are made use of the

the pedicles of the flowers, which are made use of for picking the teeth only. In other respects the virtues of

the plant are fimilar to those of fennel. See Raii Hift.
VISNAGA MINOR. See APIUM.
VIS VITE. Called also VIS medicatrix natura. Boerhaave uses this term to fignify the joint action of all the parts of a human body, whereby the machine is continually recruited and put in order. But when any thing proves too hard to be conquered by this vis, a difeafe enines. Dr. Aitkin, in his Elements of Physic, also defines it to be, the state, or condition of animal or vegetable organization indifpenfably requifite to the capability of function. Different writers variously consider this fibject. Hippocrates and many others confidered it as heat or fire. See CALIDUM INNATUM. VISUS DEBILIS HEBETUDO. See AMBLY-

See AMBLY-

VITÆ LIGNUM. See GUAIACUM. VITÆ ARBOR. See THUYA.

VITE AFFECTIONES. See EPITEDEUMA.

VITAPROPOSITA. Social It contributes to VITELLUS. The YOLK of EGG. It contributes to nourish the chick, only in preparing the white for the purpose, or almost becoming like the white. In pharmacy it is used as a medium for uniting balfams, &c.

macy it is uled as a medium for uniting ballams. See, with water. It is, as an aliment, nutritious; as a medicine, anodyne, maturating, digeflive, and relaxing, and hence it is often ufed in glyfters.

VITEX. It is a kind of buffi which is common in Malabar, See. It is also called cara nost, negundo mas is famina, aguas castus. Boethaave takes notice of fix species, but though applied to some after in its native country, it is unknown in our medical practice.

Raii Hift.

VITIA. Linneus expresses by this word, his class of cutaneous, external, or palpable diseases. Vitia is a synonym with Cullen's locales in his Nosology.

VITILIGO. A species of WHITE-LEPROSY. See ALPHUS and MELAS. VITIS. The VINE-TREE. The VITIS Vinifera Linn. Of the vine-tree botanists have enumerated above twenty species, and there are almost twenty of its productions in use. Its leaves are aftringent. If the trunk is wounded in spring, it affords a watery juice, which hath been used as a diuretic refrigerant. The flowers have a greatful finell, which is elevated with water in diffillation. Along with the water a finall portion of effential oil arifes, which possesses the flavour of the flowers in great perfection. The unripe fruit is called agresses, they are sour and harsh, and from them is expressed the omphacium, which is cooling and affringent. The ripe fruit are called agress, they afford wine, whence we have inflammable spirit, vineyar, and tarrar. The ripe fruit are called now, they allord wine, whence we have inflammable fpirit, vinegar, and tartar. When the now, or grapes, are dried in the fun, they are called now paffer, or paffulæ. VITRIOLICUM Acidum, called alfo Oleum Vitrio-

Stagma, Acidum primogenium. See Acida and

VITRIOLI COLCOTHAR, COLCOTHAR of VITRIOL, this is the fubflance which remains after the vitriolum martiale has been calcined and diffilled for a long time by an intense fire; and by that means reduced to the reduces of blood. But Mr. Le Fevre proposes an easy method of acquiring this preparation; he mixes two parts of filings of iron with one of fulphur, and a little water. After the acid of fulphur has diffolved the iron, he expofes the paste to the air, and it changes into colcothar.

VITRIOLUM. Also called calcadinum, calcatar, c binations of metals with the vitriolic acid, are called vi-triols of those metals. It seems as if the metallic part of all vitriols had been formerly supposed to be copper only; for even the ferrugineous vitriols have the name of copperas, which is expressive of copper: the vitrial of

zinc is also called white copperas.

There are three neutral vitrislic salts, with metallic bases; or three vitriols of three metallic bodies, produced spontaneously, or with very little affistance from art, viz. those of iron, called green vitrisl; of copper, called blue vitrisl; and zinc, called white vitrisl. The factitious vitriols are effentially the fame as the native.

Vitrisls are prepared in Sweden, Germany, England, and in many other countries, where there are plenty of

pyrite ftones.

VITRIOLUM ABORTIVUM. See OCHRE.

— VIRIDE. GREEN VITRIOL. The Latins call it atramentum futorium, because it is used for blacking leather.

In method of preparing it is as follows: the pyrite flones are fpread about in a large area, the height about three feet, and there they lie exposed to the air, but are now and then turned, that they may all be alike exposed thereto; thus they are reduced to a vitriolic earth, which being well washed with rain water, the liquor is conveyed by pipes into cifterns; then it is boiled to a due consistence in large leaden vessels, throwing in a quantity of old iron, which is soon consumed by the lixivium; at last the liquor is set to cool in other vessels, in which are the liquor is fet to cool in other veffels, in which are placed flicks for the vitriol to crystallize upon.

On analyzing the best green vitriel, it appeared that 3 xvi. contained fomewhat more than eight of water, fix of iron, and one and a half of pure acid. The English vitriol is purely ferrugineous, but there is feareely any

other without some admixture of copper. Sixteen ounces of Goslarien vivial, were found to contain 3 vii. of water, 3 iii. of acid, 3 v. 3 vii. and 3 i. of iron, and nearly 3 ii. of copper; but it often contains much less

of the acid.

The vitriol of iron diffolves in about twice its weight of water, and on evaporating the folution, and fetting it to fhoot, concretes again into thick rhomboidal crystals. A foliation of vitrisl in water depolits upon standing a A folution of which in water deponds upon taking a part of its metallic basis; the precipitation is greafly expedited by boiling heat, by which more of the metal separates in a few minutes, than by standing without heat for a year. The further the crystals of wiriol are freed from their metal, the more easily do they part both with their water and with their acid.

It is from this kind of vitriol, as being the cheapelt, that the vitriolic acid, called oil of vitriol, hath been usually extracted by distilling this calcined in earthen long necks, with a strong fire continued for two days. The distilled spirit appears of a dark blackish colour; and contains a quantity of phlegm, greater or less according as the vitriol has been more or less calcined. On committing it a fecond time to diffillation, in a glafs retort placed in a fand-heat, the phlegmatic parts rife first to-gether with a portion of the acid, the remaining strong acid loses its black colour and becomes clear, and this is the ufual mark for discontinuing the rectification; but at prefent this acid is extracted from fulphur, which fee.
The medicinal uses of green vitrial are the same as those

of the other preparations of iron, but the pure fort only must be used. The acid of virial retards fermentation and putrefaction, but in a less degree that the nitrous and marine acids do; when it is largely diluted with water, it is employed for preventing a putrefactive dispo-fition, correcting bilious acrimony, abating heat, quench-

ing thirft, firengthening the fromach, &c.
VITRIOLUM COERULEUM. BLUE VITRIOL, alfo cal-

led ROMAN VITRIOL, VITRIOL OF COPPER, CYPRIAN

VITRIOL, and Lapis Caruleus.

It is prepared in Sweden, Germany, &c. from the pyrite ftones and copper. It contains much less water than is in the vitriol of iron, and requires about four times the weight thereof for its folution. This has proved an ufeful tonic continued for fome time in certain cafes of epilepfia and hysteria, on some occasions it has proved also diuretic, and some other anthelmintic.—Its dose is from a quarter to half a grain according to the age of the perion, twice a day, increased to what the stomach will bear without vomiting, but should be pushed till a naufea, or fickness is occasioned .- But if in the course nautea, or fickness is occasioned.—But if in the course of a month it shews not its good effects, we should design from its use, as large quantities of copper introduced, may, like lead, prove hurtful to the body. Dr. Cullen therefore, in cases of periodic epilepsy, after giving the medicine constantly during one interval, if the disease still continues, gave it only for some days before an expected seculion, and has in this way had success. This medicine seems entirely to rest in these cases on its tonic and aftringent powers. In the beginning of severs it has been astringent powers. In the beginning of severs it has been given in naukating doses, and as a diuretic in dropsies; but as an emetic, it seems not to be preserable to the antimonium tartarifatum and is much more unmanageable. As an escharotic it has been sufficiently known, and very lately the Dr. found it in an ill-conditioned fpreading ulcer bring on a good digeltion, when both mercurials and arfenic were unfuccefsful. It has also been used for reftraining hamorrhages, and for removing films from the eyes externally applied. See Lewis's and Cullen's Materia Medica.

-ALBUM, called also Gilla Vitrioli. WHITE VI-TRIOL, OF VITRIOLATED ZINC. Zincum vitriolatum. The metallic part of this kind of vitriol is zinc; its other constituents are the vitriolic acid and water. Sometimes it contains iron, and then it hath an ochry appearance on its furface. It dissolves in twice its weight of water. It is fometimes given as an emetic, and, as fuch, it is fpeedy in its effect, and, in debilities of the stomach, is preferred to other emeties; it is principally used externally in collyria against heat, defluxion, and inflammation in the eyes; it is a powerful and safe errhine, useful in obstructions of the nostrils from indurated mucus. It is confidered as an aftringent tonic; has been given in fmall dofes, and fucceeded in fome cases, as effectually as the

VOMER. The PLOUGHASHARE. It forms the pofterior and inferior part of the feptum nafi, and is placed between the offa fphenoides and palati. It receives at its superior part the spine of the body of the os sphenoides, and the perpendicular plate, or nafal lamella of the eth-

moid, and below the cartilaginous part of the feptum. VOMICA. See Asscessus Pulmonum. Dr. Cullen, in his First Lines, observes that an abscess is formed in fome part of the pleura, and most frequently in that portion of it invefling the lungs. Ed. 4. vol. ii. p. 375. Dr. Reid observes, in his Eslay on the Phthisis Pulmonalis, that tubercles are found, on diffection of those who have died of this difease, of all fizes; from the smallest gra-nules, to the bigness of a horse bean, and commonly in chifters. On cutting into them, he fays, they appear of a white, fmooth, cartilaginous fubstance. In the fmallest, no cavity or opening appears; in those farther advanced, on the cut surface we discover small pin-holes; in those ftill larger, are one or more cavities containing a fluid like pus; which being cleared off, in the bottom is per-ceived feveral small openings or holes; through which, on prefling the tubercle, matter isfued, similar to that con-tained in its cavity. The larger tubercles, when emptied of their contents, appear like a small capfula, into which entered a branch of the aspera arteria. When the tubercles increase, they are termed vomice. These are alfo of various fizes, from half an inch to two or three inches diameter; and are ufually oviform. When found entire, their contents are whitish, yellow, ash-coloured, greenish, and sometimes feetid matter; and when rup-tured, more or less reddish. Several branches of the afpera arteria are found opening into these vomice, and they also communicate with others that lie contiguous; the apertures of the latter, are ragged and irregular, of the former, round and fmooth. The larger comics are ufually found empty, but on preffing the lungs, matter iffues into the bronchia. The branches of the pulmonary artery and vein running upon the vomice, are found much contracted; and fometimes filled up with a fibrous fubstance; their pendulous ends, hanging loose in the fubstance; their pendulous ends, hanging loose in the cavities of the vomice, completely shut up and covered with a thick slough. By this we see the reason why hamoptoe does not more frequently happen, when so great a part of the substance of the lungs is destroyed. And also, when it does take place, in what manner the mouths of the bleeding vessels are shut up again. The parts of the lungs contiguous to the vomice are found instance, more or less folid, and impervious to air blown into the trachea; for when the other parts are thus distended, they remain depressed, nor is air admitted into stended, they remain depressed; nor is air admitted into the vomice, or at leaft in very fmall quantities. Wherethe particles of the lungs near them; by which means a communication between their cavities and that of the thorax, is entirely prevented. It is farther observed that, it fems probable that the finall pin-holes perceived in the fubflance of the tubercles, are the apertures of the exhalent veffels; and that the pus found in them, and iffuing out upon preffure, is the lymph changed into that fluid. There is no abfolute criterion by which we can determine when tubercles are first formed in the lungs. They are to be fuspected, when the cough is violent: continued with fhort intermissions, particularly at night; and viseid phlegm is expectorated with difficulty. But when the cough is accompanied with coldness, succeeded by fever, and matter spit up, which precipitates in water, there is every reason to believe that comicae are completely for-

Dr. Withers observes, in his Treatise on the Asthma, p. 117 and 120, that a cough may be suspected to artie from tubercles, when it does not occur from evident cold; when it does not begin with stuffing in the head, hoarse-

mels, or any discharge of mucus from the note and throat; when it not only occurs in the fpring, autumn, or winter, but also in the fummer; when it is attended with shortneis of breath, particularly our motion; when it is not full and violent, but often trifling, so as even to be denied by the patient; and when it does not go off in a few weeks, but continues many months. Our suspicions are rendered much fronger, if the lungs have been severely injured by the meales, local inflammations, or other complaints; and they are altogether confirmed, if, with the above cireumstances, the patient be of a thin scrosulous habit, of a fine delicate complexion, with fwelled lips, glandular fwellings in the neck, and a hectic fever. We may add two fymptoms of the ferofulous affection in the melentery, such as a turnid body, frequent diarrhoeas, griping pains, emaciation, &c. which will still render our suspicion of tubercles in the lungs stronger and more indisputable. Tubercles are often ferofulous, depending on the constitution, accompanied with fymptoms of an inflammatory nature, and often occur prior to the afthma, or immediately appear to exist along with it. They are particularly dangerous to the young, whose chests are narrow, and where there is a confumptive tendency in the family. In this case, there is often great danger of a consump-tion, and therefore an early and cautious treatment in the intervals of the althma is highly requifite, to avert the impending evil. As this fubject is too extensive to admit here of a full discussion, we must content ourselves with mentioning only the most important parts of the cure. The first and principal requisites in the treatment, are to obviate and remove the inflammatory state of the constitution, left the tubercles should inflame, and end in small ulcers in the lungs, which would foon degenerate into a deep pulmonary confumption. A diet confifting chiefly of milk and vegetables, is of the utmost consequence, and should be steadily persevered in. High living, much ani-mal food, all feasoned meats and strong liquors, are very pernicious, as they increase the natural tendency to in-flammation, by inducing plethora, and stimulating the action of the heart and arteries. Regular gentle exercise is of the greatest importance, and assorb most evident relief, such as riding, walking, &c. The easy motion too of failing or travelling in a carriage is very ferviceable. Country air is strongly to be recommended, both in winter and in fummer, and along with it, the utmost caution in avoiding excess of artificial external beat. If the con-flitution be full of blood, and there be a strong hard pulse with pains in the breaft, repeated bleedings, according to the patient's firength and the urgency of the fymptoms, are requisite and highly beneficial. Mild cooling laxatives, fuch as the neutral falts, cream of tartar, rhubarb, lenitive electory, castor oil, tamarinds, &c. are adviseable, to obviate costiveness and keep the body open. Gentle emetics are fafe and ufeful ; and likewife antimonial medicines, such as tartarised antimony and James's powder, may be very advantageously prescribed in small doses as alteratives. Oily and mucilaginous medicines are given, along with nitre, the diuretic falt, and the saline mixture. Acids, both vegetable and mineral, are cooling and ufeful, but particuarly the first. Blifters and iffues have often been found productive of good effects in these cases. When the cough is troublesome in the night, and prevents the patient from refting, a gentle opiate is very fer-viceable; and if there be any feverishness, a small dose of tartarifed antimony or James's powder may be added to it, which will determine to the surface, and tend to remove any constriction of the cutaneous vessels. Other antispasmodies, after the removal of plethora, may be prescribed, and if the cough be violent and of the convultive kind, the flowers of zine have been found very ferviceable. See Percival's Observations, p. 223.

VOMICA LIQUORIS ETERNI. See ARGENTUM VI-

VOMITUS. VOMITING. It is a diforder of the stomach. A vomiting and naufea feem to be fpafmodic re-trograde motions of the mufcular fibres of the cefophagus and stomach, attended with convulsions of the muscles of the belly and the diaphragm, which, when gentle, creates a naufea; when violent, a vamiting. Vamiting is mostly an instance of dyspepsia.

The matter discharged gives different denominations to this disorder; a mucous chylous discharge of the re-liques of undigested foods is called a pituitous vomiting;

a congestion of bilious matter evacuated this way, constitutes what is called a bilious vomiting; blackish, corrupt, green, æruginous, porraceous, &c, are accidense of colour, &c. in the contents of the flomach that are discharged; when black blood is thrown up, it is called the black disease; and when the cause is in a part distant from the stomach, as when a stone passes the ureter, &cit is called a fymptomatic vomiting.

The causes are various, viz. pregnancy, poisons, hurte on the brain, inflammation of the diaphragm, or other abdominal vifeera, the motion of a ship, or coach, &cc. the quantity or the quality of the food, irritation of the gula, the translation of the morbific matter of feveral diforders to the stomach, worms, a stone in the ureters, a congestion of blood about the ftomach, &c. The proximate cause is a stimulus of the nervous fibres of the stomach.

gullet, or the duodenum.

Crudities in the prime vice are known by pituitous vo-miting, and a preffive pain about the region of the sto-mach; a laxity of the biliferous ducts by bilious, chronical, and periodical vomiting; an injury, or a feirthus in one of the vifcera, by chronical vomitings of long standing, and in which the food is thrown up before it is digefted. A flone in the kidney, or the ureter, may be suspected, if there is a pain in the loins, and a diminution of urine. Worms are probably attendant if the countenance becomes pale, and if there are pains and a gnawing fenfation in the inteffines, with an unufual spitting and itching in the

All critical vomitings are falutary. Symptomatic vo-mitings are bad when excited by a fubtil caustic acrimony; violent bilious vomitings threaten an inflammation; vomiting from worms is often a dangerous fymptom; fetid vomitings are often fatal; a conftant, or very frequent comit-ing for feveral months gives a fuspicion of an ulcer in the ftomach; when a pain attends in the foles of the feet.

hard drinking is generally the caufe-

The different causes indicate different methods of relief; when pregnancy produces this diforder, bleeding at proper intervals, and gentle laxatives to keep the bowels easy; though, in those inflances where bleeding endangers a miscarriage, the plethora should be removed by frequent gentle purges: when these methods fail, and the patient is greatly satigued, she may take the pulv-ipecae, gr. iivel iii. an hour before the vomiting comes on, and repeat it as it is required. A light breakfast, before the sickness comes on, relieves in fome inflances; and in others, the columbo-root, in mint or pepper-mint water, is most ufeful.

Sometimes violent comiting precedes or accompanies a fit of the afthma, and Floyer has observed, that cold water has afforded the most relief. In many cases of obstinate vomiting, from different causes and in different dif-orders: Dr. Withers says, in his Treatise on the Afthma, he found cold water the most grateful and beneficial to the patient; and all warm liquors evidently detrimental, by exciting pain and increasing the fickness. But if the flomach is inflamed cold liquors are very hurtful.

When the vamiting proceeds from a weakness, or irritability of the stomach, or acrid matter lodged there, in consequence of the gout, &c. affecting this viscus, the columbo-root, in conjunction with aromatics, the bark, chalybeates, and magnefia or rhubarb, will give the most

effectual relief.

When the diforder is symptomatic, the original difor-

der being relieved, this of courfe fubfides.

When bilious vomitings produce spalms in the stomach and biliary ducts, the acrimony of the bile must be corrected by diluents and dulcified mineral acids, with brandy and water, or negus, for the common drink, and if required,

give a little laudanum.

When a copious and pungent acid prevails in the ftomach, let the patient drink plentifully of weak mutton-broth, to excite the discharges, until what is thrown up is without any change in its taste; after which give magnesia alba in doses, from 3 ss. to 3 i. and repeat it as often as any uneasy symptoms may require it. When the sho-mach is appealed, the bark, bitters, and chalybeates may be used.

When hard drinking produces frequent vomiting, after a gentle emetic, give the bark, with bitters, and the dilute vitriolic acid. Light chalybeates, particularly the Bathwater, may be used as a finish to the cure.

In any of the above cases, to palliate the vomiting, the faline draughts given in the act of fermentation, the tinct. benzoes comp. with the dilute vitriolic acid or a few drops of the tinct, opii may be now and then repeated. The fp. ætheris nitrofus relieves when these fail.

Sometimes when wounds inflame, the stomach, though

distant from the injured part, will be rendered so irritable as to eject its contents; in this case warm oil being poured on the inflamed wound, by removing irritability there,

relieves the stomach also.

Bilious vanitings are powerfully relieved by gentle an-timonial emetics, or with small does of the tartarised antimony with rhub. after which bitters, particularly the

antimony with rituo. after which bitters, particularly the columbo-root, and cordials, &c.

Veniting of blood or bematemess, is known by dark coloured clotted blood being thrown up from the stomach: it is usually mixed with much phlegm. This discharge is always symptomatic. A veniting of blood is usually preceded by a tensive pricking pain in the stomach, or the left hypochondrium, and the eruption itself is almost always attended with a nausea, anxiety of the precordia. ways attended with a naufea, anxiety of the precordia, and a compressing pain, as also a kind of girding on the same side; a fainting too often attends. In this case there is no cough, as happens when the lungs are the feat of the diforder.

Bloody vaniting is the effect of an indurated fpleen, a various flate of the vafa brevia in the upper left portion of the ftomach, or of other veffels thereabout; women are particularly subject to this symptom about the time of the eruption, or on a suppression of the menses, from passion.

frights, grief, pregnancy, &c. It happens in men from fuppreffed hæmorrhoids.

There is danger from the extravafated blood lodging in the bowels, and becoming putrid; by which means a dythe bowels, and becoming putrid; by which means a dyfentery, or a putrid fever, may be produced. The bloody vomitings which happen about the middle of pregnancy, in fome plethoric habits, are rarely injurious. The fame happening during labour, or even in child-bed, if the quantity be fmall, is not often hurtful. Too generally this is a fatal difcharge; if there is no fever, if the habit is plethoric, if any ufual evacuation is obstructed, hope may be indulged; but if a fever attends, if the blood discharged be very black and settid, or if the cause is an enlargement of the spleen, an induration of the liver, or if faintings are considerable, there is but little hope.

Distinguish the pain and heat in the stomach, from an inflammation there; and from blackish hamorrhoidal exerctions.

Until the discharge by the mouth is stopped, abstain from purging medicines; let the diet be cooling, and in from purging medicines; let the diet be cooling, and in fmall quantities; except there is manifest inflammation, or plethora, omit bleeding; astringents must not be ad-ministered, for they stimulate the stomach, but opiates, fuch as the tinct. opii may be given to four or five drops two or three times a day, or give the following draught as the fymptoms, viz. pains and fpafms, may require it.

R Nitri purif. 9 i. aq. diftill. 3 ii. fyr. e mecon.

3 ii. m.

3 ii. m.

3 ii. m.

4 if the patient is hot, and the circulation hurried, give fal nitri 3 i. m. in every pint of water that is drank. Emollient glyfters with nitre relieve the fpafmodic affections in the ftomach. If fuppreffed menfes are the caufe, give mild emenagogues by the mouth, bleed according to the firength, &c. of the patient, and administer frequent emenagogue glysters. If the cause is erosion, from acrid substances in the stomach, absorbents and demulcents will be necessarily to the cause is erosion.

When the vomiting ceases, and the patient seems griped When the Soming ceares, and the parter terms griper from the flagnant blood, give him a gentle purge or two. See Meibomius Differt. de Vomitu. CUMINOSA.

VULNERARIA AQUA. See ARQUEBUSADE.

VULNUS. A WOUND. Boerhave gives the following defeription of a wound. A wound is a recent, bloody folution of continuity in the foft parts, made by a hard, that pintrument. But it may be observed, that obtuse inftruments wound, and tharp ones cut into the bones. Dr. Cullen places this genus of disease in the class locales and order dialyses.

Wounds that are superficial, when cleaned from the blood, &c. are perceptible to the fight; but when they are too deep to be seen into it is better to examine them with the finger than with the probe, and, where the wound is too small for the finger, a bougie is better than a probe, on account of its flexibility, especially where it is winding. In examining a wound, we should know the attitude of the patient when he received it, the kind of weapon, how far it penetrated, how it was directed, with what force the blow was given; it thould also be observed, what kind of fluid discharges do, or did discharge from the wound. The knowledge of these with the knowledge of our frame, the use, &c. of each part, enable us to judge rightly on the nature of the wound, its cure, and confequences.

The danger of the wound is, as the fize of the veffels that are divided, and the importance of the injured part with respect to life. The nearer a towned is to a vital-part, the more dangerous it is. Wounds in the joints are healed with difficulty; so are those that are fituated in any healed with difficulty; to are those that are intuated in any part subject to constant motion, as in the lungs or belly. The attending symptoms render a wound more or less dangerous. The age, constitution, customs, habits, and the inconveniences that may be expected, though the patient does not die, should be pointed out, or hinted at least. Dividing a principal artery in a limb, endangers mortification; a principal nerve, infensibility, and an atrophy thereof. Separation of a tendon destroys as much motion as depends on that mufcle. A wound in the medulla spinalis causes a palfy, or a mortification in the lower parts. An immoderate suppuration in a deep wound, ly absorption, may cause a heetic fever, and consume the patient in a marasmus. Great loss of blood endangers a dropsy. A wound in the breast and lungs, when healed may be the occasion of a phthisis pulmonalis; and in any other confiderable organ, an ulcer may remain, and prove the fource of a hectic fever, or of a confumption; but great caution is necessary in determining the prognoflics of wands, particularly those which penetrate into the breast or belly, on account of the different situation of the viscera, of which we have no sign during life. Van Swieten says, that he hath met with many such cases. See instances of this kind in the Lond. Med. Obs. and

Inq. vol. i. p. 26-35.

The different flates of a wound are included under those of digestion, or the discharge of matter; incarnation, or filling up with sless; a cicatrization, or skin-

ning over.

In order to the cure of wounds, especially when they are confiderable, the non-naturals demand our particular attention. The air should be dry, and moderately warm, but not hot; the diet should be dry, and moderately warm, but not hot; the diet should be moderate, though it may be necessary to allow for customs, and regard should be had to the present habit of body; rest is generally necessary, but motion hurts the superior parts less than it does the inferior; as to the excretions, strong purges, &c. are injurious, but coftiveness must be carefully guarded against the affections are to be well regulated, if they are excessive in their degree, or if long continued, though but moderately excited, they will be injurious.

When extraneous bodies are extracted, if it can be done productly, the hypotropages suppossed all models.

done prudently, the hæmorrhages suppressed, all morbid tension in the wounded part removed, and the lips of the wound, where this is required, brought properly together, the dressings may be pledgits of fost lint covered with one of tow, spread with some digestive ointment, and large enough to cover the whole; these may be secured by means of fuch bandages as the fituation of the wound best admits of; the first dressings usually remain two or three days, or until the discharge of matter renders the separation of them eafy. After the first dreffings are removed, tion of them easy. After the first dreslings are removed, the dresling may be repeated every twelve or twenty-four hours, according as the discharge is more or less abundant or acrid. If after the first dresling a warm digestive is required, add to the ung. refine flav. a little of the oldereb, vel ball, capiv. These applications need not be warmed, except when very cold: after spreading the pledgit its surface may be just warmed by holding before the first each time that the surface of the wound is cleansed, it should be performed by dabbing it gently with soft lint, and not wiping it, lest the tender granulations should be destroyed; the surface of the wound should not be made 8 Y quite quite dry, but is better for being left fomewhat moift, for

thus the digestion is less interrupted.

Mr. Sharpe observes, that the principal interuption to the healing of a wound made with a sharp instrument is the fungus, and this he would have suppressed by dry lint and a proper comprets upon it; or if it advances above the furface of the fkin, to touch its edges only with some gentle escharotic; but it sometimes happens that an obstruction to healing is the slabbiness of a wound, and which is generally removed by dabbing it at each dreffing with the following or fome fuch application: R Aq. calcis sim. It is. tinct. cor. Peruv. sim. 3 ii. tinct. myrrh. 3 i. m. Thus, if an ill constitution or bad habit of the body is no impediment, wounds on the exterior parts are generally foon healed.

When the wound is filled up with flesh, pledgits of the cerate of lapis calaminaris usually effect the last intention of cure, or the cicatrizing of the wound.

There are many accidents which occasionally are attendants on wounds in one stage or another, such as fever, inflammation, a callus, &c. the management of which will be learnt from what is already faid under the different

articles in which they are noticed.

When a small artery is wounded, if it is divided, it re-tracts, and the hæmorrhage is soon spontaneously re-strained; if it is punctured, or partially divided, if it can conveniently be come at, it may be wholly divided, or the wound enlarged, and then the artery may be tied, if pro-per preffure proves ineffectual. When a large artery is punctured or divided, it must be taken up and secured with the needle and ligature. Wounds in the axillary artery and also of the semonal, if near the body, generally

demand an amputation of the limb.

Wounds fometimes penetrate the cavity of the breaft and belly, and fometimes injure one or more of the vif-cera; the first are known by the probe, the latter by the discharge that issues from them; if the symptoms attend-ing a second that penetrates into the cavity of the breast or belly are favourable, and there is no discharge from any of the vifcera, we may conclude that they are fafe when the vifeera are unhurt; in which cafe, after excluding the air that may have rushed into these cavities, treat them as simple wounds. The air may be excluded as follows: make the patient infpire ftrongly, keeping the wound closely covered, then uncover it after this full infpiration, and let the patient at the fame time make a full and powerful effort as in expulsion of the faces; thus the including air will be driven out at the orifice; repeat this process as often as it may feem necessary. If any of the vifcera have protruded and are unhurt, return them with all speed; but if wounded, use the glover's suture, leaving three or four inches of the ligature out of the twound. If the protruded vifeers have been exposed to the air, it may be necessary, before the return of them, to use a fomentation of warm milk and water, with a little fweet oil. In all these cases slannel is the best bandage, because it gives way and retreats as the breath doth re-

Wounds in the principal internal blood-veffels are all deemed mortal; but blood is fometimes discharged from finaller veffels into the cavity of the breaft or of the belly; if this happens in the breaft it occasions a difficulty of breathing, which difficulty is worse when the patient is in an erect posture; though, if blood is discharged into both the cavities of the breast, the patient can only lie on his back, and ftand in an erect posture. To discharge this blood, if the wound is in the lower part of the breast, lay the patient on the wounded fide, and with a probe push back the lungs, that the blood may pass out; if the resund is in the upper part of the breast, an opening must be made at the back part thereof, allowing the other to close; the proper place for this aperture is between the third and fourth of the false ribs, counting from below upwards, and about five inches from the spine. But, until the hamorrhage appears to have ceafed, which may be judged of by the ftrength and equality of the pulfe, and the warmth of the patient's extremities, the operation will be useles. When the opening is made, the expulsion of the matter is affifted by the efforts of refpiration, as al-ready hinted at, for the discharge of air. In these cases the patient must be kept still, mild aftringent balsamic in-

jections may be used, and gentle opiates given if a cough attends. If blood is poured into the belly, here will foon be laborious breathing, anxiety, and intermitting pulfe, &c. If the discharge of blood is small, the patient sometimes recovers, but, if confiderable, it generally proves

When a nerve is wounded, a variety of alarming fymp-toms comes on in proportion to the fineness and tenteness of the part it is attached to, and the peculiar irritability of the conflitution; when the pain occasioned thereby is extreme, it sometimes is relieved only by dividing the nerve: this accident is soon discovered by the sharp ichor which distils from the part, and its excoriating the circumjacent parts. When a tendon is wounded, the same symptoms follow as when a nerve is injured, but only they do not fo fuddenly appear. The most common applications to wounded nerves and tendons have been the fubtil spirituous forts, fuch as the ol. tereb. &c. but they are productive of the worst fymptoms; instead of these, put the limb into the easiest position, keep the wounded part free from cold air, avoid spirituous and hot applications, and in their flead, apply a warm bread poultice, having first covered the wound with lint; or instead of the poultice, cloths may be applied after dipping them in warm oil, or warm oil

be applied after dipping them in warm oil, or warm oil and vinegar mixed in equal parts, warm fomentations may be used before the application of the poultice, if inflammation attends, or teems to be approaching.

Wounds in the joints, when they are inflicted with cutting inftruments, or with heavy weapons falling on them, are attended with danger. Though the wound is small its consequences are often grievous, from irritation, from defined in of the ligament, from the loss of synovia. See struction of the ligament, from the loss of synovia, &c. Much depends on the habit; from a large wound in the ancle, caufed by a fracture, nothing remarkable hath fol-lowed; and fatal confequences have been the refult of a fmall one. However favourable appearances may be, a guarded prognostic should always be given. Large wounds of the joints almost always require amputation. The ligament of the patella being divided by a sharp-edged instrument hath frequently been followed by a loss of the leg. The tibia being broke from the aftragalus, and attended with laceration, makes an amputation adviseable. A mere incifed wound into a joint, from letting in air and injuring the ligamentous parts, have often proved fatal, when a timely amputation would have faved the patient. In contusions of the joints from heavy bodies crushing them, if a gangrene is waited for before amputation is performed, it will be left until it is too late: the patient feldom lives until the mortification begins to feparate; but is taken off by the fever and local malady. The two great consequences to be avoided in wounds of the joints are inflammation and pain; the first is to be attempted by bleeding and purfuing the antiphlogiftic plan; the latter, by the polition of the limb and by opiates. The most relaxed polition of the limb is the best. If no tumefaction comes on, emollient applications are not wanted, but repellents and preventives; if tumefaction, tenfion, &c. appear, immediately apply emollients. There is a fymptomatic fever generally attendant, exclusive of any other circumstances, and this is sometimes attended with such a discharge as to reduce the patient greatly, and on this ac-count amputation becomes necessary. Where the joint is spoiled by pressure, or by gun-shot, the injuries of the bone require attention as well as that of other parts, and the discharge of the synovia: these seldom do well under the greatest care.

WINTERANA CANELLA; - JAMAICENSIS. Sec

CANELLA ALBA.
WINTERANUS CORTEX. WINTER'S BARK; called also cort. Magellanicus, cortex antiscorbuticus, cin-namomum Magellanicum, laurifolia Magellanica. The tree is called Magellanica aromatica arbor, and WINTER'S CINNAMON-TREE. In Dr. Lettfom's edition of Dr. Fothergill's works, is given a drawing of a branch from the tree with the flowers, and there the tree is named Winterana aromatica.

Captain Winter was the first who made the bark of this tree known in Europe: he brought it from the Streights of Magellan in the year 1579. Clusius deferibes this bark in his Exot. p. 75, and calls it by the name of its first importer; hence the name of cortex Winteranus or Winter's bark. It has rarely been brought amongst us, and hath been so little known, that Pomet in his Materia Medica, describes the canella alba for it; others have copied him, and custom hath established the use of the canella instead of the cort. Winteran, the canella is also generally called cort. Winteranus. In 1691, Mr. George Handafyd brought some specimens of branches, &c. from this tree, and gave them to fir Hans Sloane, who drew up an accout of the tree, and it was inferted, with a figure, in the Philof. Transact. for 1693. But a more perfect defeription hath been obtained by the joint aid of captain Wallis, fir Joseph Banks, and Dr. Solander, who, in the year 1766, were in those parts where it is indigenous. It is only the bark of this tree that is of any value, and that is described as being of

#### WOR

different degrees of thickness, from a quarter to three quarters of an inch, of a dark cinnamon-colour; if it is fubbed it hath an aromatic odour, and to the tafte is pungent, hot, and fpicy, its effect on the palate is flowly imparted, but durable when given out.

Dr. Morris inferted in the fifth vol. of the Lon. Med. Obf. and Inq. some experiments on the Winter's bark, by which it appears to be a peculiar kind of astringent; also, that though it gives its virtues very freely to rectified and to proof spirit, yet water dissolves its soluble parts most freely. The Doctor recommends this bark as excellent for covering the disagreeable taste of sena and force other drugs, not more agreeable to the taste.

fome other drugs, not more agreeable to the tafte.

When Captain Winter first brought this bark from the Streights of Magellan, the failors used it as a spice, and afterwards found it ufeful in the fcurvy; for which last it hath been extolled; but unhappily its substitute, the canella alba, hath been almost always used. The Winter's bark is much more powerful as a stimulant than the canella alba; it is useful to promote digestion, also as a finulant in paralytic and dropfical diforders; in which laft, when the fecretions may probably be promoted by a flimulus, the Winter's bark deferves to be preferred. In finances of remitting and intermitting fevers, it has been seen as the second of the hath been given with advantage, as a fubflitute for the Peruvian bark; whence the canella alba muft evidently be a very improper fubilitute.

The Winter's bark is in larger pieces than the canella

alba, of a more rugged furface, a deeper colour, more agreeable fmell, a warmer tafte, is more pungent, and lefs bitter. The canella alba is in rolls, fomewhat thicker than cinnamon, and is the double bark of the tree from

whence it is taken.

ZIBETHUM. CIVET, also called civeta or civetta.

An ancient character for myrrh, but at pre- It is an uncluous odoriferous fubitance, about the confife-It is an uncluous odoriferous substance, about the consistence of honey or butter, of a whitish, yellowish, or brownish colour, sometimes blackish. It is brought from Brazil, the coast of Guinea, and the East Indies. It is found in bags, situated in the lower part of the belly of an animal of the cat kind. The bag hath an aperture externally, by which the civet is extracted. Its smelh is fragrant, and too strong to be agreeable, except it be diluted. It hath an uncluous and subscrid taste, and is used in perfumes. It does not dissolve in spirit nor in water, but unites with oils both expressed and distilled, and with animal stats. Water by distillation is impregnated with its odour, and spirit by digestion. Rubbed with mucilage it mixes with water.

The black fort from the East Indies is not so good as

The black fort from the East Indies is not so good as the American, but this latter is often adulterated. See Neumann's Chem. Works; Lewis's Mat. Med. ZICCARA. A name of an Indian fruit refembling a

pine-cone, and containing twenty, thirty, or more ker-nels of no known use in medicine. It is also called Ga-

psti, Cochitfapott.

ZIMENT. See COEMENTUM CUPRÆUM.

ZINCUM, also called ZINCHUM, ZINCTHUM, TUTE-

NAG, SPELTER, BLENDE, BLACKJACK, and ZINC. It is a metalline marcalite, or a bluish white metal, fomewhat refembling lead. Stahl first explained what it was: see his Metallurgia.

Zinc crackles during the bending of it, and quickly breaks, though it is fomewhat ductile. It is about feven times specifically heavier than water; it begins to melt in a moderate red-heat, and very flowly calcines on a continuance of the fire. In a moderate white heat it flows thin, burning, fulminating, with a bright deep green or bluif green flame, and fubliming into white light flowers, which concrete about the upper part of the veffel into thin crufts, or foft loofe filaments, like down or cobwebs, called PHILOSOPHER'S WOOL.

It is extracted from a fort of lapis calaminaris, which is its ore. In its metallic form, and in that of a calx, it diffolves readily in all acids, and precipitates from them almost all the other metallic bodies.

The white vitriol is made from pure zine, by diffolu-tion in the diluted vitriolic acid, and cryftallization. The calx, commonly called flowers of zine, were formerly kept under the names of pompholix, and of nihil album. They are now ordered to be thus made by the College of Physicians, London.

ZINCUM CALCINATUM. Calcined ZINC, formerly called Flores Zinci.

Take of zinc broken into fmall pieces, eight ounces; cast them at different times into an ignited large and deep crucible, placed declining or half upright, putting upon it another crucible, in such a manner that the air may have free access to the burning zinc. Take out the calx as soon as it appears, and sit its white and lighter

ZINCUM Vitriolatum purificatum, purified vitriolated ZINC.

Take of white vitriol one pound. Vitriolic acid one dram by weight, boiling distilled water three pints. Mix and filter through paper after a proper evaporation, fet it afide in a cold place to crystallize. Ph. Lond. 1788.

The preparations of zinc are employed in external ap-

plications, as ophthalmias, particularly against thin de-duxions of rheum, and as altringents, which effect they have if the zine is finely levigated, without acrimony or irritation. Taken internally they prove emetic.

The flowers of zine were first used as an internal me-

Z Y G

dicine by the celebrated chemist Glauber, but were little known in practice till Dr. Gaubius, of Leyden, gave have fince been much employed in convulfive and fpafmodic diseases, and sometimes with good effects. Even obstinate epilepsies have been rendered much less violent by their use. Like all other medicines, however, in diseases of this class, their good effects are often only temporary, and they often fail altogether. When the flowers are genuine, a grain or two generally at first excites a nausea or sickness; but by degrees a considerable dose may be taken with little or no sensible effect. As they are liable to be adulterated, it may be proper to mention, as tells of their purity, that they make no effervescence with acids; and that, when exposed to a strong heat, they become yellow; but, on cooling, turn white again.

By a mixture of zinc with copper, in different propor-BRASS and PRINCE'S METAL. See Neumann's Chem.

ZINGI. See ANISUM INDICUM.

ZINGIBER. Ginger. Also called zinziber, gingibil faminia, chilli India orientalis, iris latifolia tuberofa, & mangaratia. It is the root of a reed-like plant, growing spontaneously in both the Indies, in China, &c. It is brought to us in knotty, branched, flattish pieces, freed from the outer bark, of a pale colour, and fibrous texture. It is distinguished into white and brown, but they are both the same root; the former is cleaned and third the latter is scaled more stringled and render. dried, the latter is scalded, more shrivelled, and render-ed less aromatic. That which is the least fibrous is reckoned the best. It is the ammomum zingiber, or ammomum fcapo nudo, fpica ovata. Linn. COMMON OIN-

This root is warm and aromatic, but not fo heating as one would expect from its penetrating heat, and the pun-gency of its tafte, as well as from the fixedness of its principles. It gives out all its virtues to rectified spirit

to be moderned received, and never stories and made in a continuous of the first fact, burieful deep process or their fact, burning, should never a substanting, with a bright deep process or bedding over a substantial story fact of the velicit factors or which we continue to the upper part of the velicit into the country, as that deep or cobusting which country contents, where it is contracted from a fact of the colories, which is a contracted from all action, and in that of a calle, it is contracted in all action, and rectipiances from them.

of wine, and the greater part of them to water. In dif-tillation water raifes its whole flavour, but spirit leaves it nearly all behind.

Ginger is used in cold and flatulent diforders with some advantage; also when there is a laxity, or debility of the intestines. Its effects are more durable than those of the intestines. Its effects are more durable than those of the peppers. The London College orders a Syruprus Zinziberis, firup of ginger, to be made by macerating four ounces of bruised ginger for four hours in three pints of boiling water; then strained; and made into syrup with the addition of clarified sugar. ZYGOMATICA OSSA. See MALARUM OSSA.
ZYGOMATICUS MUSCULUS. It is called zygematicus major, by Albinus and Winflow; also different oris. It ariles flethy from the zygomatic process of the cheek-bone; and is inferted into the cornea of the mouth, which this muscle with its partner draws outwards and which this mufcle with its partner draws outwards and

upwards.
ZYGOMATICUS PROCESSUS. From the anterior middle part of the temporal bone goes a process, which joining another from the check-bone, they together form an arch called by this name. See TEMPORUM

Mer. Melley at Mr. Christ, in his Catalogue of Ma-chanel, Arc. Plants in the Licedon Posterio Corrion, Lars, it is the American cursols, Line. It is bounded about from Bound, in oblete plants, about the clark-ing an inthe Singer, and two or dove imbes tangs, or in conditio corresponded occurries, about are inch to diameter, of no allowed occurries, about are inch to diameter, of no allowed or the condet, and we had

ENGLISH INDEX

AS a great Number of Terms are very often joined with fome Epithet, by which they are diftinguished, it is necessary to observe, that whenever a Word is wanted to be found in the following INDEX, the Epithet, as well as the Term itself, should be fought for, as it is placed fontetimes under one, fometimes under the other.

### LYMPHATIC VESSELS. From Mr. HEWSON.

#### TO FACE PLATE XVL

#### FIG. I.

#### A Back View of the Fore Arm and Hand.

- A. The Hand.
- B. The lower Extremity of the Radius.
- C. The lower Extremity of the Ulna.
- D. The Muscles on the Back of the Fore Arm turned aside to exhibit a deep seated lymphatic Vessel, which perforates the interosseous Ligament to get to the Fore-part.
- E. The Olecranon.
- aaa. Lymphatics appearing on the Back of the Fore Arm, immediately under the Skin.
- b. Some of the Lymphatics bending over the upper Extremity of the Radius to get to the Fore-part of the Arm.
- e. A Lymphatic passing over the Ulna, immediately under the Olectanon, and under the inner Condyle of the Os Humeri, to get to the Fore-part of the Arm.
- 2. A Lymphatic which has penetrated the Muscles, perforates the interosseous Ligament, and gets to the Fore-part of the Arm near the radial Artery.

#### FIG. H.

#### A Fore View of the Upper Extremity.

- A. The Scapula.
- B. The Clavicle.
- C. The Extremity of the brachial Artery.
- D. The Mufcles lying on the Inside of the Arm-
- E. The inner Condyle of the Os Humeri.
- F. The lower Extremity of the Radius.
- a. A Lymphatic Vessel which lies in the cellular Membrane immediately under the Skin, and passes up on the Inside of the Arm to the axillary Glands.
- b. Superficial lymphatic Veffels paffing over the Muscles from the Back of the Fore Arm, and likewise over the Biceps to the Glands in the Axilla.
- c. A fuperficial Lymphatic from the Back of the Fore Arm.
- d. A Gland through which it paffes.
- e. The Lymphatics from the anterior and the posterior Part of the Fore Arm uniting.
- ff. Lymphatic Glands in the Axilla. They are common both to the superficial and the deep seated Lymphatic Vessels.
- g. A deeper feated Lymphatic Vessel lying close to the radial Artery, which it accompanies all the Way to (b).
- b. The deep feated Lymphatic Vessel passing under the interosseous and ulnar Arteries, and appearing again on the Arm, at (i).
- i. The deep feated lymphatic Veffel lying close to the brachial Artery.
- & k. Two fmall lymphatic Glands through which it paffes.
- The fame Veffel now become much larger and paffing under a Branch of the Artery and fome cellular Membrane, and appearing at (m).
- m. The Trunk of the deep feated Lymphatic Vessels passing upwards to the Axilla, where it enters the Glands ( f/).

#### LYMPHATIC VESSELS.

## TO FACE PLATE XVII.

#### FIG. III.

A Back View of the lower Extremity, diffected fo as to flew the deeper feated lymphatic Veffels, which accompany the Arteries.

A. The Os Pubis.

B. The Tuberofity of the Ifchium.

That Part of the Os Ilium which was articulated with the Os Sacrum.

D The Extremity of the iliac Artery appearing above the Groin.

E. The Knee.

FF. The two cut Surfaces of the triceps Muscle, divided to shew the lymphatic Vessels that pass through its Pers foration along with the crural Artery.

G. The Edge of the Musculus Gracilis.

H. The Gastrocnemius and Soleus, much shrunk by being dried, and by the Soleus being separated from the Tibia to expose the Veffels:

I. The Heel.

K. The Sole of the Foot.

K. The Sole of the Foot.

L. The fuperficial lymphatic Veffels paffing over the Knee, to get to the Thigh.

M. 'The posterior tibial Artery.

a. A lymphatic accompanying the posterior tibial Artery.

b. The fame Veffel croffing the Artery.

c. A fmall lymphatic Gland through which this deep-feated lymphatic Veffel paffes.

d. The lymphatic Veffel paffing under a small Part of the Soleus which is left attached to the Bone, the rest being removed

e. The lymphatic Vessel crossing the popliteal Artery.

f g b. Lymphatic Glands in the Ham, through which the lymphatic Veffel paffes.

The lymphatic Veffel paffing with the crural Artery through the Perforation of the friceps Mufcle.

- A. The lymphatic Veffel, after it has passed the Perforation of the Triceps, dividing into Branches which embrace
- m. A Lymphatic Gland belonging to the deep-feated lymphatic Veffel. At this place those Veffels pass to the Fore-part of the Groin, where they communicate with the superficial lymphatic Veffels.

n. A Part of the superficial lymphatic Vessels appearing on the Brim of the Pelvis.

#### FIG. IV.

The more superficial lymphatic Vessels of the lower Extremity. A. The Spine of the Os Ilium.

B. The Os Pubis.

- B. The Os Pubis.
- C. The Iliac Artery.
- D. The Knee
- EE F. Branches of the crural Artery.
- G. The Musculus Gastroenemius.

H. The Tibia.

I. The Tendon of the Mufculus Tibialis Anticus.
a. A Lymphatic Veffel belonging to the Top of the Foot.

b. Its first Division into Branches.

ccc. Other Divisions of the fame lymphatic Veffel.

d. A fmall lymphatic Gland.

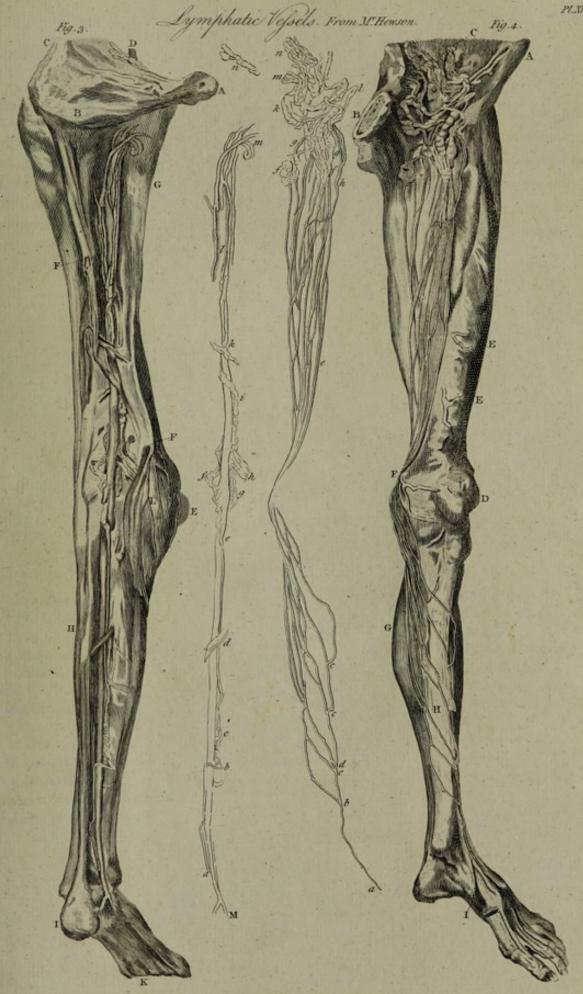

e. The lymphatic Veffels which lie between the Skin and the Muscles of the Thigh.

ff. Two lymphatic Glands at the upper Part of the Thigh below the Groin.

b. A lymphatic Veffel which paffes by the Side of those Glands without communicating with them; and, bending towards the Infide of the Groin at (i), opens into the lymphatic Gland (k.)

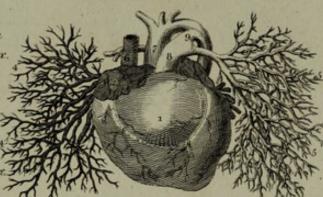

11. Lymphatic Glands in the Groin, which are common to the lymphatic Vessels of the Genitals and those of the lower Extremity.

m. w. A Plexus of Lymphatic Veffels paffing on the Infide of the Iliac Artery.

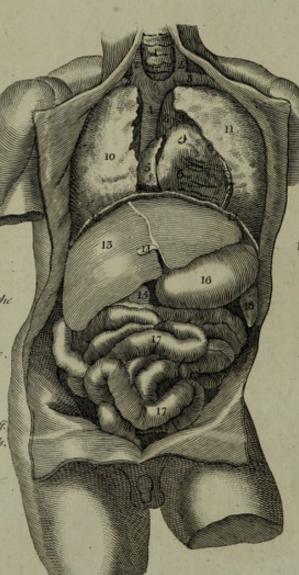

- 1 The right ventricle of a fixtus distended with wax.
- 2 The right auricle.
- 3 The left auricle.
- A Branches of the pulmons ary veins of the right lobe of the lungs, those

- 5. The arteries of the left lobe of the lungs.

#### PLATE THE FIRST.

#### FIG. I.

This gives a front View of the Uterus suspended in the Vagina. The anterior more external Part being removed, to Shew those which are more internal.

A. The Vertebra of the Loins.

B. The Offa Iliûm.

CC. The Acetabulum.

D D. The inferior and posterior Parts of the Osfa Ischium-

E. The Part covering the Extremity of the Coccyx.

F. The inferior Part of the Rectum.

G G. The Vagina cut open, longitudinally, and stretched on each Side of the Collum Uteri, to shew in what Manner the Uterus is suspended in the same.

HH. Part of the Vefica Urinaria stretched on each Side the Vagina and inferior Part of the Fundus Uteri.

I. The Collum Uteri.

K. The Fundus Uteri.

L.L. The Tubæ Fallopianæ, and Fimbriæ.

MM. The Ovaria.

N N. The Ligamenta Lata, and Rotunda.

O O. The Superior Part of the Rectum.

#### FIG. II.

This exhibits a View of the internal Parts, as feen from the right Grain, the Pelvis being divided longitudinally.

A. The lowest Vertebra of the Loins.

B C. The Os Sacrum and Coccyx.

D. The left Os Iliûm.

E. The inferior Part of the left Os Ischium.

F. The Os Pubis of the fame Side.

G, The Foramen Magnum.

H. The Acetabulum.

III. The inferior Part of the Rectum, and Anus.

K. The Os Externum, and Vagina. The Os Uteri lying loofely in the fame.

L. The Vefica Urinaria.

M. N. The Collum and Fundus Uteri with a View of the Cavity of both. The Attachment of the Vagina, round the outfide of the Lips of the Mouth of the Womb is here likewife thewn, as also the Situation of the Uterus, as it is prefied downwards and backwards by the Intestines, and urinary Bladder, into the concave and Inferior Part of the Sacrum.

O. The Ligamenta Lata, and Rotunda of the left Side.

P P. The Fallopian Tube, with the Fimbriæ.

Q. The Ovarium of the fame Side.

RR. The Superior Part of the Rectum, and inferior Part of the Colon-

# PLATE THE SECOND.

### FIG. I.

This shows the Uterus, as it appears in the second and third Months of Prognancy, its anterior Part being removed.

A. The Anus.

B. The Vagina, and its Plica.

C C. The posterior and inferior Part of the urinary Bladder extended on each Side, the anterior and superior Part being removed.

D D. The Mouth and Neck of the Womb, as raifed up when examining the fame by the Touch; with one of the Fingers in the Vagina

E.E. The Uterus as ftretched in the fecond or third Month, containing the Embryo, with the Placenta adhering to the Fundus.

#### FIG. II.

This gives a View of the Uterus in the fourth or fifth Month of Pregnancy, but here the anterior Part of the Collum Uteri is not removed.

F. The Neck of the Womb, which appears in this Figure thicker and shorter than in the former, shewing the Diminution of its length as Pregnancy advances.

G. Occupies the Situation of CC in the former, but should have been placed more interiorly, to shew the Vagina a little stretched from the Neck and Lips of the Womb, in order to shew the Parts more distinctly.

H. The inferior Part of the Fundus Uteri, the ftretching of which can fometimes be felt through the Vagina, by pushing up a Finger, on the anterior or lateral Part of the fame.

#### FIG. III.

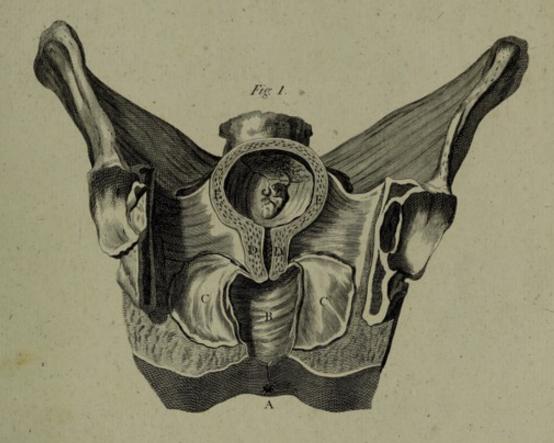

This gives a front View of the Uterus in the Beginning of Pregnancy, the anterior Part being removed, that the Embryo might appear through the Amnios, the Chorion being differed off.

A. The Fundus Uteri.

B. The Collum Uteri, with a View of the rugous Canal that leads to the Cavity of the Fundus;

C. The Os Uteri.

1

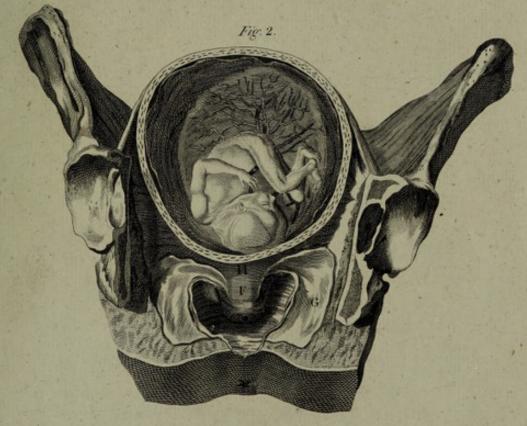

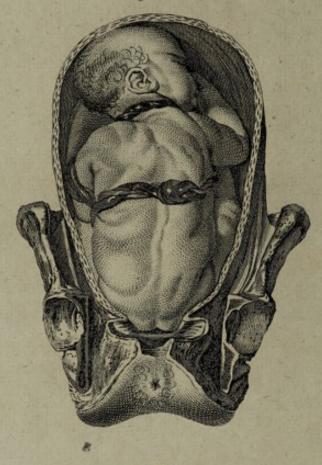

Fig. 1.

### PLATE THE THIRD.

#### FIG. I.

Represents, in a front View of the Pelvis, the Breech of the Fatus, presenting and dilating the Os Internum, the Membranes being too soon broken. The Fore-parts of the Child are to the posterior Part of the Uterus, and the Funis, with a Knot upon it, surrounds the Neck, Arm, and Body.

The Description of the Parts of the subsequent Figure will serve for this.

#### FIG. II.

This represents the Uterus in the eighth or ninth Months of Pregnancy

- A. The Uterus, as stretched to very near its full Extent, with the Waters, and containing the Fœtus intangled in the Funis, the Head presenting at the upper Part of the Pelvis.
- BB. The Os Ilium.
- CC. The Acetabula.
- DD. The remaining posterior Paris of the Offa Ischiûm;
- E. The Coccyx.
- F. The interior Part of the Rectum.
- GGG. The Vagina stretched on each Side.
- H. The Os Uteri, the Lips of which appear large and foft; the Neck of the Womb being likewife firetched to ts full Extent, or entirely obliterated.
- II. Part of the Vefica Urinaria.
- K. The Placenta at the Superior and posterior Part of the Uterus;
- L. The Membranes.
- M. The Funis Umbilicalisa

## PLATE THE FOURTH.

#### FIG. I.

This exhibits a front View of the gravid Uterus in the Beginning of Labour; the anterior Parts being vemoved, but
the Membranes not being broken, form a large Bag containing the Waters and Fatus.

- A. The Substance of the Uterus.
- BB. CC. DD. The Bones of the Pelvis.
- E. The Coccyx.
- F. The inferior Part of the Rectum.
- G. The Vagina.
- H. The Mouth of the Womb largely stretched in Time of a Pain; with the Membranes and Waters, marked L.
- K. The Chorion.
- L. The fame diffected off at the inferior Part of the Uterus, in order to shew the Head of the Foctus through the
- M. The Placenta, the external convex Surface of which, divided into a Number of Lobes, is here represented, its concave internal Part being covered by the Chorion.

#### FIG. II.

This gives a front View of Twins in Utero, in the Beginning of Labour, the anterior Parts being removed.

- A. The Uterus, as stretched with the Membranes and Waters.
- B. The fuperior Parts of the Offa Iliûm.
- CC. The Acetabula.
- D D. The Offa Ischium.
- E. The Coccyx.
- F. The lower Part of the Rectum.
- GG. The Vagina.
- H. The Os Internum, firetched open about a Finger's Breadth, with the Membranes, and Waters in Time of Labour-Pains.
- II. The inferior Part of the Uterus firetched with the Waters which are below the Head of the Child that prefents.
- KK. The two Placentas adhering to the posterior Part of the Uterus, the two Feetuses lying before them, one with its Head in a proper Position, at the inferior Part of the Uterus, and the other situated preternaturally with the Head to the Fundus: the Bodies of each are here entangled in their proper Funises, which frequently happens in the natural as well as preternatural Positions.
- LLL. The Membranes belonging to each Placenta.
