MEDICAL DICTIONA HISTORION MEDICAL

# PREFACE.

T being the lot of few, compared with the multitude, to be placed in a station that sacilitates any considerable degree of knowledge, every method taken to advance improvement is doubtless laudable, and should merit the approbation of the public: the utility of propagating what the ancients taught, and the moderns improved, must be obvious to those who are entrusted with the care of health and life; many of whom are destitute of the means of acquiring this necessary information. To remove this impediment in some degree, hath been the assiduous endeavour of the Editor, in the following sheets; and he statters himself that his attempt may be the means of exciting some abler person to improve upon his plan, and carry it much nearer to persection. Mean while, if it enables those for whom it is designed to extend their knowledge in the art they prosess, he shall be fully satisfied with having succeeded so far.

That many books embarrass rather than improve, is acknowledged; but an additional publication, which, in affording general instructions, enables the reader to felect rather than increase his volumes, cannot justly be ranked in this predicament. In the course of the sollowing pages, each respective article will terminate with a reference to some of the most eminent writers on the subject.

It would be needless to apologize for publishing a Work of this kind in the alphabetical order, when it is considered for whom it is principally designed. Systematic productions are doubtless the best adapted for a student's regular pursuit; but speedily to assist the memory in practical researches, alphabetical digests justly claim the preference.

Hippocrates was the first who methodized the healing art, by reducing his knowledge to a plain and useful system: to add lustre to his merit, he first made public what hitherto had been confined to the families of some of his predecessors; he hath described, with elegance and accuracy, most of the diseases that are now known; the names by which he called them were the same as those now in use; and his peculiar excellency consisted in describing the diagnostics and prognostics of disorders. The following is a list of the diseases on which Hippocrates hath given us his instructions.

Achores Alopecia Anafarca Anchylofis Anus, inflamed
hard tubercles of, or near the Appetite canine Aphthæ Apolepiis Apoplexy Arms, thortness of the Afcarides Afthma Auante Baldness Barrennefs Bladder, tubercles in the Blood, fpitting of - vomiting Blotches, red on the legs, from fitting by the fire Brain, concussion of the ruptured vessels in the Breath, feetid - ftraitness of the Buboes Carbuncle Catamenia { difordered natural Catoche Cancers

Cataphorá Cachexy Catarrh - a falt - a nitrous - a fharp a hot a fuffocative Caries Cheek, a sphacelus of the Chilblains Cholera morbus - a dry -- a moift Chalk-stones in the joints Cough Coryza Coma - vigil Contractions of the fibres Convultions Confumption of the whole body - ifchiadic - nephritic Colour, bad Crookedness Deafnefs Delirium Defluxion or rheum Diarrhora Dreams, frightful Dumbness

Dyfentery Dyfpnœa Dyfury Ears, pains in the - redundant moifture in the ringing in the
 tubercles about the Feehymolis from contusion Empyema Emprosthotonos Epilepsy in children Epiny&ides Eruption on the fkin Eye, diffortion of the dry-bleared clouds in the - cicatrices in the pearls in the white fpots in the - ruptured exulcerated. - inflamed dry inflammation of the Eye-lids - excrefoences on the - tumid outward - coalescence of the fcabby. - tumours on the

Face, hard tubercles on the Fainting Fevers Fiftulas Fractures Freckles Gangrene Glaucoma Green fickness Griping of the intestines Gout Genorrhœa benigna Gums, black - pain in the, from teething - fubercles on the Hæmorrhages Hæmourhoids Hearing, dull Heartburn Head, heaviness of the -- ach - - fcurfy Herpes Hefitation Hiccough Horror Humours, discharge of morbid Hysterics Hyperfarcofis Taundice Iliac paffion Impotence Inflammation external - internal Kidnies, diforders of the Labour, difficult Leprofy the white Lethargy Leucophlegmatia Lientery Lips, fiffures in the Limping Liver, inflamed Lochia, disordered Lungs, fpafmodically contracted

Lungs, varix in the fuppurated - crude tubercles in the Luxations Madness Melancholy Mind, alienation of the alienated through melancholy Miscarriage Mole Mouth, differted Naufeating food Navel inflamed Neck, a hard tumor in the Nofe, a discharge of pus in the Nocturnal pollutions Nyctalops Opisthotonos Orthopnea Pain in the loins Palpitation Peripneumony Phrenitis Phrontis Phlyctænæ Placenta adhering Plague a dry a moift Polypus in the note Pterygion Puffules from aerid fweat Pudenda, excrescences of the Pupil of the eye, too fmall or angular - exulcerated - cicatrix of the - fpoiled - removed from its natural fituation Quinfey Prominent affecting the lungs Reftleffiiefs Rheum, a defluxion of Ruptures Salivation, a fpontaneous Scurvy Senfation, fuddenly loft

Shivering Sight, a privation of Skin, difquamations of the Speech, too volatile Spleen fwelled inflamed Spine, differted forwards Sprains Sphacelus Stertor Strangury Stone Stupidity Stammering Superfetation Tabes dorfalis Teeth, stupor of the gnashing and grinding of the - of both the jaws fixed together Tetters Tefficles (welled Tenefmus Terminthi Tonfils diforders of the - fwelled Torpidness of the body Tongue fiffured - tumor under the Trichofis Tubercles of various forts Tumors Uvula, relaxed retracted
putrified
Uterus, difference of the Ulcers Urine retained Urethra, caruncles or tubercles in the Voice, lofs of the Varices Vertigo Warts Worms Whitlow Wry neck White flux Yawning

The practice of Hippocrates, with regard to the Materia Medica, was very conformable to that of the present period. Boerhaave observes, that the method of cure, pursued by the ancient physicians, was generally the best that could have been contrived, with the materials of which they were possessed; though since the time of Hippocrates, the small-pox, measles, lues venerea, and a few other disorders, have increased the preceding list; and the Arabians have greatly extended the catalogue of remedies.

The ancients have done little more than copy, comment, or vary the mode of communicating inftructions, from what Hippocrates and a few of the primitive writers handed down to them. It must, indeed, be acknowledged, that in some instances the improvements of the moderns are little more than recurring to the instructions laid down by the great father of the healing art. At the same time, without depreciating the merits of the ancients, it is justly afferted, that the moderns claim a degree of honour for having advanced medicine to its prefent state: with regard to the former, their physiology was extremely defective, their skill in anatomy very imperfect, and their knowledge in chemistry proportionably confined; notwithstanding their works are now frequently quoted either for confirmation or ornament: Galen, Celsus, and Ægineta, were the favourites of the great Boerhaave: his celebrated successor follows his example; and to the same ends others are swayed in the choice of those Greek or Latin authors, according to their respective prejudices. It may be proper here, to point out the distinguishing peculiarities of some of the most celebrated among the ancient writers.

Aretæus describes diseases with a picturesque accuracy; and in this respect he and Coelius Aurelianus surpass all others among the ancients, except Celsus, who is called the Latin Hippocrates, and whose excellencies are similar to those of Aretæus: but it ought to be observed, that the former wrote in the Greek, the latter in the Latin tongue. In the curative part of his writings Aretæus hath improved upon Hippocrates; and he is scarce equalled for method and elegance by any successor. He begins his account of each disease with a description of the part in which it is seated.

Galen is an expositor of Hippocrates. The works of his predecessors receive improvement in various branches from his hands; and many valuable hints from the ancients are no where to be found but in his Collections. He surpasses all who wrote before him, with tespect to the species, causes, seats, and symptoms of diseases, especially the acute. His masterly treatise on the seats of diseases, greatly enhances the value of his Works: in short, what he hathleft us on diet, is the basis of most that his successors have written on the subject.

Alexander Trallian is original in his plan: his diagnostics are remarkably exact, and his method of cure extremely rational. He confines himself to the description of diseases and their cure, in which he displays an extraordinary knowledge, and as nice a judgment; particularly in the curative part, in which he excels both Hippocrates and Galen. He flourished in the 6th century, from which, to the 16th, we meet with but few improvements in medicine. A compendium of his excellent Works is translated into English.

Cœlius Aurelianus deserves our attention: his descriptions of diseases vie with those of Aretæus, and he is very exact in pointing out the signs. His Works also contain many important passages from the ancients, which are not to be met with in any other productions handed down to us.

Oribalius hath transmitted to us many excellent fragments of the ancients, which otherwise had been lost; and to him we are indebted for the first descriptions of some few diseases.

Ægineta is a great chirurgical writer; he hath chiefly copied from Alexander Trallian, and hath well fupplied his omiffions.

After the Grecian physicians had flours shed, the arms of Mahomet prevailing, science was much suppressed; but at length the Arabians took the lead in physic: under their auspices few improvements were made; so that this art rather lost than gained by them.

Rhazes, in the beginning of the 10th century, was one of the most celebrated practitioners. He wrote too on every branch of physic and surgery, and introduced some new and useful instructions. He was the first who described the small-pox: and such are his description and method of treatment, that the latest improvements in the management of this disease are chiefly founded on them.

Haly Abbas, Avicenna, Avenzoar, Averroes, and Mesue, have each made additions; but in general, the Arabians are entitled to little more merit than what they may claim from enlarging the Materia Medica, by introducing medicines that were generally milder and equally efficacious, and sometimes of superior efficacy to those that were used by the Greeks and Latins.

About the middle of the 15th century, learning began to diffuse itself throughout Europe; and in the 16th, Hippocrates and Celsus were again received. Galen and Aristotle no longer maintaining their reputation as theorists solely, the Hippocratical method of concluding, from observations sounded on experience, was again restored. Vesalius now began to revive anatomy, and he improved surgery. Eustachius's anatomical tables are still, in many respects, the admiration of the present age. Mechanical and experimental knowledge began to make advances. Bacon, Boyle, and Newton, cleared and extended the path of science; astronomy appeared with new splendor, and medicine received fresh aids from every quarter. Harvey arose to demonstrate the circulation of the blood; ancient theories were now exploded; dissection greatly improved; anatomy and philosophy made rapid strides; physiology received new lights; chemistry was prosecuted with successful ardor, and every branch of medicine was thus amazingly improved.

It may eafily be deduced, from what has been already faid, that in the descriptions of diseases, their prognostics, and cure, consist the excellence of ancient authors; and with regard to whatever else relates to medicine, our recourse must be to modern writers. Fernelius, one of the earlier moderns, hath carefully and judiciously collected all that is useful in the Works of the ancient Greek, Latin, and Arabian writers; he is also more perspicuous and methodical, throwing more light on every subject than any of those from whom he copied; hence much time and study may be saved by perusing the ancients in his works. Lommius is also very accurate in his descriptions, comprising all that is valuable in the writings of his predecessors. His Medical Observations are translated into English, as are Hippocrates's Aphorisms, the Aphorisms of Celsus, and some other of the most valuable of their productions.

With regard to the rest of the ancient writings, their most interesting parts may be met with in the subjoined pages. It is hoped that this Work will be found of general benefit to those whose circumstances will not admit of an academic education, and who are nevertheless defirous of obtaining a competent share of medical knowledge.

By favour of the manuscripts of several friends, who have made Medicine their principal fludy, the following Work is executed, in many inflances, with an advantage that no individual unaffifted could possibly have obtained: to their judicious labours and generous aid, a general, but grateful acknowledgment is here paid; not but the importance of their supplies well deferve that particular thanks should be given in each article, the principal worth of which is derived from their ingenious contributions.

One principal use of a Medical Dictionary is, to discover in haste what the present urgency requires; therefore, in the profecution of what follows, peculiar care hath been taken that the bufy practitioner may refresh his memory, or derive a hint, without the tedious labour of fearching over many leaves. To convey a proper idea of this Work, and to affift in an useful and satisfactory perusal of it, the following general design and arrangement are laid before the reader.

- I. Technical terms, proper names, &c. have their etymology given; and where a farther explanation is required, it is added with concileness and perspicuity.
- II. That wanton variety to which fome authors have yielded, in giving different names to the fame subject, and the same names to different ones, serves but to perplex the inquirer; care hath, therefore, been taken to obviate this error, and each article is discussed under that name which is most in use; and its other names take their place in their respective order, referring to that under which the explanation is inferted, except for the etymology.

# III. Anatomical fubjects have,

- 1. Their various names immediately fucceeding that by which they are most commonly known.
  2. A concise description, as far as may be of service to the garded. medical practitioner.
- IV. Difeases according to their importance, either as to inconvenience to the patient, tediousness in the cure, or danger of life, are considered with respect to some, or all the following particulars.
  - 1. Their various names, or at least those most generally known. !!
  - general rank.
     different species.

  - 4. feat. 5. Who, and when they are most subject to them.
  - 6. Their caufes.
  - 7. figns { Diagnoffic and Proposed:

- 8. What difrafes they refemble.
- 9. Their occasional symptoms. 10. Preventives. 11. Indications of cure.

- 12. The proper regimen.
- 14. Their usual modes of terminating.
- V. The articles of the Materia Medica are attended to, according to their importance in practice, under fome, or all, the following confiderations.
- 1. Their various names that are generally known.
  2. Where had.

- 3. How produced.
  4. The description.
  5. The marks of distinction directing to chuse the best of
- each article respectively.

  6. Their most manifest medical powers.

  7. When the use thereof is hurtful.
  - 8. The best remedies against their imprudent use.
- 9. Dofes. 10. The various preparations of, and from, the respective
- articles. In this part, the principles of pharmacy will necef-farily be introduced. The directions given, are the refult only of experiments and observations made, according to the most approved practice.
  - 11. The most agreeable modes of administering.

  - 13. How to detect adulterations.
- 14. What should precede, accompany, or follow the use of any article, to render its effects more useful and certain.
  - 15. The analysis.
- VI. At the conclusion of each subject, there is a reference to the most approved authors who have written upon it: the reader will hereby be enabled to proceed to an acquaintance with all that hath been faid (or at least that merits his attention) respecting his enquiry; and thus, as inclination favours, he may proceed to obtain a competent skill in those branches to which his avocations more directly lead, or extend his purfuits to every part that completes the character he professes.

# PREFACE

# TO THE THIRD EDITION.

HE Medical Dictionary having met with so favourable a reception from the public, as to run through a second Edition in a short space of time, is no inconsiderable test of its merit, and hence it may appear singular, that the Work should fall into any other than the hands of the first Editor, during his life, for farther correction and improvement.—Indeed, it is to be lamented, that the ill state of Dr. Motherby's health, a man so well calculated for the execution of a Work of this nature, should render the change unavoidable; for when he undertoook a revision of this third Edition, to which he had made some Additions, he sound, unfortunately, his memory inadequate to the attempt; and perceived it suffer much from the application requisite to complete so laborious a task: dissident therefore of his own abilities from this cause, and unwilling to palm a work upon the world in too imperfect a state, he solicited me to undertake it, and was very earnest in his request, as I had long been in habits of friendship with him, and from various conversations on this subject, perfectly underderstood the improvements he was desirous of having adopted; on these accounts he put the work into my hands, with full liberty to make such alterations as I might think proper, supplying me with various hints as they occurred to him.

It will readily be conceived in how delicate a predicament a man thus fituated must stand, attempting to correct and improve the work of a living author, and that author his friend—a work which has showered upon him no small share of reputation, the resection of which perhaps constitutes one of his greatest pleasures. To obliterate therefore any of his fixed principles, upon which he has founded a number of his theories, and reasoning, though perhaps not totally according with my own modes of thinking, might be thought repaying friendship with cruelty, and sacrificing confidence to vanity;—I have, therefore let such doctrines as he has adopted, stand unaltered; only, here and there, endeavouring, where it appeared necessary, to elucidate and place them in a clearer point of view; and pursued such plans throughout the whole, as might co-operate with his wishes, centered in rendering himself not an unprofitable member to the community.

Knowing that his idea was to enrich the work with more practical documents, I have made that the principal confideration; and have thrown out such parts as seemed not closely connected with medical utility, in order to give place for other remarks which were more intimately united with, and essential to, a successful practice:

Hence all the Fosfilogy of EDWARDS which belongs to Arts, Manufactories, and Commerce, is rescinded, and such parts only suffered to remain as have been, or are, considered to belong to Medicine.

The Biographical part has also shared the same fate; because I thought the historical accounts of the Lives of the Grecian, Arabian, and other Philosophers and Physicians, were much too concise, as not comprehending sufficient to do justice to the memories of men, whose abilities, improvements, and discoveries, were too partially and too vaguely collected, especially as the History of Physic has employed the pens of many able writers, who have

gone more at large into the subject, and must be read by such as wish for any information on that head—besides being more calculated to gratify curiosity, than become beneficial, it was better omitted in a work of this kind.—And I flatter myself, such desalcation will not be construed detrimental, as more useful matter supplies the place; for in the former edition, wherever there appeared any omissions, which rendered the subject treated of incomplete, these have been corrected, and fresh materials added to make up the defect, and many references to those authors annexed, who have written most clearly and copiously on the subject; and whose works have received the distinguishing marks of public approbation.

The powers and virtues of Medicines have been particularly attended to, and many additions inferted in this department from practice, as well as from the labors of authors, who have taken great pains in investigating the modes of action of these so necessary materials, and hence identified their efficacy in many diseases, particularly BOERHAAVE, CULLEN, LEWIS, HOME, DUNCAN, WHYTT, and several others; as well as the different periodical publications of London and Edinburgh, wherein opinions seem to be delivered from experiment, the fountain from whence dependence can only be derived with any degree of confidence.

Nor has the medicated springs, a knowledge of whose powers and peculiar effects form so necessary a part of the practitioner's information, escaped attention, and in which points the former Editions were infinitely too desective.—Here the component parts, are not only given as discovered by analisation of the best physicians and chemists, who have turned their thoughts on this point, and have experimentally proved what they have delivered from repeated trials; but the constitutional effects have been marked; the dose ascertained; the method of administering them pointed out; the season wherein they possess their greatest vigor; and the dietetic, and medicinal plan described, which ought to accompany their exhibition, with the time requisite for their continuance.

With regard to the Galenical preparations, all those which have been proved useless are rejected, and also a number of farraginous masses, upon whose action there could be no dependence, and served only to perplex and soil the practitioner, in ascertaining to which of the ingredients he was to attribute any effects produced by them, and were in general nauseous, and offensive to the stomach—and supplied their places with other more simple, elegant, and efficacious compositions; and have added the new names as adopted by the Royal College of Physicians of London, so that we are generally led to the ingredients of which most of them consist, and always to that which is considered by that body the most active, consequently the precise nature of the compound will be at once found out with respect to its action, an advantage peculiarly useful to the medical Tyro; nor are there any prescriptions omitted which have stood in high estimation, and been consistence by private practice, that have occurred to my observation, which might not have found their way into any Dispensatory, or been enumerated in any formulæ already given to the public.

Another improvement has been adopted, which will doubtless be esteemed a very material one, and that is, a total alteration of the Index supplied by Dr. Motherby in the former Editions. For the Doctor had united a number of the Greek and Latin fynonimes, with fome of the English names of many diseases, medicines, and other materials, though by no means fo fully as to render the Index as useful as might be expected; besides the apparent inaccuracy in fuch an arrangement, blending together a number of original terms with those which must be considered only as explanatory of such terms. The synonimes are therefore embodied and referred to the word under which the particular description of the disease, medicine, fubstance, or term, wanted to be defined, is given. For in many it will be found that fome peculiarities are mentioned under the fynonime, that have escaped attention under the common, or generic term, an accident unavoidable in fo complex an undertaking as a Dictionary of any Art or Science, confifting of fuch a variety of divisions; and this has been thought right upon another account. For as authors use different words to express the fame thing; and some have such an amazing variety, not only in the same language, but adapted to several others agreeable to the idiom of that in which any medical, or chemical work is written. Hence, in the perufal of very ancient, or foreign authors, much ease will be derived to the reader; for in meeting with a term by no means familiar, he will, by turning to the word in this Dictionary, be immediately led to that, where the information wanted may be acquired, viz. MERCURIUS,-Mercury, has a multiplicity of denominations-Hydrargyrus; Liquor metallorum; Metallum fluidum; Argentum fujum; Argentum mobile; Vomica liquoris aterni; Adibut; Alborca; Alcharith; Alembic; Alambic; Alkaut; and a great number more, known I believe to few readers;

by turning to any one of which in this Work, he will be referred to ARGENTUM VIVUM, from MERCURIUS: the same might be said of a vast variety more, but what has been advanced will afford sufficient proof of the benefit annexed to such a scheme, and serve as a full explanation of the whole which so often occur.

And as the practice of physic is by no means confined to such as are versed in the Greek, Latin, Arabian, and fome more modern, though foreign languages, from whence has been, and is deduced no small share of medical information, but on the contrary great numbers are almost totally ignorant of every other, except that of this country, amongst whom this Work is likely to be in general use—an Index of Terms purely English has been formed, fuch as are most commonly in use, and by which diseases and medicines, vegetable as well as mineral, are generally known, and a variety of other terms of art, which would not be difcoverable by those readers without such affistance. The English names are therefore arranged alphabetically, and referred to the page where each article may be found, rather than to the term under which they are placed, and this was done for the purpose of giving a greater number of words in a much fmaller compass, and referring such as might be mentioned in two, three, or more places from one point, and that any thing which was feattered in different parts of the Work on that particular subject, might be readily collected, and a view given at once of all the information here to be acquired; and in order to catch the eye in fearching for any term wanted, referred to from the Index to the page, the term will be found in small Roman capitals, or Italics, viz. CASTOR OIL, will be found in p. 255; Dogs, Tooth, p. 303; Tooth Shell, p. 303; by any inquirer looking into the Index, as well as by those who know, they stand under CATAPUTIA, DENS CANIS, and DENTA-LIUM. Hence the commonest readers will be at no loss in finding any word in this Dictionary, under however an obsolete, or ancient a term it may be placed. Though here it must be observed, every individual word is not included, as that was thought unnecessary, where the English term comes so near to the Latin, that on looking for the word as written in our own vernacular language, the Latin word presents itself in the same order, from the letters being fimilarly arranged, and are perfectly alike, except in the mode of Termination, viz. SINAPISMUS, Sinapifm; BISMUTHUM, Bifmuth; CONFORMATIO, Conformation, &c. And here it should be observed that several words in the body of the Dictionary, as well as in the Index, may not probably be found under the general term, the Reader is therefore defired to look for the Epithet with which it is commonly joined, as CRURALES ARTER B, EMPERICA SECTA, &c. will be found under the words CRURALES and EMPERICA.

Besides these advantages, as the art of Midwistry is certainly one branch of medicine, and has been copiously treated on in this Work, and the former Editions had not supplied plates explanatory of any part of the Obstetric Art, there are now added four double plates, containing nine views of the gravid uterus, in the different stages of pregnancy, in which is included one of twins; whereby the semale organs of generation are given in a practical light, the different changes they suffer during gravidity, and the natural presentations of the sætus in utero; and these have been selected, in presence to all others, in order to give an idea of the nature of many complaints originating from pregnancy as a cause, particularly such as depend upon the distension of the uterus, and the elevation and pressure which other parts of the thorax and abdomen suffer on this account, by which means the most salutary modes of proceeding in delivery may be, with very little trouble, understood in the time of parturition; and the method not only of relieving a number of troublesome and perplexing complaints during pregnancy; but the most rational means discovered of preventing them, and others, which might arise after delivery; advantages that cannot be ascertained by the practitioner without a minute knowledge of these particulars.

Such then are the alterations, corrections, and improvements, under which this Dictionary has passed, and it is hoped that they will, in a proportionate degree, increase its value; particularly as all the useful parts in the former Editions still remain in this, and nothing has been taken from them, but what has been supplied by more practical documents, to answer more perfectly and completely the primary intention of this publication. And though it may be presumed, that many alterations might yet be advantageously made, still sew books will be found replete with more general utility, forming a copious memento to adepts in every department of medical science; and surnishing a large share of knowledge, well arranged, and easy to be comprehended by those who are entering into, or have not been long conversant with the practice of the Medical Art. Indeed if we consider the great quantity of fresh Matter, wherever any improvements presented themselves, which has been introduced, be-

fides the elegant engravings inferted to elucidate particular fubjects, and give clear descriptions on feveral parts, which would otherwife have appeared too embarraffed and abstrufe, it must be acknowledged that the Proprietors have spared no expence to render this work still further worthy of public approbation, of which I cannot avoid having fome expectation, as Dr. Motherby, the former Editor of this Work, in a Letter to me, fays, speaking of the Medical Dictionary, the sheets of which he had perused, "the many alterations and improvements you have made, I acknowledge with great pleasure." G. W.

# MEDICAL DICTIONARY.

#### AAA

The letter a, with a line above it, thus a, is used | in medical prefcriptions for ana, of each; fome-times it is written thus āā; e. g. R Mel. fac-char. & mann. ā. vel āā, ʒj. i. e. Take of

honey, fugar and manna, of each one ounce.

A, in composition, implies a negative.

A. A. A. The chemical abbreviation for amalgama,

or amalgamation. See AMALGAMA.

AABAM. LEAD.

ABACTUS. The words abasfus venter, are used to

fignify a miscarriage.

ABACUS MAJOR. A trough used in the mines, wherein the the ore is washed.

ABAISIR. See Spodium Arabum.

ABALIENATUS, corrupted. Celfus. When applied to the body, it fignifies that a part is fo deftroyed as to require removal. When applied to the fenfes, it expresses their total destruction. Scribonius Largus. If the injury happens from sudden external violence, it may require

immediate manual aid; but from internal morbid affection, the separation is best performed by nature.

ABANGA. See ADY.

ABAPTISTON, or ABAPTISTA. The perforating part of the instrument for the instrument of th hath had various contrivances to prevent its finking fud-denly upon the membranes of the brain, when the opedenly upon the membranes of the brain, when the operator was perforating the fkull: whence its name. But the prefent practice renders all precautions needlefs, that relate to this infrument, by having fubfittuted a much more manageable one. See Trephine.

ABARTAMEN. LEAD.

ABARTICULATIO. APASTHROSIS. A fpecies of articulation admitting of a manifest motion, called also distributed, description, continuing to distinguish it from

diarthrofis, dearticulatio, coarticulatio, to diftinguish it from that fort of articulation which admits of a very obscure

motion, and is called fynarthrofis. See ARTICULATIO.

ABAS. See TINEA. ACHOR. Sometimes it fignifies the epilepfy. Conftantine.

ABAVI, ABAVO, or ABAVUM. A large tree in Althiopia, bearing a fruit like a gourd. Ray's Hift.

ABDELAVI. A plant whose fruit resembles a melon, being rather more oblong; it grows in Egypt. Ray's Hift.

ABDITUS, included. Thus; abditus vase, included in a vessel.

ABDITÆ CAUSÆ. These are the very remote or

fecret causes of distempers.

ABDOMEN, the BELLY. Some fay, this word is from abdo, to bide; as its contents lay hid in it. Martinius, and others, derive it from abdere, to bide, and omentum, the coul. But Vollius fays, in his Etymology, that it is only a termination; and, as from legs, legumen; fo, from abds, abdomen. It is also called Issus Venter.

The body is generally divided into three cavities, called

by Anatomists, venters: viz. the head, or upper venter; the breast, or middle venter; and the abdomen, or lower venter. Indeed the word venter, though purely Latin, has been matriculated into our language,—and used in the fense here particularized commonly;—and in some other, though more rarely.

The belly is divided on its outer furface, into four regions, called the epigastric, the umbilical, the hypogastric,

#### ABD

and the lumbar. See EPIGASTRIUM, UMBILICALIS RE-GIO, HYPOGASTRIUM, and LUMBARIS REGIO. Thefe are all contained betwixt the circumference of the falfe ribs, and the bottom of the offa innominata-

The belly is separated from the breast externally, by the extremities of the ribs; and internally by the diaphragm, and it is terminated below by the musculi levatores and.

The bottom of the belly, on its fore part, is called the pudenda; and on its back part, the buttocks, and anus;

and underneath, betwixt the anus and the pubes, the pe-

The cavity of the belly, formed by the above-named parts, all which are covered with the membrana adipofa and the fkin, is lined on the infide by the peritonæum. This cavity contains the ftomach, inteftines, mesentery, mesocolon, liver, gall-bladder, spleen, pancreas, glands of the mesentery, vasa lactea, receptaculum chyli, kidneys, renal glands, ureters, bladder, and the internal parts of generation.

The principal arteries of the belly, are the epigaftric, which are the lowest portion of the internal mammary artery, the inferior aorta, the cooliae, the upper mesenteric, the haemorrhoidal artery, the renal, called emulgent, the fpermatic artery, the lower mefentric artery, the lumbar, the lliac, the lower epigaftric arteries, and the pudicæ.

The principal nerves of the belly, are the ftomachic, formed by the extremity of the eighth pair, the lower portion of the great sympathetic nerves, the two semilunar or plexiform ganglions, the stomachic, hepatic, splenic, renal, upper and lower mesenteric plexus, the nerves of the loins and sacrum, also the origin of the crural and sciatic nerves.

The appendix enfiformis of the sternum, the cartila-ginous portions of the last pair of true ribs, those of the first four pairs of false ribs, all the fifth pair, the five lumbar vertebræ, the offa innominata, the os facrum, the os coccygis, form the bony fides of the cavity of the belly.

The diaphragm, the muscles called, particularly, musculi abdominis, the quadrati lumborum, the pfoai, the iliaci, the muscles of the coccyx, and of the intestinum rectum, form the greatest part of the circumference of this cavity.

As auxiliary parts, fome portions of the facro lumbares, longiffimi dorfi, &c. might be added.

The mufcles belonging to the belly are five pair; viz. the sbliqui externi, the sbliqui interni, the transfeerfales, the relli, and the pyramidales. Galeu in his Treatife on the Diffection of the Mufcles, and that on the Preferra tion of Health, remarks, that the action of the abdominal muscles is necessary to the act of expiration, as they pull down the thorax, and is very useful in efforts to speak loud: he also says, that without their action we could have no stool, nor make water; for the actions of the fphincter muscles of the anus and of the bladder, are overcome by the actions of the abdominal muscles and diaphragm. He farther observes, in his Work, De Locis Affectis, that fome people who find a difficulty in going to ftool, or have a suppression of urine, relieve them-felves by pressing the abdomen with their hand; and that the expulsion of the fœtus is the work of the abdominal muscles. De Naturalibus Facultatibus.—Mr. Pott, in one of his lectures, A. D. 1782, observed, that there can be no doubt of the abdominal muscles being indispensible

to exclude the faces and urine: he faid, that he had a upward on the infide of the hand, and is inferted into little before that time feen a child, which lived nearly the external fide of the little finger, or its first joint. It three weeks, though it had no abdominal mufcles; that this child could not either propel, or expel the faces nor urine perfectly, without artificial aid. Befides it has been proved that they are greatly instrumental in promoting the action of vomiting; by Mr. Haighton-in the fecond volume of the Medical Memoirs of London-for the most violent stimuli when applied to the stomach either externally or internally, were in his experiments infufficient to produce a regurgitation of its contents, without the con-curring efforts of the diaphragm, and muscles of the ab-

There is a finus on each fide of the cartilago xiphoides, between the transverfalis and recti muscles, into which, on the left fide, the ftomach is fometimes ruptured by violent vomiting, which discase is called Gastrocele. diforder is attended with excellive pain, which is greater when the person is up, and gradually goes off when he lies in a horizontal posture, which circumstance is the pathognomonic sign of the disease. If it does not recede, it must be cut open and reduced in the same manner as in other ruptures. Winslow's Anat. Happily this case is very rare; when it occurs, little more can be done than to alleviate general symptoms; if it cannot be re-

is very rare; when it occurs, little more can be done than to alleviate general fymptoms; if it cannot be returned by the hand, any operation will be a doubtful aid. Pain, and other diforders of the belly, fometimes happen from keeping it too cool. The circulation of the blood from the vifcera in the belly, by the vena porte to the liver, and afterwards in the liver, is carried, or, at least, greatly promoted by the alternate comprefion, which the contents of the belly receive from the diaphragm and muscles of the belly; and it is of fervice in diffecting living animals, that when the vifcera of the diffecting living animals, that when the vifcera of the belly are exposed to the air, this circulation of the blood towards the liver, by the portæ, is much impeded, or totally ftopped. Hence it follows, that in proportion as the action of the muscles of the belly is impaired, and the cavity laid open, this circulation, so necessary to the

animal economy, must be obstructed.

The muscles of the belly are subject to inflammations, which have been mistaken for inflammation in the liver; to diffinguish them, fee HEPATITIS. Heurnius fays, that these muscles have a very thick membrane, which will not readily admit of the exit of pus when it is formed; he, therefore, advifes to open them by incifion, foon-er than is ufual in other instances of abscesses.

The rheumatism sometimes affects the muscles of the belly, and the case is mistaken for a colic, or for an in-flammation of some of the viscera within: in this case, however, the usual symptoms of inflamed viscera are abfent, and the medicines which are ufeful in the colic, are without effect in this cafe.

See the article VULNUS, for the management of wounds in the belly

ABDUCENS OCULL See ABDUCTOR OCULL

ABDUCERE. Scribonius Largus uses it for bibere, to

ABDUCTIO, from ab and duce, to draw, a fpecies of fracture, when a bone near the joint is fo divided transversely that the extremities recode from each other. Calius Aurelianus uses this word for a strain. Abductio properly fignifies, leading from or drawing away. It is from the action of the murcles, that the divided ends of frac-

tured bones recede. Abruptio is used in the same sense, as is also Apoclasma, and Apagma.

ABDUCTOR, a leader from, or that draws away. From abducere, to move or draw from. Several muscles are thus called, viz. — ABDUCTOR AURIS, called also triceps auris, and retrubens auriculam, bicaudalis mufcularis; detractor auris; a muscle of the external ear, called by Winflow the posserior. It is called triceps, because it hath sometimes three beginnings. It is composed of a few sleshy sibres, which arise from the superior and fore part of the apophysis mastoideus, and descend obliquely to their infertion, in the middle of the concha auricula. It covers the posterior ligament. Dr. Hunter says, that he thinks the ear hath but two muscles belonging to its external parts, that the retrahens auriculæ arises from the mammillary process of the temporal bone, and is inserted into the lower external part of the ear, to pull it backward. — Digiti minimi manus. Riolan calls it hypsthenar. It rifes from the os piliforme of the carpus, runs abies in the genus of pinus.

helps to separate the little finger from the rest, and also to bend it. It is the flever purvus minimi digiti of Albinus. — DIGITI MINIMI PEDIS. It rifes fleshy and tendinous from the femicircular edge of a cavity on the outfide of the inferior protuberance of the os calcis; it hath anof the inferior protuberance of the os calcis; it hath another tendinous beginning from the os cuboides, and a third from the upper part of the os metarfi minimi digiti. It is inferted into the upper part of the first bone of the little-toe externally laterally. It draws the little-toe outwards from that next to it. — INDICIS. It arises sleshy by two heads from the metacarpal bone of the fore-singer, and the first bone of the thumb, and is inserted by its tendon into the basis, or first joint of the fore-singer, laterally next the thumb. It brings the fore-singer from the middle-singer, and near to the thumb. Cowper calls the middle-finger, and near to the thumb. Cowper calls it adductor policis. Douglas fays, its use is to bring the index towards the thumb; whence, in respect of this it may be stiled adductor, and, in respect of that, abductor. Ocull, called also indignatorius, or the feoraful mus-cle; musculus exterior; also abducens, iracundus, and rec-tus externus. It rifes tendinous and flethy from the foramen lacerum, without the orbit. It is inferted by a thin tendon into the felerotis, on that fide next the nofe. It moves the eye towards the little angle. — Pollicis MANUS, called alfo themar, by Riolan; and abduetor brevis pollicis manus, by Albinus. It rifes by a broad, tending the manus, and fellow brevis pollicis manus, by Albinus. tendinous, and fleshy beginning, from the inner part of the traverse ligament of the carpus, and from one of its bones which articulates with the thumb, and is inferted tendinous into the fecond joint of the thumb. It draws the thumb from the fingers. - POLLICIS PEDIS, called also thener. It rices fiethy from the infide of the os calcis, and tendinous from the os naviculare, and forms a strong tendon, which is inferted at the inner part of the first bone of the great-toe, upon its fefamoid bone. It pulls the great-toe from the rest. It often bath a tendinious origin from the edge of the os cymbiforme, receiving near this bone some tendin-ous filaments from the tibialis anticus.

ABEBAEOS, Agicass, infirm, weak, inconftant.
ABELE, a species of poplar. See Populus.
ABELICEA. A tall tree growing in Crete, called also fantalus adulterinus, and pseudosontalum. See BRASILIUM

ABELMOLUCH, a fort of ricinus, or palma Christi, called Dende

ABELMOSCHUS. Ab-el-mosch, or Granum Moschie Also Alcea Indica, Alcea Ezyptiaca villosa. Bamia Mojebata, Belmosebus. Ezyptia Mosebata. Moseb. Arabum Abrette. The feed of a plant which has the slavour of musk, called the Musk Mallow. The plant is the hibifeus abelmofehus, of Linnæus. The feeds are flat, kidney-shaped, the fize of a pin-head, grey or brownish without, and white with-in. The plant is of the mallow kind, a native of Ægypt, and of both the Indies. The feeds are very fragrant, and their feent is like a mixture of amber and of musk; to the tafte they are of a flightish aromatic bitter; they are cordial; the Arabs mix them with their coffee; but their chief use is as a perfume. The best comes from Martinico. Chuse such as appear new, plump, dry, and well

ABERRATIO, ABERRATION, going aftray; from aberro, to wander out of the way. In medical writings it exprefies nature's deviating from her usual progress. By fome nosologists it is used as synonymous with dislocation.

ABESAMUM, dirt or clay.
ABESSI, alvine fæces. See Rebis.
ABESUM, unquenched lime. See Calx.
ABEVACUATIO, or Abvacuatio, as ufed by fome medical writers, is a partial or incomplete evacuation of the faulty humours, whether by nature or art. Also called As

ABICUM, the fame as coopertoria. See Coopertio.
ABIES, Fir, called also Elate Thalcia.

The fir-tree is an evergreen, and coniferous, with numerous, narrow, fliff leaves, flanding folitary or unconnected at their bases with one another.

Botanists have enumerated twelve species, if not more; but three or four of them, as follow, are those which af-ford materials for medical use. Linnaus includes the

depressions. It is the pinus abies alba of Linnæus.

These two species are natives of the northern climes; the fecond grows on dry, mountainous places; the first in lower and moister grounds. Norway produces abundance; Switzerland and some parts of Germany also afford great

quantities of them.

3. Abies Canadensis, vel Virginiana, the Canada or Virginian fir, with roundish pointed leaves, fometimes cloven, flanding like the teeth of a comb in two rows on each fide of the branches, and variegated underneath, with a double line of whitish dots. It is the pinus abies Canadensis of Linnaeus.

4. Balfamea, Balm of Gilead fir; fo called from the fragrance of the leaves when rubbed. The leaves are roundish pointed, and flightly cloven, nearly like those of the filver fir; the cones are long and pointed, and ftand erect. It is the pinus abies balfames of Linnzeus.

All the parts of these trees contain a resinous juice, im-

pregnated with a bitterifh, pungent, effential oil: turpen-tines are obtained by making incitions in their trunks at

a proper feafon.

The common red fir affords the greatest quantity of turpentine, and from the turpentine is obtained white re-fin, fee RESINA; tar, fee PIX LIQUIDA; pitch, fee PIX; and Burgundy pitch, fee PIX BURGUNDICA.

The filver fir produces the Straiburg turpentine; it is far more grateful than the common fort; it is called liquid refin, to diftinguish it from the dry refin, which re-

From the Canada fir is obtained a still finer and more From the Canada hr is obtained a titl their and more grateful turpentine, called Balf. Canadenfe: it is difcharged, during the fummer heats, through incifions made in the trees; it is transparent, and almost colourles. It is a good substitute for the balf. capivi.

The balm of Gilead fir emits from its cones a turpentine with a fragrance refembling the balm of Gilead, and the interest of the same capacities. Spirit of wine extracts a reference of the same capacities.

that in large quantities. Spirit of wine extracts a refin both from the cones and the leaves, of a fimilar quality.

Rectified spirit of wine, digested on fir, extracts all its active parts, with some of its mucilage. The cones of all the forts yield the most agreeable tincture.

Water, though it dislolves little or nothing of the pure

turpentines, yet, by the mediation of the gummy matter in the fir itself, it extracts part of its refin. The wood and the cones are taken in autumn, or its latter end, for their oil; and in distillation with water, a large quantity of effential oil arises. The oil drawn from the wood is nearly fimilar to the oil of turpentine. That obtained from the fresh cones is superior in subtilty and fragrance to all the oils of the turpentine kind ufually met with. See Zimmermann's Praelect. Chym. Neum.

The tops and the cones of the fir-tree moderately warm, promote perspiration, and increase the discharge by urine. Four ounces of the fresh tops are put to a gallon of diet-

drink.

A spirit distilled from the young leaves is a succedaneum

A part diffiled from the young leaves is a fuccedaneum for the aq. Hungarica.

The Eff. Abietis Pharmacep. August. is the balfam of the fir-tree, joined with feurvy-grass, as follows: the fir cones while young, tender, and of a red colour, are bruised and digested two days in four times their quantity of spirit of scurvy-grass, then the tincture is pressed out.

The tops and leaves of the filver fir are used in making Brunswick mum.

ABIETANUM OLEUM. Sce TEREBINTHINA.

ABIGA HERBA or IBIGA, a name for the chamaepytis, or ground-pine. It is probably fo called from abigo, to expel, as it is faid to promote delivery. Blancard thinks its name is from its leaves refembling the leaves of fir, which is called abies.

ABIT, or ABOIT. Cerufs. See CERUSSA.

ABLACTATIO. ABLACTATION, or WEANING a child from the breaft; from ab and latte, the taking a child from the milk of the breaft. Also called Apogala Hifmus. When

1. Picea, the common red fir, or pitch-tree, with a reddish bark, long, slender, quadrangular, sharp-pointed leaves, and long cones hanging downward. It is the pinus abies picea of Linneus.

2. Abies, the yew-leaved, or filver fir, with a whitish bark, roundish pointed leaves, a little cloven at the tops, and thort cones standing upward; the leaves are marked on the lower side with three green lines and two white on the lower side with three green lines and two white depressions. It is the pinus abies place of Linneus. finall a quantity; when the mother hath weak nerves, is apt easily to be furprifed, these defects spoil the milk; if the child is suddenly taken ill, from the effects of the mother's frights, or anxiety; if the milk is often dried up quickly, when perhaps the infant hath the most occafion for it: in such cases, it is adviseable to wean the child, indeed often absolutely necessary. It can never be useful to continue the breast more than eight or nine months; but generally, if a child is favoured with a good fupply by fucking, during its first three or four months, and is in a tolerably heathful state, it will rarely be the worse for weaning at this early period; so that, if it is not rather weakly, and if difficulties attend its being suckled, there need not be any hefitation about taking it from the breaft. If it feeds tolerably with the fpoon, and is free from diforders in its bowels, a tendency to convul-fions, &c. weaning may be attempted at any time. But, if feeding with the fpoon is difficult; if the child is much fubject to the gripes, &c. another nurse should be fought for, and wearing must be deferred until more favour-able circumstances attend. In general, the sooner a child is weared, the more eafily it parts with the breaft. Pru-dence directs to accustom a child to early feeding with the spoon, and to continue the same until the breast may be wholly omitted.

Children, if healthy, may be weaned at any age; but as in general their digeftion grows ftrong enough at about nine or ten months, they should only be fed once in fix hours, at the most, during the first two months; should be entirely weaned from the breast as speedily as is convenient, and also from all feeding in the night; for night feeding bloats them, and if they are not used to it in the first week, they would never want it: if they are not difturbed from their birth, in a week or two the child will be formed to a habit of fleeping most of the night very quietly, awaking only when wet, on which occasion it should be laid dry.

The food should be simple and light; not spoiled with fleeping most of the produce the state of the stat

fugar, wine, and fuch like additions, for they produce the difeases that children are most troubled with, acidities in the prime viz. Unfermented flour makes a vifcid food that turns four before it digefts, and well fermented bread foon turns four; but if this latter is made into fresh panada every night and morning, or, in cool weather, every morning, the inconvenience of fouring is prevent-ed. To avoid acidity in the child's flomach by a daily use of vegetable food, give now and then a little fresh broth, made from either yeal, mutton, or beef, once or twice in the day; suppose, for example, a mixture of equal parts of the gravy which is discharged in cutting a joint that is brought hot on the table, and warm water, to which may be added a little falt, and thus an excellent broth is readily made. This is faid to fill children with humours, it is true, but the humours are only of the most nourishing kind. Cows milk, a little diluted with water, is an excellent fubilitute for the mother's; yet, as it is apt to turn four, add to it a little Lifbon fugar. Rice is not fo apt to turn four as wheat bread is, it therefore would be a more convenient food for children, and deferves to be attended to. Toafted bread boiled in water till it is almost dry, then mixed with fresh

milk, not boiled, is an agreeable change. As the teeth advance, the diet may increase in its solidity.

As to the quantity, let the appetite be the measure of it; observing to fatisfy hunger, but no more, which may be thus managed; feed the child no longer than he cats with a degree of eagerness. In feeding, let the child be held in a stripe and the continue it would be with a degree of eagerness.

held in a fitting posture, and thus continue it until the florach has nearly digested its contents. The practice of violently dancing and shaking the child should be avoided, though moderate exercise is effentially necessary

Keep the child awake until it breaks wind after each time it is fed; divert it during the day as much as you can, and thus it will foon lay quiet all the night. Never awaken a child when it is afleep, for thus fickness and peevishness are often produced.

As foon as teeth appear, give the child now and then a piece of flesh mest in its hand to chew; but never give it

ABLATIO. To take away from the body whatever is useless or hurtful to it. In some writings it expresses the lessening of the diet with a medical view; also the interval betwixt two fits of a fever; and in chemistry, the removing any thing that needs not to continue in the procels any longer.

ABLEPSIA, ABLEPSY. Blindness, want of fight, rash-

nels, indifcretion.

ABLUENTIA Medicamenta. Diluting medicines.

ABLUTIO, ABLUTION. Awashing away; a washing off, or rinsing. In chemistry, it signifies the purifying of a body by repeated essuable of a proper liquor: this is done various ways by cohobation, circulation, &c. See Cohobatio, Circulatoria.

ABOIT, i. e. Cerufs. See Cerussa.

ABOMASUM. The name of the fourth ftomach of

a beast that chews the cud. The first is called venter, or rather ventriculus, the word used for it in Aristotle, bein xaxia. See Enystron. The second reticulum; the third, omafus.

ABOMINATIO. Some barbarous writers thus ex-

prefs fallidium ciborum, or loathing of food.

ABOLITIO, ABOLITION, or taking away; deftroying. ABORSUS, ABORTUS, ABORTIO; from ab, which, in composition, according to Martinius, implies defect, and orier, to arife. Aborior, intempetitive orior ut ab fignificet vitium. See Martinius in Aborior. ABORTION or MISCARRIAGE. The birth of a child before its due time; or, the destroying a child in the womb: termed also convulsio uteri, deperditio.

Miscarriages happen at any period of pregnancy, and from innumerable causes; most frequently in the third and beginning of the fourth month; but those which happen in the fixth or in later months, are more difficult

and more dangerous.

Women who are very thin, or very fat; women who have miscarried before, and who easily or without any particular inconvenience, during the time of miscarriage, or foon after, part with their burden, are most subject to this accident.

The causes are various: violent motions, frights, poifons, violent purges, an obstinate diarrhoea, the smallpox, and other acute discases, too much blood, great loss of blood, and not unfrequently an incautions use of the lancet: on this cause, see Dr. Wallis's Essay on Injudi-cious Bleeding in Pregnancy. Habitual miscarriages hap-pening at stated periods, without manifest cause, are very common among women of fashion, from these general causes of weakness, viz. indolence, laying long in the morning, and sitting up late at night: fear, grief, or in-deed whatever debilitates, may be a cause; longings not indulged, &c. In general, the causes may be reduced to what immediately affects the child, the placenta, the membranes, or the mother.

Whatever causes the death of the child, causes abor-

tion fooner or later.

If the membranes are too weak, they may eafily break, and fo prove a cause against which no help can be proposed. The funis may be too fhort, or the placenta separated or diseased, in which cases no care can prevent the ill effects.

As to the mother, besides the causes above enumerated, the two following are very common ones. The first is too great a stricture of the uterus; in which case it is not capable of a dilation fufficient to make room for the fortus as it increases in bulk: this is known by a great ten-fion and hardness of the belly, and violent pain therein. Bleeding, and whatever relaxes, are indicated in this cafe. The fecond is a relaxation of the uterus, which renders it unable to support the inofculations of the vessels of the placenta into itself, after the fœtus and placenta, &c. are grown to a certain weight; and of all others this is the most frequent. In these two cases, the miscarriage al-ways happens about a stated time of the woman's preg-

nancy.

An approaching miscarriage is to be apprehended by the following figns: the breafts grow flabby on a sudden; the loins have a painful weight, which reaches to the thighs; pains about the navel, head, and eyes; a gnawing at the ftomach; coldness in the extremities; when

any confectionaries. See Mofs on the Management and lie, and fometimes more like labour pains; fhiverings; Nurfing of Children. Cadogan. Armstrong. fainting; and, if it is past the time of quickening, the motion of the feetus is more languid, and lefs frequent than usual: as the miscarriage draws nearer being effected the pains in the loins increase, extending to the hips; the orifice of the womb begins to be dilated; a watery discharge from the womb is perceived, which becomes bloody, at length blood, pure or clotted, comes away. The most certain fign is the discharge of a sless-coloured flakey fubstance, which comes away with the waters: this is the tunica decidua, or spongy chorion, and when it peels off from the womb, and appears with the

waters, a mifcarriage is unavoidable. Healthy women, who have naturally a loofe belly, a moist uterus, and have brought forth large infants with eafy labour, who are lean, but not very fanguine, bear milearriages the best. But misearriages are ever to be confidered as more dangerous than natural labours; for more violence is necessary to discharge the imperfect for-tus than when it hath arrived at its full maturity; also the placenta is more firmly attached during the growth of the fœtus than when it is full grown; and, besides the danger of a fatal hæmorrhage from the adhesion of the placenta, the os tineæ does not fo eafily dilate, before the full period of gestation. If a part of the placenta is feparated, until the burden is delivered, the uterus cannot contract fufficiently to close the bleeding vessels; these hæmorrhages are extremely dangerous, and often fatal; mifcarriages are often attended with the most danger in the first pregnancy. Inflammation and laceration are fometimes the confequence.

In order to relief, in cases threatning a miscarriage, the attending circumstances must be carefully observed.

If the fœtus is dead, which is suspected by its ceasing from its ufual motion, a fenfe of weight in the bottom of the belly, which moves to which ever fide the woman lies, pains about the navel, loins, and belly, with uneafy, fenfations in the ftomach, an unufual coldness in the belly, and of the os tincæ, perceivable by the touch, hollowness of the eyes, and a loss of their usual lustre, swelling and dusky paleness of the face, &c. though the most, if not the only, certain fign is a discharge of feetid fanies from the uterus. In this case nothing can be prudently done, but the bufiness being left to nature, the exclusion will be by her duly effected.

In constitutions subject to this misfortune, be careful to avoid whatever has been suspected to cause it before, and also guard against every known cause that may possibly endanger the patient. In the first months keep the belly open with laxatives; if weakness do not forbid, bleed in the third month; if there is a fanguinary plethora, apparent weakness is no object to bleeding; the bark is proper as a strengthener, though bleeding may have been re-

quired.

If pains come on, after bleeding give tinch opii cam-

phorata, or tinct. opii cum infuf. cort. Peruv.

If an hæmorrhage attends the pains, befides the ano-dyne with the infuf. cort. Peru, and bleeding, give the pulv. ftypt. Helvetii 3fs. fingulis femi-horis. After a few doses this fymptom abates, and then each dose may be repeated at proportionably longer intervals.

If a cough attends, the pil. ftyrac. at bed-time, has a most valuable effect.

If acute difeases are the cause, their respective nature and cure are to be attended to.

If a tenefmus produces the danger, the enema ex amylo cum tinct. opii gt. xx ad xL. or a suppository, as follows, may relieve. R Sevi ov. ceræ. slav. & sp. cæti a p. æq. pulv. croc. Anglic. part. sext. totius.

When a tension of the uterus is attendant, all aftrin-

gents are improper; in this case the miscarriage must be promoted by bleeding and gentle opiates, for nothing will check the hæmorrhage here but emptying the uterus.

If the child is supposed to be dead, to attempt the restraint of the hæmorrhage will be injurious; and if the

miscarriage is so far advanced as not to be likely to be pre-

vented, medicines will be quite unneceffary.

As precautions to prevent mifcarriages during pregnan-cy, are not fo efficacious as those used betwixt a miscarriage and the next impregnation, the advantage of this in-terval should be embraced, the particular diforders should violent means have been used to expel the fœtus, convul-fions fometimes come on; pains in the belly, like a co-restored as far as possible: to this end cold bathing will morning, to the quantity of three or four half pints; their use mult be continued two or three months, and ex-ercise within the strength should be used at the same time.

Lime-water has been fingularly ufeful in this case, both in curing a disposition to, and preventing threatened miscarriages, in those who have often miscarried before. If in these cases the water was made fresh when used, and drank before the heat excited by the ebullition on quenching the lime was gone off, the efficacy would be the

greater.

Reft should be complied with, as foon as the fymptoms of a mifearriage appear; and, if no particular reasons for-bid, it is best to keep the bed till danger is past, however

Opiates with restringents allay the pain, and so remove the stimulus which promotes and increases the hamor-

Convulsions and Floodings coming on pregnant women, demand immediate help from art, to extricate the feetus from the womb; and though properly belonging to the article of midwifery, yet very naturally fall under this of

Either of these cases happening before or after labour comes on, they admit of no delay. However, in them both, there is the advantage of the waters to turn the

child in, when happening before delivery.

Convulsions. When convulsions come on in the beginning of labour, they are occasioned by the nerves of the os internum being irritated, and put on the stretch. When they come on after labour has gone on well for some time, their cause may be passions of the mind, long con-

tinued pains, &c.

A cure is uncertain when convultions come on in time of labour, except you can deliver the child; and as in fome cafes delivery is impracticable on account of the length of the neck of the womb, if the woman cannot be relieved by medicines, death must inevitably be the consequence. If then the convultions come on in the beginning of labour, bleed freely, and repeat the operation according to the firength of the woman and the violence of the disease. Empty the bowels with a clyfter; if time admits apply a biliter on the nape of the neck and on the extremities, and give afa feetida, &c. If the fits go foon off, and at the intervals, the fenfes are entire, also if there is no ferror, wait the events but if there is compiling the pulse. ver, wait the event; but if there is vomiting, the pulse be low, the patient comatofe, take the child away, and try bleeding, bliftering, and opiates. If the patient is convulled three, four, or five hours together, foams at the mouth, and the pulse is disordered, deliver if possible. If convulsions come on after the labour is in some mea-

fure advanced, they will have the fame effect as labour-pains, and the child will be delivered by them. If they have not this effect, if the head of the child is low enough for the forceps, use them. If the head of the child is jammed in the pelvis, and the uterus so contracted that it

jammed in the pelvis, and the uterus so contracted that it cannot be pushed up, nor the forceps used, there is no remedy but the crotchet, and opening the head.

If the convulsions continue after delivery, the lochia are commonly obstructed; in this case, bleed, blister, and apply to the belly a plaster made thus: R Gum. afæ fætid. 3vj. camph. 3ss. m. If the pusse fail, give fasfron, castor, &c. with suitable antispasmodic mixtures, and blister. If the pusse is full and throng, bleed: and is blisters are required, instead of the empl. cantharidis. R empl. stimul. (ex empl. lythare, cum gum, empl. canth. &c. ftimul. (ex empl. lytharg. cum gum. empl. canth. & gum. euphorb. aa p. æq.) ad plant. ped. applicand. If the convultions continue twenty-four hours, or more, after

delivery, the woman rarely recovers.

Floodings.] Floodings happening to pregnant women are very different in their effects, to are as differently to be regarded. Pregnant women have the mentes fome-times to the laft, but they are pale, thin, and do no harm. Those fluxes which do not require delivery, come on gradually, but generally with the usual pains of the menfitual flux attending; they are not continual; and, with due care, they cease. Those which cause miscarriage or death, break forth suddenly, and, in large quantities, they flow without ceasing, any otherways than as prevented by clots of blood now and then. In the first case, the ost times is not affected, in the latter it opens. the os tincæ is not affected, in the latter it opens.

In the early months, the causes are violent shocks, sud-

greatly contribute, if it is used at bed-time, or after the den or great frights, &c. but in the latter months, the sede; they should be drank at the spring, early in the cause: the uterine arteries pour their blood into the celluparation of the piacenta, in whole or in part, is always the cause: the uterine arteries pour their blood into the cellular part of the placenta; hence, when any of these cells are torn through, all the blood carried by them must be discharged by the os internum. The placenta adhering to the os internum may be the cause of slooding; in which the osling the discharge increases as the osling the property of these causes.

The figns of an approaching flooding are reftlefs pains like labour, pain in the eye-balls, troubleforme dreams; if the flooding is internal, the ostince will be ftopped with clotted blood, the belly will fwell, the pulfe fail and flutter, and faintness with giddiness come on.

Floodings are more or lefs dangerous according as preg-nancy is advanced, because the diameters of the vessels are proportionably enlarged. If the os tince is not open, there is no danger. Flooding preceding delivery is, for the most part, followed with a dead child: and generally a flooding in the first months is followed by a miscarriage.

If the flooding threatens speedy danger, attempt no-thing till the patient's friends are apprized of it, and in-sist on your endeavours. It is seldom that any manual affishance is given in the first sive months, for till after this time the os tincæ is but litte altered, and indeed the preg-nancy is often fomewhat uncertain; but afterwards the os tincæ opens, fo that if need be, the fœtus can be brought away by force. In latter months, if a flooding comes on, if at the fame time the pulse is tolerable, the colour remains, the lofs of blood not very confiderable, and if there are any pains which are likely to deliver, do nothing in a hurry, but rather wait the effect of the pains. If the discharge abates on the rupture of the membranes, pains come on, and all elfe feems well, wait; but, if the flooding continues if the pulie is low and unequal, if the strength fails the face grows pale, fainting and cold sweats come on, introduce the hand, and deliver by force; for in these cases there is danger of convulsions succeeding, and delay may haften them.

If death is not fo near, take as much time as fymptoms will permit: if called in time, suppose in the morning, the slooding just come on, the strength and spirits not yet failed, wait two or three hours, or till the evening, then the os tincze will be foftened by the longer difcharge, it will more cafily dilate, and the birth will be lefs difficult.

If the violence of the symptoms demand immediate help, proceed without waiting for pains, for they feldom return after the flooding is so violent as to cause fainting, or convulfions; nor must we wait for a confiderable dilatation of the os tincæ, which without pains is not to be expected; indeed the pains are the lefs necessary, as the hæmorrhage

affifts in relaxing it.

If flooding happens during the first fix months, bleed according to the state of the pulse, keep the patient still in bed, and though she is faint, cold, or low, give no warm cordials, for they increase the discharge in proportion as they raife the spirits. If a vomiting attends, give the neu-tral mixture, and such light food as passes soon into the circulation, such as broths, falop, milk, &c. Let these be given in very small quantities lest vomiting should be excited, but let the supplies be frequent. If costiveness offends, relieve by clysters that are barely laxative. If anxiety and wakefulness incommode, let opiates be repeated, at due distances, in small doses. The bark joined with opiates, and sometimes with pitter, also is near offendual. opiates, and fometimes with nitre, also is very effectual. The pulv. ftypt. helv. above-named, is also not to be omitted, and cloths dipped in cold water may be applied to the region of the uterus.

If this difaster happens in the seventh or eighth month, the danger is far greater than in the former months; for the diameter of the vessels are enlarged, and the neck of the uterus is long and rigid, so that if the flooding is vio-lent, the woman may be lost before the best helps can be of any use. In this case, as in the former months, it is the best not to attempt delivery, till a laxity of the parts is come on; for were we to attempt it in their rigid state,

we flould increase the flooding, tire ourselves, and exhaust the woman, and this without being able to deliver her.

The most dangerous time is the last month of pregnancy, for then the diameters of the vessels are at their greatest dimensions. If in this case the blood runs off in a full fiream, introduce the hand, break the membranes, and taking the advantage of the waters, turn the child, and bring it footling. If at this period a flooding happens,

break the membranes to restrain it, and allow time for

the labour to come on afterwards.

If during labour a flooding is caufed by a laceration of the placenta in delivering the first of twins, immedi-ately introduce the hand, turn the remaining child, and bring it away by the feet, then the uterus will contract, and the diameters of the veffels will be leffened : but if the flooding precedes the delivery of a twin, and then abates, let the other remain a little, and recruit the woman with caudle or jelly; for in twin cases the belly is vastly distended, and the vessels are very much dilated and full, and a fudden emptying of them may cause a syncope,

or even death.

The placenta is not only fometimes loofe, but also is fometimes fixed over the os tincæ, in which case delivery must be effected with all convenient speed. To deliver with safety when thus circumstanced, introduce one finger into the os tince, then two, and gradually the reft, until the whole hand is introduced; dilate the parts by degrees; then, if the membranes first offer, break them, and get the feet of the child, by which bring it away, and deliver the reft at diferetion. But if the placenta presents at the os uteri, 1st, you will know by the touch, for on introducing the finger, neither the membrane, nor the naked head is perceived; on the contrary, thick and foft flesh is felt, dillinguished from that of the child by being fofter, and also without form. 2dly, This case is always joined with a flux of blood, to the danger of both the mother and the child; therefore the birth must be haftened without waiting for pains; a finger must be introduced into the os tinex, and the placenta removed until the membranes can be reached, which done, tear them to come at the feet of the child: if you cannot push the placenta from the os tincæ, force your finger through its middle, and make way by dilating your fingers for the membranes to defeend; this done break them, and by the running off of the waters the uterus will contract, and gradually leffen the flooding: if on the waters being dif-charged the head prefents, endeavour to remove the pla-centa fo as to give way to the head, then the pains may bring forth the child; but if it is in a præternatural pot-

If the flooding happens from a blow, and there is a great difcharge in a little time, delivery must be hastened as speedily as possible; and if the hamorrhage abates not on fpeedily as possible; and if the hamorrhage abates not on the child's being brought away, the placenta must be hastened too. Remember that during delivery, an affistant should gently prefs the belly of the woman, and con-tinue the preffure a little while after the placenta is delivered; the woman must be supported by frequent small

vered; the woman must be supported by respect that quantities of caudle.

The floodings which happen after delivery are fometimes very dangerous; this kind is generally owing to the womb being fuddenly emptied, and so not having time to contract the diameters of the vessels, they remain open, and the blood by its own specific gravity pours out. The chief intention here, is to contract the uterus; to which and the present means is the application of cloths dipped end the properest means is the application of cloths dipped in vinegar, or vinegar and water: these should be laid on the back and the region of the womb. A hand may be placed on the belly, to prefs the uterus towards the pubes. But the greatest specific in this case is an opiate: it should be given in large doses, for if the woman can be once com-posed, if it be but for a few minutes, the stooding will almost certainly cease, and when it once ceases it rarely returns. In some of these desperate cases Dr. Wallis supposes the uterus and uterine vessels to be in a state of torpor, and therefore thinks in addition to the commonly advised remedies, a blifter applied over the lower vertebra of the back, and os facrum might be highly ufeful. See his hint given on this fubject, in his Notes to Sydenham's Works, Vol. II. p. 171.

To deliver a woman without pains, or to force labour, is as follows: lay her on her back with her heels upon the

bed, having affiftants to keep her fteady. The operator may be in any position that he finds most convenient; in the course of one labour he will generally find occasion to

or in the time of labour, and the patient loses not a great quantity in a floor space of time, the may bear it, and in the course of labour pains it will stop, and the labour will go on well. If the woman is plethoric, and not much weakened by the discharge; if the child presents fair, lard, or unfalted butter, he must gradually dilate the external parts, by introducing the fingers one after another, moving them in a rotatory manner; then begin to dilate the os internum, proceeding gently and gradually, refting at intervals both for his own and the woman's eafe: when the hand has passed into the uterus, he must break the membranes, but permit not the waters to run off before he has found the feet, and the child is properly turned; the feet fecured, proceed as in delivering by the feet. When the child is delivered, if the placenta adheres, but the flooding is not so violent as to render the bringing it away immediately necessary, opiates are the most likely means of promoting the separation and exclusion of it, by relaxing the parts concerned, and re-moving the stricture which always accompanies the pain: give the tinct. opii gr. xx. vel. syr. papav. albi 3 j. vel opii gr. j.

Though many later authors have written well on abor-tion, and fome moderns have added many improvements,

yet Hippocrates deserves to be read on this subject.

ABRASA. Ulcers attended with abrasion of part of the substance; or, ulcers where the skin is so tender and lax as to be subject to abrasion. James.

ABRASIO, ABRASION. The same as Aposyrma. A shaving away, a rubbing off, a superficial exulceration. From abrade, to rub off.

ABRASUM. The part abraded from the ulcer; or the skin, &c. that is rubbed off.

ABRATHAN. See ABROTANUM.

ABRIC. Sulphur.

ABRIC. Sulphur.

ABRODIETE TICUS, Abrodietical. Delicate or nice

ABROTANOIDES. A species of coral. See Ray's Hift. ABROTANUM, SOUTHERNWOOD, from account for the second seco alfo called abrathan.

The male and the female species are in use, though the college of London only directs the male. Dale reckons a third species, as being used in medicine. See ARTEMISIA temuifolia. Miller reckons up eighteen or nineteen different species.

The male species, ABROTANUM mas, is a shrubby plant, with woody brittle branches, numerous greyish green leaves, divided into flender fegments; and small, green leaves, divided into flender legments; and fmall, yellow, naked, difcous flowers, hanging downwards in clufters along the fides of the ftalks and branches. It is the artemifia foliis ramofifilmis fetaceis, caule crecto fuffructicofo. Linnæus. It is a native of open mountainous places in warm climates, particularly Italy. It flowers in July and August. In England it is raised in gardens from flips of cuttings, feldom producing feed, and not often flowers; the leaves fall off in winter, the roots and falks are personnial. and stalks are perennial.

The female species, ABROTANUM famineum, Cha-macedrys Chamacopariffus, is a bushy shrubby plant, all over hoary, with oblong slender leaves, composed each of four rows of little knobs set along a middle rib, and naked, discous, yellow flowers, standing solitary on the tops of the stalks. It is a native of the southern parts of Europe, flowers in June, and continues to flower till winter approaches, and holds its leaves through all the winter.

They are both chiefly used for fomentations, in which eafe the one may at any time be used for the other; they are powerfully discutient and antiseptic. Heister highly extols a decoction of either of them in fea or in falt water, as an antifeptic fomentation.

For internal purposes they are indiscriminately used, and are commended as antihysteric and anthelminthie; depending upon their being bitter, aromatic, and volatile; and Murray thinks they merit greater attention than has been bestowed upon them. But the male species being both stronger and less disagreeable, deserves to be

netrating bitterish taste, fomewhat aromatic; are moderately antifeptie, attenuating, diaphoretic, and diure-tic. They lole a little by drying, and are best if used when fresh. 3ij. of the tops may be used for a quart of in-

But little is obtained by distillation; spirit of wine brings over but little of the flavour, though it extracts a ftrong tincture. Six pounds of fresh tops afford about a dram of an effential oil of a bright yellow colour, whose odour

refembles that of the plant.

ABROTONITES, a wine impregnated with abrota-num. About one hundred ounces of one, to seven gal-lons of the other, are put together, and after standing a

lons of the other, are put together, and after handing a few days, the wine is fit for use.

ABRUPTIO, see ABDUCTIO.

ABRUS, a fort of a RED PHASEOLUS, or KIDNEY-BEAN, growing in Egypt and the Indies. See Ray's Hift. It is named also, Aracus Indieus vel Africanus;

They are also called Angola Semina. There are two kinds, one the fize of a pea, the other as big as a tare; both of a fearlet colour, with a black eye. The leffer are worn as amulets about the necks of children. It is also a name for the Glycyrrhiza Indica, the West Indian wild liquorice, a species of Glycine.

ABSCEDENTIA. Decayed parts of the body, which

in a morbid state are separated from the found.

ABSCESSIO, } an Abscess; from abscedo, to depart; ABSCESSUS, or, from abs and cede, to retire. A cavity containing pus, or a collection of matter in a part. So called, because hereby the parts which were joined are now feperated; one part recedes from another to make way for the collected matter.

Αποτεμα and αποτασις, used by Hippocrates, are translated by Celfus, abjeeffus, and fometimes vomica. Paulus Ægineta feems to limit the fignification of abfeeffus to fuppuration, by defining anoreus to be an abjects, or a corruption of the fleshy parts, muscles, veins, and arte-

The words equaman and apprount, fignifying to recede or retire, are used by Hippocrates with great latitude. He fignifies by them any critical removal of offending hu-mours, however discharged; also the change of one discase into another, as a quincy into a peripicumony, &c. See Apostema. But the present practice seems universally to consider an abscess as that tumor which follows a local seems and the seems and the seems are seen abscess. lows an inflammation, for almost all of them are the con-

fequence thereof.

The proper feat of abfeeffer is the cellular membrane. The matter in abscelles is formed by the heat of the part acting on the humour collected there and diffolving the adjacent fat; these two fluids are also concocted by the same heat. The formation of matter in abscesses, is the fame heat. The formation of matter in abjectis, is well deferibed by Mr. Deafe, in his Introduction to the Theory and Practice of Surgery, page 36. He fays, "The inflammation being now at the higheit, and the different feries of veffels loaded with fluids, ftill urging to the point irritated, the heat developed by the attrition between the folids and fluids, will, by rarifying the latter, diftend the former, and dilate the exhalent veffels; by which means there will be an exudation of ferous humours into the cellular and adipose interflices, whose texture in part will gradually be dissolved, the coats of the small vessels flough off, and the different feries of humours being broke down and fermenting, will form, by a new combination, a white, opaque, unctuous liquor, without any offenfive fmell termed pus. This matter, in circumferibed tumors, will occupy the centre; but, in extended inflammations, we often find many points of fuppuration, which running into one another, form large cavities and different finuses in the cellular and adipose membrane.'

The inflammatory heat continuing to increase, during three days, and that in opposition to the usual means, a suppuration will certainly follow. If the patient feels frequent shiverings, a formation of pus is certainly commenced. This shivering is produced by the absorption of some of the pus, or its thinner parts; but,

preferred. The female species is a better substitute for the artemisia than for the abrotan. mas.

The tops and the leaves of the male species have a penetre that the matter is inclosed in a cyst, or surrounded with an inflammatory matter, this absorption rarely or never happens. In the cellular membrane are lodged with an inflammatory matter, this absorption rarely or never happens. In the cellular membrane are lodged many vessels for the secretion and distribution of fat, and many veilers for the secretion and distribution of fat, and many other vessels pass through it in their way from one part to another. This membrane casily tumifies, and, being very slight, as easily divides, by which a cavity is formed, and in it is deposited all that constitutes the subfequent discharge. Farther, by the rupture of the cellular membrane, the parts which were connected are featured and their easile and the connected are featured. parated, and their tension removed, the many blood-vef-fels which before were compressed are freed, the blood circulates freely, the heat abates, and the part is lefs red, but gradually becomes more foft.

The progress of an abscess on the external parts of the body is generally as follows: the tumor increases, so does the heat, pain, and redness thereof; a pulfation is also perceived therein, a fever sometimes attends, which is increased every night: when the contents are all suppurated, and the pricking pain gives way, and an itching, with a growing numbrels, is complained of, the hardness of the part at length yields to the touch, and the skin burst-

ing, gives a vent to the contained matter.

An abfeefs should be carefully distinguished from a hernia, an aneurism, and from a varicous tumor.

If during the treatment of an abfeefs, the patient is fleep lefs and feverifh; if he breathes with difficulty and loaths his food; if the pus, when discharged, is ill-coloured, fetid, and fanious; if irruptions of blood or spongy flesh appear in the cavity of the ulcer; if faintings come on during, or after the times of dreffing, the prognostic is unfavourable: on the contrary, if these symptoms are absent, or but in a moderate degree, a favourable issue may be expected. By improper treatment a phlegmon is eafily converted into a sphacelus. Deep feated abscelses are fometimes difficultly difcovered by the touch; but as no confiderable suppuration can happen in the body without being foon after accompanied with a hectic fever, the flightest appearance thereof at once determines the case.

When suppuration is to be promoted, endeavour to cf-

fect the following intentions, viz.

18, To convert into pus the congested humours. adly, To affift the discharge of the matter when it is

duly digested.

3dly. To heal up the opening, or ulcer, for thus the abjects is denominated when the matter is discharged.

In order to the accomplishment of the first intention, avoid all repellents, for their use at this time may convert the suppurating tumor into a scirrhus, or other incurable induration; for this reason, camphorated spirit as a topic, and high cordials when the inflammation is internal, alike improper. In general, apply to the tumor fuch things as gently stimulate and moisten; such also as ob-struct the pores, and thus prevent the passage of the finer parts in their attempts to escape through the skin; to these ends the white bread poultice will furfice, if applied warm, and renewed as often as may be required, to keep up an equal heat, which will be every two or at most three hours. This application for its neatners, cleanliners, and freedom from offensive smells, is deservedly to be preferred; yet at discretion may be added a small portion of the roots of lilies, the ointment of yellow refin, or of the best gum galbanum. In slighter cases, where the part is not too tender, or in fome fluggish tumors with but little pain, a plaster of the gum galban. colat. may be applied alone, and renewed every four or five days; or, to expedite the efficacy thereof, a warm poultice may be laid upon it

twice in the day.

While externals are applied, the state of the constitution is not to be neglected; too much heat endangers a mor-tification, and with too little every attempt will be abor-tive. If the heat runs high, reduce it nearly to a state of health by bleeding and a cooling regimen. Avoid purges; but if costiveness incommodes, a clyster may be used. If a defective heat retards the suppuration, warming medi-

cines, and a cordial diet, are required.

For a due fulfilling the fecond intention, the whole of the tumor, or nearly so, must be converted into pus, before a discharge can be admitted; otherwise all that remains unsuppurated will digest with difficulty, and often
become a faulty ichor. Again, if a due discharge is not
obtained as soon as the pus is perfected, it putrises and

the matter fluctuating on the lightest pressure, and an abatement of the pain, heat, and pulfation in the

Abscesses are opened by either incision with the knife or lancet, or the caustic, but in general the first is to be preferred, for it is lefs painful than the cauftic, and does not bruife in cutting like the feiffars. The opening may be as far as the fkin is discoloured, or a circular piece may be taken out if the discolouration spreads. opening must be, if possible, in a depending part, though where nature points out, the operation should be performed. When the bad quality of an abfeefs is likely to retard its future incarnation, an opening made by a caustic best prevents the lips of the wound from growing callous. Venereal buboes, and some scrophulous tumors, if not in the face or neck, are sooness healed after opening with a caustic, and such of these as neither will give way to suppurating nor discutient medi-cines, are effectually destroyed by caustics, and the eschar soon is cicatrized. See the article ESCHAROTICA.

Many advise not to open critical abscesses before they are Many advice not to open critical abjective before they are digefled. Sharpe fays, that "Very little of the morbid matter is deposited in them before they are fully ripe, therefore till then should not be opened." It is certain that by a premature discharge, the ulcer becomes foul, and heals with difficulty.

When the knife is uled, if a nerve, vein, or artery is in the state of t

danger, let a director guide the incision, which is best begun on the lower fide, for then the matter is discharged most freely, and the operator least incommoded by it. If possible, its course should be according to that of the fibres of the subject parts: thus, if the skin is very near a nerve, the use of the part will not be injured by cutting it across.

As to the third intention, it may be observed in general, that when the opening and discharge are made, the case is confidered as a common wound, and the treatment is as directed in the article VULNUS. The first drefting may be dry lint, covered with pledgits of fost tow. Afterwards, if the part is tender, and the matter good, when the applica-tions are removed, be content without wiping it very clean. Pledgits that are spread with ointments need not be warm-ed, except the patient makes complaints thereof, and then hold them to the fire, but not fo long as that their furfaces will melt. Observe a proper posture which will favour the discharge. Repeat the dressings once or twice a day, as the quantity or the quality of the discharge requires, the feldomer they need a repetition, the fooner will the cure be perfected: and as the air offends not but by long exposure to it, all hurrying therein is quite unnecessary. Bell on Ulcers, Edit. iii. Page 54-93. Kirkland's Me-

dical Surgery, vol. ii. 49-62.

ABSCESSUS ABDOMINIS. An Abscess of the Belly. For abscesses in muscles of the belly, see INFLAMMATIO Mus-

culorum abdominis.

More internally, they are generally the effect of blows, or bruifes otherwife occasioned; and in bad habits, it is observed by Hildanus, that they are subject to great de-fluxions. The matter is apt to pass betwixt the muscles, forming finuous ulcers, as bandages cannot well be ap-plied to prevent fuch effects. The cold air particularly offends in cases of this kind. When the opening is made, offends in cases of this kind. When the opening is made, or the subsequent dressings are applied, the air in the room should be moderately warm. See Abscessus Mefenterii.—Ani. An abscess of the Anus. A large quantity of fat fills up the cavity on each side of the anus, and is the seat of this disorder there. The causes are various, as contusions, wounds, inflammations, difficult labour, hard riding, a dysentery, the veneral disease. venereal disease, &c. Abscesses sometimes are suddenly formed in this part, at others they advance very slowly. In the first case the appearances are in the beginning no other than those of a common boil, but the fymptoms foon increase, quickly proceeding to a more formidable state. In the latter, though the suppuration makes but little progress, the pain and tumor suffice to determine the nature of the complaint. The pus, whether it makes its way through the skin or through the intestines, is frequently fo tedious in its paf-

forms a fiftula, &c. or it will be absorbed, and cause a fage, that the adjacent fat is more or less corroded, and hectic fever. The time of opening is generally to be rendered fanious, whence finuses are formed of different known by the prominence observed being very thin, by shapes and fizes. Sometimes the maturation is extended on every fide, rendering the cure both difficult and un-certain. When abfeeffes in this part are left to themselves, they rarely fail to degenerate into fiftulas, and occasion troublefome callofities.

As foon as the tumor is formed, endeavour with all possible speed to suppurate it; and when this is in some degree advanced, procure a speedy discharge. To this end let the patient stand on the ground with his feet afun-der, and lean over a table upon his belly; then the operator introducing a finger into the anus, will perceive the matter in a fluctuating state, in which case, without waiting for the external figns of suppuration, make an open-ing into it with a knife: by prelling the finger in the anus on the abscess, and another on the external part, a judg-ment may be formed where to make the puncture; for, by the finger in the rectum, the pus may be preffed externally fo as to be perceived by the finger there. When the opening is made, endeavour to enlarge the wound as you withdraw the knife; and, for the better application of proper dreflings to the bottom, another incition may be made transversely. If the rectum is laid bare, an incilion must be made in it also, as far as such accident extends, in order to its re-union with the adjacent parts, for the regeneration of flesh is obtained with great difficulty on the surface of an intestine when deprived of its fat. When the matter furrounds the anus, the cure is hardly to be performed without an abfeiffion of all that is denudated. ee an extraordinary inflance of this kind in the Med. Muf. vol. iii. p. 251-257.

A proper opening being made, the dreffings, &c. are as in abjectfes in general. Though Actius observes, that when this disorder extends round the anus, while the wound is filling up, there happens a constriction of the circumjacent parts, and an obstruction of the passage of the anus; to prevent which he advises to introduce a canula there, and continue it till the cure is finished. But how far a good habit of body, with other favourable circumstances, may encourage our hope of success this way, the practitioner can only judge by the occurring circum-

stances, and his own experience.

When the cause is venereal, these tumors suppurate flowly, and without a gentle mercurial ptyalifm, a cure is hardly to be effected. See Kirkland's Med. Surgery, vol. ii. 201. — ARTHRITICUS. See ABSCESSUS Inteffi-norum. — AURIS. An abfeefs in the Ear. The fymp-toms attending an abfeefs in this part, have nothing peculiar, except that the pain is very exquifite. See OTALGIA. As to externals, little more can be done OTALGIA. As to externals, little more can be done than to keep the head moderately warm; and when pus appears, the patient may lay on that fide which favours the difcharge. With refpect to internals, proceed as in a fever, with a cooling and thin diet, which nourifhes but little, and keep the bowels moderately lax. An abfecfs ariting in the inner ear requires a peculiar treatment. Digettive and oleous liniments are carefully to be avoided, and in their flead the warm balfamies thould be introduced deep, as is convenient, into famics should be introduced deep, as is convenient, into the ear, e. g. pellets of cotton, or of wool, dipped in the effence of amber, the tineture of myrrh, or the balm of Gilead, may be used. — AxILL R. An abfeefs in the Arm-pit. Abfeeffes are often formed by injuries in the arm, hand, or fingers; fometimes a fever at its crifis lodges matter here, and when the fever is of a malignant kind these tumors suppurate but flowly. When ripe an opening flould be made with the caustic. This disorder when it terminates the plague, is usually called a bubo, which see. See also an Abscess in the Groin. — Calcis. An abscess of the Heel. The common causes of an abscess may produce it, but generally it is strumous. The principal object of particular attention is, that if there is a caries, the best method is to pass an actual cautery through a canula. Wifeman fays it faves much time, and that thus the caries feldom separates in the form of a scale, but moulders away insensibly with the matter.

— Capitis. An abscess on the Head. Wounds on on the head generally are the most speedily healed; when an abscess is brought to the state of a wound, the same advantages attend it, and the common methods fuffice

which passes through them, and is continued to the pericranium. Every where on the scalp, a caustic is the best for opening abscelles with, especially if the long confinement of the matter hath rendered the skull carious, for it makes fome way for the raspatory, which is always used, except where the sutures are: exfoliation here is very flow, therefore rasping is used, and

then incarnation can immediately proceed. Abscelles over the forehead are best opened by incision, but care should be observed, that the direction of the sibres may be followed, for a tranverse wound may cause the cyclids to fall over the eyes .- CEREBRI. An ab/ce/s in the Brain. Instances of this kind have occurred, and if the trepan is used early enough, the case ends well. ——
COLLI. An absects of the Neck. This part is affected with tumors of every kind, but generally the fcrophulous and encyfted occupy it. Abscesses here are apt to become fiftulous, but by proper compress and bandage this effect is often prevented. An opening in this part is best made with a lancet; but if the jugular vein is near, fome care is required not to wound it. — DIAPHRAGMATIS. An abjecfs of the Diaphragm. See INFLAMMATIO DIAPHRAG-MATIS. - DIGITORUM MANUUM & PEDUM. Abfeeffes of the Fingers and Toes. These are called paronychize, whitelows, selons, &c. and are at the ends of the singers and toes. Abscels in the singers are generally strumous. See Paronychia. — Dorst & Lumborum. An obscels in the Back and Loins. These are generally of the strumous kind; but, when not, they are often fatal. The matter is usually deep feated, and the bones are injured by it before a suctuation can be discovered; for want of aid the discharge is made internally, and then the patient

As foon as it can be discovered that the contents are digefted, however deep, apply a caustic, and continue it till the remission of the pain certifies the effect thereof being at an end, cut out the efchar, which in this case is an inch or more in thickness, and then force out the matter by proper means. If a setid ichor is discharged, or the bore affected, wait with patience for its autolisian the bone affected, wait with patience for its exfoliation,

for here but little can be done to haften it.

An abscess sometimes forms itself under the quadratus lumborum, diffects the cellular membrane between the quadratus, iliacus internus, and the pioas, the matter running down into the thigh, paffes as far as the inner condyle of the os femoris, pointing there as well as in the loins; but, before this, the mifchief it hath done is not to be repaired; and, if an opening is made, the patient is likely to be deftroyed by the excels of the difcharge, whence it is doubtful whether to open it or no; but yet when the it is doubtful whether to open it or no; but yet when the patient is young, and his conflitution flrong, nature should not be despaired of. One symptom of this complaint is as follows: if the leg is firetched out, the patient complains of pain; if the toes are turned out, this pain is increafed, but a relaxed posture instantly procures relief. See Psoas. Kirkland's Med. Surgery, ii. 199. London Med. Journal, vii. 14. — GINGIVARUM. An abscess of the Gums, also called Parulis, a Gum Boil. These tumors are very painful, the inflammation is often more diffused than inflammation in other parts, and more or less attended with a feedling in the cheek, or perhane the whole attended with a fwelling in the cheek, or perhaps the whole face. The tooth-ach, the general causes of inflammation, a carious tooth, &c. are the causes of this complaint. Mr. John Hunter observes, that gum boils seldom arise from any other cause than inflammation in the cavity of a tooth, the effect of which extends all over the face, but more particularly in the gums; that fometimes this discase originates from a disease in the socket of the tooth, or in the jaw without any connection with the tooth. Through bad management, or neglect, they are apt to degenerate into fiftulous ulcers. During the inflammation, to affuage the pain, let the patient hold a decoction of barley, or of camonile or elder flowers, or other anodyne ingredients, conflantly in his mouth, for the patient of fpitting it out, and taking fresh quantities, as may be needful to keep up an equal degree of heat, or, perhaps, the suppuration cannot be avoided; in which case let figs be split and held in the mouth upon the boil, and white bread poultices, wrapped in thin linen cloths, ap-plied hot externally upon the cheek of the affected fide;

for the cure. When absceles are seated on the futures, and as speedily as is convenient, let the absceles be opened, they may be troublesome by inflaming the dura mater for the contained matter foon corrodes the adjacent parts, and affects the bone. The discharge being made, the poultice may be continued a little longer, and the mouth washed three or four times a day with warm wine and honey of roses. If a bad tooth is the cause, it must be extracted before any attempts are made by medicines, or at leaft, as foon as the discharge of the abjects will permit. If the ulcer degenerates into a fiftula, inject warm wine and honey of roles into it; and if it is suspected that the bone is carious, add to this injection a little of the tinct. myrrh, or of the vin. aloes. If these methods fail, proceed as for the exfoliation of a carious bone. EPULIS and PARULIS. On this fubject, fee Mr. John Hunter's Natural Hiftory of the Human Teeth, part ii. Bell's Surgery, iv. 203.—GLANDULÆ LACHRYMALIS.

Abfeeffer in the lachrymal Glands. Whatever may be the caufe of these abfeeffes, those to which they usually are attributed feem not to have any fuch effect; they usually end in a fiftula lachrymalis, to prevent which, an open-ing must be made into them: for the performance of which Mr. Sharpe hath given very ample inftructions in his Treatife of the Operations of Surgery, and as this is fo generally possessed, the reader is desired to have re-course thereto for the needful instructions, and also to WALLIS'S Nofologia Methodica Oculorum. — HEPA-TIS. An abscess of the Liver. A suppuration is pro-gnosticated if an instammation continues in the liver more than three days; if the pain remits, and is followed by a pullation in the fame place, and if thiverings come on, with a continuance of an icterical colour; foon after which a tumor is perceived in the region of the liver, and a fense of weight also; a hectic fever follows with thirst, and an extreme feebleness. Aretæus observes, that a pain generally extends to the throat, and to the extremity of the shoulder, and a dry, but not very frequent cough, afflicts the patient. He farther remarks, that this diforder is fometimes miltaken for a tumor of the peritonzum, which latter is more irregular, and is not circumferibed by the limits of the hypochondrium.

The confequences of an abfeefs in this vifcus are:

1st, It is corroded and consumed. In this case, after a tedious icherical walting, a flow fever, great anxiety, a fanious and foetid diarrhoea, &c. the patient dies.

2dly, The abfeefs breaks inwardly, and discharges a sanious pus into the belly: thus the rest of the viscera become putrescent, a confumption of the whole body hastily advances, and an afcites, &c. ufher in death to close the wretched fcene.

3dly, The same fort of pus passes by the biliary ducts into the intestines, and regurgitating into the stomach, causes various coloured and offensive vomitings; or passing downwards, produces a violent diarrhoea. Acid and acefeent fubstances may palliate for a time, but the end

is always fatal.

4thly, The ichorous matter passing through the ramisications of the vena cava into the blood, procures fymp-toms the most formidable, the functions foon are diffurb-

ed, and the diforder only ends with life.

5thly, The tumor may adhere to the peritonzum, and form an external abfecfs, evident both to the fight and form an external abfecfs, evident both to the fight and touch. Here alone is any hope to perfect a cure; a caufitic may be applied, and left to feparate: for, as is observed by Aretæus, an incision is not safe, because it endangers a sudden death by hæmorrhage, which in the liver cannot be restrained. He farther says, "If it is necessary to make a perforation, introduce a red-hot iron as far as the sussemble which will cur and cauterize together." The same pus, which will cut and cauterize together." The fame author farther remarks, that "If the pus is well condi-tioned, and the symptoms soon sublide, the patient will recover; but otherwife this cafe is also fatal in its

othly, and laftly, Arctæus again informs us, that if the tumor does not suppurate, the excrements have an offensive and putrid kind of odour; the food passes crude and undigested, because of the weakness of the stomach and of the intestines, for the liver, so disordered, sends forth a too desective bile to assist the digestion; whence some are afflicted with a sharp corroding heat, and are worse and worse every day, and death is soon their delivery. Some recover from both the dysentery and the absense, but a dropfy cuts them off. But if thefe fymptoms remit,

BUBO. If opened with a knife, be careful not to wound the inguinal artery. In venereal cases a caustic is the best for opening them, as it dissolves part of the induration which too often remains after the greatest part is suppurated, and also assists in digesting the remainder. If absceffes in the groin, or in the arm-pit, are from the crifis of a fever, open them with a cauftic, and keep them running till all danger from the fever is over. In glandular parts all that is hardened should be perfectly diffolved; for inftances have occurred of cancers proceeding from remaining indurations. — INTESTINO-RUM. An abfeefs in the Intestines. When an abfeefs in the intestines is discharged, the case is sometimes mistaken for a dysentery; indeed, if the exulceration continues long, its treatment will be the fame as in the dyfentery, though at the first the methods are far from similar. Before an abjects is formed in these parts, there is always a throbbing pain felt near the part affected. At the beginning of the fuppuration there are unequal fhiverings, which increase and remit; also a fever, with an ex-acerbation of the symptoms in the evening. When this accident follows an inflammation of the bowels, it begins in about four days after the attack of the inflammation, at which time a flivering comes on, which extends through the whole body, and an obtufe pain, with a fenfe of weight, is perceived by the part affected. After the pus is quite formed, the fymptoms abate, and the pain nearly ceases, till the time of breaking approaches, and then the pain is renewed, and sometimes the belly is violently conflipated; after the discharge, a quantity of aqueous pus is thrown out by shool. See Actius Tetrabib. iii. ferm. i. cap. 42. In about fourteen days the pus makes its way into the cavity of the belly, and produceth inconveniences fimilar to those arising from a discharge of the like kind from the liver: or, passing into the intestines, it runs off by stool. In this case, entire membranes are discharged, and a consumption often follows.

If, on the first attack the means commended against an inflammation of the intestines fail, little more is to be done than to supply the patient with emollient and gently detergent broths, until by the continuance of the excretions the dyfenteric state is arrived, when the pro-

cedure is as in a dyfentery.

Mufgrave, in treating of the irregular gout, observes, that fometimes a gouty dyfentery degenerates into an abjects in the bowels. Celfus indeed observes, that large abscesses in these parts are not seldom the consequence of fevers and pains, especially of pains in the belly. Gouty abscelles are formed in the exsophagus, stomach, and guts, and that without giving any reason to suspect them, till they break. However, as foon as the difcharge is made, the patient should avoid all exercise. To dilute and to deterge, let the following be used for common drink: R Hord, perlat. 3 fs. rad, confolid, min. 3 j. coq. in aq. puriffim. 16 iij, ad 16 j. & cola. If the purulent difcharges are excellive, moderate them with fmall does of the tinct. opii; in case of faintness a glass or two of wine may now opii; in case of faintness a glass or two of wine may now and then be allowed; avoid all acids, acrids, and high cordials, and let the diet chiefly consist of jellies, agglutinating broths, &c. at last, when all appearances of purulency have vanished, the following may be used both to restore, and to prevent a relapse. R Gum. myrrh. pulv. gr. v. balf. Locat. q. f. f. pil. iij. bis die repetend. cum haust. decoct. supra prescript. See Warner on the Gout. ——ISCHIATICUS. An abscess in the Hip. When an abscess forms itself in the focket, or the head of the thigh-bone, there is usually a great swelling and lameness. thigh-bone, there is usually a great swelling and lameness in the hip, and in time a collection of matter is made here in the hip, and in time a collection of matter is made here tive medicines, and fuch things as are used in obstruc-also; however, this is not the only way it proceeds, for instances have occurred, in which it hath passed through

and the pus in the stools becomes white, and of a good confishence, and the patient can again digest his sood, a good hope may be maintained in favour of his doing well. But as the best criss, he notes that by urine, for thus the least offence is given. See Bell's Surgery, v. 387. Kirkland's Med. Surgery, ii. 185. London Med. Journal, vii. 22.—INGUINIS. Anabsecs in the Grein. These in this part, like those in the arm-pit, are sometimes occasioned by injuries done to the parts below, as in the same, legs, or toes; a pestilential sever may be the cause, but the venereal disease is the most frequent. See Buso. If opened with a knife, be careful not to wound hips, apply a large caustic on the part large enough to hips, apply a large cauftic on the part large enough to admit of five or fix peas, and keep up the discharge there-by as long as it appears to be necessary. Alas! though this method, if early used, is much to be depended on, like many other valuable means, it is usually applied too late. See Psoa. — Lumborum. See Abscessus Dorfi & Lumborum. — Manuum. Abscesses on the Hands. For the most part they are strumous; when not, the common methods suffice for their removal. — PROPE MAXIL-LAS. Abfeeffes about the Jaws. Besides the common causes, a carious tooth, the tooth-ach, an injury done to the socket of the jaw in extracting a tooth, &c. may produce an abscess in these parts. Abscesses under the chin are frequently found in children, but they easily give way to the common methods. The conglobate give way to the common methods. The conglobate glands under the jaws are very fubject to suppura-tion, and are often mistaken for strumous swellings, but they differ greatly from them. The strumous kind are contained in a cyst, which requires to be deftroyed by escharotics after the matter is discharged; but these are managed and cured with ease by the ordinary methods of digestion. — MEDIASTINI. An abscess of the Mediastinum. In such situations there is but little to be done for the relief of the patient; however, it is obferved by feveral practitioners, that in the venereal difease this diforder is peculiar and frequent. See Kirkland's Med. Surgery, ii. 183. — Mesenterii. An abscess of the Mesentery. Suppurations in this part are not suspected by many, because neither heat nor pain are always perceived in it; but these symptoms, though commonly attendant on, yet are not effential to inflammation and suppuration, on the sensibility of the parts these depend. It may on the fensibility of the parts these depend. It may be observed, that pus is no where more readily formed than in parts that are every where covered with fat, because the fat itself, in some degree, conduces thereto. Abscesses in the mesentery are far from being rare, and are generally to be discovered by a continual heetic fever, an opprefive uneafines in the belly, a discharge of a sanious matter by stool, and sometimes pain and heat in the intestines. The sanious matter is also not unfrequently absorbed by the veins, and being mixed with the blood, is conveyed to other emunctories, as the glands of the trachea, the kidnies, &c. Hence large imposthumes of the mefentery are often accompanied with difcharges of at the fame time no injury hath happened either to the lungs or to the kidnies. If the abfeels is feated in a place lefs fit for the exerction of its contents, very troublesome gripes, resembling a colic, are produced: if the matter is discharged into a cavity of the belly, it produces a gangree in the parts it touches. Hording Bartholius grene in the parts it touches, Horitius, Bartholine, and Tulpius, giving instances of the pus being emptied into the cavity of the intestines, and so discharged by stool; but notwithftanding all these circumstances, for the most part the diagnostics are very obscure; nay, these abscesses have been unsuspected, and diffection after death hath have been unfulpected, and diffection after death hath alone given any notice of them. If these fort of tumors are suspected, they must be diffinguished both from an inflammation and a scirrhus. In general, the prognostic is dangerous; for if the abscess breaks and discharges a very putrid matter into the belly, sudden death follows; if after the rupture the ulcer is not speedily cured, it acquires a bad quality, and induces a gangrene, a dropsy, or a consumption.

If this complaint is manifest, and the tumor can be perceived, emellicuts may be applied externally and in-

perceived, emollients may be applied externally, and internally may be administered aperient and gentle purgacompanions of a cancer here, or in fome other glandular

part. Riverius fpeaks largely and well on this fubject. See his Prax. Med. lib. xiii.—Narium. An abjess in the Nestril. Ozema. These, from the pain they occasion, are exceeding troublesome. If in the inflammatory state they can be removed by bleeding, purging, blistering the back, &c. much trouble to the patient will be faved; if, in spite of all, fuppuration advances, emollient injections may be of all, suppuration advances, emollient injections may be thrown up the affected nostril, and a warm cataplasm laid upon the nose. Wiseman observes that the matter when digested is very tough. See Bell's Surgery, iv. 76. Pearson's Principles of Surgery, i. 255. White's Surgery, 265.—NYMPHR. An abscess in the Nympha. See Ala.—Oculi. An abscess in the Eye. From the small-pox most frequently, though from other causes this accident sometimes happens. When the seat is in the transparent part of the cornea, it is discovered by the peculiar whiteness of its appearance. When it is in the opake part of the cornea, the eye is swelled, but

the opake part of the cornea, the eye is fwelled, but more particularly fo where the abfcefs is feated. If its feat is deeper, the first evidence of its existence is generally the extravalation of its contents in the aqueous humour.

Those on the transparent cornea, are generally cured by cautiously opening them with the point of a lancet, carefully avoiding the pellicles of this coat which lay beneath. In the other two kinds there is great danger of losing the fight, for they discharge themselves into the anterior chamber of the eye, though fometimes a cure is effected without any remaining inconvenience. When the mat-

ter of these diffuses itself so as to spread over all the pupil of the eye, then is formed the hypopyon; if only a part of the pupil is covered thereby, the matter forming itself into a speck like those at the bottom of our nails, it is call-

ed an onyx. Heister, in his Surgery, gives a different

account of the hypopyon and the onyx.

In the cure of the chemofis, first use remedies to resolve the inflammation; if these fail, proceed as follows. While the contents of the abscess are yet not dispersed, but extend into the hole of the pupil, place the patient fronting a good light, with his head laid on the back of an eafy chair, then make an incision into the transparent part of the cornea, under the hole of the pupil, taking care that the point of the lancet does not touch the iris, which lays behind the pus; make the aperture long enough to give a free vent, then gently inject a little warm water therein. Afterwards apply a comprefs, wetted in a collyrium of rofe-water, well mixed with a little of the white of an egg; keep the compress constantly moist herewith by fprinkling it from time to time, and drop some of it, three or four times in the day, in the orifice on the cornea. Some days after the first discharge, a fresh col-lection of pus now and then presents itself, in which case introduce a fine stillet into the incision, in order to its paffage outward, and proceed as at the first. See on these subjects Wallis's Nosologia Methodica Oculorum.

Ossium. An abscess of the Bones. Observations in practice prove, that not only in the cellular parts near the joints, but also in the middle cavities of the large bones, insummations have decenerated into absolute. bones, inflammations have degenerated into abscepter. The observation of Ruysch, in which he says, that he found in the middle cavities of the large bones, round boney pipes, separate from the rest of the bones in which he faw them, may be referred to this article. See Abscessus Periofici. — Palpebræ. An abfcefs in the Eyelid, when externally fituated, itrequires no peculiar management different from abfeeffes in general, except that in opening it when fituated near the cilia, great care is required not to enter the lancet any deeper than is barely necessary to evacuate the absects; if the edge of the eyelid is cut, an incurable wateriness is endangered. direction of the incision is the fafest in the course of the orbicular muscle. An absecs fituated on the inside of the eye-lids may be opened with a lancer, and then washed with brine, or other proper collyrium.—
PANCREATIS. An absecs of the Pancreas. This complaint is the most common in fcorbutic habits. Rio-Inn fays, that its prefence is probably gueffed at by is absolutely necessary to wean the child, and gradually a fense of weight in the region of the stomach, no divert the milk from the breasts. See Bell's Surgery, v. hardness nor tumor being manifest in the hypochon
396. Kirkland's Med. Surgery, ii. 160—175. Pearson's

and are only one amongst other scrophulous attendant symptoms. These glands are often found after obstructions in the abdominal viscera; also a difficulty death in a scirrhous state, and thus are frequently the of breathing from the compression of the diaphragm; and fometimes by preffing near the fide of the ftomach a tumor is perceptible, and then the preffure causes pain. Though for the most part the diagnostics are very obscuro Though for the most part the diagnostics are very obscure or uncertain, yet it may be observed that a hectic fever, long watchings, short sleeps followed by a sense of weariness, fainting, and cold sweats, are certain attendants when this disease is present. The cure is the same as in similar disorders of the other viscera. See Riverius's Prax. Med. lib. xiii. cap. 4.——PAROTIDIS. An abscess of the Parstid Giands, also called parstis. The parotid glands suppurate with difficulty; the less so when the general habit is disorced. real, fcorbutic, peftilential, or other affection attends. They are apt to become fiftulous; though when they arife in children, unattended by any other difease, there is no danger of ill confequences, and in fuch circumstances the best remedies are purgatives, mixed with fmall dofes of the calomel frequently repeated. In more advanced life, Trallian lays it down as a rule, that if called early to affift in fuch a case, the cure must begin with bleeding: and Celfus, with great judgment, proposes, that, "When the parotis great judgment, proposes, that, "When the parotis is unattended with any other disorder, the cure may begin with repellents and discutients; but, on the contrary, if any other complaint hath preceded or attends, suppuration must be immediately promoted." The management under suppuration is the same as in other fimilar cafes, viz. the Bubo, which fee, and Kirk-land's Med. Surgery, ii. 142. — Pectoris & Mamhand's Med. Surgery, ii. 142. —— PECTORIS & MAMM.R. An abjects of the Breaft. These are external and
internal; for the latter see Abscessus Pulmonum.
Externally this disorder happens, for the most part, to
women. Bruises sometimes are the cause, but generally,
a too active separation of the milk, or taking cold while
the woman continues to suckle. Inflammation of the
lungs and pleura often produces abjects in the breast,
externally, and upon the ribs, which prove fiftulous, and externally, and upon the ribs, which prove fitulous, and cariate the bones underneath. A frequent cause is from not letting the child fuck until two or three days after its birth; an early application of the child to the breaft, or otherwise employing the breafts before they are turgid with the milk, would in general prevent this complaint. Another cause is the use of astringents, &c. to repel the milk. If these absecties burst at the top, sinuous ulcers are fometimes the consequence; and this happens too from laxity in the habit, and a defective heat in the constitution. When inflammatory tumors happen in the breafts of pregnant women, or of those who are nurses, we ought to be very cautious in the use of repellents; in fanguinary habits, bleeding and opening medicines are necessary, with a cooling regimen. If such tumors do not very eafily and speedily give way, suppuration should be pro-moted, for this is the best way of securing against a scirrhus or a cancer.

ABS

The common white bread poultice, for neatness and efficacy, equals, if not excels, all others as a suppurant in their cases: it should be applied, and renewed as frequently as is necessary for keeping up an equal warmth, which will be every two or three hours, and continued till the abscess breaks of itself, and then we have only to enlarge the opening a little, if it be too fmall; a fmall opening is generally preferable to a large one, as it heals both fooner and more kindly: fome advise to make an opening during the state of inflammation, because of the pain which attends these tumors; but by these premature discharges fresh collections will be made, and thus may the whole breaft be wasted; or by repeated instamma-tions a scirrhous will be formed, which seldom fails to introduce a cancer. An absects here should be opened by incision, never by a caustic, only if the lancet passes near the nipple, if possible it should be directed femicircularly, both to avoid cutting it, or the areola, for thus the beauty of the part is beit preferved, and future fuckling not prevented.

It fometimes happens that in order to heal a prefent abfeefs, as also to prevent the formation of new ones, it

a difease exists, and that it has come on independent of any fymptoms indicative of pneumonic affections, with which the flate preceding suppuration is often joined: in which state if any good can be done, it must be then attempted, to prevent the formation of matter, as in cases where the other membranes of the cheft or lungs are affected with inflammation. — PERINÆI. An abfeefs in the Perinæum. An abfeefs if suspected to be forming in this part should, if convenient, be prevented, because of its troublesome effects; it retards, or totally prevents the discharge of urine; besides, by the nearness of the os pubis, those spongy bones may be affected, and consequences to be dreaded have been the event. If a fuppuration is actually begun, proceed as with other abfeeffes. See a fingular case in Le Dran's Observations. See Kirkland's Med. Surgery, ii. 253.—
Periostel. An absect of the Periosseum. This case is known by evident inflammation and pulsation in the part the force in the force. in the part, the fever, irregular shiverings, and parti-cularly an absence of the figns of resolution. As the fuppuration approaches and proceeds, all the fymptoms are augmented; but the principal fign is the irregular horripilation. Sometimes the diagnostics are obscure, because the quantity of matter collected, though productive of violent fymptoms, is too finall to raife a fenfible tumor, and in fuch cases the pain does not remit, though the pus is formed; beside, the matter gradually increasing in quantity, unless it corrodes the periodeum, it makes itself a paffage between it and the subjacent bone, and, thus by gradually feparating them, keeps up a pain of the most intolerable kind. An accident of this kind foon lays the bone bare, and corrupts it by destroying the vessels which nourish it. The pus becoming acrid, also corrodes the periosteum, and spreading through the foster parts produces of the loss where

the fofter parts, produces fiftulous ulcers.

When this diforder is manifest, a speedy discharge is to be aimed at, and the bone must be treated in the same manner as the skull when denudated. First make an incifion through the teguments only; for when the periofteum is corroded, the matter generally foon makes a way betwixt the mufcles, in which case it is a guide to the operator in piercing to the bone, which when laid bare, the remaining procedure will be as in deep abfeeffes, and when the skull is deprived of its perioranium.

— PLEUR R. An abfeefs of the Pleura. When this
is suspected, our utmost care is required to obtain a
discharge externally, to which end an opening must be made into it as early as possible, left it burit into the made into it as early as possible, lest it burst into the cavity of the breast, and form an emptyema. See many satisfactory remarks on this subject in Sharpe's Critical Enquiry, and in Le Dran's Observations and Operations. — Psoaddis sub Musculis. An absect under the Psoad Muscles. Mr. Potts observes, that this absects is generally formed in the region of the kidnies, that it growing too heavy, falls down into the groin, or some other part of the thigh. This absects is called psoas, from the tumor sliding in its fall upon the side of the psoas, or between it and the iliacus internus. It requires nothing peculiar in order to its removal. It requires nothing peculiar in order to its removal.

Pudenda. See Al a.

Pulmonum. An abscess in the Pudenda. See Al a.

Pulmonum. An abscess of the Lungs: it is also called a vomica. This disorder often grows without any previous complaint, and, rupturing suddenly, is the death of the patient. The unburst vomica is called ocult; that which is burst, open. The causes are many, particularly colds, inflammations, metallases of matter from other parts. See. inflammations, metaftafes of matter from other parts, &c. That an abscess is formed in the lungs is evident, if, after an inflammation there, shiverings are frequent, the cough grows troublesome on exercise, and after eating; if the patient can only sleep on the diseased side; if he frequently cannot lay down at all, but sits up without dar-

Principles of Srugery, i. 73, &c. White's Surgery, the cannot fleep, has a continual fever, and frequently an 441.—Pedum. Abfeeffes in the Feet. Of all the forts that affect these parts, the strumous are the worst, for in these instances the bones are usually affected; but absceptes of every kind are bad, as they are apt to form sinuous ulcers, and cariate the bones. The applications and general managements are here as in other cases.

—Pericardium. An absceptes of the Pericardium. Little has been said by authors concerning this subject, any further than diffections have proved that such a disease exists, and that it has come on independent of whole side of the lungs becomes a har of matter. whole fide of the lungs becomes a bag of matter, compreffes the found fide, and creates great anguish, which ends either with a rupture of the abjects, and a discharge of its contents, or with the loss of life. Hippocrates, in his book of Prognostics, describes this case very well. Aretzeus particularly observes that the patient is hoarse, beauty that the patient is hoarse. breathes short, speaks in a deep tone, the thorax is enlarged, yet feems too narrow for the redundant phlegm, the black of the eye is finning, and the white is extremely white, as if it was fat, the cheeks are red, and the veins of the face very prominent.

If the abfeefs is not deeply feated in the lungs it burfts into the cavity of the breath, and forms an empyema; but if it is deep, the rupture will be into the bronchia; if the orifice is finall, fo that but little matter is diffcharged at once, or if the quantity of all the matter is inconfiderable.

once, or if the quantity of all the matter is inconfiderable, and at the fame time the patient is ftrong, he coughs up what is contained in the lungs, and is fentibly relieved; but if the abscess is large, or its orifice wide, and a large quantity of pus is thrown out at once; or if the patient is weak, he dies the moment it breaks, and that is mostly

when it is leaft expected.

As a discharge into the bronchia is the safeth, the affistance of art is best used to solicit the matter this way, and to effect it, the patient should continually receive the vapours of warm water into his lungs. After this method is expected to have in fome degree loftened the lungs, let the ftomach be confiantly kept filled with any agreeable emollient liquor: thus the refiftance to the lungs being considerable on that side, the abjects and its contents will be pressed toward the wind-pipe, as there it will meet with less resistance, the sulness of the stomach will incline the patient to cough, which may concur to produce a good event. At a proper time, the cough may be excited by suffice a little vinesse up the cough or winding a little vinesse up the cough of the little vinesse up the little fnuffing a little vinegar up the note, or injecting a little into the throat; thouting, reading loud, or laughing, may answer the fame end; or by jolting in a carriage, when the ftomach is full, the abscess may burst. If on the evacuation of the offending matter the patient faints, the tharpest vinegar should be held to his nose. If the discharge is thin, brown, green, yellow, bloody, or of an offensive smell, and at the same time the pulse is outlet, and weak, the proposition in informatically but if the quick and weak, the prognostic is unfavourable; but if the pus is well conditioned and white, if the fever and cough abate, if the fweats go off, and the patient is, and con-tinues to grow eafier, if the expectoration gradually di-minishes, and urine appears of a more healthy colour, a good hope may be formed of a cure being accomplished by due care and perfeverance.

In the cure it is usual to administer the warmer balfamics, but they heat and irritate too much; instead of these, let the patient be frequently supplied with barley, or with rice cream; if the matter is tough, give the ox. scil. to affist the expectoration; a milk diet should steadily be persisted in; the bark may be given in small doses, gradually increasing them; and gentle but constant exercise, at first in a carriage, and then on horseback. After all, it sometimes happens, that when all seems well, the abscess fills again; and though it emptieth itself by the bronchia, yet a succession of moderate, and of ill health, fills up the remains of life. See Lommius's Observations. — RENIS. Anabscess in the Kidney. When an inflammation in the kidney suppurates, it is known by the following signs, viz. a remission of the pain, which is succeeded by a pulsation, a frequently returning horror, a weight and stupor in the part, with a heat and tension, the urine is purulent and social sometimes, and, at others, a mics, but they heat and irritate too much; instead of these, urine is purulent and foetid fometimes, and, at others, a whitifhpus is discharged with it, in which is nothing offenfive. If this suppuration continues some time, the whole if the patient can only sleep on the diseased side; if he frequently cannot lay down at all, but fits up without darand, in this case, a tabes renalis is frequently present; but ing to lean to one side for fear of the cough and oppression; if a small quantity of the instantant or matter remains

coagulated

and though in these cases the discharge ccases, the kidney shrinks into a withered state, and all complaints are ended at fome certain period; yet to haften this relief, diluting and gently diuretic liquors may be used, gentle laxatives and balfamics also, and probably the bark may much conduce to the expediting a cure. — SINUS MAXILLARIS. An abscess in the Maxillary Sinus, called the Antrum Highmorianum. Drake mentions this as a species of ozzena. It is known by a pain which is deposited in the cheek and a tumor there, on as a species of ozena. It is known by a pain which is deep-feated in the cheek, and a tumor there, on the outer and upper part; a discharge of offensive matter from the nostril of the affected side, especially on inclining the head to the side that is sound; sometimes the breath is rendered very difagreeable by the ca-ries produced in the teeth by this diforder. Mr. John Hunter observes, in his Natural History of the Human Teeth, part ii. that, "The pain in this disease is at first taken for the tooth-ach; however, in these cases the nose is more affected than is observed in a tooth-ach. The eye is more affected than is observed in a tooth-ach. The eye is also affected, and it is very common for people with fuch a disease to have a severe pain in the forehead, where the frontal sinuses are placed; but still these symptoms are not sufficient to distinguish the disease. Time must discole the true cause of the pain, for it will commonly continue longer than that which arises from a diseased tooth, and will become more and more severe; after which a reduction will be observed on the fore part of the which, a redness will be observed on the fore part of the check, fomewhat higher than the roots of the teeth, and a hardness in the same place, which will be considerably circumscribed; this hardness may be felt rather highly situated on the inside of the lip." The method of cure by drawing one of the dentes molares from the affected side was first proposed and practified by Drake, and his imrovement hath been continued with the happiest fuccess. Draw the last tooth but one; and if rotten, draw the next on each fide it, then through their fockets make a perforation into the antrum with a large awl; the matter being discharged, the cure may be finished by injecting a mixture of aq. calcis, tinct. myrrh. and mel rofæ. twice mixture of aq. calcis, tinct. myrth. and mel role. twice a day into the cavity, and retaining it with a tent. See Gooch's Cafes and Remarks, in which an extraordinary inftance is related, with the ingenious and fuccefsful management thereof. Mr. John Hunter proposes to effect the cure as follows: Ift, if the disease is known before the destruction of the fore part of the bone, make an opening through the partition between the antrum and the rose; or, adly, by drawing a tooth, as above: the the nofe; or, 2dly, by drawing a tooth, as above: the latter method he prefers. Bell's Surgery, iv. 209. Kirkland's Med. Surgery, ii. 150. — SPIRITUOSUS. The fame as ANEURISMA. — SPLENIS. An abfeels of the Spleen. This vifcus is rarely affected herewith, but when it is, and the suppuration is completed, for the most part it is easily perceived by the pressure of a singer; when this tumor is ready to break, the nausea and anxiety are very great. Sometimes, indeed, an absceps is formed on this part, and escapes all observation, on account of its exciting no uneasy security forms to the pressure of the pres fymptoms. Lommius fays, in his Medical Observa-tions, that an abscess in the spleen is attended with nearly the fame figns as the fame complaint in the liver: and Arctæus observes, that a dropsical kind of swelling attends the patient, his skin is of a blackish and greenish colour, he is reftlefs, breathes with difficulty, his belly is tumid with vapours, and there is a fort of a cough, by which but little is difcharged. When this kind by which but little is discharged. When this kind of absection but little is discharged. When this kind of absection but little is discharged. When this kind of absection but little is discharged. When this kind of absection but little is discharged. When this kind of absection but little is discharged. When some absection is unsupersonable in though when some away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some standard one; for the cutting away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called amputation; though when some standard one; for the cutting away of bones is called amputation; though when some little away of bones is called amputation; though when some little away of bones is called in many sense, and that a soft one; for the cutting away of bones is called amputation; though when some little away of bones is called in many senses, and that a soft one; for the cutting away of bones is called in many senses, and that a soft one; for the cutting away of bones is called in many senses, and that a soft one; for the cutting away an unsound part, and that a soft one; for the cutting away an unsound part, and that a soft one; for the cutting away an unsound part, and that a soft one; for the cutting away an unsound part, and that a soft one; for the cutting away an unsound part, and that a soft one; for the cutting away of bones i

coagulated in the minute folliculæ of the urine, it forms a basis, to which the sabulous matter, which continually is passing by it, will adhere, and gradually form a stone, and which also by the same means will be augmented.

When the abscess is burst, the urine becomes purulent: and though in these cases the discharge ceases, the kidney discountered that the continual discountered in the same discountered to the sam confined, that it can only escape downwards under the zygomatic process, and so points into the mouth on the outfide of the dentes molares, where when it hath advanced, it may be affifted by a puncture to discharge itself. Dr. Hunter observes, that when the pain hath been violent, and the fever excited thereby confiderable, he hath with advantage made an incision along the muscles; and he advises, when an inflammation is confiderable, that we open the part without delay, for we never can per-ceive any fluctuation there, as the fafcia is so tight. See Kirkland's Medical Surgery, ii. 133. — Testium.

Abscess of the Testicles. See Hernia Humoralis.

Tonsillarum. An abscess of the Tonsils.

Abscesses here endanger suffocation. In the beginning endeavour to obtain a cure by bleeding, purging, or bliftering between the shoulders, and such other means as the case may require, or discretion admit; but if, as fometimes happens, all means failing, a suppuration should take place, an incision or two may be made with a lancet into the body of tumor. Thus, by discharging some of the blood and humors before they are formed into pus, the dangerous degree of fwelling is prevented. It is never prudent to leave the matter till it is formed into perfect pus, but, at the lateft, the puncture should be made as foon as the appearance of digested matter can be perceived. It happens fometimes, that when the patient is on the point of fuffocation, a fudden fpontaneous difcharge gives instant relief; as foon as the tonfils have emptied themselves, they contract, and by the assistance of a gargle, made with the decoct. cort. ulmi & mel rose, a cure is completed in a few days. — UTERI. An abscess in the Womb. When an inflammation here begins to fuppurate, bladders of warm water should be applied over the part most aggrieved; frequent in-cessions are also to advised. Oribasius observes, that these abscesses sometimes discharge themselves into the cavity of the uterus, at others into the intestinum rectum, or into the bladder. Forestus says, that if the discharge is into the cavity of the womb, and is whitish, the patient may recover; but the ulcer con-tinuing, too often is productive of discouraging effects. Observe, when enquiry is made concerning an abscess
of any particular part, the reader will do well if he turns
also to what is faid on an inflammation and ulcer of the fame. Authors to be confulted on absects are Hippocrates, Aretæus, Celfus, Paulus Ægineta Oribasius, Actius, Actuarius, Hildanus, &c. and among those of later date, Boerhaave, Wiscman, Turner, Heister, Sharp, Dease, and Bell. — Vesicæ Urinariæ. An abscess in the urinary Bladder. An inflammation in the bladder is fometimes followed by an abfeefs. When this happens, it is known by an exacerbation of the fymptoms, and a fenfe of weight in the parts about the perinæum and pubes. In order to the cure, inject emollient fluids, mixed with warm milk, into the bladder, very frequently, to haften the fuppuration, and to folicit the difcharge into the cavity thereof. If the pus is not evacucated in due time, it acquires an acrimony, and corrodes the adjacent formula of the cavity thereof. cent parts, produces fiftulas, and other inconveniences. If the injections fail, there is no refource but that of an operation, which, though rarely required, two examples are recorded in Bonet Sepulch. lib. iii. ABSCISSIO, an Abscission, or cutting off any thing, or a part of it. From ab and feinds, to cut.

Apocope abscission is used in many senses, but mostly to

every purpose of bitters, the leaves of the absinthium vulgare are the best.

Botanists enumerate no less than thirty-two different

fpecies.

The forts in use are as follow:

1. Abfinthium Vulgare, called also absinthium latifoli-um, absinthium Ponticum seu Romanum officinarum, Bathypicron. It is the artemifia abfinthium vulgaris, foliis compositis multifidis, floribus subglobosis pendulis, re-ceptaculo villoso of Linnæus, who calls it artemisia absin-

COMMON WORMWOOD.

Wormwood is a perennial plant, with hoary divided leaves, firm woody stalks, which die in winter, fmall yellow discous flowers, hanging downwards along the fides of the stalks and branches. It hath also thick woody

The common fort grows in lanes and wafte places, hath large leaves, divided into feveral deeply indented fegments, of a whitish green colour above, and whiter underneath; they are broader than those of any other species; it flowers in June and July. When the feeds are ripened, it dies almost totally, except a little tuft, which endures

2. Absinthium Romanum, called also absinthium tenuifolium, absinthium Ponticum, absinthium minus. It is the artemisia absintbium Pontica tenuifolia, foliis multipartitis fubtus tomentofis, floribus fubrotundis nutantibus receptaculo nudo of Linnæus.

ROMAN WORMWOOD.

It hath numerous and finely divided dark-coloured leaves, hoary only underneath, the flalks are purplifh, and all its parts are fmaller than those of the other species. It is a native of Italy, some say of Hungary and Thrace; but as hardy and as eafily raifed as the other species; the

roots foon spread, and fend up new stalks in abundance.
3. Absinibium Maritimum, called also absinibium seriphium, absinibium marinum. It is the artemisia absinibium seriphium tenuifolia marina Narbonensis of Linnæus.

SEA WORMWOOD.

This is also called Roman wormwood, but very improperly. Its leaves are finely divided, and hoary all over; it grows in our falt marshes, and on the sea coasts.
4. Absinthium Alpinum. MOUNTAIN WORMWOOD. It is

also called artemisia, and genipi. It is procumbent, fine-leaved, and covered with a glossy filk-like down. It grows on the Alps, &c. but not used in England.

5. Abfinibium Valesiacum, called also absinibium seriphium, and berba alba.

MOUNTAIN WORMWOOD OF VALAIS.

It is erect, fine-leaved, and covered with a cotton-like down; the leaves are curled about the edges, are pulpy also, and of an oblong rounded figure. It grows on fandy roads in Switzerland.

All the species have nearly the same properties. The absinthium maritim. is less unpleasant than the absinthium vulg, even its effential oil is more agreeable than the oil diffilled from the other. This species is not so antiseptic as the common sort, but it is a better stomachic, and in this it differs but little from the Roman. The abfintbium Romanum is lefs difagreeable than either the common or the fea wormwoods, and is the most eligible of the three as a stomachic and corroborant; it agrees with the abrotanum fæmin. and with the flor. cham. better than with the abstrathium com. being not so stimulating; the abstrathium maritimum is often substituted for it. The two last named forts are not introduced into this country; but Haller informs us, that the absorbium Alpinum is bitter-ish, aromatic, and useful against intermittents: he also says, that the absorbium Valesiacum is aerid and aroma-

tic, but not bitter.

The common wormwood hath a strong smell, and is intensely bitter to the taste. These qualities are most remarkable in the leaves, which lofe part of their ill fmell by drying. The flowers are nearly as bitter as the leaves, but less naufeous; the roots are warm and aromatic, without the bitterness of the other parts of the plant.

The whole plant powerfully refifts putrefaction, hence it is a principal ingredient in antifeptic fomentations. It is useful in all cold phlegmatic disorders, and where there

antongst the most famous of the bitter plants, says Dr. is a defect of bile; it is a warm stomachic, but gives place Cullen, and has been used with much commendation for to more agreeable bitters, though its extract, made with water, is a very agreeable and fimple bitter, and is the best way of giving this otherwise offensive medicine. Taken in vinegar, it removes the oppression occasioned by eating mushrooms, and is an antidote against the poison of the white chamæleon, and of hemlock.

It is hurtful when the fibres are too tenfe; in fuch conflithtions a frequent use of it in wines, &c. produces a general wasting; the sight is particularly injured by it. It is destructive to bees, keeps insects from granaries, and

kills moths.

This herb gives out all its virtues by maceration, either to water, or to fpirit; but the watery infusion without

heat is the most grateful.

The preparations from wormwood now in use are not so numerous as formerly; the principal of them are as follow.

#### Extractum Absimthii.

Boil the dried leaves of wormwood in water, fupplying fresh water as required, until the herb hath given out all its virtues, strain the liquor through flannel, and evaporate it with a gentle heat to a due confiftence for making into foft pills.

This extract hath all the bitter of the herb, without its ill flavour; the water carries off in evaporating all the oil, in which the offensive flavour resides; whence, to save both trouble and expence, the liquor which remains after diffilling the effential oil may be faved, to obtain the ex-tract from, care being taken not to have used a dirty still, nor let the liquor remain in it long before it is taken out for the intended evaporation.

An extract made with spirit hath all the flavour as well as the bitter: but is now thrown out of the London Phar-

macopæia of 1788.

### Oleum Effent. Absinth.

Fresh wormwood leaves, moderately dried, when dis-tilled with water, give out their whole taste and odour thereto, and with the water arises their effential oil, in which refides their naufeous tafte and flavour, but none of their bitternefs.

In fome seasons it x. of this herb yields 3 ij. or more of its oil, in others #5 xx. will hardly yield 3 j. In rainy feafons, and in moilt foils, it affords its oil in the greatest quantities. In drier scasons the oil is more refinous,

and of a green colour.

This oil is extolled by Hoffman as an antifpafmodic and anodyne. From one to three drops it is given as an antispasmodic, or he dissolves 3 j. in 3 j. of the sp. vini. R. and directs fix or ten drops for a dose in any convenient vehicle. Boerhaave commends it in tertian fevers, thus, R Ol. abf. gt. vij. fac. alb. 3 j. bene triturat. & adde fal tartari 3 jj. aq. abf. 3 vij. m. Of this mixture he orders the patient to take 3 ij. two hours before the fit approaches, and to repeat the fame quantity every quarter of an hour, until the two hours are expired; but before beginning with this medicine the feet thould be bathed in warm water. He also orders this oil to be made up with the crumb of bread into pills, which are to be given two hours before each meal, to deftroy worms.

The oil of the absinthium maritim, is more agreeable than that of the abjinthium vulg. and it possesses all the virtues of the plant, this is also thrown out of the London

Pharmacopæia of 1788.

#### Conferva Abf. Maritim.

Take the tender tops of the sea wormwood, and pick from them all the harder part of the stalks; then beat them into a conferve with tripple their weight of lump-

This conferve should be made fresh every year; alone it is an ufeful medicine in fome cases where the herb is indicated, and deserves a place in the shops as well as any of the tribe.

## Sal Absinth. Salt of Wormwood.

It is made by burning the dried herb to athes, as in making other fixt alkaline falts. See the article AL-CALL.

The kali preparatum is now used for the fal absin-

thii, no formula being inferted in the London Pharma- forption in the internal parts, fee Dr. Hunter's Medical copecia of 1788, for this preparation.—And indeed no Commentaries; also observations thereon by Dr. Garner, fensible difference is manifested by their indifferiminate in the Med. Mus. vol. ii. p. 229, &c. use in practice.——Alpinum. See Absinthium. It ABSORPTIO. See Absorbere. is also a name of a species of PTARMICA. - CORYMB. ANUUM, and TENUIFOL. CORYMB. &c. GOLDEN CUD-- SANTONICUM INDICUM. See SANTONICUM.

ABSORBENTIA. ABSORBENT'S; from absorben, to drink up. All medicines which have the power of drying up redundant humours, either internally of externally, are thus denominated. These consist of sea-shells, coral, burnt hartshorn, crabs-eyes, chalk, boles, &c.

Under this class are included such medicines as are

called edulcerantia, for that term can only fignify that the animal fluids are by them rendered lefs sharp; and this is only effected by breaking off the points of their particles, or by fo abforbing them by foft and porous bodies that they cannot be perceived; increase of motion does the first, absorbent medicines do the latter.

dbsorbents are a species of demulcents.

The fixed alcaline falts, besides their absorbent virtue, being joined with acids, acquire other properties; for they incide and diffolve vifcid and tough humours, and by a gentle ftimulus either move the belly, promote urine, or become diaphoretic.

Iron, coral, bole, chalk, &c. have a degree of aftrin-

gency.

Abforbents are not convenient where a vifcid colluvies abounds in the ftomach, as is often the cafe in burning, bilious, and hectic fevers; but are very proper to prepare the body for evacuations when acidities abound in the first

If the intention is to abforb, conftringe, and ftrengthen at the fame time, give chalk, coral, oyiter or egg-shells; if to restrain a feminal flux, some prefer the cuttle-bone; if to loosen the belly, give magnesia; if to provoke urine, the crabs-eyes; if to promote perspiration, the burnt hartshorn; if to dissolve coagulated blood, the crabs-eyes

diffolved in vinegar.

The word abforbentia is also applied to several vessels in the human body, viz. the lacteals, which absorb the chyle; the cutaneous veilels, which admit of water from the at-mosphere, and from baths, &c. to enter into the body, and other veilels which, opening into a cavity in the body, either naturally or accidentally take up any fluids that are extravalated, and convey them into the circulating blood. The term is applied to the abforbent veffels, which are called alfo lacteals and lymphatics. See LACTEA Vafa, and LYMPHÆ Dučlus. The following kinds of abforption take place in our bodies, viz. the nutrition is abforbed take place in our bodies, viz. the nutrition is abforbed take place in our bodies, viz. from the inteftines, by veffels called there lacteals, which are the fame absorbents as are every where elfe; secondly, by bibulous orifices over the external parts of our bodies; thirdly, by the fame kind on the internal fur-faces of all cavities, as is evident from an afcites going

faces of all cavities, as is evident from an afcites going off from this abforption fometimes. Dr. Hunter fays, that abforption is folely the office of the lymphatics.

As to abforption through the fkin, let it be confidered that the use of baths, fomentations, &c. are in a great measure founded thereon, and also that they demonstrate how great a quantity of fluid may be received into the body this way. After rubbing the hand well, it hath, in a quarter of an hour, imbibed an ounce and a half of warm water; at the same rate then the whole body would have received fix or seven pounds. Dr. Munro, sen, of Edinburgh, says that the power of absorption lessens with our strength. Mr. Cruikshanks remarks, in Clare's Essay on Abscelses, &c. that they are absorbent veins which open into the cavities of the body is evident, when we consider that in an ascites the extravasated fluid is frequently received into the circulation, and then is is frequently received into the circulation, and then is difcharged by urine or by ftool. And, as Dr. Hunter hath observed, this matter is demonstrated beyond a doubt by the following experiment made on a living dog; an opening was made into the cavity of his belly, and three quarts of warm water were injected therein and fe-

cured; in about fix hours after he was examined, and not above four ounces of the water was remaining there.

Farther fatisfaction on this fubject may be received from what is faid on the power of the external abforption of the human body by Dr. Wikinfon, in the Medical Museum, vol. ii. p. 117, &c. And with respect to ab-

ABSTERGENTIA, from absterges, to wipe off, AB-STERGENTS OF CLEANSING MEDICINES. They are of the faponaceous nature, capable of diffoliong concretions formed of earth and oil, &c. which water, fimply as an abluent, cannot effect: they are also called *Detergentia*.

ABSTERSIVUS, Abstersive, cleansing, wiping away;

of the fame import with Deterforius.

ABSTINENTIA, ABSTIENCE. This, when duly regulated, is most useful to the sedentary, as a preventive of

ABSTRACTITIUS, ABSTRACTITIOUS. Thus the native fpirits of aromatic vegetables are called, to diftinguish them from spirits produced by fermentation. ABSUS. The EGYPTIAN LOTUS. See Raii Hist.

ABUTILON, an Arabic name for the YELLOW MALLOW; of which Miller enumerates fixteen species. See ALTHEA

THEOPHRASTI, &c.
ABVACUATIO, or Abevacuatis. See Apocenos.

ABVOLATIO, ABVOLATION, flying away.
ABYSSUS, ABYSS. In the chemical language this word fignifies a receptacle for the feminal matter from

word againes a receptacle for the leminal matter from which all things are formed. Others use the word for the first matter of which all things are formed.

ACACALIS, a shrub bearing a papilionaceous flower, and a siliquous fruit, called also kirmesen. Hefychius explains examples to be the flower of the Narcissus. Raii Hist.

ACACIA, from axaca, to sharpen. The EGYPTIAN

THORN, OF BINDING BEAN-TREE.

Several species are enumerated by botanists, but the

two forts uled in medicine are, I. Acacia Vera, called by Caspar Bauhine acacia foliis feorpioidis leguminofæ; and by others, acacia vera Ægyptiaca; and fpina Egyptiaca. It is the mimofa nilotica, or mimofa Egyptiaca, fpinis ftipularibus patentibus, fol. bipinnatis partialibus extimis glandula interfitinctis flore luteo, fpicis globofis pedunculatis of Linnæus.

The TRUE ACCACIA OF EGYPTIAN THORN.

Acacia Germanica, called also prunus sylvestris. It is the prunus spinosa, or prunus sylvestris spinosa, fol-lanceolatis, pedunculis solitariis of Linnæus.

The GERMAN ACCACIA, or the GERMAN BLACK-

THORN, OF SLOE-TREE.

The Egyptian thorn produces the true gum arabic. It is remarkable that the leaves and flowers of the black thorns are purgative, though the juice from the other

parts is binding.

The acacia used in medicine and brought from Egypt, is a mild, fubaltringent, gummy fubstance; we receive it is a mild, subattringent, gummy substance; we receive it in roundish pieces, wrapped up in bladders; it is of a blackish brown colour outwardly, but of a tan colour inwardly; of a hardish consistence, but not quite dry. Lemery says, that "it is made, by expression, out of the fruit of the Egyptian thorn, and that either ripe or unripe: from the ripe fruit there is a black juice, from the unripe a red or yellowish one, and of a sweet scent; and that this last is what is intended by Dioscorides." It hath no smell; applied to the tongue it soon softens, is of a moderately rough but an agreeable taste, which is followed derately rough but an agreeable tafte, which is followed by a fweetishness: it totally dissolves in water, so if any part is unaffected thereby, that is a fradulent addition; rectified fpirit diffolves but very little of it, and in this it differs from most of the vegetable astringents, for they generally give out their virtue to spirit of wine as well as

The German acacia is the infpiffated juice of the German wild floes; it is of the fame nature as the true fort: but in England, the infpiffated juice of unripe floes of our own growth is the general fubfitute; it is harder, heavier, darker coloured, being almost black, and sharper tafted than the true fort.

Succus Prunorum Sylvest. sive Acacia Germanica.

Over a very gentle fire inspissate the juice of unripe

The dose is from 9 j. to 3 j. See PRUNUS SYLVES-

ACACIA ALTERA TRIFOLIA, a species of laburnum, called Cytifus spinosus; for that called gloriosu, see BONDUCH INDORUM; -acacia gummi, fee ARABICUM GUMMI; -Indicana, fee TAMARINDUS; -Malabarica globofa, fee Intyia; -orbis Americani, fee Poingiana; -Zeylanica, fee LIGNUM CAMPECHENSE.

ACACIA FERREA, an iron fpoon. -· Acacia is also a

name of the courbaril.

ACACOS, from a negative, and xazos, bad. It is applied to diffempers that are more troublefome than dangerous: also to the aphthæ of children.

ACAHI, ALUM WATER.

ACAID, VINEGAR.

ACAJA, also called prunus Brafilienfis. It is a large tree growing in Brafil. It produces clusters of yellowith white flowers, which are followed by yellow plums, with a large stone in them. The leaves are acid and astringent, and are an agreeable sauce with meat; the wood is light

and are an agreeasie fauce with meat; the wood is light as cork, and of a red colour; the buds and tops are used as pickles. Raii Hist.

ACAJAIBA, or ACAIAIBA. The acajaiba is also called pomifera & prunifera Indica, anacardium, cajum, cassu, cajou, cajous, acajou, & kapa mara. It is the anacardium pruniferum Indicum, nuce reniformi of Linnæus. The Brasilian name for the anacardium

occidentale.

The Cajou or Cassu-TREE.

There is but one species yet known, and this is the ACAJOU, or CASHEW NUT, fo common in America, and in the West Indian islands. It produces its fruit in August and September, except in Brafil, where it is a native, and there it flowers in these months, and bears its fruit in December, which, when roasted, is as agreeable as an almond. If you bite the whole fruit when raw, it ex-coriates the mouth; therefore it must first be cut open, dipped in water, and fprinkled with falt.

The acrid oil in the fhell deftroys tetters, ring-worms,

the Guinea-worm, &c. The painters use it to make their

black colouring durable.

The tree when wounded yields a gum, which refembles

the gum arabic. Raii Hift. ACAJOU. See ACAJAIBA. It is also a name of the

anacardium occidentale.

ACAJOUANUM LIGNUM. This is not the wood of the tree that bears the acajou nut. It is mentioned by Geoffroy as being of a red colour, and never affected by worms, therefore fit for furniture.

ACAJUIBA BRASIL. See ANACARDIUM.

ACALAI, SALT.
ACALCUM, TIN.
ACALEPHE, araanon, a NETTLE, from a, a negative, xana, agreeable, and aon, a touch, because the touch, as it hurts, is not agreeable.

There is also a fish and a sca-fowl thus named.

ACANOR, a chemical furnace.

ACANTHA, from ακη, a point, ακανθα, any fort of thorn; any thing prickly, or with sharp points; also the shin, or spine of the tibia; and sometimes the spina dorsi. ACANTHABOLUS, from ακανθα, a thorn, and βανλω, to cast, or cast out. It is an instrument described by Pau-

lus Ægineta, for taking out thorns, or other fuch like things, when stuck into the slesh.

ACANTHA CAUCAS. A species of globe-thistle.

ACANTHACEUS ACANTHACEOUS, a botanic term applied to the plants of the thiftle kind, which are

ACANTHALZUCA, the fame as echinopus, or glove-

thiftle.

ACANTHICE, ακανθικη ματιχε, supposed to be the product of the carline thiftle.

ACANTHINA MASTICHE, the PINE-THISTLE.

ACANTHINUM (gum.) See GUM ARABIC.

ACANTHION, the HEDGE-HOG. See ECHINUS. ACANTHIUM, the COTTON-THISTLE. See CAR-DUUS TOMENTOSUS

ACANTHOIDES PARVA. A species of carline thiftle.

ACANTHUS, from axarba, a thorn. It is also called branca urfina, acanthus fativus vel mollis Virgilii, carduus acantbus, marmelaria.

Bear's breech, or brank ursine.

Miller mentions five species. It is a native of the fouthern parts of Europe, cultivated in our gardens, flowers in June and July, and is perennial.

The roots are very mucilaginous, and the leaves are for in a leffer degree. This mucilage is infipid, foftening, and a good fubfitute for the marth-mallow.

The herb-women too often fell the leaves of helleborafter, or bear's foot, or fphondylium, or cow's parfnep, for the bear's breech.

The common bear's breech is the acanthus mollis fa-

tivus, foliis finuatis inermibus of Linnæus. ACANUS THEOPHRASTI, a species of thistle.

ACAPATLI, LONG PEPPER.

ACAPNON, axarror i. c. fampfuchum, or marjoram.

See ORIGANUM.

ACARUS, a finall infect which is faid to breed in wax; also an infect in the skin like a loufe. Vide Ритиги-

ACARNA THEOPHR ASTI, the FISH-THISTLE; also

a fea-fifh.

ACARON, the WILD MYRTLE. ACARTUM, RED-LEAD. ACATALIS, a JUNIPER-BERRY.

ACATAPOSIS, incapability of fwallowing. See DE-

GLUTITIO.

ACATERA, the larger or black juniper.

ACATHARSIA, from a, non, and nahaipu, to purge. That impurity in a difeafed body which is not yet purged

ACAULIS, or ACAULOS, of a, negative, and καυλος, caulis, a flalk or flem. A plant is faid to be acaulis, or without a stalk, whose flower rests on the ground, as in the carline thiftle.

And Cafper Bauhine calls the carline thiftle, acaulos

magno flore. ACAZDIR, TIN.

ACATEM, or ACCATUM. See AURICHALCUM. ACCELERATORES URINA. Called also urina flimulatores. They haften the ejection of the urine. The accelerator urinæ arifes fleshy from the sphincter

ani, and fuperior part of the urethra, and tendinous from the ifchium. It is inferted into the corpus cavernofum, from near their beginning to a little below their union.

Douglas.

Dr. Hunter observes, that the acceleratores urina are fixed to, and furround the bulbous part of the urethra, meeting in a middle line or tendon, at its external posterior part. They are blended at the end of the bulbous part of the urethra, with the other muscles of the part; when these muscles are put into action, they contract upon the ure-thra, thereby making it narrower and expelling the last drops of urine. The semen also meets with a fresh pro-pulion from these muscles contracting upon it, when it is in the bulbous part of the urethra, which it is, and no farther, in the first conatus, and by being in this large cavity, would get no farther, was it not for their action; fo that they are truly accelerators of the femen as well as of the urine; and this feems the chief reason of the bulbous part of the urethra, or its being larger in one part than another, that the femen and urine might meet with a refervoir in their passage, which had a fresh contracting force or power, to forward their expulsion.

ACCESSIO, ACCESSION. The beginning of the pa-

roxylm of an intermittent fever, &c.

ACCESSORII, Nervorum octavum Par.
ACCESSORIUS. The name which Willis hath given to fome branches from the eighth pair of nerves. They arise by several filaments from both fides of the medulla fpinalis of the neck. Having advanced to the first verte-bra, each is fixed to the back fide of the ganglion of the nervus fuboccipitalis, or tenth pair; then again run upwards into the cranium by the great occipital hole, com-municate with the ninth and tenth, return out of the cranium, and in their paffage join the eighth pair; after-wards turning backward, and perforating the mufculus fterno-maftoidæus, it terminates in the trapezius, having first fent some branches to the rhomboides.

ACCESSORIUS (musculus), i. c. Flexor longus pedis.

Vide FLEXOR DIGITORUM ACCESSORIUS

ACCESSORIUS SACROLUMBARIS, vel LUMBA-See SACRO LUMBARIS (Accefforius.)

ACCIB. LEAD.

ACCIDENS. A SYMPTOM.

ACCIPITRINA, fee HIERACIUM, HAWKWEED; and SOPHIA.

ACCLIVIS.

ACCLIVIS, vide Obliquus ascendens abdominis.

ACCRETIO, from ad, and crefco, to grow to; ACCRE-TION, GROWTH, and NUTRITION: also a growing together, as the fingers to one another. See NUTRICATIO.

ACCUMULATIO, an ACCUMULATION, OF HEAPING

ACCUSATIO, vide Indicatio. ACEPHALOS, from α negative, and κιφαλκ, α bead. This word is applied to monsters born without heads.

ACER, from acris, because of the hardness of its wood.

The MAPLE TREE.

The great maple tree, falfly called SYCAMORE, is the acer pleudo platanus, or acer folii quinquelobis in æqualiter ferratis, floribus racemosis of Linnæus. It is also called platanus tragi, the great maple tree.

Nine species of acer, are enumerated by botanists. It is of the class of the polygamia monoecia.

The maple is a large tree, common enough in England,

but a native of Austria and Switzerland.

It is not much in use as a medicine, though its juice, if drank whilft fresh, is faid to be a good antifcorbutic. All its parts contain a faccharine fluid; and if the root, trunk, or branches are wounded in the fpring, a large quantity of liquor is discharged, which, when inspissated, quantity of inquor is discharged, which, when implicated, yields a brown fort of fugar, and a fyrup like the melaffes. Large quantities of this fugar is obtained from the trees in New England and Canada, and is much used in France, where it is commonly known by the names of faceharum Canadense, and faceharum accruum, maple sugar.

ACER VIRGINIANUM, odorat. Liquid Amber.

ACERBITAS, ACERBITY, SOURNESS.
ACERBUS, Acerb, four, harth; or a fourness with astringency; also bitter.

ACERIDES, Axapes es, from e, negative, and erpos, war. Gallen calls plafters fo, that are made without

ACERNUM SACCHARUM. Sugar of the maple

ACEROSUS, of acus, from axvess, chaff. It is used to fignify that brown fort of bread which is made without

first separating the bran.

ACESTA. Distempers which are curable.

ACESTIDES. The names of the chimnies of the furnaces where brass was made. They were narrow at the top to receive the fumes of the melting metal, and to collect them, that the cadmia might be produced more abundantly. Also the roof of the furnaces in which copper is fused, they are closed so as to detain the corpuscles which fly off.

ACESTIS, a factitious fort of chryfocolla.

ACESTORIS, axtropts, from axes, a cure. It firstly fignifies a FEMALE PHYSICIAN, and is used for a MIDWIFE.

ACESTRIDES. Midwives.

ACETABULUM. Kotuhn, Kotuhnsun, ogucapos, is a large cavity in a bone, to receive the convex head of another, for the advantage of a circular motion. The large cavity in the os coxendix is thus named, which re-ceives the head of the os femoris. This cavity is called the cup, from its likeness to an ancient faucer in which vinegar was brought to the table, and thence named acetabula, from acesum, vinegar, and tabula, a table. This derivation feems very probable, as εξυζαφτ, which is the fame measure as the ancients called acetabulum, feems to be derived from εξω, vinegar. The acetabulum, which receives the head of the thigh-bone, is formed by the implace of the or illumination and a continuation. juncture of the os ilium, ifchium, and os pubis; the edge of this eavity is called supercilium, and is very prominent on the upper part; the cavity is deeper on the upper and back part than on the lower and fore part. In the natural state this cavity is increased by an additional elaftic circle, which is united to its edge; it yields eafily both ways to any preffure, but recovers itself when the force is removed.

Acctabulum also fignifies a fort of glandular substance found in the placenta of fome animals. See COTYLE-DONES.

The ancient measure thus named was about the one-

eighth of a pint.

Acetabulum is also a fort of craffula, and a name for the androface and the herb umbilicus Veneris, which fee, and craffula likewife.

ACETABULUM MAR. MIN. See ANDROSACE.

ACETAR, a fallad of raw herbs, to be eaten with

ACETARIUM SCORBUTICUM. A kind of pickle in which Dr. Bates advises fcorbutic patients to dip their victuals before they eat it. It is thus made: R Fol. cochlear. marin. 3 iij. facchar alb. 3 vj. fal cochlear. 3 i. bene contund. fimul. & adde fucc. aurant. 3 vj.

ACETOSA, or ACETOSUS, eager or four; in Eng-lish it is called sorres, from the Saxon word, which

fignifies four.

Miller hath reckoned up about eighteen different species, of which the following are fometimes used in medi-

I. Acetofa vulgaris, called also acetofa pratensis, acetofa arvensis. It is the rumen acetofa of Linnaus, i. e. rumen pratensis, foliis oblongis fagittatis, floribus dioicis of Linnæus.

COMMON SORREL.

It is a species of lapathum, called sour DOCK, whose leaves are four, but not the root, which is bitter. It grows in the meadows and common fields.

2. Acetofa Romana, called alfo acetofa rotundi folia hortenfis. It is the rumex feutatus, or rumex Helveticus, foliis cordato hastatis, ramis divergentibus, sloribus hermaphroditis of Linnæus.

The ROMAN, FRENCH, ROUND-LEAVED, OF GARDEN

SORREL.

It is common in our gardens, and in many places it is

known by the name of GREEN SAUCE.

3. Acetofella, called also trifolium acetosum vulgare exytriphyllum, panis cuculi. It is the exalis acetofella; or oxalis foliis ternatis, scapo unissoro, slore albo, capsulis pentagonis elasticis, radice squamoso articulata of Linnæus.

WOOD SORREL.

It grows wild in the woods, and flowers in April. The leaves are shaped like a heart, standing three together on one ftalk.

All the forrels lose much by drying. They are all mildly acid, without any particular smell or flavour; the common is the leaft, the wood the most agreeable; they cool, quench thirst, are antiputrescent, antiscorbutic, and

The feeds are flightly aftringent, but neither four nor

If the leaves are bruifed, they afford a large portion of a green juice with very little preffure. If this juice is permitted to fubfide, a clear reddith fluid foon appears, which if poured from the fæces, is one of the most agreeable preparations from these herbs. It may be mixed with whey, and is then a most acceptable and useful drink in severs of all kinds. A decoction of the whole plant is a very agreeable substitute for wine, when wine is covered by a patient to whom we cannot prodently is coveted by a patient to whom we cannot prudently allow it. The leaves are as powerful fuppurants as the roots of white lilies. If the leaves of any of the forrels are boiled in milk, an agreeable whey is foon feparated, which is inferior to none for its palatablenefs.

A great part of the acid of forrel may be obtained in

the form of a concrete falt, which is more acid than that of tartar, more easily foluble in water, and lefs, if at all, purgative: the wood forrel yields near one-hundredth part of the weight of the fresh leaves. As the usual method of obtaining effential falts from vegetables by depuration and evaporating their juices, then fetting them to crystallize, is extremely tedious, the following processes

are given as being more expeditious.

Spiessius orders the respective plant to be taken and gently dried in the shade, then, being cut small, to pour on it a proper quantity of the sp. vini R. to digest them in a gentle heat till there is a tincture of a deepish green a gentie heat till there is a tincture of a deepsih green colour; then pouring this tincture into a glass cucurbit, distil with the heat of a water-bath, until so much spirit is raised, as to leave the remainder as thick as honey; then suffering it to rest until it is perfectly cold, crystals of a pyramidal shape will be found on the sides of the vessel. See Miscel. Berol. continuat. ii. p. 91, 92.

Stahl advises us to cut the herb small, after gently drying it, and make a strong tincture with sp. vini R. then pouring off this tincture, add to the residuum a fresh por-

pouring off this tincture, add to the reliduum a fresh portion of the fp. vini R. and digeft as before; continue to add more spirit until the herb ceases to tincture it; then gently dry the refiduum, and boil it in water to extract

all the faline parts; pass this decoction through a filter, and evaporate to a due confiftence; after which fet it in a cool place to shoot. See Stahlii Fund. Chem. p. 68.

Of these two processes, the first is perhaps best adapted for plants of the fweet, and the fecond for those of the acid kind, both which fort of plants give out all their virtue with their effential falts, confequently with a fmall portion of them diffolved in a proper quantity of pure water, we may, as with the oleafaechara, prepare the waters of those plants, without the trouble of a distillation, and also the waters of those plants which cannot be obtained by the use of a still.

The falt of wood forrel may be fubflituted for the falt

or juice of lemons.

Conferv. Lujulæ. Conferve of Wood Sorrel. Take the fresh leaves of wood forrel, and beat them into a conferve, with triple their weight of lump fugar.

This preparation keeps well, and of all the conterves this is the most palatable, being agreeably acid, and pos-fessed of a flavour somewhat resembling fine tea.

ACETOSA ESURINA. Efurine spirit of vinegar.

See ACETUM ESURINUM.

ACETOSELLA, Wood sorrel. See Acetosa. ACETUM. VINEGAR.

Vegetable liquors, in proportion to the quantity of their faceharine parts, ferment into a weaker or ftronger kind of wine; a fecond fermentation produces vinegar; the next change they undergo is the laft, and that is into a putrid state.

When malt liquor becomes acid it is called allicar. Allegar. It is not fo proper either for medical ufe, or for preferving pickles, as the wine vinegar is; for it abounds too much with a glutinous matter that is productive of

many difadvantage

If vinegar is distilled with a heat not exceeding that of boiling water, it yields first a phlegmatic liquor (which is a vinous fpirit, and may be used as such); then a slightly acid one, which is succeeded by stronger and stronger acids, till the matter remaining becomes thick as honey; if now it is urged with a stronger fire, an empyreumatic oil ascends, and a penetrating acid spirit, tainted with the ill fmell and yellow colour of the oil; and at last there remains a black coal, which when burnt into white athes, yields a confiderable proportion of fixt alcaline

The stronger and more spirituous the wine, the stronger is the vinegar into which it is converted. Geoffroy fays, that vinegars made of the German and French wines, faturate from one-fortieth to one-twelfth their weight of

fixt alcaline falt.

The acetous acid is concentrated by congelation, taking care to throw out the ice before it thaws; by diffillation from alkalies, or from metallic bodies, particularly cop-per; by this last method it may be made to faturate near equal to its own weight of a fixt alkaline falt. This acid is called radical vinegar. When the acid of vinegar is combined with alkalies, earths, or metals, dry the neutral falt fo formed, and then the acetous acid may be feparated in a very concentrated state, by the addition of

concentrated vitriolic acid.

Vinegar is mixed with the mineral acids by some fraudulent dealers, but is thus detected: if a faturated folu-tion of any calcareous earth, as chalk, made with ftrong vinegar, be added to fuch as is suspected of containing the vitriolic acid, no change will enfue if the fulpected vinegar was pure; but if it contained only a minute por-tion of that acid, the mixture will immediately become milky, and on ftanding a fhort time, deposits a white fediment. The diffilled vinegar fometimes contains a portion of lead, which is discovered by taking a small portion thereof, and adding to it a little of the aqua kali. If on the mixture being made a cloudiness appears, or a white powder falls, there is lead diffolved in it.

The acetous acid differs from all the others: it differs from all the acids in general in its particular odour; from the native vegetable acids, in fubtilty and volatility, and in not being obtainable in the form of a concrete falt; from the mineral, in its habitude to different bodies, and the nature of the compounds it forms with them: thus, whatever the acetous acid joins, it is dislodged by the ap-

The fermentation which changes wine into vinegar gives the latter feveral properties, extremely different from those of the former, e. gr : the first diffillation from vinegar extinguisheth fire, but the first from wine feeds it: Fermented vegetable spirit is the only thing that in-toxicates; and the spirit of vinegar is the antidote to in-toxication. The same liquor; which in the state of wine became weaker by boiling, in the flate of vinegar becomes ftronger thereby.

Vinegar diffolves animal earths, if not very much mixed with gelatinous matter; the earth of alum; the mineral calcareous earths; feveral metallic substances, as zinc, iton, copper, tin, lead, bifmuth, and the regulus of antimony. It dislolves the vegetable inspiritated juices, and extracts the virtues of many plants; but fometimes its acidity spoils their medicinal qualities, though in other instances it improves them; as in the intention of using the gum ammoniacum, garlie, squills, &cc. It mingles equally with the blood and its ferum, and with most of the anid mal fluids, without thickening them; but rather, as Boerhaave observes, attenuates and resolves. Dr. Alston, of Edinburgh, fays that, "It is antifeptic, and poffeffes all the virtues of the acids in general; that it is preferable to lemon juice, or any mineral acid; it peculiarly corrects narcotics, as opium, hemlock, henbane, deadly nightshade, &c. to the ill effects of which it is the antidote. In inflammatory and putrid diffempers, in many inflances, its efficacy is truly wonderful; in ardent fevers it is one of the most certain antiphlogistics and fudorifics; in putrid disorders it equally excels as a prefervative and reflorer. Fainting, lethargic and hylteric paroxyims are much relieved by it, if applied to the note and mouth; even in many inftances more than by volatile alkaline pirits, or fetid gums. In the ardent biliary fevers, as the miliary, it is a powerful affiftant. It cures furfeits from animal food. It is faid to cure the bite of a mad

Externally applied vinegar is a powerful refolvent and relaxant. When applied to any fenfible membrane, it acts as an aftringent; and, more or lefs diluted with water, is an excellent gargle for an inflamed throat, also for an injection to moderate the flour albus. In short, to relate its many good qualities as a medicine might well be the subject of a particular treatife. See ACIDA.

An imprudent use of vinegar is not without confiderable inconveniencies; large and frequent dofes too much coagulate the chyle, and produce not only a leanness but an atrophy; when taken to excess, to reduce a corpulent habit, tubercles in the lungs and a confumption has been the confequence: young children, old people, those whose circulation is languid, vital heat defective, and digeftion weak, should be very sparing in its use.

The dose, according to the different circumstances of the case requiring it, and the constitution of the patient.

may be from 3fs. to 3 iij.

See the Dictionary of Chemistry, translated from the French of Mr. Macquer, edit. 2. article VINEGAR. Cullen's Mat. Med.

ACETUM DISTILLATUM, feu Sp. Aceti. Dr-

STILLED VINEGAR.

Diftil wine vinegar with a gentle heat as long as the

drops fall free from an empyreuma.

The first pint that is drawn off is a weak vinous spirit, and should be taken away, another receiver being placed for the acid. Malt vinegar, however strong, by reason of its vifcid quality, is not only improper for diffilling on account thereof, but also because it so readily receives an empyreumatic tafte; a circumstance to which the best wine vinegar is subject, if more than about two-thirds is drawn over. That called - COLCHICUM AUTUMN. See COLCHI-CUM.—ESURINUM, Hungry Vinegar. When vinegar is concentrated it creates an appetite, hence this name; called also acetosa esurina.—LYTHARGYRITIS, and PLUMBI. See PLUMBUM.—PROPHYLACTICUM is thus made. R flor. lavend. & rorifm. fol. rutze, abfinth. falvize, menth. Al m. i. aceti vini cong. i. infund. in B. A. per 8 dies. R hujustinct. fb. i.camph. 3 iij. m. f .-- Acetum acet. proph. alfo called the VINEGAR OF THE FOUR THIEVES; for during the plague at Marseilles, four persons by the use of it, attended many of the fick unhurt; under the colour of proach of a mineral acid; and compounds formed of the their fervice, they robbed the fick and the dead, one of acetous acid and fixed alkalies, diffolve in fp. vin. R. but them being apprehended, faved himfelf from the gallows those with the mineral acids and the fame alkali will not. by discovering this remedy.—Scillæ. See Scilla.

ACHAHI.

their benefits.

ACHICOLUM. The farnin, thelus, or fudatarium of the ancient baths, which was a hot room to fweat in,

called also architholus.

ACHILLEA, a fpecies of millefolium, also a name of the ptarmica. The achilleas take their name from Achilles.

ACHILLIS TENDO, fee TENDO ACHILLIS.

ACHIOTE. The red grains of achiotl made into

ACHIOTL: also the the bixa oviedi, daburi. A fort of orleans, growing in New Spain and Brafil. The tincture made of the fruit and uted in chocolate is thus made: take the grains when ripe, infuse them in hot water; the fettling is made into cakes, and is used as a paint for the face. The remem which the Indians call achietl or urusus, the Dutch orleane, and we roucou, is a meal or flour of a feed got in the Leeward Islands and the idea of St. Dominious shafe feet and of the idea of St. Dominious shafe feet and in the control of the state of St. Dominious shafe feet and in the control of the state of St. Dominious shafe feet and in the control of the state of St. Dominious shafe feet and st. the ifle of St. Domingo; these seeds are of a vermilion colour. The roucou is made in these islands as we make starch. Chose the roucou of the deepest violet colour, and very dry. Its chief use is among the dyers. See

ACHLYS. A dimness of fight: from axxy, darkness or cloudiness. It also fignifies a small scar or mark over the pupil, of a light blue colour. It is fynonymous with caligo cornere, or blindness from opacity of the corner. See Cullen's Nosology. It is the Leucomanophelium of Sauvages, and is described a speck of the corner, some what pellucid, which occasions objects to appear as if feen through fmoke, or a cloud, and hence are more obfeured. By inspection obliquely it is discovered to be different from the opacity of the aqueous humour, ac-companying some diseases of the eye. This species often arifes from a variolous ophthalmy, or moift one, or whatever can render the cornea opaque; in infants, as their years encrease, it often vanishes spontaneously. The juice of pimpernel, either the blue or purple, dropt into the eye twice a day for the space of a week; the juice of the common star-thistle, and blue-bottle are useful: sugarcandy powdered is often fufficient. Emetic wine, which is the leaft hurtful may with advantage be dropt into the eye. The vapor of anifeed, or fennel-feed water, are of fervice. See Wallis's Nofologia Methodica Oculorum.

ACHNE. CHAFF or the FROTH OF THE SEA. Hip-

pocrates expresses by it a whitish mucilage observed in the eyes of patients who have severs: also a white mucus in the fauces thrown up from the lungs. Befides these it sig-

ACHOR. Lastumen: abas, acores. The crusta lastea of authors, and in England the SCALD HEAD. Trallian fays, that it is a fore on the outfide of the head, full of little perforations, which discharge a humour like ichov, whence its name. He farther says, that the cerion refembles an achor; but that the mouths of the perforations are larger, refembling the cells of a honey-comb, whence the name; the matter is also nearly of the con-

fiftence of thin honey. When these diseases spread, the service which ouzes out, dries, and forms a seab.

The achar differs from the favus and tinea only in the degree of virulence. It is called favus when the perforadegree of virulence. It is called favus when the perforations are large; and tinea when they are like those which
are made by moths in cloth: but generally by tinea is underitood, a dry scab on the hairy scalp of children, with
thick scales and an offensive smell; when this disorder
affects the face it is called crusta lactea, or milk-scab.
Mr. Bell, in his Treatise on Ulcers, says, that the tinea
capitis & crusta lactea, may both be reduced to the same
from lead; all which tends to prove, that the acids are
all the same in themselves, but altered by what they are;
or have been joined with.

There is great analogy betwixt acid and cold; the air
abounds most with acid in still weather when the wind
blows from the north and the east. The spirit of nitre
increases the cold of ice. Acid and cold alike preferves
from putrefaction, by increasing the cohesion of the comnonent

ACHAL ALUM-WATER.

ACHARISTON. Achariftus fignifies thanklefs. Actius and Galen deferibe fome compositions of fingular efficacy under this name; because, as they cured quickly, the patient valued them the lefs, and so made no returns of the patient valued them the lefs, and so made no returns of the patient valued them the lefs, and so made no returns of the patient valued them the lefs, and so made no returns of the patient values he patie as a genus in the class locates, and order dialytes; but under the word ulcus he places the crufta lactea as avariety of ulcer. When it happens to children, if in other respects they are healthy, the best treatment, besides keeping the belly moderately lax, is cleanliness and a moderate diet; an issue may be made and continued till the disorder is cleared and the strength of the constitution is the paramea. The achilles take their name from Achilles. Indicate is cleared and the iteragin of the confitution is yarrow, milfoil, or facezwort. See Millefolium; for that called—Ageratum.—Gallica, for Mountain rag-wort, or corn-marigold.—Lutea, fee Ageratum.—Montana. A fpecies of jacobea, called five-leaved rag-wort. See Jacobea alpina.—Ptarmica of calmed may be given as an alterative rather than as a fee Ptarmica.

ACHILLEION. A name for the fine room Achilles. Idiorder is cleared and the itrength of the confitution is established; keep the hair fhort and wash the head with the head with violent itching, a pale counternance, &c. but fill the fame method generally fucceeds in all the species and degrees of virulence. Small doses of calomet may be given as an alterative rather than as a fee Ptarmica.

ACHILLEION. A name for the constitution is

ACHILLEION. A name for the sponge of which tents are made; because Achilles made them of it.

Externally the unguent e pice may be used two or three times in a week, or creammixed with chalk in fine powder.

If the humour is repelled give warm fudorifies until it returns. Scabby eruptions on children should not be repelled when about the mouth, ears, or indeed on any part of the body. Though these eruptions depend not on the habit, but the difficulty of palling through the skin, yet cold bathing should not be used. Cleanliness and a frequent use of the warm bath are of great service. The practice of tearing up the roots of the hair is useless, therefore cruel. Keep the hair short and wash the part with aq. pur. fb. in qua solut. eft gr. x. hydrargyri muriati.

Among the ancients Actius, Egineta, Trallian, Ori-

Among the ancients Actius, Ægineta, Trallian, Ori-bafius, Galen, &c. treat profeffedly on thefe diforders; amongft the later authors Heifter and Turner may be con-fulted, with the ftill later writers, as Brooks, Smith, Bell, in his Surgery, and his Treatife on Ulcers, p. 376. Mofs on the Management of Children, &c. White's

Surgery, p. 69.
ACHRAS. A wild pear-tree growing in Greece.
ACHY, Azu, a species of cassia growing in Arabia,

ACIDA. Acids forms a species of falts, ex-

ACIDA. ACIDA. Acids forms a species of lasts, exciting upon the organ of tafte what is called four; which being quite a simple impression, is not to be defined.

Acids are animal, vegetable, and mineral. The vegetable are the native, as the juice of lemons, &c. or the product of fermentation, as vinegar and tartar. The mineral are those of vitriol, nitre, and common falt. The animal is obtained from ants, and fome other infects in confiderable quantities; it is also contained in human fat, and in the fuct of animals that ruminate, and in acetous fermentation is fometimes produced in fome of the animal fecretory organs, forming a kind of animal vinegar.

Acids are of a nature as simple and active as any of the objects of our fenfes. Saline bodies are in the first rank of the most simple ones, and of all these an acid is the basis. Whatever slames hath a latent or a manifest acid in it, for acids alone are convertible into flame. true that pure acid flames with difficulty; but when di-

vided and diffused in the pores of other substances, it readily takes fire and blazes, or explodes most violently.

A vague acid, which is volatile and liquid, is in all parts of the earth; uniting with various substances it forms different folils. Except in the effential falts of vegetables or in tartar, acids are rarely found in a folid form. The air itself is replete with acid, and without it

no creature could live.

However different the acids, as collected by art, may appear, it cannot be proved that they exist in the fame form in their original state. The spirit of nitre and sea falt are easily controvertible into each other; the different acids, in the different effects, do not flew their difference fo much as acids, as by other properties. Vinegar recovered from copper, is more perfect than before its union therewith, but never can be recovered as vinegar from lead; all which tends to prove, that the acids are all the fame in themselves, but altered by what they are;

ponent parts of the respective bodies. Strong acids, and exceffive cold, it is true, when applied to the flesh of living animals, mortifies them; but this mortification differs greatly in its nature from that produced by fire, and by alkaline falts. South winds favour, but north winds check the progress of putrid diforders. Cold concentrated and joined to vegetable and mineral bodies, feems to be of the effence of the falts called acid.

Acids differ in their specific gravity when compared

with water. They are as follows:

The acid of vitriol, as 18 to 10

Nitre 14 to 10, fome fay 15 to 10 Sea falt

12 to 10 Vegetables 10 plus to 10.

This difference shews, that some acids are more tenacious of water than others, and that when these acids are mixed with fixed alkali, fo as to form neutral falts, if the alkaline falts are the fame in proportion, it will be only increased to the fame weight whether the vitriolic or the vegetable falt is ufed, e. g. to one ounce of fixed alkaline falt, add the vitriolic acid, and the neutral falt will weigh one ounce and three drams. The fame will occur if you use nitrous acid, muriatic acid, or vinegar. If the weaker acids are used, you must pour on more of them to the same quantity of alkaline salt to saturate it, yet the salt will have only attracted the same weight of acid from each.

Acids differ in their colour, for the vitriolic is quite pale; the nitrous a dark yellow, always foaming, the marine a pale golden colour. If bottles containing these three acids, are stopped with cork, the cork is soon tinged by the vitriolic acid with a black colour; by the ni trous, with a yellow; and by the marine, with a whitish one. The vitriolic acid emits no visible vapours in the heat of the atmosphere, but imbibes moisture therefrom; the nitrous and muriatic emit copious corrolive fumes; the nitrous, a yellowish red; and the muriatic, white ones.

As to the virtues of the vegetable acid, to what is al-ready faid (fee ACETUM) its fuperior efficacy on putrid gall, in refloring fweetness to it, deserves peculiar notice. All acids have a power to correct the putrid acrimony, but the power of fweetening feems proper to the veget able alone: befides, when a putrid colluvies lodges in the first passages, this acid gently tends to solicit its discharge by ftool, an advantage not to be hoped for from the mineral tribe.

The mineral acids when intimately joined with vinous fpirits, have effects fo fimilar to those of the vegetable class, that their properties as medicines are almost the fame; but when in their seperate state, their inward use tends to coagulate the blood. In other respects, the effects

of all the kinds of acids are fimilar.

Acids gently irritate and contract our fibres when taken in a dilute state, and thus corroborate; they refift a putrid tendency, and powerfully oppose putrescence when actually existing; by the irritation they promote various secretions; they excite an appetite, and aid digestion; their cooling efficacy in fevers of every rank is not exceed-ed by any thing in uie, nor equalled for their general fafety, where causes so widely opposite produce such similar com-plaints: in some instances of coughs and asthmas, by their irritation their efficacy is fingular; if the vegetable acid is made use of, the breathing is never difordered by it, though in fome instances the mineral fort may offend. In dyfenteries, and in diarrhœas, produced by unripe fruits, the fosfil acids allay the fermentation in the bowels, and when a putrid colluvies in the primæ viæ is the caufe, at once they will be propofed as the proper remedy. By their fedative quality hæmorrhages are restrained; and as bitters are neuteralized by acids, fo the excefs and acrimony of the bile are allayed by their use. For father satisfaction into their extent and usefulness in the healing art, see FARR on Acids.

Acids, aftringents, and bitters, have a great affinity with each other. By a mixture with each other they lose their properties. Vegetable acids lessen the aftrictive power of galls on leather, &c. The mineral acids have a contrary effect. Bitters, both animal and vegetable, are neutralized by acids. See Dictionary of Chem. Neuman's Chem. Works, Percival's Med. Essays.

Acids correct the deleterious effect of most, if not all narcotic plants; but injure the phlegmatic habit, where the circulation is languid, the bile defective, or the digestion naturally weak.

ACIDITAS, ACIDITY. Difeases from this cause are frequent.

The feat of acidity in our bodies, as a difease, is prin-cipally the stomach and the small intestines. An acid acrimony is never fentibily prevalent in the blood: yet urine hath been fermented into wine.

An acid acrimony may derive its origin either from too great laxity and debility of the organs of digeftion, or from an excels of acescent food. The ferment excited in our food by the stomach is fui generis; if any part of our aliment is not digested by the proper ferment of the stomach, it will run into its own ferment, and if vegetable it will be-come four. The food of children is for the most part of the vegetable kind, and readily turns four in the stomach if the body be any way difordered, hence most of their diforders are accompanied with the evident figns of acidity, as green stools, gripes, &c. Dr. Buchan observes, in his Domestic Medicine, that many affert a prevailing acid to be the cause of all diseases in children, but that the acidity in their stomach, &c. is oftener an effect than a cause of their complaints. It is not acidity, but its excess that injures.

The redundant acid in the prime vice is known by the fourness of the eructations, the frequent cardialgia, with curdling of the chyle, &c. in the fromach, flatulence, and spasms in the intestines; when this cause is excessive in its degree, the bile is inert, the belly coffive, and the nourithment is unduly fupplied, a paleness becomes general in the skin, an itching comes on, and pustules appear here and there, and a train of nervous fymptoms foon fucceed. Indeed, in all difeases peculiar to children, there are for the most part the symptoms of an excess of irritation, the pulse sometimes beats one hundred, or one hundred and twenty in a minute, the stomach is sick, the veffels of the fkin are contracted, and epileptic or

convulfive fymptoms appear.

Infants are frequently fwept off by this diforder. Among adults, the weakly and fedentary are the only fubjects of it, except among the poor, whose scanty supplies reduce them to this unhappy state.

The cure when adults are the fubjects, confifts of a diet fitted to oppose this faulty habit; animal food, and vegetables of the aromatic alkaline kind: these, with moderate exercise at proper intervals, bid fair for a recovery. Absorbent medicines may palliate symptoms in the sto-mach and intestines, but the limat, ferri will most conduce to an effectual and abiding cure. Children thould be exercised more, and fed less than is usual; irregularity in these begets flatus, acidity, &c. Antimonial emetics repeated every twenty-four or forty-eight hours, until the more difagreeable fymptoms abate, are highly ufeful. Small dofes of P. Rhaei, with magnef. alb. to as to keep the belly foluble, is better than purging; and to this end give fmall doses frequently. To free from flatulency, R. ol. eff. fem. fænic. d. gr. i. fac. alb. vel ocul. 69. pp. gr. v—x. m. & rep. bis vel ter in die. As to absorbents, a mixture of the magnesia a. with the ocul. 69. or other calcareous earths, ought generally to be preferred, and the dofes should be very frequently repeated until some relief is obtained, and then their distances may be increased.

See Van Swieten's Commentaries on Boerhaave's Aphorifms. Medicamentorum Formulæ, Dris. Hugh Smith. Buchan's Domeftic Medicine. London Practice of Physic, edit. 3. Armstrong on Diseases fatal to Infants. Moss on the Management of Children, &c. ACIDULÆ. Called also Ferratæ. MINERAL WATER ?

that contain a brifk fpirit when unaccompanied with heat are thus named; but if they are hot also, they are called therma.

As to the antiquity of their use, see Galen, Coelius Aurelianus, Pliny, &c. who fpeak largely of their virtues.

Hoffman and many authors highly extol them, whilft others observe that a pure water, on account of its fimplicity, fuch as that from Malvern and Toplitz fprings, is to be preferred both for drinking and for bathing; and that in want of these, they may be well supplied by distilled rain, or any other that is fost and pure. Objectors fay, that the medicinal qualities in these waters only quicken their operation as water, but contribute nothing farther, and that folutions of the like materials are of equal efficacy: to which the best reply has been, that the mineral contents are often volatile, and of parts more subtile than those of art's producing; and that when the powers of nature are expiring, experience proves their efficacy by their fuccess as a last resource. Sea falt in water, which it joins with, and falls in a mil-

In general their views are according to the qualities of ky cloud. but none pure, except fixed air. 2. Alkalies; but none pure except the folfil. 3. Neutral falts; of these none but the common and Glauber's falt. 4. Inflammable folfil oil. 5. Sulphur; only in the state of hepar. 6.

Metals; pone but iron and copper. 7. Farths, of these Metals; none but iron and copper. 7. Earths; of these there are the calcareous, those of alum, and magnesia; and these only as united with fixed air, the vitrione acid, or the marine acid.

Bleeding, or purging, or both, are frequently prescribed before the use of mineral waters; but, except a plethora attends, they are not to be admitted. As these waters are designed to pass, so rest or exercise must be advised; rest and a cool situation, favour their diuretic tendency; exercise and a warm air determine them to the skin; these observed with temperance and moderation in the regimen, are the principal directions on which fuc-

Their brilk sparkling property is owing to the quantity of fixt air which they posses; and indeed to this, perhaps, is owing their chief use as medicine. To increase this property when defective, or to communicate it where it is totally wanting, see Dr. Priestley's directions for impregnation water with first air.

nating water with fixt air.

A general analysis is made by placing the water to be examined in low vessels, where it may gradually exhale; also where it may rest undisturbed in close but clear glasses. Having first examined by the eye, the taste, and the smell, fill two low glaffes, let one be well closed, and the other left uncovered; then, after fome hours or days, the spontaneous alterations may be attended to. A foum at the top, or a fediment at the bottom or fides, may discover what is fought for; or, evaporate the water totally by a gentle heat in a glass retort, save the liquor that rises in order to determine the proportion of it to its folid contents: let the refiduum be diffolved in a little distilled water, thus the falts will be separated from the earthy, me-tallic, or other matters, and their different qualities found out by the following methods.

The most common additions for discovering the contents of waters are galls, fyrup of violets, and the aqua kali; but for a minute inveftigation, the apparatus is more confiderable; for besides the materials to be added, which are numerous, in order to their fuccessful management, the operator must be furnished with scales and weights, an hydrostatic balance, different forts of glasses, cements, a thermometer, a hand-pump, microscopes, crucibles, &c. But in the use of the different means and methods for difcovering the contents of mineral waters, much prac-tice and attention is required to prevent felf-deception. The following are fome of the additions by which medi-

cinal and other contents are discovered.

Galls-When used they should be fresh powdered, or a fresh infusion of them in water should be made. A small quantity of the powder, or of the infusion, put into a cup full of the water to be examined, discovers the smallest degree of iron that can be productive of any fenfible effects. If the water contains a coarse oker, the colour ftruck by the galls is very dark; the finer iron produces the inky purple; but the finest, such as the Pyrmont water, gives the azure blue.

Syrup of violets-Mix a dram with a fmall wine-glafs full of the water, and if a green colour is produced, there is an alkaline falt in it, or alum; though Dr. Rutty fays, that if the fyrup is new, alum turns it red. This green colour is also observed when a solution of iron is met with;

with an acid it causes a red.

Aqua kali.-A few drops let fall into the water difcovers earthy matter, by precipitating it in the form of a white cloud; if a whitish cloud rises to the top, and the water underneath remains clear, the quantity of earthy matter is extremely fmall. This water precipitates the contents of all hard waters; from twenty to forty drops throws down all the felenites in fb i. thereof. If it meets with a folution of the hydrargyrus muriatus or other mercurial particles, it discovers them by producing a yel-

low colour, and it ferments with acids.

Tinct. argenti—This tincture, if made with pure nitrous acid, is the most delicate addition for discovering

Soap-It readily determines whether or no the water is hard or foft by diffolving therein: if hard the foap curdles; but if foft, an homogenous mixture is formed, and with a little agitation a froth is raifed.

Acidum nitrofum. Nitrous Acid .- If it turns the water of a green colour, it contains a folution of cop-

For more particular fatisfaction, or any confideration relating to mineral waters, fee Hoffman on the Acidulæ, and Shaw's Improvements on Mineral Waters, in his Chemical Works. Thefis Inauguralis de Aqua Sulphurea Harrowgatenfi, Edinb. 1770, auctore — Walker, M. D. as also the authors he easter mentioned under any of the particular waters treated of.

ACIDUM ACETOSUM. ACETOUS ACID. Take two pounds of the coarse powder of verdegris, let it be perfectly dried by a water bath, faturated with falt-afterwards diftil it in a fand bath, then diftil the liquor again. Its fpecific gravity is to that of diffilled water, as 1.050 to

ÆTHEREUM. ALUMINOSUM. CATHOLICON. Acidum vitriolicum. PRIMIGENIUM. SULPHUREUM.

MURIATICUM. Olim Spiritus Salis Glauberi. Sec MARINUM SAL.

- NITROSUM. Olim fp. nitri Glauberi.

- VITRIOLICUM. Olim Oleum Vitriole. See SULPHUR and VITRIOLUM VIRIDE, and also ACIDA. - VITRIOLI VINOSUM. i. e. Æther vitriolicus.

Sec ÆTHER.

ACIES. STEEL. See FERRUM.

ACINESIA, from a, not, and xiven, to move. A privation of motion.

ACINI. Berries that hang in clufters are thus called, to diftinguish them from baccæ, berries, which are fingle. ACINIFORMIS, vel ACINOSA TUNICA. The coat

of the eye, called uvea. See UVEA.

ACINOS. STONE or WILD BASIL. It is the thymus acinss of Linnæus.

It grows on chalky hills, and flowers in June. Its virtues refemble those of the calamint.

It is also a name of the great wild basil. See Basilt-

ACINOSA TUNICA. See ACINIFORMIS.

ACINUS. Properly a grape, but is applied to other fruits or berries that grow in clusters, as elder berries, privet, ivy, &c. These are distinguished from bacces, or berries that grow single, as those of the laurel. But acinus is also used for the stone of the grape, hence uvæ exacinates, grapes that have their stones taken out.

The glands which grow together in clusters are called

by fome acini glandulofi.

Acinus, a name of the flaphyloma

ACMASTICA, fee Synochus.
ACMASTICOS, called alfo, Epacmastica Istoni; the name of a fort of fever spoken of by Actuarius as fol-

" Fevers from putrefaction are continual or intermittent: of the former, fome are called ifstoni, or acmaftici, which during the whole courfe are at the fame pitch; others are called epacmafiici, these proceed and increase to their time of folution; a third fort called paraemastici, which diminish by degrees till they cease."

ACME, from a, not, and xause, to be tweary; THE HEIGHT OF A DISEASE. That state of a thing in

which it is at its utmost perfection. It is also a term in gymnastics, expressing the highest pitch of exercise.

ACMELLA, called also, Abamella, abmella, akmella, amella, admella. Bidens Urtica,—zeylanca, cannabina, cerate-cephalus, chryfanthemum bidens. A plant growing nephritic diforders, but rarely used. Raii Hift.

ACNE. A small purple or hard tubercle on the face is thus called.

ACNESTIS, from a, negative, and arass, to feratch. That part of the fpine which reaches from betwixt the fhoulder blades to the loins. This name feems only applicable to quadrupeds, because they cannot reach it to fcratch.

There is a herb to which this name is given, but bota-

nifts feem not agreed what it is.

ACO. The name of a fifth found in the Mediterranean

fea, called also aque, farachus, and farachinus.

ACOE, azoz. The sense of hearing.

ACOITUS, an epithet for honey. Pliny speaks of it by this name, because it hath no sediment, which is called

ACON, an instrument used in the ancient exercises like the difcus.

ACONE, a MORTAR, or rather a hard stone, on which

to levigate; or, more generally, a WHETSTONE.

ACONION, an ancient Greek name of a medicine prepared by levigation; probably a collyrium, or fome form of powders for the eyes.

ACONITIFOLIA. A name of the anapodophyllon Canadense morini, i. e. podophyllum peltatum, Linnaeus.

ACONITON, from a, negative, and \*2012, linne or plaister. Not plaistered. This word is applied to vessels not lined within.

ACONITUM. Various derivations are given by etymologists, as, 1st, axorn, a whetstone, or rock, because it grows on bare rocks. 2dly, a, negative, and \*sont, duft, because it grows without earth. 3dly, axwo, axwo, dart, because they possed darts therewith. 4thly, axon cours, to accelerate, for it hastens death. It is also called canici-

da, cynoclonum. Wolf's-Bane. See Anthora.

Miller takes notice of nineteen species; and some of them are called lycoctonum, or wolf's-bane, because the hunters mixed them with flesh, and laid it for the wolves, which were poisoned by it. These herbs are destructive by their caustic and suffocating quality, the animals that eat them have their swallowing stopped, and stomach cor-

Against the poison of these plants, Galen commends rue taken in wine; but, perhaps, vinegar would be more

The MONK's-HOOD, of which Dr. Storck fpeaks so much in its favour, is the following species, called aconitum and napellus; in English, blue MONK's-HOOD, HELMET-FLOW-ER, and WOLF's-BANE. It is the aconitum napellus, or aconitum foliorum laciniis linearibus, foperne latioribus, linea exaratis, Linn. Spec. Plant. p. 538. It is cultivated in our gardens as an ornament. It is fpontaneously produced in Germany, and fome other northern parts of

The doctor expressed the juice of the fresh herb, and made it into an extract by a gentle evaporation, then for

internal use made the following powder:

R extract. aconit. gr. ij.
Sacchar. alb.—3 ij. m. f. pulv. fubtil.
In feveral inftances this was given from gr. vj. to 3 fs. three times a day, with the happiest success. Its chief fenfible effect was its exciting a copious perspiration.

The cases in which Dr. Storck succeeded by the use of the above powder, where an inveterate gonorrhœa, pains that were obstinate, and which followed after agues and intermittent fevers, tophs and nodes, fcirrhous tumors, indurations of the parotid glands, and an anchylofis. See

Med. Muf. vol. i. p. 515, &c.

A person who had eaten a small quantity of monk'shood, was prefently attacked with the following fymptoms, viz. a fenfation of tingling heat in the tongue and jaws, the teeth feemed to himself as if they were loofe, and the face as if it was swelled. This tingling sensation gradually spread all over the body, particularly to the extremities; the knees and ankles lost their strength, and frequent twitching of the tendons came on; soon after he perceived a fensible check to the circulation of the blood

in the island of Ceylon, of which three species are noted through the limbs; at length a giddiness came on, then # by botanists. Two are the verbesina acmella of Linnaus, mist feemed to collect ittelf before his eyes, in his ears and verbesina lavenia of Linnaus. It is commended in was a humming noise, his senses failed, and falling into a fwoon, his eyes and teeth were fixed, his nofe contracted, breathing thort, and cold fweats were perceived on his hands, feet, and forehead. All these fymptoms followed in less than two hours from the time of eating the fallad, in which the monk's-hood unfortunately was mixed. In order to his relief, as it was suspected that he had eaten fome kind of poifon, his friends forced down into his ftomach a quantity of oil and water, and afterwards carduus tea, by which he vomited; these were repeated so as to encourage a thorough discharge from the stomach, and in the intervals, a few spoonfuls of a stimulating cor-dial was given: and thus he soon recovered.

Some writers fay, that the napellus is not poifonous in Sweden, Poland, &c. but it should be noted, that the napellus which is not poisonous, is the aconitum lycocto-num luteum majus of Bauhine, or yellow falutiferous monk's-hood. See Wilmer's Observations on the Poisonous Vegetables in Great Britain. STORCK, de Aconito.

and the Article VENENUM.

ACONTIAS, a poisonous serpent, called also cenchre-as; and another, which is also called CENCHRIAS, which

ACOPA, not eaten by moths. As applied to medicine, it fignifies against weariness, xonos, fignifying laffi-tudes. At first this word fignified the quality of the medicines, which was to relieve the pain, stiffness, and other ill effects of excessive weariness; but afterwards it only fignified the degree of confiftence which the medicines were of. These medicines were always external ones. In time the word was used to express those kind of foft cerates which were applied to tumors, &c. It is also a

name of the marsh-trefoil.

ACOPON, from α, negative, and κοπος, weariness, a reagainst weariness and lassitude. See DIACISSU.

ACOPOS, faid to be the ANATTPIE of Diofcorides, which Gerard fays is the bean-trefoil : fee alfo LABURNUM. ACOR. Sourness, ACRIMONY, particularly an acid acrimony in the stomach.

ACCÓRDINA. INDIAN TUTTY.

ACORES. The scald-head. See Achor. ACORI (Rad.) The greater galangal root. ACORIA, from α, negative, and xepsu, to fatiate. In-SATIABILITY. Sometimes it fignifies a good appetite, or

ACORITES VINUM, a wine made of the acorus and liquorice roots, each eight ounces; of wine, fix gallons; infufed cold for fix months.

ACORNA. Theophraftus fays it is a kind of thiftle, but Pliny fays it is a tree of the ilex kind.

ACORTINUS. A LUPINE.

ACORUS, See CALAMUS AROMATICUS.—ADUL-

TERINUS. See IRIS PALUSTRIS. - ASIATIACUS. See CALAMUS AROMATICUS ASIAT. --- CALAMUS and VERUS. See CALAMUS AROMATICUS. ACOS. A REMEDY.

ACOSMIA, IRREGULARITY, from a, negative, and want, ornament. Bald people are called acofmoi, because they had loft their great ornament. Blancard fays it is an

ACOUSTICA, assuit, to bear, medicines against them pensile warts, see Verruca.

Galen in his Def. Med. says it is a round excrescence

deafnefs, From axes, to bear.

ACRAI, an Arabic word, expressing either fatyriasis, or furor uterinus: meaning the same as arfacum, and ar-

ACRAIPALA, a Greek word for medicines against

a furfeit or drunkennefs.

ACRAS, or rather Achras. The WILD PEAR.
ACRASIA, INTEMPERANCE, from a, negative, and separous, to mis. The ancients mixed one pint of wine with four or five of water. Afclepiades ordered half wine and half water; hence wine unmixed was called acrafia, by a derivation retained in Latin, for tempers is the fame as κερανιυμε, to mix. Hence the word was applied to excefs, as in eating, drinking, venery, &c. By Hippocrates, and fome others, it fignifies imbecility.

ACRATIA, from a, negative, and xpar &, firength.

IMBECILITY

ACRATISMA, a BREAKFAST. The derivation of this word is the same as that of acrasia, because the wine used on this occasion was not mixed with water. A breakfast among the old Greeks confifting of a morfel of bread fleeped in wine. Children and weakly people should not omit this meal.

Our breakfasts should consist of the harder kinds of ali-

ment, to promote a plentiful difcharge of faliva.

ACRATOMELI. See Mulsum.

ACRE, axen. The extremity of the nose.

ACREA, the EXTREMITIES, i. e. the legs, arms, nose, and ears. Coldness in the extremities, which do not easily warm, are bad presages in severs.

ACRETON, UNMIXED WINE. Hippocrates expresses

by it, vehement, excessive, intemperate. ACRID A. ACRID MEDICINES.

Acrids are fubiliances of a penetrating pungency: applied to the fkin they inflame it; chewed, they promote

price to the ikin they inname it; chewed, they promote a difeharge of the faliva; and fnuffed up the nofe, they provoke fneezing.

Confidered as the fubjects of pharmacy, they may be divided into claffes, according as they yield their acrimony, which they do, 1ft, by difflation. Thus muftard, horfe-radift, feurvy-grafs, &c. give out their properties. 2dly, By infufion only, as is the cafe with the greater celandine, pyrethrum, &c. 3dly, Neither by infusion nor diffillation, as happens with the arum, dracunculus, &c.

The general effects of acrid medicines are to ftimulate the folids, and to dislove tenacious juices. In leucophleg-

matic habits, they are powerful expectorants, deobstru-ents, diuretics, and emmenagogues; and if the patient is

kept warm, they are good diaphoretics.

In constitutions disposed to inflammation, or where there is already a degree of irritation, where the juices are too thin and acrid, or the vifcera not found, these medicines are not to be used, for they aggravate these disor-

The trouble which acrid medicines give to the flomach,

is that on which their virtue frequently depends.

ACRIFOLIUM, any prickly-leaved plant.

ACRIMONIA, ACRIMONY. Sharpnefs, eagernefs, tartnefs, &c. See ACIDA. —— ALKALINA. See ALKA-

ACRIS. The top of a mountain, also the sharp extremities of fractured bones. It is also a locust, i. c. the infect fo called, and which the Indians, and fome others, commonly eat.

ACRISIA. It is when a distemper is in so uncertain and fluctuating a condition, that it is difficult to pass a right judgment on it. Blancard.

ACRIVIOLA. See NASTURTIUM INDICUM. Of acer, fbarp, and viola, a violet.

Miller takes notice of five species.

ACROBYSTIA, from aspos, extreme, and Bow, to cover.

The extremity of the prepuce.

ACROCHEIRIA, from aspec, extreme, and zeep, a hand.

A fort of wreftling, in which they only held by the hands.

Dacier fays, the combatants fqueezed each other's hands

ill state of health, joined with a loss of colour in the face. | warts, from their being fituated on the skin. Wiseman calis

on the tkin, with a flender base, so that the excrescence feems to hang by a ftring.

Sometimes they fuddenly disappear, at others they in flame or suppurate. Celfus observes, that if they are cut

out, they leave no root, fo do not grow again.

ACROCHORISMUS, from ango, extreme, and noppus;
to dance. An exercise of dancing, with violent motions of the legs and arms. Schulzius fays, they joined head to head, and hand to hand, and strove to puth one another out of their places. ACROLENION. See OLECRANON.

ACROMION. See SCAPULA. From axp@, extreme, and wase, the Shoulder.

ACROMIUM, from expos, extreme, or the top of, and up. bumerus, the top of the shoulder blade.

ACROMPHALION, from expos, extreme, or the tip, and expanse, navel. The tip of the navel, or the middle of the navel. of the navel.

ACRON. In a medical fenfe, it is the best of its kind.

In botany, it is the top or flower of thiftles.

ACROPATHOS, from expert, extreme, and wedges, a difease. It literally fignifies a difease at the height. Hippocrates applies it to the internal orifice of the uterus, and to cancers on the furface of the body, to diflinguish them from those that are inward, except he means the

alcerated, and those that are not broke.

ACROPIS, from onjog, extreme, and ol, the voice, when the voice cannot be exerted. An inarticulation of the voice, from an imperfection in the end of the tongue. It is once used adjectively in the spurious works of Hippogrates, but no where determined in its fignification and orthography.

ACROPOSTHIA, from augos, extreme, and goods, the prepuce. That part of the prepuce which is cut off in

circumcifion.

ACROPSILON, from any D, the extremity, and Joses, naked. The extremity of the glans when naked.

ACROSAPES, from axpos, extreme, and onau, to putrefy. Galen explains this, as foon changed in its superficies, or cafy of digeftion.

ACROSPELOS, a name of the WILD OAT-GRASS, or

BROMUS of Diofcorides.

ACROTERIA. The extreme parts, as the hands, feet,

ears, and nofe.

ACROTERIASMUS. The amputation of an extremity. From augusting, extremities, and this from augo,

ACROTHYMIA. See Nævus.

ACROTHYMION, from ozpa, extreme, and Souses, thyme. A fort of wart described by Celfus as hard, rough, with a narrow basis, and broad tops; the top is of the co-lour of thyme, it easily splits and bleeds. This tumor is also called thymus.

ACMO. RED CORAL.

ACT. MED. An abbreviation of Thomae Bartholini Acta Medica & Philosophica Hafniensia, vol. i. 1673-2. ib. vol. ii. 1677, &c. vol. v. 1680. ACT. PHILOS. & TRANSACT. PHILOS. The

Philosophical Transactions.

ACT. REG. SC. The Histories and Memoirs of the Royal Academy of Sciences at Paris.

ACT. S. R. Acta Societatis Regiæ, or Philosophical Transactions, London, 4to. ACTÆA. An herb mentioned by Pliny, which Ray

thinks is the aconitum racemofum.

ACTE, anth. The Elder. See Sambucus.

ACTINE. The herb bunias, or napus.

ACTINOBOLISMUS. IRRADIATION. It is applied to the spirits, conveying the inclinations of the mind to the body; it is also called diradiatio.

ACTIO, vel Functio.

The actions or functions of the body are divided into

the vital, natural, and animal.

The vital functions, or actions, are those which are abfolutely necessary to life, and without which there is no life, as the action of the heart, lungs, and arteries. On string. This is one instance, which, as Galen observes, the action and reaction of the solids and sluids on each other, depend the vital functions. The pulse and regave names to things. This name they gave to a fort of folutely necessary to life, and without which there is no life, as the action of the heart, lungs, and arteries. On

blood from the fame.

The natural functions are those which are instrumental in repairing the feveral loffes which the body fuftains; for life is destructive of itself, its very offices occasioning a perpetual waste, The manducation of food, the deglutition and digettion thereof, also the separation and distribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by thefe our aliment is converted into our nature. They are necessary to the continuance of our bodies.

The animal functions are those which we perform at will, as mufcular motion, and all the voluntary actions of the body; they are those which constitute the senses of touch, tafte, fmell, fight, hearing, perception, reasoning, imagination, memory, judgment, affections of the mind. Without any, or all of them, a man may live, but not so comfortable as with them.

The actions peculiar to the fexes are, of the organs of generation of either fex.

Private actions are fuch as regard particular parts.

Public actions are those which are performed for the fake of the whole body; fuch is the action of the stomach in digefting the aliment, &c. These are all called functions.

But each part hath an action peculiar to itself. Thus the office performed by the muscles, vessels, glands, and viscera, are called their respective actions. See professor Whyte's Treatise on Vital Motions.

ACTON, a town near London, where is a well that affords a purging water, which is noted for the pungency of its falt. This water is whitifh, to the tafte it is sweetith, with a mixture of the fame bitter which is in the Epfom water. The falt of this water is not quite fo foft as that of the Epfom, and is more calcareous than it, being more of the nature of the falt of lime: for a quantity of the Action water being boiled high, on being mixed with a folution of fublimate in pure water, threw down a yellow fediment. The falt of the Acton water is more nitrous than that of Epfom; it firikes a deep red, or purple, with the tinct. of logwood in brandy, as is usual with nitrous falts; it does not precipitate filver out of the ni-trous acid as common falt does. It j. fs of this water yields 48 grains of falt. See Allen's Hiftory of Purging Waters.
Dr. Rutty got 340 grains, or five drams two fcruples of

fediment by evaporation from one gallon: of this five drams and 21 grains were vitriolated magnetia, or vitriolated abforbent earth, called formerly nitrum calcarium; which took forty-eight times its own weight of water to diffolve it; and 19 grains of earth which did not calcine to lime, but diffolved in the vitriolic acid. This is efteemed one of the strongest purging waters near London. It is drank from one to three pints in a morning.
Monro's Medical and Pharmaceutical Chemistry.

ACTUALIS, ACTUAL. This word is applied to any thing endued with a property, faculty, or virtue, which acts by an immediate power inherent in it: it is the reverse of potential; thus, a red-hot iron or fire is called an actual cautery, in contradiftinction from cauteries, or caulties, that have the power of producing the fame effect upon the animal folids as actual fire; thefe laft are called potential cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of ittelf cold. Hence actu and actus.

This is the medicinal fenfe of the word; in logic and

metaphysics it is used otherwise.

ACTUATIO, ACTUATION. That change wrought on a medicine, or any thing elfe taken into the body, by the vital heat, which is necessary to make it act, and have its effect.

ACUITIO, sharpening an acid medicine by adding more acid, or the increating the force of a medicine by adding fomething of the fame fort.

ACULEI, the prickles and thorns on vegetables.

ACULON, or Aculos, the fruit or acorn of the ilex,

ACUMEN, A SHARP POINT. This term was introduced into anatomy by Daventer, in his Ars Obstetricandi; he calls the protuberances of the offa innom, on which we offis facri, the pointed part of the facrum.

all those which hinder the influx of the venal blood into ACUPUNCTURA, ACUPUNCTURE. Bleeding per-the cavities of the heart, and the expulsion of the arterial formed by making many small punctures. This method is practifed in Siam, Japan, and other oriental nations, on all parts of the body. In fome parts of America this practice is also in use, according to the accounts given in Dampier's Voyages.
ACUREB. LEAD.

ACURON, a name of the alifina.
ACUS, a NEEDLE. This inftrument is necessary in confining the lips of wounds, taking up and tying bloodveffels, &c. They are of various forms, according to the use they are defigned for: it is of confiderable importance that they should be sharp, and of good metal that is well tempered. See Bell's Surgery, vol. i. Likewife the name of a fifh called the tobacco pipe-fifh; is found in the gulf of Venice. There is another fifh that bears this name. And it also fignifies chaff.

ACUS PASTORIS, a name of the fcandix, i. e. SHEP-HERD'S NEEDLE, or VENUS'S COMB. --- For that called

Moschata. See GERANIUM MOSCHATUM.

ACUSTICUS, belonging to hearing. It is applied to the auditory nerve, and to medicines or inftruments used to affift, preferve, or recover hearing. ACUSTO. NITRE.

ACUTENACULUM. Heifter calls the pertaiguille by this name; it is a handle for a needle, to make it pe-netrate easily when stitching a wound. Beil's Surgery,

ACUTUS MORBUS. Acute discase, from acuo, to

quicken or sharpen.

An acute difease moves quickly to its end, and is attended with danger. There are discases without danger, that are of a short duration, so are distinct from the acute, as an ephemeris, &c. An acute difease is the opposite to the chronic, which are flow in their progress, and not so generally dangerous. Wallis's Sydenham, 1.
ACYISIS. In Vogel's Nofology it is a defect of con-

ception, or barrenneis in women.

ACYRUS. GERMAN LEOPARDS BANE. See Doro-NICUM GERMAN.

ADAL. According to Paracelfus it is the part of plants in which the medicinal virtue confifts, or the pure and active parts feparated from the impure and inert.

ADAMITA. Stones in the bladder are called adamita.

ADAMUS, Adam. The PHILOSOPHER'S STONE.

ADANSONIA. See BAOBAB.

ADARCES, a faltish concretion found about the reeds and grafs in marshy grounds in Galatia; it is also called culomochamus. It is lax and porous, like bastard-sponge. It is used to clear the skin with in leprosies, tetters, freekles &c. Dr. Plott gives an account of this production in his Natural History of Oxfordshire.

ADARNECH. ORPIMENT. See AURIPIGMEN-

ADARIGES. See SAL AMMONIAC.

ADARTICULATIO. See ARTHRODIA, also Pro-

ADCORPORATIO, ADCORPORATION, or clinging

together in one body.

ADDEPHAGIA, or ADEPHAGIA, from afer, abundantly, and payers, to cat, INSATIABILITY, a VORACIOUS

APPETITE. It is the Bulimia Helluonum. See BOULIMUS.
ADDITAMENTUM, the fame as epiphylis. The large epiphylis of the ulna is called additamentum necatum. ADDITAMENTUM COLLI, a name of the appendi-

ADDUCENS, vide RECTUS INTERNUS OCULI.

ADDUCENS HUMERI. See PECTORALIS MAJOR. ADDUCTOR, a leader to, from adducere, to move or bring towards. A name of feveral mufcles. — AD MINIMUM DIGITUM. It rifes from the unciform process of the carpus towards the annular ligament, and is inferted into the whole length of the infide of the metacarpal bone of the little finger .--- Auris. It is a common muscle, being a part which Sp gelius calls quadratus buccas detrabens, from its insertion is a fiethy fibrous elongation implanted into the root of theear .- DIGITI MINIMI PEDIS, called also transversalis pedis placentini. It rifes from the fourth metatarial bone, and going over the knobs of the toes, runs to the external fefamoid bone. sit, the offa sedontaria, which he says are the acumina of Douglas says it brings the third and fourth lesser toes the offa pubis; and he calls the os coccygis the acumen nearer the other two, and the great one .- Femoris offis facri, the pointed part of the facrum. PRIMUS vel LONGUS. It arises from the os pubis, next

the pectinaus, above the gracilis; which turning into a compact flefly belly, it begins to be inferted tendinous about the middle of the linea afpera, being continued down upon the fame, five or fix inches, fending out a tendon which joins in with that of the fourth head.—

Femoris secundus vel brevis. It arifes from the os falt, volatile alkaline falt, and water. In human fat and publis, immediately under the gracilis, by a broad tendinous, but chiefly flefhy beginning, and is inferted into the linea afpera, from a little below the leffer trochanter, to the first infertion of the last described muscle .-- FE-MORIS TERTIUS, vel MAGNUS. It arises lower down than the former, from the outer edge of the os pubis & ischium; and running obliquely towards the trochanter minor, is inferted near the glutæus maximus. This and the next mufele, are described as one musele, by Albinus and Winflow, under the names of Adduttor magnus fe-moris, and le troisieme muscle du triceps. FEMORIS QUARTUS. It arises from the protuberance of the ischium; and the adjoining interior part of that bone, by a tendinous or sleshy origin. It is inserted by a round and a long tendon into the upper and rough part of the inner and lower appendix of the os femoris, being affixed to that bone a little above the condyle, as also to some part of the linea aspera. The above four muscles are described by Dr. Hunter, &c. as one, and under the name of TRI-CEPS, which fee. Their use is to adduce, or move the thigh inwards, according to their different directions. Douglas.—Ocula, also called reelus internus. It rifes tendinous and fleshy from the edge of the hole in the fphenoid bone that transmits the optic nerve, and is inferted by a thin tendon into the tunica felerotica, where it refpects the great canthus. It brings the eye towards the nofe. Some call it bibitorius, as it directs the eye toward the glafs in drinking.—Pollicis Manus an Indicem. Riolan calls it antithenar. It rifes from the fore part of the metacarpal bone of the fore-finger, joins with the anterior portion of the flexor fecundi internodii pollicis, and is inferted with it into the fefamoid bone. See ABDUCTOR INDICIS. — POLLICIS PEDIS. It rifes by a long thin difgregated tendon from the os calcis, under the tendinous part of the massa carnea, from the os cuboides, the os cunciforme medium, and from the upper part of the os metatarfi of the second toe; it is soon

upper part of the os metataria of the second toe; it is soon dilated into a pretty large belly, and is inferted in the external os sefamoides of the great toe. Douglas says it brings the great toe near its next.

ADEC, four milk, butter-milk.

ADECTOS, from a negative, and saxes, to bite, an epithet given to medicines that relieve from the biting sense of pain, by removing the uneasiness caused by stimulante.

ADENDENTES, phagedanic or eating. It is applied

ADELPHIA, a relation; fo Hippocrates calls diftem-pers that refemble each other.

ADELPHIXIS, the analogy, relation, or fimilitude of one thing with another, or the communication, confent, or sympathy of a part with another.

ADEMONIA, of a negative, and Sauces, a genius or

divinity, or fortune. Hippocrates uses this word for un-easiness, reftlessness, or anxiety felt in acute diseases,

and fome hyfteric fits.

ADEN, a gland. See GLANDULA. Sometimes it fignifies the fame as bubo. Blancard.

ADENES CANADENSIS. See BATTATAS CANA-

ADENOIDES, from a Inr, a gland, and a I . a form. Glandiform, or like a gland. This word also is used for

the profitate, which fee.

ADENOSUS ABSCESSUS, a hard crude tubercle, refembling a gland, difficult to be refolved.

ADEPHAGIA. See Addephagia.

ADEPS, FAT, called also pinguedo, pinguis, axungia, butyrum, &c. Fat is an animal oil, contained in that part of the cellular membrane called membrana adipofa. In the young feetus is fearce any fat, the omentum feems only to contain a jelly, but in the older feetus fat begins to appear.
When the child is born, and during a few years after, it hath much fat immediately beneath the fkin; in men

How it is separated from the blood, is not certainly known. There is also a fatty substance, got from the guage. Miller's Dict.

falt, volatile alkaline falt, and water. In human fat and the fuet of beatls that chew the cud, water is contained in a fmall quantity, an inflammable oil in a large portion, and an auftere empyreumatic liquor that is acid: Macquer, in his Chemiftry, denies that it contains any alkaline falt. It is more fluid in living than in dead bodies, and its fluidity is hindered by the cells which contain it; indolence renders it less fluid, whence by inactivity it is accumulated.

Fat differs from fuet principally in the great quantity of water it contains, which being flowly evaporated, is converted into a febaceous fubstance. In the human body it sometimes concretes into a hardish substance, forming

tumors of the steatomatous kind.

In profuse sweating the fat is melted down, and passes off through the pores, and thus the person is much weak-ened. The human fat does not become fluid when Fahrenheit's thermometer rifes to the ninetieth degree; but when it begins to putrify, it eafily, and with a small degree of warmth, runs into oil.

In cetaceous fishes, the fat is thin as oil; in animals that live on herbage only, the fat is harder, and yet harder in

those that chew the cud.

The Arabians used a great variety of fats in medicine; but to relax the parts to which they are applied, and to stop perspiration, are all the chief virtues that experience Itop perspiration, are all the chief virtues that experience manifests in them. In the present practice, three kinds only are met with, and these only on account of their different confisence; they are the fat of vipers, hogslard, and mutton-suet. Their use is wholly external. As to vipers fat, it is well supplied by the oil of olives; for it does not appear that animal fats, and insipid, slavour-less, vegetable oils, of similar consistence, differ in their effects when used externally; in other instances too, there seems to be a greater similarity of nature betwist animal and vegetable fats, or insipid oils, than in any other similar animal and vegetable supplied to supplie the supplied oils, then in any other similar animal and vegetable fublishences, such as gums and fimilar animal and vegetable fubitances, fuch as gums and animal jellies: animal fats, in their refolution by fire, yield neither the peculiar stench, nor much, if any, of the volatile alkaline falt, which substances completely animalized afford.

Animal fats are not foluble in fpt. vin. R. nor in water. When feented with effential oils, the oils may be totally extracted by digeftion in fp. vini R. And by the fame means also, in a leffer degree by water. Fats may thus be freed from their ill-fmell; and those that are become

very rancid, may be made very fweet.

Animal fats preserve steel from rust better than vegetable ones: mutton fuct prevents brass from growing ill-coloured, longer than any other fat; and if a little camphor and white lead is added, these ends are still better answered.

Adipis Suillæ Sevique Ovilli Præparatio.

The preparation of Hogs lard and Mutton fuet.

Cut them into pieces, and melt them with a flow fire, then separate them from the membranes by strainings Ph. Lond. 1788.

The fat of vipers being separated from their intestines, may be melted before a gentle fire, and run through a

thin linen cloth.

See Haller's Physiology, in the chapter on the cellular membrane.

ADEPTA PHILOSOPHIA. ADEPT PHILOSOPHY. It is that philosophy, whose end is the transmutation of metals, and an universal remedy. The professors of this philosophy are called adepti, adepts. Paracelsus calls that, medicina adepta, which treats of the diseases that are contracted by celestial operations, or communicated

ADHATODA. The MALABAR NUT. There are two fpecies, viz. the adhatoda Zeylanenfium; or, common Malabar nut; and the adhatoda Indica, the willowleaved Malabar nut, commonly called the fap-tree. These are of the genus called by Linnæus justicia.

ADHESIO. ADHESION.

For the most part, if any of those parts in the thorax or belly lie in contact, and inflame, they grow together. The lungs very frequently adhere to the pleura.
On this subject see Dr. Flemyng's treatise on adhæsions,

or accretions of the lungs; or an abstract from it in the

Med. Muf. vol. i

ADIACHYTOS, from a negative, and diayou, to dif-

fuse, scatter, or be profuse. Decent in point of dress.

Hippocrates thinks the dress of a fop derogatory from the physician: he says, that many in his day hid their ignorance under ornaments of dress, and strove to get the good liking of the people by their appearance at the pub-lic games.

ADIANTHUM, ADIANTUM. MAIDEN-HAIR. Also called polytrichon and polytrichum, from woods, much, and Spis, bair; expressive of a capillary herb.

Maiden-hair is an evergreen low plant, with slender, fmooth, shining, blackish stalks, without any manifest flower: the feeds are a fine dust, lying in roundish specks about the edges of the backs of the leaves, which curl over and cover them.

Five species are noticed by botanists.

1. Adianthum verum; called also capillus Veneris; adianthum foliis coriandri; adianthum vulg. It is the adianthum capillis Veneris. Lin.

THE TRUE MAIDEN-HAIR.

It is about fix inches high, with feveral pinnæ of little roundish finuated or nearly triangular leaves, toward the tops of the stalks: it consists of a single stem, and is not branched out as that which is commonly fold in London for it. It is found in Cornwal, and in the mountainous parts of Wales; but is most plentiful in the fouth of Europe, as in France, Italy, &c.

2. Adianthum Canadense; also called adiant. fruticosum Brazilianum, avengua; adiant. Americanum, & capil. Veneris Canad. It is the adiantum pedatum Lin.

AMERICAN, OF CANADA MAIDEN-HAIR.

It refembles the true, but hath spreading branches. It is a native of America, but is cultivated in our gardens,

and is the strongest and most agreeable of all the forts.

3. Adianthum nigrum; called enopteris mas. adiant. foliis longioribus, filicula, calliphillum, callitrichum, trichomones, and polytrichum. According to Linnæus it is the afplenium trichomanes, or afplenium frondibus pinnatis, pinnis fubrotundis crenatis. Common MAIDEN-HAIR.

COMMON, OF ENGLISH BLACK MAIDEN-HAIR. It is a finall plant without stalks; the leaves are long, narrow, composed of little roundish dark-green segments, fet in pairs along a fhining black rib; the feeds are a fine duft, lying on the backs of the leaves. It is perennial, grows wild on flady grounds, old walls, and rocks. It hath a mucilaginous and roughish taste, but little or

no flavour.

4. Adiant. album; called also ruta muraria; falvia vita; paronychia; filicula petraa ruta facie; muraria fem-per virens vulgaris; and adiant. montanum. It is the asplenium ruta muraria Lin. WHITE MAIDEN-HAIR, wall rue, rue maiden-hair and

It is a native of hot countries, and possesses some degree

of the virtues of the above species.

5. Adiant, aureum; also called polytrichum aureum; muscus capillaceus major; aureus capillaris medius, &c. It is the polytrichum commune Lin.

GOLDEN MAIDEN-HAIR, OF GOLDILOCKS.

The three first species only are in general use with us; the third supplies the place of them all. These plants, as do all of the capillary tribe, abound with a neutral saponaceous quality, approaching to nitre: they give out, with their mucilage, all their virtue to boiling

The best preparation is a strong infusion made with boiling water, and fweetened with liquorice root. To be

drank freely.

The French make a fyrup of the true fort, and flavour it with orange-flower water. The Canadians make a fyrup of theirs, in which they use maple fugar.

Our confectioners prepare a fyrup as follows, which they fell by the name of fyrup of capillaire.

R Decoct. capil. Veneris Canadense, fb vj. mel Britan. 3 xviii. fac. alb. opt. fb vii fs. m. & fub finem coct. adde

ay. flor. aurant. 3 iii.

These syrups allay tickling coughs from desluxions of thin rheum, and assist the expectoration of phlegm.

As the virtues of these herbs are contained in their mucilage, they lose nothing by drying. The slavour of the Canada species may suffer by the boiling; but, as a pectoral, that loss is of no consequence.

ADIANTHUM ALBUM FILICIS FOLIO. A fpe-

cies of fern.

ADIAPNEUSTIA, from a negative, and frames, to perspire, or a, neg. Sia, per, and wna, to breathe. De-fective perspiration from dense pores, or suppressed per-

ADIAPTOTOS, from α, negative, and διαπιπίω, to flumble, or flide. The word fignifies firm; but in medicine it is the name of a remedy against the colic, made of stone-parsley, henbane-seed, white pepper, &c. made

ADIARRHOEA, from α, negative, and Διαρός ω, per-fluo, to flow out, or through. It lignifies a total suppres-of all the necessary evacuations.

ADICE, adon, a nettle.
ADIPIS SUILLÆ PRÆPARATIO, OLIM AX-UNGIÆ PORCINÆ CURATIO. See Adeps.
ADIPOSÆ ARTERIÆ. They are branches from

the phrenic arteries, which are spread on the fat that covers the kidnies. See CAPSULARES ARTERIE &

SPERMATICA ARTERIA.

ADIPOSA vel CELLULOSA MEMBRANA. The CELLULAR MEMBRANE is fo called, where it contains a white granulated matter, capable only of being fused by heat. Dr. Hunter says, that it is a composition of ductile membranes for the lodgment of oil, connected by a fort of net-work. It composes the greatest bulk of the body, and is called adipous, where there is fat; and reticula, where there is none. The Doctor farther observes, that it is composed of two kind of cells, viz. the reticular, which communicate with each other; and the adipous, which are diffined from the other, and do not communicate, but are refervoirs of the animal oil: what convinces us of this distinction is, that, in the anafara, the water goes downward whilst we are in an erect posture, but the oil does not.

The adipose membrane does not convey the venereal virus,

as is supposed by Boerhaave.

ADIPOSÆ VENÆ. These spring from the emulgents, and go to the pinguious covering of the kidnies.

ADIPOSI DUCTUS. The bags or ducts containing

ADIPSATHEON. The name of a thorny thrub in the island of Rhodes.

ADIPSIA. WANT OF THIRST. Dr. Cullen ranks this as a genus of diseases, in the class locales, and order dysorexise. But he thinks it is generally, if not always, fymp-

ADIPSON, Asylor, from a, negative, and salve

Hippocrates applies this word to oxymel; and observes, that the ptissana, by its glutinousness, is adiplon, i. e. a preventer or curer of thirst.

Medicines were thus named that allayed thirst, if used for that end; and may be applied to fuch as do not pro-

Some cold things by not exhaling the moisture, and fome hot ones by foliciting the faliva, are of this fort. The Greeks called liquorice-juice by this name. See

GLYCYRRHIZA.

ADIPSOS. The Egyptian palm-tree is thus named by the Greeks. Its fruit, before it is ripe is called myrobalons. Theophrastus calls this tree Banar , i. c. mast, from its fruit; but it is called adipson, because its fruit, before it is ripe, quenches thirst.

Adiples is a name of liquorice; and of a catapotium, or pill, composed by Asclepiades, which is made of the

feeds of cucumbers, purflane, &c.

ADIRIGE, i. e. Ammoniacum, most probably the falt. ADJUTORIUM. The bumerus; also an external medicine used to afful internal ones.

ADJU-

ADJUVANTIA. See JUVANTIA.

ADMELLA. See ACMELLA.
ADMIRABILIS. An hyperbolical epithet to particular preparations: it was generally applied to factitious medical stones.

ADNASCENT, of Adnascor. To grow to, or close

ADNATA, AGNATA, from adnafcor, to grow to.

The outer coat of the eye; called also circumcalualis, circumosfalis, albuginea, conjunctiva, epipephycos. It is that which makes the white of the eye. This is formed by the tendinous expansions of its muscles; or rather owes its whiteness to their lying under it, and is not numbered among its proper coats. It is extremely fenfible, and abounds with blood-veffels, which are very vifible in inabounds with blood-veners, which are very vinoue in in-flammations. It covers fo much of the eye as is called the white; and being reflected all round, it lines the two eye-lids, and thus hinders any thing from falling into the orbit. Where it covers the eye-lids, it is vafeular and papillous. In paffing over the orbit, it does not end at the cornea, but becomes transparent there, and is of different textures in different parts where it is spread. The felerotica appears under it.

When a foreign body gets between the eye and the eyelid, it is hooked in the villi: the best way to extricate it is, to invert the eye-lid, and to introduce a probe armed with lint and dipped in oil, which will extract it.

The inverted eye-lid proceeds from this coat. Though it is exactly commensurate to the orbit in health, yet in morbid habits, when it is inflamed, it is thickened and puffed out. If it does not yield to general remedies, as bleeding, purging, &c. fearify it, and if this also fails, cut off the redundant part.

ADNATA femilies such parts of animal or many

ADNATA, fignifies fuch parts of animal or vege able bodies as are infeparable, as the hair, wool, fruits, horns; or elfe accidental, as fungus, mifleto, and ex-

ADNATA, ADNASCENTIA, are those off-fets which, by a new germination under the earth, proceed from the fily, hyacinth, &c. ADOLESCENS, the iron bars that support the fire

in a grate or furnace.

Paracelfus would make a man without a woman, and digefted femen mafculinum in a glass placed in a dunghill, and produced fomething like a man, according to the affertion of fome of his disciples; this was called homeneulus Paracels, but would be as properly named adolescens.

ADONION, a species of southernwood.
ADONIS FLOS. RED MAITHES, OF PHEASANT'S EYE; Adonis annua of Linnæus, called also eranthemus. leaves are like those of fennel or camomile; the flowers have many leaves, expanded in the form of a rofe. The feeds collect into oblong heads. It is of no particular ufe in medicine.

Three or four species are described in Miller's Dict.

ADOR, a fort of corn called *spelta* and zea, SPELT CORN. Dioscorides mentions two kinds of the monococcous and the dicoccous, that is fuch as has only one grain or two in a hufk.

ADOS, water in which red-hot iron is extinguished.
ADRA RIZA. See rad. aristoloch.
ADRACHNE, STRAWBERRY BAY, also called comars, cometa. It is a shrub which grows in the isle of Candy; it bears fruit twice in the year; its leaves exactly refamble those of the bay tree, excepting that these have no smell; the bark is so smooth and red, that the whole thrub refembles red coral. In Crete and all Greece it is called a france. Raii Hift.

ADRACLA, i. e. Adrachne.

ADRAGANTH. See GUMMI TRAGACANTHA.

ADRAM. See GEMMÆ SAL.

ADRARAGI, GARDEN SAFFRON, called also afan, and

ADROP. Rulandus calls it azar, lapis ipfe, and azane. Ripley calls it azifur, or plumbum rubeum. It is a chemical term denoting the body itfelf, or lead, from whence mercury ought to be taken for the philosophers stone; in which signification it is taken also by RIPLEY. Or it denotes the philosophers stone itself. It is also called fa-

than the Arabian, being impure, black, and in large

lumps.
ADROTERON. See ALICA.

ADSAMAR, urine.
ADSELLARE, to go to ftool.
ADSTRICTIO, ADSTRICTION. It either expresses the flyptic quality of medicines, or the retention of the natural evacuations, by the rigidity of the respective emissions. s. See Constipatus.

ADSTRINGENS. Aftringent.

ADULTERATIO. To adulterate, corrupt, or coun-

terfeit. He that counterfeits medicines is often both a robber and a murderer.

ADUNATOS. See ADYNAMIA.

ADUSTIA. Adult, burnt, scorched, or parched, from adure, to burn, &c.

ADY, vel Palma ady. A palm-tree in the island of St. Thomas, which affords plenty of juice, that ferments into wine. The entire fruit is called by the Portuguese carvices and carissse, the natives call it abanga. The fruit externally is like a lemon, and contains a stone, the kernel of which, if heated in hot water, gives out an oil of a fassron colour, it concretes in the cold, and is used as butter: of these kernels the inhabitants give three or or four as a reflorative, two or three times a day.

ADYNAMIA, from a, negative, and fraqui, firength, force; LANGUOR, weakness, impotence from fickness or disease: adunatos, leipopsichia. Also drowsiness, or sleepiness, lassitude, DEFECT OF VITAL POWERS. In Dr. Cullen's Nofology, this word diftinguishes an order in his class neurofes: he defines it to be difeases confisting in a weak-

nefs or lofs of motion, in either the vital or natural func-tions. These diseases are also called defellivi.

ADYNAMON, a factitious wine. It is made of two parts must and one of water, which are boiled together till as much is confumed as there was added of water.

It hath the fame derivation as adynamia.

ÆDOIA, from assay modefly. The fame as pu-

denda

ÆDOSOPHIA, from αιδοσα, pudenda, and ποσορω, editum edo. In the Nofology of Sauvages, also of Sagar, it is defined to be a flatus paffing from the uterus, from the urinary bladder, through the vagina or the urethra; hence is it formed into two species, EDOSOPHIA URETHRÆ & UTERINA. This flatus is fometimes very foetid, which circumstance cannot always be accounted for. It fometimes happens when women are in labour, and hath been taken for a fign that the child is dead, but this cannot be depended on; an intolerable stench sometimes attends when the child is living. See Sauvages No-

fologia Methodica, vol. ii. p. 417.

ÆGAGROPILA, from asyays. The ROCK-GOAT, chamois, or gems. It is a little ball found in the ftomach of goats in Germany, formed of hairs which they lick. Such are found in the ftomachs of cows, hogs, ftags, &c.

Such are found in the itomachs of cows, hogs, itags, &c. with us. See Bezoar and Capra alpina.

ÆGEIRINON. Arrips, a poplar. An ointment fo called, because the fruit of the poplar, or its catkins, are an ingredient in it.

ÆGEIROS. The poplar-tree.

ÆGIDES, arris s. Small white cicatrices of the eyes, caused by a sharp humour there; or small white

concretions on the pupil; called also aglia.

In inflammations we see little white specks on the pupil of the eye, like a film, if an afflux of humours are confiderable; these always disappear spontaneously when the inflammation is resolved and the humours diverted; but if fliarp powders are used, or collyriums applied, they oft are hardened fo as never after to be moved.

feem to be what are meant by ægides. See Albugo.

ÆGIDION, from argress, or ægge. The name of a collyrium for informations and defluxions of the eyes, called alfo ægopresophon.

ÆGILOPS. See ÆGYLOPS.

ACOCERAS, from act, a geat, and seeas, a horn, FOENUGREEK, so called because the pods were supposed to refemble the horns of a goat. Also a name of boucerus, which is so called because the fruit is corniculated.

ÆGOLETHRON, from ait, a goat, and on these, de-firuction. Dioscorides, Pliny, and others, take notice of thernus, i. e. antimony, or plumbus.

ADROBOLON, from as pos, large, and Buxos, a globe, bees gather honey about Heraclea in Pontus, which hobels, or mass. The Indian bdellium, which is coarser ney is sometimes possonous, sometimes not. Tournesort

goat, and sout, a boof, because of the hardness of the seed.

ÆGOPODIUM See Angelica sylv. Minor.

ÆGOPROSOPON. The same as agidion.

ÆGRITUDO BOVINA, See BOVINA AFFECTIO. ÆGYLOPS or Ægilops. A difeafe in the inward corner of the eye; fo called from act, a goat, and act, an eye, or goat's eye; because, according to some, goats are subject to this disease.

Paulus Ægineta calls it anchylops before it burfts, and egylops after. Avicenna calls it garab and algarab. Anchylops and agylops, are but different states of the different called situal lachrymalis, which see. The agylops is the filtula lachrymalis beginning to discharge pus. Dr. Wallis fays, Why the diffinction of the ancients should be at present neglected with respect to the anchylops, and agylops, and a general term adopted which is in itself highly absurd, will not be easy to account for. Surely to denominate a complaint filtulous, where no fiftula exists must be ridiculous, and the two different fpecies as well as a third are styled fiftula lachrymalis by the moderns. Some of the ancient phylicians confidered the lachrymal fac in its state of tumefaction as an achylops; when ruptured an ægylops; and certainly the dif-tinction ought to be preferred.—See his Nofologia Metho-

dica Oculorum. Article, Epiphora a Rhyade. It is either fcrophulous, atheromatous, or of the nature

of a meliceris.

Sometimes it is a fymptom of the lues venerea. Sometimes it is with, and at others without inflammation. If

When it is strumous, it proceeds from congestion, and the tubercle is round without discolouring the skin. is caused by fluxion, pain and redness appear, with in-flammation all over the eye. Sometimes it begins with a weeping, and is not suspected until a redness appears in the eye, and then by a gentle prefiure on the part, a matter is discharge, a part of which resembles the white of an egg. If this matter makes its way into the nose, it acquires a feetid fmell, and is discharged through the nostril.

As to the cure, if the case is recent, we should begin with a cautious use of bleeding and purging; or if these are contraindicated, give such alteratives as are most esteemed in scrophulous disorders. The tumor may be refolved by anodyne and discutient applications; but if there is a tendency to a suppuration it should be hastened, and the discharge of the pus, with all convenient speed, left the bone underneath should be affected; the abscess cleanfed and healed, with the tinct. of myrrh and aloes mixed with mel rofe. If the matter hath paffed also under the cilium, a powerful deficcative, such as strong lime-water, assisted by a compress, should be used.

If the periofteum under the tumor is laid bare, an exfoliation must be hastened by a caustic, and a passage open-ed into the nose, after which dry lint alone may suffice. Too constricting medicines may produce a rhyas, fee RHYAS; too digestive applications may give rife to an

encanthis.

Sce Galen, Actius, Celfus, Paulus Ægineta, Actua-rius, Sennertus, Wifeman, Heister, Pott, Bell, Kirkland. ÆGYLOPS & ÆGILOPS. Afpris maurerum, corrus.

Names of the HOLME OAK, WITH GREAT ACORNS. Quereus Ægilops. Lin. In Venice the acorns of this tree are called Vallonia, the name of the city from whence they are brought. They use them there for tanning of leather;

their diameter is in general about an inch and a half.

ÆGYLOPS, or ÆGILOPS. Avena sterilis, Bramus
sterilis, Festuca avenacea, Gramen avenaceum. The GREAT
WILDOAT GRASS OF drank. The roots are full of small fibres, feveral stalks rife from a root, and are jointed. It grows in hedges and the sides of fields in May. By culture it becomes a species of corn. In the northern parts of A-merica it is improved to great advantage; and in the low wet boggy grounds in Great Britain, it would be profitable, perhaps, beyond any thing elfe, as it thrives best in water. It grows like oats, but in quality is more of the rice kind. A decoction of the roots kills worms.

fays it is the chamaredodendron. See Mem. de l'Acad. That called—Bromoides, vel festuca long. arist. C. Roy. des Sciences, 1704.

EGONYCHON. GROMWELL. So called from act, a leaves are small, long, and narrow; it consists chiefly of a few flender stalks, which terminate with oaten ears, but empty husks, of a bright colour. These have a long beard. — NARBONENSIS, called also festura stalica, and gramen festuca, HAVER-GRASS. It is common in Sicily and some parts of France. It runs up to about a foot high, having but few leaves, which refemble those of wheat or barley; at the top of the stalks are small ears, with hufks containing a feed like barley: these husks are imair ears, with hufks containing a feed like barley: these husks are imair ears, with hufks containing beard.

ÆGYPTIA ANTIDOTUS, the Egyptian antidote. This is a name, not of one but of several compositions.

- MUSCHATA. See ABBLMOSCHUS. -- ULCERA, alfo called Syrian ulcers. Aretæus deferibes an ulcer of the tonfils and fauces by these names; they are attended with a burning pain; the matter discharged from them infects the whole frame, and the patient is rendered mi-

ferable by its offensive finell.

ÆGYPTIACA. See PAPYRUS. ÆGYPTIACUM BALSAMUM. Balf. Gilead. See

BALSAMUM. ÆGYPTIACUM UNG. an ointment fo called from its being faid to be of an Ægyptian origin, though some fay from its colour, but improbably. Diefue is its supposed author. This ointment now is properly rejected and its place supplied by the following.

Oxymel Eraginis.

R. Æruginis pp. i. p. 3 ij. aceti. 3 vij. Mellis defpumati, 3 xiv. Diffolve the verdegris in the vinegar, and firain it through a finen rag, then add the honey, it is attended with erofion, it terminates in a cancer. In opening this abfcefs, we should be careful not to cut the edge of the eye-lid, for thus an incurable wateriness will terge foul ulcers, keep down the sungous sless, and to affirt in the cure of venereal ulceration in the mouth and

ÆGYPTION. The name of a topic used by the ancients in uterine diforders. The Greeks called the ol. rici-

ni, Aryer Jeor Ekarer. ÆGYPTIUM ALBUM, vide CRINOMYRON.

ÆGYPTIUM CROCEUM UNG. Both these are

name of one of Actius's compositions.

ÆGYPTIUS PESSUS. A pessary described by Paulus' Ægineta: it is made of honey, turpentine, faffron, oil, verdegris, &c.

AICHRYSON, from on, always, and χρυτος, gold, a name of the fedum majus. See SEDUM.

AIGLUCES, from an, always, and γλικος, fweet. A fweet fort of wine is thus named. As foon as the must is tunned, the veffel is placed under water, and their kept all the winter, that it may be cool, and not be completely turned into wine.

ÆIPATHIA. A paffion of long continuance. BLAN-

ÆITHALES, from an, always, and Sasses, to be green, name of the fedum majus.

AIZOON, from ass, always, and Con, life, a species

of the sempervivum, or sedum. ÆMBELLÆ, the lacca-tree.

ÆNEA, an epithet given to the inftrument called a catheter, from the matter of which it was formed.

ÆON, augo, the whole age of a man. But Hippocrates uses it to fignify the remains of a man's life. It also fignifies the fpinal marrow.

ÆONION. See SEDUM.

ACORA, from aware, to lift up, to sufpend on high. Gestatio, a species of exercise used by the ancients, and of which Actius gives the following account.

Gestation, while it exercises the body, the body seems to be at rest. Of the motion there are several kinds.

1st, Swinging in a hammock, which, at the decline of a fever, is benchcial.

2dly, Being carried in a litter, in which the patient ai-ther fits or lies along. It is useful when the gout, slone, and such other disorders attend, that do not admit of vio-

3dly, Riding in a chariot, which is of fervice in most chronical diforders, especially before the stronger exercise can be admitted of.

4thly, Sailing in a boat or a ship. This produces va-

rious effects, according to the different agitation of the the blood, and diminishing the external relistance to the waters, and manany tedious chronical diforders proves ef- fluids contained in the pulmonary vessels, it causes an ficacious beyond what is observed from the most skilful administration of drugs. These are instances of a passive

ÆQUINOCTIUM, the equinox. This is when the

days and nights are of equal length.

Ælius places the vernal equinox on the 23d of March, and the autumnal on the 25th of September. Paulus Ægineta makes the autumnal a day fooner. The modern aftronomers generally fixed them on the 22d of March, and the fame day in September. These scasons are confidered as unfriendly to health.

AER, Ans, air, called also Gas ventosiem. It is that transparent, classic, ponderous, compressible fluid, which furrounds the terraqueous globe, and which, when greatly agitated or driven in currents, is called wind.

Some of the properties of air are, 1. It is a part in the composition of all bodies.

2. It is a common medium, by which the union of the parts of bodies is formed and preferved.

3. It is fluid, and cannot be rendered of itfelf folid by

any known means.

4. It is elastic; but by contact and cohesion in the parts of bodies it becomes folid and unclastic; from whence again, by heat, fermentation, &c. it being separated, its elafticity returns. Heat rarifies, and cold con-

5. The weight of the air is not perceived but in large quantities; nor is the comparative weight eafily, if at all to be afcertained, as no two portions are ever of the fame weight in two parts of the atmosphere. However, from long and repeated observations, the greatest gravity of the air in Europe is found to be equal, in equilibrio, with 301 inches of quickfilver in the barometer, and the least railes it only to 271. The weight of the common air about the furface of the earth, at the time of the middle weight of the atmosphere, and in every temperate season, is to that of water as I to 850.

6. Air is necessary to animal existence. This is evident from the experiments made with the air-pump, though not without fome exceptions, for toads, vipers, cels, infects of all kinds, and fifth, live in the exhausted

7. The particles of air are too small for any microscope to discover, and yet they are larger than those of fire, water, oil, and many other sluids. Fire pervades glass, oil, water, &c. will pass through many compact substances, whilst air is refisted by strong paper.

8. Air is the vehicle of found, of the objects of taste,

of effluyia to the nofe, as is evident from observations made on the tops of high mountains, where our fenfes become duller than when we are nearer the plains.

Numerous and important are the other known properties of the air; but this subject being too extensive to admit of a minute detail of its peculiarities, after reciting a few of the most important observations on it, as it is the subject of medicine, the reader is referred to the authors

who have written on this subject.

Air passing over clayer ground is moist and thick; dry and fandy ground, it is dry and dusty; dry and stoney, it is dry and pure; on the tops of hills it is thin, free from vapours, and cool; in vallies, it is gross, impure, and bot, though in winter, if the hills are very high, the vales are the coldeft, because they are overshadowed: on the declivity of hills the oir is generally pure, and of a moderate temperature; and in an open country, such as is proper for hunting, the air is generally moderate in all its quali-ties of heat, coldness, dryness, and moisture.

North and north-oast winds are reckoned bracing and

healthy, but the valetedinarian is most comfortable when the wind is fouth and fouth-west. Dry seasons in gene-ral are more falutary than wet. We eat more and digest better in winter than in fummer. Our difpolitions and tempers are greatly affected by the feafons; long eafterly winds will make chearful people very irritable and mo-

An excess of gravity in the air quickens the circulation, dilates the lungs too much, and by compreffing the cuta-neous veffels, drives the blood copiously to the brain; whence pleurifies, peripneumonies, quinfies, head-ach, vertigo, &c.

If the air is too light, by retarding the circulation of should retain the term fixed to air when that fluid is in its

fluids contained in the pulmonary veffels, it caufes an hæmoptyfis, hyfteric and hypochondriae difeafes, rheumatifm, gout, nervous and intermittent diforders.

Too hot an air weakens the fibres, by enlarging the

bulk of the humours; it quickens the circulation, and too much increases perspiration, whence an acrimony is induced in the remaining juices. If this flate of the air continues, or if cold fuddenly comes upon it, ardent, bilious, and other fevers follow.

A cold air causes topical inflammations, such as quinfies, pleurifies, peripheumonies, by over-diffending the lungs, from its gravity conftringing the fibres, condensing the humours, and leffening the perspiration.

Too dry air thrivels up the folids, incraffates the fluids,

and disposes to fevers.

A too moist air is extremely injurious; it relaxes and debilitates, it leffens perspiration, renders the blood too watery, produces coughs, althmas, droplies, intermittent and nervous diforders.

From a mixture of these different qualities of the air, different disorders are produced: cold and moist air are bad, but hot, mosift, and light air is the worst of all, be-cause of its relaxing putrescent tendency. Besides the a-bove evident qualities, there are others that escape the sense, though manifest by woeful effects; such are from infections, malignant miafmata, exhalations, &c.

It is observed, by some, that vaults, corn magazines, apple-garrets, &c. should open to the north, for that point is invariably proper: but the fouth and west are almost constantly improper. The most healthy exposure, if a house is to be built, is found as follows; cut one of the trees that grows there transversely with a saw, then closely observe the rings; the side of the tree on which the di-stances between each ring is widest, is the most healthy exposure, and the windows of the house, all other circum-stances being the same, should ever face that way.

The infirm and valetudinary fuffer much from the difpolition and changes of the air. Dr. Keil observes that, bodies emaciated by fickness or evacuations, draw more than full ones. Dr. Monro sen. afferts, that the body absorbs more or less according to its vigour: hence, a reason may be given why those who suffer by chronical distempers feel more uneasiness or pain in the evenings, particularly in the fpring and autumn, than during the day, in the winter and fummer feafon. The abforbing power of the body being increased by disease, and the air being more replete with matter, it is unfalutary at these times, and very eafily accounts for their complaints during those seasons. Hence we discern why early going to bed is productive of advantages to manifest in those difordered persons whose prudence leads them to early repose. Med. Mus. vol. i. p. 11. 14.

The common air of the atmosphere is a fulphur, and

confifts of acid and phlogiston. Dr. Shebbeare observes, in his Theory and Practice of Physic, that the particles of air are but little attractive of one another, and that fire is the power which keeps them in their constantly moving state; that the particles of fire divide those of air, and when the feparating action of the first abates, the attrac-tion of the latter takes place. Admitting fire to be the reason of the elasticity of the air, the phenomenon of its being destroyed by fulphureous sumes, &c. is easily accounted for, for they repel fire, nay even the fermentation of vegetables is vented by the mineral gas.

Befides the common, or atmospherical air, there are various other forts, diffinguished by their respective characteristics; though of these, the really different ones from each other are the fixed, the acid, and the alkaline; of these and phlogiston all the other forts are formed.

Fixed air, formerly called gas, and fince named artifi-cial, factitious, mephitic; when found in caverns, mineral spirit; but factitious or fixt air is the general term, and when it produces any noxious effects either in confequence of the process by which it is procured, or the manner in which it is applied, it may then be called mephitic air.

The common air enters in different proportions into the compositions of all kinds of bodies, and when thus combined, is in a fixed flate; when this air is let loofe by fermentation, putrefaction, or other means, it refumes its former elafticity. It is rather fingular that philosophers

The different proportions of fixable air, in the following bodies are as under written.

In yellow wax, - -To part of its weight. Coarle fugar, 10 Oyster shells, Mustard-feed, Peafe, Tartar, Human blood,

All the forts of air might be termed fixable, as well as that to which this appellation is given, for they are ca-pable of being imbibed by fome fubitance or other, confequently of being fixed in them, after they have been

in an elaftic ftate.

FINABLE AIR, called Gas, is found at the bottom of pits; it rifes from fermenting liquors; it is one and a half heavier than pure common air; water imbibes more than its own bulk of it, flame is extinguished, and animals are deftroyed by it, even vegetables fuffer by its in-fluence; when the fixable air is feparated from chalk and other calcareous fubflances, they become cauftic; it is antifeptic, powerfully preventing and recovering from putrefaction, whence lime kilns, which difcharge great quantities of air would be useful in the neighbourhood of populous towns; in glyfters it hath been very advantageoully administered against putrid disorders, and mixed with the drink has been thought to conduce to the relief of patients labouring under putrid fevers; to fixable air, the chief property of mineral waters is attributed; the Pyrmont water owes its brifk tafte and fparkling appearance to it; and it powerfully diffolves iron when it is mixed with water.

Dr. Hulme, in his publication entitled A fafe and eafy Remedy proposed for the Relief of the Stone, recommends this air as a vermifuge; his method of admini-flering it, is by diffolving kali. gr. xv. in aq. fimp. Jiji, then in another veffel he acidulates the fame fluid, about an equal quantity, with as much acidum vitrioli dilutum, as is requifite for faturating the kali; this done, the patient drinks one of these potions, and immediately after it, the other: thus an effervescence takes place in the ftomach, where all the extricated air is retained, and from whence it is distributed with the chyle, &c. with confiderable advantage in various other medical intentions. The Dr. farther observes, that by this mixture, particular liquors forming the menftruum, we may recover an agreeable tafte, &c. in wines, malt liquors, &c. that are become vapid. In order to convey fixable air in a fepa-rate flate into the flomach, it is the practice of fome to use the natron cum crem tart. gr. v. ad faturat. They observe, that when the kali is used, the air is discharged before the mixture is completely fwallowed; but with the natron, the discharge of air requires some time. Hence, in suppressing vomiting, and in all those cases in which fixed air is usefully conveyed into the stomach, this me-thod excels. Fixable air hath been found useful in cancerous, confumptive, fcorbutic, and other diforders, where an antifeptic medicine might be expected to afford relief.

INFLAMMABLE AIR. It is found near the roofs of fubterraneous places; it is chiefly formed of an acid vapour and phlogiston; it takes fire and explodes like gunpowder on the approach of flame; it burns away, though invisibly, in the day time; it is ten times lighter than com-mon air; it may be obtained from any inflammable subflance; it kills animals as readily as fixable air; but in fome remarkable properties, the fixable and the inflammable airs are the reverse of one another.

NITROUS AIR. It is generated from pyrites and from metals, &c. by means of the fpirit of nitre. Its ulefulness in some instances feem to excel the fixable air. One of its most conspicuous properties is the great diminution of any quantity of common air with which it is mixed, attended with a turbid red or deep orange colour and a confiderable heat: this is truly furprifing, in this inftance, a quantity of air, as it were, devours a quantity of another kind of air half as large as itfelf, and yet is fo far from gaining any addition to its bulk, that it is confiderably diminished by it. The smell of the air much resembles that of the smooking spirit of nitre. Distilled water im-

most unfixed state, under this circumstance the epithet | bibes about one-tenth of its bulk of this kind of air, and fixable would be more perspicuous and scientific, and then very obstinately retains it. The nitrous air pre-we think it not unworthy adoption. those that are already putrid, in a degree far superior to what is done by fixable air. It is peculiarly offensive to several kinds of insects, and probably might be so ma-

naged as to be destructive of worms.

ACID AIR. It is obtained from metals and with the muriatic acid: or from this fpirit without the metals, or any thing elfe, being only the vapour or fumes thereof. It lofes its elafticity by coming into contact with water. It renders the water with which it is mixed, very acid. It diffolves iron very speedily and generates inflammable air. It cannot be condensed by cold, as the vapours of water are, and fo may properly be called an acid air. This acid air extinguishes flame, and is heavier that common air. Onethird of it joined with two-thirds of pure water forms a muriatic acid that equals in goodness the best that is obtained by the usual methods. But a still stronger acid may be made by mixing this acid air in a due degree with water.

ALKALINE AIR is the vapour of ammonia muriata; it is not condensible by cold; it is readily imbibed by water, and therewith forms the ammoniacal fpirits; by a combination of the alkaline air with water, a stronger spirit

is obtained than by the usual processes.

Air is injured by candles, &c. burning in it, or by crouds of people breathing in it. A common candle is faid to confume (i. e. render unfit for use) a gallon of air in a minute, if so, how is the due restoration made of what is injured by the refpiration of animals, by flames of every kind, &c. The diminution of common air by the burning candles, &c. is in part owing to the preci-pitation of the fixable air from it; which may be effected by fomething emitted from the burning bodies which has a stronger assinity with the other constituent parts of the atmosphere. In part, putrid and other kind of vapours are disfused in the air by which it is greatly vitiated. But by the vegetation of plants, which imbibe the offending matter, injured air is in part restored to its former state; the agitation of the waters, as feas, lakes, rivers, &c. contribute to the purification of the air. The burning of many materials fets at liberty their fixable air, which in part becoming elastic, supplies the defect made in the atmosphere, by the causes above mentioned, hence the feeming destruction of the air is but a circulation of it.

The extent of this subject and its influence in the healing art, renders an attention to it necessary, and the enquirer will meet with much light thrown thereon in his

perufal of the following, viz.

Hoffman, in his Med. Rat. Syft. artic. de Aere.
Boerhave on Air. Thefe two authors have treated on air both philosophically and medically; the latter hath collected all that is valuable from both his predecessors and

contemporaries.

Hale's Statical Experiments. Dr. Fr. Cliffton's translation of Hippocrates on Air, &c. Arburthnot on Air.

Huxham on Air and Epidemic Difeases. Shaw's Abridgement of Boyle's Works, in the article Air. Macbride's Effect. fay on the Nature and Properties of Fixed Air; and Prieft-ley on Different Kinds of Air. Dictionary of Chemistry, edit. ii. Percival's Essays, vol. ii. and iii. Dobson on Fixed Air.

ÆRA, cockle, or darnel. See LOLIUM. ÆRDADI, fo Paracelfus names certain spirits which

he supposes to live in the air.

ÆREOLUM, a weight of about twenty grains.

ÆRIFICATIO. It is the producing of air from other dies, or rather, converting them into air.
ÆRIS FLOS, FLOWERS of COPPER; called also anthos, phrafium viride, bidus, elzimar, eltz, attingat, eliz, alex-antbus, diamafeien. Copper reduced to small grains, by pouring cold water on it when in a flate of fusion, is thus called. The cold water is poured on the copper as it runs out of the furnace into the receiver. — SQUAMÆ, FLAKES of COPPER. These fly off in hammering this metal when heated. The best are of a deep yellow colour, and they rust if sprinkled with vinegar. These from the Cyprian copper-works are called HELITIS. — Vel VENERIS TINC-TURA. R Ærug. æris 3 j. aquæ ammon. & fp. vin. R. ää 3 fb m. & ftent fimul, donec aqua colorem faphirinum acquifiverit. This tincture is an admirable preparation, with which to make an injection for a gonorrheea,

sessed to know when the infection is only in the urethra, a person may be soon and infallibly cured by it: to an

onnee of pure water add one drop of the above tincture.

Dr. W. Saunders, observes in his Lectures on the Mat. Med. that all folutions of metals are anti-inflammatory and fedative, or eafe pain, provided that the folution is not fo ftrong as to ftimulate. There is also a tinctura volatilis æris, which is thus made: R Limaturæ cupri, 3j. aquæ ammon. 3xij. m. This folution hath been given internally to the quantity of four or five drops at a dole, as a diuretic. Boerhaave directs to be given three drops, in a morning fafting, with a glafs of mead, and this dofe to be daily doubled until the dofe is 24 drops, which con-tinue for fome days: thus he hath fucceeded fometimes in curing dropfies, though in other inflances it failed him. When effectual, it produced very copious discharges of urine. This tincture is a good fubilitute for the cuprum ammoniacum of the Edinb. Difp.

Metallic aftringents are more active than alum, more powerful, more eafily, and more quickly diffolved in the Romach, are more diffusive and extensive in their influence on the habit, and to be preferred when speedy effects are to be obtained. Of all the metals, copper is the most astringent, most soluble in the stomach; but the dose is difficultly afcertained, because of the uncertainty of the acid in the stomach, whence it is rarely used. Dr. Saunders observes, that an over dose of the ærugo æris, is active, flimulant, and aftringent, and fo quickly proves emetic, as be thrown up before it hurts: that an underdofe excites a naufea, and that to use it to the greatest ad-vantage, is to give it in naufeating dofes. The tinct. Veneris vol. if given fo as to purge and vomit, by its fudden action, fometimes does wonders.

Dr. G. Fordyce, in his Lectures on the Mat. Med. advices to withhold from the use of cupreous preparations, when the intention is to strengthen; but when it is defigned to leffen irritability, he fays, they are extremely useful, particularly in hysteric cases attended with plethora, and in epileptic spasms. In several instances of intermittents, and of mortifications, the preparations of copper, such as were in a faline state, as the cuprum ammoniac, the cuprum vitriolatum, & the tinet. Veneris vol. were equally efficacious with the bark; in this last use, the cuprum vitriolatum to gr. ss. for a dose, has

effected wonders.

Dr. Brown, in his Natural History of Jamaica, prefers preparations of copper, in those dropsies which proceed from a general langour of the folid system, in which case they prove very useful as diuretics and strengtheners. He prefers the tinct. Veneris vol. to all other preparations of this metal. He farther remarks, that in hot climates where the body is much relaxed, the vitriol of copper is the best detergent of foul ulcers.

See Neuman's Chem. Works. Dict. of Chem. edit. ii.

ÆRITIS, fee ANAGALLIS.

AEROLOGICE, that part of medicine which treats of air, explains its properties and use in the animal econoand its efficacy in preferving and reftoring health. AEROMELI, honey; also a name for manna. From

AEROPHOBI, from anp, air, and occo, fear, according to Cœlius Aurelianus, some phrenetic patients are afraid of a lucid, and others of an obscure air, and these he calls aerophshi. So that,

AEROPHOBIA, is a symptom of the phrentis.

AEROSIS, an imaginary refolution of the blood into vapour, supposed necessary to the support of the vital spirits, and faid to be brought about by the ventilation of the air during infpiration, in the manner that the flame of fuel is kindled by blowing it.

ÆROSUS (Lapis), fo Pliny calls the cadmia, which is supposed to be Galen's cadmia lapidosa.
ÆRUGINOSUS, Æruginous, of the colour of verdegrise, or green. This word is often applied to what is

discharged by vomiting of this colour, and to the bile.

ERUGO, the rust of any metal, but particularly of copper, called VERDEGRISE, it is also called azagor. See

These are the natural and artificial forts: of the first is

if care be taken duly to dilute it, and skill enough is pos- that is of a grass green when used in painting. It is called the HUNGARIAN MOUNTAIN, OR SEA VERDEGRISE. --RASILIS. Hang a copper-plate over the strongest vinegar fo as not to touch it, and after ten days ferape off the ruft, which is thus called. — Scolecia. Of this there are two forts, viz. the fossile and the factitious; the fossile is the belt, the factitious is made as follows: put ij. fb of flrong wine vinegar into a Cyprian copper mortar, with a peftle of the fame, rub it round until it is ropy, when add a dram of alum, and the fame quantity of transparent fossile falt, or of nitre, beat them well in the fun during the dog days until the whole is green and ropy, then draw it out in the form of worms.

Applied as a collyrium, being first mixed with gum

ammoniacum, any of the verdegrife deftroys the callofi-

ties of fiftulas.

ÆRUGO ÆRIS, called alfo viride æris, cupri rubigo, calcithes, VERDEGRISE. It is copper corroded by a fermen ed vegetable acid, into a bluith green fubitance. The copper is made into very thin plates, which are suspended over the vapours ariting from wine, during its acetous fermentation: or the hulks and stalks of grapes are dried, and then being bruited, are dipped in wine and made into balls, which are left to ferment until they acquire the acctous quality; when they are broken with the hand, and stratified with these copper-plates, and left until the verdegrise is produced. The wine of Languedoc is the best for this use: but though, in reading a description of the process, the management seems very easy, yet trifles prevent success, and render it very difficult to obtain. The best as well as the greatest quantity is made at Montpelier, where there is one fort in powder and another in lumps. The whole process of making this article, as it is now practised in Montpelier, may be seen in the Med. Mus. vol. iii. p. 245—250. The fort which we receive from France is generally mixed with the stalks, &c. of grapes, which may be feparated by pulverization, they be-ing more difficulty powdered than the verdegrife itself. To purify it, diffolve in fix or seven times its weight of diftilled vinegar, then decant and evaporate the folution. If good, it is dry, of a beautiful deep green, with a few white fpots; and when rubbed on the hand with a little faliva or water, it forms a fmooth paste, free from grittinefs. It is adulterated by mixing pumice-flone, mar-ble, vitriol, &c. The two first are discovered by wetting your thumb, and rubbing the suspected verdegrise betwixt to the following the impected verdegine betwist it and your finger, by which the pumice-flone and marble becomes white; the latter is discovered by burning a little on a tile, by which the vitriol is turned into a red substance. In spirit of wine and in water, this concrete is partially soluble; in vinegar it is wholly so. If a saturate folution of it in vinegar is fet to exhale in a warm place, the greatest part of the verdegrise may be recovered in a crystalline form; and if these crystals are distilled in a retort, the acetous acid afcends from them in a highly concentrated flate, and the cryftals are then called diffilled or calcined verdegrife, or the VITRIOL of VENUS; if fet in a damp place to diffolve, it is called the liquor of Venus. Verdegrife is used by dyers, skinners, hatters, painters, &c. as well as in medicine: in miniature painting the diffilled fort is the best. Its use, as an external medicine, is to deterge foul ulcers, being first mixed with other ingredients, as in the ung. bafil. virid. and the mel æruginis. If it is made into a paste with faliva, or any thing not oily nor unctuous, hard callufes may be diffolved therewith. In phagedenic ulcers, and most un-promising fores with schor, fungus, stinking discharge, and turned edges, yaws, &c. copper applied to the fore parts is useful. Foul chancres that yield not to mercury inwardly, has yielded to a solution of the cuprum vitriolatum. Whether venereal or fcorbutic, or what elfe, apply the oxymel aeruginis, or other preparations of copper; its stimulus helps nature to throw off sloughs, particularly in ulcerated fore throats. Internally taken, a vomiting is inftantly provoked by a grain or two of verdegrife, fo for its speedy effect it may be used to discharge any poisonous matter received into the stomach. Large portions, as four drams or more, have been fwallowed without any other inconvenience than the prefent vomit-These are the natural and artificial forts: of the first is ing, yet in smaller quantities, besides the vomiting, it a greenish marcasite, like the drops of iron; it is found in copper mines, but is of no use. There is also on some mountains in Moravia a fort of green grains like sand, cult breathing, contractions of the limbs, &c. which

often terminate in death. Hence great care should be had of copper or brafs vessels in which acids or fats are boiled, a deep blue, and if added to solutions of it in acids, when left the verdegrife obtained thereby flould be productive of difeases: the scurvy in seamen is supposed to be produced by this, as one cause. See-Lond. Med. Obs. & Inq. vol. ii. Though acids, &c. while boiling, do not corrode the metal, a fhort space of time serves for the effect when the boiling heat is abated. In case of verdegrife being swallowed, give oil and warm water, or large quantities of milk and water, both by the mouth and by the anus, in order to wash away the whole of this offensive matter, and endeavour to excite a discharge by vomiting with all possible speed; after due evacuations an anodyne may be given; if there is great pain, musk, or other cordials, with a milk diet, may then be prescribed.

Verdegrise cannot be reduced to powder but by levi-

gary, and Germany.

The ores of copper are of various colours from yellow to black, though generally they are blue, purple, violet, or green: the yellow is pure copper ore, the black contains a portion of filver. The ores of copper are finelted with great difficulty, and require many fusions to render them pure. An allay may be thus made: first calcine a fmall quantity of the ore, then take two ounces thereof and powder it fine, then mix it with double its weight of the black flux, intermixed with charcoal duft, after which fuse it briskly in a wind furnace, that it may flow thin for half an hour, and the pure copper will be at the bottsm.

The chemical character for copper is \$. Its gravity is to filver as eight to ten; to gold, as eight to nineteen; and to water, as eight to one.

It is confiderably but not entirely fixed in the fire. It is malleable and ductile into a fine wire.

It is claffic and fonorous.

It melts not before ignition, or a strong white heat, and when melted, if a drop of cold water is let fall upon it, it flies about with violence, fo that it is dangerous to the by-standers.

It calcines by a weaker red heat into a red powder. It readily diffolves in any falt, and is perfectly diffolved

in aq. regia, and in the vitriolic acid if made hot.

Diffolved in any acid it gives a green tincture, though the acidum nitrofum foon becomes blue after a portion

of copper is diffolved in it.

Diffolved by fixed alkalies it is green, by the volatile it is blue. Dr. Lewis observes, that if the The part of a grain of copper be diffolved in a pint of water, a blue colour will be produced by adding a volatile alkali to it.

So great is its divisibility, that one grain dissolved in a qua ammonia. will tincture 385,200 times its weight of

water.

A fmall quantity of arfenic gives to copper a great de-gree of hardness and whiteness: thus pins may be made white and brittle by it. The hydrargyrus muriatus also heat to all parts of the body at once. whitens it.

Copper burns and gives a green flame in the fire or candle. If one part of copper filings is well ground with two parts or more of hydrargyrus muriatus, and then diftilled in a glafs retort, the mercury is fent over pure and in its natural state, and the copper remains intimately mixt with the falts in the form of a yellowish or reddish refin, which is fometimes transparent, at others opake;

this refin melts at a candle and gives a green flame.

If copper is calcined till all its fulphur is wasted, it turns to a red ash, which being exposed on a tile to the twenty-fifth year; JUVENTUS, reckoned from the twenty-focus of a great burning glass, is converted into a deep fifth to the thirty-fifth, VIRILIS ÆTAS, man-hood, from red glass. This glass melted on a piece of charcoal in the thirty-fifth to the fiftieth; SENECTUS, old age, from the focus of the fame glass becomes pure copper again. Hence copper evidently confifts of a red inflammable ful-phur and a vitrifiable earth, which last is its metallic part.

Copper and zinc form the PRINCE'S METAL. Copper and the acid of grapes make verdegrife.

Copper and calamine stone make BRASS, called afterthe calamine: this is called auricheleum, which fee. The tainty fome diforders may be radically cured, and all may vapours of the zinc, which join with the copper in making brafs, increases the weight of the copper fometimes to near one half more than its original weight.

ATHER,

fo far diluted as to appear almost or altogether colourless, it changes them immediately to the same fine colour. If a piece of bright iron be immerfed in the acid folution of copper, the acid quits the copper to attack the iron, and the copper, in its separation from the menstruum, adheres to the iron, which soon appears covered with a cuprous coat. On these principles very minute quantities of cop-

per diffolved in liquors may be readily discovered.

If copper is swallowed in its pure state it is inosfensive. Some practitioners observe that copper when diffored is strongly styptic, and so far from causing exulcerations of the inteftines, that it heals them: it vomits by its naufeous flimulus, which will continue for feveral days. Dr. Alfton fays, in his Lectures on the Materia Medica, that the erata and the ferrata do not differ much in any thing but

gation.

ÆS, called also cuprum, xaxxx, Venus, Copper. It is found in many countries, but chiefly in Sweden, Hunis found in many countries, but chiefly in Sweden, HunLemery observes, that if water lies long in copper veffels, it acquires a tafte of the metal. He cautions against a careless use of copper vessels for boiling syrups, acids, &c. in; for, though while the syrup, &c. are in a boiling heat, if they are continued to all the day long, no inconveniency is difcovered; but in any degree below the heat which keeps up a bubbling in the fyrup, or whatever elfe, the metal will be corroded, and the preparation injured.

The following preparations are made from this metal: ESECAVUM. BRASS. See Æs.

ÆS USTUM, BURNT COPPER. Thin plates of copper are laid stratum super stratum in a crucible, with sulphur and fea-falt, then they are placed over a hot charcoal fire, and there continued till all the fulphur is confumed, or until the plates can be reduced to a powder. If good, it is of an iron grey on the outfide, of a reddith grey within, and if two pieces are rubbed together, a vermillion red is produced; it must also be brittle and glittering when broken. It was formerly used for destroying fungous ficsh.

If the burnt copper is made red-hot, and quenched in the ol. lini nine times, then powdered it takes the name

of SAFFRON of COPPER.

AS PAUPERUM, copper ore divefted of its filver,

when it contains any, is thus named.

ÆSCHYNOMENE (from ασχυτομαι, I am afhamed)
SPINOSA, a fpecies of the fensitive plant. See CAACO. ESCULUS HIPPOCASTANUM. Sec HIPPOCAS-

ÆSTAS, SUMMER. As this is usually a healthy season, health may ftill be prolonged, if, during the warmer months, we eat but a little at a time, and make a proportionable increase in the number of our meals.

ÆSTATES, FRECKLES in the face. ÆSTHPHARA, INCINERATION, or burning of the

flesh, or any other part of the body.

ÆSTUARIUM, STOVES or machines for conveying

ÆSTUATIO, the boiling up, or rather the ferment-

ing of liquors when mixed. ÆSTUS VOLATICUS. Vogel and Cullen place this word as fynonymous with phlogofis. It is a fudden feorching heat, with rednefs of the face, that foon flies off.

ATAS, Age. One LIFE; an HUNDRED YEARS; also A CERTAIN STAGE of OF LIFE. The ancients reckoned fix stages of life, viz. Pueritia, child-hood, which is the fifth year of our age; ADOLESCENTIA, youth, reckoned to the eighteenth, and youth properly fo called to the fifty to fixty; CREPITA ÆTAS, decrepid age, which ends in death. Blancard.

Every age hath its difeafes; and Hippocrates observes, Copper and tin make a good BELL-METAL, which is use-ful in microscopes and reflecting telescopes. that those of youth continuing after puberty are difficult to cure. In infancy and old age, many object to the use to cure. In infancy and old age, many object to the use of medicine; but as in both these stages there is great infirmity, fo there is a great fcope both for the practice and the improvement of the medical art: neglect herein which is owing merely to the zinc conntained in bespeaks an equal ignorance and inhumanity: at a cer-

ÆTHER, vel ETHER, from aißu, ardes, fplendes, bright and splendid; called liquor atbereus vitriolicus, bright and fplendid; called liquor athereus vitriolicus, nutrofus, muraticus, according to the acid of which it is formed. So the fky or firmament, and alfo the electric matter has been called; but what is here defigned is a chemical combination of the acetous acid, phlogifton, and water, but differing from alcohol of wine, from which it is obtained, by having a far less proportion of the two latter principles, of which the alcohol is divelted by the mineral acid added to it in the preparation of the ather. Macquer fays, in his Dict. of Chem. that there is a fubfitance exactly intermediate between a functions and a fubstance exactly intermediate betwixt ardent spirits and oil. That when the vitriolic acid is mixed with rectified fpirit of wine, the first liquor which arises by distillation is a mere volatile spirit of wine only; the liquor which arises next, is spirit of wine deprived of part of its watery principle by vitriolic acid. So is spirit of wine effentially altered, and approximated to the nature of oil, in propor-tion to the quantity of watery principle which it hath loft. If the distillation is continued after the ather hath arisen, the vitriolic acid having deprived the spirit of wine of all its water, an oil arises, which is called sweet oil of vitriol,

If to the æther, obtained by depriving alcohol of wine of its phlogiston and phlegm, by the addition of the vitri-olic acid, you gradually add the nitrous acid, the remain-ing phlogiston and water is separated, and the ACETOUS ACID is pure, except perhaps for the mechanical mixture of an extremely minute portion of water; and this is the purest ether. If to so much ether as is at first obtained by the aid of the vitriolic acid, more of the acetous acid be added, more of the phlogiston and water are separated, and we have the OLEUM VINI. Hence observe, that alcohol of wine is a combination of the acctous acid, phlogifton, and water; ather prepared with the vitriolic acid is the fame, but in lefs proportion of the phlogifton and water; the oleum vini contains still lefs phlogiston and water; and the ather obtained by the vitriolic acid, with the addition of the nitrous acid, most perfectly freed from its phlogiston and water, so is the purest ACETOUS ACID. Again, a mixture of ether and alcohol forms the spirather nitrosus, and the spirather vitriolicus of the shops; and a composition of alcohol, ether, and oleum vini is supposed to form the LIQUOR ANODYNUS MINERALIS HOFFMANI. The college of physicians of London for this order spiritus ætheris vitriolicus, two pounds, and oleum vini, three drams by weight.

This fluid, besides its appellation of ather, is by some named ACIDUM VITRIOH VINOSUM; by others spiritus ethereus; and in the Pharm. Edinb. it is entitled for. vini ethereus; and, as it may be obtained by means of the vitriolic, nitrous, and marine acids indifferently, fo from the name of the acid employed, the terms vitriolic, ni-trous, or marine ather have obtained, as in the London Pharmacopoeia, 1788, ÆTHER VITRIOLICUS. It should be noted that, athers produced by the different mineral acids, possess particular different properties.

Various are the processes by which æther is made. The Edinburgh Pharmacopoeia, printed A. D. 1777, contains the following, LIQUOR ÆTHEREUS VITRIOLICUS,

vitriolic athereal liquor.

Take of rectified spirit of wine, acid of vitriol, of each thirty-two ounces. Put the spirit into a glass retort, previously heated, and pour the acid to it in an uniform stream; gradually mix by gently and often shaking; then immediately distill in fand, heated previous to this operation, into a receiver cooled by water or snow. Regulate the fire so as quickly to boil the liquor, and continue to boil until 16 ounces by weight is brought over, then remove the retort from the fand. To the distilled liquor, add two drams of the strong common caustic; then distil it again from a deep retort into a receiver properly cooled, until ten ounces by weight of *ather* are obtained. If fix-teen ounces of rectified spirit of wine are poured upon the acid remaining in the retort after the first distillation, an zethereal liquor may be obtained by repeating this diffil-lation. This may be done pretty often.

The College of Physicians in their Pharmacopæia of

1788, give the following directions: first to make the SPIRITUS ÆTHERIS VITRIOLICUS, by taking of relified spirit of wine, and vitriolic acid, of each one pound, and pouring in gradually the acid to the spirit, then order them to be shook together, afterwards from a retort into

a tubulated receiver, to which another recipient is fitted, diftil the fpirit of vitriolic æther till fulphureous vapours begin to rife. But it is here necessary to observe that there is some caution requisite in mixing the two liquors, for if they are too rapidly poured together, the fucceeding heat and ebullition will diffipate a part of the mixture, run the rifque of breaking the veffel, and endangering the operator. In order to avoid which, let the vitriolic acid be added to the spirit of wine very gradually, waiting till the first addition is incorporated before any more is put in, by which means the confequent heat is trifling, and the danger is avoided. When the spirit is made, in order to make the ETHER, they add an ounce by measure of the water of pure kali, to two pounds of the spiritus atheris vitriolicus, thake them together, and distil by a gentle heat fourteen ounces by meafure.

Various modes of preparing this fluid may be feen in

the different writers.

Some of the properties of this liquid are as follow. It is the most light, most volatile, and most inflammable of all known liquids.

It fwims on the highest rectified spirit of wine, as oil

does upon water.

It is remarkably cold when dropped upon the hand; and its affects the thermometer in an extraordinary manner, caufing the quickfilver to fall, when neither water

nor fpirit of wine would produce fuch an effect.

It is neither acid nor alkaline, therefore perfectly free from that faline acrimony with which all the common vo-

latile spirits abound.

It is one of the most powerful folvents known in chemiftry. It will not mix with acids, alkalies, nor vinous fpirits. It mixes with twenty times its weight of water, if well shook therewith; and is an effectual solvent of oils,

balfams, refins, gum refins, gums, wax, &c. Macquer observes, in his Dictionary of Chemistry, that ther does not mix with water, as spirit of wine does, in all proportions; but that ten parts of water are required to dissolve one part of ather. But a larger proportion of water is more convenient, when the mixture is made to be taken as a medicine. He also adds, that ather dissolves a fmall quantity of water.

Its affinity with gold exceeds that of aqua regia there-

It extracts gold, wherever it is, from among other bafer metals (i. e. from any one, or all of them), and thus gold is both better and sooner purified than by any other means.

It is the lightest of all liquors; a bottle that holds 20

ounces of the oil of vitriol, holds but feven of the ather.

Agitated in a phial with the white of egg, lymph, or human blood, it feems rather to attenuate them.

The effects of this wonderful preparation, as a subject of philosophy, are too numerous to insert in this place; the reader is therefore referred to the authors undermentioned, who have written profesfedly on it. As to its antiquity, it is mentioned in feveral old books of chemistry; but they do not diffinctly notice nor deferibe it, nor yet the manner of producing it: the public attention to it was first excited by a publication in the Philosophical Transactions A. D. 1730, by a German, who calls himself Frobenius. On its medical properties, the most valuable, as well as most fuited to the general design of this work, we proceed to observe, that the late Dr. Ward was the first who is known to have used it in England: with the ather it was that he fo instantly relieved the head-ach, and other pains in the external parts: but for the first publication on its internal use, we are indebted to Mr. Turner, fur-geon, in Liverpool, by whom it is prepared for a very ex-tensive sale. He mixes two drams of ather with fix or eight ounces of water, and gives from one to four large fpoonfuls at a time, repeating the dose as required. Its general effects internally, are anodyne and perfpirative; others give five or fix drops for a dofe, first dropping it on fugar; it is also so potent a diuretic, that an incau-tious use of it may produce a diabetes; this is the only in-convenience to which it manifests any tendency. In obftinate head-achs, vertigos, epilepties, convultions, hyfteric and hypochondriac diforders, the palfy, gout, rheumatifn, flatulent, and other diforders of the ftomach and bowels, afthmas, hiccough, whooping-cough, &c. by its application externally, or administration internally, or both, the most desirable effects have followed. When it a dimension as to be conveniently covered by the palm of steel into an unglazed earthen vessel, with water enough the hand; moisten the rag with the æther, and instantly apply it to the part affected, pressing it very close, so as to prevent the escape of its fumes, for two or three minutes, in which time the rag will be found dry, and may be taken away. Fred. Hoffman indeed employed it, in as much as his liquor mineral. anod. may be ranked with it, as a fedative and antispasmodic.

As to the tests of the goodness of ather, Mr. Turner informs us that the most perfect fort is obtained by the affistance of the vitriolic acid; that it is colourless, and thrikes the nose very strongly with the sulphureous fmell; a drop let fall on the hand inftantly vanishes, without leaving any moisture behind; five or fix drops dropped together upon a table will disappear in a few seconds, and leave only the appearance of a large oily ring behind. The best ather requires the greatest quantity of water to be mixed with it; if, therefore, to fix tea-spoonwater to be mixed with it; it, therefore, to fix tea-spoonfuls of water, in a fmall phial, you add one of the ather
to be examined, cork it up, and flake them well together,
and if, upon flanding a little while, fome of the ather
appears at the top, in form of oil, fufficient to cover the
furface of the mixture, it is good, provided alfo that it
answers the other methods of trial; but if none appears,
or not enough to cover the face of the mixture, it was
either adulterated, or not well reclified; if to this mixeither adulterated, or not well rectified: if to this mixture of ather and water you add a little falt of tartar, and any fermentation enfues, the ather was not well rectified. It may be useful to observe, that the vitriolic acid of which ather is made, most commonly is apt to have some portion of the fulphureous acid adhering to it; and that in proportion to fuch adherence, the virtues of it are greatly impaired. To obtain, therefore, a powerful me-dicine, it is necessary that great pains be taken to render it free from all adherence of the sulphureous acid.

it free from all adherence of the fulphureous acid.

See Malouin's Chimie Medicinale, tom. ii. p. 451.

Macquer's Chimie Pratique, translated by Reid. Dictionary of Chemistry, edit. 2. Dr. Frobenius's accounts of other, inferted in the Philosophical Transactions for 1733 and 1741. Pharm. Col. Edinb. Medica.

ÆTHERIA HERBA. See ERYNGIUM.

ÆTHIOPIS, ETHIOPIAN CLARY. Salvia Æthiopis. Lin. Its leaves are like those of mullein, hairy and thick; the stalk is quadrangular, like that of balm; the feeds are two in a cell. A decoction of its root is commended in pleu-rifies and rheumatifms. Raii Hift.

ETHIOPICÆ (PILUL.) R merc. pur. (cum mucilag. e gum. Arab. extinct.) 5 vi. fulph. ant. precip. ref. guaiac. & mellis 12 3fs f. maf. & divid. in pillul. No. ccxl. quarum detur i. ad iv. mane nocteque. Dr. Plum. mer orders, in a composition of this name and quality, equal parts of calomel and fulph, aurat, ant, but the above, which is from the Ph. Col. Edinb. is in every respect equal to Dr. Plummer's in point of ufefulnefs, but not fo apt to

run off by stool.

ÆTHIOPS ANTIMONIALIS, ANTIMONIAL ÆTHIops. Dr. Cockburn gives this in his treatife on the gonor-rhoea, as follows: flux equal parts of antimony and fea falt, in a crucible, and knock off the fcoria, then rub equal parts of the regulus made in this manner, and mercury together, till they are incorporated. He extols it in cutaneous difeases, glandular obstructions, and many other chronical difeases; a few grains are given at first, and the quancal diseases; a few grains are given at first, and the quantity is increased as the patient can bear it. Malouin, in his chemistry, gives various processes for uniting antimony with mercury, some of which are more speedy and others more perfect in forming this combination.

Dr. Huxham gives the following aethiops antimonialis:

R argent. viv. 3iv. antim. crud. 3iij. sfor. sulph. 3ij. m.

per triturat.

Dr. Plummer highly commends his athiops in the Edinb. Med. Essays, as curative of spots, pimples, and flushing in the face, virulent gonorrhœas, sciatica, rheumatifms, lues venerea, ulcers with pain and fwelling in the feet, fcrophulous diforders, &c. See PILULE PLUM-

is applied externally, procure a bit of linen rag, of fuch MERI. - MARTIALIS, MARTIAL ETHIOPS. Put filings of to rife four inches above the filings; the whole is to be flirred every day, and more water supplied, as that in the veffels exhales, so that the filings may remain always covered; continue this procedure till they are reduced to a powder of an inky blackness. This preparation hath nothing but its troublesomeness to distinguish it from the common filings.—MINERALIS. Now called Hydear-gyrus cum fulphure, Lond. Ph. 1788. Æthiops, so called from its colour, which is like actual, a blackmost, from arts to burn, and wh, the countenance. ETHIOPS MINERAL. The usual method of preparing this, is to rub equal parts of pure mercury and slowers of sulphur in a mortar till the mercury disappears, and avery black powder is formed; but a more intimate coalition of the mercury with the but a more intimate coalition of the mercury with the fulphur may be effected by melting the fulphur in an iron ladle, then adding the quickfilver, and ftirring them to-gether, till the mixture is cold. If the mixture feems difposed to flame, which may be known by its swelling up, and growing fuddenly confiftent, carefully cover it, thus it is foon checked. The fmall heat necessary here is in no danger of diffipating either the mercury or the fulphur.

As fulphur to eminently abates the power of all the more active minerals, this medicine is thought by many to be no farther useful than as it is of efficacy in the flomach and bowels; others affert, that it enters the circulation, and is productive of very falutary effects. It is true that a portion of the mercury may be separated from the ful-phur, during the passage of the athreps through the body. Mr. Cruikshank says, that Mr. Hunter from experiments made on himself, thinks it probable, that every prepara-tion of mercury is dissolved in the human fluids, and converted, not only into a new preparation, but conflantly into the same kind of preparation, before it acts on the morbid virus in the fystem. He observes, that though quickfilver does not boil, in a heat less than 600 of Fahrenheit's thermometer; yet it may perhaps be wholly converted into vapour in a heat little more than that of the atmosphere, and this more particularly when its particles are separated and divided. In this state of vapour, he thinks it passes all out of the body, and becomes crude quicksilver. See his Appendix to Mr. Clarc's Essay on the Cure of Abscesses. The dose is from gr. v. to 31s. It is equally useful with the cinnab. ant. for fumigating venereal ulcers; and, like the cinnabar, it is hard to fay that it is useful any other way .--- VEGETABILIS. VE GETABLE ÆTHIOPS. By burning the fea-wrack in the open air, it is reduced into a black powder, and is then called vegetable athieps. The foap-boilers call this kelp. The best is from Scotland. From 3 i. to 3 ij. is given twice a day to remove scrophulous swellings.

ÆTHIOPUS ALBUS. See MERC. ALKALIZAT.

ÆTHOLICES, from ashe, to inflame, or burn. Superficial puffules in the skin raised by heat, as boils, fiery

puftules, &c.
ATHUSA MEUM. See Meum.

ÆTIA, arra, the cause of a diftemper.

ÆTIOLOGIA, Ætiology, from arria, a confe, seres, diffeourfe on. A treatife on the causes of diseases, and

ÆTOI PHLEBES, EAGLE VEINS. According to Ruffus Ephefius, the veins that pass through the temples to the

head, were thus called.

ÆTOLION. See CNIDIA GRANA.

ÆTONYCHUM, from arros, an eagle, and one, a claw, or nail. See LITHOSPERMUM.
AFAN. See ADRARAGI.

AFFECTIO, an affection. This is expressed in Greek by mass, hence pass. It is a disorder of the whole body, or a part of it, as in the hysteries, colic, &c. thus hy adding a descriptive epithet to affettio, most distempers are expressed.

AFFECTIO HYPOCHONDRIÆ. See Hypochon-

DRAICUS MORBUS.

AFFEOS. Froth or foam. AFFIDRA. Cerufs.

AFFINITAS, AFFINITY. Chemical affinities, also called elective attractions, are defined a tendency which the different particles of matter have to unite and adhere together, whether these particles be heterogeneneous or homogeneneous.

The translator of the Dict. of Chem. fays in a note

under the article affinity, that "By the terms affinity ing placed between the water and inflammable spirit, it is and elective attraction, we ought to understand the power to be concluded, that wherever water and spirit are mixand elective attraction, we ought to understand the power by which the constituent parts of bodies unite, and not to suppose that this power is exerted by any similarity and homogeneity of parts, or by any mechanical traction, as these terms seem to imply. The cause of this power, or the manner in which this union of constituent parts is produced, is unknown to us. To these terms, therefore, another less exceptionable, viz. the power of combination, may be substituted. In Dr. Macquer's definition of affinity are comprehended not only the power by which the constituent parts of bodies unite, which is the proper obconstituent parts of bodies unite, which is the proper ob-ject of chemistry; but also, the power by which the in-tegrant parts unite, which he calls the affinity of aggre-gation, and which is treated of by writers on natural phi-losophy and mechanics under the terms attraction, gra-viation, and cohesion. Whether these two kinds of union are produced from the same cause differently modi-fied, as our author thinks, I know not; but their effects are so different, that they deserve to be considered sepa-rately: the union of integrant parts being only an appo-fition of these parts, which are capable of being disjoined by mechanical means, and without any change produced upon their properties; and the union of conftituent parts, or combination, being attended with confiderable changes of properties, and being incapable of disjunction by mechanical means."

Attraction is of different kinds in nature, though probably they all depend ultimately on the fame principles; they are, 1. The attraction of gravitation. 2. The magnetic attraction. 3. The attraction of electricity.

4. The attraction of cohesion or of aggregation. 5. Chemical attraction. The last, as already faid, is that tendency which bodies have, however different, to unite together and to remain in union: e.g. an acid unites with a metal, an earth, or an alcaline falt, and with either of these the acid forms one body; which body does not consist of a combination of the properties of the acid and the metal, &c. but these losing their original properties on their union, a new body, different from either, is formed. Attraction is of different kinds in nature, though pro-

either, is formed.

Chemical attraction does not take place, but when the respective bodies are in a fluid state. Before chemical attraction can take place betwixt two or more bodies, it is necessary to delivoy their attraction of aggregation or co-hesion, this is effected by dissolving them. The compo-nent parts of bodies cannot come into the necessary connent parts of bodies cannot come into the necessary con-tact with each other until the integrant parts of the bodies, which are to act and be acted on, are separated, by a fo-lution of them. Dry bodies, however, finely powdered, do not unite chemically. Attraction of aggregation re-quires only the application of furfaces, but chemical attraction absolutely requires fluidity.

The power in bodies on which their various transpositions and combinations depend, and which is called their affinity, is a term like the Newtonian attraction, which is defigned to express not the cause, but the effect. When an acid spontaneously quits a metal to unite with an alkali, it is faid that it hath a greater affinity to the alkali than to the metal; this is only to fay in other words, that it will

unite with the alkali in preference to the metal.

The doctrine of the affinities of bodies is of very extensive use in the chemical pharmacy; for as several processes are founded on it, so if an error happens, and thereby the medicine proves unfit for its intended use, it may be rendered applicable to other purposes, by such trans-

be rendered applicable to other purpoles, by Iuch transpositions of their component parts as are pointed out by the knowledge of their affinities. Combinations and separations that are chemical, depend on elective attraction. Sir Isaac Newton's table of attractions, which was with the nitrous acid, was the first; next to him, Geoffroy improved on the subject, then Geller, Bergman, Dijon, Wenzel, Kirwan, &c. since them, others have contributed their additions, and from them all, the following table is formed, but chiefly from Bergman. The subbuted their additions, and from them all, the following table is formed, but chiefly from Bergman. The fubflances in which these affinities are expressed in capital letters on the top of each series, have the greatest affinity with that immediately under it, a less affinity with the next, &c. to the end of the series, &c. If any of the remote bodies have been combined with the top one, the addition of any of the intermediate bodies will disunite them; the intermediate body uniting with the uppermost of the series, and throwing out the remote one. Thus in the first series of the affinities of water, a fixed alkali be-

ed, the addition of any fixed alkaline falt will abforb the water, and occasion the pure spirit to be separated. Where several substances are expressed in one series, it is to be understood that any one of these bodies which are nearest to the uppermost, will in like manner disengage from it any one of those which are more remote.

Keir's Inaugural Thens, De Trans.

AFFION, an Arabian name of opium; also of an electary in which opium is a part of the composition.

AFFLATUS, or ADFLATUS. A VAPOUR, or as the country people call it, a BLAST: it affects the body suddenly with a disease; it is a species of crysipelas.

AFFLICTIO, AFFLICTION. Though this is not a disease, it causes many. What excites anger, envy, hate, produces diseases from tense fibres. What excites fear, or grief, beget diseases from relaxation.

AFFODILUS.

also tagetus Indicus minor; caryoph. Indicus; tanacetum Africanum, chrysanthemum Africanum, African marigold.

Miller reckons up thirteen species, but they are of no repute in medicine. Linnæus calls this genus by the

name of tagetes.

AFROB. Alchymistical lead, i. c. CRUDE ANTI-

AGA CRETENSIUM. The SPANISH MILK THISTLE. AGALACTIA, from α, negative, and γαλα, milk, a defect of milk in child-bed; hence αγαλακτώ, an epithet given by Hippocrates to a lying-in woman that hath no

AGALLOCHUM, also aromatica. The AROMATIC from each other, as well as from the specimens of it that are met with in our shops, that it seems most likely to be unknown amongst us. Other woods, as the aspalathum, lignum aquila, and calambour, which are said to be of the same nature, are substituted for it. Whatever this article is in reality, it is also expressed by different writers by the following names, viz. lign. alse, xyloalse, finkso, lign. calambac, alud bend, &c. The Arabians call it cebar, or febar, and fometimes al-cebar.

It is brought from China, and the interior parts of the

East Indies, in small pieces. It is described as being compact, ponderous, of a yellow or rusty brown colour, with black or purplish veins, sometimes purple with ash-coloured veins, and not unfrequently, as being all of a blackish colour. Such as is brought into Europe has a blackish colour. Such as is brought into Europe has a bitterifh, refinous tafte, and a light aromatic fmell. Set on fire it feems to melt like wax, emitting while it burns an agreeable fragrance; the degree of this fragrance gives

the proof of its goodness.

One ounce of this wood yields to spirit of wine three drams of a refinous extract; and to water it yields two drams. If diftilled with water, it yields an highly cordial oil, in the proportion of half an ounce from one hundred and fixty ounces. Miller. Dale.

AGALUGI, AGALLUGUN. Names of the agal-

lochum.

AGAPE. ayane, love; also an afternoon or evening's

AGARICUS AURICULÆ FORMÆ, See AURICU-

LE JUDE, Jews Ears.
AGARICOIDES, a fort of fungus.

AGARICUM, or AGARICUS, AGARIC, called also fungus laricis. Boerhaave calls it fungus igniarius, because when it is beat out it will take fire at a spark, and blaze out. It is named agaric from Agaria, a town in Afia, where it grows most plentifully. It is the boletus pini laricis. Lin.

Above twenty forts are diftinguished by botanists, one

of which is the TOUCH-WOOD, or SPUNK.

It grows on the trunks of larch trees, and also on some others, without any pedicle. Internally it is white, and of an uniform structure; outwardly it is covered with a brown bark, full of small holes underneath. In autumn this fubstance is cut off from the trees, separated from its bark, then exposed to the sun, which both dries it, and in-creases its whiteness. The lightest, whitest, and most free from gritty matter, is the best. It hath but little smell; when chewed it is at first sweet, then bitter. It gives out its active parts to watery menstrua, and also to spirituous; it is with difficulty reduced to powder, except it be first moistened with a folution of gum arabic, and afterwards thoroughly dried. It is cathartic, but hardly ever used in the present practice, as its operation is both flow and unpleafant, occasioning sickness, gripes, &c. The dofe is from 3 i. to 3 ij.

AGARICUS MINERALIS. See LAC LUNÆ. -

Muscarius. Linnœus. The REDDISH MUSHROOMS, alfo called BUG AGARIC. This is one of the poisonous vegetables that are indigenous in Great Britain. The pillar ftalk is white, thick, and hollow; thicker towards the top; egg-fhaped at its base; surrounded at its middle with a pendulous membrane, and surnished with a cap

AFFODILUS. See Asphodelus luteus.

AFFODINA. Venus.

AFFUSIO. Pouring a liquor upon fomething, and fometimes it means the fame as fuffusio, a cataract.

AFIUN. See Opium.

AFFUSIO. The African flower. Gerard

AFFUSIO. The African flo mufhroom is decaying, the gills become brownish. It is found in pastures and woods.

If the juice of this mu/broom is rubbed where bugs retreat in the day, it will destroy them. If it is infused in milk, it is destructive to slies the instant they sip it. Haller relates, that fix persons of Lithuania, perished at one time by eating this kind of mushroom; and that others have been driven mad by it. Two or three may be taken without danger, but more will occasion de-

lirium.

See Withering's Botanical Arrangements. Wilmer's Observations on Poisonous Vegetables. Lightfoot's Flora Scotia, vol. ii. p. 1010. - PIPERATUS. Linnæus. PEPPER MUSHROOM, also called PEPPER AGARIC. It is the fungus piperatus albus, lacteo succe turgens. Raii. Also the fungus albus acris. B. P. The stalk is about two inches high. The hat is convex when young: as it expands, it becomes nearly flat; its colour is a dirty white, with a mixture of grey; it contains a milky juice. The difk is constantly bent inwards: when the fungus is decaying, the hat becomes depressed in its centre, and is fometimes feen funnel-shaped. The lameliæ are close, numerous, and of a pale sieth colour.

It is very common in woods, near the roots of trees. When freely taken, fatal confequences are related by feveral writers. When this vegetable has loft its acrid juice by drying, its caustic quality still remains.

In case of injury from any of the mushroom tribe, see

AMANITA.

See Wilmer's Observations on Poisonous Vegetables. -Quercus, agaric of the oak, called also fungus igniarius. Agaricus pedis equini facie, fungi arborei ad ellychnia. FEMALE AGARIC, and, from its readiness to catch fire, TOUCH-WOOD.

It grows in the form of a horse's hoof; externally it is of a dufky afh-colour, and internally of a dufky red; it is foft and tough. The beft is faid to grow on the larger branches of oak trees; but that which is found on other

trees is often as good.

It confifts of four parts, which prefent themselves successively, 1st. The outward rind, which may be thrown away. 2d. The part immediately under this rind, which is the best of all, and is used to restrain hemorrhages from 2d. The part immediately under this rind, which wounds, and after amputations; it should be beat well with a hammer until it is foft and pliable, then flices of it of a proper fize are to be applied upon the open bloodveffel, whose discharge it restrains, not from its restringency, but its texture and adhefive quality: on the first application it adheres pretty ftrongly, but about the end of two days it begins to feparate and foon falls off. 3d. A part which adheres to the second, and which is an interior fort, may be used in less important cases. The 4th, or last part, may be powdered, and then used for the same purposes as the second and third forts. The best time for taking the fungous fubftance from the trees is in autumn, when the weather is fine, and after great heats.

As a ftyptic, this fungus does not appear to poffers any advantages greater that what may be expect from dry lint, as its fuccers hath not been maniferted but when the circulation was fo languid that lint would not have failed to have answered as well. This agarie grows on different trees, chiefly on the ash; it is the boletus igniarius, of Lin. Touch-wood, or boletus acaulis pulvinatus lævis,

poris tenuissimis. Lin. See Warner's Cases in Surgery, p. 133, &c. Neale's

Observations on the Use of Agaric.

AGASYLLIS. Dioscorides tays it is the shrub that produces the gum ammoniacum.

AGATH. See Succinum Nigrum.

AGATHONIS ANTIDOTUS HEPATICA. Agathon's Antidote for the Liver.

AGATY, the name of a tree which grows in Malabar,

and affords a fruit that in its shape and taste resembles the kidney-bean. Raii Hift.

AGEM. A name of the Perfian lilac.

K

AGENESIA.

minerals should be fixed, and from whence the trunk and branches shoot into the earth.

The uterus is called ager natura.

AGER, or AGRORUM TERRA, fignifies the common

earth or foil.

AGERATUM. So called, because its flowers pre-ferve their beauty a long time. It is also named balfamita minor; eupatorium; costus hortorum minor; ptarmica lutea, & achillea, eupatorium Meffue; berba julia; mentha corymbifera minor, maudlin, SWEET MAUDLIN, OF MAUDLIN TANSEY. It is the ACHILLEA AGERATUM of Linnaus.

Botanists have enumerated seven or eight species. It is a perennial flender plant, with undivided, indented, narrow leaves, and yellow naked discous flowers, set in umbels on the tops of the stalks: it is a native of the fouthern parts of Europe, and cultivated in our gardens. It flowers in July and August, and hath an agreeable fmell, and a warm bitterish taste. It contains the virtues of coftmary and tanfey, but is hardly ever used: infusion in water is the best preparation.

AGERATUM LATIFOLIUM SERRAT. See BAL-

AGERATUS LAPIS. A stone used by coblers to polish women's shoes. It discusses, and is gently aftringent.

AGES. The palm or hollow of the hand. AGE VITA. The name of an antidote, rather fupposed to be called jugis vita, long, or continual life. is a medicated wine, made with galangal root, long and white pepper, fage, ginger, cinnamon, faffron, and cloves, boiled in wine. cloves,

AGGLOMERATIO, an agglomeration or rolling to-

gether.

AGGLUTINATIO, AGGLUTINATION. Reunion, flicking together: fo healers are agglutinants. — PI-LORUM. A reducing the hair of the eye-lids that grow inward to their natural order, which is done by any glu-tinous matter on a probe, and drawing the hairs out, and fixing them where they flould remain.

AGGREGATÆ GLANDULÆ. Small glands are lodged in the cellular coat of the intestines next to the villous; but as they do not appear in an uninjected gut, many anatomists suspect them only to be little bits of se-

parated wax.

AGGREGATUM, an AGGREGATE. A body refulting from the union of many others which are fmaller, of

which the whole fum is the aggregate.

AGHEUSTIA. DEFECT OR LOSS OF TASTE. Dr. Cullen ranks this as a genus of difease, in the class locales, and order dysesthesize. The causes are sever, or palfy, whence he forms two species; the first he calls, Organ-Ic, arising from some affection in the membrane of the tongue, by which relishing things or those which have some taste, are prevented from coming in contact with the nerves: the fecond ATONIC, arifing without any afection of the tongue. SAUVAGES fays the cause of this difeafe is either in the brain, in the tongue itfelf, or in the paffage of the lingual nerves; -he forms two species -first, Februars, where a suppression of taste accompanies ardent, and malignant fevers, or account of the extreme dryness of the tongue, when it wants moisture, grows black and rough like wood; or from the delirium, or comatous state into which patients sometimes fall. -Second, PARALYTICA, when it accompanies a paralytis of the tongue, or fome comatous diforder-Nof. Meth.

v. i. 751.

AGIAHALID, an Egyptian tree, also called *lycium*.

It is very large, resembling the wild pear; its fruit is bitterish and styptic, the leaves are four and astringent.
AGIS. The THIGH. See FEMUR.

AGLACTATIO, DEFECT OF MILK.
AGLIA. See ÆGIDES.
AGLITHES. The division or fegments of a head of garlick, which we call cloves.

AGLUTTTIO. IMPEDED SWALLOWING. See DE-

AGME, from ayu, to break. A FRACTURE.

AGENESIA. Venereal impotency in man. Vogel. It is fynonymous with anaphrodifia, also with dysparmatismus.

AGER CHYMICUS. Dorneus says that water is the field [ager] in which God has ordained that the root of

but of no medical use, and called calychirichibon caraib.

AGNATA. See Adnata. AGNIL. See Indicum. AGNINA MEMBRANA, vel PELLICULA. Actius calls one of the membranes which involve the fœtus by this name, which he derives from its tenderness. It is the omnios. This name is adopted by Drelincourt and Bartholine.

AGNOIA, from a, neg. and ynesses, to know. It is when a patient in a fever forgets his acquaintance. Hippocrates names this circumstance thus, and observes that,

when it is joined with a rigor, it is a dangerous fymptom.
AGNUS CASTUS. The CHASTE TREE; also called

agynos, elangenon & lygus. It is the vitex of Linnaus. It is called horos, lygus, as it were ofier, because of the toughness of its rods; and chaste, because the matrons who lived chafte during the feast of Ceres laid on them at

It is a fmall tree or shrub of the willow kind, with tough branches, digitated narrow leaves and monopetalous purplish flowers, standing in spikes on the tops of the branches, followed by a fmall fruit with four oblong whitish feeds. It grows in marshes and on the fides of rivers in fome hot countries. It is a native of Italy. The feeds are of the fize of a pepper-corn, and abound with a grofs infipid oil, of a faffron colour, which is eafily obtained by expression. — It is also the name of a fort of willow called ABRAHAM'S BALM. See MELISSA. Also of the Palma Christi, whose oil is called the oil of agnus cassus. — Scythicus. The Scythian Lame, called alfo in the Scythian language barametz, i. e. lamb, or barametz, or barametz. This fort of plant is faid to grow in Tartary, Ruffia, &c. and is deferibed as growing in the refemblance of a lamb; but the truth feems to be, that when defigning perfons have met with a plant which feemed to have fome diffant refemblance to a lamb, they increased the lamb-like appearance by art, and then covered their vegetable subject with the skin of a young lamb that had been cut out of the ewe for this purpose; thus those who were not aware of the difference of a lamb's tkin whilft it is in the feetal flate, and after it is yeaned, had these frauds of art imposed on them for natural vegetable productions. The Persian lamb-skins called Persianish baranken, are lamb-skins which are stripped from their lambs in their foctal state, and thus they being much finer or more delicate, are fitter for the fumptuous dreffes of the rich.

AGOMPHIASIS, or GOMPHIASIS. A diftemper of the teeth; it is when they are loofe in their fockets, and

pained.

AGONE. HENBANE. AGONIA, from a negative, and yess, an offspring.

AGÓNIA, from eyer, a combat or firuggle. Agony, as when there is a struggle between life and death. Alfo fear and fadness of mind.

AGONOS, from a, neg. and yoves, an offspring, or

youn, barren.

Hippocrates calls those women so who have not children, though they might have, if the impediment was

AGOSTUS, from ayz, to bring or lead. That part of the arm from the elbow to the fingers, also the palm or hollow of the hand.

AGOUTI TREVA, or Aguti treva. A plant with

fruit like a pomegranate.

AGREDULA. A Species of Frog.

AGRESTA, Verjuice. The juice of unripe grapes, or the four grape itfelf; it is also called omphax. See MALUS HORTENSIS.

AGRESTEN. ACID STONE TARTAR.

AGRESTIS, WILD.

It is applied to vegetables that grow without cultivation. It expresses an ungovernable malignity in a disease. It distinguishes wild from tame animals.

Wild animals afford better nourishment than tame ones, and are more heating: the flesh of wild animals keep AGNACAT. A tree which grows about the ifthmus longer than that of the tame, and affords lefs excrement.

It is owing to their exercise that wild animals have their falts exalted, and so have a higher flavour. See MALUS

SYLVESTRIS.

AGRIA, HOLLY. Also a malignant pustule, of which there are two forts; one is fmall and casts a roughness or redness over the tkin, flightly corroding it, smooth about its centre, spreads flow, and is of a round figure; this fort is cured by rubbing it with the saliva before having breakfasted: the second fort ulcerates, with a violent rednefs and corrofion, fo as to make their hair fall off; it is of an unequal form, and turns leprous; its cure is the ap-

plication of pellitory of the wall in the manner of a poultice.

AGRIAMPELOS, from appeas, wild, and autilias, a
pine. The WILD VINE. According to Gerard it is the

black briony.

AGRIC. The abbreviation by which is meant Georius Agricola de Re Metallica, Natura Fofilium, &c.

ifilian. 1657, fol. AGRICULTURA. Agriculture is the art of cultivating the ground, tillage, hufbandry, as diffinct from pafturage. But is not concerned with medicine any farpafturage. But is not concerned with medicine any far-ther than in common with all exercises, except in the inftance of benefit supposed to be received from the va-pours which arise while ground is fresh or newly turned up, particularly the light gravelly foils: though it is to be wished, that in respect of preserving health, more exercife was used this way; thus many diseases would be easily prevented, which, when present, are disficult to be removed. It is observed to have been the practice of the great Boerhaave, to prevent, by labour in his gardens at flated intervals, those disorders which others in vain attempt to remove, which through neglect of exercise in health they subject themseives to.

On this fubject the curious will meet with much fatisfaction from the Georgical Effays by A. Hunter, M. D. Fordyce's Elements of Agriculture and Vegetation.

AGRIEL/EA, from arpros, wild, and thata, an elive, The wild olive.

AGRIFOLIUM. See AQUIFOLIUM.
AGRIMONIA, COMMON AGRIMONY, called also eupaterium Gracerum, vel veterum, vel verum, and beciam fanum, and there is a species called eupaterium Dioseori-dis, vel aderatum, vel aromaticum. The common agrimony, is the agrimonia eupatoria, or agrimonia foliis caumony, is the agrimonia eupatoria, or agrimonia folia caulinis pinnatis, foliolis undique ferratis, omnibus minutis
interflinctis, fructibus hilpidis of Linnæus. Common
hemp, and Dutch agrimony, is called cupatorium. Hemp
agrimony, Bidens; naked-headed agrimony, eupatorio Phalacron; water, and water-hemp agrimony, Bidens, eupatorium, which fee.

Miller takes notice of four species.

Le is a hairs plant with winned leaves composed of che-

It is a hairy plant with winged leaves composed of ob-long indented fegments, with final portions between, set on middle ribs, which stand alternately on the stalk; on the top grows a long spike of pentapetalous yellow flow-ers, followed by little burrs, containing each one or two feeds. It is perreanial, grows wild in hedges, and about the fides of fields, and flowers in May.

The leaves have a flight bitterish aromatic taste, the flowers are finall, stronger and more agreeable; they

give out their virtues to water and to spirit of wine.

It is best used while fresh, and the tops, before the flowers are formed, possess the most virtue. A conserve is the best form of preparation; an infusion in water or

whey is good.

It is mildly corroborant, and of great efficacy in difeases from a lax habit. Dr. Aliton, of Edinburgh, fays, that the powder of this herb is the best mode of administering it, when the intention is to corroborate, and that if thus taken in a large quantity, we may expect many of the effects of the bark from it in agues. Dr. Cullen fays it has some aftringent powers, but they are feeble, and pays little attention to what has been faid in its favour.

The dole is 3i. or more.

ALBIR. Pitch got from the bark of the yew-tree.

ALBOR. URINE.

ALBOR OVI. See ALBUMEN OVI.

ALBORA. A fort of itch, or rather leprofy. Para-celfus fays, it is a complication of the morphew, ferpigo, and leprofy. When cicatrices appear in the face like the ferpigo, and then turn to small blifters of the nature of morphew, it is the albora. It terminates without ulceration, but by fetid evacuations in the mouth and nostrils; it is also feated in the root of the tongue. Internal medi-cines, as well as corrolive ones, are forbid.

ALBORCA. MERCURY.
ALBOTAT. CERUSS.
ALBOTIM, of ALBOTAI. TURPENTINE.
ALBOTIS. See TERMINITHUS.

ALBUGINEA vel TENDINOSA TUNICA. The inner proper coat of the telticle is thus named, from its white and transparent colour. It is a strong, thick, white membrane, finooth on the outward furface, rough and uneven on the inner: into the upper part of this membrane are inferted the blood-veffels, nerves, and lymphatics, which fend branches into the tefficles.

This coat being diftended, is the cause of that pain

which attends an inflammation on the testes.

Albuginea is also a name of the advata, which see. ALBUGINOSA HUMOR. So the aqueous humor of the eye bath been called.

ALBUGO CORALLII. A name of the magistery of

coral, which it hath obtained from its whiteness.

ALBUGO OCULORUM. The white speck on the eyes. The Greeks generally named it leucomo; the Latins, nubes, macula alba, nebula, and nubecula: fome ancient writers have described it under the names of pterygium, pannus oculi, onyx, ungus, argema, and ægides. Sauvages makes it a species of leucoma, under the name leucoma. Albugo, called by Dr. Wallis the albuginous, or pearly corneal speek. The French name it tache nous, or pearly corneal speck. The French name it tache olamehe, if it thines: the Latins, margaritta; the Greeks, στραλαμπος; the French, perle. It is a variety of Cullen's caligo corneæ. With us it hath various appellations, as, a cicatrice, film, haw, a dragon, pearl,

It may be observed, that all cicatrices appear white in the black part of the eye; for the cornea being thickened, the most eminent part turns white: astringents thicken

thefe cicatrices.

Some diftinguish this diforder, by nubeculæ, when its feat is superficial; and albugo, when it is deep. Others make the following distinctions, viz. when the speck appears of a fhining white, and without pain, it is called a cicatrice; when of an opake whiteness, an albago; feated superficially, it hath been termed a speck; and more deeply, a dragon; if an abfeefs was the cause, its contents hardening between the laminæ of the cornea, caufes it to

project a little, and then it is called a pearl.

The causes are various; as inflammation in the eye, abfeels in the cornea, erofion, meafles, fmall-pox, wounds,

burns, &c.

Whendeep the cure is difficult; when the confequence of a wound or ulcer, they are rarely cured; when caufed by an imprudent useof vitriolic collyriums, and when they alter the natural shape of the eye, the prognostic is as un-favourable. Those which follow an inflammation, gene-

rally disappear spontaneously.

Happening after the small-pox, measles, or other inslammatory causes, the utmost hasteshould be made to relieve, by bleeding, purging, bliftering, diuretics, and an

abstemious diet. Avoid cold and aftringent collyriums; ALBEDO. Whiteness. In urine is observed four but the sumes of cossee, or of the decoction of the woods, may be useful. When these specks are very small, they often ulcerate; but these ulcerations are soon healed by the application of the pulv. rad. irid. paucul. face, cryftal. or, as is juftly preferred by many, the aq. cupri ammoniati. If the diforder hath been of long standing, the monant. If the disorder nath been of long standing, the cure is very difficult; however, the following methods may be attempted. Expose the diseased part of the eye to the sumes of camphorated spirit of wine directed through a quill: this, by a continued use, may abrade the speeck. This method feldom fails to excite some degree of inflammation has which the care in final degree of inflammation has which the care in final degree of inflammation has which the care in final degree of the second standard that the same in final degree of the second standard that the same is final degree of the second standard that the same is final degree of the second standard that the same is same as the second standard that the same is same as the second standard that the same is same as the sa gree of inflammation, by which the cure is effected; though when the inflammation is thus produced, it must be removed by the common methods with all possible speed. To this end, the following have been also applied with fome degree of fuccess, viz. the juice of celandine, the gall of cels, or of the pike, or of a partridge, and the oil of box: if these prove too sharp, let them be diluted with water, or with a thin solution of gum dragon: apply any of these once in twenty-four hours; and half an hour after the application, wash it off with a little brandy and water. The aq. cupri ammon, alone fometimes succeeds. When the film is very tough, and the eye not inflamed, common glafs finely levigated may be blown upon it through a quill, and repeated once in a day or two. Dr. Kirkland thinks that in general, when fmall opacities upon the cornea are curable, and if the cure is undertaken as foon as the removal of inflammation admits, nature, affifted by firengthening the eye with cold water, will effect the cure. It is cured, according to St. Yves, by beginning with the inflammation which accompanies it. BOER-HAAVE prescribed the repeated use of calomel and cathar-HAAVE presented the repeated use of calomes and cathartics to diffolve the lymph, and free the cornea from seucoma. See Unguis. See Kirkland's Inquiry, vol. i. p.

It is discutient, and was formerly applied to the inside of the throat in quinsies, being first mixed with honey; a cataplasm of alb. Graco. p. i. & conf. rofar. rub. p. ii. was applied acrofs the throat. Neuman's Chem. Works. See Canis.—Hispania, & Hispanicum. Spanish white. It is also called bianca Alexandrina. It is made from tin, in the fame manner that cerus is made from lead; also from biffame manner that cerus is made from lead; also from bismuth. It makes the skin appear white. — Jus. White broth. Boil whiting, haddock, cod, or any such whitegrained sish, in water, with a little oil; also a small quantity of anise and leeks. When the sish is parboiled, add a little falt. — NIGRUM. MOUSE-DUNG. —Olus. Lamb's lettuce, or corn sallad. ALBUMEN OVI. White of egg; called also albumor ovi, albus signer, ovi candidum, ovi albor, albamentum, album ovi, &c.

The white of an egg is a pellucid, viscous siquor; thinner towards each end, and thicker in the middle. It supplies the fectus bird with its first nourishment, and bears a great analogy to the serum of the blood. In each

bears a great analogy to the ferum of the blood. In each egg there are two albumens, involved in their proper membranes: of these, the one is very liquid, and is next to the shell; the others is more dense and viscous; it immediately furrounds the yolk. There are also two branches of umbilical veins in the egg; one goes to the white, and the other to the yolk. The white is specifically lighter than the yolk: it is condensed by heat, in which the yolk retains its fortness. The yolk is dried more in boiling than roafting; when it becomes warm by incubation, it is more humid, and like melting fat.

The chick in the egg is first nourished by the thinner or outer albumen, then by the inner and more viscous, and lastly by the yolk. The umbilical veins that go to the white, when it is spent, wither, and leave no signs of their having existed, by the time that the chicken is hatched. During the whole incubation, the white is as

fweet as when the egg was new laid.

Boerhaave observes, that the white of egg is neither acid, alkaline, nor spirituous; that it is inodorous, insipid, and fo free from acrimony, that if it is applied to naked nerves

it is fearcely perceived; and yet in twenty one days, in | a brifk tafte; and when enough of chalk is added, the the heat of 93 degrees by Fahren. thermom. a chicken is formed; that 80 degrees is infufficient, and 100 destroys the foctus and the egg too, with respect to the production of a chicken.

If an egg is steeped in water heated to 80 degrees, it lofesits tenacity; part exudes through the shell at the broad end, and the rest becomes ichorous and putrid. If the fresh white is thrown into boiling water, it instantly co-

The white of egg forms a more folid coagulum than ferum, but in other respects they are the same if put into boiling water; alcohol of wine coagulates the white of egg, and it does the fame with ferum, on which account alcohol is applied to bleeding wounds as a ftyptic.

A little putrid white of egg taken into the stomach, occasions a nausea, horror, fainting, vomiting, diarrhoea, and gripes; it inflames the bile, excites heat, thirst, fever, and disfolves the humours like the plague. On the contrary, the white of fresh-laid eggs, if taken while warm from the hen, is extremely nourishing to the infirm; it may be taken in luke-warm milk; but if any other heat is applied to it, the nutritious quality will be destroyed. The fresh white of egg prevents burns from rising in blif-ters, if it is used immediately after the accident: it mitigates inflammation of the eyes, and preferves the face from fun-burning. In pharmacy, it is used as a medium to render balfams and turpentines, &c. miscible with aqueous fluids; but as it disagrees with many stomachs when thus taken, a mucilage of gum arabic may fupply its place, it being as good a medium in fimilar circumftances, and not apt to offend the tenderest stomach.

ALBUMOR. See ALBUMEN OVI.

ALBURNUM. The fofter and paler part of wood next the bark; artificers call it the fap, to diftinguish it from the heart, which is deeper coloured, and harder. See SANTALUM ALBUM.

ALBURNUS AUSONII. A little river fish like an anchovi

ALBUS ROMANUS PULVIS. See MAGNESIA ALBA.

ALBUS, befides its well-known fignification to express white, is also the name of a fish. See CAPITO LAC-

ALCAHEST, or ALKAHEST. THE UNIVERSAL MEN-STRUUM, OF DISSOLVENT. A name first used by Paracelfus, and derived from the German words al and geeft, i. e. all fpirit. Van Helmont borrowed the word, and applied it to his invention, which he called the universal diffoleent. As it is difficult to say whether the falsity or folly of what is handed down to us with respect to this article be the greatest, the curious are referred to the writers themselves, to whom we are obliged for what is faid concerning it. See Paracelfus de Viribus Membranorum, lib. ii. cap. vi. Eph. Germ. D. xi. ann. 8. app. 3. Helmont Complexiorum atque Mistionum elementalium figmentum, sect. 27-29. Helmont Potest. Medic. sect. 3-24. Helmont Arbor Vite. Boerhaave's Chemistry. Alcabest is also a name of the liquor of flints.

ALCALI, or ALKALI, of al, and kali, i. e. of or from kali. Alkali, because a great quantity of that kind of salt is obtained from a plant called kali, the name alkali hath been given to the fixed falt of all plants; and that because an effereescence does arise upon mixing an acid liquor with the falt, all volatile or fixed falts, and all terreftrious matters which ferment with acids, have come to be called alkalies. The herb kali, which grows on the fea coasts, when dried and burnt, affords a lixivium, which, if evaporated, is the fixt alkaline falt.

Alkalies are mineral, vegetable, and animal, which three were particularly diftinguished by the term adding to it the peculiar epithet belonging to the faline ful-flance to be specified; but the College of physicians of London have now rejected the term, and diffinguished them by three different appellations; calling the vegetable alkali, KALI; the mineral, NATRON; the volatile,

AMMONIA; but they are either earthy or faline.

Earthy alcalies are those substances, which of themfelves scarce dissolve in pure water; but if added to acids,
form a tertium quid. Of this fort are chalk, limestone,
crab eyes, oyster-shells, egg-shells, &c. Thus if pure
water is acidulated with oil of vitriol, scrape chalk into it, it ferments, and during the ferment the water hath acid is loft, fo that no experiment can discover the acid. except you first separate it: and this is a certain characteriffic, or the proper meaning of an alkali, viz. it is the reverse of, or natural opposite to acid.

The saline alkalies are fixed and volatile. The latter

of which differ from the former only in volatility and its confequences; it rifes fooner than the rectified spirit of wine, it regenerates nitre and sea salt from their spirits, only the falts fo recovered are femi-volatile, refembling

Tachenius is faid to have first made the fixed vegetable alkali; he established the general use, but it was used long before his time; and it hath been faid that the burn-ing of vegetables is the only fource of fixed alkaline falts, but the evaporation of feveral mineral waters prefents us also with pure fixed alkaline salt. A fixed alkali is the basis of sea falt, &c. burning is the only source of the fixed vegetable alcaline falt.

The College of Physicians of London have now rejected the faline fubstance fal absintbil, and supplied its place with the KALI PREPARATUM, which they order

to be prepared in the following manner.

Take of pot-ash two pounds, boiling water distilled three pints; dissolve and filter through paper. Evaporate the liquor till a pellicle appears upon the surface, then fet it aside for a night, that the neutral falts which it contains may crystallize, after which pour out the liquor, and boil away the whole of the water, conftantly flirring

left any falt should adhere to the pot.

In like manner is purified impure kali from the aftes any kind of vegetables. The fame falt may be preof any kind of vegetables. pared from tartar, burnt till it becomes of an ath-colour, and indeed of all the fubitances from which a fixed alcaline falt is obtained tartar yields the largest quantity, and with the least trouble. The college has ordered the folution of pot-ash to be set by a whole night for the neu-tral falts, which are part of the composition, to crystallize, but that is not sufficient; for in order to have the alkali in its pureft state, which is their intent, freed from those falts, the solution will require to be exposed to cry-stallization three times at least, else will it retain too great a share of vitriolized tartar. Observations on the Pharmacopeia Collegii Regalis, &c. London, 1788.

Natron, or Sal Sodie, prepared.

Take of hailly propolety to the control of the

Take of barilla powdered two pounds, distilled water one gallon, boil the barilla in four pints of water for half an hour, then strain it; boil the part which remains after straining with the rest of the water, and strain it. Evaporate the mixed liquors to two pints, and fet them by for eight days, strain this liquor again, and after due boiling fet it by to crystallize. Dissolve the crystals in distilled water, strain the solution, boil and fet it aside to crystallize. This is similar to the fal alkalinus salis

This mineral fixed alkali differs from that of vegetables, in being much milder to the tafte, not fo readily diffolving in water, nor deliquating in air, therefore may be given in the form of powders, eafily affuming, like neu-tral falts, a cryftalline form. These cryftals are prismatic, greatly refembling those of the fal mirab. Glaub. now

called natron vitriolatum. See NATRON.

Fixed alkaline falt is obtainable from fea falt and nitre, and from all vegetables, except perhaps fome of the vola-tile acrid kind, which imprefs the note fharply with their fcent, fuch as mustard-feed, garlie, &c. they contain parts that are volatile, and become volatile falt. The fixed falt of fome plants vary greatly from one another, in ftrength, &c. if taken in the ftate wherein they are first extracted from the aftes; they fometimes contain a confiderable proportion of neutral falt of the vitriolic or of the muriatic kind; to difcover which, fhake a strong folution of the fuspected falt in a phial, and about an equal quantity of the fp. vini R. if the falt is purely alkaline, the two liquors on flanding for a moment will feparate, the spirit riling to the top, but both will be transparent as at first; but when neutral falts are mixed with the alkaline, though in a very finall proportion, the fpirit produces inflantly an opake milkiness in the ley, and on standing a few minutes, a saline matter falls to the bottom. Sometimes a bitter crystalline hard falt, that is neither acid nor alkaline, is found among the fixed alkaline falt; but as it does not eafily diffolve even in hot water, it is readily separated by

#### ALC ALC

means of cold. (e. g. ) Take fix pounds of the suspected falt, and put it into twenty pints of rain or other foft water, the parts that do not eafily diffolve falling to the bottom, the pure liquor may be prefently decanted, and the alkaline falt recovered by evaporation. This hard falt is never met with in making the falt of tartar, but in pot-ash it is often found. The salts of the leaves, and other herbaceous parts of plants, are more difficulty brought to a flate of purity than those of the more woody and compact, a portion of the oil being fo tenaciously retained: it is true, fome endeavour to retain this oil in the falt by burning the vegetables in a fmothering heat until they are reduced to affees. They do this to render the falt more mild; but the mineral alkali is fufficiently free from acrimony to fit easy in the most irritable stomach, when administered in the usual modes. Tachenius and Boerhaave, with many others, prefer these falts when their oil is retained: but as they had no view therein but what is answered in the mineral alkaline falt, the use thereof will at once appear more eligible, as its ftrength is more certain, and its freedom from any empyreumatic oil, fecures it from exciting naufeas. Wormwood, broom, bean-stalks, mint, carduus, and all of the thistle kind, yield a good proportion of this salt, and that tolerably free from other kinds of saline matter.

The strongest alkali is nitre dissolved with the regulus of antimony, then fet to cool, when the nitre will be found at the top, of a yellow colour. To discover the strength of these salts, let a quantity of the muriatic acid be fo diluted that fixteen drams of it may exactly faturate one dram of pure alkali; if then a folution of a dram of any given falt be faturated with the fame acid liquor, fo many drams or parts of a dram of the acid as are required for the faturation, fo many 16ths or parts of 16ths of pure alkali does the given falt contain.

Fixed alkaline falts are rendered more active and even cauftic by the addition of quick-lime, as appears in the making of lix. fapon. cauftic. com. and by the union of lime and alkaline falt in a liquid flate, oils, fats, &c. are more powerfully diffolved than by either of them in a feparate state. The volatile alkaline falt is as greatly heightened in fome of its qualities by quick-lime as the fixed is: lime renders the volatile alkaline falt permanently liquid, prevents its concretion, and also its efferves-cing with an acid, whence it is probable that the lime acts on alkalies by absorbing their air.

The ebullition which arises on mixing an alkali with an acid is not from their antipathy, but affinity, or affociating principle; the acid and alkali fo strongly rulh to each other, that the air and water are forcibly impelled, whence the commotion. Alkaline falts attract acids more forcibly

than they attract water.

Alkaline falts obtained from different plants, purified by calcination from all their oil, and by deliquation in the air, by which only the alkali diffolves, are all, except from fome of the marine, fo much alike as not to be diffinguished by any known method of trial. It is true, that fo far as difference may arise from different management in the preparation, diffinctions may be pointed out: a variation in the heat by which the plant is calcined occafions a difference in the acrimony of the produce; using the afhes fresh burnt, and after being long exposed to the air, and applying the water hot or cold with which the falt is to be separated from the ashes, makes a considerable difference; for by exposure to the air, alkalies that have been made caustic by quick-lime lose their adventitious acrimony; neutral falts are found in the ashes of some vegetables, and boiling water takes them up with the alkaline; but cold water extracts from these ashes the alka-line salts alone, except it be used in too large quantities or permitted to ftand too long upon them; and the reason why pot-ashes have less neutral falt than the alkaline falt, made by chemists, is that the chemists use hot water, but the pot-ash makers use cold water to make the affres into ley. It is the fame with the volatile as with the fixed falts, they do not differ from one an-other fo much as they do from themselves in different

Fixed alcaline falt is not fimple and pure, but is an earth whose faline part in a separate state is volatile; this is evident in the preparation of the aq. kali. which see.

The properties of vegetable fixed alkaline falt are,
It is fixed and suffice in the fire.

It is fulible with any stone that strikes fire with steel: with fand, &c. it produces glafs.

It deliquates in air, and diffolves in lefs than its weight

of water.

It does not assume a crystalline form.

It is not acted upon by vinous spirits. It hath a fiery or acrid taste, the urinous taste which it excites, is only after the falt has altered the faliva.

It is inodorus, attracts every acid, and lets loofe all volatile falts that are fixed by acids.

If effervesces with acids, and when saturated with them a neutral falt is formed.

It turns the purple of violets, and changes rofes to a green colour.

Applied to a living human body it attracts the moisture therefrom, then inflames and corrodes the part, and forms a mortification, or is cauftic.

It deterges and cleanses.

It precipitates earthy and most metallic bodies disfolved in acids.

It unites with oils both diftilled and expreffed, and forms a foap.

Its greatest affinity is to acids. It attracts air fo strongly as not to part with it until an acid fets it at liberty.

Added to the nitrous or muriatic acid, it brings those fpirits back to their own falts respectively, that is, nitre and common falt are thereby formed.

It turns a folution of muriated quickfilver in water yel-

low or red.

As a medicine, if largely diluted with water and taken in bed or a warm room, it promotes perspiration; but its tendency is more directly to urine, and this is pro-verting them into a mild aperient falt, and thus removes a cause of many chronical diseases. It resolves viscid and glutinous humours, by which, and its gentle stimulus, ob-itructions are removed, and wherever it passes secretions are promoted. It loofens the texture of calcareous concretions by itrongly attracting their air, and made into a ley with a fmall quantity of lime this power is increaf-ed. In those statulent disorders which rise from a defective bile it affords great relief.

The dose may be from gr. ij. to 3 ij. twice a day, but always plentifully diluted; the dose of 3 ij. should be mixed with at least 3xx. of water. Considerable doses may be long continued, as is evident in those who take the aqua kali puri to remove calculous complaints.

As a principal medical effect of alkaline falt, is to attenuate the blood and humours, it is obviously improper in the feurvy, and all those disorders in which the texture of the blood is already too much enfeebled; in particular diforders, this medicine is hurtful by increasing that colliquation which is always observed to attend them. It is probable, that the restrictions on the Jews with respect to their diet, was in part from the speedy putrescence to which the prohibited subjects tend; animal food is all alkalescent, but some more so than others; all fish soon putrify, but those without scales, and the shell fish the foonest.

The volatile alkaline falt is either in a dry or liquid form; when dry it is called falt, when liquid, fpirit, now water; the falt is obtained by fublimation, the water by distillation. The water is only the falt diffolved, and differs not from it but in the liquid form, and the conveniencies of its fluidity, fuch as its more readily

uniting oil with water, &c.

The volatile alkaline falt hath been chiefly obtained from the horns of deer, by diffilling them in large iron pots, with a fire gradually increased to a strong red heat; but in the fame manner as is below directed for the falt, liquor, and oil of hartfhorn; a fimilar falt, liquor, and oil may be extracted from all animal fubitances except fat, from blood dried by a gentle heat, from urine first eva-porated to the confidence of honey, and putrified. Urine, distilled with the addition of quick-lime, yields an extremely pungent figirit. Ivory, and the bones of animals, are used for this purpose; bones are, indeed, so far preferable to hartshorn, that without being desective in any

perfection observable in the horns of their produce, the ferable. Take the whitest fal ammoniae, dry it well ialt and fpirit of bones require lefs rectification, are more palatable, and less disgustful to the stomach, and the spirit retains its limpid appearance longer than does that from horns; when bones are used, their fat must be extracted first by long boiling. Wood-soot affords a falt liquor and oil, not differing from those from hartshorn, except in that it is not so easy to rectify. Sal ammoniac, being mixed with any fixed alkaline substance, its acid quits it, and being retained by the fixed alkali, the volatile alkaline falt of the fal ammoniac is obtained, and with very little trouble rendered perfectly pure; the spirit of fal ammoniac is free from the inconveniencies which attend those spirits obtained from horns, ivory, bones, &c.

Liquor, sal, & oleum cornu cervi.

The liquor, falt, and oil of hartforn.

Diftil pieces of hartfhorn in an iron pot, furnished with an earthen head, and a large receiver well lufed, on an open fire, gradually raised almost to the highest red heat. A phlegm arises at the first, a spirit follows, then comes a volatile falt mixed with an oil, this oil at first is yellowiih, but the diftillation being continued, its colour deepens to a dark red almost black: in the bottom of the pot there remains a black coal, called harts black, from its being the remains of hartihorn; it is as good as ivory black when ground fine; this refiduum, if taken out and burnt to whiteness in the open air, is the BURNT OF CALCINED HARTSHORN.

If the aqueous liquor is not removed before the falt comes over, a part of the falt dissolves in it, and thus forms what is called fpirit; but it is usual to let all come over into the receiver that can be obtained, before any feparation is made; if it is required to have the whole of the falt folid and dry, the phlegm should be removed as foon as the falt begins to arise, which may be known by the appearance of white fumes; and that this may be commodiously done, the receiver should be left unluted until this first part of the process is finished.

The oil separates from the phlegm and liquor by filtra-

tion through wetted paper, the two latter passing through,

and the oil remaining on the filter.

The phlegm may be separated from the spirit by diftillation, in a tall vessel with a gentle heat; the liquor will come over into the recipient, and the phlegm remain be-hind. In all distillation of the liquor, greatest part of the falt comes over before the phlegm, and the process should be continued no longer than till so much of the phlegm has followed as is nearly fufficient to diffolve it; that part of the falt remaining undiffolved may be a criterion to the purchaser of the fitrength of the spirit. The spirit may be rendered still purer, if to every pint of it 3ij. of pot-ash is added, and then being put into a retort the spirit is gently distilled, for thus any remaining oil is left behind with the fixed alkali. The liquor by this mode of procuring is not always of the same strength, in different thous we find it wars much, we are therefore recomshops we find it vary much, we are therefore recommended, to obviate this inconvenience, to make the liquor in the following manner. Mix two pounds of the aqua ammonia with one dram of oleum animale, and hence a good volatile antifpafmodic fpirit will be acquired, which may be improved by rectifying together, and a spirit always of a given strength procured. Observations on the pharmacopaia of the London College of Physicians, 1788.

The liquor may be divided into a volatile falt and phlegm by diffilling it it in a very tall and narrow cucurbit; the falt will arise and adhere to the head in a dry form, and

the phlegm remain behind.

To free the falt from the oil, fublime it from twice its quantity of pot-afh, for the oil will be detained thereby, and the volatile falt rifes pure. But a speedier method is, first to sublime the falt from an equal weight of chalk, and afterwards from a little rectified spirit of wine.

SPIRITUS & SALVOLATILE SALIS AMMONIACI, -called now, AQUA AMMONIÆ & AMMONIA PRÆPARATA. WATER OF AMMONIA and AMMONIA PREPARED.

Take of pot-ash th i. ss. crude fal ammoniac thi. of pure water fb iv. mix in a retort and with a gentle heat draw off to ij. of spirit.

Take of crude fal ammoniac to ij. pure white chalk thiv. mix them well, having first separately powdered them, then sublime the salt with a strong heat.—Perhaps the following method for making this falt will be found pre-

while in large pieces, picking out every part that feems discoloured; then take the cleanest chalk and dry it thoroughly, by heating it as hot as boiling water but not hotter, powder it well and dry it again, mix the fal ammoniac intimately with the chalk by trituration, while they are in this dry state, in the proportion of five parts of of chalk to four parts of the falt; put them into a retort with a thick short neck and the orifice cut very wide; six to it a fmall receiver with a long neck and lute them well together; then put them into a fand pot, and fublime the falt gradually, never fuffering the lower part of the receiver to grow hot; let the fire, however, be raifed to a strong heat at the latter part of the operation. When the whole is grown cold, break the receiver, and feparate fo much of the falt as appears white and pure from the dif-coloured; preferve it from exhaling, which would not only lessen its strength, but also dull its transparent appearance: the lefs fightly pieces may be kept for making the fpirit. ammonize compositus, or the fictitious spirit C. C. or it may be purified by resubliming. Care must be taken that no air get to the falt and chalk after they are powdered, for they both will attract moisture, which will leffen the quantity of volatile falt by melting it and run-ning down the fide of the receiver as a spirit; the fire must not be hurried left the retort or the receiver burst; nor be too great, left the falt be prevented thereby from forming on the fides. Sometimes a cake of crude fal ammoniac is found at the top of the chalk after sublimation, which may be used for making volatile spirit; this crude falt is also found in the side of the neck of the retort.

This volatile water and falt are more grateful to the flo-mach than those of hartshorn, and therefore are judiciously preferibed in all the intentions which that spirit and falt are given to answer: they are the pureft of all the medicines of this kind, though fomewhat more acid than those produced directly from animal substances, which always contain a portion of the oil of the fubject, and receive from thence fome degree of a faponaceous quality; but divefted of their oil, they differ not from the ammoniac

water and falt.

The volatile alkaline falt is very penetrating and pungent to the fmell and tafte, the only concrete falt that in its pure state emits sensible effluvia; it dissolves oils, refins, fats, &c. more languidly than the fixed alkalies, on ac-count perhaps of its not being fufceptible of any confiderable heat by which its menstrual power might be promoted. In the bodies of animals it operates more powerfully than the fixed alkaline falt, both as refolvent and flimulant, and is more disposed to pass off by the pores of the skin, and less by the grosser emunctories, and acts more remarkably on the nervous fystem; it is peculiarly useful in lethargies, apoplexies, hysteric and hypochondriac dif-orders, languors, head-ach, flatulencies, and other symptoms attending these complaints: in languors and faintings, this falt often gives immediate relief; in low fevers, flow vernal intermittents, it is an efficacious remedy; it relieves rheumatic pains, and, joined with blifters and aloetic purges, happy effects have enfued: fome admit of volatile alkaline falts in putrid difeases; but the vegetable acids, such as the acet. diftil. accompanied with blifters, are not to be controverted in this case, as being the most elicible administration. and the fair cashesis pireofer for eligible administration; and the spir. ætheris nitrofus far preferable, when fainting happens in putrid fevers, to the liquor C.C. In inflammatory fevers the use of alkaline falt is far superior in the beginning to what it is in suture periods, and this more especially if joined with the acetous acid, as in the fpirit. Mindereri, now aq. ammon. acctata.

The dose of volatile alkaline falts may be from gr. ij. to 3 i. given in a draught or in a bolus, in which latter form, to prevent the pungency of the falt from affecting the throat, it may be proper to mix it with a folution of gum tragacanth, or some other mucilaginous substance.

SP. SAL. AMMON. DULC .- now called, SPIRITUS AM-

MONIÆ.

DULCIFIED OR SWEET SPIRIT OF SAL AMMONIAC .-SPIRIT OF AMMONIA.

Take of a fixed alkaline falt 3 vi. of crude fal ammo-niac 3 iv. of proof spirit h iij. mix and with a gentle heat draw off h i. B. the dose is from sifteen drops to a dram, or more.

The volatile alkalies, not caustic, are averse to a union

#### ALC ALC

with vinous fpirits by fimple mixture; yet a folution of them in fp. vin. R. is obtainable by adding it along with water as in this process. This preparation is deservedly in great effeem both as a menstruum and a medicine; it is a folution of alkaline falt in spirit of wine, for though proof spirit is used, its phlegm does not rise; it only serves to facilitate the action of the pure spirit upon the ammoniac falt: it might, perhaps, for fome purpofes, fuch as making the fp. aminon, comp. &c. be more adviseable to make a dulcified fpirit with the spirit of fal ammoniac that is made with quick lime, for it may be mixed at once with rectified spirit of wine in any proportion, without any hazard of separating the volatile alkali; such a compo-

fitton may be thus formed, and may be named
An extemporaneous dulcified fpirit of fal ammoniac.

Take the fpirit of fal ammoniac prepared with quick lime th i. rectified spirit of wine th i. mix.

SPIRITUS VOLATILIS CAUSTICUS, vel

SPIRIT. SAL. AMMON. CUM. CALCE. VIV. PPT.

The volatile caustic spirit, or spirit of sal ammoniac,

prepared with quick lime.

Take crude fal ammoniac the ij. quick lime the ij. pure water the iv. quench the lime in the water, and then put it into a retort, then add to it the powdered falt, immediately adapting a receiver, for the pungent spirit rises on the first contact of the lime with the falt, and with a

gentle heat draw off th ij.

Or take crude fal ammoniac th iv. quick lime th v. pure water three gallons. Quench the lime in part of the water, and put it into a tin alembic, or a glass retort; then add the remaining part of the water and the fal am-moniac only broke into little pieces. Dittil over a gentle heat flyx. or xij. for good spirit, then change the receiver, and distil as long as the spirit smells of falt, and keep it instead of water for the next operation. — The spirit instead of water for the next operation. is very strong if five times the weight of the fal ammoniac is drawn off. But to agree with this spirit of the London College, drawn with cineres clavellati, only three times

the weight must be allowed.

This spirit, prepared with quick lime, is thought to be too pungent and acrid for internal use, but in the dilute state of administering this fort of medicine it is as safe as that prepared with an alkaline falt. It is an excellent menstruum for some vegetable substances, as the cort. Peruv. &c. and when faturated with fuch ingredients, it is fo theathed as to be as fafe as the other. It is too com-mon to meet with the liquor C. C. and the aqua ammon. cum ciner. clav. pp. mixed with this spirit prepared with lime; this fradulent practice is to increase the pungency of the liquor C. C. &c. and is thus detected: add to the fuspected spirit about one fourth of its quantity of recti-fied spirit of wine, which will precipitate a part of the vo-latile salt; but if mixed with that made of lime, no effect will be produced. The powder that is precipitated, may also be laid on a spoon and held over a candle, when, if it flies off, it is good, otherwise not.

The fp. falis ammoniac, cum calce, viv. ppt. appears in many cases preferable to that prepared with an alkaline falt. It is better fuited for the fp. ammon, compositus. and fp. ammoniæ. fætid. as being perfectly miscible with the sp. vini rect. in any proportion, without any separa-tion of its volatile alkaline part, and as being a more powerful menstruum for some oils, difficult of solution The cau de luce, for example, is made with the sp. sal-ammon. cum calce. viv. & ol. succin. rect. but the oil must be rectified until it hath lost its fmell, and is become limpid, and then the process will be as follows:

R. Ol. fuccin. rect. ut fupra gt. xxxvi. alcohol. vini. 3 ss. bene mifee, & adde paulatim fp. fal. ammon. cum calce viv. ppt. 3 vi. f. eau de luce. This appears milky, but if required limpid, it may be made fo by distillation; or if it is only designed for imelling to, it may be tinged of a

fine blue colour, with a drop or two of a folution of cop-per. See Malouin's Chemie Medicinale.

The College of London give the following prescription for making the EAU DE LUCE under the title of SPIRITUS AMMONI & SUCCINATUS. Succinated Spirit of ammonia. Take one ounce of alcohol. Water of pure ammonia four ounces; rectified oil of amber one feruple. Soap ten grains, digeft the foap and oil of amber in alcohol, until they are diffolved; then add the water of pure ammonia, and mix them well by shaking;—it is chiefly used externally.

Divers mixtures of volatile and vinous spirits, flavoured with aromatic and other oils, or tinctured with different ingredients, according to the intention of the preferibers, have been, and yet may be, used with great advantage. Of this fort are the following:

SPS. AMMONIÆ COMPOSITUS, instead of the sps. vola-

tilis aromaticus.

R Ol. n. m. effent. & ol. limon. effent. ad 3 ii. fp. ammon. fb ij. m. Distil these with a gentle heat. This is from the Pharmacop. Collegii Lond. 1788.

After this method, a volatile oily spirit may be prepared occasionally, and at pleasure, adapted to particular purpoles, by chufing an effential oil proper for the intention; thus in hysteric cases, where the uterine excretions are deficient, a sp. ammon, comp. may be made with the oils of rue, favin, penny-royal, affa fœtida, &c. For weakness of the stomach, the oil of mint may be taken ; for a cephalic, the oils of marjoram, Javender, and rofemary; against fainting and coldness, the oil of cinnamon; to remove flatulencies, the oil of annifeeds and fweet fennel. The fpirits thus made by fimple mixture, or by dropping effential oils into fp. ammon, with which they eafily mix, are no wife inferior in medical efficacy to those prepared by distillation, though the tinge which they receive from the oil may render them to some perfons lefs fightly.

There are some vegetables that do not become acid by putrefaction; and from these no vinous spirit can be pro duced by fermentation, and to this class belong most of the acrid aromatics; Boerhaave calls them alkalescent, fome of which are the alliaria, allium, arum, afparagus, braffica, capficum, cardiaca, centaur min. cochlearia, cepa, nasturtium aquat. & hort. porrum, raphanus com. & ruf-

ticus, ruta, finapis, &c.

That morbid quality in the blood, called an alkaline acrimony, is known to be prefent by the thirst, and defire of four things, lofs of appetite, and aversion to alkalefcent food, nidorous cructations, putrid ulcers on the lips, tongue, and other parts in the mouth, bitternefs in the mouth, ficknefs in the ftomach, and a frequent diarrhoea, a fense of heat, lassitude, and general uneafiness, a dissolution of the texture of the blood, the urine high coloured and red.

This alkaline acrimony producing a putrescency in the blood, &c. is to be remedied by the same means as the

fea feurvy and other putrid diforders.

These are useful methods of administering the fixed alkaline falt; fmall doses may be given warm every three or four hours, interpoling a purge now and then, when fuch medicines are required. If intermitting fevers return, this method, for a few days, is an excellent preparation for the bark.

ALEMA. BOILED MEAT. ALEMBACI. BURNT LEAD.

ALEMBIC, ALAMBIC. QUICKSILVER.
ALEMBICUS. This word is half Arabic and half Greek, from the Arabic particle al and αμειξ, which is again derived from aucana for avacann, to afcend. Seneca calls it in the Latin language miliarium; alembic and Moor's head. It is a copper cap tinned in the infide, made like a head in which the pipe, before worms were contrived, which paffes through a tub of cold water, is fixed to receive the vapour from the heated cucurbit or body, to convey it to the receiver. Before retorts were used to commonly, the matter diffilled was put into a vessely called a body, with a head placed on it to receive veffel called a body, with a head placed on it to receive the vapour, whence it was conveyed by a canal, called the roftrum or beak, to the receiver; this head is proper-ly the alembic, and is called alembicus roftratus, i. e. the beaked alembic, to diftinguish it from alembicus execus, or blind alembic, which is without a canal, as it is to receive dry fubftances that are fublimed into it. The ftill-head is properly an alembic; the body of the alembic was placed over a aire or in hot water.

ALEMBROTH. A Chaldee word importing the Key of Art; some explain it by fal mercurii, or sal philoso-phorum & artis; others say it is named elembros & sal fusionis, or fal fixionis. Alembrath deficeatum is faid to be the fal tartari; hence this word feems to fignify alcaline

ALEM ZADAR See Ammon. sal.

ALEOPHANGINÆ PILULÆ; these are the pil. aromaticæ Meffue. Joined with hellebore they have been called pil. aleophang. capitales & ftomachicæ.

ALEOS, from abea, brat. Taken as an adjective it

fignifies heaped, crouded, condenfed, continued; as a fub- the coast of the Mediterranean fea, a species of alga is Stantive, beat or warmth.

ALEPENSIS. A fpecies of afh-tree, which produces

manna:

ALES. The name of a compound falt. When this word is used as an adjective, it fignifies beaped, or croud-ed, or condensed. Sometimes it fignifies contracted, as the

ALESCH. See Alumen Plumosum.
ALETON. MEAL, from αλιω, to grind.
ALEURON. MEAL, from αλιω, to grind. Strictly it is the meal of wheat, though commonly applied to other forts. See Alphita.

ALEXANDRIA. A name of the bay-tree, called Daphne. See Laurus Alexandrina.

ALEXANDRI ANTIDOTUS AUREA. der's golden andidote. Myrepfus gives the prescription; it is composed of animal, vegetable, and mineral substances, and contains about feventy ingredients. --- REGIS COLLYRIUM SICCUM. King Alexander's dry medicine for the eyes. It was made of faffron, Celtic nard, and canal coal.

ALEXANDRINA; ALEXANDRINA TENUINA. The laurel of Alexandria. See Ruscus Latifolius.

ALEXANDRIUM EMPL. VIRIDE. A plafter deferibed by Celfus, made with wax, plumofe alum, &c. ALEXANTHUS. See ÆRIS FLOS under Æs.

ALEXICACON, an amulet against poison, from αλιξω,

to repel, and xaxo, evil.
ALEXIPHARMACA. Alexipharmics, from wagu, to repel, or drive away, and paquaxon, poison. These fort of medicines, though counter-poisons, yet chiefly relate to the cure of malignant fevers; but from theory, alexipharmics are what pass through the skin, or what drives the supposed poison through the pores. See Sudorifica, Diaphoretica, and Alexiperia. The term has been also applied for Amuleta. See Amuleta.

ALEXIPYRETICUM. ALEXIPYRETOS, or ALEXIPRETUM, from chaster to drive gaves, and market a fee.

PYRETUM, from axigu, to drive away, and wupflog, a fe-

A remedy for a fever, or aup, fire.

ALEXIR, i. c. ELIXIR.

ALEXITERIA, Alexiterials, from ante and there, a prefervative from contagion. The term has also been applied for Anuleta. Hippocrates used the word alexiteria to express help or remedies; but later writers use it to express remedies against the poisonous bites of ani-

AQUA LACTIS ALEXITERIA.

ALGARAB. See ÆGYLOPS.
ALGAROT. ALGAROTHI. (PULVIS.) So called ALGAROT. ALGAROTHI. (Pulvis.) So called from Victorius Algaroth, a physician of Verona, and its inventor. It is the same with the mercurius vitæ. It is only the antimonial part of the butter of antimony, separated from some of its acid by washing it in water. It is tasteless, but violently emetie, in doses of two or three grains. It is prepared with antimony and sublimate, or by mixing water with the butter of antimony, which precipitates a white powder, &c.

ALGATIA. CIVET.

ALGEDO. The running of a gonorrhoa stopping suddenly after it has appeared.

When it thus stops a pain reaches to the anus, or to the testicles, without their being swelled, and sometimes to the bladder, in which case there is an urging to dif-

to the bladder, in which case there is an urging to difcharge the urine, which is with difficulty pailed, and in very fmall quantities at a time. The pain is continued to the bladder by the urethra; to the anus by the acceleratory mufcles of the penis; and to the testicles by the vafa deferentia, and veficulæ feminales.

In this case, calomel repeated so as to purge, brings back the running, and then all difficulty from this symp-tom ceases. If the pain is great, and a sanguine plethora requires it, bleed, and give the following.

ALILAT, or auria, an Arabian name for Lucina, or the goddefs which the Greeks fupposed to prefide over child-birth.

ALIMA. A fort of fand found in gold mines, from which lead is obtained.

ALIMENTA, ALIMENT; OF FOOD BOTH SOLID AND LI-QUID: from alo, to nourish. It is fuch matter as contains an oily, infipid, or fweetish mucilage, convertible by the actions of the body into an alkalescent glue, of which all our folids and fluids are formed, and by which their wast-

ings are repaired. Next to air, food is the most necessary thing for the prefervation of our bodies; and as on the choice thereof our health greatly depends, it is of as great importance to understand, in general, what is the properest for our nourishment; and in particular deviations from health, what is the best adapted to restore us.

Our blood and juices naturally incline to a putrid acri-monious quality: fresh chyle, duly received, prevents this destructive tendency, and preserves in them that mild albuminous state that is alone confistent with health. An animal diet affords the most of this bland nutritious mucilage, watery fluids dilute the too grofs parts, and

carry off what is become unfit for use.

From the structure of the human stomach, which refembles that of carnivorous animals, and from observations, which prove, that the flesh of animals alone contains the gelatinous lymph ready prepared, which is fuited for the recruit of our frame, it is obvious what fort of diet is the properest for mankind: it is only the small portion of jelly which is separated from the farinaceous parts of vegetable, that, after being much elaborated, is converted into the animal nature: yet in robust habits, and when firong exercise is used, vegetables prevent both repletion and a too great tendency to an alkalescent acrimony of the blood. In hot climes, as well as against the constitutional heat of particular perfons, vegetables are demanded in the largest portion: in colder countries, and particularly in languid habits, they have but little share in the lift of aliments.

Animal fubitances then are the properest food for man; they only contain nutriment ready for our use; and they afford us the highest relish while our appetite continues. Fith is an inferior kind of animal diet, and even this will fate the appetite before the stomach is duly filled. Vegetables may be eaten after either flesh or fish; fesh herbs or fruits fatiate fo much that the stomach may not be filled with them, when it is already fatisfied with flesh or fish; whence it may be observed, that no diet which is very nourishing can be eat to fulness, because its nutritious parts are olly and fatiating.

Again, health depends on a certain degree of heat in the body, and it is the crassamentum of the blood that attracts and maintains it; it is also observed above that animal food alone contains the proper matter for our supplies; whether then we regard the vigorous or infirm, one general rule prevails, viz. to exceed in the use of animal or vegetable food as the present habitual heat rises or falls from that medium in which the individual's health confifts. In perfect health a mixture of vegetables in some degree is generally required, for a loathing is foon the confequence of animal food alone; hence if not to nourifh, yet to attemperate, they have their use: hot acrid habits too receive from milk and vegetables what is necessary to correct their excesses; but in cold, pituitous, and nervous habits, which want most nourishment from weak digestion, and the smallest quantity of food, animal diet is alone to be preferred.

Thus much being offered as general principles with refpect to the matter and quality of our aliment, the valetudinarian may easily regulate his diet with some advantage to himself by an attention to the few ensuing particu-

In winter eat freely, but drink sparingly; roast meat is to be preferred, and what is drank should be stronger than at other feafons: in fummer let thirft determine the quantity to be drank, cold flomachs never require much; boiled meats and vegetables, if not otherwise contradicted, may now be more freely used.

Lax habits require the winter's diet to be continued all the year, and rigid ones should be confined to that of

Fat people should fast at times, but the lean should never do so.

Those who are troubled with eructations occasioned by their food, should drink but little, lay long in a morning, and use some unaccustomed exercise.

The thirfty fhould drink freely, but eat sparingly.

In general, let moderation be observed, and though no dinner hath been had, a light supper is at all times to be preferred.

After very high-feafoned meats a glafs of water acidulated with the acidum vitriolicum dilutum or in very weak stomachs the sps. atheris vitriolici, is far more assistant to the work of digestion than the common me-

ALKAZOAL. A CRUCIBLE.
ALKEKENGI. WINTER CHERRY; also called belleacabum, folanum veficarium, verficaria vulgaris.

Miller takes notice of twelve species. The species used in medicine is the physalis alkekengi. Lim.

It is a low plant with unbranched stalks, heart-shaped acuminated leaves flanding in pairs on the joints, and whitish bell-shaped flowers; the flower-cup changes into a pentagonal bladder, which burfting discovers a red fruit like a cherry, which contains a juicy pulp and many fmall feeds. It grows wild in France, Germany, and Italy, and thrives well in our gardens. The fruit ripens in October, and continues to December, when the plant dies to the ground.

These cherries have an acidulous and not unpleasant tafte with a bitterishness, but their covering is very

They are diuretic, but neither heat nor irritate; five or fix cherries, or an ounce of their juice, is a dofe, and if given in the strangury from cantharides, a speedy relief is obtained. 3ij. of the berries infused in a pint of water is extolled in the jaundice: but they are rarely called for in the English practice.

ALKERMES. See CHERMES. A confect made of the juice of kermes berries, &c. is thus named; it was in-

vented by Meffine.

ALKERVA. An Arabian name for the Palma Christi, and also for the ol. ricini. Sec CATAPUTIA.

ALKES. BURNT BRASS.

ALKETRAN. An Arabian name for the oil of cedar. See CEDRIA.

ALKIAN. The spirit of which digests food, nourishes

and fupports man.

ALKIBRIC, ALCHIBRIC, ALCHIBERT, ALGIBIC, AL KIBIC, ALCHABRIC, ALKIBRIE, according to fome, the fulphur vivum is meant by these words; but others say

they fignify an incombuffible fulphur.
ALKIMIA. See ALCHEMIA.
ALKIN. POT-ASH.
ALKIR. SMOAK of COAL.
ALKITRAM. TAR. ALKOL. See ALCOHOL. ALKOSOR. CAMPHOR.

ALKI PLUMBI. It feems to be the ceruffa acetata. ALLA, ALE. The ancient Saxons called it ael, as do the Danes now. The Germans first invented and brought

Ale is diftinguished from BEER, by the first being fresh or new, and the other kept until the remaining gas syl-

veftre deftroyed, or incorporated with the liquor, fo as to lofe its elafticity, or at least a part of it.

Beer is called by the Latins CEREVISIA, from cerere, because corn, of which Ceres is the goddess, is its principal ingredient; also LIQUOR CERERIS, the liquor of Ceres . VINUM HORDEACEUM, barley wine; VINUM REGIONUM SEPTENTRIONALIUM, because it is drank instead of wine

by the northern people. It is also called bira.

Ale is flatulent, and fo fometimes produces colics, and the cholera morbus; it is acefcent, but it does not produce calcareous difeases, as is afferted by many. It is observed that those who drink ale constantly, are stronger than those who drink wine, and that those who do not drink any fitong liquors cannot labour fo well as those who do; but this does not appear to be the truth: men in health, and accustomed to toil, but who never drink any ftrong liquors, undergo the most fatigue, and live longer than those who daily use them. Cordials are only designed for the infirm, and to fit the healthy for extraordinary exertions; but as they occasionally may enable the vigor-ous to execute great undertakings, they also proportionably destroy the power of nature, and cause a premature old age. A constant use of wine, ale, &c. keeps up a constant sever, in most who use them freely, by which, destruction is surely the consequence, though somewhat flower than the general confessed poisons.

If malt liquor, of any degree of strength, is become other faline fubitances. See Alcali. — Volatile flat and tartifh, as it is uted, it should be drawn out of the cask into a jug, in which as many drains of powdered chalk is put as there are to be pints of liquor, thus a new chalk is put as there are to be pints of liquor, thus a new ferment will be raifed, a fprightly tafte will be reftored to the liquor, and its acidity will be deftroyed. Tart liquors of this kind are apt to produce a dyfuty,

strangury, or a gonorrhoea, in which cases, give the per-

fon complaining, a fmall quantity of brandy:

Ale being in fome countries cheaper than wines, hath occasioned it to be medicated for the same purposes as wines fo treated; and there are two ways of impregnating malt liquors with medicinal fubstances; first, by macerating the ingredients in the ale, after it is duly fermented; fecondly, by adding them to the liquor while it is fermenting, that by the power of fermentation the medicinal virtues may more fully be extracted; nutmeg, for inflance, one dram of it powdered will flavour a large vat of fermenting ale, but when the fermentation ceases, it flavours

but a very small quantity.

The following is an agreeable bitter, and far preferable

to any of the purls.

ALLABROT: A fort of FACTITIOUS SALT.

ALLANTOIDES, ALLANTOIS. The membrane fo called which forms part of the fecundines, from αλλας a faufage or hog's pudding, because in some brutes it is long and thick. It is also called alastoides, the urinary membrane, and farciminalis.

Some affert, and others deny, the existence of this in the human species. Dr. Hale says, if you first find the hole whence the urine came forth, if the allantois is too much torn, you may blow up this membrane with a pipe, to its full dimensions, and thus you can separate much of it from the chorion. De Graaf fays, that all the membranes of the fecundines will appear diffined by blowing, with a pipe, into a hole made through the chorion; and that the allantois is no where perforated by the funis umbilicalis, for the funis does not pass through any of the membranes, it only adheres to the inside of the amnios. Dr. James fays, that the allanteis, or urinary membrane, does not cover the whole foctus, but only that part of it which respects the chorion, and does not lie on the placenta; for the allantois cannot be extended any farther than to the edge of the placenta, where the amnios and chorion are fo closely joined by fibres, that no membrane can come between them, wherefore the allantois is riot every where fastened to the chorion, and consequently is not of the fame shape as the other membranes.

This membrane contains the urine that is discharged from the bladder: what paffes from the bladder into the urachus cannot, in a natural ftate, return by it. There have been inflances of persons discharging their urine at

the navel.

The liquor may be forced from the bladder to the allantois by fitting a pipe to it, and from the allantois to the bladder. If you raise the allantois a little, and squeeze it with the hand, you force the liquor into the bladder and through the penis.

Neither artery nor vein can be discovered in this mem-

brane.

If any anatomists have ever demonstrated this membrane, not one of them has given a diffinct figure of it; all the engravings which are defigned to reprefent it, are too incorrect to affords us a diffinct idea. Dr. Hunter, in his lectures, absolutely denies the existence of this

membrane, except in bruies. See on this fubject what Dr. Hales hath inferted in the Philof. Tranf. abr. vol. iv. and Monf. Littre in the Mem.

Acad. des Sciences, 1701.
ALLARINOCH. LEAD.

ALLENCE. Tin.

ALLIAR ÆRIS. A term used in preparing the philosopher's stone, to fignify philosophical copper, which is

also called water of quickfilver, white copper, and many afthms requiring expectoration, its use is admissible. Its other name:

ALLIARIA. SAUCE ALONE, OR JACK BY THE HEDGE; also called pes affininus, and hesperis allium. It is the erysimum alliaria, Lin.

This plant hath roundish, heart-shaped, slightly indented leaves, and firm upright stalks, on the tops of which, and in the bosoms of the leaves, come forth clutters of white flowers, followed by oblong bivalvous pods full of black feeds. It is biennial, grows in flady waste places, and in hedges, and flowers in May.

The leaves are fomewhat acrid, and of a garlic fmell; on drying they lose much of their fcent, and also of their tafte. Its medical virtues are fimilar to those of the onion tribe, but is not much in use.

ALLICAR. See ACETUM.
ALLICOLA. A name of petroleum.

ALLIGATURA. Scribonius Largus uses this word

for a ligature or bandage.

ALLII Infuf.
Oxym.
Syr.
See Allium.

ALLIO PRASSUM. VIPER'S GARLIC.

ALLIOTICUM, from answe, to alter or vary; an alterative medicine.

ALLIUM. Common Garlic. Called alfo, from its antiputrescent property, theriaca rusticorum. It is the allium fativum, or allium caule planifolio bulbifero, bulbo composito, staminibus tricuspidatis, Linn.

It hath long and grafs-like leaves, a fingle ftraight hol-low ftalk, bearing on the top a cluster of fmall white flowers, each of which is followed by a fruit about the fize of a pea, full of dark-coloured roundish feeds. The roots are bulbous, of an irregular roundish shape, with feveral fibres at the bottom; each root is composed of a number of fmaller bulbs, called cloves of garlic, inclosed in one common coat. It grows wild in Italy, Sicily, and other warm countries; but in England it is raifed in gar-

dens from feed.

Miller and Dale enumerate eleven or twelve species.

The roots are the part used in medicine; their virtues confift of a very acrid putrefeent volatile spirit, the principal effect of which is to warm and ftimulate the folids, attenuate viscid humours, and to refist putrefaction. Applied to the (kin they excite inflammation there; and fornetimes raife blifters; they are used as a stimulating epithem applied to the soles of the feet, in the low stage of acute diftempers, for raifing the pulse and relieving the head. Sydenham fays that garlic excels all other ap-plications for occasioning a derivation from the head in fevers of any kind; and he farther observes, that the efficacy of garlic thus applied, is more speedy than that of cantharides, and this without the objection of a dif-folution of the juices being endangered, as when the common blistering plaster is applied. The following is the method of making and applying this fort of cataplafm.

CATAPLASMA EX ALLIO.

R allii rec. cont. & micarum panis albi. 115 p. 22q. acet. acerrim. q. f. f. catapl. plantis pedis applic. & repet. omn.

Sometimes this cataplasm causes much pain, but this would not happen if it was removed as foon as an inflammation appeared, and immediately after another cataplasm of bread and milk was to supply its place. The cloves of fresh garlic are bruised, and applied to

the wrifts as a cure of agues; and to the bend of the arm to cure the tooth-ach; held in the hand they relieve hiccoughing; beat with common oil into a poultice, they refolve fluggish humours; and if laid on the navels of children, they destroy worms in the intestines.

If garlic is taken inwardly, its action manifests itself through the whole habit, the breath, urine, and the matter of perspiration are all scented with it. Externally applied for some time it instances the skin, and raises a blifter; taken inwardly it flimulates, and favours di-geftion, and its flimulus also is readily communicated to the rest of the system, and is certainly heating and in-flammatory to the whole. It not only seems to affect the perspiration and secretion of urine, but to pervade every veffel of the fyftem, hence its diaphoretic and di-uretic powers have been ufeful in dropfy. It is a remedy for the feurvy, and in pituitous, and even in spalmodic

ftimulant powers may be employed for preventing the recurrence of intermittent fevers. Bergius fays quartans have been cured by it, and uses it in the following man-nea: he begins by giving one bulb, or clove, morning and evening, adding every day one more, till the four or five cloves be taken at a dose. If the fever then vanishes the dose is to be diminished, and it will be sufficient to take one or even two cloves twice a day, for fome weeks.— This author also recommends it in deafness, and Dr. Cullen is inclined to believe it may be beneficial, as he has found the juice of onions in fuch cases very useful. Where people cannot take the garlic in fubitance, the best forms are either in syrup, or oxymel. See CULLEN's Materia Medica. If cows happen to eat the leaves of garlic their milk will be strongly impregnated with its flavour.

In cold phlegmatic habits it is highly useful by its cor-roborant, expectorant, and diuretic effects; in humoral afthmas it gives relief when the patient is oppreffed with viscid phlegm. In these instances the oxymel and syrup are excellent forms for administering it. The vinegar and honey coincide with the intention of garlie, as a detergent and deobstruent in disorders of the breast.

OXYMEL ALLIL

R rad. allii rec. incif. 3 i. fs. fem. carui & fœniculi

D. aa. 3 ij. mel Brit. 3 x. acet. acerrim. th fs.

Pour the vinegar, boiling hot, upon the garlie and feeds, and cover them immediately; when cold, strain, then diffolve the honey in the strained liquor by means of a water bath. Some prefer this medicine, when prepared with a dulcified mineral acid, instead of vinegar, for the vinegar contains a portion of viscid matter fimilar to that which offends in aithmas, &c. befides, the mineral acid

covers the offensiveness of garlic more than vinegar does.

Hoffman says, that if the cloves of fresh garlic are boiled in milk, they are one of the best anthelminties; but the best way of taking garlic is in the form of a pill

or a bolus.

In hot bilious conftitutions, garlie is improper, for where there are irration and acrimony already, it produces flatulence, head-ach, thirft, heat, and other inflammatory fymptoms: a free use of it soon promotes the piles in habits disposed thereto.

In drying this root it loses this of its weight, but fresh or dry it equally gives out its virtues to boiling water, vinegar, or brandy; and an infusion in the latter is highly useful to relieve or prevent uneasiness in the

ftomach and bowels from a gouty cause.

INFUSIO ALLII. Insusion of garlic.

R rad. allii rec. incis. 3 ij. sp. vin. gal. 16 i. m. cochl. magn. vel ii. h. s. sumed. vel bis in die.

Garlie should never be boiled; its virtues resides in an oil that easily evaporates in aboiling heat, and thus leaves it quite inert. This oil is small in quantity, but very active; it is yellowish and ropy: but the juice may be inspissated into an extract by a gentle heat.

Rectified spirit of wine digested on dry garlic roots,

PORTULACA; and, perhaps through mistake, it is writ by fome as a name of the inula ruftica. - LATIFOLIUM LILIFLORUM. See MOLY, of which it is a species .-MONTANUM-MONTANUM LATIFOLIUM MACULATUM. ALMYZA. An Arabian name for quicklime. ALMYZINTHRA, supposed to signify quicklime. This word often occurs in Myrepsus.

ALNEC. TIN.

ALNERIC, i. e. SULPHUR VIVUM.

ALNUS. THE ALDER-TREE, of which Miller enumerates feven or eight species. The forts known in medicine are the following, but are rarely if ever used in the present practice.

ALNUS, and Alnus rotundi folia glutinosa viridis.

The COMMON ALDER TREE, called amendanus, alfo-NIGRA vel Frangula. The rhamnus frangula. Lin.

The black alder.

The common alder is tall and coniferous, grows in watery places, with little branches; its leaves are clammy, the bark is of a blackish brown, and the wood is reddish.

All the parts of this tree are aftringent and bitter, the bark is more aftringent; a decoction of it hath cured agues, and is often used to repel inflammatory humours

The BLACK, or BERRY BEARING ALDER, is also found in moift woods; it is rather of the shrub kind. The inner yellow bark of the trunk or root given to 3 i. vomits, purges, and gripes, but joined with aromatics it operates more agreeably: though an infusion, or decoction of it in water, inspissated to an extract, acts yet more mildly. The berries of this species of alder are purgative, they are not in use under their own name, but are often subflituted for buckthorn berries; to difcover which, ob-ferve that the berries of the black alder have a black fkin, a blue juice, and two feeds in each of them; whereas the buckthorn berries have a green juice, and

commonly four feeds.

ALOE, a plant which affords the purging gum of the fame name; all the species, of which Miller enumerates thirty-seven, have thick fat leaves, like those of the houseleck, but much larger, running two or three feet higher, the infpiffated juice of the whole plant is GUM ALOE. An erroneous notion prevails, of the alse plant blowing but once in a hundred years; any fkilful gardener makes them flower at any time by fetting them in a bed of tan-ner's bark. The best is faid to grow in India, but all Asia produces excellent plants; in most warmclimes they are produced, as in the West Indies, &c. It is reported that Alexander landing on the island of Succotora, in one of his expeditions, took notice of the alor plant, and from that it was brought into use, and called socoro-

Of the gum we have three kinds in the shops.

I. ALOE SUCCOTORINA VEL ZOCOTORINA, -SUCCOTO» RINE ALOES.

It is imported from the ifland Succotora, in the Indian ocean, wrapped in fkins; it is obtained from the aloe Socotorina angusti folia spinosa stora purpures. Com. Hort. i. p. 9. t. 48. The alse (perfoliata) storibus pedunculatis cernuis corymbosis subcylindricis. var. Lin. It is bright on its furface, and of a reddiff colour, with a purple caft; but when powdered it is of a golden hue; it is hard and friable in very cold weather, but in fummer it foftens very eafily betwixt the fingers. It is extremely bitter, and also accompanied with an aromatic flavour, but not fo much as to cover its disagreeable taste. Its scent is rather agreeable, being fomewhat fimilar to that of myrrh.

2. ALOE HEPATICA, vel ALOE BARBADENSIS. COMMON, or BARBADOES, or hepatic alses, called kadanaku. Aloe (perfoliata) floribus pedunculatis cernuis corymbolis subcylindricis, var. vera. foliis spinolis confertis dentatis vaginantibus planis maculatis, Lin. The best is brought from Barbadoes in large gourd-shells; an inferior The beft is fort in pots, and the worst in casks. It is darker coloured than the Succotorine, and not so bright; it is also drier and more compact, though fometimes the fort in casks is soft and clammy; to the tafte it is intenfely bitter and naufeous, being almost totally without that aroma which is observed in the Succotorine; to the smell it is strong and difagreeable.

3. ALOE CABILLINA, vel ALOE GUINENSIS. HORSE ALOES. It is not easily to believe, as is generally reported, that this is only the more impure part of the Barbadoes aloe, because the difference does not confist in the purity, but in the quality. It is very diffinguishable from both the others by its strong rank smell; in other respects it so agrees with the Barbadoes species as to be often fold for it. Sometimes its purity and clearness are such, that they cannot distinguish it from the Succotorine alor; but either its offensive fmell, or its want of the aromatic

flavour, betrays it.

The general nature of these three kinds are the same, so may all be considered in the following as one, their particular differences only confift in the different proportions of gum to their refin, and in the flavours they poffefs, which renders them more or lefs difguftful for internal use. From their intense bitterness they have re-

ceived the name of fel natura.

Alses confift of a fmall portion of refin, and a large one of gummy matter; to feparate which, boil four ounces of aloes in a quart of water, until it is diffolved; let this folution fland in a cool place all the night, by which time the refin will be deposited at the bottom of the veffel, the gum continuing in its diffolved flate, but by eva-poration is recovered in a folid form. Twelve ounces of the Barbadoes alses yields nearly four ounces of refin, and eight of a gummy extract. The fame quantity of the Succotorine yields three ounces of refin, and nearly nine of gummy extract.

The alses may be purified by folution in water, and an evaporation fo immediately after, that the refin may not

have time to fettle.

When the refin fettles from the watery decoction of the alses, the impurities fublide therewith, and are to be feparated by diffolving the refin in spirit of wine; then, after a due separation of the folution from its sediment, the refin is to be reftored by evaporating the fpirit with a gentle heat.

The refin of alses hath but very little fcent; that from the Succotorine hath very little tafte, from the Barbadoes a flight bitter, and from the horse species somewhat more of the aloetic flavour.

The gummy extracts are less disagreeable than the crude aloes; that of the Barbadoes smells rather stronger than that of the Succotorine; but in taste is less ungrateful than it; that of the Succotorine hath very little fmell, and is fearcely unpleafant to the tafte; that of the horse alors hath a rank fmell, but its tafte is not worfe than that of the Succotorine.

In the refinous part confifts the vulnerary and balfamic qualities, hence for external uses the Barbadoes is the best; internally, however prepared, it hath very little ca-thartic power. In the gummy extract resides the purga-tive, and all the other qualities. The gum of the Sucotorine aloes purges more, and with greater irritation, than the gum of the Barbadoes; the former is therefore to be preferred where a ftimulus is required, as when the

menses are to be excited; the latter may be preferred for common purges. Of all the known purges, this gum is almost, if not quite, alone in being friendly to the stomach; fome are eafily moved by it, others not; fometimes it operates immediately, and its effects ceale, as is common with other purges; and fometimes it produces no fensible effect with the first doses, but when it does answer, it continues the effect longer than any other purgative, keeping the body foluble during feveral days, and it does not induce a colliveness after its purging effects are over; hence a good folution in costive habits. In fmall dofes twice a day it occasions a considerable irritation about the anus, and fometimes a discharge from the hæmorrhoidal vessels, hence it is an excellent remedy, when, ufed to relieve nervous diforders, we would promote fuch an evacuation; when this effect is not the confequence of fmall doses, they cleanse the first passages, attenuate viscid humours in the remote parts, warm the habit, and promote the fecretions. When vapours difturb the phlegmatic and fedentary, by afcending into the head, this drug is peculiarly proper; cachectic habits, and opprefitions in the ftomach from vifcid crudities, when cauted by irrelarity, are particularly relieved by it. It is powerfully antifeptic, and in common with bitters and purgatives, is an anthelmintic. In all difeafes of the nervous tribe, aloes is the strongest purge; and the best preparations for this purpose are the pilulæ ex aloe cum myrrha, or the tinct. facra spirituosa. Its essicacy in the jaundice is very confiderable, it promotes an appetite, and for this end the vin. aloet. alk. is peculiarly beneficial. It is a fuccedaneum to the bile, and is necessary in all cases where the bile is defective either in quantity or quality.

Aloes purge in flatulent cold habits where there is no

inflammation; but when the blood is inflamed, the belly very costive, the urine high-coloured, then it produces no fuch effect: on the contrary, the oftener this medicine is repeated in this latter habit of body, the more aftringent it will prove. In hot, bilious constitutions, it is injurious by heating the blood, and inflaming the bowels; in fuch habits, if it is required, it will be necessary to mix a fmall quantity of nitre with each dofe, or to use the elix. proprietatis vitriolicum. In dispositions to the gravel, as well as during the passage thereof from the kidnies, through the ureter, aleotic purges are improper. Aloes feems only to act on the large intestines, and produce in moderate dofes one or two copious evacuations of alvine contents; by a long use they bring on the piles. They seldom produce liquid stools in less doses then twenty grains, and then they gripe, fometimes feverely.

The dose of crude alses, or of the gummy extract, may

be from gr. x. to 3 i.

Alcaline falts leffen the purgative quality of aloes; and long boiling quite destroy it.

This gum is fometimes adulterated with acacia, at

others with gum arabic.

Accompanied with heat, the crude alses may be all diffolved in water; but when it is cold, it lets fall its refin. A mixture of pure water two parts, and proof spirit one part, perfectly dissolves it without heat; but rectified spirit of wine dissolves it most speedily. If water or wine is the menstruum, the alses become tenacious, and diffolve flowly; in this case, white sand should be well mixed with the powdered alses, before being added to these last mentioned sluids.

Cloves cover the offensiveness of alses the most perfectly, but their heat admits not of a due quantity being used for this purpose. The canella alba answers tolerably, and without any inconvenience; but some prefer the cassia caryophyllata for this purpofe.

The following are the principal preparations of alses. TINCTURA ALOES COMPOSITA- compound tinclure of

R Tinct. myrrh. fb ij. alse Succot. & croc. Anglic. III 3 iij. m. Ph. Lond. 1788.

This was called elix. alses, & elix. proprietatis, and was the elix. prop. of Paracelfus, who attributed to the very extraordinary properties, and so named it the Elixir of Property to Man. The original method of preparing it is improved in the above prescription; for if myrrh, aloes, and faffron are digested together, the menstruum will soon sate itself with the aloes and faffron, so as scarce to take up any of the myrrh, whilst a tincture already extracted from myrrh, readily dissolves the aloes and faffron in a large quantity.

The dose to children may be from gt. x. ad xl. and to adults to a tea spoonful.

The pilula ex aloe cum myrrha, and this elixir, may be fubstituted for each other.

ELIX. PROPRIETATIS VITRIOLICUM. The vitriolic elixir

of property.

R Myrrh. pulv. 3 ij. alse Succot. 3 i. croe. Anglic. 3 is. spirit. ætheris vitriolic. fb i. ss. m. digere, 6 dies in B. A.

The mineral acid, as used formerly, precipitated the ingredients; but when this acid is previously combined with the vinous spirit, it neither precipitates them, hor restrains the dissolving power of the vinous spirit. In hot constitutions, and weakness of the stomach, this is preferable to the compound tincture of alses.

TINCT. ALOETICA VOLATILIS. The volatile aloetic tineture. R Pulveris aloctici 3 i. fpt. fal. ammoniac. dulc. vel fpt. fal. ammon. cum calce viv. fact. fb i. m. f. tinct.

This is an elegant preparation of its kind, requiring very little, if any affiftance, from aromatics, to render it agreeable to the palate; the fpirit abating the offenfiveness of the aloes, and the aloes theathing the pungency of the spirit. The spt. sal. ammon. cum fal. tart. fact. does not diffolve near the quantity of alses that the spirits prefcribed do.

VINUM ALOETICUM ALKALINUM.

R kali pp. fb fs. alse Succot. croc. Anglic. & myrrlt ad 3 i. fal ammon. crud. 3 vi. vin. alb. mont. fb ij. m.

Let these be macerated cold for a week, then the clear liquor may be poured off for use. If the myrrh and faffron are macerated sirft, and after them the rest of the ingredients are added, a more perfect medicine will be ob-

This is the elix. proprietatis of Helmont, with fome little alteration. It is a better stomachie than the elixir of alses, for which it may be used; it is more effectual too in promoting the fecretions; and, with good advantage, it is administered to promote the urinary discharge, and to cleanse the kidnies; and, in most respects, excels the compound tincture of aloes.

The dose is from 3 i. to 3iij.

Tinctura Aloes. Tincture of aloes.

Take of Socotorine aloes, powdered, half an ounce sextract of liquorice, an ounce and an half; diftilled water, proof spirit of wine, of each eight ounces, by measure; digest in a sand heat, now and then shaking the vessel until the extract is dissolved, then strain. Ph. Lond.

Other preparations, whose principal ingredient is aloes, are the HIERA PICRA, SACRA (TINCTURA), RUFI (PILULA) AROMATICÆ (PILULÆ) which fee under their respective

Of this kind too are the famed Scoth pills, and Hooper's female pills. They feem to be no other than the aloes rolled up with what gives them their peculiar feent.

ALOIDES, WATER-ALOES, OF FRESH-WATER SOL-DIER; also called also palustris, aizeon palustris, militaris aizoides, and firatiotes.

Its leaves refemble those of the aloe, it grows in water, and on watery grounds; the leaves and flowers are al-ways above the water. It is met with in feveral parts of England, and flowers from June to August.

Mountebanks flew the fibres, which are its roots, for worms. They put them in bottles of water to make them appear thicker.

ALOMBA. }-LEAD. ALOPEC. See Alopecures.

# ALO

ALOPECES. Lat. Vulpes. The mufcles called

ALOPECIAS OPPIANI. The fea-fox.

ALOPECIA. BALDNESS, the FALLING OFF OF THE HAIR, from anward, a fox, because the fox is subject to a diftemper that refembles it, called also capillorum defluvium. When the baid part is smooth and winding, like the track of a ferpent, it is called ophinfis; but the general name of all the different appearances of bald places is AREA, which name is taken from the area in a garden, which is a fpot on which nothing grows; though Blanchard fays, that the hair fails off areatim, by fleedding, whence in general this difease is called area.

These diforders seem to have been more common among

the aucients than they are in our days. Celfus fays, that the alopecia comes at any age, but the ophiasis only affects infants; and Sennertus observes, that they both are common to all ages, though they are most frequently met with in childhood, and often succeed the tinea, achores,

and favi.

The cause is a faulty humour that destroys the roots of the hair, and that fometimes only perverts the humour that nourishes them, in which case the hair turns white, yellow, &cc. according to the different quality of the morbid humour. Galen fays, that eating mushrooms may caufe that bad quality in the humours which produces thefe diforders; and also that malignant and contagious diseases

of various kinds may produce the fame effect.

The alopecia fpreads itself on the beard, as well as on the hairy scalp, and is irregularly formed. The ophiasis usually begins at the back part of the head, and creeps about the breadth of two fingers, till it hath extended its two heads to both the ears, and fometimes to the forehead, till both heads meet in one. The ophias feems to be more malignant than the alspecia, fince that in it not only the roots of the hair, but also the cuticle is corroded as far as the roots reach; the fkin also changes its colour, and is fornetimes pale, at others darker coloured, and if pricked, a ferous blood iffues out.

'These difforders differ from the tinea: in the latter the

excoriations, and exulcerations are deeper, and often the

hair does not grow again.

In infants these disorders commonly go off as age advances; but in adults, the cure, especially of the ophias, is very difficult. If the part does not grow red with fric-tion a cure is vainly attempted; but in proportion as a redness appears readily on rubbing the part, the cure may be expected to be easy and soon effected. If a le-profy is the cause, the case is incurable. The best prog-nostic is when hairs begin to push out on the edges of the

As to the cure, if any other disease attends, begin by removing it, which done, it often falls out that the alsecia, &c. depending thereon is removed also. Before the hair falls off, if figns of the approaching difease at-tend, gentle repellents and corroborants may be used; but if the discase is formed, repellents must be omitted, the head must be shaved, then washed with ley in which is infused the abrotanum polytricham, and such like herbs, after which let the part be rubbed with a flannel or other coarse cloth until the skin grows red; this done, applications of muftard, white lily roots, nitre, tar, the affect of fouthernwood may be directed, as the preferiber's intention feems most likely to be answered by one or the other.

The topics used in the achor, which see, are well

adapted to this case.

Begin with the milder applications and proceed gradu-ally, as diferetion admits. If the skin grows more red, or is more eafily made to by rubbing the part, moderate the applications; the milder fort of dreflings may continue all the day and night; but the more active only until the fkin is fenfibly affected by them. See CELSUS, SEN-NERTUS.

ALOPECUROS, from adamet, a fox, and soa, a tail; FOX-TAIL; also called alopec, spica brevis, and gramen

Spicatum tomentofum.

It is a tender herb, with a short spike resembling a fox's tail, white and thin; the stalks have many joints, and are befet with grafs-like leaves covered with foft hair. It is plentiful in the fouthern parts of Europe, but not of any note in medicine.

Ray enumerates fourteen species.

ALOPEX. The name of a particular kind of fea-

ALOSA. The SHAD, called also clupea.

A fea-fifth the fize of a falmon, with large feales, but thin and eafily taken off. In its head is a floney bone of an alkaline nature. This fifth is the best for eating in fpring, but if pickled it keeps well all the year.

ALOSOHOC, QUICKSILVER.

ALOSANTHI. FLOWER OF SALT.

ALP. The bird called rubicilla, a Brafilian bird of the bull-finch kind very beautifully variegated with red, black, and grey. Mr. Ray gives the name rubicilla to the guifatirica.

ALPAM. A plant growing in Aregatti and Monda-belle; it is noted by Ray in his History of Plants, but it

is not known medicinally.

ALPHENIC. An Arabian word for fugar-candy, or barley-fugar: ALPHESERA, fee ALFESERA.

ALPHITTA, the plural of sapers. The meal of bar-ley that hath been hulled and parched. Hippocrates uses this word for meal in general; Galen fays, that xquara, is coarfe meal, axeeps, is fine meal, and axera is a middling fort.

ALHPITEDON: It is when a bone was broken into fmall fragments like alphita, i. e. bran, also called carve-

ALPHITON. A HASTY PUDDING. Thus the Greeks call it, but the Roman name is polenta; it is made of barley meal, moistened with water, wine, mum, or any other liquor. The foldiers had it in common ufe.

ALPHUS, αλφ & from αλφαινω, an old word for to change, because it changes the colour of the skin.

This diforder is a species of that fort of white leprofy called vitiligo, and which is divided into the alphus, melas, and leuce, called also albara; in the alphus the skin is white and roughish, not all over but in spots, sometimes the patches are broad: it has the fameorigin as the leuce and lepra, and bears the fame analogy to the leuce as the scabies to the lepra; the first is superficial, chiefly affecting the fkin: the fecond finks deeper into the flesh: but these are all disorders that only differ in their degrees of inveteracy. See LEPRA.

Oribafius commends lime-water as a lotion in all the species of this disorder, and says that the alphus requires a thin lime-water, the feabies a thicker or ftronger, and the lepra the strongest. Actius commends, as equally proper for the white or the black alphus, the following li-

ALP. EXOT. The abbreviation for Profperus Alpinus

ALP. PL. ÆG. The fame author de Plantis Ægypti. ALRACHAS. LEAD.

ALRATICA. A partial or total imperforation of the

vagina. It is an Arabic word.
ALSAMACH, or ALSEMACH, an Arabic name for the great hole in the os petrofum.

ALSECH. See ALUMEN PLUMOSUM VERUM.
ALSELAT. BURNT COPPER.
ALSEMACH. See ALSAMACH.
ALSINASTRUM. A plant found in boggy places; its roots is fibrous and white, the stalk hollow, divided into cells lengthwife; and that part which is in the water is of a purplificolour, the reft of a paie green; it bears white flowers in July and August. There are three species, but of no confequence in medicine.

ALSINE, from axos, a grove, because it delights in such places on account of their shade. It is also called morfus galline; in English, CHICK-WEED and MOUSE-EAR;

There are twenty-two species.

It is a fmall creeping herb, and too generally known to need a description; in shady cultivated ground it is to be met with the greatest part of the year, but it is also in more exposed places, where it appears in the middle of winter, and dies in the middle of summer.

It is cooling, but of too little confequence to be noted as a medicine. It is used to promote an appetite in lin-nets and Canary-birds. This is a name of some species of veronica; also of a species of faxifraga, or rue whit-low-grass. See Paronychia - that called Baccifera. One of the species of alline. - CORNICULATA. species of myosotis.

Alsine Formis, called also alsine palustris, and portulaca exigua. In English, SMALL WATER-CHICK-WEED, OT PURSLANE, OT BLINKS.

It flowers in fpring, is found in boggy ground, but of

no known medical ufe.

ALSIRACOSTUM. The name of a compound me-

dicine in Meffue, called also firacoftum.

ALSINICIUM. A species of apium, much used in Germany, also the cuminum alnorum-thysfelinum-daucus

ALSURENGIAM. An Arabic name for hermodac-

tylus, which fee.

ALT. The abbreviation for alter and Altdorf. ALTAFOR. CAMPHOR.

ALTARIS ET ALTARIT. QUICKSILVER.

ALTERANTIA. ALTERATIVES. They are those medicines that are supposed to make a change in the blood for the better, without any manifest operation or evacuation. Whatever other general operations may be proper to any medicines, all of them may be used as alteratives, and the most powerful alteratives are evacuants, given in diminished doses, if repeated at proper intervals; by administering them thus, or mixed with such other alteratives as the case may indicate, though the discharge they promote, when given in full doses, is not increased, they pass into the blood, and the secretions are pro-moted, whereby the faulty natural excretions are regulated.

Purging, vomiting, diuretic, and other evacuants, are

here uleful, as aloes, antimony, nitre, quickfilver, &c.
ALTERCANGENON. See HYOSCIAMUS.
ALTERCUM. See HYOSCYAMUS NIGER.

ALTEY PLUMBI, or ALKI PLUMBI. Most probably the face. faturni, i. c. CERUSSA ACETATA.

ALTHÆA, from axios, a remedy; called also bifmalva, hibifeus, ebifeus, malvavifeus, ibifeus, malavifeus, in English MARSHMALLOW, It is the althea officinalis foliis simplicibus tomentofis, Linn.

It is a foft hoary plant, with oblong undivided leaves, and pale flesh-coloured monopetalous flowers cut deep-ly in five sections, set in a double cap, the outermost of which is divided into nine parts, the inner into five; the fruit confifts of a number of capfules fet in form of a flat difk, containing each a fingle feed; the roots are long and flender, with feveral fibres, of a pale yellowish colour on the outfide, and white within. It grows wild in marshes and other moift places in England, though it is frequently cultivated in gardens. It is perennial, and flowers from June to near the end of fummer.

All the parts of this plant abound with a mucilaginous matter almost both inodorous and insipid. The dry roots, if boiled in water, give out near half their weight of gummy matter, the leaves afford nearly one-fourth of their

weight, the flowers and feeds still less.

All its virtues depend on its foft mucilage, which obtunds and incraffates acrid fluids, moderates tickling coughs which proceed from defluxions on the fauces and lungs, gives relief in hoarsenesses, erosions of the stomach and intestines, dyfentery, difficulty, and heat of urine, and relaxes the paffages in nephritic complaints, in which laft case the decoction, which is the best preparation, should not be slimy; two or three ounces of the fresh roots may be boiled in a sufficient quantity of water to a quart, to which one ounce of gum arabic may be added and two drams of nitre.

A decoction is the best preparation and most agreeable to be taken, but requires that large quantities be used. An ounce of the dried root may be boiled in water enough

this last name is from its leaves refembling the ears of more of the root is added the liquor will be difagreeably flimy; if it is sweetened by adding a little of the root of liquorice it will be very palatable. Some prefer the in-fusion, as long boiling destroys part of the viscidity of this plant.

The London College gives the following form for a fy-

SYR. ALTHER.

R Rad. alth. fic. 16 i. eoq. in aq. font. 16 viiij. ad the iv. colaturis adde face. alb. 16 iv. f. fyr. Boil the water with the marthmallow root, to one half, and prefs out the liquor when cold; fet it by twelve hours, and prefs out the liquor when cold. Set it by twelve hours, and after the faces have fubfided, pour off the liquor, add the facer, and boil it to the weight of fix pounds. fugar, and boil it to the weight of fix pounds. Phar. Lond. 1788.

The form for this fyrup is from Riverius, but the first

prescription was from Fernelius.

The cuftom of throwing marthmallow-leaves into hot water when used to sit over for curing the piles, is use-less, for nothing of the mucilage arises therefrom with the watery vapours.

There are many species of the althara, but this alone

is in ufc.

The great comfrey root is preferable in all the cafes wherein the althora is used.

ALTH. THEOPHRASTI FLORE LUTEO, called alfo alth. Indica, ibifcus Theophrasti, abutilon, and in English the YELLOW MARSHMALLOW.

It is cultivated in gardens, and flowers in July. Its appearance, except in the colour of the flowers, and its medical virtues are fimilar to the above species.

Miller enumerates fixteen species of this yellow flowered kind .- ARBOREA MARITIMA GALLICA. See MAL-LOW TREE. See MALVA AREOREA MARITIMA. -FOLIIS CANNAB. See BANGUE.
ALTHANACA, or ALTHANACHA. ORPIMENT.

ALTHEBEGIUM. An Arabian name for a fort of fwelling, fuch as is observed in cachectic and leucophleg-matic habits, and such as is seen under the eye-lids of those who seep too much.

ALTHEXIS, from αλθιω, to cure, or heal. It signifies

the cure of a diftemper.

ALTIHT. The laserpitium of the ancients.

ALTIMAR. BURNT COPPER.
ALTIMIO. The SCORIA of LEAD.

ALTINCAR. A fort of factitious falt used in the purgation and feparation of metals.

ALTINGAT. Rust of corper, or flowers of COPPER. See ÆRIS FLOS.

ALTINURAUM. VITRIOL.

ALITH. See Assa FORTIDA.
ALTUS. When this word is joined to forer it means found fleep, as in a lethargy, &c. ALU. See ARE-ALU.

ALUACH, or ALUECH. PURE or REFINED TIM.

ALUCO. A SPECIES OF OWL. ALUD. An Arabic name of agallechum.

ALUDEL. A CHEMICAL SUBLIMING VESSEL. Manyare to be employed at once; the matter to be fublimed is put into a body or pot, the upper part is fitted into the aludel, and this aludel into another, &c. to the top aludel a head or alembic is fixed to receive the fublimed matter.

ALUDIT. QUICKSILVER.
ALUFIR. REDNESS.
ALUM. The HESE COMFREY. ALUMBAIR. BUTTER. ALUMBOTI. CALCINED LEAD.

ALUMEN. ALUM. It is a falt. The Greeks called it rowrages. In natural history, it is a genus of falt, in the order of earthy neutral ones. Its generic character; it confifts of the vitriolic acid and a clayey earth, and changes the purple juices of vegetables into a red colour. Edwards's Elements of Foililogy.

The prefent practice employs only the two last of the following species, but as all the four have been in use they all demand a fhare of our attention.

I. Alumen plumofum officinarum, also called amianthus,

which fee, and asbestus, &cc. EARTH FLAX.

It is entirely rejected from medicine, being more dangerous than useful; it is a species of amian-thus which from its plumated appearance obtained to leave two or three pints to be poured off for use; if the name of alumen plumofum; and thence too

it is probable its admission into the number of medical cases are from ten to twenty grains, and may be repeated

2. Alumen plumofum verum, also called alumen scissile, alumen jamenum, alumen plumeum, alumen trichites; alfech, alesch. The PLUMOSE, FEATHERED, OF HAIRY ALUM.

It fometimes shoots upon the surface of those minerals that afford the factitious alum, and is also found on other bodies in the form of fibrous efflorescences, and from this form hath obtained the names of alumen plum. &c. It feems to be the native alum of the ancients; and is formed by a natural evaporation of water that hath paffed over beds of alum ftone.

3. Alumen com. Common ALUM, also called alumen crystallinum, alumen rupeum, alumen factit; FACTITIOUS OF ROCK ALUM; also ENGLISH ALUM.

4. Alumen Romanum. Roman alum; alfo called alumen rubrum, alumen rutilum, alumen rochi Gallis. Rock,

RED, or ROCH ALUM by the French. These two latter agree in their general qualities. The greatest quantity of them are artificially produced from different minerals, such as a blue slate, which is found about Scarborough in Yorkshire, Preston in Lancashire, a whitish stone at Tolfa near Rome: these stones by calcination become richly aluminous, they are then steeped in water, fresh stones being put to the same water several times; to this water, after having obtained what it can from calcined stones, is added a ley made with pot-ash, and after this a quantity of urine; this last is to cast off fome improper parts, and to prevent the alum from being too hard; the alcaline lixivium is necessary for bringing the alum into a folid form: it is by evaporation that the cryftals are obtained.

A bituminous earth is met with near Hall, in Saxony, which by exposure to the air grows hot, and at length burfts into a flame. In Sweden are ferruginenous pyrita, from which both alum and vitriol are obtained.

The English, or common alum, is colourless, and commonly in large masses, into which it is cast by melting the crystals after the alum is perfectly made, and then pouring the fused matter into vessels whose cavities give the forms it appears in. The Roman aliam is of a red-dish colour, and in small crystalized masses; but its chief difference from the English, is in its being less styptic, and less nauseous. The name of roch, or rock alum, is applied to the English by us, on account of the hardness and fize of the masses; but foreigners apply it to the Roman, on account of the hard stone, or rock, from which it is extracted.

Alum hath a peculiarly fharp, rough, aftringent tafte; it melts over a gentle fire, fending up in a vapour a fixth part, or more of its weight, and becomes a light, white, fpongy fubstance, called burnt alum; it is the only falt, that with other animal ingredients, or vegetable matters, will make the black phosphorus; it disfolves in about twelve times its weight of water; folutions of it change the blue colours of vegetables into a purple or red, and an infusion of galls, turbid and whitish. Upon adding a fixed alkaline salt to a dissolution of alum, its earth is precipitated, and its acid uniting with the alkali, forms a tart. visually the salt of th triolatum.

It is used by dyers to strike, fix, clear, and brighten their colours; by dipping paper in it, ink is prevented from fpreading on it; vintuers fine their liquors with it; fishers use it to dry codfish with; and bakers mix it with flour to make their bread white : against this last use of alum great objections have been made, but without any just pretence, for it is entirely innocent. Those who represent it as very injurious, should consider that in every pint of pump-water that is generally drank in London, where this practice most prevails, as much alum is taken, or as much of a mixture of the vitriolic acid and limeflone, or other matters, any of which are far more exceptionable than alum.

Medicinally it is used as a powerful aftringent; as such it is prescribed to preserve the gums, also to restrain ute-rine hæmorrhages, and check the fluor albus; but though in these fort of fluxes it is highly commended, it is rarely and with great caution to be admitted in dyfenteries, particularly in the beginning. See STYP. HELV. Pulvis. Though celebrated as an aftringent in fome cafes, it is no lefs extolled in the colic and other painful diforders of the bowels, attended with obstinate constipation. See Percival's Effays Med. and Exp. vol. ii. The dofes in thefe

every four, eight, or twelve hours; and when duly perfifted in, proves gently laxative, mitigates the pain, abates flatulence, mends the appetite, and ftrengthens the organs of digeftion. Alum is powerfully tonic, and it is reasonably supposed to contribute to the relief of pain in the intestines, by blunting the morbid sensibility of their nerves. As the mineral acids do, it coagulates the blood and injury. In roboth habits, after the blood and injury. blood and juices. In robust habits, after due bleeding and purging, it cures agues: either of the following usual forms may be given in a morning fasting, until the desir-ed relief is obtained. Dr. Cullen thinks it ought to be employed with other aftringents in diarrheeas. In active hæmorrhages it is not uteful, though a powerful medicine in those which are passive. It should be given in small doses, and gradually increased. It has been recommended in the diabetes, but tried without success; but joined with nutmeg it has been more successful in the property of the state of the stat intermittents, given in a large dofe an hour or a little longer before the approach of the paroxylin. -In gargles, in relaxations of the uvula, and other swelling of the mucous membrane of the fauces, divested of acute inflammation, it has been used, and advantageously; also in every state of the cynanche tonsillaris.—It is also prefer-able to white vitriol, or acctated cerus, in the ophthalmia membranarum, from two to five grains diffolved in an ounce of water. Cullen's Mat. Med.

R Nuch. mosch. major. & pond. equale alum. rup. f. pulv. in tres partes divid. cujus cap. i. omn. mane jejuno.

R Cort. Peruv. fubtil. pulv. 3 i. feri alum. 3 vi. m. f. hauft. mane jejun. fumend.

The Roman alum is counterfeited with common alum coloured; but break it, and the counterfeit will be found pale within, while the true is of a deeper red.

Alum confifts of the vitriolic acid, a metallic earth, and water; of which last its contents are nearly one half of the weight of the whole. Exposed to a moderate heat, great part of the water slies off in vapour: urged by a stronger heat, the acid spirit arises, leaving the earth behind. The earth may be separated by dissolving alum in water, then adding a folution of alkaline falt to it until a milkiness appears, when on standing a little, the earth is precipitated; and by a few ablutions, in boiling water, is

totally freed from all its alkaline parts. From this earth alum may be regenerated by the addition of the oil of vi-

There are many preparations of this drug in use, the chief of which are as follow:

ALUMEN FEBRIFUGUM, Febrifuge Alum.

R. Alum. 3 iij. in aq. card. 15 is folut. cui adde paucul. fang. drac. colatur evapor. ad fice.

Dof. 9 i. ante paroxyfma.

It is also called facebarum aluminis, or fugar of alum and azob.

R Alum. rup. 3 i. aq. font. 3 vi. m. This is of excellent use if spungy ulcers are washed with it.

AQUA ALUMINIS COMPOSITA, P. L. 1788. Compound

water of alum. R. aluminis, zinci vitriolati aa 3 fs. Aquæ ferventis fb ij. pour the water on the falt in a glafs veffel, and strain it. This was formerly called aqua aluminofa Bateanea.

In some of our public hospitals, two ounces of each of the ingredients are added to a quart of water.

ALUM. USTUM, Burnt Alum. It is only alum dried in an iron ladle or an earthen veffel over a gentle fire, by which it becomes white, light, and fpungy. It is used as an escharotic when fungous flesh rifes in ulcers; but it makes the edges of the part to which it is applied callous. Mixed with the fugar which is used to sweeten cordial waters, it precipitates the milki-ness that appears when newly distilled, and which some-

times continues if not prevented.

Coagulum Aluminis, Alum Curd.

R Albuminis ovi N° ij. & cum paucul. alum. conquaffat. donec coagulum. form.

Riverius first gave this prescription; it is a useful application in chronic inflammations of the eyes attended with

much weeping; if applied at bed-time: bleeding and purging should precede, and blisters accompany its use.

ALUMINIS PURIFICATIO. P. L. 1788. Purification of Alum. R. Aluminis. p. fb j. Cretæ p. 5 i. aquæ dif-

crystallize.

ALUMEN CATENUM, OF CATINUM. A name of the pot-ash. See CLAVELLATI CINERES. — GLA-CIALE. So alam that appears like ice was called by the ancients. -- PLUMOSUM. -- USTUM. See ALU-MEN.

ALUMINOSÆ, Ao. The purging mineral waters

are called aluminofa.

ALUMINATIO, To Nourish or FEED.

ALUNSEL. A DROP.

called alfo Aluta Ægyptia.

ALVEARIUM, from alveare, a bee-bive. The bottom of the concha or hollow of the external ear; it terminates in the meatus auditorius. It is in this cavity where the car-wax is principally lodged.
ALVEOLARIA PROCESSUS. See MAXILLARIA

SUPERIORA OSSA.

The fockets in the jaws in which the ALVEOLI. teeth are fet; they are lined with a very fenfible mem-brane, which also encloses the roots of the teeth. There are usually fixteen of these alveoli or sockets in each

ALVEOLUS. A little focket or trough.

ALVEUS. Medicinally it is applied to many tubes or canals, through which fome fluid flows, particularly to ducts which convey the chyle from the receptacle thereof to the fubelavian vein.

ALVIDUCA. Applied to medicines, it means those

which purge.
ALVI FLUXUS. See DIARRHOEA.

ALVUS. The BRLLY. Celfus uses this word for the belly, relative to the intestinal discharge, as Hippocrates and others use the words xuxia, or xuxia, calia.

ALYCE, from axes, to be anxious, i. e. that anxiety which is attendant on fevers, it is the fame as ALYSMOS,

which fee.

ALYPIA, ALYPIAS, ALYPUM, from α, neg. and 2ωπε, pain. The HERB TERRIBLE. It is also called white turbith. Frutex terribilis, empetrum, thymelæa, & globularia fruticofa.

It is of no account in medicine; it is a fpriggy plant, reddish, with slender sprays, fine leaves, and thin soft flowers; the root, like that of beet, are flender and full of an acrid juice, the feeds have a purgative quality; it is found in maritime places: it is also the name of a species

of fpurge

ALYSMOS, from anum, to be uneasy or anxious.

Anxietas, Anxiety. Hippocrates uses it to express that uneafiness that is attendant on acute diseases, which makes the patients tofs about, fo that they cannot reft long in the fame pofture. Duretus distinguishes between the anomes are erest and the anomes rautides. The first is caused by an oppression of the vital powers, the latter by fickness in the stomach; but of this alysmos there are reckoned four forts, two of which are attended with fever, and two without. It is also called Diaporema-Aporia.

r. Without fever.

Caufed by fomething uneafy in the ftomach, hence an irregular contraction of the heart, a difficult paffage of the blood through the lungs, and confequently this anxiety. Uneafiness of the stomach by sympathy, as from a stone in the kidneys, &c. produces this disorder.

2. Without fever.

Caused by vapours or spasms in the stomach, or other vifcera of the belly, as in the cholera morbus, byftetia, &c.

3. With fever.

From a difficulty in the passage of the blood through the hungs, which may be from a spasmodie stricture in the fmaller veffels, in which cafe the blood is thrown by gluts into the larger. In inflammatory fevers, this fymptom is attended with a low pulse, oppression in the breast, and difficult breathing.

4. With fever. It happens when a stricture of the vena porta prevents a free circulation of the blood in the lower belly, in this case there is great weight and oppression of the hypochon-dria. This often ends in a polypus, and so by conse-

tillatæ M: th j. boil these a little, strain, and set it by to | quence death, or a gangrene in the liver, whence a fatal putrid diarrhoca

ALYSSOIDES, from es Sos, form, and alyffiem, as be-

ing formed like alyffum. Miller mentions four species.

The flower is in the form of a crofs, confifting of four leaves; out of the flower-cup the pointal arifes, which afterwards is an elliptical thick fruit, with two cells filled with round and flat feeds, with borders round them.

It is of no remarkable medical efficacy.

ALYSSON, a name of fome species of veronica. ALYSSON SILIQUA LATA ASPERA. A Species of lunaria. See also Aspidion.

ALYSSUM. MADWORT, from a, neg. and 20000, that madness which the mad dog occasions by his bite.

The flowers confift of four leaves expanded in the form of a crofs, the fruit is short and smooth, containing many round feeds.

Boerhaave takes notice of twenty species, all which are

effected diaphoretic. The alyffum of Galen is thought to be a species of mar-

The alyfum of Piny is supposed to be the molluga. ALYSSUM VERTICILLATUM. See MARRUBIUM VER-TICILLATUM

ALZEMAFOR. CINNABAR.

ALZILAT. The name of a WEIGHT of three grains. ALZOFAR. BURNT COPPER.

AMA, AME, or AMES. A fort of fmall CAKE. Aretæus uses this word to compare the quantity of hellebore for a dofe.

AMALGAMA. In chemistry it is a substance produ-

ced by mixing mercury with a metal.

All metals may be amalgated with mercury, except iron; but gold amalgamates the most readily of any of them, filver next, lead and tin next, copper with difficulty, and iron scarce at all.

To amalgamate gold is to reduce it to a paste by unit-ing it with quicksilver, with this paste filver and other

metals are gilt.

AMALGAMA of GOLD.

Diffolve pure gold in aqua regia until the liquor is faturated, dilute the folution with twelve times its quantity of pure water, put into it fome polished plates of copper, and the powder of gold will fall upon them; let it it and in a due degree of heat until the liquid is no longer turbid by adding coppers, thake the plates, that all the gold may fall to the bottom, pour off the liquor, wath the precipitated powder with water, dry it, and in a glass mortar reduce it to an amalgama with quickfilver. After the amalgama is once formed, this, and all the rest, will receive more and more quickfilver, at the pleafure of the

By amalgamation we fee that quickfilver is the true folvent fluid of metals. All the metals may be mixed to-

gether by being first made into an amalgama.

There are various methods of making amalgamas, which may be feen in any of the fystematical chemical writings. All amalgamas are white, from whatever metal pre-

pared. The chemical character of amalgama is A. A. A. AMALGAMA of SILVER.

Precipitate pure filver from aqua fortis, and proceed as with copper.

AMALGAMA of LEAD.

Melt pure lead in an iron ladle, then put to it an equal quantity of pure quickfilver made hot, ftir them with an iron rod, to mix them, let them cool, and then you take out a filver-coloured mass which is hard, but by rubbing becomes fofter; put this mass into a glass mortar, and rub it, and add what quantity of quickfilver you pleafe, and it will be united to it most intimately.

AMALGAMA of TIN.

Proceed as with lead.

AMALGAMA of COPPER.

Saturate the best aqua fortis with pure copper, then dilute the folution with twelve times its quantity of pure water; into the liquor, when it is hot, put plates of polished iron, and the copper will precipitate as the iron dis-folves; proceed till no more copper falls, pour off the li-quor, and wash the precipitated powder with hot water until it is infipid, dry the powder perfectly, put it in a glafs

#### AMA AMA

mortar, and by rubbing, incorporate an equal quantity of

hot quickfilver.

AMALGAMATIO. AMALGAMATION, or to amalgamate. Rulandus defines it, a calcination of metals by mercury.
AMALT.

The abbreviation for amalthaum.

AMAMELIS. The amamelis of Hippocrates is generally allowed to be the fame with the epimelis of Diofcorides, which is the fmall baitard medlar.

There is another medlar in Italy, called the epimelis,

AMANITA, Fungi et Tubera. The fungus productions called MUSHROOMS, TRUFFLES, &c.

Among the ancients these are not taken any notice of, except by Oribasius, Paulus Ægineta, and N. Myrepsus.

Tournefort enumerates eighty-three species.

Nero called mushrooms & supa Star, the victuals of the gods, because the emperor Claudius died by eating them,

and was afterwards deified.

The different species are also called boletus cervi, tuberca, cervina; CHAMPIGNONS by the French, morille, mushroom, &c.

Amanite now are understood of the fungus terree, the only forts of which in use, are the MUSHROOM and the

MORILLE.

The true mushroom, called by the French, champig-non, is known by its external whiteness, and by being of a pale red within when young, and of a deeper red when older; it is, at its first appearance, of a round figure, and not much larger than a small nut; after they have a little unfolded their membranes, they appear red, full, and clofe; on the top is a difagreeable fofuness, equal and white, the matter within is very white, with short and thick stalks. They grow in meadows and commons that have a good soil: they should be gathered for eating as soon after springing up as possible, for they contain an oily and a faline part, and if they stay long before they are gathered, their salts become more active and hurtful; hence those which grow on hot beds, having more oil, are

To various causes are attributed the disagreeable effects, which fome persons experience after eating them, among which the following is noted by many as probable: in the stalks, the globular parts, and between the little membranes, may be observed, with a good glass, many fmall worms fhaped like adders, and with fcarlet heads; forme mushrooms contain more, others fewer of these animalculæ, to avoid which, examine the mushrooms well, and wash those that are to be eaten in falt and water, rhrowing away those that have many of these worms. See

When offended by eating them, fome of the following fymptoms are produced; a qualmithness first affects the patient, which increases to a confiderable degree of fickness, swelling of the stomach or of the belly, restlessness, giddiness, a palpitation of the heart, heartburn, colic, hiccough, diarrhea, accompanied with a tenefinus, flufhing heat in the fkin, with more or lefs of rednefs there, and fwelling in the face, and fometimes a fenfation all over the body, which refembles what is felt from a general fwelling; the patient stares in an unufual manner, all objects appear different from what they did before; a dif-ficulty of breathing comes on, and the mind is strangely confused: delirium, trembling, watching, fainting, cold-fweats, apoplexies, and convulsions have been consequen-ces following the eating of this fort of fungus.

For the relief of persons under these circumstances, fpeedily as possible give from gr. x. to 3i. of white vitriol, dissolved in a draught of warm water; and if the sickness is still urgent, repeat the same quantity two or three times, that the stomach may be well emptied; after which give a draught now and then, made of sharp vinegar, a large boonful in a glass of water, which sweeten to the palate. The poifon is not of the acid kind, fo fat broths and oily medicines are ufelefs. After evacuations upwards, procure a paffage downwards; if the patient cannot fwallow purgatives, let cathartic glyfters be given. After due evacuations upward and downward, befides the vinegar as above, cyder, and perry, that is brifk and fparkling, may be now and then given. Dr. Mead extols the faline mixture. If any paralytic fymptoms appear, apply finapifins or blifters. Perhaps electricity may be happily used in fuch like inftances.

The MORILLE is a kind of fpring mushroom, as large as a nut, oblong, shrivelled, tender, porous, and cavernous like the honeycomb, of a yellowish white colour, or inclining to red, and fometimes blackish; they are not fo frequently hurtful as the common mushrooms. They are met with on moift graffy foils, in woods, and on the roots of trees

AMARA. BITTERS.

Bitterness is occasioned by an acid, joined with an earthy alkaline, and fulphureous fubitance.

Bitters lofe their bitterness by the addition of alkaline

Bitters yield their virtues both to watery and spirituous menstrua; they yield very little of their taste by distillation, either to water or to spirit, nay, the bitterness is so tenaciously detained as to be improved in many ex-

They participate of the virtues of aftringents and aro-natics. Their general effects are, to conftringe the fibres of the stomach and intestines, to warm the habit, and to promote the natural evacuations, particularly of fweat and urine. In weakness of the stomach, loss of appetite, indigestion, and the like diforders, proceeding from the laxity of the fibres, or a coldness of the habit, medicines of this tribe do fingular fervice. On the contrary, when the fibres are too tenfe, or when the heat of the conftitution exceeds what health requires, bitters very fenfibly increase these disorders, and if their use is perfisted in, the confequences may be fatal.

Strong bitters are the most diaphoretic, and agreeable ones the most stomachie; as stomachies, bitter infusions

should not be strong, but light and agreeable.

Bitters are supposed to be powerful anthelmintics, but worms live longer in an infusion of aloes than in rose water; hence they do not feem likely to destroy them in our bodies.

As bitters neutralize acids, fee Percival's Effays, Med. and Exp. their use, when acidities prevail in the sto-mach, is obvious. In such cases they may be considered as indicated on a double account, viz. to correct the difeafe when prefent, and by their bracing and corroborating effects, to remove the caufe of it. When given with fuch intentions, they should be infused in brandy, or in

force of the strongest wines.

It is generally faid, that bitters are administered as a substitute to the bile, but though with this direct view they are improperly employed, as being antifeptic, re-tarders, and moderators of fermentation, and confequently opposite in their effects to the bile; yet in disorders where the bile is defective, they are administered with considerable advantage, as they check the general tendency to fourness in the first passages, which is so confrantly an attendant on a defective bile, and also to allay the troublefome ferment there, which is fo injurious by producing flatulencies

AMARA DULCIS, DULCAMARA. WOODY NIGHT-SHADE. BITTER SWEET. See SOLANUM LIGNOSUM.
AMARA, Tinct. The bitter tincture. See GENTI-

ANA. AMARACUS SAMPSUCHUS. See MAJORANA MAJORI FOLIO.

AMARUM SIMPLEX, Infuf. See GENTIANA.

AMARANTHUS, also called flos amoris, chryfanthemos, beliebryfus, amaranthus maximus, blitum maxima

FLOWER-GENTLE, and FLORAMOUR.

It runs up to three or four feet in height, with channelled stalks, which fend out feveral branches, bearing large broad leaves, ending in a long point, of a light green, and often a little reddish. On the tops of the stalks grow long fpikes of deep red stamineous flowers, hanging downwards, which if gathered in time keep their colour very well. The feeds are small and flattish, of a reddish white colour, and fhining. This plant is of very little ufe in medicine, but in the garden it deferves fome notice. It flowers in July and August; in winter the stalks rot a-way to the ground: that called LUTÆUS, is a species of goldilocks. See ELICHRYSUM. — LUTÆUS LATIFO-LIUS. German goldilocks.

AMARANTOIDES, from αμαρανδις, amaranthus, and

4150, form. GLOBE AMARANTHUS, OF EVERLASTING

FLOWER, called Gnaphalio.

There are four or five different species, but of no use in medicine. Miller's Dict.

AMARUS. Dulcis orientalis. See Costus. SAL. See CATHARTICUS SAL.

AMATORIA FEBRIS. See CHLOROSIS. In Vogel's Nosology, amatoria is defined to be a fever of a few hours continuance, beginning with a great degree of coldnefs, and arifing from expectation of marriage.

VENIFICIA, i. e. PHILTRA, See PHILTRON. ATORIUS. Thus the musculus obliquus superior, AMATORIUS. or trochlearis, and the obliquus inferior oculi, are named by some; from amo, I love: ogling is performed by this mufcle.

AMATZQUITL, vel unedo papyracea, Nicremberg. The wood is of a light texture, the leaves refemble those of the lemon-tree, but are hairy, and more pointed; the fruit are large as Pontic nuts, divided into white grains of the same shape and nature with those of a fig. It is met with in warm countries only. A decoction of the bark of its root is commended in fevers.

AMAUROSIS, from auavyou, obscure. It is a decay or lofs of fight, when no fault is observed in the eye, except that the pupil is fomewhat enlarged and motionlefs. The Latins call this diforder a gutta ferena: fome amblys-

para—Cataracia nigra offu/catie, caccitas minor, mydriafis.

Mr. de St. Yves diftinguithes this difease into the perfect and imperfect kinds. The perfect is when there is a total blindness; the imperfect is when there is at least a power of diftinguishing light from darkness. There is a periodical fort, which comes on instantaneously, continues for fome hours, and fometimes days, and then difappears; but it often returns, as in hyfterical and hypochondriacal people, &c. In another species, the pupil is al-ways contracted, whether the unaffected eye is open or

The different causes are a palfy in the optic nerve, or the retina, proceeding from a slight apoplexy, &c. a tumor, or a plethora in the adjacent parts; a translation of morbid matter from some other part of the optic nerve, to the retina; a venereal, or a rheumatic humour, may, by follow on the even be the cause. by falling on the eye, be the cause. Suppressed periodical evacuations, vapours, hysteric, and other nervous symptoms, external injuries, a preternatural contraction, as well as too great a dilatation of the iris, or whatever intercepts the nervous influence in the eye, may produce this difeafe. In the middle of the optic nerve runs that branch of the carotid artery which enters into the eye; this artery being diftended may prefs the nerve, and render it paralytic; this feems to be the cause of the perio-dical species. Depletion enters too into the lift of causes, whether it is natural or artificial; but of all the kinds, that from the genitals knits the eyes the most.

Dr. Cullen, in his Syn. Nofol. Method. ranks this genus of difease in the class locales, and order dysæsteiæ: and enumerates the species from the following causes, viz. compression, debility and its causes, spasin, and the ap-

plication or the fwallowing of poifons.

On diffection after the death of patients who had been afflicted with this kind of blindness, in some the optic nerve was found too much extenuated, fiaccid, and by far too fmall; in others it was comprefled by extravalated blood, or by a tumor, or by a turgescency of the artery which passes through it.

The phlegmatic, cachectic, aged, those with weak nerves, or that have been fubjected to severities or excelles, and persons labouring under irregular or suppressed periodical discharges, are the principal subjects of this disorder.

The figns that indicate the presence of this disorder are generally the blackness of the pupil of the eye, its size be-ing larger or less than usual, and its not contracting nor dilating when exposed to a great degree of light. Its ap-proach is generally attended with pain in the head, and as the pain decreases this diforder increases, though sometimes an absolute blindness comes on without any previous complaint. When it comes on without pain, and one eye only is affected, no defect is perceived until the found eye is closed, then the pupil of the difeafed eye dilates, though exposed to a strong light; and when the other eye is opened, it contracts to its natural fize again. In infants, the pupil is fometimes of a natural fize, though it Thefe troches were formerly prepared of the feeds of

AMARELLA, fo Gefner names the polygala, which | hath no movement, and thus they continue during many months, or perhaps a year or more, before they can fee. When pregnancy, suppressed periodical discharges, nervous disorders, or vapours are the cause, a head-ach, vertigo, drowsiness, noise in the ears, &cc. often usher in this diforder; but as in these cases it is periodical, fo it frequently returns, but foon fpontaneously paffes

The prognostics are generally unfavourable: if this blindness succeeds a fever, comes on in the aged or very infirm, a cure is not to be expected; if one eye fails, the other usually foon follows; but if the case is slight, the habit of body robust, if it happens after the measles or the imall-pox, or in pubertine virgins, it is fometimes

Observe to distinguish this disorder from the glaucoma

or the cataract, and a vertigo.

In order to the cure, an attention to the cause will be the first step to the direction of proper remedies.

According to the plethora attending, let the evacuations be directed; if it is fanguine, make a free use of the lancet; if ferous, purges, diuretics, and blifters will be proper; and an emetic may be administered, if indicated by any diforder in the ftomach.

In phlegmatic habits, and when a rheumatifm is the cause, also when a palfy in the retina is suspected, valerian may be mixed with the bark, and taken in as large a dose as will agree with the stomach, every night and morning, washing them down with a draught of the in-fusion of fage, rosemary, or other aromatic herbs, and forty drops of the tincture of foot mixed in it.

Be particularly careful to keep the bowels lax, and to this end finall dofes of calomel, mixed with aloetic pur-

gatives, are to be preferred.

thut. In infants attended with this complaint, the pupil is oft of its natural fize, but no movement is observed there, however exposed to the light. The nyctalops is supposed by some to be a species of this complaint.

If blisters are applied to the nape of the neck, place them high thereon; but if a palfy in the retina be the suspected cause, the properest place for a blister will be over the supra orbital hole, through which the nerves pass and fpread on the forehead.

The forehead may be rubbed twice in the day with the linimentum ammoniæ of the London Difpenfatory, and a flannel rag moistened in the fame may remain there in

the interval; but a blifter is preferable.

Blifters and iffues should be kept open as long as poffible. Setons on the back part of the neck are ufeful.

If periodical evacuations are suppressed, endeavour to promote their return; and, in case of failure, substitute some proper artificial discharge.

In case of any acrid humour being translated from the furface of the body, endeavour to repel it by gentle aperitives, and proper fudorifies.

Externally: let the steams of hot spirit of wine, or of coffee, be paffed two or three times a day through a funnel to the eye; this, with a cooling light diet, and repeated purging, hath been followed by a complete cure.

Sternutatories are fometimes of fingular fervice; two or three grains of the refin of guaiacum fnuffed up the nofe, difcharges a large quantity of ferum; and to the fame purpose any of the volatile alcaline spirits may be used, being sirst diluted properly.

Heister afferts the success of aromatics, carminatives, and attenuants, particularly of mercurials in small doses. Pitcairn declares the fame. Coward fays, that volatiles, chalybeats, mercurials, cephalics, and nervous medicines are the proper ones. Riverius informs us, that cupping, with fearification on the back part of the head, hath been feedlike followed with fearons.

fpeedily followed with fuccess.

If all the above fail, a falivation has fucceeded, and fo may be tried; but small doses of calomel, or rather the following folution, may be given and continued two, three, or more months. It answers the ends of a falivation, and is both more agreeable and fafe.

DIMNESS OF SIGHT.

Hippocrates often uses this word. He says this dimness of fight, and corrufcations of light feeming to dart before the eyes, are among the fymptoms of an approaching hæmorrhage in continual fevers and genuine tertians. Sometimes he uses the word ambly fmos to express the same thing. Galen explains this word by abortus, but he mif-

AMBLYOPIA, from aptros, dull, and of the eye. Vifus debilis Actii: Vifus Hebetudo. - BOERMAAVE. It is an obscurity of fight, without apparent defect in the organ. See AMAUROSIS and Dysopia.

Hippocrates means by this word, in his Aph. xxxi. fect. 3. the dimnefs of fight to which old people are fubject.

Paulus and Actuarius use it to express a gutta ferena. Actuarius fays, that there is a manifest, but not a visi- of wine; it grows fost in a very gentle heat; it is opake,

nor the humours of the eye, are difordered; and that a defect of the nervous influence is the probable cause. See

The amblyopia is faid by fome others to be fourfold: generic term for those disorders in and of the eye, called myopia, &c. The amblyopia of some writers, is the amaurosis of Dr. Cullen. See Wallis's Sauvages's Nosology of the Eyes, p. 151, &c. for that called Dissiro-RUM, i. e. DYSOPIA DISSITORUM. - LUSCORUM, i. e. DYSOPIA LATERALIS. — CREPUSCULARIS, i. c. DY-SOPIA TENEBRARUM. — MERIDIANA, i. c. DYSOPIA

Amber is the name which the Italians and French have given to amber; what the Arabians call amber is quite different from the fuccinum, for they call amber, karabe, an attractor of firaws. The Greeks call amber, harpan; and the Syrians call it harpaga, fnatcher, because it fnatches straws, &cc.

The Arabians fay that the black poplar affords amber: they call the poplar, haur, and the tear of the poplar haurus, which was changed to hambrus, to fignify amber, or, according to fome, into avrum and abrum, and thence into ambram, to fignify the tear of the poplar; and probably from the likeness of the poplar gum and amber the same

name obtained for both.

Leo Africanus fays, that the whale is called hambara by the inhabitants of Fez and Morocco, which perhaps gave rife to the notion that amber was the dung or the spawn

By ambra the Arabians mean what we call ambragrifea; and by amber they mean what the Greeks call naphtha.

AMBRA-CINERACEA, also named fuccinum-grife-GRISEA, am, fuccinum-cinereum, am-barum, ambra-arabibus, and in English AMBERGRISES

Much of it is met with in the Indian ocean; pieces of a confiderable weight have been found in the northern feas-Sometimes it is feen floating on the furface of the feas, at others adhering to rocks, and not unfrequently found in the stomachs of fishes, and now and then it is thrown on the fhore; but it is found most plentifully about the island of Madagascar and the Molucca islands. According to an account in the Philosophical Transactions, No. 385, and 387. this drug is only the produce of the male spermaceti whale; it is there faid to confift of balls from three to twelve inches diameter, lying loofe in a large oval bag three or four feet deep or wide, nearly in the form of an ox's bladder, with a pape running into and through the penis, four or five feet below the navel, and three or four feet above the anus. This bag is almost full of a deep orange-coloured liquor, not quite fo thick as oil, of the fame fcent as the ambergrise which swims in it. These AMBLOTICA. Medicines which occasion abortion. balls of ambergrife feem to be in lamina like onions, and in the fluid pieces of the laminæ are found. There are two, AMBLYOGMOS, AMBLYOSMOS, from auchous, dull. three, or four balls in a bag. Where one whale hath these balls, three or four hath only the liquor in the bag. Some fishermen observe that these balls are only in the old and well-grown whales. The rarity of catching a female whale renders it difficult to fay that they do not produce any ambergrife. It may be observed that, as there is only one bag, it is probably the urinary bladder, and the balls, preternatural concretions formed there, as the bezoars are in their respective fituations. Neumann thinks it is a bitumen, fee his Chem. Works; and of the same opinion are many others; but a paper hath very lately been prefented to the Royal Society, by Dr. Swediar, which afferts its animal production, and declares it to be the indurated faces of the spermaceti whales. It is remarkable that Messue faith, it is the spawn of the whale-fish.

Pure ambergrife is to light that it Twims in rectified fpirit

blackish veins, and speckled with greenish spots; it breaks like wax; it hath no particular tatte, though foftish, oily, and fomewhat aromatic; it affords but little to the fmell, except it is heated, and then it is very fragrant; fet on fire, its odour is like that of burning amber: with a fmall degree of heat it melts into an oil, and in a great heat it is volatile.

The genuine is fpeckled with green; the more it is va-riegated, the worfe; the best is of an ash-colour, the worst

forts approach to a deep black.

It is foluble in boiling spirit of wine; from which, if the faturated solution be set in a very cold place, a part of the ambergrife concretes into a whitish uncluous subftance. Diffilled it yields an aqueous phlegm, a brown acidulous spirit, a deep-coloured oil, a thicker balfam, and fometimes a little concrete falt. The spirit, oil, balfam and falt, are fimilar to those obtained from amber, except that the oil is more agreeable to the fmell.

Rectified spirit of wine takes up near that of its weight of ambergrise. According to Neumann, if the spirit is impregnated with a little effential oil, the ambergrife will diffolve more readily in it. A deeper coloured tincture is made with alchol, but not a ftronger. Dulcified acids and alkaline spirits have no effect upon it; water and ex-

pressed oils have as little.

It is one of the most agreeable perfumes, it heightens the natural odour of other bodies; but the great fecret to this end is, to add it fo sparingly, that while it improves the smell of that to which it is added, its own may not be discovered. From two grains to a scruple it is a high cor-dial and powerful antispasmodic; though the common dose is from two to four grains, which may be given in an egg lightly poached. Riverius says that ambergrise is a fpecific against the fames canina.

A counterfeit as well as adulterated fort is too often to be met with; the first generally consists of musk, civet, ftorax, labdanum, aloes wood, mixed together; the latter of a large quantity of bullock's blood duly flavoured with

musk and civet.

A few drops of any of these tinctures, strongly flavours

a large quantity of inodorous matter.

The best way to prepare these tinctures is to make the fpirit fimmer with the ambergrife until it is duly diffolved, after which the other ingredients may be added; the wapours exhaled during the simmering, possess hardly any of the slavour of the ambergrife, though water is so strongly fcented with it by distillation.

The tincture is best for medicinal purposes when made with ambergrise alone. Hoffman observes, that it then does not affect the patient with that vapourishness usually complained of when mulk, &c. are in the composition. If the tincture is of a due strength, and is dropped into a little water, a very milky appearance immediately follows. See Neuman's Chem. Works, Lewis's Mat. Medica. AMBRETTE. The French name of abelmofebus. AMBROSIA. The name of a fweet thrub, anciently

made use of for making of garlands.

It is a name of the BOTRYS, which fee; this is the modern ambrofia. The ancients feem to have given this name to various plants, as the lily, the greater house-leek, &c.
AMBROSIA CAMPESTRIS, called also corona and

coronopus Ruellii, nasturtium verrucosum. Swine-cresses, and Ruellius's Bucks-Horn.

It is a trailing plant, with many weak straggling branches fet with fmall cut leaves, among which the flowers grow in rough clufters of a whitish colour; they are followed by little flat pouches containing the feed; the root is white, thready, and to the tafte is like the garden-creffes. Gerard.

AMBULATIO, WALKING, Celfus fays, that welking, reading moderately loud, fencing, and playing with the ball, all ftrengthen a weak ftomach. Walking, he fays, is best if it is up and down hill, except in cases of

rugged, of a greyish ash-colour, mingled with yellow and | great weakness: because ascending and descending exercifes the whole body more than the plain does. If the vifcera are weak, riding is to be preferred to walking.

Walking preferves and riding recovers health the beft.

AMBULATIVA A species of herpes. See Herpes,

Spec. 3 and 4.

AMBULO. The name of a difeafe, called also flatulentus, and furiofus, also flatus furiofus. It is a diffen-tion or inflation attended with pain, and variously pe-riodical. It is caused by vapours shooting through various parts of the body. See D. D. Joh. Michael. Prax. Clin. Special. Caf. 19.

AMBULON. A tree which grows in the island of Aruchit; the bark fends out a fruit like fugar, of the bulk

of coriander feed. Raii Hift. Plant.

AMBUSTA. Burns, called also caufis. Dr. Cullen places this case as a variety of the phlogosis erythema.

Burns and fealds differ not as to any confideration re-fpecting the cure. A burn is from folid fubftances, but confidered in the effect on the injured body: a feald is a burn from any hot fluid, or felid when in a fluid

Their danger is according to the degree, the part injured, the peculiarity of the constitution, and consequent fymptoms. And wounds from burns are more liable to form a cicatrix than when they are produced by other

Burns may be ranked into four kinds.

1st. When a redness in the part is attended with heat and pain.

2dly. When after the burn there arise pustules or blif-

ters with pain.

3dly. When the skin and subjacent fat are burnt to a

cruft.

4thly. When the burning goes to the bone. The two first resemble an inflammation, and are to be confidered as fuch, from an external cause; the third a

gangrene, and the fourth a fphacelus.

In general, burns and fealds of any confequence require bleeding and repeated gentle purging, to prevent or to reduce inflammation. If lightning was the cause, the in-ternal use of cordials are required. And, if the pain is great, though a fever attends, anodynes internally will be necessary.

In order to the Cure of the First Kind.

Medicines that neither heat nor cool in a great degree are to be preferred. Cold water may be used in the flighter cases by means of linen rags dipped into it, and the application repeated as often as they become either dry or warm. In the fame manner brandy and rectified spirit of wine may be applied, repeating the dressings until the pain abates, and then, in their stead, the camphorated

ipirit of wine is to be preferred.

Vinous fpirits, if applied before the blifters arife, generally prevent them, and always moderate the inflammation; as do also any volatile spirits-but, if the injury is on a membranous or tendinous part, it is best to mix oil with the spirit, otherwise it will too much crisp the

part, and may occasion a contraction there.

To the fame purpose as the above, and in want of them, any of the following may be used:—The white of eggs beat thin; vinegar, in a quart of which one handful of common salt is disloved; the pickle from olives; the brine from cabbage; oil of turpentine; any cooling oil or

The Second kind.

Emollients are here required to foften the corrugated fkin and contracted veffels, by which the circulation will be fet free: if the burn is fuperficial, only raifing the cuticle in blifters, the frequent use of olive oil or linfeed oil, applied with a feather twice a day, and then a plafter of the white cerate, or the white camphorated ointment, will fuffice: if the blifters are confiderable, fnip them immediately, to discharge the humour and prevent erosion; but do not separate the cuticle, then drefs with the cerat. fperm. ceti. vel ung. alb. camph. the inflamed circum-ference may be rubbed with any cooling oil. If an eschar is threatened, or the fore requires digest-

ing, drefs with either of the following twice a day.

R Ung. refinæ flavæ, & ung. spermati ceti, 12 p. æq. Or,

R Ung. refinæ flavæ, & cerat. lap. calam, aa p. æq. If this kind of burn or scald is extensive, bleeding and purging

# AME [61] AMM

purging will be required; if infants are the fubjects, their bowels must be kept constantly lax; a cooling liquid diet, In botany; they are such as have an aggregate of sumfuch as is used in inflammations: if there is any tendency mits hanging down in form of a rope or of a cat's tail, to fever, the following is preferred by many good practi- as the male flowers of the mulberry, &c. These are also tioners to all other means.

aq. font. 2da vel quarta quaq. hora.
The Third Kind.

If a crust is formed, the cure is effected by emollients and suppurants, as in the case of gun-shot wounds, which

If the accident hath happened in the face, avoid what-ever can tend to increase the cicatrix; emollients folded in linen cloths and applied thereon are the best applica-tions; an emollient fomentation, in which is about two ounces of the camphorated fpirit to a pint, may be used at the renewal of the other dreflings, during the first three or four days, or until the crust is separated; after which the procedure will be as in any common wound.

If the crust remains firm above three days, make incifions through it, to discharge the matter underneath. And to prevent a cicatrix, as the fkin forms, let it be often exwax and the oil of eggs.

The Fourth Kind. poied to the fleam of hot water, and apply a cerate of

Where all is destroyed, even to the bone, Heister fays, that the only method is amputation; but the attentive furgeon will fometimes confider this is only a worse degree of the third kind, and proceeding according thereto, the operation may often be avoided, and the limb reflored.

A violent head-ach in one person, and pain in the limbs of another person, were removed by the parts affected being accidentally burnt, and that only in the first kind of burns. Homberg thinks that burning with moxa, with cauteries, &c. cure by quickening the motion of the humours and thinning them, and by destroying the ends of the vessels by which the humours flow less that way. After all, burns can only be judiciously treated, by confidering them as high inflammations, of the phlegmonoid or crythematous kind, which of the two the general habit will determine, and the treatment must accord, by evacuants in the first, and by bark in the second; attending in each to the material benefit arifing from removing pain by proper opiates, without which but little advan-tage will be gained, whatever other means are used.

AMETHYSTA PHARMACA, from a, neg. and

μεθυ, wine. Medicines which either prevent or remove inebriating effects of wine.

AMIANTHUS, AMIANTUS. Also called linum, afbestus, asbestinum, linum fassile, linum abestinum, linum vi-vum, linum Indicum, linum Creticum, linum carpasium, knum caryftum, linum Cypricum, alumen plumofum, confoides, corfoides, sparta polia, falamandria, EARTH FLAX and SALAMANDER'S WOOL.

It is a mineral fubstance, found in lumps of different fizes, of a greyish colour, with a filvery gloss, and composed of small filaments. It is met with in many of the islands of the Mediterranean sea; in Italy there is abundance, and it is worten there either into linen or paper, both which resist the most violent stame. It is dug up also

in the island of Anglesey, and in Oxfordshire.

Some, with very great probability, fuppose it to be iron calcined in its ore, by subterraneous fire.

It can be fpun into thread, then wove into cloth, and afterwards made into paper. The cloth thus made is not cleaned by washing, but burning; and the paper writ upon, becomes clean again by the same process.

To work it into thread, &c. it is first steeped in water to dissolve its earthy parts, which makes its threads separate, then the flaxy part is dried in a sieve, afterwards they card it like wool, then with the singers wetted with cill it is twisted as it is drawn round around a real which oil, it is twifted as it is drawn round upon a reel, which is first wound over with fine thread; but mixing the afbeftus with flax, on a diftaff, and fpinning them together, works the asbestus into a thread, which is afterwards separated in the fire, and thus the afbeftus thread is left im'a proper flate, and in this way carding is not needful. The

AMELLA. See ACMELLA.

AMELLUS. An herb in France that takes its name cloth, when made, is best kept by being most needful. The cloth, when made, is best kept by being most with oil.

AMICULUM. A covering for the pubes when the boys exercised in the gymnasium. It is also used in the fame sense as the word amnios.

AMIDUM. See AMYLUM.

AMIDUM. See AMYLUM.

AMINALM VINUM. Wine of Aminia, called afterwards.

AMINALM VINUM. Wine of Aminia, called afterwards.

AMINALM. Vinegar of Aminian wine, or any yery strong wine vinegar. any very firong wine vinegar.

AMINIA. A fort of cotton-tree. The Brafilians call the bylon Brafil. of J. B. by this name; and the Portu-

guese call it algodon.

AMISADU. PREPARED SAL AMMONIAC.

AMMA. See BRACHERIUM.

AMMAN. CHAR. PLANT. The abbreviation for mani character plantarum.

AMMI, or AMMIUM VULGARE. COMMON BI-SHOP'S WEED.

Ammi Verum, called also ammi Creticum, ammi parvum foliis foeniculi, ammi femine tenuissimo & odoratifimo, cuminum Æthiepicum, faniculum annuum origani odore, ROYAL CUMMIN, and TRUE BISHOP'S WEED.

The feeds of these plants only are used in medicine. The common fort is a native in the fouthern parts of Europe; it is plentifully propagated by feeds, which fall in autumn, and fpring up in the following fummer: the

### AMM 62 AMM

feeds of this species are larger, paler, and very different in flavour, as well as in medical power, from the true. The true species is a native of Egypt, the seeds are of a reddish brown colour, small, and flat on one side, con-

minative, of a warm pungent tafte, having a femblance of origanum in their fmell. By diffillation with water, they yield much oil of a yellowith colour, and containing their whole flavour; fpirit of wine also carries off their

odour.

AMMION. CINNABAR.

AMMITES, or Ammonites, from augus, fand. A fandy stone, also called cenchrites and meconites; some are small as poppy feed, others large as a hazel nut. When as large as a pea they are called bezon minerale, and are found near Berne, in Switzerland.

AMMIUM. See Ammi.

AMMOCHOSIA. A remedy for drying the body, by covering it with hot fand, or falt, which is preferable.

AMMODITES. A VENEMOUS SERPENT; called also cenchria, that is, MILLETY, because its tail is hard like a millet. It hath wider jaws than the viper, and is farther diffinguished by the viper being yellowish. Its bite is fpeedily destructive.

AMMONIACI EMPLASTRUM cum HYDRAR-GYRO olim EX AMMONIACO cum MERCURIO. P. L. 1788. R ammoniaci colati. p. fb j. hydrargyri purificati p. 3 iij. olei fulphurati p. 3 j. vel quod fatisfit. Rub the quickfilver with the fulphurated oil, until the globules difappear, then add gradually the ammoniacum in a liquid flate, and mix. Five ounces of this plafter contains an ounce of quickfilver.

AMMONIACUM. Gum. called also armoniacum, but improperly: alsoch, hammoniaci lacryma, alsoci.

but improperly; aliocab, hammoniaci lacryma, affac; and in English GUM AMMONIAC.

Ammon took its name from auus, the fands, but the gum and the fal ammoniac, from the country called Ammonia.

It is a concrete gummi-refinous juice, produced in the East Indies, whence it is brought in masses, consisting of little lumps, which inwardly are very white, but out-wardly yellowish or brownish; its whitest parts become yellow on being exposed to the air. From what plant it is obtained we know not. It hath a strong smell somewhat like that of galbanum, but not fo ungrateful, a naufcous fweetish taste mixed with a bitterness.

Such pieces as are white, clear, free from foreign mat-ter, dry, and large, should be preferred for internal use. Thrown on live coals it burns away in slames: it is foluble both in water and in vinegar into a kind of milk, but the refinous part, which is nearly one half of the

whole, fubfides on standing: spirit of wine dissolves near one half of it, taking up all its active parts.

Dr. Dedier says, that sb i. of this gum, afforded by distillation, of phlegm 3 vi. volatile spirit 3 ij. a volatile sectid oil 3 vi. and the remainder was a caput mortuum. But other skilful chemists have failed to obtain any oil from it by this process. Water is very slightly impregnated with it by distillation.

nated with it by distillation.

This drug is an excellent deobstruent in hysterics, when caufed by retarded menfes, and in other abdominal ob-fiructions: diffolved in the acet. fcillæ it is a powerful expectorant, for vinegar greatly exalts its virtue in this particular: in old standing colicky symptoms, proceeding from viscid matter in the intestines it produces very happy effects: it is on a par with the affa feetida for virtues of the same kind as the affa feetida possessith, though it is less than a particular and less assistances. it is less nauseous and less antispassmodic; but its princi-pal virtues is in asthmas and difficult expectoration; it gently moves the belly, and externally applied it discusses. by writers on this subject. Mr. Hasselquist says, that

The foetid gums agree in their effects with oily aromatics, but have also acrid poignant falts conjoined, and fo more forcibly raife, ftimulate, and promote fecretions; reddish brown colour, small, and slat on one side, convex and surrowed on the other. We very rarely meet
with them in our shops, the seeds of the amomum, and
of parsley, being too often fold for them.

The seeds of the true bishop weed are an agreeable carturgid blood, and in robust habits, having so excellent a stimulus, without the power of rarefaction. Of this fort, among plants, are the viseus and dracontium, among roots the arum and scilla, and most of the vegetable emetics.

The dofe may be from gr. x. to 3 fs. three times a

Given in pills is the most agreeable form. It is adulterated with common rofin-

The method of purifying it, is by foftening it in a bladder, which is immerfed in boiling water, and while it is fluid it is strained; but for inward use, the best is the largeft and most unpurified pieces.
Diffolyed in water it is called LAC AMMON. and is thus

made :

R Gum ammon. opt. 3 ij. 2q. distillatæ. # fs. m. P. L. 1788. Thus administered it is more active than in pills; the dofe may be two large spoonfuls three or four times in twenty-four hours. It varies only from the old formula, by having the distilled water substituted for that of penny royal.

AMMONIACUS, Sal, ammonia muriata, called alfo cyreniacus fal, AMMONIAC SALT, and ARMONIAC, but im-properly; likewise alemzadar, alemzadad, adariges, aquila. Many writers speak of the natural and artificial.

The natural fort, spoken of by the ancients, according to Dioscorides, is only the sal gem, and is reckoned by them among the alimentary salts; but many others say that it was made from the urine of camels, and was depolited in the fands near the temple of Jupiter Ammon. We have no evidence of native fal ammoniae of this fort being found. Tournefort observes, that out of the simple native falts other compounded falts are naturally produ-ced, viz. the effential falts, which naturally are concreted from the juices of plants, among which are native ammoniacal falts.

The artifical is the only fort known and used in the shops. It is a neutral fort, composed of a volatile alkaline salt, and the acid of sea-falt, hence the term ammonia muriata; this is the only genuine fort, though it may be made with the vitriolic or with the nitrous acid. The different forts formed of the different mineral acids, are thus distinguished; by dropping oil of vitriol on that made with the acid of sea-salt, white sumes immediately arise; red fumes from that made of the nitrous acid; and no effect follows from that made with the oil of vitriol.

Sal Ammoniac is brought to us generally in round cakes, convex on one fide and concave on the other, from the shape of the vessels into which they are sublimed. When these cakes are broken, the falt appears of a needled tex-ture, or composed of strize, running transversely and parallel to one another; the internal part is generally pure, and of an almost transparent whiteness; the outside, for the most part, is foul, and of a yellowish green or black

In England this falt is obtained from burnt cow's dung; urinous falt, joined with an acid, produceth ammoniacal falt; it is obtainable from every species of foots by subli-mation or folution. At Newcastle it is made from the bittern, which remains after making common falt, and old urine; from one hundred pound weight of the bitter cathartic falt, and three hogheads of urine, fifty-fix pound weight of fal ammsniae is obtained. In Egypt it is made from the burnt dung of quadrupeds that feed only on vegetables, this dung is collected only in the first four months in the year, when the cattle feed on spring grafs which is a fort of clover; at other seasons, and when the cattle eat other fort of food, it is unfit for this purpole. As to the camel, its excrements are not preferable

## AMM AMO

the falt-workers in Egypt pretend, that the excrements and crystalize in the same manner as is directed for nitres from men, goats, and sheep, are preferable to all others; and he farther tells us, that March and April are the only not dissolve in common water, and hence the purificatimes in which they make this falt. See his account of

his voyages.

It may also be produced from ACIDUM MURIATICUM Sal. C. C. Ammonia: p p: TINCT. FERRI MURIATI Sal. fuliginis: Sp. Ammon: compofitus: with Sps. Ammoniæ comp. HYDRARGYRUS MURIAfetidus. Liquor C. C. Aq. Ammonia:

Ammonia acetata. The ammoniac falt hath many and ufeful properties. It is foluble in water, and in spirit of wine, and in the air alone.

It renders water extremely cold while continuing to diffolve in it. The crude falt, when diffolved in water, and mixed with a vitriolic acid, effervefees violently, and produces a fense of cold, the volatile falt, treated in the fame manner, effervesees likewise, but produces heat.

After folution in water, it shoots into crystals, which

refemble feathers, or into long shining spicula.

Mixed with a fixed alkaline salt, and then sublimed, it affords a dry volatile falt; but mixed with quick-lime, its volatile parts are only to be obtained in a liquid form.

When unmixed with other matters, it may be fublimed with a confiderable degree of heat, without fuffering the leaft change in its nature or properties; but if the fire is haftily raifed during its fublimation, it remarkably vola-tilizes many kinds of bodies if mixed with it.

On account of its fea-falt it turns acidum nitrofum di-

lutum into aqua regia.

Crude ammoniac falt does not curdle milk, nor alter the colour of an infusion of roses.

it emits an urinous fmell.

Diffolved in lime-water, then a little hydrarg mur. being added, the mixture becomes of a yellow colour.

In foldering, tinning, and casting shot, the crude falt is much ufed.

It becomes volatile in a heat fomewhat greater than that

of boiling water.

As a medicine, its effects are to be ranked among the most valuable of its tribe. Boerhaave says, that it pre-ferves all animal substances from putrefaction; that its brine penetrates their most inward parts; that it is the noblest aperient, attenuant, resolvent, errhine, sternuta-

tory, diaphoretic, fudorific, antifeptic, and diuretic.

When used externally as an antifeptic, discutient, or deterfive, it is mixed with some proper somentation in the proportion of 3 vi. or 3 i. to 1b ij. of the liquid.

It is more pungent to the taste than common falt, but

is lefs antifeptic; it paffes off more freely through the pores than common falt, but does not move the belly fo freely.

It is perfectly neutral; attenuates viscid juices; promotes a difcharge through the fkin, or by urine, according as the patient is kept warmer or cooler, or according to the peculiar circumstances of the constitution; in larger dofes, as g ij. it opens the belly, and in yet larger, it proves emetic; it is an excellent febrifuge, and peculiarly affiftant to the bark; in many inftances where the bark and emetics failed in agues, the crude falt given to 3 i. every four hours, with an infusion of camomile flowers, for fome days; then every fix, and at least every eight hours hath succeeded; it is used both as an antiseptic and a renellent in gargles; when the throat is inflamed or. a repellent in gargles; when the throat is inflamed, or otherwise requires such remedies, it powerfully dissolves viscid mucus in the mouth and fauces; in violent hypochondriac cases, it hath been of fingular efficacy by a daily use of it in doses just within what are required to render the bowels lax; after taking it fix, eight, and twelve months, the cold bath hath completed the cure. From z i. to z ij. diffolved in z viij. of any fimple water, is a good fubfititute for the common faline mixture, and fame kind.

The impurities of this falt are commonly fuch as will not dissolve in common water, and hence the purification is effected by the folution and filtration. The very last crystals seldom betray any mixture of other kinds of

FLOS SALIS AMMONIACI. Flowers of the fal ammoniac.

Take dry crude fal ammoniae powdered, put it into an earthen cucurbit, and having fitted on a blind head, fub-

lime the falt with a fire gradually increased.

This hath been called aquila alba philosophorum, and .

aquila Ganymedis.

AMMONITRUM, from augus, fand, and nippor, nitre. In our glass houses this is called FRIT.

AMMONII COLLYRIUM, called also bygidion. It

is a mere farrago.

AMMA ALCALIZATA. Paracelfus fays it is water which runs through lime-stones, and so is impregnated with lime. Rulandus calls it amnis alcalizatus.

AMNESIA, or AMNESTIA, aurreria, from a, priv. and

μποτις, memoria. Forgetfulness. Some use this word as fynonymous with AMENTIA, which see.

AMNION, or AMNIOS. Martinius thinks it is derived from, or hath its name in allusion to αμποτ, α vessel, which the american rated for the recognition of the second of the secon which the ancients used for the reception of blood in facrifice. It is also called armatura, agnina membrana, charta virginta galea, indusium. THE INTERNAL MEM-BRANE WHICH SURROUNDS THE FORTUS. It is a fine thin, transparent membrane, soft but tough, smooth on its inside, but rough on the outer. Dr. Hunter fays, that it runs over the internal furface of the placenta, and that this membrane, which feems not vafcular in the human fubject, makes the external covering of the navel string, to which it is most firmly united; and that viewed in a microscope, Rubbed with quick-lime, or with a fixed alkaline falt, it appears to have blood-veffels, but they are lymphatics.

However the existence of the allantois may be disputed in the human subject, the amnion it found in all animals

both viviparous and oviparous.

AMNIS, ALCALIZATUS. See AMMA ALCALIZATA.

AMOENIT. An abridgement of amcenites.

AMOGABRIEL. CINNABAR.

AMOMI. The Dutch call Jamaica pepper thus.

AMOMIS. A fruit refembling amomum; it is alfo called pfeudamomum.

AMOMUM. STONE-PARSLEY.

Botanists enumerate three species, viz. the true, the bastard, and as a third fort the tree nightshade is in-

The amomum verum is also called amomum racemosum, caropi elettari primum, Hort. Malab. TURE AMOMUM, OF TRUE STONE-PARSLEY.

The feed is the only part that is confidered as medicinal, but it is not known whether the true amonum of the ancients exists or not; the most probable account is that of P. G. Gamelli, in the Philos. Trans. which is, that the tugus, called by fome biras, and by others caropi, is the genuine amonum of Diofcorides. See Dr. James's Dict. article AMOMUM.

Many confound the amomum with great cardamom. is a native of China. In Armenia the amomis is fubitifuted for the anomum. The college of Edinburgh fupply the place of the anomum verum with the caryoph aromat. The college of London have rejected it.

The amonum vulgare is also called fifon, finon, finnon, amomum Germanicum, fium aromaticum, petrofelinum Macedon. Fuchfii, and BASTARD STONE-PARSLEY. The

amomum, Linn.

It is a perennial plant, grows wild under moift hedges and by the fides of ditches: it flowers in July, and its feeds, which are the only part used in medicine, are ripe in August; they have a light agreeable smell, and a warm aromatic tafte, are effected as carminative and diuretic; they are not so hot and pungent as, by the best accounts, the true amonum seeds are, nor is their slavour of the

may be given, as to quantity and time, in the same manner.

Preparations of this drug are, the ammonia prepared.

It may be purified by sublimation, or perhaps more persectly as follows: dissolved in pure water, then filter

AMOR, Love. Though it is not a difeafe, it is productive thereof.

The symptoms produced by this passion are as follow; the eye-lids often twinkle, the eyes are hollow and yet appear as if full with pleafure; the pulse is not peculiar to the passion, but the same with that which attends solicitude and care: when the object of this affection is thought of, particularly if the idea is fudden, the fpirits are con-

fused, the pulse changes, and its force and time are very variable; in some instances the person is sad and watchful; in others, the person not being conscious of his state, pines away, is slothful, and regardless of food; though the wifer, when they find themfelves in love, feek plea-fant company and active entertainments.

As the force of love prevails, fights grow deeper, a tremor affects the heart and pulse, the countenance is alternately pale and red, the voice is suppressed in the fauces, the eyes grow dim, cold fweats break out, fleep absents itself, at least until the morning, the fecretions become diffurbed, and a lofs of appetite, a hectic fever, melancholy, or perhaps madnefs, if not death, conflitute the fad castrophe.

On this subject the curious may consult Æginet. lib. Ni. cap. 17. Oribaf. Synop. lib. vii. cap. 9. or a treatife profesfedly written on love, as it is a diftemper, by James

Ferrard, Oxford, printed 1640.

AMORIS POMA, also called lycoperficon, folanum pomiferum, mala aurea, LOVE APPLE. Solanum lycoperficum, Linn.

It is the fruit of a species of solanum, about the fize of a cherry, green at the first, and when full ripe is of a yellowith red colour: it contains many flat whitish feeds in a juicy pulp, which being fown in gardens, the plant flowers in July, and the fruit ripens in September.

Their quality is cooling. In Italy they are eaten with

oil and vinegar.

See Miller Bot. Off.

AMORGE. The faces of oil. See AMURCA. AMOSTEUS. See OSTEOCOLLA.

AMOTES. POTATOES, SPANISH. See BATTATAS HYSPANICA.

AMPAR, i. c. Amber. See Ambra. AMPELION. Vine-leaves, of the tendrils of VINES. Hippocrates commends them for making into pellaries to promote the menles.

AMPELITIS. CANAL COAL. Named also terra amprlites, lapis ampelites, pharmacitis, lap. obfidants, carbos. Diofcorides gives us a character of the canal coal, that

it will diffolve if oil is poured on it; but in that it differs from ours.

A species of it is found in France, with which they blacken the hair of people's heads, and call it Pierre

This species of coal is a bituminous earth, is black as jet, and fo hard that it takes a good polish, and is made into boxes, basons, and various other utensils. It contains much fulphur and falt, is divided into fcales, and is eafily powdered; when old, that is when long kept after taking it out of the mines, it falls into powder, and then it gives out a quantity of falt-petre.

It burns more bright than any other kind of coal; pow-

dered and strewed upon vine trees it destroys the worms that injure them; it is rarely used in medicine, but is commended as being more drying than terra Samia, or than many of the earths that have obtained in medicine. AMPELOCARPUS. See APARINE. AMPELOPRASON. 7 Species of garlick called

AMPELOPRASON. Species of garlick called AMPELOPRASSUM.

AMPELOS. BRIONY.

AMPHARISTEROS. It is the reverse of ambidexter, that is, a not having a proper use of either hand. Figuratively it fignifies unlucky or unfortunate.

AMPHEMERINOS, AMPHEMERINA. Iris the continued fever of Linnæus and Vogel, though others rank itas a remittent in common, from apps, a Greek prepofition, fignifying a revolution, and queça, a days a quotidian intermittent. See FEBRIS QUOTIDIANA.

AMPHIAR THROSIS. A mixed fort of articulation, partaking of the diarthrofis and the fynarthrofis; it refem-bles the the first in being moveable, and the latter in its connection. The pieces which compose it have not a particular cartilage belonging to each of them, as in the diarthrosis, but they are both united to a common cartilage, which being more or less pliable, allows them certain degrees of flexibility, though they cannot flide upon each other; such is the connection of the first rib with the sternum, and of the bodies of the vertebræ with each other.

AMPHIBIUS, AMPHIBIOUS, of auge and Bra, life. Animals are thus called that live either on the land or in the water. Dr. Hunter observes, that properly speaking, there are no amphibious animals, for fifth cannot live long without air, though much longer than men. The amphibia, according to Linnaus, are a class of animals, whose heart is furnished with one ventricle and one auricle, in which, respiration is in a considerable degree voluntai

AMPHIBLESTROIDES, from augichnopes, a net; the RETINA, OF NET-LIKE COAT OF THE EYE; also the fame

as RETIFORMIS, which fee, and VERICULARIS TUNICA.

AMPHIBRANCHIA, from αμφ., about, and βραγχια, the gills of a fifth, fome fay βραγχια, the fauces, and fome fay the jaws. The fauces or parts about the tonfils.

AMPHICAUSTIS. A fort of wild barley. Some,

but not medical writers, use this word to express the pudend. muliebr.

AMPHIDEON, or AMPHIDEUM. The os tinear, or

mouth of the womb.

AMPHIDEXIOS, i. e. AMBIDEXTER, which fee.

AMPHIDIARTHROSIS. So Winflow calls the articulation of the lower jaw, which is partly by a ginglymus, and partly by anarthrodia

AMPHIMERINA HUNGARICA. See Morbus HUNGARICUS .- For that called - CATARRHALIS, See CATARRHALIS AMPHEMERINA .- TUSSICULOSA, i. c. Catarrh from cold, also the hooping cough. - Angi-NOSA. A fymptomatic kind of quinfey, called by Huxham, febris anginofa, by others the mucous quinfey, and the cryfipelatous quinfey. See SCARLATINA ANGINOSA. AMPHIMETRION, from αμφι, αδομί, and μπτρα,

the womb, the parts about the womb

AMPHIPLEX. According to Rufus Ephefius it is the part fituated betwixt the fevotum, anus, and internal part of the thighs.

AMPHIPNEUMA, from αμφι, about or around, and ανωμα, breath. A difficulty of breathing.

AMPHISBÆNA, from αμφι, either way, and βασω, to go. Galen fays, it is an animal with two heads. Actius describes it as a venemous serpent, which moves with either end forward, from which circumstance it hath its name: it is not shaped with a thick body tapering into a slender tail, but it is of an equal thickness through its whole length. Lemery says, its colour is of a shining white, with reddish spots, and that its cheeks are so large that they consed its pass, and that its cheeks are so large that they conceal its eyes, and from this circumstance it is said to be blind. It is found in some of the Grecian isses, and in different parts of Africa. Another species was lately met him North America. Actius says the bite is much like the fling of a bee, as to its-effects, though fomewhat more violent, but it is cured much in the fame

AMPHISMILA, from augs, on each fide, and outer, an incifion knife. A diffecting knife with an edge on each

AMPHITANE. See CHRYSOCOLLA BORAX.

AMPHODONTA, from augi, on both fides, and of se, a tooth. By this word Hippocrates expresseth animals that have teeth in both jaws.

AMPHORA. A Roman measure for liquids, from αμφισρισε, by a fyncope αμφορευς, it is fo called from the two handles for carriage. Its contents are feven gallons

and one pint English.

AMPOTIS. The RECESS OF EBB OF THE TIDE. Hippocrates used this word to express the recess of the humours from the circumference to the centre of the body.

AMPULLASCENS. The alvus ampullascens is the

most tumid parts of Pecquet's duct.

AMPUTARE VIRES. To render a person weak.

AMPUTARE Nervos. To take away the strength.

AMPUTATIO, AMPUTATION. It is the cutting off

AMPOTATION. AMPOTATION. It is the cutting on a limb. From amputo, to cut off.

Hippocrates fays, when speaking of a mortification, that what is putrified must be cut off, but does not mention the taking off of limbs. Celfus is the first who deferibes this operation. Till the fixteenth ocntury, we have no account of any method to prevent the hamorrhage, which happens in this fort of operation, except Celfus. which happens in this fort of operation, except Celfus's, of making a ligature about the veffels. Pare tells us, that previous to making the incifion, a ligature, with a thin fillet, must be made above where the amputation is to be performed, which he fays, first, keeps up the skin and muscles in a raised posture; secondly, prevents an hæmor-rhage; and, thirdly, lessens the sense of seeling: he is the first who clearly speaks of preventing the hamorrhage amputation is necessary, when these operations are performed. In 1674, Mr. SPINA VENTOSA, &c. Morel, a French furgeon, introduced the tourniquet, as it is now used; but the first mention of this instrument, is in the Currus Triumphalis è Terebintho, published in London by an English surgeon in 1679. About the end of the sixteenth century, Messrs. Verduin and Sabourin, one a Dutchman, the other of Geneva, lest a label of the flesh and skin to wrap over the stump, and called it l'o-peration de l'amputation à lambeau; but they probably learnt it from an Englishman, who published this practice in 1679; see Currus Triumphalis è Terebintho. Paulus Ægineta used the actual cautery, but Ambrose Pare se-cured the vessels by drawing them a little out with the forceps, then making a ligature round them, as is often mentioned by Celius, though neglected by so many of his successfors. In the present eighteenth century, improvements are both many and important, in this branch of surgery, the crooked needle, and most other parts of the nefs. apparatus, &c. either being now introduced or improved.

### Cases requiring the Limb to be taken off.

After all that can be laid down on this particular, in many inflances the experience and fagacity of the attending furgeon alone, can properly determine for or against an operation. Mr. Bilguer, an eminent practitioner in the armies of the king of Prussia, during his late wars, reduces them to fix, as follows:

1. A mortification, which spreads until it reaches the

bone.

2. A limb to hurt, that a mortification is highly probable.

3. A violent contusion of the flesh, which at the same

time hath fhattered the bones.
4. Wounds of the larger blood-veffels of the limb when recourse is had to amputation, as the only method of stopping the hamorrhage; or through an apprehension that the limbs should perish for want of nourishment.

5. An incurable caries of the bones.

6. A cancer, or humour in danger of becoming fuch. Perhaps Mr. Bilguer may have restrained this operation rather too much: however, his humanity is manifest herein, and his ingenuity is such as renders his instruc-

tions deserving of attention.

In cases from mortification, Mr. Sharp hath well established the propriety of waiting until it ceases, and granu-lations of new sless before a better state of the blood. He observes that gun-shot wounds are best, if the necesfary amputation is immediately performed; and that the diforders of the joints, ulcers of long standing, and all ferophulous tumors, generally return on other parts, after amputation.

the man who, amidft the following demands for ampu- of the flump very much depends.

AMPULLA. A veffel shaped with a belly, as a bot-| tation, singles out a case in which he will succeed, and tle or jug. In chemistry all bellied vessels are called am- fave the threatened part. In general, then, amputation is neceffary

I. In some compound fractures. See FRACTURA.

when amputation is necessary in them.

2. A wound in the principal artery of a limb: also in fome aneurifms; a large wound with lofs of fubstance from arteries not contained within the cavity of the body, as those of the thigh, leg, or arm, they are often so cir-cumstanced as to render amputation the only possible means of saving the patient's life. It is true, every instance of a wounded humeral or crural aftery, does not demand this operation; but if the wound is such, as that the col-lateral branches in their neighbourhoodare prevented from carrying on the circulation, a speedy amputation will be necessary. See Arteria, Femoralis Arteria, Popultea Arteria, Tibialis Arteria, Humeralis ARTERIA, &c.

3. When joints are wounded, violently injured, or otherways difeafed. When the heads of bones are difeafed, their ligaments lacerated, &c. in most instances amputation is necessary. See VULNUS, SCLOPETOPLAGA,

4. A caries of the whole fubftance of a bone, or of the bones which compose a limb. See CARIES.

5. Some Mortifications. See MORTIFICATIO.
6. Many inflances of gunfhot wounds. See SCLOPE-

TOPLAGA.

7. Cancers. See CANCER.

Large bones should not be amputated in the joint, on account of the extreme thinness of the fielh in those parts, which cannot eafily be brought to cover the bone, and heal over it, whence a caries may arife, and other incon-veniencies; but if there is a probability of making the fkin grow over the bone, the operation might be performed here as well as in the fingers and toes.

If the strength of the patient is thought sufficient for him to undergo an amputation, and his cafe is fuch as is thought to require it, the following should be in readi-

1. A tourniquet.

2. A smooth fillet, an inch broad and half an ell long.

3. The amputating knife.

4. A catlin.

5. A faw.
6. A forceps.
7. Crooked needles armed with wax thread.

7. Crooked needles armed with was silved. 8. Lint and tow, made into compresses ready for use. Calomel mixed with starch, and strewed on a pledgit of lint, is perhaps the best application to the stump of an amputated limb.

9. A retractor. 10. A roller of five ells in length.

11. Pledgits of spunge.

12. Cordials, as wine, &c. to raife the patient's spirits. 73. Attendants appointed to their proper offices. A general idea of the procedure, will be best obtained

by a perufal of the directions given below for the amputation of the particular parts; to them, therefore, the reader is referred, and to fuch authors also as opportunity may favour his attending to.

### AMPUTATION of the ARM.

In most amputations, the operation should be a finger's breadth, or more, above the sphacelated, or otherwise injured part.

Apply the tourniquet so, as that it may press upon the chief artery of the limb to be taken off. When the arm is

the part to amputated, and not the fore arm, it is advised by some, for an affistant to press on the artery as it

passes over the first rib.

Then let an affiftant draw the fkin back, while the operator binds the fillet round where the incision is to be On this important fubject, Mr. Pott observes, that in made. This fillet both guards the knife, and keeps the the instances generally demanding amputation, if the rule fiesh tight, so that it more easily yields to the knife; or is adhered to, a limb will now and then be taken off that possibly might have been restored; but the number of of plaster may be preserved to the fillet for directing the those who would be so lucky, is so small in proportion knife; this slip of plaster may be applied double, that is to those who under the same apparent circumstances two thicknesses may be laid, the one upon the other; and would end fatally, that it can make no difference in the if another slip is placed about three-fourths of an inch general treatment. Selections of one case from another higher, its effect will greatly assist those of the lower. On its what constitutes judgment in surgery; and happy is the exact cutting the skin, muscles, &c. the speedy cure the man who, amidst the following demands for emerce of the sturm very much depends. and cheer him.

Two affiftants holding the limb in a strait line, an incifion must be made quite round through the skin and fat to the flesh; this done, first take away the fillet or slips of plaster, then the assistant, who holds the upper part of the limb, must draw the skin as far back as he can; after which, as near the edge of the retracted fkin as possible, the fleth must be divided, at twice, to the bone: and if there are two bones, divide the flesh between them with the point of the same knife, then, that the bone may be fawed off as near to the fieth as possible, observe as follows: it is necessary to cut the skin, &c. to the muscles first, that you may draw it back and cut the slesh as far under the skin as possible, in order to having the skin to reach over the slesh and the bone of the stump as soon as it is dreffed up: if the incition was made at first to the bone, then the fkin would not contribute to the covering of the stump. Again, to assist this intention of bringing the skin over the end of the stump, the retractor is contrived, which must be put on after the incision is made through the muscles, to draw them up with, as forcibly as the patient can eafily bear: thus the bone can be fawed off more closely to the edge of the flesh, and with less danger of tearing it with the teeth of the faw. When there are two bones, as in the fore-arm, after having cut through the muscles, and divided the inter-offeous ligament, fome recommend, instead of the retractor, to pass a compress between the bones, and therewith to draw back the divided parts until the bones are sawed through.

Where there are two bones, apply the faw in fuch a manner that both may drop together, to prevent making fplinters, and also to avoid the painful jar which the pa-tients feels when this is neglected. While the saw is working, the affiltant who holds the lower part of the limb should gently depress it, that the saw may have room to pass; and the operator should make his strokes with it as long as possible.

The limb taken off, if the larger arteries are not eafily feen, the tourniquet may be flacked, and by the blood fpinning out, they will be discovered; then with the curved needles fecure them, as directed in wounds of the arteries: when the tenaculum can be used for drawing out the artery, it will always be the best method; and having so done, tie the end of the artery with a narrow flat tape. If an offified artery is cut through, a cautery, either actual or potential, must be applied. In the fore-arm compresses generally suffice for checking the hæmor-

rhage.

The arteries fecured, bring the skin over the end of the bone as far as possible, then apply a pledgit of fost lint, and over it another of soft tow, or more if required; over thefe lay a pledgit of tow spread with the common cerate, and then with two long flips of flicking plafter placed across each other, confine the whole by fixing the ends of these slips along the sides of the stump; after this finish of thele flips along the bues of the runnp; after this hand-the drefling, by turning a worfted night cap over the whole. It is properly observed by some surgeons, that dry lint, as an extraneous body, in which light it should be considered, and as which it always acts, when clotted with blood, occasions pain, swelling, and inflammation, therefore should be laid aside, and in its place a large quantity of flour flould be firewed over the whole flump; this forms a natural cataplasm with the blood, serum, &c. over this, apply dry lint, or what other dreffings you like, which may all be removed the next day, if on any account needful, and this without pain to the patient or trouble to his affiftants.

The cultom of finishing by a roller from below upward, or indeed any way applied, is now omitted by the ableft furgeons, as by its compress it causes inflammation, pain,

and fanies, initead of a well digefted matter.

In the 2d vol. of the London Med. Obf. and Inq. Mr. Kirkland proposes the use of spunge for a part of the dresling, as soon as digestion is begun in the stump, after an amputation. He observes, that the greatest danger after this operation is from an absorption of the matter from the wound after the inflammation is gone oil, particularly if the digeftion proceeds not very kindly; and to prevent this inconvenience, as foon as the ftate of digeftion is well advanced, he directs a thin layer of fine lint the force of the artery, lay a boliter in the arm-pit, to to be applied to the stump, and, immediately upon that, press upon it; secure the whole with the bandage called some thin pieces of fine spunge, which have just then the spica descendens.

Having proceeded thus far, give the patient a cordial, been made wet, but are squeezed as dry as can be by the dicher him. The thinner matter of the dicharge from the wound being absorbed by the spunge, the sever, diarrhora, and other symptoms which it occasions when taken up into the circulation, are prevented; and where from the thinnels and acrimony of the discharge, spunge pledgits are necessary, he orders antiscptic diareties to be administered internally, and if needful the bark.

The dreffing finished, the best position for the patient

is the bed.

An affiftant flould gently and constantly hold his hand on the frump during fome hours, not only to guard against an hamorrhage, but also by the gentle prefiure to make the dreffings adhere more firmly.

The tourniquet may be gradually raifed to admit the circulation of the part more freely, and if no danger feems

to threaten, it may be removed the next day.

From plethoric habits, as foon as the patient is in bed,

On the third or fourth day, remove the dreffings, and proceed as in a common wound. If any part of the lint, &c. adheres, leave it to digett away with future applica-

The amputation of the arm, and of the form-arm, are the fame, except that in the fore-arm the brachial artery dividing into branches, fometimes demands the use of the needle, more than when the operation is in the arm. In general, when the arm is amputated above the elbow, the fame procedure will be necessary as is directed for the amputation of the thigh just above the knee.

See Bell's Surgery, vi. 425. White's Surgery 200,

201, 202.

The AMPUTATION of the ARM at its Joint with the Scapula.

Mr. Morand, the elder, first took off the arm at the shoulder. Mr. Bromfield performed it with success in London. Dr. Home, in his Medical Facts and Experiments, fays it is a dangerous operation, though attended with all possible advantages. Here the tourniquet cannot be applied. But Dr. Hunter observes that, when we confider the fituation of the blood-veffels as they pass over the first rib to the arm, it evidently appears, that by turning the shoulder outwards, and making a proper pressure with compresses and bandage, we might absolutely make our-selves masters of the blood in amputating the humerus, at its articulation with the fcapula, which is the most

intimidating circumstance in the operation.

The patient's arm being held horizontally, make an incifion through to the fleth, from the upper part of the shoulder, across the pectoral muscles, down to the aranpit; and, to fave as much skin as you can, begin it about two inches below the joint, then turning the knife with its edge upwards, divide that mufcle, and part of the deltoid, and thus the great artery and vein are expoled, and which should immediately be secured by ligatures, at least two fingers breadth below the axilla, in order to which carry the arm a little backward; then divide these vessels at a considerable distance below the ligatures, and purfue the circular incision through the joint, cutting first into that part of the bursal ligament which is nearest to the axilla; for if you attempt to make way into the joint on the upper part of the shoulder, the projection of the processus acromion, and processus coracoides, will very much embarrafs the operation: in the next place difcover the true fituation of the acromion, which having done, draw back the fkin, and in dividing the flesh introduce the knife two orthree fingers breadth under the acromion, for thus, much of the deltoid muscle is saved, which will fill up the wound, and expedite its healing. These parts cut through, raise the arm, that the head of the biceps muscle may be more casily found and divided; divide the ligament on the upper part, then on the fides, after which, the head being lifted out of the focket, cut away all that detains it, taking care not to divide the artery, &c. above the ligatures. The remaining flesh at the arm-pit should be nearly of a triangular figure, the broad part being next to the axilla. Apply the remaining slesh immediately to the socket of the scapula, and lay over them dry lint and pledgits, which may be fecured by a plaster of the shape of a Maltese cross. To prevent

To prevent the amputation of the arm at its joint with faw. Hold the faw very fleady, and make long strokes the feapula, the following hath been practifed in tome in-flances. The head of the humerus, with its adjoining part, to about four inches in length, is to be taken away. In the inflances of this kind, the patient hath enjoyed all the under-hand motions of the arm.

See Bell's Surgery, vol. vi. p. 417.

AMPUTATION of the BREAST.

In this case women only are the subjects. The patient being placed on a high chair, hold her arm horizontally backward, and a very little downward; thus the pectoral mufcle is more readily expanded, and the difordered part more easily separated from it; then make a circular incition through the teguments, and diffect the morbid part out. This done, if itrength admits, take away blood. The compress and bandage are generally sufficient to prevent hæmorrhages, the needle being feldom required; yet fometimes the branches of the mammary arteries which come out between the cartilages of the ribs into the breafts, will create fome trouble, especially one larger than the rest from towards the arm-pits, near the edge of the pectoral muscle, which is commonly more trouble-fome to stitch than the rest. Now proceed as in wounds

in general.

If in the course of the cure a sever comes on, with pains about the præcordia, and a difficulty of breathing, death is the consequence. Be careful by proper and timely bleeding to prevent these symptoms. See Bell's Surgery, vol. ii. 434-

AMPUTATION of the FINGERS and TOES.

Sometimes a finger or toe that is nearly cut through with a fharp instrument, if clapped too again whilst it is warm, will unite, at least it is better to give such cases the trial than to cut them away at the first. When cut obliquely, their reunion may be more certainly expected, than when transversely.

The fingers and toes are best amputated in their articulations; a streight knife must be used, and the incision of the skin should be made not exactly upon the joint, but a little towards the extremity of the finger or toe, that more of it may be preferred for the easier healing of it afterwards; it will also facilitate the separation of the joint, when the finger is cut from the metacarpal bone, to make two fmall longitudinal incitions on each fide of it first. When the lower joints are feparated, the first incisions should be from a little above to a little below the joint on each fide, and so deep as to divide the ligaments; and after this proceed as above. The skin grows over the cartilage very readily. If the cartilage is removed by the knife point, or any accident happening to the part, the fkin heals better, and unites fpeedily to the bone, but this is not necessary. If the patient is plethoric, let the blood run from the amputated joint, and no hamorrhage will happen thereafter. It is never necessary to take up an artery here.

In case of supernumerary fingers or toes, if troublesome, cut them off: fometimes there is no bone where they are to be cut off, in this case a knife may be used; but if there is any bone, a ftrong pair of feiffars may be used, for in infants these bones are not hard.

See Bell's Surgery, vol. yi. p. 411. White's Surgery,

AMPUTATION of the HAND.

Heister thinks it best to amputate the hand, with a knife only, at the joint of the wrift; but the usual method is to cut through the bones above the wrift, in which case, fee Amputation of the arm.

AMPUTATION of the METACARPAL and METATARSAL BONES.

If any one of these bones is carious, it may be advis-able to cut away only so much as is difordered; a small spring-saw is the most proper to divide the bones with here. After these operations, the parts heal soon, and a part of a hand or soot is better than to lose the whole.

In these cases carry your knife first along the side of the bone that is to be removed, and as close to it as you can, at the same time making the wound as smooth as possible. If one of the middle bones is to be removed, we must of course make two incisions, one on each fide; having done this, divide the integuments, &c. from the bone above and below transversely, then scrape off the periosteum, and faw through the bone with the saw called the metacarpal quently retract, and leave the bone sticking out, this

when using it. If two bones are to be removed, we should proceed as above in general, also remember to divide the integuments, &c. transversely between the two bones as is done between the tibia and fibula, or between the radius and ulna in amputations of those parts. As in amputations of the fingers and toes, fo in this case, the tourniquet is not required.

White's Surgery, 300.

AMPUTATION of the LEG.

If the leg is to be amputated, though the injury is ever fo near the ankie, as a long flump is thought more in-convenient than a short one, it is preferred to amputate it at about four or five singers breadth below the tuberofity of the tioia; if it is cut higher, the aponeurotic ex-pantion of the flexor muscle will be hurt, besides the itump would be too short for an easy support on the wooden leg; and an artery which runs into the thickness of the tibia to be diffributed to the marrow, would be unnecessarily wounded.

As the gastroenemei muscles draw back the skin more ftrongly than it is drawn elfewhere, it is proper, in order to keep the ikin equal after the operation, to cut so that the wound on the calf of the leg is farther from the mid-dle of the ham, than the wound in the fore part is from

the middle of the patelia.

In amputating the upper limb and the breaft, a chair is the propereft to place the patient on; but for the lower limbs, a table about two feet and a half high is to be pre-

ferred.

The tourniquet must be placed three or four inches above the patella, and fo as to prefs more particularly on the artery in the ham. The flips of plafter directed in the amputation for guiding the knife, must be placed four or five fingers breadth below the patella; and the operator must stand on the inside of the leg, because the sibula will then be sawed at the same time with the tibia: but if on the contrary the faw is laid on the infide of the leg, the tibia will be first divided, and the sibula, being too weak to bear the force of the saw, will be apt to splinter, so not only render the operation tedious, but also the cure more difficult afterwards.

Though the practice of making a fhort flump hath for generally obtained, Mr. White, the furgeon of Manchefter infirmary, prefers amputating betwixt the calf of the leg and the ankle, in cases that will admit of faving so much of the leg; he gives instances of his practice this way, and affures us, that the motion of the long itump is more eafy

than that of the short one.

After the separation of the limb, the dreffing, and general treatment, will be the same as in amputation of the

See Medical Obf. and Inq. iv. 168. Bell's Surgery, vi. 374. White's Surgery, 204.

AMPUTATION of the PENIS.

If a cancer, or a sphacelus, in consequence of a scirrhous gland, should appear in the penis, then every part to which the contagion hath reached is speedily to be extirpated, left the taint diffuse itself farther.

Some cut off the penis with a knife; fee Le Dran's Operations: but the following method is to be preferred.

Pass a small tube of lead, or of filver, into the urethra, a little farther than the affected part; then with a filken thread make a ligature upon the found part, near to that which is difeafed; make this ligature tighter every day until that which is faulty falls off. See Bell's Surgery,

AMPUTATION of the THIGH.

In this operation on the lower part of the thigh, the first incision is to be made a little more than two inches above the patella.

The tourniquet must press upon the crural artery, on the upper and inner part of the thigh, where the head of the vaftus internus mufcle and the triceps meet.

In amputating above the knee, we are advifed to cut down to the bone at once; but as there is a great thicknefs of the fkin, &c. it is almost impossible. However, in cutting, we should remember that the stump should be of a conical form. In this case it is of no consequence on which fide of the bone you ftand for operating.

ence, which hath occasioned the contrivance of a new mode of amputating by Mr. Allanfon, of Liverpoole, which is as follows: he first makes an incision through the skin, then diffects a fufficient quantity of it from the mufcles to cover the flump; this done he divides the mufcles down to the bone, where he finishes the diffection, and then faws through the bone at the same place, in the usual manner. He afterwards takes up the veffels with the tenacu-lum, brings the fkin over the ftump, leaves the ligature hanging out at the external orifice, and applies no kind of dreflings except fomething to cover it fuperficially.

After the operation, the roller that is to keep down the fkin, fhould go down the waift, and defeend down the thigh to the itump: thus abfeefies are prevented, which otherwise would form themselves on the upper part of the thigh. It has been recommended in amputations of this limb, to diffect away the cellular fubstance, as this has been thought to produce all the suppuration and discharge: it hath been tried, indeed, and with seeming success; but others omit this part of the operation, and think the cellular membrane is a convenient cuthion for the stump to

Another circumftance deferving attention is, after the operation, to prefs the crural artery the whole length of

the thigh by a long bolfter.

If the operation is made on the upper part of the thigh the danger is very great; the discharge from the wound when it digefts being fo copious, that the patient's ftrength is foon gone, and death is a fpeedy confequence. If a cafe is fo circumstanced as to render amputation in the upper part of the thigh necessary, it would be best to be performed in the articulation, for then the crural artery would be better fecured, and many other inconveniences avoided, which attend in the usual method; but in the most def-perate circumstances, taking off the thigh at the articula-tion is not yet encouraged. Bell's Surgery, vol. vi. 338.

AMULETA. AMULETS.

Amulets and charms are fo nearly allied, as to be con-

fidered in the fame light.

Before the days of Mofes, idolatry had diffused its baleful influence over the minds of most men, so doubtless magic, and the ridiculous attempt to cure difeafes by those means, had a date nearly as ancient. The dispute lays betwixt kings and priefts, as to which gave rise to follies of these kinds; it seems clearly owing to their defigns and arts that they had their origin, to them therefore we may leave the decision concerning it.

Three things occur to most men of favouring amulets:

the 1st, the palate is not offended; the 2d, the price is fmall; the 3d, superstition is indulged.

The words usually spoken when anulets were used, are called by the Greeks ESAOIAAI; by the Latins INCAN-TAMENTA, OT CARMINA; by the English INCHANTMENTS and CHARMS, being a fort of fong pronounced over any one, for the words were either in verse, or spoken in the manner of a fong.

Sometimes words were written and carried by the patient on some part of his body, or in some of his garments. These the Latins called anuleta, probably from amovere, to remove, or take away. They also called them

Rever happens in the arm, but it may be remedied, by PROEBIA, or PROEBIA, from probibere, to guard or defend. placing the patient on his fide, and keeping the muscles in as relaxed a state as possible. The method of amputating with first partial partial and ALEXIPHARMACA, because they with sale and the state of the probability of the only against such diseases as proceed from natural causes, but also against the power of other inchantments.

These amulets were formed of any materials which fancy

fuggefted.

Serenus Samonicus invented the ABRACADARA for the cure of the fever called hemitritæa. The Jews attributed the fame virtue to the word ARACALAN. The Arabians had much ceremony, and also care, to see if the stars favoured them, and call it TALISMAN, i. e. IMAGE.

Amulets were tied about people, so called PERIAPTA, and PERIAMMATA, from a Greek word, signifying to tie about. The royal touch to cure the king's evil! Whether hath folly in the patient, or villany in the impostors, the greatest

thare here?

Charms feem to have been artfully introduced, to impofe a belief in those not in the secret, that those who were exercifing them were in particular favour with fome fuperior being. This gave the people a venerable idea of the practitioner, and so the vulgar were more easily prevailed on to fubmit implicitiy to them; and as the mind affects the body, so in some cases the persuasion of the patient might contribute to a cure.

AMULETUM. See PERIAPTA.

AMURCA. AMORGE: fome take Bysma to be the fame. It is the fediment from olive oil, found after the new pressed oil hath deposited it gross contents.

AMVETTI, or VETTI TALL. Is the name of an In-

dian tree to which no medical virtues are attributed.

AMYCHE. A fuperficial exulceration, laceration, or fearification of the ikin; from ourses, to feratch.

AMYCTICA. STIMULATING, VELLICATING.
AMYGDALÆ. ALMONDS. The fruit of the AMYGDALUS, ALMOND TREE. Also the glands called Tonsil-LA, which fee .- AMARA. BITTER ALMONDS. -DULCES. Called also amygdalar fative, SWEET ALMONDS.
The leaves and flowers of the almond tree refemble those

of the peach tree. It is a native of Africa, cultivated in the fouthern parts of Europe, and even in England it produces fruit very little inferior to that from abroad; it flowers earlier in the fpring than most other trees, though

its fruit is not quite ripe until autumn.

Of the fruit we have two forts, the sweet and the bitter; the eye diftinguishes no difference betwixt the trees, nor between the kernels themselves. It is said that by altering the foil the bitter brings forth fweet, and the fweet brings forth bitter almonds. The almonds from Barbary, where forth bitter almonds. The almonds from Barbary, where the tree is indigenous, are bitter, while those cultivated in Europe are sweet. Linneus describes the two trees as only varieties, as follows: amygdalus communis; or, amygdalus foliis ferraturis infimis glandulofis, floribus fessilibus geminis. Vat. 2. Bitter almond. Amygdalus communis, or amygdalus foliis, &c. Var. B. Sweet almond.

The bitter almonds agree with the fweet in yielding the fame quantity of oil, not to be diftinguished from that of the fweet fort, and in all cases to be used for the same purposes; the matter remaining after the expression of the oil retains all the bitter, and tastes stronger than it did at the first. Most of the bitter matter disloves with a little heat in water and in spirit of wine, and a part arises with both in diffilling; but spirit seems to extract the most, and water to elevate the greatest quantity. A simple water is distilled from them after the oil is pressed out, which is substituted for and possesseth the same qualities in the same degrees as that drawn from cherry-flones; it is made as follows:

R Amygd. amar. post express. olei fb vi. spt. vini ten. cong. ii. elic. cong. ii.
R Hujus sp. 3 iv. aq. sont. 3 xii. m. et aq. cerasor.

nigr. vocata.

It is more than probable that the noxious matter is that in which the bitter relides, and that the activity of it is increafed by its separation from the gross oil and farinace-ous substance. The kernels of other fruits that have any bitterness or particular flavour appear to have the poison-ous principle of the bitter almo di. See a small publica-tion entitled, Experiments on Almond and Black-Cherry waters.

The diffilled oil of almonds is very poisonous; bitter

almends are commended as being deftructive of worms, if four or five, or more, according as the flomach will bear them, are taken in a morning fasting: they are diu-retic, but not fase; they occasion fickness and vomiting; to dogs, foxes, fowls, storks, horses, especially while very young, to pigeons, cats, and fome other animals, they are

The fweet kind, of which those called Jordan almonds are the best, should be chosen free from rancidness, and, if in the shells, free from all appearance of being affected by infects, a species of which penetrates them, and eats away the kernel. They difficultly digeft in our ftomachs, and afford very little nourishment, unless extremely well comminuted. As a medicine they obtund acrimony in the primæ viæ, are foftening and relaxants. They are a good intermedium for uniting with water feveral fubstances which of themselves are not miscible with it: camphor and many refinous fubstances, triturated with fix times their quantity of almonds, easily dissolve into a milky liquor. Six or eight sweet almonds peeled sometimes cure the heart-burn.

Sweet almonds are usually blanched, i. e. freed from their skin, by steeping them in hot water until it easily flips off; then triturated with water their oil unites therewith, by the mutation of their mucilaginous and farinaceous matter, into an emulsion or milky liquor.

ed, it is called the ARABIC EMULSION.

If half an ounce of chalk be added, it is named the AB-SORBENT EMULSION.

If half a dram of camphor be added, it is called the CAMPHORATED EMULSION.

The emulsions partake of the quality of the oil, and are preferibed in the fame intentions, particularly heat of urine and the strangury, whether arising from spontaneous acrimony or from irritating food or medicines.

When these emulsions have stood a while, they throw up a cream to the furface, and the whey beneath turns four. Acids joined to them forms curd and whey, just

as they do in milk-

These milky solutions of almonds in water, though containing the oil, and owing all the virtue to it, yet have this advantage, viz. that they may be given in acute and inflammatory fevers, without danger of the ill effects which the oil may produce, fince emulions do not become rancid, or acrid by heat, as all the oils of this kind foon do; and in most cases the acescency is rather an advan-

tage in the emultion.

The expressed oil of almonds is obtained from the sweet or the bitter forts equally, no difference can be discovered in their oils by any known method of trial; the oil of bitter almonds was called metopium, because the Egyptians used to make an oil in which bitter almonds and gal-banum were ingredients; they named their compound oil metopium, from the plant fo called, from which the galbanum is produced, and others give the fame name to the fimple expressed oil of this fruit. See METOPIUM.

By bruifing, then prefling the almonds, they afford nearly one half of their weight in oil: by boiling almonds in water, part of their oil feparates and is collected on the furface; but that obtained by preffure without heat

is the most agreeable.

As a medicine, this oil is useful when a tickling cough, hoarfeness, costiveness, or nephritic pains affect the pa-tient; though in infants, to whom it is given as a laxa-

tive, it generally provesbinding, by diminishing the strength of their bowels. Draughts of manna and oil of almonds, at the fame time using the common emulsion as common drink, are of fingular fervice in the gravel and in dyfuries. Some women who have hard labours, experience much benefit by taking repeated dofes of this oil for feveral days before the time of delivery: the tenefmus to which fome pregnant women are fubject, and which endangers abortion, is most speedily relieved by clysters of it, with a few drops of laudanum.

AMYGDALATUM. The emulsion of almonds. AMYGDALIA. So Hippocrates de Morbis, lib. ii. calls the tonfille.

AMYGDALIS SIMILIS. GUATIMALENSIS. See

AMYGDALOIDES, also Cometer. Thus Oribasius calls the species of tithymalus, which is named tithym. masticus.

It is a name for the white species of the gum benzoin. And in natural history, to a stone which resembles the kernel of an almond in figure. It is no natural fossil, but the petrified spine of the echinus marinus, or seaurchin, of the nature of the lapis judaicus, but wanting the pedicle and stalk of that spine. It is also a name for

the gebius or GUDGEON.

AMYGDALOPERSICUM. The ALMOND PEACH.

The frui AMYGDALUS. The ALMOND-TREE. The fruit only is used, of which there are two forts.

AMYLA. Any fort of chemical fæcula.

AMYLEON. AMYLION. AMYLUM. From a, neg. and pape, a mill, because it is made of corn without a mill, or without grinding. It is the facula of wheat, and with us called STARCH: named also

It is the purest farina of the wheat, but deprived of its falt and oil. It is made from all kinds of wheat, from po-tatoes, &c. It was invented in the ifle of Chios, and is valued by its lightness, newness, and smoothness.

The method of making starch.

Put the best wheat into water to ferment in the sun in fummer, change the water twice a day, for eight or twelve days, in which time the grain easily bursts, and is then also sufficiently fermented; now put it, by little and little, in a canvas bag, to separate the flour from the husk, by rubbing and beating on a plank, which is laid across the vessel appointed to receive the flour: as the vessels are filled with this liquid flour, a reddish water is seen swim-ming at the top, and is to be skimmed off, and clean water must be put in its place; after ftirring the whole, ftrain through a fieve, and what ftays behind must be put into fresh water and exposed to the sun, and as the sediment falls, the water must be decanted off, what settles is the flarch, and must be dried in the fun.

As a medicine, this article is often very uleful; mixed with milk it is an excellent kind of aliment in fluxes and catarrhs; 3 i. of flarch diffolved and boiled in 3 iij. of water, with a little fugar, forms an elegant jelly, of which a table fpoonful may be taken every hour or two. If it is dissolved in thin gruel it is lenient, incrassating, and of fervice against sharp defluxions, hoarfeness, a dry cough, fpitting of blood, a diarrhoea, a defentery, internal ulcers,

heat of urine, a gonorrhœa, &c.

The dose is from gr. v. to 3 fs. of the dry powder.

ENEMA EX AMYLO. The starch glyster.

R Amylum 3 iij. aq. font. 3 viij. m. &c coq. parum.

Vel.

R Galatin. ex. amylo. 3 vi. ol. lini 3 f. f. enem. In diarrhoeas and dyfenteries, when the stools are bloody, and the intestines are relaxed, the following far exceeds aftringents, or any other kind of clysters in the relief it affords.

R Galatin. ex. amylo. 3 iv. vel. 3 vi. Sp. vini. Gallic. opt. 3 f. vel. 3 i. m. enem. pro renata injiciendum.

AMYRIS OPOBALSAMUM. -- GILEADENSE. Sec CARPOBALSAMUM.

AMYON, from a, priv. and µvs, a mufele. A limb fo emaciated that the muscles scarce appear.

AMYTERIA. Sec AMULETA.

AMYTHAONIS, Empl. Amythaon's plafter. R Gum. ammon. cer. flav. gum. bdel. az. 3 viij. terebrad. irid. illyr. gum. galb. 22. 3 xx. m. ANA,

### ANA 70

ANA. This is the Greek preposition ana; it is not peculiar to medical authors, though it is common among them. It signifies of each. Thus, R aloes, thuris, myrrhæ ä, or ää. for ana ä i take of aloes, frankincense, myrrh of each one ounce.

ANABASIS, from and arm, to afcend. It is fynony-mous with epatimaftica, both being epithets of fevers, which, in their progrefs, continually increase. Or, it is the second stage of a disease, of which the acme is the

height.

ANABATICA. See Synochus.

ANABOLE, from anasawa, to cast up. The discharg-

ing any thing as by vomit.

ANABROCHISMOS, or ANABROCHISMUS, from ava, furfum, and \$90 yos, a noofe. An operation which was used to be performed on the hair of the eye-lids when they are offensive to the eye.

ANABROSIS, from araCpuores, to devour. A corre-fion of the folid parts by flarp humours. The fame is diabrofis, it occasions a discharge of blood, and often

happens in the lungs.
ANABULA. A name of the CAMELOPARDALIS,

which fee.

ANACAMPSEROS. A name of the RHODIA; also

of the herb craffula, which fee.

ANACARDIOS ANTIDOTUS THEODORETUS.

The Antidote of Anacardium. A divine gift.

It is a confect made up of many warm ingredients, but

without opium.

ANACARDIUM, ANACARDUS. Also called anacar-dium orientale, apata, the MALACCA BEAN TREE. It is

the Avicenna tomentofa, Linn.

It is externally of a flining black colour, of the shape of a heart flattened, with a thick pedicle occupying almost the whole basis. The tree is found only in the East Indies, and is called by Ray arbor Indica fructu conoide cortice pulvinato nucleum unicum nullo officulo tectum claudente. It is also Acajuiba Brafilienfis.

It is faid that the Indians use the caustic oil of these nuts to stain their chintz and callicoes, which sets the colours

so as not to wash out.

The kernel, like that of the cashew-nut, is mild and agreeable to the tafte, and yields, by expression, an oil like that from almonds, and equally good as a medicine.

A confect was formerly made of the kernels, called by

Meffuc confectio fapientium, and by others confectio ana-eardii. See also ACAJAIBA.

ANACATHARSIS. EXPECTORATION, from grandles-

ours, to purge upwards; fo many include the effect of emetics, masticatories, sternutatories, &c. See ANACATHAR-TICA. Dr. Cullen reckons expectoration generally a fymptom of catarrh.

ANACATHARTICA. Medicines which promote expectoration. Dr. Cullen confines the word expectorants to those medicines which increase the mucus by the bron-

chia.

ANACHREMPSIS, from and for and, upwards, and xps around, to hawk. The hawking up any thing from the lungs.

ANACHRON, fee ANATRON.
ANACLISIS, from arankare, to recline. Hippocrates uses this word to express the decubiture of the fick.
ANACLISMOS. That part of a chair on which the

back of a fick person leans.

ANACOCK. The name of an American species of

ANACOELIASMUS. A remedy used by Diocles, which feems to have been gentle purges, with a view to relieve the lungs

ANACOLLEMA, from aranoxxau, to agglutinate. It is the fame as frontale, only that it is always made of

See CATAPLASMA. glutinants.

ANACOLUPPA. A name of a fpecies of ranunculus. ANACOMIDE, from www.uscu. to repair, or recover a person after sickness.

ANACTORION. A name of the corn-flag.

ANACTORIUM. Mugwort. See Artemesia. ANACYCLEON, from RURADO, to swander about. answers to the word circulator, a mountebank.

ANACYRIOSIS, from suppor, authority. Hippocrates, in his treatife of decency, advifes physicians to keep up their authority, and the dignity of their profellion, which he expresseth by this word.

ANADENDROMALACHE, Names for the marsh-ANADENDRON.

ANADIPLOSIS. A frequent reduplication of fevers. Blancard.

ANADOSIS, from was is aut, to distribute. The diftribution of the aliment over all the body. See DISTRI-

ANADROME, from Josus, to run. Hippocrates uses this word to fignify pains from the lower to the upper

ANÆDROMOS, from \$90µu, to run. It is used as an epithet for those fish, which at certain seasons, ascend

up rivers, from the fea.

ANASHTESIA. INSENSIBILITY, or LOSS OF FEELING BY THE TOUCH. A refolution of the nerves occafioning lofs of feeling: the fame as finper. Dr. Cullen ranks this genus of difeases in the class locales and the order dysethesize.

ANAGALLIS, called also corchoron, pimpernela, &

aritis. The species generally noticed are

The MALE, or RED; and The FEMALE, or BLUE. Ray adds three more species.

It should be observed, that the anagallis of the Greeks

is the macia of the Latins.

This plant is low and fucculent, differing in its appearance from chickweed by the spots underneath its leaves, in having no pedicles, in the feed-veffels opening not at the top but horizontally, in the flowers not being white but red or blue; it is annual, grows wild in corn-fields and other cultivated ground, and flowers from May to August.

The expressed juice inspissated to an extract, manifests a pungent faline aufterity, and any other preparation feems ufelels; it is resolvent and detergent. The species used in medicine is the ANAGALLIS ARVENSIS, Linn.

Cattle are faid to shun the female species, but if by chance they eat it, they feek the ferus oculus as a re-

ANAGALLIS AQUATICA. A name of feveral species of veronica, of the famolus, and of the becabunga. See BECABUNGA

ANAGARGALICTA. GARGARISMS, from yes-

ANAGARGARISTON. A gargarifm to wash the

throat with, in a quinfy.

ANAGLYPHE, from αιαγλοφα, to engrave. Herophilus calls a part of the fourth ventricle of the brain thus. Anatomists now call it calamus feriptorius, from its re-

femblance to a pen.
ANAGYRIS, or ANAGYROS. A name of feveral fpecies of laburnum. See LABURNUM and Acopos.
ANAISTHESIA. Se ANÆSTHESIA.
ANAISTHESIS. Aretæus fays it is not properly a

parefis; and that is only a defect of fensation.

ANALCES, from a, neg. and some, firength; weak, effeminate. Hippocrates uses this word as an epithet for the Afiatic nations.

ANALDES, from a, neg. and an Prop. to increase. Not receiving nourishment nor increasing. Hippocrates applies this word to fruits growing about the river Phase.

ANALENTIA. A species of epilepsy mentioned by

ANALEPSIA. Johannes Anglicus calls that fpecies of epilepfy thus, which proceeds from the ftomach being difordered. So also does Riverius, and it is by fome put fynonymously with epilepsy in general.

ANALEPSIS, from assauctore, to recover and regain vigour after fickness. Hence
ANALEPTICA. ANALEPTICS. They are such things as reftore, particularly fuch also as exhilerate the spirits; these are called cardiaca, cordials: they are also such as promote flesh and strength, and are called RESTORA-TIVES.

Befides the nutritious quality of refloratives, they have a fweet, fragrant, fubtile, oleous principle, which immediately affects the nerves, and gives a kind of friendly motion to the fluids.

In discases the speediest way to restore strength is to remove the cause; but this is not to be done merely by the force of medicines, which increase the vital heat; for in convulsions and fevers, the motions are very strong, and

yet the natural strength is languid: whence it is concluded | that true strength depends upon congruous aliments, turned into laudable blood and juices, yielding plenty of animal heat, the true and only fource of firmness and vi-

Cordial flowers and herbs, musk, ambergrise, oil of cinnamon made into olea facchara, chocolate, shell-fish,

&c. are analeptic.

ANALGESIA, from a, neg. and axyos, pain or grief. Indolence, or absence of pain and grief. A state of ease.

ANALLIS. A Greek name of an unknown plant.

ANALOGIA, from are, per, by, and heros, ratio, reason. Analogy. It is the mode of reasoning of things not perfectly known, by comparison with others which are better underflood, and drawing conclusions from their fimi-litude. Hence in medicine it is a comparing of causes of difeafes with each other, and the remedies preventive and curative, and fixing our ideas respecting them from their likeness to each other.

ANALTHES, from a, neg. and axben, to cure. Incur-

ANALTOS, from a, neg. and ans, falt. Unfalted. ANALYSIS, from aranes, to refolve. It is the reducing by chemistry any matter into its primary constituent parts, with a view to discover its component parts.

To analyse mineral waters, see ACIDULE.

As to the analylation of vegetables, the usual methods obtain the same things from different plants, c. g. by diftillation is separated oil, phlegm, falt, and earth; put cab-bage in one retort, and deadly nightshade in another, and the different productions will not easily be discovered; so whether these productions existed in the same manner in the plants is not eafy to afcertain. However, moderate heat and fermentation are the best methods known for analysing vegetables.

In analyting vegetables, many useful facts are observed, which reward the toil, that is disappointed as to the object fought: thus volatile falts rise before water, but if the falts are entangled in other matters, the water may

Again, animal fubfiances contain much acid, yet the usual methods of analysing discovers none. To discover an acid not perceptible by the taste, turnsole is the best means, the slightest acid turns it red; a stronger acid turns it of a deeper red. 'To discover an alcali, acids are used, which discover it by fermenting therewith; or a solution of hydrargyrus muriatus in water, which, by mixing with an alcali, becomes of a yellow or orange colour, or it appears milky or obscure, or curdles, according to the different strength of the alcali. Sal ammoniac discovers itself by a urinous smell, if mixed with lime-water; nitre discovers itself best by detonation; vitriol blackens gall,

See the preface to Martin's Tournefort; the Memoirs of the Royal Academy of Sciences, for the years 1719, 1720, and 1721; Dr. James's Med. Dict. article Ana-LYSIS: Lemery and Homberg too deserve attention on

this fubject.

ANA-MALLU. The name of a shrub in the Brasils,

of no great importance in medicine.

ANAMNESTICA. Medicines which restore the me-

mory. Blancard uses it in this sense.

ANAMNESTICA SIGNA, from and and aguirmum, to remember. COMMEMORATIVE SIGNS,-figns which difcover the preceding state of the body, as demonstrative figns flew the prefent state; and prognostics shew the future state.

ANANAS. The PINE APPLE. The bromelia of Linn. called also carduus Brafilianus foliis aloes, nana, or nanas.

Monf. Le Cour, of Leyden, was the first who raised this fruit in Europe: they were brought from the East Indies to the West, and from thence into Europe. It refembles the cone or fruit of a pine-tree, whence it is fupposed to take its name.

Miller enumerates fix species, and others add more to

The flower is funnel-flaped, confifting of one leaf; the feeds are in the tubercles; they are fmall, and flaped like a kidney-bean; the fruit is flethy, and full of a juice, which is effected the richelt of all others in its flavour; the leaves refemble those of aloes.

ANANAS WILD. See KARATAS.

ANANCE, from apayan, necessity. Any desperate fur-

gical operation.

ANANDROI. Hippocrates uses this word joined with you was women, to express their never having known

ANANTHOCYCLUS. A plant, called by Mr. Vaillant, couronne efficurée. Its Greek name is derived from ara, without, asse, a flower, and xxxx, a circle. This flower is crowned with one or more circular ranks of ovaria, destitute of flowrets.

In the Memoirs of the Royal Academy of Sciences, for

the year 1719, are two species.

ANAPALIN. On the contrary it is opposed to CATI'XIS, which fee.

ANAPHALANTIASIS, from asapahasto, a bald perfon. Baldness of the eye-brows.

ANAPHONESIS. A species of exercise which con-

fifted in vociferation.

It exercises the breast and organs of speech, increases the natural heat, improves the complexion, and is useful for the phlegmatic. It is commended to those who have the heart-burn, bad digeftion, and want of appetite, the cachectic, &c. but finging is yet a gentler exercise. See Hieron Mercurialis de Arte Gymnastica.

ANAPHORA, from assesses, to bring up, or upwards. In a medical fense it imports spitting of blood if joined with asuaros. Hippocrates uses it for thanks due to an

obligation.

ANAPHORICOI. Those who spit blood; or, according to Actuarius, those who spit difficultly.

ANAPHRA, from a neg. and appear, froth. Hippo-

crates uses it as an epithet for stools, to express that they are not frothy.

ANAPHRODISIA, from a, neg. and apposition, venery, called also agenesia, atechnia. IMPOTENCE WITH RESPECT TO VENEREAL COMMERCE .. Dr. Cullen makes this a genus of difease, in the class locales, and order

dyforexize.

This inability and sterility arises from various causes, either from an abolition of all passionate defires, appetite, or power of action, necessary for the propagation of our species, from a defect in erection, emission, or want of fertile femen. Sauvages has given us five species, which Dr. Cullen thus divides. The true species are the paralytic and gonorrhoic—the sparious species, or where impediments occur to prevent the act, from piles, or some fault in the urethra, what is called false or sictitious, that is supposed to arise from magic. See Sauvages Nosologia

Methodica, vol. i. 770.

The cure of this difease depends upon the removal of its separate causes; when it arises from paralysis, such medicines as are necessary for the conquering that complaint must be had recourse to, particularly to eat stimu-lants. Sauvages gives us an account of a man being cured by immerfing the penis often in the day in a ftrong decoction of mustard feed. If it is occasioned by simple gonorrhœa, fuch aids are to be called in as are calculated to invigorate the fystem, tonics and corroborants are to made use of, particularly cold bathing, avoiding high-feasoned foods and cordial stimulants. If from the piles, nature and particular circumstances of the case demand.

ANAPHROMELI, from a. neg, appor, froth, and una, boney. It is honey so despumated that it will not froth. or faults in the urethra, fuch means must be used as the

ANAPLASIS, from awanhagen, to reflore to the original form. Hippocrates uses this word for the replacing a fractured bone, and for a restoration of sless.

ANAPLEROSIS, from ananhagen, to fill up.

titution of any wasted part. Incarnatives are called ana-

plerotica.

ANAPLEUSIS, from avantau, to fluctuate or float upon, or wash out. Hippocrates uses this word to express when faulty humours rot the bone, so that it falls out of its joint, as happens to the jaw fometimes. Vogel expresses by this word, the scaling or separation of the carious parts of a

ANAPNEUSIS, from anarous, to respire. RESPIRA-TION, TRANSPIRATION. Aretæus uses it to express a

truce from pain.

ANAPODOPHYLLON, of anas, a duck, wee, a foot, and pubboy, a leaf. DUCK's FOOT, or pomum maiale,

### ANA ANA

MAY APPLE, called also podophyllum peltatum, aconiti, supported with occasional doses of the mixtura e camph.

The cup of the flower hath but one leaf, the flower is hexapetalous, the foot-stalk of the slower comes from the stalk of the leaf; the fruit is the shape of an urn, in which are round fimbriated feeds

The Americans call it BLACK SNAKE-ROOT.

It bears the hardest winter in an open ground, and is increased by parting the root in August.

ANAPSYXIS. REFRIGERATION.

ANARISITESIS, from a. neg. and apires, a dinner. Hippocrates used this word for the substraction of a dinner from a patient.

ANARRHINUM. See ANTIRRHINUM.

ANARRHŒA, from ana. upward, and peu, to flow. A flux of humours, from below upwards.

ANARTHROI, from a, neg. and acopo, a joint. Fat, even to be bloated, fo that the joints are oblite-

ANAS. The DUCK.

The tame duck is not fo proper for weak flomachs that are cold and abound with acids, as the wild fort. These latter, in common with all wild fowl, are more alkalef-

ANASARCA, from ava, through, and ougt, flesh, or in the flesh, called also catafarea, epifarcidium, intercus. A species of dropsy from a serous humour, spread between the skin and slesh, or rather a general accumulation of

lymph in the cellular fyftem.

Dr. Cullen ranks this genus of difeafes in the clafs cachexia, and order intumescentize: he enumerates the following species, viz. I. Anafarca serosa, when the due discharge of ferum is suppressed, &c. 2. Anasarca oppilata, when the blood-vessels are considerably pressed, which happens to many pregnant women, &c. 3. Anafarca exanthematica; this happens after ulcers, various eruptive diforders, and particularly after the eryfipelas. 4. Anafarca anæmia, when the blood is rendered extremely poor from considerable losses of it. 5. Anafarca debilium, when debility is induced by long illness, && An ædema in any part hath the same appearances as

the anaforca, but it is partial; a leucophlegmatia is general; and an anafarca is the worst state of the leucophleg-

matia.

Its feat is the cellular membrane; if only one limb, or a particular part, hath its cellular membrane filled, it is

called an cedematous fwelling.

It is known by the fight and the touch; the fkin of the art is bloated, and confiderably larger than in a natural state; its colour is paler, and upon pressing it with a finger, the impression remains some time: if the belly is af-fected, the navel appears to be funk in, and in a morning the eye-lids, or the whole face, appears fuller than is ufually observed in the latter part of the day.

The occasional causes are scirrhous glands, a bad habit, voracious eating when recovering from a difeafe, suppreffion of periodical evacuations, &c. The more immediate causes are a defect of red globules in the blood, and want of power in the absorbent vessels to carry off the portion

of fluid conveyed into the cellular membrane.

Perfons recovering from lingering difeases are very sub-ject to this kind of dropfy, particularly if they keep late hours, or replenish their weak vessels too fast by full diet. Exposure to cold and damp air, particularly in the night, perhaps the check it gives to the natural discharge by the fkin, difpose to and produces this complaint.

The speediest cure, when the case is recent, is calomel, given to gr. x. with proper intervals to prevent a falivation, afpecially if affifted with 3 vi. or viii. of a ftrong decoction

of garlic, two or three times a day.

Mustard and horse-radish may be freely eaten, or infufions of them in white wine, ale, or water, may be drank three or four times a day. Infusions of garlie, or of juni-per berries may be taken night and morning, with from 5 i. to 3 iij. of any fixed alkaline falt in each draught. Bitters, mild aromatics, and chalybeate tinctures, greatly affift in the cure: the fquill pills, and Dover's sudorific powder, given from 3 i. to 3 ij. at bed-time, two, three, or four nights successively, do the same. Dr. Leake obferves, that as this difease generally arises from a stoppage of the pores, sweating in flannels will be a rational attempt to relieve; to this end the pulv. fudorif. Doveri, in a fufficient quantity, may be repeated every other night. ANATHRON. A fort of falt which vegetates on rocks A moderate sweating should be kept up, and the patient in the form of white stoney moss. It is a fort of nitre.

This fweating abated, let the patient gradually cool, then his fkin may be rubbed with hot flannel. after which dry linen may be put on.

The crem. tartari is recommended by Dr. Home, taken from one to two ounces in a day, diffolved in ten or twenty times its quantity of water; this dilution contributes it is thought much to the diuretic power of this medicine, as it is by this means that most diureties are determined to the kidneys.

During the intervals of fweating, endeavour to ftrength-en by the use of the bark, chalybeates, acidum vitrioli dilutum, exercifes, &c. To prevent a relapfe, if the vifeera will admit, the cold-bath will be the most advisable.

Scarifications with a knife are much commended when the legs and thighs are turgid with extravalated ferum, and indeed the water is speedily discharged this way; but some inconveniencies attend this practice; first, the lips of the wound will close in two days, so as to admit of no discharge; from a defect of heat in the constitution, the part is apt to mortify. To obviate these difficulties, Dr. Fothergill advises this operation to be performed with the " common fearificator used in cupping, and the inftrument to be placed fo as to make the wounds transversely; if the skin is thick the lancet may be so set as to make deeper and confequently wider incisions: thus a large quantity of water will often drain from the legs or thighs, without risk of inflammation, or deterring the patient from a repetition, if it is necessary. To proceed with the greatest utility, let the punctures be made with a lancet, in the most depending part, viz. the foot; their num-ber and repetition must depend on the circumstances of each individual case. The application of glasses, either before or after fearifying, is unnecessary, but the inftrument must be gently presed upon the skins until a surface is formed sufficiently stat to admit the lancets, in the scarificator, to take effect equally. By making thefe openings transversely, the fluid is more freely discharged, and they are longer before they unite. In all cases where the ikin is fo stretched as to threaten inflammation, a rupture, or a gangrene, these openings should be made without delay; also when the breath is much affected." See Ascrites. Lond. Med. Obf. and Inq. vol. iv. p. 120, 122. Dr. Leake's Medical Instructions, edit. v. Cullen's First Lines, vol. iv. edit. iv. Le Dran's Operations, edit. ii. p. 113-116. ANASPASIS, from sa and orace, to draw. Hippo-crates uses this word to express a contraction of the sto-

ANASSUTOS, from are for are, upwards, and see, to move. Hippocrates uses this word as an epithet to air, when speaking of the suffocation observed in hysteric fits, and the air rushing out with violence upwards, as also in fighting

ANASTALTICA, from avacious, to controll.

Styptic or reftringent medicines.

ANASTASIS, from avas ou to cause to rife. Hippocrates used this word to express a rising up to go to stool; also a migration of humours, and a rising up or recovery from fickness.

ANASTOICHEIOSIS, from rouxeur, a principle or element, of which bodies are composed.

ment, of which bodies are composed.

A waiting of the folids or fluids of the body.

ANASTOMOSIS, from araceμ a or ara, per, and espa,

also examplemosis, insignification. To RELAX or a mouth, also exanastomosis, inosculatio. OPEN THE MOUTHS OF THE VESSELS. The opening of the mouths of the veffels to discharge their contained fluids. Anatomists use the word to express the inosculation of the arteries and veins, or their running into one another.

The menses, &c. discharged, are said to be discharged per anaftomofin, i. e. by the opening the mouths of the

The blood transuding through the fides of the veffels, the discharge is said to be per diapedesin, transudation.

If the veffels are corroded by acrid humours the difcharge is by diathrofis, erofion.

ANASTOMOTICA. Medicines are thus called that

open the mouths of the veffels.

ANAT. The abbreviation of anatomica.

ANATES. A difease of the anus.

ANATHRON. A fort of salt which vegetates on rocks

### ANA ANC 73

ANATICA PROPORTIO, from ana anatic, or equal

ANATOMIA, analoun, from ara, through, and reuse,

to cut, or from arazura, to diffet.

Celfus observes, that "though many things do not belong to the arts themselves, yet those very things prove useful to them." So though anatomy does not form the physician, it renders him better qualified for the practice of his profession. Anatomy is the art of dissecting an animal, especially the human body, in order to demonstrate the matter, fhape, firucture, connection, and fituation of the parts; this, though it does not cure, hath a tendency to make the cure proceed both more fafely and agreeably. In fhort, whatever perfection the art of healing might have rifen to by the aid of practical experiments and observation, it cannot be denied that its greatest lights were received from anatomy and physiology. To know the peculiar structure of each part, its uie, what

In applying topical remedies, anatomy bids us expect less effect from them on the hip than on other parts of the body, because of the quantity of fat there and the thickness of the muscles. The fat about the region of the stomach, forbids external medicines for the relief of that viscus from being applied there, but directs them on the friends the ball. the fpine of the back, or rather on the left fide of the fpine, about and under the falfe ribs, not but medicines do fervice on all these parts. The linea alba, being the tendons of almost all the abdominal muscles, applications on it are peculiarly useful, hence fat rubbed on the navel procures flools; gall rubbed there, expels worms; ci-

of turpentine to the fame place.

The fympathy of the nerves leads us to diftinguish many difeases, the feat of which is in one part of the body, whilst a very distant one is the part complained of. The intercottal branch, and the eighth pair of nerves, run almost all over the body.

The greatest geniuses find that their enquiry cannot be too minute in this branch of physic, and the most emi-nent professors and practitioners have, at all times, endeavoured to increase their acquaintance therewith.

After Hippocrates succeeded Alemzon of Crotona, Aristotle, Herophillus, Erassistratus, Aretzeus, Praxagorras, Galen, Oribasius, Nemesius, Mundinus, Praxagorras, Galen, Oribasius, Nemesius, Mundinus, Alexander Achilinus, Guido de Cauliaco, Jacobus Berengarius Carpensis, Nicolaus Massa, Andreas Vesalius, Jacobus Sylvius, Michaelus Servetus, Realdus Columbus, Ambrosius Parzeus, Bartholomzus Eustachianus, Volcherus Coiter, Andreas Czesalpinus, Hieronymus Fabricius ab Aquapendente, William Harvey, Theophilus Bonetus, William Cooper, James Douglas, Clopton Havers, Marcellus Malpighius, Nathaniel Highmore, Anthony Nuck, Pecquet, Monro, sen. Morgagui, Needham, Nicholls, Ruysch, Steno, Winslow, Chefelden, and many others, who, as physicians, surgeons, or both, did honour to their profession.

The first anatomical publication in the Englishlanguage

ANATROPE, journal and surgear.

ANATROPE, journ

The first anatomical publication in the English language was, the Englishman's Treasure, or the true Anatomy of Man's Body, by Thomas Vicary, Surgeon, in London. It was printed and reprinted three or four times between the years 1548, and 1633.

It is the advice of the greatest anatomists, that authors on this subject should not be read before an acquaintance with the parts is in some degree obtained, by seeing box

with the parts is in some degree obtained, by seeing bodies diffected; until then, books rather tend to retard than to facilitate the progrefs. When by feeing all the parts demonstrated, and their uses explained, the shudent hath a clear idea of them, then reading will be necessary, both to fix the impression on the mind, and to inform him of different opinions and disputed points: for now there

ANATHYMIASIS, from Juguau, to fumigate. It fig- fettling what is just and good, and of rejecting the erro-

Those whose situation, &c. does not favour their attendance on diffection, may acquire a good general know-ledge of the anatomy of a human body, from the perufal of Keil's Abridgment of Anatomy, Chefelden's, and Northcote's Anatomy. Heifter's Compendium is also useful. Winflow's Anatomy feems best calculated for the attention of those who have already been familiar with diffections, and the demonstrations given by able anatomists.

The Anatomical Tables of Albinus, and of Eustachius, should be attended to. Albinus's edition of Eusta-chius is the best. Cooper's Tables are the most elegant. Jenty's also truly valuable.
ANALON. See ANATRON.

ANATRESIS, from ava, and zpau, to perforate. Galen uses this word to express trepanning.

ANATRIS. MERCURY. ANATRON, also called nation, anachron, foudeblanebe, parts, and influence on them, whether near or remote, kalinus falls marini, barilla, foda, falitron, and bariglia; analyn, ana

The anatron of the ancients, called natron by the Egyptians, is the MINERAL FIXED ALCALINE SALT. From fea-falt, and from the waters of many fprings, a pure alealine falt is obtained by boiling the latter to dryness, and diffilling the acid spirit from the former; which proves the affertion to be false, that declares the burning of vegetables to be the only way of procuring fixed alcaline

On the Peak of Teneriffe, the inhabitants call it SALI-TRON, which is their name for falt-petre also.

This minoral alcaline falt differs from the vegetable fixed alcali in its being milder and lefs acrid to the tafte, vet rubbed on this part relieves in the convulfive colic; melting more eafily in the fire, requiring more water to and a fuppression of urine is removed by applying the oil dissolve it; in its concreting into crystalline masses on evamelting more eafily in the fire, requiring more water to poration after folution in water, not running into a liquid by exposure to the air, and in being a less powerful fol-vent of the stone in the bladder. See NATRON under ALCALI.

> With this mineral alcali, the Spanish foap is made. This falt, joined with the oil of vitriol, forms the natron muriatum, with the nitrous acid, the nitrum cubicum; and with the marine acid, pure fea-falt; and with vege-

table acid, the natron tartarifatum.

Anatron is a name of the spume or gall of glass, which Hippocrates, though he only once had the opportunity bubbles on the furface while in the furnace; it is also the of viewing a human skeleton, yet used every method in his power to inform himself in this branch of his art, and the red, black, and azure; and lastly, of a white stoney hath left behind a tolerably good description of the human what is the form of most. what in the form of mofs.

ANCHA. See Coxa and Femur.
ANCHE, os. The THIGH BONE.
ANCHILOPS, or ANCHYLOPS. See ÆGYLOPS.
ANCHOAS. The Mexican name for the male ginger. ANCHORALIS, PROCEssus. See PROCEssus co-

ANCHUSA, called also alcibiadion, buglossum radice rubra, anchion, onochelis doris, enchusa, enchysa, onoclea, alcanna, ALKANET ROOT. It is the anchufa tinctoria, or anchula tomentofa, foliis lanceolatis obtufis, staminibus

corolla brevioribus. Lin.

The alkanet plant is rough, hairy, and perennial, with unbranched procumbent flalks. It is of the buglofskind, is not fo much danger of being prejudiced in favour of unbranched procumbent stalks. It is of the buglofskind, this or that doctrine, as he is in some degree qualified for and differs from the common buglofs chiefly in the red

### ANC ANC

colour of the roots. It grows wild about Montpelier, and in the eaftern countries; it is cultivated in fome of our gardens, but the roots produced in this clime are paler

coloured than those from abroad.

The roots are of a deep purplish colour outwardly, they give out a deep red colour to oil, wax, all unctuous fub ftances, to spirit of wine, and spirit of turpentine. -th part of the bark of this root colours 48ths of any of the above matters; by a gentle heat they most perfectly extract its colour.

There is another species called alcibiadium, onochiles, onochelis, and rexis anebion. Its principal difference is,

that its leaves are fmaller.

A third fort, with fmaller feeds, is faid to destroy the broad worm, if taken in doses of half an ounce. That called-LUTEA, is yellow alkanet. Of this there are feveral fpecies, but they have no medical properties at-tributed to them. And—LUTEA MINOR, is a fpecies

of comfrey.
ANCAYLE, fee AncilyLosis. A contraction of a

joint, or the back part of the knee.

ANCHYLOMERISMA. In Sagar's Nofology, fignifies a concretion, or growing together of the foft

ANCHYLOPS, from ayaula, a stricture. See ÆGI-LOPS. It is the fiftula lachrymalis in its beginning in-

ANCHYLOSIS, from ayxives, erooked; it is also called ancyle, ancylofis, anchyle, a STIFF JOINT, a species of which is called orthocolon. It is a species of contracture, in Cullen's Nosology. Some diffinguish this disorder thus: ancyle, is when the bones are immoveable, and the joint in a bent position; but if the limb is straight, it is named orthocolon. Petit divides this case into the true and false; the true are such wherein the bones are united fo as to become as it were one; the false is when from the tendons being contracted, or other parts about the joint are difeafed, the limb is rendered immoveable.

The bones are covered at their ends where they form joints, with cartilages, to facilitate their motion, and to prevent any farther production of bone; and if these car-tilages should be eroded, there will be an excrescence consequently thereon, which will produce this disorder: however, it is fometimes a cure of fome other worse mis-

The general causes are a caries, abscesses in the joints producing caries, offisication of the ligaments, strumous and ricketty diforders, contraction of the tendons.

When the bones are united, the cure is imposfible; and

whatever elfe is the cause, the cure is very uncertain, on account of the difficulty of coming at the seat of the difeafe; and, indeed, often from the difficulty of knowing what part about the joint is the part primarily and principally affected, or even in any degree the cause.

The most simple case of this kind is that from a long

confinement of the limb to one polition; an inflammatory affection of the ligaments, from external injuries, is generally very difficult to remove; rheumatic and arthritic matter falling on the joint is hardly to be removed; but the worst is what is commonly called a white fwelling,

which is most probably owing to a scrophulous virus.

On diffection, after the appearance called a white swelling, there is always found a great thickening of the liga-ments, which fo confounds the feveral parts, that they can scarce be diftinguished, together with crude matter forming finuses through this undistinguished mass; and generally an erosion of the cartilages at the end of the

bones.

If the cause is a rigidity of the tendons, emollient topics are the proper means of relief. Dr. Lobb, from ob-ferving the glovers foften hard leather, with a mixture of the yolk of egg and water, proposed it in some instances of this kind with the best success: his prescription is as follows:

EGG LIQUOR.

Take the yolk of a new-laid egg, beat it with a fpoon to a water, then, by a fpoonful at a time, add fix table fpoonfuls of pure water, shaking the mixture well, that the water and egg may be well mixed; this done, apply it by gently rubbing it on the contracted part three or four times a day; rub it for a few minutes each time, and let a fresh mixture be made every day.

Others commend mucilaginous oils, of which the of. e pedib. bovon. neat's foot oil, is the best.

If an inflammatory state of the ligaments is the cause, remedies that are known to refolve inflammation in deep feated parts are the most proper; these are medicaments of the aftringent and ftimulant kind, and not emollients. Blifters, the most powerful remedies of this fort, have in many inflances fucceeded in this cafe, whilft it was in a recent state.

In more inveterate cases a few cures have been effected by the pump. Warm water pumped upon the difeafed part, and falling from a confiderable height upon it, hath by repetition been successful. The warm bath hath had the like happy effects by continuing an hour or more at a time in it, and repeating the fame for feveral days fue-ceffively. After the bath or the pumping, emollients must be applied.

In ferophulous cases, all means hitherto used have failed; however, as palliatives, when the tumor bursts into ulcers, the aqua lithargyri composita, and such like preparations, are considerably beneficial.

See Petit on the Difeases of the Bones. Heister's Surgery. Mem. de l'Acad. Royale des Sciences, an. 1721, and 1728. Aikins's Obf. on the Preparations of Lead. Bell's Surgery, vi. 283. White's Surgery, 431.

ANCHYNOPES, a name of ray-grafs.

ANCHYROIDES. See Coracoides.

ANCI, also galioncon, ancus, WEASEL-ELBOWED, from γαλκ, a weafel, and αγκων, an elbow. As when the head of the humerus is in the arm-pit. These patients are also called musicalnes. The disorder which this name exprefies, is, when the humerus is luxated in the uterus, or in infancy when an abfeefs thrufts out the head of the

ANCINAR. BORAX. ANCON. See OLECRANON.

ANCONÆUS, from annun, the elbow, Musculus, called also cubitalis musculus. It rifes by a round short tendon from the outer condyle of the os humeri backwards; it foon grows fleshy, and is inserted into the ulna about three inches below its head, serving to extend the arm. This muscle is reckoned by some as a part of the brachiæus externus; from which in dissection it cannot be feparated without violence.
ANCORA. LIME.

ANCORALIS, ANCHORALIS, which fee.

ANCOSA. See Lacca.
ANCTER, ANCTERIASMOS. The Greek term for the fibula, or button, by which the lips of wounds are held together, which operation Galen calls ayalustarus; ancterialmus

ANCUBITUS. That affection of the eyes in which they feem to contain fand. It is also called petrification.

ANCUNULENTA. Women are so called during the time of menstruation. Ancunulenta is composed of am, for auch, and cunia, quasi, somew, to pollute. From the Greek zens, comes the Latin canum, whence are derived cunire and inquinare.

ANCUS, a name for fuch as have an arm bent, fo that

they cannot extend it, from ayar, an elbow. See Anci.
ANCYLE, & Ancylosis. See Anchylosis.
ANCYLOBLEPHARON, from ayarabos, bent, and
βλιφαρον, an eys-lid. A difease of the eye which closes the
eye-lids. Vogel defines it to be the gluing together of the upper and under eye-lid.

Sometimes the eye-lids grow together, and also to the tunica albuginea of the eye, from carelessness when there is an ulcer in these parts. Both these cases are called ancyloblepharon by the Greeks.

SAUVAGES lays, "That it is an adhesion of the superior with the interior eye-lid; whence the eyes lids wink, and the rays of light are either totally or partially inter-cepted. This diforder derives its origin from glutinous discharges, such as attend most ophthalmies, chiefly in ulcerated eye-lids, and is cured by warm milk, and abforbent powders, commonly tutty; or the coalition is a perfect concretion of the palpebre with each other, or often with the eye." In these cases sometimes there is a final aperture, which is generally in the great angle of the eye; if there should not be any, a perforation must be made in either angle, a probe with a grove then intro-duced, and with a fine-edged knife let the parts of

# ANC

feparated. This done, fee if the eye-lids adhere to the globe, if that should be the case, they must be carefully divided from each other, in the operation being more fparing of the eye-lid than felerotica. If the adhesion is only to the conjunctiva, blindness is not the confequence; if on the cornea, the fight is inevitably lost. The re-union is better prevented by injection, or lint placed between the eye-lid and ball of the eye, after dipping it in some mild liniment, than by a plate of lead, as recommended by SAUVAGES, be it ever so thin, as that might from its

hardness bring on a severe inflammation. Mr. Bell fays, when the adhesion of the eye-lids is slight, and has not been of long duration, it may be separated by the end of a blunt probe infinuated behind it, so as to tear it asunder; but when they adhere firmly, or to the eye-ball, he advises flow diffection of every adhering fibre, and then the eye only to be covered with a piece of foft lint spread over with Goulard's cerate, or any other cool-ing emollient ointment; and after the first dressing, a fmall portion of the fame daily infinuated between the eye-lids. Perhaps in preference to all others the following may be used, the unguentum hydrargyri, cum hydrargyri parti una, adipis fuille pp. partibus quatuor, bis de die utendum: the parts may be bathed twice a day with a weak folution of the zincum vitriolatum purificatum, or ceruffa acetata. See Wallis's Nofologia Methodica Oculorum, p. 51. Bell's Surgery, vol. iii. p. 297. Cullen's First Lines, vol. ii. p. 271. Edit. 4.

ANCYLOGLOSSUM, from αγκορος, crooked, and γλωσσα, the tongue. A contraction of the ligaments of the tongue: TONGUE-TIED. Vogel defines it to be an adhefion of the tongue to the adjacent parts, fo as to hinder fucking. fwallowing, and focaking.

fucking, fwallowing, and fpeaking.

Some have this imperfection from their birth, others from fome disease. In the first case the membrane which supports the tongue is too foort or too hard; in the latter,

iupports the tongue is too thort or too hard; in the latter, an ulcer under the tongue, healing and forming a cicatrix, is fometimes the cause; these speak with some difficulty, and are called by the Greeks μογιαρίο.

The ancyloglossi by nature are late before they speak, but when they begin they soon speak properly: these we call tongue-tied. Mauriceau says, that in this case it is a small membranous production, which extends from the frequellum to the tip of the tongue, that hinders the child frenulum to the tip of the tongue, that hinders the child from fucking, &c. He forbids the cruel practice among nurses, of tearing this membrane with their nails, for thus ulcers are fometimes formed, which are of difficult cure: and he advises to fnip it with scissars in two or three places, being careful not to extend the points of the feiffars to far as the frænulum. When the child's tongue is tied, it is observed not to suck very freely, he loses his hold of the nipple very frequently, and whilst sucking he makes a chucking kind of a noise. The instances rarely occur which require any kind of affishance, for if the child can thrust the tip of its tongue to the outer edge of its lip, this disease does not exist; and if the tongue is not greatly restrained, the franulum will stretch by the child's sucking and crying. Besides, without an absolute necessity for it, an operation should not be admitted; for without great circumfpection, by cutting the frenulum, the nerves paffing there may be also cut, and then a loss of speech is the consequence.

Sometimes the tongue is bound down with a flefhy fubflance; when that is the cafe, it should never be cut through, because a dangerous hæmorrhage would follow, without any attending advantage; all that is advisable in this circumstance, is to direct the nurse, now and then, this circumstance, is to direct the nurse, now and then, to stretch it gently by a light pressure on it with her singer end. When in consequence of delivering a child by the feet, a swelling is observed under the tongue, the nurse should be forbid to use any means, for the complaint will be increased thereby: this tumor will soon subside.

See Hildanus in Cent. iii. Obs. 28. where he gives an

accurate account of the nature, cure, and bad effects that may follow on improper methods being used for the cure of this diforder. He never cuts more of the frænum than appears ligamentous, and then orders it to be gently rubbed

two or three times a day with honey of rofes.

Bell's Surgery, vol. iv. p. 336.

ANCHYLOMELE, from αγαυλος, creoked, and μελος, a probe. A crooked probe, or a probe with a hook.

ANCYLOSIS, fee ANCHYLOSIS.

ANCYLOTOMUS, from argundes, creeked, and regines to cut. Any crooked knife used in surgery.

ANCYROIDES, a process of the scapula, so called from always, uncus, a beak or book, and sufes, form. See Coracoides Processus.

ANCYROMELE, fee ANCYLOMELE.

ANDA. A tree growing in Brafil, with fruit which taftes like the chefnut, and is purgative: two or three kernels are fufficient for a dofe. The rind of these kernels is aftringent.

ANDARAC. RED ORPIMENT.
ANDENA. Steel which melts in the fire, and may be east into any form.

ANDHURA. The BAT or FLITTER-MOUSE.
ANDIRA, called also angelyn & arbor nucifera.
It is a tree which grows in Brafil, whose wood is pro-

per for building. The fruit is a yellow kernel; it is bitter, aftringent, and, if taken inwardly, it destroys worms; 3 i.

of it in powder is a dofe.

There is another species, which only differs in not being bitter. The Andrra Acu, or Andrra Guacu. Is a large kind of BAT, nearly as large as a pigeon: They are met with in Brafil; and are called by fome horned bats, because of a pliant excrescence above the beak. They persecute all forts of animals, also get to the beds of men, and suck their blood.

ANDRACHNE A name of a tree like the straw-

berry-tree, fee Arbutus Andrachne; also of the herb

ANDRACHNE, wild, fee Peplion.
ANDRANATOME, or Androtome, from any, and resease, to cut. The difection of a human body, man, and repow, to cut. especially of a male.

ANDRAPHAX, or Andraphaxis, fee Artiplex

ANDRIA, from eye, a man. An HERMAPHRODITE. ANDRIUS, MANLY. It is metaphorically applied to

ftrong wine, or wine from the illand of Andros.

ANROGENIA, from and, a man, and yenas, to generate. A fuccession of males.

ANDROGYNE, & ANDROGYNI, from arms, a man, and yore, a woman. Effeminate men, and Herma-phrodites. See Gynanthropus.

ANDROMACHI THERIACA.

This medicine of Andromachus hath above fixty ingredients in it, but the vipers are what gives it its name of theriaca; for the word Sustan, imports all fierce animals in general, but more particularly the poisonous fort. It is needless to repeat the universal good ascribed to this composition by its author; it was his catholicon.

We will just observe how such compositions came into

practice, and what was meant by an antidote. Hippo-erates and the ancient physicians founded their princi-pal maxims in practice on their observation of certain motions of nature in particular diftempers, and diet was their chief administration. Herophilus began to use medicines more freely, for Hippocrates used very few.

As to crowding to many drugsinto one medicine, fome fay it was, that a concurrence of fimilar ingredients might be more effectual; but Pliny fays, it was only to make the

people imagine fomething more in their favour.

The word antidote is from two Greek words, one of which fignifies against, the other fignifies given, because antidotes were given against poison, contagion, corrupted humours, &c. This word feems to be in the Greek both masculine and feminine, and sometimes neuter; the Latins say have antidotus, and hoe antidotum: but the Greeks most probably used the word at first as an adjective; as in faying arrifore, they understood or faid foregue, a compound or medicament, i. e. an antidote of fo many ingredients, an antidote for the liver, &c.

The treacle of Andromachus is called VENICE TREACLE,

because great quantities of it was made there, and thence transported to other countries. It is now rejected from the present Pharmacopæia of the London College, very

ANDRONION, i. c. Andronis pastilli, or the TRO-CHES OF ANDRON. They are made with alum, balaustines,

ANDROSACE, also called umbilic. marin. cocblea carlata, acetabulum marinum minus, fungus petræus marinus, cotyledon marina, and SEA NAVELWORT. It is a fub-marine

production, found on the rocks and shells of fishes about | an oval shape, flatted on one side, convex, and marked the coast of Montpelier, and elsewhere. It consists of numerous, flender, thort filaments, more or lefs bent or arched, of a whitifh or grey colour, hard and brittle, bearing each upon the top a striated concave body, nearly of the figure of an inverted cone.

In powder it is given as a vermifuge. It does not dif-fer very materially from coralline. If the dried androface is held in the flame of a candle, it yields a dazzling brightness, and this repeatedly for several times, and the

coralline does the fame.

ANDROSACES, SUMMER NAVEL-WORT.

This is a plant which is found growing on the feacoasts of Syria. It is called androfaces from its bringing relief to men. It is flender, hath thin stalks which are bitter; it is without leaves, but hath fmall pods on the top of thefe stalks, in which are the feeds. The flowers are white.

Two drams of this herb, or of its feed, taken in wine,

powerfully promotes urine.

ANDROSÆMUM, or ANDROSÆMON. Alfo called Siciliana, clymenum Italorum, afcyroides, bypericum, ciciliana, dionylias, and fome erroneoully call it afcyrus. In English it is named TUTSAN, or ALL-HEAL, PARK-LEAVES, and ST. PETER's WORT. It grows in hedges and thickets, the leaves refemble those of laurel, the stalks are red, and the flowers, which blow in July and August, are yellow. Two drams of this are moderately purgative, but it is rarely used.

The name androsemum, is from even, a man, and aisia, blood, for it makes the singers red if they rub it. Tutsan is a corruption of the French words tout-fain, which fignifies all-heal. It is also a name for St. John's wort.

ANDROTOME. See ANDRANATOME.
ANDSJUDÆN. So Avicenna calls the affafætida. ANEBION. ALKANET ROOT. See ANCHUSA.

ANECPYETUS, from a, neg. and exausos, suppurated,

not suppurable. See ECPYEMA.

ANEILEMA, or Aneilesis, from armae, to roll up, or involve. An involution, fuch as is caufed by flatulence and gripes.

ANEMIA. The name of a diforder which Hippocrates

mentions, but does not describe. It is unknown what

it is.

ANEMONE. WIND-FLOWER. Called also phenion. There are the garden and the wild forts, each of which are divided into many fpecies. They are much admired in gardens, but rarely used in medicine. The root of the scarlet anemonies are deterfive if bruifed while fresh, and applied to ulcers, and on the skin it raises blisters. The herb hath been used in collyriums and errhines.

Anemone Pratensis. See Pulsatilla nigri-

CANS

ANEMONOIDES, also called nemorosa, ranunculus phragmites albus vernus. The wood anemone.

Miller enumerates fix species of it.

Its virtues as a medicine are fimilar to those of the garden anemone.

ANEMONOSPERMOS, from αρτμος, wind, and σπερμος, feed; because the wind easily bears away the

This flower was originally brought from the Cape of Good Hope, is an ornament in gardens, but of no note in medicine.

Miller reckons up four species, and Boerhaave enumerates fix.

ANENCEPHALOS, from a, neg. and 12 x1902/16, the brain. Brainless, or those who are born without brains;

also those who are foolish or mad.

ANEOS. Struck with the loss of voice and reason.

ANEPITHYMIA. ERROR OF APPETITE BY DEFI-

ANEFITH I MIA. ERROR OF APPETITE BY DEFICIENCY, as in inflances of anorexia.

ANERIC,
ANERIC,
ANERIT,
Sulphur vivum.

ANESIS. Remission.

ANESUM. See Anisum.

ANETHOXYLA. The woody root of dill.

ANETHUM. DILL or ANET. It is the anethum graANET.

ANET. Cyrolens: or arethum fractibus com-

ANET. Sveolens: or, anethum fructibus compreffis, Linn.

It is an annual umbelliferous plant, with finely-divided leaves, and yellow flowers. The feeds are brown, and of

with three longitudinal ridges on the other; about their edges they are furrounded with a yellow leafy margin. It is a native of Spain and Portugal. By cultivation it thrives in our gardens. It flowers in July, and in September sheds its seeds, by which it is propagated.

The herb, flower, and seeds are medicinal, but the

feeds only are used in the shops. They are carminative and antispasmodic in the prime vie. Cullen's Mat. Medica; 3 i. to a dose is reckoned specific in hieroughs. They give over all their virtue by distillation to water, but not by digestion or infusion. With the distilled water there arifes a confiderable portion of oil, which, as a carminative against hiccoughing, from two to four drops are given for a dofe. Rectified spirit of wine obtains all the virtue by digeltion, but takes very little over with it by diftillation. The London college orders a timple water from these seeds, as follows.

# AQUA ANETHI. DILL WATER.

Take of dill feed one pound, of water fufficient to prevent an empyreuma, draw off one gallon.

ANETHUM FÆNICULUM. See FÆNICULUM VULGARE. ANETICUS, from armus, to remit. An epithet for

paregories, or pain-eafing medicines.

ANEURISMA, from areupone, to dilate much; and that from ana, afunder, and cops , broad: called also Hamatocele arterio um.

The aneurism is a tumor, arising from the dilatation or rupture of the coats of an artery. Arteries only are the feat of this disorder; and any artery, in any part of the body, may be thus affected, as any vein may be the feat

Dr. Cullen ranks this genus of difeafes in the class lo-

cales, and order tumores.

Dr. Hunter divides ancurifms into four kinds, viz. the true, the falfe, the mixed, and the varicofe.

### First, OF THE TRUE ANEURISM.

The true ancu ifm is formed by a dilatation of the artery. It may happen in any part of the body, but most fre-quently is found in the curvature of the aorta, which is subject to this disorder from the extraordinary impulse of the blood there; from the curvature it runs upwards along the carotids, or the fubclavians, generally increafing, till by its great diffention it is ruptured, and the patient

The degrees of the dilatation of the aorta in cases of this kind are various; in some the curvature of this artery hath been so enlarged as nearly to fill the upper part of the breast. And what is peculiar, and delerving our attention, is, that the fpot of the veffel, which is the weakeft, and where the difease begins, is apt to be stretched more in proportion than other arteries, and to form particular cells, where they meet with firm refiftance, more than

where their support is fost and yielding.

The sac formed by the distension of the artery is not a diftention of a particular coat, but of the whole fubflance of the vessel: but the thickness of the coats of these facs will last only to a certain period; for when the vessels of the coats can no longer conform to the extension, the circulation grows languid, the fac becomes thinner at its apex, and foon after burits: farther, as the aneurifmal tumor increases in fize, it meets with refistance from the neighbouring parts, and as the coats will be more or lefs af-fected, according to the degree of the refiftance, in fome places they will be fimply diftended, in others abfolutely destroyed, e.g. where the aneurism presses against the dia-phragm, it will be thinner than where it suffers no presfure; it is still thinner where it presses against the tendinous part of the diaphragm; and where it preffeth the fpine, it is the foonest croded through. A proof that all preflure must be avoided in all instances of this fort.

The blood that fills thefe tumors is always fluid, by being conflantly renewed; that is, as faft as one drop enters another paffes out, and continues its course in the circulation; but, notwithstanding this blood is sluid, its passage in the tumor is retarded, and this remissions in its motion, which is more or lefs confiderable, according to the fize of the aneurism, occasions some of the fibrous parts of the blood to separate from the red part, and adhering to the internal coat of the aneurism, it there forms fibrous

ftrata, which may easily be taken for real membranes by those not accustomed to observe them. These sibrous firata cannot be dispersed by any means, either external or internal, and pressure cannot be used, because thereby the coats of the artery are foon destroyed.

Secondly, OF THE FALSE ANEURISM.

In the number of internal causes: externally, strains, blows, and punctures are the most frequent; pressure used on a true aneurism, by bursting the coats of the artery, produces a false one; suspending the breath, as in lifting great burthens, wrestling, &c.

It hath been said that a polypus existing internally, sometimes occasions an aneurism; but Dr. Hunter observes, the it rarely or never happens that a polypus is formed till.

It is formed by a rupture or wound in the coats of the artery, and is of two kinds, viz. the diffused and the cir-

cumferibed.

The diffused is that in which the extravasated blood runs through the cellular membrane, in the interstices of firmer parts; this generally makes a rapid progrefs, may extend itfelf to a great diffance, and hath little or no pulfation, except very near the aperture of the artery; but these circumstances will somewhat vary, according to the fize of the opened artery and the strength of the circula-tion. With regard to the lodgment of the fluid, this spe-

tion. With regard to the lodgment of the fluid, this species of false aneurism is analogous to the emphysema, and is the highest species of ecchymosis.

The circumscribed, beats, and finks under pressure, like the true anuerism, and indeed cannot be distinguished from that, except by the knowledge of its cause, or by a careful dissection of the part: it appears soon after the accident which gave rise to it, and is commonly slow and gradual in its progress. It happens when the orifice in the artery is very small, so that the blood flows but leisurethe and finds the adjacent membranes so firmly united as to the artery is very Imall, to that the blood flows but leifurely, and finds the adjacent membranes so firmly united as to keep it within a certain channel. It consists of one bag with a smooth inside, and communicates by an aperture with the cavity of the artery. This species of anaerism is, perhaps, the most common among those that happen in the arm after bleeding, especially when a considerable pressure hath been made use of immediately after the accident.

### Thirdly, OF THE MIXED ANEURISM.

This is formed partly by a wound or rupture in the ar-tery, and partly by a dilatation of the reft. It cannot ea-fily be diffinguished from the circumscribed species of the false anearism, and will often so emulate the true one, as not to be diftinguished from it but by a careful diffection.

### Fourthly, OF THE VARICOSE ANEURISM, OR THE ANEU-RISMAL VARIX.

This is when there is an anaftomofis, or an immediate communication between the artery and the vein of the part where the patient hath been let blood, in confequence of the artery being wounded through the vein, so that blood passes immediately from the trunk of the artery into that of the vein, and so back to the heart.

This species differs from the common spurious ancurism in one circumstance only, viz. the wound remaining open in the fide of the vein as well as in the fide of the artery. But this one circumstance will occasion a great difference

in the fymptoms, the tendency of the complaint, and in the proper method of treating it.

Dr. Hunter first described this species of aneurism, and to him the world is indebted for many improvements re-

fpecting the other kinds.

Mr. Bell, in his System of Surgery, divides the ancurism into two species, viz. the encysted, and the diffused. The encyfted includes all those instances in which the coats of the artery, being only dilated, the blood is confined in its proper coat: of this kind he reckons the varicofe aneurifm. The diffused includes all those in which from an aperture in the artery, the blood is fpread about in the cellular mem-brane, out of its proper courfe.

The causes of aneurisms are various. In the true aneu-

rifm, a particular natural weakness in a part of an artery is the immediate cause; and in general the causes of all the species may be one or other of the following: internally, a fulness of the arteries concurring with some violent motion, or other particular cause; an internal tumor pressing on fome part of an artery; or where there is no parti-cular turgidness of the vessels, violent action, sudden anger, vomiting, &c. by propelling the blood too forcibly to some particular part; thus, by stretching the artery a true, or by bursting it, a salse anearism, or the mixed one, will be formed: convultions, and other violent (palmodic fymptoms, and perhaps an acrimony in the blood, by fayour of fome other concurring cause, may itself be ranked

that it rarely or never happens that a polypus is formed till the last moments of life, when the heart's power having nearly ceased, the whole blood cannot be propelled from the heart, but stagnates, forming polypuses; which being found after death, have been supposed to have pre-existed, and to have been the cause of what they were only the ef-

fect.

As to internal aneurifms, there is no certain criterion by which to afcertain their existence before they approach by which to altertain their existence before they approach to the furface of the body; whatever symptoms they occasion before they form a tumor externally, as they may be produced by other causes, they are but equivocal signs. The pathognomonic sign of all the species of aneurisms is, a perceptible pulsation in some part of the tumor, more or less manifest, as the artery is seated superficially or deep. The true aneurism is generally of an oblong sigure, and hath a strong pulsation in it; it subsides on depression; if it is an aneurism of the aouta, a strong pulsation is perceived. it is an aneurism of the aorta, a strong pulsation is perceived against the sternum and ribs on every systole of the heart, and when it extends above the sternum, there is a tumor with pulfation. These tumors are without discoloration in the fkin, except on the point of burfting; there is no pain in them; they subside by preffure while the blood is sluid, but when it is coagulated, they disappear but very little thereby; if there is a fac with a narrow basis, the blood re-enters the artery with a hissing noise when the tumor is pressed. Sometimes there is a redness from the expansion of the parts beyond their ca-pacity, or from the putrefaction of the blood, in which case there are generally a fever and fainting also. common appearances of an ancurism from the wound of a common appearances of an antarim from the wound of a lancet, are a difcharge of blood through the orifice of the skin, by jerks, instead of an uniform stream; and upon being stopped from bleeding outwardly, an infinuation of it among all the muscles, as far as it can spread, in the shoulder and arm, constituting the disfused aneurifm: in this case the arm becomes livid from the exchymosis, and the

blood coagulating prevents any fensible pulsation.

In the false kinds of aneurisms the cyst is probably formed of a portion of the aponeurosis that runs over the vessel, which admitting of some extravastated blood undergraph it becomes a vessible to the company of the compan neath, it becomes exceffively thickened and expanded; that this membrane is the cyft, feems to be confirmed by our fo readily discovering the puncture in the artery upon opening the tumor: or it may be formed of the cellular membrane, which admits both of thickening and expan-

The appearances of the varicole aneurism will differ from the common false one as follows: the vein that was punctured will become varicous, and will have a pulfatile jarring motion, on account of the stream from the artery; there will be a hissing noise, which will be found to corres-pond with the pulse for the same reason; the blood in the tumor will be almost entirely fluid, because it is kept in constant motion: it is soon formed to its largest size, and there remains, if it is not disturbed by imprudent management; there are no confiderable inconveniences confequent. That this fort of aneurism is present, may be further known by placing a finger over the orifice in the ar-tery: thus the ftream of blood propelled into the vein, at every pulsation, is felt; by applying the ear to the tumi-fied vein, a tremulous motion and noise are perceived; by prefling the corresponding artery, this motion, noise, &c. cease, and on the removal of this pressure the motions, &c. return; the artery becomes larger in the arm and fmaller in the wrift; the vein being emptied by pref-fure, inflantly fills again on taking the preffure off; the pulse at the wrift grows weaker as the artery above en-

The beginning aneurism in the aorta should be distinguished from a palpitation of the heart; from hysterics, in which fymptoms of fuffocation fometimes attend; from fever with fainting, both which are fometimes the confequence of a falle aneurifm; from varices of the veins and their effects; from an emphyfema; from an ecchymofis; from encyfted fwellings in the neck, in which are often perceived

years, but there can be no cure attempted, nor other pal-liatives used than what consists in composure of mind and quietude of the body. All aneurifms are incurable that lay too low for the operation; and, if unadvitedly opened, the patient's life is in immediate danger, for bandages, which are the only palliatives in fuch cases, are but uncertain dependants. The diffused ancurism is not only fubject to hæmorrhages, but also to a mortification.

The method of cure is the same in the true, the false, and the mixed aneuri/ms; the varicous needs but little, if any affiftance: if it is enlarged by exercise and becomes painful, indulge a little rest, and moderate the future labour; perhaps bothing the part with a little spirit may af-ford some small relief, but bandages and all other means

must be avoided.

To palliate, when the operation is impracticable, bleed as often as is required to keep the force of the circulation moderate; let the diet be temperate, and the exercise very gentle; keep the bowels constantly soluble; where pref-sure is used, it must be such as only checks the force of the blood, not refift it; flannel bandages, or knit stockings, &c. are the most proper for this purpose. But all pressure is best avoided when the aorta is the seat of the aneurism, however the tumor may appear externally: it is true that, if the integuments give way, and the coagulum formed on the inside of the tumor thereby hath lost its support, the affiftance of a bandage is immediately neceffary, as it is the only means to prevent a fatal hæmorrhage; in this dilemma, if the substitutes to the integuments are judiciously applied and accompanied with fuch topical medicines as refift both suppuration and putrefaction, the life of the patient may be preferred for fome time.

When the operation can be admitted, it is adviseable first to attempt the cure by compression; because it sometimes proves effectual, is always a good preparatory step to the operation, by its enlarging the collateral anaftomor-ing branches, and thereby disposes the part to have a more free circulation after the division of the artery; but when the tumor is large, the palliative method should not be long continued, because it injures the neighbouring

parts, and will occasion more inflammations, floughings, &cc. when the operation is performed.

The prefiure, whether before or after the operation, floughings are considered as much as possible to the affected part, that the passage of the blood through the anastomosing veffels may be free, by which we may prevent the morti-fication which fometimes enfues, for a want of a free cir-

Some few inftances of fmall aneurifms and punctures of the artery from bleeding, have fucceeded by the use of bandage, but they almost all require the operation at last, which is performed nearly in the fame manner in every part; but larger aneurisms cannot receive any advantage from the prefiure, therefore where it hath been used long enough as a preparative to the operation, the fooner it is performed the better.

Mr. Bell observes, in his System of Surgery, that in diffused or false aneurisms, pressure cannot be applied to the artery alone, without at the fame time affecting the refluent veins; and as this circumstance, by producing an increased resistance to the arterial pulsations, must undoubtedly force an additional quantity of blood to the orifice in the artery, that therefore no advantage is to be expected from it; but on the contrary, that on many occafions there is reason to suppose it hath been productive of
mischief. But though preffure ought never to be attempted in any period of the diffused aneurism, yet in
some stages of the other species of this disease, it may be often had recourse to with advantage. In their early ftages, while the blood can be yet preffed entirely out of the fac into the artery, it often happens, by the use of a bandage of fost and somewhat elastic materials, properly fitted to the part, that much may be done in preventing the fwelling from receiving any degree of increase; and on some occasions, by the continued support thus given to the weakened artery, complete cures have been at last ob-

perceived a strong pulsation from the stroke of the adjacent artery; and from tumor formed from ruptured veins.

The aneurism of the aorta may prove satal many ways: it more and more injuries the general health, as it continues proved useful, it ought never to be carried to a great length; tight bandages in these cases always counteract the intention. Indeed, the greatest length to which it more and more injuries the general health, as it continues profiser ought to go, should be to serve as an easy support to the parts affected, and no farther. With comparing the profiser ought to go, should at the same time be used. pression, other means should at the same time be used, fuch as low diet, occasional bleeding, a lax state of the bowels, freedom from strong exercise, &c.

### THE OPERATION FOR THE ANEURISM.

Having taken away fome blood, and promoted fuch other discharges as seemed needful, apply the tourniquet near the shoulder, supposing the humeral artery to be the seat, tighten it so that the pulse cannot easily be perceived; lay the arm in a convenient fituation, then make an incition on the infide of the biceps mufele, above and below the elbow, a confiderable length, which being in the course of the artery, will discover it as soon as the coagulated blood is removed, which must all be cleared away, the wound being dilated for that end. Be eareful not to cut the larger veins, nor the bag; the fame attention is were flying in cutting the armount of the birth of the b tion is necessary in cutting the aponeurosis of the biceps; for this aponeurofis, the capfula, the bag, and the fking feem all united.

If the orifice does not readily appear, let the tourniquet be loofened, and the effusion of blood will direct you to it; then carry a crooked needle armed under it, tie the veffel just above the orifice, and when you have fecured the upper part, flacken the tourniquet a little; for if on flackening it, there is any havenorrhage from the inferior parts of the artery, it plainly appears that the collateral branches are open, and that there is a free circulation. The first ligature secured, make a second a little below the orifice, and leave the intermediate space of the artery to

flough away without dividing it.

Avoid taking up the nerve with the ligature, if you conveniently can; the readiest method to do which is, as it lays on the infide, at a little diffance from the artery, to relax that veffel by bending the arm moderately, and to raife the artery from its bed by a probe introduced into its orifice, or by pinching it up with the finger and the thumb: the nerve is eafily diffinguished from the artery by feeling, fo the artery may be drawn from the nerve. If the nerve should be taken up, a portion of the adjacent shesh being taken up with it, no inconvenience need be feared.

After the operation, the limb is generally fome little time without pullation, which, if it does not recover in

twenty-four hours, amputation is not to be deferred. In the Lond. Med. Obf. & Inq. vol. ii. page 360. is an inflance of an aneurism in the arm being cured, by proceeding in general as above, but instead of the ligatures a fteel pin was paffed through the lips of the orifice in the artery, and fecured by twilling thread about it, as is done on the hare-lip; after a few days the pin came away with the dreffings.

See instances of aneurifus in the thigh, being cured, in the Lond. Med. Obs. & Inq. vol. iii. p. 106. And in the Edinb. Medical Commentaries, vol. ii. p. 176. Also in

Warner's Cases of Surgery.

ry, p. 115.
ANEURISMA PRÆCÓRDIORUM. Aneurifm in

the heart, or in the aorta near the heart.

ANFAKA. A COAGULUM.

ANFIAN, fee OPIUM.

AN-FIR-FILIUS. MERCURY.
ANFRACTUOSUS. ANFRACTUOUS. Full of windings: called anfractuofities.

ANG. ET ANGUIL. The abbreviation of Simplici

ANGEIOTOMIA, from ayluer, a veffel, and reuse, to cut. An opening of the veffels as in arteriotomy and phlebotomy. It also fignifies a particular diffection of the

veffels for anatomical purposes. See Angiologia.
ANGEIOTOMISTA. An Angeiotomist. A perfon skilled in the course of the blood-vessels, or who can

diffect them readily.

ANGELICA ARCHANGELICA. | called alfo imperatoria | Sativa, | Sativa, berba pettoraria, and garden angelica. It is the angelica, archangelica, foliorum impari lobato. Lin. — Sylvestris minor, called alfo agapodium, berba Gerardi, podagraria, GOUT-WEED OF WORT, WILD ANGELICA, and ASH-WEED.— SYLVESTRIS MAJOR. WATER ANGELICA.

The garden angelica hath the odd leaf at the end of

each rib, and generally fome of the others cut into two or three lobes. It is found by the fides of rivulets, on the mountains of Lapland, and is cultivated in gardens all over Europe; the best is faid to be produced in Bohemia and Spain; but Linnaus fays that the best is that which grows on the mountains in northern countries. It is a biennial plant, but if the stalks are cut down before it flowers, the roots fend forth new heads, and may thus be continued for many years. The roots are in the greatest perfection in the second spring; they should be well dried and kept in a dry place, and frequently aired, or they grow mouldy, and are the prey of worms. The whole plant is used, and by some hath been so much esteemed as an alexipharmic, as to have obtained the name of princeps alexipharmacorum. Many hold the English angelica in a much efteem as the Spanish, and fay that the latter dif-fers from the former only in having been long kept, by which the difagreeable flavour of the fresh roots is lost. Though all the parts of this plant poffefs the fame virtues in a great degree, yet the root is the ftrongeft. It refembles zedoary as a medicine, but is milder, and it is a good carminative. Externally applied, it discusses inflammative to the part of the pa tory tumors in cold habits.

The feeds come nearest to the roots in point of medical

virtue, but scarcely retain either their vegetative or me-dicinal power until the following spring. The leaves lose nearly all their virtue in drying. A ftrong water is obspirit of wine best extracts the refin, in which the virtues

refide in the dried roots.

The stalks and the roots are candied in the same man-

ner as the ERYNGO, which fee.

Dale reckons up four species of angelica, they have all faller virtues, chiefly differing in the degree, but the above is the best. The wild fort in use, is the angelical faller of the control of the c fylvestris, foliis æqualibus ovato-lanceolatis ferratis. Lin-HRUS. — ARBOR. A fpecies of the herb Christopher.

— ARBORESCENS SPINOSA. A fpecies of the herb Christopher. Also a species of arelia. — CANADENSIS TRIFOLIUM. A species of myrrhis. — MONTANA PERMITSIS AND ARBORES OF ARELIA OF A PERMITSIS AND ARBORES OF A PERMITSI RENNIS PALUDAPII FÓLIO. COMMON LOVAGE. See LE-VISTICUM. -- PRATEMSIS APII FOLIO. A Species of the oreofelinum. Also a name of the English faxifrage.

ANGELICUS, PULVIS. See MERC. VITA.

ANGELINA ZANONI ACOSTÆ. Castanea Mala-

barica angelina diela, ansjeli.

It is a large tree, growing to the thickness of fixteen feet in diameter; it is met with in Malabar and the East Indies, on fandy and rocky grounds. Its fruit is ripe in December, and continues bearing one hundred years. It is not remarkable for any medical properties. See Raii

ANGELOCALOS. The true name of the twenty-fourth name of Myrepfus, and not as is commonly writ

ANGELYN. See ANDIRA. ANGI. BUBOES in the GROIN. ANGIGLOSSI. STAMMERERS.

ANGINA, from ay xu, to firangle. A QUINSY, also

called cynanche.

It is an inflammation in the parts of the throat that are fubservient to respiration, speech, and deglutition; by fome it is called a strangulation of the sauces, by others, and most properly, an inflammation of the internal

When the disorder is epidemic, it is so usually between the fpring and fummer, and after a long run of cold and rainy weather.

The true quinfy, the cymanche tenfillaris of Cullen, is an acute inflammatory diforder.

The baftard quinfy is a lymphatic and catarrhal one, and

its fever is not acute but rather chronical, being of the catarrhal kind.

The Greeks give different names to the true quinfy, according to the respective parts on which this disorder falls; but various authors among them also differ in naming them; fo the Latins, confidering the diforder as one, wherever its violence might have more peculiarly been manifested, included them all under the name angina: and we, after their example, under that of quinfy. curious may fee the various appellations given to the dif-ferent circumstances of this diforder, in the writings of Arctæus, Cœlius Aurelianus, Hildanus, and Alexander Trallian.

Dr. Cullen's generic name for quinfy is cynanche, which he places in the class pyrexiæ, and order phlegmafiæ: and diftinguishes five species. 1: Cynanche toasitlaris, when the inflammation begins in the tonsils and affects only the mucuous membrane of the fauces: 2. Cynanche maligna, also Ulcerofa gangranofa, when the fever is of the low kind, and ulcers are formed in the fauces. 3. Cynanche trachealis, when the traches is so affected as to constitute the disease called the CROUP. See SUFFOCATIO stribula. 4. Cynanche pharyngea, when the pharynx is principally affected. 5. Cynanche parotidea, when the external parotid and maxillary glands are so affected as to form the difease called the MUMPS:

The feat of this difease, i. e. the cynanche tonfillaris, is properly in the upper part of the throat, particularly those parts of it that form the pharynx and the larynx, as the root of the tonge, the os hyoides, the passages of the nof-trils which open into the mouth, the pharynx, the inter-nal and external muscles of the larynx and pharynx, which are thirteen in number, the mufeles which move the jaws, the fine ramifications of the blood and the lymphatic veffels, and the adjacent nerves; also the tonfils,

Mr. Pott fays, that the inflammation of the tonfils conflitutes this diforder; that, if they partially cover the pharynx, it is a fpurious; and if they that it entirely up, it is a complete or true quinfy. Dr. Cullen defines it to be an inflammation of the mucous membrane all over the inter-

The young, the fanguine, and on those in whom an inflammatory diathesis is attendant, are most disposed to the true quinfy. A disposition to it is often acquired by habits, that is, by a few repetitions of its returns.

The cachectic, and those who are subject to catarrhal fevers, are much inclined to the bastard quinfy.

The causes are the same as are productive of inflammation in general; particular conflitutions, &c. determine the inflammation to particular parts. The true species is excited in fanguine habits; the spurious in phlegmatic

Coelius Aurelianus gives the following accurate description of the true quinfy. the fymptoms are, first, pains without any evident cause, a difficulty of moving the neck and throat, a confiderable discharge of saliva without any vifible tumor, with a dull pain and fenfible afperity of the fauces, a difficulty of fwallowing the usual fluid which gathers in the mouth like spittle; after these, an impediment of respiration, as if clogged with some gross humour. As the disease increases, the part grows red, with a manifest tumor, at length the fauces, uvula, parts about the tongue, and upper part of the throat, are elevated by the humour to a remarkable degree, which is attended with a difficulty of fwallowing, besides a strangulation in proportion to the tumor, a difficulty of breathing, and a nausea: if the mouth be opened, a dry tension of the tongue is per-ceived when it is pressed with the singer. When this disorder is increased to a great degree, the tumor fpreads over the neck and face, the mouth flows with faliva and a viscid humour; the eyes are prominent and blood-shot, and the veins are distended. As the difease increases, the tongue fwells, and is forced over the teeth; there is a drynels of the fauces, a cold numbnels of the joints, a frequent pulse, a difficulty of lying on the back or the side, with a defire to fit up, and an inarticulate confused speech, not without pain. As this complaint tends to destroy the patient, he grows worse, becomes livid in the face, and speechless, there is a sterior in the throat and breast, and fails; fome utter a voice like a dog, others only froth at the mouth; upon these symptoms death necessarily ensues. If the disorder is without a manifest tumor, there is a slenderness of the neck, with an inslexible erection or ex-

tension of the same; the face and eyes are hollow, the forchead is distended, the colour livid, respiration extremely difficult, but with no manifest tumor either inwardly or outwardly, the patient is extremely feeble and dull, and dies under a very quick and acute fuffocation.

See Acut. Morb. lib. iii. cap. 1, 2.
Boerhaave observes, that if the internal muscular membrane of the afpera arteria is the feat of the difeafe, a tumor, heat, burning pain, and acute fever are excited, without any external figns of the diftemper; in this case the voice is small, shrill, and uttered with a hissing noise, inspiration is very painful, respiration is small and frequent, and fearcely performed but in an creet posture; hence the circulation through the lungs is impeded, and the pulse foon finks, great anxiety comes on, and the pa-tient foon dies. The nearer the feat is to the glottis and epiglottis, the more fatal it is.

If the inflammation is feated in the mufculus albus of

the glottis, together with the flethy mufcles which close it, the passage of the air to the lungs is foon closed up. The figns of this species are the same as the preceding, only that the pain is exquifite during the elevation of the la-rynx in order to fwallow, and is remarkably increafed by fpeaking, the voice is firill and acute, excessive anxiety comes on, and death approaches sooner than in any other

fort of the true quinfy.

If only the muscles which elevate the os hyoides and larynx are inflamed, it is thus known, respiration is tolerably free and easy, but the first part of the action of swal-lowing is very painful.

When the pharynx alone is affected, the specific signs are seen by examining the fauces; breathing is tolerably eafy, fwallowing very painful, or fometimes impossible; and then that which is attempted to be swallowed, returns by the nofe, no aliment can be taken; and in this case, the fluids of the body are apt to become the more acrid; however, the fever, in this case, is not so acute as in some

others, nor is death fo fpeedy.

If the tonfils, uvula, and velum pendulum palati, with the muscles called pterygostaphlini, are much inflamed, nearly the same symptoms will arise as in the preceding case, respiration is rather more laborious, and is little or not at all performed through the nose, and by the sauces not without some difficulty. What is attempted to be swallowed, is forced through the mouth again by reason of the great pain which it excites, there is a perpetual difcharge of faliva, by hawking, and a continual copious diffillation of phlegm into the cavities of the tonfils, an acute pain is left in the internal ear and in the Euftachian tube, a crackling noise is perceived in the ear during the action of swallowing, and sometimes a deafness comes on. The venereal disease often causes this species, which then is dangerous.

If all or most of these parts, are inflamed, the case is indeed desperate, for the return of the blood through the compressed jugulars being intercepted, the sauces, lips, tongue, and sace swell, the tongue hangs out of the mouth, and is greatly inflamed, the eyes are red, prominent, and ghaftly, the brain is glutted with blood; hence the fight, hearing, and feeling, are all dull; hence also a delirium, yawning, ftertor, impossibility of lying down, because of the strangulation attending that posture, and a manifest redness, tumor, pain, and pulfation in the breast and neck; whence the jugular and frontal veins, and the venæ ra-

ninæ, become varicofe.

To these observations of Boerhaave may be added, that the proper fymptom of a quinfy is, the difficulty of fwal-lowing as well with respect to folids as fluids; for if a lowing as well with respect to solids as fluids; for it a large tumor affects the top of the ecsophagus, and contracts it, the liquids, but not folids, may pass through it; but if the tumor be seated in the top of the larynx, where it is covered with the epiglottis, solid substances, by pressing the tumid epiglottis, find a way to the ecsophagus, while liquids, not pressing with that force which the solids do, slide through the gaping space by the tumor, into the asperia arteria, and there cause great uncassings.

The true quinfy must be distinguished from the bastard purge be given, such as the following:

all he strives to drink regurgitates at the nose, the pulse species, particularly that called the dry; from the prufails; some utter a voice like a dog, others only froth at the mouth; upon these symptoms death necessarily ensues. If the disorder is without a manifest tumor, there is a disorder is without a manifest tumor, there is a disorder of the neck with an inscrible coefficient of the muscles and parallels. a spasmodic contraction of the muscles, and paralysis; from the gangrenous quinfy; from a tumor of the tonsils and of the uvula; from that pain in the glands in and about the fauces, and tumor observed in some scorbutic and venereal patients, when their diforders are obflinate and accompanied with erofion; and from aphthæ. It fhould be remembered that every inflammation in the throat is not a quinfy, that only being one which is at-tended with fever, difficult respiration, and difficult fwal-

The most violent, and also most dangerous kind, is that which is feated in the internal mufcles of the larynx; but the danger is generally estimated by the degree of the fever, and the difficulty of breathing, which last is the worst when the thyroarytænoid muscles are affected, as their office is to close the larynx. A sudden translation of the instammation from the external parts is dangerous; for fometimes a delirium and convulfions follow, or per-haps a mortal peripneumony; if the troublefome fuffoca-tion abates, and thepain, with the inflammation, appears more outwardly, the difeafe may end well; if otherwife, an abfects will be formed in the throat, and danger will attend its discharge: a symptomatic quinfy is dangerous, on account of the weakness from the original disease; a on account of the weakness from the original cheate; a frothing at the mouth, a confiderable fwelling in the neck, a dufky redness of the tongue, coldness of the extremities, a great contraction of the pracordia, anxiety, and a hard convulsive intermitting pulse, are dangerous prognostics; a gangrene in most parts of the throat are fatal. If an eryspecies appears on the neck and breast, and continues, it is a good prognostic, but suddenly disappearing it is fatal; much viscid saliva is a bad sign in the height of the disease, because it indicates a great degree of strangulation; but in the decline it is a favourable symptom,

ariting then from relaxation: great pain in the head, or elfewhere is very unfavourable.

The diet should chiefly confist of thin cooling liquids, as thin water-gruel, barley-water, very weak whey, chicken-broth, &c. all which should be drank at least as

warm as new milk.

The patient should fit up in the day for some hours at least; he should avoid speaking as much as is convenient; his feet and legs should be put into warm water for some minutes twice a day; and his neck should be kept warm with flamel.

In general, the treatment should be the same as in the inflammatory fever; for in this difease, the fever, and particular inflammation, being reduced, the cure is ef-

fected.

Begin the cure with a free bleeding from a large orifice Begin the cure with a free bleeding from a large orifice in the arm, and repeat the operation according to the violence of the fever; if the heat and itrength of the puffe require it, the bleeding may be ad deliquium, in order to which the patient may ftand up during the difcharge of the blood, affiftants being ready to fupport him when the fainting comes on: though fuch free bleeding will not often be required. Bleeding under the tongue hardly ever feems necessary; a few leeches fet on the external fauces, would be far more useful; the ligature used about the would be far more ufeful; the ligature ufed about the neck, by retarding the circulation above it, may be as prejudicial as the small discharge of blood therefrom is ufeful.

According to the feverity of the fymptoms, let blifters be applied to the back and behind the ears: thefe latter may be larger or lefs, that they may extend down the fide of the neck, and in some degree round it. For the encouragement of the humours outwardly, fir John Pringle, besides the application of a blifter on the back commends another to be laid across the throat. The application of blifters needs not take place until after a free bleeding, and the operation of at least one brift purge; after which, or during its operation, apply a blifter to the back, and the next day another on the throat: thus a more ufe-ful effect is observed to follow than if both had been applied together. Keep then running until the diforder is overcome, elfe as the parts heal, the inflammation will be apt to return.

As foon as the patient is bled, let a brifk but cooling

# 8i 7

R Inful. sense 3 iij. natri vitriolati, 3 fb. ad 3 i.m.

The passage of this purging draught may be hastened down by a clyster, in which 3 i. of nitre may be dissolved, if the sever runs high. If possible this draught should be daily repeated during the first three or four days; if they cannot be swallowed, purging clysters, with nitre in them, must be daily administered until medicines can be taken by the mouth. Gentle purging should be continued through the whole course of the disease.

Gargarifms are immediately to be used, but acid ones are to be avoided until the decline of the disease, for they are hurtful by contracting the emunctories of the faliva and the mucus, and by thickening those discharges: the following should be used at this time, for it thins the faliva, and causes the glands to secrete and excrete their contents more freely.

R Decoct. hordei compositi fo i. sal ammoniaci 3 ij.

As inflammations about the fauces are differently cir-cumflanced, the following observations, with respect to

gargles, thould not be unnoticed.

1. In case of great pain and heat avoid the use of a fyringe, and encourage the patient in frequently washing his mouth and throat, with whatever is appointed for that end: hartihorn jelly, or the julep of roses, with a little nitre and camphor, would be adviseable here.

2. If the throat is dry, the tongue burns and fwells, and the breathing and fwallowing is difficult,

R Alb. ovi (bene conquaffat. ad liquor. aquof.) 3 ij.

aq. rofar. & fyr. moror. 22. 3 i. fal prunel. gr. xv. m.

3. If the quinfy is of the latent internal kind; wash the mouth and throat frequently with milk and fal prunelle.

4. The inflammatory pain, from the flagnation of a tharp faline ferum in the glandulous part of the throat, near the feat of the pharynx and larynx, attended with a redness, and a copious discharge of faliva, but not a sever, is best discussed in the beginning by a gargarism of brandy alone, that is somewhat below proof.

When a copious foul ferous humour falls upon the

glands of the palate and throat, detergent gargarifms, fuch as the following, are to be freely used.

R Zinci vitriolati purificati 3 i. aq. purifim. fb i. m.

6. If the mouth only is dry and parched, an emollient gargle, such as that with the compound decoction of barley and fal ammon. suffices.

7. In inflammatory quinfies, acid gargles may be used after the inflammation is fomewhat abated, and not before; at which time

R Infufi role 3 iij, acidi vitrioli diluti gt. xv. m.
In the intervals, when purging medicines are not operating, give cool nitrous and faline medicines, with small doses of the antimonium tartarisatum in them, as is usual

in the ardent and inflammatory fevers.

The promoting of external inflammation about the throat lessens that which is internal; hence stimulants, fuch as the linim. ammoniæ have been applied to the neck and throat, by means of flannel dipped therein, or

the following may be used.

3 ss camphor. 3 s. m. f. linim. cum quo inung. fauces
externæ sepius. But if a blister across the throat can be complied with, its effects, though flower, will be more

advantageous.

If the external inflammation is confiderable, a difcutient fomentation and cataplasm may be applied, or, in their ftead, the following limiment may be rubbed on the neck and throat three or four times a day, and flannel rags may be constantly kept on, being moistened with the

R Camph. q. v. ol. oliv. q. f. fiat linim. molle.

If a fpeedy fuffocation is threatened, proceed to bronchotomy, while the strength of the patient gives some

flattering hope that he may recover.

If fuppuration cannot be prevented, forbear evacuation and all repellents. When the fuppuration takes place, the fwelling abates, and the fymptoms are lefs violent, the pus opens itself a way either externally or internally; if externally, the ulcer is easily cured, if it does not form finuses; if internally, the matter falls into the lungs and produces ulcers there. That the absects is formed, may be known by a general upenfines. formed, may be known by a general uneafinefs, a pain

tions on the gums, and infide of the cheeks and lips, with a difagreeable tafte and odour. In this case cataplasms should be applied warm on the throat, and the fteam of warm vinegar, mixed with water, should be received with the breath; and as foon as a fluctuation of matter can be perceived, puncture the absects, that the matter may, if possible, be discharged at the mouth, after which gargle with the following:

R Infusi rose 3 vi. tinck. myrth 3 ß acidi vitrioli

dilut. gt. xx. m.

If the patient is not deftroyed by the respiration, deglu-tition, or the brain being affected, this disorder terminates as other inflammations, by refolution, suppuration, or a mortification.

We should observe, that when a difficulty of swallowing is not attended with acute pain, or inflammation, it is generally owing to an obstruction of the glands about the throat; it only requires that the patient be kept warm, and the throat gargled with fome gentle ftimulant, as a decoction of figs with a little vinegar or honey, or the flour of mustard: this fort of quinfy is called the pap of the throat, the falling down of the almonds of the

cars, &c.

See Arctaeus, Cœlius Aurelianus, Hildanus, Trallianus, Hoffman, Boerhaave, Le Dran's Operations, Wallis's Sydenham, and Fordyce's Elements, part ii. Cullen's First Lines, i. 279, edit. 4.

ANGINA AQUOSA. See Angina gangrena; also a kind of analarca. See Boerh. Aph. 791.—The Gangrena, called also gangrena aquosa, angina maligna, angina sufficativa. ERYSIPELATOUS, ULCERATED, MAangina fufficativa, ERYSIPELATOUS, ULCERATED, MA-LIGNANT, OF PUTRID SORE THROAT. It is the cynanche maligna of Dr. Cullen.

It is a putrid remittent fever, accompanied with an ulcerated fore throat, or with an inflammation of the mucous membrane. Though this is generally confidered to be a difease of the whole habit; still there are some circumftances attending oftentimes the cure, to make us believe it may now and then only be local, for at the onfet it will not unfrequently yield to vomits, and gar-gles, and local bliftering; though at others all the differ-ent fymptoms attending this fpecies have been prefent without any ulcers in the throat.

This malady is most frequent in autumn, generally at-

tacking children and weakly relaxed adults

It is often produced by exposure to infectious vapours; when it is not, cold is the most probable cause, in habits already hereto pre-disposed. The breath of these patients is infectious.

It fometimes begins with rigor, horror, and coldness, which are followed by a great heat; when an inflamma-tion affects the throat, there is first a fiery redness there, fometimes without any fwelling, at others there is a confiderable but puffy one, which does not prevent the fwallowing nor the breathing in any confiderable degree, a foreness rather than pain is felt in the throat; the parotid glands often fwell and are painful; whitish sloughs appear in the fauces, not rising above the surface of the mem-brane, which are often surrounded by a redness, and, according to the degree of the difease, are from a very florid colour to that almost black; these sloughs generally change to an ash colour, and fometimes to a black one; they give an offensive smell to the breath, spread wider, and run deeper, until the patient is cut off, or the floughs fall off, leaving ulcers; but fometimes the patient recovers without any fensible separation. If the disease is violent, the mucous membrane in other parts of the body are affected; head-ach, faintnefs, and anxiety, with fick-nefs, vomiting, or purging, attend at the beginning. Those usually go off in about twenty-four hours, but if they continue, the danger is much increased thereby; the eyes appear red and watery, the nostrils are inflamed, and they discharge a thin and acrid fetid matter, which exceriates the nostrils and lips; and fometimes an hæmorrhage comes on by the third or fourth day, or per-haps later. After two or three days from the beginning an eryfipelatous inflammation appears externally on the throat, and also on the extremities; this eruption relieves the fickness, purging, and other disagreeable symptoms. The pulse is seldom hard or full, but is often frequent and fmall; the fever in the evening is inconfiderable, In the mouth, thivering and transient heats, a fensation of being often attended with a delirium; but in the mornthickness and heaviness in the tongue, small white erup- ing a moderate sweat comes on, which for the present

### ANG 82 ANG

relieves the patient : though the fymptoms regaining their ftrength; the patient fometimes falls a victim to their

force in three, four, or fix days.

Care should be had to diffinguish this fort of complaint from the catarrh, the fpurious quinfy, aphthæ, and other

exulcerations in the mouth.

A fetid ichorous discharge from the ears often attends the worst and fatal eases; but when the patient recovers, indurated parotids and deafnefs enfue.

### The indications of cure are.

1. To support the vis vitre.

2. To promote perspiration, or evacuate the accumulated ferum.

To refift the patrefaction.

3. To relift the patteraction.

The whole danger depends on the flate of the blood, which is a putrid one, accompanied with that which is attendant on low nervous fevers: though the pulfe, and other fymptoms, may feem to indicate evacuations in the beginning, they are cautiously to be admitted, for the natare of this kind of quinfy is fuch, as foon to produce the fame effects in the conflitution, as are brought about by bleeding, purging, &c.

The patient should be kept in bed, but not much warmer by the use of cloaths than when in health; the air may be refreshed and purified not only by opening the windows now and then, but also by the vapours from boiling water, in which is infused myrrh, rosemary-flow-ers, or vinegar; \$170ng whey, made with good Mountain or other wine, may be the common drink; and if there is much fickness, give mint tea, or red wine and water aci-

dulated with the acid of vitriol diluted.

Begin the cure with an emetic, which should be given as speedily after the attack as possible, thus the symptoms are rendered much more mild.

R Antim. tartar gr. 6. ad gr. i. fs. aq. font. 3 iv. m. bibat calidam superbibendo infus. flor. cham. & post operat.

R Conf. aromaticæ 3 f. p. rad. contray. gr. x. aq. alex, fp. cum aceto 3 ij. aq. pur. 3 i. fs. m. f. hauft. & 4ta. quaq. horá repetend.

This kind of emetic tends to more advantages than any other in this diforder; and if there is either a vomiting, or purging, or both attendant, they are much alleviated by it.

If the purging continues, check it with either ftimu-

lants or opiates

R Spec. e fcord. 3 iij. aq. cinnam. 3 vi. fpt. cinam. 3 i. fumat. cochl. i. fs. post fingulas fedes liquidas. Though in other fevers bliftering is not adviseable in

the beginning, in this the earliest use of them is to be encouraged, and the following method of preparing them is recommended by Dr. Percival of Manchester.

R Empl. stomach. vel e cymino p. ii. vessicator. p. i. Camphor. pulv. 3 i. fs. m. f. empl. inter scapul. applic.

He farther observes, that in this case the skin is easily inflamed, fo that this mild plafter fufficiently discharges the ferum, and at the same time is antiseptic. In the first stage of this disease, a blifter to the back, or to each fide of the throat, produces very falutary effects; but as the skin is particularly disposed to inflammation, inconveniencies sometimes arise from the too powerful stimuli of the common blifter plafters, whence the above prefcribed one is preferred. When the plafter is fpread, warm it gently, and lay on its furface a thin piece of muslin; thus it irritates lefs, produces lefs strangury, and thus it may fafely be applied even where the fkin is eryfipelatous.

Gargles made of acids and aftringent ingredients, may be thrown into the fauces by means of a fyringe, if the

patient cannot use them without.

R F. rofar. 3 viij. acidi vitrioli diluti gt. xii. alum. rup. 3 f. tinct. myrth. 3 i. m. f. garg.

Rad. ferpentar. virg. 3 ij. coque per femi horam, colatur, & adde acetum acerrim. & tinct. myrrh. aā 3 i.

mel. opt. 3 ij. m.

One of these gargles should be frequently used, the mouth and throat should be constantly kept clean therewith; and always before the patient swallows any thing, let him wash his mouth and throat well with it.

The contrayerva is also used in gargles for this kind of fore throat; but as an antiseptic it is better to use myrrh dissolved instead of it.

The bark is the principal medicine, and the most to be relied on. It should be given with red wine, if the pulse does not forbid, which it rarely does; but if it increases the anxiety, it must be omitted.

If the floughs do not feparate, touch them with an arm-ed probe dipped in the following:

Ř Infusi rosæ ž ij. oxymellis æruginis. 3 ij. m.

vel

R Aq: pure 3 ij: acidi muriatici q. f. ad grat. acid.

If the ulcers foread faft, the bark must be given, or a cold infusion of it, as freely as the stomach will admir.

If the tonsils are much swelled, blifter the back, and

behind the ears, and use one or other of the above gargles,

freely.

If the heat is exceflive, add to the bark the fp. rether nitrofi, or the fp. febrif. Di. Clutton. It should be obferved that the vegetable acids are apt to produce a diar-rhoea, and nitre does more harm by leffening the vis vitæ than it does good by its antifeptic property, fo neither of them are to be admitted in these cases; but the mineral acids are free from those ill' effects, and are both good antifeptics and diaphoretics, and the above named ones may be freely given in all that the patient drinks.

If any eryfipelatous appearance is observed about the fauces, &c. or if they are tumid and ulcerated, immediately use the steam from vinegar, myrrh, and honey, as hot as can be borne, and use it often. It is detergent and antiseptic, and preferable to any of the gargles.

A cataplasm of the bark and camomile flowers, boiled in vinegar, with the addition of camphor 3 i. fs. or 3 ij. laid across the throat, and renewed every four hours, greatly foftens and relaxes the glands of the neck, it exhales an antifeptic vapour, which is drawn in by the mouth at every infpiration, and much is also absorbed from it. Incases less important, instead of this cataplasm, flannels may be applied to the neck, after being dipped in spirit of wine camphorated, and sharp vinegar, mixed in court and the state of the second necks. in equal parts.

A pediluvium made with the bark and camomile flowers boiled in vinegar and water, may be used three or four times a day; if the patient is too feeble to fit up, let flannels be wrung out of this decoction, and applied to his limbs. Befides the relaxing and antifpalmodic effects of this remedy, it tends to produce a fwelling in the feet,

which relieves very much.

Fixed air, separated during the fermentation of an alcaline falt with the vitriolic acid, is advantageously adminiftered by way of clyfter, or mixed with fome proper one.

See Aretæus de Causis & Signis Morborum, lib. i. cap. 9. Dr. Fothergill's Treatise on the Putrid Sore Throat. Dr. Huxham. Le Cat, Johnson, and Chomel, on this disease. EDOMATOSA. See ANGINA AQUOSA.--MALIG-NA & SUFFOCATIVA. See ANGINA GANGRENA .-PECTORIS. For the first account of this disease the world is indebted to Dr. Wm. Heberden of London.

The patient is feized whilft walking; and more particularly if he walks foon after eating, with a painful fen-fation in his breaft; the moment he ftands ftill this uncaliness vanishes: but after this complaint hath continued fome months, it does not cease so suddenly after resting; it will now come on even while the perion is in bed, obliging him to rife every night for feveral months toge-ther. In some inveterate cases it hath been brought on by very trivial accidents, fuch as coughing, going to ftool, by fwallowing, or by speaking, or any slight dif-turbance of mind. Sometimes, though rarely, it attacks while the patient stands or fits still. In some persons it is the worlt in winter, in others during the fummer fea-fon. When a fit approaches whilft the patient is walk-ing, its duration is fhort; but if comes on in the night, it will continue an hour or more. Now and then, though

rarely, there are feveral days before any remission is manifest; and, during this time, the greatest danger seems to be attendant. The pulse is, at least, fornetimes not difturbed with the pain, confequently the heart is not affected by it.

Persons of fifty years of age and upwards, with short necks, and who are inclined to be corpulent, are the most fubject to this difease; it is, though rarely, met with in

those who are far younger.

The natural tendency of this complaint is, to kill fuddenly, yet some continue affected with it for twenty

The feat feems to be in or about the os sternum, but always more to its left fide than to any other part of it: and a pain in the middle of the left arm is fometimes at-

tendant.

The cause is most probably a spasm or cramp, or an ulcer, or both. A spasm, or convulsion, appears most likely, from the suddenness of the attack, and as speedy departure, the long intervals of ease, the relief afforded by wine and fpirituous cordials, its generally bearing the motion of a horse or carriage so well, which circumstance often diftinguishes spalmodic pains from those which arise often diffinguilles spalmodic pains from those which arise from ulcers, and its coming on in the night after the first sleep, at which time asthmas, the night-mare, convulsions, and other disorders attributed to the disturbed functions of the nerves, are peculiarly apt to return, or to be aggravated. That an ulcer may also contribute to this disorder, seems to be suggested, because the patient foractimes spits blood mixed with a purulent matter, which forms too to come from the feat of the disorder. which feems too to come from the feat of the diforder.

In order to the cure evacuations have been tried, but to no purpose; though wine, and other cordials, taken at bed-time, will prevent or weaken the night fits: yet nothing does this fo effectually as opium; ten, fifteen, or twenty drops of the tincture of opium taken at bed-time, will enable those patients to keep their bed until the morning, who had been forced to rife, and fit up two or three hours every night for many months. This quan-tity, or more, may fafely be continued as long as it is required. Dr. Bergius, a Swedish physician, says, that this disorder is a kind of spasmodic asthma, and that it is relieved by a ftrong folution of the gum. ammon. e. g. gummi 3 f3. in aq. puleg. vel hylfop. fb f3. cap. cochl. ij. bis terve in die. ANGOS, a vessel; a receptacle of humours. ANGSANA, vel Ansava, called also drace arbor.

It grows in the East Indies; the liquor which diffils from a wound made in this tree is used as a medicine, when it is condensed into a gummy consistence. It is of a red colour, astringent, and is fold for dragon's blood. Raii Hist. Plant. Dale.

At is also the name for the dragon's blood tree.

ANGU. See Cassada.

ANGUILLA. The EEL.

Eels are nourishing. Those that are met with in rivers, or other clear running waters, are the best; as to their fize it is immaterial: the liver and the gall are extremely acrid. Boerhaave says, that no fishes have a more acrid gall; and that with a mixture of the galls of the eel and the nike, made into nills, he bath cured many rickety. the pike, made into pills, he hath cured many rickety children with hard and fwelled bellies.

The torporific eel, found in Guiana, in South America, if caught by a hook, violently shocks the person who holds the line: the same eel touched with an iron rod, held in the hand of a person whose other hand is joined to another, &c. communicates a violent shock to ten or twelve persons thus joining hands, in a manner exactly similar to that of the electric machine. No shock is perceived by the holding the hand in the water near the fish when it is neither displeased nor touched; but if it is angry, it can give a shock to a person at five or six inches distance. This shock is produced by an emission of electric particles, which the fish discharges at pleasure. On the death of the animal no such electric property remains. the death of the animal no fuch electric property remains, and then the Indians eat it.

ANIMAL. All bodies endowed with life and with fpontaneous motion are called animals.

All fubstances proceeding from animals are faid to belong to the animal kingdom, to diftinguish them from the

vegetable and the mineral classes.

The earth of animals differ not from that of vegetables in any respect yet discovered. Yet there are certain dis-ferences betwixt one animal earth and another, some being calcareous, others not, &c. See TERRA - EARTH,

animal and vegetable.

The oils and fats of animals, like the gross oil of veget-ables, are not of themselves soluble, either in water or in spirit of wine; but by the intervention of a third body, as of mucilage of gum, &c. may be rendered miscible therewith. The oils of animals differ from those of vegetables : Ift. The finer animal oils are not, like the vegetable, procured by a moift, but by a dry diffillation, that is by combustion, and hence all animal oils have an empyreumatic finell. 2dly. Though an acid is found in the fat of animals, yet in the diffilled oils of animal matter, a volatile alcaline property is found in them; whereas in the diffilled oils of vegetables there is always an acid. The volatile alkaline falts, therefore, contained in the oils of animals, is the reason why they are more pene-trating than the diffilled oils of vegetables, and have a more immediate tendency to put the blood into a com-motion. Two drops of the ol. c. c. intimately mixed with the ip. vini R. 3 B. are fufficient to produce a copious fweat for four men, if divided into four dofes; hence animal oils should be cautiously given to the young and fanguine.

The odorous matter of some animal substances, as musk, eaftor, &c. is like the effential oils of vegetables, foluble in fp. vini R. and volatile in the heat of boiling water.

The gelatinous principle of animals, like the gum of vegetables, diffolves in water, but not in spirit or in oil. Like the gums also it renders oil and fats miscible with water.

However, many animal juices differ greatly even in these general kinds of properties, from the corresponding ones of vegetables. Thus animal serum, which appears fimilar to vegetable gummy juices, hath this remarkable difference, that though it mingles with cold or warm water, yet, on confiderably heating the mixtures, the animal matter separates from the watery fluid, and concretes into a folid mails, if the heat is about one hundred and fifty by Fahrenheit's thermometer.

Animal fubitances become putrid much fooner than vegetable ones, and when corrupted are much more offen-five. See PUTREDO.

Animal matter, burnt in the open air, is refolved, like vegetables, into foot and affees, but with this difference, that no fixed alcaline falt can be obtained from the ashes, and that no acid vapour accompanies the fmoak. Exposed to the fire in close vessels, after the watery moi-flure, a volatile alcaline salt is obtained, together with an empyreumatic oil that is more fetid than that from vegetables.

ANIMAL BEZOARTICUM OCCIDENTALE. The leffer American deer. — BEZORADICUM ORIENTALE. The bezoar goat. — Moschiferum. The musk animal. See Moschus. — Zibethicum. The civet cat.

ANIMALCULÆ. A diminutive of the word animal; that is, they are such little creatures as require to be viewed through glasses, to differn them distinctly. Rain, as foon as it fails, contains many animaleulae, but fnow still more; the dew on glass windows is full of them. In

They follow their liquor, in which they fwim to the laft drop, and then for want of it, they feem to ftruggle and die; after their feeming death, put water to them, and they revive. When feemingly dead they are very flat, but if not past regain, they soon recover their plumpnefs.

Animalculæ chuse the surface of liquors, probably for

the want of air.

Dip a needle point into the oil of vitriol, then into a drop of liquor in which these animalcula are, and they instantly spread about to evade the acid, and soon drop down dead. If the needle is dipped in a folution of com-mon falt, or in the tincture of falt of tartar, the fame is observed to follow. Sugar, urine, and blood, speedily destroy them.

Vinegar contains animalcula like eels.

Default, and fome others, endeavour to prove that all difeafes are owing to animalcula; but it does not appear, that any animal substance contains animalcula until it becomes putrid, and then these are the effect rather than the cause of diseases.

The white matter which flicks to the teeth, abounds

with animalculae, and vinegar deilroys them. See Philof. Tranf. abr. vol. iii. Dr. Hook's Micogra-

ANIMALE DIPPELII, OLEUM. DIPPEL'S ANIMAL

The College of Phylicians of London, in their Pharmacopæia, have given the following prefcription for

making it:

R olei c. cervi. fb j. ter distilla - this will feldom produce it fufficiently pure, it will require, five, fix, and fome-times more, before it becomes the quid defideratum. Mixing it with quick lime, or powdered charcoal into Mixing it with quick lime, or powdered charcoal into a pathe, is faid to be a great improvement, thortens the process, and makes the product more limpid, as these fubstances keep down more of the gross matter, than would remain without such an addition. After it is made pure, it should be kept guarded from the access of air, else it will soon be spoiled, by its free absorption of dephlogisticated air, on being too much exposed to the atmosphere. Observations on the Pharmacop. Londingolis. 1788.

nenfis, 1788.

Animal sils thus rectified are thin, limpid, and of a fubtil, penetrating, not difagreeable fmell and tafte. They are anodyne and antifpalmodic in doles from fifteen to thirty drops. Hoffman highly extols them; he fays that a dole excites fweat, and supports it for twenty-four hours, without caufing any langour or debility. He far-ther observes, that if twenty or more drops are given on an empty flomach, fix hours before the accession of an intermittent fever, they frequently remove the diforder; and that they are effectual against chronical epilepsies and other convulsive fymptoms, especially if given before the usual time of the attack, and preceded by proper evacua-

They lose much of their quality by keeping.

The empyreumatic oils of vegetables, rectified in the same manner, become possessed of the same effects as those of the animal kind.

All empyreumatic oils diffolve in fp. vini R. and the more they are rectified, their folution therein is the easier, a circumstance in which they differ from effential oils, which by repeated distillations become more difficult to diffolve.

ANIMALIS FACULTAS. See FACULTAS & Ac-TIO. - MOTUS. ANIMAL MOTION.

From the elasticity of the fibres, and the distension of the cells in the cellular membrane, by the rarefaction of their contained fluid, from the effect of the fire converged from the earth to the blood, and thence carried to the cells of the cellular membrane, an action and re-action is begun and continued betwixt the vital heat and the fibres; and thus motion, particularly the involuntary, or that on

which life depends, is begun and supported.

Bellini, in his de Motu Cordis, when speaking of the egg, and the first appearances which follow the application of heat, says, that the nervous system is the first which is expanded by the heat of incubation.

boiled water the faint their shape, and fometimes revive.

The animalculæ get in shoals in the study step fire of repelling the particles of sluids, which are non-clecking the many hours before they are collected together.

As to the motion of the heart, let the power lodged in fire of repelling the particles of sluids, which are non-clecking, and of acting by pulsation, be considered; also will be many hours before they are collected together.

cells of the cellular tunic; that the cellular membrane water, except in diffillation, by which it gives a part of furrounds every fibre in the heart; and that each of these its flavour, and a small quantity of oil. fibres is elastic: thus then, the first communication of heat from without, whether by incubation from the hen, or other external fire communicated to the foctus, will be carried to the nerves, and dilate the fluid in the veficles of the tunica cellularis; and thus dilating every vesicle, must distend every muscular fibre, and increase the volume of the heart; but as it is the nature of fire to act by pulfations, and of elafticity to re-act, after being acted upon, the fire having finished its operation of distending the veficles of the tunica cellularis, and of lengthening the mufcular fibres, passes off through the body, and at that in-ftant the elastic power takes place in its turn, and con-tracts every individual fibre of the heart in its length, and confequently the diameters of the ventricles, which must have been distended by the influence of the fire, together with the diffension of the whole heart, are contracted by this elasticity in the fibres, and thus the blood, which it had received, is propelled from thence into the arteries.

The motion of the heart. The arteries being dilated by

the fame influence as the heart is, and contracted by the elaftic power of their fibres, the blood is driven forward

through the whole course of its circulation.

Thus the circulation of the blood is supported and continued through the animal, and the involuntary motion of the heart, auricles, and arteries, are accounted for by those

alternate powers of dilatation and contraction.

And hence it appears, that the whole propulite power lies not in the heart alone, for every possible part of the arterial tube hath the fource of dilatation and contraction in itself, that is in its cellular membrane and fibres, confequently of continuing the motion which was imparted to the blood by the action of the heart.

The voluntary motions too depend on the powers and influence of the animal heat or vital fire, under the dominion of the will. The vital fire is contained in the brain, medulla fpinalis, ganglions, and nerves, in a quantity fomewhat exceeding the requirements of the involuntary motions; and the voluntary exercise of any musicle depends entirely on the greater quantity of this fire, determined thither by the act of volition.

In the involuntary motion of the heart, quite different effects are produced by the fame principles of action, from what follows their effect in the mufcles fubfervient to the will; that is, the heart is dilated in all its parts by the vital fire, but the muscles of voluntary motion are contracted: this follows from the fingle circumstance of those

last muscles being fastened at each end.

See the Theory and Practice of Physic. by J. Sheb-beare, M. D. Maganife's Doctrine of Instammation, p. 31—52. Haller's Physiology, the Lecture on Muscu-lar Motion. Kirkland's Differtations on the Brain, Nerves, &c. -- SPIRITUS. ANIMAL SPIRITS. See CA-

ANIMATIO. Animation. The particular effect produced by the vis vitæ in all animated bodies, by which life is begun, and supported. Also, an enigmatical word used by alchemists in their employ of transmuting metals. Quickfilver is faid to be animated, when, by conjunction with a perfect metal, it is reduced to a certain species.

ANIME. The Portuguese corrupted the word anime

into anime.

The gum anime is also called RESINA ANIME & refina courbaril, aminera, animum. Piso calls the tree from whence it is obtained, jetaiba, and the Indian call it courbaril. It is the hymenera courbaril of Linnaus.

J. Bauhine reckons up five species, but the whitest is

The gum anime is a transparent, yellowish-white, refinous gum, obtained from a large tree in Brafil and New Spain, and also in the eastern parts of the world. That from the East, Dioscorides calls by the names myrrha and minea; but in our flops we have no other than the American forts. The fmall tears are the pureft. It hath but little taffe, though to the fmell it is very agreeable. It eafily breaks between the teeth, but if chewed for fome time it foftens and becomes adhefive. If it is laid on a red-hot iron, it immediately melts, catches flame, and burns quickly away, leaving only very little white

It dissolves in sp. vini R. but is very little affected by

It is diuretic, the dofe is 9 i.

The gum copal is often fold for it.

ANIMELLA. The glandules under the ears, and all along under the lower jaw, also called lasticinia.

ANIMI, & ANIME DELIQUIUM. See LIPOTHY-

ANIMIFERA ARBOR BRANSILIANA. See Cour-

ANIMI PATHEMATA. AFFECTIONS of the MIND. ANIMOMETER. An inftrument that measures the

ftrength of the wind:

ANIMUS. The MIND. The body and the mind reciprocally affect each other with respect to health and difcase; whatever invigorates the body, renders the faculties

of the foul proportionably active and ftrong:
Ariftotle hath long fince observed that those animals whose blood abounds with thick fibres are bold and furious, and that a thick hot blood contributes to ffrength, but not to understanding. He also observes that a thin blood is better calculated for the different purposes of

fensation and understanding.

The circulation of the blood not only unites the foul with the body, but also governs and directs its operations; with the circulation of the blood, the animal and vital functions continue, and they vary, and cease to be, ac-

cording as the circulation varies or ceafes.

Would then any one preferve the faculties of the mind, and a due order of the pallions, let his care be to continue the blood in its due healthy ftate. Examples daily occur, in which it is feen that the chearful glass raifes the man as it were above himself; also, that its undue use ener-

vates and destroys him.
On the other hand, a disordered mind injures the body; violent passions make great ravage in its constitution; and lefs violent ones, if continued somewhat longer, have as dreadful an effect. Fear and terror contract the vessels in the exterior parts of the body, and force the blood into the larger ones about the heart and lungs; which again produce coldness in the extremities, a palpitation of the heart, uneasiness in the bowels, &c. Sadness greatly leffens the vis vitæ, whence a disposition to a chronical disorders. Anger increases the ftrength, quickens the pulse and breathing, but throws the whole frame into a tumult, and its confequences are fometimes fatal.

ANINGA, also called iba, arbor aquatica Brafil:

Ray takes notice of three species, two of which grow in water, the third in moift and fludy woods; the roots of the first two forts are bulbous, and possess medical virtues; they are used for fomentations against inflations of the hypochondres. Of that species which is found in the woods, the leaves are the medicinal part; they are bruifed and applied as a general remedy for healing ul-cers. Raii Hift. Pl.

ANISATUM. A wine in which anifeeds are infufed thus; take of Afcalon wine, this was a ftrong wine, 15

ANISCALPTOR, from onus, the breech, and fealps, to ferateb; so called because it is in use when this office is performed. See LATISSIMUS DORSI.

ANISCA MARKET MARK

ANISO MARATHRUM. A species of scandix. ANISUM. Anise. It is the pimpinella anifum of Lin-Africanum fruticescens folio et caule vere COERULEO TINCTIS. --- FRUTICOSUM AFFRICANUM GALBANIFERUM. GALBANUM PLANT. — HERBARIIS. Anifum, anicetum. COMMON ANISE.

Hoffman calls the feeds folamen intestinorum, by way of eminence, for their service in complaints of the bowels. —— INDICUM, Anifum Chinze, anifum ftellatum, Zingi, anifum percegrinum, femen Badian. faniculum Sinenfe, cardamemum Seberienfe, anifum Sinenfe, and Philippinese

and Indian stellated anise.

The common anise, i. e. the pimpinella anisum, is a small, annual, umbelliferous herb; its seeds are roundish, striated, flatted on one side, pointed at one end, and of a pale colour inclined to green; the upper leaves are divided into fine fegments, the lower are entire and roundish, and ferrated about the edges. It is a native of Egypt, Crete, and Syria; is cultivated in the fouthern parts of Europe, and grows in our gardens in England; but it does not arrive at any great degree of perfection with us.

Anifeeds have an agreeable aromatic odour, and to the tafte they are gratefully warm, with a degree of fweetness; they are carminative, much used in flatulent complaints, griping of the bowels; they are also moderately anodyne, diaphoretic, diuretic, and discutient; an infusion of them in water moderates the thirst in a dropfy and abates the diarrhoea; the fume received up the nostrils abates the head-ach in fome inflances; they promote an appetite, and check hiccoughing, when a flatus and coldness in the flomach are the causes. They are supposed to increase the milk in nurses. Geoffroy says the odour in percept-ible in that fluid. Cullen's Mat. Med.

Those who are offended with the feeds, may take the fpiritous preparation of them, for the spirit in some mea-

fure covers their flavour.

Water and spirit of wine both completely extract the virtues of anifceds; but in distillation very little of the feeds are carried over with the spirit; however, after its evaporation, a powerful and agreeable extract remains.

The London college, 1788, gives a compound anifeed water, called Sp. Anisi Compositus, olim,

# AQ SEM. ANISI. COMP.

R Sem. anifi & angelic. as th fs. fpt. vini ten. cong. i. Aquæ, quod fatis fit ad præcavendum empyreuma. elic.

The angelica feeds are added to improve the flavour of those of the anise. This water is apt to be milky if drawn so low as directed above: a glass of it assists digestion after full meals, and when vegetables have been too freely

Along with the water in distillation, their effential oil, called by Van Helmont Intestinorum Solamen, arises to the quantity of 3 i. from 16 iii. it possesses the taste, smell, and all the virtues of the seeds in the highest perfection; it congeals when the air is not fenfibly cold into a butyraceous confiftence, hence in diffilling, the water in the refrigeraory flould not be kept too cool, it should rather be warm, particularly towards the end of the process, or the oil will congeal in the worm of the still.

The dose is from two to twenty drops, which may be

made into an elegant draught thus,

R Ol anisi gut. ii. vel q. v. mucilag, e gum. arab. 9 i. fp. vin. ten. 3 ii. aq. pura 3 i. ss. m. s. haust.
This oil is also obtained from aniseeds by expression; it is

of a greenish colour, grateful to the taste, and strong of the feeds, of which, it sixteen ounces are lightly moistened by exposure to the steam of boiling water, about an ounce of oil may be obtained from them. This oil confifts of a grofs infipid inodorous one, fimilar to the common expressed ones, and of a part of the effential oil of the feed, on which last its flavour wholly depends. If this expressed oil is digested in rectified spirit of wine, the effential oil is extracted from it; or if it is diftilled in water, the effential oil arifes and leaves the inodorous one behind. The grofs oil feems to refide in the kernel of the feed, the effential in the cortical part.

The Indian or STELLATED ANISE. The feed-veffel of this species consists of rusty, brown-coloured, hard, wrinkled capfules, half an inch or more long, joined by their bafes to the number of fix or more in the form of a ftar, each of which includes one feed, externally gloffy, and of the co-lour of linfeed, internally white. It is the produce of a small tree which grows in Tartary, China, and the Philip-

pine islands.

The hulks contain the chief of the flavour, which is the fame as that of the common anifeed, but not so fiery; if they are digested in spirit of wine, they yield a most acrid refinous extract. The feeds afford much effential oil by distillation in water, which is thinner, more limpid, and more fragrant than that from the common fort-

This species of anifeed is not yet common in the shops, though they are deserving of a preserence to those in use.

ANNETESTES. So Paracelfus calls the Galenists, by

way of derifion, because he thought them ignorant of the causes and principles of things,

ANNORA. Calcined egg-shells or quick-lime.

ANNORATIO. The very beginning of a febrile paroxysm, called also the attack of the paroxysm. There is equal or smooth. Unequal, irregular.

The feeds only are used in medicine; and those which another annotatio or episemasia, which is proper to hectic fevers, happening an hour or two after eating: in this other countries, and are generally the most esteemed.

Aniseeds have an agreeable aromatic odour, and to the

MINOR.

ANNULARIS CARTILAGO. The cricoides, which fee, is thus named from its shape. From annulus, a ring. — Digitus. The ring-finger, or that next to the little one. — VENA. The vein betwirt the ring

and little finger.

ANNUS: The YEAR. The ancients divided the year into winter and fummer; their fuecessors divided it into

fpring, fummer, autumn, and winter.

A philosophical year is a common month.

ANNUS AMADIN. LONG LIFE.

ANNI TEMPORA CONSTANTIA, vel INCON-STANTIA. Confiftent feafons, fuch as keep their ufual temperature. Or inconfiftent feafons, when the weather is unfettled.

ANO, and, UPWARDS. The fuperior parts. Emetics are thus called, as purging medicines are called xaru,

ANOCATHARTICA. Medicines which purge up-

wards, as emetics.

ANOCHEILON, from are, and xux, a lip. The UPPER LIP.

ANODINA. NARCOTIC MEDICINES. See ANODY-

ANODMON, from a neg. and of us, a fmell. WITH-out smell. It stands opposed to fetid. ANODUS. A word used by the chemists for what is separated from the nourishment by the kidneys. Greek word asofes, anodus, from a neg. and ofes, a tooth, fignifies toothleft.

ANODYNA, from a privative, and of one, doles; or

a neg. and ason, pain.

Anadynes are medicines which ease pain, and procure

fleep. They are divided into time terms.

1. Paregories. Paregories, or fuch as affuage pain.

1. Paregories. Or fuch as relieve by processing the processing of the paregories. 2. Hypnotica. Hypnotics, or fuch as relieve by procur-

ing fleep,

3. Narcotica. Narcotics, or fuch as eafe the patient by stupifying him.

Opiates and narcotics destroy fensation. Some hypnotics and paregories, procure ease and sleep by removing

the offending caufe, as nitre, camphor, &c.

The dofes of these medicines are generally regulated by the pulse; yet this rule is not without exceptions. If the pulse is strong, a larger dose is safe; if weak, a less dose must be given.

Camphor is the best anodyne in nervous cases, and at the decline of severs.

Hemlock procures eafe and fleep without capfing that head-ach, next morning, ufually complained of after takanodynes should not be given without great caution, on

a full ftomach, nor in dropfies.

ANODYNIA. INDOLENCE, or absence from pain.

Synonymous with anæfthefia.

ANODYNUM. BALS. The ANODYNE BALSAM. Bates's anodyne balfam is usually made thus:

R Linim, fapon, fb i. tinct. theb. 3 iv. m.

Bateman's drops are thus made, only with a weaker fpirit, and tinctured with anifeeds.

remedies in general fucceed as in a fimple lofs of appetite, the difference of the cases confisting only in the degree. Hoffman particularly commends mint and its preparations. Emetics are not to be omitted. See APEPSIA.

ANOSIA, from a, neg; and races, a difeafe. The ab-

fence of a difease:
ANOSMIA. A diminution or loss of smelling, which is thus accounted for. The faline fulphurcous effluvia exhaling from bodies, and drawn into the notirils by the means of infpiration, and there diffolved by the humidity of the pituitary membrane, act upon the olfactory nerve, and thence arises the perception of odours, which may be deftroyed in various ways, from a drynels of the pituitary membrane; its too great mucofity, as in a coryza; its infarction, as in ozena; -in an obstruction of the nostrils as in a polypus, and other circumstances. Hence all the species may be reduced to two heads, though SAUVAGES enumerates, seven: 1st. when it arises front a catarrh; 2d. from an ozena; 3d. from a polypus; 4th. from venereal affections; 5th. from worms; 6th. from driness; and 7th. from paralysis. Dr. CULLEN arranges this genus of difeafe in the class locales and order dyfæsthesiæ. And mentions two species, viz. 1. Anosmid organica, when there is fome evident fault in the membrane that lines the nottrils, as a catarrh, a polypus, a venereal infection, &c. 2. Anofinia atonica, when the membrane of the nostrils is paralytic. In these different instances, an attention to the cause will lead to the means for relief:

ANOTASIER. SAL AMMONIACUS.

ANSJUDEN. See ASSA-FORTIDA.

ANTACIDA. ANT-ACIDS. Such remedies as refift

or deftroy acids.

There was a time when it was supposed that most difeafes depended on a quantity of acid and alkali contained in the fluids. It is true, they both exist in the blood, but altered by chemical combination; fo that it is very feldom, if ever, that we find any mark of acidity there; none that can be rendered fensible to any chemical experiment. But when a quantity of acid is thrown in, it paffes to the kidnies, and proving divretic it paffes off with urine: indeed it cannot exift long in any quantity in the veffels without being neutralized by decompounding the ammoniacal falts of the blood, and uniting with the volatile alkali which is detached.

We have no occasion to employ any remedies to destroy either acidity or alkalescency in the vessels, for it does not appear to be contained in them; though acids may be in the first course of the circulation, being sensibly perceived in the kidnies, and increasing the secretion of the glands of the breast, And if vegetable food be not thoroughly digested, a sickness, vomiting, heart-burn, and in infants, frequency of the pulse to a statl degree, may be produced, and this from the acid produced from the food in the

flomach going into its own acefeent fermentation.

Though the fundamental cure of fuch acidity of the ftomach be ftrengthening it, yet if the quantity of acid in the prime vize be very confiderable, it is better to evacuate it by an emetic: if it is not fo very confiderable in its quantity, yet, as it will act as a ferment, it will accumulate again; we must therefore employ some subflances which will combine with it, fuch as alkali, cal-careous earth, magnefia, &c. Mild alkali is thought to hurt if given freely, but this is imaginary; it is preferable to abforbent earth. The magnefia becomes laxative when it meets with an acid, the calcareous earths are rather aftringent,

aftringent, so is either of these effects are required, they may be mixed in such proportions as to answer the desired end. The fossile alkaline salt hath its advantages in fome instances. The mild alkali is always to be preferred, for they do not diffolve the mucus in the first paffages fo freely as the volatile does. For children the dofe of fixed alkali may be from gr. iij. to v. for adults from gr. x. to 3 i. if the fossile alkali in crystals is used, allow for its water, which is at least one half of the whole. As diet, shell-fishes are peculiarly agreeable.

It is not sufficient that we destroy the present acidity in

the stomach; it is also necessary that the stomach should act powerfully on the food, to prevent future difturbance

from this cause.

ANTAGONISTA, from art, against, and ayanta, to strive. One acting in opposition to another.

This word is applied to muscles which counteract each

other.

ANTALE. See ANTALIUM.
ANTALGICUS, from art, against, and adyon pain.

Such remedies as eafe pain.

ANTALIUM, also called antale and tubulus marinus. It is a shell like a pipe, of the thickness of a small quill, and about an inch and a half in length; it is hollow, and hath hollow lines running from one end to the other: its colour is white, or a greenish white. A kind of worm is the natural inhabitant of this shell, and its medical uses

are the fame with the shells of oysters, &c.

ANTAPHRODISIACOS, I from art, against, and
ANTAPHRODITICA. Apostitus, Venus. Antivenereal, or fuch medicines as extinguish amorous de-

ANTAPODOSIES, from an an another to reciprocate. Returns of the paroxyfms of fevers.

ANTARTHRITICUM. Anti-arthritic. From anti, against, and apsquires, the gout. Medicines against the gout.

ANTASTAMATICA. ANTI-ASTHMATIC. From arti, against, and ασθμα, an astbma. Remedies against

ANTATROPHON, from arti, against, and arpopta, a confumption. Medicines against confumptions.

ANTECEDENS CAUSA. See PROEGUMENE.

ANTECEDENT SIGNS, ANTECEDENTIA SIGNA.

fuch figns as precede the difeafe.

ANTELABIA, προχειλά, from προ and χειλός, a lip.
The extremities of the lips.

ANTELIX, or ANTIHELIX. It is that part of the ear

which is opposite to the helix.

ANTEMBALLOMENOS, from wh, instead of, and encane, to contribute. Substituted. Called also succedance, succedance, antiballomena.

ANTEMBASIS, from wh, mutually, and ancam, to enter. A mutual infertion or ingress, applied by Galen

to the bones.

ANTEMETICA, from ash, against, and nuthers, vo-

Remedies against vomiting.

ANTENDEIXIS, from ark, against, and everyous, to indicate. Contra-indicatio. A contra-indication. As when one symptom requires a remedy which another symptom forbids the use of. Probibens is used in the fame fenfe.

ANTENEASMUS, or ANTENEASINUM. A particu-

ar kind of madnefs; in it the patient is furiously irritated, and endeavours to lay violent hands on himself.

ANTEPHIALTICUS, from αγθη, and εφιανθης, the night-mare. A name for the remedies adapted to the cure of the faid diforder.

ANTIEPHEPTICA, from ave, against, and southers, the epilepsy. Remedies against an epilepsy and other con-

vulfive diforders.

ANTERA - See ANTHERA

ANTERIOR MALLEOLUS, Musc. See Musc. EXTERN. AURIS.

ANTERIORES NASI, Musc. See Pyramidalis NASI.

ANTERIT. MERCURY.
ANTHEA, in the plural fignifies REDNESS.
ANTHEDON. A tree which Ray takes to be the mespilus aronia.

ANTHELIX. See ANTIHELIX.

ANTHELMIA, also called fpigelia, caryophyllus Indi-the asphodel; others say it is the stalk only.

ANTHERICUM. See Asphodelus luteus. cus. Indian Pink, and WORM-GRASS of Jamaica. It is

It is found in different parts of the island of Jamaica, and other of the windward islands. It rifes from a fmall tapering root, well charged with fibres on all fides, by a straight, smooth, roundish, and hollow stalk, which feems to grow thicker as it rifes to the height of five, feven, or nine inches; at the top are generally four leaves, ob-long, sharp-pointed, and almost equal, with veins, which running obliquely towards the sides or edges of the leaf, turn off and terminate towards the point; out of the centre of the crofs, formed by these four leaves, rise one, two, or more fpikes, bearing flowers, which fpikes are from half an inch to two or three inches long, and range the flowers and feeds on one fide of them pretty thick; the mother-stalk hath generally one, two, or three joints, out of which spring twice as many leaves opposite, and like those at the top, add as many branches in an alternate order, which terminates like the mother-stalk.

The usual method of administering this medicine is as

follows:

R Herb. anthelm. 3 fs. coque in aq. font. 3 xii. ad. 3 viii. colaturæ adde facchar. alb. & fuc. limon. q. f. ad gratam acid. dulcedinemque, detur cochl. ii. magn. h. f. &

mane proxim.

Half a dram of this herb may be infused five or fix hours in a quarter of a pint of boiling water; one half of the strained liquor may be given to a child of twelve years old, and the other half the next morning: if no inconvenience is manifest from this dofe, the infusion may be made still stronger.

For adults who are not remarkably feeble, 3 iii. of this herb may be boiled down to 1b i. and the dofes may be from two to fix common spoonfuls, according to its effects

on the patient.

In most persons it procures sleep; in many, after tak-ing a full dose, their eyes are observed to sparkle, and also to be distended after the sleep is over; and if there was a fever from worms, the pulse becomes more regular, and the heat moderate, and by the use of a purge or two af-terwards, worms are discharged; this medicine must be continued as long as the worms are observed to pass away with the stools. If its effect on the eyes of children is fuch as to produce a painful diftention in them, it is better

ANTHELMINTICA, from avri, against, and aspers, a worm. Remedies against worms: antifcola is a word

of the same import.

Many are the diforders faid to be brought on the nervous fystem by worms, the cause of which, according to some, is their corrolion of the nervous coat of the inteffines; according to others, it is the acrid exhalations arifing from the bodies and excrements of the worms. As to the removal of them, the gums, affa fœtida, and fagapenum are preferred, for they drive away the worms by their offensive vapour; tansey, garlie, and camphor, have a similar effect: tanfey and worm-feed are useful by strengthening the stomach and intestines, and by refisting the putrid colluvies; but purgatives, by discharging the redundant mucus lodged in the bowels, seem to be the only proper

worm-deftroyers. See Vermes.

ANTHEMIS. WILD CHAMÆMILE. See CHAMÆMELUM VULGARE. — NOBILIS. See CHAMÆMELUM FLORE PLENO. — COTULA, See COTULA FOETIDA. PYRETHRUM. See CHAMÆMELUM PYRETHRUM.

Galen fays the Anthemis is the fame as Euanthemon. ANTHERA, from and, a flower. Also Antera. A compound medicine used by the ancients, so called from its florid red colour. There are various compositions which had this name. Antheræ, indeed, were prepared for any particular part of the body, in the form of powders, electaries, &c. and were used as collyriums, dentrifices, &c.

Antheræ, in botany, are the little heads in the middle of the flowers, supported by the staminæ. See APICES.
ANTHEREA. See ANTHORA.
ANTHEREON. Called also Geneion: Hippocrates

uses this word to express the chin, and all that part of the face where the beard grows.

ANTHERICOS. Diofcorides fays it is the flower of

medicated oils and wines.

ANTHOPHYLLUS. The AROMATIC CLOVE, when ripe, is thus named. See CARYOPHILLI-AROMATICI.
ANTHORA, called also antithera, anthera, antherea,

aconitum falutiferum, WHOLESOME HELMET-FLOWER, WHOLESOME WOLF'S BANE, COUNTERPOISON MONKS-HOOD, and YELLOW HELMET-FLOWER: it is the Aco-NITUM ANTHORA of LIN.

This plant is diffinguished from the poisonous aconites, by the leaves not being gloffy, by their being cut entirely down to the pedicle, and by the segments being very narrow, and of nearly the same width from end to end. It is a native of the Alps and Pyrennes, from whence we have the dried roots, which are of an irregular roundish shape, a little obiong, brown on the outside, white within, hard to break, but not tough; to the taste it is acrid and bitter, to the imell it is faint; if chewed a little constringes the fauces, and a nauseous sweetness is perceived. It is supposed to be an antidote to the poison-ous aconites, particularly to that species called thera, whence its name antithora.

ANTHOS, as , a FLOWER. Hippocrates means by this word, flowers in general; and if Galen is right in his comment, Hippocrates includes the teeds what use fisters. It is also used for firs exist. And when used alone fignifies the flowers of rosemary, and is fornesimes taken for the plant, but improperly. The flowers are faid to anticipate.

ANTICNEMION, from and everagains, and expussion of the plant, but improperly. See Rorismarinus.

An ame applied to sweet-scented winc.

ANTHOUS. Properly rosemary, but transferred to metals; it signifies the fifth essence, or elixir of gold.

ANTHRACIA, ANTHRACOSIA, or ANTHRAX. A BURNING COAL. A fore kind of swelling, which is often a symptom in the plague, so called from its burning native. See CARRINGULUS. ture. See CARBUNCULUS.
ANTHRACITES. See Schistus.

ANTHRACOSIS OCULI. A fealy corrofive ulcer of the eye, attended with a defluxion.

ANTHRAX. So Vitruvius calls the native cinnabar.

See also CARBUNCULUS.

ANTHRISCUS. See SCANDIX & CAUCALIS.

ANTHROPE, from artipunt, a man. Thus Herododotus calls the human fkin.

ANTHROPOLOGIA, from ανθρωπος, a man, and 20, a discourse. A description of man.

ANTHROPOMORPHOS, from ανθρωπος, a man, and

μοροπ, hape. A name for the mandrakes.

ANTHROPOSOPHIA, from αιθρωπώ, α man, and espen, wisdom or knowledge. The knowledge of the na-

ANTHYLLIS LEGUMINOSA, called also vulneraria rufli-

ca, KIDNEY-VETCH, and LADY'S FINGER.

It grows in pattures, flowers in June, but is not remarkable for its medicinal virtues. That called,—LEGU-MINOSA HIRSUTA, &c. is a species of the above,—and for —— MARITIMA ALSINES FOLIO. SEA CHICKWEED.

See Hernitaria, Alsines Folio.

ANTHYPNOTICA, from ανθι, egainft, and ὑπνος, fleep. Medicines againft fleepinefs.

ANTHYPOCHONDRIACA, from ανθι, againft, and ὑπνοχνιδριο, the hypochondria. Medicines againft the difference of the hypochondria.

orders of the hypochondria.

ANTHYPOCHONDRIACUM, SAL. Called also antioflericum fal. It is the refiduum remaining after the diffillation of the water, and fublimation of the fal ammon. which confifts of the marine acid and the fixt alcahon. which consists of the marine acid and the fixt alcaline falt, or the alcaline earth, according as one or the other was used in the process; or rather, the falt obtained by folution and crystallization from this residuum.

ANTHYSTERICA, from arst, against, and irreps, the attents. Medicines against the hysteric passion. These medicines might as well be called uterines, for many of these recovers the disorders of the attent at the resolution.

them remove the diforders of the uterus, that produce hyf-

teric fits.

ANTHYSTERICUM SAL. See ANTHYPOCHON-DRIACUM SAL.

ANTHIA. The name of a fish.

ANTHINES, from affer, a flower A name of some the tonfils when inflamed. From affect, to occur, because they answer one another.

ANTIAGRI, from askades, the tonfile, and aypa, a

prey. Tumors of the tonfils.

ANTIARTHRITICA. Medicines against the gout.

ANTIARTHRITICA. Medicines against the gout. ANTIAS. The TONSILS.

ANTIBALLOMENA. See ANTEMBALLOMENOS.

ANTICACHECTICA, from and, against, and nazzetia, a cachexy. Medicines against a cachexy.

ANTICADMIA. A species of cadmia, also called pseudocadmia. Anti is here joined to express its being substituted for the true cadmia.

ANTICAR BORAX.

ANTICARDIUM. The hollow at the bottom of the breast, usually called the pit of the stomach. See Scrosscultus Cordis. From asses, against, and nazzetia, the BICULUS CORDIS. From ash, against, and sastia, the

ANTICATARRHALIS. A remedy against a catarrh. ANTICAUSOTICUS, from only, against, and xausos, burning fever. Remedies against burning fevers.

ANTICHEIR, from only, against, and xuy, the band.

The thumb of a person's hand.
ANTICIPANS. The Greeks express this by meadow lives; it is applied to difeafes whose succeeding paroxysms anticipate the time of the preceding fit, that is, each of whose fits begin somewhat sooner than the preceding.

the calf of the leg. Hippocrates uses this word to express
that part of the tibia which is bare of flesh.
ANTICOLICA. Remedies against the colic.

gration. Medicines against a vertigo.

ANTIDOTARIUM. A book in which antidotes are prescribed, or a place where they are prepared, see Dis-PENSATORIUM.

ANTIDOTOS EX DUOBUS CENTAURÆ GE-

NERIBUS. So Actius calls a powder that is fimilar to the duke of Portland's powder. See Chamædrys.

ANTIDOTUS, or ANTIDOTUM. An antidote from ash, against, and \$180µµ, to give. This is explained under the words ANDROMACHI THERIACA. The philosopher's stone is thus called by way of eminence.

ANTIDYSENTERICA. Medicines against a dysen-

ANTIFEBRILE. Remedies against a fever.
ANTIFIDES. The calx of metals.
ANTIGONI COLLYRIUM NIGRUM. The black collyrium of Antigonus. It is made of cadmia, antimony.

pepper, verdigrife, gum arabic, and rain-water.
ANTIHECTICA. Remedies against a hectic fever.
ANTIHECTICUM POTERII. A medicine invented by Potesius, also named antimonium diaphoreticum joviale:

it is thus prepared:

Take the martial regulus of antimony fix ounces, and of pure tin three ounces; melt the regulus first in a crucible, or the tin will partly evaporate, then throw into it
the tin; when the whole is melted, pour it out into a
warm greased mortar, and when the mass is cold, powder
it, then add to it thrice its weight of nitre, and designate the mixture in a c ucible, throwing in only a spoonful at a time; after which calcine it, that is, keep it in fusion for an hour, then grind it to an impalpable powder, pour thereon a fufficient quantity of warm water, ftir them well until the water becomes milky, which thus loaded with the finer parts of the powder, it is to be poured off, and fresh water added to the remainder; repeat this until nothing but indissoluble fæces remain, fusfer all the milky liquors to rest after mixing them together, and a powder will fall to the bottom, which must be well washed with warm water and dried for use.

This medicine hath been extolled in the dispensatories,

as effectual against hectic fevers, but it is now difregarded.
ANTIHELIX. See ANTHELIX and AURICULA.
ANTILEPSIS, from armanucane, to lay bold of. Hippocrates speaking of securing bandages from slipping, uses this word: also apprehensis is used in this sense, and apprebenforium.

#### ANT ANT 90

ANTILOBIUM. That part of the ear which is opposite the lobe, i. e. the tragus, from any, against, and weight, from the loaves not being spongy, from the large-ness of the strine, and from its totally evaporating on a

ANTILYSSUS, from asl, against, and Aussa, the

madness caused by the bite of a mad dog.

It is the name of any medicine for the cure of this fort

ANTIMONIAL. PILUL. Ds. WARD. Dr. WARD'S ANTIMONIAL PILL.

Take well levigated glafs of antimony four ounces, mix it well with one ounce of dragon's blood, then beat them into a mass with a little mountain wine, after which divide it into pills of about one grain and half each.

Mr. Clutton, the chemilt, fays that they contain a por-

tion of arfenie.

One of these pills is a full dose for a full grown person.

— PULVIS. The ANTIMONIAL POWDER.

Take of antimony coarfely powder, harthorn flavings, of each two pounds; mix and put them into a broad red iron pot, flirring constantly till the mass acquires a grey colour. Powder the matter when cold, and put it into a coated crucible; lute it to another crucible inverted, which has a fmall hole in the bottom, augment the fire by degrees to redness, and keep it so for two hours; laftly, reduce the matter when cold to a very fine powder, this is faid to be a preparation equally efficacious as that of Dr. James's, and produces similar effects. It is adopted by the London College, and inferted in the New Pharmacopecia, and is certainly preferable to the tartarifed anti-mony joined with the teltaceous powder which used to be fubilituted for that of James's.

ANTIMONIUM, called also flibium, aleimad, alcotol, stimmi, platyophthalmon, larbason, satanus devorans, lupus philosophorum, aurum leporosum, ens primum solare, alamad,

ailmad, the RED LION, and ANTIMONY.

Antimony is fometimes found in a particular ore, but most frequently mixed with other metals; and hence its name may have been derived, antimony being the fame with araueren, an enemy to folitude. It is called fatanus devorans, and lupus philotophorum, from its power of devorans, and lupus philotophorum, from the devouring or destroying as it were all metals when in fufion with it. It is a semi-metal, of a whitish or a filver
they are more lasting.

Thus it is easy to perceive how justly it is afferted to

Its chemical character is a circle, denoting the body of gold, and a cross to shew it is corrolive, which as it pre-

vails it is placed at the top thus & .

There are mines of antimony in Hungary, Transylvania, Germany, France, and in England some are met with. The French antimony is about equal parts regular and sulphur; but the best is from Hungary. The English is, of all the forts, the least fit for medical use, for it is often mixed with lead or tip from which have the often mixed with lead or tin, from which, however, if feparated, it is as good as any other: that which is spot-ted with red, Dr. Alston, of Edinburgh, thinks it posfeffed of some arfenic, so should be rejected.

The antimony is generally found mixed with hard stones or fpar, from which it is feparated by eliquation; fome ores are mixed with arfenic or with cobalt; fome are dug up which are composed of fine shining lines like needles, fometimes disposed in regular ranks, at others without any observable order, this is termed male autimony; some are disposed in thin broad plates or laminæ, and called female antimony by Pliny; and from their different mixtures and appearances other names are given to them.

The mineral being broken into pieces, it is put into earthen pots whose bottoms are perforated with small holes, and a moderate fire is applied round them; as the antimony melts, it runs through the holes in the bottom of the pots, and received into conical moulds that are placed underneath; in these moulds the lighter and more droffy part rifes to the furface, while the purer and more ponderous falls to the bottom; whence it is that the broad part of the loaves are less pure than the apex or fmaller end. The antimony thus feparated from its ore, is called crude, which yet is but an ore, or a combination of a par-ticular metal with common fulphur. It confifts of a metallic part, called its regulus, and of

The goodness of crude antimony is discovered by its ftrong fire.

Its general appearance is a ponderous brittle mineral, or femi-metal, composed of long shining streaks like needles, mixed with a dark leaden-coloured substance, and hath no particular tafte or fmell, and is brought to the

shops in the form of conical loaves.

Antimony, like most of the best medicines, found its way as an internal one in the medical practice with great difficulty; the ancients confidered it as a poison, and only fit for external uses. Basil Valentine, in the fifteenth century, first brought it into vogue as an internal medicine, publishing a work called Currus triumphalis Antimonii; but it foon loft its repute, until Paracelfus raifed its credit again, after which it was received and rejected feveral times, until, by the fucces of empyrics, it acquired an established place in regular practice; and is now justly ranked with the most valuable part of the materia medica.

The crude antimony, if made into an exquifitely fine powder, is, in many diforders, as efficacious as any of its preparations; in numbness and pains of the limbs, which follow a falivation and other caufes, three grains may be given three times a day, gradually increasing the dole by one grain at a time, until it amounts to half a dram, then it should be gradually lessened by the same proportion as it was increased: in the paresis and palfy the same method is also effectual.

The preparations of antimony are, in general, used both as alteratives and evacuants, and hardly any article in the materia medica will admit of fo extensive a use as this: in acute difeafes, as well as chronical, it is equally a prin-cipal in the cure, the varieties of these complaints only requiring fome difference in its adjuncts. In fevers of the inflammatory and putrid kinds, it is alike the proper remedy; and in chronical discases, whether from the rigid or lax habit, it is also to be depended on.

It promotes all the fecretions and excretions, particularly those of the skin, intestines, urinary passages, and salval ducts, by gently irritating the whole nervous and vascular compages. If given in small doses, gradually increasing them, yet keeping to that proportion which excites no sensible discharge, it is a most effectual remedy for regenerating a healthy state of the blood, such a one as will maintain the vital heat in a natural way; for this

be curative in fo many diforders, and those too of oppofite natures. As an auxiliary to other medicines, on which the cure more directly depends, its efficacy is no lefs to be admired; it quickens their action and increases their powers, particularly those by which any evacuation is to be promoted, mixed in under-doses which such medi-cines, their operation is generally more easy too; of itself it excels as an expectorant, and fome of its preparations provoke the fallwary difcharge in the fame manner as when mercury hath been freely taken; but that made by antimony is ropy, whereas that with mercury is very

If any preparation of antimony is too free in its operation upwards, it may be carried through the intestines by taking a little common falt in any finall drink made warm, or it is restrained by a draught of water acidulated with

the acidum vitrioli dilutum.

The preparations of this drug are numerous, but except that which is called the muriated antimony, they only differ from each other in their degrees of activity: the just named preparation, the antimonial wine, emetic tartar, and pulvis antimonialis, are the only ones which derferve our notice, out of the great variety which fwell the dispensatories. Besides these we may, indeed add two private prescriptions, which are deservedly celebrated, viz. the febrifuge powder of Dr. James, and that of Edinburgh, the latter of which is recommended to us on the best authority, as possessed of those very desiderata, the want of which was the cause of other preparations being complained of. See EDINBURGHENSIS PULVIS.
After naming fome of the pharmaceutic properties of

#### ANT ANT 91

common fulphur. Newmann, and fome others, affert that its emetic and cathartic qualities are owing to a small portion of arsenic contained in it; but this is objected to, from observing that the ill effects of arsenic are very different out, it is to be separated from its scorice when cold. ferent from those of antimony; and again, that the activity of antimony is destroyed by means that have no such effect on arfenic.

It is easier of fusion than its pure metal.

It melts before it is red hot, but not before its containing veffel is fo.

All its medicinal virtue is in its metallic part.

Water neither diffolves the fulphur nor the metal. Rectified spirit of wine affects not the metal, but takes

up a fmall portion of the fulphur.

Wine, or any vegetable faponaceous acid, acts on both the fulphur and the metal.

Vitrolic acid takes up the inflammable part of this fe-mimetal and unites with it into an actual mineral ful-

phur.

The muriatic acid, and the aqua regia, are its proper folvents; the other diffolvers of metals convert it into a

Crude antimony is volatile in the fire, and volatilizes all metals except gold, so as to make them fly away with it in the form of a vapour; hence its use in refining gold.

The folution of it in aq. regia, or in the muriatic acid, is precipitated by the addition of water.

United with fulphur, or partly calcined with nitre, its wirulent activity in the prime vie is much abated. When entirely deprived of its phlogiston by calcination,

it becomes quite inert, acquiring additional weight.

It is foluble in hepar fulphuris.

### ANTIMONIUM CALCINATUM -olim CALX ANTIMONII.

The London College directs to take of powdered anti-mony, and mix it well with thrice its weight of nitre, then to throw it by degrees into a red-hot crucible, calcine the white matter about half an hour, and when cold let it be powdered; afterwards wash it with distilled water. The dose is from ten grains to a scruple.

The dose is from ten grains to a scruple.

This was formerly called anim. diaphoreticum; it is a perfect inert metallic earth, and hath been taken to the quantity of half an ounce, without producing any sensible effect; but if the nitre is not perfectly free from sea-falt, this calx will be emetic, because, in this case, there is not the due quantity of nitre for the proportion of the sea-falt. Huxham says, that one eighth of nitre makes as inert a calx as any larger quantity doth.

Crude antimony deslagrated with different proportions of nitre, is more or less active, and is the different preparations called crocus and hepar.

rations called crocus and hepar.

The unwashed calx is called antim. diaph. nitratum. when washed it is called calx antim. lota, vel dulcis.

Cheap as this calx is, it is fometimes adulterated with

# Antimonium Catharticum, Di. Wilfon. Wilson's purging Antimony.

Take four ounces of the glass of antimony finely powdered, gradually pour thereon twelve ounces of the vitriolic acid; digeft rhem forty-eight hours, then diftil them in a fand-heat; when the whole is cold, wash the powder which remains at the bottom of the retort, until all its acrimony is loft; then dry and grind it with an equal weight of natron vitriolatum, and a double quantity of the vitriolated tartar; keep this mixture a quarter of an hour in gentle fusion, in a crucible placed in a wind-fur-nace, then taking it away from the fire, when it is cold, powder it, afterwards wash and dry it again for use.

Its inventor fays that it is the most certain antimonial purge; that it operates without naufeating the ftomach; and that it may be given from three grains to ten for a

### CERUSSA ANTIMONIL. The CERUSS OF ANTIMONY.

This preparation differs not from the antim. calcinatum above, though the regulus of antimony is ordered in it, instead of the crude mineral, as in making the calx.

CROCUS ANTIMONII. CROCUS OF ANTIMONY.

The London College now directs to take of pure crude antimony and nitre, of each equal parts, to powder them

It is also called crocus metallorum, and hepar antimonii,

but improperly.

The crucible should be heated to a white heat, or the mixture will not be duly melted; and the longer it is kept in fusion, the deeper its colour will be. But as com-monly made there is less nitre used, and a small quantity

of common falt thrown into it, to promote the fluxion.

This preparation is violently emetic, much of the fulphur of antimony is confumed; but the variety found in the strength of different parcels, and the rugged effects of it in general, renders it almost unfit for any use, except amongst horses.

#### CROCUS ANTIMONII MEDICINALIS. MEDICINAL CROCUS OF ANTIMONY.

Take eight ounces of antimony and one ounce of nitre; powder, mix, and deflagrate them, then the matter being immediately taken from the fire and cooled, powder it

This is fomewhat more active than the crude antimony: from gr. eight to twenty operates gently, both upward and downward.

### CROCUS ANTIMONII MITIOR. The MILDER CROCUS OF ANTIMONY.

Take of crude antimony two pounds, and of nitre one

pound, powder and deflagrate them.

Be careful to remove these two last from the fire as foon as the deflagration ceases, and before the metal melts. In all these processes only a little of the composition must

be thrown in at a time, and no more must be added until the deflagration ceases, lest the violence of the deflagration would throw out much of the matterinto the fire.

This last preparation is called mitior, with respect to the crocus antimanii, commonly called crocus metallorum; but it is stronger than the crocus antimonii medicinalis.

### ANTIMONIUM MURIATUM-MURIATED ANTIMONY. Vice CAUSTICI ANTIMONIALIS. ANTIMONIAL CAUSTIC.

According to the London College it is thus made:take the crocus of antimony in powder, and vitriolic acid, of each one pound; muriatic, or fea-falt dried, two pounds; pour the vitriolic acid into a retort, adding gradually the muriatic falt and crocus first mixed together, then let them be distilled by a fand-heat. Let the matter procured by distillation be exposed several days to the air,

and afterwards the liquid part poured off from the fæces.

This preparation is the speediest escharotic that is in use, and it gives less pain than any of the other kinds. Inwardly it may be taken from one to two drops, in

broth.

ANTIMONII PREPARATIO. PREPARATION OF ANTI-MONY. Olim, Antim. Crud. ppt. Crude Antimony prepared.

As fine powder discovers but little medical effects, it should be levigated to a great degree of subtility, and then it becomes a powerful alterative. If it is not duly comminuted, it stimulates the stomach and bowels to an ejection of their contents, without any valuable ends being answered. The levigation should be continued until the whole is fine enough to be suspended in water for some time; then the levigated matter must be put into a large quantity of water in a large veffel, which must be repeat-edly shaken, that the finer parts of the powder may be diffused through the water; then the liquor must be poured off and fet by until the powder fettles; and the groffer part, which the water would not take up, is to be farther levigated and treated in the fame manner.

THECTICUM POTERIL.—ESSENTIA. The effence of antimony. See VINUM ANTIMONII. -- FLORES The FLOWERS of ANTIMONY.

If the pure regulus of antimony is continued in fution

in an open veffel, being volatile, it gradually exhales in thick white fumes, which condense on the adjacent bo- by a single susion. dies into white flowers, which are violently emetic.

In hypochondriae complaints, their efficacy is faid to be as great as that of the bark in intermittents; and they are faid to be a specific in manias, if a specific in any disease really exists. SULPHUR AURATUM. See SULPH. ANT. PRECIPITAT. — OLEUM. See ANTIMONIUM MURIA-TICUM. — PANACEA. The PANACEA OF ANTIMONY.

Take of crude antimony fix ounces, of nitre two ounces, common falt an ounce and a half, charcoal an ounce. Mix, powder, and deflagrate them in a red-hot crucible, and after the injection of the last portion, continue the fire a quarter of an hour longer, then, removing it from the fire, let the matter be cold.

The addition of the common falt is unnecessary, and the charcoal only haftens the alkalization of the nitre.

At the bottom of the crucible is the regulus, in the middle is a compact liver-coloured fubstance, and at the top more spongy mass; this last, when powdered and edulcorated by various washings in water, is called the panacea. The liver-coloured part is a churlish kind of croc.

This panacea is no other than a fulph. antimonii precipitat. it is faid to be the basis of Lockyer's pills .-CEA DI. WILSON, i. c. SULPH. ANTIM. PRECIPITAT.

REGULUS. The REGULUS of ANTIMONY, called

luna philosophorum.

The metallic part of antimony is what is called its regulus. It is a metal of a particular species, of a bright white colour, a leafy texture, very brittle, near seven times specifically heavier than water, and melts in a low white heat; if continued in fusion, in an open vessel, it gradually exhales in thick white fumes; melted with common sulphur it becomes fimilar in appearances and qualities to the crude antimony; no known art can render it malleable; in it is contained all the medicinal qualities of antimony; it is corroded by the vitriolic and nitrous acids into a white powder, but the marine acid perfectly and properly diffolves it; it will not diffolve in acidum nitrofum dilutum,

The largest quantity of regulus hitherto obtained from antimony, is by calcining it without addition, as in making the glass of antimony, and then reviving the calx by fusion, with an equal weight of the black flux. As soon as it is fluid, pour it into a cone, and the pure regulus will fall to

The regulus of antimony hath been cast into pills, in The regulus of antimony hath been calt into pills, in which form it hath acted as a cathartic. These pills being separated from the stools after their discharge, they have been taken again and again with the same effect, but without any sensible loss of their weighter quality. These pills are called PERPETUAL PILLS. A cup made with this regulus was called the antimonial cup; wine poured into it presently became emetic, and no loss of the cup was observed thereby.

Antimonia, Regulus Martialis.

Take horse-shoe mails, for they are the softest iron, and

Take horse-shoe nails, for they are the softest iron, and fuse most speedily, one part, and of crude antimony in powder two parts. Throw the nails into a crucible, and make them white hot; then throw in the antimony, and increase the heat until the whole is in perfect fusion. As this process requires great heat, the fusion may be accelerated by adding two parts of nitre, which being thus al-calized, forms a hepar fulphuris, which diffolves a part of the regulus, and renders the fcoria more fluid.

Sulphur hath a stronger attraction to iron than to antimony, whence the use of nails in this process; but this regulus does not materially differ from that prescribed

If this regulus discovers by its dull, grey colour, spon-giness, hardness, and difficulty of fusion, that it retains much of the iron, a little fresh antimony must be added. When the regulus is separated from the scoria, it may be purified farther, by fufing with one-fixth or one-eighth of its weight of nitre, until the nitre receives from it no more yellow colour.

When a ftarry appearance is formed on the top of this regulus, it is called REGULUS ANTIMONII STELLATUS. This appearance chiefly depends, after perfect fusion, on its cooling flowly, and without being moved. The fimple regulus is more readily made to exhibit a ftarry ap-

The feoria remaining after the first fusion for making this martial regulus, is little other than a fulphurated iron, scarcely retaining any of the metal of the antimony; but, exposed to the air in a shady place, it falls into a black powder, whose finer parts washed off with water and deflagrated with thrice their weight of nitre, are the CRUC. MARTIS APERITIVUS STAHLII. The groffer part treated in the fame manner is his CROC. MART. ASTRINGENS.

The amber-coloured scorize arising in the purification with nitre, are a strong caustic alcali, called NITRUMCAU-STICUM, vel SCORIA REGULI ANTIMONII SUCCIN. which is powdered, and thrown whilft hot into rectified spirit of wine, then well agitated and digefted, you have the tinel. antimonii acris ph. brand. which is of a paler, or deeper red colour, as the spirit is less or more oily.—RUBICUNDA MAGNESIA. See MAGNESIA OPALINA.— REGULUS MEDICINALIS. Take of crude antimony eight parts, of nitre one part; powder, deflagrate, and fule the whole together; then pouring the fluid into a cone, feparate the regulus from the fcoria when cold.

It is milder than the croc. ontimonii mitior, but equally

uncertain. It is, when powdered, the genuine pulv. fo-brifug. Cranii.— SAL. See EDINBURG. PULVIS.— SCORIA. The DROSS OF ANTIMONY.

The whole of the antimony may be reduced to a drofs by fusion, with a mixture of sulphur and alcaline salt. This scoria consists of an alcaline salt, a liver of sulphur, a part of the regulus diffolved by the hepar fulphuris, and fome vitriolated tartar .- SPIRITUS. See CLYSSUS ANTIMONII. SULPHUR PRACIPITATUM. PRECI-

PITATED SULPHUR OF ANTIMONY.

The London College of Physicians, 1788, have ordered two pounds of antimeny to be mixed with four pints of the water of pure kali, and three of distilled water, then boiled with a flow fire for three hours, conftantly firring and adding diffilled water as it shall be wanted; afterwards the hot ley to be strained through a linen cloth, and into the liquor, whilft in this flate of heat, as much diluted vitriolic acid to be dropped gradually asis sufficient to precipitate the sulphur, and the vitriolated kali to be washed off with warm water; by this process searce two ounces of the antimeny has undergone a folution. A dif-ferent mode has been recommended which deferves adoption. Let one pound of pure vegetable alkali, five ounces of antimony, and three of fulphur, be put into a crucible, covered, and gently melted for a few minutes; then, in an iron mortar, let the mafs, whilft it is quite hot, be pulverized, and about two gallons of boiling water be poured on it. Let it stand for ten minutes, and then be strained. This solution should be immediately mixed with four gallons of water, acidulated with twelve ounces

with four gallons of water, acidulated with twelve ounces of vitriolic acid, and thus will the medicine wanted be acquired. Observations on the Pharmacop. Lond. 1788.

It was formerly called sulphur auratum antimonii, the golden sulphur of antimony; because if it was rubbed on filver, it gave it the colour of gold. It hath been called embryonatum, panacea, kermes mineral, pulvis Carthusanus, Passella consider universally purying sulphur, teller considered. Russel's powder, univerfally purging Julphur, leffer con-

taury, &cc.

Lemcry first published an account of it — SULP REGULI SUCCINEA. See ANTIM. REGULI. MART. -TARTARISATUM. See TARTARUM EMETICUM. -- SULPHUR

TINCTURA. TINCTURE of ANTIMONY.

Take of the falt of tartar one pound, of crude antimony half a pound, and rectified spirit of wine two pounds a powder the antimony, mix it with the falt, and melt them together with a strong fire for an hour; then pour out the matter, pulverize it, and add the spirit, and digest altem for three or four days.

If any of the antimony is taken up, it is in too fmall a quantity to deferve notice. This preparation is also called TINCT. SALIS TARTARI, which appellation feems to be the most proper. — TINCT. ACRIS. See ANTIM. REGUL

MARTIALIS.

ANTIMONIALE VINUM. ANTIMONIAL WINE. Also called vinum emeticum, vinum benedictum, & effentia antimonii.

Take of vitrified antimony powdered, one ounce and an half, and mix it with a pint and an half of Spanish white wine. Let them stand without heat during twelve days,

### ANT ANT

how and then shaking up the powder; then filter through | ANTIMONIUM VITRIFICATUM. paper for use. Ph. Lond. 1788. Haller calls this effentia stibil, and adds an ounce of the

yellow part of lemon-peel to the above.

Madeira wine is the leaft apt to become four in hot weather, and is by many preferred. As to the glass of antimony, it is preferable to any of the calces, or even to the regulus itself; because the first containing more or less of the fulphur of the antimony, the wine faturates itself therewith, to the exclusion of the same proportion of the metallic part; and the latter does not yield its virtue to readily and copioutly to this folvent.

The pure metallic part of antimony dissolved in mild vegetable acids, are the most safe and certain of all the antimonial preparations, and capable of being fo managed as to answer all the falutary purposes that can be rational-

It is good in all cases in which antimony is found useful, either in its crude state, or otherwise managed.

It may be taken in tea, or other small liquors, from ten

to one hundred drops for a dole; in doles of two or three

drams, it generally proves emetic.

Dr. Huxham juffly afferts this to be the best of all the antimonial preparations. He observes, that it quickly acts on the human conflitution, and as quickly passes through the body; that it is an admirable attenuant and decollirecnt, without heating one-tenth part fo much as the volatile alcaline falts; and that in most cases it is more fafe and efficacious, particularly in the peripneumonia

noths.

The strength of this wine depends on the acidity of that with which it is made; the more acid it is, the more strongly it will be impregnated, and vice versa: and as the weaker the impregnation is, the safer it will be as a medicine, so the soft sweet wines are preferred to the

This wine admirably affifts other medicines, where it alone could not be depended on : thus, in the gout, it may be used as an alterative, if joined with perspiratives; in nervous diseases, with nervines; in leprous cases with nitre and the woods; as a discretic, mixed with opiates and terebinthinates; as a diaphoretic, with camphor; as an expectorant, with camphor, or with the fetid guns, particularly the gum ammoniacum; as an alterant and de-obstruent, with the extract of hellebore, with the bark, with myrrh, &c.

When mixed with camphor, larger dofes may be taken without offending the stomach; and when perspiration is to be promoted, or putrescence to be resisted, it is a pro-

per addition.

Huxham afferts it to be as fafe an emetic as any, in dofes

of an ounce or more.

As a purging medicine, to be taken into the stomach,

from one to two drams generally fusfices; but clysterwise an ounce and half, or two ounces are required.

One dram or less is a proper dose for a perspirative, or diuretie, according as the patient is managed for those ends; or this dose may be administered as an alterative or

deobstruent.

It acts more powerfully than the quantity of metal con tained in it would do by itself, though it does not so much diffurb the conflitution; nor is acefeent, nor even acid food fo necessary to be shunned when this preparation is nied, as when the crude antimony, or any other of its preparations are.

As to the certainty of its strength and constancy to the same degree, a very small care will ascertain them, an advantage which gives it the preference to the tartarized antimony the different parcels of which are extremely different in their metallic contents.

It may be proper to caution against mixing alcaline faits, either fixt or volatile, with any other medicines that are to accompany it, lest they decompose it.

Besides this the London College, 1788, have given the following prescription for another wine, which they call VINUM ANTIMONII TARTARISATI. Wine of tartarised Antimony. Take of tartarifed antimony, two fcruples; boiling diffilled water, two ounces by meafure; Spanish white wine, eight ounces by measure. Dissolve the tartarised antimony in the boiling distilled water, and add to it the wine. Its uses are fimilar to the former.

NTIMONIUM VITRIFICATUM. Vitrified Antimony.
Olim, VITRUM ANTIMONII. GLASS of ANTIMONY.

Take of powdered antimony, by weight four ounces, burn it in a broad earthen veffel, with a fire gradually increased, stirring with an iron rod, until it no longer emits a fulphureous fmoke. Put this powder into a crucible, so as to fill two thirds of it. A cover being fitted on, make a fire under it, at first moderate, afterwards stronger until the matter be melted. Pour out the melted glafs. Phar. Lond. 1788.

This glafs is chiefly prepared for making the antimenial wine, and the tarrarized antimony.

Antimonii Vitrum Ceratum. The cerated glafs

of antimony.

Take of the glass of antimony in fine powder one ounce, and of bees wax one dram. Melt the wax in an iron ladle, then add the powder, fet them on a flow fire, without flame, for the space of half an hour, continually ftirring them with a fpatula; then take it from the fire, pour it upon a piece of clean white paper, powder it, and keep it for ufe.

The glass melts in the wax with a flow fire; when the whole is become nearly of the colour of Scotch snuff, it

may be removed therefrom.

The ftrength of this medicine is uncertain. It is milder than the glais, because the wax hath restored some phlo-

gifton to it.

The ordinary dose to a strong man is ten grains, but fome give twenty; but they begin with three or four, and gradually increase the quantity, as the stomach will admit. To a boy of ten years old three or four grains may be given. Sickly children may begin with one grain, and more may be added as it is observed to assect them.

Dr. Young of Edinburgh first published this in the Edinburgh Med. Essays. It is commended as a specific in

dysenteries, either with or without a fever. Sir George Baker speaks highly of it in his work de Dysenteria, but it is an uncertain medicine, and often inefficacious. The first dose sometimes causes vomiting, and almost always purges, though inflances do occur, in which a cure is effected without any fickness or evacuation following upon the taking of it. If the first, or any other dole, purge the patient lo is to fatigue him, wait until the next day before another is given. Cures often follow upon taking one dofe; and it very rarely happens that five or fix are required.

Pregnant women may take it; and infants at the breast

may have half a grain given to them.

Let nothing be drank during three hours after taking it, except a difposition to vomit requires it, and then give

water-gruel.

In diarrhocas, also, and in colic pains from viscidities in the intestines, it is a fafer and better method of cure than the usual ones. In uterine hæmorrhages it hath been given and followed with the happiest effects.

Dr. Alston of Edinburgh says, that if this medicine

is made with crude antimony, it is more fafe and equally effectual. If it is long kept, the wax feparates from the

metallic part, and it then is too active.

ANTIPHLO-

ANTIPHLOGISTICA. ANTIPHLOGISTICS. These are those remedies which tend to weaken the system. The only means we have of weakening the system is by exhausting the living power; and this is most readily and certainly done by evacuation, particularly bleeding. There are various modes by which the body may be weakened, but many of them are productive also of other effects; e.g. mercury excites a falivation by which a considerable execution is produced, with weakened. but may be with respect to the folids, and whatever invigorates the folids, but many of them are productive also of other in putrid difeases.

Alcaline falts and acids, when alone, resist putrefaction more than when by mixture they are formed into yourself. effects; e. g. mercury excites a falivation by which a confiderable evacuation is produced, with weakness; but the mercury alfo flimulates. Stimulants are weakeners when used to certain degrees, but they are rarely used to this end, because by the time that they would weaken considerably, they would kill the patient, &c. respecting other means. The only way by which the system is simply evacuated, is by bleeding. In general, a vein may be opened in the arm. See Phierotomia. In fome inftances of local inflammation, relief is more fpeedily and effectually fecured by the topical evacuation of a fmall quantity of blood, from or near the part affected, than by a more liberal evacuation from the general fystem. For topical bleeding, lecches are most fre-quently used. See HIRUDO. Sometimes scarification is preferable to leeches, though used on the same principle. See CUCURBITULA.

ANTISPASIS, from att, againft, and oran, to draw.

A REVULSION. The turning the course of the humours whilst they are actually in motion. The doctrine of revulsion is the invention of Hippocrates.

ANTISPASMODICUM, from arts, ogainfl, and ontoμο:, a convulsion. A REMEDY AGAINST CONVULSIONS. Some medicines remove fpasins by immediate contact, as affes milk, cream, oil of almonds, &c. others by repelling animal heat, as the gas fulphuris, nitre, fal ammoniac, &c. and where the strictures are produced by inanition, or defective vital heat, spasms are removed by those means that restore the vis vitae, such as valerian, castor, musk, &cc.

Opium, balfam. Peruv. and the effential oils of many vegetables, are the most powerful of this kind. Opium, for its immediate effects, excels; balf. of Peru, in many instances, produces more lasting benefit than opium, and indeed it fometimes succeeds where opium hath failed; the effential oils differ as antispasmedies from opium, in this, they act more upon a particular part than upon the fystem in general, and have no soporitic effect.

Dr. Home, in his Chemical Experiments, hath attended

to the comparative strength of this kind of medicines; he does not pretend to positiveness in his conclusions, but from what arose to his observation, is led to arrange them as follows.

Amongst the first or weaker class, are the fol. aurant. flor. cardamines, artemisia, pæonia, viscus quercinus, extr. hyofciami, caftor, mofch. cuprum ammoniacum, and electricity. - Amongst the second class, are fear, camphor. zincum calcinatum, and blifters .- The third are affa for-

tida, æther, and hydrargyrus.—The fourth and ftrongest are, cort. Peruv. opium, and bleeding.

He farther observes, that most of the antispasmodies have, besides their antispasmodic quality, other secondary ones, which have as much influence in their effects: befides, fome of them possess many laxative and fudorific powers, which others do not: they may be diffinguished into the ffimulant or inflammatory, and sedative or antiinflammatory. Of the stimulant, or inflammatory, are electricity, valerian, the bark, quicksilver, assa feetida, opium, &c. Of the sedative, or anti-inflammatory, are bleeding, musk, castor, flor. cardamin. cupr. ammon. blifters, camphor, æther, zincum calcinatum, &c.

Antifpasmodics are a very uncertain species of medicines in their effect on the disorders for which they are generally effectmed useful. They are best adapted for those spasmodic affections which are attended with great mobility, and which are usually known by the name of spaf-modic diseases. They are more useful in preventing the approach, and in removing fpasms which are more immediately present in weaker habits; and in preventing the returns of spasms when given in the remission of the spasm in strong habits: on the contrary, they are left

#### 95 - ] ANU ANU

removing the prefent fit, in ftrong habits than they are in weak ones. Sometimes, indeed, in ftrong habits they both remove the prefent fit and prevent returns. Cullen's

ANTISPASTICON. A general epithet for any medi-cine that works by way of revulsion. ANTISTERNON, from arra, against, or apposite to, and supress, the sternum, or breast. The back is to called, and suppose, the flernum, or breaft. The back is to called, because it is opposite to the breaft-bone.

ANTITASIS, from acre, against, and resea, to extend.

A contra-extension.

ANITTHENAR, from arri, against, and 9112p, the palm of the hand. See Adductor Pollicis Manus ad Indicem.

Dr. Hunter applies this name to a muscle of the foot, and says it arises from the os cuneiforme, and is inserted in the external sesamoid bone.

ANTITHORA. See ANTHORA. ANTITRAGUS, from ark, against, and reayes, the the thick part of the anthelix.

The name of a muscle which acts only on the cartilage of the ear. See AURICULA.

ANTITYPUS. Ab arti, & turlu, percutio. See

ANTIVENEREA. Medicines against the lues venerea.

ANTIVENEREALIS, AQUA PRESERVATIVA. It is a folution of caustic alcali in water, to be injected up the urethra in men, and the vagina in women, and to wash the parts with, after coition :- but care must be taken that the folution should not be too strong, lest it should occasion exceriation and inflammation.

ANTIZEUMIC, i. e. Preventers of sermentation in

general.
ANTONII SANCTI IGNIS. St. Anthony's fire. See ERYSIPELAS.
ANTONOMASTICA. See Cochlææ.

The male ANTOPHYLLON, or ANTOPHYLLUS. caryophyllus, or the large full grown ones. ANTRAX, i. e. ANTHRAX. See CARBUNGULUS.

ANTRISCUS, called also cherophyllum sylv., cerefoli-um sylv., opium sylv., and daucus sepianius. It is a plant which resembles hemlock or chervil; but

it is of little use in medicine.

ANTRUM BUCCINOSUM. The cochlea or laby-rinth of the ear. - GENÆ, HICHMORIANUM MAG-NUM, called also finus maxillaris, and antrum maxillæ superioris. MAXILLARY SINUS. Highmore boasts of the diffeovery, but Casserius takes notice of this part before him, under the first name.

All the body of the upper jaw-bone is hollow, and its eavity forms this antrum; each hath a winding paffage into the nostril, on the side on which it lies; this cavity and the fockets of the teeth are often divided by interpo-fition of only a very thin bony plate. The membrane which lines this cavity is fometimes inflamed, and matter forming there is discharged by drawing one of the dentes molares. See Abscessus sinus Maxillaris. molares. See Abscessus sinus Maxillaris.
ANTYLION. The name of an aftringent used by P.

ANUCAR. See BORAX.

ANUS. In botany, fignifies the posterior opening of

a monopetalous flower.

a monopetalous flower.

Anus, a contraction of the word anulus, a ring; called also culus bedra; arches; under the plexus, before the united thalami nervorum opticorum, there is a hole on each fide, one of which is called anus in anatomy. See Cereprum.—It is also the lowest part of the intestinum rectum, commonly called the fundament. The extremity of the rectum contracts into a narrow orifice, the fides of which are disposed in close folds. This is called fphintler ani: it hath several muscles belonging to it, some of which surround it as sphincters; the rest are broad and sleshy planes inserted in it, and which being inferted likewise into other parts, sustain it in its natural situation, and restore thereto, when it is disturbed by fituation, and reflore thereto, when it is diffurbed by the force necessary for excluding the fæces; the latter muscles are termed levatores ani. Two ligaments belong to the anus, viz. the ligamentum cutaneum offis coc-

useful in preventing the return of spasms in weak habits than in stronger ones; nay, they rather increase the tendency to spasmodic complaints in weakly people, if given in the interval of those disorders; and are less useful in the interval of those disorders; and are less useful in the removing the present sit, in strong habits than they are with the internal coat of the intestinum rectum. This part is extremely vafcular, hence the troublefome hæmor-rhage when the operation is performed for the fiftula in

The anus is subject to many disorders, and they are generally fomewhat difficult of cure, because of the irritability of the part, which subjects it to receive fresh injury from many accidents; Actius observes that astringents are acrid, and the sensibility of the anus cannot bear them; also that astringents which are not acrid, such as metals, should be applied here. On the diseases of this part, fee Actius, Celfus, P. Ægineta, Turner, Heisler, and Wiseman. See also the article Rectum below.

Wiseman. See also the article RECTUM below.

EXCRESCENCES ABOUT THE ANUS.

Various excrescences are found about the verge of the anus; many of these are produced merely by relaxation, which are fafely removable: these are unattended with a life accepted discharge, and are single or dispain, any difagreeable discharge, and are single or distinct, let their number be what they may. In removing them prefer the ligature, for the fake of avoiding a troublefome hæmorrhage.

When they discharge a bloody fluid matter, and are painful, they are also generally in clusters, or not distinct, and for the most part disposed to, if not already become can-cerous. Mr. Pott observes, that in cancerous cases of this kind, there is rarely a fingle excrescence, but the gut is for the most part surrounded with them; and if a fine ger is passed into the intestine, those tumors produce the idea of pushing the finger into a rotten pomegranate. Beyond palliation, no relief can be afforded.

The ANUS IMPERFORATED.

Sometimes children are born with a membrane across the anus, which obstructs the ejection of the excrements. If the fituation of the anus cannot be discovered, by reafon of the thickness of the superfluous substance which closes it up, a cure cannot be expected; for much, if not the whole rectum is closed up or wanting. If the case admits of a cure, the situation of the anus will be seen by a

prominence, or by a little hollow.

This accident is generally fpoken of as if always cir-cumftanced alike. Mr. Pott very judiciously divides it into four classes. 1st. Where there is no mark or vestige of an anus perceptible; in this case the rectum is as it ought to be until it arrives at the bulb of the urethra; from this there is no intestine, so no anus externally. If the rectum reaches too near the part where the anus thould be, the impulse of the fæces against the skin will discover where a perforation may be made; but if no such impulse is to be felt when the child coughs or cries, relief cannot be afforded. 2d. Where there is a circle of the skin which coughs or cries, resisting the skin which coughs are constituted in the skin will be skin will b mark in the skin which points out where the anus should be; in this instance the difficulty is not considerable. However, it may be proper to observe here, that the perforat-ing instrument should be introduced in the direction of the os facrum; if it paffes forward, the bladder, or the uterus, or both, may be injured; if it is to be introduced far up, to divide a membranous obstruction in the rectum, in cutting it should be moved not upward, but from fide to fide; thus you avoid cutting the profitate gland, or the vesiculæ feminales, and perhaps the neck of the bladder.
3d. Where there is a well formed anus, and perforated, but it hath no communication with the intestinal tube, from the rectum being imperforated. In this inftance if the child is not duly attended to, it dies in great agonies. If an infant hath had no ftools during the first or second day after its birth, a finger fhould be dipped in oil, and thruit up the rectum, to discover whether or no the obstruction is there. 4th. Where there is neither anus nor rectum, but the intestinal canal terminates in the colon; in this case there is no relief to be expected. Another equally unfortunate kind, is that in which there is a fort of rectum, but it is rolled up like a bit of catgut. Here all attempts to affift are vain, for though for the prefent a difcharge was obtained, as the inteffine is deficient, evacuations could not be continued.

The means, &c. of relief, in the first three of the above classes, are the same. In either of them the opera-tion should be performed without delay or regard to any

objections; for if it is not conformed to, death will increase means by it fuch a change as implies deliverance evitably follow. The best instrument is a large trocar, from a disease.

APANCHOMENOI, from arxs, to firangle. Strange. as follows: keep the point of the trocar within the canula until it is fixed against the obstructing part; then push the trocar forward, and if you succeed the meconium will infiantly be discharged; this discharge may be left to itself for these or four hours, or until the belly is well emptied. After a due discharge, pass a singer up the rectum to dis-cover whether or no there is any stricture. If a stricture is met with, introduce a probe-pointed knife on the back of your finger, and divide it on each fide. To finish the cure, let a fmall candle be introduced up the gut every two or three hours, until the anus, &c. is quite pervious, and no more aid appears to be required. In two or three weeks the stools will pass properly, and all inconvenience will generally be ended. See Bell's Surgery, vol. ii. p. 275. Edinb. Med. Comment. vol. iv. p. 104. White's Surgery, p. 379. And Abscessus Ani. Anus inflammatio. See Proctalgia.

ANXIETAS. ANXIETY. RESTLESSNESS. See ALVS-

MOS.

ANYDRION. A species of solanum. ANYPEUTHYNA. In medicine this signifies events that cannot be charged on the phylician, nor render him

accountable for them.

AORTA. According to Fœlius, but without a folid reason, this word is applied to the lobes of the lungs. Also the name of the great artery proceeding from the left ventricle of the heart, of which all other arteries, except the pulmonary, are but the branches: called also Graffa arteria. - Magna arteria. From the heart it extends itself, by its various branches, to the most distant parts of the body. Each of the divisions and subdivisions of the aorta receive different names, e. g. the aorta gives rife to the carotid and the fubclavian arteries, the branches of these again receive other names, &c. These branches are in pairs except the cocliaca, the two me-fentericæ, fome of the colophageæ, the broughialis, and fometimes the facre.

The beginning of the aurta is furnished with femi-lunar valves, as the plumonary artery is, and the fame triangular bodies to close up the little space left by the valves. is larger in women than in men. It is called the afcend-ing aurta from the heart fo far as it goes upwards; and descending, from the curvature to the os facrum, where it terminates in the iliacs .. The defeending asrta is divided into the fuperior, which reaches from the curvature to the diaphragm, and the inferior, which extends thence to the

bifurcation, where the iliacs begin.

The asrta goes from the basis of the heart, nearly opposite to the fourth vertebra of the back, and ascends obliquely, with respect to the body, from the left to the right side, and from before backwards; then bends obliquely from the right to the left fide, and from before backwards, reaching as high as the fecond vertebra of the back, from whence it runs down again in the fame direction, forming an oblique arch; from thence it defeends in a direct course along the anterior part of the vertebræ, all the way to the os facrum, lying a little towards the left hand, and there terminates in its two subordinate branches in the iliacæ.

The aurta afcendens is principally distributed to the thorax, head, and upper extremities: the fuperior por-tion of the asrta defeendens furnishes the reft of the thorax: the inferior portion furnishes the abdomen and the

lower extremities.

To conceive more diffinelly of the general course of the arteries, or of the particular course of any individual alone,

a view of the figure of the arteries will greatly affift.

The aerta is fubject to many diforders, as inflammation, ulcers, polypufes, aneurifms, offification, &c.

AOVARA. A fruit about the fize of a hen's egg, many of them are included in one pod; it is the produce of a kind of palmatree which are used in Africa and the of a kind of palm-tree which grows in Africa and the East Indies. The kernel of this fruit is white: to the table it refembles cheefe; it is of an affringent quality, and when preffed, an oil is forced out which is very much

APAGMA., vel APOCLUSMA. The thrufting of a bone or other part out of its place. See ABDUCTIO.

APALACHINE GALLIS. See CASSINE.

APALLAGE, from anamaren, to change. Hippo-

APANCHOMENOI, from ayxa, to firangle. Stran-

APANTHISMUS. A fearcely perceptible line, pro-perly in painting, to which Galen refembles the fmall

APANTHROPIAI, from auto, from, and assessor a, a an. An aversion to company, or love of solitude.
APARACHYTUM VINUM. Wine not mixed with

fea-water.

APARAQUA, A species of briony growing in Brasil.

APAREGORETOS, from a, neg. and wanter, to comfort, mitigate; what assords no comfort, or relief.

APARINE, called also philanthropus, ampelocarpus, inc. assorberine, asperula, gratterona, GOOSE-

omphalocarpus, ixus, afpavine, afperula, gratterona, GOOSE-GRASS, CLIVERS, and CLEAVER'S BEES. CLEAVERS, GOOSE-SHARE. HAYRIFF. It is the Galium Aparine of Linn.

It is a flender rough annual plant; fp bushes, and flicks to whatever it touches. fpreads upon are fquare, brittle, and jointed; the leaves are oblong and narrow; the flowers are white and followed by little round burs .- It has been tried in fcrophula but without fucceis.

An extract made of its juice is possessed of a pungent faline bitterness. The fresh juice in doses of two or three ounces is diuretic. It is best if gathered when half grown. It is also a name of the lentibularia minor. LATIFOLIA. See ASPERULA.

APARTHROSIS, fee ABARTICULATIO, from are,

ab and assess, a joint.

APATHES, from a, neg and eass, an affection or possion. Such as feem to be void of human passions. This temper is also carried to that instexible sternness which extinguishes the affections of humanity, as was instanced in Diogenes the Cynic, and Timon.

APATHIA. Apathy expresses the quality of not feeling, a freedom from the impulses of passion, and

mental perturbation.

APECHEMA, from ano and nyout, a found, apochepima. Properly a refounding, or the repercufion of the found, an echo; but in medical fense it fignifies a con-

tra-fillure.

APEIBA BRASILIENSIBUS. A tree growing in Brafil, whose wood serves for making boats, &c. but in medicine no part of it is used. Rasii Hist. Plant.

APEIROI, from a, neg. and weeps, an experiment. Unexperienced, unaccustomed.

APELLA. Abbreviation of the prepuce. Galen gives

this name to all whose prepuce, either through disease, section, or otherwise, will not cover the glans.

APEN. A fort of bread made with the juice of the

ambalam-tree and rice, in India.

APENSALUS. A veffel with a narrow neck to hold

APEPSIA. INDIGESTION. From a, neg. and weeks, to digeft: also dyspepsia. That genus of disease which Dr. Cullen names dyspepsia, or indigestion, he arranges in the class neuroses and order adynamia. The symptoms are, a want of appetite, a fqueamiftness, fometimes vomit-ing, sudden and transient distensions of the stomach, cructations, heartburn, pain in the region of the flomach, and generally costiveness; and these without any other diforder either in the flomach itfelf, or any other part of the body.

Indigestion is very frequently a secondary and sympathetic affection, but the above fymptoms are effential to this difeafe, as idiopathic. All these symptoms may arise from one cause, viz. weakness, loss of tone, and weaker action in the mufcular fibres of the floranch: and this weakness is the proximate cause of this diforder when an original one. The remote causes are various, as tumor, &c. in the ftomach itfelf; or fome diforder of other parts communicated to the flomach, as in the gout, &c. in both which cases the indigestion is symptomatic.

In most cases of indigestion, as an original disease, the reaker action of the mufcular fibres of the ftomach, is the chief cause, and also the most frequent : perhaps a depravity or defect of the gastric juice may sometimes be the cause, but even here, perhaps the weakness just mentioned, and which in all cases is attendant, is that to which we can attend usefully in practice. To succeed in the cure, avoid the occasional causes, remove fuch symptoms

## APH APH

vigorate the tone of the stomach. In order to which the patient must be informed of the necessary changes in his conduct; for though he often pursued such a practice conduct; for though he often puriued luch a practice without fensibly fasfering, except he conforms to a contrary one the present complaints will not be overcome. Crudities, acidity, and cottiveness must be removed, at least in their excefs, as they tend both to aggravate and continue indigestion. The ends accomplished, the restoration of the tone of the stomach alone remains for perfecting relief; to this end fee ANOREXIA.

Abitemiousness and excess are like causes of indigestion. An over diftention of the ftomach may in fome measure injure its proper tone; and long fasting, by inducing a bad quality in the juices fecerned into the flo-mach, render it feeble, and generate wind. Hard drinking, and any of the causes of an anorexy also injure

digestion.

Little need be added in order to the cure, for the treatment of the anorexy is the fame as is required in this cafe, to which therefore the reader is referred.

The columbo root, not mentioned in the article Ano-REXEA, is particularly useful when the stomach is languid, the appetite defective, digeftion with difficulty carried on, or when a naufea with flatulence attends. It may be given in substance with any grateful aromatic, or infused in Maderia wine, now and then interpoling gentle doses of the tineture of rhubarb. In case of a defective bile, make pills of this root with a foft extract of ox's gall.

A mixture of mustard feed with the columbo root is

of admirable utility in complaints of this kind; particularly where acidity and flatulence prevail much in the

The Bath waters, affifted with warm nervines and corroborants, are not to be omitted, when circumflances admit of their ufe.

See Percival's Esfays in the Reflections on Exper. 4, 5, nd 6. Cullen's First Lines v. iii. p. 217, edit. iv. APEPTON. Crude or indigested.

APER. The BOAR. This appellation is given to the fwine, in his wild state: when tamer, fus, fcropha, and porcus. See Porcus.

APERIENS. APERIENT. The fame as debostruent.
APERIENS PALPEBRARUM RECTUS, of Fallopius and Douglas. A muscle of the eye-lid, thus named from its ftreight progress and use. It is the same with the levator

palpebra superioris.

APERISTATON, from a, neg. and esperants, affiction and danger. An epithet in Galen for an ulcer that is neither troublesome nor dangerous.

APERITTOS, from a, neg and wiperlos, redundant. Such aliment as generates but little excrement. The op-

posite quality is called perittomaticos.

APERTUS. It is used for exulceratus, as in saying an open cancer, &c. in which cases the tumor is become ulcerated.

APES. BEES.

If they are dried and powdered they are fomewhat diuretic; but their chief use is for the preparing of honey and

Bees collect the farina facundans from the apices of the flowers, and eat it; they receive nourishment from it, then cast it up and mould it into wax; art hath been exercifed to make wax of this powder, but in vain; it is only the stomach of the bee that can effect it.

The belly of the bee is inwardly divided into four parts, containing the inteffines, the bag of honey, the bag of poifon, and the fling. The bag of honey is transparent as crystal, and is emptied at proper times into the cells of the comb for the proper times. of the comb, for the maintenance of the community dur-

ing the winter.

APETALI. So Tournefort names the fifteenth class of vegetables. See Flos APETALUS under the article Flos.

APEUTHYSMENOS, from 11-801, firait. See Rec-

TUM INTESTINUM.
APHACA. YELLOW VETCHLING.

APHACA ANGUSTIORIS FOLII. A species of dan-

APHÆRESIS, from apaigin, to take away. To take away any superfluous thing in a medical way.

as tend to aggravate the disease or to continue it, and in- pocrates often applies this word to the touch of the puvigorate the tone of the stomach. In order to which the denda, in order to discover disorders of these parts. It is

APHEBRIOC. SULPHUR.

APHELICESTEROS, of ano, from, and harata, youth,

One past the flower of age.

APHEPSEMA, from e. La, to boil. A decoction.

APHESIS, from apingu, to remit. Hippocrates gene

rally fignifies the remission or solution of a disease by this

APHILANTHROPIA, from α, neg. and φιλανθρωπία, the love of mankind. The first degree of melancholy, when a person hates society, and delights in solitude.

APHLEGMANTON, from α, neg. and φλεγμα,

degm. Void of phlegm.

APHONI. So Hippocrates calls those who labour un-

der a caros.

APHONIA. A name of the catalepsis; and for the palfy in the tongue. See CATALEPSIS.

APHONIA, from a, the part, priv. and curn, a voice.

One who hath loft his voice, See Anaudos.

Hippocrates uses this word to express those who, with

the lofs of voice, lofe all voluntary motion; as in epilep-

the lofs of voice, lofe all voluntary motion; as in epilepfies, apoplexies, a fyncope, &c.

Dr. Cullen fpeaks of this lofs of voice as a fuppreffion
of the full found, which happens just before fwooning,
&c. He ranks this genus of diseases in the class locales,
and order dyscinesiae. Besides the instances of its being
symptomatic, he observes three species, viz. Aphonia gutturalis; when the gullet is affected by a tumor in the fau
ces, or the glottis. 2. Aphonia trachealis, when the tra
chea is compressed, or morbidly contracted. 3. Aphonia
atonica, when the nerves of the larynx are wounded or
paralytic.

If one of the recurrent nerves, which are formed by the par vagum and the nervus accefforius, and reach the lapar vagum and the nervus accelerius, and reach the la-rynx, is cut, the person is capable as it were of only a half pronunciation: but if both are cut, the speech and voice are both lost. The loss of speech happening in hysteric patients is also called aphonia; but more proper-ly that loss of speech is thus named which depends on some fault of the tongue.

Seeing that the motion of any part is destroyed, or leffened at least, by the interception of the nervous fluid in its paffage there, and that the nerves deftined for the mo-tion of the tongue, arise principally from the fifth pair, it appears that the seat of this disorder is in the said fifth pair of nerves, and that the immediate cause is a diminu-tion or total obstruction of the nervous sluid through them. Hence, a palfy of the tongue, which is either antecedent or fubfequent to hemiplectic or apoplectic diforders, demand our utmost attention.

If an appears alone, it generally befpeaks an approaching hemiplexy or apoplexy; but if it fucceeds these disorders, and is complicated with a weak memory, and a sluggishness of the mental powers, it threatens their return. That aphony usually terminates the best, which proceeds from a stagnation of serous humours compressing the branches of the fifth pair of nerves, which run to the tongue; but it is no lefs afflictive to the patient, and is

very obstinate of cure.

Other causes of this disorder are, the striking in of eruptions on the skin, a congestion of blood in the sauces and tongue, obstructed periodical evacuations in plethoric habits, spasmodic affections, worms, a crumb of bread falling into the larynx, fear, too free a use of spirituous liquors; also whatever destroys the ligaments which go from the arytenoid to the thyroid cartilages, will destroy

The prognoftics vary according to the cause or causes. That species which is owing immediately to spasms, soon gives way in the removal of them. If a palfy of the tongue is the cause, it is very apt to return, if relieved; but often

continues incurable.

In order to the cure, endeavour first to remove whatever obstructs the influx of the nervous fluid into the tongue; and fecondly to strengthen the weak parts. These general intentions, in all cases, being regarded, the par-ticular causes must be removed as follows:

If worms are the cause, antispasmodics give present re-

lief; but the cure depends on the destruction of these ver-

and nitrous antifpalmodics are to be used.

That species of aphony which remains after the shock of an hemiplexy or apoplexy, requires blifters to be ap-plied to the nape of the neck; other means are rarely ef-fectual.

If fpalmodic constrictions about the fauces and tongue are the cause, external paregories are of the greatest ser-vice: anodyne antispalmodies may be laid under the tongue, and the feet bathed in warm water; carminative clyfters also are useful.

When a palfy of the tongue produces this complaint, evacuations, according to the patient's habit, must be made, and warm nervous medicines must be externally applied and internally administered; blisters also should be placed

between the fhoulders.

In case of repelled cuticular eruptions, sudorifies should be given, and the patient's drink should be warm. liquor c. c. fuccin. or the vin. antim. may be mixed with tinctura benzoës composita, or with the balf. Peruv. and given, at proper diffances of time, in the patient's drink, or on a lump of fugar.

Sometimes the ferum flows fo rapidly to the fauces and adjacent parts, in a falivation, as to deprive the patient of all power to fpeak; in this case diaphoreties and laxatives, with a forbearance of all mercurials, are the speediest re-

medic

APHORISMUS, from aponicu, to separate or distinguish. A short sentence, briesly expressing the properties of a thing; or which serveth as a maxim, or principle, to guide a man to any knowledge, especially in philosophy

APHORME, of ano, from open, a motive. Hippo-crates expresses by this word, whatever gives rise to a disease, by a fort of metaphor; for this word hath relation to human actions, and their motives.

APHRAINON, from a, neg. and opened, to be wife.

One who has loft the use of his reason.

APHRODES, from αφρΦ, froth. Spumous or frothy. Hippocrates applies this word to the blood and excre-

APHRODISIA, Aphrodisiasmus, I from Appolitu, Venus. Venereal commerce. Some express by this word the age of puberty, or the venereal

age. APHRODISIASTICON CLIDION. A TROCH, fo called by Galen; it was used against spitting of blood and dysenteries: P. Ægineta speaks of its being made of balauf-

nes, rhuberb, opium, and other aftringents.
APHRODISIUS MORBUS. See Lues venerea. APHRODITARIUM. A powder recommended by

P. Ægineta for hollow ulcers.

APHROGALA, from apps, froth, and yana milk. It is also called capilacteum. No writer hath described this, but what the Romans used under this name, seems to be fomething like what we call fyllabub.

APHROLITRUM. See APHRONITRUM. APHRON. A wild kind of POPPY. Also the name of a cephalic plafter described by Actius in his Tetrabib.

4. ferm. iii. cap. 13.

APHRONITRUM, from appos, forme, and nroov, nitre. Spume of NITRE. Salts formed of the vitriolic acid and a terrene or gypfeo-calcareous element are thus called. It is a name also of the natron. See ANATRON.

APHROSCORODON, from agoos, spame or frost. It is a large species of garlic, called also allium ulpicum; and hath the above name because, when beat with vine-

and hain the above name occasie, when bear with vine-gar, it generates much froth.

APHROSYNE, from αφιρο, filly, folly, or dotage.

APHTHÆ, called also by Celfus ferpentia oris ulcera,

SPREADING ULCERS IN THE MOUTH, and in England puflusa oris, THE THRUSH, named likewise alcola.

Dr. Cullen ranks this genus of difease in the class py-

rexia, and order exanthemata.

This diforder appears in white fpecks upon the tongue, and the back part of the palate in children: thefe fpecks gradually fpread all over the infide of the mouth, and from thence all the way through the ftomach and inteffines: the fize of these specks increase as the violence of other fymptoms are augmented; and they are then more yel-low, or of other more unfavourable colours.

Dr. Hunter fays, that thefe white specks are inflammatory exudations, and not ulcers; which feems to be con-

In case of a congestion of blood about the head, bleeding firmed by their falling off, and being succeeded by other thicker ones, which falling off also, are again succeeded

Sometimes no other fymptoms attend, but more frequently they are the refult of inward fits, and are accompanied with four belchings, gripes, diarrhoras, fever, or foreness of the mouth.

The black thru/b rarely occurs; when it does, it is al-

ways a putrid fymptom, not an original difeafe.

Infants are the most frequent subjects of this diforder, and amongst them, those fed by the hand more than those that have the breaft. In adults, they are often accompanied with miliary eruptions.

Hippocrates speaks of aphthas of the pudenda of preg-nant women, and of aphthas of the aspera arteria.

Celfus observes that aphthæ are most dangerous in infants; and Boerhaave fays, in adults they are frequent in acute difeases, and are then attended with inflammation of some of the viscera. The more they spread, the danger is increased in all cases.

In adults, the aphtha in the mouth are diffinguished from the ulcerations in the angina gangrena, by the whitenefs of the floughs, by the edges not being red and angry, and by there not being a fhining rednefs all over the fau ces, with other fymptoms that ufually attend this fort of quinfy.

If the cure is not foon effected in children, the contents of the bowels become more acrid, and produce vomitings, four and curdled stools, gripings, convulsions, and often

First cleanse their stomach and bowels, with as much of the following mixture as will operate both upward and downward.

R Mannæ Calab. 3 fs. aq. puræ 3 ij. f. folutio colaturæ adde vin. antim. gut. xx. m. detur cochl. mediocn. pro re nata.

If the child is cossive, due attention must be had thereto. The best topical application is as follows:

R Boracis opt. subtilif. pulv. 3 fs. mel Britan. 3 i. m. f. litus.

In feverer cases, double this quantity of the borax may be added in this litus, Whichever of them are used, a small tea spoonful should be rubbed well about the mouth, and then gradually fwallowed once in an hour or two.

If after the removal of the specks the mouth is very fore, let a thin folution of the gum. tragac. in rose-water, be frequently held in the mouth.

As a purge in this diforder, when infants are the fub-jects, Dr. Canvane extols the ol. Ricini. and at the intervals of purging, he fays, that much relief is obtained by giving the ipecacuanha as a perspirative.

That severe degree of the thrush which is so frequent in

the West Indies, requires the application of perpetual blifters, which should be kept open with the ung. can-

tharidis, and in this case much relief is given to the patient by a due use of a proper detergent-

R Boracis opt. fubtil. pulv. 3 iij. mel rofar. 3 ij. acidi vitriolici diluti. 3 ij. m. f. litus ut fupra utend.

APHYLLANTES ANGUILLARE. A fort of daify. Raii Hilt. - Monspel. A species of caryophyllus. APHYLLON. See OROBANCHE.

APHYTACORES. A fort of trees, faid by Pliny to produce amber, fee lib. xxxi. cap. 2. APIASTER. The bird called the bee-eater. See

APIASTRUM. BAUM. Sec MELISSA.

APICES, of apex, a top or point. In botany they are the fummits, or those bodies which hang upon the chives or threads which generally furround the pointals of flowers, and contain the prolific powder, which is analogous to the male fperm of animals: called alfo Intherse.

APIITES. See APITES.

APINEL. A root which is met with in fome of the American islands; it is called by the natives yabacani. Its name Apinel, was that of a captain of horse, who first

made the Europeans acquainted with it. If, with a rod, takes up their virtues, and an extract made therefrom a piece of this root is put into the mouth of a ferpent, it is foon destroyed. If a person chews it, and rubs his hands and feet with it, the ferpents flun him, nay if he takes the ferpent it cannot hurt him. See Hift. de l'Acad. Roy.

APIOS. The PEAR-TREE; -- also round knobbed-

APITES, or APITES VINUM, from antis, the pear-tree. The wine of pears, or PERRY. Its virtues are much the fame as those of cyder.

APIUM. SMALLAGE.

Miller enumerates thirteen species.

It is an umbelliferous plant, with bright green-winged leaves, cut flightly into three winged portions, ferrated about the edges; the feeds are fmall, oval, plano-convex, furrowed, of a pale brown, or ath-colour; the root long, about the thickness of a finger, with a number of fibres of a pale yellowish colour on the outside, and white within. It is biennial, flowers in August, grows wild in rivulets and watery places, and is frequently cultivated in gar-

The cicuta aquatica, growing naturally in the fame places, may be mistaken for it; but is thus distinguished: the leaves of this cicuta are deeply divided, quite to the pedicle, into three long, narrow, sharp-pointed fegments; whereas those of fmallage are only slightly cut into three

roundish obtuse ones.

The fresh roots of [mallage, when produced in their native watery places, partake in fome degree of the quality of those of hemlock, have an unpleasant smell, and bit-terish acrid taste; but by drying they lose the greatest part of their ill flavour, and become (weetish; they are aperi-ent and diuretic, but the seeds are to be preferred in all medical purpoles, and are good carminatives. In diffillation thefe feeds yield an effential oil, and they give out their virtue to fp. vini. rect. fo completely, as, on evaporation, to leave an excellent extract.

The apium is also called apium sativum, eleoselinum, belesselinum, paludapium, apium palustre, apium dulce, and

celeri Italorum.

By culture this plant hath been improved, and is the cellery of our gardens, called also apium sativum; in this ftate the roots have an agreeable warm fweetish taste, without any of the ill flavour of the original fmallage: but Ray observes, that if neglected, it degenerates into its first disagreeable state. However, as by culture this plant is improved for the table, it is rendered less powerful as a medicine.

Heleofelinum, or MARSH SMALLAGE. This is a larger fort, growing also in watery places, of the same nature

as the celery,

Oreofelinum, MOUNTAIN PARSLEY. It grows on rocky laces, and refembles the Macedonian parfley. See

Hipposelinum, also called olusatrum, grielum, agrisse-linum, and Smyrnium. It is a large kind of apium, whose roots are white like those of celery, and are eaten like them.

APIUM PYRENIACUM THAPSIM, called alfo fefeli Pyren. thapf. felinum Pyren. MOUNTAIN PARSLEY, or the fecond bastard turbith. It grows on the Pyreneans, but is of no note in medicine.

Bunium, also called daucus petroselini vel coriandri solio, faxifraga montana minor, WILD PARSLEY. It grows in stoney places, and is somewhat warming and diuretic.

Selinum montanum, called also apium peregrinum, vifnaga minor, felinum peregrinum, daucus peregrinus, STONE-PARSLEY. It hath nothing remarkably different in its medicinal powers from the COMMON PARSLEY.

APIUM HORTENSE, called also petrosclinum vulg. apium, felinum, GARDEN-PARSLEY. Apiumpetroselinum, or apium hortense, foliolis caulinis finearibus, involucris minutis. Linn. It is too well known to need description. roots are diuretic, and are best in a decoction, which should be drank plentifully. Distilled with water a small portion of essential oil is obtained; sp. vini rect. extracts the whole of their virtues, and, after evaporation, leaves a good extract. The leaves are warmer than the roots, and afford more effential oil; but the feeds are the best part of the plant: they are warming, carminative, bitter, and diurctic; Three pounds of the feeds yield about 3 i. of effential oil, the most of which finks in water. Sp. vini rect. best

APIUM MACEDONICUM. Petrofel. Macedon, daucus Macedon, apium petræum, patrapium. MACEDONIAN PAR-SLEY. Bubon Macedonicum. Linn. We have only the feeds in the shops, which differ from the common fort in being dark-coloured, and covered with a rough hoariness: their virtues are similar to, but weaker than the common fort.—That called — MARITIMUM DULCE MOUNTAIN PARSLEY. See APIUM & OREOSELINUM.

— PALUSTRE. A fpecies of fium. See SIUM ANGUSTIFOLIUM. — RISUS. A fpecies of ranunculus.

— SATIVUM. CELERY. See APIUM. — SYLVESTEE. A fpecies of rangue of the control of t TRE. A species of myrrhus. Also a name of the antrifens. — SYLVESTRE LACTEO SUCCO TURGENS. MILKY PARSLEY. See OELSNITIUM.

APLYTOS, from a neg. and ware, to wash. Un-washed. An epithet of wool, which is called by the La-

tins lana fuccida.

APNŒA. A defect of respiration, such as happens

in a cold, an apoplexy, &c. APOBAMMA. The fame as embamma, a flight tincture, and applied to water in which hot iron hath been quenched.

APOBRASMA. The bran of wheat, or the froth of

APOCAPNISMUS. FUMIGATION. From \*\*\* Trock. meak. APOCATASTASIS. To reftore, an amendment, a cellation, or fubliding.

APOCATHARSIS. An expurgation.

APOCENOS, See ABEVACUATIO. Also partial fluxes;

as watery eye, gonorrhoea, &c.

APOCERUGMA. A declaration, that is, fuch declarations as are thought proper to be made to the patient refpecting his danger.

APOCEACULISMENON. It is when a bone is

APOCEACULISMENON. It is when a bone is broken after the manner of a stalk, near the joint.

APOCHOPEMA, see APECHEMA.

APOCHREMMA. The matter of spit hawked up.

APOCHREMPSIS. A hawking up of spit.

APOCHYLISMA. The same as the rob of any fruit.

APOCHYMA. The pitch which is fcraped from fhips, formerly effected in medicine.

APOCLASMA. The fame as ABDUCTIO, or rather

apagma, which fee.
APOCLEISIS. An exclusion. But Hippocrates uses the word from whence it is derived to express a loathing of food.

APOCOPE. See Abscissio. From απο, from, and

ΑΡΟCRISIS. In Hippocrates it is the fame as eccryfis.

ΑΡΟCRUSTICON, from αποκροώ, to repel. An epithet for a remedy of a repelling and aftringent quality.

APOCYESIS. A birth, or bringing forth of a child. APOCYNON. A little bone in the left fide of a frog,

formerly held in great efteem.

Also the name of a plant called cynanchon, pardialan-

ches, cynomeron, cynocrambe, DOG'S BANE.

The leaves, mixed with meal, kill dogs, wolves, foxes, and panthers, and immediately affect their hips with a pairy. A fpecies of this is called pfeudo ipecacuanha. Boerhaave enumerates twenty-two species. It is a shrub with leaves like ivy, but forter, fharper pointed, ftrong fcented, vifcous, and full of honey-like juice; the fruit confifts of feeds contained in pods like those of beans. This plant is not in medical use.

APOCYNUM, called also HIPPOMANES. A name of swallow-wort; and of fome species of peripleca.

TRIFOLIUM INDICUM. A species of toxicodendron.

APOCYRTUMENA. It is spoken of humours forming into a kind of cone, when suppurated and ready to be discharged.

APODACRYTICA, from απο, fignifying negatively, and δακρυ, a tear. They are medicines which first excite, and then evacuate, the superfluous mostlure of the eyes,

and thus preventing preternatural moisture there. Such are onions, celandine, hellebore, &c.

APODYTERIUM, from arosona, to unclothe. A private room before the entrance into the baths, where the bathers undreffed themselves. It is also called conisterium and Spoliarium.

APŒUM,

APCEUM, from a neg. and wish, of fome quality. Void of all femible qualities, possessing neither aftringency, nor acrimony, nor any other remarkable faculty, as water amongst moist substances, and starch amongst dry. It is similar to institute and the APOGALACTISMUS. See ABLACTATIO.

APOGEUSIA. DEPRAYED TASTE. APOGEUSIS. Loss of TASTE. See AGHEUSTIA. APOLEPSIS, from archausavoum, to be suppressed, re-tained, &c. also dialepsis, interceptio. An interception, suppression, or retention, which may be of urine or any other natural evacuation.

APOLEXIS, from απολογω, to ceafe, or end. A decaying time of age, and opposed to the flower of age.

APOLINOSIS, from λογον, flax. So P. Ægineta calls the method of curing a fiftula by raw flax. See Omoli-

APOLLINARIS. True nightshade, also black hen-

See HYOSCYAMUS NIGER. bane.

APOLYSIS, from agonou, to release. A folution or releafe. Such as the exclusion of a child, the folution of

APOMAGNA, from αποματί», to abflarge. Any thing used to wipe away fordes, as a handkerchief, or a spunge,

APOMATHEMA, from are, neg. and ματθανω, to learn. Hippocrates expresses by it, a forgetfulness of all

that hath been learnt.

APOMELI. A fweet liquor made with honey-combs, diluted and boiled with water. Galen fays, that Hippo-crates, and others, called apomeli by the names of oxyglici, and expglices, and that fome were made with, and others without vinegar, fome being fweet, and others four and fweet. It is fimple oxymel.

APONENCEMENOS, from amovosa, to be negligent,

or averse. An adverb importing an utter aversion to any

APONEUROSIS, of aze from, and verov, a nerve. Any nervous, or, as now called, tendinous, expansion. The tendon or tail of a muscle, called by Hippocrates,

There expansions of tendons, called aponeurofis, or fascize, grow thinner and thinner, till they are lost in the cellular membrane. Instances of these are frequently met with, c. g. the outward mufcles of the thigh are bound down by one of these expansions, viz. the FASCIA LATA, which fee. Dr. Hunter describes this aponeurofis as proceeding from the musculus fascia lata, on the ex-ternal part of the thigh, and from the gluteus maximus on the posterior part.

There other fascize, as those of the legs, which, like ofe of the thighs, cover the muscles. The soles of the those of the thighs, cover the muscles. The soles of the feet are strong fasciæ, which prevent the slexor muscles of the toes being hurt, when we tread. The fasciæ on the thighs and legs, bind down the muscles while in action, and also increase their strength by compressing

When matter is formed immediately under any of the fasciæ, it cannot point where it is first formed, but runs under them to fome distance, to gain an exit: to prevent inconveniencies from this cause, as soon as matter can be felt under a fascia, it is right to give it vent immediately, and not to wait for its pointing, as in other fituations; when this happens under the temporal muscle, great difficulties attend. See Temporalis Musculus.

APOPALLESIS, from αποπαλλω, to throw off in a APOPALSIS, hasty manner. An expulsion of the

as in abortions

APOPHLEGMATISMUS, of απο, from, and φλεγμα, phlegm. A medicine, which by holding it in the mouth, promotes a discharge of phlegm, such are pellitory root, horse-radish, &c. In this tribe may be canked fours, or whatever discharges a load of serum from the head, the parts about the throat, &c. when folid it is called maffi-catorium. Medicines possessed of this power are called aticum and commanfum.

APOPHRADES, from the fingular anospas, unfortunate. Those days in which an acute distemper comes to

a fatal crifis, or no crifis at all.

APOPHTHARMA. A medicine to procure abortion.

APOPHTHORA. An abortion. From αποφθειρω, to

APOPHYADES. The ramification of the veins.

APOPHYAS, of ano, from, and own, to grow. An appendix. Any thing that grows to, or proceeds from

APOPHYSIS, from aregou, to produce; or from emo, and que, to grow. An appendix. Anything that grows to, or proceeds from another, as boughs and branches; in anatomy it mostly fignifies the projection of a bone. It is also called probole, echphysis, processius, productio, projectura, and prosuberantia.

APOPHYSIS GRACILIS. The apophysis of the

neck of the malleus in the car.

APOPLECTA. A name for the internal jugular vein

which afcends by the fide of the afpera arteria.

APOPLECTICA. Medicines against the apoplexy, fo called inflead of antipoplectica. Vogel fays it is a continued fever coming on upon an apoplexy.

APOPLECTICA VENA. Scc JUGULARES VENÆ.

APOPLEXIA, from anonimose, to strike or knock down, or smite suddenly; the Latins call it attentious morbus. The APOPLEXY. It is also called sideratio, attentius

flupor, palperia.
Dr. Cullen ranks this genus of difease in the class neuroses, and the order comata. He also takes notice of nine species, befides those instances in which it is symptomatic, viz. 1st. Apoplexia fanguinea, with figns of an universal plethora, and chiefly of fulness in the head. 2d. Apoplexia ferosa, which happens generally in aged and leucophlegmatic people. 3d. Apoplexia hydrocephalica; see Hydrocephalus. 4th. Apoplexia atrabilaria, observed in persons disposed to melancholy. 5th. Apoplexia traumatica; when the head is hurt by violent external force. 6th. Apoplexia venenata, from poisonous matters, whether externally applied, or internally taken. 7th. Apoplexia mentalis; from passions of the mind. 8th. Apoplexia cataleptica, in which the respiration is not flertorous, and though the limbs maintain any accidental position, yet they give way to external force amplied to position, yet they give way to external force applied to them. 9th. Apoplexia suffocata, See Submersio, which happens in cases of hanging and drowning. See CAROS.

An apoplexy is a fudden privation of all fense and voluntary motion; the pulse, at the same time, being kept up, but respiration is oppressed. A deep sleep, with insensibility, and snorting, seem to be constant attendants. Dr. Cullen says, The apoplexy is that disease in which the whole of the external and internal senses, and the whole of the voluntary motions, are in some degree abolithed; while respiration and the action of the heart continue to be performed. To the definition of apoplexy, he adds, that the abolition of the powers of fenfe and motion, is in some degree only; meaning by this, to imply, that under the title of apoplexy, are comprehended those diseases, which, as differing from it in degree only, cannot, with a view either to pathology or practice, be properly diffinguished from it. Such are the difeases named carus, cataphora, coma, and lethargus. Lom-mius observes, that this diforder is generally ushered in by fudden and acute pains in the head, vertigo, dimnefs of fight, grinding the teeth during fleep, a coldness of the whole body, especially the extremities; then, as though thunder-struck, the patient falls down sometimes with shricks; immediately after the eyes are shut, a snorting comes on, the difficulty of breathing is great, endangering fuffocation, the breaft ceases to heave just as if it was bound in cords; sense and voluntary motion are entirely loft.

There are different species of apoplexies, which demand our utmost attention, as the cure is very different in each, particularly the two first, the others agreeing more with the second. The first is the sanguineous apoplexy, in which we find a strong full pulse, a red and bloated visage, the patient's neck fwelled, an oppreffed loud refpiration, with a little hoarfenefs. This species prevails amongst the robuit who have much blood, loaded with craffamenturn. The fecond is the ferous apoplexy, in which the fymptoms are, in general, like those in the former species, except that the pulse is weaker, the countenance pale, or at least far less ruddy, and the breathing less oppressed. The third is the fpaimodic apoplexy; the fame figns attend this as are usual in the second species, only it is sooner removed, and rarely degenerates into a palfy. The fourth is the symptomatic, such as from flatus in the

ftomach, the gout, &c.

The remote cause is a plethora, the antecedent cause is

fome great commotion of body or of mind, as from viofanguineous hath, for a general and principal caufe, an in-creafed vital heat; - the ferous a defective heat; - and the other species have some cause which renders the diffusion of the vital heat irregular, whence spasms, which are a mediate cause of this disorder. It should be remembered here, that the erassamentum of the blood is the attractor of the vital fire, the nerves conduct it, and the brain is its principal refervoir: various caufes may determine this fire in greater quantities to a particular part than what is necessary for the due discharge of its functions, or it may be directed with a more than ordinary speed and force there; and in proportion to the quantity, or the velocity of it, in the apoplectic stroke, the part to which it is directed will fusier, both as to suddenness and danger; fhould it be determined thus to the heart and arteries, circulation would be stopped, and death the immediate confequence; but directed to the feat of fensation, and the origin of all voluntary motion, an apoplexy is pro-duced. The serous Apoplexy hath for its general and its principal cause too, a defect of vital heat, whence the redundancy of ferum, to which this species is usually at-tributed: farther, the crassamentum not being able to attract the degree of heat requifite for the due diftention of the cells of the cellular membrane, and the contraction of the fibres, occurring circumstances easily deprive par-ticular parts of their heat, and cause it to rush with violence on some other; and a suddenly deficient diffribution of the vital fluid produces fimilar effects, in fome instances, to an excessive one. And, as to all other fpecies, which indeed are but fymptomatic, it is as the morbid cause, hath an influence on the heat with respect to its distribution, that it is productive of this disease.

Dr. Cullen thinks that the proximate cause is, in general, whatever interrupts the motion of the nervous power, whether from the brain or to it. Of applexies from in-ternal causes, he thinks the motion of the nervous power is interrupted by some compression on the origin of the nerves; and this compression is occasioned by an accumulation of blood in the veins of the head. In apoplexies from external causes, the motion of the nervous power is interrupted by directly deftroying its mobility; as when mephitic air, fumes from charcoal, &c. are admitted to

From an attention to the fymptoms of an apoplexy, and the appearances observed on diffecting those to whom it had proved fatal, the brain is most probably its feat. Wepfer, in his histories of those subjects, observes, that the veffels in their brains were often ruptured, or very turgid; at other times the ventricles of the brain were filled with a watery humour; or a portion of ferum, &c. was found betwixt the brain and its membranes.

Old men, the indolent,-those who indulge in gluttony or drunkenness,-short-necked people, are the most sub-

ject to apoplexy.

This diforder should be distinguished in its species, and also from those other maladies to which it bears a resemblance. The fanguine apoplexy must be distinguished from the ferous and the fymptomatic, and each from one

another; and apoplexies must be diffinguished from a lethargy, an epilepty, hysteric suffocations, a palfy, a carus, a catalepsis, and syncope.

The danger seems to be chiefly proportioned to the difficulty of respiration; if it is tolerably easy, and the patient can swallow, there is good hope; but if respiration
is very difficult, or intermittent, and what is given the patient to drink, returns immediately by the nose, a recotient to drink, returns immediately by the nofe, a reco-

very is hardly to be effected.

Those who have been attacked with any kind of apoplexy, are subject to relapses, each of which are more dangerous than the preceding; to prevent which due regard should be had to all that can conduce thereto, that it may be avoided: fuppers, hot rooms, violent exercife, particularly in the fun, going to bed late, long fleeps, continuing in the cold, especially if the feet are subject to be so, and whatever is suspected to dispose to this dif-

order must be carefully attended to, and prevented.

In order to the cure, in case of the sanguine species, immediately uncover the patient's head, raise it up as high as possible, and give him the advantage of fresh

If it can conveniently be done, bleed, ad deliquium, lent exercise, hard drinking, passions of the mind, &c. to reduce the vital heat; ten or fixteen ounces may be taken the immediate cause is a compression of the brain. The away immediately, and the same quantity may be repeated in an hour or more, according as the pulse will admit. Some affert an extraordinary efficacy from opening the temporal artery during the fit. Dr. Cullen observes, that, when an attack of apoplexy is immediately threatened, blood-letting is certainly the remedy to be depended on, and blood should be taken largely, if it can be done from the jugular vein, or the temporal artery. But, when no threatening turgefeence appears, the obviating plethora is best effected by leeches applied to the temples, or scarifications of the hind head: and these are more safe than general bleedings. When there are manifest symptoms of a plethoric state in the vessels of the head, a seton, or pea iffue, near the head, may be very useful in obvi-ating the turgescence of the blood.

Lenient clysters, with a table spoonful of common falt

in each, should be given as speedily as possible, and repeated every three or four hours until proper means can

be administered by the mouth.

Cooling medicines should be given as soon as they can be fwallowed, let the first be a brisk but cooling purge

In the fit, fome affert that a handful of common falt, diffolved in a pint of water, if poured down the patient's throat, will fpeedily recover him: the trial is eafy, and nothing to be feared in case of failure.

Blifters may be applied all over the feet. Dr. Cullen prefers the application of them to the head.

Keep the patient still and calm, and let his diet be aqueous, and such as affords the least nourishment.

In the ferous kind, bleeding is rarely to be admitted, but purging with the tinct. aloes (or fuch like) will be abfolutely necessary, as foon as the patient can be made to

fwallow, and repeat the dose every third day.

Raise his head high, as already advised, and try to pour down the solution of common salt, above hinted at.

Wrap the feet warm in hot flannels.

Clysters may be repeated twice a day, and made as di-

rected in the fanguine apoplexy.

Dr. George Fordyce thinks that the compression producing apoplexy, feidom or never arifes from the ferous part of the blood being extravalated, or, &c. but adds, whether blood or ferum be the cause, the same methods must be pursued for relief; and besides bleeding, to relieve the brain, he urges the advantage of purging, which he fays diminishes the circulation from the brain as well as from the intestines. The more active purgatives he recommends, and to repeat them fo as to keep up the fe-Apply blifters to the shoulders, and on the sleshy parts of the legs.

Volatile fpirits, with valerian, aromatics, and ferru-gineous medicines, are to be directed. Thefe, as indeed all ftimulants, are leaft hazardous and most useful, when the fit is not prefent.

The diet must be light, but cordial and nourishing. In gross habits mustard-feed may be swallowed whole two or three times a day, to the quantity of a table spoonful each dofe. Horse-radish may be eaten freely.

In the fpafmodic, or other fymptomatic kinds of apo-plexies, an attention to the general habit of body, and the nature of the disease attending, will lead most directly to the cure.

Dr. Flemmyng recommends trepanning as a powerful affiftant in the cure of apoplexies, by taking off a degree of preffure from the brain. See his observations on this

APSINTHATUM, from adatos, wormwood. A fort of drink accommodated to the ftomach.

APSYCHIA. See LIPOTHYMIA.

APTYSTOS, from a, neg. and aften, to fpit. An epithet for diforders in which fpitting, though an usual fymptom is yet wanting, as in what is called a dry althma,

a dry pleurity, &c.
APUA, called alfo aphya. The fish called Anchovy.
They are taken near Genoa and Provence, and are pickled in falt. When pickled they are faid to warm the

ftomach, and to promote an appetite.
APULOTICUS. See EPULOTICA.

APYETOS, from a neg. and wwo, pus. An epithet for a tumor that will not suppurate.

APYRENOMELE. See APYROMELE. APYREXIA. The abfence of a fever. APYRINA. The currant vine.

APYROMELE. A probe without a button: a melotris; called also appronomele.

APYRON, from a neg. and wue, fire. A name of fulphur vivum; also of the Æthiops mineralis, when

prepared without fire.

APYROTHIUM. A name of fulphur vivum. AQUA. WATER. Abody, with other conflituents, hath, in all its parts, an attractive and cohefive force; if this cohefion is fo weak that the gravitation of parts brings them to a level when left by themfelves, it is called a fluid; and the fluid we call water, it is a colourlefs, infipid, inodorous, uninflammable one, strongly related to both air and earth, but more so to the last, for it readily abforbs them, as they abforb it. It owes its fluidity to a certain degree of heat, fince with a heat, two-thirds lefs than that of our blood, it congeals; and with about twice the heat of our blood, it boils, beyond which it cannot be made hotter.

Water is more compressible in winter than in fummer, contrary to most, if not all other stuids; it is also classic. See Philof. Tranf. vol. lii. p. 640. Its fluidity Boerhaave

attributes to the fire which it contains.

It is a circumftance of importance towards fuccefs in the cure of many diforders, to be acquainted with the qualities of the water, which is generally used by the patients. The change of air hath often received the credit of a cure, which was the fole effect of a change of

ing. Many chronical diseases owe their rise to this fluid, though it is rarely suspected to be the cause of ill health.

The urine of the most healthy is loaded with earthy matter, and as water is the only diluter of what we receive into our stomachs, if it is not pure, but already furcharged with mineral contents, it cannot diffolve and carry off the recrementitious parts of our fluids; and thus water is a negative cause at least of diseases.

On the foftness and the purity of water its falutary ef-

Good water is known by readily mixing with foap and not curdling therewith; and by quickly boiling peafe, pulfe, &c. foft and tender; and it keeps beft in large

veffels in cold places, and in earthen or glafs veffels.

Though ill effects are produced by an excess in the use of it, yet if moderately drank, it assists digestion, quenches thirst, is an universal vehicle for solid food, it dilutes the fluids, corrects acrimony, promotes fluid fecretions, and if any medicine can challenge the name of catholicon, it

Muddy water may be cleared by adding two or three grains of alum to each pint, and thus the water is not inured. If hard, it may be rendered foft by adding ten grains of the falt of tartar to each pint, after which it will be both agreeable and free from all inconveniences. In want of the falt of tartar, chalk may be added.

River water is the best for short voyages; but the spring

water, being longer before it putrifies, answers better for

Stagnant waters, water in which is much melted fnow or ice, dew, water from mines and high rocks, fuch as rifes in low flat lands, and particularly from fprings, in which are an unftuous, earthy, bituminous matter at the bottom, are bad: but good waters are obtained from fprings which are on high lands, that confift much of a clean earth and gravel; from the clouds, by rain falling at a diffance from great towns; rivers and rivulets; but 

AQUÆ MEDICINALES. MEDICINAL WATERS.

The medicinal or mineral waters participate more or less of the earthy, saline, &c. matters over which they run in their fubrerraneous passages, and with some pre-vailing ingredient from which they receive their names-

Mineral waters contain,

1. ACIDS. Of these none are pure except fixed air; and all mineral waters that are acid, are so from this air. The mariatic acid is the most frequently met with in twaters, but it is always combined with the mineral fixed alkaline falt. The nitrous acid is rarely met with in swaters, occasionally it is found on the furface of the earth, produced from the fullage of towns. The vitriolic acid; it is always combined with phlogiston, earth, alkaline falt or metal falt, or metal.

2. ALKALIES. The fosfil alkaline falt is the only alkaline matter found in waters, in a separate state: it is also found in combination. The vegetable fixed alkali is rarely found, and then only in a very fmall quantity,

produced by accident from putrefaction.

3. EARTHS. Calcareous earth, the earth of alum, and magnefia alba. The calcareous is in union with the vitriolic acid, and is the gypfum. The aluminous earth is in waters called aluminous, but in union with the vitriolic acid. The magnefia alba is in the fea-water, Epfom water, and all the waters that contain the fal cathart, amarus. Sometimes the acid in union with an earth is the fixed air. the fixed air.

4. Fossil oil. The inflammable fossil oils, are naphtha, petroleum, Barbadoes tar, British oil, &c. all which are met with on the surface of different waters, as well as in

rocks, &c.

5. METALS. Of these, copper is found in some, iron in others. The reports of arienic and other metallic bodies being the contents of natural springs, are without evidence. Both copper and iron are in a state of union in the first size of the virialic acid. with either fixed air, or the vitriolic acid.

6. NEUTRAL SALTS. None are found in mineral wa-

7. SULPHUR. This is never in water, otherwife than in a flate of hepar. Calcareous earths, and alkaline falts, are the mediums to render it miscible with water. See Dr. Prieftley's Experiments for impregnating mineral waters with fixed air; and Dr. Brocklefby's Experiments on Seltzer water, inferted in the London Med. Obf. and Inq-vol. iv. Dr. Walker's Thefis de Aqua fulphurea Harrowgatenfi, 1770.

AQUÆ ALKALINÆ. ALKALINE WATERS.

The waters of those springs which afford alkaline con-tents, are more or less charged with the mineral alkaline falt, or with a calcareous earth, which they discover in the residuum left after evaporation. Of this kind are the waters of Upminster, Brentwood, Weal, Seltzer, and Tilbury, which last is the strongest of the kind in England; a quart of it may be taken in a day against crudities and acidities in the prime vie, alvine fluxes, and other diforders from debility of the fibres.

AQUE CATHARTICE AMARE. BITTER PURGING

The dry matter left on evaporating these waters consists The dry matter left on evaporating their waters country of the fall catharticus amarus, intermixed with different earths, of which the magnefia alba is the principal, and in fome inftances a fmall portion of other faline matters. The quantity of falt in different waters is from 3 iii. to i. fs. of falt in a gallon. Of this kind are the waters at Northaw, Streatham, Barnet, Alford, Colchefter, Lambeth, and Dulwich: but more remakable for their strength are the successing, from a pint of which the following are the fucceeding, from a pint of which the following proportions of their medicinal contents were left on evaporating them.

From th i. of Epfom water there remained forty grains; of Acton fifty grains; of Cheltenham fixty-four grains; of Kilburn fixty-four grains; of Jeflop's well near Kingfton

feventy-two grains.

The doses of these waters are from \$\mathbb{h}\$ i. to \$\mathbb{h}\$ iii. to be drank a little at a time until the whole is confumed. If taken as alteratives, they may be mixed with milk, whey, wine, &c. and drank as common drink, not exceeding

fuch a quantity as just keeps the bowels lax.

The active parts of these purging waters being separated at great distances by the swater in which they float, prevents their coming into contact with the ftomach in great numbers at once, by which the naufea, griping, licknefs, &c. is prevented, which happens when the active parts of a medicine is comprised in a narrow compass, as in small draughts made in the shops; so they purge without wasting the spirits, or hurting the appetite.

If they create flatulence, griping, or other uneafiness in the bowels, a little brandy, or any aromatic tincture taken with them, prevents such effects.

AQUE CHALYBEATE. CHALYBEATE OF STEEL

WATERS.

They discover their irony contents by striking a purplish or bluish black colour on the addition of powdered galls; though if the quantity of acid in the water is confiderable, then aftringents give no notice of the iron: but a tinc-ture made with Pruffian blue by digefting it in volatile alkaline spirits, succeeds univerfally, and a blue colour is produced on mixing it with any water in which iron is a part, or the whole of its mineral contents.

These waters differ extremely in their contents; in some they resemble the vitriol of iron, as in the Hartfell waters; in others they are a mixture of the mineral fixt alkaline falt with the vitriol of iron; fome again con-

tain much oker, &c.

The fpontaneous feparation of the iron, which hap-pens in many of these waters, is owing to the loss of their fixed air. It is this air that is the solvent of the iron in them, and also that causes the sparkling and sprightly taste observed in them whilst fresh. See Act-DULÆ.

Their use is the same with that of iron itself; in all cases where the one is adviscable, the other may be admi-

nistered. See FERRUM.

From one to three points may be drank in a day, the fame precautions being observed as when the artificial preparations of iron are taken.

The most proper seasons for drinking them are the

warmer months, and when the weather is clear and dry. During their use, the patient should sup early, use moderate exercise, and rise early in the morning.

AQUE SULPHUREE, vel THERME. SULPHUREOUS

WATERS OF HOT-BATHS.

These receive their name from their sulphureous impregnation, and their heat. Their heat is from the mixture of sulphur and iron in the beds through which they flow. See Dr. Cheyne's Treatife on the Bath Water.

Sulphur in its whole fubstance is contained in some waters; in others, as in the hot fprings of Toeplitz, there is not any; and feveral that have the fetid fmell of fulphur, poffess no more of it than is in the vapour which arises from the solutions of sulphur during its precipitation with acids. However, as above observed, most hot waters feem to differ chiefly only as the iron or the fulphur predominates in them; where the fulphur predominates, they are

hotter, more naufeous, and purgative.

The three principle European hot westers, are those of Aix-la-Chapelle, Bourbon, and Bath. The first abounds more eminently with sulphur, which makes its heat, naufeoufness, and purgative quality fo great, that but few people can bear it. The fecood is of a middle nature. And the last, by not partaking so much of the sulphur, and more of the iron, is less offensive, and more agreeable in

its operations.

In England, the best waters of this kind are those at Bath and Buxton. See BATHONIÆ & BRISTOLIENSIS AQUA. There are feveral others beside, whose efficacy is far from being useless, though somewhat short of the qualities found in those just named. The Harrowgate and Llandrindod fulpbur-waters stand high in the lift of

Their excellency is in their usefulness to weak stomachs, that are injured by fevere attacks from the gout, hard drinking, &c. to constitutions enseebled by tedious illneffes: in relieving pains in the limbs; in reftoring the paralytic, and those who labour under nervous disorders. They are also used to bathe in; and where a total immerion either cannot be complied with, or is not thought necessary, they are used in the manner of the stillicidium. In general, wherever the vital heat is defective, they are calculated for usefulness; but, where it abounds, they should be foreborne; they should not be admitted of in any cases attended with harmorrhages, though in other respects they may be required.

Dr. James Keil observes, that the best way of using

mineral waters as alteratives, is to take frequent fmall draughts. And to this it may be added, that they should be continued a month or two to reap any confiderable ad-

If they render the stomach uneasy, omit them, until by other means this vifcus is repaired, and the appetite fome what reflored. If they cause a drowsiness, put it off by exercise, and not an indulgence of sleep. See BATHO-NIÆ AQUÆ.

AQUE CRETACE vel Cale. CHALK, or LIME WATERS. Thefe are either natural or artificial. The best natural fpring of this kind in England is that at Briftol; and the properest season for drinking it, is from April to Septem-

They are of use to cleanse the urinary passages when ul-cerated, for which purpose they should be drank freely and constantly; indeed, in most internal ulcerations, they are of confiderable fervice; the Briftol water is found peculi-arly efficacious in fpalmodic complaints, and in such as take their rife from the acrimony of the humours; and, in the diabetes, it is esteemed a specific, if applied to in its early ftages: in confumptions, it is extremely beneficial;

if applied to in the early period of those complaints.
Whatever advantages these waters possess, perhaps they may not exceed a proper use of lime water, if it is made fresh each time it is to be drank, and is swallowed whilst the heat remains which arifes; from the ebullition of the

There are fprings of water which are impregnated with copper, fuch are the fprings at Neufol in Hungary, and at Wicklow in Ireland. They are little different from a folution of the vitriol of copper in common water: fome of these springs afford vitriol on evaporating them duly.

Of this fort of waters are those of Pyrmont, Spa, Tunbridge, Hampstead, Islington, Hartfell, &c. The Pyrmont and Tunbridge are the best.

For making an artificial chalybeate water, see Buxton Water.

AQUE SULPHUREE, vel Therme. Sulphureous practice feems totally to neglect them.

These are not used in medicine.

These are not used in medicine.

See Hippocrates de Ære, Aquis, & Locis. Percival's Essays Med. & Exp. 2d edit. Dr. William Heberden's Observations on the Waters in and about London, inserted in the Lond. Med. Trans. vol. i. For the analysis and uses of particular waters, see Dr. Rutty's Synopsis.

AQUÆ PAVOR. The same as hydrophobia.

AQUÆ STILLATITIÆ SIMPLICES. The simple distilled waters, now called only aquæ—the word simplex is omitted, viz. Aqua mentha piperitidis, &c.

Distilled waters are only water impregnated with the

Distilled waters are only water impregnated with the effential oil of the fubjects distilled with them. When more oil is brought over than the water can take up, it fwims at the top, or finks to the bottom, and is to be fe-parated by a funnel. Cohobating may answer for obtaining more effential oil, but it does not increase the strength of the water first distilled. And such plants as do not sufficiently impregnate the water at the first distilling are improper subjects for this operation; other methods are to be used to obtain their virtues See DISTILLATIO.

Diffilled waters are extemporaneously made with the olea facchara, or with the effential falts. See OLEO SAC-

CHARUM, CARMES EAU DE, and ACETOSA.

When fimple waters are used alone, or as the principal medicine, they are agreeable enough; but when used on-ly as vehicles for other more powerful remedies, diftilled water is by far more elegant; and as but few of the simple vaters are of fufficient efficacy to be used alone, they are hardly worth the trouble of making.

AQUE STILLATITIE SPIRITUOSE. Spirituous diftilled waters, now called only fpiritus, viz. spiritus pulegii,

All the virtues of distilled waters are owing to the effential oil they take up. Spirit of wine differs from water in this, it keeps all the oil that rifes with it perfectly diffolved in a limpid state: but yet as spirit of wine boils in about one-fifth less of heat than water does, it is an improper vehicle for substances that require the heat of boiling wa-Thus in diftilling cinnamon with a proof spirit, the fpirit rifes with very little flavour of the cinnamon, but when the water follows, it brings with it the oil of this spice.
Distilled spirituous waters are of the proof spirit strength,

and formerly were called compound waters, in contradif-tinction to those that consist only of simple or common water. The most agreeable spirituous waters are made by using a pure rectified spirit of wine, covered with a proper

quantity of pure water.

When the distilled liquor is as strong as rectified spirit of wine, it is called distilled spirit. See CARMES EAU DE.

AQUA MARINA. SEA WATER.

It contains, befides the common alimentary falt, a portion of the bitter purging falt, which remains diffolved after the common falt hath cryftallized; and after the bitter purging falt hath been separated, there remains a small portion of a pungent saline siquor which refuses to cryftallize, and which appears to be a solution of the earth called magnessa alba in the marine acid.

The quantity of salt in different seas is from about

The quantity of falt in different feas, is from about one-fiftieth to near one-twentieth of the weight of the water. In the colder feas there is lefs falt; the greatest

quantity is in the feas under the line.

In the English Channel a pint of water yields about an ounce of falt.

Sea water hath been used with much success in many cases of grandular swellings. Dr. Russel, in his Treatise on Sea Water, observes that in the inflammatory state of these swellings, when they tend to suppurate, it is better omitted, until the inflammation abates, or the pus is

discharged.

The dose is from this is to the first to be drank every morning for some months. It gently purges, promotes the secretion in general, warms, and strengthens. In many cases, bathing in salt water affifts the internal use of it as a general corroborant, and as a topical discutient and antiseptic.

On the first use of this water it creates thirst, but this

### [ 105 ] ARA AQU

the dose, speedily palliates this complaint.

In inflammatory cases it should be refrained from, be-

cause it excites heat.

Though the efficacy of this water hath been extolled against glandular swellings, its advantages have been as peculiarly manifested where the bones have been carious, and in the destruction of worms.

AQUÆDUCTUS. See Tuba Eusta-FALLOPII. SCHIANA.

AOUALA. ARSENIC, or SULPHUR.
AOUALICULUS. That part of the belly from the
navel to the pubes. Sometimes it is used to express the ftomach, or the intestines. It is the same with bypogaf-

AQUAT. The abbreviation of aquatilibus.
AQUATICUM LENTICULATUM, fee LENTIBU-LARIA.

AQUARIUS. IRON.

AQUATUM, vel AQUEUM, watery, diluted. Alfo

the chalaza of an egg.

AQUE, A species of PALM TREE.

AQUEUM. See AQUATUM. AQUIDUCUS. See HYDRAGOGOS.

AQUIFOLIUM, of axis, a prickle, and folium, a leaf. It is also called agrifolium, ilex aculeata baccifera, HUL-VER-TREE, HOLM, OF COMMON HOLLY.

Miller enumerates thirty-three species: It is a prickly bush so commonly known, that a description is unnecessary. Its bark is used for making BIRDLIME It is peeled in June or July, then boiled in water until it is tender, then the water is all drained until it is dry, after which it is piled up with fern, in layers; thus it rots two or three weeks, or until it becomes a mucilage, then it is beat in a mortar until it is like a dough, after this it is worked with the hands in a running water, which foon leaves nothing but the pure birdlime. It is then put into a pot to despumate, and, at last, taken from thence, and put into another for use. Birdlime is also made of misleto, and feveral other vegetable matters.

The berries of the bolly are warming, ten or twelve of

them discharge wind and slime by stool.

AQUILA. Is a chemical name for the spirit of Mercury, also for fal ammoniac. Paracelfus uses this word for mercurius præcipitatus; and it is a name for arfenie,

for fulphur, and for the philosopher's stone.

AQUILA ALBA, a name of calomel, of a preparation of fal ammoniae, and fublimate, &c. — Alba Philo-sophorum, & Ganimedis. See Ammoniaci salis flo-res. — Coelestis. It is the panacea, or cure for all difeafes. It is prepared of mercury effentificated. — VENERIS. A preparation made with verdegrife and fublimed fal am-

Aquila hath many other epithets joined with it, as rubra, falutifera, volens, &c.

AQUILÆ. The veins were fo called which pass through the temples into the head. — LAPIS. See ÆTITES. — LIGNUM. EAGLE WOOD. It is generally fold for the agallochum. It is that part which is next to the bark.

AQUILEGIA, called also aquilina, columbina, aquileia, teenis officulum, chelidonia folvestris; COLUMBINES. It is

the aquilegia vulgaris. Lin.
It is a plant with flender reddish stalks, and bluish green leaves, in shape formewhat roundish, with many small indentations, and one or two deep ones; the flower is blue, red, or white, confifting of five or fix petala, each of which is supposed to resemble a flying eagle or pigeon, whence its names. It flowers in June.

The feeds are fomewhat mucilaginous.

AQUILEIA. See AQUILEGIA.
AQUILENA. LARKSPUR.
AQUILINA. See AQUILEGIA.
AQUILONES. North-eaft winds. See ETESIA.
AQUO. See Aco.

AQUOSUS HUMOR OCULI. The WATERY HU-MOUR of the EYE. It is a limpid water that fills all the space between the cornea of the eye, and the anterior part of the cryftalline bumsur. The space in which this bumsur is confined, is called the anterior and posterior chambers: the first is betwixt the cornea and the iris, this is the larger of them. The second is betwixt the iris and the cryftalline. These slower consists of many leaves, which expand like the first is betwixt the cornea and the iris and the cryftalline. These slowers are succeeded by a globular fruit, which is succeeded by a globular fruit, which is

effect foon wears off; and fleeping quickly after taking | humour. The veffels which furnish this humour are too fmall to be described. If a wound discharges this sluid, it is restored in two or three days again. In old age it is not fo limpid, whence probably one cause of obscure fight at that time. The chief use of it seems to be to keep the cornea diftended, fo that the rays of light may be duly refracted in paffing to the retina for the iris to float loofely in, whereby its actions may be easily performed.

AQUULA. A diforder of the eye-lids is thus called. Performed.

Egineta, in lib. vi. cap. xiv. fays, that it is a pinguious fubthance under the skin of the eye-lid, and is also called bydatis. It is the bordeolum bydatidosum, or Sauvages' HYDATIDOUS OF WATERY STIAN: In children it is fometimes fo troublefome as to produce much uncafinefs: The upper eye-lid appears watery, and cannot be elevated; the eyes are very tender, diffilling a rheum, especially in a morning, if exposed to the light. In order to the cure, an incition is made through the ikin of the eyelid, and the cyft is to be diffected out, if it will not come

by gently pulling and moving it about.

Mr. St. Yves takes notice of a complaint on the edge of the eye-lids, or on the tunica conjunctiva, which relembles the bladders that appear on the skin after a burn; he calls these also bydatir. The method of cure which he proposes, is to open the tumor with the point of a lancet, which when done, nothing farther is wanted. But if all the circumference of the globe is covered with water, the conjunctiva will be inflamed, and in this case bleeding, purging, and a collyrium of aq. calcis will be neceffary. See Wallis's Nofologia Methodica Oculorum. Bell's Sur-

gery, vol. i. p. 264.

ARA PARVA, A LITTLE ALTAR. A neat way of applying a bandage, fo as to refemble the corner of an altar.

ARABICUM, GUMMI. See GUMMI ARABICUM.

When the ancients use the word gummi, without and the ancients use the word gummin, without and the second sec

other word to restrain its fignification, they mean this gum: ARABIS. See DRABA.

ARABIS CANDIDA. A fpecies of thlaspi. — MA-LAGMA. A malagma made by the Arabians against strumous fwellings and tubercles. ARAC. See ORYSA.

ARACA-GUAM. A species of the guava-tree.
ARACA-MIRI. A shrub growing in Brasil. It bears fruit in March and September, which tastes like a mixture of musk and straw-berries, and when candied or made into a marmalade, is cooling and moderately aftringent. The leaves and buds have the fame qualities, and the root is diuretic and antidyfenteric. Raii Hift:

ARACHYDNA, or ARACHIDNA CRETICA. Aracoibes. It is one of the four leguminous plants which

Ray fays bears fruit both below and above ground.
ARACHNE. The spider. Sec-Aranea.

ARACHNOIDES, apagen, a spider, and uses, a form.

One of the coats of the eye which refembles a spider's web. It is also called ARANEA, which see. The external lamina of the pia mater is also thus named. See PIA MATER.

According to Celfus, this coat in the eye immediately covers the vitreous humours. He fays too, that Herophilus gave it this name. Dr. Nicholls and Albinus injected it, and fay, that the veffels run upon it like rays from a centre. It is now called tunica vitrea.

ARACOIBES. See ARACHYDNA.

ARACON. BRASS.
ARACUS. The WILD VETCH. That called —— AME-RICANUS, is a species of Indian vetch. — AROMATI-CUS. See VANILLA: — INDICUS, vel AFRICANUS. See ABRUS.

ARACYNAPPIL. Called also malo aurantio. This

plant is only just mentioned by Ray.

ARADOS. Hippocrates means by it, the perturbation excited in the itomach by digefting the aliment there. It also fignifies any peturbation in the body.

ARAON. Thin, rare, flow. It is applied to breathing, as when we say the breathing is not frequent, nor thick. The air is also faid to be rare, when not too much condensed. condenfed.

AR ÆOTICA. Things or medicines which rarefy.

fucculent, and full of oblong feeds. There are four or five species, one of which grows in Canada, and is there called farsaparilla, because its roots and virtues are like it.

ARBUTUS, called also unedo, comarus, comaroides, See Miller's Dict. and Philof. Trans. Ab. vol. v.

ARALIA HUMILIS. A name of the GINSENG. ARALIASTRUM. It is a plant whose flowers are complete, regular, polypetalous, and hermaphrodite, ftanding on an ovary. It is followed by a berry, in which are two flat feeds like a femi-circle, which both together represent a heart. The stalk is single, ends in an umbel, of which each ray bears but one flower. Above the middle of the stalk come out several pedicles, as in that of the anemone, on the extremity of which grows feveral leaves like rays.

There are three species, viz. the ninzin, plantula mari-

landica, and the nafturtium marianum.

ARANEA, called also arachne, araneus, the CATCHER,

the wolf, and spider.

As is common to most infects, spiders abound with vo-latile falt, in consequence of which they are sometimes useful in agues, if taken inwardly. A scruple of the spider's web hath, in many instances, been given with success, an hour before the fit of an ague, and an hour after it. This produces no sensible effect, and may be given when the bark is not fafe. By this name is also called the coat which includes the crystalline humour of the eye. It is a continuation of the coat which covers the vitreous humour. The aranea is also called the capfula of the crystalline humour. It is furnished with vessels from the ciliary processes, and from an artery which enters the bottom of the retina, and runs through the vitreous humour.

Aranea is also a name of the coat of the vitreous hu-

mour of the eye. See ARACHNOIDES.

ARANEOSA URINA. URINE, in which is fomething like spider webs, with a fatness at the top. It indicates a colliquation.

ARANEOSUS PULSUS. A fpider-like pulse. This is, according to Galen, a small pulse that moves as if shaken by short pusses of air.

ARANEUS. The spider. See Aranea also Ast-

ARANGIA, ARANTIA. An ORANGE. See Au-

RANTIA HISPALENSIS.

ARARA FRUCTUS SECUNDUS, OT ARARA FRUCTUS AMERICANUS. It grows in Cayanca, and, when bruifed, it is applied to ulcers. Raii Hift.

ARATICU APE. The CUSTARD APPLE.

ARAXOS. Soot.

ARBOR. A TREE. It is defined to be a plant of the largest growth, whose trunk is perennial and fingle, and divided into many large branches, which are again subdivided into fmall twigs, called fprigs, on which the leaves, flowers, and fruit are produced, for that called — Arbor AQUATILA BRASILIENSIS. See AMINGA.

— BRASILIANA JU-) (COPAU.

- BRASILIANA JU-GLANDI, &c. — CUCURBITITERA CUIETE. AMER. &cc. PALMA JAPONICA. - FARINIFERA. - FEBRIFUGA PE-CORTEX PERUVIANUS RUVIANA. - INCANA SILIQUIS CAJAN. TOROSIS. - INDICA. AMELPODI. Sce CASSA LIGNEA CANELLA - JUCADICE. ALBA. MOUL ELAVOU. -LANIGER A SPINOS A CODAGA PALA. - MALABARICA LAC-TESCENS, &cc. ORLEANA. - MEXICANA. -NUCIFERA. ANDERA. - SILIQUOSA MA-CAVALAM. LABARICA. - SPINOSA. LYCIUM. - SPINOSA INDICA, BONDUCH INDORUM.

ARBOR IN AQUA NASCENS. The TUPELO-TREE. It

grows in Virginia, Maryland, and Carolina.

ARBUSCULA AFRICANA REPENS. A trailing fhrub, which grows in Africa. See Miller's Addenda, for that called — CORALLII, or CORALLOIDES. See Prefect metals.

fragaroides, ferentis, fraga, fragaria, and rubra. The STRAWBERRY-TREE.

In common with the fummer fruits in general, the fruit of this tree is cooling and relaxing, antifeptic, aperient, and a promoter of the urinary and alvine feeretions; mixed with watery liquors, they are thereby rendered more miscible with the blood, and so are of use in fevers. The jellies, and inspillated juices, are less flatulent than the raw fruit.

This tree-firateberry is like a quince-tree, and is com-mon in the fouth of Europe. It is the fruit which pro-

perly is called unedo and comarus.

ARBUTUS ANDRACHNE. Androchne, or EASTERN STRAWBERRY-TREE, called also arbutus folio non ferrato.
This is not noted that I know of in medicine, but greatly admired as a beautiful ornament in the garden. In Dr. Lettfom's edition of Dr. Fothergill's Works is given a figure from a branch in flower, also an accurate botanic description of it. He tells us that Dr. Alexander Russel first introduced it here from Aleppo, in 1754. It thrives in the open ground with us, and a specimen is now in the garden of Upton, the property of the late Dr. Fothergill, and about twelve feet high.

ARBUTUS, UVA URSI. See UVA URSI.

ARCA ARCANORUM. The Mercurius Philosopho-

ARCÆI, BALS. vel Linim. vel Ung. See ELEMI. ARCANNE. RED CHALK, OF RUDDLE. ARCANUM. A fecret, or a medicine whose preparation, or efficacy, is kept from the world to enhance its value. With the chemifts it is a thing fecret, incorporeal, and immortal, and which can only be known by experience, for it is the virtue of every thing which operates a thousand times more than the thing itself. For that called —— CORALLINUM. See MERCURIUS CORALLI-- Duplex, or Duplicatum, also called Panarea duplicata, the double fecret. See NITRUM VI-TRIOLATUM, under NITRUM. — JOVIALE. It is a preparation of tin and quickfilver, amalgamated and digeffed in fpirit of nitre, &c. but now not in use.

MATERIALE. Among the chemists it is a specific extract, nearly allied to the matter of our bodies. Specificum. It is an extract of the interior nature of things, and is of two forts, aftral and material.

Many medicines have the name of the arcanum TARTARI. TERRA FOLIATA TARTARI. See DIURE-TICUS SAL. - THEOPHRASTI. It is the quinteffence of any thing most high, exhalted, or, as he says, it is the virtue of a thing refined by a thousand exaltations. He boats of four arcana especially. 1. The arcanum of the first matter. 2. Of the philosopher's stone. 3. Of the mercury of life. 4. Of tincture. Blancard.

ARCEUTHOS. See JUNIPERUS.

ARCHÆUS, from apyn, the principal, chief, or first mover. A fort of primum mobile fet up by Helmont, to superintend the animal economy, and preferve it. It is akin to Plato's anima mundi. Hippocrates uses the words αρχαι φοσε, to fignify the former healthy state before the attack of the difeafe.

ARCHANGELICA. A name of angelica, and also of

ARCHANGELICA FLORE ALBO. See LAMIUM ALBUM.
ARCHE, apxn. The first attack of a disease, its first stage, that time of the disorder in which the patient first

takes to his bed, or in which help might be effectual.

ARCHENDA. A powder prepared of the Egyptian privet, to be applied to the feet to check their fetid odour-ARCHEUS. A term coined by Paracelfus; by it he would express the sole active principle in the material

ARCHEOSTIS. WHITE BRIONY.
ARCHIATER. The principal physician at a court.
ARCHIGENI MORBI, acute difeases, so called from apxe, the chief, and yingua, to be, because they hold the principal rank amongst diseases.

ARCHIMAGIA. A name for chemistry, because by it gold is attempted to be made.

ARCHIMIA. The art of changing impersed into

ARCHITHOLUS, See Achicolum.

TUM

bearing down of the rectum.

ARCION.
ARCIUM.

BURDOCK.

ARCOS. BURNT-COPPER.

ARCTATA PARS. So Scribonius Largus calls a part

comprefied, or closed by a fibula.

ARCTATIO, vel ARCTITUDO. It is when the intestines are constipated from an inflammation. Also a Preternatural streightness of the pudendum mulicbre.
ARCTION. WOOLLY-HEADED BURDOCK.

ARCTIUM LAPPA, vel ARCTIUM MAJOR. See

BARDANA.
ARCTOSCORDON. BEAR GARLICK.

ARCTOSTAPHYLOS. SPANISH WORTLES.
ARCTURA. Inflammation, &c. of the finger, from a curvature of the nail. Linnæus.
ARCTURUS CRETICUS. A fpecies of moth mul-

ARCUALIAvel NERVALIA OSSA. The SINCIPUT;

but fome fay, the temple bones.

ARCUALIS SUTURA, coronalis futura, which fee. ARCUATIO. A gibbofity of the fore parts, with a curvation of the bone of the iternum.

ARCUATUS MORBUS. The JAUNDICE. See

ICTERUS

ARCULÆ. The caverns in which the eyes are

lodged.
ARDABAR. A fpecies of ARUM.

ARDENS FEBRIS. The ARDENT FEVER, from

ardeo, to burn. It is the fame as caufus.

Fevers from ardency are the ephemera and lipyra, and all in which a phlegmonous inflammation attend, the hectie, all fevers from an inflammation of the mucous mem-

brane, and most intermittents.

Ardent fevers have for their principal cause too much crassamentum in the blood, which retains too great a portion of the vital heat. In a healthy state, the heat of the blood is about ninety-eight degrees of Fahrenheit's thermometer. To preferve this state, perspiration, and all the fecretions, should be free, and in due quantity; for whatever increases the crassamentum, or lessens the discharge of ital heat, alike lays a foundation for this fort of fever. When the heat is excessive, the blood divides faster than it can be fecreted by the feveral emunctories, and in fevers the blood is thinner than it was before, and fo takes up more room in the veffels, whence many of the fymptoms ufually attending.

A dry air is a cause also of this kind of fever; in spring, when the air is cold and dry, the ardent and inflammatory fevers prevail much. A dry air does not conduct so much heat from our bodies as a moist one does; hence it is detained, and an undue accumulation of it foon destroys that equilibrium of nature which constitutes health.

That an increase of the natural heat is alone the immediate cause of ardent fevers is farther evident from its being a fufficient cause of all the symptoms that usually attend them, fuch as the ftrong quick pulse, redness of the

eyes, hot breath, white tongue, anxiety, &c.
Barley and oatmeal gruels are the propereft kind of aliment, as they leaft increase the crassiamentum in the blood.

In order to the cure, as the fymptoms arise from in-creased heat, the remedies will be whatever most speedily reduceth it. And as the redundant heat is principally owing to an accumulation of the crassamentum in the blood, to lessen the quantity thereof by an immediate and free bleeding, also to carry off the heat by such medicines as repel it, are the obvious methods of relief.

First then, bleed freely from a large orifice, and if the patient is robust, and the heat excessive, let him be supported on his feet, until the operation is ended, that he may faint, if possible; the heat is always less after faint-ing than when the same quantity of blood is discharged without this accident happening. If a repeated loss of without this accident happening. If a repeated lofs of blood feems needful, proceed therein at proper intervals until the pulfe and the heat contraindicate it.

The infpiffated juice of this fruit is the terra Japonica;

Immediately after bleeding, let a brifk, but cooling now called catechu, but it is generally adulterated with purge be administered. Sydenham observes, that purging other matters.

immediately after bleeding, cools to a great degree; also, ARCHOS. The Anus. Also the Intestinum recum.

ARCHOPTOMA, In Vogel's Nosology, is defined a

that the method of curing fevers by perspiration, is not only less certain, but more troublesome and tedious; nay, that it prolongs the disease, and endangers the patients. Among the cooling purges, none excels the ol. Ricini, and may be thus given.

R Ol. Ricini ver. 3 fs. ad 3 ij. Aq. menth pip. 3 i. ad ij. m. f. hauft. ftatim fumend.

& repet. altern. quaq. die. In want of the ol. Ricini, draughts with fal nitri & electar. e casia may be given, or an infusion of tamarinds,

and fuch like.

During the intervals of purging, let frequent fmall draughts of accidulated fubtepid liquors be taken, and the doses of cooling medicines should be repeated every two hours, or oftener, fo that the effect of one may not be loft before its power is affifted by the repetition of another; a fault very manifest in the common methods of administer-ing them. Nitre, kali acetatum, and fal ammon. crud. will be proper on this occasion; and if to each dose of them as much antimonium tartarifatum, or vin. antim. is added as the ftomach will eafily retain, or, in want of them, the vin. ipecacuanh. their advantages will be increafed.

If there is a confiderable naufea during the first two or three days after the attack, a grain or more of the antim. tartar, may be added to the purge, which is administered after the first bleeding, and thus the stomach will be re-lieved by the same medicine by which the general com-

plaint is opposed.

If this kind of fever hath attended four or five days be-fore affiftance is obtained, the above method must not be put in practice; yet if the heat is great, and the pulfe ARDAS. SORDES, FILTH.

ARDEA. The HERON. There are feveral species of laxative that is cooling may also be given by the mouth; strong, a moderate bleeding may be of use. A gentle and, until the crifis, let gentle alexipharmics, and light broths, be duly continued; for after the fifth or fixth day of an ardent fever, there is generally fome difficulty to keep up the vital heat to that degree which is necessary to health, or the due procedure of the fecretions and excretions.

If a naufea continues after the emetic is worked off, the common faline draughts may be given at proper intervals.

A Diarrhœa may be critical, fo should be attended to with care; and until the patient's strength is affected by it, there is nothing to be done. When a check to it is

judged necessary, give the following: R Pulv. ipecacuanh. gr. iii.

- contray. c. gr. xv. m. f. chart. 2da vel 3tia quaq. hora fumend.

R Mixture Cretaceze. 3 iv. tinct. catechu. 3 fs. m.

fumat. cochl. ii. post singulas sedes liquidas.

Deliriums coming on demand attention to diftinguish whether their cause is inflammatory or spasmodic. If from inflammation, bleed, inject cooling clysters with nitre frequently, and supply the patient with cooling medicine by the mouth. In case of spasms, with low spirits and a weak pulse, apply blifters to the neck and arms, and finapifins on the feet: Sydenham afferts, that garlick bruifed and applied thereto, quiets the delirium more ef-fectually and speedily than blisters. gum ammoniacum.

ARGEMA, or ARGEMON. A diforder of the eye called Albugo, which fee; from appos, white. Vogel

defines it, an ulceration of the cornea.

ARGEMONE MEXICANA. PURGING THISTLE.

Also a species of glaucium. See PAPAVER SPINOSUM.

ARGEMONIA. An herb called by the Greeks farco-

colla, but it is unknown.

ARGENTINA, also called anserina, potentilla pentaphyloides, SILVER WEED, and WIAD TANSEY. It is the Potentilla Auserina of Linn.

Boerhaave reckons up nine species.

It is a low creeping plant, with leaves that are covered on their under fide with a filver-coloured down, and is commonly on the fides of rivulets and uncultivated places; it flowers in June.

The leaves are rather aftringent; the root refembles the tafte of parinips, but are not of any value as a medi-

ARGENTUM, also called Luna and SILVER.

Silver is fometimes found pure in the mine, but generally mixed with tin or with lead. To the ore there often adhere a corrolive bituminous fulphur, which in fulion renders the filver volatile, or converts it into a gloffy feoria: this lofs is prevented by first roasting the ore, then reducing it to powder, afterwards adding mercury, and grind-ing them fo long together that the filver becomes wholly united to it, which may afterwards be separated by distil-

The greatest mines are found in Chili and Peru, and there they separate it from the other mineral matters by pulverization, ablution with water, and amalgamation with mercury. The filver mines in England, Germany, and other parts of Europe, afford it mostly in an ore of a yellow, red, brown, or blackish colour, from an admix-ture of arsenic, sulphur, or both, and this ore requires a calcination for the dislipation of the arsenic, &c. and then the filver is separated from the remaining earth by fusion.

By means of lead it is separated from all the baser me-tals, and from gold by dissolving it in the acidum nitrosum. It turns to scoria, and becomes volatile if used with an-

It melts with nearly the fame heat as gold, and is the next to it in ductility

It is the next to lead in point of gravity.

It turns yellow and then black from the vapours of brimstone, or any fulphureous steams, as from vaults where human excrements are deposited, &c.

It is eleven times specifically heavier than water. It is fixed, and indestructible by the fire.

It is foluble only in the nitrous acid, with which it unites fo ftrongly, that a heat which fufes the filver will not part them. In the nitrious acid it is diffolved into a limpid fluid, which stains the folid parts of animals black, is corrofive, and intenfely bitter.

Though not foluble in the vitriolic or the marine acids by a moderate digestion, yet it may be precipitated from

As it is infoluble by any vegetable or animal juice, if swallowed it is neither useful nor hurtful. Its only medical use is as a caustic, for which purpose that preparation called the lunar caustic is made.

Causticum Lunare. Lunar Caustic, now Argent-UM NITRATUM. Silver nitrated.

Diffolve pure filver by a fand-heat in about four times its weight of diluted nitrous acid: then dry away the humidity with a gentle fire; afterwards melt it in a crucible, that it may be poured into proper moulds, carefully avoiding overmuch heat, left the matter should grow too

thick. Pharm. Lond. 1788.

The crucible should be large enough to hold five or fix times the quantity of the dry matter, for it bubbles and fwells greatly, and the operator flouid guard against the drops that spirt up; keep the fire moderate until the ebullition ceases, and till the matter becomes consistent in the heat that first made it boil, then quickly increase the fire until the matter is thin at the bottom, like oil; on which immediately pour it into moulds, without waiting until

the fumes cease to appear.

The moulds may be of iron, or of pipe-clay that is soft

enough to admit of a greafed flick into it.

When it is cold break the moulds, wrap each piece of the caustic in paper, and keep it from the air, or else it will dissolve. For its mode, &c. of application, see CAUSTICUM LUNARE.

If this caustic is dissolved in water, and then some thin plates of copper be added, the pure filver will be precipi-

Some call it inflammable filver, for it flames like nitre until it is reduced to the pure state of filver, if laid on a

The pilula lunaris is only a milder kind of lunar caustic, and is now wholly neglected.

## Tind. ARGENTI. The Tindure of SILVER.

Take a quantity of pure filver, melt it in a clean crucible, then directly pour it into fair cold water, eight inches high, in a cylindrical veffel; the filver is thus feattered into grains, which are called granulated filver. Put an ounce of this granulated filver into a clean urinal glafs; then take two ounces of the nitrous acid, put thereto one grain of refined filter, and if it be foon perfectly diffolved, fo as that the liquor is still limpid, the spirit is good; if not, it is not sit for this use. If the spirit is good, pour two ounces of it upon one ounce of the granulated filver in the urinal glas; upon which it foon becomes hot, and diffolves the filver. A little of a black powder is always observed to settle, and it is pure gold; so pour off the clear solution into a clean glass for use.

At one touching this tincture eats away the callous lips of ulcers; it foon destroys warts: it makes a lasting black ftain in all animal fubftances; and is also used for making

artificial agates.

The filter never gives any tincture to the spirit : if therefore any colour is observed, it is probably from some copper which the filver retains: however it is not fit for the nicer experiments in which this tincture is used.

Pure strong nitrous acid dissolves half its weight of filver, in a moderate heat; but it will not diffolye in aqua regia, hence the method of feparating gold from

ARGENTUM MOBILE. So Aristotle calls the argent. vivum. — NITRATUM, See CAUSTICUM LUNARE.

— VIVUM, called alfo bydrargyrus, and now used by the College of Lond, mercurius, liquor metallicus, metallum fluidum, argentum fusum, argentum mobile, mecurius chemicorum, vomica liquoris aterni, QUICKSILVER.

is pure gold, but the outer part is of the colour of filver,

with a corrolive underneath.

Some dispute its being a metal; others affert it to be a proper one: it hath all the properties of metal except malleability, and, according to the experiments of professor Braun, it is rendered malleable by exposing it to a due decrease, it is read that the properties of the state of the s gree of artificial cold, that is, to about 528 below the freezing point on Fahrenheit's thermometer, whence it may properly be deemed a perfect metal. In the Venetian territories are the greatest quantity of

mines producing quickfilver; we have much from the East-Indies; Spain and Hungary both afford great quantities of it; in China, Japan, and many other places, it is met with; about Montpelier, in France, there are fome mines in which it is found.

It confilts of a volatile vitrifiable earth and fulphur.

It is found in the earth in a fluid form fometimes, and fo pure as not to need any refining; it is then called virgin quickfilver; but most frequently it is found mixed with other fubstances: the most general state in which it is met with in the mines, is mixed with fulphureous ores, of a red colour, called cinnabar, and the richer the ore, the redder it is.

ing with vinegar and a little falt, which diffolves the me-talline impurities; and by diffillation, either alone or with

the addition of lime, pot-ash, or iron filings.

The people who work in the quickfilver mines foon die; at the first of their being affected they are seized with tre-mors, after which a fallvation comes on, their teeth drop out, and pains seize them all over, particularly in the

Hippocrates does not feem to have been acquainted with this mineral; Ariftotle and Diofcorides rank it amongst poisons; Galen fays that it is corrolive; Meffue, the Arabian, was the first who used it medicinally, and he only applied it in the form of an ointment in cutaneous diffempers. Avicenna observes that it may be swallowed crude, and that it passes through the body. About the end of the thirteenth century it was introduced into Europe as a medicine, but not effeemed a fafe one until the venereal difeate was brought over, and was found to yield to its efficacy. The first internal mercurial medicine which gained real credit was the pilul. Barbarosse, which was composed of quickfilver, rhubarb, musk, &c.

# The Characters are as follows.

It is the heaviest of all bodies except gold. Gold is to mercury nearly as 4 to 3.

When well purified it is as simple as pure gold.

It is totally volatile in the fire by heat not much greater than that of boiling water, and by a far lefs heat it is cal-

cinable into a red powder.

The fumes raifed by fire are fearcely visible, and yet by being received into cold water may be reduced to the

state of pure quickfilver.

It amalgamates most readily with gold, next with lead, next with filver, next with tin, scarcely at all with iron, and with great difficulty with copper.

By the affiftance of trituration or of heat it diffolves all

metallic bodies except iron.

The vitriolic acid hath no effect upon it until it is concentrated by heat; the nitrous acid acts quickly upon it; fixed falts make no impression, and the spirit of falt hath little or no effect upon it; vegetable acids have as little; nor do neutral falts alter it any way.

It is allowed to be pure when a little held over a fire in

an iron ladle totally evaporates.

It is often adulterated with lead, a large quantity of which may be incorporated with it by the intervention of bimuth, in a moderate heat; and in this cafe the lead cannot be separated by pressure through leather. This abuse may be discovered by the mercury staining paper blackish; by its not running into round globules; by its leaving a powdery matter or a coloured spot on the bottom of the vellel; and by its producing a turbid milkinels during its diffolution in aqua fortis.

As a medicine it is used to promote the secretions in general, particularly the faliva. The more perfectly it is divided the more powerful and penetrating is its action, which is chiefly exerted in the fmall lymphatic veriels. Whether used internally or externally it liquifies all the

Its chemical character is \$ , which denotes that the infide | juices in our bodies, and may be fo managed as to propure gold, but the outer part is of the colour of filver, mote excretions through all the emunctories. If not restrained it first fuses the humours, then determines them to the mouth, and causes inflammation, tumors, and ulcerations there.

No talk is perhaps more difficult than to dwell on the modus operandi of medicines; yet an observation of Dr. Kirkland, in his Inquiry, vol i. p. 496, &c. deserves attention. He says that its effects, speaking of the ophability. thalmia, are not entirely to be afcribed to removing obstruction in the vafa minima, as it corrects more kinds of acrimony than one. I have feen good effects from dif-ferent preparations, but I prefer very small doses of pure quickfilver to all the boasted chemical preparations of this mineral. A fingle grain of quickfilver, extinguished in starch, repeated in the manner we give the solution of fublimate, will have powerful effects, without troubling the patient, as too often happens in the use of the sublimate. It is happy for the patient that the fpiculæ added to it by the chemists, are dissolved in the primæ viæ. I believe all the preparations of mercary are decomposed in this paffage; and I am of opinion, that giving small dofes, adds to its efficacy, because a grain of quick-filver taken twice a day, very often affects the teeth, if

From the ore it is separated by washing in water; grindg with vinegar and a little falt, which disloves the mea fcruple taken at once produce the fame effect? A large quantity of pure divided quickfilver fometimes passes off without any remarkable effects. See the remark under the article ÆTHIOPS MINERALIS.

Dr. George Fordyce observes, in his Chemical Lec-tures, that quickfilver is a powerful stimulant in flow inflammations to forward suppuration, as in scrophulas particularly. Indolent tumors often arise which are of long continuance; these may often be dispersed by the use of mercury, the stimulus of which occasions such a quantity of watery fluid to be thrown out, and the abforbents to act fo strongly as to cause it to be dissolved and re-absorbed. In old ulcers the efficacy of quickfilver is often valuable. In chronic rheumatisms, when there is no confiderable degree of inflammation, and where it is required to keep up a conftant flimulus, mercury will generally remove the difeafe. It is advantageously used as a fudorific in cutaneous eruptions, which it very powerfully removes; it keeps the fkin moift, and difpofes the little inflammations to heal. Befides the property of mercury in its being a stimulant, it hath a peculiar power in destroying the venereal virus, and also various other instances of acrimony. Quickfilver is the only known fallvant; many things flimulate the glands in the mouth, and increase their usual discharge, but quickfilver alone produceth this effect by being absorbed, and carried into the circulation. In sloughs and in erysipelatous ulcers it is improper, also in cases of scirrhous or of cancerous tumors; in spat-modic complaints, instances of stupor or of gout, it should be avoided. Its advantages in cases of suppressed menstrua are not worthy of attention; the aid it seems to give is never lafting. Some employ it as a purgative, but this is not vindicable. In dropfies quickfilver is not adviscable; for though it may promote the absorption of the stagnant suid, it so weakens the habit as to re-produce a proportioned inundation. Befides the falivary glands, quickfilver feems peculiarly to affect the throat, the inteftines, and the joints, a circumstance to be regarded in the use of this powerful medicine; and from which, if due care is not taken to prevent them, the effects will be injuriously active.

It hath been swallowed crude, as an universal remedy. Dr. Dover and Dr. Cheney commend it in the follow-

ing diforders.

 Joined with the gum guaiacum and a little aloes, it hath been fuccefsfully used in the crysipelas, gout, and defoedations of the fkin.

2. In hyfteric complaints its advantages are confiderable, if joined with the bark, valerian, aloctics, or the gum pills, as circumstances may require.

3. In conjunction with preparations of iron, it fucceeds

in suppreliion of the mentes

4. In intermittents it avails, when joined with the bark and iron.

In ophthalmias it hath been effectual when accompa-nied with millepedes and laxatives.

6. The hydrargyrus cum Creta joined with gum guaiac.

the antimonial wine, does wonders in chronical rheumatifms.

In the jaundice, fciatica, and anafarcous dropfy, the hydrargyrus cum Cretă is fuccefsful to admiration.

And to these of Dr. Cheyne may be added, that old foul ulcers are fometimes brought to digeft by its ufc.

The hard bellies of children are relieved by it, if accompanied with fuch other medicaments as the particular cafe may require.

By boiling two or three ounces of quickfilver in four pints of water to two pints, and ufing the clear liquor for common drink, it destroys worms.

And in the venereal disease it is a specific.

The true fecret of curing difeafes with mercury is to cause it to circulate with the blood as long as possible, without producing any evacuation at all.

A long use of quickfilver weakens the habit, and so should be accompanied with mild antimonials, the bark, or farfaparilla, &c. as circumstances seem most to require.

Quickfilver is divided by carthy powders, ballams, mucilages, &c. but with nothing more advantageously than the mucilage of gum arabic. Mr. Plenck, of Vienna, directs a dram of it to be mixed with two drams of gum arabic in powder, by degrees to add a little water, and to continue the trituration of them together until the globules totally disappear, after which half an ounce of any fyrup, and half a pint of water may be added, and two common spoonfuls of the mixture may be taken every night and morning in fuch cases as require its use.

Gum arabic powerfully restrains the mercury from running off by the fallwary glands; and if a fallwation is al-teady excited, it is the best assistant in checking it.

Crude quickfilver in general is of equal advantage with an; of its preparations; yet, in particular constitutions, o 1: or other of them may demand a preference.

Many are the preparations made from this metal, and t is most useful are inserted in the course of these pages.

ARGENTI VIVI Purificatio, now HYDRARGYRI Purifi-catio. The Purification of QUICKSILVER. Ph. Lond. 1788.

Take of quickfileer, and iron filings, of each four pounds; rub them well together; and diffil from an iron veffel.—This is a fhorter process, and more perfect than that of the old London Pharmacopæia.

ARGENTUM MOBILE, & FUSUM. See ARGENTUM

ARGISTATA. Incorporated with wax.

ARGILLA. CLAY OF ARGILLACEOUS EARTH. Mr. Edwards defines it to be, a genus of earth which is foft, very ductile, and tenacious, when moilt; and rendered very hard by fire. See his Elements of Foshiogy. Moist clays, besides the tenacious indisfoluble earth,

which is their principal characteristic, contain, 1st. A portion of an earth that is foluble in acids. 2dly, Of acid, which may be separated by a strong fire in distilla-tion; this acid is of the vitriolic kind. And, 3dly, A small portion of iron reducible by inflammable fluxes into its metallic form.

Clays unite with water into a turbid liquor, flippery and fmooth to the touch, and remain fome time furpended, the fand, grit, and other grofs matters fubfiding.

They may be freed from their alkaline earths by means of acids; from their faline matter by a coction in water; and from their iron by digeftion in aqua regia. Thus purified, they have all nearly the fame appearance and qualities. If dried to as to fall into powder all clays adhere again with moisture.

Exposed to a strong fire, they lose their fost glutinous

quality, and are reduced into hard masses.

An estate possessed of clays, marles, or loams, may be better than for pasture or tillage. And all the apparatus to examine them with is, water, aq. fortis, a crucible, a

microscope, a fire, and your fenses.

ARME. A coalition of wounds, also the joining of the futures of the head.

ARMENA BOLUS. ARMENIAN BOLE. See BOL. ARM

ARMENA. An instrument with all the apparatus for

any work we are about.

ARMENIACA MALA, called also pracecia. The APRICOT-TREE. Theophrastus calls it persea, to distinguish it from the peach; it was afterwards called persea-pra-cox. The Latins called it pracequa, whence the latter Greeks formed their beriescea, whence the French word

This fruit is more used for pleasure than health: of the

kernels in the stones is made ratifia.

ARMENUS Lapis, also called lapis Armenius, azutum, caruleum foffile, Armenium. The ARMENIAN STONE.

It is a copper ore, of a pale blue colour. It operates inflantly as an emetic in a dofe of four grains: it is very little different if at all from the lapis lazuli.

ARMERIA. Armerius pratenfis, armerius fylvestris, armeraria pratensis, mas. caryophillus prat. lacin. stor. simpl.
MEADOW PINK. It grows in watery places, and slowers
in May. The slowers are alexipharmic. Dale.
ARMERIA RUBRA LATIFOLIA. BROAD-LEAVED

SWEET WILLIAM.

ARMERIUS MONTANUS. A fpecies of statice.

ARMERIUS SIMPLICI FLORE. A fort of gillyslower. ARMILLA. The round ligament that confines the

tendons of the carpus. From armus, an arm.
ARMONIACUM. See Ammoniacum.

ARMORACIA. WATER-RADISH. See SISYMBRIUM. Alfo WILD RADISH 2nd HORSE-RADISH. See RAPHANUS. ARMORARIA PRATENSIS. See ARMERIA.

ARMORUM PUGNA. A fort of gymnastic exercise, confifting of a mock duel, the antagonist being only a post.

ARMUTHEUS LAPUS. Corruptly written for ar-

menius lapis.
ARNABO.

ARNABO. ZEDOARY.
ARNALDIA. A malignant flow difease of the chronical kind, attended with an alopecia; it was formerly

very common in England.
ARNICA MONTANA. This is the fpecies recommended by the Edinburgh college; arnica Plantagini folia, foliis ovatis integris, caulinis geminis oppolitis. See Doronicum Germanicum.

ARNOGLOSSUM. LAMB'S TONGUE. A fpecies of

plantane. See PLANTAGO LATIFOLIA.

ARNOTTO. See ORLEANA.

AROEIRA. A fposies of lentifk.

AROHOT. MERCURY.

AROMA. Any thing fragrant or odorous; fometimes it is taken for myrrh.

AROMA GERMANICUM. ELECAMPANE. See ENULA. Aroma Philosophorum. Saffron; fee Crocus. Also the fasfron-coloured flowers raised from lapis hæma-

AROMATICA.

Aromatics, or fpicy drugs, are of a warm pungent tafte, with more or lefs of a fragrant finell; fome are purely with more or lefs of a fragrant finell; fome are purely aromatic, as cinnamon, nutmegs, &c. others have a fweetness mixed with them, as in the angelica root, anifeed, &c. fome have an aftringency, as cinnamon; others a mucilage, as the cassa lignea, &c. some a bitterness, as orange peel; and others are also bitter and aftringent, as the bark.

The feveral medicinal virtues of these mixed aromatics, are extracted by the same means as from those which are lefs compounded; thus the arsmatic part of lemon-peel arifes in diffillation with water, whill the bitter remains behind in the extract, &c.

The arematic matter contained in different fubjects differs much in their pharmaceutic properties. The virtues of all aromatics are extracted by fp. vini rect. water extracts a portion from some, but from many none at all.

In distillation they arise with water more perfectly than with spirit, though in some few instances the aromatic matter wholly rifes in diffillation, both with spirit and

with water, as of lemon-peel, whilft pepper ftill retains part of its aromatic matter, though diffilled with water.

In the effential oil, and refinous part of aromatics, all their peculiar qualities refide. The more effential oil any vegetable affords, the weaker the oil is, and vice verfa.

Aromatics warm the stomach, and by degrees the whole body, hence are ufeful where the vital heat is below the par of health; they promote the natural fecretions; they refift putrefaction, hence fo plentifully produced in hot climes; many of them have a specific virtue, which fits them for ufefulness to particular parts: thus wormwood is ufeful to the fromach, parfley to the kidneys, &c.

AROMATICA AQUA. See AQUA PIPER. JAMAICA.

NUX. The NUTMEG. See NUX. MOSCH. —TINC-

RA. See CINNAMOMUM. AROMATICÆ PILULÆ. AROMATIC PILLS.

In fmall dofes, as of ten grains or more, this warms

the flomach, and by degrees the whole habit. The Collegeof Physicians of London have in the place fubfituted the following composition, and called it - Pulvis Albericus cum Guaraco - Albetic pswder with Guaiacum.

R. Aloes Socotorine, p. 3 i. is. Gummi guaiaci, p. 3 i. Pulveris aromatici, p. 3 is. rub the aloes and gum guaiacum separately to powder, then mix them together. Phar. Lond. 1788. See Aloe.

AROMATICÆ, SPECIES, now PULVIS AROMATICUS.

The Aromatic Powder.

Take of cinnamon two ounces, the leffer cardamoms freed from their hulks, ginger, and long pepper, of each one ounce, mix, and make them into a powder.

This is an improvement of the fpee. diambra fine edu-

ARON. See ARUM.

ARONIA. The Neapolitan medlar. See MESPILUS

ARONIA.

AROPH. A contraction of aroma philosophorum, a name given to faffron. See Crocus. Also a name which Paracelfus gave to the flowers raifed by sublimation, from lap. hamat.
ARQUATA. A name of the birds called the curlew

and the wren.

ARQUATUS MORBUS. The JAUNDICE.

ARQUEBUSADE. It is the name of a water which is also called aqua vulneraria, aqua sclopetaria, and aqua catapultarum. The name arquebusade is a French word, catapultarum. that implies, it is good for gun-fliot wounds. It is mint, fage, mugwort, &c. diftilled in wine.

ARQUIFOU. See ALQUIFOU.

ARRAC. See ORYZA, and PALMA COCCIFERA.
ARRACHE. See ARTIPLEX.
ARRAPHON. Without future. The word is applied to the cranium when naturally without futures.

ARRHŒA. The stoppage of a flux: and by Hippocrates appropriated to the suppression of the menses

ARRHOSTIA. Infirmity, ill health. ARRHYTHMUS. See ARYTHMUS. ARSACUM. See ACRAI.

ARSAG. ARSENIC.

ARSALTOS. See Asphaltos. ARSANECK. ARSENIC SUBLIMED. ARSATUM. See ACRAI.

ARSENICUM ALBUM, called crystallinum, rifagal-lum, realgar, arfag, artaneck, white Arsenic, and RAT'S BANE.

Arfenic though it feems to have an affinity both to fulphur and to a femi-metal, yet is not manifeftly either. It is contained more or lefs in most kinds of ores, particularly those of tin, bismuth, the white pyrites, and cobalt, from which last the greatest quantity is obtained: the ore of the cobalt being broken in pieces, is placed over a fire, and the orfenic fublimed from it, which refting on the fides of long chimnies deligned for its reception, is fwept off into proper vessels to be re-sublimed, or at least melted, by which it is formed into the shining masses which are met with in the shops.

What we have in England is chiefly brought from the

mines in Saxony and Bohemia. Some fmall quantities White ar fenic, fublimed with one tenth its weight of are fublimed in Cornwall from the cobalt that is found fulphur, is yellow; and with one-fifth it is red.

If ar fenic is mixed with any metal it renders it friable,

destroying its malleability.

One grain of arfenic makes a pound of copper like filver, without wholly depriving it of its malleability; the copper thus changed is called alchymy.

It is used by enamellers, glafs-makers, potters, and

Exposed to the fire in an open vessel, it softens, then is dislipated in fumes, which have a garlic smell; these fumes, if received on iron, appear in form of flowers, and if they pass into the mouth, a dryness is instantly perceived there, with an uneafy pricking fenfation.

Lead mixed with it, and fet over the fire, boils up and evaporates mostly in fmoke; the remainder runs into a

yellow glass that is fusible.

Iron abforbs arfenic in the greatest quantity, and most readily; copper the next, then tin, lead, and filver the leaft.

Common fulphur unites readily with arfenic, and ren-

ders it fufible, making it also yellow or red according to the quantity that is added.

Large portions of fulphur render it inert.

The pure white arfenic hath a penetrating corrolive tafte, and taken into the body is a violent poison; it produces speedy dryness in the throat and inflammation, dejection, fainting, stupor, delirium, tremors, convulsions, palfy, thirft, burning in the stomach, gripes, vomiting, cold sweats, hiccoughing, and at last death. Besides the effects which it hath in common with other poisons, it remarkably attenuates the coats of the flomach, and perforates the intestines, occasions a swelling and sphacelation of the whole body, and a fudden putrefaction afterdeath, and particularly of the pudendæ.

When the quantity taken is not fatal, it occasions tre-

mors, palfies, or lingering hectics.

Though there is but little hope, after this poifon is fwallowed, yet if affiftance is to be had, immediately give a feruple of the white vitriol to excite a vomiting, and repeat it two or three times; give the patient plentifully of warm water mixed with fweet oil, after each dofe of the vitriol, that if possible the stomach may be well cleared of the poison; large draughts are peculiarly proper, as they diftend the ftomach, and fo more effectually wash away what may be lodged in its villous rugæ. After fushcient vomiting, give mucilages and demulcents, particularly plenty of gum arabic, both by the mouth and clyfterwife; fat broth should be continued some time, and the bowels must be kept lax. If the poison hath had time to get into the blood, let cordial perspiratives be added, such as rad. serpent. V. &c.

Arfonic has been given with some success in cases nearly approaching to cancerous, and by fome faid even to have cured cancers when they have been confirmed, and also have been administered with great efficacy in the ague-

See CANCER and INTERMITTENT FEVER.

ARSENICUM FLAVUM FACTITIUM. Arfen. citrinum, vel croccum, YELLOW ARSENIC, called also arfenicon. - RUBRUM FACTITIUM. RED ARSENIC. See AURIPIGMENTUM.

In reading ancient authors on the yellow and red arfenics, it should be observed, that their arfenies are not the fame as ours. Among the Greeks two kinds were in use, viz. the yellow, which we now call orpiment, and auri-pigment; and the red, which they call fandaraca. The Arabians had also two kinds, viz. the yellow, which they call fandaraca; and the red, which they call realgar. It was the folial fulphurated arfenies that the ancients used medicinally, and only those which were yellow and flaky like tale, and which alone they called a fenicon. The white ar fenic is a discovery of later times. The auripigwhite ar fenic is a discovery of later times. The auripig-ment we meet with is of the yellow fort, its taste is not very acrimonious. Boerhaave and Mead, both of them, commend the use of its fumes to be received into the mouth in asthmas. The best mineral orpiment is brought from Turkey; it is very little, if at all, poisonous. See AURIPIGMENTUM.

Our yellow and red arfenies are artificial, being no other than the white, mixed with different proportions of fulphur. The white is the strongest, the yellow weaker, and the red weakeft.

Both the yellow and the red fosfil arfenies, when of a fmooth texture, are called zarnichs, but when composed of finall feales or leaves, they are called auripigmenta.

ARSIORA. CERUSS.
ARTABA. An Egyptian measure containing about

five of our pecks.

ARTANECH, or ARTANECK. ARSENIC.

ARTEMISIA, called also mater berbarum, absimblium alpinum, berens fecum, parthenium, pingulum fancti Johan-nis, berba regia, toxitefia, anactorium, bubastecordium, the HEART of BUBASTUS, and COMMON MUGWORT. The fpecies used by the direction of the Edinburgh college is the artemisia vulgaris, or artemisia foliis pinnatilidis planis incisis subtus tomentosis, racemis simplicibus recurvatis, floribus radio quinque floro. Lin. See MA-

It is a plant with firm stalks, of a purplish colour, with deeply-divided seaves, resembling those of common wormwood, of a dark green colour above, and hoary underneath. The flowers are fmall, purplish, naked, and discous; they stand creek on spikes on the tops of the branches. It is perennial, grows wild in the fields and on waste grounds, the flowers appear in June.

It hath been in much efteem for promoting the uterine evacuations, and moderating hyeftric spasms, for which purpofes it is used in infusions for common drink, and in

The flowers and the tops are the ftrongeft. It is a

name of the botrys, which fee.

ARTEMONIUM. The name of a collyrium defcribed

by Galen.

ARTENNA. An aquatic web-footed bird, called alfo diomedia.

ARTERIA, aplepea. An ARTERY. From aug, car, and Tupiu, to keep.

By the word artery Hippocrates means what is now known by the name of afpera arteria; nor were the veins diftinguished from the arteries in the oldest times.

An artery is a strong elastic ramifying tube, arising from the heart. The arteries are properly but two, they rife from the two ventricles of the heart, one of them is called aorta, which fee; the other is named the pulmonary artery, for it springs from the right ventricle of the heart, and is wholly confined to the lungs.

The figure of an artery fomewhat refembles a tree; the fmaller ramifications of the arteries frequently anaftomofe with each other, as may be observed in the coats of an intestine when they are injected. The largest ap-pearances of this kind are in the vertebral orteries, which unite in the skull. The use of the anastomosis is to keep up an equal circulation, they likewife ferve to mix the

blood better.

It is generally faid that the arteries are of three forts, viz. the fanguine, which circulate red blood; the ferous, through which ferum only is naturally conveyed; and the lymphatic, whose contents are lymph; it is also said, that if the blood is pushed into serous vessels, it is there obstructed, but they are all the same tube continued, which gradually divides into branches, and these branches grow imaller the farther they are from the heart; near to the heart, the thicker blood circulates, the force of the circulation is there stronger; and far from the heart the circulation leffens in its vigour, fo the thinner fluids only run there; but if by exercise, or other means, the heat of our bodies is increased, the circulation is pushed, the red blood and other orders of thinner fluids, can proceed to where ftill thinner fluids only circulated before; for the fmaller veffels not being constructed to receive only such certain fized globules, can diftend to the capacity required by fuch degrees of circulation as are occasionally happening, and contract again to their former dimensions, as soon as the diftending force is removed.

Arteries terminate three ways, the most common is that into the veins. Harvey discovered, or demonstrated, the

circulation of the blood; but Malpighius first observed, that the last branches of an artery, running into minute bronchiales, cesophage, intercostales, &c. divisions, dispose themselves on a membrane as on a firm base, and there open into one another by the mutual intercourfe of fmall canals: he first traced out these canals through numerous mazes and windings, through which they convey the blood; but here the fmall branches, difpofed with great nicety, extend over equal fpaces, and deflitute of lateral fhoots, as being no longer fub-divided, changing their figure, constitute the origins of the veins and lympheducts, with their finuses.

The next termination of arteries is into little cavities or

finufies, as into the corpora cavernosa penis, &c.

The last is into excretory ducts.

The arteries generally lie deep, and always run on the inflected fide of the limb, as in the axilla, the inner part of the cubit, &c. this fituation prevents their being either ftretched or compressed in the various motions of the

In the beginning of each artery there are three valves, which appear like purfes, and prevent the return of the blood to the heart; the other parts of the arteries are free

from valves.

The coats of the arteries are three in number.

1. The EXTERNAL; it contains a great number of blood-veffels, and many nerves run through it; it is claffic and its fibres run quaquaverfim.

2. The MIDDLE; it is made of fibres which are difposed nearly circularly, and parallel to each other.

3. The INTERNAL is a thin membrane, whose furface

is very fmooth, to give an eafy passage to the blood. Some anatomists say, that these coats are muscular, but this opinion stands confuted, when it is considered that the coats of the arteries remain elallic after the animal is dead, and that the muscles after death are absolutely inelastic. This, however, proves not the want of mufcular fibres, but that they consist of elastic ligament in part.

The cellular membrane is improperly numbered among the coats of the arteries, for it only connects the real

The nearer to the origin the weaker are the arterial coats, whence the frequency of ancurifms in the begin-

ning of the aorta.

Arteries are often met with of a ferpentine form, but they are not fo in a natural state of health, except during particular actions, &c. and then they recover their original state as soon as the temporary cause is removed. The cause is the dilatation; the coats are elastic, therefore whatever differeds them, must at the same time, lengthen them, and thereby produce serpentine turns. This frequently happens in injecting the arteries of dead bodies: in the viper it is very apparent in an artery which runs along the outfide of its lungs, every time that the heart beats, this artery is feen in a ferpentine form. The arteries of the uterus are more convolved in the last months of pregnancy than they were before conception; fo far is the common observation from being true, that the uterine arteries have naturally a ferpentine course, to admit of the enlargement of that organ in pregnancy, without flietching the arteries.

The arteries are liable to offification, particularly the iliac and crural. This happening where an amputation is performed, requires a caustic. The offification begins in the internal membrane, which first thickens, then grows fpongy, by degrees becomes griftly, and at last like bone; of the fouthern parts of Europe, and then this diforder extends to the outer coats. From The fresh roots have a nauteous, aerid, biting taste, but this circumstance a mortification is sometimes produced.

See MORTIFICATIO.

The particular arteries may be feen under their respective names, but their general course runsthus. From the right ventricle of the heart arises the pulmonary artery, which is wholly distributed in the lungs

The aorta arifes from the left ventricle of the heart, and immediately fends off the coronary arteries into the heart and its auricles.

From the upper part of the arch of the aorta rifes the

carotids, which supply the head.

Near the carotids rife the subclavian arteries, which fend off the internal mammary, the upper diaphragmatic, and others, which are differred in the breaft: when the fubclavian hath passed out of the thorax, it receives the name of the axillary artery, and when in the arm the humeral, and in the fore-arm the cubital.

The upper portion of the aorta descendens sends off the

The inferior portion of the aorta fends off the inferior diaphragmatic, cœliae, mesenteric, spermatic, emulgents &c. then dividing into two, forms the iliac arteries, which fend off branches about the lower part of the belly, then descending into the thighs, legs, and seet, form the crural, tibial, &c.

Wounds of the large blood-veffels require amputationtoo frequently; the great quantity of blood which wouldbe loft, if the usual methods to restrain hemorrhages should fail, would endanger if not destroy the patienter After a ligature is formed, the circulation may or may not be duly carried on; if it should not, the operation will be indispensible. The collateral branches are not always sufficient for carrying on the circulation, fo as to prevent from mortification. The intercostal artery, when wounded, is fatal. Wounds of the arteries in the hands are dangerous. The popliteal artery in the ham, if injured, absolutely demands amputation. The humeral artery, if injured high up, it requires the amputation of the arm, &c. and various other inflances. Bell's Surgery, i. 97, &c. White's Surgery, 173.

ARTERIA ASPERA. See BRONCHIA.

VENOSA. The pulmonary vein.

ARTERIACA. Medicines against disorders of the

voice, and the afpera arteria.
ARTERIOSUS, Ductus, also called canalis, and canaliculus arteriofus. This, in the fœtus, arifes from the extremity of the arteria pulmonalis, just where it is going to give off the two branches, and opens by its other end into the beginning of the descending aorta, just be-low the great curvature. In the adult it is obliterated, but in the fœtus it is open, and conveys the blood, which hath no passage through the lungs in this state of the animal, from the pulmonary artery to the aorta.

ARTERIOTOMIA, from apinesa, an artery, and

repres, to cut. It is the opening of an artery for the dif-

charge of blood.

Galen, Antyllus, Oribafius, P. Ægineta, and feveral others highly extol this practice in inveterate head-achs, which relift all other means; also as a remedy against violent inflammations of the eyes, the epilepfy, &c. operation is generally confined to the head, because of the bone being immediately under, and giving the advantage of a proper compress. When the temporal artery is opened, a finall knife, fuch as is used for the fiftula lachrymalis, is better than a lancet, and the incifion must be so as to divide the artery transversely, thenthe inconvenience of an aneurism is avoided.

Heister condemns arteriotomy, especially before every other method hath been tried. See Beli's Surgery, i.

White's Surgery, 178.

ARTETISCIUS, or ARTETISCOS. One who fuffers the loss of any member, or who hath a very defective one.
ARTHANITA, called cyclamenus, cyclamen, panis

borcinus, sow-BREAD. It is the cyclamen Europeaum. Lin. It is a low plant without any other stalk than the slen-der pedicles of the leaves and slowers; the leaves are green, with white fpecks above, and purplish beneath; the flowers are purplish, monopetalous, deeply divided into five fegments, followed by round feed-verfels; the roots are large, fomewhat globular, with feveral fibres, blackish on the outfide and whitish within. It is perennial, a native

little or no fmell. Long keeping destroys all their vir-

One dram of the powder purges, but its most frequent, as well as most proper use, is as an errhine.

There is another species, called cyclamen autumnale,

COMMON SOW-BREAD.

ARTHETICA, or ARTHRETICA, from ophion, a joint. The herb GROUND-PINE. It is useful against diforders of the joints.

ARTHOICUM, or ARTOICUM, or PANNONIUM, from apps, bread. An oil formerly made by digesting feveral roots with bread.

ARTHREMBOLUS, from appear, a joint, and escanse, to impel. An instrument for reducing luxated

ARTHRITICA, belonging to the gout. ARTHRITIS, from spaper, a joint. The Gour. the order of inflammations. He diftinguishes its species into, 1. Podagra Regularis, Regular Gout. 2. Podagra Atonica, Atonic Gout. 3. Podagra Retrograda, Retro-cedent Gout; and 4. Podagra Aberrans, Mifplaced Gout. The REGULAR GOUT is when the inflammation appears in the joints to a due degree, and after continuing a while, gradually disappears, and the patient recovers his usual health. The ATONIC GOUT is when there is manifestly the goury diathesis, but from some cause it does not produce the inflammatory affections of the joints, but digestion is disturbed, and the general health is variously affected. The RETROGADE OF RECEDENT GOUT is when inflammation hath as usual attacked the joints, but not with either its usual degree or the usual pain, and then fuddenly abates, an internal part as fuddenly being affected thereby. The MISPLACED GOUT, is when the gouty diathelis produces inflammation in some internal part, instead of the joints of the extremities.

The ancients called all kinds of pain, which was feated in the joints or the external parts, by the common name of arthritis. The word rheumatismus was not known amongst them; but in the fixteenth and seventeenth centuries, fome celebrated French physicians have called the pains which afflict the intermediate spaces, between the joints and muscles of the neck, or of either arm, or of the anterior or posterior part of the thorax, the shoulders, scapulæ, thighs, and hands, by the name of rheu-matism. And those they style arthritic which affect the joints, though according to the different part, they diftinguished the same gouty pain by a different name, as podagra in the feet, chiragra in the hands, onagra in the elbow, dentagra in the teeth, lumbago in the vertebræ of the back, dolor ifchiadicus in the articulations of the os ischium: but the difference betwixt the gout and the rheumatism is considered as very great, both in their

regular in its returns, and gradually leaves the patient in its decline; and irregular when its attacks are irregular, when it afflicts the patient varioufly, and when it feizes

the internal parts.

When the fits are regular, it chiefly affects the nerves, tendons, membranes, and ligaments of the joints, parti-cularly the fmall joints and feet; when irregular, the viscera, as the lungs, stomach, &c. are the feat of this disorder: but it is the tunica cellularis of the respective parts that are affected, which is the proper and immediate feat of the disease. Aretæus says, that any part of the body is susceptible of the gout, and Actius observes, that in the extremity of it the iris is affected.

It generally attacks those aged persons whose early life hath been fpent in indolence and luxury; those who have large heads and voracious appetities; the plethoric, and those who possess the best stamina of life. Children nor youth are not exempt from it. Women are rarely affected with it; but Aretæus observes that when they have it,

the pain is excessive. It is often hereditary

Among its various causes, indigestion is the primary one. The pre-disposing cause is a largeness of the lac-teals, and straightness of the small vessels, particularly the perspiratory; Dr. Kirkland observes, that if ever the gont is hereditary, it is plain the folid parts of the body are those primarily affected; for if we look into nature, it is the organization or peculiar form and texture of its parts, that the offspring inherits from its progenitors; and that it is this structure in animals which alters and adapts the juices passing through them to their proper of-fice. Consequently, if the folids are formed in a diseased ftate, the fluids they carry will degenerate from health; and it is therefore reasonable to suppose the alteration from nature; we observe, in the juices thrown off in an hereditary gost, is the consequence of some morbid structure; the same may be said of the gost brought on by intemperance, for diet hath the power of changing the whole body. The immediate cause seems to be the acrimony of earthy particles undiffolved; whatever elfe conduces to the production of the gout, is but an occa-

Dr. Cullen, in his Nosology, gives it the name of podit. Dr. Cheyne says, that the chief reason why the gouty draga. It his 24th genus of diseases, and, according to matter so generally fixes on the joints, is because of the his arrangement, it is of the class of febrile disorders, and pressure there from the heads of the bones, which lessens the capacity of the small vessels; to which may be added, the fmallness of the glands in the joints, and the natural coldness of these parts, occasioned by the distance from the heart; that the earthy particles above named are con-veyed into the tunica cellularis of the ligaments, tendons, &c. where the veficles are less than in the bellies of the muscles and fleshy substances, and is retained in them. and being more or less acrimonious, they occasion more or lefs heat, and cause that inflammatory appearance, and intolerable pain, which accompany this complaint; but the parts affected, foon losing their fensibility, the spafm abates, and the offending matter is again returned into the circulation, or fent out of the body through the

Cajetanus Tacconus, M. D. tried many experiments, in order to difcover whether the gouty matter is acid or alkaline, and he concludes that it is sometimes one, and fometimes the other; and perhaps this conjecture is highly probable, when we confider that the flone in the kidnies, which very often alternates with the gout, is fometimes of the nature of one, and fometimes of the other. The figns by which he diftinguishes these are, first, if the gout produces no tophi or knots, or does it very flowly, and especially if it is attended with cedematous fwellings, it depends on an alcaline humour; but if the knots are large and quickly formed, an acid is the

caufe.

Dr. Hunter thinks that the offeous matter is separated by fmall arteries, and thrown upon the membranes or cartilages, as proper beds for it to lie on, and that there is more or less separated as the vis vitre is greater or less; and that in the gout there is a redundancy of bony matter, and it is probably this that forms the chalk ftones. Dr. Cullen, as indeed feveral others, confider the gouty matter as an effect. and not a cause of the disease.

cause, seat, symptoms, and cure.

The gout is a chronic disorder, and the pain that attends it is principally spassmooth. It is generally considered as regular when it only affects the extremities, is gestion, drowsiness, head-ach and sickness, a weariness, dejection of spirit, pain in the limbs, with a fenfation as if wind or cold water were palling down the thigh, is also complained of, the appetite is sometimes very keen a little before the fit approaches, a flight pain is felt in paffing the urine: foon after midnight a pain attacks the great toe, or fome other part of the foot, or ancle, though now and then it is fixed in the calf of the leg; this pain is accompanied with a fenfation as if cold water was poured thereon, and foon followed by a thivering with some degree of fever: after this the pain increases, and fixing in the fmall bones of the foot, the patient feels a variety of torturing pains there for about twenty-four hours, which then abate, the part becomes inflamed and fwelled; towards the morning the patient falls afleep, a perspiration comes on, which terminates the fit; but what is commonly called a fit of the gout, confists of several fuch as these: and though a recovery proceeds from the first remission, some uncasiness returns every night, and goes off the following morning. The first fit may continue two or three weeks, but a tendernefs where the pain was feated remains much longer. It may be that the patient remains free from any return during the fucceeding or a fecond year, but when it does it is still more painful; and soon after this the returns grow more and more frequent, increasing until the strength failing, and fensation is diminished, then, though the patient is seldom free, he is not violently afflicted.

There is a great refemblance, in many particulars, betwixt the gent and chronic rheumatifm, fo they flould be carefully diftinguished; the inflammatory rheumatifm too hath been mistaken for this disease. It sometimes requires much attention to diftinguish a gravelly complaint from a gouty one. There is a great fimilarity betwixt an intermitting fever and the progress of a gouty fit, and instances have occurred, where the patient, having not been manifestly visited with it, that much difficulty attended a rightly distinguishing of the complaint. Nervent distinctions of the complaint. ous diseases require our care no less, to distinguish them

from gouty diforders.

The regular gout is confidered as more troublesome than fional cause, but yet may aggravate as well as give rife to dangerous, or rather as nature's method of relieving from all other complaints; though Aretœus observes, that the podagra sometimes degenerates into a dropsy, or an afthma, in which case death is unavoidable.

If t

In order to the cure, there is little to be done in the fit, and out of it the best intentions are, first to increase the digestive powers; and secondly, to promote and sup-

Port the natural perspiration.

On the approach of the fit, and until its departure, a flender diet is generally prescribed, but so various are the constitutions of different persons, that this article is most properly determined by the attending physician. Sydenham's rule, viz. moderation, is perhaps, the best general one on this subject: he says, let the patient take no more than is easily digested, nor less than is necessary to keep than the fairness and as to the quality, the palate and are up the fpirits; and as to the quality, the palate and appetite may determine, for that which is best relished is the most easily digested, though it be what is usually esteemed the contrary. One kind of sielh meat he confines the patient to, at one meal, and that to be eaten only at noon; but in different days a variety may be allowed. is good neither to oppress by excess, nor induce feeble-ness by needless restrictions. Mead feems to be an unexceptionable cordial.

An early going to bed is firstly to be conformed to, but early rising is not so necessary.

When circumstances admit, gouty patients should al-ways endeavour to be in a good air when they expect the return of the fit. In the country, perspiration is most easily supported, and there the patient recovers the soonest. A warm and dry air is almost alone both a preservative

from, and a cure of the gost.

How necessary exercise is, as soon as the pain will admit of it, and that daily, during the intervals of the fits, need be no farther noticed than by observing how much a due and conftant perspiration preserves from this disease. Frictions with coarse flannel, the flesh-brush, &c. riding in a carriage, or on a horfe, and, when ftrength admits, fome regular daily labour, should be the methods that nothing should interrupt.

Pattions unrestrained, and close attention, by weaken-

ing the digeflive powers, conduce to the violence of this difease, and to the frequency of its returns.

In the fit, cover the affected limb with new combed wool, or the fostest flannel. As to external applications there are very opposite opinions afferted. Dr. Kirkland thus far observes, that emollient cataplasms, warm bathing, camphor, aromatic oils, and anodyne spirituous applications, give ease, either by relaxing or taking off the sensibility of the part; yet they have no property in themselves of promoting a discharge of the gonty matter. Compositions, for promoting a discharge of gonty matter, must be so managed as to be capable of softening the inflamed parts without over relaxing them; for either ten-fion or relaxation will prevent exudation: they must have an attenuating and ftimulating property to invite the humors outwards, and yet be incapable of inflaming; and in this intention the state of inflammation must direct us. If the inflammation is great, a neutralized foft plafter, that does not adhere will answer the purpose. If the parts are less tense, and require a warmer stimulus, a vo-latile plaster will be preferable; but with external appli-cations, internal medicines will be necessary to promote an outward discharge, and when the metastasis seems to be about complete, these methods will scarcely fail to eva-cuate and produce case.

cuate and produce eafe.

If there is a fickness, or uneasiness in the stomach, give carduus, or camomile tea, to excite two or three evacuations; or if something stronger is required, give a little ipecacuanha. Vomits promote perspiration, and if used when a sickness, or other uneasiness, is already selt in the stomach, no danger need be apprehended.

If a sanguine plethora is observed, the loss of a little blood should precede the emetic. The heat of the body, and the strength of the pulse, will safely direct the quantity to be taken away: as bleeding can only be useful by unloading the vessels, it should be taken away with caution, by a little at a time, and repeated as required. tion, by a little at a time, and repeated as required.

The day after the emetic, a gentle purge may be given, if in a fanguine and robust habit.

R Infus. senæ, 3 ji. vel iij. natri vitriolati, 3 ij. sps. menth. 3 iii. m. f. haust.

But if not remarkably strong, and attended with great

R Tinct. aloes, tinct. rhubarb. aa 3 vi. vel 3 i. m. f.

If this latter draught was taken, and repeated once or twice, as foon as any symptoms of an approaching gour appear, the violence of the succeeding diforder would be much lesiened, if not the whole of the complaint prevent-ed. If the pain is considerable after the operation of the purging medicine is over, an anodyne may be administered, and repeated at other times, if the urgency of the pain requires it.

Purges fuited to the strength of the constitution, and the peculiarities of any habit, if repeated at proper intervals, are of fingular benefit either for hallening away the present, or retarding the approach of an absent gout, and as the pain is chiefly fpafmodic, opiates may be used with-out the usual apprehensions. The soap pill may be pre-ferred; but if a draught is desired the tincture of opium may be used; ease and sleep promote perspiration, and thus a principal intention in prescribing is answer-

Dr. Kirkland observes, his ideas of the gout are, that in consequence of a particular state of the folids, the juices acquire a morbid disposition, which in part brings on what are called gouty symptoms; but upon a depuration being made to the extremities by an effort of nature, the body is relieved till a fresh accumulation of gouty matters and till the state of the paids. ter again diffurbs the patient. May it not then, he adds, be allowed, that nervous energy is leffened, and a great degree of morbid irritability is brought on, and that both these effects should be attended to in the cure? To effect the defired relief, imitate nature, and remove the morbid matter out of the body by those means that different circumitances make most fuitable. When gouty people have been troubled with flatulency, acrid etuctations, reftless nights, &c. much relief hath been afforded from calomei, affisted by gentle purges. Hence it seems clear, that the true method of relieving the gout is, to support nervous energy and evacuate the gouty matter. When a regular fit occurs, nature accomplisheth the defired relief, but when the is interrupted in this effort, no melief, but when she is interrupted in this effort, no method gives speedier relief, under an inflammatory state, than proper purging. Dr. Cheyne observes, that many have given an active purge every morning, and quieted its tumult with an anodyne in the evening; and thus continued until the fit was overcome. If required, besides the anodyne at night, a cordial may be directed. The pain abated, and swelling subsiding, to restore the former strength was attempted by gentle stomach-purges, aromatics, and warm alteratives. When the disease is not determined to one point, also when it affects the head, stotermined to one point, also when it affects the head, stomach, or bowels, proper purges give the most speedy re-lief. In administering purges in gouty habits, however proper and necessary, no disease requires more prudence in the management of them, on account of the desiciency of the nervous power fo generally attendant on the gout. Therefore, except inflammation forbid, the nervous energy must be supported during the operation of pur-gatives; and the patient's strength must be duly attended to, left evacuation by purgatives should too much en-

If a fever accompanies, plenty of fmall diluting drink must be supplied, small white wine whey may be given at night, with a little of the sp. ammoniaci compositus. Sage tea accidulated with the jelly of any acid fruit, or with the diluted vitriolic acid, is also an useful mixture for common drink

for common drink.

Let the vis vitæ determine the quantity of cooling and of cordial medicines. To support perspiration, and to preferve the heat of the body as nearly as possible to that of health, are leading points of management through the

whole of the paroxyim.

In the decline of the fit, when the fkin begins to peel, and the urine deposits a laudable sediment, a few gentle bitter purges should be given, and frictions, or rather ex-ercise, should be used to recruit the strength: three com-mon spoonfuls of the following infusion may be given

twice a day.

R Cort. Peruv. opt. 3 ij. — aurant fice. 3 i. fs. rad. ferpent. V. 3 iij. croc. anglic. cort. cinnam. a 3 ij. fp. vini Gallic. fb i. fs. m.

Or if the stomach will bear it, a tea spoon-full of the bark may be taken, in fine powder, with a glass of good

flitutions.

The flannels should be gradually east off as soon as the pain is gone, though a fwelling and lameness still conti-nue. Then to streigthen the weak part, immerse it every night at bed time in cold water, then wipe it quite dry before laying down. Local bliffers, are here ufeful; to abate the fwelling left remaining, and giving firength to the

Ryc-meal poultices are a fashionable application, but topical remedies are most fasely omitted.

Iffues just above the knee, on the infide, should be made in gouty patients, their discharge contributes much to the preventing the gout from affecting the viscera.

Dr. Dawson's success with the use of the tinch. guaiac.

and an occasional bleeding, deserves the attention of medical practitioners. He recommends it in the gaut, with or without fever, and in both the acute and chronical rheumatisms. His general mode of prescribing it is

hath manifested itself on the extremities, cannot be dif-tinguished from other diseases which assect the particular part on which it is fixed. The internal, or irregular, goast, generally seizeth the stomach or the intestines, causing a loss of appetite, colic, diarrhea, &c. though sometimes it attacks the head, and produces a vertice, head as it attacks the head, and produces a vertigo, head-ach, or an apoplexy; or, falling on the lungs, it refembles a peripneumony; if it takes its feat on the nervous fystem, a replication, it is taken its lear of the recreation of the palify is the confequence. But whatever part it refts in, the only proper cure is the expulsion of it into the extremities, by cordials, diaphoretics, and chalybeates. Mild blifters may also be applied to the feet. The sudden blifters may also be applied to the feet. The sudden transitions of the gout, which are sometimes instantaneous, Dr. Kirkland thinks, are effected by the consent of parts. He observes that pains in many instances have vanished, though in very diffant parts, when a medicine hath been applied to the fromach; that spasms have been instantly produced in the fide, when a wound in the ancle hath been wiped with a foft rag. May not then a diffant gouty pain he inftantly brought on by a local affection of the nerves !

The GOUT in the STOMACH. It is fometimes invited here by acrid matter lodged in this viscus, and fometimes repelled from other parts by injudicious management, and other accidents. In this cafe there is fickness, loathing of food, eruclations, cardialgia, vomiting, heat, a conftriction or pain, &c. Some one or more of these appear, at the same time the extremities are free and easy. Old people who have lived freely in their youth, but are now become fober and absternious, are sometimes affected with hypochondriac symptoms in the stomach, which resemble gouly ones; but they are to be diffinguished by the man-ner in which they seize the patient, their vehemence, and

intervals.

If a fanguine plethora with an ardent heat is observed, bleed, then apply a mild blifter to the feet. If the breathing is difficult, the ftomach opprefied, eructations, naufea, or vomiting are troublefome, a gentle vomit may be advifed; and foon after its operation, if coffive, let a folutive clyfter be injected, and afterwards a dofe of Venice treacle.

Three or four times a day give a dose of some warm bitter stomachic, and now and then purge gently with the pil. ex aloe cum myrrha, or with the tinct. aloes made with brandy, or the tinct. rhab. Here proper purging is

generally required. See above on their use

If, notwithstanding the above, the sickness continues, give ten drops or more of the tinch, opii, with a glass of mint or cinnamon water, and repeat it every four or five hours until the stomach can retain its contents; after which, to haften the diforder into the extremities, give the following powder three or four times.

R Ferri rubiginis gr. v. ad x. rad. ferpent. V. 3 i. m.

f. pulv.

Or instead of this powder, the patient may take two large spoonfuls of an insusion of garlic in brandy, adding to each dose ten or fifteen drops of the tinct. and it two or three times in the day.

The Bath water is almost a specific in enscebled con- able spice, heated, and drank betwixt each dose of the

The ARTHRITIC COLIC, or the GOUT in the INTES-TINES.

Any part or the whole of the intestinal tube may be affected. It often happens to the aged and infirm, and sometimes the more robust suffer this way. A general uncainefs, lofs of appetite, a naufea, or a wandering pain in the bowels ufhers it in, but the pain foon fixing on one part of the belly, confirms the diforder; by this time a remarkable oppreffion is felt in the breaft. To these two fymptoms, pain in the belly and oppression in the breast, which are capital ones, are added one or more of the following; a rumbling in the bowels, frequent eructations, costiveness, a vomiting of bilious matter, low spiritedness,

want of fleep, &c.

A peculiar-weakness in the bowels, and an accumulation of impurities in them, may invite the gouty matter; error in dict, repellents imprudently applied to the extre-

mities, &c. may determine it to this part.

If the pain in the inteffines, and the oppreffion in the breaft, continue long, the danger is hardly to be over-

come, nor, indeed, is there much fafety until the com-plaint is wholly in the extremities again.

A bilious fever fometimes attends, in which case if the heat and trength of the patient will admit, begin the cure heat and strength of the patient will admit, begin the cure with bleeding, but be careful not to reduce him much. If the stomach seems oppressed by its contents, a gentle emetic will be adviseable, and, presently after, let a warm bitter purge be administered; or, opening glysters with alla fortida in them. During the intervals of purging, if an acid is prevalent in the first passages, magnesia alba should be given frequently; or if a bilious matter abounds, bitter infusions, that are also laxative, must be presented. That complied with, those chalybeates recommended for removing the gout from the stomach must be used for the same end in this case. A glass of strong wine may now and then be taken. If the spasms in the bowels prevent the esseated prevent the efficacy of purging medicines, apply a warm fomentation to the belly; or if they are fo weak as that the medicines run off too fast by stool, proper aftringents must be used. Red port wine, from half a pint to a quart in twenty-four hours, will produce singular advantage of the produce of the tage; and as foon as any medicine is perceived to agree with the stomach, let that be adhered to until the diforder is fixed in the extremities. If after this the belly is greatly diftended with wind, let an oily emollient clyfter be

really differed with wind, let an only emolinent clyffer be now and then administered, and this symptom will subside. To prevent returns, the Bath water is the specific. A GOUTY DIARRHOEA. If in goaty patients, and during a fit, a diarrhœa comes on, the pain and swelling at the same time gradually vanishes, the diarrhœa is evidently caused by the goat. The effect of this diarrhœa is very uncertain. If it soon abates, and is not excessive it from proves useful, but, when the intestines are an entired in the same are an entired to the same are same and the same are same as a same and the same are same and the same are same as a same are same are same as a same are same as a same are same

often proves useful; but when the intestines are en-feebled by previous irregularities, &c. great danger attends. If the cause be crudities in the first passages, a dose of the tincture of rhubarb will be necessary, and then rethe thecture of rhubarb will be necessary, and then re-ftringents, with perspiratives, must be given, tinct. opii in small doses, accompanying. The decoction of burnt hartshorn will be a proper drink, now and then adding red wine. When this disorder is abated, to prevent a re-turn, give the chalybeate powder directed against the gent in the itomach. Sydenham recommends a wear, and to repeat it night and morning for feveral days when this

repeat it night and morning for leveral days when this case proves obstinate.

A GOUTY DYSENTERY. When this mode of the gone's attack is present, there is a gnawing pain, a quick pulse, and a small sever. If at the time there is any gonty symptoms in the seet, they soon disappear, sly to the intestines, where the distended arteries at length bursting, blood is discharged, and passes off by stool, and sometimes a quantity is thrown up bythe mouth. Subsquare to this are great harmons, loss of streams to be a constant and the streams.

times a quantity is thrown up bythe mouth. Subfequent to this are great languors, lofs of ftrength, coldness of the extremities, and the utmost danger.

In this case keep the patient as free from motion as possible. Cordials must be given with caution, left the blood should be too much rarefied, just so much as to keep off swooning will be then needful. If the loss of blood is considerable, give five or fix drops of the tinct. opii in a spoonful of strong cinnamon water now and them. The decoction of hartshorn may be drank, but any other sood or medicine must be omitted until the danger is lessend. Great care is required to keep the A glass of strong wine may be mixed with some agree- danger is lessened. Great care is required to keep the

tion or laxity are equally pernicious. Jellies are the most proper diet, rice milk for a change, and such other aliment as is eafily digefted, nourifhes much, and is agglu-tinant. As foon as the patient is a little recruited, fleel waters may be used, and after a while preparations of the

A GOUTY MELANCHOLY. The tender and delicate are often reduced to this state, during regular fits of the gout in the extremities. These persons are chearful in the intervals, but when the paroxysms cease, or are imperfect, the appetite fails, and the digeftion is deprayed, rumblings in the bowels are troublefome, and an almost conftant pain is felt in the intestines, hence a melancholy is induced. When the gout is afflictive this melan-choly abates; but when the gout gives way, the melan-choly increases fo that the intervals of health are very

For relief from this deplorable state, begin with an emetic, then give the pill. ex aloe cum myrrha, and in the evening after its operation a cordial, instead of an opiate. On the days that are free from purging, the tinct. aloes may be directed as an alterative. Let chearfulness be encouraged, daily exercise on horseback, and such means as may duly regulate the vital heat be attended to.

A GOUTY SWOONING. This may be from an imprudent use of cold liquors, from irregularities in the diet. The patient complains of general indisposition, a paleness and general cold sweat comes on, the pulse is flow and unequal, and, at length, the patient faints: whatever degree of the gent was in the extremities, now retires, and without speedy help death closes the scene.

Speedily administer cordials in a liquid form and large dofes; repeat them as often as the least tendency to swooning may require; let frictions be used on the feet, and flannels wrung out of hot wine or brandy be applied to the belly: proceed thus until a recovery is effected. If the ftomach feems oppressed with improper aliment, let it be discharged with an emetic of zincum vitriolatum purificatum, worked off with warm wine. One of the best cordials is brandy, mixed with as much hot water as the

patient can bear to fwallow with it.

The GOUTY ASTHMA. Those who are constitutionally inclined to an afthma, are the most subject to this fpecies of it. An injudicious use of opiates, and of repellents, a suppression of any usual evacuations may be the cause of the gout appearing in this form; an alth-matic gout sometimes follows an interrupted fit of the regular gout, as a fit of the gout fometimes cures an afthma. The gouty afthma is of two kinds, viz. the dry and the moift. Those who have been accustomed to drink spiritous liquors are most subject to the dry species, in which the breathing is flort and difficult, at-tended with oppression in the breast; but there is little or tended with oppression in the breast; but there is sittle or no cough, nor any spitting. Those of a thin lax habit are more subject to the most kind, in which a viscid matter is freely coughed up, and which relieves a little until a fresh quantity is accumulated. The gouty matter is sometimes so discharged this way, that gouty persons are kept clear from all other indispositions, whilst free from returns of the regular gout by it. Sometimes the gout appears originally in the form of an afthma, and cannot be diftinguished until a regular fit falling on the extremities frees the lungs. The dry afthma is the most

Where there is a fanguine plethora, bleed. Where this is not attendant, repeated purging, with fuch medi-cines as determines the gout to the extremit es must be used. To relieve the cough, the usual medicines are pro-per here. To prevent a return of either the dry or moist kinds, fresh air, an exact regimen, and particularly avoid-ing suppers, are of great service. A tendency to the dry afthma is best opposed by gum ammoniacum, with the powder recommended above against the gout in the stomach. The most requires diuretics, perpetual blisters hetween the shoulders, and issues above the knee on the

infide of the limb.

howels in a proper state, for a tendency to either constipa-tion or laxity are equally pernicious. Jellies are the most proper diet, rice milk for a change, and such other ali-more rarely, or more mildly affected by them than usual, or when a regular fit is interrupted in its courfe, a heavinets in the breaft is perceived, a cough, and a load of phlegm in the lungs, which at the first is thin, but gradually grows thicker, and more abundant in quantity, after which there is an hoarfeness, with disheulty of breathing. As the spitting increases, the goat in the extremities declines. This spitting, if not so excellive as to greatly weaken the patient, is useful. Of all the above accidents a cough is the most frequent, and generally follows a regulation of the state o lows a regular fit, though it rarely accompanies it. It also sometimes ends in a regular fit, especially if assisted by fome brifk warming purge. A catarrh or defluxion is always accompanied with an afthma and inflammation of the lungs. This is not dangerous, except the lungs are naturally very weak, or have been much hurt by any ac-cidents. These coughs and defluxions are rarely attenda-ed with any sever; but a flight cold, or a small degree of imprudence in the use of spirituous liquors, endanger an inflammation of the lungs.

If the conflitution is not very weak, bleed; and in all cases of this kind give repeated purges. After the first purge, join pectorals to such other remedies as tend to drive the gout to the extremities. In inveterate cases the bark is very useful. If great care is not had to produce a regular gout, the cough increases, and the patient falls into a fatal confumption. Disphoretics, and externals to bring the gout into the feet, must be early used, or other means will be inessectual. If this disorder hath continued any time, the treatment will be wholly as in the peripneumony, without any regard to the gout, i. e.

bleeding, gentle vomits, blifters, and expectorants.

A GOUTY QUINSY. This complaint formetimes feizes the patient at the fame time that the pain attacks the joints, at others it follows a regular fit. When it forms an abfects that discharges plentifully, it always supplies the place of a gouty fit. This quinty sometimes ends in a regular fit in the extremities. Persons with fhort thick necks are the most subject to this disorder. A greater degree of fever precedes this quinfy than any other species of regular gour; and the blood, when taken away, is more sizy than in any other instance of it. If a nausea and sickness, a heaviness, numbress, and wandering pain hath preceded this disorder, the cause may be fulpected to be gouty, if the patient was formerly subject to regular fits of the gout, and which have been some time past interrupted.

Begin the cure by a free bleeding; immediately after let a clyfter be injected; the next day let a gentle purge be given, a blifter applied to the neck, and from the be-

ginning use gargarisms.

In a day or two more, if the symptoms run high, repeat the bleeding. If the pain is confiderable in the throat a cataplaim may be applied warm across it; and if danger of a fuffocation attends, proceed to bronchotomy.

Whatever medicines are used, those that drive the gour down to the feet must not be neglected. If the tumor garifm, and when it is discharged an astringent one should be used.

The antimonial wine may be used in this case to moderate the fever.

A GOUTY CONSUMPTION. The gouty matter af-fecting the already difordered lungs, fometimes produces a confumption. At the first, a heaviness in the breast, a difficulty of breathing, and hoarseness comes on; then a thin phlegm is discharged, which soon grows thicker, and as it increases in quantity the patient wastes away: in the mean time the extremities are free from all fymptoms of the gout. A violent cough, which is always an attendant, brings on an hæmoptoe; at length a hectic comes on, followed by violent fweats. Old men, and women after the time of child-bearing, are alone the fubjects of this

Bleeding and purging, fo as not too much to diminish A GOUTY PERIPNEUMONY. Those with a tender constitution, and a bad conformation of the breast, or whose lungs have been hurt by some accident, are subject to this disorder when also gouty. If a regular fit of the gout hath not previously affected the extremities, it is hardly possible to know that the gout is the cause when

iffues are also not to be neglected.

The GOUTY HEAD-ACH. This is generally an at-tendant of those who have been afflicted many years with the goat, and who indulge in luxury and cafe. It is frequently preceded by the figns of an approaching fit of the goot, which figns end in a regular one; but the pain flies to the head, and continues there for some weeks or months, and, unless relief can be obtained, the refult is an apoplexy. A giddiness, noise in the ears, a large pulse, difficulty of breathing, wandering pains in the limbs, a florid colour of the face, are attending symptoms, but they all vanish as soon as this head-ach is changed into a regular fit of the gout in the extremities.

Begin the cure with bleeding, especially if accompanied

with dimness of fight, and a pullation of the temporal arteries; but have regard to the gout, and be cautious of lessening the vital heat below what health requires. If the stomach is very uneasy, order carduus, or camomile tea, to provoke two or three evacuations. A mild ftomach purge should also be given, and occasionally re-peated. The usual methods for producing a regular gout thould be used, but with caution, as sometimes they ra-ther aggravate the head-ach. The head may, however, be rubbed with fp. ammoniæ compositus and a blister appli-

ed betwixt the shoulders.

A GOUTY GIDDINESS. What is faid of the fubjects, causes, &c. of the head-ach, are applicable here; but it may be observed, that this giddiness does not terminate in an epilepfy as does the common fort; but if a regular fit of the goat does not terminate it, an apoplexy may be the confequent, and then the usual symptoms of a common giddiness leads on to those of the apoplexy; so that its gouty nature must be discovered by attending to the state of the constitution, and by considering what fort of

paroxyfms have preceded.

To remeay this diforder proceed as in the head-ach,

To remeay this different proceed as in the head-ach, avoid washing the head with cold applications, keep the feet always warm, and the bowels lax.

The GOUTY APOPLEXY. In this case the head is heavy, the face bloated and red, the tongue often faulters, the motions of the body are disorderly, and the steps are unequal, the disorder increases, sense and voluntary motion are lost, the eyes become like those of a corpse, a footing. See, as in the genuine apoplexy, so that its a fnorting, &c. as in the genuine apoplexy, fo that its gouty nature is to be discovered only by enquiring whether or not any gouty symptoms have preceded. One comfort attends this that does not in the common apoplexy and that if the resistant are to the interest of the state o plexy, viz. that if the patient recovers of his diftemper,

plexy, viz. that if the patient recovers of his diftemper, he afterwards enjoys a much better flate of health.

The cure confifts in removing the gout into the extremities. Bleed as freely as the ftrength and heat of the conflitution will admit; inject a clyfter, in which are two large fpoons full of common falt; and, as foon as it can be fwallowed, let a brifk purge be given. Keep the feet very warm, and apply to the joint that was ialt affected a ftimulating plafter. If the patient is not thus relieved, apply a blifter to his neck, or all over his head; and one on each ancle, if the gout ufed to be most in the and one on each ancle, if the gout used to be most in the feet; or to the wrists, if it chiefly affected the hands. Horfe-radish may be chewed to excite a discharge of fa-

Horfe-radish may be chewed to excite a discharge of faliva; the usual medicines for expelling the gout are not to be omitted, the feet or hands may be strongly rubbed two or three times a day. After recovery make issues.

The GOUTY PALSY. The gouty matter so affects the nerves in some instances as to be the cause of a palsy, and this more particularly in plethoric habits, those who reside in damp situations, live sedentarily, indulge in excesses, &c. Affecting the tongue, it renders the speech defective, or destroys it. Sometimes the appetite is diminished, and an aversion to aliment is occasioned by the stomach being affected; a member only suffers in some; ftomach being affected: a member only fuffers in fome; in others, one fide of the body, or the whole of it. If this diforder happens in bilious conflitutions, particularly if it occurs after a bilious colie, the patient lofes his appetite, he waftes away, and his eyes have a yellow hue. Succeeding an apoplexy it is difficult of cure, and,

if the apoplexy returns, it is fatal.

Begin the cure with bleeding, if the pulfe and heat admit of this evacuation, or at leaft cup with fearifications

beate waters should be drank for some time. Riding and joints, that are most frequently the feat, some stimulating plafter. After thefe, if a tumor appears on the extremity to which the application is made, lay a bliftering plafter on it, and another on the neck. The powder with iron, recommended against the gout in the stomach, should be given with the bark; frictions and baths may also be used. Guard well against costiveness, and forget not to infert iffues.

The wandering Gour. Gouty people often feel pains wandering in the back, loins, shoulders, external parts of the head, &c. which remove and return without fixing long any where; these are often mistaken for rheumatic. 'The wandering gout some say is a scorbutic affection, confifting in a wandering, or a fhifting pain, affecting the nervous parts about the joints, and proceeding from an acid and malignant acrimony in the lymph, together with an extraordinacy mobility and vaporofity of the fame, on account of the thinnels of its contexture: happening in the loins, it fometimes is very troublefome, and of fome duration. The pain in this cafe refembles that from a stone in the kidnies, but it is feated in the cellular membrane about the spine. The gonty matter falling on the eye causes an inflammation in its coats; an eryfipelas terminating in a gour, fliews that its cause was a gout. These kinds of gouty symptoms are less danger-ous than when the viscera are affected, and it is very rare that they fall on the internal parts, though they are often transferred to the extremities, causing regular fits of the gout. The teeth are sometimes the seat of the wandering gout, fo are the nose, lips, tongue, and indeed any part of our frame.

When the back, shoulders, and external parts of the head are affected, if the pain is violent, and the strength and heat will admit, begin with bleeding, then give aloetic purge, and repeat it as occasion requires. After which, if the diforder is not thereby fent into the joints, repeated sweatings may be tried. The same method may be observed in wandering pains, or an cryfipelas from this cause. If the inflamed eye does not give way to this

method alfo, wash it with the following collyrium.

R Camphor. gr. vi. spi. vini Gal. & aq. puræ ää

∄ii. m.

If this inflammation does not thus give way, bleed in the jugular vein, and the next day give a brifk purge; after which apply a blifter to the neck, which keep open with the ung. cantharidis as long as possible, and, at the fame time, use such other means as bring the gout into the feet. If the pain in the teeth is obstinate, proceed in the fame manner as when the eye is inflamed; only inflead of

the collyrium let horse-radish, or other means be used, which promote a discharge of the faliva: or the tooth may be pulled out, and immediately put into its place again. If the muscles of the belly, side, breast, or the calves of the legs are the parts pained, apply bags of hot fand, or bladders of hot water thereto, and, if required, affit nature to drive the complaint to the extremiliar. nature to drive the complaint to the extremities.

When this disorder imitates the gravel, besides the application of bladders filled with hot water upon the loins inject clysters, in which from ten to thirty drops of the tinct. opii are mixed.

The Gour complicated with the STONE. This cafe fhould not be confounded with the arthritic colic, in which the pain is about the navel, and not in the loins.

For relief in this painful fituation, let the patient drink plentifully of a decoction of marihmallow roots, fo as to puke with it. Direct him a lubricating clyfter; as foon as this hath paffed, a draught with tinct. opii, twenty or twenty-five drops will be proper; or let the enem. terebinth. be injected every hour, and opiates in fmall quantities given by the mouth: but be careful in the use of aromatics lest inflammation should be excited in the part aggrieved. Purging with manna, dissolved in whey, will also be proper, and may be repeated in three or four days, not forgetting an opiate after its operation. In those instances in which there is great debility with-

out inflammation, blifters, finapifms, fmall dofes of James's powder in the conf. aromat. powerfully remove the complaint. But even in the vague and mitplaced gout, where the nerves of the viscers are rendered torpid, and almost insensible to the effects of ardent spirits, and warm active cordials are necessary to give warmth, and enable them to exert themselves in this oppressed state; yet gentle on the back; presently after inject a clyster, stimulating purges must be repeatedly given to agitate the blood, and drive the gent into the extremities, and apply to the purging is also highly useful: here the warm aloctic purgatives carry off the offending matter, and thus afford great eafe and relief. Sometimes, advantage is not to be expected from purgatives, as when the gouty fymptoms are produced, not by a fuperabundance of gouty matter, but by the gout affecting the nerves. In enfeebled fubbut by the gout affecting the nerves. In enfeebled fubbut by the gout affecting the nerves are chiefly to be relied on; fuch as the generous warm cordials, volatile falts, fortid gums, warm flomachies, iron, &c. volatile falts, fœtid gums, warm itomachies, iron, &cc.

Of the Gour in the intervals of the Firs. It is only by the use of proper means, when no manifest disorder attends, that any lafting advantages are to be reaped from medicine; and, even then, no speedy relief is to be ex-pected. The patient mult be informed, that perseverance must accompany patience, if any degree of durable benefit

is obtained.

The means now used are residence in a good air, diet, exercise, and medicine. These are to be attended to daily, and through life, because the disease being habitual daily, and through life, because the disease being habitual or constitutional, it necessarily requires continued opposition. Air, diet, and exercise, are to be such as experience manifests to be the most suitable, and, as to medicines, those which strengthen the digestive powers, and such as keep up the discharge through the skin, are to be properly adhered to.

See Sydenham's Works, who admirably describes the regular gout, with notes by Dr. Wallis; Musgrave on the Gout; he excels in his description of the irregular gout. See Warner's Full and plain Account of the Gout; he includes the chief of what his predecessors have writ on

cludes the chief of what his predeceffors have writ on this subject. See Shebbeare's Theory and Practice of Physic. Cullen's First Lines, vol. ii. edit. 4. Kirkland's Inquiry, vol. i. Dr. Cadogan's Differtation on the Gsmt. ARTHROCACE. An ulcer of the cavity of the bone,

with caries. Dr. Cullen makes it a fynonym with fpina ventofa, which fee.

ATHRODIA, from appear, a joint, and Junques, to cavity, and admits of motion on all fides. See DIAR-THROSES. It is also named Adarticulatio, Profarthrofis.

ATHRODYNIA. The CHRONIC RHEUMATISM.

ATHRODYNIA. The chronic rheomatism.

ATHROPUOSIS, from apoper, articulus, and wwo, pus. This word is variously used. Dr. Aitkin, in his Elements of Surgery, expresseth by it, instammation of a joint; and then by phlegmone articuli, he means the same thing. In another part of the same work he expresseth by it, an abscess in a joint. And, in a third place in the same Elements, he with others uses it as synonymous with instammation in the loins, particularly in the cellular inflammation in the loins, particularly in the cellular membrane lying under the pfoas mufele, &c. as by Dr.

Dr. Cullen by this word expresses a genus of disease which he ranks in the class pyrexize and order phlegmafize; and as its fynonyms, he places it with the lumbago pfoadica, lumbago apostematosa, lumbago ab arthrocace, is-chias ex abscessia, and morbus conarius. In this disease he fays there are pains in the joint or the muscular parts about it: these pains happen oftentimes after bruises, they are deep, dull, of long continuance; the swelling is either none, or but little diffused; the inflammation not confiderable; the fever at first is but gentle, but at last is because and to conclude the part another the second to the part and to conclude the part another the second to the part and to conclude the part another the second to the part and to conclude the part another the second to the part and to the second to the s hectic; and to conclude, the part apostemates. See Abscessus Dorsi & Lumborum, and also-Psoadis sub-MUSCULIS, and ISCHIATICUS, under ABSCESSUS. See Bell's Surgery, vol. v. 419. Kirkland's Med. Surgery,

vol. i. p. 427. ARTHROSIS. See ARTICULATIO.

ARTIA. According to fome it is the fame as arteria; and others fay it is only the afpera arteria.

ARTICOCA, or ARTICOCALUS. An ARTICHOKE.

ARTICULARIS MORBUS. When the gout rifes from the toes to the ancles and knees, and they swell and inflame, it is thus named. — VENA. Called also subbumeralis. Under the head of the os humeri the bafilica vena fends off this branch. It paffes almost transversely round the neck of that bone from within backwards, and from behind outwards, and runs upon the fcapula, where it communicates with the venæ fcapulares externæ.

is of two kinds, viz. articulation and connection. Artisulation is of two kinds, 1st, Diarthrosis, which fee;

These roots answer, as well as garlic, for cataplasins to be applied on the feet in deliriums, &c. Cullen's Mat.

\*\*Med.\*\*

\*\*Med.\*\*

tion or fympbyfis is of three kinds: 1st, By ligament, called fynchondrofis. or fyndefmofis. 2dly, By cartilages, called fynchondrofis. 3dly, By muscles passing from one bone to another; called fysfarcofis.

Articulation, in botany, is the connection of parts that

confift of joints or knees, fuch as the pods of French honeyfuckles, which, when ripe, divide into fo many parts as there are knees or joints; also those parts of plants which fwell into nodes or joints, and which ufual-

ly fend forth branches.

ARTICULUS. A JOINT. The difeases of the joints are a luxation, a fubluxation, and anchylofis. The infertion of a number of tendons into the ligament, ferves not only to strengthen it, but, by their action, to hinder it from being pinched in the motion of the limb, which is a mechanism observed in every joint of the body. Wounds

here often require amputation. See VULNUS.

ARTIFICIALE. Whatever is made or prepared either of the native from of cinnabar itfelf, or from the vein of

ARTIFICIALIS SAL. See Marinus sal. ARTISCHOCUS LÆVIS. The ARTICHORE. See

ARTISCUS, from asi , bread. Troches are thus called, because formed like a loaf.

ARTIYPOCHROS COLOR. A palish yellow colour

which attends a diforder of the spleen.

ARTIZOA, from \( \xi\_{os}, \) lifa. Short-lived.

ARTLOICUM. See Arthoicum.

ARTOMELI, from app, bread, and usu, boney. A fort of cataplasm prepared of bread and honey.

ARTOPTICIUS PANIS. TOASTED BREAD.

ARTOS, asles, bread. Autopyrus. See PANIS. ARTYMA. The fame as Condimentum, which fee: ARUBUS. BUTTER. ARVINA. FAT.

ARUM, called also arum maculatum, aron, jarus, isa-ros, pes vituli, barba aronis, sacerdotis virile, serpentaria min. dracentia miner, alimum; LORDS and LADIES, CUC-KOW-PINT, WAKE ROBIN.

Ray enumerates ten species. That directed by the college of Edinburgh, is the arum maculatum, or arum acaule, foliis pastatis integerrimis, spadice clavato. Linn.

It is a low perennial plant, grows wild under hedges, and by the fides or banks in flady places. In March it fends out two or three leaves flaped like a fpear, a naked ftalk follows thefe, which bears a purplish pittil inclosed in a long fleath, followed in July by a bunch of red berries. The root is irregularly round, about an inch thick, brown on the outfide, and white within. Some of the plants have leaves that are fronted black, others with the plants have leaves that are fpotted black, others with white, and others have none. The black fpotted are the white, and others have none. The black fpotted are the ftrongest of all the three. Those that grow in moist shades are stronger than those that grow in dry exposed

The fresh roots are acrid and pungent to the taste. chewed, the tongue will be affected with a burning fenchewed, the tongue will be affected with a burning ten-fation, which continues for fome hours, but may foon be relieved with a little milk. The firm, hard roots should be chosen. They loofe too much by drying to be worth keeping; but a syrup made with them would keep as well as the syrup made of garlic does. They afford nothing by distillation, nor infusion; yet if buried in fresh fand, they will keep very well for several months, provided that they are kept just most only and, in every season, they they are kept just moist only; and, in every season, they

are in full virtue alike.

As a warm stimulant they may be given, if mixed with

a mucilage of gum arabic, or as follow

a mucilage of gum arabic, or as follows:

R Rad. ari recent. bene contus. Pulv. gum. arab. āā part. ij. Spermat. cæti, part. i. Syr. alb. q. f. f. electar.

A continued ufe of this first warms the stomach, excites the activity of the digestive powers when they happen to be languid, and stimulates the whole system. Bergius tells us it manifestly promoted perspiration, and frequently produced a plentiful sweat—the dose of the fresh root from 10 gr. to i. 3. It hath been useful in deep-seated pains of the rheumatic kind successfully.

These roots answer, as well as earlier, for carabiasms to

order the following formula. Conserva Art. Conferve of wake robin. Take the fresh root of wake-robin bruiled, half a pound; clarified fugar one pound and an half; beat them together in a

mortar: the dose is one dram. ARUM HUMILE ANGUSTIFOLIUM. See ARISARUM. - MOSCHATUM. See PIPER. --- POLYPHYLLUM, DRACUNCULUS. See DRACONTIUM. -- SCORZONER &

ARUNDO, HARUNDO, vel CALAMUS. The COMMON much. The stalks run up fix feet high, or more, are hollow, and jointed. At each joint there issues long, narrow, grass-like leaves, that are rough and hard; and, on the top, is a spike of a brownish red colour, full of a soft downy substance, without any visible seed. These reeds die away every winter.

Of reeds, or canes, there are a great variety, the finest of which for walking with, come from Bengal. Some are hollow, and fit for making musical instruments of. Others afford the matter which is manufactured into fugar. But as to medical qualities, they possess not any which are

ARUNDO DONAX, called also arundo Cypria, arundo fativa. The GREAT REED. That named - SCRIPTORIA is the Harundo minor, elegia. The WRITING REED.

TABAXIFERA; also called arundo mambu, tabaxir Arabibus, canna, bambu. The BAMBU CANE. These contain a fugary kind of juice. The young shoots are the basis of the composition called achar; but when this cane beans of the composition called achar; but when this can't becomes tall and old, it lofes all its agreeable qualities.

— FARCTA ATRO-RUBENS. Arundo naftes craffa major & minor. Calamus texicus, naftes. The walking cane. Thefe are brought from India and Syria; the best from Bengal. ——FARCTA FLAVA. Arundo naftes vel texica. The DART-WEED. It is brought from Syria.

— FARCTA INDIÆ ORIENTALIS. The DRAGON'S BLOOD CANE. It grows in the East Indies. The juice of its fruit is called dragon's blood in drops.

of its fruit is called dragon's blood in drops.

The fugar cane is another species. There are many other forts, but these are the chief of any value.

ARUNDO INDICA: Canna Indica. See SAGITTARIA ALEXIPHARMACA, and CANNACORUS. - MAJOR. A name of the TIBIA, which fee. — MINOR. A name of the fibula. — SACCHARIFERA. See SACCHARUM. — SYRIACA. SEE CALAMUS AROMATICUS. — VIBA BRASILIEN SEES. THE SUGAR CANE.

ARVISIUM. See MALVASIA.
ARYTÆNO-EPIGLOTTICI. These are small fleshy fasciculi, each of which is fixed by one end in the head of one of the arytænoid cartilages, and the other in the

nearest edge of the epiglottis.

ARYTÆNOIDES, vel ARETÆNOIDES, from apotaina, a funnel, and 11805, shape. The arytænoid, or
EWER-LIKE CARTILAGE. Called also Guttalis, Gutturifer-

others, confittute the head of the larynx.

ARYTÆNOIDEI MUSCUL. MINOR, vel Obliquus, vel Transversalis. They are fituated on the back part of the arytænsid cartilage. They are very small runfoles which run upon the transversalis. muscles which run upon the surface of the greater artie-noid muscles; they arise from that part of each of the cartilagines arytansida, next the cricoides on the other fides, and terminating in that part of the other or adjoining the arytanoidal cartilage, that is farthest from the cricoides on the other sides. Their use is to assist the arytanoidei majores in their action, which is much strengthened by the manifest decussation of their fibres. Douglas. - MAJOR. They are under the arytanoidei minores. They have an infertion into the annular cartilage, and help to close the glottis. They arise fleshy from the arytanoid cartilages near their junction with the cricoid cartilages, and running transversely of an equal breadth, with strait fibres. They are inferted into the fame fide of the other cartilage. Their use is to shut the rimula, or chink called glottis, by bringing these two cartilages nearer one another.

ARYTHMUS, ARRYTHMUS, ENRYTHMOS, from a, negative, and \$08,000, a modulation, or modification of time and found in mufic; but used to express order and harmony in other things. Galen applies it to the pulfe not modulating according to nature. It is opposed to

The London college in the Pharmacopecia of 1788, eurithmus, or justly modulated. The pulsus arythmus is of three kinds.

Every age hath its natural pulse, which, as long as it keeps in its due RYTHMUS, or modulation of time and force, is called EURITHMUS; but if it deviates, it is a pulfus arythmus. But,

1st, If it runs into a modulation proper to the next age,

it is pulfus PARARYTHMUS.

2dly, If it changes to a pulse proper for any other age, it is called pulfus HETERO-RYTHMUS.

3dly, If it passes into a modulation not proper to any

age, it is then a pulfus ECRYTHMUS. AS, the name of an ancient coin. Alfo Affarium. It was also a weight and a measure amongst the Romans, each of twelve ounces. See CYATHUS.

ASA. HEALER.

- Dulcis.

—— DULCIS.
—— ODORATA. See BENZOINUM.
—— FOETIDA, vel ASSA FOETIDA. Alith, andijudan tring. The STINKING HEALER. Also called bingifeb, laser, laser-pitium, silphium, bin, bindisch, and DEVIL'S DUNG. It is the settle concrete juice of a plant which grows in Persia, and other parts of the eastern countries. Kempfer says, that the plant is a-kin to lovage, and that it is the root which yields the gummy juice. See Kemp-fer's Amanitates Exotica. It is the juice of the ferula affa fatida, or ferula Perfica umbellifera, foliolis alternatim finuatis obtufis, floribus ex viridi luteis. Linn. This juice is whitish at the first, but it gradually becomes brown, and grows harder also. The best pieces that are brought into Europe are of a pale red colour, variegated with white. This gum hath a strong fetid smell like that of garlic, and a naufcous bitter biting tafte, but lofes much by keeping. Its finell and tafte refide in the re-finous part, ipirit is therefore the best to digest it in; though water extracts the greatest part of it by the aid of the gummy matter. In distillation with water there is a ftrong impregnation, and thus a pale-coloured effen-tial oil is received; the remaining decoction affords a bitter extract.

As a medicine it is in high efteem; it is the ftrongeft of all the deobstruent fetid warm gums; it is more diaphoretic and expectorant than the gum ammoniacum. When it difagrees by reason of its strength, the milder gums of fimilar efficacy should be used in its stead. The next to it is the gum galbanum, which if too ftrong muft give way to the gum fagapenum, or to the ftill milder gum ammoniacum, or to myrrh, or to the wild valerian root, which is the mildest of them all. In statulencies, and all the symptoms called nervous, it acts as an anodyne and antifpaimodic; though fometimes the addition of musk or opium, or both, greatly improves its efficacy. It is by far more quick in its effects than any other of the fetid gums; and it is the speediest in relieving the anxieties and oppressions of the precordia, which frequently attend nervous diforders, and malignant fevers: but in fuch cases its efficacy is increased by joining it with valerian, one part of the former to two parts of the latter may be a general proportion. Large dofes of affa fatida, with a blifter on the back, hath relieved in epilepfies, and in palies that fucceed epilepfies; proper evacuations premifed. It is a fovereign remedy if joined with falt of amber and blifters. In the nervous althma, joined with an equal quantity of the gum ammoniacum, it relieves to admiration; however, it must be owned that it fometimes fails in this case, and then the bark is to be tried. In hysteric complaints, fetids are only palliatives; for hysteric fusions a plaster of assa facilita 3 vi. and camp. 3 ss. mixed, by far excels those made of the gum galbanum: for its quick operation, it is best distributed in volville science. diffolved in volatile fpirits. In nervous cases it acts as an opiate fometimes where opium fails, and without leaving any lowners on the fpirits, and where neither fucceed fe-parately, they often answer if joined. Cullen's Mat.

The officinal preparations are the

Pilulæ Gummofæ. now Pilulæ e Gummi. GUM PILLS. Ph. Lond. 1788.

Take galbanum, opopanax, myrrh, and fagapenum, of each an ounce; of affa factida, half an ounce; with the fyrup of faffron, beat them together.

At the first taking of these pills, much disorder is oc-

enfioned in fome nervous conflitutions; but this effect Pulvis Sternutatorius. Sneezing Powder. Now, Pulfoon wears off, or may be relieved by a dose of opium taken at bed time.

Spiritus Volatilis Feetidus. FETID VOLATILE SPIRIT. Now, Spiritus Ammonia Feetidus. FETID SPIRIT of

Take of any fixed alkaline falt, a pound and a half; of fal ammoniac, a pound; afa factidia, four ounces; of proof fpirit, three quarts. Dittil off, with a gentle heat, five pints. Ph. Lond. 1788.

Tindura Foetida. The FETID TINCTURE. Now, Tindura
Afae Foetida. TINCTURE of Asa Foetida.

Take of afa fatida, four ounces; of rectified spirit of wine, one quart; digest with a gentle heat for fix days, and strain.

These three preparations are according to the London

ASAB. See BOROZAIL.

ASAPHATUM. A fort of ferpigo, impetigo, or intercutaneous itch, generated in the pores like worms. When the ikin is impressed, they come out like long threads, with black heads.

ASAPHEIS, from a, negative, and gases, clear. Such patients as do not utter their words diffinctly are thus

named.

ASAPHIA. It is the paraphonia palatina of Cullen. See Paraphonia. It is derived from a, neg. and sapes, clear. Hippocrates uses this word to express that utterance of words that is not clear; a muffled hefitating tongue that hath no plain utterance; fuch a confusednels of voice as proceeds from an indisposition of the organs of speech. Sometimes this word signifies a du-bious kind of delirium not easy to be discovered.

ASAPHODES. See Asaphia. ASARABACCA. See Asarum.

ASARCON. VOID of FLESH.
ASARITES. The wine of afarum, made with muft, 15 vi. and afarum three ounces.

ASARON, called also nardus rustica, nardus mon-ASARUM, stana, WILD NARD, and COMMON ASSA-

RABACCA. It is a low plant, without stalks, the leaves are stiff and roundish, with two little ears resembling a kidney, of a dark shining green colour, set on pedicles three or four inches long. The slowers confist of purplish stamina, ftanding in a cup, and are followed each by a capfule con-taining fix feeds. It is perennial and evergreen, a native of the fouthern parts of Europe and the warmer climes, and raifed in our gardens. The dried roots are brought from the Levant, but those of our own growth are nearly

The roots and leaves have a ftrongish, but not unplea-fant finell, somewhat like that of nard, and a nauseous, bitter, acrid state. They both have the same effect as a medicine; but when dry, three times the quantity should be given that is required of the fresh: twenty grains is emetic and cathartic. In fmall dofes this herb promotes the menses, is diuretic, and perspirative. Spirit of wine extracts its virtues, and, insused in water, it gives out a confiderable portion of them. Boiled in water its virtues are destroyed, but not if boiled in wine.

Its operation is rugged, and its use confined to that of an errhine. A grain or two of the powdered root faufted up the note, procures a confiderable evacuation, without caufing the patient to faceze. The leaves, though as flrong as the roots in all other respects, in this of an errhine are milder. The herb fauffs have this plant for their basis. Cullen's Mat. Med.

An ounce of juice expressed from the fresh leaves, ope rates as an emetic in maniacs when antimonials fail.

The species in use, is the afarum Europæum; or the afarum foliis reniformibus obtufis binis. Linn. The London college directs the following.

VIS ASARI COMPOSITUS. COMPOUND POWDER of ASSAR ABACCA.

Take the dried leaves of affarabacca, of marjoram, of Syrian maftich thyme, and dried lavender flowers, of each an ounce. Mix, and make them into a powder.

This powder was called pulv. cephalicus.
ASARUM VIRGINIANUM, called also ferpentaria

rigra, afarum cyclamina. BLACK SNAKE-WEED.

This hath leaves like those of pistolochia, and are spotted like sow-bread. The roots are brought from Virginia, mixed with the rad. ferpent. Virg. and are used as being the fame.

ASBESTINUM. See AMIANTHUS.

ASBESTOS, or ASBESTUS. QUICKLIME. Alfo a name of the AMIANTHUS, which fee, and ALUMEN, fpecies the first.

ASBO. The name of an unknown animal.

ASCALONIA. A species of onions.
ASCALONITIDES. Eschalots, BARREN ONIONS,

ASCALONITIS. A fpecies of onions.

ASCARDAMYCTES. One who keeps his eyes long fixed and immoveable, without twinkling.

ASCARIDES, from arms, to move. A fort of worms fo called from their continual troublesome motion, which causes itching. They are very small, white, and have sharp pointed heads. They are generally lodged in the rectum; but sometimes are also higher up, even in the store. See Vermes.

The fymptoms by which it is known that worms are existing in the body, are the same in general, whatever be the species of them, but an itching in the anus is the almost constant sign of the ascarides being in the rectum. They occasion such uneasiness in some people as to make them faint; and generally are so troublesome in the night as to deprive them of fleep. Sometimes there is fo much heat in the inteffine, as to cause a sensible tumor about the anus; but as these worms are voided in the stools, their presence is most certainly known by seeing them there: for there is no one fign but what is wanting in fome patients.

Though this fort of worms are as difficult to destroy

as any other, they are less dangerous.

These little worms are so inveloped in mucus, that great difficulty attends the destruction of them. The best known remedy is the Harrowgate water, if drank at the fipring: the flower of brimftone, taken with treacle, in fuch a quantity as to gently purge the patient every day, is perhaps the next in efficacy to the Harrowgate water. The fumes of burning tobacco injected clyfterwife into the rectum is of fingular efficacy; suppositories of cotton dipped in the gall of an ox may be tried; a decoction of favin in water hath been often used with success, when taken for fome time; and perhaps repeated dofes of rhubarb may answer as well as any other remedy. See VERME

ASCENSUS MORBI. The afcent or increase of a

ASCETÆ. WRESTLERS.
ASCHIA. The GRAYLING OF UMBER. The fifth is remarkable for its delighting in rapid streams that are shallow and clear.

ASCIA. The simple bandage is so called when the rounds afcend or defcend upon each other in the form of a ferew; the French call it deloires. See DELIGATIO.

ASCITES, from agrees, uter, a bottle, or water bottle, It is termed also afclites, bydrocele peritonai. It is the DROPSY of the BELLY. When water is accumulated in the cavity of the belly, betwirt the peritoneum and the viscera; in the dilated cavities of the glands or other veffels contained in the abdomen; or in the duplicature of the peritoneum, it conflitutes this difease. See Kirkland's Med. Surgery for an inflance of an encyfted

afcites, vol. ii. p. 165.

Dr. Cullen ranks this genus of difease in the class cachexize and order intumescentize; and he enumerates two fpecies, viz. I. Afeites abdominalis, when the tu-mour of the belly is equal, and with evident fluctuation. 2. Afeites faccatus, when the ovaries, &c. are the feat of the difeafe, in which eafes the tumor is not equally extended in all parts of the belly, and the fluctuation is

not fo evident.

men, and women after child-bearing, are the fubjects.

The causes are various; the jaundice, long continued intermittents, an assima, a rupture of some lymphatic vessel, obstructions in any of the viscera, most frequently a scirrhous liver, and, in short, whatever can lessen the quantity of craffamentum in the blood, and confiderably reduce the vital heat, may be a general cause : but the immediate causes are either a rupture of the lymphatics, in which case the fluid appears whitish when tapping is per-formed; or the exhalent vessels throwing off more than

the abforbents can take up again.

This kind of dropfy is fometimes very rapid in its approach and progress, then continues many years without making any progress, at others its advances are very flow, even a number of years before it manifests itself in a confirmed state. One of the first figns is a pitting of the ancles towards the evening, with a fhortness of breath; though it should be observed that the pitting of the ancles is not conclusive, for it often attends pregnant women, and old men with gross habits, and who have laboured many years under an afthma, who, when fuddenly freed therefrom, have an cedematous fwelling in their ancles However, if after the fwelling of the feet, the legs and thighs fwell too, the case is plain, and this usually happens in the progress of the afcites. Besides these symptoms, the infide of the hands are dry and hard; transpiration is greatly diminished; the urine is less and less in quantity, appears turbid, high-coloured, and deposits a large quantity of a lateritious fediment; the belly gradually fwells; and in proportion the breathing becomes flort, the appetite for eating fails, and thirst increases; a flow fever attends; the face and arms are emaciated; a paleness at first and afterwards a yellowish colour is seen in the skin; these symptoms growing worse a dry cough comes on; the belly is greatly distended; and except the water is contained in cysts, or hath rendered the integuments too tense, it may be selt to sluctuate by gently tapping one side of the belly with one hand, while the other is placed on the opposite side; at length little blisters arise on the section which containing an acrid linear coverder in feet, which containing an acrid liquor, corrodes, in-flames, and ulcerates them; when this fymptom appears the bowels are also inflamed, and death is at hand. Many other fymptoms occur, as varieties in the circumstances of the constitution, &c. give rise to them, but these already recited are the more constant attendants.

The asciles must be distinguished from pregnancy; from excrescencies, and other tumors in the belly; and

from a tympany.

If a scirrhus in any of the viscera is the cause, a cure is not to be expected; a purging, by preventing the efficacy of medicines, is a dangerous, generally a fatal circumftance; perspiration increasing, or the discharge of urine becoming more plentiful, are favourable prognoftics; if an afcites fucceeds other difeases, in which the viscera were injured, if the thirst is great and other symptoms violent, there is but little hope of recovery: an hæmorthage, or an eryfipelas coming on, with an increase of the fever, are destructive visitants. It is a bad fign, if, when diureties are properly used, the urine is not difcharged in a proper quantity. If the fluctuation, when you lay your hand on one fide of the belly and tap with the other on the other fide, can be felt only partially, the operation of tapping is even then vindicable, as it will afford a temporary relief; though in fuch a case you are not to promife an emptying of the belly totally; for if you do, feven times in ten you will be deceived, except you can feel the fluctuation by flriking on any point of

In order to the cure, the intentions are, first, to promote the natural fecretions, that the water may be evacuated; and secondly, to increase the vital heat; which, if the viscera are unfound, cannot be effected. Whatever increaseth bodily strength, will assist in carrying off the water, by giving power to the abforbent veffels. Some dropfies, therefore, may be cured in the beginning by ex-ercise, the bark, chalybeates; but this method will not fucceed, except where the strength is but little impaired, the vital parts found, and abforbing powers ftrong. In general, more fuccefs may be expected from attempting

& colature cap. 3 iv. ter quaterve. in die. Muttard-urles may be made for a change, and with confiderable advan-

Frictions, exercise without fatigue, and a dry air, con-

duce much to the patient's relief.

Proper evacuations being made, proceed with antimenials, chalybeates, aromatics, diuretics, or fudorifics. In the use of evacuations the choice of them may be directed by confidering the cause of the disease, as when obstructed perspiration gave rise to it, sudorifies will be indicated,

Stimulating, acrid, and aromatic medicines should accompany the use of evacuants, that the extravalated fluids may be abforbed and determined to the respective enunctories; in weakly habits, diuretics and fudorifics may accompany them; in the more robust, emetics and cathartics

may be used.

As to purges, in anafarcous cases, strong doses of the draftic kind are often necessary; but in the ofcites some caution is to be had in their use, lest an inflammation should be produced: in a beginning complaint of this fort, brisk doses, and of the active kind, sometimes do well; but when the patient's strength is reduced, more moderate ones, or purgatives mixed with emetics, will be the beft, and they may be thus administered; moderate doses of them may be alternately repeated, and in their intervals diurctics and corroborants are to be duly

supplied.

Purges should be repeated as often as the patient's strength will admit; when their use is thought secossary, during their operation, cordial liquors instead of the usual fimple ones should be given, and at night an opiate must not be omitted. It is true that different purging medicines will be required for different patients, and fometimes for the fame at different times; but in general for the ftronger calomel and jalap, and for the weaker calomel and rhu-barb, will be proper; as foon as they are worked off, the following, or fuch like draughts will be necessary, the belly being quickly diffended again if it is neglected. In general, if emetics and purgatives are given, it should only be in the early state of the disease, where the patient is young, and the internal parts yet remain firm and uninjured; for if due skill and caution do not direct, they will increase the patient's weakness, and aggravate the difease. Sometimes, indeed, they promote urine, when diuretics fail, and in such eases they may be continued with advantage; but after their operation, it will be proper to direct some proper strengthener, that the veffels may be braced as the water is drained off.

R Syr, papaveris 3 fs. vel 3 i. fps. menth. pip. aquæ ammoniæ acetatæ 33 fs. tincturæ cardamomi com-

politæ 3 ij. fal fuccin. gr. vi. m. f. hauft.

Many other forms are to be met with in Brookes's, or in the London Practice of Physic, by which the pre-feriber may be directed to an agreeable and useful va-

When the water of an afeites is carried off by any other method than by a puncture through the peritoneum, it is done by that operation of nature called absorption; purging, fweating, and diurctics, of all other medicines, most

promote it, whence their principal use.

Vomiting, when the viscers are found and the strength will admit, by the shock it gives to the belly in particular, and its efficacy in promoting abforption, is highly bene-

ficial.

If the fwelling is moderate, or the conflitution feeble, diuretics will be more fuitable than emetics and eatharties; though they require to be accompanied with warm through they require to be accompanied that the through the state of t may be added to every pint of wine that is drank, and a common wine-glass full may be taken every three hours; brandy or rum may be given with a watery infusion of juniper berries. Of the varieties for drink, those to which the conflictation is the leaft accustomed, genean increase of the urinary discharge; particularly if the complaint is of long standing, and the bowels are weak.

The diet should be cordial and nourishing; and vinous fever attends, instead of the fixt alcaline salts, the neutral are to be prescribed, and here the following forms have generally the most desirable effects.

R Ferri rubiginis 5 ij. ad 3 fs. rad. fcillæ pulv. 3 i. pul verisaromatici, 3 ij. conf. abfi maritimi, 3 i. fyri q. f. f. electar, cujus capt. q. n. m. m. bis terve in die cum

R Kali acetati 3 fs. ad 3 i. fs. aq. diftillat. 3 i. fs.

fps. raph. comp. 3 ij. m.

If the faline ingredient runs off by stool it must be checked. The bark, joined with iron, foap, and rhubarb, fucceed very well, when accompanied with this neutral falt. Diuretics fometimes fail from a spasm affecting the kidneys; in which cafe give, now and then, a tea-spoonful of oxym. scillæ. and tinct. afæ fætidæ in the patient's drink; and afterwards, to relieve the pain in the bowels, &c. give magnefia and powdered galangal root.

Dr. Leatherland observes, that an afectes is the least apt to return when removed by diuretics.

Hellebore, joined with lixing falts, is powerfully diu-

retic. The tonic pills of Dr. Bacher are celebrated in droplies; their operation is purgative and diuretic: hel-lebore is the chief part in their composition, and they are

R Extract. hellebori nigri, myrrhæ folutæ, 53 3 is card, bened, pulv. 3iij. & 3 i. m. f. massa aere sicco exficcanda, donec formandis pillulis apta fit, finguli ad gran.

The extract is made from the helleborus niger foliis angustioribus of Tournefort, and is obtained thus: bruise the roots, cover them with spirit of wine, in which th part of a fixt alcaline falt was previously mixed; let them frand twelve hours, now and then stirring them about; pour off this, and add a fresh quantity of spirit; treat it as before, then pour on as much Rhenith wine as will rife about fix inches above the furface of the hellebore, and now and then add a little, to keep it to the fame height for forty-eight hours, after which fet it over the fire to boil for half an hour, then strain by the assistance of firong expression: repeat the whole of this process with the remaining root. Mix the liquors obtained at both ex-pressions, and add to the whole twice the quantity of boiling water; then evaporate to the confiftence of a fyrup: add to it again about twice the quantity of boiling water, and evaporate as before. Then add about a ninth part of the spirit of wine, and evaporate the whole to the consistence of turpentine. Thus the volatile nauseous and acrid parts are dishipated, the useful active parts being still re-

The folution of the myrrh is made by diffolving it in water over a gentle fire, straining through a linea cloth, and then evaporating to the confiltence of a thin extract.

As to the carduns, the dried leaves gathered before the feeds appear, are to be powdered fine.

These pills have been given in different numbers up to thirty for a dose, taken by ten at a time, and an hour between each portion. As they brace up the folids, they are prohibited where inflammation, suppuration, or tendency to a gangrene is suspected; but in cold pituitous labits they are greatly to be relied on. Though it hath been generally said that the thirst of hydropic patients is not to be gratisted by a free use of liquids, Dr. Bacher orders them without any restraint, and afferts that the efficacy of his medicine very much depends on the unre-ftrained use of mild ones. He also says, that, whatever may be the principal of cure, in all dropfical cafes, the patient should drink in proportion to the requirement of his thirst. This practice of allowing the patient to drink is farther confirmed by the success of several instances related in the Lond. Med. Trans. vol. ii.

The urinary discharges are also much promoted by opium, in cases that are attended with much pain, espe-

cially when it is feated about the kidneys.

The forms of diureties are numerous, and fo abound in all practical writers, as to render a long lift of them unneceffary here: however, as fquills are generally used in these cases, it may be observed that they are most diuretic when neither very dry nor very moss. The common dose is from two to three grains, night and morning and it is to be observed that they seldom are useful without they create a names and form a morning. out they create a naulea, and some vomiting; this is pretty clearly proved in the clinical experiments of Dr. Home.

Horfe-radish may be eaten freely, and whole mustardfeed may be fwallowed two or three times a day, to the quantity of a table spoonful at a time. And as the vehicle in which diureties are administered may lessen or improve their essets, it may be observed that whey is one of the most convenient; in want of which an infusion of juniper berries, or other material of fimilar quality, may be fubflituted; or a decoction of the feneka root may be used. Diuretics are a very uncertain kind of medicines; and fo divertified they are in their effects on different habits, that until trial is made, it will be difficult to fix on any thing : they operate the best when the patient is much in the open air. Great benefit has been derived from the ufe of the digitalis purpurea, fox-glove, in fmall dofes, from one to two, three, or four grains, twice a day, in powder or in decoction. Dr. Withering thinks it one of the most certain diuretics in the whole materia medica, on which he has written a pamphlet well worth confulting.

Sudorifies have succeeded, but are very uncertain; of these none seems to excel the pulv. sudorifie. Doctoris Doveri, now called pulvis ipecaccuanhæ compositus. Ph. Lond. 1788. Their happiest effects are when some relief s already obtained by fome other means. Dr. Percival gives an inflance of fuccess, in the second vol. of his Essays, from rubbing the skin every night and morning with dry cloths furnigated with camphor, and giving in-ternally the mixtura e camphor, so as that a dram of

camphor was taken in a day.

In the London Med. Journal, vol. i. p. 91. the cyftalli tartari, from 3 is. to 3 ij. a day, and diffolved in twenty times its quantity of water, is highly recommended; more or lefs is given as may be needful to promote two or three evacuations.

Experiments on which have been tried by Dr. Home, and published in his work above quoted, which speak much in favour of this medicine. A falivation raised with mercury hath succeeded after

the failure of all the other usual means.

When the afcites is attended with an anafarca, fearifications made in the legs may be tried before tapping; but there is no direct method by which the water of an afcites can be expected to be thus difcharged.

When other methods fail, tapping should be tried, it is at least a palliative; and if earlier used might be often absolutely curative. When this operation is performed, the water is drawn off too speedily, by which too much of the vital heat is wasted, and hence the patient sometimes swoons, and ill success ensues. Some advise this operation as foon as there is water enough to make it fafe and practicable, without waiting for a diftention: Dr. Fothergill advises to this purpose, see Lond. Med. Obs. and Inq. vol. iv. p. 114. And though Dr. Hunter is somewhat doubtful in respect, his objections rather plead for, than against, it. See PARACENTESIS. Dr.

Baker too urges an early operation.

For the relief of occasional symptoms. See Hydrops. The afcites happening to pregnant women, palliatives only are to be used until her delivery, unless danger of suffocation from the excessive diffension demands it.

When the duplicature of the peritoneum is the feat of the afcites, tapping is alone the remedy. See Milman on the Dropfy. Leake's Medical Instructions, edit. 5. Cullen's First Lines, vol. iv. White's Surgery, 304. and Wallis's Sydenham.

ASCITES UTERINUS. See HYDROMETRA.

ASCITICUS. One who labours under an afcites. ASCLEPIAS, called also birundinaria, contrayerva, vincetonicum, TAME POISON, SILKEN CICELY, and WHITE

SWALLOW-WORT.

This plant hath unbranched stalks, fmooth leaves fet in pairs, and clusters of monopetalous flowers, followed by two long pods full of a white cottony matter, with small brownish feeds. The root is large, composed of many slender strings hanging from a transverse head, brown externally, and white internally. It is perennial, grows wild in gravelly places, and flowers in July. It is reckoned a species of apocynum, or dog's-bane; but it is distinguished from all the other species by its affording a limpid juice, that of all the rest being

The root when fresh gathered, smells like valerian root, but loses its odour by drying; chewed it is sweetish at the first, then bitterish. In doses from 3 i. to 3 i. it is sudorific and diuretic; in the first characters it hath been fo commonly used by the Germans as to have obtained the name of contrayerva Germanorum.

ASCLEPIOS, ATHENIPPUM. The name of a dried finegma described by P. Ægineta; of a troche in the writings of Actius; and a collyrium in Galen.

ASCOMA, from across, a bottle. The eminence of the pulpes at the scars of manusium.

the pubes at the years of maturity.

ASCOS, from assures, leather. A BOTTLE. They were formerly all made of leather, and Hippocrates used to apply them when filled with hot water to pained parts.

ASCYROIDES, Ascyos, Ascyrum, Ascyrus. See

ANDROS EMUM.

ASDENIGI. The BLOOD-STONE.

ASE, or Asse. Hippocrates by these words means a loathing of food from a conflux of humours in the ftomach.

ASEB. ALUM. ASEDENIGI. The BLOOD-STONE.

ASEF, ALHASET. See HYDROA.
ASEGEN. DRAGON'S BLOOD.
ASELLI, also called millepedes, onifei, centipedes;
SLATERS, HOG-LICE, CHURCH-BUGS, SOW-BUGS, and

WOOD-LICE

These are insects, according to Linnzus, of the class aptera, and genus onifeus. This genus distinguishes those infects that are without wings, have fourteen feet, are fetaceous, have bent attennæ, a mouth furnished with two palpi, the head intimately joined to the thorax, and an oral body. It comprehendeth fifteen species. One species is the wood-loufe, and the variety which is of a bluith colour, and, if touched, rolls itfelf up into the form of a pill, is the fort that is generally ordered in medicine: they are found under flones and logs of wood, in cold most places. There are different species, but the pale brown and the blueish black forts are indiscriminately used. Those found in vaults are faid to contain the most falts, and fo are the most esteemed.

The London College directs them to be dried by fuf-pending them in a thin canvas bag, placed within a co-vered vessel and over the steam of hot proof spirits, that being killed by the vapour they may become friable.

Millepedes are reckoned diuretie, but the effects ufually attributed to them are doubtful.

ASELLUS MAJOR. The cop-FISH; it is called also mer lucius, cabeliau, mer bua, melva, and the KEELING. It is a fea-fifth, and fhould be chose by its whiteness. It is very nourishing.—Mollis, vel Minor. The whitness.—Marinus. This is the name of a fish called MERLUCIUS, or SEA-PIKE; it was fometimes allowed to be eaten by those who laboured under febrile affections,

and has been greatly commended by Langius.

ASEMOS, from a, neg. and onua, a fign. An epithet applied to events that fall out contrary to all appearance, and without any manifest cause. A crisis happen-

ing beyond hope.
ASEPH. PLUMOUS ALUM.
ASEPTA, from α, neg. and σεσω, to putrify. Unputrified; but Hippocrates used this word to fignify uncontribed; but Hippocrates used this word to fignify uncontribed. cocted or undigested.

ASIATICUM, BALS. The BALM of GILEAD.

ASIGI. VERDIGRISE.

ASILUS. The name of a fort of BEETLE, called also tabe, tabanus, and the GAD-FLY. It is an oblong flender fly, of a blackish colour; its body is shaped like an hunting-horn, and is sharp pointed: this sly is troublefome to horfes, &c.

ASIMION. An ingredient mentioned by Myrepfus,

but not known.

ASINGAR. VERDIGRISE.

ASINUS. The ASS. Its milk is in much effect as a medicine. See LAC.

A Coorsies of GRASSHOPPER.

ASITI. Those are so called who take no food for ASITIA. Want of an appetite. See ANOREXIA. ASIUS, LAPIS. See Assius Lapis.

ASJOGAM. A tree growing in Malabar and the East Indies, whose juice is used against the colic. Raii Hist.

ASMAGA. A mixing of certain metals.
ASMAS. See BUGLOSSUM SILVESTRE.
ASMIAR. VERDIGRISE.

ASODES. See Assodes. ASOPER. Soot.

ASPADIALIS, Ifchuria: A fuppression of urine from the urethra being imperforated. See Ischuria.

ASPALATHUM, called also agallochum. CALAM-

BAC WOOD. It is brought from the East Indies, it is of a bituminous and fatty kind, or refinous, and of a bitter tafte. It is fold very often for the agallochum, having fimilar virtues, but weaker. See AGALLOCHUM.

ASPALATHUS, called also lignum Rhodium, diache-

ton, diplacon, lignum rofe odore, lign. thuris, erylifceptrum, radix Rhodina, Rhodium, or Rose-Wood.

Rofe-wood is the root, or the wood of a thorny shrub, but of which we have no certain account. It is brought from the Canary islands in long crooked pieces, externally of a whitish colour, internally of a deep yellow with a reddish cast. The heaviest and the deepest coloured is the best.

When rubbed or fcraped it fmells like rofes. To fpirit of wine it gives out all its virtue, but this tincture fends nothing off by diffillation except the spirit, hardly affected with the fmell or tafte of the wood; water also extracts its virtues, and carries them with it in distillation; this diffilled water refembles that from damafk rofes. Fifty pounds weight of good wood afford one pound of effential oil, which is used as a perfume; it is weaker

than the oil of rofes, but of the fame odour.

An agreeable cordial tincture is made by macerating 3 iv. of this wood with a pint of rectified spirit of wine;

from ten drops to a tea-spoonful is a dose.

ASPALTUM, i. e. Asphaltum. See Bitumen.

ASPARAGI. The young shoots of vegetables.

ASPARAGODES. Curled colewort.

ASPARAGUS, called also afpharagus, sparagus;

SPERAGE, and SPARROW-GRASS.

It is a perennial plant, chiefly used as aliment; in the fpring a number of shoots appear, they rife to the height of two or three feet, then divide into slender firm spreading branches, clothed with fost green capillary leaves, the flowers are of a pale green colour, and incceeded by thining red berries. It grows wild in Cornwall and fome other parts of England.

Though confined to the kitchen, it affords very little nourithment, the young fhoots only are eaten; a decoc-

tion of the roots is diuretic, a ftrong infusion of them is preferred by some. See also CYMA.

ASPARINE. See APARINE.

ASPASIA. The name of a constrictive medicine for the pudenda muliebria, confifting of wool moistened with an infusion of galls.

ASPER. A fmall river-fifth found in the Rhone. It is fo named from the roughness of its scales and jaws.

It is good food.

The oil of a/per is commonly enquired for as a means of catching fifth with eafe and certainty. It is probably the oil of ofpray which is meant, for there is a fable, that the bird fo called, as it flies, drops fomething on the fur-face of the water, by which the lift is allured; hence the oil of the bird is supposed to have the same effect; but as there is no such oil, the oil of box, or any other such like,

ASPERA. A species of POLYPODIUM; also a term used for the inequality made by the cartilages of the ASPERIA ARTERIA, which is the WIND-PIPE, called also trachea arteria. It passes down from behind the tongue into the lungs, is situated before the cesophagus, and surrounded, laterally and before, by the thyroid gland. It enters the cavity of the thorax behind the upper part of the sternum, where it is crossed by the large vessels which run up to the head. At about the fourth vetrebra of the back it divides into two branches, that which goes to the right lung is divided into three branches, the other which goes into the left is divided into two; these branches are called bronchize, and at their extremities are expanded into oblong veffels, after having loft their cartilaginous nature, and are called veficulæ Malpighianæ. cartilaginous forward, and membraneous backward. See

When any fmall fubitance falls into the trachea, it occasions much uneafiness until it is thrown up. To affift its difcharge, Actius commends sternutatories; some commend expectorants and emetics, which may also be

fafely

fafely used; but to excite a cough, as some advise, is too

ASPERATA. See Asperum.
ASPERATUM SPECILLUM. The RASP-LIKE PROBE, the fame as blepharsxyflum.

ASPERELLA. Sec Asprella.

ASPERGINES. The fame as Aspersio, which fee.

ASPERGULA. Sec Asperula.

ASPERIFOLIUS, of afper, rough, and folium, a leaf. An epithet for fuch plants as are rough-leafed, having An epither for fuch plants as are rough-leated, having their leaves placed alternately, or without any certain order on their stalks. They have monopetalous flowers, cut or divided into five, and after each flower there commonly follow four feeds.

ASPERITAS. ROUGHNESS, aspecity, sharpness.

ASPERSIO. To SPRINKLE. Medicines administerable and by

ed this way were called by the Greeks sympasmata, and by

the Latins aspergines.

ASPERUGO, Called also aspergula, aperine latifolia,
ASPERULA, Separtica; stellaris, stellata, matrifylva
Germanica, rubeola montana edora; APARINE, WOODROW,

and woodroof. Afperula odorata, Linn.

It is a low umbelliferous plant, grows wild in woods and copies; it flowers in May, hath an agreeable odour, which is much improved by moderate drying: the tafte is a little auftere. It imparts its flavour to vinous liquors, and is commended as a cordial and deobstruent. It is alfo a name for SQUINANCY WORT, and RUBIA SYNAN-

ASPERUM, ASPRUM. ROUGH. An epithet applied to bodies with uneven furfaces. Galen observes that every rough body is uneven, but every uneven body is not rough; and that roughness is occasioned by too great dry-

neis, or from acrimony.

ASPHALATHUS. A species of LABURNUM, called tuesfoil acacia. Cysisus spinosus.

ASPHALITIS. A kind of TREFOIL. Also a name

of the laft vertebra of the loins.

ASPHALTOS. ASPHALTUM, ASPALTUM, AR-ALTOS. Species of BITUMEN. See BITUMEN. ASPHARAGUS. SPARROW-GRASS. See ASPARA-

ASPHENDAMNOS. The MOUNTAIN MAPLE, ASPHODELUS. The ASPHODEL.

Ray takes notice of five species, three of which are

but a baftard kind; the others are the
Asphodelus Albus. White Asphodel. — Lu-

TRUS, also called basta regia, Bernhardi testiculus, anthericum, affodilus, iphion, erizamba, KING's SPEAR, and YELLOW ASPHODEL.

The afphodel roots refemble an acorn, are acrid, heating, diuretic, &c. The leaves are like those of a leek; the stalk is smooth, bearing on its top a flower called AN-

THERICOS, which fee.

These plants are natives of Italy, France, and other warm parts of Europe. The fresh roots are commended in the form of a cataplasm, to be applied to scrophulous swellings. That — cum Folius Fistulosis. Is a species of Phalangium.

ASPHYXIA, from α neg. and σφοζε, α pulse, from σφοζε, to leap or beat, like an artery. A PRIVATION of the PULSE. Though this cannot be absolutely the case, whilst a person lives, yet to our perception it may. It is by a long failure of vital and animal power; as from drowning, mephitifm, &c. Most instances of asphysy are varieties of apoplexy; the rest are instances of syncope, for the most part, if not all. See LIPOTHYMIA and Apo-

The species which are considered as belonging to apo-

plexy, are the following:

ASPHYXIA SPINALIS. i. c. APOPLEXIA SANGUINEA.

- a MEPHITIDE. a Musta.

- a FUMIS.

- a CARBONE. - FORICARIORUM. h. f. APOPLEXIÆ VENENA-TÆ.

- SIDERATORUM.

ASSALIAE. WORMS that breed among planks. They are also called coffi, teredones, termes, thripes, and xylo-

ASSANEGI. The powder that falls off from the walls

of falt in the falt mines.

ASSANUS. A weight confifting of two drams.

ASSARABACCA. See ASARUM, and NARDUS CEL-

ASSARE. In the spagirical language, it is to dry a thing fit for powdering.
ASSARIUM. See As.

ASSARTHROSIS. See ABARTICULATIO:

ASSATIO, Assation, from affo, to reaft with fire. Frying, toafting, broiling, and roafting, are different spe-

Frying, toatting, broiling, and roatting, are different species of affation.

ASSATURA. A piece of any thing just removed from the fire after roasting.

ASSE. See Ass.

ASSERAC. See Assis.

ASSERVATIO. In pharmacy it is the same as confervatio, or the repositing things ready for use.

ASSIDENS SIGNUM. An assident sign, that is, such as a susually accompanies a disease, but is not, as the an one as usually accompanies a disease; but is not, as the pathognomonic, infeparable from it.

ASSIDUUS. Some use this word instead of continuus,

fo fay affidua febris, instead of continua febris.

ASSIMULO, to ASSIMILATE, from ad and fimilis, to make like to; as when what we cat is converted into our flesh. Assimilation, when spoken of our aliment, differs in name only from nutrition.

ASSIS. Asserac. The Ægyptian name for bangue.

ASSISTENTES. See PARASTATA.
ASSITRA. See MANDARU.
ASSIUS LAPIS, called also afius and azius lapis, farcophagum, Assian stone. Thee stones receive their name from Affos, a city of Troas, in the Leffer Afia, where they are found. It is of a tophous, foft, friable, and loofe fubitance, with a powdery matter growing on it like meal, fuch as is feen on the walls of mills; it is called the flour of the Affian rock. This flour confumes loofe fpongy flesh; the stone possesseth the same virtue

in a less degree.

ASSODES. Asodes. A continual fever, in which the outward parts are moderately warm, but inwardly there is great heat, an infatiable thirst, perpetual toffing, watching, and raving. Some call it a kind of tertian

fever.

ASSOS. ALUM.

ASTACUS, or ASTACUS MARINUS. The LOBSTER. Labfter is one of the first among the foods that are alcalefcent, and posicises all the advantages as such, that are

attributed to the crab. See Cancellus.

Astacus Fluviatilis. The crevis of CRAY-FISH. These are found in rivers; are of the same general nature as crabs and lobflers. They afford the concretes called crabs eyes. See Oculi Cancrorum.

ASTAPHIS. A RAISIN.

ASTARZOF. The name of an ointment, and also of

a mixture, which were used by Paracelsus. The first confisted of litharge, house-leek juice, &c. The second, of camphor and rofe-water.

ASTCHACHILOS. So Paracelfus names a malignant gangrenous ulcer, which fpreads from the feet upwards. Some call it araneus.

ASTER. STAR-WORT. See INGUINALIS, ENULA. - ANNUUS RAMOSUS ALBUS LATIFOLIUS CANADEN-A fpecies of LEUCANTHEMUM. --- ARVENSIS COERULEUS ACRIS. BLUE FLEA-BANE. See SENECIO. —— ATTICUS. A name of ERYNGO; Inguinalis; GOL-DEN STAR-WORT; byophthalmus; - for that named —— OMNIUM MAXIMUS. See ENULA.— PALUSTRIS. Boerhaave makes this a species of FLEA-BANE. See JACO-EÆA. AQUATICA. CONYZA. — PALUSTRIS PARVO FLORE GLOBOSO. SMALL FLEA-BANE. See CONYEA. PERUANUS. POTATOES. See BATTATAS CANADENSIS. - PRATENSIS AUTUMNALIS CONIZÆ FOLIO. COM-MON FLEA-BANE, - that called --- THALASSIUS; is named Stella marina. SEA-STAR. A certain zoophyte or infect of which there are many species, and of which Aldrovandus hath wrote prolixly. Hippocrates hath recommended it with brailies, and fweet-fcented wine against what is called the ascent of the uterus, and hysteric pains.

ASTERIA, | Called also Gemina solis, Ba-Gemma. STARD OPAL, and STAR GEM, which last name it seceives from its sparkling like a star. It is generally faid to be a species of opal; it is transparent like crystal, but much harder. It is a name also of

ASTERIAS, i. c. Astroites. See Artrochites; also a name of the bird called a bittern.

ASTERISCUS. ANNUUS. PURPLE OF GOLDEN ASTEROIDES. START-WORT. BASTARD START-WORT. See INGUINALIS.

ASTHENIA. EXTREME DEBILITY.

ASTHENIA a HYDROCEPAHLO. APOPLEXIA HYDRO-CEPHALICA. See Apoplexia.

ASTHMA, from as, or asps, to breathe. A chronic, laborious, wheezing respiration. Galen says, that the Greeks gave this name to a quick respiration, such as happens to people who run, &c. The word now is applied to a diforder, the chief symptom of which is a difficult or short breathing; or a laborious wheezing respiration, with a sense of straitness in the breast.

This diforder is of two kinds, viz. the humoral, pi-tuitous, or moift; and the fpafmodic, dry, nervous, or

convulfive.

Dr. Cullen ranks this genus of disease in the class neurolis, and the order spasmi; besides, the instances in the body. 3. Afthma plethoricum; when any accustomed evacuation of blood ceases, or when, from any other cause, the vessels are too full.

Those of a fanguine habit, with small vessels, and with strait chests, are the most subject to this disease; it may come on at any age, but generally its approach is after the

prime of life.

The causes of the ashma are concisely enumerated by Dr. Dover, who fays they are inflammation, convultions, or plenitude. When fymptomatical, any diftemper that affects the breaft or lungs may be the cause; but when it is an original disease, some defect in the lungs, or other parts subservient to respiration, is a principal one. The parts jublervient to relpiration, is a principal one. The lungs may be preternaturally large; an edema, also an emphysema in this viscus, may produce this disorder; a redundancy of blood; the vital heat too copiously determined to the lungs, from a check to perspiration; a defect of the vital fire in the lungs; a diminished perspiration is the most frequent cause in England, from the neglect of changing the cloaths with the scalous; the nervous kind is produced by a preternatural irritability of the lungs, acrid defluxions, mineral and other fubtile exhalations, or a fpafimodic stricture of the diaphragm alone may be the cause: cold north winds occasion this kind of asthma in some constitutions, and not unfrequently its rife is from a fubtile acrid matter about the nervous parts of the pracordia, which generally is fent there by an imprudent repulsion of the morbid matter of exanthematous diforders, the drying up of iffues, or old ulcers, &c.

Dr. Cullen fays, that the afibma depends alone upon a particular conflitution of the lungs: that the proximate cause is a preternatural, and, in some measure, a spas-modic constriction of the musicular sibres of the bronchiæ, which not only prevents the dilatation of the bron-chiæ, necessary to a free and full infpiration, but gives also a rigidity which prevents a full and free expiration. He adds, this preternatural constriction, like many other convultive and fpafmodic affections, is readily excited by a turgefeence of the blood, or other cause of any unufual fulness and diftention of the veffels of the lungs.

In the diagnostics of the humoral and nervous kinds of afibma, the discharge of phlegm in the first, and the freedom of all apparent disorder after the fit of coughing ceases, in the latter, being the principal difference. Aretæus's description may suffice for both: he says, "the patient is feized with an oppression of the breath, a list-lessness on using any kind of exercise, the breathing is disficult and laborious, he becomes hoarfe and coughs, is troubled with flatulencies of the precordia, and racked with uneafy eruclations; he is subject to watchings, and in the night time is very little, and almost imperceptibly hot, his nostrils also become too much contracted for a free and easy respiration. If the disorder is degenerating, and becoming more formidable, the cheeks grow red, the eyes prominent, like those of strangled persons, he snores whilst awake, but much more when alleep, his voice is indiffinct, languid, and faint; he is fond of a free and cold air, and loves to walk in the open fields, because a house is a scene too narrow and confined for his breathing with the freedom he wishes. He breathes in an erect pofture, and is eager to attract all the air he can, for this purpose he opens his mouth wide, and seems disconcerted because it is too small for his purpose. His face, except the cheeks, which are red, becomes pale, a sweat breaks out about his forchead and neck, he is racked with a tharp and continual cough, and expectorates a fmall quantity of thin, cold, and as it were frothy matter. In respiration his neck becomes tumid, and there is a retraction of the pracordia. His pulse is small, frequent, and depressed: his legs becomes fmall and flender; if these symptoms thould happen to be increased, they sometimes suffocate the patient, in the fame manner that an epilepfy does; but if they are alleviated and leffened, the cough becomes lefs frequent, and returns at longer intervals; a large quantity of fanious and moift spit is expectorated, copious and aqueous flools are discharged, and the urine is evacuated in large quantities, though nothing as yet subfides in it. His voice becomes more sonorous and clear, his sleep which it is symptomatic, he observes three species, I.

Asitima spontaneum; when there is no manifest cause, or any other disease attending. 2. Asitima exanthematicum; when some aerid humour is repealed from the surface of breathes at longer intervals, and more easy, though with

a certain roughness." To this may be added, that as the it is found upon the whole that there is no certainty or paroxyfm abates, the urine is higher coloured and lets fall a fediment; and under this different fymp-reason why the fits so often occur first in the night toms may appear as conflitutions vary, but generally a coftiveness attends. In many persons there are cedematous swellings of the feet, hands, face, or back; a torporfeizes the arms, leaden coloured spots are seen in the face, there is also sometimes a slight anomalous several to the face of the same feet in the face, there is also sometimes a slight anomalous several to the same feet as the sa which increases a little in the evening; this train of symptoms leads on to one species or other of dropsy, or perhaps ends in a palfy of some part, or of one side. In the pituitous assume, the patient is feldom free, though at some times much better than at others; easterly winds bring on or aggravate this diforder, occasioning a large expec-

Dr. Cullen fays that, the term afthma may be most properly applied, and should be confined to a case of difficult breathing, that has peculiar fymptoms, and depends upon a peculiar proximate cause: that it does not feem to depend upon any general temperament of the whole body, but upon a particular conflictution of the lungs alone: that this difeafe, as coming by fits, may be generally diftinguished from most other species of dyspnoea, whose causes being more constantly applied, produce therefore a more constant difficulty of breathing; if some fallacy is a series few interests and produce the series in the left observation. in a very few instances appears in this last obsevation, I must add that it is seldom that such sits put on the ap-

pearance of the genuine afthmatic fits.

Dr. Withers on the afthma, fays, "The attack of the convulfive afthma is fudden, and at its first appearance the fit is short. The symptoms, which usually precede it are langour, statulency, head-ach, sickness, pale urine, disturbed sleep, a sense of straitness and sulness about the pit of the stomach. In some cases there is an uncommon stupor, drowfines, and heaviness. The fit is frequently observed to come on about one or two o'clock in the morning, or at any hour after the first sleep. The patient wakes suddenly, and feels a great tightness and constriction around the cheft, with a difficulty of breathing, and an impediment to the free ad-mission of air into the lungs. Both inspiration and expiration are flow, laborious, and accompanied with con-flant wheezing, particularly the latter. Great bodily anxiety always attends this diforder. As the lungs cananxiety always attends this dilorder. As the lungs can-not be fufficiently dilated with air, the paffage of the blood through the pulmonary vessels is not free. Hence the face, in full and plethoric habits, appears red and bloated, and the vessels of the eyes are unnaturally tur-gid with blood. The action of the heart is greatly di-sturbed, as is evident by the weakness, irregularity, and increased quickness of the puise. During the fit the patient has generally a longing instinctive fit the patient has generally a longing inftinctive defire for cool fresh air, which always revives him. A fmall close room with a fire in it is extremely offensive to him, and all warm things, given internally, increase the flatulency in the stomach and bowels, which is always the most troublesome after a full meal. When the fit has continued a few minutes, half an hour, or an hour, it leaves the patient; his refpiration becomes free and natural, his pulse flow and regular, his complexion puts on its usual appearance, and the bodily anxiety goes off. The urine is generally pale, and the skin somewhat dry before the sit, and desire its progression but a characteristic progression. before the fit, and during its progress; but at the termination of it the urine, for a day or two, is high coloured, and deposits a sediment, and the skin seels soft and moist.

FLOVER. This is the description of a first and moderate attack of the disorder. In some cases it appears in a more violent form, even at its commencement, and continues for feveral days before the fit terminates. Sometimes the patient will have one fit, and then remain free from a relapfe for many months. At other times I have feen fits come on for leveral nights together, the patient appearing almost perfectly well during the day, with his appetite and pulse both natural. When the assume once makes its attack, it feldom or never fails to recur, though the intervals between the fits according to the control of the control o the intervals between the fits are very uncertain. When the aftbma is rooted in the conflitution, it often makes its attack in the fpring and autumn. In many cases it attacks periodically, once in ten days or a fortnight. Sometimes it occurs regularly at the full and change of the moon. Floyer mentions a case where the fits occurs defor force week together and the attacks. ed for feven weeks together, and the patient was obliged the cough still recurs, but with less violence, and in the to sleep in a chair. But from the strictest observations evening it is often very teasing and distressing, especially

reason why the fits so often occur first in the night, is thought to be owing to the heat of the bed, and the horizontal pofture in which the patient lies. Relapfes are commonly attended with an increase of the symptoms, and the vigour of the constitution is gradually impaired, till, by length of time, general or chronic weakness is induced. The difficulty of breathing in the fits arises to a much higher degree and the sensation of arises to a much higher degree, and the sensation of tightness over the breast is so great and distressing, that the patient feels as if he were bound with cords. His anxiety at this period is inexpressible, and he labours in respiration, as if every moment would be his last. Severe vomiting frequently occurs, and the matter discharged is flimy and frothy, or of a greenish or yellow colour. The hands and feet are cold, and the patient is subject to palpitations and faintings. Cool fresh air becomes absolutely necessary. The eyes are prominent, the face is fometimes pale, and fometimes high coloured, bloated or livid; the pulse is extremely weak, irregular, and even intermitting; there is a difficulty of swallowing, the patient can fcarce fpeak, cough, or expectorate during the fit, and the ftomach and bowels are violently di-ftended with wind. While thus labouring for breath he is obliged to rife from his bed, he cannot bear even the weight of the bed-cloaths upon him. His shoulders are constantly elevated, to give the muscles of the chest their greatest power of action, in raising the ribs in inspiration. At this time too the patient, though before costive, will frequently have a loose stool. When the violence of the fit abates, and respiration becomes free, the cough returns, and the patient begins to expectorate phlegm, which is fometimes intermixed with blood. As foon as an easy copious expectoration takes place it affords great relief, for the evacuation is made immediately from the parts affected, from the very yeffels which have been contracted with spasm. This expectoration is one of the most certain signs of the abatement of the complaint, as it denotes the solution of the spasmodic contraction of the bronchial air-veffels. Along with this expecto-ration of mucous matter, intermixed fometimes with blood, the other symptoms also of the solution of spasm occur, i. e. a moisture and foftness of the skin, and a fediment in the urine. The blood which is fpit up in this complaint, proceeds generally from a rupture or di-latation of blood-ressels in the lungs, a symptom which may eafily be accounted for, from the great obstruction of the circulation of the blood through the pulmonary veffels, during the continuance of the fit. In fome cafes indeed, the quantity of blood which is fpit up, is in full habits very confiderable, and at the fame time critical, being accompanied with an abatement of the fymptoms. But all free discharges of blood from the lungs, though they afford relief, yet they are unfavourable figns, as they denote greater violence of the difease, during the course of which the very efforts of nature to relieve are in themfelves fo alarming. The nofe too will fometimes gush out with blood during the feverity of the fit, from the ob-firuction given to the return of the blood through the pulmonary veffels into the left auricle of the heart. Thus in a fhort time the fit of the convultive afthma goes off. The patient then becomes cautious of catching cold. But excels of care tenders his conflitution to a high is gree, and is, as we shall afterwards prove, a very erro-neous procedure. In a course of years one fit succeeds another, and the disorder increases in the violence and duration of the fits, as well as in the frequency of their returns. The expectoration from the mucous glands of the lungs, which still continues to relieve at the termination of the fits, becomes itself a very troublesome fymp-tom. The mucous glands are relaxed, and the discharge of mucus greater than natural. Hence the bronchial or of mucus greater than natural. Hence the bronchial or air-veffels are frequently obstructed with phlegm, and from this cause the freedom of respiration is disturbed: the patient breathes with unusual disticulty, although his convulsive fits be not upon him. When he first wakes in the morning he has generally a severe sit of coughing, which continues till he has got up the phlegm that provoked the cough, by preventing the free admission of air into the air-vessels. Through the day, at different times, the cough still recurs, but with less violence, and in the evening it is often very teasing and distression, rescaled is united with the convulive, and both together exist in the fame patient. The humar al asthma is a diforder of the mucous glands of the lungs, in consequence of which they are relaxed, and the discharge of mucus, being unnaturally copious, obstructs the freedom of respiration. This part of the diforder is more constant; the convulfive ofthma is more violent and of thorter duration. The humoral afibma is more severe both with respect to the cough and difficulty of breathing in winter, but in summer, when the weather is warm, and perspiration free, it often difappears totally between the intervals of the fits of the convultive afthma. The convultive afthma too is fometimes feverer in winter than in fummer, especially when combined with the humoral, or with a catarrh. But it often happens that the warm weather affords little or no relief, nay even in many cases it is observed, that the irritability of the constitution and the rarefaction of the blood is so much increased by the warmth of the weather, that the frequency and severity of the fits are greater in the warm and fultry, than in the cold feafons of the year. In this case the humoral assistance is continued on during the fummer months by the convultive afthma, as a fymptom of the natural and critical folution of the fits. But even in this fituation of the patient, the fymptoms of the humoral afthma are greatly alleviated by the warmth of the weather, which is by no means conftantly the fact with respect to the convulsive afthma. Along with or after the convulfive afibmas, either when pure or when complicated with the humoral, there is often a great foreness in the breast, partly from the obstructed circulation, partly from the spalmodic contraction of the muscular fibres of the air-vessels, and partly from the frequency and severity of the cough. Sometimes too there are rheumatic stitches in the sides, which are extremely painful and alarming to the patient; but the ju-dicious practitioner will eafily diffinguish them from internal affections of the breaft, by the external foreness and the acuteness of the pain in consequence of motion. The frequent returns of fits fometimes cause obstructions in the lungs, which, as the diffection of dead bodies clearly afcertains, appear full of knots or tubercles. These tubercles are most liable to occur in those who have naturally a narrow contracted cheft, in which the lungs have not a free and eafy motion; these render the diforder very obstinate, they cause a long continuance of the cough after the asthmatic fit, and frequently end in fmall inflammations of the lungs, attended with internal pains, difficulty of breathing, feverifhness, profuse sweats, and wasting of the flesh. I have already observed that the humoral astioma often supervenes on the convulsive. It is necessary also to observe, that the convulsive often at-tacks those who have long been previously afflicted with the humoral afilma. Patients subject to entarrhs and winter coughs, during which they expectorate a confider-able quantity of thick or frothy phlegm, are fometimes fuddenly feized with violent difficulty of breathing, and great tightness over the breast, so as to dread even instant suffocation. This new complaint, after having tormented them for fome hours, or perhaps a day or two, leaves them almost as suddenly as it at first attacked them, and they look back with furprize at their happy deliverance from fo formidable and unexpected an enemy. Their old habitual cough and aithma, with foreness and stuffing in the breaft still remains upon them, but after what they have lately fusfered, they bear it without repining. In this manner they continue for fome time, till the convulfive afthma attacks them again, and perhaps with addi-tional violence. Thus, by frequent returns of the fits, convulfive afthma becomes habitual to the patient, and he has the misfortune to find himfelf labouring under a complication of two diseases, the one aggravating the other, and both growing worse. The convulsive afterna fometimes attacks persons of a thin spare habit, whose constitutions have been greatly emaciated by a long expofure to causes of general or chronic weakness. fome cases it seizes patients who are robust and full of blood. At other times it occurs in those who are gross, phlegmatic, corpulent, and in fuch habits it is often very diffrefling. It is frequently connected likewife with hydiffressing. It is frequently connected fixewise with hy-fterical and hypochondriacal complaints, in irritable and obstruction in the lungs, the symptoms totally disappear. The

on any fudden motion of the body, or in cold damp foggy relaxed conflictations. The convulire afihma, recurring weather, which obstructs the exhalation of the perspirable for many years, is capable of reducing the strongest conmand that the strongest constitutions, and of bringing on the symptoms of general debility; but if it attacks a constitution already weaks ened and exhaufted, it is obvious that it will necessarily weaken and exhauft it more. The patient will lede weight, fink from his cloaths, and appear emaciated, especially if the veffels of the lungs are so relaxed that a confiderable quantity of mucous matter is expectorated. The stomach and bowels are more particularly liable to be affected in the convultive afthma; they are often feized with colic pains, diftended with wind, tormented with burning heats, and agitated with tremulous motions, which give a fenfation to the patient of fomething moving and fluttering within him. Floyer too has observed, that flight fits of the afilima often affect the stomach and bowels, and not the lungs. The appetite is greatly impaired, fleep is often prevented, or it is diffurbed and unrefreshing. The menses are sometimes obstructed, and sometimes they are brought on before the usual period, and when plethora prevails, that discharge is accompanied with relief. The patient is sometimes costive, though sometimes he will have loose stools. The extremities, particularly the arms, shoulders, and upper parts of the body, are often affected with great uneafinefs. Symptoms of fever are not effential to the difease, though they frequently occur, especially when the humoral afibma or a catarrh is complicated with the convultive. A hectic fever, with a colliquative diarrhoea, faintings, palpitations, violent vomitings, cold-nefs of the extremities, fwelled legs, and other dropfical fymptoms, arifing from weakness, relaxation, and ob-itruction to the circulation of the blood through the lungs, is common in the last stage of the disease. But a hectic fever, indeed, will fometimes occur in very irvitable and relaxed habits, when no immediate danger is threatened.

From the preceding account of the symptoms of the convulsive afilma, it will appear obvious that the diffinetion of it from every other difease cannot be difficult. The sudden attack of the fits, the short time of their duration, the violence of their fymptoms, the state of ease and good health between them and their returning at intervals, will fufficiently characterize the complaint. The convultive afilma is fometimes combined with the humoral afilma, the pleurify, true peripneumony, false pleurify, false peripneumony, dropfy of the breast, ca-tarrhal and confumptive complaints; and if any one desires the fullest discussion in these different cases, the best way is, an accurate study of the respective histories of all the different complaints which bear any refemblance to it. In many inflances in the practice of medicine, words can never make those minute diffinctions which are very obvious to the eye and other fenfes.

When this diforder is recent, and produced by gouty matter, and fuch like, there may be some hopes of a lasting recovery; otherwise it is rarely if ever cured. An eruption of the menses, or of the hamorrhoids, during a paroxyfm, alleviates it much; improper management causes an asibma more readily to end in a dropfy; convulfive afilmas greatly endanger the life at every return, yet feldom prove fatal. If frequent and long continued, if the patient escapes with his life, a dropfy is the refult, which is the destruction of the patient. If a flow fever comes on, an unequal intermittent pulse; a palfy of the arms, a continual palpitation of the heart, a preternatural fmall discharge by urine, or a syncope, death is at hand. An afihma coming on old people, usually attends

The proximate cause of the convulsive or spasmodic assuma, is a sudden contraction of the muscular coats of the air-veffels of the lungs. When the mufcular fibres of the air-veffels are contracted, along with the midriff and the mufcles of the cheft (the contraction of which last fometimes occurs), the free admission of air into the lungs is prevented, and the patient labours for breath. Expiration and infpiration are flow, because the parts performing the function of respiration are not able to act, but with the utmost difficulty. When this spasm is removed, the patient, after the expectoration of a little phlegm, feels himself almost restored to perfect health, for the cause being obviated, and there being no fixed

complicated with the humoral, is a fpasmodic contraction of the air-veffels of the lungs, preceded and followed by a relaxation of the mucous glands, with an increased se-

eretion of mucus.

The remote causes, which comprehend both the predisposing and the occasional, are next to be considered. These, operating together, produce the proximate cause, with which the disease necessarily exists. The occasional causes seldom or necessarily exists. unless there be a predisposition in the constitution, either natural or acquired; and where there is a predifpolition there will be no disorder, if the body be not exposed to the action of the occasional or exciting causes. we are taught not to induce a predisposition, where one exists not in the constitution; and where one exists, the greatest caution is requisite to avoid the occasional causes, and then the predifposition will be attended with much

lefs, if any, inconvenience.

The chief predifpoing causes of the convultive asthma, are a narrow contracted chest, morbid irritability of the lungs, and pulmonary obstructions in consequence of tubercles,

either fcrophulous or formed by repeated catarrhs, win-ter coughs, pleurifies, and peripneumonies.

The occasional causes of the convulsive asithma, are cold, moisture, sudden changes of weather, dust, metallic fumes, smoke and other particular smells, mephitic vapours, evacuations, great fatigue, neglect of exercise, shouting, and all strong exertions of the voice, certain disorders in the constitu-

tion, anger, joy, surprize, fear, grief, and other depressing passions, excels in venery, and intemperance in diet.

The obstinacy of the disease is to be estimated from the violence and duration of the symptoms, the age of the patient, the condition of this conflitution, the nature of the predifposition, and the power of the exciting causes. If the symptoms of the spasmodic affection in the lungs run high, if the disorder be of long standing, and, when once excited, continues for several days; if the returns of it be frequent; if the lungs be greatly obstructed with phlegm at the termination of the convulsive fits, and an obstinate cough remains during the intervals, with a laborious respiration, and a copious expectoration of mu-cous matter, the cure is difficult, tedious, and uncertain. Tubercles and obstructions in the lungs, &c. are symptoms too unfavourable to admit of hope. If on the contrary, the disorder be recent; if the patient's constitution be not greatly impaired; if there be no natural deformity in the cheft; if respiration after the termination of the fit be free, and the cough with expectoration of phlegm not violent, nor obstinate in its duration; if the occupa-tion of the person be not injurious to the lungs, or, if so, can be easily relinquished; and if the lungs be not obstructed with tubercles, either in consequence of a fcrophulous habit, or repeated inflammatory affections, the case bears a favourable aspect, and may in all human probability be frequently treated with fuceefs .- When infants are feized with the afthma, it often ends in fuffocation, especially if powerful means for the removal of it be not applied at its commencement.

The indication of cure will be to drive the humours

to the exterior and inferior parts, to procure a due and equable circulation, and remove the feveral causes which fupport the diforder, by medicines adapted to their refpective natures: the two first are to be answered during the paroxyfm, the latter in the intervals between them. In the convultive afilma, the care will be to alleviate the fpaimodic strictures of the breast, and parts subservient

water, may properly fupply the place: mustard-whey is an excellent common drink in the pituitous afibma, so is an infusion of hyssop, ground-ivy, sweetened with li-quorice. Exercise should be moderate, but regular and daily, the seet should be kept warm, and perspiration asfifted with a flannel fhirt.

With respect to the air which these patients breathe, it should be observed, that some are easy only in a dry serene one in the country, and others are fo only in the moift vapid air of great towns; with one a light, and with another a heavy atmosphere, does the best. In order to a

The proximate cause of the convulsive aslbma, when heat must be determined there, which should be discharged with the vapours in expiration whatever then deftines more of this heat to this vifcus than can be eafily difcharged, will produce an afilma, and also require a moist or foggy air to breathe in, for thus the superfluous heat . will be conveyed from the lungs. On the other hand, in fuch conflitutions as do not fupply the lungs with the needful quantity of vital heat, a dry open ferene air, on lands that are high, and where the fun continues through the day, is necessary, for thus an elicape of the already distributed at the state of the laready diminished heat is prevented. Having distinguished to which of these two classes any particular patient belongs, and seated him in the proper air, if he is of the first fort, proceed with bleeding, a thin, cooling, and diluting diet, give frequent small doses of nitre, and, at proper intervals, let purges with Glauber's salt be worked off with plenty of warm but very thin gruel; bathing in subtepid baths, and blisters, will also be of use: but if of the second, the right air being chosen, order a nutritive animal diet with mal diet, with generous liquors for common drink, let ferrugineous medicines, with the bark, bitters, gum Benjamin, gum ammoniacum, the warm balfams, as those of Tolu and Peru, be duly used.

In both the above cases, the natural perspiration should be carefully supported, and as a check thereto is the most frequent cause of asibmas in this country, a particular re-

gard should always be had unto it.

Periodical afthmas give way to the bark, affifted with fuch other means as peculiar circumstances may require.

The nervous afibma admits of bleeding only where there is a fanguine plethora; a pulse strong and flow does not indicate bleeding in the same degree as if it were strong and frequent. A strong, frequent, and hard pulse, demands a frequent discharge by bleeding. But much discretion is required in this affair from various discounts that are not in the same in the same in the same and the same in the same in the same and the same in the same in the same and the same in the same and difficulties that occur in judging. In other cases, anti-fpasmodics, warm nervous medicines, opiates, and the bark, are the principal means of relief; caftor, tinctura opii camphorata, fal c. c. with affa fœtida, and gum ammoniacum; and if they fail, try the bark and opium.

An anafarca is fometimes attended with a greater difficulty of breathing than a confirmed afcites, to when a fudden afibmatic fit is observed, without any visible cause, if there is the least fulness of the face, which indeed is only to be feen in fome inflances after laying down, or any appearance of an orderna in the ancies or feet, the cause is undoubtedly the fame in the lungs; and that this is the case will be further confirmed by the pulse being suppressed: as the speediest relief, give immediately of calomel gr. x. by which, as soon as it operates, the pulse and the breast will be relieved : this dose may be re-

peated after a few days.

Vomits are usually administered too foon in afilmas: expectoration should be rendered somewhat free, and then they may be given with more fafety and greater advantage; the oxym. feillæ and antimonium tartarifatum are efteemed the best, but Dr. Akenside prefers, and with fome reason, the ipecacuanha, which, whether in the humoral or tpafmodic kinds, he always uses as speedily in the fit as attending circumstances will admit, and experi-ences the speediest relief by it; when he prescribes the ipecac. in chronical cases, he gives from three to five grains every, or from five to fifteen grains every other morning, according to the degree of the difease, and without regard to any particular paroxyfin, and thus con-tinued it for three, four, or fix weeks; he fays it is as The diet should be light: sweet things, and such as are shall be avoided: old Rhenish wine mixed with Seltzer water, or with a pure light common water, is useful when it only excites a nausea, as when it pukes; whence it seems, that in the relaxing quality, its virtue consists, as used in these cases. When the spasmodic attends the humoral assume, he prescribes the specacuanha, useful; if wine is apt to turn four, spirits diluted with with all desirable success. See Lond. Med. Transact. water, may properly supply the place: mustard-whey is vol. i. Dr. Cullen remarks, that as statulency in the stomach, and other fymptoms of indigestion, are frequent attendants of afthma, and very troublesome to afthmatics, fo, both for removing these symptoms and for taking off all determination to the lungs, the frequent use of gentle vomits is proper in this disease. In certain cases where a fit was expected to come on in the course of the night, a vomit given in the evening has frequently feemed to prevent it. See Vomitus.

Diuretics are particularly useful in an afibma attended with a cachexy, two parts of nitre, and one of fal amdue exercise of the lungs, a proper quantity of the vital moniac, given every, or every other day, so as to pass freely

observed to irritate the cough, the rad. scillæ gr. iv. ad xii.

may be preferred.

Expectorants, in the moift afibma, are important aids. Garlie is celebrated, the fquills and gum ammoniacum are most commonly used; but perhaps an extract of tobacco might be so managed as to exceed any of the medicines now in use for this end; for those, who are not used to chew tobacco, are very speedily relieved by holding it in their mouth until a sickness come on, and then going into bed to sweat; a few repetitions of this hath totally freed One of the best general forms of expectorants is the

following:

R Gum. affa fœtid. gum. ammoniac. āā. 3 i. fs. Aq. pur. 3 ix. m. detur cochl. larg. freq.

To this mixture may be added as required, the tinct. opii camph, the oxym. feillæ or fyr. allii. Sometimes

the affa foetida difagrees.

Dr. Millar recommends the miftura camphorata in the fit of the afibma, this dose is one or two spoonfulls every three or four hours. Before he gives the miftura camph. he usually prescribes a gentle emetic, and then a dose of the tinct. rhei, or tinct. aloes.

Diaphoretics are always fo far needful as that the na-tural perfpiration should be supported; but when the afibma is produced by acrid matter, &cc. repelled from the fkin, they are absolutely necessary, being then principally to be depended on: powders, with nitre and puly. contrayerv. with two or three grains of camphor in each dole. The fp. febrif. Di. Clutton is excellent for this purpose, and frequent draughts of warm elder-flower tea may accompany them.

Purges should not be of the rougher kind, but manna with casha, joined to small doses of the antimonium tartarifatum, or if the genuine can be obtained, the ol. Ricini, given in a warm vehicle, is the best. In some

cafes, glyfters only can be admitted.

Opiates, when admitted in the humoral afthma, should be accompanied with expectorants, the tinct. opii camphorata, and the pil. e flyrace, are excellent; or if the tinct. opii is ventured on, it should be mixed with the ox. scillæ. In the spasmodic asthma, the tinct. opii hath been found necessary even to a hundred drops, in a few hours; but in all fpafmodic complaints, opiates, mixed with purgatives, in fuch quantities as to keep the bowels lax, is the best method of administering them.

Bleeding. The pulfe and heat of the body will generally best determine when to use or to omit this operation, When a fudden fit is produced by an eafterly wind, if it is voilent, bleeding, though on other accounts not advifeable, may, notwithstanding, be necessary; in such inflances judgment and fagacity will be put to the trial.

Iffues should be made in the inside of the thigh, just

under the gartering place, for there their discharge is usually greater than in the back, and their trouble far less; their use is equal, be the kind of asthma what it will.

Blifters on the back are an excellent aid during the fit, in cases of humoral asthma, and to prevent returns, keep them open as long as possible. In the spasmodic or true afibma, iffues and blifters are of less efficacy, but not to be omitted.

In the pure convulsive afilma, bathing the feet in warm water is of admirable efficacy, in many inflances. Dr. Withers feems to be the first who has proposed

the flowers of zinc. He fays that, when plethora or ful-ness of blood is not present, I have found them to succeed where others have failed. This is, the Dr. observes, a powerful antifpafmodic, and at the fame time beneficial in ftrengthening the conftitution. The dofe of these slowers is from two grains to fifteen, two or three times a day.

See the article vomica, for directions in cases of tu-

Variety of forms are to be feen, which are well adapted to the diforder in general, and the symptoms in particular, in Dr. Smith's Formulæ Medicamentorum, and in Dr. Brookes's and the London Practice of Phylic.

Dr. Percival observes, that in Derbyshire, when the miners or fmelters of lead find themfelves affected with the afibma, they usually leave their occupation for a few proved that the fixed air arising from the calcination of

freely by urine, is very beneficial; but if these sales are lime-stones, is an effectual and speedy remedy in this dif-

The afibma, in some instances, ends in a partial palfy; in others, in fome species of dropfy; sometimes, though not often, the patient is fuddenly fuffocated; this accident, when it happens, hath for its cause a polypus in the lungs; and inflances have occurred of its ending in an inflammation of the lungs.

See fir John Floyer on the Afilma; Cullen's First Lines, edit. 4. vol. iii. Withers on the Afilma.

There are feveral difeafes called afilma which more properly belong to other genera, viz.

HMA INFANTUM. h. f. SUFFOCATIO STRIDU-ASTHMA INFANTUM.

- NOCTURNUM, i. e. INCUBUS. - CATARRHALE,

h. f. DYSPNOEA CATAR-- PNEUMODES, - PNEUMONICUM, RHALIS.

- PITUITOSUM.

- A GIBBO, i. c. DYSPNOEA THORACICA. - PULVERENTULORUM, Ih. f. DYSPNOEA EX-TRINSECA. - METALLICUM.

Some are merely fymptomatic-

ASTHMA a POLYPO CORDIS, these are considered as

——— Febricosum, dyspnæa; though only fymptoms of fome other difeafe.

ASTITES GLANDULOSI. See PARASTATE.

ASTRACIDES. PINE-KERNELS.

ASTRAGALO.
ASTRAGALOIDES.
The name of fome species of ASTRAGALOIDES. MILK-VETCH. See OROBUS and ERVUM.

ASTRAGALUS, also called the SLING-BONE, ballifle os. Astrion the talus, or first bone of the foot, so named from its being used in ancient sports, or something of that shape called cockal, in like manner with our dice,

and going by the fame name. It is the upper bone of the foot, the tibia refts upon it; its upper and under fide are covered with cartilage, and on its under fide it articulates with the os calcis; the fore part of this bone is cartilaginous, and there it articulates with the os feaphoides. It is also a name of the

liquorice-vetch, of the milk-vetch, the filk-vetch, of Diofeorides, and of a species of orobus. See Ozonus-GLAUX vulg. LEGUMINOSA POLYGALAVERA & ERVUM,

- Aculeatus. See Tragacantha. - Argenteus, Syriacus. See Ervum. - LUTEUS PERENNIS SILIQUA GEMELLA ROTUNDA VESSICA REFERENTE. WILD CHICHES; also called CICER SILVESTRE.

ASTRANTIA VULG. ET NIGER. See IMPERA-

TORIA.

ASTRAPE. LIGHTNING. Galen reckons it among the procatarctic causes of an epilepsy; and it is doubtless a cause of disease in lesser degrees of its influence, as well as of death in greater. In the Phil. Trans. art. xlii. an. 1766, Dr. Laurence gives an inftance of a fingular effect

ASTRICTA. When applied to the belly it fignifies COSTIVENESS

ASTRICTORIA. ASTRINGENTS. Substances that ASTRINGENTIA. coagulate the animal fluids are called oftringents; of those that are used medicinally, fome rank those only as aftringents that are taken by the mouth, calling those flyptics that are only applied externally.

Astringents contract and strengthen the fibres, and in-

craffate the fluids; those medicines termed Exsiceantia Indurantia, Roborantia, Siftentia, and Tonica, are included therein; but more firicily they should be confined to those medicines that increase the contractile force of the vessels, and at the same time inspissate the sluids.

An animal fibre is capable of being contracted in two different ways, either from the property common to all matter, of its particles being brought nearer to each other by external causes; or from an internal power of action resulting from the vital principle. The first species of contraction is produced by affringents, which exert their efficacy equally on dead and living flefh; the fecond is excited by itimulants, for the operation of which the vital principle is necessary. These powers may exist separate from each other, or they may be united. In general most of the medicinal applications belonging to either of these days, and work at the lime-kilns, experience having classes, unite, in various proportions, a stimulant and an aftringent quality.

and the blood is watery, they tend to expel fome of the water by some secretory organ, and so prove diuretic and fudorific, &c. but this only in lax habits: in general, they tend rather to check than to increase secretion. There is a certain quantity of [power of contraction in the whole body; this power of contraction may be exerted in the larger or finaller veffels, but it is exerted more in the former. A moderate action then of astringents increasing the contraction of the fmall veffels, and diminishing the contraction of the larger, prevents the living power from being exhausted, and so strengthening the system. Assimgents, then, are fometimes, when employed in a moderate quantity, ftrengthening medicines. The cohefive power of the parts is but little, if at all, altered by aftringents, for fimple aftringents can in but very few cates be applied to the bare fibres or membranes: strength then is produced by the making the small vessels contract rather than the large ones; but assume a generally speaking. the large ones; but aftringents, generally speaking, are ra-ther weakening than strengthening remedies; for in this respect they have just the same effect as stimulants. If all the vessels be strongly excited to press on the blood, the living power will by this means be exhausted, and the pa-tient will, after the action of the assimpted hath ceased, be weaker than before; they produce only a temporary contraction, and when continued some time, they lose their power, and leave the parts more lax than before they

Afterngents are applicable in cases where the muscular fibres have been stretched, as in bruises and strains; in these cases astringents are used at the beginning as sedatives to abate inflammation, and also as aftringents to re-ftore the lost tone of the parts; and after the removal of inflammation they are continued only as tonics. Aftringents are fometimes ulcful for checking too great fecregents are iometimes uteful for checking too great tecre-tions, which effect they generally produce in confequence of their acting more powerfully on the fmall veifels in con-flringing, than on the larger veifels in increasing the im-petus of the circulation. In hamorrhages, aftringents have been employed with advantage, but the advantage is in paffive hamorrhages only; for when there is a strong action of the vellels, aftringents would be very injurious.

Aftringents are often useful for lessening morbid irritability and fenfibility, for they act not only on the fimple fibre, but also on the living power: morbid irritability is belt removed by a moderate use of astringents. Those afiringents that have no stimulus, such as the uva uri, &c. ease pain from irritation, whence their usefulness in fits of the flone. Aftringents promote suppuration as well as the bark, and in the like instances that are benefited by the bark

When fudden changes are to be produced, give the fosful aftringents; when irritability or other habitual diforders are to be removed, use vegetable and metallic aftringents, they are the most powerful, and exceed alum in activity and efficacy; dilute folutions of metals, externally applied, are anti-inflammatory and fedative, whilst the core folutions inflame and are powerful causing. ftronger folutions inflame and are powerful cauftics.

During inflammation, or an inflammatory diathelis avoid aftringents that have a degree of ftimulus; avoid all aftringents when the blood tends too much to the head; avoid aftringents during a fanguine plethora, or obstruc-

tions in the vifcera.

Astringents are best administered in small doses, with a large quantity of fome proper liquid. They are generally diftinguished by a rough austere taste, and changing solutions of iron, especially those made with the vitriolic

Dr. George Fordyce observes, that afiringents act more on the small than on the large vessels about the precordia; hence they increase the quantity of blood there; they have, at the same time, a disposition to throw the shudd out of the vessels; when the vessels are naturally large less they have, at the same time, a disposition to throw the shudd out of the vessels; when the vessels are naturally large less than the vessels are naturally large. They yield their virtue to water by infusion, and also to a special point in a less degree; by distillation they afford nothing, and the large vessels are not without restriction, when considered with respect to the application of those medicines to the living sibre. They yield their virtue to water by infusion, and also to a special point in a less degree; by distillation they afford nothing, and the large vessels are not without restriction, when considered with respect to the application of those medicines to the living sibre. They yield their virtue to water by infusion, and also to a spirit in a less degree; by distillation they afford nothing, nor to oils do they impart any of their qualities. Extracts

made from aftringent vegetables do not keep long.

Dr. Percival, in his Effays Med. and Exp. observes, that aftringents, acid and bitters, neutralize each other; that vegetable acids lessen their aftriction externally, but mineral acids increase it both internally and

externally.

Vegetable affringents are the most powerful, as medi-cines, and of these one of the strongest is galls. ASTRIOLISM. BLASTING, OF PLANET-STRIKING.

ASTRION. See ASTRAGALUS.

ASTROBLES, from aepes, a flar, and flands, to firike. BLASTED, or PLANET-STRUCK. When applied to human

bodies, it fignifies apoplectic or fphacelated.

ASTROBOLISMOS, from arps, a flar, and garry to firike upon, i. e. planet-struck. The abasting of trees, or mortification by a blast; but when applied to the human body, it fignifies an apoplexy or a fphacelus. This term is brought into our Lexicons, but is used only by

Theophraftus of Plants.

ASTROCYNOLOGIA, from acros, a flar, nurs, a dog, and north, a differentian. The name of a treatise on

the dog-days

ASTRONOMIA, ASTRONOMY, from acress, a flar, and repos, law. It is the science which teaches the knowcontraction, and when continues longer when produced their effects till fome time, fo it continues longer when produced.

distances, or distan in fome inflances, the effects on our atmosphere may be influencial on our bodies for their good or harm. orology, and those other branches of science by which we

are taught the nature, properties, &c. of our atmosphere, feem more directly proper to medical enquiries.

It is pleaded, that the aspects of the stars insluence the human body, because that in the vernal equinox, or the summer soltice, the force of intermitting severs is destroyed, though obstinate in all other seasons; and because that the equinoxes are peculiarly hurtful to some fort of patients; but these circumstances are better accounted for on principles lefs remote than those derived from aftro-numy. The late Dr. Mead was a great advocate for this branch of science being an effential qualification in a

ASTRUM. A STAR. With the chemists this word fignifies that virtue and power which accrues to things from their preparation; thus, the aftrum of falt is its refolution into a fluid flate, by which it can exert itself more. Afrium is a name given to many medicines.

ASUAR. See Myrobalani India.

ASUGAR. Verdigrise.

ASUOLI. Soot.

ATAC. Nitre.

ATA MARAM. See AHATE DE PANUCHO RECCHI. ATAXIA. ATAXY, from a, priv. and ragge, to order.

Some particular irregularity or diforder.

ATAXMIR. An Arabic word expressing the method of treating an eye when preternatural hairs grow under

the natural ones.

ATEBRAS. A SUBLIMING VESSEL.
ATECHNIA, arrayen, from a, neg. and rexem, an art, want of art. Linnæus uses this word as expressive of venereal impotency, and thus it is fynonymous with ana-

ATER SUCCUS. See ATRABILIS.
ATERAMNA. This word occurs in Hippocrates's
Lib. de Aerc, Locis, et Aquis, and is expounded by
Galen as fignifying difficulty of concoction, and hard.

ATHAMANTA CRETENSIS, See DAUCUS CRE-

TICUS

ATHANASIA, &, neg. et 3asarse, death. The IM-MORTAL PLANT. A name given to TANSEY, because when stuffed up the nose of a dead corpse, it is faid to prevent putrefaction: also it means immortality. The name of an antidote of Galen, also of one faid to be Oribasius's; it is the name too of a collyrium described by Aetius. Besides these, it is the appellation of many other compositions. See TANACETUM.

ATHANOR, Among the chemists it is a fort of digest-ATHONOR, ing furnace, contrived to maintain its heat a long time, and is a furnace which communicates with its chimney by a lateral canal, fuch as is in the furnace for a fand-bath; this furnace is carried to a confiderable height above the part where this canal enters it: it is filled with fuel up to the top, and closely covered, and as the lower part of the fuel confumes, it is supplied by what is above, which falls down into its place; thus a constant and equal heat is maintained a long time without any attendance. See FORNAX.

ATHARA. A fort of PAP made with wheat-flour. ATHENA. A plaster in much repute among the an-

ATHENATORIUM. A thick glass cover which is, in the Theatrum Chymicum, vol. iii. p. 33, directed to be luted to a cucurbit, when the alembic is taken off in a particular process there prescribed.

ATHENIONIS CATAPOTIUM. The name of a

pill in Celfus's writings.

ATHENIPPON. The name of a collyrium, also call-It also a name of many collyria.

ATHENIPPUM. See ASCLEPIOS.

ATHER. The BEARD of BARLEY; also the top of the beard of an arrow.

ATHERA. A fort of food made with wheat-flour, like the pap-meat which is given to children. Pliny fays

it is an Ægptian invention.

ATHEROMA, from alrea, pulse, pap, or a kind of psultice. It is a kind of tumor, thus named from its poultice-like contents. It is colourless, void of pain, containing in a cyft, a matter like pap, intermixed forme-times with hard corpufcles, and formetimes with a hard-ish matter like the chewed bones of chickens. It is of an irregular shape, not easily impressed with the singer, nor after impression does it easily rise again, in which it disfers from the meliceris. See Nævus.

ATHLETICUS, ATHLETIC, from abrew, to contend. It implies the fame as a robust constitution fit for wrest-

ATHONOR. See ATHANOR.

ATHRIX. See DEPILIS.
ATHROON, In medicinal authors it imports copious,
ATHROOS, Saccumulated, or fuiden, and is the re-

verse of by degrees: similar to Confertus.

ATHYMIA, from a, neg. and 30,000, conrage. Pusillanimity. In medicinal authors it usually signifies that dejectedness, despondence, anxiety, and despair, which frequently occurs in the course of distempers. Some use

this word as fynonymous with melancholia.

ATINCAR, or ATINKAR. See BORAX.

ATITARA. The Brasilian name for the palma bu-

milis spinosa. Raii Hist. See PALMA MINDR.
ATLAS, from athau, to sustain, or othaui, to carry.
The name of the first vertebra of the neck; so called because it sustains the head, as Atlas was supposed to sustain the earth. It is a bony ring, and in its back part it re-ceives the proceffus dentatus of the fecond vertebra; it hath no fpinal process, its transverse processes are very thick; instead of the two superior oblique processes, which the other vertebra have, there are two oblong holes which receive the condyls of the os occipitis, and the inferior oblique processes are horizontal to admit of rotation.

ATMOSPHÆRA. The ATMOSPHERE. The whole

body of air and vapours which furrounds the earth. The height of the atmosphere probably depends on the level of the sea. All the animating properties of the air seem also to be derived from the evaporation of the waters of the sea, joined to the exhalations from the earth: these vapours which afcend into the air, feldom rife above a certain di-ftance from the furface of the fea, and above this height See ISCHURIA.

He observes that the ancients called bad waters thus, and that, as joined with other words, it hath other fignifications.

A property of the tops of mountains, they become barren, and only the magazines of perpetual fnow. Thus the atmosphere may magazines or perpetual into two, the animated and the unanimated parts. The animated part, as it is the feat of
life in fome fenfe, fo is it also the fource of disease.

ATOCHIA. PRÆTERNATURAL LABOUR.

ATOCIUM. A name of the LYCHNIS SYLVESTRIS,

which fee

ATOLLI. A fort of pap, made of the meal of maize and water which the Indians mix with their chocolate.

ATOMUS, from a, negative, and rewre, to cut or divide. An ATOM. It is a particle of matter fo fmall as not to admit of any farther division. Asclepiades taught that atoms were the primordia of all things, and that they were not perceptible to our fenses, but only to our understand-ings; that they had no qualities, for the qualities of bo-dies which they compose depend on the order, figure, number, &c. of many atoms joined together; and this last circumstance he proves by observing, that a lump of silver is white, but if filed down it is black; and horns of goats are black when whole, but white if filed down. Galen fays, that Asclepiades, adhering to the sentiments of Democritus and Epicurus with regard to the principles of bodies, had only changed the former names of things, calling atoms molecules, and a vacuum pores.

Molecules were divisible, but atoms not.

ATONIA, from a, negative, rate, to firetch. ATONY; defect of mufcular power. Relaxation, laxity, debility, or different arture. This word was much in use among the methodic sect, who ascribed the causes of all different ers to relaxation, stricture, or a mixture of these. It is generally fynonymous with palfy.
ATORSAXACOTL.

The fruit of a ATORSAXOCOTL CHICHILTIC. fpecies of ma-

caxocotlifera, which fee.

ATRABILARIÆ, CAPSULÆ. See CAPSULÆ ATRA-

BILARIÆ.

ATRA BILIS. Ater fuccus; bilis atra; mercurialis; BLACK BILE, or MELANCHOLY. According to the ancients it hath a twofold origin: 1ft, From the groffer parts of the blood, and this they called the melancholy humour. 2dly, From yellow bile being highly concocted. Dr. Percival, in his Effays Med. and Exp. fuggefts, that it is the gall rendered acrid by stagnation in the gall-blad-der, and viscid by the absorption of its sluid parts. Bile in this flate discharged into the duodenum, occasions univerfal disturbance and disorder, until it is evacuated; it occasions violent vomiting, or purging, or both, and previous to this the pulse is quick, the head aches, a delirium comes on, a hiccough, intense thirst, inward heat, and a fetid breath. Some describe this kind of bile as being acid, harsh, corroding, and, when poured on the ground, bubbling up, and raising the earth after the man-ner of a ferment. Dr. Percival says, that by the use of the infus. served with the tinct. columb. he had checked the vomitings occasioned by this

ATRACHELUS, from a, negative, and Teaxens, the

neck. SHORT-NECKED.

ATRACTYLIDI. A name of a plant which refem-bles the atractylis. See CALOCHIERNI. ATRACTYLIS, called cricus, carduus luteus, carduo-

enieus, DISTAFF THISTLE.

It is a plant which grows in Italy, Greece, and other warm countries. Its leaves are of the fame nature as those of the carduus benedictus, but the stalk is the part that is chiefly used. The women keep them for distasts. See CALOCHIERNI.

Also a name of the common WILD CARLINE THISTLE. ATRAGENE, called also viorna, clematis, clematis arthragene Theophrasti, stammula, and TRAVELLER'S JOY. It grows in hedges, slowers in July: the whole plant is of a caustic quality, and laid on the skin it presently raises a blister there. Dale.

ATRAMENTUM SUTORIUM. A name of the GREEN VITRIOL, of the chalcanthum, and melanteria. See

VITRIOLUM VIRIDE.

ATRAPHAXIS, or ATRAPHRAXIS. See ATRIPLEX. ATRESIA, from a, negative, and Tpau, or Tpiu, to perferate. IMPERFORATION.

ATRETARUM ISCHURIA. A SUPPRESSION of URINE, from the menses being retained in the vagina.

ATRETI.

which do not reach fo far as to perforate into its

ATRIPLEX. ORACH, or ORACHE: also called atriplex alba vel rubra hortenfis, arrache, atra-phaxis, atraphranis, chryfolachanon, olus aurcum; WHITE, RED, OT

GARDEN ORACH.

It is an annual plant rifing from feeds, and chiefly em-It is an annual plant rifing from feeds, and chiefly employed in the kitchen. That named — FOETIDA. Called alfo garefinum, andraphan, vulvaria, chenopodium fatidum, chenopodium vulvarium, atriplex olida, blitum fatidum; STINKING ORACH; is the chenopodium vulvarium, foliis integerrimis rhomboideo-ovatis, floribus conglomeratis axillaribus. Linn. It is a low procumbent plant, fprinkled all over with a whitish clammy meal, the largest are fould of a council forum, with an obsuse. leaves are fmall, of a roundith figure, with an obtufe point. On the tops of the branches come forth clufters of imperfect flowers, followed each by a flattifh feed. It is annual, gows wild about dung-hills, and flowers in

August.

It hath a strong disagreeable smell, somewhat like that of falt-fish. Such of it as is found growing amought old rubbish is weaker than that in moutter ground. Water takes up all its virtue by insusing it loses its strength by keeping. It is a fetid anti-hysteric, antispasmodic, and acts without irritation. It can only be used in its recent state, as in its dry state it loses all its sensible qualities. Therefore, the best form is a conserve, of which two or three drams may be taken in a day. Dr. Cullen wishes it was often employed, Mat. Med. — CHENOPODIUM. The HERB MERCURY. — MARITIMA. See HALIMUS and PORTULACA. — MORI FRUCTU. See CHENOPO-DIO, MORUS. MAJOR & MINOR. — ODORA SUAVEO-LENS. See BOTRYS. — OLIDA. See ATRIPLEX FOE-TIDA. - SYLVESTRIS, WILD ORACH. See CHENOPO-DIUM & CHENOPODIO MORUS.

ATROPA, BELLADONA. DEADLY NIGHT-SHADE.
See SOLANUM LETHALE and BELLADONA.

ATROPHIA, from a, and trees, to neurife. Also contabescentia. Immutritie, tabes; an ATROPHY, or falling away of the sless. It is a wasting, with loss of strength; but without a hectic, or any expectoration. Some say that out without a hectic, or any expectoration. Some fay that in an atrophy, the fat only is wasted. The Latins call it inutritio, the want of nutrition. It is also called a nervous confumption. Dr. Cullen ranks this genus of disease in the class cachexize, and order marcores. He enumerates four species. I. Atrophia inanitorum, from too great evacuations, also tabes nutricum sudatoria;—a sanguissava. 2. Atrophia famelicorum, from deficient nourishment. 3. Atrophia cacochymica, from bad nourishment. rishment. 3. Atrophia cacochymica, from bad nourishment; also tabes syphilitica;—ab bydrope. 4. Atrophia debilium, when the function of autrition is so depraved as to be productive of diforder.

An airophy implies a mere collaption of the cellular, vafcular, and mulcular fyltems, with univerfal weakness, from too great waltings, or too fmall recruits, of chyle, blood, lymph, &c. throughout the whole habit, without and vifeera. A phthifis, or confumption of the lungs,

is from obtruction, an athropy from inanition.

This diforder is best considered as but of one kind, and the different species as still the same; but arising from dif-

ferent causes, or advanced to different degrees.

The causes are a weakness in the organs of digestion, whence an undue supply of chyle to the blood; a diet that affords infussicient nouring the state of the state bility of the nervous fystem; a defect of, or an excoriation of the mucus, which defends the inner furfaces of the heart and arteries; excesses of the passions, and in luxurious pursuits; too copious evacuations, &c.

The figns in the beginning are, a decrease of strength, loss of appetite without much sever, cough, or short breath, though in the progress, when a consumption of the flesh hath gradually affected the whole habit, there is fome degree of difficulty in the breathing; the urine is inconstant in its colour, though generally high, and small in quantity; sometimes it is pale and profuse; in time the blood in the Po, it resembles a sturgeon.

ATRETI, IMPERFORATE, from a, priv. and Timto, perforate. Those of either fex are thus called, when their anus, or any other natural aperture, is closed.

ATRICES. Small tubercles about the anus, which recede and return again, especially at the first. Valesius de Taranta reckoned them among condylomata & fici.

ATRICI. Small sinuses in the intestinuan reckum, which do not reach so far as to perforate into its soul institute. As a reachest in the latest interesting the same interesting to the same interesting the same interesting to the same interesting food is almost infatiable. As a weakness in their chylo-poetic organs is the cause, soon diffecting those patients after death, their mesenteric glands are tumified, their livers much disordered, their intestines are filled with black fetid fordes, and the muscles of their bellies are extenuated almost to a membrane.

This diforder should be distinguished from leanness, the rickets, and that weakness and leanness in some children, who pine only for want of a due fupply from the

breaft.

The cure will be regulated by the caufe.

If this diforder depends on any other, as on a diarrheea, fluor albus, diabetes, gonorrheea, &c. the cure will de-pend on the cure of the original difease.

If the cause is indigestion, with a viscid obstruction of the melentery, which is the case in children and old people for the most part, give now and then gentle doses of ple for the most part, give now and then gentle dofes of rhubarb with calomel; or fal polychresticus, and, in the intervals, let stomachics, with warm perspiratives, be prescribed. Carefully avoid irritating purges, for they aggravate the symptoms by inflaming the bowels. The kali acetatum, tinet, guaiac, and ferrugineous medicines, may be used, and those with the helleb, nig. adding thereto the bark if required.

If there is an irritable habit from any of the causes above specified, endeavour to abstract from the stimulus, and appeafe all spasmodic affections by opiates, mucilages, gen-tle astringents that are glutinous, the bark, and such other medicines as the present symptoms may indicate.

The ferophulous and cancerous cases only admit of pal-liating, by keeping the circulation as low as the general health will admit. A thin light diet is the most proper, such as jellies of both vegetable and animal substances, broths, &c. not forgetting the bark, and acidum vitrioli dilutum, as corroborants.

When excellive evacuations have been the caufe, the decoction of farfaparilla, falop, chalybeate waters, bark,

and gentle riding, are proper.

A venereal taint is often an unfufpected caufe; in which case mild mercurials, with farfaparilla, and a milk diet, are the cure.

ATROPHIA INANITORUM. See TABES BORSALIS.

ATTA. Festus says it is one who, by reason of the tenderness or other defect in his feet, touches the ground rather than treads on it.

ATTAGEN,
ATTAGENA PHRYGIA.

The name of an Afiatic partridge, commonly known by the name of FRANCOLIN. The Greeks call it lagopus, bare's-foot, because its feet are downy. It is of a dusky red colour on its back, and feems to be the same as our red cock, which Aldrovandus calls attagen. Ray names it francolino Italerum. Pliny describes it under the name of lagopus altera, and with us it is called the RED COCK, GOR COCK, MOOR COCK, OF RED GAME. They are best in autumn for food, are not remarkable in medicine, though the gizzard on its infide is very fragrant just after the bird is killed.

ATTALICUS. The name of fome compound medicines mentioned by Galen.

ATTELABUS ARACHNOIDES. An aquatic

infect, partaking of the nature of a fpider and a grafshopper. It is ranked among the species of locusts.
ATTENUANTIA, from attenus, to make thin. ATTE-

NUATING MEDICINES. These act on the solids and fluids. Such as operate on the sluids by immediate contact are but few, and indeed only fuch as are watery, and they act only by the water in them. Vifcid humours, alkaline, and other falts, are diffolved by water. Most of, or all the other attenuants, act on the folids by increasing their tone, and fo enabling them to attenuate the too thick fluids. See Hoffman, vol. i. and ii. cap. iv.

ATTICUM. The name of a plafter used by Hippo-

crates. When joined with another word, it is an adjective, and fignifies attic.

ATTILUS. The name of a river fifth, found mostly

to transmute it into filver.
ATTINGAT. See ÆRIS FLOS.

cle which rifes from the corrugator fupercilii by a thin fascia. - Oculi, i. c. Musculus superior, & rectus superior oculi. Sce Elevator Oculi.

ATTONITUS MORBUS, Names of the APOPLEXY.

STUPOR. See APOPLEXIA. It is also given to that species of palfy which succeeds the

ATTRACTIO. See Repulsio and Affinitas.
ATTRACTIVUM, ATTRACTIVE. Paracellus pretends to have had an attractive medicine, which would draw away the discases of the body; but the extravagancies of this whimfical genius, with respect to it, though not deserving a place here, may be met with in his Archidox. lib. vii.

ATTRACTIVUS, ATTRACTORIUS, and ATTRA-HENS, are applied to remedies that have a power of at-

ATTRITA. Galling from attrition, or rubbing one

part against another. See INTERTRIGO.

ATTRITIO. ATTRITION. It is when the cuticle

is separated from the cutis, by compression.
ATTY ALU. A species of FIG-TREE.

ATYPOS, from a, negative, and \(\tau = \frac{3}{2}\), a form or tenor. IRREGULAR. It is applied to diseases which have no regularity in their periods. Also a deformity in the limbs

AUANTE, The DRY DISEASE. Hippocrates de-AUAPSE. Scribes it thus. The patient cannot bear either abstinence or eating. Fasting causes a rumbling in his belly, and gnawing pain in his stomach. He vomits up various matters, and after vomiting he is at easte. After eating there are cructations, an inflamman tory heat and redness; a constant feeling as if a painful flool was to be discharged, yet only wind is evacuated; a head-ach is complained of; a sense of pricking, as with needles, in different parts of the body; the legs seem heavy, grow seeble and extenuated, and he becomes

The method of cure which he prescribed was, first to give a purge, and after it an emetic; then directs absti-nence from fat food, temperance, bathing, unctions, and moderate exercife.

AUCHMOS, from aum, to dry. The Latins call it fqualer. It is hot dry fultry weather.
AUCUPALIS, or AUCUPARIA. A name of the ernus, or forbus fylvessiris.
AUDACIA. In a medical sense is that fort of boldness which we meet with in deliria or madness. It also

fignifies impudence.

AUDITORIA ARTERIA. The internal auditory artery goes off from each fide of the arteria bafilaris to the organ of hearing, and accompanies the auditory nerve, having first furnished several small twigs to the membrana arachnoides

AUDITORIUS MEATUS. The paffage that conveys the air to the auditory nerve. It leads from the lower anterior part of the concha to the tympanum, and is partly anterior part of the concha to the tympanum, and is partly bony, partly cartilaginous; all within the temporal bone is the bony part, is the longeft, and forms the bottom; the reft is cartilaginous, and makes the external opening, or orifice of the canal: thefe two parts make a canal of about three fourths of an inch long, a little tortuous, and wider in fome parts than in others. On the membranous covering of the cartilaginous part, we observe the yellow bodies, supposed to be the glandula ceruminis. The bony part of the meatus is nearly horizontal, and straight; the cartilaginous part is curved and winding. The bony part of the meatus is nearly horizontal, and straight; the cartilaginous part is curved and winding, which should be observed when a syringe is used to inject any thing with into the ear.—Nervus. The Auditory nerves. The seventh pair of nerves are called and ditory nerves, so are the sympathetici minores. This pair of nerves is divided into the portio mollis, which is distributed to the meatus auditorius internus, and so passes to the vestibulum and cochlea; and into the portio dura, which goes out by the aquæduct, between the massoid and stiloid processes. On these nerves, no covering from the dura mater can be traced. See Portio Dura. AUDITUS. The sense of hearing. By this sense we perceive the elastic tremors of the air; hence the

we perceive the elastic tremors of the air; hence the rifes from mephitic caves.

ATTINCAR VENERIS. The whitening of copper organ of bearing is made up of hard bones, and of elaftic cartilages and membranes. The elaftic air only receives fonorous tremors, and transfers them, as we fee water ATTINGAL. See LERIS PLOS.

ATTOLLENS AURICULÆ SUPERIOR. A muftransfers any impulse given to it. The aforesaid found is
e which rises from the corrugator supercisii by a thin
feia.—Oculi, i. c. Musculus superior, & rectus
perior oculi. See Elevator Oculi.

The body which produces sound
ought to tremble or vibrate in all, even the least of its particles. From fuch a tremor the contiguous air is beat into waves, whereby the parts of the air that lies outer-most are compressed, and sly back again so soon as their elafticity gets over the impulfe, whence the air flies again towards the fonorous body, where it is now more loofe and rarefied, to be there again compressed by the impulfive power; and in the fame manner the anterior and outer portion of air furrounding that which is imand outer portion of air furrounding that which is impelled, is by the action of the latter compressed and removed farther from the trembling body, yet so as to return again in its proper time by the force of elasticity, driving its contents to the tremulous body for the exciting of a new wave. These impulsions of the air are required to succeed each other with a certain velocity; and in order to render them audible, they must not be sewer than thirty in a second of time. As these sonorous waves are more frequent in a given time, fo much sharper is the found heard, and the more strongly does it affect us, till we come to the most acute of audible founds, which have we come to the most acute of audible founds, which have 7520 tremors in a fecond. Acute founds are in general yielded from bodies that are hard, brittle, and violently shook or struck; but grave founds from the contrary. Sounds, whether acute or grave, are carried through the air with a celerity equal to about 1038 Paris feet in a second; but a contrary wind retards their progression about one-twelfshot of their velocity. Sounds being elastic are reflected from hard bodies in angles, equal to those of their incidence; but the same found uthered into the open air, and dilating through an immense sphere, grows pro-portionably weaker; but if it be ushered through a tube in a cylindrical shape, it becomes increased: therefore the sonorous waves of the elastic air being driven into the cartilaginous sunnel of the ear, are repelled and collected together by alternate resections from its elastic sides into together by alternate reflections from its elattic fides into the cavity of the concha, from whence it proceeds through the auditory paffage, with a force fo much ftronger as the furface of the outer ear is larger than the fection of the faid auditory paffage, through which the fame force is continued entire forward, and increased by new refo-nances, excited from the percussion of the elastic carti-lages and hard bones, fo as to mix imperceptibly with the primitive found. At the bottom of the auditory paffage is the membrane of the drum of the ear; it consists of s the membrane of the drum of the ear; it confifts of feveral plates, one of which is dry, rattling, fplendid, and pellucid; this membrane is constantly so stretched as and pellucid; this membrane is constantly to stretched as to be easily put into a tremulous motion, and upon it the fonorous waves strike, after receiving their last reslections from the auditory passage. This membrane is stretched over a cavity in the os petrosum, called the tympanum or drum, which consists of several cavities. In the tympanum are the bones called the bones of bearing, which are supposed moveably: the first of which is the malleus, whose handle is fixed to the membrane of the drum, and whose handle is fixed to the membrane of the drum, and at one end to the second bone called the incus, to which it returns the tremors impressed upon the membrane; the incus rests on the orbicular bone, and this upon the stapes; the stapes and the air of the tympanum press the stapes are the second to the supplementary pressed to the second to the supplementary pressed to the second to the auditory nerve, whence the fense of found is conveyed to the common sensory. When, by the force of external sounds, the membrane of the drum is forced too much inward, it is probably supported by air which passes from the mouth through the Eustachian tube into the inner ear. The importance of the cochlea of the ear, in order to the conveyance of the found, is very confiderable. For a more minute information, confult Haller's Physio-For a more minute information, confuit Haller's Physiology, in the lecture on Hearing; and the ingenious obfervations of Dr. Shebbeare on this fubject in his Theory
and Practice of Physic, and the article Sonus.

AUGARES. The name of an unknown medicine.

AUGMENTUM, AUXESIS. The increase of a difcase, from its attack to its height.

AUGUSTUM. An epithet given to several comnound medicines.

pound medicines.
AULISCOS. A CATHETER OF CLYSTER-PIPE.
AURA, fignifies an exhalation or vapour, fuch as a-AURA.

AURA VITALIS. So Helmont calls the vital heat.
AURANGIA. An ORANGE. AURANTIA,

ENASCENTIA, See AURANTIUM.

ENASCENTIA, See AURANTIUM.

IMMATURA.

DULCIS. See AURANTIA SINENSIS.

AURANTIUM. The ORANGE-TREE. It is an evergreen with many prickly branches; fmooth, firm, broad leaves, having each two heart-like appendages on the pedicle; the flowers are white, pentapetalous, fet thick together among the leaves; the fruit is large, round, and yellow, divided internally into eight cells filled with a juicy pulp and white feeds; it is a native of the warmer. juicy pulp and white feeds: it is a native of the warmer climes, and fearcely bears the cold of this country. best are brought from Portugal and Spain, the next from France and Italy. This tree bears flowers and fruit all the year. The fruit of these trees are the poet's golden

AURANTIA HISPALENSIS, called also mala aurantia fructu acido, major arantia malus, arangia, mala ourca, chrysomelea, nerantia, orangia, and SEVILLE ORANGE. It is the citrus aurantium, or citrus petiolis

alatis. Linn.

The flowers of this tree are highly odoriferous, and are used as a perfume: they are bitter to the taste; they give their taste and smell both to water and to spirit, but most perfectly to rectified spirit of wine. The water which is distilled from these slowers is called aq. naphæ. In distillation they yield a small quanty of essential oil, which is called ol. vel essentia neroli; they are brought from Italy and France.

The leaves also yield an effential oil by distillation, but it is not so agreeable as that from the flowers.

The yellow rind of the fruit, freed from the white fungous part, is a grateful warm aromatic bitter, a good ftomachie, and ufed to give a grateful flavour to other medicines. It is warmer than the peel of lemons, of a more durable flavour, and abounds more with a light fragrant effential oil, which exudes upon wounding Infused in boiling water it gives out nearly all its fineli and tafte; cold water extracts the bitter, but very little of the flavour. In diffillation all the oil rifes, but none of the bitter. The London college direct a fyrup

SYRUPUS CORTICIS AURANTII. The SYRUPOF ORANGE-PEEL.

Take out of the outer yellow sind of a fresh Seville orange-peel, eight ounces; of distilled water, five pints; sleep the peel in the water for a night in a close vessel, and in the morning diffolve in the liquor, strained, of doubled-refined fugar as much as is fufficient to make a

TINCTURA CORTICIS AURANTII. TINCTURE of ORANGE-PEEL.

Take of the fresh exterior peel of Seville oranges, three

ounces; proof spirit of wine two pints, digest for three days, and strain. Ph. Lond. 1788. The juice of Seville oranges is a grateful acid, useful in both ardent and putrid severs. Its acid matter differs in fome of its pharmaceutical properties, both from the fermented acid of vinegar, and from the native acid falts of the leaves of plants; from the former in its not being volatile, or not exhaling upon infpiffating the juice, nor rifing in diffillation with the heat of boiling water; from the latter, in its being foluble in fpirit of wine, the infinite of the latter in its being foluble in fpirit of wine, the infpiffated juice liquifies in air, water, or fpirit of wine; whence it is easily preferved during many years, either in the form of an extract, or in a dilute state, as in a spirituous folution.

The young unripe Seville oranges are called Curaffoa, or Curafiao apples; also aurantia curassave canea Curassava, or Curassava apples; also aurantia curassaventia, aurantia enascentia, and aurantia immatura. They are a grateful aromatic bitter, of a flavour very different from that of the peel from the ripe fruit, and without any acid, what little tartness they have when freth is lost in drying. Spirit of wine extracts perfectly all their virtue; water imperfectly; infufed in wine or brandy they afford a good bitter for the ftomach. They are used to promote the discharge in iffues, whence their name of iffue peas-

AURANTIA SINENSIS, called also aurantia dulcis, poma Sinensis, mala aurantia Chinonsia, and China or sweet

DRANGES.

The rind hath a faint smell, and but little bitterness, fo is never used in medicine: the juice hath a grateful sub-acid sweetness, in general of the same qualities as our fummer fruits.

AURANTIA CURASSAVENTIA, AURANTIUM CURAS-SAVENSE. CURASSAO ORANGES. They feem to be im-mature oranges that by fome accident have been checked in their growth. They are the citrus aurantium. Linn.
AURATA. The name of a fifth, called also piscis fa-

cer, orata, and GILT-HEAD; and one named a RUFF. Sec Aspredo.

AURATUS GERMANORUM. It is an oleo-faccharum with the oil of cinnamon.

AUREA ALEXANDRINA. An antidote invented

AURELIANA CANADENSIS IROQUÆIS. See

GINSENG. AUREUS. A weight equal to a dram and a half; also a pompous appellation for many compound medicines. Blancard says, it was a weight amongst the Arabians of a dram, a feventh part; the same with denarius.

—Capil. Medius. See Adjanthum, species fifth.

Ramus. The art of making gold.

AURICHALCUM, ACATEM, or ACCATUM CHRY-SOCALCUM. BRASS. A mixture of copper and lapis calaminaris. The alchemists found it out by feeking to turn copper into gold. Brafs is not fo readily diffolved as copper. See As.

as copper. See Æs.
AURICOLLA. See CHRYSOCOLLA. — ETHELA.

A red tincture, and the white flower of gold.

AURICULA. The external part of the ear; which is divided into the upper part called pinna, and the lower foft part called the lobus, or lobulus. The pinna is divided into feveral eminences and cavities; the eminences are the belix, anti-belix, tragus, and anti-tragus.

The helix is the large border round the ear, or the exterior compass of the ear, so called because of its tor-

tuofity.

The anti-helix is the large oblong eminence, furrounded

by the helix.

The tragus is the little anterior protuberance below the fore part of the helix, which in the aged is often covered with hairs.

The anti-tragus is the posterior protuberance below the

inferior extremity of the anti-helix.

The cavities are the fcapba, on the infide of the helix; the cavitas innominata or folla navicularis, at the anterior upper part of the anti-helix; the concha, which is fituated under the anti-helix: there is a fort of feptum conchæ, which is a continuation of the helix; and the fourth ca-

vity is the meatus auditorius externus.

The auricula is composed chiefly of cartilage, which gives and preserves its shape. It hath the advantage of being variable, for there are certain small muscles called helicalis major and minor, tragicus, and anti-tragicus which are peculiar to the ear; they are supposed to act only upon the cartilage, and alter its situation, whence

it is supposed that we have the power of receiving more or less found into the meatus auditorius.

The external ear is fixed to the cranium, not only by the cartilaginous portion of the meatus, but also by the ligaments, viz. the anterior, which is fixed by one extremity to the root of the apophylis zygomatica of the os tem-poris, close to the corner of the glenoid cavity, and by the other extremity to the anterior and superior part of the cartilaginous meatus. And the posterior ligament is fixed by one end to the root of the mastoid apophysis, and by the other to the posterior part of the convexity of the concha, fo that it is opposite to the anterior ligament. There is also a kind of superior ligament which seems to be only a continuation of the aponeurosis of the frontal and occipital mufcles.

The lobe feems to be a doubling of the teguments, it is only skin and cellular membrane. For a particular ac-

count of the veffels, &c. fee AURIS.

AURICULA INFIMA. The LOBE of the EAR .-LEPORIS. See BUPLEURUM. --- MURIS, also called myofotis, pilofella major, dens alpinus, anthyllis, corufcus; COMMON OF CREEPING MOUSE-EAR. Boerhaave makes it a species of dens leonis. The fort used in medicine is the bieracium pilofella. Linn. See HIERACIUM ALPINUM; DENS LEONIS.

It is a low, creeping, hairy plant, with leaves like

those of a daify, joined to the stalks without pedicles, tympanum, which see, and the labyrinth. See LABA-green above and white underneath; the flowers are a RINTHUS. number of yellow floscules, set in scaly cups, which are followed by small black downy seeds; is perennial, grows wild in dry pasture ground, and flowers in June

It is lactescent and bitterish; the leaves are of the same nature as those of dandelion, cichory, &c. but less succulent and bitter, with some astringency and a slight sweetishness, that remains in the mouth for some time. roots are more bitter than the leaves, but not so aftringent. This plant is rarely used, if ever, in the present practice.—MURIS CAMERARII. SEA KIDNEY VETCH. URSI, called alfo fanicula Alpina lutea, YELLOW BEAR'S EARS, oricola, and FRENCH COWSLIPS. They grow plentifully in Switzerland, Savoy, and many other places: it bears thick, large, green leaves, and on the tops of the stalks there are flowers of different colours. In Utrecht this flower is called primula sdorata, on account of its agreeable fmell. The juice removes spots on the face. This is also the name of a species of verbascum, and of SANICLE.

AURICULÆ CORDIS. At the basis of the heart is observed two muscular bags, which are called its auricles; they are joined to the ventricles. See Cor. The right is larger than the left, and it is very thin. The left auricle in human subjects is a kind of muscular bag, pretty thick, and unequally square, into which the four pulmonary veins empty themselves.—Judæ, called also functions. gus sambuci, fungus membranaceus, peziza auriculam referens, agaricus auricula forma; Jews ears. Peziza auricula. Linn. They are a fort of fungus which grows on elder-trees: their internal use is generally thought not fafe, but a decoction of them in milk is amuch esteemed gargle in the quinfy.

AURICULARIA. EAR-WORT. See MENTHA PA-

LUSTRIS FOLIO OBLONGO. Alfo the EAR-WIG. AURICULARIS. See EXTENSOR MINIMI DIGITI. DIGITUS. The little finger is called the ear-finger, because with it we are most apt to rub and pick the inner ear.

MEDICULARIUS. A physician for the ear.

AUTICULARIUS. Belonging to the ear, also an

AURICULARUM SEPTUM. See Cor.

AURICULATUM. See Fol. AURICULATUM. AURIGA. A name of the fourth lobe of the liver.

Alfo a fort of bandage for the fides, described by Galen.
AURIGO. The Jaundice. See Icterus.
AURIPIGMENTUM, also called arsenicum croccum, arsenicum stavum, adarneck; etbel; orpin, orpin, orpinent, and AURIPIGMENT. Galen called it arfenicon, and Sera-pion calls it narueth. See Arsenicum Rubrum.

There are three kinds of orpiment, the gold-coloured, the deep red mixed with yellow, and the greenish and yellowish, which is the least valuable. The best is a yellow finning fulphureous mineral, confifting of little flakes or feales like tale. If powdered *orpiment* is fet on fire, it will flame, and yield the odour of common brimfire, it will fame, and yield the odour of common brim-flone; if a plate of copper is held over these sums at their first rising it becomes white and brittle; an iron plate is also turned white by them; it is soluble in oil. Mercury joined to an acid salt is a part in this mineral; but, as is the case with crude antimony, its sulphureous combination is such as to render it inert. If it is kept long in a subliming vessel over the sire, the whole mass is raited and concretes in the upper part of the veffel into a red pellucid fubitance like a ruby, leaving only a very finall portion of metallic earth at the bottom.

Some use it for fumigating venereal ulcers; Dr. Mead and others commend its fumes in afthmas; mixed with quicklime it hath been used as a depilatory. The painters use it for a gold colour, without the opinion of its being poisonous; but, if swallowed, its effects are similar to those of the hydrargyrus muriatus.

AURIPHOMESTRUM RUNNING A PROPER OF PRAISONER.

AURIPIGMENTUM RUBRUM. A name of REALGAR,

AURIS. The BAR. The sor is usually divided into the external and the internal. See the external under the article Auricula. By the external is meant all that lies without the external orifice of the meatus auditorius in the ost temporis; by the internal, all that lies within the cavity of this bone; but it is divided into the auricula, which fee, the meatus, fee Auditorius Meatus, the

The arteries of the external car come anteriorly from the arteria temporalis, and posteriorly from the occipitalis. The veins are branches of the external jugulars. The portio dura of the auditory nerve having passed out of the cranium through the foramen stylo-mastoidæum, gives off a branch, which runs up behind the ear, whence it sends off several filaments to the meatus and fore-side of the ear. The second vertebral pair send also a branch to the ear, the ramifications of which communicate with those of the other branch from the portio dura.

The bones of hearing, called malleus, incus, orbiculare, and flapes, are placed in the cavity of the tympanum, immediately on the infide of the membrana tympani. The malleus is joined by its handle to the membrana tympani, and its round head refts on the incus, the long leg of which refts on the os orbiculare, which is fixed to the fore part of the stapes, the sole of which rests on the hole called fenestra ovalis.

The use of the external car is to collect founds, and to render their impression on the other organs of hearing most perfect; this is evident from those who have their cars cut off, being obliged to use a horn or some means to affift them in hearing: all animals, as deer, hares, &c. whose ears have much motion, always direct them so as to meet the found.

How hearing is effected, fee Auditus and Sonus. On the ears fee Caffebhomius, Du Verney, Valfalva, Celfus, and Winflow's Anatomy. They treat either of

Auris Marina, A fiell-fifth very common on the Aurmar, S coafts of Scotland, Guernfey, Normandy, &c. it is shaped like an ear, it adheres to rocks, and to render them eatable they are first boiled, then

AURIUM SORDES. See CERUMEN AURIS. AURORA CONSURGENS. A whimfical phrase by which the alchemists express the vegetation of their gold.

AURUM, Gold, called also fol, and ren metallorum. The chemists called it sol, because they thought it to be under the influence of the sun. Its character is a circle with a dot in the middle, thus O, denoting a body per-

fectly inacrimonious, fmooth, and equal.

It is found more or lefs in every country; but the greatest part of what we have comes from America, particularly from the mines of Peru; but the Afiatic is eftermed the finest. Sometimes it is found pure and unmixed, in fmall grains or in large lumps, and is then called virgin gold; but for the most part it is found in ores of different kinds, to separate it from which various methods are required: its chief matrix is flint. All fand contains a greater or less quantity of it.

Gold is a yellow metal, nineteen times heavier specifi-

Its ductility is such as to admit of one grain of it being drawn out to the length of five hundred feet, which no other metal will: indeed it is the most divisible of all bodies; if melted with 100,000 times its weight of filver, it will be so perfectly blended with it, that any grain of the melted mass is, on assaying, found to contain its portion of gold: a fingle drop of its solution in aqua regia, gives a metalline taste to a pint of the rectified spirit of wine. It is so ductile that the wire-drawers can extend a wine. It is so ductile that the wire-drawers can extend a leaf to the 12,000,000 part of an inch in thinness, over a flatted filver wire, which will be perfectly covered though viewed with a microscope. One grain of rold may be so beat out as to cover a large house, and still be so compact as not to admit of the rays of light through it. The force of cohesion in gold depends on its freedom from sulphur; for one grain of sulphur mixed with 1000 grains of pure gold, destroys its malleability. It is sussible in a low white heat, requiring more heat to melt it than tin does, and less than iron or copper. It

melt it than tin does, and less than iron or copper. It

turns white before it melts.

mixture of the nitrous and marine acids, called aqua regia; pitation ceafe, let the whole fettle, pour off the clear litis the fea-falt in this that diffolves this metal, for hardly quor, and wash the precipitated matter with water till any other salt will affect gold: but though aqua regia is it becomes insipid, and then dry it. any other falt will affect gold; but though aqua regia is the common folvent of gold, it is not the only one; for the fumes arising from a mixture of the oils of tartar and of vitriol will diffolye it, and a common liquid menstruum may be produced from these, which will have the fame power. Quicksilver is also a solvent by amalgamation. And the liver of sulphur sused with it, takes it up so perfectly that it will be carried into a milk of sulphur, by the common process afterwards with it. It may also be calcined by common sulphur, if set on fire and flaming.

The beautiful and most design of all holders.

Pulvis Auri. The Powder of Gold.

It is the heaviest and most dense of all bodies After repeated refinings, fome filver is ftill found adhering to it : yet it is the most pure and homogene of all natural bodies.

It cannot be refolved into more simple principles than

those of itself.

If pure, it founds but little; it is fofter than lead, and fearce elastic. The alloy in gold renders it more fit for many uses, but its cohesion is greater in its pure state, consequently would be less subject to wear, if coined into money without the alloy.

It readily amalgamates with pure quickfilver.

When in fusion, it readily mixes with filver; and thus mixed it will run into a mass with iron, but more easily

with copper.

Its colour and beauty is not injured by the air, or any of the damps, &c. that usually float in it. It is neither disposed to tarnish itself, nor to discolour other things: gold and gilded things are only fullied by the adhesion of other bodies, which may be washed off by their proper solvents, without affecting the gold, however thin it may

If effential oils are shaken with a solution of gold in aqua regia, they imbibe the gold from the acid, and carryqua regra, they imbibe the gold from the acid, and carrying it up to the furface, keep it there a while diffolved;
but gradually throw it off again, on standing for fome
hours, in form of bright yellow films, to the fides of the
glafs. Æther, though fo light a fluid, takes up the gold
still more readily and completely, keeping it permanently
diffolved. Rectified spirit of wine mingles uniformly
with acid solution, but after having stood some days the
sold songardes and rises in films to the surface. Tim part gold separates and rises in films to the surface. Tin put into a solution of gold in aq. regia precipitates it.

It was the Arabians that introduced gold into medicines; Avicenna escemed it for its cordial quality; but

as no means are yet discovered by which to separate its component parts, and it is insoluble by any of the animal fluids, its medicinal power can only confift in its being

an antidote to poverty.

If one part of pure gold be calcined with five parts of tin, a powder is produced which is useful in forming arti-ficial rubies and amethysts. And when diffolyed in aqua regia it dyes skins, bones, and ivory, of a durable purple colour.

Gold is volatilized by mixing it with arfenie; or take the hydrargyrus muriatus, rub it well with gold, first re-duced to powder, then distil in a retort with regulus of antimony, and the body of the gold will afcend in the form of a red oil, and be perfectly volatile.

#### AURUM POTABILE.

Diffolve in a moderate heat half a dram of fine gold, in two ounces of aqua regia, and add to the folution an ounce of the essential oil of rosemary, shake them together, and then set them to rest; after which separate the oil by decantation, and add to it sour or five ounces of rectified spirit of wine, digest them for a month, and it will become purplish. This is also called tincture of gold, but it contains not any of the metal, the colour is from the other ingredients. Besides this a decoction of the lentisk wood has this name. See Lentiscus.

AURUM FULMINANS. Cerauno-chryfos, chryfo-ceraunius.

Put a dram of the filings of gold with half an ounce of new-made aqua regia, into a matrais placed in fand; when the mentiruum ceafes to act, pour off the folution, and if any of the gold is left, add as much more aqua regia as will be necessary to diffolve it; dilute the folution with ten times its quantity of warm water, then drop in the lixivium of tartar till the effervescence and preci-

In drying it the utmost care is required, for in a small heat it explodes with violence, even with strong rubbing it flies off in the manner of gunpowder. The more it is washed the lefs violently it sulminates when heated. It

## PULVIS AURI. The Powder of Gold.

Diffolve gold in aqua regia, then evaporate the fluid from it, and the gold remains in the form of a purple

Many attempts have been made to convert other metals into gold, but until they can be made as heavy, all attempts will fail; there seems only to want the art of giving gra-vity to metals and stones in order to the production of

gold and diamonds.

See a history of gold, and the various arts depending thereon, in Dr. Lewis's Philosophical Commerce of Arts,

AURUM ELEMPIUM. See SUCCINUM.

HORIZONTALE. It is an oleofaccharum, made with the oil of cinnamon.

- LEPROSUM. See ANTIMONIUM.
- VEGETABILE. A name given to SAFFRON. See CROCUS.

AURUS BRASILIENSIS. See CALAMUS AREM.

ASIATICUS.

AUSTER. The SOUTH VIND, which is hot, moift, and productive of putrid difeases. It means also AU-STERE, and is formed by the union of acid with terreftrial particles, fuch as in unripe fruits, aftringent juices, austriaus. &c.

AUSTRIÆUS. A species of PINE TREE.
AUSTROMANTIA. A pretending to tell events
from a superstitious observation of the winds.
AUTALIS. TOOTH-SHELL. See DENTALIUM. Also
the entaglia. See ENTALIUM.
AUTTHEMERON

AUTHEMERON, from aulos, the same, and nuses, a day. The very same DAY. A medicine is thus called that gives relief on the same day it is taken. Galen has two remedies of this kind.

AUTOGENES, from as jos, it felf, and y nopas, to be preduced. An epithet of the narciffus with a white flower, becanfe its bulbous root, before it is fet under the earth, puts forth leaves, fo that the plant feems to fpring from

AUTOPHOSPHORUS. See Phosphorus.
AUTOPSIA, AUTOPSY, from autos, bimfelf, and olis, fight, or seles, bimfelf, and exituate, to fee. Ocular evi-

AUTOPYROS. See ARTOS PANIS.

AUTOUR. A fort of bark which refembles cinnamon, but is thicker and paler; the infide is of the colour

of a broken nutmeg, with a multitude of fpangles. It is almost inspired, and hath no smell at all. It comes from the Levant, and is an ingredient in the carmine dye.

AUTUMNUS. AUTUMN. The season of the year between summer and winter, beginning astronomically at the equinox, and energy at the follice: popularly is comparished. Aurust Sentember, and O'Cobert. Colline of the season of the season. comprises August, September, and October. Celius wifely advises people to begin early in this feason with warmer cloaths, for the irregularity of the weather subjects them to a variety of diseases.

AUXESIS. See Augmentum.

AUXILIARII Musc. See Pyramidales Musc. AUXYRIS. A corrupt word for ofyris, POET'S ROSE-MARY

AUZUBA OVIEDI. See CARANDAS.

AVACCARI. A little tree, the leaves, fruit, and flowers of which refemble the myrtle, but it is more

aftringent; it grows on mountains in the provence of Malabar. It is used against dysenteries.

AVANACU. See CADEL AVANACU.

AVARAMO-TEMO. The name of a siliquose tree which grows in Brasil. Its bark is externally of an ash colour, and internally very red, both it and the leaves are aftringent; a decoction of the bark hath been extolled to dry ulcers, and is faid to have cured cancers. Raii Hift

2 M

Miller takes notice of fix forts, viz. the hazel-nut, the fmall manured ditto, the large cob-nut, the Spanish nut,

the red filbert, and the white filbert.

The juli, or katkins, which grow on the trees early in the fpring, and the shells, are restringent or binding. An emulsion made of the kernels of nuts or filberts, and mead, is commended in coughs. Filberts nourish more than nuts, the roundest kernels are most efteemed. They all afford a confiderable quantity of an agreeable foft oil by expression.

AVELLANA CATHARTICA. See CATAPUTIA MINOR.

- MEXICANA. See CACAO. - PURGATRIX. See CATAPUTIA MINOR and BEN.

AVELLANÆ INDICÆ GENUS OBLONGUM.

An inferior species of NUTMEGS.

OATS. There are two kinds, the black AVENA. and the white; they have fimilar virtues, but the black ones are chiefly fown for horfes; they are lefs vifcous and less nourishing than rice or wheat, yet afford a fufficient nourifhment to as active and vigorous a people as the world produces, viz. the Highlanders in the north of this ille. Gruels made with them, digeft eafily, have a foft mucilaginous quality, by which they obtund acrimony in inflammatory diforders, coughs, hoarfenefs, roughnefs, and exulceration of the fauces.

Some affert that roafted oats make hens lay eggs in

Water-gruel answers all the purposes of Hippocrates's ptisan.— For that named FATUA, see ÆGYLOPS BROMOIDES.—GRÆCA. See BROMUS STERIJS.— STERILIS. The GREAT WILD OAT-GRASS. See ÆGILOPS.

AVENQUA. The Portuguese name for the adian-thum Brasilianum. The MAIDEN HAIR of Brasil.

AVENS. See CARYOPHYLLATA.

AVERSIO. AVERSION. The diverting of a flux of humours from one part to another, also a nausea or inappetency, or the recession of the uterus from its proper

AVES vel AVICULA CYPRIÆ, BACILLUM. Odo-riferous or perforated candles or fticks of wax, made to be burnt in times of peffilence. See CANDELA FUMALIS.

AVEVETL. An Indian name for the abies Mexicacua.

AVIB. An abbreviation of avibus.

AVICENNA TOMENTOSA. See ANACARDIUM. AVICULÆ HERMETICÆ. The univerfal falt which is faid to be found in dew.

AVICULARIA SYLVII. A name for the greater

VENUS'S LOOKING-GLASS.

AVILA. A fpecies of apple produced in India; it is larger than an orange, round, and of a yellow colour. It grows in South America, on a flirub or creeping plant, which adheres to the adjacent trees. This apple contains eight or ten nuts, in which are bitter kernels.

AVIS MEDICA. The PEACOCK.

AVO. The MALLOWS of MADAGASCAR.

AVOIR DU POIS. This, in the French language, fignifies to have weight, because the pound so called, contains fixteen ounces, and hath more weight by some ounces, than that which is called Troy weight, which contains

AVORNUS. A name of the BLACK ALDER. AVOSETA. An aquatic bird as large as a pigeon; its beak is four or five inches long, black, and turned up, and pointed at the end; the head is blackifh, the body white, feet bluish, the toes joined by membranes, and the legs long. It is found in Italy AVRANCUM. EGG-SHELLS. It is found in Italy.

AVRARIC. MERCURY.

AXEA COMMISSURA. A fort of articulation. See TROCHOIDES.

AXEDO. The name of a fpell in Marcellus Empiricus, to render a person impotent.
AXILLA. The ARM-PIT.

AXISLARIA ARTERIA. The SUBCLAVIAN ARTERY, having left the thorax immediately above the first rib, in the interffice between the portions of the scalenus muscle, there receives the name axillary, because it passes under the axilla. This axillary artery detaches the external mammary arteries to the breast; the axillary lies behind, on the inside of the coraco-brachizeus; when it has got to any metalline body. The same as azoth.

AZOM.

AZOM. the under fide of the fubfcapularis, it gives off a branch

AVELLANA, called also corplus; the HAZLE-NUT. to that muscle, the ferratus major anticus, &c. The axillary artery gives off the inferior feapular, which paffes backwards, chiefly to the infra fpinatus. Just below the head of the humerus the axillary throws off the humeral or articular artery, which passing round the joint anasto-moses with its fellow. The axillary artery commonly runs down behind the tendon of the pectoralis major, then paffes over the coraco-brachizeus, goes down on the infide more and more forwards, just covered by the inner edge of the biceps, passes under the aponeurosis of that muscle, and a little below the bend of the arm, between the pronator teres and fupinator radii longus, divides into the radial and ulnar arteries.

AXILLARIS NERVUS. The AXILLARY NERVE;

also called the ARTICULAR NERVE, arises from the last two cervical pair; it runs in the hollow of the axilla, behind the head of the os humeri, between the mufculus teres major and minor, and turns from within outwards and backwards round the neck of the bone, and runs to the deltoid mufcles.—VENA. The AXILLARY VEIN. It is the continuation of the subclavian vein, from its paffage out of the thorax to the opposite side of the axilla.

AXIOMA. An AXIOM. A self-evident proposition, so neither requires nor admits of demonstration.

AXIRNACH. Superfluous fat, found fometimes in

AXIS. Superitudes far, found formetimes in the upper eye-lids of children.

AXIS. That round which any thing revolves or is supposed to revolve. In botany, it is a taper column placed in the centre of some flowers or katkins, about which the other parts are disposed. With anatomists the name of the fecond vertebra, and according to fome the first vertebra, of the neck; it hath a tooth which goes into the first vertebra, and this tooth is by some called the axis, by others the axle. Blancard fays it is the third vertebra from the skull.

Axis ARTERIÆ COELIACÆ. The trunk of the

exem, the axle of a chariot or fuch like. Hog's-LARD. See ADEPS .- For that named CASTOREI, fee CASTOR. The adeps or fat of the beaver, from whence the drug called castor is taken. See CASTOR.—LUNK. A fort of terra figillata. See BOLUS CANDID.—LUNK CHYMICA. A name for the WHITE BOLE. See BOLUS CANDIDUS,
——DE MUMIA. MARROW.——SOLIS. See SIGILLATATERRA. ——VITRI. SANDIVER, or SALT of GLASS;
it feparates from glafs whilft it is making, it is acrid and

biting. It hath been used to clean the teeth with.

AZOM. Boiled Butter.

AZOTH. The fame as azoch. Paracelfus also fignifies by it, the universal remedy prepared of the sun,

moon, and mercury.

Azeth is also taken for the liquor of quickfilver mixed with vitriol and falt, and so sublimed, which is also

with vitriol and falt, and fo sublimed, which is also called aqua permanens, crystallus philosophorum, & luna physica. Azeth is a name for brans. It sometimes signifies the quickssiver of any metallic body. See Rebis. AZRAGAR. Verdigrise.

AZUB. ALUM.

AZUR. Red coral.

AZURIUM. A chemical preparation described by Albertus Magnus. It consists of quickssiver two parts, sulphur one third, sal ammoniac one fourth, mixed in a mortar, then set in a vessel over the sire, till a bluith smoke arises, then take it from the sire, break the glass, and arises, then take it from the fire, break the glass, and powder the contents.

AZUTUM. The ARMENIAN STONE. See ARME-

NUS LAPIS.

AZYGES. A name of the os sphenoides, which AZYGOS MORGAGNII. See STAPHYLINI. A name of the os sphenoides, which see.

AZYGOS, from a, neg. and ξυγες, a pair, without a fellow. The mufculus azygos of Morgagni, rifes tendinous from the junction of the offa palati, and runs down the palatum molle to the middle of the uvula, ferving to

orly from the vena cava fuperior, a little above the peri-

cardium; it is immediately bent backwards over the origin of the right lobe of the lungs, forming an arch which furrounds the great pulmonary veffels on that fide, as the arch of the aorta does those on the left, with this difference, that the curve of the azygos is directly back-wards, but the other is oblique, from thence it runs down by the right fide of the vertebræ dorfi, and before the intercostal arteries, and getting behind or below the diaphragm, it terminates by an anaftomofis, fometimes with the vena renalis, at others with the neighbouring lumbar vein, fometimes immediately with the trunk of the vena cava inferior.

The vena azygos fends out branches from its upper part to the afpera arteria and bronchia, by the name of venæ bronchiales, afterwards it fends out the intercoffales dextræ superiores lower down the intercostales dextræ in-

feriores.

Sometimes there is an axygos, on the left fide, proceeding from the arch of the common azygos; it is afterwards diffributed in the fame manner as the other on the right

fide; but this disposition is very variable.

The azygos having reached the last rib, fends off a large branch, which bending outwards perforates the muscles of the belly, is ramified betwixt different planes, and communicates with the branches of the intercostal veins,

# BAG

In the chemical alphabet is MERCURY.

BABUZICARIUS, from βαζαζω, to speak infausel. BACANON. CABBAGE SEED.

BACCA. A BERRY. In botany, is a roundish fruit, mostly fost, with one or more feeds in a pulpy substance, covered with a thin skin; but if harder, and covered with a thicker skin, it is called pomum, or apple.

BACCA MONSPELIENS. See BACCHARIS.

BACCÆ, are fmall roundish fruit that grow feattering upon trees and shrubs, and in that are distinguished from acini, which are berries hanging in clusters.

BACCÆ BERNUDÆ. SCE SAPONARIÆ NUCULÆ. BACCAR. Jalio called bacca Monspeliensium, BACCHARIS, Sconyza major vulgaris, eupatorium, bacharis, GREAT FLEA-BANE, PLOUGHMAN'S SPIKENARD. It is a fweet-fcented furubby plant, used for making gar-lands; the leaves are rough, the stalk is bent into angles, and from one to four cubits high; the flowers are purple, inclining to white, of a fragrant fmell, the roots like those of black heliebore, they smell like cinnamon. It delights in rough and dry grounds. The roots are a powerful emenagogue, the leaves moderately astringent. Miller Bot. Hift.

BACCHIA. So Linnzus named the GUTTA ROSA-

CEA, which fee, and varus.

BACCHICA. The Ivy.

BACCHUS. The name of one of the heathen gods prefiding over vineyards, hence it is a term given to WINE; the fifth called MUGIL or MULLET, also bears this name

BAHEI COYOLLI. Ray takes it to be the areca, or

BAHEL SCHULLI. An Indian tree; also called

genista spinosa Indica verticillata flore purpureo cœruleo.

A thorny shrub, of which there is one species growing in fandy ground, another in watery. A decoction of the roots is diuretic; the leaves boiled and sprinkled in vinegar have the fame effect. Raii Hift.

BAHOBAB. See BAOBAB.

- Major.

BALANDA, and VALANIDA. Names of the BEECH-

BALANDINA. A factitious stone spoken of by Ray-

BALANI, or GLANDES. A fort of shell-fish shaped like an acorn, whence its name. It is also called pollici-pedes; many forts of them are found adhering to the

pedes; many forts of them are found adhering to the rocks on the coafts of Britain, Normandy, Spain, &c. BALANINUM, OL. OIL of the BEN NUT.
BALANOCASTANUM. See BULBOCASTANUM.
BALANOS. Properly it is an Acorn; but Hippocrates, in his treatife de Affectionibus, expresses by it an oak. Theophrastus uses it sometimes to express any glander. diferous tree. From the fimilitude of form, this word is used to express suppositories and pessaries. It is a name

for the glans penis. See Adipsos.

BALANUS. The Glands, or nut of the YARD.

MYREPSICA. See BEN.

BALASIUS. A fort of gem of the carbuncle kind.
BALAUSTIA. called also maius Puinca fylvestris;
BALAUSTIUM. granatus fylvestris, the double flowered wild POMEGRANATE, or the BALAUSTINE TREE.

The Punica granatum, plena major, Linn.

Balanslium is properly the cup of the flower of this tree. The balanslium, which are in the shops, are large rose-like flowers of a deep red colour, set in long, bell-shaped, tough cups; they are produced on the balanslia flore pleno majore, C. B. which is a low prickly tree or hard. fhrub, with long narrow leaves, with a brownish acerb fruit, about the fize of an orange. It is a native of the fouthern parts of Europe, and is cultivated in our gardens for the beauty and duration of its flowers. The dry flowers are brought from abroad into England, but those of our own growth do not feem to be inferior to the foreign.

These flowers are mildly astringent, but less powerful than the bark of the fruit, and have a rough bitterifh tafte. They give out their virtue to water, and to rectified spirit of wine; the extracts made from these tinetures retain all their aftringency, but the watery infu-fion yields moft, and the spirituous a somewhat stronger

The dose of these flowers may be from one scruple to two drams, to which quantity, most of the vegetable

aftringents may be given.

BALBUTIES. A defect of speech, properly that

fort of stammering, where the patient sometimes hesi- glow is excited in them by moderate exercise, and this tates, and immediately after speaks precipitately; the when the stomach is the most empty. pfellifmus balbutiens of Dr. Cullen.

BALCHUS. See BOLCHON.

BALLA-MUCCA-PIRA. See Momos DICA.

BALISTÆ, Os. from \$2224, to caft. See ASTRA-

BALLOTE, called also marrubium nigrum fætidum, marrubiastrum, melissophyllum, and BLACK STINKING HORE-HOUND.

It shoots up from one root, in numerous black, square, hairy stalks; the leaves like common horehound, but larger and rounder, black, and hairy, and set at distances about the stalk, like those of the melissophyllum, by which name it is called by some; the slowers are white, and grow about the stalks in whorles. It grows in paths, highways, and hedges, flowering in July.

A strong decoction of it, freely taken, is of great estimated against hysteric affections.

BALNEA. BATHS.

Embrocations, fomentations, and baths, differ from each other as follows: the first are sluids, designed to pass through the skin, when rubbed on it, to dislodge fome obstruction, ease pain, or to irritate the part into more warmth, and a greater fense of feeling: the second differ only in the manner of application, which is with actual heat, by means of fiannel cloths or sponges, and that they are made in an aqueous menstruum, as their application is more extensive: the third differ from them both in being univerfal, the whole body being immerfed in a bath, and from the first in being always of a watery

kind. Baths are either of fimple cold water, and then are called cold baths; fimple or medicated water made hot, or that is fo by natural means, these are called warm or

hot baths, according to the degrees of heat given.

The first instance of cold bathing as a medicine, is that of Melampus's bathing the daughters of the king of Argos; and the first of warm bathing is Medea's use of it, whence the was faid to burn people alive, because that Pelias, king of Theffaly, died in a warm bath under her

Of the artificial warm baths, the fulphureous are the most useful; they promote perspiration, relax, and penetrate. The following are good general forms for

# BALNEUM SULPHUREUM, a SULPHUR BATH.

R Raffur, guaiac, fulph. nativ. aā jh i. fs. coq. in aq-font. cong. xiij. ad xij. & adde aq. font. frigid. q. f.

R Hepat. fulphuris 3ij. Aq. font. calidæ q. f.

These baths should be entered into every day; and in some obstinate disorders of the skin, twice a day is not

Spring waters are usually the coldest; but if required, the coldness may be increased by adding fal ammoniac, nitre, or rolls of brimstone, just before the patient enters into them.

The sea water is the heaviest, and is so in proportion to the degree of falt it contains; but it is not fo cold as the fresh water of springs.

### Of the COLD BATH.

Cold bathing is the most useful where a strong shock is required, the humours too much dispersed, and a counteracting revulsion of the folids to promote the circu-lation of the blood and humours impeded, and where the furface of the body requires bracing up to a more tense

The cold bath contracts the folids, condenses the fluids, and accelerates their circulation; and this by its ftimulus, when the water is fresh, and by its gravity as well as stimulus, when it is falt. As to pressure, the cold and the hot bath seem not to differ; if the benefit is expected from this principle, the fea-water must be chosen.

In tender conflitutions, and fome difeases in which a morbid viscidity is the offending cause, a moderate warm bath should be used before the cold one is attempted, and

the approach to coldness should be gradual.

When the fibres are rigid, and the viscera unfound, cold bathing is injurious; fat people are very little bene-

Previous to cold bathing, evacuations, fuch as the conflitution of the patient requires, flould be made. When fweating is to follow the immersion in cold water, the patient should return from the bath as speedily as possible, be rubbed dry, and then put to bed. If cold bathing is used to increase the strength, to preserve health, or to thin the humors, sweating should not succeed. In a morning is the best time for the cold bath, because then the peripiration is generally most finished, and the body freest from what nature can alone throw off by the skin. If the cold bathing continues to make the patient cold and numb after he comes out of the water, notwithstanding precautions against this effect, this kind of bath-ing must be omitted. While it continues to excite an univerfal glow after coming out, it is useful.

In climes that are changeable, and where there is much damp weather, cold bathing, by making the fkin lefs fufceptible of fuch changes, proves very falutary. In cold countries, bathing in cold water is generally the leaft difagreeable, and the most falutary. The Russians used cold bathing both frequently, and in a manner that is also cold bathing both frequently, and in a manner that is almost peculiar to themselves; they first make themselves fweat and then plunge into the cold bath; but it should be observed, that the different effects of going into cold water when hot, are from the different modes of the heat being excited. The Russians heat themselves before cold bathing, by exposing their bodies to an external heat, and fitting quictly in it; now in this case, though the pulse is quickened, yet the lungs are not affected, nor is respi-ration hurried: but if the heat had been excited by exercife, the respiration would have been affected at the same time, and in the fame degree as the pulse; and from this circumstance arises the danger of sudden cold succeeding heat thus raifed.

Though the proper use of a cold bath is very strengthening to many, yet if the patient stays in much longer than is necessary for being wholly immerfed, he will be weakened by it, and that proportionably to his continu-

Dr. Wainwright observes, that the most obvious effects of bathing are, from the pressure of the water on our bodies, and from its moisture. The pressure is increased by cold, and the moisture by warmth; he fur-ther says, that first, if we would have the blood dis-folved; secondly, viscid matter removed from the sides of the veffels; thirdly, the glands fcoured; fourthly, the fpirits increased and rendered more active; fifthly, the urinary discharge promoted; fixthly, obstructions in the viscera removed; if the cases are not remarkably confirmed, order bathing; for on the first, second, and third of the above intentions, it is that we proceed thereby to cure the itch, leprofy, and elephantiafis; on the first four, the palfy, melancholy, and madnefs; on the fifth, gravelly cases; the fixth, in conjunction with the other, in cachectic, icteric, and hydropic cases.

# Of the WARM and HOT BATH.

Warm bathing was regarded by the Greeks and Romans not only as an efficacious remedy, but also as one of the highest enjoyments of luxury. The North American Indians, are very fuccefsful in their cures by vapour bathing, which they manage by shutting themselves in a finall room, then throwing a very hot ftone into a pail of water, and when thus fweated for fome time, they plunge into cold water, then return again to receive the hot vapours. The Greeks, at this day, have hot baths in their houses, if capable of bearing the expence; if not, public ones are provided by the government for them, which also obliges them to bathe there at certain periods of time, though no diforder is manifest; and certainly with much reason, especially as age advances, for old peo-ple are strengthened by it, perspiration is also facilitated, which in dry skins is much retarded, and thus many discases are prevented.

It is on the principle of absorption that benefit by the warm, and all medicated baths, is faid to be defired; but certainly great good is to be expected from the promo-tion of intentible perfpiration, and folliciting the circula-tion of the fluids to the furface of the body.

Before entering on a course of hot bathing, let the fitted by it; and none should engage in it before a gentle plethora, if there is any, be reduced by proper evacuation;

When diforders, or their causes, are confined to the inward parts, so as to interfere with their functions, then the warm bath is the propereft method of relief.

The heat of the bath being regulated, for weakly peo ple faint in very warm ones, let the patient's body be well rubbed, that its power of abforption may be increased, and it should be well dried at least, on returning out of the water.

In the morning fasting, and four hours after dinner, are proper times for bathing, and an hour at a time is the longest stay in the bath that should be permitted.

If after bathing a few times, the belly feems retracted, the patient will be benefited by continuing it; but if the hypochondres feem inflated, and uneafiness is complained of in the bowels, or if alternate heat and cold affect the patient, it must be omitted.

The corpulent, those with tense fibres, and those with cold temperaments, are much benefitted by the warm bath.

The fenfations of the patient will best determine the necessary degree of heat to be used, that which produces the most agreeable is the point to be abided by; but where much heat is most likely to be of use, it can be best supported by the patient, if a small quantity of petroleum Barbadense is added to the water.

Cancers have been much relieved by baths, and more benefit may perhaps be obtained by this method of cure than by any other; for the glands are the most absorbent parts, and by this method medicines come directly to the part, whereas by the stomach they undergo some change before they arrive at their proper feat of action. Proba-bly fcirrhous tumors, tophs, nodes, &c. would be best attacked in their beginning this way.

Warm bathing is generally forbid in those diforders that impair the understanding, or affect the head with giddiness and pain, in which the lungs are weakened or affected, when inflammation is an attendant fymptom, when a flying gout or rheumatism is also the matter of complaint, and when there are moveable tumors. But in almost, if not every other case, where bathing is advisable, the warm is to be preferred; and if it neither finks the spirits, wastes the strength, nor lessess the appetite, it will be proper to continue it.

See among the ancients Hippocrates, Celfus, Cœlius Aurelianus, Aretæus, and Trallian; and among the moderns, Hoffman, fir John Floyer, and Dr. Wainwright,

BALNEABILIS. An epithet for fuch waters as are

proper for bathing.
BALNEUM ARENÆ. BALNEUM SICCUM. The SAND BATH.

Over the mouth of a common wind furnace, place one end of an iron plate, with a ledge round it, and un-der this plate the canal must run, by which the furnace communicates with its chimney; the plate must then be filled with fand or other dry matter, for placing the me-dicines to be directed in the few than being bindled. dicines to be digefted in; the fire then being kindled, the heat will be different in different parts of the plate, and thus, as the things to be digested require more or lefs warmth, they may, at the fame time, be fuited by one and the fame fire, for the heat of the fand gradually decreases as the plate on which it lays is extended from the mouth of the furnace.

The veffel containing the matter to be heated, hath its bottom and fides totally covered with the fand, and there it is continued until the digeftion is completed.

Ashes may be used in this bath when a leffer heat is wanted, fand for a greater, and iron filings for the greatest. See FORNAX. —— MARIÆ vel MARIS. The WATER OF VAPOUR BATH; fometimes it imports the heat of boiling water.

This is when the veffel, containing the matter to be treated, is placed in another that is full of water, under which a fire is put, that by this means the water becoming hot, may, in its turn, heat the matter to be digested. When a greater heat than that of boiling water is not required, this method of digestion is preferable to that by the fand bath, because the heat cannot exceed at any time that which is required. — SICCUM. See BALNE-UM ARENÆ. — VAPORIS. A VAPOUR BATH. This is properly when the veffel containing the matter to be digested is exposed only to the steam that arises from

ation; and make the bowels lax if they are not already | boiling water. Vapour baths are also applied to the hus man machine in many cases, where warm baths have been thought adviseable, but with more certain successand relax the habit in general lefs, where the fluids are wanted to be follicited externally.

BALSAMELLA, i. c. BALSAMINA. See MOMOR-DICA.

BALSAMI OLEUM. See Balsam GILEADENSE. BALSAMICA. BALSAMICS. Balfamica is a Latin word which fignifies mitigating. The term balfamic is a very loofe one; it includes medicines of very different qualities, as emollients, detergents, reftoratives, &c. but in medicines of all these kinds there seems to be this requifite in them, viz. that they be foft, yielding, and adhefive; also that by their fmallness they have a ready difpotion to motion. Medicines of this tribe are generally required for complaints whose feat is in the viscera, and as they cannot be conveyed there but by the common road of the circulation, it follows that no great effects can be expected from them but by their long continuance. Hoffman calls those medicines by the name of balfamics which are hot and acrid, also the natural bal-

fams, gums, &c. by which the vital heat is increased.

Dr. Fothergill cautions against the very general use of balfamics in consumptions; to this end he inserted a valuable paper in the fourth volume of the London Medical Observations and Inquiries; which may be seen in his Works, vol. ii. Amongst other observations, he says, that from the idea, that all balfams are healing, and that in all ulcers they are indicated, they have been dithat in all ulcers they are indicated, they have been di-rected in cases of ulcers in the lungs; the consequence, he doubts not, hath been frequently statal. Ballamic medi-cines, he adds, are warm, and stimulate the folids; the effect of such medicines will vary greatly in different states, &c. of the same diseases, e. g. If in an inflamed ulcer, in a young and vigorous constitution, a warm stamulating gummy refin is applied, pain, heat, and inflammation will enfue, fluxion to the pained part will be great, a very confiderable difcharge will follow, confifting of the juices emitted from the wounded veffels, and the veffels themselves dissolved by heat and putrescence. If these are excessive, the detriment to the sick will be in proportion to the degree of the discharge and the part affected. The fame medicines applied to a cold, ferous, phlegmatical habit, in an advanced age, will be just fufficient perhaps to produce such effects as would be deemed perfectly inlutary; that is, bring on a proper digeftion. Suppose now, that these medicines have similar effects when internally exhibited, what can be expected from them in cases of ulcerated lungs? If they pass the stomach, &c. and arrive at the seat of disease unaltered, their essential will be as just related. They will stimulate, quicken the circulation through the lungs, and by confequence render their motion more frequent; a circumstance very unfa-vourable to their being healed. If the patient is young and vigorous, the discharge of sluids, and the dissolution of the folids, will be in proportion to the activity and heat of the medicine, and the temperament of the fuf-ferer. These effects will at once be condemned as injurious in a discase which requires the heat to be abated, and the irritation to be leffened; fymptoms which never fail to manifest themselves when the lungs are ulcerated. Though, as antifepties, balfamic medicines should be proposed, their stimulus on the solids would produce ill effects, too far counterblancing the advantage, to admit of their being administered.

BALSAMUM, called also baifamum genuinum antiquorum, balfamelæon, Ægyptiacum balfamum, balf. Gileadenfe, Afraticæ, Judaicum, e Meccha, & Alpini; oleum enfe, Afiaticæ, Judaicum, e Meccha, & Alpini; oleum balfami, eylebalfamum, opobalfamum, the BALM of Gi-LEAD; which is a refinous juice, obtained from an ever-green tree or thrub, faid to grow in Syria and Arabia. The amyris Gileadenfis, or amyris folia ternatis integer-rimis, pedunculis unifloris lateralibus. Linn. The best fort, which naturally exudes from the plant, is scarcely known in Europe. Prosper Alpinus says that it is at first turbid and whitish, of a strong pungent smell, like that of turpentine, but much sweeter and more fragrant, of a bitter aerid aftringent taste; on being kent it becomes thin. bitter acrid aftringent tafte; on being kept it becomes thin, limpid, light, greenish, and then of a golden yellow; after which it is thick like turpentine, and loses much of its fragrance; some compare its smell to that of citrons, others to a mixture of rosemary and fage-flowers.

It does not feem to excel any other of the balfams ex-cept in its fragrance; all the balfams agree in their general qualities, differing only in the degrees of warmth, pungency, and gratefulnefs. The balm of Gilead is a warm, flimulating, expectorating, detergent, diuretic cordial, and nervine medicine; its diuretic quality is greatly

increased by the addition of a fixt alkaline falt.

The Canadian bolm of Gilead fir affords a balfam that is often imposed for the genuine fort. If the true ballam is dropped in water, when thin, it fpreads itself on the fur-face, imparting to the water much of its taste and smell, and the groffer part remaining at the top is thick enough to be taken up with a needle; this is reckoned a mark of its being genuine. If pure balfam is dropped on a woollen cloth, it may be washed off without leaving the least stain or mark, but the adulterated flicks to the place. The pure coagulates with milk, but the adulterated will not.

This balfam is made into draughts by mixing it as fol-

BANANIERA. A name of the FICUS INDICA.

BANDURA, called also planta mirabilis distillatoria. Its feeds and feed-vessels are like those of gentian; but it is most remarkable for a foliacious sheath about a foot long, and as thick as a man's arm; it hangs by a leaf, and is half full of a fine potable liquor. The root is aftringent, the liquor in the sheath is cooling, it grows not far from Columbo in moift shady woods. Raii Hist. See

BANGUE, called also bangue canabi fimile, cannabis Indica trifoliata, bangue Indorum; cansjava, called by the Ægyptians affis; cannabis peregrina, altheese folius cannabinis, kalengi-cansjava, tfyeru-cansjava.

It refembles hemp in its stalk, the rind of the stalk, and

the leaves; but its medicinal qualities differ very much.
The feeds and leaves are heating, and strangely affect the imagination. It grows in Indostan and other parts of the

BANICA. See PASTINACA SILVESTRIS.

BANILIA, Sce VANILIA.

BANISTERA. Miller takes notice of five species, all natives of the warmer parts of America. Three forts grow in Jamaica, the other two in the Spanish West Indies-Also in woods, and run up adjacent trees to the height of ten or twelve feet. Father Plumier and fir Hans Sloan called them maple; but the flower, and indeed all the plant except its feed, being fo very different, Dr. Houstoun named them banistera.

BAOBAB, The tree is the largest production of BAHOBAB, the whole vegetable kingdom. The trunk is not above twelve or fifteen feet high, but from fixty-five to feventy-eight feet round. The lowest branches extend almost horizontally, and as they are about fixty feet in length, their own weight bends their external trunks. mities to the ground, and thus they form an hemispherical mass of verdure about one hundred and twenty or one hundred and thirty feet diameter.

The roots extend as far as the branches. That in the middle forms a pivot, which penetrates a great way into the earth, the rest spread near the surface thereof.

The flowers are in proportion to the fize of the tree; and are followed by an oblong fruit pointed at both ends about ten inches long, five or fix broad, covered with a kind of greenish down, under which is a ligneous rind, hard and almost black, marked with rays which divide it lengthways into fides. This fruit hangs to the tree by a pedicle two feet long and an inch diameter. It contains a whitish fpongy juicy fubitance, of an acid tafte, and feeds of a brown colour and the shape of a kidney-bean. The pulp that furrounds these seeds is powdered when dry, and brought into Europe from the Levant under the name of terra figillata Lemnia. It grows mostly on the west coast of Africa from the Niger to the kingdom of Belin.

It is the only species of the genus called by Linnaus,

adansonia.

The bark of this tree is called lale; the negroes dry it in the shade, then powder and keep it in little cotton bags, and put two or three pinches into their food; it cools them

and promotes perspiration.

The mucilage obtained from this bark is a powerful remedy against the epidemic fevers of the country that produces these trees; so is a decoction of the dried leaves. The fresh fruit is as useful as the leaves for the same pur-

pofes.

Profper Alpinus, in his work De Plantis Ægypt. de-fcribes a fruit under the name of basbab, which is of the fize of a lemon, and refembles a gourd in its fubstance, of a gratefully acid taste, with black seeds in it, and a pulp of a red colour. And from its resemblance to this fruit, a stone which he mentions is called the basbab

BARBUS, called also barba, barba, mystus fluviatilis;
BARBUL. It is a fish of an oblong form, and a middle
size, beset with large tender scales, and found in pure
running waters. There are two forts, one is bearded,
the other not. They breed three times in a year.

BARBUS CALLED A Service of her met with in some

BARBYROUSA. A species of hog met with in some of the East India illes, particularly that called Bouro.

BARDANA. BURDOCK. It grows on highway sides, and is sufficiently known by the burs which stick to the cloaths.

BARNADA MAJOR, called also lappa major, arctium lappa, personata arcium Dioscoridis, Britannica, CLOT-BUR, or GREAT BURDOCK. It is the arctium lappa, or the arctium major, foliis cordatis inermibus petiolatis. Linn. The roots have very little fmell, but a fweetish tafte, with a light bitterishness and roughness. Boiled in water they impart a brownish colour, and a fost vapid kind of taste. Extracts, however made, are as infipid as the root. They are chiefly commended as diuretic and antifcorbutic; but are also used against rheumatisms, the lues venerea, and in all cases in common in which China and sarsaparilla roots are prescribed, for they resemble them in all their fensible qualities.

The leaves are bitter, and more faline than the roots, and have none of their fweetness. The feeds are bitter, and flightly aromatic. A dram of them is a dofe as a diuretic; but the prickly matter on their furface must be well removed, before administering them. The best method of using this plant as a medicine is in the form of a decoction, in which the root only is boiled, e. g.

Decoflum Bardanæ Rad. The Decoction of BURDOCK ROOT.

R Rad. Bardan. 3 ij. aq. puræ fb iij. coq. ad confumpt. fb i. & adde kali vitriolat. 3 ij.

Of this a pint should be taken every day in scorbutic and rheumatic complaints .- MINOR, called also lappa minor, xanthium, the LESSER BURDOCK, or LOUSE-BUR. The stalk is juicy, the leaves oblong and sharp-pointed, and of a yellowish green. The slowers are inconsiderable, but the fruit is a rough capfula, containing a single feed. From this roughness of the fruit it is called a burdsck, though not in the least allied to that plant. It grows in which is followed as formal and in the least allied to that plant. rich fat foils, and is found on fome commons. Its juice is commended against scrophulous disorders .-TICUM, called also lappa major montana, bardana montana, perfinata altera, perfonata montana, and WOOLLY-HEADED BURDOCK. Its virtues are much the same with the other species of burdocks.

BARIGLIA, Names of the mineral fixed alkaline BARILLA, falt. See ANATRON.
BARRELIA. A plant fo called from Jacobus Barelier, of Paris, a great botanist. In Jamaica it is called SNAP-DRAGON. Miller mentions two species; but it is not noted for medicinal virtues.

BARNACLE. A shell-fish, that is found adhering to the planks of thips during long voyages. It is also a name

of a species of goose that is met with in Scotland.

BARNET WATER. It is of the purging kind, of a similar quality to that of Epsom; and about half its strength. See AQUA CATHARTICA AMARA.

RAPONETERS.

ftrength. See AQUA CATHARTICA AMARA.

BAROMETRUM, BAROMETER, of Bapos, beauty, and pergen, measure. An instrument to determine the weight of the air, or observe the changes; it is commonly called a weather glafs, and frequently the Torricellian tube, from Torricelli its inventor. He confidered that a column of water of about thirty-three feet, was equal in weight to a column of air of the same base: and concluded, that a column of mercury, of about twenty-nine inches and a half would likewife be equal to a column of air. He accordingly made the experiment, and the apparatus he then used is now the common barometer.

The bore of the common tubes that are hawked about for fale is too fmall. The glass tube should be one-third, or at the least one-fourth of an inch in diameter, hermetically fealed at one end, and open at the other; the length flould be thirty-four inches: the mercury with which it is filled must be pure. Fill the tube quite full with this mercury; and having in readiness a bason with a flat bottom, and about two inches high, in which is also fome mercury; invert the tube, and put it in the bafon, itill holding your finger underneath it, till it is in the mer-cury of the bason, then place it in a frame. On taking away your finger, the mercury in the tube will immediately subfide to about twenty-nine or thirty inches, according to the state of the air, it being very rarely lower than twenty-eight, or higher than thirty-one inches. the barometers that are generally used, the highest which the mercury is known to fland in the tube, is usually about twenty-nine inches, when the air is heavy; but not above-twenty-fix, when the air is very light. If a fcale of four inches be divided into tenths, and placed against the upper end of the tube, the instrument is complete.

In fine dry weather the air is charged with a variety of vapours, which float in it unfeen, and render it extremely heavy, fo that it preffes up the quickfilver; or, in other words, the baremeter rifes. In moist rainy weather the for them to rise, so that then the air is sensibly lighter, and preffes up the quickfilver with less force; or, in other

words, the barometer falls.

The barometer measures the weight of the air with exactness enough for the general purposes of life, yet it is often affected with a thousand irregularities, that no exactness in the instrument can remedy, nor for which theory can account. When high winds blow, the mer-cury is generally low; it rises higher in cold weather than in warm; and is usually higher in the morning and evening than at mid-day: it generally defeends lower after rain than it was before it. There are also frequent changes in the air without any fensible alteration in the barometer. In general men feel themselves braced, strong, and vigorous, with a large body of air prefling upon them: they are languid, relaxed, and feeble, when the air is light, and so fails to give our fibres their proper tone. On advancing up high mountains, the air is less and less dense, and usually the same inconveniencies are selt that are complained of when the air is moift. But it is observed in the Journey to the Glaciers, in the duchy of Savoy, edit. 2. that Mr. de Luc and his companions, when at the summit of Buett, were above the level of the Mediterranean sea 3315 English yards; yet, except by their instruments, did not perceive any difference in the density of the air. The air there they found to be near one-third lefs denfe than that of the plains below them; yet, though the weight of the atmosphere was so much diminished, the equilibrium within their bodies was undisturbed. In this place, Mr. de Luc observes, how much naturalists are deceived in attributing the alterations that many persons experience upon the falling of the barometer, to a difference either in the weight or denfity of the air, affigning as a cause, the failure of an equi-librium between the external and internal air, or a difference of motion in the heart and lungs, occasioned by the air's being more or less dense. For, if these changes, he fays, could fo fensibly affect our organs, what would become of those Chamois hunters, who pass every day from

the bottom of the vallies to the highest mountains? What | would become of the women of the hamlets by Sixt, who also a name of the as sphenoides from its forming the mid-go up to Fonds (a distance of above six hundred yards in dle of the basis of the skull: The os facrum is called by perpendicular height) every night in the fummer feafon, to milk their cows, and leaving their cattle to the care of their children, go down again every morning to affift their hufbands in the cultivation of their lands? Thefe people perceive no inconvenience; even althmatic peole find none, notwithstanding the barometer varies in these several places, as is usually observed in other similar ones. It is added, that it is necessary to have recourse to fome other cause, which ordinarily accompanies the variations of the barometer, to account for the alterations in our health, and particularly in our ftrength, from which few people, perhaps, upon fuch occasions, are entirely exempted.

The barometer may be applied to feveral uses, as meafuring the heights of mountains; for twelve thousand and forty inches of air being equal to one inch of mercury near the furface of the earth, twelve hundred and four inches, or one hundred feet, must be equal to one-tenth of an inch of mercury. Consequently, if a bars-meter be carried up any great eminence, the mercury will descend one-tenth of an inch for every one hundred seet

that the barometer afcends.

But the great use of the baraneter, is to predict the future state of the weather for several hours, and sometimes days preceding, though not to a certainty, yet in many inflances to a good degree of probability: in order to which observe, 1ft, The rising of the mercury presages fair weather, and its falling, wet. 2d, In very hot weather, the falling of the mercury foretels thunder. 3d, In winter, its rifing portends froft; and in a continued froft, foretels fnow. 4th, When foul weather happens foon after the falling of the mercury, expect but little of it; and to on the contrary of weather. 5th, When the mercury continues to rife for fome time before the foul weather is over expect a continuance of fair weather to follow. ther is over, expect a continuance of fair weather to fol-low. 6th, In fair weather, when the mercury continues to fall before rains come, then expect a great deal of it, and probably high winds. 7th, The unfettled motion of the mercury denotes changeable weather. It is not so much the height of the mercury that indi-

the notion much the neight of the mercury that had-cates the weather, as its motion up and down; therefore to know whether the mercury is actually rifing or falling, observe the following: 1st, If the surface of the mer-cury be convex, it is then rifing. 2d, If the surface be concave, it is falling. 3d, If the surface is plain, or ra-ther convex, it may be considered as stationary.

There are different forms of this instrument; they have each their advantages and difadvantages: but the common

BASAAL. The name of an Indian tree growing about Cochin. It flowers and bears fruit once every year, from the first year of its bearing, to the fifteenth. A decoction of its leaves with ginger in water is used as a garga-rism against disorders of the fauces. The kernels of the

BASILARE Os. A name of the os cuneiforme. It is

this name too. Se SACRUM 8s.

BASILARIS ARTERIA. It is a branch of the vertebral artery, upon the apophysis bafilaris of the os occi-pitis. The two vertebral arteries soon unite, after they have got into the skull and form this artery about the cunciform process of the os occipitis. It runs forward under the great transverse protuberance of the medulla oblongata, to which it gives ramifications, as well as to the neigh-bouring parts of the medulla. Sometimes it divides into two branches from about the apophysis bafilaris, which communicate with the posterior branches of the two internal carotids, and are loft in the posterior lobe of the

BASILIANIS APOPHYSIS. The great apophysis

of the os occipitis

BASILICA VENA. The ancients termed the bafilic vein of the right arm, the vein of the liver, VENA HEPATICA BRACHII; and that of the left arm, the vein of the fplcen; VENA SPLENICA BRACHII. Sometimes the baffaca hath a double origin, by a branch of the communi-cation with the trunk of the axillaris. It continues its course along the middle of the os humeri, between the muscles and integuments; and having reached the inner condyle, and fent off obliquely in the fold of the arm, the mediana basilica, it runs along the ulna, between the integuments and mufcles, a little towards the outfide, by the name of cubitalis externa: and, a little below it, fends off another branch, which runs along the infide of the forearm near the ulna; this branch may be called cubitalis interna. Sec CEPHALICA VENA.

BASILICUM UNGUENTUM FLAVUM. Now called UN-GENTUM RESINÆ FLAVÆ. OINTMENT of YELLOW or BEE's-WAX.

Take of olive oil a pint; yellow wax, yellow rofin, of each a pound; of common turpentine, three ounces. Melt the wax and rofin over a gentle fire, then add thin oil, and ftrain the mixture while hot.

It is commonly employed as a digeftive on wounds and ulcers: it is as ufeful as the linim. Arcæi, now called unguent. e gummi elemi. If it is required to be a little

guent. e gummi elemi. If it is required to be a little warmer, a few drops of ol. tereb. com. added.juft when used will make it so. It gives place to no medicine of its intention, and justly superfedes the use of all others of its kind. Pharm. Lond. 1788.

BASILICUM. BASIL. It is a plant with square stalks, oval leaves set in pairs, and long spikes of labiated slowers, whose upper-lip is divided into sour parts, the lower entire, the cup hath also two lips, one cut into sour seedings, the other into two. This is a term also for accommon symposium, bethe residue of common symposium, bethe residue common medium citrafor ocymum vulgarius, berba regia, ocymum medium citratum. COMMON, OF CITRON BASIL.

Ocymum caryophyllatum, ocymum minimum. or BUSH BASIL, with uncut leaves.

Both these are natives of the eastern countries, and fown annually in our gardens for culinary uses. The feeds, which rarely come to perfection in England, are brought from the South of France and Italy. They flower

in June and July, and feed in August.
Infusions of the leaves are drank in catarrhous complaints and uterine diseases, and to promote expectora-tion. They are succulent, slightly aromatic, have a mu-cilaginous taste and strong smell, which last it loses partly in drying. The first fort resembles the scent of lemons; the second that of cloves. Distilled in water they yield much oil, of a penetrating fragrance, fimilar, but fuperior to the oil of marjoram.

Clinopodium majus, called also clinopodium acinos, and GREAT WILD BASIL. See ACINOS.

Boerhaave enumerates nine species. It grows in hedges. Is an aftringent and emenagogue BASILICUS PULVIS. The ROYAL POWDER.

rifm against diforders of the fauces. The kernels of the fruit kill worms. Raii Hist.

BASELLA. CLIMBING NIOHT-SHADE from Malabar. It hath an annual root, a purple climbing stalk, thick fucculent leaves, and flowers that are in spikes. Miller enumerates three species, but they are of no note in medicale.

3 fs. gr. viij. m.

This is a convenient purge for gouty and rheumatic people, for whom it is best made into pills, and to be taken at bed-time. It is also one of the best purges for grofs-bodied children, who are subject to breed worms, and have large bellies; for though the ingredients are efficacious, its operation will be mild and fafe enough. It clears the bowels of flime, and discharges those humours that obstruct the mesenteric glands, and in a great mea-fure the lacteals themselves, which is often the case in children, and is attended with a hard belly, a sinking breath, frequent fevers, and a decay of strength in the lower parts. Those slight intermittents which such children are subject to, will much sooner be cured by such a purge than by the bark; for these purges reach, and carry off the cause, but the bark pens it up; and by curing one, while fuch restriction continues, gives room for a return with much greater aggravation.

The dose for children is from ten grains to fifteen; for

adults from fifteen grains to two feruples.

BASILIDION. A cerate described by Galen, and used for the itch.

BASILIS. A collyrium mentioned by Galen. BASILISCUS, The BASILISK. Called also a COCK-ATRICE, and REGULUS, or LITTLE KING, because of a white fpot on its head, fupposed to be like a crown. It is one of the most poisonous kinds of ferpents.

Bafilifeus, in chemistry, is also the philosophical sub-

limate mercury.

Bafilifeus is the name of some kinds of stones, and, among the rest, a name for the philosopher's stone.

BASIOGLOSSI, from Basis, the foundation, and press the tongue. See CERATOGLOSSUS, or HYOGLOS-

BASIO-PHARYNGÆI. See HYOPHARYNGÆUS. BASIS, from Baiva, fixus fum, I am fixed. The support of any thing upon which it stands or goes.

The broad part of the heart is called its bafis, to diffin-

guish it from the apex or point.

In pharmacy by basis is meant, that ingredient on which the most stress is laid for answering the intention of any compound medicine.

BASSI COLICA. The name of a medicine in Scribonius Largus, compounded of aromatics and honey.

BAT. An abbreviation of Batavia.

BATATAS. See BATTATAS.

BATAVIS. A species of PRIVET.

BATCIA. A name of the postimaca sylvestris.

BATHMIS. A feat, basis, or foundation, from \$astu,

fundatus sum.

Hippocrates and Galen use it to express a finus or cavity of a bone, which receives the protuberance of another at the joints, particularly those at the articulation of the humerus and ulna.

BATHONIÆ AQUÆ. Called also aquæ solis, aqua

badiza. BATH WATERS.

Dr. Cheyne accounts for the heat of this water by the following experiment: first mixing filings of iron, and the powder of fulphur, then working them into a paste with water, and putting them into a cellar, under a cock which drops water gradually and flowly, the paste will ferment fo, that the water running from it shall be of the fame heat and virtue with those of Bath, though not fo pleafant, nor fo well fitted for human bodies. These are the only two natural bodies known, which, meeting with each other, will produce heat in water without artificial fires. Tournefort observes, " that the filings of iron will grow warm by fleeping in common water, but much more so in fea-water; and if powdered sulphur is added thereto, the mixture will burn.

Dr. Cheyne farther observes, that the heat of Bath toater is owing to a principle in itself, as is evident from its retaining its heat longer than any other water heated to the fame degree: that the fulphur in the Bath water is evident to the fenses, for it is collected from the furfaces of the bath; and iron is manifeftly in it, as appears from the blue tincture which it ftrikes when mixed with an infusion of galls; and by analysis sea-falt is found in

Most hot waters feem chiefly to confist of fulphur and iron, and to differ only as the fulphur or the iron predo-

ter, more naufeous, and purgative. According to the Experiments of Dr. Bryan Higgins, a Winchester Gallon of Bath water contains

Of calcarious earth combined with vitriolic dwt. gr. acid, in the form of felenite 3 1910 Of calcarious earth combined with acidulous

0 2275 Of marine falt of magnefia 2270 0 1410 Of fea falt

Of iron combined with acidulous gas 010 Acidulous gas, befides what is contained in the above earth and iron, twelve ounces measure; and atmospheric

air two ounces.

It is from the combination of fulphureous gas, fea-falt, &c. that the Bath water is fo ufeful wherever the vital heat requires an increase; nothing but iron can make such a fpeedy improvement as this water does in decayed conftitutions; and it is the foapiness of it, from the union of its fulphur and iron, that relaxes fo as to give vent to gouty, and other matters, by perspiration. This water gives much relief in gouty and nephritic complaints; in disorders of the stomach, arising from a weakness of the absorbent power in the digestive study. It is of singular efficacy in relieving that species of palfy which is frequently met with amount painters, plumbers, and other manufactures of lead. It is fafe and beneficial only when the vigour of the constitution is reduced, and when the vis vitæ is to be reftored.

The feafon for drinking the Bath waters is whenever they are wanted; for there is little or no fensible difference in them at any time compared with another. Some who have drank them for fome time, leave them off for a month in the hottest weather, but cold constitutions need not, for they find them rather better at that time. With some persons cold weather suits the best with their drinking it, especially when the season is dry, and in clear frost it is the best of all.

More than two pints in a day can never be required, which may be drank at three or four times, a few hours intervening betwixt each portion; and in fuch chronical diseases as require preparations of iron, the artificial ones may at the time be used.

In all internal diforders, where iron and fulphur are prescribed, the internal use of this water is effectual; and by bathing only in it, much relief is obtained from fixed or wandering pains, ftiffness of the joints, contrac-tions of the tendons, wasting of the limbs, palses, rheu-

By the experiments of Dr. Prieftley and some others, it remains beyond a doubt, that to the quantity of fixed air contained in mineral waters, is owing to the whole virtue of fome, and a principal one of them all. And fuch is the tenuity of the fulphur and iron in these waters from their perfect solvend the fixed air therein, that the nicest fealed cork cannot long retain the medical parts; they should therefore be drank on the spot.

The four principal waters in England that poffefs any remarkable heat, are those of Bath, Buxton, Briftol, and Matlock. The first of which raises Fahrenheit's thermometer from about one hundred to one hundred and twelve; the fecond to about eighty; the third to feventy-fix; and

the last to fixty-fix or fixty-eight.

Dr. Monro, in fpeaking of these waters, says the high-eft degree of heat attributed to them by

Dr. Howard, Dr. Charleton, and Dr. Lucas, are from the pump of the king's bath, 113 hot bath 114 crofs bath 108 119 of Fahrenheit's ther-119 mometer. IIO

And that on evaporation, a gallon of them has been found to contain, of iron 1/2 parts of a grain; of calcarious earth 22½ grains; felenites 31½ grains; Glauber's falt 25½ grains; fea-falt 51½ grains; which were mixed with an oily matter, but not more forthan is common to all waters. From this and other accounts it appears that the Bath waters are chalybeates, in which iron and earth are kept fuspended by means of aerial acid; and that they are impregnated with a small portion of selenites, sea-falt, and either Glauber salt, or vitriolated magnetia. Indeed these waters were for a long time esteemed to be fulphureous, but certainly they have not a title to that name in the least; they do not affect the colour of filver, or metallic folutions, or produce any other effect of

water impregnated with fulphur.—They operate powerfully by urine, and promote perspiration; and if drank quickly, and in large draughts, they fometimes purge; but if taken flowly and in small quantities; they rather incline one to costiveness; cause a sense of heat; and oftentimes a heaviness of the head; with a propensity to sleep—particularly on first drinking them.—These waters have been much recommended in diforders of the stomach and bowels; in the gout, rheumatifm, palfy, and variety of other complaints. -They are likewise much used for bathing in ; - and for pumping on paralytic, or other diseased limbs: when taken internally as they often heat on the first using them, it is right to cool the body

by taking a dofe or two of fome mild aperient medicine, and to live on a cooling regimen, before entering into a course of them, and for the plethoric, to lose a few ounces of blood; - and during these courses to live regular, and if inclined to be too coffive, to take occasionally a dofe of fome cooling physic. See AQUA SULPHUREA; Dr. Cheyne's Account of

the Bath-waters; and Dr. Falconer's Effay on the fame. Monro's Treatife on Medical and Pharmaceutical Che-BATHRON. The SEAT or SUPPORT. It is also the

BATRACHIUM. CROWFOOT, CRANE'S-BILL. See GERANIUM.

BATRACHUS. An inflammatory tumor which rifes under the tongue, especially of children. Actius fays it is a tumor under the tongue, especially in the veins. See RANULA. From Satteax , a frog. BATTARISMUS. See PSELLISMUS.

BATTATAS, Called also BATTATTA VIRGINIANA, BATTATUS. Solanum tuberosum esculentum, papas vel pappus Americanus vel Peruvianus. The common or Virginian Potatoes.

They were first brought into Europe by fir Francis Drake in 1486. He then brought home the famous ma-thematician Mr. Thomas Heriot, who was fent to Virginia, by fir Walter Raleigh, to explore the productions of the country, who brought these roots with him. He gave them to Gerard the botanist; who first planted them in London; and fent them to Cluffus, in Holland, who also planted them in Burgundy; and he fent them to Italy, as appears from the works of these, and several other authors. It was from this introduction into Europe that so many writers say they were natives of Virginia; but the truth is, they will not grow there without kilful culture. They are natives of Peru.

Petatoes are a species of solanum, viz. folanum tuberefum of Linnæus, and though with us they require a funny exposure, yet in the hot countries where they are native, those that grow on the furface of the ground, or under too thin a covering of earth, are so strong of the possonous quality of night-shade, that the hogs will not

The light mealy ones are the best, and, by proper ma-The light mealy ones are the best, and, by proper management, a wholesome nourishing bread is made of them. Their use, as at present, is both profitable and falutary. More brandy may be obtained from an acre of pstates, than from an acre of barley. They also afford much starch.—They contain water more than half their proportion of other matter which renders them of easy solution, and digestion in the stomach and are less liable to become associated and sive the heart have then the to become acceleent, and give the heart-burn than the unfermented cerealia.

The varieties of potatoes are numerous, and may yet what ftronger, and by much a the food contained in the apples. The or verjuice, diffolves it wholly. be increased from the seed contained in the apples.

potatoe itself is not properly the root of the plant, but rather an under ground fruit, produced upon a confined branch. The real roots do not produce potatoes, they only ferve the purpose of drawing nourishment from the foil, as the leaves above extract it from the atmosphere. The potatoe below, and the apple above, are in fact the fame, but living in different elements, they affume different ap-pearances. The one feems to be intended for the prefervation of the species, the other for the food of animals. Such is the increase of this vegetable, that from one large potatoe, which was cut into nine pieces, eight stone and eight pounds, of good fizable ones, hath been produced.

Potatoes produced from fets, after a number of years are found to decrease in bearing; for which reason they should be brought back every fourteen years to their original. It is after this period, that those produced from the feeds themselves decline.

In Sweden, the leaves of the potatoe plants are manufactured for imoaking inflead of tobacco.

See on this article many remarks, both curious and pro-fitable, in the Georgical Effays. Cullen's Mat. Medica. BATTATAS HISPANICA, also called amotes, Indica ca-motes, batatas occident. BELLICULUS. A species of shell-fish like the PERI-

BELLIDIOIDES. See Bellis Major.

BELLIRICUS MARINUS. A shell-sish like the periwinkle.

BELLIS. The DAISY.

Of this plant there are many species, and several other

plants also are called by this name.

Bellis Minor, called also confolida minima, fymphytum minimum, bellis fylvestris minor, BRUISEWORT, and COMMON DAISY. Bellis perennis, Linn. It is too well known to need a description. Its leaves and flowers loofen the belly, are commended in disorders that arise from drinking cold liquor while the body washot. The leaves are flightly acrid, the roots rather more fo. They have a fubtle penetrating pungency, that is not hot nor fiery, but like the contrayerva. The root preferves this pungent matter when dried, and an extract made with water, or with fpirit, retains the greatest part of its virtues. It is an ex-cellent antiscorbutic.—That named — Major, also called confolida media Lobelii, bellidioides, bellis fylvestris, caule folioso major, leucanthemum bellidis facie, buphthal-BEHEM, or Behemen. Been, and ben, are erroneoully made to be homonymous with balanus myrepfica.
The name of this root in Arabic, is behem, or albehem.
The behem is of two kinds, the white and the red. The
Greeks use the term hermodactyls for behem; both of
which they describe as the same, and as being of two sorts,
viz. the white and the red.
The glans unguentaria is the Arabian ben.
BEHEN ALBUM, called also jacea orientalis patula,
behmen abrad Arabum, raphomicoides lutea, and the true
white ben, or behem of the ancients.

BEN, also called balanus myrepsica, glans unguentaria, mun ben, nun unguentaria moris, Coatlis. The OILY ACORN,

oily NUT, or BEN NUT.

It is a whitish nut, of the size of a small filbert, roundish, triangular, with a kernel covered with a white skin,
produced by a middle-sized tree, resembling the birch.
It grows spontaneously in the East Indies and America;
we have them also from Arabia.

These kernels have a nauseous bitter, oily taste, are

purgative, occasion a nausea and gripes: on expression they yield one fourth their weight of a yellow oil almost insipid and flavourless; the nauseous bitter remains behind, infipid and flavourlefs; the naufeous bitter remains behind, and is not foluble in oily menitrua. This oil does not grow rancid by long keeping, as is common with expressed oils, on account of which it is used as the basis of odoriferous unguents and perfumes. It is impregnated with the odour of jessamine, and other slowers, by stratifying them with cotton dipped in the oil, and repeating the process with fresh slowers, until the oil becomes sufficiently odorous, after which it is squeezed out from the cotton in a prefs. It is also a name of the behem.

Dale says that the signum nephriticum is the wood of

Dale fays that the lignum nephriticum is the wood of the tree which bears these nuts.

There is another species of ben, much larger than the above. Monardus calls it ben magnum, feu avellana purgatrix, the GREAT BEN OF PURGING FILBERT It purges

and vomits violently.

BENATH. The Arabic name for fmall puftules which rife in the night after fweating.

BENEDICTA, AQUA. Formerly the aqua calcis fimplex was thus called. It was the name of a water diffilled from ferpyllum, and also of the vinum bene-

BENEDICTA, AQUA COMPOSITA. i. c. AQ. CALCIS.

COMP. See CALX. — HERBA. The HERB BEN-

BENEDICTUM LIGNUM. See GUAIACUM. -

BENEDICTUS LAPIS. A name for the Philofopher's ftone.

BENEOLENTIA: SWEET SMELLING MEDICINES. BENGALLE INDORUM. See CASSUMMUNIAR.

BENGLEIRI. A species of EVERGREEN INDIAN RI-CINUS, which grows in Malabar, &c. Raii Hist. BENINGANIO. A fruit which grows in the bay of St. Augustine: it is of the size of a lemon, red without,

and grateful to the flomach. Raii Hift. BENIVI ARBOR, The Benjamin-TREE, and the GUM. See BEN-BENIVIFERA, BENJOINUM, & BENJOIVUM. BENJUI. ZOINUM.

BEN-KADALI. A species of KADALI.

BENZOE, BENZOIFERA, and BENZOIN. GUM BEN-

BENZOINUM, called also afa dulcis, affa ederata, belzoe, benjoinum, liquor firenaicul, vel cyreniacus, balzoi-num, benjovinum, GUM BENJAMIN. It is a concrete refinous juice, obtained from a middle-fized tree, with leaves like the bay-leaves, but not ribbed, and falling off in winter, bearing flattish nuts, the size of nutmegs, whose sleshy covering is externally rough and hairy. It is a na-tive of the East Indies and of North America, particularly of Virginia and Carolina; but it is only brought from the East Indies: it grows in open ground with vigour in England. According to Weston, the tree is the laurus benzein, or laurus foliis enervis ovatis utrinque acutis integris annuis, redolens benzeinum, floribus par-vis luteis, baccis nigricantibus, Linn. The Benjamin vis luteis, baccis nigricantibus, Linn. The Benjamin tree. But the laft dilpenfatory of the Edinburgh college, fays it is the terminalia, benzoin, faliis lanceolatis, Linn. And Curtis, in his Catalogue of the British Medicinal Plants, &c. in the London Botanic Garden, fays it is the croson benzoe. The leaves and the bark fmell like the gum; and to rectified spirit of wine they give out a refin, like the Benjamin; but no refin naturally flows from it: the refin is obtained by incifions made in its trunk about the origin of the first branches. Some fay it issues out from the incisions made only in the bark: as it runs out it is white, but foon becomes yellowish, reddish, or brownish. It is brought into Europe in brittle masses, composed partly of white, and partly of yellowish or light brown pieces. The white pieces are called benzoe amygdaloides, and are reckoned the best; they are hard, tolid, shining, transparent, and possess very fragrant smell: this gum-refin hath but little taste, impressing the palate with a slight sweetishness; its smell impressing the palate with a slight sweetishness; its smell is very fragrant if rubbed or heated, and is less heating than most of the other balfams.

If pure, it totally diffolves in rectified spirit of wine. By digeftion it imparts to water much of its fragrance and pungency: the filtered liquor, gently exhaled, leaves a cryftalline matter, of a feemingly faline nature, amounting to an eighth part of the whole.

#### Flores Benzoini. FLOWERS of BENJAMIN.

They partake of the fragrance of the refin; diffolve in fpirit of wine, and with the affiltance of heat, in water also, from which they are prevented from separating, if as much fugar is added as will give the confiftence of

fyrup to the water.

The College of Phylicians of London, in their Pharmacopocia, order the flowers of Benjamin under the title of FLORES BENZOES. Flowers of Benjamin, to be thus

raifed.

Take of Benjamin in powder, one pound, put it into an earthen pot placed in fand; and with a flow fire fublime the flowers into a paper cone, fitted to the pot. If the flowers fhould be of a yellow colour, mix them with white clay, and refublime them, only a small portion should be put in at a time, and the heat be very gentle. Ph. Lond. 1788.—They also order a Tinctura Benzoes composita. Compound tinsture of Benjamin, formerly balfamum traumaticum, in the following

Take of Benjamin three ounces; storax strained two ounces; balfam of Tolu one ounce; Socotorine aloes half an ounce; rectified spirit of wine two pints-digest with a gentle heat for three days, and strain.

Oleum Benzoini. OIL of BENJAMIN.

If the powdered Benjamin is exposed to a gentle heat in a retort, it melts and fends up the flowers; after which a thin oil rifes, which is yellowish, slightly empyreumatic, and mixed with an acidulous liquor called the fpirit of Benjamin; then follows a thick butyraceous matter. The thin oil re-diffilled with water lofes its taint, and now finells agreeably of the Benjamin, and feems to be of the fame nature as effential oils; and yet the Benjamin itself, when diffilled in water, yields no effential oil.

Tinetura Benzoini. The TINCURE of BENJAMIN.

Take of gum Benjamin four ounces, and rectified fpirit in Actius.

of wine a pint. Digeft three or four days in a fand-heat,

BEREN and strain off the tincture.

Lac Virginalis. VIRGIN'S MILK.

To twenty ounces of pure water, add one ounce of the tincture of Benjamin; and if more water is necessary to render the mixture milky, add it.

Magisterium Benzoini. The MAGISTERY of BENJA-MIN.

If the lac virginalis be permitted to stand some time, the Benjamin precipitates in the form of a white magistery. This magistery is the Benjamin in its whole substance, and is preferred by fome to the flowers; but the flowers

be precipitated from spirit by water.

The principal use of the gum Benjamin is in perfumes and as a connectic. It approaches in virtues and fragrance to the florax and balfam Tolu. It is uteful in afthmas and other diforders of the breaft, for removing obstructions and promoting expectoration, in which intentions the flowers are given from grs. iv. to xv. the flowers are also a powerful errhine. The tincture may be given in doses from twenty to eighty drops, but is chiefly used to make the skin smooth, and to clear it; and to scene wash-balls. The lac virgin, must be used when a roughness or blotches and venercal spots discolour the skin and render it un-fightly; it may be rubbed on gently every day with a soft rag: it renders the sace and arms agreeably smooth.

Draughts are made with the gum itself by rubbing it

The flowers of Benjamin, are manifeftly a faline sub-stands of the acid kind, of considerable acrimony, and stimulant power. They have been recommended as a sub-stands but her ben completed by the sub-stands of the acid kind, of considerable acrimony, and stimulant power. They have been recommended as a sub-stands but Dr. Calling has completed them in succession. pectoral; but Dr. Cullen has employed them in fome afthmatic cases without effect, half a dram appeared to be heating and hurtful. Mat. Medica.

BER. The name of a tree growing in the East Indies and bearing a fruit like a jujeb.

BERBERI. According to Athenæus it is the name of

a fhell in which pearls are found.

BERBERIS, called also oxyacantha Galeni, fpina acida,

oval, of a pale green colour, finely ferrated about the edges; the flowers are yellow, monopetalous, ftanding in clusters on the top upon naked foot-stalks, followed by oblong red betries, containing in each generally two feeds: fome of the individuals have no feeds in their berries; and fometimes berries with and without feeds are found on one bush. It grows wild on chalky hills, flowers in May, and its fruit ripens in September.

The fruit is a mild reftringent acid, ufeful in hot bilious

diforders, and colliquative putrid difpositions in the humours. The leaves have the same virtues as the berries, but in less degree. The inner yellow bark is austere and bitterish, gently purgative, and useful in the jaundice. The bark of the root is mildly aftringent. These barks do not keep long, and are best used in insusions, one ounce of bark to a pint of water.

Sal Effent. Berberis. Essential Salt of Barberries.

juice of barberries in a fand heat for two days, after which evaporate the liquor to one half, then fet it in a cold cellar a few days and the falt will concrete; when the falt ceafes to shoot, evaporate again, and more falt will be obtained. Simon Paulli calls this the tartar of barberries.

Gelatina Berberorum. The JELLY of BARBERRIES.

To a pound of barberries, picked clean from their stalks, add a pound of white fugar, boil them with a gentle heat, to a due confiftence, then prefs the jelly through a flannel

BERDIRAMON. See BISTORTA.
BEREDRIAS. The name of an ointment mentioned

BERENI SECUM. See ARTEMISIA.

BERENICE. AMBER.

BERENICIUM. A fpecies of nitre mentioned by Galen.

BERETINUS FRUCTUS. A fruit found in the Ma-

BERGAMOTE, or BERGAMOT. It is a species of citron, produced at first casually by an Italian's grafting a citron on the flock of a bergamet pear-tree, whence the fruit produced by this union participated both of the citron-tree and the pear-tree. The fruit hath a fine tafte and fmell, and its effential oil is in high efteem as a perfume.

The effence of bergamet is also called effentia de cedra. and is preferred by some to the slowers; but the slowers are only the faline part of the gum with some of its fragorance, and it is the resinous part that is most disposed to
be precipitated from spirit by water.

It is extracted from the yellow rind of the fruit by first
cutting it in small pieces, then immediately squeezing the
oil out of them into a glass vessel. This liquor is another-

rial oil.

A water is distilled from the peel as follows: take the outer rind of three berganists, a gallon of pure proof fpirit, and four pints of pure water, draw off a gallon in a balneum Marine, then add as much of the best white fugar as will be agreeable. Or,

Take of the effence of bergamot three drams and a half, of rectified spirit of wine three pints of ammonia pre-pared a dram, distil off three pints in a balneum

Maria

BERIBERIA. Dr. Aitkin, in his Elements of Surgery, uses this word as fynonymous with contractura, which

BERIBERI. A species of palfy common in some parts the East Indies. The name in the language of the of the East Indies. The name in the language of the country fignifies a sheep. Bontius thinks that this name was given to this disease because that in it the patients seem to imitate theep in lifting their legs when they walk. He fays this palfy is a kind of trembling, in which there is a depravation of the motion and fenfation of the hands and feet, and fometimes of the body. The cause is generally from exposing themselves to the cold vapours of the night too foon after exercise.

In this case a pituitous matter infinuates itself betwixt the joints and relaxes their ligaments. Generally its approach is gradual; but fometimes it feizes fuddenly.

The symptoms are, an univerfal lassitude, a faulty motion of the hands and feet, and the fame throbbing titillaerespinus, berbaris, PIPERIDGE OF PIPERAGE BUSH, and BARBERRY. The berberis vulgaris, Linn.

It is a large prickly bush, with brittle branches, covered with an ash-coloured bark, under which lies another of a deep yellow colour; the leaves are small, smooth, rather the property of a role green colour force of the property of the leaves are small, smooth, rather than the property of the leaves are small, smooth, rather than the property of the leaves are small, smooth, rather than the property of the leaves are small, smooth, rather than the property of the property of the leaves are small, smooth than the smooth of the property of

The cure is tedious. The disease is not mortal, except by feizing the mufeles of the breaft, for as to obstruct

respiration and the voice.

In order to the cure, moderate exercise, and frictions are useful; the Indians use a half-bath made of water, in which is boiled an aromatic kind of herb called lagondi, or, in want of it, camomile and melilot. The affected parts are rubbed well with a mixture of the oils of mace and rofes. Bleeding is not required, but, on the contrary, warm nervous firengthening reftoratives are to be used: now and then a gentle purge may be admitted. Decoctions of farfaparilla and guaiacum are alfo of fervice. See Bontius de Medicina Indorum.

BERICOCCA. The APRICOT. See ARMENICA MALA.

BERMUDENSES, BACCA. BERMUDAS BERRIES.

See SAPONARIÆ NUCULÆ.

BERMUDIANA. A plant from the Bermudas islands Digest two ounces of lemon-juice with two pints of the is thus named. It hath a flower of the lily kind. Miller

mentions two species; but it is not remarkable for any medical virtue

BERNARDIA. A plant fo called by Dr. William Houftoun, in honour of Dr. Bernard de Jessieu, of Paris-

The male and female are different plants; the male plant produces katkins; the female plant produces a fruit which refembles that of the ricinus. Miller takes notice which refembles that of the ricinus.

of four fpecies; but they are not used in medicine.

BERNAVI. An electary mentioned by Prosper Alpinus, in his Work, De Medicina Ægyptiorum. It is prepared in India: its composition is unknown; but very extraordinary effects are attributed to it.

BERNHARDI TESTICULUS. See Asphodelus

LUTEUS, that called — EREMITA. See CANCELLUS. BERNICLA. See BRANTA. BERRIONIS. COLOPHONY, gum juniper, or ver-

BERS. A fort of electary ufed by the Egyptians for gaiety; it contains opium, and creates a temporary delirium

BERULA. BROOK-LIME. See BECABUNGA.
——— GALLICA. See SIUM ANGUSTIFOLIUM.

BERYTION. The name of a collyrium described by Galen as good against an ophthalmia. Also of a pastil against the dysentery.

BES. An eight-ounce measure. See CYATHUS.

BESACHER. A FUNGUS OF SPONGE. BESASA. WILD RUE.

BESL. FASCIC. An abbreviation of Bafilii Befleri Fascieulus rariorum.

GAZOPHYL. An abbreviation of Gazophylacium Rerum naturalium Michaelis Ruperti Befleri.

- HORT. Eys. An abbreviation of Befferi Hortus

Eystetensis.

BESLERIA. A plant thus named in honour of Bafilius Besler, an apothecary at Nuremberg, who was the author of a book called Fiortus Eystetenis. Miller takes notice of four species, but they are not of any medical

BESONNA. Rulandus explains it by muscarum fun-gus. Probably he means a sponge, which is the nidus

of fome fort of flies.

BESSANEN. In Avicenna it is a redness of the external parts, refembling that which precedes the leprofy; it occupies the face and extremities. Dr. James thinks it is what we call chilblains.

BESTO. A name in Oribafius for SAXIFRAGE.

BETA. BEETS. It is a plant with large, fmooth, broad ribbed, juicy leaves, and flender, ftriated, branched ftalks, bearing tpikes of imperfect flowers, followed each by a roundilh, rough, watery feed-reffel. Different are cultivated for cultivary uses. Lineagues (inspected) forts are cultivated for culinary uses: Linnaeus supposes them to be varieties of the wild beet which grows on some of the fea-coafts of England, Holland, &c. There is a whittifh-leaved called ficula or cicla, a green-leaved, and a red-leaved fort, all with long, thick, white-roots; and a long-rooted, also a turnep-rooted fort, all over red. They are all biennial. That named — ALBA, called alfo ficula; is the cicla, beta pallefeens. Common where-BRETS. - RUBRA UNIZ. called also BETA NIGRA. TURNEP ROOTED RED-BEET, RED ROMAN-BEETS, OF BEETRAVE. — SYLVESTRIS. WILD-BEETS. There is a wild fort which Diofeorides calls LIMONIUM.

Beets, used as food, are difficult of digestion, and afford but little nourishment. If freely eaten they are laxative and emollient. They give out their virtue to water by boiling. The red ones give out their colour to fpirit of wine, and on expression their colour accompanies their

juice

The juice of both the kinds has been confidered as a powerful errhine, occasioning a copious discharge, but no sneezing, but Dr. Cullen says in the trials he made, the juice fruffed up the nose gave no large or durable evacuation, Mat. Med. The dried red beet roots yield one twentieth part their weight of sugar, and the dried white beet roots one tenth.

BETLE, called also betre, betele, betble, betelle, BEET-LA, BRETLE, piper longum foliorum nervis decurrentibus tenuioribus & mollioribus. and bulatwaela.

It is a feandent plant, growing in different parts of the East Indies: it bears a fruit which resembles a lizard's tail: its tafte is agreeable, and in the Mahacca ifles is called firit boo. The ancient botanifts confound its leaf with the malabathrum.

Mixed with other things, as fancy directs, the Indians chew it almost continually. It is gratefully cordial, but feems to injure their teeth.

BETONICA, called also vetenica cordi, and common or WOODY BETONY. The betonica officinalis, Linn.

It is a low plant, with dark green, oblong, wrinkled leaves, that are crenated, hairy, and fet in pairs, on fquare unbranched flalks; bearing thick fpikes of labiated purplish flowers, each of which is followed by four oblong triangular feeds, inclosed in the flower-cup. grows wild in woody and flady places; flowers in June and July, in winter it dies to the ground, the roots con-

The leaves and tops are agreeably fcented, but it foon flies off from the dry herb: to the tafte they are warm, rough, and bitterifh; if powdered they make a good er-

rhine.

An infusion of the leaves in boiling water contains all the virtue of the herb, and is the belt preparation of its From large quantities a finall portion of effential oil is obtained by diffillation. The roots are faid to be naufoous, bitter, purgative, and emetic; and as a medicine very fimilar to the hellebor. alb. It is also a name for a fpecies of fideritis.

BETONICA AQUATICA. See SCROPHULARIA, AQUATICA. — PAULI. See VERONICA. — CORONARIA. CLOVE JULY-FLOWERS. See CARYOPHILLUS RUBER.

BETRE. See BETLE.

BETTONICA. GREAT WATER-DOCK.

BETULA. The BIRCH-TREE. The betula alba of

It delights in moift woods. It hath many flexible branches and fomewhat woods. It had many next to bran-ches and fomewhat oval, fharp-peinted, ferrated, deep-greea leaves, hanging on long and weak pedicles, produc-ing finall fealy cones, which contain little winged feeds. The bark is externally white and chapt, confifts of a thick brittle substance, of a dark brownish red colour, covered with three or four whitish, very thin, smooth, flexible, tough, femi-transparent, membranous coats.

If this tree is wounded in the fpring, pretty deeply into its trunk, there gradually iffues a large quantity of a limpid fweetish juice. It is best when drawn from the upper part of the tree; soon after the leaves have begun to ap-pear, the juice loses its sweetness. This juice hath been drank as an antiscorbutie: it sensibly promotes urine, and freely taken it moves the belly. By fermentation it becomes a vinous liquor; and infpiffated to the confiftence of a fyrup, it yields a brownish concrete like manna, if set in a cool place. The leaves and bark are antiseptic, the bark is burnt

to correct bad air, and for this purpose it is the next in

goodness to juniper.
BETULUS. See OSTREA. A cough. See Tussis.

BEXUGO. The root of the elematitis Peruviana of C. B. one dram of which is enough for a purge. BEXUGUILLO. The PERUVIAN IPECACUANHA.

BEYA. So the alchemifts call the aqua mercurialis, which, in their language, is wife to the gabrien or ful-

phur of the philosophers.

BEZOAR. This is originally a Persian word, viz. BADZCHER, OF LAZCHER, OF PAHAZAR, which fignifies an antidote. Avenzoar is the first who mentions it as a

medicine, or who gives its hiftory.

Bezoar stones are preternatural or morbid concretions formed in the bodies of feveral land animals; they are composed of several strata or layers, like an onion. the Hift. de l'Acad. an. 1703, it is afferted that all bezoar frones are bilious concretions of the respective animals

which afford them.

Bezoars may be ranked thus: 1. The true oriental and occidental. 2. Such stones as are got from animals, and refemble bezoar; fuch as those from apes, and even the refemble bezoar; fuch as those from apes, and even the various species of peauls and crabs eyes. 3. The several species of fossile bezoars. 4. Those that have only the shape, without the virtues of bezoars, such as the human calculi in the bladder, kidneys, and gall-bladder; or in the same parts of oxen. 5. The ægagropila. which are balls formed by hairs collected in the stomachs of several animals, especially the ruminating forts, and are called builthown or cow's bezoar: the German bezoar is a hairy ball taken out of the stomach of the rock-goat. See Ægagropila. For that called — Germanneum, see Capsa Alpina. — Perci. See Bezoar Hystricis. CAPSA ALPINA. - PERCI. See BEZOAR HYSTRICIS. - ORIENTALIS,

It is supposed to be produced in the cavity at the bottom of the fourth stomach of a species of goat in Persia called parau. It is only found in the old ones, and only in those which feed on particular mountains. Though these are of great value in Europe, they are of greater in Persia, whence we suppose that they are only artificial ones that are brought here. The genuine ones are about the fize of a kidney-bean, generally of an oblong rounded figure, but often of other forms, varying according to the shape of the body over which they are as a crust; for all the bezoars, whether animal or fosfil, are formed upon a nucleus of one kind or another, as a bit of straw, a stone, or other matter. They have an even smooth furface, and are of a thining olive colour, or of a dark greenith one. Onbeing broken they appear to be composed of a num-ber of concentrical coats, of which the inner are as smooth and gloffy as the outer. In the middle is either a cavity, fome powdery matter, or fome fmall pieces of the leaves or flaks of plants, or other fuch like fubftances. The fubstance included in the bezsar shews how it is produced; these folid bodies remaining in the stomach may irritate its glands, and the lymph continually thickening (together with the juices of the plants on which the animal feeds) round these bodies, may well be supposed to form the polished layers.

The marks of its genuineness are, its striking a yellow or green colour on white paper that hath been rubbed with chalk; a red-hot needle not piercing into it, or occafioning any bubbles, but either making no impression at all, or at most taking off only a little scale; and its suffering no diminution of its weight, or difunion of its parts, by steeping in water. If on licking it with the tongue a

powder comes off, it is fictitious.

The genuine ftone is without either fmell or tafte. Cartheuser thinks that they are all fictitious which have a fcent like that of ambergrife. It is not acted on by spirit of wine. Its gravity is to that of water nearly as 11 to 1. Reduced into an impalpable powder, it retains its green-ish hue, which by moistening with spirit of wine during its levigation, is somewhat improved. This powder gives no tincture to water or to spirit, though violently agitated in them; but diffolves almost totally in the acids of nitre and fea-falt, and effervefces ftrongly with them; it tinges them of a deep yellow (almost red) co-lour; the vitriolic acid raises a slight effervefcence with it, but diffolves very little: vinegar acts on it but very

Notwithstanding all their boasted virtues, it is certain that they are absolutely indigestible in the stomachs of the animals in which they are found; and they are equally fo in the human, except when accompanied with an acid; fo that no more can be expected from this concrete than from any of the testacea that are foluble in acids; but it is inferior to them, being far less absorbent than they, and more difficulty acted on by any acid of either the animal or vegetable kinds.

A great degree of heat will divide the lamina of bezoar ftones; fometimes they feparate in breaking them; and if bit between the teeth, the layers will difunite, if the bezsar is good, it flicks to the teeth like glue. On expof-

ing them to heat they afford an oil and an alcaline falt. When this stone is powdered for use, it must be leviated to an exquisite fineness, with rectified spirit of wine.

The fpirit improves its colour.

This powder was formerly made into balls, which were called Gascoign balls, from one Gascoign their inventor; which are at prefent fold under that name by the trading chemists, or rather a sophisticated medicine without bezoar

- OCCIDENTALIS, called also LAPIS BEZOAR, PE-RUVIANUS, the American or occidental bezoar.

It is found in the stomach of an animal of the stag kind, which is a native of Peru, and other parts in the Spanish West Indies. Clusius relates, that a friend of his at Peru, who first discovered this species, being defirous to know how these stones were formed in the bodies of these animals, he diffected one, and found in the ftomach a kind of pouch, where those stones are ranged in a row like the buttons on a coat. This kind of bewalnut to that of a hen's egg. Its furface is rough, and not so green as the oriental fort, being often greyish or parations.

ORIENTALIS, called also LAPIS BEZOAR, HIR-brown: it is also more brittle, and of a looser texture, cus BEZOARTICUS, and the ORIENTAL BEZOAR STONE. composed of thicker coats, and exhibits, when broken, a number of fine crystalline strize, curiously interwoven. It is less esteemed than the oriental, though not in the leaft inferior to it as a medicine. --- HYSTRICIS, called alfo PILA HYSTRICIS, BEZOAR PORCI, LAPIS PORCINUS, PEDRO DEL PORCO, LAPIS MALACENSIS, the PORCUPINE BEZOAR, OT GALL-STONE. It is found in the gall-bladder of an Indian porcupine, particularly in the province of Malacca; it is of a roundish figure, and of a pale or purplish colour, fometimes betwixt a green and white; it is foft, fmooth, and flippery to the touch; to the tafte it is intenfely bitter, and the water in which it is fleeped foon becomes bitter alfo. It does not appear to differ from the biliary concretions of an ox or any other animal. It is rather to be called an ægagropila than a ftone, as it confifts of woolly fibres, and a bitter friable matter, having neither laminæ nor membranes. - SIMIÆ, or LA-PIS SIMIR, the BEZOAR of the MONKEY. Stones of this kind are found in the stomachs of certain monkeys in Brazil, and the East Indies, but which very rarely pro-duce them. They are about the fize of hazel nuts, harder than the oriental bezsar, of a dark green colour almost black. Their scarcity renders them costly, and they are rarely to be met with.—Fossile. Fossile BEZOAR. It is a fmall hollow body from Italy, found in fand and clay pits, of a purple colour, with a rough fur-face, the fize of a walnut, and light. When broke, it is found to be an irony crust, containing in its hollow a fine greenish white earth resembling pale bezoar. The earth is used and not the shells. It seems to be of the nature of bole armoniae. It is also called BEZOAR MINERALE, TERRA SICULA, LAPIS BEZAHAN, SICULUS ALBUS, BEL-ZUAR MINER. SICILIANA, MINERAL BEZOAR, and SI-CILIAN EARTH. They feem chiefly to be a species of calcareous earth. See Edwards's Elements of Fosiilogy.

—MICROCOSMICUM, called also calculus bumanus, the calculus of the human bladder.

It is various in its degrees of hardness, as well as in its fize and figure. It has been used in the place of other more coftly forts. — ANIMALE. ANIMAL BEZOAR. Take the whitest calcined hartshorn, levigated to the greatest subtility, pour on it drop by drop, the spirit of vitriol, to form it into a paste to be made into balls.

The liver and heart of vipers powdered, is called animal bezear. — Bovinus, called also LAPIS ALCHERON.

The Portuguese call it MESANG DE VACA. It is a stone found in the gall-bladder of a bull. — MINERALE. See BEZOAR FOSSILE; also the BEZOARTICUM MINERALE,

below; also ammites.

BEZOARDICA RADIX. See Contrayerva. BEZOARDICUM JOVIALE. BEZOAR with TIN.

Take the regulus of antimony three ounces, pure tin two ounces, muriated quickfilver five ounces; melt the two ounces, murated quickfilver five ounces; melt the regulus in a crucible, then put to it the tin, so as to make a new regulus, to which, after being levigated, add the muriated quickfilver, and distil the mixture in a retort. Let the butter which rises, be fixed, by three repeated distillations, with thrice its weight of the spirit of nitre; then calcine the powder, and throw it, whilst ignited, into a proper quantity of spirit of wine, and dry it for use.

it for use.

This differs yery little from the anti-hecticum Poterii, and it is a mere calx, and might as well be prepared by

simple deflagration with nitre.

BEZOARDICUS PULVIS. Sce BEZOAR ORIEN-

BEZOARTICUM, BEZOARTIC; that is possessed of the virtues of bezoar.

- MINERALE. Drop the butter of antimony into three times its weight of the spirit of nitre, distil them in a retort; at first the marine acid arises with a little of the nitrous spirit, and is the spiritus nitri bezoarticus; the diffillation being continued until a dry white mass re-mains, which must be calcined in a crucible, in a naked fire, heated to an almost white heat, and so kept for half an hour.

The common calx of antimony generally supplies its place, for like that calx it is absolutely inert.

BEZOARTICUS SP. NITRI. See BEZOARTICUM

BEZOAS. It is a name given to many chemical pre-

BIANCA.

BIBITORIUS MUSCULUS. See ADDUCTOR Oculi, or Rectus internus oculi.

BIBULUS LAPIS. See PUMEX

BICAUDALIS vel INTRICATUS MUSCULUS. See TRICEPS AURIS.

BICEPS MUSCULUS, from bis and caput. A dou-

ble-headed mufcle.

--- HUMERI, called also BICEPS INTERNUS HUMERI Dr. Hunter calls it EICEPS FLEXOR. It rifes by two heads, one of them, which is a flender tendon, from the uppermoft part of the glenoid cavity; it runs across, within the cavity of the joint, under the ligament of the articulation, passes in the groove between the two tubercles, and going down grows fleshy. The second head rises from the extremity of the coracoid process, runs down the axilla, and joins the first, forming a tendon, which finks between the interflices of the muscles, to be inferted into the tubercle on the infide of the radius-This mufcle, belides being a flexor, acts as a rotator of the radius, when the hand is prone. This mufcle fends off an aponeurofis towards the infide of the arm, which is commonly what is wounded when the tendon is faid to be pricked by bleeding. This aponeurous was first noticed by Cowper.

---- EXTENSOR. This mufcles rifes by two heads, the longer taking its origin from near the neck of the os humeri, runs between the teres major and minor, down the back part of the arm, and joins the short head which rifes on the outfide of the deltoid, and is inferted into the

olecranum.

--- FEMORIS. This mufcle hath two heads, the longer rifes in one mass with the semitendinosus, but having advanced a little way they part; they arise from the protuberance of the ischium, on its back part, as the biceps advances it becomes sleshy. Between the biceps and the semitendinosus, the vessels lie in the ham. The short head rises from the linea aspera, between the infertion of the biceps and the origin of the valtus externus. The two heads join, and are inferted into the fuperior epiphysis, or outer part of the fibula. It bends the tibia, and partly rotates the leg by turning the foot outwards.

BICHICHIÆ. An epithet of certain pectorals, or rather troches, defcribed by Rhazes, which were made

of liquorice, &c.

BICHOS. A Portuguese name for the worms which get under the toes of the people in the Indies, and which are deftroyed by the oil of the cashew nut.

BICION. See Vicia.

BICORNE OS, from bis, double, and cornu, borned.

See Hyoidis os.

BICORNIS. A mufcle is fo called when it hath two terminations; also a name of the flexor carpi radialis, and of the extensor carpi radialis.

— Piscis. The cuckold fish.

BICUSPIDES. See MOLARES.

BIDENS, called also verbafine, verbefina ,cannabina aquatica, hepatorium, aquatile, eupatorium arabum, ceratocephalus, WATER HEMP AGRIMONY, WATER AGRI-MONY, HEMP AGRIMONY, and WATER HEMP.

It hath oblong acuminated leaves, deeply indented, fet three on one pedicle, and the pedicles in pairs; the flowers, which stand in the umbel-like clusters, confift of purplish flosculi set in scaly cups, followed by oblong feeds winged with down. It is perennial, grows wild by the fides of rivers and ditches, and flowers in July.

The leaves have a light agreeable finell, and pungent bitter tafte, are aperient, corroborant, and of some efficacy in icteric complaints; powerful against the scurvy and codematous swellings of the feet. An infusion in boiling water, drank freely, is the best method of using

The juice of the fresh herb may be taken in doses from one to two ounces: larger dofes operate by vomit and

The root purges strongly.

- ZEYLANICA, See ACMELLA.

BIENNIALIS. BIENNIAL. Herbs are faid to be biennial when their roots continue two years.

BIFOLIUM, alfo called ophrys, ophris, orchis hifolia, di-dyme, ordinary WOOD BIFOIL, and COMMON TWAY-BLADE.

The root is slender, but much branched, it fends up one stalk with two leaves from its fides, that are large, oval, and full of nerves; the flowers grow on spikes at the top, they are roundish, and of a dull green colour. It is found in woods and other shady places, and flowers in June; and ranked among the agglutinant aftringents. Miller's Bott. Off.

BIGASTER. A name given to mufcles that have two

BIGNONIA. So Tournefort called this plant in memory of the Abbe Bignon. It is the TRUMPET-FLOWER, or SCARLET JESSAMINE. Miller, in his Dictionary, enumerates eleven species, but they are of no value in medicine.

BIHAL. An American name of a plant whose flower is like a lily; there are two species of them, but not used

in medicine. Miller's Dict.
BILADEN. STEEL OF IRON.
BILIARIA ARTERIA. The BILIARY ARTERY. When the hepatic artery hath advanced as far as the veficula fellis, it gives out the biliaria, which accompanies the two cyflic branches in the gall-bladder, and then is loft in the great lobe of the liver. See HEPATICA AR-TERIA.

BILIMBI. A tree of about eight or ten feet high, which Bontius calls BILLING-BING; and by the Europeans

it is named malus Indica, fructu pentagono.

It is cultivated in the gardens in Malabar, bears flowers and fruit all the year. The juice of the root is cooling; expressed from the fruit cures the itch, and several other tkin difeafes, if applied by laying on linen cloths that have been dipped in it. Inwardly taken, it abates the gripes and a diarrhoea. The ripe fruit is eaten as a delicacy, the unripe made into a pickle for the use of the

There is another species called nebi-pouli, or bilimbi altera minor. The male species of the nebi-pouli is called ala-pouli. Raii Hist. pouli.

BILIS, called also FEL, BILE, and GALL.

It is a bitter viscid juice, secreted from the blood in the liver, and collected in the receptacle known by the name of gall-bladder. The blood collected from the adjacent abdominal vifcera, is thrown into the vena portæ in the liver, which ramifying through this vifcus, carries the blood, charged with biliary matter, fit to be fecreted, to its ultimate branches, from which the bile is emptied into the beginnings of the biliary ducts, called bori pilarii, and by them is conveyed into the ductus hepaticus; this duct paffes on a little way, then enters into the ductus commu-nis choledochus, whence the bile is partly discharged into the duodenum, and partly regurgitated into the ductus cyflicus, then falling into the gall-bladder, it remains there until it is wanted; by lodging there fome time it is also more perfected, for being at rest its thinner parts are exhaled, transudes, or are reabsorbed, and the rest becomes thicker, more acrid, increases in bitterness, and the depth of its colour.

The hepatic bile, before it is mixed with the cystic, in every respect resembles lymph, that is sub-alcaline and

rather oily; it continually paties into the duodenum, but the cyftic, only as required.

The bile is formed from the blood in the fecretory veffels of the liver. It is of a faponaceous quality; ten parts out of twelve is water. By analytis fix pounds of ox-gall was found to contain eighty ounces of water, three ounces and two drams of oil, twenty-four drams of volatile, and five of a fixed falt.

It is the least putrescent of any juice in the body; its use is to mix the chyle, to support the peristaltic motion of the intestines, and to assist in completing the digestion. When the stomach is full, the cystic bile is more copiously discharged into the duodenum; when it is empty the he-patic more freely into the gall-bladder.

This faponaceous juice refifts acidity, and corrects it in the bowels; it easily mixes with water; renders oily, mucous, and vifeid bodies, mifeible also with that fluid; and if rubbed with refinous gums, attenuates them. In fhort, there is fcarce an animal or vegetable substance that it will not diffolve. When drove through the warm veffels with the blood, it necessarily produces its effects dice. Newmann fays that it contains no alkaline falt, and it is not a foap. The livers of infants are very large, and their bile, though fecreted in a confiderable quantity, yet is frequently aimost inert; whence acidity prevails in their first passages, and other ill effects of indigestion An excessive use of acids, by overcoming the qualities of the bile, induces indigeftion. in common with all bitters, neutralizes acids by mixture, and is itself neutralized by them; and when the bile tends to putrescency, the native vegetable acids are its best re-

The gall-stones formed in the gall-bladder, are not of a cretaceous nature, but are merely coagulated bile; this

is plain from their unctuous inflammable nature. It is observed, that the gall of small animals is stronger and more fubtile than that of the larger kinds, whether is the most active.

Befides its use in the animal economy, and in various manufactories, it is an article of some value in the materia medica; and, from its manifest properties, seems to be

entitled to more notice in the practice of medicine.

The gall of oxen infpiffated to an extract, hath been commonly that which was used; it prevents milk from turning four in the flomach, and refolves it when coagu-An extract made by the evaporation of its humidity, in balneum Mariæ, until it can be rolled into pills, may be given to children in dofes of one grain, three times a day, and to adults three or four grains at each dose. When administered elysterwise, half a dram may be used at a time. This extract is an excellent bitter of the ftimulating and refolvent kind, and in want of appetite, or other diforders, from a deficiency of bile in the first paffages, this animal bitter is likely to be more ufeful than the vegetable kinds. The best success hath followed its use in obstructions of the abdominal viscera; promoting urine, and the menses; and if this is not thought sushciently efficacious, the gall of ecls and pikes may be fub-flituted in its flead; with this, Boerhaave tells us that he hath frequently cured ricketty children, whose bell'es were hard and very much swelled. These more acrid kinds also destroy warts if now and then applied thereto.

A sense of weight in the stomach is owing to the want

of the folvent there, which should digest the food.

A defect of bile disposes the body to various diseases, as hypochondriae, cachectic, &c. Fernelius, in his Pathology, fays, that many have died from this cause alone. When, from its defect, a costiveness is induced, the oleum ricini is of fingular fervice, it should be followed with nitrous and saponaecous medicines, and the Bath water

may finish a cure.

When the bile offends by its acrimony, producing too frequent and copious discharges by stool, the oleum ricini will be more safe and effectual in correcting it than any of the other usual means; and here also a finish may be given to the cure by the use of Bath water. Here oranges

and ripe fruits are ufeful if freely eaten.

When bile in the stomach offends, it causes chilliness, or fhivering, anxiety, and fhiverings; here too, the oleum ricini purges without irritating, powerfully obtunds the acrimony of the bile, and by moderating the fever, which almost always attends this case, it proves a most speedy

remedy.

If acidity prevails, and the bile is four, abforbents and thubarb will be proper; also magnetia alba, especially if coftive. If the ftomach is loaded, give a vomit. To pre-vent acidity, strengthen with bark bitters and chalybeates.

In case of viscid mucus offending the domach, repeated vomits and bark, with occasionally aromatics to stimulate that organ, are necessary. At intervals R. tincl. aloes, cochl. magn. hora ante prandium, vel pil. ex aloe flammation of the bowels comes on. cum myrrha q. f.

If there is a putrid tendency from falted meats, &c. give acids, fixed air, wort, and all kinds of vegetables. Be careful to avoid coftiveness, with aloes, rhubarb,

gently to move the belly.

the bile that fevers are augmented;" also, that "in

there; fo that the blood, in a fhort time, is quite dif- fevers, the bile becoming putrid, acquires a malignant folved, and a dropfy the natural confequence of a jaun-dice. Newmann fays that it contains no alkaline falt, ly, and in large quantities, into the membranes of the duodenum, as is fufficiently proved by the dry cough, the ofcitation, fuffocation, anxiety, diffension of the precordia, pain, naufea, vomiting, and white urine." --Pathol. de Febrif. And Hoffman observes, that " corrupted bile renders all fevers worfe; also that fresh portions generated, cause the returns of intermittents, whence it is obvious why evacuants, which operate without irritation, and such medicines as oppose putrefaction, as the bark, &c. are the best for removing them." It is certain that in fevers the bile is not only plentifully generated, but is also peccant in its quality, whence, if not duly evacuated, must be productive of many dis-agreeable symptoms; from which cause the importance of a foluble belly in febrile diforders. From a faulty bile in the intestines, when a fever attends, is often owing the on land or in the water; and, of land animals, that of aphthre, inflammation in the fauces, purple foots in the the hawk and ferpent; of water, that of the pike and cel fkin, cryfipelatous diforders, hæmovrhages, diarrhæas, aphthæ, inflammation in the fauces, purple foots in the

Such is the importance of the bile in our constitution, and the ill confequences of an error in it, that every aid is defirable, by which our knowledge of its nature, &c. can be promoted. See SICK-HEAD below in the article

BILIOSUS FEBRIS. The BILIOUS FRVER; called alfo the MARSH, REMITTENT, AUTUMNAL REMITTING, and CAMP FEVER. Febris flava; febris maligna Barbaden-

When a fever is accompanied with bilians discharges by vomit or flool, whether it be continual, intermittent, or remittent, it is called bilious. It is an inflance of the ty-phus icterodes of Dr. Cullen. See his Nofelogy. In his First Lines, vol. i. he observes that the typhus is a genus that comprehends feveral species; that these, however, are not well afcertained by observation; many of the different cases do not imply any specific difference, and seem to be merely varieties, ariting from a different degree of power in the caufe, from different circumstances of the climate or feafon in which they happen, or from different circumstances in the constitution of the persons affected. One effect arising from these circumstances in the constitution of the persons affected, is an unusual quantity of bile appearing in the course of the difease; which is almost a distinguishing character of intermittent severs; but if it should appear with a continued fever, it could only be confidered in fuch a case as a coincidence, owing to the state of the season, producing no different species, or fundamental distinction, but merely a variety of the

In Britain, it generally prevails after hot weather; in hot countries it is most frequent in damp marthy places, and after great rains, that are succeeded by great heats. In both fituations, they who are exposed to damps, and to the night air, are most subject to it.

Befides the caufes in general of fevers, it is occasioned by a copious fecretion of the bilions fluid, which is poured into the duodenum and ftomach, where, by its acrimony, it stimulates and produces inflammation, whence the

fymptoms proper to this fever arife.

Belides the usual fymptoms of fever, there is an extraordinary inquietude and anguish, a burning heat, cardialgia, naufca, vomiting or purging, or both, and thereby a difcharge of bile. The thirit, in this difcafe, is exceflive, and the dejection of spirits equally so; the pulse is fmall but quick, fometimes it remits very fenfibly, at others the remissions are very obscure; and at last an in-

If the evacuations are cadaverous, death usually is at hand, and an involuntary discharge of the excrements is

ufually fatal.

If the puffe is full and hard, bleeding may be admitted &c. Cream of tartar given in small doses at due di- in the beginning, but rarely, if ever, requires a repetition. flances, is an excellent medicine, administered to as And if in hot countries, it is best to omit this evacuation gently to move the belly.

But in all cases begin with giving a grain Fernelius fays, that "it is owing to the putresceney of or two of antimonium tartarifatum by way of emetic.

If faline medicines are given, the neutral mixture is the

most proper, but each dose should be administered in the act of effervelcence.

And as foon as an intermission is perceived, begin with the bark, for it is the chief dependence. But if the difeafe is very violent, or the patient in a hot clime, the bark must be given before the intermission, for on its early use depends the cure; a dram may be given every hour in wine and water, or what elfe the patient uses for his common drink. If the bark, in substance, is not agreeable, let a cold infusion of it be substituted, which may be acidulated with the acidum vitrioli dilutum, and the patient may take it as freely and frequently as his flomach will bear. If it runs off by flool, or is ejected by vomit, a few drops of the tinct. opii will probably prevent it. After the vomit fome recommend the following pow-

der: R antim. tartarif. gr. j. p. contray. c. gr. v. m. to be repeated every two hours, until it procures a vomiting, purging, and fweating; but the use of the columbo-root

feems far more eligible

Dr. Percival, in his Effays Medical and Experimental, informs us, that in these fevers, the pulv. rad. columbo, gr. xv. ad xx. with the kali vitriolat. D i. ad D ij. given every four, five, or fix hours, produces both speedy and beneficial effects. The neutral falts, he observes, abate the febrile heat, allays thirst, and brings on a gentle falu-tary diarrhea; whilst the columbo supports the patient's strength, obviates the fickness, and checks the septic fer-ment in the primæ viæ. Dr. Haygarth, of Chester, farther remarks, that, after the primæ viæ are unloaded of their bilious contents, the columbo-root admirably allays the naufea, fo constantly attendant on this disorder; and that in this fever, though the remillions are very evident, and the accessions marked with chills, and other symptoms of an intermittent, yet the bark is not always fo fuccefsful as to encourage its ufe; but he fays the columbo answers our warmest wishes, by correcting the bile, restoring the proper tone of the stomach, and of the whole habit; it excellently prevents relapfes, to which, in this fever, the patient is peculiarly disposed.

BILIOSUS ARDENS FEBRIS. The burning bilious, called also the YELLOW FEVER; the West Indian sever. It is the typhus icterodes of Cullen. It feems not to differ from the biliefus febris just noticed; except that its cause is increased in its power, when it attacks a patient

in a hotter country.

The Europeans who live irregularly, give way to excesses, and are not careful to guard against the heats and dews that are common in the West Indies, are the chief

fubjects of this difeafe.

It attacks with a transient chilliness and shivering, which is foon fucceeded by a burning heat all over the body, but more particularly about the precordia; the pulle is high and quiek, but not hard: the eyes are heavy, a violent head-ach comes on, with beating in the temporal arteries, also a thick laborious respiration; a nausea foon follows, and what is difcharged upwards is bilious; anxiety is very great; pain is complained of in the back and loins, and an uneasy lassitude in the limbs. In about twelve hours after the first invasion of this disease, the tongue is very dry, rough, and discoloured; thirst is ex-cessive, a foreness is felt all over the body, and a delirium comes one. In the last stage the patient labours under a coma, manifeits a great oppression about the precordia, the respiration is very difficult, and at length the tendons tremble, cold fweats and convultions appear, to uther in death. When the patient recovers, the crifis ufually hap-pens in the fourth day after the attack; the regular crifis generally discovers itself by a susfusion of the bile all over the body, the yellow tinge fometimes appears in the eyes, twelve hours after the fymptoms of this fever approaches; the fooner it appears the more favourable is the prognostic. If the skin continues dry and rough, the patient rarely re-covers, however good his pulse may be. Incessant vomit-ing, and the discharges growing darker coloured, are fatal figns; and if a dry tkin accompany an inflamed rednets of the eyes, death may be expected in a few hours.

In order to the cure, bleeding must immediately be proposed, more or less freely according to the strength of the patient; though after the third day it is rarely adviseable: the operator would do well to observe the state of the pulse during the discharge of the blood, and if he finds it slag he should deast; if it rises he may proceed.

After bleeding, let an emetic be given with antimonium tartarifatum gr. j. vel. ij. this best evacuates the offending bile. After this, the belly must be rendered soluble by repeated doses of faline purges.

The primæ viæ duly evacuated, the bark must be freely

used, in doses as large, and as frequently repeated, as the flomach can digest them. The propercit time to begin with it is as soon as a remission is observed, or a diaplicrefis is produced. If the bark in fubitance does not agree, let an infusion of it in cold water be tried, and if that cannot be complied with, give the following:

R Rad. serpentarize V. 3 ij. eroc. Anglie. 3 ss. infund. in aq. bullient 3 x. per horam unam; colatur 3 vi. adde aq. menth. vulg. 3 ii. vin. Madeirenf. 3 iv. acidi vitriol. diluti q. f. ad gratam faporem; & cap. cochl. ij. omni

horà vel fæpius. Or

Repeated doses of the common faline mixture may be

given in the act of fermentation.

The vomiting, which usually cludes every means hither-to used, even the tinct. opii, gut. ij. vel. iij. in every draught of the patient's drink, and blifters applied to the region of the flomach, may probably give way to the rad. columbo, as mentioned in the article BILLIOSUS FE-

In the beginning the drink may be a decoction of toafted bread in water, or other small liquors accidulated with tamarinds; and as the fever declines, a little wine may be

When the delirium threatens or approaches, blifters keep off the coma, which usually comes on when they are omitted. If a coma is attendant, blifters must be applied to the head, arms, and legs; and finapifms to the foles of the feet. Cordial medicines, with camphor, must be duly administered.

The diarrhoes, which fucceeds this fever, must not be fuddenly flopped, if the patients health is not too much impaired by it.

See Biffet on the Bilisus Fever of the West Indies. London Med. Obs. & Inq. vol. iv. p. 156. Blicke on the Bilisus Fever of Jamaica. Sir John Pringle, Drs. Chalmers, Lind, Towne, Warren, Cleghorn, Rouppe, all deferve attention on this subject.

BISMALVA. Marsh-mallows. See Althra.

BISMUTHUM. BISMUTH; also called wifmuthum, marcafita, Galæna inanis, plumbum cinereum Agricolæ, blende Germanis, MARCASITE of SILVER, and TIN GLASS.

It feems not to have been known to the Arabians, their marcafite was the lapis pyrites. Some reckon it a species of tin. It is a bright pale lead-coloured mineral; when broke it appears of a filver white; it may be powdered without difficulty; it is nearly ten times specifically heavier than water, of a flaky contexture; its earthy part affords as good a blue as that from cobalt; it is mixed with fulphur and arfenic; by fusion the fulphur and arfenic evaporate, and the metallic part runs off from the earthy. In Cornwall there is much of this mineral; fometimes it is found mixed with the cobalt. Bifmuth is eafily feparated from its ore by means of fusion with the common black flux. It melts long before ignition, a little fooner than lead, but later than tin. A ftrong fire fublimes it into white flowers; it is convertible into glass by heat alone. The nitrous acid diffolves it, from which it precipitates in the form of a bright white powder, by dilution with water. The marine acid does not readily affect it, and the vitriolic fearce at all. It impregnates the ve-getable acid with a naufeous tafte. The chief of it that is brought into England is from Saxony. Dr. Alfton de-nies that the ores of bifmutb contain any arfenic; it is true that the bifmuth, when brought to us, is without fuch particles.

It mixes eafily with feveral metals, but deftroys their ductility. It promotes the fusion of other metallic bodies. Mixed with lead and tin, it forms a compound that melts with a very small heat; the following proportion is so fu-fible, that it hath been proposed for injections, two parts of lead, three of tin, and five of bifmutb. If bifmutb is mixed with lead, a larger portion of the latter can be combined with quickfilver than can be without this method; and the quickfilver cannot be freed from this mixture by the common methods.

It is not now in any medicinal ufe.

## Flores Bismuthi. The FLOWERS of BISMUTH.

Take four ounces of bifmuth very finely powdered, half a pound of nitre equally fine, put the mixture by little and little into an earthen body, that is perforated in the fide, and fixed to a proper number of aludels; when the body is red hot, and the operation ended, take away the aludels, and wipe away the flowers with a feather.

#### Magisterium Bismuthi. MAGISTERY of BISMUTH.

Diffolve bifmuth in aqua fortis, without heat, adding the bifmuth by little and little at a time. Pour the folution into fixteen times its quantity of water, and thus a bright white powder is precipitated. If a little rectified fpirit of wine is added, the precipitation is haftened. Wash the precipitated powder in fresh parcels of water, and dry it in a fhady place.

This preparation hath been used as a cosmetic, but it gradually impairs the natural complexion, and thickens

the fkin.

The Spanish white is a magistery of bismuth, made by diffolving it in spirit of nitre, and precipitating it with falt

BISNAGARICA ARBOR MYRTI AMPLIORI-US FOLIIS, &c. A fpecies of CUBEB TREE. BISON. A fpecies of ox in America, &c. BISTACIUM. See PISTACIA.

BISTORTA. BISTORT. Called alfothe GREATER BISTORT, or SNAKEWEED; colubrina beadinamon. It is the See Dict. of Chem. edit. 3. Edwards's Elements of Forpoligenum biflorta, or polygonum caule simplissimo mono-

flachys, foliis ovatis in petiolum decurrentibus radice intorta, of Linn.

It is a plant with oval, pointed, wrinkled leaves, of a dark green colour above, and bluish underneath, standing on long pedicles, and continued a little way down the pedicles, forming a narrow margin on each fide. Among these arise, round, slender, jointed, unbranched stalks, furnished with smaller and narrower leaves, which have no pedicles, bearing on the top spikes of imperfect five-leaved red flowers, which are followed by triangular leaves. It is perennial, grows wild in moift meadows, and flowers in May and June.

The root is bent vermicularly, whence its name, and jointed at each bending. It is commonly about the thick-ness of a finger, furrounded with bushy fibres, of a blackish brown colour on the outside, and reddish within. It is distinguished from the other bistort roots by being less bent; that of the officinal species having only one or two bendings, and those of the other three or more.

This root is powerfully aftringent, antifeptic, and alexipharmic. It is of fingular efficacy in fluxes, against loofeness of the teeth, spongy gums, and foreness in the mouth. It is faid to cool, but this is by its being antiacrid, whence all aftringents are cooling. The dofe is from gr. x. to 3 i. Water totally diffolves its aftringent matter. Extracts made with water, or with fpirit, retain all the flyptic qualities. All the parts of this plant poffers the fame qualities as the root, but in a lefs degree. If the roots are boiled in vinegar, an excellent antifeptic gargle is obtained. Dr. Cullen fays it feems to be one of the strongest of our vegetable astringents, and justly commended for every virtue that has been afcribed to any other: he has frequently employed it in intermittents, and has given it both by itfelf, and along with gentian to the quantity of three drams in one day. Cullen's Mat. Medica.

The tormentil root is fo fimilar in its efficacy, that it may always be fubflituted for it.

BISUL. An abbreviation of BISULCIS.

BITHNIMALCA. A word coined by Dolæus, to fig-nify a peculiar active principle refiding in the ftomach, and prefiding over the functions of chylification, &c. called alfo Gufteranax

BITHYNICI TONSORIS EMPLASTRUM. The

Bithinan barber's plafter for splenetic people. See Actius Tetrabib. iii. ferm. ii. cap. xxii.

BITHINOS. The name of a plafter described by Galen.

BITI. A tall evergreen tree in Malabar, and other parts of the East Indies. An oil is prepared from its root, with which to cure the alopecia.

BITUMEN. Called also asphaltes, pisasphaltus, asphal-

tum, afpaltum, bitumen Judaicum, carabe funerum, gum-mi funerum, mumia, CARABE Of SODOM, FOSSILE PITCH,

and JEWS PITCH.

It is a mineral fulphur. It is a folid light fubstance, of a dusky colour on the outside, and a deep shining black within, having but little taste or smell, except it is heated, in which case it emits a strong pitchy odour. It is not soluble in oils, nor in vinous fpirits; it melts but imperfectly in the fire. On burning it, a large quantity of affies are left behind. It is found in the earth in many parts of Egypt, and floating on the furface of the Dead Sea. At

first it is soft, but grows hard by keeping.

The genuine sort is generally supplied by different bituminous substances sound in Germany, France, and other countries; but these substitutes have a stronger pitchy smell than the true fort. They are farther distinguished from the true, by their more perfectly dissolving with heat, and by their not leaving so many askes behind when burnt. Neuman says, that when the genuine bitumen is diffilled in a retort, it yields a light infipid phlegm, about I-IIth its weight of an oil, that refembles the native petrolea, but of a more difagreeable and empyreumatic finell; and any of the above fubfitutes may well be admitted. Fossile pitch is found in many parts of this ifland, in the feams of lime-stones. The virtues of all these substances depend on the quantity of petroleum which they contain. See Petroleum and Succi-NUM.

the human body, &c.

BLASO. An Indian name of a tree, the fruit of which,

when powdered, is given to destroy worms. Raii Hist. BLASTEMA, from βλας ανω, to germinate. Also called germen. A bud, off-set, or shoot of a plant: but Hippocrates expresses by it a cutaneous eruption or

BLATTA, or BLATTA FOETIDA. The SLOW-LEGGED BEETLE. It is that fpecies of the beetle which is so com-mon in bake-houses. If they are boiled in oil, or bruised therein, then dropped into the ear, they relieve pains in

BLATTA BYZANTIA, OF BYZANTINA. Called also unguis odoratus, dactylus: Constantinople sweet-hoof.

Blatta, and Blattea, have had various fignifications. The PURPLE FISH, the WELK, and other fifthes of the same kind, i. e. that are wreathed, have but one perforation through which they put forth their tongues, and take their food; they have also a fort of cover, under which their food; they have allo a fort of cover, under which they thrust out their tongue to feed, and draw it back at pleasure. In the purple sist, this cover is what is properly called blatta byzantia; it is named unguis from its likeness to a man's nail in its shape and colour. It is often consounded by writers with the unguis odoratus. This unguis, called blatta bizantia, is without any odour; but the Indian shell-sish, which affords an unguis, is agreeably seemed. fcented.

BLATTARIA LUTEA. YELLOW MOTH MULLEIN. Ray takes notice of ten fpecies. It is faid to possess the fame virtues as the verbalcum, but is of very little note in medicine.

BLATTI. A name of a species of SALICA BLATTI. The wild MALABAR PLUM-TREE. A name of a species of salicaria.

BLECHNON MINUS. The leffer-branched FERN. See FILIX QUERNA.

BLENDE. A German name for BISMUTH.

BISMUTHUM ZINCUM.

BLENNA, or BLENA. A thick phlegm defeending from the brain, through the noftrils; which shews a beginning concoction.

BLENNORRHŒA BLENNORRHAJAIA.

GONORRHOEA.

BLENNUS. The name of a fifth, found in shallow

waters, but not of much value.

BLEPHARA. The EYE-LIDS.

BLEPHARIDES, from βληφαρισ, an eye-lid. The hairs on the edges of the eye-lids, also that part of the eye-lids themselves, on which the hairs grow.

BLEPHAROPTOSIS, from βλεφαρον, palpebra, eyclid, and τ'hους, cafus, defcent, called also ptofis. A dislocation, or displacing of either, or both eye-lids, by elongation, retraction, turning inwards or outwards, with different symptoms in different species;—but the true blepharoptosy, or praternatural descent of the cye-lid, arises from a wound of the frontal nucles of the temple, or the superior levator of the mucles of the temple. ple, or the fuperior levator of the eye-lid—or from any large tumor dragging down the eye-lid; from inflammatory, or cold defluxions clongating the palpebra; from mere relaxations of the eye-lids brought on by fuperfluous ferum; or from a pally of the palpebra, which is fome-

times constant, fometimes periodical.

The varieties of this species are obvious-with respect to the fifth it must be remarked, that the cheek of fame fide, the lower jaw, the tongue, eyes, and other parts are affected. The fecond and third varieties are owe their origin; to the fourth, corroborating fpirituous fomentations are ufeful; the fifth must be attacked by anti-paralytic remedies administered externally and in-ternally; which, if in two varieties, do not properly suc-ceed, a cure must be fought for from a surgical operation, performed on the prolapfed palpebra, or on the fkin of the forehead which also treat as in curing the first variety from a wound. - Internal remedies are confiderably ufeful, fuch as will draw off the fuperabundant ferous fluids, which are chiefly purgative, and diuretic remedies, particularly jalap, and fal diureticus. A-mough the remedies for any paralytic affection, electri-city should be had recourse to, as occasioning the nervous fystem to exert its power, and by that means recover the action of the muscular fibres of the eye-lid. As for that variety which is faid to proceed from relaxation, the use of alum with an infusion of oak-bark is recommended for an external application which not fucceed-ing, the relaxed fkin must be cut away, and the edges of ing, the relaxed ikin must be cut away, and the edges of the wounds confined together by futures, and healed in that fituation. See Dr. Wallis's Nosologia Oculorum. There are several other species of this disease. See Entropium, Ectropium, Lagopthalmus.

BLEPHAROTIS. Inflammation of the Eye-Lids.
BLEPHAROXYSIS. See OPHTHALMOXYSTRUM.

BOETHEMA. A REMEDY.

BOETHEMATICA SEMEIA. Auxiliary figns in dif-

eafes, such as give notice of a cure observable in them.

BOGIA GUM. See Essula Indica.

BOICININGA. The RATTLE-SNAKE, and Do-BOICINININGA. MINICA SERPENTUM.

It is a ferpent of Brafil, about four or five feet long, as thick as a man's arm, of a raddill colour inclining. thick as a man's arm, of a reddish colour inclining to yellow, with fmall eyes, a forked tail, tongue, and fharp teeth. The tail, towards its end, is furnished with a parallelogramous substance, three singers or more in length, and about half a singer's breadth in width, consisting as it were of small links combined with one another; they are dry, fmooth, flaining, and of an afh-colour, inclining to red. This substance increases every year a link, and makes a noise like little rattles when the serpent creeps.

It is faid, that this ferpent cannot approach a piece of a root, which in Virginia is known by the name of rattle-fnake-root; but the blood-root is the most frequent remedy against their bite. This root is bruised and applied to the wound, and a decoction of it is drank.

Troches are made with the gall of rattle-snakes, which are caught in spring. This gall is mixed with chalk, or meal, into a passe; these are called trochisci Connecticotiani, from the Connecticut colony. They are anodyne, three or four grains are taken after great satigue, but

may be given to fourteen grains or more.

The rattle-fnake, as well as all other venomous ferpents, is destructive of itself by its bite. Pigs eat these fnakes greedily when they can meet with dying ones, or

fuch as are disabled from biting them.

When a person is bit by a rattle-fnake, purple spots, and a difficulty of breathing, soon attend, with other symptoms that manifest a coagulation of the juices; in which case, lessening the quantity of blood in proper time will lessen the overload at the heart, and give both it and the lungs more liberty to dilate and contract their muscular membranous fibres; and with the affiftance of proper alexipharmics, given at the fame time, may attenuate and add fresh vigour to the curdled mass; and thus a stop is put to those ruptures, and extravafations, which appear at the extremity of the small vessels. Many medicines are used by the Americans as an antidote to the poison of this animal. Those in most esteem have a quick, warm, pungent taste, though mild, and volatile on the tongue; but the most noted remedy is the following, which was discovered by a Negro. Take of the roots of plan-tain and horehound, in fummer the whole herb, a fullicient quantity; bruife them, and squeeze out the juice, and give immediately a large spoonful. If the pa-tient be swelled, pour it down his throat. If it does not relieve in one hour, give a second spoonful, which never fails. If the roots are dried, moisten them with a little

It is faid that rattle-fnakes have a power of charming birds, and other small animals, so as to make them their

BOLUM RUBRUM. See ALMAGRA.

BOLUS. A MOLE or BOLUS. Bringer differ not from electaries, only in that they are made rather of firmer confiftence, in fingle dofes, and therefore more proper where great exactness is required in the admi-nistration, and where the speedily perishing drugs are to be used, for they are only made for immediate use. The light and ponderous powders may more conveniently be mixed with mucilage, for fo they are the leaft bulky. The quantity of each is a morfel, or a mouthful, as much as can be conveniently fwallowed at once, whence their name buccella.

Bolus, Bole. Boles are a genus of earths, which readily fall down into a loose mass in water; having a degree of ductility, when not pervaded with too much water; and fmooth, and rather uncluous to the touch. Ed-

wards's Elemens of Foliology.
There are various species of boles, the chief of which are as follow, viz. the Armenian, Brench, of Blois, and the Bohemian.

Bole is a friable, but viscid earthy substance; chalk is the simplest and driest of the earths used in medicine; marl is more fat and greafy; clay is still more so; but bole the most. It unites with water into a smooth paste, adhering to the tongue, and dissolving, as it were, in the mouth; it is of the clayer kind, but more readily imbib-ing water than the clays strictly so called. When moist-ened, it is less viscous and cohesive, more easily disfusible through water by agitation, and more freely fubfiding from it. It is foft and uncluous to the touch.

All the medicines, or the most of them, that are used under the names of terra, are bolar earths, or different kinds of bole. Some of them were made into cakes, and stamped with some impress or other, and these have the general name of terræ figillatæ, or sealed earths. These

are all factitious.

All the boles have for their basis one and the same argillaceous earth, which is not diffoluble by the heat of boiling water, in acids, or alkalies, or any other known mentfruum; and in a firong heat grows hard, losing its property of imbibing of water, and being thereby formed into a tenacious mals. The different colours of the bales proceed from a flight admixture of a ferrugineous calx, all which contains a second of the second of t which contain more or lefs of it. Some of them contain a portion of calcareous earth; the bale of Blois contains much of this earth, but the common French bole hath very little, and the Armenian none at all. The vitriolic acid, as well as the ferrugineous calx, are intimately mixed with the boles.

Boles are adulterated with fand, and other fuch like matters, and are artificially coloured too. But all these are feparated by diffolying the mixed bole in water, and being heavier than it, they fubfide before it. Genuine bole fubfides uniformly, without any feparation of its parts. The genuine yellow boles retain their colour in the fire, or have it deepened; whill the counterfeit forts burn red. Pipe-clay coloured is the common fubilitute for bolar earths. Not any of these boles now are allowed to possess any medical virtues. Therefore, very properly, the London College have exchanged two compositions under the titles of pulvis e Bolo compositus sine opio & cum opio: for the following,

Take of prepared chalk half a pound; cinnamon four ounces; tormeatil root, and gum arabic, \$\sigma 3\$ iij. let them be reduced into powder separately, and mixed together-the dofe is from ten grains to forty, or more.

Pulois & Creth Campolitus com Opic. Compound Pow-DER of CHALK with OPIUM.

Take of compound powder of chalk eight ounces; purified opium hard, reduced to powder, a dram and an half mix: forty-three grains of this contains one grain of opi um, the dole from ten grains to two scruples, or more.

BOLUS ARMENIA. ARMENIAN BOLE. Called alfo balus Orientalis, Archamon, BOLE ARMENIC, and BOLE

ARMONIAC.

It is of a pale, but bright red colour, with a tinge of yellow. It is harder, and of a lefs glofly furface, than It is of a pale, but bright red colour, with a tinge of yellow. It is harder, and of a lefs glofly furface, than most other boles, having generally a rough dusty surface. It does not effervesce with acids. It comes chiefly from the Levant, rarely from dermenia. It should be smooth, soapy, and free from grit; it differs very little from the terra Sinopica. The dermenian and Lemian boles, see Lemia Terra, were always reckoned the best, but they are generally supplied by substitutes of inferior boles, or with pipe-clay coloured with the coloothar of vitriol. Their virtues indeed are nearly alike. — Armenia Alba. Is brought from the same parts where the red fort is brought from, and is of the same efficace. — Blessinsis. Bole of Blots. Is a yellow bole, it effervesces strongly with acids, and is much lighter than any other of the boles, and than most of the other yellow carths. — Bohemica. Bohemian bole. Called also German bole. Is yellow, with a cast of red, generally slaky, and is not acted on by acids. — Candida. White bole. Called also tora sigillata Golibergensis, unicorum minerale, and axungia luma chymicis. — Communis. Common bole. Called also bolus Gallica, French bole. Is of a pale red colour, variegated with irregular specks, and veins of a whitis yellow. It is much softer that the Armenian, and lightly effervesces with acids. Proc-clay, coloured with red chalk, is its usual substitute. — Toccaviensis. Transylvanian bole. Called also bolus Hungarica, bolus Tokaika, and beius Pannonica vera. This it as good as the Armenian. — Tabrillis. Red chalk. — Judaicus. A name for the Marsh Mallow. — Silesiana. See Sigillatat a terra.

SIGILLATA TERRA.
BOLYNTHON. Cow's DUNG.

BOMBAST. COTTON. Called also xylon, goffipium, BOMBAX.

There are three fores of cotton trees: one creeps on the earth like a vine, the fecond is thick like a buffy dwarf tree, the third is tall as an oak. All the three, after pro-ducing beautiful flowers, are loaded with a fruit as large as a walnut, whose outward coat is black. When this as a walnut, whole outward coat is black. When this fruit is ripe, it opens and difcovers the cotton; the feeds are feparated by a mill from the cotton. This tree grows in many places in the Levant, East and Welt Indies, efpecially in the Antilles. The fruit is oval. The cotton of the first fort, which creeps on the ground, is the best. That produced near Smyrna is greater than any where else. They sow the feeds, which are like little beans, in June, gather the cotton in October, and the foil there produces three cross in a year.

Produces three crops in a year.

The tkin of the feed is mucilaginous, the kernel is fweet like an almond, and of virtues fimilar to the althea-If cotton is applied to wounds it excites inflammation; and, when worn next the fkin, it checks perspiration.

BOMBUS. A RESOUNDING NOISE, or RINGING of the EARS, from flatus confined there. A bad fign in

BOMBYX. The Silk-worm. They are of no medicinal use, but it is said, that if their bags are burnt, they yelld a larger quantity of volatile falt than any other animal substance. Hence it might be superior to burnt sponge.

BOMPOURNICKEL. A fort of coarse bread used

Pulsis & Cretà Compositus. Compound Powder of neither nourish nor strengthen so much as the coarses, that is made with the bran and all together. Bread made that is made with the bran and all together. Bread made of the bran alone, is more ftrengthening than that which is made of fine flour, when it is made for labouring people. The Romans, for three hundred years, only used the bran of the corn. In Norfolk this fort of bread is in use at this day. See Coliphium.
BON ARBOR. The COFFEE-TREE.

BONA. The Kidney Bean. BONAN. An abbreviation of Philippi Bonanni Recatio Mentis & Oculi.

BONASUS. A kind of WILD ox, found about the mountains between Pzeonia and Media. BONDUCH INDORUM. Called also bonduch cine-

rea, bonduch pianta Indiano, arbor spinosa Indica murica-tis siliquis, lobus cehimatus, acacia gloriosa, lentisci soliis spinosis store spicato luteo siliqua magna muricata, caretti, inimboia, &c. marsas. Molucca nurs, and Bezoar

The plant rans up to five or fix feet in height; it is a native of both the Indies. The round beans only are in use, which are of an ash-colour on the outside, and white within. It is warm, bitter, and carminative.

Ray mentions another species, which he calls bonduch

Indorum filiqua minime fpinofa.

BON. SEP. An abbreviation of Bonetus Sepulchre-

BONIFACIA. See LAURUS ADEXANDRIA and HIP-

BONONIENSIS. LAPIS. The BONONIAN STONE. Called also phosphorus Bononiensis, spongia solis, lapis lucidus, tapis illuminabilis, phosphorus Kircheri; the LIGHT-CARRIER, and BONONIAN PHOSPHORUS.

It is a fmall, grey, foft, gloffy, fibrous, fulphureous ftone, about the fize of a walnut. When broken, a kind of crystal, or starry tale, is found therein. This stone is met with in the neighbourhood of Bologna, or Bononia, in Italy; and, when duly prepared, makes a species of phosphorus.

When this phofphorus is held to the light, it retains it for fix or eight hours after. As a medicine, this flone

is caustic and emetic.

BONT. An abbreviation for Jacobus Bontius, who is a writer of good credit.

BONTIA. The BARBADOES WILD OLIVE. It is of no note in medicine. Miller's Dict. vol. ii.

BONUS HENRICUS. See MERCURIALIS.

BOONA. The KIDNEY BEAN.
BOOPS, BOAX, or Box. A fifth mentioned by Al-

BOOS THALASSIOS. The SEA-cow.

BORACE.
BORACTRION & BORAXO. BORAX.

BORAGO. See BORRAGO. BORASSUS. The tender medullary fubflance which

BORASSUS. The tender medullary jubitance which grows at the top of the great palm-tree.

BORAX. Called also chryscella, capisfrum auri, anucar, atmear, brace, tincar, amphitane, baurach, nitrum factitium, santerna, and nitrum nativum. See Tincal.

BORAC, or Borax, called also Baurac, signifies nitre. The barbarians corrupted it into borax, and applied it to the chryscoolla, It is a mineral crystalline talt; the ancients called it chryscoolla. It is not much unlike alum. If genuine, it hash a sweet taste at the talt; the ancients called it chrysocolla. It is not much unlike alum. If genuine, it hath a fweet tafte at the first, but afterwards an uncluous one. Its pure crystals are octagonal prisms, finely cut; it diffolves difficultly in cold water; it easily dissolves in boiling water, but, on the water cooling, the borax concretes into a folid mass; to keep it dissolved in cold water, it requires near twenty times its weight. It swells and bubbles in the fire, and foon becomes a glass, which yet dissolves again fire, and foon becomes a glafs, which yet diffolves again in water; but if mixed with flint or fand, it becomes a hard and durable glass, even hard enough to cut common glass. It is an excellent flux for metals, and for their ores; it changes the colour of blue flowers to green; precipitates earthy and metallic bodies diffolved in acids; it renders vegetable and animal oils miscible with water; it does not fensibly ferment either with acid or alkaline liquors; it diffolves in acids more easily than in water; a folution of bsrax made in a menstruum of in Weitphaira.

The wreitlers among the Greeks used this kind of bread alone; for the bread that is wholly of fine flour, does folve in the air. If break is mixed with the crude fal ammoniac,

it may be concluded, that berax is rather alkalescent, though it is a salt of its own kind.

There is a natural fort called crude berax, it is brought into Europe in dirty lumps, and of a difagreeable fmell. In this ftate it is called tincal, or tincar, and contains an oily matter, earth, and ftones. The artificial is but this natural fort rendered pure by art. The manner of refining it is known but to few; but after coming from the
refiners, it differs fo from the general falt, that Cramer
calls it an adulterated borax. An artificial fort is faid to
be made of nitre, urine, &c. See Schroder on this subical. The oils matter is senarated from the natural boject. The oily matter is feparated from the natural bo-rax, by heating it in an iron ladle until it ceafes to bubble and flame; thus the oil is destroyed; then boil it in

water, and the falt is extracted pure.

Geoffroy fays, that "borax is at first a fluid, which oufes from various mines, but chiefly from those of copper. These springs are met with in Persia, the East In-dies, and other contries in Asia. This sluid is falt, muddy, and greenish; but by the summer heats it is so evaporated, that the falt is found concreted in the refervoirs made for its reception." Beecher also tells us, in his Alphabetum Minerale, that "the universal acid, in dissolv-ing a stone or a susible earth, forms borax, as it forms alum

when it meets with an earth fit to make lime. The borax of the fhops is often adulterated with alum; but then it is not fo light, nor clear, nor does it fwell fo

much as the pure when it is put on live coals.

Its conflituents feem to be the mineral fixt alkaline falt, and a peculiar kind of acid. By all the mineral acids, its alkaline basis may be disjoined from the subacid part. This analysis may thus be effected: dissolve eight ounces This analytis may thus be elected: dinoive eight ounces of borax in three ounces of warm water; then add three ounces of the oil of vitriol. Evaporate this mixture until thin plates begin to appear upon the furface, which are to be fwept off with a feather; then let the fire decay, and the veffel stand unmoved, till more crystals are formed, which are to be well rinfed with cold water, and dried for use. These crystals are the famed sal sedativus, which Gaubius fays will procure reft in inflammatory fevers when opiates fail. To this end it is given from gr. viij. to xvj. Dr. Morris used to give it to maniacs in doses of two drams to compose them. See SEDATIVUS SAL. Lemery fays, that two ounces of borax afforded him rather more than half an ounce of fedative falt; but he obtained it by fublimation, which method produces a purer falt, but is more tedious. It is obtained by fublimation thus: put a mixture of nine parts of borax, three of the oil of vitriol, and one of water, into a widenecked retort; place the retort over a fire at first gentle, then hastily increased until the vessel is red-hot; the se dative falt arises, and fixes itself about the neck of the retort; the liquor that diftils and falls into the receiver should be poured back as the matter dries which is in the retort, for the fedative falt only rifes while it is moift.

After the feparation of the fedative falt from the borax, by means of the vitriolic acid, what remains is only a combination of this acid with the mineral alkaline falt. The fedative falt, joined to the marine alkali, recomposes

This peculiar and characteriftic ingredient of borax, the fedative falt, though called fubacid, from its property of neutralizing alkalies, fcarcely discovers any other mark of acidity. Its taste is bitterish, and rather cool; it makes no change in the colour of blue slowers, nor does it effervesce either with acids or alkalies; a spirituous solution of it if set on fire, burns with a green flame. As a medicine it is antispasmodic and anodyne, whence its name fedative.

The borax itself is used for soldering gold, whence its name chrysocolla. It is a solder for other metals also; and a powerful flux for susing minerals of all kinds with.

It is used to give a gloss to silks.

As a medicine, it seems to possess greater virtues than those that are yet manisested in it. It is a powerful deobstruent, diuretic, and emenagogue, in doses of half a dram, or two scruples. A solution of it in water is the most efficacious means of removing aphthous crusts from the mouth and fauces. Externally it is a far better cosmetic than bismuth. Dr. Alston of Edinburgh says, that it

aramoniae, an urinous fmell is emitted like that which arifes from a mixture of fixt alkaline falts with it: whence it may be concluded, that berax is rather alkalefcent, the vafa minima, mixes with the blood, and dilutes it. the vala minima, mixes with the blood, and diddes it.

If given in powder it is emetic, but mixed with aromatics, this quality is checked, and in the fluor albus it is faid to be a fpecific.

A dofe of berax is from gr. v. to 3 i. fs.

BORBONENSIS, or BORBONICUS. A patronymic

epithet for the Bourbon waters.

BORBORODES. FECULENT, MUDDY, DIRTY,

BORBORYGMUS. A rumbling noife, excited by wind, mixed with fome degree of humidity in the bowels. This fort of noife is likewife what is produced by treading

in the mire, βορζος , whence its name.

BOREAS. The NORTH-EAST WIND. The northern winds are of a cold, but wholesome temperament. They abound with acid particles, whence they resist putrid diseases, but beget those that depend on the rigid fibre.

BORI. GREAT EATERS.

BORIDIA. A fort of falt meat, prepared of a kind of fifth, which is eaten raw. Oribafius takes notice of it. BORITIS, from \$6000, vorax. The philosopher's stone,

which melts the copper of wife men, and renders it fluid like water. BORIZA. See LUNARIA.

BOROMETZ, or BORONETZ. See AGNUS SCY-

BOROS. VORACIOUS. A voracious water, or fuch

a one as begets a good appetite.

BOROZAIL. The zail of the Ethiopians. It is a difease epidemic about the river Senegal. It principally infests the pudenda, but is different from the lues venerea, though it owes its rife to immoderate venery. In the men it is called afab, in the women offa batus.

BORRAGO, vel BORAGO. BORRAGE. Alfo

called buglossum, buglossum, latifolium, and BORAGO HORTENSIS. See BUGLOSSUM.

It is a hairy rough plant, with wrinkled, blackith green leaves, approaching to an oval frape, with round hollow flalks, on which the leaves are fet alternately. On the tops of the branches come forth blue, and fometimes reddish, or whitish monopetalous flowers; each of which are followed by four wrinkled blackish feeds. It is peren-

nial, grows wild on wafte grounds, and on old walls.

The leaves are fucculent; their medical qualities are not discernible until the juice is separated from them by presure, and then they are hardly worth our notice. A decoclion of them affords a small quantity of the nitrous and muriatic salts. The leaves are ranked among coolers,

and the flowers among cordials.

MINIMA. A fpecies of OMPHALODES, which

BORRI-BORRI, BOBEREI. An East Indian name for curcuma, turmeric, and also of an ointment ased there, in which are the roots of turmeric.

BOS. The BULL, COW, OX, HEIFER, or any other of the neat kind.

As a medicinal article, we may reckon beef-tea, which is thus made. Cut a pound of the lean part of of a but-tock of beef into thin flices, add to it two pints of water, boil them over a quick fire during five minutes, then feparating the fcum, decant the clear liquor for use. It is often made by just boiling the beef, then immediately removing it from the fire, and letting it ftand to cool in a veffel well closed; or indeed only infused in boiling water, for from hence it is supposed to retain the finest and more subtile parts of the nutritious lymph, which boiling diffipates, and feems more agreeable to ftomachs greatly debilitated; though if it boils ten, fifteen, or twenty minutes, which last is the longest that it should be allowed, it contains more of the stronger part of the beef.

BOSA. An Egyptian word for a mass which is made of the meal of darnel, hemp-feed, and water. It is in-

ebriating.
BOSCAS. A fort of dry pitch, which is tenacious like

BOS INDIANA. See BUBALUS.

BOSCAS MAJOR. A fort of duck called a MAL-

BOSMOROS, I from \$2000, to feed, and usp & a per-BOSPORUS, I tien, or division. A kind of corn is

BOTAMUM. WASHED-LEAD.

diftinguish them, and they describe them well; as to their virtues, they have done very little more than copy from the ancients, of whom Diofcorides is the chief. But as the ancients, though careful in their account of the virtues of plants, have not only neglected an accuracy in their descriptions, but given the same name to different subjects; so the descriptions of the moderns, and ac-

fubjects; fo the deferiptions of the moderns, and accounts of the virtues given by the ancients, fail of that ufefulnefs which otherwife might have been expected.

This branch of knowledge is very ancient. Solomon is recorded as having known all the plants from the cedar of Lebanon to the hyfiop upon the wall. Hippocrates is the next, of whom we have any valuable account: he fpeaks of the virtue of about two hundred and thirty plants, but does not deferibe them. Cratevas, or Crateias, a contemporary of Hippocrates, deferibes those plants of whose virtues Hippocrates gives an account. Theophraswhose virtues Hippocrates gives an account. Theophrastus, and some others, pursued this kind of knowledge, until at length Dioscorides rose up, and surpassed them all. He describes sour hundred and ten plants, and mentions, by name, one hundred and ninety more; he also treats on their virtues; but fince him no great notice hath been

William Turner gives Fuchfius's prints, with their names in English, German, French, Latin, and Greek. Fuchfius's prints are large. Tac. Theod. Tabernamontanus gave figures, which are copied by feveral of his fuc ceffors. Rembertus Dodonæus of Leyden, hath given very elegant figures. Carolus Clufius also hath left us many excellent figures. John and Cafper Bauhine neglected to establish the genuses of plants, yet their Pinax is a very useful betanic work. Crispinus Passeus published his Hortus Floridus, with very accurate figures. Tourned fort improved betany more than all before him; he formed it into a science and civing it the size of accuracy added fort improved bstany more than all before him; he formed it into a fcience, and giving it the air of accuracy, added figures alfo. Our countryman Ray is valuable in this purfuit. Boerhaave's peculiarity in his bstanic fyftem, is to diffinguish plants by the parts of fructification, for these never vary by foil, clime, culture, &c. but the appearances of plants alter very much in other respects. Besides these, there are the improvements of Linnæus, Miller, and others, whom, but to name, is to praise. One of the latest works of this kind, is the Institutes of Bstany, by Colin Milne, LL. D.

Dr. Grew's work on the Structure of Plants, and on Vegetation, or the Growth of Plants, are among the most

Vegetation, or the Growth of Plants, are among the most

valuable on the fubject of botany.

BOTANICON. The name of a plaster described by

BOTARGUM. The falted spawn of the mugil, or

BOTHOR. It hath three fignifications among the Arabians. 1. Tumors in general: 2. A tumor with a folution of continuity: and 3. Small tumors, which last is the most proper. Some take it for an abscess of the nostrils. Blancard says it fignifies pimples in the face,

notifils. Blancard fays it fignifies pimples in the face, which do not fpread, but are easily suppurated and vanish. It is besides a general appellation for pimples in the face, lungs, or other parts. And the Arabians call the small-pox and measles by this name.

BOTHRION, vel BOTRION, called also calloma. A small ditch, from \$69,20, a ditch. This word is also used to express a small ulcer of the cornea, hollow, straight, clean, without purulent, thick, or scaly fordes, equal to the head of a pin; if it should be an internal lamina of the cornea, it creates that called gerontoxon. A staphyloma succeeds. Sauvages Nosologia Methodica. Also the sockets of the teeth.

Also the sockets of the teeth.

BOTIN. TURPENTINE. Also a balfam from it. BOTIUM. See BRONCHOCELE.

BOTOTHINUM. A term used by Paracelfus, by which he would express the flower of a disease.

BOTOU, or BOTOUA. See PAREIRA BRAVA. BOTRITIS, BOTRITES, from BOTROS, a BOTRYITES, BOTRITES, from Borgos, a clufter, BOTRYITES. | properly of grapes.

thus called, because it is divided by the mill to fit it for | It is a fort of burnt cadmia, resembling a cluster of grapes, and collected from the upper part of the furnace, where it is burnt; as what is collected in the lower part is called placitis. Schroder fays, that the betryites is collected in the middle part of the furnace, the placitis in BOTAMUM. Washed-Lead.

BOTAMY, from the Greek word \$\beta\_{\text{days}}\$, berba, an berb. The feience of plants; that part of natural history which belongs to vegetables, hence he who is verfed in this fludy is called a botanift.

BOTRYS. It is difficult to fay what particular plant this fludy is called a botanift.

BOTRYS. It is difficult to fay what particular plant this is: the following are by fome placed under this name.

— The OAK of CAPPADOCIA, or of JERUSALEM; also called artemifia, ambrofia, chenopodium, and atripiem odera, feu fuaveolenus. It is the chenopodium botrys, Linn. See AMBROSIA.

- MEXICANA. The MEXICAN TEA. Called also botrys ambroficides Mexicana, eparath Mexicanava, cheno-podium, botrys Americana, atriplex odor: Americana, and Artemisian betrys. See AMEROSIA ARTEMESIA.

The above plants are natives of the fouthern parts of Europe; they are fown annually in our gardens. The leaves and flowery heads have a firong, but not unpleafant feent, are moderately aromatic and bitterish to the taste. If they are much handled, an unctuous resinous juice adheres in confiderable quantities to the fingers.

The proper menstruum for their active matter, is rectified spirit of wine; but boiling water also takes up the greatest part of their virtue. An insusion of them drank

as tea is useful in coughs, and humoral afthmas. They are ranked among the anti-spasmodics.

These plants differ from the English mercury, and from the stinking orach, chiefly in their leaves being like those

of an oak.

BOTUS, BOTIA, or BOTUS BARBATUS. It is a chemical veffel, which is called a cucurbit, also a veffel placed upon a veffel; a veffel for fusion, or a descenforium, a chemical furnace in which distillation is per-formed by defeent; a crucible made to pour out of. See

BOUBALIOS. A WILD CUCUMBER. Some explain

it to be the pudendum muliebre.

BOUBON. The Greek word from whence BUBO is taken. It fignifies the groin, fometimes the glands in the groin, and a tumor of the fame; also a tumor in the neck, or arm-pits, or behind the ears, or of any of the external glandular parts.

BOUCERAS. See FENUM GRÆCUM, also ÆGOCE-

BOUGIE. In the French language means a wax candle. The term is applied to a machine, which (as the wax candle formerly was) is introduced into the urethra for removing obstructions there. It is likewife known by the term catheter vel candela cerea. See MEDICATA.

In Dr. Swediaur's Pharmacopæia Syphiliteia, there

In Dr. Swediaur's Pharmacopæia Syphiliteia, there are the following preferiptions for bougies, called catheteres, first made of silver, but they are better formed of elastic resin, of various sizes. The second he calls Ceres, of elastic resin, or of musical chords, made from the intestines of sheep. The third, Ceres medicari.

R Cere slavæ liquesactæ. Bj. spermatis ceti, 3 iij. aquæ lythargyris acetati, Ph. Lond. nov. 3 ij.—3 j. these being mixed together, and removed from the fire, slips of linen cloth are to be dipped in the composition, of which the bougies are to be formed. The fourth are the Ceres medicari, said to be the invention of Le Dran-

CEREI MEDICATI, faid to be the invention of Le Dran-R. Herbæ conii maculati, foliorum Nicotianæ tabaci,

Mons. Daran, a French surgeon, lately boasted of his introducing bougies as an improvement in his art, and acquired considerable profit by making and follows.

quired confiderable profit by making and felling them. Scultetus, about the middle of the feventeenth century, used them in diseases of the urethra, and probably Mons.

Daran took the hint from him.

Different compositions have been used, and generally mercury was a part in them. Riverius made a plaster

25

as follows: R Ol. oliv. fb iv. ceræ citrin. fb ij. minii fainting, and that in the fames canina, the patient vomiss & ceruf. aā fb i. fs. tereb. Venet. & rez. alb. aā 3 iij. his greedy meals as dogs do; though with fome they own

Whether the bougies are made up of these or any other Whether the basgies are made up of their or any other compositions they must be of different fizes, from the bigness of a knitting needle, to that of a goose quill. They are made of linen rags, spread with a proper matter, and then rolled up as follows. Having spread any quantity of linen rag with the composition that is chosen for the purpose, cut it into slips, from fix to ten inches long, and from half an inch to an inch broad; then dexterously roll them on a glazed tile into the form of a wax candle. And as the end of the bougie that is to be entered first into the urethra, should be somewhat smaller than the rest, it would be as well to cut the slips a little tapering. It should also be observed, that when the beagies are rolled up, that side must be outward on which the plaster is

Monf. Daran, and fome others, attributed the action of their bougies to the composition they made use of in forming them. Mr. Sharpe apprehended, that as much of their efficacy was owing to the compression they made on the affected part, as to any other principle. And Mr. Aikin juftly fays, as it is evident that bougies, of very dif-ferent compositions, succeed equally well in curing the fame diforders in the urethra, it is plain that they do not act by means of any peculiar qualities in their composition, but by means of some property common to them all. This must be their mechanical form and texture, therefore their mode of action must be simple compressional.

The efficacy of mere compression in many cases of conftriction is well known, from the use of sponge tents for widening parts that are ftraightened by cicatrices; and admitting obstructions in the urethra to be from a constriction formed by cicatrized ulcers, or a projection of the ipongy fubiliance of the urethra into the canal, we may eafily conceive that a gentle continued elastic compression will, in time, overcome the difease. We may also readily account for the inferior efficacy of metallic and whalebone bougies, from their not having the property of fwelling with moisture, and therefore not making the composition fo equal.

As to bangies procuring a discharge of matter, there is no doubt but the mechanical stimulus of a foreign body, in such a tender part, though free from difease, must produce it in fome degree, and that this will be varied ac-cording to the chemically flimulating quality of the com-position, and the irritable state of the urethra; but it pointion, and the irritable listle of the urethra; but it is eems an abfurdity to apply a topic made uniform throughout, to the whole length of a canal, with a view of producing extraordinary effects upon a particular part of it, by means of fome powerful quality in the ingredients. As to that part of the bougie which was in contact with the difeafed part being particularly covered with matter, this circumstance is owing to the greater irritation of the urethra where the diforder is, than in the other parts of

See Sharp's Critical Enquiry, ch. iv. and Aikins's Ob-fervations on the external Ule of Preparations of Lead. Bell's Surgery, vol. ii. 201, &c. and White's Surgery, 371. BOUL A Chinefe name for BOHEA TEA.

BOULIMUS. A VORACIOUS APPETITE, from \$3, a particle which in composition augments the fense, and Apes, hunger. Boulimus, or bulimus, fignifies an ox's appetite, though this difease is more frequently called fames canina, a CANINE or DOG'S APPETITE; it is also called

malacia, or HUNGRY EVIL; phagedana adepphagia, bulimiasis, bulimia, bupcina.

Dr. Cullen names this genus of difease bulimia. He places it in the class locales, and order dyforexia; and distinguisheth three species.

1. Bulimia helvonum, in which there is no other disorder of the stomach than an excessive craving of food.

2. Bulimia fyncopalis, in which there is a frequent desire of food. which there is a frequent defire of food, and the fense of hunger is preceded by a swooning.

3. Bulimia emetica, also cynsrexia, in which is an appetite for much food, which is presently ejected by vomiting.

This diforder consists in an infatiable defire of food, and could return of the appetite.

a quick return of the appetite after eating. Some diffinguish betwixt boulimus and fames canina, whilst others make them but one. They first fay that the boulimus is not attended with a vomiting, but, in its flead, with

his greedy meals as dogs do; though with some they own it runs off by stool instead of vomiting.

In fome it may be a natural misfortune, for on diffection is hath been found, in a few inflances, that the right orifice of the flomach was too large, confequently the aliment was too foon expelled through it. Galen fays it is caused by an intense acid in the stomach, or other acrimony in the gaftric juice. Others attribute it to a weakness in the lower orifice of the ftomach, worms,

Lommius observes that in this case there is great hunger, much is eaten, which oppressing the stomach is again thrown up, the patient is thus relieved, but the appetite returns; the ftomach cafed by eating, is again opprefied, and is again relieved, as that of a dog by vomiting. There is no danger if food is supplied, though the pa-

tient is pregnant, except large colliquations attend, or fainting is frequent. Fainting with a full flomach, is a dangerous fymptom, coldnefs in the extremities, generally fatal, and the breath failing when a fainting comes on death may be excepted at her.

on, death may be expected at hand.

From faintings the patient is recovered by offering to his finell a toaft dipped in wine, or roafted meat. After recovery from the fit give him fome food; and let it be of fuch a kind as cools and nourifles, but is not foon digefted, fuch as carrots, beets, parfnips, with foft fat, and farinaceous fubstances.

If an acid is the cause, after vomiting give the testaceous powders, the lixivium of tartar, and iron filings.

If worms are suspected, anthelmintics must be pre-

When the cause is not very manifest, moderate doses of opium may be given at proper intervals, but fome circumfpection is required in administering it. Besides vomiting, purges with aloes will be adviseable: wormwood, and such other medicaments, as warm and strengthen the stomach. Galen commends frequent small does of brandy; and Riverius fays, that ambergrife is peculiarly ufeful, if five or fix grains be repeated at due intervals.

This diforder terminates variously, as in a lientery, dropfy, atrophy, cachexy. See Galen, Alexander Trallian, Paulus Ægineta, and Lommius.

BOUNIAS, see BUNIAS, from \$2005, rugged, because

it delights in rugged places.

BOUTUA. See PAREIRA BRAVA.

BOVILLÆ. The MEASLES.

BOVINA AFFECTIO. The DISTEMPER of BLACK CATTLE. A difease among black cattle, caused by a worm lodged between the skin and the flesh, and perforating the same. The Arabians call it agritude bovina; it is but little known in Europe. It is not mentioned by the ancient Greeks.

Some confound this diforder with the dracunculi, but they are very different: but fomething analogous to this diforder is a cutaneous one, with which fome feorbutic conflitutions are frequently affected, and which fecms to be owing to an obstruction of the perspirable matter which concretes in the pores of the skin, and forms a scheed, which may be squeezed out, and which sometimes causes a small suppuration, and is discharged with the

Avenzoar gives the following account of the bovina affectio. "Sometimes a worm breeds between the skin and the slesh; and if this worm is not foon killed, the consequences may be pernicious. As soon as it is perceived, burn the adjacent part with a hot iron, so that the heat may penetrate to the worm, in a degree sufficient to kill it. This done, dress as is usual after burns, and pure with aloes."

purge with aloes."

Here Avenzoar speaks of this diforder as in human fubjects. But Albucasis, who hath two chapters, one on the dracunculi, another on the bovina affectio, says, "This worm, which is generated between the skin and slesh of black cattle, takes its course over the whole body, and is plainly perceivable in its motion, from one pare to another, until it breaks the fkin, and wherever it makes a breach, there it finds an egrefs." Alzaravius fays, "that in human fubjects this worm paffes betwirt the fkin and the flesh, as Albucasis hath represented it in brutes; and that it is generated of the same matter, as that from which lice are produced.

Another bovina affectio is described in a Dissertation de Boum Celtro, by Wallisnerius. This celtrum, or vexatious sly, pitches on the backs of black cattle, and with a kind of sting, growing to its hinder part, perforates them, and into each perforation introduces an egg, which fome time after gives birth to a worm, and this to a fly, which in due featon is like its parent. When this a fly, which in due feason is like its parent. When this fly pierces the skin, it causes severe pain in the oxen. The worm, however, which is deposited, grows without any remarkable injury to the health of the animal; it never moves from its place, but in the following fpring it occasions a tumor, out of which it finds its way when fummer approaches, and becomes a fly. See Le Clerc Hift. Lumbric.

Under this article may be placed the chicas, or chicres. They are fmall worms, which in the warmer parts of America, frequently breed in the muscular parts, and

America, frequently breed in the muscular parts, and particularly in the feet. The Indians pick them out, and then apply to the fore, by rubbing, the ashes of wood. Hossiman speaks of a kind of worms that the children in Milnia are subject to. He says that these children are frequently seized with a tabes, which reduces them to mere skeletons. The cause is a fort of worms like black hairs lodged under the skin. These animals are usually called comedones, or gluttons, because they devour the nutritive juices in their distribution. When the skin is rubbed with boney in any warm place they come out a rubbed with honey in any warm place they come out; but cold makes them keep concealed within. See CRI-

Sennertus speaks of a fort of worms called feuren, firenes, or crinones. He tells us, that a species of puftules among the Germans, which rife on the palms of their hands, and the foles of their feet, are called feuren, that these worms are known to be there by the greater itching of these parts than is perceived at other times.

BOVISTA. See LYCOPERDON. — MAXIMA AL-

BA. GREAT DUSTY MUSHROOM.

BOXUS. The MISLETO which grows on trees.

BOZA. The name of a drink much used in Turkey.

BRABE. An herb mentioned by Oribasius.

BRABYLA. The plums which are called Damascene and Hungarian. They are large, sweet, and of a blue

BRACHERIUM: AMMA. A furgeon's bandage and truss for a hernia. A word used by the barbarous Latin writers, probably from brachiale, a bracelet.

BRACHIA. The division of the large branches of

trees from the trunk.

BRACHIÆUS MUSCULUS. The name of two muscles of the arm, from brachius, an arm. That called - INTERNUS, begins where the deltoid mufcle ends, covers the interior and anterior furface of the os humeri and is inferted into the coronoid process of the ulna, ferving to bend it. And the — EXTERNUS, feems to be the third beginning of the gemellus; its origination is continued from above the middle of the infertion of the fame, and from the back part of the os humeri, to its cavity, which receives the olecranum in the extension of the cubit, where joining with the tendinous outside of the gemellus, it is inferted into the fuperior and external part of the ulna, called olecranum. See GEMELLUS, and Ancon Eus. Cowper.

Douglas fays, that the brachieus externus, and the bi-

ceps externus, or gemellus, make but one fingle muscle with three heads, to which he gives the name of triceps

cubiti, or extenfor cubiti magnus triplici principio natus.

BRACHIALE. So the ancients called the carpus.

BRACHIALIS ARTERIA. The BRACHIAL ARTERY. It is the continuation of the axillary artery, which as foon as it hath passed behind the tendon of the pectoralis major, receives the name of brachial. It runs down on the inside of the arm, over the musculus coracobrachialis and anconœus internus, and along the inner edge of the biceps, behind the vena bafilica, giving out

fmall branches as it goes along.

Between the axilla and the middle of the arm, it is covered only by the skin and fat; but afterwards it is hid under the biceps, and runs obliquely forward as it de-feends, being at fome diffance from the internal condyle; but it does not reach the middle of the flexure of the arm. Below the fold of the arm it divides into the cubitalis and radialis.

From its upper and inner part it fends off a particular branch, which runs obliquely downward and backward, over the anconai, and then turns forward again near the external condyle, where it communicates with a branch of the radial artery. A little below the infertion of the teres major it fends off another branch, which defeends, and is united with the radial artery, and also with the

The common trunk of the brachial artery having reached the flexure of the arm, it runs, together with a vein and a nerve, immediately under the aponeurous of the biceps, and palles under the vena mediana, detaching branches on each fide to the neighbouring muscles.

Sometimes, though very rarely, the brachial artery is divided from its origin into two large branches, which run down on the arm, and afterwards on the fore-arm, where they are called cubitalis and radialis. Winflow.

BRACHIALIS EXTERNUS and INTERNUS. | See BRA-

CHIÆUS EXTERNUS and INTERNUS.

BRACHIO-CUBITALE LIGAMENTUM. The expansion of the lateral ligament, fee LATERALIA LIGA-MENTA, which is fixed in the inner condyle of the os humeri, runs over the capfula, to which it closely ad-heres, and is inferted like radii on the fide of the great figmoid cavity of the ulna; it is covered on the infide by feveral tendons, which adhere closely to it, and feem to strengthen it. Winslow. That called RADIALE LIGAMENTUM, the expansion of the lateral ligament, fee LATERALIA LIGAMENTA, which runs over the ex-ternal condyle of the os humeri, and is inferted round the coronary ligament, and from thence all the way down to the neck of the radius, and also in the neighbouring parts of the ulna. Through all this passage it covers the capfular ligament, and is covered by feveral tendons adhering closely to both. Winflow.

BRACHIUM. The ARM. In Hippocrates it figni-

fies that is now called the humerus. From the elbow to the wrift is called the fore-orm. By the orm is generally meant the whole, from the shoulder to the wrist.

BRACHUNA. SATYRIASIS, FUROR UTERINUS.

BRACHYCHRONIUS, from Brazus, fort, and Kposos, time. An epithet of a difease, which continues but a short time.

BRACHYPNŒA, from βραχυς, foort, and πτιω, to breathe. BREATH fetched at floort intervals.

BRACHYPOTÆ, from βραχυς, fmall or front, and πτιω, drink. LITTLE DRINKERS. To drink but little

in ardent fevers is a bad fign.

BRACHYS. See Brevis.

BRACIUM. COPPER.

BRADYPEPSIA. Weak digeftion, or concoction of food. Blancard fays it is a flow digeftion, proceeding from a depraved difposition of the acid ferment in the ftomach.

BRADYS. SLOW.

BRAGGAT. A drink made of water and honey.

BRANCA. An Italian word fignifying fost; hence the acanthus is called BRANCA URSINA, bear's foot, from the refemblance of the leaves to the foot of a bear. -LEONIS, OF PES LEONIS. See ALCHIMILLA. — UR-SINA. See ACANTHUS, PASTINACA, and BRANCA. — URSINA GERMANICA, i. c. SPHONDYLIUM. Sec PASTI-

BRANCHÆ, Names of the glandulous tumors of BRANCHI. State fauces which refemble two almonds, and are accompanied with a difficulty of spitting

and troublefome breathing.

BRANCHUS. A DEFLUXION OF HUMOURS upon the FAUCES. It is a species of catarrh, which Coclius Aurelianus calls RAUCITAS.

BRANTA, or BERNICLA. The ROAD-GOOSE.
BRASILIA. See BRASILIUM LIGNUM.
BRASILIANA ARBOR AQUATICA. See ANIN-GA IBA. - ARBOR JUGLANDI SIMILIS, NUCIBUS CA-RENS. A fort of wood in Brafil, which refembles that of the walnut-tree.

BRASMOS. FERMENTATION.

BRASSADELLA, or BRASSATELLA. See OPHIO-

BRASSICA. CABBAGE. Of which there are thirty fpecies; Linnæus ranks them all under the name braffi-ca radice caulefcente tereti carnofa. They are all bien-nial. All the species are supposed to be only varieties of the fmaller kind, which grow fpontaneously on our fea-

coasts. It is also a name of the turritis.

Cabbages are faid to be difficultly digested, and to afford but little nourishment; but as they have a stronger ten-dency to putrefaction than most other vegetable substances, and during their putrifying state fend forth an offensive smell, which much resembles that of putrifying animal bodies, it feems more reasonable to believe that they are the most easily digested in our stomachs, and also very nutritious.—All of them, says Dr. Cullen, may be confidered as a supplemental provision only, and are seldom chosen by the quantity of nourishment they afford, but by the tenderness of their texture, and the fulness and fweetness of their juice.

Cabbages are far from being unfalutary; they neither induce nor promote a putrid difposition in the human body, but, on the contrary, are a falubrious aliment in the true putrid feurvy. They loofen the belly when eat-en freely, and produce much flatulency; but by well boiling, they lofe their laxative quality. The Broffice have great powers as antifoorbutics, and taken in largely as aliments have proved a cure for the fourvy, this per-haps is owing to their acefcency.

The Germans make the following preparation of cab-

bage, to which they give the name

Sauer Kraut. The English imitating the found, Sour CROUT.

Take of the cabbages in common use, cut them into thin flices, put them into a cask that is previously cleaned, dried, and lined in its whole inside with the sour paste called leaven; on each layer of the sliced eabbage sprinkle a small handful of salt and press it down; when as much is put into the cask as it will contain when thus forcibly preffed, and all the liquor is poured off which is fqueezed out of the cabbages; cover it with a clean cloth, then lay the loofe cask head thereon, and over it any heavy weight that the preffure may be continued; lastly, thus let it stand in a warm room until it ceases to ferment, and then it is fit for use. When used, boil the wanted quantity for the present meal in water, during two hours or more then pouring off the liquor, add to it a little butter, and eat it with bacon, faufages, &c. as the palate directs.

If the cask is closed up when the fermentation of the

cabbage is finished, this preparation will be preferved in its perfection many years, and would be a convenient part of feamen's diet, as a prefervative from the feurvy.

The white fort is the most putrescible and fetid; the red is the sweetest, most emollient and laxative: if the stalks of the red kinds are cut longitudinally in autumn, and placed in a cool shade, a laxative juice resembling honey or manna exudes from the incisions. That called - SATIVA, is the COLEWORT or CABBAGE, named also caulis, braffica capitata alba vel rubra, braffica sabauda alba, &cc. — FLORIDA. CAULI-PLOWER, called also braffica multi flora, caulis florida. — Congylodes. TURNEP CABBAGE, called also braffica caularapa, rapocaulis, braffica caule rapum gerens.

The feeds yield by expression an oil which is useful for

This wood is rarely met with in prefcriptions; it is and braffica crifpa laciniofa. - Capitata virescens fometimes substituted for red sanders, with which it agrees in most of its properties, with this difference, that the red sanders does not give out its colour to water;

TRIS. SEA COLEWORT OF CABBAGE, called also crambe

maritima folio brassica, brassica maritima monospermos, and brassica marina Anglica.

Crambe in general fignifics a cabbage; but the modern botanists distinguish it from a cabbage. Boerhaave says the characters of this plant are these, viz. the seed-vessel and course and cou is unicapfular, divides into two parts, and contains each a fingle oblong feed. — ITALICA TENERRIMA GLOME-ROSA FLORE ALBO. TABAUDE. The SAVOY CAE-BAGE. — MARITIMA, called also foldanella maritima minor, convolvulus maritimus hofiras. SEA BINDWEED, SER-COLEWORTS, and SCOTCH SCURVY-GRASS. The convolvulus foldanella, Linn.
This is a species of convolvulus; its leaves are roundish

and fet on long pedicles; the flowers are of a reddiff pur-ple colour, large, and flanding folitary in the bosons of the leaves. It grows wild on the fea-coast in the North of England, and slowers in June.

The leaves are a rugged cathartic; this quality refides in the milky juice which exudes upon wounding them. A decoction of the dried leaves, from 3 fs. to 3 iii. is

Miller takes notice of three species.

BRASSIDELLICA ARS. A way of curing wounds, mentioned by Paracelfus, by applying the herb broffadella to them.

BRATHU. The herb SAVINE.

BREGMA, from \$\beta\_{P\times\u03c3\u fquare figure; they are nearly of the fame thickness all over, and divided into an upper and lower part by a cir-cular line; on the upper part they are covered only by the integuments, on the lower by the crotaphite mucle; towards the posterior and upper part there is a hole through which the veffels of the dura mater communicate with those of the scalp. These bones have a large extent, but are the weakest in the human body. The trepan may be applied to any part of this bone except on the lateral parts of the pollerior lower edge of it, the lateral finuses lying under those parts. It often happens that tumors are formed on these bones in infants, which contain a fluid, and give to the touch an appearance of deficiency of bone, which is not the cafe. The best method of treating these tumors is to leave them to themselves, their contents will be taken up by the absorbent system.

BRONCHIA. The aspera arteria descends from the fauces down the throat, growing narrower as it approaches to the lungs, at its termination dividing into two bran-ches called the bronchia. These ramifications are again divided into numberless others, which are distributed

the four principal warm waters naturally produced in they terminate in fmall veficles like clufters, which ad-England this is the leaft for See BATHONIENSIS AQUA. here to these small bronchial ramifications, conflicting here to these small bronchial ramifications, constituting the chief part of the lungs. The use of the bronchia is to afford an ingrefs of the air into the lungs, and a free return of it thence, with fuch fuperfluous matter as is ready to be carried out of the body with it, which is also one of the organs of digestion; and considered by fome as an emunctory for the discharge of phlogiston.
BRONCHIALES ARTERIÆ. They sometimes go

from the fore fide of the superior descending aorta, sometimes from the first intercostal, and sometimes from the arteriæ æsophagææ. Sometimes they arise separately from each fide to go to each lobe of the lungs, and fometimes by a fmall common trunk, which afterwards feparates towards the right and left hand, at the bifurcation of the afpera arteria, and accompany the ramifications of the bronchia.

The bronchial artery on the left fide often comes from the aorta, while the other arifes from the fuperior intercostal on the same side; which variety is owing to the situation of the aorta. Sometimes there is another bronchial artery, which goes out from the aorta polleriorly, near the superior intercostal, above the bronchialis anterior.

Communications have been observed between the bronchial artery and the vena azygos, and with the coronary

artery of the heart.

Ruysch first discovered these vessels, and he describes both the bronchial arteries and veins in his fourth epiftle.

GLANDULÆ. At the angle of the first ramification of the trachea arteria we find on both the fore and back fides certain foft roundish glandular bodies, of a bluish or blackish colour, and of a texture partly like that of the thymus, and partly like that of the thyroid gland. There are many such like glands at the origin of each ramification of the bronchia. Dr. Hunter supposes their office is to separate a mucus to lubricate the lungs: they are different both in colour and structure from the conglobate and lymphatic glands.

— GLANDULA. See THYROID πA GLANDULA.

BRONCHOCELE, from βρογχος the wind-pipe, and
κελη, tumor. Alfo called Bocium Botium. It hath various names in different writings; the Swifs call it gou-tier; fome have called it bernia gutturis, guttur, tumidum, & trachelophyma, exechebronchos; gongrona hernia bron-chialis; Heister thought it should be named tracheocele; Mr. Proffer, in his late publication on this diforder, from its frequency on the hilly parts of Derbyshire, calls it, with others, the Derbyshire-neck; and not fatisfied respecting the similitude of this tumor with that observed on the neck of women on the Alps, he calls it, particularly that which he fo well deferibes, the English bronebocele; as various causes give rise to this complaint, the more ftrictly to diftinguish that, in which he expects fuccels in his attempt to cure, he calls that species which is not produced by external accidents, such as loud-speaking, crying, blows, &c. the natural, the spontaneous, or the curable bronchocele.

The seat of this disease is the thyroid gland, which

Dr. Hunter hath observed lies just below the larynx, round the trachea. The tumor appears in the fore-part of the neck, between the skin and the wind-pipe. Women are the most frequent subjects of this disease, in whom it ufually appears early. Dr. Hunter met with one case of this kind in a young surgeon; but it rarely happens in males, or being less in sight is not often noticed.

Various causes of this disease are assigned by different writers. On the mountainous parts of Genoa and Pied-

mont, they attribute these tumors to their drinking water cooled with ice. Dr. Leake observes, in his Medical Advice, ed. 5. It is very probable that such glandular swellings as happen about the neck and face, thould be owing to the severity of the cold, moist air, especially fince they generally appear in winter: he adds, as far as he could observe, these tumors were rare in the warm dry climates of Italy and Portugal. Some writers attribute it to a scrophulous cause. Mr. Proffer inclines to think that it is a dropfy in the gland, and fimilar to the dropfy in the ovaries. He relates that Dr. Hunter diffected one of these glands that had been confiderably enlarged, and it was found to be enthrough the substance of the lungs, and which consist of larged by a number of cysts silled with water. Yet most

Mr. Proffer very accurately describes this disease as follows: the bronchecele is a tumor arifing on the forepart of the neck; it generally first appears some time betwixt the age of eight and twelve years, and continues gradually to increase for three, four, or five years; and fome times the last half year of this time, we are told, it grows more than it had for a year or two before. It generally occupies the whole front of the neck, for the whole thyroid gland is here enlarged, but it does not rife near to high as the ears, as in the cases mentioned by Wiseman, and it is rather in a pendulous form, not unlike, as Al-bucasis says, the slap or dewlap of a turkey-cock's neck when he is angry, the bottom being the bigger part of the tumor, it growing gradually less upwards: but as to its figure, it varies considerably in different cases. It is soft, or rather flabby to the touch, and fomewhat moveable; but when it has continued fome years after the time of its growing, it gets more firm or confined. By the fituation and nature of the complaint, it generally occasions a difficulty of breathing, and very much fo upon the patient's taking cold, or attempting to run or walk faft; in fome the tumor is fo large, and fo much affects their breathing, as to occasion a loud wheezing; but we meet with many exceptions to this general rule. Some shall have the disease in an aggravated degree, and suffer but little by it; in others, though the enlargement of the gland is not near fo confiderable, yet they fuffer much more from it. In common, the opulent of those who have the complaint in a confiderable degree, will be rendered incapable of enjoying life; the poor, of getting their living. Dr. Hunter observed, in his lectures, A. D. 1771, the formations this temper contains ways, but that now that fometimes this tumor contains water, but that now and then it fuppurates.

The bronchocele should be distinguished from a scirrhus, also from an aneurism, and particularly those swellings in the neck that rise from strains, ruptured vessels, &c. It is the natural, not the accidental, that is above deferibed, and which arises spontaneously as it were, that is countly and any those from country as it were, that is curable, and not those from external and other manifest

This tumor is not apt to become cancerous. Mr. Gooch fays, he never knew this difease to endanger life, however large it was; but he observes a considerable inconvenience from it in cases of quinsey attending with it. Mr. Sharpe mentions, that the only cases requiring bronchotomy, were owing to the presence of brancheceles. Dr. Hunter has noticed, that this disorder appears two or three years before or after menstruating; and that it fometimes spontaneously disappears if the menstruation approaches kindly; and Mr. Prosser adds, that often this change in the constitution does not seem at all to affect the tumor, but it continues to grow as before.

Some have observed, that the drain of an issue, or of a perpetual blifter, applied on fome other occasion, has prevented the growth of the bronebscele; the iffue or blifprevented the growth of the branchesele; the flue of ball-ter being dried up, the tumor in the neck would increase faster; and upon the iffue's being opened again, or the discharge of the blifter, it would be somewhat sunk, or however its growing bigger prevented. But on this method no dependence can be had. By reason of its situ-ation, it cannot be extirpated; it is so entangled with the recurrent nerves, the first branch of the external ca-rotid artery, &c. that those who have attempted to diffect it, were glad to desist; and if hy chance, a supportation it, were glad to defift: and if by chance, a suppuration is formed, an ill conditioned ulcer is the confequence, which is very difficult of cure. If it can be difcuffed, that mode of relief alone can be prudently attempted; and thus Mr. Proffer hath succeeded in many instances. On this plan the late famous Coventry medicine was formed. Mr. Wilmer has inserted it in an Appennix to his Cases, &c. in Surgery. It begins with an emetic the day after the moon is at full, and the day after that a purge; the night following, and seven nights successively, the following bolus must be laid under the tongue at bedtime; and on these seven days a bitter stomachic powder should be given at noon. The bolus to be laid under the tongue, is formed of calcined sponge, cork, and pumice-stone, of each ten grains, syvup a sufficient quantity. But to proceed to that method by which Mr. Profess affires us the spontaneous or curable cases are religious. fer affures us the spontaneous or curable cases are relieved, chi, as now understood, are the ramifications. he says, that several have succeeded by the use of his meshe fays, that feveral have fucceeded by the use of his me-

writers agree that its true cause and nature are alike un- dicines, though they were nearly advanced to their twenty-fifth year, which was more than twelve years after the appearance of the tumor on their necks; after the twenty-lifth year of the patients's age, no inflance of fuccefs hath occurred. He orders one of the following powders to be taken early in the morning, an hour or two before breakfast, and at five or fix o'clock in the evening, every day for a fortnight or three weeks. The powder may be taken in a little fyrup, or fugar and water, or any thing elfe, fo that none is loft. If it does not fit well on an empty stomach, it may be taken betwixt breakfast and dinner:

R Cinnab. ant. op. levigat. milleped. ppt. & pulv. 22 gr. xv. Spong. calcinat. 2j. m.

After these powders have been taken for two or three weeks, the patient should omit them for about a week, or nine days; then begin with them again, and take as many more, after the fame manner; and also at bed-time, every night, during the fecond courfe of the powders, three of the following pills are to be taken.

R Hydrargyr. 3 v. terebinthinæ Strasburgensis 3 ij. extracti colocynthidis comp. 3 iv. pulv. rhabarbari. 3 j.

First grind the quickfilver with the turpentine till it appears no longer, then beat them up with the reft into a mais. If the turpentine chance to be too thick, it is to be thinned with a little olive oil.

These medicines do not require any confinement, except they are taken in fevere weather, and then it may be only to the house; nor need the diet be much regarded. It may be fufficient that the medicines are taken in a temperate feafon, or rather warm weather, and the patient lives exactly in the ufual way, taking fome care against catching cold, during the fecond course of the medicines. The patient, if a servant, should avoid standing, especially at the washing-tub, or fuch other work as is done with cold water. As to diet, when no alteration hath been made in it, the fuccess has been the same as when stated regulations were regarded. In this, discretion may occa-fionally direct. If the pills continue to purge, after tak-ing them a few days, it would be better to leave out the extr. coloc. comp. in the preparation of the pills, and fubfitute its weight of liquorice-powder, that the quick-filver may remain in the same proportion. In general it will be proper for the patient to be purged twice or thrice with manna and falts, or any gentle cathartic, before the powders are begun with. The medicines are here pro-portioned for an adult of a good conflitution; therefore, it the patient is younger, or of a weakly habit, the dofes must be managed accordingly. As to external applica-tions, they may be hurtful, but do not appear likely to be useful. regulations were regarded. In this, diferetion may occabe ufeful.

To conclude, it may be proper to observe, that the patient must not expect to find benefit in a little time; per-haps it will be as long after the medicines are all taken, as the time they are in taking, before much difference will be perceived in the tumor of the neck. It is necessary that the medicines be begun with at a proper time, especially the fecond courfe; a few days should always be dispensed with on that account.

Amongst the earlier writers, Albucasis is the first who gives any useful account of this disorder. See it trans-Jated into Freind's Hift. of Physic, and into James's Med. Dict. art. Bronchocele. See also Turner's Surgery, vol. i. p. 164. Wilmer's Cases and Remarks in Surgery, in the Appendix. But the best of the moderns on this subject is an Account of the Method of Cure of the Bronchocele, by Thomas Proffer, edit. 3. Gooch, in his Med. Obf. gives an inflance, of an aqueous bronebscele.
Bell's Surgery, vol. v. 514, White's Surgery, 289, Memoirs of the Medical Society of London, 217.

BUBO. A BUBO, from Boolup, the groin. It is a tu-mid gland which is inflamed, or tends to suppuration: but it is generally understood only of those glands which are in the arm-pits, or the groins. Galen fays, in his first book De Diff. Febr. "a bubo is a kind of inflammation."

Dr. Cullen ranks this genus of difease in the class lo-cales, and order tumores. He defines it to be the suppu-rating tumor of a conglobate gland. See his Nosology,

Bubbes are diffinguished into mild and malignant; the mild is when no manifest previous disease is in the body; the malignant is when fome peltilential difease, or some infectious one, excites them, as in the plague, lues ve-

nerea, &c.

The chief danger when buboes arise, is from the bad habit of body, or fome attendant difease; if neither of these accompany them, at the worst they are but a little

troublefome.

The cure of the mild kind will easily be effected by

The cure of the mild kind will eafily be effected by gentle mercurials externally applied, and a purge now and then; though if a suppuration threatens, it is best to encourage it, and proceed as in a common abscess.

A pestilential bubo is known by its appearing at the time of a pestilence, and being attended with more or less of the symptoms therereof; though, indeed the bubo is the first symptom in some patients, at a time of pestilence. The appearance of a bubo, when the plague either prevails or attacks a person, is generally a happy pressue, and in the management of it repellents must not be used, but by all means suppuration encouraged; and as soon but by all means suppuration encouraged; and as soon as a tumor appears, which, in this case, though the armpit is the general seat, yet it may be in any other part, as in the groin, the parotid glands, &c. apply the speediest suppuratives, and second them by the use of cordial antisticular invaselle. tifeptics inwardly.

the arm-pits are the feat; they tend very flowly to a suppuration, and while no tendency to a suppuration apears, it is best to disperse them; but if nature directs it, let suppuration be encouraged; at the same time let anti-venereal alteratives be used internally.

In the beginning these tumors are fore, if touched; hard, and gradually increasing they become painful; and

if they tend to suppurate, an inflammation appears.

The venereal virus thickens the lymph in those glands which are the feat of this difeafe, whence fecretion is rendered difficult in them, then impossible, and at length they fwell, &cc. Sometimes this fort of bubs arifes folely from the venereal contagion directly paffing to the affected gland, and there fixing itfelf; the bube is then the effen-tial difease. Or a generative being suddenly stopped, or being too fmall in its discharge, a bubo arises, and is a fymptomatical difease: if it arises without any late contagion, it then is the pathognomonic fign of a latent pox. This tumor should be diftinguished from those that

are fimply inflammatory, peftilential, strumous, or the critical discharge of some other disorder; and when in the groin, it must be diffinguished from the epiplocele, and the enterocele. Also from the detention of a testicle

in the groin.

In order to the cure, when venereal, the chief confideration is to deftroy or eliminate the venereal poifon with which the body is contaminated; this done, the bubo is no other than a fimple tumor or abfeefs in the part; this being duly adverted to, if the babe is but in its beginning, it may generally be dispersed by bleeding, if the habit is inflammatory, or a sanguine plethora is manifest; and by rubbing as much of the ung. hydrargyri on the patient's groin as he can bear without salivating; gentle purging, at proper intervals, and a cooling diet, assist this intention. But if, by the increase of the inflammation, it appears that a suppuration is likely to folflammation, it appears that a suppuration is fixely to solve, the sooner this state is completed the more perfect and fatisfactory will be the cure. The common bread poultice applied warm, or, if this cannot be complied with, a soft plaster, on which is galbanum, may be applied; all evacuations must now be forborne, and the diet may be more generous. The prominent part of the suppurated tumor may be destroyed with a caustic, and the place may be treated as is common in venereal cases. ulcer may be treated as is common in venereal cafes.

The bubses that are scirrhous or cancerous, are best left quiet, especially while they are easy: when they are pain-

ful, treat them as ocult cancers.

See Heister's Surgery, Aftruc on the Venereal Difease, or Chapman's Abridgment of Aftruc. Bell's Surgery, vol. 405. Wallis's Sydenham, vol. i. 143. White's Sur-

gery, 20.
BUBON. Vogel thus specifies the bubo in the groin. BUBONIUM. A name of the Golden STAR-WORT.
BUBONECELE, from BovGuy, the grain, and znan, a
tumer. It is also called bern in inguinalis, or RUPTURE of the GROIN; and is when the intestines force the integuments through the ring of the external oblique m'uscle of the belly, or as Dr. Freind rem arks, through the cavity in the thigh, between the pe clineus and the fartorius, though this latter is called bernia femoralis, or cruralis.

The cause may be great distension of the bowels from

wind, violent exercise, as leaping, lifting burdens, &c.
The figns are, a tumor in the groin, or upper part of
the scrotum, beginning at the ring of the abdominal mutcle, and extending more or lefs downward towards, or into the fer otum, in men, and the labia pudendi, in women. This tumor appears differently to the touch, according to its different contents. If a portion of the ileum forms the tumor, its furface is fmooth and renitent, but much more fo if the patient coughs or fneezes. If only a piece of the omentum hath flipped down, the tumor is more Pabby when felt, its furface is more unequal, and it makes less relistance to the finger. If both the inteffine and omentum are descended, the diagnostics will be less diffinct, and requires generally fome experience to affift in judging of what can hardly be learnt by descriptions.

This diforder must not be confounded with the hydroeele, nor the tumor of the tefticle calledhernia humoralis,

A TENEREAL BUBO. These very rarely happen any where be observed that the greatest pain in the bubonecole, is at but in the groin, though instances have occurred in which the pit of the stomach, which arises from the omentum, that is connected with it.

To reduce the hernia, without cutting or croding the part, is called TAXIS; and when it is thus reduced by the hand, if the rupture confiited of a portion of the inteffine only, it generally flips up at once; the patient being laid on his back, with his heels brought near to his buttocks, affifts the return of the protruded parts: if a piece of the omentum is the contents, its return is not fo speedy; if there is both omentum and intelline, the latter afcends first, and the former feels slabby, but soon after it follows also. Sometimes after the intestine is returned, a soft knotty substance remains unreduced, and resists all the efforts to reduction, until the patient's vessels are emptied by bleeding, repeated purges, and a low diet; the vari-cous feel which this fubfiance hath, feems as if it was the mesentery with its vessels diffended.

In infants the reduction is generally easy, and as they get strength they are less subject to a relapse. In the vigour of life the return is generally more difficult, and the

neglect or bad management more dangerous.

The greatest mischief to be feared is a stricture, which is made by the borders of the aperture in the tendon, through which the intestine passed; and of this accident there is greater danger in the robust than in infants and valetudinarians. If no appearance of this fymptom at-tends a patient, the use of gentle means alone are to be admitted; but a stricture demands immediate assistance at all times, and in every circumstance.

The cure is palliative or radical: the means are the fame in both kinds; the event depends on what is not within the reach of art. The furgeon's part is to reduce the prolapfed bodies, and with a proper bandage to pre-vent their defeent; if nature lends her aid, the aperture may be so contracted as to remove our fear of the parts returning. It is true, circumftances may attend, in dif-ferent cases, which may require some difference in the

management. See HERNIA.

When the case is such as to require an operation, cause of it is, an increased degree of the stricture, which renders reduction difficult, fometimes impracticable. In this case the pain in the groin is great as also in the belly; the sever, nausea, and suppression of the intestinal dis-charges, all increase, as does the tension of the belly, &c. But as great nicety attends the determining when to use the knife, every operator, on such an occasion, will take the advice and affiftance of those whose experience hath enabled them to act with most advantage.

To proceed in the operation, thave the pubis and groin, and in order to have as much empty space as possible for the return of the protruded parts, the patient should be advised to empty his bladder entirely, then having laid the patient on his back, on a table of a convenient height, with his legs hanging easy over the end of it, with a ftraight diffecting knife an incision must be made through the ikin and membrana adipofa, beginning just above the ring of the abdominal muscle, and continuing quite down to the inferior part of the scrotum; upon the division of the membrana adipofa, fome finall tendinous bands appear diffinct from each other, lying close upon the hernial fac, which is next to be divided: here caution is necessary, as the fac is thinner in some parts than in others: Even this external incision of the teguments ought to be made with great caution: for although in by much the greatest proportion of hernial fwellings, the spermatic vessels lie behind the protruded parts, yet on some occasions they have been found on the anterior part of the tumor; so that in order to avoid the risk of wounding them, so soon as the skin is divided, the remainder of the operation ought to be done in the most cautious manner, care being taken to avoid every large blood-vessel that makes its appearance. The incision in the fac is best made about an inch and a half, or two inches below the stricture, and need be no more than such an aperture as will just admit the extremity of the probe, into which opening introduce one, and if it will go up and down, then enlarge it with a probe-pointed biftory, fufficient to introduce your finger to divide the whole, remembering to divide it downwards first, which gives more room, and lessens the hazard of nor a bubo, or other glandular fwelling in the groin; nor with a testicle detained in its passage through the groin, or with the hydrocele of the spermatic cord. But it may first. The fore-singer introduced into it is the best of all

knife on the finger, the fac should be divided, first downward to the bottom of the scrotum, then upward to the ring. Upon the first division of the hernial fac, a fluid is discharged, differing in quantity, colour, &c. in different differing in quantity, colour, &c: in different patients. In opening the fac great care is required to evade wounding its contents. The fac being fairly divided up to the ring, the inteffine puthes out, and feems to be more in quantity than it did while in its confinement. At this juncture, if the quantity of the protruded inteffine is not very great, try to reduce it by first pulling down a little more, for thus its bulk being lessened, it perhaps may note, without dividing the ring; if this does not furceed. pass without dividing the ring; if this does not succeed, the probe-pointed knife, conducted on the fore-finger, will immediately divide the upper part of it, and fet all free. The fac and ring divided, the contained parts come into view, and according to their different states, will be variously managed. If found, immediately reduce them, remembering that the parts last protruded should be first returned. Slight adhesions may be separated with the singer, or snipped with the feisfars. If the parts are so adherent as not to be capable of being returned, remove adherent as not to be capable of being returned, remove the stricture by dividing the fac and ring, and leave the prolapsed parts in the scrotum as you find them; but this case cannot easily be supposed to happen. If the contained parts are quite mortified, death will be the iffue; but if the mortification is not very extensive, return them; if the intelline is mortified, make a ligature and fix it to the wound, thus the freces will pals out there, and the pa-

tient may live many years after.

In women this kind of rupture may be cured by a caustic, which cannot fo well be admitted of in men, on

account of the spermatic chord.

The portion of gut found in hernial fwellings is very various, no part of the intestinal canal being entirely exempted from falling down. Hitherto the ileum has been commonly supposed to form the substance of the greatest proportion of such tumors; later and more accurate obfervation, however, renders it probable that the eccum, appendix vermiformis, and part of the colon, are more frequently contained in the hernial facs than any other

portion of the gut.

See Pott on Ruptures, Le Dran's Operations in Surgery, Sharp's Operations of Surgery. Lond. Med. Obf. & Inq. vol. iv. Bell's Surgery, vol. i. White's Surgery,

318.

BUBON GALBANUM. See GALBANUM.

— MACEDONICUM. See APIUM MACEDONICUM.

BUCCA. The CHEEK. They are the fides of the face; they reach from the eyes and temples between the nofe and ears. The upper prominent parts of the cheeks

BUCCACRATON. A BUCCEA or BUCCELLA, that is, morfels of bread fopped in wine, which ferved in old times

for a breakfast.

Paracelfus calls by the name of buccella, the carneous excrescence of a polypus in the nose, because he supposes it to be a portion of slesh parting from the bucca, and in-

finuating itself into the nose.

BUCCALES GLANDULÆ. All the insides of the cheeks, near the mouth, are full of fmall glandulous bo-dies called by this name. They open by fmall holes or orifices, through the inner membrane of the mouth.

BUCCELATON, BUCCELLA PURGATORIA, and BUCCELLATUS. A purging medicine made up in the form of a loaf, confifting of feammony, &c. put into fermented flour, and then baked in an oven.

BUCELLA. See BUCCACRATON.

BUCCINATOR MUSCULUS, constrictor musculus. The TRUMPETERS MUSCLE, from Bezaver, a trumpet. It is thus named because of its use in forcing the breath to found the trumpet, by two diffinct beginnings on each fide, one tendinous and fleshy from the lower jaw, between the last dens molaris, and the root of the fore-part of the processus coronæ; the other is sleshy from the upper jaw, between the last dens molaris and the procesfus perigoides, from whose extremity also it arises tendinous, being continued between these two originations to the pterigo-pharyngæus on one side, and the mylopharyngæus on the other; from thence proceeding with the other; from thence proceeding with the other; from the other is the ajuga reptant, sound. It is a low plant, with two kinds of stalks, round creeping ones, and upright square ones. They bear loose spikes of

directors, and upon that finger a narrow-bladed curved, thraight fibres, and adhering to the membrane that covers the infide of the mouth, but without touching the gums ment necessary to finish the operation with. With this of either jaw. It is inserted and lost in the angle of the lips. By its fubitance on each fide it conflitutes the cheeks, and through its middle the ductus falivalis fuperior paffes. Its use is not only to move the cheeks with the lips, but also to contract the cavity of the mouth,

with the hps, but allo to contract the cavity of the mouth, by bringing them inwards, and fo thrust the meat between the teeth, for its better comminution.

BUCCINUM. The wheels. Whelks calcined have the same effect as the purplish-fish, but are somewhat more caustic. Filled with falt, then burned in a crude earthen pot, they make a good dentrifice. It is a sea shell-fish, of which there are many forts, but they all are alkalies and absorbents.

BUCCILA. A diminutive of bucca, the check. The

BUCCULA. A diminutive of bucca, the cheek. The flefhy part under the chin.

BUCELLATIO. A way of ftopping the blood by applying lint upon the vein or artery.

BUCERAS, or BUCEROS, FENUGREEK. See F.ZNUM

BUCRANION, from \$86, an ox, and xpxxxx, a head; fo the antirrhinum is called, because it resembles an ox's

BUCTON. The HYMEN.
BUFFAL. See BUBALUS.
BUFFELI. A ring made of the horn of a buffalo, which is worn on the ring-finger to cure the cramp.

BUFFELUS. The BUFFALO. See BUBALUS. BUFO. The TOAD; also called rubeta, rana rubeta. The toad is of the frog kind, and of the number of those animals which have only one ventricle in the heart. It is much like the frog, but its belly is more inflated, and tkin more full of tubercles; it is of an afh-colour, with brown, blackifh, and yellow fpots. It does not croak like the frog, but makes an indictinct noife that is obscure, and like the word see or rather he from which see and like the word gen, or rather bu, from which some suppose it is called bufo. It is said to have its name rubeta from rubus, because it is often found under bramble bufhes.

There is a very polionous species in America called cururu by the Brasilians, and caps by the Portuguese.

The common toad was first introduced into medicine

upon a cure being performed on an hydropic perfon, to whom powdered toads were given, in order to dispatch him, but he voided a large quantity of urine after taking it, and foon recovered of his diforder. Since this, teads, gently dried and powdered, have been used as a diuretic,

but the present practice rejects them.

BUGANTIA. CHILBLAIN.

BUGLOSSUM. BUGLOSS; called also buglossum angustifolium majus, buglossum vulgare majus, buglossum fa-

truum, GARDEN-BUGLOSS.

The garden-buglofi is a rough plant, refembling borrage, and differing from it chiefly in the leaves being narrow, less prickly, not wrinkled, and of a bluish green colour, and in the fegments of the flowers being obtufe. It grows wild on waite grounds in the fouthern parts of Europe, is cultivated with us in gardens, flowers from June to the end of fummer, and in winter it dies to the ground, but the roots continue. It is a name of the berrage, berrage; and as a medicine is nearly fimilar, but its roots are less mucilaginous. For that called — RADICE RUBRA, fee ANCHUSA. — SYLVESTRE. See ECHIUM, STONE-BUGLOSS, called also onofma, afmas, phimitis, and lycopfis

Its leaves refemble those of alkanet, and it hath neither flalk, feed, nor flowers. The root is long, flender, and red. It is found in rugged flony places.

Botanists enumerate seventeen or eighteen species. - Angustifolium Semine Echinato, a species of cynogloffum. — MARINUM INCANUM FLORE COR-RULEO. See CERINTHOIDES, and CYNOGLOS. MARITIM.

BUGLOSSUS. The SOLE-FISH.

BUGLOSSUS. The SCIE-FISH.

BUGONES, from 8st, an ex, and ynouna, to be bred, or generated of. An epithet for bees, because the ancients thought them to be bred from the putrefaction of an ex.

BUGULA. BUGLE. Called also confolida Midia, prunella Germanis, fymphitum medium, and MIDDLE-CONSOUND. The fort used in medicine is the ajuga reptans,

found wild in woods and moift meadows, and flowers in

May.

It is mildly aftringent, the root is the most fo.
There are ten species. That called—Of
LUSTANICA, is a species of BAUM.
BULAT-WÆLA. See BETLE.
BULAPATHUM. A species of DOCK.
DILL BASPHODELUS. An ASPHODEL, with -ODORATA

bous root.

balano caftaneum, pancascolus; bulbocastanum majus & minus, EARTH-NUT, HAWK-NUT, KIPPER-NUT, and PIG-NUT.

This root is as large as a nutmeg, hard, tuberous, and whitish, fending out fibres from the bottom and sides; the lower leaves are winged, cut into several divisions of leaves, finer and fmaller than those of faxifrage; the stalk is above a foot high, having one leaf about the middle, which is fine and flender as fennel, having the like leaves at every division of the branches, on the tops of which grow thin umbels of fmall white flowers. It grows in fandy and gravelly places, and flowers in May. The root only is used; it is caten either raw or roafted. It grows in

It is fweetish to the taste, nourishing, and of use against the strangury and bloody urine. That called—Consophyllon is a species of myrrhis.

BULBOCODIUM. See NARCISSUS LUTZUS SYL-

VESTRIS

BULBONACH, called alfo viola lunaris, lunaria ma-jor, leucoium lunatum, bolbonac, SATTIN and HONESTY. 'The ftalk is two or three feet high, as thick as a man's little-finger, hairy, and of a dark red, or an azure colour; the leaves refemble those of a nettle, but are much larger,

is called a tunicated root, of which kind is the onion, the tulip, &c. the latter is called fquamous or fealy, fuch is the lily and the martagon; named-Esculentus, are such bulbous roots as are commonly eaten. That named — Vomitorius, called also muscari, ASH-CO-LOURED-GRAPE FLOWER, muscari obsoletiore flore, byacinthus racemosus moschatus, sibcadi, dipeadi, and MUSK-GRAPE FLOWER.

It hath a leaf as flexible as leather, the root is covered with a black rind, but in other respects like the bulbus esculentus. The root is emetic and diuretic. It grows in gardens about Constantinople, and in Asia.

- SYLVESTRIS. WILD DAFFODIL. See NARCIS-SUS LUTÆUS SYLVEST.

BULCASIS. See ALBUCASIS.

BULIMIA, BULIMIASIS, & BULIMUS, BOULIMOS. Bulimia, when the fame inclination to eat exists as in the bulimus, without the power; and after the patient does eat he faints. Marryot's Art of Healing. See BOULIMOS.

BULITHOS, from \$25, an ox, and \$1,625, a flone. A stone found in the gall-bladder, kidnies, or urinary bladder of an ox

BULITHUM. The hairy ball found in the ftomach or bowels of oxen, cows, and calves. See Bezoar.

BULLÆ. Puftules arifing in the eye, or from burn-

ing any part.
BULLION. Gold or filver in the ore, or imperfectly refined.

BULLOSSA FEBRIS. The VESICULAR FEVER. See PEMPHIGUS

BUMELIA. The COMMON ASH TREE. See FRAXI-NUS.

BUNA. COFFEE.

BUNAS, vel BOUNIAS, Actine. Navew. It is a plant of BUNAS, vel BOUNIAS, actine. Navew. It is a plant of Jetter & Jacculi mucofi.

It is faid that Bellini first observed these bags, but Douglas the turnip-kind, with oblong roots, growing flender from

of blue flowers; the leaves are fomewhat oval, foft, and the top to the extremity. Linnneus supposes two forts, fet in pairs about the joints of the stalks. It is perennial, viz. the wild and the sweet navew, to be but varieties, and calls them by the name of braffica radice caulescente fuliformi. They are biennial. It is alfothe napus fativa, napus duleis, NAVEW GENTLE, RAPE, FRENCH NAVEW, SWEET NAVEW, and FRENCH TURNIP. It is the braffica napus of Linn.

BULAT-WÆLA. See Betle.

BULAPATHUM. A species of dock.

BULBASPHODELUS. An asphodel, with abulbus bulbocastanum, pancascellus; bulbocastanum majus & sinut, easth-nut, hawk-nut, kipper-nut, and sinut.

This root is as large as a nutmeg, hard, tuberous, and hittish, sending out fibres from the bottom and sides; and lower leaves are winged, cut into several divisions of it is called pseudo-bunium, or napus sof Linn.

It is cultivated in gardens for the kitchen. They are warmer, and more grateful, than the common turnip, and afford a good pectoral juice.

The seeds of both forts are warm and pungent, approaching to the virtues of mustard, but much inferior in their essay. Water takes up all their virtues. They yield by expression a large quantity of oil, which is fold under the name of rape oil: the wild fort is cultivated for this purpose.

The seeds of both forts are warm and pungent, approaching to the virtues of mustard, but much inferior in their essay. Water takes up all their virtues. They yield by expression a large quantity of oil, which is fold under the name of rape oil: the wild fort is cultivated for this purpose.

This seeds of both forts

it is called pfeudo-bunium, or napus fylvestris Cretica, or CANDY WILD NAVEW. Dale.

— Sylvestrais, napus fylvestris, RAPE and WILD NAVEW. It is the brassica napus, Linn.

It grows on dry banks, and among corn, with leaves more like those of cabbage, than of turnips, and of a period of the state o culiar unpleafant tafte.

BUNITES VINUM. WINE of BUNIUM. It was formerly made of bunium, two drams, and must, four pints.

BUNIUM. WILD PARSLEY See APIUM PYREN.

THAP.

BUPEINA. See BOULIMOS.

BUPHAGOS. The name of an antidote in Marcellus

BUPYTHALMUM. Ox-EYE, or OX-EYED. That called - Cotul & Folio, called also cotula flore lutes radiato, is the camomile-like ox-eye. - GERMANICUM, the leaves refemble those of a nettle, but are much larger, and hairy; the branches and summit of the stalk are laden with slowers of a purplish, or carnation colour; the root is knotted, whence the name bulbonach; the seeds are large, red, and acrid to the taste. It grows spontaneously in Germany and Hungary, and is sown in gardens in England.

This plant is a warming, diuretic medicine. Raii Hist. BULBUS, vel BOLBOS. Bulbous roots are such as consist of either several coats involving one another, or of the several scales lying one over the other. The sirst is the camomile-like ox-eye.—Germany in the camomile-like ox-eye.—Germanic limits of the summit anaecti minoris folio, chamemeter limits that the summit summit solves in the summit summit summit solves. The summit summit

is the bellis major; of which there are five species. See Miller's Bot. Off. — CRETICUM. See PYRETHRUM PELLITORY OF SPAIN. — MAJUS. See BELLIS MAJOR. BUPHTHALMUS. A DISTEMPERED-EYE. From

BUPHTHALMUS. A DISTEMPERED-EYE. From βss, an ox, sφθαλμος, oculus. From its vaft largeness like an ox's eye. See Exopthalmia.

BUPLEURUM, HARE'S EAR. Alsocalled auricula BUPLEURON. Ileperis, perfoliata, & bysophyllon. It grows on hilly places in France, &c. flowers in July and August, is detersive and diuretic. Dale. Also Thorow-wax. For that called—Arborrescens Sa-LIS FOLIO, the SHRUB HART-WORT, fee SESELI ÆTHIOPICUM.

BUPLEUROIDES. A plant which much refembles the bupleurum. Miller's Dict.

BUPRESTIS. The BURN cow. They are a kind of cantharides, and are possessed of a good degree of the same virtues. It is also a name of an herb, which was in much efteem among the Greeks as an esculent one. BURAC. All kinds of salt.

BURDUNCULUS. An herb mentioned by Marcellus Empiricus.

BURGUNDIÆ PIX. BURGUNDY PITCH. It is the turpentine from the mountain-pine, boiled to the confiftence in which we have it. See PIX BURGUNDICA.
BURHALAGA. A name of the SEA HEATH-SPURGE,

See EMPETRUM THYMELÆÆ FOLIIS.

BURINA. PITCH.
BURIS. So Avicenna calls a fcirrhous hernia.
BURNEA. PITCH.

BURRHI SPIRITUS MATRICALIS. Burrhus's fpirit for diforders of the womb.

It is made with myrrh, oblibanum, and amber, in fpi-

lubricating mucus, to facilitate the motion of the tendons, lion, those on the stalks are entire. It is annual, comwhere they play upon one another, or upon a bone.

Bell's Surgery, vol. v. 479. Monro's Description of the Bursa Mucosa, and their diseases.

Mr. Gooch, in his observations, takes notice of a wound into one of these bags on the side of the knee, which from the discharge he concluded to have been in the burfal ligament, but it healed kindly, and gave him to fufpect that these bags may be the seat of disorders not yet adverted to. He hath also given the following lift of them.

1. DELTOIDES. A large one fituated under this muf-

cle, upon the acromion fcapulæ.

2. BICEPS BRACHII. A fmall one invefting the tubercle of the radius, both on the fide where the tendon is fixed, and also on the other side, where there is no tendon. It adheres strongly to the whole tubercle, and loofely to part of the fupinator brevis, under which it lies,

as well as under the tendon of the biceps.

3. ILIACUS INTERNUS & PSOAS. A large thin and pliable one is found upon the ifchium, beneath the tendons of the iliacus internus and píoas, as they país down to their infertions, in the os femoris. It is attached to these tendons, and to the anterior surface of the capsular ligament; and this facculus fometimes communicates with the joint.

4. LATISSIMUS DORSI & TERES MAJOR. One is fituated between the extremities of the tendons of these

muscles, adhering strongly to them.

5. GLUTEUS MAXIMUS. A large thin one, firmly connected by a small part of it to the back of the trochanter, immediately under the termination of the gluteus medius, and is loosely attached to the rest of the trochanter, and the tendon of the gluteus maximus.

6. GLUTEUS MEDIUS. A small one situated between

the termination of its tendon and that of the pyriformis,

adhering to both.

7. GLUTEUS MINIMUS. A finall thin one, attached to its tendon and the trochanter major.

8. GEMINI. A fmall one between them and the ter mination of the obturator internus, connected to both, and to that part of the capfula of the joint which lies un-

der the gemini.

g. BICEPS CRURIS. One is fituated between the end of its tendon exteriorily, and the capfular ligament of the knee, adhering to both.

10. SEMIMEMBRANOSUS. A fmall one, lies between its tendon, which runs between the inner condyle of the

tibia, and the capfular ligament of the joint.

11. CRURALIS & VASTI. Behind the tendons of the cruralis and vafti there is a thin, but large one, connected to those tendons before they join, and, after their junc-tion it is fixed to the patella. It also adheres to the capfula of the joint that expands itself over the bone.

12. GRACILIS, SARTORIUS, & SEMITENDINOSUS.
Under the extremities of the tendons of these muscles, is a large one, adhering to them on one fide, and on the other to the capfular ligament of the knee, on the in-

fide where these tendons play.

13. Gemellus. A large one lies under its inner head, firmly attached to its tendinous origin, also to the extremity of the semitendinosus, and the capsula of the

knee near the anterior condyle.

14. Soleus. The tendon of the foleus passes over the upper part of the os calcis, between which and the bone lies a large facculus, and, near that, is found a glandular body which furnishes a mucous fluid for the more effectual lubrication of these parts, that are in such constant motion in walking.

15. TIBIALIS ANTICUS. A fmall one, is fixed to the

tendon a little before its termination, where it plays on

the top of the foot.

16. Peroneus Longus. One lies under the tendon of this muscle, where it plays over the os cuneiforme, on the outside of the foot.

BURSA PASTORIA FOLIIS PERFOLIATÆ. A fpecies of thlaspi.—Pastoris. Shepherd's purse. Called also thlaspi fatuum, thlaspi fatui. The fort used in medicine is the thlaspi bursa pasteris, Linnaus.

It is a plant with small tetrapetalous whitish flowers, a-

long the upper part of the branches, followed each by a nous kind, confequently differs from the lignum guaia-triangular feed-veffel refembling a purfe, whence its name.

Douglas first described them. Their office is to emit a The lower leaves are deeply jagged like those of dandemon on waste grounds, flowers in April, and so on to the end of fummer.

An extract made with water from the dry leaves is un-gratefully mucilaginous, and fub-alcaline. This plant is not in use. Miller's Bot. Off.

- TESTIUM. See SCROTUM.

BURSALIS MUSCULUS. So called from its refemblance to burfa, a purfe. See MARSUPIALIS.

BUSELINUM. A species of APIUM. Also the COM-

MON CARROT.

BUSSII SPIRITUS BEZOARDICUS. The BEZO-ARDIC SPIRIT of Bussius, who was an eminent physician

at Drefden.

Take the fpirit of ivory, faturated with fubtile oil and falt, two ounces; crude fal ammoniac, four ounces; potash, dissolved in water, eleven ounces; amber, half a pound; oil of juniper, half an ounce; diftil them in a retort. A falt rifes first, and then the spirit, which diffolves this falt.

BUTIGA. See GUTTA ROSACEA.
BUTINO. TURPENTINE, OF ITS BALSAM.
BUTHALMUM MAJUS. See BELLIS MAJOR.
BUTOMON. YELLOW WATER-FLAG.
BUTOMUS. The WATER GLADIOLA. BUTOR. The bird called a BITTERN. BUTUA. See PAREIRA BRAVA.

BUTYRUM. BUTTER. See ADEPS. BUXB. An abbreviation of J. C. Buxbaumi Enume-

ratio Plantarum, 1721, 8vo.
BUXTONIENSIS AQUA. BUXTON WATER. See AQU & SULPHURE A. Buxtonis in the Peak of Derbyshire. The waters there are the fecond in degree of heat among those of this isle. The water of St. Anne's well contains calcareousearth, fosfil alcali, and sea-falt; but of these their quantity is fo finall, that when a gallon of the water was evaporated, the fediment was only betwixt twenty-three and twenty-four grains. This water strikes a light green with the fyrup of violets, it fuffers no change from galls, from fixed vegetable alcalies, or from mineral acids; it be-comes mllky with the volatile alcali. The specific gravity of this water is precifely equal to that of rain-water, when their temperatures are the fame; but when first

taken from the fpring it is four grains in each pint lighter.

The temperature of the bath is about eighty-two degrees by Fahren, therm, that of St. Anne's not quite for much.

Befides the contents already mentioned, which the water of St. Anne's well possesses, it contains a considerable quantity of mephitic air, in which its stimulus and indeed its efficacy refide, and which is quickly diffipated by exposure to the atmospheric air.

This water is alterative, and not evacuant. Begin the use of it by taking about a pint in the forenoon, and gradually increase the quantity. The cooler the weather, the hotter and more medicinal is the water. It increases the vital heat, is useful in the gout, rheumatism, dry althma, convulsive disorders, indigeston, loss of appetite from in-temperance, contractions of the tendons, defective cata-

menia, &c.
See Short's History of Mineral Waters. Percival's Effays, Med. and Exp. vol. ii. Dr. Hunter's Essay.

Befides the tepid mineral waters which are in fo much repute, there is a fpring here of a fine clear chalybeate water, which has a rough irony tafte. Dr. Short evaporated a gallon of it, and had remaining a scruple of folid matter, above half of which he fays was ochre, and the rest a saline matter composed of sea-salt and nitrum calcarium (vitriolated magnesia). This water is drank for the fame purposes as other chalybeates.

BUXUS. BUXUS SEMPERVIRENS. The BOX-TREE.

The Hollanders call it palm-tree. It is an ever-green, and full of branches. Its leaves are gloffy, and almost of an oval shape. The wood is yellowish, and more compact and ponderous than any other of the European woods. The flowers are imperfect; the fruit is a green berry, divided into three cells, containing fix feeds. It is found

wild in some parts of England.

An infusion of the leaves in water hath a strong, naufeous tafte, is purgative, and destroys worms. The active matter of the wood is of the faline, and not of the refi-

The leaves of the common dwarf-box dried and powdered are faid to destroy worms in children. As much as will lay on a shilling may be given at bed-time, every night.
BUXUS AFRICANA FOLIO OBLONGIORI. A

species of vitis.

BUYO-BUYO. A fort of pepper in the Philippine iflands. Ray calls it piper longum monardi.
BYARIS. See RETE ADMIRABILE.

BYARIS. See RETE ADMIRABILE.
BYNE. MALT made of BARLEY.
BYNG. A Chinefe name of GREEN TEA.
BYRETHRUM, See CUCUPHA.
BYRETHRUS, See CUCUPHA.
BYRETHRUS, BYRETHRUS, Tom Boyen, a fkin, and Folium.
BYRSODEPSICON, from Boyen, a fkin, and Folium.

to curry leather. See SUMACH.

BYSAUCHEN, from Bow, to bide, and auxin, the neck. People are thus called who by elevating their shoulders hide their neck. Also one who hath a morbid stiffness of the neck.

BYSMA, from flow, to flop up, obstruct, fill up, confti-pate, or stuff. The covers, or stopples of any vessels. Some take the bysma to be the same with the amurca. See BYZEN.

BYSSUS. It is the lowest, and a barren kind of moss, confifting of a very thin, and, to the naked eye, an imperceptible fort of wool, which is produced from various fubstances, appearing sometimes like a very fine powder, sometimes like down, and often lasts for a considerable time, in which respect it differs from the fungus, as it does also in having no head, or any other resemblance to the rest of the fungi. In Ray's Synopsis there are twelve species. It is also a name for the pudendum muliebre; of a fort of fine cloth wern by the ancients: and some think the fine cottons brought from the East is the byffus of the ancients.

BYSTINI ANTIDOTUS. An antidote often mentioned by Actius, which feems to be much like Mitrhi-

date.
BYZANTINA. See BLATTA BYZANTINA.

BYZANTINA. See BLATTA BYZANTINA.

BYZEN. In a heap, croud, or a throng; called also by/ma. It is derived from the word βωξω, or βυω, to fill up by ftuffing, to condense., thus it expresses any thing that is sufficiently dense. Hippocrates uses this word to express the hurry in which the menses flow away in an execution discharge of them. ceffive discharge of them.

# CAA

In the chymical alphabet fignifies falt-petre. CAA-APIA. It is a fmall low plant, with a o root about two fingers breadth long, as thick as a fwan's quill, and fometimes as large as a man's little finger. This root is knotty, and covered with filaments that are three or four fingers breadth long. Outwardly it is of a yellowish grey colour, but inwardly it is white. After being chewed a little it is acrid, and hath nearly the fame virtues with ipecacuanha, whence it hath also received that name.

The Braffilians cure the wounds from poisoned darts with the juice of this root, which they pour into the wound. Pifo fays it hath the fame efficacy against the

bite of ferpents.

CAA-ATAYA BRASILIENSIS, hence its name Euphrafia affinis Brafiliensis siliquosa. It is a plant which grows in Brasil, of no smell, but bitter to the taste. A decoction of it operates powerfully both upward and downward. It refembles the euphrafia. Raii Hift.

CAACHIRA. See ANIL CAACIICA BRASILIANIS. Called also Colubrina Lustanica. An herb growing in Brasil, whose leaves resemble those of the male speedwell, somewhat hairy, green above, and white underneath. It is full of a milky juice. When fresh it is bruised, and applied against venomous bites. Raii Hift.

CAACO. The SENSITIVE PLANT, also called a febyns-

mene fpinosa Brasiliens secunda, and berba viva.

It is a native of Brasil. If the leaves of this plant are touched by any thing, they immediately contract, but soon after return to their former state. Dr. Shebbeare supposes, that this plant is distended by a portion of the general returns to the second returns to the second returns to the second returns the second return neral principle which animates all nature, and that the touch of any foreign body discharging a part of it, is the cause of its contraction, from which it recovers as the fame is reftored by its own power of attracting it. tops of this plant are noxious, and the roots are their an-tidote. A decoction is made of a handful of that part of the root which is under ground, boiled in fix pints of water for a few minutes, half a pint of which is to be drank every hour or two, until the patient is well. This root is an antidote to feveral poisons which the Americans have amongst them.

There is another species called caaco; berba viva tertia species; as febynomene spinosa tertia.

CAAETIMAY BRASILIENSIBUS, called also sene-

cio Brafilienfis.

It is a tall plant which grows in Brafil, the leaves of which have a hot and acrid tafte. A decoction of them cures the itch, by washing the parts affected with it. Raii vii. ix.

CAACHIYUYO BRASILIENSIBUS, Fruter bac-eifer Brafilienfis. A fhrub growing in Brafil, its leaves are powdered, and then applied to ulcers as a deficcative. Raii Hift.

CAAGUA-CUBA. Baccifer arbor Brafilienfis. A fmall tree growing in Brafil, but of no known medical

virtue. Raii Hift.

CAA-OPIA, called also arbuscula gummifera Brasili-ensis. It is a tree growing in Brasil, from the bark of which, if incisions are made, a juice is emitted, which, when

## CAC

dry, refembles the gutta gamba in all refpects, only in being fomewhat redder. Raii Hift. CAAPEBA. See PAREIRA BRAVA.

CAAPOMONGA. A plant growing in Brafil, but of no known medical use. Raii Hist. Called also campanula

CAAPONGA. The Brafilian name of a fort of famphire, also called trifolia spica, crithmum marinum non spi-nosum. The leaves and young stalks are pickled for the

use of the table, though they are gently diuretic.

There is another species, it is called perexyl Lustianis; it resembles purslane, and is of the same nature as the

above.

CAAPO-TIRAGUA BRASILIANIS, also called rwbia Brajilienfis. It is a plant which grows in Brafil; it refembles, in fome refpects, the rubia, but it is not a genuine species thereof. Raii Hift.

CAAROBA. A tree which grows in Brafil; the leaves are bitter, a decoction of them promotes perspiration, and is ufeful in the venereal difeafe. Raii Hift.

CABALA, CABBALA, CABALIA, CABULA, CABAL-LA, KABALA, KABBALA, CABALISTICA ARS. The CABALISTIC ART. It is derived from the Hebrew word, fignifying to receive by tradition. It is a feience which confits in a mysterious explication of the Scriptures, however they were received. This is the Jewish cabala; but, from this original, the word is applied to any fort of mysterious or magical explication of things. Paracel-fus though uses it in a medical fense, saying cabalifie figns cannot deceive, fi Dis placet, besides some enthusiastic philosophers and chemists, have transplanted it into medicine, importing by it fomething magical.

CABALATOR. NITRE.

CABASSONUS MASSILIENSIUM. A fifth found

in the Mediterranean fea; also called laveronus.

CABALLICA ARS, from xxxaCaxxa, to throw down. A term in gymnaftics, importing among wreftlers the art of foiling, or throwing an antagonist down.

CABEB, or CABEBI. Scales of Iron.

CABELIANUS. A fish of the cod, or of the pike

kind.

CABELIAU. Con-fish. See Asellus Major.
CABULATOR. NITEE.
CABUREIBA. Pifo describes it as the tree that asis also Ray's opinion, hence it stands for the BALSAM of Peru. See Peruvianum Balsamum.

CACAGOGA. OINTMENTS, that by being rubbed on the fundament procures ftools. See P. Ægineta, lib.

CACAI, See CACAO. CACALIA, also called leantice veterum, and STRANGE COLT'S-FOOT.

It hath a flosculous flower, and downy feeds; the leaves are large and white; it grows in flady places. Its virtues are the fame as those of the common fort. Miller enu-

merates feven species.

CACALIANTHEMUM, fo called by Dr. Dillenius; it is also called the CABBAGE-TREE, and the CARNATION-TREE. Originally it was brought from the Canary islands. There is a species which was first brought 2 X

CACAMOTICFLANOQUILONI. The PURGING

POTATOE. See BATTATAS PERIGRINA.

CACANUM. A plant supposed to be the cacalia, as the fame virtues are attributed to it. See P. Ægineta and

CACAO, called also cacoa, amygdalus similis Guatimalensis, cacava, cacari, quaboitl, caravata, chocolata, cacai, avellana Mexicana, cacavera, cacavata, cocao America, the PEAR-BEARING WHOLESOME ALMOND-TREE, CACOA, and CHOCOLATE. It is the thesbroma caeno of Linn. The nut is the only part of this tree which is used; its shape is nearly like that of an almond, but of a larger fize. The shell is dark-coloured, brittle, and thin; the kernel throughout is of a brown colour. It is produced by a fmall American tree, which bears a large red fruit like a cucumber; in this fruit is contained from thirty to a hundred of these nuts. A good tree produces a crop in June and another in December. The principal diffinctions among these nuts are the fize and place from whence they are brought: the larger kind from the province of Nicaragua, in Mexico, are most esteemed. The chief of what we have in England are brought from Virginia and Jamaica.

These nuts have a light agreeable smell, and an unctuous bitterish taste, but not ungrateful. Those from Ni-caragua and Caracco are the most agreeable; those from the French Antilles, and our American islands, are the

most unctuous.

The principal use of this kind of nut is for making the liquor which is known by the name of chocolate; which is a mild, unctuous, nutritious fluid, and greatly demul-In hectic, fcorbutic, and catarrhous diforders, an atrophy, malignant itch, and hooping cough, checolate made in the ufual way is faid to relieve after all other ufual methods have failed. In all diforders from an acrid falt, whether acid or bilious, this liquor is highly ufeful. When checolate is mixed with demulcent and aromatic ingredients, it is useful for the hypochondriac and melan-cholic. It is faid to make the teeth black.

All the forts of chocolate nuts afford by preffure an oil of the fame kind of the tart are obtained the fame way

from other kernels and feeds.

ed from the rind and germ, and levigated on a hot flone, dilute them with a proper quantity of hot water, and keep them in a water bath till the oil rifes to the top; which, when concreted, is of a brown colour, and by repeated liquefactions in hot weather becomes white.

This process is from the Paris Monthle of the performance which form this diforder.

The causes are various: 2s, what

This process is from the Paris dispensatory.

To prepare the kernels of the chocolate nuts for use, bruife them, after having separated their hulks; then place

not very hot; and thus they are fo diffolved at to be fit for making into cakes or rolls for ufe.

This fubflance is not always eafily digefted, and has

corn, a few feeds of rocou, and a little vermillion. The Spaniards mix cloves and cinnamon with them. The French mix with their's a little cinnamon, vanilla feeds, eyes. See Chlorosts.

into Europe from the Cape of Good Hope. See Miller's and fine fugar: in Paris they make up their checolate for Dict. Take of checolate nuts, freed from their hufks, and fine fugar, of each a pound; of cinnamon, finely powdered, two drams; and of vanilloes half a dram; beat them well together, and form them into cakes or rolls.

After drinking of chocolate, if it is uneasy in the sto-

mach, relief will be found from drinking a tea-cup full

of cold water.

An artificial checolate is made of almonds thus: take of fweet and bitter almonds of each an ounce, roaft them in an iron pan until they are brown, then wipe them clean, and bruife them in a mortar, gradually mixing with them four measures of warm milk, two eggs that have been well mixed with a little cold milk, and as much cloves, cinnamon and fugar as may be agreeable to the palate.

CACAPHONIA. A depravity of the voice.

PARAPHONIA

CACATORIA FEBRIS. A name given by Sylva to

a kind of intermittent fever attended with copious ftools.

CACARI, CACAVIFERA,
CACAVA QUAHOITL,
CACAVATA.

CACAVATA.

CACAVATI.. A fpecies of French Marigold.
CACCIONDE. A pill commended by Baglivi against the dysentery: its basis is the terra Japonica.
CACEDONIUM TARTARUM. The peccant mat-

ter in the human body, generated from separations by the secretive faculty, which are not immediately succeeded

by the operation of the expulsive.

CACHALOT. The SPERMA CÆTI WHALE.

CETE ADMIRABILE.

CACHEXIA, from manos, ill or bad, and etis, a babit.

A bad habit of body.

A cacheay is an universal bad habit of body, in which there is a defect of vital heat. Or, it is that disposition in the body which depraves the nourifhment thereof, and makes the fkin of a difagreeable colour. If difficult menfitruation is the cause, it is called a chlorofis. In Dr. Cullen's Nofology, it is the third class of difeases. He defines it to be a depravity of the constitution of the whole, or of a great part of the body, without any febrile or nervous difease as the primary one.

They are the most disposed hereto who are naturally of

a laxand fpongeous habit, which confifts in the foftness of Oleum feu Butyrum e Nucl. CACAO. The OIL or BUTTER a laward toongeous habit, which conflicts in the formers of the register of the tendence of the tendence of the tendence when the flower refer of the tendence when the tendence when the flower refer of the tendence when the flower refer of the tendence when the tendence and the flenderness of the tendons. Women are more Roaft the nuts flightly in an iron pan, then being clear- fubject to it than men, and men of a fanguine, and of a phlegmatic habit, than those of different ones; for such persons are apt to be plethoric, which occasions the liver sometimes to be obstructed, whence the train of confe-

The causes are various: as, whatever can lessen the natural heat of the conflitution; whatever produces replenuts, thus managed, afford fometimes more than half tion or depletion; a bad quality introduced into the circulating fluids; the nerves in the uterus and intellines It is not liable to turn rancid by long keeping; hence it having the fame origin, the diforders in the first disturb is a proper basis for odoriferous unguents: but its indigestible property renders it unsit for internal use. ture's wants, a cacheary is the consequence; free eating or three pounds of them into a pan over a gentle clear fire, fir them about until they are a little heated, and as foon as you find that the hufts will peel off, carefully free the kernels from them, for they are totally indicated. as you find that the hufes will peel off, carefully free the kernels from them, for they are totally indigefible. The mucilaginous pulp contained in these huses, if pressed, yields a cream that is cordial and grateful to the taste; as an emollient for external application, is of admirable efficacy.

To prepare the kernels of the checolete pure for a few contained and grateful to the taste; as an emollient for external application, is of admirable efficacy.

To prepare the kernels of the checolete pure for a few contained and grateful to the taste; and the folids, and this Dr. James observes may produce any of the symptoms that the different writers say are proper to this state of the body. In pubertine girls it is caused by difficult mensure and the folids, and this Dr. James observes may produce any of the symptoms that the different writers say are proper to this state of the body. In pubertine girls it is caused by difficult mensure and the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the symptoms of the pulces and defect in the folids, and this Dr. James observes may produce any of the symptoms of the sympt

Its presence is manifested by a pale white countenance, but oftener by a yellowith or greenish colour in the tkin, them before a clear fire or in an oven that is warm, but a tumidness, coldness, and a lost slabbiness of the body, with a general feebleness; a weariness is also complained of, a difficulty of breathing on the least exercise, the feet fometimes given many inconveniencies, which are apt to occur from this cause, but these may be obviated in a pulse slow and soft, the wind is inactive, during sleep an opposition occur from this cause, but these may be obviated in a pulse slow and soft, the eve-lide have an endemator. Link occur from this cause, but these may be obviated in a great measure by a very diligent triture, uniting very intimately the farinaceous and oily part of which it confists.

The Mexicans mix with these nuts a portion of Indian corn, a sew seeds of rocous, and a little vermillion. The little part of the search of the search

There are feveral chronical diforders which may properly be called cachexies, but are diftinguished by differing in their cause, seat, or other circumstance; the cacochy mia, chlorofis, fluor albus, &c. are inftances of this kind. But what is generally understood by cachexy, (which is a general bad habit of body, without any one remarkable tymptom by which any particular diforder is characterized), should be diftinguished from a jaundice, leuco-

phlegmacy, an atrophy, a feurvy, &c.
Old persons are the most severely afflicted with a cachesy, for old age itself is a species of this disorder. That Species which is suddenly produced by intemperance and a deprayed digestion after chronical diseases, is more easily removed than that which is from a fault in the vifegra. An ill colour in the fkin, as it indicates very often a dif-An ill colour in the lkin, as it indicates very often a dil-order in the liver, is confidered as a fymptom of a com-plaint very difficult to overcome. If fainting fits are fre-quent, the danger is great. If its cause is from an hæmorrhoidal discharge, the cure is generally effected with difficulty. If women are cachectic from desective menstruction, they either become barren or bring forth weakly children: and of all diforders, none more eafily degenerate into an anafarca, ascites, atrophy, or a hectic

fever, than does a cacheny.

The indications of cure are, to correct the bad quality of the juices, to strengthen the stomach, and to invi-

gorate the fystem.

Hence the diet should be nutritious, cordial, and such as nourifles in the least quantities, and repeated often, to asford a plenteous nourifliment, and of such a nature as to oppose the cause and circumstances of the disorder. Exercise should be constant and regular, but within the compass of the strength. The primæ viæ being evacuated, administer such medicines as increase the vital heat, fuch as warm bitters, aromatics, and chalybeates, anti-monials have been also advised, but they are apt to relax the stomach, and therefore should be given sparingly. Stomach medicines should be given just before and after meals. If the cause is a suppression of any usual evacuation, endeavour to promote the return of it. If laxity of the fibres, or defect of vital heat, aromatics and iron should begin, and exercise complete the cure. That call-

—— UTERINA. See FLUOR ALBUS.

CACHLAN. See BUPHTHALMUM VERUM.

CACHLEX. A little STONE or PEBBLE. Suidas makes it the name of an animal. Galen fays that the eachleces heated in the fire and quenched in whey, endues

them with an aftringent virtue against a dysentery.

CACHOS, or Solanum pomiferum folio rotundo tenui.
It grows only on the mountains of Peru. It is a shrub of at grows only on the mountains of Peru. It is a thrub of an extraordinary greenness: the leaves are thin and round: the fruit resembles the mad-apple, of an ash-colour and a grateful taste. The Indians use it as a diuretic, and to expel concretions from the kidnies. Raii Hist.

CACHOU. See TERRA JAPONICA.

CACHRYSERA, LIBANOTIS. Galen says it some-CACHRYS, times means parched barley; called also says for conclusion.

ed also canebry, or canebrys.

CACHUNDE. A compound medicine much effection ed by the Chinese and Indians. Zacutus Lusitanus says it is made with amber, musk, aloes wood, pearls, emeralds, granates, jacinths, galangals, cinnamon, aloes,

CACHYMIA. CACHIMIA, or KAKIMIA. A term in Paracelfus, by which he intends an imperfect metallic body, or an immature metalline ore, which is neither a faline substance nor a metal, but yet almost metal. Gachymic may be divided, Ift, into sulphureous, as marcasites, bismuths, and cobalts; or, 2dly, into mercurials, arsenical or orpimental, and such like; or, 3dly, into faline, such are all tales.

CACOA. See CACAO.

CACOALEXITERIUM, from xaxes, evil, and alastranses, a remedy or medicine, i. e. Alexiterium.
CACOCHOLIA. An indipolition of the bile.
CACOCHROI, from xaxes, ill, xpoa, colour. Such as have an ill colour in the face-

CACOCHYLIA. Indigeftion or depraved chylifica-

CACOCHYMIA, from waws, ill, and xums, bumsur. A deprayed flate of the humours.

CACOETHES, from xaxos, ill, and xôo, mos, a cuf-tom, which when applied to difeases, signifies a bad qua-lity or disposition. Hippocrates applies this word to malignant and difficult distempers. Le Dran explains it to be an evil ulcer, boil, or forc. Galen and some others express by it, an incurable ulcer, that is rendered so through the acrimony of the humours flowing to it. Lin-neus and Vogel use this term much in the same sense with Galen, and describe the ulcer as superficial, spreading, weeping, and with callous edges.

CACONIÆ. A corrupt word for canoniæ.

CACOPATHIA. An ill affection.

CACOPHONIA. A depravation of the voice, of which there are dumbness and difficulty of speech. Vogel defines it to be a difagreeable, sharpkind of voice. Cullen

uses this word as synonymous with Paraphonia.

CACOPRAGIA, from \*4.805, ill, and \*parlo, to do or all. A depravation in those viscera by which nutrition is

CACORRYTHMUS, from xaxes; ill, and property order. An epithet of a diforderly pulse.

CACOS. EVIL, BAD. Also the name of an Indian herb, of a red colour: it is diuretic, and useful against calculous diforders.

CACOSITIA, xaxos, ill, and arror, food. A LOATH-ING of FOOD. Linnæus defines it to be a fixt aversion to

CACOSPHYXIA, from xaxes, ill, and squees, from squees, to leap or beat like an artery. A diforder of the pulse in general.

CACOSTOMACHUS. Literally, an ill or bad flo-mach; but is fpoken of food that is bad for the flomach. CACOTHYMIA, from \*\*\*2805, ill, and Sugars, the mind.

Any vicious disposition of the mind.

CACOTROPHIA, from xxxxxx, ill, and τριου, nutri-

ment. Any fort of vicious nutrition in general.

CACRY. The SEEDS of LIBANOTIS.

CACTOS. The CHARDON. See CINARA.

CACUBALUM. The BERRY-BEARING CHICKWEED.

DECIDUA

CADUCUS. When put substantively, or as an ad-

jective joined to morbus, it means an epilepfy. CÆCILIA. The BLIND-WORM or SLOW WORM, alfo called excilia typhlops, and excilia typhlinus Greeis. It is a species of serpent, whose bite is of much the same effect as that of the viper.

CÆCITAS MINOR. The fame as AMAUROSIS;

ATREN, which fee.

CÆCUM INTESTINUM. The BLIND GUT; fo called from its being perforated at one end only; called also menomachen. What we now call the appendicula cæci, Rufus Ephesius called the cæcum. But modern anatomists divide the large intestines, which form one continued canal, into three portions. This canal begins by a kind of facculus, or bag, which is the first of the three portions, and is called cæcum. Dr. Hunter says that it lies on the inside of the os illum upon the illacus that it lies on the infide of the os ilium upon the iliacus internus, and is only a round thort broad bag, whose bottom is turned downwards, and its mouth upwards. This intestine, which is about three fingers breadth long, is hid by the last convolution of the ilium. It hath the fame bands as the colon, which bands take their origin from the appendicula caci vermiformis. Winflow obferves that this bag lies under the right kidney, and that

The veins are from the greater melenteric, and one of the

the posterior and inferior mesenteric.

CÆMENTUM. See Coementum.

—— Cuprum. Cement copper, called also ziment by means of iron. The name is derived, as is faid, from ble place for the operation. by means of iron. a vitriolic water in Hungary called ziment.

CÆRULEUM. See CYANUS. CÆSALPINA. A plant fo named by Father Plumier, who discovered it in America, in honour of Andreas Casfalpinus, an eminent botanift, and one of the first who attempted to class plants. It is called the many-leaved Cæsalpina, but is of no medical use. Miller's Dict. CÆS. & CÆS. ALP. An abbreviation of Andræus

Cæfalpinus de Plantis

CÆSAREA SECTIO. The CÆSAREAN SECTION OF operation, also called byflerstomia, and byflerstomatscia. It is the operation whereby the feetus is extracted from the the Cafarian operation from Julius Cafar, who was brought into the world this way. Some fay it was one Cafo, who was the first thus taken from his mother's womb, and from whom the operation is named.

There are three causes wherein this operation is neces-fary. I. When the mother dies and the foctus is perceived to be alive, and this happening in labour, or in the last two months. 2. When the fectus is dead, but so preternaturally fituated as to be impossible to deliver it in the usual way. 3. When both the mother and the child are living, but the same difficulty attends as in the second

Many instances have occurred in which both the mother and the child have lived after this operation. Heister gives a very diffinct account of this operation, in his Surgery; and of its success in his Institutes of Surgery p. ii. § 5. cap. 113. See also Mem. de l'Acad. Roy. de Chirur. vol. i. p. 623. ii. p. 308. Edinb. Med. Essays, vol. v. art.

37 and 38.

It should not be recommended if the woman is living before the falls into labour, and yet it must be attempted before the hath suffered much by her inestectual throes; for when the is thereby reduced, the operation is almost

fure to be fatal.

To perform this operation, lay the woman on her back, place a pillow under her right fide, to turn the uterus as much as possible on the left; then the operator must make a longitudinal incifion, beginning as high up as the navel, on the outfide of the linea alba, and carrying it down in an oblique direction towards the ilium, he must cut carefully through the muscles of the belly, and also the peritoneum, and introduce a finger into the abdo-men, which must be carried along before the point of the knife, in order to prevent the vagina from being wounded. The incifion is ufually directed to be on the left fide, for fear of wounding the liver, because the large lobe lies on the right fide; though there feems to be more danger of the omentum, or a flexure of the inteffines; because as the uterus rises up, it carries the viscera above it, and to each side; but the omentum is frequently found lying between it and the parietes of the belly. The incision into the uterus must be longitudinal, and as long as the external wound will permit, taking care not to wound the Fallopian tubes: the child must be taken out at the incifion, and after it the placenta and membranes; the water and blood must be absorbed with sponges: the wound in the uterus must be left to nature, for by its contraction it will be brought into about an inch and a half in length. The external wound is to be futured with the interrupted flitch, and then to be dreffed up, as in general. If any confiderable veffels are cut through, they thould be taken up.

In the Lond. Med. Obf. and Inq. vol. iv. p. 261, &c. is an inftance of this operation being performed, which,

its diameter is more than double that of the fmall intef-tines. Its arteries are from the mesenterica superior. to be obtained from them, that all they relate is very vague; and that it is indifferent on which fide the incifion branches Riolan calls the vena execulis. The nerves from is made, farther than as some present circumstance may determine; that the hæmorrhage spoken of by Heister is not so much to be dreaded as he intimates; that the course of the linea femilunaris, as nigh to the outer edge of the rectus mufcle as possible, feems to be the most eligi-

Paré, Guillimeau, Rolfincius, Hoorne, Mauriceau, So-lingen, and fome others, are faid to be violent oppofers of this operation; but the truth is, they only object to it in certain cases, where they thought others rash in proceeding to it. As a substitute for this operation, the section of the symphysis of the pubes is proposed. See Pubis Ossa. See also an Account of the Cassacan Section by Dr. Vaughan of Leicester. Bell's Surgery, vi. 446.

White's Surgery, 451. CÆSARES. Children who are brought into the world

by the Cæfarian operation. Called also Gæsones.

CÆSIUS. See GLAUCUS.

CÆSONES. See CÆSARES.

CÆTCHU. See TERRA JAPONICA.

CAF, CAFA, CAFAR. See CAMPHORA.

CAGASTRUM. Paracelfusufes this word to express the morbific matter which generates difeafes, and that is not innate but adventitious. Difeases arising from the cagrassum are pleurify, pestilence, sever, &c.

CAGUACU-APARA, or The American Bezoar CAGUACU-ETE.

CAGUACU-ETE.

CAHVEH, See Coffee.

CAINITO. An American name for the STAR-APPLE. Miller mentions two species, but they are not of any note in medicine.

CAIPA TIJAMBOU. A species of wILD JAMBOS.
CAISA. See Terra Japonica.
CAJAHABA. An Indian plant which adheres to trees like ivy; the natives bruile it, and bind it upon fractures. Raii Hist.

CAJAN, or CAYAN. Phaseolus, arbor incana siliquis torefis, cavan dieta thera parem, pifum aborefens. A fhrubby plant with pods containing four reddift peas. A decoction of the leaves reftrains the hæmorrhoids when exceffive. Raii Hift.

CAJEPUTI OLEUM. It is thought to be obtained from the grains of paradife: it is commended as a nervous medicine, and being ufeful in fome cardialgias. The dofe is four or five drops in any convenient liguor.

The dofe is four or five drops in any convenient liquor.

CAJOUS, See ACAJAIBA.

CAJUM,
CALABA. Indian Mastich Tree. It hath rofaceous flowers, which are followed by a fleshy fruit that includes a nut. This tree is a native of the warm parts in America. From the trunk and branches a gum, like the gum mastich, issues.

CALÆ, CALÆM, or CALÆMUM. A kind of Indian tin, which being subjected to the fire is changed into a kind of cerus, such as is made of lead and Euro-

pean tin.

CALAMACORUS. INDIAN REED.

CALAMAGROSTIS. REED-GRASS. See GRAMEN ARUNDINACEUM.

CALAMARY. The CUTTLE-FISH.

CALAMBAC, See AGALLOCHUM.

CALAMEDON, from \*\*axaus, a reed. A species of fracture which runs along the bone in a right line, but is lunated in the extremity.

CALAMINA, CALAMINA STONE, CADcalled cadmia lapidofa arofa; cadmia fosfilis, CALAMITE,

CALAMY, and CALAMINAR STONE.

It is a metallic mineral, of a grey, brown, yellow, or pale red colour, and fometimes of all these colours varithough unfuccefsful, yet merits attention. In this case the incision was made on the right side; and it was observed that the woman complained but little during the operation, except when the needles passed through the peritoneum in making sutures; and that the uterus either in distinct mines, or intermixed with the ores of seemed very little sensible of any injury done to it. It is not set to the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks made on writers who have desired in the remarks and those of the second with the order of the remarks of th is noticed in the remarks made on writers who have de- the name of zinc, and contains a small portion of iron-

Fosfilogy, as a cryptometalline stone, and its varieties as so many species of the zinc-stone genus: some are varieties of the zinc floffes; they are transparent or gloffy.

The quantity of zinc is variable in different parcels of this ore. In the Berlin Memoirs Marggraf fays, that from 2-16ths to 7-16ths of the weight of the ore is pure metal. The common fort in our shops in England frequently

If this ore is not already calcined, it must be heated to a ftrong red heat, then quenched in water; and this procefs must be repeated three times. Before calcination it is of a grey or red colour; but when calcined it is yellow.

It is an error of fome writers who fay that the calamy is a recrement of melted copper, and that tutty is a recre-ment of melted brafs; though it is true that the best calamy is what flicks to the iron rods used in stirring the matter

in the furnaces while brafs is making.

The name cadmia hath been applied to feveral different things. Diofeorides meant by it the recrement which arifes from brass whilst melting: Galen applied it to the recrement of brass, and a stone found in some mines: the talamine ftone is now thus called ; and the Germans have given this name to cobalt; whence Agricola fays that there are three forts, viz. one metallic, one follile, and one of the furnaces.

Though the calamine stone is an ore of zinc, it is not the only one; for zinc is found in the ore of lead, and of other metals. The principal use of this mineral is for changing copper into brass, which it does by its metallic part mixing with the copper while it is in a state of fu-

For medicinal uses the calamine, after being calcined, should be levigated to an impalpable powder; it is then called lap. calam. ppt. See Comminutio. When thus prepared it is useful in collyria as an aftringent and corroborant, and against defluxions of this acid humanic. orant, and against defluxions of thin acrid humours upon the eyes, and in ointments for cutaneous exulcerations,

the eyes, and in ointments for cutaneous exucerations, &c. if it is exquifitely fine, it acts as an abforbent or deficeative, but if not, it is efcharotic.

The London College directs the following cerate, in which this mineral is the principal ingredient.

Geratum Epuloticum. CICATRIZING CERATE; now called Ceratum Lapidis Calaminaris. CALAMINE-CERATE.

Take of olive oil, a pint; yellow wax, calamine prepared, of each half a pound; melt the wax with the oil, and as foon as the mixture begins to thicken, fprinkle in the calamine, and ftir all well till the cerate is quite cold. Ph. Lond. 1788.

This hath been called Ceratum Turneri. Dr. James fays that he remembers to have met with a like cerate in a publication by an old English furgeon who preceded Dr. Turner. The Edinburgh College calls it ung. lap. calamin. Magisterium Lapidis Calaminaris. The MAGISTERY

of CALAMINE.

Take of calamine fubtily powdered, four ounces; put it into a matrafs, and pour upon it a pound of the muria-tic acid; let them digeft upon warm fand forty-eight hours; filtre the folution and precipitate the magistery with the spirit of urine; free it from the salts by several ablutions, and dry it for use. In doses from three to seven grains it is emetic and cathartic. See Neumann's Chemical Works. Lewis's Materia Medica, and the Dictionary of Chemistry, 4to.

CALAMINTHA, from sala sirên, good mint. CA-

It is a plant with fquare ftalks, the leaves fet in pairs; the flowers on branched pedicles, whereof two iffue from one joint in the bofoms of the leaves; the upper lip of the flower is divided into two fegments, the lower into three. It is perennial, and flowers in July and August. It is also a name of the Saturcia.—Anglica. Field ralamint, called alfo calam. pulegii odore nepeta agreftis, calam. fol. ovatis, &c. and fpotted calamint. Meliffa nepeta Linn. Its ftalks are reclining; the leaves are fmall, irre-

It is generally calcined before it is brought into the shops, in order to separate some sulphurcous and arsenical particles of which it is supposed to be possessed, and also to render it more easily reducible into powder.

Calamine is ranked by Mr. Edwards, in his Elements of states. By distillation with water, they give out a large all their virtue, and by evaporation it carries off all their flavour. By distillation with water, they give out a large portion of effential oil, that is pungent to the tafte and ftrong of the herb: the decoction in the ftill, after the oil is carried off, is rough, bitter, and aromatic. Rectified fpirit of wine extracts the virtues of this herb the most completely. —Humilion. Ground-ivy. See He-DERA TERRESTRIS. —Magno Flore. Mountain CALAMINT with a large flower; also called calaminiba montana magno flore, MOUNTAIN-MINT, the GREATEST CALAMINT, and the MORE EXCELLENT CALAMINT. It hath large leaves and flowers, the leaves are deeply ferrated, pointed, and fet on pedicles. It is a native of the fouthern parts of Europe, and raifed in our gardens.

It hath a moderately pungent tafte, and a more agree-able one than any of the other calamints, and is a bitter ftomachic. That called --- Monrana is the common calamint, named also cal. vulg. vel officinarum Germanize, and calam. flore magno vulg. It is the meliffa calamintha,

The ftalks are large and upright, the leaves are pointed and ferrated. It is found on the fides of the highways, but it is not fo common as the field species, nor are its leaves so powerful in their medicinal qualities, not having he penny-royal fmell. — PALUSTRIS. Water Calamini, called also calam. arvensis verticillata, mentha arvensis verticillata hirfuta, calamintha aquatica. FIELD-MINT with whorled coronets. It grows on the fides of ditches: the whorles are placed at a diffance in the bosoms of the leaves. It is feldom used.

leaves. It is feldom used.

Herba felis, also called cataria, mentha cataria, nepeta cataria major vulgaris, nep. and CAT-MINT. It is so called from its being destroyed by cats; it is a hoary plant with square stalks; the leaves are heart-shaped, acuminated, serrated, and set in pairs on oblong pedicles; the slowers are whitish, labiated, standing on spikes on the tops of the branches; the upper lip is divided into two, and the lower into three fections. It grows wild in

hedges, and on dry banks, and flowers in June.

The leaves are moderately pungent and aromatic, fmell strong, and resemble spear-mint and penny-royal, of the virtues of which they partake. Water extracts all their active matter, but rectified spirits extract it more completely. pletely. Diftilled with water they yield a yellow effential oil, not quite fo agreeable as the herb, though finelling ftrong of it; the remaining decoction is bitter and subaftringent.

CALAMITA. A name for the dry fort of storax, to diftinguish it from the liquid. It is also a name for the LOADSTONE. See MAGNES.

CALAMITA ALBA. The WHITE SAND-STONE. See

MAGNES ALBUS.

CALAMITA of RHASES. The COMMON LOAD-

CALAMITIS. A name of that factitious cadmia which, by fixing to iron rods, acquires the figure of a reed; the word is applied to pumpbolyx, to calamine, and Agricola calls a marine flony plant thus.

CALAMUS. The ftalk of any plant. See CAUDEX. It is also a REED. See ARUNDO.

CALAMUS AROMATICUS. SWEET-SCENTED FLAG; also called clava rugosa, diringa, jacuantatinga, accorus verus, typha aromatica. It is the accrus calamus vera of

The name of calamus aromaticus is given to the acorus, but they are very different things; the first is a stalk of an Eastern reed, which is slender, hollow, white, and of a fragrant smell; it is also called calamus advatus, and

arundo Syriaca.

The fweet flag is a plant with long narrow-pointed leaves, like those of the common iris, and of a bright green colour; they are divided by the longitudinal rib into two unequal proportions, one of which is smooth, the other transversely wrinkled; the flowers are imperfect and ftand thick together, forming an elegant fpike : the root calam. fol. ovatis, &c. and spotted calamint. Melissa nepeta
Linn. Its stalks are reclining; the leaves are small, irregularly oval, slightly indented, without pedicles, the flower-stalks larger than the leaves; it grows wild in dry
grounds and by the sides of fields, in hedges, highways,

The dried roots are brought from the Levant, but those of our own growth are preferable. Dr. Alfton fays, that this root is aromatic, stomachic, and carminative. As an aromatic it promotes the fluid fecretions, is of use in gangrenes both internally and externally, agreeably stimulates, and produces a pleafant fenfation in the mind. Their aroma is fixed, and will keep many years. When fresh
gathered the scent is not agreeable, but somewhat like that
of leeks; by drying this kind of slavour goes off.
Chuse that which is found, tough, and whitish within

when broke.

Water best takes off the bitter part of this root, and fpirit the aromatic part. In distillation with water, it fends up a very fmall portion of effential oil, leaving a

nauscous bitter in the decoction.

More agreeable bitters supercede its use, but it is a tolerable fubilitute for gentian, and other gently warm bitters. That named—Aromaticus Asiaticus, is the Asiatic Sweet-flag; called also acorus Afiaticus, aurus Brasiliensis, and capicatinga. It grows in both the Indies. Its root agrees in virtues with that of our own ODORATUS. See CALAMUS AROMATICUS.—SCRIPTORIUS. A dilatation of the brain, near, or in the fourth ventricle, is thus named, because it resembles a quill. See ANAGLYPHE.—TOXICUS. The WALKING-CANE. See ARUNDO, FARCTA ATRO-RUBENS.

CALANDRA, or CHALANDRA. A large kind of

LARK is thus named.

CALATHIANA. MARSH GENTIAN.
CALBIANUM. The name of a plaster in Myrepsus.
CALCADINUM, CALCATAR, CULCOTOR. See VITRIOLUM.

CALCADIS. WHITE VITRIOL, or, according to

fome, it is fal alkali.

CALCANEUM, CALCAR, CALCIS OS, PTERNA. The HEEL-BONE. It is the largest bone in the foot, of which it is the posterior part, and in some measure the basis. The-large tendon, called tendo Achillis, is inserted into this

If it is injured in its fore-part, it may fafely be amputated. CALCANTHOS, CALCANTHUM. See VITRIOLUM.

CALCANTUM. A kind of RED DRINK. CALCAR. See CALCANEUM.

CALCAR GALLI. A species of Mespilus.
CALCARIS FLOS. The LARK-SPUR.
CALCARIUS LAPIS. LIME-STONE. Sec CALX.

CALCATAR. See VITRIOLUM. CALCATON. Troches of arfenic.

CALCATREPOLA. See CALCITRAPA. CALCATRIPPA. GARDEN LARK-HEELS. See

DELPHINIUM.

CALCEDONIUS. See CHALCEDONIUS.

CALCENA, CALCENON, CALCENONIA, CALCINONIA, CALCENONIUS, CALCENOS, CALCETUS. Paracelfus ufes these words to express the tartarous matter in the blood; or that the blood is impregnated with tartarous principles. CALC. MUS. An abbreviation of Museum Calceola-

ralium Veronense.

CALCEOLUS D. MARIÆ SACERDOTIS. OUR LADY'S OF PRIEST'S SLIPPER. It is a fpecies of alifma, having in the middle of its flower, a hollow like a flipper. CALCEUM EQUINUM. See Tussilago.

VERDIGRISE; also a MARCA-CALCHITHIOS.

CALCHOIDES OSSICULA. See CUNEIFORME OS

CALCIDICUM. The name of a medicine in which is arfenic

CALCIFRAGA. BREAK-STONE. An epithet given to the herb fcolopendrum or fpleen-wort, in Scribonius

CALCIGRADUS. Hippocrates means by it, one who in walking lays much firefs upon the heels.

CALCINATIO. Alfc, CONCREMATIO, DEFLAGRATIO. CALCINATION. The calcination of a body is, proporly fpeaking, to expose it to the action of the fire to produce fome change in it; or it is the feparating, by means of fire, the more volatile from the more fixed parts of any compound body; or the destruction of the inflammable principle thereby, or both.

and marshy places in many parts of England, and in Holland. The stalk dies in winter, but the root is pelint of the stalk dies in winter, but the root is pelint of the stalk dies in winter, but the root is pelint of the stalk dies in the evaporation of the stalk dies in the stalk dies in the evaporation of the stalk dies in the the air and watery principle; in the exposing gypfum, alum, borax, and several other falts to the fire, which deprives them of the water that is necessary for their crystallization; and in the roasting of minerals, which carries off their fulphur, arfenic, and other volatile con-

The inflammable principle is separated from impersect metals by exposing them to the fire; in an intente heat they are deprived of their form and metallic properties, and are changed into earthy matters, called metallic calces. Here it may be observed, that what are called calces of gold and of filver, are improperly to termed, being only these metals reduced into fine powders; no method is known by which these metals can be deprived of their phlogiston, or inflammable principle. The changes made by this second kind of calcination, are different from the former; in this case the alteration is effected not by evaporation, but by decomposition and destruction of the phlogiston; it is therefore a cumbustion, and not a volatilization of their inflammable principle.

There is an evaporation of volatile parts, and a depri-vation of the inflammable principle, without any fentible combustion, in exposing imperfect metals, combined with vitriolic and nitrous acids, to a due degree of heat; in this process the acid rises, and at the same time carries with it the inflammable principle; for inflance, in calcining

the vitriol of iron.

Acids, particularly the nitrous, extract the inflammable principle from imperfect metals, and reduces them by folution, without fire, to a state similar to that by calcination; whence fuch acids are confidered as capable of calcining them; and metallic fubitances, dephlogifticated by their means, are called calces.

Calcination is faid to be actual, when effected immediately, and only by the action of fire; and potential, when aqua fortis, or fome different folvent, is used to

corrode iron, or any other metal.

The calcination, which by means of fire reduces folid bodies into a powdered flate, also alters the qualities there-of, hence it differs from comminution.

To this head belongs the burning of vegetable and ani-

mal matters; otherwise called ustion, incineration, or

concremation.

There are feveral species of calcination, by which different degrees of the fame effect are produced, and thus calcination is perfect or imperfect: the first is where the utmost change, except vitrifaction, is brought about; the second is where the circumstances of the process are li-

mited in proportion to the change intended.

The calcination of metallic bodies, gold and filver ex-cepted, are promoted by nitre. This falt exposed to the fire in conjunction with any inflammable fubftances, ex-tricates their inflammable matter, and burfts with it into flame, accompanied with a hiffing noife; this process is called deflagration, or detonation. To understand the principle of this operation, it must be observed, that the afflux of air, or a substitute for it, is necessary to the support of fire; and that nitre, or any thing containing the acid thereof, is fuch a fubflitute; that if nitre be added to any matter containing an inflammable principle, and a heat be imparted to the mixture, fufficient to bring the nitre to fulion, fire will be produced, and a calcination effected, even though all the air be excluded.

The manner of operation varies according to the nature of the matter to be calcined, and may, according to the principle on which it is performed, be diffinguished into three kinds, combustion, calefaction, and detonation.

Calcination by combustion is where the body kindled fupports, with the affishance of the air, the fire which colcines it, as in the inflance of coals in the culinary fire-Vegetables are thus calcined, and when they are thus treat-

ed, some call the operation incineration.

Calcination by calefaction is, where the calcining heat is not generated in the body itself, but imparted to it from fome external fire. The methods here are various, almost as the different kinds of matter thus treated; and in the management regard must be had to the substance of the containing vessel, for some should be made of iron, others of glass or clay, &c. the heat must be differently regulated, or else vitrisaction, instead of calcination, may ended to the containing fue. Calcinations of this kind are expedited by the increase of surface, which is given to the calcined matter, and the copious admission of air through that part of the furnace where the matter is placed, by stirring it with a spatula, by previous pulverization, and by raking off the calx from the surface of the metal, as fast as it appears thereon. It should be farther observed, that if any coal, or other inflammable matter, that does not contain a mineral acid, be fuffered to fall on the calcining matter, calcination will thereby be prevented, and part of what is calcined will be revived or reduced, that is, it will return

into its metallic form again. Calcination by detonation differs from combustion only in this; in the latter the affiltance of air is necessary, in the former this want is supplied by the nitre that is added to the matter, which producing a quicker and more intenfe fire, both shortens the operation, and in some instances, perfects it more fully. Detonation is thus performed: a proper quantity of nitre is mixed with the matter to be calcined, a cr c ble is heated red-ho, then the matter thus mixed is gradually thrown in, an explosive effervescence foon follows the injection of each quantity, the ceffation of which effervefeence each time, is the proper limit of the intervals of throwing in, till all is in, at which time it is finished. The crocus antimonii, and some other medicines, are thus prepared. A portion of the alkaline bass of this falt, fometimes joins with the calcined matter; but the rest is to be separated by water, which is to be added warm, and after being well mixed, it is to be poured off, and the same to be repeated till the falt is ex-

tracted; this is called edulcoration. The metals which melt before ignition, are calcined by keeping them in fusion for fome time. Those metals which require a strong fire to melt in, calcine with a much lefs heat than is fufficient to make them flow; hence the fcorification, or burning of fuch iron or copper veffels, as are long exposed to a confiderable fire without defence from the air.

In calcination the metals visibly emit fumes; yet the weight of the calx proves greater than that of the metal employed. And all the metalliccalces and feorize are revived into their metallic state, by fusion with any animal or vegetable inflammable matter.

Except the calces of lead and bilmuth, all the metallic calces require an addition to make them melt in the strongest fire that can be made in common furnaces; and the additions, called fluxes, chiefly confift of a mixture of fixed alkaline falt, with fome inflammable matter. As these fluxes not only fuse the calx, but also revive it into metal, they are fornetimes called reducing fluxes; of which the following is one of the chief, and is called the black flux.

Take of nitre one part, and falt of tartar two parts, grind them well together, then fet the mixture on fire, by throwing in a bit of red-hot coal; cover the veffel and fuffer them to burn until the whole is changed into a black

alkaline coaly mass.

Metallic calces or fcoriæ mingle with twice their weight of this black flux, and exposed to a proper fire in a close-covered crucible, melt and resume their metallic form. But though the calx was heavier than the metal of which it was formed, on reviving to its original metallic state, its weight is less than at the first.

See Newman's Chem. Works, Lewis's Materia Medica, the Dictionary of Chemistry. CALCINATUM MAJUS. It is whatfoever is dulcified by the chemical art, which was not fo by nature; fuch as dulcified mercury, lead, and the like fubitances, which are very speedily confolidated.—MAJUS POTERIL. It is mercury diffolved in nitrous acid, and precipitated with falt water. Poterius used it in the cure of ulcers. MINUS. Any thing which is fweet by nature, and fpeed-

ily cures, as fugar, manna, tamarinds, &c.

CALCIS VIV. FLORES. The pinguious matter which floats on the top of new-made lime-water is thus

CALCIS OS. See CALCANEUM. CALCITARI, i. c. SAL ALCALI. CALCITEA. See VITRIOLUM.

CALCITEOSA. LITHARGE. See LITHARGYRUM. CALCITHOS. VERDIGRISE. See ÆRUGO.

CALCITRAPA. COMMON STAR-THISTLE; also called carduus stellatus, rupina, jacea, ramocissima, jacea flellata, erupina, and calcabepola.

The ftalk of this plant is divided into numerous branches, fpreading about, and rifing near two feet high, with a few leaves on them placed at the divifions of the ftalks; the flowers are of a reddiff colour, grow thick upon the branches, and come out of heads, which are composed of feveral feales, each ending in a long, straight, hard, and tharp thorn; these flowers pass away in down, containing white flattish oblong seeds; the root is single, about a finger's breadth long, runs deep into the ground, of a whitish colour, and has a thick bark on it. It grows near highways, on commons, and flowers in June.

The leaves are bitter; a dram of the feed, in a glass of wine, powerfully expels viscid matter which obstructs the urinary paffages; the root is used against the gravel, and the stone in the bladder; and the bark of the root is extolled in the nephritic colic. It should be gathered about the end of September, and when dried a dram is a dofe.

Dale.

CALCITRAPA OFFIC. SY. BARNABY'S THISTLE ; called also carduus stellatus lutea, carduus fossitialis, spini fossitialis, jacea stellata, jacea tutea capite spinosa minori, and leucanthe veterum.

It is commended as an anticteric, anti-cachectic, and lithoutriptic. Dale.
CALCOIDEA OSSICULA. See CUNEIFORME OS.

CALCULIFRAGUS. LITHONTRIPTIC: CALCULOSUS. Afflicted with the flone

CALCULUS. The GRAVEL and STONE. The Greeks call this diforder lithiafis, the Latins name it calculus, and in English we understand by gravel, small flower that pass from the kidneys through the ureter, &c. in a few days; and by the flore, a calculous concretion in the kidneys, or in the urinary bladder, which is too large to pais, or at leaft without great difficulty. Some call it rephritis; though now, in modern practice, this is confined to an inflammation of the kidneys. See Nepharts.

This flore in the bladder is called Bezoar miferocofmi-

What is called a fit of the gravel or flone is, when from the flony concretions in the kidneys, &c. there is pain, with other fymptoms which ufually attend, when nature endeavours to difcharge them.

The concretions that form this difease, are very various in their properties; and when out of the body require very different folvents to destroy their cohenon. See

Lond. Med. Trans. vol. ii. p. 105, &cc.

The human calculi contain about half their weight of fixed air, much volatile alkaline falt, fome oil, a little earth and phlegm; and the different hardness observed in different ones, is owing to the variety in the proportion of the constituent parts. From the supposition that the flower in the kidneys, and the bladder, confift of calcareous earth, they have been called calculi; but fir Torbern Bergman afferts that the most exact analysis cannot discover in them, upon an average, above one part in a hundred of this earth.

Stones are generated in any part of the body; but when the flone is spoken of as a discase, it is understood to be seated in the kidneys, ureters, or the bladder. As to what is called a flone in the gall-bladder, it is only a coagulation, or at most a concretion, of the bile, and not properly of the calculous kind.

Persons of vigorous constitutions are more subject to

this disease than those of a more lax and cold habit.

If any small indissoluble substance is fixed in any p of the body, a ftony crust foon forms itself upon it, either more or lefs. Thus it may be formed in a kidney, and increasing, may obstruct it, and even prove its destruction by corrupting it; in this case a bloody feetid and purulent urine is discharged; or if this concretion is removed from the kidney, obstructing the ureter, it occasions at first a fpafmodic, but fometimes it produces an acute inflammatory pain there; or, defeending into the bladder, it is either expelled with the urine, and discharged through the urethra, or detained there, where it increases in bulk by the attraction and adhesion of the earthy parts of the urine, form in strata of different colours; the nucleus which fell from the kidney always remaining red. As to the production of flones in the human body, a fmall attention to the causes of the gouty matter, and to the affinity betwixt the gout and the flone- also on recollect-ing that a fit of one is often transmuted into a fit of the other, we shall be readily led to conclude, that the causes

in the constitution conducing to the formation of one or the other disorder, from the said leading cause. Wine is ranked among the occasional causes, so is hard and stemy water; but the tartar of wine agrees not with the human calculus in its conftituents, except in possessing some fixed air and earth, and these in proportions very different too: and as to flony waters, they, at most, can only prove a negative cause; water is the only diluter, and in the performance of its office of diffolving not only our food, but also the recrementitious parts of our juices, it promotes health, and counteracts diseases and their causes: when pure water only is drank, the veffels are permeable, the excretions duly performed, and every thing that is faulty carried out of the body; but water impregnated with indigestible particles, is already faturated with its own contents, therefore lefs capable of diffolying and carrying off with it fuch other particles as require its affiftance in order to their discharge.

Hoffman observes, that the pain which is excited by calculus in the bladder, attended with a constant strangury, is to be referred to spasm as its cause. For on account of the spasmodical stricture, which not only affects the mustake the strangury of the spasmodical stricture, which not only affects the mustake the strangury. the spasmodical stricture, which not only alrects the mu-cular coat of the bladder, but also its sphincter and the urethra, all the distressing symptoms in the discharge of urine are induced. But while such spasmodic affections are sometimes brought on by calculus, it is also certain that they may arise from obstruction and stagnation of blood in the veffels of the bladder, as in cafes of fuppreffion either of the hæmorrhoidal or of the menstrual flux; or from fome acrid application to the bladder; and from va-

rious other caufes.

In some instances, the difficulty of discovering whether or no there is a fione in the bladder is such, as to elude the or no there is a flow in the bladder is luch, as to elude the best skill in the symptoms thereof; the greatest dexterity in using the catheter, and the best helps that experience hath given in the use of any other means. However in general, if the patient handles his penis frequently, if he hath a motion to stool when he begins to discharge his urine, if he walks in the streets with his legs straddling, it is not doubted but that there is a flone in the bladder, Le Dran fays, that when a fmall flone is lodged in the neck of the bladder, the patient is only pained whilft the first drops of urine pais, each time that he attempts to discharge it; if the flone is large, the greatest pain is whilst the last drops are discharging; but if there is a difficulty in passing the urine all the time of its going off, the case is not a flone.

The figns of a flore in the kidneys are, an obtuse pain in their region; a naufea, ficknefs, and frequently a vomiting; a titillation at the point of the penis; coftivenefs, and flatulency; the pain fometimes extending to the groin, hip, or to the neighbouring tefficle; there is a chilnels, flivering, and difficulty of breathing; the leg, on the fame fide with the affected kidney, is fometimes contracted, and at others benumbed; the urine is discharged frequently, but with difficulty and in fmall quantities, or it is totally suppressed to as a distinguishing sign, the sedi-ment of the urine may be attended to, for it subsides di-rectly; if then this, with the other named symptoms attend, the patient's case is manifestly this disorder.

As to a flowe in the urethra, it may be detained in va-rious parts, but its fituation may eafily be known by the

pain or by a catheter.

Pain in the loins from the gravel or flone in the kidneys, fhould be diftinguished from that which is caused by fpafms, fuch as frequently happen in nervous difeafes; from the colie, which it much refembles in the beginning of the fit; from the lumbago, and from pain in the ploas muscle; also from the gout in the parts, or a latent intermitting there. The stone in the bladder should be diffinguished from both these last also; from spasmodic fymptoms; from the pain excited by sharp urine, or other acrid matter descending from the kidneys, or otherwise introduced into it; an abscess in a part adjacent pressing forcibly against it; an ulcer, or other disorder in the uterus; and any complaint in the intestinum rectum.

A flone in the kidneys often brings on a tabes renalis.

When the violent pain hath continued for several days and

nights without intermission, and hath exceedingly reduced

of both are, a defective folution of the earthy particles of our aliment by the powers of digeftion; other peculiarities the appetite begins to fail, a naufea comes on, and a hectic heat approaches, the danger is great. An inflammation

of any of the viscera approaching is also fatal. In administering remedies for the relief of these disorders, it should be remembered, that during the fit, the treatment must be very different from what it is in the abfence thereof. During the paroxyfm the inflammation is removed by bleeding, emollients, and terebinthinate clyfters, in which is the oleum ricini; this oil should also be given by the mouth as a purge: warm baths be made use of; and when the inflammation is abated, opiates, with oily emollient decoctions, may be administered. In general, plethoric habits are relieved by proper bleeding. While the violence of the pain continues, with difficulty in the discharge of urine, nothing affords greater relief than emollient oily ciysters, warm bathing, and the pediluvium. Fomentations made with the flor. chamæmil. &c. and applied to the part most pained, considerably allay

the pains and spasms.

After the fit is over, begin with a cautious use of diuretics and lithontriptics; and when there is no inflamma tion nor pain, the aqua kali may by given in fmall

quantities

The following is the best mode of preparing and admi-

nistering it.

Take of kaliprepared, eight ounces; of fresh quick-lime, four ounces; of diftilled water, a quart; mix them well together in a large bottle, and let them fland for twenty-four hours; then pour off the ley, filter it through paper, and keep it in well ftopped vials for use. Of this the dose is from thirty drops to three or four drams, which is to be repeated two or three times in a day. Mix the quantity to be used in the day with three pints of plain broth, which has been made with the lean part of yeal, all the fat or oily has been made with the lean part of veal, all the fat or oily parts being separated from it, by putting it, when made, into a large bowl, and skimming them off with a spoon when cold, and let the patient drink within an hour a pint of this broth three times a day, early in the morning, at noon, and in the evening: continue the use four three, four, or more months, living during this course on such

things as leaft counteract the course of this medicine.

Instead of this the following folution of the vegetable alkali fully saturated with fixed air, acrial acid, has been lately recommended, as a powerful dissolvent of the stone. Take two ounces of falt of tartar, and dissolve it in two quarts of distilled water, and then saturate the solution. quarts of diftilled water, and then faturate the folution with fixed air fully, and let the patient take eight ounces

every eight hours.

The diet should be light, and of a laxative kind, exercife moderate, but as confrantly as the ftrength, &c. will admit of. The water that is drank, and all the liquors that are of a watery kind, must be, from such supplies as are absolutely free from all mineral impregnations.

Lithontriptics are to be used during the intervals of the fits; but as some stone stone

in acid, and others again in no known menstruum, before any of these kinds of medicines are used, the nature of the offending calculi should be known: this discovery is easily made by an attention to experiments on the fragments, &c. that are cast off, or to the contents of the urine.

Bleeding. During a fit, if the habit is plethoric and fanguine, this evacuation both guards against and removes inflammation, and also tends to relax the rigid fibres. As to those persons who are subject to regular returns of the graves, they should lose blood a little before the return is

expected.

Diuretics. These should never be of the forcing kind; the emollient and oily are the most proper, and after them diluting ones, both by the mouth and by elysters frequently repeated. In general, the more painful the fit, the gentler should the diuretics be, and the less copiously given. The aged and weak should be allowed the use of cordials with their diuretic medicines. A very free use of diuretics in the kidneys thousand the pain and forefree are jure the kidneys; however, when the pain and spasms are very violent, and yet there is hope that the flone will pass the urinary ducts, gentle diuretics, mixed with mild ano-dynes do most fervice; for the latter relax the parts and case the pain; and the former then more easily and safely propel the stone. When gravelly matter hath been seen to be discharged with the urine, and to subside presently after the patient, if the extremities become cold, or if the urine it is made, light fteel waters, either of the purging or of continues to be totally suppressed, death is to be expected. the diuretic kind, very safely and effectually expel it, and strengthen

ftrengthen the kidneys; the water should be continued some weeks, and repeated at proper intervals. But if a ftone in the kidneys is so large that there is no hopes of its passing through the ureters, the steel waters should not be used. Purges. Of all the purging medicines, the oleum ricini is to be preferred in calculous disorders; whether a street or other cause of inflammation, produce gargette.

flone, or other cause of inflammation, produce gravelly fymptoms, after bleeding, emollient and lubricating medicines will be necessary. To these ends, and to relax the passage for the calculus to pass from the kidnies to the bladder, this oil conduces in a particular manner, even beyond any other known medicine: it should be given both by the mouth and clyster-wife. In want of this, oil manna with nitre, or fal cath, amar, mixed with the oil of almonds, must be used; for they both empty the intestines, and take off all pressure upon the ureters, they also moderate the heat of the body, and lessen the inflammation; thus they relax the fpalm too, which the pain occasions. If the ol. ricini is taken in the fit, so as to keep the belly lax, and the aqua kali puri is taken at proper intervals, mixed in any fuitable vehicle, their efficacy in calculous diforders will equal that of the most boafted noftrums used in these cases. In slighter cases,

boafted noftrums ufed in these cases. In slighter cases, where gravel is to be carried off, give a mixture of soap, four parts, and rhubarb one part, twice a day, in dose sufficient for keeping the bowels easy.

Clysters. Their use is singularly beneficial. The colon forms a kind of arch over both the kidneys, is sometimes joined to the left, and consequently, if a warm emollient decoction be to be thrown up into it, it may, by its heat and most vapour, relax and soften the kidney like a somentation. Hence we see why wind in the first passages, and much hard dry excrement, usually occasion such grievous much hard dry excrement, usually occasion such grievous disorders, as to bring on a fresh sit; also why the lest kidney is more subject to complaints than the right. The

kidney is more subject to complaints than the right. The ol. ricini is peculiarly useful in emollient clysters; and turpentine dissolved with the yolk of an egg should be a part of their composition: or, R Decoct. com. pro clyst. B s. balf. cap. vitel. ovi admixti, 3 ii. ol. ricini 3 ii. m. f. enema. To this clyster thirty drops of the tinctura opii may be added, when the pain is great.

Opiates. When the vomiting abates, the stomach and bowels are freed from their foul contents, and the belly is rendered soluble; then, and not before, it is proper to give opiates, which, by easing the pain, and relaxing the spassing the contention of the sibres, most effectually open a passage. As to their repetition, it can only be determined by the attending physician. When the pain is of very long continuance, and accompanied with great prostration of strength, especially if these occur in advanced age, and of strength, especially if these occur in advanced age, and with a weak state of the pulse, Hossman forbids the use of opiates, as of a poison; and says that in such cases, gentle cordial waters, as those of mint, balm, and cinnamon, with the addition of a few grains of saffron, and the moderate use of wine, are the best means for supporting nature. Yet, if the loss of strength is caused by the violence of the pain alone, opiates will be necessary.

Lime-water. It seems to be useful by depriving the calculus of its oily particles, and volatilizing the salts, and

calculus of its oily particles, and volatilizing the falts, and fo deftroying the coments of its parts.

The semicupium is a necessary assistant when the pain is violent, for it powerfully relieves the stricture of the part. After fitting a fufficient time in it, let the patient take from gr. ten to twenty of the foap pill, and go to bed.

Vomiting is fometimes a troublesome symptom, but if not very fevere, it is rather uleful, fo not to be fuddenly checked. Whilft moderate, it rather prevents the cohefine of the gravel, and promotes its expulsion. When it is necessary to remedy this complaint, let the patient drink freely of some warm aqueous liquor to free the stomach from its contents; and if need be, give the faline draught in the act of fermentation, and in a few minutes after it give the following: R Tinch benzois composit, gutt. xxx. tinch, opi, gtt. xx. aq. menth. 3 i. m.

If a stone sticks in the kidney, or the ureter, medicines are unlass that act by timulating, and a plentiful wise of

are unfafe that act by ftimulating, and a plentiful use of diluents are thrown up without producing any advantage to the patient; but when the anodynes, oily medicines, &cc. have confiderably abated the spasses, when the pulse is grown calm and soft, and the whole body is of a moift and equable heat, then the expulsion of the stone or gravel may be attempted, by giving very gentle expellents now

Bloody urine is fometimes a fymptom attending the gravel, in which case a dose of manna may be taken as a purge, in a quart of milk-whey at feveral draughts: See Wallis's Sydenham. To quicken its operation, and render it easier in the stomach, a flice of lesson may now and then be sucked. This may be repeated twice in a week, for it both eases the pain, and moderates the dis-charge of blood. After its operation, let a dose of opium be taken at bed-time. If the bloody urine is from the bladder, and attended with spasms there, or an ulcer, warm external applications are ufeful, fuch as bladders of warm water laid just above the pubes.

Spafms in the bladder are often very troublefome. Whilft they are actually prefent, and are attended with pain and difficulty of urine, emollient oily glyfters, baths, and half-baths should be used, and internally give almond emulfions, with nitre, caftor, faffron, and fp. ætheris vitriolici compositus. If a translation of rheumatic matter caused the spasms, issues may be used, and perspirative

anti-rheumatics.

When calculous complaints attend during pregnancy, if the pain is violent, bleed moderately, give only medicines by the mouth; and clyfters, fuch as are directed above, may be repeated as oft as the state of the case may seem to require; and if these fail, give opiates so as to procure rest. If a stone is perceived in the bladder, it should be reft. If a ftone is perceived in the bladder, it fhould be extracted before pregnancy; but if the woman is already pregnant, wait until her delivery, for fear of inflammation. During the time of labour, the ftone fhould be puthed and kept up above the child's head, if possible; if this cannot be done, the affistant must pass up his hand as soon as the os internum is sufficiently dilated, and, breaking the membranes, turn the child, and bring it away footling, then there will be room for the stone to be raifed by the catheter, to present the child's head from pressing by the catheter, to prevent the child's head from preffing it against the urethra, which would give the woman great pain, and perhaps lacerate the parts.

As a preventive of the gravel, &c. Dr. Hales proposes for the patients, at all times, to lie with the head and upper parts of the body confiderably higher than the lower: for thus the urine is not detained to long in the kidnies

as to allow its tartarous parts to unite with each other.

The uva urfi in powder, given from 9 i. to 3 fs. or 3 i.
twice a day with the common emulfion, in which should be double the quantity of gum arabic, is often productive of every defirable advantage. An infufion of the feeds of wild carrot is deemed also a specific. Acids are as powaerful folvents of fome calculous concretions, as the caustic lixivium is of others, and of this kind the acidum muriaticum may be preferred.

See BOERHAAVE, who fpeaks well on this fubject, and Aretæus is also admirable on it; Alexander Trallian and Lommius deserve to be consulted; Hossman hath many excellent remarks on this difease in his Med. Rat. Syst. WALLIS'S Sydenham. Lobb on the flow and gout. Medical Mufeum, vol. i. and iii. Bell's Surgery, vol. ii. 9, &c. White's Surgery, 348. Memoirs of the Medical Society.

vol. i. 225.

A Stone is sometimes forced from the bladder into the urethra, and fometimes it is generated in this paffage. Dr. Boerhaave observes, that if recent urine be placed in a heat no greater than that of a healthy man, it foon throws off a flony matter to the fides of the veffels; whence we learn, that calculous matter, by too long a detention of this fluid in the bladder, may both foon and eafily be formed; and a little of it may in its paffage with the urine be fo entangled in the urethra as not easily to be extricated, and so become the bass of a larger stone, which time produces. Mr. Warner observes, that the urethra, in cases of this kind, becomes a cyst, which cyst acquires a great degree of hardness, remaining compact and whole till an inflammation is produced by its incapacity of admitting any further diftention: this inflammation is foon after communicated to the teguments, by which means they

become painfully tender, and are easily lacerated.

If a stone is obstructed in its passage through the urethra, and the urine requires to be drawn off, though this
is difficultly effected, yet if possible it must be done; after
which, a little warm oil should be injected up the urethra, and repeated every hour; then bleed the patient, give him an emollient clyfter; after its operation an anodyne draught will be proper, plenty of the common emulion flould be drank, and the patient being placed in a warm 2 Z bath

bath presently after the clyster is administered, and the oil, injected, often facilitates the exit of the stone.

If the flone flicks in the neck of the bladder, and requires an operation for its extraction, introduce two fingers into the anus, to detain the stone until the incision is gers into the anus, to detain the flone until the intentions in made through the perinaeum upon it. After the operation, as well as for fome days before, Heifter advifes the patient to drink as fparingly as possible, that the wound may not be hurt by the urine; to guard against which, a canula may be introduced beyond the wound, and kept in the urethra until it is healed. In whatever part the flone is lodged, make the incition in the course of the urethra, and cut fo upon the ftone as that the wound in the ikin may be parallel to that in the urethra. When the ftone is extracted, close the wound, and keep its lips together, by first laying on it a pledget of lint, spread with together, by first laying on it a pledget of hin, please from edigeftive ointment, then fecured with flips of plaster, as directed for the dry future. See Heister's Surgery, Warner's Cases in Surgery, Gooch's Treatise on Wounds, and the Med. Mus. vol. i. & ii. Bell's Surgery, vol. ii. 9,

CALCULUS BILIARIS. GALL STONE.

The flore in the gall-bladder is not of the nature of calculi above noticed, being only the bile concreted into hardish lumps. These stones are found for the most part hardish lumps. These stones are found for the most part in the gall-bladder, though they are often met with also in the duct. com. choledochus.

The gall-flones often lie quiet in the gall-bladder, and until diffection after death, were never known to exift; but when they are prevented from paffing through the gall-ducts, they generally obstruct the paffage of the gall into the intellines, and produce also many them. into the intestines, and produce also many other afflictive

fymptoms.

The diagnostics of this disorder are sometimes very obscure, and in shortvery uncertain; for other causes produce the fame kind of fymptoms, as those which attend in this difease. Of this see an instance in Mr. White's Treatife on the Diforders of the Bile: however, the usual Treatife on the Diforders of the Bile: however, the usual fymptoms are a lois of appetite, a sense of sulners in the stomach, sickness, vomiting, languor, inactivity, sleeplessness, and, if the obstruction continues a sew days, a wasting of the sless; a yellowness of the eyes, skin, and urine; whitish stools; a pain in the pit of the stomach, and the pulse in its natural state. The pain excited by obstructions of the gall-ducts, from the gall-stones passing through them, does not affect the pulse, which is a pathognomonic symptom. This pain, which in some is extremely acute, in others a slight uneasiness, is felt about the region of the liver, and its particular seat is in the gall-duct, just where liver, and its particular feat is in the gall-duct, just where it enters the duodenum. In fome patients the yellowness does not appear, in others it is attendant for several months. There is no disease more painful than this in fome inflances; it is as frequent as any diforder of the liver; it receives much relief from art, and is not dange-

In the cure, pain is the first object of attention, and when it is confiderable, opium is the only refource; a dose may be taken as soon as the patient perceives its apdole may be taken as loon as the patient perceives its approach, and repeated every hour or two until a remiffion is procured. The vomiting, which generally attends, is nature's effort to diflodge the gall-flones; and, whether it is prefent, or abfent, as foon as the pain begins to abate, let an emetic be administered, and repeated if required; and after its operation let an opiate be given. Purging medicines may also contribute to the same ends as vomits; and of these, such as act with the most ease, and may be continued with the greatest safety, as sea-water, the waters of purging springs, neutral salts, &c. These may be repeated every other day for several months without palling the appetite, or lessening the strength. A little rhubarb may also be taken now and then. See London Med. Transactions, ii. 123. Memoirs of the Med. Society of London ii. 272.

London, i. 373.

The juice of grafs in the fpring is a powerful folvent.
Mr. White fays, that he hath given alcohol faturated with
the ol. tereb. ather. and advantageous effects have been

CALDAR. TIN.

CALDARIUM. A vessel in the baths of the ancients to hold hot water. It is also the same as Laconicum. CALDERIÆ ITALICÆ. Hot baths near Ferrara,

in Italy. Ufeful in difficulty of urine.

CALDUS, for CALIDUS, is frequently used by Scribo-

nius Largus.

CALEFACIENTIA. Such medicines as warm the habit, by their flimulating power, are fo called; rm the fynonymous with flimulantia, which produceand are effects: hence called calefacients.

CALENDULA. GARDEN-MARIGOLD, called also caltha calendula fativa, chryfanthemum, fponfa folis, folfe-

quia, and fingle marigold.

Of the many forts of marigold, this is the only one that is generally received in medicine. It is fo common in our gardens, that a particular description is needlefs. It is annual, propagates itself by seeds, and flowers from May to the end of Autumn.

The leaves have more virtue than the flowers, their

expressed juice contains most of their pungent matter; it is aperient, and promotes the fecretions in general. The flowers are a flight cordial. — ALPINA. GERMAN LEO-PARD'S BANE. See DORONICUM ALPINUM. — AR-VENSIS, is that named the WILD MARIGOLD; also called caliba arvenfis, calendula minima, and caliba minima. The leaves are flinking and bitter, and if burnt in the candle they crackle like nitre.

Some prefer it to the garden fort. Its juice is given from one to four ounces in the jaundice and cachexia; and the leaves are commended as a fallad for children that have fcrophulous tumors .-- PALUSTRIS. COMMON SINGLE MARSH-MARIGOLD. Also called populago, caltha,

paluffris, pfeudo belleborus, ranunculoides pratenfis, &c.
It grows in marfhes, and is very acrid. It is fo cauftic

that cattle avoid it, for it excites an inflammation if they chance to swallow it.

CALENTURA. It is a violent ardent fever, in which a delirium comes on both early and fuddenly. It happens to feamen when failing into very hot countries. Dr. Oliver gives the hiftory of a cafe, in the Philof. Tranf. Abr. vol. iv. in which he observes, that when the delirium came on, the patient imagined that he was in green field; that after a free bleeding he flept, and waked without any other complaint than weakness from the loss of blood, and foreness from thruggling during his delirium. He farther adds, that this fever attacks in the night, whence the reaadds, that this fever attacks in the night, whence the pa-tient, under the notion of green fields, runs into the fea before any one is aware, fo that few of these cases occur to their observation. Dr. Shaw advises, that the patients indulge in reft, also to bleed freely, give plenty of barley-water; an emetic a few hours after bleeding, and then

CALESIAM. A tall tree, which bears clusters of berries like grapes or currants. These berries contain a flat stone with a kernel in it. It grows in Malabar. Of the wood is made sheaths for knives and swords. The bark, made into an ointment with butter, cures convul-fions from wounds, and heals ulcers. The juice of the bark cures the aphthæ; and, taken inwardly, the dyfen-Raii Hift.

tery. Rail Hitt. CALI, i. c. Kali, or Pot-Ash. See Clavellati

CALICHAPA. The TRUE WHITE THORN.
CALIDARIUM. That part of the hot bath which the Greeks called bypocauflum.

CALIDRIS BELIONII. The French call it chevalier.

It is a water-fowl, of the bigness of a pigeon; its legs are long, and because its body is high mounted, and its motion is swift, it is called chevalier. It is met with in meadows where there are pools and rivulets. There are feveral species, and their flesh is a nourishing food.

CALIDUM INNATUM. The ANIMAL HEAT, or VITAL HEAT. See VIS VITÆ.

The particles of air are but little attractive of one another; fire is the power that keeps them in their constantly moving state, or is the spring of their action, or of the

elaftic principle that is found in air.

Fire is repelled by fulphureous fumes, or all mineral gasses, the vapour that ascends from putrifying animal substances, and many other natural and artificial subjects. The air is rarefied by beat, and condensed by cold. Humid vapours cool the air, because water is a conductor of fire

Some fubstances attract and retain a larger portion of beat than many other natural bodies; and in the human body, the red globules in the blood attract and retain beat in the largest proportion of any other part, as is evident from the beat and diforders that attend the rigid fibre, which is always proportioned to the quantity of red blood. Experiments made with the different parts of the blood, after its being taken from the body, contri-bute much to the proof of this affertion.

The immediate cause of animal beat, is the crassiamentum of the blood, attracting and retaining the fire which

is dispersed through the earth.

The nerves are the conductors of the fire attracted from the earth, through the whole human frame, as the vari-ous operations in the animal economy, and actions that depend on our wills require.

Every fibre in the human body is elaftic, and covered with the cellular membrane, which is formed of the conti-

nuation of the nerves or their coats. Thus,

From the red blood attracting and retaining, and the nerves conveying, animal beat is excited and preferved.

All our fluids are vehicles and conductors of fire. Concomitant with the excess or defect of red blood, is the excess or defect of animal beat. The excess of red blood is attended with the rigid fibre, and its confequents. The defect, with the lax fibre, and its confequents. Life, health, discase, and death, depend on the fire received by our blood from the earth, and our first regard in our curative confiderations should be thereto.

The common beat of the human body, in health, is about ninety-eight degrees of Fahren, therm, but some conflitutions are healthy at eighty-three; and this heat continues the fame, whether the atmosphere, or other furrounding bodies, exceed, or fink, below ninety-eight, unless when a discase is produced thereby; the conseof Fahre, therm, with moderate clothing; and 144 above, without alteration.

The beat of the body rarely decreases lower than 94,

nor rifes to more than 110 of Fahren. therm.

See Dr. Magenife's Doctrine of Inflammations, p. 31—52. Dr. Berdoe's Enquiry, and his Remarks on Voltaire's Difcoveries in Natural Hiftory. Dr. Shebbeare's Theory and Practice of Physic. Dr. Haller's Physiology, the Lecture on Mufcular Motion. Dr. Kirkland's Differ-tation on the Brain and Nerves. Drs. Crawford and Elliot on Animal Heat.

CALIETA, or CALIETTE. The young fungi on the

juniper-tree.

CALIGO. A growing darkness of the eye, or dimness of fight from a manifest cause; as in cases of the cataract, &c. Dr. Cullen places this genus of disease in the class locales, and order dysesthesia. He defines it to be, fight diminished, or wholly abolished; from a dark barrier between the object and the retina, in the eye itself, or in the eye-lid. He also enumerates five species, viz. 1. Caligo lentis; the Glaucome Woolhoufii, Maitre Yean, St. Tves; this he denominates the cataract, and Sauvages calls it the true cataract; it is caused by an opake spot behind the pupil. See CATARACTA. 2. Caligo cornea, from an opacity of the cornea. 3. Caligo pupille, from obstruction in the pupil, called also Synizesis. 4. Caligo humorum, Glaucoma Vogelii, from a fault in the humours of the eye. 5. Caligo palpebrarum, from a discorder in the eye-lids. See Cullen's Nosology, edit. 3. CALIHACHA. The MALABAR CINNAMON, or CASSIA

CALIX, fee CALYX, and PERIANTHIUM.

CALLÆON. The gills of a cock, which Galen fays is

a food neither to be praifed nor condemned.

CALLAF. A shrubby tree resembling a cherry tree. The flowers appear before the leaves, they are yellow, of a fine fmell, and from them an odoriferous water is drawn. See Prosper Alpinus Rerum Ægypt. lib. iii.

CALLARIAS. A kind of fea-fifth, which Aldrovan-dus takes for the whiting. Others differ from him, but

they do not describe it.

CALLECAMENON. BURNT COPPER. CALLENA. A kind of SALT PETRE.

CALLI, mops, Galen uses this word to express the

nodes in the gout, CALLIBLEPHARON, from καρλός, beauty, and βλεcapir, an eye-lid. Meditines appropriated to the eyelids.

CALLICREAS. See PANCREAS.
CALLIGONUM, from \*\*\* beauty and yow, a oint, or knot. See POLYGONUM.

CALLIOMARCUS. The Gaulish name in Marcellus Empiricus for the herb COLT's-FOOT.

CALLIONYMUS, from xxxxx, beauty, and eroua, a

CALLIPHYLLUM, from xarlos, beauty, and publets a leaf, i. e. Trichomanes. See ADIANTHUM NIGRUM. CALLITRICHUM, from καλλώ, beauty, and 9μξ, a

bair. See Adianthum Nigrum.

CALLOSITAS, Callosity, from callus. See Callus.

CALLOSUM CORPUS. A part of the brain is thus called. See CORPUS CALLOSUM.

CALLUS, is a cutaneous, carneous, or offeous hard-nefs, either natural or preternatural. But generally it means the callus generated about the edges of a fracture. Sometimes it means a corn on the toes, or the hardness in the hands produced by labour; also the hard edges of ulcers. See Bell's Surgery, ii. 326. Kirkland's Med. Surgery, ii. 246.

This term and callofitas, are in a special sense spoken of the eye-lids, both by Galen and Scribonius Largus. For the callus in the hands and on the soles of the seet,

fee CLAVUS. But the word

Callus has a particular fignification, in which it means the callofum corpus of the brain. Paracelfus gives the name of callus to an abfeefs, or ulcer, caufed by an acrid and arfenical nutritious juice, which excites a vehement

The contraction of the part divided is a common fymptom in wounds; and the stronger the contractile force, the greater the retraction of the fides of the wound from each other. The fkin of the head is thick and ftrong, and equally tenfe on all parts of the fkull, and under it lays a cellular membrane. For these reasons when the skin of the cranium is divided, the lips of the wounds are speedily far retracted from each other and are called callus, for which reason wounds of the forehead generally leave large fears behind them.

As the growing vessels in wounds of the soft parts are highly tender and pulpous, in consequence of their not being covered with the skin, they may easily be too much distended, and degenerate into fungous slesh. The same holds true in the callus of the bones, which may become luxuriant when the veilels which conflitute the fubfrance

of the growing bone, are differeded, either by a redundance, or too ftrong impetus of the fluids.

Dr. Nitbet and Dr. Hunter imagine a callus of the bone is not formed by the inspissation of any fluid, but from a regeneration or, as it were, granulation from the fibres of

CALVITIES, CALVITY or BALDNESS, particularly CALVITIUM, on the finciput. Galen fays that the

cause of this is, a defect of moisture. CALX. This word is applied to whatever is subjected to calcination, or chemical corrotion. See CALCINATIO. It also comprehends many different stones, in this one

character, that they burn to lime.

Lime-stone, hence calcarius lapis; also called faxum calcarium abejum. Lime-stone is a general name for all those stones from which quick-lime is commonly prepared. They contain a portion of fulphureous matter, and the marine acid; but though the limes prepared from different ftones, answer many general purposes equally well, they differ greatly in their efficacy in many chemi-

cal and other kind of experiments.

All ftones have for their basis either crystal or spar; those that have crystal run into glass by burning; but those that have spar burn into lime. All sea-shells, and any stone or earth that effervesces with an acid, will burn to lime. The harder the stone the stronger is the lime it produces. It may here be observed, that both earths and flones are termed earths by the chemift, but they are divided into two classes by the fossilit; calcareous earths and stones are thus characterized, considered as the objects of fossilogy. Calcareous earth is an earth which effervesces with acids. Calcareous stone is a stone effervescing with acids, burning into quick-lime, and not striking fire with steel. See Edward's Elements of Fos-filogy. But we must observe that amongst earths, the calcareous is a genus; amongst stones the calcareous an

When stones of the sparry kind have been calcined by the fire, they are converted into quick-lime; and while they continue unpossessed of aqueous moisture, they retain this character. When calcareous stone is either figured or transparent, it takes the name of spar.

Quick-lime diffolves in nitrous, marine, and vegetable quick-lime diffolves in nitrous, marine, and vegetable acid, unites with the vitriolic into an indiffoluble and infipid concrete, produces heat on mixing it with water, and gives thereto a medicinal quality. If quick-lime is expoled to the atmosphere, it falls into a powder, and lotes all the diffinguishing properties of quick-lime, except that it retains its acrimony longer in a moist than in a dry flate.

The flones from which quick-lime is produced, con-

tain a large quantity of air, which in calcination is ex-pelled: hence ftrong quick-lime raifes no effervescence, or emits no air-bubbles during its disfolution in either

acids or alkalies.

Lime is diftinguished into calx viva, calx extinela, and calx loto. The first is lime in its siery state, as brought from the kiln; the second that which, having been long exposed to the air, is fallen to powder; the last that which hath been deprived of its salts by repeated assussment of water.

Sir Torbern Bergman observes, that calcareous earth is commonly found faturated with aerial acid, which exhibits the appearance of effervescence, upon being driven from its basis by a stronger acid. Calcareous earth, he fays, is found diffolved in most waters, by means of a redundant portion of the aerial acid. That by burning it loses that acid, together with a proportion of water which it was combined with, and enters into a chemical combi-

CALTHA, or CALTHULA. MARYGOLD. See CA- heat, is the reason, that when the quick-lime meets with the former, its lets go the latter; by which means a great quantity of fenfible heat is produced, converting a part of the water which it hath abforbed into vapours; which, if the calcareous earth were in the form of a stone, would

break it down into a fine powder.

Quick-lime is employed for increasing the activity of alcaline falts, for making the milder kind of caustics, and for destroying the hair on places where it is thought to be unseemly; it dissolves sulphurs and vegetable refins, and produces many effects fimilar to those of the fixed alcaline falts.

Aqua Calcis, LIME-WATER.

Take of quick-lime; half a pound; boiling diftilled water, twelve pints; mix, and fet it afide in a covered veffel for one hour; then pour off the liquor, which keep in a close veffel. Ph. L. 1788. The quantity of lime diffoluble in water, is much greater than is generally suspected. Dr. Alston observes, that one third of the quick-lime is foluble in water; see his Differtation on Onick-lime. The above method of making lime, water. Quick-lime. The above method of making lime-water, limits the quantity of water too much, for the lime requires feveral hundred times its weight of water to dif-

The College of Edinburgh direct particularly to fprinkle upon this quantity, in an earthen veffel, four ounces of water gradually, keeping the veffel flut during the effervefence, and its falling to powder; then to mix the rest of the water with it by stirring; to renew the stirring after it has subfided, and this for ten times, always keep-ing the vessel shut during the ebullition, to prevent the accefs of air, and to filter it through paper, placed in a funnel, close shut at its top.—The London College, by avoiding the frequencies of stirring, expose it less to the

The lime-water is a folution of the quick-lime in water, and receives no improvement from the ingredients added in the compound forts which used to be ordered, for they precipitate much of the lime which the water suspended. When the lime-water loses its taste, so does it is virtues. It hash a strong structure taste, which is followed by a It hath a ftrong ftyptic tafte, which is followed by a fweetish one; it changes the juices of blue flowers to a green; it precipitates metallic bodies that are dissolved in acids; it tinges filver of a coppery hue; it turns red wine to a dark colour; and by those properties its ftrength may be estimated.

The specific gravity of water is increased by the lime more than the weight of the calcareous matter taken up, on account, perhaps, of the water being deprived of

If lime-water is close kept, it may be preferred many months; but in open veffels, the calcareous matter foon separates from the water, and concretes on its surface.

Lime-water diffolves thick phlegm, or mucous matter, and the curd of milk. The flone lime is best for build-ing with, but that which is made of the shells of cockles or oyfters is to be preferred, when it is used in medicine as a solvent of calculous matter, &c. When the shell lime-water hath been drank to the quantity of three pints in a day for fome weeks, it hath been ufeful in fcrophulas, fluxes, and other complaints from an acrimonious falt. It promotes expectoration in those who abound with phlegm. It generally induces a costiveness, but this is prevented by mixing a little milk in each draught. In cold phlegmatic conflitutions it is peculiarly ufeful, but in hot bilious habits, and during either critical or periodi-cal evacuations, it should be foreborn. It strengthens the cal evacuations, it inoula be foreborn. It it rengtiens the appetite, and affifts digeftion; it is a good antifeeptic, and greatly helps the concoction of matter in abfecties, that do not suppurate kindly. It corrects acidity in the primæ viæ. In the diabetes and hectic sever, it is of singular efficacy, if drank when fresh made, and before the heat excited by mixing the lime with the water is vanished. Four ounces or more of lime-water, are given to adults, and repeated twice a day, or oftener in fome alvine-fluxes, and leucorrhæa; and though it may not be lithontriptic in any great degree, it alleviates fome calculous fymptoms. In fome kinds of ulcers, it is applied as a wash; and in some cases as an injection.

The fofter the water is, used for making lime-water, nation with a certain quantity of the matter of heat, in which state it is called quick-lime. Farther, that its attraction for water being greater than for the matter of boiling water dissolves the lime more freely than cold. It is better to pour the water gradually on the lime, for otherwise much of the calcareous matter is unaffected by it.

CAMPECHENSE LIGNUM. Logwoop; also called Acacia Zeylanica, lignum Campescanum, lignum fappan, tham pangam, lignum Campechianum, lignum Indicum montanum, lignum tintille Campech. CAMPEACHY WOOD, BRASILETTO, and JAMAICA WOOD. It is the hamatoxylon Campechianum, Linn.

It is the sweed of a prickly pod-bearing tree, a native of Campeachy island. It is brought into Europe in large compact logs of a red colour. Its fruit resembles cloves in their quality.

This swood is chiefly brought for the use of dyers, but it is also found to be a very useful medicine in a dysentery; it powerfully restrains this kind of flux, yet it does not contract the fibres, as is the case with astringents; it obtunds acrimony, and hath more of a balfamic tafte than of an aftringent one. It strengthens the bowels, and in-deed the general habit. It is an agreeable medicine, being free from any thing disgustful to the taste, and almost void of smell.

The London College directs an extract from this wood,

as follows.

Extractum Ligni Campechensis. The EXTRACT of Log-wood. Ph. Lond. 1788.

Take the shavings of logwood, one pound; boil it four times, or oftener, in a gallon of distilled water, to one half; then boil all the liquors, mixed together and strain-ed, to a proper consistence. The shavings are here ordered to prevent it from being mixed with Jamaica, or other cheaper woods; which might be the case if bought in powder.

Rectified soirit of wine takes

Rectified spirit of wine takes up more from this word than water does; therefore it is better to digest its powder in as much fpirit as will cover it three or four fingers 3 A

breadth above its furface, then boil the refiduum in water as directed above; after which, the watery mentitua are first evaporated to the consistence of honey, then the spirituous one is mixed therewith, and the whole reduced to riety of cases, it is necessary to give its effects on the human spirituous one is mixed therewith, and the whole reduced to a proper confiftence.

### The DECOCTION of LOGWOOD.

Boil three ounces of powdered logwood in four pints of water to two, at the end of which add two drams of cinnamon, boil them together a few minutes, and when

cool ftrain off the liquor for ufc.

This extract and decoction are either of them agreeable, mild, and fafe, when ftronger aftringents are not fo; and this advantage attends the logwood, which cannot be faid of aftringents, it may be used with equal safety, whether a fever attends or not. These preparations make the stools and urine appear like blood. The extract may be taken and urine appear like blood. in dofes from gr. x. to 5 fs. the decoction to three or four ounces, three or four times a day.

The preparations of this wood are chiefly held in efteem for their aitringency, and may be given tafely in fluxes, and at the clote of dyfentery; but in the beginning they are mifchievous, fo Dr. Cullen has found them.

When flatulencies attend in diarrhoeas and dyfenteries, a few grains of the cortex elutherize is a proper addition to each dose of the above extract or decoction. See Lewis's Mat. Med. and Newmann's Chemical Works. Cul-

len's Mat. Med.

CAMPHORA. CAMPHOR; called also caf, cafa, cafar, ligatura veneris, capbura, capbora; CAMPHOR. It is a folid concrete, chiefly obtained from the woody part of fome trees, which are met with in the island of Borneo, in the East Indies, and in Japan; it is only from the latter that it is brought into Europe. Campber is obtained chiefly from the laurus campbora, or the laurus fol. tri-plinervis lanceolata-ovatis nitidis, petiolis laxis, floribus parvis albis of Linn. The CAMPHOR TREE. In fmaller quantities it is obtained from fome cinnamon trees, and in very fmall quantities from feveral other vegetables. That in Japan is extracted from a large tree of the bay kind, called lauro camphorifera, and by Linnæus, laurus foliis trinervis langeolata-ovatis; nervis fupra bafin unitis.

As first fublimed or distilled from the wood, it is of a brownish colour, and composed of semi-pellucid grains, mixed with fome impure matter; in this state it is imported by the Dutch, and purified by a second sublimation, &c. but after a manner only known to themselves, except the Venetians, who formerly were the only refiexcept the Venetians, who formerly were the only retners of it: the laft process in the management is so contrived, that the head of the subliming glass is kept warm
enough to make the campbor run together into a mass of
its own figure, in which form it is brought into the shops.

Dr. Lewis says, that it may be purished in sp. vin. rect. by
solution, and recovered from the spirit by distillation, the
spirit all rising before the campbor; and after this it may
be formed into loaves by susson, with a gentle heat in a
closs results.

The ancient Greeks do not mention campbor; it was

first used in medicine by the Arabians.

Campbor is a vegetable concrete, uncluous to the touch, with a fragrant fmell fomewhat like that of rofemary, and a bitter aromatic pungent tafte, accompanied with a fense of coolness on the tongue; it is volatile like effential oils, but without their acrimony, it also differs both from them and from the sebaceous oils, in suffering no sensible alteration from long keeping, in being totally exhale-able in a warm air, without any change or separation of its parts, and subliming unaltered in the heat of boiling water, &c. it burns in water, it receives no empyreuma-tic impressions, nor does it fusfer any resolution from any degree of fire, to which it can be exposed in close vehicle, though readily combustible in the open air. It diffolves in concentrated mineral acids, rectified spirit of wine, oils, &c. but not in water, in vegetable acids, nor alcaline liquors. It melts into an oily appearance, with a lefs degree of heat than that of boiling water; laid on a red-hot iron it totally evaporates in a bright white flame and copious fumes, which, condensing, form a foot.

Campber is known to be good, if when it is put upon hot bread, it turns moilt; if it becomes dry it is bad: it should be kept close in a bottle or a bladder, not to prevent

man machine in the clearest point of view which we are able. And first, the question is, whether its power is of a stimulant or fedative nature? Dr. Cullen teems clearly to have proved the last, when taken into the stomach-externally it is certainly stimulant, for when taken into the mouth it has an acrid tafte, and, though by its evaporation it excites a fense of cold air, what remains is a fense of heat in the mouth and fauces. When taken down upon the flomach it often gives pain and uneafinels, which he imputes to the operation of the acrimony upon the upper orifice. When applied to any ulcerated part, it perceptibly irritates and inflames: thefe are marks of its stimulant power. When thrown into the stomach of brute animals, it operates there by a small portion of its effluvia, for when a mass of any bulk has been thrown in, though it has produced considerable effects on the body, neither the bulk nor weight are found sensibly diminified; hence he concludes the operation has been upon the nerves of the flomach, and by these on the rest of the fystem, and the operation to be entirely that of a fedative power. However, the fudden death of many animals occasioned by it, as experimentally proved, shew still more evidently its sedative effects in the sensorium, which destroy the mobility of the nervous power, and which destroy the mobility of the nervous power, and thereby extinguishes the vital principle. It can no other way be accounted for, for campber first operates by in-ducing stupor and sleep, and the other symptoms of deli-rium. Furor and convulsions can all be explained by the struggle which occurs between the force of the sedative power, and reaction of the system, as in cases of other poifons. It evidently shows no stimulant power on the fanguiferous system, for the pulse, where it has been obferved, has been flower than before its effects took place.

With regard to the discases in which it has been employed, we find it has often been given with advantage in fevers of all kinds, particularly nervous fevers, at-tended with much watchfulnefs, and delirium. WHERL-HOFF administered it in many inflammatory diseases with great benefit, and considers it as a refrigerant. It has been remarkable in putrid fevers, from its antifeptic powers; and Collin has found it efficacious in curing and refifting gangrene. From its use in low, and what are called malignant fevers, and from its antifeptic powers, it is highly probable that it has been of great fervice in the confluent fmall pox, and also in favouring the eruption of exanthemata, and bringing them back to the fkin, when from any cause they have suddenly receded ;

but this he fays, not from experience.

In chronic cases, whenever diseases depend upon a mobility of the nervous power, and an irregularity of its motions; it may be expected fuch a powerful fedative should be of service, hence its use in hysteric and hypochondriac cases, which the Doctor has frequently observed, as well as many other practitioners. In convultive and spasmodic affections it has been of service, and even in epilepfy ufeful, which last has been entirely cured by this medicine alone, but it has been fingularly beneficial when united with cuprum ammoniacum, white vitriol, or calx of zinc. It has often been employed, and fometimes fuccefsfully, in cases of maniacal and melancholic cases. It has also been given succefsfully in acute rheumatism, and the Doctor fays that he has no doubt of campbor having a peculiar power in taking off the inflammatory flate in cases both of rheumatism and gout; but as campber is ready to occasion a translation from external application, as proved in a case recited by him, it will in gouty cases be always employed with great danger. It is often found useful in relieving tooth-ach, and may be in ophthalmia, from its power of taking off local inflammation.

When united with other substances it has been found peculiarly ufeful; with draftic purges it is faid to mode-rate their acrimony, and thereby their violent operation-It has the power of correcting the acrimony of cantharides, according to general opinion, but in this point fome are very doubtful. It moderates the action of mercury, at the same time does not deprive the saline mer-curials of much of their deobstruent virtue. United with

opium it prevents fome inconveniencies and diforder which happen to taking opium alone; and joined with the Peruvian bark, gives it more energy and force, whether in curing fever or gangrene. It should either be given in large doses, not under twenty grains; or if in smaller, they must be repeated at short intervals, if any sensible effects are to be obtained from it. It maybe divided and rubbed with nitre or fugar, and a few drops of spirit of wine, or diffolved in mucilage of gum arabic, the campbor previously diffolved in a little spirit of wine, or expressed oil. But for a fuller discussion on these points see Cullen's Materia Medica.

An imprudent dofe of campber produces coldness of the extremities, vertigo, a small weak pulse, drowsiness, uncasiness about the precordia, &c. but these effects are relieved by an emetic, followed with small doses of vinegar,

or other vegetable acids.

Emulfo Camphorata. CAMPHORATED EMULSION.

Add a dram of campber to a pint of the almond emulfrom, now called lac amygdale — ALMOND MILK; to mix the campber, it will be necessary to use an additional quantity of the mucilage of gum arabic. A large spoonful, or more, may be given every two hours. Nitre, or ful, or more, may be given every two hours. Nitre, or acids, may be added, as the occasion may require.

The London College directs the following preparation,

Miffura & Camphora. The CAMPHORATED MIXTURE. Farmerly Julepum à Camphora. CAMPHORATED TULEP.

Take of campber, one dram; rectified spirit of wine, ten drops; of double refined fugar, half an ounce; of boiling dithilled water, a pint. Rub the complex first with the rectified spirit, then with the fugar; lastly, add the water by degrees, and strain the mixture. This is better made by mixing the campber with double its quantity of gum arabic, for thus it is lefs apt to vellicate the ftomach, and cause anxiety; a large spoonful contains about two grains of campber: by this method vinegar may be added instead of water; vinegar renders the campber more easy on the ftomach, and improves its antifeptic power. So has it been faid of nitre, but experience does not prove the validity of this opinion.

The emulsion, or the mixture of campber, are excellent in low and putrid diforders, being, in these cases, the lightest and best cordials, especially for women or

feeble men, with fpafmodic fymptoms.

A very fmall proportion of campber is diffolved in this menftruum by the mode here preferibed; but if campber and myrrh be united in equal proportions, well triturated together, they will form an uniform mixture, with an aqueous folvent gradually added, as proved by fome ex-periments recited in the Memoirs of the Medical Society of London, 1789.

The London College also orders the following for ex-

Spiritus Comphoratus. CAMPHORATED SPIRIT. For-merly Spiritus vinofus Camphoratus. CAMPHORATED SPIRIT of WINE.

Take of campbor, four ounces; of rectified spirit of wine, a quart; mix them fo that the campbor may be dif-folved. This is often successful in removing pains, inflammations, numbness, palfy, &c. by rubbing the part affected with it. An ounce of campber will dissolve in jess than an ounce and a half of spirit, and in these soluions it does not exhale, for the fpirit must all be evapo-ated before the campber will depart.

The SPIRITUS CAMPHOR & TARTARIZATUS is thus made.

Mix equal parts of campber and falt of tartar, in a pro-per quantity of proof-spirit, and draw off one half. But this preparation does not possess any advantages above the

The College of London used to add 3 i. of campbor to 1b j. of the white ointment, and called it ungt. alb. campborat. but have now rejected it; though it is esteemed by some cooling, emollicat, and discutient, and useful against cutaneous heats, tetterous or serpiginous erup-

Works, and other writers, but they do not appear to poffers any peculiar advantages above the crude campber-

A mixture of olive oil two parts, with one of campber, is called oleum camphoratum; and is of use in inflamma-tory swellings of the throat, if mixed with a proper cataplasm and applied thereto, and also in ascites when the abdomen is much diftended, if rubbed freely on, every night and morning

CANALICULUS, vel CANALIS ARTERIOSUS.

See ARTERIOSUS DUCTUS.

CANALIS. A CANAL. It is also a round hollow instrument for embracing and holding a broken limb. Hippocrates speaks of its use, and Scultetus represents. different forts of them in his Armamentarium, part i. tab. 23.

According to Gorræus, canalis fignifies the hollow in the fpine where the medulla oblongata defcends. Canales semicirculares. The femicircular canals

of the ear.

They are three in number, one fuperior and perpendi-lar, one posterior and perpendicular, and one horizontal; their fize is nearly the fame, but generally the fupe-rior perpendicular is the greatest. They begin in the vestibulum, wind round the bone, and terminate in the vestibulum again; each at their origin have a separate orifice, but the two perpendicular meet and return into the veftibulum by one common orifice. That thefe ducts contribute to hearing, appear from their being found in birds and fifnes, though the cochlea is not found in either.

CANALIS SEMIS. PETROS. The BONY HALF CANAL. See TYMPANUM.

VENOSUS. The vein of the funis umbilicalis proceeds from the placenta to the navel of the child, and thence to the vena porta, with which it communicates by its main trunk, where there is a canal, which goes to the vena cava hepatica, thus called, and also ductus venofus; it runs between the lobulus Spigelii and the left or fmall lobe of the liver. This ductus venofus enters the vena cava hepatica of the left fide, just where that is

piercing the great trunk of the vena cava inferior.

CANANGÆ OLEUM. Hoffman mentions this oil against cutaneous heats, tetterous or serpiginous eruptions.

Different preparations are called oils of campbor, several of which may be seen in Newmann's Chemical

ii. cap. 6.

CANCAMUM, xayxayor. A tear from an Arabian ceous powders, feems to fupply, in some measure, the tree, but it is not easy to say what. Different authors want of the natural. affert it to be different substances; the gum anime is subflituted generally for it. See Diofcorides, Lemery, and

CANCAMUM GRÆCORUM. See COURBARIL.

CANCELLUS. The WRONG HEIR, also called affaci marini species, Bernhardus eremita, cancer intessis degens. It is a small species of cray-sish, which the French call

BERNARD THE HERMIT, because it shuns others, and retires into the first shell it meets with. It is found in the slime near the rocks, but commonly in a shell of a conic figure, and as large as a nut. There is a larger species in the American iflands; it is three or four inches long: they call it the SOLDIER, because it fortifies itself in ashell which is not its own. Father Du Tertres fays, half its body is like a grafs-hopper.

Hang them in the fun, and they diffolve into a kind of oil, which is very speedy in curing the rheumatism, if

rubbed on the part.

CANCER. The CRAB. Cancer in Latin corresponds with the raparies, the aranes, or the naumares of the Greeks, and to the crab in the English.

- MARINUS, is that called the SEA-CRAB; named

alfo pagurus, and cancer mous.

FLUVIATILIS. The RIVER-CRAB, OF CRAY-

FISH: it is also called commarus and gammarus.

The crab is an exanguious fish, of the oviparous kind, and is amphibious. Crabs, lobsters, and craw-fifh, are greedy of flesh; they eat frogs, and if they meet a carcase, though it lays out of the water, they never leave it until the whole is confumed.

Their flesh is the best in summer; and, in common with all shell-fish, it is peculiarly useful to those whose prime vice abound with acid; though it is considered rather difficult of digettion, and affords not much nutrition.

The black tips of the claw of fea-crabs are levigated and used as an absorbent under the name of puly, e chel. e. ppt. The London College directs a compound powder, made with crabs claws, red coral, and chalk; but any one of them is as good as them all together or fingly: they all confift of the fame calcarcous animal earth.

Pulvis e Chelis Cancrorum compositus. Compound Pow-DER of CRABS CLAWS.

Take of the tips of crabs claws prepared, one pound; chalk, red coral, each prepared, of each three ounces;

mix them all together.

The composition has been considered inelegant, for the chelæ cancrorum, confilts of a calcareous earth, part of which is combined with the phosphoric acid and glutinous matter; the corallium rubrum contains the fame, and these are mixed with chalk, a somewhat more pure calcareous earth; hence are these calcareous earths joined with naufcous impurities, instead of pure absorbents. The creta and telta oftreorum will better fupply the place, and if calcareous earth is defired to be combined with phosphoric acid, it may be found in a pure state in the cornu cervi ustum. Observations on the Sp. Alterum Pharmacop. Londinensis, 1788.

The college of Edinburgh directs the following prepa-

ration called

Pulvis Teffaceus Compositus. The Compound Testace-ous Powder.

Take of oyfter fiells prepared, one pound; and of white chalk prepared, half a pound. Mix them toge-

The use of all the absorbent earths, and preparations of shells, is to abforb acidities in the primæ viæ, and this prescription from the Edinburgh Dispensatory, is equally valuable as a medicine with any other preparation of the kind, however attended with pompous epithets. If they meet with no acid to dissolve them, they should be accompanied with gentle purges. They firongly promote putrefaction, whence their use seems to be forbid in putrid difeases, and also from their absorbing acids so powfully in the prime vize, their prohibition is necessary. In ardent fevers their use is somewhat important, oyster fhells are diffolved with a very weak acid into a mucilage, like that which lines the inner furface of the flomach, bladder, blood-veffels, &c. which is abraded when there is inflammation in them; and this jelly, formed of testa-

See Haller's Nofology, Lewis's Materia Medica, and Neumann's Chemical Works-

CANCER. Xaganis, a crab. By the term cancer, the Roman writers understood what the Greeks called gangrene and sphacelus; but the discase which is now called cancer, is what the Greeks and Romans meant by carcinoma, and carcinos. See Celfus, lib. v. cap. xxviii.

Galen fays, that as the erab is furnished with claws on both fides of its body, so in the carcinoma, or carcinos, the veins, which are extended from the tumor, reprefent with it a figure much like a crab. And Boerhaave fays, that if the fragnating matter of a feir raus is put in motion, fo as to inflame the veriels fituated in its margin, it be-

comes malignant, and then is called a cancer.

With Hippocrates we may, perhaps, most properly confider all the species as comprised in the ocult and open cancer. A cancer then is, as P. Ægineta deferibes it, an unequal tumor, with or without an ulcer. Hippocrates calls that an occult cancer, that is yet unburft, or without an ulcer; and that an open, or an ulcerated one, that is burft or ulcerated. The degree of malignity is in proportion to the acrimony of the matter of the tumor, the putrescence of which is known by the smell, the sharpness of the fanies, and the speedy corrolion of the parts about the ulcer. The degree of malignity in the occult cancer is judged of by the degree of itching, heat,

fhooting pain, and fudden increase of the tumor.

Dr. Cullen places this genus of disease in the class locales and order tumores. He defines it, a painful scir-

rhous tumor, terminating in a fatal ulcer.

Any part of the body may be the feat of this diforder, though a gland is generally its immediate fituation. The obstruction is in the minute lymphatic vessels, and the adjacent parts are affected as a confequence. In men a cancer most frequently seizes the tongue, mouth, or penis; in women, the breafts and the uterus, particularly about the ceffation of their periodical difcharges; and in children, the eyes.

Celibacy, as well as the celiation of the menfes, conduces to the production of cancers in women, whence antiquated maids are the most subject to them: next to these are those mothers who have not suckled their children; then those women who are past child-bearing; and the least so are men, and those women who have bore children, and nurfed them with their own milk. Hollerius observes, that girls are subject to glandulous tumors whose menstrual discharges are scanty.

The matter of cancers is inspissated lymph, obstructing the glands, whence pus is never well formed in them. Lymph stagnating in the scirrhous body is capable of being rarefied by heat; when heated it expands, and the tumor is enlarged; on the increase of the swelling, a part of the scirrhus forms an apex; then the skin burits, the morbid matter obtains liberty, and spreading more and more, it turns out the lips of the ulcer all round. Hence the preternatural heat excited in a feirrhous tumor is a proximate cause of its becoming a cancer; and whatever can excite heat in a fcirrhus, may be a remote, or pro-catarctic caufe of this difeafe. The caufes of a fcirrhus are the remote causes of most cancers, and are whatever can coagulate, or dry the juices, prepared in, or received by the glands. The matter thus obstructed, destitute of the means of being refolved, or changed into pus, may lodge many years without giving much trouble; but when by any cause the motion of the humours is increased through the adjacent previous vessels, an inflammation is produced, pain and heat come on: thus the fcirrhus, which hitherto was inert, now acquires an acrimony, by which the containing parts are irritated and corroded. Sorrow, and other diffurbance of the mind, eafily converts a feirrhus into a cancer. The veffels of The veffels of diftended glands become preternaturally fenfible, whence it becomes more easy for any cause of local inflammation. to cause a cancer. When a scirrhus so enlarges as to be affected by the heat, or preffure of the adjacent parts, it foon becomes cancerous. Sparing, or obstructed periodical excretions, as already observed, are the frequent causes of this disorder. Gooch and Turner give instances of cancerous ulcers being produced by touching cancerous matter with the tongue

A hard unequal tumor that is indolent, and without

pricking, shooting, or lancinating pain, and a change of colour in the skin, it is known to be a cancer. It generally is fmall in the beginning, and increases gradually; but though a change of colour in the skin is made to a red or livid appearance, as well as from an indolent state a painful one is induced, it is fometimes very difficult to fay, when the transition out of the feirrhous into the cancerous state happened; the progress being quick or slow according to concurring causes. Gooch very well obferyes, that when the tumor is attended with a peculiar kind of burning, shooting pains, and the skin hath acquired the dusky purple, or livid hue, it may then be deemed the malignant feirrhus, or confirmed cancer. He forther adds when they foredge and is a supervised to the same and the sa farther adds, when thus far advanced in women's breafts, the tumor fometimes increases speedily to a great fize, having a knotty unequal furface, more glands becoming obstructed; the nipple sinks in, turgid veins are conspicuous, ramifying far about, and resembling a crab's claws. These are the characteristics of an occult cancer. on the external parts, and we may suspect the existence of one internally, when fuch pain and heat as hath been described, succeed in parts where the patient hath before been fensible of a weight and pressure, attended with obtuse pain. A cancerous tumor never melts down in suppuration like an inflammatory one, because the ob-firuction is in the minute lymphatic vessels; but when it is ready to break open, especially in the breast, it generally becomes prominent in some point, attended with an increase of the peculiar kind of burning, shooting pain, commonly felt before, at intervals, in a less degree, and deeper in the body of the gland, or glands. In the prominent part of the tumor, in this state, a corroding ichor fometimes transudes through the skin, soon forming an ulcer; at other times a confiderable quantity of a thin lymphatic fluid, tinged with blood from eroded vessels, is found on it. Ulcers of the cancerous nature discharge a thin, foetid, acrid fanies, which corrodes the parts, having thick dark-coloured retorted lips; and fungous excrescences frequently vegetate from these ulcers, not-withstanding the corrosiveness of the humour. In this flate they are often attended with excruciating, pun-gent, lancinating, burning pains, and fometimes with bleeding.

Though a feirrhus may truly be deemed a cancer as

foon as pain is perceived in it, yet every painful tumor is not a cancer; nor is it always eafy to fay whether a cancer is the diforder or not; irregular hard lumps may be perceived in the breaft, but on examining the other breaft where no uneafine's is perceived, the fame kind of tumors are fometimes found, which renders the diagnoftics uncertain.

The itching, increasing tumor, and pain, are owing to heat rarifying the obstructed humour, distending the vessels, and producing a preternatural sensibility in them. As any part of the tumor is more enlarged than another, there an apex will be formed, the top of which will be covered with a tenfe, fmooth, shining, thin skin, of a darkish red colour, because the blood meets with difficulty in passing through its vessels, which are too much diffended. The skin rendered thin by violent straining, is at last burst by the contained matter; hence the ulcer, which by the continuance of the fame causes that produ-ced it, increases. While the blood-vessels remain unhurt, a ferous ichor only appears in the ulcer; but when they are corroded, blood also issues forth, and as the fungous slesh disloves, some pus is generated. The ftinking fanies is from the heat of the part, and the accels of the air patrifying it.

A cure is rarely made but with the knife or cautery; when these methods of relief are not used, the treatment is only palliative. If the tumor firmly adheres to the Subjacent part, it can neither be extirpated nor wasted away by a caustic: if it is moveable, it may generally be taken away if at a due distance from such blood-vessels as would endanger life by being wounded. In general, the larger are more dangerous than the leffer, the painful than the indolent, and the ulcerated than the occult. When a breast is once feirrhous, it feldom continues long

any discolouration in the skin, is called a scirrhus; but is attended with a hardness of the adjacent glands, success when an itching is perceived in it, which is followed by a hath rarely followed an attempt to cure. In habits not otherwise disordered, an ocult cancer should not be exasperated by emollients, flimulating applications, or intemperance, for then it may remain a long time without inconvenience; though at the ceffation of the menfes in women they will be exafperated, whence, if it can conveniently be done, it may be most proper to extirpate early.

Mr. Henry Fearon fays, I am inclined to think that were we to treat cancerous complaints at an early period, as proceeding from inflammation, we should be much more successful in practice.—His mode of cure consists in bleeding, either topical or general, according to the feat of the complaint, or part affected, which must be per-fevered in for a sufficient length of time, to which must be joined a milk and vegetable diet, an open belly, and faturnine applications, avoiding wine, spirits, and fer-mented liquors. Memoirs of the Medical Society, Lon-

The indications of cure are, 1st, to extirpate the tumor, and prevent a return of the difease: or, 2dly, to palliate when extirpation cannot be admitted.

The diet should be cool, moift, and light; the mind should be tranquil; and the body as free from violent action as possible.

If the cure is to be effected by extirpating the tumor, fee AMPUTATIO) and if this method of relief is attempted, care must be had to remove all other cancerous tumors, the whole of each must be cleared away, and the habit of body must be corrected as much as possible; and when the wound is nearly healed, it may be kept open in the manner of an iffue.

Catheretics are proposed for destroying the tumor, when the knife cannot be fubmitted to from the patient's dread. The most famed of hese have arsenic in

their composition. Mr. Plunket's application is, on good authority, said to be as follows:

"Take of crow's-foot, such as grows in low moist grounds, one handful; dog-fennel, three springs; pound them well: add to them three middling thimbles full of crude brimftone, and the same quantity of white arsenic in fine powder. Make these into small balls, and dry them in the sun. These balls must be powdered and mixed with the yolk of an egg, then laid over the fore or cancer upon a piece of pig's bladder, which must be cut to the fize of the fore, and smeared with the yolk of an egg. This must not be applied on a piece of bladder larger than a half crown, if the cancer to be extirpated is on the face; the fame caution is required if it is near the heart; but elsewhere it may spread the fize of the fore. The plaster must not be stirred until it drops off of itself, which will be in about a week. Clean bandages are often to be put on.

This arfenical preparation will answer best in recent cases, but it should never be used except the whole tu-mor can be removed. The crow-foot is added to destroy the skin, but this end will, perhaps, be better answered, by rubbing the part immediately over the tumor with antimonium nitratum, the day before the arfenical medi-cine is applied: this makes way for the action of the arfenic. Instead of the simple mixture of brimstone and arfenic as above, the preparation of arfenic, called mag-nes arfenicales, should be used. This caustic does not destroy the gland, but only the substances all around it, to the tumor comes out as if it had been dexteroully diffected out; and it must be observed, that a patient should never go into a warm bath whilst arienic is applied.

Severaleminent practitioners have formerly encouraged this method, as Fallopius, Zaber, Sennertus, &c. but though on fmall cutaneous glands it may do, in the larger and deep-feated it is unfafe; for by the irritation of thefe medicines an inflammation, and, perhaps, fever are brought on, which are dangerous symptoms; and by the fubtil penetrating quality of arfenic, the life of the patient is also greatly hazarded, whatever be its mode of application and correction.

Mr. Pott observes, that if a caustic is used, it should be such a one as will penetrate quite through the tumor and effectually eradicate it at the most in two or three applications; this the common ones will not do, for they only reach as far as into the cellular membrane, hence in a flate that threatens a cancer, without affecting the only reach as far as into the cellular membrane, hence axillary glands, the other breaft, or the uterus. Any kind of acrimony in the habit disposes a scirrhus to a petition of the caustic, the tumor reinflames, hardens, speedy change into a cancer. When a cancer in any part

3 B

ment, more and more untractable. Causties harden the furrounding parts, and produce other ill effects, and this gave origin to that ridiculous idea of the feirrhus or can cer having claws or roots, &c. If caustics are used, the most active ones are to be preferred.

If the cancer is ulcerated, frequent dresling with dry

lint, or such other things as experience manifests to be the least uneasy, are the most eligible. In general the palliative method will be, To avoid all external means while the disorder is in

its occult flate; to prevent its being handled, or prefied by the cloaths, that it may kept eafy and cool. To correct the habit of body, if any way difordered; and with the alteratives may be given small doses of hy-

drargyrus muriatus, but with great caution.

To moderate pain. To keep the belly foluble with cooling medicines, fuch

as manna, natron vitriolat. &c.

To bleed as often as the ftrength will admit.

To avoid cordials, exercise, or whatever can excite a greater heat than is proper to health in a state of rest.

A flight inflammation in the neighbourhood of the tu-mor, which yet is in its feirrhous state, may be relieved by means of Goulard's saturnine water, and thus is hindered from degenerating into a cancer; but if the in-flammation is confiderable, a cancer cannot be prevented.

Bleeding is necessary, at least as often as pain and fe-

verishness require it.

Purging should not only be used to prevent a costive habit, but also immediately after every bleeding, to in-crease its cooling effect.

Pain, when urgent, requires bleeding, cooling purges, a fpare diet that is thin and cooling, and anodynes inwardly. This fymptom is also much relieved by destroy-ing the sensibility of the parts by preparations of lead. Fever. This requires the same means for its relief as

are recommended against pain; to which may be added any other febrifuge that the state of the constitution may feem to admit of. Milk and water, or a decoction of farfaparilla, are convenient for common drink.

The best external medicine in the occult state is a well dreffed hare's or rabbit's fkin; for now all emollients, ftimulants, and unctuous preparations are to be avoided.

When the cancerous tumor becomes ulcerated, the edges of the ulcer are hard, ragged, and unequal, very painful, and reverfed in different ways, being iometimes turned upwards and backwards, and on other occasions inwards. The whole surface of the fore is commonly very unequal; in some parts there being considerable risings, and in others deep excavations. The discharge, very unequal; in fome parts there being confiderable rifings, and in others deep excavations. The difcharge, for the most part, is a thin dark-coloured fetid ichor, and is often possessed of such a degree of acrimony as to excoriate, and even destroy the neighbouring parts. In the more advanced stages of the disease too, by the erosion of blood-vessels which occurs, considerable quantities of pure blood are sometimes discharged. There is generally a burning heat complained of, all over the surface of the ulcer, and an increase of the shooting lancinating pains, which were much complained of before the ulcer was formed. The appearances of these ulcers are so various. formed. The appearances of these ulcers are so various, that it is, perhaps, impossible for any description to take them all in. Some have fungous excrescences about their edges refembling cauliflowers, or strawberries; others have none. When the cancer is ulcerated, the following have been extolled.

R Ungu. faturn. cum duplici quantitate cerre albæ paratum & ceratum.

R Pulv. e ceruff. C. mucilag. gum. arab. ãã 5 ij. ceruffe acetatæ. 9i. probe contritis in mortario marmoreo adde fenfim aq. calcis & rofar. ãã 3 vj. f. lotio.

After gently cleanfing the ulcer, wash it with the lotion just warmed, then covering it with dry lint, or lint moist-ened in the lotion; lay over the whole a plaster spread with the cerate, which may extend fomewhat over the edges of the fore.

In general, that which is the easiest is the best, and often a cerate of oil and wax is preferred.

A mixture of vinegar, with twenty times its quantity of water, is fometimes of excellent ufc.

Goulard commends his faturine preparations.

Tar-water, both inwardly and outwardly, hath been attended with confiderable advantage, and particularly when the diforder appeared at or about the ceffation of he menstrual discharge.

Narcotic herbs, fuch as the folanum and cicuta, have been used with success. See the articles respectively.

Carrot poultices renewed twice a day remove the nau-feous fmell which attends cancerous ulcers. See DAUCUS. Fixed air applied to the ulcer hath the fame effect, if it thould be used every fix, eight, or twelve hours, and af-ter it, rags may be laid on the fore, after dipping them in lavender, or other odoriferous water mixed with vi-

negar.

The hydrarg muriatus, gr. is given night and morning, as in venereal diforders, with the decoct farfaparil. ing, as in venereal diorders, with the decoct. Iariaparii, keeping the body lax, but not to purge, hath been manifeftly ufeful, though it is owned that its efficacy is left in cafes where the ulcer is very confiderable. It hath often fucceeded in cancers of the face and nofe. The bark may accompany it when the habit is lax.

The bark and hemlock may very advantageously accompany the use of this mercurial medicine, and may, in general, be thus administered.

in general, be thus administered.

R Extract. cicut. gr. v. vel plus bis in die; or rather the powder.

R Infus. cort. Peruv. 3 iij. bis terve in die.

R Hydrargyri muriati, gr. 1-16th, ad fs. bis in die. If the muriated quickfilver is not easy in the stomach,

a few drops of the tinct. opii, may accompany each dole.

In recent cases the hemlock is sometimes useful; its external use is more effectual than its internal; and its efficacy exceeds that of carrot poultice, though they all, and in every mode, are useful. Mr. Justamond intimates in his Lectures on the Operations of Surgery, that the best way of using hemlock is to make a bath with it; when this bath is used, it must be tepid, and the patient may flay in it during fifteen or twenty minutes, and repeat it two or three times a week. He farther recommends as a powerful efficacious medicine, the ferrum ammoniacale internally; it may be given three times a day, beginning with ten grains made into two pills, and increase the dose as far as the stomach will bear it.

In the fourth volume of the Edinburgh Medical Com-mentaries, is an extract from a publication by Dr. Le Febure, a French physician, by which it appears, that the internal use of arienic is frequently effectual in curing cancers. He fays, that in fome instances the cancerous virus is alkalescent, and in others it is accessent. His general method of administering this medicine is as fol-

R Arfen. alb. gr. iv. f. folutio in aq. font. distil.
hujus folutio detur cochl. magn. cum lact. vaccin. cochl.
magn. & fyr. e mecon. 3 fs. mane jejuno.
The arfenic is directed to be of a clear, white, shining

appearance, and in fmall cryftals; and every morning that the dofe is taken, the patient must not take any thing after it during one hour. This course must be continued eight days, after which a dose is to be taken in the same manner, twice every day; the first in the morning, the last about eight at night. At the end of a fortnight, last about eight at night. At the end of a fortnight, three doses are to be given in a day; the third being taken about mid-day. Thus, women of weakly constitutions, may continue until a cure is completed. But with an adult of a good constitution, the dose may be augmented, by degrees, every eight days, till he takes fix table spoonfuls of the solution every day; two table spoonfuls being taken for each dose, with as much milk, and half an ounce of the syrup of poppies. For children, tea-spoons must be used, and the dose should, on no account, exceed three of these, with a proportionable quantity of the syrup. But, besides that, the solution of the arsenic is thus to be increased to a certain height, in point of quantity, the increased to a certain height, in point of quantity, the ftrength is also to be augmented. Six grains of arsenic may be dissolved in the second bottle of the solution, and eight in the third. But, beyond this, Dr. Le Febure thinks it unadviseable to proceed. In general, he says, six bottles of the solution is sufficient for the cure of an open cancer; in one case, however, eight were neces-fary. He asserts, that this method is never attended with any ill accidents; and adds, that the arfenic does not act in any certain manner upon the fecretions. A purgative in any certain manner upon the tecretions. A purgative compounded of manna, rhubarb, and fal feignette, is to be given every eight or twelve days. Whey, with twelve grains of nitre to the bottle, or a weak decoction of the roots of marfhmallows, with the fame quantity of nitre, may be given for common drink. The belly is to be kept open by injections of whey, bran-water, or pure water, with the addition of emollient herbs, if necessary, or a little

little honey. With respect to regimen, it is directed to abstain from wine, and sermented liquors. Broths, made with a little beef, veal, or chicken, are proper. Broiled, roafted or boiled meat, ought to be taken in small quanti-ty. Spinnage, lettuce, succory, or forrel, may be given with advantage. Ripe fruit is not to be forbid. Rice cream, and milk in different forms, are a very proper part of diet. The doctor has sometimes been obliged to give the bark, and to open an iffue, when the humours where either very alkalescent, or in very great quantity. He confiders an iffue as ufeful in every cafe. When the ulcer is cicatrized, he recommends cold or warm mineral waters, according to the circumflances of the patient, with a view of completing the cure, or where these cannot be had, he gives artificial ones. Besides this treatment by internal medicines, the method of drefling the ulcer becomes also an object of attention. If the tumor be not ulcerated, he directs it to be washed with a folution of arfenic, having eight grains in a pint of water. After washing with this folution, apply the following cataplasm; take of carrot-juice, one pound; of acetated cerus, half an ounce; of arsenic disloved in distilled vinegar, half an ounce; of liquid laudanum, a dram and a half; form the whole into a mass of a proper consistence with as much powdered hemlock as is necessary. With part of this cataplasm the tumor is to be covered to a tolerable thicknefs, and the whole kept up with the common plafter. If the cancer be ulcerated, it is advised that the ichorous ferofity be taken away at each drefling, by means of dry lint. The ulcer is then to be fomented with the arfenical folution, having the chill taken off it, and about one third of red wine added to it. If the fore be of a very bad kind, it is advited that the arfenic be diffolved in a decoction of bark, for fomenting the ulcer. Afterwards the cataplasm mentioned above, and the plaster are to be applied. This treatment must be renewed every twelve hours. In De-cad II. vol. i. of the Medical Commentaries of Edinburgh, a folution of arfenic is given in drops, in intermittent complaints; which may also be administered in this in the

fame manner, gradually increasing the dose; as much as the labit will bear, with equal efficacy and more elegance.

Mr. Bell, in his Treatise on Ulcers, edit. 3. p. 299, &c. observes, that cancers are most frequently in the lips in men, and the breasts in women. The sooner cancerous men, and the breafts in women. The fooner cancerous cases are operated upon, the greater is the chance of the extirpation proving effectual, and vice versa. In general cancers are a local complaint at their beginning, and should be extirpated, the earlier the better, before the formation of matter. When the complaint is on the breaft, although part of it only may be affected, the whole should be always taken off. But, although it be proper to extirpate every part that is really discaled, none of the external teguments should be ever unnecessarily destroyed, nor should more of them be taken away than is requisite. nor should more of them be taken away than is requifite. A little before the fore heals up, an iffue should be intro-duced, so as to discharge freely before the cicatrix is formed. If feirrhous or cancerous diforders appear in feveral different parts, the removal of any or all of them, would not probably be effectual. If cancers adhere to another adjacent part, they rarely can be extirpated with fafety; a cancerous tumor may be attached to a circumjacent muscle or tendon, and may admit of an operation: however, much prudence is requisite in attempting a desperate case. See alsohis Surgery, vol. ii. 434, where he directs

how to amputate cancerous breafts. CANCER on the Face. These are generally seated on the lips, nose, or eye-lid. When they ulcerate, they are always attended with a hardness, which extends in proportion as that which formed the first tumor is dethe colour of the kin, which, before it indurates, turns red; and in extirpating, all that is thus florid must be cut away, as well as the part that is manifestly cancerous. See Le Dran's Obi. When a cancer on the lip becomes ulcerous, it appears at first like a crack, and then gradually widens. In extirpating cancerous lips, the operation is best performed as for the cure of the hare-lip. Mr. Sheldon observes that cancer in the cheek, which no operation can cure, proceeds from a polypus.

CANCER, in the Intellines. In this case the patient

is continually afflicted with an highly acrid and obstinate dysentery, which corrodes all the parts it touches, and is attended with frequent convultions, and fixed pains.

CANCER in the Tefticle. The most powerful means may be tried; great advantage hath followed the internal and external ule of hemlock, but castration is generally the fad, but fafeft refource.

CANCER in the Womb. This difease happens generally about the time of the menfes difappearing, but may approach at any other period of life. Women, who have been accustomed to a large discharge by their menfes, are more liable to cancers in this part than in any other, and the difease commonly begins when that discharge goes off, or when it disappears. It is known by pains in the pelvis and womb, of the stretching, tearing kind, mixed with shooting pricking ones; indurations in the part, senfible to the touch, a preceding immoderate discharge of the whites, reds, or both. Actius describes this case very well, and says that "there is a violent pain in the groins, upper part of the belly and loins, whilft the parts origi-nally affected can hardly bear to be touched: but if the cancer is ulcerated, besides the pain, hardness about the neck of the womb, there are ulcers with tumid, fordid, and whitish lips, and from them a feetid sanies slows, &c. The discharge from these ulcers are very various, being fometimes bloody, fanious, or accompanied with floughs, &c. If the indurations are not ulcerated the discharge is fanious and acrid. In time the labia fwell, and are wdematous, and if, as fometimes happens, the inguinal gland is obstructed, the cedema extends along the thigh.

In this unhappy case, besides the general methods, a close adherence to the extract. cicut. must be insisted on; beginning with a small dose and increasing it gradually, gr. x. ter die vel sæpius. This moderates the pains better than opium.

Mr. Justamond is very fanguine in his expectations of a cure from the use of the hemlock bath, and the ferrum ammoniacale, as above directed. See CANCER.

Dr. Le Febure recommends, in case of cancerous ulcers in the womb, that injections should be frequently thrown up, of a decction of carrots and hemlock, having four grains of opium, and as much arfenic, diffolved in every pint of it: fee his general method of cure with arfenic above, in the article CANCER. When in the bone or bones of a limb a cancer takes place, the amputation of that limb will be necessary.

The peculiar advantages of Mr. Fearon's mode of excision of the breatt, and his after-treatment, merit attention; and are conducted as follows.

The patient being feated conveniently, with her head supported upon a pillow, by an affistant behind, and her arms held by one on each side, the surgeon makes a hour containing in the direction of the ribe a listle below. zontal incision, in the direction of the ribs, a little below the nipple, the afliftants then draw the teguments as far afunder as poffible, and prefs their fingers on the bleeding arteries, whilft the furgeon is diffecting the difeafed mais from the skin above, and the pectoral muscle or parts below: after which, the wound being carefully examined, every fmall indurated or thickened part is to be removed.

The hæmorrhage by this time generally ceases; but if an artery still bleeds freely, it must be secured by means of the tenaculum and ligature, the ends of which are left a proper length out of the wound. The whole is then spunged clean, and the parts and edges of the wound are laid in even and perfect contact, and retained so by two, three, or more futures of the interrupted kind, according to the extent of the wound, and by the applications of flips of adhefive plafter, in the intermediate spaces, across the line of incision.

About the third or fourth day the ferous discharge appears through the bandages, and the flips of plafter grow loofe and require to be removed; the flifthes in the teguments are then to be divided with a pair of fciffars. incifion is afterwards dreffed daily with small slips of lint, forcad thin with a mild cerate, made of the purest oil and wax. The ligatures by which the arteries are secured, are gently tugged every day after the first inflammation is abated, and drawn away in due time for the fecondary union, or what is termed adhefive inflammation, to take place. The cure is greatly accelerated by repeatedly supporting the edges with a few slips of adhesive plat-

When the skin is ulcerated or diseased, a second incision is made in as strait a line as the inclusion of the diseased part will admit, down to the extremity of the first; and the edges, &c. are brought together in the fame man

ner as in the first incision. The incision is to be made below the nipple, because the natural position of the part more readily affists the union, and the breast is less subject to deformity.

Thus the cure is generally completed in a fortnight or three weeks; nay fometimes in as many days as weeks, where the suppurative process has been allowed to take

place.

A large thick foft compress made of linen, which has been in use, is to be applied after each mode of drefling, and a linen, or rather a fiannel roller, about five inches broad, and fix or eight yards long, bound gently fight over all. The arm on the affected fide is to be supported in the flexed polition, by a handkerchief tied round the neck. See Fearon on Cancers.

Pity it is, that in this disease, the opportunity of pro-curing relief is so little minded, and often lost! The following hints, if duly attended to, may serve to shorten the progress of an evil, which, if neglected, must be pro-

ductive of the worst consequences.

1. In its infant state, when the tumor is round, fmooth, and not hard to the touch, the disease often yields to an alterative courfe.

When the humour is become large, round, fmooth, and in fome degree indurated, it feldom gives way to such

mode of treatment.

3. When the humour is hard and unequal, and attended with pricking pain, it feareely ever admits of relief from fuch means; and I believe never, when it has attained what may be confidered as a fourth stage; that is, when the tumor is of a floney hardness, and very un-equal, attended with acute shooting pains. In this latter ftage of the diforder, when the breaft begins to lofe its natural colour, and the nipple is drawn in, the knife should be submitted to without hesitation; and indeed, from duly confidering the progress of the disease, as specified in the above hints, I am convinced that the easiest, fafest, and most proper periods for extirpation, are in the second and third ftages. See London Medical Journal. vol. v.

CANCER OSSIS. See SPINA VENTOSA. CANCHRY, of CANCHRYS. See CACHRYS. CANCINPERICON. Hot Horse dung.

CANCRENA. Paracelfus uses this word instead of

CANCRUM ORIS. Canker of the Mouth, called alfo, CANCRUM ORIS. Canter of the Mouth, called alfo, Aphtha ferpentes, Librofulcrum, Gangrema oris. Gangrene feorbutique des Genevies. It is a deep, foul, irregular, fetid ulcer, with jagged edges, which appears upon the infide of the lips and cheeks; and is attended with a copious flow of offensive faliva.

This difease is seldom seen in adults, but it most commonly attacks children. When the ulceration begins at the inner part of the lip, it exhibits a deep narrow sulcated appearance, and quickly spreads along the infide of

ed appearance, and quickly fpreads along the infide of the cheek, which becomes hard, and tumefied externally. The gums are very frequently affected, the teeth are generally loofe and diseased; matter is often found in the fockets, and abfeeffes fometimes burft externally through the cheek, the lip, or a little below the maxilla inferior : And it is not uncommon to fee an exfoliation of the alveolar processes, or even of the greater part of the lower jaw. Among the children of poor people, where this disease is often neglected or mismanaged at the beginning, 2 gangrene will fometimes supervene.

In order to the cure, it will be proper, to remove any diseased teeth, bones, &c. if possible; to prescribe a milk and vegetable diet, and to allow a prudent use of semented liquors; to give the Peruvian bark, sarsaparilla, elm

bark, and mineral acids.

External applications may be preparations of copper: a diluted mineral acid: burnt allum: decoction of bark, with vitriol, or borax: tincture of myrrh, &c. See Pearson's Principles of Surgery, vol. i. p. 262.

CANCRORUM LAPIDES. See Oculi CANCRO-

CANDELA. A CANDLE. If the flame is unfleady it hurts the eyes, and this fault is owing to the wick not being duly twifted, or dry enough when it received the tallow, or from bad tallow; also from an improper fort of mixtures in the wick.

Exhalations from candles, are falutary or hurtful according to the materials they are formed of. Old tallow often fends off bad fumes; wax, though white, creates the head-ach, and often hurts weak lungs; logs fat is very offensive; beef tallow alone is not good; that of sheep afford the best.

CANDELA FUMALIS, or candela profuffitu odorata, called alfo tada and avicula Cypria. These are made of odoriferous powders, mixed with one third or more of the charcoal of willows or lime-tree, and reduced to 1 confiftence with turpentine, laudanum, &c. Refinous fubftances alone, mixed up with balfamics, will do, they give out a grateful odour, purify the air, and excite the ipirits. They are also, from their form, called becilli, and masse ad fornacem, because they are usually applied to a hot grate or chimney, to diffuse their finell without lighting them. See Chomel's Dict. Economique, for that called Cerea, medicatea. See Bougie. - Arbor, i. c.

CANDOU PURCHASII. Arbor Maldivensis.
A tree that much refembles the cork-tree, as to its
wood, and of the height of the walnut-tree. The trunkis fungous, lighter than cork, the bark whitish, it bears no fruit. Ran Hift.

CANDUM. SUGAR-CANDY.
CANELA. A word used by the ancients for CINNA-MON, or rather Cassia. CANELLA. See CINNAMOMUM.

CANELLA ALBA, called also cinnamomum album, five canella tubis minoribus alba, cassila lignea Jamaicensis, casella cubana, canella Malabarica, aromaticum lignum, aromaticus cortex, caminga canella Malabarica, caryophilli fauvis odoris, Sc. cortex Winteranus spurius, costus corticosus, gingiberis amaritudo, arbor jucadice, and WILD CINNAMON TREE.

Dr. Brown, in his Natural History of Jamaica, calls the tree laurus fol. enerviis, and adds to this Lin. Sp. Pl. Weston, in his Universal Botanist, copies it from another edition of Linneus, and fays, Winterana canella, or Winterana Jamaicensis, foliis enerviis obovatis obtusis nitidis, racemis, terminalibus, cortice piperis modo acri, fructu viridi calysculato racemoso.

The bark of this tree is commonly, but fally, called cortex Winteranus, It is a large tree, whose bark confifts of two parts, an outward and an inward; the outer is as thin as a milled shilling, of an ash grey colour, with whiter spots here and there, and several shallow furrows of a darker colour, running variously through it; the taste is aromatic. The inner bark is thicker than that of cin-namon, being as thick as a milled crown piece, smooth, namon, being as thick as a miled crown piece, throoth, of a whiter colour than the outward, and of a more bitting and aromatic tafte, resembling that of cloves, and not glutinous when chewed, but dry, and crumbling between the teeth. Some call it the West Indian cinnamon-tree. It grows in Jamaica, Antigua, and other of the Caribbee Islands. The bark is the chief part in use, the poor natives use it in the place of all other spices, its virtues though smiler are very weak. It is fold in Eng-

virtues though fimilar are very weak. It is fold in England for the cort. Winter, for its virtues are the fame. It yields a heavy oil, which when mixed with a little oil of cloves, is fold for it; and Dr. Brown adds, the adulteration is no prejudice to the oil of cloves. See Miller's Bot. Off. and Dr. Brown's Natural History of Jamaica. For the called Curant. that called CUBANA. See CANELLA ALBA, and CASSIA LIGNEA.— CUURDO. TRUE CINNAMON TREE. See CINNAMOMUM. — JAVANENSIS MALAVARICA. CANICÆ

panis carticaceus, very coarfe bread.

CANICIDA. See Aconitum.

CANICIDIUM. A diffection of living dogs.

CANICULARIS. Dog-days. This is the time

when the canicula, or dog-ftar rifes and fets with the fun; they begin about the middle of July, or fomewhat later, and end about the latter end of August, or beginning of September. In some countries they still maintain the opinion, that bleeding, purging, and other means of relief, are not efficacious in this feafon, because of the great heat and unufual languor of the patient; but if they confidered that the heat rarifies the blood, and occasions a fort of plethora which oppreffes, and that taking away blood leffens this plethora, and takes off this languor, which was caused by oppression or distension, surely there no-tions would be discarded.

CANINA APPETENTIA, FAMES. See BOULIMUS. —Brassica. See Mercurialis sylvestris.— Lingua. See Cynoglossum.—Malus. See Mandragora.—Rabies. See Hydrophobia. CANINI DENTES, called also columellares dentes.

The teeth betwixt the incifores and the grinders, of which there are one in each fide, both in the upper and lower

jaw. See DENS.

Mr. John Hunter, in his Natural History of the Human Teeth, names these cuspidati, because though made somewhat like the incisores, they have the two sides of the edge sloped off to a point, and this point is very sharp. Their fangs are longer than those of the incisores, and therefore, from their fangs being supposed to extend the greatest part of the way to the eye, they have been called the EYE-TEETH. The cuspidatus on each side of each jaw, stands next to the incisores. Their use seems to be to hold what is caught or taken. In Varro, and Pliny, they are called columellares.

CANINI MINORES. The musc. incisorii laterales, fometimes send a few sibres to the musculi canini, which Winflow gives the above name to.—Musc. Winflow fays that each of the two musc. canini are fixed above the focket of the dens canini, and terminate in the arch of

the orbicularis labiorum.

CANINANA. A ferpent in America is thus called : it is about two feet long, with a green back and a yellow belly. It hath its name from its creeping after men, and permitting itself to be handled by them like a dog. CANINUS SENTIS. See CYNOSBATOS.

CANIRAM, called also malus Malabarica. It is a large tree, bearing a fmooth gold-coloured apple, whose pulp is white and mucilaginous: this fruit is remarkably bitter, and fo is its feeds, and indeed the whole tree. The root is cathartic, the bark restringent. Raii Hist. See also Nux vomica.

CANIRUBUS. See CYNOSBATOS.

CANIS. A Dog. The Latins call the whelp catulus and catellus. Gloves made of dogs fkins are worn in fummer to keep the fkin smooth and cool. The external furface of these skins is smooth, as is common with po-lished bodies, reslect the heat back again. The white dung of this animal was formerly in effect under the name of album Gracum, but is not now used, which see.

CANIS. A name of the frænum, by which the pre-

puce is tied to the glans.

The WHITE SHARK, CANIS ARCHARIAS. ROUND FISH; called also lamia, canis Aristoteli, canis Ga-leus, and canis marinus. It is found in the Mediterranean fea, and in the main ocean. — INTERFECTOR. See CEVADILLA. — PONTICUS. A BEAVER. See CASTOR. CANITIES. Greynels of the hairs, or grey-headed. CANNA. See ARUNDO TABAXIFERA.

CANA DOMISTICA MAJOR CRURIS, and canna major. A name of the tibia. This name was given it from its refemblance to an old mufical instrument. CANNABINA. See Acmella.
Cannabina. Bastard Hemp.
It is a genus of plant whose flowers have no petals, but

confifts of a number of threads, and are barren; for the See CUCURBITA.

CANICA. Coarse meal was anciently thus called, seeds are produced on semale plants, which have no vision from canis, a dog, because it was food for dogs. Hence ible flower, but membranaceous seed-vessels that interpretable close triangular feeds, which are, for the most part ob-

There are two species. Boerhaave mentions three

more under the name of connabina.

CANNABINA AQUATICA. See BIDENS. CANNABINUM. See EUPATORIUM.

CANNABIS. HEMP, or SEED-BEARING HEMP. It is the cannabis fativa, Linn. It is a tall annual herb with digitated leaves, cultivated in fields, on account of the mechanic uses of its tough rind. Some of the plants called male, produce flowers composed of a yellowith stamina fet in five-leaved cups; others, called female, produce feeds, moderately large, covered with a fhining dark grey-coloured fhell, under which is lodged a white kernel.

This plant hath a rank fmell of the narcotic kind, which is supposed to injure the health; the essuvia of the fresh herb is said to weaken the eyes and affect the head, and the water in which the herb hath been steeped for facilitating the feparation of the tough rind, is thought to be a violent and fudden poison; but perhaps the deleterious quality of this water may be chiefly from the putrefaction of fome part of the bemp which remains in it. The leaves of an Oriental bemp, called bang or bangue, and by the Egyptians affis, are faid to be used in the eastern countries as a narcotic and aphrodifiac.

The faint finell of the feeds goes off in keeping; their tafte is unctuous and fweetish, accompanied with a flight warmth. On expression they yield much insipid oil, which unites with water by trituration, into an emulfion. Decoctions of them in milk are commended in coughs, heat of urine, &c. in which cases their use depends on their emollient and demulcent qualities. Miller's Bot-

CANNABIS INDICA PEREGRINA. See BANGUE. CANNACORUS. The Indian REED; also called arundo Indica florida; arundo Indica latifolia; curcuma,

barundo floridacalamacorus, and canna Indica. It fends forth feveral stalks about four feet high, as thick as a finger, and jointed at intervals; the leaves are broad, large, fibrous, pointed at the extremities, and of a pale green colour. The flower is of a red colour, and pale green colour. The flower is of a red colour, and grows on the top: it is fhaped like that of the gladiolus; before it is perfectly open it refembles a crab, whence fome have named it the crab-flower. It grows only in warm places. Its leaves are wrapped about the gum elemi.

Miller takes notice of five species.
CANNADELLA. See CHANNA.
CANNULA. A diminutive of canna; also a name

for feveral inftruments in furgery , they are tubes of dif-ferent fhapes and fizes; introduced into openings for the conveyance of a fluid from the part.

CANNUTUM. A REED OF CANE.

CANONIAI. Hippocrates in his book de Aer. &c. calls those persons thus, who have straight and not prominent bellies. He would intimate that they are disposed as it were by a straight rule.

CANOPICON. A name in Dioscorides for ptyusa,

a fort of SPURGE.

CANOPITE. The name of a collyrium mentioned by

CANOPUM. In P. Ægineta it is both the flower and the bark of the elder-tree.

CANSCHENA-POU. A species of mandaru. See

MANDARU.

CANSIAVA. See BANGUB.
CANT. An abbreviation of Cantabrigia.
CANTABRICA. Pliny fays it is an herb that was discovered in the time of Augustus, in the country of the Cantabri, in Spain, whence its name. It is called lavender-leaved bind-weed. See Convolvulus Minor.

CANTHARIDES.

CANTHARIDES, also called FRENCH FLIES, Musca Hispanica, Spanish flies, cantharis major. Melocvesicatorius, alatus viridissimus nitens, antennis nigris. Linn. They were formerly brought only from Spain, whence they were called Spanish files; but they are met with in France, Italy, fome parts of Germany, and other countries. Newmann fays that they are found chiefly in the fpring feafon, and on poplar and afth-trees.

They are an infect of the beetle kind, known by their

fhining golden green colour, which is also of a bluish cast. They have a ftrong and fickly fmell; when tafted they make no impression on the tongue at first, but presently

an acrimony and pitchy flavour is perceived.

The largeft and belt are brought from Italy; they should be chosen fresh-coloured, entire, and free from dust. Newmann says, that after long keeping they fall into a grey brown powder, and in this state are unfit for use, their intrinsic qualities perishing with their external

form. It has been thought that they peculiarly affect the kidneys and urinary passages, proving diuretic; though whether they affect the former it is much doubted, if we can believe the evidence of Dr. C. Smith, and Dr. Cullen, notwithstanding WERLHOF gives a remark-able instance of the diuretic powers of cantharides; and tells us, he had frequently experienced the fame in dropfy and other difeafes. He gave a grain of the powder in a dofe, and repeated this every four hours, and it was only after the third dose, after a suppression of urine of many days standing that it began to yield: still Werlhof discontinued the use of cantharides in dropfy, and other diseases. Externally they are caustic, and are used to raise blisters, for which end Aretæus first rubbed them on the head. When they are applied to the skin, the heat and motion of what perspires, set them in action, whereby they penetrate it, and so stimulate the fibres as to bring on a flux of sluid that raises up the cuticula, through which it cannot pass, into a blifter. They produce a more plentiful discharge of serum than any of the vegetable acrids. They also destroy sungous slesh. Internally their esseasy is truly valuable, when skillfully managed. The case where their internal use is most necessary, and most faster where their internal use is most necessary, and most faster. is, when they are wanted to fcour the urinary passages, and this is when they are obstructed with sloughs, and fuch viscidities, as are apt to be washed off from the ulcerated parts; this happens most in women. In venereal cases, where much filth hath fallen on the genitals, the tincture is very useful. They are commended in gravel, leprofies, and virulent gonorrhoeas, the fluor albus, ulcers in the bladder, uterus, and kidneys. The phlegmatic may take them without much caution, but the hot and bilious require them mixt with proper correctors. Their use in cutaneous diforders has fometimes been fuccefsful. Cullen's Mat. Medica, &c.

In cases of stone in the kidneys, fits of gravel, stone in the bladder, some cedematous cases, and sometimes in pregnant women, their use is not to be admitted

However used, they are apt to produce a strangury, and inflammation of the urinary passages; to prevent which, when blisters are applied, some rub 9 i. or 9 ij. of camphor in fine powder, on the surface of the plaster; but this requires also the assistance of nitre, oily drinks, soap pills, &c. Washing the blistered part when dressed, with warm milk, greatly relieves these symptoms. When improved the state of the state of the plaster into the state of the plaster. prudently taken into the flomach, they cause great heat, inflammation, bloody urine, a dribbling heat and withal, a priapilm, thirst, and a cadaverous breath, &c. in which cases give nitre, camphor, mucilage of gum arabic, and acids; simple oxymel is of excellent use as an antidote. Sometimes blisters laid to the thighs, or calves of the legs, have produced a gangrene, because a flux of humours is very easily invited to these parts; therefore should not be applied to them when they are cedematous, but rather to the infide of the arms, wrifts, nape of the neck or head.

A dose of the arms, writts, nape of the neck of head.

A dose of the powder may be from half a grain to fix grains; and of the tincture from five to fifty drops, twice a day. By beginning with a small dose, and gradually increasing it, a much larger quantity may be taken.

The powdered flies, the spirituous extract, or the watery one, applied to the skin, all blister it equally; but the half proposation for interval use is that in the second of the skin and th

the best preparation for internal use is the tincture. Newmann fays, that milk and oil are the best correctors.

Their active part is a refinous matter, fimilar to vegetable refin. Some fay that their efficacy is from an acrid falt; but as Newmann well observes, their practice contradicts their theory, for they use spirit for making the tincture, and water is the proper menstruum for fals.

Water, proof spirit, and rectified spirit, all take up the

active part of cantharides equally; but it does not rife with any of them in distillation. The residuum, after digesting the flies in water or spirit, does not in the least blifter or inflame the fkin.

The London College directs the following preparations.

Tindura Cantharidis. Tindure of Spanish Flies.

Take of cantharides bruifed, two drams; of cochineal, half a dram; of proof spirit of wine, a pint and a half; digest and strain for eight days.

This tincture may dand a week to digest, without heat,

and then be used: it contains all the virtue of the flies.

The dose may be from x. to l. drops twice a day. Two or three drops may be added to each dose, according as the patient can bear them. Some add balfams, &c. in making this tincture, and then commend it as more ufeful when the kidneys, womb, or bladder are ulcerated, or the urethra is corroded; but whatever additions may be thought of, they are best joined extemporaneously, or in-terposed by themselves at proper intervals. The diurent power of the files is much improved by the addition of fps. ætheris nitrofi, and they may be thus administeted.

R Tinct. canthar. 3 ii. fpt. æther. nitrofi, 3 iii. tinct.

opii, 3 i. m. cap. gut. 40 bis die.

Unguentum Cantharidis. Ointment of SPANISH FLIES, formally Unguentum ad vesicatoria.

Take of Spanish sies, two ounces; distilled water eight ounces; ointment of yellow refin, eight ounces: boil the water with the Spanish slies to one half, and strain. To the strained liquor add the ointment of yellow refin. Evaporate this mixture in a water bath, saturated with sea salt to the thickness of an ointment. The use of this ointment is to dress blisters with, that must be kept conflantly open, for thus they are prevented from healing.

Emplastrum Vesicatorium. Blistering Plaster. Now Emplastrum Canthavidis. Plaster of SPANISH FLIES.

Take of Spanish flies, one pound in powder; plaster of wax, two pounds; prepared hog's lard, half a pound; having melted the plaster and lard, a little before they coagulate sprinkle in the flies. Most skins are softened by bathing them with warm vinegar, and if a bliftering plafter is applied immediately after, in some instances it produces a speedier effect. Complaints have been often made of the failure of blifters, which have arisen from neglect or ignorance; the apothecary, therefore, should be careful to have the flies good, fresh powdered, that powder very fine, and that the plaster be neither made in too great quantity at once, nor fpread with too hot a fpatula.

Ceratum Cantharidis. Cerate of SPANISH FLY.

Take of the cerate of sperma ceti, softened by heat, fix drams; Spanish slies, reduced to a fine powder, one dram, mix. Ph. Lond. 1788.

In cases where the common bliftering plasters are thought to be too active, Dr. Percival commends the following composition and manner of application. It may be called,

### Empl. Vesicator. Mitius.

R Empl. veficat. Ph. Lond. p. i. vel ij. empl. flo-mach. p. i. vel. ij. camphor in fpt. vin. folut. 3 i. vel

If a plaster of this composition be moderately warmed before the fire, then covered with a fine foft piece of muslin, it will occasion much less irritation than the usual ones, produce no ftrangury, or but in a flight degree, and when to be removed will feparate from the fkin with great facility. Nor will this covering prevent its vesscating ef-fects. Hence blifters may thus be applied when the skin is disposed to erysipelatous inflammation from its great fenfibility, or when the evacuating power is wanted with-out the ftimulus.

#### CAN [ 195 ] CAN

Cantharides are principally used for bliftering: this article will then be mest properly concluded by a few observations on the effects and uses of blifters.

Whether cantharides are applied externally or admini-flered internally, fimilar effects are produced; but yet it is not agreed, with respect to blifters, whether their action and mode of operation is directly on the skin, or by the absorption of their stimulating particles. However, ex-perience hath established the use of blisters in the following cases, viz.

In low nervous severs, when the pulse is languid, and

spirits funk, the præcordia oppressed, the breathing dif-

ficult, or a delirium comes on.

Ardent and inflammatory fevers, when, in their advanced state, the patient becomes languid, and possessed of fymptoms that indicate the approach of an opposite disorder, viz. the low or putrid kind: the vis vitæ must be supported, and the finking powers roused by blisters. In short, in any fever, when a langour, a coma, or a violent spalmodic pain in the head approaches, they must be immediately used.

Putrid fevers. The mild bliftering plafter above mentioned, may be applied as there directed, or where no particular reasons demand such caution, that of the Lond. Col. may be used, as a stimulus to the solids, to quicken

the circulation, and promote the fecretions.

Small-pox. When the patient's habit is lax, the pulfe depressed, and the heat not sufficient, either during the expulsion or the suppuration of the pustules; when they are of a bloody kind, and a delirium threatens or attends; also when the swelling of the face is not likely to be duly succeeded by that in the hands and feet.

Apoplexy. Blifters may be applied to the head, &c. particularly in those persons in whom the vis vitæ is below

what health requires.

Carus and lethargy. Here blifters are peculiarly indicated.

Palfy, whether general or particular, though in the lat-ter their application is most efficacious.

Incontinence of urine, if applied on the region of the os facrum.

Gutta ferena, if laid on the forehead.

Tympanites, in which case, if the bowels are not al-

ready inflamed, blifters may be applied on the belly.

Scirrhous tumors of the conglobate glands of the neck, are relieved by the blifters applied to the head.

Scirrhous tumors of the glands in the groin are dispersed

by blifters on the thighs.

White fwellings. Those tumors so called, that so frequently defroy the joints, and in the end the patient, is in fome instances, cured by an early application of blifters upon them.

Convulsions and spasms. Blisters assist in relieving them almost universally by their stimulus, when applied on a part free from the disorder.

Epilepfies, both idiopathic and fympathetic, are often much relieved by blifters.

Afthma, both the humoral and nervous kinds are mo-derated by blifters, and particularly by perpetual ones. Spafmodic pains in the bowels are relieved by applying

blifters on the part affected.

Pains from inflammation, when the inflammatory diathefis prevails ftrongly and uniformly through the fyftem, and no one part is more affected than another, blifters are hurtful; but when the head, lungs, or any particular part is affected more than the rest of the body, they are remarkably useful.

Deliriums, attended with a pulse that does not admit of bleeding, are removed by blifters.

Ophthalmia. This diforder is as much benefited as most, by blifters behind the ears, or on the fore-part of the head; Hoffman advises to lay them on the foals of the

Quinfey. After bleeding and purging, a blifter between the thoulders is a necessary application, and another across the throat is often of eminent service.

Malignant quinfey. In the first stage of this disorder a blister to the nape of the neck, and on each side of the throat, produces salutary effects; in this case, the milder

bliftering plafter above noticed is to be preferred.

Pleurify. The pain felt in the fide, is best relieved by a blifter laid over where it is feated; though in pulmonic diforders Huxham advises that the legs be bliftered.

Coughs, both the hooping and other kinds, have their violence abated, and cure promoted by a proper use of blifters.

Inflammation of the liver. One of its principal remedies is a blifter laid over the part affected. The fame advantage follows this practice when inflammatory pains are fixed in the stomach, intestines, &c. or when pain in these parts have flatulency for their cause.

Diarrhoea. When this diforder attends the meafles, no

remedy is equal to the application of a blifter.

Dylentery. When the pain attendant on this diforder yields not to fomentations, a blifter over the pained part is the only refource.

Sciatica, Gout, and Rheumatifm. The most eminent practitioners extol the use of blifters, if applied to the

parts affected at a proper time.

Pregnant women require some caution, when blifters are proposed; but the milder plaster above noticed, if ap-plied as there directed, may be safely used when circumftances require it.

Anafarcous Dropfies. The fearifying the legs may be preferable; yet, when the patient will not comply therewith, the mild blifter plafter just mentioned may be fafely used, and with confiderable advantage.

See Lewis's Mat. Med. Baglivi's Differt. on the Ufe and Abuse of Blisters. Percival's Essays Med. and Exp.

edit. 2. p. 183, 248.

CANTHARIS. Major. See Cantharides.

CANTHARUS. The BEETLE. See SCARABÆUS. Also the name of a fish, which by some used to be called SCARABÆUS; formerly administered as food, though not very agreeable on account of the loofeness, and humidity of its fielh. Gaza calls this fifth sparus.

CANTHI, CANTHUS. Karos, a primitive in the Greek. An angle of the eye. Anguli Oculi. The cavities at the extremities of the eye-lids, called the corners of the eyes; the greater canthus is next to the nose; the leffer conthus lies towards the temples.
CANTHUM. SUGAR-CANDY.

CANTIANUS PULVIS. 'The Counters of Kent's powder. It is made with the rad. contrayerv. coral. alb. crystal. ter. Lemn. cerus. ant. mosch. ambergrif. & croc. Anglic.

If cochineal be added, it is called pulv. cant. rub.

If calcined toads be added, it is called pulse cant. nigr. CANTION. An epithet for fugar; but in conjunction with it is SUGAR-CANDY.

CANTIUM, or CANTUM. A word used by the Greeks, to fignify angulous, and is applied to crystallized

SUGARS.

CANTUARIENSES AQUA. CANTERBURY WATERS At Canterbury, there are five wells, not far from each other; they are strongly impregnated with iron, sulphur, and fixed air. Their tafte is fomewhat harsh and austere; their fmell is ferruginous and strong of the fulphur. They are inferior to no mineral waters in England, in most disorders in the stomach, in asthmas, catarrhs, rheumatisms, gouty complaints, the scurvy, jaundice, diseases of the skin, chlorosis, agues, &c.

CANUM CERASA. Dog-cherries. A species of

Periclymenum.

CANUTUM, or CANNUTUM. The REED or CANE.
CAOPOIBA BRASILIENSIBUS, called also Coapoiba. A large tree growing in Brafil, but of no known use in medicine. Raii Hist.

CAOVA. The drink called COFFEE CAOUP. A tree in the island of Maragnan, in America, with leaves like those of the apple-tree, but larger. The flowers are red, mixed with yellow, and the fruit is like an orange. Raii Hift

CAPPASSONUS GENUENSIUM. The fifth called

LAVARONUS

CAPELINA; or Capitalis reflexa, CAPELINE DE LA

TETE. See DELIGATIO, Species, 8.

A REFLEX BANDAGE. It is a double-headed roller, about twenty-four feet long, and the breadth of two fingers; the middle is fixed to the occiput, and after two or three circular rounds the rollers interfect each other upon the forehead and occiput; then one roller being reflected over the vertex or fagittal future to the forehead, the other is continued in a circular tract; they crofs each other upon the forehead, after which croffing, the first head is carried back obliquely towards the occiput, and in a circular direction, but the first is brought again over the fagittal future backward and forward, and fo continued till the whole head is covered. It is used in the hydrocephalus, but is not of any advantage.

CAPELLA. A CUPEL OF TEST. See CUPELLA. Alfo

the ALEMBIC, and the BASTARD PLOVER.

CAPER. The GOAT. Or, Capra Domestic
Dr. Cullen, in his Class of Nutrentia, reckons the milk of animals, amongst which he enumerates that of goats, and fets them down in proportion to their folid contents: thus, women's, ass's, mare's, cow's, sheep's, and goat's; and fays, that the three first agree very much in their qualities, having little folid contents; and when evaporated to dryness, having there very foluble, containing much faccharine matter, of very ready acefcency, and when coagulated, their coagulum being tender, is eafily broken down. The three last agree in opposite qualities to the three mentioned, but here there is fomewhat more gradation. Cow's milk comes nearest to the former milks: Goats milk is less fluid, less fweet, less statulent; has the largest proportion of infoluble parts after coagulation, and indeed the largest proportion of the coagulable part. Its oily and coagulable part are not spontaneoutly feparable, never throwing out a cream, or allowing butter to be readily extracted from it. Hence the virtue of these milks are obvious, being more nourishing, though at the same time less easily soluble in weak stomachs, than the three first, less accedent than these, and fo more rarely laxative, and peculiarly fitted for the diet of convalefcents without fever. The three first again, are lefs nourifhing, more foluble, more laxative as more acefcent, and adapted to convalefcents with fever. Mat. Med. p. 112. Lond. 1772.

Goat's whey is aperient, abstergent, attenuating, and laxative; it is generally preferred before all other wheys.

CAPHORA. See Camphora.

CAPHURA. BAROS INDORUM. A species of

campbor which separates from the ol. caphure on re-diftilling it. This campber sometimes oules from the bark of the root of the cinnamon tree, in the form of oleous drops, which infenfibly concrete into white grains. CAPHURÆ OL. An aromatic effential oil diffilled

from the root of the cinnamon-tree.

CAPICAGTINGA. A fpecies of acorns which grows in the West Indies, larger and more useful than ours in Europe, of the same qualities, but it possesses them in a greater degree. Also the Asiatic sweet flag. See Calam. Arom. Asiaticus.

CAPILLAMENTA, from capillus, a bair. Capillaments in flowers are generally underflood to mean the chives which support the apices. They are those slender filaments that spring up within

the leaves of a flower and are more usually called the ftamina; whence a capillaceous flower is also a ftamineous one. Again, by capillaments are meant those slender parts

one. Again, by capillaments are meant those slender parts which resemble hairs, and are produced from vegetables; as, for instance, from seeds, roots, &c.

CAPILLAMENTUM. The hairy or villous integuments belonging to animals. Called also Capillitium.

CAPILLARIA VASA, from capillus, a hair. CAPILLARY VESSELS. The smallest vessels in our bodies are so called, because they appear as small as hairs.

CAPILLARES VERMICULI. Those small worms in infants, which some call crines, crinedones, and dracunculi. See Caisones.

culi. See CRINONES.

CAPILLARIS. Any thing that refembles hairs, whether fmall veffels in our bodies, thread-like parts of plants, &c. Ray calls those vegetables capillares which have no main stalks, but whose seed is on the back of their leaves, for they grow close to the ground, as the hair grow to the head

CAPILLATIO. A capillary fracture of the cranium.

See TRICHISMOS

CAPILLITIUM. See Capillamentum. It is also used for trichiasis.

CAPILLORUM DEFLUVIUM. See ALOPECIA.

reflected by the fide of the other; the last is continued general. The hairs are hollow, and furnished with vessels; are knotted at certain diffances, like fome forts of grafs, and fend out branches at their joints. The diforder called and fend out branches at their joints. plica Polonica proves them to be hollow. As to the branching of the bair, it is visible enough at the extremities with a microscope, and it is apt to split if worn long and kept dry. Each of these bairs have a bulbous root, of an oval shape, which is lodged in the skin. As long as any moisture remains about the roots of the bair it continues to grow, though the body be dead and mouldered to duft. Drake's Anat.

Dr. Cheyne, in his English Malady, observes that as the bair is for strength, so is the general habit.

The principal diforders in the bair, fee in the article ALOPECIA.

CAPILLUS VENERIS CANADENSIS. See ADIANTHUM

CANADENSE.

VENERIS. See ADIANTHUM. VERUM.

CAPIPLENIUM. A CATARRH. It is a barbarous word, but Bagliyi uses it to fignify that continual heavi-ness or disorder in the head, which the Greeks call care-

CAPISTRATIO. See Phimosis.
CAPISTRUM. A bridle, or rather a horse's head-stall. Also the name of some chirurgical bandages about the head. In Vogel's System of Nosology, it is the same as Trismus, which see.

CAPISTRUM AURI. The bridle of gold, or rather the foldering of gold: it is a name given to borax, because of its use in soldering this metal. See Borax.

CAPISTRY. A single-headed roller used for support-

ing the under jaw when fractured or luxated: it is ap-

plied under the chin and over the head.

CAPITA. Heads in plants are either those receptacles of the feeds, which by their globous figure represent a head, as the heads of poppies, &c. or they are the same as bulbs.

CAPITALIA. See CEPHALICA. CAPITALIS REFLEXA. The bandage called the

CAPITATÆ PLANTÆ. Are plants whose feeds with their down, being included within a squamous calyx, are conglobated into a roundish figure resembling a head.

CAPITELLUM. The head or feed-veffels, frequently applied to moffes, &c. as in capitulum. Some fay it fignifies foapy water, others fay it is a lixivium.

CAPITILUVIUM. A bath or lotion for the head.

CAPITIS OBLIQUUS INFERIOR. See OBLIQUUS

Superior. — Obliques Superior. See Obliques
Superior. — Par Tertium Fallopii. See ComPlexus Minor. — Posticus. See Rectus Major.
— Rectus. See Rectus Minor. — Vena. See
Cepialica Vena.

CAPITO ANDROMACHUS. Thus Geiner calls a fish, which is also named zerta, because it passes out of the sea into the river Elb. It lives both in the sea and in rivers, and is reckoned to be of a good kind for food.

—LACUSTRIS. This name is given by Gefner, to the fifth, called by the ancients albus, the flesh of which was fo hard, and fo difficult of digeftion, that it was confidered as the poorest and worst of all fish for culinary pur-

CAPITULUM. In botany, is the head or top of any plant. In chemistry it is an alembic. See ALEMBICUS. In anatomy it is a smaller process or protuberance of a

bone received by another bone.

CAPIVARD. A a Portuguese name for a WATER-DOG. Lemery describes an animal under this name, that is met with in Brasil, which stays in the water all day, and at night goes on the land to ravage the gardens and tear up trees. Its body is like a hog's, and its head refembles a hare's. Its flesh is good for food.

CAPIVI BALSAMUM. Balfam capivi, called also

copaiba, copaiva, capivus, albus balfamum. The tree which affords it is called arbor balfamifera Brafiliensis, and arbor copaiba Brafiliensibus. It is the copaifera officinalis, or copaifera fol. pennatis subrotundis, slore rubro. CAPILLORUM DEFLUVIUM. See Alopecia.

CAPILLUS, also Crinis. The Hair. Capillis is properly the bair of the head, but is used also for bair in the British American islands. Deep sections are made

Into the trunks of this tree, during the hotter fummer months; one tree femetimes is met with that affords five or fix gallons of balfam, but the fame tree never yields it twice.

This balfam is at first limpid and colourless, and smells like calambour wood; as brought into Europe it is generally yellowish, and somewhat thicker than olive oil; by long keeping it becomes fill thicker, but does not dry. In CAPNOS, FUMITORY.

CAPNOS, ATHEORY.

long keeping it becomes that thicker, but does not dry. In all littee of its confiftency, it continues clear and transparent. To the fmell it is grateful, to the tafte bitterish and biting, not intensely so, but durable.

To prove its genuineness, drop it on paper, if it spreads not, as oil, nor runs through, it is good; on the contrary, if it spreads or finks through it is adulterated. It is also effectuated genuine when a drop falling from the point of a recollering to old water, finks to the bettom, or is suffered. needle into cold water, finks to the bottom, or is suspended in the middle; but if it is suspended at the top, or spreads, it is spurious. If genuine it is said that it does not give the violent finell to the urine of those who take

We rarely have it genuine; the balfamum Canadense is generally sold for it. The Canada balfam is the product of the pinus (balfamea) soliis solitariis subemarginatie; subtus linea duplici punctata, Linn. The turpentines and their productions, frankineense, and the Canada balfam, all possess nearly the same qualities as the balfam

Diffilled with water it yields half its weight, or nearly fo, of effential oil; the remaining refin is tenaceous and inodorous. If it is diffilled in a retort, without any addition, by a fire gradually raifed, it fends over first a light yellow oil, which smells strongly of the juice; then a dark coloured oil, and after it a fine blue oil, both which are pungent to the tafte, having also an empyreumatic flavour,

but not an ungrateful one.

The balfam capivi is used in gleets, the fluor albus, coughs, ulceration in the lungs and urinary paffages; is purgative in dofes of two or three drams; it is detergent, heating, and irritating; but though it heats it agrees in heating, and irritating; but thought it heats it agrees in heatic fevers. Rieger fays that it should not be given in fevers, nor where there is an acrimony in the juices. When joined with the aqua kali it powerfully provokes urine in dropsies. It gives relief in hæmorrhoidal affec-tions, in doses of twenty to forty drops, once or twice

The usual doses are from x. to xl. drops, the least offensive method is to take it in a glass of cold water, or

in milk.

Divided by the white of egg, fugar, honey, or the powder of gum arabic, it mixes with water into an uni-form milky fluid. The best of these mediums is the gum, which should be used in the proportion of one part to three parts of the balsam. It easily mixes with distilled oils; but difficultly with expressed ones. If a small quantity of alkaline salt is added to rectified spirit of wine, it perfectly diffolves this balfam into a fragrant liquor, more agreeable than the balfam alone. See Neumann's Chemical Works, Lewis's Mat. Med. Cullen's Mat. Med.

CAPIVUS ALBUS. See CAPIVI BALSAMUM.

CAPNELÆUM. In Galen's works, it is faid to be a refin that flows spontaneously from some tree in Lacede-mon. In Cilicia it is called capnelaion, from \*\*exposi-fmont, and \*\*exposi- oil, fmonty oil; but in Lacedemon and some other places it is called \*\*exposi-ves, the first product, Facilias says it seems to be called \*\*exposi-aion because of the

fmoak it gives when placed near the fire.

CAPNIAS, from καπτρος, fmoak. A kind of vine which bears part white and part black grapes. See Theophraftrus de Causs Plant. lib. v. cap. 3.

CAPNICIUM CHELIDONIUM. See FUMARIA

CAPNISTON. An epithet of a fort of oil prepared of feveral kinds of fpices and oil, by kindling the fpices, and fuffumigating the oil.

CAPNITIS. TUTTY.

CAPNITIS. TUTTY.
CAPNOIDES, from \*\*marros, fumitory, and \*150s, likenofi. Podded fumitory. Called also Pseudo fumaria.
The whole appearance of this plant resembles fumitory; but the ftyle of the flower becomes a long taper pod, which contains many round fhining feeds. It is of no note in medicine. Miller's Dict.

CAPNORCHIS. INDIAN BULBOUS-ROOTED FUMI-It is of no

CAPNOS LATIFOLIA, See FUMARIA BULBOSA.

CAPO. A name of the American TOAD. See Buro. Also a CAPON. The design of castrating a cock is to render him a fit leader for the other poultry, and also more fleshy.

CAPO MOLAGO. GUINEA PEPPER. See PIPER IN-DICUM.

CAPOLIN MEXICANORUM HERNANDEZ. Sweet Indian Cherries, called also cerafus dulcis Indica.
The bark is restringent. There are three species, the
xitoma capolin, the belocapolin, and the tolacapolin. Raii

CAPOTE. See ZIECARA.

CAPOTES. See COVALAM.

CAPPARIS. The CAPER BUSH. It is a low prickly buffs, grows wild in Italy, Spain, and the fouthern parts of France. The bark of the root is bitteriffs and acrid to the tafte, and is ranked among aperients and diureties. The green buds of the flowers are pickled in vinegar and falt, and are used at the table to help the appetite. In Holland and Germany they substitute the buds of the flowers of the cytifogenista scoparia vulgaris flore luteo, for the cotter, and nickle them in the formation.

for the capers, and pickle them in the fame manner.

CAPPARIS FABAGO,

— PORTULACA, C. B. See FABAGO.

CAPRA ALPINA. The CHAMOIS OF GEMS, called alfo rubicapra, rupicapra, and dorcas. It is met with on the Alps belonging to Switzerland: it is a species of wild goat, in shape and fize resembling the tame one, with short horns, the ends of which are hooked. The stones found in their stomachs are called agagropila and bezoar Germanicum.

-DOMESTICA. See CAPER. -Moschi. See Moschus.

STREPSICEROS. See ANTILOPUS.

CAPREOLARIS. See CAPREOLUS.
CAPREOLARIS. See SPERMATICA CORDA, from CAPREOLARIA. Scapreolus, a tendril of a vine.

CAPREOLATA. A species of the Brionia mgra, growing in Brasil. Raii Hist.

CAPREOLUS. In botany it is the long smooth production in plants, which is like a ftring, and grows out of the stalk. It consists of rough vesicles and bundles of small sibres, of an elegant orderly contexture, and is the instrument with which some plants of weak stalks are furnished, that they may not creep on the ground, but use it to lay hold of, and so twine themselves about the neighbouring plants. In the ivy, the capreolus is not only af-fiftant to the plant in climbing, but it ferves inftead of a root, whence fuch plants are called feandent. See CLAviculus. In anatomy it is the helix of the ear, and in zoology the ROE-BUCK, which is also called caprea Plinii, caprea, and dorcas. It is found in Scotland and other parts.

Moschi. See Moschus.

CAPRICALCA. A kind of wild bird, which feems to be of the goofe kind. Lemery takes notice of it. CAPRICERVA OCCIDENTALIS. The deer which

affords the West Indian BEZOAR .- ORIENTALIS. The deer which affords the East Indian BEZOAR.

CAPRICORNUS. LEAD. CAPRIFICUS. The WILD FIG-TREE. Called also Erineas. See FICUS SATIVA.

CAPRIFOLIUM. HONEY-SUCKLE OF WOOD-BIND, also called matrifylva, periclymenum, chamæcerasus. It is the lonicera periclymenum, Linn. It is a climbing fhrub, common in shady places; for the beauty and sweetness of its slowers it is cultivated in gardens: its medical properties do not recommend it in practice, though some attribute extraordinary efficacy to it.

CAPRIMULGA. A large kind of viper, which is

not poisonous.

CAPSELLA. A name in Marcellus Empiricus for VIPERS BUGLOSS.

CAPSULA. A diminutive, from capfa, a little bag or cafe, or cheft. In furgery it is a bag made of the broken or diftended membrana cellularis, or other membrane, formed by nature to enclose or lodge some extravalated juice, or other matter contained in those tumors called encyfted. Thus it is the fame with cyftis. But in botany, it is the fhort pod, or hufk of a plant, containing the feed. According to the number of cells for feed, the pod is

According to the number of called uni-capfular, bi-capfular, &c.

CAPSULA COMMUNIS GLISSONII. It is a production of the peritoneum, including the vena porta, and biliary duch in the liver. It is also called capfula venæ portæ, Vagina portæ. Glisson sirst described it particularly.—Cordis. See Peri-

CAPSULÆ ATRABILARIÆ, also called glandulæ fupra-renales; renes succenturiati, capsulæ renales, and

glandulæ renales.

They are glandulous bodies, lying on the upper part of the kidneys; or they are two little, oblong, flat, triangular bodies, lying at the upper end and infide of the extremity of each kidney; the right behind the vena cava, and the left behind the spleen and pancreas, being attached by vessels to those of the kidneys. When they are cut into, there seems to be a small cavity, containing a deep green juice; and if viewed when fresh, a white substance where the veffels ramify, the inner part is a tender fubflance like the liver, fo that it readily breaks down. Both the external and internal parts are valcular, and two or three large veffels may be observed in the middle, which give it the appearance of a juice as above mentioned: Euftachius was the first who described these glands. They are larger in the sectus than in the adult. Their

use is not certainly known.

CAPSULARES ARTERIÆ. The arteries of the renal glands are thus called, and arise from the aorta, above the arteria renalis, and give out the arteriæ adipofæ, which go to the fat of the kidnies. Sometimes they come from the trunk of the cœliaca. The right capfular artery comes, most commonly, from the arteria renalis, of the fame fide, near its origin; the left from the aorta above the renalis.—VENA. These are branches from the emulgents, and go into the renal glands.—Semina-Les. The extreme parts of the vafa deferentia, which have their cavaties dilated in the manner of capfules. Their use is to transmit the semen from the testes to the

veficulæ feminales.

CAPSULARIA LIGAMENTA. CAPSULAR LIGA-MENTS, also called Ligamenta mucilaginosa figaments as they contain many glands to separate the synovia. Every articulating bone is surnished with a capfular ligament, which ligament is composed of two layers; the external layer is the stronger, being made by the periofteum, the inner is thin and uniform.

The use of the capsular ligament is, 1st. to connect the bones, which is performed by the outer lamella: 2dly. to confine the fynovia, which is the office of the inner

They are long and large in those bones that are design-

frequently inferted into them, that by their action they may draw them outward, and prevent their being pinched. They are generally of an equal thickness all round, in the enarthrois and arthrodia; but in the ginglymus they are thick on the fides, and thin on the fore and hind parts, as in those places their thickness would have been inconvenient, by hindering the due flexion and extension of the joint; but the tendons strengthen the joint in that part, and partly compensate for the weakness of the li-

In complete luxations, the capfular ligament is gene-

rally, if not always ruptured.

That of the os femoris, is extended, from below the neck of the bone, to admit of a more extensive rotation.

The capfular ligament of the head of the humerus proceeds from the edge of the glenoid cavity in the fcapula, and is continued over the hemisphere of the head of the os humeri, and is fixed near its edges towards the mufcular furfaces of the great and finall tuberofities, and runs down on the neck of the bone, below the lowest part of the cartilaginous hemisphere. In all this course, the cap-

CAPSICUM.

A species of pepper. See Pi- sull is closely fixed in the bone, except a small portion where it passes over the inner articular tendon of the bi-

ceps muscle.

The capfular ligament always includes the whole joint.
Of collections within the capfular ligaments of the joints, fee Bell's Surgery, vol. v. 485. Also, of concretions and preternatural excretences within the capfular ligaments

of the joints, fee Bell's Surgery, vol. v. 491.

CAPSULATE PODS, from capfa, a cheft. They are the little fhort feed-veffels of Plants. Miller's Dict.

CAPULUM, from καμπλε, to bend. A contortion of

the eye-lide, or other parts.

CAPUR. CAMPHOR.

CAPUS. A CAPON. See CAPO.

CAPUT. The HEAD. The parts in the lower cavities are the feat of the vital faculty, and the head is the feat of the animal faculty; it being the feat from whence

all fenfation is derived.

Befides the external integuments of the bead, there is an aponeurotic expansion which covers it like a cap. It is alfo fpread round the neck, and on the shoulders, like a riding-hood, for which reason Winslow calls it cost, and the superior portion of it, the aponeurotic cap. It is very the tuperior portion or it, the aponeurotic cap. It is very firong, and appears to be made of two firata of fibres crofling each other; as it foreads to the neck, it becomes thinner, and is loft infenfibly on the clavicles. It fends out a production on each fide from above downward, and from without inward, which having paffed over the fuperior extremity of the mufculus maffoideus, it runs behind that mufcle toward the transverse apophysis of the vertebræ of the neck, where it communicates with the ligamenta intertransversalia. See PERICRANIUM. ligamenta intertransversalia. See Pericranium.

The bead comprehends the cranium and the face; the cranium is diftinguished into the upper and lower parts. The bass of the skull externally is very uneven, internally it is divided into three pair of cavities, and one azygous cavity. The first pair are above the orbit, in which the anterior lobes of the cerebrum are placed; and the next pair contains the middle lobes; the posterior pair are placed behind the foramen magnum occipitale, where the posterior lobes of the cerebellum are lodged. The azygous cavity is fituated upon that part of the sphenoide bone called the ephippium, or fella turcica, where the glandula pituitaria lies.

The bones of the upper part of the cranium are nearly the fame thickness. Where the bone is thick there is of the same thickness. Where the bone is thick there is a larger space occupied by the meditullium; where they are very thin, there is no meditullium, whence in the latter case the cranium is diaphanous, in the former opaque. The cranium is laterally depressed, which ferves to enlarge the sphere of vision, and to increase the strength of the skull on its fore and hind parts, by making them more convex, which is a necessary contrivance to prevent injuries by falls, we generally pitching on these parts, feldom on the sides. See FACIES and CRANIUM.

The best way of forming a perfect idea of the bones of the bead, is to have a skull, the bones of which are sepa-

rated by art, and another, in which they are connected,

in their proper articulations.

The nerves from the fifth pair, and the hard portion of the feventh, are distributed through the external parts of

the head.

Through the small foramina of the os ethmoides, the filaments of the first pair of nerves pass to the nose, and

are called olfactory nerves.

In the os sphenoides is the foramen opticum, through which the second pair of nerves, called the optic, pars. This hole, which is feated below the anterior clinoid pro-cess, likewise admits the branch of the carotid artery that

goes to the eye.

The foramen lacerum superius lies between the transverse spinous, and orbiter processes of the os sphenoides: through this hole the three pair of nerves, called motores oculi; the fourth pair, or pathetic; the first branch of the fifth pair; the whole fixth pair, except one reflected branch;

and an artery from the internal carotids, pass to the orbit.

Behind the last mentioned hole, in the same bone, is the foramen rotundum, through which the second branch of the fifth pair of nerves, called the fuperior maxillary

nerves, pais to the bottom of the orbit.

The portio mollis of the feventh pair of nerves, called

the auditory nerve, is distributed to the meatus auditorius internus; the portia dura comes out by the aquæduct.

The eighth pair of nerves, called the par vagum, pass out by that common hole, between the temporal and occipital bones; where likewise the internal jugular vein, which is a continuation of the transverse finus, goes out of the cranium

The ninth pair of nerves pass through the holes of the

occiput, above the condyles.

The tenth pair of nerves pass through the foramen magnum, where likewise the vertebral arteries enter. The external eminences are, the two maftoid processes, the two styloid processes, the two condyloide processes, the two pterygoid, the two arches called zygomata, the external spine of the occiput, the condyloide and coronoide apophyses of the lower jaw.

The principal uses of the bones of the head are, to contain the head to be the fort of the arrange of sufficient

tain the brain, to be the feat of the organs of fenfation, to ferve for mastication, respiration, and the formation of

the voice.

Lancist's tables of the bones of the bead are good ones. See Winflow's Anatomy, or Monro's Ofteology. CAPUT, is the bead of a plant. See CAPITA, also a

a process. See Processus.

—— Contutiens. This muscle is the first of the intertransversales colli, to which some have given this

— GALLINACEUM. See ONOBRYCHIS. — MONACHI. See TARAXACON.

-- MORTUUM. A DEAD HEAD. In chemistry it imports the dry freces left in a veiled after the moifture hath been diffilled from it. It is also called terra damnata, and terra mortua. The earthy part of moift bodies serves as a basis to the other principles; it is that which brings them together, which unites them, and which gives to them their solidity. When the active principles are extracted, it is called caput mortuum. It hath the name of caput, before the separation, because it contains the foiritums and effectial parts of because it contains the spirituous and effential parts of the mixed, even as the head of an animal contains its fubtle parts; and afterwards it receives the epithets of rates and floats on the furface: it is confiderably aromortuum and the term terra damnata, to shew that being rived of these active principles, it is not capable of producing any effect. Lemery Chem.

— Obstitum, so Tulpius calls the way neck. See

CERVIX. It is a kind of contractura .- PURGIA. A barbarous word used by some to signify such external remedies as purge the head. These are either errhines or masticatories.—VITULI. See ANTIRRHINUM.

CAPUBEBA BRASILIENSIBUS. A fort of grass growing in Brasil, two or three feet high, with reddish

Raii Hift.

CARA BRASILIENSIBUS, called also igname, inbame; a fpecies of convolvulus. Ray mentions three kinds of it. Befides it is a name given by the old Roman authors to a plant with large and esculent roots. foldiers of Cæsar are said, in some of their marches, when diffressed for provision, to have made a fort of bread of this root; and P. ÆGINETA and DIOSCORIDES inform us that this plant was of the pastinacha, or parfnip kind. It was probably the elophoboscum, or wild parfnip, which has roots long and thick, and of as good a tafte, as those cultivated in gardens, only they were not quite fo tender. It is supposed that our word carrot is derived from this CARA. Chambers's Encyclop. by Rees.

CARAB, a pop. CARABACCIUM LIGNUM. The wood taftes like cloves, but very mild, and quite grateful, of a cinnamon colour. It is brought from India, but not much known in practice. Baglivi fays, it corrects acrimony, and a feorbutic diffolution of the lymph. See Cassia Caryo-

CARABE. See Succinum.

CARABE FUNERUM. See BITUMEN.

CARABE, TROCHISCI, i. e. pulv. e. fuccino comp.

CARABUS. This word is variously understood; with fome it fignifies an infect of the beetle kind; or those which are bred in dried woods, and belong to the fcara-

wards to the fella turcica, and fo to the clinoid processes, baci; with others, the eray-fish; and sometimes it is used for the locuita marina:

CARACALLA. The name of a species of American

CARACOSMOS. A name of the four mare's milk which the Tartars fo much admire:

CARAGNA: See CARANNA.

CARAGUATA ALOE BRASILIENSIS. The
COMMON ALOE of BRASIL. Some species of it grows
among the rocks; one species of it affords better cloth
than flax does: If the root, or fresh leaves are bruisfed, and thrown on the furface of the water, fifthes are fo in-fatuated by it, as to be eafily taken by the hand. There are feveral species, as the carag. guacu, carag. acanga, &c. Raii Hift.

CARAINAMBI. A fpecies of cara.
CARAMBOLAS. This tree bears fruit three times in a year. It grows in the East Indies. To its different are attributed as many medical virtues. Raii Hift. CARAMBU. A species of lysimachia growing in

CARAMENO. See Hyboucoumu Americanus. CARANAIBA. A fpecies of palm or date tree. CARANDAS AURUBA OVIEDI. A fhrub grows

ing in the Indies, with leaves like the arbutus; its fruit is blackifh, and finged like an apple. Raii Hift.

CARANNA, also called Caragna Brelifts. It is a concrete refinous juice brought from New Spain, and

other parts of America, in little maffes, rolled up in the leaves of flags, outwardly of a dark brown colour, in-wardly brown, with a caft of red, variegated with irregular white ftreaks, fomewhat foft and tenacious as it first comes over, but in length of time growing dry and friable. The whiter the gum, the better it is, especially if of the confistence of a plaster. Its virtues are the same as those of tacamahaca, but more efficacious. It hath an agreeable fmell, with a bitter and flightly pungent tafte. Rectified fpirit diffolves three-fourths of it, and water diffolves all the reft, except the impurities. By diffillation it affords much effential oil, of an orangecolour. It is fragrant, and, to the taste, moderately pungent. If the spirituous tincture is inspissated, it yields a tenacious refin, and an oily matter, which fepamatic, and moderately bitter. Etmuller fays, that this gum is ufeful against pains in the stomach, and in the joints, if fpread plafter-wife, and applied thereto. See Lewis's Mat. Med.

CARA NOSI. See VITEX. Also an Indian shrub

called negunds.

CARANTIA. See SILIQUA DULCIS.

CARANTIA. See SILIQUA DULCIS.

CARANTIA SEE SILIQUA DULCIS.

CARANTIA SEE SILIQUA DULCIS.

CARA-SCHULLI, Frutex Indicus fpinofus: An Indian fhrub like the caper-buth. A decoction of the root provokes urine. Raii Hift.

CARATA. A weight called a carat or karat; gold, filter, and all plate, is weighed by carats. The pound

filver, and all plate, is weighed by carats. The pound weight is divided into twenty-four parts called carats; and the ounce is divided into twenty-four parts, which are alfo called carats.

CARAVATA. See CACAO.
CARBASUS. Scribonius Largus uses this word to fignify the thin linen, or foft threads, on which the furgeons fpread their ointments, &c. i. e. LINT.

CARBO. A COAL. The charcoal is generally under-

flood by this word, when foffilis is not joined with it.

It is also a name of the carbunculus.

CARBO FOSSILIS. PIT-COAL, or SCOTCH-COAL. Hoffman fays, that when it is analyfed by diftilling in a retort, over an open fire, it first yields a phlegm, then an acrid fulphureous spirit, then a subtil oil, then a groffer oil, which falls to the bottom of the receiver; then by a brifker fire, an acidulated falt like that of amber; in the retort there is left a black earth that is light, and which, on the application of fire, emits neither flame nor fmoke. The gross empyreumatic oil contains a quantity of mineral fulphur: thus coal, as all bitumens are, is an oleous fulphureous acid, with fine alcaline parts.

These coals are only used for the advantage of their heat, by burning them in floves; but for fome purpofes

is, they are charred, or reduced to coaks: this is effected the Greeks anthraces. by a method fimilar to that of making charcoal of wood: by this operation they are deprived of their phlegm, their acid liquor, and much of their fluid oil.

Charcoal, or vegetable coal; that is the coal into which wood is converted by the following process:

Pieces of wood are fo disposed as to form a pile, generally conical, this pile is covered with turf, to prevent the too free draught of air, by which the wood would be reduced to ashes, and not to coal. The pile is then kindled, and the fire continued till the watery and the more volatile parts of the wood are diffipated, that is, till no more fmoke arifes, at which time the wood is thoroughly red hot. The external air is then to be totally excluded by covering the pile with earth, and thus the fire is extinguished.

In chemistry, by the word coal is understood any substance containing oil, which hath been exposed to fire in a close veffel, so that all its volatile principles are expelled, and that it can fustain a red heat without farther decomposition. This coal is an unalterable compound, in every instance except of burning in open air, and of communi-cating its phlogiston to other bodies. There is some dif-ference in the different coals obtained from various substances, but they all consist of an earth, which is not perfectly refractory, of a faline matter, which is fufible, and affiits the fufion of other fubstances, and of phlo-

The vapours that arise from both fossil and vegetable esals, are extremely pernicious, producing a species of apoplexy in those persons who are exposed to them. They produce at first a sense of uncasiness, then a chillnefs, fickithnefs, and kind of head-ach, which ufher in a lofs of fenfe, a fixednefs of the eyes, a rigidity of the whole body, a ghaftly countenance, a finall frequent and irregular pulfe, feverifinefs, &c.

In this cafe the noxious vapours act on the brain and pervess, and not as here been conventional.

nerves, and not, as has been generally faid, on the lungs; these vapours, and those from fermenting vegetables, putrifying animal fubitances, or from caverns, operate in the fame manner; and as accumulated and con-fined, their effect is more or less instantaneous. They attack the vital principle, and extinguish it if they are copious; and a leffer quantity produces the fymptoms of a debility in the nervous fystem. To prevent suffering from this cause, avoid close rooms where these substances are burning, and never enter their repositories but when a candle will continue to burn there.

In order to the cure, expose the patient to the open air; if the patient can swallow give him acidulated liquors; if he is infensible throw cold water on his face; strong vinegar may be rubbed about his nostrils, and held under them; blood may be taken from the arm; as soon as possible make him swallow cold water, with vices are in the control of th with vinegar in it; stimulating clysters are useful: to remove the fpasms, the sps. ætheris vitriolicus compo-fitus, with small doses of opium, will be proper. If these fail, let a strong healthy person breathe forcibly into the mouth of the patient, so as to distend his

See the Chemical Dictionary, Newmann's Chemical Works, Shebbeare's Theory and Practice of Physic, and Percival's Essays, Med. and Exp. vol. ii.

CARBO. See CARBUNCULUS.

CARBOS. CANAL COAL. See AMPELITES.

CARBUNCULUS. A CARBUNCLE, from carbo, a burning coal. It is called carbo, antbran, antrax, and pruna. Paulus Ægineta fays it is a crufty ulcer, beginning for the most part with a pustule like a burn, and fometimes without it; at first the patient scratches the part, whence arises one or more pultules, fmall as a grain of millet, which breaking becomes a crusty ulcer, as if it was produced by an actual cautery; the crust is rather of an ash colour or blackish, it adheres, and is fixed on its base to the part, and spreads by its phagædenic property; the siesh all around is inflamed and black, and thines like bitumen. Heister says, a carbuncle is an inflammation, which, in pestilential times, rises with such vesicles as are the usual effects of a burn; this inflammation, for the post says fordingly described to the post of th mation, for the most part, suddenly degenerates into a sphacelus, and corrupts the subjacent parts to the very bones, rendering them as black as a coal; and this feems

they undergo a process previous to their being used, that to be the reason why the Latins call them carbunculi, and

In the Edinb. Med. Commentaries, vol. vi. p. 165. it is observed that carbuncles are a gangrenous spot upon the fkin, having the appearance of a burn, with red, livid, or black veficles, bounded by an inflammatory ring, which foon terminates in a hard black efchar. The anthrax, an affection of somewhat the same nature with the carbuncle, only the former is more prominent, penetrates deeper into the adipofe membrane, and occasions a higher degree of pain and inflammation.

Dr. Cullen places it as a variety of phlogofis crythema. Carbuneles generally break out fuddenly and unexpectedly, in an hour or two at the most, and are attended with pain and heat. As foon as it is opened, it difcharges a livid fanies, or fometimes limpid water. It is black within, which is a fign that the fphacelus hath feized the fubjacent flesh, and is making its progress. In those that recover, a feparation is made betwixt the found and the difordered flesh, by means of a suppuration. There is no part of the body but what may be the seat; and they are generally attended with buboes. The proximate cause is the inflammation from the pestilential contagion. Danger is great when the colour is livid; the milder fort are first red and then yellow. When they are seated on the sace,

neck, breaft, and arm-pits, they are generally fatal.

Heifter also observes, that the cure by internal medicines will be best effected by such medicines as free the habit from the pestilential disease which causes these ulcers. Heifter's Surgery, Bell on Ulcers, edit. 3. p. 97—99. Kirkland's Med. Surgery, vol. i. 320, vol. ii. 280, 389. Pearson's Principles of Surgery, vol. i. 136. White's

As to the external means, one object should engage the attention, viz. to appeale pain as much as pollible; none therefore but the loftest, most lenient, and ano-

dyne or relaxing can be proper-

Van Swieten describes another fort of carbuncle in his Comments on Boerhaave's Aph. and fays, it is an ulcer, which, when after a violent and commonly very painful inflammation, there happens a rupture of the fkin in feveral places, and fragments of the corrupted paniculus adipolus are difcharged at its orifices.
CARCAPULI FRUCTU MALO AUREO ÆMU-

LO CODDAMPULLI. The Indian YELLOW ORANGE-

TREE of MALABAR.

It is a tall large tree, with yellow flowers, and large round fruit, that is ribbed and whitish when ripe, of an agreeable acid and sweetish taste, and with feeds of an azure blue colour. This fruit recovers lost appetite, and is restringent. It is also called gboraka.

—— LINSCOTANI. This differs from the above in its flower and fruit. The fruit of this species is sweet, round, and of the five of a cheere. It is also called boxes.

round, and of the fize of a cherry. It is also called kanna ghoraka. They both afford the gamboge, but this latter the best. Though this is not the common gamboge which is from a plant of the effula Indica kind. See GAMBOGIA.

CARCAROS. A SORT of FEVER. See QUER-

CARCAS. The BARBADOES NUT-TREE. See CA-

CARCAX. A fpecies of poppy, with a very large head.

CARCER. Paracelfus means by it a remedy proper for reftraining the diforder by motions of body and mind, as in curing the chorea fancti Viti.

CARCHARIAS, from \*\*xay xay\*\*, frarp. The fhark is thus called because of its sharp teeth. See Canis

CARCHESIUS. The name of fome bandages noticed by Galen, and described by Oribasius. Properly it is a top of a ship's mast.

CARCHICHEC TURCARUM. The BLUE FRIM-

ROSE, carchichec, fignifies in the Turkish language from-flower, and this flower is so called because it raises itself above the fnow in winter. It is of various colours, fome

are blue, others white, purple, carnation, &c Raii Hift.

—— POLYANTHUS. A PRIMROSE of CONSTANTINOPLE, which bears upon one ftem a multitude of flowers, diffused in the manner of an umbrella, lefs than the preceding, but as various in its colours. Raii

common knot-grafs.

CARCINODES. A tumor refembling a cancer.

- CHOIR ADES: Strumous fwellings of a malignant quality, painful to the touch, and exasperated by medicines

CARCINOMA, and CARCINOS. See CANCER. It femetimes fignifies the cancer only in its ulcerated flate; or cancerous ulcer, however produced.

CARDAMANTICA. A fpecies of fciatica creffes.
See LEPIDIUM; and also CARDAMINES.

CARDAMELEUM. The name of a medicine men-

tioned by Galen

CARDAMINDUM MINUS. INDIAN CRESSES. Sec.

NASTURTIUM INDICUM:

CARDAMINES, also called cardamantica, nasturtium Equaticum, flos culi, iberis, herba veteribus ignota, fophia; MEADOW-CRESSES, LADIES-SMOCK, and CUCKOW-FLOWER. The cardamines pratentis, or cardamines foliis pinnatis foliolis radicalibus fubrotundis: eaulinis lanceolatis. Linn.

This plant grows about a foot high, its lower leaves are pinnated; each leaf confifts of four or five pair of fmall, roundish pinnæ, not always set directly opposite, having one fingle, that at the end larger than the reft; the stalk is smooth and round, bearing leaves which are lefs, and have narrower pinnæ. The flowers grow feveral together at the top, each confifting of four roundish leaves of a white colour, or, in some plants, having a dash of purple, with darker veins running through them. The feeds are small and reddish, growing in long slender pods. The root is small and sibrous. It grows

in meadows, and flowers in April.
Sir Geo. Baker confirms its ancient character of being antifpafmodic and anti-epileptic, fee Lond. Med. Trans. vol. i. p. 442, &c. where he relates the cafe of a spafmodic afthma, that relifted all other means, being cured by taking the flowers of this plant, at first 9j. twice aday, by which relief was had; and afterwards 3 fs. twice a-day, by which the cure was perfected. The chorea fancti Viti was cured by 3 fs. twice a-day. The cafe was obstinate while other means were used, but foon gave way to these showers. To these he adds a case in which the palfy, a difficulty of fwallowing, and convul-fions were complicated; and though these diforders had been of long standing, relief was obtained by 3 fs. of these flowers taken twice a-day. He farther observes, that thefe flowers improve the appetite, that 5j. hath forceeded as an antifpalmodic, where opium, camphor, and valerian failed; and that they have been given to 3 i. fs. three times a-day.

Linneus observes, that these flowers are pungent to the tafte. Diofcorides fays, they are warm and diurctic.
Galen, that they refemble water-creffes in tafte and virtues. Dale, that they are anti-spasmodic; and Dr. T.
Robinson, that they are powerfully anti-epileptic.
Dr. Cullen mentions this plant, and particularly its flowers to be far inferior to several other of the fili-

quose in the fensible qualities, so much so that he should not have thought of taking notice of them, as fubjects of the materia medica, but on the authority of fir Geo. Baker, referring to his paper on this fubject above quoted.

---- PUGILLA SAXATILIS MONTANA. A Species of

nasturtium.

CARDAMOMUM. The COMMON OF LESSER CAR-DAMOMS, called alfo elettari, cardam. minus, and cardam. fimpliciter. The leffer cardamon feeds are the produce of the ammum cardamsmum, or amonum feapo fimpli-cissimo brevissimo, bracteis alternis laxis, Linn.

Gardanians are a dried pod, with feeds, brought from Malabar in the East Indies; the best comes from Comagenc, Armenia, and the Bosphorus. They grow also in Arabia. These pods are divided internally into three cells, in each of which are two rows of triangular feeds, of a brownith colour on the outlide, and white within.

The plants grows in the form of our reeds.

Sem. cardam. min. The leffer cardamons have short

triangular hufks, scarce half an inch long. The feeds freed from their hulks are a grateful aromatic, warm but not fiery, and not fubject, like the peppers, to create immoderate heat. The hulks should only be separated

CARCINETHRON. A name in Oribatius for the spirit, and nearly so to water. In distillation with water a large quantity of effential oil rises; it is pungent to the tafte, and fmells ftronger of the feeds; the remaining decoction is bitter and mucilaginous, but void of the flavour and warmth of the feeds. A fiprituous tinc-ture, when evaporated, leaves the virtues of the feeds almost all in the extract, which is more grateful than the feeds themselves. All the spirituous preparations are more agreeable than the watery.

Tinctura Cardamomi. TINCTURE of CARDAMOMS.

Take of the smaller cardamom seeds, freed from their hulks, and bruifed, three ounces; of proof spirit of wine, a quart; digest for eight days, and strain. This tincture policileth all the virtues of the feeds; and among all the aromatics there are none that answer so well, in general, at this tincture, for rendering mineral waters, and other faline liquors, eafy and agreeable in the flomach.

Tiettura Cardamomi composità. Compound Tincture of Cardamoms. Formerly Tinctura Stomachica.

Take of fmaller cardamsm feeds, hulked, carraway feeds, coehineal, of each, powdered, two drams; cinnamon, bruifed, half an ounce; raifins, ftoned, four ounces; proof fpirit, two pints; digeft for fourteen days, and firain.

CARDAM. MAJUE. The GREATER CARDAMOMS. The amomum granæ paradifi, Linn. Their pods are about an inch long, triangular, and with two rows of feeds in each. The hulks are tough, and thicker than those of the lesser kind. They grow in Java and the East Indies. They are not in use, being much weaker, though of the same nature, than the lesser fort. That called — Medium, grows in pods of a round figure, but being much weaker than the lesser force is a not in use.

but being much weaker than the lefter species, is not in use.

Miller's Bot. Off. Dale. Cullen's Mat. Med.

—— PIPERATUM. See PARADISI GRANA.

—— SIBERIENSE, INDIAN, OF STELLATED ANISE. See Anisum Indicum.

CARDEGI INDI. INDIAN LEAF. See FOLIUM. CARDIA. So the Greeks call the heart; but now the word is generally used for the left orifice of the Romach, hence the name of the diforder called cardialgia. Sometimes it means the pith of a tree. The ancients called a fyncope also by this name, when it was caused

CARDIACA HERBA: MOTHERWORT. It is also called agripalma gallis, marrubium, and cardiaca lycopus, Rucllii. It is the leonurus cardiaca, Linn.

It is called eardiaca, because it relieves in faintings and diforders of the stomach, particularly in children, and in hypochondriaes. It is a large plant, with fquare branched ftalks, the leaves fet in pairs on long pedicles at the oints, and the flowers in clufters round the upper joints. The leaf is dark-coloured, cut deep into three sharppointed, indented fegments, of which the middle one is the longeit, and the two lateral ones commonly again deeply cut. The flower is purplift, labiated, with the upper lip long and arched, the lower flort, and cut into three fections. It is biennial, grows waste in wild grounds, and flowers in July.

It hath been famed in diforders of the flomach, proceeding from thick phlegm. It loofens the belly, promotes perfpiration and urine, also the uterine purga-tions. Its sensible qualities are such as give us to expect these effects from it. The leaves and tops have a strong, rather a difagreeable fmell, and a bitter tafte. By keeping, or by boiling, the difagreeable fmell is diffipated. An extract of a pungent bitter, subfaline quality is obtained by evaporating the watery decoction. But an infusion of the tops before it flowers, is the best preparation See Dale, Miller's Bot. Off. Lewis's Mat. Med. CARDIACA. In pharmacy it fignifies constitute, and is

also named cordialia, analeptica, confortantia, conforta-

The word cordial is of a large extent. Things of very opposite natures may prove cordials, by relieving the same fymptoms, when opposite causes produce them. To understand their operation on the body, it is necessary to consider, that a langour or faintness must be the consequence either of what oppresses, or else of what exhaults the vital powers; that which retards the progress of the at the time of use, for the feeds lose much of their the vital powers; that which retards the progress of the flavour if taken out. They give out all their virtue to vital principle in our frame, or is an impediment to its

to the fibres; thus, under an oppression of spirits from heat, when no extraordinary action, or indisposition of body, hath exhausted them, a glass of cold water is a cordial; for it stimulates the fibres, and rouses them to their wonted action: and when from violent exercise, or a tedious difease, a person faints, warm medicines, or aromatic and spirituous liquors, are also cordial, by pro-ducing in us the same effect. But in general by cordials is understood, those preparations, whose warm and active parts immediately, on being received into the ftomach, produces a chearfulness in us, with increased strength. Valcarengus says, that a cordial is whatever destroys, or at least blunts, the force of the morbific cause, restores the loft tone of the folids, and gives due motion to the fluids, and by that means procures a just equilibrium, which is the only and lasting principle of all the mo-tions in our body. It should be observed, that weakness arifes from a redundance, as well as a deficience, in the constituents of health: whence from this definition of cordials, opposite means assume the same character, for thus they both are cordials, by opposing the cause of langour.

CARDIACÆ ARTERIÆ, & VENÆ. See CoroNARIÆ ARTERIÆ, & VENÆ.

CARDIACUS MORBUS. So the ancients called the

THE CARDIACA PASSIO. The CARDIAC PASSION. It is a disorder that is frequently mentioned by the ancients; but by the moderns, it is mostly treated of under the name of fyncope; and, indeed, from the description which the ancients give of a cardiac paffion, it may well be referred to that article. The name cardiaca paffio is from the part supposed to be affected. Coclius Aurelianus fays, " that this diforder, according to fome, denus fays, "that this differer, according to tonic, derived its name from the part affected; for they imagine that the heart is the principal feat of it." Soranus declines the giving a definition, and fays, "that there is no perceptible fign of any tumor about the heart," which fome fuppose, and he afferts, "that it is a quick and inflantaneous folution, or relaxation." Hippocrates mentions this diforder in his first and second book of Epidemics. Erafistratus also speaks of it in his books concerning the belly. Artimedorus Sidenfis fays, it is a tumor about the heart: but by the account which Cœlius Aurelianus gives of it in his Acut. Morb. lib. ii. he feems to

describe the syncope very clearly and accurately.

CARDIALGIA. The HEART-BURN, from \*ap\$ia, the left orifice of the stomach, and about, to be pained; pain or uneafiness about the upper orifice of that organ. It is fometimes the fame as cardiogmus; and an inflance of

dyfpepfia.
This diforder is called soda, beart-burn, or fpurious eardialgia; pain in the stomach, or the true cardialgia, alfo cardimona. In the fpurious kind the pain is not fo great, nor does the strength fail, nor is there any toffing, or remarkable inquictude. In the true, there is pain in the stomach, or about its orifices, but generally felt about the part called the pit of the flomach; it is attended with great anxiety, difficulty of breathing, want of flrength, inquietude, reaching to vomit, coldnefs, and trembling of the extremities. Sometimes the uncafy fenfation extends the whole length of the cefophagus, with a preffure or constriction, and usually attacks by fits.

Some fay that the upper orifice is the feat of this dif-order, others that it is in the lower; and this latter is very probable, for the uncafinefs is generally perceived in the ferobiculum cordis, where the lower orifice of the stomach is placed; the rest of the stomach may be affected from the pain in its orifice. In those who have died

of this diforder, on diffection the right orifice only hath appeared to be in an unnatural state.

Those whose stomachs abound with acid, or with bilious diforders, are the most subject to these com-

plaints.

The causes are various, as flatus, acid, and other acri-monious humours in the stomach, or a loss of its mucus, fpicy and pungent aliment, worms, a transition of rheu-matic or of gouty, &c. humours to the stomach, or an ulcer in any part of it; fat aliment, especially if cold fmall liquors are drank too toon after cating it; ontous atter, which is known by bitter and naufcous cructations, as the fpt. æth. nitrofi, acid. vitriol. dilutum. fpt. febrifug. fmall liquors are drank too foon after eating it; bilious

influence, produces the fame fensation as a diminution of as well as by a yellow or greenish discharge by vomiting; it does. In both these cases, medicines of opposite congestions of blood about the region of the stomach from natures produce the same effect, that is, they add force a plethora, or from spasses. Dr. Hunter thinks this disorder is generally caused by fumes arising from acrid hu-mours rather than from the humours themselves: his reason is, because if the patient puts himself into a posture to prevent the sumes rising to the part affected, immediate relief is generally found. A spasm in the orifices of the stomach, by which the vapours are impeded in their passage from this viscus, and by the heat of the part rari-fying the air, produces a distension, anxiety, &c. anger, particularly after meals; corrofive poisons; stones in the gall-ducts, or in the ureters, by sympathy produce this difease in the stomach.

Those who labour under this complaint, have an uneafy fenfation in the ftomach, anxiety; heat which extends fometimes up the cefophagus; opprefion, faintnefs, in-clination to vomit, a difcharge of clear lymph from the flomach, the mind feems difturbed; there is a difficulty of breathing, lofs of flrength, coldnefs of the extremities, of breathing, lots of iteragua, colonials of the extremites, frequent eructations, which, while discharging, alleviate the pain; head-ach, vertigo, trembling, a weak pulse that is intermitting and unequal; the face is pale, yellow, or livid, &c. More or less of these symptoms are the attendants of the cardialgia, which approaches generally with yawning and littlessies, and at its height the extremities are cold. It does not quit the patient till heat returns into the feet, and it often totally vanishes with a

copious perspiration.

The cardialgia must be distinguished from that oppression and uneasiness in the stomach, which is only the effect of overcharging it with food, the colic, and a

fwooning.

If this diforder succeeds a fever, with petechial or pur-ple spots, it is generally a fatal sign; following a cestation of pain in gouty limbs, manifests the turn of the disorder inwards, which is dangerous. If it succeeds foul exulceration in the skin, there is much danger. Coming on upon a sudden check of a dysentery, it is a bad sign; but, except it is attended with insammation, or the consequent of fome other disease, it is rarely dangerous.

In order to the cure, it should be considered, whether or no the diforder is symptomatical; if it is, regard must chiefly be had to the primary diforder; if it is an original complaint, its various causes must be adverted to, that the remedies may be adapted to the particular one in the

present case.

The diet should be light, generally of the animal kind; what is drank should not be apt to ferment; brandy and water, or water in which toafted bread is fleeped, generally agree; or camomile tea, which fooths the fpaf-modic motions of the stomach. Lime-water, the mineral alkaline waters, and diffilled water, are proper for common drink-

If acid juices in the primæ viæ are the cause, absorbents and mild alkalines will be the remedies, and of these the mixtura cretaces, magnesia alb. with small doses of the

natron pur. are elegant and efficacious.

If with acidity the digefton is weak; befides the magnetia at proper intervals, bitter infusions mixed with mild aromatics will be proper, and chalybeates, particularly the rubigo ferri-

Acrimony of any kind is relieved for the prefent by cold water, in which gum arabic is diffolved. If the acrimony is of the acid kind, it produces a gnawing darting pain;

if of the alkaline, a burning pain.

When an alkaline acrimony, or an acrid hot bile, thrown into commotions by an excess of anger, is the cause, the faulty matter should first be evacuated by stool: nitre in fmall dofes, frequently repeated, will be neceffary; a draught of cold water may now and then be given, and stupes, wrung out of a warm fomentation, may be applied to the stomach, until a general perspiration comes on; this will be useful when a cardialgia accompanies a cholera morbus; when this disorder from this cause follows a tertian fever, the cure should commence with an emetic; when a vomiting attends a bilious cardialgia, awoid hot tarminatives, but fupply the patient with fps. wtheris vitriolicus compositus, in due doses, and as frequently as the urgency of the fymptoms require.

In general, in any of the cases of alkaline acrimony, after an emetic, a gentle cathartic, or both; acids, fuch Di. Clutton. fps. ætheris vitriolici compositi, diluted with water, or other fmall liquors are indicated.

If from falt aliments, warm water should be drank, and after it a little of any spirituous liquor.

If aromatics or high seasoned food is the cause, frequent draughts of warm water give the speediest and most effectual relief.

When an undue use of spirituous liquors creates this disorder, the bark and vitriolic acids, before and after meals, moderate exercise, and the mineral alkaline waters, are the best means of recovery.

When flatulence with a weak flomach are the chief causes, carminatives, such as flor. cham. vel cort. aurant.

3 fs. ad 3 j. gives much relief, but mild opiates are often to be preferred.

The fedentary and studious are subject to this disease from a laxity in the stomach, when the habit in general is robust, in this instance the cort. Peruv. pulv. 3 fs. vel sem. finap. non contuf. cochl. mediocr. bis terve in die; vel 3 i, his terve in die; or if these fail, warm bitters, and the fetid gums joined with light chalybeates generally succeed.

When worms produce it, avoid all the acrid anthelminties; give warm milk, mint, penny-royal, or any other fimple diftilled water.

In hyfteric or hypochondriae cardialgias, light infusions of the bark, with rhubarb, and small doses of fixt alkaline falt, the chalybeate waters, and exercise on horseback should also, if possible, be used. In hypochondriac cases nitre is often useful.

When a congestion of blood, from impeded or suppressed periodical evacuations, give rife to this complaint, bleed, give antifpafmodics, and endeavour to promote

their due discharge.

Surfeits are fometimes the cause, in which case, after a vomit, give camomile or carduus tea; and if the diet was putrid, let vinegar and other vegetable acids be taken.

Violent vomits, draftic purges, and caustic points produce this disorder, and when these are its cause, give plendred to the cause of the

ty of warm water to promote two or three discharges upwards, then milk and water and oily mixtures, with fmall dofes of fome warm opiate.

Clyfters are ufeful auxiliaries in all the cases of this kind.

Gouty, &c. matter in the ftomach, causing this com-

plaint, is to be removed by warm cordials, taken in mo-derate quantities, until the flomach itself becomes warm: how much will do this the feelings of the patient alone can determine.

External applications for abating pain in the ftomach, if this diforder feems to be in the upper orifice, are best applied to the left side of the eighth or ninth vertebra; and in other diforders in this part, as nausea, vomiting, &c. they are most effectual when laid on the left fide, towards the back, and on the spurious ribs.

CARDIALGIA INFLAMMATORIA. INFLAMMATION in the STOMACH. See GASTRITIS. - SPUTATORIA.

The fame as Pyrosis, which fee.

CARDIMELECH. A fictitious term in Dolæus's Encyclopedia, by which he would express a particular active principle residing in the heart, appointed to what we call the vital functions.

CARDIMONA. Sec CARDIALGIA.
CARDINALIS FLOS. The CARDINAL FLOWER.
It is called also trachelium Americanum, American THROATWORT: it is thus called from the intenfe redness of its flower, which vies with the cardinal's fearlet robe. See RAPUNTIUM.

CARDINAMENTUM, from cardo, a binge. An hinge-

like articulation.

CARDIOGMUS, from xapstusses, to have a gnatwing pain at the mouth of the stomach. The same as cardialgia. Also an ancurism in the aorta near the heart, which occasions pain in the praccordia.

CARDIONCHUS. Ancurism in the heart, or in the

aotta near the heart.
CARDIOTROTUS. One who hath a wound in his

beart. CARDITIS. Inflammation of the heart. Dr. Cullen includes this genus of difease in the class pyrexia and or-der febres. He defines it to be a sever, with pain in the region of the heart, anxiety, difficulty of breathing, cough, unequal pulse, palpitation of the heart, and fainting. See INFLAMMATIO CORDIS.

CARDO. The articulation called ginglymus is fometimes thus named, because of its similatude to an hinge.

CARDONES. The name of an Indian herb.
CARDONET. A WILD ARTICHORE. See CINARACARDONIUM. In the phrase of Paracelfus, it is a wine medicated with herbs.
CARDOPATIUM. The LOW CARLINE THISTLE.

See CARLINA

CARDUO-CNICUS. See ATRACTYLIS.

CARDUUS. The THISTLE. The general characters of which are as follow: the leaves are fet alternately on the branches, and are prickly; the heads are mostly fquamous and prickly; prickles are on most or all parts of the plant, and they are mostly lackescent.

But the modern botanists so vary in their arrangement,

that each reject some which others rank in this class.

Boerhaave hath thirty species in his catalogue.

CARDUUS BENEDICTUS. The ELESSED OF HOLY THISTLE, also called carduus enicus sylvestris, cardui lutei procumberis sudorifici & amori. It is the centaurea tomodifica or the contaurea benedicla, or the centaurea calycibus duplicato ípinolis lanatis involucratis, foliis femidecurrentibus denticulatospinosis, Linn. It is a plant with rough, narrow, jagged leaves, fituated alternately, terminating in fost prickles, and large hairy branched stalks, leaning to the ground; on the tops of which grow large fealy prickly heads, in-cluding a number of yellow floredli, which are followed by oblong ftriated feeds inclosed in down. It is a native of Spain and some of the Archipelago islands, and is annually fown with us in gardens.

The leaves have a penetrating bitter tafte, not very ftrong or durable in the mouth; when fresh they are more ungrateful than when dry. The plant should be hung up loosely in an airy place after it is well dried, for if pressed close it rots. The best time for gathering it is when in

flower.

When this herb is used to excite vomiting, a decoction of it in water is the best, for thus its more nauseous parts are extracted; cold water in an hour or two extracts the light grateful bitter; but if the infusion is continued much longer, the naufeous part is also extracted; rectified spirit extracts only the agreeable bitter, but, though heated, it

does not eafily take up the offensive parts.

The slight infusion with cold water helps the appetite, and is useful when the digestive powers are weak; it fits eafy on the ftomach, and no bitter is lefs heating. Dr. Cullen thinks this plant a fimple and pure bitter, though not a very ftrong one; and therefore has none of the extraordinary virtues afcribed to it. An ounce of the dried leaves may be infused two hours in a pint of fost water; it may be flavoured at pleafure with any aromatic. It may be made stronger by returning the liquor on fresh parcels of the leaves or tops. It affords nothing valuable by diftillation. See Lewis's Mat. Med. Miller's Bot. Off. Dale. That named—Fullonum, called also dipfacus fativus enaphos, is the manured TEASIL, or FUL-LER'S THISTLE.

It hath a ftem that is four or five feet high, branched and furnished with a few prickles; the leaves are long, armed with prickles, and fet in couples along the ftem, they encircle the ftem fo as to form a kind of bason; the ftems are terminated by large prickly heads in the form of an egg. Their chief use is among the manufacturers of woollen cloths; their prickly heads are used. - Ful-LONUM SYLVESTRIS, called also diplacus sylvesiris, labrum Veneris, virga pastoris major, WILD TEASIL, or VENUS'S BASON.

They grow on the fides of ditches and near the highways, are of the same kind as the manured, but not so ftrong.—Hemorrholdelis, also called cardus vinearum repens, cardus vulgarishmus viarum, cirsum arvense, cardus ceanothos. The common creeping WAY-THISTLE.

Its roots are whitish, but now and then incline to black, and have a ftrongish smell: it fends forth fibres that creep on the ground, and propagates itself to a great diffance: it is common in tillage ground and highways: it flowers in July and Augnst. It is called hamorrhoidalis because it relieves the pain of the hamorrhoids if beat into a poultice and applied. — LACTEUS, also called carduus Mariae, carduus leucographus, carduus Marianus, carduus, albis maculis notatus vulgaris, filybum. Common MILK THISTLE, or LADY'S THISTLE. It is diftinguished from all other thiftles in England, by having its leaves cut in feveral lacinize full of hard sharp prickles, having all the apper part spotted with long and broad white spots. It

notatus exoticus, Bedequar Arabum Rauwolfii, anieus albis maculis notatus. The Spanish MHK-THISTLE.

The characters of this and the next fpecies are, it is perennial, hath long, narrow, deeply jagged leaves, that are prickly and laying on the ground; in the middle of which grows a large roundish head, without any stalk, encom-passed with smaller leaves, which may be cat as artichokes are; the flower issues from the middle of the head.

Boerhaave enumerates feven species, also called carlina gummifera, carduus bumilis gummifera, cinafa acaulis gummifera, inine, carlina acaulos gummifera, chamaleo albus Dioscoridis, columna, and PINE-THISTLE. Its flowers are composed of purplish floseuli, like those of the common thistle. It is a native of Italy and of Candy. Its roots are larger than those of the carline thistle, and smell ftronger; if wounded when fresh, they yield a viscous milky juice, which concretes into tenacious maffes, at first whitish, and resembling wax, when much handled growing black, supposed to be the ixion, ixia, and acanthina mastiche of the ancients: this gum was formerly chewed for the fame purpoles as the mastich gum: the root hath the fame virtues as the carline thiftle roots. — Acan-Thus. See Acanthus. — Altilis. The artichors. See Cinara. — Brasilianus Foliis Alors. See Ananas. — Chrysanthemus. See Scocymus.— ANANAS. — CHRYSANTHEMUS. See Sconymus.

COERULEUS ERECTUS TINGITANUS, &c. The Tangier will not have the hardness and resistance, observable in a perennial blue distance. — Cretensibus. See Culochierni. — Domesticus. The artichoke. If the incumbem part changes to a livid colour, the bone see Cinaral. — Esculentus. The chardon. A is then without doubt in a mortifying state.

CARICA. A DRY FIG. The tree is the ficus (Carica) foliis palmatis, Linn. See Ficus Sattva. CARICUM, vel Carycum. The name of a medicine

for deterging ulcers.

It is prepared of the black hellebore, captharides, and feveral other things mixed together.

It is also the name of an oil mentioned in Athenœus,

CARIES. Mr. Sharp fays it is a partial mortification of the bone, which separates from the found part sooner or later. Dr. Cullen places this genus of disease in the class locales and order dialyses. But as Mr. Bell observes in p. 124. of the 3d. edit. of his book on Ulcers, every species of caries attended with loss of substance may be termed an ulcer; but to prevent confusion, he confiders caries as an accidental symptom of ulcers, and speaks of it under the general name of carisus ulcer-

This corrupted state of the bone is called caries, fpbace-

lus, teredon, or tredon.

This diforder happens when the bone is deprived of its

grows on banks and flowers in June. The leaves and periofteum, and having loft its natural colour becomes feeds have fimilar virtues to those of the cardaus benedictus, but in an inserior degree. It is faid to be efficacious against pungent pains. Miller's Bot. Off.—

LACTEUS SYRIACUS, also called cardaus albis maculis when the bone is corroded, dicharging a sanies which confumes the adjacent flesh. Of the many names given to the caries, as spinosa ventosa, spinosa ventosicas, gan-grene, or cancer of the bones, as Celsus calls it, or teredo and predarthrocaces, there seems to be only the following needful: first, when the cause is internal it is the spina ventosa, or, with Severinus, when it happens to children, it may be called predarthrocaccs; and fecondly, when the cause is external, it may be called corres-

That an inflammation of the periofteum is tending to a gangrene, and fo a caries of the bone is known, first, from the figns of inflammation preceding; fecondly, a freedom from pain in the affected part, without a manifest cause, and from a dense, flow, increasing, and not very painful-tumor of the incumbent parts. But among the figns of a beginning gangrene, the fudden removal of pain is falla-cious, for this happens in inflammations of the periodeum, when the perioticum is corroded fo as to admit the matter to escape betwixt the muscles, though in general, when pain is relieved by a refolution of inflammation, it goes off gradually only; but a good resolution hardly if ever hap-pens after a violent inflammation. Again, when a gangrene is threatened, the taint is propagated through the cellular membrane, which, by flight caules, is often raised into a large tumor; but, as all the fymptoms of an inflammation ceafe when a gangrene is prefent, the tumor

ancients, at least as to its cure, fays, lib. viii. cap. 3. "We may foon, by means of a probe, difeover a caries of the bone fince the probe will penetrate less or more, according as the caries is superficial or deep." When the probe comes to the found part of the bone, it is relifted. Wifeman, vol. i. p. 96. edit. 5. fays, "If the bone be bare, its corruption is easily differned, though fometimes it be covered with a grumous or viscous matter, which rubbed off, the bone appeareth white, brown, or black. If the white be porous, the caries may be deeper and more dangerous than if it were black and hard. If the bone lies fo hid as that you cannot feel it with your probe, yet you may judge it carious from the quantity or quality of the matter. If the bone lies near, and the flesh is lax and white, it is ftrongly suspicious that the bone is carious: but if the matter flinks or be oily, it is a more certain fign of rottenness. Ulcers of long continuance near a bone do also foreshew a earies, according to Hippocrates. Also the difficulty in cicatrizing them, and the frequent and fudden eruption of them after they are cured, giveth a fufpicion of a foul bone. But if the bone is much corrupted, the matter is fetid, and the probe will penetrate into it."

In living persons the bones are of a reddish or bluish colour: the first fign of a vitiated bone, is a change from this colour to a white, yellow, dark, and at last a black one: a white denotes a beginning mortification; hence, when small perforation are made in a cranium thus affected, the first sign that a cure succeeds is, when the white furface of the bone begins to assume a reddish co-

The friability of carious bones is much augmented by the acrimony of their humours, and chiefly of their corrupted medullary oil; for the cohesion of the bones depend much on the interpolition of it between the terref-

The peculiarly difagreable fetid fmell which arifes from carious bones is from the corrupted medullary oil.

When a caries is under an ulcer, the flesh over the caries is soft, flaccid, fungous, inflated, and tumid; the lips of the ulcer inverted, the fanies clear, subtil, fetid, and full of small black scales, nor can the ulcer be healed, at leaft only superficially, and it foon breaks out again. See ULCER with a caries

In the Edinb. Med. Effays, Dr. Monro gives a particular account of feveral species of this diforder, viz. The DRY or GANGRENOUS CARIES, which is, where the bone is fmooth and firm, and throws out little matter; its furface

it turns very brown or black. This kind exfoliates with lefs difficultly than any other. The WORM-EATEN CARTES or ULCER of the BONES; this species hath not such a dark co-lour as the former, it discharges more matter; the cavern-ous, or spongy texture of the bone is evident. The CARNE-ous CARLES or ulcer of the bones with hyperfarcosis; this fort differs from the worm-eaten caries only in the addition of spongy flesh growing in the cells of the bone; this spongy fleth often bleeds if touched with the greatest care. PHAGEDENIC CARIES with hyperfarcofis; in this case the periosteum is thickened, the bone softened, and its surface is croded, a yellow red fpongy fubitance fprouts out: the difference betwixt this and the carnous caries is, that in the latter the fpongy flesh grows out of the caverns while the grey or brown coloured fpongy bony fides of them still remain; but in the former, the bony fibres disappear wherever the spongy fielh comes, so that one can scarce determine by the probe whether or no the bone is carious: upon feraping away this bone-confuming flesh, the surface of the bone appears rough indeed, but not much eroded, nor greatly altered in its colour. The scrophulus Carles: this is fometimes observed when an abscess is opened; the bone at the bottom of it appears white and smooth, without its periofteum or connection to any of the neighbouring parts, except by its ligaments at the extremities; and this way of bones mortifying most commonly happens in scro-phulous habits. The SCIRRHO-CANCROUS CARIES: in one species of exostosis the tumefied bone is softer in one part than in other, and is not composed of regular fibres, nor cavernous, but as if the offifying juice had been thrown out irregularly; over which a cartilaginous or tendinous fubflance is spread, and from this a firm shining smooth flesh grows out, which, after the teguments are moved, fends forth a thin stinking acrid fanies; the patient complains often of throbbing pains in it, and fometimes confiderable hæmorrhages are made from imperceptible veffels in its furface. The SPREADING CANCROUS CARIES: in the ipreading eating cancers, the bones are wafted, as well as the foft parts, and the appearances are the fame in both, unlefs that the bones do not confume quite fo faft.

In confidering a caries of the bones we should remem-ber, that the bones have their vessels and circulating sluids, and the fame general texture which the foft parts have; fo that folidity, and a stronger cohesion of parts, are the only evident distinguishing characters of the composition of

Heister observes that the cure of a caries depends on removing eafily and speedily all the corrupted parts of the bone, and that in the gentleft cases this is done by rectified spirit of wine being applied by means of lint dipped in it; in more violent cases a solution of mercury in aqua fortis is required, and in the most malignant the actual cautery will be necessary; but these hinder suppuration, and retard the operation intended.

An exfoliation of the carious laminæ of the bone, are

fometimes feparated in two or three weeks, and in other

Inflances they are not removed in a year.

It is necessary to examine strictly all circumstances, and to discover, if possible, what cause either general or topical may have made the corruption of the bone, that endeavours may be used to remove it, if it still subsists: the lues venerea, ferophula, feurvy, gangrene, abfeefs, wounds, contufions, and many other difeafes, may be the

When the bone is perceived to separate, if the pus which flows from under it is mild and in a due quantity, it will be the belt suppurant and incarner, and nothing is to be done but to remove the pieces of bone as often as they are perceived to be loofe. If the quantity of pus is too fmall, drefs it with ung refine flave or other such digestive. If the opening in the integuments is so small that the matter detained is either absorbed into the circulation, or forms finuous ulcers, the aperture must be enlarged by means of sponge tents, and kept so by dossils of lint. Indeed, if the exsoliation is likely to be tedious, in some cases it may be hastened by the use of a caustic or actual cautery, though in general the supportation which contributes to throw off the discased part is thereby retarded, or the rasp may be used; if instead of the actual cautery a potential one is preferred, the common caustic is the best.

In the WORM-EATEN CARLES it is necessary to destroy all

at first is not of a very dark colour, but before exfoliation the affected part of the bone as foon as conveniently can be it turns very brown or black. This kind exfoliates with done, by raiping, chiffeling, trepanning, &c. according as done, by raiping, chifieling, trepanning, &c. according aw each of them can be applied; after which the method is as above. When the ulcer is deep, let honey diffolved in vinegar and water be injected into it every day.

In the CARNOUS CARIES the fungous and corrupted parts are best destroyed by a caustic; though Gouch, in his Cases and Remarks, vol. ii. p. 359. gives an infrance of the inefficacy of caufties in this cafe, and of the necessity of
using the actual cautery, which he in general prefers.

The PHAGEDENIC CARTES: one or two applications of
the potential cautery are fufficient to reduce it to the most

le kind of caries; but fometimes great difficulties at-

The scrophulous caries: deftroy fully the teguments which cover the abfeefs formed on the bone with a cauftic, cut the efchar through the middle to evacuate the matter; and to fave the eschar as long as possible, let mild applications only be laid on the fore; and to affift the dif-charge of the matter, wash it with water; but if it is fetid,

mix vinegar with the water.

In general a mild treatment is to be preferred. In the flighter cases endeavour to excite and continue a degree of inflammation in the adjoining found part of the difeafed bone, so as that it may be the means of separating the mortified part. This is done by making a number of small perforations all over the surface of the carious bone, to fuch a depth as to give the patient a very little pain, and no farther; this operation may be renewed in different parts every third day, or thereabout; thus suppuration will take place, and a confequent separation of the carrous part. But when the disease is extensive, and goes deeper than the second lamella of the bone, instead of little perforations made by the pin which fixes the trepan, it will be adviseable to use a small head of a trepan; this inftrument applied at proper diffances over the furface of the caries, and carried just so deep as to produce a little uneasiness will occasion the needful inflammation and suppuration. As foon as any of the parts loofen at the edges, their final feparation may be always greatly haften-ed by daily infinuating below them the end of a common spatula, so as to press their edges a very little upwards. After the use of these instruments, apply to the useer the fame dreflings as in cases of a simple ulcer; and, to moderate the foctor of the caries, the dressings may be covered with lint, moistened with a strong decoction of the cort. Peruv. & fol. jugland. The caries separated, dress as in cases of simple ulcers in slessy parts. If the caries penetrates very deep into the substance of a bone, so that a confiderable portion is affected, or, as frequently happens, the difease extends even round the bone, the thortest method then is to take out at once, all the difcased parts, either with the head of a trepan frequently applied, or by means of a fmall fpring-faw. This may be performed on the skull, hands, feet, legs, or arms. See the article Tibla for the process.

In the SCIRRHO-CANCROUS CARIES, in this case, as in cancers of the glands, extirpation is the only remedy; but here also the disorder is apt to return in another part. The SPREADING CANCROUS CARIES seldom heals: it

may be dreffed with lint, or a cautery may be applied; but it generally breaks out again after a feeming cure.

Some affert that fea-water is more efficacious in caries

of the bones than in glandular fwellings.

A caries of the whole bone or bones, forming a limb, is fometimes productive of the necessity of amputation; particularly when the internal furface of fuch bones are affected as well as the external, and that through the whole extent or near it. In fuch inftances, if the whole bone is not removed by amputation, the patient will perish. It too often happens that in young subjects, with the best health, the whole habit will be so injured by the carious bone, that a hectic fever of the putrid kind, with all its horrid train of fymptoms, will quickly deftroy the patient.

Monro's Account of the Caries, in the 5th vol. of the Ed. Med. Effays. Bell's Treatise on Ulcers, edit. 3. and his System of Surgery. Pott's Works. London Med. Transactions, vol. iii. p. 25.

CARIMA. See Cassada. CARIM-CURINI. An Indian shrub, the bark of which is used in a decoction against the gout; and a de-coction of the leaves against a difury. Raii Hist. CARIMPANA. A species of PALM-TREE.

CARINA. In botany it is the concave petal or fegment of the butterfly-flower, or any cavity which refem-bles the keel or lower part of the boat. With the ancient botanists it was the hard shell of walnuts.

In graffes, carina expresses the furrow-like cavity which runs through the whole length of the leaves of the cyperoides and cyperus graffes, or graminisolious plants, and end in acute angles. Sometimes by carina is understood the prominence of this furrow, which jets out on the backfide of the leaf, and runs like a nerve through the middle of it.

In zoology, it is applied to the first rudiments of the fpine of a chicken during incubation.

CARIUM TERRA. LIME.
CARIVILLANDI. See Sarsaparilla.

CARLINA. CARLINE THISTLE. The species used in medicine is the carlina acaulosi, Linn. It is also call-

ed cardspatium, ixia, chamaleon albus, acaulos magno flore, carlina bumilis, the Low Carline Thistle.

That species with the flower composed of a number of white petals fet round a middle disk, is a native of the mountainous parts of Italy and Germany. The roots have a strong disagreeable smell, and weak bitterish, sub-

CARLO SANCTO, RADIX. St. CHARLES'S ROOT. It is found in Mechoacan, a province of America: its bark is easily separated from it, and hath an aromatic flavour, with a bitter acrid taste. The root itself consists of sender shribs. The bark is sudorific, and strengthens the gums and flomach: the Spaniards call it St. Charles, on account of its great virtues.

CARMES, EAU DE. CARMELITE WATER, called alfo MAGISTERIAL WATER of BAUM. It hath its name from being invented by the Carmelites at Paris.

Take of fresh baum, fix ounces; fresh lemon peel, the

yellow part, two ounces; nutmegs and coriander feeds, of each half an ounce; bruife them and put them into rectified spirit of wine and pure water, of each a pint and a half; let them stand in a moderate heat for three days, then draw off two pints and a half in a vapour bath. Rectify the distilled liquor by a fecond distillation in a water

bath, drawing off only two pints.

Mr. Beaumé observes that all aromatic spirits ought to be prepared in the same manner; that in this rectification only the more volatile, fubtil, aromatic parts arife, there remaining behind a white liquor, acrid, bitter, and loaded with only the groffer oil, deprived of all the specific flavour of the ingredients. He farther observes that aromatic fpirituous waters have lefs fcent when newly dif-tilled than after they have been kept about fix months; and he found that the good effects of age was produced in a fhort time by means of cold, and that by plunging quart bottles of the liquor into a mixture of pounded ice and fea-falt, the fpirit, after having fuffered for fix or eight hours the cold hence refulting, proves as grateful as that which both here keep teams as that which both here keep teams as the cold hence refulting. as that which hath been kept many years. Simple waters asso, after having been frozen, prove far more agreeable than they were before. Geoffroy takes notice of this melioration by frost. See Hist. Acad. 1713.

CARMINA, VERSES: also INCHANTMENTS. See

AMULETA.

CARMINANTIA, or CARMINATIVA. CARMINA-TIVES. In general by these words are meant such me-dicines as dispel wind; the ancients had much of mystery in their practice, and celebrated these medicines by sing-ing of verses when they administered them, as they by their frequent speedy relief seemed to act as by a charm; so from carmen, the Latin word for a verse, the word car-minative is derived. Some derive it from carmino, to card wood, or cleanse it from foulness; and say that the physicians by a metaphor, used to fignify the expulsion of, or cleansing from the wind. Others from carmina, charms, which were formerly superstitiously used for several cures. Others, because they produce carmen, music.

The action of carminatives may be fomewhat understood by considering that all the parts of the body are perspirable. Sanctorius determines all that we call wind; to be fuch perspirable matter as makes its escape through the coats of the ftomach and intestines; between the feveral membranes of the mufcles also may be fuch perspirable matter: now, whatever rarifies and renders collections of these vapours thinner, conduces to their difcharge, and as all those things in medicine of this denomination are warm, attenuant, and confift of light fubtil parts, it is easy to understand how a mixture of them with the flatus may agitate and rarefy it, especially as they also create such agreeable sensations on the fibres, which help by invigorating their tone also to expel it.

Boerhaave places the following draught amongst the first of this tribe of medicines: R Spt. nitri d. 3j. aq. menth.

CAROLI. CHANCRES. CAROPI. See AMOMUM VERUM.

CARORA; also CYNNIA. The name of a vessel that refembles an urinal.

CAROS. See CARUM.

CAROS. See CARUM.

CAROS, \( \text{xa20} \), or carus, fynonymous with foper. It CARUS, rifes on a coma, and is a flight degree of apoplexy, in which you get fome broken incoherent answers from the patient; when called, he fearce opens his eyes: yet, if he be pricked, he hath feeling enough to manifest his fense of it. This disease is supposed to take its name from carien, the walnut-tree; or else the tree is named from this disease. See Caryon.

The cema lethargus, coma vigil, coma somnolentum, cataphora, are diseases, that respect sleeping chiefly, and they rise on each other; the coma is the lowest degree, the lethargy the highest, and is itself a species of apoplexy, which is the highest degree of these diseases. Galen says, that if the carus oppresses respiration, as in

len fays, that if the carus oppresses respiration, as in those who snore in their sleep, it is an apoplexy. Boerhaave says, that a carus is a slight apoplexy from a hot cause, and is attended with a fever; and a lethargy is a flight apoplexy from a cold caufe.

Hippocrates fometimes calls this diforder aphonia. Galen, in his Method. Med. lib. xiii. calls it catsche. Coelius Aurelianus calls it gravatio; and Pliny gra-

Dr. Cullen confiders the carus, cataphora, coma, hæ-morrhagia cerebri, catalepsis, ecstasis, and affectus cerebri fpaimodico-ecstaticus, as apoplexies, and the typhomania and lethargus as fymptomatic apoplexies. In a carus there is infensibility and sleepiness, with quiet respiration. It fometimes fignises a loss of fense and volun-

Tary motion, respiration remaining uninjured.

The immediate cause of sleepy affections seems to be a defect of, or an impediment to the passage of the vital principle. The remote causes are, whatever diminishes the vis vitæ, or that can obstruct its influence, as tumors reassage on the brain, a supressency of the vessels from preffing on the brain, a turgescency of the vessels from

A coma vigil is known by a burning and extensive pain in the head, attended with a fense of ebullition therein, There is a strong inclination to sleep, and the patient either does not fleep at all, or if he does, he awakes immediately with little or no relief, but there is no delirium. This diforder is always fymptomatic, and often attends acute fevers, and ufhers in a phrenzy. It fometimes attends an hemiplegia.

COMA SOMNOLENTUM. In this diforder the patient is languid, and his chief complaint is a constant drowfinels. He often falls afleep at meals, in converfation, and in the midft of business; and, when awaked, he foon falls afleep again. Luxurious old men are most subject to it. It is a primary diforder, and unattended with

The CARUS. This is a profound fleep, out of which great difficulty attends the roufing a patient; though he feems fensible of pinching, or pricking him with pins, he either does not speak, or he immediately relapses into the same degree of sleep. This diforder is either idoipathic, or symptomatic, and often attended with a fever.
When it is symptomatic, it is faid to be of three kinds,
but is only the same disease in the different periods of that complaint, of which it is a fymptom. The first happens in acute fevers in their beginning or increase; and if convultions and hiccoughing comes on it is foon fatal. The fecond comes after acute fevers, and when the patient is exceeding weak, the fleep will continue for fe-veral days; if it happens in acute fevers on critical days, with a sweat, it is a good omen. The third happens a day or two before death, when the patient's strength being exhausted, he lies deprived of sense and motion, as it were in a profound fleep, and under it expires:

A LETHORGY is a heavy perpetual fleep, with fearce any intervals of waking 1 it is attended with fuch a flupidity and forgetfulness, that when the patient yawns he forgets to that his mouth; or whatever he begins to do, he forgets to proceed in it, and falls afleep. It is attended with a fever, which is a symptom thereof, and is chiefly discovered by the frequency of the pulse; and does not

invade fo fuddenly as an apoplexy, nor does it kill fo foon.

Bonetus, in his Sepulchretum Anatomicum, observes, that those who died of sleepy diforders, on being opened, in their brain was found a copious ferum diffused through its substance, yet so, that the cortical part thereof, with its meninges, were principally overflowed with water; in fome he found the ventricles replete with ferum, and the cortical part untaffected by it, and thefe, he fays, were never troubled with fleepy diseases. But he ob-ferves, that the more this watery fluid penetrated into the medullary part of the brain, the more obstinate was the fleepiness during the life of the patient. In some who died of drowfiness, he found abscesses, tumors, and feirrhofities of the brain; but these were only on the anterior and cortical region of it. In some he found the veffels of the pia mater very much diftended with blood.
The COMA VIGIL should be diftinguished from the per-

vigilium: and each of these disorders from one another; also all of them from an apoplexy, an hysteric fit, and a

A coma vigil often prefages a phrenfy, and convul-fions; and in malignant fevers is often fatal. When pains attend a carus, they portend convultions; and, in proportion to the violence of the fever, a carus is more or lefs dangerous. A lethargy is always dangerous, but the most so when the limbs are affected with a tremor, and a cold (weat is perceived on the face.

In order to the cure it should be considered, that an excess, as well as a deficiency of the vis vitæ, may be the cause: and that in the beginning of fevers, an excess is

the cause for the most part.

When the cause is an excess of the vis vitæ, and a sever attends, an inflammation of the membranes of the brain may be expected, therefore a free bleeding will be the first step towards relief. But, as mostly happens, the vital powers are below the requirement of health; in which case, if there is any plethora, it is of the serous kind, which does not admit of bleeding, but must be relieved by purges, and fuch other evacuations as promote only the thinner excretions.

obstructed menses and hæmorrhoids, &c. a too free use of spirituous liquors, exposure to offensive vapours, blows and fuch like circumstances.

The general indications are, ist, To rouse from sleep and To remove the difficulty of the circulation, the stagnation, or extravasation of the blood or ferum in the

head. 3d, To reftore the loss of strength.

To shake off the drowliness. After due attention to the degree of heat and ftrength, by which bleeding will be required or forbid, use such medicines as while they raise or depress the vital force, may also produce a tremulous motion in the whole nervous fystem. When the fleepiness is from a great defect in the animal powers, volatile falts may be held to the nose, but, in general, the pungent acid spirits are greatly to be preferred; vine-gar may be blown up the nottrils, or if it can be had, the fpirit of verdigrife will be the best.

Due evacuations being made; cold water may be poured

on the head; for this purpose the head should be thaved just before. This both tends to remove the sleepiness;

and to ftrengthen the membranes of the brain.

Cataplaims of ftrong vinegar, mustard feed, camphor, and caftor, with any other such like stimulants, may be

applied to the temples, and the head after flaving it.

Blifters may be applied to the neck and feet.

If there is no confiderable plethora, iternutatories may affift in deriving the redundant moisture from the head. Some caution is necessary in admitting them, left an apoplexy should be the consequence, by forcing a glut of humours upwards: but if admitted, one of the best is vitriolated zinc, purified, dissolved in water; gr. x. to 5

fs. will be a good proportion.

Strong frictions may be used on the lower parts. Strong clyfters, in which are the fal gemmæ.

To remove the difficulty of the circulation, &c. If an extravalation of blood, or ferum, is the effect of external violence, bleeding may be freely used, and such other methods as are proposed to relieve when contusion happens in this part, but generally trepanning is found necessary. A red face, eyes turgid with blood, turnid veins, a strong pullation of the arteries, indicate bleeding in any fleepy affection; though it may be proper to confider whether the turgefeence in the veffels is from a plethora, or from rarefaction, before taking away the blood; and also whe-ther the plethora is of the fanguine, or the scrous kind. The belly should be kept soluble, and nervous diapho-

reties, fuch as the vin. ant. fal fuccin. &c. may be given to remove fpalms in the intestines, if they foem affected

therewith.

When the patient recovers, a relapse must be guarded against, by diminishing or removing the cause; by a well regulated diet, and due attention to all the non-naturals; by moderate exercife, and chearful company. See Galen, Cœlius Aurelianus, Moor's Pathologia Ce-

rebri, Hoffman, and Boerhaave.
CAROTA: The CARROT. See DAUCUS.
CAROTIDEÆ ARTERIÆ. The CAROTID ARTE-RIES. In making experiments, by tying the nerves, to prove the compression on them, so as to intercept their communication with the brain, the parts to which they belonged were deprived of fense and motion. The first who tried these experiments, thought the animals turned comatous; and ascribing this effect to the intercepting any passage of vital blood from the heart to the brain by the way of arteries, they gave these blood-vessels the name of carotides, or soporaria, from wapa, the bead, or sapor, Sound Reep.

From the fore part of the curvature, just before the trachea, the right fubclavian and the carotid, mostly arise in one common trunk, which run upwards a little way, and then divide. The left caretid rifes fingle, and runs upwards on the fide of the trachea. Both these caretids run up as high as the fide of the larynx, even to the upper part of the thyroid cartilage, before they give off one branch, and there they divide into the external and internal; the latter goes to the infide of the cranium, the pia mater, &c. the former, which is the largeft, gives branches

to all the external parts of the head.

The external caretid is anterior, the internal is posterior, the external fituated more inward and nearer the larynx. It is the fmalleft, runs infenfibly outward between the external angle of the lower jaw, and the parotid gland, which it supplies as it passes; afterwards it ascends on the fore-fide of the ear, and ends in the temples. It sends off the gutturalis superior, sublinguales, maxillaria inferior, maxillaria externa, &c. The internal

caretid

earstid leaving the general trunk, is, at first, a little incurvated. It is fituated a little more backward than the external, and generally runs up, without any ramification, as high as the lower orifice of the great canal of the apophysis petrosa of the os temporis; it enters this orifice, and the cranium through a notch in the fphenoidal bone; and, except one branch, which goes to the eye, it is wholly fpent upon the brain. See Winflow's Anatomy.

CAROUM. The CARAWAY.

CARPA. See CARPIO. CARPASUS. An herb, the juice of which was formerly called opocarpason, opecarpation, or opeculpason, and is esteemed poisonous, but it is not certainly known

CARPATA. See CURCAS.

CARPATHICUM. From the fresh cones of the trees which yield the common turpentine, is distilled a fine effential oil, faid to be corpathicum, or Germanis oleum.

CARPENTARIA. It is the name of an herb, but

fo variously spoken of, that it is impossible to say what

CARPENUS. See OSTRYA.

CARPERITARIA. See BARBAREA. CARPESIUM. This is an aromatic vegetable; it is often mentioned by the ancients, but it is not known

CARPHOS. See BOUCERAS.
CARPHUS. In Hippocrates it fignifies a ftraw, or mote, or any fmall fubiltance. It also fignifies a fmall pultule, for the cure of which Aetius, Tetrab. i. recommends rubbing them with the dried feeds of mercury.

CARPIA. LINT. CARPINUS. The HORN-BEAM TREE.

CARPIO, vel CARPA, vel CYPRINUS. The CARP. Fish of this kind that are fed in rivers, are far better than those that are fed in ponds; and of these the largest and best fed are the best. They seed on herbs, mud, slime, and the smaller fishes. They are nutritive and easily discreted. The head is the finest part of the fish, and of

gested. The head is the finest part of the sish; and of the head, the tongue is the most delicate.

CARPOBALSAMUM, from \*\*apros, fruit, and \$axeauer, ballam. It is the fruit of the tree that yields the BALM of GILEAD, i. e. amyris opobalfamum vel amyris Gileadenfis, Linn. It is about the fize of a fmall pea, with a fhort pedicle; of a roundith or oval fig pointed at the top; composed of a dark brown, or reddish black, wrinkled bark, marked with four ribs from top to bottom, and a whitish or yellowish medullary substance. This fruit, when in perfection, is faid to have a pleasant, warm, bitterish taste, and a fragrant smell, resembling that of the balsam itself. But such as is now met with in the shops, is almost without smell or taste. It is only or-dered in the theriaca and mithridate; but the London College substitute cubebs for it: often the Jamaica pepper

is fold for it. See Balsamum.

CARPOLOGIA. A DELIRIOUS FUMBLING; as when a patient feems to be gathering fomething from off the bed-cloaths, which yet is difficultly performed, because of the trembling which affects his hands. It is usually a fatal

fymptom in fevers CARPOS. A feed, or fruit.

CARPUS. Kape \$, a Greek primitive, A wrist, called by the ancients brachiale. It confifts of eight bones, viz. the os feaphoides, lunare, cuneiforme, pisiforme, tra-pezium, trapezoides, magnum, and unciforme. The three first make an oblong head, by which they are articulated to the lower extremity of the bones of the fore-arm by arthrodia. The articulation of these three bones, with the bones of the inserior row, is such as allows of motion, especially backward and forward, to which the arthrodia of the os magnum with the scaphoides and lunare greatly contribute. The trapezium on the one side, the pififorme, and cunciforme on the other, being raifed above the rest of the bones of the earpus, make a fort of arch for the secure passage of the slexors of the fingers, and the transverse ligament being extended from one side of the arch to the other, binds them down in their proper place. Lyferus gave the eight bones of the wrift their respective names. The four bones of the second row are all in a line, the first being articulated with the thumb, and the reft with the metacarpus. These bones See Winflow's Anatomy.

enieus, enecus, carthamus tinctorius, Linn. Carthamum officinarum enecum, carduus fotious, SAFFLOWER. It agrees with the thiftle in most of its characters, but its feeds are deftitute of down. The leaves are oval and pointed; on the tops grow fealy heads, with faffron-co-loured fiftular flowers; these are followed by smooth, white seeds, of an oblong roundish shape, yet with four sensible corners, remarkably heavy, so as to sink in water. This plant is annual, a native of Egypt, and culti-vated in other parts on account of its flowers, which are used in dying. It does not come to much perfection in England.

The feeds have an uncluous fweetish taste, which on chewing are acrid and difagreeable. With water they form an emulsion by trituration; and to spirit they give out a little naufeous acrid matter. They are cathartic indofes of 3 j. or ij. The flowers are difficultly diftinguifhed by the eye from true faffron, when they are well
cured, but they have neither its finell nor tafte. They
give to fpirit of wine a deep faffron tincture, and to water
a paler yellow. After the yellow matter is extracted by
water, the flowers appear of a red colour, and communicate to fpirit of wine a deep red.

Some have the art of preparing the feeds of malons and

Some have the art of preparing the feeds of melons and of cucumbers, fo as to refemble the exceriated feeds of baftard faffron, for which they fell them; but the genuine feeds are not fo white as the artificial.

Botamists enumerate three species. Miller's Dict.
CARTHAMUS ACULEATUS. The BLACK CHAMÆLION Chamelion nigrun

CARTHUSIANUS PULVIS. See KERMES MINE-

CARTILAGINOSUM. See PATELLA.

CARTILAGO. A CARTILAGE OF GRISTLE. Dr. Hunter defines it to be a fmooth, folid, diaphanous, elastic, infensible, inorganic substance. He observes, that in the fresh subject it appears uniform, and with-out any visible fibres; when cut in any direction, its surface appears fmooth like wax or glue. On a cartilage-there is no periodicum, but its place is supplied by the perichondrium. Cartilage is the least affected by prefure, of all animal fubstances, while the body is living; their fubstance is firm and dense, and their texture so sine, that when cut, they appear only like a stiff jelly.

Cartilages are distinguished into three kinds:

First, such as supply the place of a bone in an adult, as the trachea; secondly, such as supply the place of bones in young subjects, as epiphyses; and, thirdly, such as are common to the sectus and adult, and are expanded on the extremities of articulating joints.

The articulating cartilages cannot be injected to their middle folid part, though the external veifels are eafily filled. The cartilages are supposed to be supplied with nerves, but they are too minute to be visibly demon-

ftrated.

The uses of the articulating cartilages are, first, to prevent abrasion, as without them the continual attrition of the bones against each other's surface, must have produced a true anchylofis; fecondly, by their elafticity, they break the force of collifion; thirdly, they ferve as indolent bo-dies, to admit of motion and friction without pain.

A difease never affects the cartilages primarily. They are incapable of exfoliation, but when difeased from some preceding disorder of the bone, the whole is generally affected, and the cohesion between the cartilage and the bone in the joint being less than between the parts of the cartilage itself, causes it to separate from the bone. If a part of the cartilage is destroyed it is never restored.

CARUI. See CARUM.

CARUI FOLIA, C. B. i. c. CARUM PRATENSE of Par-

CARUM, CARAWAY; also called carvi, cuminum pra-tense, caros, careum, carvi, cari; CARAWAIES. It is the carum carvior carum pratense, folia pinnatifidis planis, floribus albis, umbellatis intequalibus confertis.

Botanists enumerate three species. It is an umbelliferous plant, with ftriated branched ftalks, two or three feet high, and finely divided; the leaves are fet in pairs along a channelled rib, every two of which ribs crofs one another at their origin on the stalk: the feeds are small, of a brownish or blackish colour, somewhat bent, striated, CARTHAMUS. BASTARD SAFFRON. Called also flat on one fide, and convex on the other. It is a native

of the northern climes; cultivated in gardens with us, but by chance found wild, and is a biennial plant.

The feeds only are in use, they are warm and carminative; have an agreeable fmell, and are given in powder from 9 j. to 3 j. They have the fame virtues as the anifeed, and differ only in the peculiarity of their odour.

An extract made from a tincture, with rectified fpirit, retains all the virtue of the feeds. After infusion in water, fpirit extracts a ftrong tincture; watery infusions are ftrongest to the fmell, and spirituous ones strongest to the taite.

Diffilled in water all their aroma rifes.

CARUNCULA. A CARUNCLE. This word is a di-minutive from caro, flesh. A caruncle is a small piece of flesh, or an excrescence that hath the appearance of flesh. Thus there are the caruncula lacrymales in the corners of the eyes; the carunculæ myrtiformes, which are at the entrance into the vagina, and faid to be formed by the rupture of the hymen, fee HYMEN; the carunculæ papillares of the kidneys; and a caruncle of the urethra at the orifice, which opens from the veficulæ feminales, befides many others, all which are the products

The uvula is fometimes called caruncula.

Morbid exercícencies of flesh are called caruncles, and fmall portions of a flethy fubstance, which are fometimes discharged in a dysentery by stool, or in diseases of the u-

rinary passages by urine.

Excrescences in the urethra arise from its ulcerated or excerteenees in the drethra artie from its dicetated of excoriated fides, by fharp corroding matter palling through and lodging there; these are faid to happen after the cure is completed, which makes them mistaken for the stone, or nephritic symptoms. A stricture in the urethra is generally, if not always, the case; when these morbid cancer is fosselled, and above passel in the boxes the runcles are suspected, and a bougie passed a little above the obstruction, and kept in three or four hours, more or less, every day, cures it; the figns are, when the urine is difcharged it passes from the urethra, divided into two or more streams, fometimes only with pain, and in drops; but the only certain fign is, to pass a probe or bougie, up the urethra, until the obstruction is met with, and if any is found on this fide the valve, at the entrance of the blad-der, there is reason to suspect this disorder. Bell's Surgery, vol. ii. p. 188.

CARUNCULA LACHRYMALIS. Is fituated between

the internal angle of the eye-lids and the ball of the eye; it is a fmall reddish oblong fubstance, and hath the appearance of being fleshy, though it is thought to be glandular. The ancients call it glandula lachrymalis, also innominata glandula. It ferves to prevent the internal edges of the lids at that part, from ever coming into contact with one another; and thereby the orifices of the lachrymal points being to a certain degree kept open, the tears pass freely through these points into the sac.

CARUNCULE MYRTIFORMES. They are seen as the contact with the

veral fmall knots or protuberances, at the entrance of the vagina; they are the remains of the ruptured hymen, and

when large, have been taken for cancers.

CARUNCULOSA ISCHURIA. A suppression of urine, from caruncles in the urethra. See Ischuria.

CARUS A FRIGORE, i. e. Apo-PLEXIA SANGUINEA.

- A HYDROCEPHALO, i. c. Apo-PLEXIA SEROSA,

PLEXIA SANGUINEA.

CARUS. See CAROS.

CARVA. The Cassia Lignea tree. See Folium.

CARVI. CARRAWAY. See CARUM.—CARVI

SPINA See RHAMNUS.

CARYA. The WALNUT TREE. Also walnuts ren-

dered black by boiling.

CARYCE, or CARYCIA. Galen fays it is a coffly fort of food prepared by the Lydians. Various supposes it to be thus called because it was black like the boiled walnuts.

CARYCUM. See CARICUM. CARYEDON CATAGMA. See ALPHITEDON.

CARYITES. A name of the FEMALE TITHYMALUS. corallodendrum.

CARYOCES. A Portuguese name for the fruit of the Guinea palm-tree. See also Adv. CARYOCOSTINUM ELECT. See SCAMONIUM.

CARYON. A NUT. This word is applied to all fuch fruit as inclose fomewhat catable within an hard shell. Plutarch fays that the ancients called the walnut caryon, because it induces a heaviness and stupidity of spirits.

CARYON BASILICON. The WALNUT. See Ju-GLANS .- HERACLEOTICON. A fmall nut, as a hazle nut, or filbert, fo called, because it was brought from Heraclea, in Pontus, into Greece. LEPTON.

nut, as filberts, or hazle nuts, from remps, fmall.

CARYOPHYLLATA; also called berba Benedicta, caryopb. vulgaris, garyopbilla janamunda, avens, HERB BENNET. It is called caryopbyllata because its smell refembles that of clove July flowers. It is the geum urbanum, Linn.

Boerhaave enumerates eight species.

It is a rough plant with dark-coloured winged leaves, and pentapetalous yellow flowers, flanding in ten-leaved cups, on the tops of the branches; the feeds are hairy, the roots are flender, full of fibres, of a dark brownish colour on the outfide, and reddith within. It is perennial, grows wild in woods and hedges, and is found in

flower the greatest part of the summer.

The root is gently styptic, corroborant, and stomachies, hath a middle austere aromatic taste, a pleasant smell, especially in the fpring, and when produced on dry warm-foils. It has been faid to cure intermittents where bark has failed. Indeed it is strongly aftringent with some aroma, when recently raised in the spring season, and from a dry soil; however with regard to its efficacy in intermittents, there is great reason to doubt, as the experiments of the Swedish physicians contradict those of the Danes, and the Germans, who are the great advocates for this medicine. It gives its aroma most to spirits, and its astringent matter to water or to spirit. In distillation with water it affords a finall quantity of an agreeable concrete oily mat-ter, and the remaining decoction, if infpiffated, by evaporation, is moderately aftringent. Lewis's Mat. Med. Cul-len's Mat. Med.

CARYOPHYLLI AROMATICI. The AROMATIC

CLOVES; called alfo garyophyllus, binka, and clous.

The unripe fruit, or perhaps the cups of the unopened flowers of a bay-like tree, which grows in the Molneca Islands. In shape it resembles a short thick square nail; of a rusty colour inclining to black: in the middle of each clove are found a stylus or stamina, with their apices; at the larger end shoot out from the four angles four little points, like a star, in the middle of which is a round ball of a lighter colour than the rest, composed of four small feales or leaves, which feem to be the unexpanded petala of the flower. The tree is the caryophyllus aromaticus, or caryophyllus orientalis aromaticus, fructu elevato monopyreno, fol. ovato-lanceolatis oppolitis flor terminalibus, staminibus corolla longioribus. Linn. The clovetree is one of those whose flower is produced above the rudiments of the fruit: the ripe fruit fometimes brought to England under the name of anthophyllus, is marked on the top with the remains of the flower; is about the fize and fhape of an olive, and contains under a thin blackiff shell, a hard kernel of the same colour, which hath a deep longitudinal seam on the side. The cloves are said to be cured by exposing them to smoke, and afterwards drying them in the fun.

The largest and darkest coloured are the best, and those which feel oily when preffed. Another mark of their goodness is, when on piercing them with a needle, a little liquid matter like oil oozes out. Those that are of a light brown colour have had their oil extracted from them.

Cloves have a ftrong but agreeable fmell, a bitterish hot pungent taste; are one of the hottest, and most pungent and acrid of the aromatic class, and have all the virtues ascribed to aromatics in general. They are remarkably disposed to imbibe humidity, and when robbed of their active parts, and afterwards mixed with fresh cloves, they regain from them a confiderable share both of taste and smell. The Dutch extract the oil from them and then mix them with others, from which it hath not been separated; but their dryness, less pungent odour, and pale colour, discover the fraud.

Rectified spirit of wine takes up all the virtue of cloves: CARYL. A confect made with the flowers of the an extract from this spirituous tincture, amounts to nearly

one-third of the cloves used in preparing it, and retains nearly their whole virtue. Infused in water they give out to it more of their fmell than to spirit, but not so much of

Diffilled with water they give over very flowly about one-fixth of their weight of effential oil, at first yellow and afterwards a reddish brown, but if the fire is very moderate its colour is pale; it finks in water, is mild and not very pungent; but the only way to have it genuine, is to diftil it ourfelves. What we have from the Dutch is very acrid, and contains near half its weight of an infipid exprefied oil. It is probable, that from an admixture of the refinous part of cloves, this fophisticated oil receives both its acrimony and high colour : or, as fresh cloves are faid to yield a high coloured fragrant thick oil upon expression, it may be that the common oil of cloves, brought from the spice islands, is no other than this oil diluted with infipid ones.

If the oil of cloves is adulterated with an infipid expressed oil, it is discovered by dropping a little into alcohol, and on shaking them the genuine oil mixes with the spirit, and the inspired oil separating is discovered.

The oil of eloves is made into an agreeable draught by mixing it with a made into an agreeable draught by

mixing it with a proper quantity of gum arabic, and then with water. See Newmann's Chem. Works. Lewis's Mat. Med. Cullen's Mat. Med.

REGIUS; both are the names of the TSHINKA .- RUBER. GILLYFLOWER; also called tunica, vetonica, betonica coronaria, caryoph. bortenfis, and CLOVE JULY FLOWER. It is the dianthus caryophyllus, or dianthus floribus folitariis, fquamis calycinis fubovatis brevifimis, corollis crenatis. Linn.

It is well known in our gardens; is perennial, and faid to be a native of Italy. There are many varieties, but those employed for medicinal use are of a deep crimson-colour, and an agreeable aromatic fmell, fomewhat akin to that of the clove spice; and this odour is not very soon

diffipated.

These flowers are esteemed moderately cardiac, diuretic, and perspirative; but they are chiefly used in the form

of a fyrup, for the beauty of their colour and flavour.

The London College directs the following fyrup:

Syrupus Caryophylli rubri. Syrup of CLOVE JULY FLOWER.

Take of fresh clove July flowers, with their heels cut off, two pounds; of boiling distilled water fix pints; macerate the flowers in the water for twelve hours in a veffel of glafs; and in the liquor strained, dissolve as much dou-

ble refined fugar as is required to make a fyrup.

It should be observed that the beauty of the colour is a principal quality of this fyrup, no preflure of the flowers,

is to be admitted.

In St. Thomas's hospital, a substitute for this firm is made by using the aromatic clove, and for the colour a little cochineal is added. See Lewis's Mat. Med .-FLORE SIMPLICE. SINGLE PINKS.

CASAMUM. A name in Myrepfus for the cyclameni. CASCARILLA. A diminutive from cascara, the Spanish word for a bark or shell, also called eleutheria, nafcaphthon. See Thuris Cortex. The Spaniards apply the word cafcarilla to the Peruvian bark, as we ap ply the word easternia to the returns bank, as we apply the word Easternia to the return bank, as we apply the word large and the return case of the c

common opinion that old cheefe digefts every thing, yet is left undigefted itfelf, but this is without proper foundation. New ebeefe digefts difficultly, and when old is acrid and hot. Cheefe made from the milk of sheep digests sooner than that from cows, but it is less nourishing and that from the milk of goats digests sooner than either, but is also the least nourishing. The acrimony in cheefe is from the rennet, which is increased by age: As to the goodness of this article, that is best tasted which discovers no particular quality to excess, and which is the foonest digested. In general, it is a kind of food fit only for the laborious, or those whose organs of digestion are strong.

See Galen de Alim. Facult.

When specking of this article, of which Dr. Cullen in his Materia Medica, vol. i. gives a very minute account, well worth perusing, he tells us "the caseous, or coagulable part of milk, is certainly a great, if not the greatest part of the neurishment which milk affords, and is in itfelf the more nourishing the more it is united with the oily parts. When the coagulum has the whey, taken from it, it becomes a more nutritious fubflance than the milk it was taken from, but will probably be of more difficult digestion. Cheese in its dried state, when made from milk previously deprived of its cream, may be still a very nutritious matter, but of very difficult digestion; but made of entire milk must be a more nou-rishing substance, and of much easier digestion; and made of entire milk, with a portion of cream taken from other milk added to it, will be ftill more nourishing, and hardly of less easy digestion as the oily parts every where interposed between the parts of the gluten must render the adhesion of this less firm; and as cheefe is made of cream alone, that will be certainly the most nutritious, and of the easiest digestion.

But cheese is not only made of cow's milk alone, but also of the milk of ewes and goats, and often of a portion of the two latter added to cow's milk. In all these cases, as the milk of ewes and cows contains a larger portion of the oily and cafeous parts, fo in proportion as these are employed, the cheese becomes more nutritious, but at

fame time of more difficult digeftion.

As cheefe is employed not only when recent and fresh, but also under various degrees of corruption, it is liable to; fo it acquires new qualities; and according to the degree of corruption, it becomes more acrid, and flimulant, partly by the acrimony it has acquired from corruption, and partly by the great number of infects that are very conftantly generated in it in that flate. In this corrupted condition it can hardly be taken in fuch a quantity as to be confidered as alimentary, and as a condiment influencing the digeftion of other food, it is a point difficult to explain, though it is commonly admitted. When toafted it is certainly not easily digested by weak stomachs, as a portion of the oil is separated, and the other parts more firmly united by that process, hence for those hurt by indigestion, and heated by a heavy supper, it is a very improper diet. CASIA, i. e. Cassia.

CASSA. A barbarous word in Fallopius de Affib. for

CASSADA, called also cacavi, cazabi, cassave, cassave, pain de Madagascar, ricinus minor, maniot, yucca, maniiba

aipi, aspima caxera, aspipaca. This plant grows in the it grows spontaneously in Egypt, and the warmer part of warmer parts of the western world. Its root is the part in the East Indies, and hath been thence introduced into the use, and is poisonous; this root is called yuca, the Mexicans call it quanticamotli, and when it is prepared into a flour, thay call it caffavi. See MANDIHOCA.

Though this root is a strong poison, it is made into a

wholefome bread, called angus; by boiling its volatile parts are diffipated, and therewith the poisonous part.

There are many species of this plant, which may be feen in Maregrave, but the stalks and roots of them all

pass under the common name of mandihoca. This bread is used in Hispaniola, and other West India islands, in Mexico, and even from Florida to the Straits

of Magellan.

The liquor that is preffed from this plant is called MA-NIPUERA; the root macerated in water until it is foft is called mandispiba, fee MANDIHOCA; of the fediment of this is made a finer flour called vipeba by the Brafilians, and by the Portuguese farinha fresca, the undried dressed meal farinha relada. Some of the species cannot be deprived

of their poisonous quality.

The soft mandihoca is called puba; when dried over the fire or in the fun It is called carima, and of this good bread is made, which is called musam, or angu, or enfrande. Of the carima and the tipioca are made emultions, ptifans, &c. which are used in confumptions, dysenteries, fevers, faintings, against poisons, and hæmorrhages, both internal and external.

The juice of roucou is an antidote to the poison of

this plant. Raii Hift.

CASSAVE, CASSAVI. See CASSAD A.

CASSALE VULNUS. A term Egnifying a wound in

the breaft: from the Arabian word cas, a breaft.

CASSAMUM. The fruit of the balm tree.

CASSATUM. Weak spiritless blood that is grumous and of Paraelles and the circulating blood. It is a word of Paracelfus.

CASSE, EAU DE, OF EAU DE CASSE-LUNETTE. It is Inow-water diffilled from the flowers of the cyanus.

CASSIA. A name of SENNA. See SENNA ALEXAN-

DRINA.

CASSIA CANELLA. Sec CASSIA LIGNEA .-PHYLLATA, called also piper tavasci caryophillus aromaticus frustu rotundo, caryophyllon garyophillon Plinii, amomum, CLOVEBERRY-TREE, SWEET-SCENTED JAMAICA PEPPER TREE. The bark is called cortex cariophylleides CLOVE BARK, and caffice cortex, CASSIA BARK. Miller mentions

nine species of cassia.

The bark is in use; it is brought from Jamaica, Cuba, and other of the West India Islands. It is rolled like cinnamon, but is rather thinner, rougher on the outlide, and of a dark brown colour. It is warm and aromatic, refembles the fmell of cloves, but is weaker and mixt with a cinnamon flavour. It agrees with cloves in the folubility and volatility of its active principles. Spirit of wine takes up all its aroma, but carries very little of it in distilling. Water takes up its fmell, but not much of its tafte, and diftil-Jed with water, a small portion of an effential oil arises, which refembles that of cloves, but is more pungent.

A fimilar bark is brought from the East Indies under the name of culiltawan or culilawan, a compound Malabarian word, which is translated into the Latin by cortex caryophylloides, or clove bark. That distinguished in Europe by the name of culilawan is thicker than the other, and is more of a cinnamon colour, but scarcely differs from it in finell or tafte. The fame with this feems to be the carabaceium of Baglivi. Rumphius observes that the outer and inner barks of different parts of the tree differ in colour and tafte from one another; whence probably fuch differences as may have been observed in those brought under different names into Europe.

The unripe fruit is the JAMAICA PEPPER. See PIPER. — CINNAMOMEA. The true CINNAMON TREE. See CINNAMOMUM.— CRASSIOR. See FOLIUM.— CRIBATRA. The pulp of the CASSIA FISTULARIS.—FISTU-LA. A name of the true CINNAMON TREE. - FISTULA BRASIL, i. c. TAPYRA-COAYNANA. —FISTULARIS, called alfo cassia nigra, cassia solutiva, cassia purgatrin, canna chaiarxambar conno. fistula, PURGING CASSIA It is the cassia situla, or cassia fol. quinque jugis ovaris acuminatis glabris, petiolis eglandulatis, Linn. The Alexandrian purging callia.

The cassia hisula is the hard woody cylindrical pod of a

West, and is brought to us from the Brasils. The pods are about an inch in diameter, and a foot or more in length; externally of a dark brown colour, fomewhat wrinkled, with a large fear running the whole length up-on one fide, and another lefs visible on the opposite fide, internally of a pale yellowish colour, divided by thin transverse woody plates, in a number of little cells, containing each a flattish oval feed, with a fost black pulp. The pulp is called by some medulla, by others wild honey, because of its sweet taste, which is followed by

an ungrateful kind of acrimony: that from the East Indies hath a more agreeable fweetness and less acrimony than

the West Indian kind.

The oriental pods are fmaller, fmoother, and thinner rinded than the occidental, and its pulp is of a deeper fhining black colour. Those pods that are dry, and in which the feed rattles, are generally rejected; but Neumann thinks that they are very little, if any, worse than the other, as it is only their humidity that is wasted, and by this lofs it is fecured from being mouldy or four. The best fort, if gathered before it is full ripe, grows mouldy and becomes four or harsh.

The pulp of cassia dissolves very readily in water, whether pulp of try, but not fo readily in fpirit of wine. It is usually extracted by boiling the bruifed pods in water, and evaporating the strained solution to a proper confistence, the exhaling vapour carries nothing off. The pulp foon turns four, fo should be extracted only in small

Caffia was unknown to the ancient Greeks, and was first used by the Arabians. Where irritating purges would do harm, this may be fafely used: in doses of a few drams it is generally laxative; is particularly uliful in coffive habits and inflammatory cases; and, according to Geof-froy, is peculiarly beneficial in those tensions of the belly which attend an imprudent use of antimonials: as a cathartic, two ounces is required, and so is feldom used for this end. However, at prefent, it is rarely given by itself, and is confidered of little use; the pulp of prunes being

recommended to supply its place.

It is fometimes quickened by stronger purgatives, or with the antimonial emetics, of which last it diminishes the activity fo far, that four grains or more of emetic tar-tar may be taken in a decoction of cassia by those who without it can bear but one grain or a little more; it is joined with manna, and is supposed to enhance its purga-tive virtue; a mixture of half an ounce of cassia with two drams of manna, is faid to purge more than three times the quantity of caffia by itself, or than a yet greater quanti-

ty of manna when alone.

Cassia, if repeatedly taken tinges the urine of a yellow, green, or brown colour, according to the quantity given. The London College directs the following preparation:

### Electarium e Cassia. Electary of CASSIA

Take of fyrup of roles, the pulp of cassia, fresh extracted, of each half a pound; of manna, two ounces; of the pulp of tamarinds, one ounce. Beat the manna, and with a flow fire diffolve it in the fyrup, then add the pulps, and the heat being continued, reduce the whole to a proper confiftence.

This electary was formerly called diacaffia: the tamarinds render the tafte of it very agreeable, and does not fubject it to turn four. Two or three drams is a dofe as a folutive. See Lewis's Mat. Med. Newmann's Chem. Works. Cullen's Mat. Med.

CASSIA LIGNEA, called also canella Malabarica, xylocassia, cinnamomum, five canella Malibarica, & Javaneessis, karva, canella Cubana, arbor jucadice, cassia canella. WILD CINNAMON TREE, MALABAR CINNAMON TREE, or cassia lignes tree. See FOLIUM.

The leaves of this tree are, by way of eminence, called

FOLIUM, which fee. The bark is called caffia lignea, and is brought from the East Indies. This tree is of the cinnamon kind. It is the lawrus caffia, or lawrus Malabarica perpetuo florens, fol. triplinerviis lanceolatis, Linn. The cassia, or wild cinnamon tree. Curtis, in his catalogue of Medicinal, &c. Plants, in the London Botanic Garden, calls it laurus Malabathrum. This bark refembles cinnamon in appearance, but is diffinguishable by its breaking short or smooth, whilst cinnamon breaks fibrous and shivery; tree called pudding-pipe tree, which refembles the walnut: lalfo by chewing, after which the caffia becomes mucilagi

nous, but the cinnamon auftere and dry. It refembles cincompletely, and if the tincture is evaporated it all remains
not mon in flavour, but is weaker; it contains a mucilage, of
which cinnamon does not fenfibly partake: if powdered

CASSUTA. Donner. See Cuseura which cinnamon does not fenfibly partake: if powdered and boiled in water, the water becomes glutinous, fo as to concrete on cooling into a jelly.

Spirit of wine extracts the aroma, and water extracts the mucilage. By diffillation in water it yields a fmall portion of oil, which differs not from that of cinnamon; and if care is taken in diffilling it with water, no difference can be discovered from what it produces, and that which is drawn from true cinnamon; but if too much heat is continued at the end of the operations, it produces an empyreumatic flavour, because of the mucilage, which is very apt to be changed by the fire. As a cordial, it is equally good as cinnamon, if twice the quantity is allowed for a dose; but as to aftringent powers it has no pretentions. See Newmann's Chem. Works, Lewis's Mat. Med. Cullen's Mat. Med.

CASSIDA, also called fcutellaria, tertianaria, Lyfimachia galericulata. HOODED LOOSE-STRIFE

Lyfimachia cœruleo galericulata, or gratiola cœrulea;

HOODED WILLOW HERB. Dr. Turner fays it was called tertianaria, from its ufe

in intermitting fevers : it is bitter, flinks like garlic; but is of very little use in medicine. CASSIDBOTT. See CORIANDRUM.

CASSINE. Cassiny, also called alaternoides Africana lauri ferratæ folio, Apalachine gallis, cassina herba, herba eassiona alaternus. It grows in Carolina; the leaves are about the shape and size of sena leaves, blackish when dried, shining in the upper part, green underneath, and have no taste, but an aromatic smell. Dale calls it a species of alaternus. There are two forts, and they are the third and fourth species of alaternus. Miller calls the coffine vera Floridanorum, the South Sea tea-tree; and the perigua, the cassio berry bush. Some call the Paragua or South Sea tea, by the name of Bartholomew's herb. It grows near the fea, and is not known to grow far inland. The trade for this tea is chiefly at Santa Fé, whither it is brought by the river of Plate: there are two forts, the yerba de palos, and a finer and a better fort called yerba de camini. It is most probable that the yerba de camini is the Paraguay or South Sea tea, and the yerba de palos is our cassio-berry bush. Miller's Dict. CASSOB. ALKALINE SALT.

CASSOLETA. A kind of humid fuffumigation deferibed by Marcellus.

CASSONADA. See SACCHARUM.

CASSOUVARIUS. The name of an exotic bird, which Dr. Crew, in his Comparative Anatomy, affirms to be without a craw.

CASSU. See ACAJAIBA.
CASSUMMUNIAR, called also cassummunar bingalle risagon bengalle Indorum, calmunar, calumunar, rysagon, and calminaris calminar. The root brought from the East Indies is tuberous, an inch or more thick, marked on the furface with circles or joints like the galangal, a fpecies of which it is reckoned by fome: it is brown on the outlide, and of a dufky yellow within. We have no certain account of the plant from which this root is taken; it is brought over in irregular flices.

This root was introduced by Marloe as a medicine of

CASSUTHA.

CASTALTICUM. A barbarous term for cataftalti-

CASTANA. CHESNUTS.
CASTANEA. The CHESNUT-TREE, called also lopima, cast. fativa, mota, Jupiter's acorns, and Sardinian acorns.
The coat between the kernel and shell is aftringent; the kernel is windy and fomewhat binding, but if roafted and mixed with honey, it is commended for coughs and fpitting of blood. CASTANEA SYLESTRIS.

The WOOD CHESNUT-

TREE.

Boerhaave mentions three species.

found at a town from whence it takes its name in Rofshire, found at a town from whence it takes its name in Rofshire, in Scotland: and here there is a fpring of ftrong fulphureous water, which has been in great repute for many years. Dr. Monro, from an analyfis he made of these waters, says, that a gallon contains about 59 grains of solid matter, viz. of absorbent earth, 14 grains; of selenites 264 grains; of selenites 264 grains; of saline matter, 304 grains; the greatest part of which is true Glauber's salt, mixed with a pittance of sulphur, and probably with a very small portion of marine bittern. This water is said very sensibly to increase the urine, and sometimes remarkably open the pores. It whets the appetite, and sits light on the stomach; some have the head-ach after drinking their morning bottle, but it is of no long duration, nor to any morning bottle, but it is of no long duration, nor to any great degree. Dr. Mackenzie has directed people with various complaints to drink them, and observes that fome very foul faces have been cleared by their use; the herpes removed, the eryfipelas received benefit, foul ulcers cured, &c. Dr. Monro afferts, that many of those ulcers cured, &c. Dr. Monro afferts, that many of those cutaneous disorders called scorbutic have been removed by their means, and that they cure the itch. As this water contains but a small portion of purging salt, and does not operate by stool, some purging salt may be occasionally added to the first glass, that is taken in the morning, and if equal parts of this and sea-water be mixed, they will form a purging sulphureous water, similar to that of Harrowgate. See Monro, vol. ii. Medical and Pharmaceutical Chemistry, &c.

CASTOR. The BEAVER. It is also called siber, and can't positions. The caffor siber, or castor cauda ovata

CASTOR. The BEAVER. It is also called fiber, and canis ponticus. The caftor fiber, or castor cauda ovata plana, Linn. It is an amphibious quadruped, inhabiting fome parts of Prussia, Poland, Russia, and Germany; but the greatest quantities are met with in Canada. In the inguinal region of this animal is found four bags, of an oval shape, a large and a small one on each side; in the two large ones is contained a softish, greyish yellow, or light brown fubstance, which in a warm dry air grows by degrees hard and brittle, and of a darker and browner colour: this is also called easter, and is what is used in medicine. The two smaller bags have a smell much like that of the larger but contain a loster and more unctuous

kind of matter, which is not of much value.

On cutting thefe bags, when dry, and as brought into the shops, they are found full of a brittle friable sub-stance, of a brownish red colour, interspersed with fine membranes and fibres, exquifitely interwoven. Neumann fays that the best comes from Prussia; but most, if not all other writers, fay from Russia. The Russian is in hard round bags: an inferior fort comes from Dantzig; it is fmaller and moifter. The worst is from New England; it is in thin long bags.

The Russian caster hath a strong, but not agreeable,

fmell; the other forts are weaker and more ungrate-

full.

Cafter is ranked among antispalmodics, and certainly, on many occasions, a powerful one, and has been useful, uncommon efficacy in nervous difeases; at present it is almost in every case requiring such remedies, when nsed as a stomachic, but its use is not so general as it seems to deserve. It is warm and aromatic, slightly bitter, in smell resembling ginger, or zedoary, from which it differs in being milder. Spirit of wine extracts all its virtue

distinction between these bags or glands of the beaver and his testicles, which latter they were generally said to be. Alb. Seba says that the Siberian caster is the best, then the Norwegian, then the Swedish, then the Polish, and the worst is from Canada. But from whatever country it comes, chuse that which is from a full grown beaver, hath a fetid and disagreable smell, an acrid biting taste, a brownish colour, and a friable texture.

It is adulterated with dried blood, gum ammoniacum, galbanum, &c. mixed with a little of the powder of coffee and fome quantity of the axungia cafforei. But to detect the fraud, observe that the genuine follicules arise both from one common source; that the matter contained in them is of a firm confiftence, and too bulky to be forced therein in their natural flate; the smell is not so strong as the genuine; it is true, that sometimes the difficulty to diftinguish the false from the genuine is very great, but the fophistication is undoubted, when the membranes,

pellicles, and fibres, appear intermixed with the cafter.

This drug does not keep well in powder. Rectified fpirit, proof fpirit and water, by the help of a little heat, extracts the whole virtue of the cafter. Rectified fpirit takes up the less ungrateful parts, and water the more naufcous. Proof fpirit acts equally, though with some difficulty, on both; the sp. ammon. compositus is an excellent mensitruum for it, and in many cases improves its cellent menstruum for it, and in many cases improves its

virtues.

The London College directs a tincture from this drug.

Tinelura Castorci. Tinelure of Caston.

Take of Russia castor, two ounces; of proof spirit of wine, a quart; digest for ten days without heat, and then ftrain. Heat only extracts the groffer part mor e plentifully than a cold maceration does, and proof spirit does this more than a rectified one. If it should be wanted to be fuddenly diffulible, it is better joined with afa foetida and compound spirit of ammonia. See Edinb. New Difpenf. 1789. CASTOR. A name of the cataputia major. See

CATAPUTIA.

CAST. DUR. An abbreviation of castore du-

CASTRATIO, CASTRATION. This operation is erformed when the testicle is scirrhous or cancerous. CASTRATION. This operation is when the tefticle is feirrhous or cancerous. When the tefticle fuppurates, it is only treated as a common abfects. Mr. Barnard fays that out of a hundred patients that he caftrated, only three were living three years after: and that when after the operation, the wound heals nearly, and not completely, it commonly proves mortal. Some of the most eminent this day in practice observe, that when a scirrhus is extirpated, it is as apt to return as a cancer is in the breaft; if it is of the virulent kind, certainly; and the patient will probably live as well and as long if the operation is not performed, as when it is; therefore, in general, there is no inducement to proceed to it.

But if the tefticle must be extracted, first examine whethere or not the spermatic cord is free, which must be laid bare, tied, and cut; after which proceed to dissecting all the diseased part of the scrotum, though perhaps it may be best to dissect the tumor out first, as it leads you up to the chord before you tie it. If the tumor is large, or if it adheres to the skin, make an oval incision to take it out; the incision is begun a little above the tumor, for the

better convenience of tying the veffel.

Mr. Gooch (fee his 2d vol. of Cafes) first slits the sheath of the chord with the point of a knife, then opens it far-ther with a finall pair of crooked feiffars, by which method the vessel is fairly discovered, and easily taken up with a crooked needle and ligature. And he farther observes crooked needle and ligature. And he farther observes that if the whole spermatic cord is tied, the consequences are disagreeable, or perhaps fatal; he therefore, after disfecting the sheath, secures only the artery, and thus an hæmorrhage is prevented, and the usual consequences of tying the whole cord avoided. Dr. Hunter long since advised to secure the artery, and leave the rest to the cord; may, he suggests a sufficient security though the artery should be left untied; though if it is to be cut close to the ting he advises to tie it before cutting, that it may not ring he advises to tie it before cutting, that it may not

but is refolvent and detergent: in some cases it is another charge. See Sharpe's Operations, Le Dran's Operations, and his 74th Obs. Heilter's Surgery. Bell's Surgery,

vol. i. p. 520.

CASTRENSIS. An epithet given to the dyfentery in camps, because there it is apt to affect the foldiers, on account of their being more exposed to the air of the

night, which aggravates the difeafe.

CASUS. This word fignifies the fame as symptoma; fometimes it is used for any thing fortuitous or fpontaneous, or a fall from an eminence. In Paracelfus it fignifies a prefent distemper, and also an entire history of a dis-

CATABLEMA. According to Galen, Hippocrates means by it the outermost fillet which fecures the rest of the bandage. Called also Fimbria.

CATACHLOOS, from Xxon, grass or green barb;
Galen expounds it "a very green colour." It is applied to stools, and then may read for this word, CATACHOLA. very bilious

CATACHRISTON. A medicine applied by way of

unction.

CATACHYSIS. To pour upon; an affusion. CATACLASIS, from rajanas, to break, or distort. Galen explains it to be an affection of the eye, as when the eyelids are distorted. Vogel defines it to be a spaftic

occlusion of the eye.

CATACLEIS SUBCLAVICLE. According to Galen it is the first small rib of the thorax, from zaja, below,

mass, clavis, the clavicle.

CATACLINES, from Rajanasse, to lie down. It is the

CATACLYSMA, from sajanhutu, to wash. A CLY-

CATACLYSMI. Embrocations. Colius Aurelianus expounds this by illifiones aquarum, dashings of

CATACORES. Full, abundant; and when applied

to stools, it means that they are purely or intenfely bili-ous. Hippocrates uses it in both these senses. CATACONESIS, from xalausrau, to irrigate. Irriga-tion by a plentiful affusion of liquor on some part of the

CATAGEMU. See GAMBOGIA.

CATAGLYPHE, from youpu, to cut in wood or metal, An excavation, hole, or pit. Hippocrates uses this word in his De Art. & de Morb.

CATAGMA, a FRACTURE. See FRACTURA. Galen. fays, "a folution of the bone is called catagma, and cless is a folution of the continuity of the flesh; that when it happens to a cartilage it hath no name, though

Hippocrates calls it catagma."

CATAGMATTICA, from xalaya, de luco. Remedics proper for cementing broken bones, or to promote a cal-

lus, from xajayuuu, kata contra, ayyuui, frango. CATAGOGE. In Hippocrates's Epid. lib. vii. it means

a region, and its circumjacent part.

CATALENTIA. Paracelfus coined this word to ex-

press an epilepsy.

CATALEPSIS, CATALEPSY, from καθαλαμθασιν, to occupy, detain, seize, or interrupt. It is also called catache, catochus, congelatio; and by Hippocrates, aphonia; by Antigenes anaudia; by Cœlius Aurelianus, apprehensio, oppressio; and also by some apoplexia cataleptica, detentio; encatalepsis; prehensio, comprehensio; deprehensio.

The word catalepsis hath many fignifications, as perception, or the knowledge of a thing; the retention of the

tion, or the knowledge of a thing; the retention of the breath, as when a person strains at stool; a retention of any humour which ought to be evacuated; an interception of the blood in the veilels by a bandage, as in bleeding; and the difeafe which is the fubject of this article.

Some suppose the catoche to be the coma vigil; but

most writers mean by it the catalepsy.

This disorder is reckoned by some under the list of acute This diforder is recknied by tome under the lift of acute ones; and indeed with the carus, it may be ranked among the fpecies of apoplexy. See CAROS. Dr. Cullen ranks it as a fpectes of apoplexy, viz. apoplexia cataleptica. Its feat feems to be in the back part of the brain, from the fymptoms of the difease, and the observations made on diffecting those who die of it.

Women, those with a melancholic habit, and a very active imagination, are most subject to it, especially if 3 H

cold climes.

The immediate cause seems to be an impediment to the influx of the vital fire into the nerves subservient to fenfation, and involuntary motion, whilst it is carried on in its natural, and in some measure a more impetuous manner in the nerves fubfervient to the vital actions. This retarded influx of vital principle, is from a fpafmodic conftriction of the parts where the feat of the difeafe is; and hence arises all the symptoms of this disorder.

The remote causes are the same as those that produce melancholy, and other nervous affections; the fecondary causes are also the same that produce other disorders in the nervous fystem, such as poor diet, cold and moist countries, fear, anger, anxiety, intenfe thought, excesses

of any kind, worms, &c.

This diforder rarely occurs: when it does, the fits feize the patient at intervals, and laft generally a few minutes, though now and then they continue for fome hours or days. It is rarely preceded by any figns that indicate its approach; in a few inflances a ftiffnefs in the neck, a dull pain in the head, &c. have ufhered in the fit. In the diforder the patient is fenfeless and motionless, continuing in the posture in which the fit attacked him, until a recovery from it; the limbs are moveable by another person, but, however they are disposed, the patient never alters their position, until the paroxysm is at an end. He neither fees, hears, nor feels, whatever methods may be used to excite the fensations. He swallows greedily all that is given him; the countenance becomes florid; the eyes are open, feem fixed upon fome object; at the close of the fit he fetches a deep figh, and then recovers. Other fymptoms also attend different patients, or the fame at different times, such as tears dropping from the eyes, grinding of the teeth, &c. but the above are the most generally attended to the second of the teeth of the control of the nerally attendant.

Care must be taken not to confound a catalepsy with a

If this difease proceeds from passions, the danger is not fo great as when a thick blood, or suppressed accustomed evacuations, are the cause; in the latter it is mostly fatal.

In general the cure will be similar to that of the apo-

plexy. The indication, in the fit, is to relax the spasmo-dic stricture; and, out of the fit, to remove the material, or fecondary causes, which contribute to the production of the constriction.

In the fit apply pungent acid spirits, such as the spirit of verdegrife, to the nofe, or the strongest wine vinegar. Forestus strongly recommends anti-fpasmodic oils to be rubbed on the nape of the neck, and on the back part of the head, after shaving it.

Strong stimulating clysters may be injected, if the anus is not too much constricted to admit them.

Bleeding is commended, if the face is very red and turgid; but the heat and strength of the patient will best determine the propriety of this operation.

Blifters, though recommended, feem not fo eligible an

application as finapifms to the feet.

I'wo or three spoonfuls of the following mixture may be given, at proper intervals, either during the fit, or in its abfence.

R Gum. aff. foetid. 3 ij. aq. puleg. 3 iv. fp. ammoniæ foetid. and tinct. valer. vol. 22 3fs. m. In the absence of the fit, endeavour to remove the mediate causes. According as these are, the remedies will be formed; remembering that if fears, apprehensions, and passions of the mind are the causes, medicines cannot be expected to be useful, at least not effectual; but in fuch like cafes, a change of air, travelling, diverting company, &c. are to be infifted on.

The catalepfy fometimes ends in a melancholy, epilepfy, or fatal apoplexy.

See Cœlius Aurelianus, Acut. lib. ii. cap. x. and Hoffman, Brookes's, and the London Practice of Physic. CATALONGAY. The plant that bears the St. Igna-

tius's bean.

CATALOTICA. This word is by mistake put for

CATALYSIS, from xaiaxou, to diffolve or defiror. It fignifies a palfy, or fuch a refolution as happens before the death of the patient; also that diffolution which constitutes death.

CATAMENIA, from sala, infra, or rather fecundum,

they use a cold regimen, are exposed to bad weather, and according to, and une, mensis, the month. The fanse as

MENSES, which fee.
CATANANCE. See CICHORIUM.
CATANANCE LEGUMINOSA. See NISSOLIA.
CATANTLEMA, from wikase, to draw, or pour cuater, a kind of lotion by infusion of water. Moschion de Morbis

CATANTLESIS. A lotion with hot water, expressed out of fponges, recommended by Marcellus Empiricus

against hot running ulcers of the head.

CATAPASMA. I from wasce, to fprinkle. The CATAPASTUM, ancient Greek physicians meant by this, any dry medicine reduced to powder, to be iprinkled on the body. Called also conspercio, epipasion, pasma; their various uses may be seen in Paulus, lib. vii. cap. xiii. Catapasms are of various kinds, according to the intention of the physician. Powders put in the drink were called diapafma: though Pliny fays, that fuch powders as were valued for their grateful fmell were called diapaims. Oribaiius fnews from Antyllus, that empajmata was used in order to restrain sweat, or any other evacuation by the pores; or for exciting an itching. Catapajms were fprinkled on ulcers, but diapaims were prepared for the fake of their fcent, and were applied to the armpits, and the infide of the thighs, to remove their fcent.
Ceel. Aurel in Morb. Acut. lib. ii. cap. xxxviii. fays, that
fympafmata were fuch powders, as being endowed with an
aerid quality, were fprinkled on the body to procure heat.
CATAPASMUS. A term used by Ceel. Aurelianus,
probably by mistake, for some other word. It implies,
probably by mistake, a rubbing of the posterior part of the

according to him, a rubbing of the posterior part of the

shoulders and neck downwards.

CATAPASTUM. See CATAPASMA.

CATAPHORA, from real speeps, which, among other fignifications, implies to render fleeps. A preternatural propensity to fleep. See CAROS. Galen calls a coma by this name.

CATAPHORA COMA. i. c. APOPLEXIA SANGUINEA. CATAPHORA HYDROCEPHALICA, i. c. APOPLEXIA

SEROSA. See APOPLEXIA.

CATAPHRACTA. See QUADRIGA, from xala?passu,

to fortify.

CATAPHISMA. A kind of thick poultice of meal

CATAPLASMA, also EPIPLASMA, a POULTICE, from nalandaseu, illino, to spread like a plaster. Cataplasus take their name fometimes from the part to which they they are applied, or effects they produce, fo are called anacollema, frontale, epicarpium, epispasticum, vesicatorium, and, when mustard is an ingredient they are called fina-

These kind of applications are softer, and more easy, than plasters or ointments. They are formed of some vegetable substances, and applied of such a confistence as neither to adhere nor run: they are also more useful when the intention is effected by the perpetuity of the heat or cold, which they contain, for they retain them longer

than any other kind of composition.

When defigned to relax, or to promote suppuration, they should be applied warm. Their warmth, moisture, and the obstruction they give to perspiration, is the method of their answering that end. The proper heat, when applied warm, is no more than to promote a kindly pleafant fenfation; for great heat prevents the defign for which they are used. They should be renewed as often as they cool. For relaxing and suppurating, none excel the white-bread psultice, made with the crumb of an old loaf, a fufficient quantity of milk to boil the bread in until it is foft, and a little oil; which laft ingredient, befides preventing the positive from drying and flicking to the fkin, also retains the heat longer than the bread and milk alone would do. To preferve the heat longer, the poultice, when applied, may be covered with a firong ox's bladder.

When defigned to repel, they should be applied cold, and ought to be renewed as oft as they become warm: a proper composition for this end, is a mixture of outmeal and vinegar.

Epithems are also a kind of cataplasms.

Cataplasma Emolliens. An Emollient Poultice.

Boil half a pound of the crumb of bread, and one ounce of white foap, in a fufficient quantity of cow's milk, to

Cataplasma Discutiens. A Discutient Poultice.

Take of barley meal, fix ounces; the leaves of hemlock fresh gathered and bruifed, two ounces; crude fal ammoproper confidence. Mix them without using heat, and apply it cold.

Cataplasma Saturni Goulardi. Goulard's Saturnine POULTICE.

Take a fufficient quantity of Goulard's vegeto-mineral water, put it in pipkin, with a fufficient quantity of bread crumb. Let them just boil gently, and apply it in the common method, renewing it every five or fix hours. Every time it is renewed wash the part with the vegetomineral water, and particularly the edges of the poultice.

It is commended in cancerous and fcrophulous cases,

also on milk tumors of the breast.

CATAPLEXIS, from Thuses, to firike. Any fudden flupefaction, or deprivation of fensation in anyof the members or organs.

cording to Aretwus, it fignifies the instruments of deglu-tition. Hence also CATAPOSIS, from xalariya, to fwallow down. Ac-

cataporium. A PILL.

CATAPSYXIS, from Juxus, to refrigerate. A refri-geration without shivering, either universal, or of some particular part. A chillness, or as Vogel defines it, an uneasy sense of cold in a muscular, or cutaneous part.

CATAPTOSIS, from salameriu, to fall down. It im-plies such a falling down as happens in apoplexies; or the spontaneous falling down of a paralytic limb, expressed

often by decidentia.

CATAPULTARUM AQUA. See ARQUEBUSADE. CATAPUTIA. Spurge. Under this name are ranked the CATAPUTIA MAJOR; called also palma Christi, ricinus vulgaris, agnus castus; eraway granodilla, Peruviana kik, kiki, ricinus Americanus, nhambu guacu of Piso, cherva major, COMMON PALMA CHRISTI, GREAT SPURGE, ME-

major, COMMON PALMA CHRISTI, GREAT SPURGE, MEXICO SEED, caffor; and by the Italians it is called cataputia maggiore. It is the Ricinus Americanus, Linn. the AMERICAN PALMA CHRISTI; or, ricinus communis foliis peltatis fubpalmatis ferratis, Linn.

This plant is as tall as a little tree, and is fpread into many branches; the leaves expand like one's hand, with the fingers a little feparated: the flowers are fmall and in bunches. On the body of the plant there are clusters of rough triangular hufks, each containing three fpeckled feeds, about the fize of fmall kidney-beans, which have in their fhells white kernels, of a fweet, oily, and fometimes their shells white kernels, of a fweet, oily, and sometimes

of a naufeous tafte.

These seeds are called grana ragium, and were used by Hippocrates, and perhaps before him. If they are used in substance they are acrid, and purge roughly; but the oil expressed from them acts more gently, though very efficacioufly.

The leaves when beat and boiled in milk to the confiftence of a poultice, are powerful supparants, used for dressing blisters and children's heads that are scabbed,

The feeds are externally variegated with black and whitish streaks, refembling both in shape and colour the infect called ricinus, the tick, whence the name ricinus is given to the plant. The oil which these feeds afford is what the plant is most valued for. This oil is obtained both by expection and decoding that the former method both by expression and decoction; but the former method is the best for medical uses.

This oil is known by the names of sl. ricini, alkersa, sl. palmæ Christi, oil of Kik, oil of Agnus Castus, and Castor oil. See Ægyption.

This oil operates fooner after exhibition than any other known purgative, as it produces this effect in two or three hours, it feldom gripes, or gives more than two or three ftools. It is particularly fuited to cures of coffiveness and of spalmodic colic. It is not heating or irritative. ing to the rectum, and therefore well fuited to cases of hamorrhoids; besides its easily operating as a purge it is of peculiar use in hot, bilious constitutions, in sebrile disorders of the ardent kind; and, by joining it with

reduce the whole to a proper confiftence. Amongst the poor, the bran from wheat may be used instead of bread, Its efficacy exceeds all other kind of purging medicines in adding a small quantity of oil or lard to it. Its efficacy exceeds all other kind of purging medicines in the colie, in calculous diforders, and all fuch cases as re-quire the bowels to be moved, and yet forbid the use of

powerful ftimulants.

To children it may be given in the manner of an oleo-faccharum. Gooch, in his Medical Observations, commends the following method of administering it to adults, and affures us, that two or three spoonfuls taken occafionally at bed-time, keeps the bowels foluble, even when the bleeding piles attend. A larger dofe, or the above, more frequently repeated, fuffices for a purge on any occafion

R Ol. ricini 3 j. fs vitel. ovi parum, probe contritis in mort, marm, adde fenfim aq. menth. pip. & aq. cinnam.

33 3 ij. fyr. roße, 3 fs. m.

He observes that it acts by lubricating rather than by

ftimulating.

In the colic, a table fpoonful of this oil may be mixed with a little pepper-mint water, and repeated every half hour, or every hour, until it promotes the defired evacuation. If the fromach rejects it, a gentle puke may be excited by a few grains of ipecacuhana, and then the oil will be more easily retained.

In fevers it both opens and cools; but in the lower kind of fevers it cools too much, if not guarded by fome money aromatic. In the wellow fever of the

fome proper aromatic. In the yellow fever of the West Indies it is almost a specific. When the belly is already too lax from acrid bile, this oil obtunds the acrimony, and thus restrains the excessive discharge; in dyfenteries it relieves by its obtunding acrimony. The intentions of cure in nephritic complaints, and the properties of this oil, being confidered, will readily point out its use in those afflictive complaints, for it purges brifkly, in fmall quantities, without irritation; it is cooling, and fo allays all febrile heats; it corrects acrimony, and prevents the cohefion of calculous concretions, if it does not diffolve them. In gonorrhoeas, the fluor albus, the conflipation peculiar to fludious and fedentary perfons, &c. this oil is of fingular efficacy. It is particularly to be observed of this oil, that if it be frequently repeated the dole may generally be more and more diminished, for persons of costive habits, who at first required half an ounce or more for a dose, after being frequently repeated, had the body kept lax and regular, by two drams. The best mode of its being given to prevent sickness, or naufea which it fometimes oceasions, is to mix, one of tincture of fens to three parts of the oil; shake them well together, and take them in this form.

Chuse it of a pale colour, limpid, and rather inclining to a greenish cast, almost insipid to the taste, with but little fmell, and of a thickish consistence; this fort is obtained by expression. That which is separated from the feeds by decoction, is of a brownish colour, of a rancid and disagreeable finell and taffe; this should never be used internally. See Lewis's Mat. Med. Lond. Med. Obi. and Inq. vol. ii. Canvane's Diff. on the Ol. Palmæ Christi. Med. Mus. vol. iii. Cullen's Mat. Medica.

CATAPUTIA MINOR. GARDEN SPURGE. Alfo called

lathyris major, and tithymalus latifolius.

All the fpurges are acrid; the milky juice, in which their virtue lies, is caustic and cathartic; the root, or bark, prepared by infusion in vinegar, hath been given to a dram; three or four of the leaves purge strongly: the milky juice is faid to destroy warts: but none of this tribe are now used, because of their excessive acrimony.

Under this article may be ranked the three following

Ricinoides. The BARBADOES NUT; also called pineus purgans, pinhones Indici, carcas, nux Barbadensis, faba purgatrix, jatropha, curcas, ricinus Americanus major femine nigro, munduy-guaru, nux cathartica, and avellana cathartica. The fruit is oval-shaped like a wall-nut, and contains oblong black feeds. The tree is a native of America, and also of the East Indies; it grows to a confiderable fize. The feeds are extremely acrid, and afford an oil that purges, but is rarely used on account of its activity.

Aveilana cathartica. The PURGING NUT. Also called nuces purgantes, jatropha, and ricinoides. The tree is a native of America, and the West Indies; grows to a confiderable fize. Its fruit is oval-shaped, containing round-

file interpal ufe of the hyof.

operate briskly by vomit and ftool.

Grana Tiglia. The MOLUCCA-GRAINS, fo called because they were first brought from the Molucca islands. They are also called tiglium, craton, and pinus Indica nucleo purgante. The tree is a native of America and the East Indies; the fruit is roundifh, containing dark greyish feeds, shaped nearly like those of the palma Christi. They are intenfely hot and acrid, operate with a degree of viru-lence both upward and downward; and of the four forts above mentioned, this is the most active. One dram of the oil is a strong dose.

The wood and leaves of the above five trees and plants are strong cathartics. Hermann fays, that the wood of

the tiglia, called panava, or pavana, operates violently when fresh, but when long kept is sudorific.

CATARACTA. A CATARACT, from nasapasasa, to mingle together, or put out of order. Dr. Cullen places it

as a species of caligo.

A catarall is an opacity of the crystalline humour of the eye, which prevents the rays of light passing to the retina, and fo preventing vision. Dr. Hunter says, it is when an inflammation in the coat of the crystalline humour hath rendered it opake; but Mr. St. Yves feems to

intimate, that the crystalline humour swells.

Hippocrates called it, Glaucosis. Galen Hypochysis, the Arabians Gutta opaca. The ancient Greeks iποχυμα, or iποχυσις, which Celfus renders by the word suffusio; and γλαυκοσις, or γλαυκωμα, which Galen, and most of the ancients, say, is a dryness, or concretion of the crystalline humour. Actius fays, it is a change of the crystalline humour to a sky colour, with a dryness and occacretion. And some in our day observe, that the principal difference betwixt a cataratt and a glaucoma is, that, in the latter, the crystalline humour becomes hard, and of a sky colour, (glauci coloris); and in the former it is soft.—But the idea of cataract is now totally cleared from all that confusion, in which it was usually involved, it is universally allowed to be an opaeity of the crystalline lens, and its capfule.

Mr. de St. Yves divides the cataratt into the true,

doubtful, and falfe.

The True, is when the crystalline humour hath lost its transparency: and this he subdivides into three forts; 1st, When the crystalline humour is soft: 2dly, When it is

hard: and, 3dly, When it is purulent.

The Doubtful, are those in which the success of the operation is as uncertain as the use of topical remedies. These are of four forts, 1st, A membranous catarast: adly, A filamentous cataratt: 3dly, Cataratts from blows or other external injuries: and, 4thly, From a defect of the membrane, which covers the bottom of the focket in the vitreous humour. The first and third of these he subdivides again, each into three kinds, as he endeavours to be minute, as well as full, in his description of this

The False, are those in which the remedies afford no relief farther than to palliate pains, or to remove deformity; and thefe he divides into the glaucoma, and the thaking catarael.

All this division, and fubdivision, feems little regarded in prefent practice; but yet some useful hints will be de-

rived by a perufal of this author.

When a catarad begins, the patient at first complains of a diminution of his sight; and on a careful examination of the eye, a whiteness is perceived very deep in it: on examining the eye at distant periods of time, its opacity becomes more and more manifest to the observer, and the patient very fenfibly lofes the advantage of fight. The

progress of a cataract is usually very flow.

No medicines are known, that are capable of removing this disorder of the eye; but methods of operating on the crystalline humour are used to recover the fight thus obstructed. The first is by depressing, the second by extracting this humour. In a recent case it may not be amiss to try fuch medicines as relieve the gutta ferena. Sometimes fuccess seemed to follow repeated doses of calomel, and poultices of fresh hemlock on the eye, constantly keeping ablister on the back. Small doses of Hydrargyrus muriatus daily repeated for a length of time, have been useful.

Sauvages enumerates no less than five species, and of the cataracta vera fix varieties, and tells us that two pa-thents he knew cured by the internal use of the hyoseya-

ish, and somewhat triangular, brownish seeds, which mum, one of the species which he inferts under the title have but little acrimony, and taste like almonds, but yet of membranacea, is very doubtful. He says, that it was of membranacca, is very doubtful. He fays, that it was discovered by Lower in horses, and arises from a mucus exuding from the margin of the pupil, or uvea, which concretes fometimes into a membrane, that obstructs the pupil; but whether this membranous cataract exists in the human species, he thinks uncertain, notwithstanding there have been experienced oculists, who have thought that they have fometimes found this and depreffed it with the needle. See Sauvagefii Nofologia Methodica, vol. ii.

p. 723. Mr. Sharp gives it as a general rule for proceeding to the operation, when the catarnat is entirely opake; he observes, that sometimes they are of a proper confidence for the operation before they become so, but forbids proceeding thereto while the patients can perceive any thing through them. Cataractis are of different colours; the pearl coloured, and those that appear like burnished iron, are thought proper to endure the needle; the white are supposed milky; the green and yellow are horny; and incurable; the black cataract Mr. Sharpe takes to be the

gutta ferena.

The yellow catara & often adheres to the iris fo as to be incurable. When a gutta ferena attends, the operation

will not relieve

There is little to be expected from the operation, when the discased eye is either diminished, or increased, from its natural fize.

Before and after the operation, a'due regard must be had to the state of the patient's constitution; and fuch means are generally advised, as will keep it somewhat be-

low its natural vigour.

When no objection to the operation attends, Mr. Sharp commends the following method for deprefling the cata-rall. "Place the patient in a convenient light, and a fuitable height: put a pillow behind his back, that his body may bend forward, and the head approach near to the operator; then inclining the head a little backwards upon the breaft of the affiftant, and covering the other eye, so as to prevent its rolling, let the affiftant lift up the superior eye-lid, and the operator depress a little the inferior one: this done, strike the needle through the tunica conjunctiva, fomething less than one-tenth of an inch from the cornea, even with the middle of the pupil, into the posterior chamber, and gently endeavour to depress the catara. With the flat surface of it. If after it is dislodged it rises again, though not with much elasticity, it must again and again be pushed down. If it is membranous, after the discharge of the fluid, the pellicle must be more broken and depressed. If it is uniformly sluid, or exceedingly elaftic, we must not continue to endanger a terrible inflammation, by a vain attempt to succeed.

After the operation, treat it as an ophthalmy; and a collyrium, of one part rectified spirit of wine, and ten parts of luke warm water, will be as proper an application

Mr. Daviel has the honour of having discovered the method of extracting the crystaline humour; but Mr. St. Yves practifed it about fixty years before him. When the crystalline lens had passed through the pupil into the anterior chamber of the eye, both Mery and Petit extracted it, for then the depression is impracticable. When this method of relief is put into practice, proceed as fol-

Pass your knife through the cornea, into the anterior chamber of the eye, about a line before the iris; for if it is not put there the iris will, perhaps, be wounded: if you go too far on the cornea, you may get between its la-mina, and fo not perforate into the chamber: after puncmina, and to not perforate into the chamber; after punc-turing into the chamber, guide your knife with the flat fide perpendicular to the eye, through the aqueous hu-mour horizontally (being careful not to wound the iris) and then thrust it out at the opposite side and situation of the cornea in which you insert it; then turning its edge obliquely and perpendicular outwards, make an incision rather through the inserior half of the cornea, then lifting up the superior part of it, the crystalline humour will burst its aranea, and drop out; but if it should stick at burst its aranea, and drop out; but if it should stick at its exit through the wound, it shows that the capfula of the crystalline is not broke, on which you must puncture it with the knife, and then it will drop: but if the disease is in the aranea, or the capfula of the crystalline, you must extract it also with the forceps.

With respect to the nature of this disorder, or the state

ferves that until the year 1720, or thereabout, neither the state, nature, nor seat of this discase were truly known; at least not to those who practised surgery. Accident, he adds, first proved it to be a distemper of the corpus crystallinum, and to be in granted abstract. tallinum, and to be in general absolutely confined to it. Heifter is the first writer on this subject, who leads to any just idea of it. Mr. Pott feems to be the first who dwells on the true state of the crystalline humour when a cataract is formed. He fays, that the idea of a beginning or imperfect catarall being foft, and that of a mature or perfect cataract being hard, is erroneous; at least, for the most part. That the natural found transparent crystalline, is very far from being uniform in its confidence through its whole fubftance; its external part is much fofter, and more gelatinous, than its internal: which therefore although equally transparent, may be faid to form a kind of nucleus, and is always of a much firmer texture. He adds, if this known difference of confiftence, between the external and internal parts of the cryf-talline, was duly attended to, it would folve many of the appearances in cataraels; which for want of fuch attenin, are either not accounted for, or very abfurdly. Among other phænomena, it would account for the very different colour which the different parts of the same catara& frequently bear; and which hath furnished the wildest conjectures. From this found and natural state, it is capable of feveral morbid alterations, it is capable of being diffiled or of becoming a fluid, without lofing any thing of its transparency: it hath been supposed by very able anatomists, that the human crystalline has sometimes between its furface and its capfula, a fmall quantity of fine pellucid lymph; and confequently that there is no imme-diate connection between the body and its investing membrane. In many beafts, as well as fifthes, this is known to be the case; but whether it be so in the human eye, is not very eafy to be known during life; but that this is the case sometimes from diffemper, there is no doubt: that is, the whole crystalline is dissolved into a fluid which still preferves its transparency; and this seems to form what is called the black cataract, which is a species of the gutta ferena. Mr. Pott goes on to observe that, the crystalline hu-mour is capable of being dissolved into an apparently uni-form sluid of a gelatinous consistence, which will be more or lefs opake through the whole of it; it fometimes becomes opake, while it undergoes a partial kind of diffolu-tion, which leaves, or renders the different parts of it of very different degrees of confiftence; and it now and then, though very rarely, becomes opake through its whole fubitance, and yet preferves its natural degree of firmnefs. From this variety of alteration, which the crystalline hu-mor is capable of undergoing, proceeds that variety of appearance which our ancestors have called so many different kinds of cataracts. The idea of beginning cataralls being foft, and hardening as they become more per-feΩ, hath an ill influence in practice. When the cryftalline humour becomes fofter than it should be, it is cer-tainly distempered, and unfit for perfect vision, whether it be opake or not; but that this softened lens will ever be harder, we have no reafons to depend on, any more than we have evidences that an opacity is a proof of its induration. The most fluid eataracts are as opake as the most firm ones. Farther inconveniences attending the idea of ripe and unripe, foft or hard, cataracts are as follow: the early or unripe state is supposed an improper one for the operation, and that the patient must wait for a later or ripe one; it then becomes a matter of confideration whether the patient shall or shall not continue blind for a very uncertain space of time. Again, the foft state being supposed not the proper one, a more opake and hardened state is expected as a necessary consequence of time, which not being true, the patient is either never relieved, or at beft is deprived of that advantage without any just reason. Besides the body of the crystalline lens, its capfula or invefligating membrane may be the feat of the disease; it may become opake while its contents are clear and duly transparent. This may happen after the operation for depressing a harder cataras, or for letting out a softer one. When the capsula is the seat of the difeafe, and happens to take place after depressing or extracting the crystalline lens, it fometimes vanishes in a few weeks, and fometimes requires an operation.

of the crystaline lens, whatever improvements have been made within the present century, respecting its disordered flate, many difficulties are still attendant. Mr. Pott obalways sluid, so in others they become instantly indurated; whence it follows that there is no point of time for which we flould wait, but at any time when on other accounts the object is a proper one, the furgeon may proceed. Previous to the operation, it is right to know the circum-flances which render it likely or unlikely to succeed. To have it fucceed, the cryftalline humour should be opake, and all the other parts of the eye capable of performing their functions; the eye should be of its natural fize, when with a cataract the globe of the eye is manifestly enlarged, the patient is incapable of perceiving light, or diftinguishing betwixt light and darkness, in such a case the operation must be omitted. The pupil ought to be capable of contracting and dilating; it hash been taught by many, that when the pupil is immoveable, it is to no purpose to perform the operation, which in a general sense is true, though not in a particular one; the operation ration certainly should not be performed if the pupil is immoveable from a paralysis of the part, nor if it adheres to the crystalline, as in these cases we could not operate with any fuccess; but if it is immoveable or almost so from a diftention of the crystalline humour (which Mr. Pott thinks fometimes happens), you may operate; however, in these cases, on a very nice examination the pupil, will be found to have a very finall degree of motion. The patient ought always to be able to diffinguish light from darkness, and a white from a black body; if he is not, though you remove the cataraca from over the pupil, yet the retina is incapable of performing its office. In the following inflances fuccess is hardly to be expected by either couching or extracting the crystalline body; when the diseased crystalline is somewhat of the colour of brass, or of a bright yellow, or of a copper colour, the operation does not succeed; the pupil being generally found immoveable and the whole eye enlarged. all the parts of the eye are enlarged, or when the crystalline protrudes through the pupil, the case is not a proper one for the operation.

As to the extraction or depression of the cataras, those who undertake to perform those operations will doubtless have availed themselves of all the information given by the best writers on these subjects; and to those who wish for fuller directions, &c. the subjoined writers are those from whom the whole of what art hath taught will be received.

CATARACTA NIGRA. The fame as AMAUROSIS.

CATARIA. CAT-MINT. See MENTHA CATA-

CATARRHALIS FEBRIS AMPHEMERINA. The CATARRHAL FEVER, OF CONTINUAL QUOTIDIAN of the ancients. It begins in the evening, with a fhivering and a coldness of the skin and extreme parts, a costive-ness, a frequent desire of making water, but the urine is small in quantity; a weakness of the head, an universal languor, a false appetite, thirst, disficulty of swallowing, a stimulus in the larynx, a heat in the nostrils and fauces, attended with fneezing, and a weight in the breaft. Towards'night heat, and a quicker, fuller pulse, a cough, with a defluxion of rheum, a heat in the fauces, unquiet fleep, fweating in the morning, and at length a total loss of appetite fucceeds.

The immediate cause is a sharp, acrid ferum, or lymph,

which irritates the glandulous tunics, or the nostrils, pa-late and fauces, the afperia arteria, and branches of the bronchia, and fometimes the cefophagus, ftomach, and in-teflines are affected; whence a cough, hoarfenefs, fpit-ting of a vifcid matter, fneezing, a defluxion on the lungs, naufea, gripes, &c. followed by a faiutary flux.

Women, children, and weakly men, are its chief fub-

It is most frequent in spring and autumn, or in very variable feafons.

In feven, or betwirt that and fourteen days, a catarrh comes on; and as foon as its discharge appears at the nose, the symptoms of this fever go off; tometimes incomplaint, or, perhaps, a diarrhoea proves the natural means of cure.

The intentions of which are, 1st, to sheath the acri-mony of the lymph; 2dly, to increase perspiration; 3dly,

to promote the expectoration of the vifcid mucus-The first intention is answered by absorbents and demulcent drinks; the fecond, by adding faffron and fnake-root to the abforbents, and by washing them down with tepid liquors; the third, decoctions of figs, mixture with gum ammoniacum, &c.

If the heat is confiderable, nitre may be joined with the other medicines; and if the cough is violent, the camphorated tincture of opium, or ftorax pill, may be given

at bed-time.

After the fever is abated, if a copious fpitting continues, to the perspirative powders a few grains of cort. eluther. may be added. See Hoffman's Med. Rat. See CATAR-

CATARRHEUMA. See CATARRHUS. CATARRHEXIS. A violent and copious eruption or effusion; joined with \*\*strum\*, it is a copious evacuation from the belly, and fometimes alone it is of the fame fignification. In Vogel's Nofology, it is defined a difcharge of pure blood from the belly.

CATARHECUS. A word applied to diseases proceeding from diffillations of rheum.

CATARHOPA PHYMATA. Tubercles tending downwards; or, as Galen says, those that have their apex on a depending part.

on a depending part.

CATARRHOPOS NOUSOS. A remiffion of the difease, or its decline, and opposed to the paroxysm.

CATARRHUS, a defluxion, from sara and peu, to flow down; called also bronchos, catarrheuma, fluxio, rheuma. It is an inflammation of, or an increased and morbid fecretion from the mucous membrane of the nofe, eyes, throat, mouth, or lungs, which in the leffer degrees of it, is called a cold. Dr. Cullen ranks this gegrees of it, is called a cold. Dr. Cullen ranks this genus of difease in the class pyrexiæ and order profluvia. He also enumerates two species: the first from cold, the second from contagion. Hippocrates hath seven species of defluxions under the appellation of catarrh.

When inflammatory symptoms precede the increased secretion, it is called a hot catarrh. If a sever precedes it, a catarrhal seven. See Catarrhalis Februs.

When the secretion of the mucus is increased at the be-

When the fecretion of the mucus is increased at the beginning of the diforder, and inflammation appears afterginning of the diforder, and inflammation appears after-wards, but in no very confiderable degree, it is then call-ed a cold catarrh; when there is a violent cough excit-ed, either by an exceflive catarrh, by the rupture of a vomica in the lungs, by a polypus driven into the pulmo-nary artery from the heart, or by a fpafmodic conftric-tion of the nerves, it is called a fuffocative catarrh. Many include under the word catarrh, almost all kinds of defluxlons; but the most received distinctions have been included in thefe verses:

Si fuit ad petius dicitur Rheuma CATARRHUS. Ad fauces BRONCHUS ad nares efto CORYZA.

The feat of the catarrh is in the membrane of the nofe, the frontal finuses, the antra Highmoriana, all the cells of the os fphenoides, the mouth, fauces, eyes, the afpera arteria, and its branches in the lungs.

This diforder is most frequent in cold climes, in spring and autumn, or in variable seasons; and happens chiefly to those who have narrow chefts, long necks, or such as are disposed to coughs, and those who are phlegmatic and weakly.

In general it is produced by whatever gives a check to perspiration; stimulating diet, passions of the mind, &c. may conduce to this disease. The suffocating kind is produced by a palfy in the nerves, fubfervient to respiration, and polypous concretions in the pulmonary veffels.

In a hot catarrh, the fymptoms, according as the different parts are affected, are a rednefs, heat, forenefs, and fenfe of diftension in the eyes and eye-lids; at the same time there is an unusual secretion of tears, and watery mucus, which running down the cheeks inflame them.

When the nose is affected, there is a sense of stuffing and watery in the possible of the sense of the fwelling in the nostrils, an alteration in the voice, a loss of fmell; and if the inflammation runs high, a thin mucus

deed a copious perspiration relieves, and at others a large riation of the upper lip: If the throat, trachea, or lungs, discharge thrown up from the lungs, gives a turn to the are the seat of the disease, the rheum separated in these parts inflames them; fometimes a fwelling of the nofe attends, or, perhaps the whole face is puffed up, a lan-guor, stupor, deafness, and foreness of the ears are also complained of, and a running from them. When the throat is affected, the tonfils, and parts thereto adjacent, are red, fore, and hot, accompanied with a fecretion of watery mucus, which stimulates, and occasions a constant, troublesome, tickling cough; fometimes the whole mouth is fore, there are little excoriations of the tongue, and a conftant flow of faliva, with foreness of the falivary glands, and the lips are inflamed and excoriated. When the larynx or trachea are affected, a foreness is felt in them, attended with a hoarfeness, and generally with a troublesome tickling cough. In the lungs this disease produces a foreness, tightness, and sense of stuffing in the breaft, with difficulty of breathing, and a violent cough, with which either nothing, or only a watery mucus is at first spit up, and which produces foreness under the ster-num, and in the fides, and sometimes head-ach. sickness, and reaching. Sometimes all these parts are affected at once, but more generally it happens that one only is discassed at the first, and it spreads more or less, as circumstances concur to favour its progress. There is more or less of inflammation too, according to the strength of the patient, or the violence of the disease. In the evening the symptoms are more troublesome, but, in the morning a gentler positive in the skin appears, and the patient ing, a gentler mouldure in the skin appears, and the patient is easier. In weakly habits the pulse is frequent, but not very hard; the appetite is loft, and the increase of the evening paroxysm is considerable.

In the cold catarrb, the fecretion of the mucus comes on first: there is, therefore, a running from the nose; the matter is not watery, but viscid, though thin, and not very stimulating. This mucus, when it is secreted into the throat, produces a cough, by which it is thrown off, and sometimes a nausea; or affecting the lungs, there off, and fometimes a nausea; or affecting the lungs, there is a spitting with the cough. This expectoration of phlegm is most considerable after sleeping; but there is no great sense of foreness or of studing. After some days, inslammatory symptoms come on, though not in a great degree, nor is the whole system often much affected. These symptoms are followed by an increased secretion of mucus, which becoming viscid, if it was not so at the beginning, lose its stimulus. If the inslammation is great, the mucus discharged is yellowish, and sometimes timed with blood; as this goes on, the other symptoms tinged with blood; as this goes on, the other fymptoms abate, and, at length, the discharge by spitting grows whiter, then less in quantity, and thus the disorder ends. Whiter, then lets in quantity, and thus the difference ends.

If the patient is in a cold atmosphere, the cough is the more troublesome, the other symptoms are aggravated, and the disease is prolonged. If through an imprudent exposure to the air, a relapse happens, the same course is run through that had just before been passed. If the inflammation is very considerable, an angina, or a quinty, may be produced; or if there is also the inflammatory diathefis in general, a pleurify, or other diforders which tend to a confumption, may occur.

As different fymptoms appear, according to the violence of the attack, &c. different difeafes are imitated by this, and care should be taken to distinguish the catarrh from an angina, peripneumony, ulcerated fore throat, venereal and other ulcerations in the throat, &c. and the fuffocative catarrh must not be confounded with the hooping cough, afthma, and other difficulties of breathing.

According to the heat of the body, and the strength of the patient, the cure may be begun by bleeding, or with purging, succeeded by gentle laxatives, diuretics, or perspiratives, as one or the other may seem most likeor peripiratives, as one of the other may feem most likely to relieve, and let them be repeated as circumftances
may require. After purgatives, let a gentle opiate be
given at nights, joined with a finall dole of the antimonium tartarizatum. If pain in the breaft is confiderable,
let a blifter be applied as near the part affected as is convenient. If the throat is fore, the volatile liniment may
be applied to the fore-part of it. Perspiration may be
promoted with the usual antimonal preparations, issued promoted with the usual antimonial preparations, joined with such other prespiratives of the cooling or warmer kinds, as the nature of the case may require; and by bathing the feet in warm water at night. This last meis secreted, which produces heat, and foreness of the nof-trils, sneezing, and sometimes inflammation, with exco-inflammation does not forbid, the following anodyne preparation will be a good auxiliary. R opii pari. gr. the spirit, and reduce the mass to the consistence of a ij amygd, decort, gr. x, antim, tartarisati, gr. ij. s. pili no. pill, adding the seeds toward the end of the process.

vi. cujus capt. j. ter in die.

In chronical catarrhs very great advantage is obtained by a frequent use of purgatives, mixed with opiates, in fuch quantities as not to prevent their efficacy as laxatives, c. g. R Pil. ex aloe cum myrrha, gr. xv. pil. fapon. gr. viij.

m. f. pilul. no iij. h. f. fumend.

To moderate the cough, eafe the foreness complained of inwardly, and affait the difcharge by fpitting, mucila-ginous medicines may be administered, such as the infu-fion of linfeed, mixtures with spermaceti, &c. See Hoffman's Med. Rat. Sylt. Opuscula Med. Docto-

ris Baker, Dr. Fordyce's Elements, part ii. Brooks's Prac-tice of Phylic. Schneider bath writ largely on this difeafe. Cullen's First Lines, vol. ii. 83. cdit. 4. Wallis's Sydenham.

CATASARCA. See ANASARCA.

CATASCHASMOS, from oxalu, fignifying to fearify

CATASTALMAGOS, Is the name which the Greeks, in the time of Cellus, had for a diffillation.

CATASTALTICUM, from x2xxxxxxx, to reftrain, or

TEAM. to contract. It fignifies styptic, astringent, repress-

ing, fometimes termed caftalticum.

CATATASIS, from \*\*x3/2600, to extend. In Hippocrates, it means the extension of a fractured limb; or a diflocated one in order to replace it: also the actual replacing it in a proper fituation.

CATAXA. Both Actius and Actuarius express by this

word raw filk, or filk before it is dyed.

CATE. See Lycium.

CATECHU, or CASCHU. See TERRA JAPONICA.

CATEIADION. A long inftrument which was introduced into the nostrils, in order to provoke an hæmorrhage in the cure of the head-ach. It is mentioned by

CATELLORUM, OLEUM. It is olive oil in which young whelps have been boiled until their flesh separates from the bones; after which is added thyme, marjoram, &c. which fland together in the fun, and then the oil is frained for ufc. See PH. PARIS. CATELLUS. See CANIS.

CINEREUS. A CUPEL OF TEST. Sec CUPELLA.

CATEVALA. COMMON ALOE.

CATH. An abbreviation of catholicus. CATHÆRESIS, from auea, to take away. Any fort of fubtraction of a part of the body by any kind of eva-cuation, called also detractio.

CATHERETICA, from appe, to take away. Remedies which confume superfluous flesh.

CATHARMA, from xabaspa, to purge. The excre-

ments purged off from any part of the body.

CATHARMOS, from \*28224, to purge. Purgation by medicines; and the cure of a diforder by superfittious

CATHARSIS. PURGATION. Whether by the men-

fee, lochia, urine, stool, in a way natural or artificial. CATHARTICA, from xatase, to purge. This word is generally used as expressive of purging medicines; but it also implies emetics.

Catharticum Extractum-Now called, EXTRACT COLO-CYNTH. COMPOSITUM. COMPOUND EXTRACT of

The London College directs the following:

Take of Succotorine aloes, an ounce and a half; of the pith of coloquintida, cut fmall, fix drams; fcammony, powdered, half an ounce; fmaller cardamom feeds, hulked, and powdered, one dram; of proof fpirit, a pint. The spirit being poured upon the coloquintida, digest, with a gentle heat, sour days; then to the tincture presented out, add the aloes and scammony, first separately reduced to powder; and these being disloved, draw off in the neck of the bladder, in cases of ulcers, or

This is a very effectual purge; the dose is from gr. x. to 3 fs. It is an improvement on the extractum Rudii, a composition, except for the addition of turbith, which was deferibed by Andernacus fome time before Euftachius Rudius. Andernacus called it extractum folutorium

compositum.

CATHARTICUS, SAL, called also fal-catharticus, amarus, fal amarus, magnessa vitriolata, Ebshamensis sal. Purging salt, Epsom salt, and English salt. This falt was first obtained from the mineral water at Epfom; it was afterwards feparated from the brine which remains after the cryftallization of common falt, and this latter is the fort which is now in general ufe. composed of the vitriolic acid and magnetia: differing from the natron vitriolatum, in that the latter hath a mineral alkaline falt for its basis. The first is often fold for the latter, but they are thus diftinguished: to a folution of the first, add any alkaline falt in a state of solu-tion, and the earth will soon be precipitated; the like addition being made to a folution of the fecond, no alteration is perceived.

It is with this fal amarus that the purging mineral waters are impregnated, and to which they owe their virtue. It hath a bitter tafte, is foluble in less than twice its weight of water, fhoots into long prifmatic crystals, liquifies and bubbles in a moderate heat, emitting a quantity of aqueous vapours, it changes to a white fpongy mass; this spongy mass is more bitter than the salt was before this change was made in it by the heat.

That the acid contained in this salt is of the vitriolic

kind, appears from its precipitating chalk that is diffolved

in aqua fortis, or other acids.

If this falt is disloved in water, and crystallized afresh, it concretes into a larger kind of cryftals, which resemble

it concretes into a larger kind of crystals, which resemble the purging salt usually called Glauber's.

This fast is a gentle purgative, operating in general with ease and safety, yet with a sufficient efficacy, and quickly finishing its operation. Its passing off hastily, and not extending its action so far as most other purgatives, seems to be its principal imperfections, though if given in small doses, is passes farther into the constitution, promotes the secretions in general, and proves an excellent aperient in many chronical disorders. It feldom occasions gripes or sickness. &c., which is common with occasions gripes or sickness, &c. which is common with resinous purges. If the patient keeps warm, small doses will sweat him; if cool, they pass off by urine. As a purge, from an ounce to an ounce and a half is a full dole, which, when diffolved in a quart of water that hath a dram of mace or of cardamom feeds previously infused in it, is very easy in the stomach. See Lewis's Mat. Med. Neumann's Chem. Works.

the natron vitriolatum. Its operation is very gentle.

— GLAUBERI SAL. See GLAUBERI SAL.

CATHEDRA. In Hippocrates is the anus. CATHERETICA, from \*\*makenges, to throw down. See Corrodentia

CATHESTECOS. An epithet for a strict and regular diet

CATHETERUS, CATHETER, from #291mm, to thrust into. It is a long crooked tube for passing along the urethra into the bladder, either for the discovery of a stone thra into the bladder, either for the difcovery of a ftone there, or to occasion a flow of urine if suppressed. The Latins call it sistua. See Celsus, lib. vii. cap. 26. And it had the epithet zenea bestowed on it from the matter of which it was formed, being of brass or copper.

CATHETERISMUS. The introduction of the catheter into the bladder. This appellation was given by P. Ægineta to this operation; and it is required in the following crass.

following cases.

I. When a stone lies internally on the neck of the bladder, and stops the discharge of the urine.

2. When a preternatural weakness of the bladder hinders the urine from being discharged in the usual manner; and when other remedies fail, as often happens in women weakened with labour, &c.

3. When by too long retention of urine, the bladder is

wounds of the kidneys, or after discharges of bloody

5. When the urethra is contracted or obstructed, or the neck of the bladder; but in this case bougies are preferred, or when the proftate are scirrhous, or tumid, and prevent the paffage of the urine.

6. In the last months of pregnancy it is sometimes use-

ful to introduce the catheter, to draw off the urine.
7. When a prolapfus uteri produces an ifchury.
8. When a liquor is to be injected into the bladder, in which case a bladder may be filled with the liquor to be injected, then fastened to the catheter, and so by gentle preffure conveyed through it.

It is eafy to introduce the catheter into the bladder of a woman, but in men's fome difficulty attends. Heister fays, that the easiest method of introducing the catheter is for the man to lay on his back, and the operator to take the penis in his left hand, as he stands on the patient's left fide, reclining the penis towards the navel; then he is to introduce the catheter with its concave part to the belly, into the urethra, fo far as the os pubis, and fo thrufting it under the fymphysis of those bones, and moving the handle, fomewhat in a circular polition, he

gently forces it into the bladder. If the catheter is too fmall, it is the more apt to stop in the cotrugations and foldings of the urethra, which often occur in old men. Dr. Hunter observes that some impe diments are often met with at the caput gallinaginis, in which case he advises to draw the catheter a little back, and prefs the end of the catheter a little higher, and then it will flip in; but he cautions against using any force. If a difficulty is still found, he advises to put a finger into the anus, at the same time draw the perinaum forward, and therewith endeavour to affift the catheter in its intro-

Those catheters are the best that are made with small

holes at their ends instead of long eyes.

Though this instrument may be required on some ac-

counts, yet in the following cafes it cannot be used.

1. When the neck of the bladder is greatly inflamed, for then the urethra is much contracted, and to force in this case would endanger a sphacelus.

When a caruncle, cicatrix, or hard tubercle ob-

ftructs the passage. 3. In old men, fometimes from the stricture shrinking, or from wrinkles in the urethra.

4. From the diftention of the fpongy fubstance of the urethra with the blood.

5. From a scirrhofity or preternatural humour of the proftate gland.

6. From a ftone lodged in the neck of the bladder.

7. When the uterus is remarkably prominent and pendulous over the offa pubis, the neck of the bladder, then forming an angle with the body of the bladder, hinders the passage of the catheter.

CATHIDRUSIS, from xatifoun, to place together.

The reduction of a fracture.

CATHIMIA. In the Spagyric language it fignifies, 1.

A subterraneous mineral vein, where gold and filver is dug; 2. Concretions in the furnace of gold and filver;

CATHMIA. LITHARGIUM, LITHARGE, which fee, and the fpume of gold, filver, brafs, or iron.

CATHOLCEUS. An oblong fillet which came over the whole bandage of the head called perifcepaftrum.

CATHOLICON. A general or universal medicine. Formerly it was supposed to purge off all kinds of bad humours. From xaja, through, and axos, the whole, i. e. univerfal, fometimes also termed diacatholicon.

CATHYPNIA, from επρω, fleep. A profound fleep. CATIAS, from καθισμι, dimitto. An incision knife, formerly used to extract a dead feetus, and for opening an abscess in the uterus.

CATILLIA. The weight of nine opines.

CATIMIA. See CADMIA.

CATIMUM ALUMEN. POT-ASH.

CATIMUS FUSORUS A CANALY See CRIT.

CATINUS FUSORIUS. A CRUCIBLE. See CRU-CIBULUM.

CATISCHON. One who is coffive or not eafily

purged.

CATIUS. The name of an inftrument for extracting a dead child.

CATIXIS. On the fame fide. In inflammation of the liver a crisis of blood discharged from the nose is by the right nostril; and inflammation of the spleen by the left; and it hath long been observed, that nature endeavours with more vigour, and more certain fuccefs, to free herfelf on the passages on the same side of the dif-

CAUCALIS. BASTARD PARSLEY, called also echinophora tertia, lappula Canaria, pfeudofelinum, anthrifcus, daucus annaus minor, and HEDGE-PARSLEY; they have dug; 2. Concretions in the furnace of gold and filver; generally red flowers, and and possess the common qua-3. Gold; 4. Spuma argenti; and 5. Soot that adheres to the walls in burning brass.

It is also a name of feveral species of car-

> CAUCALOIDES. A name of the patella, in Mof-chion de Morb. Mulieb. fo called from its likeness to the flower of the caucalis.

> CAUDA. In botany, the tail of a leaf; is a production of the middle rib, and connects the leaf with the stalk, after the manner of a pedicle; when the middle rib hath an appendix of the leaf running along it, it is often called a winged leaf.

> CAUDA. Actius in his Tetrab. 4. ferm. 4. ch. 103. fays that in fome women a fleshy substance arises from the os uteri, and fills the vagina. Sometimes it protuberates without the lips of the pudenda, like the tail of fome animal, whence its name. In order to extirpate it, he advifes to extend it with a forceps, and then cut it off, after which it must be dressed with lint dippid in rough wine. P. Ægineta speaks to the same purpose. It is also a name of the coccygis os.

> - EQUINA. HORSE-TAIL. In Botany it is a plant with a thick, hollow, strait stalk, full of joints, long, flender, rough, stiff, jointed, rush-like leaves, standing

#### CAU CAU 22I

feveral round every articulation in form of a ftar. It is | perennial, and common in watery places. Boerhaave

enumerates ten species.

Equisetum, called also hippuris, equisetum palustre longioribus, equifetum majus, afprella; GREAT MARSA or WATER HORSE-TAIL. The leaves are moderately aftringent: they give out their active matter to water, and to spirit; but are not of efficacy enough to obtain a place in practice.

Equisetum arvense longioribus setis; called also equisetum minus terreftre, equifetum fegetale, CORN HORSE-TAIL. It is the equifetum arvenfe, Linn. It has its flowers feparate from the stalks which bear the leaves. They appear in April and May. The qualities of this are similar to the above named species.

Equisetum palustre brevioribus foliis, polyspermum, called allo polygonum feeminium cauda equina feeminia, pina-fiella ruppio, pinaftella furrectior, FEMALE HORSE-TAIL. This species is found in lakes and other watery places.

Equifetum poligonoides beceiferum majus, ephedra maritima major, tragus, uva marina major, polygonum bacci-ferum, SEA-GRAPE, or SHRUB HORSE-TAIL. This grows in Sicily, and other maritime places in the Mediterranean.

Ephedra maritima minor, called also polygonum bacciferum maritmum minus, tragus, uva marina, equifetum iv. Mathioli, hippuris minor, equifetum polygonoides bacciferum minus, LESSER SEA-HORSE-TAIL. See Dale, Ray,

Boerhaave, and Miller.

In ANATOMY, the medulla spinalis ends about the first or fecond lumbar vertebra, and there forms itself into many branches which receive all together the name cauda equina. From the loins downwards the holes in the vertebræ are fomewhat lower than the origin of the nerves that pass through them; hence it is of importance when any diforder arises from an injury of any of the nerves below the first and second lumbar vertebra to advert to this circumflance; and as at the first or second vertebra of the loins the cauda equina begins, fo in tracing the fource of all the nerves below these parts, their origin is together there. See LUMBARES.

CAUDA MURIS. A species of RANUNCULUS. See also

- PORCINA. See PEUCEDANUM. VULPIS RUBICUNDI. RED LEAD.

CAUDATIO. So an clongation of the clitoris is called.

CAUDEX. The TRUNK of a TREE. The trunk, flock, or stem, is that part of any plant which lies betwirk the root and the branches. In herbs and understrubs this part is called caulis, the stalk, thryfus, fcapus,

ely fo as not to cohere.

CAULIAS. An epithet for that juice of the fylphium which flows from the ftalk, by way of diffinction from that which flows from the root, and is called \$\delta(\cdot) \alpha(\cdot) \alpha(\cdot).

CAULIFEROUS. Such plants are fo called as have

CAULIS. The STALK. In botany it is a part of a plant receiving the nourishment from the root and conveying it into the other parts with which it is clothed, not having one fide diltinguishable from the other. The flalk of a tree is called its trunk. See CAUDEX. It is a name also for both the penis and vagina; and in corn and grass it is called the blade; and is also a name for a cabbage or colewort. See Brassica Sativa.

— Florida. Cauliflower. See Brassica

- PROCUMBENS. A procumbent or trailing stalk —— PROCUMBENS. A procumbent or trailing stalk is that which lies on the ground, and propagates itself by emitting roots, as the ivy and strawberry.

—— RUBRA. RED COLEWORT.

—— SCANDENS. A climbing stalk is that which climbs by the help of tendrils, as the vines and briony.

—— VOLUBILIS. A twining stalk is that which twifts about any prop, without the help of tendrils, as the long and kidneysbear.

the hop and kidney-bean.

CAULODES. The WHITE or the GREEN CABBAGE.

CAULOS. A STALK. This word is used by way of eminence to express the stalk of sylphium or lafer.

CAULOTON. An epithet of the BEET.
CAUMA, from sais, to burn. The heat of the atmosphere or of the body in a fever.

CAUNGA. A name of the areca.

CAUSA. A CAUSE. It is more difficult very often to difcover the causes of disorders than to prescribe for the cure, when the cause is known; and it is by this skill and sagacity in making such discoveries that a physical content of the content of the cause of the c fician shews how much he is above the mountebank and pretender. Great confusion is met with in most writers on this subject; and indeed it is hard to say from whose theory we shall proceed to an useful practice. One says that the causes of diseases are in the fluids; another fixes them in the folids; fome proceed from chemical, and others from mechanical principles, &c. But when reafoning a priori is laid afide, when nature is fludied, and theory is confirmed only by clinical observation, this sub-ject, so perplexed, may gradually unfold, and a theory be formed which, so far as it extends, will happily convert this uncertain science into an art.

It is some satisfaction to be able to account for morbid fymptoms, though the difeafes which give rife to them may be in their own nature incurable; for, where we cannot relieve, we shall at least be prevented from doing

Difeases should be distinguished by their causes, and not their effects; for this method, in many instances, Boerhaave and Van Swieten are truly admirable. It is owned that men of experience may be led from the effects of a disease to the knowledge of its cause in some cases; but then the curative indications can only be properly taken from the knowledge of the true caufe.

The causes of diseases are always something physical; they are that which makes a difease to be present; they are what impairs the functions, by producing diforders

in the folids, fluids, or both.

Causes are variously confidered and divided by different writers, but perhaps the following general order will be found as free from objections as any of the different ones. Most diseases have four causes, viz. the predisposing, primary, antecedent, and conjunct. The three last are called morbific causes. And it should be noticed that two efficient causes sometimes produce a disease, or even one, (e. g.) Ift. By violent exercife, a stone falls from the kidnies, but obstructs the urethra, and causes pain: here are two causes, viz. the primary, i. e. the exercise; and the conjunct, i. e. the stone. 2dly. A wound by a fword, the wound is owing to a fingle cause, which is the primary one, i. e. the fword. A conjunct cause may be a procatarctic cause at the same time, e. g. an extraneous body lodged in the cefophagus. The ante-cedent caufe may also become the conjunct; or the conjunct may become the antecedent; e. g. a plethora of blood in the veffels may be the antecedent cause of a phleg-CAULEDON, because it breaks like naule, a branch.

A species of fracture, when the bone is broken transif it settles on any part; e contra, the coagulated blood which is the conjunct cause of a phlegmon, may become the antecedent cause if it is taken up again by the veffels, and re-enters the circulation.

The predifpoling cause, also called causa proegumena, and by some the antecedent; but then, in their division they have only three general causes. The predisposing causes are those which render the body more fit to receive a morbid impression, when a primary cause is applied; also that disposes the body to suffer in one or other mode more readily than in any different ones. This kind of cause is a fault in the original constitution; or else it is induced in time by fome accident. Of itself it neither constitutes nor produces a disorder; but when certain morbid causes occur, it savours their effects; e.g. a long neck and stat breast disposes to a consumption, a short neck to an apoplexy, flenderness to a pain in the fide, rigid fibres to inflammation and fever, lax fibres to a cachexy and dropfy, &c. Some difeases pave the way for others, as an aithma for a dropfy, colic for the palfy, small-pox and measles for an inflammation in the eyes, and a confumption, &c. And a part, once injured, is more sub-ject to be affected in the same way again.

The primary cause, called also the privative external,

evident, apparent, remote, active, efficient, præincipient, procatarctic, or occasional. This excites the pre-disposing cause to action, or these causes applied to the body that is pre-disposed thereto, excite diseases; and are generally nerally an error in one or more of the non-naturals, or wounds, contusions, compressions, mucous matter thrown out of the follicules of the glands before the falts are abforbed. Dr. Shebbeare observes, in his Theory and Prac-

3 K

tice of Phylic, that " if, instead of attending to particular vens febris; a burning, or highly ardent fever. Hippodiforders, with all the minute differences which attend them, we were attentive to the primary canfe, our medi-cinal knowledge would thereby be more advanced." He farther observes, that " an excess or defect of vital fire, is the most general cause of diseases;" what he advances on this fubject, may be feen in the just quoted publication, and deferves more attention than feems hitherto to have been given it.

The antecedent eaufe, called also the mediate. These eaufes are usually in the exercta and retenta. In most complaints, the non-naturals first diforder some of the evacuations, this is the primary cause of the disease; then thefe evacuations affect the blood and juices, which is the fecond cause; the blood and juices thus affected, will not fail to diffurb the action of the parts, which is the last and immediate cause of disease, and in which consists the

nature of all difeases.

The immediate, called also the conjunct, proximate, continent, formal, hidden, and internal. The immediate causes are those which, taken altogether, immediately conflitutes the present disease; the presence of these conftitutes and continues them; and their removal is the cure: as the air in an emphysema, and the blood in an aneu-

rifm.

A knowledge of the proximate cause enables us to judge of the nature of the complaint and its remedies. The empiric feet rejected this enquiry. The knowledge of this kind of causes may be learnt from, first, a fore-knowledge of the nature and powers of the remote causes; feeondly, from collating the different fymptoms of the difease together, and by ftrict reasoning to reduce them to one fimple cause; thirdly, from the pernicious or falu-tary effects of the remedies applied during the disease; fourthly, by a careful inspection of dead bodies. In this last, much skill in the appearances met with in dead bodies is required, left the effects of the causes should bemistaken for the causes themselves.

The proximate cause is often difficult to be discovered, fometimes impossible; and general causes are very numerous, hence the difficulty to fix on the particular one. CAUSIS. A BURN. See AMBUSTA.

CAUSODES FEBRIS. See Causus. 'Celfus renders this word by febris ardens.

CAUSOMA. In Hippocrates fignifies a burning heat and inflammation.

CAUSTICA. CAUSTICS, from zaus, to burn. Cauflies destroy the texture of the parts to which they are

Cauffics are, the actual cautery, or red-hot iron; burning moxa, &c. See Escharotica.

CAUSTICUM AMERICANUM. See CEVADILLA. - ANTIMONIALE. See ANTIMONIUM MURIA-TUM, under ANTIMONIUM.

- COMMUNE FORTIUS. Ph. Lond.

The common stronger Caustic of the London College. — Called now, CALX CUM KALL. PURE LIME WITH PURE KALI.

Take of quicklime, five pounds, four ounces; water of pure kali, fixteen pounds; boil away the water of pure kali to a fourth part; then fprinkle in the lime, reduced to a powder by the affusion of water. Keep it in a vessel close stopped.

- LUNARE. See ARGENTUM, called also lapis infernalis, but now ARGENTUM NITRATUM, NITRAT-

ED SILVER, which fee.

When couffics are applied upon an abfeefs, &c. lay on a piece of flicking plafter upon the foft part of the abfeefs, having previously cut a hole in it, nearly as big as the efchar is to be made: then in the hole of the plafter lay the cauftic, which must be secured by another piece of sticking plaster, when the eschar is formed, it must be cut through, and wholly, or the greatest part of it, separated with the knife.

According to the intention of applying a caustic, it must lay on longer, or a lesser time; if to form an issue it may lay on four hours, or if to lay a bone bare, the fame time may be allowed; to deftroy a large gland it may lay on fix hours; to open an abfects, more or lefs, ac-cording to the thickness or hardness of the skin. See ESCHAROTICA.

CAUSUS, from ware, to burn; canfedis febris; den-

crates describes this fever, and according to him, a fiery heat and infatiable thirst are its peculiar characteristics. Galen's account of it is much the same. Hossman, in his Med. Rat. Syft. is very particular in his description of this disorder; and observes, with the ancients, that its pathognomonic fymptoms are, an intenfe burning all over the body, an unquenchable thirft, and a parched, furrowed, black tongue. Aretæus deferibes this diforder, and Lommius is very accurate in his account of it; but from any of their relations, it does not appear to be any other than a continued ardent fever, in a bili-ous conflitution. They observe, that the heat of the body is not only intense, but that the breath is peculiarly fiery; the patient's extremities are cold; his pulfe is frequent and fmall; the heat is more violent internally than externally; and the whole foon ends in recovery or death. Boerhaave, in Aph. 738. calls it an ordent fever. Dr. Cullen places it amongst the remitting tertian severs.

The cure is the fame as in ordent fevers in general.

See ARDENS FEBRIS. .

An inflammation of the aorta and vena cava is a fpecies of caufus.

CAUTERIUM, from Kates, to burn. A CAUTERY, either actual or potential. See ESCHAROTICA.

Cauterium Potentiale Ph. Edinb. The POTENTIAL CAU-TORY of the Edinburgh Difp.

Take of Ruffian pot-ash and quick-lime, of each equal parts; of spring-water, three times the quantity of the whole; macerate them for two days, occasionally ftirring them; then filter the ley, and evaporate it to drynes; put the dry mass into a crucible, and urge it with a itrong fire till it flows like oil; then pour it out upon a flat plate made hot, and while the matter continues foft, cut it into pieces of a proper fize and figure, and keep it in glaffes closely stopped.

This is also called lapis septicus. It is a strong and sudden caustic, but it deliquates too foon in the air, and runs beyond the bounds it ought; indeed the fuddenness of its action depends on its disposition to liquify. But this inconvenience is avoided in the calx cum kali puro.

Ph. Lond. 1788:

CAVA HERBARIORUM. | See FUMARIA BULBO-

CAVA MAJOR RADIX. SA.
CAVA VENA. The large vein which receives the refluent blood, and conveys it to the heart, is thus named.

The vena cava is generally described as being two, viz. the ascending and the descending; the right auricle receives them both, one at its upper, the other at its lower

The fuperior vena cava is distributed principally to the

thorax, head, and upper extremities, and but very little to the parts below the diaphragm.

The inferior vena cava is distributed principally to the abdomen and lower extremities, and very little to the parts above the diaphragm.

The ancients called the vena cava superior, the vena

cava afcendens; and the vena cava inferior, vena cata

defeendens.

According to Winflow, who is extremely accurate in his description of the blood-vessels, the superior or ascend-ing vena cava runs up from the right auricle of the heart, almost in a direct course for about two fingers breadth within the pericardium, on the right fide of the aorta, but a little more anteriorly. When it passes out of the pericardium, it runs up to near the cartilage of the first true rib, and a little higher then the curvature of the aorta; here it divides into branches, viz. the right and left fubclavian veins. The trunk of this upper vena cava from where it leaves the pericardium, to the just named bifurcation, fends out anteriorly the vena mediastina, pericardia, diaphragmatica superior, thymica, mammaria interna, and trachealis. All these are called dextra-Their fellows on the other fide are called finistræ; they do not fpring from the trunk of the vena cava, but from the left fubclavian vein. Posteriorly, a little above the pericardium, the trunk of the vena cava fends out a capital branch, called vena azygos. It runs down by the vertebræ dorfi, almost to the diaphragm, giving off the greatest part of the venæ intercostales and lumbares su-

Hardly a quarter of an inch of one fide of the vend cava

inferior is contained in the pericardium; from thence it immediately perforates the diaphragm, to which it gives the venæ diaphragmaticæ inferior, or phrenicæ: it paffes behind the liver, through the great finus of that vifeus, for fome time to the fun, and thus this wine is made fit to which it furnishes those branches called venæ hepaticæ. In this course it inclines towards the spina dorsi and aorta inferior, the trunk and ramifications of which it accompanies all the way to the os facrum, the arteria coeliaca and the two melentericae excepted. Arrived at the os facrum, it terminates by a bifurcation, and forms the two illiacz, which give off the hypogafricz, and fome other branches diffributed into the pelvis; then they pass under the ligamentum Fallopii, and there take the name of crurales, each of which are diffributed throughout the lower extremities.

CAVALAM. A Malabarian plant, called also arbor filiquesa Mulabarica pluribus ad fingules flores lebis. It is not remarked for any medicinal virtue.

CAVERNA. A CAVERN. Also a name of the fe-

male pudenda.

CAVIARIUM. It is the pickled roe of the flurgeon.

CAVICULA, The ANKLE, also the os cuncifome.

CAVITAS INNOMINATA. See AURICULA.

CAYAN. See CAJAN.

CAYENNE, See PIPER INDICUM.

CAYMANES. The WEST INDIAN CROCODILE, or ALLIGATOR.

CAYUTANA LUZONIS. See FAGARA MAJOR.

CAZABI. See CASSADA.

CEANOTHOS, i. e. Carduus vincarum repens. See CARDUUS HAMORRHOIDALIS.

CEANOTHUS. See CELASTUS INTERNUS.

CEASMA, from zeatu, to fplit, or divide. A fiffure or fragment.
CEBAR. An Arabian word for agallachum.

CEBIPIRA BRASILIENSIBUS. Guacu, or Miri-A tree which grows in Brafil. Its bark is bitter and aftringent, and of which baths and fomentations are made for the relief of pains in the limbs, difeases from cold, tumors of the feet and belly, itch, and other cutaneous difeafes.

CECIS. A GALL of the OAK.
CECRYPHALOS. Hippocrates by this word means the net in which women confined their hair. It is also that stomach of ruminating animls which lies next before

CEDMA. The fame as Pudendagra, which fee. CEDRA, Essentia de, i. c. Eff. Bergamotte. See

BERGAMOTTE.

CEDRELÆUM. Oil of CEDAR. See CEDRIA.

Among botanists, it signifies that species of cedar which is faid to exceed all other trees in size.

CEDRIA. It is called the pitch and the resin of the

CEDRIA. It is called the pitch and the refin of the great cedar-tree, so that it is the crude tears of the cedar. Some fay it is different from the cedrium, or oil of cedar, which is more oily and liquid; but by writers in general, it is called cedria, codrium, and cedrelaum, &c. The Arabians call the oil alkertan. Gorraus and Pliny fay, that the great cedar yields a pitch called cedria, to which Galen gives feveral names, and among the reft he calls it cedria. Salmafius fays, that the Arabians call the oil of cedar ketran, or alkerran; and we, by a corruption of that word, give the name of cedrinum to the pitch which is used for thips. Though the Greeks confound cedreheum with cedria, they are not the fame; for the cedria is the pitch, or refin, that diffils from the cedar-tree; and the cedrelæum is an oil obtained from pitch or refin, and which fwims above it in boiling, and is collected with wool. Diofcorides fays, that the best cedria is thick, pellucid, of a naufeous fmell, when poured out it does not forcad, but runs into drops, and has a power of preserving dead bodies from corrupting: but notwithof preferving dead bodies from corrupting: but notwithtanding all the difputes, it does not appear to be really
known what the cerdium is.

CEDRINUM LIGNUM. So the wood of the juniper tree is called. See Juniperanus.

— Vinum. Cedar wine. Take thin pieces of
wood, just cut from the tree, while the fruit is on it,

and expose them to the sun, or a fire, to obtain their

In the fame manner is prepared wines from juniper, pine, cyprefs, bay, and the wood of some other trees. All these wines are remarkably heating, diuretic, and astrin-

gent, and the bay wine is particularly fo.

Cedar wine is also prepared by mixing half a pound of the bruised berries with fix pints of must, which are placed in the fun for forty days, and then taken for use.

Cedrinum is a name for that composition of wax and

refin used for ships. See CEDRIA.

CEDRIS. The fruit of the great cedar tree.

CEDRITES. Is wine, in which the refin which diffils from cedar-trees hath been steeped.

CEDRIUM. See CEDRIA. Also a name for TAR.

CEDRO. The CITRON-TREE.

CEDROMELA. The fruit of the citron-tree. CEDRONELLA. TURKEY BAUM. See MELISSA.

CEDROSTIS. See BRYONIA ALBA.

CEDRUS, called also cedrus conifera folis laricis, co-drus Libani, cedrus magna larix, larix orientalis. The great cedar of Libanus.

No modern botanists find any of the cedar-trees that agree with the Scripture account of their loftiness, but rather with that account of them which the Pfalmift gives, when he fays, the flourithing flate of a people is, that they spread their branches like the cedar-tree. Maundrel, in his Travels fays, he measured the trunks of some old cedar-trees, and found one to be twelve yards in circumference, and thirty-feven yards in the spread of its boughs.

The cedar of Lebanon is an ever-green comferous tree, with very narrow, fliff, tharp-pointed leaves, flanding feveral together in tufts. It is a native of the bleak fnowy mountains of Syria, and is not as yet become common in England. As a medicine, it differs very little from the virtues of the fir-tree. Its finell is confiderably more agreeable, and the refinous juice extracted from the trunk of the cedar-tree, by incifions, is more difposed to con-crete into a folid brittle mass than that from the firtree; nor does the matter which diffils from the cedartree lose much of its finer parts in drying; even boiling water does not eafily carry off the flavour of cedar-wood

By diftilling the wood with water, a fmall quantity of effectial oil is obtained, which congeals in a moderate degree of cold. The decoction in the ftill affords an extract by evaporation, which fmells confiderably of the wood, and is in tafte bitterifh and faline. In the faline nature of this extract, this wood differs from all the refinous ones that have been examined. Margraff fays, that the faline part which shot from the extract just named, was common falt. That -- cum Folio Cypri, called also lycia, bellonio, oxycedeus, juniperus, thuyæ genus quartum, and sabina baccifera.

It is a fhrub with yellow flowers, and fleshy leaves, placed four together like those of cypress. The flowers are followed by a round fruit like a mulberry in tafte and fmell, and of a purple colour when ripe. In this fruit are three or four feeds which fmell like rofin. Until this tree is three or four years old, its only diffinction from the juniper bush is, that its leaves are foster and shorter. It grows in many of the fouthern parts of Europe. Its medicinal qualities are like those of juniper. Dale informs us of another species which he found in Carolina, and which affords a gum so like the true olibanum, that when mixed they cannot be separated. Hence he concludes, that this is the tree that affords the olibanum.

- AMERICANUS. See THUYA.

- BACCIFERA, i. c. SAINA BACCIFERA. Sce CEDRUS FOLIO CYPRI.

- CEES. See CRINONES.
- FOLIO CUPRESSI, See OXYCEDRUS. -- LYCIA.

- PHOENICIA, called also thuya Massiliensium, juniperus e Goa, cedrus e Goa, sabina Goensis, and juniperus Curoliniana. Its virtues are similar to those of juniper. CELASTRUS. The STAFF-TREE.

—— INERMIS, foliis ovatis, ferratis, trinervis Linnæi. Called alfo ceonstbus Linnæi. It is a species of carduus. Some noted Indians depend more on this than on the

exceedingly virulent, they mix fome of the roots of the rubus caule aculeato foliis ternatis Linn. with it.

CELE. Kan, a TUMOR, caused by the protrusion of a

CELERI ITALORUM. See APIUM.

CELESTRUS THEOPHRASTI. See ALATERNUS.

CELESTRUS THEOPHRASTI. See ALATERNUS.

The ducts which carry off them.

The ducts which carry off them. CELULÆ MASTOIDÆÆ. These are very irregu-lar cavities in the substance of the mastoid apophysis, which communicate with each other, and have a common opening towards the infide, and a little above the posterior edge of the orbicular groove. These cells are lined by a fine membrane, which is partly a continuation of the periofteum of the tympanum, and partly feems to be a glandular ftructure like a kind of membrana pitui-The maffoide opening is opposite to the small opening of the Euftachian tube, but a little higher. See TYMPANUM.

CELLULOSA MEMBRANA. The CELLULAR MEMBRANE. It is called the mucual web, tela cellulofa, paniculus adipofus, and membranana adipofa; the French call it tiffue cellulaire, tiffue-muquen, and l'organe cellulaire. This membrane is of the greatest extent, and of the utmost consequence in the human structure; for it not only enfolds, but it enchains and penetrates into every part; indeed it feems to be the very constituent of most, if not all the parts that are called the folids in our bodies. Experiments prove that all membranes, without exception, and the veffels, which are hollow membranes, the parenchymatous fubfiance of the vifeera, ligaments, and a great part of the bones, either are, or have been cellular membrane. The cellular membrane by being compacted in different degrees of firmness, forms these solids. Air introduced under the skin diffuses itself through ail the furface of the body, penetrates into the interflices of the muscles; and Haller afferts, that even the vitreous humour of the eye hath received the flatus of an emphyfema.

Some describe the cellular membrane not as one, but as a congeries of many membranous laminæ joined irregularly to each other at different distances, so as to form numerous interflices of different capacities, and which communicate with each other. These interflices they call cellulæ, and the fubiliance made up of them cellulous fubstance.

But generally, and that most properly, it is considered as being of two kinds, viz. reticular and adipose; and is described as a composition of ductile membranes for the lodgment of oil, connected by a fort of net-work. In fome parts its fubstance is merely a net-work of slender fibres, and small membranes which give it ductility and looseness; for instance, under the skin of the penis and fcrotum. In other parts, it is more or lefs loaded with oil, and is lefs porous or foongy in its fubstance, as under the skin of the buttocks, and in the foles of the feet. Dr. Hunter uses the term cellular as the generical name, and the terms reticular and adipofe, for expressing the two species. He also observes, that the reticular part is evi-dently dispersed through the whole body, except, perhaps, in the fubstance of the bones, of the brain, and in the humours of the eye. That is found in a much greater degree in the belly of muscles than in the tendons, in which it is fearcely different. And he is of opinion, that the adipose membrane is composed of two kinds of cells, viz. the reticular, which communicate with each other; and adipofe, which are diffinet, and are the refervoirs of the animal oil. He urges, as a proof of his opinion, that the water in an anafarca goes downward, whilst we are in an erect posture, but the oil does not. The oil is supposed to be secreted by the small arteries, and occa-fionally absorbed into the circulation. Though Dr. Hunter thinks, that wherever there is fat in the human body, that there is a particular glandular apparatus superadded to the reticular membrane, consisting of vesicles, or bags, for lodging the animal oil, as well as vessels sitted for its fecretion.

Whether or no the cellular membrane be the basis of all the organized and vascular parts of our frame, Dr. Hunter hath proved, that the most simple parts of it are vascular; that the callus which unites broken bones, is itfelf bone, and also vascular; that the morbid adhesion between the and also vascular; that the morbid adhesion between the lungs, &c. and their adjacent parts are vascular, and that be diftinguished from catharis. Genosis imports a gene-

lobelia for the cure of the pox, and use it in the same | a cicatrix in the skin is vascular. Whence he infers, that manner as the LOBELIA, which fee. If the diforder is all our folids are organized, and that whether lengthened, or renewed, they shoot in a vascular form. But here the doctor fpeaks of the visible parts.

The cellular membrane receives the terminations of the nerves, both of the brain, and of the medulla spinalis. Perhaps it is formed of the continuation of their coats,

The ducts which carry off the fluid fecerned in this membrane, pass out between two membranes like the ureters in the bladder.

The uses of this membrane are many, some of which are of the utmost importance, considered in a medical view, and others but little understood. Among the variety, the following are fufficiently obvious:

1. It fills up interftices, and gives an agrecable contour

to the body.

2. It is a cushion to defend against pressure, hence it is of a thicker composition in infants.

3. It connects the parts of the body, but fo as to admit of a fliding motion on the circumjacent parts.

4. In some parts of the body it serves as a bed for ten-der parts to be lodged on, as in the orbit, scrotum, &c.

5. It ferves as a refervoir for animal oil.
6. And from observing, that the destruction of it in a muscle is always attended with a loss of motion there; it is justly concluded to be of use in conveying the principle of life, and duly diffributing it throughout the

This membrane is the feat of abfeeffes, the leucophleg-matia, emphylema, anafarca. In a confumption it is fhrunk up so as to be hardly visible; in an anafarca its greafy contents are all destroyed; and in an emphysema, almost its minutest parts are rendered visible. Bullets, and other large fubitances that cannot pass the circulation, pass by the cellular membrane.

On this article, fee what Dr. Hunter fays in the Lond. Med. Obf. and Inq. vol. ii. p. 26, &c. Haller's Physiology; Malpighius on the Gelular Membrane; Dr. Shebbear in his Theory and Practice of Physic; also Recherches fur Tiffu Muqueux, ou POrgane cellulaire par

opening the head in epilepfies.

CENIOTEMIUM. A purging remedy, formerly of ufe in the venereal difeafe, fuppoied to be mercurial.

ticular humour which offends with respect to quality.

CENT. An abbreviation of centuria.
CENTAUREA BENEDICTA. See CARDUUS BE-NEDICTUS.

CENTAURIOIDES. HEDGE-HYSSOP.
CENTAURIUM. CENTAURIUM. Boerhaave mentions thirteen forts.

CENTAURIUM CAPITATUM. A Species of SER-RATULA.

- MAGNUM, MAJUS. See RHAPTONICUM VULG.
-- MINUS. Centaurium minus, or leffer centaury. It is the gentiana centaurium, or, gentiana corollis quin-quefidis infundibuli formibus, caule dichotomo, flore purpurco, Linn. the PURPLE LESSER CENTAURY.

It is a fmall plant, with three-ribbed, fomewhat oval leaves, fet in pairs on the stalks which divide towards the top into feveral branches, bearing umbel-like cluffers of bright red, funnel fhaped-flowers, cut into five acute fegments, followed by little oblong capfules, full of very finall feeds. It is annual, grows wild in dry paftures, and among corn. It flowers in July, fome call it the febri-

The leaves and tops are strong bitters, having scarcely any smell or flavour, and agree with the gentian root.

The feeds are bitter, but the petala of the flowers and roots are almost inspid. The flowery tops are chiefly the part that is ufeful, and, as a corroborant stomachic bitter,

are in much efteem. All its active parts are readily given out to water, or to rectified fpirit of wine. Water takes up with the bitter an infipid mueilage; but spirit only takes up the bitter part. Hence the watery extract is more in quantity, but lefs bitter; and the fpirituous one lefs in quantity, and more bitter. Cartheufer fays that one ounce of the herb yields about half an ounce of the watery extract, and scarcely two scruples of the spirituous. The extract is prepared in the same manner as that of wormwood, and may be in the fame manner as that of wormwood, and may be nied instead of that of gentian, as more cheaply prepared. See Neumann's Chem. Works, Lewis's Mat. Med. It is also a name of the fulph. ant. precip. See ANTIMONII SULPH. PRÆCIPITATUM.

CENTIMORBIA. See NUMMULARIA.

CENTINERVIA. PLANTAIN.

CENTINEDES. WOOD-LICE. See ASELLI.

CENTRATIO. Paracelfus expresses by it the degenerating of a filing principle, and contracting a corrolive

CENTRATIO. Paracellus expresses by it the degenerating of a faline principle, and contracting a corrolive and exulcerating quality. Hence centrum falis is faid to be the principle and cause of ulcers.

CENTRION, from \*tyku, to prick. An epithet for a plaster mentioned by Galen, and which is calculated against stitches in the side.

CENTRUM. In chemistry, is the principal residence, foundation, or source of any thing. Also that part of medicine in which its virtue resides.

CENTRUM NERVEUM. The tendinous part of the diaphragm, which hath a triangular appearance, is thus named by some, called also centrum tendinosum.

—OVALE. Vicusses first called a part of the corpus callessum thus. It is convex, and of the form of the cerebrum. See CEREBRUM.

—Tendinosum. The same as centrum nerveum.

TENDINOSUM. The fame as centrum nerveum.

CENTUNCULUS, i. e. Alsine. Elanchard fays it is the gnaphalium. CEPA. The ONION. Allium cepa, Linn. Botanists enumerate ten kinds.

The common snisn is a plant with a fingle bulbous root composed of a number of coats, producing long fistular leaves, and a tall, naked, bellied stalk, bearing always a cluster of hexapetalous white slowers, each of the control of cluster of hexapetalous white flowers, each of which is followed by a roundish capsule, containing a number of black angular feeds. It is chiefly cultivated for culinary uses, and affords a large proportion of alimentary matter, particularly in their boiled state, as they shew, with some sweetness, a large proportion of mucilaginous matter, with their acrimony exhaled—In their fresh state, they are very acrid and stimulating. In bilious hot dispositions they produce statulence, thirst, and head-ach to they are uses, and affords a large proportion of alimentary matter, particularly in their boiled state, as they shew, with some sweetness, a large proportion of mucilaginous matter, with their acrimony exhaled—In their fresh state, they are very acrid and stimulating. In bilious hot dispositions they produce statulance, thirst, and head-ach; they are useful in cold, suggist, and phlegmatic temperaments; they are warming, attenuant, and promote both expecto-

ral evacuation. Catharfis means the evacuation of a par- ration and urine. They are powerfully antifeptic; and

if applied to tumors are suppurating,

The root is the most active part; it loses most of its virtue by drying. Distilled wish water all its flavour and acrimony arises. The active matter is much more volatile than garlie, but in other respects they agree.

Onions have the most effect of any of the alkalescent plants in dissolving gravelly concretions. The expressed juice has been servicable in dealness. Neumann says, that the characteristic principle of this root is its essential that the characteristic principle of this root is its effential oil, notwithstanding it cannot be collected in a separate state. See Lewis's Mat. Med. or Neumann's Chem-Works. Cullen's Mat. Med.

-CEPA ESCALONICA. See CEPASTRUM.

SECTILIS. CHIVES.

CEPÆA. It is a name given by fome to the anagallis

CEPASTRUM, According to Dale it is the allium folvestre, the cepa escalanica, and schemopressum; these he tays differ from the cepa in that their root is proliferous; and their stalks are not bellied.

CEPHALÆA. A long continued pain in the head.

See CEPHALAGIA, CEPHALALGIA, from separs, the bead, and exys, pain. The HEAD-ACH. It is also named cepbalea, and cepbalaponia. By fome it is used to signify a dull pain of the head, which is of a short duration. But most frequently it is used as expressive of pain in the head in general, without regard to circumstances.

It is fometimes acute and fometimes chronical.

It is fometimes acute and fometimes chronical.

In fome the pain is in the back part of the head, from a contraction of the occipital muscles. When mild it is called cephalaja, when inveserate it is called cephalaza. When one side of the head only is affected it takes the name of hemicrania; in one of the temples only, it is intitled crotaphos; and that which is fixed to a point, and that is generally in the crown of the head, is diftinguished by the name of clavus byflericus.

The nervous membranes of the head are the general feat of pains there, as the perioranium, the fkin, dura mater, the membrane which covers the finus in the os

frontis, &c.

Women, on account of their care about their hair; and children, because of the irregular indulgences that are al-lowed them by improper foods, are the most subject to this diforder.

The causes are very numerous. Hippocrates, in the 13th section of his book De Flatibus, says, "As the motion of the blood in the head is performed through very narrow channels, the redundance and confinement of this fluid excites pain; for as the blood is naturally hot, when it is impelled by any force, it cannot quickly pass through the narrow channels, fince it meets with many hindrances and obstructions, for which reason there is a pulsation about the temples." This account of the origin of beadachs is not excelled by any fucceeding writer. Among the variety of causes are suppressed or diminished customary evacuations; the acrid matter of some diseases, by fixing particularly on any part of the head; a caries in the bones of the head; polypufes, &c. obstructing the blood's passage through the jugular veins and sinuses of the brain; stoney concretions in the brain; acrid humours repelled from the external parts of the head; abscess in the brain; a want of sleep; exposure of the head either to heat or coldness; a spasmodic constriction of the nervous membranes in the head; uneafiness in the stomach, and the faulty quality of its contents; cold feet; inanition; re-pletion; hardness and adhesion of the meninges. The hemicrania is usually from diforders in the stomach; and periodical pains have their cause in the stomach or other

viscera, &cc. When the pain is in the back part of the head, it is ufually from a fpaim of the occipital mufeles. Some bead-achs are attended with fever, and others not. When a suppressed usual evacuation of blood from the nose is the

When a lues venerea is the cause, it often renders the cranium carious. When the cause is from a hot bilious habit, the pain is acute and throbbing. When from a cold phleg-matic habit, there is a dullness and heavy oppression in the head, and a sense of coldness in the part. When hysteric affections are the cause, the pain is fixed generally to a point in the crown of the head, fcarce exceeding the breadth of half a guinea; in some it feems as if a nail was driven into the head; fometimes it feizes the forehead and allects the eye-brows; fometimes it is in the finciput, at others in the occiput; fometimes it is near the vertical future, at others about the temples; and a fentation of cold is always attendant on this kind of pain in the part af-fected; it is called clavus or clavus hyftericus.

When the cause is within the cranium, and the pain is attended with a confiderable degree of fever, there is danger of a phrenitis. If, when no fever attends, a fudden pain attacks hypochondriae patients, or fuch as are difposed to melancholy, depriving the patient of sleep and appetite, and is accompanied with a duliness of hearing, and an internal pulfation of the veffels, there is danger of madnefs. When a fudden pain of the head is followed by a ringing of the cars, a weakness in the knees, and interruption in the speech, an apoplexy may be expected. Frequent bead-achs in young people prognofticate future arthritic diforders. Violent bead-achs with pale urine in fevers indicate an approaching delirium. lent and long continued bead-achs often end in deafness, blindness, vertigo, apoplexy, and epilepsy or palsy, &c.

The causes distinguished, and the particular cause de-

termined, will eafily lead to the cure; but, in general, if the fluids are impetuously conveyed to the head, they must be derived to the less noble parts. The spasmodic stric-tures relaxed, the cause must be removed; and to prevent a relapfe, the whole nervous fystem must be strengthened.

Patients subject to pains in the head should eat sparing-ly at night, lay high with their heads, keep their bowels foluble, and feet warm.

Vomits. They are proper to begin the cure with, in all cases where the stomach is in fault, which it is in all hemicranias, and most periodical bead-achs.

Bleeding. This operation is only necessary where there is a fanguine plethora or an inflammation attendant. Opening the temporal artery is ufually extolled in violent head-achs; but, if the external jugular vein was opened, greater benefit, and that more speedily, would be pro-

Baths for the feet. In all cases where bleeding cannot be conveniently admitted, a bath of tepid water, in which the feet and part of the legs may be now and then placed,

will be of fingular ufe.

Purges. Lenitives are more proper in all kinds of beadachs than the more active purges. The ol. ricini, elect. e caffia, or vinum aloes, are to be preferred.

Æther. If this is dropped on a rag, laid upon the palm of the hand, then immediately applied to the part affected, inflant relief is fometimes obtained. Thus the late Dr. Ward cured pains that were fituated fuperficially.

A branch from the fith pair of nerves is spread on the membrane that lines the nostrils, and another branch from the fame passes through the foramen supercilia, and spreads on the teguments of the forehead; hence, when pain is in the eye-ball and forehead, a heat is perceived in the nof-trils, and benefit may be expected from external means, if applied to the membrana narium and to the forehead; also from alternate pressure near the superciliary holes of the frontal bones.

If fpafms of the lower parts propel the blood upwards, and so produce this diforder, bleed, then rub the spafmodic extremities with rether to relax them, and place the feet in tepid water.

Symptomatic head-achs are only removed by relieving the original diforder: e. g. if the venereal diforder gave rife to it, mercurials will be the proper medicines; if any other diforder in which an acrimony is induced into the juices, let the means of relief respectively be accompanied with a free use of a decoction of sarsayantlla.

Periodical head ach are the medicilificult to remove:

Periodical head-achs are the most disficult to remove: In these cases the bark is the general remedy, and when it fails, large doses of valerian, duly repeated, will succeed.

If the pain is fo great that the ftrength is leffened by it, the first endeavours must be to abate the pain by gentle laratives and anodynes, and then to remove the caufe.

If a beginning caries is observed to be the cause, cut dia recity upon it, for thus relief is soon obtained; but if the caries hath reached the diploe, the only cure is the trepan-In the hemicrania, vomits, repeated bitter purges, and

warm strengthening stomachies are the proper means.

Habitual bead-achs have been much relieved by cold bathing, and by the use of antimonial wine taken in doses as large as the ftomach will bear, with a ftrong infusion of

the wild valerian root. When an acid in the primæ viæ gives rife to this diforder, a glass of warm water may be taken now and then with thirty drops of liquor c. c. and a dofe of rhubarb with

magnefia, every thirdor fourth day. In that species called clavus a blister may be applied to the part, fetid pills and valerian must be given freely, or instead of a blister, ather may be applied to the pained part, and warm pedilaves may be used.

If a transition of gouty matter to the head produces pain there, give now and then the visus alass as a solutive, the last and the produces pain the state of the last and the produces pain the state of the last and the produces pain the state of the last and the produces pain the state of the last and the produces pain the state of the last and the produces pain the state of the last and the produces are the state of the last and the produces are the produces the state of the produces are th

blifter the legs, and give draughts with fal c. c. vol. rad-ferp. conf. aromat. &c.

CEPHALALGIA CATARRHALIS, i. c. CATARRH from

-INFLAMMATORIA. See PHRENITIS.

—HERBA. See VERBENA.
—SPASMODICA. The fick head-ach. For affiftance in this afflictive malady, we are first, I believe, indebted to Dr. Fothergill; who observes that it is not the complaint of any particular age, fex, constitution, or fea-fon, but that it is incident to all. The fedentary, inactive, relaxed, and incautious respecting diet, are the most exposed to it.

The patients, he observes, generally awake early in the morning with a head-ach, which seldom affects the whole head, but one particular part of it, most commonly the forehead, over one frequently, fometimes both eyes. It is fometimes fixed about the upper part of the parietal bone, of one fide only; fometimes the occiput is the part affected; fometimes it darts from one to another of these places. From the time it commences, until it wholly ceases, it is sometimes more, sometimes less tolerable. With this is joined more or less of fickness, which in some is just barely, in many is not sufficient, without affistance, to provoke vomiting. If this pain does happen, as it most commonly comes on early in the morning, and before any meal is taken folders any thing is the way an last this commonly comes on early in the morning, and before any meal is taken, feldom any thing is thrown up but thin phlegm, unlefs the straining is severe, when some bitter or acid bile is brought up. In this case the disease foon begins to abate, leaving a soreness about the head, a squearnishness at the stomach, and a general uneasiness, which induces the sick to wish for repose. Perhaps, after a short sleep, they recover perfectly well, only a little debilitated by their sufferings. The duration of this conflict is very different in different persons; in some, it goes off in two or three hours; in others, it will last twenty-sour hours or longer, and with a violence scarcely to be endured. or longer, and with a violence fearcely to be endured, when the least light or noise seems to throw them on the rack. In young persons, it most commonly goes off soon; if it continues to harrass them many years, as it sometimes does, the fit is of longer duration, and leaves the whole frame in fo weak a condition, as to require fome length of time to recover. Its returns are very irregular; some have it every two or three days, some once in two or three weeks, others in as many months, and some yet feldomer. Those who use but a little exercise, and are inattentive to their distance weeks. their diet, are the greatest sufferers; costive habits are most exposed to it; an habitual laxity of the bowels com-

ing on has removed this complaint.

The difease is spasmodic; it attacks after digestion is performed, when the bile has acquired its full activity, undiluted by fresh supplies of liquid, and the nerves exposed to irritation: from numerous circumstances it appears to proceed from the stomach. For the most part it proceeds from inattention to diet, either in respect to kind or ceeds from inattention to diet, either in respect to kind or quantity, or both; and without exact conformity to rule in this respect, medicine proves ineffectual. Occasional and too general mischief arises from eating butter and other fat substances, pepper, or other spices, meat pies, rich baked puddings, drinking strong liquors, also a very free use of malt liquor. Bitter medicines too are not generally agreeable. Quantity as well as quality of diet is generally hurtful. Bile, if very acid or bitter, is a frequent cause. There are habits in which the bike, whether affects.

In order to relief, an emetic, or mild cathartic, and fome time after it an anodyne, will carry off the complaint. But perhaps in a few days it may return, though in some a month or more even to a year will pass before another fit is repeated. If disposed to costiveness, an agreeable laxative flould be so used as to keep the belly open: where acid bile abounds, bitter and absorbent laxatives; where acid bile abounds, bitter and abforbent laxatives; where the bitter is abundant, falines are generally useful. In the former case give small doses of stomach-bitters, with a little alkaline falt, or a chalybeate, once or twice a day: In the latter, mineral or vegetable acids, and a diet of the same nature, soap and pil. aloes cum myrrha, or magnesia and rhubarb in small doses, daily continued, will often prove, in cases of acid bile, very useful, or the following: R aloes Succotorin. 5 i. rad. rhab. & rad. glycyrrhiz. incis. 33 35s. insunde in aq. calcis 3 viij. colature adde tinct. lavend. 35s. m. cap. cechl. i. ij. vel iij. pro re nata.

This disease is not the effect of any sudden and accidental cause, but the effect of reiterated errors in diet, or in conduct, which by weakening the organs of digestion, and otherwife difordering the animal functions, have affected the fecretion of their juices, and perhaps the organs them-felves, fo as to require a fleady perfeverance in the ufe of medicines. This change cannot be effected speedily; it requires a patient observance of proper regimen, in respect or having a head. It is applied to plants which are called both to medicine and diet. The former ought therefore capitated.

to be so contrived, as to be taken without disgust for several weeks together, and to be repeated at proper distances, till the end is obtained, digettion rightly performed, and the bile fecreted and discharged as health requires; by which means, all that train of evils, which are the consequences of its detention and diftempered flate, will be gradually removed. Unless the whole plan of diet, both in kind and quantity, are made to conspire with medical prescription; the benefit arising from this are hourly ani-hilated by neglect or indulgence. It demands attention to observe the just medium, and no less resolution to keep to it, which the stomach invariably points out in respect to quantity: how much must be determined by every indiidual, and those who are happy enough to abstain at the first sensation of fatiety, have made great progress in the art of maintaining such a command of appetite, as, under most chronic indispositions, is one of the greatest aids of recovery; and in health, is one of the furest preservatives against them. These patients are often subject to false against them. These patients are often subject to falle appetite, a craving that does not arise from the demands of health, but from the morbid picquances of the juices in the flomach, which prompts them to eat more, and more frequently then nature requires, whence many take more than can be digested, &c. by which their sufferings are increased, and the disease gains ground. See BILIS.

See Dr. Fothergill's Works by Dr. Lettfom, 4to edit. p. 597, &c. Medical Observations and Inquires, vol. vi.

p. 103, &c.

CEPHALARTICA. Medicines that purge the head.

CEPHALEA JUVENUM. The HEAD-ACH that often attends youth at the approach of puberty.

CEPHALICA, CEPHALICS. From \$1000000, the head, also capitalia. Thus remedies against disorders of the head are flyled; cordials are comprehended herein, as are also whatever, promotes a free circulation of the blood. also whatever promotes a free circulation of the blood through the brain.

Except when the disorder arises from excess of heat or an inflammatory difposition in the head, moist topics should never be used; but always dry ones.

To rub the head after it is shaved proves an instantaneous cure for a cephalalgia, a fluffing of the head, and a weakness of the eyes, arising from a weak and relaxed frate of the fibres.

And as by every fresh evacuation of the humours their quantity is not only lessened, but also their recrementi-ous parts derived thither, the more frequently the head is shaved, the larger quantity of humour is discharged; so that the frequent shaving of the head and beard, is like a perpetual blifter : and inafmuch as it is ufeful, it is a

cepbalic.

POLICIS. A branch from the cepbalica vena, feat off from about the lower extremity of the radius,

neid or bitter will purge, and thefe this diforder rarely and runs superficially between the thumb and the meta-

CEPHALICA TINCTURA, Ph. Edinb. Take four ounces of wild valerian root, finely powdered; one ounce of Vir-ginian fnake-root, powdered; half an ounce of the tops of rolemary, and fix pints of white French wine; digeft for three days, and then firain off the clear liquor for use: if to the cephalic tincture be added two ounces of sena, one ounce of black hellebore, and two pints of French white

wine, the cephalica tinetura purgans is formed.

Purgatives are ufeful additions to cephalic medicines.

VENA. The CEPHALIC VEIN, called also capitis tiena. It was fo called because the head was supposed to be relieved by taking blood from it. It does not attend any peculiar artery; it comes over the shoulder between the pectoral and deltoide muscles, and runs down the back part of the arm; when it gets to, or a little below the bending of the fore-arm, it divides into two, below the outer, as the bafilic does below the inner condyle of the os humeri. The inner of the two branches of the cophalic vein is called mediana cephalica, and is the fafeft to bleed in. It is a branch from the axillary vein.

CEPHALICUS. Pulvis. See Asarum. CEPHALINE. That part of the tongue which is next

the root and nearest the fauces.

CEPHALITIS. The fame as PHRENITIS, which fee. CEPHALOIDES, CEPHALOTOS. Shaped like a head,

a disease. This term is applied to a fever that is frequent in Hungary, and which is also called sebris Hungarica. CEPHALO-PHARYNG/EUS, from x12002, the head,

and \$\phi\_{apoy\(\tilde{\chi}\)}\$, the throat, called also glosso-pharyng aus, mylopharyng aus. A muscle of the pharynx is thus named. It arises above, from the cunciform process of the os occipitis, before the foramen magnum, near the holes where the ninth pair of nerves pass out; lower down, from the pterygoid process of the sphenoid bone, from the upper and under jaw, near the roots of the last dentes molares, and between the jaws; it is continued with the buccinator muscle, and with some fibres from the root of the tongue and from the palate. It is inserted into a white line, in the middle of the pharynx, where it joins with its fellow, and is covered by the constrictor medius, i. e. hyo-pharyngæus of Douglas. Its ufe is to compress the upper part of the pharynx, and to draw it forwards and upwards. Innes. See Pharynx, and PTERYGO-PHARYNG ZI.

CEPHALOPONIA. See CEPHALALGIA.

CEPHALOS. See Mugilis.

CEPHALOTOS, i. c. CAPITATÆ. See CEPHA-

CEPINI. VINEGAR.

CEPULA. Large MYROBALANS. CERA. WAX. It is a concrete, collected from vegetables by bees; and extracted from their combs after the ables by bees; and extracted from their combs after the honey is separated from them. It possesses the attractive power of amber; it is lighter than water, but heavier than proof spirit: with the affistance of heat it is soluble in rectified spirit of wine. Dr. Alston says it is more soluble in this spirit than in oil. It is not at all soluble in aqueous siquors. With a small degree of heat it is dissolved into the appearance of an oil; and in this state it is easily miscible with oils, and any kind of fat. It readily takes fire, and burns all away. It almost totally rifes in distillation, partly in form of a thick empyreumatic oil, and partly in that of a consistent butyraceous matter, which by repeated distillations becomes sluid and thin. Hence it appears that all the wax, like camphor, is vola-Hence it appears that all the wax, like camphor, is volatile in a certain heat. Inflammable vegetable oils may exist under the various forms of oil, balfam, rofin, pitch, dry

Yellow wax, in the ftate it is taken from the combs, is, while fresh, of a lively yellow colour, tough, yet easy to break; hath an agreeable flavour, fomewhat refembling honey: by long keeping it loses its colour, its agreeable forcell. fmell, and becomes harder and more brittle.

Diffilled with water it impregnates the liquor with the fcent, but gives no appearance of oil. If chewed, it proves tenaceous, and neither mingles with the faliva, nor difcovers any peculiar tafte. By a mixture of gum arabic in fine powder it is rendered foluble in water; the wax requires its weight of the powdered gum for this end; and thus prepared it is still insipid, and void of all acri-

Dioscorides says that wax is healing and softening. When wax is made into an emulsion, or mixed with spermaceti and made into an electary, or divided by rubbing it with the testaceous powders while it is in a melted state, it is successfully used to blunt the acrimony in diarrheas, and dyfenteries; it fupplies the lofs of mucus in the bowels, and heals their excoriations.

The College of Edinburgh gives the following prepara-

# Pulvis Teflaceus CERATUS.

Melt yellow wax over a gentle fire, and carefully ftir into it by little and little as much of the compound powder of crabs claws as the wax will take up. The dofe is a dram twice a day.

The chief uses of wax are at present in platters, ointments, and cerates, partly to give confiftence, and partly on account of its emollient and suppurating quality.

The College of phyficians of London order an EM-PLASTRUM CERÆ, platter of wax; formerly called emplafirum attrabens, to be made of yellow wax and fheep's fuet, prepared, of each three pounds; yellow refin, one pound; melted together, and the mixture to be strained whiss it remains in its sluid state. Ph. Lond. 1788.

## Oletem Cerze. OIL of WAX.

Cut yellow toax in fmall pieces, and put as much into a retort as will fill near one half, then add as much clean white fand as will nearly fill the retort; after which place it in a farld furnace. At first an acid liquor arises, afterwards a thick oil, which sticks in the neck of the retort, unless it be heated by applying a live coal. The thick oil is also called the butter of wax, and may be rectified into a thin oil by distilling it several times, without addition, in a fand heat; if it is not thus rectified, it never turns hard again.

Boerhaave highly extols this oil as an emollient, and for healing chaps; and roughness of the skin, for discussing chilblains, and, with the affistance of exercise, for re-laxing contracted tendons. It is rarely used on account of its empyreumatic fmell, but it is wholly free from all

acrimony.

White war. It is the yellow war artificially deprived of it colour, by reducing it into thin flakes, exposing them to the fun and air, and occasionally sprinkling them with water. When fufficiently whitened, it is melted and cast into thin cakes. Some whiten it first by dissolving it in hot water, then forcing it through linen strainers into shallow metalline moulds, and then expose it to the air. When wax is thus robbed of its colour, it is also deprived of its refolvent quality; but it is rendered more

The College of Physicians of London give the following form for making the Unguentum Ceræ, Ointment of Wax; formerly called Unguentum Album. Take of pil, a pint: let these be melted over a gentle fire, constantly and quickly stirring the compound, until it grows
cold. Ph. Lond. 1788.

A sew drops of rectified spirit of wine renders wax
more easy pulverizable. See Lewis's Mat. Med. Neumann's Chem. Works.

CERA DI CARDO. So the Italians call the gum subite wax, four ounces; fperma ceti, three ounces; olive

of the carduus pinea. See CNICUS .- CINAMOMI. See CINNAMOMUM.

CERÆÆ, called also Girri. So Rufus Ephesius calls the cornua of the uterus, from meas, a born.

CERAGO. The aliment of BEEs. CERAMIUM. A Greek measure of nine gallons. CERANITES. A pastil or troch is thus named by Galen.

CERANTHEMUS. BEE-GLUE OF BEE-BREAD. See

CERARE. To incorporate or mix.

CERASA GUMMOSA. See COPALXOCOTL TEPEA See CANTHARIS. CENSIUM.

CERASIATUM. A purging medicine in Libavius, fo called because the juice of cherries is a part of it.
CERASIOS. The name of two ointments in Mesue.
CERASMA. A mixture of cold and warm water, when the warm is poured into the cold.
CERASORUM NIGRORUM AQUÆ. See AMYG-

DALE AMARE.
CERASUS. The CHERRY-TREE. It receives its name from Cerajus, a city of Pontus, from whence they were imported to Rome by Lucullus, and thence propagated into Britain, according to Pliny's account. Boer-haave fays that through culture the species are already forty-four in number.

Cherries have the same general properties as other summer fruits; they are agreeable, cooling, and quench thirst.

CERASUS. — ACIDA NIGRICANS. The MORELLO CHERRY. — AMERICANA. See MALPIGHIA. — AVIum NIGRA. See Lauro-cerasus, Bird Cherry, and Padus. — Dulcis Indica, i.e. capollin. Mexic. Hernan.—NIGRA, called also cerasus major, BLACK CHERRY and MAZZARD.—RACEMOSA FRUCTU NON EDULI. See LAURO CERASUS .- RUBRA, called alfo coafa fativa, cerafus Anglica, the RED or COMMON ENGLISH CHERRY. SYLVESTRIS AMARA MAHALES PUTATA, ROCK CHERRY. See MAHALEB. - TRAPE-

CERATIA. See LAUROCERASUS.
CERATIA. See SILIQUA DULCIS.
CERATITES. The YELLOW HORNED POPPY.
CERATITIS. UNICORN STONE. See UNICORNU. Marcellus Empiricus fays it is the SEA VIOLET. And Pliny calls the HORNED POPPY by this name. CERATIUM. The fruit of the CAROB-TREE.

CERATO-CEPHALUS. See ACMELLA and BI-

CERATO-Grossus, from xeeas, a horn, and pharra, ongue. See Hyo-GLOSSUS.

CERATOIDES, from \*\*\*realog, the gentive case of \*\*reag, a born. A name of the tunica cornea. See CORNEA.

CERATOMALAGMA. A CERATE. CERATONIA. See SILIQUA DULCIS.

CERATO-PHARYNGEUS MAJOR & MINOR: Sec HYOPHARYNGEUS.

CERATOPHYLLUM: An aquatic plant, of which two forts are noticed; one of which is also called millefolium aquaticum cornutum, and equisesum sub aqua repens foliis bifureis: but no medical virtues are attributed to them. Raii Hift.

CERATUM, from cera, wax, CERATE, called also cere-

CERATUM, from cera, wax, CERATE, called alfo cereleum, which fee, eeroma, ceronium, cerotum. Cerates
chiefly differ from plafters in confiftence, being a fofter
kind of plafter, or harder kind of ointment. Their confiftence is very convenient: when mercury is made up in
plafters a fufficient quantity is not abforbed from them to
produce any valuable effect; but in a cerate it powerfully
refolves and difcuffes, and when thus applied to venereal
tophs and nodes they often yield to it. The general rule
for cerates is, eight parts of oil, fat, or juices, four of
wax, and one or two of powders: or three ounces of oil,
half an ounce of wax, and two or three drams of powder. half an ounce of wax, and two or three drams of powder. The London College directs the following cerates.

Ceratum Album. WHITE CERATE, new called Ceratum Spermatis Ceti. SPERMA CETI CERATE.

Take of olive oil, four ounces in measure; of white wax, two ounces in weight; of spermaceti, half an ounce in weight: melt all together, and stir them well, till the cerate is quite cold. Ph. Lond. 1788.

Ceratum Citrinum. YELLOW CERATE, now called Ceratum rezinæ flavæ. CERATE of YELLOW RESIN.

Take of the ointment of yellow refin, half a pound ; of yellow wax, one ounce: melt them together. Ph. Lond. 1788.

CERATUM EPULOTICUM. See CALAMINARIS LAPIS CERATUM LITHARGYRI ACETATI. Cerate of acitatlitharge. See LYTHARGYRUM.

CERATUM SAPONIS. CERATE of SOAP. See SAPO. CERATUM CANTHARIDIS. Cerate of SPANISH FLY.

CERAUNO.

CERBERUS TRICEPS. See Puly. e SCAMMONIO. C. CERCHNOS, \*\*\*\*, \*\*\* wheezing. See RHENCHOS. CHERCHODES. Those are to called who labour

under a dense breathing. See DASYS.

CERCIS, x19x15, a peffel for a mortar, or spoke for a wheel; also a name of the bone called radius. See Sili-QUASTRUM.

CERCOSIS, \*\*\*powers\*\*, a difease of the clitoris, which confists in its preternatural enlargement, from \*\*\*eps\*\*, a

CEREALIA. All forts of corn of which bread is made. The Greeks use the word demetrias in the fame fense. See FARINACEA.

CEREBELLUM, as it were the LITTLE BRAIN,

called also epeneranis-parencephalis.

The cerebrum and cerebellium together, are often called cerebellum, when the brain is fpoken of in fmall animals,

as birds, pigs, &c.

The cerebellum is flattened, and convex on its upper and lower part; its greatest extent is from fide to fide. It is fituated under the posterior lobes of the cerebrum, and divided into two lobes by a small process of the dura mater, which is a continuation of the falx running in its direction. It is covered by the pia mater like the cerebrum, but the lobuli of the cerebellum differ from those of the cerebrum, mostly lying horizontal. It hath no convolutions like the cerebrum, but it hath curved parallel lines described on its surface by the pia matter, and is of a darker colour than the cerebrum. It is composed of a cortical fubstance, and a medullary part like the cere-brum, but disposed in a more regular manner, and a per-pendicular section of it hath a beautiful appearance, called arbor vitæ, the trunks of which form the peduncles of the cerebellum. On the back part of the isthmus which joins the cerebrum and cerebellum, we fee four eminences, the two upper are called nates, and the two lower teffes. Before these the aqueduct runs down into the fourth ventricle, the medullary covering of which is called vulvula magna. The fourth ventricle is placed between the cerebellum and the medulla oblongata.

CEREBRI COMPRESSIO. Compression of the brain.

Also compressus.

This often happens from external injuries, and then is generally attended with the following symptoms; giddi-ness, dimness of fight, stupefaction, loss of voluntary motion, vomiting, an apoplectic flertor in breathing, convultive tremors in different mufcles, a dilated flate of the pupil, even when exposed to a clear light; paralysis of different parts, especially of the side of the body, opposite to that part of the head which has been injured; opposite to that part of the head which has been injured; involuntary evacuation of the urine and freces, an opposited, and in many cases an irregular, pulse; and when the violence done to the head has been considerable, it is commonly attended with a discharge of blood from the note, eyes, and ears. Some of the milder of these symptoms, such as vertigo, stupefaction, and a temporary loss of footbilling and the propagation of the state of the second propagation. of fenfibility, are frequently induced by flight blows on the head; and as they often appear to be more the confequence of a flock, or concussion given to the substance of the brain than of compression induced upon it, so they foon commonly disappear, either by the effects of rest alone, or some other gentle means. See Concussio. But when any of the other fymptoms take place, such as convulsive tremors, dilatation of the pupils, involuntary passage of the urine and faces, and especially when much blood is discharged from the mouth, note, eyes, and ears, it is almost certain that much violence has been done to the brain and that compression in one part or another is induced. In fine a compression of the brain may be brought on by whatever contributes to diminish the cavity of the cranium, or increase its contents in any confiderable degree: hence fractures attended with depression of any part of the bones of which it is composed, forcible introduction of any extraneous body through both tables of the skull, the effusion of of the bones of the head produced by lues venerea; collection of water in the ventricles, or other parts of the brain, may occasion this disease. For the cure of which,

GALRA, the skull. CEREBRUM. The BRAIN. Its structure and use are not fo fully known as fome other parts of the body, and different authors confider it in various manners. However, according to the observations of those most famed for their accuracy and dexterity in anatomical enquiries,

its general structure is as follows.

The whole mass of brain is divided into cerebrum and cerebellum. It confifts of two fubftances, viz. cortical or cineritious; the other medullary. The first is of an ash-colour, the second is white, and of a firmer texture: they both are vafcular, but the cortical is more fo than the medullary, from whence the nerves proceed. When the two hemispheres of the cerebrum, each side of the falx being called an hemisphere, are removed, a white part, called corpus callofum, running from one hemisphere to the other, appears. The centrum ovale is the appearance of a particular section of it. The anterior ventricles are two oblong bodies, placed one on each fide the corpus callofum, with a partition between them, called the feptum lucidum, which is a continuation of the medullary fubflance of the corpus callofum. There is commonly much water in these ventricles in those who die of diforders in their heads, as in the epilepfy, hydrocephalus, &c. but naturally they only contain about half a fpoonful. In watery heads the fluid is always found in the cerebrum only; the cerebellum never hath any fhare in it. Each ventricle at the posterior part throws back an appendage, which makes a cavity in the posterior lobe of the cerebrum. Below the feptum lucidum appears the fornix, narrow at the anterior extremity, where it rifes by a double basis, called its crura, which follows the track of the ventricle; in each ventricle are eminences of a cineritious colour, called corpora firiata. The plexus choroides, is a plexus of veffels which follow the tweep of the ventricle: it is formed by the veffels of the pia mater; it is partly collected in two loofe fasciculi, which lie one in each lateral ventricle, and partly expanded over the neighbouring parts, and covering in a particular manner the thalami nervorum opticorum, glandula pinealis, and other adjacent parts, both of the cerebrum and cerebellum, to all which it adheres. The parts of this plexus which are in the ventricles, contain some very small glands, which are considerably increased in some diseases. After the fornix is removed, we fee a large plexus of veffels, particularly Galen's great vein, which go to form the torcular berophilli, or fourth finus. Under the plexus, before the united thalami nervorum opticorum, is a hole on each fide called the anu, and the vulva; the latter goes to the infundibulum, the former to the aqueduct and third ventricle. The thalami nervorum opticorum are white exter-nally, and grey within. The third ventricle is very small; it runs back under the two thalami, between them and the medulla oblongata. The pinealis glandula, pineal gland, is a little greyish body, the fize of a peat it lies-just a little before where the transverse and longitudinal processes meet, where the vessels go to form the torcular. It is covered by the pia mater, and is connected by a little bone to each thalam. nerv. opt.

Numberless experiments prove, that the nerves are ne-ceffary to life; and that when the brain, or medulla spi-nalis, is much injured, life is at an end, or at least health: yet no part of the brain being injured, immediate death may enfue from different causes, though an injury of the

medulla oblongata is so instantly fatal.

Behind the infundibulum is seen, the corpora albican-

tia, or glandulæ Willifii.

Two glands are faid to be in the brain, viz. the fuperior or glandula pinealis; and the inferior, or glandula pituitaria. They have the external appearance of glands,

but as to their being fuch is not certainly known.

The cerebrum fills all the upper portion of the cavity of the cranium, or the portion which lies above the transverse septum; each lateral half is divided into three eminences called lobes, one anterior, one middle, and one

3 M

dura mater, and of the two great lateral finuffes, but also of all the inferior finuffes of this membrane, in all which the veins terminate by different trunks.

Malpighius fays that the brain is a gland; but others who have attended to the use as well as the structure, &c. of

it, as anatomifts, fay it is not.

Dr. Shebbeare, in his Theory and Practice of Physic, feems to confider the brain as a non-electric body, and intimates, that the red globules of blood contain the vital heat, which they attract from the earth; that the circulation carrying the red globules to all parts, the nerves conduct the vital principle therefrom to the brain, where meeting with electric, or non-conducting fubftances, fuch as the bones &c. of the skull, it is accumulated by the brain, and its watery contents, to be in store and readiness

to return by the nerves as wanted.

Dr. Kirkland, in his Differtation on the Brain and Nerves, denies that the brain is fibrous, and afferts, that the nerves are only the continuations of the mucus, which constitutes the brain. He intimates, that this mucus is fensible. He observes that, " if we view the brain within the skull, just before it enters those membranes, which form the covering of the nerves, it will appear that the infide of a nerve is not a mass of fibres arising from the white part of the brain, but that it is a small portion of the white part of the brain itself, which is not fibrous. This being conducted by the dura and pia mater to the different parts of the body, it deposits one, or both of these coats, and is diffused round every fibre, not only upon the part it is carried to, but a confiderable way round; fo that each portion of the brain conveyed by its own nervous case, meeting, form one continued, or connected fubitance, in every part included within the cuticle, and gives that gloffy, or gelatinous appearance, which is fo readily diftinguished in the mulcular fibres. From whence it appears, that the brain is not confined to the skull, but is expanded in every part of the body, in the fame manner, but much thinner, as the retina is expanded at the bottom of the eye." This fimple method of confidering the brain as a fenfible mucus or jelly, both frees us from much perplexity, which attends all other views of it, and also has a happy influence in the doctrines which depend on this part of our frame.

Those who are disordered in their brain, are first affeeled with a stupor, often make water, and have other fymptoms in common with those who have the strangury. These symptoms continue eight or nine days, and then, if there is a watery or mucous discharge from the nose or ears, there is a solution of the disease, and the strangury ceases. Plenty of white urine comes off from the patient, without pain, until the twentieth day; at which time the pain in the head leaves him, but a dimnefs of fight re-

mains if he looks long at any object.

Dr. Hunter observes, that the principal parts of the medullary substance of the brain in ideots and madmen, fuch as the thalami nervorum opticorum, and medulla oblongata, are found entirely changed from a medullary to a hard, tough, dark-coloured fubiliance, fometimes re-fembling white leather.

See Shebbeare's Theory and Practice of Physic; Win-slow's Anatomy; Haller's Physiology; Kirkland's Differ-tation on the Brain and Nerves; alto his Differtation on

the Sympathy of the Nerves.

CERVICALES. The nerves which pass through the vertebræ of the neck are thus called.

The first cervical nerve throws out a confiderable branch to the occiput, it joins the ninth pair from the brain, to form the first cervical ganglion of the intercoftal.

The fecond cervical nerve hath a very remarkable plexus; it fends out a very confiderable nerve to the occiput, as well as the first. It fends off three branches behind the sterno-massoideus, where they are entangled with the accessorius Willisii. The first branch going upward and backward becomes cutaneous on the posterior parts of the temporal and parietal bones. The fecond goes up-ward and a little forward under the sterno-mailtoideus, and throws branches to the parotid gland, to the lobe, and to the posterior fide of the ear. The third goes horito the posterior side of the ear. zontally forward to the neck, and there becomes a cutaneous nerve, which is fometimes pricked in opening the external jugular vein.

The third cervical nerve goes downwards by a number

phrenic nerve, which runs towards the thorax, before the anterior portion of the scalenus, between the subclavian CERVI artery and vein, contiguous to the trunk of the par vagum; runs down before the root of the lungs, follows the per-cardium, and branches out in the diaphragm. That on the right is shorter than that on the left, as the latter goes round the apex of the heart.

The four inferior pairs, the above to be understood as pairs, are larger than those already named. Their main trunk, with the first nerve of the back, passes between the portions of the scalenus over the first rib, into the axilla, where they produce fix trunks, which go to the upper ex-tremities. In their way thither they detach branches to

The first of these six branches is the humeral, which follows the course of the artery of that name, round the head of the os humeri.

The fecond is the cutaneus, cutaneous nerve, which runs down the infide of the arm, and goes into the fore-arm, just where we prick in opening the basilie vein, and is

often wounded.

The third is called the mufeule-cutaneus, and is larger. It rifes pretty high, and throws branches into the cora-co-brachizus, through which the trunk paffes obliquely; it is then covered by the biceps, and palling through be-tween the brachizeus and biceps, it fends off feveral branches, and lies on the outfide of the tendon of the laft mentioned mufele, where we commonly bleed in the medisn cephalic vein.

The fourth is called cubitalis, vel ulnaris, the ulnar

The fixth branch, called the radial nerve, passes down the inside of the arm, and then backwards between the brachizeus externus, and the short heads of the biceps externus attended by the artery. When it hath got round it runs down, and at the head of the radius it gives off a cutaneous branch, which goes to the thumb and fingers on the back of the hand, whilst the main trunk passes round the head of the radius through the supinator radii brevis, and goes betwirt the radius and ulna, to be loft in the extensor digitorum communis, and the muscles of the carpus and thumb.

CERVICALES ARTERIÆ. The ARTERIES of the

The cervical artery rifes from the fubelavian on its unper fide, and is prefently afterwards divided into two, which fometimes come out feparately, and at others by a fmall common trunk; the anterior one goes to the anterior mufcles which move the neck and head; the posterior

to the scalenus trapezius, &c.

The anterior cervicalis, running behind the carotid of the fame fide, is diffributed to the mufculus coracohyoidaus, maftoidaus, cutaneus, fterno-hyoidaus, and fterno-thyroidaus, to the jugular gland, and afpera arteria; the mufeles of the pharynx, bronchia, exophagus, and to the anterior mufeles which move the neck and head. This artery has been observed to fend out the intercostalis

The posterior cervicalis arises sometimes a little after the vertebralis, and sometimes from that artery. It passes under the transverse apophysis of the last vertebra of the neck, and from thence runs up backward, in a winding courfe, on the vertebral mufcles of the neck, and then returns in the fame manner. It communicates with a de-feending branch of the occipital artery, and with another of the vertebral, about the fecond vertebra. It is diftributed to the mufculi fcaleni, angularis fcapulæ, and trapezius, and to the jugular glands and integuments.

VENE. The CERVICAL VEINS. They are branches from the upper external jugular veins, or from the vertebral veins; they spread in the vertebral mus-

of filaments towards the shoulders, and produces the cles of the neck, and communicate with the humeralis &

CERVICALIS: Belonging to the neck. The arteries and veins of the neck have this epithet.

- Descendens. | See Sacro Lumbaris ac-CERVICARIA. BELL-FLOWER, OF CAMPANULA.

The flower confifts of one leaf thaped like a bell; before it is blown it is of a pentagonal figure, and, when fully opened, it is cut into five fegments at the top. The fuminit of the pedicle is expanded into an ovary, whose apex is crowned with a monophyllous quinquind calyx, divided into five long fegments. The feed-veilel is for the most part divided into three cells, each having a hole at the bottom, by which the feed is emitted.

Boerhaave enumerates thirty-four species, but they possess no considerable medical virtue. The most com-

mon of them are the

Campanula esculenta, rapunculus, campanula flore carules, rapunitum parvum, SMALL or GARDEN-RAMPION.
The roots are used in fallads.

Medium, campanula foliis profunde incifis fructu duro, viola Mariana peregrina. Syrian BELL-FLOWER.

Trachelium, called also campanula vulgarier major. GREAT THROAT-WORT, and CANTERBURY-BELLS.

The root is very moderately aftringent.

CERVICARIA ALBA. See LASERPITIUM VULGARIUS. CERVICULA SPIRITUS. Rulandus fays it is the fpirit of the bone of a stag's heart. CERNI SPINA. See RHAMNUS.

CERVIX, also Collum. The NECK. It is that part dually backwards, and gets behind the inner condyle of the os humeri, betwixt which, and the olecranon, it passes to the fore-arm. A little above the carpus it divides into an anterior and posturior branch which goes to the palm, the back of the hand, and fingers.

The fifth branch called medianus, the median nerve, passes down contiguous to the brachial artery, and accompanying the vessel, goes to the fore-arm, and to the palm of the hand, thence to the thumb and fingers.

The fixth branch, called the radial nerve, passes down to the branch, called the radial nerve, passes down to the branch, called the radial nerve, passes down the largest and the posterior or nape.

It contains the largest, a part of the traches or to the state of the branch of the traches or to the state of the branch of the traches or to the state of the branch of the palm of the hand, thence to the thumb and fingers.

The fixth branch, called the radial nerve, passes down the largest applied figuratively to other parts: thus there is the neck of the bladder, and the neck of the uterus; also cervix of a bone, which is when the process stands out in a roundish ball, the round part is called caput, and the neck of the bladder, and the neck of the neck of the bladder, and the neck of the bladder, and the neck of the bladder, and the neck of the ne

It contains the larynn, a part of the trachea arteria, the pharynn, part of the afophagus, the mufculi cutaneis, sterno-massociaei, sterno-hyodaei, bystheroides, coraco bysidaei, splenius, complexus, the musculi vertebrales, which lie upon the first seven vertebrae, and a portion of the medula fpinalis.

The arteries which go to the neck, are the arterize carotides externite, & internæ, vertebrales, & cervicales. The veins are, the venæ jugulares externæ & internæ, cervicales & vertebrales. The nerves are, the portio dura of the auditory nerves, the eighth, ninth, and tenth pair, the feven cervical pairs, and the nervi fym-

pathetici maximi.

Among other diforders to which the neck is fubject, a contraction of it to one fide is of the number. 'Tulpius calls this contraction caput obflipium; he hath removed this diforder in those who were twenty years of age, or more, and were born with it. Meckren and Roonhuyfen have had the fame fuccefs.

This diforder is usually described under the title of the wry-neck. It proceeds from various causes, as burns, a stricture in the skin, a relaxation of some of the muscles in the neck, or a contraction of them; but for the most part the cause is a contraction of the mastoid or

sterno-mastoid muscle only.

When a paralysis is the cause, it is incurable; if it is produced by a defluxion of humours, fweating the part is often of use; if the skin is contracted by a burn, rub it with emollients, and apply warm fomentations, and if these fail, make two or three incisions transversely through the skin where it is contracted. If the cause is from feveral mufcles being contracted, no method of re-lief is yet known; but if there is a contraction of the mattoid-muscle only, or as called by some the sterno-mastoid-muscle, the cure is effected by dividing it. In order to form this operation, Mr. Sharpe directs

in his Treatife of Operations, " to make a transverse incifion through the skin and fat, something broader than the muscle, and not above half an inch from the clavicle; then passing the probed razor with care underneath the muscle, draw it out and cut the muscle. After the incifion is made, the wound is to be filled with dry lint,

muscle from re-uniting; to which end they are to be fe- fish, and seems to be its brain. parated from each other as much as possible, by the asfiftance of a supporting bandage for the head during the whole time of the cure, which will generally be about a month."

Mr. Potts directs to cut through as near the middle as may be, taking care not to wound the carotid artery, nor the jugular vein. Dr. Hunter prefers making the incifion near the sternum; he fays, that at the lower part of the muscle it is best to perform this operation, because there the cellular membrane is not in any great proportion. Mr. Sheldon advises, when the sterno-mastoid muscle is to be cut, not to use the razor above named, for thereby danger attends, from cutting the carotid artery, the jugular vein, and the eighth pair of nerves. He advises to use an incition knife, to cut gently in a transverse direction; then the fibres will fly from the edge of the knife, and with a moderate attention, the dangers just mentioned will be avoided. See Bell's Surgery, vol. iv. p. 366. White's Surgery, p. 387. Wounds in the neck. See VULNUS.

CERVUS. The STAG, HART, or male of the red

Their flesh, until they are three years old, is excellent. The bone of the /lag's heart is but the tendons of the mufcles of its heart hardened. This bone, as it is called, should be very white.

Balls are formed in their stomachs from the hairs which they fwallow when licking themselves. These balls are called elaphopila. Sec ÆGAGROPILA.

The tears of a flug are the fordes collected in the inner angles of the eyes, refembling wax. This matter hath many virtues attributed to it; three or four grains are a dose.

CERVUS MINOR AMERICANUS BEZOARTICUS. The

deer which affords the West Indian bezoar.

- ODORATUS. See MOSCHUS. --- PLATYCEROS. The FALLOW-DEER. See DAMA. -- RANGIFER. The REIN-DEER, called by fome authors tarandus, and machlis. It is an animal very common in all the northern nations, of the shape of a flag, but its body is thicker, and its whole make much more robust, and ftrong. It is of prodigious use as a beast of carriage, to the Laplanders, and almost all the other nations far north. SCHEFFER alledges from TORNEUS, that though a cloven -footed animal, and plainly of the deer kind, it does not chew its cud: this, however is wholly difbelieved by the more accurate naturalists. Its horns and hoofs have been faid to be of use in spasmodic affections.

CERVUS VOLANS. A fort of beetle fo called. See SCARABÆUS.

CESTRITES VINUM. Wine impregnated with

CESTRUM. BETONY.
CETACEUS. CETACEOUS. Those fishes are thus
CETACEUS. des very large, bring forth a perfect animals, ealled which are very large, bring forth a perfect animal inftead of fpawn. Or which, like viviparous animals, refpire by means of lungs, generate, conceive, bring forth young, and nourish them with milk.

CETE. The Spermacett whale.

CETERACH. See ASPLENIUM.

CETUS. The WHALE. The are many kinds of this fish, but the two principal are the Greenland whale, and the spermaceti whale;—also called halana vulgaris, halana major, musculus, myslicetus. The GREENLAND, or BLACK WHALE.

It is from the upper jaw that whale-bone is taken, and from no other part of this fifh. Befides this bone, its only produce is its oil, called train-oil, used for burning in lamps, but of no confequence, in medicine. In Paris they have two forts of whale oil; the best is called huile de grande baye, it is made from the blubber immedi-ately after it is taken out of the whale, whence the French oils are not of fo offensive a smell as those from Holland, which are melted down, &c. after their arrival there.

CETE ADMIRABILE, also called cachalet, balana maerocephala, &cc. trompa, byaris, cete, occa; the spermaceti whale. This species does not assord any whale-bone; but instead of that, it hath teeth, which are ivory. From its body it yields a finer oil than that from the Greenland fpecies; and it also affords spermacers, which fee.

and always dreffed to as to prevent the extremities of the | This matter is lodged in an oily state in the head of this

CEVADILLA, called also febadilla, fabadilla, caussii-cum Americanum, bordeum cansticum, cans interfector, and INDIAN CAUSTIC-BARLEY. It is the feed-veffel of a Mexican plant, its form and structure a barley-ear, but with fmaller feeds, not above the fize of linfeed: They are reckoned the strongest of the vegetable constics. Monardes fays, that for destroying vermin, and as a corrolive for fome kinds of ulcers, they are as effectual as the aced on the part. Dale fays, it is the capfula of the feed that is used.

CEVIL. This is a term of Paratelfus, denoting a certain indurated fubitance in the earth, fimilar to the calculus in the human species, and is a remedy approprinted for the stone. It is also called LUDUS HELMON2

TII, which fee.

CHAA. A Chinese name for TEA. CHAB. An abbreviation of Dominicus Chabraus, M. D. Stirpium Icones & Sciagraphia, 1677. CHACARILLA. See THURIS CORTEX.

CHACRIL. A name which the French give to the

CHÆREFOLIUM. See CHÆROPHYLLUM.

CHÆROPHYLLO. See PERCEP.ER. CHÆROPHYLLUM, called also cerefolium, gingidium, charefolium, chærophyllon, cherefolium; COMMON CHERVIL. It is the feandix cerefolium, Linn. It is an umbelliferous plant, with winged leaves like those of parsley, producing smooth longish feeds, shaped like a bird's beak; a native of the fouthern parts of Europe, fown annually in our gardens, and flightly aromatic, aperient, and diuretic, differing not from parfley in its medical virtues. Diffilled with water, it affords a fmall quantity of effential oil. The name also of some species of myrrhis.

- SYLVESTRE PERENNE CICUTÆ FOLIO, Cicutaria, cicutaria alba, cerefolium fylvestre, myrrbis fylvestris, WILD CICELY COW-WEED. The roots are poisonous, caufing difficulty of breathing, torpors, and madnefs. The root refembles parfnips, and are called by the country people MADNIPS. The plant above ground refem-

bles hemlock.

Botanists enumerate four species. Raii Hist. Cherophyllum Sylvestre. See Antriscus.

CHAIARXAMBAR. See Cassia Fistularis.
CHAITA. Properly the name of quadrupeds; but
Rufus Ephefius expresses by it the hair of the hind-head.
CHAIANDRA. See CALANDRA.

CHALAPA. See JALAPA.
CHALASIS, from MANAGE, to relax. RELAXATION.
CHALASTICA MEDICAMENTA. RELAXING ME-DICINES.

CHALAZA. from x52a2a, a bail-flone, or cha-CHALAZIUM. lazion,—called also lupea. A HAIL-STONE. Some call them grandines. This name is given to a white knotty kind of ftring at each end of an egg, formed of a plexus of the fibres of the membranes, whereby the yolk and the white are connected together.

called aquatum.

It is a species of the hordcolum. STYE, STIAN, or STITHE, is a moveable scirrhous tumor on the margin of the eye-lid, refembling a hail-stone whence its name. It is white, hard, and encysted; and differs from the critbe, another species, only in being moveable. It con-tinues long, and proceeds flowly. Sometimes it may be dispersed with the ung. corrul. fort. and with a few doses of calomel, of one grain each. In weakly habits these may be accompanied with bark and steel. If they fail to relieve, make an incition through the fkin which covers them, and diffect the tumor clearly out, or touch the fkin over them with caustic, then either press the tumor out, or touch it until the whole is wasted. See St. Yves on the Disorders of the Eye. Bell's Surgery, vol. iii. p. 264. Nos. Meth. Ocul. of Dr. Wallis, p. 4.

CHAMÆDROPS. In Paulus Ægineta and Oribafius,

it is the fame as chamædrys.

CHAMÆDRYS. GERMANDER. Also called quereula calamandrina, triffago, chamæd. minor, repens cham. vulg. SMALL GERMANDER, and ENGLISH TREACEE. It is the teuerium chammedrys, or teuerium foliis ovatis incifo crenatis petiolatis, floribus fubverti cillatis ternis, caulibus procumbentibus, Linn. CREEPING GERMANDER. Boerhaave mentions feven species of chamedrys.

The fmall germander is a fmall, creeping, shrubby plant, with fquare stalks, small, stiff, oval leaves, notched from themiddle to the extremity, like those of the oaktree, fet in pairs at the joints, and purplish labiated flow-

CHALCIDICA LACERTA. The ferpent called ers, fet thick together, wanting the upper-lip. It grows wild in France, Germany, and Switzerland. It is fome-times found wild in England, but is generally raifed by

culture in gardens. It flowers in June and July.

The leaves and tops are bitter and aromatic, but by no means confiderable. They lofe a little by drying; they are mildly aperient and corroborant. In uterine diforders, and rheumatic complaints; they are most efteemed. The best time for gathering this herb is when the feeds are formed, and they they are not accomplaints. the feeds are formed, and then the tops are preferable to the leaves. When dry, the dofe is from 3 is. to 3 j. Either water or fpirit will extract their virtue, but wa-

ter takes up more of the bitter matter.

It is an ingredient of the noted powder, which goes by the name of the duke of Portland's.

Pulvis ad Rheumatismum vel de Morbis Arthriticis Ducis Portlandii. The DUKE of PORTLAND's POWDER for the Gout or the Rheumatism!

Take of the roots of round birthwort and gentian, the tops and leaves of small germander, lesser centaury, and ground-pine, of each equal parts; powder them all together. Of this powder a dram must be taken, in any convenient liquor, every morning fasting, for three months; then two fcruples for three months; and, after that, half a dram for fix months; and to conclude the process, half a dram every other day for a year. Actius calls a powder fimilar to this, antidotos ex duobus centaurea genéribus.

Dr. Cadogan observes, that by keeping up a degree of fever, the gout is prevented from fixing on any part by the above use of this powder. Experience in general hath tended to leffen the credit of this composition, which hath little more than its antiquity to support the character that it was lately puffed off with. It differs but little from the diacentaureon of Coelius Aurelianus, the pulvis principis Mirandole, and others, of which an account is given in the Lond. Med. Obf. and Inq. vol. vi. p. 126, &c. where also the origin of the duke of Portland's powder is traced, and shewn to be but a va-riety of the many powders which the ancients used under the following names, viz. antidotos ex duobus centaureæ of Aetius, amarant. grammatici ad podagricos, climax, vel feala facra, &c. CHAMÆLUIE. See Tussilago.

CHAMÆMALUS. A kind of dwarf-apple. Gerard

calls it the PARADISE APPLE.

CHAMÆMELUM. CAMOMILE. Galen calls it Enanthemon.

The root is fibrous, the calyx fquamous, and expandod with a manifold feries of leaves. The flower is generally radiated, feldom naked, with radiated petals, for the most part white, with a yellow disk; the leaves are finely indented; in other things it refembles the bellis.

Boerhaave enumerates eighteen species, of which the

following are the most common.

CHAMÆMELUM nobile, called also cham. Romanum, chamaemilla, leucanthemum odoratius, vel odoratifimum repens, common, or creeping, or Roman, or trailing perennial camomile. It is found wild in moist pasture ground in many parts of England, but is commonly cultivated in gardens. It flowers in June, and so on through the fummer; and the feeds come to perfection at the time of flowering. The leaves and flowers have a ftrong ungrateful finell, and bitter tafte. The flowers are more aromatic and bitter than the leaves and the stalks; the yellow disk is by far the strongest part. The fmell and tafte are both improved by careful drying.

These flowers lose very little by long keeping.

The flowers only are used internally; they are bitter, carminative, anodyne, antispasmodic; of particular use in colics of the cold and flatulent kind; in nephritic, hyperhondriac, and other spasmodic disorders; the pains of child-bed women are much relieved by ftequent draughts of a warm infusion of them; they pro-mote the uterine discharges. They are almost a specific in agues, by giving from half a dram of the powder during the intermission; but as this quantity is apt to run off by the bowels, it is best given, therefore, joined to an opiate or astringent; but it is more effectual. The camemile by moving the bowels makes it useful in flatulent and spasmodic colics, and also in the dysentery; but in diarrhæa, it has been found hurtful. In intermitting fevers of the low and irregular kind, especially when they border too much on continual fevers to admit of the bark, in this cafe the camomile is affifted by a mixture of fixed alkaline falts, and other corroborating medicines.

The dose may be from gr. x. to 3i. of the dry powder. Of the fresh juice from the whole herb, the dose may be from one to fix ounces, which, if taken just before the paroxysm of agues, is effectual in a few doses. This juice is peculiarly useful against a strangury, in asshmas,

jaundice, and dropfies.

Camomile flowers give out their virtue to water and to spirit; the dry flowers make a more agreeable infusion than the fresh ones, or newly dried; and the most grateful is when cold water only is used. Distilled with water, they impregnate it strongly; and, from a large quantity of flowers, a finall quantity of effential oil may be thus obtained. This oil is of a yellowish colour, and possesset all the virtues of the flowers in an eminent degree.

Externally, this herb is discutient and antiseptic; but the flowers possess the greatest degree of these qualities. Dr. Pringle fays that their antiseptic power is 120 times

greater than that of fea-falt.

A green oil is prepared from the herb, whilft it is fresh, in April and May at farthest, by boiling it with olive oil until the leaves are almost crisp: but as boiling dislipates all the best part of the herb, the properest method is to steep the flowers cold in the oil, and to strain it off as it is wanted.

## Extractum Chamameli. Extract of Camomile.

Boil the flowers in diffilled water, then prefs out the decoction, strain it, and set it by until the feeces have subsided, then re-boil it in a water-bath faturated with fea-falt, to a confiltence proper for making pills, Lond. Pharm. 1788. this is remarkably antifeptic, according to the experiments of fir John Pringle, and in dofes of one

CHAMALINUM VULGARE. So Tournefort calls the manner have the College of Physicians of London ordered the extract of broom-tops, gentian, black hellebore, liquorice, rue, and favine to be made.—But if the extract of this flower is acquired from spirituous tincture, it retains much of their flavour, as well as their bitter tafte.

Lewis's and Cullen's Mat. Med.

CHAMEMETUM VULGARE, called also leucanthemum

Dioscorides, anthemis, chamomilla; COMMON WILD, or DOG'S CAMOMILE. It is the anthemis arventis, Linn. the CORN CAMOMILE. It is upright, annual, and grows wild in corn-fields. In France, and other countries on the continent, these are used indiscriminately with the other species, but they are weaker and more disagreeable. The oil obtained from this species by distillation is of a fine blue colour, but the air soon changes it to a yellow.

FLORE PLENO, called also cham. nobile

flore, multiplici, cham. Anglicum flore multiplici. cham. repenf. cham. Romanum, and DOUBLE CAMOMILE. The Anthemis nobillis, Linn. They are produced by culture. They differ in their flowers from the Roman camemile, above described, in being double, or having several rows of the white petals and the thick disk proportionably

The fingle and the double flowered forts are often used indiferiminately; their leaves differ very little; but the flowers, as their active parts, are confined to the yellow disk, and as the fingle have larger disks than the double, and when very double have scarce any disk, the fingle must be allowed to be stronger; but they cause an uneasiness in the stomachs of some people, which the double does not, whence more generally used.

The single fort assords most oil.

CHAMRMELUM FETIDUM, called also cotula fatida, chamamelum fatidum, STINKING CAMOMILE, MAITHS, and MAY-WEED. It is annual, growing in waste grounds and amongst corn. It is more upright than the other species; its leaves are finer, and flowers thicker

In its qualities it differs greatly from the three preced-ing. Its fmell is difagreeable; its flowers are almost infipid, but the leaves have a strong acrid bitter taste.

It has been efteemed ftrongly fudorific. Dr. Brown Langrish gives an account of a decoction of this, recom-mended by a gypsey, throwing a person affected with a rheumatism into a profuse sweat, and curing him of the

- CANARIENSE. The leucanthemum Canari-CHRYSANTHEMUM. See BUPTHALMUM

GERMANICUM.

CHAMÆMESPILUS. It is the arie, a species of wild SERVICE-TREE.

CHAMEMESPILUS GESNERI. See Mespilus folio subrotundo fructu rubro.

CHAMÆMORUS, called also chamæ-rubus foliis ribes Anglica, rubus palustris humilis, vaccinia nubis vulgo, Cambro-Britannica, Lancastrense vaccinium nubis, rubus Alpinus bumilis Anglicus, rubus Alpinus foliis ribis, rubo

Ideo minori affinis, CLOUD-BERRY, and KNOT-BERRY.

It is a fhrub which grows on boggy mountains in England and other northern countries; the leaves refemble those of the mallow or of the currant-tree; the fruit is like the rafberry, when ripe it is sweet, tart, and of a yellowish red. It ripens in July and August. This fruit, when ripe, if boiled, without any addition, to the con-fiftence of a pulp, will keep well if closely covered in pots; and as an antifcorbutic far excels the fcurvy-grafs and other vegetables of its tribe in common ufe.

The chamemorus Norwegiæ is only another species of the same plant. Raii Hist. CHAMÆNERION. A name for several species of

CHAMÆPEUCE, i. e. Chamæpuce of Diofcorides, alfo a name of the STINKING GROUND-PINE. See CAM-PHORATA.

CHAMÆPITUINUM VINUM, It is wine in which the bruifed green leaves of the chamæpitys have been in-

CHAMÆPITYS, also called abiga, ibiga, ajuga, iva arthritica, chamapitys lutea vulgaris sive folio trifido, or two scruples either given by itself, or added to other remedies proves highly benesicial in flatulency, indigestion, and pains of the stomach and bowels. In the same and fideritis in Eubera. Common ground-pine. It is the tenerium chamapitys, or tenerium folis trifidis lineari-bus integerrimus, floribus fossibus lateralibus fositariis luteis,

bus integerrimus, fioribus sessibus lateralibus sentie dissus.

It is a low hairy creeping plant with square stalks, whitish clammy leaves, cut deeply into three narrow segments, set in pairs at the joints, and yellow labiated flowers without pedicles, and wanting the upper lip. It is annual, grows wild in fandy and chalky grounds in some parts of England; slowers in July and August, and has a long stender sibrous root.

The leaves are moderately bitter, of a resinous but not differently litter, any reaching in this respect, as in their

difagreeable smell, approaching in this respect, as in their external form, to those of the pine-tree. They are aperient, and corroborate the nervous fystem; are commended in palfies, rheumatifms, gout, and uterine obstructions; are very attenuating and diuretic, and in general of fimilar virtues with the chamædrys.

They give out their virtue to water, but fomewhat more fully to spirit: on distillation with water a very small portion of effential oil is obtained, resembling in some degree that from turpentine. But an infusion of the dried herb in white wine is the best preparation. The dried leaves may be taken to a dram for a desc. may be taken to a dram for a dofe.

CHAMPACAM. A large tall tree in the East Indies, which bears fragrant flowers twice a year, and not fruit until it is advanced in age. Ray thinks it is the champaca of Bontius. The dried root of its bark is an emenagogue:

the flowers are reckoned cordial.

CHANCRE. The ancients called fuch like ulcers on these parts caries pudendorum. Chancres resemble the ulcers in the mouth, which are called by the name of canker. They are venereal ulcers. Aftruc fays that their feat is in the febaceous glands, and Boerhaave fays that their feat is in the febaceous glands, and Boerhaave fays that they appear on any part of the body: but generally they are on or near the pubes. They appear at first like a little eryfipelatous inflammation, with itching; this is followed by one or more small putfules filled with a transparent sluid, becoming sometimes white; these break and a small but forcading where is formed sometimes mainful. a fmall but fpreading ulcer is formed, fometimes painful, generally inflamed, fore, and unequal at the bottom, often with hard protuberant ash-coloured edges, covered with whitish sloughs.

The furrounding callofity, about the edges of these ul-cers distinguishes them from all others. This hardness Boerhaave fays is from the coagulating quality of the ve-

nereal virus.

The foftest parts are most subject to this kind of ulcer: the more fensible the part on which it is feated is, and the more irregular the form of the ulcer, greater is the diffi-

culty of curing it.

If a chancre is feated in the urethra it may be miftaken for a gonorrhœa, but may be diftinguished by the smallnefs of the discharge, the pain during erection being in the extremity of the penis, or a particular spot in the ure-thra, but principally by examining with the touch of a probe or bougie whether it is callous or not.

The lips of these ulcers never appear swollen or retorted, but contracted, smooth as if polithed, and of a pale colour; the pus in them shines like melted tallow; it hath little or no ropy lentor, and is of a dirty white colour, fometimes inclining to green. It finks no farther that into the cellular membrane, which it deftroys. And when thefe ulcers heal, the ikin there adheres to the fubjacent mufele, and forms a cavity of a livid red colour.

In order to the cure, the venereal infection, which is their only cause, must be destroyed. They may be dressed

with the unguentum hydrargyrum forcad on lint, once in twenty-four hours, and thus they are easily removed.

Mr. Bell observes, that venercal ulcers, are those which appear as primary symptoms; or which arise in consequence of a general taint. Of the former kind are chancres. If foon after exposure to infection, an ulceration appears,it is most probably only a local affection; its appearance will be at first like a small miliary spot, which soon rises and forms little ulcers that upon bursling discharge fometimes a thin watery fluid, and on other oc-cafions, a more thick yellow matter. The edges of fuch fores are generally hard and painful, and attended with more or lefs inflammation. They are not often very painful; a cure might be affected by a very superficial drefling, yet as we have no means of being certainly fafe, the cure of even the flightest chancre, should never be trusted to any other remedy than the internal as well as external use of mercury; at least in moderate doses. In every case of ulcerated chancre not attended with much inflamation, after wiping the fores as clean as poffible, let them be fprinkled well with the hydragyrus nitratus ruber, finely powdered, and pledgits of any common ointment be applied over it; and after two or three dreflings, the ulcer will be generally clean and nearly healed. In fome conflitutions, by the irritation of the mercury,

when not used with proper care, the ulcers turn cancer-ous; these cases are easily made to appear like fores that are well disposed to heal, but yet rarely admit of a cure. This should caution practitioners to guard against acri-mony in the blood when mercurials are used.

See Aftruc on the Venereal Difease, or Chapman's Abridgment of Aftruc, Heifter's Surgery, Lond. Med. Tranf. p. 337, &c. Bell on Ulers, edit. 3. p. 383. CHANDRILLA. A species of serratula.

CHANNA. A fort of fea-fifth like a perch. Also another fifth not unlike this which at Marfeilles they call

CHANTERELLA FLAVA GELATINOSA. It is a fort of fungus, about an inch high, growing in clusters. Tournefort includes under this name all those fungi whose heads are folid, that is, neither lamellated, nor porous, nor latticed, nor prickly, nor turning to duft when

ripe. CHAOSDA. Paracelfus uses this word as an epithet

for the plague. CHAOVA. The Egyptian name for COFFEE. See

CHAR. PLANT. An abbreviation of character

plantarum.

A CHILBLAIN. CHEIMETLON, from guina, winter.

CHEIMIA. COLD, SHIVERING.

CHEIRAPSIA, from xno, the bond, and ambusu, to

SCRATCHING.

CHEIRI, called also keiri, leucoium luteum, viola lutea, ebeyri, COMMON YELLOW WALL-FLOWER. It is the

cheiranthus cheiri, Linn.

The ftalks are woody and brittle; the leaves are oblong, narrow, fharp-pointed, fmooth and of a dark green colour; the flowers are numerous, yellow, tetrapetalous, open fucceffively on the tops, are followed by a long flender pod, containing reddith flat feeds. It grows wild on old walls and among rubbith, and flowers in April and

CHEIRISMA. HANDLING, or a manual operation. CHEIRIXIS. SURGERY.

CHEIRONOMIA. CHIRONOMIA. An exercise mentioned by Hippocrates, which confilts of peculiar gesti-

culations of the hands. CHEIZI. Paracelfus means by it quickfilver, when he fpeaks of minerals; and flowers, when he fpeaks of veget-

CHELA. A FORKED PROBE mentioned by Hippocrates for extracting a polypus from the noie. In Rufus Ephefiusit is the extremities of the cilia. But most commonly it is used for claws, particularly of crabs. It also fignifies fistures in the heels, feet, or pudenda. CHEL. CANC. PULV. C. See CANCER FEUVIA-

CHELIDON. The swallow. Also the hollow at the bend of the arm.

CHELIDONIA. The GREATER and LESSER CELAN-

CHELIDONIA SILVESTRIS. Sec AQUILEGIA. CHELIDONIUM. See BRIONIA ALBA.

CHELIDONIUM MAJOR, called also cheledonia, papaver corniculatum luteum, TETTER-WORT, and GREAT CE-

Boerhaave takes notice of five forts.

This plant hath longish leaves, divided to the rib into roundish and indented portions, of which those at the extremities are the largest, of a bright green colour on the upper side, of a bluish green underneath, full of a goldcoloured juice, as are likewife the stalks; from the bosoms of the leaves iffue long pedicles, bearing clusters of tetrapetalous yellow flowers, which are followed by brownish pods, containing flattish shining black feeds to the lost of thick at the top, with a number of fibres at the bottom, the discovery of its etymology and its orthography) from externally brownish, internally of a deep yellowish red or a fassiron colour: it is perennial, grows wild in hedges and a fassiron colour: it is perennial, grows wild in hedges and a fassiron colour: it is perennial, grows wild in hedges and a fassiron colour: it is perennial, grows wild in hedges and after digettion. Among the Greeks it was called xinus, after digettion.

Charltonus Exercit. de Differentis & Nominibus Anima-| The leaves and roots have a faint unpleafing fmell, and to the tafte are bitter and acrid: they give out their active matter to spirit and to water; the pungency they possess is mentioned by Galen.

CHARONIUS. CHARONEAN. An epithet for caves, fome of which are in Italy, where the air is loaded with a poisonous vapour, that animals soon expire if exposed pates the smell of this herb.

It is aperient, attenuant, and ufeful in the jauudice, when not accompanied with inflammatory fymptoms. The fresh juice is used to destroy warts and films in the eyes; but for this latter purpose it is diluted with milk. Of the dried root from 3 fs. to 3 i. is a dose; of the fresh root infused in wine or in water the dose may be to 3 is. -Minus, called also scropbularia minor, ficaria minor, chelidenia retundifelia miner, curfuma, curtuma hamor-rbeidale, vel hamorrbeidalis berba, ranunculus vernus, FILEWORT, and LESSER CELANDINE. It is the ranunculus ficaria: Linn.

Boerhaave enumerates four species. It is a small plant with roundish fmooth shining green leaves, fet on long pedicles; and slender procumbent stalks, bearing bright gold-coloured folitary flowers of eight or nine petala, which stand in three-leaved cups, and are followed by clusters of naked feeds; the root confists of slender fibres, with a number of tubercles or little knobs. It is perennial, grows wild in hedges and moift meadows, and flow-

ers in April.

The leaves are antifcorbutic, but are without fmell, and have very little tafte, though on chewing, a flight pungency is perceived. The roots are reckoned a specific. if beat into cataplasms and applied to the piles: they yield a large portion of mucilaginous matter to water.

Raii Synop. & Hist.

— Majus areorescens folias quereinus. See

BOCCONIA CHELONE. A TORTOISE. It also imports a part of old walls and among rubbish, and nowers.

The flowers have an agreeable smell, but to the taste are nauseously bitter and pungent. Water takes up all their active matter; but no essential oil is obtained by distillation, though this way a water is obtained that possible fessent much of the flavour of these flowers.

The flowers are reckoned among the nervines, deobstruents, diureties, and antiparalytics.

The flowers are reckoned among the nervines, deobstruents, diureties, and antiparalytics.

CHEINION. A HUMP-BACK, so called from its resemblance to the shell of \$\chi\_{\text{Matter}}\$, a tortais.

CHELTENHAM WATER. This arises from a sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire; and is one of the sorting near Cheltenham, in Gloucestershire.

fpring near Cheltenham, in Gloucestershire; and is one of the most noted purging waters in England. When taken up from the fountain it is clear and colourless; has a faline, bitterish, chalybeate taste; it strikes a pale but vivid purple colour immediately on being mixed with an insusion of galls. When exposed to the air in an open glass vessel it throws up a quantity of air bubbles, becomes turbid, and loses its brisk chalybeate taste, and processes of the last which insusion of stalls. On examption perty of tinging with infusion of galls. On evaportion it is found to contain a calcareous earth, mixed with othre, and a purging falt. In one gallon were found by Dr. Short, 74 grains of calcareous earth mixed with ochre, and 673 grains of a purging falt. Experiment the fo-cond afforded 42 grains of earth, and 580 purging falts The third 70 calcarcous earth, and 622 purging falt. Dr. Rutty, 36 grains of earth, 494 of falt, which was composed of vitriolated magnefia and a small quantity of fea-falt. Dr. Lucas, 4 grains of iron, 1812 grains of calcareous earth, mixed with a fmall portion of sclenites, 3621 of falt of the nature of Epsom, but drier and finer. Dr. A. Fothergill makes the salt to be a native Glauber, mixed with a portion of Epfom falt. As a purge, this water is drank from one to three pints; though in general from half a pint to a quart is suffi-cient. It operates with great ease. See AQUE CA-THARTICA AMARA.

CHELYS. The BREAST. So called because it refembles in its figure the back of a tortoise.

CHELYSCION. A SHORT DRY COUGH.

CHEMA Blancard says it is a certain measure.

mentioned by the Greek physicians, supposed to contain two small spoonfuls; the Athenians had one of two drams, and another of three.

As to the word chemy, it is a very trifling innovation:

Chemistry may be called the anatomy of natural bodies,

or the reducing them to their component parts by attraction. See AFFINITAS.

Dr. Aiken defines it to be the art of combining or feparating the constituent parts of bodies by fire.

It is an important branch of natural philosophy, and hath for its objects the properties of bodies, which it discovers by analysis, and by combinations:

As to its antiquity, Tubal Cain is not improperly faid to have practised it. Those chemical arts which are exercifed without literary fludy were introduced by necessity, and gradually improved from the earlieft times; but they were practifed by those who knew no more than what related to their own business; one branch occupied each practitioner, as the miner, the affayer, the fmith, the dyer, &c. each confined himfelf to his narrow fphere; no one described his art farther than as a mechanic inftructs his apprentice, to they were none of them under-ftood fcientifically.

The first grand object which engaged chemists in this peculiar character was, the transmutation of inferior metals into gold: and in the fourth century they distinguished themselves by the name of alchemists. This visionary pursuit subsided till the seventeenth century. In the sixteenth Paracelsus was negatively useful in reforming chemistry; for those who despised his conduct in most inflances of it, and yet were wise enough to observe that his success in the use of his chemical preparations exceed. his fuccess in the use of his chemical preparations exceeded theirs with the then usual ones, they engaged with new views in their pursuit of this art. These were the inven-tors of modern chemistry. The inquisitive and the ingenious now began to observe, describe, and unravel the operations of workmen, and they writ clearly on every subject. Agricola is one of the first of these writers, who, though contemporary with Paracellus, was of a very opposite character; mines and metallurgic works are his principal subjects. Neri, Merret, and Kuncle; besides their improvements in other respects, have very fully described the arts of making glass, enamels, imitations of precious stones. Kircher and Conringius seem to have quite put an end to the ancient alchemy.

In the beginning of the seventeenth century James Barner, physician to the king of Poland, was one of the first who arranged in order the principal chemical experiments, to which he added rational explanations; this work is entitled Philosophical Chemistry. Bohnius, Becker, Stahl, and Boerhaave, all contributed their advancements; Macquer, Neumann, Lewis, and others of their own nations, possess distinguished honour as improvers of this art. But after all, in the presace to the Dictionary of Chemistry, it is declared that "Chemistry remains but little more than a collection of sacts, the causes of which, and their relations to one another, are fo little understood, that this art is not yet capable either of the fynthetic or analytic modes of explanation, and is not yet capable of being

ranked as a science.'

Those who would see the learned controversies relating to the antiquity of chemistry may confult Borrichius and Conringius, de Hermetica Medicina, the history of the Hermetic Philosophy by the Abbé Langlet de Fresnoy; a small sketch of the same may be also seen in the narrative

to the former London College Dispensatory, p. 24-27.

Besides the uses of chemistry in various other arts, it hath introduced many improvements into physic. It hath

while in their natural combined state.

Many authors might be recommended for improvement in the present state of this art; but, in general, satisfaction will be obtained from Lewis's Mat. Med. the Dictionary of Chemistry, 1771, NEUMANN'S Chem. Works. BERGMAN. FOUREROY. CULLENS'S Mat. Med. LAVOISIER'S Elements of Chemistry, and WEIGLEB'S General System, translated by Dr. HOESON.

CHEMOSIS, from xarve, to gape, called also chymosis, It is when, from inflammation, the white of the eyes fwells above the black, fo that there appears a fort of gap, I

general, and gonesa; the last of which hath been generally whence the name, Galen, de Euphorlistis calls a red and followed by the later writers on this subject, though the carnous inflammation of the cornea tunica. Paulus says most approved editors and other learned men have premost approved editors and other learned men have pre- it is a chemosis; when through a vehement inflammation, ferred the former. The modern Greeks write grana. both the eye-lids are turned outwards, so as scarce to cover the eye, and the white of the eye appears higher than the black, and occupies much of it. Le Dran calls

it a tumor on the white of the eye.

This is a species of opthalmia, called by Sauvages, Ophthalmia chemosis, and also by Aetius, by De Meserey, traumatica. The CHEMOSIC, OT CONJUNCTIVA-CORNEA-PALPEBRAIC OPHTHALMY. Sauvages fays, This arifes from an external cause as a violent contusion of the eye, whence an hyposphagma, of from a chirurgical opera-tion performed on the eye, an extraction of a cataract; from the operation for the unguis, or empyesis, &c. or from an internal cause, as metastasis, or severe catarrh in tacochymic habits. It is known by the black-red fwelling of the conjunctiva, with a depression and obscurity of the cornea, which feems to lie, as it were, in a ca-vity: The inflammation is fevere with excruciating pains of the eyes and head; a fenfe of weight also above the orbit, pervigilium, fever, pulfation, a fwelling, occlusion or fliutting of the eye-lids. It terminates fometimes in fuppuration of the eye, whence an irremediable blindness; at least leucomata succeed it.

In Dr. Cullen's Nofology, it is a variety of that species of ophthalmy, which he names the ophthalmia membranarum. It is when the inflammation is very great, caufing the tunica conjunctiva fo to thicken or project, that the cornea, or transparent part of the scelerotica, appears depressed and sunk in the globe. When the ophthalmy is in this state, it is, for the most part, accompanied with violent pain. As some observe in this state of the inflammation, the white part of the eye is become more like raw flesh; or, as others, that it resembles the pile of red velvet. All the transparent part of the cornea often comes away by suppuration, which destroys the anterior chamber of the eye. The cicarrix, subsequent to the suppuration, hinders the crystalline and vitreous humours from follows out and by the means, the suries desired. from falling out, and by that means, the entire decay of the globe is prevented: fometimes both happen." This difeafe is often fatal; lofs of fight always follows; and generally the pain which comes on deftroys the pa-

In order to relief, the violence of the difease requires the speediest and most powerful aids. Bleeding, according to the strength of the patient, after which a purge will be necessary; and this repeated as required. A blister may be applied on the forehead, or leaches to the temples, and after them a blister there, over the part where they were applied. Goulard's faturnine poultice may be applied cold over the eye-lids, and renewed as often as it grows warm. Antimonial perspiratives may be given inwardly. See, as in general for inflammation of be given inwardly, &c. as in general for inflammation of the eyes. Indeed every method ought to be purfued, which can most immediately subdue the inflammatory fymptoms. See Nofologia Methodica Oculorum, with notes by Dr. Wallis.

CHENALOPEX, from χων, α goofe, and αλωπηξ, α fex.

The shell-drake. See Vulpanser.

CHENOCOPRUS, from χην, a goofe, and ποπίος, dung, Goose-Dung. It was formerly used as a powerful resolvent, diuretic, and anti-icteric. The green was thought the best; it was collected in spring, dried, and given from 5 s. to 3 i. for a dose.

CHENOPODIO-MORUS MAJOR, also called atriations of the collected of

plex, mori fruelu major, fragifera major, spinachia fragi-fera, the GREAT MULBERRY BLIGHT, OF STRAWBERRY

SPINNAGE.

furnished us with many of the most powerful remedies, by putting into our hands some of the active principles of fragifera minor, atriplex sylvestris mori frustu, atriplex bodies directed of those other parts which are but as clogs sylves baccifera, the LESSER MULBERRY BLIGHT, or DER-RY-BEARING ORACHE.

They have no medical virtues attributed to them.

CHENOPODIUM, from xav a goofe, and wee, a foot,
CHENOPUS. GOOSE-FOOT OF SOW-BANE; called also atriplex filvestris, pes anserinus, botrys, botrys Mexicana, and atriplex filv. latifolia. It is reckoned among the uterines, but not used in the present practice. Boerhaave enumerates sourteen species, besides two others, with leaves like those of the herb kali: see also Mercu-RIALIS.

CHENOPODIUM, linifolio, villofo. FLAX-LEAVED ORACHE,

oracie, of summer, offris, and berba fludioforum.

Chenopodium fortidum. (See Atriplex, fortiller, tolday)

VULVARIUM. TIDUM.

CHEOPINA. See Chopino. CHERAS. See SCROPHULA.

CHEREFOLIUM. See CHEROPHYLLUM. CHERIONIUM. It is that in which nature cannot be altered. Thus cryftal hardened by nature cannot be melted, as that which is made by art.

CHERMES, also called coccum fearlesinum, kermes, alkermes, cocci badicum, coccum chermefinum, coccum tinetorium, coccum bapticum, grana kermes, cocca baptica, grana infectoria, coccum infectorium, SCARLET GRAIN, and KERMES BERRIES. They are the produce of the quercus coccifera, Linn. See Coccum BAPTICUM.

Kermes, among the Arabians, fignifies a fmall worm; and more among the Greeks, whence the Latin word coceum, both which mean a kernel or grain; for which reafon, among the later Greeks, instead of the word \*\*\*\*\*\*\*, the word ownant, a worm, is substituted; for these grains are full of fmall worms, the juice of which affords the fearlet colour and dye. Hence the worm is taken for

the grain itself.

An infect which much refembles the green-house bug, lays its eggs on the shrub called ilex aculeata cocciglandi-fera, ilex coccigera, the SCARLET OAK. The females fera, ilex coccigera, the SCARLET OAK. The females of this kind have no wings. The colour of these berries, or rather infects, is like that of a blue plum; the brown colour which they have when brought to us, is from their having been washed with vinegar. They are about the size and shape of peas that are cut into two parts; the hole in the slat surface leads to the skin of the belly. When these insects are fresh, they appear full of minute reddish ova, and which, in long keeping, change to a brownish-red colour. They are cured by sprinkling with vinegar, which prevents the exclusion of the ova, and kills such of the animalculæ as are already hatched, and would otherwise foon fly away. They are brought from France, Spain, Candia, &c. where they are gathered in May, and early in the mornings, while the prickly thorns on which they adhere are foft with the dew.

Geoffroy obtained an urinous kind of spirit from them by distillation. The fresh kermes on expression yield a red juice, of a light agreeable fmell, and a bitterish tafte, that is fub-aftringent, and fomewhat pungent; but before it is brought to us, it is boiled up with fugar, into the confiftence of a fyrup. The dried grain, if not too long kept, gives out both to water and to spirit the same deep red colour, the fame fmell and tafte, as is in the expressed juice. By evaporation the watery tincture loses nearly all its smell and taste, but the spirituous tincture does not: besides, spirit extracts the active parts most com-

pletely.

They are grateful to the palate, efteemed cordial and aftringent, but they are not either one or the other in any confiderable degree; confequently neither they nor their preparations are of much value.

CHERMES MINERALIS. See KERMES MINERALIS.

CHERNIBION. In Hippocrates it is an URINAL. CHERSA. See FECULA. CHERSÆA. An epithet of one of the three species

CHERSYDRUS, from X1950, earth, and isus, water.

An amphibious kind of ferpent which resembles a small land-afp

CHERUTRUNDA. A species of folanum.
CHERVA. An Arabian name for CATAPUTIA.
CHEVALIER. See CALIDRIS BELIONII.

CHEVASTRE. A double-headed roller, applied by its middle below the chin; then running on each fide, it is croffed on the top of the head; then paffing to the nape of the neck, is there croffed: then paffes under the chin, where croffing it, is carried to the top of the head, &c.

until it is all taken up.

CHEYRI. See CHEIRI.

CHEZANANCE, from 25%, to go to fleol, and arayse, necessity. It fignifies any thing that creates a necessity of going to fleol; but particularly in P. Ægineta, it is the name of an ointment with which the anus is to be subbed to procure flets. Active gives this name to be rubbed to procure floois. Actius gives this name to a platter, which was to procure floois by applying it to the

CHIA TERRA. EARTH of CHIOS, now called Scio,

ORACHE, or SUMMER CYPRESS, OF BELVEDERE. Called an island in the Archipelago: It a greyish earth, brought also linaria, sceparia, ospris, and berba studioserum.

CHENOPODIUM FOETIDUM. See ATRIPLEX, FOE but now neglected. Fuller's earth, or pipe-clay coloured, and impressed with proper signatures, are the general sub-

CHIACUM COLLYRIUM. In P. Ægineta, it is a remedy for diforders of the eyes, of which the dry ingredients were bruifed and prepared in Armenian wine. CHIADUS. In Paracelfus it is the fame as furun-

CHIASMOS. It is the meeting of any two things un-der the form of a crofs, or of the letter X, Chi; whence it is named. The adverbs chiafti and chiafticos mean the fame

CHIASTOS. The name of a bandage in Oribafius, fo called from its refembling the letter X, Cbi.

CHIASTRE. A bandage for the temporal artery. It is a double-headed roller, about an inch and an half broad, and four ells long. The middle is applied to the fide of the head, opposite to that in which the artery is opened, and when brought round to the part affected, it is croffed upon the compress that is laid on the wound, and then the continuation is over the coronal future, and under the chin; then croffing on the compress, the course is, as at first, round the head, &c. till the whole roller is

taken up. CHIBOU. The French speak of a spurious gum ele-

mi of this name.

CHIBOULS. A fort of onion which forms no bulbs at the roots.

CHIBUR. SULPHUR. CHICHIAXOCOTL. The fruit of a species of Ma-

caxocotl. See MACAXOCOTLIFERA. CHICOS, or CHICRES. A fort of worm. See Bo-VINA AFFECTIO.

CHEIN-DENT. GRAMEN CANINUM.
CHILCHOTES. See PIPER INDICUM.
CHILLI, BALS. DE, This feems to have been an imposition. Salmon speaks of its being brought from Chill, but there is no evidence of any such thing. The Barbadoes tar, in which is mixed a few drops of the oil of anifold is provided for its provided of the oil of ani-

feed, is usually fold for it.

CHILIODYNAMON, from xales, a thousand, and surgues, virtue. An epithet of the herb polemonium. In Diofcorides, this name is given on account of its many

virtues

CHILIOPHYLLON, See MILLEFOLIUM. CHILLI ARBOR. The PERUVIAN-BARK TREE.

CHILLI GUINEA-PEPPER. CHILLI INDIÆ ORIENT. Se Sec ZINGIBER.

CHILON. One who hath large prominent lips, applicable to fifh, as well as the human species; called also labes, or whose lip or lips are inslamed and swelled.

CHILPELAGUA.

See PIPER INDICUM.

CHILTERPIN.

CHIMIA. CHEMISTRY. See CHEMIA. CHIMOLEA LAXA. Paracelfus means by this word, the powder which is feparated from the flowers of

CHIMUS. A term in Paracelfus of an uncertain meaning; though most likely it is the drofs of metals, or of their ore

CHINA ORIENTALIS. China radix, fankira, quaquara, smilax aspera Chinensis, or China Root. It is the smilax China of Linn.

It is an oblong, thick-jointed root, full of irregular knobs, of a reddish-brown colour outwardly, but inwardly of a pale red. There are two forts, the East and the West Indian. The first is most esteemed; it is paler and

harder than the other, and is the root of a species of smilax, which in China is called lampatam. The plant is a climber, with tendrils, and, like the vine, it bears clufters of large berries of a red colour. It

is a native of China and Japan.

The root hath but little fmell or tafte. An infpiffated decoction of them yields an uncluous, farinaccous, almost insipid mass. It is said to promote perspiration and urine. Prosper Alpinus says, that the Egyptian women use this root to fatten, themselves with. It first appeared in Europe as an anti-venereal about the year 1535, but now it gives place to farfaparilla. This East India kind being the best, may be diffin-

guished from the other by its yellow-brown colour out-wardly; its white, or reddish-white colour inwardly; by there its being in flattish long pieces, full of knots, firm, and fmooth when cut. - Occidentalis. China spuria nodofa, fimilax aspera, pseudo China, kabolossa kiribunna-wel, smilax Indica spinosa, jupicanga, oscacatzan, pahu-atlanica, China Mexicana. American, or West In-DIAN CHINA.

This plant is a climber, and bears black berries, grows wild in Virginia and Jamaica, and bears the cold of our clime. The root is brought chiefly from Jamaica, in long round pieces, full of knots; whitilh without, and

reddish within.

In fcrophulous diforders, fome prefer it to the Oriental kind. In other cases, it is of like virtue with it, but in-ferior. — Supposita. Senecio Madraspatanus, parin chakka, senecio Afaticus, pseudo China, or Bastard China.—It grows in Malabar, the root greatly resembles the Chins root, both in appearance and qualities. Lewis's Mat. Med. Raii Hift. —— CHINE. The PE-RUVIAN-BARK. See CORT. PER.
CHINENSE. The CHINA-ORANGE.
CHINCHINA. PERUVIAN-BARK. See CORT. PE-

RUV

CHIOLI. In Paracelfus in the fame as furunculus. CHIQUES. A name which the French give to the worms which get under the toes of the negroes, and which are destroyed by the oil which flows out of the cashew-nut shell.

CHIRAGRA, from zeip, the hand, and aypz, a feizure.

The gout in the hand.

CHIRONES. See BOVINA AFFECTIO.

CHIRONIA. See BRYONIA NIGRA.
CHIRONIUM. An epithet of a malignant ulcer, difficult to be cured, with a hard, callous, and tumid margin, fo called from Chiron the Centaur, who is faid to be the first who knew how to cure them. It is also called telephium.

CHIRONOMIA. See CHEIRONOMIA.

CHIROTHECA, and Podosbeca. In the preparation of anatomical subjects, they are a glove and a sloge of the fearf-skin, with the nails adhering to them. They are brought off with very little trouble after the cuticula loosens from the parts below by putrefaction, which comes on by long keeping a subject; and this method is better than that of forcing off this skin by means of boiling

CHRURGIA, from xue, a band, and epyor, work, manual operation, surgery, or that part of medicine which confifts of manual operations. In this branch of healing the ancients had great merit in many particulars; but notwithflanding the flight manner in which M. C. Bernard speaks of the moderns, their improvements are an honour to them, and to their profession, both by rendering ancient methods more supportable, and introducing new ones entirely unknown to their predeceffors, and these in cases where with them the patient was left hopolefs.

Among the ancients, Celfus, Paulus Ægineta, and Albucafis excel. After them, the principal systematical writer is Heister. Though numerous are the authors a-mong the moderns, whose publications on subjects in this province deserve the utmost regard, many of which are referred to in this work under their respective articles.

CHIRURGORUM SAPIENTIA. See SOPHIA.
CHIST. The name of a measure. See SEXTARIUS.
CHITON. A coat, or membrane.
CHI-TUA. A species of agallochum.

CHI-TUA. A species of agallochum.
CHIUM VINUM. CHIAN WINE. A wine of the island now called Scio. Dioscorides says, it is less dif-

posed to intoxicate than any other fort.

CHIVEF THEVETI, J. B. A cucurbitiserous tree, bearing a large fruit, as big as a large melon, very sweet, and which melts in the mouth like manna. Rail Hist.

CHIVES, in botany, are the fine threads of flowers, or the little knobs which grow on their tops. Chives tipped with pendants are the apices of flowers, having farina hanging and flaking at their points, as the tulip, See STAMINA.

CHILIASMA. A warming fomentation, called also

CHLORA. See CHLOROS.

CHLORASMA, from xhupos. A palish green colour, shining with a fort of splendour, and inclining to wa-

CHLOROPUS GERMANIS. The GEEEN PLOVER. CHLOROS, xxapos, or CHLORA. This word is variously applied to a green colour, as a pale green, a yellowith pale herbaceous green, &c. When chlores fignifies green, it is spoken of things recent, and not dry, and it is applied to leguminous plants before they are dry, or

come to perfection.

CHLOROSIS, from Chloros, χλαρος, green, or χλαροςω, I am green. The GREEN-SICKNESS, called also Febris alba the WHITE-FEVER, the VIRGIN'S DISEASE, febris amatoria, and ifterus albas. Though Hippocrates does not feem to have known these names of this diforder, yet in the 34th and 35th paragraphs of his book De Intern. Affection, he deferibes it fully; and when it hap-pens to girls, he fpeaks of it in his book De Virginum Morbis.

Most authors treat it as a species of cachexy, and in-deed it is no other; only distinguished from other species by its having retarded or suppressed menses for its cause: Dr. Cullen had ranked it as a genus of difease in the class neurosis, and order adynamize, but now he says, it is only a symptom of amenorrhoza. A vitiated appetite, a strong defire of eating absorbent substances, are constant attendants on this diforder; and, if married women become chlorotic, they are thereby rendered barren, or elfe the childrenthey bring forth are weakly. The common fymptoms, when from difficult menstruation, are, a paleness in the lips, a livid colour about the eye-lids, indolence, coldness, particularly in the feet, lofs of appetite, naufea, vomit-ing, diffurbed fleep, a languid pulfe, limpid urine, which in time becomes turbid; a tremor, if exercife is brifk, or if the patient afcends up hill; a frequent palpitation of the heart; the feet are puffed up; heart-burn, intermit-ting head-achs, fainting, &c. See AMENORRHOEA, ting head-achs, fainting, &c. and Menses Deficientes.

It is treated as a cachexy. See CACHEXIA.

CHNUS, yrus, fine foft wool; but, according to fome, it is chaff, found, or wind.

CHOA. See CHUS.

CHOAVA. COFFEE. See COFFEA. CHOCOLATA. CHOCOLATA. See CACAO.

CHŒNICIS. The TREPAN, fo called by Galen and Ægineta. From xourt, the nave of a wheel.

CHERADES, from xough, a fivine. The fame as

CHCERADOLETHRON, from Xupes, a fwine, and eraspee, destruction. Hog-Banz. A name in Actius for the nanthium or LOUSE-BUR.

CHOIRAS. See SCROFOLA, from xorpts, a hog. CHOIAC, fo Actius calls the month of December. CHOLADES, fo the fmaller inteftines are called, because they contain bile.

CHOLAGO. See CHOLAS.

CHOLAGOGA, CHOLAGOGUES, also colegon, from game, bile, and aye, to drive out, or evacuate. By che-lagogues the ancients meant only such purging medicines as expelled the internal faces, which refembled the cyllic bile in their yellow colour, and other properties, as brightness, tenacity, and bitterness; but it is uncertain that there are any fuch purging medicines as particularly act on the bile. We may, however, retain the word for fuch purgatives as are found most useful when bile offends, or are useful when the liver is diseased. Of this kind is antimony, which is supposed to act more powerfully on bile than any other medicine. Under this de-CHIVETS. The small parts at the roots of plants by shirth they are propagated. Miller's Dict.

CHIVIQUILENGA. The Malabar name for Curcas. the bile to pass freely into the intestines.

is fo called, because it contains the liver, which is the ftrainer of the gall. CHOLE. The BILE.

CHOLEDOCHUS, from xoxe, bile, and Isxquan, to eccive. It is a common epithet for the gall-bladder, the biliary ducts, and the common gall-duct, which commu-nicates with the duodenum, called

CHOLEDOCHUS DUCTUS. It feems to be a continuation of the ductus cyftieus; for it is often observed, that the ductus hepaticus runs, for fome space, within the fide of the duetus cyficus, before it opens into its cavity: also at the opening of the hepatic duet into the cyftic, there is a fmall loofe membrane to hinder the bile from

regurgitating.

CHOLEGON. See CHOLAGOGA.

CHOLERA MORBUS. It is a vomiting of and purging of bilious or other acrid matter, with great pain and fever. Coelius Aurelianus fays the name is derived from xons, bile, and pos; a flux. It is called also diarrhaes, ebolerica; fellishua passio:

There is the true ebolera, and the spurious one. Hip-

pocrates divides this diforder into the moift and dry; and there is a kind of cholera morbus which frequently happens to children from dentition. Dr. Cullen names it cholera. He ranks it in the class neuroses, and order spasmi. He observes two species: 1. Cholera Spontanea, which happens in hot feafons, and without any manifest cause. Cholera accidentalis, which occurs after the use of food that digefteth flowly, and becomes too acrid-The true species is most frequent in autumn, and hap-

pens chiefly to young persons; the spurious is produced by surfeits, and though happening most frequently about September, may as well as the true species occur at any

other feafon.

The feat of this diforder feems to be the whole volume of the intestines, but more particularly the duodenum and bilious duct, as appears by the vomiting, and stools, which

The cholera and bilious diarrhoea, are incident to the bilious, dry, and choleric; for those of a fucculent, phleg-matic, and fanguine habit, are more frequently, subject to a pituitous flux. Those who are subject to a corbutic a-crimony, or who have acid fordes in the primæ viæ, are subject to this disorder; so are those of a passionate tem-In fultry weather it is most frequent: hence it is a faid by Bontius and Thevenot to be endemic in India,

Mauritania, Arabia, and America.

The true cholora approaches often suddenly; fickness, pain, flatulency, and diffention of the belly, are first per-ceived, and are soon followed with frequent vomiting and purging of bilious matter; the vomiting and purging come on both at once, and continue very frequent, and violent pain racks the bowels. The matters voided, are, at first, the remains of the food; afterwards bilious humours, more or less mixed with frothy mucus, of a yellow, green, and at length, often of a black colour; fometimes bloody, like the washings of siesh, extremely acrid and almost corrosive. The pulse is frequent, and some simes fmall or unequal; heat, thirft, and anxiety now attend; cold (weats prefently appear, and fpasmodic contractions affect the extremities. In greater degrees of this diforder, the mufcles of the belly, and, indeed, the whole body are feized with spasms, ineffectual strainings to vonit, with an almost continual urging to stool, usher in an hiccoughing, lividness of the nails, convulsive contractions of the legs and arms, and fometimes the patient is carried off in twenty-four hours.

The fymptoms of the fpurious kind are fimilar to those

In the dry species there is a considerable distension of the stomach and intestines from wind, which is plentifully discharged both upward and downward with extreme anxiety, but without either vomiting or purging being atten-

The remote causes are various; as acrid poison taken into the flomach, rough emetics or purgatives, diet that is acrid, fuch as foon ferments or corrupts, violent passions, the gas fylvestre from fermenting vegetables, or springy elaftic liquors, &c.

The immediate cause is the vellication of the nervous coat of the stomach and intestines, which induces a convultive constriction of the viscers, and which constitutes as often as they return, at least until the pain abates.

CHOLAS, vel Cholago. All the cavity of the illium | the difeafe, also produces the painful symptoms that attend, and are various, according as different parts are most affected:

Hoffman fays, that the dangerous vomiting and purging, which infants are thrown into, from the vehement anger of the nurse, and those which follow the exhibition of arfenic, and fome other poisons, and the virulent catharties and emetics, feem to be no other than the true

The dry cholera proceeds from a collection of acrid and flatulent humours in the stornach, by which the adjacent nervous parts are vellicated and diffended, in which respect it resembles the humid cholera.

The cholera morbus must be distinguished from a billious

loofeness, a dysentery, and the dry chelcra.

It is often fatal; no distemper is more speedily so, except the plague. The more corrosive the matter is that is discharged, the more intense the heat and thirst, the greater is the danger. Hippocrates fays, that if black blood and black bile are voided together, death is certainly at hands An exorbitant discharge of green humour, both upward and downward, fainting, hircough, convultions, coldners of the extremities, cold fweats, a finall intermitting pulse, and the continuance of the other fymptoms after the loofenels and vomiting ceale, are mortal figns. Danger is extreme, if what is vomited fmelts like the internal excrements. If the vomiting ceases, sleep succeeds, and the patient forms relieved, there is good hope; also if the difease continues more than seven days. But the best sign is a free discharge of flatus downwards.

The general indications of cure are:

1ft, To correct and foften the acrid peccant matter, and fit it for expulsion, and if necessary, to expel it by art.

2d, To check the violent commotions.

3d, To strengthen the weakened nervous parts.

When this disorder is caused by corrosive posson, treat it as directed in the articles Arsenic and Merc. Cor.

If rugged emetics or purgâtives gave rife to it, foment the region of the ftomach and belly with spirituous fomentations, and afterwards with a liniment of ol. nerv. ol. rr. m. &c. and give internally warm opiates, fuch as the

conf. opiat.

Fermenting and corruptible diet fometimes give rife to this diforder, in which case give draughts of warm water to excite two or three evacuations by vomiting; after which the bowels may be gently moved downwards, and the patient well fupplied with thin gruel, which may be drank

If violent anger brought on the diforder, carefully avoid emetics and purgatives, and any kind of cold drink, for fome time after its approach, left an inflammation of the ftomach should be produced. In this case, absorbents mixed with nitre, water-gruel, barley-water, decoction of hart's-horn shavings, &c. after which, a few grains of ipe-cae, may be admitted of, and a gentledose of manna with

The spurious cholera, or that species which hath a furfeit for its cause, requires the same treatment as the true

kind does.

In the true cholera, Aretæus long fince commended frequent fmall draughts of tepid water, to evacuate the present contents of the stomach; after which, when bilious discharges appear, loathing, restlessiness, &c. come on, give the patient a quarter of a pint of cold water to check the purging, to cool the ardent heat of the flomach, and to abate the thirst; this he advises to be repeated, as often as the patient throws up what he drinks: and if fainting, with other fymptoms of weakness, come on, he says,

little wine may be added to each draught of water.

Many fince Aretæus have extolled cold water, and the more so as the climate, season, and constitution of the patient are warm; for it cools, blunts acrimony, and re-

stores the tone of the parts.

Sydenham commends a fimilar practice for the most part; he orders, if called in at an early period of the difeafe, a chicken to be boiled in three gallons of water, but fo as that the water hardly taftes of the flesh; of this the patient is to drink freely, and, at the fame time, receive it glyfterwife until the whole is confumed; thus the offending matter will be evacuated both by vomit and flool, and also obtunded. The glysters may be repeated

is diffolved, or any other infinid mucilage, butter-milk, which fome prefer above every liquid, gentle acid drinks; or, as Dr. Douglas hath advised in the Edinb. Med. Eff. a decoction of oat (or other) bread that is first toasted until it is brown as coffee, but not burnt; as much of this toafted bread should be boiled in the water as will render the decoction of the colour of weak coffee.

These liquors should be plentifully drank, until the patient is sufficiently reduced to render the exhibition of

opium fafe.

If the fymptoms are not exceeding violent, from a quarter to half a grain of tart. emet. may be given in part of the drink, every three or four hours; or, if the vo-miting is not very troublesome, from twenty to thirty grains of rhubarb may be taken in a draught of any of

the above liquors.

When the strength is reduced by the evacuations, and When the itrength is reduced by the evacuations, and the primæ viæ cleared, the vomiting and purging may be checked with opiates. Sydenham directs the tinct. opii, from twelve to twenty drops, or more, in a little mint water, to be repeated two or three times a day, or oftener, as the urgency of the pain, or frequency of the evacuations require, and to continue it, at least night and morning, until the patient recovers some degree of

If the diforder hath continued fome hours, and the patient is already weakened, begin immediately with the tinct. opii, and proceed with it as already directed. If the symptoms of weakness are extreme, the pulse weak and intermitting, and convulsions are approaching, give the tinct. opii to twenty-five or thirty drops, in a large fpoonful or two of strong cinnamon water, and after it a draught of whatever liquor the patient hath to drink, mixed with an equal quantity of wine.

Nitre is useful when great anxiety attends.

The faline draughts given in the act of fermentation

often allays the vomiting very foon: they may be re-

peated after each evacuation upwards.

But, perhaps, it will be found, that a free use of the columbo-root will be alone an adequate remedy against this dangerous difease. It rarely requires any means to be employed for promoting the discharge of bile, or to cleanse the primæ viæ, previous to its administration. As soon as affistance is demanded, begin with this medicine, and give from 3 s. to 3 ii. of it firely powdered. in a glass of peppermint-water, and repeat it every three or four hours, more or less, according to the urgency of the symptoms. In hot climes this remedy is almost specific, it soon abates the violent evacuations, and by continuing it a few days, every other fymptom vanishes.

Hosfman observes that in choleras and bilious diarrheeas,

especially such as are excited by passion, it is necessary to abstain from sudorifies and a sudorific regimen, particularly at the beginning; these being apt to bring on vio-lent rheumatic or arthritic affection.

lent rheumatic or arthritic affection.

The cholera morbus fometimes destroys the patient in twenty-four hours. If it is cured, the patient is much relieved in three or four days; it rarely continues a week, beyond which it never lasts, except it turns into some other disease. See Aretzeus, Cœl. Aurelianus, Hoffman, Fordyce's Elem. p. 2. Edinb. Med. Est. vol. v. Wallis's Sydenham. Cullen's First Lines, vol. iv. 39.

CHOLERA SICCA, i. e. Colica Accidentalis. See COLICA.

CHOLERICA. See HEPATIRRHOEA. It is a flux from the bowels without a colic. It is a kind of di-

CHOLOBAPHINON. An epithet of copper which resembles gold. Libavius calls it as coronarium. CHOLOMA, from sudes, lame, maimed. Galen says

that in Hippocrates it fignifies any diffortion of a limb. In a particular fense it is taken for a halting, or lameness

in the leg.

CHOLOSIS. In Vogel's Nosology this is a genus of disease, which he defines to be lameness, from one leg being shorter than the other. It is fometimes the case with children, that one leg seems to be longer than the other, and the patient walks rotatorily in consequence of it. Mr. Pott thinks that this is owing to a kind of paralysis of the part. In these instances, the glutari muscles are in a very relaxed state, and the disease most

In want of chicken-water, as advised by Sydenham, bar-ley-water may be used; water in which a little gum arabic is dissolved, or any other insipid mucilage, butter-milk, means of relief, are the cold bath, the bark, iron, setons, the vitriolic acid, &c.
CHONDRILLA vel CONDRILLA. It is a species

of succory, the root of which is perennial, and the

leaves finely jagged.

Boerhaave enumerates the following species.

Chondrilla cœrulæa, lacluca Sylvestris peren. lacluca humilior flore cœruleo. Gum succory.

It grows wild in Germany and Italy, a gum-like maffich is found about its branches, which is used with myrrh as an emenagogue.

Chondrilla vet lactuca fylv. flore albo.

Chondrilla vel lactuca fylvestris majore flore incarnato.

vel Lactuca Perennis Humflior Den-TATA. BLUE FLOWERED GUM SUCCORY, with broad cut leaves.

There is another kind of chondrilla with different characters from the just named. The feeds of this kind are oblong and narrow, and the calix, in a manner, fiftular and cylindrical. Of this there are five species, as follow:

Chondrilla vel fonchus levis parvis floribus, lactuca sylvestris murorum flore luteo.

Chondrilla vel lactuca fylvestris purpurea, sonchus mon-

tanus purpureus.

Chondrilla hieracii folio annua. The ANNUAL GUM SUCCORY with hawkweed leaves. Hieracium pulchrum, hieracium montanum.

Chondrilla viminea, chondrilla cichoroides, chond. junica, chond. viminalibus virgis, lattuca fytoestris perennis lutea, &c. Gum succons with yellow flowers.

Chondrilla viminea viscona Monspeliaca.
