CHONDROS. The fame as ALICA, which fee. It also fignifies any grumous concretion, as of mastic, &c. It is the Greek word for cartilage; and Hippocrates calls the cartilage xiphoides by this name.

CHONDROSYNDESMUS. A cartilaginous ligament, from xeropo, cartilage, and our spu, to lie toge-

CHONDROPHARYNGÆUS, fee PHARYNX. rises from the cartilaginous appendage of the os hyoides, and is inserted in the membrane of the fauces. Douglas.

CHONE. See INFUNDIBULUM. CHOPIN. An English wine quart.

CHOPINO. A CHOPINE; also cheepina. A pint measure at Paris. Some say it contains fifteen ounces and a half, others say sixteen ounces.

CHORA. A REGION. Galen in his work De Usu
Part. expresses by it particularly the cavities of the eyes;

but in other of his writings he intimates by it any void space.

CHORDA, 2098 . Properly a musical chord. Metabut in other of his writings he intimates by it any void space.

CHORDA, 2008. Properly a musical chord. Metaphorically it is used to signify a tendom. Poets often express by it the intestines. Paracelsus, in his work De Orig. & Cur. Morb. Gal. calls the pudenda by the name of chordæ. A painful tension of the penis in the lues venerea is called chordæ.

— MAGNA. See TENDO ACHILLIS.

— TYMPANI. The fifth pair of nerves from the brain divides into three capital branches, one of which is called the inferior maxillary. See NERVES. A branch of the inferior maxillary nerve forms the lingual, which, soon after it leaves its origin, is accompanied by a small

foon after it leaves its origin, is accompanied by a small diftinct nerve, which runs upward and backward towards the articulation of the lower jaw, in company with the lateral muscle of the malleus, and passes through the tympanum, between the handle of the malleus and the long neek of the incus, by the name of the chorda tympanis. It afterwards perforates the back fide of the tym-

CHORDÆ TENDINEE. See Cor .--WILLISIT. Willis observed small chords going across the sinuses of the dura mater, and from him they are thus named.

CHOR-

CHORDAPSUS. An ancient name for the colic, ever can be a cause of convulsions, and paralytic relax-when seated in the small intestines. See Colica. It is the sline a passo, which see.

Those who have once suffered under this disease are the iliaca paffio, which fee. CHORDATA GONORRHŒA. A ganerrhæa at-

tended with a chorder.

CHORDEE, fo the French call what others name corda, eborda, corde and chorde, from xopsa, the chord of a mufical instrument.

It is a painful contraction of the under part of the penis, which when it is erected, and only then, is painful, and feels as if pulled downwards with a cord. The pain is principally under the frenum, and along the duct of the urethra.

Aftruc diftinguishes it, when the whole body of the penis is regularly drawn downwards in the form of a femicircle, from inflammation, or an ulcer in the membrane that lines the urethra, or in the corpus cavernofum urethræ, and when the glans only is drawn down by inflam-mation, or spasmodic stricture in the frænum. He also observes, that besides the chordee, there are other distortions of the penis, e. g. if the suspensory ligament that connects the penis to the os pubis is inflamed, or if only one of its cavernous bodies is injured, the penis will either be bent upwards, or to one fide, and these are relieved in the fame manner as the chordee.

Dr. Rutherford of Edinburgh, in his Clinical Lectures fays, that inflammation and fwelling in the corp. cavern.

ureth. is the cause of the chordee.

In order to the cure, if the patient is plethoric and firong, bleed; if the pain is great during erection, give an opiate at bed-time, and rub the ungt. cccrul. fort. all

along the duct of the urethra every night.

If the inflammation is wholly from a flux of humours on the part, mercury will heighten it, fo should be forborn until the defluction ceases; but when the inflammation is the defluction ceases; but when the inflammation is the same and the same are the same and the same are the same ar mation is from the venereal poilon simply, mercury is

its proper antidote. CHOREA, vel CHORION, SANCTI VIII. St. VITUS'S DANCE. And called vitifaltus, by Paracelfus lafeivus. Horstius says that there were some women who once every year paid a vifit to the chapel of St. Vitus, near Ulm, and there exercifed themselves day and night in dancing, being disordered in mind, till they fell down like those in an extasy. Thus they were restored till the return of the following May, when they were again seized with a reftlesses and disorderly motion of their limbs, fo as to be obliged, at the anniverfary feaft of St. Vitus, to repair again to the fame chapel for the fake of dancing. From this tradition, a fort of convultion, to which girls are principally fubject before the eruption of the menfes, took its name. But yet the diforder above deferibed by Horftius is different from what we call St. Vitus's dance.

Mead and Pitcairn fay that this diforder is of the paralytic kind; Sydenham fays it is convulfive; Bifs and Cheyne fay that it partakes both of the convultive and paralytic kinds. Dr. Cullen calls it cherea. He ranks it

in the class neuroses, and order spasmi. Sydenham is generally allowed to excel in his defcription of this complaint, which is as follows: " It is a kind of convulsion, which principally attacks children of both fexes from ten to fourteen years of age. It first shews it-felf by a lameness, or rather unsteadiness of one of the legs, which the patient draws after him like an ideot, and afterwards affects the hand on the fame fide, which being brought to the breaft, or any other part, can by no means be held in the fame posture for a moment, but is distorted or snatched by a kind of convulsion into a disferent pofture or place, notwithflanding all possible efforts to the contrary. If a glass of liquor be put into the hand to drink, before the patient can get it to his mouth, he uses a thousand odd gestures; for, not being able to carry it in a straight line thereto, because his hand is drawn different ways by the convulsion, as foon as it hath reached his lips, he throws it suddenly into his mouth, and drinks it very hastily, as if he only meant to divert the spectators."

Its cause is from an acrid humour falling on the nerves; fometimes from worms: Cheyne says it sometimes rises from an epilepfy, which is leaving the patient as his fittength increases; and Pitcairn intimates that its cause is from a paralytic affection of the muscles. From the variety of symptoms observed in different patients, what-

very fubject to a relapfe. However violent the fymptoms are, they never are fuddenly defructive. When recent in a young perion, of an otherwife good conflitution, there is hope of a fpeedy cure. If the menfes or hamorrhoids are obstructed, their return will intigate if not cure the difease. If the temperament is very fentible, the difease hereditary, or become habitual, the cure is very difficult. Through ill management it may degenerate into an epilepsy or hypochondriac melancholy.

Dr. Cheyne, in his Treatife on the Gout and Bath Waters, intimates that the indications of cure are, 1. To evacuate. 2. To attenuate. 3. To corroborate. And he informs us that he effects the first by a vomit once a week, until the disease abates, and then he lengthens the intervals. The second he effects by giving for a month or fix weeks, on the days in which the emetic is not ad-ministered, a large dose of Æthiops mineral, with Bath water. The third by an anticachectic regimen and nervous corroborant; fuch as the bark, orange-peel, iron, cold bathing, &c.

Valerian in large dofes, e. g. three drams in a day, hath been followed with fuccefs. The cardamine, which fee, is almost a specific. Of purges the vinum aloes, or pil. ex aloe cum myrrha are the most proper. Dr. Mead particularly cautions us to administer medicines at and about the changes of the moon.

See Wallis's Sydenham, vol. ii. p. 327. Mead's Influence

of the Sun and Moon, upon Human Bodies; Cheyne's English Malady, and his Essay on the Gout, &c. Bits's Medical Essays, Cullen's First Lines, vol. iii. edit. 4.
CHORION. and the Xept, vel 20078. Vide H. Steph. Thes. A name of the external membrane of the foctus.

In women, as in some animals, the charies at the first is without any sensible placenta. It hath its name from the chorus or croud of blood-vessels which are spread upon it. It adheres to the amnios by a gelatinous substance, and is divisible into two lamellæ; the internal, or true charies, is even more thin and pellucid than the amnios, whilft the external, or false cherion, is thick and opake. This spongy cherion adheres to the uterus at every part, and grows thicker as it approaches the placenta, whillf the internal lamina adheres infeparably to the inner furface of the placenta; hence it is plain that the fubfiance of the placenta is betwixt these two lamellæ of the chorism. This membrane hath abundance of lymphatic veffels; but in the human placenta the veffels cannot be traced by injection on the amnios and cherior, yet the uterus fends veins to the outer chorion : perhaps the arteries do the fame. See DECIDUA.

The use of the chorion is to fustain the umbilical vessels. CHOROIDES, from x5960, the chorion, and ecosy, likeness. It is an epithet of several membranes, which, on account of the multitude of their blood-vessels, resemble the chorion. It is the tunica retiformis oculi, a name of one of the coats of the eye. See RETIFORMIS. It lines the felerotis, is a thin vafeular coat of a brownish colour, generally faid to derive its origin from the pia mater's covering of the optic nerve. From the colour of part of this membrane it hath been called uvea, the external furface of which is called the iris, but at prefent the whole forepart of this coat is called iris; and the relt is called charaides. It confifts of two laminæ, the exterior is flightly connected with the felerotica, and is also covered with a black matter, called nigrum pigmentum. Both laminæ are extremely vascular; the extremities of the vessels of the inner surface project therefrom, and are termed villi and papillæ. As this internal lamina was first noted by Ruysch, it is called sunica Ruyschiana. The black substance which lies between the felerotica and choroides is also found betwixt it and the retina. Near where the selerotica becomes transparent, the eboroides is firmly united to it, and at this circle of adhesion the choroides feems to change its colour and texture, appearing as a whitish kind of ring, of a compact substance, and is termed ligamentum ciliare. Here the internal lamina of the ligamentum ciliare. choroides dips inwards, to make what are termed the pro-ceffes. The ciliary processes are on the inside between the iris and choroides, as the ligamentum ciliare is on the outfide. The charaides is continued on the infide of the

transparent

transparent part of the felerotis, and there forms the iris; the perforation in the middle of which is called pupilla. The artery is a branch of the carotid. The veins empty themselves into the optic finuses, which are again difcharged into the internal jugulars; but fome of these veins communicate with the external veins of the eye, fo part of the blood is emptied into the external jugulars. The nerves are from the ophthalmic branch of the fifth pair, and a branch of the third pair.

Opposite to the insertion of the optic nerve the charaides is wanting, and forms that white speck on which if the picture of an object falls we are incapable of feeing it.

CHOUAN. A French name for a fmall yellow feed refembling worm-feed, but rather larger, which in tafte is a little falt and biting. It grows on a plant brought from the Levant, and is used in making carmine:

CHOUDE PALMISTE. The cabbage of the palm-

tree. See PALMA.
CHOVANA MANDARU. A species of mandaru. CHOYNE. An American cucurbitiferous plant, whose leaves resemble those of the bay-tree, but is neither of any note in medicine, nor for the palate. Raii Hift.

CHRISTI MANUS. A name given to fugar that is depurated, boiled in rofe-water, and cast into troches,

with or without prepared pearls.

CHRISTIANA RADIX. A species of VETCH. See
ERVUM under ASTRAGALUS.

CHRISTOPHORIANA. The HERB CHRISTOPHER.

It is a plant with a rosaccous slewer, whose ovary is soft like a berry. Boerhaave takes notice of four species; but they have no medical virtue attributed to them.

VIRGINIANA. | Species of aralia.

CHRISTOS, from XPIN, to anoint. It is whatever is applied by way of unction.

CHRONICUS, or CHRONIUS, from XPIND, time.

CHRONICAL.

Difeases which continue long, and are without any fever, or at least a confiderable degree of it, are thus called, to diftinguish them from those which proceed rapidly and terminate foon, and are called acute.
in the cure of chronical diforders, Dr. Fothergil inti-

mates that those means or medicines which enable the ftomach duly to perform its office, are the most effectual, if not the only remedies. See what he hath inferted on this subject in the first vol. of the Lond. Med. Obs. p. 314. Dr. Cadogan feems to corroborate this by his ob-fervations on the causes of chronical diforders; which he fays are indolence, intemperance, or vexation: though now and then he allows that an ill cured acute diforder may be the caufe of chronical ones. See his Effay on the Gout and Chronical Difeafes. Wallis's Sydenham, vol.

i. p. 4. CHROS. Galen fays that the Ionians mean by this word all that is of flesh in our bodies, i. e. all except

bones and cartilages.

CHRYSANTHEMI FLORE PLANTA AFRA
BACCIFERA RAMIS IN ACULEUM ABEUNTI-

US. A species of CHRYSANTHEMOIDES. SANTHEMUM. It is a plant whose flower resembles the small sun-flower, and whose overy becomes a stone, containing a hard kernel. Boerhaave mentions three species, but they have no medical virtues attributed to them. HARD-SEEDED CHRY-

CHRYSANTHEMOS. See AMARANTHUS. CHRYSANTHEMUM, called also bellis lutea foliis

profunde incifis major; chryf. fegetum; CORN MARIGOLD.

Botanifts enumerate fourteen species. It is an annual plant frequently met with amongst corn. The Germans commend it in the jaundice, but it does not obtain in practice with us.

It is likewise a name for the bidens, some species of African, and also garden marigold. See CALENDULA.

- AFRICANUM FRUTESCENS SPINOSUM. A fpc-

eies of chryfanthemoides.

—— Africanum, i.e. African marygold. See Othononia Africanus Flos.

- ALPINUM. MOUNTAIN RAGWORT. See JA-COBJEA.

ALBE. A species of chrysanthemoides.

CHRYSANTHEMUM BIDENS. See ACMELLA. - CONYZOIDES. GOLDEN STAR-WORT. See IN-

GUINALIS. --- Conyzoides Palustre Minus Flore Glo-

BOSO. SMALL FLEA-BANE.

- COTULÆ FOLIO. See BUPTHALMUM VERUM.
- FOLIO COTULÆ FLORE ALBO. A species of cotula.

FRUTICOSUM SUBCANDIDUM. A species of

-INDICUM RAMOSUM. A species of fun-flower. - INDICUM, i. e. POTATOES. See BATTATAS CANADENSIS.

- INDICUM FLORE ET SEMINE MAXIMIS AN-NUUM. SUN-FLOWER.

- PERENNEL COMMON OX-EYE.

- LEUCANTHEMUM. See BELLIS MAJOR.

— PERUVIANUM. SUN-FLOWER.
— VALENTINUM. A species of zotula.
CHRYSATTICUM. An epithet of a fort of passium, recommended by P. Ægineta to be drank with the feed of

atriplex, for the jaundice. CHRYSE. The name of a plaster in P. Ægineta for

fresh wounds.

CHRYSISCEPTUM. A name for the WHITE CHA-

CHRYSITIS, or CHRYSITIS SPODOS. See LYTHAR-

CHRYSOBALANUS. NUTMEG. See Nux Mos-

CHRYSOBERRILLUS. The YELLOW BERYL. See

CHRYSOCALLIA. A name in Diofcorides for the

anthemis or chamæmelum.
CHRYSOCERAUNIUS. See AURUM FULMINANS. CHRYSOCHALCOS: See AURICHALCUM.

CHRYSOCOLLA, from xpoore, gold, and xeam, glue, or folder. Borax, called also caruleum montanum, auricolla amphitane. See Tincal.

CHRYSOCOME, from χρυσος, gold, and κομε, bair.
A name for many species of Velichrysum; which see.
CHRYSODENDRON. See Conocarpodendron.

CHRYSODENDRON. See CONOCARPODENDRON. CHRYSOGONIA, from 250505, gold, and 7000001, to be made or generated of. It is the AURIFIC TINCTURE. CHRYSOGONUM. RED TURNEP. CHRYSOLACHANON. GARDEN, or WHITE ORACHE. See ATRIPLEX. Also an unknown plant mentioned by Pliny.

CHRYSOMELIA. ORANGE. See AURANT: HY-

CHRYSOPŒIA, from xpuses, gold, and mouse, to make. The art of changing inferior metals into gold by the help of mercurius philosophorum.

CHRYSOPUS. A name for the gummi-gutta. See

GAMBOGIA.

CHRYSOSPLENIUM. GOLDEN SAXIFRAGE. s a perennial plant, of which two species are noticed by Boerhaave, viz.

Chryfofplenium foliis amplioribus auriculatis, faxifraga rotundifolia aurea, alchimilla rotundifolia aurea birfuta. GOLDEN SAXIFRAGE WITH LONG EARED LEAVES.

Chrysofplenium foliis minoribus subrotundis, faxifraga rotundifolia aurea minor montis aurei.

They have not any medical virtues attributed to them. CHRYSULCA. An epithet in Helmont and fome others for aqua Stygia or aqua regia.

CHRYSUN, from xxxxx, gold. An epithet of two collyria for the eyes, and also of two pessaries for the ute-

rus, in Actius.

CHU, or CHUs. The name of a measure. The same as CHOA, congine—this was a liquid measure among the Athenians, containing fix fextarii, or twelve Attic cotylæ, or nine pints or pounds of oil, ten of wine, thirteen and an half of honey, according to GALEN. LINDEN fays at least eight of wine and four ounces. RHODIUS afferts that the Chus, or congius, weighs ten pounds. Cas-TELLI

CHUNDRILLA VERCURIA. See ZACINTHA. CHUNNO. The Peruvian name for POTATOE BREAD. CHYBUR. SULPHUR.

CHYLARIA. A discharge of whitish mucous urine.

- Arborescens Æthiopium Folis Populi It is the dysuria mucofa of Cullen. See Dysuria.

CHYLIFERA VASA. See LACTEA VASA CHYLIFI

CHYLIFICATIO. See Chylosis. Chylification. pints of milk, the breaft of a boiled capon, and two The first concoction or the changing of the aliment into

chyle by the power of the ftomach.

CHYLISMA, from \*\*\* juice. In Diofeorides it

fignifies expressed juice.

CHYLISTA. Hartman's chylista is a glass of antimony obtunded by levigating it with mastich dissolved in rectified spirit of wine; the oleose part of this spirit blunts the fpicula of the vitr. ant.
CHYLOPOIETIC. Of the chyle.

CHYLOSIS. See CHYLIFICATIO.

CHYLOSTAGMA DIAPHORETICUM MINDE-RERI, called also aqua theriacalis bezoardica. It is a liquor distilled from the ther. Andromachi, or from Mithridate or fuch like matters.

CHYLUS, Xulos. The CHYLE. In general it is a juice inspiffated to a middle consistence between humid

and dry

In Hippocrates the word xonos is used to express the juice and sorbile liquor of barley, which liquor they call strained ptisan, being the expressed substance of the barley; not what the Latins call cremer, which is only the expressed water of the barley. To xonos is opposed ptisan unstrained.

The aliment received into our ftomachs is converted into a fluid state, the oily part of it mixed with the faliva and other juices secerned into the stomach and duodenum, becomes like milk, and is called chyle. The bile mixing with the digested aliment when it is conveyed into the duodenum, affists the separation of the nutritious chyle from the excrementitious part. The nutritious chyle is conveyed by the lacteals into the circulation, to be converted into blood. The chyle seems to consist of oil, mucillars water a complete part and fixed in cilage, water, a coagulable part, and fixed air-

From the chyle proceeds the milk which flows into the breafts of nurses, as well as all that is required to recruit the wafte made by the actions of living bodies. See

LAC.

The chyle when it enters the blood does not immediately mix with it, but in many inflances is proved to pals in a feparate flate through the whole circulation; e. g. the chyle hath been feen to float on the furface of blood which was taken from the arm: in the last stage of a diabetes the urine manifeftly points out the presence of chyle in it. See Haller's Physiology on the Chyliferous Vessels; Percival's Med. Essays, edit. 2. p. 251, &c. CHYMATION. The name of a penetrating medicine

m Marcellus Empiricus. CHYMIA. CHEMISTRY.

CHYMIATER. A chemical physician, or one who cares by chemical medicines. Called also jatrochimicus.

CHYMIATRIA, from xuma, chemistry, and inferia, healing. The art of curing diseases by chemical medicines

CHYMOSIS. See CHEMOSIS. CHYMOSUM. In Paracelfus it is CHYLUS.

CHYMUS, X0µ25, humour or juice. In the common fignification of the word it is every kind of humour which is incraffated by concoction. Sometimes it means the finest part of the chyle when separated from the faces. In Galen it is the gustuory faculty or quality in plants

CHYTLON. In Hippocrates it means a plentiful in-

unction with oil and water.

CIBAGE, pino fimilis Orientalis. A tree growing in the Eastern countries resembling a pine-tree.
CIBARIUS. PANIS. HOUSEHOLD BREAD.

CIBATIO. By this is meant the affumption of meal and aliments. In chemistry it means corporatic, incorporating. It is also considered as nutrition of the dry parts of our machine; or is an accumulation of what is fubtile or fine, or a fubtilization of thick, or groffer parts.

CIBORIUM. EGIPTIAN BEAN. See FABA ÆGYP-CIBOTIUM. TIA.

CIBOUL. A fort of ONION nearly allied to the feal-lion. They have no bulb at the root, and are cultivated in the kitchen garden. CIBUR. SULPHUR.

CHARTELL

CIBUS ALBUS. WHITE POOD. It is a species of jelly, which in Fuller's Pharmacopæia is thus made: take four

ounces of blanched fweet almonds; let them be beat and ftrong impression made; then boil them over a gentle fire, adding three ounces of rice meal; and when they begin to coagulate, add eight ounces of white fugar, and ten spoonfuls of rose-water; mix all well together.

The Spaniards give the name of cibus albus to a certain

American plant.

CICADA. The BAUM CRICKET. An infect common in Italy, fomewhat refembling a cricket. It hath wings, is very noify, and is faid to live on dew, which it fucks from the dwarf afh-manna-tree. These infects, when dried and burnt, are used in the colic, and stone, as a

CICATRICULA. A little white speck or vesicle in the coat of the yolk of an egg, wherein the first changes appear towards the formation of the chicken or the nervous cylinder.
CICATRISANTIA. See EPULOTICA.

CICATRIX, from cicratico to fkin. A feam or ele-vation of callous fleth, rifing on the fkin, and remaining there after the healing of a wound or ulcer, and is com-

monly called a fear.

It is the destruction of the cellular membrane by inflammation that causes cicatrices to tuck inwards, as they are always observed to do. Some commend the steams of hot water to be often applied to the growing kin, to pre-vent a cicatrix, and to drefs with a cerate of wax and the oil of eggs.

CICCUS. A fmall fixcies of GRASHOPPER, and a

fpecies of WILD GOOSE.

CICER, album, nigrum, vel rubrum; cicer fativum, cicer Arietinum, crebinthus CHICHES, CICHES, CICERS, and CICH PEASE. The fort used in medicine is the cicer Arietinum. Linn.

Chiches, a fort of pulse, cultivated in warmer climates, where our finer peas do not thrive so well. They are a strong statulent food, hard of digestion. They are sown in France, Italy, &c. slower in June, and the peas are ripe in July.

CICER SYLVESTRE, astragalus luteus perennis siliqua gemella rotunda vesicam referente, glaux. WILD CHICHES. CICERA. CYDER.

- TARTARI. Small pills composed of turpentine

and cream of tartar.

CICERBITA. See Sonchus.

CICERCULA. See LATHYRUS.

CICERI SYLVESTRIS MINOR. MILE-WORT of Dioscorides. See GLAUX DISCORIDIS.
CICHOREUM. SUCCORY.

CICHOREUM LATIFOLIUM. See ENDIVIA.

— SYLVESTRE, and fatiyum. WILD and GARDEN SUCCORY. The wild is the cichorium intybus.

It is a plant with oblong, dark green, hairy leaves, deeply jagged like those of dandelion, but larger; in the bosoms of which, towards the tops of the branches, the flowers come forth in fpikes, confifting each of a number of blue flat flofculi, fet in a fealy cup, which afterwards become a covering to feveral fhort angular feeds: the root is long and flender, of a brown colour on the outfide, and white within. It is biennial, grows in hedges, and by road-fides and flowers in large and lark

fides, and flowers in June and July.

It abounds with a milky juice, of a penetrating bitterift tafte, and of no remarkable finell: the roots are bitterer than the leaves or stalks, and these much more so than the flowers. But by culture in gardens it lofes its green

the flowers. But by culture in gardens it lofes its green colour, and in a great measure its bitterness, and in this state is a common sallad herb: the deeper coloured and the deeper jagged the leaves are, the bitterer is the taste of the whole plant.

The whole plant is mildly aperient, and if freely used it loosens the belly. The virtue resides in the milky juice, which may be extracted by coction in water, or by pressure. The wild and the garden sorts may be used indifferently, but should be used as sood rather than physic. If the root is cut into small pieces, dried and roasted, it resembles cosses, and is a good substitute for it.

Chendrilla carulea cyani capitulis, also called sessances.

Chondrilla carulca cyani capitulis, also called fesamsides, cicherium carul. coronopi foliis angustis, &c. BASTARD SUCCORY, OF LION'S FOOT WITH BUCKSHORN LEAVES.

Catanante

SUCCORY.

- VERNICARIUM. See ZACINTHA. Called also VERRUCARUM. Endivo lutea.

CICILIANA. See Scolymus
CICILIANA. See Andros mum.
CICINDELA. The clow-worm, also called hauTours, notificula terrestris, scarabaus, cicindela mas &

The flying glow-worms are males, and the reptile ones are the females. Some reckon them anodyne, others that they are useful against the stone in the bladder. CICINUM. OL. See RICINI, ol.

CICINUM. OL. See RICINI, ol.

CICIS, RISEI In fome places of Hippocrates and Theophraftus it is put for RESIG. A GALL.

CICLA. WHATE BEETS. See BETA ALBA.

CICONGIUS. Blancard fays it is a measure containing twelve fexturies or pints.

CICONIA. The STORK.

CICUTA. HEMLOCK.

CICUTA. HEMLOCK.

CICUTA MAJOR FORTIDA. The comium maculatum, vel comium majus feminibus striatis, or spotted hem-lock, of Linn. It grows wild almost all over the world, and with us is sound about the sides of the fields, under hedges and in moilt strady places. It is a tail umbelliferous plant, with large leaves, of a blackish green colour on the upper side, and a whitish green underneath, divided into a number of small oblong somewhat oval segments, which stand in pairs on middle ribs; these segments are again deeply cut, but not quite divided on both sides; and many of these ultimate sections have one or two slighter indentations. They much refemble parsey or chervil, especially the leaves of the smallest one or two flighter indentations. They much refemble parfley or chervil, especially the leaves of the smallest forts, whose possonous quality is the most violent. The forts, whose poisonous quality is the most violent. The stalk is round, smooth, hollow, irregularly variegated with spots and streaks of a red or blackish purple colour: the slowers are white, and blow in June or July; the seeds greenish, stat on one side, very convex, and marked with sive surrows on the other. The root is oblong, about the size of a middling parsnep yellowish without, white and sungous within, and part of it hollow; it changes its form according to the season. The leaves have a rank simell, but do not much affect the taste.

The best for medical use is that which hath arrived at its full vigour, and is rather on the decline, or just when the slowers sade; the rudiments of the seeds become observable, and the habit of the plant inclines to yellow. That which grows in exposed places is generally stronger than what grows in the shade, and that which grows in dry places is also to be preferred.

man what grows in the Inade, and that which grows in dry places is also to be preferred.

It agrees with all ages, and every circumstance of patients. Joined with pectorals it promotes perspiration. It hath been of great efficacy in epilepsies and convulsions. Internally and externally it abates inflammations of the eyes; it is narcotic and anodyne, it promotes rest and eases pain. It feldom creates thirst or head-ach, which fucceed opiates next morning, and as rarely creates cof-tiveness, but commonly produces a lax stool the day following. It possesses a property of altering thin, corrosive, cancerous ichor, and renders it mild. It hath been used with considerable advantage in fanious ulcers, gleets, painful discharges from the vagina, fixed pains from acrid

Cotamance, CANDY LION'S FOOT. It is a species of surrounded with such seirchosty; and in some ulcers, certainly that approached to the nature of cancer; may, in those that might be considered truly cancerous, he has known it relieve the pains, mend the quality of the matter proceeding from the fore, and even to make a confidetable approach towards the healing of it, but never completed it. Mat. Med. It has been confidered by fome as very ufeful in the chincough, and rheumatic com-

> When bemlock is imprudently eaten, it causes a vertigo, a dimness of fight, hiccough, a fort of madness, and coldnels of the extremities, convultions, and death, by an utter interception of respiration; fornetimes by the spafma, which it produces in the stomach and other nervous parts, haemorrhages are the confequence; or if this happens not, an epilepfy comes on, which, without very speedy relief, is fatal. The proper method of relief is to discharge the stomach of its contents by means of the nost active emetics, and then to administer frequent doses of sharp vincery. vinegar, &c. as in the articles AMANITA and VENE-

> The proper method of administering bentleck inwardly is, to begin with a grain or two of the powder, or inspit-fated juice, and gradually to intrease the dose until the full one is arrived at, which is thus known: for the most part a giddiness affects the head; there is a motion in the eyes as if fonething puthed them outwards; a flight fickness and trembling agitation of the body; a laxative flool or two the morning after the dose. One or more of

> the symptoms are the evidences of a full dose, and here continue until none of these effects are observed; and then, after a few days, increase the dose; for little ad-vantage can be expected but by a continuance of full doses. In fome constitutions even small doses greatly offend, occasioning spalmodic twitchings, heat and thirst; in such instances its use must be discontinued.

> The College of Phylicians of London order instead of

the former extract the inspillated juice of bemlock, Suc-CUS CICUTA SPISSATUS, made in the following manner:

let the expressed juice of bemlock, cleared from its facees, be evaporated in a water bath, faturated with muriatic salt to a proper consistence. Ph. Lond. 1788.

After all, this plant is not found to be so injurious as has been related, for it has been taken a long time without any bad effect. The cicata aquatica is probably the fort which is so possessand and is mistaken for it. Externally it is applied with advantage, and particularly in the nally it is applied with advantage, and particularly in the form of poultice; not in platter. In the first mode, it has been useful in refolving fome indurations, especially those of the scrophulous kind, but in the indolent scirrhofities in the breatls of women, it is feldom of any fervice; and the frequent applications of bemlock poul tices, have been known to do much harm by bringing these tumors sooner to an open cancer. See Wilmer's Observations on Possonous Vegetables. Withering's Bot. Arrangement, vol. i. p. 161. Cullen's Mat. Med.

For that called Alba, see Cherophyllum sylves-

TRE, &c.

CICUTA MINOR, called also cicuta fatua, cicutaria tenuifolia, cicutaria fatua, cynapium. The LESSER HEM-LOCK, OF FOOL'S PARSLEY

It is a species of a small growth, and unhappily mistaken fometimes for parfley.

ferum, flour albus, and feirthous tubercles. It powerfully promotes the menses, particularly when suddenly restrained by colds, &c. Inveterate itehes have been cured by an internal use of the extract. Cancers have had their virulence much abated by it. It neither heats, nor coole, nor disturbs the animal functions. It promotes perspiration in some, and a copious discharge of urine in others. Though it is not a cure in cancers, yet it is a specific anodyne; when the uterus is affected therewith, relieving more effectually than opium.

It is useful in sphilis according to Mr. John Hunter. Dr. Cullen observes that when hembeck, either in form of powder or extract, has no sensible effect, when taken to twenty grains for a dose, the medicine may be supposed to be imperfect, and that, if it is to be continued, another parcel of it should be employed. He says also, that the petals. Tips simple. Pointal; seed-vessible into the parcel of it should be employed. He says also, that the petals. The summits roundish. Seed-vessible into the parcel of it should be employed. He says also, that the petals of the summits roundish. Seed-vessible into the petals of the summits roundish. Seed-vessible into the parcel of it should be employed. He says also, that powder or extract, has no fensible effect, when taken to twenty grains for a dofe, the medicine may be supposed to be imperfect, and that, if it is to be continued, another parcel of it should be employed. He says also, that he has known it useful in resolving and discussing scirring the has known it useful in resolving and discussing scirring the says also, that he has known it useful in resolving and discussing scirring the says also, that he has known it useful in resolving and discussing scirring the says and ferophulous nature: also in healing users which had some upon scirrhous tumors, and which continued to be with rundlets opposite the leaves. Leaf-stalks with blunt and some upon scirrhous tumors, and which continued to be 30

borders; leaves with about feven pair of little leaves, WALL-LOUSE, or BUG. It is of a rhomboidal figure, a flowers in July.

It is one of the most active of the vegetable poisons. Early in the fpring, when it grows in the water, cows often eat it, and are killed by it; but as the fummer ad-vances, and its fmell becomes stronger, they carefully

avoid it.

Mr. Wilmer observes, that the poison is of that class which produces epileptic fymptoms. Wepfer notices fome children, who, on taking fome of the roots of this plant, were feized with pains of the praccordia, lofs of speech, abolition of the fenses, and terrible convulsions; the jaws were locked, blood ftarted from the ears, the eyes were difforted, and fome of these children died in half an hour. Others have observed that the old roots are more active and fudden poifon than arfenic, or than corrofive fublimate.

If any of this plant is taken, a quick vomit should be instantly given, after which give vinegar in water, to be drank now and then. See VENENUM.

See Lewis's Mat. Med. Lond. Med. Obf. and Inq-vol. iii. p. 229, &c. 400, &c. vol. iv. p. 104, &c. Neu-mann's Chemical Works. Medical Mufæum, vol. iii. p. 566. Withering's Botanic Arrangement, vol. i. p. 177. CICUTA SESELI PELOPONENSE, sefeli Peloponense, ci-

cutaria latifolia feetida vel feetidiffima. GREAT BROAD-LEAVED BASTARD HEMLOCK. The root is large and thick, the stalks are thick, hollow, and jointed; the leaves are like the green bemlsek, but thicker; the seeds are long, thick, gibbous, and shaped somewhat like a half-moon, and are much channelled.

— VIROSA. See CICUTA AQUATICA.
CICUTARIA. WILD CICELY, or COW-WEED. See
CHÆROPHYLLUM, SYLVESTRE, &c. The name alfo of BASTATD and WATER HEMLOCKS.

Likewise several species of MYRRHIS.

CIDRA. CYDER.
CIGNUS. A measure fo called, containing about two

CHIA. The extreme parts, or edges of the eye-lids; they are femi-circular, and cartilaginous, with hairs fixed in them, which by fome are called cilia. See TARSUS. CHIARES GLANDULÆ. CHIARY GLANDS. On the inner edge of each eye-lid, in the tarfus, is a row of

fmall holes, which are the excretory ducts of what are called the ciliary, or glandulæ Meibomii, Meimbomius's glands; these glands appear of a whitish colour, and are situated on the internal surface of the tarfus; their ducts are short, refembling white lines running down towards the edge of the eye-lids. Thefe glands, like the miliary ones, fecern an uncluous matter, which prevents the attrition of the eye-lids from their frequent motion to keep the edges foft and free from excoriation, and to prevent the tears from falling down the cheeks. See TARSUS.

CILIARE LIGAMENTUM, also called proceffus ciliaris. It is a range of black fibres, circularly disposed, having their rife in the inner part of the choroides, and terminating in the prominent part of the cryftalline, which they furround, or rather the felerotica joins the choroides, and round the edge of the cornea, they adhere firmly; at this circle the choroides feems to change its colour and texture, appearing as a whitish kind of ring; this ring is termed ligam. ciliare: here the internal lamina of the choroides dipsinwards, to make what are termed the pro-ceffes, which are little folds of the inner lamella of the choroides. These folds become broader until they terminate in a broad point in the chrystalline humour; the whole radiated ring, made by the ciliary processes, is sometimes called corona ciliaris.

CILIARIS MUSCULUS. That part of the mufc. orbicularis palpebrarum, which lies nearest the cilia miftaken by Riolanus, who gave it this name for a diftinct

CILIUM. See CILIA.

CILLO. One who is affected with a perpetual trembling of the upper eye-lid, from cillendo, a being in continual motion.

CILLOSIS. A trembling of the upper eye-lid. CILO. One whose forchead is prominent, and tempers compressed, called BEETLE-BROWED.

CIMEX. Cimex domesticus, cimex lectularius. The

which are variously divided and indented. Petals yellow- dark brown colour, and hath fix legs. The skin is is pale green. It is met with in shallow waters, and extremely tender, so that it bursts with the least compresfrom, and emits an offensive smell. Six or seven are given inwardly to cure the ague, just before the fit comes on.

CIMOLIA ALBA, TERRA; called also Greta fullmica, terra candida, terra fullonica, argilla candida, argilla alba, Greta cimolia. TOBACCO-PIPE-CLAY.

It obtained the name Cimolia from the island Cimolus, now called Argentiere. It hath nearly the fame quality with the boles, and is often substituted for them. Its foft viscous quality is its only medicinal one, and in this particular it excels most of the earths of its kind.

The Cimolia alba of the ancients feems to have been a fort of loose marle; probably it was our fuller's earth. In Cornwal there is a fort of clay called fleatites, which is used as soap, as well as the Cimolia alba of the ancients. This fort, which is called steatites, is marked with a seal, and called terra figiliata alba, and fome call it terra Samia: but it is only a fatter pipe-clay.

——Purpurescens, Terra; called alfo fmetlis, terra

faponaria Anglica, terra fullonica, and FULLER'S EARTH, It has its name smectica, from σμηχω, to absterge.

It is a kind of marle rather than a compact earth, and of

the fame qualities as bole. Edwards, in his Fosfilogy, ranks it as a species of bole.

CINA CINA. The PERUVIAN-BARK. See CORT.

CINARA. The ARTICHOKE. Also called feelymus, artischocus lavis, costus nigra, carduus sativus non spinosus, cinara hortentis, carduus sativus, seelymus sativus, cinara maxima alba, carduus domesticus capite majore, carduus altisis. The species used in medicine is the cynara solymus soliis subspinosis pinnatis indivisisque, calycinis squamis ovatis. Var. v. Linn.

Bourhaum mentione six species

Boerhaave mentions fix species.

Artichokes are fufficiently known not to require a de-feription; they are natives of the fouthern parts of Europe,

perennial, and cultivated in our kitchen gardens.

The bottoms of the heads, and the fleshy parts of the fcales, are easily digested, though flatulent, and afford but little nourishment. The leaves are bitter, and give out their bitterness along with the juice; on being bruised and pressed. This juice is powerfully diuretic and useful in dropsies; it should be mixed with an equal quantity of white wine, and taken to the quantity of three or four tawhite wine, and taken to the quantity of three or four table fpoonfuls every night and morning. In England we only eat the heads, but the Germans

and French cat the young stalks after boiling them.

Cinara spinosa, called also carduus esculentus vel spinossissimus elatior, chardone, cactos. The CHARDON.

As a medicine it is similar to the artichoke. It is a culinary plant, which is blanched like celery, and, like that extensive with appear and sale in Italy.

that, eaten raw with pepper and falt in Italy.

Cinara fylvestris, also called scolymus fylvestris, wild

ARTICHOKE, or CARDONET. They grow in Italy and

France, but the flowers are only used. See Dale, Ray.

CINARA ACAULIS GUMIFERA. See CARDUUS PINEA. CINAROIDES. A fhrub which grows near the Cape of Good Hope, also called lipidocarpodendron. CINCHONA. PERUVIAN-BARK. See CORT. PERU-

CINCLESIS, in Vogel's Nofology, fignifies a morbid nictitation, or an involuntary winking.

CINCLISIS, or CINCLISMOS, from xxyxxi (u, to fhake. Hippocrates means by it a small and repeated motion. CINERARIA. A species of RAGWORT. CINERARIUM. The ash-hole of a surnace.

CINERES RUSSICI. See CLAVELLATI CINERES.

CINERITIUM. A CUPEL. See CUPELLA. CINERULAM. See SPODIUM.

CINETUS. The DIAPHRAGM.

CINGULARIA CLUBMOS. See Lycopodium. CINGULUM. A GIRDLE or BELT. Dr. Cheyne, in his Effay on Regimen of Diet, &c. fays, "Cincture, with a broad quilted-belt about the loins, to keep the bow-

els in their natural fituations, and the chylous veffels in their best locality, and in flabby constitutions, weak bow-els, and atrophies, is of great benefit."

—MERCURIALE. A MERCURIAL GIRDLE, called also cingulum sapientia & cingulum stultitia. It was an invention of Rulandus's; different directions are given for making it, but the following is one of the neatest.

STULTITIE, See CINGULUM MERCURIALE.

CINABARINUM BALSAMUM. The simple balfam of sulphur is a proper substitute, and a better medicine, as

a pectoral particularly.

CINNABARIS. CINNABAR. Also called cinnab. nativ. purum minium, minium Gracorum, magnes epilepfia. Native cinnabar, a ponderous, red, fulphureous ore of

quickfilver. It is found in Spain, Hungary, East Indies, &c. The finest is brought from the East Indies. Mr. Edwards, in his Elements of Fosfilogy, places it as a species of quick-filver stone, in the order of cryptometalline ftones. See CRYPTOMETALLINE.

Sometimes it is brought to us in large irregular maffes, at others it is in fmaller roundish ones, fmooth without, and ffriated within; and of a deep red colour throughout.

This ore confifts of fulphur and quickfilver, in the proportion of from four to feven parts quickfilver to one of fulphur; the finer the colour, the more quickfilver it contains: with these constituents there is generally much earthy matter, from which it is easily sublimed. If this earth be of the calcareous kind, iron-filings, or fuch fubftances as abforb quickfilver more than fulphur does, may be added; fome of the sulphur will be detained by them.

One part lime, &c. one part iron-filings, is usually sufficient for extricating all the quickfilver from four parts of cinnabar; or the sulphur is easily separated by boiling the cinnabar in a lixivium of wood-ashes, or rather of decrepitated nitre, and then precipitating it with vinegar.

The heterogeneousness of the native cinnabar renders it lefs fit for use than the artificial. See Dict. of Chemistry, Lewis's Mat. Med. Neumann's Chem. Works.

Cinnabar is a name now confined to the native and factitious forts; but formerly it was applied to dragon's blood, to madder-root, to cerufs calcined to rednefs, and to fome

CINNABARIS ANTIMONII. See ANTIMONIUM.

CINNABARIS FACTITIA. Artificial CINNABAR, now called hydrargyrus fulphuratus ruber, RED SULPHUR A-TED QUICKSILVER. It has also had the name of mercur ius cinnabarinus.

Take of purified quickfilver, forty ounces; of pure fulphur, eight ounces. Stir the quickfilver into the fulphur melted; and if the mixture takes fire, it is to be extinguished by covering the veffel. Then let the matter be reduced to powder and sublimed. Ph. Lond. 1788.

The quickfilver in the cinnabars is too much restrained by the fulphur to be efficacious as an internal medicine. Their chief use is for fumigating venereal ulcers; but hydrargyrus cum fulphure may at any time be fubilituted for

If it is adulterated with red lead, it may be discovered by putting a little on a hot iron; for thus the cinnabar is

all evaporated, and the lead remains behind.

This preparation is used by painters under the name of vermillion; and to improve the colour, the less sulphur is used the better; and if a little arfenic be added in the sub-limation, though the preparation is thereby spoiled as a medicine, it is more perfect as a pigment.

An oval carthen jar is the best subliming vessel. The

great art of making this cinnabar is first to manage the fire fo as to continually to keep the matter fubliming, yet not so as force its way through the mouth of the veilel, which is covered with an iron plate. Secondly, to put in but little at a time.

-GRÆCORUM. See SANGUIS DRACONIS.

CINÆ, SEM. See SANTONICUM. CINNAMOMUM, also called cinnamum, canella, canella Zeylanica, laurus Zeylanica, caffia cinnamomea, canella cuurdo, kurudu;-cinnamon. The last fort of which the Arabians diftinguish by the term karfemosyllon; is used to

express the same.
It is the bark of a tree of the bay kind, growing in the island of Ceylon, freed from the outer green or greyish part, and cut into long slices, which curl up in drying

Take three drams of quickfilver; thake it with two into quills or canes, the form in which it is brought to ounces of lemon juice until the globules disappear; then departed the juice, and mix with the extinguished quick-filter, half the white of an egg; gum-dragon finely powdered, a feruple; and fpread the whole on a belt of flannel.

Cingulum Sancti Johannis. Mugwort.

Cingulum Sancti Johannis. Mugwort.

It is often mixed with the cassia bark, which is thus distinguished; the cassia hath a close smooth surface, which it shews on being broken, and, when chewed, it is flimy; it is also of a dark brown colour, whereas the cinnamon is rougher to the fight and taste, having an astringency and brittleness in chewing, and is of a paler brown colour.

It is one of the most grateful aromatics, of a fragrant finell, moderately pungent, but not fiery, fweetish to the taste, and somewhat astringent, but not considerable as to be trufted to by itfelf. The fine flavour is faid to refide in the thin pellicle which lines the interior furface of the bark, and which abounds with veficles of effential oil; the rest of the bark, while fresh, being merely aftringent, receiving its flavour from the inner pellicle; accordingly the thinnest pieces are the most cordial, and the thicker most astringent. In using it we should never lose light of its being stimulant and astringent; for even the simple diffilled water, when frequently employed, has proved hurtfully irritating to the fauces.

Infused in boiling water in a closed vessel it gives out the greatest part of its virtue. The watery decoction, after distillation, yields, on being inspissated, a mild aftringent mass, but without the flavour of the cinnamon.

Rectified and proof spirits extract its virtues better than water, and that without heat; but in diffillation they carry over very little of the flavour.

An extract made with rectified fpirit of wine has all the virtue of the spice: cinnamon affords about 1-16th of its weight of extract.

The London College directs the following waters.

Aqua Cinnamomi. CINNAMON WATER.

Take of cinnamon, one pound; of water, as much as is fufficient to prevent burning; macerate for twenty-four hours, and diffil off a gallon. As the oil of cinnamon is very heavy, in time it falls to the bottom; and as this water loses its milky appearance, it loses its aromatic and cordial quality; to prevent which, some let it run upon sugar, which keeps the oil divided and suspended.

Aqua Cinnamomi Spirituofa. Spirituous CINNAMON WATER. Now called Spiritus Cinnamomi. Spirit of CINNAMON.

Take of cinnamon, a pound; of proof, spirit a gallon; of water as much as is sufficient to prevent burning. Distil a gallon. In distilling with proof spirit the spirit which arises first is almost slavourles; the warer which arifes after, bringing the oil with it, and this oil being dif-folved by the fpirit, is the reason why it is so limpid. As the oil of cinnamon is the heaviest of almost any vegetable oil, therefore, when cinnamon water is distilled, use a low flattift ftill, and a quick equal fire. As very little of the oil rifes with the fpirit, the best method is first to distil the cinnamon with water only, and then to add a proper quantity of rectified spirit of wine.

The aromatic principle in cinnamon refides in the ef-fential oil, which arifes when diffilled with water, flow and difficultly, rendering the liquor rather milky. When and difficultly, rendering the liquor rather milky. When a large quantity is diffilled at once, a small portion of the oil is found funk to the bottom of the receiver. To obtain this oil more eafily and plentifully, let the water, after it is diftilled, ftand in a cold place. A pound of good cinnamon affords a dram or a dram and a half of this oil, which, if exposed to the air, loses its virtue without any fensible loss of its weight; so that it is not the oil that is efficacious, but the spirit in the oil. The oil of cassia bark is substituted for the oil of cinnamon; however, as they are the fame in their medicinal virtues, no objections can be reasonably made. The ol. canel, alb. is also mixed with the ol. cinnam. fo is the ol. caryoph.

Oil of cinnamon is one of the most immediate and most

powerful cordials; a drop or two may be given in a draught mixed up with a little fugar or mucilage of gum

arabic.

Cinnamon, when fresh, affords much more oil than what is above mentioned; but the Dutch extract great part of it before they fell it, fo that the best method is to buy it of them. In proportion as the oil is separated, the cinnamon lofes its pungency. It is faid that the Dutch obtain above an ounce of eliential oil from every pound. If this oil is genuine, and you dip a pen-knife point into it, it will not flame at a candle, but fmoak; if it foon flames, it contains rectified spirit of wine.

From the fruit of the cinnamon-tree a white sebaccous matter, refembling the ol. n. m. per express. is obtained by coction or by expression. It is white, and is called

tera cinnamomit

The London College directs the following tinctures.

## Tinclure of CINNAMON.

Take of cinnamon, an ounce and a half; of proof spirit, a pint. Digest without heat, for ten days, and strain. It contains all the cordial and restringent qualities of the cinnamon itself: if it is continued for some time daily, it

warms and strengthens the stomach.

Casp. Neumann, in his Prelect. Chem. says, that a pound of cinnamon contains near three-fourths of its quantity of an indiffoluble earth, two ounces of a refinous fubitance, an ounce and a half of gummy fubitance, and about two fcruples and a half of effential oil. See Neumann's Chem. Works, Lewis's Mat. Med. and Cullen's Mat. Med.

Tinetura Cinnamomi Composita. Compound Tincture of Cinnamon. Formerly the Tinetura Aromatica. AROMATIC TINCTURE.

Take of cinnamon bruifed, fix drams; leffer cardamom feeds freed from their hufks, three drams; long pepper and ginger, reduced to powder, of each two drams; proof spirit, two pints: digest for eight days and strain. Ph. Lond. 1788.

CINNAM ALBUM. See CANELLA ALBA. CRASSIORE CORT. VULG. i. c. MALABA-THRUM.

MAGELLANNICUM, VEL COTTEXMA GELLANI-NICUS. See CORT. WINTERANUS.

---- MALAB. See FOLIUM & CANEL. ALB.

CINNERES RUSSIC. POT-ASH. See CLAVEL-

CINNIOGLOTTUS CINNATUS. Paracelfus coined these words to express the total destruction and cor-ruption of mineral bodies.

CINNUM, or CINNUS. The fame as CYCEON, which

CINZILLA. So Paracelfus calls the diforder which

others call ZONA.

CION, stay. A name which Aretæns gives the uvula. Also the name of a disease, which is a swelling or relaxation of the uvula, see HIMAS. Hippocrates gives this name to a carunculous excrefeence in the pudendum mulicbre.

CIONIA. In Discorides it is the middle part of a whelk or purple fish, near the centre of the strize, which being calcined, is more caustic than the other

CIONIS. A painful thickness of the uvula.

CIPOREMA. A species of GARLIC growing in Brasil, without leaves. Rail. Ind.

CIRCÆA, from Circe, the famous inchantrefs. EN-CHANTER'S NIGHTSHADE. Called also Dipcas. Its leaves resemble those of the garden nightshade: the flowers are small and black; the seeds are like those of the millet; they are inclosed in a fort of corniculated capfule; the roots are three or four spans long, white, scented and heating. It grows on rocky ground, where it is exposed to the fun.

Boerhaave fays that there are two species, viz. Circaa Lutetiana, ocymastrum verrucarium, or EN-CHANTER'S NIGHTSHADE.

Circaa minima, the fmallest enchanter's nightshade. The virtues of the first species resemble the garden

nightflade.
CIRCOCELE. A CIRCOCELE, from siposs, varis, and unda a tumour. See Cirsocele.

CIRCULATIO. CIRCULATION. For what is understood by it in chemistry, see CIRCULATORIUM and Di-

In anatomy it is the circulation of any fluid through the veffels destined for its conveyance. But properly circulation is only applied to the blood, because it moves from the heart to return to it again; but the other fluids do not return to where they first were separated.

Dr. Hunter says there are only three men who have any claim to the discovery of the circulation, viz. Serve-

tus, Sefalpinus, and Harvey.

Servetus discovered the blood going from the right ventricle, by the pulmonary artery, to the lungs, where it was mixt with the infpiratory air, and returned by the veins to the left auricle, and so into the aorta. He traced the circulation through the lungs; but like the old anatomists, he attributed the functions of the arteries to the

Sefalpinus fays that the blood cannot be returned to the heart by the arteries of the valves, but by the veins, where the passage is open; but his ideas were confused and neg-lected. He observes that the arteries and veins come from the heart. He improves greatly upon Columbus, who, in 1559, described the circulation through the heart and lungs. Thus improving on Servetus, he shews the use of the valves; but still abides in the track of the old anatomists. He does not carry the circulation from the aorta to the vena cava; but he fays the blood cannot return by the arteries, and that it passes through the veins. He imagines that the blood is in the arteries whilst we are awake, and being received into the veins by their anafto-mofing with the arteries, is returned to the heart whilft we are afleep. Here is the circulation completed fo far as that one could not well read it without being ftruck with the notion, and almost convinced of the truth of it. But his account is so jumbled with the notions of the ancients, and in other parts of his works he speaks so contrary to this, that one would really imagine he did not thoroughly understand what he advanced there.

Harvey led to the discovery in full, by a Treatise on the Valves of the Veins, in the beginning of the seventeenth century. See ARTERIA. When he first published his History of the Circulation, the novelty and merit drew upon him the envy of the most learned men in Europe, who accordingly appealed him, but always a second polynomials. who accordingly opposed him; but afterwards, incapa-ble of arguing against truth, they strove to rob him of the discovery, alledging that it was known to Hippocrates; but this will not bear a controversy.

However with regard to the circulation it is thus clearly described. The blood is conveyed from the left ventricle

of the heart by the aorta and its branches to the minutest and most remote parts of the body, and then passing from the extremities of the smallest arteries into the incipient veins, circulates through them into their larger branches, and so on into the right auricle of the heart, thence into the right ventricle, from whence it is forced (with the fresh supplies that it receives from the chyle in passing through the fubclavian vein) into the pulmonary artery, and after circulating through, and being acted upon by the lungs in its paffage through them, is returned by the pulmonary vein into the left auricle, and thence into the left ventricle, and fo on the fame round, until death con-

cludes the progrefs.

Dr. Shebbeare observes, in his Theory and Practice of Physic, that during the dilatation of the heart, when the rhyne, that during the chiatation of the heart, when the blood enters the ventricles, the coronary arteries receive that fluid, contrary to all the other arteries of the body, and thus supply the body of the heart with the blood; and perhaps this blood is partly the cause of the vital heat be-ing attracted stronger into the heart by the nerves at that time than at any other; though there is another reason for its paffing at this time rather than at any other, viz. the passage of the blood is freer through the arteries during the heart's inflation than at the contraction, because those veffels then approach nearer the direction of a ftraight line. That the heart is not the one and fole cause of circulation appears because the arteries all perform their diastole at the same instant, in healthy people. If the heart's propelling the blood was the cause of the circulation, the pulsation of the artery would be an undulation, and in different parts it would be perceived at different times, as

heart would be in fuccession.

That some other power than the velocity of the blood dilates the capillary arteries to give passage to the globules, feems evident also from the experiments of Dr. Hales, he poured water into the aorta and other arteries of dogs; and though water is fo much a more limpid fluid than blood, and its force and velocity equal to that given to the blood by the heart, yet it never paffed by the anafto-mofes of the arteries and veins, but through the fides of the arteries; and this seems to prove that the arteries are totally stopped by the contraction of their fibres, after the vital fire no longer continues to act, and that the force of the heart hath not a power equal to what is required to dilate them. Befides, it should be remembered that fire acts momentaneously in all the distances in which it hitherto hath been tried.

The eaufe of the great velocity of the blood's motion is distributed to the whole arterial tube, and the heart, instead of moving a weight equal to more than that of the blood, in this way, impels no more than about two ounces, the quantity supposed to be contained by the ventricle in each diaftole. See Animalis Motus, also Haller's Physiclogy, lect. iv. Berdoe on the Nature and Circulation of the Blood may be confulted.

The circulation of the blood in a foctus hath fome pe-culiarities different from what is observed in adults. 1st, The blood does not all pais through the lungs; a very fmall part only each time that it returns to the heart. adly, The blood brought by the two years cave into the right auricle of the heart, passes chiefly into the right ventricle, but not entirely; for fome portion goes immedi-through the foramen ovale into the left auricle, and especially that brought up by the cava inferior. Suppose then two thirds of the blood got into the right ventricle, in order to pass along the pulmonary artery, yet all the blood that flows into it in the fœtus will not circulate through the lungs, for a considerable part must necessarily the darker arterios a directly to the arterios and the control of the contro pass by the ductus arteriosus, directly to the aorta, before it hath arrived at the lungs, so that probably not above one third of the blood circulates through the lungs every time it is brought back to the heart. That blood which time it is brought back to the heart. That blood which was thrown out directly from the right to the left auricle, goes thence to the left ventricle, and so on to the aorta, without touching at either the right ventricle or pulmonary artery, and consequently not coming to the lungs. After the child is born, and a little grown up, the foramen ovale becomes closed up in most subjects, though in some instances it is found to continue more or less open during the whole life of the person.
CIRCULATORES. MOUNTEBANKS. See AGYRTÆ.

CIRCULATORIUM. A CIRCULATORY GLASS. It is a veffel in which the contained liquor when put over the fire, performs certain gyrations, and circulates by afcend-ing and defcending in such a manner that the more volatile parts of the liquor raifed by the fire, not finding a paffage, may always fall back again. Thus chemical circulation is only a species of digestion. Repeated distillation answers the end of circulation. See DIGESTIO.

CIRCULATUM. According to Boerhaave the circulation of the circulation of the circulation.

latum of Paracellus was a liquor prepared from sea-salt. Paracellus obtained from this salt a perpetual oil, which he called circulatum minus, circulatus sal minor, ens primum salium, oleum salis, siquor salis, aqua salis. He had also a circulatum majus, which he called also materia mercurii salis, and ignis vivens. Different writers affert variously concerning these circulatums; and those whose curiofity leads to an enquiry into the process for obtaining them, may see Barchusen in his Pyrosophia-Maets, and the Col-lectanea Chim. Leydens. and Blancard's Lexicon Reno-

CIRCULATUS SAL MINOR. See CIRCULATUM. CIRCULI IGNEI. See ECLAMPSIS.

CIRCULUS. A CIRCLE. Besides its proper signifi-cation it is applied to parts of the body; as by Hippo-crates to the balls of the cheeks, the orbs of the eyes, or the cavities which furround the eyes, &c. Circulus is also the name of an iron instrument used by the chemists

the impress at different distances of the artery from the of cold air, or a few drops of water, divides it if applied heart would be in succession:

The eirculus is reckoned among furgical instruments, figures of which may be feen in Scultetus's Armamenta-rium Chirurgicum, tab. xxii. fig. 6, 7. tab. xliii. fig. 5. CIRCULUS QUADRUPLEX. See CIRCUS QUADRUPLEX.

arteries of the external lantina are fent feveral ramifications to the circumference of the iris, where they produce a vafeular circle, called circulus arteriofus. From this vafeular circle pass off many smaller vessels, which form themselves into arches, and from these arches still finer veffels are fent, which probably fecrete the aqueous

CIRCUMCALUALIS. See Conjunctiva Tunica. CIRCUMCISIO. CIRCUMCISION. Albucafis defcribes feveral methods of performing this operation; but the best is to stretch the prepuce over the glans and make a ligature about it, then with a razor cut off all that extends farther.

about it, then with a razor cut off all that extends farther. In warm countries this operation feems to be convenient in point of cleanlinefs; for the glandulæ odoriferæ lying under the prepuce, corrupt and become acrid, corrode the glans, inflame both it and the prepuce; and thus fornetimes health as well as neatnefs may require it.

CIRCUMFLEXUS PALATI, called alfo mufculæs tubæ novus; fpbeno-falpingo flaphylinus; flaphylinus txternus, tenfor palati. It rifes from the fpinous process of the fphenoid bone, behind the foramen ovale, which transmits the third branch of the fifth pair of nerves, from the Eustachian tube, not far from its offeous nerves, from the Euftachian tube, not far from its offeous part; it then runs down along the pterygoides internus, paffes over the hook of the internal plate of the pterygoid procefs by a round tendon, which foon fpreads into a broad membrane. It is inferted into the velum pendulum palati, and the femilunar edge of the os palati and extends as far as the future which joins the two boness. Generally some of its posterior fibres join with the conflrictor pharyngis superior, and palate-pharyngæus. Its use is to stretch the velum, to draw it downwards, and to a side towards the hook. It has little effect upon the tube being chiefly connected to its offeous part. Inness CIRCUMFORANEI. See AGYRTÆ. CIRCUMGYRATIO. CIRCUMGYRATION. A turns-

ing of the limb round about in its focket.

CIRCUMLITIO, in general, is any medicine applied by way of unction, or as a litus; but in a particular man-ner it is appropriated to ophthalmic medicines, with which the eye-lids are anointed.

CIRCUMOSSALLIS. A name of the tunica conjunctiva oculi. See Adnata. Le Dran fo calls the peri-

CIRCUMSTANTIÆ. CIRCUMSTANCES. In medicine they are whatever are not effentially necessary connected with the principal indicant. Of this kind, in what are commonly called res naturales, are the condition of the patient and the part affected; the strength age, sex, cuf-tom, and way of life. In the preternaturals, are the times of diseases, paroxysm, number, and symptoms. In the non-naturals, are the air and soil. These regulate the conduct of a physician.

CIRCUS, vel CIRCULUS. QUADRUPLEX. The four-fold circle. It is a kind of bandage, called also plintbins

Sec Galen de Fafciis.

CIRRI. The little fibres on the roots of plants are thus called. Also the same with ceraes, which see. In Pliny they fignify the four leffer claws of the polypous

CIRSIUM. A kind of THISTLE, of which Boerhaave enumerates nine species. Their leaves are covered with fhort foft prickles.

CIRSIUM ARVENSE. COMMON WAY-THISTLE. See CARDUUS HÆMORRHOIDALIS.

CIRSOCELE, from signey, a varix, and xnho, a tumor. It is also called varicocele, circocele, ramix varicosus, and bernia varicofa.

This diforder confifts of a varicous state of the spermatie veffels. Any large tumor in the abdomen, or exterfor cutting off a neck of glass vessels, as retorts &c. the nal force pressing the veins, or a large tumor of the the circulus is heated, then pressed close to the glass forcum stretching the vessels, or impeding the return of where it is to be divided, and when the glass is hot a blast the blood, may occasion the veins of the scrotum, or the 3 R

equal knots, and the tefticles hang lower than in their natural state. But mostly this disorder depends on a relaxed flate of the veins themselves.

Sometimes young men of a falacious turn, abounding with feminal matter, are subject to this diforder, mostly in the ferotum. However, when neither pain nor other troublesome symptoms attend, no regard need be paid to the case, except it be to apply to matrimony for the cure. As this diforder is symptomatical, to remove the circumstances on which it depends, will be its cure. It fometimes depends on the preffure of an hernial trufs upon the spermatic process; and then an alteration in the bandage, will probably answer the purpose. If tumors of a fcirrhous kind are the cause, and they are so fituated as to admit of extirpation, let them be removed. However, when the veins have been long diffended, fo that their coats are become very weak, incifions may be made lengthways into them, after which drefling as in a common wound, a cicatrix will be formed, and the return of the complaint prevented. Before incisions are made in the veins, it will be proper to try a fuspenfory bandage, the cold bath, the application of a folution of alum, or other aftringents. Before opening the knot in these veins it will be proper to try evacuants, lying in an horizontal posture, by which the course of the returning blood is facilitated; the scrotum and its contents should be supported by a proper bandage, and strengthening embrocations may be applied to the part affected. See Heister's Surgery, Bell's System of Surgery, vol. i. p. 493. Pott's Works, 4to. White's Surgery, 334-CIRSOIDES. It is an epithet in Rusus Ephesius for the upper part of the brain. He also applies this name to

two of the four feminal veffels.

CIRSOS, upo. A varix.
CISSA. A deprayed appetite. See MALACIA.
CISSAMPELOS. An epithet in Galen and P. Ægineta, for the helxine. See Convolvulus Minor.

CISSAMPELO RAMOSO DI CANDIA, i.e. Con-

volvulus in canus foliis Pilofellæ. CISSAMPELOS PAREIRA. See PAREIRA BRAVAL CISSANTHEMOS. A name in Dioscorides for one

of the two species of cyclamen.
CISSARUS. See CISTUS.
CISSINUM. The name of a plaster mentioned by P, Ægineta.

CIST, or RIST. A measure of wine containing about

four pints.

CISTERNA. A CISTERN. A name of the fourth wentricle of the brain, and of the concourse of the lacteal veffels in the breafts of women who give fuck.

It is likewife a name of a species of chamæcistus, called DWARF CISTUS.

- HUMILIS. A name of the Parnassia, which see.

LADANIFERA. See LADANUM.

CITHARUS. According to Hefychius it fignifies the

eaft, the fide, and a species of fish.

CIFRA INDIS LIGNUM. A fort of reddish sweetfcented wood, of an aromatic tafte, growing in the East Indies. Raii Hift.

CITRAGO. BAUM. Also a name for the Mol-CITRARIA. davica betonica flore albo. See ME-LISSA

CITREUM, called also citron, malum citrcum, malus medica, malus citria, citrcum vulgare, mala Affyria. The

It was first brought from Assyria and Media into Greece, and thence into the fouthern parts of Europe, where it thrives and produces perfect fruit, which is larger and less fucculent than the lemon; but in all other respects the citron and femon trees agree.

As to its medicinal qualities, the chief difference from those of the lemon are, that the citron juice is less acid, the yellow rind is hotter, bitterifh, and its flavour more volatile, even so that it rifes with rectified spirit of wine.

fpermatic veins, to be dilated with blood, in which case | Oils obtained from the fresh peels of the more odorithey are also here and there diversified with large and un- ferous kinds, by rolling the fruit on a plane stuck full of points, are brought from Italy, and used as perfumes; these are more grateful, and less pungent, than such as are drawn by distillation with water. The oil prepared either of these ways is subject to lose its flavour, and become thick and relinous in keeping; when diffilled with rectified spirit of wine, and afterwards separated from the spirit by dilution with water, it retains much longer its odour, fluidity, and limpidness. See Lewis's Mat. Med.

> CITROMELLE. So the French name the liquor which we call BARBADOES WATER. Take the dry yellow rind of citrons to iii. of French brandy to vi. infufe cold for a month, then diftil in B. M. in a retort, with a receiver luted to it. When the strongest part of the spirit is drawn off, add to the remainder the pulps of the citrons; let them macerate five or fix days; then diftil, and add what comes over to the former fitrong spirit; add to this mixture as much fugar and orange-flower water as is needful to render it agreeable.

> CITRINATIO. COMPLETE DIGESTION; and, according to Rulandus and Johnson, it fignifies resurrections

CITRINULA. SPEAR-WORT.

CITRONES. A term of Paracelfus's, which he no

CIFRULLUS, called also anguria, Iace Brafilenfibus, tetranguria; the WATER MELON, or CITRUL. It is the cucurbita citrullus, Linn. It is a kind of gourd. The Greeks call it arraner, from arros, which fignifies any veffel, or receptacle. This name was probably given, because when the pulp was taken out, a vessel may be made of the shell for holding any liquor. The branches run along the ground; the fruit is large, sometimes an big as a man's two fifts, and at others as a man's head; the rind is fmooth, of a green colour, variegated with specks of a paler green, though in this it is not always the same. The pulp is grateful to the taste; the feeds are oblong, broad, rhomboidal, and blackish. The feeds only are used in medicine; they are one of the four greater cold feeds.

CITRUM. The CITRON. The citrus medica, Linn. CITRUS AURANTIUM. See AURANTIA HISPA-

LENSIS.

LIMONUM See LIMONUM.

CITTA. The difease called PICA. An unnatural longing for catables

CIVETA, or CIVETTA. See ZIBETHUM. CLÆR. A chemical term for the bone-flour, which is prepared from the bonesof the fore part of the cranium of a calf, depurated from the fat by boiling, then cal-cined to whiteness, and levigated finely, afterwards moistened with water, and calcined again in an earthen pot closed, and after cooling, reduced again to a subtil powder, which is sprinkled through a sieve upon earthen veffels to prevent their contracting chinks.

CLAKIS. A name for BARNACLES.
CLAMOR. A folicitous exaltation of the voice.
CLANDESTINA. The name of a plant described by Tournefort in his Inft. but to which no medical virtues are afcribed.

CLANGOR, or as the Greeks write Clange, \*\*\a776. It is properly the cry of cranes, geefe, &c. A fhrill noife. Clangofum de voce dicitur, que a gravi tono inchoata in acutum definit. See Ainsworth's Lat. Dich.

CLARETA. The whitz of an EGG.

CLARETUM. CLARET. By this name is generally understood an infusion of aromatic powders in wine, which is afterwards edulcorated with fugar and honey. This fort of liquor is also called vinum Hippocraticum, and by the Germans Hippocras; because when the infusion is sinished, it is strained through Hippocrates's fieve. It is prepared of various ingredients, according to the intentions to be answered.

Extemporaneous clavets are made by pouring into those wines a small quantity of tincture, according to the intention, made with spirit of wine, which some keep under the name of tincture of elares.

CLARIFICATIO. CLARIFICATION. It is to render

any fluid more transparent and free from fæces. See DEPURATIO.

CLARUM. Any thing made of crystal.

CLASIS, A fracture, from xxxw, to break.

CLASPER. See CLAVICULUS.

ChAUDIACON. The name of a collyrium in P.

CLAUDICATIO. Staggering, halting, or limping, as when one leg is shorter than the other.

CLAUSTRUM GUTTURIS. The passage to the throat, which lies immediately under the root of the tongue and tonfils.

- VIRGINITATIS. See HYMEN.

CLAUSURA. An imperforation of any canal or ca-vity in the body. Thus,

- UTERI, is a preternatural imperforation of the

- TUBARUM FALLOPIANARUM. A morbid imperforation of the Fallspian tubes, mentioned by Ruysch as one cause of infecundity:

CLAVARIA ALBA & MILITARIS. Two forts of

fungufes, but of no medical virtue.

ČLAVA RUGOSA: See CALAMUS AROMATICUS.

CLAVATA. The name of a future: CLAVATIO, i. c. Gomphofis.

CLAVELLATI CINERIS, also called alumen catinum, foda, fal alkali fixum, cineres Ruffici, cali, kali, petaffa, gaftrinum, gatrinum. Pot-Ash, and PEARL-Ash.

The ancients called the aftes of burnt wood, lix; the

moderns call them eineres clavellati, from clavæ, or clavi, billets, into which the woods were cleft. The English name pot-ash is from the pots in which the lixivium was boiled.

Pot-after are made in most countries that abound with the hard kind of wood; as Scotland, Ireland, Sweden, Pruffia, Poland, Hungary, Ruffia, and many parts of North America, from which laft the best is brought

It is produced from the ashes of vegetable substances, by diffolying their falt in water, decanting the clear fo-lution from the after which fubfide, and then evapo-

rating the clear liquor to drynefs.

Oak, ash, and other trees that shed their leaves in autumn, are proper, and the fmaller fhrubs, &c. commonly called underwood; but evergreens, as the pine, cyprefs, &c. yield very little falt. Fern, bean-ftraw, and most annual plants, afford a large quantity of falt; dead trees are feldom good, but old hollow trees are the best.

The timber may be cut down at any feafon of the year, but should be burnt as foon as possible. Pieces of eight or ten feet long may be laid in piles, filling the interffices with the chips and smaller wood; then the fire should be kindled at both ends of the pile. As foon as the pile is burnt down, rake fuch after as lie thin on the outfide, a little in towards the middle; add no fresh fuel, nor throw on any of the brands. The aftes must lay without being stirred, till you can bear your hand in them, and no longer; then place them in a fleade on a plank floor; there wet them, until they are brought near to the confiftence of mortar in the first mixture of lime and farid, or so as to flick together, and ram then in a heap, in which they must continue not less than twenty days, but may continue many months. This is called WOOD-ASH.

Kilns are also made for the more advantageous burning

of wood into ashes.

Wood-ashes, put into veffels with false latticed bottoms, covered with clean straw, are to be firmly pressed toge-ther; then cover their surface four or sive inches deep with foft water, and as it fubfides, add more; place a receiver underneath to receive the folution, and continue adding water until the ley is very weak; pass this ley through a fresh parcel of athes, until it is strong enough, which is when it weighs eighteen carats, or more. This ley must be conveyed, as it is wanted, into a pan to be evaporated to dryness, and the produce is called

If the ley of swood ashes, made strong enough to bear an egg, is boiled briskly, until a pellicle appears on the surface, then gently boiled until it thickens, then continued just bubbling until it is very hard; after which taken out in pieces, which must be cut out with a cold this and sweet on the floor of a surrace, the middle chiffel, and spread on the floor of a furnace, the middle door of which is to be kept open, and the flues stopped up so as to make a gentle fire at first, and to keep the falt just covered with the flame: if it is thus continued also called TENDRIL, CLASPER, and CAPREOLUS, which

until it begins to look fair, and incline to look red, then kept red-hot, and turned now and then, until it is of a pearl colour, it is called pearl-ofh. When this pearl-ofh is cold enough to handle, put that which is imperfectly calcined, with fuch as falls into powder, back into a caldron with fresh ley. From contact with some inflam-mable matter it liath sometimes a blue colour, but it

thould be of a pearl colour.

Pot-a/b is faid to be a creature of the fire. In fome parts of Germany it is prepared from the fame wood of which charcoal is made. A number of tubes made of copper, or of iron, are so disposed in the pile of wood intended to be burnt into charcoal, that the water, acid, and oil, which are obtained in ordinary distillations, shall, when separated from the wood by fire, pass through these tubes into buckets placed to receive them. The oil is then to be separated from the acid siquor, which is then to be boiled in copper or iron veffels, and the re-fiduum dried and calcined. By this calcination, the acid falt is alcalized. This method, and the preparation of falt of tartar, by calcining tartar, thews that vegetable alkali is produced by convertion of an acid to an alkali; but the general practice wherever pot-ash is made, is to burn wood, lixiviate the ashes, evaporate the ley, and calcine the produce. Sometimes in calcining, too much heat being admitted, fome part of the pot-ash will be fused, and then it appears of a blue colour, but this circumitance should be guarded against.

Pearl-ofb is entirely soluble in water, and is, in all re-

spects, the same as the fixed ALKALINE SALT. See

Pst-a/h, if good, is equal to pearl-a/h in every confideration, particularly if prepared according to Mr. Stevens's method.

The Russian pot-ofh contains a large portion of quick-

Pot-ash often, though carefully prepared, contains some portion of neutral falt, which is either a vitriolated tartar, or fea falt. It also contains some earth. The earth is separable by dissolving the falt in water. The neutral falt dissolves with dissiculty, and so may easily be separated by folution in cold water, which readily diffolves the alkaline falt, but leaves the neutral unaffected; or the pot-ash may be left to deliquiate in the air, and thus its separation will be perfect, for no part of the neutral salt will be thus dissolved. The sea-salt discovers itself by decripitating, if laid on red hot-iron; and is feparated by diffolving one part of pot-a/b in two parts of water, for in this the fea-falt will not diffolve.

Pet-afb is met with of various colours; but when good, if it is exposed to the air, it first grows clammy, then runs to an oily liquid, which, when dried, leaves an impal-pable powder of a whitish colour. It hath but little fmell, and is of a quick, pungent, urinous tafte; does not crumble in folution, but diffolves gradually; it fer-ments, but does not foam, with acid; and it unites with

As a medicine, the virtue of the alkaline falt of pot-af/h are the fame as those of any other vegetable fixed alkaline

See Neuman's Chem. Works; Dict. of Chemistry; 4to. and fee Mr. Stevens's Plan for making Pot-affs. CLAVI SILIGINIS. Grains of rye that are diseased,

and grow like a horn.

CLAVICULA. In botany. See CLAVICULUS.

CLAVICULE. In anatomy, the CLAVICUES, called also furculus. From clavis, a little key. So the collarbone is called from its likeness to an ancient key.

Each clavicle refembles the Italian letter f. they bend forwards near the sternum, and backwards near the sca-They are more firait in women than in men. They are placed almost horizontally, between the sternum and acromion, and are connected to the sternum by a fort of arthrodia. At their extremities, next the sternum, is a ligament, which runs across to the other elavicle, and it is connected to the first rib likewise by a ligament. These bones, by keeping the scapulæ in their proper situation, ferve for the more free and easy motion of the

fee. They are of various textures; fome of them emit at glue at their terminations, by which they stick as well as cling; others have points, by which they flick into trees, walls, &c. and these points not only serve for holding fast with, but also as roos.

CLAVIS, or CLEIS. In anatomy, the fame as clavicula. In chemistry, it is any menstruum, particularly of minerals, which unlocks them, as it were, and penetrates to their

inner fubstance.

CLAVUS. An instrument in furgery mentioned by Amatus Lufitanus, which was defigned to be introduced into the ulcerated palate, for the better articulation of the voice. Sometimes this word fignifies indurated tubercles

of the womb. Also
A corn. Called likewise callus, condyioma clavus, and tylloma. Dr. Cullen defines it a lamellated hard thickening of the cuticle. He ranks it as a genus of difease in the class locales, and order tumores. The word clavus is used by some to signify the hysteric pain in the head, called clavis, and clavus hystericus.

Corns are a fort of horny excrefeence growing on the feet and toes, and on the hands of labouring people. These callosities resemble an inverted wart, and are seated in the cutis and cuticle, arising chiefly from pressure and attrition, and are excessively painful when rooted near a tendon. The easiest and best way to get rid of them, is to take off all uneasy pressure, and apply a piece of plaster, spread with soap, or plaster of lytharge, little more than the size of the corn, which may be close on the part for four or five days together, to render its furface foft, and that part which appears fodden pared away, but by no means fo low as to touch the quick, after which the plaster is to be renewed, and the whole process may be repeated in five or fix days, till the corn appears likely to turn out at the root, or waste away. Soaking the part in bran and warm water, is very useful previous to each cutting. Hog's gall dried in the bladder, spread thin upon rag and applied to the corn only has often proved efficacious; it is aptto inflame the part a little, but the corn generally withers after a few applications of this kind, and turns out at the root. See White's Surgery, also Bell's Surgery, vol. v. p. 539.

CLAVUS HYSTERICUS. A fymptom attending fome hysteric patients, which is thus described by Sydenham: "Hysterics sometimes attack the external part of the head, between the cranium and the perieranium, occasioning violent pain, which continues fixed in one place, not exceeding the breadth of one's thumb; and it is also accompanied with enormous vomiting." See CEPHALALGIA. Such again attends a venereal caries, or an exitosis of

fome bone of the cranium.

---- OCULORUM, called also flaphyloma. Celfus fays that it is a callous tubercle on the white of the eye, and takes its denomination from its figure. He advises to perforate it with a needle to the bottom of the root,

to cut it out, and then dress it with lenients.

CLEIDION, vel CLIDION. An epithet of a pastil described by Galen and P. Ægineta. It is the name of an epithem, described by Aetius. Sometimes it signifies the same as clavicula.

CLEIDOMASTOIDEUS. See CLINOMASTOIDEUS.

CLEIS. See CLAVIS.

CLEISAGRA, from xxile, the clavicle, and ayea, a pain. The gour in the articulation of the clavicles to the sternum.

CLETTHRON, i. e. CLAUSTRUM.

CLEMA. A twig or tendril of a plant. CLEMATIS. See ATRAGENE. Also a name of a

species of vinca pervinca.

CLEMATIS RECTA. Also called flammula furresta

alba, flamula Jovis, and UPRIGHT LADY BOWER. The fpecies used, see FLAMMULA JOVIS.

The herb with the flower are caustic; the root, seeds, bark, and all, if rubbed with the fingers, then held to the nottrils, ftrike them like lightning with a ftrong fmell. It yields a water as hot as spirit of wine, but it does not feem fafe to administer it internally.

-COERULEA vel PURPUREA REPENS. Clematitis peregrinis coerulea vel rubra. VIRGIN'S BOWER. PEREGRINA FOLIIS PYRI INCISIS. SPA-WISH CLIMBER, OF TRAVELLER'S JOY, with ent leaves.

The reft are diftinguished by their leaves, or the colour of their flowers, or by their flowers being double: Raii Hift.

CLEMATITIS. CLIMBER. A fort of plant fo called, because it climbs up trees with claspers, like those of vines. The root is perennial and fibrous. Boerhaave enumerates twelve species.

CLEONIS COLLYRIUM. The name of a collyrium

described by Celfus.

CLEONIS GLUTEN. Is mentioned by Oribafius, lib. iv. and recommended for reftraining fluxes; it confifts of terra Samia, myrrh, grains of frankincenfe, of each equal parts; the white of egg, a fufficient quantity; fpread on linen cloth, to be applied to the temples, and

CLEPSYDRA, from xxentu, to conceal, and is up, water. Properly an instrument to measure time by the dropping of water through a hole from one veffel to another but it is used toexpress a chemical vessel perforated in the same manner. It is also an instrument mentioned by Paracelfus, contrived to convey fuffumigations to the

CLIBANUS. A little portable oven. CLIDION. See CLEIDION.

CLIMATERICUS ANNUS. From climatter, the round of a ladder. The CLIMACTERIC YEAR. According to some, this is every feventh year; but others reckon only those years that are produced by multiplying seven only those years that are produced by multiplying seven by odd numbers, viz. 3, 5, 7, 9, to be climaterical. These years they say bring with them some remarkable changes with respect to health, life, or fortune. The grand climateric is the fixty-third year; some making two, add to this the eighty-first year. The other remarkable ones are the seventh, twenty-first, forty-ninth, and fifty-fixth. The credit of climateric years depend on Pythagoras's introduction of the doctrine of numbers. CLIMAX, also called scala sacra. A name given by the ancients to some antidotes, the ingredients in which gradually diminished in quantity, e. g. Chameedrys ziji.

gradually diminished in quantity, e. g. Chamædrys 3iij.

centaurii 3ij. hyperici 3j.
CLIMIA. A name for the CADMIA FORNACUM, which fee.

CLIMA EREPS. Rulandus explains it by cadmia

auripigmenti. CLINICUS, from x247x, a bed, also cataclines. CLINICAL. It is applied to patients who keep their beds. Hence a clinical physician is one who attends the sick. CLINOIDES. The four small processes of the os sphe-

noides, which form the cella turcica, from 11805, refem-

blance, and zhre, a bed. CLINO-MASTOIDEUS, vel cleidemasseideus. So Albinus calls one portion of the sterno-mastoideus, which is also a name of the maltoid-muscle. See MASTOIDEUS

CLINOPETES. A person who, on account of great weakness, or any disorder, is obliged to lie in bed, or on

CLINOPODIUM. COMMON MARUM. See MARUM. A species of BAUM. GREAT WILD BASIL. See BASILICUM; and a species of fatureia.

CLISSUS. In Paracelfus, it is a certain virtue, or

occult vicifitude of things, which go and return; thus the flowers of all vegetables grow flaccid in the evening, but revive, and are expanded in the morning, by the virtue of this cliffus. It also fignifies the same as clyffus. CLISTUS. See CLYSSUS.

CLITORIDIS FLOS TERNATENSIBUS. A beau-tiful flower growing in the island of Ternate. The inha-bitants boil and eat it; but it hath no medical virtues attributed to it.

CLITORIDIS MUSCULUS. Innes calls it ereffer clitoridis, and deferibes it as arifing from the crus of the os ischium internally, and in its ascent covers the crus of the clitoris, as far up as the os pubis. It is inferted into the upper part of the crus and body of the clitoris. Its ufe is to draw the clitoris downwards and backwards, and may ferve to make the body of the clitoris more tenfe, by

fqueezing the blood into it from its crus.

CLITORIS, called also a firum Veneris, columella dulcedo Veneris, epideris, bypodermis. It is a part of the external pudenda, fituated at the angle which the nymphre

forms with each other. In the angle between the labia externa, and the upper angle, we observe the prominent extremity of the clitoris, which is covered with a preputium fimilar to that of the penis. It is very vascular and villous; the villi are very nervous, and full of vessels, to occasion a greater irritation in coitu. The clitoris is in many respects analogous to the penis; the two crura cliteridis arise from the ischium, and running along the lower edge of the os pubis and the os ifchium, unite, to form the corpora cavernofa of the clitoris. It is furnished with two erector muscles, whose origin and insertion are the same as in the penis; but though the clitoris has a glans, there is no corpus spongiosum urethræ; its trunk is sustained by a suspensory ligament, fixed in the symphysis of the offa pubis. Like the penis it has an erection, and it is thought to be the principal seat of venereal

The clitoris is of different fizes in different women but in general, it is fmall, and covered with the labia. The preternaturally enlarged clitoris, is what consti-

tutes an hermaphrodite.

When the cliteris is too large, it may be fo extirpated as to remove the unnecessary part; but this requires much care, for a farther extirpation subjects the patient to an involuntary discharge of urine.

CLITORISMUS. A morbid enlargement, or swelling

of the citoris.

CLOACA. A JAKES. In comparative anatomy, it imports the canal in birds, through which the egg defcends from the ovary in its exit. In this it is remarkable, that the part which is next the ovary is jagged like the morfus diaboli, and fluctuates in the abdomen without any attachment of the part which is next the ovary in the abdomen without any attachment. tachment to the ovary; hence anatomists have been puz-zled to comprehend by what means the egg falls into it. CLONICUS. See CLONOS. CLONICI. Diseases from clonic spasm. See Spas-

MUS CLONICUS.

CLONODES. An epithet for a fort of pulse which is vehement and large, at the same time unequal in one and the fame stroke.

CLONOS. Khaper. Any tumultuary, interrupted, or inordinate motion. It is applied to the epileptic and convulfive motions. See Spasmus clonicus.

CLOUS, i. c. AROMATIC CLOVES. See CARYOPH.

CLUNES. The BUTTOCKS. These are the two posterior and lower parts of the abdominal cavity; and are feparated by a foffa, which leads to the anus, and each buttock is terminated downwards by a large fold, which diftinguishes it from the reft of the thigh. They conflit of thin, fat, and muscles, principally those of the glutzei.

CLUNESIA. Inflammation of the anus. See Proc-

TALGIA

CLUPEA. A fish called a SHAD. See ALOSA. CLUS. & CLUS. HIST. An abbreviation of Caro-

lus Clufius rariorum Plantarum Historia.

CLUS. HISP. 'An abbreviation of Carolus Clusius ra riorum aliquot stirpium per Hispanias observatorum His-

CLUS. CUR. POST. An abbreviation of Carolus

Clusiii Curse Posteriores.

CLUTIA. It is a rose-shaped slower consisting of five leaves. Boerhaave mentions but one species, which is the strubby Æthiopian clutia, with a pursane leaf, and a greenish white flower, called frutes Æthiopicus.

CLYDON. A suctuation and slatulency in the sto-

mach and inteffines.

CLYMA. The fæces of filver and gold.

CLYMENOS DIOSCORIDES. A fpecies of scor-

CLYMENUM. A species of VETCH. See ERVUM. CLYMENUM DIOSCORIDIS. CHICHLING, OF EVER-

CLYPEALIS CARTILAGO. The THYROIDE CAR-

CLYPEUS. It is supposed to be an instrument used in the ancient baths, to increase or diminish their heat, by admitting or excluding air.
CLYSSIFORMIS DISTILLATIO. A diffillation of

fuch substances as are subject to take fire, and fulminate

by a tubulated retort.

CLYSSUS. Cliffus vel Cliffus. Among the ancient chemists, this word imported an extract prepared of various fubstances mixed together. Among the moderns, it fignifies a mixture, containing the various productions of one substance united with each other: e.g. when the diftilled water, the fpirit, the oil, the tincture, and the falt of wormwood are so blended, that the mixture is possessed of all the united virtues of the simple, from which these preparations are obtained. Clyffufes were formerly prepared from the vapours of different matters joined with nitre;

ed from the vapours of different matters joined with nitre; feveral inftances of which may be feen in the Dictionary of Chemistry; and as their virtues merit not the trouble of preparing them, the curious are referred thereto.

CLYSSUS ANTIMONII. It is obtained by deflagrating—— MINERALIS. I a mixture of antimony, nitre, and fulphur, in a red-hot retort, fixed to a receiver, in which is some water. But as it is no other than a weak spirit of sulphur, it is not worth the labour of preparing. See Dict. of Chemistry, and Neumann's Chemical Works.

CLYSTER A CLYSTER From Nation (1994)

CLYSTER. A GLYSTER. From XANTH, to wash or cleanse out. Sec ENEMA.

CNAPHOS. See HIPPOPHAS; also carduus fullonum,

and a FULLER's SHOP. CNECUS. See CARTHAMUS; also the feeds of the

CNEMIU. Galen expounds it, fomething belonging

DIGITORUM PEDIS COMMUNIS.

CNEORON. It is the fame as the gneftron, or thy-

CNEORON ALBUM. ROCK-ROSE. It is a species of convolvulus major rectus Creticus argentæus, but not with a fcandent stalk. It grows in Crete, and slowers in June it is of no remarkable virtue.

folia humilior flore purpureo odoratisfima.

CNESIS, Armore, the fame as enimos, and enyma, CNESMOS, from xram, to ferateb. That eager, hurrying feratehing observed in brutes; but is more generally meant of the itching itself.

CNESTON. It is species of thymelæa; a RASP.

which is also called enester, and particularly a rasp for

fcraping cheefe. CNESTRUM.

CNESTRUM. A species of thymelæa.

CNICELÆON, from xxxx, cnicus, and sxxxx, sil.

Oil made of the seeds of cnicus. The virtues are the same as of the ol. ricin. only weaker.

CNICION. A name of the trifolium.
CNICUS. A name of the CARTHAMUS, which, fee. Modern botanists exclude the carthamus from the species of enicus; and they give the following as the characters of the enicus, viz. the heads are furrounded with a crown, formed of a complication of a multitude of leaves. Boerhaave speaks of nine species, among which are the carduus benedictus, the TANGIER PERENNIAL BLUE DISTAFF THISTLE, the cnieus Hispanicus arborescens fœtidissimus, STINKING SPANISH TREE-DISTAFF THISTLE, carduus pinea, or verum chamælcon, or CHANGEABLE THISTLE WITHOUT A STALK, the PINE THISTLE. The people in Apulia gather the gum of this cardnus pinea, and name it erra di cardo. Raii Hist.

The enieus, used as a purge by Hippocrates, is supposed to be the carthamus. See ATRACTYLIS.

—— ALBIS MACULIS NOTATIS. SMALL SPANISH
MILK THISTLE. See CARDUUS LACTEUS SYRIACUS.
——— SYLVESTRIS. See CALIOCHIERNI, and CAR-

DUUS BENEDICTUS.

CNIDE. A name in Diofcorides for the NET-

CNIDELÆON. Oil made of the grana enidia. CNIDIA COCCIS. See THYMELEA.

GRANA. CNIDIAN BERRIES; called Ætolion.

Cocca cnidia. Coccalos. Coccum. Gnidia grana. Some fay these are the fruit of the thymelæa, which see, others of the mezereon, others of the cneoron. Ray fays, the berries of the thymelæa are not the grana enidia, but the

feeds contained in the berry.

CNIDOSIS. An itching and ftimulating fenfation, fuch as is excited by the enide, or nettle. Celfus renders

it prurigo.

ophthalmy.
CNISMOS, i. e. CNESMOS: See CNESTS.

cnissoregmia, from mose, a nidorous fmell, and thrown, an erutlation. A nidorous erutlation cnyma, to ferage, or grate. In Hippoerates it fignifies a rature, punction, or vellication; and

also the same as encomor.

COA. A plant so named by father Plumier in honour of Hippocrates. It is an ever-green of the scandent kind, with a globular bell-shaped flower, consisting of one leaf. It is found in America, particularly about Campeachy. The seeds have been brought to England, and plants raised from them; but they are not remarked for any medical virtue. Miller's Dict.

COAACHIRA INDORUM. See Indicum.

COACUS. An epithet of a treatife of Hippocrates's called Coacæ Prænotiones, from Coos his birth-

COAGULANTIA. In general fuch things as coagu-late fluids; but in medicine it fignifies more particularly fuch remedies or poisons as coagulate the blood and juices

flowing from it.

COAGULATIO. COAGULATION, is when a fluid, or fome part of it, is rendered more or less solid. This is variously effected, and from the different methods, as well

as means, the appellations vary.

Heat and cold are the two principal natural agents for esagulating fluids. When heat is used by art, its effect is called coagulatio per fegregationem, or seperationem. When cold is thus made use of, its effect is called coagulatio per comprehensionem, which is when no part of the fluid is loft, and all its parts are brought into a solid ftate.

Different means congulate different matters ; thus heat Different means cognitate different matters; thus nearcoagulates falts by diffipating their moisture; cold coagulates water by freezing it; water coagulates camphor, if it
is diffolved in spirit of wine; spirit of wine, if pure, coagulates the white of egg and other matters; and motion
coagulates milk into butter.

The coagulatio-continua is produced either by impastation, that is, when powders, &c. are mixed with the
fluid; or by condensation, that is, when coldness is applied to water so as to congeal it.

plied to water fo as to congeal it.

The coagulatio-partis is when one fubstance fo adheres to another, as to form a more folid body; for example,

dry things with moift, oil with water, &c.

The coagulario-totius is preternatural, when beterogeneous matter is united; and natural, when homogeneous

fluids are coagulated by way of generation.

COAGULUM. Curdled concretions, formed by the mixture of two liquors, are thus called; fuch as the curd for cheefe, separated from the serous part of milk, by means of rennet infused in warm water &c. It means also RENNET, or RUNNET; and is the concreted milk found in the stomachs of sucking quadrupeds, which as yet have received no other nourishment than their mother's milk. In ruminating animals, which have feveral ftomachs, it is generally found in the laft, though fome-times in that which is contiguous.

If rennet is dried in the fun, and then close kept, it may

be preserved in perfection for years

Not only the rennet itself, but also the flomach in which it is found, curdles milk, without any previous prepara-tion. But the common method is, to take the inner membrane of a calf's ftomach, to clean it well, to falt, and hang it up in brown paper: when this is used, the falt is washed off, then it is macerated in a little water during the night, and, in the morning, the insusion is poured into the milk to crudle it.

The medicinal qualities of rennet are its aerimony, refol-vent power, and usefulness in surfeits from food of diffi-

ent digeftion.

COALESCENTIA. COALESCENCE. The union, or growing together of two bodies, which before were fepa-

COALTERNÆ FEBRES. Fevers mentioned by Bel-lini, which are most probably imaginary. He describes them as two severs affecting the same patient, and the paroxysm of one approaching as that of the other subsides. COAPOIBA. See CAOPOIRA.

CNIPES. Small worms that infest vines.

CNIPOTES. ITCHING. Some take it to fignify a dry canals more narrow, or contraction of the diameters of of the capacity of the arteries.

COARTICULATIO. See ABARTICULATIO.

COATLIS. See BEN.

COAVA. The infusion of cossee, as it is usually

COAXOCHITL. The American name for the tagetes Indicus minimis flore feriese hirfutie oblito.

COBALTUM, called also cadmia metallicas. COBALT. It is a ponderous hard fossil, or metallic and earthy mineral, or a kind of marcasite. It hath been found in some parts of Asia, is now chiefly dug up in Saxony, and also met with in some parts of England. The best way of diftinguishing it from other mineral matters, is to turn it into glafs, or to melt it therewith, for it gives thereto a fapphire blue colour.

Cobalt is the foundation of zaffer or fmalt; and from it the greatest quantity of arsenic is obtained, that is used all

over Europe.

The cobalt when dug up, is mixed with various other fubftances; it is then broken into fmall pieces, and calflame of the fire may pass over the calcining matter, and keep it ignited: the flame in passing over the cobalt, carries off a copious sume, which is conveyed from the top of the furnace into a large winding wooden chimney, which is some scores of yards long, to the inside of which the sumes adhering in the form of a white soot, is at proper intervals, swept down, and when melted is the white arteries. arfenic.

After the arfenic is thus separated, the cobalt is calcined two or three times; and then being finely ground with two or three times its weight of powdered flint, with which being melted, ZAFFER is produced. The zaffer being powdered and washed, the whitish part that separates from it thereby, is called escaped, and the blue powder is arread blue, each named blane tarbe.

If two parts of calcined cobalt, one part of pot-ash, and three parts of common fand, are melted together, a vitre-ous, opake, bluish mass is formed, which when ground to powder is called fmaltum, SMALT, or encaustum caruleum, or POWDER-BLUE.

Bismuth, small portions of filver, and other matters,

are found in different parcels of cabalt.

On the outfide of the mines where cabalt is found, there is a mineral of the colour of streaked roses, called the flower of cobalt.

The chief use of this mineral is for obtaining arsenic, and the reguline part, which is the blue made use of for colouring glass, china, and other such like manufactures. See Lewis's Mat. Med. Dict. of Chem. 4to. and Neumann's Chem. Works.

COBASTOLI. Ashes.
COBBAN. A finall tree much like the peach-tree. It grows in Sumatra: the fruit quenches thirst, and the ker-

nel affords an oil by expression, which is externally used against pains. Raii Hist.

COBITES. A fresh-water sish of the gudgeon kind.

COBRA DE CAPELLO. A venomous serpent, which is also called ferpens Indicus coronatus, viper indica vittata gesticulatia, vipera pileata. The INDIAN SERPENT. The part in use is a stone taken out of its head, called pedro del cobra, and by mistake piedra di cobra: it is of an oval figure, plain on the outside, and gibbous on the other, of a brown colour, shining, with pores interfeested. It is said to be an antidote to the posson of venomous animals; but neither this quality more to truth. venomous animals; but neither this quality, nor the truth of its being a natural production are afcertained.

COCCINILLA, also called coccinella, ficus India grana, fearabeolus hamisphericus cochinelifer, cochenilla, coccus Americanus, cochinelle, cochenille, cochinilla, coccus

It is an infect, but, as brought to us, appears in little grains, that are wrinkled, of an irregular figure, convex on one fide, and flat or hollow on the other; externally they are of a dark red colour, generally fprinkled with a whitish clammy powder; internally of a deep bright red. It is brought from Mexico and New-Spain; and found adhering to the leaves and branches of the opuntia, called nopal, or nopalnochezeli in New-Spain, or the AMERICAN PRICKLY PEAR-TREE, OF INDIAN FIG. Coccus (calli), calli coccinelliferi, Linn. The natives carefully collect, preferve, and cure them. The male infects have wings, and are about the fize of a flea; the females have no wings, and are larger: when full of young they swell so as to re-femble berries, in which state they are swept off from the leaves and branches of the opunts with a pencil: if lest until the young ones creep out, the parent dies, and its body becomes an empty husk. It is the semale fort that

The greatest consumption of this article is amongst the fearlet dyers, and for making carmine. By different ma-nagement it affords all the thades of red, from the lowest to the highest.

Carmine is a fecula or powder that fettles at the bottom of the water wherein eschineal hath been mixed; with this the drapers rub fearlet cloth where it misses to take the

Aq. regia, impregnated with pewter, improves the Bow fearlet into a flame colour.

Aq. fortis, impregnated with pewter, produces from eschineal a fearlet dye.

Cochineal affords also the finest lake.

Rags dyed in the dregs of the fearlet dye made from eschineal, is called TURNSOLE, which is used to colour wines, &cc.

Cochineal gives a fine durable red to proof and recti-fied spirit, and a deep durable crimson to water, and none of them lose any of their colour by inspissating them to an

This infect hath been commended as diuretic, diaphoretic, and corroborant; but these qualities are not duly afcertained.

Neumann observes, that the watery infusion contains a large portion of mucilage; and Cartheuser says, that the mucilaginous, bitterish, watery extract, amounts to three-fourths of the weight of cochineal. An ounce of cochineal diffilled in an open fire, gave out two feruples and three grains of phlegm; four feruples of an urinous fpirit; fifteen drops of an oily fpirit; twenty-two grains of volatile falt; and five feruples two grains of an empyreumatic oil: the caput mortuum weighed two drams two feruples, and yielded five grains of a fixed lixivial falt. See Neumann's Chem. Works; Dict. of Chem. Lewis's Mat. Med. COCCOBALSAMON. 'The fruit of the true balfam

COCCONES. The grains or acini of the pomegranate.
COCCONILEA. A name for the coccygria.
COCCOS. The cocoa. See Palma coccifera.
or Coccum. In Hippocrates, when without any addition, it fignifies the grana chidia: but coccus

implies any berry or grain.
COCCULI INDI AROMATICI. JAMAICA PEPPER. COCCULUS INDUS, called also cocculæ officinarum, cocci Orientales. Indian Berry. It is a brown fruit, of the fize of a very large pea; it is rough, brittle, and when perfect hath a white kernel. It is brought from Malabar and the East Indies, where it grows in clusters on a large tree called nathatam. It is poisonous; it brings on a nausea, fainting, and convulsion if swallowed. The nexious quality resides in the kernel, and it operates both

COCCEIRA INDICA. The cocoa-nur TREE. See as an emetic and purgative. It is only used, externally, and that very rarely: made into ointment, or infufed in water, it destroys lice more effectually than the staves-acre. Mixt with paste it stupifies fishes so that they will lie on the water and not attempt to escape from the hand that takes them. Condronchius wrote a treatife on these ber-ries: Wepfer takes notice of several experiments made with them in his work De Cicuta Aquatica. See also Raii Hist. and Neumann's Chem. Works.

COCCUM. See CNIDIA GRANA.

COCCUM BAPHICUM, infellorium, tinelorium, cherme-linum vel searletinum. See CHERMES.

COCCUS AMERICANUS. - INDICUS TINCTORIUS: COCCINILLA. See - CACTL

DE MALDIVIA, called also nun Indica, palma coccifera, tavaccare, nux medica, palma Maldivica vel Maldivensis, the Maldivia Nut. It hath a black rind, more shining than the common cocca or Indian nut, and its shape more oval; the pulp when dried is ex-tremely hard, white, porous, and full of clefts on its superficies, and of an unpleafant tafte. It is found in the earth and on the fea-shore about the Maldives; but the leaves or branches of the trees which produced these nuts, were never known. Drinking cups are made of the shells. Raii Hift.

- POLONICUS. - RADICUS TINCTORIUS. } It is faid to be fizes, from a poppy-feed to a pepper-corn, and in greater or leffer numbers adhering to one plant. Breynius de-feribes it as being round, fmooth, and of a purple violet colour; has a thin fkin, inclofing a blood-red juice; one half or more of it is covered with a rough dark-brown cruft, by which it adheres to the roots. It is gathered in funmer and dried in earthern platters. One of these exposed to the sun, by the latter end of July produces a small worm, which worm, after a few days, produces from 50 to 100 or more eggs; these in a month after are hatched, and the young ones fixing to the roots of the plant, and its lowest branches, live by sucking it juice. These berries are used as a colour in dying, for they abound with a purple juice. As a medicine their virtues are the same with the chermes, and for these they are a good fuccedaneum. See Neumann's Chem. Works, and Raii Hift. Plant.

COCCYG/EUS Musc. It rifes from the fpine of the ischium, and is inserted into the side of the os coccygis; this muscle and its fellow form a sling to bring that bone upwards and inwards. It is nothing else but a continuation of the posterior part of the levator ani. It is Winflow's coccygious posterior.

Coccyc aus Anterior, called alfo Ifchio-coccyg quis. This muscle is fixed in the anterior portion of the small transverse ligament, at the upper part of the foramen ovale of the os innominatum; from thence it runs between the great transverse ligament of the pelvis and the musculus obturator internus, and is inserted in the lower part of the os coccygis.

- POSTERSOR. This mufcle is fixed to the inner concave edge of the two first vertebræ of the os facrum, to the inner and lower edge of the ligamentum facro-sciaticum, and to the spine of the os ischium, and is inferted in the infide of the os coccygis, above the coc-

cygeus anterior, it is called also facro coccygeus. COCGYGIS os. Also called cauda; coccyx. It is fituated at the extremity of the os facrum, and is in some measure an appendix thereof; it is bent forward towards the pelvis; the fore fide is flat, the back part rather convex; it is made up of four or five pieces, like false vertebræ, joined together by cartilages, more or less pliable; fometimes all the species are cemented together. The first piece is the largest; it hath two shoulders, betwixt which and the os facrum is a notch, through which a pair of nerves pass. The other pieces are irregular squares, diminishing in squares, as they descend.

Daventer and fome other writers fay, that difficult la-bour are often caufed by these bones being anchylosed; but experience manifests that these gentlemen were impatient, and waited not long enough for nature to do her own business: it is generally found that when the head is confined in the pelvis, and advances but flowly, or not at

along very well.
COCCYS. The COCOA. See PALMA.

COCCYX os. See Coccygis Os, MENNES

COCCHENILLA. COCHENILLA. See COCCINILLA.

COCHIA. A name formerly of fome officinal pills: the etymology of this word is obscure. There were two compositions bearing this name; the pil. esch. majores, which were taken from Rhases, and the pil. coch. minores, which were taken from Galen: the first is now totally excluded from practice; the fecond is now called pil. colocynth. cum aloc. See Colocynthis.
COCHINILLA. Cochineal. See Coccinilla.

COCHINILLIFERA. COCHINEAL PLANT. COCHITSAPOTL. See CAPOTE.

COCHLEA. Called also antrum buccinosum. The ear is by Plutarch, who fays that Empedocles, a feholar of Pythagoras, was acquainted with it and its use, for he faid that founds were formed there. It is a winding cavity, which turns round a nucleus in a spiral manner. It is larger where it begins, and becomes fmaller like a horn, the fecond turn almost within the first, and the third within the fecond, making about two turns and a half. It is divided into a fuperior and inferior cavity, by a parti-tion in the middle, perpendicular to the axis of the spindle of the cochlea: that part of the partition next the axis is bony, which terminates in an edge, where it is membranous; it grows narrower towards the apex. The feala, which is next the bafis, opens into the tympanum by the fenestra rotunda; that towards the apex into the vestibulum by the feneftra ovalis.

That the cochlea is a part of the organ of hearing may be concluded from its spiral lamina, which are hard, dry, flender, and easily broken; all which conditions are required in bodies susceptible of tremulous motions. Again, when the large branch of the portio mollis of the seventh pair of nerves arises at the basis of the cseblea, it is divided into a great number of smaller branches, which paffing through all the finall meatufes with which the spindle is persorated, are distributed to the various windings and meanders of this spiral lamina, where they lose themselves. This lamina is not only calculated for receiving the vibratory motion of the air, but its fructure ought also to be looked upon as a convincing proof that it is qualified and disposed for accommodating itself to the different characters and degrees of these motions; for fince it is broader at the beginning of its first circumvolution than at the extremity of its last, and fince the breadth of its other parts are in like manner proportionably diminished, we may venture to assirm that its broadest parts are only fit for the reception of flow and languid vibrations, which are productive of grave tones, fince they may be put into a commotion without the other parts undergoing any change, and vice verfa, that when its narrower parts are struck, their vibrations are brisk and lively, and confequently produce acute tones. Therefore, according to the various commotions of the spiral lamina, the nerves distributed through its substance receive the various impressions of the air, which exhibit and represent various tones or modulations of found. See Sonus.

COCHLEA CELATA. See ANDROSACE.

FOSSILIS and LAPIDEA. See COCHLITA.

COCHLÆÆ, xexxe, to wind, or wreathe. SNAILS. The facil is an animal lodged in a flort thick turbinated shell, whose aperture is closed in the winter with a kind of cement. The land seails are called operculares: that fort which adheres to briars and tendrils of vines, &c. are iometimes called fefilon and pomaticae.

Before the time of Seranus Samonicus, who flourished

in the third century after Christ, shell-snails were not recommended in phthisical cases. But indeed, abstracted from the shell, snails without shells do not differ from those that have them; it is the different shells that form the

different species.

Snails abound with a vifeid flimy juice, which they readily give out by boiling to milk or water, fo as to render them thick and glutinous. They are a tender fubstance, therefore easily digestible; very nutritious and demulcent. Employed in cases of emaciation and hectic fever, though

all, that by waiting and leaving the work to nature, the as animal food, they cannot be refrigerant according to head is moulded into the shape of the pelvis, and comes the opinion of many, still perhaps they are only slightly ftimulant.

In Holland the fea-fnail, called the periwinkle, is eaten; in France the land-fnail, called the vine shell-fnail, is caten; but the fmall white shell-fnail is the most valued.

Naturalists describe a great variety, but the following only have medical virtues attributed to them, though the large aft-coloured [nail is faid to be that which is in-tended for medicinal ufe; but the fmaller, dark-coloured, spotted, or striped fort, more common in gardens, is taken indiferiminately, and their qualities do not appear to differ.

Earth-worms, or any other jelly, are as good as fnails,

if not better.

If falt is put upon the fnail it foon dies, but it first con-tracts itself so as to force out all its mucus.

Cochlea aquatica. The WATER-SNAIL OF PERIWIN-KLE.

- margaritifera. See Concha Margaritifera. - minor ex luteo & nigro variegata. The PARIS

GARDEN-SNAIL.

- nuda. - olearia, fo called, because its shell makes a good oil crewet.

- purpurifera. The PURPLE-FISH, or murex. - farmatica. A large facil found in the Baltic fea. - terrefiris, also called limax, csebl. vulgaris,

cochlea teftacea. COCHLEARIA, cochlear, eschleare, dsedys, and co-chlearium. A spoon. Perhaps fo called from refembling a shell. The ancients had two kinds of cochlearia; the greater, which contained a dram, and the lesser, which contained a scruple. Various indeed are the accounts of the ancient cschlearia; but in the present London and Edinburgh Dispensatories a cochleare is, of syrup half an ounce in weight, and of distilled waters three drams in weight, by measure half an owner.

weight, by measure half an ounce.

It is also a term for scurvy-grass, a low plant, with thick juicy leaves, somewhat hollowed, so as to resemble a spoon, whence its name; those from the root standing a ipoon, whence its name; those from the root training on long pedicles; those on the stalk joined close to it without pedicles; producing toward the upper parts of the stalks small white tetrapetalous slowers, followed by roundish feed vessels. It is annual, grows wild in several parts of England, particularly about the sea-coasts and salt-marshes, and slowers in May or sooner. In Greenland and some other northern parts it is mild and totally destitute of pungency, and yet as effectual as that which destitute of pungency, and yet as effectual as that which grows with us, when eaten for the same purposes. The cochlearia officinalis is the cochlearia foliis radicalibus subrotundis, caulinis oblongis subfinuatis, Linn. common or GARDEN SCURVY-GRASS. And a variety of this, viz. cochlearia officinalis minor, i. e. cochlearia minor roundo folio nostras, Linn. SMALL-LEAVED SCURVY-GRASS.

- BATAVA, called also cochl. hortensis, vel rotundifolia; ROUND-LEAVED, DUTCH, or GARDEN SCURVY-GRASS. The radical leaves are unevenly roundiffs, and those on the stalks are oblong. It is cultivated in gar-

dens. It does not change its qualities with the foil.

BRITANNICA, called also cochl. marina, cochl. folio finuato. ENGLISH SCURYY-GRASS, OT SEA SCUR-VY-GRASS. It is the cochlearia, Anglica, Linn. All its leaves are alike, oblong, pointed, deeply and irregu-larly indented and finuated.

The fresh leaves of both forts have a disagreeable smell, and a penetrating acrid taste: the first fort is by much the strongest. The leaves are the strongest part of the plant: they are antiseptic, attenuant, and aperient: they promote urine, but neither heat nor irritate so much as their pungency would cause one to suspect. In the scurvy, pally, rheumatic and wandering pains, they are used with advantage.

A small quantity of puttings covers their disagreeable.

A fmall quantity of nutmeg covers their difagreeable

Their active parts are wholly in the expressed juice. Water or spirit alike extracts their whole virtue. The pungent pungent part exhales in drying, and in evaporating the fubjects of this operation, and fuch other materials as

liquors which possess it.

The best preparation, as well as the best method of preserving the herb with all its virtues, is by beating it up with sugar into a conserve, and keeping it in a close

The principal virtue refides in an effential oil, feparable in fmall quantities by distillation in water; this oil finks in water, yet it is very volatile, fubtil, and pene-trating. Reclified spirit of wine carries the oil with it in distillation as easily as water does. A pint of spirit will take with it all the oil from two pounds weight of the leaves.

Spiritus Cochlearize Spirit of SCURVY-GRASS.

Take ten pounds of the leaves of fresh scurvy-gras; of rectified spirit of wine, five pints: macerate the herb twelve hours, and with a water-bath draw off five pints. This is called fimple fpirit, in contradiffinction to what is called golden. The dofe is from twenty to an hundred drops. Horfe-radifh may be mixed, or wholly fubflituted, without any fentible difference in any point of

Spiritus Cochleariæ Aureus. Golden Spirit of Scur-vy-Grass. Succus Cochleariæ compositus. Com-pound juice of scurvy-grass; formerly succus feerbutiei; scorbutic juices.

Take of the juice of garden feuruy-grafs, two pints; of brooklime, and water-creffes, each a pint; of Seville oranges, twenty ounces; mix them, and after the fæces have fubfided, decant off the liquor, and strain. Dose

from two ounces to four, twice a-day.

To a pint of the simple spirit of scurvy-grass add an ounce of gamboge. The dose is from twenty to fixty drops. See Lewis's Mat. Med.

- ALTISSIMO FOLIO. A species of lepidium.
- ARMORACIA. See RAPHANUS RUSTICANUS. COCHLEATA. See MEDICA.

COCHLIA, COCHLIAS. See COCHLEA.
COCHLIAXON. A name for a part in a machine

described by Oribasius.

COCHLIDIUM. The same with x000018. A small shell-final, whose shell Breynius says is of a conical sigure, and regularly spiral form. This author, in his Difference of the conical state of the conical

species of the cochlidium.

COCHLITA. It is also called cochlea fossilis or lapidea. It is a ftone of the shape and figure of a certain shell-snail. It is said to be lithontriptic.

COCHONE. Galen explains this to be the juncture of the ischium, near the feat or breech; whence, fays he, all the adjacent parts about the feat are called by the fame name. Hippocrates often mentions these parts. Hefychius fays that cochone is the part of the spine which is adjacent to the os facrum and breech, and tells us that fome call the parts on both fides the os facrum by this

name, and adds, that the ischia are thus called. COCILIO. A weight of eleven ounces. COCKENILLE. See Coccinilla. COCO. See PALMA COCCIFERA.

COCOLATA. CHOCOLATE.

COCOMICA Signa. A term used by Paracelfus, but his meaning is unknown.

COCOS, i. c. Palma Indica coccigera angulofa. See PALMA COCCIFERA.

COCTIO. BOILING. Also decotio. The effect of boiling differs from that of infusion in some material particulars. In the heat of boiling water the effential oils of vegetables, in which their virtue generally refides, are diffipated; and when the medicine to be obtained is to

confift of the more volatile parts of the ingredients, in-fusion is obviously preferable to decoction.

In decoctions, those ingredients should be boiled first from which their virtues are most difficultly extracted; and those which more readily give them out may be re-ferved until the latter end of the bailing; such volatile ones as hardly bear the heat of boiling water may be added when the decoction is removed from the fire; they may fland closely covered until the liquor is cool enough

Agglutinants, aftringents, and emollients, are the chief

require fome force to feparate their parts.

By decoction the fermentation of fermentable liquors

is destroyed. See Dict. Chem. 4to.

By the coction of humours is meant the digeftion of the aliment into chyle with the first coelion; the reduction of the chyle into blood, which is the second; and the separation of the juices from the blood by means of the

paration of the juices from the blood by means of the glands, is the third and laft.

COCYTA. See Malis.

CODA. A species of BEETLE.

CODA-PANNA. A species of PALM-TREE.

CODAGA PALA. Also called arbor Malabarica lactescens, josmini flore odoro, filiquis oblongis. It is a tree which grows in Malabar, the bark of which, when power dered and death in some rills, referring horeocaches and death and death in some rills. dered and drank in four milk, reftrains hæmorrhages and alvine fluxes. The root boiled in water makes a good fomentation against inflammatory tumors, and taken inwardly, deftroys worms. Rail Hift. See CONESSI. CODAGEN. See Hydrocotyle.

CODDAM-PULLI. See CARCAPULI and CAMBO-GIUM.

CODIANUM. Sus LUTÆUS SYLVESTRIS.

CODI-AVANACU. An under-firm growing in fandy foils in the East Indies. The juice of the whole plant taken in wine is a good remedy for fluxes. Some other preparations are made from it.
CODOSCELLÆ. Buroes.

CŒCALIS VENA. A branch from the concave fide of the vena mefaraica major; it runs to the beginning of the colon; it divides by two arteries, one of which communicates with the galtro-colica; the other, after fending branches to the intestinum coccum and appendicula vermiformis, communicates below with the extremity of

the great mefaraic vein. CELA. The hollow of the eyes, or rather above and below the eye-lids. They are puffed up in a cachexia. The carla of the feet are the hollow parts at the bottom

of the foot, adjacent to the heels.

CŒLESTINUS COLOR. In Paracelfus it fignifies

a fky colour.

CŒLIA. It fignifies a cavity in any part of the body, or in any of the vicera; it is also the same with ALVUS, which fee: if are is joined with it, it fignifies the stomach, and fometimes the thorax; and w xare joined with it, is the lower belly, or intestinal tube, from the cardia to the anus

CŒLIACA ARTERIA, wornes, venter. The cæliae artery arises anteriorly from the aorta descendens, as soon as it has passed through the diaphragm; its trunk is short, but it fends off from the right fide two fmall diaphrag maticæ, though fometimes there is but one. The left branch, which rifes from the intercostales and mammarite, fend ramifications to the superior orifice of the stomach, and to the glandulæ renales of the fame fide, as the right furnishes the renal gland on the right fide, and the pylorus. After these the ealiac artery lends off the arteria ventriculi coronaria, and the gastrica superior; then divides into the arteria hepatica on the right hand, and the arteria fplenica on the left. Sometimes this artery is divided into the coronaria, hepatica, and fplenica; in the fame place, very near its origin, the trunk going out from the aorta in a straight line, and the branches from the trunk almost at right angles, like radii from an axis, whence this trunk hath been called axis arteriæ cæliæcæ.

- MUCOSA. See DIARRHOEA MUCOSA. --- CHYLOSA, i. c. DIARRHOEA See DIARRHOEA. COELIACA.

- LACTEA.
- PASSIO. The COELIAC PASSION is a species of diarrhoea, in which the aliment is carried off in a liquid state, but not well digested; the discharges resemble chyle. Aretseus calls those afflicted with this disorder BENALANCE; Coelius Aurelianus calls them contriculofi; Hippocrates does not name the difeafe. Sauvages enumerates four species, the chylosa, purulenta, mucosa, and lactea; but the first is generally understood by the

intestines; and flatus break forth with some violence, the pain of the stomach is severe, resembling pricking; the patient becomes weak, and emaciated. The disease continues long, is periodic, and difficult to cure.

It is caused by a disorder in the first passages, which

admits of the aliment being dissolved, but not properly digested. Dr. Freind says, that it originates from an obstruction of intestinal glands, on which account a sufficient quantity of lymph cannot, by these, be supplied for diluting the chyle, and rendering it sit to pass into the lacteals, hence it passes off with the excrements. He diftinguishes it from the chylous flux, by observing that in this the cause is an obstruction of the lacteal vessels.

The fymptoms attending this diforder are in general fuch as are met with in different patients labouring under a diarrhoea, which are as the constitution and various other circumstances differ.

It must be diftinguished from other intestinal discharges, and from what Celfus calls carliacus ventriculi morbus.

The cure is tedious at best, but often uncertain. It fometimes abates, but is apt, upon the least irregularity,

As the cause is in part an interception of the humours which used to be discharged from the glands in the first paffages, aftringents are obviously prejudicial; and these remedies which gently irritate the bowels, and deterge the mouths of their glands, are manifestly the means of relief; to this end vomits of ipecacuanha may now and then be given, and gentle purges frequently repeated in fmall dofes. As indigeftion or weakness of the stomach in part contributes to the production of this dif-order, warm ftrengthening ftomachies will be ufeful; the diet and other non-naturals also must be properly regulated. See DIARRHOEA.

See Aretæus, lib. ii. cap. 7. Cœlius Aurelianus Morb.

Chron. lib. iv. cap. 3.

CŒLIE. See VENTER.

CŒLI-FLOS. COELI-FOLIUM. Paracelfus called this nofloch and cerefolium; others call it flos terrae. In fome places it is known by the name of STAR-FALL. Stellarum purgamentum.

It is a species of jelly, sometimes clear, at others green-ish, and agitated with a kind of tremulous motion so long

as it is fresh.

It is found after rain in meadows, and in dry parched grounds, generally betwirt the fpring and furnmer fea-fons. If it is not gathered before the rifing of the fun, it will be shrivelled up to a thin membrane of a brownish colour. Magnol, in his Botanicum Monfpelienfe, calls it muscus sugax membranaceus pinguis. And Tournefort calls it noftoch ciniflonum.

It is a production of the earth, to which it adheres by one or more flender roots. The embryo at first appears like a fmall tubercle, which is flefhy, foft, and diverfified with inconfiderable inequalities, like those on ftrawberries, at first of a greenish blue colour, but afterwards clear. Afterwards this membrane is unfolded on the earth, and thus it remains while the weather is moift, not fading till the wind and fun dries the earth. It affords a clear infipid liquor, that turns hydrargyrus muriatus white, and fyr. violar. green. It affords a vola-tile falt well cryftallized, a volatile urinous fpirit, and a

The Germans use it to make the hair grow.

COELI SPECTATOR. See URANOSCOPUS.

CŒLOMA. Kenama, bellete. An ulcer in the tunica cornea of the eye. See BOTHRION.
CŒLOSTOMIA, from zona, bellete, and roun, the month. A defect in speaking, when a person's speech is obscured by sounding as if his voice proceeded from a

CCEMENTATIO. CEMENT. It is a tenacious mat-CCEMENTUM. Ster by which two bodies are made to adhere. What is used by the chemists is commonly called lute. See LUTUM.

Besides cements are those powders and pastes with

reliae passion, which is a chronic discharge of liquid in-digested aliment; in this disease, on account of the de-bility of the digestive power, the aliment is left half di-gested, and becomes depraved both in colour, smell, and consistence, for the colour is white; the excrementious matter filthy, and offensive; there is a rumbling in the of common salt prepared, and of nitre and verdigrise, each an ounce; mix.

There are many compositions for cementing, which may be feen in chemical writings; one of the chief of them is what is called the royal cement, because used in purifying gold from filver. It is thus made: Take four parts of fine brick-dust, one part of green vitriol, calcined to rednefs, and one part of common falt; mix them well, and then work them into a firm paste with water. See Dict. of Chem. 4to. Newmann's Works.

CŒNA. SUPPER. Suppers that are heavy flould be avoided, because the stomach is more oppressed with the fame quantity of food in an horizontal pofture than in an erect one, and because digestion goes on more flowly when we sleep than when we are awake. They should also be eaten long enough before bed-time, that they may be nearly digested before going to sleep, and then a draught of pure water will usefully dilute that which remains in the ftomach.

CŒNOTES, from xxxxxx, common. The physicians of the Methodic sect afferted that all diseases arose from relaxation, stricture, or a mixture of both. These were called carnotes, because diseases have these in common.

CCRULEUM MONTANUM. MOUNTAIN BLUE, also called chrysocolla. It is a blue ore of copper.

- Fossile. See Armenus Lapis. - NATIVUM. See LAPIS LAZULI.

CŒRULEUS LAPIS. See VITRIOLUM COERULEUM. COFFEA, called also coffee, jasminum Arabicum cassana folio store albo odoratissimo, cosse, cheava jasminoides, coffee Tree or Bush. It is the cossea Arabica,

The fruit of the coffee-tree, called its berries, are of a pale colour and oval shape, rather less than a common bean, convex on one fide, and flat on the other, with a remarkable furrow

The tree is of the jeffamine kind, with leaves like those of the bay-tree: it grows in Arabia Felix; from thence it was introduced into the West Indies. The fruit is a juicy berry, including two of the feeds, joined by the flat fides, and covered each with a thin fhell.

Coffee was but little known in Europe before the feven-teenth century. The first coffee-house in London was erected in the Tilt-Yard, in the year 1652. In Paris it was scarcely known until 1669; though at Marseilles it was used in 1644. Rauwolfius, a German, and Prosper Alpinus, an Italian, were the first Europeans who writ on the use of it.

The Arabian coffee is called the Levant coffee, and is the finalleft; the Java coffee is called the East India coffee; it is larger, and of a whitish livid colour: the American coffee is called English or Surinam coffee; the berries are large and of a greenish colour; but the best are small, close, and somewhat transparent.

The Archie word colour, families any kind of linear

The Arabic word caboua, fignifies any kind of liquor, confequently the liquor made with coffee. Hence the Turks derive their cabueb; whence again the European

word cafe.

In Arabia, persons of rank only use the seminal capfules, and the pellicles immediately covering the berries; these preduce a grateful liquor, but for this purpose the capsules, &c. must be fresh. The French call this case, à la fultane.

The coffee-berries have a farinaceous, fomewhat unc-tuous bitterish taste; and little or no smell. It is roasted to destroy that flatulence that it hath in common with all farinaceous substances. Many feeds, &c. by roasting, acquire the slavour for which coffee is admired. Dillenius hath given a differtation in the Ephem. Nat. Curioso, on the fubitances which in fmell and tafte refemble coffees and finds that roafted rye, with a few roafted almonds, to furnish the necessary proportion of oil, comes the nearest to it.

From fixteen ounces of roafted ceffee, Neumann ob-tained feven ounces, two drams, and two feruples of wa-tery extract; and afterwards five drams and one feruple of spirituous extract. On reversing the operation, he ob-

and four ounces of watery; the refiduum, in both cafes, was nearly the fame, viz. about one half of the whole.

The roafted feeds ground into powder foon lofe their flavour in the air; impart it to water and to fpirit by light cochion, or digettion, and give over a great part of it with water in distillation. The roasted berries keep very well; to recover their brisk flavour, lay them before the fire a few minutes, and, when they are warm, they may be ground for use, and are then as agreeable as when first roasted.

Coffee should be boiled eight or twelve hours before it is drank, and if the liquor is mixed with an equal quan-

tity of milk, it is excellent.

If coffee is drank warm within an hour after dinner, it is of fingular use to those who have head-achs from a weakness in the flomach, contracted by attention, or from weaknefs in the flomach, contracted by attention, or from drunkennefs. It is ufeful when digeftion is weak. The phlegmatic and corpulent are much benefited by its ufe. In some delicate habits it produces nervous symptoms. It is slightly aftringent and antiseptic, moderates alimen-tary fermentation, and is powerfully sedative. See Lewis's Mat. Med. Newmann's Chem. Works; Percival's Eff. Med. and Exp. vol. ii. Lettsom's edit. of Fothergill's Works, vol. ii. Works, vol. ii.
COGGYGRIA. It is a species of sumach.

COHOB. Cobobatie, cobobium cobopb. COHOBATION. It is the returning of a liquor, diffilled from any fubflance, back again upon the fame fubstance, and diftil-ling it again, either with or without an addition of fresh ingredients. The alembic, called a pelican, was invented for the more easily effecting this operation. Modern chemists neglect it. COHOL. See Alcohol. Castellus says it it used in

powder.

COHOPH. See COHOB.

COHYNE. An American tree, with leaves like the laurel. Its fruit is as large as a melon, fhaped like an egg. The Indians make cups of it. The fruit is not catable.

COILIMA. A fudden fwelling of the belly from

COIRA. See TERRA JAPONICA.
COITIO. The act of venery. See Venus.
COLATORIA LACTEA. Aftrue fays they were formerly called glands, and are fituated on the third and internal tunic of the uterus, and that they are veficular bodies. See FLUOR ALBUS.

COLATORIUM. A strainer of any kinds

COLATURA. Any strained or filtered liquor is called the colature.

COLCAQUAHUITL. An American plant com-

mended in palies and uterine diforders. Raii Hift.

COLCESTRENSIS AQUA. COLCHESTER WATER.

This mineral water is of the bitter purging kind, fimilar to that at Epfom, but not fo ftrong. See AQUÆ CATHARTICÆ AMARÆ.

COLCHICUM; also Coum. Boerhaave mentions eight fpecies.

Colebicum, called alfo colebicum atumnale, colebicum foliis planis lanceolatis erectis, &c. Linnzei, colebicum commune, eslebicum Anglicum purpureum & album. MEA-DOW SAFFRON.

It grows in meadows that are moift and rich; and fometimes it is found in marfly grounds. It hath two fleshy bulbous roots, the one producing from its lower part a finaller bulb. From the last arises in autumn, along a furrow, in the side of the old root, a slender, hollow, transparent pedicle, widening at the top into a flower like those of the crocuses, divided into six segments, of a purplish or whitish colour, withering in two or three days. From the same root there comes forth in the next spring three or four upright leaves, like those of the lily, in the middle of which appear on thort pedicles, commonly three triangular pods, about the fize of fmall walnuts, divided into three cells, full of roundish dark coloured from the c feeds. The outer root is barren and shrivelled, the inner one produces the plant.

thined four ounces and four feruples of spirituous extract, for about thirteen hours, it operated violently by vomiti tool, and urine. One grain of it being fwallowed by a healthy man, produced heat in the stomach, and soon itter flushing heats in different parts of the body, with requent shiverings, followed by colicky pains; after which in itching in the loins, and urinary passages, was per-ceived, and then came on a continual inclination to make water, a tenefmus, pain in the head, a hurrying pulfe, hirst, and other difagreeable fymptoms.

Notwithftanding these effects, when made into an oxy-nel, it becomes a safe, but powerful medicine. The cots should be fresh, and full of sap, when they are used. in flicing them, they emit acrid particles, which affect he head, irritating the notirils, throat, and breaft; the ingers that hold them when cutting, become numb for a ime, and lofe their fenfation; though after being fleeped in vinegar, they are almost insipid, their acrimony being

When this root is imprudently fwallowed, the following method gives the speediest relief. To a pint of water add an ounce of vinegar, or lemon-juice, and half an ounce of the fyrup of poppy heads. Of this take three ounces every quarter of an hour. After the use of this hath removed the immediate effects of the colchicum, finish the cure with demulcents.

Acetum Colchici. VINEGAR OF MEADOW SAFFRON:

Take of the fresh roots of meadow faffron, sliced, an ounce; white wine vinegar, a pint. Mix and digest in a glass vessel, over a gentle fire, during forty-eight hours, then ftrain off the liquor.

To render this vinegar more mild, and lefs difagree-

able, it is made into an oxymel, as follows:

Oxymel Colchici. OXYMEL OF MEADOW SAFFRON.

With a pint of the vinegar of meadow faffron, mix two pounds of clarified honey; gently boil the mixture, frequently stirring it with a wooden spoon, to the thickness of a syrup. Pharm. Lond. 1788. It is of consequence that the bulbs be in persection, they should therefore be taken up in autumn.

This oxymel is agreeably acid, gently vellicates the tongue, is moderately aftringent, excellent for cleanfing the tongue, is moderately attringent, extended dofe it is an emetic, and fometimes a purge; but its most general effect is as a diuretic, and as such it is very constant, and remarkably powerful.

The dose should be small at the first; half a tea-spoon-

ful may be given two or three times a-day, increasing the dose as the stomach will admit. In dropsies, and tertian agues, its fuccess has been great; as an expectorant it fucceeds when fquills fail; and, when opiates are joined with expectorants, this oxymel should be preferred, for no medicines in conjunction interferes with its operation. See Dr. Storck's Effay on the Use and Effects of the Root of the Colchicum Autumnale. Its use in dropsies, see London Med. Journal, vol. i. p. 395.

—— ILLYRICUM. See HERMODACTYLUS.

ZEYLANICUM. See ZEDOARIA. COLCOTAR. RED INK, VITRIOL.

COLCOTHAR. CHALCITI OFFICINARUM. See

VITRIOL. COLCOTHAR.

—— (SAL). When the colcothar of vitriol is washed in water, a falt is obtained from it which is thus called; it is also named fixed falt of vitriols. If borax is added to this falt, and the mixture exposed to the fire, it eafily fublimes in the form of filver-coloured faline flowers, thus forming the fal fedativus Hombergii. Two ounces of this fixed falt of vitriol well calcined, must be diffolved in a quart of warm water; the fame quantity of borax must be dissolved also in a quart of warm water: these folutions being mixed and filtered, the clear liquor must be evaporated in a glass alembic to dryness, then the dry mass must be sublimed. By mixing oil of vitriol with twice its weight of borax, the same sedative salt may be obtained.

COLES, or Colis. See PENIS.

COLETTA ETLA. See ERYNGIUM ZEYLANICUM.
COLI DEXTRUM, LIGAMENTUM. Where the mefentery changes its name for that of mefocolon (which is
about the extremity of the ileum) the particular lamina, When the root is young and fresh, its taste is very acrid; but when old, it is mealy and faint. For medical purposes it is best when full of sap. Two drams of this root killed a large dog; after putting him to great torment fold, which is turned to the right side, forms a small transverse fold, which is thus named.

Coli tion of the mefocolon, a little below the left kidney.

COLIA, or COLIAS. A fish which refembles a ma-

COLICA. The Colic; termed also rachialgia

The appellation of colic is commonly given to all pains of the belly, almost indifferiminately, but properly it is confined to pains feated in the colon; however it is not necessarily so limited. From the different causes and circumstances of this diforder it is differently denominated, and fome difference in the mode of cure is also to be obferved in different cases.

When the pain is accompanied with a vomiting of bile, or with obstinate costiveness, it is called a bilious colic; if flatus causes the pain, it takes the name of flatulent, or windy colie; these two last named are varieties only of the fpaimodic colie: when accompanied with fymptoms of heat and inflammation, it takes the name of inflam-matory colic, &cc. The different kinds feem to be properly included under the diffinctions of inflammatory, spalmodic, or from irritation, and flatulent, or from wind.

The inflammatory is when actual inflammation feizes fome part of the intestinal canal, the disorder will then be confidered and treated as an inflammation of the refpective part. See INFLAMMATIO VENTRICULI, & IN-

TESTINORUM.

The fpaimodic is when pain affects the belly princi-pally about the navel, attended with an obstinate costivenefs, and either a naufea, or actual vomiting. In the beginning it is absolutely void of inflammation, though, as a confequence, this fymptom fometimes appears.

The flatulent is when, from a fudden rarefaction of vapours in the intestinal canal, there is pain; and as an effect of the diftention, or of the pain, a conftipation of

Dr. Cullen places this genus of difease in the class neroses, and order spassion. He enumerates seven species. 1. Colica spasmodica, with retraction of the navel and spasm of the muscles of the belly. 2. Colica Pictonum, this in many things is like the former, at length terminates with pains in the arms and back, which uther in a palfy. 3. Colica flercorea, which happens from coftiveness. 4. Colica accidentalis, from flarp undigefted matters. 5. Colica meconialis, in infants, from a retention of meconium. 6. Colica callofa, from a callous stricture of the colon. 7. Colica calculofa, from calculi formed in the intestines.

The spalmodic colic is treated of under a variety of names: Hippocrates feems to include it under pains of the belly, where he calls all pains of the intestines, iliac; others, fince him, have named it chordapfus, ileus, vel-vulus, &cc. Writers of a more modern date have named it differently, according as it appeared epidemically in a particular country, or was apprehended to proceed from a particular cause, or had certain symptoms attending it: hence the names colica Pictonum, colica faturnina, colica plumbariorum, colica Damnoiorum or of Devonshire, bilious colic, dry belly-ach, the painter's colie, spasmodic colic nervous colic, colic of Surinam, &c. &c.

Pains of the bowels are common to all ages, but the tender and easily irritable, are most frequently subject to

As to the feat, the whole region of the intestines is the fubject of this diforder; in any part of them it may ma-

nifest its presence.

Whatever be the preceding, the immediate cause is always a spalm: and with respect to the theory of pains in the intestines, it may be observed, that the cause from whence they arife, hath its feat in a part diffant from where the uneafinefs is felt. Whenever an inflation happens in an intestine, there is either an obstruction from excrements, or a fpafm in another part. When either obstruction or constriction happens in fome part of the fmall intestines, or a compression on them; or when a load of excrement is lodged in the beginning of the colon on the right fide, there arifes a great and painful infla-tion of the belly above and below the navel, and also in the middle of the fame. If the lower part of the colon, or the intestinum rectum, is thus affected, the colon in the left hypochondrium, towards the spleen, together with that part of it which is seated beneath the stomach, and near the liver, becomes greatly inflated. When, as it often happens in hypochondriac and hyfteric diforders,

COLI SINISTRUM, LIGAMENTUM. It is a contrac-on of the mefocolon, a little below the left kidney. COLIA, or COLIAS. A fifth which refembles a maand intercostal branch of the nerves, which spread them-felves on the jejunum. In this case the duodenum and stomach are inslated, the breathing is thereby affected, and great anxiety comes on-

Spafms may be excited by extraordinary agitations of mind, or uneasy affections thereof; also by acrid and ftimulating matter thrown upon the bowels. Bile, and other excrementitious fordes, may be too long retained, or otherwise have changed their healthy qualities; acrid fubstances may be swallowed, or conveyed to the intef-tines by other means; vapours from lead, in the various employs where its use is frequent, as well as solutions of it from the tinning, by which kettles, &c. are lined, and various other methods by which this pernicious metal is conveyed into our bodies; the matter of the gout, &c. diverted from their original feat to the intestines; worms;

obstructed periodical evacuations, &c.

Whatever be the cause, the approach and progress of this disorder is nearly the same. It begins with a sense of weight, or pain, at the pit of the stomach, attended with lofs of appetite, yellownefs in the countenance, a flight ficknefs and coftivenefs; the pain gradually in-creases, and from wandering about becomes fixed somewhere about the navel, from whence painful dartings proceed, at times, in various directions; wherever pain is felt, a foreness and tenderness remain some time afterwards; the fickness keeps pace with the pain, and, at length, a vomiting of bilious matter comes on; the urine is diminished in its usual quantity, and a tenesmus some-times adds to all the other grievances. While the pain is fpafmodic, the pulse remains unaffected, except concurring circumstances produce a change in it; the urine is various; if the smaller intestines are the feat of the pain, it is felt more acutely; if the larger intestines are the parts aggrieved, the fense of the pain is more dull and heavy; sometimes there is a bitter taste in the mouth, and a yellowness in the countenance: if the symptoms are not relieved, an inflammation, or a gangrene, may enfue; or, the excrements returning, are ejected by vo-mit, and the iliac paffion puts an end to the whole, by opening the way for death.

The colic should be distinguished from a fit of the gravel; stones passing through the ureters; rheumatic pains in the muscles of the belly; a beginning dysentery; the blind piles; from a stone passing through the gall-duct; and from the staulent pains which receive the denomi-

nation of flatulent colic

Of the remarkable symptoms that sometimes come on in consequence of this disorder, a palfy is the chief. Dr. Thierry fays, that it is the natural criffs of a colic: however it may be observed, that it sometimes comes on during the fit, though generally it follows: and, fecondly, it feldom appears after the first fit, if the colic was not ill-treated.

When the colic attacks with a shivering, and the pain is very violent, great danger attends it, for an inflamma-tion is denoted thereby. When lead is the cause, the co-lie is apt to terminate in a spasmodic asthma, or a palfy. A fweat, a falivation, an hæmorrhage at the nofe, or from the hamorrhoidal veins, fpontaneously occurring, fome-times terminates the colie; though, if after the strength is exhausted, a colliquative sweat comes on, a stupor of the hands or feet are to be feared, if not a true palfy. If the violence of the pain continues to increase, fatal ef-fects are to be expected.

As preventives from this complaint, those who are at times afflicted with pains in the belly should be careful to keep from all violent agitations of the mind, fhun expolures to the northern winds, keep the feet dry and warm, abstain from flatulent food, and spirituous li-quors. Those whose occupation subjects them to the fumes of lead, or to the influence of any of its prepara-

tions, should breakfast on fat broth, or eat bread that is spread with sweet lard, before they begin their work.

In order to the cure, as a spass is declared to be the immediate cause, its resolution is the chief indication; to which end relaxing and antifpafmodic medicines, with purges, which, while they folicit the internal difcharge, will not increase the morbid irritation, are the proper means.

If the pains are violent, and the pulse full, take away niftered, and its operation quickened by the use of senseblood in proportion to the strength of the patient; after tea, of a solution of the neutral salts, or of castor oil. which the ftomach may be cleanfed with as much warm camomile tea as will excite two or three discharges by vomiting, or, if need be, a few grains of ipecacuanha

may be given.

After the stomach is cleanfed, opium should be given, and the dose, which may be more or lefs, according to the violence of the pain, must be repeated every two or three hours, until sleep is procured, and case obtained. The notion that a free use of opium may cause the palfy

is erroncous.

As foon as by a due use of opium the sickness and pain abate, let gentle purges, that is, fuch as operate with the leaft irritation, be given: when the pain is first mo-derated by the use of opium, take 3 ii. of the sal amar. in warm water; if repeated every two hours it will operate with fufficient efficacy; though the ol. ricini should be preferred, because its repetition need not be so frequent as the other purgatives: however, in want of it, 3 i. of crystal, tart. or 3 is, of sulph. præcip. may be repeated every hour or two. The ol. ricini may be given to 3 i. with an equal quantity of the tinet. card. comp. Ph Lond. or any other agreeable mixture. If the ol. ricini is not to be had, any other purgative that is not painful in its operation may be used. When a free passage is obtained downwards, laxatives must still be continued, until all danger of a reland former to be appeared. danger of a relapse seems to be removed.

If dofes of a grain or two of opium, repeated every fix bours, fail to relieve, forty drops of the tinct. opii may be mixed with four ounces of warm olive oil, and injected clysterwife. This may be repeated as often as the

pain returns.

In case of a relapse, after the good effect of purges, the propereft method is to begin as at the first, and moderate the pain by means of opium, before the use of purging medicines.

Fomentations, and warm baths, may prove auxiliaries, but no great dependence is to be had on them. It is true, that while the patient is fet in the warm bath, the pain abates, but when he is taken out, it returns. In this diforder, the pain must be allayed during some hours before the intestines will be disposed to perform their office of excretion, and few, if any patients, can continue in the bath fo long as case is required. Some affert, that the warm bath being used before the belly is evacuated, is hurtful, by conveying the offending humours into the blood, initead of determining them to the fkin, and thus may be cause of convulsions.

Dr. Warren and Bifs relate their fuccess in attempting the cure of the colica Pittonum, as it is denominated by one, and the dry belly-ach by the other, by means of a falivation with mercury; and observe, that as soon as the ptyalism was perceived, the pain abated, and returned no more. One of these gentlemen observes, that in mild of mint.

cases, where a falivation seemed not necessary, blisters applied to the upper and fore-part of the thighs, near the groin, were sometimes effectual. Dr. Hugh Smith speedy relief.

Dr. Grafhuis commends alum as a specific in this dif-order: and Dr. Percival, in his Eff. Med. and Exp. re-lates the successes which hath attended his use of this medicine in various painful diforders of the bowels. He gives it from gr. x. ad xx. every four or fix hours; and a few dofes thus administered, never failed to procure

relief, and, duly repeated, to effect a cure.

Dr. Percival also proposes as follows, in a letter to Dr. Duncan, which is inserted in the 5th vol. of Edinb. Med. Comment. p. 172, &c. In violent colies, attended with vomiting and an obstinate constipation of the bowels, it has been the common practice amongst physicians to give opiates, in conjunction with purgatives. This method of treatment has been lately improved by administering the opiate first, and the purgative an hour or two afterwards. But I take the liberty of fuggesting to you another mode, which, as far as my own experience extends, has proved the most successful. I direct three or four ounces of a ftrong decoction of poppy heads, with twen-ty, thirty, or forty drops of tinctura opii, to be injected into the intestines, and retained as long as possible. If it be specified, the glyster is repeated till the pain is relieved, and the vomiting ceases. A dose of calonel and jalap, or of any other brisk cathartic, is then admi-the mill. It was made for the wrestlers. This name

By this process, evacuations are procured with more case, certainty, and expedition, than by any other which I have tried. For opium, when given in a clyfter, does not check the perifialtic motion of the inteffines, nor counteract the operation of any purgative fo powerfully as when received into the stomach. And, in this way, it is most efficacious in alleviating the sickness, and in putting a ftop to the violent retchings with which colies are often attended. The tafte of laudanum is often so nauseous, that it is frequently rejected as foon as fwallowed. And, if the extractum opii be given in a folid form, time must be allowed for its folution, before any effect can be expected from it.

The columbo-root infused in boiling water, and given to the patient in the beginning of this disorder, may be useful to abate the sickness and vomiting.

The palfy which remains after the removal of the colic is best relieved by the use of Bath-water; but as the circumstances of many do not admit of this method, the whole length of the fpine may be rubbed with Barbadoes tar, diffolved in rum, and fuch other antiparalytics may be used, as the constitution of the patient, and other cir-

cumstances, may admit.
See Dr. Tronchin on the Colica Pictonum, with Dr. Schomberg's Notes. Dr. Thierry on the Colica Pillonum. Dr. De Haen on the Colica Pillonum. Dr. Huxham on the Colic of Devonshire. Dr. Warren's Account of the Colica Pictonum, in the Lond. Med. Trans. vol. i. ii. Dr. Sydenham's Works, with Notes, by Dr. Wallis. Dr. Percival's Effays, Med. and Exp. vol. ii. p. 194, &c. Dr. Brooks' and the London Practices of Physic. Med. Mus. vol. iii. p. 579, &c. and Dr. Shebbear's Theory and Practice of Physic. Cullen's First Lines, vol. iv.

The flatulent colic is usually a symptom or consequence of fome other diforder, and is neither accompanied with fever nor thirst; however, the pain is acute, as the seat of the complaint is in the small intestines; cardialgie fymptoms, with efforts to vomit, fometimes attend, and a coffiveness is the consequence of the great differntion.

Sometimes it is caused by wetting the feet, or other-ways checking the perspiration; in which case, instead of taking heating medicines, rubbing the legs with warm cloths, and afterwards keeping the feet for some time in warm water, will be the most effectual remedy. When a person is subject to frequent returns of this

diforder, it proves that their digestive powers are weak; and in order to the cure, this circumstance is to be at-

tended to.

To promote the discharge of wind, clysters of warm water, with a little common falt, may be frequently re-peated. Warm camomile tea may be now and then drank, and tinct. of rhubarb, with a few drops of the oil

Cryftals of tartar, diffolved in water, is a ufeful drink. Sometimes the conf. opiata, joined with rhubarb, gives

COLICA COLCOTOR. See CALCADINUM.

—— SINISTRA, [ARTERIA]
i. e. Mescenterica inferior arteria.

ARTERIA. - Superior, [ARTERIA] ARTERIA. i. e. Mesenterica superior.

--- VENA. It is a branch from the vena mejeraica major. It runs from the anterior part of the trunk before it joins the artery, to the middle of the colon, where it divides to the right and left, and forms arches. On the left it communicates with the upper branch of the hæ-morrhoidalis and on the right with the fecond branch of the meferaica.

- RECTA, VENA. It is a branch of the gastro-colica vena; it goes to the right portion of the colon, from thence to the upper part thereof, where it divides,

and anafomofes with the colica, and the coccalis.

COLLICULUM. See NYMPHÆ.

COLIFORME OS. See Os CRIBROSUM.

COLINIL. Called also Nil; Indiga spuria; Polygala Indica. The name of an American plant, the juice of which, with a little honey, cures puftules in the mouth.

3 U

is derived from Greek words, which imply strength of limbs. Kaner, a member, and ips, strength. Some of the most ancient nations called the bread thus made panis furfuraceus. See Aulius Gellius, lib. ii. cap. 9. Panis impurus. See Hippocrates. Athenæus, lib. iii. calls it fincomifton, bread prepared of unfifted meal. Cochus Rhodiginus, lib. ix. c. 16. calls it panis cibarius, and panis gregarius. Terence calls it pams ater. It is the fame as in Westphalia is called bompournickel, which see. This fort of bread was always esteemed both for nourishing the body, and for rendering it robust. The Greeks called that bread most nourishing that had the most bran in it, and that fort the least nourishing that had the most flour in it. Varrius in Pliny, informs us that the Roman people, for 300 years, used only the bran of their cornCOLIS. See PENIS.

COLLATENNA. A certain specific for the cure of

rounds. It is mentioned by Paracelfus in his work De Vita Longa

COLLATERALES. So Spigelius calls the ereflores

penis from their collateral order of fibres.

COLLATITIUM. A fort of food prepared, according to Blancard, of the flesh of a capon, or a pullet bruised, and then mixed with mutton broth, and given with verjuice, or lemon-juice.
COLLETICA, from xixas, glue. Conglutinating me-

COLLICIÆ. The mion of the ducts which convey the humours of the eyes from the puncta lachrymalia to the cavity of the nofe.

COLLICULA. See NYMPHR. A diminutive of col-

lis, a bill.

COLLIGAMEN. A LIGAMENT.

COLLIQUAMENTUM. An extremely transparent fluid in an egg, observable after two or three days incu-bation, containing the first rudiments of the chick. It is included in its own proper membranes, diffinct from the albumen. Harvey calls it sculus. COLLIQUATIO. COLLIQUATION. A diffolying, or

wasting, from collique, to melt away. COLLISIO. See CONTUSIO.

COLLIX. A fort of round loaf or cake; but in Hippocrates, and other Greek medicinal writers, xoxxit imports a fort of pastil, or troche, of the form above mentioned.

COLLOBOMA. The growing together of the cyclids. COLLODES. Glutinous, from xxxxx, gluc.

COLLODIUM. A word in Paracelfus's work De Vita Longa, but he no where explains it. COLLUM. See CERVIX.

COLLUTORIUM ORIS. See GARGARISMA.

COLLYRIUM, from waxe, glue, and copa, a tail, because the ancient collyria were in the form of a rat's tail, and prepared of powders made up of fomething glutinous; according to fome, from xxxxx, to flop, and is, a running. Suppositories, tents, and other things, have been called collyria from their form; but as they were used whole, or in their proper form, they were called en-tire; but what were called collyria, without the epithet entire, were powdered fine and applied to the eyes.

At prefent a collyrium only means a topical medicine

for the eyes. It differs not from a lotion, but as applied

to the eyes, it is now called a collyrium.

Collyriums made with vegetables and falts that entirely diffolve, are more elegant, and agree better with the eyes,

than when they are made with powders.

Hoffman condemns all acrid, aftringent, cooling, drying, and mucilaginous applications to the eyes. Wede-lius fays, that opium does not cafe pain in the eyes when externally applied, but rather excites greater heat. He fays, that aloes eafe the eyes more than opium.

ys, that aloes eafe the eyes more than a oua.

Collyr. Coeruleum. See Sapphirina aoua.

Samian Earth. It is an - SAMIUM. Brown SAMIAN EARTH. It is an earth of the marly kind. There is also a white fort.

They are brought from the island of Samos.

——Siccum, i. e. P. e ceruff. comp. See Plumbum.

COLOBOMA, from \*\*pace\*coo\*, to main, the growing together of the cyc-lids. Also the want of a particular member or part of the body.

COLOBOMATA. In Cellus this word is expressed.

by curta. Both the words fignify a deficiency in some part of the body, particularly the ears, lips, or alse of the

COLOCASIA; called alfo Manzizanion: it is a plant with a tuberous, thick, and farinaceous root. Boerhaave mentions five species, but nothing is faid of it as a medicine. It is also a name of the Egyptian bean. See FABA ÆGYPTIA.

COLOCHIERNI CARDUUS CRETENSIBUS. A

plant which differs very little from the atractylis.

COLOCYNTHIS. BITTER-APPLE. Also called ban-COLOCYNTHIS. BITTER-APPLE. Also called ban-dala, albandale, colocynthidis medulla, coloquintida. Bit-ter or wild gourd. It is the dried pulpy part of a species of gourd. The cacumis colocynthis, or cucumis sollis mul-tifidis, pomosis globosis glabris, Linn. differing from the common fort only in the leaves being deeper jagged, and the fruit not eatable. It is brought from Aleppo, and grows in many parts of Turkey. It is very light, white, and of a sungous texture, composed as it were of mem-brancous leaves, with a number of roundish seeds lodged braneous leaves, with a number of roundish feeds lodged in the cavities.

The feeds are unctuous and fweetish like those of cucumbers, but not purging; the fungous medulla, freed from the feeds, is acrid, naufeous, and bitter to the tafte, and is a ftrong, irritating cathartic; fome commend it also in leffer doses, as an alterative in chronical disorders. It is rarely used alone, though ten or twelve grains will purge violently, but is mixed with other purgatives, to

quicken their operation.

When boiled in water it gives out a large quantity of flime; to proof spirit it does the same; the watery de-coction inspiffated to an extract purges briskly, but with less irritation than the colocynth itself, and half its weight-Mr. Balduc fays, that the active matter refides in its falts, which far exceed the refin and the oil in quantity, and that hence water is its best menstruum.

The London College order it in the extract. colocynthidis compositum. See Catharticum extractum.

Colocynthis fructu rotundo major. The grea-

ter coloquiniida. It grows where the above species is met with, and possessing similar virtues.

COLON, from xolder, bollow. It is the first of the large intestines, and the most considerable of them all, called also enteron. From the ecceum it reaches in the form of an arch above the umbilical region, and extends to the lower part of the left hypocondrium, then runs down before the left kidney, to which it is connected, and below which it turns toward the fpine, and forming two opposite convolutions, terminates in the rectum, which having passed below the last vertebra of the loins to the inside of the os facrum, is bent backwards on the concave fide, to which it is joined, and running in the direction of the os coceygis, bends a little forwards, and terminates in the extremity of that bone.

The continuity of the colon is a little interrupted by the intestinum ileum, which advances into the cavity of the colon, and together with a certain fold of that intestine, forms what is called valvula coli.

The whole convex fide of the colon is divided longitu-

dinally into three parts by three ligamentary bands, con-tinued from those of the cocum and of the same struc-ture with them. Two of these bands run on each side along the great curvature of the colon, and the third along the small curvature. This last was first noticed by M. Morgagni. Between these ligaments the intestine is formed into cells, called the cells of the colon, and are processes of all the coats. The cellular coat does not differ from that of the small intestines; the internal coat is not villous, but papillous; the rugæ are waved and

Where the ileum terminates, there is a valve called valvula eaci, celi, or ilii. Its figure is oval, it keeps foft and loofe, and upon the very edge there is a diffant spincter, which acts so as to hinder the fæces from re-

turning into the ileum.

The whole course of this intestine is such, that when warm clyfters are plenteously injected, their efficacy is by it applied to almoit all the abdominal viscera, for it begins under the right kidney, and runs up on its fore-part, passes under the gall-bladder, then runs upon the first curvature of the duodenum, to all which it adheres; from thence it runs before the great convexity of the ilomach, then touches the fpleen, and goes on to the left kidney, &c. as above mentioned.

The colon on its upper part receives arteries from the mesenterica superior and inserior, the lower portion is

fupplied from the mesenterica insertion, one of which forms the internal homorrhoidal artery. The veins are from the vena portæ ventralis, the meseraica major and of the bladder had been croded by it. From this time, minor, or hemorrhoidalis interna. The nerves of the arch of the colon are the two mesenteric plexuses.

When pain is in the colon, it is less acute, and with a fense of weight; when in the small guts, there is not any sense of weight, but an acute pain. If sever attends pain in the colon, the pain extending to the ribs gives a fuspi-picion of pleurify, though the colon in reality is only af-fected. The colon is narrower in the right fide than elfewhere, whence colic pains rife more frequently, and rack more violently in this part. The excrements are long retained here, and often are much indurated before they

COLOPHONIA. Colophony, or BLACK ROSIN. It is also called refina fritta vel tosta, and dried resin. It is only resin whose humid and volatile parts are most diffipated. It receives it name of colopbonia from Colophon, a city of Ionia, because the best was formerly brought

from thence.

Two forts are mentioned in ancient writings, the one dry, the other in a liquid form. The latter feems to have been liquid pitch, which is the crude refin of the pine brought from Colophon, the former was the refina fricta. The latter Greeks called every kind of refin, colophony.

The best colophony is the refin of turpentine, which after the ethereal oil is distilled, is again urged by a strong continued fire.

continued fire.

COLOGUINTIDA. See COLOCYNTHIS. COLOR INDUS. It is a mixture of blue and purple. COLOSTRUM. The first milk of any animal after bringing forth its young is thus called; that from cows is also called BEESTINGS. It is gently cathartic, and purges off the meconium, thus it ferves both as aliment and me-

An emultion prepared with turpentine, diffolved with the yolk of egg, is fometimes called coloftrum.

COLOTES. A kind of lizard.

COLOTOIDES. Variegated like the fkin of a lizard.

Hippocrates applies it to the excrements.

COLPOCELE. A hernia that is feated in the vagina. In the Edinb. Med. Comment. vol. v. p. 257. is the following inflance, of the urinary bladder protruding into the vagina. The patient had been for many years, liable to violent hyferic affections, which at laft were fucceedto violent hysteric affections, which at last were succeeded by a dry, convulsive kind of cough. When in course of time, this cough disappeared, she was seized with a suppression of urine, together, with great pain and tenseness in the abdomen. Other remedies failing, the catheter was had recourse to, for evacuating the urine, but theter was had recourse to, for evacuating the urine, but it was with difficulty introduced. This suppression returned very frequently; was always preceded by the convulsive cough, and sometimes even with convulsions, which commonly ended in faintings. The obstruction which occurred to the introduction of the catheter, seemed to proceed from a considerable weight and pain which the patient complained of in the forepart of the genitals, and which was always most severe when the suppression of urine was not considerable. On examinfupprellion of usine was not confiderable. On examining the parts, the hypogaftric region was tenfe and painful, but there was no confiderable tumor perceivable, as there usually is, in the under part of the belly, when the urine has been long suppressed; but, upon introducing the singer into the vagina, while the suppression continued, a large tumor was discovered, which occupied the whole cavity of the vagina. In this swelling, a suctuated by compressing it, unless the catheter was at the same time introduced, and then a plentiful evacuation ensured in introduced, and then a plentiful evacuation enfued; though, even in this manner, the contents of the fwelling could not be entirely difcharged, unlefs the compreficon was continued. When the urine was entirely evacuated, the catheter could be eafily introduced; the tumor difappeared; the fuperior part of the vagina felt lax and flaccid; and the inger could be easily pushed up to the mouth of the uterus, till the tumor began again to in-crease, by the urine collecting in the bladder. Then the mouth of the uterus, this the tumor began again to increase, by the urine collecting in the bladder. Then the fupprefion returned, attended with tension and pain as before, which commonly ended in convultions, unless the urine was in due time evacuated by the introduction of the catheter. The urine, which at first was of a natural appearance, after the diforder had subsisted for some powerfully resists the putrefaction of animal sless, names, womiting, purging, diarrhoea, dysentery, become refully fedative, acidity in the prima viz.

the fenfibility of the bladder became fo much increased, that it was found necessary to introduce the catheter much more frequently than before. On considering the case, it appeared, that a peffary, properly adapted for the sup-port of the relaxed parts, would, in this case, probably be the most effectual remedy; and an instrument of that kind being procured, and so constructed as not to pre-vent the discharge of the mentitual sux, it was introduced; and being continued for feveral years, till the parts had again recovered their tone, a complete cure was at length obtained. The peffary was then no longer necessary, and the patient discharged her urine with per-

COLPOPTOSIS. A bearing down of the vagina:
See PROCIDENTIA VAGINÆ.

COLUBER BERUS. See VIPERAL

COLUBRINA. See SERPENTARIA. It is also a name of the DRACONTIUM, and of the BISTORTA, which fee. COLUBRINA LUSITANIA, HERBA. See CAACICA.

COLUBRINUM, called colubrinum lignum, radix colu-brina, nux vomica minor Moliceana, modira, caniram, nux vomica altera, folanum arborescens Indicum, and SNAKE-WEED TREE.

It is the wood of the trees on which the nux vomica grows, and of other trees of a fimilar kind. Linnaus mentions two species of strychnos, viz. flrychnos nux vo-mica, and flrychnos colubrina. See Strychnos. They are brought from the East Indies in pieces about the size of a man's arm, covered with a brownish or rusty coloured bark, internally of a yellow colour, with whitish

It hath a faint smell, but not a difagreeable one; on chewing it fome time, it is bitterish: it gives a gold co-lour to water and to spirit. It affords a fourth of its weight of extract by means of spirit, but not so much

by water.

It hath been given in dofes to half a dram, as an anthelmintic, in quartan agues and fome other diforders. It operates differently, fometimes paffing off by urine, at others by fweat, and also by stool. In a lesser degree it

possesses the ill qualities of the nuces vomicæ.

COLUBRINUS LAPIS, also called ferpentis lapis. It hath its name from the coluber snake, from which it was thought to be taken; but it is now known to be an artificial composition. It is made of hartshorn, luted up in an earthen pot, where it burns to a blacknefs, and is afterwards polithed. The Moors fay it is made of a kind of clay. It is fabled to be a cure for the bites of ferpents, by applying it to the wound.

COLUMBAC. That part of the agallochum which is betwixt the heart and that part which is next the back.

COLUMBINA. See AQUILEGIA.

COLUMBO, COLUMBA, COLUMBE, or in the Portuguese language raijs de Mosambique.

It is produced in Asia, from whence it was transplanted to Columbs, a town in the island of Ceylon, whence its name, and from whence all the East Indies is supplied

It is brought into Europe in circular pieces of different fizes up to three inches diameter; its fides are covered with a thick wrinkled bark, of a dark brown hue exter-nally, but internally of a light yellow. It is a root, and confifts of three lamine, viz. the cortical, which in the larger pieces is a quarter of an inch thick; the ligneous, which is about half an inch; and the medullary, which forms the centre, and is near an inch in diameter. This last is fofter than the other parts, and when chewed forms laft is fofter than the other parts, and when chewed feems to be very mucilaginous. Many fmall fibres run longi-tudinally through it. The cortical and ligneous parts are divided by a circular black line.

It hath an aromatic fmell, but is difagreeably bitter,

and flightly pungent to the tafte.

It is almost a specific in the cholera morbus, nausea,

dity, and also in correcting its begun putrescency. It is a good fubflitute to the bark where an aversion thereto renders the taking of it difficult. A tincture of this root in brandy is the most useful remedy known for moderating the retchings fo commonly attendant on pregnant women during the first months of pregnancy. Dr. Cullen fays it is a strong and agreeable bitter, and has employed it in many inftances of dyspepsia with great ad-vantage. In stopping vomiting it has frequently answered, but not always, even where there feemed to be a re-dundancy of bile; but in changing the acrimony, and cor-recting the putrefeency of the bile, he has not found it more powerful than other bitters.

It may be given in power from three grains to two drams, but the common dofe is from ten to fifteen grains,

every three or four hours.

Diffilled with fpirit, it fends over little or nothing of its tafte or fmell; but the extract made by evaporating a decoction of it in rectified spirit of wine is better than the root itself in powder: about two-thirds of this root is obtained in the fpirituous extract.

The College of Physicians London, order the follow-

ing tincture:

## TINCTURA COLUMBE, Tincture of COLUMBO.

Take of columbo-root, powdered, two ounces and an half; proof-spirits of wine, two pints; digest for eight days, and strain: a table spoonful of which may, be taken in mint-water, or an insusion of orange-peel, which last renders it the most grateful. It powerfully and speedily relieves colicky pains from flatulence or from indigestion.

## EXTRACTUM COLUMBA. Extract of COLUMBO-ROOT.

Take twelve ounces of columbo-root in powder, digeft it four days in rectified spirit of wine, three pints; filter this tincture; boil the residuum repeatedly in different waters, until it yields little or no taste to the liquor; strain the decoction, and evaporate until six pints only remain; then evaporate in a vapour-bath, and, when nearly finished, add to it the tincture, and reduce the whole to the confiftence of a pill.

In diforders of the ftomach, attended with a violent fermentation of the food, with flatulence and great aci-

dity, no other known medicine equals this extract.

See Dr. Cullen's Mat. Med. Dr. Percival's Effays,
Med. and Exp. vol. i. ed. 2. Notes to Sydenham by Dr.
Wallis, vol. iv. p. 221.

COLUMELLA. The cliteris, also the uvula, and the

falling down of the uvula.

COMA. In botany, is the top of a branch, or flower, or plant, or of the leaves of trees. Raii Hift. Also the hair of the head.

In Galen's Exegefis it is expounded by cataphora, and in his treatife of a coma, he fays, that coma includes every cataphora, both the fleepy and wakeful. By the word coma the author of Prorrheticon often expresses a lethargy. Some call the coma by the name typhomania, being fupposed to confift of a mixture of phrenzy and the lethargy. It is the coma formolentum of authors. In reality, it is a lefs violent degree of appolexy, in which the lofs of fen-fation is not fo confiderable. See Caros.

COMA AUREA. Frutex Africanus ambarum fpirans. GOLDEN LOCKS, also GOLDEN CUDWEED. See GNAPHA-

LIUM AUREUM, & ELICHRYSUM.

— VIGIL; called also agrypnocoma. A disease, wherein the patients are continually inclined to sleep, but scarce can. Blancard. See Caros.

COMAROIDES. See ARBUTUS.

COMARUS. See Arbutus.

COMATA. Under this name, Dr. Cullen hath an order in his Nofology, in the class neuroses. In this order he comprehends those affections which have generated the comprehends the compre order he comprehends those affections which have generally been called foporofe difeafes; but (he fays) they are most properly diftinguished by their confisting in some interruption or suppression of the powers of sense and voluntary motion, or of what are called the animal functions. These (he adds) are usually suspended in the time of natural sleep; but in all these diseases, sleep, or even the appearance of it is not constantly a symptom. There are also termed refolutiones nervorum.

COMBUSTIO and COMBUSTURA, from con and

See Ambustio and Calcinatio.

COMEDONES. A fort of worms. See BOVINA

AFFECTIO, and CRINONES.
COMETA. See ADRACHNE.
COMETES. See AMYGDALOIDES.
COMETZ. HALF A DROP.
COMISDI. GUM ARABIC.

COMISTE, COMISTIALIS MORBUS. The EPILEPSY. This quency of persons being seized with this disorder while in the assemblies called comitia. COMITISSÆ PULVIS. See CORT. PERUV.

tura benzoes comp. See BENZOINUM.

COMMI. Gum. When alone, it fignifies gum arabic. The χομμι λευχον mentioned by Hippocrates in his de Morb. Mulicb. is gum arabic.

COMMINUTIO. COMMINUTION. From comminer,

to break to pieces, also contritio. It is the reduction of any solid body into finer particles by any means whatever,

and is of two kinds, viz. contusion or pulverization, and | Complexus Minon, called also massidens lateralis,

levigation or trituration.

Subfervient to pulverization, where extremely fine powders are required, two fecondary motions are necessary, viz. fearcing and elutriation: the first is the passing of any pounded matter through a searce of a proper degree of fineness; the latter is by diffusing the powdered fubstance in a proper quantity of water; then decenting the liquor with the lightest part of the powder, Sec. as directed in the preparation of crude antiquor &c. as directed in the preparation of crude antimony. See ANTIMONIUM.

In powdering any fubiliance, care should be taken to accommodate the substance to the instruments: such things as will diffolve metals should be prepared in stone or glass mortars; very hard bodies will abrade soft marbles, to prevent then the mixture of the instruments made use of with the medicine that is prepared by them, such mortars, stones for levigating on, &c. must be chosen as cannot be affected by the uses they are em-

ployed in. Light dry fubstances, refins, roots of a tenacious tex-Light dry lubitances, feins, foots of a tenacious tex-ture, are more eafily pulverized if the mortar is previ-oufly rubbed with oil; camphor and cortex require a lit-tle water; tough fubitances may be grated or rafpéd; hard minerals, as flint, calamine ftone, &c. fhould pre-viously undergo an extinction, that is, fhould be made red-hot and then quenched in water; the alcaline and calcareous ftones need not this process, for they would thereby be converted into lime. thereby be converted into lime.

Some metals, if heated to a proper degree, are ren-dered brittle, and then by agitation are eafily powdered; of this kind is tin. This commination of metals is called

Simple as this pharmaceutic operation is, its importance is confiderable in medicine: refinous purgatives, when well triturated, are more easily foluble in the animal fluids, and operate more briskly with less irritation: antimony, finely powdered, discovers but little efficacy; but exquisitely levigated, is a powerful alterative. Mercury, and many other medicines, owe their virtue to commission.

Roots, and fuch other articles as confift of different parts, viz. a refinous, ligneous, &c. fhould be wholly powdered, and then the whole powdered fubflance should be well mixed together, for without this precaution one

part will be too active, and another too inert.

In levigating, fome fluid must be added to the levigated matter. Earthy and other hard bodies that are not foluble in water, must first be finely powdered in a mor-tar, then levigated with water on a hard marble stone,

tar, then levigated with water on a hard marble ftone, and afterwards dried on a chalk ftone.

Bezoar, on account of its colour, should be levigated with spirit of wine.

COMMISURA. A future, juncture, or joint.

COMMISSURES. The angles of the labire pudendæ above and below, or the point where the lips meet.

COMMOSIS. The first stratum of gummy matter with which bees line their hives. It also signifies that art which is employed in concealing natural imperfections with respect to beauty: this is distinguished from the cosmetic art, which consists in preserving the beauty which is natural. which is natural.

COMMUNICANTES FEBRES. According to Bellini they are two fevers which infest a person at one and the fame time, the paroxyim of one beginning as foon as

the other ceases.

COMMUNIS SAL. See MARINUM SAL.

COMPASSIO. COMPASSION. In Nofology is the fuffering of one part on account of an affection of fome other part: this is called fuffering by confent.

COMPEBA. So Actuarius and Myrepfus call CUCOMPEPER. SEES. See CUBEBA.

COMPRESSOR NARIS.

COMPLEXUS, called also Trigeminus. This muscle runs obliquely, rifing from the transverse processes of the

runs obliquely, rifing from the transverse processes of the fix inferior cervical vertebræ; and fix, feventh, or eighth fuperior dorfal vertebræ, it then directs its courfe up-wards, and is inferted into the concavity, below the transverse line of the occiput, and bends the head back. It sometimes receives a few slips from the spinal pro-cesses of some of the vertebræ of the dorsum. The

complexus being removed, we see the two recti and the two obliqui.

trachelo-masteidaus, & capitis, par tertium Fallopii. When the fplenius mufcle is removed, we fee the complexus and the complexus minor; the complexus is nearer the spine, and the complexus minor is under the upper edge of the splenius; it is various in different bodies. Albinus deferibes its originations twelve different ways: it rifes from the transverse processes of the three uppermost vertebræ of the back, and from the five lowermost of the neck, where it is connected to the transversalis cervicis, by as many thin tendons, which unite into a belly, and run up under the splenus: It is inferted into the middle of the posterior side of the mastoid process, by a thin tendon. Its we is to a fill the amelian by its inferted into the interest of the mastoid process, by a thin tendon. tendon. Its use is to affift the complexus, but it pulls the head more to a fide. Innes: COMPREHENSIO. See CATALEPSIS.

COMPRESSUS, from con and prems, to prefs together. Compression of the brain. See CEREBRI COMPRESSIO. COMPUNCTIO. See PARACENTESIS.

CONARIUM, consides, & consides corpus. The glandula pinealis is thus called from its shape being like that of a cone. See PINEALIS GLANDULA.

CONCAUSA. A cause which co-operates with an-other in the production of a disease.

CONCENTRANTIA. Abforbents of acids are fometimes thus named.

CONCENTRATIO. CONCENTRATION. To concentrate a body is to approximate its principal parts by removing those which keep them asunder, and which are not proper to the body concentrated. This word is generally applied to the dephlegmation of acids, and particuarly of

the vitriolic by distillation, and of vinegar by congelation.

CONCEPTIO. CONCEPTION. After all the conjectures, enquiries, observations, &c. to discover this process in nature, with many others, it is still only to be resolved into the divine contrivance. Dr. Berdoe, in his Enquiry into the Influence of the Electric Fluid, defines conception to be, "The first occult fensation by which the unformed being unites itself to its parent." He farther observes, that the foctus is not perfected at once, but passes through different gradations of its existence as follow

" 1st. The fecundating powers of the uterus are employed to collect the colliquamentum, in which the gone of Hippocrates is to establish the rudiments of the future embryo. This first division in the formation of the fortus, is perhaps the primitive attractive power of the ani-mated mucus, collecting together the first particles of the nervous fystem to form the cicatricula, medulla oblon-

gata, &c.
"This 2d division is what Hippocrates calls cuima, or

the conception, and is what conception is above defined to be.

"The 3d division in the formation of man was called embryon by Hippocrates; in this state it consists of a trunk without limbs, the expanding of which completes the embryo flate.

"The last division is called course, paidion, factus, or CHILD."

However fecretly conception is effected, its effect on those who are its subjects is very manifest by symptoms that immediately appear, particularly in the human spe-cies; all which are produced by a pretended introdulity being induced into the uterus, and indeed into the general habit.

See Malpighius, De Graaf, and Harvey; also Berdoe's Enquiry, Kirkland's Treatife on the Child-bed Fever, Hamilton's Outlines.

CONCEPTUS. The very first rudiments of the see-

tus in the uterus after conception.

CONCHA, A SHELL ANIMAL. Some confine this word to the shell, whilst others intend by it the animal with its shell. Some use it only to signify fishes with two shells, the history of which fort fee in the Spectacle de la Nature, tom. i.

Sea field-fish, when boiled, are eaten as wholesome food, and are alcalescent: their shells are absorbent; if calcined are not so, but become a quick-lime, possessing a lithontriptic virtue.

CONCHA ANATIFERA. These shell-fishes are thus called, because it was fabulously faid that a species of duck was formed in them.

- AURICULE. See AURICULA.

Egyptians to fmooth their linen, and by the Turks and

Greeks to polish paper.

— MARGARITIFERA. Thisword belongs to every shell-sish in which pearls are found; but because the best pearls are found in the East Indies, it is confined for the most part to the concha Indica magna, whose shells are moderately hollow, thick, and externally of a yellowish colour, rough, uneven, and not striated; internally they are smooth, and shine like pearls. It is a species of oyster, and is eaten raw or roasted. It is principally found in the Persian sea. The shell of this sish is the mater perlarum. It is also called cochlea margarisifera.

MATER UNIONUM. See MATER PERLARUM.
VALVIS ÆQUALIBUS. See MATER PERLARUM.
PERSICA. It is found in the Persian sea, and is of the bivalve kind.

· PICTORUM. So called from its shell being rasped

down for mixing up colours as an ingredient.

—— SAXATILIS. See CONCHITES.

—— STRIATA. The COCKLE.

—— VENEREA, VENERIS, or ERYTHRÆA. VENUS'S SHELL.

It is an univalve wreathed shell having a finall longitu-dinal and denticulated chink or aperture in it. It is also called concha porcellana, from its aperture refembling the mouth of an hog, and concha Cytheriaca, from Venus, who received the epithet Cytheraea from Cythera, a Gre-

As a medicine for these shells the cockle-shell may be

fubstituted.

CONCHA. A liquid measure among the Athenians, which contained half an ounce, or, according to fome, three spoonfuls, and others again say five spoonfuls, or fix drams. Galen says that the concha magna was the same as the acetabulum, which of liquid contained an ounce and a half, and in weight fifteen drams; and that the concha minor was half an ounce of liquid, and five

drams of weight.

CONCHÆ NARIUM INFERIORES, the inferior fpongy laminæ of the nofe. Also called Convoluta INFERIORA. They are fituated in the nafal fosse, one in each fide; they are suspended like the ethmoidal conclus, without resting on any thing. The inferior edges are the most considerable of their three edges; they are rough, thick, a little rounded, and turned outwards, that is, toward the os maxillare. By their anterior superior edge, they are joined to the anterior transverse eminences of the os maxillare; their posterior superior edge is the longest, and is joined backwards to the small transverse eminence of the middle portion of the os palati. See Winflow's Anatomy.

NARIUM SUPERIORES. So Winflow calls the inferior part of each lateral portion of the os ethmoides. Also named convoluta superiora and lamina spongiora in-

CONCHARUM ANTIFEBRILE. In Bates's Pharmacopeia it is thus directed: pour vinegar upon the muf-cle shells, and macerate them for twenty-four hours, wipe off the external mucus, dry and reduce them to a powder, during which operation add a spoonful of car-duus water, to prevent the light parts from slying off. A dram is a dose as a febrifuge and diaphoretic. CONCHISOLIA. See MANGA.

CONCHIS. Among the Romans its an entire bean wrapped up in its entire capfule.

CONCHOIDES. According to Breynius it is a bivalve shell-fish.

CONCHYLIA FOSSILIS. Fossile SHELLS. They

are lithontriptic.

CONCIDENTIA. A decrease of bulk in the whole or any part of the body, or the subfiding of a humour.

CONCOAGULATIO. The congulation, concretion,

CONCHA LEVIGATA, or LEVIGATORIA. A shell-sish it was first formed in, appears from the matter of the of an oval form, with a very smooth shell, used by the small pox and measles, both which are effectual in inocu-Egyptians to smooth their linen, and by the Turks and lating, in whatever state of the disease it is taken. And it is most probable that, in every infectious sever, the morbid matter, after assimilating some of the humours into its own nature, passes off in the same state that it was in when the body was first disordered by it. Far-ther, acrimony in the blood is not rendered mild by any process in our frame; on the contrary, it is always ex-pelled by some of the emunctories. And as to what is observed in pus, none of a kindly nature is formed whilst the heat of the body much exceeds the degree that is proper to health; but in its flead there is an ichor.

Sydenham's notion of concoffion was, that " the concollion of the febrile matter means no more than a preparation and feparation of the morbific from the found particles."

particles."

See Kirkland on Fevers, p. 14, 27.

CONCREMATIO. See CALCINATIO.

CONCRETIO. In Chemistry is the condensation of any study substance into a more solid mass, importing the fame as coagulation. In surgery it is the growing together of any parts which are separate in a natural state.

CONCURSUS. See Syndrome.

CONCURSUS. A CONCUSSION, from comenties, to shake. A jost or shock of the brain by blows or falls.

Extravalation and commotion, is what old writers, when they found no fracture or depression of the scull, and yet the patient died in consequence of the injury re-

and yet the patient died in confequence of the injury re-ceived, called a concuffion. A concuffion of the brain is a fudden and a violent motion thereof, and of the pia ma-ter, with fuch a fudden diftention of their blood-yessels. (occasioned by a determination of their contained blood, both arterial and venal, into one direction by the force of the accident) as occasions them to lose their power of propelling their contents as formerly, or of continuing the circulation of the blood as before. Mr. Deafe, in his Observations on Wounds of the Head, remarks, that the two carotid, and the two vertebral arteries, supply the brain with blood; that these arteries lose their strong elastic coats on entering the cavity of the cranium; that their capacities are enlarged, and their tunics become fimilar to those of veins. That elevation and descension we see, on exposing the dura mater, and which correfponds to expiration and to inspiration, gives us room to imagine the brain is not always in so close a contact with this membrane, as is generally supposed. From this disposition, he adds, we can readily conceive, how easily the conceifion, in consequence of fractures or smart strokes on the head, will be transmitted, so as to affect the vessels of the size of fels of the pia mater and brain. And the degree may appear from a temporary suspension of the faculties of the brain, to a total abolition of them, as happens when death enfues. Many of these cases are not attended with any immediate alarming symptoms, and yet those vessels will suffer so much by the shock, as to be rendered incapable, by their oscillating powers being weakened, to continue the circulation; and which, after some time, if not restored, will infallibly lay the soundation of their suture instammation. When we consider the infinite number of vessels that run through this viscus; the general communication that exists between them, we shall not be surprised that a great number may be obstructed, or rather rendered incapable of the office of circulation, and the sluids be suspended in them, and no immediate injury arise that will impede the sunctions of the brain. death enfues. Many of these cases are not attended with injury arife that will impede the functions of the brain, and, of course, the patient feel no present complaint. However, we know that our sluids cannot long exist in this fituation, without being liable to degenerate from their original mild nature, and become a principle of irritation, which will excite the furrounding veffels to quicker ofculations, so as to determine their fluids with redouof culations, fo as to determine their fluids with redouor any part of the body, or the subsiding of a humour.
CONCOAGULATIO. The coagulation, concretion,
or crystallization of different salts, first dissolved together
in the same sluid.

CONCOCTIO. Concoction. It is generally understood to be that work upon the morbid matter, by the
power of nature or affistance of art, as renders it fit for
separation from the healthy parts of our fluids, and to be
thrown out of our bodies. But this doctrine, at least in
fevers, is doubtful, if not fasse. That morbid matter
passes off from the blood in a crude state, or in the state

of culations, so as to determine their fluids with redoubled velocity towards the point irritated; and of course an
inflammation will succeed. Dr. Whytt, on the Motion
of the Fluids in the small Vessels, p. 240, says, an inslammation is not owing to an increased force of the
heart and large arteries, consequent upon an obstruction of
the small vessels, whether this arises from some obstructing matter overstretching their fibres, or acrid matter irritating them. Mr. Schmucker, in his Chirurgical Obfervations, published at Berlin, deserves to be consulted
on this subject. He observes, that in many cases of
wounds

wounds of the head, especially in those from gun-shots, which at first, and for many days after being inflicted, appear to be attended with no kind of danger, at last turn worse, and frequently carry off the patients. He adds, that on the opening the heads of such patients assume that on the opening the heads of such patients assume that on the opening the heads of such patients assume that in the suppuration of the pia mater, or ter death, either pus was found diffused upon the pia mater, or a gelatinous semi-purulent kind of matter was the ground, nor against any hard body, most frequently the ground, nor against any hard body, most frequently. appear to be attended with no kind of danger, at last turn worfe, and frequently carry off the patients. He adds, that on the opening the heads of such patients after death, either pus was found diffused upon the pia mater, or a gelatinous semi-purulent kind of matter was observed. Most frequently the brain itself appeared perfectly found. Mr. Schmucker attributes the loss of life in these cases, chiefly to an affection of the tunica arachnoidea, (i. e. upper lamina of the pia mater) and of different lymphatics. The contusion occasioned by gun-shot wounds, and fimilar accidents, produces always, he fays, an effusion and stagnation of lymph, which in eachectic and debilitated subjects, is with difficulty absorbed, and is commonly therefore either converted into pus or ichor.

It is often very difficult when an accident from exter-nal violence happens to the infide of the head, to know of what kind it is, and where is its feat: in fuch circum-flances confider the fymptoms; how the misfortune hap-pened, with any other circumstance that may throw light

on the case; formetimes the misfortune proves satal only for want of knowing what part is injured.

The signs of a concussion do not always appear immediately after the injury is received. Mr. Pott remarks. that the fymptoms attending a concussion, are generally in proportion to the degree of violence, which the brain it-felf has sustained; and which, indeed, is discoverable only by the fymptoms. If the concuffion be very great, all fenie and power of motion are immediatly aboliflied, and death follows foon: but, between this degree, and that flight confusion, (or flunning as it is called) which attends most violences done to the head, there are many stages. Sometimes a concession produces the same kind of oppressive symptoms as an extravalation, and the patient is either almost or totally bereft of fenfe; at other times, no fuch symptoms attend, but the patient gets no fleep at all, hath a wild look, an eye much like that of a perfon who hath long watched through apprehension and anxiety; talks much, and very inconfiftently; hath a hard labouring pulse, some small degree of sever, and sometimes an inclination to vomit; if not retained, the fometimes an inclination to vomit; if not retained, the patient will get out of bed, and act with a kind of frantic abfurdity, and appears in general much hurt by a ftrong light. Stunning is a flight degree of commotion, which foon goes off. Mr. Deale, in his Observations on Wounds of the Head, says, that if the instrument with which the blow was given, was not heavy, nor the force very great, the patient, after a few minutes, perceives no complaint more than might be expected from a simple wound. If the patient be attended it is very feldom that the surgeon will be able to determine the first days, whether any farther injury has actually taken place or whether any farther injury has actually taken place or not. The wound digefts as kindly, and the patient per-forms all the functions necessary to health, as well as be-fore he received it. In such as become afterwards affected, whether they underwent profuse evacuations, or were entirely left to nature, it made so very little difference as purated state of the parts underneath the cranium, that the variation could never be attributed to the treatment. The first symptoms that generally alarmed those patients who were brought to the hospital, were slight shiverings, attended with an inclination to puke. In some, this was preceded by a languor, accompanied with more or less sever, and often with a dull pain in the head, and melancholy look. The wound, in some, put on the appearance which Mr. Pott describes in his book on Wounds of the Head, p. 63. But this was not always the case, not that infallible sign of the instantion and putrefaction of the dura mater he makes it; nor did this appearance often take place, until the fever and other symptoms were far advanced. In some of the strictless of the course in such as the course, and other symptoms were far advanced. In some of the strictless in the part affected to be frequently well bathed; at the sintential sign of the instantial and other symptoms of the dura mater he makes it; nor did this appearance often take place, until the fever and other symptoms were far advanced. In some of the strictless of the course in such as the sum of the to the time or manner in which they were first invaded by the symptoms that usually attend an inflamed or sup-

the ground, nor against any hard body, most frequently causes a fracture or fissure, with but small comcussion; when a blow is given with such violence as to knock the person down, and his head hits the ground, if the skull is not thereby broken, a concuffion will be the confequence. If the head strikes against a hard immoveable body, in consequence of a fall from a considerable height, a concustion with an extravalation usually follows, and generally death is the consequence. A concustion of the brain feldom is attended, if ever, with extravalation, un-less when re-action follows the blow. A concussion with a fracture is lefs dangerous than one with a fiffure, be-cause in the first case the extravalation is lefs.

To diftinguish betwixt a concussion and an extravasation of and in the brain, is fometimes extremely difficult, though in many instances, very easy. The first stunning or deprivation of sense, whether total or partial, may be from either, and no man can tell from which; but when these first symptoms have been removed, or have spontaneously disappeared; if such patient is again oppressed with drowfines, or stupidity, or total or partial loss of sense, it then becomes most probable that the first complaints were from commotion, and that the latter are from extravafation. But when, after feveral days from the accident, at which time the fymptoms were inconfiderable, or foon paffed off; the watchfulness above noticed, &c. attends, the case is clearly a concustion. See

COMPRESSIO CEREBRI.

In those who recover from a commotion of the brain, the office of fome particular nerve or nerves is often deranged or deftroyed; as a fquint of one eye produced, which lafts for life; a diffortion of the corner of the mouth; an incapacity of tetaining the urine for a great length of time; and often a total incapacity through life of diffinguishing by the smell the rankest leek from the fweetest rose.

The cafe discovered, bleeding and antiphlogistics should be used, to prevent if not remove the inflammation; and if the injured part of the infide of the head cannot be difcovered, the chief dependence is on bleeding, purging, and fweatings

Bleeding may be performed in the temporal artery, or in the jugular vein, though generally from the arm fuf-

Except there is a depression of the skull, the trepan does not feem necessary. On this subject authors vary much.

Lenient purges, which operate with the least irritation, are of singular estimately; according to Job a Meek'ren and some others, they prevent an abscess forming itself in the lines, which for a singular than the lines which for a singular than the lines.

liver, which fometimes, when they are omitted, follows in confequence of a concuffion of the brain.

The diet should be cooling and slender.

If great heat is perceived in the head, apply thereto an

that infallible fign of the inflammation and putrefaction of the dura mater he makes it; nor did this appearance often take place, until the fever and other fymptoms were far advanced. In fome, these fymptoms made a rapid progress, so as to carry off the patient in a few days. In others, they seemed to advance more flowly, and were less severe although not less fatal. Mr. Dease goes on to observe, that he hath seldom seem these symptoms appear earlier than the eighth, or later than the fixteenth or severementh day, between the eighth and the fixteenth, being in general the period most to be dreaded. If the trepan was applied at any time after those symptoms took place, the appearance of the dura mater

emetics, he fays, are commonly attended with the best effects; venæsection, however, must always be premised to the use of these remedies.

Mr. Bromfield afferts the happieft fuccess in these cases from the use of Dover's sweating powder; after bleed-ing, if required, he orders the bowels to be evacuated by means of a clyfter, and then a fcruple of Dover's powder, the operation of which must be encouraged by putting the patient between blankets, and repeating it every twelve or twenty-four hours, according as the vio-lence of the fymptoms require. As it is chiefly from the attenuating property of the opium that relief is ex-pected, he uses such a proportion of the vin. antim. mixed with tinch. opii, as will be needful to keep up a diaphorefis when the violent fymptoms are allayed, and until fuch a freedom from complaint as needs no farther fimilar aid, is brought about: of this he gives ten or fif-teen drops every four or fix hours. As oft as the violent fymptoms return he hath recourse to the powder: and fuch was his fuccefs, that in more than a hundred cafes he fucceeded, and in two which were attended with fractures of the fkull, cures were thus effected without the use of the trephine. Mr. Justamond says, that the tre-pan is never required, and that the best we can do, is to leave the patient entirely at rest.

See Bohnium, in Renunciatione Vulnerum de Vibra-tione Cerebri; Berengarium de Commotione Cerebri; Monf. Bertrandi's Dif. on the Concuffion of the Brain, in Mont. Bertrand: S Dit. on the Conceptor of the Brain, in the 3d vol. of the Mem. of the Royal Acad. of Surgery; Wifeman's Surgery, book v. ch. ix. obf. x. Gooch's Cafes and Remarks, ed. 2. and Bromfield's Chirurgical Obf. and Cafes, vol. i. ch. i. Deafe's Obf. on Wounds of the Head; Pott's Works; Bell's Surgery, vol. iii. p. 132.

CONDENSATIO. CONDENSATION. It implies a

contraction of the cutaneous pores by means of cooling, drying, or aftringent medicines. It is also an inspiffation of any fort of fluid, whether in or out of the body: hence condenfantia medicamenta, are medicines that condenfe or inspiffate the juices.

CONDER. FRANKINCENSE OF OLIBANUM. See

OLIBANUM.

CONDIMENTUM. Artyma conditura. A CONDI-MENT OF PRESERVE. From condio, to feafon, pickle, or pswder. It fignifies whatever procures fweetness and a grateful tafte to any fubstance. But, in a more restrained fense, that is called condimentum which is used in preparing aliments, whether with an intention of rendering them palatable or affifting their digeftion. See CONDI-

CONDIO. To embalm; also conditura. The Latins call it pollincio. The practice of embalming is as ancient as the first record of the character of physician. See Genefis, ch. l. v. 2. In the Eaft it is still practifed, but feems not so general as formerly. On this subject fee Paré Dionis's Surgical Operations, Gooch's Treatife on Wounds, p. 456; Greenhill's Art of Embalming;

Bell's Surgery, p. 465.
CONDITUM. PRESERVES. They are made by fleeping or by boiling recent simples (of the vegetable kind) first in water, then in fyrup or a folution of sugar. The fubject is afterwards either kept moist in the syrup, or taken out and dried, that the sugar may candy upon it: this last is the most usual method. This art was formerly a branch of the apothecary's business, but now is wholly in the hands of confectioners.

The Latins and the latter Greeks meant by conditum a fort of mulfum, that is, a wine impregnated with honey and aromatics.

CONDITURA. See Condimentum; also Condio. CONDRILLA. See Chondrilla. CONDUCTIO, in Colius Aurelianus is a spasm or

CONDUCTOR, from conduce, to guide. A CONDUCTOR. It is an inftrument used in surgery for the direction of a knife when a finus is laid open. It is also a name of the instrument called a GORGET, which is used

name of the instrument called a GORGET, which is used the operation of lithotomy.

CONDURDUM. A plant mentioned by Pliny, lib. xxvi. cap. 5. He also calls it herba folstitialis flore rubro. Parkinson thinks it is the vaccaria, which Boerhaave calls lychnis segetum rubra foliis persoliatæ.

CONDYLI. Knots in the bones about the joints of

the fingers, which make them thicker.

CONDYLOID A. APOPHYSES. See MAXILLA IN-

CONDYLOMA, 2008 whos, a joint or tubercle. A tu-mor fo called from its refemblance to a condyle, a joint bent, or a tubercle. It is a hard eminence, which arifes in the folds of the anus, or a hardening or a fwelling of the wrinkles there. These tumors often happen in the orifice of the uterus, and other parts. It is variously de-fcribed in authors; one fays it is a tumor of the cuticle; another ranks it as an instance of farcoma. An anonymous French writer fays, it is in general a fleshy excrefcence which appears on the fingers, hands, feet, and principally about the anus, the perinaum, and the private parts of both fexes. He adds, that warts, the tumors called ficus, marifca, thymus, &c. are all but different inflances of condylomas.

It generally proceeds partly from a fault in the quality and partly from a fault in the quantity of the fluids flowing there. At first it is named a tubercle, but when hardened a condyloma.

Authors abound with unnecessary distinctions respecting tumors, &c. but all tubercles and fungi, whether within the verge of the anus or more outward, are all of the fame nature, and are cured by the fame method, whethe fame nature, and are cured by the fame method, whether ealled condyloma, ficus, fungus, crifta, or whatever edfe, and are tumors of the glandules of the part, which increasing, like a polypus of the nofe, prove troublesome, being often painful. Those who are troubled with the piles have them very much. They often appear in the pudenda from the lues venerea.

If the roots are small, a ligature may extirpate them; if broad, they are best removed by a caustic, if care is taken that it doth not injure any other part.

See P. Ægineta, Celsus, Heister, Turner, Wiseman; Bell's Surgery, vol. ii. p. 264.

CONDYLOMA CLAVUS. A CORN. See CLAVUS.

CONDYLUS. A CONDYLE. It is a knot in any of the joints, formed by the epiphysis of a bone. In the fingers it is called the knuckle. See PROCESSUS. In botany it fignifies the joints of plants.

CONEION. In Hippocrates it imports the cicuta. It is faid to be thus named from nayar, to turn round; because it produces a vertigo in those who take it internally. CONESSI, called also codago pala, conessi seca, cadaga pala, cadaguspali. It is the bark of a small tree growing in Ceylon and Malabar, and on the Coromandel coast, where it is called coness. It is blackish outwardly, and covered more or less with a whitish moss or scurs, which should be scraped off. To the taste it is gratefully which should be scraped off. To the taste it is gratefully auftere and bitter. When powdered and made into an electary, it is commended in diarrhocas; half a dram may be taken three times a day. When used it should be fresh powdered, for it soon loses its medical qualities under any form or preparation. When taken to restrain an alvine flux, an emetic of ipec. should precede its use-Those with whom a diarrhoea is frequent in moist weather are much benefitted by its use, if a dose is taken

morning and evening.

CONFECTA. COMFITS or SUGAR-PLUMS. Seeds or other fubflances incrufted with fugar. These, when impregnated with purging ingredients, are given to children when they will not take the usual forms of medicines.

CONFECTIO. A CONFECTION. In general it is any thing prepared with fugar. In particular it is the fame as conditum. These articles are also called dry confects. The word confectio, when alone, fignifies a fost electary. The dry confects are now a branch of the confectioner's business, though formerly a part in the apothecary's: they are dry substances, such as the roots of eringo, the peels of oranges, &c. which are incrusted with sugar, and are called candied root or peel. As to the soft electaries, the London College prescribes the following:

Confestio Cardiaca. The CORDIAL CONFECTION, now called Aromatica. The Aromatic Confection.

Take of zedoary in coarse powder, sassron, of each half a pound; diftilled water, three pints; let them macerate for twenty-four hours, then press and strain them. Evaporate the strained liquor to a pint and an half, to which add the fubfequent ingredients reduced to very fine pow-der; compound power of crab's claws, fixteen ounces; cinnamon, nutmegs, of each two ounces; cloves, one ounce; leffer cardamom feeds hufked, half an ounce;

double-refined fugar two pounds: and thus form the confection. Pharm. Lond. 1788. This is altered from of the last Dispensatory, and may be considered as an improvement. It is certainly an agrecable cordial, and car-minative, but flould not be long kept, as by that means it lofes its efficacy. This is fublituted for the confect or cordial of fir Walter Raleigh.

Confectio alkermes. See Chermes.

— Anacardii. See Anacardium.

— Aromatica. See Confectio Cardiaca.

Confectio Damocratis. DAMOCRATES'S CONFECTION. This was formerly called Mitbridatum, from Mithridates king of Pontus and Bithynia, who, after the example of Attalus of Pergamus, is faid first to have experienced the virtues of simples separately, and then combined them. But it should be noted that the original compound as prepared by this king, consisted of but a few ingredients. Serenus Samonicus fays, that when Pompey took the baggage of this prince, he was furprifed to find that this antidote confifted of only twenty leaves of rue, two walnuts, two figs, and a little falt. Of this he took a dofe every morning, to guard himfelf from the effects of poifons. It is now, however, very judiciously thrown out of the London Dispensatory of 1788.

OPIATA. See PHILONIUM. —— SAPIENTUM. See ANACARDIUM. CONFERTUS. See ATHROOS. CONFERVA. A barren kind of mofs, deflitute of

little flowery heads, and even of those bodies and tubercles which some other kinds are furnished with instead of them, and confifting only of round, finooth, and uniform leaves, or rather little stalks divided into fine capilaments. Ray, in his Synopsis, describes three forts.

CONFIRMANTIA MEDICAMENTA. Medicines

which reftore or confirm the strength of the body, or any part of it: or medicines which faiten the teeth in their

fockets.

CONFLUENTIA. A term used by Paracelsus to express the agreement, conjunction, or confederation of the microcosm with the stars, or of a disease with remedies?

CONFORMATIO. CONFORMATION. Some difeases are called morbi make conformationis, or organical difeafes; that is, which depend upon the ill conformation of the parts. These, if external, may admit of a chirurgical cure; and proper exercife, regimen, and medicines may fometimes contribute much to the relief even of those which are internal, or at least may render them

fupportable.

CONFORTANTIA. See CARDIACA.

CONFRICATIO. In pharmacy, is the reducing of any eafly friable fubflance to powder by rubbing it with the hands, as flarch, for instance: or it signifies the rub-bing any fost and succulent vegetable with the hands, to

express the juice.

CONFRICATRICES. Lascivious women, who gratify their luftful desires with what the Greeks call coaces, enis coriaceus, and hence plunge themselves into a va-

riety of chronic difeases.

CONFUS Æ FEBRES. Bellini fays he met with fuch, and that they were two fevers attending at the fame time, beginning and ending together, but so confusedly as not to be diffinguished.

CONFUSANEUS PANIS. Bread made of meal,

from which the bran has not been separated.

CONFUSIO. A diforder of the eyes, which happens when, upon a rupture of the internal membranes which include the humours, they are all confounded toge-

CONGELATI, or CONGELATICI, or CONGELATIO. Persons afflicted with a catalepsis are so called. See CATALEPSIS.

CONGELATIO. CONGELATION; also CONGLACI-ATIO; COAGULATIO. It is such a change produced by cold in a sluid body, that it becomes condensed; thus

Conglociation is when a liquid is converted into ice.

Water is rarefied or expanded by congelation; but pinguious bodies and fixed metals are rendered more com-

pact by it.

The condensation of any liquor by setting it in a cold place is called congelation.

The stones produced in some caverns from the drops

petrifying waters are called congelations. CONGELATIVA MEDICAMENTA.

which ftop fluxions, infpiffate and dry.

CONGELATUS. Frozen, or froft-bitten. Perfons thus affected by the cold are compared to cataleptic patients, but ftill there is much difference between a cata-

lepfy and a frost-bitten cafe.

Cold braceth up the body when applied to it in a cer-tain degree; upon this conftriction being increased, the humours are carried in a larger quantity to the internal parts, and are principally accumulated in the head, they ftagnate in the vessels of the brain, and diftend them: hence they produce a stricture in, or a compression on the nerves that arise from the brain, which is the origin of a catalepsis, attended with an abolition of the senses. The cold continuing, with its effects just mentioned, at length there is an extravalation of the blood or ferum in the head, by which the cerebellum is compreffed, whence death enfues, which is ushered in by a lethargy, ending in an apoplexy.

When a man is pierced with cold, so as to be benumbed, if he attempts to warm himfelf by the fire, pains are prefently produced in the part exposed to the heat, and a mortification is too often the consequence; just as is seen in frozen fruit, which if put into cold water that is near freezing, it recovers, but if put into warm water, or in a warm place, it foon rots; and if men, when too feverely affected with cold, would first put the frozen part into cold water, or cover it with fnow, until a fense of warmth is perceived, or some degree of motion returns, at which time a little warm wine, mixed with camomile tea, might be drank, or either of these alone, and then proceed gradually to allow of warmth, a mortification would be

avoided.

When travellers begin to be drowfy in the cold, they should redouble their speed to extricate themselves from danger; for though their sleepiness is easy, it is often

fatal.

The heat of our bodies, when in health, exceeds that of the ambient air, even in the hottest weather; whence a confiderable degree of cold is required to freeze the foft parts of our bodies: it is because our extremities are the coldest parts, that frost always affects them soonest. And when a mortification from cold approaches, Van Swieten observes, that the part affected by it is first pale, then red; this reducis is attended with a troublesome pain,

and a violent itching; after this the colour becomes al-most purple, and at last black.

That sudden heat applied after extreme cold, should produce the fame fymptoms and confequences, will be readily understood by what follows. As water cools it condenses, until it comes to the freezing point; but in the act of congelation it expands with a violence that nothing can resist. When a person goes into the cold air, his fluids are gradually condensed, the vessels collapse, and the skin is pale, the circulation again pushes the blood into the arteries, whose contracted extremities allow it into the arteries, whose contracted extremities allow it only to pass slowly, and make the skin look red; also produces an itching, because of the obstruction that it meets with; the blood being pushed from behind, whilst the obstruction is increased before, a livid colour is produced, and a tingling pain; at last the circulation being stopped, a gangrenous black finishes the scene, with a loss of all sensation, the vessels being stretched far beyond their natural dimensions by the frozen juices. In this case, applying of cold water dissolves the frozen juices, and condenses them; thus the vessels have room to contract, and are assisted in so doing by the coldness of the water: after this, if warm diluting liquor is drank, a water: after this, if warm diluting liquor is drank, a diaphorefis is produced, and all danger is overcome; if warmth is applied at the first, the outer parts are quickly thawed, but the inner vessels still obstructed, soon burst by the rarefaction of their contents, and destruction to

the part is inftantly produced.

See Tiffot's Advice to the People; Van Swieten's Com. on Boerh. Aph. 422, 427, 454. Med. Muf. vol. i.

CONGENERES. When spoken of muscles, it imports those which concur in the same action

CONGENSIBUS QUIQUOAQUI CONGO, i. e. Cara.

CONGER, or Congrus. The conger-eel. It is a large fea-cel. It is often called the fea-ferpent.

CONGESTIO. Congestion, or collection. From congers, to gather into a heap. A fwelling which gradually arifes, and takes time to ripen; in opposition to that bifluxion, which foon is formed, and foon terminated.

CONGIUS. A GALLON. This is a very ancient meeting and is generally faid to have been equal to ten

measure, and is generally said to have been equal to ten pints of wine, and nine of oil. The Athenian congius, or conchus, weighed nine pounds, and the Roman weighed ten, or contained ten Roman pints of wine. In the London and Edinburgh Difpenfatories the gallon is

only eight pints.

CONGLATIATIO. See Congelatio.

CONGLOBATA GLANDULA. A conglobate GLAND, from conglobate, to gather fingly into a ball. All the glands are either conglobate, or conglomerate. A conglobate gland is a little fmooth body, wrapped up in a fine fkin, by which it is feparated from all other parts, only additions an artery and a perse to page in, and siving additions an artery and a perse to page in, and siving admitting an artery, and a nerve to pass in, and giving way to a vein and excretory canal to pass out. Of this fort are the glands of the brain and the testes.

Under the title of conglobate glands Winflow includes the lymphatic glands alone; and he calls all the other conglomerate. See Winflow's and Keil's Anatomy.

CONGLOMERATA GLANDULA, from conglomerate, to heap up together. A conglomerate gland is composed of many little conglobate glands all tied together, and wrapped up in one common membrane. Sometimes all their excretory ducts unite, and make one common pipe, through which the liquor of all of them runs, as the pancreas and parotids do. Sometimes the ducts uniting form feveral pipes, which only communicate with one another by crofs canals, and fuch are the mammæ. Others again have feveral pipes, without any communi-cation with one another, of which fort are the glandulæ lachrymales & proftate; another fort is, when each gland hath its own excretory duct, through which it transmits its liquor to a common basin, as the kidneys. See Winslow's and Keil's Anatomy.

CONGLUTINANTIA. Healing medicines, from

conglutino, to glew together. CONGRUS. See Conger.

CONIA. LIME, xerra, when joined with reare, it

imports lixivium, or ley of vegetable afhes; also wine impregnated with fir. Dioscorid lib. v. c. xlviii.

CONIFERÆ ARBORES. Conferous trees. They are such which bear cones, as the cedar, fir, pine, &c.

CONILE. See MYRRHIS. So called from its refemblance to sarrior, bemlock.

CONIS, xoys, duft; fine powder; aftes; a nit in the hair; fourf from the head; and fometimes it fignifies lime.

CONISTERIUM. See APODYTERIUM.
CONIUM MACULATUM. See CICUTA, MAJOR CONJUNCTA CAUSA. The conjunct caufe, or the

immediate caufe. See CAUSA.

—— SIGNA. The pathognomonic figns of a difeafe are fo called.

CONJUNCTIVA TUNICA; called also circumcahealis. See Adnata.

The conjunctiva is erroneously confounded with the adnata; they are two diffinct coats, and both but partial coverings of the fore part of the eye, though the conjunc-

The adnata, also called albuginea, is thus formed; five of the muscles which move the eye, take their origin from the bottom of the orbit, and the fixth arises from the edge of it; they are all inferted by a tendinous expansion into the anterior part of the tunica felerotica; which expanfion gives the whiteners peculiar to the fore part of the eye. It lays betwirt the iclerotica and the conjunctiva.

The conjunctive is a thin transparent membrane, which lines the inner furface of the eye-lids, and, at the edge of the orbit, has a fold, and is continued forward, over the anterior half of the globe of the eye. It is exterior to all the other coats of the eye, and connected with the albu-ginea, by means of a cellular fubftance; from which it may eafily be separated in the dead subject by diffection. See Ware's Remarks on the Ophthalmy, &c. p. 5. some call it the mucous coat.

CONNA. See Cassia Fistularis.

CONACARPODENDRON, allfo called chrysocarpo-dendron. The SILVER-TREE. It is a native of the country of the Hottentots. Boerhaave mentions ten species. See Miller's Dict. vol. ii.

CONOIDES, from xorse, a cone, and sides, shape. See

CONARIUM.

CONOIDES CORPUS. The GLANDULA PINEALIS, which fee.

CONQUASSATIO. CONQUASSATION. In pharmacy it is a species of comminution, or an operation by which moift concreted fubstances, as recent vegetables, fruits, the softer parts of animals, &c. are agitated and bruifed, till partly by their proper fucculence, or by an affusion of some liquor, they are reduced to a soft pulp.

CONSERVA. A conserve. Conferves are compo-

fitions of recent vegetable matters, and fugar, beat toge-

ther into one uniform mass.

On account of the large quantity of fugar contained in conferves, it is obvious that their use in medicine can only be auxiliary to other more efficacious drugs. The conferves of lavender, rosemary, orange and lemon peels, are the best of all others. A useful dose may be taken of

Mucilaginous fubstances, if mixed with fugar, become glutinous; aftringents become foft; bitters are every way improper for this form; and lightly flavoured vegetables foon spoil: fo none of these are proper to make con-

The general observation for properly making conferves are but few: I. Leaves are to be picked from their stalks.

2. Flowers are to be separated from their cups.

3. When the flowers or leaves are properly prepared, they must be beat into an uniform mass, in a marble mortar, with three times their weight of powdered lump fugar.

Orange peel may be rafped, or ground in a mill, and

then beat up with the fugar.

Rofes are to be ground before being beat up into a con-

CONSERVATIO. In pharmacy, the fame as after-vatio, it is preferving, pickling, or keeping from putre-faction, and evaporation, by the addition of fome other fubstance.

CONSERVATIVA MEDICINA. That part of medicine which relates to the preservation of health.

CONSILIGO. SETTER-WORT. Sec HELLEBORAS-TRUM.

CONSISTENTIA. When used with respect to dis-ease, it imports the state or acme thereof. When applied to the humours, excrements, or excretions, it imports their confiftence.

CONSOLIDA. COMFREY. Of this there are many species.

CONSOLIDA MAJOR, called also fymphytum majus, GREATER COMFREY.

GREATER COMFREY.

It is the fymphytum officinale, or, fymphitum fohis ovato-lanceolatis decurrentibus, flore purpureo. Linn.

A rough hairy plant, with large, fomewhat oval, pointed leaves, producing on the tops of the branches fpikes of white or purplift pendulous, nearly cylindrical flowers, followed each by four thining black feeds. The root is thick and fleshy, black on the outside, and white within. It is perennial, grows wild in moist grounds, and flowers in May or June. There is a fort with purple flowers, but it is rarely met with. The purple and the white flowers are but varieties of the fame species.

The whole plant is used, but the root is the only part

The whole plant is used, but the root is the only part that deferves much notice; it gives out to water by de-coction about two thirds of its weight of mucilage, that is almost void of smell and taste, and similar to that from the althæa, but more tenacious; whence in all the purposes for which the althra root is used, the comfrey is to be preferred. This mucilage is its only medicinal prin-ciple. See Lewis's Mat. Med. Neumann's Chem. Works.

CONSOLIDANS. CONSOLIDATING. This is applied to medicines that produce new flesh, from confolido, to make firm.
CONSPERSIO. See CATAPASMA.

CONSPICILIUM, or Conspicillum. A PAIR of SPECTACLES.

These helps to the sight are with convex, concave, or slain glasses. The first magnifies the objects looked at, the fecond diminishes them, and the third are called conferves, being made of white or green glass, for preserving

It is a caution of importance not to use spectacles too foon; and, when they are begun with, not to change them too often, for it may happen that in time none can

be obtained that will fuit.

Sometimes after the use of spellacles during some years, it has been known that the crystalline reassumes its proper form, fo that they are no more required: See Martin's Effay on Vifual Glaffes.

CONSTANS. When applied to the ftrength, or vital powers, it imports firmness, or a good condition.

CONSTELLATUM UNGUENTUM. It is an oint-

ment made of earth worms, cleanfed, dried, powdered, and mixed with the fat of boars or bears.

CONSTIPATIO. See Constipatus, Stomachus,

ADSTRICTIO, and OBSTIPATIO.

CONSTIPATUS. Costive. Dr. Cullen gives this diforder the name of shiftpatis. A person is faid to be coffice, not only when the excretion from the intestines does not daily happen, but also when what is discharged is too hard to receive its form from the impress of the rectum upon it.

Hoffman fays, that cofficency is generally owing to fpafms in the intestines themselves, or as propagated by consent; but various causes conduce to this habit, as an inert bile, acidity prevailing greatly in the first passages, coldness of the feet, fitting much, especially if the body is to be bent forwards, working with vigour, drinking but little, and that after a full meal, &c.

This habit of body is generally attended with head-ach, vertigo, difagreeable talte in the mouth, a diffelish of food, and as it is a fure step towards chronic complaints, hath, in different persons, very various effects. In costive bodies, the moisture which should be discharged with the excrements is abforbed into the constitution, and though a strong perspiration may discharge some part of it, yet the groffer part remains by which much terrestrial matter is lodged in the blood, which fails not to produce one diforder or another, as it happens to be at last thrown on one or another part.

The costiveness peculiar to studious people is much relieved by alkaline falts, or the ol. ricini. Artificers who fit much, and work with their bodies leaning forward,

are belt relieved by the fame.

In melancholic cases, alkaline salts answer the best if long continued, for they leave no effects which tend to

render the body coffice.

Women during pregnancy are fometimes coflive from the prefiure of the child's head against the rectum. Early care should be had to prevent an accumulation of freces by a due administration of the milder purges, for rugged ones are to be absolutely rejected in this case.

Old people, from the weakness of their muscles, have hard fæces collected in the rectum; and notwitstanding they take laxative medicines, which procure a discharge of what is thin, the indurated matter still lodges except

manual affiftance is given.

Aloes given in fmall dofes proves fufficiently laxative, and this effect is continued longer after its use than is obferved with respect to any other medicine; and when flatulencies are very troublesome, if a little assa foetida is joined therewith, more confiderable relief may be expected.

Calomel very much prevents other purging medicines from leaving cofficents behind.

Habitual costioness hath been much leffened both by

the cold and hot baths, also by early rising and walking in

In the Lond. Med. Obf. and Inq. vol. iv. are two cafes of costiveness, which refemble diarrheeas.

CONSTRICTOR ALÆ NASI, also called depreffer labii fuperioris. Fallopius first described these, though Placentinus assumes the first discovery. They rise sleshy below the root of the nares, immediately above the gums of the dentes incifforii, and afcending transverfely, are in-ferted into the coats of the alæ nafi, and the superior part

of the upper lip.

—— ANI. See SPHINCTER ANI.

—— ISTHMI FAUCIUM. From the uvula two arches where run down, and there is a cavity between them, where the tonfils are lodged. The anterior arch goes down to the basis of the tongue, and is thus called; the other paffages down the palatum molle, and goes to the pharynx; whence it is diftinguished by the name of palatopharyngæus...

CONSTRICTORII. Difeases attended with conftriction.

CONSTRINGENTIA. ASTRINGENTS. CONSUETUDO. CUSTOM. Also bexis.

In medicine this chiefly respects the non-naturals, and produces habits which sometimes are pernicious. Custom fometimes increases the efficacy of applications, though sometimes the contrary happens. When enform hath formed an habit that is improper, it is best to remedy it by degrees. See Fordyce's Elements, part i. p. 58, &c. CONSUMMATUM. The French call it conformed.

It is a broth fo strong as to concrete into a jelly when cold. Frequent mention is made of it in the French medicinal

CONSUMPTIO. See PHTHISIS. CONTABESCENTIA. See ATROPHIA.

CONTAGIO vel INFECTIO: CONTAGION, OF IN-FECTION. Of diforders from infection, some require an immediate contact with the bodies of the infectel, as in the case of the lues venerea, and the small-pox, as also the measles, which require at least an approach within the reach of the essure from an infected body. In other inflances the infection is forcad by more general causes, fuch as the air, diet, &c. Of these there are three kinds, which differ only in their being more or less in quantity, and are all curable by the fame means, applied in different degrees. These infectious effluvia spring from either fermenting vegetable fluids, putrifying animal or vegetable bodies, or mineral exhalations. And it is remarkable that each of these alike are destructive of slame.

It is by the destruction of the vital principle in us, that infellion proves fo fatal; it is thus that fome poifons fo

foon destroy us.

According to the kind of effluvia and its degree, different diseases are produced, e. g. where mineral exhalations prevail, nervous colics, nervous and intermittent fevers, peripneumonia, notha, &c. When putrid ones are diffused in the air, scurvies, plagues, gangrenes, &c. are the consequence. These are called somites.

At every inspiration these effluvia are taken into our bodies, and thus produce their ill effects. They are fwallowed with our food, by which their quantity being increafed, their power of action is also greater, possessing an affimilating property too, no wonder that destruction is fo fpeedy, as in many instances is observed. See MIASMA.

In thort, fo fimilar are the effects of infection and poifon, that they may be confidered as the fame, differing only in their modes of communication. See VENE-NUM.

See on this subject Mead on Poisons, effay the fifth;

and Shebbeare's Theory and Practice of Physic. Cullen's matic smell; a rough, bitter, penetrating taste; and, when chewed, they give out a sweetish kind of acrimony.

CONTEMPERANTIA. See TEMPERANTIA.

CONTENSIO. It fometimes is used to express a tendon or stricture.

CONTENTA. CONTENTS. By these are understood any fluids contained within a folid part of the body.

CONTENTUS. STRETCHED.

CONTINENS FEBRIS. A continual or a continent fever, which proceeds regularly in the fame tenor, without either intermission or remission. This happens rarely

CONTINUA FEBRIS. A CONTINUED FEVER, attended with exacerbations, and flight remissions, but no intermission.

CONTORSIO, from contorqueo, to turn afide, Con-TORTION. In medicine this word hath various fignificaincomplete diflocation. 3dly, A diflocation of the verte-bræ of the back fideways, or a crookedness of them. 4thly, A disorder of the head, in which it is drawn to one fide.

CONTRA-APERTURA. A Counter-opening. This is fometimes necessary in wounds made by puncture, or a bullet, &c. to discharge what is contained in them, or to prevent their growing filtulous. The circumftances requiring this procedure are so various, as to demand the fagacity of a furgeon, in order to a proper procedure: however, in general the opening is made by paffing a trochar, or fuch like inftrument, to the bottom of the wound directing its point to the nearest skin, and continuing it through, fo as to make the old and the new aperture one continued pallage: or, secondly, by cutting through the skin, &c. directly upon the intruded body, or upon the button of the probe, which may be introduced to the bottom of the wound to direct the incision. See

Petit and Heister's Surgery.
CONTRACTURA. CONTRACTURE. An immo bility of any of the joints, induced by a preternatural contraction of some of the muscles destined in a natural state to move them; or from some derangement of the

offeous or ligamentous parts about the joint affected.

Dr. Cullen ranks this as a genus of difeafe in the class locales, and order dyscinesiæ. He distinguishes two species.

1. Contrastura primaria, from a rigid contrastion of muscles, termed also obstipitus.

2. Contrastura articularis, from rigidity of the joint.

Dr. Aitken observes that joint contraction (as he terms this diforder) is most frequently symptomatic: and when it depends on muscular contraction only, he advises the tepid bath, and deligation, and counteraction by weights, hung in due proportion, to oppose the contraction. CONTRA-FISSURA. CONTRA-FISSURE.

crack in the skull, opposite to where the blow was given; suppose the blow received on the right bregma, the fiffure is occasioned in the left. See FISSURA.

CONTRAHENTIA. Medicines which shorten and

reckoned the only medicines which do this.

CONTRAINDICATIO. See ANTEN-DEIXIS.

CONTRALUNARIS. An epithet given by Dietericus to a woman who conceives during the menstrual discharge.
CONTRA-VERMES, (SEM.) See SANTONICUM.

CONTRAYERVA, called also Drakena, Cyperus, longus odorus & inodorus Peruanus, dorftenia, bezoardica radix. COUNTER-POISON. It is the dorftenia contrayerva, Linn.

This root was first brought into Europe about the year 1581, by fir Francis Drake, whence its name Drakena. It is the root of a small plant which is found in Peru, and other parts of the Spanish West Indies. There are two kinds, the one placenta ovali, the other angulari & undu-lata. That fort which is generally brought to us is about an inch or two long, half an inch thick, full of knots, furrounded on all fides with numerous long tough fibres, most of which are loaded with fealy knobs, of a reddish

They are diaphoretic and antifeptic; of use in low neryous fevers, and those of the malignant kind; though taken freely, they do not produce much heat.

Dr. Cullen fays both this and ferpentaria are powerful ftimulants, particularly the last, and both have been employed in fevers in which debility prevailed. However he thinks wine may always supercede the stimulant power. of these medicines, and that debility is better remedied by the tonic and antiseptic powers of cold, and Peruvian bark than by any flimulants. By the affiftance of heat, both spirit and water extract

all their virtues, but carry little or nothing over with them in diftillation; extracts made by inspillating the decoction retain all the virtues of the roots.

The London College directs the following preparation.

Pulvis Contrayervæ Compositus. Composund Powder of Contrayerva.

Take of the compound powder of crabs claws, a pound and a half; of contrayerva root, five ounces: mix, and make them into a powder. Pharm. Lond. 1788.

This powder was formerly made up in balls, and called lapis contraverva. It is excellent in the decline of ardent fevers, and through the whole course of low and nervous

The rad. ferp. V. in all cafes may be well fubfituted, for it excels the contrayerva. See Lewis's Mat. Med. Neumann's Chem. Works. Raii. Hift. and Cullen's Mat.

CONTRAYERVA NOVA, OF MEXICAN CONTRAYERVA. It was introduced into Europe after the above fort, and is brought from Guiana, as well as from Mexico. The root is longish, about two fingers thick, externally rough, and of a brownish colour, internally white, with a pith in the middle of a fweetish aromatic taste, and but little inferior to the fort introduced before it.

- ALBA. See ASCLEPIAS.

CONTRITIO. In pharmacy is the fame as commi-

CONTUSA, from contundo, to knock together. Contufio, contusura, collisio. Contused wounds, contustions, or brusses.
When any part is bruised one of these two are always confequent, and commonly both happen together; either the small blood-vessels of the contusted part are broken, and the blood they contained is spread about in the adjoining parts, or elfe without fuch an effusion of it, these veffels have loft their tone, their active force, and no longer contributing to the circulation, their contents stagnate. In either of these cases, if nature, either with or without the affiftance of art, does not remove the impediment, an inflammation comes on, followed by an imperfect unkindly suppuration, with putrefaction or gan-grene. Beside which there are peculiar symptoms from the injury done to a nerve, a blood-vessel, or a bone.

CONTRAHENTIA. Medicines which shorten and strengthen the fibres. Aftringent medicines are generally reduced to three classes; for, reckoned the only medicines which do this.

CONTRAINDICATIO. See Anten-deixis. abolished which depend upon a due and determinate mo-tion of the fluids through the found vessels. Or,

Secondly, The discharged humours collected either in the natural or preternatural cavities of the body, by their bulk and quantity preis upon the adjacent parts, and either totally deftroy or at least difturb their respective functions.

Thirdly, The humours thus discharged, may, by their continuance and stagnation in the cavities, acquire such a degree of acrimony as to corrode and deftroy the adja-

when the internal parts are bruifed, and the external integuments are entire or confine the extravalated fluid, the confequence is, 1. An echymofis. 2. A fpurious aneurism. 3. A sugillation. 4. Ulcers and gangrenes. 5. A caries. 6. A scirrhus, or a cancer.

Boerhaave observes that contusions on fleshy parts may brown colour on the outfides, and pale within.

The tuberous parts of these roots are the strongest, and should be chosen for use. They have an agreeable around a gangrene in all the parts below the injured part,

Contustions from gun-shot wounds are not so dangerous from the destruction of the injured vessels and the consequences thereof, as from the general concussion that the whole body fusiers from the air which is violently impelled against it, and from this concussion it is that most of the grievous fymptoms proceed, which are confequent on

wounds or bruifes from fire-arms.

In no cafe should we be more cautious of pronouncing the event of any difaster than where a concussion or a con-

twiss happens, and where both may have occurred, the caution, if possible, should be greater.

Bohinus de Rununciat. Vulner. § 2. cap 1. gives the following case from Paaw: A man was struck on the bregma; on examination no fracture was found nor fif-fure, and he continued vigorous, during ten months after, when, being feized with a vertigo, he dropped down, and foon after died: on opening his cranium, in the place where the blow was received, the bone and membranes of the brain were putrid and fetid. Similar inflances have occurred to others in their practice, and the fame happening to any other bone, by affecting the marrow, may be as deftructive as in the cranium. When bruifes are received inwardly it is not easy to judge readily of the extent of injury done by them, and when the case becomes more manifest, it is too late to attempt relief.

In order to the most effectual relief, remedies must be

used that diffolve coagulated fluids, and that restore the

tone of the veffels.

For external use, where the skin is not much destroyed, a mixture of tharp vinegar, with twice it quantity of water, may be applied frequently by means of linen cloths wrung out of it, and as often as they dry moistened again. Spirituous applications should not be used, except where the fole intention is to firengthen the injured fibres; in flighter cases a small quantity of spirit may be mixed with vinegar, and used on the first reception of the bruise.

If on account of a tumour or wound a poultice is ap-

plied, the common bread poultice is the beit.

If the bruife is confiderable, and particularly if any internal part is affected, bleed as freely as the conftitution will admit; direct a cooling liquid diet; let clyfters be repeatedly injected, if the lower belly be the feat of comrepeatedly injected, it the lower beny be the leaf or com-plaint; and, in all cases, repeated gentle purging is of the greatest advantage; of all the purging medicines per-haps none excel the volatile tincture of aloes.

The advantages of the tinct. opii externally as a re-folvent, of Dover's powder, and the anodyne antimonial drops recommended in the article Concussio, deserve

the fame attention when contusions happen, and on the

fame principles.

CONVULSIO. A CONVULSION, or involuntary contraction of the mufcles, from convello, to pull or haul

ogether. Called also Hieranofos.

Of convulsions there are different species, as the epilepsia, emprofibotonos, opisibotonos, tetanus, &c. Dr. Cullen places this genus of disease in the class of neuroses, and order spasmi. See Spasmus clonicus.

The brain and its expansions, the nerves, are the feat of these disorders. Primarily, any nervous part is the seat, as the stomach, and, as frequently as any other, the duodenum, which being irritated by its contents, convulsions

are the consequence.

Weakly habits with impure juices are most subject to these affections; those with choleric temper, acute genius, and a delicate turn of mind, are all liable to attacks of this kind.

The immediate cause of convulsions is generally distinguished from the immediate cause of an epilepsy (which yet is a species of convulsion) by being seated differently; or rather the convulsion and epilepsy are said, to differ thus, a spasm of the coats of the medulla spinalis is the immediate cause of convulsions; in the dura mater, of the epilepsy. The mediate causes are passions of the mind, uneasiness in the stomach and bowels, or other nervous parts; and among the material causes are, worms, acrid medicines, a repulsion of morbid matter from the super-ficies of the body inwardly, wounds, dislocations, &c. In infants, whose disorders of this kind are symptomatic,

an acrimony in the contents of the bowels is the general cause, though the pain excited by the teeth passing through

the gums is also a frequent one.

Sometimes convulsions attack fuddenly, at others their approach is indicated by certain fymptoms; fuch as coldness of the feet, or a sense of formication, which also seizes the os coccygis, and like a cold vapour ascends through the spine of the back; the left hypochondrium is affected with tensive and flatulent pains, and a costiveness attends; It is a veffel refembling an inverted come, made of brafs or iren and is used for separating reguluses from their sections are perceived, and in different patients other tize; for while the suite is pouring into the crucible it is struck with a mallet, in order to produce a tremulous motion in it, by which the heavier parts fall to the bettom.

CONVALLARIA The trive of green and some continuing longer, in others pass off sooner, and souther the structure is after the fit there continues in some a confidence of the structure is after the structure. fiderable langour; though in others this is not complained of; delirium, fleepiness, vomiting, or other fymptoms fometimes follow upon the departure of a convulfive paroxyfm, and there are causes in which little or no sensible

uneafiness is perceived on recovery from it.

Infants, while in that state which so generally subjects them to convulsive diforders, and particularly when difposed thereto, are attended with a cough, vomiting, or 3 Z

diarrhora; their features are at times difforted; a bluenefs ately be administered, and a generous nourishing diet appears about their eyes and upper lip, and twitchings or allowed. startings are often observed, particularly a contraction of the fingers into the palm of the hand, and during the in-tervals of the fits they are drowfy. As death draws nigh the convulsions are more frequent.

Convulsions, as diftinguished from an epilepsy, should not be confounded with those that constitute the epilepsy,

or are accompanied therewith.

These disorders often degenerate into a melancholy, or

The indications of cure are, to correct or to discharge the material cause, to allay the spasm, and to strengthen the nervous fystem.

In the fit there can be but little done. The only cases that require immediate assistance in the fit are, when it is fo violent as to fwell the neck, and the face becomes red, and there feems to be danger of an apoplexy; also when convulsions seize pregnant women, and labour at the same time comes on; in this latter instance delivery must be

haftened as the only cure.

Dr. Bland thinks that convulfions in pregnant women, and during labour, have nothing peculiar in their cause from those which happen to women differently situated; and though external agents, particularly violent affections of the mind, may fometimes, as at other periods, excite them; yet this will rarely happen, unless there is fome peculiar vice in the constitution, disposing to them: and, from observation, he thinks, he is justified in saying, that the puerperal state is far from favouring them; as women at that time may do and fuffer, almost with impunity, what at any other time would be attended with the most ferious confequences. But whatever may be the cause, he observes, there is evidently in the fit, as in the apoplexy, a too rapid and dangerous determination of the blood to the head, which demands the most immediate and ferious attention. To remedy this, blood must be immediately drawn, and, if possible, from the jugulars. The state of the labour should then be enquired into, and if the child is not too far advanced in the pelvis, it will be right to preferibe a large flimulating glyfter to empty the bowels; and at the fame time lefter the determination to the head; this, if not fufficient for the purpose, should be affished by a few grains of jalap and calomel, or some other brisk purge. If the labour is far advanced, the convulsions will act upon the secus; and if there is no impediment, either from wrong prefentation, or difpre-portion of the child to the pelvis, will, in a little time, fafely expel it. If any obstacle to delivery is found, the position of the child, if faulty, must be altered; or we ought to have recourse to other necessary ashistance, in the fame manner as if convulsions were not prefent. In either way the termination of the labour will frequently put an end to the convulfions. But if this is too haftily performed, before the veilels have been properly emptied, and the rapid motion of the blood in them diminished, there will be danger from the torrent rushing too impetuously into the intestines or other abdominal viscera, of inflammation in fome of those parts, inducing puerperal fever, and oftentimes death. But where the labour is not far advanced, after the exhibition of the glyster and purgative, thirty drops of the tinct. opii may be given, and repeated, interpoling occasionally the glyster or cathartic, as fymptoms shall indicate. See Dr. Bland's Esfays on the Treatment of Convalfions during Parturition.

Convulsions are fometimes a fymptom attending fevers, and may be produced by inanition, as when harmorrhages, &c. have happened; also by repletion; irritation is most frequently their cause; in these cases relief will most readily be procured by means adapted to remove it: the same method of relief as is last proposed, when convulsions are a symptom of fevers, should be attended to when they are caused by wounds; here warm oil, or the warmer kind of bulfams applied to the injured part, are often a fpeedy cure, where no ftricture in the part remains unrelieved by manual operation: the causes of irritation are indeed various, and therefore different means will be required to affect

Convulsions in children from teething require the loss of blood, particularly if the gums are fwelled and painful; in this case bleeding is the grand specific.

When depletion is the cause, cordials must immedi-

If suppressed menses or piles, their return must be promoted; here hot and acrid means should be avoided, warm baths, with antifpafmodic and gentle anodynes, preferred.

Worms, producing this diforder, are to be deftroyed, and the prefent fymptom relieved by clyfters of milk, fweet and oily fubflances; calomel may be mixed with rhubarb and valerian, but irritating medicines must be fhunned.

Irritating poisons cause convulsions, which generally are fatal: however, demulcents and gentle opiates should be tried.

The itch or other morbid humours being repelled, and producing this diforder, will require absorbents to correct the prime viæ; and to relieve from the prefent fymptom, antipalmodics with cordials and gentle anodynes should be used.

Other causes may produce the same complaint, and, as in other instances, they must be investigated, as the surest way towards relief.

Musk produces happy effects if given in dofes from a feruple to half a dram, as is inftanced in a cafe related by Dr. Owen of Salop. See the Lond. Med. Obf. and Inq. vol. iii. p. 183, &c. The cause was, a shock received from an electric machine; the quantity of musk which he prescribed at the first was half a dram every four

Bleeding is only necessary in plethoric habits, and Hoffman lays, that this operation should not be performed until after the fit, for otherwise the disorder will be

protracted.

Laxatives are effentially necessary, as an open belly conduces to prevent and relieve this kind of affliction: of these kinds of medicines, rhubarb, manna, and diu-retic salt, are to be preferred.

Warm bathing, in many cases of this kind, is follow-ed with happy effects.

Convulsio Clonica. Convulsion alternating with

relaxation.

Clysters, in which are from x. to xxx. drops of laudanum, give speediest relief, when the intestinum rec-tum is affected with the spasms.

Blifters applied upon the part affected, are powerful means of relief. Dr. Whytt relieved a patient who complained of an alternate motion of the mufcles of his belly, by a blifter applied thereon; and he fays farther, belly, by a blifter applied thereon; and he fays farther, that, when epilepsies arise from an uneasy sensation in the arm or leg, a blifter applied there is the most effectual remedy. And in the convulsions peculiar to children, as a drain, a blifter may be highly useful.

Atther, in many instances, hath been usefully applied for the removing of spasmodic complaints.

CONYZA MINOR FLORE GLOBOSO, also called pulicaria, esser palustris parvo flore globoso, coniza minima, conyza mediæ species flore vix radiato; SMALL FLEA-BANB.

The chief use of all the stea-banes, is to destroy fleas

and gnats, by burning then fo as to wafte away in fmoak.

- PALUSTRIS SERRATIFOLIA. A Species of do-

ria. See DORIA.

CONYZOIDES. See SENECIO.
COOPERTIO. COVERING, CLOATHING; or a small cloak, by which the body is defended from the air, according to HIPPOCRATES, it is derived from approcham, cooperire, tegere, to cover, in which fense it is several times used by him. It is applied to the belly, and uterus investing the sectus; and also to a medicament, which is placed upon the tooth, involving it like a plaster, by SCRIBONIUS.

COOPERTORIA, i. e. Cartilago thyroides, called

alfo abicu.

COOSTRUM. The middle part of the diaphragm.

COPAIBA, COPAIFERA OFFICINALIS, Balfam. capivi.

COPALXOCOTL TEPEACENSIUM. A tree mentioned by De Lact, much like the cherry-tree, whose fruit abounds with a glutinous juice: hence the Spaniards call it cerafe gummofa. Raii Hift.

COPAU. A fort of wood refembling the walnut tree; it grows in Brail. It is called arber Brafiliana juglandi fimilis, nucibus carens. Raii Hift.

COPEIA; COPELLA AMERICANORUM, COPEY, and COPEIGA. The name of a tree in Hispaniola, in America, whose leaf serves for paper, and of which the Spaniards there make cards. This tree affords a kind of

mards there make cards. This tree anords a kind of matter of which a fort of pitch is made. Raii Hift. COPELLA. A CUPEL. See CUPELLA. COPHOS, \*\*P\$\(\text{seps}\), deaf. A fort of toad mentioned by Nicander. It also fignifies deaf, dumb, or both together. It is also used to express a dulness of any of the senses. COPHOSIS. DEAFNESS, DUMBNESS, or dullness of

any of the fenfes.

COPIIBA BRASILIENSIBUS; also called Baccifera Arbor, Brafilienfis, &c. It is a tall tree, growing in Brafil, but not remarkable for any medical virtue.

COPISCUS. A fort of FRANKINCENCE. COPOS. WEARINESS. A gently warm bath foonest relieves it; for what is weariness but an overstretching or too great a tenfity of the fibres, occasioned by using them too long or too violently? and must upon their being relaxed go off again. It is for the same reason thas sleep takes off weariness.

COPOVICH OCCASSOU. A tree mentioned by De Laet, which grows in the West Indies; the leaves refemble those of the pear-tree; and the fruit called ou-mery, is like a large pear, and when ripe is eaten as a delicacy. Raii Hift.

COPRAGOGUM, from xompos, dung, and aye, to bring away. The name of a gently purging electary, mentioned by Rulandus.

COPRIEMETOS, from κοπρος, dung, and εμεω, to vomit.

A person who vomits up his excrements.

COPROCRITICA MEDICAMENTA, from κοπρος,

excrement, and sparse, to separate. See Eccoprotica.

COPPROSTASIA. A constriction of the Belly.

COPTARION. A medicine in the shape of a very small cake. These were directed for disorders of the

afperia arteria and lungs, and for many other intentions by the ancients. It is a diminutive from COPTE, from κοπίω, to beat or pound, because it was formed by beating or pounding the ingredients into a paste. It was the form of a medicine used by the ancients are wearly made of passetable subdiverses and a passetable subdiverse and a passetable subdive ents, generally made of vegetable fubitances, and applied externally, as on the stornach, &c. also given internally

on many occasions.
COPULA. A LIGAMENT.

COQUENTIA MEDICAMENTA. Medicines which

promote concoction.

COR. In chemistry signifies gold; and sometimes an intense fire. In botany, it is the beart of vegetables, or their pith, fee MEDULIA. Also the minute portion of any feed from which the root and bud rife. In anatomy, it is that vifcus in the breaft called the beart.

The beart confifts effentially of two cavities; there beof the beart contains eigenfraily of two cavities; there being two hearts joined together in the human body, ferving for two circulations of the blood, one through every part of the body, and one through the lungs. The right fide of the heart is fimilar to the left, excepting that both the auricle and ventricle have fewer mufcular fibres, and that the auricle receives blood from the vence cave, and the ventricle throws it into the pulmonary artery.

The beart hath two motions, fystole and diastole. Harvey, and others fay, that the fystoles of the two auricles of the beart, the two venticles, and the aorta and pulmonary artery, are respectively synchronous with each other. But Dr. Nichols, with great probability, thinks that the motion of the auricles are afynchronous, and that the ventricles and arteries are likewise dilated and contracted at different periods of time.

The fituation of the beart is in the middle of the cavity of the thorax, but rather inclining to the left; on each fide of it lie the lungs, loofe, playing upon the ribs and diaphragm, and attached at their roots to the beart

by the pulmonary veffels.

The beart is attached, on its lower fide, to the diaphragm, by the pericardium, which is a membranous bag, incloting the beart and all the parts belonging to it.

The figure of the beart is conoid, its base is irregular, because of all the large vessels fixed there. The human heart differs from those of quadrupeds, which are round every where; the human rather represents half a cone, because the under part which lies upon the diaphragm

The apex of the beart is to the left and forwards, its fituation varies fomewhat with the motion of the dia-phragm, but that is very little, as it lies upon the tendi-

nous part.

The body of the beart is composed of two large muscular cavities, called ventricles, one to the right and for-wards, the other to the left and backwards. Winflow calls them anterior and posterior.

At the basis of the heart are two muscular bags, called auricles, adjoining to the ventricles; they lie contiguous to one another below, but above they are diffant, as the aorta and pulmonary artery lies betwirt them.

The beart hath a feptum divided into two, called fep-

tum ventricularum, and feptum auricularum.

The right auricle receives the two venue cave, one at the upper part, the other at the lower; the blood brought thither by the contraction of the auricle, paffes into the right ventricle, from thence into the pulmonary artery, then through the pulmonary veins, into the left auricle, which propels it into the left ventricle, from whence it is fent into the aorta, to be difperfed all over the body, and at last is returned by the two cave to the right auricle.

The two cave go into the middle part of the auricle, each fomething inclined inwards; the angle between them is partly filled up by the left auricle; there is a transverie ridge upon the feptum auricularum, called tuber-culum Loweri, which is placed there to hinder the current of the blood from each cava rufhing directly against each

The right auricle hath an appendicle which ferves to fill up the part between that and the aorta; for the fame reason the left hath an appendage upwards, and to the left fide, to fill up the space between the pulmonary artery and the left ventricle. The whole of the cavity of the auricles internally is not fmooth, but composed of fasci-culi, running from one fide to the other; this fasciculated texture obtains lefs in the left than in the right auricle; it is most observable in the apendages of the auricles, which no doubt is with a view to hinder the blood from concreting, as there it is most out of the way of the circulation.

Between the tuberculum Loweri, and the cava inferior, we fee the foramen ovale, which runs upwards from the right to the left auricle: in the feetus there is a valve which is loofe, but this valve in adults is connected to the feptum auricularum; fometimes the foranien ovale is open during life.
The coronary vein opens into the right auricle, between

the orifice of the cava inferior, and the paffage into the

The fibres of the auricle are fo irregularly disposed as to act as fphincters, and hinder the regurgitation of the blood.

At the infertion of the cava inferior is a valve called

beart; this ventricle is thicker than the auricle, and the whole internal furface of it is fasciculated. It hath two orifices, one at the lower part, where it receives the blood, and one at the upper part where it expels it: the auricular orifice is furrounded by a loofe membrane, which is notched into three parts, called valvulæ tricufpides, which, though reckoned three, are really but one.

From the edge of the valves we see certain fibres continued, called chorder tendineer, which, collected, make what are called the carnea columnea, and lead to the internal structure of the beart: their use is to hinder the valvulæ triculpides from being inverted; and the fasciculi are of use to churn the blood, and are only in the middle

to hinder this fluid from stagnating.

The other orifice, which leads into the pulmonary attery just at its beginning, is furnished with three femilunar valves, whose loose floating edges lie towards the artery, whilst the others are fixed to the ventricle. In order to make these valves catch more, each hath a little mamilla in its middle (to fill up the triangular space which is left) called the corpus fefamoideum of Aurentius: these valves hinder the blood from regurgitating into the beart.

The left auricle lies rather on the back part, behind the basis of the beart, and towards the left. It is situated bear to the basis of the beart, and towards the left.

low the bifurcation of the trachea and pulmonary artery. It is ftronger than the other, and is fmooth internally ex-cept at the little appendicle, because the pulmonary veins being two on each side, the blood cannot stagnate. There

more force to open it.

The left ventricle is fasciculated. At the orifice be-tween the auricle and the ventricle is a valve, called the valvula mitralis, which runs from the one to the other; is about two or three inches. it is fiffured into two points, which are fixed to the auricles; and hang down loofe into the ventricles. The chorden tending, and columna carnen, are the fame as in the other, but much stronger. The orifice, by which it expels the blood, is situated in the middle of the ventricle, so the aorta rises from the middle of the basis of It is alkaline and absorbent, and consists of the same gethe heart. The larger flap of the valvula mitralis hangs down between the auricele and ventricle; and fome imagine it ferves as a valve to both the auricular and arterial Med. Cullen's Mat. Med. orifices; but this is abfurd.

The coronory arteries are two. See Coronari # Ar-

The action of the left ventricle is to throw the blood into the aorta.

The foramina thebesii are venal orifices, faid to open

into all the cavities of the beart.

The fibres of the beart are mufcular; at each of the orifices is a tendinous ring, where the fibres of the ven-tricles begin, which go downwards to the apex, where they turn in, and run up on the infide, representing in perspective a figure of 8. There are some fibres common to both ventricles, which, as they compress them both, Dr. Hunter thinks is a proof of the ventricles being in action at the fame time.

According to Lancisi, the nerves of the beart are both numerous and large. In each fide there are inferred five pair, viz. from the par vagum the fuperior intercoftal pair, the vertebral pair, the inferior intercoftal pair, and

the phrænic pair.

See Winflow's Anatomy. Haller's Phyfiology.

COR ACINE. An epithet for a fort of paftil, quoted by Galen from Afclepiades.

CORACINI LAPIDES. See

CORACINUS. The crow-FISH. It is found in the Nile, and other rivers in the Mediteranean fea. Certain

bones found in its head are called coracini lapides.

CORACOBOTANE, from \*\*\*epat\*, a crow, and \$\*\*oran\*, a plant. A name for the laurus Alexandrina.

CORACO-BRACHLEUS (MUSCULUS), from \*\*epat\*, a

crow, and brachium, an arm; also called coracoides, red.
coideus. It rifes from the point of the coracoid process, oil of anifeeds, white wax, milk, or juice of citrons, humeri. Riolanus gives it this name, and Arantius first all extract the red colour from cerel.

evalvula nobilio, it is larger in the feetus than in the adult; took notice of it as belonging to the arm. Winflow calls whose office is to hinder the blood from flowing back into it coracobrachialis. It hath been called perforatus Cafferii, the vein. The right ventricle on its lower part lies on the dia-phragm; on its upper part, it makes the larger part of the to a nerve. Spigelius calls it nonus bumeri placentini. to a nerve. Spigelius calls it nonus humeri placentini. CORACO-HYOID &US, called also omo-byoid eus, emoplato-

byodaeus, and cofte-byoidaeus. It rifes from the fuperior part of the upper cotta of the scapula, and is inserted into the basis of the os hyoides, to pull it downwards

and backwards.

CORACOIDES PROCESSUS. The beak-like procefs. Its name is from its likenefs to a crow's beak, figmoides processus. It projects from the anterior extremity of the upper costs of the scapula. This process is a little crooked, with its point inclining forwards: a ligament goes out on its superior part, to connect it to the acro-mion and clavicle. At the birth of children it is cartilaginous; it is also called anchoralis proceffus, cornicularis

proceffus, conchyroides.

— Musculus. See Coraco-brachizus. It is called coracoides, from 20025, a crow, and esse, form, because it proceeds from the process which is formed like a crow's beak.

CORACOIDEUS. See CORACO-BRACHIALIS. CORACOIDEUS PROCESSUS. See SCAPULA.

CORACUM EMPLASTRUM. The name of a

plaster described by P. Ægineta.

CORALATUM. A name for the merc. præcip. rub.

CORALLINA. Called also Museus Marinus, Museus
Maritimus, Corallina Anglica, Corallina Alba, SEA co-

RALLINE, and WHITE WORM-SEED.

It is a marine production, common on rocks and shells in shallow water, &c. It refembles a small plant withare no valves on the orifices of the pulmonary veins. out leaves, confifts of feveral jointed branches, generally This auricle is stronger than the right, because the left ventricle is stronger than the right, and therefore requires reddish; of a brittle stony substance, friable betwixt the fingers, and crackling between the teeth. It hath commonly been supposed a vegetable, but late observations give us to believe that it is of animal origin. Its height

> It ought to be entire, of a ftrong fea-fmell and falt tafte. Worms will live in a ftrong infusion of it for feveral days, notwithstanding it is given in doses of ten

CORALLIUM, CORALIUM, or CORALLUM. CORAL.

It is also called lithodendron, or tree-stone.

- ALBUM RAMOSUM. Madrepera vulgaris, coral-

liam officinarum oculatum, aud WHITE CORAL.

— NIGRUM. Alfo called antiphates, lythophyton nigrum, teratophiton arboreum nigrum, pseudo-corallium nigrum, and BLACK CORAL.

What is usually shewn for black csral is a woody, and

not a stony plant. See KERATOPHYTON.

The best fort of subite coral is brought from the Medi-

terranean, and is not porous, but folid.

RUBRUM. RED CORAL.

This is what hath been chiefly used in medicine. It is a hard, brittle, branched substance, resembling a plant without leaves, usually about the thickness of a goosequill, full of knots, fometimes streight, and fometimes variously bent, both externally and internally of a deep bright red colour. It is found adhering to rocks and other bodies in the fea, particularly in the Indian and Mediterranean feas, and in the Perlian gulf. It has generally a covering of foft fungous matter, in which is a great number of cells, containing a milky liquor. This cortical part is feparated easily whilft fresh and fost. Corals are supposed now to be of the animal kind.

Red coral contains fome iron; its basis feems to be the fame calcareous animal earth as that of corraline and other

animal earths. It is alkaline and abforbent.

The common testacea, coloured with dragon's blood, is fold for it; but by shaking this substitute in water, the fraud is discovered, for the colouring matter being sepa-

only farther observed, that halk, caral, or oyster-shells, may be indiffering inately used.

CORALLO FUNGUS. a species of sungus so called.

CORALLODENDRON. It resembles a tree; the

leaves are for the most part consisting of three lobes; the flowers are papilionaceous, and are succeeded by knobbed bivalve pods, which contain several kidney-shaped seeds.

Boerhaave mentions two species.

flowers ommonly called in America the BEAN-TREE.

Arbor. coral. min. or the LESSER TRREE-LEAVED

AMERICAN CORAL-TREE, with blacker feeds and ipines.
Ray informs us, that the inhabitants of Malabar make fheaths for their knives and fwords with the wood; that they use the wood with the bark for washing of their garments with, which they call farassas, and of the flower they make the consection called caryl. The powdered leaves when boiled with the mature cocoa-nut, confumes venercal buboes, and eases pains in the bories. The juice of the leaves, taken with the oil fergelim, mitigates venereal pains.

CORALLOIDES. So called from their likeness to

coral. See DENTARIA.

They are a dry juiceless substance, brittle, ligneous, ramous, and surnished with apices: on the apices of the tops
of the branches grow fungous tubercles, which contain
many small seeds. Boerhaave enumerates nine species.
They are faid to be astringent, but are not of any note in medicine.

- FRUTICOSA PLANTA MARINA RECTIOR.

It is the titanokeratophyton quod lithophyton marinum albicans.

- MINOR BULBIFERA, i. e. Dentaria heptaphyllos baccifera.

- FLAVA. A fort of fungus.

- FUNGUS, also called EROTYLUS. Tournefort uses it to express a genus of mushroom; which are thus distinit to express a genus of mulinroom; which are thus dishinguished—they are of a fleshy, sungous texture, and are branched in the manner of coral. The species he enumerates are nineteen. They are faid to be corroborant and aftringent, but little notice is taken of them.

CORCHORON. See Anagallis.

CORCHORUS. Called also melsein, melsehin, and

elus Judaicum, nonnullis. It is an Egyptian plant, bear-ing pods with afh-coloured feeds. Raii Hift. ing pods with afh-coloured teeds. Ran Albert CORD. EUR. An abbreviation of Euricii Cordi bo-tano logicon, five Colloquium de Herbis. CORD. An abbreviation of Valerii Cordi Historia

Rirpium.

CORDA, or CHORDA. A CHORDEE, see CHORDE.

CORDA TYMPANI. The portio dura of the seventh pair
of nerves having entered the sympanium, it sends a small branch to the stapes, and another more considerable one, which runs across the sympanum from behind forwards, paffes between the long leg of the incus, and the handle of the malleus, then goes out at the fame place where the tendon of the anterior muscle of the malleus enters.

Dr. Monro thinks that the chorda tympani is formed by the fecond branch of the fifth pair, as well as by the

portia dura of the feventh.

It is called corda tympani, because it crosses the tym-

panum as a cord croffes a drum-bottom.

CORDÆ WILLISH. See DURA MATER.

CORDIA SEESTINA. See SEBESTEN.

CORDIALA. See CARDIACA.

CORDOLIUM. The HEART-BURN.

CORE. The PUPIL of the EYE.

COREMATA. BRUSHES, or BESOMS; but in P. Egineta it is used to fignify medicines for cleaning the skin.

CORIANDRUM. CORIANDER; also called cassidate.

CORIANDRUM. CORIANDER; also called cassistations. The coriandrum satisfure or coriandrum majus, fructibus globosis, Linn. This plant is an umbelliferous one, with finely-divided leaves; the lower ones are like parsley; the seeds are of a pale yellowish brown colour, they are striated. The plant is a native of Italy, and is cultivated in some parts of England. It is annual, slowers in June, and ripens, it is said, in July or August.

The leaves have a small degree of an aromatic smell, mixed with a greater degree of what is offensive. The

Many preparations have formerly been made from red coral; but as the present practice justly rejects them, it is only farther observed, that halk, coral, or cyster-shells, may be indifferiminately used.

CORALLO FUNGUS. a species of fungus so called. rect the odour and tafte than any other aromatic; and are equally powerful in obviating the griping it is very apt to produce. Rectified spirit of wine takes up all their virtue, but water only partially extracts it. Dif-tilled with water, a small quantity of essential oil is ob-Arbor. cerel. also called Arbor. ceral. filiquosa, filiqua tained, which partakes agreeably of the quality of the fleethris spinosa arbor Indica, arbuscula cerallii, and the feeds. Pure spirit carries off in evaporation a great part three-leaved American coral-tare, with deep red of their flavour. Raii Hist. and Lewis's Mat. Med.

CORIANDRUM MINUS TESTICULATUM. SMALLER

TESTICULATED CORIANDER.

CORIANON, See CORIANDRUM: CORIARIA. See RHUS. CORINDUM. A species of PRASI

CORIS. See SYMPHYTUM PETRÆUM, and HYPE-

CORIS LUTEA, CORIS LEGITIMA CRETICA. See HY-PERICUM SAXATILE.

CORIUM. See PELLIS; also a name of the dartos muscle. See Darros.

CORNACHINI PULVIS. See SCAMMONIUM.

CORNEA. A coar of the EYE, which is also called felorotica ecratoides. It is the first coat which is proper to the eye; it is ftrong, thick, and tendinous; its anterior part is diffinguished by the name of cornea transparens, or cornea lucida, and the posterior part is called
cornea opaca. Some call the transparent part cornea; and
and the posterior part cornea opaca, and feleratica, or feleratis. The transparent part of this coat is elastic, the
opake part is not. The opake part is made up of several
laminae closely connected, whose sibres run in different
directions, and form a dense, compared substance. The directions, and form a dense, compact substance. fore part of this coat bearing a fancied refemblance to parent horn, takes the name of cornea.

The cornea confifts of two principle laminæ, an exter-nal and internal one, each of which is composed of thin-ner laminæ. The substance of the cornea is in some degree elaftic, the better to fit the eye to the different mag-nitudes and diffances of objects; it is also perforated with many small holes, through which a fluid is supposed to be constantly discharged, but which soon evaporates. The sclerotica and corner are furnished with arteries, chiefly from a branch of the internal carotid. The nerves

proceed chiefly from the ophthalmic branch of the fifth

The cornea transmits the rays of light into the eye, and produces the first refraction of those rays which are neceffary to vision.

The natural transparency of the cornea is liable to be obscured by inflammation, or by humours affecting it,

by abscesses and ulcers.

It feems more proper to consider this coat of the eye as the SCLEROTICA, which see, and the corner only as

its transparent part.

CORNESTA. A RETORT.

CORNI. The CORNEL TREE. The fruit is moderately cooling and aftringent. The fchagri-cottam is a fpecies of cornel which grows in Malabar, the expressed juice of which, drank with fugar, is cooling and aftrin-

CORNICULA. An instrument of horn, which was used by the ancients for the purpose of a cupping-glass. The broad part was applied to the skin, and the opposite part ended in a point with a hole in it, through which, by sucking, the skin was raised into the instrument.

CORNICULARIS PROCESSUS. See CORACOIDES

CORNICULATÆ PLANTÆ. Plants which pro-

duce many diffinct horned feed-pods, called filiqua.

CORNU CERVI. In chemistry, is the beak of an alembic. In botany, the cornu cervi alterum repens is the nasturtium sylvestre, capsulis cristatis. It is also particularly the HORN of the STAG or HART. Those of the burt, or male red deer, are to be underflood; but those commonly used are the male or female of the common falow deer. See DAMIA.

fall w deer. See Daniel.

HART's-HORN shaved, gives out to water, by boiling, 2 foft gelatinous matter, inspid and flavourless, in quantity about one-fourth of the weight of the bern. This jelly

is used as a nourishing diet, and to obtund acrimony. It is putrescent, so should be mixed with acids, as the juice of lemons, or with wine or spice, according to the different circumstances of the patient. The Edinburgh College directs the following:

# JELLY of HART'S-HORN.

Boil half a pound of the flavings of bart's-born in fix pints of water to a quart; to the strained liquor add one ounce of the juice of lemon, or of Seville orange, four ounces of mountain wine, and half a pound of fugar, then boil again to a proper confiftence.

The borns of deer are used for obtaining a liquor, falt, and oil; but there is no observable difference betwixt one animal fubstance and another for this purpose, except that one affords more oil than another: hence the bones of oxen and other animals, the hoofs of horses, the horns of oxen, ivory, blood, urine, foot, the white of eggs, the fhells of tortoifes, hair, filk, &c. all afford the fame liquor,

falt, and oil. See ALCALI.

Hart's-born is faid to be prepared philosophically, when it is suspended in a still, while distilling any spirituous liquor the born being cut into thin flices, and placed in the neck of the ftill, fo as only to be affected by the vapours, thus it is rendered white and friable. This preparation was accidentally difcovered at Drefden, in Saxony, by Was accidentally discovered at Dreiden, in Sacony, by Caspar Pantzerus, an apothecary, and native of Prussa. At present it is boiled till the black part separates, and then the inner white part is dried for use. Hosiman orders some alkaline salt to be put into the water when boiling to make the black part soon soft. This process frees the barns from their glutinous matter, and thus renders them friable.

By calcination the earthy part is obtained most pure and perfect, in quantity to about half the weight of the horn. The London College directs to burn pieces of harr's-born, till they become perfectly white, then rub them to a very fine powder; it is then called calcined harr's-born, and is to be powdered and levigated for use. As the intention of this operation is to burn out from the borns all that is volatile, and leave only the terrestrious part, here therefore the heat cannot be too great; for the earth of beart's-born is not like that of coral and the testacea, convertible into quick-lime. The borns left after diffilling the fpirit, falt, and oil, are as proper as fresh ones. The calcined barr's-born is found to be a mixture of calcareous earth and phosphoric acid, and is the weakest of the absorbents, being the most difficult of folution in acids. The earth of all bones is the same as folution in acids. the earth of bart's-born.

Solutions of this earth in vegetable acids are reftringent, and it is probable that it only checks fluxes by uniting with acid humours in the primæ viæ. The London College only directs the following decoction.

Decollum Cornu Cervi. Decoction of Hart's-Horn.

Take of burnt hart's-horn prepared, two ounces; gum arabic, fix drams; diftilled water, three pints; boil the water away to a quart, and ftrain it off. This is used as a common drink in fevers attended with laxity of the bowels.

# Decoctum Cretaceum. CHALK DECOCTION.

Take of chalk fubtilly powdered, two ounces; of gumarabic, half an ounce; boil in water three pints to two; pour off the liquor from the heavier parts that fall to the bottom. This may be substituted for the former.

If a little cochineal is added, it is called the red decoction.

These decoctions are used as common drink in acute difeases, attended with a diarrhœa, and where acrid humours prevail in the prime viæ, and to this end chalk is to be preferred to the calcined hart's-born. See Lewis's Mat. Med. Neumann's Chem. Works.

CORNU UNICORNI. | See UNICORNU. - FOSSILE. CERVINUM. See CORONOPUS.

CORNUA. Horny excrescences, which fometimes

arife on fome part of the body.

CORNUA UTERI. In comparative anatomy, the borns of the womb. The womb is so divided in some quadrupeds, as to form corners refembling borns.

CORNUMUSA. A RETORT.

CORNUS. The CORNELIAN CHERRY. That used in medicine is the cornus mas. Linn. or cornus bortemfis.

FORMINIA. The DOG-BERRY, OF GATTEN-TREE.

- FORMINIA FOLIIS VARIEGATIS. The STRIPED DOG-BERRY-TREE. Miller takes notice of feven other species of the dog-berry-tree.

—— HORTENSIS MAS. The CORNELIAN CHERRY.

CORNUTA. A RETORT.
CORNUTIA. A plant fo called from Cornutus, a physician at Paris, who published a history of Canada plants. Miller's Dict. vol. ii.

CORN. An abbreviation of Jacobus Cornutus, M. D.

Canadenfium plantarum, &c. Historia.

COROCRUM. A FERMENT.

COROLLA. The PETALS of flowers.

CORONA. A CROWN. In botany it is a feries of fmall beards, or rays, in discoid flowers.

—— CILIARIS. See CILIARE LIGAMENTUM.

- IMPERIALIS. CROWN IMPERIAL. It is a bell-shaped flower, a fine ornament in gardens. Boerhaave enumerates thirteen fpecies. In the petals is a juice that is very fweet, which the Turks use as an emetic, but the whole plant is esteemed poisonous.

—— REGIA. The HERB MELILOT.

- RUELLII. See AMBROSIA CAMPESTRIS.

must line see Ambrosia Campestris.

— solis. Sun-Flower. This flower is well known as an ornament in gardens. Boerhaave enumerates eighteen species. It is a native of Peru, and other warm countries of America. It is not known to possess any valuable medicinal qualities; though some take notice of it as heating, and an agreeable food. It produces a resinous tear which is its most active part. A gum also flows from it, copiously obtained, if the seed-vessels are taken when ring out finall and horized in water. The seeds are when ripe, cut fmall, and boiled in water. The feeds are made into bread.

- SOLIS RAPUNCULI RADICE. The species is used

as food in Canada.

---- SOLIS PARVO FLORE TUBEROSA RADICE. See BATTATAS CANADENSIS.

- TERRÆ. GROUND-IVY. See HEDESA TERES-

CORONALE OS. See Os FRONTIS. CORONALIS SUTURA. The future upon the crown of the head.

CORONARIA LIGAMENTA. The coronary liga-ment of the radius is a fort of ligamentary hoop, furrounding the circular circumference of the head of that bone, reaching from one fide of the fmall lateral figmoid, or transverse cavity of the ulna, to the other, in an arch, which is about three-fourths of a circle. It is nearly as folid as a cartilage. It connects the radius very closely to the ulna, yet admits of the pronation, and the supination of the arm.

CORONARIA VASA. Veffels that furround the heart like a crown; also in the stomach. See

CORONARIÆ ARTERIÆ & VENÆ. The coRONARY ARTERIES and VEINS. The first branches which the aorta fends off are the coronary arteries of the heart; they appear between the aorta and the pulmonary artery, run round the basis of the heart and to the apex, giving branches chiefly to their respective ventricles. They frequently anastromose both at the basis and apex. One of these runs anteriorly, the other posteriorly on the heart, and sometimes there are three. They are lost in the fubstance of the heart.

The coronary veins of the heart are distributed on its furface, much in the same manner as the arteries; they rise chiefly from the right auricle, and come out in the angle between the vena cava and the passage into the ventricle; one principal branch runs to the apex the great trunk, to the other parts. Dr. Hunter fays, that the cordnary vein of the heart opens into the right auricle, between the orifice of the cava inferior, and the paffage into the ventricle, and is furnished with a femilunar valve, to hinder

the blood from flowing back.

Mr. C. F. Wolf observes, in his paper in the Transactions of the Imp. Acad. of Scient. at St. Petersburgh, that the great coronary vein, and the rifice by which it communicates with the right finus of the heart, were

first who noticed the valve with which this orifice is fur-nished. Since his time, Mr. Wolf fays, anatomical writers have constantly spoken of this valve as being of a femilunar shape, but he afferts that its figure is oblong and narrow; and that it is a valve of its own kind, different from any other to be met with in the human body.

These arteries and veins are also called cardiaca. The coronary artery of the flomach rifes from the cocliaca, goes first to the left side of that organ, a little beyond the superior orifice, round which it throws branches, and also to every part of the stomach near it: and these branches communicate with those which run along the bottom of the ftomach to the pylorus; afterwards it runs on the right fide of the fuperior orifice, along the fmall curvature of the flomach, almost to the pylorus, where it communicates with the arteria pylorica, and turning towards the fmall lobe of the liver, it gives off fome branches to it; then it advances under the ductus venofus to the left lobe of the liver, in which it is loft near the be-ginning of the duct just named, having first given off some small branches to the neighbouring parts of the diaphragm and omentum.

The coronary vein of the stomach, is sometimes, a branch from the vena portæ ventralis, or from its principal branches. It fometimes fprings from the fplenica.
The coronaria ventriculi is fo called, because it furrounds
the upper orifice thereof. It runs along the small arch to the pylorus, and gives out branches to the fides of the

CORONARIUM LIGAMENTUM. See JECUR. CORONARIUS STOMACHICUS. The ramification of the nerves from the eighth pair near the upper orifice of the stomach.

CORONE. So the acute process of the lower jaw-

CORONILLA, called also polygala. This plant somewhat resembles the scorpion sena. The pod is composed of many parts, joined, as it were, by a fort of articulation, each of which is turgid, with an oblong seed. Boerhaave takes notice of eight species, but no medicinal virtues are attributed to them.

CORONILLA INDICA. See INDICUM.
— MONTANA. LESSER SCROPION SENA. See EMERUS MINOR.

CORONOID. See PROCESSUS.

CORONOIDUS APOPHYSIS ULNÆ. It is at the upper end of the ulna; prominent, and a little pointed, refembling a broad fhort beak. It is received into the anterior cavity above the pulley, at the lower extremity of the os humeri, when the fore-arm is bent.

CORONOIDUS APOPHYSIS MAXILLÆ. See MAXILLA

CORONOPUS, from xegure, a carrien crow, and most, fest, the plant being faid to refemble a crow's fost. It is also called cornu cervinum, berba fiella, fiella terræ,

plantago, BUCK'S HORN PLANTAIN.

Its flowers and fruit are like those of plantain, but its leaves are deeply cut. Its root is long and flender; many of its leaves lie flat on the earth in a circular manner, whence the name fiella terræ, or flar of the earth. The leaves are downy, long, and narrow; the stalk is hoary; the seeds are small, and of a dark brown colour. It grows on fandy places and heaths, and flowers in June.

Its medical virtues are the fame as those of the other

plantains. Botanists enumerate five species.

The two bodies thus named, rife by two diffinct crura from the lower part of the offa pubis; after which they join, and are continued to the glans. They are feparated

known to Galen, but Euftachius feems to have been the artery and a vein run, which enter near the union of the crura, and ramify throughout the spongy substance.

CORPORA FIMBRIATA. A border on the edge of the fornix in the brain is thus named.

 LOBOSA. See RENES.
 OLIVARIA. Two eminences on the medulla oblongata are thus named. Winflow calls them corporate. slivaria, which Willis calls

- PYRAMIDALIA; but these are two eminences, on the medulla oblongata near the corpora olivaria. The

ipermatic veffels have this name given them by fome.

STRIATA. Two prominences in the laterial ventricles of the brain. They got this name, because by feraping them with a knife, we meet with a great number of white and ash-coloured lines alternately disposed, and which are only the transverse section of the medullary

and cortical laminæ mixed together. See Cerebrum.

CORPULENTIA. See Obesitas and Polysarcia.

CORPUS CALLOSUM. If the falx is cut away from the crifta galli, and turned backwards, then the two lateral parts of the cerebrum are separated, we see a longitudinal portion of a white convex body, which is a mid-dle portion of the medullary fubstance of the brain: under the inferior finus of the falx, and also a little towards each fide it is parted from the mass of the cerebrum, to which it is fimply contiguous from one end of that finus to the other; fo that at this place the edge of the infide of this hemisphere only lies on the corpus callosum much in the same manner as the anterior and posterior lobes lie on the dura mater. Both extremities of this medullary body terminate by a finall edge bent transversely downwards. The furface of the corpus callofum is covered by the pia mater; along the middle of its surface, from one end to the other, there is a kind of raphe, which hath on each side a white cord. The corpus callofum covers the two lateral ven-tricles. See Cereberum.

- GLANDULOSUM. See PROSTATA.

MUCOSUM. See RETE MUCOSUM.

- PAMPINIFORME. The SPEMATIC CHORD. See
- PYRAMIDALE. SPERMATICA CORDA.
- RETICULARE. See RETE MUCOSUM.

- sesamoideum. See Cor.

- spongiosum urethræ. The fpongy body of the urethra. It is of the fame fubitance as the corpora cavernofa, and furrounds the urethra. That part which is next the proftrate is thick, but as it runs on it becomes fmaller, and at the extremity forms the gland. That end next the proftate, because of its bigness, is called the bulb of the uretbra; the other end forms the glans upon the extremities of the corpora cavernosa.

—— VARICOSUM. The SPERMATIC CHORD. See

SPERMATICA CORDA.

CORRAGO. BORRAGE. CORÆ. The TEMPLES. CORRECTIO. CORRECTION. This word, in pharmacy, fignifies, first, that medicines, which operate vio-lently, are corrected by adding fomething which checks their action. Secondly, when fome addition lessens the noxious quality of a medicine. Thirdly, when nauscous medicines are made more palatable.

CORRIGIOLA. According to Fuchfius, it is the fame

as POLYGONUM MAS.

CORROBORANTIA. CORROBORANTS, or ftrengthening medicines. Under this head are placed abforbents, agglutinants, and aftringents. These give bulk and firm-ness to the solids, which are rendered necessary by the continual waste which the actions of life occasion. Absorbents remove redundant moisture, astringents contract the relaxed fibres, and agglutinants add substance, where a previous waste renders a supply necessary.

CORRODENTIA. CORROSIVES, or corroding medicines, also called catharetica. They are thus divided: 1ft, The mild, such as burnt alum, the ashes of green wood, calomel, calx hydrargyri alba, and zincum vitriolatum purificatum. 2d, The strong, as hydrargyrus nitratus ruber, colcoth vitr, troch. de minio vigonis. by a septum, disposed like the teeth of a comb, so that any sluid forced into one, distends the other. The two crura are connected to the symphysis of the os pubis by the ligamentum suspensionium, which proceeds from the cartilage, and is dissused upon the sheaths of the corpera cartilage, and is dissused upon the sheaths of the corpera cartilage, are several white ligaments, which seem to be placed there to hinder the penis from being over much distended. In the axis of cach corpus cavernssum, an single sheath and particularly if so confined upon the part, as to have their actions excited by the the heat of the body. In the two first cases they are this, father de Lugo brought a parcel of it to Rome; called catharctics; in the last, potential caustics. See and from him also it received the name of name of cort.

CORROSIO, from corrodo, to eat away. Corrosion. It is the acting on bodies by means of proper menstrua, fo as to produce new combinations, and a change of their form, without converting them to fluids. This depends on the fame principles as folution. The subjects are usually metals; and the modes are either, first by immerfing the body to be corroded, in fome fluid mentruum, and this is called corrofion by immerfion; or, fecondly, by exposing it to the action of some vapour, and this is called cementation. There are other kinds of corresion, as by fprinkling the fubject with some proper fluid, rubbing it with fome dry fubstance, &c.

CORRUDA. ROCK-SPARROW-GRASS.

CORRUGATOR COITERII. Volcherus Coiter first took notice of this pair of muscles. They are thus called from their use, or from con and rugo, to wrinkle. Douglas calls them frontales veri; others call them depressores supercilii, or frontalis musculus, & verus. They rise from the root, or upper part of the nose on each fide, and are inferted tendinous into the fkin of the eye-brows, and run obliquely upwards. They depreis the eye-brows, and wrinkle the lower part of the forehead, hence called CORSÆ. The TEMPLES.

CORSOIDES, See AMIANTHUS LAPIS.

CORTALON- In Myrepfus, it is the fame as

CORTEX CARDINALIS DE LUGO. The cort. Peruv. was thus called, because the cardinal Lugo had testimonials of above a thousand cures performed by it in the year 1653. — CARYOPHYLLOIDES. See CASSIA CARYOPHIL-

LATA.

—— CULITLAVVAN, also called culilavan, culitlatvan. It is a hot aromatic bark found in New Guinea, of fimilar virtues to the cortex maffory. See Cassia CARYO-PHYLLATA CORTEX.

- ELATERII. See THURIS.

- MAGELLANICUS. See WINTERANUS CORTEX. — MASSORY. It is a warm aromatic bark, found in New Guinea. It is alexipharmic, carminative, and ftomachic. The inhabitants powder, then mix it with water, to anoint their bodies with in cold wet weather.

It is also used against pains and gripes.

— Peruvianus. The Peruvian Bark; also called cinchona, china china, kinkina, chinchina, cina cinae, kina kina-kina, magnum deidonum, quinquina, quinquina, polquahuil, cortex partum, cortex Peruanus, certae cardinale de Luca and the Irsuiz Bark. The tree from cardinalis de Lugo, and the JESUIT BARK. The tree from whence it is acquired is called by fome the ARBOR FEBRIFUGA PERUVIANA. The powder of this bark hath been fold under various names, as pulvis comitiffie, pulv.

patrum & Jefuitarum. Berlin powder, &c.

It is the bark of a tree which grows in Peru, according to the account given of it by Mr. Arrot, a furgeon, who lived a long time there. It is the cinchona officinalis, or cinchona panicula brachiata, Peruvian Jesuit Barktrree. There are four forts of this bark, viz. the reddiling which we have feel age the yellowish, whitish, and the curling; the two first are the best, the curling is from young trees. Mr. Condamine fays, that the tree is called cascarilla, and is very diffe-

rent from the quinquina-

Its vir tues were discovered by the Indians about the year 1500. A lake near a town in Peru was furrounded by these trees, which were torn up by an earthquake, and falling into the adjacent water, they rendered it bitter.

An Indian, urged by his thirlt during a fever under which he laboured, drank of this water, because no other could be had; however, observing that he foon recovered, he related the case, and others were also cured. On this enquiry was made, and to the trees it was found that the water owed its virtue; then it was foon discovered, that the bark alone possessed the medicinal quality. In 1640, a Spanish soldier was quartered in an Indian's house, and being seized with an ague, his landlord, moved with compassion, told him of a cure, and with the same he cured his companions. At length the vice-queen, wife either any natural or critical difcharge; fo that when on of the count de Cinchon, then vice-roy of Peru, was other accounts it is indicated, its administration is fafe. feized with an intermitting fever; this foldier cured her If ever injury was derived from its use in any case in alfo; hence the name Cinchona and Comitifie. After

card. de Lugo. From Rome it was spread into France and England, and at length became general. By way of eminence it is called the BARK.

This bark is brought in pieces of different fizes, fome rolled up in short thick quills, and others flat; the outside is brownith, and generally hath a whitish moss spread upon it; the inside is of a yellowish, reddish, or ruly iron colour. The best fort is bitter, resinous, breaks close and smooth, is friable betwirt the teeth, pulverizes easily; when powdered, is of a cinnamon colour, but ra-ther paler; and, according to the opinion of some, as the furest test of its goodness, it hath a musty kind of smell; and at the fame time fo much of the aromatic, as not to be difagreeable. The inferior kinds, when broken, ap-pear woody, and in chewing feparate into fibres. That which is called female bark, is redder in the infide, it is also thicker, and on the outside more white and smooth, is weaker to the finell and taste than the above, and, in

medical virtue, greatly inferior.

The variety of diforders in which the bark can be used to advantage may feem to entitle it almost to the character of an univerfal medicine; in many difeafes it is a fovereign remedy; and every practitioner, in proportion as his knowledge of its qualities increases, finds he can still employ it in a larger extent of cases. It is certainly a bitter, and aftringent, and has fome degree of aromatic conjoined; but it is upon the two former qualities its power altogether depends as a tonic. With regard to the ftomach it is indisputable, and it is well known that the flate of the flomach is readily communicated to the reft of the fystem: hence it may be discovered, where this medicine is likely to be attended with advantage in its application, and where it may be hurtful. In all disorders where the hark is useful, other medicines of the astringent, or bitter kinds, or combinations of them, have also been of service, though not equally with the bark, if it is given in substance; its virtue resides in the whole of its parts mixt together, none answering so well, if separated.

Dr. Cullen fays that the Peruvian bark belongs to the class of bitters, and along with its bitterness has an aromatic acrimony, depending on an effential oil prefent; with this it has a flypticity and aftringency, which fomehave thought proper to deny it, but which is fufficiently evident when, by diffillation or folution, part of the other qualities are extracted; all the common qualities of bitters are ascribed to the bark. It has the same effects in the stomach, and intestines. In a large quantity, he has seen it purge, and habitual coftiveness cured by it, which has proceeded from the weakness in the alimentary canal, by giving doses of 3 i. for several days together, which seemed to work a considerable change in the system. Carried into the blood little notice has been taken of the diuretic or diaphoretic powers of the bark. It is supposed to strengthen the whole system; and, indeed, we may conclude that its virtues chiefly reside in its tonic powers.

Some are intimidated from the use of the bark, though

manifestly indicated, because of their apprehensions of its astringency: for example, in asthmas it is forbid, though an ague requires it; but it is fafe in all diforders when there is a fair remission of the fever, and the pain that may attend it. The truth is, the bark is not very aftringent, the prejudices on that account hath very little foun-dation. It is fafely given just before the accession of the cold fit in agues, and in general if the pulse of an adult does not exceed seventy strokes in a minute, it is safe and useful. So far from causing obstructions, it, in many in-stances, resolves those already formed; in many glandular tumors, in fcrophulous difeases, and venereal phymofes, &c. this medicine is a powerful remedy; it hath holes, &c. this medicine is a powerful remedy; it hath long been given to women, fuecefsfully, to the quantity of a dram every three hours, two days after delivery, without leffening the lochia; during the natural flux of the menses it hath been frequently administered without interrupting them; in the confluent small-pox its use does not lessen the spitting: whence it does not seem probable, that the bark is so powerful an aftringent as to obstruct either any natural or critical discharge; so that where on which it is adapted to relieve, a too late, and not too

gency it never can endanger.

As a febrifuge it was first and principally celebrated, and in this character it maintains its reputation. In every kind of fever except the inflammatory, or in their in-flammatory stage, it is extremely useful: in the ardent, if given when they intermit, it effects a cure; in the lower kind its use is earlier, and its effects as falutary. Almost all disorders which appear in the form of intermittents yield to its power.

Its antifeptic power is a difcovery of later date; but in this respect its credit is established. It, by increasing the crassiamentum of the blood and its adhesion, thus refifts a putrid flate and difposition in our bodies.

Abfecties and ulcers that discharge a fanies instead of pus, are foon reduced to a healing state on taking the bark; the fanious and bloody matter in variolous pushules foon change their appearance on its use, and only need be with-held, if the difficulty of breathing should be increafed by it. The glandular tumors are refolved by it, and in inflammatory ones it promotes a laudable suppu-

Most symptoms that attend a strumous habit yield to the efficacy of the bark, except when the bones are af-fected; and pain attends tumors of this kind, from their being fituated contiguous to tendons and membranes, it then increases the uncafiness.

In almost every case from a lax fibre, the bark is of fer-

vice, either as a principal or an auxiliary remedy.

In nervous afthmas, joined with fetids, the bark is greatly advantageous after expectoration hath removed all tension in the lungs; and in humoral asthmas, if there is a fediment in the urine, a moilt skin, and a weak pulse, it is both ufeful and fafe.

In many inftances the external application of the bark answers in a good degree its internal use. In the Lond-Med. Obs. and Inq. vol. ii. are instances of cures effected by quilting it in wailtcoats which were worn next the

Again, it should be noticed, that as a judicious use of this medicine is of extensive benefit, so an improper one may be productive of as ill effects; for, although it is a febrifuge, its use in ardent severs is during their intermillion only; when the fibres are tense its use is not required, as to increase their firmness is its primary effect; confequently in all difeases arising from or attended with tense fibres, the bark is obviously improper. Though the bark is a powerful antifeptic, yet in those gangrenes that are attended with a fulness of the pulse from a fanguine plethora, it fhould not be admitted; it excellency is in those mortifications where the blood is poor, and that

take their rife from this poverty.

In all cases where the bark is depended on for the cure, the doses should be as large and their repetition as frequent as the ftomach will cafily admit; in most cases its efficacy will be improved by some suitable auxillary, as in grofs habits, purging with calomel, rhubarb, or jalap, thould precede its use; in bilious, and when heat is complained of, nitre should be joined with it; in lax habits with thin and pool blood, aromatics and chalybeats, bitter and warm diaphoreties, greatly affift it; and if ob-firmctions are fuspected in the abdominal viscera, the kali

acetatum will be a proper adjunct.

Various are the preparations of the bark; but when the stomach will bear it, the powder, if very fine, is the most agreeable and the most useful; in case of aversion to the powder, the next best preparation is the infusion in cold water, prepared as follows:

# INFUSION of the BARK.

Take one ounce of bark in fine powder, and twelve ounces of foft water; add the water, by a little at a time, continuing to triturate it for about ten minutes in a marble mortar; then let them stand together, without subjecting them to any heat for three-quarters of an hour, and strain. The elegancy and strength of this preparation is increased by the addition of a small quantity of French brandy during the triture. This infusion is sooner prepared, is as ftrong, and more agreeable than the decoction: it may be taken in doles of two and three ounces.

In boiling, the refinous matter of the bark is hastily fe-parated by the heat, but is not properly diffolved by the water, hence in cooling it begins to feparate, renders the

early administration, must be blamed; from its aftrin- liquor turbid, and at length falls to the bottom: but when macerated in cold water, the medicinal parts are gradually separated and extracted together, and are retained by the water in a flate of perfect folution. For weak flomachs no preparation excels this.

Dr. Saunders relates the following experiment, in his observations on the superior efficacy of the red Peruvian bark. A decocion of both red and common Peruvian bark was prepared by taking an ounce of each, and boil-ing them in a pint and half of water, to one pint; the former had greatly the superiority in strength and power. A pint of fresh water was added to each decoction; the boiling still continued till that quantity was evaporated. The decoction of the common Peruvian bark feemed gradually to lofe its fentible qualities, while that of the red bark still retained its own. The same quantity of water was added as before to each, and the decoction repeated until a gallon of water was exhausted; at the expiration of which time, the common Peruvian bark was rendered almost tasteless; the red bark still retaining nearly its former fenfible qualities. This experiment proves, that the common practice of boiling the bark is hurtful to its powers.

Next to this infusion in water, an infusion of Rhenish wine may be preferred; and the next to it, a tineture drawn with good French brandy. In ferophula, the shell lime-water is a good menstruum for the bark; and in cases where relaxation fimply demands the use of the bark, the lime-water made with stone-lime should be preferred. The disgustful taste of the bark is covered by liquorice,

or orange-peel, or a finall quantity of Winter's bark.

The College of London directs two extracts, and two

tinctures from the bark.

### Extractum Corticis Peruviani. EXTRACT of PERUVIAN BARK.

Take of Peruvian bark coarfely powdered, one pound; diffilled water, twelve pints; boil for an hour or two, and pour off the liquor, which while hot will be red and pellucid; but as foon as it grows cold it becomes yellow and turbid; boil the bark again in the fame quantity of water as before, repeating thefe boilings till the liquor remains transparent when cold: then evaporate all thefe decodions, firshed and mixed together, to a proper condecoctions, ftrained and mixed together, to a proper confiftence: Ph. Lond. 1788.

This extract is to be prepared under a double form; one of the confiftence of a pill; the other hard enough

to be reduced to powder.

The extract is not fo ftrong of the bark as is imagined; befides, it is hardly poffible to make it without fome degree of empyreuma, and the advantage of its form no way compensates for the expence and trouble in preparing it. Ten grains of the hard extract are computed to be equal to half a dram of the bark in powder.

# Extractum Corticis Peruviani cum Refina. Extract of Peruvian Bark with Resin.

Take of Peruvian bark coarfely powdered, one pound; rectified spirit of wine, four pints; digest for four days, and then pour off the tincture; boil the residuum in ten pints of diffilled water, to two; then strain the tincture and decoction feparately; evaporating the water from the decoction, and diffilling off the spirit from the tine-ture, until each begins to be thickened; lastly, mix the refinous with the aqueous extract, and make the mais, fit for forming into pills. Pharm. Lond. 1788.

### Tinetura Corticis Peruviani. TINCTURE of PERUVIAN BARK.

Take of the Peruvian bark, four ounces; of proof spirit of wine, a quart; digest with a gentle heat for eight days, and strain. Pharm. Lond. 1788.

This is an agreeable preparation, but as it is too heating if a large dose is given, it would be better to add twice the quantity of the bark to this quantity of spirit, and then the bark would be given more plentifully in each dose of tincture.

# Tincture of Bark. Compound

Take of Peruvian bark in powder, two ounces; exterior peel of Seville oranges, one ounce and an half; Virginian fnake-root bruifed, three drams; faffron, one dram; 4 B cochincal This was the tinctura corticis Huxhami, and is certainly Raii Hift. a good tonic and cordial. Pharm. Lond. 1788.

In the year 1782, Dr. Saunders, physician to Guy's hospital, published his Observations on the Superior Efficacy of the Red Peruvian Bark. This publication may be referred to, as not only the first on this subject, but also containing many other important hints respecting the

practice of medicine. The following few extracts are here fubjoined.

The red Peruvian bark is in much larger and thicker pieces than the common Peruvian bark. It evidently confifts of three different layers. The external is thin, rugged, and frequently covered with a mosly substance, and of a reddish brown colour; the middle is thicker, more compact, and of a darker colour: in this appears chiefly to refide its refinous part, being extremely brittle; and evidently containing a larger quantity of inflammable matter than any other kind of bark. The innermost hath a more woody and fibrous appearance, of a brighter red than the former. The entire piece breaks in that brit-tle manner described by writers on the materia medica, as a proof of the fuperior excellence of the bark. In reducing it to powder, the middle layer, which feems to contain the greatest proportion of refin, will not give way to the pestie fo easily as the other layers; this should be particularly attended to when it is used in fine powder. Its flavour is chiefly discoverable, either in powder or folution, is evidently more aromatic, and has a greater degree of bitterness than the common bark.

It is highly probable, that it is the bark of older trees than that which is called quill bark; that it is from the trunks and larger branches of them; and that a more particular care may be taken in collecting and drying it;

whence its fuperior qualities.

The tafte and flavour of the red bark is more difficultly evolved, and is therefore at first not fo obvious, from the closeness of its texture, and from the resnous coat being fo well defended, and inclosed between other two layers. It is evidently heavier than any other kind of bark, and feems to have been prepared and dried with greater attention, its original appearance and form being better pre-

The red bark is so much warmer than the other, that it would feem to answer all the purposes derived from the union of cordials, aromatics, serpentaria, and the like, so much recommended in the obstinate quartan intermit-

tents of elderly people.

By the testimony of many practitioners it appears, that intermitting fevers are more speedily and effectually cured, either by infufion, decoction, or powder of the red bark, than by those of the common bark; and this also by leffer quantities of doses of the former than of the latter. Dr. Saunders fays, that from the numerous trials he hath made with it, in intermitting fevers, and other difeases, he is disposed to conclude that it need be employed only in half the quantity we generally recommend of the other

The infusion, decoction, and tincture, made with red bark, are confiderably stronger than those from the same quantity of common bark; and it is faid to have afforded more than twice the quantity of extract than is obtained

from the same portion of common bark.

In an infusion of the red bark, the spirit of vitriol lost its acidity more perfectly than in an infusion of the bark before in use. A decoction of the red bark keeps perfectly good, during more than a month in the fummer scason; whilst that of the common bark is sensibly changed in a few days. In the decoction of the red bark, the powder which is separated during the cooling of it, re-mains intimately diffused through the liquor, so that it continues loaded and turbid whilft at reft: in the decoction of the common bark, it feparates, and eafily subsides to the bottom.

COSTÆ. The RIBS. In ANATOMY, the cofter (as if they were custodes or guards, Littleton fays, from conflo, on account of their firmness to the heart and lungs) are generally twelve on each fide, though fometimes there are but eleven, at others thirteen are found: their extremities next the vertebræ are rounder and stronger than those which join the sternum; the upper edges are more round than the lower, which are depressed internally for lodging the intercostal vessels and nerves; this channel is not observable at either extremity, which is a plain direction to perform the operation for the empyema ra-ther towards the sides of the thorax than at either extre-

The ribs are articulated at each extremity, of which the posterior is doubly joined to the vertebræ; for the head is received into the cavities of the two bodies of the vertebræ by ginglymi, and the larger tubercle is articulated to the tranverse process of the inferior vertebra by arthrodia, by which means they are properly guarded against luxations.

They are divided into true and false; the true are the feven superior, whose cartilages are joined to the sternum; these ribs include the heart, lungs, &c. The salfe are five inferior, whose cartilages are not joined to the sternum; unto all these the diaphragm is connected; and within them the flomach, liver, fpleen, &c. are con-

The cartilages of the false ribs are only connected to one another by a membrane which covers them; the two laft are joined to the vertebræ by a round head, and their cartilaginous extremities are loft in the interflices of the muscles, by both which circumstances they become more moveable than the other ribs.

The upper rib, contrary to the rest, is flat upwards and downwards, that it may not incommode the lungs, and to leave room for the subclavian vessels and muscle.

The anterior extremity of each rib is lower than the posterior; therefore, when elevated, the cavity of the thorax will be increased in its diameter backwards and It is a dwarf tree, refembling that of the quince. The forwards, and the middle part of the fuperior ridge is

lower than the posterior part; thus, when elevated, the diameter of the thorax will be laterally increased.

COSTO-HYOID ÆUS. See CORACO-HYOID ÆUS.

CRAB YAWS. A name in Jamaica for a kind of ulcer on the foles of the feet, with hard callous lips, fo magir, KIDNEY-WORT, NAVEL-WORT, and WALL PENNY-hard that it is difficult to cut them. The ungt. hydratgyri fortior is their cure.

CRADE. In Hippocrates it is the branch of a fig- hangs down in the form of a thin oblong membrane. See

CRÆCA MAJOR. See VICIA. CRÆPALE. Galen fays it is a diforder of the head produced by excessive drinking of wine; called also CRA-

CRAMBE. A CABBAGE; but botanists distinguish it therefrom. Boerhaave fays its feed-veffels are unicapfu-tar, divided into two parts, and contain an oblong feed. The species are, the braffica maritima, and the crambe Orientalis dentis leonis follo erugginis facie.

CRAMBEION. Erotian fays it is an old Sicilian word for hemlock; but in Hippocrates it fignifies a decoction

CRAMPUS. So Helmont-calls the CRAMP. This complaint is often very troublefome; it is not usually dangerous, though inftances have occurred, in which, paffing from the limbs to the bowels, the patient hath with difficulty recovered. It feems to be a kind of con-vulfion; it occasions a sudden, painful rigidity of the muscles affected, but it soon goes off: it principally affects the limbs or neck.

In the Med. Mus. vol. in. is an instance of a care effected by drinking a glass of tar-water every night and morning. For prefent relief, the readieft cure is to take hold of a roll of brimftone, which prefently breaks, and thus the patient is eafed. But this difease, is either idiopathic, or symptomatic. When of the former class it affects the legs, thighs, or other parts fuddenly, whilst fwimming in cold water, or whilst the tibize are exposed to the cold night air, or when the mufcles are uneafily fituated; the digastric muscles are subject to this complaint; whilft the neck naked is exposed to the cold air, the pain is intolerable, but in a minute or two abates fpontane-oully, particularly if warmth with friction is applied to

the parts. The sympathtic cramp, is that which affects the lower extremities, particularly in the cholera morbus, with ftrong differition and exeruciating pain of the calves of the legs; from whence the afflicted moving their legs cry out; and as often as a vomiting fupervenes, they are in great torture. The best assistance, after a vomit has been premised of chicken water, twenty drops of liquid laudanum should be administered. If the breast should be affected with this fpains, a fugitive pleurodyne arises, but violent with a fear of fuffocation; if the throat, a

fpafmodic angina.

CRANEIA. The CORNELIAN CHERRY-TREE.

CRANGON, also called fquilla crangon, and the
PRAWN. It is a fea shell-fish of good nourishment.

CRANIUM. The SKULL. It is that part of the

head which is covered with hair; befides the os frontis, it confifts of the two parietalia, the two temporal, the occiput, the os ethmoides, and os sphenoides. See CAPUT. As to its medicinal virtues they differ not from those of other bones

CRANTERES. See SAPIENTIE DENTES. CRAPULA. See CREPALE. It is also a surfeit. A diforder from fomething taken into the ftomach, and occasioning a fickness, or at least a loathing of that to which the diforder was owing; though fometimes it fig-nifies a plethora, from indolence, and full but improper feeding, in which case perspiration is defective, and eruptions form themselves in the skin; but this is only an allowed impropriety; properly it is chalera accidentalis. See Cholera Morbus.

A furfeit from animal food, as mufcles, putrid flesh, &c. is best remedied by the use of vegetable acids, which may be taken diluted with water, a vomit being premised, and this, even though a vomiting and purging both at-

When an excess of feeding is the cause, the prime viæ being evacuated, and the nature of the plethora atvize being evacuated, and the nature of the plethora attended to, that the load may be properly evacuated, the indication of cure will be, to recover the perforatory discharge, consistent with which distretics may be used, but the increase of any other evacuation would interfere with the principal design.

CRASIS, from \*\*spayrous\*, to mix\*. The temper of the blood peculiar to every constitution.

CRASPEDON. A disorder of the uvala when it

CRASPEDON. A disorder of the uvala when it

Aretæus de Caufis & Signis Acut. lib. i. cap. 8.

CRASSA ARTERIA. See AORTA.

— MENINX. See DURA MATER. - INTESTINA. The large INTESTINES.

CRASSAMENTUM. So the red globules in the blood are called: in the due proportion of which confifts the health and life of a man. See CALIDUM INNATUM. CRESSENA. A term of Paracelfus, by which he

would fignify certain faline, putrefactive, and corrofive partieles, which produce ulcers and tumors of various

CRASSULA, called also faba cross, faba inversa, sedan telephium, fabaria, anacampseros, cotyledum alterum, serofularia media vel tertia, acetabulum alterum. COMMON ORPINE, or LIVE-LONG. The fort used in medicine, is

the fedum telephium, Linn.

It is a plant with unbranched stalks, which are clothed with thick, sleshy, oval leaves, but producing no leaves immediately from the root; the flowers stand in form of umbels on the top of the stalk, and are followed each by three, or four, or fix pods full of small seeds: the root is irregular and knobby. It is indigenous in England, and

Common orpine, with the leaves flightly or not at all ferrated, grows in hedges and shady grounds, hath red-dish or whitish pentapetalous flowers. The leaves are anti-inflammatory, but their power feems too inconfiderable for a place in practice.

CRASSULA MINOR. See SEDUM.

CRATÆGUS. The WILD SERVICE-TREE. Cotenafier.

— ALPINUS. The WHITE BOAM-TREE.

— OXYCATHA. See SPINA ALBA. CRATÆOGONUM. Seë MELAMPYRUM. CRATEVÆ SIUM. WATER-CRESSES.

CRATIBULA. The iron bars or grate which coverst CRATICULA. I the ash-hole in chemical furnaces. CRATICULARIS. Bread broiled on the hearth or

on a gridiron; from craticula, a gridiron. CRATON. See CATAPUTIA MINOR. CREA. The fpine of the tibia or the shin.

CREBER. Frequent. It is applied to respiration, and to the pulse when the intervals betwixt each inspira-

tion, or each pulsation of the artery, are short.

CREMASTER, from assuau, fuspendo, to suspendo.

These muscles are also called suspensivi testium. Dr. Hunter says they arise from the inside of Poupart's ligament on each fide, run down to the perforation where the feminal cord comes out, and being expanded over it, makes part of the tunica vaginalis communis. The course of this muscle being so very oblique, makes the spermatic cord seem much more than it really is. Their use is to draw up and suspend the testes.

CREMER. The name of a distemper endemial in

CREMER. The name of a distemper endemial in Hungary, which seems to be a fort of crapula. It is cured by drinking a small quantity of any cordial water. CREMNOI. The LIPS of ULCERS, also the labie pudender, from nessuard, a precipice, or selving-place. CREMOR, xumes, or xumes. It is the expressed juice of any grain; also the strained juce of any grain, particularly of barley boiled till it be so fost as to pass through a strainer (see Ptisana); and lastly, it is the cream of milk, or expressed water of barley. See Chylus.

— Calc. viv. The cream or flour of quick-lime is the pinguious substance floating on the top of newmade lime-water, which when taken off and dried becomes insipid.

CRENA, or crenated. Leaves are faid to be fuch, as are cut about the edges into feveral obtuse segments. They differ from serrated leaves in that these latter have

more acute incifures.

CREPATIO. In pharmacy, is the cracking or CREPATURA. burfting of any feed in boiling, and this is to be understood when feeds are directed to be

of fomentations, rubbing the joint with the ungt. hy- is of a shining white friable appearance, and readily didrargyri, and to administer purges now and then.

A discharge of air from the anus, when attended with a noise, is thus called.

CREPITUS LUPI. PUFF-BALLS. See LYCOPERDON VULGARE. Called also orbicularis.

CRESPINUS. The BARBERRY-TREE. See BER-

CRESPULUM. In Myrepfus it is the herb called

CRESSIO. WATER-CRESSES.
CRETA. CHALK. Kentman mentions fifteen forts; but the only one now used in medicine is the white chalk. - ALBA. So called because the best was formerly

found in Crete, now Candia, it is also called terra Creta,

and Creta Candida.

It is now found in most parts of the world. It is a pure white mineral calcareous earth, of different degrees of hardness; it crumbles between the fingers, and stains them white; also readily diffuses itself in water, and as foon subsides again; it sticks to the tongue without any aftringency. It is met with both in the form of stones and in powder.

The best is that which is persectly white, fost, close, and solid, equal and uniform when broken, free from fand and other bodies, and that it is rather agreeable than infipid to the tafte. Many other earths are of a fimilar

It does not diffolve in the vitriolic acid, but readily in all others, even totally in vinegar. The vitriolic acid precipitates it from all other acids, and forms with it a felenites. It is convertible into quick-lime; with borax it melts into a trasparent glass. The solutions of it in acids

Chalk is employed as a remedy against the heart-burn, and other diforders that have acidity in the prime vize for their cause. Dr. Slare afferts from experiments, that it abforbs acids fooner, and more powerfully, than crab's-eyes, calcined hartflorn, or coral. Some use it when finely powdered, to sprinkle on erysipelatous inflamma-tions. When chalk is saturated with an acid, it is said to become subattringent, otherwise it hath no such property; hence chalk given when acidity prevails in the ftomach, fometimes produces coftiveness; this though is much doubted by Cullen and others. Two drams for a dofe, and repeated at proper intervals, have often effected a speedy cure, both in a diarrhæa and a dysentery; but this effect was owing to its absorbing those acrid juices whose stimuli caused the morbid exerction. When milk turns four on the stomach, a scruple of chalk may be given with each half pint. When on any account a free use of chalk is required, if the belly is inclined to costiveness, laxative medicines should now and then be taken, otherwise concretions will be formed in the bowels, or the mouths of the lacteals will be clogged, and a marafmus will be the confequence.

Chalk thould be finely powdered, and feparated from its groffer parts by elutriation: Boerhaave prefers it to the C. c. c. for making the white decoction with. Bates formerly used to boil half a pound of chalk in three pints of water to a quart, after which he just permitted the groffer parts to fall, and poured off the yet turbid fluid for use. And the London College directs the following:

CHALK MIXTURE, Miftura Cretacea, formerly called JULEPUM E CRETA.

Take of the whitest chalk prepared, one ounce; of double refined fugar, fix drams; of gum arabic, finely powdered, two ounces; of diffilled water, a quart, mix. Pharm. Lond. 1788.

See Dale, Lewis's Mat. Med. Dict. of Chem. New-

mann's Chem. Works, Cullen's Mat. Met. Besides this the following are often used:
Decostum e CRETA. See CORNU CERVI.

Pulvis e CRETA Compositus
Pulvis è CRETA Comp. cum Opio
The two last supply the place of the pulvis e bolo compositus and pulvis e bolo compositus cum opio of the old London Pharmacopæia.

CRISELASIA. The driving a ring or circle. Driv-

CRISELASIA. The driving a ring or circle. ing a hoop was one of the ancient gymnaftics: this hoop was as high as the breaft of the perion who used it. It was commended for rendering the limbs pliable, and for ftrengthening the nerve

CRICO-ARYTÆNOIDÆI Musculi. Muscles of the larynx, whose office is to open the glottis. They rise from the cricoid cartilage, and are inserted into the

arytænoid.

- ARYTENOIDES LATERALIS. They lie laterally upon the upper edge of the cricoid cartilage, and are in-ferted into the lower part of the fide of the arytænoid. They ferve to dilate the glottis.

- ARYTANOIDES POSTICI. They lie upon the back part of the cricoid cartilage, and are inferted into that knob which flands on the back part of the basis of the arytænoid cartilage, near the angle of the bafis, one on each fide. They open the larynx, and are called by

Cafferius, par cucultare.

——PHARGYN MI. These muscles arise from the lower part of the fide of the cricoide cartilage. They feem to be appendices of the thyro-pharyngar, flewing no other marks of distinction but these insertions, and a small disference in direction, because as they run backward they descend a little; for this reason Winslow says, he hath fometimes looked on them as one, and called them thyro-crico-pharyng wi. The lowest of these muscular fibres, he fays, make a complete circle backwards, between the two fides of the bafis of the cartilago cricoides; this circle is the beginning of the cefophagus, and has been thought by fome to form a diffinct mufcle, called cefo-phagus. Sometimes there is another fasciculus of fibres detached from the thyro-pharyngæus, and inferted late-rally in the thyroid gland, for which reason I call it musculus thyro-adenoi-dæus.

Innes calls it the constrictor pharyngis inferior; and de-feribes it as follows. It arises from the side of the thyroid cartilage, near the attachment of the flerno-hyoideus and thyreo-hyoideus muscles, and from the criceid cartilage, near the crice-thyroideus. This muscle is the largest of the three, and some the crice-thyroideus. joins with its fellow, the superior fibres running obliquely upwards, covering nearly one half of the middle constrictor, and terminating in a point; the inferior fibres run more transversely, and cover the beginning of the cesophagus. Their use is to compress that part of the pharynx which they cover, and to raife it with the larynx

a little upwards. See PHARYNX.

- THYROIDEL. Certain muscles of the larynx, which shut up the glottis. They rise from the anterior and lateral part of the cricoid cartilage, and are inserted into the lower edge of thyroid cartilage. Some call thefe rycothyroidaus anticus.

CRICOIDES, also CYMBOLARIS CARTILAGO; x71x05, a ring, and s1806, a form. The name of the annular car-

tilage belonging to the larynx.

CRICOS, \*\*\*\*\*, a ring or circle. So Hippocrates calls the annular cartilages, which form the afperia arteria.

CRIDONES. Worms which breed in the fkin. See

CRIMNODES, of xpsupov, bran. An epithet for urine,

which deposits a branny fediment.

CRIMNON. Dioscorides describes it as being a coarse fort of meal produced from zea and wheat, of which they make pulse. Galen says that κριμοα are the largest particles of torrised barley, which have escaped due contufion in the mill.

CRINATUM, from \*pror, a lily. An epithet of thyoniama, or fuffumigation, mentioned in P. Ægineta. 4 C CRINEDONES.

CRINEDONES. See Capillares Vermiculi. CRINES.
CRINES. See CAPILLUS.

CRINITUS, from crinis, a bair. An epithet of plants, whose roots abound with capillaments, or small fibres,

CRINOMYRON, from \*popen, a lily, and pages, an bintment. Ointment of lilies, confifting of lilies and fome other aromatics. It was also called Ægyptium

album, and fusinum.

CRINON. A fily.

CRINONES, called also comedones. Ambrose Paré mentions this disease as follows "The mention of dracunculi calls to my memory another kind of abfcefs, altogether as rare. This our Frenchmen name cridones, I think, a crinibus, i. e. from bairs. It chiefly troubles children, and pricks their back like thorns. They tofs up and down, being not able to take any reft. This difease ariseth from small bairs, which are scarce of a pin's length, but those thick and strong. It is cured with a fomentation of water more than warm, after which you must presently apply an ointment made of honey and wheaten flour; for io, these bairs lying under the skin, are allured and drawn forth; and being thus drawn, they must be plucked out with small mullets." See Edinb.

Med Comment. vol. ix. p. 64.

In the Hiftory of the Royal Medical Society at Paris, for the year 1776, is a paper as follows, on this subject, by Mont. Bassignet. This disease, which is faid to be peculiar to the town of Seyne and its neighbourhood, attacks almost all the new-born children. Authors call it erinsns, or comedons. In the place itself it is called cies, a corruption of ceddes, a provincial word that fignifies a brifile. It appears in many cases within twelve hours; in others not till a month after birth, and sometimes, though rarely, at a more advanced age, of even twelve or more years. The fymptoms are described to be a vio-lent itching, which is increased by the heat of the bed, and prevents fleep; a continual agitation; incapability of fucking, the child's tongue not being able to accommodate itself to the nipple; and, lastly, a hoarseness, and gradual extinction of the voice. Of all these symptoms the last is considered as the most certain, so that by the weakness of the child's cries, and the alteration in its voice, the degree of the disorder is to be judged of. As foon as it is observed, they proceed to the cure, which confifts of frictions by women of the country, who are fo accustomed to this disease, that they seldom eall in either a physician or a surgeon. These frictions are made on different parts of the body, according the three states of the difease which are fometimes diffinct, at others comthe diteate which are tometimes diffined, at others com-plicated. In the first, to a diminution of voice is joined an inability to suck. This, we are told, requires fric-tions at the upper part of the sternum, neck, cheeks, and about the jaws, and temples. If the child's tongue is at liberty, and yet he is still unable to seize the nipple, his arms or singers at the same time feeling tense, this is the second state of the disease, and requires frictions on the second. The third is known only by the change in the fore-arm. The third is known only by the change in the voice, and is cured by rubbing the arms, fhoulders, back, and calves of the legs. The mode of friction is as follows: the woman wets her hand with faliva, and rubs the fkin of one of the child's arms; for inftance, along the tenfor muscles, till the feels a confiderable roughness. She then quits this arm and begins with the other, rubbing always in fmall circles, and conftantly in the fame direction. Nothing particular is observed in the skin previous to these frictions. Some of the most experienced women, however, speak of a fort of tension which gives way to rubbing. In many cases where this practice hath been neglected, the child, it is said, has been carried off by convultions or diarrhoes. In fome fubjects a fpecies of dark, rough hairs, not longer than the tenth of an inch, and in others, little substances refembling very fine red hair, not quite fo rough as the former, and furnished with a minute bulb at their extremity, appear on the fkin, and terminate the difeafe. This circumstance it is that gives name to the difease. To what is above faid, a case is related of a girl ten years old, who, after having been for some time ill, and taking different medicines, at length tried frictions as above described, and these brought out a prodigious quantity of dark coloured, rough hairs, after which the got well.

Mr. Loppy, in his Tractatus de Morbis Cutaneis, treats on this difease. See the London Medical Journal, vol. ii. p. 289, &c. See also Bovina Affectio, above. CRIOGENES. An epithet for certain troches mentioned by Paulus Ægineta, and which he commends for cleaning fordid please.

cleaning fordid ulcers.

CRIOMYXUS. An epithet for perfons abounding

with mucus in the nofe.

CRIPSORCHIS. See CHRYPSORCHES. Concealed testicles, from uponin, to hide, oppie, a testicle. This is when the testicles are yet detained in the abdomen, or have not made their descent into the scrotum. See Testes and PARORCHIDIUM.

CRISIMOS. CRITICAL.

CRISIS, from xeam, to indicate, also criterion. The termination or change of a disease either by recovery or

Hippocrates first established the doctrine of erifes, and critical days; the reason why in his time this exactness happened was, because they committed severs to them-felves, and did nothing to disturb the procedure of nature, fo that the diforder always kept the fame type. A crifit only respects acute diseases, and more particularly continual fevers. Now the physician is called in to give some affishance, critical days are not a subject of attention, the type of the diforder, or the erifis, being accelerated or retarded by what is administered.

Asclepiades and Celsus deny that diseases have their

critical days; and Langius fays, " if a crifis is to be expected, inedicine is superfluous."

The word crisis is not confined to this fignification, for fometimes it means the excretion of fomething noxious from the body: or the fecretion of the noxious humours in a fever, for the word \*porter, fignifies also to feparate, or as it were to pass through a sieve, &c.

Those who observe critical days, consider crudity is that state of the morbid matter wherein it is too viscid, or otherways unfit for a regular feparation from the or otherways unfit for a regular feparation from the founder juices; concoction, as that works upon the morbid matter by the power of nature, or affiftance of art, which renders it fit for feparation from the healthy part of our fluids, and to be thrown out of our bodies; crifis, is the actual difcharge of the morbid matter, whether brought on by the power of nature, or by medical aid; and the critical day is, the time that this difcharge happens. Perhaps the fallacy of this may be feen into by adverting to the article Concoction, already noticed.

In favour of this subject, see Hippocrates, Galen, P. Ægineta, and Fernelius; on the other side, see Asclepiades, Celfus, Langius, and Faber.

des, Celfus, Langius, and Faber.
CRISPATURA, CRISPATURE, CURLING. In medi-

cine it is a fpafmodic contraction of the membranes and

CRISPINUS. The BARBERRY-TREE.

CRISTA. The name of a tubercle about the anus and pudenda. Tubercles of this fort are fo called on account of their form. The caufe and cure are the fame as the condyloma.

CRISTÆ CLITORIDIS. See NYMPHÆ.

CRISTA GALLI. In botany it is the name CRISTA GALLI FORMINIA. of feveral species of the alectorolophus. YELLOW RATTLE.

CRISTA GALLI. In anatomy, it is an eminence rifing from the upper part of the os ethmoides, to which the beginning of the falciform process is attached. It is called crista galli, from its supposed resemblance to the comb of a cock. See ETHMOIDES os.

CRISTA PAVONIS. See POINCIANA flore pulcherimo. CRISTA PAVONIS CORONILLÆ FOLIO. See BRASI-

LIUM LIGNUM

CRITERION. See CRISIS. CRITHAMUM. See CRITHMUM.

CRITHE. BARLEY; and from its fimilitude, a fort of tubercle on the eye-lid is thus named; this tumor is called alfo a STYE. By Actius, Grande; it is a hard feircalled also a STYE. By Actius, Grando; it is a hard scirrhous immoveable stian in the interior part of the eyelid, containing a pellucid body. When small it is seated
on the edge of the eye-lid, but when large it spreads further. When they do not suppurate they become wens.
They are apt to disappear and return. If there is instammation, endeavour to suppurate it with the white bread
poultice: if it is hard, destroy it with a mixture of equal parts of hog's lard and quickfilver. If the lower eye-lid

CRITHMUM, called also faniculum marinum majus, berba Santti Petri, caaponga, critmum; CRETHMON Batiz, faniculum maritimum minus, crithmum marinum;

SAMPIRE, PASPIRE, and SAMPHIRE.

It grows wild on rocks, and in maritime places; the leaves refemble those of fennel, but the fegments are thicker and shorter; to the taste they are warm and bitter, to the smell somewhat like smallage. They are aperient and diuretic. Their chief use is as a pickle.

There is another species called crithmum vel faniculum

marinum majus odore apii & baticulz.
CRITICA SIGNA. Those figns which are taken from the critis of a difease, as to recovery or death.

CRITICI. CRITICAL FEVERS. Those which terminate with a lateritious fediment in the urine.

CRITMUM. See CRITHMUM. CROCIDE CONFECTIO. The name of a confect commended by Nicolaus Myrepfus for the colic.

CROCINUM. OIL of SAFFRON. It is mentioned by Dioscorides as confifting of olive oil, myrrh, and a small quantity of foffrom.

CROCODES. An epithet for certain troches in P.

Egineta. CROCODILION. The GLOBE-THISTLE. This name is given to the carline-thiftle, the eryngo, the echinopus

CROCODILUS TERRESTRIS. See Scincus.
CROCOMAGMA. Diofcorides informs us, that it is prepared of the ungt. crocinum, and fpices preffed and made into troches, called also Ecmagma.

CROCUS. SAFFRON; called crocus fativus, crocum, crecus autumnalis fativus; because of its golden colour the chemists call it aroma philosopherum, by contraction aroph; others have called it sanguas Herculis, aurum vegetabile, and anima pulmonum, Jovis sloss. For its extraordinary efficacy in some diseases, it is entitled rex vegetabilium, and panacea vegetabilis; from its power of exciting laughter it hath the appellation of bortus latitiae, and medicina tristitiae. Besides these, various other names are to be met with in different authors. Its name of faffron

is from the Arabian word zaffaran, or zahafaran.

Saffran is a bulbous-rooted plant; its leaves are flasped like those of grafs; the flower is of a purplish blue colour, cut deep into fix fegments; in the middle of the flower, among the stamina, arises a pistil, which is divided at the top into three fleshy filaments; the upper part of these filaments is of a deep orange-red colour, and are the saffron of the shops. The plant is perennial, the flowers blow in September. Boerhaave enumerates twenty-eight species. The officinal crocus is the crocus sativus, vel crocus spatha univalvi radicali corollæ tubo

The filaments of the faffron flowers are carefully fe-parated, and moderately dried in a kiln, and when no farther manufactured are fold under the name faffron in the hay. But the greatest part of this article is, after being dried to a certain degree, prefied into thin cakes. It is cultivated in France, Spain, Auftria, Hungary, &c but the beft is produced in England, and may be diffinguished from all others by the greater breadth of its blades; the beft is in long broad filaments, of a deep red colour, without any yellow parts, moderately dry, yet flexible and fost to the touch, difficultly pulverized, of a strong and agreeable smell, especially at a distance; affeeting the eyes fo as to draw tears from them, of a pungent and fomewhat bitterish taste; it readily impreg-nates the hand with its smell, and stains the moist hand

with a deep yellow colour.

As a medicine it is efteemed an agreeable aromatic, of a warm pangent bitterish tafte; it is also an anodyne, antifpafinodic, cordial, and attenuant. Boerhaave ranks it among narcotic poifons, and in case of an imprudent dofe being taken, he orders a vomit and acidulated draughts. It is often a very powerful emenagogue, and in this intention requires caution in its use, as some patients are more extraordinarily affected by it than others; in disorders of the lungs it hath been so efteemed as to obtain the name of anima pulmonum. In coughs it is

is affected, the tumor is more frequent on its infide, and then is best if diffected, or to make way for it outwardly ple of faffron, with half a grain of musk, is of confiderably applying a caustic on the skin just upon it. See St. Yves on Difforders of the Eyes. Also Hordeolum and Chalaza.

Chalaza. of it; he has given it in large doses without producing any sensible effects, hardly, in any degree, increasing the frequency of the pulse; and as anodyne or antispasmodic, he fearcely observed its operation. In one or two instances he had some reason to believe in its emenagogue power, but in others not at all, though repeatedly employed in large doses. And though the Doctor has given it in every shape, and in larger doses than authors ever proposed, he still has not discovered in it any considerable power or

Reclified fpirit of wine, proof fpirit, wine, vinegar, and water, all extract the whole virtue and colour of faffron. About three parts in four of the faffron are taken up by each of these menstrua, and what remains undiffolved is inodorous, infipid, and of a pale clay colour.

Tinctures drawn by acid liquors foon lofe their fine colour; the watery and the vinous tinctures foon fade, and participate part of the diffolved faffron; but those made with proof or rectified spirit will keep good during

many year

In diffillation water is strongly impregnated with its slavour; and if the quantity of fasses is large, a small portion of a fragrant and very pungent essential oil may be collected, which, according to Vogel, amounts to about a dram and a half from sixteen ounces. The remaining decoction, inspissated to an extract, retains all the virtues of the saffron, except the cordial one. The spiritous extract retains much of the cordial quality.

The dearness of saffron subjects it to many artisices, by which it is adulterated, but the best method of avoiding them is to purchase only the fort called hay-saffron. In distillation water is strongly impregnated with its

ing them is to purchase only the fort called hay-faffron.

The London College directs the following preparation from faffron :

Syrupus Croci. Syrup of Saffron.

Take of faffron, one ounce; boiling diffilled water, two pints; macerate the faffron with the water for two hours, in a veffel clofe ftopped, and to the strained liquor add of double refined sugar sufficient to make a syrup. Pharm. Lond. 1788.

CROCUS ANTIMONII. See ANTIMONIUM. - Indicus. Turmeric. See Curcuma.
- Martis, aperiens, and astringens. See

FERRUM.

- METALLORUM. See CROC. ANTIM. under AN-TIMONIUM.

- SARACENICUS. The flower of baftard faffron. CROMMYON, or CROMYON. An ONION. CROMMYOXYREGMIA. Acid and foetid eructa-

tions refembling the tafte of onions.

CROPIOT. A fmall fruit mentioned by Clufus, like the Ethiopian pepper, containing a fmall black feed.

CROTALARIA. It hath fingle leaves, in which it differs from rest-harrow; the pods are turgid, in which it differs from Spanish broom. Bornhave mentions five species; but it is not remarkable for medicinal virtues.

CROTAPHITES. See Temporalis musc. from \*\*\*spling to time, or \*\*\*spling to beat as the pulfe. CROTAPHIUM. A pain in the bead near the tem-

CROTON. The plant rifinus. According to Foefius, it fignifies in Hippocrates, the bronchia of the lungs expectorated; a name also of the seeds from whence the ol. ricini is taken.

CROTON BENZOE. See BENZOINUM. - CASCARILLA. See CASCARILLA.

CROTONE. A fungous excrescence on trees, but by a metaphor, it is applied to excrefeences and fungous tumors on the periofteum.

CROTAPHOS. Pain in the temples. See CEPHA-

CROUSMATA. This word is met with in Myrepfus, and is translated by defluxions, rheums; but Fuchfius thinks in should be read, populara. They rife from the cRUCIALIA, LIGAMENTA. They rife from the

GALLII SPECIES. A Species of CROSS-WORT. See CRUCIATA VULGARIS.

CRUCIATA. CROSS-WORT. So called because its leaves are disposed in the form of a cross. Boerhaave divides the species into spicated and verticulated.

CRUCIATA VULGARIS; also named crucialis cruciata hirfuta, crucialis gallii species. Gallium latifolium store

lutes, MUG-WEED and CROSS-WORT.

The roots are flender and creeping, the branches hairy; about a foot high; at the joints of the stalk are placed four round pointed leaves that are hairy, and have footstalks; the flowers are small and yellow, each followed by two small round black seeds. It grows in hedges, and the fides of fields, and flowers in July. The leaves and tops are commended for promoting expectoration. Raii

CRUCIBULUM, also called, tigillum, catinus, fusorius, or CRUCIBLE. It is an earthen vessel, made for enduring the greatest degree of heat, generally wider above than below, and of a round, or triangular figure. Calcined bones are equal, if not superior, to any other materials for making them; some are made of equal parts of the best potter's clay dried, of plumose alum, and of bastard tale, finely powdered, formed into a paste with whey, and then baked as other pottery wares. Chalk cut into the form of a crucible, then steeped in linseed oil for twentyfour hours, answers many purposes very well; some use the powder of common tiles, and an equal quantity of chalk; these are mixed with linseed oil, and then baked. Various other materials, and modes of combining them, may be feen in Pott's Differtation on Crucibles, and in the Dict of Chem.

CRUDITAS. CRUDITY. It is applied to unripe fruits, to raw flesh, undigested substances in the stomach, humours in the bodywhich are unprepared for expulsion,

and to the excrements. See CRISIS.

CRUENTA SUTURA. BLOODY SUTURE; when the lips of a wound are brought together by means of a ligature made with a curved needle.

CRUNION. The name of a diuretic compound me-

dicine described by Actius.

CRUOR. Blood extravasated and congealed, from xgues, frigus. Sometimes it means the BLOOD in general,

and fometimes the venal only.

CRUPINA. The BEARDED CREEPER, called also cyanus pulchro semine centaurii majoris, cyana palustris, chondrilla Hispanica, chondrilla rara purpurea, crupina belgarum. It hath no known medical virtues.

CRUPINA. See CALCITRAPA.
CRURA CLITORIDIS. The two fpongeous bodies that form the clitoris, before their union are thus called. See CLITORIS.

- MEDULLE OBLONGATE. The two largest legs, or roots, of the medulla oblongata, which proceed from

the cerebrum. See CEREBRUM.

CRURÆUS. CRUREUS, or CRURALIS, from crus, a leg. The crureus, the vaftus externus, and vaftus in-ternus, may be confidered as one muscle. See VASTUS INTERNUS.

The crureus muscle covers almost all the fore-fide of the os femoris, between the two vasti. The tendons of the crureus, rectus anterior, and of the two vasti, unite into one, and are inferted into the fide of the patella, in the edge of the ligament of that bone, and in the adjacent lateral part of the head of the tibia. They extend the

CRURALES ARTERIÆ. The CRURAL ARTE-

The external iliac arteries pass out of the belly under the inguinal glands, and there take the name of crural; they run over the heads of each os femoris, turn under they run over the heads of each os femoris, turn under the crural vein, presently after passing out of the abdomen; here they are not covered with any muscles, but presently plunge betwixt the sartorius, vastus internus, and triceps muscles, and are covered by them all the way to the lower part of the thigh. A little above the internal condyle of the os semoris they perforate the tendon of the triceps, and run to the posterior part of the thigh, down

In the ham, and there take the name of poplites. In the course of these arteries, they give out the pudics externs and other branches to the different nuscles of the shigh.

CRUCIALIS INCISIO. An incision in the form of a cross.

CRUCIALIS. In botany, is the cruciata hirsuta.

joins the third, and that again communicating with the fourth, they produce this erural nerve, fee LUMBARES; which paffing under Poupart's ligament, runs on the fore-part of the thigh upon the iliacus internus muscle; it difperfes itself into many branches, one of the principal of which accompanies the vena saphena all the way to the

ankle. See also CRURÆUS.

CRURALIS VENA, called also ifchius. The external iliac vein, going out from under the ligamentum Fallopii, on the inside of the iliac artery, is there called crural. About an inch below its passing out of the abdomen, it seems of a large branch, called the saphena; after which it sinks in between the muscles, and is distributed to all the inner parts of the lower arteralists. inner parts of the lower extremity, accompanying the crural artery to the toes. In its defcent down the thigh, it runs behind the crural artery; when it hath arrived into the lower part of the thigh, its fituation is between the crural artery, and the inner condyle of the os femoris,

crural artery, and the inner condyle of the os temors, and just above the ham it takes the name of poplitea.

CRUREUS. See CRURÆUS.

CRUS. The LEG. It includes the whole of the lower extremities from the os innominata to the toes, viz. the thigh, leg, and foot. It fometimes fignifies only femur, the thigh, and by fome it is also confined to that

part between the knee and ankle. CRUSTA. The shell of a lobster, crab, cray-fish, prawn, or thrimp; also the name of a fcab, or fcurf, upon a difeafed part, or an efchar; or a fort of crust or cream which coagulates on the fuperficies of any liquor, as upon blood, urine, or upon fermentable liquors during one stage of their fermentation.

CRUSTACEA. See Achor.

CRUSTACEA. And μαλακοτρακα, are animals which CRUSTACEA. have their external parts firm and hard, but contain a fielly foft fubflance within; or, which being covered with flender crusts or shells, are destitute of bones internally, which have their heads furnished with horns and other appendages, they have eight feet obliquely bent, and two arms called claws, notched like a forceps Pliny comprehends all crustaceous animals under the name of CRABS. Linnœus classes them among insects without wings, under the generical name of CRABS.

Dr. Cullen takes notice in general of the lobster, crabprawn, and shrimp only, of which he says the two former

hardly differ in any quality from one another, and from the small proportion of volatile alkali that is obtained from their entire substance, or extract, he concludes they con-tain less of animal substance than the flesh of quadrupeds, birds, or even the amphibia. With respect to them as aliment, they are much of the nature of most fishes; approaching to the nature of many, in being without oil, or having it in a very small proportion, and therefore affording less nourishment. They appear to be more difficult of digestion than most sishes. Mat. Med. CRUSTULA. Sometimes this word signifies an ec-

CRUSTUMINA PYRA. PEARS much admired by the Romans, and mentioned by Columella, lib. v. c. x.

Rhodius takes it to be the bergamot pear, but from its hiflory his notion feems not probable.

CRUSTUMINATUM. A fort of rob made of the
juice of apples and pears, boiled up with honey and rainwater. Actius gives directions for making it.

CRUX CERVI. The BONE of the STAG'S HEART.

CRYMODES, from \*\*poof\*, cold. An epithet for a fever wherein the external parts are cold.

CRYOXA. Erotian fays it is a kind of pot-herb.

CRYPTÆ, from \*\*poof\*(a, to hide. Hollow places, like cavities, containing fome fluid. See Folliculus.

CRYPTOGAMIA. The 24th of Linnzus's claffes of

plants. They are fo called from the obscurity of their manner of impregnation. Their parts of generation are obscure. The mosses, mushrooms, and ferns are of this fort. In fome of them, as in the fern, the feeds are found on the back of the leaves of the plant.

CRYPTOPYICA. Ischuria. A fuppression of urine, from a retraction of the penis within the body. See

CRYSORCHIS. 'A retraction, or retrocession, of one nature of faturation, and the variation of the solvent power

CRYSTALLI. Eruptions about the fize of a lupin, white, and transparent, which fometimes break out all byer the body. See Chrystalling.
Crystalli tartari. See Tartarum.
CRYSTALLINA. The CRYSTALLINE HUMOUR of

the EYE; from xguranas, ice; which comes from, xgues, cold, and sixxouat, to grow together, called also crystallinus

Immediately behind the aqueous humour is fituated the eryflalline; it is transparent, of the colour of crystal, and therefore is thus called. It is situated between the aqueous and vitreous humours, its anterior part being opposite to, and very near the pupil; its posterior part is lodged in a cavity, formed for its reception in the middle and fore-part of the vitreous humour: the figure of the crystalline is that of a lens, convex on both fides, but rather more so posteriorly. The crystalline is the least, but of the most firm confishence of the three humours of the eye. It is more firm in the middle than in the fides; and, in time, is apt to change both in its confiftence and colour, growing ttill more firm, and becoming yellowith. It is invefted with a dense, firm membrane, which is rather loofely connected to it; it is perfectly transparent, but when injected, appears furnished with an immense quantity of blood-vessels. In the fœtus there appears a branch of the artery that passes through the axis of the optic nerve, which comes through the vitreous humour, and ramifies through the capfula of the cryfialline in a radi-ated manner; this is much larger in the focus, and ftronger than in adults; these branches go to the tips of the processus citiares, and are there imperceptible. The erystalline humour is membraneous, and consists of many coats inclosed in one another, the whole of which are contained in a capfula, formed by a continuation of the covering of the vitreous humour. This capfula is called Aranea, which see. The crystalline humour produces a second refraction of the rays of light; the first refraction, which is produced by the cornea and the aqueous humour not being fufficient to bring them to a focus at the retina.

CRYSTALLINÆ. CRYSTALLINES. See CRY-STALLI. The Italian physicians call them tareli. They are pultules filled with water, are transparent, and, on that account, receive the name of crystallines. They are one of the worst symptoms attendant on a gonorrhoca. They are lodged on the prepuce without pain, and though caused by coition, have nothing of infection attending them. The cause is supposed to be a contusion of the lymphatic vessels in the part affected. Dr. Cockburn, who hath described this case, recommends for the cure a mixture of three parts of lime-water, and two of rectified spirit of wine, to be used warm, as a lotion three times a day.

CRYSTALLINÆ MANUS. In Hippocrates, are hands

so cold as to feem frozen.

CRYSTALLINUM. WHITE ARSENIC. See ARSE-

CRYSTALLINUS HUMOR. See CRYSTALLINA. CRYSTALLION. In Oribafius, it is a name for the

CRYSTALLIZATIO. CRYSTALLIZATION. It is the operation in pharmacy used for reducing falts to their proper specific form; the falts then appearing like cryfials gives this name to the operation. All the alcaline falts are excluded from this operation, for fixed ones never af-fume this form, and the volatile fly off before a pellicle can be discovered. Some of the neutral kind, particularly those of which certain metallic bodies are the basis, are as incapable of explalization as any other fort of falt, except fome other fubitance be added, with which the water hath a greater affinity. Different falts also require different quantities of water to diffolve them; hence, if a mixture of two falts be diffolved in one fluid, they will begin to separate at different times of the evaporation: upon this foundation falts are freed not only from their impurities

water to diffolve in, shooting first.

All falts when disfolved in such a quantity of water a is not fufficient to keep them in that the finite figure their coalescence, do form themselves into similar figure. The is not fufficient to keep them in that flate, and preven-

but also from one another; that which requires the most

of hot and cold water, which are principles on which this operation depends, fee in the article SOLUTION and MENSTRUA. The end of crystallization is, to render the falts pure and distinguishable, as well by freeing them from feculence, and giving them their proper form, as by

feparating each kind from every other.

The manner of crystallizing falts is, to make a faturate folution of them in boiling water; (hot water diffolves more falt than it can fuspend when cold), then put the folution into a proper veffel, and let it fland ftill in a cool place till the crystals are formed; this requires some days. When cryftals are formed, this requires tone days.

When cryftals are formed, the remaining folution, called the mothers, must be poured off, and what the cryftals retain must be drained from them, which is done on a paper, then dried; the mothers may be evaporated to dryness, or kept for the same purpose again.

If falts are dissolved in too much water, evaporate unsuit the falt. The area of the same purpose are the same purpose of the same purpose of the same purpose.

til the falts shew a disposition to concrete, even from the hot water, by forming a pellicle on the furface. If large, and the most perfect erystals are required, remove the solution from the fire before the pellicle appears, otherwise the suddenness of the erystals are will diminish the perfection of the erystals. In this case evaporate until some drops of the liquor let fall on a cold glazed plate, discovers crystalline silaments; where this mark of sufficient exhalation appears, remove the veffel from the fire into a lefs warm, but not cold place; cover it with a cloth, to prevent the access of cold air, and thus leave it till eryfials are formed. If the falt is pure, no more is necessary, but if not, filtration will be required, previous to the solution being left for the separation of its contents.

In eryflallizing large quantities, flicks are placed across in the veffels, on which the falts forming, are taken out in a more perfect figure, and with lefs trouble, than when they adhere in thicker concretions to the fides and bottoms

of the veffels.

Sudden cooling, or shaking the vessel with either of them, prevent the falts from being properly and regularly

Care should be taken that the substances of the vesiels

are fuch as not to endanger corrolion.

The figures of falts cannot be destroyed; for if they are comminuted ever fo finall, yet upon recryfallization, they form themselves again into their proper shapes. Common falt discovers quadrilateral pyramids, with square bases, or nearly cubes. Sugar discovers the same pyramids with oblong and rectangular bases. Alum hath fix sides supported with an hexagonal base. Crystals of vitriol refemble ificles, among which are fome polygons. Sal ammoniac refembles the branches of a tree, or feathers. Salt of hart's-horn refembles a quiver of arrows. Glauber's falt refembles both fea-falt and vitriol. Nitre appears in prifmatical columns, or are hexagonal prifms. Salt of tin reprefents a flar, its lines radiating from the centre to the circumference.

Salts retain in crystallization a portion of water, and on this their crystalline form feems much to depend. Nitre contains about one-twentieth of its weight of water; alum one-fixth; fea-falt one-fourth; borax, green vitriol, and the bitter purging falts, from one-third to one-half. Rectified spirit of wine diffolves some falts, affifts the

ryflallization of others, and is necessary for separating any

oily matters therefrom.

See Boerhaave's Chemistry; Dictionary of Chemistry; Neumann's Chemical Work

CRYSTALLUM MINERALE, i. e. Sal prunel purified by folution, and crystallization. See NITRUM.
CRYSTALLUS PHILOSOPHORUM. See AZOTH.

CRYSTALLOIDES TUNICA. Sec ARANEA. CRYTHE. A grandinous immoveable stain. See HORDEOLUM. This is a hard, scirrhous, immoveable stain in the interior part of the eye-lid, containing a pellucid body. See Chalaza.

CTEIS. See Pubis OSSA, or Pecten. Ctenes, in the plural number, implies those teeth which are called

CTESIPHONTIS MALAGMA. A plaster described

CUBEBÆ. CUBEBS, also called piper caudatum, by Actuarius campeba, and by Myrepsus compiper. Piper cubeba. 4 D

fis acutis, fpica folitaria pedunculata oppositi folia, frue-tibus pedicellatis, Linn. They are dried berries of an ash-brown colour, generally wrinkled, greatly resembling pepper, but furnished each with a stender stalk. They are brought from Java, and other different parts of the East Indies. They are a warm spice, agreeable to the fmell, and fomewhat pungent to the talte. Their qualities refemble those of pepper, but are much milder. Diffilled with water, they yield a small quantity of ef-sential oil, which possesses most of their virtue. An extract made with rectified spirit of wine abounds with all their virtues, for the odorous principle does not exhale with Spirit.

Chuse such as are found, large, smooth, plump, and heavy; for if they are wrinkled they have been gathered before they were ripe. See Raii Hist. Neumann's Chem. Works, Lewis's Mat. Med.

CUBBIS. See FAGARA MAJOR.

CHUBLICOP ME OF SEE CHURCHES OF

CUBIFORME os. See Cuboides os.

CUBITALIS. The nerve called also the ulnar nerve. See CERVICALES. Chefelden describes the cubital nerves as being two in each arm, the upper passing over the upper extuberance of the os humeri, and runs on to the thumb and the three next fingers by its branches, which fpread when it approaches the thumb; the inferior, which paffes under the inner extuberance of the os humeri, and

runs on to the ring and little fingers.

CUBITALIS VEL ULNARIS ARTERIA. or ulnar artery, parting from the radical about a finger's breadth below the bend of the arm, finks in between the ulna and the upper parts of the pronator teres, perforates the palmaris longus and radizeus internus; near the carpus it lies just under the integuments, is continued on the infide of the os pififorme, runs before the annular liga-ments acrofs the palm, and forms an arch which analto-mofes with that of the radial; whence these arteries go to the finger and thumb, one running on each of the fingers. In its course it sends off various branches.

- Musculus. See Anconæus musculus. - Externa & Interna, Vena. See Basi-

CUBITI PROFUNDA, VENA. Sometimes from one and fometimes from another of the branches, called mediana, a branch goes out on the infide of the fore-arm which is thus named.

CUBITUS, from cubando, because the ancients used to lie down on that part at their meals. See ULNA. Or the elbow, or the fore-arm from the elbow to the wrift. See Brachium. It is also a cubit measure. In botany it is eighteen inches; fo the stalks of plants are named cubitalis, bicubitalis, &c. according to their height.

CUBOIDES, from xoc , a cube, and uso, os. Called also cyboides varium os, cubiforme, quadratum, grandinosum varium, tessar, multiforme. This bone is fituated immediately before the calcis; on its fore-side it such in the cubiforme. it fustains the os metatarsi of the little toe, and that toe next to it. The offisication of this bone is scarce begun at the birth.

CUCI. The fruit of the eucisphoron, which is improperly ranked as a palm-tree, called palmæ facie cucio-phora. It is a round, oblong Indian fruit, of the fize of a fmall fift, yellowish, of a fweet agreeable taste, and with

CUCIOPHORON. The tree which bears the fruit

called cuci.

CUCOS. The kernel of the fruit of a species of palm-

tree; the fruit is the fize of a cherry.

CUCUBALUS. BERRY-BEARING CHICK-WEED, OF CAMPION, of the decardria trigynia class, of which there are fixteen species and seven varieties. It is also called

CUCULATUM MAJUS. BRANDY, or SPIRIT of

CULI FLOS. See CARDAMINES.

CUCULLA, Culture Culture Cucultaris Musculus, farifes by a firong round tendon, from the lower part of the protuberance in the middle of the os occipitis behind; and by a thin membranous tendon, which covers part of the fplenius and complexus mufcles, from the rough curved line that

subsba, vel piper foliis oblique ovatis, f. oblongis veno-fis acutis, fpica folitaria pedunculata oppositi folia, frue-covers the spinous processes of the superior vertebrae of the neck, but arises from spinous processes of the two inferior, and from the spinous processes of all the vertebrae of the back, adhering tendinous to its fellow the whole length of its origin. It is inferted, flefhy, into the posterior half of the clavicle, tendinous and flefhy, into the acromion, and into almost all the spine of the scapula. Its use is to move the scapula, according to the three directions of its fibres; for the upper deteending fibres draw it obliquely upwards; the middle transverse straight fibres draw it directly backwards, and the inferior afcend-ing fibres draw it obliquely downwards and backwards. Where it is infeparably united to its fellow in the nape of the neck, it is named ligamentum colli, or nucha. Innes. It is observed by Douglas, that Galen divides this mufele into two, viz. the superior and the inserior. The first he calls the trapezia; and to the fecond, later anatomists have given the name of cuculla, from whence they are both commonly named cucultares. Its upper part, from the os occipitis to the spinal process of the last vertebra colli, is inteparably united to its fellow of the other

CUCULLATA. See SANICULA.

CUCULLATÆ FLORES. CUCULLATE FLOWERS.

See FLOS LABIATUS.
CUCULLUS. See CUCUPHA, and also EPITHEMA.
CUCULUS. The CUCKOW, or CUCKOO. The stomach of this bird reaches from the lower part of its throat to its vent. It is not for want of affection, truly speaking, that the cuckes leaves its egg for other birds to hatch, but from the polition of its ftomach. In other birds the ftomach is near the back, and all the inteffines are beneath it, from whence it is eafy for them to incubate their eggs, as well as their young ones; but in the cuckos the stomach is under the intestines, which in incubating would subject it to pain.

CUCUMERARIA.
CUCUMERINA INDICA.
See Momordica.
CUCUMIS. The CUCUMBER. The cucumber hath 2
flower confifting of one leaf, which is bell-flaped, and expanded towards the top, and cut into many fegments, of which fome are male, others female. The best fruit is long, and of a deep green. This plant is annual and raised from feed, the best of which is long, thick, and with a thin rind.

CUCUMIS AGRESTIS, called also cucumis affininus, elaterium offic. The WILD or SQUIRTING CUCUMBER. The fruit from whence the elaterium of the shops is obtained, is the momordica elaterium, or momordica pomis hispidis, cirrhis nullis. Linn. This fruit is watery, hairy, and almost of an oval shape, about two inches in length: when ripe, it burfts on being touched, and throws out with violence its whitish juice and black feeds. It is fown in our gardens annually, but is found wild in many other countries. From the circumstance of its bursting with violence, the Greeks call it elaterion, which fignifies the elaftic power of the air, derived from sauru, to shake, or exagitate. Elaterion also fignifies any purging medicine, particularly those that act with violence, as does the juice of wild cucumber: whence another reason for calling it by this name. All the parts of the wild cucumber are purgative; the fruit is the most so, and the root more active than the leaves. The juice of the fruit hath an unpleafant fmell, and a durable naufeous bitter tafte: on flanding a few hours, it feparates into a thick part, which falls to the bottom, and a thin watery fluid, which floats above; the thick feecula, when dried in the fun, or any other gentle heat, is a strong irritating but slow catharti and often operates likewife upwards; it remarkably raifes the pulse, and feems to excite a feverish state for a time; it is therefore only used in cold phlegmatic confti-tutions, as in dropsies. In which disease it was much employed by Sydenham, and Lifter. See Sydenham's Works with notes, by Dr. Wallis. Lifteri Exercitationes Medicinales de Hydrope.

The London College directs the following method of

preparing elaterium.

Slit ripe wild cucumbers, and pass the juice, very gently preffed, through a very fine hair fieve into a glazed vefand complexus mufeles, from the rough curved line that fel; fet it by some hours, till its thicker part shall have extends from the protuberance towards the masterial profession of the temporal bone; runs down along the nape of draw away the rest by straining; let the thicker part

which remains, be covered over with a linen cloth, and | dried by a gentle heat. Pharm. Lond. 1788.

Care should be taken not to press the cucumber, so as to force out any of the pulpy part, for thus the prepara-tion will be proportionably weakened. Two or three grains are a full dofe of this medicine, though five grains have been given, and good effects only were observed. An extract made with wine from the roots is equally ufeful with this fecula, called elaterium.

Elaterium is mentioned as a purging medicine by, Hippocrates; fometimes it occasions great uneafines in the bowels, if too large a dose is given; in which case acids and mucilages are the proper antidotes. See Raii Hift.

Lewis's Mat. Med.

CUCUMIS ÆGYPTIA. CHATE OF EGYPTIAN CUCUM-BER. It is more white, foft, and round than our garden eucumber, but of fimilar qualities.

— Canadensis. See Sievos.

— colocynthis. See Colocynthis.

- GALENI. MELO VULGARIS. A species of encumber. - HORTENSIS, Cucum. vulgaris, cucumis fativus,

OF GARDEN CUCUMBER.

The feeds of this species are the only part used in me-dicine; they have usually been prescribed in a mixture of equal portions of the feeds of the citrul, gourd, and pumpion, under the general name of the greater cold feeds. The feed of all these plants are similar in their medical properties. The fruit of the cucumber is not very nutritious, because perhaps it is employed in its unripe state, though it makes a confiderable part of the aliment of many persons in warm climates, and seasons, and its aqueous, cooling, and acescent quality renders it very proper for summer aliment, and an agreeable food in hot, bilious dispositions. From the firmness of its texture, it is often retained long in the flomach occasioning acidity, and flatulence; hence it should be accompanied with some of the condiments. Formerly the feeds were beat into an emulsion with other ingredients, but now are rarely called for in practice, the

almond emulsion superceding their use.

—— PUNICUS CORDI. See BALSAMINA.

CUCUPHA, called also cucullus, pileolus, birrethus, pileus, byrethrum, byrethrus. An odoriferous CAP for the head. It is made like what is called the fkull-cap for children, of either filk or linen; it is double, and between its fides are put cephalic aromatic drugs in powder; fometimes they are mixed with cotton, to keep them fometimes they are mixed with cotton, to keep them equally dispersed; these spices are also sprinkled with some suitable effential oil, or spirit, or vinegar; then the cap being sowed round its edges, it is placed next the head, and another over it. When half of the skull, or only a particular part of it is to be applied, it is called a semi-enember. The ingredients should be renewed when their virtue is worn off. The proportions of the species was usually as solven to the secretary of leaves of leaves of leaves of leaves the secretary of the secretary of leaves of le are ufually as follow: of roots, an ounce; of leaves, two or three hands full; of flowers, two or three pugils; of gums, one or two drams; of powders, one ounce; the whole rarely exceeds four ounces. Cucapha act by the exhalations from the spices they contain. They are apt to render the patient disagreeably sensible of all changes of weather. See EPITHEMA.

CUCURBITA, Cucurbita lagenaria, Linn. The

GOURD. It is a large fruit, growing on a plant; its feed is one of the four cold feeds mentioned in the article

CUCUMIS. See also BOCIA.

— A CUPPING-GLASS. See CUCURBITULA.

Alfo a cucurair. A chemical veffel, so called from its resemblance to a gourd, for it gradually arises from a wide bottom and terminates in a fmall neck. Some call it was urinale, because it is shaped like a glass in which urine is inspected; though some are shallow and wide-mouthed. It is used in distillation, with a head, &c. and then it constitutes a fort of alembic: it is also used in digeftions, with a blind alembic fitted to it.

Cucurbits are made of glafs, earthen ware, or of me-tals according to the respective uses in which they are en-gaged: the earthen ones are called canthari figulini; the copper ones are lined with tin, and are called vesice dis-tillatorize.

The broader the bottom, and the narrower and longer the neck, the more difficultly its contents are diffilled, fo that the lefs obedient any subject is to the fire, the narrower the bottom and the shorter the neck should be, and vice verfa.

It is a blind cucurbit, when another fmall cucurbit is placed on with its neck in the neck of the larger. The leffer are called separatory encurbits. If its belly is spherical, and its neck long and cylindrical, it is called a MA-TRASS OF 2 BOLT-HEAD.

The length of the neck is fuch, that scarce any of the li-quor ascends to its mouth, the cold external air repelling it before it arrives there, and it falls again to the bottom of the veffel. Thus the digeftions of menftruums, with the fubstances to be resolved in them, are conveniently carried on without any lofs. Befides these advantages, the long-necked eucurbits are fingularly useful in separating pure alcaline and volatile spirits and falts from water, oil, and volatile earth.

Cucurbits are more used for digesting and subliming

than for diffilling. See Dict. of Chem.

CUCURBITA CITRULLUS. See CITRULLUS.

— VERUCCOSA. A Species of melopepo. CUCURBITIFERA TRIFOLIA INDICA FRUCTUS PULPA CYDONII ÆMULA. See COVALAM.

CUCURBITULA, also called cucurbitu. A CUPPING-GLASS. Formerly this instrument was made of horn, or fome kind of metal. It is of great antiquity, being mentioned by Hippocrates. Different names have been given to them, according as they were used, with or without fearifications, as leves, arentes, ficcatæ, &c. The ancients had them with narrow mouths, for drawing more forcibly, and with wider mouths for drawing more gently.

Dry cupping is when the glaffes are used without scarifying. Sanguineous or wet, is when scarifications are

The prefent mode of applying a cupping-glass is to convey some light subject into it while slaming, that the air may be expelled by the heat before the slame express; the glass should be applied to the skin whilst the slame continues; it then adheres with a ftrong attraction. The use. of dry cupping is to invite a humour to the place where the glass is applied, in order to the removing it from an-other. The operation should be repeated until the part

becomes red, and is in pain.

When fearification is used with expping, the part should first be dry expped until it appears red; then make the incisions with the scarificator; if scarifications are to be made in several parts, begin below and proceed upwards, or the blood will incommode the operator; the scarifications made, the air must be excluded from the glass by burning something in it, as above mentioned, and then applying it: a little spirit of wine is as neat and effectual as any thing for the pabulum of the slame. The prefure of the external air presses the glass forcibly to the skin, and the glass being emptied of its air by the fire introduced in it, powerfully attracts the blood. The operation ended, wipe the part with a fponge dipped in warm water, and to stop the bleeding, a little spirit of wine may be applied by dipping a linen rag therein, and applying it over the fearifications.

This operation does not feem to be necessary, except when blood cannot be obtained by opening a vein in the usual manner. Celfus, lib. ii. cap. 11, fays, that "cnpping is needful when the body is to be relieved in some
acute disorder, and yet the strength does not admit of a
loss of blood from the veins." It is true, that the flow discharge of blood by cupping does not lessen the vital heat fo much as the same quantity of blood does when suddenly taken away by opening a vein; but in such cases, as Celsus supposes, other more eligible means of relief may be made use of with less fatigue to the already enscebled

be made use of with less fatigue to the already ensechled patient, and more to his advantage.

The blood extracted by scarification and supping, Hostman says he often examined, and sound to be the same with that from the veins; if so, there appears no other advantage from supping than what arises from opening a vein, except what may happen from the flow discharge of the blood in the first method of extracting it, and the relief of the part only, when the complaint is local.

Some extol supping in apoplexies, epilepsies, and some kind of convulsions, because they say that the spasms are increased by the speedier discharge of blood which is confequent in phlebotomy.

See Coelius Aurelianus, Celsus, Morgagni, Hossman, Haller, Bell's Surgery, vol. i. p. 154, &c. White's Surgery, p. 180.

Surgery, p. 180.

CUDU

CUDU PARITI. A fhrub which grows in Malabar: it flowers all the year long. The leaves are anodyne when externally applied. The fruit checks a dyfentery.

Cataplafma Cumini. Cat Raii Hift.

CUEMA. See CYEMA. xurgea. The conception, or rather according to Hippocrates, when the complete rudiments of the feetus are formed. See Embryon,

CUIETE. A name of the arbor cucurbitifera Ameri-

cana folio subrotundo.

CUIPOUNA. A tree growing in Brasil. Raii Hist.

CULBICIO. A fort of stranguary, or rather heat of

CULEUS, or CULLEUS. A Roman measure containing twenty amphoræ: fometimes it fignifies a leather

CULILAVVAN. See CORTEX CULLITLAVVAN. CULINARIUS SAL. The culinary or alimentary

falt. It is generally called common salt, because of common use in culinary preparations; but the sea-falt seems, from its universality in the world, to be more properly the common salt. Sea-falt consists of this culiproperly the common fait. Sea-jait conflits of this cul-nary falt and the fait usually called Epsom falt, or fal cath. amar. When fea-water, or a solution of the fal gem. is evaporated, the first crystals that are formed are the culinary falt, which when separated from the remaining brine, and the evaporation is continued, the fucceeding crystals are not of the culinary kind, but the bitter purging falt of the shops. The constituents of the culinary falt are, the spirit usually called acidum muriaticum, and a mineral alcaline falt. See MARINUM SAL.

CHITTLAWAN See Corr. CHITTLAWAN

CULITLAWAN. See CORT. CULITLAVVAN.
CULLEUS. The largest liquid measure among the

Romans. See CULEUS.

CULMEN. The STALK or BLADE of CORN or GRASS.

CULMUS. Culminiferous plants have a fmooth jointed stalk, are usually hollow, and at each joint wrapped about with single, narrow, sharp-pointed leaves, and their seeds are in chaffy husks, as wheat, barley, &c.

In grasses and corns, the culmus or stalk corresponds to the caudex or trunk of trees; so that it generally denotes that were between the course of the caudex or trunk of trees; and the caudex or trunk of trees; and the caudex or trunk of trees; and the caudex or trunk of trees; the trunk of trees is the trunk of trees.

that part between the root and the ear or panicle: but botanists differ in their distribution of plants into culmeniferous. Also the stubble of corn, remaining after the ears are cut off, is fo called.

CULTER. The third lobe of the liver.

CULTER. The third lobe of the liver.
CULUS. The ANUS, which fee.
CUMANA, called alfo gacirma. An Indian tree,
like that of the mulberry-tree, its wood is fo hard that it strikes fire like a flint.

CUMANDA GUACU, and CUMANDU GUARA.
Two species of a large fort of KIDNEY-BEAN.
CUMBULU, called also nux Malabarica unclussa flore encullate. A tall tree growing in Malabar, the root of which is used in a decoction with rice for common drink

CUMINOIDES. WILD CUMIN. Called also cuminum sylvestre, pastinaca tenuifolia Cretica, and daucus odora-tus Creticus.

This plant grows in Crete; the feeds only are in use;

they are carminative. Raii Hift. CUMINUM. CUMIN. According to Miller this name is derived from noun, to bring forth; because it is faid to be efficacious in curing sterility. It is also called cyminum and faniculum Orientale. It is the cuminum cyminum, or cuminum Ægyptiacum sativum, semine longiore. Linn.

This plant refembles fennel, but is much fmaller; produces longish, slender, plano-convex seeds, of a brownish colour with yellowish strize. It is annual, a native of Egypt and Ethiopia; is cultivated in Sicily and Malta, from whence it is brought to us.

These seeds are bitterish to the taste and warm; have an aromatic but difagreeable flavour. Water takes up much of their fmell by infusion, but not much of their tafte. Diftilled with water, they afford a pungent oil, which partakes much of the flavour of the feeds. Rectified spirit extracts their whole virtue; the spirituous extract is very warm, moderately pungent, and not a little naufeous.

These seeds are carminative and stomachic, but rather too ungrateful; externally they are difeutient and antifeptic.

The London College directs the following preparations;

Cataplafma Cumini. CATAPLASM of CUMIN.

Take of eumin feeds, one pound; bay berries, the leaves of water-germander dried, Virginia fnake-root, of each three ounces; of cloves, one ounce; with honey equal to thrice the weight of the species powdered, make a cataplasm. Ph. Lond. 1788.

Emplastrum Cumini. CUMIN PLASTER.

Take of Burgundy pitch, three pounds; yellow wax, cumin feeds, carraway feeds, and bay berries, of each three ounces. The pitch and wax being melted together, fprinkle into them the reft, reduced to powder, and ftir all well together. Ph. Lond. 1788. See Miller's Dick. Lewis's Mat. Med. Raii Hift.

CUMINUM ALNORUM. See ALSNICIUM. For that named ÆTHIOPICUM, fee AMMI VERUM.

- CORNULATUM. See HYPECOUM.

PRATENSE. See CARUM.

CUNEALIS SUTURA. The future by which the os sphenoides, or cunciforme, is joined to the os frontis.

CUNEIFORME Os. From cuneus, a wedge, called also clavicula, cavilla, Chalcoideum os, Basilare os. A name of the os fphenoides, from its being wedged between the other bones. Also the third bone of the first row in the wrift. It is called fo from its appearing like a wedge flicking between the two rows. See CARPUS.

os EXTERNUM, or Chalcoideum externum of the tarfus. At its posterior edge it joins the os naviculare and os cuboides; it supports the metatarfal bone of the toe next the little one, and that next the great one and of the middle toe. The os euneiforme medium vel minimum, is flill more wedge-like than the former; it fustains the metatarfal bone of the toe next to the great one. The os cunciforme internum, and maximum, fufftains the os metarfi of the great toe. All thefe are cartilaginous at the birth of children. Thefe bones are also

called calcoidea officula.

CUNILA SATIVA. See SATUREIA SATIVA.

CUP. HORT. CATH. A. Supplementum Alterum ad

CUPELLA, called also capella, copella, catellus cinereus,

cineritium, patella documaflica, or testa probatrix, explora-trix, or docimassica. A CUPEL or TEST.

These are vessels used for separating baser metals from gold or silver; they are made of earth, and are hollowed like a dish: they resist every degree of fire that is needful to keep any metal in fusion; they also retain these metals when suiced. The ashes of bones or of plants, that have been calcined, are the properest for making them; though Cramer prefers those made with plaister: whichever of these materials are chosen, they must be perfectly calcined, then levigated, after which, they must be formed into a paste, and moulded into their proper form, and burnt in a potter's furnace. See various directions con-

cerning them in the Dict. of Chem.

CUPEROSA. COPPERAS.

CUPHOS. LIGHT. When applied to aliments, it imports their being eafily digefted; when to diftempers,

that they are mild.

CUPR Æ AQ. See AQUE CUPREE.

CUPRESSUS, called also cypariflus, cypreffus. The CYPRESS-TREE. The cupreffus sempervirens, Linn. It is a tall ever-green-tree, native of the warmer climates, bearing male and semale flowers on the same branches; the leaves are flender and fo are the branches, which forcad forming a cone, the apex of which is the top of the tree; the fruit is a kind of nut, as large as a walnut; and aftringent. The flowers have an agreeable odour, and have been used in conjunction with some other ingredients for making an oil by infusion with olive oil, which was named oleum cyprinum.

There are three species of this tree.

CUPRI AMMONIATI AQUA, olimi AQUA SAP-PHIRINA.

Take of lime-twater, one pint; fal ammoniae, one dram; let them stand together in a copper vessel, until the ammonia is faturated. Phar. Lond. 1788.

CUPRI RUBIGO. VERDECRISE. See ÆRUGO ÆRIS. CUPRUM. See Æs.

CUPRUM AMMONIACUM. AMMONIACAL COPPER

Take of purest blue vitriol, two parts; volatile alkali of sal ammoniac, three parts; rub them briskly in a glass mortar, till the effervesorace is finished, and they run calmly into a violet coloured mass, which is to be rolled up in a piece of bibulous paper, and exsiccated, first upon a chalk stone, and afterwards with a gentle heat, then put up for use in a close vial; this is a very active medicine, used for the same numbers and in the same recommendations. dicine, used for the same purposes and in the same man-ner as VITRIOLUM CORRULEUM, which see:

An abbreviation of curse posteriores.

CUR. POST. An abbreviation of cure pofteriores. CURA AVENACEA. A decoction of oats and fuc-

cory roots, in which a little nitre and fugdr were diffored, was formerly used in severs, and was thus named.

CURASLAVENTIA. See AURASTIUM.

CURCAS, called also carpata, chiviquilenga. The BARBADOES NUT. See CATAPUTIA MINOR:

CURCUMA. TURMERIC; also called cross Indicus; terra marila, cyperi genus ex India, cantacerus radice crosca, manjella kua, cypira, kaba, and by the Indians borri-borri: the Portuguese call it saffran de terra; the name curcuma is Arabian: the Arabians call every root of a saffron colour by this name, curcuma. There are two of a faffron colour by this name, curcuma. There are two fpecies, the long and the round-rooted, but the first is the best, and the fort in use. It is the curcuma longa, or curcuma Indica foliis conceolatis, nervis lateralibus numerofiffimis, Linn. INDIAN LONG-ROOTED TURME-

The root is the only part in use; it is small, tuberous, and knotty; it is brought from the East Indies; externally it is greyish coloured, but internally it is of a deep lively yellow, which tends to red! a longish and a round fort is mentioned by fome authors, but the first only is

It hath a flight aromatic and bitterish taste; and some-what disagreeable smell. It gives out its virtues both to water and to spirit. By distillation with water a small quantity of effectial oil is obtained; and from the remain-ing decoction a bitter extract is obtained by evaporation. The spirituous extract retains nearly the whole virtue of the root.

It has been thought a powerful remedy in obstructions of the vifcera, particularly the abdominal; and also much used in icteric and uterine disorders: the dose may be from a scruple to a dram. The powder is often mixed with yellow peas, ground fine : the roots should be chosen of the largeft fize, fresh, compact, heavy, not easy to break, of a lightish yellow without, and a deep reddish yellow within.

It is chiefly consumed by the dyers. See Lewis's Mat. Med. Neumann's Chem: Works:

CURIMENTOS. So the Portuguese call some pains

in the limbs, which are relieved by a warm bath made with an aftringent bark, produced in the Brazils.

CURMI. Discovides says it is a drink made of baraley, which is used instead of wine; such a liquor is used in Iberia and Britain, which is prepared of wheat; this is ale.

CURSUMA, or CURTUMA. See CHELIDONIUM

MINUS.

CURTA. See COLOBOMATA. CURURU. See Bufo.

CURURU APE. A scandent tree which grows in Brazil, and bears pods with seeds like beans: these seeds

deftroy fish.
CURUTU PALA. A shrub which grows in Malabar; the bark of the root boiled in water cures a diarrhoea;

bar; the bark of the root boned in water cures a diarrical, boiled and taken with it, cures a dyfentery.

CUSCUTA, called also cassumer, cuscuta major, cassumer, epithimum, DODDER, and DODDER of THYME. The cuscuta Europæa, Linn. It is of the number of plants called parasitical; it hath no leaves, grows on thyme, and consists of a number of slender juicy filaments, sometimes have and there small heads of white or reddish producing here and there finall heads of white or reddiffi

CUPRESSINUM. CYPRESS WINE. See CEDRI- Howers which are followed by roundish capfules full of minute feeds. A large kind, known by the name of HELL-WEED, is common in heaths upon furzes, nettles, &cc. this bell-weed destroys the vegetables which afford it nourishment, whence its name; it is also called diaboli intestina, the DEVIL's GUTSI

Dadders are supposed to partake of the virtues of the plant on which they grow. It is hardly known in practice, but is recommended as a resolvent, detersive, and

diutetic.

Dedders are found on almost all plants. Raii Hist.
CUSPIDATUS. POINTED. In botany it is when
the leaves of a flower end in a point. Some of the teeth

are called cuspidati. See Canini dentes.

CUSPIS. Properly the point of a spear; but it is applied to the glans penis. It is also the name of a

CUSTOS OCULI. An inftrument to preferve the

CUTAMBULI. A name of a fort of worms either under the fkin or upon it, which by their creeping cause

uncafines and pain.

CUTANEI MUSCULI: See PLATYSMA MYOIDES.

CUTANEUM OSSIS COCCYGIS LIGAMENTUM. It goes out anteriorly from the extremity of the os coccy-gis; is flender, and divides into two portions at the orince of the anus, which runs into the membrana adipofa, are inferted in the skin on each fide of the anus by a kind

of expansion, and continue to divaricate, they are lost on the two sides of the perinaum.

CUTANEUS. See SPHINCTER ANI. There is also a nerve so called. See CERVICALES.

CUTANEUS INTERNUS NERVUS. It rifes from the union of the feventh cervical, and first dorfal pairs, runs over the other brachial nerves, and paffes down on the over the other brachial nerves, and panes down on the infide of the arm, between the mufeles and integuments; it divides into two branches, which accompany one another as far as the inner condyle on one fide of the vena bafilica, being covered by the ramus medianus of that yein; then runs down towards the wrift, where it fpreads,

and on the beginning of the palm of the hand. The other branch passes backward along the integuments, and down to the little singer.

CUTICULA. The SCARF-SKIN. The Greeks call it empidermis, because it is placed upon the true skin as a covering. It is as large as the true skin, and more compact; it is full of pores for the evacuation of what transmires through it from the body, though the best glasses do pires through it from the body, though the best glasses do not enable us to discern them; it hath neither blood-vessels nor nerves, therefore it is void of sense. Dr. Hunter fays it is an organized body, though its organization can-not be demonstrated. Leuwenhoeck afferts much with respect to the pores which he says he discovered in it; but to what he hath said it sufficeth to refer the reader.

The integuments, or the univerfal covering of the body, are, the cuticle, the rete mucofum, the cutis, and the membrana cellularis; besides these, the old anatomists reckon the membrana communis mufculorum, which is not now reckoned in the number; and the paniculus carnofus, which is only found in brutes. The rete mucofum is added by the moderns.

The whole furface of the fkin is covered by the rete mucofum, and the rete mucofum with the cuticle, fo that

the caticle is the most external.

The caticle does not, in general, extend so far as the skin does, though upon the belly it stretches considerably, without losing its thickness. Its origin is obscure, and its generation surprisingly sudden. Friction loosens it, but soon a new stratum grifes. but foon a new stratum arifes.

The euticle is continued, not only over all the exter-nal parts of the body, but also in all the cavities thereof, where the air can arrive; as in the mouth, or ophagus, afpera arteria, inteffines, &c. where it is called the epithe-lium; in these places there is no cutis, but there are innu-merable papillæ. No nerves nor vessels can be demon-strated to exist in it.

In examining the porcs, the cuticle feems to infinuate itself into them, to complete the excretory tubes of the cutaneous glands. The fosfulæ of the hairs have likewise the fame productions of the cuticle, and it feems to give

a fort of coat to the hairs themselves.

The best method of separating the cuicle for examination is to macerate it in water.

jects of feeling, and moderates the imprefions, which, without it, would be too painful. It also moderates the perspiration, which, without it, would be too copious.

The colour of the cutis differs in different persons, and also in different parts of the same person; but it is to the difference in the rete mucosum that complexious are so opposite to one another. See the Observations of Dr. Monro of Edinburgh on the Epidermis, in the Edinburgh

Med. Effays.

In the tecond volume of the Medical Mufeum, is a remarkable infrance of a young man lofing the use of his hands, by the cuticle there being thickened and hardened in an extraordinary degree. He was a dyer, and by frequently cleaning brass wire in the mixture which is used for dying Saxon colours, which confifts of the oil of vitriol, tartar, alum, &c. this complaint was gradually produced. His hands were quite stiff from the hardness of the curicle on their palms, and on the infide of the fingers; the enticle there appeared like parchment full of chaps; and on endeavouring to ftraighten the fingers by force, blood flarted from every joint. As the acid feemed to contri-bute much to the difease, the following emolient liniment was ordered. B ol. oilvar. 3 ii. aq. kali, 3 ii. m. f. linim. With this he rubbed his hands, frequently, particularly before going to bed; and to prevent the linument from being too foon rubbed off he wore gloves. In about four days the fkin feenred a little foftened, and his fingers did not fuffer fo much by endeavouring to firetch them out. He complained that the lisiment occasioned much fmarting, whence the following was directed with a view to abate the acrimony of the alkaline falt; R ol. olivar. 3 ii. aq. kali, 3 i. vitel. ovi, No. ii. f. linim. This, ufed as the other, in three days was lefs troubleforme, and produced forther evidence of relief : the hardened cuticle began to peel off, and a new flexible one appeared under-neath; many of the chaps were healed, and he began to have fome use of his fingers. He continued the last pre-feribed limment about two months, and then, to prevent a relapse, he used the following- R axung, porcin. 3 in-vitelli unius ovi, ol. lavend, gut. v. m. s. liniment. With this he rubbed his hands every night at bed-time; and on continuing it about a month he obtained a perfect eure. Except three dofes of purging physic, he took no-thing inwardly as a medicine, during the cure. CUTICULARIS MEMBRANA. The DURA MATER,

which fee

CUTICULOSUS. See SPHINCTER ANI.

CUTILIA: Certain cold fountains in Italy, mentioned by Celfus and Pliny, which were used in baths.

CUITO. A wood-Louse. See Aselli.
CUTIS. The skin. It is a firong thick, univerfal, eovering of the external parts of the body, immediately above the adipole membrane. It is composed of a close texture of fibres of various kinds, and also of veins and arteries, variously disposed; where there are large orifices, it terminates by being gradually loft. Its inner furface is moulded upon the outer furface of the membrana adipofa, whose membraneous part being produced, forms the /kim.

The /kin, on its outfide, is unequal: this is occasioned by the miliary glands, and the bulbs of the hair. It is naturally contracted, but when it is fwelled it is fmooth-Upon its furface we observe the papille pyramidales which are longer in some parts than in others, as in the fingers, where they are called villi, and appear in rows, each having two ranks contiguous; these are the organs of touch. Opposite to the joints, the skin is formed into plice, to admit of a free motion. Its whole surface, outwardly, is covered with the rete mucofum, and the cuticle.

The fkin is thickeft between the fhoulders, and on the back part of the neck. Dr. Hunter fays, that when the fin is once destroyed, it is never regenerated, but the edges fireteh confiderably to form a covering, after that a cicatrix, which is hardened flesh, completes the

the aling.

The outer furface is furnished with small eminences, called papilla pyramidales, and the inner surface with the miliary glands. Fewer papille appear on the Alin of the belly than elsewhere; the anterior portion of it is not only thinner and more compact than the posterior, but it belly than elsewhere; the anterior portion of it is not only thinner and more compact than the posterior, but it hath this likewise peculiar to it, that it may naturally be formerly used in the operation of the trepan.

CYCLISMUS.

The cuticle is a medium betwirt the fkin and the fub- very much increased in breadth, to an extraordinary degree, without losing any of its thickness, in proportion to what it gains in breadth; and it is generally more difficult to pierce the skin of the belly with pointed instru-

Turner hath professed with See Faba. It also figuises a

wood-loufe in the form of a bean.

CYANUS: The BLUE-BOTTLE; also CERULEUM; Of this plant Boerhaave enumerates twenty-two species. That used in medicine is the centaurea cyanus, Linn. also a species of serratula.

CYANUS ÆGYPTIACA. ECYPTIAN BEAR. See FABA

ÆGYPTIA PALUSTRIS.

- Major, called also cyanus montanus; verbal-

culum cyanoides, GREAT BLUE-BOTTLE.

The eyanus orientalis major moschatus, i. c. sweet-sultan, or sultan-flower, is somewhat cordial.

— Minor, also called baptifecula, battifecula, blaptifeca, papaver Heracleum, cyanus segetum. Blue-Bott

TLE, OF CORN-PLOWER

The latter of these two is the most noted, but not as a medicine, to which character this kind of plants have but little pretention, but for the fine blue colour obtained little pretension, but for the line blue colour obtained from its flowers. It is a greyish green plant, generally growing among corn; the flower is large, and of a deep blue colour; it is annual, and produces flowers during most of the fummer months. If these flowers are hastily dried, they keep their colour longer than any other blue ones. They neither give their colour to spirit nor water. They are said to be in a small degree diuretic.

In the Gentleman's Magazine for March, 1748, p. 122, is a process for producing a sine blue colour from these

is a process for producing a fine blue colour from these

flowers.

ORIENTALIS ODORATUS. See AMBERBOI.

— PULCHRO SEMINE CENTAURII MAJORIS.
BEARDED-CREEPER. See CRUPINA.

CYAR. Properly, the eye of a needle; but it is used to fignify the orifice of the internal ear.

CYASMA. Brown spots in the lips, forehead, and

hands of pregnant woman.

CYATHISCUS, from 2009, a cup. The hollow part of a probe, formed in the shape of a small spoon, as

CYATHUS, suader, a cup, from the verb xues, to pour out. It was a common measure among the Greeks and Romans, both of the liquid and dry kind. It was equal to an ounce, or the twelfth part of a pint. The fextons was two ounces; the quadrans, three ounces; the triens, four ounces; the quincums, five ounces; the femis, fix ounces; the feptuns, feven ounces; the bes, eight ounces; the dod ant, nine ounces; the dextans ten ounces; the deans, eleven ounces; the as, fextuns, or cotula, twelve ounces. The cyathus was made with a handle like our punch-ladle. The Roman topers were used to drink as many cyaths as there were Muses, nine; alfo as many as there were letters in the patron's name; alfo as many as there were letters in the patron's name. Thus, they had modes of drinking similar to the modern health-drinking, or soasting. Pliny says, that the cyatious of the Greeks weighed ten drams, and Galen says the same; though elsewhere he says, that a cyathus contains twelve drams of oil, thusteen drams and one scruple of wine, water, or vinegar, and eighteen drams of honey. Galen fays, that among the Veterinarii the eyathus contained two ounces.

The modern cyathus is \$ j. fl.
CYBITOS. The cubitus,
CYBOIDES, See CUBOIDES.

CYCEON, from suxau, to mix; also connum or cinnus. It is a mixture of the confiftence of pap, made with wine, honey, flour, and cheefe. This name was given to fome ptilans; also a kind of fallad in which cheefe was

CYCIMA. LITHARGE.
CYCLAMEN. SOW-BREAD.
CYCLAMEN EUROPÆUM CYCLAMENUS. SCEARTHA-

CYCLOPION. The white of the eye, from xxxxxx,

to surround, and of, the eye.

CYCLOS. A CIRCLE. Hippocrates uses this word to fignify the cheeks, and the orbits of the eyes.

CYCLUS METASYNCRIFICUS. It is a long protracted course of remedies, persisted in with a view of restoring the particles of the body to such a state as is ne-

ceffary to health:
CYCNARION: A collyrium mentioned by Galen and P. Ægineta. It was fo called because its colour refembled that of a fwan.

CYDAR. TIN.

CYDONATUM. A preparation of quinces with an addition of aromatics, described by P. Agineta.

CYDONIA. The quince-tree. Also called cotonea, mala cotonea majora et minora, malus cydonia. It is the pyrus cydonia, or pyrus cydonia fylvestris, fol. integerrimis storibus solitariis, Lin. The WILD QUINCE-TREE.

Petrajsha anymeryte five species

Botanists enumerate five species.

The quince-tree is low, a native of the rocky banks of the Danube, and is common in our gardens. resembles in shape some forts of round pears; it hath an agreeable and itrong fmell, an auftere acid tafte; its expressed juice is cooling and restringent, is useful in nau-seas, sickness of the stomach, and sometimes relieves vomiting; by boiling it lofes its aftringency. The feeds abound with a mucilaginous fubftance, which they give out to boiling water. One dram of them makes fix ounces of mucilage, about the confiftency of the white of egg. It is the most agreeable of all the mucilages, but is apt to become mouldy in a short time.

The London College directs the following.

Mucilago Seminis CYDONII MALL. Mucilage of QUINCE . SEED.

Take of quince feed, a dram; distilled water, eight ounces; boil with a gentle fire, till the water thickens; then strain through a linen cloth.

Formerly a fyrup was made of the juice of the fruit, and a conferve, called MARMADADE, jelly, miva cydoniorum, or dyacydonium; but it is now an article in the confectioner's business only. See Lewis's Mat. Med. Raii Hist.
CYDONIA EXOTICA. See COVALAM.

CYEMA. See CUEMA.
CYGNUS REGINÆ. A collyrium described by

CYLICHNE. A fmall veffel or box for holding medicines; a gallipot, or pill-box.

CYLINDRUS. The CYLINDER. The fruit of plants

are termed cylindrical when they refemble a column; fo are maffes of plaster. See MAGDALEONES.

CYLLOS, from xxxxxxx, to make lame. In Hippocrates, it is one affected with a kind of luxation which bends outwards, and is hollowed inward. Such a defect in the tibia is called cyllosis, and the person to whom it belongs is called, by the Latins, varus, and is opposed to valgus.

Blaffus is one whose legs are bent the other way.

CYLLOSIS. See CYLLOS.

CYMA. By a figure this name is applied to the tops of plants which the Latins call turio and asparagus.

CYMBÆ Os. See SCAPHOIDES Os.

CYMBALARIA, also called Linaria. IVY-LEAVED

TOAD-FLAX, or IVY-WORT. It grows on old walls in Italy and Switzerland. It hath the fame virtues as the navel-wort. See feveral species of cymbalaria, under the article LINARIA

CYMBALARIS CARTILAGO. See CARTILAGO

CRICOIDES

CYMBIFORME. See Scaphoides. From cymba,

CYMIA vel CYNNIA. A vessel in the shape of an urinal

CYMINUM. See CUMINUM.

CYMINUM CORNULATUM. See HYPOCEUM.

CYNADONTES, from xuer, a dog, and of us, a tooth.

CYNANCHE. RENGYEN, also Synanche. A species of or from REDERS, the quinsy, in which the tongue is inflamed, and swelled so that it hangs out beyond the teeth. Arctæus says, it is thus named from dogs either being subject to it, or else when in health they hang out their tongues at times. The canine teeth.

CYCLISMUS. A troche. Also a fort of circular Coelius Aurelianus fays, that the voice of a patient in a guinfy resembles that of a dog or of a wolf, hence called CYCLOPION. The white of the eye, from xuxasu, lycamehe. Or perhaps the word cymanehe is derived from yeanche. Or perhaps the word cymanche is derived from some, and arxe, to inffocate; for when dogs are hanged, because their bodies are not heavy enough to make a strong compression of the rope, they struggle long, with their eyes turgid, their tongues hang out of their mouths, &c. and because a set of similar symptoms affect the patient in a species of quinsy, this name is given to it. Cymanche is Dr. Cullen's generic name for quinsy. See ANGINA:

CYNANCHE EPIDEMICA. ANGINOSA. The Mu-EXANTHEMATICA.

Y. See SCARLITINA ANGINOSA.

PAROTIDEA, also Angina externa, MUMPS, it is a pecies of quinfy. Dr. Cullen names it cynanche parotiacacurles; oreillons; observazioni. This name is given to diforder which manifested itself by a slight fever, foon after the appearance of which, the face, neck, and particuarly the throat, were confiderably fwelled, and of a fomewhat deeper colour than a damask rose, but the tumor rarely extended to the eyes. This fwelling was chiefly external, and fometimes to increased in a few days, as to obliterate the features; and yet this quick and extraordinary

diffention of the parts was rarely attended with pain.

This diforder was of the inflammatory kind; it chiefly affected the young and the poor; it was very rarely mor-tal, and feldom terminated in an abfects, but gave way to general antiphlogiftic methods.

Sometimes the tumor fubfided in three or four days, and from the face was translated in men to the testicles; but this circumstance required no alteration from the ge neral method of cure, nor did the fwelling in the telli-

cles ever suppurate.

The patients bore bleeding, purging, and nitrous me-dicines very well. In some a thickness and hardness remained upon the parotid and maxillary glands, after the patient was very well in all other respects; these yielded to some doses of calomel, with gentle purging, the affected part being kept warm, and the patient to a suitable regimen. Sometimes a mild mercurial ointment was useful. See Gooch's Cases and Remarks, p. 74-76, and Appendix to the same, p. 13, &c. Cullen's First

Lines, edit. 4. vol. i. p. 303.

CYNODECTOS. Bitten by a mad dog.

CYNODES. CANINE.

CYNODESMION, from xxxx, a dog, and 3xx, to bind.

or from xxxxx, the yard of a man, and 3xx, to tie. A ligature by which the prepuce is bound upon the glands. Sometimes it fignifies the lower part of the prepuce.

CYNODONTES, from xwee, a dog, and offer, a tooth.

CYNOGLOSSUM

enumerate nine species.

CYNOGLOSSUM MAJ. VULG. Lingua Canina. GREAT-RR HOUNDS-TONGUE. It is the cynogloffum officinal.

It is a biennial plant s produces, the first year, large, foft, tongue-shaped, long, pointed leaves: the fecond-year, a thick branched stalk, with pointed leaves joined to it, without pedicles; on the tops of the branches are dark purple flowers, which are followed by four flat feeds: the root is oblong, and of a dark brown or blackish co-lour on the outside, but white within. It grows in shady places, and flowers in June.

The roots have a rank, but not very ftrong fmell, like these of the narcotic plants, which in drying is mostly diffipated; but those that happen to grow on dry ground have very little finell.

- MARITIMUM. Cerinthoides argentea flore pul-

chre cœrulco. Bugloffum marinum incanum flore cærulco. Echium marinum

Their medical effects, if they poffers any, are very little known>

- Minus Album, &c. A species of omphalodes. - Montanum Majus. \*\*Cerimbe. Honey-wort.

Of this Boerhaave enumerates eight different species. CYNOLOPHA. Pollux calls these certain asperities of the vertebras, and beginning of the fpine of the back.

CYNOLYSSA. The fame as lyffe, or as hydrophobia.

CYNOMORON. A name of the cynocrambe, in P. Egineta; also of the Apseynon.

GYNOMOJA. A name of the psyllium in Oribasius.

CYNOPTICON. See DACNERON.

CYNOREXIA. The same as bulimia emetica. See

BOULIMUS

GYNORRHODON. I from wer, a dog, and jodes, a EYNOSDATOS. I rofe. Alforcalled caninus fentis, canirubus, cynocytis, rofa canina, Linn. rofa fylvestris vulgaris, rofa fylvestris inodora. The DOG-ROSE OF HIP-TREE. It is one of the largest plants of the rose-kind, grows wild in hedges, and flowers in June. The fruit is made. into a conferve, as follows.

## Conferva Cynosbati. Conferve of the Hir.

Take of the pulp of ripe bips, one pound; of double refined fugar, twenty ounces; mix them into a conferve.

The bips are to be split, and the hairy feeds carefully picked out; and then, when the fruit is mellowed by franding a few days, it must be passed through a hair heve, and to the pulp the fugar must be added. Ph. Lond. 1788. If this caution is not observed in pulping the fruit, the rough prickly matter enclosing the feeds, may be retained in the conferve; a fmall portion of which will occasion uncasiness at the stomach, an itching about the anus, and fometimes vemiting. There is also a fungus or gall growing upon this tree, called bedeguar,
which is faid to be possessed of, and celebrated for its aftringent power, but it is yet not sufficiently tried with us,
to speak with great certainty.

CYNOSORCHIS. A name of several species of orchis.

See ORCHIS.

CYON. A Dog. Alfo the inferior parts of the penis

CYOPHORIA, from sonua, the fatus, and ospu, to

respect to her pregnancy.

CYPARISSUS. See Cupressus.

CYPERI GENUS EX INDICA. See Curcuma.

CYPEROIDIS GRAMEN. See GRAMEN CYPE-

CYPERUS. A plant with grafs-like leaves, and triangular stalks, bearing tufts of flowers on their top, which

are followed by a triangular feed.

- Longus, Linn. Cyp. odoratus radice longa.

cyperus panicula sparfa speciosa. The ordinary sweet cyperus, or English Galangale. It hath a long slender root, crooked and knotted, on the outfide of a blackish

CYNOGLOSSUM. Hounds-rongue. Botanists ed. This long root is somewhat aromatic, but most no-

CYPERUS ROTUNDUS. Cyp. Creticus, vel Syriacus:
ROUND-ROOTED CYPERUS. This plant hath feveral
roundish roots, about the fize of wallnuts, connected by
fibres, rough, and rusty-coloured on the outside, of a
yellow white within. It is a native of the East Indies, and grows wild in some other countries. The roots have the same smell and taste as the long fort have. This fort is most noted for its aroma; but they may be used indifferently. Raii Hift.

AMERICANUS. See SANCTE HELENE RA-

ESCULENTUS. SWEET CYPERUS, or ruft-mut.
LONGUS ODORUS. A name of the contraverva.
Nikoticus. See Papyrus.

CYPHI. A composition of fixteen ingredients, such as honey, raifins, cardamom feeds, &c. It was much used in the Egyptian facrifices, and hence the troches,

called trochifei cypheos.

CYPHOMA: From suppos, to bend. A kind of gibCYPHOSIS. Shofity, an incurvature of the fpine of
the back, when the vertebræ incline preternaturally out-

CYPIRA. TURMERIC. See CURCUMAL CYPRESSUS,

See Cupressus.

CYPRUS DIOSCOR. EASTERN PRIVET. See INDICA.

CYPSELE, or CYPSELIS. The EAR-WAX. CYR ÆNIA. In Rulandus is fignifies the faces of faf-

fron infufed in oil-

CYRBASIA. Properly the tiara, or cap, worn by the Persan monarchs. Hippocrates uses this word in his Treatise of the Diseases of Women, in describing a fort of covering which he directs for the breafts.

CYREBIA. The husks of barley, or of other corn, which fall off while they are torrifying, or when soaked

CYRENAICUS LIQUOR. See BENZOINUM.

- SAL. See SAL AMMONIACUS.

— Succus. It is applied to the juice of the lafer-pitium of the ancients, from the country where it most flourished, by Scribonius Largus, Paulus Ægineta, and fome others; and by Sanctorius. It is also taken nosice

of by the fame name in his Aphorifms.

CYRONES. See PHTHIRIASIS.

CYROSEON. The podex or ANUS.

CYRTOIDES. GIBBOUS.

CYRTOMA. Any preternatural tumor or gibbofity, from supide, hump-backed. In Vogel's Nofology, it fignifies a particular flatulent tumor of the belly.

CYRTONOSUS. The RICKETS. See RACHITIS.

CYSSEROS. The podex. ANUS. Or intell refluence.

The podex, ANUS, or intell rectum: CYSSAROS.

EISSANGOS THE POUCE, AND S. BREEL TOTAL SUPPLY, is the breech.

CYSSOTIS. INFLAMMATION of the ANUS

CYSTEOLITHOS, from zuris, the bladder, and zufos, flone. The STONE in the BLADDER.
CYST. HEPATICI DUCTUS. See HEPATICO-CYS-

TICI DUCTUS

CYOPHORIA, from xunua, the fatus, and ospu, to crry: Gestation. It is fpoken of a woman with respect to her pregnancy.

CYPARISSUS. See Curressus.

CYPARISSUS. See Curressus.

CYPARISSUS. See Curressus. ARTERIA

VENE. A branch from the vena portæ ven-tralis; they run along the vefficula fellis, from its neek

to the bottom, and as they are often only two in number, they are called cyficæ gemellæ

CYSTIRRHAGIA. Discharge of the blood from the urinary bladder. It is always a symptomatic disorder.

CYSTICAPNOS AFRICANA SCANDENS. AFRI-

brown colour, and white within; it grows in marshy places, and those in England are as good as the foreign ones.

The root hath an agreeable aromatic smell, and a bitterish taste; both water and spirit take up its virtues; by distillation a very small quantity of effential oil is obtain-

eyflicus. It conveys the gall from the gall-bladder to the duodenum.

CYSTICA ISCHURIA. See ISCHURIA.

CYSTIDES. Encyfted tumors, and those whose substance is included in a membrane.

CYSTIS. A BAG. It is applied to any receptacle of

CYSTINS. A BAG. It is applied to any receptacle of morbid humours, assis, a bag.

CYSTINX. A finall bladder.

CYSTITIS. Inflammation of the urinary bladder.

Mezerey, names it cyfiffogia. Dr. Cullen places this genus of difease in the class pyrexize and order phlegmaficæ, and observes two species. I. Cyfitis a causis internis. 2. Cyfitis a causis externis. See INFLAMMATIO VESICÆ.

CYSTIPHLOGIA. See CYSTITIS.

CYSTOTOMIA. A cutting of the bladder in the operation for the stone.

ration for the ftone.

CYSTOLITHICA. ISCHURIA. A fuppreffion of urine from a ftone in the bladder.

CYSTOPHLEGICA. A fuppreffion of ISCHURIA.
urine from a palfy in the bladder.

CYSTOCELE. A hernia formed by the protrution of the urinary bladder.

CYSTOPHOSIS. The inner membrane of the bladder protruding through the urethra.

CYSTOPHLEGMATICA. ISCHURIA. A fup-

CYSTOPHLEGMATICA. ISCHURIA. A fupprefilion of urine from abundance of mucus in the

CYSTOPASTICA. A suppression of urine from a spassion in the spinster of the bladder.

CYSTOTHROMBOIDES. A suppression of urine from grumous blood in the bladder.

CYSTOSPYICA. A suppression of urine from purulent matter in the bladder.

CYSTOPROCTICA. A suppression of urine from pain in the bladder, caused by indurated frees, wind, inflammation, abscess, &c. in the rectum.

CYSTOTOMIA. A cutting of the bladder in the

operation of the flone.

CYTHION. A collyrium mentioned by Celfus.

CYTINIFORME \ Generally fignify the flower of the CYTINUS. \ \ \ \true pomegranate; but fometimes used to fignify the cups of flowers which expand after the fame manner; they are also termed cytiniforme.

CYTINUS HYPOCISTIS. See HYPOCISTIS.

CYTINUS GENISTA. COMMON BROOM. See GE-

CYTISO-GENISTA. COMMON BROOM. See GE-

CYTISUS. BEAN TREFOIL. Boerhaave mentions

fixteen fpecies.

CYTISUS ALPINUS, also called laburnum, anagyris non fætida. BEAN TREFOIL TREE. The leaves are faid

GENISTA.

— INCANUS SILIQUIS FALCATIS. See MEDICAGO.

CYZICENUS. An epithet of a plaster described by

Galen, and commended for ulcers and wounds of the

# DAM

In the chemical alphabet, fignifies VITRIOL. DABURI. See ACHIOTL.

9 DACETON, from Jaxes, to bite. An epithet for fuch animals as hurt by biting.

DACHEL. So Boerhaave calls the palma major. DACNERON, from Janes, to bite, BITING. An epithet for a collyrium in Trallian, also called exydercia, and

DACRYDIUM. See DIAGRIDIUM.

DACRYODES, from Jaxev, a tear. In Hippocrates it is a fanious ulcer.

DACRYOMA. A coalition of one or more of the puncta lachrymalia.

DACRYOPŒOS. An epithet for fuch things as cause the tears to flow, such as onions, &c. DACTILETUS. The HERMODACTYL.

DACTYLETHRAI. A machine shaped like a finger,

and introduced into the ftomach to excite a vomiting.

DACTYLION. WEB-FINGERED. DACTYLIOS. A TROCHE.

DACTYLON RADICE REPENTE. See GRA-MEN DACTYLON.

DACTYLOTHECE. So Paré calls an instrument which he used in some cases of injury done to the fin-

DACTYLUS. The DATE. In Boerhaave it is the palma major. It is also a name of the blatta byzantia; and, among the Greeks, it is the fame meafure as digitus

among the Latins.

--- PALMULA, called also palma major, palma daslylifera, the GREAT PALM-TREE, or DATE-TREE. It is cultivated in the fouthern parts of Europe; its fruit is oblong, larger than an acorn, and includes a frone. The best dates come from Tunis. Chuse those that are fost, large and not much wrinkled, of a reddish yellow colour on the outside. on the outfide, and a whitiff membrane between the flesh and the flone. They are moderately aftringent, yet are eaten as food in Africa.

DÆDALUS. QUICKSILVER.

DÆDION. A diminution of dais, a TORCH. It is a

kind of peffary.

DÆMONIA. Melancholy fupposed from possession of demon

DÆMONIS. ORDURE.

DAMONOMANIA. The melancholy which is fup-posed to arise from possessions of demons, &c.

DAIS. DAS, OF TADA. See TADA.

DAITIDES. Galen fays it is great torches; but by
a metaphor it fignifies heads of garlic.

DALE. An abbreviation of Sam. Dalei M. L. Phar-

DALECHAMP. LUGD. An abbreviation of Histo-

ria Generalis Plantarum Dalechampio elaborata.

DALECHAMPIA. So father Plumier calls a plant growing in Martinico, in honour of J. Dalechampius. See Miller's Dict. vol. ii.

DALIGTHRON. A name of the thalidrum. See SOPHIA.

DAMA. FALLOW-DEER. This is a species of the cervus, in the order of pecora, in the Linnæan System, called cervus dama, and also cervus platyceres. This animal lives entirely on vegetables and water, and its falts

are not highly exalted; nor is it much inclined to putre-feency. The venifon of a deer killed when cool, differs much from that of one heated with exercise. The fibres of the first are harder, the slesh more tough, and less easily foluble in the stomach. But from the nature of its ecconomy, from its wild, and exercised state, and from being generally killed in the blood, is an alkalescent, sapid animal, confidered as a very great delicacy, and, though an exercifed animal, of easy digestion. Its sless approaches very near to that of fheep, though undoubtely it is more fapid and alkalescent. This is the deer with which we are best acquainted, and are most known under the name of venison. Medicinal virtues have been attributed to different parts. The recent blood drank immediately from the veins, hath been faid to remove vertigo; the gall to be deterfive, and take away films from the eyes; the liver hath been recommended in diarrhoa; the horns are used exactly in the same intentions as those of the ftag, and the fat or fuet agrees perfectly with that of the fame animal.

DAMASCENA PRUNA NOSTRATA. See PRU-NUS DAMASCENA

DAMASCENÆ PASSULÆ vel UVÆ. The

largest kind of grapes.

DAMASONICUM. See Doria narbonensis.

DAMASONIUM. The stary-headed water-PLANTAIN. GERMAN LEOPARD'S BANE. See also Alisma and Helleborine.

DAMESONIUM. DORIA'S WOUND-WORT. See

DAMNATA TERRA. See CAPUT MORTUUM.

DANAIS. See Conyza.

DAPHNE. In botany, it is a genus of the octandria monogynia. It is also a name for the BAY-TREE, and of the MEZEREON. See also ALEXANDRIA.

DAPHNE GNIDIUM. Sec THYMELEA MONSPELIACA.

LAUREOLA. Sec LAUREOLA MAS.

MEZEREUM. Sec LAUREOLA FÆMINA.

DAPHNEL EON, from Japen, the bay-tree, and shares, The OIL OF BAY-BERRIES, called also laurinum. When bay-berries are full ripe, they are boiled in water, and their oil, as it appears on the furface thereof, is feummed off, and is the green oil of bays, which is bitter, acrid, and ufeful as a topical application in palfies, and other nervous diforders. See LAURUS VULGARIS.

DAPHNITIS. A name for the best pieces of cassia. See AcTUS

DAPHNOIDES. Spurge-laurel. See Laureola

DARATOS. UNFERMENTED BREAD.

DARCHEM. A name of the best cinnamon.

DARSINI. The Arabian name for the ordinary fort of true cinnamon.

DARSIS, from Jegu, to exceriate.

DARTA. A TETTAR, RING-WORM, or the ITCH.
DARTOS, from Serve, leather, or a pelt. Dartes, a
Greek name derived from its raw or excoriated appearance, and not from its use in contracting the forotum.
See Warner on the Testicles, p. 2. One of the coats which forms the serotum, is called the dartes muscle, also corium; but Dr Hunter says that no such muscle can

be found, and Albinus takes no notice of it in his table See SCROTUM.

DAS. See DAIS. DASYMMA. See TRACHOMA, from dasus, rough. DASYS, Denfe, thick, close, or rough. An epithet for a tongue that is parched in a fever. Applied to respiration, it fignifies a breathing as if the lungs had not room to expand. Those who labour under this density of

breathing are called cerchodes.

DATURA, and DATURA. See STRAMONIUM.

DAUCITES VINUM. Wine in which is the feeds

DAUCUS. The CARROT, called also carota. Boerhaave reckons up feven species; also a name for a species of myrrhis.

CAUCALIS.

- VULGARIS, called also daucus sylvestris, pastimaca temuifolia, staphylinus, Gracorum vel sylvestris.
WILD CARROT, OT BIRD'S-NEST. This is the fort the feeds of which are used in medicine. It is the dancus carota, or dancus sylvestris tenui folius, seminibus hispidis, petiolis, fubtus nervofis, Linn. The wild carrot, or bird's neft.

of CRETE. It is the athamanta Cretenfis of Linn.

That which is called carrot of Crete, is often brought from Germany, &c. the best is large, fresh, found, and

of an acrid taile.

The wild carret is common in many uncultivated parts of England, and flowers in June: the feeds are fimilar in their tafte and fmell to those of the Cretan carrot, but weaker; however they are substituted for them, and, if insufed in ale or wine, they give out all their virtues, which are diuretic, antiscorbutic, carminative, and lithontriptic. Half a pound of the feeds may be infused in five or fix gallons of ale, and a pint of the clear liquor may be drank three times a day. The feeds of the wild carret have in many inflances been ufeful in the flone and gravel, particularly in the latter, when accompanied with great pain and coffee-coloured or bloody urine. The feeds should be gathered in August. They feem to be forcing, but not dangerous. Half an ounce of the feeds may be put to half a pint of boiling water, and the infu-fion drank with fugar and milk, inftead of tea, for breakfast, and again in the afternoon. Gouty people who are afflicted with the gravel, are much relieved by it. Some experience relief from this infusion in a few days; others are longer, even to twelve months, before they perceive any fentible effect from it, but after that have been happily rewarded for their perseverance.

- SATIVUS. The COMMON GARDEN-CARROT. This root is in frequent use, and though it will not yield any grained fugar, it affords a great deal of a fweet, and melligenous juice which gives a ftrong mark of its nutritious quality. When boiled, it affords a tender, and not very flatulent food. The roots when fcraped fmall, and made up into a poultice take off the difagreeable fmell which attend ulcerated cancers. The raw carret may be feraped or grated, then made into a cataplasm with cold water, and applied to any kind of setid ulcers. See Lond. Med. Obs. and Inq. vol. iv. p. 183, 358, &c.

Lewis's Mat. Med.

MACEDON. See APIUM MACEDONICUM.

MONTANUS. See OREOSELINUM. It is also a

species of sefeli. odoratus Creticus, &c. WILD CUMIN. See CUMINOIDES.

- PALUSTRIS. See ALSNICIUM.

- PEREGRINUS. See APIUM, under felinum montan.

- PETROSELINI Vel CORIANDRI FOLIO. See APIUM. PYREN. THESS. under BUNIUM.

APIUM. PYREN. THESS. Under BUNIUM.

—— SELENOIDES. See OREOSELINUM.

—— SEPRINIUS. See ANTRISCUS.

DAULONTAS FRUTEX. An American fhrub, which Lemery fays possessed for the properties of camomile, and its berries relieve in asthmas, &c.

DAUPHINY SAL. It is the salt obtained from an earth in the province of Dauphiny in France. It is a natural natural virtual virtual and the province of Dauphiny in France.

tural natron vitriolatum.

DAURA. So Paracelfus calls BLACK HELLEBORE. DAVERIDON. OIL OF SPIKE.

DEARTICULATIO. See ABARTICULATIO and DIARTHROSIS

DEASCIATIO. See Aposceparnismus. DE BOOT. An abbreviation of Anfelmi Boetii de Boot, Gemmarum & Lapidum Historia, &c. DEC. The abbreviation of decad.

DEBILITATES. Difeafes from deficiency, as blind-

nefs, want of appetite, &c.
DEBUS. So Paracelfus calls a medicine which is given

DECAMYRON. In Oribafius it is a composition made of ten aromatics.

DECANDRIA. The tenth of Linnæus's classes of plants. In it are one style, and ten filaments in each

DECANTATIO. DECANTATION. The separating

of a clear liquor from a fediment, by pouring gently.

DECIDENTIA. It is an epithet affixed to fome acute difeases, which are protracted beyond fourteen days, to the twentieth, nay fometimes to the fortleth day, hence difeases are called acute per decidentiam, or ex decidentia, or it has the same meaning as CATAPTOSIS,

DECIDUA, from the Latin, de, from, and cado, to fall. Falling, fading once in the year. Those things that fall away, as leaves off trees. In botany, deciduous, plants are fuch as cast their leaves in winter, and is applicable to trees, fhrubs, and herbaceous vegetables. From this Dr. Hunter calls the fpongy chorien by the names decidua and caduca, both which words fignify falling off. Dr. Hamilton observes that the membranes (speaking of those which contain the feetus during pregnancy) confist, externally, of two layers of the fpongy chorion, called decidua and decidua reflexa; internally, of the true chorion and the amnion. They form a pretty ftrong bag, commencing at the edge of the cake, going round the whole circumference, and lining the internal furface of the womb. The membrana decidua, or that lamella of the spongy false chorion, which is in immediate contact with the uterus, is originally very thick and fpongy, and exceedingly vafeular, particularly where it approaches the placenta. At first it is loofely, as it were, spread over the ovum; and the intervening space is filled with a quantity of gelatinous substance. It gradually becomes more and more attenuated by stretching, and approaches nearer to the interior lamella of the decidua, called decidua reflexa: and about the fifth month the two layers come and contact, and athers so as to become apparently one memcontact, and adhere fo as to become apparently one mem-brane. The decidua reflexa, in its structure and appear-ance, is similar to the former, being rough sleecy, and vafcular, on its external furface; internally, fmoother, and perforated with a number of fmall foramina, which are the orifices of veffels that open into this internal furface. In advanced geftation it adheres intimately to the former membrane, and is with difficulty feparated when the double decidua comes off entire; but the outer lamella more commonly adheres to the uterus after the placenta and other membranes are expelled, and is afterwards carles off with the cleanfings. The decidua reflexa becomes thicker, and more vafeular as it approaches to the placenta, and is then blended with its fubflance, conflitting the cellular or maternal part of the cake, as it is termed by Dr. Hunter. The other or more internal part helongs Dr. Hunter. The other or more internal part belongs to the fœtus, and is flyled the fœtal part of the placenta. The double decidua is opake in comparison of the other membranes; the blood-vessels are derived from the uterus, and can be readily traced into it. Dr. Hunter supposes that the double decidua lines the uterus nearly in the fame manner as the peritoneum does the cavity of the abdomen, and that the ovum is inclosed within its duplicature as within a double night-cap. On this supposition the ovum must be placed on the outside of this membrane, which is not very readily to be comprehended; unless we adopt fignor Scarpa's opinion, and suppose it be originally en-tirely composed of an inspissated coagulable lymph.

Dr. Ruysch called this exterior coat the tunica filamentofa; more modern authors, the false or spongy chorion. But Dr. Hunter found the spongy chorion to consist of two distinct layers; that which lines the uterus he styles membrana caduca, or decidua, because it is cast off after delivery; the portion which covers the ovum decidua re-

The portion which covers the ovum is a complete membrane, like the true chorion and amnios; but that which immediately lines the uterus is imperfect or deficient, being perforated with three foramina, viz. two fmall ones, corresponding with the insertion of the tubes at the fundus uteri; and a larger ragged perforation opposite to the orifice of the womb. See Dr. Hamilton's Outlines; Dr. Hunter on the Gravid Uterus.

DECIMANA. An erratic kind of fever which returns

every tenth day

DECLINATIO. It is when a difease abates. In Avicenna it is an imperfect diflocation.

DECLIVIS. See Obliques Descendens. DECOCTA. It is a water that hath been boiled, and is cooled by the help of fnow.

DECOCTUM ALBUM. See CORNU CERVI.

CAMPECHENSE. See CAMPECH. LIGNUM.

— NITROSUM. See NITRUM.

— RUBRUM. See CRETA.

DECOCTIO. See Coctio.

DECOLORES. Difeafes which difagreeably change

the colour of the fkin.

DECREPITATIO, vel CREPITATIO. The crackling noise which common falt makes when subjected to the fire. DECURTATUS PULSUS. A weak pulse or a deficient one. If it fails, and revives by turns, it is called decurtatus reciprocu.

DECUSSORIUM. An instrument to depress the dura mater after trepanning, quia decutit membranam, or from its extremity being grooved, decuffatim.

DECOLATIO. It is when a part of the cranium is

cut off with the teguments, in a wound of the head.

DEFECTIVI. Diforders from the body being partially

or in general defective in its vital powers: it is fynonymous with adynamia

DEFECTIO ANIMI. A FAINTING OF SWOONING. DEFENSIVA. In Paracellus they are cordials. DEFENSIVA. In Paracelfus they are cordials. DEFENSIVUM. An epithet for fome furgical topics

DEFERENTIA VASA. Immediately beneath the tunica albuginea are lodged the testicles, the tubuli of which run on to form the epididymis; when becoming larger, they unite and form the vala deferentia, which afcend in the fpermatic cord behind the blood-veffels, and having got through the abdominal rings, are reflected downwards, and paffing on the back of the bladder, between that and the ureter, go on the infide of the veficula feminalis, to its anterior end, where they unite with the vesicula, and from the union of these with vesiculæ feminales, two ducts are formed and continued, which gradually approaching each other, they become contigu-ous at the notch, in the basis of the profirate gland, and terminate in a small duct on each side of the caput gallinaginis, in the urethra. At a diffance from the vefi-culæ feminales, the vas deferens is hardly capable of ad-mitting an hog's briffle; but as it approaches the veficulæ, it grows larger both externally and internally, and becomes cellular and tortuous. DEFIXUS. Impotent with respect to venereal desires.

DEFLAGRATIO. See CALCINATIO. DEFLUVIUM. A falling off of the hair.

DEFLUXIO, from defluo, to flow down. A defluxion. The flowing down of humours upon any inferior part,

DEFORMATIONES. Differtion of particular parts, and other deformities.

DEFORMES. Synonymous with cachexia. It fignifies diseases occasioning external deformity of the body.

DEFRUTUM, from defervends; called also bepsena. It is MUST, or the juice of grapes, boiled to the confumption of one half, before it is permitted to ferment

flexa, because it is restected from the uterus upon the case there will be frequent vomitting of blood, and other ovum, forming the connecting medium between them. kinds of matter; 2dly, a scirrhous bronchocele; 3dly, a thickening of the mucus in the exfophagus; 4thly, indu-rations of the exfophagus; 5thly, a fungus in the exfo-phagus; 6thly, a facculus formed by fome hard fubfitance lodging a little time in the exfophagus, and weakening its coats; 7thly, by fpaims; 8thly, foreign bodies fticking in their passage to the stomach; 9thly, tumors pressing against the fide of the cefophagus.

Mr. Warner relates a fingular case of difficult favallowing, in which the ecfophagus, befides being otherways difeafed, was ulcerated in its internal furface. Though a fimilar one may no more admit of a cure than that which he relates, yet its infertion here may extend the which he relates, yet its infertion here may extend the advantage he proposed in first publishing it, viz. to enable others to form a just prognostic, though not an agreeable one; and also prevent the administering of many useless applications, in a case that does not admit of much relief. The case is as follows: a young woman, aged twenty-five, was admitted into Guy's Hospital, on account of a difficulty in swallowing, with which she had been afflicted for some months; there was not any thing appeared outwardly, that could lead to the discovery of appeared outwardly, that could lead to the discovery of the malady, but she complained of a particular tightness in fwallerving, just below the back part of the cricoid cartilage. The part affected was too low to be locked into, but it was cafily discovered by conveying down the throat a bit of spunge, fastened upon whale-bone, and dipt in sweet oil, which, though very small, could not be made to pass beyond it. She at length became incapable of taking any nourishment, and died soon after. capable of taking any nouritament, and died food after. After death, her neck was opened, and upon taking out the cefophagus, it appeared confiderably thickened about an inch in length, just below the cricoid cartilage. Upon opening the cefophagus lengthways, its coats appeared fo contracted in the deceafed part, as to be only just capable of admitting a paffage to a common probe. The internal coat of the cefophagus was in part ulcerated, and befineared with matter. All the adjacent parts were found and well. found and well.

When a bronchocele is the cause, whatever its state be, as it admits of but little relief, or none, there is no palliating the difficulty of fwallowing caufed by it, further than that which the bronchoccle admits of.

Hoffman takes notice of difficulty of fwallowing from a thickening of the mucus in the ecophagus. He fays, a mucous matter not unfrequently concretes, during the night, in the fauces and gullet, and is afterwards with difficulty brought up. This proceeds, not from the afpera arteria, or the pharynx, or the pituitary tunic of the nofe, but from the glands of the cefophagus itfelf, irri-tated by acrid, acid, or hot exhalations from the flomach. In fuch cases, he observes, that, warm aromatics, and spirituous medicines, must necessarily do harm, by surther inspissarily the lymph, and rendering the humours in this part more acrid. He recommends diluents and mineral waters as the principal remedies; and relates a case, in which a cure was effected by abstinence from a more generous diet, and the use of a soft and stender one; drinking the Egra waters, omitting suppers, and taking a dose of a purpus powder in a draught of cold taking a dose of a nitrous powder in a draught of cold water, at bed-time.

Indurations happening in any part of the cefophagus, is amongst the causes of a difficulty of fourliering; an instance of which is already noticed. These tumors rarely admit of relief. In the London Medical Journal, vol. iii. p. 157. is the following case extracted from the History of the Royal Medical Society in Paris, for the year 1776. A young lady, aged fixteen years, after being troubled for about three months with a spasmodic cough, began to have a difficulty of fwallowing, which increased to fast, that after a very short time she became incapable of taking any nourishment by the mouth; fo that for the space of three months, life was supported folely by glyf-DEGLUTTIO, from deglutis, to fivallow. The act of fwallowing. In fivallowing, the morfel is collected on the upper furface of the tongue, is fqueezed againft the bony palate, and then carries the palatum molle backward and upward; the pharynx meets it, the tongue keeps close up to the palatum molle, the rimula of the larynx is shut, and the bolus is forced down the ecsophagus.

A distinctly of fwallowing, called dysphagia or aglutitis, may be caused, 1st, by ulcers of the ecsophagus, in which

taken; and the patient foon after the had fwallowed the If an indigeftible fubflance is forced into the flormach; fecond dofe, brought up a confiderable quantity of pus. the patient should live on a mild, smooth diet, confiding From this moment, the was able to fwallow broth; and chiefly of farinaceous matters, as puddings, foops, &c by proper care recovered. When ferophulous indurations happen about the cefophagus, the ungt. hydrargyri rub-bed on the neck, over the induration, or finall dofes of bed on the neck, over the induration, or finall doles of calomel, hath often been of fingular efficacy, especially iii. p. 7. is an account of a quill being swallowed, and if used early after the attack of the disorder. If the case extracted by means of a probang, with a thread or two is of more considerable duration, the mercurials should passing from one end to the other, and faitness the inbe given fo as to excite and support a moderate ptyalism for fome time.

In the London Medical Obtervations and inquires, vol. iii. p. 85. is the hiftory, &c. of a cafe, in which deglatition was obstructed, from a preternatural dilatation of a bag formed in the pharynx. This instance was provolume it is observed, that many bodies, whose bulk and figure permit them to pass easily through the intestines, In the London Medical Observations and Inquiries, duced by a cherry-flone lodging in the throat, which was returned three days afterwards by a fit of coughing; the part where it had lodged gradually gave way, and re-tained a part of the food which was taken at each meal; tained a part of the food which was taken at each meal; culty. Pieces of money of various fizes have paffed by this circumstance increasing, no aliment at length could the anus in a few days; pieces of lead, as builets, &c. pass into the stomach, but all returned without causing either pain or fickness. It is proposed, if a similar case should occur, to pass a tube into the cesophagus, and through it, to inject a due quantity of broth; by which, life may be continued many years, and the enlargement of the iac, from the food prelling into it, will be thus totally prevented.

Deglutition produced by spasms. See Œsophagus. Tumors prelling against the fides of the cesophagus. When these cause a difficulty of fivallowing, relief can

be reached with the fingers, or with the forceps, attempts to extract it may be made. When pins, fish-bones, or fuch-like bodies, flick across the gullet, some advice to prefs a crotchet (a wire with its end turned up like a hook) below these bodies, and then to turn it so as to bring them up with it. Pins, and such-like sharp bodies, when they have fluck in the throat, have been returned by fivellowing a piece of tough meat tied to a strong thread, and then pulled up again. If the detained body may nus's Prefages.

DEJECTION A discharge of the excrements by Roos.

On prognostics from this evacuation, see Prosper Alpinus's Prefages.

DEJECTORIA. Purging medicines. prebang; that is, a flexible piece of whale-bone, with a piece of fpunge fecured to its end. It hath frequently happened, that though indigeflible bodies have been fwallowed, no inconvenience hath arifen therefrom. If piece of spunge secured to make happened, that though indigestible bodies nave supposed, no inconvenience hath arisen therefrom. If the bodies cannot be easily moved up or down, endeavours should not be continued long, less the cessophagus should become instance. Whilst other means are used, it is recommended that the patient should frequently supposed from fostening liquid, as barley water, or milk and water, or such like; and if he cannot swallow, an affishant may now and then inject the like through a crooked tube that will reach into the gullet: thus, not crooked tube that will reach into the gullet: thus, not crooked tube that will reach into the gullet: thus, not crooked tube that of inflammation is secured, but if, when the continued long, less that continued long, less that continued long, less that continued long, less the continued long, less the continued long, less the continued long, less the continued long, less which dry the eyes by min and the body is left in the part, treat the patient as if labouring under an inflammatory difease; bleed, direct a low diet, apply a poultice round the patient's neck: the fame treatment will be required, if an inflammation takes place in the part, though the obstructing body be removed. A proper degree of agitation hath fometimes forceded in removing the obstruction body better than fucceeded, in removing the obstructing body, better than instruments. Thus, a blow on the back hath often forced up a fubfitance that fluck in the gullet: but this is ftill more proper and efficacious, when the fubfitance falls into the wine-pipe; in this case, vomiting and sneezing are to be excited. Pins which have stuck in the gullet, have been discharged by riding on a horse or in a carriage. If the lips.

3. The EXPULSIVE BANDAGE. It is a single-headed not swallow, he may be supported by means of glysters until relief is obtained. If there is danger of suffocation, dually less, by all and even edgings, from the bottom of the operation of bronchotomy may be had recourse to. the wound to its orifices.

carefully avoiding all irritating and heating things; and thus proceed until the required relief is obtained;

In the London Medical Observations and Inquiries, vol. sponges which were connected with each end of this in-

trument.

are not much to be dreaded when they arrive at the ftomach, though they have passed the colophagus with diffhave done the fame, though fometimes they have been detained for years.

In the London Medical Transactions, vol. iii. p. 30. is an account of a crown-piece which a man fwallowed; fome time after, and on another account, an emetic was given him, but without any effect with respect to the crown-piece; but fome weeks after he was taken with a fickness and yomited several times, and in vomiting, brought up the crown-piece without any pain, after its laying in his flomach from the 12th of March, 1771, to

When these cause a difficulty of swallowing, relief can only depend on the dissolution, or extirpation of such tumours: if these cannot be effected, whatever can be thought of to palliate may be tried.

Foreign bodies sticking in the passage to the stormach, is no unfrequent cause of this disorder; to remove which, is the chief intention of cure. Many are the contrivances for these ends, but it would often be better to leave the case to nature than to deal roughly with a part so irritable as the oxfophagus is, as it is often necessary to bring back the subject swallowed. If the substance can be reached with the singers, or with the foreceps, attempts

orifice of the ftomach, fuch as is perceived in the heart-

burn, &cc.

DEHEB, or DEHEBEB. GOLD.

DEHENE. BLOOD. DEHENES. INK.

DEHENEZ. ROMAN VITRIOL.

DEJECTIO. A discharge of the excrements by stool.

DEINOSIS, from Anow, to exaggerate. Exaggeration. Hippocrates uses this word with respect to the supercilia, where it imports their being enlarged. DELACRYMATIVE, DELACRYMATIVES. Medi-

flit in the middle, of three or four inches long. After drefling the wound, compresses should be applied on each fide of it, fo as to prefs from the bottom to the lips of the wound, before the roller is applied, which by having one head paffed through the flit, an opportunity will be given of drawing the lips of the wound together. The whole must be managed so that the bandage may act equally. When wounds are stitched, this bandage supports the stitches, and prevents their tearing

2. The RETENTIVE BANDAGE. It is usually the fingleheaded roller. It should be applied, first on one side op-posite to the wound, and brought round, so as to bring the lips of the wound closer. The contrary manner separates

three times folded, and long enough to wrap, at least, once respiration, are favourable. and a half round the limb to which it is applied, and broad enough to spread farther than the injury extends. At each end, two notches are to be cut, deep enough to admit of the bandage's wrapping close about the limb; the notches should be at equal distances, and, if the cloth is folded twice, each end will have nine flips, called tails; the two ends being alike flit, it is the eighteen-tailed bandage. In many cases, this bandage is more commodious than the roller, as it admits of viewing the limb, and

drefling the wound without moving.

5. The TRIANGULAR BANDAGE. It is generally a hand-kerchief doubled into that form. In common cases it is used on the head, also as a support to the testicles when

fwelled, &c.

6. The NODOSE BANDAGE. It is a double-headed roller, made of a fillet four yards long, and about an inch and a half broad; it must be reversed two or three times, so as to form a knot upon the part which is to be comprefled; as when an hæmorrhage from a wound is to be stopped.

7. The QUADRANGULAR BANDAGE is about three feet fquare, or a little longer than broad. The French call it

le grand couvre chef.

8. The CAPELINA OF REFLEX BANDAGE. It should not be full four inches broad, fometimes narrower, fix or eight yards long. It must be so applied as to be smooth and even upon the part in necessary circulars and reslexers.

There are variety of other bandages; but the occasion, and the genius of the furgeon, will generally best fuggest, in particular cases, what mode of applying the bandage will be the most proper.

Befides the above-named, there are the CIRCULAR or ANNULAR, that is, when the upper rounds come exactly over the under. The OBTUSE, or ASCIA; the French call it DOLOIRES; it is when the rounds afcend or defcend upon each other in the form of a fcrew. The REPENT; the French call it RAMPANT; it is when the bandage is applied to the part affected, in rounds, separate, and at a little distance from each other. The REFLEX or REFLECTED: the French call it RENVERSEE; it is when the bandage must be inverted, and turn back, as in those ap-plied to the legs, and where the part is of different thickneffes. The EXPELLENT, or EXPULSIVE BANDAGE, is when it is applied to the legs to repel a fwelling there, in which case it is applied first to the feet, and rolled upwards. The SCAPULARIA, SCAPULARY and NAPKIN, is a piece of cloth four or fix fingers broad, with a flit in the middle to pass the head through, and long enough to reach from the bottom of the sternum over the shoulders, and down the back, as low as the sternum is before.

Whatever directions may be given concerning band-ages, they fall fhort of enabling a person dexterously to apply them; seeing them applied, and also being exer-cised in the application, are effentially necessary. See

figures of bandages, and directions as circumftantial as words perhaps can express, in Heister's Surgery. Pott's Works. Bell's Surgery, vol. vi. p. 469.

DELIQUIUM, from delinquo, to stuom. This word fignifies the same as LIPOTHIMIA, which see; also the folution of any body when exposed to the air, as in mak-

ing the aqua kali.

DELIRIUM, from delirs, to rave, or talk idly. It is termed also, alienatio mentis. When the ideas excited in the mind do not correspond to the external objects, but are produced by the change induced on the common fenfory, the patient is faid to be delirious. The Greeks call it paraphreness. In the English there is no word for it, except light-headedness be admitted.

In madness, reason is destroyed; in foolishness, which

the Greeks call morofis, reason is defective; and in a de-

lirium, reason is vitiated.

The paraphrenefis, or delirium, differs from a madnefs, in not being perpetual, which happens in deliriums with-

Galen fays, that deliriums are caused by the heat and acrimony of the sluid, but principally by yellow bile. See his book de Sympt. Caus. lib. ii. Many other writers say that the bile is the cause. Dr. Shebbeare, in his Theory and Practice of Physic, attributes this disorder to either an excess, or a defect of vital heat. As to presages from deliriums, in these and many other cases, no great danger

4. The TAILED BANDAGE. It is a linen cloth two or is to be apprehended, whilft the pulse, the appetite, and

DENODATIO. DISSOLUTION.

DENS. A TOOTH. The teeth are usually fixteen in each jaw; they are divided into the body, which is above the gum, and the root, or fang, which is within the foc-ket of the jaw; the neck is the line of division between the root and the body. They are made up of a bony fubstance and an enamel.

The enamel covers only the body of the tooth, that part which is out of the gums, as far as to its neck; it is not bone, for it is not vafcular, nor capable of being injected: further, if animals are fed with madder, the bony part of the tooth will be injected, but the enamel will remain unaltered; or steep the enamel in a weak acid, and it will all become a powder; whereas when bone is thus fteeped, a fost griftly part remains. Each root is hollow for the admission of vessels and

nerves to pass into the substance of the teeth, but these

cavities grows less as we advance in years.

Offification

Offification begins in the body of a tostb, and is con- substance touching it, pain is excited : relief is often obtinued to the root, and there are as many points of oflifi-eation as there are tubercles in the tooth. The long part eation as there are tubercles in the tooth. The long part of the tooth is the hardest part in the body, except the enamel which covers the teeth. Mr. John Hunter fulpects that the teeth when full grown, are not fimply bone. He observes, that bones are tinged with the colouring matter of madder when they are complete and perfectly grown, if the animal is fed for a time with this root; and teeth, whilst growing, receive this tinge, but not when they are perfected; in all other bones this red colour is in time carried out of them by absorption, and they return to their original colour, but when a tooth hath had this colour given to it, which must be while it is growing, when it is perfected it never lofes it, which thews their want of the abforbent fystem, and therefore, most likely, of the vascular also. The rickets do not affect the teeth; for we never find them grow foft like the other bones, but they remain perfectly hard: laftly, in old age, the other bones become brittle and wafte, but the teeth never do.

The teeth are divided into three classes, viz. the incifores, canini, and molares. The incifores, called also dentes lactei, and dentes riforii, are the four anterior teeth in each jaw; they appear the first. The canini, or dentes oculares are one on each side of the incisores, in each jaw. The molares are five on each side of both jaws: Cicero calls them genuini. Sometimes, before twenty years of age, and fometimes at five or fix and tweny, the last of the grinders appear, and are called dentes fapientize and dentes genuini. Mr. John Hunter divides and names them as follow; viz. from the fymphysis of the jaw on each fide, are two INCISORES, which see. One Cuspidatus. See CANINI DENTES. Two, bicuspides. See MOLARES. And, three, molares, the last of which is the dens fapientias. See MOLARES.

The incifores, canini, and the two first of the grinders, are formed at the birth, and are those tests which are fied. They usually cut or appear about the seventh month, and are shed about the seventh year. The secondary teetb are formed in fockets of their own, which are fituated below the other focket. The three dentes molares on each fide, do not come through the gums until all the first set of teetb are shed; then they come through with the fecond fet, and are never fhed. Some people never have the dentes fapienties. At three years of age, or thereabout, a child hath its first set of teetb, which are twenty.

There are generally as many protuberances on the body of the teeth as there are roots; but these latter some-times grow together, at other times they are divaricated, especially on the upper jaw, where, not having a sufficient depth, because of the maxillary sinus, they spread and are extracted with greater difficulty than those on the lower

The fifth pair of nerves fupply the testh with branches, which are wrapt up with the blood-veffels by means of a membrane, and running under the teeth, enter into their cavities. From an attention to the fifth pair of nerves, and the parts to which they are distributed, many of the phenomena attendant on diforders of the teeth may be accounted for. Mr. Moss observes, in his Essay on the Management of Children, &c. that the teeth, when a child is born, are lodged in the fockets in the jaw-bones, and are covered with, and inveloped by a thin membrane that is very irritable, and fenfible of pain, viz. the periofteum of the teeth; fo that when the teeth begin to grow, and emerge from their recesses, or fockets, they must necessarily differed, perforate, and force their way through this membrane, which, when upon the full stretch, from its fensibility gives great pain, and occasons fevers, startings, and all the symptoms which happen during the time of breeding the teeth. As soon as this membrane is completely divided in that part by the testh or teeth, which then happens to be rifing, the child is relieved for the prefent, from the fever and other complaints, but which are subject to return upon the succeslive riling of the other teeth.

Diforders in the teeth depend chiefly on a caries in them; an inflammation in the membrane which covers their root, &c. and a defluxion of humours on the faid membrane. When a tooth is carious it oftens occasions a fetid breath, and the air passing into, or any warm or cold

tained by filling the carious part with mastich; but the best method is to extract the tooth. In case of an inflammation in the membrane which spreads itself about the roots of the teeth, bleeding or purging, according to the flate of the conflictation, will be needful; warm barleywater may also be held in the mouth, and such other general methods may be used as are found to be useful in other inflammatory disorders. When a defluxion of humours give rife to complaints in the teeth, purging will be peculiarly ufeful; blifters may be applied behind the cars or on the back, and horseraddish or pellitory root may be held between the gums and cheeks, to excite a difcharge of faliva. Besides these general causes, a morbid quality induced into the general habit may give rife to diforders in the teeth, as happens in feorbutic and venereal patients, in which cases, the method of cure will consist in frecing the constitution from these kinds of complaints.

The tartareous crust which is secreted from the blood and lodged on the teeth, is speedily removed by touching it with acidum muriaticum, and then washing it off with water.

On the teeth, and their diforders, fee Mr. John Hunter's Natural History of the Human Teeth; Euftachius de Dentibus, Hoffman de Dent. corum Morb. & Cura; Hurlock on Breeding of Teeth; Moss on the Management of Children; Bell's Surgery, vol. iv. p. 191, &c.

White's Surgery, p. 280.

Dens Alpinus. See Auricula muris.

— Caballinus. See Hosciamus.

- CANINUS. A name of feveral species of the panicum.

- CANIS. Dog's TOOTH. Boerhaave mentions five species. The flower is shaped like that of a lily: the root is long, fleshy, and formed some what like the tooth of a dog: the leaves refemble those of the cylcamen. The dried roots are commended as anthelminthic, but are not used with us.

--- LEONIS, also called taraxacum, urinaria, hierachium alpinum hedypnois, PISS-A-BED, and DANDELION. It is the leontodon taraxacum, or leontodon calyce fquamis interne reflexis, foliis runcinatis denticulatis lævibus, Linn. It is a low plant, with long, narrow, deeply indented leaves, lying on the ground; among which arises a fingle, naked, hollow pedicle, bearing a large, yellow, floreulous flower; the flower is followed by small feeds, covered with a tuft of long down: the root is oblong, flender, yellowish, or brownish on the outside, and white within. It is perennial, common in uncultivated places, and flowers from April to the end of fummer.

The roots stalks and leaves abound with a milky juice, that is bitterish, but of no particular slavour. They are mildly detergent, and aperient, but more powerful than the cichoreum fylvestre. Boerhaave highly commends it as a resolvent. But the more immediate and sensible operation of this plant is to loofen the belly, and promote urine, which it does without heating; and has been confidered by fome, as highly efficacious in removing biliary obstructions. It is given plant and root, boiled in decoc-tions, or its expressed juice may be administered: it may also be taken as part of diet and eat fresh.

Boerhaave takes notice of twelve species. See Raii Hift. Lewis's Mat. Med. It is also a name of the auricula muris, and FOLIIS INTEGRIS, &c. HUNGARIAN HAWKWEED.

DENSITAS. DENSITY. It is that property in any body which is opposite to rarity, whereby it contains such a quantity of matter under such a bulk. But in medical writings, denfeness sometimes means frequency, and is applied to the pulse, and to respiration.

DENTAGRA, from one, a tooth, and ayou, a frizure. It is used both to signify the gout in the teeth, and an in-

ftrument for drawing them, called dentaspago, dentiducum,

DENTALE. See DENTALIUM.

DENTALE VIRIDE STRIATUM. See ENTALIUM. DENTALIS LAPIS. It is the tartarcous matter which is formed about the teeth in the likeness of a stone.

DENTALIUM, also called dentale, autalis, tubulus dentalis, and TOOTH-SHELL. It is the shell of a small seafifth; it is oblong, flender, and of a whitifth, greenifth, or reddifth colour, about two inches long, striated, and mark-

DENTARIA, called also coralloides, feptifolia, SET-FOIL-TOOTHWORT, and CORAL-WORT. This plant hath a long pod, full of round feeds; when this pod is ripe, its valves are twifted into a spiral form, and discharge the feeds with violence: the root is fquamous, flethy, and denticulated. It flowers in April: the root is drying and aftringent.

DENTARIA. A name of the orobanche, and of the

plumbago.

DENTARPAGO. The inftrument called dentagra. DENTATA. So the fecond vertebra of the neck is called. It is remarkable for its process, which is called processus dentatus, which plays in the hollow of the anterior arch of the vertebra above it (called Atlas). From the fides of the proceffus dentatus, the ligaments go off to attach it to the Atlas, and from its point a ftrong one is fent out to the os occipitis. It expresses DENTATED. In botany a dentated leaf is one that is notched at the edges, with a number of blunt points refembling teeth; also called denticulatum.

DENTELLARIA. See PLUMBAGO.

DENTES COLUMELLARES. In Varro and Pliny, they are the same as Varro elsewhere calls dentes canini. - GENUINI. Cicero calls the molares thus; but

they are the tests called fapientia.

— LACTEI. See INCISSORES.

— OCULARES. EYE-TEETH. See DENS.

They are thus named, because that extracting them is supposed to injure the eyes.

RISORII. See INCISORES.

DENTICULATA. A name of the moschatellina foliis fumariæ bulbofæ.

DENTICULATUM. In botany, the fame as dentata. DENTICULI ELEPHANTIS. See ENTALIUM.

DENTIDUCUM. See DENTAGRA.

DENTIFRICIUM, from dentes fricare, to rub the teeth. DENTIFRICE. Medicines for cleaning the teeth. The most effectual destifrices are the mineral acids, the best of which is the acidum muriaticum, next is the acidum vitriolicum. But the acidum nitrofum should never be ufed, for it destroys the enamel of the teeth.

DENTILLARIA. LEAD-WORT.

DENTISCALPIUM: or DENTISCALPRA. An inftru-

ment for fcraping off the crust which is formed on foul teeth. In Oribafius, it is an instrument for separating the gums from the teeth.

DENTITIO. DENTITION, or breeding of teeth. Sauvages, in his fystem of Nosology, makes this a species of odontalgia. Cullen makes dentitio synonymous with edaxi/mus; but does not admit it as a difeafe. See

ODANISMOS.

Children often fuffer much uneafiness from the cutting of their teeth. Yet teething is not properly a disease. Whatever dangerous fymptoms may occasionally attend this process of nature, they are owing to some accidental disorder attendant on the child. Plenitude is generally the morbid habit, which is productive of fatal confequences during dentition. In this case, bleeding, and a frequent repetition of folutives, must be used. If a morbid acrimony in the blood is attendant, the pain will be increased, which accompanies this state; in which case, alteratives adapted to the cafe must be prescribed.

If there is much fever and a tosth is ready to cut, an incifion may be made in the gum, to remove its tension.

A troublesome cough is often an attendant on teething; in which case, a plaster of Burgundy pitch, applied to the nape of the neck, is of confiderable tervice. A fresh one may be applied when the first begins not to adhere. Dr. Withers observes in his Treatise on the Asthma,

p. 301, 302. that, "If a child has a difeafe in his breaft, the cutting of a tooth, as it often excites pain, fever, and general irritability, will be found commonly to increase But this affords no proof why a cough and shortness of breath, with pulmonary obstructions in the lungs, should be thought a necessary attendant on teething. According to the best of my observations, it is an indis-putable fact, that healthful children cut their teeth without a cough, and, when in others a cough attends teething, it is in general an accidental circumftance, proceeding from a local complaint in the breaft, and is not

ed with two or three bands about it. As a medicine, the lence of the cough, the rifing of the phlegm from the oyster-shell may be substituted for it. See ENTALIUM. lungs, inflammations, pulmonary obstructions, and ulcerlungs, inflammations, pulmonary obstructions, and ulcer-ations, which have followed, and been proved by diffec-tion, have fully convinced me of the truth of the above affertion. I should not have dwelt at all on this fact, if I had not observed that the notion, which I am endeavouring to refute is pernicious to fociety, and productive of fatal confequences. For, when we tay that a cough with shortness of breath, is a common symptom of teething, we unite the two complaints together under one idea; and as we confider teething as natural and necessary, the other being united with it and regarded only as an effect, falls in under the fame general idea, and confequently is too often supposed to require no particular treatment, by which means it is neglected, and in many inftances proves fatal."

When children are vigorous, they cut their teeth carlier; weakly children, particularly those that are disposed to the rickets, are later before their teeth appear. Mr. J. Hunter fays, that weakness and disease in the body

does not affect the teeth.

A flavering, or a diarrhoa, are favourable fymptoms during the time of cutting the teeth. Children attended with these symptoms, are rarely disturbed with any of the violent diforders, fuch as convulfions, &c. See Harlock's Treatife on Dentition. Mr. John Hunter's Nat.

Hift, of the Human Teetb.

Hoffman observes, that the teeth appear in some in the feventh month, in others later, as in the ninth, or even the twelfth; the fore teeth are generally cut first, from the friction of the nipple; next the eye teeth; and, lastly, the grinders. In some, this process gives but little uneafinefs; in others, it is accompanied with very troublefome fymptoms. In difficult dentition, the child is preternaturally hot, cries immoderately, ftarts in his fleep, often applies his hand to his mouth, fucks with eagernefs, and even bites the nipple. The gums fwell and look whitish and reddish; the faliva is copiously difcharged, and often hangs vifcid from the mouth; the belly either coffive or over loofe. Sometimes acute fevers, convultive and epileptic motions, diffortions of the jaws, and other violent fymptoms are joined, different in different fubjects, according to the difficulty of the erup-tion of the teeth, or the fentibility of the child. Amongst the prognostics, he fays, that those who are plethoric, fleepy, coffive; also those who are seized in dentition with a cough, who are of great fensibility, or an hereditary passionate disposition, have the most to fear. Hippocrates observes, that those who are attacked by the acute fever, efcape convulsions; and that the teething is casiest in winter. The principal indications of cure are, to abate the pain and inflammation; and to foften and relax the gums. If the belly is not naturally lax, it should be kept to. A spontaneous looseness is falutary, and should not be checked; if it is, convulsions and other threatening fymptoms, are then much more apt to fucced.

Mofs, in his Effay on the Management of Children, &c. remarks, that the time of cutting the first teeth is uncertain; it fometimes happens in the third or fourth month; at others, not until the fixteenth or eighteenth; but that, in general, it is about the feventh or ninth. He adds, that there are two stages or periods of teething, which it becomes needful to attend to: the first is the time of breeding, and the fecond, the time of cutting the teeth. The first, or breeding the teeth, commonly begins about the third or fourth month; it may be known by a copious discharge of saliva from the child's mouth taking place; its being pleased with having its gums rubbed with a finger, or other harder substance; its becoming more fretful, &c. If now there is great heat, thirst, fever, a dulness and drowfiness, with frequent startings when afleep, it will be necessary to procure a few stools, and to keep the bowels lax, if they are not already so; if a loofeness at this time attends, though it is somewhat severe, it should not be checked. The griping which fometimes accompanies this loofeness, is generally abated by the use of a little magnefia. When the drowfiness, starting, and feverithness above named come on, bleeding with leeches will be fingularly useful. Two leeches may be applied to the feet every, or every other day, until these symptoms abate. During the thirst, if the children crave sweetened drinks, liquorice may be boiled in the water which is merely symptomatic of the cutting of a tooth. The vio- given, as it does not increase this troublesome symptom. After

be repeated now and then until the fever is removed. Should convulsions come on, the above treatment will be also well adapted to relieve. A difereet use of anodynes are an important addition in this instance. fecond flage or period of teething, is that of cutting the teeth; this usually begins about the seventhor minth month: in this, the symptoms and management are in general the same as those of the first period. And it may be noted, that a child who a little before was pleased with having his gums rubbed, will now feldom suffer any thing hard to touch them; for when a tooth is upon the point of coming through the guin, the gum is exceeding fore, and fensible of pain from the slightest touch. It may be known that a tooth is near cutting, when the gum, in one particular part, where the tooth or teeth may be expected to come, appears fuller and more diffended than ufual, and than the other parts of the gums are; the gum in that part looks red and inflamed at the bottom or base, but is paler or whiter at its point or edge; and when the tooth is very near cutting, the edge of the gum feems as if it had a flat white blifter upon it, and appears thicker and broader than the edges of the gums are in other places: at this time, if any alarming symptoms come on, cutting the gum over the edge of the approaching tooth will be a fpeedy and often an effectual means of relief. Sometimes though, in cutting the gums, the fymptoms abate, the tasth does not appear until fome days, or per-haps weeks after; nay, fometimes the gum heals, and the former uneasy symptoms return; which, for their relief require the cutting to be repeated, and that feveral times before the toub will completely appear. It is a mistaken notion, that repeated cutting the gum, renders it harder, for the contrary happens; on which, see Mr. John Hunter's Practical Treatile on the Diseases of the Teeth, p. 121. Bell's Surgery, vol. iv. p. 191, &c. White's

Teeth, p. 121. Bell's Surgery, vol. iv. p. 191, &c. White's Surgery, p. 280.

DENTO. One whose teeth are prominent to a great degree, or who is full-mouthed.

DENTODUCUM. The instrument called dentagra.

DENUDATIO. DENUDATION. It is spoken of bones that are lade bare by the slesh being torn off them.

DEOBSTRUENTES, de, priv. and softrue, to obstruct.

DEOBSTRUENTES. They are such medicines as open obstructions: they are the same as aperients and desppilations.

DEPART. In chemistry it is a method of refining, or feparating gold from filver, by means of nitrous acid. It is also called quartatis.

DEPASCENS ULCUS. DEPASCENT ULCER. See

PHAGEDÆNA.

DEPERDITIO. See Abortus.

DEPETIGO. A kind of itch, in which the fkin is

DEPHLEGMATIO. Vinous fpirits are faid to be dephlegmated, or rectified, when well freed-from their

DEPILATORIUM, DEPILATORY, Medicines which take off the hair, such as quick-lime, orpiment, &c...
There are three kinds of depilatory medicines; 1. The
pfilotbra, or depilatoria, by way of eminence; 2. Those
which thin the hair; and, 3. Those which are corrosive,

and extirpate the hair.

DEPILIS, i. e. ATHRIX. A falling off of the hair.

DEPOT LAITEUX. See LYMPHÆ DUCTUS.

DEPLUMATIO. An affection of the eye-lids, with
a callous tumor, which cautes the hair to fall off. Actius fays it is a diforder of the eye, confifting of a madarofis

DEPREHENSIO. See CATALEPSIS.

DEPRESSIO. A DEPRESSION. In furgery this word generally fignifies particularly a finking inwards of fome part of the skull, which happens from an external vio-lence by which the bone is fractured. This injury is ex-pressed by some by the words impressio, introcessio.

In this case, the same symptoms may attend as are ob-ferved in an extravalation within the skull, and are caused by the fame means, viz. mechanical pressure; they differ widely from those of a concussion of the brain. See

Dr. Hunter feems to think, rhat it is almost impossible to raise a depression of this kind, because the fracture is through.

After the bleeding, blifters behind the ears of on the back, more extensive in the inside than the outer one, and the are not to be omitted. The antimonial emetics should spiculæ can never be brought exactly to six each others However, as according to filldanus and Van der Weil, fome skulls have been so fost as to be depressed without being fractured, fuccels may be expected at leaft in fome cases; and where the bones are soft and yielding, they may be raifed by means of a string fastened to an adhefive plaster, which may be applied to the depression after shaving the part. But after all, if their elevation was eafily practicable, it would be unwarrantable, in general, to be contented with mere elevation; for all the ills attending and following fimple fractures, are more likely to happen from depressed pieces of bone; therefore, removing the depressed pieces, is the only right intention to be pursued.

DEPRESSOR, also Deprimens, from deprimere, to pull, or draw down. In anatomy, a name applied to several muscles, because they depress the parts they are

fastened to.

DEPRESSOR ANOULI ORIS, a name given by Albinus to the depressor labiorum communis. It rises from the outer part of the lower edge of the lower jaw, at the side of the chin, and is continued outwardly, to the greater zygomaticus, to the nafalis of the upper lip, and thence into the outer part of the orbicularis, where it furrounds the upper lip at the corner of the mouth. It extends and joins the elevator of the corner of the mouth.

EPIGLOTIDIS. It rifes from the ligament on the

thyroid cartilage on its fore part on each fide, and is in-

ferted in the spiglstiii, near its basis, on each side.

Labsorum Communis. See Depressor an-

- LABII SUPERIORIS, called also triangularis con-Aritter ala nafi. It rifes from the fockets of the inci-fores, runs to the superior part of the upper lip, and some fibres to the nofe.

- Oculi, called also humilis rellus inferier, deprimens, mufculus inferior. It rifes tendinous from the back part of the focket, cohering in fome measure with the

covering of the optic nerves, and is inferted into the fore part of the felerotica, after running under the cyc.

—— SUPERCILIT. See CORRUGATOR Coiterii.

DEPRESSORES ALÆ NASI. The depreffers of the wings of the nofe. They arife from the upper jaw-bone outwardly, where the gums cover the lockets of the dentes incifores and canini, and are inferted into the root of the wing of the nose, advancing up the side of the wing a little way; they pull the also downwards.

— Costarum. They are so similar to the levatores longiores as to need no farther description, only (as their name imports) their office is the reverse of the other.

- Labit Inferioris, also called quadrati. They arise sleshy on each side of the chin, march obliquely, and croffing each other, terminate together in the whole edge of the lip, where it grows red.

MAXILLE INFERIORIS. See PLATISMA MY-

DEPRESSORIUM. An instrument which is used for depressing the dura mater after the operation of the

DEPRIMENS. See DERPESSOR. It is also the name

of the depressor oculi.

DEPURATION, vel clarificatio aut defpumatio. It is the freeing of any fluid from all heterogeneous matter or feculence. This operation is of three kinds: 1ft, Decantation, which can only take place where a difference is in the specific gravities of what constitutes the mixture; whence that which is the heavieft falls to the bottom, and the lighter part is feparated from it by the decantation or pouring off: when fluids are to be separated from oils, a tritorium, or separatory glass, is used. 2dly, Despumation; this is performed by adding the whites of eggs, or other such viscid matter, to the suit to be clarified, and, after a perfect commixture, making them coagulate by means of heat, and thus carrying to the surface all the heterogeneous matter; the impurities are then, with the concreted vifeid matter, feparated with a fpoon. This is also called clarification.
3dly, Filtration, percolation, or colature; it is performed by passing, without pressure, the sluid to be purified through strainers of linen, stannel, or paper, which re-taining the seculence, permits only the clearer sluid to pass

three props, with the cone downwards; it is then filled with the liquor, which gradually drops from the apex: it is generally used when the matter must be passed through whilft hot.

When paper is used for filtering through, it must be supported by fitting it to a funnel, or by laying it on a linen strainer, in a sieve, or other such like convenience. When paper is fitted to a funnel, ftraws thould be placed here and there betwirt them.

Distillation and sublimation are practised in the case of foirits and falts with a view to deparation, and the opera-

tion is called in these cases redification.

DEPURATORIA FEBRIS. DEPURATORY FEVER A name given by Sydenham to a fever which prevailed in the years 1661 and 1664. He called it depuratory, because he observed that nature regulated all the symppulsion in a certain time, either by a copious fweat, or a free perspiration. See Sydenham's Works, with notes by Dr. Wallis: toms in fuch a manner as to fit the febrile matter for ex-

DERAS. Aspais, a flocep-skin. The title of a book in chemistry, treating of the art of transmuting base metals into gold. It is wrote on sheep-skins; hence also

DERBIA. See IMPETIGO.

DERMA, Segua. See DERAS.
DERIVATIO. DERIVATION. In medicine it is when a humour which cannot conveniently be evacuated at the part affected, is attracted from thence, and discharged elsewhere; thus, a blifter is applied to the neck to draw

away the humour from the eyes.

The doctrine of derivation and revultion to much talked of by the ancients is, in their ferse of these terms, wholly exploded. By revultion they meant the driving back of the fluids from one part to another. The only rational meaning of the word revultion, as here applied, can have is, the preventing too great an afflux of hu-mours to any part, either by contracting the area of the vessels, or diminishing the quantity of what flows from them; the first of these intentions is answered by the application of repellents to the part; the last by bleeding and other evacuations: thus, any medicines promoting the fecretions, may be faid to make a revultion, and in this fenfe derivation can only be understood.

DERMATOIDES, from seppea, a skin or leather, and eide, likeness. Leather-like. An epithet of the dura

mater.

DERTRON. Foefius fays it is the abdomen or omen-turn; Linden and Coronarius, it is the fmall intestines.

DESCENSIO. It is spoken of the gentle and mode-DESCENSUS. rate motion of the body, or of the humours downwards. The chemists call it distillatio per descensum when the fire is applied to the top and all round the veffel, whose orifice is at the bottom, and the vapours confequently driven there. Liquifying falts by exposing them to the air, as in making the aq. kali, is also a fort of distillatio per descensum,

DESCENSORIUM. The furnace in which the distil-

DESCENSORIOM. The latitate in which the untillatio per defcensum is performed.

DESESSIO. Celsus uses this word for fitting on a
close-stool. Desurcatio is used in the same sense

DESICCATIO. DRYING. The chemists also refer
it (though improperly) to calcination.

DESICCATIVUM. DESICCATIVE, from desice, to

dry. In pharmacy it is applied to fuch topical medicines as dry up the humours flowing through a wound. See EPULOTICA.

DESIDIA OBLIVIO. LETHARGY. See LETHARGUS. DESIPIENTIA. The fymptomatic phrenitis. DESME, from \$40, to tie or bind. This word occurs

in Moschion, and fignifies the same as MANIPULUS

DESMIDION. It is a diminutive of define, fo figni-

fies a fmall handful.

DESMOS. In Hippoc. de Fract, this word fignifies an affection of the joint after a luxation, in the manner of a tye or ligature, whereby they are rendered incapable of bending or ftretching out. It proceeds from inflammation.

DESPUMATIO, from despumo, to scum. Despuma-TION. Sec DEPURATIO.

When flannel is used, it is commonly formed into a DESQUAMATIO, from de, privative, and squama, cone, called Hippocrates' sleeve, and its base is hung on the scale of a fish. To take off scales. By a metaphor three props, with the cone downwards; it is then filled is applied to a foul bone, the lamine of which rise like feales; it is the fame as exfoliation. Sometimes it figui-

fies the fame as abrasio.

DESQUAMATORIUM. An epithet of a trepan, called also exfoliationem, for abrasing part of the cra-

DESTILLATIO. See DISTILLATIO.
DESUDATIO. See EPHIDROSIS.

DESUDATION. A profuse sweat succeeded by an eruption of pustules, called fudamina, bidrea, or HEAT-PIMPLES.

DESURRECTIO. See DESESSIO.

DESURRECTIO. See DESESSIO.

DETENTIO. See CATALEPSIS.

DETERGENS, from deterges, to wipe off. DETERGING. See Abstergentia. Detergents differ only in degree of efficay from vulneraries. They have more fubtil parts, and so are more fit to mix with, attenuate, and wear away the contents of abfeeffes and ulcerations, and fuch vifeid humours as adhere to and obstruct the veffels.

DETERIORATIO. DETERIORATION. The impairing or rendering a thing worfe; it is the opposite of melioration.

DETERSORIUM. The apartments at baths where

the fweat was feraped off.

DETERSORIUS. The fame as abstersive. See Ar-

DETONATIO. DETONATION, from detono, to make a great noise. In chemistry it is that noise and explosion which any substance makes upon the application of fire to it. It is also called sulmination; but detonation is a less degree of thundering noise; it is a crackling noise, and less explosive than the fulminating noise. See Calcinatio. As nate is the cause of most explosions, the word detenation hath been appropriated chiefly to the in-flammation of the acid of this falt with bodies containing phlogiston; and it is frequently given to those inflamma-tions of nitrous acid, which are not accompanied with explosion. See Dict. of Chem. DETRACTIO. See CATHÆRESIS. DETRAHENS QUADRATUS. See PLATISMA

DETRACTOR AURIS. See ABDUCTOR AURIS. DETRITIO. See RHACOSIS. In a general fense it is

taken for trituration, from detero, to rub off.

DETRUSOR URINÆ, from detrudere, to thrust or squeeze out of. Douglas divides the muscular covering of the bladder into two distinct muscles; the longitudinal fibres he calls the detrufor urina, which he describes as arising from the prostate gland going round the fundus, and being lost in the gland again; the oblique sibres he calls constructor, and describes it as running obliquely under the other. But Dr. Hunter says, it is plain that there are no other regular muscles, and this distinction is merely

DEUNX. An eleven ounce measure or weight. See

DEURENS FEBRIS. See CAUSOS.

DEUSTIO. See ENCAUSIS.
DEUTERIA, I from Sulless, fecundus. A poor DEUTERINAS, kind of wine, which the Latins Alfo adhesion of the placenta.

DEUTERION. The SECUNDINES. DEVALGATUS. See BLÆSUS.

DEXAMENE. Any receptacle, but particularly the labrum or folium, that is, a deep bafon in which bathers might fwim. It was also called colymbetar and embasis.

DEXTANS. A ten ounce meafure or weight. See CYATHUS.

DIA, J.a. The beginning of feveral terms in medi-cine; and when the name of any thing begins with thefe three letters they fignify composition, and the word with which they are compounded is the chief thing in the compolition.

DIABACANU, from bacanon, a principal ingredient in it. An hepatic remedy mentioned by Trallian. DIABEBOS. The ANKLE BONES. Hippocrates uses

this word.

DIABESASA, from ha and fireara, wild ruc. name of a preparation, in which rue forms a part

DIABETES, from Siz Carpe, to pass off or through;

fome call it diarrhau wrinofa; diarroia ex oure; dipfacos; diarrhis; hydrops ad matalam; profluvium urina. That disrefis; bydrops ad matalam; proflevium uring. That diforder in which what is drank fuddenly paffes off, and is evacuated almost crude. Or it is an excessive discharge of crude urine, exceeding the quantity drank. Boer-haave, in his Institutes, says, it is a frequent copious discharge of lacteous urine, in conjunction with an ex-

traordinary thinness of the humours.

Dr. Cullen places this genus of disease in the class neuroses, and order spasmi. He notices two species, 1st, Diabetes mellitus, when the urine hath the colour, odour, and tafte of honey. 2d, Diabetes infipidus, when the urine is limpid, and not fweet. Dr. Home defines it to be an extraordinary increase of the urine as to its quantity, and that of a sweetish taste; attended with perpetual thirst, and a dry skin, which for the most part is also

fealy.

Lommius fays that the feat of this diforder is in the kidnies; but this does not appear to be the case, and some

difficulty attends the affertaining it.

Youth is scarcely ever attacked with this disorder: its most frequent subjects are these in the decline of life, who have been subject to a liberal use of wine in their youth, and who are also employed in the more violent kinds of

The causes are generally said to be, a relaxation of the renal duck; too great a tenuity of the fluids; or obstructed perspiration : but perhaps, on maturer consideration, a defect of vital heat, and the concurrence of such accidents as determine the serum to the kidnies, are the real causes. The discharge is not a truly urinous one, no more than that through the skin in a hectic sever is of a

truly perspirable kind.

Befides the frequent and too copious discharge of urine, it is generally infipid, though fometimes a fweetness both to the fmell and tafte is observed in it; thirst, an heetic heat, a weak but quick pulse, a gradual wasting of the sless, and, after some time, an anasarcous tumidness comes on. Dr. Lister observes that it is slow in its approach; that in the beginning the mouth is dry, the faliva white and frothy, and an unufual heat is perceived in the bowels. If by accident the urine is fuddenly checked, there follows a fwelling of the loins, ferotum, legs and feet; and what urine is difcharged paffes off with pain,

and thus death is foon uthered in.

The fweetness of the urine (which symptom is not conflant, but generally when it does attend only appears towards the end of the disease, or when death seems near at hand, is owing to the chyle passing unaltered into it, which, as Dr. Morton observes, gives a sweetness to the matter expectorated in the last stage of a phthisis.

When recent, and the constitution of the patient not much injured, a cure is sometimes effected; but if of long flanding, and there is a debilitated or otherwise dis-ordered habit, no hope of relief can be encouraged.

The general indications of cure, are, 1. To increase the erassamentum of the blood; and 2. To divert or

restrain the preternatural discharge.

The diet should be the same as in an hectic sever, viz. animal substances, such as broth made of beef, shell-sish, milk often, and in fmall quantities; and jellies; barley-water, in which the root of comfrey is boiled, and limewater, may be the common drink.

Moderate exercise on horseback, and dry friction of

the whole body, affift in promoting perspiration; and which, when excited, peculiarly tends to divert the discharge through the kidnies.

When unquenched lime is mixed with the ferum of

blood, it generates those falts that are necessary to the true urinary discharge; and if lime-water is drank as freely as the thirst requires it, its efficacy exceeds that of Briftol water in the cure of a diabetes, notwithstanding the latter is esteemed as a specific: but, in order to this advantage from lime-water, it must be drank while the heat continues, which it poffesses from the lime being quenched in the water.

At proper intervals, during the use of lime-water as above directed, the acidum vitrioli dilutum cort. Peruv. limat. ferri, and whatever can improve the crafts of the

blood, may also be administered.

A flannel fhirt may be worn to folicit a discharge through the skin. The tincture of cantharides is faid by

Dr. Morton, to be a specific in this complaint. Others prefer the ferum aluminofum, made as ftrong as the ftomach will bear it, and direct half a pint to be taken night and morning. With others, the vitr. cœrul. gr. fs. given twice a day, diffolved in any agreeable liquor, is most depended on. When the means first proposed are unsuccessful, recourse may be had to these, or such other means as experience may suggest. Rhubarb is found to be of singular advantage, and from the success which follows on the use of antispasmodies, joined with other means, a fpafin in the ducts, through which fome other excretions are conveyed, rather than an irritation in the kidnies, may be a principal cause of this malady.

See Aretæus, Lommius, Boerhaave, Lifter, Shebbeare's Theory and Practice of Physic, Lond. Med. Obf. and Inq. vol. iii. p. 274, &c. vol. v. p. 298. Cullen's First Lines, vol. iv. Wallis's Sydenham.

DIABOLUS METALLORUM. A name of TIN, because when incorporated with other metals, they are not reduced but with the greatest disficulty. See STANNUM. DIABOLI INTESTINA, i. c. DODDER. Sea Cus-

DIABOTANUM, from Bajare, an berb. The name

of a platter prepared of herbs.

DIABROSIS. See ANASTOMOSIS, and ANABROSIS.

It is also a corrosion, either by any medicine or humour, from JiaCporen, to cat through.
DIACADMIAS. The name of a plaster, whose basis

DIACADAMINTHES. The name of an antidote whose basis is calamint.

DIACARCINON, from expenses, a crab or cray-fifth.
The name of an antidote prepared of these kinds of fish.
DIACARYON, from scapus, a wallout. Rob of wallnuts.

DIACASSIA, i. e. Electarium e caffià. See Cassia

STULARIS.
DIACASTORIU, from Europes castor. A name of

an antidote whose basis is castor.

DICATHOLICON. Sometimes it is called catholicon, from Sia, of, and nasoninos, univerfal. The univerfal purge. Originally it was prefcribed by Nicolaus, and was an electary, which he proposed as a purge suited to carry off all kinds of humours.

DIACEPTATESSON. A name given by Van Helmont to a purging preparation of antimony. It is also a term in Paracellus; he feems to mean a vomit excited by quickfilver. According to fome, this word fignifies quickfilver diffolved in alcaheft.

DIACENOS, from xeros, empty, void. An epithet of porous bodies, fuch as fponge, pumice stone, &c. DIACENTAURION. So Cœlius Aurelianus calls a

preparation which is the fame as the pulv. arthrit. ducis Portlandii. See CHAMABRYS.

DIACENTETON. The name of a collyrium in Cel-

fus. It is to called from urpas, a horn, because burnt

hartfhorn is a principal ingredient.

DIACHALASIS; from hazaza, to be relaxed. This word was formerly used to fignify the opening of the sutures of the cranium;

DIACHALCITIS: The name of a plaster whose basis is the chalestis.

DIACHEIRISMOS, from xue, a band. It is any

DIACHELIDONIUM, from xxxxiv. A swallow.

DIACHELIDONIUM, from xearler. A swallow: A preparation of fwallows.

DIACHETON, i. e. Rhodium. See Aspalathus.

DIACHOREMA: All forts of excretions from the DIACHORESIS. I body, but more properly and frequently those by stool. See Distributio.

DIACHRISTA, from xear, to anoint. In P. Ægineta it signifies medicines that are applied to the fauces, palate, uvula, and tongue, to absterge phlegm.

DIACHRYSU, from xearos, gold. The name of a plaster mentioned by Galen, which was used when limbs were fractured.

were fractured.

DIACHYLON, from Dia, ex, and zunes, a juice. An emollient digeffive platter made of certain juices. This name is given to very different compositions for platters, and is now the empl. lithargyri of the London Difpen-

DIACHYSIS, from you, to fufe or melt. Fusion. DIACHYTICA,

difcufs, or diffolye.

DIACHYTOS. An epithet of wine prepared of grapes that have been dried feven days, and were prefied

on the eighth.
DIACINEMA, dianiven, dimoves, to thrust or put aside.

A flight diflocation.

DIACISSU. An acopon in Mar. Empericus is thus named from sarous ivy.

DIACLYSMA, from wave, to wash out, or rinfe. It generally fignifies a gargarism.

DIACOCCYMELON, from MANNUMBAR, a plum. The

fame as diaprunum.

Such milk is fudorific.

DIACODIUM, from &ia, ex, and nodeia, a poppy bead. See MECONIO E SYRUPUS.

DIACOLOCYNTHIDOS PILULÆ. Alex. Trallian's composition which bears this name is called pil. de nitro in the Augustan Dispensatory: they consist of aloes, colocynth, nitre, &c.
DIACOLOCYNTHIS, from colocynth, which is the

chief ingredient in the preparation.

DIACOMERON. The name of an antidote in My-

repfus.

DIACOPE, from διακοπτω, to cut through. A deep cut or wound, or the cutting off any part.

DIACOPRÆGIA, from κοπρΦ, dung and αιξ, α goat.

A preparation with goat's dung against disorders of the parotids and fpleen.
DIACORALIUM ALEXANDRI. A preparation of,

or in which is corallia, MALE PIMPERNEL

DIACRISIS, from Sumprou, to judge or diftinguish. The judging of diseases and symptoms. It is also a name for delphinum in Oribalius.

DIACROCIUM. A name in Platerus for the elect.

DIACROCU, from \*sotto, faffron. The name of a dry collyrium in P. Ægineta, in which is faffron.

DIACURCUMA, from curcuma. A word which Fuchfius thinks Mesue used for faffron. A name of several antidotes in Myrepsus, of which saffron is an in-

DIACYDONIUM. MARMALADE of QUINCES. See

CYDONIA.

DIADAPHNIDON, from Dapne, the bay-tree bay-berry. The name of a drawing platter prepared of bay-

DIADELPHIA. The feventeenth of Linnæus's classes of plants; in it is one style, and the filaments unite fo as to form two bodies.

DIADEXIS, DIADOCHE, See METASTASIS.

DIADOSIS, from Siasisaus, to diffribute, or diffipate. In medicinal authors it fignifies to remit, though fometimes it means the distribution of the aliment over all the body.

DIÆRESIS, from Piagese, to divide or Separate. It is any solution of continuity.

DIÆRETICA, from Siangese, to divide. Corrosive me-

DLÆTA, also DIATERETICA. DIET. Though this word is often confined to what we eat and drink, yet Galen and most other medical writers include in it the whole of what are called the non-naturals. On this fubpict fee Galen, whose work is the bass of what hath been writ fince his day; fee Hoffman, Arbuthnot, Mackenzie, and others, on the non-naturals.

DIAGLAUCIUM. The name of a collyrium recommended by Scrib. Largus. It is thus named from Glauding and the state of the

eium, which, according to Diofcorides, is the juice of a

DIAGNOSIS, from Sidymonu, to difern or distinguish, also dignetie. The diagnostics, or the figns of a disease. They are of two kinds, viz. the adjunct, and pathognomonic; the first are common to several diseases, and ferve only to point out the difference between difeafes of the same species; the latter are those which always attend the disease, and distinguish it from all others.

DIAGRYDIUM, quasi \$\sigma\_{x\text{pi}}\sigma\_{x\text{pi}}\$; also Diacrydium. A preparation of scammony. The ordinary way of

A preparation of fearmony. The ordinary way of The transudation of blood doing which is by baking the fearmony in a quince; ry. See ANASTOMOIA.

DIACHYTICA, in Diofeorides, are medicines that fome make it receive the fumes of lighted fulphur; hence fome make it receive the lumes of lighted fulphur; hence diagrydium fulphuratum. Some incorporate it with a quantity of fpiritus vitrioli rofati, futicient to make a fort of liquid pafte, which is afterwards fet to dry in the fun or by a gentle fire; hence diagrydium refutum. But these modes are considered now as of no consequence, as correctors. See Scammonium.

DIAHERMODACTYLU. A purging medicine, whose hose is the hermodactisk.

whose basis is the hermodactyls.

DIAHEXAPALA, or DIAHEXAPTE. See LAURUS. DIAION. The name of a pastil in Myrepfus. Violets are its chief ingredient.

DIAIREOS. An antidote in Myrepfus in which is

orris root.
DIALACCA. An antidote in Myrepfus, in which is the lacca.

DIALAGOOU. The name of a medicine, in which

is the dung of a hare.

DIALEPSIS, from διακαμέτειο, to interpose, or from διακιπω, to leave a space between. To intermit. The same as apolepsis. Hippocrates means by it the space left in a bandage for a fracture in which the dreslings are applied to wounds.
DIALIBANON

A name of feveral medicines in

which frankincense is an ingredient.

DIALOES. A composition in which is aloes. DIALTHÆA. The name of an ointment in Myrepfus, from which the ointment of althma feems to have

DIALYSIS, from Diazon, to diffolore, or render languid, also diffolutio. A diffolution of the strength, or a weakness of the limbs. Also a discontinuity or division of a

DIALYTICA. A folution of continuity, as in frac-

tures, wounds, &c.
DIAMARENATUM, from amarena. RED susACID CHERRIES. Schroder has two compounds in which CHERRIES are the bafis.

DIAMARGARITON. An antidote in which pearls

DIAMASCIEN. See Flos ærts.
DIAMASCIEN. from Jamassaus, to chew. A masticator

DIAMBRÆ PIL. Sec AROMAT. PILULÆ.

—— SPECIES, called species aromatica, now pulvis aromaticus. The prescription is originally Metue's, and had its name from the ambergrise which was in the composition. See Aromatica species.

DIAMELON. The name of a composition in which

is quinces.
DIAMISYOS COLLYRIUM. A collyrium in which mify is an ingredient.

DIAMNES. An involuntary discharge of urine, and that insensibly. This word is used by Joh. Anglicus. DIAMORON. A preparation of mulberries and honey. DIAMOSCHU. The name of an antidote in which

is mutk

DIAMOTOSIS, from \$40.70; lint. The introduction of lint into a wound or ulcer.

DIANA, in chemistry, is the filter of the philosophers.

It is also a name of filver.
DIANANCASMAS, from arayun, force or necessity. The foreible restitution of a luxated part into its proper place. Hippocrates calls an inftrument thus, which is intended for reftoring a difforted fpine. DIANDRIA. The fecond of Linnaus's classes of

plants; in it there are one ftyle and two filaments in each

flower

DIANTHON. The name of an antidote in Galen, from which it is probable that the species of dianthus was taken, which is thus made:

R Plor rorifm. 3 i. rofar. R. & rad. glych. aā 3 vi. caryoph. arom. spic. nard. nuc. musch. rad. galangal. cort. cinnam. rad. zedoar. lign. aloes fem. card. min. fem. anethi, fem. anifi, & macis. 22 9 iv. m.
DIANTHUS CARYOPHILLUS. See CARYO-

PHILLUS RUBER.

DIAOPORON, from sweet, autumnal fruit. A com-

position in which are quinces, mediars, and services.

DIAPASMA. See CATAPASMA.

DIAPEDESIS, from sia, through, and median, to leap.

The transludation of blood through the coats of an arte-

DIAPENCIA. Rulandus fays it is the alchimilla.
DIAPENSIA. See SANICULA MAS.
DIAPENTE. A composition so called because it confirs of five ingredients. It is thus made:

R Rad. gentian. Ariftol. Long. vel Rot. Raf. Eboris;

bac. laur. & myrrh. na p. æq. m. f. pulv. Mefue is faid to be its author, but Vegetius describes

DIAPEPEREON. An antedote mentioned in Galen. DIAPHÆNICON. The name of an electary for

purging off phlegm, &c.
DIAPHILEDONU. The name of an antidote in My-

repfus.

DIAPHLYXIS, from Jiaφιζω, to moissen. In Galen's Exegesis it is expounded by effusions or ebullitions.

DIAPHONE. See Perspiratio.

DIAPHCENICON, from φωτιξ, a date. A medicine

DIAPHORA, from Stagepo, to differ. DIFFERENCE. In medicine it comprehends the characteristic marks and figns which diftinguish one disease from another. It also fignifies a corruption of food in the stomach; and then is an instance of DYSPEPSIA, which see.

DIAPHORESIS, from διαφορίω, of δια, through, and φιρω, to carry. It is an elimination of the humours through the pores of the fkin; termed also Discussio.

DIAPHORETICA. DIAPHORETICS. Medicines

which promote perspiration. Diaphoretics, called also perspiratives, differ from fudarifies, the former only increase the insensible perspiration; the latter excite a sensible discharge through the skin, which is called sweat. See SUDORIFICA.

One half of a fudorific is generally a due dole for a

Hoffman observes, that diaphoretics are the best edulco-rants, or sweetners of the blood and humours. DIAPHRAGMA. The diaphragm, from Siaogassas, to make a partition, or inclosure, of Jia, through, and opposes, to close; or, from Jiapparis, intersepie; because it divides the cavity of the thorax from that of the abdomen. It it also called the MIDRIFF. Diazona, disfertum, Hypozona septum transversum, Succingens membrana. Coelius Aurelianus calls it the discrimen thoracis & ventris, because it separates the thorax from the belly. Pliny calls it the pracordia, because it stands, he says, like a wall to defend the heart. Hippocrates, with many of the ancients, call it passes; they also gave the name of diaphragma to the strait places of the sauces, between the mouth and the cesophagus, terming it by way of distinction the diaphragma by the cesophagus. Galen and Rufus Ephesius call the cartilaginous partition between the nostrils, the diaphragm of the nose. But the only part which is now called diaphragma, is that which

feparates the thorax from the belly.

The diaphragm is composed of two muscles; the small one rises by two tendons, called crurx, from the second lumbar vetebra, and receives a flip from the first vertebra of the loins, and from the ligament which joins the last rib to the vertebra; the two cruræ then run upwards and grow sleshy. The large muscle rises from the inside of the margin of the thorax, all round, from the false ribs to the xiphoid cartilage; its fibres shoot forwards, and form that triangular appearance called the and form that triangular appearance called the centrum tendinofum, or centrum nerveum. Winflow calls it the middle aponeurofis, or aponeurotic plane of the diaphragm: Meffrs. Le Gare and de Bordeu call it centre phrenique. There is a notch between the cruræ of the leffer mutcle, where the aorta passes. In the larger muscle are two holes, one in the tendinous part, for the vena cava, which the other hole is for the cefophagus, and is fituated in the flefhy part, which feems to be for this reason: that it as the damphragum in its action preffect on the flomach, it as the damphragum in its action preffect on the flomach, it might cause an evacuation of its contents, unless at the fame time it was to serve as a sphincter to the cesophagus, by reducing its cavity from an oval figure to a narrow flit; wherefore the diaphragm acts in this case as an antagonist to the abdominal muscles, which contradicts that opinion, that vomiting is occasioned by their joint action. From confidering the attachment of the diaphragm, it will be feen that its action will be to render itself flat, and thereby to enlarge the cavity of the thorax; but if we regard

it as acting round the vifeera as round the pully, we may conceive how it both depresses the viscera, and raises the ribs; at the same time, still more enlarging the cavity of the thorax. The veins are large, and go directly to the vena cava. The arteries are fometimes immediately from the aorta, and fometimes from the cocliac; a few twigs are received also from the lumbals and adipose. The nerves are from the plexus cervicalis on each fide, and

from the fecond pair of the vertebre.

In infpiration, the diaphragm descends towards the belly; this is its proper motion, which, as a muscle, is contraction. In expiration it is relaxed and drawn upwards, forming a concavo-convex figure, the concave fide being towards the belly. It affifts in the expulsion of the excrements and foctus. It is in perpetual motion, and feems to have other and more important uses in our constitution than as yet are clearly feen into. See Berdoe's Enquiry, p. 27 and 126. It is also a name of the feptum feroti. See Scrotum.

DIAPHRAGMATICÆ ARTERIÆ. The DIA-PHRAGMATIC ARTERIES. They are also called phrenice arteria. As foon as the aorta gets through the diaphragm, it fends off two arteries thereto; though fometimes the diaphragmatic arteries are branches of the ceiliac, and fometimes the right diaphragmatic artery rifes from the lumbar artery. The diaphragmatic arteries generally appear on the under fide of the diaphragm, very rarely on the upper; they give small branches to the glandulæ renalls, and to the fat which lies on the kidneys; these latter are called adipose. Besides these capital diaphragmatic arteries, there are other leffer ones from the intercoftales, mammariæ, internæ, mediaftinæ, pericardiæ, and cœliacæ.

- VENE. The diaphragmatic veins, also called phrenice vene. They spring from the vena cava inferior, just as it descends through the diaphragm: they appear generally on the lower side of the diaphragm. The left

branch runs much upon the pericardium.

- Superiores Venz. The upper diaphragmatic veins, also called pericardio-diaphragmatica vena. right comes anteriorly from the root of the bifurcation, near the mediastina, and is spread about the pericardium: the left from the left subclavian.

DIAPHRAGMITIS. INFLAMMATION of the DIA-PHRAM. In Cullen's Nofology, it is fynonymous with pleuritis. We have a particular description given of its symptoms by SAGAR; he fays, it is an inflammation attended with an obscure pain at the spurious ribs, oppresfion of the breaft, often bloody fpits, difficulty of breathing, and anxiety; the afflicted complained of tightness, like being bound with a cord, at the præcordia; often drawing back the angles of the mouth almost involuntarily, they become delirious; fometimes they are feized with a lethargy, or preternatural propenfity to fleep; the pulse is unequal, irregular, intermittent, and hard; the hypochondria drawn inwards, respiration, without the hypochondria drawn inwards, respiration, without the motion of the diaphragm; the urine fometimes pale, fometimes high-coloured, with an internal burning heat at the praecordia. These symptoms he gives from what he has seen in his own patients. This disease is also called paraphrenitis, which see.

DIAPHTHORA, from \$\phi\_{25ps}\$, to corrupt. In Hippocrates it signifies the corruption of the feetus. An abortion

DIAPHYLACTICOS, from polarow, to keep. Pre-

fervative or prophylactic.

DIAPHYSIS. An interflice, a partition, or whatever intervenes between things. Galen explains it to be a nervous and cartilaginous protuberance in the middle of the joining of the os tibize with the os femoris, which enters that large finus, and makes a separation between the lower heads and processes of the os femoris, which are inferted into the finus of the os tibiae. This fubstance only appears in recent subjects. In other places, the diaphysic is spoken of as a cavity, chink, &c. for the reception of some other part.

DIAPISSEL/EON. A composition in which is liquid

pitch as a chief ingredient.

DIAPLASIS, from anageu, to form, or from hannageu, to put together, or fashion. Conformation. It figui-fies the replacing a luxated or fractured bone as near as

may be to its proper fituation.

DIAPLASMA. An unction or fomentation applied all over the body, from hathleful, to finear over.

DIAPNE-

· DIAPNE.

DIAPNE. An involuntary discharge of urine. in this disord DIAPNOE, from diamne, to perspire. Perspiration, of the body.

from Sia, through, and wines to breathe.

DIAPOREMA, from Siaropie, to be in doubt. Anxi-ETY in diftempers. The fame as ALYSMUS, which

ingredients.
DIAPRUNUM, also called Diacoccymelon. The name of two compositions in which are prunes: both are purging electuries. The elect. e fenna is used in their stead. DIAPSORICUM. The name of a collyrium in Mar-

cellus Empiricus.

DIAPTERNES, from wherea, the heel. A medicine made of the heels of animals and cheefe.

DIAPTEROSIS, from slepes, a feather. The clean-

ing of the ears with a feather.

DIAPYEMA, from weep, puss An ABSCESS or SUP-

DIAPYEMATA, SUPPURATING MEDICNES.

DIARRHODOMELI. The name of a composition of feammony, juice of rofes, &c.
DIARIA FEBRIS. A DIARY FEVER. It is the fame

as ephemera. It is an inflance of the synocha.

DIARHOCHÆ. The interflices betwirt the circum-

volutions of bandages-DIAROMATICUM. A medicine composed of aro-

DIARRHAGE. A fracture in particular of the temple bones

DIARRHODON. A name of many compositions in which rofes are an ingredient. See EUELPIDIUM.

DIARRHEA, from diagine. See Lorentom.

DIARRHEA, from diagine. to flow through; I a, through, and jim, to flow; also fluxus; it is when the intellines are folicited to a too frequent discharge of their contents. Dr. Cullen places this genus of disease in the class neuroses, and order spasmi. He notices six species.

1. Diarrhwa crapulosa; when the excrements are more fluid and more copious than is natural. 2. Diarrhau biliessa; when very yellow sæces are copiously discharged.
3. Diarrhæa mucosa, called also leucorbois; when the discharges abound with mucus.
4. Diarrhæa cæliæca; when the excrements are chylous, appearing milky.
5. Diarrhæa lieuteria, called also lieuteria spontanea; when 5. Diarrhea lienteria, called also lienteria /penianea; when the aliment foon paffes through, and but little altered. 6. Diarrhea hepatirrhea; when the difeharges are crude and ferous, and attended with very little pain. If at-tended with pain, it is fometimes called a colic. When the evacuations are fluid, but partly indigefted, it is called eachieve paffis. When the aliment is carried through the bowels, and ejected in an indigefted state, or nearly fo, the diforder is called lienteria. These are only different degrees of the fame diforder.
Those who have been rendered weak or irritable by a

hot feafon, or fultry clime, or by being exposed to a pu-trid vapour, are peculiarly liable to this difease.

The immediate cause is irritation in the intestines; but the causes of this preternatural irritation are numerous; the most frequent, are an undue use of purgatives, acidity, or putrescency of the aliments; acrid bile; pus secreted from abscesses, and carried to the intestines; a laxity of the glands of the intestines; obstructed perspiration; putrid vapours; a translation of the morbid matter of other diseases to the intestines; passions of the mind, &c.

Whatever other fymptoms occasionally attend a diar-\*haa, belides a too copious and too frequent discharge of the intestines, they are not proper to it, but are acciden-tal. The loss of appetite, and of strength, are conse-quences of the excessive evacuations, or of some other attending diforder, ficknefs, pain, &c. which in many cafes attend, are rather conjuncts with, than conflituents of this morbad exerction. The discharges are various in different patients, and also in the same at different times. If there is a deflux of watery humours, the loofeness is most urgent by night and after sleep; if a diforder in the mecous, and made chiefly in the day. An offending bile, when too freely emptied into the inteffines, diffurbs in the night more than in the day. In violent cafes, (kins appear in the ftools like the coats of the inteffines; thefe are pieces of the cuticle, which lines the rectum, &c. and

In this diforder is thickened and separated, then east out

DIAPNOE, from διαπτω, to perspire. Perspiration, of the body.

Om δια, through, and απω, to breathe.

DIAPOREMA, from διαπτρω, to be in doubt. Anxition differences. The fame as ALYSMUS, which e.

DIAPRASIUM, from πραπιω, horehound, one of its agredients.

DIAPRUNUM, also called Diacoccymelon. The name of two compositions in which are prunes: both are purging the compositions in which are prunes: both are purging from the classical compositions in which are prunes: both are purging fatal. When a looseness and returns, accompanion. fatal. When a loofeness abates and returns, accompanied with a fever, it is generally troublesome, and some-times much danger attends it. Copious as well as fre-quent discharges, subject the patient to fainting. If a fpontaneous vomiting comes on upon a long continued purging, it proves generally a cure. Bilious discharges cease on the accession of deafness; as, on the contrary, a deafness often hath its solution upon the discharge of bile. Acid eructations, which do not begin with the diforder, but come on afterwards, are favourable indications. The lofs of appetite, and hiccoughing, are bad. A moift fkin, and a fediment in the urine, are fymptoms of the most favourable kind.

The diet may be preparations of rice, and the white

decoction may be the common drink, or camomile tea.

When unattended with pain, fever, or other violent fymptoms, the stomach may be cleared with a few grains of ipecac, and, after it, a draught may be given of the tinet. rhab.

If any further affiftance feems necessary, whatever kind of fymptoms attend, a perspiration, excited by such small doses of specae, pulv. as will not solicit the stomach to a discharge, seems to be a specific. To children it may be given in a clyster, which must be repeated three or four times a day, each containing eight or ten grains of this powder. Adults may take two or three grains in a powder or draught, and repeat it two or three times a day, as der or draught, and repeat it two or three times a day, as the case may require.

A fupprefilion of the evacuations by means of aftringents, or of opiates, before the pulse fails, is improper; but the ipecac. may be used at all times with fasety and advantage; a warm bath, or any other external method of promoting perspiration, contributes much to the assistance of the ipecacuhana. To this end, opiates are the best internal aids; but when their use is forbid, the baths, or flannels wrung out of warm water, may be wrapped round the legs and thighs, and the patient at the fame time duly guarded from cold.

When a diarrham is chronical, moderate exercise in a

dry warm air is beneficial; Sydenham commends riding on a horfe; but a carriage is more proper, as it defends more from the moisture of the atmosphere, and strengthens the bowels in a greater degree: in this case, besides small doses of pulv. ipec aromatics and chalybeats should be ad-ministered, and a moderate use of diuretics, in some instances are useful.

If atenesmusis troublesome, R Enem. examyl. vj. 3. cum tinct. opii, gut. xx. ad xxx. vel spt. vin. Gallic. 3 i. m. & repet. pro re nata.

When obstructed perspiration is the cause, the stools are usually serous: in this case, bleeding sometimes is required before other means can be used with proper ad-

When an acrid bile produces a diarrhae, a few grains of nitre will be a necessary addition in each dose that is

given, to restrain the discharges.

When a diarrhaea attacks child-bed women, it is a threatening fymptom, and if it continues above two or three days is very dangerous. In this fituation, a clyfter with flarch and tincture of opium, should be injected, and immediately after it the columbo-root may be given by way of infusion in boiling water; a tea-cup full after each evacuation. It is fafe and efficacious, like the ipecac-whether a fever attends or not, and like it may be administered in those early stages in which astringents are often forbid.

When grief or other paffions give rife to this diforder, the cure is difficult; the affections of the mind are a check to perfpiration, and powerfully counteract every means of exciting it. In such a case, the feet must be kept warm vomits and purges omitted, except very mild ones, and antispasmodics, with modern doses of opium, must be perfifted in for the cure. Small doses of the tinct. opii, in feveral collyria, in which are myrrh, output, See Euri-

draughts of valerian tea, will be proper.

The diarrbaa which attends infants during dentition, is much relieved by the following: R Pulv. rad. columb.

D i. ad 3 i. magnef. alb. B ii. ad 3 ii. aq. menth. 3 iv.

m. detur cochl. parv. 2da, vel 4ta, vel 6ta, quaq.

Aftringents are only indicated when the exorbitant difcharges endanger life; and when these are admitted, logwood and its preparations are to be preferred. The cort. fimaroub. is fingularly efficacious; the biftort and tormentil roots are powerfully fo; but alum, which is fo ufeful in hæmorrhages, which has been thought not to be of great advantage here, is recommended strongly to be tried by Dr. Cullen.

If flatulencies are very troublefome, the following bolus may be repeated every three or four hours. R Extr. lign. Campech. 3 i. pulv. cort. eluther. gr. x. fyr. q. f.

In fcorbutie, arthritic, and other discased habits, a diarrhau is often a confequence of the peculiar acrimony of the humours, affecting the inteffines; in which cases, to correct the morbid quality of the fluids, or to remove them to a less dangerous fituation, will constitute the cure. Here regard must be had to the original diforder.

Infants that have not the breaft, are fometimes fo dif-ordered by watery ftools attended with gripes, that all the ufual methods of relief are but vain endeavours; when this happens, a fresh breast will as rarely fail to cure, and therefore should not be neglected. The stools attending these tender patients, are sometimes green as well as wa-tery, and generally usher in convulsions. The easiest and most effectual management is to give three, four, or six drops of the vin. ant. or more, if necessary, to provoke a vomiting, and repeat it every four, fix, or twelve hours, until the colour and confiftence of the stools are amended, While the stools are four and green, three or four drops of aq. kali may be given at proper intervals, or the mix-

ture above preferibed, with magnef. alb. and r. columb.

DIARTHROSIS, from δια, per, and αρθρον α joint It is that species of articulation which is moveable, also called abarticulatio, dearticulatio, genou. Different authors vary in their division thereof, but Dr. Hunter reckons it to consist of three species: 1st, The enarthrosis, or ball and specket, which is when a large head is received into a description of the species. into a deep cavity. 2dly, Arthrodia, which is, when a round head is received into a fuperficial cavity. These two kinds admit of a motion on all sides. 3dly, The ginglymus, which is when the parts of the bones mutually receive, and are received: this kind of articulation only admits of flexion and extension. See ENARTHROSIS.

DIASAPONIUM. An ointment in which foap is a

principal ingredient.

DIASATYRION. An electary, in which is fatyrion.

DIASCILLION. So M. Empiricus calls the vinegar and oxymel of fquills.

DIASCINCI. A name for mithridate.

DIASCORDIUM. So called from the fcordium in it. It was called elect. e fcordio. Hieronymus Fracaftorius first prescribed it; fince named confectio Fracastorii, though it is now rejected from the LondonPharmacopocia,

DIASENA. It is an antidote in Myrepfus, containing fena; but isvery different from the pulv. e fen. now in

DIASERICOS. A composition in which silk is an in-

DIASMYRNON, or DIASMYRNES. A name of lobolus.

PIDIUM and ATHENIPPON.

DIASOSTICA, from outs, to preferve. That part of medicine which relates to the prefervation of health.

DIASPERMATON. A name of two malagmas which are compounded of feeds.

DIASPHAGE. An INTERSTICE. Hippocrates expreffes by it the interval betwixt two branches of a vein.

DIASPHYXIS, from epoco, to firike. The pulfation

DIASTASIS, from Juane, to feparate. It fignifies the distance betwirt the fractured ends of bones receding from each other, also the interstice which is naturally be wixt the radius and the ulna. Sometimes it fignifies that liftention of the mufeles which happens in convultions. When this word is applied to the itomach, it means an effort to vomit; and when used with respect to the pulse,

it is the fame as diaftole. Some fignify by it a luxation.

DIASTEATON, from reae, fat. The name of an intment, in which are the fats of a ftag, fwine, goofe,

DIASTOLE, from Startha, or Sta, and stanu, to outract, to firetch. In anatomy it imports the dialation of the heart, auricles, and arteries. In the diaffole, the artery is enlarged both in length and breadth. The heart hath two motions, viz. its diaffele, and its fyftole. In the fyftole, the elaftic coats of the arteries only act by reftoring themselves. The diaffele is performed almost inftantaneously, the fystole more gradually, infomuch, that the latter employs two-thirds more than the former. When the heart begins to vibrate, the diafiole is the first motion. Kirkland's Med. Surgery, vol. i. p. 306.

DIASTOMOTRIS: It is usually joined with pools, a

probe, and implies any dilating instrument, as a speculum

DIASTROPHE, afide. A diffortion of the limbs.
DIASULPHURIS EMPLASTRUM. This is a pre-

scription of Rulandus's, but it contains only a very small proportion of fulphur with wax, &c.
DIATAMERON. See ANTIMOROS.

DIATASIS, from fractures, to diffend, to firetch out. The extension of a fractured limb, in order to its reduc-

DIATECOLITHU. An antidote in which is the

lapis Judaicus, which is called THEOLOGO.

DIATERETICA. See DIATA.

DIATESSARON, Jia, ex, and TISTAQUE, four. A compound fo called because made of four ingredients, viz. gentian, bay-berries, myrrh, and the root of birthwort, in equal quantities.

DIATETTIGON. The name of an antidote, in

which are grafs-hoppers.

DIATHESIS, from Fra Johnus, to dispose. An affection or a difposition, as when the blood is inclined to some faulty state. See HEX15.

DIATRAGACANTHI SPECIES. See Gum. TRA-

DIATRINSANTALON. A confect, in which is the wood called fanders

DIATRION PIPEREON SPECIES: A powder preferibed by Galen, which chiefly confifts of peppers.

DIATRITARII. An abitinence during three days DIATRITOS. I was one of the points in practice by which the first methodic physicians diftinguished themfelves from others. This term of three days they call diagrams. tritos, and not the abstinence itself; and from this circumstance the methodics, had the name of diatritarii. On the third day they gave fuch medicines as they thought of importance, and not before. Coolius Aurelianus gives the name diatritos not only to the space of three days, but to the third day in particular also.

DIAULOS, from &15, twice, and awa, a flation. A kind of exercise in which the person runs a straight course for-

wards and back again.

DIAZOMA. A name of the diaphragm, from Jia, DIAZOMA. A name of the diaphragm, f and Corrupts, to Surround. See DIAPHRAGMA.

DIAZOSTER. A name of the twelfth vertebra of the back. It is also called from twent, the belt, which lies

DICENTETON. The name of a collyrium described.

by P. Ægineta.
DICHALCON. A weight equal to one-third of an

DICHASTERES. The dentes incilorii. See INCI-

DICHOPHYIA. It is a diftemper of the hairs, when they split or grow forked; from sixa, double, and que,

DICOCTA. Water first heated, then cooled with

DICOTYLEDON. See COTYLEDON.

DICRÆUS. BIFID.

DICROTUS, from Ju, twice, and \*180, to firike. An appellation of a pulse, in which the artery feems to strike double. Dr. Solano first observed it, and it is considered as a certain fign of an approaching critical hæmorrhage from the nofe. It is also called a rebounding pulse.

DICTAMNITES. A wine medicated with dittany.
DICTAMNUS. DITTANY.

DICTAMNUS ALBUS, called also fraxinella, WHITE or BASTARD DITTANY. Boerhaave mentions three species. It is a plant with leaves refembling those of the of the stalks are long spikes of purplish and white flowers, which are followed by pods with black seeds in them. It is perennial, and grows wild on the mountains in France, Italy, &cc. It is the dictamnus albus, or dictamnus flore albs, Linn.

The roots are whitifh; their cortical part freed from the pith and fmall fibres, are dried and rolled up, and in this form are brought to England. The young roots, which are about the fize of a quill, are the best. they have an agreeable fmell, which is all diffipated in drying: they are confiderably bitter, and this quality is taken up both by water and by spirit; and on inspissating the sincture, remains in the extract. They are not much used, though commended as an anthelmintic, aperient, and uterine medicine : the dofe may be from 9 i. to 3 i.

- CRETICUS, called also eriganum Creticum, dic-tanums verus, dittany of Candy, or of Crete. It is the origanum diffamnus, Linn. It is a fmall, fhrubby plant, with fquare stalks, and roundish leaves, that are covered with a thick white down; the flowers are in spikes of a purplish colour. It is perennial, a native of stony grounds in Greece, and the ifland of Candy. It bears the ordinary winters of our clime. Those we have from abroad, however superior, whilst fresh, to our own produce, are hardly so good when we receive them.

Whilft the leaves are in perfection, they are warm and aromatic, have an agreeable fmell, and a hot biting tafte, refembling that of the thymus citratus. The garden-pennyroyal is of the fame quality, but not quite fo ftrong, though in general far better than the dittany which we receive from abroad. Both water and fpirit take up the virtues of this plant. If a large quantity is diffilled at once with water, a small portion of effential oil is obtained, which is of a yellowish colour, of an highly pungent, aromatic tafte and fmell; it congeals in the cold into the appearance of camphor; the remaining decoction, when inspissated, is a bitterish, disagreeable mass, but destitute of the slavour and warmth of the herb; the spirituous extract possesses all its virtues. See Neumann's Chem. Works; Lewis's Mat. Med.
DICTYOIDES, from fintum, a net, and usos, like to.

NET-LIKE. A name of the rete mirabile.
DIDYME. The ORCHIS ROOT. See BILDLIUM. DIDYMÆA. The name of a cataplasm mentioned by

DIDYMI. Twins. A name of the testes, testicles; also of the eminences in the brain, called by that name. DIDYNAMIA. The fourteenth of Linnzeus's classes

of plants; in it is one ftyle; but the filaments are of different lengths; two of them of the fame length are longer than the reft.

DIECBOLION, i. e. ECBOLION. A medicine causing

DIELECTRON. The name of a troche, in which is

DIEMEAC. Terms in Paracelfus. They fignify a DIENER. kind of fpirit, which he fays refides in

DIERVILLA. The name of a plant, fo called by Tournefort, from Mr. Dierville, a furgeon, who brought it from Arcadia. It is not remarkable for any medical property. See Miller's Dict. vol. ii.

DIETA. See DIETA.

DIEXODOS, from Jia and igodes, a way by which any thing paffes, also DIODAS. In Hippocrates, it is the de-

DIFFLATIO. TRANSPIRATION. See PERSPIRA-

DIGASTRICUS: See BIVENTER, from \$15, twice,

or double, and yasne, a belly.

DIGESTIO. DIGESTION. In furgery it is the difpoling an ulcer, or wound, to suppuration by the appli-

cation of proper remedies.

In pharmacy, it is the fubjecting of bodies, included in proper vessels, to the action of a gentle heat. The term digistion is often used for maceration, and in this case, the process is without heat; where this circumstance is not expressed, digestion always implies the use of heat. In some cases, digestion is used to produce a change in one single body, as in hydrargyrus nitratus ruber, in others, to promote solutions, or other combinations. Circulation is a mode of digefling: the veffels generally used are matraffes, or Florence wine flasks, either of which may be converted into circulatory veffels; also by inverting the neck of one into the neck of the other. The operation is generally performed in a fand-bath, by which the degrees of heat may be regulated according to the intention of the operator; this heat never arises so as to make the matter boil. Digeftion is used for making tinctures, wines, elixirs, &cc.

In the animal economy, it is the conversion of aliment into chyle, and then into blood. By digestion, the specific differences of all substances are abolished; the blood formed from different kinds of aliment, whether used fingly, or together, does not fensibly differ in its properties, provided that the organ of digeftion be f fliciently powerful to convert them into blood. Digeftion in the ftomach alone is capable of converting our food into chyle, and the power of animal digestion can alone affimilate it

into our own nature.

When the aliment is converted into chyle by being digested in the stomach, it is carried into the duodenum, where, mixing with the bile, the nutritious parts are fe-parated, and the reft is conveyed through the inteftines, to be cast out as excrement. The thinner part of the chyle being separated from the gross, is conveyed by the lacteal vessels into the receptacle of the chyle, and thence into the left subclavian vein, where it begins its circulation with the blood.

Boerhaave observes, that many causes concur in the proportion of digeftion; as the aids of cookery; the action of mastication; the mixture of saliva with what we eat, and of other juices in the œfophagus and ftomach; the motion of the diaphragm and abdominal mufcles; and, laftly, in the duodenum, the mixture of bile, and the pancreatic

Haller denies that any kind of fermentation takes place in the ftomach in order to digestion; and feems to attri-bute the greatest effects, in order to the diffolution of our aliment, to the separation of the air therein contained, and the action of the bile.

From the experiments of Reaumur, and Pere Bertier, it appears that the stomachs of granivorous animals digeft their contents partly by trituration, and carnivorous ones principally by folution in a proper fluid. These are further confirmed by Mr. John Hunter, in his late publication on Digostion of the Stomach after Death, which see. See also Haller's Physiology, and Shebbeare's Theory and Practice of Physic.

and Practice of Physic.

DIGESTIVUM, SAL SYLVII, i. c. SAL MARIN.
REGENERAT. Sec MARINUM SAL.

DIGITALIS. PURPLE FOX-GLOVE. Digitalis purpurea, or digitalis calycinis foliolis ovatis acutis, corollis obtufis: labio fuperiore integro, Linn. Boerhaave mentions eleven fpecies. It is a hairy plant with ferrated leaves; a thick angular stalk, on which are numerous purple, tubulous flowers (which are compared with the finger of a glove) hanging downwards, in a row along one fide, each on a fhort pedicle; the flower is followed by an oblong pointed capfule, full of finall angular feeds. It is biennial; grows wild in woods and on heaths, and flowers in June, July, and August. It grows only in gravelly foils.

The leaves are bitterish and nauscous to the taste; they give out their virtue both to water and to spirit. Dr. Hulfe recommends an ointment made of it by boiling

Dr. Withering confiders this as one of the most certain dicureties in the whole materia medica. The leaves are the part in use; of which from one to three grains in powder may be given to an adult twice a day, alone, femetimes united with aromatics; and fometimes formed into pills with foap and gum ammoniac, and indeed the dose may be gradually increased, but four grains is generally a sufficient dose in dropsical cases. Or a dram of rally a futherent dofe in dropfical cafes. the dried leaves may be infused in half a pint of boiling water, for four hours, adding to the strained liquor, an cance of any fpirituous water: two table fpoonfuls, or an ounce given twice a day is a medium dose for an adult; if the patient be ftronger than ufual, or the fymptoms very urgent, this dole may be given once in eight hours; and on the contrary, in many inflances half an ounce will be futhcient. When this medicine is disposed to purge, opium may be advantageously joined with it, for if purges it fails of fuccess, according to the doctor's account: but when the bowels are too tardy, jalap may be given with it at the fame time. Neither of these additions interfere with its diurctic effect. See his Pamphlet of the Digitalis Purpurea published at Birmingham, 1785.—It is also a name of the SESAMUM, ORIENTALIS. which fee.

DIGITALIS MINIMA, i. c. HEDGE-HYSSOP. See GRA-

DIGITELLUS. A name of feveral fungufes, many of which are specified in Dr. Martin's translation of Tournesort: they are of no note in medicine.

DIGITIUM. A fort of contracture, by which the joint of a singer is sixed. Also a whitlow; and a pain with wasting of a joint of the singer.

DIGITORUM TENSOR. See EXTENSOR DIGI-

TORIS COMMUNIS.

DIGITUS. A FINGER. The thumb and the four fingers are each composed of three bones; those of the fin gers are formed alike, but those of the thumb are much thicker and stronger, in proportion to their length, than those of the fingers, which is a necessary contrivance, as they counteract all the four fingers. The first joint of the fingers is arthrodia, the two last are ginglymus. The different parts of the fingers are called phalanges; the first phalanx is the largest, and the last the least. See Pha-LANK

DIGLOSSON, from de, double, and paurou, a tongue. A name of the laurus Alexandrina, because that above its leaf there grows another lesser leaf, resembling a tongue, which for

DIGNOTIO. See DIAGNOSIS.

DIGYNIA. One of Linnæus's fubdivisions of the classes of plants, when there are two styles in the slower. DIHÆMATON, from aua, blood. The name of an antidote, in which is the blood of many different animals

DIHALON, from ax, falt, A plaster prepared of falt and nitre, and adopted to foul ulcers.

DIPETES. In Hippocrates it is applied to semen, and signifies a sudden or immediate defluxion.

DIKALEGI. TIN.

DILATATIO. A DILATATION. Sometimes it is used for signified.

for diastole.

DILATATORES ALARUM NASI. DILATORS of the Nostrils. They are small, thin muscles, having adouble order of fibres decustating each other. They rise from the interior and inferior parts of the offa narium, and are foon inferted to the fuperior parts of the alæ. They pull up the alæ, and dilate the nostrils.

DILATATORIUM. A furgical instrument for dilat-

DILL. CAT. GISS. An abbreviation of Joannes Jacobus Dillenius Catalog. Plant. Spont. Circ. Giffam Nafcent.

DILL. H. MUSC. An abbreviation of Joannis Jacobi

Dillenii Historia Muscorum.

DILUENTIA. DILUENTS. They are whatfoever, on being mixed with a fluid, renders its parts more fluid. They produce their effect by dividing each part into fmaller parts, and then are called attenuants, or fimply by mixing therewith, in which case, the diluent must be a fluid, more fluid than that with which it is mixed, and

the fame time directs gentle purging two or three times perties are in water only; and the diluting property of water is increased only by fire.

DILUTUM. DILUTED. Sometimes this word fignifies an infusion.

DILYTÆA. In Myrepfus, it is the fat of fome animal, but of what is unknown.

DINICA, from Jurgu, to turn round. Medicines against

DINOS. A VERTIGO.

DIOBOGON. The weight of 3 i. also called gram-

DIOCRES. The name of a pastil in Myrepsus.
DIODOS. See DIEXODOS.
DIŒCIA, PLANTA, a plant in which the male slower is upon one plant, and the female slower upon another. other; hence its derivation, des, bis, and outer domus. It is the twenty-fecond of Linnaus's classes.

DICENANTHES. An epithem in Trallian against

the cholera morbus.

DIOGMUS. A vehement palpitation of the heart.

DIONIS COLLYRIUM. A collyrium in Oribafius, fo called from Dion its author.

DIONYSIA. The name of a plafter for abfeeffes, invented by Hera the Cappadocian. It is also called Dio-

nystanum empl.

DIONYSIAS. See Andros mum.

DIONYSISCI. Horned. Certain bony eminences near the temples, or rather the people with those prominences, from Dyon, a name of Bacchus, who is described often with horns.

DIONYSIUS. A name of DITTANDER. DIONYSOS. The name of a collyrium in Actius. P. Æginetta hath one like it which he names collyrium.
malabathrinum, and ifothcon.
DIOPORON, from οπωρα, autumnal fruit. The name

of a medicine in Ccel. Aurelianus; it was used against

DYOPSYRUS. See MESPILUS, folio rotundiore

fruction nigro fubdulci.

DIOPTRA, from διοπτομαί, to fee through. An inftrument for dilating any natural cavity, the better to fee its three fuch as the feether way. its state, such as the speculum uteri, &c.

DIOPTRON. A name of the specularis lapit.
DIOPTRISMOS. The operation which confists in dilating the natural passages with a dioptra.
DIOROBON. A medicine in which are vetches

DIORRHOSIS, or DIOROSIS, from opec, office, ferum. A convertion of the humours into ferum and water.

DIORTHOSIS, from open, right, or from Supplem, to direct. A refliction of a fractured limb into its natural

DIOSANTHOS. The caryophillus tenuifolius plumarius flore pleno purpurascente, a species of single WILD PINK. The flowers are cephalic. DIOSCOR. An abbreviation of Pedacii Discoridis

Opera Grace & Latine Interpretatione Jani Antonii Saraceni Lugdunzei Medici.

DIOSCOREA. A plant fo called, in honour of Diof-corides. See Miller's Dict.

DIOSCURI. A name of the paretides; from Diof-curi, a name of Caftor and Pollux. DIOTA. The name of a wooden cup, which was

lined with aromatics, to give a flavour to the beer that was drank out of it.

DIOXELÆUM. A malagma, in which was oil and

vinegar.

DIOXUS. The name of a collyrium in Marcellus Empiricus, in which is vinegar.

DIPCADI. A name of the mufcari obfoletiore flore

ex purpura virente, and bulbus vomitorius.

DIOSPYROS. See GAUJACANA. Alfo a name of the WHITE WHORTLES.

DISTA. See DYOTA.

DIPHRYGES, or DISPHRYGES. SCURF.

There are three kinds; 1st, Metallic, produced only in Cyprus, it is found in the mud of a pool, whence it is taken and dried in the sun, then burnt, whence the name, from Pic, twice, and open, to terrify, it being as it were twice roasted. 2d, The dross in working copper. 3d, Pyrites calcined to redness.

DIPLOE, from Jenne, double, called also meditullium,

the skull. Some fay, the two tables of the skull them-

felves

DIPLOMA. The written inftrument which gives authority for men to practife as physicians, from Γεπλου, to fold. A double vessel. To boil in diplomate is to fet one veffel, containing the ingredients intended to be

acted upon, in another larger veifel full of water, and to this latter veifel the fire is applied.

DIPLOPIA. αλαπος, duplus, and εξοις, vifus. A depravity of fight, by which the fame objects appear double, multiplied, or often repeated. That fymptom is already of thest duration, and we bear it fresh, as almost always of short duration, and we bear it freely, as in experiments, whether in that case looking with one, or both eyes. So long as the object is not within the dior both eyes. So long as the object is not within the di-flance of diffinct vision, two images opposite to one fora-men, or aperture, and having fallen upon the eye, are not united in the retina, but in diffinct places; and therefore they have not the optic point as a centre, whence the image appears double. The optic portion is a circular point in the bottom of the eye, whose centre the optic axis occupies; but as often as we look at any object with both eyes, so often, unless there should be some defect in the organs, we so turn the eyes that each axis of the eye concurs in the same point of the object; and we have been taught by long habit, our sense of and we have been taught by long habit, our fenfe of touching chiefly directing us, that a double image an-fwers to one object, when so often as an image falls upon the optic point, so often we judge that object single, but if a double image should fall upon the same eye, and not concur in the optic point, then the same eye, and not concur in the optic point, then the same object appears to us to be seen in two different places, and therefore to us it appears double. Dr. Cullen makes it a variety of the second species of PSEUDO-BLEFSIS, which he calls MUTANS, in which objects appear, by fome means or other, changed from what they really are: and the diplopia is that which varies according to the variety of the remote cause, of which he enumerates, from Sauvages, ten species. See Nosologia Methodica Sauvagesii, & Culleni. Wallis's Nofologia Meth. Oculorum, with

DIPNOOS, from \$15, double, and \$20520, to breathe.

An epithet of wounds which penetrate into fome cavity, or quite through a part, or that hath two orifices.

DIPSACON, i. c. RHODIUM. See ASPALATHUS.

DIPSACOS, I from \$1/40, a thirft. A name for the DIPSACUS, I diabetes. But in botany it is the TEA-

DIPSAS. DRY EARTH. Also the name of a serpent, whose bite causes thirst, The serpent is also called

DIPSETICUS. An epithet for fuch things as cause

DIPYRENON, from \$15, double, and women, a berry or kernel, or the end of a probe refembling a berry. Also the name of a probe, with two buttons at one end. It is mentioned by Coelius Aurelianus.

DIPYRITES, or DIPYROS, from \$15, revice, and was, fire. BREAD TWICE BAKED. Hippocrates recommends

it in dropfies.

DIPCÆA. The INCHANTER'S NIGHT SHADE. See

DIRADIATIO. See ACTINOBOLISMUS.

DIRECTOR, from dirigo, to direct. An hollow in-firument for guiding an incision-knife. DIRECTORES PENIS. See ERECTORES PENIS. DIRINCA. A name in the isle of Java, for the SWEET-

SCENTED FLAG. See CALAMUS AROMATICUS.
DISCESSUS. A chemical term, which the French call depart, or linguart; it fignifies, in general, any feparation of two bodies before united: but it is particularly applied to the separation of gold from silver by the acidum nitrosum, where the silver is dissolved, but the gold left

DIOSCOIDES, from Firms, difeus, the quoit used in the Roman games, and 11855, a form. An epithet for the crystalline humour of the eye, from its form resembling

DISCRETA PURGATIVA. In Fallopius it is that

It is the fost part between the two tables of the bones of The bandage is held with the left thumb upon a com prefs, fo that about a foot hangs below the forehead; then the roller is carried round the temples and occiput in the circular direction; after this, the part which hangs down is to be carried over the head to the occiput, and there having rolled it feveral times about the head, it is to be fecured. It is a term also applied to the diaphragma.
DISCIFORME. The KNEE-PAN. See PATELLA.

DISCUS. A DISK. It is a body employed in the gymnaftic art, but not eafy to fay what. In botany it is an aggregate of florets, forming as it were a plain furface.

DISCUSSIO. See DIAPHORESIS.

DISCUSSORIA. DISCUTIENTS. They are fuch DISCUTIENTIA. medicines as by their fubtilty diffolve a flagnating fluid, and diffipate the fame without an external folution of continuity. Such discutients as also mollify are to be preferred, of which kind are opium and camphor. Suppurants discuss, and discutients suppurate. Oils, and what ftops the pores, may be applied when fuppuration is aimed at, but they are improper when the defign is to difeufi

DISLOCATIO, from diffece, or from dis, afunder, and locus, a place, to put out of its place. See LUXATIO. DISPENSATORIUM. DISPENSATORY. The place,

or fhop, where medicines are prepared; but more frequently a book, treating of the composition of remedies; called also antidetarium.

DISRUPTIO. A fpecies of violent puncture which

penetrates the fkin to the flesh.

DISSECTIO, from \$\(\textit{s}\), afunder, and feco, to eut. Diffection. The cutting up a body, with a view of examining the ftructure of the parts.

DISSEPIMENTUM. It is the thin feptum which divides the feveral cells in the fruit of plants.

DISSEPTUM. The DIAPHRAGM. See DIAPHRAG-

DISSOLVENTIA. Medicines which diffolye concre-tions in the body are thus called. In chemistry, diffolvents are menstrua.

DISSOLUTIO. Dissolution. A fincepe is thus named, so is death. Solution of continuity, or discontiand thus it is fynonymous with dialyfes.

DYSOPIA, is fuch a depravity of fight, that objects cannot be feen diffinctly but in a certain light, or at a certain diftance, or in particular positions, of which Dr. Cullen enumerates five species, 1st, Tenebrarum, in which objects can only be feen in a ftrong light. 2d, Luminis, in which objects cannot be feen but in an obscure light. 3d, which objects cannot be seen but in an obscure light. 30, Dissistorum, in which objects at a great distance cannot be perceived. 4th, Proximorum, in which objects very near cannot be seen. 5th, Lateralis, in which objects cannot be seen unless situated in an oblique position. See Culleni Nosologia Methodic. edit. 4.

DISSOLUTUS MORBUS. See Dysenteria.

DISTENTIO. DISTENTION. It signifies simply dilateration, pandiculation, or a convension, as nervous differentials.

tation, pandiculation, or a convultion, as nervous diften-

tion almost always implies.

DISTICHIA, or DISTICHIASIS, from Fig, double, and DISTICHUM. That species of barley which hath

only two rows of grains.

DISTILLATIO. DISTILLATION, also DESTILLATIO.

Sometimes it fignifies the fame as defluxion, or catarrh.

In pharmacy it is the separation of the more volatile from the more folid parts of any substance by means of heat. Or it is the condensing and collecting the lighter parts of bodies, previously rarified by heat. Re-distilling a sluid several times from fresh parcels of the same kind is called cohobation, but no advantage is derived from this practice. When diffillation is repeated, in order to purify or separate the matter distilled from some parts not required, it is called rectification. Diffillation with an alembic or a common ftill is called per afcenfum, because the vapours rise and are condensed in the upper part of the vessel: thus all distillations may be performed that require no greater heat than boiling water. When a heat greater than boiling water is required, retorts may be used; from their shape the volatile parts of what is distilled in them can only escape through the side, whence this is called per latus. When the heat is to be applied above the bodies to be distilled, so that the lighter parts fort of purging which evacuates a particular humour.

DISCRIMEN. It is a small roller, about twelve feet long, and two fingers breadth broad, rolled up with one head and used after bleeding in the forehead, as follows:

this is called per latus. When the heat is to be applied above the bodies to be distilled, so that the lighter parts are forced downwards into a vessel placed for their reception, it is called per descensum: this method is now never the same of the bodies to be distilled, so that the lighter parts are forced downwards into a vessel placed for their reception, it is called per latus.

used. When the volatile parts that are rarified by diffil-lation are in a dry form when collected, this operation is called sublimation. When no more heat is applied than by which he is frequently thrown down suddenly, and that is necessary just to raise a vapour, which when condensed only falls in drops, it is called a cold distillation: roses and other things valued only for their flavour, and which do not admit of drying, are commodiously distilled this way; and the dry cake left after diffilling roses is better for making a decoction or syrup than after any other management; in this kind of diffillation, the subject should neither be bruifed nor have water or any other thing added to it:
they should be gathered with the morning-dew upon
them: a retort and receiver placed in a fand-bath is the
best apparatus in this case. The worm still is most frequently used now for diffilling; it is called also the hot ftill, because it is worked with a fire which makes the materials boil; it communicates with a leaden spiral tube (called the worm), which is placed in a tub filled with water (called the refrigeratory); in this worm the vapours are condensed, and run out in the form of a small stream into whatever veffel is placed to receive it.

The end of diffilling is the feparation of fome bodies from those with which they were mixed; as in obtaining vinous spirits, effential oils, volatile spirits, &c. or for the more speedy or effectual combination of such bodies as require a boiling heat, as in the case of the spt. ætheris ni-

As a principal article in diffillation is to apply no more heat to the fubject than is just necessary to accomplish our intention, retorts are fometimes used, and are placed on an open fire, on fand baths, or in water-baths, in order the more certainly to adjust the heat to the degree of volatility which the subject to be distilled possesses. In distillong waters, whether for using, or obtaining effential oils, the mentiruum should be attended to as well as the heat to be applied; for as fome effential oils require the full heat of boiling water, they cannot be raifed by the use of spirit of wine: this happens in distilling of cinnamon, and fome other ponderous oils.

Retorts are proper when the subject to be diffilled would

corrode the metal of a still, as in the obtaining of any mi-neral acid, or preparing other corrolive matters. Earthen veffels are fometimes used, and on some few occasions iron ones. But as to these, and many other observations on this subject, they are fully noticed under the articles where an attention to them may be required.

DISTORSIO, or DISTORTIO. It is applied to the eyes, when a person seems to turn them from the object

eyes, when a person seems to turn them from the object he would look at, which is called squinting. See STRABILLISMUS. It also signifies the bending of the bone preternaturally to one side. See Bell's Surgery, vol. vi. p. 281.

DISTORTIO SPINÆ. vel VETEBRARUM. This discase in the spine is manifest by its becoming more or
less curved, and by a loss of the use, generally, of the
lower limbs. It is sometimes called the curved spine.

Mr. Pott is the first who hath favoured the world with

many just idea either of its nature or cure. In one of his any just idea either of its nature or cure. In one of his publications he calls it a kind of palfy in the lower limbs; in another he speaks of it as a useless state of them. From his account of this diforder, it hath a fcrophulous origin; but as its most striking symptoms are from the caries, which takes place in the bodies of some of the vertebra, may it not be properly termed the firumous spinal caries ? Mr. Bell, in his Surgery, vol. vi. p. 294. calls it distortion of the Spine.

In this discase, there is a total or partial abolition of the power of using, and sometimes of even moving the limbs, generally only the lower, but sometimes the upper, or both, in consequence of a disease in the spine, which is first manifested by a curvature taking place in some part of it. To this diftemper, both fexes, and all ages, are equally liable, though the majority of these patients are infants or young children.

When the attack is made on an infant of only one or two years old, the true cause is rarely discovered until two years old, the true cause is rarely discovered until fome time after the effect has taken place; the nurse or parents suppose that the child is weakly, or hath been hurt at its birth. When on the attack the patient hath been used to walk, the loss of the use of his legs is gradual, though not in general very flow. At first he shews signs of being soon tired, he is languid, listless, and unwilling to move much, or at all briskly; soon after this he is observed frequently to trip and stumble, although there is

quickly, he finds that his legs involuntarily crofs each other, by which he is frequently thrown down fuddenly, and that without Humbling; upon endeavouring to fland fill and erect, even for a few minutes, his knees give way, and bear forward. When the diftemper is a little farther advanced, it will be found that he cannot, without much difficulty, direct either of his feet precifely to any exact point; on attempting to do fo, they fuddenly interfect, and very foon after, both thighs and legs lofe much of their natural fentibility, and become perfectly ufelefs. When an adult is thus affected, the progress of the diffemper is much the fame, but rather quicker. Arrived at this flate, whatever be the age or fex of the patient, complaint is made of twitching and frequent pains in the thighs, par-ticularly when in bed, and of uneafy fenfation at the pit of the ftomach; when he fits on a chair or a ftool his legs are almost always found across each other, and drawn up under the feat; in a little time after these particulars have been observed, the power of walking is totally loft.

The true curvature is invariably uniform in being from within outwards. This curve of the fpine varies in fituation, extent and degree, being either in the neck, back, or, more rarely, in the upper part of the loins; fometimes comprehending one vertebra only, fometimes two, three; or more; by which the curve becomes necessarily more or less extensive; but whatever variety these circumstances may admit, the lower limbs most frequently feel the effect; fometimes the arms only are paralytic, as it is called, and a few inftances have occurred in which both legs and arms were alike affected. The effect is also different in different subjects; some are rendered totally and absolutely incapable of walking in any manner, or with any help, and that very early in the course of the disease, that is, foon after the appearance of the curvature; others can move with the help of crutches, or by grafping their thighs just above the knees with their hands; fome can fit in an creek posture or in a chair, without much trouble or fatigue, whilit others are incapable of doing so, at least for any length of time; fome have such a degree of mo-tion in their legs or thighs, as to enable them to turn and move for their own convenience in bed; others have not that benefit, and are obliged to lie until they are moved by another.

When a naturally weak infant is the fubject, the curvature is in the vertebræ of the back; it is not unfrequently productive of additional deformity, by gradually render-ing the whole back what is vulgarly called humped; and by alterations which all the bones of the thorax fometimes undergo in respect to situation, in consequence of the slex-ure and weakness of the spine, by which, such persons are justly said to be shortened in their stature; but in all cases, where this effect has been gradually produced, to whatever degree the deformity may extend, or however the alteration made in the disposition of the ribs and sternum, may contribute to fuch deformity, yet I think that

it will always be found, that the curvature of the fpine appeared first, and, if I may so say, singly, and that all the rest are consequential.

The general health of the patient does not seem, at first, to be materially, if at all, affected; but when the disease has been some time, and the curvature thereby increased, many inconveniencies and complaints come on, fuch as, many inconveniencies and complaints come on, fuch as, when the incurvation is in the neck, and to a confiderable degree, by affecting feveral vertebre, the child finds it inconvenient and painful to fupport its head, and is always defirous of laying it on a table or pillow, or any thing to take off the weight. When in the dorfal vertebre, there is a difficulty of breathing, lofs of appetite, indigeftion, dry cough, quick pulfe, a difposition early to an hectic pain, and what they all call tightness at the sto-mach, obstinate constipations, or purgings, involuntary flux of urine and fæces, &c. with the addition of what are called nervous complaints, some of which are caused by the alterations made in the form of the cavity of the thorax, others feem to arise from impressions made on the abdominal viscera.

An adult in a case where no violence hath been committed, or received, usually complains, that his first inti-mation was a sense of weakness in his backbone, accom-panied with what he calls a heavy dull kind of pain, at-tended with such a lassitude as render a small degree of exercise fatiguing; that this is soon followed by an unwere frequently convulfed by involuntary twitchings, par-ticularly troublesome in the night; that soon after this, he not only became incapable of walking, but that his power either of retaining or discharging his urine or faces was confiderably impaired, and his penis became incap-able of erection. The adult as well as the child complains constantly of a tightness and pain at his stomach, and he finds all the offices of his digeftive and respiratory organs

much impeded.

The lofs of motion in the limbs, which generally accompany, a difforted fpine, is supposed to proceed from the said diffortion. Until the curvature is discovered, it generally passes for a nervous complaint; but when the state of the vertebra hath been adverted to, recourse is also also been adverted to account for most always had to some previous violence to account for it; fome blow, fall, or other accident, which are supposed to have hurt the back, or deranged the spine. In some few instances, these exertions may have been such, as might be allowed to have been equal to the effect; but in the majority, these are so far from being the case, that if they are admitted to have any share at all in it, some predisposing cause, at least, must be looked for, in which consists the very effence of the disease. From many considerations respecting this subject, it appears, that when we attribute the whole of this mischief to the mere accidental curvature of the spine, in consequence of violence, we will also an effect for a cause, and that previous both we miltake an effect for a caufe; and that previous both to the paralytic flate of the legs, and to the alteration of the figure of the back-bone, there is a predifpoling caufe of both, confifting in a diftempered flate of the ligaments and bones, where the curve foon after makes its appear-The primary and fole cause of the mischief, differenced flate of the parts composing, or in immediate connection with the fpine, tending to, and most frequently ending in a caries of the body or bodies, of one or more of the vertebræ; from this proceed all the ills, whether general or local, apparent or concealed; this causes the ill health of the patient, and in time the curvature. The helpless state of the limbs is only one consequence of feveral proceeding from the fame cause.

It has been supposed that there is a dislocation of the vertebræ, but there is no displacement of them with re-gard to each other; the spine bends forward only, because the rotten bone or bones, intervening between the found ones, give way, being unable in fuch a state to bear the parts above. From every circumstance in the living, and appearance in the dead, it is evident that the complaint arifes from what is commonly called a ferofulous indispo-fition affecting the parts that compose the pine, or those in its immediate vicinity: this morbid affection shews it-felf in a variety of forms but they are always such as fooner or later determine the true nature of the distemper. Sometimes each of the diftempered flates of these parts, is accompanied by a greater or lesser degree of deformity and crookedness of the spine, without any apparent disease of the bones composing it; sometimes the deformity is attended with erofion or caries of the body or bodies of some of the vertebræ; and sometimes the same bones are found to be carious, without any crookedness or alteration of figure. It may not be amifs to remark, that ftrumous tubercles in the lungs, and a diffempered flate of fome of the abdominal vifcera, often make a part of the

attendants.

It is further to be observed, that when these complaints are not attended with an alteration of the figure of the back-bone, neither the real feat, nor true nature of the diffemper are pointed out by the general fymptoms, and confequently that they frequently are unknown, at least while the patient lives. When the ligaments and cartilages of the fpine become the feat of the diforder, without any affection of the vertebræ, it fometimes happens that the whole spine, from the lowest vertebra of the neck downwards, gives way laterally, forming one great curve to one fide; and fometimes a more irregular figure, and attended with many marks of ill health. The attack is fometimes on the bodies of fome of the vertebræ, and when this is the case, ulceration and erosion of the bones is the consequence; this erosion or caries of the bones. often produces the curvature peculiar to this difeafe, by

usual sense of coldness in his thighs, not accountable for | wasting the body of each vertebra that is affected, and from the weather, or any cause that can produce a diminution of their sensibility. That in a little time more, his limbs were affected with an unusual sensibility, also were frequently convulsed by involuntary twitchings, particle down as above noticed. When the attack is made upon the dorsal vertebræ, the sternum and ribs, for want of proper fupport, necessarily give way, and other deformity, additional to the curve, is produced. As to the cases of carious fpine without curvature, it sometimes happens that internal abscesses and collections of matter are formed near the fpine; this matter affecting the fpine, and also making its way outward, produces what are called ploa abscettes, &c. and deftroy the patient; the real and immediate cause of death in these instances are rarely known until the body is examined. The useless state of the limbs is by no means a confequence of the altered figure of the spine, or of the disposition of the bones with re-gard to each other, but merely of the caries: of this truth there needs no other proof than what may be drawn from the cure of a large and extensive curvature, in which three or more vertebræ were concerned; in this, the de-formity always remains unaltered and unalterable, not-

withstanding the patient recovers both health and limbs.

From diffections it has appeared that in this disease either there is a defect of offisie matter or a caries of some

of the vertebræ.

Mr. Pott observes that, in compliance with custom, he hath called this disease a palfy; but that notwithstanding the limbs be rendered almost totally useless, yet there are some effential circumstances in which this affection differs from a common nervous palfy: the legs and thighs are rendered unfit for all the purpoles of loco-motion, and have loft much of their natural fentibility; but notwithstanding this, they have neither the flabby feel which a truly para-lytic limb has, nor have they that feeming loofeness at the joints, nor that total incapacity of reliftance which allows the latter to be twifted in almost all directions; on the the latter to be twifted in almost all directions; on the contrary, in this disease, the joints have frequently a confiderable degree of stiffness, particularly the ancles, by which stiffness the feet of children are generally pointed downwards; and they are prevented from setting them state on the ground. In the true paralysis, from whatever cause, the muscles of the affected limb are soft, slabby, and unresisting, and incapable of being put into even a tonic state; the limb itself may be placed in almost any position or posture; and if it be listed up, and then let go, it falls down, and it is not in the power of the patient to prevent, or even to retard its sall: the joints are perfectly and easily moveable in any direction; if the affection be of the lower limbs, neither hips, not knees, nor ankles, have any degree of rigidity or stiffness, but permit the limb to be turned or twisted in almost any manner. But in cases of useless limbs from the same cause as that of in cases of useless limbs from the same cause as that of the curved fpine, the mufcles are extenuated and leffened in fize; they are rigid, and always in a tonic flate, by which the knees and ancles acquire a fiffinefs not very eafy to overcome; by means of this fliffinefs, mixed with a kind of fpafin, the legs of the patient are either confiantly kept ftretched out first, in which cafe, confiderable force is required to bend the base or they are be the able force is required to bend the knees, or they are by the action of the stronger muscles drawn across each other, in fuch a manner as to require as much to separate them. When the leg is in a straight position, the extensor muscles When the leg is in a straight position, the extensor muscles act so powerfully as to require a considerable degree of force to bend the joints of the knees; and when they have been bent, the legs are immediately and strongly drawn up, with the heels towards the buttocks: by the rigidity of the ancle joints, added to the spassmooth action of the gastroenemii muscles, the patient's toes are pointed downwards in such a manner as to render it impossible for him to put his feet flat on the ground, which makes one of the decisive characters of this distemper. Thus the marks of distinction between this distemper. Thus the marks of distinction between this distemper of consounding them.

The restoration of the spine to its natural figure, depends much on the early administration of the help proposed; though the distemper may be so far cured, as that the patient may recover the use of his limbs, yet such an alteration may have taken place in the bodies of the ver-tebræ, as to render it impossible for the spine to become straight again; and, if from inattention, from length of time, or from any other circumstances, it happens that the bodies of the vertebrae become completely carious,

der, after the discharge hath continued for some time, the patient begins to seel better health, he gradually recovers his appetite, gets refreshing sleep, hath a more quiet and less hectical pulse; but the chief relief is from having got rid of that diffressing fensation of tightness about the stomach; in a little time more, a degree of warmth, and a sensibility is selt in the thighs, to which the warmth, and a lenilouity is left in the thighs, to which the patient hath been a stranger for some time; and generally much about the same time the power of retaining and discharging the urine and fæces begins to be in some degree exerted. The first return of the power of motion in the limbs is rather disagreeable, the motion being involuntary and of the spalmodic kind, principally in the night, and generally attended with a sense of amendment, if the muscles concerned. At this point of amendment, if it may be fo called, it is no uncommon thing, especially in bad cases, for the patient to stand some time without making any farther progress; this in adults occasions im-patience, and in parents despair; but in the milder kind patience, and in parents defpair; but in the milder kind of cases, the power of voluntary motion generally soon follows the involuntary. The knees and ancles by degrees lose their stiffness, and the relaxation of the latter enables the patient to set his feet flat upon the ground, a certain mark that the power of walking will soon follow; but those joints having lost their rigidity, become exceeding weak and are not for some time capable of serving the purpose of progression. The first voluntary motions are weak, not constantly performable, nor even every day, and liable to great variation, from a number of accidental circumstances, both external and internal. The first atcircumstances, both external and internal. The first atbear every mark of nervous and muscular debility. The patient requires much help, and his steps, with the best support, will be irregular and uniteady; but when they have arrived at this, no instance hath occurred in which the full power of walking was not foon attained. When the patient can just walk, either with crutches, or between two supporters, he is generally troubled to refist or overcome the more powerful action of the stronger muscles of the thigh over the weaker, by which his legs are frequently brought involuntarily across each other, and he is suddenly thrown down. Adults find assistance in crutches, by laying hold of the chairs, tables, &c. but for children a go-cart is the beft; it should reach up to the arm-pit, and should enclose the whole body; this takes off all inconvenient weight from the legs, at the same time enables the child to move them as much as it pleases. Or the instrument of Mr. Jones should be worn, which in all cases would be serviceable, and in many a perfect cure, as it acts by taking off the superincumbent weight

from the difeased vertebre. See his Essay on Crookedness, with a variety of cures therein inferted.

While the curvature of the spine remains undiscovered
or unattended to, the case is generally supposed to be nervous, and nervous medicines, fo called, are as generally ous, and nervous medicines, fo called, are as generally out, and advantage. When the administered; but without any advantage. When the case is known, recourse is too frequently had to steel stays, swings, screw chairs, &c. to restore the spine to its natural figure; but still the patient growsunhealthy, and, natural figure; but still the patient grows unhealthy, and, languishing under a variety of complaints, dies in an exhausted emaciated state. The remedy for this dreadful disease consists merely in procuring a large discharge of matter by suppuration, from underneath the membrana adiposa on each side of the curvature, and in maintaining such discharge until the patient shall have perfectly recovered the use of his legs. They who have been experimentally acquainted with the very wonderful effects of purulent drains, made from the immediate neighbourhood of diseased parts, will not be much surprized at this particular one; and will immediately see how such kind of discharge, made and continued from the distempered part, checks the further progress of the caries, gives napart, checks the further progress of the caries, gives nature an opportunity of exerting her own powers of throwing off the diseased parts, and of producing by incarnation an union of the bones, now rendered found, and thereby citablishing a cure. It matters not by what means the discharge is procured, provided it be large, and from

With a caustic an eschar is to be made on each side of

and the intervening cartilages are destroyed, no affistance is to be expected from the proposed remedies. According to the observations made on the usual effect of the discharge produced by art for the removal of this disor-Apply each cauftic near the fide of the curvature, so as to leave the portion of the skin covering the spinal processes of the protruded bones, entire and unburt, and so large that the sores upon the separation of the eschars may easily hold each three or four peas in the case of the smallest curvature, but in large surgers at least as many more curvature, but in large curves, at least as many more. A few days after applying the caustics, the slonghs begin to loosen, it is then proper to cut out all the middle, and put into each a large kidney-bean; when the bottoms of the fores are become clean in suppuration, sprinkle now and then a small quantity of finely powdered cantharides on them, by which the fores are prevented from contracting, the discharge is intercased, and possibly other benefit is obtained. The issue should be kept open until the cure is complete; that is, until the patient has not only the perfect use of the limbs, but also the general health. By means of this discharge, the croding caries is first checked, then stopped, in consequence of which an incarnation takes place, and the cartilages between the bodies of the vertebræ having been previously destroyed, the bones become united with each other, and form a kind of anchylosis. No degree of benefit or relief, no curvature, but in large curves, at least as many more. kind of anchylofis. No degree of benefit or relief, nor any the fmallest tendency towards a cure, is to be expected until the caries be flopped, and the rotten bones have begun to incarn; the larger the quantity of bones concerned, and the greater the degree of wafte committed by the caries, the greater must be the length of time required for the correction of it, and for restoring to a sound state so large a quantity of distempered parts; and vice verfa. Nothing can be more uncertain than the time required to accomplish a cure: fometimes it is perfected in two months, and at others it requires two years; and in this laft, two thirds of the time hath paffed without any fenfible amendment.

The discharge by means of the issues is all that is requifite for the cure; but yet, this is no reason why every affifting means should not be applied at the same time in order to expedite, such as the bark, cold bathing, fric-

In the course of lecturing in the year 1781, Mr. Pott observed, that it seems to be one of the few things that one may reason upon a priori, viz. that the whole train of the various symptoms of this disease are derived originally from a conflitutional predifpoing cause; for, whenever in a curvature of the lpine the discharge begins to have any effect, the leffer fymptoms, if they may be fo called, as pain in the ftomach, tightness across the breaft, incapacity of holding the urine or freces, all give way be-fore the removal of the lameness from the curve begins

Lastly. If it is considered, that the primary cause of Laftly. It is considered, that the primary cause of the curved fpine and all its fymptoms, preceding, attending, and confequent, is a morbid flate of the fpine and of the parts connected with it, the following inference will be allowed, viz. by an early and proper attention, the temporary lamenets, permanent deformity, and fatality, may be prevented. It is found that iffues are capable of affecting a perfect curve, even after a caries hath taken place, and that to a confiderable degree, which is also true: is it not reasonable to conclude, that the same true; is it not reafonable to conclude, that the fame means made use of in due time might prove preventive? In many habits iffues would be beneficial, independent of this diforder; infants and young children of strumous habits, are the fubjects who are most liable to this disternper; and they are in general more served by artificial

drains than any other perfons.

It is to be observed, a curvature of the spine may take place from the mollities offium, the rickets and from the various causes of caries. An aneurism often produces a caries in the bones; fo an ancurifm near a vertebra may render it carious; the venereal difeafe fometimes attacks the vertebre, and renders them carious. The ferofula attacking the lymphatics and glands about the fpine, is faid to be the constant cause of the curved fpine above noticed, in which the curvature is angular; the angular protuberance arises immediately from the caries of the vertebra or vertebræ, and is attended with a ufele state of one or more of the extremities: but may not any cause, that produces a caries in the vertebrie, occafion the angular initead of the curved appearance of the fpine? and when the carious vertebra happens, fo as that Sal Diureticus: Diuretic Salt, now called, Kali acciti is nearly destroyed, may not all the same symptoms proceed from such destruction of the vertebra or vertebræ, though the causes of the caries were various?

See Remarks on that Kind of Palfy of the Lower Limbs, See Remarks on that Kind of Palfy of the Lower Limbs, which is frequently found to accompany a Curvature of the Spine, and is fuppofed to be caufed by it, by Percival Pott, F. R. S. &c. 1779. Farther Remarks, on the ufeleis State of the lower Limbs, in confequence of a Curvature of the Spine, &c. by Percival Pott, F. R. S. &c. 1782. Jones's Effay on Crookednefs. Select Cafes of the Diforder commonly called the Paralyfis of the Lower Extremities, by John Jebb, M. D. &c. Edit. 2. Bell's Surgery. London Med. Journal vol. vi. p. 338.

DISTORTOR ORIS MUSCULUS. See Zygomaticus Minor mufc.

cus MINOR musc.

DISTRACTIO. In chemistry it is a forcible division of substances from each other which were before united,

either by feparation or calcination.

DISTRIBUTIO. DISTRIBUTION. It fometimes implies division. In medicine, it relates to the nutritious uices, and is the fame as anadofis; or to the excrements, and is the same as diacheresis, or diacherema.

DISTRICHIASIS, from Su, double, and Spit, a bair, also difficbia, difficbiafis. A diffease of the eye-lid, which consists in its having a double row of hairs, or at the leaft fupernumerary ones. Galen. Actius. See TRI-

DISTRIX. The hair growing smaller and smaller.
DIURESIS, from \$20, by, and \$200, wine. An excreon of urine. It also signifies a DIABETES.
DIURETICÆ. DIURETICS, for \$20, by, and \$200, tion of urinc.

urine. Medicines which provoke a discharge by urine.

Celfus fays every fragrant herb that is cultivated in a garden is diaretic. However numerous diaretic medicines may be, there are none whose efficacy is so uncertain in their operation.

How fome things pass off by urine so immediately after being taken into the ftomach, is still a matter of dif-

Honey and fugar increase the virtue of diureties; they fhould be often used to be effectual, and the body should

be kept cool.

If a medicine is defigned to pass off by urine, walking gently in a cool air will assist it; but sweating or considerable warmth directs it to the skin, or at least restrains its efficacy. Diverties of the saline kind are divertic or perspirative according as the body is kept cool or warm.

In administering this kind of medicine, they are rarely given with respect to their operation as discretics, but with respect to the habit or state of the patient's body, as apppears from the different classes of medicines that come under this denomination; the chief of which remove impediments to, rather than promote the difcharge of

The following different classes of medicines are used

with a view to promote the discharge of urine.

1. Cordial nervous medicines. These accelerate the 1. Cordial nervous medicines. motion of the blood when too languid, and increase its fluidity, and thus increase this discharge.

2. Emollient balfamics. These relax and lubricate, so

- obtain a passage for what is too bulky.

  3. Substances consisting of falts and mucilages. These guard against stricture in the vessels, and at the same time fit the matter to be discharged for a more easy exclufion.
- 4. Detergent balfamics. These rarify and scour away viscous or sabulous matter which obstruct the passages.
- 5. Alkaline and lixivious falts. These keep the sluids at least in a due state of tenuity for being excreted.
  6. Acid and nitrous falts. These determine the serum to the kidneys, if not counteracted by heat.

7. Antifpafmedics. These relieve by taking off a stricture in the kidneys.

See Hossman's Med. Rad. Syst. Alexander's Exper. Essays, p. 149, &c. Cullen's Mat. Medica.

DIUREFICUS SAL. DIUREFIC SALT, also called fal. Sometic territories. fal Sennersi, tartarus regeneratus, and arcanum tartari foli-ata terra, effentiale fal. It is a fixed vegetable alcaline falt faturated with the acetous acid, and evaporated to dry-ness: when the process is carried no farther, it is of a brownish colour, and appears somewhat oily, and it is called tart. regen. When it is purified to perfect whiteness it is called fal diuretjeus.

of diffilled vinegar over a gentle fire: when the fermentation ceases, add more diffilled vinegar, and when the fermentation fublides add more virtegar; and proceed thus until the vinegar being nearly all evaporated, fresh vinegar will not excite any fermentation, which usually happens when about ten quarts have been used; then gently evaporate to dryness. The fait left will be impure, which is to be melted for a time with a gentle heat, then diffolved in water, and filtered through paper. If the melting hath been duly performed, the filtered liquor will be colourles; if otherwise, of a brown colour-Laftly, the water is to be evaporated with a very gentle heat in a shallow glass vessel, the falt as it dries being frequently stirred, that the humidity may the sooner be discharged, which should be kept in a vessel, close stopped, or it will distolve by the mositure of the air. If on diffolving a little of it in water, or the spirit of wine, any faces are observed in either of these liquids, the whole must be dissolved in spirit, filtered, and evaporated again. Ph. Lond. 1788.

In order to success in this process, care must be had duly to faturate the fult with the acid, duly to ealeine it afterwards, and at last to dry it without heating it too much. For the first, make the smithing trial, when the liquid is almost evaporated away, by dipping a coloured paper into it, as directed in the article SPT. MINDER. The degree of calcination may be judged of by dropping a little in water, and observing when it begins to part with its blackness readily; if, after this, the calcination is conti-nued, the sait will be brownish. In the last drying care must be taken not to melt it; for thus its whiteness will be lessened, and dregs will fall on dissolving it in spirit.

The only use of rendering this falt white, by depriving it of its oil, is that it may reft more eafily on weak flo-machs; but if the process above was carried on no farther than to faturate the alcaline falt, then the evaporation of the liquor being performed in a water-bath, the oily part of the falt would not have an empyreumatic flayour, with which to offend, the remaining trouble of the above method would be spared, and a medicine in all cases

as good would be obtained.

Dr. Lewis directs the falt of tartar to be diffolved in cold water and filtered, and then to faturate this folution with diffilled vinegar: after which the evaporation is to be made over a very gentle fire, fo that the liquor may not boil, until a pellicle appears on its furface, after which the rest of the process must be finished in a water-bath; the pellicle as it whitens must be taken off, and the rest kept continually flirring until the whole is taken away in the form of a white fcum, which may be dried in an

In making of this falt care should be taken to use a pure alcaline falt, in which no neutral one is mixed: though, after all possible care in preparing the kali acctatum, a bare mixture of the falt of tartar with vinegar, to a point of faturation, without evaporation, or any other proce-

dure, is very little if at all inferior.

The dofes of this falt will be according to the intention had in prescribing it. From ten to twenty grains it is a mild aperient; from twenty to thirty an alterative and diuretic; from a dram to half an ounce it is purgative. When this falt is given as a purgative, the patient is nei-ther griped nor weakened by it; and as it is diuretic too, it is a peculiarly proper purgative in dropfies. The fixed alcaline falts are more diuretic; but when feverifiness forbids their use, the kali acetatum very well supplies their place. In the jaundice and other complaints in which chalybeate medicines are indicated, but are from accidents forbid, this falt may be given to advantage, and then pre-parations of fteel may be perfifted in. See Lewis's Mat. Med. Neumann's Chem. Works.

DIURNUS. An epithet of difeafes whose exacerba-

tions are in the day time.
DIUTURNUS. When applied to difeases it fignifies chronical.

DIVERSORIUM. The RECEPTACULUM CHYLI, which fee.

DIVERTALLUM. Paracelfus fays it is whatever is generated of elements.

DIVIDENS

DIVINUS. A pompous epithet for many composi-

tions given on account of their fupposed excellencies.

DIVINUS LAPIS. It is the name of a preparation made by fusing alum, falt-petre, and Cyprian vitriol together, and then, while fluid, adding a small portion of

DIVULSIO URINÆ. An irregular separation of urine, in which the sediment is divided, ragged, and un-

DIWIPAHURU. A fort of convolvulus, which is found in the illand of Zeylon.

DOCHME. A measure among the Greeks of four

fingers breadth.

DOCUMASTICA. See CUPELLA.

DOCIMASTICE. The docimatic art is the art of examining foshis, in order to discover what metals, &c.

they contain.

DOCTILETUS. Paracelfus names it as a medicine for the cancer; but he does not explain what it is.

DOD. An abbreviation of Remberti Dodonæi Stir-pium Historiæ Pemptades fex.

DODARTIA. So Tournefort calls a plant in honour of Monf. Dodart. Miller mentions two species; but they are of no use in medicine

DODECADACTYLON. The duedenum, from Jo-Juza, tweever, and Justician, finger's length. DODECANDRIA. The eleventh of Linnaus's classes

of plants; in it are one style, and twelve filaments in each flower fixed at their bases to the inside of the cup.

DODECAPHARMACUM. A composition in which are twelve ingredients; for which reason it is a name of

the apostolorum unguentum.

DODECATHEON. The name of an antidote which confifts of twelve fimples. It is described by P. Ægineta; alfo of the Sanicula, which fee.

DODRA. A kind of potion among the ancients made

of nine ingredients.

DODRANS. A nine ounce measure. See CYATHUS.

It is the name also of a measure of nine inches, and a ht of ten ounces.

DCDYX, i. e. Cochleare. See Cochlearia.

DOGGA. An Arabic term for the PARONYCHIA.

DOGMA, from doses, to be of opinion. In medicine it is a fentiment founded on established principles, however founded, which are the professed rules of the dogmatis, as distinguished from one of the methodic or of the aversion for

the empiric fects.

DOLICHOLITHOS, from Fanx &, a kidney-bean.
Velchius gives this name to certain blackish stones brought from Tyrol, of the shape of a kidney-bean, and which emit an odorous effluvium upon attrition.

DOLICHOS. Long or prolin. It is also a pod or kid-ney-bean, called dolichos urens, pruriens volubilis (see Phaseolus Zurratensis); and a race of twelve, or

DOLOIRES. See Ascia. Deligatio.

DOLOR. PAIN. As the brain is the feat of fenfa-tion, fo it is of pain. Boerhaave and most other authors on this fubject affign a stretching of the nerves as the only immediate of pain; but as the nerves do not appear to conflit of fibres, this cause of pain does not feem to be well founded; nor indeed will it be easy to treat this subject clearly, but in proportion as the means of sensation are understood. See the articles Brain, NERVES, and SYMPATHY.

Many kinds of pain are met with in authors; fuch as a gravitative pain, in which there is a fenfe of weight on the part affected, which is always fome fleshy one, as the liver, &c.; a pulfative pain, this, Galen fays, always fucceeds fome remarkable inflammation in the containing parts, and is observed in abscelles while suppurating: a tensive pain, which is also called a distending pain; it is excited by the distension of some nervous, muscular, or membranous part, from either fome humour, or from flatulence: an acute pain is when great pain is attended with quick and lively fensations: a dull pain is when a kind of numbness is as much complained of as the pain

The mediate and more remote causes of pain are generally obvious; and when so, the cure will consist for the

DIVIDENS FASCIA. The name of a bandage for most part in removing them; for though in many inflances the chief complaint is very distant from the seat
of these causes, yet their removal is the proper method of relief: the respective methods of affecting which are intimated in each diforder included in the rank of painful ones. Perhaps all pains may be included with irrita-tion, in those that have spalm or inflammation for their

When pain is owing to inflammation, the pulse is quicker than in a natural state; generally full, hard, and tense; the pain is equal, throbbing, and unremitting. If a spain is the cause, the pulse is rarely affected; at intervals the pain abates, and then returns with some degree of aggravation; gentle motion fometimes abates, or oven cures, in fome inflances; but in inflammatory cafes, no fuch effects are ever experienced. See Dr. Lobb's

Treatife of Painful Diftempers.

The pains is frequently attendant on child-bed women, called after-pains (from their happening only after delivery) are often occasioned by scooping, to fetching away coagulated blood, which is a needless endeavour. When no improper treatment in delivering the secundines can be suspected, the irritability of the uterus alone is to be considered as the cause. Care should be taken not to confound these after-pains with, or miltake the pains attending puerperal fevers, or the colic. After-pains come by fits, and foon go off, but return at different intervals, which are longer each day, and after two or three days usually cease, though fometimes they continue seven or eight: notwithstanding these pains, the lochia flow properly, and generally more abundantly after the cessation of each fit; this does not happen in colicky complaints, nor is the belly fo free from tumefaction when the puerperal fever is attendant.

As these pains are of the spasmodic kind, anodynes and gentle opiates, with frequent draughts of warm caudle, chamomile tea, &c. are all that are required in order to their relief. See the authors recommended under the ar-

ticle PUERPERILIS FEBRIS.

Among the various causes of pain, a singular one is related in the third vol. of the Lond. Med. Obs. and Inq. p. 241, &c. Some perfors who had taken cold during their being falivated, were afflicted with pains which re-fifted all the usual methods of relief; at length the author of the narrative referred to the fuggested cause, and by exciting a fresh salivation, the pains abated; the spitting was kept up a little while, and permitted to abate with some caution, and thus the cures were completed.

DOLORES.

Painful diseases.

DOLOROSI EXTRINSECI. Painful difeafes of the limbs.

— INTRINSECI. Painful difeafes of the internal

DOMESTICUS, DOMESTIC. In zoology, it fignifies animals that are fed at home, in diffinction from those called wild. In botany, it fignifies cultivated. In pharmacy some medicines are thus named which are managed in a family without the direction of a physician.

DOMINICUM SERPENTA. See BOICININGA.

DONAX. See ARUNDO DONAX.

DORA. A name for a species of milium.

DORCAS. See CAPRA ALPINA, and CAPREOLUS.

DOREA. So Rhases calls a person who can see by day and not by night. DORIA.

DORIA. Alfo called Lobellii, DORIA NARBONENSIUM. Damefonium, virga aurea major, alifma, damafonicum, Jacobæa pratenlis. Do-RIA'S WOUND-WORT.

It grows on the banks of rivers, flowers in July and August, is commended as a vulnerary, but not in much

DORIA, alfo called Jacobæa palustris, virga aurea, folidagini, lingua avis, lingua major, conyza palustris, con-solida Saracenica, with white pointed leaves.

It is found in fenny countries, but of no great use in medicine.

Boerhaave enumerates fifteen species.

DORIDIS HUMOR. So the sea-water is called in

Serenus Samonicus.

DORIS. A name for the echium; also for the anchufa.

DORONICUM. LEOPARD'S-BANE.

DORONICUM AMERICANUM LACINIATO FOLIO. PE-RENNIAL SUN-FLOWERS with large divided leaves.

DORONICUM

DORONICUM GERMANICUM, called also arnica, alifma, doronicum Plantaginis folio, calendula Alpina, lyrus, acyrus, and GERMAN LEOPAR'S-BANE. It is the arnica montana, Linn.

The leaves are like those of plantain; the roots are ob-

The leaves are the thore of plantain; the roots are oblong: it is a native of the mountainous parts of Germany,
and flowers throughout the fummer.

The leaves and flowers have a penetrating bitterish
taste; when bruised their odour excites sneezing. Both
water and spirit extract their virtue by infusion, and in
distillation carry much of it over with them. The roots ditillation carry much of it over with them. The roots are more aromatic than those of the above species, and their active matter is less volatile. The Germans call it lapforum panacea, from its supposed efficacy in resolving coagulated blood. Some extol a decoction of the whole plant in severs with hamorrhages, effervescencies &c. but it is not of much note with us. See Neumann's Chem. Works, Lewis's Mat. Med.

- MAXIM. AMERICAN, &c. TREE-LIKE PFREN-

MAXIM. AMERICAN, &C. TREE-LIKE PFRENNIAL SUN-FLOWER, with a broad plane-tree leaf.

— PANNONICUM. A species of WATER-PLANTAIN.

— ROMANUM, also called desonicum radice scorpii, doron. vulg. GRAPHOY, aconitum pardalianches minus, BROAD-LEAVED LEOPARD'S-BANE, ROMAN LEOPARD'S-BANE, and WOLF'S-BANE. It is the deronicum pardalian-

ches, Linn.

It is a native of the Alps; cultivated in our gardens; hath heart-shaped leaves, and roots that are knotted, and refemble a scorpion's tail. It slowers in June and July. The roots are sweetish to the taste, and slightly aromatic. Some extol it in epilepsies; but it is not noted at present in our practice. Some think it is the duranego of the

Arabian

DORSALES. The nerves which pass out from the vertebræ of the back are thus named: These dorsal nerves, as foon as they pass from the vertebre, send out two branches anteriorly, which contribute to form the inter-costal, and fend several twigs backwards to the muscles. The dorsal nerves go to the internal and external inter-costal muscles, running on the muscles state of the costal muscles. costal muscles, running on the under side of the ribs; those that go to the true ribs reach as far as the sternum; those that go to the frue hos reach as are as the terminal, those that go to the spurious ribs are dispersed on the muscles of the belly. The first dorsal never goes to the axilla, to join the cervical; the last is diffused over the transversalis and obliqui interni; and at the spine of the os ilium it throws a branch out, to be a cutaneous nerve

on the hip.

DORSIFERÆ PLANTÆ. Darsiferous plants, of dorsum, the back, and sero, to bear. Such plants as are of the capillary kind without stalks, and which bear their seeds on the backs of their seaves.

DORSTENIA. So Father Plumier called contrayerva, DORSTINEA. In honour of Dr. Dorsten, a German

physician.
DORSUM. The BACK. Most etymologists say, from

deorfum, because it bends downwards.

What is commonly called a gibbofity is a preternatural incurvation of the spine of the back, either to the posteincurvation of the lipine of the back, either to the potterior or to the lateral parts. It generally happens from external causes, as blows, tight stays, &c. Gouey, in his Surgery, gives an instance from a preternatural contraction of the muscles of the belly. A relaxation of the ligaments of the vertebræ may also be the cause. See Heister's Inst. of Surgery. See Distortio spinæ.

DORYCNIUM. Shrub Trefoil of Montpelier.

Alfo the ROCK-ROSE.

DORYCNIUM IMPERATI. A name for the convolvu-

lus major rectus Creticus argenteus.

DOTHIEN. A BOIL. See FURUNCULUS.

DOUGLASSIA. A plant fo called by Dr. William
Houftoun, in honour of Dr. Douglas. See Miller's Dict.

DOVERI PULVIS. See IFECACUANHA.

DRABA, called alfo lepidium Arabis; ARABIAN MUS-TARD, and TURKEY CRESSES. The feeds ferve as pepper in feafonings, but are not noted as a medicine.

DRABA. A name of a species of lepidium, of leu-coium, and of several forts of hesperis.

DRACHMA. Among the Greeks this was the name of a coin; also of a weight, which they divided into fix oboli. The Romans reckoned eight drams to an ounce, and twelve ounces to a bound. and twelve ounces to a bound.

DRACO. A DRAGON, from France, a ferpent. DRACO, called draco herba, tarachon, tarchon, dracun-

culus bortenfis, abrotanum lilifalio, TARRAGON.

The leaves of this herb refemble those of hyslop; the flowers grow on the top of the plant, and appear like those of southernwood. It is planted in gardens, and flowers in July 2nd August. The leaves have a strong feent, somewhat like senael; they are warm and stomachie, but not much noticed in medicine. See Miller's

DRACO ARBOR IND. SILIQ. See ANGSANA. See alfo

SANG. DRACONIS.

--- CEPHALON. AMERICAN DRAGON'S HEAD. The flowers refembles the mouth of a dragon when it is open.

FIGENS. The name of an anti-epileptic powder extolled by Dolæus.

- SYLVESTRIS. See PTARMICA.

DRACONTHEMA, from Seazon, a dragon, and aque,

blood. See Sanguis DRACONIS.

DRACONIIA. See DRACONTIUM. DRACONTIA MINOR. See ARUM.

DRACONTIDES. A name given, as Rufus Ephefius in-

forms us, to some veins proceeding directly from the heart.

DRACONTIUM, also called dracunculus polypbyllus, dracuntium, Colubrina Dracontia Erva de Sancia Maria, ferpentaria, arum polyphyllum, DRAGONS and MANY-LEAV-ED ARUM. It is the arum dracunculus, Linn.

It is a plant with smooth glossy leaves, fet on long pedicles; the stem is single, thick, whitish, and variegated with purple streaks; on the top is a long sheath, including a dark-coloured pistil, like that of arum, but larger, which is succeeded by a cluster of red berries. The root is large, rather round, externally inclining to yellow, and internally white. It is perennial; a native of the southern parts of Europe.

Its botanic characters are the same as those of arum, and its medical virtues so similar, that each may be subftituted for the other. It is only useful whilst fresh, and the fame pharmaceutic management as directed for arum

is proper for this.

DRACUNCULUS HORTENSIS. See DRACO.
DRACUNCULI, from Prant, a ferpent. Guinea worms, called also eapillares vermicule, TAPE-WORM, and SOLITARY-WORM. The Arabians call it Medinensis

Dr. Freind fays, that Aetids is the first who gives an account of these worms; but Plutarch quotes Agatharchides for an account of them, who writ long before

They are common in both the Indies, in most parts of Africa, in Switzerland, Genoa, and many other hot countries. Some confound them with the bovina affectio, but they are not the fame. See MEDINENSIS VENA.

"This worm resembles a common worm, but is often much because it is commonly found in the largest have force."

much larger: it is commonly found in the legs, but fome-times it is in the mufcular part of the arms. These worms are bred in Ethiopia and India, principally affecting chil-dren; and their generation is not unlike that of the broad worms of the belly. While they move under the fkin they create no trouble; but in length of time the place near the dracunculus fuppurates, and the animal puts forth its head. If it be drawn, it excites confiderable uncafinefs, efpecially if drawn fo forcibly as to break it; for the part left within creates intolerable pain." Actius in Tetrabib. 4. ferm. 2. cap. 85. Paulus Ægineta mentions them as being always feated in the mufcular parts of the thighs, legs, and arms; and he fays, that fometimes they are met with in the fides of children. Avicenna fays, that thefe warms are from ten to fifteen palms. cenna fays, that these worms are from ten to fifteen palms long. Albucasis mentions one of twenty palms. In the fixth vol. of the Edinb. Med. Essays, mention is made of one that was three yards and a half in length.

In fome inflances, befides the pain which these worms occasion, a fever is also a consequence.

Kempfer observes, that these worms prevail most when the weather is hottest; and he attributes their production to stagnant rain-water, which is so much drank in hot

Dr. Towne, in his Treatife on the Difeases of the West Indies, describes this worm as being long, white, round, and resembling round tape or bobbing. This description is just.

Nothing need be done until a tumor appears; and then the best method is to promote suppuration; as soon as the tumor is open, the head of the worm appears, which being tied by a thread, may be secured on a roll of linen fpread with sticking plaster, and as the worms appears, it may be rolled round this linen, until the whole is extracted; after which, the treatment will be only as in common cases. During the time that this worm is coming out, the greatest care is necessary that it may not be broken, for the confequence of fuch an accident are tedious ulcers in the whole length of the part which is poffeffed of the remaining worm. A daily use of aloes, or of any other anthelmintic, is convenient, during the extraction of the swarm, as fuch means are observed to haften its expulsion. See Bovina Affectio.

DRACUNCULOIDES. BASTARD HERB-DRAGON.

DRACUNCULUS, from Joines, a ferpent. A name of the heib tarragon, dracontium, and of the Guinea worm. Also the ulcer made by the Guinea worm.

DRACUNCULUS AQUATICUS. A species of arum hortensis. See DRACO PRATENSIS and PTARMICA.

—— POLYPHYLLUS. See DRACONTIUM.
DRAGACANTHA. See Gun TRAGACANTHÆ.

DRAGMA. An HANDFUL. DRAGMIS. A PUGIL.

DRAKENA RADIX. See RAD. CONTRAVERVA. DRANGÆA. A name of several antidotes. Fuschius fays it answers to what the moderns call traggea.
DRANK. See BROMUS. ÆGYLOPS.
DRAPTA. DILACERATED.

DRASTICOS, from dow, to all, effelt or perform. DRASTIC, affive. It is an epithet bestowed on medicines of prefent efficacy and potent operation, and is commonly applied to emetics and cathartics of a violent quality. DRESDENSIS PULVIS. It is an eleofaccharum, in

which is the cil of cinnamon.

DRIFF. So Helmont calls Butler's stone, or some fuch preparation, which is also called periapson falutis magneticum. It is faid to cure diseases by a touch of it

with the lips and tongue.

DRIMYLEON, from Joseph, eager, foreted, and haver, a tion; also de unymoros. This was a term of reproach bestowed by Menodotus, the empiric, upon the physicians of his time, who professed to govern their practice by reason.

DRIMYPHAGIA, from super, acrid, and caye, to eat. The eating of acrid substances.

DROMA. The name of a plaster described by My-

DROPACES. See CEROPISSUS.
DROPACISMUS. Ingredients for these compositions
DROPAX. are pitch, oil, bitumen, galbanum, and other stimulants. See CEROPISSUS.

DROSATUM, i. e. Rofatum. Wine made of rofes infufed, or any other composition, where rofes make the

Chief ingredient.

DROSERON. The name of an ointment in Myrepfus.

DROSIOBETANON BETONY.

DROSOMELI. MANNA.

DRUMYMOROS, from deposet, eager or shrewd, and

DRUPAS, vel DRYPA. An epithet for olives, which,

when ripe, fall from the trees spontaneously.

DRYINUS, from 3pos, an oak. The name of a kind of ferpent; they live about oak-trees.
DRYOPETES. A fpecies of green frogs.

DRYOPTERIS. See POLYPODIUM TENERUM MINUS.

DRYPA. See DRUPA.

DUBEL COLEPH. A composition of coral and

DUBELECH. The cavity of an apostem, with ma-

DUBLETUS. An ABSCESS. This word is from the

Arabic DUCIA, or DUCCIA. Barbarous terms for a drop.

They imply also that species of bathing which we call pumping, and the French la douche. Baccius, in his Treatise of Baths, lib. ii. gives rules for this kind of bathing. See also Le Dran's Observations, p. 310.

DUCIS HOLSATIÆ Sat, i.e. Nitrum vitriolatum.

See NITRUM.

DUCTUS, from duco, to lead. A BUCT or CANAL. This word is frequently applied to parts of the body through which particular fluids are conveyed.

DUCTUS ARTERIOSUS. It is found only in the fœtus; and very young children: it arifes from the aorta defcendens, immediately below the left fubclavian artery. In adults it is closed up, and appears like a short ligament adhering by one end to the sorts, and by the other to the pulmonary artery, fo that in reality it deferves no other name than that of ligamentum orteriofum.

- AURIS PALATINUS. See TUBA EUSTACHIANA. - AD NASUM. See MAXILLARIA SUPERIORA

OSSA. - Nigri. On feparating the crystalline and vi-treous humours from their adhesions to the ciliary pro-cesses, part of the black pigment, which is on the cho-roides chiesly, is left lying in black radiated lines, which are thus named.

- STENONIS. See SALIVAL. DUCT. STEN.

- THORACICUS. It is a thin transparent canal, which runs up from the receptaculum chyli, along the ipina dorfi, between the vena azygos and aorta, as high as the fifth vertebra of the back or higher; from thence it passes behind the aorta, towards the left fide, and afcends behind the left subclavian vein, where it terminates in some subjects by a kind of vesicula; in others by several branches united together, and opens into the back side of the subclavian vein near the outside of the internal jugular. It is furnished with many femilunar valves turned upwards. Its opening into the subclavian vein in the human body is, in the place of valves, covered by feveral pellicule, fo difposed as to permit the entrance of the chyle into the vein, and hinder the blood from running into the dust. It is sometimes double, one lying on each fide, and fometimes it is accompanied with appendices, called pampiniformes.

- VENOSUS. In a foctus, as the venta cava paffes the liver, it gives off the duttus venofus, which communicates with the finus of the vena porta, in the adults

becomes a flat ligament.

WHARTONI. The inferior falival duct is thus named from his deferibing it.

DUDAIM. See MANDRAGORA.

DUDASALI. A species of SNAKE-WOOD.

DUELLA. A weight of eight scruples.

DUENECH. ANTIMONY.

DUENEZ. FILINGS of STEEL.

DULCACIDUM. Any preparation that is fweet and

DULCAMARA, i. c. Amara dulcis. See Solanum

DULCEDO SATURNI, i. e. Ceruffa. See PLUM-

VENERIS. See CLITORIS.

DULCIS RADIX. LIQUORICE ROOT.

DULECH. A term used by Paracelfus and Helmont

for a fort of fpongy ftone generated in the body.

DULESH. A fpecies of alga.

DUMUS. A BUSH. Buffer fend out branches from near their roots hence are diftinguished from trees, whose ftem rifes confiderably before any branches are fent out. Dumus is a bufb, fuch as the thorn; and rubus is also a

bu/b, but fuch as the briar.
DUOBUS, SAL DE, i. e. Nitrum vitriolatum. See NITRUM.

DUODENALIS ARTERIA, also called intestinalis. As foon as the gastrica dextra hath passed behind the stomach it sends out the duodenal artery (which sometimes comes from the trumk of the hepatica); it runs along the duodenum, on the side next the pancreas, to both which it furnishes branches, and also to the neighbouring part of the ftomach.

DUODENALIS VENA. A branch from the vena portæ ventralis, called inteffinalis; it is diffributed chieffy in the duodenum, but fends fome branches to the pancreas. A branch of the gaftrica is also thus called. The hæmorrhoidalis interna gives a branch of this name to the duo-

DUODENUM, from duodeni, twelve. This intestine is thus named from a supposition that its length does not exceed the breadth of twelve singers, and if measured with the ends of the singers, it is about the matter, also called dodecadastylen ecphysis. It begins at the right orifice 4 M

the right kidney, to which it is attached by the cellular membrane, from thence passes between the kidney and liver, passing across the spine about the last vertebra of the back; it comes out on the left side, behind the root of the mesentery; as soon as it arrives at the mesentery, it forms the jejunum. It is the wideft and shortest of the small intestines; indeed it is a fort of succedancous stomach, and is by some called ventriculus succenturiatus. Its extremity next to the jejunum, is fixed in a course almost perpendicular upwards. It is not entirely covered with the peritoneum, nor is it furbelowed on the mefentery, for thereby it would have dragged the ftomach down, but is attached to the neighbouring parts. Its outer coat is furnished with more cellular membranes than any of the other small intellines; the villi in its inside are thicker than in the flomach, and its texture is like a fungus, and not like hairs, as it is usually represented in figures. As its form is much like that of the stomach, so is its use of the fame nature; it is furnished with liquors peculiar to itself, fince not only a large number of finall glands, difcovered by Brunnerus, which discharge a menstruous lymph, are situated in it, but also because the pancreatic juice mixing with the bile, accomplishes the farther ela-boration and rectification of the chyle; thus the digestion of the aliment, begun in the stomach, is further elaborated in the duedenum. For its arteries and veins, fee DUODE-NALIS ARTERIA & VENA. Its nerves are the middle plexus of the femilunar ganglion, and fome filaments of the plexus fromachus and hepaticus. The duodenum is connected with the cefophagus by the fame coats, and hence they communicate with the coat which furrounds the faue:s and the mouth. Like the ftomach, the duedenum hath a connection with almost all the body by the nerves.

Of such importance is the dusdenum, that Sylvius asferts it to be the feat of almost all the disorders in the phylician's province; Helmont agrees with him; and indeed the more this inteffine is understood, the greater appearance there feems to be of reality in their thoughts. In the circulation no morbid matter can be faid to be produced; in the ftomach and dusdenum a ftagnation, and confequent degeneracy, may be, and often is pro-duced: if the bile stagnates in the duadenum, it soon acquires a morbid quality, and occasions great anxiety, with other afflictive symptoms. Other juices by too long delay there, acquire a morbid acrimony alfo. From this fource, viz. the morbid contents of the duodenum, it is easy to trace many diforders. The truth of this is farther confirmed, by the fuccess of emetics, and of gentle purgatives. in the cure of many chronic complaints. When morbid matter in the dusdenum is the suspected cause of any illness, emetics should not be omitted. The reason why emetics are infilted on, is, because the stomach and the dusdenum have a glandulous coat over their nervous one; whereas in the other intestines, the nervous coat lies more immediately exposed to the action of purging medicines, which often pass the stomach and dusdenum, without much affecting their nervous coat. Or if emetics are not ventured on as fuch, the action of purges may be quickened by a fmall addition of the antimonial wine, or of tartarized antimony. See Monro's Observations on the Intestines in the Edinb. Essays, and Fred. Hossinan on the duodenum.

DUPLICANA. See TERTIANA DUPLEX.
DUPONDIUM. A weight equal to four drams.
DURA MATER, also called culticularis membrana
mater, crassa menina, to distinguish it from the meninx tenuis or pia mater, which two membranes are called meninges, or matres, from being the supposed source of all the other membranes.

The dura mater lies contiguous to the infide of the ficult every where: its fubstance is very compact; it is white, and gliftening like a tendon, and by fome divided into two lamelle, by others into more. The external furface of this membrane is analogous to the internal furface of the periofleum in all parts of the body; it adheres more firmly to the cranium at the futures than elfewhere, because of the vessels which run in these, and in the proceffes which are thrown out. The inner furface of the dura mater is in general a fmooth membrane, and lies loofe upon the pia mater, except at the finuses, where DURIO. they are attached by means of the veins which come out like a melon.

of the ftomach behind the liver; runs backward, and obliquely downward; then turns a fecond time towards the finuses. The processes of the dura mater are divided into the external and the internal. The true external are those that line the foramina, which, when they get out; are lost in the pericranium; but when the processes of the dura mater are mentioned, without particulariting them, the internal ones are to be understood. The longitudinal, or the proceffus falciformis, falciform process (so called from its shape being like that of a fcythe) begins at the crista galli; runs thence in the direction of the fagitral future, to the middle of the os occipitis, dividing the cerebrum into two hemispheres; it there forms two transverse processes which lie between the two posterior lobes of the cerebrum and cerebellum. The glands of the dura mater, fpoken of by fome old anatomists, are not ever met with by the moderns. The finuses of the dura mater are venal, though their structure and form differ from veins; every section is triangular, and their shape like a prism. The veins are is triangular, and their shape like a prism. The veins are every where pouring their blood into these sinuses from all parts of the brain, and there are several cords going across them, which from their discoverer, are called erder Willifit. The orifices of the veins of the pia materinto the finuses, are in a direction contrary to the course of the blood in the finuses. The principal finus runs along the processes. The longitudinal finus begins small at the crista galli, becomes larger as it proceeds, and running on to the os occipitis, forms the two transverse sinusces, which passing out of the cranium, between the os temporis, and the os occipitis, forms the internal jugular veins. Just at the angle where the longitudinal finus divides into the two transverse, the fourth finus, called torcular Herophili, opens, which is formed by the vena magna Galeni. mater appears more red than the tendons, because of the arteries which go to the brain, and which play upon its furface before they penetrate it. The arteries go from fide to fide, but do not open into the finuses, as some have afferted. Wherever an artery runs upon the dura mater, it is accompanied with one or more veins, which contribute to make the fulci on the cranium, as well as the arteries. Its principal uses are as a covering for the brain; it also serves as an inner periosteum. The use of the processes is to connect the bones, and the use of the sinuses is to return the blood freely.

The dura mater, when exposed in a living animal, is feen to have a pulfation corresponding to that of the arteries, and is owing to the fystole and diastole of the arteries of the pia mater. When the dura mater is laid bare, it commonly sloughs like a tendon; in some cases it is offsited. The brain is sometimes protruded through the bregma in children, and the dura mater ferves for a bag for the rupture. Gooch, in his Med. Obf. gives an instance of a fractured skull; in which case, a fluid being perceived under the dura mater, in order to its discharge this membrane was cut through with the scissars from one car to the other, and the patient recovered.

The nerves are from the trunk of the fifth pair, and from the common trunk of the eighth pair. The arteries

from the carotids, called,

DURAE MATRIS ARTERIAE, and meningere. The DURA MATRAL ARTERIES. The external carotid artery fends a branch through the fpinal hole of the os fphenoidale, which is the middle artery of the dura mater, and is called by way of eminence, the artery of the dura mater. It is di-vided into many branches, which are dispersed through the fubilizance of the external lamina as high as the falx, where these ramifications communicate with their fellows on the other fide. The impressions of this artery are seen on the inside of the parietal bones; the anterior and lower angle of which, inftead of a fimple impression, contain a canal for the passage of a trunk of this artery; on which account, feveral accidents happen in fractures of the fkull. The external carotid fends off another branch through the fuperior orbitary fiffure to the dura mater, called its anterior artery. The carotid and the vertebrals fend its branches. Winflow calls the first mentioned of these arteries, fphens-fpinalis. Dr. Hunter fays, the dura matral artery proceeds from the inferior maxillary artery, and paffes through a hole in the petrous part of the temporal

DURATUS. HARDENED; but Scrib. Largus ex-

presses by it, macerated.

DURIO. A large tree in the East Indies, with a fruit

See DORONICUM.
DUTROY. See STRAMONIUM:
DYAHIBALA. A name for the mimofa non fpinofa

DYAMASSIEN. See ÆRIS FLOS.

DYNAMIS, from Imauat, to be able. It is the faculty or power from whence an action proceeds. Galen often uses this word for a composition of a medicine, sometimes particularly of an approved one.

DYOTA, also DISTA. A PELICAN, or circulating

veffel, with two ears, refembling in shape a man standing with his arms bent outward, and his hands on his sides.

DYS ASTHAESIA, from Due, difficulty, and aus have un, to feel or perceive. A dulness of sentation, or faulty

DYSALTHES, from dos, difficulty, and ander, to cure,

difficult of cure.

DYSANAGOGOS. An epithet for tough viscid mat-

ter, which is difficultly expectorated.

DYSCATAPOTIA. A difficulty of fwallowing, which Dr. Mead thinks a more proper term than that used in canine madness, called HYDROPHORIA, as it is more particularly descriptive of the affection under which

the unhappy patients labour.

DYSCINESIA, from \$ve, bad, and sorte, to move.

Difficulty of motion. Also faulty or defective organs, also termed intemperies. This is the third order of Dr. Cullen's class locales—defined, Motions impeded or depraved from the fault of the organs.

DYSCRASIA. Dyscracy. An ill temperament or habit of the blood and humours, and in the jaundice and

DYSCRITOS, from dos, difficult, and upous, a crifis. Difficult to be brought to a crisis, or brought to an im-

perfect crifis.

DYSECEA, from \$15, difficult, and assu, to bear.

DEAFNESS. Dr. Cullen places this genus of difease in the class locales, and order dysæsthesiæ. He points out two species. 1. Dysecwa organica, from a fault in the organs by which found is transmitted into the internal ear. 2. Dysecwa atonica, in which there is no manifest fault in the organs for transmitting found into the internal ear.

See SURDITAS and CERUMEN AURIS.

DYSELCES, from Jus, difficult, and 4240, on ulcer.

An epithet for fuch persons whose ulcers are difficult to

DYSEMETI, from 3vs, difficult, and sute, to venit, those who vomit with difficulty.

DYSENTERIA, from 3vs, difficulty, or evil, or disease, and esses, the intestines. A DYSENTERY. It is called diarrhea carnosa and dissolutus morbus, often the BLOODY-PLUX, because blood sometimes appears in the stools. but this is not a common fymptom, nor effential to the difeafe. Dr. Akenfide calls the dyfentery a rheumatism in the bowels, and fays, that a dyfentery and rheumatism are the same. The Latins name this disorder tormina. Cœlius Aurelianus calls this diforder a rheumatism of the belly, and fays it is preceded either by a diarrhoea, a cholera morbus, or a tumor of the belly. Dr. Cullen defines it a contagious fever, in which the patient has frequent ftools, accompanied with much griping, and followed by a tenefinus. The ftools, though frequent, are generally finall in quantity; the matter voided is chiefly mucous; fometimes mixed with blood. At the fame time, the natural fæces feldom appear, and when they do, their form is generally compact and hardened. He places this difease in the class pyrexire, and order pro-fluvize. There is but one species, which varies its name from different circumftances, e. g. dyfenteria castrensis, from happening in a camp, when described by an author whose observations were made in a camp. Dysenteria worms. Dyfenteria carnefa, when fleshy or sebaceous lumps were discharged. Dyfenteria intermittens, when accompanied with an intermitting fever. Dyfenteria alba, when the stools had no blood in them. Dyfenteria miliaria, when accompanied with miliary eruptions. All others are fymptomatic.

In fome inflances, this difease is acute, but more frequently of a chronic kind.

According to different authors, the dyfentery is divided

DURONEGO. BROAD-LEAVED LEOPARD'S-BANE. into many species; but with respect to the cure, the best method of confidering it is as follows: a diarrhoza is conthe the diarrhea, attended with inflammatory, putrid, or other fymptoms, or may be totally free from them; fimply then the diarrhea, attended with pain, is a dyfentery, and all other fymptoms are accidental; and though requiring fome difference in the method of cure, they do not confidence in the ftitute different dyfenteries. For different species, confult Dr. Zimmerman.

When the fmall intestines are the feat of the difeafe; and blood is discharged, it is more intimately mixed with the stools than when the feat is in the larger: when the lower inteffines are principally affected, an hiccough is a frequent fymptom. The pain being above or below the navel, generally indicates the feat of the difeafe; if below, the stools foon follow the returns of pain; and the feat is in the greater or lower inteffines; if above, and the flools do not quickly follow the pain, the fmall intellines are chiefly affected. When the feat is in the rectum, the excrements, and the abrafions of the part, are feparately voided; but as the malady is higher, the abrations and excrements are more mixed in the difcharges.

The plethoric, bilious, and those of irregular life, are the most subject to a dysentery.

The primary causes are an error in the non-naturals, particularly the air and diet. Hippocrates observes, that dysenteries rage most in those summers which succeed very cold and dry winters, followed with a rainy fpring; that a rainy winter and a dry fpring also produce them. Bontius remarks, that the hottest season hath the most natural tendency to produce them; and that about August or September, when the cold nights fucceed the heat of the day, this diffemper rages the most. This remark of Bontius's is the most applicable to what happens in our camps, where the foldiers are exposed to damps in their night watches, as well as to cold and damp grounds, where generally they are situated. This obstructs perspiration, and as the bowels are more or lefs weak, nature feeks her relief in their discharges, and the constitution is proportionably harraffed. A putrid air particularly offends the bowels, and irritates them to inordinate discharges, and putrid aliment is no less mischievous. Fruit, and fermentative liquors, too freely used, are often productive of this diforder.

The antecedent cause is generally, if not always, a suppression of some other excretion, and for the most part

this is that of perfpiration.

The remote cause is confidered to be a specific contagion, and the proximate, or at least the chief part of the proximate cause, or an attention to which the cure in a great measure depends, consists in a preternatural con-striction of the colon, occasioning at the same time, those spasmodic efforts which are felt in severe gripings, and which efforts, propagated downwards to the rectum, occasion these frequent mucous stools and tenesmus. See Wallis's Sydenh. vol. i. p. 226.

By some the immediate cause is thought to be a stimulus applied to the intestines. The bile and pancreatic juice becoming acrid, or too abundant, irritate and excite to proportionably frequent ejections. Purges administered when the irritability of the bowels is preternaturally increafed, or aliments that are acrid, or become fo, may also solicit to this morbid evacuation, and produce the painful fymptoms ufually attendant on it. Sydenham, who defcribes this diforder well, calls it a fever of a peculiar kind, and fays that it is caused by the morbid matter turning particularly on the intestines, and that the meseraic

arteries convey it there from the blood.

The diagnostics, according to Sydenham's celebrated description, are as follow: the patient is attacked with a chillness and shaking, which is immediately succeeded by a heat of the whole body; soon after this, gripes and stools follow; it is indeed often not preceded by a fever, but the gripes attack first, and the stools foon succeed. Intolerable gripings, and a painful descent, as it were, of the bowels accompany every evacuation. The difcharges are chiefly mucous, except now and then an excrementitious one intervenes without any confiderable pain. The mucous ftools are generally ftreaked with blood, but fometimes no appearance thereof is feen throughout the difease; nevertheless, if the ftools are

vigour of life, or hath been treated with cardiaes, a fever arises, and the tongue is covered with a thick, white mucus, and if he hath been much heated, it is black and dry; great lofs of flrength; a lowners of fpirit, and all the figns of an ill-conditioned fever are joined with it. This discase it attended with extreme pain and sickness, greatly endangering life, if unfkilfully treated; for when the spirits are much exhausted, and the vital heat diminished by frequent stools, before the matter can be expelled from the blood, a coldness of the extremities enfues, and there is danger of death, even within the peri-ods of acute difeafes. But if the patient efcapes for this time, feveral fymptoms of a different kind fucceed. Sometimes in the progress of the disease, instead of the fanguineous filaments, which are usually mixed with the flools in the beginning, a large quantity of pure blood, unmixed with mucus, is voided at every flool; which, as it manifelts an erofion of fome of the larger veffels of the inteffines, it threatens death. Sometimes an incurable gangrene feizes the inteffines, which is caufed by a violent inflammation excited by the afflux of hot acrid matter to the affected parts. At the decline of the difease, aphthæ frequently affect the internal parts of the mouth, especially if the patient hath been kept hot for a long time, and the execution of the matter bath been long time, and the evacuation of the matter hath been checked by aftringents; the fuel of the difease not having been first carried off by cathartics: these aphthæ generally forethow imminent death. If the patient furvives the foregoing fymptoms, and the difeafe proves lasting, the in-testines at length seem to be affected successively downwards, till it be driven to the rectum, and ends in a tenefmus; upon which the natural stools occasion great pain in the bowels, the faces in their passage through them abrading the small guts; whereas the mucous stools only offend the rectum during the time that the matter is made and discharged. Though this disease is often mortal in grown persons, and especially in the aged, it is nevertheless very gentle in children, who have it fometimes for feveral months without any inconvenience, provided the cure of it be left to nature. Thus far Sydenham.

To the symptoms enumerated by Sydenham, many others might be named, which occasionally attend; but as the principal differences in this diforder may be included in what are called the inflammatory, putrid, and malig-nant kinds, it may fuffice just to describe their general

appearances.
The INFLAMMATORY DYSENTERY approaches with a violent fever, and a hard pulfe, which in other dyfenteries is generally fmall (and that only in the progress of the fickness), becomes full; an almost continual and intolerable pain in the belly, which increases on the part being touched, and still more after vomiting, stools very incon-Ederable with respect to quantity, a head-ach, red face, and sometimes a diftended belly.

A PUTRID DYSENTERY discovers itself by a bitterness in the mouth, which appears directly on the first attack; a vo-mitting of bilious matter, which is fometimes also mingled with worms, a shivering that returns in the course of the disorder, the slightness of the sever, the paleness of the countenance, and the variegated colour of the ex-

A MALIANANT DYSENTERY is attended in the beginning, or whenever any other kind degenerates into it, a fudden weaknefs, great anxiety about the pit of the flomach, heavinefs in the head, an heavy, oppreffed, deadly aspect, frequent flight convultions, a weak voice, frequent fainting, fometimes miliary eruptions, petechiæ, aphthæ, ficknefs,

and a very weak pulfe.

The dyfentery thould be diftinguished from a diarrhoea, a cholera morbus, a flux from the piles, an abicels of the

intestines, and other discharges therefrom-

The gripes, so troublesome, and a pathogn amonic symptom, are owing to the irritation in the part affected; this irritation continuing, the mucus and lymph is discharged, and by being mixed with air, gives that slimy frothy appearance to the stools, and, in time, the mucus being too much abraded, a tenesmus is produced. The blood in the scole harvest from the produced. the flools happens from the rupture or enlargement of the mouths of fome fmall veffeis, and is lefs mixed with excrement, according as the discharge of it is lower in

frequent, mucous, and accompanied with gripings, the the intestines; and more intimately mixed therewith, as distanger may as justly be entitled a dysentery as if blood was discharged along with them. If the patient is in the The aphthae are produced by an absorption of morbid matter from the bowels. The fuety-like matter, and tkins in the stools, are thus occasioned: the mucus, &c, being discharged, the villous coat becomes abraded, and so passes off in those appearances; or it may be only the epithelium which is continued on the inner furface of the inteffines, which, when feparated, becomes thick as when raifed on the fkin by a blifter, and fo ejected.

Sydenham fays, that a dyfentery when ill treated is apt to affect the patient more or lefs for fome years after.

In general the prognostics are taken from the intenseness of the symptoms, the colour and smell of the stools, the flrength of the patient, and the length of the diforder's continuance. It is never without danger, and never to be flightly regarded, for nature alone contributes very little to its cure. There is always danger of a mortification of the bowels until the disease gives way. When the excrements are of various colours, and of an ili fcent, there are ulcers in the inteffines, and then the danger is increased. If blood appears on the first day, or any thing that causes irritation, the danger is great. When the fever is urgent, when the cause is contagious, the patient already reduced by previous fickness, or attended at pre-fent with any other diforder, the danger is proportionably enhanced. An hiceough, delirium, the pain and thirst ceafing at once, the excrements patting involuntarily, convulfions, coldness of the extremities, figns of ulceration in the intestines, vomiting with hiccough, are among the mortal fymptoms.

Scarce any difease requires more care and skill in order to a rational cure than this, and as danger is almost a constant attendant, every caution for prevention will be as needful as prefcriptions for the cure; those then who are in warm climes should carefully avoid the coldness of the evenings, and the chilling dews which fucceed the fultry days; those who are confined in jails, in camps, &c. should avoid the vapours from putrid faces; and if any disorder of this, or of any putrid kind is prevalent, the bark may be taken at proper intervals. If there is any suspicion of the difease approaching, an emetic should be given immediately, a warm fudorific fhould fucceed, and, in the morning, a dose of rhubarb may be given to pro-

mote a gentle motion downward.

When the diforder is manifest, an irritation is the im-mediate cause, the direct indications are, to correct or excited by it. As to accidental symptoms, and those peculiarities that distinguish this disease into different species, an attendance to their general nature must lead to the par-

ticular treatment required on their account.

Peculiar attention is required respecting the non-naturals; the air should be kept as pure as possible, and moderately warm; cleanliness is absolutely necessary, whence the excrements should be immediately removed, the linen, and every thing about the patient, frequently changed. The diet may be of rice, falop, panada, the broth of lean meat acidulated with lemon or orange juice, jelly of ani-mal fubitances with cinnamon. Dr. Rutherford extols the following; boil a few hands-full of wheat-flour, tied up in a tight rag, until it is as hard as starch, which it will be in fix or eight hours: of this, two or three table spoons-full, when grated, may be boiled in milk and water, enough to make it into a pap,: this may be made agreeable to the palate with fugar, &c. and used both for the general food, and for the substance of clysters, which in this diforder are frequently required. For drink, milk and water, butter-milk, the white decoction, or what is still preferable, a decoction of mallows in milk and water, may be freely used.

Agreeable to the indications above mentioned, it was usual with Sydenham, and some other judicious practitioners, whose success justified their proceeding, to begin the cure, if called in early after the first attack, by a gentle emetic, and copious draughts of fome thin fluid, to cleanfe the ftomach; and clytters of the fame were frefrequently injected, that the irritating cause might be leffened, if not wholly carried away from the feat of the

diforder.

heat, to be repeated until the gripes were abated; these hath been given at a dose, and frequently repeated. In were administered warm. After this, the patient was general the following method of administering it is to be put in bed, and a sweat promoted. When the patient approved of: was greatly exhausted, endeavours were used to check the evacuation. Dr. Robinson (see his Theory of Physic and Difeases) begins with an emetic of ipecac. after its operation he gives a cordial draught, with about five drops of the tinct. opii, and repeats the fame every four hours, or after each evacuation downwards; and now and then he proposes a clyster of red wine and diascordium. Both these physicians proceed with respect to a dysentery with the fame views as in a cholera morbus, which feems only to differ in its feat from this diforder. It may here be added, that diluting drinks taken plentifully are often fo beneficial in the beginning, as to render any other medi-cine unnecessary: they may be drank cold or warm as most agreeable to the patient. As to other remedies, their use is indicated by the nature of attending symptoms, only being required, as circumstances not effential

to the difease occur. The principal are as follow.

BLEEDING. In the inflammatory kind this operation is necessary; but when there is no manifest inflammation, nor obvious tendency thereto, it cannot be with propriety proposed. When the loss of blood is proper, the pulse

will be found full, ftrong, and hard.

NITRE. When the heat of thirst is great, if the patient is of a choleric or bilious habit, fmall dofes of nitre will be useful; when the fever is considerable, and the symptoms of inflammation attend, antiphlogiftics are needful remedies, and the nitre may be given with two or three grains of ipecae, and ther. Androm, one fcruple, made into a bolus, with the balf. Locatel.

OL. RICIN. Dr. Akenfide refolves the whole virtue of the ipecac. in this disease to its relaxing the coats of the inteffines, and in mitigating the gripes; these effects are as powerfully produced, if not more so, by this oil. In the beginning of this disorder, whether it be of the inflammatory or bilious kind, it excels all other purges.

PURGATIVES. In every kind of dyfentery, purging medicines should only be such as evacuate the contents of the bowels; and the ol. ricin. may be fuited by proper addi-tions to every fpecies; rhubarb, with a fmall portion of antimonium tartarifatum is in general proper, except in the bilious or putrid kind, in which crystall. tart. tamarinds, and fuch like, are to be preferred; though towards the end of the cure, rhubarb may be allowed, with advantage.

SWEATING. In all the species of this diforder, this eva-cuation is deficient and difficultly promoted; but when excited, conduces greatly to the cure. In the malignant kind of defentery, prespiration must be promoted by means the most effectual, in conjunction with cordials. The first passages being well cleared, small doses of antim. tartar, with the puly, ipecae, should be repeated so as not to excite the fensible discharges, and may be affished in their operation by the pores, with such other means as the circumstances of the patient may require. Opiates are generally the best auxiliaries in this case, and a vapourbath, or wrapping the legs and thighs in flannels wrung out of warm water, greatly expedite this intention. IPECACUANHA. Dr. Akenfide afferts the propriety of this remedy in every form, flate, and degree of this dif-

cale; and that the more its use is experienced, the more its merits are established. Its virtues are owing to its relaxing and fedative quality and determining the fluids to the furface; one or two grains should be repeated every four or fix hours, more or lefs, according as the fymptoms require it, or as the stomach will retain it.

DIURETICS, in fome instances, have been useful; but are not to be attempted, except where all other means fail, or when they have been efficacious in former inflances.

ASTRINGENTS. They are ufeful when, after numerous evacuations, the strength fails. Among these, alum is not found so useful as it is in hæmorrhages, and is rarely prescribed. The cort. simaroub. removes this complaint without the usual inconveniencies of astringents. drams may be boiled in a pint and quarter of water to a pint; and two ounces of the strained liquor may be taken three or four times a day. The lign. Campech. is also useful, and in some respects to be preferred to most other medicines of its class; for where altringents are required, it may be fafely used, whether fever or inflammation attend or not. From a feruple to a dram of the extract

R Extract. lign. Campech. 3 ii. f. pil. xx. cujus cap. iii. vel iv. quarta vel fexta quaque hora cum 3 ii. decoch fimaroubæ. These medicines ought to be given with caution; and scarce ever exhibited till the close of the complaint; not however till the intestines have been furficiently evacuated, and the morbid matter removed by emetics, aperients, or naufeatives, for given early in the difeafe they are productive of great mifchiefs.

The tenefmus, when troublefome, may be relieved by

clyfters of ftarch.

CORT. ELUTHERIA. In fome infrances where the inecac. failed, or difagreed, this medicine hath been attended with the defired fuccefs; and to reftore the tone of the inteflines after the abatement of the diforder, this bark is generally to be preferred to the Peruvian.

The VITRUM ANTIMON. CERAT. given from gr. ii. ad x. and a gentle opiate after it, is generally efteemed as 2 specific. It may be repeated two or three times a day, or oftener if required, and the stomach retains it.

The RAD. COLUMBOE is particularly useful in the bilious and putrid dyfentery, and may be used as in the diarrhoea,

The Nux Vomica. Dr. Hagftroom, a Swedish physician, recollecting the supposition of some celebrated pro-fessors, that the epidemic dysentery is an hæmorrhage of the inteflines brought on by animalculæ, he was led to imagine that nux vomica, which is known to be fatal to large animals, might also prove equally destructive to these animalculæ. The auftere tafte of this fubitance confirmed him in his ideas on this fubiect, and knowing that it might be taken in small doses without danger, he ventured to try its effects. He began by cleanfing the bowels with rhubarb and cream of tartar, after which he preferibed a feruple of nux vomica, in powder, to be taken once a day. The good effects of this remedy exceeded his expectations. The fueces which followed the use of this medicine was equal, whether used in those dysenteries which followed putrid fevers, or those in which no such fever had preceded. In many instances a cure was ef-fected in three or four days. This medicine seemed to have a better effect when taken in warm water or beer than when fwallowed in either of these liquors cold. See

the Lond. Med. Journ. vol. iii. p. 189.

Those with whom a dyfentery is fatal, are carried off by the mortification in their bowels, to which regard

fliould always be had throughout the cure. See Sydenham on the Dyfentery, with notes by Dr. Wallis: Alex. Trallian. Among the ancients, befides Alex. Trallian, Aretæus, Cœlius Aurelianus, and Celfus may be consulted; but among the latest authors, and where improvements on predeceffors may be expected, fee Baker on the Dyfentery, Akenfide's Comment; Zim-merman's Treatife; and Dr. Wilfon on the Dyfentery; Cullen's First Lines, vol. iii. p. 101. edit. 4. Mofeley on the Dyfentery of the West Indies: also the Lond. Med.

Journ. vol. ii. p. 86. vol. vii. p. 337.

Dysenteria catharticis, (i. e. Diarrheea mucofa.

Dysenteria parisiaca, See Diarrheea.

There are many fympathetic dyfenteries.

DYSEPULOTOS, from Sos, difficulty, and sos, a cicatrix, Sv., difficulty, and emsken, to cicatrize. An epicus is the fame.

DYSHÆMORRHOIS. Suppression of the bleeding

DYSHELCES, from Jus, male, and mars, ulcers. One who hath ulcers difficult of cure.

DYSIATOS, from Sve, difficulty, and auouas, to heal or cure. Difficult of cure.

DYSLOCHIA. Suppreffion of the lochia. DYSMENORRHŒA. Difficult or painful menftruation. See AMENORRHOEA, and MENSES DEFICIENTES.

DYSODES, from Jug, bad, and of a, to fmell. An ill fmell, FOETID. Foefius fays, that in Hippocrates we are to understand by this word, a factid disorder of the small intestines. It is also the name of a malagma for the pleus rify, and of an acopon, which Galen and Paulus de-feribes. Sauvages, and fome other nofologists, form a ge-nus of diforder which they name dyfodia, and define it to be flinking exhalations from the whole body, or from a particular part, e. g. flinking fweat, flinking breath,

flinking feet, &c.
Dr. Percival takes notice of a kind of STINKING BREATH, (dysades pulmonica) to which persons with a narrow chest and scrobutic habit are peculiarly incident. He observes, that it feems to originate from a want of power to make a full expiration, by which too much perspirable matter is retained, and corrupted by flagnation in the veficles of the lungs. In fuch cases he hath found the most falutary effects from the use of myrrh and fixed air, internally administered. These antiseptic substances are probably carried to the lungs, and difcharged together with the offensive vapour, which they correct, at the same time that they invigorate the smallest ramifications of the bronchize.

DYSOPIA. DIFFICULT SIGHT. Dr. Cullen places this genus of difease in the class locales and order dysæfthefire. He diftinguishes five species. 1. Dysopia tenebrarum, when a great light is required for diffinct vision. 2. Dyfopia luminis, when fight is most distinct in an ob-2. Dyspia lumins, when fight is most distinct in an obfeure light. 3. Dyspia distinction, when objects must
be very near to be seen. 4. Dyspia proximorum, when
objects cannot be seen distinctly it very near. 5. Dyspia
lateralis, when objects are best discerned by a side view.

DYSOREXIA, from sus, bad, and species, appetite. A
BAD APPETITE. Also a wrong APPETITE, as when the
appetite is excessive, or requires unusual food, &c. it is
supportance with better states.

fynonymous with byper afthefis.

DYSPEPSIA, from Sue, difficult, or bad, and wealth toconcoll. DIFFICULTY of DIGESTION, or rather depraved one; as when what is digefted becomes acid, or poffeffed of other morbid qualities. The gustrodynia is an instance. Dr. Cullen places this genus of disease in the class neuroses and order adynamia. See APPPSIA.

DYSPHAGIA. Impeded deglutition. The fame as aglutitio. See DEGLUTITIO.

DYSPERMATISMUS; also Agenchia. Such an impediment to the femen virilis, in coition, as renders it infufficient for generation. Dr. Cullen places this genus of difease in the class locales and order epischeses. observes eight species. 1. Dyspermatismus urethralis, when the fault is in the urethra. 2. Dyspermatismus nodosus, when a tumor is formed in the corpus cavernosus penis. 3. Dyspermatismus praeputialis, when the impediment is from a straightness of the orifice of the prepuce. 4. Dyspermatismus mucosus, when the urethra is obstructed by a too viscid mucus. 5. Dyspermatismus hypertoricus, when there is an excess of erection of the penis. 6. Dyspermati/mus epilepticus, from epileptic fits coming on dur-ing coition. 7. Dy/permati/mus ephractodes, from a want of vigour in the genitals. 8. Dy/permati/mus refluus, when the femen is thrown backward into the urinary bladder. See STERILITAS.

DYSPHONIA, from bus, difficulty, and ques, the voice.

A difficulty of speech.

DYSPNŒΑ; also Dyspnoon. DIFFICULT BREATHING, from δυς, difficulty, and πνημ, to breathe. Dr. Cullen places this genus of difeafe in the class neurofes, and order spasmi; and defines it to be, a constant difficulty of breathing, without a fense of straightness in the breast, but rather that of fullness and obstruction there. A cough is frequently through the whole course of the disease. He distinguishes eight species. I. Dypnæa catarrhalis, when with a cough there is copious discharges or heat, except during the endeavours to void it, or its of viscid mucus. 2. Dyfpnæa sicca, when there is a actual passing off, and for a short time, the pain perceivcough without any considerable discharge. 3. Dyfpnæa ed afterwards is in the glans, a circumstance not so paraerea, when the cough is much eafed with fome changes of the weather. 4 Dyspnaea terrea, when earthy or calculous matters are fpit up. 5. Dy/pnara aquo/a, when is voided in large qua there is a fearcity of urine and cedematous feet, without happens in the ftone. any symptoms of a dropsy in the chest. 6. Dyspnwa pinguedinofa, from corpulency. 7. Dyspace theracica, from a straightness, or ill formation of the chest. 8. Dyspace extrinseca, from manifest external causes. It is spoken of by many as a species of asthma, but much difficulty attends such a view of it, and as much in affording relief. If respiration be only thick and quick, without the other if the heat of urine proceeds from acrimony in the urine, fymptoms, it is called dy/pnaca.

It is a spasm affecting the vital functions. SAUVAGES defines it a difease whose principal symptom is a shortness of breathing, with chronic indifposition, not intermitting, and without figns of hydrothorax or empyema.

The most usual causes of dyspnea are, phlegm lodged in the bronchia, or the too strong constriction of the bronchia themselves which prevents the easy ingress of the air into the lungs.

Nofologists enumerate many species of this disease: Sauvages no less than twenty-two, but most of them are fymptomatic; and few, if any of them, admit of more than to moderate their violence; in order to which it is advisable to moderate the plethora in the lungs, and avoid

all hurry of respiration.

Sometimes naufeating emetics are good expectorants in this case, especially if given in small doses. Gum ammoniacum, and asia feetida, may be used. Blisters are often benesicial. Issues may be formed in the thigh. In fome cases these have their use, but in too many instances affiftance fails.

DYSPNOON. See DYSPNOEA.

DYSRACHITIS. The name of a plaster in Galen. DYSTHERAPEUTOS, from du, difficulty, and Sipaπiva, to heal. Difficult to heal.

DYSTOCHIA, from δυς, difficult, and τωτα, to bring

forth young. Difficulty in labour or child-birth.
DYSTŒCHIASIS, from Fos, bad, and roux or order. An irregular disposition of the hairs in the eyelids.

DYSURIA. DYSURY, from des, painful, and sper, urine. A DIFFICULTY OF VOIDING THE URINE. It is called fillicidium, arder wine, obstruction, heat, and difficulty of

voiding urine, and frangury.

A total fuppression is called Ischuria, which see. A partial supression is called dysuria, and may be with or without heat. When there are frequent painful, or uneafy urgings to discharge the urine, and it passes off only by drops, or in very small quantities, it is called a strangury. When a sense of pain or heat attends the discharge of urine, it then passes with dissiculty, and is discharge of urine,

tinguished by the name of heat of urine.

The dylaria is acute and chronic. Dr. Cullen places this genus of disease in the class locales, and order epifcheles. He diffinguishes fix species. 1. Dysuria ardens, when the urine scalds in passing off, and there is not any evident disorder in the bladder. 2. Dysuria spassing when a spass affects the parts which communicate with the bladder. 3. Dyfuria compressionis, from something pressing the bladder. 4. Dyfuria phlogistica, when the parts about the bladder are instanced. 5. Dyfuria irritata, when there are the signs of a stone in the bladder. 6. Dyfuria irritata, suria mucesa, also called glus; vesica morbus rarus, when there is a copious excretion of mucus.

The causes are various: as caruncles in the urethra; a ftone in the neck of the bladder, or in the urethra; fpain, or inflammation in the neck of the bladder or urethra; acrimony in the urine, abrading the mucus from the bladder, or the urethra; the venereal difease and the scurvy often produce this disorder; an ulcer in these parts, and a defect in the discharge of mucus for lubricating the urinary passages. The chronic dysary hath generally for its cause a rheumatic, arthritic, scorbutic, or other morbid humour fixing itfelf in the villous coat of the bladder.

near its neck, and in the urethra.

The diagnostic figns of a dyfury fometimes fo much re-femble those of a stone in the bladder, that some difficulty attends the diftinguishing of them, especially when the dyfury is of the chronic kind. However, in general, the difficulty of discharging urine is unattended with pain ed afterwards is in the glans, a circumftance not fo par-ticularly attendant in the ftone; in the chronic dyjury, bloody urine is more frequently caused by exercise, and is voided in large quantities after vigorous motions, than

Heat of urine is not from an increase of the natural heat thereof, but from its coming in contract with the inner coat of the bladder, or of the urethra; its acrimony abrades the mucus from these parts, or their mucus is too sparingly supplied, whence the acrimony of the urine irritates them too much, and excites the fenfe of heat and pain. And it will be known by the high colour and thinnels of the

urine, or elfe a mixture of unufual matter.

The different kinds of dyfuries should be distinguished from each other; and they from the stone in the bladder, or urethra, from the ischuria, and from the piles-

The dyfury is not a dangerous diforder, but it is both incident. It is often miltaken for the stone, and aggratroublesome and difficult to cure, particularly in the aged. Whenever it happens, if it continues long, it ulcerates the bladder and its neck.

In order to the cure, the particular cause must be discovered.

When the application of blifters cause a strangury, wash the blistered part with warm wilk and water when

When an acrimony in the juices are the cause, if it is venereal, give anti-venereals; if fcorbutic, give antifcor-butics, &c. If the pulfe admit of it, bleed; give lenient cooling laxatives, fuch as cassia, tamarinds, the ol. ricini, or draughts of oil and manna. It is usual to give nitre, but a solution of true gum arabic is by far more useful; an ounce of it should be taken in a day. Camphor, and fmall doses of laudanum, are often of great service. Spt. atheris nitrosi, may be taken in each draught of common drink, or the following draught and clyster may occasionally be administered.

R Tinct. opii gr. xx. fpt. æth. nit. gr. xxx. ol. amygd. 3 ii. aq. font. 3 i. fs. m. f. hauft.
R Balf. Peruv. 3 i. fs. in vitel. ovi folut. finct. opii 3 i. & 3 ii. ol. oliv. 3 ii. decoct. per enemate 3 viii. m. f. enem. A femicupium is often of ufe.

The patient thould drink plentifully of a folution of gum arabic, or falop, of whey, or of a decoction of marth-

mallow root.

When the pain is violent, let the mucilage of gum ara-bic, or fome oily matter, be injected into the urethra before discharging the urine.

If there are caruncles in the urethra, bougies should be

carefully introduced therein, and repeated as required.

In the chronic Dyfury, after other means fail, a falivation excited by the use of mercury hath succeeded; and an iffue in the infide of one thigh, a little above the knee, prevents the return, or at leaft renders relapfes very eafy. When the patient is too weakly to admit of falivation, a dose of the uva urfi may be taken every morning, and after it half a pint of lime-water, mixed with a ftrong decorbing of the great water, dock root.

coction of the great water-dock root.

Dr. Percival observes, that there is a species of chronic dysay, to which persons of an arthritic or scorbutic habit, and who have passed the meridian of life, are peculiarly

vated by the use of lithontriptics. He adds, that it hath many fymptoms in common with that diforder, fuch as frequent and urgent calls to make water; pain at each extremity of the urethra; a mucous discharge, tenesmus, and sometimes a suppression of urine. But the patients who labour under it feel no uneasy weight in the perinæum, and always void their water with much less difficulty in an erect than in an horizontal posture. The complaint, also, may be further distinguished from the ftone by having fhorter intervals of eafe; by more frequently injuring the retentive power of the bladder, and by occasioning no fudden interruption to the stream of urine in the absence of pain. It seems to arise from an acrid defluxion on the coat of the bladder, which is thereby rendered fo exquifitely fensible, that the stimulus of the urine becomes almost intolerable, and very frequent efforts are excited to expel it; these efforts, however, should be restrained as much as possible, because they tend to increase the pain and irritation of the bladder, and to prevent the complete discharge of its contents; for that organ cannot effectually contract itself without a due degree of previous diffention. Of all the remedies which Dr. Percival tried, he fays that mercury was the most fuccessful; it feldom failed to afford relief, and generally produced a cure, if administered with perseverance and in sufficient quantity. According to the urgency of the case, one, two, or three scruples of the ungt. hydrargyri fort. should be rubbed into the thighs every night, till a flight ptyalism ensues: the symptoms for the most part abate before the the spitting comes on, and after it has continued a while, they disappear entirely. Sometimes, in flighter cases, the doctor gives half a grain of calomel, with two grains of James's fever powder, twice everyday; and this small dose of mercury, if duly continued, may fusfice to effect a cure, without producing any falivation, or even foreness of the mouth. See Lond. Med. Journ. vol. iv. p. 69.

Violent heat in the urinary paffages of women have been cured by the use of the bark.

See the authors under the article ISCHURIA, Bifs's Effays, Lobb on painful Diftempers, Gooch's Cafes and Remarks, vol. ii.

## EBR

AU DE LUCE. See SPS. AMMONIÆ SUCCI-, NATUS, under ALCALI.
EBELL. The feed of fage, or of juniper.
EBENUS. EBONY.

EBENUS ÆTHIOPICA, called also palma baira layri, palma Americana spinosa, palma Brasiliensis sexea airi. MACOW EBONY-TREE.

Acow EBONY-TREE.

It grows in America; the wood is black and very heavy,

It is chiefly used by mechanics. In finking in water. It is chiefly used by mechanics. medicine it is hardly known.

EBENUS, or Lignum Indicum. EBONY. Dale thinks this is the true Indian ebony of the ancients.

brought from the island of St. Helena. Ray thinks it is the true Indian ebony.

Camellus enumerates feven species, but they are none

of them used medicinally.

EBISCUS. MARSH-MALLOW. See ALTHEA.

EBRIECATUM. By this term Paracelfus expresses the partial loss of reason, as it happens in drunkenness; and by the addition of the word COELESTE, that kind of enthuliafm which is affected by many heathen priefts,

EBRIETAS. DRUNKENNESS. Spirituous liquors render the fibres rigid, and increase our natural vigour, but this effect is fleeting. If they are often repeated, or other-ways too freely used, their excess of action enervates the conftitution, the appetite fails, and digeftion is too feebly carried on; confequently due fupplies not being carried to the blood, the fpirits fail, and a general feebleness enfues. Add to this, that spirituous liquors create a morbid acrimony in the blood, and gradually coagulate its thinner parts, whence a scirrhous liver and obstructed mesencial electric classics.

teric glands.

When from a frequent or excessive use of spirituous liquors the stomach loses its sensibility, the saline and saline ponaceous medicines should be used, and after them the waters at Bath may finish the cure. When this excess produces relaxation in the stomach, pituitous, and often bilious humours, too much abound in this organ; here emetics should be used; rhubarb and aloctic purges now and then repeated; then bitters, bark, and chalybeates, joined with moderate exercise, bid fairest for restoring

ftrength. When the over-night's potation is too liberal, a quantity of cold water should be placed at the bed-side, and as restleffness comes with heat, a dryness of the tongue, &c. this water should be drank as freely as the thirst requires it; thus, by degrees, a perspiration is produced, and the most effectual relief obtained.

Fermented vegetable spirits are alone the cause of drunkennels, and vinegar is an antidote; whence, in case of what is called being dead drunk, a draught of strong vinegar will relieve, or recover therefrom, fooner than any any other means; but in such a case, let the person be seated in a chair, and not with his head low. After he is a little roufed, give warm water with vinegar, acidum vitriolum dilutum, or fps. ætheris nitrofi, to drink. Frequently apply a sponge dipped in vinegar to the mouth and nose; an emetic that operates with speed will also have its usefulness; a clyster, and after it a purging draught may be administered, and then attempt to promote a gentle fweat.

## ECC

EBESMECH. A name in Langius for QUICKSILVER. EBSHAMENSIS SAL. See CATH. AMAR. SAL. EBULUS, also called chamatatte, fambucus humilis, fambucus herbacea, WALL-WORT, DANE-WORT, and DWARF ELDER. It is the fambucus chulus, Linn.

It is an herbaceous plant, dying to the ground in win-ter with longer leaves than those of the elder-tree, and nine leaves on one rib. It grows wild in many parts of England, flowers in July, and produces ripe black berries in the beginning of September.

Its virtues are the fame as those of the common elder,

but fomewhat more efficacious. It is a powerful hydra-gogue, and in finaller doses a powerful resolvent and de-obstruent. See Cullen's Mat. Med. Wallis's Syden-

EBUR. IVORY. See SPODIUM ARABUM.
EBUR FOSSILE. See UNICORNU.
ECBOLION, from excans, to cast out. A medicine which causes abortion. Called also diecoslion, hence ecbolica and diecbolica.

ECBRASMATA, from εκξεασσω, to cast out, or from βεαζω, to be very bot. Fiery pultules on the surface of the body, also called ecchymata.

ECBRASMUS. See FERMENTATIO.

ECBYRSOMATA, from βυρσα, a skin. Protuberances of the bones at the joints, which appear through the skin.

ECCATHARTICA, from xatterpes, to purge. According to Gorræus, eccathartics are remedies which, applied to the skin, open the pores; but in general they are under-flood to be deobstruents: fometimes expectorants are thus

called, and so are purgatives also.

ECCHYLOMA, from Xux®, a juice. An EXTRACT.

ECCHYMATA. The same as ECBRASMATA.

ECCHYMOMA ARTERIOSUM. The spurious

aneurism. ECCHYMOMA. If from exxuu, to pour out, or from ex, ECCYMOSIS, without, and χυμΦ, juice, called also exfuccatio. It is an effusion of humours from their respective vessels, under the integuments; or, as Paulus Ægineta fays, "When the slesh is bruised by the violent collision of any object, and its small veins broken, the blood is gradually discharged from them." This blood, when collected under the ikin, is called an ecebymosis; the when collected under the ikin, is called an ecebymolis; the fkin in the mean time remaining entire, fornetimes a tumor is formed by it, which is foft and livid, and generally without pain. If the quantity of blood is not confiderable, it is ufually reforbed; if much, it suppurates: it rarely happens that any further inconvenience follows: though in case of a very bad habit of body, a mortification may be the result, and in such case a regard must be had thereto. Dr. Cullen places this genus of disease in the class locales, and order tumores. See Strout arms class locales, and order tumores. See SUGILLATIO. Bell's Surgery, vol. i. p. 93. where it is called thrombus, when it is round and small; and when more diffused it it is called ecchymofis. White's Surgery, p. 172. ECCLYSIS, from takers, to bend, or turn afide. A

ECCOPE, from north, to cut, or encoute, to cut off.

The cutting off of any part.

ECCOPEUS, from \*orfu, to cut. An ancient inftrument, of the fame use as the modern raspatory.

ECCOPROTICA, from nonger, dung. Also coprocritica.

Mild cathartics, whose operation extends no farther than to evacuate the intestines

ECCRINOLOGICA, from expre, to feerete or feparate. That part of medicine which relates to the doctrine

ECDORA, from Jesu, to exceriate. EXCORIATION, and particularly used by P. Amannus, for an exceriation of the urethra

ECHECOLLON, from soxxa, glue. A glutinous to-

ECHELION. The name of a plant in N. Myrepfus. ECHETROSIS. So Hippocrates calls the WHITE

An abbreviation of Echinodermatus.

ECHINIDES. In Hippocrates it is mentioned as what

ECHINATA SEMINA. \ Such feeds of plants as ECHINATE SEEDS. \ are prickly and rough are thus named, from echinus, an urchin. Certain perfolious are thus called from this liberals to the feed.

trefactions are thus called from their likeness to the sea hedge-hog or archin. ECHINOPHORA. The name of fome species of

parfley. See CAUCALIS.

ECHINOPHTHALMIA, from exwe, a bedge-bog. and openions, an inflammation of the eye. An inflammation of the hairy part of the eye-lids. I suppose that the term is distinguished thus, because the eye-lid is set with hairs, as the echinus with prickles.

ECHINOPODA CRETENSIBUS, called also genistated the eye-lide is set with the control of the eye-lide.

Greece and its ifles, but of no medical note.

ECHINOPUS, called also crocodilion, acanthalruca, feabiefa carduifolia, spherecephala elatior, GLORE THISTLE. It is raifed in our gardens. The root and feeds are moderately diuretic; but are not in use. Boerhaave mentions five species.

MINOR. The LITTLE GLOBE THISTLE.

ECHINOS, called also sermum aquaticum. A fort of rough water-thiftle that is prickly like an hedge-hog.
ECHINUS. In botany, those plants or parts of plants which are befet very closely with spines, like a hedge-hog, termed echinated. The prickly head or cover of the feed is also thus named. It is also the name for the hedgehog, which is likewife called acanthion.

ECHIUM. Euglefum filvefire deris. Vipers EugLoss. The leaves are hairy, and almost prickly; the
stalk, which is about a foot high, is also rough and prickly; the slowers grow on spikes curled inward like a
stooppon's tail, of a bine colour, and containing four rough feeds shaped like a viper's head; the root is thick, and runs deep. There is nothing remarkable in its medical virtues.

ECHIUM. A name of the bugloffum fylveftre, of the cerintboides, and of a species of HOUNDS TONGUE.

— MARINUM. See CYNOGLOSSUM MARITIMUM.

ECHOS. In Hippocrates it is the fame as tinnitus aurium.

A FAINTING OF SWOONING.

ECLAMPSIA TYPHODES. See RAPHANIA.

ECLAMPSIS, from Aauru, to fine. It is a fielding light, or those sparklings which strike the eyes of epileptic patients. Coclius Aurelianus calls them circuli ignei,

feirtillations or fiery circles. Though only a fymptom of the epilepfy, Hippocrates puts it for the epilepfy itself. ECLECTICA MEDICINA, from analym, to circle. Archigenus, and some others, selected from all other sects what appeared to them to be the best and most rational; hence they were called celestics, and their medicine ec-

lettic medicine

ECLEGMA, From Maxe, to lick. See LINCTUS. ECLEICTOS,

ECLYSIS. An univerfal faintnefs.

ECMAGMA. A kneaded mass, or the crocomagma.

ECMEPHIAS, of ικ, from, and πφος, a cloud. A

flormy wind breaking out of a cloud.

ECPEPIESMENOS, from εκπιεξω, to deprefs or prefs

outward. An epithet for ulcers with protuberating lips.

ECPHRACTICA, from ικ, and φρασσω, to obfiruel.

Deablitment medicines.

ECPHRAXIS, from ex, and powers, to obstruct. An opening of the pores.

ECPHYAS, from \*\*, and pow, to produce. An appendix, or excrefeence. Some call the appendicula vermiformis thus

ECPHYSESIS, from es, and evrau, to breathe. A quick expulsion of the air out of the lungs.

ECPHYSE. Flatus from the bladder through the ure-thra, and from the womb through the vagina.

ECPHYSIS, from ex, and gow, to produce. An apo-physis, appendix, or process; also a name of the DUODE-NUM, which see.

ECPIESMA, from ix, and riiçu, to press. The same as magma. Also the juice that is pressed out from the plants of which the magma is made. It is also a kind of fracture of the cranium, in which the bones are shattered, and press inwardly, affecting the membranes of the

ECPIESMOS, from (x, and = 16%, to prefs. In general it implies expression, but it is also the name of a diforder of the eye, which confifts in a great prominence of the entire globe, thruft, as it were, almost out of the or-bit by an asslux of humours.

It is also a true exophthalmy, produced by strong exer-tions, by which the eyes are so far pressed out as to re-main prominent. Protuberances of the eyes, happening from the effects of labour from child-bed pains are often cured by the succeeding discharges and lochia. It is therefore necessary that we should endeavour to affist these. Wallis's Nosologia Oculorum.

ECPLEROMA, from TARPON, to fill. In Hippocrates they are hard balls of leather, or other fubstances, adapted to fill the arm-pits, while by the help of the heels, placed against the balls, and reprelling the fame, the luxated os

humeri is reduced into its place.

ECPLEXIS, from exampson, to terrify or aftenift. A flupor or aftonishment, from sudden external accidents.

ECPNEUMATOSIS, from ε4, and ανευ, to breathe.
ECPNŒA, EXPIRATION. That part of respiration in which the air is expelled from the lungs.

ECPTOMA, from (xxxxxx), to fall out. A luxation of the bone; the exclusion of the fecundines; and, speaking of corrupt parts, it signifies a falling off. It is also an hernia in the scrotum, and a falling down of the womb.

ECPYEMA. By Hippocrates it is understood a copious collection of pus, from fome tumor, particularly an inflammatory one having suppurated, a vomica or abscess with fuppuration. It comes from the verb εκπωσμω, vel entities, in pus vertor, to be turned into pus. Hence medi-the moderns confine it to a difease of the cheft. See

ECPYESMA. A fracture of the skull, when the pieces

press the meninges. ECPYSIS. An excrescence.

ECREUELLES. So the French call a ferofula.

ECREXIS, from payuou, to break. A RUPTURE. Hippocrates expresses by it a rupture or laceration of the

ECROE, from expens, to flow. An efflux, or the course by which any humour which requires purging is evacuated. The same as exerrheusis, exerrhosis, exer-

ECRUSIS, from expen, to flow out. In Hippocrates it is an efflux of the femen before it receives the conformation of a feetus, and therefore is called an efflux, to diftinguish it from abortion.

ECRYTHMOS, from pobuse, harmony. It is applied to the pulse, and fignifies that it is diforderly or irre-

ECRYTHMUS. See ARITHMUS.

ECSARCOMA, from eags, flesh. A fleshy excres-

ECSTASIS, from existynas, to be out of one's fenses.
An ecstasy. In Hippocrates it fignifies a delirium. Dr.
Cullen ranks it as a kind of apoplexy. See Extasts.
ECSTROPHIUS, from expenses to invert. An epi-

thet for any medicine that makes the blind piles appear

outwardly.

ECTASIS, from Terre, to extend. An extension of

the fkin, the reverse to wrinkling.

ECTEXIS, from Tixe, to liquify or confume. An EMA-GIATION.

ECTHELYNSIS, from exhause, to render effeminate.

ECTHLIMMA, from explain, to dash or press out against. An ulceration caused by pressure on the skin.

ECTHLIPSIS, from explain, to dash or press out against. EListon or expression. It is speken of swelleyes, when they dart forth sparks of light. ECTHYMA, from 1880, to break out. A pultule or

cutaneous eruption.

ECTILLOTICA, from extense, to pull out. Medicines which confume tubercles and corns, or which affift in pulling off fuperfluous hairs from any part.

ECTOME, from ex, out, and Tspero, to cut. Excision

OF EXTIRPATION.

ECTOPIÆ. PROTRUSIONS OF MISPLACED PARTS. As when a part of the body is moved from its proper feat, and forms a humour.

ulceration of the skin about the os facrum.

ECTROPE, from sursems, to divert, prevert, or invert. It is any duct by which the humours are diverted and drawn off. In P. Ægineta it is the fame as ectropium. ECTROPIUM, from signam, to evert, or turn sutwards. When the eye-lids are so inverted or retracted,

or turned outward, that their interior red fkin becomes prominent, and the eyes cannot fufficiently be covered by them. It is also called eversio; but by the Greeks ettropium. Hence it may properly enough be termed a turning outward, or an eversion of the eye-lids. When this misfortune happens in the fuperior eye-lid, in confequence of its refemblance to a hare's eye, it is called by the Greeks, lagophthalmus, or lagophthalmia, hare's eye. Galen, in his Definit. Med. makes ectropium an eversion of the eye-lids in general. But according to Paulus Ægineta, lib. vi. cap. 12. the ellropium is peculiar to the under eye-lid, and lagophthalmus to the upper. Some, juftly enough, diftinguish between the effrequent and lagophthalmus, the latter of which is, when the superior eye-lid is not everted, but only, like a hare's eye, retracted by any cause, so that it cannot sufficiently cover the eye. The like misfortune often happens in the lower eye-lid, without any degree of everfion, though few have noticed this fymptom. Hence it may be confidered as a species of ellropium.

Sometimes this diforder is unaccompanied with any ether, but often an inflammation of the eye, a farcoma, or an encanthis attends it. When it appears alone, it is caufed by cicatrices after wounds, exulcerations, burns, and imprudent use of astringents, or from the protube-rance of the internal fleshy parts. In old people, a relax-ation of the orbicular muscle fometimes causes it in the

lower eye-lid.

If the eye-lid is greatly difforted and contracted, or if the diforder hath been of long continuance, a remedy is

rarely to be expected.

When a cicatrix is the caufe, endeavour to foften it by a frequent application of the streams of warm water, the egg liquor mentioned in the article ANCHYLOSIS, &c. At night proper compresses may be applied to bring the eye-lids together, and keep them so.

When a contraction of the eye-lid is the cause, if emollients and compresses fail, an incision in the form of a crescent may be made at a small distance from the eyelashes; in the upper eye-lid the points of the incision should be downwards, and in the under eye-lid upwards; thus the skin will be lengthened: the number of incifions may be one or more, according to the degree of the contraction; if more than one is required, make the reft parallel to the first, and at a small distance from it. When the necessary incisions are made, stretch the skin, and lay compresses of lint upon it; but at the second dressing, spread the lint with some digestive ointment to encourage the flesh rising betwixt the incisions; and slips of sticking plaster may be used to keep the upper and lower eye-lids close until the incisions are healed.

If an inflammation produces fungous flesh, first allay the inflammation, then gradually confume the fungus with the mildest escharotics.

In old age, a relaxation of the orbicular mufcle fome-SOFTNESS. It is applied to the fkin and flesh when lax times produces this complaint; in this case, relief must and soft, and to bandages when not sufficiently tight. be attempted by spirituous and strengthening applica-

Tumors in the orbit are fometimes the cause, and when

Tumors in the orbit are sometimes the cause, and when not of a cancerous kind, the cure will depend on their extirpation. Ware's Remarks on the Ophthalmy, &c.

ECTYROTICA, from the fame. Medicines which ECTYROTICA, cause miscarriage.

ECTYLOTICA. So Horftius calls medicines that

destroy callosties.

ECZEMA, from \(\xi\_{\text{su}}\), to boil, or to be bot. An hot ECZESMA, painful puttule.

EDELPHUS. So Paraceltus calls one who makes

EDELPHUS. So Paracellus calls one who makes prognostics from the nature of the elements.

EDENTULUS. WITHOUT TEETH.

EDERA QUINQUEFOLIA. A name of the vitis quinquefolia Canadenis, feandens.

EDERA TRIFOLIA. See TOXICODENDRON.

EDES. EDETS, AURUM ELIMPIUM. See AMBER.

EDESSENUM PELARIUM. The name of a collytium in Actions.

tium in Actius.

EDIC, EDICH, OF EDIR. IRON. See FERRUM.

EDINBURGENENSIS PULVIS. EDINBURGH POW-DER, also called antimonial falt. It is a preparation of antimony, similar to the emetic tartar; the preparation is kept a secret by those who prepare it. As a sebrifuge, it is reckoned a specific: it is soluble in water; invariably of the same strength; and the dose such, that a grain or two over or under, is not attended with inconvenience. It is probably the antimonium tartarifatum, prepared with merc. vitæ, instead of the antimon. vitrisic. See TART. EMETIC.

EDRA. A fractured bone, in which, befide the fracture, there is an impression from the instrument by which

was broken.

EDULCORANTIA. EDULCORANTS. See ABSOR-

EDULCORATIO. Sweetening with fugar or ho-

EDULCORATIO. Sweetening with fugar or honey. But in chemiftry, it is the rendering preparations fweet, that is, mild, by depriving them of their actimony: this is done by repeated affusions of water; thus the acid and other faline fubstances are washed from them.

EFFERVESCENTIA. EFFERVESCENCE. It fignifies a slight degree of ebullition in liquors exposed to a due degree of heat. The chemists apply it to that ebullition which is excited by mixing an acid and alkali together: if the effervescence produces heat, they call it a hot effervescence; it cold, a cold effervescence.

Some confound it with fermentation; but Boerhaave

Some confound it with fermentation; but Boerhaave judiciously limits fermentation to that commotion in vegetable juices which produces a vinous or an acctous li-quor, and calls those ebullitions that are produced by the

mixture of bodies effervescencies.

EFFIDES. CERUSS.
EFFILA. FRECKLES.
EFFLORATIO, OF EFFLORESCENTIA. Scc Exan-

EFFLUVIA. Minute particles which exhale from bodies. By these effluvia from morbid bodies contagion

is propagated. See Contagion.

EFFCETE, from ex and fatur. BARREN, childless. But figuratively, it is any thing that is so decayed as to have lost its virtue.

EFFRACTURA. A species of fracture of the cranium when the bone is broken and much depressed by a

EGELO. NARROW-LEAVED LABURNUM.
EGESTIO. EXCRETION. Generally used with respect to evacuations by stool.
EJACULANTIA.

The vessels which reEJACULATORIA VASA. Series the feminal matter elaborated in the testicles, and convey it to the penis. These are the epididymis, the deferentia vasa, the vesicular feminales, and the prostata.

FILAMIDES, from 40.40, to involve. The meninges or membranes of the brain, viz. the dura and pia mater.

EILEMA, from unity, to firm convolutions. In Hip. de Flatib, it fignifies painful convolutions of the intellines, from flatulence. Sometimes it fignifies a covering. Vogel fays it is a fixed pain in the guts, as if a nail was driven in.

EILEON, from man, to wind. Gorraus fays it is a

name of the intestinum ileum.

EILEOS, from was, to form convolutions. The ILIAC

EISBOLE, from ng, into, and βαλλω, to caft. It fig-nifies flrictly an injection, but is used to express the access of a distemper, or of a particular paroxysm.

EISPNOE, from us, in, and wnu, to breathe. INSPI-

EL. BOT. An abbreviation of elements of botany. ELA-CALLI. An East Indian shrub, whose juice is an excellent cathartic in dropsies. Raii Hist. ELEAGNUS ORIENTALIS. See JUJUBA.

ELÆAGNON, See AGNUS CASTUS. ELÆAGNUS, called also thus myrtifolia Belgica, gale, chamalaagnus, rbut fylveftris, myrtus Brabantica aut Anglica. Gaule; sweet willow, or Durch

MYRTLE.

It grows in heaths, and uncultivated foils, in marshy and watery places; it flowers in May and June. It is very bitter. Some use the flowers in ale instead of hops. very bitter. In fome countries it is held in much efteem, but hath not obtained with us. Boerhaave reckons up three species. It is also a name for the WILD OLIVE.

It is also a name for the WILD of LIVE.

ELÆOMELI, from ελαεν, είλ, and μελε, benry. In Syria this oil is prepared from the buds of a certain tree, though fome fay from the trunk; it is sweet, thicker than honey, and of a purging quality. See Dios. lib. i. c. 37.

ELÆOSACCHARUM, from ελαεν, είλ, and σακχαρ, sugar. A mixture of effential oil with fugar is thus named and the sharman. This oil requires at least eight or the state of the sharman.

in pharmacy. This oil requires at least eight or ten times its quantity of fugar, which should be well rubbed with it, and kept close in a phial. In the effential oil of vegetables resides most of the virtues that are communicated to water, or to vinous spirit by distillation; hence, if a proper quantity of water or of vinous spirit be added if a proper quantity of water or of vinous spirit be added to these elæosaccharums, a water is immediately produced of similar essence with a distilled water.

ELAMBICATIO. A method of analyzing mineral waters, to investigate their virtues.

ELANULA. Alum as hard as iron.

ELAPHICON. A name for elaphosboscum.

ELAPHOBOSCON. See Sisarum.

ELAPHOBOSCOM. See Pastinaca sylvestris.

ELAPHOPILA. The hairs collected in the stomach of a stag, and formed there into a ball. See Ceavis.

of a stag, and formed there into a ball. See CERVUS. ELAPHOSCORODON. STAG'S OF VIPER'S GARLIC.

ELAPS. A ferpent whose bite produces a diforder like the iliac passion.

ELAQUIR. RED VITRIOL.

ELAS MARIS. BURNT LEAD. ELASIS. The fame as elasticitas. ELASMA, from exame, to impel. A lamina or plate of

any kind. But it is used to express a clyster-pipe.

ELASTICITAS. ELASIS, ELATER. ELASTICITY, from traure, to impel, or repel.

It is the property in bodies by which they reftore themfelves fpontaneoully to the figure and dimensions which they had lost by the action of some other body applied to them.

ELATE. So the ancients call the vagina which incloses the flowers and rudiments of the fruit of the great

palm-tree.

ELATE THELEIA. See ABIES. ELATER. See ELASTICITAS. ELATERIUM. See THURIS CORTEX; and also, fides its application to the wild cucumber, and its preparations, fee CUCUMIS AGRESTIS; it is often used in Hippocrates to express an external application of a digestive or a detergent nature.

ELATHERIA. See THURIS CORTEX.

ELATINE, also called Veronica farmina, linaria, FRMALE FLUELLIN, FEMALE SPEEDWELL. The species
used in medicine is the antirrhinum elatine, Linn. Boerhaave places it as a species of linaria, of which he reckons
twenty-two species. The elatine is a low procumbent

plant, with oval accuminated leaves, that are downy; the flowers are purplish coloured; it grows annually in corn-fields, and flowers in July.

The leaves have a rough bitterift tafte, and but little fmell; both water and spirit extract their whole virtue. The expressed juice may be given to three or four ounces three times a day; but its medicinal power has not kept it a place in practice

ELATINUM OLEUM. The name of an oil in Diof-

ELCOSIS. Numerous, or large chronic ulcers, carious, fœtid, and attended with a flow fever.

ELECTARIUM. An ELECTARY. Electrics are of the fame confiltence and materials as bolufes, and in chronic difeases, where the exactness of doses is not necessary, and the long continuance of the medicine requires the concifeft form this is better than bolufes, powders, or draughts. Electories for keeping in the shops require a care to avoid such things as will destroy one another by being combined: aftringents and agglutinants fpoil by being mixed with fugar; alkalies and acids will ferment if they lie together; naufeous, bitter ingredients are improper for this form; fteel, antimony, and Æthiops mi-neral, because of their colour, are best made up in pills; but the colour of cinnabar is improved by mixture with the conferve of rofes or hips. The confitence of elettaries should be fuch as neither candies nor ferments,

Extemporaneous electories should not exceed two or three ounces, half of which is conserve; but this is not a fixed rule; for the confideration of how much of the medicine can conveniently be given for one dofe is fometimes to be attended to: when the ingredients are ungrateful, they are best to take if mixed up with mucilage and a folution of liquorice juice. See Lemery's Univer-

fal Pharmacopecia.

ELECTIO. ELECTION. That part of pharmacy which confifts in a knowledge of the various simples which compose the materia medica, and directs the choice of drugs, distinguishing the good from the bad.

ELECTRODES, from \*\*Newtypo\*\*, amber. An epithet

for ftools which finne like amber.

ELECTRON. AMBER. See Succision. It is also
ELECTRUM. Is mixture of gold with a fifth part

ELECTRUM MINERALE. The tincture of metals is ELECTRUM MINERALE. The tincture of metals is made of tin and copper, to which some add gold, and double its quantity of martial regulus of antimony, melted together; from these there results a metallic mass, to which some chemists have given the name of electrum minerale. This mass is powdered and detonated with nitre and charcoal to a kind of scoria; then it is powdered again whilst hot, and then digested in spirit of wine, whence a tincture is obtained of a fine red colour. This sincture is a deobstruent. tincture is a deobstruent.

ELECTUARIUM è SENNA, formerly called ELEC-

TARIUM LENITIVUM. See SENNA.

ELEGIA. See ARUNDO SCRIPTORIA. ELELISPHACOS. SAGE.

ELEMBRAT. See ALEMBROTH.
ELEMENTUM. An ELEMENT. Galen fays the element of any thing is the fmalleft and most minute part of that thing whose element it is. Others define it others wife; but what one philosopher afferts, others prove to

Among the chemists, fire, air, water, and earth, are called elements; also primary principles.

ELEMI, called also Icicariba icica. Gum ELEMI.

It is a dry refinous fubstance; the best is brought from It is a dry refinous substance; the best is brought from the East Indies and Æthiopia; an inferior fort is the pro-duce of a kind of olive-tree in the Spanish West Indies; the amyris elemifera. Linn. What we have from the East is wrapped in siag leaves; is softish, somewhat trans-parent; of a pale whitish yellow colour, inclining to green; instammable, and of an agreeable slavour when melting; to the taste it is bitterish; it dissolves totally in rectified spirit of wine; by distillation with water about one ounce of essential oil is obtained from sixteen of the

Its chief use is as a digestive in the form of an oint-ment: the London College gives the following prescrip-tion, in which it is the chief ingredient.

Ungentum Elemi. OINTMENT of ELEMI.

Take of tried mutton fuet fresh, two pounds; of gum elemi, one pound; of common turpentine, ten ounces. Melt the gum with the fuet; and all being removed from the fire, add forthwith the turpentine, and, while the mixture is fluid, strain it.

This is one of the best of the officinal digestives. Arcreus was its first prescriber, and from him it was sormerly called sinimentum vel balfamum Arcai. See Lewis's Mat. Med. Neumann's Chem. Works. ELEMNIFERA CURASSAVICA ARBOR. The

GUM ELEMI-TREE, called also Mytobalanura Zeylonica:

AMYRIS. See ELEMI.

ELENGI. A tall tree which grows in Malabar, and bears fragrant flowers, effected for their cordial quality. ELEOSELINUM, from exos, a fen, and sexues, parfley.

A name for smallage. See Apium. ELEPHANTIA. A fort of anafarca.

ELEPHANTIA ARABUM. According to fome it is the elephantiasis, when the feet are swelled and hard. In Dr. Cuilen's Nosology, is is synonymous with elephantiasis.

ELEPHANTIASIS, called also elephani Lozari merbus

vel malum; Phænicius morbus. It is generally ranked as a fpecies of leprofy; fee Lepra Arabum. Some fay it is the highest degree of skin diseases; and others distinguish it from the leprofy by having its feat in the siefly, whilst the leprofy only affects the skin, or, at the most, the integuments. This disorder receives its name from its affecting the legs to as to make them refemble those lities

Dr. Cullen places this genus of difease in the class ca-

chexize, and order impetigines.

Dr. Towne affures us, that negroes are very commonly the subjects of this diforder, and that it bears a great af-finity to the best account we have of the lepra of the Arabians. He fays those are the most subject to it, who, after fevere acute fevers, long continued intermittents, or other tedious illnesses, are either much exposed to the inclemency of rainy seasons, and the cold dews of the evening, or who are constrained to subsist on bad dier.

On the first attack, the patient complains of shiverings; these continue a few hours, and are succeeded by a pain in the head, back, and loins; a nausea and vomiting soon follow, with pain in one of the inguinal glands (never in both); a severe sever follows; the gland reddens, becomes hard, but feldom suppurates; a red streak run down the thigh, from the swelled gland to the leg, almost an inch broad, and of a slesh colour; this streak soon swells, and then the fever abates, and the matter is thrown upon the leg by an imperfect crisis. By degrees the leg is more and more tumefied, and the veins are formed into large and more tumefied, and the veins are formed into large varices, which are very apparent from the knee downward to the toes. After this, the fkin grows rugged and unequal, a fealy fubflance foon forms itfelf on it, with fiffures here and there. These seales do not dry off, but are daily protruded forward, until the leg is greatly enlarged. Though this scaly substance appears harsh and insensible, if it is very superficially touched with the point of a lancet, the blood freely oozes out. Notwithstanding the monstrous size of the diseased leg, the appetite remains good, and in all other respects the patient is healthy: many of them continue thus for twenty years or healthy: many of them continue thus for twenty years or more, and make no other complaint than what the enormous fize of the leg occasions. It rarely happens that both legs are affected. White people are afflicted with this diforder when subjected to the same circumstances that are the apparent cause in blacks.

This disease is infectious, and often found to be here-

ditary.

The cure is uncertain: however, after cleanfing the first passages, warm perspiratives may be mixed with antimonial, and administered with the bark. The diet and other helps should all conduce to increase the vis vitæ. Mercury is faid by some to be injurious; but the experience of other passages in the fail based with ence of others manifests its usefulness, when joined with the above-named remedies.

Aretæus describes the elephantiasis with great accuracy. Towne is particular in the account of it. See Turner also in his Diseases of the Skin, and Brooks's Practice of Phyfic.

In the Lond. Med. Trans. vol. i. p. 23, &c. is inserted a description of the elephantiass, as it appears at Madeira, and also the method which in one instance was attended shrubby, downy plant, clothed with long very narrow

with fuccefs. In this country the diforder appears at first in the form of tubercles on any or all parts of the body; in time they ulcerate: if they happen on the beard or eye-brows, the hairs there fall off, but this does not happen on the head. The legs swell, and are hard, white scales cover them, and fissures appear here and there, though in some instances the legs are emaciated and full of ulcers. Many other party discrepable symptoms are of ulcers. Many other very difagreeable fymptoms are observed in different patients.

None are observed to receive this disorder from others by contact, but generally the children of the diseased are

fubject to it.

The bark, with the following embrocation and bliftering, proved curative, after mercurials and antimonials failed.

ELUTHERIA. See Thuris cortex.

ELUTRIATIO. Washing over. It is the pouring of liquor out of one veffel into another, in order to teparate the fubfiding matter from the clear and fluid part.

ELUVIES. In Pechlinus it imports the humour differenced in a fluor albus.

charged in a fluor albus. ELUXATIO. See LUXATIO.

ELYMAGEOSTIS. Names of the panicum.

ELYTRON, from thum, to involve, or cover, a covering or sheath. Hippocrates calls the membranes which involve the fpinal marrow shope.

ELZIMAR. See ÆRIS FLOS.

EMACIANTES. Difeases that occasion a wasting of

the whole body.

EMANSIO. Etmuller uses this word instead of Supproffie, when speaking of suppressed menses. Emansis menfium is the retention or ablence of the menfes beyond their usual period of appearing. See AMENORRHOEA. EMARGINATO. To EMARGINATE. To cleanse

a wound of the fcurf, &c. about its edge.

EMARGINATUS. Thefe leaves of plants which are hollowed at their extremities, fo as to form a heart, are called emarginated leaves.

EMASCULATIS. See MALAZISSATUS.

EMBAMMA, vel bamma, from Banle, to immerge, or dip. A fauce or pickle to dip victuals in. Muftard is a kind of embamma. See APOBAMMA EMBAPHION. A cruet for containing embammas.

EMBASIS, from er, and Baist, to go. A deep bason or tub filled with water for fwimming in, called dexamene.

EMBELG. See Myrobalani emblici.

EMBOLE, from queansu, to put in. The reduction

or fetting of a diflocated bone.

EMBORISMA. An ANEURISM.

EMBOTUM. A funnel conveying fumes into any orifice of the body.

EMBREGMA, I from subject us, to moissen, sprinkle, EMBROCATIO, or soak in. EMBROCATION. It is an external application in a fluid form, usually prepared of volatile and spirituous ingredients, and mostly used to relieve pains, numbness, or passes. See Lotio.

EMBROCHE, from emergence, to make wet, i. c. Em-

brocatio, or fomentatio.

EMBRONTETOS, from βροσ]α, thunder. Properly it is one thunder-firuck; and from a fimilarity of effects, it is applied to apoplectic persons.

EMBRYON. An EMBRIO, from εν, in, and βρου, to pullulate, or bud forth. Thus the child in the womb is called, because it buds forth in the internal parts. So Hippocrates calls the child in the womb when in its third stage, that is, before it is a complete child. See CUEMA, CONCEPTIO.

Galen fays, that the Greeks did not call the feetus un-der two months old by the name of embryon, but named it cuema; but others fay it is embryon during the whole time of its being in the womb. Homer applies the term embryon to the feetus of brutes; and Theophrastus does the fame with respect to the seeds of plants, and they are followed in the fame by all the moderns.

EMBRYONATUM. See ANTIM. SULPH. PRÆCI-

EMBRYONUM BALS. vel Spr. It is a prefcrip-tion of Bates; but in point of excellency it is exceeded by a mixture of the spirituous anisced water, and simple

EMBRYOTHLASTES, from tucquer, a fatus, and sau, to break. An inftrument to break the bones of a feetus, in order to its more eafy delivery. It is also a

CROTCHET for extracting a foctus. EMBRYOTOMIA. EMBRIOTOMY. From excepts, a fatus, and repres, to cut. It is a cutting of the child whilst in the womb, in order to its easier delivery.

EMBRYULCUS. It is when the embryotomy is made

use of for delivering a child from the womb.

EMBRYULCIA, from eucepoor, a fatus, and exau, to draw. An hook for the extraction of a child when ladraw. An hook for the extraction of a child when labour is difficult. In the present practice of midwifry, as circumstances vary, the farms is drawn away from the uterus by the CURVED FORCEPS, the STRAIT FORCEPS, the BLUNT HOOK, or the CROTCHET; the latter of these wounds, and so generally kills the child, but its delivery is only expedited and facilitated by the other three.

The blunt hook is used when the child presents with its breech, and the pains are not sufficient for effecting its delivery. In this case, the hook is carefully to be fix-

its delivery. In this case, the hook is carefully to be fix-ELYMOS. Names of the panicum. ed in the groin of the child, and as the pains return, na-ELYTHROIDES or Elithroides, from extraper, vagina, ture must be affished by gently pulling with the hook;

but if much strength is required it is still better to leave the delivery to the usual assistance of the hands only with the labour-pains, because the hook may diflocate or break the thigh of the child. When the hook is used, it should be taken away as foon as the finger can be fixed in the child's groin, for thus the danger is much leffened.

The crotchets are used in the same manner as the forceps, except that the crotchet having a hook as its point,

is forced into the part to which it is applied.

Is forced into the part to which it is applied.

The strait forceps are used for bringing the head of the child forward, when by reason of its size, or the want of pains, it cannot otherwise be protruded; but much care should be had in using them. They are never necessary whilst the head is above the brim of the pelvis; and indeed very rarely when it hath descended lower. Dr. Hunter absolutely forbids their use if they can possibly be avoided, and that consistent with the fastety of the child; for if time is allowed, the parts will dilate, and the head will be mounted to as to rask with the least the head will be moulded fo as to pass with the least possible violence.

The forceps, as improved by Smellie, are the best; he reduced their length, to prevent their being used before the head is sufficiently low. They should not be applied before the ears can be felt, and before using them, the

following rules should be observed.

1. The external parts should be fufficiently dilated. The exact fituation of the child's head should be known; and this is best discovered by feeling one car.

3. A finger should be in the os internum to guide the forceps, left a part of the uterus itself should be included in them. When the finger cannot be thus introduced, great care is required in passing the forceps along the fide of the child's head.

4. The blades of the forceps should be well greafed be-

fore they are introduced.

5. If poslible apply the blades over the child's ears, for thus they are placed on the narrowest part of the head; when this cannot be done, fix one before one car, and

the other behind the opposite one.

6. The forceps should be passed up in the direction of a line, that would be supposed to pass through betwixt the navel and the scrobiculus cordis; at the same time keeping the handles as far back as the perinæum will eafily admit. When the forceps are fecure, pull them from blade to blade, for otherwise they are apt to slip off.
7. The handles should be tied tight before the operator

begins to pull downwards with them; and when the two blades are locked, the lock should be about an inch from the child's head.

8. As the child's head advances, the operator flould alternately reft and pull while the perinaum is on the ftretch, and until the vertex is brought from under the os pubis; then the handles of the forceps being gradually railed towards the mother's belly, and the pulling repeated with caution, whilft with one hand the perinteum is fupported, the forchead will be freed from it. The forceps are now to be taken away, and the delivery finished

as is ufual, with the hands alone.

The different cases in which these forceps are required, may be feen under the article PRÆSENTATIO.

The LONG CURVED FORCEPS. They were invented by The LONG CURVED FORCEPS. They were invented by Smellie, with a view to faving the life of the child when the body being delivered, the head could not be brought away in the ufual manner. In this cafe, the crotchet was formerly ufed. Thefe forceps are longer than the straight ones, because they are applied when the head of the child is above the brim of the pelvis; but as it can very rarely happen that where the buttocks have passed (especially when doubled, as in breech presentations) the head will be detained; these instruments will hardly ever be required. Indeed when the head is fenarated from the quired. Indeed when the head is separated from the body, and left in the uterus, if the pelvis is much diftorted, the long curved forceps may fometimes be preferable to the ftreight ones; but in this cafe, if the fize of the head is leffened by emptying it of part of the brain, the delivery may generally be effected by one hand and one crotchet.

AMERICANUS. See INDICUM.

EMESIA, EMESMA, and EMETOS, from euto, to po-

EMESIA, EMESMA, and EMETOS, from sute, to ve-mit, the action of vemiting.

EMETICA, EMETIC, from sute, to vemit. The be-nefit of emetics in case of poisonous or other offensive subjects being lodged in the stomach, arises from their evacuating power, and not only clears the stomach, but the upper parts of the intestines; besides, from the shock which they give to the general frame, they are highly useful; they also evacuate bile, and prevent stagnations happening in the system of the vena portarum, which often lay the foundation of the most obstinate complaints; nor is the compression alone consisted to the liver which nor is the compression alone confined to the liver which they give, but the whole abdominal vifcera experiences the good effects, as also those of the thorax; and clear the intestines downwards; besides they excite the force of the circulation in every part of the lystem, and deter-mine the sluids to the surface of the body, from all which circumstances much general utility may be derived in practice.

Medicines of this kind act by irritation, the effect of which is a conatus nature to expel fomething obnoxious; hence a cathartic in an over dofe often proves emetic.

When emetics are administered, if bleeding is also required, that operation should be first performed. If the patient is costive, or if he hath a serous plethora, purging should precede the use of emetics, especially in children. Fat people should take emetics on an empty stomach, after using brisk exercise about noon; and thin

mach, after using britk exercise about noon; and thin people should take them about an hour or two after eating.

During the operation of an emetic, the person should see that the discharges will be much more easy. Though drinking freely generally assists the operation of these medicines; yet if two or three draughts do not come up, the throat should be tickled with a seather, or a few grains of white vitriol may be swallowed, because by drinking more, the stomach may be so distended as not to be able to circle its contents. to eject its contents.

In all feverith paroxyfms, inflammations of the ftomach, fpafms in the ftomach from anger, hysterics, &c. congestions of blood in the upper parts; if on any account an emetic is indicated, bleeding should precede, and the

plethora be removed.

A decoction of the bulbous roots of common daffodil is one of the gentlest emetics in the materia medica. Horfe-radish and mustard are diuretics as well as gentle emetics, and as they discharge only the contents of the flomach, their use is the safer in cases which do not admit of more active ones. A tea spoonful of the flour of mustard may be added to each pint of warm water, and repeated as required.

In venereal diforders, the hydrargyrus vitriolae. has been thought the most proper. In old chronic complaints, antimonial emetics are to be preferred, as they are attenuating and deobstruent. In maniae cases, antimonials are never to be omitted. When possons are swallowed, the zincum vitriolatum purificatum is the best adapted

for speedy relief.

The ulefulness of emetics extends very far into medical practice. When the menses are excellive from any obitruction in the returning veffels, an emetic may procure relief; and when the menses are suppressed, emetics powerfully assist in restoring their due course, if taken a little before the time of their usual return. The head-ach attending youth at the age of puberty is much relieved by this discharge. The vomiting which so frequently is attendant during pregnancy, is much relieved by frequent small doses of the pulv. ipecae. Two, and from that to fix grains, may be now and then given, to restrain the frequency and violence of these discharges; and the grainings in consequence of the inec. is far less than those relief; and when the mentes are suppressed, emetics powftrainings in confequence of the ipec. is far lefs than those

Those who are violently strained by emetics, those who

have ruptures, or aneurisms, as also those whose viscera lients act upon the parts to which they are immediately

An opiate should generally succeed an emetic; and when these evacuants are too powerful, or operate more than is required, opiates greatly reduce their efficacy; common falt given in the gruel will turn the operation of emeties downwards; a fpoonful of brandy fometimes fucceeds in checking their action; mild oils, grateful acids, and aromatics, are also efficacious helps.

On the subject of emetics, Dr. Fothergill's Inaugural Differtation (a translation of which is in that edition of his works published by Dr. Lettsom) may be read with considerable advantages. In this publication, besides the many occasional remarks on other important subjects, the doctor very advantageously dwells, I. On the action of vomiting, and the various means used to excite it; he attends to emetics with respect to their strength or different power on the stomach. 2. The use of emetics considered as stimulants. 3. The use of emetics as evacuants. 4. The uses of emetics, arising from their mechanical force: this last division he concludes with observations on some diseases in which emetics may be hurtful. In the course of his remarks under the above divisions, most diseases are noticed which are benefited by emetics operating in any one of those modes. But such is the importance of every part of his performance, that to felect would leave too much; it is therefore thought best, after a general infor-mation of its contents, to urge the perusal of the work itself, on every inquirer into the subject.

EMETICUM MITE. The mild emetic of Boerhaave

is made by deflagrating one part of crude antimony with two of nitre. By this process, not only all the sulphur, but much of the phlogiston of the regulus is consumed; it is therefore mild.

EMETICUM VINUM. See ANTIMONIALE VINUM. EMETOCATHARTICUM. A medicine which ope-

EMETOCATHARTICUM. A medicine which operates by vomit and by flool.

EMEU, also called eme, casear, casearis; the Cassowary. It is a large bird of the offrich kind.

The emeu and cassowary are generally spoken of as one, but they are different birds. The emeu is met with in South America, and the cassowary in the Molucca islands. See Goldsinth's History of the Earth and animated Nature and the cassowary in the Molucca islands.

EMISSARIUM. An EMISSARY. In medicine it is any orifice of the body, whether natural or morbid, out

of which any thing is emitted.

EMMENAGOGA, EMMENAGOGUES, from touterea, the menfirual difebarges, and are, to draw, lead, or force. They are fuch medicines as promote the difebarge of the menstrual flux. Of these the principal are the fetid gums, aromatics, aloetics, chalybeats, and the prepara-tions of black hellebore. Some medicines ranked un-der this class produce their effect by lessening irritations, others by their stimuli. When spasms in the vessels obthruck, mugwort powerfully relaxes; caftor, faffron, or borax do the fame. The ftimulating kinds should not be given, except the body is full of good blood and juices; for as they urge to an excretion, they cause a discharge of what cannot be spared until then. A third kind of emmenageques are, whatever conduces to fill the body with healthy fluids. But on this subject there is great uncertainty, few, if any of this class having been found to answer the expectation of the practitioner, indeed so little fo, that one cannot almost in any case of amenorrheea with much confidence promise success; however the general doctrine at practical standards and the the same and neral doctrine at present stands, that the medicines which are to be employed in both the states of amenorshora, are chiefly those, which strengthen, and increase the ac-tion of the vessels of the uterus.

EMMENIA, from per, a month. The menstrual dif-

EMMOTOS, from µ0705, lint. An epithet for perfons, parts of the body, or diforders that require lint for

EMODIA. A STUPOR of the TEETH.

EMOLLIENTIA. EMOLLIENTS. Medicines of this class relax and supple the solids; they also sheathe and soften the asperity of the suids. When externally applied, they are termed emollients; but if internally adminished they are termed emollients. nistered, demulcents seems to be their properest appella-tion. See DEMULCENTIA. Dr. Cullen says, that emol-external parts, and in many instances of putrid severs.

are unfound, flould be cautious in the use of these Herculean remedies.

An opiate should generally succeed an emetic; and or by being infinuated into the interftices of dry particles, they diminish the friction, that might otherwise occur, and thereby render the whole more flexible. The former feems to be the operation of water, the latter of oil.

Emollient topics are formed of water, oily, and mucilaginous fubstances. Water, particularly when assisted by a moderate heat, is plentifully absorbed from the whole furface of our body; it powerfully relaxes and di-lutes, being mifeible with almost every animal fluid. Oil relaxes and obtunds what is acrid; and mucilage also sheathes sharp humours. In compositions of this kind, the aqueous part should be freely allowed; for the mucilages require to be largely diluted; gentle friction on the part increases their efficacy, and as to the heat with which they are applied, it should not exceed what produces a pleasing sensation. From the relaxing quality of emollient topics, and their sheathing of acrimony, it is that they are good sedative applications, when pain from tension, or from irritation, is excited: from the sympathy of the nerves their efficacy is conveyed also to distant and deepfeated parts, and thus it is that the warm bath proves to powerful a fedative. From the fame principles these applications rank with antispasmodics. Emollients, by relaxing the fibres, and increasing the congestion of fluids, promote fuppuration; and laftly, the heat with which they are applied concurs with their other effects to rank them with the tribe of feptics; their oily parts parti-cularly dispose them to a putrid acrid acrimony. See Aikin's Observations on the external Use of Preparations

of Lead, p. 29, &c. EMOTIO. When this word is used with respect to the mind, and in a medical fenfe, it fignifies a delirium; when relative to fome bone, a luxation is to be under-

EMPASMA, from warsu, to sprinkle upon. See CA-

EMPEROS. MUTILATED.

EMPETRUM It is a plant which refembles heath. See ALYPUM.

EMPETRUM MONTANUM FRUCTU NIGRO, called also erica baccifera procumbens nigra, erica coris folio; BLACK-BERRIED HEATH, CROW-BERRIES, and CRAKE-BERRIES.

- LUSITANICUM FRUCTU ALEO, called also erica

erella baccis candidis, and erica coris folio.

THYMELÆÆ FOLIIS, also called fanamunda, and SEA-HEATH. This last fort grows on the coast of Andalusia, it flowers in February. A dram of the root purges strongly. About Gibraltar it is called burhalaga, but is there only used to heat their ovens with.

EMPHRACTICA, frm epasse, to obstruct. Such to-pics as flop the pores when applied to the skin; also em-

EMPHRAGMA, from ceason, to obstruct. An IM-PEDIMENT, or OBSTRUCTION. Thus Hippocrates calls the parts of a child which present in an unnatural pos-ture, because they observed the birth. EMPHYSEMA, from posses, to instate. It is any sla-

tulent tumor, but by it is generally understood, a foft tumor arising from air being admitted into the cellular membrane. In Hippocrates it fignifies an inflation of the belly, and sometimes a tumer in general. When ruptures or tumors are of the flatulent kind they are called PHYsocele. Dr. Cullen means by the word pneumatofis, which is his general name for this discase, the swelling formed by air or elfe flatus or rarified fluids. He places it in the class cachexize and order intumescentize. species are, I. Pneumatosis spontanea; that is, when it happens without manifest cause. 2. Pneumatofis traumatica, when it happens from a wound in the thorax. 3.

Pneumatofis venenata, when the cause is from the swallowing of poison, or an external application of it. 4. Pneumatofis hysterica, when accompanied with hysterics.

The most frequent cause of this diforder, is the piercing of the pleura, and wounding the lungs by the pointed fragments of broken ribs, though it fometimes happens that an emphysema is produced in the lungs by lacerations therein, without any injury having happened to the pleura:

stances from a fixt to an elastic state. It never happens from pointed instruments, as the blood instantly stops the

An emphy/ema is manifest by a fost puffy swelling, in which case the skin appears gloffy, the tumor gives way on pressure, but that removed, it instantly returns, a crackling is perceived on stroking the emphy/ematous part; when the lungs are wounded, a troublesome cough attends, and the matter expectorated is mixed with blood; fometimes air escapes from the lungs into the cavity of the breaft, and not being discharged outwardly through the pleura, &c. it occasions great difficulty of breathing, anxiety, a fense of suffocation, stupor, a livid colour in the face, and if relief is not speedily obtained, the patient dies. The air detained in any part of the cellular mem-brane may produce a mortification there.

When these kind of tumors happen in putrid disorders, fomentations may be applied to them, made with equal parts of sharp vinegar and rectified spirit of wine; but when a wound is the cause, if the breathing is quick and laborious, bleed, and repeat the operation as often as this symptom renders it necessary. Punctures, or rather fmall incifions, may be made into the cellular membrane, with a lancet, or in different parts of the body; the air will thus be excluded, if gentle preffure is also made on the tumor: when the air is thus evacuated, a compress may be dipped in vinegar, and applied over the part where the wound is supposed to be; a tight bandage may secure it, and the patient should be directed to lie on the injured fide, to prevent a fresh afflux of air. Nitre, and pectoral emulsions, may be given to prevent internal suppura-tions. When the air is detained in the cavity of the breast, Mr. Hewson proposes to discharge it by a small opening made with a knife on the fore-part of the chest, which if, on the right-side, must be between the fifth and fixth ribs, because there the integuments are thin; but if on the left-fide, the opening must be betwixt the fe-venth and eighth, or betwixt the eighth and ninth ribs, the better to avoid wounding the pericardium. See Le Dran's Obf. No. 29; James's Med. Dict. Art. Fractura; and London Medical Observations and Inquiries, vol. ii. p. 17, &c. vol. iii. p. 28—36, 372—399. White's Surand London Medical Observations and Inquiries, vol. ii. p. 17, &c. vol. iii. p. 28—36, 372—399. White's Surgery, p. 78.

EMPIRICA SECTA. The EMPIRIC SECT. It was begun by Scrapion, fome fay Heracleon, &c. about 278 years before the birth of Christ.

Alexandria.

EMPIRICASE

Alexandria.

EMPIRICUS. An EMPIRIC, from πειρω, to experience, or εμπειρω, to try. In a good sense it is applied to such as found their practice on experience, and pay little regard to theory, but such only as is founded incontrovertably on facts, totally freed from all speculative ideas. In a bad fense it is an appellation bestowed on a set of quacks, who, without knowledge, pretend to perform miracles by some desperate nostrums, careless of the de-struction they create, labour only to pillage their unfortunate patients, generally at the expense of their health, and too often of their lives. For the difference between the empiric and dogmatift. See Percival's Effays Med. and Exp. vol. i.

EMPLASTICA, from \$\(\pu\pi\pi\assamp\assamp\), to obstruct, or spread upon; also emplattomarq. See EMPRACTICA.

EMPLASTRUM, from \$\(\pu\pi\pi\assamp\assamp\assamp\), to obstruct or spread

upon. PLASTER.

Plasters are compositions for external use; they do not poffels much medical virtue, and are chiefly employed to make retentive dreflings, or to keep the parts to which they are applied warm and tight. This they do more equally and fteadily than a bandage of linen can, efpeci-ally if there is no fwelling. They are composed of oily and unctuous substances, united with powders, into such a confiftence, that the compound may remain firm in the a consistence, that the compound may remain firm in the cold without flicking to the fingers; that it may be fost and pliable in a small heat; and that by the warmth of the human body it may be so tenacious, as readily to adhere. When a plaster is softened to the consistence of stiff honey, it is called cerate; when softened so as to spread easily whilst cold, yet not to run with the heat of the body, an ointment; and if betwixt the consistence of an ointment, an oil, and a limiment.

Calces of lead boiled with expressed oils unite with them

Putridity raifes the air both in vegetable and animal sub- into a plaster of a good confishence, and are a proper basis for feveral other plasters. Plasters may also be made of refins, gummy refins, &c. without wax, especially in extemporaneous prescription: but for officinals, these compositions are less proper, as they soon grow too fost in keeping, and fall flat in a warm air.

As some difference is observed in the hardness of a

plaster for the breast or stomach, and one that is to be applied to the limbs, the following proportions are generally observed. For a fost plaster take one ounce of exprefled oil, one ounce of wax, and half an ounce of any powder; for an harder, add an ounce more of wax, and half an ounce of powder.

EMPL. ADHÆSIVUM NIGRUM. The BLACK STICKING PLASTER, called also the LADY'S COURT PLASTER, and

the CHICHESTER PLASTER.

Diffolve twelve ounces of the gum Benjamin in twelve ounces of rectified spirit of wine, and strain the solution. In a separate vessel dissolve a pound of the best isinglass in five pints of pure water, then strain the solution. Mix these solutions together, and let them stand in a narrow veffel, that the groffer parts may fubfide: when the clear liquor is cold it will form a jelly, so, when spread, it must be near the fire to melt. This quantity suffices for spreading on ten yards of half-yard-wide silk; in order to which the silk must be stretched in a frame, then the mixture may be fpread on it with a sponge or brush: this must be done with the warmth of a fire. As each spreading dries, it must be repeated to the tenth or twelfth time; after which touch it lightly with the brush to give it a gloss.

Its use is too generally known to need any thing fur-ther being said, than to propose an easy substitute, which is as follows: dissolve a pound and a quarter of fine isin-glass in five pints of water, and before it cools spread it

on filk, in the fame manner as above directed.

— Anodynum. Take four pounds of common plasser, melt it over a gentle fire, with an ounce and a half of common black pitch. When this is spread, mix with each ounce weight of it half a dram of opium, and the same quantity of camphor in fine powder. This compolition is very efficacious in relieving old pains.

- ATTRAHENS. DRAWING PLASTER, now called

emplastrum ceræ; PLASTER of WAX.

Take yellow refin, yellow wax, of each three pounds; of tried mutton fuet, one pound. Melt all together, and

strain the mixture while it remains fluid.

This is given by the London College, to fupply the place of the melilot plaster; but plasters are not agreeable forms for dreffing with after the removal of a blitter; cerates, by being foster and less adhesive, are to be preferred: the ceratum spermatis ceti, or the ceratum refinæ slavæ, are good substitutes for this plaster.

- CANTHARIDIS. See CANTHARIDES. - CUMINI. See CUMINUM.

- COMMUNE. The COMMON PLASTER. Now

Take of olive oil, one gallon; of litharge finely powdered, five pounds; boil them together with about a quart of water over a gentle fire, continually fliring, till the oil and the litharge are united, and acquire the due confiftence of a plasser; and if the water is wasted before the operation is over, more water (previously made hot) must be poured on.

As foon as the mixture is warm begin to ftir it; in about four hours the boiling will be completed; but to ascertain this, drop a little on a tile to cool, by which you will eafily discover whether the litharge is dissolved or not; the boiling must be continued very gentle, or the plaster will be black, or perhaps boil over suddenly. If water should be added that is not very hot, the plaster would explode with violence and be wasted: this accident will happen with hot water, if the plaster is very hot. If the composition proves discoloured, the addition of a little white lead and oil will improve it; but if it is expected to be very white, nothing but a true client oil. expected to be very white, nothing but a true olive oil will do.

- Saponis. This is another composition in the Dispensatory of the London College; but, as sap is much more advantageously used in liquid forms, the practitioner will rarely be induced to apply it in that of a solid

EMPLASTRUM STOMACHUM. STOMACH PLASTER. with fymptoms of suppuration, and particularly if thick Now called emplastrum ladani, plaster of ladanum.

Take of foft labdanum three ounces; of frankincenfe one ounce; cinnamon and expressed oil of mace, of each half an ounce; of effential oil of mint, one dram: add to the frankincense melted first, the labdanum a little heated, till it becomes foft, and then the oil of mace; afterwards mix in the cinnamon with the oil of mint, and beat them together in a mass, in a warm mortar, and keep it in a vessel well closed.

These plasters should be frequently renewed to produce any effect, and should be applied on the five lower ribs of the left fide, towards the back.

EMPLATFOMENA. See EMPLASTICA.

EMPNEUMATOSIS, from surrew, to blow into, or inflate. An inflation of the flomach, the womb, or other

EMPORIUM. A MARKET-TOWN; but metaphorieaily applied to the SRAIN, which is the feat of all rational and fentitive transaction.

EMPRION, from wass, to face. SAW-LIKE. A kind of pulse mentioned by Galen, in which the artery is un-

equally differenced by Garett, in which the artery is an equally differenced in different parts.

EMPROSTHOTONOS, from emprovement, forwards, or before, and retre, to bend, or firsteh. It is when the body is bent forward and confined fo by a fpafmodic contraction. tion. Celfus, lib. iv. cap. 3, fays, it is a convulfive stiff-ness of the neck, by which the chin is fixed on the breast.

EMPTYSIS, from a jow, to fpit out. Aretzeus limits this word to a difcharge of blood by fpitting, when it comes only from the mouth, fauces, and parts adjacent.

EMPYEMA, from es, within, and were, put or matter. The ancients called all internal suppurations emprema; sec ECPYEMA. But at present this name is confined to a collection of purulent matter lying loose in the cavity of the breast, and lodging on the diaphragm. See Cullen's First Lines vol. ii. p. 375. edit. 4.

Arete, iib. i. de Caus. & Sign. Morb. Chron. cap. 9.

fays, "They who have purulent abfeeffes in the cavities of the body, whether within the thorax or below the diaphragm, if the pus be discharged upwards, are called news (empsi), if downwards, apostomatici. And if there be a suppuration in the thorax, and the pus be discharged through the lungs, it is called number." But the moderns account it only an empyema when purulent matter floats upon the diaphragm. If matter is lodged on both fides of the breatt, there are two empyemas. Dr. Cullen confiders the empyema, not as an original difease, but as a mode of terminating one; e. g. inflammation attacks the pleura, the membrane of the lungs, or of any part included in the thorax; this inflammation suppurates, and the discharge not being favoured with any other exit than into the easity of the cheft, this disease is produced. the cavity of the cheft, this difease is produced.

The pus, that forms an empyema, may be from an ab-feefs in the lungs, pleura, mediaftinum, pericardium, or diaphragm; or perhaps from that inflammatory exudation, or inspiffated ferum, which Dr. Hunter observes is formed into a kind of pus, and is often found in large quantities in the cavities of the breaft, belly, &c. Wounds in the breaft may also evacuate their matter into its cavity, and prove a cause of this disease. And Le Dran informs us that he met with instances of abscesses in the liver making a way through the diaphragm, and empty-ing themselves into the breast.

When any fluid matter is collected in the cavity of the breaft, it may be known by the following figns; the breathing is short and laborious; expiration is more difficult than infpiration; the patient perceives a fluctuation when particular motions are performed; fometimes there is an enlargement of the cavity of the thorax, and an one fide only, the patient cannot lie on the other; a flow fever, heat at the extremities of the fingers, hollowness of the eyes, &c. but as to the kind of matter which is lodged here, it can only be known by the nature of the diforder which preceded its accumulation, from the preceding and concomitant fymptoms. The matter may be water, blood or pussent of the matter may be water, blood or pussent differences and veins which go from the acrta and vena cava to the kidnies. According to the ancients, they firained, and, as it were, milked the ferum through the kidnies.

EMULGENTES ARTERIÆ & VENÆ. See REMULSIO, from emules. diforder which preceded its accumulation, from the pre-ceding and concomitant fymptoms. The matter may be water, blood or pus, and the latter of these may be suf-pected when there hath been an inflammatory disorder called EMULSIONS; though now the College of Phicians

If the matter of an empyema is not speedily expectorated, the patient dies of a confumption, with an heetic fever, which is always exasperated at night. If the mediaftinum is corroded through, upon opening the thorax a fudden fuffocation often enfues. If the empresa is of long flanding, the ftrength decayed, a colliquative diarrhoea comes on, with a wafting of the body, the operation, inflead of relieving, haftens the death of the patient. When this difference is the death of the patient. this diforder is merely local, the operation may fucceed; but if the habit is ftrumous, or otherwise unfound; if fever, coughing, thirst, and other symptoms, are either numerous or considerable in their degree, there is but small hope of a recovery. The operation is also ineffectual if the lungs adhere to the pleura, or if the matter lodged on the diaphragm was emptied from a cyfl.

The chirurgical operation by which relief is obtained takes its name from the difease, being called the operation for the operation of the operation to be voided by this operation are blood, matter, and water: Gooch gives a cafe in his Med. Obf. of air in the thorax producing the symptoms of an empyema; it passed through an ulcer in the lungs, but the ulcer healing, the air was evacuated by the operation for the empyema, and a complete cure was effected. But, except in cases of purulent matter, the affiftance of the furgeon is rarely required. Blood will be gradually abforbed; therefore, as is declared by Mr. Sharp, Mr. Pott, and other eminent practitioners, it need not be removed by any artificial

opening.

The manner of operating is to fix on the part for the be formed for the offending matter. Whether an open-ing is made by means of a knife or a trochar, as Albinus hath observed that the diaphragm on the right side ascends higher into the thorax than on the left, it may be proper to pierce on the right fide between the third and fourth spurious ribs, but on the left between the second and third; and at about half or two thirds of the distance from the sternum to the vertebra; for here the museless are thinneft, the artery is concealed under the rib, and the diaphragm at a due diftance. Matter lodged in both cavities of the thorax require that the operation be per-formed on each fide. See Hippocrates, Galen, Arctæus, Boerhaave, with Van Swieten's Comments, Le Dran's Operations, Sharp's Operations, Heifter's Surgery, Bell's Surgery, vol. ii. p. 383. Kirkland's Med. Surgery, vol. ii. p. 175. Pearfon's Principles of Surgery, vol. ii. p. 94. White's Surgery, p. 303.

EMPYEMATA. So the acients called suppurating

medicines; for they named an internal collection of pus,

empyema. EMPYI. Purulent or suppurated, or those who have

purulent abfeeffes internally.

EMPYREUMA, from εμπορευοι, to kindle, of πυρ, fire. In chemistry it is the offensive smell and taste which dis-

tilled waters, or other fubstances, receive from being too much exposed to the fire.

EMPYREUMATICA OLEA. EMPYREUMATIC OILS. These are sils both of the animal and vegetable kinds, which are diffilled with a heat greater than that of boiling water; for thus they receive a burnt finell. Some fpeak of these sile as being of one diffinct class, but they have nothing in common except that they are half burnt, they diffolve more or lefs in reclified fpirit of wine, are acrid, by repeated distillations they may be rendered volatile, and almost free from their disagreeable smell. They

are confidered as powerful antifpalmodies, that however in chief use is the slum animale.

EMPYROS. One labouring under a sever.

EMULGENS. EMULGENT, stroking or milking out.

It is applied to the arteries and veins which go from the

of the lungs, pleura, or other parts in the breaft, attended of London have rejected that term, and supplied it with

40

LAC. But generally they are made from farinaceous feeds, | times obtained by keeping the bowels lax. White's Sura which are beat up with some fluid, by which their oily parts are intimately blended with it. Their use is chiefly parts are intimately blended with it. Their use is chiefly for common drink in acute diforders. This form is perhaps the belt for administering camphor. For the emuli. com. amyg. arab. abforb. & camphorat, fee AMYGDALUS.

EMULSIO CAMPHORATA. See AMYGDALUS.
EMUNCTORIUM. An EMUNCTORY, from emungo,
to clean, wife away, or drain off. The passages in the
body, by which superstood matters are evacuated, are
called emunifories. The glands are also thus named, Particularly (according to the ancients) these which received ticularly (according to the ancients) those which received the excrements from the noble parts, as the parotides from the brain, the axillary glands from the heart, and the inguinal from the liver.

ENÆMOS, from aua, blood. So Hippocrates and Galen call fuch topical medicines as are appropriated to

bleeding wounds.

ENÆOREMA, from aussess to exalt, of ausses, sub-lime. It is the pendulous substance which floats in the middle of the urine, called also fublimamentum. Nubecula

ENARGES, from eggs, white, or evident. Hippocrates applied this as an epithet to dreams.

ENARGES, from eggs, white, or evident. Hippocrates applied this as an epithet to dreams.

ENARICYMON. See ARYCIMON.

ENARTHROSIS, from ey, and appear, a joint. The ancients called that species of diarribrofis thus, where the round end of one bone moves in the cavity of another; as the head of the femur in the acetabulum of the os inas the head of the femur in the acetabulum of the os innominatum. it is confidered as a fynonym to Genou. This species of articulation is also called the ball and

ENCHANTHIS, from ev, in, and send so, an angle of the eye. This diforder is an encyfled tumor on its inner angle. At the first a tubercle appears on the caruncula lachrymalis, or on the crescent-like red cuticle adjacent to it; afterwards this tumor extends over the pupil of the eye; when this happens the tears continually trickle down the cheeks, the fight is impaired, the countenance deformed, and the eyes inflamed.

When it is of a mild nature it may be destroyed by gentle escharotics; while this method of cure is proceed-ing, the belly should be kept lax, and an issue in the arm, or a perpetual blister between the shoulders should be

continued.

When this tumor is of a malignant kind, it is attended with pain, is of a livid hue, and often becomes cancerous. If it is manifeftly cancerous, palliatives only are to be used; but if not, dissect the whole tumor and its cyst; in doing which raife it with the forceps, the better to avoid cutting either the eye or the caruncle : if the latter is hurt, the tears will ever after run down the cheek; it is therefore fafer to leave a little of the luxuriant flesh, and to destroy it afterwards with a caustic. See ECTRO-PIUM, above; and Heister's Surgery, White's Sur-

gery, p. 231. ENCARDION, from xap \$100, the heart. The pith of

vegetables.
ENCARDIUM PREMNU. The heart and marrow of the trunk; but Dioscorides improperly calls the tender medullary fubstance which grows on the tops of the great palm-tree, thus.

ENCATALEPSIS. See CATALEPSIS.

ENCATHISMA, from eyeafenas, to fit in. A femi-

ENCAUMA, from w, in, and xais, to burn. The feoria of filver is thus named, fo is the mark left by a burn, and also a pushule which is produced by a burn.

A fuperficial ulceration on the eye is thus called. Actius fays that those ulcerations on the eyes which arise from defluxions of humours receive different names; as when one is formed on the pupil, covering a great part of it, and is of a bluish colour, it is called caligo: when an ulcer is not so wide, but is deeper, and also seated in the pupil, it is called nubecula: when the surface of the pupil appears rough, and of an afh colour, an epicauma is faid to be formed; and when after a fever an ulcer is formed, with a fordid cruft, and is feated either on the pupil or the white part of the eye, it is called an encauma, which, when fixed in the pupil, fuch an erofion of the coats of the eye happens, as in the end is the destruction of all its humours. In the beginning of these cases relief is some-

gery, p. 229. ENCAUSIS. ENCAUSIS. A BURN or SCALD; or rather the in-flammation caused by a burn or scald. It is also that action of heat upon the body, which external causes occasion, ei-ther the power of the sun, sire, or more vehement affections, &c. It is a fynonym with deuftio. The HEART-BURN, with thirst. In Dr. Cullen's Nofology it is fynonymous with crythema and ambuftio.
ENCAUSTUM CORULEUM. A name of the

powder called by washerwomen POWDER-BLUE. See

COBALTUM.

ENCEPHALON, from er, suithin, and \*spxxe, the bead. The encephalon includes the dura and pia mater, the cerebrum, the cerebellum, and the medulla oblon-

ENCEPHALOCELE. A RUPTURE the of BRAIN. ENCEPHALUS. The BRAIN. So Theophraftus calls the tender medullary fubftance which grows on the top of the great palm-tree.

ENCERIS, from xxeet, wax. Bits of wax found in

plasters as they cool.

ENCHARAXIS, from xapassu, to fearify. SCARIFI-

ENCHEIRESIS, from x109, the hand. Galen uses this word as part of the title to one of his works which treats of diffection. The word imports the manual treat-

ment of any subject.

ENCHILOMA. So Lemery says an elixir is some-

times called.

ENCHONDROS, from xorfgos, which fignifies both a grain, and a cartilage. Hence implies both granulated and cartilaginous.

ENCHORIOS, from er, and guess, a region or country.

ENDEMICAL

ENCHRISTA. Liquid medicines for anointing any part with.

ENCHUSA. See ANCHUSA.

ENCHYMA, from exxes, to infuse. Infusion, or a fanguine plethora.

ENCHYMATA. Liquid medicines to be infufed into

ENCHYMOMA. BLUSHING. Dr. Hunter fays this is a nervous affection. It is from ergos, I pour in. In the writings of the ancient physicians, it is a word by which they express that sudden effusion of blood into the cutaneous veffels, which arises from joy, anger, or shame; and in this last instance, is what is usually called blushing.

ENCHYMOSIS. BLUSHING; also an extravalation of blood which makes the part appear livid. Thus, but im-

perly, it is fynonymous with ecchymefis.

ENCHYSA, ALKANET. See ANCHUSA.

ENCHYTOS. An epithet for any thing infufed into any cavity of the body.
ENCLYSMA. A CLYSTER.

ENCELIA, from es, in, and zozasa, the belly. All the contents of the abdomen.

ENCOLPISMOS. An uterine injection.

ENCOPE, from ey, in, and xon 70, to cut. An incifion, and figuratively an impediment. ENCRANION. The CEREBELLUM, from ev, in, and

ENCRIS. A fort of cake made of fine meal, boiled in oil, then fweetened with honey.

ENCYMON, from 17 Now, to conceive. Pregnant with

ENCYSTIS.

ENCYSTIS. A WEN.
ENDEDINEMENOS, from www. to turn round like a vertex. An epithet for the eyes which perpetually turn in their orbits. ENDEIXIS.

ENDEIXIS. An INDICATION.
EMDEMIAS, or ENDEMIUS, from 19, and 80,000, people. An epithet for difeases to which the inhabitants of particular contries are subject more than others.

ENDESIS, from Sta, to tie. A LIGATURE, band, or

ENDICA. Rulandus fays it is the freces at the bot-

tom. It is also called mose bazuania.

ENDIVIA, called also intybus, scariola, seriola, cicho-reum, latifolium, ENDIVE. This plant is in common use in our kitchens: it very much resembles success both in its appearance and virtues.

- ERECTA. See HYOSERIS ANGUSTIFOLIA

ENDIVIA ERECTA LUTEA NAPIFOLIA. See LAMP-1 SANA

LUTEA. A name for the cichoreum verrucarium, and the bedypnois annua.

--- VULGARIS. A name of feveral species of cicho-

reum.

ENELLAGMENOS, from evaluation of anaario, to change. An epithet applied to the joints of the vertebrae, because of their alternate or mutual reception and infer-

ENEMA. A CLYSTER. From tomps, to emit, eject, or thrust in, also ENCLYSMA. The words enema, elyster, and lotion, are equivalent to each other, and fignify any liquid medicine injected into the anus. With us, elysters are injected by means of a bladder and pipe; but in many other eountriesa syringe is always used, by which the liquor is farther thrown up into the bowels.

The countries of liquor used in each challer will ware

The quantity of liquor used in each eluster will vary according to the age of the patient and intention pro-posed. For infants, two ounces at the most suffices; a child of fix years old from four to fix ounces; a youth of fourteen years, from fix to eight ounces; and to an adult,

from ten ounces to a pint.

In diarrhœas, and all diforders where the intestines are weak, also whenever the clyster is to be retained; the quantity for an adult should not exceed fix or eight ounces.

In ardent fevers, and inflammation of the bowels, they answer the end of a fomentation, and should be adminiflered from a pint to a quart. In putrid fevers, it is one way of expediting a quantity of proper acid and antifeptic medicines into the conflitution, particularly fixed air. Nourithment may be conveyed by elufters, when from fome complaint of the mouth, throat, or flomach, nothing can be conveyed that way: many have been thus supported during feveral months.

Clyflers thould never be either hot or cold when used; but to warm that they may be eafily fuffered on the back of the hand; then their effect in the intestines will be the

most agreeable.

When a clyfter is intended only for emptying the intef-tines, half a an ounce of common falt is a better addition

It is a practice with many to mix oil in reftringent elyfters, but as it counteracts the intention of the preferiber, it should always be omitted in them.

When a very powerful stimulus is required in purging elysters, it is most fafe to mix emetics with them, and of these the vin. antimon. should be preferred.

ENEMA EX AMYLO. See AMYLUM. ENEOS. Vain, empty, or ufelefs. The Greeks call those who are unable to perform the common offices of life, such as dumb, deaf, &c, erea.

ENERGIA. ENERGY, from egypt, a work.

ENERVATIO. It is a equivocal term, signifying

aponeurofis or debilitation.

ENFLURE DES JAMBES. See LYMPHÆ DUCTUS. ENFONDE. A fort of bread made of caffada. See

CASSADA.

ENGISOMA. An inftrument formerly used about fractures of the cranium. Also a fracture of the cranium, in the middle of which the bone preffes upon the membrane of the brain, and makes the appearance of ruson, the caves of a house; from expice, to draw

ENGOMPHOSIS, See GOMPHOMA

ENGONIOS, from yona, anangle. Hippocrates expresses by it the bending of the arm at a right angle.
ENGORGEMENT LAFTEUX. See LYMPHE

ENGUAMBA URUVAPENSIUM. The name of a tree whose fruit is black, but yields by expression a yellow oil. Raii Hist.

ENHÆMON. The name of a platter in Myrepfus. ENITÆON. The name of a timple in Myrepfus, but

not known what.

ENIXA. A woman in Child-Bed. ENIXUM. The chemists apply this word to a third kind of falts, which are formed of acid and alkali: Galen calls them the third, but at present they are known by the name of neutral.

PARACELSI SAL. It is the caput mortuum of the spirit of nitre, joined with vitriolic acid. It is much the same as kali vitriolatum.

ENNEANDRIA. The ninth of Linnœus's classes of plants: in it are a ftyle and nine filaments in each flower

ENNEAPHARMACOS, from syra, nine, and caruaxos, a medicine. A composition of nine simple ingredients. It is also the name of a peffary mentioned by Ga-len and Ægineta. It is a name of the antidotus Heracli-dis, and of several plasters mentioned by Actius, and

ENNEAPHYLLUM, from evera, nine, and quoxor, a

of. See HELLEBORASTRUM: ENOCHDIANUS. In Paracelfus it is one who equals Enoch in longevity.

ENOC DIANA VITA. A VERY LONG LIFE.

ENRYTHMOS. See ARYTHMUS.

ENS. An ENTITY or thing really existing. In Para-celfus our imports the power, virtue, and esficacy, which a thing exerts upon our bodies.

Ens PARVUM SAPIENTIUM. It is foap made by mixing fixt alkaline falt with diffilled vegetable oil. The falt must be quiet hot when mixed with the oil, for the least portion of water prevents their union: after their combination they are to be placed fome time in a fubterraneous place. A finall quantity of the falt remaining on the furface of the oil will attract water, and prevent the fuccess of the process.

--- PRIMUM SALIUM. See CIRCULATUM.
--- SOLARE. See ANTIMONIUM.

ENSIFORMIS, from enfis, a fword, and forma, a form, CARTILAGO. The SWORD-LIKE CARTILAGE, called also xiphoides; sometimes it is bifurcated at the end, and is then called furcella or furcella inferior. This is the cartilage at the bottom of the flernum; but the ancients oft give the name of enfforms to the whole breaft-bone. Dr. Hunter observes, that " if this cartilage should be pressed inwardly by a blow, it will occasion vomitings and ed inwardly by a blow, it will occasion vomitings and violent pains, by preffing against the pylorus; in this case, it would be proper to lay it bare, and elevate it; but the diaphragm arising partly from it would probably displace it." From the form, or from accidents in this cartilage, many diseases arise, as a cough, pain in stooping, disticult breathing, &c. That these should happen will not appear wonderful, when we consider that the diaphragm is attached to it, and that the great lobe of diaphragm is attached to it, and that the great lobe of the liver and the stomach lay immediately under it. ENSTACTON, from rate, to distil. Instillations.

The name of a liquid collyrium in Galen, which Ægi-

neta calls stacticon.

ENTAGALIA. See ENTALIUM. ENTALE. A VESSEL. ENTALI. FOSSIL ALUM.

ENTALIUM, called also tubulus vel siphunculus maris, dentale, dentalium, dentale virida striatum, denticuli ele-

phantis. The entagalia, or PIPE-SHELL.

It is a finall shell brought from the East, resembling one of the dentalia, with its small end broken off. It is two inches long, open at both ends, and slender, of a whitish green colour, and ridged legthwise, with some transverse bands on it. The fish that lives in it is a kind

of worm with four horns.

The modern Italian call all ftones, metals, woods, &c. that are cut with lines or figures, or barely channelled,

ENTATICA MEDICAMENTA. Medicines that provoke venery. Cœlius Aurelianus calls them fatyrica.

ENTATICON. The name of a plaster in P. Ægineta.

ENTERA. So Hippocrates calls the bags in which were inclosed medicines for fomentations.

ENTERADENES, from evlegor, an inteffine, and aday,

a gland. The INTESTINAL OLANDS:
ENTERENCHYTÆ, from vinga, the viftera, and
«Txue, to infule. Instruments for administering clysters.
ENTERITIS. An INFLAMMATION of the EOWELS.

Dr. Cullen places this genus of difease in the class pyrexia, and order phlegmasiae. He distinguishes two species. I. Enteritis phlegmonodea. 2. Enteritis erysis pelatosa. See Inflammatio Intertinorum.

ENTERITIS MESENTERICA. The fame as mefenteritis. ENTEROCELE, from essess, an intestine, and near, a rupture. See Hernia intestinalis.

- OVULARIS. A rupture of the intestines through the foramen ovale.

ENTERO-EPIPLOCELE, from ofpor, an inteffine,

integuments of the belly.

ENTERO-HYDROCELE, from 1990, an inteffine, 5840, water, and xnhn, an bernia. A dropfy of the ferotum, with a defeent of the inteffine.

ENTEROMPHALOS, from estagos, an intestine, and ougases, the navel. A rupture of the intestine at the navel. This feldom happens but to women in labour, or from

ENTERON, from 1976, within. Internal and Intestine. But in Hippocrates Epid. 6. § 4. ap. 3enteron fignifies fimply the colon.
ENTEROPHYTON VULGARE. The SEA CHIT-

TERLING. It is a marine plant, and grows fomewhat in

the form of a gut.

ENTERORAPHE. A SUTURE of the INTESTINES.
ENTEROSCHEOCELE, from erregor, an intefline, boxion, the ferstum, and known, an hermia. It is when the intefline defeends into the ferstum.

ENTHEMATA, estilique, to put in. Medicines applied immediately to recent wounds, in order to prevent

an inflammation and ftop an hæmorrhage.

an inflammation and top an haemorrhage.

ENTHETOS, from 18/108µµ, to put in. Any thing introduced, but particularly fuch as are put up the nose to prevent an haemorrhage there.

ENTHLASIS. A contusion with the impression of the instrument by which it happened; called also illisis.

ENTHUSIASMUS. A ENNATIC STROKE; it is when a person is engaged in religious affairs, he loses his reason. See, in an cellacy sees strange sights, or hears the

reason, &c. in an ecitacy sees strange sights, or hears the noise of musical instruments, &c.

ENTRICHOMA, from er, and тыхица, the bair. The

edge of the eye-lid on which the hairs grow.

ENTRIMMA, from εθρίζω, of εν, and τρίζω, το rub, grate, or triturate, See INTRITUM.

ENTROCHUS. An oblong flour nearly as thick as a man's finger, from one to two inches long; bluish co-loured, and made up of joints, as so many rings. They are found frequently in clay pits. Sometimes the joints are found loofe, then they are called trachitar. It is a part of the arm of a ftar-fifth, or fome fuch like fea-animal, that is petrified. It is always hardened with sparry matter, and like it, is diuretic. A trachite, when found separate, is as broad as a fix-pence with a hole in the centre, and of dif-

broad as a fix-pence with a hole in the centre, and of different thickneffes; the colour is bluith or greyifh, and
when broke, it is gloffy and thining.

ENTROPIUM. See TRICHIA. The eye-lids turning outwards. See Wallis's Sauvages's Nofology of the
Eyes, p. 16. with notes.

ENTYPOSIS, from where, to make an impreffice, of
torse, a type, or image formed by impreffice. The acctabulum of the humerus. It is not used by any physical
writer, but mentioned by Jul. Pol.

ENUCLEATIO. The taking a kernel out of a nut.
ENULA, called also inula, enula campana, belenium,

ENULA, called also inula, enula campana, belenium, ofter, omnium maximus. SCAB-WORT, and ELECAM-

Platerus calls it aroma Germanicum.

Miller enumerates thirty species; and Boethaave makes it a species of after. It is the inula helenium, or inula foliis amplexicaulibus ovatis rugosis, subtus tomentosis, calycum squamis ovatis, Linn. It is a large plant, with long, wrinkled leaves that are ferrated; of a pale green colour above, and hoary underneath; the flowers are yel-low, and of the discous kind, and are followed by oblong feeds, winged with down; the roots are flort and thick, uncluous to the touch; brown or blackish on the outside, and whitish within. It is perennial, grows wild in moist rich foils, and flowers in June.

The fresh roots have a weak but not very grateful fmell; when perfectly dried, they are more grateful: when chewed, they discover at the first, a kind of rancid glutinous tafte, quickly fucceeded by an aromatic bitter-nefs, which by degrees becomes more pungent. They are disphoretic, diuretic, and flomachic; if taken freely they loofen the belly; they powerfully attenuate vifeid humours, and affift expectoration in coughs and humoural affirms. When fresh, they are an excellent vehicle for fquills. Dr. Cullen, though he fays, that both from its farafills and changed madilies it was first to be from its fensible and chemical qualities, it promifes to be a medicine of some power, still he is at a loss to determine what are its peculiar virtues.

The spirituous extract is the most active preparation, and as easy to digest.

and saidheer, the ementum, and man, a tumer. It is when but the watery is far more abundant in the quantity which both the omentum and intestines protrude through the is obtained from these roots, and so limbe inserior in its virt: . s, as to deserve the preserence for general use. Neumann obtained from an ounce of the dry root, by means of water, fix drams and a half of extract, but by means of pirit, only two drams and a half. Much of the aromatic warmth and bitterness of these roots, reside in the more fixed parts which do not exhale in the heat of boiling water, they are therefore well preferved in the watery exwhich concretes into white flakes, and partly into an uncluous mass like softish wax. Thirty ounces of roots afford about a dram of this oil. Geosfroy the younger, observes, that this oil resides in the exterior part of the root near the bark. When this concrete oil is but newly distilled, it is strongly possessed of the flavour of elecanpane, but it foon lofes all its fmell by keeping.

#### Extraff. ENUL. CAMP.

Boil elecampane roots in water; press and strain the decoction, and set it by to settle; then pour off the clear, and boil it down to a confishence of pills, taking care to prevent its burning towards the end of the operation. The dose may be from 3 i. to 3 i. in a lax state of the fibres of the ftomach, and in some disorders of the breast.

The dose of the root may be to two drams.

The rad. enal. c. condit. is prepared in the same manner as the Eringo root, which see.

See Raii Hift. Lewis's Mat. Med. Neumann's Chem.

Works. Cullen's Mat. Med.

ENULON, from er, and wor, the gums. The internal flesh of the gums, or that part of them which is within the mouth. See ULON.

ENUR. That vapour of water of which stones are

generated.

ENURESIS. An involuntary discharge of urine. Dr. Cullen places this genus of disease in the class locales, and order apocenoics. He diffinguishes two species. I.

Enurefis atonica, when some other disease hath injured the spincter of the bladder. 2. Enurefis irritata, from compression or irritation of the bladder. See URINA,

ENYPOSAPROS, from to, within, ino, a prepolition, which in composition is a diminutive one, and sampes, putrid. An epithet used to the spit of hepatic patients.

ENYSTRON, from 1904, to perfect. The last or fourth ventricle in animals that chew the cud, which completes

the digestion. According to Aristotle, it is a second ven-tricle, or a thick part of the stomach of ruminating ani-mals, in which the food is concocted. Gorræus makes it

EON. The whole compass of the eye.

EONASTICA. It is a continual putrid fever that is still increasing. See Acmasticos, and Anabasis.

EPAGOGION. A name in Dioscorides for the pre-

See PREPUTIUM.

EPANADIDONTES PURETI. Fevers, whose heat is not biting to the touch in the beginning, but becomes more and more fo in the advance.

more and more to in the advance.

EPANADIPLOSIS, from β-107.88, reduplication. The reduplication of a fit of a femitertian fever; that is, the renewal of a cold fit before the hot fit is ended.

EPANASTASIS. A TUMOR or TUBERCLE.

EPANCYLOTUS, from αγκυλος, crooked, cvinding. A fort of bandage, in Oribafius.

EPANTHESMA, or EPANTHISMA, from ανδος, α

flower. An EFFLORESCENCE. EPAOIDAL See AMULETA.

EPAPHÆRESIS, from ent, importing a repetition, and

EPARHERESIS, from ext, importing a repetition, and αφαιρτσι, a removal. In Galen it is used to express a repeated evacuation by bleeding.

EPARGEMOS. An epithet for a person affected with that disorder of the eyes called argemon.

EPARITA. A fort of earth.

EPARMA, from and, to elevate. Any kind of tu-EPARSIS, mor, but frequently applied to the parents.

EPAROTH. See BOTRYS MEXICANA. EPENCRANIS. A name of the cerebellum. EPERLANUS. Called also viola marina. The SMELT. This fifth receives its first name from its pearl colour, and the fecond from its violet-like fmell. It is very nourithing,

# [ 341 ]

EPHEBÆON. The Pubes. See Pubis ossa. EPHEDRA. MARITIMA MINOR. Hippuris minor. A species of HORSE-TAIL. See CAUDA EQUINA.

It is also the name of an instrument for reducing lux-

ations.

EPHEDRANA. The BUTTOCKS.

EPHELCIS, from exase, an ulcer. The crust of an ulcer, or a small abrasion, or bloody fragment coughed

EPHELIS, from err, and hass, the fun. SUN-BURN-ING. A freekle, or fmall puttule on the face. See LEN-

EPHEM. GERM. An abbreviation of Ephemerides

Medico-physicae Germaniæ.

EPHEMERA, from 1911 paga, a day. A DIARY FEVER, or fever of one day's continuance only: febris diaria.

Ardens febris. It is an instance of synocha. In this case, such a heat as attends an excess of wine, a pulse fomewhat full and quick, but foft and regular, a flight head-ach, a naufea and reftleffnefs, are all the fymptoms, all which terminate without any fensible evacuation. If it continues unto the third day, it is not a diary fever; and if the constitution is very dry, an hectic is to be dreaded. See Lommius's Med. Obs.

— DICHOMENE. It is a kind of febris erratica.

EPHEMERIDES. Helmont calls those difeases thus which feize the patient at particular times of the moon,

ephemerides agrotorum, the almanacs of the fick.

EPHEMERON. A name of the hermodactylus, which the Arabians call furengian; also of the colchicon, which they call furengian. The first fort is harmless, the

EPHEMERUM. SPIDER-WORT. Boerhaave mentions four species, all growing in Virginia; and Dale mentions an ephemerum, or DEADLY SAFFRON. They are of no medical ufe.

EPHESIUM. The name of a plafter described in

Celfus.

EPHIALTES, or EPIALTES, from epalloques, to leap

upon. The NIGHT-MARE. See INCUBO.
EPHIALTIA. A name of the paonia.
EPHIDROSIS, from up. \$700, to break out into a feveat. Called also bydropedefis. This is what the Latins call defudatio and mador. Dr. Cullen places this genus of difease in the class locales, and order apocenoses. This fweating is often unnatural in quality as well as quantity. In most instances, this disorder is symptomatic; when it

In most instances, this disorder is symptomatic; when it is idiopathic, weakness is the most frequent cause.

EPHIPPIUM, a SADDLE. See SELLA TURCICA; it is called ephippium, from its resemblance to a saddle.

EPHODES, from ent, and if so, away. In Hippocrates it hath three significations. 1. The ducts or passages by which the recrements of the body are evacuated.

The periodical attack of a fever, from the common use of it to express the attack of thieves. 3. The access of similar or diffimilar things which may be useful or huntful to the body. hurtful to the body.

EPIALOS. An epithet of a fever, from water, gentle, as, the fea; because the sea while undisturbed is gentle, and this kind of fever gently heats the patient. Galen defines it to be a fever in which the patient labours under a preternatural heat, and a coldness at the same time The ancient Latins call it quercera. Hesychius says, that the cold shivering preceding a sever was thus named. Some reckon it among the varieties of tertian sever.

EPIALTES. See EPHIALTES.

EPIBOLE, from emicana, to press upon. See Incurso.

EPICARPHIM from emicana, to press upon.

EPICARPIUM, from em, upon, and mapmes, the wrift. The fame as Perciarpium, which fee, also Cata-

EPICAUMA, from xaue, to burn. See Encauma. EPICERAS. A name for foenugreek. See F. Anu-

EPICERASTICA, from weparrount, to min, or attem perate. Medicines that obtund acrimony, and eafe trou-blefome fensations.

EPICHOLOS, from x2200, bile. Bilious.
EPICHORDIS, from x2200, an intestine. The MESENTERY. From ent, upon, and x2200, a gut. See

EPICHORIOS, from ext, upon, and xopa, a region.

See EPIDEMIUS. EPICŒLIS. The UPPER EYE-LID.

EPICOLICÆ REGIONES. The lateral or lumbal regions. These parts of the body which are adjacent to the colon. From ert, super, and makes, bellevo. EPICRANIUM. See Occipito Frontalis.

EPICRASIS. A critical evacuation of bad humours,

an attemperation of bad ones. When a cure is performed in the alterative way, it is called per epicrafin.

EPICTENION, from \$\sigma\$1, above, and \$\sigma\$1, pubes. The part above the pubes. Also the fine lint which hangs above where \$\sigma\$2 is \$\sigma\$2. about where flax is dreffing.

EPICYEMA, from xue, to conceive, alfo Epigonon.

In Hippocrates it is a FORTUS; also a MOLE.

EPICYESIS, from sow, to conceive. SUPERFORTA-TION.

EPIDEMICA AQUA. See ALEXITER. Aq. fp. EPIDEMIUS, from ers, upon, and supos, the people. EPIDEMICAL, also EPICHORIOS. An epithet of diseases which at certain times are popular, and attack many peo-ple at the fame time. A disease which appears, and geneple at the fame time. A diteate which appears, and generally prevails, then for a time difappears, is also called epidemical. See Obf. on Epidemic Disorders, &c. by James Sims, M. D. Dr. Wallis's Sydenham. EPIDERIS. The clittoris. EPIDERMIS, from see, upon, and signer, the skin. The scare-skin. See Cuticula. EPIDESMUS, from die, to bind. A bandage by which foliage halflers. See are focused.

fplints, bolfters, &c. are fecured.

EPIDIDYMIS, from err, upon, and houses, a tefficle.
The epididymis may be reckoned a kind of teftis accessorius. It is a body, on the upper part of the tellicles, which is formed of a continuation of the tubes that constitute the testicles; the continuance of the epididymis upwards, forms the vafa deferentia.

- DISTENSA. ÉPIDIDYMIS DISTENDED. Sec

SPERMATOCELE.

EPIDOSIS. Preternatural enlargement of the parts. EPIDROME, from επι, upon, and βρειω, to run. An afflux of humours; as it happens when a ligature is made

on any part.

EPIGASTRICÆ ARTERIÆ: The EPIGASTRIC

ARTERIES.

The external iliac artery divides into two branches at the ligamentum Poupartii; one of them is the epigastric, which runs to the infide of the rectus abdominis, at whole upper part it communicates with the internal mammary. Dr. Hunter observes, that in the operation for the semoral rupture, we rifque cutting the epigaftrica if we cut up-wards and outwards; and if upwards and inwards, the spermatic is in danger, as the hernial fac lies in the angle between the two.

The external iliac veins, a little before their going out of the belly, fend off from the infide the epigafiric veins, which fend branches to the neighbouring glands, and run up the musculi recti abdominis, and then advancing, join the mammaria

EPIGASTRIUM, from ens, upon, or above, and yarres the flomach. The upper fore-part of the belly is thus called. It reaches from the pit of the stomach to an imaginary line above the navel, supposed to be drawn from one extremity of the last of the false ribs to the other.

Its fides are called hypochondria, and are covered by the falfe ribs, betwixt which lies the epigafrium.

EPIGENEMA, from επίγεναμ, to generate over and above, or anew. Sometimes it fignifies a fymptom, at others, any thing grown over another, as when the faliva is thickened, and forms a fur on the tongue:

EPIGINOMENA, from επιγινωμαι, to fucceed, or fuperace.

Galen favs, they are those fymptoms which na-

come. Galen fays, they are those symptoms which naturally succeed or may be expected in the progress of a disease; but Foesius says they are new accellions of some other affection to diseases, which never happens but in Stubborn and malignant diseases. See EPIPHENOMENA. EPIGLOSSUM. A name for the Laurus Alexan-

EPIGLOTTIS, from em, above, and your 711, the aperture of the larynx. It is a cartilage, shaped like the leaf of a plant: Winslow says, the pursane leaf. It is joined to the anterior and superior part of the thyroides, over which it appears erected behind the root of the tongue, to which it is connected by ligaments fixed to the cornua of the os hyoides; it is also connected with the arytanoid cartilages. It covers the glottis whilst we swallow, to prevent any thing from falling into it.

4 R EPI-

EPIGLOTTUM. An inftrument mentioned by Paracelfus, for elevating the eye-lids.

EPIGLOUTIS, or EPIGLUTIS, from επι, above, and γλωσίας, the buttock. The fuperior part of the buttock. EPIGONATIS, from επι, μροπ, and γοιν, κ kneed

The PATELLA

EPIGONON. See EPICYEMA.
EPIGOUNIDES. The muscles inserted into the knees. EPILENTIA, I from equantum, to feize, invade, of EPILEPSIA, Soppress. The EPILEPSY. It is also called morbus caducus, interlunius morbus, magnus morbus, morbus attenitus, or FALLING SICKNESS, because the patient falls suddenly to the ground; the great, or Herculean distale, on account of its violence, and the difficulty in conquering it; morbus facer, or facred difease, because it affects the mind, and most noble parts of a rational creature; divine disease, either because it requires something more than human for its cure, or because it was thought to be fent from heaven as a curse upon earth; morbus infantilis, and puerilis, because it happens most frequently to infants and children. Comiste, and

Omitialis Morbus, which fee.

Dr. Cullen places this genus of difease in the class neuroses, and order spasmi. He distinguishes three species.

1. Epilepsia cerebralis, when it arises suddenly without any manifest cause; no uneasiness proceeding, except fometimes a giddiness, or loss of fight. 2. Epilepsia fympathica, when it arifes without any manifest cause; but is preceded by a particular fensation arising from fome part of the body which goes upwards to the head. 3. Epilepsia occasionalis, when it arises from manifest irritation, and ceases on the cessation of the morbid irrita-

An epilepsy is a violent, involuntary, or convulsive contraction of the nerves, membranous, and muscular parts of the whole body, attended with an abolition of fense, and drawing its origin from a spalmodic stricture of the membranes furrounding the brain, the fpinal marrow, and the nerves; whence the vital principle is imetuously conveyed into the organs of motion, but in a leffer quantity into those which subserve the purposes of fensation. Dr. Cullen defines it as confisting in convul-tions of the greater part of the muscles of voluntary motion, attended with a loss of fense, and ending in a state of infentibility, and feeming fleep.

Weakly and pampered children are the most subject to

this diforder; men more than women.

The causes are various; the principal and immediate one is a fpalmodic stricture in the dura mater, and its continuation over the fpinal marrow and nerves; but as the fecondary and remote causes are very various, so there arises different species, and denominations of epileptic fits. When the cause is in the brain itself, it is called an idiopathic epilepfy; when in other parts it is called fympto-

The idiopathic epilopsy hath for its secondary causes external violence, as blows, bony protuberances arising internally in the basis of the skull or in the lateral, or the falciform finuses; from this cause the disorder is chronical; an obstruction of the jugular veins, or of the sinuses of the dura mater, especially the falciform sinus, from polypous concretions or other matters, the passions of the mind, an ill conformation of the brain, &c.

A symptomatic epilepsy hath for it secondary causes, eachectic and hypochondriac habits; flatulencies proceeding from the stomach and bowels; spasms of the intestines; irregular fecretions and excretions; the acrid matter of eruptive and other diseases translated to the brain; pains that are violent and attended with spasms in the nervous parts; stones passing through the ureters cause a symptomatic epilepfy which hath obtained the name of the nephritic epileply, worms, poisons, &c.

Among the primary causes of epilepsies are whatever can impair the general vigour of the constituion, and

particularly that injures the nervous fyftem.

To form a more diftinct idea of the ætiology of an epilep/9, it should be observed how different the circulation of blood through the brain is carried on from what it is in the rest of the body. As soon as the arteries enter the head, they lose their stronger coat, and consist of a thin membrane only, which is destitute of sensation and motion, they are emptied into the venous sinuses in the dura mater, thence the blood is conveyed into the jugular veins, see. to the heart again. The structure of the dura mater in the rest of the body. As soon as the arteries enter the head, they lose their stronger coat, and consist of a thin

fhould be attended to, and its other peculiarities. To this end, fee Baglivi de Fibra Motrice, lib. i.

The diagnostics vary much in different people; some are fuddenly feized, others have a train of symptoms foreboding the attack, fuch as wearinefs, an oppreffive pain in the head, interrupted fleep, a languid pulie, a pale countenance, flupor and drowfinefs, an unufual dread and terror, a ringing in the ears, palpitation of the heart, inflation of the præcordia, diffurbed respiration, rumbling in the bowels, a difcharge of fetid ftools, coldness in the joints, and a copious difcharge of urine. Some also perecive a kind of cold vapour gradually ascending from the extremitses to the heart and brain. Whether more or less of these symptoms precede the attack, or none of them attend, the fit approaches fuddenly, and as it were unex-pectedly, the patient falls down on his back to the ground; the thumbs are firmly fixed on the palms of the hands; the eyes are distorted, and the white part of them only appears; all fenfation, both internally and externally, is destroyed; there is a frothing at the mouth with a hisling noife, the tongue is often lacerated by the teeth, and the joints are feized with a violent trembling. In some there are many ridiculous and difagreeable diffortions and gesticulations; in others, instead of convulsive mo-tion there is a highly rigid spasm in all the members, by which they are so fixed that no force can move them. In infants; the penis is erected; in young men, the feed is ejected, and fometimes the urine is discharged to a confiderable diftance, and this, as well as the difcharges by stool are involuntary. At length these symptoms remit; the patient feems to have a fort of respite at intervals, but the eye-lids remain immoveable; the teeth grind upon each other, the tongue hangs out of the mouth; when the paroxylm ceases, the patient is entirely ignorant of every thing that happens during it; he rolls on the ground, his countenance appears sad, he begins to yawn, and thretches himself with a kind of violent efforts; he rises and walks flowly, feems uneafy, and the veins of his forehead appear diftended. Some are so affected after their recovery, that for a time they know not their most familiar friends; others are more or less affected with some of the symptoms that precede the attack of the fit. In some, the returns are regularly periodical, in others, irregular and uncertain. By frequent returns of this dif-order, the patient grows dejected, is indolent, subject to a vertigo, and trembling if he looks upward, becomes liable to fudden anger from trifles, and many other unhappy attendants gradually gain upon him.

The epilepfy should be diftinguished from the apoplexy,

convultons, and hysterics.

That kind of epilepfy which refembles a fleep, is more dangerous than that in which convultive motions happen. The hereditary kind is rarely cured, and when the dif-order is chronical or habitual, fuccess is not to be depended on. When the approach of puberty, or the eruption of the menses does not remove an epilepsy in women, nor delivery of the first child, an hereditary cause may be suspected, but a cure is not to be expected; caused by frights they are never cured, or fo rarely as to afford but little hope, for when the patient feems recovered, triffes are productive of a relapfe. When the fit approaches during Seep the danger is greater. Hippocrates afferts, that boys are relieved from this diforder about their feventh, fourteenth, or feventeenth year, There is some hope of a cure when the case is not inveterate or hereditary, when the case is in the primæ viæ, or some disorder translated to the nervous fyftem.

From the variety of causes, and the nature of some of them, it is difficult to flate the indications and method of cure. However, with Dr. Smith we may propose, I. To prevent an impending paroxysm. 2. To shorten a present one. 3. To guard against sutree attacks. The first of these intentions is answered in plethoric habit. bits by fuitable evacuations and antispasmodics, as nitre, opium, mulk, &c. in languid constitutions, by warn nervous medicines, as caftor, valerian, camphor, fetid gums, volatile falts, the bark, chalybeates, &c. Cheyne fays, that the epilepfy differs but little otherwise than in the

are long; but before these are applied, or when the fits, are floor, endeavour to force open the mouth by means of a wedge thrust between the teeth, when the jaws are separated as far as the patient can easily admit of in health, the fit will generally be removed; and in cases where the patient hath due notice of its approach, he may prevent the fits by introducing the wedge into his mouth. When the fits are preceded by peculiar fenfations in the toes, feet, or legs, a bandage applied tight below the knee will often prevent the paroxylm; or wherever these fensations are felt, let a bandage be applied there, and continued from thence upwards. In-stances of absolute cures have occurred by cutting down to the part in which those peculiar feelings were first per-ceived. See an instance in the Edinb: Med. Essays, vol. iv. and fee the article ALBADARA. Cœlius Aurelianus prefers the blowing of strong vinegar up the nostrils, to volatile falts. The third intention requires, if possible, that the cause be known, in order to its being removed; but unhappily in some instances it cannot be discovered, and in some if it could, no remedy could be applied. However, in some cases, the cause hath been clearly discerned, and in others, cures have been effected where the cause was only guessed at; whence there is encourage-ment for endeavours under very doubtful circumstances. Among the means of cure, and what is extolled as a fpecific, is the flores cardam. given to a dram, three or four times a day. See CARDAMINE.

In the Medical Commentaries of Edingburgh we have accounts of epilefies having been relieved and cured by flowers of zinc, stramonium, white vitriol, pilulæ cerulæx, pillsconsisting of the cuprum ammoniacum mixedup with bread; and bleeding. See vol. i. p. 5. 7.

An issue kept open in the vertex hath been curative in

fome instances, and in all cases concurs with evacuants in general in removing the plethora, which often, by compreffing and irritating, is the cause of the disorder. When contufions or fractures of the skull, or a fragment of it, prefs upon the brain; when a caries in the bones of the fkull from the lues venetea, or other diforder, is the caufe of epilepfies, the part must be trepanned. When the epitepfy is symptomatic, the original disease removed, the symptomatic of course will also be cured. In some inftances a few large dofes of affa fœtida hath effectually relieved; in others, four or five drops of the tinct. opii, every morning and night, hath had the fame effect; a milk diet continued for three or four mouths hath fucceeded; and various other particulars are mentioned in practical authors from which the like advantages have been reaped. In general, befides proper evacuations duly re-peated, warm nervous medicines, and the bark will be the most to be depended on, with issues in the inside of the thigh, a little above the knee; and if the returns are periodical, or feem to be influenced by the moon, attend to its changes, and, after an emetic let the bowels be emptied by a gentle folutive, and the patient be directed to avoid whatever he observed to produce or increase his fits. Valerian and the bark, mixed in equal quantities, may be taken to 5 i. or 5 i. fs. three times a day. Mulk from gr. x. to 3 fs. twice a day. See Hippocrates, Cel-fus, Celius Aurelianus, Aretæus, Hoffmann, Boerhaave; and among the best authors on this subject, see Threlfal's and Lyson's Essays on the same; Cullen's First Lines, vol. iii. edit. 4

EPIMEDIUM. BARRENWORT. It s a plant with leaves like those of ivy. Its fruit is a pod with flattish round seeds. Dioscorides takes notice of it, but the virtues he attributes to it render it worthless. Also a species

of toxicodendron.

EPIMELIS. The SMALL BASTARD MEDLAR. See

EPIMORIOS, from uniqu, to divide. SUPERPARTIAL. In Galen it is an epithet of the difference of pulse with respect to their inequality of the time they keep in beat-

EPIMULIS. The KNEE-PAN. See PATELLA. EPINENEUCOS, from 1600, to nod, or incline. It is an epithet of a pulse which beats unequally in different parts of the artery. It is also called perineucos. Galen fays it is familiar in hectics.

EPINEPHELOS, from stasks, a cloud. CLOUDY. apppears like a cloud.

EPINOTION, from em, upon, and vales, the Shoulder; the SHOULDER-BLADE.

EPINYCTIS, from ear, on, and sot, night. It is a kind of pushele which rifes in the night, whence its name. Celfus fays this puftule is of a bad kind, of a whitish or fomewhat livid colour, with a violent inflammation round These tumors affect the hands, arms, and thighs. The ancients rank them with the terminthus, which is rather less. Some describe them as of a dusky red colour, and fometimes of a livid and pale colour with great inflammation and pain. In a few days they are faid to burft and gleet, and separate away in a flough. It appears to be a kind of furunculus. When it is opened there is an efflux of fanies, and an ulcer is found therein. The pain is more violent than is in proportion to its magnitude, for it is scarcely so large as a bean. Paulus and Actius fay it creates no great pain in the day-time, but that it is troublefome in the night. Celfus recommends that in this, and all other kinds of pultules, the patient walks much, abstains from all acrid food, and is very sparing in his diet.

EPIOS. MILD, GENTLE. An epithet which Hipporrates before an mild enidenie forms.

crates bestows on mild epidemic fevers.

EPIPACTIS. Diofeorides mentions this plant, and Boerhaave take it to be the helleborine latifolia montana.

EPIPAROXYSMUS. It is when the patient fuffers more exacerbations than are usual in a fever-

EPIPASTON. See CATAPASMA.

EPIPECHY, from em, above, and engue, the cubit,
The part of the arm above the cubit.
EPIPEPHYCOS, from em, upon, and que, to grow.

A name of the adnata.

EPIPHÆNOMENA, from 171, importing addition, and φαιτομενου, a phonomenon or fymptom. Those adventitious symptoms which do not appear till the disease is found, and seems to be the same as epiginomena.

EPIPHLEBOS, from επι, and φλεψ, a vein. One

whose veins are prominent.

EPIPHLOGISMA, from επι, and ολογιζα, to inflame, of φλοξ, a flame. A violent inflammation, attended with pain, tumor, and redness.

EPIPHORA, from emission, to carry with a force. In a medical fenfe, it is an impetuous flux of hemours, efpecially an inflammatory one of the blood, to the whole furface of the body, or to any part thereof, but more par-ticularly it is when tears trickle down from the eyes, in confequence of obstructed puncta lachrymalia, or an inflammatory influx of the humours upon the eye.

The epiphora or WATERY EYE, also called a lippitude, sculus lachrymans, and MOON-EYE, it is when the tears do not pass the puncta lachrymalia, but run down the cheek. Some confound this with the fiftula lachrymalis, because in both the tears run down the cheeks; but in the fiftula lachrymalis there is pus mixed with the tears. Whatever prevents the tears from paffing through the puncta lachrymalia and nafal duct, produces an epiphora; as first, any tumors, as the encanthis in the great angle of the eye. Secondly, any accident, as a wound, burn, &c. cloting up the puncta lachrymalia. Thirdly, de-ftruction of the nafal duct. Fourthly, a polypus of the nofe. Fifthly, a fiftula lachrymalis. Sixthly, an inver-fion of the eye-lid. See ECTROPIUM. Laftly, an erofion, or other defect of the caruncula lachrymalis.

Dr. Cullen places the epiphora, or watery eyes as a genus of difease in the class locales and order apocenoses.

When this diforder exists, it is more easy to discern than

it is to discover the cause.

When the cause is a humour in the angle of the eye, a polypus in the nose, a distortion in the eye-lids, and a fitula hebyemalis, they must be removed. When a conglutilachrymalis, they must be removed. When a congluti-nation of the puncta lachrymalia is the cause, we are to examine whether their ducts are totally conglutinated, or it is only their mouths that are covered; for if it is after a burn, or from a cicatrix after a wound, &c. a cure is hardly to be hoped for; but if only a cuticle covers the duct, a perforation may be made with a needle, and then a hog's briftle, or filver wire may be oiled, and paffed through, and continued till the part is healed. If the cause is a and continued in the part is latery and is, a cure cannot be performed, because that gland cannot be reftored. See Heister's Surgery, Brooks's Practice of Physic, White's Surgery, Surgery, p. 233, and Dr. Wallis's Nofologia Oculorum.

EPISPASMOS, from emoran, to ottract. In improvement of the pipeling of PHYLLOSPERMIFEROUS PLANTS, of επι, προπ, φυλου, α a leaf, σπεγμα, feed, and φερω, to bear. They are fuch as bear their feeds on the back of their leaves, as do all

EPIPHYSIS, from emipus, to grow to, or upon. Called also additamentum. It is a small bone annexed to the larger by means of an intervening cartilage; this cartilage is only observeable in growing subjects, for in adults it cannot be distinguished from the bone. Epiphyses being of a larger diameter than the bone they belong to, ferve to render the articulation more firm; and the muscles inferted into them, act with greater force, as their axes are farther removed from the centre of motion. Epiphyles are fometimes separated from the head of the

bone, and militaken for a luxation, or a fracture.

EPIPLASMA. See CATAPLASMA. Also a name for an application of wheat meal, boiled in hydrelæum, to

EPIPLOCELE, from exertheor, the omentum, and make, a rupture, called also bernia omentalis. An HERNIA, or rupture of the omentum. It is when the omentum protrudes through the openings in the integuments of the belly. Mr. Sharpe fays, in the fifth chapter of his Opera-tions, that fometimes fo large a quantity of the omentum hath fallen into the fcrotum, as by drawing the ftomach and bowels downwards hath excited vomiting, inflammation, and the fame train of fymptoms as happen in the bubonocele; and that when this happens it is necessary to open the ferotum, in which the operation and process will be the fame as in the bubonocele. It is necessary also that the rings of the muscles should be dilated, or otherwise, though some of the mortified part of the omentum is removed, the rest cannot well be returned, so will gangrene. But except an inflammation, &c. are actually commenced, this method is not to be attempted.

EPIPLOICÆ. APPENDICULÆ. The peritoneal coat of the intestines sends out some processes like little epiploons, to which Winslow gives this name.

EPIPLOICA ARTERIA. Before the splenic artery

arrives at the fpleen, it fends a branch to the omentum,

which is thus called. See SPLENICA, ARTERIA.

DENTRA VENA. It is a branch from the trunk

of the mefaraica major which goes to the omentum.

—— SINISTRA VENA. It arifes from the splenica at the small extremity of the pancreas, and is ramified on the omentum all the way to the colon, where it communicates with the hemorrhoidalis interna.

EPILOITIS. It is that species of inflammation of the peritoneum which Dr. Cullen calls peritonitis omentalis. See PERITONITIS. It is also called the CHILD-BED FE-

See PUERPERILIS FEBRIS.

EPIPLOOCOMISTES, from twishes, the caul, and xομιζα, to carry, as if it was a burden. It feems to be only a term of raillery, from επιπλοου, the omentum, and

a term of railiery, from επίπλου, the omentum, and κομιζομαι, to posses of have.

An epithet for those who have a large epiploon, in comparison of brutes. Vesalius understands it of one who hath a preternaturally large epiploon. Or it may be applied to one labouring under an epiplocele.

EPIPLOOMPHALON, from επίπλουν, the omentum,

and suapros, the navel. An bernia umbilicalis.

EPIPLOON, from επιπλεω, to run over, because it feems to float upon the guts. See OMENTUM. EPIPLOSCHEOCELE. An hernia, in which the

omentum descends into the scrotum.

EPIPOLÆUS. SLIGHT, GENTLE. Hippocrates ap-

plies it to diforders that are no way dangerous.

EPIPOLASIS. A redundance and fluctuation. In chemistry it is when what is sublimed ascends only to the furface and there fettles.

EPIPOROMA. It is any indurated tumor in the joints, from πωρος, from υπιπωροώ, to barden. A callous concretion, a tophus, or tophaceous callas, molefting the joints.

EPISARCIDIUM, from ouet, flesh. See ANARSACRA. EPISCHESIS, from 15 Xu, to flop, retain. See

EPISCHION, from e=, upon, and uzzor, ifchium.
The os runis. See Ossa Pubis.
EPISCOPALES VALVULÆ. See MITRALES

EPISEION. The PUBES. See PUBIS OSSA. EPISEMASIA. See ANNOTATIO.

EPISPASTICA, from twowan, to draw. What the ancients called epispassics, were such external applications as only rubified the skin: they drew the humours more copiously to the part to which they were applied; and according to the different degree of effect, received different names; the flightest were called phanigmoi, the next were finapismi, the next were vesticatorii, and the strongest were caustics. The London College hath changed the name of bliftering plafter from veficatorium to emplaftrum cantharidis. See CATAPLASMA, EPISPASTICUM MEDICAMENTUM. A dry me-

dicine prepared for the cure of malignant ulcers by in-

EPISPHÆRIA, from opaige, a sphere. The brain being somewhat of that shape. According to some, it is the windings of the exterior fubstance of the brain; others

fay, it is the winding veffels on the furface thereof.

EPISTAPHYLINI. See STAPHYLINI.

EPISTASIS. According to Hippocrates, it is the fame with epifebesis, a suppression of proper excretions; it also means the superficies of urine, called insidentia, and is opposed to the upostasis, subsidentia, or sediment

EPISTAXIS. Hippocrates expresses by it, repeated distillations of blood from the note. Dr. Cullen uses this term to diftinguish bleeding at the nose, as a genus of difease, which he places in the class locales and order hamorrhagiæ. See Hæmorrhagia. EPISTHOTONOS. The tetanus bending the body

forward. See TETANUS.

EPISTOMION. A STOPPER for a BOTTLE, &c. Alfo

vent-hole of a furnace called a register.

EPISTROPHÆUS, from ent, upon, and speed, to turn.
Alfo Lepistrophis. The first vertebræ of the neck; fo fome (though improperly) call the fecond. It is also writ-ten epistrophea, and epistrophis. EPITASIS. In Hippocrates it is the beginning and in-

crease of the fit.

EPITEDEUMA. The way of living which a person prescribes to himself. Coclius Aurelianus calls it vitæ affectiones. And Celfus, vita proposita.

EPITHELIUM. So the cuticle on the red part of the

lips, cesophagus, aspera arteria, &c. is called. See

EPITHEMA, from em, upon, and tilique, to cover, to lay upon or apply. A LID or COVER; but is also used to fignify a topical medicine. Epithems are, I liquid; and when applied warm, are sometimes called fomentations or embrocations. 2. Dry, or folid. These are medicated powders sewed up in cloths, and are called sacculus, saccus, encupha, encullus, frontale, scutum, settulus, and pulvinar. 3. Those of the soft or poultice kind, as snapsims, and other kinds of poultices. Turner confines the name of epithem to liquids in which rags are dipped, to be applied to the part affected. See Gaubius de Formulis Medicamentorum.

EPITHESIS. In furgery, it is the rectification of crooked limbs by means of inftruments.

EPITHYMBRUM. A fpecies of mois growing on

the thymbra, or winter-favory.

EPITHYMUM. See Cuscuta.

EPOCHETEUSIS. A derivation of the juices to

other parts.
EPOMIS, i. e. Acromion, from em, upon, and upos, (houlder. See SCAPULA.

EPOMPHALUM, from ers, upon, and outques, the

EPODOS, method of curing differences by incanta-

EPOSCHION. The tendril of a plant.
EPOMPHALION, from 171, upon, and outpass, the
navel. A medicine which purges by being applied to the region of the navel.

EPOSILINGA. SCALES OF IRON.

EPSOMENSIS AQUA. EPSOM WATER.

This water has been long in repute, and was the first water from whence a bitter purging falt was acquired. It is one of the most noted purging waters in Europe; and its medicinal powers are contained in the salt which bears its name. See CATHARTICUS SAL, and AQUA

eathartica amara. The fpring of this water is fituated near Epfon, in Surry. There are different accounts of the products of this water respecting the quantity of its folid contents.

From one all the contents of this folial matter Dr. Allen alledged that \$\frac{1}{2}\$ ounce.

Dr. Rutty, 1 ounce, and in fome feafons only half the quantity.

Dr. Lucas, only 5 drams and 1 feruple.

earth, or infoluble matter; but Dr. Rutty fays, that he found a much less proportion of it, and that it was of a calcareous nature. The salt is mostly a vitriolated magnesia, or vitriolated absorbent earth. Dr. Lucas says, that if the natural salt of this well be disloyed in distilled water, and that evaporated, it shoots into crystals, like Glauber's falt, and that there remains a bittern which will not crystallize. Dr. Rutty affirms that it requires at least twenty-four times its own weight of water entirely to diffolve it, though the factitious Epforn falt diffolves readily in little more than an equal weight of water.

EPULIS, from em. upon, and sha, the gums.

A kind of tubercles in the gums, of which there are two fpecies; one without pain, the other is troublefome, and often degenerates into a cancer. They are of different fizes, fome having a broad basis, and others a slender neck,

by which they are united to the gums.

The best method of cure is totally to extirpate them : when they have a fmall neck, or root, they may be twitched off with a thread. When the basis is broad, deflroy it with the aqua kali, or a folution of fal ammoniac. If these mild corrosives fail, it is better to use the knife than to hazard the danger which attends the stronger

After the humor is extirpated, wash the mouth with red wine, or oxycrate with alum; and when the blood ceafes to flow, use a mixture of the honey of roses with oil of myrrh. See Turner's Surgery, vol. i. p. 210. Heister's Surgery.

EPULOTICA, from \*δπ, a cicatrin, επελου, is to cicatrize. EPULOTIC. Cicatrifantia; desiccatriza. Topical

medicines which dry up humidity, reprefs fungous flesh, and dispose wounds or ulcers to be covered with skin, are ranked under this name. Dry lint, gentle comprefs, and the cerate with lap. calam. are the general applications.
EPULOTICUM. CERATUM. See CALAMINARIS

EQUI CLIBANUS. In chemistry it is the heat of

HOUINA FRASA. See FABA MINOR. EQUINOX. See ÆQUINOCTIUM.
EQUI VENTER. See VENTER.
EQUISETUM, and EQUISETUM PALUSTRE. See

CAUDA EQUINA.

- POLYGONOIDES. See ALGOIDES.

- SUB AQUA REPENS. FOLIIS BIFURCIS. See

CERATOPHYLON.

EQUITATIO. RIDING. Nothing ftrengthens the vifcera and intestines more than this species of exercise, which should be taken when the bowels are in their most empty state, or when the business of digestion is somewhat advanced. Its use arises from the repeated gentle agitation given to these parts, which are calculated to remove vifceral obstructions, promote the circulation of the blood, clear away viscidities from the bowels, determine the fluids to the furface of the body, and increase perfpiration. Dr. Huxham had fo high an opinion of this remedy, that he fays, where tedious courses of medicines have failed, in fome chronic difeases, riding only has performed a cure: hence advises, when a patient can fit on horfe-back, that he should have daily recourse to this exercife.

EQUUS MARINUS. See Hippopotamus. ERANTHEMUS. See Adonis flos. ERAWAY, i. e. Ricinus vulgaris. See Cata-

EREBINTHUS. See CICER.
ERECTOR CLITORIDIS. See CLITORIDIS MUS-

ERECTORES PENIS. These muscles arising from the infide of the tuberofity of the ischium, are lost in the crura, where they unite. They are also called directors penis; and Spigelius calls them collaterales penis.

EREGMOS, from payrous, to break. It is any legu-

ERETHISMOS, from episitu, to excite, irritate. In general, whatever is an obstacle to nature is an erethismos. In particular, it fignifies an irritation of the belly, from thin acrimonious humours, and their discharge in liquid stools.

ERETRIA TERRA. ERETRIAN EARTH. Also called canabil. There are two forts; one is white, the other ash-coloured. The latter is most effected.
EREUGMOS. An ERUCTATION.

EREUMENA URA. Urine that affumes a cloudy confiftence in the middle.

EREUXIS. ERUCTATION.
ERGALIA. That part of alchemy that explains the inftruments thereof.

ERGASIMA. A name of the worlt fort of myrth. ERGASTERIUM, from 1970, a work. A LABORA-TORY. In particular, it is that part of a furnace in which the copel, alembic, retort, &c. containing the matter to

be acted on, is reposited.

ERGOT. So the French call a disease, which refembles one in England, which is caused by eating bad corn.

ERICA, also called erice, COMMON HEATH, HEATHER, LING. Boerhaave mentions eight species, but others add ftill more. The flower is of a curious structure, and a decoction of them is commended as a folvent for the ftone; five ounces of it are to be drank every night and morning. See Raii Hift.

- BACCIFERA, &C. | See EMPETRUM MONTA-CORIS FOLIO. | NUM.

ERICERUM. The name of feveral collyria in Actius, fo called from erica, beath, which is an ingredient.

ERIGERON, also called fenecio, conyzoides.

ERIGERUM. SIMPSON, and GROUNDELL. It is a low

plant, and too generally known to require a description. The species used in medicine is the fenecio vulgaria, Linn. It is an annual plant, but may be found at all times of the year. The juice of the leaves are a powerful emetic. An infusion of them, or their expressed juice, may be given. Some maniacs find that a tea-cup full of the juice will operate with them as an emetic when other means fail, and thus they remove flight attacks of their diforder. See Lewis's Mat. Med. and for their fingular power externally applied, Edin. Med. Effays, vol. ii.

ERIGERON CŒRULEUM, BLUE FLEABANE. — QUARTUM.
ERINEOS, i. e. CAPRIFICUS, or WILD FIG-TREE.

See Figure Sativa.

ERINOS. The name of a plant deferibed by Dioscorides as refembling ocymum, and bearing white flowers, which are followed by black feeds. Bauhine mentions two other plants which have this name, and Muntingius another, which differs from them all.

ERIOPHORON. A fort of woolly bulb mentioned by

Theophrastus.

ERITHRONIUM SATYRIUM, i. e. Dens canis latiore rotundioreque folio.

ERIX. The fuperior part of the liver.

ERIZAMBÆ. See Asphodelus luteus.

ERODINIUM. A word used by some chemists to ex-

Prefs a prognoftic.

EROTION, i. e. APIASTRUM. See MELISSA.

EROTOMANIA. That fort of melancholy to which lovers are fubject. See Melancholia.

EROTYLUS. See Coralloides fungus.

ERPES. See HERPES.

ERRANA. ERRATIC FEVERS, irregular TER-ERRATICA. TIANS OF QUARTANS.

ERRHINÆ. STERNUTATORIA, ERRHINES, from hev, the nofe. Errhines are the name which Galen gives to flernutatories; they are substances, which, if snussed up the nose, promote a discharge of mucus therefrom. At present the milder sorts are distinguished by the name of present the minder forts are cittinguilled by the name of errhines, and the stronger by that of fiermatateries, hecause they excite a sneezing. By the use of this kind of medicines, the megrims, opthalmia, and tooth-seh have been cured by this violent operation, but their practice appears hazardous. Beside, the general shock that sneezing gives to the whole body, it tends to remove the remote obstructions; hence its use extends to lethargies, evilence control of the property of the sneezing the fies, palfies, apoplexies, head-achs, vertigoes, catarrhs,

gutta ferena, &c. The action of fuerzing feems to be more extensively useful by its general shock than that of vomiting; but it should ever be observed, that if there is any kind of plethora in the habit, that should be removed be-fore flernutatories should be administered.

ERRIPSIS, from pin a, to precipitate. When spoken with respect to the body, it signifies a loss of strength.

ERROR LOCI. Boerhaave is said to have introduced When spoken

this term, from the opinion that the veffels were of different fizes for the circulation of blood, ferum, and lymph, and that when the larger fized globules were forced into the leffer veffels by an error of place they were obstructed. But this opinion does not feem well grounded. See Ar-

ERVADO CAPITAON. The name of a plant in

Brafil, called also cotyledon repens Brafiliensis.

ERUCA: Rocket: called also enzomen. Boerhaave mentions feven species. This kind of plant resembles mustard in appearance, but is distinguished by the smoothness of its leaves, and its disagreeable smell. The seeds have a pungent tafte, fomewhat like that of mustard, but The fort used in medicine is the braffica eruca, Linn. It is also a term for MUSTARD.

major fativa. GARDEN-ROCKET. The roots have a hot biting tafte, and the feeds have the fame qualities. The herb is eaten as a fallad, and is somewhat warming and

diuretic, but is not in use as a medicine.

- SYLVESTRIS, called also eruca fylv. major, eruca tenuifolia, &c. WILD-ROCKET. Its qualities are much the fame as those of the garden species, but its tatte is fomewhat more acrid and bitter. See BARBAREA.

Reseda vulgaris. BASE-ROCKET.

Refeda miner, called also phyteuma, valeriana, feptima. SMALL BASE-ROCKET.

Boerhaave reckons up fix species of resedas, but they are not of any value in medicine.

LATIFOLIA LUTEA. A species of sisymbrium. See BARBAREA.

- SILIQUA CAULI OPPRESSA. HEDGE MUSTARD. See ERYSIMUM.

ERUCAGO. CORN-ROCKET; called also erucago fegetum, sinapi echinatum, raphanistrum dispermum Mon, peliacum. Some fay it is attenuating, others rank it with antifcorbutics; but it is not of any note in medicine.

ERUTHEMATA. Red fiery tumors which arise from an inflammation, as in cryfipelas.

ERVA DE SANCTA MARIA. A name of the dra-

ERVILIA. See OCHRUS.

ERVUM, called affo orsbus. The BITTER VETCH. It is the orvum ervilia, Linn. This plant grows up two feet in height, its leaves and flowers are like those of the tare in their shape, but are less and of a white colour; these flowers are succeeded by pods which contain two or three large, round, whitish feeds. It is a native of France, Italy, and some other of the warm parts of Europe. The seeds have a farinaceous disagreeable bitter taste, are nephritic, powerfully diuretic, and if mixed with honey are expectorant.

Astragaloides Lusitanize. The Portugal Bastard

Astralagus, called also Christianæ radix, astragalus Syriacus birsutus, erebrychis peregrina, astragalus argenteus. The silk vetch of Dioscorides. Dale says it is difficult to fay what plant this is.

Clymenum. The CHICHLING-VETCH. Boerhaave men-

tions four forts of this vetch, and Miller a fifth.

Securidaca, also called hedysarum majus, pelecinum.

HATCHET-VETCH. The name pelecinum is from TEALUNG, a hatchet, because its seeds are shaped like a two-edged

All these kinds of vetches are natives of warm climes, but are produced in our gardens. But whatever their medical qualities are, they do not obtain in practice. See Miller's Dict. vol. i. ii.

- SILVESTRE. See NISSOLIA.

ERYNGIUM. ERYNGO. Boerhaave reckons eleven species, and Dale enumerates still more. It is also called eringus, eryng. maritimum, inguinalis, SEA-HOLLY and ERYNGO. It is the eryngium maritimum, or eryngium

prickly leaves, angular or jagged about the edges; the flowers are white; the roots are flender and long, brown on the out-fide and white within. It is perennial, grows plentifully on fome of our fandy and gravelly thores: in flowers in July.

The root has an agreeable fweet tafte, which on chewing is followed by a light aromatic pungency. It is putrefeent, and a mean betwixt animal and vegetable food. Freely used, it is aperient and diuretic; but more fit for

diet than as a medicine.

The candied roots, bought at the confectioners, are an ingredient in artificial affes milk which is thus made:

Take of candied erynge root, one ounce; pearl barley, half an ounce; liquorice root, three drams; boil them in two pints of water to one pint, to which add a pint of new milk from the cow; boil them gently together, then strain for use. Half a pint should be drank three times a

day.

ERYNGIUM ZEYLANICUM, called also melampyro cognata Maderas, &c. coletta veetla. This species of eryngo is not in use with us.

- LUTEUM MONSPEL. See SCOLYMUS.

- MINIMUM MITIUS CAPITULO MAGNO. A species of cnicus.

ERYSIMO. A name of a species of turritis.

ERYSIMUM, called also iris, camelina, chamaplion, verbena famina, cruca filiqua cauli oppressa. HEDURAMUSTARD. It is the crysimum officinale, Linn.

It is an hairy plant, with oblong narrow leaves, tough branched stalks; bearing numerous finall yellow flowers; which are followed by thort roundish pods full of finall reddish brown feeds. It is annual, common in waste

places, and flowers in July.

This plant is not in much effecm; it has been employed in the cure of hoarieness, in the same manner as horfe-radish, see RAPHANUS RUSTICANUS. And perhaps has the advantage over the other filiquose plants, as having less acrimony, which allows it to be more freely and frequently used. Cullen's Mat. Med. The leaves are herbaceous to the taste; the flowers are attenuant, expectorant, and diurctic; the feeds resemble in their qualities those of mustard, but are much weaker; their acrimony is extracted totally by water, and partially by soirit. Water is freed totally by water, and partially by fpirit. Water is strongly impregnated with them in distillation. Stahl highly commends the active parts of this plant in fcirrho-cancerous tumors. It is also a name of fophia, and fifymbrium.

ALLIARIA. See ALLIARIA.

LATIFOLIUM, alfo called finapi filveffre, &c.
BROAD-LEAVED HEDGE-MUSTARD. Its virtues are fimilar to those of the other kind. Raii Hift.

- THEOPHRASTI. See FAGOPYRUM.

ERYSIPELACEA. Called also Antonii sancti ignis; ERYSIPELAS. Signis sacer; brunus berpes ferus; ignis Parsicus. Authors vary in their derivation of this word. Constantine and Martinius derive it from sow. to draw, το μελας, the neighbouring parts. Pollux calls the word εροθροπελΦ, from εροθρος, red, and μελος, black, from its variety of colours. And this name feems to be from the colours which this diforder induces in the parts it affects. Hippocrates calls this diforder emephanous; the Latins call it ignis facer when it is of the ulcerated kind: it is also called zoster, zona, or the GIRDLE; SHINGLES: in Switzerland it is called the violet: some name it the rofe, from its red colour. The common English term is SAINT ANTHONY'S FIRE.

The true species is acute and inflammatory. The bastard

kind is more chronic than acute.

Some define this diforder as being "That state of an

Some define this diforder as being "That state of an inflammation wherein the affected part becomes white, when it is pressed with the finger; but soon assumes its former colour, when the pressure is removed."

Dr. Cullen places this genus of disease in the class pyrexize and order exanthemata. He distinguishes two species, 1. Erysipelas vesiculations, in which the inflammation occupies broad spaces, and on which large vesiculations form themselves. 2. Erysipelas physicandes, in which there are many small inflamed pinples on the skin, which soon are formed into numerous small vesicles. foon are formed into numerous fmall vehicles.

This diforder may be on any part of the body; but the face is most frequently affected, the arm next, and then the feet and other parts. The feat of the true species is in the furface of the skin; Heister say in the scarffkin and fat contiguous thereto, and the internal mem-branes. The baftard kind lies deeper, and is apt to degenerate into ulcers.

Autumn, or when hot weather is fucceeded by cold and wet, are the feafons which favour this difeafe, and in which it most frequently happens. The fanguine and plethoric, young people, and pregnant women, are the most subject to it. Those who have once been affected are very liable to future attacks.

The causes are in general the same as those which produce other kinds of inflammations; but chiefly fudden cold fucceeding a great heat or fweat, obstructed per-fpiration, and a sharp blood. Tissoft fays that it results from two causes: Iss. An acrid sharp humour, which is commonly bilious, disfused through the mass of blood: of this opinion were Hippocrates and Galen. 2dly, The hu-mours not being duly discharged by perspiration. Maga-nis, in his Doctrine of Lusangerations, observed that nife, in his Doctrine of Inflammations, observes that a plutinous humour is fupplied by the febaceous glands, to preferve the fenfibility of the fkin and keep it moift, by checking, in fome measure, the egress of the fluid which goes off through its pores; this glutinous humour being wanting in an eryfipelas, the fkin is dry and parched, because the erethism of the vessels is but small, and the morbific humours having nothing in their way to retard their egrefs, exhale through the expiring vessels of the skin; and that it is by the want of this glutinous humour that an eryspecial differs from any other inflammation of the fanguine or phlegmonic kind. From the want of a tumor, fomewhat fimilar to the febaceous, it is, that other membranes are the feat also of an erysipelatous inflamma-

The diagnostics of this disease are well described by Tisso as follows: it is sometimes but a sight indisposition, which appears on the fkin, without the person being fenwhich appears on the ikin, without the perion being lenfible of any other diforder, and it most commonly breaks
out in the face or on one leg. The skin becomes tense,
or stiff, rough, and red; but this redness disappears on
pressing the spot with a singer, and returns on removing
it. A burning heat is selt in the part affected, which
makes the extent uneass, and sometimes hinders him makes the patient uneafy, and fometimes hinders him from fleeping. The diforder increases for two or three days, continues at its height one or two, and then abates foon after this, that part of the fkin which was affected falls off in large feales, and the diforder terminates. Sometimes the malady is more fevere, beginning with a violent flivering, which is fucceeded by a burning heat, a vehement head-ach, fickness at heart (as it is commonly termed) or reaching to vomit which continues till the the second or third day; the sever then abates, and the sickness goes off; though frequently a less degree of sickness, or loathing, and of sever remaining during the whole time of the increase of the disease. When the inflammation and eruption happen in the face, the head-ach con-tinues until the decline of the difeafe; the eye-lids fwell, the eyes close and the patient hath no ease. It often paffes from one cheek to the other, and extends fuccef-fively over the forchead, neck, and nape of the neck, under which circumftance the difeafe is of a more than ordinary duration. Sometimes also, when it exists in a high degree, the sever continues, the brain is oppressed and obstructed, the patient raves, and his case becomes exceeding dangerous. A violent erysipelas in the neck brings on a quinfey, which is very grievous, and often fatal. When it attacks the leg, the whole of it is swelled up, and the heat and irritation from it is extended up to the thigh. Whenever the tumor is confiderable, the part it feizes is covered with fmall puftules, filled with a clear watery humour, refembling those which appear after a burn, these afterwards dry and scale off. Sometimes, when this distemper affects the face, the humour which iffues out of these pustules is thick and gluey, and forms a thick scurf and scab nearly resembling those of sucking children, and they continue fast on the face many days before they fall off. When the disease is violent, it continues eight, ten, or twelve days at the fame height, and is at last terminated by a very plentiful fweat, that may fometimes be predicted by a restlessness, attended with

An explipelas rarely comes to suppuration; when it does the suppuration is always unkindly, and much disposed to degenerate into an ulcer. Sometimes a malignant kind of eryspelas is epidemical, and then it often terminates in a gangrene. This distemper often shifts its situation, it fometimes retires fuddenly, but the patient is uneafy and difordered, he hath a propenfity to vomit, with a fenfible anxiety and heat; the eryfipelas appears again in a different part, and the patient feels himfelf quite relieved from the preceding fymptoms. But, if instead of re-appearing on fome other part of the surface, the humour is thrown upon the brain, or the breast, he dies within a few hours; and these fatal changes and translations sometimes occur without the least reason or colour for ascribing them either to any error of the patient, or of his phyfician. If the humours have been transferred to the brain, the patient immediately becomes delirious, with a highly flushed vifage, and very quick sparkling eyes; soon after he proves frantic, and goes off in a lethargy. If the lungs are at-tacked, the anxiety and heat are inexpreffible. There are some constitutions subject to a very frequent, and, as it were, an habitual eryfipela: if it often affects the face, it is generally repeated on the fame fide of it, and that eye is at length confiderably weakened by it.

Sydenham reckons the ESSERA (which fee) a species of eryspelas, and calls it the bastard or scorbutic kind; and this he says is with or without ulcerations. What Pliny calls zofter, and others call zona, thingles, &c. Syden-

ham reckons a species of this disorder.

The eryspelas should be distinguished from the plague, and from inflammations of different kinds that happen on

As to the prognostics, many of them may be noted from the diagnostics above related: when it approaches sud-denly, but with little disturbance, and attacks a person with a good habit, and when no nervous, membranous, or principal parts are affected, there is but little to be ap-prehended from it. Sometimes a convultive difease, as an afthma, colic, &cc. hath been relieved by the approach of an eryfipelas. Danger is very confiderable when this diforder is deeply feated, fixed on a fentible part, and the habit of body but indifferent: in fome bad habits this diforder leaves behind it a fwelling in the foot, or ankle, or both, which is both troublefome and difficult to remove; by bad management it is easily and foon rendered fatal; frequent returns denote a difordered liver or gall-bladder; when it is feated in the face, a drowfiness often attends it, in which case there is danger of a phrenitis, or of a mor-tal lethargy; when it seizes the breasts, particularly of women in child-bed, or who give suck, an abscess is the confequence for the most part: if the nostrils and mouth

consequence for the most part: if the nostrils and mouth are dry, and the patient is drowsy, an inflammation of the brain is to be suspected: it is generally fatal within the seventh day, when the patient dies; and they who are often seized with it, at last die of it.

The diet should be thin and perspirative; roasted apples may be eaten freely: the drink may be whey, barleywater, small beer, water-gruel, or if the pulse sinks, small negus may be allowed. The patient should keep out of the bed during some hours in the day. But equal care should be taken to guard against the extremes of heat and cold.

In order to the cure, the first endeavour should be to remove this disorder by resolution. In the slighter cases, perspiration may be kept up with frequent draughts of camomile or of elder-flower tea, acidulated with the spt. seb. Di. Clutton, or with other cooling perspiratives. If the face and head be affected, gentle but repeated purg-ing is to be directed; they should also be continued until all danger seems to be alleviated. But if the pulse is strong and hard, bleed, and repeat it as the sever and ftrength of the patient indicate; in this case, besides ni-tre and other cooling perspiratives, the bowels may be kept soluble by means of whey, prepared by turning cow's milk with cream of tartar, tamarinds, &c. Dr. Freind observes that when the head is affected, purges are the specifics; but it may be added, that in such like cases sinapisms may be applied with singular advantage to the foles of the feet.

From an admission of cold air the erysipelatous matter is

on the part from whence the inflammation receded, and mation. finapifms to the feet; at the fame time forget not to administer a purge, and to repeat the like as the case may

When the pulse is low, cordials and the warmer per-fpiratives should accompany the use of blisters.

When an erysipelas attacks, or is repelled to the lungs, the only chance of life is to divert it therefrom, and fix it on the external parts: in this case, besides the fever, pain in the breaft, and other violent fymptoms, the patient frequently faints; and what is worfe, he rarely furvives his fufferings.

Blifters are often useful, but should be applied as directed under emp. vesicat. mitior. in the article CANTHA-

RIDES, which fee.

In the wandering kinds of this diforder give half an ounce of the rob. fambue, four times a day with five or fix grains of the kali vitriolat. in each dofe; every third day give a cooling purge, place the patient every evening in a pedilave, and after it apply finapifins to the feet. From the nature of this difease, and from the pecu-

liarities in the skins of different persons, much caution is required in the application of external remedies. When the fearf-skin is raised in blisters, and the serum begins to transude, then apply absorbing external medicines, such as chalk finely powdered, or a thin rag may be spread over the inflamed part, and the chalk or fine flour sprinkled upon the rag; or, instead of these, slannels wrung out of a decoction of elder and camomile flowers may be applied as often as they grow cool. Among liquids Goulard's faturnine water is one of the best applications, and may safely be used in every case where a resolution of the in-

flammation is the aim. See also SECALE.

If, notwithstanding all endeavours to discuss, the symptoms of a suppuration still prevail, encourage them by few days. applying the common white bread poultice, with faffron

If a gangrene is threatened, besides the inward use of camphor and the bark, spirituous and strengthening applications should be employed externally, such as mixtures of lime-water with camphorated fpirit, or camphorated fpirit mixed with tineture of myrrh, or an infusion of the bark.

It may be observed here, that the eryfipelas is not al-ways of the phlegmonic kind. It formetimes appears with a redness in the skin; a kind of pushness instead of a fwelling; the pain is more acute, but the throbbing of the veffels lefs; no circumferibed tumor, but the parts are more inflamed; at the decline of the difease the redness of the skin becomes of a purple hue; it is very liable to terminate in a mortification; the habit from the first, and throughout is very irritable, and the strength depress-

and throughout is very irritable, and the itrengin depicts
ed. It generally attacks the heart and precordia, and is
accompanied with cardialgia, itching, inflammation of
the fkin, painful exulcerations, and fmall lucid puffules.

It is true, in fome ftrong habits, both a phlegmonous
and the low eryfipelatou inflammation attend together,
in which case, a moderate bleeding may fometimes have
its use, but should be cautiously admitted. If the low
confinedatous inflammation attacks, and the patient labours eryfipelateur inflammation attacks, and the patient labours under great deprefion of strength, irritability, &c. we must support him with wine, and keep up his strength by the same; when blisters arise, it happens from the salts of the watery parts of the blood being thrown out upon the furface, and there stimulating; in this case the bark may be freely given, from 3 vj. to 3 i. or more if the stomach will bear it, in twenty-four hours. When the pustules are all out (and not before) and ripened, snip the blisters, and drink up the sluid with fost rag, then apply the ung. sperm. cett; or ung. lapid. calamin.

— CURANS. ARBOR. See PAVATE.

— INFANTORUM. Explipelar of infants. This diforder feems to be first noticed by Dr. Underwood, who, in his Treatise on the Diseases of Children, calls it

fometimes fitrick inwardly; when this happens, bleed Anomalous Inflammation; though in treating of it he immediately, apply blifters on the fides of the neck, one lays inflants are liable to a kind of engineering inflammation;

It never appears, I think, later than the month, but most frequently shews itself a few days after birth. It attacks the most robust as well as delicate children, and in an inflantaneous manner; the progress is rapid; the skin turns of a purplish hue; and soon becomes exceed-

ingly hard.

The milder species of it appears often on the fingers and hands, or the feet and ancies, and sometimes upon or near the joints, forming matter in a very floor time. The more violent kind is almost always seated about the pubis, and extends upwards on the belly, and down the thighs and legs; though I have two or three times feen it begin in the neck. The fwelling is but moderate, but after becoming hard, the parts turn purple, livid, and very often sphacelate; especially in boys, when it falls on the scrotum. The penis swells, and the prepuce puts on that kind of emphysematous appearance which it has in children, when a stone is sticking in the urethra.

Various means have been made use of without succefs; though for a time fome benefit was received from faturnine fomentations and poultices, applied on the very first appearance of the inflammation, but it foon spread and a gangrene prefently came on; or, where matter had been formed, the tender infant funk under the difeharge. It is now fome years fince I proposed making trial of the bark, to which sometimes a little confectio aromatica has been added; from which time feveral have recovered. Dr. Garthshore has lately tried, the application of linen compresses wrung out of camphorated spirit of wine, in the place of the vegeto-mineral water, which has proved very successful in several instances; nevertheless, the greatest number of infants attacked with this diforder, ftill fink under its violence, and may of them in a very

ESCAPATLI. A species of SENA.

ESCHARA, vel ESCURA. An ESCHAR or CRUST. In furgery it is a hard cruft, or a feab upon the flesh, formed by the application of a red-hot iron, a caustic, or fome sharp humour of the body. Also a slough, formed on a wound or ulcer, and is an inflance of mor-tification. Likewife the name of a fub-marine plant which refembles a net or cobweb, called alba manna perofa; frondipera; porus reticulatus. Boerhaave mentions three species. Their virtues are fimilar to those of coral; but none of them obtain in practice.

ESCHAROPEPA. In Hippocrates it is an epithet for

roafted barley-meal.
ESCHAROTICA, from soxagou, to fkin over, feab

II. I. 418. Escharotics. Medicines fo called, which, imprefion when applied to the flesh, form a hard crust, or eschar;

or medicines that thin over a wound.

Caughica, CAUSTICS, and efebarotics differ only in degree, both being what deftroys any flefhy part to which they are applied on living bodies. Van Helmont first afferted their inesseasy on dead bodies; and Dr. Petit of Paris confirmed it. These kinds of applications do not Paris confirmed it. These kinds of applications do not act upon the body from any innate power in themselves, but only as actuate by the heat and moisture of the circulating fluids which are found to be fo effential to their action, that on the dead body they produce no alteration : they first heat the fluids in the part to which they are applied, and rarify them so as to burst their vessels; then the finer parts slying off, the part is left dry, and incrufted.

Cauteria. CAUSTICS or CAUTERIES, are diftinguished into actual and potential. The actual is real fire, that is, an iron made red-hot; but thefe, on account of their ter-rifying appearance; as well as the pain which they occa-fion, are now laid afide. Thefe act on the folids. The potential are those which do not act with immediate burning, but only as the body is disposed to favour their action. The chief of these are what were called cauflicum lunere, commune fortius, antimonale; now named argentum nitratum, calx e kali puro, antimonium muriatum. They act by the acrid falts which they con-

Their use, besides that of destroying excrescences, &c. is to open large abscesses where there is danger of cutting fome adjacent vessel, or when the knife appears horrid to the patient. In this case, the common milder caussic generally sussices, and may be thus applied; lay a piece of sticking-plaster on the lost part of the abscess, having previously cut a hole in it, nearly as big as the eschar is to be made; then, in the whole of the plaster lay the caussic which must be several by another size of sticking tic, which must be secured by another piece of stickingplaster: when the skin is not inflamed, the eauftic very often occasions little or no pain. When the eauftic hath produced its effect, an opening may be made through it for the discharge of the pus, but the rest may digest away. When issues are made by caustics, or bones laid bare by them, the eschar must be cut out immediately, or the next day, lest new slesh should fill up the part which is opened. To lay a bone bare, or to make an issue, lest the caustic lay on about four hours; to destroy a large gland, lay it on six hours; but to open an absection it may gland, lay it on fix hours; but to open an abfects, it may remain two or three hours, according to the thickness of the skin, though generally, when the effect of the caustic is completed, the part on which it is applied ceases to be

When a large fungus is to be destroyed by a causlic, the method described in the Edinb. Med. Essays seems most eligible; it is as follows: the lap, infern, was applied to a tumor on the coats of the testis: after the separation of the eschor, the lap, infern. & ol. vitr. were alter-nately used, by rubbing the part first with the lap, infern, then in less than a minute after, with a fir stick dipped in the ol. vitr. which instantly removed the pain occafioned by the lap. infernalis; at each drefling, this alternate application of these opposite caustics was repeated, till as much was wasted as was then thought convenient; the moilture was absorbed by an armed probe, and a digestive applied. This method prevents the continuance of pain, and is not productive of any degree of inflammation; it is also recommended for the removal of scirrhus, or any other kind of tumor that admits of a caustic being made use of.

Mr. John Hunter recommends a mixture of opium with conflict in order to lessen the pain which they oc-casion. White's Surgery, p. 188. ESCARPE See FASCIA. ESCHEL. It is an imperfect zasser. See Cobaltum. ESCORZONERA. See Scorzonera.

ESCULUS. A species of oak is thus named.
ESCURA. See ESCHARA.
ESDRÆ ANTIDOTUS. An antidote described by P. Ægineta. ESEBON. COMMON SALT.

ESSATUM POTENTIALE. The medicinal power or virtue which refides in vegetables and minerals.

ESSATUM VINUM. Spirit of wine impregnated with the medicinal virtues of vegetables.

ESSENTIA. The ESSENCE of any thing. From philosophy this word hath been transferred to chemistry, where it feems strictly to import the distinguishing part

of medicinal fimples, separated from all other parts of the body which contained it.

ESSENTIA ABIETIS. See ABIES.

--- NEROLI. See AURANTIUM.
ESSENTIALE SAL. See DIURETICUS SAL.
ESSENTIALIS. ESSENTIAL. It is an epithet for falts procured from vegetable juices by cryftallization. How these salts are procurred, see ACETOSA. When the viscous juices of vegetables are used in this process, as those of comfrey, &c. the falt cannot be obtained with out a previous fermentation to diffolve their tenacity. Juices that contain an oil or a balfam will not eafily yield their falt, for oils and balfams prevent the cryftallization of the falts. Thefe falts are never alcaline, though by burning, they are convertible into an alcaline.

The oils peculiar to different vegetables are also called

Some fevers are called effential by way of diffinction

from the fymptomatic.

Essentialis sal, Essential salt. given to all concrete faline substances, which preserve the imell, tafte, and all other principal qualities of bodies from which they were obtained, which bodies are only vegetable and animal. The usual method of preparing them, is by evaporating, to almost the consistence of a fyrup, the liquors containing the effential falt, viz. the expressed and depurated juices and strong decoctions, and by keeping them in a cold place. The crystals which shoot from these liquors may be depurated by dissolving

them in water, filtrating, evaporating, and crystallizing. Very often the falts thus obtained from animal and vegetable matters are nothing but vitriolated tartar, vitriolated natron, nitre, common falt, and other fuch neu-tral falts, which ought not to be confidered as the effential falts of the fubitances from which they are extracted: those only are the effential falts, in the combination of which we find oily parts, which cannot be separated from them, unless the salt be decomposed. See Essen-TIALIS and ESSENTIAL SALT in the Dict. of Chemistry.

ESSERA. The CHRONICAL NETTLE-RASH. It is called effere, fora, and fara, by the Arabians; Sydenham calls it a BASTARD or SCORBUTIC ERYSIPELAS; fome name it the NETTLE-SPRING, from its refemblance to the eruptions excited by the ftinging of nettles. Dr. Cullen hath not determined where to place this kind of difease; he observes, that it is different from the urticaria, or acute nettle-fever. This nettle-rash, he thinks may be numbered with the diforders in the order impetigines.

The effera is a species of tumor not mentioned by the Greeks nor Latins. It is a chronical diforder, and is

feated in the fkin.

Some people are affected with it only when the weather is frofty, others only in the hottest months. Persons of all ages and of both sexes are subject to it.

In some patients this disorder takes its rife from causes which prove curative in others. Senertus fays the caufe is in the ferum. Dr. Heberden intimates, that whatever it is which produces the itching and tubercles in the fkin, when muscles, &c. disagree with those that cat them, it

is the fame cause which produces the effera.

This diforder appears in the skin in the form of small white hard tubercles; sometimes there are very broad tumours, and long ones alfo, such as appear after being firuck with the lash of a whip; an intolerable itching at-tends them, and generally the skin is inslamed and very red in the spaces betwixt the cruptions. The elevations appear fuddenly, they feldom continue long, and are apt to difappear from one part and appear again in another. No part of the body is exempt from this complaint. When many of the tubercles appear together, the part feems fwelled. In fome inflances this diforder totally difappears in a few days, in others it hath continued many months, and even years, difappearing at times, but returning after very fhort intervals. For the most part the appear fuddenly, they feldom continue long, and are apt

fometimes fo great as to deprive the patient of his fleep; mella, a cellular bony fubfitance is observable; the figure but fome patients complain of fickness, head-ach, or of the cells is uncertain, they communicate with the other troublesome symptoms during the presence of the eruptions, whilst others are only thus affected on their fuddenly finking in.

Serapio fays there are two species of effera, but his

distinctions do not seem well grounded.

The effera should be distinguished from that species of itch which appears in the form of dry pimples at the first, but foon after have a thin ferum lodged on their apex, in the manner of a fmall velicle. Some confound the effera with the epinyclides, but the latter hath also a thin hu-mour which ouzes from them.

No danger attends this complaint, either as to life or health, any farther than the itching may hinder fleep.

As to the cure, the only indication is to allay the itching; how to answer this is difficult to fay, because of the different effect which follows from the application of the fame remedy in a variety of cases. In short this disorder feems to fland without any rational prescription for its cure. See Sennertus, Wallis's Sydenham, and Dr. William Heberden's Remarks on the Nettle Raft, in the fecond volume of the Lond. Med. Tranf.

ESTHIOMENOS, sofiu, to eat, from toftouat, to eat. EATING, CORRODING. An inflammation in the tkin, attended with a fharp humour, more properly the herpes

exedens. It is indeed any inveterate ulcer.

ESULA, vel Ezula. Spurge. There are many speeies of plants which bear this name, for which, befides what are here inferted, there are others which rank un-

der the articles cataputia and tithymalus.

Esula Indica, called also tithymalus Orientalis arborescens triquetrus spinosus, and talukgbaba. The plant that produces the gum bogia differs not from this species of esula; but, as Sydenham observes, there are two species of gamboge, one collected from a plant called lonan cambodia, and the best fort from the codampulli.

The fourges generally agree in their containing a milky juice, which is violently emetic and cathartic; and, if ap-

plied to the fkin, corrolive.

- MAJOR, also called tithymalus palustris fruticosus, tithymalus magnus multicaulis, GREAT MARSH SPURGE, and GERMAN SPURGE; also the GARDEN SPURGE.

- MARINA. See TITHYMALUS MARITIMUS. - Minor, also called pityusa, tithymalus foliis pini, tithymalo cyparissie similis, and PINE SPURGE. Some have named it the COUNTRYMAN'S RHUBARB.

- Solisequa. The sun spurce. See TITHY-

MALUS HELIOSCOPUS.

ETESIÆ. The cool winds from the East. Pliny fays, that the Aquilones, i. c. north-east winds, are called Prodromi, and that they blow eight days before the dog-flar rifes. He also observes that the Etesian winds, that is the same north-east winds, set in two days after the dog-star rifes and continue forty days. Prosper Alpinus informs us, that the Etefian winds blow in Egypt when the fun enters Cancer, and blows almost all June, July, and August; and that at the rising of these winds, the Nile rises, and the pestilence ceases. The south wind brings the pestilence there; and these winds they call Capsin, from Campsis, a general; who, with his whole army, was suffocated in the sands which were driven upon them by these winds.

ETHEL. It imports both fire and blackness. In chemistry, the words ethel, terra alba, fulphur album, fumus albus, auripigmentum, and magnefia, all mean the fame

thing.
ETHER. See ÆTHER. ETHICA. See HECTICA.

ETHMOIDES, os, from thues, firainer, or fieve; usos, a form; called also cribriforme os; cribrofum os; coliforme a form; called also cribriforme os; cribrosum os; coliforme os; foraminalentum fongiosum os. This bone is placed between the two orbits of the eyes, where there is a notch left for its insertion. The cribriform lamella is the internal plain, thin, horizontal plate, which hath a superior middle eminence called crista galli, to which the beginning of the falciform process is attached; round the crista galli, except at the hind part, this lamella is pierced obliquely by many small foramina, through which the filaments of the olfactory nerves pass. From the middle of the cribriform lamella, the nasal lamella rises extremely thin, but at its anterior extremity it becomes

the itching is the only inconvenience, and this indeed is I thicker. At a little distance from each side of this lasfrontal finuses, and with the cavity of the nose; their outward posterior surface is smooth, and is called as planum; it makes a part of the orbit. The offa spongrofa, or turbinata superiora, are situated at the inferior part of the cellulæ; their sigure is oblong, and they are sharp at their extremities.

The cribriform lamella is the body, as it were, of the the ethmoid bone; and it is so thin, that it may easily be pushed through by a probe: when it is hurt, the acci-

dent is ufually fatal.

ETIMODRYS. A name for the quercus cum longo

ETRON. See Hypogastrium.

ETTALCHE. A name of the cedrus folio Cypressi major.
ETYTHOXYLUM BRASILIANUM. See BRA-

SILIUM LIGNUM.

EUANASPHALTOS, from ev, eafe, and avarquales, recover firength. One who is foon reftored. EUANTHEMON. Galen fays it is the fame as an-

themis, & chamaemelum.

EUAPHION, from w, cafe, and apn, the touch. A medicine for the hamorrhoids. Galen takes notice of it. It hath its name from its gentlenefs.

EUCA RISTOS. An epithet for an antidote in N.

Myrepfus: EUCHROON. A plaster mentioned by S. Largus. EUCOILIA. An epithet for cherries, importing that

EUELPIDIUM. A liquid collyrium, called also di-

arrhodon and diafmyrnon.

EUELPISTI. A plaster described in S. Largus.

EUEMBOLOS, from ω, swell, ω, in, and βαλλω, to One expert at fetting of bones.

EUEMETI, from 10, importing facility, and 1440, to vomit. Those who vomit with ease.

EUERES, from 10, well, and 1927 105, an oar. Easy to be rowed. But Hippocrates uses naval terms, and applies this word to instruments. In his book de Medico, it fignifies ready or bandy.

EUEXIA, from to, well, and the, a habit. A good

habit of body.

EUGEOS, from w, well, and m, the earth. The uterus is thus named on account of its fertility. It is also a name of the hymen.

EULE. A worm, properly that is bred in ulcers.
EULOGIUM. In Foreftus from Rhafes, it fignifies an exanthematous diforder, the fmall-pox, or the meafles.
EUNUCHION. A name of the LETTUCE. It is find to be thus called because Venus laid upon a bed of

them after the death of Adonis, to restrain her venereal

EUONYMO ADFINIS OCCIDENTALIS. See GUALACUM

EUONYMOIDES CANADENSIS. A plant growing in Canada, mentioned by Boerhaave, but hath no

medical virtues atributed to it.

EUONYMUS, alfocalled tetragonia, fufanus, fufaria, prickwood, and the SPINDLE-TREE. Boerhaave enumerates four species, and Miller reckons up ten. In France and Germany, the wood is made into spindles, whence the names fusaris and fusaria. The fruit is emetic and ca-thartic, and if powdered, and sprinkled in the hair, it kills lice. Raii Hist. See also Sinarouba.

EUONYMNUS VIRGINIA RIBESSII FOLIO. See SPIR MA,

EUPATORIOPHALACHRON. NAKED-HEADED AGRIMONY. Miller enumerates ten species of this plant,

but they are not noted for any medical virtues. EUPATORIUM, also called bepaterium, cannabinum, WATER HEMP, WATER AGRIMONY, DUTCH AGRIMO-NY, and COMMON HEMP AGRIMONY. See AGRIMONIA. The eupaterium used in medicine, is the eupaterium cannabinum, Linn. It is a plant in much use in Holland, but not in England: it is found on the sides of ditches and rivers; is acrid and bitter to the tafte; the leaves are ftrengthening and aperient. Boerhaave fays, that the turf-diggers use it against foul ulcers, the scurvy, and of the cribriform lamella, the nasal lamella rises ex-tremely thin, but at its anterior extremity it becomes root is cathartic. Two ounces of the fresh juice, or a

dram of the extract, is a dofe. Raii Hift. It is also the name for a species of Baccharis, and of FLEA-BANE. EUPATORIUM AROMATICUM, vel oboratum. A

fpecies of AGRIMONY. See AGRIMONIA.

ARABUM. See BIDENS.

- VERUM & VETERUM. See AGRIMONIA.

- Messue. See Ageratum. EUPEPSIA, from w, good, and wente, to digeft. GOOD DIGESTION.

EUPETATON. A name of the laureo mas. EUPHORBIA PALUSTRIS. See TITHYMALUS.

EUPHORBIA PALUSTRIS. See TITHYMALUS. EUPHORBIUM, from Euphorbus, a physician, in honour of whom king Juba, who first found it out, gave it that name, w, well, and occe, to feed; called also schadida-calli, seadidacalli, tithymalus accordes fruiteofus, &c. The Euphorbium Plant. Euphorbia officinarum. Linn. Boerhaave mentions twelve species. It is a prickly lactescent shrub; from it the gummy, resinous, concrete juice, called gum exphorbium exudes. This gum is brought from Barbary in drops, or teats, of an irregular form, some of which when broken, contain little twigs, and other vegetable matters. The tears are generally very and other vegetable matters. The tears are generally very eafy to break; they are of a gold colour outwardly, and

white within; they confift of equal parts of refinous and gummy matter; their acrimony refides in the refin.

The sprittuous tinctures are excessive fiery, and when inspirated they are still more so. The watery insuson and extract are bitterish, having only a slight though durable excession. able acrimony. Neither fpirit nor water carries over any thing from this gum by distillation.

This drug is too acrid for internal use; it is a part in the composition of some stimulating platters which are used in palsies and some other disorders. Some have used

used in palities and some other disorders. Some have used it as an errhine, but it is too active for such a medicine for in very small quantities, it is liable to be very violent; the fine dust which rises in powdering, assects the operator's head and throat violently. Cullen's Mat. Med.

In the second vol. of the Med. Mus. is an instance of person, who, through mistake, swallowed some of the tincture of employbium, and was relieved by frequent draughts of water and olive oil, and a small quantity of camphor. The symptoms produced by the employbium camphor. The symptoms produced by the eupher bium were a burning pain in the mouth, throat, and flomach, with a violent fuffocation.

with a violent suffocation.

EUPHORIA, from \$\varphi\$, well, and \$\varphi\varphi\varphi\$, \$\text{to}\$ bear. The easy bearing of a disorder, or the operation of a medicine. EUPHRAGIA, It is the supbrassia officinalis, Linn. Boerhaave mentions three species. It is an herb with little, oval, serrated leaves, set in pairs without pedicles; the flowers appear on the top of the stalks; they are white outwardly, but inwardly they are streaked with purple and yellow. It is annual, grows wild in uncultivated grounds, and flowers from July to September.

It is a very mild corroborant; is slightly aftringent, and hath been much extolled against disorders in the eyes. Both spirit and water extract its virtues. Some take an insussion of it, others use the powder in the manner of fnuss, in cases of dim-sightedness. The following preparation, called pute. Heliden, hath been held in great repute. R Euphrassia \( \frac{3}{2} \) ii. macis, \( \frac{3}{2} \) s. m. f. pulv. cap. \( \frac{3}{2} \) i. ad \( \frac{3}{2} \) iii. It is also the name of a species of CHICK-WEED.

EUPHRASIÆ AFFINIS. BRASIL SILIQUOSÆ. See

CAA-ATAYA BRASILIENSIS. EUPHROSYNE. See EUPHRASIA.

EUPORISTA, from su, easy, and mapsus, to afford. EUPORISTON, Medicines easily prepared.

EURYTHMIA, from so, right or juft, and subpos, order and harmony, properly in music. It imports dexterity in handling inftruments; also the proper order of

the pulfe curythmum. See ARYTHMUS. EUROPEE. See VERONICA. EUSARCHUS. WELL-FLESHED.

EUTHESIA. Galen explains it to be an innate strong

EUTHYPOROS, from ever, firaight, direct. An epithet of extension made with a view to reduce a broken

EUZOMON. The berb ROCKET. See ERUCA. EVACUATIO. TO EVACUATE. See EXCRETA and RETENTA.

Evacuating medicines produce their effects by general principles, which capaciates them for other effects, according to the skill of the administrator, and not by a particular power of felecting bad humours from the good. The good and the bad are mixed in the body, and are evacuated in the fame proportions.

EVACUATORII. Difeases attended with increased

EVAPORATIO. EVAPORATION. It is a diffipation of the finer parts of any fluid by means of the fun or fire: Chemical evaporation is always earried on by heat, yet cold and winds cause water to evaporate. The hardest

ice is not exempt from evaporation.

In pharmacy folid bodies are recovered from their flate of folution by evaporation with heat. This process is ap-plicable to all those substances which are less volatile than the menstruum, or which will not exhale by the heat requifite for the evaporation of the fluid, as folutions of al-kaline falts, and the inodorous parts of vegetables and animals from water, and refinous and odorous bodies in pirit of wine, as the tineture of mint made with spirit of wine, which, when separated from the spirit by evaporation, leaves a refin rich with the properties of the herb. See Dict. of Chem.

EVERRICULUM, In Paré it is a fort of spoon used to clear the bladder from gravel, &c. after lithotomy.

EVERSIO. See ECTROPIUM.

EVISTIOLA. In Paracelfus it feems to import a leprous diforder in the nape of the neck.

EXACERBANTES. REMITTING FEVERS. EXACERBATIO. See PAROXYSMUS.

EXACINATA. Fruits which have their stones taken out. Sec ACINUS.

EXAERESIS, from et, out of, or away, and aspa, to remove. It is that part of furgery, which consilts of re-

EXALMA, from stands, to loop out. Hippocrates ap-

plies it to the flarting of the vertebra out of their places.

EXALTATIO. EXALTATION. In chemistry, it fignifies an operation by which a substance is raised to a greater degree of virtue. Of exaltation there are two kinds: first, maturation, which is affected by digestion. fermentation, and projection. Secondly, gradation, fee GRADATIO. Exaltation is also defined a micro-chronic fubtilization, by which a thing by a gradual diffolution is transposed into a pure and more exalted degree of its virtue, and this is effected by circulation and ablution. Rulandus.

EXAMBLOMA, or Examblosis. A MISCARRIAGE. EXANASTOMOSIS. See ANASTOMOSIS.

EXANG. The abbreviation of Exanguibus, EXANIA. The fame as procidentia; also in particu-

lar, the bearing down of the anus.

EXANIMATIO: DEATH, or a syncope.

EXANTHEMATA, from efasts, to spring forth like a flower; called also efforatios and efflorescentia. Pustules or ERUPTIONS: Eruptive severs; any kind of cruptions that elevate the skin.

EXANTHROPIA. According to Wedelius, it is the

third degree of melancholy.

EXANTHEMATA SEROSA. That species of ve-ficular sever, called the greater. See PEMPHIGUS.

EXARMA, from starpount, to be elevated. An elevated

EXARSIO, a hot intemperature, fuch as happens in

EXARTHREMA, from \$\$, out of, and as \$\$ son, a joint. A LUXATION.

EXARTHROS. An epithet for a perfon whose joints

are large and prominent.

EXASPERATIO. EXASPERATION. Besides its fignifying the increase of a disorder, it is also a rendering

the tkin rough.

EXCATHISMA. A Semicupium:

EXCIPIENS. In prescriptions, that is called the excipient which receives the other ingredients, and gives them a proper form; as officinal electaries, conferves,

robs, &c.
EXCIPULUM. In chemistry it is a receiver.

EXCLUSORIUM. A medicine which causes abor-

EXCORIATIS, EXCORIATURE, or ABRASION of EXCORIATURA. the fkin.

EXCREMENTUM

EXCRETA & RETENTA. The things cast out of the body, and those that are retained. The natural excretions do not so directly imply and absolutely regard life, as they indirectly regard health, and the exercise of all the functions of life. The artificial evacuations from the circulating fluids are of blood, ferum, and lymph; and these are made according as the plethora is of the fanguine or ferous kind: by bleeding, the red blood and the vital heat are diminished; by purges, vomits, diuretics, &c. the ferous discharges are made; and by perfpiration the lymph is evacuated.

The fecretions are best performed in a regular state of health; hence in diseases, all turbulent symptoms should be allayed with the greatest speed. And as the degree of heat in the constitution is that on which regular secre-tions chiefly depend, its excess or diminution demands our first attention, that its state may be reduced as near

as may be to the standard of health

EXCUTIA VENTRICULI. A brush made of fost of substance." briftles, fixed in a flexible brafs wire, with filk or flaxen thread wrapped round it. When it is used the patient drinks a quantity of warm water; then the excetta being dipped in some proper liquor, is passed down into the stomach, where it is moved about, the better to wash the

EXECHEBRONCHOS. An epithet for a person who

hath a prominent throat. See BRONCHOCELE.

EXECHEGLUTOS. One who hath prominent buttocks

EXELCOSIS, from these, an ulcer. An EXULCERA-

EXERAMA. The matter ejected by vomiting. EXERCITATIO. EXERCISE. The exercise of the body for the benefit of health is called gymnaitic.

military exercises, gardening, hubandry, or other employ in the open air, very much conduce to health. To exercise moderately in the open air an hour or two before breakfaft, improves the appetite, and conduces much to cheer the spirits: and as to glandular obstructions, they are both beit prevented and cured by moderate exercise.

On the other hand, when exercise is too freely used, it

occasions loss of appetite, loathing of food, heat in the bowels, coftiveness, rigors, and fainting. In this case, a moderate use of wine, warm bathing, quiet sleep, and a moist nourishing diet, afford the most proper relief. See Fordyce's Elements, part i. Mackenzie on Health.

EXERRHEUSIS, EXERRHOSIS, EXERRHYESIS. These

words have the fame fignifications as Ecroe.

EXFOLIATIO. EXFOLIATION. The process by which the dead part of the bone separates from the found. One principal cause of an exfoliation of a bone is, an interruption of the continuity of the veffels which nourish it. The coldness of the air by contracting and drying up the extremities of the small vessels of the bone, also puts a stop to the circulation of the nourishing matter through them. Mr. John Hunter observes, that "one part of a bone is never separated from another by the rotting of the dead part, for that which comes away is as found as it ever was. Exfoliation takes place fooned in bones wherein are the fewest cells, and whose texture is the closest. Before any part of a bone can be thrown off by exfoliation it must be dead. But even then, till the process of exfoliation begins, the bone adheres as strongly as ever, and would remain for years before it could be separated by putrefaction alone. Bones are composed of two substances, viz. a true animal matter, and an earthy one, which are only intermixed with each other. A dead bone acts on the fuftem in the fame man-ner as any other extraneous body. It flimulates the adjacent living parts; in confequence of which, fuch a procefs is begun that must terminate in its being thrown off. The effects of this stimulus, are, first, that the living adjacent bone becomes more vescular; a circumstance which always takes place when a part hath more to do than is just sufficient for the support of life. Secondly, that the earth of the living part, where it is in contact

EXCREMENTUM. An excrement. It is whatever requires to be discharged out of the body, from extense, to divide, part, or separate.

EXCRESCENTIA, from ex and exesses, an excrescence. It is any thing which grows preternaturally upon any part of the body.

With the dead bone, is absorbed; hence the bone becomes foster, and adheres by its animal matter only. Thirdly, that the living animal part is at last absorbed along the surfaces of contact: this part of the process commences long before the last is similard. Both of them begin first at the surface, though in their course they do not every other than the surface, though in their course they do not every other than the surface, though in their course they do not every other than the surface, though in their course they do not every other than the surface. where take place in an equal degree at the fame time. Fourthly, in proportion to the waste made by the last part of the process, a fengus arises from the living furface, and fills up the intermediate space, so that there may be no vacuum. These different stages taken together, conflitute ulceration. When any part of a bone is once loofe, it will be pushed to the surface in the same manner as most other inanimate bodies would be, and this stage is partly mechanical, partly a continuation of ulceration. A proof of the third stage above mentioned, may be derived from those cases where people die while exfoliation is going on. A fmall groove or worm-eaten canal can then be discovered, which becomes gradually deeper, and follows the irregularities of the living and dead furfaces. After the application of the trepan, a circular visco of bone is few and the property of the control of the con cular piece of bone is frequently thrown off, which is al-ways lefs than the fpace from whence it came. This however, would never be the case, were there not a loss

When a bone is laid bare by any accident, and an exfoliation is feared, if feveral perforations are made in the bone, the exfoliation will be prevented; in then cases, the wound should be kept clean, and desended from unchaous and watery medicaments; pledgets of hat are as proper applications as any; or they may be dipped in a mixture of the ol. tereb. and tinch myrrh. As to cousties, Mr. Hunter says, that "causties, or the actual cautery, do neither of them hasten exfoliation; they produce death only in part of the bone, which is the first step towards extellation. If causties ever hasten exfoliation, where the expoliation. If causties ever hasten expoliation, where the bone is already dead, it must be by producing inflamma-tion in the adjacent living bone; this brings about a change in it, and makes it exert a power which it was incapable of before."

EXFOLIATIVUM. A RASPATORY. See DESQUA-MATORIUM

EXIPOTICOS, from exprosum, to prefi out or filtre. An epithet for digefling, or deterging medicines. Galen

fays they are the fame as drawers.

EXITURA. A SUPPURATED ABSCESS. But Paracelfus applies it to all forts of putrid excrements.

EXITUS ANI. See PROCEDENTIA ANI.

EXOCHAS, or Exoche. A tubercle on the outfide of the anus, from εξω, without, εχω, to have.

EXOCYSTE. A prolapfus of the inner membrane EXOCYSTIS. of the bladder.

EXOMPHALOS, from 18, sut, and supaxous, a navel.

Any proteinerance of the navel, but particularly the barnia umbificalis; also a dropfy of the navel.

EXONCHOMA, from 18, sut, and orxes, a tumor.

Any large prominent tumor.

EXONEIROSIS, from 18, 001, and 01005, fleep. A nocturnal pollution. It is when in fleep the femen is ejected. This, if rare, may be from redundant vigour; if frequent, it proceeds from weakness of the feminal vessels. This latter cause is the most frequent.

EXOPHTHALMIA, from et, out, and oppaanus, the eye; called also buphthalmus, a diffication of the eye; its natural fize increased, or not fensibly changed; there-fore the globe, more or less diffended, rifes from its orbit, either fwelling or pushed out, and falling downwards, its bulk fearce altered; nor can it be covered by the palpebræ, which should close over the eye, healthful in other respects. See Wallis's Nosologia Meth. Oculorum. EXORESCENTIA. EXACERBATION.

EXOS. A LEECH. Also a fish from which isinglass is

obtained.

EXOSTOSES. See GUMMA. EXOSTOSIS, from et, of, or out, and oreev, a bone, called also hyperoflesis. It is a preternatural excrescence of a bone, or a tumor on a bone. Mr. Pott calls it an enlargement of the bone. Its hardness equals, or rather exceeds that of the bone from which it proceeds. Monf. Petit calls the fpina vento/a by the name of exoflofis, but the two diforders are very different.

Dr. Cullen places this genus of discase in the class lo-

cales, and order tumores.

The exostosis feems to be caused by the discharge of a superfluous quantity of offisic matter upon the part where it is seated, or from a separation of the bony lamella. The cause of the first is not known, but the other may be when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous the superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous the superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous the superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous the superfluous to be dried, over a gentle fire, or by absorbing it, as when superfluous the the effect of irritation, which will occasion a swelling of the bone, and this irritation may be discassed or not; if difeafed, the part must be amputated; if not, which is not unfrequently the cafe, the patient may live to an old age, without any confiderable inconvenience.

This difforder should be diffinguished from venereal nodes,

from the rickets, from tophs, and from the spina ventosa. The difeafed irritation may be known by its violent and

frequent pain.

In order to cure, as foon as the nature of the cause is understood, and encouragement to hope for fuccess is manifelt, make an incision, and lay the bone bare, then with a chiffel take the diseased part away. This will succeed if the habit is not much vitiated; but if the conftitution is also faulty, and the exoliosis proceeds from the exuberance of bony matter, amputation is the only me-thod of relief, though generally in this case, the whole is best left to nature.

Sometimes a preternatural hardness of the ligament is called an exoftofis; this fpurious fort, as well as the ve-

nereal nodes, are relieved by mercurials.

Exostoses happening in the middle of hard bones are generally hard in all their parts, but those near the ends of them, or about the joints, have often only an hard external lamina. When this disorder happens on the bones of the fkull, the confequence may be an apoplexy, epilepfy, or a palfy. See Petit's Difeafes of the Bones, part ii. ch. xvi. Bell's Surgery, vol. v. p. 541.

EXOTICUS. EXOTIC, from 18., without. Any thing

EXPECTORANTIA. EXPECTORANTS. They are medicines which promote a discharge from the lungs, or from the aspera arteria. Some expessor operate by rendering the matter sit for a discharge; others stimulate to an exerction; and some open the emunctories in ormal protruberance of the same bone, as also from the upper and external part of the ulna next to the ancorneus.

Distrosum communis. It is also called disjoint to the control of the same bone, as also from the upper and external part of the ulna next to the ancorneus. brought from foreign countries.

EXPECTORANTIA. EXPECTORANTS. They are to pass are to be constringed, give such medicines as ob-tund and inerassate; of this kind are the suce, glych, croc-Angl. sp. creti. althran, syr. e mecon. pil. styrac. If thick viscid matter is to be discharged, and a stimulus is required, to assist its evacuation, give insusions of hyslop, orris root, or of elecampane; the sal diurcticus, gum ammon. gum. benz. gum. myrrh, or flof. fulphuris, will be pro-per. When a stronger stimulus is required, the ox. scillæ or small doses of antimonial preparations, will be neces-fary. See Hossmann's Med. Rat. Syst. See Anaca-THARTICS.

In fome inftances when expellerants are required, their efficacy is checked by the use of the bark, iron, &c. but if these medicines are mixed with the expectorating ones,

those inconveniencies are not observed.

EXPECTORATIO, EXPECTORATION, from ex, and pellus, or from expellers, to throw out of the veffels. See Expectorantia and Anacatharsis.

EXPLORATIO. EXPLORATION. In furgery it is

the probing a wound or ulcer.

EXPLORATRIX. See CUPELLA.

EXPLOSIO. Explosion. In chemistry it is called detonation, or fulmination.

EXPRESSIO. EXPRESSION. It is a mechanical operation, by which the juices of many plants are obtained, and fweet oils, which are not volatile, may be extracted from many fubstances, in which they reside superabundantly, and uncombined. Such are all emulsive seeds,

and fome fruits, as oranges, lemons, olives, &c.

This operation is effected by first bruising the fubftance, and then forcibly fqueezing it in a press. The
more fucculent bodies may be bruised and wrapped in a linen cloth, before they are committed to the prefs; but more viscous subjects require that a little water be added

to them before they undergo this operation.

When feeds, from which an oil is to be obtained, are fubjected to this management, the cheeks of the prefs fhould be heated, in order to a more copious discharge of the oil, the product will by this means be increased; but when oils are to be taken internally, expression with cold plates is the most proper, as those which are heated, dis-pose the oil to become soon rancid and offensive.

When heat is employed, the operation is by coction, infolation, or by torrefaction; the first relates to fluids, the second to fluids and solids, and the third to folids only. Decantation and filtration, fubferve the process of

EXSUCCATIO. An ecchymolis.

EXSTASIS, israeis. Dict. are the effected as, a trances, as if a person was out of himself; a swooning. A species of catalopsis. It is when a person remembers person after the proposal is over the ideas which he fectly, after the paroxyfin is over, the ideas which he conceived during the time it lafted. See Ecstasis.

EXTENSOR. An EXTENDER. This name is given

to feveral mufcles.

EXTENSOR CARPI RADIALIS. This mufcle takes its origin from the rifing line of the os humeri, that runs towards the outer condyle, and from the fame condyle it runs close to the radius, and passing through a groove, where it is bound down, it divides into two tendons, where the muscle is called by some bicornis. One of these tendons is inserted into the basis of the first, and the other into the fecond metacarpal bone. Some call this muscle by the name of radians externus; others by that of extensor carpi exterior, & geminus. Winflow calls IT ULNARIS EXTERNUS.

- CARPI ULNARIS. Some call it extensor carpi interior. It rises from the outer condyle of the os humeri, and then receives an origin from the edge of the ulna; its tendon paffes in a groove behind the flyloid process of the ulna; it paffes and is inferted into the infide of the bass of the metacarpal bone of the little

DIGITORUM COMMUNIS. It is also called digitarum tensor. It partly rises from the outer condyle of the os humeri, and partly from the outer edge of the ulna; it patfes behind the lower extremity of the radius, where there is a groove for its lodgement, and forms four tendons; that for the little finger passes different from the others: the three last communicate, and are inferted into the second bone, and partly into the last of the respective singers, that is the third, middle, and forefingers.

DIGITORUM BREVIS. It is also called pediens. It rises from the anterior part of the os calcis, runs across the instep, and divides commonly into four tendons, but fometimes only into three, which are inferted into the

three toes next to the greater one, or into all the four.

— DIGITORUM LONGUS; called also Cnemodallylens. Dr. Hunter calls this extensor longus digitorum pedis. It rises from the upper part of the tibia and fibula, and the interoffeous ligament; its tendon paffes under the annular ligament, and then divides into five, four of which are inferred into the fecond and third phalanges of the toes, and the fifth goes to the basis of the meta-tarfal bone. This last Winslow reckons a distinct muscle, and calls it peroneus brevis.

- INDICIS. It is also called indicator, and extensor indicis proprius. It rifes with the extenfor digitorum communis, lies between the ulna and radius, runs close to the interoffeous ligament, paffes over the back of the hand, and is inferted into the posterior part of the index.

Longus. It rifes from the inferior costs of the

fcapula; and the

internus.

internus.

MINIMI DIGITI. It is also called auricularit. It rises partly tendinous at the extremity of the external apophysis of the os humeri, and partly sleshy from the superior part of the ulna, and becomes tendinous as it paffes under the annular ligament at the carpus; it is there divided into two, and fometimes into three tendons, which are united into one at its infertion into the fuperior part of the third bone of the little finger.

- PRIMI INTERNODII POLLICIS. It rifes high up

round the radius, runs across the carpus, and is inferted KUVIANI, &c. which see into the trapezium, and the first bone of the thumb.

- SECUNDI INTERNODII POLLICIS. It rifes from the radius, and the interoficous ligament, deferibes the fame course as the preceding, and is inserted into the second bone of the thumb.

EXTENSOR TERTIL INTERNODII POLLICIS. It rifes from the back part of the ulna, near the middle, and from the interoffeous ligament; then goes obliquely crofs the car-pus to the third bone of the thumb. When it acts, it not only extends, but also brings the thumb backward, fo that some people can bring the end of the thumb to the

- POLLICIS LONGUS. It rifes from the middle and fore-part of the fibula, and the interoffeous ligament, and paffes over the instep to be inserted into the last bone of the great toe.

- POLLICIS BREVIS. It is only a flip from the extenfors of the toes, and is inferted into the first bone.

EXTENUATIO. LEANNESS. Prosper Alpinus ob-ferves, in his Presages of Life and Death, that, if after being extenuated by a disease, the disease is removed, but the body continues lean, the nutriment being duly received, it denotes a relapse. Again, leanness from a spit-ting of blood, attended with a flow sever, portends death. And, laftly, that it is a bad fign in an ardent fever for the body not to become speedily lean, or to waste immode-rately; the first prognosticates a tedious disease, the lat-

LEI. See TENSOR MEMBRANÆ TYMPANI.

— TYMPANI AURIS. See LAXATOR EXTERNUS.

EXTINCTIO. See COMMINUTIO.

EXTIRPATIO. AMPUTATION.

EXTRACTIO. EXTRACTION. The liquors which diffolve bodies in their pure flate, extract them from im-purities or other admixture, and take up all their virtues. Extraction is performed by macerating the fubject in its appropriated menftruum in the cold; or digefting or circulating it in a moderate warmth; or infuling it in boil-ing liquor, and fuffering them to stand until they are cold; or by actually boiling them for some time. Heat reatly expedites extraction; but it is injurious to fome fubstances, by occasioning the menstruum to take up their groffer and more ungrateful parts; yet others again impart but little to a heat that is not equal to that of boiling water. As heat promotes, so cold prevents extraction. Tinctures made by heat deposit much of their contents in cold weather.

Vegetable juices obtained by expression, or watery, or spirituous decoctions, or infusions, when exposed to a continued heat, the fluid gradually exhales, carries off the more volatile parts, and leaves the more fixed in one mass; which, if from a vegetable juice obtained by expression, is called an inspissate juice; if from a watery decoction or insuson, it is called an extract; if from a spirituous tincture, it is called a resin or essential extract: the term extract is frequently used as a general appellation of all three kinds.

tion of all three kinds.

Infpiffated juices, when evaporated no farther than to the confiftence of honey or oil, are called rob or fapa. Spirituous tinctures reduced to a like confiftence are called balfam. See the New Dispensatory, and the Dict. of Chemistry.

from, or out of the body, any thing that is offensive.

EXTRACTUM. An EXTRACT. In pharmacy it is

a folution of the purer parts of a mixt body inspiffated by evaporation nearly to the consistence of stiff honey. See EXTRACTIO; each of which commonly take their name from the substance used from whence this extrast

from the radius, ulna, and interoffeous ligament; it wheels | is formed, as EXTRACTUM CHAMMMELI, CORTICIS PE-

EXTRACTUM EUSTACHIANUM. See RUDII EXTRAC-

- Purgans. See Hedera arborea. - Saturni. See Plumbum.

EXTRAVASATIO. EXTRAVASATION, from extra and vafa, out of the veffet. This is applied to any of the fluids in the body which are out of their proper veffels: thus an ecchymofis, fugillation, or aneurifm, may be called extravalations.

An extravefation on the brain produces one or more of the following fymptoms, viz. a palfy of one leg or arm, or both; dizzinefs; fleepinefs; impaired fight; ravings; bleeding at the nose or ears; vomiting; loss of fense;

ftupor, &c.

An extravalation on the brain should be distinguished from a concussion thereof; in the first the symptoms are often better and worfe; in the latter they are continually

Wounds on the head with extravalations are very fallacious, because the extravasation may be between the skull and the dura mater, or under it, both at the same time, or under the pia mater, or in several other parts of the brain; but when these happen, bad symptoms are directly

produced.

Whenever the dura mater, either by depression, fissure, or fracture, loses its adhesion, there will be from its blood-veffels that are broken an extravafation between the bone and it. An extravalation is less considerable when a fracture of the skull happens than when there is a fiffure. An extravalation is also more or less dangerous, according to what part of the brain the accident happens on. Extravafations from a blow are most commonly found under the skull, that is, between it and the dura mater; in this case a lethargy or other symptom will continue, until the extravasation is removed.

Fallopius, Chalmet, Albucafis, and fome others, think that though fome extravalated blood should putrify in the belly, it cannot do the inteffines or other viscera any hurt, but will subside to the groin, and there form an abscess; or that more likely it will be absorbed and discharged by

ftool, before it putrifies at all.

Mr. Bromfield recommends the use of opiates in fractures and concussions of the brains (see Concussio); the fame practice may be also useful in some degrees of extravalation; but besides this he observes, that when violent accidents have happened to the head, an issue in the opening formed by the separation of the additamentum of the temporal bone is of singular advantage. See his Chirurgical Observations, vol. i.

EXTRAVERSIO. EXTRAVERSION. In chemistry

it is the rendering manifest any thing faline, alcaline, or acid, concealed in mixed bodies, and is just the reverse

EXTRINSECI. The external parts, particularly the limbs. Also painful disorders of the external parts. EXTUBERANTIA. Tumors that are feated under the skin, but do not levate it.

EXUBERES. Children which are weaned are thus

called.

EXULCERATIO. The fame as ulcer; but generally used to express those beginning erosions, which wear away the substance, and form an ulcer; or when an excorpation begins to suppurate.

EXUMBILICATIO. A protuberance of the navel.

EXUNGULATIO. EXUNGULATION. The cutting off the ungues, or white part of the petals of roses.

EXUVLÆ. The sloughs or skins of ferpents that are cast in spring. See Angulum Senecta.

EZQUAHDUITL. The DRAGON'S BLOOD-TREE.

EZULA. See ESULA.

EZULA. See Esula.

# FAC

FAL

ABA. The BEAN, called also cyamus, phaseolus, the countenance pale, greenish, or blackish. Some call
This plant hath a long unicapsular pod, full of
kidney-shaped seeds; the stalks are firm; the after the onset of an acute disease, it indicates death.

leaves grow in pairs, and are as it were conjugated to a rib which ends in a point.

Faba was called by the Falifci, a people of Hetruria, baba; whence probably comes the word faba. Martinus derives the word from was, to freed, as if it were paba, The word beam feems to be from the Italian word batama.

Beyonaleasis. See Mynamians.

- BENGALENSIS. See MYROBALANIA - CRASSA. See CRASSULA.

- ÆGYPTIA, called also cyanus Ægyptiaca, nym-phwa Indica, nymphwa glandifera, nymphw Madaraspa-tana, hem tamara, nelumbo, lien Sinarum, colocasia. The PONTIC BEAN, OF ÆGYPTIAN BEAN. It grows on marshy grounds in Egypt, and some of its neighbouring countries. Some call it ciberium and cibetium, from the manner of planting it, which is first to lodge it on a moist clod, which is afterwards immersed in water. When the flowers falls a fmall pod appears, in which the bean is lodged. It is eaten either raw or boiled, and is of an aftringent quality; it also strengthens the stomach. See Dales

— FERRIFUGA. See NUX VOMICA.

- GRÆCA LATIFOLIA. See GUAJACANA. - INDICA. See NUX VOMICA. SERAPIONIS.

INVERSA. See CRASSULA.

MAJOR, called also phaseolus major, faba cya-mus leguminosa, Turkey BEANS, and GARDEN BEANS. They are a ftrong flatulent kind of food, nutritious, but not easily digested, especially when old. The slowers afford an agreeable fragrance, which they impart to water by distillation. The fresh leaves beat up into a poultice with cream are cooling and repellent. The ancients call the slour of beans saba fresa, and lomentum fabæ, because it is prepared without the skin, in which lies the aftringency, salfely, though generally attributed to the flour.

MINOR, also called equina frafa, HORSE-BEANS. These differ no other way from the garden species than in being lefs.

- PURGATRIX. The BARBADOES NUT. See

CATAPUTIA MINOR.

- SANCTA IGNATII. See NUX VOMICA. SERA-PIONIS.

SUILLA. See HYOSCIAMUS NIGER.

FABAGO, also called leguminosa, capparis portulaca, fabaginea, peplios Lutetianorum, telephium, and capparis fabago. It is a bitter plant, which the Syrians ule for killing worms.

FABARIA. ORPINE. See CRASSULA.

FABA SUILLA. COMMON BLACK HENBANE. FABRILIS NIGRICA. BLACK-LEAD. FABRORUM AQUA. Water in which hot iron is

FACIES. The FACE. It comprehends the forchead, eye-brows, eye-lids, eyes, nofe, mouth, chin, cheeks, and ears. Its bones are those of the upper and lower

HIPPOCRATICA. The HIPPOCRATIC FACE. It is when the nose is sharp, the eyes hollow, the temples funk, the ears cold and contracted, and their lobes inverted; the fkin about the forehead hard, tenfe and dry;

FACIES RUBRA. See GUTTA ROSACEA.

FACULTAS. A PACULTY. It is the power of performing any action. The animal faculty, is an action whereby a man exercises sense, motion, and the principal functions of the mind, which are three; imagination, reasoning, and memory.

FÆCULA. It is a medicine which consists of the

faces of vegetable juices.

—— BRYONIA. The FACULA of BRYONY. Take of the roots of white bryony, any quantity; fcrape them and fqueeze out their juice; which, after standing a while, deposits a sediment, from which the thinner part may be

feparated by decantation, and the reft dried for use.

F.EX. It is properly the sediment of lees or grounds of any fermented liquor; but in medicine it is generally understood of wine. It is the same as faces and fecula.

The alvine excretions are thus called.

FAGARA MAJOR, also called cayutana Luzonis cubebisa

It is a plant which is found in the Philippine islands. The berries are used, and especially the outer rind: it is

- OCTANDRA. See TAGAMAHACA:

FAGONIA. A plant so called in honour of Dr. Fagon of Paris. Miller takes notice of two species; but they have no medical virtues attributed to them.

FAGOPYRUM, called also fegopyron, frumentum Saracenicum, erysimum Theophrasti, fagotriticum, tragopyron, BRANK, BUCK WHEAT. It is said to be originally from Africa. It thrives every where; delights in a wet foil; is sown in fields, flowers in July, less nutritive than harley or year. but more forthan millet or namic. Rail Hist.

barley or ryc, but more fothan millet or panic. Raii Hift. FAGUS, called also exya or exyas. The EEECH-TREE. Its leaves refemble those of the horn-beam: the fruit is produced at a remote distance from the flower, but on the same tree, and is a callous substance, acuminated, and inclofing two triangular feeds or nuts. It grows in woods and in hedges. The maft (i. e. fruit) is in use; it agrees in its properties with those of the chestnut. The oil expressed from besch nuts is extelled as a destroyer of worms: a child may take two drams of it every night and morn-ing; an adult may take an ounce. The poor people in Silefia use this oil instead of butter. Raii Hist. FAIRBURN WATER. Fairburn is in the county of

Rofs, in Scotland, about two miles from the Caftle-Loid well. It is a strong sulphureous water something of the fame nature, but not fo powerful; a gallon on evapo-ration yielded of absorbent, dark-coloured, light earth, two grains; of white calcareous earth, fifteen; of Glauber's falt, mixed with yellow matter, &c. twenty-four grains; but no felenites. It is used for the fame purposes as Casile-Lord waters, but not so much frequented.
Monro's Medical and Pharmaceutical Chemistry, vol. ii.
FALCATA SILIQUA CORNUTA. See MEDICA.

FALCIFORMIS PROCESSUS. The duramatral procels called also the falx. See DURA MATER.
FALDELLA. Contorted lint used for compresses.

FALLOPII LIGAMENTUM, also called ligamentum

It is only the lower border of the tendon of the external oblique muscle of the belly, stretched from the fore part

of the os ilium to the pubis.

FALX. FALCIFORMIS PROCESSUS. See CEREBELLUM. FAMES. HUNGER. When the ftomach is empty, or when we fast longer than ordinary, it is common to say that the stomach pinches us. As the liver is not then fustained by the stomach and intestines, it descends by its own weight, and principally by means of its middle ligament, pulls the diaphragm along with it: it is in that place, therefore, that we have this uneafy fenfation, and not at the superior orifice of the stomach as is generally thought.

See Haller's Physiology.

When animals die for want of food, their death is not directly the consequence of bunger, but a putrid fever, which is excited by the blood's losing its bland gelatinous

intermittent fevers, made of aromatic irritating fubiliances, and applied to the wrifts.

FAR. Actius fays that it is any kind of frumentaceous grain, decorticated, cleanfed from the hufks, and afterwards bruifed and dried.

FARCIMINALIS. See ALLANTOIS.
FARCTURA. In pharmacy it is the fluffing of any exenterated animal, or excavated fruit with medicinal in-

FARFARA. A name of the herb colts FOOT. See Tussilago.

FARFARUS. WHITE POPLAR.

FARINA. MEAL OF FLOUR.

FOECUNDANS. IMPREGNATING DUST. It is placed on the apices of flowers, and falls from thence upon the head of the pillil or female part of the flower, and is thence conveyed to the matrix, in order to impregnate the feed.

FARINACEA. Under this title are included, those fubstances employed as aliment, called cerealia, legumina, and nuces oleofæ, and are diftinguished as they contain more or less faccharine and oily matter. cerealia the fugar is large in proportion to the oily mat-ter; in the legumina, the oil fomewhat larger in pro-portion to the fugar; in the nuces oleofæ, the oil fomewhat ftill in greater proportion. Under the title cerealia are commonly put the feeds of feveral gramine-ous, and culmiferous plants that are employed as food for men, barley, tye, milet, rice, oats, mair wheat for men, barley, rye, millet, rice, oats, maiz, wheat, buckwheat, falep, chefnut, and potato. The legumina, or pulies, are the pea, bean, and kidney bean; which last are in this country only employed, in their young green state. The nuces oleofie are the nut, almonds, walnut, pistachio nut, and fome products of others, as chocolate. See Panis.

FARINARIUM. See Alica.

FARINHA FRESCA. A Portuguese name for a fine flour of the cassada. See Cassada.

—— RELADA. A Portuguese name for the undried dressed meal of the cassada.

FARINIFERA. See PALMA JAPONICA.

FARREA NUBES. See FURFUROSI.

FARCIA. A BANDAGE, FILLET, or ROLLER; or the DOCTRINE of BANDAGES. Æsculapius is said to be their first inventor. The chief uses of bandages are to maintain the due fituation of dreflings, or to make a proper com-prefs on a particular part. Ideas of bandages are difficultly conveyed otherwise than by the actual application of them. Much hath been faid by various authors on this fubject, but a moderate share of practice, and of fagacity, will best supply proper hints as each case requiring them occurs to the practitioner. However, under the respective name of each fort of bandage, a description of it is attempted in the course of this work. On this subject Heister's Surgery, James's Med. Dict. Verdue, and Le Clerk, may be consulted.

## The Sling.

The French call it escarpe. This name is given to several forts of bandages.

The Sling with four Heads.

Its length should be four feet (more or less according to the fize of the head) its breadth that of fix or eight fingers. Its use is to retain the dreffing on a wounded head. It must be slit in the middle, from each end, so as to leave about two hands breadth undivided in the middie, and the four ends must be rolled up to where the division ends. Apply the middle of the undivided part upon the dreffings, then tying the two posterior heads forward, and having secured their ends, the two anterior ends must be carried backward, and secured behind the

### The Sling with fix Heads.

Its length is about three feet, its breadth about twelve or fourteen inches. Divide it from each end up to within a hand's breadth of the middle into three parts. Apply the middle undivided part to the vertex, then tie the two anterior tails behind the head, the two middle under the chin, and the two posterior upon the forehead.

# The Sling for the Nofe.

It hath four heads, and is eight feet long, and two or three inches broad; in the middle it is left entire, but from thence, each way, it is flit to the ends. In the middle, where it is entire, an opening is made for the apex of the nose, that the bandage may be firm. The middle is applied upon the nose, the two upper heads to the neck, and then to the forehead; the lower ones behind the neck, but a little higher than the first, and then up to the forehead too.

### The Sling for the Breafts.

It is four feet long, and fix inches broad, and flit like the fling with four heads, about a foot in the middle being left entire. The middle is to be applied upon the dreffings on the affected breaft, then carry the two upper heads over the opposite shoulder, and the two lower under the arm of the affected fide, towards the fcapula of the other fide, fasten them there to the upper ends which are over the thoulder.

### The Single Bridle.

It is a fingle-headed roller, fourteen or fixteen feet long, and two or three fingers broad, for fecuring the jaw when fractured or luxated.

#### The Double Bridle.

It is the fame as the fingle, only rolled up with two heads, but the fingle may always be used instead of it.

# Bandages for the Lips.

These are of a proper length and breadth, and formed as the sling with four heads.

## The Divider for the Neck.

This bandage for the neck is twenty-four feet long, two or three finger's breadth broad, and is rolled into two heads. Its middle is placed on the forehead, and thence paffes round the head two or three times; then being pinned to fecure it, the rollers are carried under each arm-pit, and brought back over the fhoulders, and crofs the neck in the form of an X, then pafs on to the forehead is taken pafs on to the forehead, &c. until the whole is taken up.

## The Uniting or Incarnating BANDAGE.

It is about eight feet long, and two inches broad; in the middle is a flit about the length of three or four fingers. It is rolled up from each end to the flit in the middle. It is used for keeping together the lips of large wounds on the head or face, or where elfe it can conve-niently be applied. A narrow compress being laid on each fide of the dressings which are on the wound, the sit part of this bandage is applied near the wound, for that one of the heads of the bandage being carried round the head (or elfewhere it is applied) may be passed through this slit, the bandage then being drawn so tight as to consine the lips of the wound in an easy contact, bring back the head which was paffed through the flit, and then continue the application of both heads according to the direction they lie in, or as best fuits the intention. Except extraordinary fymptoms require, this bandage must not be removed during fix or eight days.

The Retentive BANDAGE for the Neck.

Two diffinct ones are usually directed, but one circular roller answers every useful purpose.

The BANDAGE of Heliodorus, or the T BANDAGE.

The letter T, whence the name of this bandage, de-The letter 1, whence the name of this bandage, de-feribes its shape. The tail is sometimes slit up to such a length as is required. It is generally used when a ban-dage is required to retain the dressing on the groins, pubes, or lower part of the belly. One part of it is sastened about the wait, the other part, which hangs down, is brought betwit the thighs, up to the belly, and is sastened to the part which is already secured.

The Napkin and Scapulary.

It is used when a bandage is required on the breaft, or belly, or back. It confifts of a napkin pinned round the body, higher or lower, as is the fituation of the diforder which requires it; then, to prevent its falling, the fca-pulary is applied, which is a piece of linen, four or fix inches broad, with a flit in the middle for the head to pals through; its length fufficient when the head is paffed through, and it reits on the shoulders, for one end to be pinned to the napkin behind, and the other end to the tapkin before. Some fasten the scapulary behind, and then flitting the other end far enough to bring each part

over the shoulders to be fastened before.

FASCIA. A part of the tendon. See Aponeurosis.

LATA. It is a large membranous, tendinous, or ligamentary covering. Winflow deferibes it as a mufcular ligament, which is fixed about the edge of the crifta of the os ilium from the large tuberofity, to the anterior fuperior fpine, to the ligamentum Fallopii, and to the aponeurofis of the oblique external muscle of the belly. It is also fixed on the lateral inferior part of the os facrum, and to the neighbouring part of the ligaments by which that bone is connected to the bones of the ilium and ischium. From thence it advances over the gluttei and thigh between the membrana adipofa and mufcles, all the way to the interior and outer part of the knee. It is very thin on the patella, but is easily separated from it. It is also continued over the external anterior part of the tibia, covering the muscles which lie there, and is strongly inserted into the head of the tibia and of the fibula. It is ftrongly inferted into the linea afpera femoris between the vastus externus and biceps, forming a fort of septum be-tween these muscles. See Aponeurosis.

LATA MUSCULUS. It rifes from the outfide of the ilium, runs downwards and outwards, and below the trochanter major joins with the tendon of the glutzeus maximus, and runs down laterally to the leg. This muscle ftretches the fascia lata above described, wherefore Albi-

nus calls it tenfor fasciæ femoris.

LUMBORUM. It is a strong tendon fixed to the lateral part of the os farcum, from the spines of the facrum, from the spine of the ileum, and the spines of the lumbar

FASCIALIS. See SARTORIUS.
FATUITAS. The fame as morofis. From fatuus, insipidus; aliments that were insipid the Latins called fatui, whence the fameness in speech of sooiishness and un-favouriness. In Cullen's Nosology, it is synonymous with

FAUCES. Called also isthmion; the top of the throat; the space about the openings into the larynx and pharynx, which can be seen when the mouth is open and the tongue depressed. Upon looking into a person's mouth when wide opened, we see a fost curtain hanging from the palate bones, named velum pendulum palati; in the middle of which we likewise observe a papilla projecting from the velum, named uvula, or pap of the throat. From each fide of the uvula, at its root, two arches, or columns, are fent down, the anterior to the root of the tongue, the posterior to the pharynx. Between these arches, on each side, the cellular glands, called amygdalæ, or almonds of the ears, are situated. The common opening behind the anterior arch may be named fauces, from which there are fix passages, viz. two up-wards, being one to each nostril; two at the sides, or one to each ear, called the Euftachian tubes; two downwards, the anterior is the paffage through the glottis and
larynx into the trachea, which terminates in the lungs;
the polterior is the largest, named pharynx, or the top of
the cetophagus, which leads to the stomach. Innes on the Muscles.

FAUFEL. See ARCA; also a name of terra Japonica. FAVAGO AUSTRALIS. A species of BASTARD SPONGE. See ALCYONUM FARRAY.

FAVUS. See CERION and ACHOR.

FEBRIFUGA. FEVERFEW, also such medicines as mitigate or remove severs, from febrem sugere, to drive away a fever. The the centaurium minus is thus called by fome, also the matricalist.

FEBRIFUGUM CRÆNIL. See REG. ANTIM.

MEDICINAL.

- OLEUM. FEBRIFUGE off. When the flowers of antimony are made with fal ammon, and antimony fublimed together, if they are exposed to the air, they run

into a liquid thus called.

FEBRIFUGUS PULVIS. The Germans give this name to the pulv. ftypt. Helv. In England a mixture of ocul. canter. 3fs. and tart. emet. gr. ii. hath obtained the fame appellation; in fevers it is given in doses of gr. iii. to vi. with fuch other things as prefent circumstances re-

- SAL, i. c. SAL. MARIN. REGENERAT. See MA-

RINUM SAL.

- SPIRITUS DI CLUTTON. Mr. CLUTTON'S FEBRIFUGE SPIRIT.

Take the oil of fulphur, by the bell, and rightly prepared, rectified oil of vitriol, and spirit of falt, of each equal parts; and of rectified spirit of wine triple the quantity of the whole. Digest them together for a month, then distil to

drynefs.

As much of this spirit as renders pure water agreeably acid is given in every draught of common drink in ardent and inflammatory fevers, and in the nervous and putrid kinds it is administered in such cordial and antiseptic liquors as are proper in the respective cases. See the certain method of curing all continued fevers, by Jo-

FEBRIS, wopfles, from wee, ignis, fire. A FEVER. Dr. Cullen makes febrile affections under the word PYREXIE his first class of diseases and defines their characteristics. racter in general. After chilliness, a frequent pulse, in-creased heat, several of the functions of the body injured, the strength of the limbs particularly diminished. The first order of which is FEBRIS, which is deferibed, a langour, laffitude, and other figns of debility preceding, a pyrexia comes on, without any primary local difeafe.

It hath generally been faid that a fever is an effort of nature to remove or expel some morbific matter from the blood, and so to restore health, and this is attempted to be proved by cruptive fevers abating when cruptions appear on the skin; but this seems not to be the case, for the sever is no other than a fymptom, which increases and protracts the difeafe; and an immediate extinction of the fever, at or near its onfet, if possible, is the furest and most rational method of removing the disorder by which

it was caufed. See Synocha.

Various are the divisions and subdivisions of fevers which different writers have enumerated, but fome have included them in those of the ardent, nervous, and putrid kind: at least every acute fever is best managed by the methods required in one or other of the just named three kinds.

In ardent fevers the red blood is redundant, and the heat of the body increased beyond the medium of health. In the nervoms kind, the lymph is difordered; and in the putrid fort there is fuch a defect of the natural heat as admits of a putrid quality taking place, and increasing in the blood.

An acute fever is when the pathognomonic symptoms proceed with rapidity, and danger to the patient. When these symptoms proceed more flowly, and with less danger, the fever is said to be chronical.

All fevers are symptomatical. And perhaps it is but the truth to affert, that all fevers are but every fever dif-ferently circumstanced; or, that fever is one and the same disorder, but appearing differently, according to the va-rious circumstances that it meets with in different constitutions.

A stimulus is the only immediate cause of fevers. Dr. Kirkland observes, in his Treatise on Child-bed Fevers, acrimony.

As to the diagnostics of fevers, they vary for the most part of them, in different patients, and in the fame patient at different times; and a fever may manifeltly exist, though many of the usual attendants be not present. However, it is sufficient to know that the pathognomonic figns of a fever, that is, those figns that are present in every fever, and without which a fever cannot subsist, are heat and a disordered pulse; these attend every fever, every degree and every stage of it; and from these marks alone do we judge of the presence or absence of this disorder.

As a preternatural heat excited is a principal conftituent of a fever, fo to this circumstance may be attributed many of the symptoms which attend in its different stages. But it should be adverted to, that the same degree of heat is not in the same degree immoderate in different persons, for the natural temperament varies greatly in one from what it is in another; therefore that degree of heat is moderate, or its contrary, which is nearest or farthest from the natural state of the individual in that respect.

The only indication of cure is, to abate the heat. answer this one indication, will require some circumstantial differences is different cases; but the pulse and urine will always direct the judicious practitioner in those par-

Every fever is a symptom of some disease, either manifest or latent; and as the secretions are disturbed more as this fymptom increases, the immediate suppression of it will at once appear to be the necessary aim. Both the se-cretions and excretions are best performed in a regular flate of health; when then the fever is fubdued, medi-cines adapted to the diforder which produced it, are more at liberty to act, and nature is also better able to discharge what is morbid.

Contraries are the cure of contraries; and cold, the natural opposite to heat, is its certain antidote. Hippocrates, Galen, Celfus, Avicenna, and all the ancients, used the present cold method of relieving from fevers. They expose their patients to cold air; they give them cold water to drink, and that not only to fatiety, but also

often to make them vomit.

Proper evacuations being made, if possible let the pa-tient walk in the cool air; if he is incapable of this, let him be expefed to it in his room; the windows may be opened, and the chamber fprinkled frequently with water: if this fuffice not, let him drink cold small liquors in proportion to his thirst, and put his hands and feet into vef-fels of cold water, there to remain, at least until the senfations it produces are no longer quite agreeable. When by these means, a tendency to sweat appears, assist it by such diluting liquors as the case requires: as the patient's heat abates, and his thirst is lessened, let his drink be given warm.

This method of suppressing fever by means of cold, is not to be rejected, even when cordials are required to support the patient's strength. See Februarus Spirits Di. CLUTTON.

Whilst these cooling methods are pursued to suppress the morbid heat, fuch other medicines should be pre-

feribed as the other fymptoms may require.

Under this management, belides that the cure is fhort, the usual horrible symptoms are kept off. If the patient recovers, he is not reduced to the low effate to which by other management, he would have been; and if he dies, he at least retains his senses to the last.

As in the fmall-pox, so in every kind of fever, the great delign of medicine is to reduce the patients heat to that degree which constitutes his healthy state. Sydenham hath observed, that, "the fittest degree of heat to pro-mote the expulsion of the variolous matter, is the natural one, and fuch as is fuited to the temper of the fleshy parts; and whatever exceeds or falls fhort of it, is dangerous on either hand." From this it appears, that a fever will increase the disease, and that its affistance is not needful for the expulsion of the morbid matter. No greater proof can be given or defired in favour of the above proposed procedure than its constant success in the present pracof innoculators for the imall-pex.

BLEEDING should begin the cure in all ardent fevera; the discharge, as to its quantity, will be determined by the pulse. If there is a fanguine plethora (fee PLETHORA), in ardent fevers, or exposure to severe degrees of cold,

acrimony, is from the matter irritating the nerves, or | bleed from a large orifice in the arm ; and if the patient their medullary parttimes the heat is much increased, when the vessels are diftended only by the rarefaction of the blood. In cases of this kind, the cooling perspiratives will reduce both the heat and rarefaction, also supercede the necessity of bleeding. Give Clutton's sebrifuge spirit freely in the patient's common drink; or in want of it, let nitre be administered, but let it always be swallowed the instant that it is dissolved, for thus it's efficacy is best infured.

VOMITING is also among the needful aids on the fever's

first attack; and among the rest, the antimonial ones are to be preferred. Antimonial medicines given on the first onfet of a fever, curb the circulation, and promote all the discharges. They cool for the present by promoting exerctions, which, with the secretions, they influence beyond all other medicines now in use: before these, their influence on the nervous fyslem is such, that the strength is rarely so much reduced, when they are duly adverted

to, as it is when they are omittted.

PURGES. Sydenham well observes, that "nothing cools the body fo speedily and fo laftingly, as bleeding, when immediately fucceeded by a purge. Bleeding is the speediest, but a purge immediately succeeding, in-creases its effect, both as to its degree and continuance." Proper medicines of this kind are the natron vitriolatum, kali vitrolatum; natron tartarifatum. tamarind. rhab. manna, &c. and if to thefe, two or three grains of the antimonium tartarifatum is added, the operation will be both ways, and thus the emetic feparately administered will not be needful.

CLYSTERS. A copious injection of warm water into the intestines should never be omitted in ardent fevers; the national and the country of any fluid that may be taken by the mouth. In putrid fevers, antiputrescent medicaments conveyed glysterwise into the body, is equally advantageous; amongst these, fixed air is justly ranked with the

most falutary.

Cooling Medicines. These are nitre, fal ammoniae, aqua ammoniæ acetatæ, Clutton's febrifuge spirit, antimonial wine, cold air, cold water, and the faline mixture. The antimonium tartarifatum, joined in fmall doses as a diaphoretic to the faline draughts, is one of the most volatile remedies in the early stages of most acute diforders; or instead of the vin. ant. the tinct. ipecacu-anha may be added in such quantities as the stomach can eafily retain. It is usual to prescribe the faline mixture indoses, to be repeated at the distance of four, fix, or eight hours; but in ardent fovers, they should be repeated every hour, day and night, until the symptoms abate, or at least

as often as may be without purging.

COLD WATER. Hippocrates fays, " If the patient is very thirsty whilst labouring under an acute fever, cold water is of great use if given till is makes him vomit." Celfus advises the use of cold water, and directs the patient to drink it even beyond fatiety. Galen fays, that "cold water is a perpetual remedy against the fever itself." He directs its use both in ardent and putrid fevers, and even to immerfe the patient in the cold bath, if a copious drinking of it does not fuffice. Paulus fays, that "the heat may be extinguished by cold water, by which we have wholly cured burning fevers:" and essewhere, he says, that "the cold bath alone is of use to those who labour under an ardent fever, without an inflammation, a tumor, or an eryfipelas." To the fame purpose many others of the ancients speak, and the practice continued about 1500 years. Indeed, among the moderns, there are and have been those, who pursue the same practice; they proportion the degree of cold to the degree of heat, and continue its use until the abatement of inward heat, and the pulse, foretel that this diforder is entirely subdued. The patient's fenfation will, with very little attention, determine the necessary degrees of cold and heat in the management of them under fevers; that degree which feels the most agreeable, is the proper one. To render the use of cold water more effectual, small quantities of tamarinds, cryftals of tartar, or kali tartarifatum may be diffolved in it; apples, or other fruits or mucilaginous matters, fuch as lint-feed, or marshmallows, may be previoufly boiled in it.

This practice of the ancients respecting cold water

is at prefent a hazardous practice, and however proper it may appear to be, it should be advised with great cau-tion; and nothing but a certainty of success should induce at least young practitioners to direct it, in the manner as above recommended, the world would readily condemn it for its apparent rafhnefs, and one accident tend to destroy a reputation, perhaps meritoriously obtained.

COOL AIR. Besides rendering the air in the room as Cool. Air. Betwee rendering the air in the room as cool as may be, farther advantages will arife in ardening fevers, by actually exposing the patient to the cold air it-felf; always remembering, that the degree of heat or cold is always to be determined by the patient's feelings; that which is agreeable is also profitable. Sometimes the infpiration of cold air is beneficial, when, because of other fymptoms it would be injurious to expose the body to any degree of cold; however, in every febrile cafe, a pure cool air is the best to breathe in. As the redundant heat is the only fymptom to which the cold is exposed, its use is equally called for in putrid, as in ardent fevers; but the application of cold is not to be confidered as a cure. Of other fymptoms, or of the causes of the respective kinds of fevers, therefore, antiphlogiftic cordials, or antiputref-cents, must be also prescribed as required, and that through the whole progress of the complaint.

DIAPHORETICS. A burning uneasy heat attends the

patient who labours under any kind of fever, until by per-ipiration, a general moisture is diffused over all the skin. Betwixt 83 and 98, by Farenh, therm, are the ftandards of heat in healthy men; and the body cannot fweat if heated or cooled many degrees above or below its natural state. If the heat arises farther than fix degrees above, or finks in the fame proportion below the medium of health in fome; or in others, above ten degrees, or below them, no fweat can be excited, until by cooling medicines, or by cordials, the morbid degrees of heat are removed. Befides the use of cooling or of cordial medicines, whether the fever is of the ardent or the putrid kind, flannels wrung out of hot water may be wrapped round the pa-tient's legs and thighs, to affift in exciting perspiration. When a sweat is excited in the ardent seven, keep it up with due fupplies of whey or water-gruel, gently heated; if in the low or putrid kind, red-wine negus, or beef-tea, will be most proper. See SUDDRIFICS.

CORDIALS. Their good effects in fevers are not from

their increasing the degrees of heat, but from their stimuli, by which the too languid powers are roused, and the cir-culation pushed to the extremities of the vessels.

BLISTERS. In ardent fevers blisters are best applied after the abatement of the heat, and when the pulse begins to flag, except in case of local inflammation being an at-tendant, and then a blifter applied over the part affected affords confiderable relief; but in those fevers where the pulse is languid, as is in the low and putrid kinds, the

carly use of blitters is of the greatest advantage.

Confinement in BED. Though continual confinement in bed is inconvenient in inflammatory fevers, yet sitting up too long, subjects the patient to flying rheumatic pains, or to a jaundice when the fever goes off. At the decline of the fever, the patient lays conftantly in bed, with lefs prejudice, or rather with advantage.

IRRITABILITY. As a preternatural irritability, or an unusual irritation, are the causes of fevers, camphor hath been used to abate them, and that with considerable ad-vantage; it powerfully lessens spasmodic irritability, and is no lefs efficacious in relieving internal local inflammations. Small doses of laudanum have been prescribed on the fame principle; but both these medicines are to be given in conjunction with antiphlogistics, or antifeptics, ecording to the nature of the attending fever. At the decline of ardent fevers, and throughout the whole course of putrid ones, the bark is not to be omitted, for it proves in these cases both an antispasmodic and antiputrescent.

ACIDS. In general they all cool powerfully, but the dulcified mineral acid fpirits are to be preferred, such as the spt. actheris nitrofi. sp. seb. Di. Clutton, &c.

NEUTRAL SALTS. They all lower the pulse, cool, and prove sedative; but the dulcified mineral acids are still to

ABSORBENT POWDERS. They are commonly preferibed in fevers; and may be uteful in as much as they unite with the seid upon the flomach and form neutral falts, otherwise they are of no service, and are much better

Longings. When this fymptom happens in fevers, it should be moderately gratified; what is longed for, the stomach will easily digest; and these gratifications often tend to promote the cure.

HEMORRHAGE AT THE NOSE. Never attempt to flop it when happening in a fever, whilft the pulse is full, the extremities warm, and the lips red.

PURGING. Whent his symptom occurs in fevers, an

emetic is generally the properest remedy, but in general it may be left to nature, until it manifestly reduces the patient's strength; and when medicines are required, cordials, perspiratives, blifters, and nutritive diet, are pre-

ferable to aftringents.

DELIRIUM. When this fymptom happens, if the pulfe is full and quick, bleed, and apply ftimulating cataplasms to the seet. If the pulse is weak and irregular, let a blister be laid betwixt the shoulders, and give warm nervous medicine s.

HICCOUGH. This fymptom is generally dangerous; the camphorated mixture, large dofes of musk, and gentle cordial opiates, are the necessary aids when it comes on.

NIGHT SWEATS. These happen frequently at the decline of a fever, or after it is quite abated, and are best relieved by a light but nourishing diet, moderate exercise in the air, the diluted vitriolic acid, and an infusion of the

NAUSERA, SICKNESS, or VOMITING. These may happen at any time of the difease; if in the beginning, after an emetic, give two or three large fpoonfuls of an infu-tion of columbo-root, and repeat as the frequency of the vomiting may require.

A COUGH and SPITTING often follow, as the confequence of a fever, but may be relieved for the most part by bitters, bark, light chalybeates, and exercise in the air.

When patients recover from fevers, they are generally feeble for fome time and apt to take cold. Trifles at this time endanger a relapfe; chearful company is useful; exercise should be gradually engaged in; the diet should be light, nourifhing, frequently taken in small quantities, and full meals should be carefully avoided.

See Wallis's Sydenham in the article of Fevers; Grant's Observation on the Nature and Cure of Fevers; Lyfon's Effay on the effect of Camphor and Calomel in continual Fevers ; Kirkland's Effays towards an Improvement in the Cure of those Diseases which are the Causes of Fevers; Fordyce's Elements, part ii.

Befides offification and wounds, this artery may be the feat of an aneurism. This last named accident is distinguished in its earlier stage by its being circumseribed, and small, but it gradually increases; for a time the pulsation in it is sufficiently remarkable, but as the tumor enlarges, the pulfations in it is more obscure, and at last is not to be perceived: when the aneurifm is arrived to this flate, the lower part of the leg becomes cedematous from the pref-fure above: and the limb in general is more and more unfit for use. Arrived at this flate, if relief is not afforded, a mortification will be the iffue. It rarely happens that the operation for the aneurism will suffice in this case; for in general, the artery is not only dilated and burst, but it is also distempered to some distance above the dilatation. Befides the want of collateral branches to carry on a due circulation is another impediment to a ligature being applied. Amputation, in thort, in this inftance, as well as when this veffel is wounded high up, near the belly, or low, near the ham, is the only relief. In case of an aneurism, if on performing the operation, and tying the artery, pain follows, with sever, tension, &c. the issue will be fatal, if amputation does not befriend. If the tumor is about the middle of the thigh, when from an ancurifm, and is yet but fmall, it may be laid bare, and the artery tied above and below. But if the tumor is much enlarged, the artery will be found difeafed to a confiderable diffance above, and then the ligature will fail. If the tumor is near the groin, amputation itself is very uncertain as to faving the patient's life; if it is low, near the ham, or in it, amputation will be indiffernible, being the only means of refcuing from a fatal mortification. See Mr. Pott's Works, and his Remarks on the Necessity, &c. of Amputation in certain Cafes.

FEMORIS, Os. THIGH BONE. In the thigh is only one; it is the largest and strongest of any of the cylindrical bones. On its outfide, near the neck, is a large tuberofity called the trochanter major; and there is a leffer one, on the infide, named the trochanter minor. The posterior concave furface of this bone hath a ridge rifing in its middle, called the linea afpera, whose inferior extremity divides into two. The inferior extremity of this bone is formed into two condyles, between which a confiderable cavity is found, especially at the posterior part. The two con-dyles are contiguous forward, but at a distance back-wards. The os femoris is articulated to the acetabulum by enarthrofis; to the tibia and the patella by gynglymus. Winflow observes, that all the processes from this bone are cartilaginous in new born children.

FFMUR. The THIGH. It is also called femen, coxa,

agis, ancha, and crus.
FENESTRA OVALIS & ROTUNDA, from Fenestra, a window, and pana, to shine. See TYMPANUM. FERENTIS. See ARBUTUS.

FERINA. That delirium in which the patient rages violently, is furious. It is the fame as MANIODES, which fee.

FERINUS. Savage, or brutal; but in a medical fenfe it fignifies noxious or malignant: hence it is applied to

FERMENTATIO. FERMENTATION; also called Ecbrafmus. It is the effecting that change in certain vegetable juices (of the nature of fugar) to which they have a natural tendency, whereby vinous spirits are produced; and, by some variation in the treatment, vinegar. The heat required, is between fixty and seventy degrees on Farenheit's thermometer.

Fermentation, befides its use in producing vinous spirits and vinegar, is sometimes used as preparatory to diftilling for other purposes than that of producing spirits, as, for instance, to unlock various substances for making diffilled waters, and obtaining effential oils, and is thus performed. The fubftances being first bruised, are to be insused in water, to which a quantity of yest is to be added, fufficient to raife a ferment; as foon as the ferment is begun, the whole must be committed to the still. The only caution here is to take it in due time, and to use no yest that can give an improper taste. See Boerhaave's Chemistry, vol. ii. Shaw's Chem. Lectures, and the Dicts of Chem. This term is often made use of by medical written.

FEMORALIS ARTERIA. The FEMORAL ARTERY. 1 the found humours are converted into the nature of forme morbid miasmata which have been absorbed into, or ged nerated in the body, as in cases of cruptive and some

other fevers, the formation of pus, the lues venerea, &c.
FERMENTUM. FERMENT, BARM, YEST, LEAVEN.
Pliny in his Nat. Hift. lib. xviii. ch. vii. fpeaks of the barm from malt liquor being used in Spain and Gaul, whence their bread was lighter than that of other nations. There are many other fubflances which excite fermentation, but this from malt liquor is always preferred to the others, whether for the purposes of pharmacy, or other instances wherein it is employed.

FERRAMENTA CANDENTIA. RED-HOT IRONS.

So Celfus calls the actual cauteries.

FERRAMENTUM.. Inftruments made of iron.

FERRAR. HESP. The abbreviation for Ferraria Hefperides.

FERRAR. FLOR. The abbreviation for Ferrarius de

Florum cultura.

FERRATÆ, AQUÆ. See ACIDULÆ. FERRI RUBIGO. See FERRUM. FERRI TINCTURA MURIATI. See FERRUM.

FERRUGO. Rust of IRON. FERRUM. IRON. It is also called chalybs, Mars, Edic, Edich, Edir. Its chemical character is &, by which is meant, that iron is gold at the bottom, the circle being

the character of that perfect metal.

Melampus used rusted iron to cure a man of impotency.

This is the first record of its use as a medicine.

Iron is a greyish metal, very hard, the next in specific gravity to copper, between seven and eight times specifically heavier than water, diffinguishable from all other bodies, in its metallic state, by its attracting, or being attracted by the loadstone, but losing this peculiarity on being reduced by fire to a calx. It is the hardest and most classic of all metals, not sushble without an intense white heat; it melts the slowest of any metal and calwhite heat; it melts the flowest of any metal, and calcining by the continuance of a weaker heat; it calcines more easily, though it melts more difficulty, than any other metal. If iron is long kept in fusion, it loses its fulphur, becomes more brittle, and at length is converted into a bluish glass, which, if exposed to the heat of a large burning glass, after laying it on a piece of charcoal, it takes up the sulphur it had lost, and is true iron again.

Iron is corrosible by a moist air, into a reddish yellow rust, and is soluble in all acids, on mixing with which it emits a gardie odour. it emits a garlic odour. Acids precipitate from iron all the common metallic bodies except zinc, forming with the marine acid, a yellow, with the nitrous, a dark red, and with the vitriolic, a pale green folution. All falts, except the alkaline, diffolic iron.

In medicine, the diffinction betwixt iron and fteel is

not necessary, though the steel is supposed to be harder than iron, yet it is not so, but by an additional process; and, as a medicine, as well as in chemical process, the

foftest iron is preferred.

Iron combined with acids becomes an aftringent fubstance; and upon its astringent and tonic powers its medicinal virtues entirely depend; for by increasing the tone of the vessels, it increases their vigour and activity. Boerhaave says, that iron is nearer allied to the human body than any of the other metals, fo as to be almost wholly foluble therein.

The medical uses of iron are most confined to, and manifested in chronical disorders; in which its efficacy is superior to that of all animal and vegetable substances put together. Weak, lax, pale, and leucophlegmatic habits, and all diforders in which is a defect of vital heat, are relieved by this metal. It strengthens the stomach, and chylopætic organs in particular; and by its continued use, the whole system is invigorated, the pulse is raised,

and every evidence of health reftored. By the fame corroborating power, whereby it promotes deficient, and reftrains redundant difcharges; where the suppression, or excessive flux arises from debility and relaxation; it contrarywife increases fluxes, and confirms obstructions, when they proceed from tension, rigidity, or spasmodic strictures of the vessels.

An aperient and astringent virtue hath been attributed to different preparations of iren; but they are all aperient Dict. of Chem. This term is often made use of by me-dical writers, to express that process which is supposed of the patient who takes them, and not as they have any to be carried on the fluids of the human machine, when such property in themselves.

etic purges, is almost a specific. In this as in most other cases the crude ires filings, when very small, excel all the other preparations; and in this case the filings are peculiarly proper; for the stomach of chlorotic patients abounds with acids, which are absorbed by the filings of iran. It may be that on the gas which is excited by the ferment of the iran with the acid in the ftomach, the principal efficacy of the iran is dependent. The aloetics to be joined with iron in this diforder, are the pil. ex aloe cum myrrha, or vinum aloes, these may be taken not as purgatives, but as alteratives, and to evacuate the in-testinal contents only. If in this disorder, the breathing is rendered difficult by the use of iron, join it with myrrh, or gum ammoniacum.

Suppressed menses, and also the immoderate discharge of them, are restored to their natural order by this salutary metal. See MENSES. In hypochondriac and hyfteric complaints, no medicine is to be preferred to this, though others have a ufeful influence herein, and are not to be omitted. In the rickets, iron is the specific; and though in fevers, or where the heat of the body is exalted though in tevers, or where the heat of the body is exalted above the par of health, iron, as it increafeth the heat, is generally prohibited, yet in fome low fevers, it hath been administered in conjunction with nitre, and thus was productive of the most desirable effects; when the fibres were lax, a mixture of vitr. virid. and fal nitri, in equal parts, was given in doses of ten or twenty grains; thus the velocity of the pulse and feverishness were abated, though the habit in general was thus improved.

In some instances, where iron is a necessary medicine.

In fome inflances, where iron is a necessary medicine, it, notwithstanding, is apt to occasion sickness and per-turbation; in this case, give a mild opiate, or direct the medicine to be taken in bed, half an hour before the pa-

tient rifes in the morning, and when he goes to reft at night; or he may be directed to walk after each dose.

The best forms for administering iron will be determined by the intentions of prescribing it. If to correct the deprayed ferment in the stomach be the primary intention, the filings may be given in the form of a pow-der, or an electary; but if to exalt the blood, open ob-ftructions, and improve the general habit, a ferrugineous

wine is by fome preferred.

Small doses, and duly repeated, are better than large ones; ten grains of the pure filings, and two or three grains of folutions in acid vehicles, are fufficient.

The preparations in general use, are as follow:

#### Limatura Ferri. Fillings of IRON.

Of all the preparations, this alone possesses all the virtues of iron. not fo powerful an absorbent of acids in the primæ viæ, nor does it possess to large a share of the gas, which is separated by the action of acids on pure iron. If pure iron is reduced into fine filings, it is the least offensive to the taste, and the most extensively useful in its effects.

Ferri rubigo called formerly Chalpbis rubigo. The Rust of IRON prepared.

Moiften clean filings of iron with water, and fprinkle over them with a little powdered fal ammonise; and when the whole is dried, powder and pass it through a fine fearse. The dose is the same as that of pure filings. The College of Physicians of London, order one pound of iron filings to be exposed to the air, often moistened with water until they are corroded into ruft; then pounded in an iron mortar, and the very fine power to be washed off with distilled water. The remainder, which will not by moderate rubbing be reduced into a powder, eafily washes off, and must undergo the same process; the washed powder must be dried for use. Pharm. Lond. 1788.

## Flores Martiales. Martial Flowers; now called Ferrum Ammoniacale.

Take of iren filings, one pound; of fal ammoniac, two pounds. Mix, and fublime; what remains at the bottom of the veffel mix, by rubbing together with the fublimed matter, and again fublime. Pharm. London,

The fuccess of this process depends chiefly upon the fire's being haftily raised, that the sal ammoniae may not fublime before the heat is become strong enough to en-

In the chlorofis, iron with aromatics, bitters, and alo- or iron veffels will be the propereft for carrying on this work. The most convenient vessel is an iron pot, to which may be luted, an inverted earthen jar, with a fmall hole in its bottom to pass off the elastic vapours which

FER

arise during the operation.

When these slowers are sophisticated, they are of a dull and pale yellow colour; but if these sophisticated flowers are placed over the fire in a proper vessel, the slowers will

fly off, and leave the mixture behind.

The dofe of these flowers is from gr. vi to 3 i. They may be taken in a bolus, or in the form of tincture; as

to pills, they render them crumbly.

They may be substituted for all the other preparations of iron; they are esteemed as a specific in the rickets, but, in reality, possess no advantages above the filings even in this particular instance. They have been called ens Veneris, and flor. fal. ammon. martiales.

From these flowers, dissolved in warm water and pre-cipitated with the aq. kali, is produced that powder, which is called Mars diaphoreticus, and, by Zwelfer, fulphur vitrioli anodynum martiale.

These flowers dissolved in sp. vini r. is the sedativum

Vinum Chalybeatum. Chalybeate Wine; now called Vi-num Ferri. Wine of IRON.

Take four ounces of the filings of iron; of cinnamon and mace, of each half an ounce; and of Rhenish wine, four pints. Macerate without heat for a month; then strain off the wine for use. But the College of London order four ounces of the filings of iron to be digested for a month in four pints of Spanish white wine, often shaking the vessel and then strained. Phar. Lond. 1788.

Solutions of iron in vegetable acids, are much more mild, and less ungrateful, both to the palate and stomach, than fuch as are made with the mineral acids.

The dose is from a tea-spoonful to a table-spoonful, two or three times a day, in any convenient vehicle.

Tinet. Martis in Sp. Salis. Tineture of IRON in Spirit of Salt; now called Tinetura Ferri muriati. Tineture of muriated IRON.

Take of the rust of iron, half a pound; muriatic acid, three pounds; pour the muriatic acid upon the iron, in a glass vessel, and shake the mixture now and then, during three days; fet it by, that the fæces may fubfide, eva-porate the liquor poured off to one pound, and add thereto three pints of the rectified fpirit of wine. Pharm. Lond.

This was formerly called tinct. martis Mynfichti.

Tintl. Flor. Mart. Tintlure of the Flowers of IRON.

Take of the martial flowers, four ounces; and of proof fpirit, one pint. Digeft and strain.

All the tinctures of steel are no other than real solu-

tions of iron made in acids, and combined with vinous fpirits; but the first of these two is the strongest. The dose of the first may be from ten to twenty drops three times a day; and, of the latter, three times the quantity

## Linivium Martis.

may be allowed.

Let the matter which remains after fubliming the flowers, be fet by in a moist place, and it will run into a li-quor which is the lixivium.

Some call it oleum martis per deliquium, and effentia martis. The dose is from one to three or four drops.

# Mars Saccharatus. Candied STEEL.

Put any quantity of clean filings of iron into a brafs the any quantity of clean nings of won into a brain kettle, fulpended over a gentle fire; add to them by little and little, twice their weight of white fugar boiled to the confiftence of candy, with which powdered flarch hath been previously mixed, in the proportion of one dram to a pound, agitating the kettle continually, that the filings may be crusted over with the fugar, and taken the filings may be crusted over with the fugar. ing great care to prevent their running into lumps. The dole is 3 fs. two or three times a day.

Mars Solubilis, called also Chalybs Tartarizatus; now Ferrum Tartarifatum. Tartarifed IRON.

fire's being haftily raifed, that the sal ammoniac may not fublime before the heat is become strong enough to enable it to carry up a portion of the iron; hence earthen able it to carry up a portion of the iron; hence earthen a thick paste, which expose to the air, in an open earthen wessel.

veffel for eight days; then rub the matters, dried in a rent parts of the body; and from the firm cohefion of bath of fand, to the finest powder. Pharm. Lond. 1788. these parts, or the defect therein, Boerhaave deduces the From three grains to twenty are a dofe.

Sal Martis, Salt of STEEL. Chalybis Sal, now called Ferrum vitriolatum. Vitriolated IRON.

Take filings of iron, vitriolic acid, by weight of each eight ounces; distilled water, three pints; mix them in a glass vessel, and when the effervescence has ceased, place the mixture for some time on hot fand; then pour off the liquor; filter it through paper, and after proper evaporation fet it by to crystallize. Pharm. Lond. 1788. It is given from half a grain to three or four grains for a

#### Extractum Martis.

Iron filings are to be diffolved in fome vegetable acid,

and then evaporated to a due confiftence.

As to the crocus martis operions, and crocus martis aftringens, the College of London fubilitutes the colcoth-vitrol for them. They are all three but a calx of iron; and of all the preparations of this metal, the calces are supposed to be the least useful, as they are the least solu-ble in acids. Though Mr. Beaumé observes, that these calces recover their original metalline state by digesting in olive-oil during an hour or two; whence probably a revival of them. See Dict. of Chem. 4to. from the French; Lewis's Mat. Med. Neumann's Chem. Works.

FERRUM AMONIACALE. See FERRUM. - EQUINUM. HORSE-SHOE VETCH. Boerhaave mentions three species, and Dale says they are aftrin-

EQUINUM GALLICUM, &c. The least jointed

podded collutea.

- TARTARISATUM. See FERRUM.

FERSÆ. The MEASLES. Sec MORBILLI. FERULA. FENNEL GIANT. It hath a large, fuccu-

lent, milky root; the stalk is fungous, and full of a pitchy matter. Boerhaave enumerates thirteen species.

FERULA AFRICANA GALBANIFERA, &c. called alfo ferula fructicola fempervirens. The galbanum plant. From this plant we have the galbanum of the shops. See GALBANUM.

- FOLIO BREVIORI. See MEUM LATIFOLIUM

ADULTERINUM.

- GALBANIFERA, called also ferulago; SMALL FENNEL GIANT.

- GLAUCO FOLIO, &c. also called thapfia ferulacea, libanetis famiculi folio, panax afelepium, and CANDY ALL-HEAL. This species grows in Candy; its roots and feeds are diuretic and emenagogue.

— MAJOR SEU FOEMINIA; called also ferula tenui-ore folio, ferula feeniculi folio. FENNEL GIANT. It is cultivated in gardens, and flowers in July. The gum which is obtained from this plant is the SAGAPENUM,

GALBANIPERA.
FESTUCA AVENACEA. The GREAT WILD OAT-GRASS. See BROMUS STERILIS.

FESTUCA ITALICA. See ÆGYLOPS NARBONENSIS.

LONG. ARIST. See ÆGYLOPS BROMOIDE:.

FIBER. The BEAVER. See Castor.
FIBRA. A FIBRE. Among the fluids in ovo, there is a terrestrial matter, the particles of which, foon after conception, begin to cohere (by the power of nature) and form themselves into threads called fibres. These ter-restrial particles are united by a gluten. The most simple fibre confifts of the most minute parts applied to each other longitudinally, fo that the smallest fibre is that which confifts of two elements longitudinally applied to each other; fince one fuch element belongs only to the

Haller fays, that the least discoverable fibres are of two kinds. The first are lineal; the second are conjoined with a breadth frequently larger than their length: and these latter, he inform us, are those of which the cellular membrane is made up.

general fource of difeafes. See Boerh. Aph. and Haller's

Physiology, in the article of ANIMAL FIRE.

The strength or weakness of a fibre can only be defined in a relative tenfe. Soon after conception, the cohesion is fo fmall as to be deflroyed by a very gentle shock; but as time advances, different degrees of cohesion is observed, till the degree is attained which gives perfection to the being. The perfection of cohefion is when a fibre, or vef-fel, &c. will bear, in some degree, more force to be exercifed against it, than what they are particularly defigned for by their state and office. Many, but equally unsatisfactory, are the rules laid down to diffinguish betwixt the rigid and lax fibre in particular conflitutions; but with a view to practice in the recovery and prefervation of health, as a rigid fibre is a concomitant of excellive heat, and the lax fibre of a deficience thereof; an attention to the heat of a patient's body will be a more easy and fatisfactory principle on which to proceed. See CALIDUM

INNATUM.

The state of the body in which there is a lax fibre, Dr. Geo. Fordyce calls the general weakness. He observes that weakness may be divided into two kinds: the first, in which the irritation and fenfation are confiderably increafed: the fecond, in which thefe fenfations are greatly diminished; as in the apoplexy and palfy. The first is called fingle weakness, which may be subdivided into two varieties; 1. When by any means it is produced on a fudden, in which case it is easily restored. 2. When it comes on flowly, then it is reftored with difficulty. Thefe two, then, differ effentially; from their causes, symptoms, effects upon the system, and their manner of cure. The fecond is called paralytic weaknefs. Various are the causes of weakness: e. g. bleeding, by exhausting the living power; all evacuations when too copious, and too long continued; antiphlogistic medicines, all which lessen the living power: a particular part may be weakened by exciting a fecretion from the mucous gland of that part, or from a part which lies near, though not connected with it. The system may be strengthened by various means, as follow. 1. By nourithing ftrengthening diet. If the veffels have been fuddenly emptied, give freely of nou-ishing food, as much as the powers of the confliction will eafily digeft the veffels will receive it, and the ftrength will foon return. If the weakness approached flowly, good nourishment will not reflore so speedily; for the organs of digestion being considerably weakened, and that gradually, renders the digestion of food difficult; therefore, in these cases, give moderate quantities of proper food, and repeat it often. In hectic fevers, sometimes the arteries are acting strong; thence it is necessary sometimes to take off that great degree of contraction, by di-minishing the system, by bleeding; then the patient may be capable of receiving nourishing diet. When the sto-mach is weak, the patient should avoid those vegetables that produce acidity in the primæ viæ; hence cabbage, beans, peas, &c. are not proper. Farinaceous feeds, pre-pared and given with animal food, are the best. 2. The body may be strengthened by exercise. When exercise is used, it should not be carried on to such a degree as to weaken the patient by it; it should be equal and univer-fal through the whole body, not in any one part more than another: for this reason, riding in a carriage, &c. where the body is equally moved, is much preferable to any other; but if we want to use a more violent degree of exercife, riding on horseback would be of great service. The patient should go out when the air is free and pure; thus the circulation is increased and passes through the lungs without being obstructed; but if he goes out in a most air, the lungs become somewhat obstructed; then anxiety, &c. are produced. The exercise should be agreeable to the patient, in order that the mind may be agreeably affected. 3. The strength may be restored by means of cold. Cold contracts the external vessels by which the integral about the preceding are kent filled. by means or coat. Coad contracts the external teach, by which the internal, about the precordia, are kept filled, which always tends to keep up the firength of the patient; farther, it takes off the irritability of the fyftem, and prevents people when exposed to cold from readily fuffering by it. If the cold be suddenly applied, it contracts the external veffels too much, by which the interior On the different proportions of the terrestrial matter, and the gelatinous which forms the simple sibre, depend the different degrees of hardness and softness in the different degrees of hardness

and farther, it should not be too considerable, though applied slowly, for it will produce weakness, and by its seed at the preparations of iron are often preferable to either the bark seed to be stimuted or bitters; but when the system is disposed to be stimuted. This however must be according to what degree the man hath been habituated to. The transition from heat to cold, or cold to heat, should not be fudden. The cold bath has been employed to itrengthen the fyftem; it feems to be a very uncertain remedy; for a fudden expofure to cold contracts the veffels too much, and the interior veffels are filled, fo that after the patient comes out, the heart acts with greater force, and propels it again upon the fking hence a fweat is produced; by this a kind of paroxylm is brought on. Sometimes it is of great fervice; but in difeates that are attended with weaknels, where there are confiderable fecretions, as in a gonorrhoea, benigna, &cc. the discharges are sometimes re-produced, inflead of being taken off. A temperate bath, in which is diffolved a quantity of altringent substances, as the seawater, acts as an aftringent on the fkin after the patient comes out, and often firengthens the fystem. Cold climates have a greater tendency to strengthen the habit than the warm, as the atmospere is more dense, and refpiration more free. 4. The lyftem may be ftrengthened by the patient being fituated fo as to breathe properly. It is effentially necessary to have a quantity of respirable air to breathe in. There are two effects that respiration produces on the blood; in the first place by propelling it backwards and forwards through the lungs, that it may not be accumulated in the right fide of the heart; in the fecond place, by what it conveys to and returns from the blood, its colour changes from a dark to a florid red. From a want of pure air, anxiety, &c. is produced, and a weaknefs foon follows. Those who dwell in large towns are more subject to diseases from weakness; those who live in villages are generally more robust, and subject to inflammatory complaints. But although a cool air conduces in general to increase the strength, when the patient is greatly exhaulted by profuse evacuations, or from long continued weakness; by fending him into the country, the purer air there may cause too free and great a circulation, as the large veffels then contain but a fmall quantity of blood, fuch a weakness will thereby be produced as to cut the patient off. 5. Medicines are the next means of restoring lost strength. These are such as invigorate the solids, chiefly by increasing the living power; of this fort are camomile, gentian, wormwood, the bark, and some other bitter vegetables. Among the metals, iron is peculiarly adapted to usefulness on this principle. All these leffen irritability, whilft they give tone to the relaxed fibres. In cases where the habit hath been fuddenly weakened, but the organs of digestion and the appetite are not impaired, there is not often occasion to employ these remedies, but only to use a nourishing diet. If, for example, a patient is weakened by a sever, and a little of the inflammatory symptoms remain, it is better to omit these medicines; but, if a degree of sever be left, and there is a want of appetite, colliquative purges, &c. and the strength does not return, we may use them with advantage. weakness be brought on suddenly, and is attended with partial evacuations, it is necessary to employ them. When ftrength is fuddenly loft, it is observable, that amongst all the just-named medicines, the bark is the best. When the weakness is flowly produced, these medicines may be employed with great advantage, if fuitable precautions are not neglected. 1. In people of melancholy temperaments, where there is evidently a contraction of the wessels, as well as a weakness, which is indicated by a hard pulse'; we thould endeavour to take off this disposition to contraction before we employ them, which may be done by evacustion. Indeed in melancholic habits, it often happens that we cannot by any means employ them. 2. They are apt to destroy the irritability with regard to themselves; for if you give them, at the first, for about a week, their effects are produced; the patient feems much relieved; but after a continuance through a fecond or third week, their effects are in a manner loft. For this purpose, it is better to vary the medicines; giving the bark and fteel alternately, and leaving them off for a time, fo that they do not become habitual to the patient, and then after fome time the patient repeating them again, his strength is restored. When weakness is gradually brought on, and in consequence of lingering diseases, it is generally better relieved by bitters and other strengtheners than by the bark.

or bitters; but when the fyltem is disposed to be stimulated, they cannot be employed with advantage. Iron having a flimulus, it should be given in a state of folution, which will leffen its ffirmularing powers. But it thould be remembered, that ferrugineous preparations are not proper in melancholic habits, because their flimulus produces costiveness. In lax habits only, they are to be employed.) When strengthening medicines are given, they should not be directed in too large doses. If the bark (see instance) is given, two, or at the most, four drants will fuffice in twenty-four hours. Too large dofes errare weak-nefs. When the flomach and the intellines are weak, the whole fystem is generally affected; and on the con-trary, vice verfa. If the weakness of the prime vice is very great, it fometimes produces a palfy in these parts, In anxiety and lofs of appetite, give acids, particularly fuch as do not ferment in the flomach, and give them an hour or two before dinner. If flatulencies attend, wine and spices may be fervicable. If the stomach is loaded with mucus, give an antimonial vome; and direct the patient to live on animal food, and farringceous feeds, properly prepared. If neither the piles nor the mentes for-bid, aloetic purgatives will be the best for guarding against coffiveness; in case of either of these forbidding the use of aloes, it may be advisable to give rhubarb with the magnesia alba. See Edinb. Med. Com. vol. iv. p. 399.

FIBULA. It is the name of a contrivance of the ancients for bringing the lips of wounds together. Also a BUCKLE. Hippocrates sometimes uses the word for the part only of the bone that forms the outer ankle, perhaps, because they used to buckle their shoe in the place. A CLASP or BUTTON. The ancients called the fmall bone of the leg thus, from its joining the tibizand mufcles together: this bone is also called perone, focile minus, arundo minor, canna minor, cruris, fossilus, sura, and radius. On the out-fide of the leg and behind the tibia, the fibula is placed: its upper extremity is flattened where it is connected to the tibia; its lower extremity hath an oblong head, which is received by the external cavity of the tibia; below this the head of the fibula is extended in a coronoid process, contiguous to the outlide of the aftragalus, which process

is called the malleolus externus.

FIBULEUS. A name of the mufculus peronœus

FICARIA. See SCROPHULARIA MAJOR. It is also name of fig-wort, and of the leffer celandine. See CHELIDONIUM MINUS.

FICATIO. See FICUS.

FICOIDEA. A plant fo called from its refemblance to the ficoides. There are two species, but they are not noted in medine.

FICOIDES. It is a fucculent plant, which refembles house-leek. Boerhaave enumerates fifty-three species. They are faid to be emollient. Ficeides is also a name of anana, and of the melseaffus.

FICUS, vel ficatio. The name of a tubercle about the anus or the pudenda. See THYMUS. It is the fame as CONDYLOMA.

- AMERICANA. See MELOCACTUS. - ÆGYPTIACA. The CRETAN MULBERRY-LEAV-ED FIG-TREE; called alfo fycomorus.

- Indica. See Banana and Musa.

- INDICE GRANA. COCHINEAL. See Coci-NILLA.

INFERNALIS. A name of the palma christi.

— MALABARICA. See TEREGAM.

— SATIVA, called also ficus aerida, ficus communis, caprificus, criness. The FIG-TREE. The ficus carica of Linn. The dried figs are called carica. This tree is of a middling fize, with large leaves cut into five fegments. It is remarkable for producing no flowers previous to the fruit. It grows spontaneously in the warmer climes and is cultivated in our gardens.

The best figs are brought from Turkey; many are brought also from the south of France, where they dry them, first by dipping them in scalding hot ley, made of the ashes of the fig-tree, and then exposing them to the

This fruit is glutinous and falt; for first they stick to the hands, and then scour them after the manner of lixi-

vial falts, whence it is that they excite to ftool without griping. They are confiderably nutrimental, perhaps more fo, because their fugar is united with a large portion of mucilaginous matter, which is generally supposed to be of an oily nature, and therefore contributing to a nu-tritious quality. Grateful to the stomach, and easier to cipal medicinal use is as a lubricating emollient sweet; they are an ingredient in pectoral decoctions and suppurating cataplasms. See Lewis's Mat. Med. Cullen's Mat. Med. digest than any other of the fweet fruits. But their prin-

FIDICINALES. The muscles called lumbricales. FILACEI RADICES. FILACEOUS ROOTS. They are fuch as are furnished with many filaments.

FILAGO. CUD-WEED. See GNAPHALIUM. - ALPINUM. The herb LION'S FOOT. See LEON-

FILAMENTUM. A FILAMENT. A body appearing

in the form of a slender thread.

FILELLUM. The frenum of the prepuce.

FILETUM. The frenum under the tongue.

FILICULA. See ADIANTHUM NIGRUM.

- PETRÆA RUTÆ FACIE. See ADIANTHUM ALBUM.

FILIPENDULA. DROPWORT, also called faxifraga

rubra, and amanthe.

It grows wild in fields and chalky grounds: it is rough and bitter, and is flightly pungent. Boerhaave mentions two species. Other dispuss ts are mentioned under CE-NANTHE. The species used in medicine is the spirce filipendula. Linn. It is also a name of several species of alectorolophus.

— AQUATICA. See CENANTHE AQUATICA. - CICUTÆ FACIE. See CENANTHE CHERO-PHYLLI FOLIIS.

FILIUS ANTE PATREM. A name of the tuffilago, because its flowers appear before the leaves. This name is also give to other plants whose flowers appear before their leaves.

FILIX. FERN. Boerhaave mentions nine species. Fern is divided into the male and female kinds; the male hath no branches, but only one main rib; the female is branched.

- ACULEATA. See LONCHITIS.

- FLORIDA, called also filix ramosa, ofmunda vulga-ris, and palufiris. Flowering fern, and osmund roy-AL. It is the ofmunda regalis, Linn. It is the largest of the true English ferms; towards their tops are round, slender, feed-bearing, curled heads of a brownish colour, covered with feeds; they appear in June and ripen in July. The root confifts of many fmall, long, round parts matted together, blackish on the outside and green with-in, covered with small sibres. It is found in marshy and boggy places. The roots are efteemed as useful in all the cases that the roots of the other species are recom-mended against; but a conserve of the tender buds or heads is the best.

- FOEMINIA, called also filix ramosa major. FEMALE FERN, BRAKES, OT BRACKEN. It is the polypodium filix

famina, Linn.

MAS. MALE FERN, called also lonchitis polypodium filix mas; or polypodium frondibus bipinnatis : pinnis obtufis crenulatis stipite paleaceo, Linn. The ferns are well enough known to render their description needless; but it may be observed that on the leaves of this fpecies are tubercles which contain the feed, and about the end of the fummer they may be found. The root of the male fern refembles that of the ofmund royal, and is often fold for it. The roots of most of the species, when chewed, are of a fweetish taste, and are glutinous, but foon become bitterish, subastringent, and nauseous: they are used by some for destroying the worms called tenia: It seems though doubtful to Dr. Cullen whether they have any specific power in killing worms, either of one kind or another; for the ftomach bears confiderable quantities of it without uneafinefs; and when given by itfelf it has no fensible effects: It is generally given with some draftic purge, therefore its apparent good may in fome cases be derived from that source; others use them as deobstruents and extol them against the rickets. The male fern, and those that bear flowers, are most antiseptic and subastringent; the female fern is more vifeid, faponaceous, and diuretic. Cullen's Mat. Med.

FILIX QUERNA, called also blechnon minus, filix ramosa minor, filix arborea. The LESSER BRANCHED FERN.

QUERNA REPENS. See POLYPODIUM TENERUM

FILTRATIO. FILTRATION. It is the passing of any fluid through a strainer or filtre, to separate from it any grofs particles which it contains, and to render it limpid. Generally a paper is folded into the shape of a funnel, and then placed in one; into which some of the liquor is to

be poured, which is to pass through the paper thus placed.

FILTRUM. See FILTRATIO. It is also a stone which is found in the bay of Mexico, which is used for

filtering liquors through.

FILUM ARSENICALE. SUBLIMATE MERCURY.

See MERC. CORR. SUBL. FIMBRIA. FRINGE. Those leaves are faid to be fimbriated that are jagged about the edges. In furgery this word means the fame as CATABLEMA, which fee.

FIMUS. DUNG. The dung of many animals hath been in use; but the present practice excludes them all from the materia medica.

FINGRIGO. See PISONIA.

FISSILIS LAPIS. See HIBERNICUS LAPIS.

FISSURA. A FISSURE OF CRACK, from findo, to cleave. These are either natural or morbid: thus the mouth or other natural apertures into the body are called fiffures. Morbid fiffures are cracks in the skull, &c. or are when a bone fractured in any part is lengthways.

A morbid fiffure differs from a fracture, in that the first

hath fome degree of cohesion, but in the latter there is a

hath tome degree of continuity. A fracture is tranverse or oblique, and a fiffure is longitudinal.

Fiffures most frequently happen in the skull, and of these there is, first, the contra-fiffure, or counter-fiffure, and this is when the blow is received on one side of the head, and the skull-is cracked on the other; or, where the internal table is broken, the external remaining found ; or, where the ftroke is received on one bone, and the fisher is in that adjoining. Many authors doubt the existence of a counter-fisher, and it is disficult to account for it; but the facts are too well attested to deny them. Hippocrates, Galen, Celfus, Berengarius, Fallopius, and several others, affert their having met with instances of them. them. Secondly, that kind which is most frequent is that which when large is foon discovered by laying the bone bare, and cleaning the part with spunge. But sometimes they are so small that some art is necessary to discover them; in which case rub a black liquor made of burnt bone, or cork, mixed with water, and immediately wash it off again; this black liquor finking into the crack difcovers where its fituation is: or, if the head is clean flaved, and the patient is bled freely, an cedematous puffinels will appear in a day or two over the part affected.

Fiffures are often productive of worfe confequences than fractures, for there is often at the fame time a concustion of the brain; whence it is the more necessary to be well affured of the attendance of this accident, or the contrary. Inftances of the ill effects of fiffures have happened ten months or more after the accident. It is not simply the fiffure that is dangerous, but the violence that occasioned it, which also occasions the teguments and the bone to fuffer: all the bad fymptoms depend principally upon the rupture of a great number of veffels, and a de-tention of extravafated liquids, whence the bone is corrupted; and when this happens, a fuden and unexpected death is often the confequence. The cranium cannot be fiffured without being also contused, by which many vef-sels in the substance of the bone and in the diploe are

Trepanning feems to be the propercit method of relief, though the method recommended by Mr. Bromfield in concustions of the brain hath alone effected a cure.

FISSURA CEREBRI. MAGNA SYLVII. The anterior and middle lobes of the cerebrum on each fide are parted by a deep narrow fulcus, which afcends obliquely backwards from the temporal ala of the os fphenoides to near the middle of the os parietale, and this fulcus is thus called.

FISTULA. So the Latins called a catheter. See CATHETERUS.

FISTULA. In furgery it is a kind of ulcer. It differs from a finus thus: a fiftula is narrower, generally conti-nues longer, and hath its internal furface and its orifice for the most part callous, Paulus Ægineta fays, " a fiffas-

la, which derives its name from its refemblance to a reed and proceed afterwards as is usual in recent wounds. Mr. or pipe, is a callous finus, generally the confequence of abfeeffes." And Celfus defines a fiftula to be "a deep, narrow, and callous ulcer." The feat of a fiftula is in from one end to the other, then cutting out all the harthe cellular membrane. It is known to be prefent when there is an aperture on the furface of the body from which a fanious, or other matter, either flows or may be preffed out; its depth and direction is discovered by a probe; or, if the directions are various, warm water may be injected therein, and if the course is near the skin, it will be observed by the elevation made by the water, or if otherwife, the quantity of water retained will determine the fize of the eavity. The probe indeed difcovers whether the fiftula runs upon an adjacent bone, or whether or not the bone is carious, which the water does not. The various parts in which these ulcers are seated, and the different circumstances attending them, constitute the chief differences betwixt one fiftula and another. As to the prognoffics, the thicker the cellular membrane, or the more firsts of mufcles upon each other, the more mifchievous a fifiula ufually proves: whilft it is fimple, and extends no farther than it can be wholly come at with a knife, it may be generally cured; when so situated as to open into the neck of the bladder, or when it is attended with a caries in the adjacent bone, particularly the os faerum or the coccyx, the cure is very difficult, and often imposible.

Mr. Bell, in his Treatife on Ulcers, includes the fiftula

Mr. Bell, in his Treatife on Ulcers, includes the fiftula in his species of sinuous ulcer. By sinuous ulcer he means that kind of fore which hath one or more openings running into it from chinks of the same, or of different directions, and generally seated in the cellular membrane. A sinus, as thus described, he says, is the most simple state of the disorder, and is, by long continuance, or by the use of drying astringent applications, liable to become hard and callous in its internal surface, and in such a state, from its supposed resemblance to a pipe, is termed a sistual. The most frequent cause of sinuses forming in ulcers and abscesses, is the want of vent to the discharge, which easily infinuates itself into the soft yielding substance of the cellular membrane, and proceeds on gradually till it somewhere or other finds an opening either externally, or into some of the neighboaring cavities. An improper application of bandages on ulcers is sometimes a cause.

when fifulas, as yet not become callous, are complicated with ulcers, the most expeditious relief is from an incision to the very bottom, if it can be done without danger, after which they are to be deterged and confolidated. Another step is, to press their bottoms towards their orifices; for which purpose a narrow compress, or a slip of plaster wrapped up in that form, is, after the ulcer is cleaned, and proper medicines put into the fistula, to be applied to its bottom, and secured, as in other ulcers, with lint, plaster, and bandages; in applying the bandage, apply it to the bottom of the fistula, or, at least, to make it tightest there, that the peccant matter may be propelled from the bottom to the mouth of the fistula, in consequence of which the bottom will be soonest healed; this happens most frequently when the fistula is in the arms or legs, or when its mouth is lower than its bottom. Beloste, and some others, absolutely discard all tents and injections; but as to the latter, whon fistulas lie too deep for having their most remote parts cleansed, detergent injections must be used, such as a decoction of birthwort, mixed with honey of roses, or with the tincture of myrrh and aloes: this or some other such like must be injected warm at every dressing, and retained for a short time, at the same time gently compressing the bottom and mouth of the fistula, that the peccant matter may more effectually be washed off, and this method must be continued until the bottom of the sistent with a begins to be conglutinated; then dress with some soft digestive, in which is the balf. Peruvor balf, capivi. This method failing, the manual operation must be attempted, but, indeed, it is not to be depended on, except when the opening can be made to the bottom of the ulcer. The incision is made with most case to the patient with a knife; but whatever instrument is used, as much skin and sless have the end; for when the bottoms of fistulas are laid open, the corrupted matter is not only discharged, but medicines are also mo

to shun the practice of laying the different sinuses open from one end to the other, then cutting out all the hardened parts, fo to convert the whole into one common ulcer. This method he owns will frequently effect a cure; but, independent of the great pain, and very large unfeemly cicatrix which it occasions, it cannot, in every case, with safety be put in practice. E. g. when finuses run far up the rectum, it cannot ever be conveniently done; they penetrate deep, and run below either large bloodveffels, tendons, or nerves; it would never furely in these cases be adviseable to have recourse to such treatment. The intention of cure, in every case of finus is to produce a coalescence of its sides, so as to destroy any vacuity that may have occurred: the most effectual means of accomplishing which, is, 1st. to make a depending orifice for a free exit to the matter; and then, 2dly, by a gentle irritation to induce, on the internal furface of the finus, a flight degree of inflammation, which, by experience, is known to be that flate most favourable to the production of adhesion between any two parts; fo that a firm union of the fides of the finus to one another, may, in due time, be obtained. To answer both these inten-tions, Mr. Bell says, that the introduction of a seton is fufficient. The feton must pass from the orifice in the ulcer along the course of the finus to its other extremity, where an opening, large enough for the difcharge, should be made, as is done in cases of abscess. The cord of cotton, or of filk, should at first be pretty large, more or less fo, according to the capacity of the finus; it should be diminished gradually as the cure advances, by taking away a thread or two from its thickness every second or third day; and at last, when the discharge is greatly lesfened, by the vacuity occasioned by the finus being mostly filled up, the feton should be totally withdrawn, and a bandage somewhat tight being applied over the part, and continued for fome time longer, a complete cure will, in general, be in due time effected. The first step then to be taken, is to discover the direction of the finus, or finuses, which may commonly be done, either by introducing a probe, or by observing where the matter points, or being allowed to collect for some time, and from whence it comes on the parts being pressed; then into whence it comes on the parts being prefled; then into every finus that opens into the ulcer, a feton should be introduced. This method of curing finuses, by the use of a feton, is free from all danger, and is admissible in all cases of this kind. A feton, by means of a director, may always be used with safety. The sinuses, being removed by the setons, the ulcers they were connected with are then to be cured as is usual with that species which it happens to belong to. This practice rarely fails in any case of simple sinus is in general it answers in real fillular: case of simple sinus; in general it answers in real fistule; when a fifula happens in the perinaum, this practice is peculiarly advantageous, not producing that troublefome cicatrix which happens when the knife is used. The only objection to the use of the seton in cases of fiftula in ano, is the irritation it would occasion in the gut. But as Mr. Pott hath so simplified the management of the fiftula in ano, to his method that inflance may be referred. See Celfus, lib. vi. c. iv. Boerh. Aph. the English translation, p. 102, 103. Pott's Treatife on Fiftulas. Bell's Treatife on Ulcers, edit. 3. p. 244, &c.

#### FISTULA in ANO.

No part of the body is more subject to abscesses than the part immediately furrounding the lower part of the rectum; it is much exposed to pressure and other external injuries, which impede the free motion of the blood there, which turns into pus, and as the skin here is pretty thick, the pus will infinuate itself up amongst the fost neighbouring parts, and form sinuses, which degenerate into fiftulas.

This kind of fifula is called complete when there is an opening into the gut, and another externally; it is called incomplete when there is no external aperture.

The fymptoms of the incomplete kind are analogous to those of the piles, and so are difficultly diftinguished. The complete kind hath generally callous lips, which, with the discharge therefrom, more readily points out the nature of the case.

Abfecties in this part should be opened as soon as we find a sluctuation of matter, and that by a large aperture, which is the most effectual method to prevent a return.

In examining one of these fiftulas, if the probe does not puncta for the most part, but sometimes through the lower readily pass, inject warm milk into it, and observe if any only, or in a few instances through both. returns by the rectum; if it does, it is clear that the gut is perforated. When the probe is used for examining with, let the patient stand on the ground with his seet. pretty far asunder, and lean on his belly over a table, then an assistant can hold the buttocks assunder, that the operator may more readily introduce his finger into the anus before he examines the fiftula with a probe. If the fiftula runs fo deep that the finger introduced into the anus cannot eafily reach the orifice, then the cure is not practicable, on account of the hæmorrhage from the veffels, which admit not either of compression or ligature. If a fifiula hath been of long ftanding, in a bad habit, and the discharge is such as to weaken the patient, the operation should not be attempted, at least till the constitution is repaired; but if the patient is of a good habit, if the

fifula returns the operation may be repeated.

The method of operating is as follows, according to Monro's instruction: "Wherever the opening of the fiftula is, if it hath any turnings where it reaches the gut divide them, and make them strait, avoiding the sphincter. After this I attempt to promote incarnation, which might beffen the cavity and by degrees fill it up, by injecting balfamic foftening medicines; though fometimes a patient of a good habit may be cured by applying a poultice of bread and milk, and a digeftive. If this fail, I endeayour to render the parts entirely callous and infenfible, by injecting a mixture of lime-water and brandy, with a by injecting a mixture of lime-water and brandy, with a little honey of rofes, increasing the brandy and diminifiling the reft, as the parts lofe their fensibility, until at length I inject pure alcohol, which renders them quite infensible." See Heister's furgery; Le Dran's Operations. Sharp's Operations. Celfus speaks well on this subject. Pott's Treatise on Fishalas. Bell's Surgery, vol. ii. p. 282. Kirkland's Med. Surgery, vol. iii. p. 201, 235. London Med. Journal, vol. v. p. 392. White's Surgery, p. 386. Surgery, p. 386.

#### FISTULA in the EPIDIDYMIS.

In the Lond. Med. Obf. and Inq. vol. ii. p. 273. is an instance of a fiftula in this part being cured. The substance of the relation is as follows: a man of thirty-five years of age hurt his testicles by a fall; a suppuration followed, and the matter was discharged externally. After this the suelling being reduced by means of an emolter this, the fwelling being reduced by means of an emol-lient cataplasm, a fiftula was discovered in each epididy-mis; a probe director was then introduced into the left finus, which was cut open its whole length; after which all the indurated parts were diffected, and all the difeafed fkin; the fame was done on both fides, and a part of the epididymis on the right fide was cut away. After this the dreflings as in common wounds finished a cure. And what deserves some notice in this case is, that the functions of the testes were afterwards fully executed.

#### FISTULA LACHRYMALIS.

It is generally understood to be such a disorder of the canals leading from the eye to the nose as obstructs the natural paffage of the tears, and makes them trickle down the cheeks. In the first and mildest stage of this disease, an inflammation in this part is alone observed: in the next stage there is matter discharged from the puncta lachrymalia, which flows along with the tears; or it may be that the matter proceeds from an orifice broken through the ikin, between the note and the angle of the eye. The last and worst degree is when the matter of the abfeels has not only corroded the neighbouring foft parts, but also the subjacent bone, by which it becomes carious. For a distinct idea of the seat of this disease, see a figure

of the lackrymal ducks in a plate annexed to the chapter on this subject, in Sharp's Operations of Surgery.

If the skin which separates betwixt the angle of the eye and the nose is not corroded through, it is called imperfect; if it is corroded through, it is a perfect; and if the subjacent bones are affected, it is a compound signala lamalis.

Other disorders about the seat of the fiffula lachrymalis are confounded with it; but properly this kind of fiffula is a corrosion of the ducts of the lachrymal sae; in confequence of which pus flows out of them into the great angle of the eye: when the clear lachrymal fluid flows out without a mixture of pus, the diforder is an epiphora. The matter of a proper fiftula flows through the upper

only, or in a few instances through both.

The symptoms are, frequent droppings of tears, and of a purulent matter, especially in a morning, and this without any manifest external inflammation; by pressure with the singer upon the lachrymal sac, a discharge of pus follows, which is emitted through the puncta lachrymalia; if this pus is ill feented, the adjacent bones are generally carious; the fame is indicated by a green or blackish ecolour of the discharged matter, although the smell be not offensive: when the matter is of a bad fmell or colour, the probe will readily determine the flate of the bone; for fometimes it is not injured, notwithstanding the attendance of the usual figns; as, on the contrary, there is fometimes a caries when the pus is discharged with every laudable appearance; though, if there is a daily and con-fiderable discharge of faulty matter, a caries will for the most part be formed in the lacbrymal bone, the os planum, or in the jaw-bone. If the nafal duct is obstructed, it is known by injecting some suid into it, when, instead of the fluid palling through the noie, it returns by the puncta lachrymalia: if there is an encyfled tumor, the exterior parts (well with a hardness, and will not yield to the preffure of the fingers, but there is no inflammation; on the contrary, if the tumor yields upon preffure, there is a lachrymal hernia. Inflances have occurred of a fiffula lachrymalis not discharging pus with the tears, but the pus was discharged alone when the patient was afleep, and

this hath happened when a caries attended.

If the difease is recent, the habit of body not remarkably faulty, the external skin not corroded, the nasal duck unobstructed, the matter of a good colour and confiseence, forbear incision, and also the cautery; for compresfion and mild aftringent collyriums will frequently succeed in this mild stage of the disorder; the matter should be now and then gently preffed out with the finger, by which its acquiring an acrimony will be prevented. But if the duct into the nofe is stopped, nothing will succeed but the operation; in performing which, push the loose skin of the under eye-lid upon the globe of the eye as much as you can then cut a passage into the lichryma! groove, which is known by the crackling of the ox unguis under the pressure of the knise; then if need be introduced. the preffure of the knife; then, if need be, introduce a probe, and perforate into the nofe; be well aware of getting your knife upon the upper part of the maxillary bone, which you will know by the refiftance; in this case go a little farther back with your instrument: further, observe in perforating the os unguis not to prefs upon it too for-wards, for then you will be obstructed by a part of the maxilla superior, which makes part of the canal wherein the sac is lodged; if you prefs inwards there will be dan-ger of injuring the os nasi, or the septum nasi, or the os ethmoides; but if the instrument is passed backwards and downwards towards the uvula, no obstruction will be met with.

met with.

For compreffing inftruments with which to cure the flighter cases, see Sharp's Operations, and Gooch's Cases. On the Fisual Lachrymalis, see Sharp's Operations, Le Dran's Operations, Edinb. Med. Essays, vols. ii. and iii. Pott's Treatise on the Fisual Lachrymalis, St. Yves on Disorders of the Eyes, Heister's Surgery, Bell's Surgery, vol. iii. p. 469. Kirkland's Med. Surgery, vol. iii. p. 134, London Med. Journal, vol. i. p. 62. vol. ii. p. 77, 83. Wallis's Sauvages's Nosology of the Eyes, p. 77, 83. White's Surgery, p. 256. White's Surgery, p. 256.

### FISTULA in PERINZO.

This kind of fiflula is when an opening in the fkin corresponds with one in the urethra. It sometimes happens that one opening out of the side of the urethra is attended with feveral through the skin, but it rarely happens that there are more than one opening through which the urine is discharged from the side of the urethra.

After lithotomy, a puncture of the perinœum, an abfcefs in the fame part near the urethra, a fcirrhus in the glandula proftata, &c. a fiftula is formetimes formed, through which the urine makes its way in part, whilit the

reft is passed through the natural passage.

A fifiula proceeding from the urethra runs in various directions before it reaches to the external opening of the fkin, fo that when the external opening is near the anus, it may be taken for a fifula in that part; but the difcharge of urine through the fifula at once diftinguishes its feat.

Befides the callofities on the external orifice of thefe

fiftulas, there are fometimes calculous concretions lodged meri, and almost from the whole surface of the ulnas in their cavities; indeed, fo various are the circumstances forming a tendon, which is inferted into the os pishformer attending different cases of this kind, that only general rules can be laid down for proceeding to the cure.

In general, in order to the cure, the outward opening must be enlarged by cutting away the callous lips, or destroying them by caustic; but it sometimes happens that this end may be answered by introducing a bougie into the urethra, in order to distend its capacity. Le Dran observes, that though there are several fiffulous orifices, and several callosities in the perinœum, and when the water passes off in a small stream through the natural passage, the chief remedy will be the introduction of bougies; also that as this canal is enlarged, the external orifices are diminished and healed, and the callosities are softened.

Mr. Bell prefers the cure of this fistula by the introduction of a seton. See Fistula, above. See Le Dran's Operations, where this article is well treated on. Bell's Surgery, vol. ii. p. 226. London Med. Journal, vol. i. p. 379. White's Surgery, p. 395.
On fiftulas in general, fee Celfus, Cæfar Magatus, Boerhaave's Aphovifms, the English translation, and Pott's

Treatife on Fiftulus.

FISTULARIA, i. e. Pedicularis pratentis purpurea.
FISTULARIS. FISTULAR. In botany those flowers are thus called which are compounded of many long hollow small florets, like pipes. And those plants are called fiffulous whose stalks are hollow like a pipe.

FIXATIO. FIXATION. In chemistry it is the rendering any volatile substance fixed, so as not to sly off

upon being exposed to an intense heat. FL. LAP. The abbreviation of Car. Linnæi Flora

FL. NORIB. The abbreviation of Johannis Georgii

Volckameri Flora Noribergenfis. FLABELLUM MARINUM.

A name of the keratophyton maximum cinereum elegantissimum reticulatum.
FLAMMULA. So the skein of silk was used to be called with which setons were used to be made. It is a name of feveral species of ranunculus. See RANUNCULUS

LONGIFOLIUS, &c. of the artragene and elematis.

FLAMMULA JOVIS. The UPRIGHT LADY'S BOWER. It is the clematis recta, or clematis foliis pinnatis : foliolis ovato lanceolatis integerrimis, caule erecto, floribus alvis pentapetalis tetrapetalisque, Linn. UPRIGHT TRAVEL-LER'S JOY.
FLATUARII. CHEMISTS.

FLATULENTUS. See AMBULO.

FLATUS. FLATULENCE. It is vapours rarefied by the heat of the part where they are contained; whence dif-tensions, uneasy fensations, and often a considerable de-gree of pain. It is for the most part an instance of dyfpepfia.
FLAVII CLEMENTIS MEDICAMENTUM. The

name of a medicine for the gout; it is described by Ac-

FLAVUM LIGNUM, called also lignum nostratibus, tatai-ibi, xanthoxylum morus. FUSTIC WOOD, or FUSTIC TREE. It grows plentifully in Jamaica. It is used by dyers for staining a yellow colour, but it is not noted as

FLEMEN. A tumor about the ancles. Sometimes

FLENESIN. A name for the gout.

FLETUS. Weeping.

FLEXOR. A name applied to feveral muscles, from their office, which is to bend the parts to which they be-

- BREVIS MINIMI DIGITI MANUS. It rifes from the unciform process of the carpus, toward the an-nular ligament, and is inserted into the basis of the little

- CAPITIS. See RECTUS INTERNUS MAJOR.

partly inferted into the trapezium, and partly into the first metacarpal bone.

- CARPI ULNARIS. It is also called flexi carpi interior. It rises from the inner condyle of the os hu-

FLEXOR DIGITI PARVI MINIMI. See ABDUCTOR MI-

FLA

NIMI DIGITI MANUS.

- DIGITORUM ACCESSORIUS. See FLEXOR LON-GUS PEDIS. Dr. Hunter call it accefforius.

- INTERNODII DIGITORUM PEDIS. See FLEXOR SUBLIMIS.

- INTERNODII PRIMI DIGITORUM. These are muscles that are both on the hands and feet. calls them LUMBRICALES, which fee. Dr. Hunter deferibes the lumbricales as productions of the flexors, and defcribes diffinctly that

- INTERNODII PRIMI POLLICIS MANUS. It rifes fron the annular ligament of the carpus, and is inferted

into the first bone of the thumb.

- INTERNODII PRIMI & SECUNDI POLLICIS. These muscles rise sharp and fleshy about the middle of the back part of the fibula; then running into a tendon in passing over the joint, and then through a channel in the inner part of the os calcis, are inferted into the up-

also called flexor fublimis, or perforatus. It rises from the inner condyle of the os humeri, and from the forepart of the head of the ulna and radius; it paffes through the annular ligament, and fpreads out into four tendons, which are inferted into the basis of the second phalanx: they are bound down by what is called an annular liga-ment, which is really a general sheath of the fingers, thicker at the joints than elsewhere. Brown calls this mufcle flexor fecundus.

- INTERNODII SECUNDI POLLICIS MANUS. Ît is made up of two portions, the anterior of which is inferted into one fefamoid bone, the posterior into the other.

—— INTERNODII TERTII DIGITORUM MANUS.
Dr. Hunter calls it perforans manus. It rifes from the inner condyle of the os humeri, from the external part of the ulna about its middle, and from the interoffeous ligament it runs between the perforatus, and forms four tendons, which pass through as many slits in the perfora-tus, to be inserted into the basis of the last phalanx.

mus Pollicis manus. It often hath a two-fold beginning, one from the internal fubftance of the os humeris between the perforatus and perforans; this head is sometimes wanting, and fometimes fprings from the upper and fore part of the ulna; the second head rises on the radius; it paffes over the articulation of the carpus, and is im-planted in the upper part of the third bone of the thumb.

LONGUS, or perforans Pedis, called also accessorius. It rises from the posterior part of the tibia just below the poplitaeus, and from the interoffeous ligament; then goes on the inside of the astragalus and os calcis (from whose internal part a short head rises, which is called accessorius), and passing through the slit of the perforatus, its four tendons are inferted into the basis of the last bones of the toes. This muscle receives some

fibres from the flexor pollicis longus.

POLLICIS BREVIS. It is short, thick, and fleshy, feemingly divided into two muscles, by the tendon of the flexor policies longus passing over it. It rises from the flexor policis longus passing over it. It rises from the upper part of the os cuneiforme medium, and running over the termination of the mufculus peronæus primus, is implanted into the offa fefamoidea of the great toe, which are likewlfe tied to the fuperior part of the fecond

bone of that toe.

- POLLICIS LONGUS MANUS. It rifes from the fore part of the radius, and commonly receives one flip from the coronoid process of the ulna; it forms a tendon which paffes deep under the annular ligament, runs between the two fefamoid bones, over the first and fecond bone, to be inferted into the basis of the third.

- POLLICIS LONGUS PEDIS. I rifes from the pofterior part of the fibula; it passes in a groove between the astragalus and os calcis, is covered by the abductor politicis, and goes between the fesamoid bones, betwixt which is an annular ligament, to be inferted into the the last bone of the great toe. It gives some fibres to the perforans

LONGUS, or perforans pedis: called also Ac-

is called accefforius), and paffing through the flit of the perforatus, its four tendons are inferted into the basis of the last bones of the toes. This muscle receives some sibres from the slexor pollicis longus.

FLEXOR POLLICIS OSSIS PRIMI & SECUNDI. It is a large difgregated muscle, arising from the ligamentum transversale carpi, the bones of the carpus at the basis of the mons lunæ, and the os metacarpi of the middle singer, whence it passes to its insertion into the first and second bones of the thumb. In its tendon, near the insertion into the first bone of the thumb, are placed two sefamoid bones. Its actions are various, as are the directions of the mufcles.

- sublimis, or Perforatus Pedis. Winflow calls it flexor digitorum brevis, and Brown calls it flexor fecundi internedii digiterum. It rifes from the lower and inner part of the os calcis; it is divided in four tendons under the fole of the foot, which are inferted into the

bones of the fecond phalans.

FLORES. FLOWERS. In chemistry they are the most subtil parts of bodies, separated from the more gross, by fublimation in a dry form, and found under the re-fpective name of the material used, as benzoinum, antimonium, &c. Mace is fometimes called the flowers of nutmeg. In botany, fowers are confidered as under the article Flos, which fee. In pharmacy, they are directed to be gathered when moderately expanded, on a clear dry day before noon. Red rofes are taken before they open, and the white heels are clipped off and thrown away. Those fowers that are gathered for keeping should be dried in the shade, but as quickly as possible; in some instances, the place may be warmed by a fire, though the sun is not so conveniently permitted to shine upon them. When the fewers are dried, they must be kept close and dry; if they become damp, expose them to a warm sun until they are dry, and then they do not soon attract moisture from the air. With their scent and colour their virtues go. Considered as an article in the materia medica, it may be observed, that the virtue of different and colour their virtues go. ferent flowers refide in different parts of them; e.g. faffron is a production which rifes fron the ftyle of the flower; it contains all the medicinal qualities of the plant, at leaft all those for which faffron is esteemed; the active part of camomile flowers is in the yellow difk; in roles, lilies, and feveral others, the virtues are in the petala; and the flavour admired in rolemary flower is chiefly in

FLOS. A FLOWER. In botany, it is that part of a plant in which are the parts of generation, and that of both the fexes. In some flowers are the parts proper to one sex only, in others both sexes are included in the same flower. Botanists distinguish the flowers of plants

as follow :

- APETALUS, called APETALI, which fee. Thefe hout petals. They have no other covering on the are without petals. They have no parts of generation but the calyx.

- CAMPANIFORMIS, or cumpaniformis. These flowers are shaped like a bell. Those whose edges spread wide are termed open bell-shaped flowers; but those which are much less spread, are called tubulous bellshaped flowers.

CARYOPHYLLEUS. It is fuch a flower as is

fhaped like a clove gilly-flower.

— compositivs. It is a compound flower com-

posed either of florets, or of semi-florets, or of both together; of this kind is the blue bottle and many others.

— cruciformis. It is composed of four petals, placed in the form of a cross. Of this fort are the cabbage, the wall-flower, and mustard.

— cuccili. See Cardamines.

- FLOSCULOSUS. A flosculous flower. It is competed of feveral florets, included in one common cup. - INFUNDIBULIFORMIS. A funnel-fhaped flower;

of this kind is the primrofe, &c.

just below the poplitzus, and from the interosfeous ligathe beard. Sometimes the crest is wanting, and then the ment; then goes on the inside of the astragalus and os calcis (from whose internal part a short head rises, which bugulæ, &c. Some call this an unilabiated flower. In fome species, the upper lip is turned upwards, as in the ground-ivy; but most commonly the upper lip is convex above, or turns the hollow part down to the under lip, and fo reprefents an helmet, whence they are called

galeate, encullate, and galericulate.

FLOS LILACEUS. A lily-shaped flower. It is generally composed of fix petals, which resemble those of the lily. Of this fort are the talp and the asphodel.

— MONOPETALUS. A flower composed of one leaf. All those flowers whose leaves are joined at the bottom, so that they fall off entire, are termed memopetalous flowers.

- MONOPETALUS ANOMALUS. An irregular flower

confifting of one leaf.

- PAPILIONACEUS. A pea-bloom flower. It is flower which in fome measure refembles a butterfly with its wings expanded; it always confilts of the vexillum, which is a large crect petal, two wings which compose the fides, and the carina, which is a concave petal; this is sometimes entire, at others it consists of two petals

adhering pretty closely together.

—— PERSONATUS. A personated flower. It is an irregular monopetalous flewer, whose upper part resembles the beaks of fowls, such as the toad-slax, &c.

—— PETALODES. A petalous flower. It is a flower

whose organs of generation are furrounded with petals.

— POLYPETALUS. A polypetalous flower is one composed of several petals. When these agree in figure and position, it is called a regular polypetalous flower; but when the petals do not agree in figure and polition, it is called an irregular and polypetalous flower.

—— PYRAMIDALIS Farnefianus. See BATTATAS

CANADENSIS.

Of two parts, viz. the disk and the rays, which are feveral semiflorets fet round the disk in the form of a star, these are called radiated discous flowers; but those which have no such rays are called naked discous flowers.

- ROSACEUS. Rofe-shaped flowers. They con-fift of four or more petals, which are placed circularly

in form of a rofe.

ROTATUS. It is a flower in the form of a wheel;

fuch as those of borrage.

--- SANGUINEUS MONARDI. See NASTURTIUM INDICUM.

indicom.

scorpioides. Those flowers are ranged on one fide of the pedicle, which twifts at the pedictoropium.

semiflosculosus. A femiflofculous flower.

It is composed of several semiflorets, included in one

---- STAMINEUS. It is one which is composed of many chives included in a calyx, having no petals. Of this fort is the biftort, &c.

- sterilis. barren flowers. These have no embryo adhering to them, so are called male flowers.

TERRE. See Coelifolium.

THERE. SEC CORFFORMS.

— VENTRICULATUS. Whorle-shaped flower. These grow closely united, surrounding the stalk at the joints.

— UMBELLATUS. An umbellated flower. It is when the extremity of the stalk, or branch, is divided when the extremity of the traits, or traiten, is divided into feveral pedicles, or rays, beginning from the fame point, and opening in fuch a manner, as to form a kind of inverted cone like an umbrella. When the pedicles, into which the flalk is divided, are fubdivided into others of the fame form upon which the flowers are difposed, the first order is called rays, the second pedicles. That umbel which consists of pedicles only is called a single umbel; that which is composed both of rays and pedicles is bel; that which is composed both of rays and pedicles is

called a compound umbel.

—— URSEOLATUS. Pitcher-shaped flower. Of this fort are the arbutus and whortle-berry.

FLUOR, also flus. This word, when used adjectively, is applied to fignify the habitual fluidity of any sub-LABIATUS. Lip-shaped flower. It is an itance, or that property by which a substance cannot be irregular monopetalous flower, divided commonly into rendered folid; and it is employed as an epithet to distance is the upper is called the crest, and the under one inguish such substances from others of the same kind, but which are habitually folid, or which may be rendered fo: veffels from whence this morbid flux makes its exit; and e.g. a volatile alkali treated with quicklime is always liquid, and cannot be made to concrete or crystallize, fo live menstrual discharges, abortions, violent extraction of is called fluor volatile alkali, to diftinguish it from the the placenta, &c.

concrete and crystallizable volatile alkali

When the word fluor is used substantively, it fignifies a certain kind of stone which is fusible, or which facilitates fusion. Of this kind are most spars, which are called fluors. Mineralogists differ much in describing fluors; but by the word fluor, that kind of flone which we call fpar is generally underflood. Spar appears like cryftal, it is co-lourlefs and pellucid, but not fo bright as cryftal; it commonly rifes in triangular points, and when burnt, it is converted into lime, whereas crystal runs into glass. Spar is the basis of most stones, it is the petrifying matter of all the tribe of animal petrefactions. Springs that are impregnated with spar are diurctic. See Dick. of Chem. Neumann's Chem. Works. As an object of fossiology, the fluor, or the flusses, are anorder in the clases of stones; their characters are, that they are fossile bodies, which strike not fire with steel; effervesce not with acids; very readily are brought into fution, either by themfelves, or when mixed with certain other earths and ftones, efpecially the calcarcous; and more easily brought into fu-fion, under fimilar circumstances, than the fosfil bodies with which they can be confounded. See Edwards's Ele-

ments of Foshlogy. The white flux, commonly called FLUOR ALBUS. The white flux, commonly called the WHITES, also cachenia uterina, leucorrhaa, leucor-rhois. It is a flux of matter from the vagina, which is of different colours and confiftencies, but generally of a pale or whitish colour. Astruc distinguishes this disorder into lymphatic, the femilacteous, and lacteous. Dr. Shebbeare fays, that the fluor albus, the hectic fever, and the diabetes are of the fame general kind, and that they are caused by a defective vital heat in different circumflances. In Dr. Cullen's Nofology it is the menorrhagia alba. See

MENORRHAGIA.

The feat of this diforder feems most probably to be in that part of the uterus next to the os internum, though principally in the vagina. Aftrue fays, that the feat is in the glands about the fundus uteri; these glands he calls eplars a lastra, and says, that when they discharge more than is required by the design of nature in their proper use, this disease is formed. Hossman says, "that in a natural state the uterine exhaling yessels become blood-vessels at the menstrual period, and when their plenitude is regularly discharged, they contract to their former dimension and tones, but when, by immoderate evacuations, or fion and tone; but when, by immoderate evacuations, or other causes, their elastic power is much weakened, they never fully contract, but separate the serous part of the blood, which by its stagnating, or from the particular flate of the body, acquires various degrees of acrimony and confiftence." But as pregnant women are liable to this complaint, it does not appear that this matter in them proceeds from the uterus, except as above observed, from about the os internum; for the spongy chorion firmly ad-heres to its inner surface in almost every part. Some women, it is true, have the menfes returning in every month of pregnancy, which, though deficient both in quantity and quality, yet rather confirms Hoffman's opinion on this fubject, as well as that the vagina may be a principal feat of the discharge.

Women who abound with ferum, those with lax fibres; women at the flower of their age, and girls at the approach of the menfes, are the most subject to this dif-order; though girls of three years old, &c. up to old age, have been its subjects. Hostman observes, that women who are subject to a mucous desluxion at the nose, are upon a suppression of the menses, affected with a fluor

That the immediate cause of a fluor albus is debility of the veffels from which the menstrual discharges are made, or a retarded circulation of the blood through them, appears from some women having always a fluor albus whenever their menses are detained. In some languid habits, the fluor albus returns periodically instead of the proper menstrual evacuation, until the patient's constitution is duly invigorated; and in many instances, the finer albus is manifest only during the absence of the menses, as also from several circumstances observable in the manner of its appearance in different perfons.

The more remote causes are whatever can weaken the

five menstrual discharges, abortions, violent extraction of

From Hippocrates's description of this disease it appears to have a great affinity to a cachexy. He says, that "the matter discharged resembles the white urine of an ass; white swellings appear in the patient's face, the part below the eyes swell, her eyes are difordered, and appear as if the was dropfical; the colour of the fkin is whitish, and the lower part of her belly tumid; in her legs appear tumors fo lax and fo foft, as to retain the impressions of the finger; she perceives a biting pain in the stomach, and seems to seel an acid water sodged in it when she is either fasting or happens to vomit; when she goes up a steep place she is feized with short breathing; her legs are cold, her knees feeble, her uterus is preternaturally opened, and fallen down with a sense of weight to its mouth." In fome, this discharge is daily, and in others, it appears two or three times in a month, and continues each time only a few days; the humour is ferous and limpid in fome, and in others more vifcid; fometimes it is acrid, and occafions an itching, pricking, or even an excoriation; in its greater degrees of virulence, it appears of different shades from the slightest yellow to a green or even a blackish green colour, and it is then more or less fetid. When the case is of a milder kind, the symptoms are often not regarded; but when it is more violent, a cachexy is soon the confequence; then there is a pain and fenfe of weight in the loins, turbid urine, longings and loathings, indi-gestion, swelling of the face in the night, and of the feet in the day, palpitation of the heart, fainting, all which ending in dropfy, or a confumption, proves fatal.

This diforder should be distinguished from a cachexy, a gonorrhoca, pale and ill-coloured menses, and from ulcerations and abfecties in the parts of generation.

If this diforder is moderate it is supported along time.

If this diforder is moderate, it is supported a long time without much inconvenience, but in increased degrees it foon spoils the beauty of a fine face, weakens the digestive powers, and produces a general bad habit; it occasions sterility in some women, and, in more, a disposition to miscarry. If the flux is unseasonably checked, the belly swells, a hectic fever comes on, and a train of the most difagreeable fymptoms follow.

The indications of cure are, to promote digeftion, increase the vital heat, and reftrain the preternatural difcharge; in order to which, the diet should be light, coridial and nourishing; ifinglass dissolved in milk is peculiar arly useful, and so are frequent moderate quantities of red. Port wine. The exercise should be moderate, carefully avoiding fatigue. The state of the stomach must be attended to, and digestion promoted by warm stomachies. The blood will be best improved by warm aromatics,

chalybeates, antimonials, and the bark.

An emetic of ipecacuanha, or of the antimonial kind, may begin the cure, if any symptom attends which may probably be thus relieved. But from the nature of the difease, a speedy cure is not to be expected, if the degree of disorder is considerable; the patient should, therefore, be guarded against impatience at the first onset towards relief; this adverted to, Dr. Cheyne recommends mild mercurials to alter, then chalybeates to invigorate, and at last the bark and cold bathing to finish the cure. See his Cure of the Diseases of the Body and Mind.

In the beginning, warm baths made by fufpending aro-matic herbs in foft water, are very ufeful.

matic herbs in loft water, are very ufetul.

Mild purges, fuch as rhubarb, or, which is yet to be preferred, the ol. ricini; one or other of these should be now and then repeated in gross plethoric habits.

As a mercurial alterative, the following may be used; it neither injures the stomach, nor disturbs the bowels. Re hydrargyri purificati, 3 ii. tereb. Venet. 3 ii. ad hydrarg, fixand. cui adde rhabarb. 3 i. s. cochin. 3 s. elix. prop. q. s. f. massa pillular. Of this such doses may be repeated in the property and morning as the nations can take, without innight and morning as the patient can take, without in-creasing the fensible discharges.

Astringents are univerfally prohibited by Hossman; his

cautions in this respect deserves a peculiar regard.

Injections of water, mixed with small quanties of vinegar are useful at the latter end of the cure. This mixture may be injected up the vagina two or three times

plethora.

Diurctics are peculiarly proper for leffening the ferous last deferves an attentive perusal. Leek's Medical Instructions, edit 5. Wallis's Sydenham.

When the flux is much discoloured and setid, and is fo attended with heat, pain, and ulcers, it is probable FLUXIO. See FLUOR.

FLUXIO. See CATARRHUS. also attended with heat, pain, and ulcers, it is probable that a scirrhus is seated in the uterus, or that a cancer may be formed there; in this fituation, palliatives only can be proposed, such as bleeding once in a month, or at longer periods, as may seem most needful; purging now and then with manna, a milk diet, and narcotics repeated

night and morning. Dr. Leek feems to have well confidered this difeafe, and to have given very ample inftructions for its relief, in his Medical Inftructions. He observes that, the fluor albus, is first, from simple weakness, and relaxation of the solids, which may either be general, where the whole fy-ftem is enervated and unfirung; or partial, where the womb only is thus affected, in confequence of hard labour,

frequent miscarriages, suppression, or immoderate quantity of the menses or sprains of the back.

Weakly women with lax solids, who have had many children, and long laboured under ill health, are, of all others, the most subject to this disease, from which they

fuffer more than others.

Dr. Leck observes that, the discharge proceeds from the veffels subservient to menstruation; because in tender habits, where those veffels are weak, and so remain too long uncontracted, the fluer albus fometimes immediately follows the menses; and goes off by degrees as they gradually close. This discharge also proceeds from the mucous glands of the womb, as is evident in very young females of eight or ten years old, in whom, though rarely, it is observed, and where it must then necessarily have escaped from these parts; the uterine vessels not being fufficiently enlarged for its paffage at fo early a period. fometimes, as in pregnant women, it proceeds from the vagina, and not from the womb itself. The application of peffaries, from the pain of irritation they occasion, are also apt to bring on this discharge: hence it is plain, that this disease may happen, when the blood is in a pure state, and where the fault is in the vessels, or strainers by which the sludes are vitiated and changed from their natural qualities.

The fluor albus is, first, from simple weakness of the folids in general: or, fecondly, of the womb in particular. And Dr. Leek proposes as follows.

And Dr. Leek propotes as follows.

First, Nourishing simple food, such as veal broth, jelly, fresh eggs, milk diet, &c. R rad. sarfaparil. 3 i. s. coq. in aq. fort. ad thi. cola & adde infus. cort. Peruv. thi. extract. cort. Peruv. Moll. 3 s. clix. vitriol acid. gut. 160. m. cap. cochl. vi. bis in die. The same method is proper when the whites follow the menses. Smith's forge-water may be injected into the womb twice a day, the cold both may be used water other day in obligate. the cold bath may be used every other day in obstinate cases. Lime-water with a litle milk may be used for common drink.

Secondly, Where the difcharge is sharp, and of long standing, it is improper to suppress it suddenly, until the the blood is freed from its impurities, and hath recovered its soft and balmy quality of which it hath been deprived. R Infus. suppress in a super liberie R pril c. 3 i. m. bif. 7man. repet. diebus a purg. liberis R pil. merc. Ph. Ed. extr. cicut. 22 3 i. m. f. pil. xx. cap. i. mane nocteque. After this courfe for a few weeks, begin with the following ftrengthening bitter: R puly. cort. Peruv. 3 i. centaur. min. and cort. aurant. rec. aa 3 fs. aq. font. bull. fb i. m. f. infus. cui adde, R gentiana comp. 3 ii. cap. cochl. vi. bis vel ter in die. The fame food and regimen, as in the first case; abstain from malt liquors, drink rice-water, in each pint of which dif-folve gum arabic 3 fs. If weak and of a cold bloated ha-bit, infuf. of faffafras wood, or infuf. of Juniper berries with a little French brandy it, may be the common drink. When the begins with the bitter infusion, at the fame time use chalybeate water for common drink, if it occafions cofficeness or head ach, defiff, and let the drink be imperiale fweetened with manna until the head ach and costiveness are removed.

As to forms for flomachie and chalybeate preparations, Sc. see a sufficient variety in Brook's and the Lon-don Practice of Physic. Cullen's First Lines, vol. iii. p. 24 31. Hamilton's Midwifery, edit. 2. p. 119, 137, 140. Hossman's Differnation on the Fluor Albus. This

FLUXUS. A FLUX. Sometimes it fignifies a defluxion, and in this fense, it is the same as catarrhus. Sometimes it bears a restrained sense, as fuxus ventris, which is a continued evacuation of humid faces, without either a tenefmus or lientery; or a fluxus hepaticus, which is when, from a weaknefs in the liver, the excrements are like water, in which flesh hath been wasted. Hippocrates uses the word pob, fluxus, in his work de Nat. Mu-lieb. of which there are the fluor albus, and fluor ruber, i. e. menfes. Fluxus, justs, is spoken of a falling off the hair. See Trallian, lib. i. cap. 2. In Cullen's Nosology, it is synonymous with Apocenoses, which see.

FOCARIUS. Bread broiled on the hearth or gridiron.
FOCILE MAJUS & MINUS. Feeile, an Arabic

term but a barbarous one. Names formerly given to the ulna and radius in the arm, and to the tibia and fibula,

in the leg.

FOCUS. In metallurgy, Rulandus fays it is a fmelting house. Focus morbi. The focus of a disease is the part where it is fupposed to keep its principal residence, and whence it communicates its noxious influence. Some ancient anatomists gave this name to the first lobe of the

FODINA. A name of the labyrinth of the ear. See

FŒDULA. A species of fungus. FŒNICULI, vel FORNICULATUM LIGNUM. SAS-

FŒNICULUM. FENNEL. Faniculum feems to be a diminutive of fanum, hay; because when withered and dried, it is like hay reposited against winter. Boerhaave mentions eight species

—— vulgare, called also faniculum Germanicum, marathrum, common fincle, or common fennel. The anethum faniculum, or anethum fructibus ovatis. Var. B. Linn.

This plant is fo common on our tables, that its description is here needlefs. Its feeds are fmall and dark-co-loured, being of a blackish brown. The plant is perennial, native in the fouthern parts of Europe, but thrives

in our gardens.

The feeds are warm and pungent, more fo than those of the fweet kind, but they are not fo palatable; the fame difference is observed in the waters and oils obtained from these feeds by distillation, and also in the extracts which are made from them. These seeds are warm and carminative, they are commended against nauseas and loathing, and if eaten in the morning failting they are faid to help the fight.

The leaves have the fame flavour with the feeds, and

fmell stronger; but to the taste are weaker and less agree able. They impregnate water, fufficiently ftrong with their virtues, by diftillation; and by the fame process they afford a confiderable quantity of effential oil. Rectified fpirit of wine extracts an agreeable aromatic from them, which retains the whole itrength, after evapora-

tion, to a proper confiftence.

The roots, taken up in fpring, have a pleafant fweet tafte, are flightly aromatic, and are ranked amongst the

aperient roots.

FOENIC. DULC. SWEET FENNEL. This species of FOENIC. DULC. SWEET FENNEL. This species of plant is annual, a native of warm climes, and cultivated in gardens. It is the anethum faniculum, vel anethum fructibus ovatis, Linn. A variety of the faniculum vulgare. The seeds are larger, paler, and sweeter than those of the common fort; they contain a gross oil, which is easily obtained by pressure, and have been esteemed pectoral and diuretic: but when freed from the essential oil, are perfectly insipid. The London College directs to distil a simple water from the feeds; a pound of these bruised, to draw off a gallon. See Lewis's Mad. Med. Neumann's Chem. Works. Neumann's Chem. Works.

SYLVESTRE. A name of the BASTARD SPIG-MEL. Sec MEUM LATIFOLIUM ADULTERINUM.

TORTUOSUM. See SESELI MASSILIENSE. FŒNUM BURGUNDIACUM. See MEDICA.

- CAMELORUM. See JUNCUS ODORATUS. - GRÆCUM. FENUGREEK. See TRIGONELLA. It is called also bouceras, buceras, epiceras, and is a plant with serrated, roundish leaves; whitish papilionaceous flowers, followed by long, slender, crooked, slattish pods; containing yellowish rhomboidal feeds surrowed from angle to angle; or, as Neuman observes, oblong flattish, quadrangular, and roundish at one end. These seeds are fown annually in the fouth of Europe, from whence they are brought to us.

The feeds only are in ufe, and their prevailing princi-

ple is a mucilaginous matter. An ounce of these seeds renders a pint of water very slimy; their chief use is in emollient cataplasms and fomentations, and in emollient and carminative clysters. See Lewis's Mat. Med. and Neumann's Chem. Works.

FOENUM GRÆCUM SYLVESTRE. See CLAUX VULG.

FŒTABULUM. So M. A. Severinus calls an abf-

cels with a cyft.

FETIDA TINCTURA. See ASA FATIDA.

FŒTUS. Fætus a fovendo vel a coller, coire, or rather fetus, from fee, see Voss. ETYMOL. The young of all viviparous animals whilst in the womb, and of oviparous animals before being hatched: the name is transferred by botanists to the embryos of vegetables. See CONCEPTIO.

In the human fatus are feveral pecularities not to be found in the adult; fome of them are as follow: 1. The ductus, or canalis arteriofus. See ARTERIOSUS DUCcontinuations of the hypogastrics, after the birth are shrivelled up, and form the ligamenta umbilicalia inferiora.

3. The veins of the navel-string, which are formed by the union of all the venal branches in the placenta, and passing into the abdomen, become the falciforn ligament of the liver. 4. The Ductus venosus, which fee. 5. The lungs, which before being inflated with air, are compact and heavy; but after one infpiration they become light, and, as it were, fpongy: and it may be noted here, that the notion of the lungs finking in water before the child breathes, and of their fwimming after the reception of air, are no certain proofs that the child had or had not breathed, much lefs that it was murdered; for the uninflated lungs become specifically lighter than water as foon as any degree of putrefaction takes place in them; and this foon happens after the death of the child: befides, where the utmost care hath been taken to pre-ferve the child, it hath breathed once or twice, and then died. 6. The thymus gland is very large in the fatus, but dwindles away in proportion as years advance. 7. The foramen ovale in the heart of a farius, is generally closed in an adult. 8. The circulation of the blood. See Cir-CULATIO.

On the nutrition of the fatus, fee the Edinb. Med. Effays, vol. ii. They feem to be nourished by a species of

abforption.

The extra uterine factules are generally lodged in the cavity Fallopian tubes; though fometimes they are in the cavity of the abdomen. Whenever they are formed, they point to the anus, or, as now and then happens, to the navel; and by occasioning an irritation and inflammation, an abicets is formed; on the opening of which, a paffage is formed for the child, which generally comes away by piece-meal. See infrances recorded in the Lond. Med. Obf. & Inq. vol. ii. and iii.

As to marks, &c. impressed on the fatus by the force of the mother's imagination, &c. much is said with greater plausibility than fatisfaction on both sides: some things of the kind which are gravely related, are doubtless absurd; but that the whole should be rejected, seems to be very

FOLIACEUM ORNAMENTUM. The fringed fub-flance at the extremity of the tubæ Fallopianæ. FOLIATA TERRA. A name for sulphur after it

the flower of a plant, being a collection of those fine-coa

the flower of a plant, being a collection of those nuc-co-loured leaves which conflitute the compass of the flower: FOLIUM. A LEAF. It is a part of a plant, extended in length and breadth, so as to have one side distinguished from the other. In Latin it is called folium, to distin-guish it from the leaf of a flower, which is called petalum. See Petala. The different kinds of the leaves of plants are thus described by botanists.

- ALATUM. A winged leaf. It is as it were com-

ANGULATUM. An angular leaf: It is when the margin is cut into feveral angles.

- AURICULATUM. An eared leaf. It is one whose base next the pediele is indented, somewhat resembling

- Composition. A compound leaf. It is one which is divided into feveral parts, each refembling a fimple leaf.

- CRENATUM. A crenated leaf. It is one which

is cut about the edges into feveral obtuse segments:

— DIGITATUM. A digitated leaf. It is a compound leaf, divided into several parts, all of which meet together at the tail, so as to resemble a hand.

HEPTAFOLIATUM. An heptafoliated leaf. It is a digitated leaf, confifting of seven singers.

- INTEGRUM. An entire leaf. It is one that hath

no division on the edges.

- LACINIATUM. A jagged leaf. It is one that is cut about the edges into feveral deep portions in an ir-

regular manner.

PENNATUM. A pennated leaf. It is a comcalled a lobe, placed along the middle rib, either alternately or by pairs. When the middle rib is terminated by an odd lobe, it is called an equal pennated leaf. When the lobes are all nearly of the fame form and bignefs, it is called an uniform pennated leaf; when they are not fo. it is termed difform.

— QUINQUEFOLIATUM. A quinquefoliated leaf. It is a digitated leaf, confifting of five fingers.

— RAMOSUM. A ramofe leaf. It is one which is still farther divided than the winged leaf, as is the common or female fern.

—— SAGITTATUM. A spear-shaped leaf. It is one which ends in three sharp angles, resembling a dart.
—— SIMPLEX. A simple leaf. It is one that is not divided to the middle.
—— SINUATUM. A sinuated leaf. It is one that is

cut about the edges into feveral acute fegments, like the teeth of a faw.

- TRIFOLIATUM. A trifoliated leaf. It is a digi-

tated leaf with three fingers.

TRILOBATUM. It is a trilobated leaf. It confifts of three obtufe lobes which are not divided to the

- UMBILICATUM. An umbilicated leaf. It is one that hath the pedicle failened to the backtide of a les; so that on the upper side of the leaf there is a small

cavity formed like a navel.

FOLIUM. It is a name of the philosopher's ftone; also of that triangular membranaceous sinus, where there is a concourse of the sagittal and coronal sutures in infants: it fignifies a relaxed uvula in Arnaldus. And is a term alio for fel. Indum, Malabat vum, Malabatrum, talamabatrum, cardegi Indi, canella Malavarica, carva, canella fylvefiris Malabarica, caten karua, canella Javanensis. WILD CINNAMON-TREES, INDIAN LEAF. The

tree is the laurus cassia of Linn.

The bark of the tree is called cassia lignea, or cortex crassior, also cinnamomum Malabaricum, and is often subtituted for the true cinnamon. It is the produce of the East Indies. Like the cinnamon it is a cordial, but does not poffess its coroborating quality; it is thicker, more woody, and of a redder colour than the true cinnamon; it is less hot to the tafte, and, on chewing, is mucilaginous, by which it is eafily diftinguished from true cinnamon. Chuse that which is small, purplish, eafily broken, fragrant, acrid, sweetish, and mucilaginous when chewed

The leaf, which is called by way of diffinction, folium, is of a firm texture, of an oblong oval shape, pointed at both ends, smooth and glossy on the upper side, and is perfectly prepared by a process mentioned in the Theat. is of a firm texture, of an oblong oval shape, pointed chym. It is also a name for the sal discreticus. It is one of the parts of less so on the under; of a yellowish green colour on the

upper, and of a pale brownish one on the under side, furnished with three ribs running its whole length, very protuberant on the lower fide, and two finaller ones which bound the edges. Both the leaves and their pedicles are very mucilaginous; chewed they render the faliva flimy or glutinous; infused in water, they give out a large quantity of strong tenacious mucilage; but of the aroma, which is strong in the bark, they possess but little. Ray fays, that these leaves are diurctic. See Lewis's Mat. Med.

FOLLICULUS. A follicle, a little bag, called also eryptæ. In surgery, it is a bag which contains the matter of some abscelles and tumors, and the melliceris, &c. In botany, it is the thin involucrum, or membranaceous cover which incloses the feeds of plants. In anatomy it

FOLLICULUS FELLIS. The GALL-BLADDER.

VESICULA FELLIS.

FOLLIS, i. e. FOLLICULUS. It is also the name of a

FOILIS, i. c. FOILICULUS. It is and the name of a large leather bag filled with wind, and used as an exercise by the ancient Romans.

FOMENTATIO. A FOMENTATION; from fomen or foves, neurifhing, or cherishing; also called embroche. To foment is to cherish with heat, to bathe with warm liquors. Fomentations are powders, or dry things in bags; or liquors in a bladder, or fponge, or flannel, and applied warm to a difeased part. See Forus.

FOMES. Fewel. From fovends. When spoken of

difeases, it is the internal or antecedent cause which fo-

ments and continues the difeafe.

FOMES VENTRICULI. A name which the ancients

gave to the SPLEEN. See SPLEN.

FOMITES, Cloaths, &c. receive contagious matter from human bodies, and retain it in an active state for a long time. The substances thus imbibed are called fomires; and many think, that contagion received from them, is more powerful than that arising from human bodies. See Contagio.

FONS CHYMIÆ. The FOUNTAIN of CHEMISTRY.

An epithet of MERCURY.

- PHILOSOPHORUM. The philosopher's fountain.

An epithet of the balneum Mariæ

— PULLANS, vel PULSATILIS. If is the part on children's heads called fontanella.

FONTALE ACETOSUM. In Paracelfus it is the

fame as acidulæ.

FONTALIS MAJOR. BROAD-LEAVED POND-WEED. FONTANELLA. In anatomy, it is the membranous part which is found in new-born infants at the coronal and fagittal commissures, and which, in length of time, hardens into a bone. It is called fons pullans. See Pul-

FONTANELLA, a diminutive of fons, also fontieulus. A little fountain. In furgery, it is metaphorically used to fignify the small aperture called an ISSUE. If yet were made in Hippocrates's time, and have more or lefs maintained their credit down to the prefent age. By iffues, ferum is discharged from the body. It pocrates observed, that ulcers and iffues dry up in the beginning of severs, and experience hath ever confirmed the same: others observe, that when iffues dry up, and become livid or black, some disorder is approaching. The courts where iffues are generally made are. 1. On the courts where iffues are generally made are. parts where iffues are generally made are, 1. On the coronal future, just where it joins the fagittal; but a perpetual blifter on this part is to be preferred. 2dly. The neck. 3dly. The arms, near the the lowest part of the deltoide muscle, in the interstice between it and the biceps muscle. 4thly. Above the knee, on the inside of the thigh, where there is a sinus, which may easily be perceived by the singer. 5thly, Below the knee, on the inside of the leg, where generally a sinus may be perceived. 6thly. On the back, but on all occasions, when these left are found that are found that the second the second that the second that the second that the secon when these last are formed, they would be more useful and less troublesome, if placed above the knee.

The method of making an iffue is, first to mark the part with ink, then the operator and an affiftant having raifed the fkin with their fore-fingers and thumbs, the operator puthes a lancet through the fkin, fo as that an opening may be made into it, large enough to receive a fmall pea; the pea being introduced, it is fecured by a flicking-plafter and bandage; after which, every twentyfour hours a fresh pea muit be replaced, and the old one

thrown away.

Some apply a caustic, and let it continue fix or eight

hours, then cut the efchar and infert a pea.

Inflead of common peas, fome ufe wooden or filter balls to promote the discharge; others take the dried

oranges, called orange peas, or cut pieces of gentian or oris-roots to a proper fize: and

When iffice, or perpetual blifters are difagreeable, a plafter of Burgundy pitch may be worn for fome time with advantage; when it fails to adhere, a fresh one may

be put its place.

If her are formed with great advantage, when we would heal ulcers of long flanding. In many cafes, after the ulcers are healed, the if her may be gradually diminished, as the constitution improves; but even then to dry up the iffue, would not be judicious, as many diffurecable, and fometimes fatal effects have been the confequence; befides there is fo little necessity for running any risque, as we can with advantage chuse the fituation, and thus render its continuance less exceptionable on this subject. See Bell on Ulcers, ed. 4. p. 140. his Surgery, vol. 4. p. 376. 384. White's Surgery, Lera on the Theory of Illues; and Hossman on the same, in the 6th vol. of the fol. edit, of his Works.

FONTICULUS. In furgery; it is the fame as fonto-

FONTINALIS. A fort of mofs with close uniform heads, supported by very short pedicles, and when ripe, they open transcriety in the upper part, and discharge a capitellum.

FORAMEN. An HOLE, from forando, to perferate.

See Os and CAPUT.

FORAMEN CÆCUM. The name of a bele in the middle of the tongue. See LINGUA.

LACERUM. See CAPUT.

—— DALERUM. See CAPUT.

—— OVALE. On examining the heart of a feetus, we find this bole: it is feated under the tuberculum Loweri, and goes through the feptum auriculatum, directly opposed to the vena cava inferiora. After the child is born, and a little grown up, this hole closes up, though in some inflances it remains a little open, even threath ald one. through old age. Sec Con.

FORAMINULENTUM Os, See ETHMOIDES OS. FORCEPS, PINCERS; from formum, or forbum, an ob-folete word, fignifying bot and capere; or from formum

ants; but the only fort which is noted is the

—— MINOR. The ANT, or PISMIRE. This infect
contains an acid juice, which it emits on being irritated: this acid is what most likely occasions the uneafiness on our skins when they are faid to have stung us. A gross oil is obtained by expression from ants, after distilling them in water; and an effectual oil arises with the acid liquor in distillation. The medical qualities of this insect are not known. See Lewis's Mat. Med. Neumann's Chem. Works.

FORMICANS.

FORMICANS. FORMICATING. An epithet be-

flowed by Galen on a low unequal pulse.

FORMIX. 'The fame as noti me tangere; lupus, or

berpes efibitimeness.
FORMULA. A technical term, fpoken of the confitution of medicines, whether fimple or compound, both with respect to their confistence and description. the forms of medicines.

FORNAX, also Furnus. A FURNACE. One principal part of the pharmaceutic apparatus confifts in contrivances for containing and applying fire, and for directing

and regulating its power.

The most simple furnace is the common store, called the furnace for open fire; it consists of an iron hoop and a few bars placed horizontally to support the fire; over it is placed the veilel to be heated, but it refts on a trivet. If a deep hoop is used, and the fire-place communicates

with a chimney, and hath a place below for the aines to thus: when one bone is broken in one place only, and no fall into, and for the air to pass through, it is called a wind-furnace; of the wind-furnaces, some have the chimney over the middle, and others have it on one fide; the first is fometimes used as a reverberatory furnace, in which the flame can be returned upon the furface of the fubject exposed to the fire; the second is used for melting certain materials in crucibles, or for fixing a still, or other vessel which is used for boiling in. There are other kinds of furnaces, which, from their use or form, receive different names. See ATHANOR, BALNEUM ARENÆ, &c.

A commodious portable furnace, for a bufiness of small extent, may be formed also of the larger kind of the common black-lead melting-pots, by cutting a door at the bottom for the ash-pit, and another above this for the fire-place; and introducing a circular iron grate of fuch a fize, that it may reft between the two doors. See more of furnaces in the Dict. of Chem. and in Dr. Lewis's Commercium Philosophico-technicum, part the

FORNICATUS, or fornicated petals, are fuch flower-leaves as are arched, after the manner of the creft of clary or fage.

FORNIX. See ACHICOLUM.

FORNIX. It is part of the corpus callofum in the brain; and is so called, because of a distant resemblance that it hath to the arches of ancient vaults, when viewed in a particular manner. See CEREBRRUM and LYRA. FORTIS, AQUA. It is a name which artifts have

given to the nitrous acid, because of its dissolving power. See Nitrum. It is also called Elephas. In the manufacture of soap, the caustic alkaline lixivium is called also the fireng water.

FOSSA. In anatomy it is the same as fossa navicularis.

It is properly a ditch.

FOSSA AMYNTA. It is a DOUBLE-HEADED ROLLER, about four yards long, and an inch and a half broad. Begin the application at the tip of the note; and crofling at the

neck again, crofs on the nofe, and finish with circulars.

MAGNA. Called also Fossa. See AuriNAVICULARIS. CULA. Also the interior cavity, and rima vel foffa magna of the pudendum muliebre,

which appears on a feparation of the labia.

—— PITUITARIA. See Sella TURCICA.
FOSSILIS SAL. See Sal GEMMÆ.

FOSSILUS. A name of the tibia, also of the fibula. FOTUS. A FOMENTATION. Fomentations are fluids externally applied, ufually as warm as the patient can bear them, and in the following manner: two flannel cloths are dipped into the heated liquor, one of which is wrung as dry as the necessary speed will admit, then immediately applied to the part affected; it lays on until the heat begins to go off, and the other is in readiness to applied to the part affected. ply at the inftant in which the first is removed; thus these sannels are alternately applied, so as to keep the affected part constantly supplied with them warm. This is continued fifteen or twenty minutes, and repeated two or three times a day.

Every intention of relaxation and foothing by fomentations, may be answered as well by warm water alone, as when the whole tribe of emollients are boiled in it; but when difcutients or antifeptics are required, fuch ingredients must be called in as are adapted to that end.

The degree of heat should never exceed that of producing a pleasing sensation; great heat produces effects very opposite to that intended by the use of fomentations. For these applications, Hippocrates, according to Fæsius, make use of the word thermalma.

FOTUS ANODYNUS. Sec ANODYNUM.

FOVEA. In anatomy it is the finus of the pudendum mulicipre. In the bath-rooms it is a fudatory for receiv-ing one or both the legs, in order to fweating. FRACASTORII Species i. e. Pulv. e bolo. See Bo-

FRACTURA. Also called by the Greeks catagma. A FRACTURE. Paulus Ægineta says, that "a fracture is such a separation of a bone as is made by external force." Lib. vi. cap. 89. and thus a fracture is diftinguished from a caries. Dr. Cullen places this genus of difease in the class locales, and order dialyses.

Fractures are differently denominated, according to their different direction; as a transverse, oblique, longitudinal, &c. fracture. The French distinguish fractures

remarkable injury is perceived in the adjacent parts, it is called a fimple fracture; 2dly, when a bone is broken in more parts than one, or when two bones that are joined together, as the radius and ulna, are both broken, it is called a compound fracture; but, 3dly, if with a fracture there is a diflocation or a wound, it is then a complicated fracture.

In fractures, the power of nature is great in producing new bone. The reunion of the separate parts of the bone, is by a renewal of the organical bony structure, and not by a glucy matter, which hardens into what is

called callus.

Frattures are discovered by the eye, the ear, and touch. It is never prudent to promife a speedy cure, because certain accidents may occur, which may for a time pre-vent the re-union of the fractured bones: when this accident happens to pregnant women, a cure is fometimes not effected until after delivery. See an inflance in the Lond. Med. Obf. & In. vol. iv. Hildanus mentions three cafes of this kind. Heifter fays, that a fracture will not heal in a pregnant woman; but this is not always true. A bad habit of body, as when there is a feorbutic or a venereal taint, may prevent the bone from healing; or a caries may retard the union: if a wasting of the limb, or a palfy comes on upon a fractured bone, the cure will be flow, if it is ever effected. If a fracture happens under where an ulcer hath been a long time, it is very difficultly united. A fracture in the cranium, vertebræ, ribs, sternum, os ilium, or os pubis, are danger-ous, on account of the near vicinity of the brain, spinal marrow, or other of the vifcera.

In order to a cure, if called after the tumor or a violent inflammation is come on, the extension must be de-ferred until they are removed; but if these symptoms are flight, proceed to extension, to prevent their increase. If there is a wound, all foreign matters should be re-moved at the first dressing, if possible; all strictures, &c. made easy; if the wound is too small, it should be dilated; and, if possible, this should be done before inflammation comes on, for then the parts become more fenfible. If possible, contrive that the matter may have a depending discharge from the wound, that all danger from absorption may be avoided; but do this without altering the relaxed state of the limb, which is of such import-ance, that hardly any thing should interfere with this particular. If a bone protrudes, it is better to faw off a part than to permit the matter to lodge so as to be abforbed: this operation is but very little trouble to the patient, but the lodging of the matter is extremely fo. a luxation accompanies a fracture, reduce the luxation first, and afterwards proceed with the fracture; though if the fracture is very near the head of the luxated bone, reduce the fracture, and wait its healing before you make any attempt on the luxation.

When a fimple fracture happens, reduce it, and lay the limb eafy; then apply a cataplasm of oatmeal, oil, and vinegar, or, as a substitute a plaster of cerat. alb. The bandage with eighteen tails is the best, both in simple and compound fractures; it is more commodious than the roller, as it allows of viewing the limb without dif-turbing it. At the conclusion, if the leg is cedematous, the laced flocking is the beft; and rubbing it daily with a flannel, or a flesh-brush, will restore the plumpness of

the calf.

Compound fractures are often attended with mortification; but this fhould not always haften to amputation. As foon as any tendency to this fymptom appears, make use of an antiseptic fomentation in which sal ammon. is dissolved; dress the wound twice a day, and wrap the part up with the catap cumin; then apply bladders of warm water, one third or half full, to keep up a proper warmth from drefling to drefling; befides thefe, give the bark joined with rhubarb; in fome cafes the bark fould be given with nitre, and in others with camphor, volatiles, and fnake-root. Inflances deviating from this advice are as follow:

When amputation feems necessary, confider, whether, if amputation is omitted, life will not be endangered. It is impossible in some instances to know immediately whether a limb can be faved or not. However, when a bone or bones are broken into many pieces, and that to a confiderable extent, as often happens from cannon-shot,

5 B

broad wheels of caariages, &c. passing over or falling on a limb, the fost parts being so torn and bruised, as to rendered a mortification of the part the most probable and the most proper aid and that mishout host of time. If the der a mortification of the part the most probable and the most immediate consequence, amputation will be the most proper aid, and that without loss of time.—If the ends of a bone, or two bones, by which a joint is formed be crushed, and the ligaments which hake a part of the joint are considerably injured, another instance occurs in which amputation cannot with propriety be deferred.—Some instances of compound frastures require speedy amputation: all who die from this cause, die of an inflammation seizing the limb tending to a gangrene; this panyrene makes a rapid progress along the cellular mempangrene makes a rapid progress along the cellular mem-brane to the vital parts, and destroys before nature can acco nplish, a separation, or art stop its career; therefore, instead of waiting for a separation of the mortified from the sound part, or instead of waiting two or three days to try what art can do, proceed immediately to the separa-tion. To wait in this case, is to lose all opportunity of faving life, except perhaps in an instance of one in fifty, taving life, except perhaps in an inflance of one in fifty, a disproportion too great to admit of any hesitation. A very short time makes all the difference between probable safety and fatality. If in a compound fradure this just named inflammation hath taken place, and hath continued some hours, amputation would surely destroy; the only chance then, is to use such antiphlogistic regimen, &c. as appears to be indicated, and when these have no farther use, then support the patients with cordiols, the bark, &c.—Again, inflammation may not run high, yet frequently there are lodgments of matter, and thols, the bark, &c.—Again, inflammation may not run high, yet frequently there are lodgments of matter, and after feveral openings, fresh collections are formed; the patient, instead of being recruited, wastes by the discharge, he hath night-sweats, loss of appetite, &c. In these cases the bone continues difunited, and amputation at last is necessary. Mr. Pott observes, that in compound fractures, there are three points of time in which amputation may become necessary. may become necessary. 1. Immediately, or as soon as may be after the receiving of the injury. 2. When the bones continue a considerable length of time without any manifest disposition to unite, and the discharge from the wound is such that the patient's strength fails, and general symptoms of dissolution approach. 3. When a mortification shall have taken such complete possession of the inferior part of the limb, quite down to the bone, that upon feparation of fuch parts, the bone or bones shall be left bare in the interspace. The first and second of these are matters of serious confideration; the third hardly requires any. The necessity of early amputation in the above cases where it is thus urged, arises from the dread of the ill effects of a greatly obstructed circulation, owing to a large destruction of vessels; these added to those arising from pain, irritation, and the admission of air, often produce a great degree of severand-instance. air, often produce a great degree of fever and inflamma-tion, which hurries on quickly to a gangrene and death; and if a joint is injured, the danger is increased. If poffible then, determine for the operation before inflamma-tion approaches; for if this fymptom, with irritation and tension, have taken place, the operation will be too late. In the fecond instance, with respect to the point of time for amputation, the patient or his friends must determine it; for with the furgeon it is not a matter of choice, but of abfolute necessity. In the third instance, with respect to the point of time, it requires no consideration; for if the foft parts are destroyed down to the bone or bones, either the furgeon must faw them, or they must be lest to feparate. In either case, the patient loses his limb. These are some of the principal instances which determine in favour of amputation; experience, and the fe-veral authors who have writ well on this fubject, will fuggeft more, and amongst these may be consulted Pott's Works, quarto edition; also, by the same author, a pamphlet entitled, Remarks on the Necessity, &c. of Amputation in certain Cases, &c. See Gooch's Works. Obs. or Mr. Pott's General Remarks on Fractures, by Thomas Kirkland, Surgeon, and the Systems of Surgery, &c. by Bell, Dease, Kirkland, &c.

### FRACTURE of the Carpus.

These bones are small, and rarely broken; and when they are, they cannot be properly replaced, nor will they confolidate. Befides, the ligament and tendons are for much bruifed, that in confequence thereof, the joint of fiderable amputation is most adviseable; but if you can form the next proceed as follows: having placed the free

Surgery, p. 145.

#### FRACTURE of the Clavicle.

Whatever part of the clavicle is broken, the part which joins the fcapula defeends below that part which is fixed to the sternum, on account of the weight of the arm. When this bone is fractured, the patient cannot lift up his arm; it hangs inclined towards his breaft, and in a flight motion of the humerus the fradure in the clavicle will be evident to the touch, fight, or ear, or them all. To reduce this fracture is cafy, but to retain the bones in their proper fituation is more difficult. An affiftant should place his knee between the scapulæ of the patient, then with his two hands draw the shoulders back; thus the clavicles will be extended; the furgeon standing before the patient, must then reduce the ends of the bone, by raifing the arm to its proper fituation, instead of load-ing the other end next the sternum, with compresses to bring down the rifing end of the bone, as they call it, which is only fo from the other being carried below it by the weight of the arm: this done, apply above and be-low the clavicles a narrow, but thick boilter to fill up the cavities; upon these lay two narrow bolsters, in the form of the letter X; over these place a piece of thick paper moiltened with vinegar; then put a wad of tow, or a ball made of fost rags, under the arm-pit, next to where the fracture is, for the support of the shoulder; after this apply the bandage, so as to keep the fractured ends from moving; and, lastly, suspend the arm in a sling fixed about the neck. See Bell's Surgery, vol. vi. p. 59. White's Surgery, p. 138.

### FRACTURE of the Cubit.

The cubit hath two bones, viz. the radius and ulna. Fractures here are discovered by the fight, touch, and ear: by the touch and fight, by moving the hand of the affected cubit inward and outward; though a fractured ulna, from its inability to support the joint, will shew itself sooner than that of the radius: the ear discovers a grating noise, if the elbow is held steady, and the hand is moved inward and outward.

If the radius is to be reduced, and the fragments have receded towards the ulna, an affiftant should stretch the arm, and the furgeon should press down the patient's hand towards the ulna, until the depressed part is elevated; after this, compress the arm on each side with the palms of the hand, so as to restore the compressed muscles between the ulna and radius, and the fragments of the radius to their natural polition; then lay a compress and strong pasteboard upon the fore-part of the arm, over the quadratus muscle, to prevent it drawing the fractured bone toward the sound one; after which, apply the circular bandage, and suspend the arm in a sling, with the hand in a prone fituation.

If the ulna is fractured, proceed as when the accident happens to the radius; only remember to turn the hand towards the radius, until the depressed part of the ulna has recovered its former polition.

If both these bones are broken, proceed, as with either of them fingly. Mr. Pott observes in this case, that it is necessary to put the longitudinal compresses as near as may be betwixt the bones, in order to prevent the callus uniting them, which would hinder the rotatory motion of the arm.

It often happens in fractures of this part, that, not-withflanding all possible care, a stiff joint follows; there-fore, though (in this particular instance, and in the pa-tella) keeping the whole limb strait relaxes the particular muscles of the bones; yet if a stiff joint is to be feared, as foon as ever the benefits from relaxation are over, gently bend the limb. A stiff bent cubit being much more useful than a strait one. See Lond. Med. Jour. vol. i. p. 356. Edin. Med. Com. vol. ix. p. 382. White's Surgery, b. iv. Bell's Surgery, vol. vi. p. 84.

#### A FRACTURED Finger.

the hand becomes rigid; and ableeffes, fiftulas, and caries, fave the part proceed as follows; having placed the frac-

tured bone properly, and reduced the fragments, roll it up with a narrow filler to the next finger. Begin the bandage about the wrift, carry it over the back of the back of the bandage about the wrift, carry it over the back of the tured, carry it round each separately, and then round them all; then put a ball into the hand, and bind it tight to the singers; after which continue the roller back to the wrift, and finish by placing the hand in a fling. Bell's Surgery, vol. vi. p. 93. White's Surgery, p. 145.

#### FRACTURE in the Foot.

Fractures in the tarfus, metatarfus, and toes, are generally accompanied with wounds from the contusion of the nerves, tendons, ligaments, and membranes. They are cured much in the same manner as those of the carpus, metacarpus, and singers. Fractures in this part, as well as in the hand and leg near the ankle, especially when the malleolus recedes from the principal bone, feldom admit of fo complete a cure as to leave the limb free from fome inconvenience. Bell's Surgery, vol. vi. p. 130.

#### A FRACTURED HUMERUS.

If this bone is fractured in the middle, no great difficulty attends; but if near the superior and anterior head, both pain and danger are foretimes prefent. To reduce this fraBure, place the patient in a chair; his elbow being bent, let an affiftant fleadily grafp the fractured bone at its lower end, and another affiltant to the same a little below the shoulder; then the arm being extended gently, the operator takes the fractured part in his hand, and as foon as the extention is fufficient, theb one being thereby replaced, he applies the baudage, and continues by hanging the fore arm in a fling.
It fometimes happens that when the case is an oblique

fracture, the tharp end of the bone is so intangled in the adjacent muscles as to prevent a re-union; but an incision being made upon them, and the point fawed off, makes way for an eafy replacing them, and a fpeedy cure. See an inflance in the Med. Muf. vol. ii. p. 404, &c. See Bell's Surgery, vol. vi. p. 79. White's Surgery, p. 143.

### FRACTURED Jaws.

When fractures of the upper jaw stretch towards the eyes, the consequent inflammation is often dangerous; and when they penetrate the antrum, they are generally and when they penetrate the antrum, they are generally tedious and occasion much deformity. Replace the fractured bones with the fingers, when there is no wound; or with forceps or a narrow scapula when the parts are laid open; and a piece of adhesive plaster is the best for restraining the dressings. Bleeding, and an antiphlogistic regimen must be advised to obviate inflammation of the eye and contiguous parts. The reunion of fractured parts must be left to nature.

When the lower jaw is fractured, and its situation is afcertained, replace the bones carefully; which may be

afcertained, replace the bones carefully; which may be done by placing the patient in a proper light, with his head well fecured, and the fingers of one hand preffing upon the infide of the jaw, while the other hand is employed externally in guarding against any perceptible inequality of the bone. If a tooth is scated in the course of the fracture, extract it immediately; but if a tooth not sected in the course of the fracture. tooth, not feated in the course of the fracture, is forced out of its focket, replace it if you can, and fix it by tying it to the contiguous firm teeth. This done endeavour to retain the fractured bones in a proper fituation till they are firmly reunited. For this end, the best means are a compress and bandage of soft old linen or cotton. The parts being kept firm by an affiftant, a thick comprefs should be laid over the chin, and made to extend from ear to ear along each jaw; and over the whole a four-headed roller should be applied. Liquid diet is best until the cure is performed. See Bell's Surgery, vol. vi. p. 52. 58. White's Surgery, p. 137.

## A FRACTURED Knee-Pan.

When a fmall fragment of the patella is attracted upwards, if the patient is fat, it is not very easy to discover this case. In fearching to know whether or no the patella is broken do not bend the knee, because you separate the fragments thereby farther from each other, and occasion unnecessary pain. This bone is generally broken transversely, the lower part remains fixed to the knee, but the

of the bones approach within an inch of each other; in this fituation retain them by a compress and bandage. The fractured parts should never be brought close together, for thus a stiff joint should be occasioned.

Sometimes the ligament which fecures the kneespan to the tibia is broken, and this case is mistaken for a fracture of the knee-pan; however, the mistake is not of much consequence, as the prognostics and method of cure are the same. See Warner's Cases of Surgery; Med. Mus. vol. iii. p. 349, &c. Bell's Surgery, vol. vi. p. 111. White's Surgery, p. 147.

## A FRACTURED Legs

In the leg there are two bones, viz. the tibia and the fibula. The tibia is generally fractured near its lower extremity, where it is weakeft; and often, when the tibia is broken the fibula fuffers the fame at its upper extremity. When there is a diflocation of the maleolus in-ternus, the fibula is commonly fractured, and has occa-

A fractured fibula feldom gives any uncafinefs or himders from walking; however, it may be discovered by taking hold of the leg under the fura with one hand, and with the other moving the foot; for thus the hand which holds the leg will diffinguish the fracture. Mr. Pott fays that in this case a tight bandage upon the fractured part is not to be admitted: but that if it is applied to the two extremities, the broken end will be brought into contact, and thus a cure will be effected.

When the tibia is fractured lay the patient on the injured fide on a flat furface, and raife the knee on the frac-tured limb towards the abdomen, at the fame time bending the joint of the knee; thus the extensor muscles of the foot are relaxed, and thus the extension required for the reduction will be performed with ease. Having replaced the fractured bone, apply a long splint padded with tow to the sibila, and another on the inside of the leg and over part of the tibia, and fecure them with straps. The patient may lay on the injured side during the cure, and thus a cradle or fracture-box will be needless; the knee may also continue in the same posture as that in which the fracture was reduced.

There is an important difference attends a fradure from gun-shot, and the like accident from any other cause. For example, in case the tibia is fractured at its lower end by a gun-shot, although the part of the tibia above is apparently unhurt, yet if the amputation is not performed above the next joint, the patient will lose his life; the limb in this case must be taken off above the knee. Though if any other cause had produced the like fradure, the operation would have been performed below the knee. Bell's Surgery, vol. vi. p. 121. White's Surgery, p. 149.

A FRACTURED Metacarpus. An affiftant may extend the fractured hand upon a fmooth table, while the furgeon with his fingers endeavours to replace the fragments. White's Surgery, p. 145.

## A FRACTURED Neck.

What is called a broken neck is as follows: the processus dentatus of the second vertebra is tied to the skull by a ligament, and kept close to the fore part of the first by a ligarity and expected to the fore part of the first vertebra by another in that vertebra, that it may not bruise the spinal marrow; and when either this ligament or process is broken, it makes that fort of broken neck whose consequence is sudden death.

## A FRACTURES of the Noice

Both the bones and the cartilages are liable to be If the bones are broken, the nofe appears flat where the fracture is; and if the cartilage is the fuffering part, the nofe leans to one fide. If the injury is confiderable, the cure is incomplete; and from the nearness of this part to the brain, the danger is confiderable; an ozena, a caries, or a polypus, may be the confequence. In order to a cure, place the patient in a reclining posture, and elevate the depressed parts of the nose with a quill, unnecessary pain. This bone is generally broken trans-versely, the lower part remains fixed to the knee, but the apper is drawn by the muscles on the fore part of the

with difficulty, remove it. When the bones are reduced they do not easily feparate again. Mr. Bell fays, any portion of bone that is quite loofe, and nearly feparated from the rest, should be removed immediately, whether it be raised up, or forced into the nostril; but whatever adheres to the remaining portion of bone, with much firmness, should be replaced: See Bell's Surgery, vol. vi. p. 49. See White's Surgery, p. 137.

## A FRACTURED Os Innominatum.

When this accident happens there is great danger, effectially if the patient vomits a brown or bloody matter. In reducing this kind of fracture, the patient must lie on the found fide; the fractured parts must be restored by the furgeon's hands alone; then compresses dipped in rectified spirit of wine must be secured by means of the spica bandage. See White's Surgery, p. 143.

## A FRACTURE of the Os Sacrum and Os Coccyx.

It is discovered by the pain perceived in the part, and by the touch. Endeavour to reduce the fragment with your fingers, but if it be depressed inwardly, pare the nail of your fore-finger pretty close, then greafe and introduce the finger into the intestinum rectum, and thus the de-pressed part may easily be replaced; this done, the T bandage may be applied over a proper compress; the pa-tient must be directed to keep his bed for two or three weeks, and when he turns from one side to the other let him turn over his belly; when he rifes, the properest seat will be a bottomless chair. See Bell's Surgery, vol. vi. p. 74. White's Surgery, p. 143.

## FRACTURES of the Ribs.

When the ribs are broken, and their ends recede from each other, when they project outward, no confiderable damages enfue; but if they prefs inward, they produce an uneasy pricking, inflammation, cough, fever, an ab-feels, or spitting of blood, &c. In order to the cure, it is generally completed by applying an exact uniform cir-cular compreflive bandage, if neither inflammation nor fwelling forbid; if these fymptoms attend, reduce them by bleeding, &c. then the bandage and a cooling diet will succeed. See Bell's Surgery, vol. vi. p. 63. White's Surgery, p. 140.

#### A FRACTURE of the Scapula.

If the acromion is broken, it is eafily reduced with the fingers, if the os humeri is raifed upwards a little; but it is to difficultly retained that those patients feldom can lift up their arms afterwards freely: after the reduction put a compress on it and a ball under the arm-pit; apply the

bandage, and put the arm in a fling.

If the neck of the feapula, which is below the acromion, or the acetabulum, be broken, the accident is not eafily difcovered; but a stiffness of the joint, an inflammation, an abfeefs, or other bad fymptoms follow.

All other fractures of this bone are lefs hazardous, and to reduce them an affiftant should extend the arm forward, whilft the furgeon, in the best manner he can, is employed in restoring the fragments with his hands, laying thereon compresses, and past-board splints, and securing all with the fascia stellata, or quadriga. See Bell's Surgery, vol. vi. p. 76. White's Surgery, p. 140.

## Fractura Cranii. FRACTURE of the Skull.

When from an injury done to the head by external vio-lence, there follows a lofs of fpeech, and of fense, a le-thargy, convulsions, &c. as these signs may be the effect of an extravasasion of matter on the brain, of a concussion thereof, as well as of a fracture, no certain conclusions can be made therefrom: for certainty, you must proceed to incision upon the part where the injury was received: if upon making an incision you find the pericranium loose you may certainly conclude there is a fracture. In examining for a fracture, care is required to distinguish it from a future, particularly the uncommon ones, as those about the offa triquetre; however, if upon scalping we find the perieranium firmly adhering to any part that re-fembles a fracture, we may be affured that there is a future,

if there is no wound, a plaster may suffice to secure the whole; and if there is a wound, treat it as if on any other part. If a splinter is so fituated as not to be re-united but cranium under your singer to be loose, a fracture is

clearly the case.

When a fracture happens on the skull, the trepan is immediately used by some surgeons with a view to obviate or prevent the effects of such a degree of violence, as hath fractured the skull; but others of the first rank in eminence forbid its use, except when a part of the skull is depressed. Celsus advises not to proceed to an operation before the approach of unfavourable fymptoms, and Ruysch says, that "when the symptoms are not augmented, we are not proceed to incision and perforation, but, after bleeding, we are to attempt the cure by often repeated application of warm cephalic fomentations." Agreeable to these is the advice and practice of Mr. Bromfield, when a concussion of the brain happens. See Concussio. The fame proceeding is equally proper in case of a fracture. See White's Surgery, p. 211.

#### A FRACTURED Sternum.

After a depression or a fracture the part is in pain; this accident is also known by the bone grating if moved by the fingers, and by its moving in consequence of a little pressure against it; though the proper indication is a manifest suns or inequality in the part.

The latent vessels in the sternum are broken, from whence proceed pains in the breast, dissiculty of breathing, violent cough, spitting of blood, extravasations of blood on the precordia, or within the mediastinum, with other

dangerous fymptoms. To reduce this kind of fratture, lay the patient on his back over fome hard pillows, that his shoulders may be depressed and the breast elevated; the operator must then press forcibly, and with some violence shake each side of the breaft, for thus the ribs are extended and the fternum pushed forward. If this fails, make a crucial incision into the skin, and elevate the depressed part of the sternum with a terebra gently screwed into the part.

After the reduction the napkin and fcapulary may be

applied to keep the thorax firm.

Mr. Bell fays, in the fixth vol. of his Surgery, page 67, &c. that, "In some cases, it is fractured without being displaced; in others, it is not only broke, but at the same time beat in upon the pleura. When it therefore have not the them. fore happens that the pain, cough, oppreffed breathing, and other fymptoms, do not yield to blood-letting and other parts of an antiphlogistic course, some other method of cure should be attempted. An incision should be made upon the injured part, of a fufficient length to admit of a free examination of the bone; when the depreffed piece may be raifed either with a common fealpel or a levator, if there be an opening that will admit an instrument; or when this is not practicable, an opening may be made for this purpose with the trepan. If the operation be per-formed with caution, the bone may be raised with safety; and this being done, the fore must be treated in the usual way. See White's Surgery, p. 139.

## A FRACTURE of the Thigh.

Hippocrates justly observes, that when either the bone of the humerus, or of the thigh, breaks inwardly, a worse train of symptoms follow than when the same happens outwardly, because of the vessels and nerves that

are lodged in their inner parts.

When the thigh is fractured in its middle or lower part, its restitution may be effected by the hand, but when the accident happens on the upper part a greater force is generally required. Wherever the feat of the fracture is, the polition of the patient, and of the limb to be reduced, should be ordered as in the case of a fractured leg; then a due extension being made, and the ends of the fractured bone replaced, spirits, properly padded with tow, must be secured; and if Gooch's machine for fractures of the thigh-bone is made use of, little more than patience will be required in order to the cure; but in want of this machine, the position proposed when the leg is fractured may be trusted to, and that particularly when

the neck of the thigh is the feat of the diforder.

When a fragure of the thigh is complicated with a wound, it is dangerous, and fometimes incurable. Happening near the joints it is ufually fatal, as the large blood-vessels are then too frequently lacerated. The dan-

and taking up the wounded veffel, the fracture may then be reduced; but if the bone is much injured, and the hamorthage violent, amputation is usually the most eligible method.

A fracture of the neck of the thigh-bone is fometimes mistaken for a luxation, but it is more easy to break than to luxate this bone, and fractures in its neck are more frequent than in its other parts. A fracture in the neck of this bone is both more difficultly reduced and retained than in the body of it, and a lameness usually follows the re-union. The oblique direction of the neck, with the quantity and strength of the muscles, are the causes of

The figns of this kind of fracture are, according to Gooch, "The thigh and knee turning outwards, the limb is much shortened, and considerably shrunk, pain in the course of the fartorius muscle, which, from its origin and insertion, must frequently be put upon the stretch, often causing pain on the inside just below the knee, and a crepitus is observed when the patient moves his limb."

When these symptoms appear, the limb being gently but steadily extended until the fractured limb appears as long as the found one, let the patient be laid in the posture recommended when the leg is the part thus affected, and let bleeding, &c. be employed to prevent or to remove imflammation. If Gooch's extending machine could be obtained, its use would be the most eligible method for preventing future inconveniences. Bell's Surgery, vol. vi. p. 95. White's Surgery, p. 146.

### FRACTURES of the Vertebræ.

When any of the vertebræ are fractured without affecting the fpinal marrow, then there are only the posterior apophyses, or acute tubercles injured, and they are not dangerous. When these parts only are fractured, replace them with your fingers, and apply on each fide the Ipina dorfi, narrow compresses moistened with spirit of wine, and fecure them with pafteboard fplints, and the napkin

Fractures in these parts are easily known by the pain there, as also on slightly touching them.

If the transverse apophyses which tend towards the cavity of the thorax are broken, then the heads of the ribs which are inserted into them will likewise be broken, and

much danger attends this cafe. When the body of a vertebra is broken, the fpinal marrow is injured; then the parts of the arms, vifcera, or legs which are below them, become immediately motionless, and death is sooner or later the consequence. In this case, not to seem either negligent or ignorant, lay the injured part bare, elevate the fragments which press the medulla, and if loose extract them; then clean the wound, and dress with balfamics as long as life continues. See Boerhaave's Aphorifins, the English translation, p. 84. 88. Petit on the Diseases of the Bones; Aitkin's Treatife on Fractures; Pott's general Remarks on Fractures, and Kirkland's Observations on the same: and for machines to be used after the reduction of fractures, see Gooch's Cases and Remarks. Bell's Surgery, vol. vi. p. 71. White's Surgery, p. 142.

FRÆNUM. See Ligamentum annulare. The term is also applied to the membranous ligament under the tongue; and also to that under the penis which ties.

the tongue; and also to that under the penis which ties

the prepuce to the glans. See PENIS LINGUA.

FRAGA. The STRAWBERRY. See ARBUTUS. Bocr-FRAGA. The STRAWBERRY. See ARBUTUS. Boerhaave mentions fix species. The common wood firauberry is the most agreeable, slowers in May, and the fruit ripens in June. Strauberries are apt to putrify in the stomach; hence the custom of eating them with sugar and wine. A decoction of the whole plant is used against the jaundice.

FRAGARIA. See Arbutus.

FRAGARIA PENTAPHYLLI FRUCTU. A species of FRAGAROIDES. BARREN STRAWBERRIES. See

FRAGIFERA. MAJOR & MINOR. See CHENOPO-PRAGILITAS OSSIUM, also called friabilitas offium.

ger is not much less if the wound is on the back part of It consists in a too great redundance of the earthy printing the thigh, because of the difficulty of dressing it. FRANCOLIN. See ATTAGEN.
FRANGULA. See ALNUS MIGRA.
FRAXINELLA. See DICTAMNUS ALBUS.
FRAXINUS, called alfo bumelia. The ASH-TREE. It is the fraxinus excelsior. Linn. It is a tall tree com-mon in woods and hedges. Its bark is whitish; the feeds are oblong, reddish, or brownish-coloured, shaped somewhat like a bird's tongue, whence their name lingua avis, ornithogloffum, &c.

The fresh bark is bitterish and astringent, but loses much in drying. In dofes of a dram it is diuretic, and the watery extract hath the fame effect. The middle bark hath been useful in intermitting fevers, when affifted

by alkaline faits.

The feeds called lingua avis, from their being fhaped like a bird's tongue; are diuretic, healing, and drying. Their dose is a dram or more. Raii Hift. Lewis's Mat. Med. That called

- ORNUS, is the species on the surface of which manna exudes and concretes. Cullen's Mat. Med.

FRENA. A name for the fockets of the teeth. FRIABILITAS OSSIUM. See FRAGILITAS.

FRICTA. BLACK ROSIN.
FIRCTIO. RUBBING. Friction of the body upon its whole furface, if duly repeated, will do more in the recovery of health, and towards the fupport of it, than is generally and towards the fupport of it. nerally apprehended; it promotes perspiration, quickens the circulation, and opens the finer vessels through which those discharges are made, on which health and vigour much depend. Fridion contributes not only to
the conveyance of medicines into the body, but also to
their action and usefulness there, when introduced.
This means of health is best used when the prime vize are most empty, when the chylopoetic organs are too lan-guid. Fristions with rough cloths over the whole belly when the patient is fasting, produces advantageous effects. Gentle fridien with pinguious fubflances relax; but ftrong fridien with rough dry cloths ftrengthen.

FRIESEL. So the Germans call the miliary fever.
See MILIARIS FEBRIS.

FRIGIDARIUM. A veffel in the baths for holding cold water. Also the cold bath itself.
FRIGERARIA. The PUTRID FEVER. See PUTRIDA

FRIGUS. Cold. In Vogel's Nofology, it fignifies the coldness of the feet and hands. Cold is faid by fome to be a privation of heat; but heat and cold are only the names of certain fenfations in living animal bodies; and the fenfe of coldness is produced by bodies which exift, and that are the subjects of the sense in the same degree as are those which produce the sense of coldness and extin Many fubstances excite the fense of coldness, and extinguish fire itself; and a greater degree of artificial cold making matter is produced by a mixture of the spirit of nitre with powdered ice, than nature manifelts in any inflance. See the process by which professor Braun produced an artificial cold, and by which quickssiver was so frozen as to become malleable, in the Med. Mus. vol. i. p. 123, &c.
The effect of cold on our bodies. See Congelatus.

FRITTA. FRITT. It is a mass of salt and ashes concreted to the sand, by the cold, in making of glass. FRONDIPORA. A submarine plant, called Escha-

RA, which fee.
FRONS. The FOREHEAD. It is that part which is

FRONS. The FOREHEAD. It is that part which is above the eyes, deflitute of hair, and that reaches from one temple to the other.

FRONTALE. A name for any topical medicine which is applied to the forchead; fee CATAPLASMA: but particularly it means a linen bag, in which cephalic ingredients are tied up, in order to be applied to the forchead. See EPITHEMA.

FRONTALIS, Museulus. The frontal muscle, also Called corrugator coiterii. It rifes thin, broad, and fleshy, from the upper part of the

the os frontis near the futura coronalis, and defcending by the posterior and forepart of the temporalis, meets with its partner near their infertions to the fkin of the eye-brows. They wrinkle the fkin of the forchead.

FRONTALIS NERVUS. The fifth pair of nerves from the brain fends off its first branch called orbitarius, & ramus fuperior, which is subdivided into three, the first of which subdivisions is the frontal; it spreads on the upper part of the orbit of the eye, to the fat which surrounds the globe of the eye, the musculus elevator pal-

pebræ, &c.

- Sinus. The FRONTAL SINUS. There are two of these, one on each side of the nose. They are formed of the separated laminæ of the os frontis; they are placed above the orbits at the bottom of the os frontis on each fide the top of the nofe; they are lined with the fame membrane which lines the notirils, and they open into them. Sometimes they are wanting.

VENA. It is a branch from the external jugular,

forming a vein in the forehead.

FRONTIS, Os. The BONE of the FOREHEAD; called also coronale os, inverecundum. The external furface of this bone is smooth at its upper convex part, but below, feveral cavities and processes are observed. At each angle of the orbit the bone jets out to form two each angle of the orbit the bone jets out to term the internal and two external processes. The ridge which makes the supercilium, is called the superciliary process. The procession malalis, nasal process, is situated between the two internal angular processes. The two orbiter processes are continuations of the superciliary. There is a ceffes are continuations of the fuperciliary. There is a notch between these for the reception of the ethmoid bone. At the internal angular process there is a cavity, where the glandula lachrymalis is lodged; at the external angular process there is another cavity for the pulley of the musculus obliquus major. The foramina are three on each fide; one in each fuperciliary ridge, through which a nerve, vein, and artery, pass to the teguments, &c. of the forehead. Near the middle of the internal fide of the orbit, in the transverse future, or near it, is a fmall hole called orbiter internus: the orbiter internus posterior is smaller, and lays about an inch deeper in the orbit. On the inside of the os frontis there is a ridge, which, on the the upper part, is inperceptible, and grows more prominent at the bottom, where there is a foramen execum; to this ridge the falx is attached. The frontal finus is placed over the orbits, and is divided by the fep-

tum just described. FRUCTUS. FRUIT. Properly it is the part of a plant wherein the feed is contained, but in general it is any feed or grain covered or uncovered, but with the coverings when there are any. The chemists call metals

the fruits of the earth.

FRUCTUS UMBILICATUS. Umbilicated fruit. It is that which had the other parts of the flower growing on its top when it was an ovary. They utually form a cavity, when it is known by the name of the umbilicus, or navel, as in the medlar, rofe, &c.

FRUMENTACEUS. A term applied to all fuch plants as have a conformity with wheat, with refpect

either to their fruit, leaves, ears, or the like.
FRUMENTUM. CORN. It is fpontaneous in no climate, but industry raises it in all. They are a species of grafs in their primitive state, whose seed are improved by culture. A name given also to wheat. See Tra-TICUM.

FRUMENTUM CORRUPTUM. So Tacitus calls MALT.

INDICUM. MAYS, OT MAIZE.
 SARACENICUM. See FAGOPYRUM.
 TURCICUM. MAYS, OT MAIZE.
FRUTEX. A SHRUB. It is a plant with many woody

perennial trunks, fuch as rofes, fyringos, &c. which di-vide into feveral ftems near the ground; but the word is generally used by gardeners for all woody plants of low growth.

FRUTEX ÆTHIOPICUS. A name for the clutia, and a

fpecies of conacarpodendron.

- AFRICANUS CONIFER. A name for feveral fpecies of conscarpodendron and lepidocarpodendron.

- AFRICANUS AMBARUM SPIRANS. See COMA

- BACCIFER BRASILIENSIS. See CAAGUIYUYO. - CORONARIUS. A name of the fyringa alba. WHITE LILAC.

FRUTEX INDICUS BACCIFERA. See BELILIA.

- INDICUS SPINOSUS. See CARA-SCHULLI. - ODORATUS SEPTENTRIONALIUM. Sec MYR: TUS BRABANTICA.

— PAVONINUS. See POINCIANA.

— TERRIBILIS. See ALYPUM.

FRUTICOSUS. FRUTICOSE: Plants which are of

hard woody fubstance.

FUCOIDES: A fpecies of plant which grows in water. It is of a middle nature betwixt conferva and corallina, and fucus. It is often finely divided, and of a more tender fubitance than the fucus, and not diftinguished by nodes and joints like the conferva and corral-

FUCUS. It is a species of plant growing in water, whose leaves and stalks are of various figures. It is generally of a viscid and coriaceous substance, and is furnished with vesicles on both sides, which admit of the air being formed to affift its floating. Its extremities are of-ten let with tubercles, which feem to contain fomething of a feminal nature.

Botanists enumerate many species, but except two of them, they are not noted in medicine, and these are,

1. Alga marina latifolia vulg. See QUERCUS MARINAS

2. Lactuca marina; which fee.

FUCUS LACTUCÆ FOLIO. See LACTUCA MARINA:

- MARITIMUS. See KALI.

--- MARINUS. See ALGA.
--- TUBULOSUS, &c. See ENTEROPHYTON VUL-GARE.

FUGA DÆMONUM. See Hypericum. FUGILE. EAR-WAX. In Paracellus, it means an ap-

pearance in the urine like wax. Some express by it a bubo, and others the tumor called parotides.

FULIGO. Soor. It is the shining black concrete, formed by the smoak from wood, that is used in medicine, and to be here understood by foot. It hath a disagreeable smell, and a pungent bitter nauseous taste; the more resinous the wood, the more bitter will be the foot. By a chemical analysis it affords a volatile alkaline falt, an empyreumatic oil, a fixed alkali, and an infipid

The foot gives out its virtues to water, or to proof spirit, each of which dissolves about one-fourth part of good foot; and is confidered as an antifpafmodic. FULMINARIS LAPIS. See CERAUNIA.

FULMINATIO. FULMINATION, from fulmino, to lighten, or thunder. In chemistry it hath two fignifications: 1st, An explosion, and is the same as detonation. 2dly, In the depuration of the more perfect metals, it is when upon infufing them with lead, a bright colour fucceeds a kind of fulphureous cloud before appearing in the metal

during the fusion.

FUMARIA. FUMITORY. Also call fumus terre, and herba melancholifuga. It is the fumaria officinalis, or fumaria pericarpiis monospermis racemosis, caule diffusion fumaria pericarpiis monospermis racemosis, caule diffusion fumaria pericarpiis monospermis recembers. fulo, flore purpureo, Linn. Common Purpus Fumitory. It is a plant with bluifh green, finely divided leaves, producing, towards the tops of the stalks, spikes of irregular purplish flowers, followed each by a single seed. It is annual, flowers in May and June, and delights in fliady places. The leaves have a bitter faline taile; an extract obtained by infpiffating the expressed juice, of a decoction of the leaves in water, is very bitter. The juice of these leaves, if dropped into the eyes, are supposed to cure dimness of fight; whence the name fumaria, because it provokes tears, and clears the fight after the manner of smoke. The whole herb is diuretic, resolvent, and loosens the belly.

FUMARIA ALBA, also called cyslicapnos Africana feaudens, AFRICAN CLIMBING BLADDER FUMITORY.

It is a climbing plant, chiefly refembles the fumitory above described, only that the fruit is an oval bladder, in

which are the feeds.

- Bulbosa, called also aristolochia cava, aristolochia adulterina; capnicium chelidonium, capnas latifelia; cava herbarierum; cava major radix; piftolochia concava; pfeudo ariftolochia. GREAT BULBOUS FUMITORY, or HOL-LOW-ROOT.

It is found in moift shady places, and, like the above species, its chief sensible quality is its bitterness.

FUMIGATIO.

FUMIGATIO, from fumus, fmoak, Fumication. By near the middle of the placenta, but fometimes it is near the fubril fumes that are inspired as well as inhaled into the edge thereof; it is composed of two arteries and two our bodies, much benefit or prejudice is produced, according to the nature of the matter, and the conflictution in which it is received. It is evident from the palfies produced among workers in lead mines, &c. and the benefits received in many cafes when the air is impregnated with falutary materials; catarrhs and catarrhous coughs are relieved by fumes received with the breath; and, by the fame method, expectoration is affifted in humoral afthmas, and even ulcers in the lungs are faid to have been healed by this method. The advantage of mercurial funigations in the cure of venereal ulcers is known to every practitioner.
FUMUS TERRÆ. See FUMARIA ALBUS. See

ETHEL.

FUNCTIO. See Acrto. FUNGOIDES. A fpecies of fungus without a head or cap, whose pedicles or stalks are of various shapes and divisions. As to its substance, it consists of an uniform

matter, which is undivided into lamellae or pores-FUNGUS. TOADSTOOL. It is the loweft, and a very imperfect genus of plants, having neither visible feed nor flowers, as in other vegetables, and remarkably differing from other plants, because it hath not an an herbaceous colour nor leaf, properly speaking, nor any thing else analogous in its contexture. Most of them spring up, and are foon diffolyed into the mucous matter whence they arose. The species are very numerous. See Ray's Synopsis. The ESCULENT FUNGI, are truly different from every other vegetable that we meet with; for distilled without addition, they afford no acid, but a large pro-portion of volatile alkali; and exposed fo as to undergo fpontaneous fermentation, they shew no acefeency, but become immediately putrid; and hence appear to partake more of animal nature, and as such should be confidented by fidered, being more nutritious than any of the vegetable

Fungus. Mushrooms. See Amanita.

In furgery, it is a fpongy excrefeence which arifes in wounds and ulcers, commonly known by the name of proud flesh, though often improperly fo called. In general, dry lint is the best application. But a spongy lax slesh rising up in ulcers, differs much from the fungus in healing wounds; it often requires the knife, or some nearing wounds; it often requires the knife, or fome caustic application; this spongy sless is in one mass, but the fungus in healing wounds is in many little protuberances. When this ill-conditioned spongy sless arises, it is of very little use to attempt its destruction before the general habit of body is improved, and when this is effected, dry lint, or other gentle means, will generally suffice. The surrous area or carriers have a country to the surrous areas a carriers have a country to the surrous areas a carriers have a country to the surrous areas a carriers have a country to the surrous areas a carriers have a country to the surrous areas a carriers have a country to the surrous areas a carriers have a carrier and the surrous areas a carriers have a carrier and the surrous areas a carriers have a carrier and the surrous areas a carriers have a carrier and the surrous areas a carriers have a carrier and the surrous areas a carriers and the surrous areas a carriers and the surrous areas are a carriers are a carrier and the surrous areas are a car fuffice. The fungus over a carious bone cannot be re-moved before the caries is put a ftop to, and the exfolia-tion completed; but after these the fungus disappears fpontaneoutly.

If fungus excrescences arise from the brain, after trepanning, they may be cut away with a knife, and sup-pressed with lint dipped in rectified spirit of wine, and

gentle preffure.

White fwellings are called fungi by fome authors. In Vogel's Nofology, it fignifies a fort cedematous tumor of the joints. It is also the name of a tubercle about the anus. The cause and cure are the same as the condyloma.

PETRÆUS MARINUS. See ANDROSACE. FUNIS BRACHII. The corp of the ARM. So the Arabians call the mediana vena.

veins, though fometimes there are two arteries and one vein, and at others two veins and but one artery. Thefe veffels are convoluted, and are furrounded by a fine network of fibres of a gelatinous texture. The arteries are continuations of the internal iliaes or hypogastries; the veins are formed by the union of all the branches in the placenta; they are continued into the abdomen at the navel, and so on to the vena porta in the liver. After the birth, the remaining parts of the arteries in the abdomen form the ligamenta umbilicalia inferiora, and the veins form the falciform or fulpenfory ligament.

There is always a point where the funis begins, and where the integuments separate from it; whence it is indifferent whether you cut it nearer or further from the belly, fo that a ligature can be made upon the portion that is left with the child, as it always drops off at the

fame place.

If the funit is torn off from the child, fo that a ligature cannot be made on it, La Motte affures us, he fucceeded in preventing an hæmorrhage by applying pledgits of lint, and confining them with proper compreffes and bandage; but fome recommend the needle and igature.

If the child descends to the os externum, but seems to be drawn up and down as though it was fuspended by a rope, it may be suspected that the funis is very short, or that it is entangled, in which case some practitioners have cut it at about sive or six inches from the child's belly. But a necessity for this can hardly occur, for with a literature of the resistance in all the resistance in the second of the second tle patience it will ftretch fufficiently. FURCALÆ. See CLAVICULÆ.

FURCELLA. FURCELLA. The enfiform cartilage. FURCULA INFERIOR. See Ensironmis.

FURFUR. BRAN. It is commended as excellent for removing offensive fordes from the head; and for relieving head achs, by rubbing the head with it after well heating it. FURFURATIO. See FURFUROST.

FURFURES. So urine is called which possesses a fediment resembling bran. It is a name for furfurosi.

FURFUROSI. Those patients are so called who are afflicted with a fort of scurf or scalines on the head, which upon combing discharges a scaly substance like bran, whence the discase is called furfures, and furfuratio; though fome call it porrigo, and farrea nubes.

FURNUS. See FORNAX.

FURIOSUS. See AMBULO.

FUROR UTERINUS; called by the Arabians, acrai-med, also brachuna, astromania. Dr. Cullen calls it nymphomania. It is a species of madness, or an high degree of hyfterics. Its immediate cause is a preternatural irri-tability of the uterus and pudenda of women (to what the diforder is proper) or an unufual acrimony of the fluids in these parts.

Its presence is known by the wanton behaviour of the patient; the speaks and acts with unrestrained obsecnity, and as the diforder increases, the fcold, cries, and laughs by turns. While reason is retained the is filent, and feems melancholy, but her eyes discover an un-usual wantonness. The symptoms are better and worse, until the greatest degree of the disorder approaches, and then by every word and action her condition is too manifest.

In the beginning a cure may be hoped for, but if it continues it degenerates into a mania; long intervals, and a recovery of flesh also give hopes.

In order to the cure, bleed in proportion to the pa-tient's strength. Camphor, in dose of 15 or 20 grains with nitre, and small doses of the tinct. opii should be repeated at proper intervals. Some venture to give the cerus acetata in doses of three to five grains. bleeding, cooling purges should also be repeated in pro-portion to the violence of symptoms, &c. What is useful in maniac and hypocondriac disorders, is also useful here, regard being had to fanguine or phlegmatic habits, &c.
When the delirium is at the height, give opiates to compose, and use the fame method as in a phrenitis, or a FUNIS VEL FUNICULUS UMBILICALIS. The NAVELSTRING. It is commonly about half a yard long, though
this is uncertain, it being fometimes not above half this,
and at others it is a yard or more. It is usually fixed

pose, and ute the same method as it a partenne, or
mania. Injections of barley-water, with a small quantity of hemlock-juice, may be frequently thrown up into
the uterus; this is called specific, but matrimony, if
possible,

Physic.
FURUNCULUS, from fure, to rage; called also dethiens; a note or site. It is a phlegmonous humour
which commonly terminates in a suppuration of a peculiar kind. It is a variety of the phlogosis phlegmone.

It breaks open at first on its top, or the most pointed part, when some drops of pus, like that from an abscess, comes out; after which the germ, or what is commonly called the core, is seen; this core is a purulent substance, but so thick and tenacious, that it appears like a folid body, which may be drawn out in the shape of a cylindral that the state of the state comes out; after which the germ, or what is commonly called the core, is feen; this core is a purulent fubflance, but fo thick and tenacious, that it appears like a folid body, which may be drawn out in the shape of a cylinder, like the pith of an elder, fometimes to the length of an inch. The emission of this core is usually followed by the discharge of a certain quantity of liquid matter, fpread through the bottom of it. As soon as this difference is proposed to the common of the common mode of pinguious and concreted substances.

possible, should be preferred. See Riverius's Practice of Physic.

Physic.

FURUNCULUS, from fure, to rage; called also dethiens; a note or sile. It is a phlegmonous humour which commonly terminates in a phlegmonous of tumor, for if repelled it almost as certainly returns which the project of the phlegmonous property on some other part; but indeed the surgeon is seldom applied by the first part of the project of the projec plied to on account of it, the common method of applying a poultice of flour and honey answering every pur-pose. GABIREA. A pinguious species of myrrh,

mentioned by Dioscorides.
GACIRMA. See CUMANA.
GÆDA. The abbreviation of Johannes Gædartius
Metamorph. & Hist. Nat. Insectum, in part. iii.

GÆODES. A species of ætites, or a round fort of belemnites.

GAGEL. See GALE.
GAIDEROTHYMUM. A name of the stachys spinofa Cretica.

GAL. The abbreviation for Galen.

GALACIA. See GALAXA.
GALACORTA. A fpecies of scorzonera. GALACTIA. An excess or overflowing of milk. GALACTINA. See LACTICINIA.

GALACTINA. See LACTICINIA.
GALACTIR RHOEA. See GALACTIA.
GALACTITES LAPIS, from yana, milk, the MILKstone. It is also cailed morechibus, galaractis, and galaricides. Dioscorides says, that in one year one may perceive its growth to have been considerable. It seems to
be an inferior kind of French chalk. When it is ground down with water, it renders it milky in appearance; whence its name

GALACTODES. In Hippocrates it fignifies both milk warm, and a milky colour.

GALACTOPHORA MEDICAMENTA. Medi-

GALACTOPHORA MEDICAMENTA. Medicines which increase the milk.

GALACTOPHORI DUCTUS. The LACTEAL VESSELS, from γαλα, milk, and φιρω, to carry.

GALACTOPŒTICA, from γαλα, milk, and ποιεω, to make. MILK-MAKING. An epithet applied to the faculty of generating milk.

GALACTOPOSIA. The method of curing by a milk

GALÆNA INANIS. BISMUTH. See BISMUTHUM. GALANGA. GALANGAL. It is the maranta galanga, Linn. It is a graffy leafed-plant, which grows in China and in the East Indies. The dried roots are brought into Europe in pieces of about an inch long, and half an inch thick: it is branched, full of knots and joints, with feveral circular rings: it is of a reddish brown colour, on the outfide, and of a pale red within.

This root hath an aromatic fmell and bitterish hot biting tafte; but the heat and pungency prevail more than the bitter. Dr. Lewis observes, that the pungent matter appears to be of the fame nature with that of pepper; that it relides not in the volatile oil, but in a more fixed matter. Neumann fays, it refembles ginger in its fmell, taste, and chemical composition, but that ginger is to be preferred, as it is more agrecable.

There is a galanga major, but as it is weaker and much more difagreeable, it is not used. See Lewis's Mat. Med. Neumann's Chem. Works.

GALASTIVIDA. A species of MOTH MULLEIN.

GALAXA, also galacia, is a term of Paracelfus. It Take of galbanum cut into fmall pieces, two ounces; teum; the Greeks, yexatiae works, wethe MILKY WAY from the Latin via latten, and is nothing more than a for eight days, and ftrain. They confider it as a warm 5. D

ABIANUM OLEUM. See Petroleum vul- congeries of fixed, or nebulous stars. Paracelfus says its principle, is a most subtile sulphur, the cause of winter, and producing clouds. Some speaking analogically apply the word galaxa to the porofities in the cranium, and CHARLTON distinguishes the passages, and distribution of the chyle by the name of galaxia.

GALAXIUS. See Morochthus.

GALAXIUS. See Morochthus.
GALBANUM, Gum. It is the concrete, gumray, refinous juice of an evergreen plant, with leaves like those of anise, growing in Syria, the East Indies, and Ethiopia. This plant is named ferula Africana, oreoscilinum Africanum, anisum fruticossum galbaniserum; and anisum diricanum fruticencescent, &c. ayborzat. The plant is the bubon galbanum, or the bubon foliolis rhombeis dentatis glabris striatis, umbellis paucis, Linn. The gum is brought to us in pale coloured, senitransparent, soft, tenacious masses, of different shades from white to brown; the better forts of which, on being opened, appear comthe better forts of which, on being opened, appear com-posed of clear, whitish tears, often intermixed with little stalks or feeds of the plant. It partakes more of the refinous than of the gummy quality, though it is nearly all foluble in water. It hath a strong unpleasant smell, and bitterifh warm tafte, is unctuous to the touch, and foftens

In medical virtue and fentible qualities it refembles the gum ammoniacum, but is less efficacious than it in althmas, though more efficacious than it in hysterie diforders. When affa feetida is too flrong, galbanum may be tried; and if it difagrees, give ammoniacum. Dr. Cullen fays, by itself it has little power, but serves to afford a variety, fo requifite in the use of antispaf-

modics.

A mixture of spirit of wine two parts, with one part water, diffolves all but the impurities, which are common-

ly in confiderable quantities.

If in confiderable quantities.

Great part of the virtue of galbanum confifts in its effential oil, and is carried up in diffillation, either with water or with fpirit, whence great care is required in purifying it. For making of plafters, and fuch like inferior purpofes, the best method is to expose it in winter to a sharp frost, and whiss it is brittle to powder it: thus the impurities may in fome measure be separated in the fearce; for internal uses, it is best managed by including it in a bladder, and keeping it in hot water, until it is soft enough be strained by pressure through an hempen

Befides the effential oil yielded by distillation with water, an empyreumatic oil is obtained, by diffilling in a retort without mixture. This empyreumatic oil is of a fine blue colour, but changes in the air to a purple.

It is common to fpread galbanum on leather, and to ap-

ply it to the belly in hysteric diforders, and when spasms diforder the belly of a woman soon after delivery; but the following is to be preferred. R Gum aff. feetid 3 vi. camph. 3 is. f. empl. See Neumann's Chem. Works; Lewis's Mat. Med. Cullen's Mat. Med.

The College of Physicians order the following tincture

to be made.

Pharm. Lond. 1788.

GAALBEI, or GALBEUM. A fort of ornamental and medical bracelets worn by the Romans.

GALBULA. In the plural number it fignifies CYPRESS

GALBULI. The cones or nuts of the cyprefs-

GALBULUS. When the fkin of the body is natu-

rally yellow.
GALE, also GAGEL. See ELAGNUS, and MYRTUS

BRABANTICA.

GALEA. Galea, a HELMET. See PILEUS. In anatomy it is the name for the amnios. In SURGERY, a bandage for the head is thus called. In BOTANY, the upper lip of a labiated flower is called its gala or creft Among difeafes, it is by analogy a name for a species of head-ach, which surrounds the head like an helmet.

GALEANIONES. People with one arm fhorter than

the other.

GALEANTHROPIA. It is a species of madness in which a patient imagines himself to be a cat, and then he imitates its manners. The name seems to be from yake. a cat, and avegumes, a man.

GALEGA, called alforuta capraria, and GOAT'S RUE. It is the galega officinalis, Linn. The roots is perennial; on the stalks are pods with oblong kidney-shaped feeds.

on the stakes are pools with obtoing kidney-maped seeds.

It is a native of Spain and Italy, where it is eaten as food, but it is not noted in medicine.

— NEMOROSA VERNA. A species of orobus,

GALEGÆ. A species of senna.

GALENA, from γαληνη, a calm. It was a name of the theriaca before the addition of vipers to it. It is the name of a lead ore, in which is a little filver. According to some it is the same as plumbage, or melibdana. Some say that no metal can be extracted from it, and others say it is an ore of zinc, but mixt with various other substances. This laft is the most proper affertion.

GALENION. The name of malagma, in P. Ægi-

GALEOPSIS, vel GALIOPSIS. See LAMIUM LUTE-GALEOPSIS, vel GALIOPSIS. Sum. Also called lamium rubrum, urtica iners magna factidifima, flachys factida, and HEDGE-NETTLE. Boerhaave enumerates fourteen species. This species, he says, is a good antihy-flerie, and an infusion of the leaves and flowers is useful in a nephritic colic. He attributes some degree of virtue to the species called CLOWN'S ALL-HEAL, see PANAX COLONI; to the YELLOW ARCHANGEL, and SPOTTED ARCHANGEL, fee LAMIUM; but to the rest nothing medicinal is known to belong to them; also it is the name for a species of CLARY; and Anguillare, a species of BASTARD DITTANY.

GALERITA. See PETASITES.

GALI. See INDICUM.

GALIA, from galler, GALLS. There are two compo-fitions, one called pure, the other aromatic, and galls were a part of the composition. Galia moschata, or mufcata; in this was NUTMEG. Galia zibettina; in this

GALIANCON. See Anci. When one arm is fhorter than the other, this is the term used.

GALIUM APARINE. See Aparine.

VERUM. See GALLIUM.

GALLÆ, called nuces gallæ, gallæ maximæ orbiculatæ, gallæ fpinofæ, GALLS. The gallæ robur 3, vel

quereus, cerris, Linn.

They are hard round excrescences, cynipidis nidi; found in the warmer countries on the oak-tree. They are produced from the puncture of an infect, and affording a lodgement for its young, until they are capable of eating a passage through; the tear which issues from the wound, gradually increased by accessions of fresh matter, forms a covering to the eggs and succeeding infects. Those galls which have no hole, are found to have the dead infects remaining in them. Two forts are diffinguished in the shops, one faid to be brought from Aleppo, called Oriental, or Aleppo nut, or galla spinosa; the other from the fouthern parts of Europe, called European called GAMBOGE.

It is a gummy refinous concrete, brought from the greyish or blackish, and verging to a blue; unequal to East Indies, said to be the produce of certain trees called

antifpsimodic, promifing to be of fervice in flatulency, their furface, hard to break, and of a close texture : the hysteria, and the afthmatic complaints of old people. others are of a pale brownish or whitish colour, smooth, round, easily broke, less compact, and of a much larger fize. The two forts differ in strength, but in other respects are of the same quality.

Chuse the small, protuberant, bluish, and heavy one

Galls are a ftrong aftringent, supposed to be one of the strongest in the vegetable kingdom. They have no pecu-liar smell or taste; their medical character is simple aftringency. Both water and fpirit take up nearly all their vir-tue. The fpirituous extract is the strongest preparation, but the fimple powder is as good as any other mode of administering them. The dose of the powder is from a

few grains to a dram.

They are not much used in medicine, though they have been faid to be beneficial in intermittents, and one of the most powerful of the vegetable astringents; one part of galls finely powdered, added to eight of hog's lard, has been an outment used with efficacy very often in the hamorrhoids. They are much employed for making black writing ink, and the colouring matter for dying black with. A decoction of galis seems more rough and aftringent to the tafte; but an infufion of them in cold water, ftrikes a deeper black with green vitriol. See Lewis's Mat. Med. Neumann's Chem. Works, Cullen's Mat. Med.

GALLATURA. That part of the white of an egg

which is more denfe and close than the reft.

GALLENA TESSULATA. LEAD ORE, One hundred pounds weight of this ore yields from fixty

to feventy of pure lead.

GALLI GALLINACEI CAPUT. See GALLINA-

GALLIA MOSCHATA. A composition of troches, in which are only aloes, amber, and mulk, made up with GALLICUS MORBUS. The FRENCH DISEASE.

Sec LUES VENEREA.

GALLINAGINIS, CAPUT, also galli gallinacei caput. When the profitata is cut open, we discover the eminence called caput gallinaginis. It is thick behind and slender before; on each side of this eminence appears the orifices of the viscoulae seminales.

GALLITRICHUM. A Species of BAUM. Also a name of several species of clary. See HORMINUM.

GALLIUM, called gallion, CHEESE-RENNET, LADY'S BED-STRAW. It is the Gallium verum, Linn. It is a plant with square stalks; long narrow leaves, which commonly stand eight at a joint in the form of a star. On the tops appear thick clusters of small yellow monopetalous slowers, which are followed each by two seeds. It is perennial, found in dry waste grounds, and flowers in June and July.

The flowers have a strong, not disagreeable smell; the leaves little or none; but they both poffers a degree of acidity, on which account they are used in some places for turning milk or feparating its curd from the whey, whence its name cheefe-rennet. The whole plant is faid to be its name cheefe-rennet. The whole plant is faid to be cooling and reftringent, but it is not much used in medicine. Boerhaave mentions five species. It is also a name for MADDER. See RUBIA SYLVATICA LÆVIS.

--- LATIFOLIUM FLORE LUTEO. A species of CROSS-WORT. See CRUCIATA VULGARIS.

GALREDA. A kind of jelly made by boiling the cartilaginous parts of animals. In Paracelfus, it figni-

fies an excrementitious mouldiness.

GAMANDRA. The largest quantities are produced GAMBOGIA. In the province Cambogia, or Cambodia, from whence it is called Cambodia, Cambogium, Gam bogia, Carcapuli, &c. From the virtues afcribed to it against the gout, it is called gummi ad podogram, gummi gutta, &c. By a corruption of the above names it is called, gotta, gbitta, gutta gamba, gamon, gamandra, cattagemu, jentou gamna, gamboida, gemandra, gobcathu, &c. From its gold colour it hath been called chrysopus, and from its purgative quality it is named fuccus lanatious, succus Indicus pur-gans, and scammonium orientale. With us it is usually

coddam-

of the effula, or tithymalus kind. The tree is the Cambegia gutta, or Cambegia of Linn. Indian Cambegia. It is brought to us in large cakes and rolls; it is folid, brittle, of a fmooth furface, perfectly opake, free from any visible impurities, of a deep reddiff yellow-colour, equal and uniform throughout its whole substance. It flains the moift hands of a yellow colour: when chewed, it hath little or no tafte, but foon after it impresses a pungent acrimony and heat, and occasions a dryness in the mouth. It easily melts over the fire; it takes slame from a candle, it burns with a white flame and leaves a grey ash.

In medicine it is chiefly used as a draftic purge, but it weakens the stomach. It produces copious discharges by stool, and its operation is usually very quick. On the first use of it, it generally vomits, and then purges; in dropsies it hath been much recommended; but in a hot, dry habit it should never be ventured on. The dose is from gr. iii. to xx. When given with calomel, or other purgatives, it is not fo apt to be discharged upwards. If given in a liquid form, and duly diluted, it needs no corrector; boiling in water leffens its activity; folutions of it in alkalized water, acts only by stool and urine; the

latter it promotes very freely.

It is best given in doses of three or four grains rubbed down with a little fugar, and repeated every three or four hours, it then operates without vomiting or griping, and after the third or fourth exhibition evacuates water free-

ly, both by flool and urine.

Rectified fpirit of wine diffolves five parts out of fix, and acquires a deep gold-colour from it; water, affifted by heat, takes up nearly as much, but on cooling it deposits much of the resin; but if the water is first im-pregnated with an alkaline salt, it deposits none. See Tournefort's Mat. Med. Lewis's Mat. Med. Cullen's

GAMBOIDEA. | GAMBOGIA.

GAMMATA, FERRAMENTA. An inftrument mentioned by P. Ægineta, made like the Greek letter y; it was used for cauterizing an hernia aquosa.

GAMMARUS. See CANCER FLUVIATILIS.

GAMON. See GAMBOGIA.

GAMPHELE. The CHEEK. The jaw, from γαμφΦ,

GANGAMON. A name of the ementum, from its fupposed likeness to a fishing-net, which the Greeks call gangamon. Some call that contexture of nerves about the navel thus.

GANGILA. See SESAMUM.

GANGLION. A primitive in the Greek. In ana-tomy, it imports a knot frequently found in the course of the nerve, and which is not morbid; from wherever any nerves fends out a branch, or receives one from another, or where two nerves join together, there is generally a ganglion or plexus, as may be feen at the beginning of all the nerves of the medulla spinalis, and in many other places of the body. See PLEXUS.

In furgery, it is a moveable tumor formed any where

about the tendons of muscles, and the ligaments; the most frequent situation is about the carpus; but whatever part of the body it is in, it is near the fkin, and is not attended with any confiderable uneafiness to the patient. Ganglions are formed of lymph, which is fecreted within the vaginæ of tendons; they are different in their form, confiftence, and other appearances, but they never suppurate. Mr. Sharp reckons these tumors among those encysted ones called meliceris. For the most part the matter of a ganglion refembles the white of an egg. Dr. Cullen ranks it as a genus of difeases in the class locales, and order tumores.

As to the cure, Mr. Sharp affures us that he hath frequently fucceeded, by making an incition through its whole length, and at the fame time dividing the ligament of the wrift, and afterwards dreffing as in wounds in general. Mr. Warner gives two inftances of his fuccefsfully extirpating them: he observes, that the objection from danger of wounding the fubjacent tendon or ligament, is of no weight, fince the accident can be generally avoided, and should it happen, the difaster may be easily healed, as happens daily in wounds of this fort;

coddam-pulli; but some say it is obtained from a thrub Surgery, in the chapter on encysted tumors. Warner's Cafes in Surgery, Heifter's Surgery, Bell's Surgery,

vol. v. p. 476.

GANGRANA, from years to graze. A GANGRENE, or beginning mortification: See MORTIFICATIO:

- AQUOSA. See ANGINA GANGRANA.

ORIS. See CANCRUM ORIS.

ORIS. A name for the fring ventions
GANGRINOS, SAL. Fuchfius fays it is the fal foffilis: GANNANA, and GANNANAPERIDE. Names for

the cort. Peruv.

GARAB. An Arabic name for the diforder called ÆGILOPS, which fee.
GARB. A Moorish name for an Arabian species of

GARENT-OUGUAN. A name for GENSING. GARGALE, GARGALOS, GARGALISMOS. IRRITATION OF STIMULATION.

GARGARISMA, or GARGARISMUS, from yas Japilas and that from yapyapsur, the throat, also colluterium oris; to wash the mouth. A GARGLE: Its use is, for washing the mouth and throat with when inflammations, ulcerations, &c. are there: A small quantity may be taken into the mouth, and moved brikly about, and then ipit out; or if the patient cannot do this to any advantage, the liquor may be injected with a fyringe. gargles are required, their use should be more frequently repeated than is done in common practice. See more particular observations on this subject in the article ANGINA.

GARGATHUM. A bed on which lunatics &c.

were formerly confined: GARID. HIST. The abbreviation of Petrus Garidel,

M. D. HIST. PLANTS

GARIDELLA. A plant fo called by Tournefort, in honour of Dr. Garidel, of Aix, in Provence. It is called by C. Bauhine, nigella Cretica folio famiculi. It is not noted for any medical virtue.

GARON, or GARUM. A kind of pickle prepared of fish; at first it was made from a fish which the Greeks called garss; but the best was made from mackerels: Among the moderns, garum fignifies the liquor in which

fish is pickled:
GAROSMUM: See ATRIPLEX FOETIDA.
GARROTILLO. So the Spaniards have named the cynanche maligna, or ulcerated fore throat.
GARYOPHYLLATA. See CARYOPHILLATA.
GARYOPHILLI. See CARYOPHILLI.
GARYOPHILLON PLINII. See CASSIA CARYO\*

GARYOPHYLLUS. The AROMATIC CLOVES. See CARYOPHILLI AROMATICI.
GARZ. The abbreviation of garzia ab borto aromat.

GAS. From geift, which in the German language is spirit. The word gas is an invention of Helmont's; in general it is a spirit incapable of coagulation, such as rifes from fermenting liquors, &c. It is now called fixed air. See Prieftley on Air. Introd. p. 3. See Aer.

—— FRUCTUUM. Elementary water which exhales

from fruits.

- PINGUE SULPHUREUM. The lethiferous exhalations from caves, &c.

- salium. See Gas fructuum.
- siccum, i. c. Sublimate. See Merc. corros.

- SULPHURIS. The spirit of sulphur called aqua fulphurata.

- SYLVESTRE. The fubtile fpirit which rifes.

from fermenting liquors.

— ventosum. The Air. See Aer.

— vitale. The fpirit of our life.

GASCOIGNI PULVIS. GASCOIGN'S POWDER. See BEZOAR.

GASELLA, or GASSILA. The AFRICAN WILD GOAT. from which a species of bezoar is taken.

GASTER. In Hippocrates it generally fignifies the fame as abdomen; but fometimes it means only the utcrus; at others, the ftomach.
GASTERANAX. See BITHNIMALCA.

GASTRICA. PAIN in the STOMACH.

he recommends the cutting away part of the cyft, and then digefling the reft away. See Sharp's Operations in It proceeds from the hepatica arteria; it paffes behind

testinalis; then runs along the right fide of the great curvature of the stomach, to the neighbouring parts of which, on both fides, it distributes branches, and at last

ends in the gastrica finistra.

GASTRICA ARTERIA SINISTRA VEL GASTRICA MI-NOR. It is a branch of the splenica; it runs from the left to the right, along the left portion of the great curvature of the ftomach. It supplies the omentum with branches called galled gaftro-epiploice finiffræ, and then it communicates with the gaffrica arteria dextra; and from this union, the gailtro-epiploicæ mediæ are produced.

Vena epiploica sinistra. See Gastrica

SINISTRA VENA.

---- VENA RECTA; called also gastro-epiploica dex-tra. It is sometimes a branch from the vena porte yentralis, or from its principal branches. It goes to the pilorus, to the great curvature of the stomach, and com-

municates with the gastrica finistra, &c.

- VENA SINISTRA. It goes out from the fplenica, at the left extremity of the pancreas, from whence it runs to the great extremity of the ftomach, and along the great arch, until it meets the gastrica dextra. In its passage it fends branches to the sides of the stomach, and communicates with the coronaria ventriculi.

GASTRICUS SUCCUS. The GASTRIC JUICE. It is so called from gastra, the stomach. It is a thin, pellucid juice, which distils from certain glands in the stomach for the digestion, &c. of the food.

GASTRINUM. POT-ASH. See CLAVELLATI CI-

GASTRITIS. See INFLAMMATIO VENTRICULI. INFL AMMATION of the STOMACH; also called cardi-algia inflammatoria. Dr Cullen places this genius of dif-ease in the class pyrexiæ and order phlegmasiæ. He obferves two species. I. Gastritis phlegmonodea. 2. Gastritis erysipelatosa.

GASTROCELE, from Acres, the Somach, and wan, tumor or rupture of the Somach. The tumor is in the upper part of the linea alba. When this accident happens, there is continual vomiting; every thing taken is immediately rejected; fo an atrophy fucceeds. All hernize of the linea alba require the fame management, but this of the stomach deserves particular attention. They are easily reduced, and should be kept up by a truss. See

GASTROCNEMII, from yarne, a belly, and smar, the leg or fine-bone. Albinus calls these muscles by the name gemellus. At the origin of each of these muscles, it is a biceps rising from each condyle of the semur; the heads soon join and leave a notch, through which the large veilels and nerves pais, and is inferted into the up-per posterior part of the os calcis. The tendon of the foleus, with the tendon of this muscle, forms the tendo These muscles form the greatest part of the calves of the legs. Brown calls them gastrocnemii ex-terni, and says that some call them sura.

GASTROCNEMIUS INTERNUS. So some call

the foleus mufcle.

GASTRO-COLICO VENA. It is a branch from the meseraica minor, and is soon divided into two branches, one of which runs to the head of the panereas, and forms the gastrica resta vena, and the colica resta vena.

Gastro-Dynia. Pain in the stomach. It is an

instance of dy/pepsia.

GASTRO-EPIPLOICA, from yarre, the flomach, and exitation, the omentum. An epithet for the arteries and veins that go to the ftomach and omentum.

GASTRO-EPIPLOICA VENA. A branch of the gastrica

finistra is thus named.

- DEXTRA. See GASTRICA RECTA VENA.

- SINISTRA ARTERIA. See SPLENICA ARTERIA. GASTRORAPHIA GASTRORAPHY, from yarre, a belly, and beque, a future. In strictness of etymology this word fignifies the fewing up of any wound of the belly; yet in common acceptation it implies that an inteffine is wounded as well as the belly. This operation is ufeless in small wounds, but necessary in large ones. The best method is to pass double ligatures in one needle, in order to include the rolls at one end, and be tied upon them with bow-knots on the opposite fide, which gives an opportunity of straitening and loofening the knots at pleasure. After passing in as many ligatures as feem necessary,

the pylorus, and beyond it fends out the duodenalis or in- | bring the lips of the wound gradually together, and keep them fo until the knots are tied.

As to the operation of stitching the bowels, it can only take place where they fall out of the abdomen fo as to fee where the wound in the inteffine is, or how many wounds there are. See Sharp's and Le Dran's Ope-

GASTROTOMIA. GASTROTOMY. Opening the belly and uterus, as in the Cafarean operation, from yasse, belly, and reurs, to cut.

GATRINUM. POT-ASH. Sec CLAVELLATI CI-

GATTARIA. CATMINT. See MENTHA CA-

GAUDIUM. Joy. If fudden and immoderate, it to wears away the strength, that madness or sudden death fometimes enfues.

GAULE. See MYRTUS BRABANT. & ELÆAGUS. GAZAR. The BAY-TREE.

GAZELLA. The GOAT which affords the oriental bezoar. Gazella Africana is the ANTELOPE. -See ANTELOPUS.

GECHYTON. The external parts of the earth which

GEDWAR, GEID, or GEIDWAR. See ZEDOARIA. GEISON. Properly the caves of houses, but by a metaphor is used for the prominent part of the eye-

GELASINOS, from 71205, laughter. An epithet for the four middle fore-teeth, because they are shewn in laughter.

GELASMUS. The SARDONIC LAUGH. See RISUS

SARDIONCUS

GELATINA. JELLY. Jellies, gums, and mucilages are fomewhat fimilar. Jellies are the productions of art, and are either vegetable or animal; mucilages are also either animal or vegetable; jellies are made of the juice of ripe fruit boiled up with fugar to a proper confiftence, or of ftrong decoctions of horns, foft bones, &c. The jellies of fruits are acefcent; those of animal substances

GELATIO. FREEZING. Sometimes it expresses the rigidity of the body which happens in a catoche or ca-

GELSEMINUM. A name of a species of apocynum;

also a species of JESSAMINE. See JASMINUM.
GEMELLÆ CYSTICÆ. A name given to the blood-veffels which run on the gall-bladder, because they

are often only two in number.

GEMELLI. See GEMINI Musc.

GEMELLUS. So Albinus calls the gastrocnemii mufcles.

GEMELLUS MAJOR. See BRACHIÆUS EXTERNUS. GEMINA SOLIS. See ASTERIA.

GEMINI. Thus Albinus calls the two muscles which Winflow calls gemelli. They are two flat, narrow, fmall muscles, fituated almost transversely one above the other, between the tuberosity of the ischium and the great trochanter, immediately below the pyriformis, and parted by the tendon of the obturator internus.

GEMINUS. A TWIN. It is also called genellus and didymus. According to the present theory of conception twins are formed by two ova fwimming in the uterus, and are impregnated by the animalculæ in the male feed. It

is a name also for the extensor carpi radialis.

GEMMÆ SAL, also called fal gemmeus, fal fossilis, adram, lucidum fal, maltheorum, ROCK SALT, FOSSIL SALT, COMMON SALT, and fal gem. Sal gemma, or fal gem. It is so called by reason of its transparency. It is gem. It is so called by reason of its transparency. It is found in many high mountains of Europe, &c. as in Poland, Catalonia, Persia, East Indies, &c. It is probable the rocks of this salt are in the sea, whence the faltness of the water is preserved; for as falt soon loses its favouriness and antriputrescent property, fresh salt is ne-cessary for the purposes which it effects in the waters it impregnates. The salt in the sea-water all comes from impregnates. The falt in the fea-water all comes from the earth. It is the fame as the fal marinus; but when found in rocks in the earth, it receives the name of fal gem, and sal fessilis. It is purified by folution in water, and when the pure solution is evaporated to dryness, the salt is used as the common or alimentary salt. In the mines of Wilizca is a fort that is hard enough for making into toys, vafes, &c. but the fofter they use in the kitchen.

There are species of different colours, but the pellucid is June and July, It is of the same nature as the common that which is used in medicine; it is esteemed more broom, but more efficacious. penetrating than the other falts which are formed by

GEMS. A species of goat, called also CAPRA AL-

PINA, which fee.

GEMURSA. The name of an excrefcence betwixt

GENA. The upper part of the face between the nofe

GENEIAS. The downy hairs which first cover the cheek; also the name of a bandage mentioned by Galen; it comes under the chin.

GENEION. Sec ANTHEREON.

GENERATIO. GENERATION. The parts of generation proper to men are those which prepare the feed and separate it from the body; these are the testes, the veficulæ feminales, and proftatæ, and those which convey the feed into the womb, which office is performed by the penis. The parts of generation proper to women are the vulva, mons Veneris, labia pudendorum, nymphæ,

clitoris, hymen, vagina, uterus, and ovariæ

Much is faid that is both curious and entertaining with respect to the manner how generation is effected; but, except that the semen is ejected through the penis into the uterus, where it renders the semale ovum prolific, the whole is hypothesis. However, the curious may see what is faid by Aristotle and Galen among the ancients, and by Harvey, Steno, de Graaf, Swammerdam, Van Horne, and Lewenhoeck, among the moderns. It may be noted that Lewenhoeck's doctrine of animalculæ feems to fall to nothing, when it is confidered that they cannot be discovered before the femen begins to corrupt. See also Haller's Physiology, lecture 33.
GENIALIS ARTERIA, See MAXILLARIX AR-

GENICULUM, or GENICULUS. A KNOT. Such oots and pods of plants are faid to be geniculated as are

GENIO-GLOSSI, from γενειεν, the chin, and γλωσσα, the tongue, also called mesoglossi. These muscles arise from the chin, above the genio-hyoides, and enter the middle of the tongue to move it forwards. Winslow fays that they can push the tongue out, retract, or ex-

--- HYOTD AUS, from yesses, the chin, and hyoides, the bone of the tongue. A finall muscle arising from a tubercle above the beginning of the mylo-hyoides, and is inferted into the upper part of the base of the os hy-oides. It is also called rectus attollers.

—— PHARYNGÆI, called alfo mylopbarangæi. Thefe are muscular fibres joined to the side of the genio-glossi, and inferted into the sides of the pharynx, and continue their conjunction with the genio-glossi all the way to the

GENIPAT. See JANIPABA.
GENIPI. See Absinth. Alp.
GENISTA, called also cytiso-genista, cytisus seeparius vulgaris. Common broom. It is the spartium seeparium rium, or spartium fol. ternatis solitariisque, ramis iner-mibus angulatis, slore luteo, Linn. It is a shrubby plant, with numerous angular twigs; the leaves are fmall, and fomewhat oval, fet three on a pedicle; the flowers are papilionaccous, and of a deep yellow colour; after the flowers there follow broad pods, with flat, hard, and brownish feeds. It is common on heaths, and uncultivated fandy grounds; it flowers in May and June.

The leaves and stalks have a nauscous bitter taste, which they give out by infusion in both water and spirit, and which, on inspissating the liquors, remains concentrated in the extracts. A decoction of the tops of green brown. Half an ounce of the fresh tops belied in a pound of water to half a pound, and two spoonfuls given every hour till it operates by stool, or the whole is taken—hereby repeating it every day, or every other day, cures fome droplies. See Lewis's Mat. Med. and Cullen's.

GENSITA ARBORESCENS AFRICANA. A species of

- CANARIENSIS. See LIGNUM RHODIUM.

GENESTA SPARTIUM SPINOSUM. See ECHINOPODA

CRETENSIBUS, and ALTRAGI.

— SPARTIUM, also called nepa Theophrassi, genista spinosa minor, and the LESSER FURZE. It is so generally known as not to need a description. Its virtues are the fame as those of the common broom.

- SPINOSA INDICA, &c. See BAHEL-SCHURLLI. - Spinosa major, also called spartium majus, serpius, genistellæ spinosæ assinis, babel sebulli, nepa, FURZE, or GORS Its medical virtues are the fame as those

of common broom.

TINCTORIA, also called chame/partium genif-tella, tintlorius flos, GREEN-WEED, and DYER'S WEED. It is found in pasture ground; it flowers in June and July, and seems to be of a similar nature, as a medicine, with the common broom.

Botanists enumerate twelve or more species of broom-

See Raii Hift. Plant.

GENITALIUM. Difeafes of the genital paffages. GENITURA. The femen mafculinum; also the pu-

GENOU. This word is used to express the articula-tion called diarthrosis; it may be synonyme with enera-throsis, but does not agree so well with other species, though used for them all.

GENSING, called also ginsen, ginseng, ninzin, nindsin, nis, sisaram montanum Coracense, zingin, auretiana Canadensis Iroquais, garent-ouguan, India orientalis radia genuina, plantula Marilandica, &c. It is the panax quinquefolium, Linn.

Genfing, is the root of a fmall plant growing in China, Turkey, and in fome parts of America, particularly in Canada and Pennfylvania. It is two or three inches long, taper, about the thickness of the little finger, often forked at the bottom, which gives it a distant refemblance of a man, whence it is called ginfing; it is elegantly striated with circular wrinkles; it is of a brownish yellow colour on the outfide, and whitish, or of a pale yellow within; on the top are commonly one or more little knots, which are the remains of the stalks of the preceding years, and from the number of which the age of the root is judg-ed of. Those roots which are brought from China are fomewhat paler than those from America, but in no other

respect is any difference found.

Ninzin hath been supposed to be a synonymous name with gensing; but ninzin is a root of a different species; its virtues are weaker, but of the fame kind as those of gensing: the ninzin root is larger, lighter, and less firm than the gensing; it is whitish on the surface, yellow within, hath a slight aromatic smell, an acrid bitteriss

tafte, and is a species of fium.

The Chinese esteem this root as a general restorative and powerful aphrodifiae; but these qualities are so weak that it is scarce worth retention. See Cullen's Mat. Med. To the tafte it is mucilaginous, and fweet like liquorice, yet accompanied with a degree of bitterness and a slight aromatic warmth, with little or no fmell: the fweet matter of these roots is preserved in the watery as well as in the spirituous extract, and so is their aroma; the spirituus

extract is a pleasant warm bitterish sweet:

A dram of the gensing root may be sliced and boiled in a quarter of a pint of water to about two ounces; then a little sugar being added, it may be drank as soon as it is cool enough; the dose must be repeated morning and evening, but the fecond dose may be prepared from the fame portion of root which was used at first, for it may always be twice boiled. M. Reneaum says that the hepatica nobilis Tragi is endued with the principal virtues of the gensing. See Raii Hist. Plant. Kempf. Amen. James's Med. Dict. Lewis's Mat Med. Lond. Med.

Tranf. vol. iii. p. 34.

GENTIANA. GENTIAN, GREATER YELLOW GENTIAN, or FELWORT. Some have called it the European kinkina. It is the gentiana lutea, or gentiana major lutea, corollis quinquefidis rotatis verticillatis, calycibus fpathaceis, Linn. In fome editions it is writ corollis subquinque fidis.

- HISPANICA, called also spartium arborescens, This plant is faid to be called gentiana, because Gen-JUNCEA, spartium Hispanicum frutex, and tius, a king of Illyria, first took notice of it. Boerhaave SPANISH BROOM. It is common in gardens, flowers in enumerates feven species; but the above, whose root only

flowers are in clusters at the top of the stalk; they are of a pale yellow colour, fomewhat bell-shaped, and deeply cut into five fegments; the feeds are contained in oblong capfules; the root is moderately long, flender, branched, brownish on the outside, and of a deep gold colour within; its pith is woody, though more fpongy than the rest of the root. It is perennial, a native of the mountaneous parts of Germany, Switzerland, France, and their neighbouring countries, from whence the dried roots are brought to us; but the plant is fometimes found wild in England.

Sometimes another root is fold for that of gentian, but should be carefully distinguished, as it is poisonous; it is thought to be the thora valdentis of Ray, or aconitum primum pardalianches of Geiner: it is known from the true gentian by being of a paler colour externally, having longitudinal wrinkles; when cut into its texture is closer than that of gentian; it is whitish within, and it is not bitter, but when chewed is only perceived to be muci-

The best roots of gentian are of a middling size, of a lively yellow colour, tough, and most free from fibres. The older and larger the roots the more porous, and the

younger and flenderer are more compact.

Neumann obtained from 3 xvi. of this root, by means of fpt. vin. r. to the quantity of 3 vii. ss. of refinous extract; and by means of water, 3 ix. of a gummy one.

The Londom College directs a watery extract; fee CHEMAMELI EXTRACTUM, but the spirituous is to be preferred; their doses may be from gr. x. to 3 ii. or 3 i. In distillation spirit carried nothing over, and water too little to deferve notice.

It is ftrong flavouries bitter, and by any agreeable ad-dition is rendered very grateful to the stomach. Of all the preparations, an infusion in cold water is the most acceptable to the palate, and it possesses more of the virwhen a warm vehicle is required, the tinct. gentiance is to

be preferred.

The gentian root is flomachic, corroborant, and antifeptic. By some writers its febrifuge virtues have been made equal to those of the Peruvian bark, but in many cases have failed, though joined with gall and tormentil roots in equal parts, and given in fufficient quantity, has cured intermittents in Scotland. See Cullen's Mat. Med. When used as a tent in wounds, it does not make callous lips, whence it is often used for imbibing the moifture in issues, which it also dilates. See Lewis's Mat. Med. Raii Hist. Neumann's Chem. Works.

#### Tinctura GENTIANÆ composita. P. L. 1788. Compound Tincture of GENTIAN.

GENTIANELLA. A species of gentian.

GENU. The KNEE; also the patella, KNEE-PAN. The knee is the articulation of the thigh and leg bone; the joint of the knee being a ginglymus joint, admits, consequently of only seven and extended.

is used, is the principal one of note in medicine. The bent, when it will allow of a small rotation by the ligatifulk is unbranched and jointed; the leaves are oblong, ments being relaxed. This joint is made up of the feacuminated, ribbed, and set in pairs at the joints; the mur, patella, and tibia; the fibula does not reach the joint, and therefore hath no part in its composition. The patella in extension is drawn up, in flexion it is pulled down. Under the ligament of the patella is a facculus mucosus; this mucus is very like the synovia. The strength of this, as of all joints of the ginglymus kind, is on the fide. The captular ligament is large, and admits of the collection of a fluid within the joint; in which case the swelling appears above and on each side the patella, but chiefly above, on account of the ligaments being thinner there; what is called the synovial gland, Dr. Hunter thinks it not one: in general, he thinks that there are no fynovial glands; and that this, like all the rest called synovial, is mere fat; and that what is called synovia, is secreted here and in all the other joints, by the veffels of that vafcular membrane covering the cartilages, and this fatty substance under the internal lamen of the capfular ligament of each joint. Befides the capfular ligament, there are two others covering the posterior parts of the condyles of the femur, and fixed nto head of the tibia, between its two cavities; thefe ligaments are firetched when the leg is extended, and re-laxed when the leg is bent, at which time they allow the little lateral motion of the joint by their being relaxed. Between the tibia and the femur are two femilunar cartilages; they are thick on their external edges, and thin in their centre. They are tied to the tubercle by their horns; they alter their figure according to the fituation of the bones, to make the shape of one correspond to that of the other.

It fometimes happens, that pieces of cartilage, or bone covered by cartilage, are found loofe in the cavity of the joint of the knee. These are of different fizes. Some of them are as large as common garden beans. They are generally flat, oblong, having their edges rounded. It is feldom that there are more than one of these loofe cartilages in a joint; but fometimes there are two. Mr. Cruikthank fays, that he formerly confidered them as belong-ing to the patella; and that, like the offa triquetra in the skull, they owed their origin to distinct points of officeation. But having fince found one entirely cartilaginous, and another, which, though bone, covered by cartilage, was formed on the lower end of the femur, and this cor rinced him of his mistake. In the last mentioned case Mr. Cruikshank says, that there was a cavity in the lower end of the femur, corresponding to the loose bone, shew-ing that they had been connected with one another; though, as both furfaces was nearly fmooth, the manner of their connection was not evident. He supposes that, during their growing, these cartilages and bones are con-nected to the neighbouring parts by vessels; and that, when either their determined growth is finished, or their size is too large for the easy motion of the joint, they become loose. When they become loose, the synovia, from the irritation they induce, is fecreted in greater quantity; the cafpular ligament becomes diftended, the three appears swelled, a degree of stiffness takes place in the motion of the joint, with more or less of external in-flammation. There is also the distinct feel of the sluid underneath; and the loofe bit of cartilage gets frequently above the condyles of the femur, on the out or infide of the knee, and may be laid hold of with the thumb and finger through the integuments. When the patient hath walked much, the fynovia is fenfibly increased, and on remaining more quiet, for two or three days, is as fenfibly diminished. The fymptoms are fometimes fo mild as not to need an operation, but at other times it is the only expedient for relief. Mr. Cruikshank here observes, that much feems to depend on the furgeon, whether this operation shall be a dangerous one or not. Mr. John Hunter recommends the moving them by incifion; but thinks the particular fpot where the operation is to be performed, as well as the manner of operating, deferve the greatest attention. There is a part within the cavity of the joint of the knee, which receives the basis of the patella, during the extension of the leg. It partakes more of the nature of cellular membrane than capfular ligament, and lies under the lower extremities of the vafti and crureus muscles, before they are inserted into the pajoint of the knee being a ginglymus joint, admits, confequently, of only flexion and extension, except when it is or bone, and cut down upon them at this place; the in-

cifion, he thinks, should be no larger than just to allow of their being eafily thrust out. A slitch or two is then to be passed through the divided integuments, and the lips of the wound, by these means, are to be brought together. These stitches, however, must not pass into the cavity of the joint; inflead of uniting the parts in this cafe, they would act as fetons, and produce inflamma-tion in place of preventing it. To be convinced of this hit affertion, he fays, one needs only to be put in mind of the introduction of a feton into the tunica vaginalis testis, for the radical cure of the hydrocele. The aim of the furgeon then is, if possible, to heal the wound by the first intention. A piece of sticking plaster, with proper bandage, and polition of the joint, may even make fittches in the integuments unnecessary. Mr. Hunter recollects fix or feven cases in which these cartilages were removed by excision, though not just in the manner recommended: all of thefe, except one, did well. The operation in this one was attended with great inflammation, and followed by an anchylofis of the joint. Other inflances of ill fuccess I have heard of, but it must be observed that there are constitutions where any wound, much more a penetrating wound into the cavity of the joint of the knee, will be attended with danger. The circumftances which the operator has most to avoid, Mr. Hunter afferts, is the exposing the cavity of the joint too much; the lacerating or bruiling of the capfular ligament; the not properly closing the orifice in the integuments; or the employing a blunt or dirty inftrument in the dividing them. All, or any of these circumstances, be thinks, will produce inflammation in the joint, and render the operation exceeding dangerous. But in tolerably found conflitutions, the operation now recommended, performed with the necessary precautions, he is con-vinced, is as fafe a one as most operations in surgery. When the cavity of the joint has inflamed, the danger, he owns, is very great. Ligament and cartilage, the sub-flances composing joints, have fewer vessels than any other parts perhaps of an animal body; they inflame, suppurate, or go through the usual processes of parts under irritation, with greater difficulty; and, when they have gone through them, the confequences are generally destructive of the ordinary intentions of these processes; the joint anchyloses, and is destroyed instead of being recovered. The irritation, meanwhile, attending such fruitless processes, generally prove fatal. See Mr. Cruikshank's Letter to Dr. Duncan, in the Edinb. Med. Commenta-

ries, vol. iv. p. 342, &c.

GENUFLEXIO. KNEELING. In kneeling, the offa pubis are lower than when we stand; and this not only increases the hollow of the loins, and throws the belly and its viscera more outward and forward, but also, in fome measure, strains the abdominal muscles; which is so uneasy to some persons as to cause them to faint away. This depression of the os pubis in kneeling, depends partly on the tension of the two musculi recti anteriores, the lower tendons of which are, in this fituation, drawn with violence under the condyloid pulley of the os fe-

Winflow.

GENUGRA. A name in Paracelfus for the gout in

GENUS. In botany is a class or order of plants hich agree in fome common character that diftinguishes

them from all others.

ration by folution.

The abbreviation of Gerarde: by it is often GER. to be understood the Herbal gathered by John Gerarde, and which was improved by Tho. Johnson. GER. EMAC. The abbreviation for Gerarde's Her-

bal enlarged, &c.
GERANIS. A bandage used by the ancients in case

of a fractured clavicle, or a diflocated shoulder. GERANIUM. A bandage which from the days of Hippocrates was thus named, but is now called fpica fim plex. In BOTANY, it is the name for CRANE'S BILL. Of this kind of plant Boerhaave enumerates fixty-eight species. It hath its name from the remarkable long beak of its feed-veffel, which resembles that of a crane: it confifts of five capfules opening inwards, and containing each a fingle feed: the flowers are pentapetalous.

GERANIUM ROBERTIANUM, Linn. also called gratia Dei, and HERB ROBERT. It hath reddish or purplish flowers on one pedicle; the leaves are divided quite to the foot-stalk into three segments, and these again are deeply cut. It is the only fort used in medicine.

---- BATRACHIOIDES, also called gratia Dei Germanerum, and CROW'S FOOT CRANE'S BILL. It is the geranium pratenfe, Linn. It hath two blue (but fometimes white) flowers on one pedicle; the leaves are large, wrinkled, and divided into five or feven fegments, which again are deeply cut on their edges.

- COLUMBINUM, called also pes columbinus, DOVE'S FOOT, and DOVE'S FOOT CRANE'S BILL. It hath purple flowers, standing two on a pedicle; the leaves are shaped like those of mallows, and have long foot-stalks.

Moschatum, called also acus moschata, Mus-

covy, and MUSKED CRANE'S BILL. It hath a number of red flowers on one pedicle; the leaves are indented, oval-shaped, set in pairs along a middle rib, which is ter-minated by an odd one.

- SANGUINARIUM, called also bematodes, and BLOODY CRANE'S BILL. It hath solitary flowers, which on their first appearance are red, but soon change to a bluish colour; the leaves are roundish, but divided almost to the pedicle into five fegments, which are often fubdi-

vided at the extremities into three.

All these plants are found wild in different parts of this kingdom; they flower in May, June and July. They have an aftringent tafte; the first species hath an unpleafant fmell; the second, third, and fifth have no smell; the fourth hath a musky scent, but it is soon lost by bruifing the plant. Their stiptic matter is extracted both by water and rectified spirit, and on evaporating the filtered liquor remains in the extract. See Raii Hist. Lewis's Mat. Med.

GESNERA. An American plant fo named by Father Plumier, in honour of Conrad Gefner. Miller describes three species.

GESOR. GALBANUM.

GESTATIO. A species of exercise. See AGRA.
GESTATIO. GESTATION OF PREGNANCY. It is the progress of the foctus from the time of conception to that

of parturition.

When the ovum falls into the uterus, it is faid to be about the fize of a poppy head; that in ten days it weighs half a grain; in thirty days twenty-one grains; in three months about three ounces, and at the end of nine months children are of different fizes from four to nine pounds

in weight: ten or eleven pounds are very rare.

Women with the first child frequently have great pain in the parietes of the belly from the uterus dilating the

mufcles :

muscles; in this case some relief is obtained by rubbing the parts in pain with warm oil.

The time of a woman's pregnancy is nine folar months, each of which is reckoned to be about thirty days, ten hours and a half; but it often happens that the child is born at feven months, and fometimes at ten.

After the conception the face foon points out that an alteration in the constitution hath taken place. It is from in-ercased irritability that the chief of the symptoms attending pregnancy arile; they proceed from the uterus as the principal fituation of the first cause. The uterus becoming more habituated to diftention, &c. fome of the fymptoms abate, but there still remains a sufficient number to prove that pregnant women are attended with an increased fpafmodic irritability, and which feems to be necessary for promoting the delivering of the fœtus at the proper period; for it is increased during labour, but after that it disappears.

Women who conceive whilft they give fuck, frequently have not the menses to reckon from; therefore, the best way is to fet down four months when the first motions of the child are perceived: those who have the menses should count from the middle of each period, and they will feldom differ more than four or five days.

Though, in some few instances, women are met with who know their state from the moment of conception, yet in general it is not easy to assure a patient of her pregnancy, or the contrary, until the end of the fourth month, and then the only proof is by the touch, which, in this case may be thus performed: place the woman on her seet, with her buttocks against a chair that is rather higher than common, let her lean forward with her breafts, and then introduce two fingers into the vagina; then, if the is pregnant, the os internum will be found entirely closed, the neck of the uterus will be felt, but it is yet very little or not at all altered: as the preg-nancy is more advanced, the nearer it is to parturition, the thinner or flatter is the neck of the uterus, and the larger the uterus itself. If the touch is attempted before the fourth month, when you endeavour to prefs against the uterus, it being light, evades the touch, and rifes above the finger. If on thus examining you feel the flat, small, and hard body of the uterus, she is not pregnant; but if she is, the uterus will be in some degree enlarged. La Motte, before he makes his effay by the touch, lays the woman on her back, with her knees elevated, and the heels near the buttocks, and if he finds the belly more hard and diftended in the hypogastrium than in the epi-

gastrium, he judges the woman to be pregnant.

As to all the other usual signs of pregnancy they are uncertain, as they may be produced by obstructed menfes. A nervous fever, tympany, ascites, dropfy of the uterus, hydatids forming themselves on remaining pieces of the placenta, a feirrhous womb, dropfy of the ovaries, a polypus in the uterus, &c. from all which a pregnancy thould be diffinguished.

Many interesting observations on this subject may be feen in the practical treatifes on midwifery, and on the

management of pregnant and puerperal women.
GESTICULATIO. GESTICULATION. Two species of gymnaftics, confifting of a fpontaneous agitation of the parts, and throwing the body into different poftures, much like actors on the stage. Oribasius, says, it is a middle kind of exercise betwixt dancing and mock fight-

GILIADENSE BALSAMUM. See BALSAMUM CAR. POB LSAMUM.

GILLA VITRIOLI. See VITRIOLUM ALBUM. GINGIBERIS AMARITUDO. See CANELLA ALBA. GINGIBRACHIUM. A name for the feurvy, be-

cause the gums, arms, and legs, are affected with it.
GINGIDIUM. COMMON CHERVIL; see CHERO-PHYLLIS, also the oriental tooth-pick, and a species of carrot. See Thapsia orientalis.

GINGIDIUM HISPANICUM. See VISNAGA.

GINGIHIL. See ZINGIBER.

GINGIPEDIUM. A name for the feurvy, because

the gums and legs are affected.
GINGIV A. The gums. They are that reddifh, compact, fleshy substance which covers the two sides of the whole alveolary border of both jaws, infinuates itfelf betwixt the teeth, and adheres to them. Arteries from the carotids run in the gums and nerves from the fifth pair.

The gums are apt to become fpongy, and to separate from the teeth; but the cause is frequently a stony kind of cruft; which forms itfelf therein, which when feparated, the gums foon return to their former state, especially if rubbed with a mixture of the infusion of roses sour

parts, and the tincture of myrrh one part.

The feury is another diforder which affects the gums. This diforder, when not manifest in any other part, sometimes appears in this: indeed when a feorbutic diforder invades the whole habit, its first fymptom is a putrid state of the gums. Sometimes a fcorbutic complaint attacks the gums, and occasions heat, pain, and itching there, and presently after, if they are flightly touched, they bleed; then white spots appear here and there, which are red and instamed about their circumference. If this case is neglected, especially in young persons, it spreads, and a copious flux of thin setid faliva is discharged, which corrodes all around it. In Holland it is called the water cancer. Befides proper internal antifcorbuties, the beft external application is the acidum muriaticum, diluted with water.

GINGLYMUS. It is a species of diarthrofis, called also cardo. It refembles the motion of a hinge, whence its name. There are properly but two species of this fort of articulation. The first is confined to slexion and extenfion. Winflow calls this the angular ginglymus. In this fort of ginglymus either each bone partly receives and partly is received by the other, as in the articulation of the humerus with the ulna; or many eminences in one bone are received into as many cavities in the other. The fecond is adapted only to fmall turns towards each fide, or to fmall lateral rotations; hence Winflow calls it a lateral gynglymus; it is either fingle, as in the articulation of the first vertebra of the neck with the apophysis dentiformis of the fecond; or double, that is in two different parts of the bone, as in the articulation of the ulna with the radius.

GINSEN, or GINSENG. See GENSING.

GINSENG. A species of panax. It is the panax quinquefolium, or panax foliis ternis quinatis, Linn.

GISCARA. A species of palm-tree.

GLANDES TERRA. A name used by some authors for a tuberous root of a plant called lathyrus repens tuberofus. GLANDES

GLANDES UNGUENTARIÆ. MYROBALANS. Sec 1 MYROBALANI.

GLANDIUM. See THYMUS.

GLANDOSUM CORPUS. See PROSTATE.

GLANDULA. ADEN. A GLAND. A gland may be defined a circumferibed apparatus of the foft parts, whose office is to secern a certain juice, and throw it out of the immediate circulation.

The glands are roundish bodies, seated in the cellular membrane, generally near the large veffels; their fubstance is firm, and of various colours. Sylvius was the first who divided the glands into conglobate, now called lymphatic, and conglomerate. Malpighi added what he called the folliculus or fimple gland; inftances of which are the fmall glands behind the ears, but the most re-

markable are those in the fauces.

Dr. Nicholls divides the glands into finuous, tubular, and equal. What he means by finuous gland is when each little gland hath its own excretory duct, through which it transmits its liquor to a common bason, as the kidnies; his tubular is the fame as the conglobate gland of Sylvius, of which the telles are an inflance. By an equal gland he means where the veffels are branched, as in the liver.

Ruyfeh proves by fubtle injections, that the fubflance of the glands is vafcular, confifting of a ramefying artery, partly terminating in a vein, and partly in an excretory duct.

Mr. Hewfon fays, that the little corpora globofa, which

most modern anatomists call cryptæ and folliculæ, are no-

thing but convoluted arteries.

The glands are often difordered by becoming large and indurated; when they are fwelled and hard, they are faid to be indurated; if they grow harder, they are faid to be feirthous; if when hard they become painful, they are incipient or occult cancers; if their hardness and pain continue long, they are called carcinomata, or invested at occult cancers; and if the fkin breaks, they are called ulcerated cancers.

Indurated glands in children's necks are generally from voracity, or a bad diet; the cure therefore will confift in moderating the quantity and amending the quality of their aliment. These tumors, even though they tend to suppuration, may generally be removed by the use of small dofes of calomel. Sea-water is also used before suppuration begins, and the extract. cicutæ powerfully refolves them. See Scrofula, Scirrhus, Cancer, Lupia, Nævus. See alfo Kirkland's Med. Surg. vol. ii. p. 475.

On the glands, as a fubject of anatomy, fee Sylvius, Malpighi, Ruysch, Cowper, Havers, de Bordeu, &c. GLANDULA LACHRYMALIS. See CARUNCULA LA-

CHRYMALIS.

GLANDULÆ CERUMINIS. See Auditorius MEATUS.

MYRTIFORMES. When the hymen is torn, its fibres contract in three or four places, and form what is thus named.

- ODORIFERÆ. They are fituated on the infide of the corona glandis, i. e. of the glans penis; they fecrete a fluid, whose thin part flies off, and the thicker remaining, acquires a particular odour, whence the name. These glands are often the seat of a clap, in those who have a long prepuce; and when affected they emit a pus exactly fimilar to that which flows from the urethra.

SUPRA RENALES. See CAPSULA, ATRABILA-

RIÆ.

- VASCUSLRES. See GLANDULÆ MUSCOAÆ. GLANDULOSOCARNEUS. Glandulofocarneous. An pithet given by Ruysch to some excrescences which he observed in the bladder.

GLANDULOSUM CORPUS. The prefirate. GLANS. See GLANS PENIS, and BALANOS. It is alfo a strumous swelling; and a name for a pessary, or a

Suppository.

GLANS JOVIS THEOPHRASTI. The CHESTNUT-TREE.

See CASTANEA.

GLANS UNGUENTARIA. See BEN. GLASTAVIDA CRETENSIUM. A species of blattaria.

GLASTEA BILIS. A fort of bile.

GLASTUM. WOAD. It is also called isatis sativated vel latisfolia. It is the isatis tinctoria, Linn. It is cultivated only for the use of dyers, who obtain from it their best blue; an inferior fort is called by the French vonede; and indigo is reckoned the produce of the worst species. This plant is not used in medicine, though it is faid to be aftringent. From the isatum sylvestre, a volatile salt hath been obtained by fermenting the herb only, and without the affiftance of fire. See Lewis's Mat. Med. Neumann's Chem. Works.

GLASTUM INDICUM. See INDICUM. GLAUBERI SAL. GLAUBER'S SALT, fal mirabilis, fal catharticum Glauberi, now called NATRON VITRIO-LATUM, vitriolated natron. The fal Dauphiny is a na-tural production of this kind, but that in general use, and which receives the name of Glauber (its author) is artificial. It confifts of a vitriolic acid in union with the mineral alkaline falt, and fo is a neutral falt.

The London College directs to take of the falt which remains after the diffillation of the muriatic acid, two pounds, diffilled water two pints and an half, burn out the fuperfluous acid with a ftrong fire, in an open veilel; then boil it a little in the water, ftrain the folution, and fet it by to crystallize. Ph. Lond. 1788. In cold weather it will shoot in forty-eight hours, and in warmer weather in about twice the time.

The fineness and largeness of the crystals depend, in a good meafure, on the quantity of acid. The Edinburgh College directs one part of the oil of vitriol to two parts of fea-falt for obtaining the spirit of falt, and the residuum is as nearly of a due degree of acidity as can be ascer-

tained by a general rule.

Mr. Fergus, in Piccadilly, London, fays, that from kelp fb ii. is and fomething lefs than two ounces of the oil of vitriol, he obtained half a pound or more of Glanber's falt. This is cheaper than when the foda is used. He prepares it as follows: take calcined kelp, 15 i. pow-der and diffolve it in a glazed earthen pan with boiling water, fb ii. then filter or decant the clear liquor into another glazed earthen difh, which being placed over a gentle fire, as foon as it is hot, gradually pour into it as much oil of vitriol, diluted in the proportion of one part oil with one and a half of water, as is necessary to faturate it; when no effervescence is observed on adding the diluted oil of vitriol, then filter the mixture through paper, or let it stand to depurate; then decant and evaporate to a pellicle, and fet it by to crystallize.

The fal. cath. amar. is nearly of the fame quality with the natron vitriolatum, and is often substituted for it, after being that into crystals resembling the natron vitriolatum, but though both these falts have the vitriolic acid, their bases are not the same. The Glauber falt hath the mineral fixed alcaline salt for its basis, but the sal cath. amar. hath the alcaline carth called magnefia alba for its basis. When one is imposed for the other, the deception may be detected as follows: diffolve a little of the fufpected falt in water; then add to it a fmall quantity of a folution of any fixed alkaline falt; let both these folutions be clear; if no change happens on the mixture, the fuspected falt is the genuine Glauber falt; but if a milky turbidness succeeds, which after a while falls in the form of a powder, it is the fal cath. amar.

The true natron vitriolicum is apt to lofe fo much of its water as to become opake, and at length, if kept in a dry

place, it falls into a white powder.

place, it falls into a white powder.

In doles of a few grains it is aperitive, in larger ones it is diuretic and eathartic; as a purge it is given from \$\frac{3}{3}\$ fs. to \$\frac{3}{2}\$ ii. and if it is diluted in water from \$\frac{1}{1}\$ i. to \$\frac{1}{1}\$ ii. It answers every purpose of the Epsom and other fuch purging waters. It is cooling, and so checks the vis vitae, that Dr. Alston observes it to be a specific in the process from a paresaction of the blood. Some - Penis, called also balanus, caspis, and NUT. It hamorrhages from a rarefaction of the blood. Some is formed by the corpus spongiosum urethrae, which is surgeons with a solution of it in vinegar; turned over the corpora cavernosa penis. Its external and Dr. Kirkland finds it useful as a topic in ophthalfurface is a continuation of the integuments, and when mies. But on the other hand, a too free use of it hath the cuticle is taken off, every little villa feems a veffel. In the fifth volume of the Edinb. Med. Effays, is an account of a glans penis being regenerated after amputation.

See Lewis's Mat. Med. and Dict. of F

DIGLAUCIUM, and PAPAVER SPINOSUM.

GLAUCIUM GALLIS. A species of poppys GLAUCOMA, GLAUCOSIS, or GLAUCEDO, from yasses, a sky-blue colour, or from yasse, an owl, whose eyes are of that colour. Mr. Sharp, in his Operations of Surgery, p. 158—163, fays, that the glaucoma of the ancient Greeks is the fuffulio of the Latins, and the cataract of the present times. See CATARACTA. Mr. St. Yves fays, it is a cataract accompanied with a gutta ferena; called cataracta glaucoma, according to which nothing need be added, except that, in such a case, the operation, and all other means are ufclefs, unlefs to eafe pain, and to mend the figure of the eye. See Wallis's Sauvages, on the Eyes, p. 221.

GLAUCOMA VOGELII. See CALIGO HUMORUM.
— WOOLHOUSII, MAITRE JEAN, S. IVES. See

GLAUCOS, or GLAUCUS; also Caefius. Sky-coloured, or a blue and grey like that in the fky. Pliny takes no-tice of a fift thus called.

GLAURA. Thus Paracellus calls immature annue. GLAUX. WILD CHICHES; cicar fylvefire; also a species of owl.

GLAUX DIOSCORIDIS, called also glaux Hispanica, MILK-WORT of Dioscorides, and ciceri sylvestri minori affinis. It is much disputed what it is. Dale.

- VULG. LEGUMINOSA; also called ufiragalus; glycyrrbiza fylvestris store lutes; fænum Græcum sylvestre; bedysurum glycyrrbizatum, and Liquorice vetch. It grows in thickets and about bushes, and under hedges; it slowers in July: the herb and seed are commended for increasing the milk in women's breasts; the root is fweetish, aftringent, and diuretic, but it is very rarely used. This plant is often sold for the galega. Raii Hist. GLECOMA HEDERACEA. See HEDERA TER-

REST.

GLISOMARGO. WHITE CHALK. GLOBULARIA FRUTICOSA. See ALYPUM. Monspeliensium, vel Vulgaris. French

GLOBUS HYSTERICUS. In hyfteric diforders a globe feems to afcend from the flomach, or from the breaft, into the throat, and almost suffocates the patient; this feeming ball is a fpafmodic affection, and is produced by the fpafm of the upper orifice of the ftomach being relaxed, and the air ruthing up into the celophagus, where it is confined in consequence of a spasm in the muscles of this part. In violent attacks for immediate relief, put the feet in warm water, and give an opiate.

GLOSSA. The TONGUE.

GLOSSOCELE. An extrusion of the tongue.
GLOSSOCOMA. A RETRACTION of the TONGUE. A RETRACTION of the TONGUE. GLOSSOCOMON. Properly a case for the reeds of an hautboy, from y λωσσα, a tongue, and nouse, to guard, or GLOSSOCOMION. An inftrument or cafe for containing a

GLOSSO-PHARYNGÆI. These muscles are fibres

Chem. For many curious properties discovered in this, and stable the come from the tongue, running along its lateral codes, from which they are parted backward, and run GLAUCIUM. The YELLOW HORNED POPPY. See down on the fides of the pharynx under the ftylo-pharyngai. See PHARYNX. Also a name of the cepbale-pha-

ryngei.
GLOSSO-STAPHYLINI. Thefe two mufcles are fixed in the lower and lateral part of the basis of the tongue, whence they run up obliquely backward, along the an-terior half arches of the septum palati, and terminate in-fensibly on each side near the uvula. The thickness of the two anterior arches of the palatum molle is occafioned by thefe.
GLOTTA. The TONGUE.

GLOTTIS, from 3 2017a, the tongue. It is the narrow flit at the upper part of the afpera arteria, and covered by the epiglottis when we hold our breath, and when we swallow. The glottis, by its dilatation and contraction, modulates the voice. It is a name also for the bird called

the GREAT PLOVER.

GLUS. The fame as dysuria mucosa.

GLUTÆA ARTERIA. It is a branch of the Hypo-GASTRIC ARTERY, which fee. It is generally the largest of these branches; near its beginning, it sometimes sends out the iliaca minor, and fometimes the fmall branch that goes from that artery to the os facrum, and other parts fixed to that bone; afterwards this artery paties out of the pelvis in company with the feiatic nerve, through the upper part of the great finus of the os innominatum, below the mufculus pyriformis, and is diffributed in a radiated manner to the three glutzei mufcles. In its paffage it gives branches to the os facrum, os coccygis, the mufculus pyriformis, the mufcles of the anus, and to the neighbouring parts of the rectum, forming a particular hæmorrhoidalis interna. It fends twigs to the bladder, and parts near it; and detaches a pretty long branch, which runs down along with the feistic nerve.

GLUTÆUS MAXIMUS. Brown calls it glutæus

major. This muscle rises from the posterior lateral part of the os occygis, from a ligament which is extended between the os facrum and os coccygis, from the flat fur-face of the ileum, where it is connected to the os facrum, and from the spine of the ileum. Its anterior portion grows tendinous, where it runs over the trochanter major, and makes part of the fascia of the thigh. Its posterior portion is inserted into the hind part of the femur, ferving to extend it. This muscle, with the glutzeus medius and glutæus minimus, make up the fleshy part of the

buttocks; whence their name.

- MEDIUS. It rifes as high as the fpine of the os ileum, and is inferted into the very uppermost part of the trochanter major, ferving to bring the thigh backward and outward.

MINIMUS. It rifes rather lower than the pre-ceding, and forms a middle tendon, which is inferted into the trochanter major, blended with the medius. It is an abductor of the thigh.

GLUTIA. The two fmall protuberances in the brain, called nates.

GLUTOS. GLUTOS. A BUTTOCK, from yash, buttock. GLUTTUPATENS. An epithet for the flomach.

GLYCYMERIDES MAGNA. See CHAMA.

GLYCIPICROS. WOODY NIGHT-SHADE. GLYCYRRHIZA, called also liquiritia; radix dulcis; and abipson; Liquorice. It is the glycyrrbiza glabra, or glycyrrbiza foliolis ovatis, impari petiolato, stipulis nullis, sloribus pallide cœruleis, leguminibus glabris, Linn. SMOOTH LEGUMENED, or COMMON LIQUORICE, It is a plant with oval leaves, fet in pairs along a middle rib; the flowers are finall, bluish, and papilionaccous, stand-ing in spikes or naked pedicles; the flower is followed by a fmooth pod, containing flat kidney-shaped seeds; the root is long, slender, slexible, of a brownish colour on the outside, and yellow within. This plant is perennial, a native of the southern parts of Europe, and plentifully cultivated in England. The roots may be taken up the third year after the slip or off-sets have been planted.

The English liquorice is as good as any of the foreign: the root, when carefully dried and powdered, is of a richer and more agreeable taste than when fresh, and of a dull yellow colour, with a cast of brown; but what is commonly fold is adulterated by a mixture of flour. The dry root is as good as the fresh; the fresh may be kept from drying, if buried in dry fand; wet fand rots it.

Liquorice

Liquerice is almost the only sweet that quenches thirst; and for this quality the Greeks call it adipfon. But this is supposed more to arise from long chewing the root, which brings out the acid and bitterish taste of the root, stimulates the mouth and fauces, and thus acts by producing a stux of faliva. If it is mixed with other unprolately medicines, it covers their offensive tastes; it is the least disposed to ferment, of any of the sweets: it is attenuant, detergent, diuretic, expectorant, and also de-mulcent; though by some it is only allowed to have properties fimilar to fugar, it gives out all its virtue to water; but as spirit diffolves less of the mueilage, the spirituous tincture and extract are the fweetest.

Extractum, vel fuccus GLYCYRRHIZA. Extract or juice

This extract would be best made, by pressing the fresh roots betwirt iron rollers, and then the juice might soon be inspissated without the loss of any of its virtue.

The College of Phyticians of London order this extract, with those of camomile, broom tops, gentian black hellebore, rue, and savin, to be made in the following manner: boil the article in distilled water, press out the decoction, strain it, and set it apart that the faces may subside, then boil it again in a water-bath, saturated with fea-salt to a consistence proper for pills. Pharm Lond.

- INDICA. See ABRUS.

GNAPHALIO. See AMARANTOIDES.
GNAPHALIUM. CUDWEED, called also albinum. Boerhaave enumerates seven species under the name of filage. See also Linagrostis. It is also a name of

fome foecies of BASTARD DITTANY.

GNAPHALIUM VULG. MAJ. Also called filago; berba GNAPHALIUM VULG. MAJ. Also called filage; berbaimpla; gnaph. Germanicum; and COMMON CUD-WEED. It grows about a foot high, usually with one woolly stalk, with long, narrow, crumpled, sharp-pointed, whitish leaves, set pretty close to the stalk; on the top of the branches are round globules or heads, composed of a number of small naked flowers in clusters, and from the middle of these spring smaller branches, bearing on their heads the like, but smaller flowers; these heads pass away in down, holding very small feed. It grows on dry haven grounds, and often on fallow fields. barren grounds, and often on fallow fields.

GONGYLION. A PILL.
GONOIDES, from your, feed, and edge, form. Refembling feed. Hippocrates often uses it as an epithet for the excrements of the belly, and for the contents of the urine, when there is something in them which resembles the seminal matter.

GONORHEA, from your, seed, and see, to flow. It is an involuntary efflux of seminal juice. Dr. Swediar cherves, that this name is improperly applied to the dif-

observes, that this name is improperly applied to the difcase known by it. He proposes, if a Greek word is ne-cessary, to name it blennorrhagia, from βλερτος, πυευις, and μεω, to flow, i. c. πυειβιακικ αεθίντικ; and thus he diftinguishes it from the real gover baras, and from gleets, to which latter he gives the name blennorrhoea, mucifluxus

paffivus, i. e without phlogiftic symptoms.

Some reckon three species of this disorder. Ist. A simple generator, also called a benign generator, and a gleet. 2dly. A virulent or venereal gonorrhaa; impro-perly so called from its resemblance to the preceding. 3dly. An involuntary efflux of a whitish fluid from the urethra, in consequence of avenereal gonorban. Dr. Cullen places this genus of disease in the class locales, and order apocenofes. He diftinguishes four species, I. Genorrhaa pura, when, without venereal engagements, a purulent discharge is observed from the urethra, without dysuria, &c. 2. Generrhwa impura, when, after impure coition, there is a purulent dicharge from the urethra, with heat of urine, &c. 3. Generrhwa laxorum, when there is a pellucid dicharge from the urethra, without erections of the penis, but with venereal thoughts while awake. 4. Generrhwa dormientium, when during fleep, but, in dreaming of venereal engagements, there are erections of the penis and confequent feminal difcharges.

The benign gonorrham is defined by Dr. Fordyce, in his Elements of the Practice of Physic, part the second, to be "an increased secretion from the mucous glands of the urethra, without infection." The matter discharged is whitish and mild, producing no excoriation or other disorder on the parts through which it passes, or on which

The principal cause is a weakness in the parts, which are the seat of the disorder; occasional causes, are acrimony in a cacochymic, scorbutic, or arthritic habit, violent or too frequent purging, violent exercise, too frequent coition, cold, excels of spirituous liquors, &c.

Dr. Swediar well observes, that the virulent gonorrhaa is a local inflammation, attended with the discharge of a puriform matter from the urethra in men, and from the vagina in women; accompanied with a frequent defire of making water, which occasions a fealding, or pricking and burning pain, during the time of its passage; and arifing from any flimulus applied to these parts, provided it be sufficiently strong. Sometimes, by the violence of the irritation, the secretion of mucus seems to be totally fuspended, or at least confiderably diminished, so that no dispended, or at least confiderably diffinition, to that no discharge, or only a very small one, takes place, though the other symptoms rage with the utmost violence. In this case the disease hath obtained the very, improper name of governheas sicca. He adds, though the matter (i. e. of the discharge) hath a purulent appearance, it is not a real pus; it is only the mucus of the urethra or vagina second in a larger quantity than usual, and changed in its creted in a larger quantity than usual, and changed in its

pearance. That the discharge from the urethra, &c. is only an increased discharge of the mucus of the parts, hath been some time supposed, but is first rendered undoubted by Dr. Stoll, of Vienna, with which evidence Dr. Swediar hath favoured us, by a note in his valuable publication on this subject. It is a follows: Dr. Stoll had, about the year 1782, the instructive opportunity of diffecting a man who died while labouring under a virulent gonorrbaea. On opening the urethra carefully, he found its internal furface preternaturally red; two of the lymphatics preternaturally white and enlarged; and the puriform matter ouzing out from the internal membrane, especially at the lacuna, where the seat of the disorder was, without the least appearance of an ulceration or excoriation."

When this complaint is the consequence of a venereal taint, the matter of the discharge is commonly adhesive and whitish, and capable of communicating infection, though the inflammatory fymptoms are entirely carried off; though fome fay it is incapable of communicating infection, even when the inflammatory fymptoms are not entirely removed. When it takes place from any other cause, it begins with a running nearly similar to that in a venereal gonorrban, but generally lefs in quantity, and is not attended with so much inflammation, and is never infectious. In both cases, the inflammatory symptoms may, by exposure to any of the causes, be increased to as great a degree as when there is insection; but they go off of themselves in a few days, and sometimes the running with them. The running sometimes ceases of itself in a week or two; fometimes it continues for years without any detriment to the patient; and now and then a cafe occurs, in which the patient is much weakened by it; for when it occasions involuntary emissions of semen, it may be fatal.

It is the most obstinate after a venereal taint, in phlegmatic habits, and in those who, when young were subject to catarrhous defluxions; for the fibres of such persons are very lax. Sometimes it relifts all means, and at last departs spontaneously.

The indications of cure are, 1. To deftroy the venereal virus. 2. To defend the parts from its acrimony. 3. To

abate the irritation which it occasions.

To answer these ends, oleous and mucilaginous injec-

To answer these ends, of cous and muchaginous injections are well adapted, particularly if they have opium, and the mildeft mercurial preparations combined with them.

A mild regimen, in all respects, is the most proper; mucilaginous drinks, as the almond emulsion and such like, should be plentifully drank; and if required, an anodyne may be given at bed-time. Much and strong and the property of the anodyne may be given at bed-time. exercife, and external cold, are to be avoided. Those of a less robust frame may be less sparing in their diet, and be not so abstemious with respect to cordial liquors.

If the venereal taint gave rife to it, and mercury hath been either not used at all, or in an undue quantity; or if there is any fuspicion of any remaining infection, the fafest method is to begin the cure by a mercurial course.

If fymptoms of an inflammatory fever appear, bleed-ing may fometimes be ufeful; but, in general, more fer-vice will be derived from topical evacuations of blood, and from emollient and fedative fomentations and poultices, Dr. Swediar observes, that on the other hand, when the patient is of a weak and irritable habit of body, the dif-charge very thin and copious, attended with violent pains charge very thin and copious, attended with violent pains and quick pulse, the cort. Peruv. given internally, according to circumftances, with or without opium, is the most uleful administration; and that opium given in emollient glysters, is sometimes particularly useful in these cases: it allays or prevents the frequent painful erections, the return of which should be prevented as much as possible.

To prevent the more violent symptoms, the patient should, from the beginning of the disease, wear a bagtrus, or other means to keep the scrotum supported and

Neutral falt, and other purgatives than those which

keep the bowels lax, are injurious.

When the fymptoms are more exafperated, as when the heat of urine is great, a tenfion is perceived in the length of the urethra, the urine is only paffed by a few

colour and confiftence by the stimulus applied to the parts; drops at a time, erections are frequent, pains shooting like the mucous discharge from the note or lungs, on taking cold, where the mucus assumes nearly the same appearance. That the discharge from the urethra, &c. That the discharge from the urethra, &c. will be necessary along the perinaum, and the infid of

The fame treatment will be proper when the discharge, during the inflammatory flage, is suppressed, and a her-nia humoralis is threatened or hith taken place.

If a fcorbutic or other acrimony is the cause, allay it at least before strengtheners are begun with.

When no circumstance, besides a weak habit, requires our notice, an infusion of the bark in red wine may be given to two ounces three times in the day; and other means of firengthening the general habit may be used.

Sometimes it happens that the cold bath increases the running; but when there is neisher plethora, nor a bad habit of body, nor any other contraindication, the patient may go into the bath every morning and evening; and after each emersion he may go into bed; and, whilst there, he may drink two cups of some warm infusion, by which the humours will be derived to the skin.

Refinous aftringents, such as the balf, capivi, &c. may be given three or four times a day; but in inflammatory habits much caution is required, to avoid the exciting any

new degree of inflammation.

The following injection may be used at proper intervals during two or three weeks. R Aq. pure vel aq. calcis si. 3 vj. pulv. e cerus, c. 3 i. zinci vitriolati puri-

flicati, gr. x. ad 3 fs. m. See Aretæus de Cauf. & Sign. Chron. Morb. lib. ii.e. 5. Fordyce's Elements, part ii. Tabes Dorfalis. Swediar on Venereal Complaints. Cullen's First Lines, edit. 4. vol. iv. p. 386, &c. Lond. Med. Journal, vol. ii. p. 23. White's Surgery, p. 400.

GOUDBOOM. A species of conocarpodendron. GOUI. A name for the feeds of the baobab.
GOUTIER. See BRONCHOCKLE.
GRACHIS. The name of fome mufcles; fo called

from their thinnefs and flatnefs.

GRACILIS. See RECTUS INTERNUS. It rifes close to the edge of the os pubis, where it joins to the ifchium, and runs to the internal condyle. It ferves to bend the thigh forward.

- ANTERIOR. See RECTUS ANTERIOR MUSC. Winflow gives the name of gracilis anterior to the rectus

--- INTERNUS. See RECTUS INTERNUS.
GRADATIO. GRADATION. Is an exaltation of the qualities of metals in degree by which their weight, co-lour, and confiftence are chiefly brought to a degree of perfection, for it has not the power of changing the sub-stance by itself, but only produces their qualities, or quantities, and makes them form a hidden state more manifest, their former species nothing changed; but if nature gives white gold, gradatisn makes it red; if volatile, fixes it; if impure, purifies it. Rulandus, Johnson. See Exal-

GRAMEN. GRASS. Tournefort enumerates eightyfix species; and others add many more. See Sceuch-zer's Agrostographia.

Grosses are one of the seven natural families, into which all vegetables are distributed by Linnaeus. They are defined to be plants which have very simple leaves, a jointed stem, a husky calyx, termed gluma, and a single seed. In Tournesort, they constitute a part of the fifteenth class, termed apetali; and in the sexual system of Linnaeus they are mostly contained in the second order of the third class, termed triandria digmia. Wheat, oats, barley, and rye, are grasses improved by culture. It is also a name for several sorts of triticum.

GRAMEN ALOPECUROIDES & ALOPECUROS. Fox-

GRAMEN ALOPECUROIDES & ALOPECUROS. FOX-

TAIL. Sec ALOPECUROS.

- ARUNDINACEUM; also called gramen dumetorum; gram. paniculatum arundinaceum; gram. tomentofum arund. gromen spica candida, &c. calamagrofis;
REED GRASS. It is a species of reed, of similar virtues
with the common reed. See CALAMUS. The root only is ufed.

- AVENACEUM. See BROMUS.

— CANINUM; also called gramen Dioscoridis; gramen repens; gram. loliaceum radice repente; quick GRASS; couch GRASS; and DOG'S GRASS. The French

GRASS; COUCH GRASS; and DOG'S GRASS. The French call it chien-dent. It is the triticum repens. Linn. It is a creeping grafs, of a whitish green colour, with knotty stalks, bearing a spike of imperfect flowers somewhat refembling a wheat-ear; the roots are whitish, or a pale yellow, long, slender, jointed at distances, variously bent and interwoven. It is perennial. Scheuchzer describes sexteen forts of this grafs.

The roots are sweetish, mildly aperient in obstructions of the viscera, diluent, deobstruent, diuretic, of use in ulcers of the bladder, difficulty of urine, and the stone in the gall-bladder. But in order to any good advantage, Boerhaave's direction to take some pints of the expressed juice of fresh roots every day, must be attended to; he observes, that sheep and cattle, when afficted with the stone, indurations of the liver, &c. in winter, are relieved in spring by the fresh grafs, which produces a diarrheea at the first, and then a resolution of obstructions, &c. tions, &c.

CRUCIS.

— CRUCIS.

— CRUCIS.

— CYPERIOIDIS.

— EGYPTIACUM.

See Nelim-Fl-salib. Are roots in medicine named cyperi; the long and round; and the plants which produce them both, grow in watery places, and have leaves and flowers, in fome measure results. The roots and plants are possessed of the same virtues as attenuants, deobstruents, diuretics, emenagogues, and stomachies, and are serviceable in the earlier stages of dropfy; they cure ill-fcented breaths, are good in nep-thritic diforders, in colies, and uterine complaints. They are taken in powder and decoction, though the present practice difregards them.

- DACTYLON; also called dactylon radice repente; gramen dactyloides; gramen canarium ischemi paniculis; gramen legitimum; COCK's FOOT GRASS.

It grows in fields and vineyards, in fandy places: its virtues are the fame as those of deg's graft.

DACTYLON AROMATICUM.
See JUNCUS.

- ODORATUS.

- DACTYLON PLUMEUM. A fort of grafs in Brafil. FESTUCA. See ÆGYLOPS NARBONENSIS.

  FUCHSII. A species of CHICKWEED.

  LOLIACEUM. See LOLIUM.

  MANNÆ; also called gram. dactylon esculen-

tum; ifchemen fativum: Russia seed, and Manna-Grass. It grows in Germany and Poland; its feeds are used; they are small, oblong, pellucid, white, of a faint taste, and, when decorticated, they resemble, and are found to possess the same qualities as rice.

PARNASSI. See PARNASSIA.

- POLYGONUM; also called fanguinaria; polygonum mas, & latifolium; COMMON KNOT-GRASS.

GRAMEN POLYANTHEMUM MAJUS. A species of

SPICATUM, &c. FOX-TAIL. See ALOPE-CUROS and PHALARIS.

TOMENTARIUM. See LINAGROSTIS.

GRAMIA. The fordes of the eyes. GRAMINULÆ. TADPOLES. GRAMMA. See DIABOLON.
GRAMME. The iris of the eye.
GRANA. See COCCINILLA.

- INSECTORIA; KERMES; See CHERMIS.

GRANADILLA. The Passion Flower. Miller mentions feventeen species: it is a fine ornament in gar-dens, but not noted in medicine.

GRANADILLA PERUVIANA. A name of the CATA-PUTIA MAJOR, which fee.

GRANAL. An evergreen tree in America, of a pois-

fonous quality.

GRANA PONDUS. A grain weight. It is the

weight of a wheat-corn.

- TIGLIA. See MOLUCCENSE LIGNUM, and CATAPUTIA MINOR.

GRANATA MALA. GRANATUM. Alfo called mala punica; malus punica; punica; malum granatum; malicerium; POMEGRANATE. It is the punica granatum. Or punica fylvestris Italica, foliis lanceolatis caule arboreo var. β, Linn. It is a prickly tree, or shrub, with long narrow leaves, deep red flowers, set in bell-shaped cups of the same colour; the fruit is about the fize of an orange; it confifts of a thick tough rind, externally brownish, and internally yellow, with a juicy pulp, and numerous feeds in cells like a honey-comb. It is a na-

The flowers are a mild aftringent, fimilar to those of the wild pomegranate; which last are preferred only on account of their being larger. The pulp of the ripe fruit is a grateful subacid sweet, and of the same general qualities as the summer fruits. The rind is moderately aftringent. gent, and is called cortex granati; malicorium; phidium, and fidium: it gives its virtue out most abundantly to water,

but the flower yields it most freely to spirit. See Raii Hist. Lewis's Mar. Med.

GRANATRISTUM. A name for a CARBUNCLE.

GRANATUS SYLVESTRIS. See BALAUSTIUM.

GRANDEBALÆ. The hairs under the arm-pits.

GRAND-GOR. See LUES VENEREA.
GRANDINES. Tumors on the eye-lids refembling.

hail-stones. See CHALAZA.
GRANDINOSUM (from its resemblance to an hail-

ftone) Os. See Os CUBOIDES.

GRANDO. Crithe. See CHALAZA.

GRANULATIO. It is a reduction of metals into fmall grains; and the raifing of the fleshy parts in ulcers in a healing flate.
GRANUM MOSCHI. See ABELMOSCH.

— REGIUM. See CATAPUTIA MAJOR.
GRAPHIOIDES, from ypapis, a pencil, and sides, a
form, i. e. Processus Styliformis. Also a process of the ulna towards the wrift.

GRAPHISCUS. An inftrument for extracting darts

with. Diocles invented it, and Celfus describes it.

GRAPHOIDES, or STILIFORMIS, from γραφικ, flylus, because of its supposed origination from the process of the temple bone, so called, see BIVENTER MUSCULUS.

GRAPHOY. BROAD-LEAVED LEOPARDS-BANE. See

DORONICUM GERMANICUM.

GRATIA DEI. A name of the HERB-ROBERT, of the HEDGE-HYSSOP, and of feveral other vegetables.

See GIRANTUM ROBERTIANUM.

— DEI GERMANDRUM. CROWFOOT CRANE'S

Geranium Batrachioides.

GRATIOLA; also called digitalis minima; gratia dei; water-hyssor, and hedge-hyssor. Gratio-la officinalis, or gratial floribus pedunculatis, solii lanceolatis ferratis, Linn. It is a low plant, with finely ferrated leaves set in pairs on the stalks without pedicles; the slowers are whitish, jointed, and surrounded with fibres. It is perennial; a native of the south of Europe; but it is raised in our gardens.

The leaves have a nauseous, bitter taste, but no re-

The leaves have a naufeous, bitter tafte, but no re-

5 G

markable smell; they purge briskly, and vomit also; 3 i. GUAIACUM. GUYAC. Also called guaiacen, hagieof the dry herb, infused in wine and water, is a full dose;
z so, in powders, a slight decoction of it in milk, operates
the most mildly; an extract made with wine is given to
two scruples. Kramer says, that this root is similar to
iperacuanha, and equally useful in diarrhoras and dysenteries; he says it cures intermittents, and is preferable
to the decoction of the woods in the lues venerea. See
Raii Hist. Lewis's Mat. Med. It has been said to be a
powerful promoter of utile and sweat, purging, and
Ultic Hutten says this wood was introduced in the powerful promoter of urine and fweat, purging and vomiting also at the same time; and has been beneficial in mania, gonorrhora, ozena, ulcers in the fauces, &c. Edin. Med. Com. vol. v. p. 6.
GRATIOLA COERULEA. HOODED WILLOW-HERE.

See CASSIDA.

GRAVEDO. A COLD. Gravedo imports a pain in the head with a fense of heaviness, or such a running from the nose as is when we take cold; it is the fame with catarrhus and coryza. Celfus translates xoguça, by the word graveds; and Colius Aurelianus translates it by the words catarrhus and nares. It is, most properly, that weight or lifteffnels which accompanies a transpiration, or taking of cold, as is commonly called, and, as Dr. Cullen observes, is generally a symptom of catarrh. See CATARRHUS.

By a cold is generally understood a sudden check of perspiration from an improper exposure to cold; the confequences of which, whilst confined to the general notion of a cold, are the same as attend the lesser degrees of catarrh: in its further advances, it is productive of fevers, confumption, and other diforders both troublefome and

dangerous.

Persons who easily take cold, should use frequently mo-derate exercise, and take such medicines as increase the vigour of the circulation, and strengthen the general system: the too great irritability of their constitutions may be diminished by opium, bark, refiding in dry cold places, &c. The disposition to take cold may be in a good degree lessened, by gradually acquiring the habit of being exposed to sudden changes of beat and cold.

Beginning disorders of this kind are much and speedily

relieved by immerfing the feet in warm water, just before

going to fleep.

On the fubject of taking cold, fee Dr. Fordyce's Ele-ments, in the article CATARRH; Heberden's Observ. in the Lond. Med. Trans. vol. ii. p. 521, &c. and Dr. Stern's Advice to the Comfumptive, &c. edit. 7. p. 9, &c. GRAVIDITAS. PREGNANCY. Also an extraordinary distension of the abdomen during pregnancy. GRENETTE. See Santonicum.

GRESSURA. The part between the pudenda and anus.

GRIELUM. See APIUM. Hippoclinum.
GRINDERS ROT. Scythe-grinders are fubject to a difease of the lungs, from the particles of fand mixed with iron duft, and this diforder is among themselves called by this name.

GRIPHOMENOS. Pains which go from the loins to

the hypochondres

GROSSULARIA, also called uva crifpa, and GOOSE-BERRY BUSH. It flowers in April, and its fruit ripens in July. The unripe fruit is faid to abate the longings of

GROSSULARIA non spinosa. Currants. See Ribes.

GROSSUS. An unripe FIG.
GRUMUS. A concentrated clot of blood, milk, &c.
GRUTUM. A fort of groß oatmeal.
GRYPA. An ointment described by N. Myrepfus. GRIPHIUS PES. An inftrument mentioned by Parey for extracting a mole from the uterus.
GRYPHUS. The PHILOSOPHER'S STONE.
GRIPOSIS. An incurvation of the nails.

as paper.

Ulric Hutten fays this wood was introduced into Europe in 1517; but Braffavolus fays, not until 1525. It is brought from Jamaica, Mexico, and other parts of the West Indies, particularly from the Antilles. It is brought over in large pieces, each weighing from four to five hundred dred weight; it is hard, compact, and fo heavy as to fink in water; the outer part is often of a pale yellowish colour, GRATTERONA. See APARINE.

GRAVATIO. See CAROS.

GRAVATIOUS. An epithet for a fort of pain attended with a fenfe of weight.

GRAVATIOUS. An epithet for a fort of pain attended with a fenfe of weight.

Gravati imports a pain in its perceived. When chewed, it imports a mild acris finell, except when heated, and then a flight aromatic one is perceived. When chewed, it imprefes a mild acrimony, biting the palate and fauces. Its pungency refides in its refinous matter, which it gives out in fome degree to water by boiling, but fpirits extracts it wholly.

Of the bark of guaise there are two kinds, one imooth, the other unequal on the furface; they are both of them weaker than the wood.

The gum, or rather refin, exudes from the tree, and is The gum, or rather refin, exudes from the tree, and is of a brown colour, partly reddifh, and often greenifh, brittle, having a gloffy furface when broke, of a pungent tafte, affecting the tongue and palate in the fame manner as is faid of the wood. The chief of what is brought to us is in irregular maffes, of a dutky green colour. There is a fort in drope; it is the beft, but is very rarely met with. In the choice of the wood, that which is the freshest, most ponderous, and of the darkest colour, is the best, the largest pieces are to be preferred; and the best method is to rasp them as wanted, for the finer parts are apt to exhale when the raspings or the chips are kept a while. In chusing the gum prefer those pieces which have

while. In chufing the gum prefer those pieces which have slips of the bark adhering to them, and that easily separate therefrom by a few quick blows.

Neumann affures us, that a composition of colophony and bassam of sulphur is imposed on the unwary for true gum guaiacum; but the cheat is easily detected by exposing it to a due degree of heat, by which the odour of the false is perceived to be quite different from that of the

The guyae wood was first introduced in Europe as a remedy for the venereal disease; it is a good affistant to mercury, as it warms and stimulates, and so promotes perspiration and urine; it also proves a gentle purgative in a somewhat increased dose, and these seem to be its primary virtues. When the excretory glands are obstructed, the vessels lax and flaccid, the habit replete with serous humours, in many cutaneous and catarrhous diforders, fome female weakneffes, in gouty complaints, and rheumatic diforders, it produces good effects. The hectic fever which fometimes follows a fallwation gives way to a decoction of the woods. Guaiacum is very valuable as a diaphoretic, for it feems the heart and great vertical more than it does the heart and great vertical transfer. more than it does the heart and great arteries; hence, fafer than those which act more powerfully on the latter parts of the fyftem; hence, from its action, it is juftly effected more effectual than other fudorifies in the lues venerea; and has, on this account, been found ufeful in

all cases of rheumatism, and, perhaps, in the gout.

A long use of this medicine hath been observed to produce a yellowness of the skin. In thin emaciated habits, and an acrimonious state of the fluids, it often does harm. It is also improper in hot bilious habits, and where the

fibres are very tenfe.

Three ounces of the wood, or four ounces of the bark, may be boiled in thiv. of water to thii. and if a little liquorice is added at the latter end of the boiling, or when the decoction is taken from the fire, it will abate the dif-GUABAM. A fweet cooling fruit which grows in the West Indies, See Raii Hist.

GUACATANA, also called fropbularia Indica. It is a plant which grows in New Spain. A cataplasm of it eases the piles. See Raii Hist.

GUAIABARA. A tree that grows in Hispaniola; the Spaniards call it uvero; the leaves are large, and used as paper. in the ftomach.

If the thin flavings of guyac are distilled in a retort, at first there arises a liquor which is almost purely water; then on increasing the fire, an acid, reddith, empyreuma-tic liquor paffes over with a little fluid reddith oil; befides thefe, much air is separated from this wood; the refiduum is a perfect coal. A pound of guaide um wood, diffilled over an open fire, gave 3 iii. is, of acid, which is called fpirit, and 3 i. fs. of empyreumatic oil.

Extractum Ligni GUATACI, molle & durum. Extract of

LIGNUM VITE, foft and bard.

Boil th i. of guaiaeam thavings in a gallon of water until half of the liquor is waited, repeating the operation by adding the fame quantity of fresh water to the fame thavings four or five times. The feveral decoctions past through a thrainer, are to be mixed and inspillated together; when the aqueous parts are almost exhaled, a little sp. vini. rect. may be added, that the whole may be reduced into an uniform tenacious mass. This extract is called fost when of the conflictence of a mass for pills, and hard when it can be powdered. The spirit is added at the conclusion of the boiling, that the resinous part may be perfectly mixed with the gummy.

Besides the virtues attributed to gayar in general, the harder extract is an excellent errhine.

Refina GUAIACE. Refin of GUAIACUM. It is prepared in the fame manner as the refin of JALAP, which fee.

The refin is the only active part of this wood; it is obtained pure by means of rectified fpirit of wine both from the wood and the gum. The natural refin is never pure; and about 3 xii. of pure refin is obtained from 3 xvi. of

Balf. GUAIAC. Ballam of GUAIACUM.

R Gum. guaiac. It i. balfam. Peruv. 3 iii. sp. vini. rect.

Ib i. fs. m. 'This was formerly called balf. polychreftum.

Pinel. GUAIACI. Tinclure of GUM GUAIACUM. Take of gum guaiacum, four ounces; compound spirit of ammonia, a pint and an half, digested for three days, and strain. Pharm. Lond. 1788.

The dose is from a small tea-spoonful to a large table fpoonful two or three times a day. Dr. Dawson frequently directs the larger of these doses with great advantage in rheumatic and arthritic complaints, in which cafes, and against palsies from lead, he extols this tincture as almost

a specific. See Raii Hist. Plant. Miller's Dict. Lewis's Mat. Med. Neumann's Chem. Works. Dict. of Chem. Cullen's Mat.

GUAIANA. CORT. See SIMAROUBA.

GUAJABO, See GUAJAVA. GUAJABO POMIFERA INDICA.

GUAJACANA, called also dio pyros, faba Graca la-tifelia, pjeudo lotus. The name of a plant, three species of which are mentioned by Boerhaave. They are not much known, but the leaves and fruit are fomewhat aftrin-

GUAJACUM PATAVIUM ANGUSTIFOLIUM.

i. e. Guajacana.
GUAJAPALA. See Moluccense Lignum.
GUAJAVA. The guava, guayava, guajabe; guajabe pomifera Indica. The name of a tree in the West Indies, whose fruit is offendered and moderately affingent. the root is also aftringent. Boerhaave mentions three fpecies. See Raii Hift.

GUAO. A West India tree called thetlatian; its

juice is fo acrid as to be injurious to those who sleep un-

GUAPARAIBA. The MANGROVE-TREE. It grows in the West Indies. It is also called mangle, and paretuvier. If the root is slit and toasted, then applied to the punctures made by the poisonous fifth called niqui, it per-forms a cure. See Raii Hift.

GUARERVA-OBA. WILD CUCUMBER.

GUARIRIGUIMYMIA. A florub in Brafil like a myrtle. Lemery fays its feed destroys worms.

GUARERVA. A fort of cucumber which grows in Brafil. See Raii His.

GUASSEM. Certain black feorbutic spots mentioned

GUATIMALA. An inferior kind of indicum. GUAVA; and GUAVAVA. See GUAJAVA.

GUAZUMA. BASTARD CEDAR. GUIDONIS. BALS. GUIDO'S BALSAM. See ANO-DYNUM BALS.

-GUILANDINA. MERINGA. Sec NEPHRITICUM LIGNUM

GUIRAPARIBA: The name of two forts of trees in Brazil, one of which is a fort of chony. See Raii Hitt.

GUITY-COROGA, The fruit of the guity-ibat It contains a ftone as large as a godfe's egg, the kernel of which is aftringent.

GUITY-IBA. A tree growing in Brafil, and bearing the fruit called guity-toroga. Two other trees are thus starned, viz. the guity-torolog, and the guity-toa.

GULA. See Œsopragus.

GUMA, MERCURY.

GUMMA. Plur. Gammata, a fort of lumor, to called from the refemblance of their contents to gums. It is a tumor arising out of the substance of a bone; it is so fost as to yield to the finger. When thefe tumors are harder they are called tooks, tophs; when harder fill, they rebones are exostoses. In venereal patients such tumors often happen on the head, and even in the middle of the most folid bones. They feem to be produced when the xelfels running between the bony lamina being either obstructed or inflamed are dilated, and so raise the incumbent laminie. Perhaps the bone degenerates too into a morbid foftness. A foftness of the bones fometimes fucceeds abfeefies of the adjacent parts, and fometimes the origin of the diforder is lodged in the fubftance of the bone, especially in the lues venerea; gummata have, how-ever, been discovered, when no such adequate cause could be observed. Perhaps there is an acid cacochymy, or a partial degree of what causes the molines. See Petit on Difeafes of the Bones. LUES VENEREA. Bell's Surgery, GUMMI. Gum. It is a concrete vegetable juice of

no particular finell or tafte, becoming viscous and tenacious when moistened with water; totally diffolving in water into a liquid more or less glutinous in proportion to the quantity of the gum; not diffolving in vinous fpirits or in oils; burning in the fire to a black coal without melting or catching flame; fuffering no difficution in the heat of boiling water.

The true gums are gum arabic, gum tragacanth, gum fenega, the gum of cherry and plum-trees, and tuch like. All elfe have more or lefs of refin in them.

The virtues of gums are fimilar to all mucilaginous fubstances in general, vegetable and animal; the more tenacious, glutinous vegetable productions, are called gums; those that are less so are mucilages. The first diftil naturally from trees, the fecond are the produce of

art. See Neumann's Chem. Works.

GUMMI ARABICUM, called also gum acanthinum, lamae; gum. Thebaicum, gum. Serapionis, GUM ARABIC, and the true GUM ACACIA. It exudes from the Egyptian scacia, or thorn-tree, whose fruit affords the infpif-fated juice of that name. See Acacia. In Linneus's fyltem, this tree is called mimofa Nilotica. The true Egyptian acacia. It is brought from Turkey in small ir-regular masses, of a clear whitish, or very pale yellow colour.

The gam Senegal is generally fold for it, but they are thus distinguished; the gam arabic is in whitish transpa-rent pieces; it is dry and brittle; but the gam Senegal is clammy, tenacious, rougher, of a deeper colour, and in

larger pieces.

The gum does not diffolve in spirit, nor in oil; yet when it is foftened with water into a mucilage, it is easily miscible with both, also with refins, and renders them miscible with water. Dr. Grew was used to mix essential oil with water by means of gum arabic; and in the Lond. Med. Obf. and Inq. vol. i. a variety of experiments are inferted, by which it appears that oils both expressed and diffilled, refins, balfams, &c. may by the fame means be mixed uniformly with water or with spirit. Alcaline falts both fixed and volatile, though they render pure oil miscible with water, prevent the mixture of gam with oil. Acids do not in the least prevent the effect of the gum in this particular.

Animal glues have the general qualities of the veget-

nutrimental, and apt to run into a putrid state. Confidered as the subject of chemistry their difference is very great; those of the animal kind are changed by fire into a volatile alkaline falt, and a fetid oil; the vegetable into an acid liquor, and a very minute portion of oily matter, confiderably lefs fetid than the former.

The medical character of gum arabic is its glutinous quality, in confequence of which it ferves to incraffate and obtund thin acrid humours, fo proves ufeful in tickling coughs, alvine fluxes, hoarfeneffes, in fluxes of the belly with gripes, and where the mucus is abraded from the bowels, or from the urethra. In a dyfuria the true gum arabic is more cooling than the other simple gums, to should be preferred. It is by some, and with apparent probability, only supposed to act as an internal demul-cent in the alimentary canal, notwithstanding the uni-versally prevailing doctrine of the much greater extent of its demulcent power and action. Cullen's Mat. Med. One ounce of gum arabic renders a pint of water con-fidenable alumination of the control of the con-

fiderably glutinous; four ounces gives it a quick fyrupy confiltence; but for mucilage one part gum to two parts water, is required, and for some purposes an equal proportion will be necessary. See Lewis's Mad. Med. Neu-

mann's Chem. Works.

GUMMI FUNERUM. See BITUMEN.

- GUTTA. See GAMBOGIA. AD PODAGRAM.

- RUBRUM ASTRINGENS GAMBIENSE. The RED ASTRINGENT GUM from Gambia, named alfo Kins. Some call it fang. dracon. offic. or the finest and true DRAGON'S BLOOD. Dr. Oldfield calls it true gum Senegal. In the inland parts of Africa it is called pan de sangue; pan is said to be a corruption of the Portuguese word palo, which

bgnifics wood.

It is supposed to exude from incisions made in the trunks of certain trees called pau de fangue, which grow in the inland parts of Africa. It is very friable, eafily breaking between the fingers; it is of an opake, dark, reddift co-lour, appearing almost black in the mass, and, when pow-dered, it is of a deep brick red. In chewing, it first crumbles, then flicks together a little, and in a fhort time feems wholly to diffolve, impressing a very considerable aftringency, accompanied with a slight sweetishness. It hath no smell.

It differs from the red lumps of the common gum Seneblood, in diffolving in water; and from both, in having fo remarkable a ftypticity when tafted. It diffolves both in fpirit and in water; they each take up about two-thirds

of it.

This gum hath been used in obstinate chronical diarders from laxity and acrimony. It is the most gummy of all the astringent drugs, and is a powerful astringent, proving such in several instances of diarrhea; it is also proving such in several instances of diarrheea; it is also serviceable in uterine hæmorrhages, and joined with alum, as in the pulvis stypticus. Ph. Edin. is considered by some as one of the most powerful aftringents which they have ever employed. Cullen's Mat. Med. See the Lond. Med. Obs. and Inq. vol. i. p. 358, &c.

—— Senegalense, called also gum Senega, gum Senica, gum Orientale, and gum Senegal. It is brought from the island Senegal, on the coast of Africa. It is faid to be the produce of a tree of the same genus with that which affords the gum arabic, acacia sliquis compressis, Ph. Paris.

pressis, Ph. Parif.

Greatest part of this gum is in larger and darker pieces than the gum arabic; it is rough on the outside, but c is fmooth: and in these two circumstances gum arab confifts the chief known difference, except that the gum arabic is dry and brittle, whereas this is clammy and tenacious.

The clearest pieces of gum Senegal are fold for gum arabic; in general their qualities are the same; but the gum arabic is thought to be more cooling, and the gum

Senegal is certainly more adhefive.

TRAGACANTHA, also called dragacanthum adraganth, GUM DRAGANT, and TRAGACANTH. This gum exudes from a prickly bush of the same name which grows in Crete, Greece, and Afia, (tragacantha, or fpina birci, GOAT's-THORN.) The aftragalus Mafbli-

able gums, with this difference that the former are more enfis, Linn. according to fome writers; and the aftragalus tragacantha albus, Linn. according to others. 'The Edinburgh Pharmacopocia directs the first. It is chiefly brought to us from Turkey, in irregular lumps, or in long vermicular pieces. In Candy it begins to exude about June, and is more or less pure and white according to the weather after its exudation, and its accidental mixture with dust.

Chuse that which is white, light, smooth, and transparent in vermicular strize, of a sweetish taste, and without fmell. A yellowith or brownith colour is no mark of

imperfection or impurity.

It differs from all other gums in giving a thick confiftence to a much larger quantity of water, and in being much more difficultly diffolved in water. It is the ftronger of the simple gums, and more powerful as a mucilage but not as a demulcent. In common with other gums, it softens and thickens acrid humours.

The pulvis e tragacantha compositus of the London College is thus made:

R Tragacantha in pulverem tritæ, gum. arabici, amyli singulorum. 3i. fs. facchari purisseati, 3 iij. simul in pulverem tere. Ph. Lond, 1788.

It is mild emplijent and affect in tablica

It is mild, emollient, and ufeful in tickling coughs, and for obtunding thin acrid humours. See Lewis's Mat, Med. Neumann's Chem. Works. Cullen's Mat.

GUSTATORIUS. A name of the third maxillary

branch of the fifth pair of nerves.

GUSTUS. The TASTE. Upon the tongue, towards the apex and fides under the fkin, are obtuse papille of various figures. These papille are prominent in the tongue of a living person, when put out and applied to any body to be tasted. In dead persons they absolutely disappear, but are very prominent in living hungry ones. They rise from the nervous body which covers the muscular flesh of the tongue, whence they pass through the perforations of the corpus reticulare in the same manner perforations of the corpus reticulare in the fame manner as in the fkin, and are covered with finall vagings formed by the exterior membrane of the tongue. These vagings are porous, that what is tasted by preffure may have the greater influence on them. Laurentius Bellini has shewn that these papillæ only are the medium of taste, and that the other parts of the mouth, tongue, and palate, contribute nothing to it, except perhaps those parts of the inner side of the cheek which lie near the meeting of the dentes molares

It hath been generally faid that the parts of fubitances which contain an oil and a falt are the true object af taffe; whence falt, fpirit, foap, and oil, must alike be the fame. It hath been also afferted that the diversity of taffer are owing to the different figures which are natural to falts; but as to this, professor Haller replies to the contrary and says that the mechanical reason of the diversity of flavours, feem to refide in the intrinsic fabric, or apposition of their clements, which do not fall under the scruciny of the senses. He says, that in general whatever contains less salt than the saliva, is insipid, but that the nature or disposition of the covering with which the papille are clothed together with that of the inices and of the alignment. ed, together with that of the juices and of the aliments lodged in the fromach, have a confiderable thare in determining the fense of taste; infomuch that the same slavour does not equally please or affect the organ in all ages alike, nor in persons of all temperatures, nor even in the same person at different times.

In general the taste determines what aliment is falutary;

for the most part whatever offends the taste is injurious in the stomach. See Haller's Physiology, in his Lecture of

GUTTA. A DROP. Drops are an uncertain form of administering medicines; and where great exactness is necessary, they should not be prescribed. The shape of the bottle from whence the drops fall occasions a considerable

shle difference in the quantity to administered; the con-filtence of the sluid is often a still greater cause of dif-

This is also a name of the apoplexy, from a supposi-tion that its cause was a drop of blood falling from the

brain upon the heart.

GUTTA GAMBA. See GAMBOGIA.

— OPACA. See CATARACTA.

— ROSACEA. See VARUS. Also called simply refaces, from the little red drops or fiery tubercles different barrache free and research. perfed about the face and nofe; fome call it rubedo maculofa, or rubercum macules, Ionthas butiga, gutta rubea ruonia, and rofea. Nicholaus Florentinus diftinguishes three degrees of it, viz. 1. Rubedo fimplex, seu facier rubra. 2. Rubedo puffulosa. 3. Ulcerosa. He also says that the cause is a hot viscous blood, generated from an intemperies in the liver, which being brought to the sace stops there, and causes redness, and when it does not foon obtain a passage through the skin, it rises into pimples, and at last ulcerates, having vistated the frame of the cutaneous glands by its long stagnation.

That the cause is in the liver seems to be supported by That the cause is in the liver seems to be supported by observing that often, on the disappearance of stery pimples in the face, an indurated liver is a consequence, and thence a dropfy; and, on the contrary, disorders of the liver are sometimes relieved by cruptions in the face, whence great care should be used in applying topics.

Though tipplers are most subject to this complaint, the most abstemious are sometimes affected with it, by

fuddenly drinking a draught of cold water when they are

The prognostic is doubtful as to the cure. If the case is recent and mild, and the habit of body good, there is hope; if of a long standing, inveterate, or malignant, a cure is a defideratum.

In general a temperate regimen is proper; but if the patient is accustomed to a generous diet, a fudden altera-tion is not adviseable; all violence should be avoided as to exercife; the mind should be kept as calm as possible: Scarborough water is generally escened very useful: spirituous and spicy food should be omitted; so should pork, cheefe, and all that does not eafily digeft.

As to topicals, practical writers abound with variety of them: but great caution is required in their use; nay, they are often dangerous. Heifter fays that the pimples or pultules in the face are finall biles, and as fuch are cured with whey and mineral waters.

Internally, the fpring juices, mercurial deobstruents, with antimonials, saponaceous, and after these ferrugineous preparations are to be preferred. Antimonials, as they have the best effect in the emunctories of the skin, are not to be omitted. The bowels should be kept con-Rantly lax. And during the feafon the fpring juices may be constantly taken. Bitters, particularly an infusion of the Seville orange peel, is an excellent auxiliary. See Heifter's Surgery. Turner's Difeafes of the Skin. Brooke's and London Practice of Physic. Med. Obf. and Inq. vol. i. p. 189.

- ROSEA. RUBEA, VEL RUONIA. See GUTTA ROSACEA. GUTTA SERENA. Sec AMAUROSIS and AMELYOPIA. GUTTÆ VITÆ. See BALS. TRAUMAT.

GUTTALIS. See ARYTANOIDES.
GUTTETA. Castellus informs us that the word
goutte in French fignifies convulsion; hence the name of
a preparation called pulvis ad guttetam; it confisted of dittany, human skull, contrayerva, &c. but many mix only equal parts of peony and valerian roots. It was originally an invention of Riverius, and by fome is called epileptic powder.
GUTTUR, See BRONCHOCELE.

GUTTURALIS ARTERIA. The first considerable branch of the external carotid is the superior guttural which arises just where it parts from the internal and runs to the thyroid gland, and to the muscles and other parts of the larynx or pharynx, hence called laryngea.

The interior guttural artery is the TRACHEALIS ARTERIA, which ice.

GUTTURALIS VENA, called also trachealis. The right goes from the under-part of the bifurcation above the mammaria of the fame fide, and fometimes from the fubclavia. The left from the left fubclavian near its

GYMNASTICS. Thefe are the GYMNASTICA. exercises of the body which were proposed for the resto-ration and preservation of health, and for the cure of diseases. These exercises were of Greek origin; they are fo called from the word yours, naked; for these exercises were performed by naked men in the public games. These exercises were wrestling, running, leaping, and other acts of agility and force.

Herodicus, the father of Hippocrates, was the first

who introduced these exercises into medicine.

The Egyptians thought gymnaftics not necefflary; they thought that by them a genuine health was not generated, but in its flead a fhort-lived strength, highly dangerous to young people. See Hieronymus Mercurialis de Arte Gymnaftica. Fuller's Medicina Gymnaftica.

GYMNOSPERMOS. See Angiosper Mos.

GYNÆCIA, from your, woman. It fignifies the menstrua, and sometimes the lochia.

GYNACIUM, from yose, a woman. A feraglio, also a name for antimony.

GYNECOMASTON. An enormous increase of the

breafts of women.

GYNÆCOMASTOS. A man whose breasts are large, like a woman's, from 7077, a woman, and pares, breaft.

GYNÆCOMYSTAX, from 7078, a woman, and 12072\$, a beard. The hairs on the female pudenda.

GYNANTHROPOS. That species of hermaphro-

dite which partakes more of the female than of the male : that species which partakes most of the male is called an-drogynus. These distinctions are groundless, for all her-maphrodites, so called, are properly women. GYNECANTHE. BLACK BRYONY. See BRIONIA

GYPSOPHYTON. The GREAT SAXIFRAGE.

## HÆM

ABA. See FABA.

HABASCUM. The name of a Virginian root
which refembles a parfnip, and is a falutary food.

HABENA. The name of a bandage, contrived to keep

the lips of wounds together.

HABILLA DE CARTHAGENA. BEAN OF CAR-

TAGENA. See BEJUIO.

HABITUS PLANTÆ. The babit of a plant is the outward appearance of plants, or what is called their port.

HACUB. A species of CARDUUS, the young shoots of which are eat by the Indians, but the roots are emetic.

HADID. IRON.

HÆCCEITAS. The quinta effentia of the chemists.

HÆMA. BLOOD.

HÆMAGOGOS, from asua, blood, and ayu, to bring away. The name of an antidote in Nicolaus Myrepfus, which was used for promoting the menstrual and hæmorrhoidal fluxes.

HEMALOPIA. A variety of the pseudoblepsis ima-ginaria. In which all things teem to be of a red colour. HEMOLOPS, from aua, blood, and auto, the coun-tenance. The livid marks of sugillations in the face and

HÆMATAPORIA. A wasting, from a poverty of

blood.

HÆMANTHUS, from auux, blood, and as 905, a flower. The BLOOD-FLOWER, or AFRICAN TULIP. Boerhave mentions three species, but no medical virtue. HÆMATEMESIS. VOMITING of BLOOD. It is always symptomatic. See VOMITUS.

HÆMATIA. An epithet for a fort of garum, HÆMATION. I made of the intestines of fish macerated in fall.

macerated in falt.

HÆMATITES, from aua, blood. The Greeks call the ore of iron thus, from its supposed virtue of stoping blood. It is called also BLOOD-STONE, azedigrin. When it was in flattish cakes, with knobs on the surface, then the ancients called it bamatites; but when it was in long striated pieces, they call it fchiftus, but they possess

no diffinguishing qualities different from each other.

The terra sinopica is also called blood-stone.

From twenty-four parts of good haematites, nineteen parts of iron hath been extracted, but half its weight it often affords. Plenty of it is met with in Germany, France, and Spain, but we have as good as any in England. It is very hard, of a dark red colour; but on powdering it, the redness becomes brighter. As a me-dicine, nothing can be expected from it that is not afforded with more advantage by iron; and as it is very difficultly powdered, the crocus martis may be fubfituted in its room, or the rubigo ferri. See Lewis's Mat. Med. HEMATITINOS. An epithet of a collyrium in

Galen, in which is the hoematites.

HÆMATOCELE, from auja, blood, and wake, a tumor. It is a species of false hernia in the scrotum; it consists of a collection of blood in the tunica vaginalis; its appearance is the fame as when an hydrocele is the diforder, and so is the method of its cure. See Celfus.

P. Ægineta. Bell's Surgery, vol. i. p. 482. Pott's Works,

4to. 1775. White's Surgery, p. 342.

HÆMATOCELE ARTERIOSUM. See ANEURIS-

### HÆM

HÆMATOCHYSIS, from aua, blood, and xxx, to pour out. It is a term used by Willis to fignify an hæmorrhage. See HÆMORRHAGIA.

HÆMATODES. BLOODY CRANE'S-BILL. See GE-

RANIUM SANGUINARIUM.

HÆMATOMPHALOCELE. A tumor in the navel, turgid with blood, from awa, blood, outant, navel, and

HÆMATOPEDESIS. BLOODY SWEAT.

HÆMATOPHLŒBŒSTASIS, from αιμα, blood,

φλεψ, α vein, and ςασες, α flation. It is a suppression of
the impetuous current and intumescence of the blood in the veins. But Galen fays, that fome understand by it the veins full and tumescent with blood.

HEMATOXYLON CAMPECHIANUM. See

LIGNUM CAMPECHENSE.

HÆMATURIA. BLOODY URINE. It is always fymptomatic. See URINA.

HÆMITRITÆUS. A species of sever. See SEMI-

HÆMOCERCHNUS. Blood brought up from the fauces, with a noise, or rattling, or bloody excretions

fauces, with a noise, or rattling, or bloody excretions discharged in a dry form.

HÆMODIA. A painful stupor of the teeth, caused by acid and austere substances touching them.

HÆMOPTOE. See HÆMOPTYSIS.

HÆMOPTYICUS. A person who discharges blood from the mouth is thus called.

HÆMOPTYSIS, from auaa, blood, and alow, to spit. HÆMOPTYS. A spitting of blood; also called HÆMOPTYS. If blood is discharged from the nose or mouth, it is generally called a spitting of blood; but it seems more proper when blood flows from the nose, to call it a bleeding at the nose; when from the stomach, a vomiting of blood; and only when from the lungs, a spitting of blood. fpitting of blood.

Dr. Cullen places this genus of disease in the class pyrexise, and order hamorrhagin. He observes five species.

1. Hamoptysis plethorica, when no other disorder is attendant than the excess of blood.

2. Hamoptysis violenta, where some external violence hath been the cause.

3. Hamoptyfis phthifica, where there is a wasting and continued debility takes place after a cough. 4. Hamoptyfis calculosa, when with the discharges by coughing there are calcareous concretions thrown up. 5. Hamoptyfis vicaria, when accustomed evacuations being imprudently checked is the cause.

Paffionate people, weakly flender people, with long necks, and flat breafts, and those who while young were subject to bleed at the nose, are most subject to an be-

An hæmoptoe may happen three ways: I. By an accidental rupture of the veffels, in which cafe if the veffels are fmall, and the patient is quiet, there is no danger; but if large, the danger is confiderable. 2. From an ulcer in the lungs, whence in coughing it will be for-ced up, and mix with phlegm or pus, in which case dan-ger is great, as some large vessel may be eroded. 3. By anastomosis, this is without danger, and oft relieves wo-men whose menses are suppressed.

Sometimes the bronchial artery is ruptured. If the

orifice is fmall, the discharge is soon at an end, for the

the artery is compressed, and the rupture closed: in some instances this blood is absorbed, in others it corrupts and excites an inflammation, which terminates in foppuration, then making its way into the bronchia, is by degrees fpit up, but often a consumption follows.

Sometimes the rupture happens in the pulmonary artery, and then the discharge of blood is sudden, more copious and florid than when from the bronchial artery; it is also without pain, and unmixed with phlegm.

When this diforder is from a rupture of the pulmonary artery, as just observed, the following symptoms are not fo generally attendant; but for the most part the preceding fymptoms are anxiety about the præcordia, difficulty of breathing, an oppressive undulatory pain about the diaphragm, flatulencies in the belly, a coldness of the extremeties, hoarfuefs, a dry tickling cough, &c. as thefe fhew a general stricture on the verfels, and a tendency of the blood to inflammation, so they are commonly the fore-runners of a copious discharge of blood from the fauces, by which means it may always be diftinguished from an harmoptoe. Though the discharge be from the bronchial artery, if it hath not laid any time in the breaft, it may appear thin and florid; but in this case its ejection is not fudden, and its appearance is blackish and fomewhat thick; though a frothy cough attends, there is a pain and heat in the breast, with a sense of weakness there during the disease, sometimes a severishness appears, but it abates with each discharge of blood, which returns at intervals until the cure is effected. Sometimes matter is mixed with, or follows after the discharges.

Spitting of blood is generally useful in pleurifies, and

peripneumonies; in a dropfy, the feurvy, and confump-tion, it denotes an ulcer in the lungs; in the robust, a fpitting of blood is not very dangerous, but in the tender nd feeble the cure is very difficult, and often impossible;

if blood proceeds from an ulcer it is fatal.

The patient should be kept cool and quiet both in body and mind; his diet should be fost, cooling, and slender, but yet fufficiently nourifhing; fpirituous liquors and fermented ones should be at least to sparingly used, that the blood may never be rarefied thereby; the voice should

not be exerted in any extraordinary degree.

Medicines need not be given before the patient feems weakened by his complaint; and then in proportion to the ftrength of the patient, bleeding in the arm may be repeated. When the conflitution will admit of this ope-ration, the difcharges by it should be copious, for one free bleeding is far more useful than many sparing

Nitre, if taken early in this diforder, is much to be de-pended on. The following method is the most convenient and ufeful; R Sal nitri 3 fs. conf. rofar. 3 iv. m.

cap. q. n. m. major, 6ta vel 3tia quaq. hora pro re nata. Purges of the natron vitriolatum are fingularly useful in checking internal hæmorthages, and may be fo re-peated as to keep the bowels always lax.

De Haen recommends the drinking of cold water.

Styptics are not to be depended on.

If the cough is troublesome, an electary with nitre and fperma cæti will be ufeful; and as an opiate the pil. e ftyrace may be given in fuch doses as just to allay this troublesome symptom. See Wallis's Sydenham. Lond. Med. Obs. and Inq. vol. iv. p. 206, and Med. Museum, vol. ii. p. 257—259. Brooke's Pract. of Phys. Cullen's First Lines, vol. ii. p. 336, edit. 4-

- Ex Tuberculo Pulmonum, i.e. Hæmoptysis PHTHISICA.

CATAMENIALIS, } h.f. H.E.MOPTYSIS VICARIA. PERIODICA,

HEMORRHAGIA, from aua, blood, and proon, to break forth, or provous, to break forth, called by Willis Hamatochylis; also Sanguislunus. There are but sew bamorrhages (not owing to external violence) which would prove fatal if no means were used to stop them; hence many medicines have, at different times, had the repute of being specifics. Periodical and critical hamorrhages have generally their cause in the prime vize, and their properest remedies are such as those that purge, and ren-der the bile temperate, of which kind are the natron

blood stagnating in the cellular substance of the lungs, vitriolatum; but still to be preferred is the ol. ricini ver-The feat of spontaneous bamorrhages is generally where the veffels are tender, and not braced up by neighbouring membranes, &c. as in the noftrils, bronchia of the lungs, the gums, ftomach, intellinum ileum, the extremity of the intestinum rectum, the uterus, and vagina; though rare inftances are recorded of bamorrhages from velicls which lie deeper, and are more defended.

Those who abound with thick fibrous blood rarely are affected with this diforder; a disposition to it is generally hereditary, and is increased by action, close thinking, hot acrid aliments, &c. those who have too much ferum in their veffels, who have a foft texture of body, are fe-dentary, or have a defective perspiration, and who eat more than they can eafily discharge, are most subject to

bæmorrhages.

The causes are not directly a redundancy of blood, its acrimony, or thinness; but rather from an irregular unequal circulation, which happens when the parts remote from the heart are by a stricture so braced up that the blood cannot eafily return through the veins, hence the fmall arteries and particularly those that are the least de-fended, are ruptured. But the causes of those bamorrhages that are of the fymptomatic kind are to be fought for in infarctions and obstructions or indurations of the vesiels and the vifcera, which put a stop to the free circulation of the fluids, and occasion a glut on particular parts. From what is just faid, acrimony and rarefaction are not excluded from the occasional causes, as is evident in fcorbutic habits, &c.

In acute diseases, when there are small discharges of blood which fuddenly ceafe, they indicate at leaft a tedious disease. Hamorrhoges are falutary when no incon-venience is observed from them, for then the habit is one way or other relieved. When this accident happens from difordered vifcera, especially if the liver, spleen, or lungs, are the parts affected, the consequence is generally fatal, by producing a dropfy, a hectic, &c. which uthers

in death.

As to the cure, the best remedies, where topical ap-plications cannot be admitted, are, a cool air, rest, a sparing mild diet, given in small quantities at a time, acidulated drinks, nitre & natron vitriolatum, as directed in the harmoptysis, and opiates in small doses; Hossman adds to these, frictions of the feet, and bathing them in warm water. If the disorder is symptomatic, the cure depends chiefly on the removal of the original disease. Persons rarely die of hamorrhoges, unless the large arteries are divided; but those who suffer a great loss of blood fall into a deliquium, and then the hemorrhage stops: if the patient is thus left dead, as it were, in a moderately warm room, give only a fmall quantity of flesh broth frequently, and thus drooping life may be supported, until the divided vessels contract themselves and con-folidate. Those who endeavour to recover persons from the deliquiums which bemorrhages occasion, by giving cordial liquors, do not restore the lost quantity of fluids, but increase the action of the vessels on their remaining contents, by which more blood is still discharged: again, if a large artery is not wounded, or fuch a one as being affixed to a bone cannot retract itself and close, the orifice, by the elafticity of the veffel, is contracted and concealed within the lips of the wound. Dr. Hunter recommends to leave all internal homorrhages to nature; and

fays, that life is fafe if the patient is permitted to faint.

As to external bamserbages, which admit of topical affiftance, it may be observed, that almost all the blood discharged from wounds, are discharged from the arteries; for pretty large veins, when divided, discharge but little blood. Sometimes the bleeding vessel admits of a compress on the ruptured or wounded part; but when this cannot be effectually applied, the needle and ligature are the properest means of relief. Hamorrhages in the mouth sometimes require the actual cautery; but in other cases escharotics are not adviseable. See WOUNDS

of the ARTERIES.

HEMORRHAGIA, or Hamorrhages from the nofe, is a word fynonymous with Profusio, and in Cullen's Nofology, fignifies active or febrile hamorrhages. See Paorusio EPISTAXIS. In perfons of a spungy habit they are co-pious and frequent; especially if the vessels are small and numerous. In lean persons, whose vessels are large, they donot to frequently happen; but when they do, they

The causes in general are the same as in other morbid

hæmorrhages.

Bleeding at the nose is often preceded by some degree of quickness in the pulse, a slushing in the face, pulsa-tion in the temporal arteries, heaviness in the head, dimness of fight, heat in the nostrils, an itching there, &c. All hamorrhages, but especially from the nostrils, are generally accompanied or preceded by a stricture of the ikin and external parts, a detumescence of the vessels, a refrigeration, lassitude in the limbs, costiveness, and pains in the belly.

In many inftances the lofs of blood by the nofe is falutary, as the vertigo, head-ach, epilepfy, dimnefs of fight, &c. Those who in childhood often bleed at the nose, when older become subject to disorders in the breast, the rheumatism, piles, nephritic, or colic pains.

In attempting a cure, it should be remembered, that periodical bleedings at the note should not be stopped, at least before the patient is much weakened by it, lest an apoplexy or a lethargy should be the consequence. What is related above, concerning hamorrhages in general, fhould be remembered in this particular cafe. Gently purging with the natron vitriolatum, is in this inflance almost a specific; putting the hands and feet in warm water affifts in removing the spafm of the vessels in the extremities.

When, notwithstanding internal medicines, and dossils of lint put up the nostrils, the blood continues to flow from the nose, the following method, communicated (if I remember right) by a furgeon in Birmingham is effectual. The hint of this method of stopping up the noftrils and paffage into the throat, is mentioned also in Le Dran's Operations, Case vi. in the Remarks, and easily puts an end to the complaint. "Take a piece of strong sewing silk, wax it well, and to one end of it sasten a doffil of lint; then take a piece of catgut (about the fize of a fecond ftring of a violin) and introduce it up the bleeding nostril; when you perceive it in the mouth, take hold of its end with a forceps, and draw it out thereat, make a knot upon it, and fasten the end of the waxed filk to it; then withdraw the catgut back again by the nostril, take hold of the filk, and pull the doshi of lint into the potterior nostril: after which, stuff the anterior noftril full of lint, and thus you certainly ftop the bleeding. After a few days the lint may be taken away." See Hoffman; and Van Swieten's Comm. on Boerh. Aph. Cullen's First Lines, edit. 4. vol. ii. p. 256. Bell's Surgery, vol. iv. p. 70. London Med. Transactions, vol. iii. p. 217. White's Surgery, p. 263.

Hæmorrhagia uterina. Excessive menses. See

MENORHAGIA.

HEMORRHOIDALE, or HEMORRHOIDALIS HERBA.

See CHELIDONIUM MINUS.

HÆMORRHOIDALES ARTERIÆ. RHOIDAL ARTERIES. They are the external and internal.

- Interna arteria. See Mesenteric ze ar-TERIE. It foon divides into branches, one of which runs down behind the intestinum rectum, to which it is distributed by feveral ramifications, and it communicates with the arteriæ hypogastricæ.

HÆMORRHOIDALIS. HÆMORRHOIDAL FEVER.

This is a fever of fhort duration, mentioned by Vogel, and confidered as fymptomatic, which he defines an ephi-mera, attended with pain of the fpine, piles, or at least

painful varices breaking out about the fourth day, which terminate the febrile affections.

HAMORRHOIDALIS EXTERNA ARTERIA. See Pu-

DICA ARTERIA.

— EXTERNÆ VENÆ. The EXTERNAL HÆMORRHOIDAL VEINS. They fpread about the inteltinum rectum and anus; andproceed from the hypogastricæ venæ:
they communicate with the hæmorrhoidales internæ.

— INTERNA VENA, called also mesariaca interna

they communicate with the hemorrhoidales interna.

— INTERNA VENA, called also mesariaca interna zena. The INTERNAL HEMORRHOIDAL VEIN; also called the lesser mesariac vein. It is called hemorrhoidal, from the tumors often found at its extremity next the anus, which are called hemorrhoides. It is one of the three great branches of the vena porte ventralis; though some

are profuse. Fernelius observes, that "persons whose times it springs from the splenica: it sends a branch to the viscera and liver are weak and scirrhous, are subject to duodenum from near its beginning: then it is divided into two branches, one of which ascends, the other departments." fcends; the defcending branch runs down on the left portion of the colon on its lower incurvations, and on the intestinum rectum to the anus. The hamorrhoidal veins have no valves

HÆMORRHOIDES, from aua, blood, and few, to flow. The HEMORRHOIDS, or PILES. A discharge of blood from the hæmorrhoidal veins is thus named, and is also called the OPEN, or BLEEDING PILES: when instead of this hamorrhage there are large tumors, which are generally painful at the lower part of the rectum, they are called the blind piles. Dr. Cullen places this genus of discase in the class pyrexiæ, and order hæmorrhagia. He distinguishes four species: I. Hæmorrhagia. rhois tumens, when there are external fwellings on the edge of the anus. 2. Hæmorrhois procidens, when the piles are external, and caufed by a bearing down of the anus. 3. Hæmorrhois fluens, when the piles are internal without external tumor, or bearing down of the anus. 4. Hæmorrhois cæca, when there are pains and tumor about the anus, and no difcharge of blood.

From diffections this difease seems to be an echymosis in the cellular membrane of the lower part of the rectum, from the extremities of the neighbouring vellels: if this be true, it accounts for the great lofs of blood this way, without lofs of strength, for it is gradually emptied into the echymofis, and it is from thence that it pours out fo

feemingly plentifully.

There is feldom much difcharge from the external hæmorrhoidal veffels, but they readily admit of varices bemorrhoidal veffels, but they readily admit of varices bemorrhoidal veffels, but the intering formed in them, which are painful. But the internal hæmorrhoidal veffels not only difcharge a large quan-tity, but, when fuppreffed, those diforders are generated which arise from diforders of the liver, spleen, panereas,

melentery, and intellines,
Near the extremity of the intellinum rectum, internally, are little jagged processes, fomewhat like the carunculæ myrtiformes in the vagina, which are the feat of the internal, as well as of the external piles.

Those who are of a lax, spongy habit, and disposed to feed; who eat heartily, and drink freely; who indulge in ease; who are habitually costive, &c. are the most

fubject to this diforder.

The piles often affect pregnant women, from the pref-fure of the uterus on the hamorrhoidal veins. In all other cases, the immediate cause is a difficult circulation of the blood through the hæmorrhoidal veins, in confequence of their perpendicular fituation, and want of valves. The discharge happens when the extremities of the vessels in the intestinum rectum are so distended by the accumulated blood, as to be returned. Whatever generates a redundance of blood, retards its passage through the ramifications of the vena portæ, or invites it in too large quantities to the hæmorrhoidal veins, disposes to this complaint. Aloes, garlic, jalap, and even rhubarb in some constitutions, bring on the piles, by deriving an afflux of humours to their seat: aromatic food, sweet and strong wines, anger, grief, or any violent commotion of body or mind do the same.

The blind piles appear in the form of tubercles of different fines from that of a present the common of the piles appear in the form of tubercles of different fines from that of a present the common of the piles appear in the form of tubercles of different fines from that of a present the common of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of the piles appear in the form of tubercles of different fines from the piles appear in the form of tubercles of tubercles of the piles appear in the form of tubercles of

ferent fizes, from that of a pea, up to a pullet's egg.
They are diftinguished from other tubercles about the
anus, by their colour and resistance to the touch, for they appear livid or black, and, when preffed by the finger, they feel like a bladder filled with water; which circumftances are not observed in other tubercles in the anus, or about it: fome of these are soft and not painful, others are hard, painful, and inflamed. This kind of piles generally appear in coffive habits that are plethoric, and in women that are pregnant, or after difficult labour, or suppressed menses. If these blind piles burst, they form the open, or bleeding piles. The blind piles sometimes cause such a spanning in the analysis renders sitting difficult, and the administration of a clear investible and some and the administration of a clyster impossible; and some-

ferous and mucous, refembling the white of egg: at length the firength is impaired, the pulfe is languid and trembling, and a cachexy, an heetic fever, or a dropfy

comes on, and the case becomes desperate.

The piles are not always readily distinguished; and attention is sometimes required, lest they be confounded with the colie, or a dysentery, or with tu-

mors about the anus.

When the cause is a tumor in the liver or spleen, a fatal atrophy, or hectic is the consequence. Excessive harmorrhoidal discharges often terminate in dropsies; but if they fucceed a dropfy from an indurated liver, death is at hand. On the contrary, moderate discharges from the hamorrhoidal veins give great relief to the conflictation that is oppreffed by the gout, affhma, ischiadic pains, diseases of the kidnies or bladder, hypochondriac, hysteric, or maniac disorders, &c. Only those discharges of blood from the anus are to be deemed morbid, by which the patient is enfeebled, and the digeftion, &c. are

The general indications are, 1. To take off the increased impetus to the feat of the disease, by bleeding, and small doses of ipecacuanha. 2. To induce an aftriction to the relaxed vessels; this should be done flowly; and to this end, alum is a proper application, or the bark may be used, but other vegetable aftringents are too powerful.

3. To avoid all irritation, by regulating the stools.

An incautious use of improper diet will render the best medicines ineffectual in this difease; carefully therefore avoid that, and every accident that can increase the

malady.

Bleeding at proper intervals, where there is a fanguine plethora, will in fome measure prevent the returns, or at least moderate the violence of them; a light diet, that is cooling and laxative, should be kept to; broths and gruels are ofeful, but inflaming liquors should be cautiously

When the piles do not bleed, they are attended with confiderable pain; in which case, dossils of lint, dipped in warm olive oil, may be applied, or other emollient liniments may be spread on soft rags, and kept on with proper bandages: if the piles are troublefome by their bulk, drefs them with a mixture of simple lime-water, in which is a small quantity of camphorated spirit of wine and a little acetated ceruffa.

The bowels must be kept lax; and for this end, the elect. e cassia is far preferable to the elect. e senna comp.

Sulphur, and the ol. ricini, are also proper laxatives.

If the want of tone in the rectum be a cause, chalybeate tinctures, with bitters, and cafcarilla, may be taken for

If other diforders attend, which conduce to the pro-duction or continuance of the piles, fuch remedies as are

adapted to their removal, must not be omitted.

Forms of medicines, both internal and external, are abundantly prescribed in practical authors; therefore the reader is defired to select, as circumstances may seem to

If the cafe requires the affiftance of a furgeon to check the hamorrhage, a cooling purge may be administered, and five or fix hours before any operation, inject a clyster, then laying the patient with his belly across a bed or table; let an affishant separate the nates, then the operator may tie up the bleeding veins with a needle and thread; but if there are tubercles, take hold of them with the forceps, and cut them off, tying them up also; but be careful not to leave the smallest vein open. If the profusion ceases not thus, apply lint, with proper compresses, and the T bandage. If the veins are high in the rectum, distend it with a convenient instrument until the veins can be come 2t. If the blind piles encompais the anus, fo as to prevest the discharges by stool, and to prove otherwise trou-blesome, remove the largest of them by a ligature, which may be tightened daily until the tumor drops off: but before this attempt, let warm spirit of wine be used, in order to disperse it. If the distended vein is high and inslamed,

ture of quick-lime and fulphur.

HARROWGATE WATER. This is a falt, purging, fulphureous water. It had long been doubted whether these waters contained any sulphur; but it now put out of dispute, by the experiments of Dr. Kilvington and the right reverend bishop of Landaff. The former of which being at the wells, which had not been cleared for the approaching fummer, observed a circle of a yellowish concretion around the margin of the bason, as high as the water rofe, a fmall portion of which he fcraped off, and dried; and on putting a little of it on a red-hot iron, it produced a blue flame, and fmelt ftrong of fulphur. The bifhop examined the fcum which the water had thrown up, the mud or fediment which they dropped, and the fubttance feraped off the infide of the bason, and by every trial, found that they contained sulphur. These waters are drank from has a pint to three phur. quarts, or more. In fmall quantities, they prove diurc-tic; in large, ftrongly purgative. They are extremely ufeful in cutaneous and fcrofulous diforders; also as anthelmintics, destroying and evacuating worms, and their nidus; where the digeftive powers are weak, and the intestines loaded with viscid faburra, they have been beneficial, and indeed ferviceable in many chronic com-plaints. They have been employed externally in form of walkes, fomentations, and baths, particularly in cuta-neous difeafes. See Dr. Monro, on Mineral Waters, and AQUÆ SULPHUREÆ. Besides there are three other wells contain different waters.

1st. The Sweet Spa. This strikes a light purple with galls, and from a gallon, on evaporation, were acquired a feruple of folid matter at one time, and only eight grains at another; of these sediments, above one half was earth, the rest a calcareous nitre, vitriolated magnesia.

2d. TUWHET. A gallon of this yielded at one time thirteen grains; at another, nineteen of a refiduum, of which three fifth parts were calcareous earth mixed with ochre; the other two fifths vitriolated magnefia.

3d. ALUM WELL. From the roughness of this water, it was supposed to contain alum, a gallon of which yielded, on evaporation, eight grains of a dark coloured brown sediment, which had a rough vitriolic taste and curdled milk. It is probable, Dr. Monro thinks, on surther examination, that this water may be found to be a reak vitriolic water. Dr. Short confiders these as cha-

HARTFELL WATER. This iffues from the Hart-fell mountain in the county of Annandale, Scotland. It is quite pure and pellucid; has an irony, and fo strong a styptic taste, that it is suspected to contain alum. By being exposed to the open air, it becomes weaker, and is observed to be stronger in wet, than in dry weather. On evaporation, a gallon afforded, of solid matter, fortytwo grains; thirty-fix were fal martis, and fix earth. It is supposed that the falt contains more than the common fal martis. As this water, on being exposed to the air, drops an ochreous fediment, and becomes weaker; it is

This water is recommended in cures, where chalybeates are useful; in menorrhagia, fluor albus, gleets, old dysenteries, in diseases arising from relaxation, and many other complaints. Monro, on Mineral Waters. HARUNDO. The COMMON REED. See ARUNDO;

are the finovial glands, and are thus called because Ha-

HEBDOMADARIA. It is one of the febres crraticze. HEBE. The hairs which grow upon the pubes; the part on which they grow, or the age when they appear.
HEBISCOS. MARSHMALLOW.

HECTICA vel ETHICA. From the for a species of sever. It is also named by different writers, the SYMPTOMATIC FEVER; IRREGULAR INTERMITTENT FEVER; FEVER of SUPPURATIONS, and LENTA FEBRIS, SLOW FEVER. Hippocrates deferibes this fever under the name of phthifis; Celfus is the first who speaks of it under the name of an heelic sever, and he directs the cure: what were afterwards called flow heelic severs, were among the first physicians called tabid, or long continued fevers, or marasmi. At present, by slow and better severs are meant those which are chronical, and continually, by a preter-natural, though by a mild and unremitting hear, con-fume the juices, induce a consumption, and impair the strength. There is a consumed steady health when it is said there is a good habit of body: and when it is faid there is a bettie cough or fever, it is understood that the diforder is not cafual, but permanent, or that it makes a part (as it were) of the constitution. Dr. Cullen does not rank this kind of fever as a genus, but confiders it always as symptomatic. It may be called febris chronica non Critica, as it has no criss, and is of long continuance.

On diffecting patients whose death was the consequence

of an bellie fever, there were found abfeeffes in one or other of the vifcera, or fcirrhous tumors, or those of the fleatomatous kind; whence it is evidently a fympto-

matic fever.

Lying-in-women, and those in whom the menses cease, are liable to this disorder: intemperate drinkers by the injury they do the stomach and liver, are very subject to it; as are all in whom are difordered glands, or abteeffes,

or ulcers in the internal parts.

The principal cause, is the matter of internal ulcers, which is absorbed into the blood: this matter, according to its quality and quantity, excites a sever more or less frequent and violent. The matter, producing this kind of sever, may be formed in any part of the body indifferently, though perhaps the glands of the messer may be its most frequent source. A scirchous cland in any be its most frequent fource. A scirrhous gland in any part, almost constantly excites this fever; hard druking, by injuring the flomach and liver, produces the fame et-A falivation is fometimes the caufe. Dr. Reid, in his Effay on the Nature and Cure of the Phthifis, denies that the absorption of pus is the cause of the sever which attends the pulmonary confumption. He attributes it to the following caufe, viz. In a ftate of health, a very large quantity of perspirable matter is discharged from the furface of the lungs: but when the lungs, from inflammation, or the formation of tubercles and vomicæ, are rendered in part impervious to the air in infpiration, the usual quantity of fluid cannot be carried off by the action of respiration; the quantity so retained will remain in the habit, till excreted by fome other emunctory. That quantity of fluid fo retained in the habit, he conceives to probable, that part of the impregnated matter is diffolved and fuspended by agrial acid, though great part is kept in its state of folution by means of the acid of of the skin: and as the impediment to its exit by the of the fkin: and as the impediment to its exit by the lungs continues, so the fever is daily renewed, that the constitution may be relieved from its accumulated burden. He adds, as the lungs, by the increase of the di-feases, becomes more and more incapable of exhaling the usual quantity of lymph, we find the morning sweats proportionably increased, and the exacerbations of the fever more violent, till towards the close of the difeate, when the patient's strength is so exhausted, and the mufcular force and action of the veffels fo much weakened, as probably to be unable to produce fuch a degree of fe-ver as is necessary to force the fluid through the pores of the skin; it falls upon the intestines, and produces a di-arrhoea. From being usually costive, the patient hath frequent motions in a day; till in a short time the purg-ing becomes confirmed: we then find the sever and sweating confiderably diminished, and the expectoration of purulent matter in less quantity. The quickness of the pulse

pulse betwixt the paroxysms of the sever, he supposes to

Its appearance is like that of an intermittent of an irregular kind, the pulse rarely settled to a natural flate; but remains quick, though weak; the chillness of the heetic sever is not regularly succeeded either by a dry heat or fweat, though one or other of them generally fol-lows it; and the hot fit fometimes approaches without any fenfible degree of chilliness preceding. The fweat coming on does not feem to relieve the patient much; when the fweat is over, the fever will fometimes continue; and in the middle of the fever the chillness will return, which Dr. Wm. Heberden notes, as a certain fign of the prefence of this fever and its pathognomic fymptom. This fever is very irregular in its returns. In the fit, the urine is fo various, that nothing can be afcertained from its appearances. When the cause is an ulcer on the furface of the body, there are often pains which resemble the rheumatism; but these pains are generally situated very remote from the ulcer which is their original cause. A studen pussing up of some part of the body nal cause. A sudden pussing up of some part of the body is sometimes observed in this disorder, which soon subfides fpontaneously. For the most part its approach is gradual, but its issue is not the less to be dreaded on that account. The skin is dry, the tongue hard and parched, the cheeks slushed, the sleep is not refreshing. Hippo-crates observes, in this Treatise de Internis Assectionibus, that, on the approach of the fit, the whole breaft is pained as far as the back; that a cough is often an attendant, and a quantity of thin faline faliva is discharged: that in the progress of the disease the whole body is emaciated, except that the legs becoming rather tumid, seem not much affected; the breathing resembles a whistling through a reed.

through a reed.

Galen fays, that the pathognomonic fign is, the fever being increafed after eating and drinking.

The bellie fever should be distinguished from the intermittent, the common inflammation, and the flow or nervous fevers. Dr. Reid distinguishes the bellie from a pulmonary confumption, as differing from the bellie from abscelles or ulcers in other parts: the bellie fever occasioned by abscelles in the liver, under the ploas muscle, and other parts of the body, he says, have not the remissions and morning sweats like the pulmonary bellie; on the contrary, it is continued less violent; and the skin occasioned by abscesses in the liver, under the psoas mus-cle, and other parts of the body, he says, have not the remissions and morning sweats like the pulmonary bessic; on the contrary, it is continued less violent; and the skin

ufually dry.

If the pulse runs on to above 90, or as fometimes happens, to 120 in a minute, much danger attends; though fometimes the pulse will be unaffected under a variety of other fatal fymptoms. In lying-in women it is generally fatal; though it must be confessed that some have recorered, when attended with every fign of a fatal cafe. The fatal figns are, a continually weak, quick pulse, an entire lose of appetite and strength, an Hippocratic countenance, a little red or oily urine made with an hissing noise, the hair falling off, a diarrhœa, immoderate sweats,

and fwelling of the feet.

As a variety of circumstances give rise to severs of this kind, a diversity must be expected in the cure.

As far as this difease is confidered of the putrid kind, the bark will be that on which relief will principally de-pend; but if there is no manifest ulcer, it does not pro-mife much; if it affects the breathing, add to each pint of the infusion, two or three drams of baltam of Peru. In some instances, the cort. elutherize is preserable to the bark, and vice verfa.

In most cases the sole intention is to relieve the symptoms, fuch as moderating the heat, preventing collivetoms, such as moderating the heat, preventing contivenefs and its opposite, checking the night sweats, and at
the same time putting the body into as good a general
health as may be, by exercise, air, and a proper diet.

When falivation is the cause, a milk diet, with the
decoctions of guaiacum, is generally successful.

Bleeding in small quantities give a temporary relief.

When it follows other diseases, and is attended with a
had digestion, integral heat, sweating in the hands and

bad digestion, internal heat, sweating in the hands and feet, give an emetic, and repeat it every two or three days: then let the kali acetatum with as much rhubarb be given as fuffices to keep the bowels moderately lax for a few days; and after these the bark, joined with bitters, and a nourishing diet. The columbo-root is here to be preferred.

In cacochymic and scorbutic habits, in cases from a have arisen from the form the progressive inflammation defect of the menses or hamorrhoids, or the abuses of one set of tubercles after another. fome advantage.

In general, a milk diet is to be preferred. Affes milk is the most cooling; but in want of it, mix barley-water with equal quantities of cow's milk, and let two or three

with equal quantities of cow's milk, and let two or three pints be taken in a day. Self-zer water may be used with the milk instead of barley-water.

Riding is to be regarded, as noticed in the article Phythesis. See Hippocrates de Intern. Assect. Arcticus de Cur. Acut. lib. ii. Fernelius, Hossman, Shebbear's Theory and Practice of Physic; Dr. Wm. Heberden's Obs. in the Lond. Med. Trans. vol. ii. p. 1—17. Dr. Fordyce's Enquiry into the Causes, &c. of putrid Fevers. Cullen's First Lines, vol. ii. 221, &c.

HEDER A. Loy.

HEDERA. Joy.

HEDERA ARBOREA. COMMON, OF TREE-1VY. It is the bedera helix, Linn. It is an ever-green plant, climb-ing and fpreading on old walls and trees; the leaves are angular; the flowers appear in autumn, and are followed in winter by clufters of black berries. The leaves are naufeous to the tafte, not used with

us, but are commended by the Germans, as being ufeful in the atrophy of children: the dose is from 9 i. to 3 is Quercetanus used to make an extract from the berries, which he called extractum purgans. From the stalks of the plant, a resinous juice exudes in warm countries, which is called gummihederæum; it is of a reddish brown colour outwardly, and of a bright brown yellow inwardly, of a vitreous glossiness, but not pellucid; when rub-bed, it emits a light agreeable smell, and is of a refinous subastringent taste: it is chiefly used as other resins in

- TERRESTRIS. GROUND-IVY. Called also chamaciffus; chamalema; calamintha humilior; corrona terra; ALE-HOOF; SUN-HOOF; JACK IN THE HEDGE; GILL GO-BY-THE-GROUND; Glecoma bederacea, or glecoma foliis reniformibus crenatis, floribus ex cœruleo purpureis. Linn. It is a low, hairy, creeping plant, with fquare ftalks; roundish, or kidney-shaped leaves set in pairs at the joints; the flowers are bluish and labiated; the upper

ifh all the winter. There are four species.

This herb hath a quick, bitterish, warm taste, an aromatic, but not very agreeable sinell, which is in a great measure dissipated by drying. It is supposed to be useful in disorders of the breast, and is an attenuant. Dr. Pitcairn speaks highly of it in consumptions. Though Dr. Cullen thinks it of no consequence, and says, that in many cases in which he employed it, he had had no evidence of either its diurctic, or pectoral effects, and thinks it highly improbable that it should be powerful in curing ulcers of the lungs, and various cases of phthiss. Mat. Med. Ale, in which ground-ivy is insused, is rendered Med. Ale, in which ground-rey is infused, is rendered very fine by it, and is called GILL-ALE. It gives out its virtue most perfectly to water by infusion, on inspissaing the filtered liquor, only the unpleasant smell is dislipated. See Lewis's Mat. Med.

HEDERULA AQUATICA. See LENTICULA AQUA-

TICA TRISULCA.

HEDRA. The anus; also the excrements thence voided; it sometimes fignifies the basis of an abscess, or that part which is subjected to that which is converted into matter. Hippocrates fometimes uses this word to fignify a species of fracture. HEDRICOS. An epithet for remedies appropriated

HEDYCHROI. A name for certain troches. Their

composition is in some of our later dispensatories. HEDYOSMOS. A name of mint, on account of its

fweet fmell.

HEDYPNOIS. Boerhaave mentions four species: it is faid to agree with succory in its virtues, but is not of any note in medicine. It is also a name of the dens leonis. Endivia lutea.

HEDYSARUM. FRENCH HONEY-SUCKLE. Boer-haave mentions eight fpecies; they are faid to be deobstruent and vulnerary, but do not obtain in practice. See alfo ERVUM.

See GLAUX vulg. leguminofa.

HEDYSMATA. See STYMMATA.

HELCYDRION. A finall ulcerous pultule.

HELCYSTER, from \*\*\*\* to draw. An hook for

Extracting the foctus.

HELEAGNUS. A fpecies of gale.

HELENIASTRUM. BASTARD ELECAMPANE. Miller takes notice of two forts. They are natives of America, but not remarkable for medicinal qualities.

HELENIUM See ENULA.

- CANADENSE. Some species of fun-flower are thus named.

—— Indicum. A name of fome species of sun-flower; also of potatoes. See BATTATAS CANAD. HELEOSELINUM. See APIUM.

HELIANTHEMUM. POTATOES; also chammeiflus; a species of sun-flower. See BATTATAS CANADENSIS. HELICALIS MAJOR. A finall mufcle, which only acts upon the cartilage of the ear.

MINOR. A mufcle of the external ear. See

AURICULA.

HELICHRYSUM, from \$1.00, the fun, and xpooss, gold. Goldylocks. See Elichrysum, Montanum; also Gnaphalium Montanum.

HELYCHRYSUS. See AMARANTHUS. HELIDÆI, PULV. See EUPHRASIA. HELINITRUM. See NITRUM.

HELIOCHRYSON. Some species of goldylocks. See

HELIOCHRYSUM. GOLDEN CUDWEED. See GNA-

PHALIUM AUREUM.

HELIOSCOPIOS. SUN-SPURGE.

HELIOTROPIUM. TURNSOLE, or HELIOTROPE.

Botanifts enumerate ten or eleven fpecies; but they are not much used medicinally. The flowers of this kind of plants are funnel-shaped; their brims are cut into ten unequal fegments; they are collected into a long reflexed fpike, refembling a fcorpion's tail; each flower is followed by four naked gibbofe feeds.

Heliotropium majus. The Great Turnsole.

Its leaves are bitter; they give a deep red colour to blue paper. The juice of this plant deftroys warts; a decoction of it is faid to purge off pituitous humours.

—— TRICOCCUM; called alfo ricinoides; FRENCH, or COLOURING TURNSOLE. This species grows plentifully in France; the leaves are of pale green, almost of an ash colour; the flowers are yellow: when the berries are expressed, linen rags are dipped in the juice, and then are expressed, linen rags are dipped in the juice, and then exposed to the vapour of urine, which gives them a red colour. The colour of turnsole is extremely susceptible of alteration in acids, which, according to their ftrength, give different degrees of redness to it. Alcaline falts do not affect it. See Raii Hift. Plant.

--- INDICUM. POTATOES. See BATTATAS CA-

NADENSIS.

HELITIS. See ÆRIS SQUAMÆ.

HELIX. A fpiral line, from 11Ate, to turn. The external circle or border of the outer ear. See Auricula. HELLEBORASTER, HELLEBORASTRUM.
BEAR'S-FOOT. See HELLEBORUS, NIGER HORTENSIS

FLORE VIRIDI.

HELEBORIZE. Hippocrates and others after him used, prepared bellebere, which they introduced into the rectum, both for vomiting and purging, which they made ftronger or weaker as they required, and the vomiting purging, or both, produced thus, they called belleborizing.

HELLEBOROIDES, called also aconitum byemale;

oconitum leteum minus; aconitum unifolium luteum bulbo-fum. The leaves are like those of the aconitum; but in general it agrees both in appearance and virtues with black hellebore.

HELLEBORO-RANUNCULUS. The leaves are fingle, and roundly turned like those of the ranunculus. They are of the fame colour with the flower. The flower is rofaceous. It is faid to be caustic.

HELLEBORUS or Elleborus, from soner Bopa, to kill by eating. This name is applied to feveral rofaceous flowered plants, and is a name of female fanicle.

HELLEBORUS NIGER HORTENSIS FLORE VIRIDI; called also helleboraster minor; helleborastrum; belleboraster minor; helleborastrum; belleboraster maximus; constiligo; believed to have been a more active kind than ours. In enneaphyllum, GREAT BASTARD BLACK HELLEBORE;

HEDYSARUM GLYCYRRHIZATUM. LIQUORICE VETCH. FETID BLACK HELLEBORE; SETTLE-WORT, OF SET-TER-WORT. This plant runs up higher than the bear'sfoot, with which it is generally confounded; but this
hath white flowers with a purple edge, and is poifonous;
whereas the bear's-foot hath green flowers, and is more
falutary. These plants are used for destroying worms in
children, but are not very fase. Perhaps the most beneficial and safe instance of their usefulness, is to sprinkle the
powder of them in issues, to increase their discharge.
They grow wild in shady places. See Tournefort's Mat.
Med. Raii Hist. Plant.

HELLEBORUS ALBUS: also called sucretures. COMMON.

Helleborus Albus; also called veratrum; COMMON white Hellebore. Veratrum album, or veratrum album white HELLEBORE. Fenatrum album, or veratrum album fibircum, racemo fupra de compósito, corollis exalbidis erectis, caule ramoso, Linn. This plant hath large, oval, ribbed leaves, placed alternately on a round stalk, which they embrace by a tubulous basis; in their bosoms, towards the top, appears clusters of hexapetalous, greenish white slowers, followed each by three slat pods, containing whitish, triangular feeds; the root is short, commonly near an inch thick, with numerous sibres hanging from it: externally it is of a brownish colour, but internally much more white. It is common on mountainous nally much more white. It is common on mountainous places in Germany, Switzerland, &c. It is not certain that our hellebore is the fame as the ancients, though

generally this species is thought to be so.

When the root of white bellebore is fresh, it hath a difagreeable smell, which is lost in drying; to the taste it is nauseous, bitterish, acrid, penetrating, and durable. When powdered it is used externally against some cutacular cruptions, and for destroying cutaneous infects; but if applied to any fore, it excites vomiting and other dif-agreeable fymptoms; fnuffed up the nofe it proves a vio-lent fternutatory. If the powder is taken from gr. x. to xv. it operates powerfully both upward and downward, but except in maniac cafes it is rarely used. If on taking this root it does not work off freely, give an emetic to bring it upwards, or it will probably produce convul-fions. Hoffman observes that it affects the fauces, pro-ducing strangulation and danger of suffocation, with great anxiety; and he recommends the juice of quinces as the

Tindura Veratri. Tindure of WHITE HELLEBORE.

Take of powdered white hellebore roots, eight ounces; of proof fpirit, two pints. Digeft, and filter through paper.

This is the best internal preparation. It is given to actuate cathartics, &c. in apoplectic, lethargic, and maniae cases. In chronical disorders it might be used to great advantage, if fmall dofes were begun with, and gradually increased. The powder in dofes to the quan-tity of a grain and an half to a dram of sneezing powder, quickens the operation.

Gefner in his treatife on this plant fays, that an oxymel

with the root is a powerful expectorant, and opens all

natural fecretions.

- NIGER; called also veratrum nigrum, melampo-dium, imperatoria nigra; CHRISTMAS FLOWER, BLACK HELLEBORE.

It is the belleberus niger, or belleberus fcapo fubbifloro fubnudo, foliis pedatis. Lann. The Christmas Rose.

It is called melampedium, from Melampus, who was the first that used it in medicine. He observed its purging quality in the goats which fed on it, and thence introduced it into the materia medica. It is a low plant, without any other stalk than the pedicles of the leaves and flowers; the leaf is divided quite to the pedicle, into fix, seven, or more smooth, firm segments, resembling and flowers; the leaf is divided quite to the pedicle, into fix, feven, or more finooth, firm fegments, refembling bay-leaves, indented from about the middle to the extremity; the flower is large, naked, pentapetalous, of a pale rofe-colour, with numerous flamina in the middle, which are followed by five or fix pods full of flinning black feeds, the petala continuing and changing greenish; the root conlists of numerous fibres, hanging generally from a knotty head, externally of a blackish colour, internally white. It is perennial, grows wild in the mountainous parts of Germany, Switzerland, &c. It flowers in our gardens in January.

in small doses as an attenuant and deobstruent. Its pe-culiar and principal use is in obstructions of the menses, therefore it will be five grains. culiar and principal use is in obstructions of the menies, when the habit is plethoric, and the constitution fanguine, in which case, ferguginous preparations would be improper. The emenagogue virtues of this medicine may be confidered as very doubtful, for Dr. Cullen fays, he never found any in many trials, nor has he met with any practitioners of this country (Scotland) though often trying it, who had better fuccefs in this respect; and particularly, neither in his own practice, nor that of others has he met with one instance of the power of bellebore in producing hæmorrhagy. Mat. Med. It promotes urine and perspiration; in hypochondriac diforders, it may be joined with chalybeates, and if the pulse is low, add the fetid gums, with a julep of volatile falt; in dropfies it is ufeful, if joined with lixivial falts. In all nervous cafes which do not admit of chalybeates, its advantages are confiderable.

To the tafte this root is bitter and pungent; if chewed for a few minutes it benumbs the tongue. Dr. Grew ob-ferves, that it is first felt on the tip of the tongue, and then on its middle. The fibres are stronger, and more active than the tuberous head, and the cortical part of this than the internal. It frequently lofes its virtue by long keeping; and when it hath loft its fmell it is good

for nothing.

The roots of the poisonous aconites resemble those of black bellebore, but are diffinguished by their colour; the aconitum being lighter coloured than the palest black hellebore roots; therefore, for fafety, chuse the

Long coction destroys the active parts water extracts, by boiling, and spirit, by digestion, nearly all the virtue of the root. Rectified spirit takes up chiefly the irritating refinous part. After due coction in water it gives out little to spirit; but after repeated digestion in pure spirit, it yields to water a large portion of mucilaginous diu-

The London College directs a watery extract; fee Ex-TRACT. GLYCYRRHIZE, and a tincture with proof fpirit, which is made in the following manner:

R. Rad. helleb. nigri in pulverem crassium tritæ 3 iv. coccinellarum in pulv. tritarum 3 ij. fpt. vinosi tenurosis, m. fb ii. digere leni calore per dies octo, & cola. Pharm. Lond. 1788. The extract is a good and fafe preparation when defigned for a cathartic; it contains also all the diuretic part; the irritating power is in a good degree de-ftroyed by boiling. The dose is from gr. x. to 3 ss. but as an alterative the tincture is far preferable, for it pos-fesses the whole virtue of the roots. See Neumann's Chem. Works. Tournesort's Materia Medica. Lewis's Materia Medica.

HEMEROLOPIA. Blindness in the night. A fort of pfeudoblepsis.

HEMICERAUNIOS. The name of a bandage, in

Galen, for the back and breaft.

HEMICRANIA, from ignov, or ign, balf, and sparrov, the fkull; called also migrana, hemipagia. A pain in only on one side of the head. It is called MEGRIM. See CE-

HEMICRANIA LUNATICA. A kind of febris erratica. HEMIOBOLION, or HEMIOBOLON. Half an obolus,

HEMIOLION. It is according to Galen twelve drams, and in another fense it is the same as sesqui altera, the whole of a thing and half as much more, as fesquiuncia, sescuncia, an ounce and an half.

HEMIONIS, from inteves, a mule. Mule's DUNG. HEMIONITIS. MULE'S FERN. It grows in Italy. It refembles the hart's tongue in appearance and virtues.

HEMIONIUM. A name for the afplenium. HEMIPAGIA. See HEMICRANIA.

HEMIPLEGIA, from incov, half, and where, to HEMIPLEXIA, frike. Dr. Cullen arranges it as that species of palfy, in which one side or the other of the body is affected. It usually begins with, or follows a paroxyfin of apoplexy; and when the bemiplegia, after substitute of apopticy, and when the commonly fubstitute for forme time, becomes fatal, it is commonly by passing again into the state of apoplexy. The relation, therefore, or affinity between the two diseases, is sufficiently evident, and is further ftrongly confirmed by this, that the bemiplegia comes upon persons of the same con-flitution, and is preceded by the same symptoms that are observed in cases of apoplexy. See PARALYSIS. Lond.

Med. Journal, vol. i. p. 323. vol. ii. p. 198.

HEMIRHOMBION. A fort of bandage mentioned HEMITOMON.

by Hippocrates, called alfo fe-

mirhombus, from its figure. HEMITRITÆUS, from isusov, balf, and rellasse, third, or tertian. It is the fame as femitertiana febris.

HEPALALGIA. INFLAMMATION, OF PAIN IN THE

LIVER, or its region.

HEPAR. HEPER. Martinius and Gorræus derive it from irrer, to work, and ear, blood; upon a supposition it was to prepare the blood. The LIVER. See JECUR.

HEPATARIUS. HEPATIC.

HEPATEROS, from έπας, the liver. It is an epithet for a fort of dysentery, in which an aqueous blood is ex-

HEPATICA. LIVERWORT. Also a pain in the re-

gion of the liver.

HEPATICA VULGARIS, called also lichen petraus latifolius, bepatica fontana, hepatica terrestris, jeceraria, be-patica stellata. STONE, or STAR LIVER-WORT. It is a species of moss; it grows in moist stony places; it is perennial, and runs up to feed in March and April. It is faid to be aperient and refolvent, but it is very little

known in practice.

Nobilis, called also trifolium aureum, bepatica, trifolia, berba trinitatis, trifolium bepaticum, ranunculus tridentatus vernus. HERB TRINITY, and NOBLE LIVERworr. It is the anemone bepatica, Linn. It is a low plant, without any other stalk than the pedicles of the leaves and slowers; the slower is commonly blue, sometimes reddish or white, and are followed by white feeds. It is perennial, grows in gravelly flady grounds in Ger-many and other parts of Europe It flowers in our gardens in March, or fooner.

This plant is efteemed a mild restringent and corroborant, and infusions of it are fometimes drank as tea. Its aftringent matter is equally diffolved in water or spirit, and wholly remains in the extract made by inspifiating the infusion or tincture over a gentle fire. See Lewis's

Mat. Med. Raii Hift.

— Alba. A name of the parnaffia.

— ARTERIA. The HEPATIC ARTERY. As foon as this artery leaves the cœliaca, it runs to the upper and inner part of the pylorus. Sending off two branches, a fmall one called pylorica, and a larger one called gaftrica dextra, or gaftrica major. Having fent out thefe two, it advances behind the ductus bepaticus, towards the vefica fellis, to which it gives two branches, called arteria cyf-tica, and another called bilaria, which are loft in the great lobe of the liver. Afterwards this artery enters the fiffure of the liver, and joins the vena porta, with which it runs in the capfula Gliffonii, and accompanies it through the whole fubfiance of the liver by a numerous ramifications which may be termed arterize bepatice proprize.

—— BRACHII. VENA. See BASILICA VENA.

—— MINOR. VENA. A branch from the vena portze

ventralis. Or, fometimes it is a branch of the cyfticæ

- STELLARIS. See ASPERULA.

5 K

HEPATICÆ

rior part of the great fiffure of the liver. Sometimes these branches rise from the vena cava by one main branch, and then divide. These correspond with the venze portze. The venz cava also sends others, which corre-

fpond with the bepatic artery.

HEPATICO-CYSTICI DUCTUS; also Cyft. bepatici ductus. That fide of the body of the gall-bladder which lies next the liver, is connected to that bowel by a vaft number of filaments which run a great way into the substance of the liver; and among these filaments there are some ducts which form a communication between the port bilarii and gall-blader. These ducts are the most numerous about the neck of the bladder.

HEPATICUS, HEPATIC, from kase, liver. It is

HEPATICUS. HEPATIC, from wase, liver. It is an epithet for any thing belonging to the liver. The ancients confined the word to an inflammation of the liver; but the moderns use it to fignify those persons whose livers are difordered from any caufe.

HEPATICUS DUCTUS. See PORTA VENA.

— FLOS. A name for the parnallia paluft. & vulg. HEPATIRRHŒA; also Choterica. A species of diarrhœa, which see. All other bepatirrhœas are symptomatical.

It is that species of diarrhoea, in which a crude and ferous discharge is very frequent and without pain.

HEPATIRRHOEA INTESTINALIS, i. c. Diarrhoea hepatirrhœa. See DIARRHOEA.

HEPATITIS. Inflammatio Hepatis. An IMFLAMA-

TION of the LIVER.

An inflammation may be in different parts of the liver, as in the membranes only, or in its fubstance; in the concave or the convex fide thereof, &c. Inflammation in the hepatic arteries is faid to cause some symptoms not unlike those of the hydrophobia. See Hippocrates Coac. lib. exxxix. Aretæus de Cur. Acut. lib. i. and Trallianus,

Dr. Cullen places this genus of difease in the class py-rexiæ, and order phlegmasiæ. This disease seems to be

of two kinds, viz. acute and chronical.

Winflow fays, that the feat of inflammation in the liver is in the ramifications of the vena portæ, or the hepatic artery; but Dr. Heberden gives it as his opinion, that the inflammation is first in some of those parts to which the liver is contiguous, and so is communicated to it from them. Dr. Cullen afferts, that the inflammation

is only in the extremities of the hepatic arteries.

The acute bepatitis may be feated either on the convex or on the concave fide of the liver. In the former case, a more pungent pain and hiccough may be produced, and the respiration is more considerably affected. In the latter, there occurs lefs pain, and a vomiting is produced; commonly by fome inflammation communicated to the stomach. The inflammation of the concave surface of the liver, may be readily communicated to the gall-bladder and bilious ducts; and this perhaps is the only cafe of idiopathic bepatitis, attended with jaundice.

This diforder is most frequent in warm climes; it is

produced by the common causes of internal inflammation, and by obstruction of the hepatic ducts, or of the ductus communis choledochus. It fometimes arifes at the beginning of a fever, as other internal inflammations.

Dr. Cullen observes, that the remote causes of *hepatitis* are not always to be discerned.

When the seat of the disorder is in the membranes, the pain is more acute, and it refembles a pleurify more than when the fubitance of the liver is the part affected, In this acute kind, the pain is pungent, the fever very confiderable, the pulse is frequent, ftrong, and hard, and

the urine is high coloured.

In general when the fubftance of the liver is inflamed. a pain is perceived there, which is not often very acute, at the first, but gradually increasing its shoots up to the top of the left shoulder, and sometimes into the throat and about the clavicle. Some reckon the pain darting into the throat to be the pathognomonic fymptom. The pulse is not much altered in the beginning, if there is not much sever, which sometimes is the case during the first days, and indeed during the whole of the time of inflammation in many inflances; in which cases the in- thorax, the pain of the loins does not follow, but a dull flammation is only known to have happened, by the confequent abfects in the liver. In this chronical kind, it the recti mufcles; frequent fneezings, and a plenitude

HEPATICE VENE. They spring directly from the | fometimes happens that very little disease is observed unvena cava inferior, as it passes down through the poste-rior part of the great fusiver of the liver. Sometimes large, or when the convex part of the liver is affected, a tumor is visible externally, and occasions a cough, a difficulty of breathing; the pulse is then quickened, and the patient cannot well lay on his left-fide. When the inflammation chiefly affects the concave, in proportion as it is near the flomach, it brings on fickness, thirft, hiccough, and vomiting; or if near the hepatic ducts, or the ductus communis choledochus, it prevents the pafa fage of the bile into the duodenum, and the fymptoms of a jaundice appear; but in all cases of inflammation in this vifcus, the quantity of the bile thrown into the duodenum is increased, and the evacuations become bilious.

Dr. Cullen fays, that the acute bepatitis may be known by a pain more or lefs in the right hypochondrium, in-creafed by preffing upon the part. The pain is very of-ten in fuch a part of the fide as to make it appear as that of a pleurify, and frequently, like that, is increased on infpiration. The disease is fometimes also attended with a cough, which is commonly dry, but fometimes humid-When the pain thus resembles that of apoplexy, the patient cannot lie easily, except upon the fide affected. In every kind of acute bepatitis, the pain is often extended to the clavicle, and to the top of the floulders. The dif-eafe is attended fometimes with hiccough, and fometimes with vomiting. The jaundice is often mentioned as a constant symptom of the hepatitis; but experience shews

that the disease may ofted occur without a symptom.

The importance of this subject, particularly to those who may be situated where their actual attention to it is required, will, it is hoped, apologize for feeming repeti-tion, when improvement in the defeription and cure of this disease, are the attending advantages. Mr. Mathews, in his excellent observations on bepatie diseases, says, that the diagnostics of this enfeafe vary confiderably in different constitutions. It is not only in the first attack of the diforder, that we are to form our opinion respecting the certainty of the complaint, but in the second also; for men who are in the zenith of health are more frequently affected with the diagnostics of the second state, than with the fymptoms of the prior; and although in the healthy, the modes of the diforder are the fame, yet, according to the strength of the afflicted person, we find the symptoms more or less violent. Thus a robust, athletic man, will have the fymptoms in every flage of the difease much more violent on him, than a thin person, whose frame is more irritable. Those who are of a coffive habit of body generally fuffer very much by this complaint, and frequently after the cure, are fubject to fanguinary drainings from the hæmorrhoidal veffels. Men who are reduced by difeafes, or by medicines for imaginary evils, are always attacked by this diforder in a regular manner, and are generally relieved before the fecond or final effects take place; therefore, to be well acquainted with the various approaches and progress of the complaint, it is ne-cessary to distinguish the symptoms as they occur in an enervated habit, which may be divided into two claffes, the first of which, attended with inflammation and pain, is removed by evacuations and mercury; the fecond, that originates in obstructions of this viscus, with all its alarming fymptoms, it is cured by mercury only; then we will remark the diagnostics peculiar to the healthy and vigo-rous, which may be also classed in the former, with this difference, that the second stage of the afflicted becomes the first in the healthy, and is cured by the like means: the fecond, or final period in the healthy patient, is fup puration or scirrhus; the method of cure the same. The fymptoms of the first state of the disease, in the reduced habit, consequent on medicine, or the effects of a bilious remitting fever, are a great flatulency in the ftomach, with four and fetid eructations; putrid and hot borborygmi; acute pains in the muscles of the thighs and legs, drowsiness, particularly after taking any nourishment, with universal lassitude and inactivity; in the morning, an inclination to vomit, and fometimes a little frothy b lious fluid is brought off; a fevere periodical pain in the right lumbar region, ftretched along the fpermatic chord, frequent defire of making water, which is always crude and pale. In those who have a small abdomen and large fixed pain under the enfiform cartilage, with tenfion of

about the epigaffric region; the pulse generally tense, fmall, and rather full, fometimes rifing to the natural flate; the skin hot and dry, and the circle of the hepatic region remarkably heated. This is the description of the early part of the difease, which, if properly attended to, may generally be prevented from running into the fecond flage. But if from some cause, the disorder gets worse, the next effects will follow, and must be treated accordingly. This, though tedious and alarming, feldom proves fatal, and is thus diftinguished; a rotundity of the hepatic region, with great pain under the false ribs, and the liver very sensible to the touch; a slight, dry, heckie cough; oppreflive fighing, and great difficulty to read, or repeat long fentences; frequent periodical purgings, at-tended with griping in the umbilical region; depraved appetite, vagrant pains on the right fide of the thorax, with laborious respiration, particularly when by accident a larger quantity of air than ufual is received into the lungs; total inability of blowing the nofe, followed by acute pains in the diaphragm and inferior parts of the feapula; inflammation of the eyes, with fmall, quick, tenfe pulfe; an universal parched dry skin, with insatiable thirst; a contraction of the right pectoral muscle, and an aptness to incline the body forward; tremor of the hands, and a remarkable pale whiteness of the nails; the urine voided in fmall quantities, and feldom; though always exceedingly high-coloured and hot. These are the most material indications of a fixed bepatitis in the female habit, which, according to the age or strength of the pa-tient, will be more moderated or increased. We now come to that mode of the bepatitis which acts on the body of a healthy, vigorous man, reducing him in a few days to the most feeble state. It hath been before noticed, that the fecond stage of the valetudinarian is the first of the healthy; but we are also to remark, that the diagnostics of this period in this case are amazingly more acute and rapid than in the former; for in one day all this train of evils will be complained of, but in the other, the complicated fymptoms move flowly. We next de-feribe the final stage of the difease, by describing it as operating on the body of an healthy person. The diagnostics of this disorder are very violent and severe; grievous pains in the forehead; flaring wildness of the eyes; exceeding acute fixed pain under the ribs, extended to the right pap; hard laborious cough, and by reclining the body forward, in the action of itooping, an immediate diate inclination to vomiting follows, with a stupid dizzines, and a resection of green rays; but the patient on resuming an erect posture, in a few minutes recovers his fight; the urine is rendered in small quantities turbid, and of a faffron colour, the breathing short and oppreflively heavy, with frequent fingultus, and an univer-fal parched heat over the body; total lofs of appetite and perfpiration; costiveness and infatiable thirst; startings and twitchings of the mufcular fystem; the countenance markably pale, with a black mass surrounding the mouth and the eyes, tinged with an inflammatory yellownefs; the right fide of the abdomen confiderably enlarged, very dense and hard, and, if forcibly pressed, occa-fioning a pain in the scapula, and an instantaneous sicknefs, with coughing and fneezing; the pulfe fmall, hard, and quick, frequently fluttering, and very often the vibrations are not to be diffinely felt; then inflantly falling and rifing to almost the natural state, and again returning and finking as before; amazing periodical tremor-of the hands, and in fome plethoric thin habits, the an-kles are puffed and swelled; those who do not cough much, have always a great discharge of acrimonious fluid from the nofe, with continual spitting, sometimes ac-companied with large ulcerous blotches in the mouth and tonfils. In this mature state of the diforder, the patient can rest on either side, but not on his back, without being immediately affected with incubus; but in the lefs advanced state of it, or after plentiful evacuations, this is a common fymptom, occasioned by the fize and weight of the liver, which when lying on the left fide, falls down from the diaphragm, and rends the adhesion, or stretches the accreted part, either of which will occafion the fymptom; but in the former case, the liver is so much increased in fize, that there is not fufficient room in the abdomen for this accident to occur, which reason-ing will hold good also before the adhesions have taken place, or before the bulk of the liver is confiderable. The

feverity of the difease does not always depend upon the immediate fize of the liver, but frequently on that of the gall-bladder, or ducts, or the adhesions formed to the diaphragm, which is always the case when the upper or gibbous portion of the liver is the feat of the difeafer. When the fymptoms are fevere, without any apparent enlargement on the right fide of the abdomen, with little tension and hardness, yet, on prefling the liver, a sick-ness, cough, &c. are brought on, it is a certain and manifest testimony that the disease is situated about the region of the gall-bladder, and that the bladder with the bilious ducts are principally affected; but when the liver is in the large state before related, it is the actual bulky fubstance of that viscus which is diseased. Sometimes the belly is univerfally fwelled, with pain in the umbilical region; this originates from the entire mass of liver being affected, and occupying a great portion of the left abdominal sphere; when the suppuration is matured, and breaks out with severe coughing and most copious spitting, the mercurial course will be improper. The great which now is to support with autritions food and group object now is, to support with autritious food and emol-lient ptifans. This is the first state of the hepatitis that does not admit of a cure by mercury; and it is worth notice, that medical assistance in the first appearance of the disorder will sometimes entirely prevent the fatality of it. The second state of the bepatitis, which does not require mercury, is, where the matter points outwards; when the suppuration is in the superior part of the liver, it appears in a conical form, but when the collection is lower down, and tends externally, the tumor is of a round, flat shape; both may be distinguished by the great fluctuations in them, and their yielding so readily to gentle pressure, without creating pain.

Inflammation in the liver may terminate by refolution, &c. but most frequently it ends in a suppuration, and fo proves fatal by bringing on an incurable heetic fever, though when the matter can be discharged externally a cure may be expected. If properly treated in the begin-

ning, it is rarely mortal.

The resolution of the bepatitis is often the consequence of, or is attended with evacutions of different kinds. An hæmorrhage, fometimes from the eyes, fometimes from the hæmorrhoidal vessels, gives a folution of the disease. Sometimes a bilious diarrhœa contributes to the same event; and the resolution of the bepatitis, as of the other inflammations, is attended with fweatings, and with an evacuation of urine, depositing a copious fediment. This kind of inflammation should be distinguished from

inflammation of the pleura, of the diaphragm, of the ftomach, and of the muscles of the belly, also from spasmo-

die pains.

The fymptoms in the beginning does not much alarm the patient, whence early affiftance is not always had re-course to. However, if called in before the fifth day, bleed, and repeat the operation; if the symptoms do not foon fubfide, the strength of the patient, and other attendant circumstances, will determine the quantity of blood to be taken away, and the frequency of repeating the operation. After a free bleeding, a large blifter may be laid over the part affected. This done, if there is a free paffage for the bile into the duodenum, keep the bowels lax with proper dofes of antimonium tartarifatum cum pulv. rhab. vel infuf. transind. with vitriolated natron, &c. In other cases, the pulv. antimon.;—haust. salin.;—and such other antiphlogistics as are generally useful against internal inflammations; but in all cases,

bliftering, as just named, is necessary.

If these means fail, or if it is too late for their proper use, and the symptoms of a beginning suppuration are manifest, begin with the bark; give 3 ss. of the powder four or five times a day, and increase the quantity, until

3 is. is taken every twenty-four hours.

If the abfcefs points externally, encourage it by ma-turating cataplasms, and open it as soon as possible, particularly if, from its immobility, the liver seems to ad-here to the peritoneum, and then the bark may be given to two ounces in twenty-four hours, if the ftomach will retain it, and thus proceed until a good suppuration appears. If from purulent or ichorous ftools, it is evident that the abicels is burit into the duodenum; or from other fymptoms, that it hath made its way into the cavity of the belly, the fame methods may be used, though the fame effects cannot be fo fully expected,

In the East Indies, it is usual after bleeding to excite | a falivation, and support it according to the strength of the patient; but the bark feems to be a preferable method. A loofeness coming on answers as well as a

fpitting.

Heracles, where the best was produced.

HERACLEUM. A species of sphondylium.

HERACLIUM OL. It is thought to be the oleum

ligni buxi.

HERACLIUS, LAP. LOADSTONE. See MAGNES. HERBA. An HERB. All fuch plants whose stalks die to the ground every year. Those whose roots contitinue only one year, are called annual; if they continue two years, they are called biennial; and, if they con-

tinue many years, they are perennial.

Herbs are to be gathered when the leaves are at their

full growth, before the flowers unfold, except it be those whose flowery tops are preferred. They are best when quickly dried, and that in a room that is heated by a fire to a degree equal to the hottest summer's day with us. Aromatic plants should be gathered from warm dry foils; fetid ones from moist and rich soils. All berbs and leaves should be gathered in clear dry days, as soon as the morning dew is diffipated. When berbs are well dried, they are good as long as their colour remains, both for decoctions, and for diffilling; those that are good when dry, are better than when they are green.

HERBA PARIS, also called uva lupina, aconitum pea-dalianches, folanum quadrifolium, bacciferum, HERB PA-RIS, HERB TRUE-LOVE, or ONE-BERRY. It is the Paris quadrifolia, Linn. It is a low plant, grows wild in flady woods; it flowers in April and May; the berry is ripe in July. Gefner fays its juice is narcotic, but it is not much in use. See Raii Hist. for that called ALBA,

fee ABSINTHIUM VALESIACUM.

HERBATUM CANADENSIUM, called also panaces mostbatum, SWEET SCENTED ALL-HEAL of AMERICA. This plant is found in Canada; it is more an alimentary shan medicinal one.

H. BEAUM. The abbreviation of Herbertus à Beaumont, Horti Beaumontiani Exoticarum Plantarum Cata-

HERCULES. The name of feveral potent medi-

HERCULIS BOVII. The name of a once famous

emetic and cathartic preparation.

HERCULIS CLAVA. HERCULES'S CLUB. It is a thorny tree, its bark is hot to the tafte, but of no rentarkable medical virtue.

HERMANNIA. The name of an herb in Africa, of which Boerhaave enumerates feven species; their virtues

are fimilar to those of marshmallows.

HERMAPHRODITUS, from 'Equit, Mercury, and Appoint, Venus. An HERMAPHRODITE. One who is supposed to be of both sexes; but the truth is, the clitoris of a woman being of an extraordinary fize, is all the peculiarity in this supposed species of the human kind. See Cheselden's Anatomy. HERMODACTYLUS. HERMODACTYL. It is the

colchicum Illyricum, Linn. called alfo alfurengium, ephe-meron. It is the root of a plant, brought from the Turkish dominions. It is of the shape of a heart of different fizes and colours, fome are reddish, others yellowish, brownish, or white; the white and hardest are the beit. Each root is flatted on one fide, and hath a furrow on the other. Some reckon it a species of colchicum.

It hath a vifcous farinaceous sweetness to the taste, but no smell. The ancients say it is eathartic, but the dried ones which we receive, are quite inert. Prosper Alpinus informs us, that the Egyptian women eat them as a means of becoming fat. They are not of any known use in me-dicine. See Lewis's Mat. Med. Neumann's - Chem. Works.

HERMODACTYLUS FOLIO QUADRANGULO, called also iris tuberosa, iris bulbosa, and snake's-HEAD IRIS.

The roots of this plant hath a tubercle, which is both

emetic and cathartic.

HERN. The abbreviation of Francif. Hernandez Nova Plantarum, Animalium, & Mineralium Mexicano-

HERNANDIA. It is a well known herb in the American islands, generally called JACK IN THE BOX, but of

no medical note.

HERNIA, from igros, a branch. A RUPTURE. In confequence of fome fudden effort, part of the abdominal contents are forced through the interffices left between the tendinous expansions of the abdominal muscles, for the paffage of nerves and blood-veffels, or fome other part, and a tumor is formed, which, from its refemblance of the budding, or pushing forth of a branch, hath been called an bernia. Dr. Cullen places this genus of disease in the class locales, and order ectopiæ.

According to the situation of these tumors, or from

their contents, or both, they obtain their respective denominations; though fome take their name from attending circumstances. 1. Those from the situation are the umbilical, ferotal, ventral, &cc. 2. Those from the contents are the enterocele, epiplocele, entero-epiplocele, pneumatocele, &c. 3. Those from attending circumstances, are the incarcerated hernia, &c. Distinction hath been made indeed betwixt the true and falle bernie; they are all tumors of the scrotum, but the true are from the abdominal vifcera defeending into it, and exist either in the groin or fcrotum; whereas the falfe are from other causes, they begin below and ascend upwards, they are the bernia humoralis, hydrocele, hæmatocele, farcocele, &c. they are not displacements of parts, but a morbid state of, or diseases in the part where the tumor appears; for the Greek term Kenn. Hernia, means also tumor, as well as rupture.

This accident being unattended with rupture, or divi-tion of the containing parts, the whole of the difease must at first be considered as a change of situation of the contained parts; and as fuch, were they immediately returned, and kept in their place, the diforder would entirely cease; but continuing in that preternatural situation, they are presied upon by the tendons through which they pass, and the circulation of blood being obstructed, inslammation and mortification speedily supervene; which, how-ever, is not owing to any change of state in the tendons, but merely to their natural elasticity, acting upon an in-

which they become incapable of returning through the

If affiftance is called to the patient in time, the return
of the protruded parts must be attempted by such means as cause the veffels to contract, thereby diminishing the bulk of the folids, and repelling the fluids, fuch as cold, aftringent, and ftimulating applications. Emollients are absolutely to be avoided, for they cannot relax the tendons; but they may, and often do enlarge the bulk of the bernia, and render its reduction more difficult, if not impossible. Cold astringents should be immediately applied, fuch as Goulard's faturnine water; at the fame time these may be assisted by a gentle but continued com-pression on the part with the singers, or with small bolfters of foft linen cloth; by continuing these efforts for fome time, the veffels become visibly less distended, the fwelling grows flaccid, at length the stricture gives way, and the disorder is removed.

When all proper attempts fail to reduce the contents of an bernia, the fooner the operation is performed the better; but when there are evident figns of the intestine being in a mortifying flate, fuch as the tumor having loft its renitence, &c. Mr. Gooch recommends it as a very reasonable practice to make an incision into the tumor, ample enough to evacuate the feces freely, which may effectually remove the strangulation of the intestine at the abdominal ring, and then to treat the wound as a mortification, not being over bufy with the knife in cutting away what appears to have loft its vitality, but allowing nature to throw off the mortified flough. If it is a doubtful point what condition the parts contained in the tumor are in, proceed with caution in the operation, until you come to the intestine, and if that is mortified, open it too, and if the evacuation of the feces do not effectually make way for the return of the parts, the abdominal

ring must be opened by incision.

But, after replacing the bernial contents, to retain them requires very often the affiftance of a bandage, or a proper compress. Mr. Pott observes, "all that can be done by surgery towards the cure of a bernia, is to replace the prolapsed body or bodies in the cavity of the belly, and to prevent them from flipping out again. When whatever formed the tumor is replaced, the furgeon hath done his part, the reft is nature's; whether the tendinous aperture will fo contract as to prohibit a future defcent or not, is matter of uncertainty, and not to be

known but from the event."

When a rupture happens, and is unattended with any figns of stricture, or other violent symptoms, a bandage or a trufs will be the most eligible means of relief. As to the modes of operation, when the knife is necessary, fee the respective species of this disorder, and the authors referred to at the conclusion of this article.

HERNIA AQUOSA. See HYDROCELE.

— BRONCHIALIS. See BRONCHOCELE.

— CARNOSA. See SARCOCELE.

- CONGENITA. It is a rupture where the intef-tine and tefficle are found in contact. The teftes are originally fituated in the abdomen, just beneath the kidonginally lituated in the abdomen, just beneath the kid-neys, and gradually descend near the time of birth through the sheath of the spermatic chord into the scrotum, each carrying along with it a pertioneal coat, which makes the tunicæ vaginales. This discovery was made by Dr. Hun-ter, in the year 1755, assisted by his brother Mr. John Hunter; it was demonstrated by the doctor in his public lectures that year.

Soon after the birth of the child, the communication between the tunicæ vaginales and the abdomen, is obliterated by the stricture of the parts; but if the intestine falls very foon, it prevents this stricture from taking place, and thus this kind of bernia is formed.

In the treatment of ruptures of this kind, little difference occurs from the management of the bubonocele, in its more ordinary form. See Bell's Surgery, v. i. p. 340. Dr. Wrifberg observes, that in his diffections, he fe-

veral times found a part of the omentum or intestines adhering to the testicle in the abdomen of the fœtus, and when this happens, an hernia congenita will be likely to often as they grow warm and begin to dry. In want of take place. The fame thing, he adds, will occur, when this water, a mixture of vinegar and brandy may be used; the peritonacum in its course over the seminal vessels to thus, if the part is suspended properly, and if the patient

creafed and yielding fubjacent bulk. The obstacle to the reduction of the prolapsed contents is, therefore, the increased bulk which they have acquired from stricture, by on the right side, which is the common seat of the bernia on the right fide, which is the common feat of the bernia congenita. See the London Med. Journal, v. i. p. 376.

White's Surgery, p. 332.

— CRURALIS. See HERNIA FEMORALIS.

— CYSTICA. The beenia of the urinary bladder. dominal ring, or under Poupart's ligament. The fluctuation of a liquor which can be preffed into the body fo

as to occasion a desire to make water, or to run immediately out by the common urinary passage, are the symp-toms by which this species of bernia may be discovered; if it arifes to any fize, the patient cannot discharge his urine without lifting up and compressing the tumor.

While recent it is eafily reduced, and kept from re-turning by a proper bandage; but if it is adherent, a fuf-penfory is the best relief. If this bladder adheres to a rupture of an intelline, great caution is required (if the operation becomes necessary) to avoid opening the

bladder.

- FEMORALIS. See CRURALIS. This species of rupture is the fame in both fexes, and formed by the falling of the omentum, or inteffine, or both of them, into the infide of the thigh, through the arch made by the os pubis and ligamentum Fallopii, where the iliac veffels and tendons of the ploas and iliacus internus mufeles pafs from the abdomen. See Buronocelle. Treat it first by the fame methods as are proposed for ruptures in general, if the operation is necessary, proceed as for the general; if the operation is necessary, proceed as for the bubonocele, with the difference of dilating the ligament instead of the rings of the muscles; the dilation must be made obliquely outwards, inftead of perpendicularly up-wards, to avoid dividing the veffels. White's Surgery,

- FLATULENTA. See PNEUMATOCELE.

FORAMINIS MAGNI ISCHIL. It is when the in-testines or omentum fall through the great hole of the ischium into the internal part of the thigh, between and under the two anterior heads of the triceps muscle. In such a case there must be great laxity of the ligament, and the intestine must lie behind the pectineus muscle, wherefore no pressure can be used to keep it up, and the operation cannot be attended with fuccefs; because as the inteffine is ftrangulated, the orifice cannot be dilated, by reason of the vicinity of the vessels.

- GUTTURIS. See BRONCHOCELE.

HUMORALIS; called also inflammatio testium; though this is often a difease of the tunica vaginalis of the telticle: it confifts of an inflammation and fwelling there; but any of the integuments of the testicles, or the tefticles themselves, may be the seat. Dr. Swediar says, that the testicle itself is never swelled, or in the leaft affected, in the beginning of this complaint, and that the only affected and fwelled part is the epididymis. He adds, if the tellicle becomes fwelled, it is not till after the other part is affected, and that from bad treatment. It is most frequently a venereal symptom, but may also happen from irritation, from bruises, and other external injuries. It may terminate any of the ways that are common to inflammation in other parts.

It is often caufed by a floppage of the venereal gonorr-hoea, or rather from a transposition of the venereal poi-fon, or, in other words, the irritation of the poison transpoted to a different place in the urethra; .viz. the caput gallinaginis, or the mouth of the excretory ducts of the feminal vehicles; in which case, brisk purgatives, if they produce a return of the running, are useful. Vomits, produce a return of the running, are uleful. Vomits, when the constitution can bear them, powerfully affist in removing this disorder whilst in its inflammatory state; but they should not be given until the inflammation begins to give way, and then the pulv. ipecac. is as useful

as the hydrargyrus vitriolatus.

Whatever be the cause, endeavour to remove the inflammation and tumor, by bleeding according to the strength of the patient; let the bleeding be immediately fucceeded by a brisk purge, and let the topical application be of the common aftringent and stimulating kind, such as Goulard's faturnine water; let them be applied cold by means of rags folded feveral times, and repeat them as often as they grow warm and begin to dry. In want of this water, a mixture of vinegar and brandy may be used;

can conform to lay much on his back, this tumor will be removed in a short time, without the usual violent pain or the hardness remaining afterwards, which is almost the constant effect of emollients. As soon as the inflammatory fyn., toms abate, mercury may be preferibed inter-nally, and the ungt. hydrargyri fort: may be rubbed on the ferotum every night, either to prevent or remove any degree of induration. If, notwithflanding every endeayour to the contrary, a suppuration cannot be prevented, an emollient cataplaim must be applied warm, and continue until a due discharge of the matter is effected. The knife is usually preferred for opening this kind of abfeels with, but care is required lest the testicle should be wounded: the dreflings may be the fame as directed for abfeeffes in general. On abfeefs in the tefficles, fee Kirk-land's Med. Surgery, vol. ii. p. 256. Dr. Swediar pro-pofes, in cases of virulent gonorrhoea, in order to prevent the hernia humoralis, that the patient avoids expofing himfelf to cold, violent exercife, venery, ftrong purges, and that he keeps the ferorum duly sufpended. If the hernia humoralis takes place, he proposes, first, to allay the irritation, and then to recall the poison to its former original feat: to this end, if the pulse is quick, full, and strong, bleed immediately, but with due regard to the constitution. If costive, a glyster should next be administered, to empty the present contents of the in-testines; after this, if it can be conformed to, the patient may fit half an hour in a warm bath, or on a perforated chair over the steam of hot water, for the same length of time, previously suspending his testicles. From thence he must go to bed, and a warm dry bag-truss thould be immediately applied. After this, a warm bread poultice may be applied to the penis to reproduce the running, or determine the retropulsed poison to its original feat again. And what is peculiarly beneficial is, to give a full dofe of opium by the mouth; or in its flead, a glyster of ol. lin. and decoctum hord. as p-seq. cum tinct. opii. gt. xl. lx. The diet must be low. When the running returns, relief is proportionably obtained. If required, repeat the opiate every twenty-four hours; and the parts must be exposed two or three times a day to the steam of hot water. Dr. Swediar's Obs. on Venereal Complaints. Aikins's Obs. on Prep. of Lead. London Med. Obf. and Inq. v. iii. p. 152, &c.

INCARCERATA. An incarcerated, imprisoned, or confined hernia. It is either when the prorruded in-testine so adheres that it cannot be returned, or when it cannot be returned, because of the flatus or other matter which is defeended into it, not being capable of a return.

Its tymptoms are, a fwelling in the groin and upper part of the ferotum, larger or fmaller according to the quantity of contents, very painful to the touch, and refitting the imprefs of the fingers; the pain is increased by coughing, fneezing, or flanding upright, and there is a fre-quent vomiting, with a suppression of all discharge by the anus, and a sever presently comes on.

If speedy relief is not obtained, the consequence is

fatal.

Very copious or repeated bleeding, and a proper pofture, are the principal helps; the patient should be laid with his kips much higher than his shoulders, and thus by gently raifing the ferotum, and a light preffure on the tumor, the inteffine may return; fmall dofes of opium may be given at due intervals : but if there is an adhesion, the operation is necessary, and if a gangrene is observed in the detained intestine, keep the found part of it so unit-ed with the aperture in the groin as to be the future anus. London Med. Journal, vi. p. 118, 259. Edinb. Med. Comment. v. 270.

- INGUINALIS. See BUBONOCELE.

- INTESTINALIS. Enterocele. See HERNIA SCRO-TALIS.

LACHRYMALIS. When the tears pass through the puncta lachrymalia, but are stopped in the nasal duct, the s flagnate in the facculus lachrymalis, and generally diffend it; whence this name. Anel calls it bydrops fac-

culi lachrymalia, a droply of the lachrymal fac.

If the inner angle of the eye is pressed, and an aqueous humour flows out, it is the fistula lachrymalis. See Kirkland's Med. Surgery, v. ii. p. 135.

OMENTALIS. See EPIPLOCELE.

SCROTALIS; called also Intestinalis. It is when the omentum, the inteftine, or both, protrude and defeend into the ferotum. It is called a perfect rupture, in contradiffinction to a bubonoccle, which is the fame diforder, only that the defcent is not fo low. The bernia ferotalis is diftinguished into the true and false; the true is when the omentum, or intestine, or both, fall down into the ferotum; the false is when a humour or an inflammation causes a tumor in this part; such as in the case of an hydrocele, hernia humoralis, &c.

— UMBILICALIS; called also Epiplo omphalon; omphaloses; exemphalos: It is when the omentum, or intesting or both controlled it is when the omentum.

tine, or both, portrude at the naval. It rarely admits of other relief than the palliative. White's Surgery, p. 323.

UTERI HYSTEROCELE. Inflances have oc-

curred of the uterus being thrust through the rings of the muscles, but this is hardly to be discovered, if there is no child in it, whose strugglings would lead us to the proper distinction of it from the rupture of any other part.

VAGINALIS. There is naturally a deep fort of cavity between the rectum and the back part of the uterus, made by the peritoneum descending pretty low, and forming a kind of pouch, in which a portion of the small intestines, when the uterus is not pregnant, is commenly lodged; and sometimes the intestines themselves, by present fing hard against the peritoneum at this most depending part of the abdomen, gradually firetch this membrane so as to deepen this cavity much, and thereby diffect as it were the back part of the vagina from the fore part of the rectum, and thus form the tumor in the vagina, which is called an hernia vacinalis. is called an hernia vaginalis.

- IN VAGINA. See COLPOCELE.
- VARICOSA. See CIRSOCELE.
- VENTOSA. See PNEUMATOCELE.
- VENTRALIS. This may happen in almost any

point of the fore part of the belly, but is most frequently found between the recti muscles, either above or below the navel. It is generally large, and is only to be relieved by returning the protruded parts, and preventing their return by a proper bandage. The tumor which requires this operation is feldom bigger than a walnut; fo when there are the fymptoms of a bernia, and yet no appearance of one in the groin, the belly should be examined. The manner of relieving the stricture will be by dilating the part, as in other cases. But after the operation a

bandage must always be worn, as the cicatrix cannot be trusted to. White's Surgery, p. 324.

— VESICALIS, seu CYSTICA. In this species, the unrinary bladder is the part protruded, either in the groin scrotum, through the opening in the external oblique muscle of the abdomen; in the fore part of the thigh, under Poupart's ligament, or in the peringum, through fome of the mufcular interflices of that part, indeed the bladder has been pushed into the vagina, and formed hernial tumours of no inconfiderable degrees of magnitude. The common attendant fymptoms are; tumor with fluctuation, either in the groin, fore part of the thigh, or perinaum, which generally subsides when urine is voided. When the swelling is large before water can be made with freedom, it is commonly necessary to have recourse to pressure, at the same time that the tumor, when in the groin or thigh, is as much elevated as possible; but when the swelling is small, and especially when no stricture is as yet produced, water is generally made with great case. When this complaint is simple, it commonly proceeds from a suppression of urine. Hence every cause of suppression ought to be guarded against as far as possible; and when no adhesions take place, and if the protruded portion of the bladder can be reduced, a truss properly fitted to the part should be worn for a confiderable length of time. When the parts cannot be reduced, as long as no symptoms occur to render the operation necessary, a suspensory bag, so fitted as effectually to support the prolapsed parts, while at the same time it does not produce severe pressure, is the only probable means of relief. When a portion of the bladder happens to protraide into the various of the protraide. to protrude into the vagina, after reducing the parts, defcents may be prevented by the use of a peffary; and the fame means will be successful in preventing a salling down of part of the intestinal canal into the vagina; a species of rupture which now and then occurs. But frould the protruded parts be attacked with pain and in-flammation, in confequence of firsture, fo as to render the operation necessary, we must proceed as in other fi-

milar cases of dividing the parts occasioning the stricture. | sus; which includes the crusta latter, and the tinea ca-See Le Dran's Operations; Mem. de l'Acad. Royale pitis, see Achor. 3. Herpes miliaris; called also formica Chirurg. Sharp's Operations; Sharp's Critical Enquiry; miliaris; of this variety is the ulcerous cruption called Mons. Arnaud on Ruptures; Pott on Ruptures; Gooch's the ringworm. 4. Herpes excelens; this includes the Treatise on Wounds, p. 427, &c. Aikins's Obst on Prep. of Lead, p. 91, &c. Bell's Surgery, v. i: p. 369

to 377. HERNIARIA. RUPTURE-WORT; also called polygoglabra, Linn. It is a fmall foreading plant, found in fandy ground; it flowers in June and July; is faid to be diuretic and aftringent; but is not of much note:

- ALSINES FOLIO. SEA CHICKWEED, also called paronychia alfinas folio incana, and anthyllis maritima.

Boerhaave mentions other species also.

HERPES, vel ERPE\*, from 47 = 10 forcad or creep. TETTER. These disorders are apt to creep on and spread about in the fkin. Dr. Cullen places this genus of difease, in the class locales, and order dialyses; it belongs also to the impetigines.

These ulcers in the skin are divided by some into five

Species.

1. The fimple. These consist of single pustules of a vellowish white colour, and sharp pointed; they are inflamed about their bases, and are naturally dry; these burn, itch, and fmart a day or two, and then disappear.

2. The TETTER, RING-WORM, or ferpige: These are the same in appearance as the first, only that they fun in heaps; they more difficultly pass away; for they contain more corresive matter; their smarting and itching is more violent; they eat sometimes through the skin, and spread considerably; they neither form matter nor come to digestion. The cure is sometimes difficult; in fome persons they return at certain seasons. If the habit of body is faulty, restore it, purge gently with mercutials, and then apply the following to the parts affected: R Hydrargyri muriati, gr. xvi. aq. calc. si. si. im. s. lotio. Vel, R Calcis hydrargyri albæ. 3 ii. ungt. simplicis, \( \frac{7}{3} \) i. m. When a serpigo is a symptom of the scurvy, the great water-dock root is an excellent remedy, as indeed it is in all respects of herpes.

3 and 4. SHINGLES, or zona aurea, &c. Dr. Cullen makes this, i. e. Herpes zoster, fynonymous with his eryspelas phlyctenodes. It is fometimes accompanied with inflammation and fever. This kind appears in large clusters, on the neck, breast, loins, hips, or thighs; the heads are white and watery, and are fucceeded by a fmall round fcab refembling millet feed, whence the name heres miliares ; and now the diforder is still more grievous. In these cases the ill habit of body being first attended to, it must be remembered that the external applications must be more mild than those above prescribed. Internally the treatment may be as in the eryfipelas: the chief indication is to take off the irritability of the fyftem; which is best done by a proper use of the cort. peruv. The prognostic of death from its surrounding the body is false; the malignity of the tumor alone being the only ground

of fear. These two kinds were called by the ancients by the names vermis repens, vermis mordicans, formica miliaris; Wiseman calls them ambulativa.

5. Herpes exedens, also called nome, noli me tangere, uleus depascens, herpes depascens, esthiomenos formix; and Celsus calls it ignis sacer. According to Dr. Cullen it is of the species of inflammation which he calls erythematous. It refembles an ulcerous eryfipelas; its humour is the most corrosive of any of the species; it corrodes down the sleshy parts, and separates it into scales: when it disppears it leaves hard tumors behind it, on the parts that were ulcerated. In order to the cure, the hydrargyr. muriatus may be given as directed in the lues venerea, with a decoction of the woods or farfa. The fores may be washed with a solution of hydrarg muriat, in aqcalcis.

Some have succeeded with a dose of jalap every fourth day, and an electuary of bark, two parts to one of faf-

Mr. Bell, in his Treatife on Ulcers, places the tinea and the berpes, as varieties in his species of ulcer, which he denominates cutaneous. He further observes that the cutaneous ulcer may in all its varieties be included in the four following; viz. 1. The berpes farinofus; which in-sludes what fome call the dry tetter. 2. Herpes pushulo-

the ringworm. 4. Harpes exidens; this includes the ulcers called depascent, and phagedenic.

The berpes farinosus is the most simple kind. It ap-

pears on any part of the body, most frequently on the face, neck, arms, or wrifts; it comes out in broadifh fpots, which confift of very fmall red pimples; which are attended with a troublesome itching; they soon fall off in the form of a white powder which resembles sine bran; they leave the fkin perfectly found, but are apt to return in the form of a red efflorescence, fall off, and renew as

The berpes pultulofus occurs most frequently in children, generally attacks the face, and behind the ears; of-ten on other parts of the head also, but rarely elsewhere. It appears in the form of pullules, which are originally fe-parate and diffinct, but afterwards run together in clusters. At first they seem to contain nothing but a thin watery scum, which afterwards turns yellow, and exuding over the whole surface of the part affected, at last dries into a thick crust or scab: when this falls off, the skin below frequently appears entire with only a flight degree of red-nels on its furface; but on fome occasions when the matter hath probably been more acrid upon the feab falling off, the fkin is found flightly excoriated. See ACHORES.

The berpes miliaris generally appears in clusters, though fometimes in diffinct circles of very minute pimples. These are at first perfectly separate, and contain only a clear lymph, which, in the course of the disease, is excreted upon the surface, and there forms into small distinct scales; these at last fall off, and leave a considerable degree of instammation below, that still continues to exade fresh matter, which likewise forms into cakes; and so falls The itching in this fort of ulcer, is always very troublesome, and the matter discharged from the pimples is so tough and viscid, that every thing applied to the part adheres so as to occasion much trouble and uneasinefs to the patient on its being removed. The whole body is subject to this diforder, but it most frequently appears on the loins, breaft, perinceum, ferotum, and

The berpes exedens discovers itself on any part of the body, but mostly about the loins, where it fometimes fpreads to fuch a degree as to extend quite round the waift. At first it usually appears in the form of several small ulcerations, collected into larger spots of different sizes and various figures, with always more or lefs of an eryfepelatous like inflammation. These ulcerations difcharge large quantities of a thin, sharp, serous matter, which sometimes forms into small crists that in a short time fall off; but most frequently the discharge is so thin and acrid, as to spread along the neighbouring parts, and there to produce the same kind of fores. Though these exceriations or ulcers, do not in general proceed further than the true fkin, yet fometimes the discharge is so very penetrating and corrosive as to destroy the skin, the cellular membrane, and, on some occasions the muscles themselves:

Dr. George Fordyce speaks of an instance of this dis-ease, under the name of barpes rapiens; and says, it arises upon the head in fmall ulcers, covered with a brown moift crust, and shining, but similar to venereal ulcers. He adds, its cure is the fame as for the venereal ulcers, which

In the cure of these various cuticular diseases, it hath been generally believed to be unfafe, and even dangerous, to proceed in any other way, than by correcting the original diforder of the fluids, which was supposed to produce them. It may occasionally happen, that some diforder in the general habit is attendant on any of these ulcerous complaints, and that a regard thereto may be required; complaints, and that a regard thereto may be required; but in the greatest number of instances, they are more certainly and more speedily removed by the use of local remedies merely. In many diseases of the skin, antimonials are frequently given with advantage, but their efficacy seems principally to depend upon their producing a determination to the skin, and keeping up a free discharge of the matter of perspiration; which from various causes is long retained on the surface of the body, and there becomes accide, and doubtless is a frequency cause of disc becomes acrid, and doubtless is a frequent cause of disordered affections in this part. Accordingly, all fuch

lefs powerful in keeping up a free perspiration. This is further evident by observing, that a due use of the warm bath, is as efficacious in these cases, as the use of antimo-nials and other medicines supposed to carry off morbid particles through the skin. In the treatment of every herpetic diforder, the first and principle circumstance to be attended to, is, that not only the parts affected, but even the whole surface of the body, be kept clean and perspirable as possible; to this end the frequent use of warm bathing, and of frequent gentle frictions, with clean linen cloths (in the dry forts of these complaints) are sin-gularly serviceable. In the milder instances, the following externals generally fusfice. 1. The aq. calcis fi. ufually is all that is required in herpes farinofus. 2. The folutions of lead in vegetable acid, are also very effectual; the following is a useful general form. R Cerustie acctate, \$\frac{7}{3}\$ fs. Acet. acerrim. \$\frac{7}{3}\$ iv. aq. dift. \$\frac{1}{15}\$ ij. m. This may be applied in the form of cataplasm, mixed with bread, or by means of foft rags dipped into it, and laid directly on the parts. In some particular and more inveterate cases, the following is sometimes to be preferred; viz. R Hydrargyri muriati. gr. x. aq. dift. fb j. m. This is very efficacious as an embrocation in any of these diforders. In the most obstinate instances of this complaint, the greatest care is required that perspiration is duly fupported, viz. warm diluent drinks frequently taken, as well as the use of the warm bath. The ant. crud. ppt, to 3 ii. in the day, if mixt with a little gum guaiac. and contribute further aid by its efficacy in unloading the bowels. In the more vigorous and plethoric habits, cooling laxatives, are peculiarly beneficial. Iffues are fometimes necessary in the more inveterate forts of herpes. In the berpes exedens, a degree of inflammation often attends that requires attention; here the faturnine applications, above all others, check its progress, and at length totally remove it. But if, as it fometimes happens, the herpetic ulcer hath made its way into the mufcles, the following ointment is preferable to either the faturnine folution, or that of hydrarg. muriati. R Zinc. pulv. fubtilifs. 3 ij. Axung. porc. 3 vj. m. The ungt. faturnine of the different difpensatories, is also an useful application in this last mentioned instance. But care must be taken that this ointment is not become rancid. If notwithstanding the use of the above, the disorder is unconquerable, it may be suspected that a venereal taint at the same time subsists in such a patient. A slight herpetic diforder becomes obstinate by being accompanied with the itch: in fuch cases, attention must be had to fuch difeases respectively, before those of the herpetic kinds can be removed. In some instances of the herpes exedens, the following bolus has been used with considerable advantage; R Hydrargyri calcin gr. ifs. Confect. opiatæ 3 i. m. omn. noct. fumend.

HIERANOSOS. See Convulsio. Some express by it a continued kind of convultion without pain or lofs of

HIERA PICRA, itees suspect. HOLY BITTER; now called pulvis alocticus. It was formerly called hiera logadii, and was made in the form of an electary, with

honey, but now the species is kept in dry powder.

The London College directs the powder to be prepared as follows: take the gum of Soccotorine aloes, one pound; of white canella, three ounces. Rub them into into a fine powder feparately, then mix.

HIERABOTANE, from 12702, boly, and Bolarn, on berb. Holy Hers. In Diofeorides, it is a species of verbena. See VERBENA.

HIERACANTHA. A name in Boerhaave for the

carlina fylvestris vulgaris.
HIERACEUM. GOLDEN LUNGWORT. Also a name

of fome species of fonchus.

HIERACIUM, from bieran, a hawk. Accipifring. HAWKWEED. Boerhaave mentions forty species, but only four have any medical virtues attributed to them.

- LONGIUS RADICATUM. LONG-ROOTED HAWKweed. The stalks of all the kinds are full of branches, slender, and elegant; the leaves are disposed alternately; the calyx is thick, firm, and expanded; the seeds are smooth and angulous, or striated.

The root of this species strikes deep into the ground; is long, thick, and but little branched; the leaves lie flat on the ground, are rough and hairy; the flowers are like those of the dandelion, but less of a yellow colour, and turn into down; the feeds are long and flender. It grows in fields and meadows, and flowers in May, and io on to August or September. It is cooling, aperitive, and diuretic

- ALPINUM, also called Pannonicum, berba costa, costa pulmonaria, pilosella major, dens Iconis, pulmonaria Iutea. BROAD-LEAVED HUNGARIAN HAWKWEED. Ir grows on chalky hills, flowers in June, and is extolled in pulmonary diforders.

MINUS, called also hieracium leporinum. LESSER HAWKWEED. It grows in patture ground, flowers in June and July, and its virtues the same as the hieracium majus, but bitterer, and otherwise presentle.

— MAJUS, also called fonchus repens multis. GREATER HAWKWEED. It is found in fields; it flowers in July; the leaves cool, and are moderately aftringent. See Rail Hist.

Sec HYOSERIS.

— MONTANUM. A species of chondrilla.

— MURORUM. See PULMONARIA AUREA.

— PILOSELLA. Se AURICULA MURIS.

HIERACULUM. HAWKWEED.

HIERATICUM. The name of a malagma, formerly

appropriated to diforders of the liver, ftomach, and other of the abdominal vifcera.

HIEROPYR. The fame as the erythematous species

of inflammation.
HIGUERO. The CALABASH-TREE. It is a large tree, common in all the American islands, and on that continent. The flowers are shaped like those of a lily, of a white and greenish colour, but a disagreeable smell. The fruit is of various fizes and figures; it is green at the first, but when ripe it is black and hard, containing feeds like a gourd, and a yellow kernel. The unripe fruit contains a white juicy pulp, that finells like nafturtium, but of a fweetish taste. The unripe fruit is preserved with sugar, and is used in severs. The ripe affords a shell for

cups, &c. See Raii Hist.

HILUM. The blackish spot in a bean, called its eye.

HIMANTOSIS. Relaxation or lengthening, and

fmallness of the uvula.

HIMAS. Properly a leather thong or ftrap. But in medicine it is a laxness of the uvula, when it becomes long and flender. It differs from the clonis, which is when the uvula is thickened.

HIN. HINDISCH, See AsA-HING. The Indian and Persian name. FOR HINGISCH.
HIN-AWARU. See INDICUM.
HINKA. See CARYOPHILLUS AROMATICUS. FOETIDA.

HIPPACE. The rennet of a colt. Also cheese made of mare's milk

HIPPECACUANNA. See IPECACUANHA.
HIPPOCASTANUM. The HOWSE CHESTNUT-TREE, called also castanea equina pavina. The fort recommended by the Edinburgh College, is the asculus hippocastanum, or asculus Boribus heptandris, Linn.

In England we have the white, yellow, and scarlet flowering ebestinat-trees. They are cultivated in gardens and walks, and flower in May and June. The fruit is a good errhine. Jo. Jac. Zannichelli affirms, that after many trials he has found the bark of these trees to have the fame effect as the Peruvian-bark. See Raii Hift. HIPPOCRAS. See AURETUM.

HIPPOCRATICA FACIES. See FACIES HIPPO-

HIPPOGLOSSUM. DOUBLE-TONGUE; also called biflingua, bonifacia, uvularia, laurus Alexandrina, ruscus latifolius. It is the ruscus bippoglossum, Linn. This plant is nursed up in gardens chiefly as a curiosity. Raii Hist. See RUSCUS LATIFOLIUS.

HIPPOLAPATHUM. MONK'S RHUBARB. See LA-

PATHUM HORTENSE.

HIPPOLAPATHUM, ROTUNDIFOLIUM. See LAPA-

THUM ALPINUM.

HIPPOLITHUS, from iππος, a horse, and λείω, a stone. A stone found in the stomach or intestines of a horse.

HIPPOMANES, from inwest, a borfe, and macreman, to be mad. It is a name for the cynocrambe, or apocynum, because it makes horses mad if they eat of it. It is also a name of the juice of tithymallus. Some take it to signify the fecundines of a mare. Laftly, the flefhy substance which fometimes adheres to the forehead of a new foaled

which tometimes adheres to the forenead of a new foaled colt is thus named; also the hippophese.

HIPPOMARATHRUM, from inπος, an horse, and μαραθρού, sennel, HORSE-FENNEL, also ENGLISH SAXI-FRAGE. See Raii Hift. Plant.

HIPPOMYRMACIS See FORMICA MAJOR.

HIPPONE. The name of a malagma which Aetius

HIPPOPHÆS. Dioscorides describes it in lib. iv. cap. 162, but it is not certainly known what it is. The fynonyme, according to Dale, is the enaphos lappago, hippo-phæstum, bippomanes, spina purgatrix, rhamnus cathar-ticus, tithymalus maritimus vel spinosus. The Purgino THORN. It grows in the Morea. The juice purges powerfully.

HIPPOPOTAMUS. The RIVER-HORSE. It is faid

HIERACIUM MINUS FOLIO DENTIS LEONIS OBLONGO. that when he grows unwieldy he comes to the land, takes a reed, opens a vein in the leg; and when he hath loft a fufficient quantity of blood, he stops it with mud.

Another species is the equus marinus, rofmarinus, waleus, mors, or morz. The teeth of which are very large,

and are a fort of ivory.

HIPPOSELINUM, ALEXANDERS, also called slufatrum, Smyrnium, macerona, & berba Alexandrina. It is the Smyrnium olufatrum, Linn. An umbelliferous plant, with leaves like smallage, but larger. It was formerly blanched in gardens for culinary use. The feeds are bitterifh, aromatic, and carminative; they give out all their virtue to rectified spirit of wine, but not fully to water. The roots are bitter, and are recommended as resolvent, diuretic, and emmenagogue. On incision they yield a whitish juice, which when inspissated, resembles myrrh; whence the plant hath been called, from one of the names of that gummy resin, Smyrnium. Boerhaave mentions three species. See Raii Hist. Plant. See also APIUM.

HIPPURIS, from iππος, a horse, and ερα, a tail. It is the name of several forts of equiseum. See CAUDA

EQUINA.

HIPPURIS MINOR. See EPHEDRA MARITIMA

HIPPUS, from iππος, equus, a borfe. It is an affection of the eyes, under which they are continually trembling and twinkling, as is usual with those who ride on horfe-back. The author of the Definitiones Medica, fays, that it is an affection contracted from the birth, and is owing to a defect in the mufcle which fuftains the eye. HIRA. This word is variously understood: however,

fome express by it the intestinum jejunum; others exend it to all the intestines, and others mean by it all the con-

tents of the abdomen.

HIRAPITANGA BRASILIENSIBUS. WOOD. See BRASIL. LIGNUM.

HIRCI BARBA. See TRAGOPOGON.

HIRCUS BEZOARTICUS. The goat which affords

the oriental bezoar. See Bezoar Orientalis.

HIROUUS. The great angle of the eye.

HIRSUTIES. Unnatural hairiness of the body.

HIRUDO. The LEECH, also called fanguisugar, and birndo medica. Themson is the first who takes notice of leeches. Those should be chosen whose backs are striped, and bellies spotted, and which are taken from running

waters that are clear, and have a fandy bed.

They are only used for drawing of blood, where and when the lancet cannot be conveniently used; and for this end, may prefer those which have been kept in a vessel of clean water for some time, to those which are

but newly taken from the running waters where they originally refided.

Some think that letches have a polionous quality, be-cause that the wound they make sometimes heals with difficulty; but this happens when the lancet is used, and depends on the bad habit of the body. Perhaps from the manner of their biting it is, that the erysipelatous kind of inflammation arises, but be that as it may, it almost always goes off in a day or two.

To make leeches fasten soon, keep them hungry, and rub the part to which they are to be applied with warm milk or blood; if they flick longer than is thought convenient, they must not be pulled off; but if their heads are touched with common falt, they foon drop off of themselves: if they are thought not to have drawn a sufficient quantity of blood, apply cloths wrung out of warm water upon the orifice, or, if convenient, put the part into warm water, and thus the bleeding may be pro-

longed.

Keep the leeches in bottles not quite filled with water, and renew it every three or four days at the lateft: a little fugar may be added to the water in which they are kept.

Leeches are fometimes applied to the anus, when the hæmorrhoids are suppressed; but bleeding in the ankle or foot feems more likely to be useful, for the leeches can only be applied to the external hæmorrhoidal veins-When local inflammation, &c. is to be removed, in many instances, topical bleeding is preferable to general. By applying leeches we most probably open the small veins. only, and as no preffure is made as is done when the lancet is used, the vessels of the part are certainly more evacuated than the rest of the system. Though one leach 5 M

may be allowed only to draw one ounce of blood, yet at it as a variety of phlogofis phlogomone. See Wallis's Satistic makes a kind of lacerated wound, the difcharge may be vages. Bell's Surgery, vol. iii p. 264.

Continued until double the quantity is evacuated. In ophthalmies, leeches have been useful when general bleed-ing hath failed; ten or twelve leeches applied about the temples have relieved a violent cephalalgia almost immediately, &c.

The curious may confult the following writers on leeches, viz. Aldrovandus, Gefner, Botallus, Schizius, Heurnius, Cranfius, Schroder, and Stahl.

HOLOSTEUS. See OSTEOCOLLA.
HOLOSTIUM. A species of plantane.
HOLOTHURION. Whether plant or animal is not known; but, according to Bontius, it is poisonous.

HOLOTONICOS, from oxus, whole, and Term, firetch. It is spoken of universal convulsion, or rigor of the whole body. It is the same as tetanus.

HOLQUAHUILT. PERUVIAN BARK. See CORT.

PERUV

HOMA. A kind of anafarcous fwelling.

HOMOGENEUS, from ouer, like, and grous, kind,

an uniform body, or mixture.

HOMOLINON. CRUDE FLAX, or coarfe flaxen cloth, of which towels were made in the public baths.

HOMONOPAGIA. HEAD-ACH.

HOMOPLATAE. The SHOULDER BLADES.
HOMORUSIA. A medicine mentioned by Avicenna.
HOMOTONOS. Equable. It is an epithet for a
continual putrid fever, which preferves the fame tenor

through all flages.
HOMUNCULUS PARACELSI. See Anolescens. HOPLOCHRISMA. The WEAPON SALVE, XHOUR

HOR ÆUS. Properly it is fruit that is ripe about autumn: but modern authors express by it any fruits which

HORDEOLUM. STIAN. It is a tubercle on the eye lids, refembling a barley-corn in shape; it is also called crythe, and crithe, which see. It is small, red, hard, and immoveable: it is feated above the eye-lashes. Is an en-cysted tumor which contains a thick matter. It is painful; fometimes hurts the fight. Its feat is either on the infide or outfide of the eye-lid. It is a species of wen, according to Dr. Aitken's fyltem: but Dr. Cullen places

HORDEUM. BARLEY. In the shops there are two kinds of barley; or at least the same kind of barley in two forms.

HORDEUM DISTICHON; also called berdeum Gallicum vel mundatum; COMMON, and SCOTCH BARLEY. It is

the bordeum vulgare, Linn.

Barley is less nutrimental, less glutinous, and more cooling, than either wheat, oats, or rice. It was the principal aliment and medicine amongst the ancients in acute difeases and from the common use of the shelled barley, ptifana, in the form of decoctions, and other preparations of the fame general nature have been diftinguished by that name. The common barley is freed from the shells in mills, and in this state is called French or Scotch barley. A fort of shelled barley is formed into small round grains in Holland and Germany, which, from their pearly whiteness, are called *pearl-barley*.

Decoctions of these in water, contain their lighter and

more agreeable parts, and are important affiftants in acute and inflammatory diforders: but decoctions of barley are most useful, when accompanied with faline saponaceous medicines; for otherwise they run off by urine, without mixing with the blood; besides being applied in this manner and by way of nutriment, in its malted state it proves remarkably antiseptic; infasions of which, called WORT, have been given fuccefsfully for the prevention

of the fea fcurvy.

- CAUSTICUM. See CEVEDILLA.

HORMINUM. CLARY; called also gallitrichum; fclarea, orvala; GARDEN-CLARY. It is the fatvia borminum, Linn. It is a whitish, green, slightly hairy plant, with square stalks, on the tops of which are long spikes of bluish slowers. It is perennial, a native of warmer climes, cultivated with us in gardens, and slowers in July

and Angust.

The leaves are bitterish, have an aromatic kind of fmell, but difagreeble to many people; they are recommended as antifpafmodic; their active part refides in an unctuous, refinous matter, which is wholly taken up by fpirit of wine, and on infpiffating, the tincture remains in the extract. Water takes up the greatest part of their views by infusions and in diffillation virtue by infusion; and in distillation, carries the whole of it over. The feeds possess the same qualities as the

HORMINUM SYLVESTRE. WILD-CLARY; called also felarea Hispanica, and sculus Christi. This species resembles the other in appearance and qualities; but as to the latter, it is much inserior. See Raii Hist.

Boerhaave enumerates twenty-nine species of garden-

clary, and fourteen of the wild fort.

HORROR, from borres, to shake with cold. A tree mor, is only a vibration of one limb. A refrigeration is becoming very cold. A perfrication is when great coldness is accompanied with a gentle unequal motion of the skin. An borrer is, when the coldness spoken of in a perfrication is considerable, and attacks by fits, without attacking the whole body; fo that an borror is fuch an affection of the skin alone, as a rigor is of the whole A rigor is an irregular agitation of all the body.

HORTUS. A name for the female genitals.

HORTUS LÆTITIÆ. See CROCUS.

HOTTONIA. WATER-VIOLET. It hath a rofe-shaped flower, confifting of only one leaf; it is of a rofe-colour too, and grows in watery places. It is not noted for any medical virtue. See Miller's Dict. vol. ii.

HUAXACENSIS, also called Ricinus Novæ Hifpa-HUCIPOCHOTL, niæ. Hernandez describes it as

a shrub which creeps like a vine, with a fruit like a hazelnut, the kernels of which operate upwards and down-

Wards, but not violently.

HUDDA MULLA. A fpecies of jeffamy.

HUICAN. See GUAIACUM.

HUILE DE GRANDE BAYE. See CETUS. HUITZASE. A name of the feeds of the mefquite-

HUMERALIS ARTERIA. The HUMERAL ARTE-RY. It rifes from the lower and fore-fide of the axillaris, and runs backward between the head of the os humeri and teres major, furrounding the articulation, till it reaches the posterior part of the deltoides, to which it

#### HYD [ 419 ] HYD

to the neighbouring parts. A puncture of this artery near the moulder, though the hæmorrhage may be reftrained by ligature, yet fuch a mortification will probably enfue, as without amputation will generally occasion the lofs not only of the person's limb, but life also.

HUMERALIS MUSCULUS. See DELTOIDES.

- NERVUS. See CERVICALES. HUMERI OS. The BONE of the ARM; called alfo adjuterium. It is articulated by its head, to the feapula : in children this head is an epiphyfis; immediately below the head is the part called the neck of the humerus. This bone grows broader at its lower extremity, and at the end it is formed into two condyles, on the external of which the head of the radius moves; and in the cavities betwixt thefe condyles, the ulna chiefly hath its

HUMILIS. Musc. See Depressor Oculi. HUMIRUBUS. Dewberry.

HUMOR. HUMOUR. A general name for any fluid. The ancients feem to have called the nutritious juices the

HUMORALIA. In Linnæus's Nofology, it is an or-der of difeafes in the clafs vitia; and fignifies diforders attended with vitiated or extravalated fluids.

HUMORARIA. A kind of continued fever, which

feems to be inflammatory. It is noticed by Sagar.
HUMULUS. The HOP. See LUPULUS.
HUMUS NIGRA PICTORIA. See CRETA NIGRA.

HUNGARICA AQUA. See ROSMARINUS.

HURA. The SAND-BOX TREE; also called hura Americana; JAMAICA WALNUTS; warnelia, and bavelia. It is a native of the Spanish West Indies; the leaves are full of a milky juice; the feeds purge upwards and downwards. The shell is used for holding sand, after the seeds are taken out; whence the name. Miller's

HUSO. See ICHTHYOCOLLA.
HUTZOCHITL. BALS. PERU.
HYACINTHUS HARE-BELLS. Boerhaave enume-

HYACINTHUS HARE-BELLS. Boerhaave enumerates fifty-eight species, but none of them are noted for any medical quality, except the byacinthus oblongo flore corruleus major; called also byacinthus Anglicus sive Belgicus, vel Hispanicus. The roots of all the kinds are bulbous: the flowers of this species are agreeably scented, and of a purple or blue colour. It is found in woods, hedges, and thicksets: it flowers in May. Galen says, that the roots are antihickeric; and others say, that they restrain all kinds of fluxes. See Miller's Bot. Off. It is also a name of several forts of muscaria. For that It is also a name of feveral forts of muscaria. For that called STELLARIS, fee LILIO HIACINTHUS.

RASEMOSUS MOSCHATUS. See BULBUS VOMI-

HYALODES, from bases, glass, or glass. An epithet applied to urine which deposits much vitreous, white, viscid sediment.

HYALOIDES, from baλos, glass, and us so, likeness.

An epithet of the vitreous humour of the eye.

HYANCHE, from is, a fuine, and αγχω, to strangle.

A quinsey, accompanied with an external tumor on each fide the throat, is thus called, because the necks of fuine are subject to swellings.

HYBOUCOUHU AMERICANUS. The name of an American fruit, of the size of a date, but not eatable; an oil is expressed from it, which they keep in the shell.

an oil is expressed from it, which they keep in the shell of a fruit called caramens, whence the oil itself is sometimes fo called. This oil is chiefly ufed against an American diforder called tom, which feems to be the same with chigres, or a collection of very fmall worms in the

Beshy parts, which cause a tumor.

HYDARTHROS, from is ap, water, and appear, a joint. A fort of clear water which issues from wounded joints. It is also a name of the synovia.

Dr. Cul-

HYDARTHRUS. A WHITE SWELLING. Dr. Cullen places this genus of difeafe in the class locales, and order tumores. Here we shall notice two disorders, per-

haps agreeing only in the difficulty to relieve them.

Mr. Bell, in his Treatife on Ulcers, fpeaks of this difeafe under the name of white fwellings of the joints. He fpeaks of it as of two fpecies, viz. the rheumatic, and the more inveterate or fcrophulous fpecies. These swellings are more frequent in the large, than in the smaller joints. The first species begins with an acute pain in

is distributed. It its course it gives off several branches the joint, and frequently the tendinous aponeurotic exto the neighbouring parts. A puncture of this artery pansions of such muscles as are connected with it. There is, from the beginning, an uniform swelling of the whole furrounding teguments; and confiderable tention generally prevails; but there is feldom, in this period of the diforder, any external difcolouration. The patient, from the beginning, fuffers much pain from the motion of the joint; and always finds it easieft in a relaxed posture, fo keeps it bent; which, especially in the knee, produces a kind of rigidity in all the flexor tendons of the limb. In consequence of the want of motion, happening from this circumstance, such joints soon become stiff. The swellcircumstance, such joints soon become stiff. The swelling gradually increases to twice, or perhaps thrice the natural size of the part. The cuticular veins become turgid and varicose; the limb below the swelling decays in its fleshy substance, at the same time that it frequently acquires an equality in point of thickness, by becoming odematous; the pain increases, especially if the patient is warm in bed; and abfeeffes form in different parts of the fwelling. In all these abscesses a sluctuation of a fluid is evident on preffure, and all fuch fwellings afford a peculiar elaftic feel, they rife as foon as the preffure is removed. These different collections, on breaking or being laid open, discharge much matter, which at first is of a good confiftence, but foon degenerates into a thin fetid fanies; the fwelling, notwithstanding the discharge retains nearly its former dimensions. If the orifices are not kept open by art, they foon heal, and new collec-tions forming in different parts, again break out and heal as before: in length of time the whole furrounding teas before; in length or time the whole lurrounding teguments are covered with cicatrices. But long before
this time, the patient's health hath fuffered confiderably,
first from the pain, which destroys both sleep and appetite; and secondly, from the absorption of matter into
the system, a quick pulse, night-sweats, and diarrhæa
occur, and carry off the patient, if either an amputation of the limb or a cure of the disorder does not befriend him. All this happens without any affection of friend him. All this happens without any affection of the bones of the joint; when, however, by a long continuance of the complaint, these ligaments are corroded, the cartilages and even the bones are foon brought to fuffer. The causes of this species are strains affecting the ligaments of the joints fo as to produce inflamma-tion, bruifes, luxations, or rheumatic disposition. This species of white fwelling occurs most frequently in young plethoric people: the pain in this species is diffused over the whole joint, and fometimes extends along the mufcles that are attached to it: the fwelling is confined to the that are attached to it: the iwelling is confined to the foft parts, and is from the beginning exceedingly evident. And we may add, when fuch fwellings occur in young, fitning, plethoric people, and especially those who have been subject to rheumatism, they will most probably prove to be of the rheumatic species. In the rheumatic white fwelling, as it is always at first of an inflammatory nature, bleeding will be adviseable, and is best taken from the part affected. Cupping and scarifying are here principal remedies: the instrument should be applied to each cipal remedies; the instrument should be applied to each fide of the difeafed joint; at least eight or ten ounces of blood fhould be discharged, and repeated at proper in-tervals, according to the violence of the symptoms and strength of the patient. Cupping is in general pre-ferable to leeches; but when the swelling of the joints is confiderable, it is impossible to procure a sufficient quantity of blood this way; in which case leeches must be applied. On the anterior part of the joint, where the cupping-glasses, or leeches, have not been placed, a biliter should be directly applied; and the part should be kept open with issue-ointment, till the wounds from whence the blood was discharged are so far healed, that a blifter may be laid on one side of the joint; and as soon as this is nearly healed, the other side should be also bliftered. By thus alternately applying them, first to one fide, and then to the other, almost a constant stimulus is kept up, and thus the advantage is more frequently to our wish. Cooling laxatives are necessary at proper intervals; as is also a strict antiphlogistic course of diet, &c. It is in the first stages only that this or any other course can be of much service, and in these, cures are sometimes effected. The original inflammatory asfection being removed, drains should no longer be used; and while there are yet no appearances of the formation of matter, mercury is fometimes useful, if continued a few weeks to keep the mouth merely fore; for this purpole,

drachms of the ointment may be used three times a day. In order to rub this medicine in with every advantage, an hour should be spent each time in rubbing. Falls of warm water on swellings of this kind are much recommended by Le Dran, &c. By a proper use of the several topical remedies in the first or inflammatory state of the disease, and afterwards, but still before the formation of matter, of mercurials, friction, &c. many have been cured. In many instances, by the bent position in which the limb has long been kept, the use of the joint is lost; and this, from the contracted state of the slexor tendons when it happens in the knees: in this case, all other fymptoms being removed, pure olive-oil may be applied warm; as much of it as can be easily confumed by an hour's gentle friction should be rubbed in, three times a day; the friction should be extended over the whole muscles about the part. By paying attention to open the different abfeeffes foon after their formation, the matter may probably be prevented from injuring the capfular ligaments of the joints; the destruction of which renders

amputation necessary. The SECOND SPECIES, hath the pain more acute, for the most part, but it is more confined most commonly to a particular spot, and that generally the middle of the joint. The swelling is at the first for the most part very inconsiderable; and little difference is seen most part very inconsiderable; and little difference is seen in point of size between it and the opposite sound one. The least motion gives great pain; so that the joint being constantly in a bent position, stiffness and rigidity is soon produced. As the disorder advances, the pain is more violent, the swelling increases, and the ends of the bones that compose the joint grow larger. In process of time there is perceived a very peculiar elastic feel; varicose veins appear over its surface, and collections of matter occur in different parts of it: these upon bursting, or being laid open, discharge considerable quantities of purulent matter, or more frequently a thin setid sanies; or being faid open, dicharge conhaerable quantities of purulent matter, or more frequently a thin fetid fanies; and if a probe can be passed to the bottom of the sores, the bones are found carious, and pieces of them are often discharged at the openings. As the disorder continues the constitution suffers; a diarrhoea with night-sweats commencing, the patient is reduced to extreme weakness. From every lymptom, and appearance on diffection, this fpecies feems evidently to be an affection of the bones; the furrounding foft parts only fuffer from their connec-tion. This species seldom occurs as the consequence of any external accident. It generally begins, without the patient's being in the leaft able to account for it. From the effects usually produced on the bones which it attacks, it would appear to be a species of the real spina ventosa; and which again, is very probably a difeafe of the fame nature in the bones that icrophula is of the foft parts. It is further observed, that this species of white swelling is generally either attended with other evident symptoms of scrophula subfishing at the time; or that the patient in an earlier period of life has been subject to that disorder; or what is nearly the same, he is descended from scrophulous parents. In this species of the disease, the pain is at the first, and also when the complaint has been of is at the first, and also when the complaint has been of confiderable standing, confined to a very small space; there is seldom for some time any perceptible swelling, and when it does more fenfibly appear, the bones are found evidently to be the parts chiefly affected, the furrounding teguments coming only to fuffer on the further progress of the disease. When swellings of this nature appear in fuch patients as are evidently of fcrophulous dispositions, where, together with a fine skin and delicate complexion, there are either hardened glands in the neck, arm-pits, or the groin: when any, or all these oc-cur if the disorder has begun without any evident external cause, we need not doubt its being of a scrophulous nature. We may here add, in the small joints, when the diseased parts of the bone begin to cast off, a cure may be sometimes promoted by assisting the efforts of nature; but in all the large joints, particularly in the knee, and ankle, it is not probable that any other resource than amputation will afford relief. And even the effects of this operation can feldom be depended on as lafting. In this cafe opiates in large dofes will be found the best remedy.

an ointment of quickfilver and hogs-lard may be prepared, rever to be advised till the complaint is pretty far adbut with fo small a proportion of the former, that two vanced: I have constantly observed in this disorder, that amputation has more frequently succeeded, when the patient was previously much reduced by diarrhoeas, &c. So that in no case whatever is it proper to have recourse to amputation, until every probable means for faving the limb has been tried in vain.

Edinb. Medical Effays, vol. iv. p. 242 and 246. Bell on Ulcers, edit. 3. p. 435, &c. Lond. Med. Trans. vol. i. p. 104. White's Surgery, p. 66.

HYDATINON. The name of an ancient collyrium. HYDATIS. See AQUULA.

HYDATIS. HYDATIDS. They are transparent bags

filled with water. Sometimes they are fingle, at others in clusters; generally on the liver, but are also on any other part. Hydropic patients, for the most part, have them on their livers. In the Lond. Med. Trans. p. 486. is an inftance of bydatids coughed up from the lungs.

Dr. Cullen places this genus of difease in the class los

cales, and order tumores.

There are two species of bydatids in human bodies,

The first fort is organized, and is connected with vefthe first fore is organized, and is connected with vel-fells by peduncles. It confifts of a bag, or bags of differ-ent fizes, filled with ferum; as these bags increase they thicken. Sometimes their contents are bloody, and flakes of coagulable lymph are floating in them. This kind of bydatids only diffurb by their fize. The bydatids of the ovaria are of this fort, so are those in the kidnies, uterus,

The fecond are supposed to be confined to the liver, and consist of a strong bag formed in the substance of that viscus; this bag is vascular, and lined with a fost, pulpy, opake coat, resembling the retina of the eye. It contains a liquor of a whey colour, in which a number of detailed are supposed to the contains a of detached velicles are found swimming, or there is a feries of them, one within another. This species is pro-ductive of worse effects than the former. This bag sometimes burits, and its contents falling into the cavity of the belly, a kind of afcites is the confequence; its exter-nal cyft is fubject to inflammation, and adhesion to the

nal cylt is subject to inflammation, and adhenon to the adjacent parts, whence, if suppuration takes place, various ill consequences may follow. See Med. Communications, vol. i. p. 101. Lond. Med. Journal, vol. i. p. 125. vol. vi. p. 139.

HYDATODES, I from idales, the genetive case of HYDATOIDES, i if us, water, and sides, a shape side with water; for limpid urine; for the aqueous humour of the eye; and for one in an anglarca.

humour of the eye; and for one in an anafarea.

HYDEROS. A general name for a dropfy; but by Galen it is particularly applied to anafarea.

HYDRAGOGOS, from both water, and arm, to bring away. Hydroticus Aquiducus. HYDRAGOGUE. Remedies that evacuate much water are thus named. In Hippocrates, Epidem. lib. vi. it imports a person grown-dropsical from drinking water.

HYDRARGYRUM. QUICKSILVER; from bear, water, and appropriet. Thus the ancients named quickfilver.

HYDRARGYRUS. QUICKSILVER. This term, the College of Phylicians of London have adopted for the argentum vivum, in their Pharmacopecia of 1788, and use it for the word mercurius, in all the preparations, wherein this is the material part of the composition. See ARGENTUM VIVUM.

# HYDRARGYRUS ACETATUS. ACETATED QUICK-SILVER. Pharm. Lond. 1788.

Take of quickfilver purified, one pound; nitrous acid diluted, two pounds; water of kali, a fufficient quantity: mix the quickfilver with the acid in a glafs veffel, and diffolve it in a fand-bath, then gradually drop in the water of kali, that the calx may be deposited. Wash this well with distilled water, and dry it by a gentle heat. Then take of this calx, one pound; acetous acid, a sufficient quantity to distort the calx; mix in a glass vessel, and the calx being dissolved, filter the liquor through paper; afterwards let it be evaporated, until a pellicle appears and fet it by to crystallize, which let be kept in a vessel well corked: a few grains are a dose. This composition is said to be the basis of Keyser's Pills. See KEYSERI PILULÆ.

QUICKSILVER. Pharm. Lond. 1788.

Take of purified quickfilver, nitrous acid diluted, of each half a pound; mix them in a glass veffel and let them fland till the quickfilver is diffolved, let them boil to produce the folution, pour the boiling liquid into a glass veffel, in which must be first put another boiling liquor confishing of muriatic salt four ounces, distilled water eight pints; after the white powder is deposited at the bottom of the veffel, let the limpid liquor swimming above be poured off; and the remaining powder be often washed with warm water until it becomes insipid to the taffe; then let it be laid on filtering paper and dried by a gentle heat.

HYDRELÆUM. A mixture of oil and water. Ori-

basius and P. Ægineta.

HYDRENTEROCELE, from is Just, water, solesson, an intestine, and seem, a tumor. A dropsy of the scrotum.

Vogel describes this disorder as compounded of a dropsy and a hernia.

HYDROA. A symptomatic kind of miliary sever: the same as Boa; which see; also a fort of pustule called

Alpolef.
HYDROCARDIA, from idee, water, and naplea, the beart. Hildanus coined this word to fignify a ferous,

finious, or purulent tumor of the pericardium.

HYDRO-ENTERO-CELE, (from wamp, water, and HYDROCELE. | from wamp, water, and HYDROCELE. | from wamp, water is in the contents of ruptures, but particularly is applied to a DROPSY in the SCROTUM, called by-drops ferati, also bydrops testis, bernia aquasa, oscheocale, and oscheapbyma. Dr. Cullen places this genus of disease in the class cachexine, and order intumescentiae.

There are two kinds: the first is when the water is lodged in the cells of the membrana cellularis fcroti, but this is generally a symptom of an anasarca. The second, and only proper species, is formed by water lodged with-in the tunica vaginalis of the testicle. The first is known by pits remaining for a time where it is impressed by the finger; the second is not subject to this accident.

The cause, when not anasarcous, is a preternatural discharge of that water, which is continually separating

on the internal furface of the tunica vaginalis, for the

moistening, or lubricating the testicle.

From the time of its first appearance, it is feldom known to disappear, or diminish, but generally continues to increase, though in some much faster than in others. In one it grows to a painful degree of diffention in a few months; in another, it continues many years, with little diffurbance. As it enlarges it becomes more tenfe, and is fometimes transparent, so that if a candle is held on the opposite side, a degree of light is perceived through the whole bulk of the tumor; but the only positive ways of knowing that a fluid is the contents, is to feel for the fluctuation thereof, or to discover that the distension of the tunica vaginalis is the cause of the tumor, and not an hernia of the omentum or intestines, or some other diforder of the part.

The hydrocele must be distinguished from an hernia of the abdominal contents, an hernia humoralis, and a far-

In order to the cure, if the water is lodged only in the cellular membrane, fearifications may be made in the legs, as in an anafarea; for in this cafe an anafarea is attendant, and the cause of the distension of the scrotum. If the case is a proper bydrocele, if any other disorder

HYDRARGYRUS MURIATUS MITIS. MILD MURIATED is fuspected to give rise to it, the original disorder must first be removed. If no such disorder attend, as a palliative cure, the trochar, or a lancet, may be pushed into the feat of the water, in order to its discharge; and as the testicle lies always on the posterior part of the tumor, the perforation must be made into the anterior and lower

Mr. Bell, in the first volume of his Surgery, proposes for the palliative cure of this complaint, the use of a flat tro-char in preference to a lancet. The most proper part for introducing the instrument is the most anterior point of the under part of the tumor. The patient being scated, the operator with his left hand should grass the tumor on its back part, so as to push the contained sluid into the anterior and under part of the fwelling. Then make an opening through the fkin and cellular membrane, about half an inch long, with a lancet; then take the trochar and introduce it through the tunica vaginalis, then withdrawing the stillete, and the water will be discharged. After which the canula may be withdrawn, and a piece of adhefive platter should be applied to the orifice, and a compress of soft linen may be laid over the scrotum, and

the whole may be firmly supported by a T bandage.

Mr. Pott proposes a radical one, by exciting an artificial inflammation in the turnica albuginea, and the tunica vaginalis, by means of a feton, so as to produce an obliteration of the cavity, which is the feat of the disease. Mr. Else prefers the application of a caustic to the fore and lower part of the scrotum. And Mr. Bell recommends an incition to be made into the upper and fore part of the scrotum, and for it to be directed downwards. It is proposed here to give a general account of these three methods, and recommend to their authors works on the

fubject for further particulars.

Mr. Port's Method by a Seton.

The point to be aimed at, is to excite fuch a degree of inflammation both in the tunica vaginalis and tunica albuginea, as shall cause a general and perfect cohesion between them; and this, if possible without the produc-tion of slough or abscess; without the hazard of a gan-grene, and without that degree of symptomatic sever which now and then attends both the caustic and the incision; and which, when they do happen, are so alarming both to the patient and to the furgeon. These ends I have frequently obtained by the use of a seton. It requires confinement to bed only for a few days, after which the patient may lie upon a couch to the end of the attendance, which is generally finished in about three weeks or a month at farthest, and during all the time, no other process or regimen is necessary, than what an inflammation of the same part from any other cause would require. The manner of performing it is as follows. Chuse a time when the vaginal coat is moderately dis-tended, and having pierced it with a trochar of a toler-able size, draw off the water; when that is done, introduce into the canula, a probe armed with a feton, confifting of ten or twelve ftrings or threads of filk; pass the probe as high to the upper part of the vaginal coat as you can, and on the end of that probe make an incision of such a fize as to enable you to pull it out eafily together with a part of its annexed feton; then cut off the probe, and tie the filk very loofely, covering the orifices with pledgits. By the next day, the feton will be found to have contracted fuch an adhefion to the tunica albuginea, as would cause a great deal of pain to detach; but this it is perfectly unneceffary to do, and it flould be suffered to remain without molestation. In about forty-eight hours the fcrotum and testicle begin to swell and inflame; the patient should then lose a little blood, and have a stool or two, and the whole tumefied part should be wrapped in a soft poultice and suspended in a bag-trus. The disease, from this time bears the appearance of a large hernia humoralis, and must be treated in the same manner, by fomentations, cataplasms, &c. The adhesion of the seton to the albuginea generally continues firm, and I never meddle with or move it, till it becomes perfectly loofe, which it feldom does for the first fortnight, or until the inflammation is going and the humours fubfiding. By the time the feton becomes loofe the coalition of parts is univerfally and firmly accomplified. I then withdraw it, and heal the orifices with a superficial pledgit, &c.

Mr. Else's Method, by a Caustic.

My method is this:—to lay a small caustic upon the anterior,

the testible: a large caustic is quite unnecessary, and every advantage may be derived from one whose eschar will be no bigger than a shilling. The loose and pendulous situ-ation of the ferotum renders the application of a bandage fo very inconvenient, that we cannot easily prevent the caustic from spreading somewhat; for this reason, I cover no more than the fize of a fixpence, on a prefump-tion that it may make an efchar as broad as a shilling, though it commonly makes one of the fize of a halfcrown. The intention is, that it thall affect, and if poffible, penetrate though the tunica vaginalis; fo that the time it is fuffered to lie on, is proportioned to the fup-poind thickness of the cyst. The caustic should never remain on, lefs than five hours; but if it be fuffered twenty-four hours, it can do no mischief when properly guarded. On the removal of the caustic, digestives may be applied to the eschar, or the common cataplasm of white bread and milk. The scrotum must be suspended in a bag-truis; and the patient had best be confined to his bed; though, even this circumstance is sometimes omitted without detriment. Sometimes, immediately after removing the caustic, fometimes within twelve or twentyfour hours, or even at the distance of two or three days, the palient begins to complain of pain in the fcrotum and loins, has now and then fome colic pains, and the pulfe a little quickened, and the tongue whitih. At different periods of time, from the removal of the caustic, but generally within forty-eight hours, an alteration is perceptible in the ferotum; the tumour upon grafping feels more tenic and hard than if was before; and this hardness answers to the figure of the tunica vaginalis in its whole extent; and a little attention will convince an observer, that it is this membrane alone which gives the fensation of tension and hardness, and no other part. The colic pains and febricula feldom continue more than twentyfour or forty-eight hours; and very frequently are fo inconfiderable, as to require neither evacuation, nor any internal medicines. If, however, the pulfe is quickened a little, the pain of the back and the colic diffreshing to the patient, they will be speedily removed by one or two bleedings, and injecting one or two glyfters. As foon as the pain of the back, (except what ariles from the weight of the fcrotum), the febrile heat, and other fymptoms are removed, for they commonly go off altogether, the patient need no longer be confined to his bed, but may be fuffered to get up and walk about the room, provided the ferotum be suspended. In a few days the eschar of the fcrotum will loosen and come away, exposing to view the tunica vaginalis, which bears evident marks of its having been affected by the caultic and prepared to flough off; and when prefied with the finger, the undulation of the water may be felt within it. As the cure proceeds, the floughy tunica vaginalis will project more and more through the orifice in the ferotum; and when it appears ready to burst, it may be punctured with a lancet, for this reason only, that it will relieve the patient from the weight of the tumor; for no other advantage can be derived from it. If the water is discharged by a pune-ture, the ferotum by degree collapses, and the orifice in it is filled up with flough, which prevents the access of external air to the testicle. These floughs continue to come away with the dressings daily for about four, five, on fix weeks, and in proportion to their difeharge, the hand tumor of the ferotum lessens. Upon casting off the last flough, the hardness is entirely gone, the wound immediately cicatrizes; and the cicatrix being about the size of a singer's end, adheres strongly to the body of the testis, which has never come in sight, nor has had any application brought in contact with it, during the whole process.

Mr. BELL's Method, by Incision.

The patient being placed upon a table of a convenient height, and being properly fecured by two affiftants, with the ferotum lying nearly upon the edge of the table, the operator with one hand thould grafp the tumor to as to hold it firm and make it fomewhat tenfe on its anterior part; and with a common round-edge fealpel in the other, he is now to divide the external teguments by one continued incision from the superior extremity of the tu-mor, all along its anterior surface down to the most de-pending point of the swelling. By this means, as the divided scrotum retracts a little, the tunica vaginalis is

anterior, inferior part of the ferotilm, taking care to avoid laid perfectly bare, for the breadth of half an inch or fo, from one extremity to the other. An opening is now to be made with a lancet into the vaginal coat, just as its upper extremity where the first incision commenced. This opening should be of such a size as to receive the operator's singer, which being inserted, the probe pointed bistory is to be conducted upon it, and by means of it the fac is to be divided to the very bottom, all along the course of the first incision. By making the first opening into the fac at the upper end of the tumor, much trouble and inconvenience is prevented, which, making the first orifice below, is fure to occasion: for as we have before remarked, when the tumor is first opened below, the water is inftantly evacuated; and as that produces an immediate collapse of the tunica vaginalis, the passage through its cavity is not afterward eafily discovered, Whereas, by making the first opening above, as the wa-ter is thereby evacuated gradually as the incision is extended downwards, the vaginal coat continues diftended to the bottom till the incition is completely finished. The incifion being completed in the manner directed, the tef-ticle covered with its tunica albuginea comes into full view. Sometimes the teltis protrudes from the wound altogether; in which case it must be replaced with great caution, and it ought by all means to be covered as quickly as possible from the external air; and provided none of the tunica vaginalis is to be removed, this may be al-ways done immediately, by finishing the drefling direct-ly on the sac being opened. When the sac is not much thickened, there is no necessity for removing any part of it; but when it is discovered to be otherwise, to be thick and very hard, the removal of a portion of it on each fide of the incision, makes the cure of the remaining fore more easy and expeditious. As in this hardened state, the fac generally separates with great ease from the fur-rounding teguments, any quantity of it may be easily taken away with the scalpel without the least hazard of wounding the fcrotum.

urine from a rupture of the urethra opening into the fcro-See ISCHURIA.

HYDROCEPHALUM, I from Dap, water, and ke-HYDROCEPHALUS. I pann, the bead. Dropsy of the HEAD, it is an effusion of water in the cranium, between it and the brain; and taking rife from the ven-tricles, the ferum is infiltrated through the whole sub-stance of the brain; or the water is betwixt the skull and the skin. Dr. Cullen places the external hydrocephalus as a genus in the class cachexiæ, and order intumescentiæ. The internal hydrocephalus he places as a species of apoplexy, apoplexia hydrocephalus. Dr. Fothergill names the internal hydrocephalus, the dropfy of the ventricles of the brain, for the ventricles are the proper seat of the disease. Dr. Macbride, calls it the febris hydrocephalus.

It hath been termed internal when the water is feated between the brain and the skull; and external, when betwixt the fkull and the fkin.

This diforder, whether external or internal, most frequently happens to children; but instances have occurred of adults being the subjects of it.

The beginning fymptoms of the internal bydrocephalus may fomewhat vary in different fubjects; but in general, a pain in the nape of the neck, or the shoulders, or fometimes in the lower limbs; very rarely, though it now and then happens, that the arms are complained of: when these parts are not the seat of complaint, the head and flomach are more or lefs uneasy, a fickness comes on, and various other symptoms, which so resemble disorders from worms, that some difficulty attends the judging the disorder to have any other cause; after a sew days, symptoms are more alarming; a violent pain is deep seated in the head extending some temple to temple and extending the head, extending from temple to temple, and across the forehead; fickness is at times considerable; now and then the patient doses, the breathing becomes irregular,

and the patient frequently fighs; the pulse becomes flow and irregular; at the beginning, and a little before death's approach, feverifines attends, especially towards evening; at last the pulse quickens, the breathing is very laborious and difficult, the heat excessive, almost every from irritation in the heat excessive, almost every from the property of the brain, from irritation in the heat excessive, almost every from the pulse becomes flow the trochar. But in two or three cases, where children had died from a great collection of water within the ventricles, he hath observed that, when the brain collapsed after cutting into one of the ventricles, some part of the feptum lucidum was lacerated by the weight of the brain, fymptom, from irritation in the brain, by turns attend; the patient is averfe to the light, takes things greedily, and cannot bear any posture but to lie horizontally; the excrements are insensibly voided; the hands are commonly kept about the head; the cyclids becomes paraly-tic, and the iris immoveable; a great heat and fweat fpreads all over the body; the pulfe trembles, and ftrength foon fails, if a fudden convulsion does not end the cataftrophe.

Many of these symptoms are common to worm cases,

teething, and other irritating causes, that it is difficult to fix upon any which particularly characterifes the difeafe.
The most peculiar feem to be the pains in the limbs, with
fickness and head-ach, which last is incessant, and which
though frequent in other difeases of children, are neither fo uniformly nor fo constantly attendant as in this. Another circumstance observed to be familiar, if not peculiar to this diftemper, is, that the patients are not only coffive, but it is with the greatest difficulty that stools can be procured: these are generally of a very dark greenifh colour, with an oiliness or glassy bile, rather than the slime which accompanies worms; and they are for the most part extremely offensive. In complaints arising from worms, from dentition, and other irritating causes, fpalms are more frequent than in this diforder.

No cause is discovered of these violent sypmtoms, but

a quantity of pure ferum in the ventricles of the brain; in a natural state there is not more than half an ounce in all the four cavities, whence four ounces may be eafily supposed to be the adequate cause of this disorder, as well as that a fmall degree of depression of the skull is the cause of its usual effects.

In infancy, before the bones of the cranium are fully formed, a much larger quantitity of water is contained under them, without the attendance of any of these violent fymptoms. When the diforder is begun thus early, the head is fometimes greatly enlarged, the bones then grow foft, the features are greatly changed, and the eyes

goggle.
There is a fpurious kind of hydrocephalus, much of the fame nature as the fpina bifida. It appears on the lower part of the occiput like a bladder of water, underneath which is a deficiency of bone. Opening it would be as fatal as the opening the fpina bifida.

fatal as the opening the spina binda.

Many authors have wrote on this subject; but Dr.

Whytt's History of the Hydrocephalus, in a tract at the end of his work, is the best of any other. To this may be added, the Observations on it, by Dr. Fothergill and Dr. Watson, in the London Med. Obs. and Inq. vol.

As to the cure none is pretended to, as from the fituation of the cause no remedy can be applied: however, as the symptoms from worms are so similar to the beginning symptoms of the bydrocephalus, which happens to those whose skull is perfectly offisied, anthelminthics are to be tried; as when worms are the cause, relief is thus obtained; and when the bydrocephalus produces them, fuch

remedies are not in any degree injurious.

Much has been afferted in favour of exciting a falivation by means of mercury, at least of using it so as to reftore the necessary absorption of the suid in the ventricles of the brain; but it is objected, that when mercury hath been useful, the disease hath been mistaken, and that it was not the internal bydrocephalus. See the Lond. Med. Tranf. vol. ii. Edinb. Med. Com. vol. v. vii. and viii.

Dr. Monro, in his Observations on the Structure, &c. of the Nerves, proves, that the four ventricles of the brain communicate with each other. He observes, that in the bodies of every one of fifteen children, who died from internal bydrocephalus, that all the ventricles were diffended, and their paffages from one to the other were much enlarged: in none of these cases was there any water between the dura matter and furface of the brain, but on cutting into one of the lateral ventricles, all the ventricles were emptied. He further adds, that in the chronic species of internal bydrocephalus, where the head is enlarged by water within the ventricles, fome furgeons have ventured to discharge the water by a puncture with

after cutting into one of the ventricles, fome part of the feptum lucidum was lacerated by the weight of the brain, or of the water in the opposite ventricle, which did not readily enough cscape by the natural communication. So that, upon the whole, if we properly confider the vari-ous dangers which must arise from the puncture of the brain, and the laceration of the feptum between the ventricles, from the unequal bending and preffure of the parts when the brain collapses; from the admittion of the air to the furface of the brain, which cannot well, or at all, be prevented, because the bones cannot, by the application of a bandage, be brought to yield inwards, fo as to be adapted exactly to the fhape of the brain, fuch proposals will appear improper in the highest degree. If, indeed, the water is situated between the dura mater and furface of the brain, and of course between the spinal marrow and its fheath from the dura mater, a cafe which, marrow and its fleath from the dura mater, a cafe which, perhaps, more rarely happens than is generally fupposed; or if, from a very evident fluctuation, chiefly about the bregma, we strongly suspect this to be the case, it will, probably, be adviseable to give the patient the only, though small, chance of cure by the operation. In one case, of a boy of three years of age, whom I visited in 1764, with the late Dr. Whytt, &c. the head was greatly enlarged, with all the ordinary symptoms of bydrocephalus. Dr. Whytt, who had seen several patients killed by a few ounces of water within the yentricles, and had never seen ounces of water within the ventricles, and had never feen the head fenfibly enlarged by water lodged in the ventricles, infifted, that the water must be situated on the outfide of the brain; and, as I could not prove what I sup-posed, that it was within the brain, it was agreed that a furgeon should be called, and a puncture made. Mr. James Rae was asked to attend, and I proposed that the James Rae was alked to attend, and I proposed that the puncture should be cautiously made with a lancet, at the outer side of the bregma, as far as possible from the superior longitudinal sinus. The skin being accordingly sirft cut, and then the dura mater, and a probe introduced without discharging water, we desisted from making any farther attempt. The puncture soon closed, and the child survived three months. After death I opened the head; we drew from the ventricles above two pounds of water. See Med. Communications, vol. i. p. 404. Lond. Med. Journal, vol. i. p. 357. Memoirs of the Medical Society of London, vol. i. p. 165, 169.

HYDROCISTIS. ENCYSTED DROPSY, or DROPSY

of a PARTICULAR PART.

HYDROCERATOPHYLLON, a name given by Vaillant and many others to a genus of plants, called by Dillenius dichotophyllum, and by Linnæus ceratophyl-

lum, which fee.

HYDROCOTYLE, MARSH, or WATER PENNYWORT. The name of a plant mentioned by Boerhaave,
but of no note in medicine. It is also called codagen; and is of the pentandria digynia class, of which Lin-

næus enumerates five species.

HYDROGARON. Garum diluted with, water. HYDROLAPATHUM. See LAPATHUM AQUATI-

HYDROMELI, HYDROMEL. It is water impreg-nated with honey. It is also called mulfum, aqua mulfa, or melicratum. After it is fermented, it is called vinous bydromel, or mead.

HYDROMELON. It is made of one part honey, impregnated with quinces, and two parts of boiled water, fet in the fun during the dog-days.

HYDROMETRA. DROPSY of the WOMB. In this.

case the hypogastric region in women is gradually increased, and the swelling refembles the shape of the womb; on pressure a succuration is perceived; it may take place during pregnancy, but usually it is not attendant. It is formed by serosity accumulated in the cavity of the womb. Dr. Cullen places this genus of disease in the class of cachexiae, and order intumescentiae. See HYDROPS UTERI.

HYDROMPHALON, from voue, water, and suparas, navel. A tumor of the navel, containing water.

HYDRONOSOS, from voue, water, and voces, a dif-

fe. See Sudor Anglicus. HYDROPEGE. Spring-water. HYDROPEDESIS. See EPHIDROSIS. HYDROPHOBIA, from wap, water, and occus, to be observed, the symptoms are in general a slight pain in the wound, fometimes attended with itching, but always is a symptom of that species of madness caused by the bite of a mad animal, whence the distemper is called so neighbouring parts, and, at length, from the extremities itfelf; but this fymptom is not peculiar to this difeafe, nor always attendant on it. See DYSCATAPOTIA. This disorder is also called rabies canina, cyanthropia, cynolefia. Dr. James observes, that this kind of madness property belongs to the canine genus, consisting of three species, viz. dogs, foxes, and wolves, to whom only it feems inherent and natural, scarcely ever appearing in other animals except it be inflicted by those of the dog-kind. Dr. Heysham defines it to be an aversion and horror at liquids, as exciting a painful convultion of the pharynx, occurring at an indetermined period, after the canine virus has been received into the fyllem.

The bydrophshia is a nervous diforder, though followed by inflammatory fymptoms. Dr. Cullen places this genus of difeafe in the clafs neurofis, and other spasmi. He distinguishes two species. 1. Hydrophsbia rabiosa, when there is a desire of biting. 2. Hydrophsbia simplex, when

The general divisions of this diforder is into the dumb,

and the raving madnefs; but inflances are related in which it hath appeared periodically.

The principal and original feat feems to be about the ftomach, and parts contiguous to it. Dr. Seleg thinks that it is in the par vagum and intercostal nerves; for most of the symptoms happen where these nerves are in-

terspersed.

The fmallest quantity of the faliva of a mad-dog, and that either fresh or dry, produces this disease. The in-fection may lay dormant for many months, but in gene-ral it appears in three or four weeks, and if in fix weeks no sign of disorder manifests itself, the patient is usually concluded to be safe. Some have observed, that the near-er the place bitten is to the falivary glands, the sooner the fymptoms appear. In order to communicate the infection, a wound feems to be no more necessary than it is in the fmall-pox; to man it is communicated by the faliva only, but dogs have received it by being in the kennel where mad-dogs have been before. It is above observed, that the dog kind have only this disorder naturally, but other animals having received the infection, may communicate it to other species. The dread of water is a symptom in some severs, and in some particular inflammations, &c. See Edinb. Med. Commentaries, vol. xi. p. 331.

The material or proximate cause seems to be in the irritation of the nerves that are the more immediate feat

of this complaint.

According to Boerhaave, the figns of madness in a dog are as follow: he becomes dull, folitary, and endeavours to hide himself; he seldom barks, but makes a kind of murmuring noise, at the same time he refuses all kinds of meat and drink; he is enraged at and flies upon flrangers, but in this stage he remembers and respects his master; his ears and head hang down; he walks nodding, as if overpowered with sleep: this is the first stage, and a bite now, though dangerous, is not so bad as afterwards. After these lymptoms, the dog begins to pant; he breathes quick and heavy; hangs out his tongue to emit a great deal of froth from his mouth, which he keeps perpetually open; fometimes he walks flowly, as if half affeep, and then fuddenly runs, but not always directly forward as is pretended; at length he forgets his mafter; his eyes look difpirited, dull, full of tears, and red; his tongue is of a lead colour; he is fuddenly extenuated; he grows faint and weak, oft falls down, then rifes up, and attempts to fly at every thing, and now grows mad and furious: this fecond stage feldom continues thirty hours, death by that time putting an end to the disease, and a bite received now is in-

To these symptoms the following may be added, which are considered as certain signs of a dog's being mad. I. All other dogs, upon smelling the dog that is going mad, will avoid him, and run away with horror. 2. The tone of the dog's voice, when he barks, feems hollow and hoarfe. In the dumb madnefs, if the dog is confined, he barks incessantly for a day or two.

When the human species are the subjects of this disorder, though in particular inftances fome variation may

it passes into the viscera; the cicatrix (if there hath been a wound) begins to fwell, inflames, and at length dif-charges an ichor; this pain is confidered as the primary invariable mark of a beginning bydropbobia. There are other more general pains refembling rheumatic ones; they are of a quick, flying, convulfive kind; they affect the patient in the neck, joints, and other parts; often a dull pain feizes the head, neck, breaft, belly, and even runs along the back-bone; towards the conclusion of the diforder, the patient complains of this kind of min the diforder, the patient complains of this kind of pain shooting from the arms towards the breast and region of the heart; besides these symptoms, a lassitude, a dull pain in the head, and a vertigo come on; the patient is gloomy, murmurs much, is forgetful, drowfy, at times his mind feems difordered, by turns he is wrathful, his flumbers become difturbed, and, awaking from them, convultive agitations immediately follow; a deafnefs is fometimes complained of, the eyes are watery, the afpect forrowful, the face becomes pale and contracted, fweat alfo breaks out about the temples, an unufual flow of fa-liva at length comes on, with a dryness of the fauces, a foulness of the tongue, and in some the breath becomes fetid. Besides these, from the beginning there is a peculiar stricture and heaviness on the breast, a struggling as it were for breath, a fighing, a naufea, and vomiting. This oppression of the pracordia, is one of the primary and constant symptoms of this diforder; it begins, increases, and ends only with it: this is the first stage, under which different patients vary as to their continu-ance. As the above fymptoms increase, the second stage advances; a fever comes on, which at first is mild, and attended with momentary horrors, but in fome there is no fever; wakefulnels becomes continual, the mind is more and more difturbed, a delirium approaches, and an aversion to fluids and polished bodies. At first a conftriction of the gullet is perceived, and difficulty of swallowing, but as yet liquids are freely taken; afterwards, however, they are refused; this symptom augments so visibly, that when any liquid comes before their fight, immediately an horror seizes them, and if they strive to drink, spassms are produced, on which anxiety and loss of senses follow; as soon as the surface of the liquid is touched, a strangulation in the throat is felt, the stomach is inflated, the larynx outwardly is fwelled, and that quite fuddenly, and as fuddenly falls; though liquids are thus obstructed, folids are nevertheless swallowed with tolerable ease; yet this symptom may become so violent as totally to prevent the folids from passing as well as liquids. In some an exquisite sensibility is induced, so that the air offends if it touches the skin, the light becomes painful, and the least sound is intolerable. light becomes painful, and the least found is intolerable. The patient now murmurs and mourns grievously; at times he lofes all knowledge of his inmate acquaintance, he then becomes defirous of biting; reason returns at the intervals, and he laments his own calamity; the thirst excites a desire of drink, but in vain they strive, and soon sink into the most affecting despondency; confcious of the approaching inclination to bite, he warns his friends of their danger, and advices them to keep at a diffance; a priapifin, and involuntary emiflions of fe-men, fometimes attend this stage, at the approaching conclusion of which the fever and thirst increase: the urine is lixivious, and but in fmall quantities, the tongue hangs out, the mouth foams, the pulse is throbbing and convulsive, strength fails, cold sweats come on, the tight-ness in the breast increases, by which the patient soon expires in fpafms.

The fymptoms appear in fome two or three days after

the bite, more frequently not until after as many weeks; and inftances are well attefted, in which a year hath paffed before the infection hath taken place; when the diforder is once manifest, the fymptoms are fometimes so rapid, that a quarter, or half an hour, makes a considerable change.

The infection may be communicated, as that of the fmall-pox is, by inoculation; and it is observeable, that when the small-pox is inoculated, if no inflammation appears about the puncture, or till after the inflammation appears, there is no small-pox ever comes forth; so the

fame is observable in the bite of a mad-dog, though the, wound readily heals fornetimes, yet it conflantly breaks eye, which swells in cachectic and hydropic cases.

out a-fresh, and inflames before any of the terrible symp
HYDROPHYLLON. WATER-LEAF. It is a plant

out a-fresh, and inflames before any of the terrible symptoms appear.

That this disorder is primarily and principally nervous, appears from the constant and chief symptoms that attend, viz. the sying pains, the tightness of the precordia, the dissiculty of swallowing, the horror on the approach of water, the quick sensibility manifest by the uneaffness selt on the air's approach, &c. Dissection discovers nothing with respect to this disorder.

Agreeable to the nature of the immediate cause, the cure is effected only by such means as destroy nervous

cure is effected only by fuch means as deftroy nervous or fpafmodic irritation, or that by a fpecific property de-ftroys the peculiar acrimony which causes the diforder.

flroys the peculiar acrimony which causes the disorder. Of the first, opium is the only one to be depended on; and of the second, mercury in such portions as to excite a ptyalism, is the approved means.

Solid opium, to the quantity of gr. i. vel gr. i. s. may be given every three hours, or as often as the effect of the preceding dose feems to have ceased. Musk, in large doses, every six or eight hours; sponges dipt in vinegar may be applied to the mouth and nostrils; and a piece of slannel, moistened in the following, three or four times a day: R Tinct. opii 3 ii. camp. 3 i. m. The warm bath is also useful. warm bath is also useful.

In fome inflances, mercury, given by the mouth, or applied by unction, until a fpitting came on, has proved effectual. The falivation should be kept up by the same means as at first it was excited, and continued during two or three weeks. The unguentum hydrargyri fort, should be well rubbed into the wound two or three

times a day.

times a day.

A late foreign writer fays, that if vinegar is given to a pint a day, divided into three dofes, one in the morning, another at noon, the third at night, it effects a cure. On the contrary, fome others fuppose the poison communicated by a mad-dog, is of an acid nature, and propose absorbent alkaline earth, as chalk, bole, &c. for the cure. Dr. Vaughan proposes the actual cautery to be applied to the part after the bite as soon as possible; or rather a dilatation of the wound, if small, and filling it with gun-powder, then setting fire to it; this, he supposes, would produce a laceration of the part, would secure a free and continued discharge for some time, and he thinks that the action of the ignited gun-powder upon the poison may have its use.

the poison may have its use.

Perhaps the following may be pursued as the most probable means of relief that the present art directs. Avoid sea and cold bathing; keep the wound open by a pea, and sprinkle cantharides into it every second or third pea, and iprinkle cantharides into it every lecond or third day; rub in the ung. hydrargyri fort, so as to raise a gentle ptvalism, and particularly rub the throat with it; if spasmodic symptoms appear, give opiates with antimonials to excite perspiration. R Opii, gr. xij. f. pil. ix. cujus cap. i. tertia quaque hora. And R antimonii tartarifati gr. \(\frac{1}{2}\); micæ panis q. s. f. f. pil. sexta quaq. hora spatiis internue observationend. The warm bath, if the patient does not observe to it, generally rallistes.

bent does not object to it, generally palliates. See Actius, Ccelius Aurelianus, Lommius, Layard, Default, Choifel; Dr. James's Treatife on Canine Mad-Default, Choifel; Dr. James's Treatife on Canine Madnefs; Dr. Mead on the bite of a Mad-dog; Dr. Seleg's Differtation on the Hydrophobia; Dr. Nugent's Effay on the Hydrophobia; Med. Muf. vol. ii. p. 97, &c. Lond. Med. Tranf. vol. ii. and Lond. Med. Obf. and Inq. vol. iii. Edinb. Med. Comment. vol. v. p. 42. Dr. Vaughan's two Cafes of the Hydrophobia. Cullen's First Lines, vol. iv. White's Surgery, p. 102. Memoirs of the Medical Society of Lond. vol. i. p. 243.

Perhaps the best mode for preventing the mischief from taking place, would be to let the part immediately on the bite being given, be sucked well for some little time, then let a portion of the slesh be cut out, larger and

then let a portion of the flesh be cut out, larger and deeper than the wound given by the dog, that filled with mercurial ointment, and the whole furrounded with bliftering ointment, then proceed to give mercury internally, with antifpafmodics, as mentioned above, and let a ptyalifm be raifed by means of inunction with mercurial ointment, and this continued for fome time. These means appear the most effectual, and would, if objected, most likely be constantly successful.

HYDROPHTHALMIA. See PROPTOSIS.

HYDROPHTHALMION. It is the part under the

with a bell-shaped flower, but not noted for any medical

HYDROPHYSOCELE, from olog, water, coox, a flatus, and xehr, an bernia. An HERNIA proceeding from a mixture of water and flatulencies.

HYDROPOIDES, from boowly, a dropfy, and ester, a refemblance. It is applied to aqueous excretions, fuch as

are common in dropfies.

HYDROPS, from was, water. A DROPSY. In reality there are but two kinds, viz. the anafarca, and the afcites, though many other diforders have this name annexed to them, as hydrocephalus, hydrocele, &c.

All droppies are chronical difeafes from lax fibres; this

laxity of the fibres may be general or particular: its general if not universal concomitant, is a redundant serum. In the anafarca, the water is clear and limpid, but in the afcites it is more thick and gelatinous, or even fometimes

mixed with flefhy concretions.

All ages, and both fexes, are liable to this diforder; but generally it happens to men advanced in years, and to women after child-bearing. Those who live in low whose employ requires much fitting, and

to women after child-bearing. Those who live in low wet situations, whose employ requires much sitting, and those who make too free with spirtuous siquors.

The general or immediate cause of all dropsies, is the exhaling vessels throwing off more fluid than the absorbent vessels can take up again. Dr. Hunter thinks that the water in anafarcas transudes through the sides of the vessels; but however this may be, if the water is not taken up by the absorbent vessels, a dropsy is the consequence. The mediate cause is a defect of vital heat. quence. The mediate cause is a defect of vital near. The remote causes are numerous; such as immoderate evacuations, difeases of long standing, immoderate use of spirituous liquors, water-drinking too suddenly after being accustomed to more generous liquor, a scorbutic acrimony, a scirrhous liver, which generally begets an ascites, because of the rupture of one or more of the lymphatics which spread on its surface, a defect in the

One of the first figns of a dropsy is the pitting of the ankles, this indicates the anafarcous species: but this is not so certain a fign in women as in men, because that women are subject to it from pregnancy, a suppression of the menfes, &c Nor, indeed, is it always a fign in men, for in old men, with gross habits, who have been afthmatic during fome years, and are fuddenly freed from it, a fwelling will affect their legs, without any farther harm; yet when a difficulty of breathing attends this state in men, a dropfy is carried to their difforder. The pathognomonic figns of the ascites are a thirst, high-coloured urine in small quantities, and difficulty of breathing, with abdominal diffention. See Anasarca and Ascites.
The afcites should be diffinguished from pregnancy

a mole, or other tumor in the uterus; a tympany; and ædematous tumors of the feet, legs, and thighs, &c.

Dropfies are not readily fatal, except they have poly-pous concretions in the heart, or pulmonary veffels; a feirrhous liver; tumefied mesenteric glands; or, if women, a scirrhous, or otherwise disordered uterus. Purgmen, a terrinous, or otherwise disordered uterus. Purging prevents the efficacy of medicines, and so is a dangerous circumstance. Bleeding of the nose, ulcers breaking out, or a gangrene appearing in any patt, are fatal. Great thirst, the upper parts greatly extendated, scbrile horror with external heat, are very dangerous. An eryspelas on the legs, livid streaks or spots on the skin, or a dropfy coming on in the breast, are also among the fatal symptoms.

fymptoms.

The general indications of cure are, to promote the natural fecretions, and to increase the animal heat; but if the vifcera are unfound, this latter cannot be effected.

The diet should be nourishing, light, and cordial; spices, mustard, horse-radish, &c. are to be freely used, and vinous liquors should be freely drank.

Proper evacuants for carrying off the redundant hu-mours, and fuitable alteratives for refloring the natural

Whether the cure be of the radical or palliative kind, much relief is afforded to the patient by moderating cer-

tain fymptoms, fuch as,

THIRST. This is caused by the acrimony of the lymph, and a defective secretion of the saliva; in this case let the patient drink in proportion to his inclination, and his palate may direct the choice of liquor. Acid liquors, fuch as cyder, or in want of it, give vinegar mixed with the spirit of juniper and water, or Rhenish wine and water, or such others as convenience will admit of. Nitre may be held in the mouth.

DIFFICULTY OF EREATHING. If the dropfy was caused by a fanguineous afthma, some recommend the loss of a few ounces of blood; but though a momentary relief is thus obtained, the injury from it is more to be feared than the advantage will reasonably admit of hazarding. The fafest method is, if possible, to obtain relief with a mixture of the gum. ammon. gr. vi. or viii. and acet. feillæ. 5 i. fs. in any proper vehicle; this may be repeated as the occasion requires. The infusion of garlie is also ef-

HYSTERIC OR NERVOUS AFFECTIONS. These are often occasioned by an acid in the primæ viæ: give the mixture prescribed against a diarrhoea; and if the globus hysteri-cus disturbs the patient, the following limiment may be rubbed on the belly every night: R Balf. anod. Bat. 3 i.

ol. palmæ 3 fs. ol. menth. 3 ii. m.

A PURGING. In this cafe all other medicines than what removes it are useless. R Kali 3 i. ss. fac. alb. 3 fs. aq. menth. sativ. 3 x. m. cap. cochl. ii. quatuor in die. This mixture neutralizes the acidity in the primæ viæ, directs the offending matter to the kidnies, and not by the anus, and thus this fymptom is often removed.

Volutions This is often occasioned by acidity in the

ftomach, and a gentle dose of ipecacuanha as often re-

lieves it.

SICKNESS This is frequently relieved by the julep. perlat. or a little of the fp. ammon, comp. in aq. menth. pip. though, as the causes vary, they should be attended to, and the remedies respectively adapted.

GRIPES. R Calom. gr. iv. vel vi. pulv. rhab. gr. xxv. ol. menth. gut. ii. Kali, gr. v. fyr. q. f. f. bol. h. f.

PAIN IN THE SCROBICULUS CORDIS. This is generally

relieved by two or three grains of ipecacuanha.

Cantharides has fucceeded after all other means have failed. Four grains diluted with a large quantity of barley-water, has acted as a very powerful diuretic; and a fourth part of that quantity was given at three different times. The bark, falt of wormwood, and rhubarb, were also prescribed, and a cure was soon obtained.

See Hoffman, Boerhave, Lifter, and Lyffon on this difeafe; Wallis's Sydenham, Shebbeare's Theory and Practice of Physic, Le Dran's Operations, Lond. Med. Trans. vol. ii. Brooke's and London Practice of Physic,

Cullen's First Lines, vol. iv.

HYDROPS ADMATULAM. See the DIABETES.

- ARTICULI. A species of spina ventosa.
- Cysticus. The ENCYSTED DROPSY. It is a collection of water enclosed in a cystis, that is in an hydatid, and is most frequently in the abdomen. Generally it is feated on the liver; but on whatever part it is fixed, a feirrhus is previously there; so that a radical cure is not to be expected. Whilst the size is moderate, there is no uneafiness, but pain increases with its bulk. If there is a fingle cyftis, and it is large, its water is discovered as in an afcites, by applying one hand to the fide of the belly, and tapping with the other on the opposite fide; but if the cyfts are many, the fluctuation is not easily perceived. When the cyft is fingle, tapping may be used as a palliative remedy; but when the cyfts are more, less advantage is to be obtained from them. See

Le Dran's Operations, edit. 2. p. 129.

GENU. A DROPSY in the KNEE. When water is collected under the capfular ligament of the knee, this disorder is formed. Dr. Hunter observes, that if the fynovia is feparated in too large a quantity, and the ab-forbent vessels do not their duty properly, an hydrops ar-ticuli succeeds, which causes a relaxation of the ligament. Mr. Sharp recommends, in order to the cure, a tight probably from an hydatid burft bandage, leaving the superfluity to be absorbed by the bi-

vigour of the conflitation. See ANASARCA and ASCI- bulous veins. To this might be added some attenuating and discutient embrocation, such as the aq. amm. acetatæ; or a folution of fal ammon. crud. in acet. acerim. their proportion may be 3 is. to 15 i. See Gooch's Cafes and Remarks, vol. ii. p. 259—266. Edinb. Med. Commentaties, vol. vi. p. 132.

HYDROPS MEDULL & SPINALIS. See SPINA BIFIDA,

called also Hydrometra Ovarii.

called also Hydrometra Ovarii.

— Ovarii. A dropsy of the ovaria. This species of drops most frequently happens to the barren and superannuated. It is one of the encysted kind, and sometimes happens to pregnant women. It usually begins without any pain, the woman at the same time continuing in good health. It is not perceived until it is much enlarged, and commonly affects but one side. It is known by its being moveable, when the patient is laid on her back, to relax the muscles, then the lumps may be moved from side to side; by passing the singer up the be moved from fide to fide; by paffing the finger up th vagina, the orifice of the uterus is found to move with the tumor, which diffinguishes it from the ascites, &c. though when the fluid is contained in one bag, and is very thin, if the bag also extends to the scrobiculus cordis, it is very difficult to say whether the disorder is the ascites or the dropfical ovary; but when there are se-veral cysts, there are manifest inequalities. Generally this disorder terminates in an universal leucophlegmacy. Internal medicines are of no efficacy towards a cure, and it rarely happens otherwise than that other methods of relief increase the complaints and haften death. Dr. Percival gives an inftance of a cure being effected by a fpontaneous vomiting; fee his Effays Med. and Exp. But the general health of the patient is the whole that can reasonably be attempted.

- PECTORIS, alfo HYDROTHORAX. A DROPSY in the BREAST. Dr. Cullen places this in the class cachexia, and order intumescentiae. When water is extravasated in the cavity of the breast, this disorder is formed; the water may be in only one, or both fides of the mediaftinum. But fometimes this fluid is contained in hydatids, whose fituation may be on the diaphragm, the pleura, on the external furface of the lungs, or in the substance thereof, also on the surface of the heart, or in the pericardium. When the water is contained in the hydatids, the

knowledge of the case and cure are alike hid from us.

Any of the causes of a dropsy may produce this species; it sometimes happens from a disorder of the lungs, and generally the rupture of a lymphatic is the caufe.

The fymptoms, particularly when the water is extra-vafated on the diaphragm, are, an oppression of the prac-cordia, and an extraordinary shortness of breath, which is better when the patient is in a supine posture than when erect; by which it is distinguished from the asthma, in the fits of which the patient cannot lie down. In the drop/y of the breaft, cedemateous fwellings are not only observed in the seet, but also in the hands, which Baglivi fays is a pathognomonic fign. Inspiration is more easy than expiration; if there is much water in one fide, that fide appears fomewhat larger than the other, and the face, arm, and leg on that fide are puffy.

Inftances have occurred in which the water hath been absorbed; but, for the most part, the patient falls a vic-tim to the disease. As a palliative, however, when the water is perceived to fluctuate, it may be drawn off by a canula and trochar, introduced betwixt the fourth and fifth of the falle ribs, and about four fingers breadth from the fpine. See Le Dran's Operations, edit. 2. p. 117, 118. Cullen's First Lines, vol iv. Bell's Surgery, vol ii-

p. 356, &c.
Pericardii. Dropsy of the pericardium. This is a fuperabundance of watery fluid collected within the pericardium. There are no fymptoms by which the disease can be discovered in the living body certainly; cases can only be referred to in some of which the cause has can only be referred to in some of which the cause has only been suspected, in others made obvious by diffection. See Sauvages's Hydrothorax Pericardii, Morgagni de Causs Sedibus Morborum, xvi. 34, 36. Senac de Cœurtom. ii. p. 349. Dr. Bouillet, Differt. 1758. Edinb. Med. Eff. vol. v. p. 56, 58, 59.

—— PULMONUM. The DROPSY of the LUNGS. Its seat is in the cellular membrane of the lungs. Some

times it approaches fuddenly, and then it happens most probably from an hydatid bursting, and so filling the cel-

The diagnostics are very obscure; however, though name of a plaster, which is called panacea, and the following is sometimes equivocal, it will generally PLASTER of the THREE BROTHERS. It is described point out this diforder, particularly when the attack is fudden. The difficulty in breathing is conflant, and increafed by the least motion, though not much varied by different attitudes of the body; the patient complains of great anxiety about the precordia, and when he attempts to take a deep infpiration, he finds it impossible to dilate his chest, and his breath seems to be suddenly stopped; the pulse is small, languid and oppressed; the face pale and bloated; the legs usually swelled, and the whole habit is for the most part leucophlegmatic.

In order to relief, a brifk mercurial cathartic should immediately be given; after this give the feneca root in liberal dofes, for it contributes to relieve in every intention, operating powerfully by expectoration, urine, and perfpiration. Belides thefe, the ufual diuretics, fudori-fics, &c. may be administered, as fometimes one medi-cine fuecceds when others fail. If the case is desperate, an opening may be tried, as in the operation for the empyema, and then a puncture may be made into the lungs to dicharge its morbid contents. See Edinb. Med. Effays, vol. vi. p. 126. Percival's Effays Medical and Exper. p. 172. Bell's Surgery, vol. ii. p. 356, &c.
Hydrops Sacculi Lachrymalis. See Hernia la-

chrymalis.

SCROTI. See HYDROCELE.

- UTERI. DROPSY of the WOMB. Its feat is in the cavity of the womb. Boerhaave observes that when the internal cavity of the womb is closed up, there is fometimes to great a collection of water there, that the belly appears as if affected with an afcites. Se Hy-DROMETRA.

The diagnostics are not distinct, for many fallacious figns of pregnancy accompany this diforder. It is diffinguished from the ascites by its being confined to the region of the uterus; and by the thinness of the os tincæ. If the tumor is from a scirrhus, it is never in the middle,

nor is it round as is the dropfy.

The cure is difficult; for this kind of dropfy is foon followed by an anafarca, a flow fever, and a marafmus.

If a canula can be introduced into the uterus, it is the best and speediest remedy; but sometimes a scirrhus, a cicatrix, or tubercles prevent it. If the canula canot be introduced, use hard riding, violent shocks with emetics, fternutatories, and brisk cathartics. As a deobstruent, borax may be given from ten to twenty-five grains, twice a day. A peffary may also be tried.

HYDROPYRETOS, from whop, water, and wuperes, a fever. Blancard says it is the same with the fuder

HYDRORACHITIS. Also called spinose, bydrocele spinalis, SPINE DROPSY, &c. It is a genus of disease, which Dr. Cullen places in the class cachexiæ and order

intumescentize. See SPINA BIFIDA.

HYDROROSATON, from idap, twater, and jodos, a rose. It is a drink made of water, honey, and the juice of roses. See Ægineta, lib. vii. c. 15.

HYDRORHODINON. It is water mixed with the oil of roses. This Galen was used to give as an emetic

in cases of poison.

HYDROSACCHARUM. It is a composition of fugar and water, which answers to the hydromeli by chang-

ing honey for fugar.

HYDROSARCA, from boup, water, and capt, flesh.

A tumor or abscess produced of water and flesh. See

M. A. Severinus.

HYDROSARCOCELE, from blue, water, sapt, flesh, and xeas, an bernia. A fpecies of hernia is thus called; it is formed of water and flesh, or rather a testicle that is both scirrhous and dropsical. Pott's Works, 4to. See SARCOCELE.

HYDROSELINUM. WATER PARSLEY.
HYDROTHORAX. See HYDROPS PECTORIS.
HYDROTICUS. See HYDRAGOGUS.
HYGIDION. A collyrium described by Ægineta,

in Actius.

in Actius.

HYGIEINE, from iying, found or heathy. It is the first part of methodical medicine, being that which prefcribes rules for the prefervation of health.

HYGIENISTES. Hygienists. Physicians who only attended people in health, and that in order to preferve the same, and to prevent diseases. The temperaments of the constitution, the air lived in, the food lived on, the houses disease in the supplication of the houses dwelt in, the changes in the functions of the body, those changes to which different ages, seasons, climes, &c. expose people, were the objects of their at-

HYGRA. LIQUID PLASTERS, also LIQUID ROSIN.

HYGROBLEPHARICUS, frem bypes, bumid, and βλιφαρος, an eye-lid, also Hygrophthalmicus. An epithet given to some ducts of emunctories discovered in the ex-

treme edge or inner part of the eye-lids.
HYGROCIRSOCELE, from bypos, bumid, supres, varia, and man, a tumor. A species of hernia: it is when the fpermatic veins are varicous, and the fcrotum

is filled with water.

HYGROCOLLYRIUM. from bypos, bumid, and non-August, a collyrium. A liquid collyrium, or when a collyrium confifts chiefly of liquids.

HYGROLOGIA. HYGROLOGY. It treats of the

various humours of the body.

HYGROMETRUM. The HYGROMETER. It is an inftrument by which is shewn the different degrees of moisture in the atmosphere. The word is derived from types, humid, and perpor, a measure. Wedelius gives this name by way of allusion to the machine so called, to those infirm parts whose susceptibility of impressions flew different states of the air, with respect to its moif-ture more exactly than the instruments contrived for flewing the fame

HYGROMYRON. The name of a liquid ointment

described by Actius.
HYGROPHOBIA. See HYDROPHOBIA.

HYGROPHTHALMICUS. See HYGROBLEPHARI-

HYLON. HYLON. A species of cotton-tree. See Aminia. HYMENEA. Courbaril. See Anime.

HYMEN, iques. A membrane in general; but by it is usually understood the membrane which appears in the form of a crefcent, and is fituated at the entrance of the vagina, called also Claufirum Virginitatis, Eugeos. When this membrane is ruptured, it is shrivelled up, and forms the caruncular myrisformes. See CARUNCULA. It naturally fhrinks with years, and often disappears before the age of twenty, so can be no proof of virginity.

In some infants this membrane so closes up the urethra,

that the urine cannot be voided; in others the urine paffes, but when the menfes flow, they cannot be dif-

charged, because of the imperforated hymen.

When the mark of perforation cannot be feen, the cure is thought to be impracticable; but when the puncture of a lancet could not produce the defired effect, a trochar and canula hath fucceeded, though a paffage of four inches was perforated before the end was obtained. See Heister's Surgery, and the Edinb. Med. Commentaries

HYMOCHYMA, from imoxeu, to pour under.

SUFFUSION of the EYE.
HYOGLOSSUS. The name of a muscle of the tongue. It rises from the basis, but chiefly from the cornu of the os hyoides, running laterally and forwards, to shorten the tongue. Some divide this muscle into three, and call them basio-glossus, or hypsiloglossus, or hypsilogides, the chondre-glossus, and the cerato-giossus. Douglas divides it as follows. He says, it arises sleshy from three different places; its first origin is broad and carnous from the cornu of the bone hyois; this is properly the cerataglossus: its second head comes from part of the basis of this bone, and its name basioglossis: the third beginning is derived from the cartilaginous append-— HYGEIA, also Ammonii Collyrium, from the hyoides, which some call chondroglossus:

— HYGIEIA, siring, sound. HEALTH or sound the sound age of the hyoides, which fome call chondrogloffus: these three unite, and their fibres running in the same great part of the muscles did arise from the basis of the one, and in some others he found few or none of their

fibres to fpring from thence.

HYOIDES Os, from a and sobs, called also Bicorns Lambdoides. It is fituated in an horizontal position between the root of the tongue and the larynx; it is convex on its anterior part, and hollow on the posterior; the cornua become smaller as they run back, and rather diverge; at the end of the cornua there is a graniform appendicle, from whence a ligament runs to the ftyloid process of the os temporis, and another ligament connects the bone to the larynx. The ancient Greeks compared it to their vowel v, whence its name hyoides, yoides, hypfiloides, and upfiloides. It is the balis and support of the tongue.

HYOPHARYNG ÆUS. The hyppharyngæi muscles, it is the balis and important in the support of the tongue.

in general, are those on each fide which are inserted in the os hyoides; and they may be reckoned three pairs, viz. the bafio-pharyngæi, cerato-pharyngæus major & minor. They come from the bafis and the horns of the os hyoides. Innes calls it confirietor pharyngis medius, and describes it as follows. It arises from the appendix of the os hyoides, from the cornu of that bone, and from the ligament which connects it to the thyroid cartilage, the fibres of the fuperior part running obliquely upwards, and covering a confiderable part of the fuperior conftrictor (i. e. cephalo-pharyngarus) terminate in a point. It is inferted in the middle of the cunciform process of the os occipitis, before the foramen magnum, and joined to its fellow at a white line in the middle back part of the pharynx. The fibres at the middle part run more transverfely than those above or below. Its use is to compress that part of the pharynx which it covers, and to draw it and the os hyoides upwards. See PHARYNX.

HYOPHTHALMOS, from is, a fivine, and ophasuss, an eye. Hogs EYE. It is a name for the after atticus,

also for a species of achates.

See NICOTIANA.

HYOSCIAMUS, from ve, a fwine, and xvxxxe, a bean, Hog's BEAN; but the plants to which this name is given are called hen-banes; it is also called dens cabalinus. These plants have hairy, oblong, deep-indented leaves, and bell-shaped flowers, which are followed by irregular cup-like capsules, which contain the seeds. Boerhaave enumerates eight species. It is also a name for tobacco.

HYOSCIAMUS NIGER. Hyofciamus foliis amplexicaulibus finuatis floribus feffilibus, Linn. called alfo apollinaris, altercum, faba fuilla, COMMON or BLACK HEN-BANE. It is one of the poifonous vegetables that are indigenous in Great Britain. The root is long, tough, white, and when recently cut through, fmells like liquo rice; the stalks are thick, round, woody, irregularly branched, and covered with a hairy down. The leaves branched, and covered with a hairy down. furrounding the stalk at their base, stand irregularly : they are large, foft, and downy, pointed at the ends, and very deeply indented at the edges; their colour is a greyish green, and they have a virose disagreeable smell. The flowers are monopetalous, divided into sive obtuse fegments, and when acurately examined, are not without beauty, although they have a difagreeable appearance on the plant: they are large, of a dirty yellowith colour, reticulated with violet-coloured veins. The feed-veffels follow one after every flower: they are large, and contain a great quantity of feeds of a brown, rough, and irregular figure.

This is the only species of henhane that is a native of Great Britain; and it is a dangerous poison. The feeds, leaves, and roots, if received into the stomach, are all poisonous. The root, in a superior degree, produce various disorders; madness is one effect of this vegetable; if the stomach does not reject what it has received, a flupor and apoplectic fymptoms, terminating in death,

are the usual confequences.

Henbane, in its external appearances, much refembles parfnip, from the use of which we are often told that ill effects follow: it is probable that in those instances the roots of benbane have been mistaken for those of parsneps, for henbane is often found on dunghills, and with the dung is carried into gardens, where, with parineps, &c. it grows up, and is mistaken for what it is not.

The fymptoms which arise in consequence of swallow-

Douglas adds, that in some subjects he hath observed a it produces apoplectic disorders, with a hard full pulle, great part of the muscles did arise from the basis of the red face, an abolition of the senses and voluntary motions, and difficult respiration; in others, stupidity or an appearance of intoxication are the confequences. Some on fwallowing the feeds, have complained of thirft, giddiness, dinness of fight, raving, and profound sleep; a dilated pupil is often the effect of this poison. The poison of benbane is very similar in its effect to that of opium when taken in large quantities, and like opium, if administered with skill, it is a valuable sedative, anodyne, and moderates excess of irritability. It possesses the advantages of opium with the additional one of keeping the bowels lax: but then it must be given in large doses. Hence has it been laid aside, for in full doses it is apt to create delirium much more than opium.

Its ill effects are relieved as directed in the article

AMANTIA, which fee.

Dr. Stork pressed out the juice from this plant, and with a gentle heat inspissated it to an extract; of this he gave from one grain to twenty, every twenty-four hours; thus he relieved many from palpitations of the heart, a tendency to melancholy, coughs, and other fpafmedic diforders and convultions, and this after other means failed. See his account of this plant, or fee an abstract from it in the Med. Mus. vol. i.

See Lewis's Mat. Med. p. 315. Wilmer's Obf. on the Poifonous Vegetables in Great Britain. Withering's Bot. Arrangement. Memoirs of the Med. Society of

Lond. vol. i. p. 310. Cullen's Mat. Med. Hyosciamus Albus, Linn. White Henbane. leaves are fmaller and more woody than those of the black fpecies; the plant is a native of the fouthern parts of Europe; its qualities are fimilar, but not fo powerful as those of the common fort.

— LUTAUS. See NICOTIANA MINOR.

HYOSERIS. It is also called bieracium minus. It is a plant of no note in medicine; though fome fay it agrees with fuccory in its virtues, the Endivia crefta.
HYOTHYROIDES. These muscles are also called

thyro-hyoides. They run from the thyroid cartilage to the os hyoides, they are attached to the knobs of that cartilage, and the line between them. Their use is to bring these knobs nearer to each other.

HYPALEIPTRON. A fort of spatula for spreading

ointments with.

HYPALEIPTON. A liniment.

HYPECOUM, also called hypecoon filiquosum, eym-

mum, cuminum cornulatum, and HORNED CUMIN.
This plant is common in France, but of no medical note. HYPERÆSTHESES. ERROR of APPETITE whether by excefs or deficiency. It is fynonymous with Dr. Cul-

HYPERARTETISCUS. Supernumerary parts, or

HYPERCATHARSIS, from barr, a preposition fignifying excefs, and nasapose, purgation; also imperinelis and hyperines. It is an excellive purging from medicine. It is a variety of the diarrhoea mucofa of Dr. Cullen.

It happens when too violent purging medicines, or exceffive dofes of milder ones, have brought on a disposi-tion to frequent discharges by stool; other causes of irritation in the bowels may produce the fame effect. For the cure, proceed as in violent diarrhoeas. Gentle anodynes, frictions, and perforatives were much depended on by the ancients. See Oribat. Med. Col. lib. xiv. cap. 42. P. Ægineta, lib. vii. cap. 7. Actius Tetrab. i. ferm. 3. cap. 118.

HYPERCORYPHOSIS, from επιρ, above, and κε

oops, the vertex, or a PROMINENCE, or PROTUBERANCE. Hippocrates calls the lobes of the liver and lungs by-

PERECRISIS, from επερ, above, and προτες, a
HYPERCRISIS, criffs. An HYPERCRISIS, or suPERECRETION. It is when nature, oppressed with her
burden, makes such efforts, to free herself by such excessive evacuations as endanger the patient.

HYPEREPHIDROSIS, from inte, excess, and Pour,

IMMODERATE SWEATING.

HYPERICUM. St. John's wort, also called perforata, fuga dæmonum, androfæmum, and hypericum vul-gare. Boerhaave mentions thirteen species, and Miller enumerates thirty. It is called fuga demonum on acing this species of benbane, are, madness of the furious count of its virtue in curing those who were supposed to kind, which endures for some days; in some instances be possessed. The species in use, is the bypericum personal to the species of the supposed to the suppose of atum, or hypericum foliis obtufis pellucido-punctatis, of the part; brpschondria diaborborizonta, a rumbling

common Sr. John's WORT.

This plant has flender, round, woody stalks, that are reddish; small obtuse oblong leaves set in pairs, which when held to the light, feem to be perforated, whence the name perforata; they bear numerous gold-coloured pentapetalous flowers on the tops of the branches, which are followed by blackifh hutks, full of fmall feeds. It is

perennial, grows wild in the woods and uncultivated places, and flowers in June and July.

The flowers abound with refin, but yet poffers fo much mucilaginous matter that water diffolves all its active parts. The leaves also contain much of the same refinous matter. Distilled with water, an effential oil is obtained, which much resembles that of turpentine. To the taste the leaves and flowers are bitterifh; and, from their general qualities, they promife to be useful as a detergent. See Lewis's Mat. Med. Neumann's Chem. Works. It is also a name for the spirar and coris.

HYPERICUM SAXATILE, &c. BASTARD ST.

JOHN'S WORT, also called hypericoides, coris lutea, and coris legitima Cretica.

The feeds are faid to be diuretic, emenagogue, and

powerfully antifpafmodic.

HYPERINESIS. See HYPERCATHARSIS.

HYPERINOS. It fignifies the fame as hypercatharfit, and also the person who suffers from it.

HYPEROA. The PALATE, from ὑπερ, above, and

HYPERO-PHARYNGÆI. See PERISTAPHYLO-

HYPEROSTOSIS. According to fome, it is the fwelling of the whole bone. In Cullen's Nofology it is fynonymous with exofisfu.

HYPERSARCOMA. A POLYPUS of the NOSE. A

feelily exercicence.

HYPERSARCOSIS, from ἐπερ, execfs of, and σαρξ, flefib. It is a flefily exercicence, or proud flefib.

HYPEXODOS, from ἐπε, under, and εξεδος, a paffing out. A FLUX of the BELLY.

HYPEZOCOS. It fignifies the membranes which

are spread under other parts, as the pleura, &c.

HYPNOBATES, \ from ὑπτος, sleep, and βαινω, to

HYPNOBATASIS, \ go. See Somnambulo.

HYPNOLOGICA. It teaches the due regulation of

floep and waking.

HYPNOPŒOS, } from ὑπρις, fleep, and ωριου, to
HYPNOTICUS, Scaufe. HYPNOTICS, medicines
which procure fleep. See ANODYNA.

HYPNUM. It is a fertile kind of moss, furnished

with uniform calyptrated heads; the stalks are more branched and fet at a wider diffance than those of the

HYPO, ins. A preposition signifying under; but, in composition, it imports not only inferiority with re-

fpect to fituation, but a remiffion or diminution.

HYPOCAPNISMA. SUFFUMIGATION.

HYPOCARODES, One who labours under alo w
HYPERCAROTHIS. degree of a carus.

HYPOCATHARSIS. A SLIGHT PURGING.

HYPOCAUSTUM, from ino, under, and naow, hun. An apartment for bathing and fweating in, it is heated by a fire under the floor; but the word generally

HYPOCHEOMENOS. One who labours under a

HYPOCHŒRIS. A species of fonchus.

HYPOCHONDRIA, from in, under, and xxxxxxx, a cartilage. The hypochondria are that part of the body, on both fides, which lie under the spurious ribs, and is extended to the ilia, comprehending not only the muscles but the internal viscera; because, according to Pollux, they are subjacent to cartilages. Celsus, from several places in Hippocrates, renders the word præcordia. Cœ-

lius Aurelianus often puts præcordia inflammata for an Inflammation of the hypochondria.

Affections of the hypochondria, according to Hippocrates, are hypochondrian anglafmenon, a retraction of the bypochandrium inwards, without any proper diforder

floribus luteis tryginis, caule ancipiti, caule rotundo Linn.

common Sr. John's wort.

This plant has flender, round, woody stalks, that are

&c. The hypochondria dried up and contracted inwardly: bypochondria meteora, tumid bypochondria, these are raised by slatulencies; bypochondrii xyntasis, a distension of the bypochondria from inflammation; bypochondrii seolitoes, an inequality of the bypochondrium; bypochondrium chronium, an bypochondrium affected with an oblitinate disorder: and

HYPOCHONDRIACUS MORBUS. The HYPO-CHONDRIAC DISEASE; it is also called affectio bypochondria, paffie bypechendriaca, HYPOCHONDRIASIS, VAPOURS,

SPLEEN, &c.

Hoffman strenuously maintains, that the hypochendriac difease, is not the same as that called hysterics. He obferves, that a strangulation of the fauces, a quick and difficult respiration, so as to endanger a sussion, doss of speech and all sense of motion, are the proper and effential symptoms of the hysterics: that the bypochondriac disease is inveterate, and rarely so cured as not to be again easily excited by the least accidents that can cause it, which is not the case with the hysterics; that though many of is not the case with the hysterics; that though many of their symptoms are the same, yet they each have such as the other is never accompanied with, otherwise than by the two diforders being attendant at the fame time. On the other hand, many others confider these two diforders under the general title nervous, and thus they only differ, as peculiarities in the conflitution vary, or as the fla-tulencies, &c. which attend the patients thus difordered may affect this or the other part. Dr. Cullen places this genus of difease in the class neuroses, and order adynamiæ; the hyfteric difease he places in the same class, but in the order spasmi. In this definition of the hyperbondriae difease, he says there is indigestion with langour, sadness, and sear, in a melancholic temperament. The state of mind peculiar to hyperbondriaes, and called vapours, or low spirits by some, is thus de-feribed by Dr. Cullen. "A langour, listlessness, or want of resolution and activity, with respect to all undertakings; a disposition to seriousness, sadness, and timidity; as to all future events, an apprehension of the worst, or most unhappy state of them, and therefore often upon flight grounds, an apprehension of greatevil. Such persons are particularly attentive to the state of their own health, to every the imallest change of feeling in their bodies; and from any unusual feeling, perhaps of the slightest kind, they apprehend great danger, and even death itfelf. In respect to these feelings and fears, there is commonly the most obstinate belief and persuasion." The doctor also observes, that it is only when the state of mind just described is joined with indigestion, in either sex, somewhat advanced in years, of a melancholic temperament, and a firm and rigid habit, that the disease takes the name of hypochondriae.

The feat of the hypochondriae passion is in the stomach and bowels, even though disturbed passions wer: the cause; for first these parts are disordered, then the other parts in consequence. In this Hossiman thu: far agrees, by faying the peristaltic motion in the bowels is retarded

by fpaims.

The causes are, forrow, sear, or excess of any of the passions, too long continued watching, irregular diet; in fome there is an habitual disposition to this disorder, and fuch people have generally a fallow or brown complexion, and a downcaft look, a rigidity of the folids, and torpor of the pervous power. Whatever may give rife to nervous diforders in general, may be a cause of this in particular: whatever may be the foregoing causes, such as passions, indigestion, increased or diminished fensibilities.

lity, &c.

The figns of this diforder are fo various, that to deferibe them is to describe almost every other disease; but in general there is an insurmountable indolence, deject-

edness of spirit, dread of death, costiveness, a flow and somewhat difficult inspiration, statulencies in the primee viæ, and various spasmodic affections, &c.

Whatever stomach generates acidities from fermentation, or a putteractive disposition in the alimentary solids and fluids mixed, there will ever be more or lefs of the bypochondriac diforder; the gas, feparated by either of thefe caufes, is fuddenly diffufed here and there, and its peculiar property is to repel the vital heat wherever it is

5 P

prefent

duced by other caufes, whence attention is necessary to discover, whether a difficult passage of the blood through the vessels in the stomach and guts, as Hossman hath af-ferted, or certain flatulencies, as others relate, or whatever else may be an adequate cause, in order to the adapt-ing of proper remedies. The hypochondriae disease is very difficult to cure; it rarely occurs early in life, generally in more advanced years only, and when once it hath taken place, it often increases as life advances. It should be diftinguished from indigestion, especially when indigestion is accompanied with vapours.

The principal indications of cure are, 1st, To correct the vicious cause in the stomach. 2d, To increase the

vital heat.

The diet should be light, easy in the stomach, agreeable to the palate, cordial, and nourifhing. In general, animal diet, and fpirituous liquors, lowered with pure water, for the common drink.

The cure is always flow, therefore hope should be sup-

ported by every probable artifice.

Whatever be the cause, begin with an emetic, and repeat it at proper intervals to two or three times; then purge with the pil. ex aloc cum myrrha, or the tinct. aloes; and by leffer dofes of thefe, or of the faline purges, as circumftances may indicate, keep the bowels eafy through the whole of the cure. After these, proceed with bitters mixed with aromatics and chalybeates; and thus, if a due degree of exercise is used, a cure may be expected. Here Dr. Cuilen observes, that in the hypochondriac disease there is a want of activity, which is to be remedied; there is not a loss of tone in the fibres, but on the contrary a rigidity in them : whence he recommends warm bathing; the drinking of tea and coffee; exercise, not so much as it excites the activity of the stomach, but as it operates on the mind, and diverts it from its despondency. In managing the minds of hypochrondriacs, carefully avoid any intimation that their complaints are imaginary, and as carefully avoid both raillery and reasoning in address-ing them. Be ever watchful to interrupt his attention, by engaging it with any object but his own feelings. Divert them with any employ that is neither attended with emotion, anxiety, nor fatigue. Diversion, in which fome fkill is required; exercife in the air, which requires fome dexterity, are both to be admitted: riding is better than either walking, failing, or travelling in a carriage; and to ride a journey is the best mode of using it.

An excess of acidity is a prevalent fymptom for the most part, and requires a close attention to all the means of obviating acidity as well as the use of antacids.

COSTIVENESS, an afflictive fymptom, is beit relieved by fuch gentle laxarives as just folicit nature's usual office, without exciting extraordinary discharges.

If the pulse is quick, and heat of the body inclining to

feverifhness, omit the aromatics and steel, but let the bark and elixir of vitriol be administered.

If during the fits THE MIND IS HARRASSED, give a gentle anodyne in a carminative water. If PAIN AND FLATULENCE, accompanied with AN HEAD-ACH, attend, the fame means is also effectual.

If spasmodic symptoms are confiderable, tending to convulsions, relief may be obtained by means of opiates joined with fetid gums, or with musk, according as each may best agree with the respective patients.

Warm bathing in pure water, heated fufficiently to raife Fahrenheit's thermometer to fixty or fixty-five, should nates be continued until the cure is nearly effected, and then gradually approach to the cold-bath.

Chearful company conduces much towards relief; but running into mirth, or any exercise used so as to fatigue,

are injurious.

A dry warm air is almost universally proper. See Nervous Diseases in the following pages. Hossman on the Morb. Hypochond. Shebbeare's Theory and Practice of Physic. Cullen's First Lines, vol. iii. edit. 4.

HYPOCHYMA, I from \$\sigma\_0\$ and \$\chi\_0\$, to pour. A CA-HYPOCHYSIS, TARACT. See CATARACTA.
HYPOCISTIS. The RAPE of Ciftus. Also called HYPOCHYSIS, TARACT. See CATARACTA.
HYPOCISTIS. The RAPE of Ciftus. Also called OROBANCHE. The species used in medicine is the cytinus overed underntath. A deep sistuous ulcer.

present in any considerable degree; and from this cir-cumstance alone may all the symptoms be accounted for; but yet it is allowed that the same effects may be pro-duced by other causes, whence attention is necessary to its pharmaceutic properties; for the hypeciflis almost to-tally disloves in rectified spirits of wine, but the acacia is unaffected by that mentruum. See Raii Hist. Plant. Lewis's Mat. Med. Both this and the acacia are now thrown out of use.

HYPOCLEPTICUM VITRUM, from iπο, under, and κλιτίω, to fleal, because it, as were, steals away the water from the oil. It is the same as Separatorium,

which fee.

HYPOCŒLON, from 1000, under, and using, the cavity above the upper eye-lid. It is the cavity under the lower eye-lid. See Ruffus Ephefius, lib. i. cap. 4.

HYPOCHOPHOSIS, a lefs degree of cophofis.

HYPOCRANIUM. A kind of abfects, to called be-

cause seated under the cranium, between it and the dura mater

HYPODERIS. In Ruffus Ephefius, it is the extremity of the fore-part of the neck.
HYPODERMIS. The CLITORIS.
HYPOGASTRICA SECTIO. In lithotomy, it is

what is called the HIGH OPERATION.

HYPOGASTRICÆ ARTERIÆ. See ILIACÆ AR-TERIA, for the external hypogostric arteries. The hypo-gastric, or internal iliac arteries, dip into the inside of the pelvis, just over the shoulder of the facrum; when it arrives at the fide of the pelvis, it throws down branches to the contents of the pelvis, and then goes through the sciatic notch. In the fœtus, the internal iliac is larger than the external, because it goes to the placenta, whence, after birth, it daily thrinks, and makes the chord, which was the umbilical veffels.

— Venæ. These veins run the same course with

their corresponding arteries, except that they do not send off the vena umbilicalis. The hypogastric veins are the

internal-iliac branches.

HYPOGASTRIUM, from ino, under, and yarne, the flomach; called also aqualiculus; etron; it is the lower external region of the fore-part of the belly; it extends from the lower extremity of the regio umbilicalis, to the bottom of the offa innominata. It is divided into three parts, viz. the pubes before, and the groins on each fide. When the integuments are removed from this region, you discover the linea alba, the lineae femilunares, and the lineae transversæ.

HYPOGRASTOCELE. The VENTRAL HERNIA.

tongue which adheres to the lower jaw, and the feat of the difeafe called rana, whence Actius names it 5000 persons;

βατραχες, the frog under the tengue. See RANULA.

HYPOGLOTTIDES. They are a kind of medicine to be held under the tongue until they are diffolved.

HYPOGLUTIS, from ὑπο, under, and γκελος, the nates. It is the fleshy part under the nates towards the thigh. Some fay it is the flexure of the coxa, under the

HYPOMIA, from \$\tilde{v}\tau\$, under, and wase, the shoulder.

In Galen's Exegess it is the part subjacent to the

HYPONOMOS, from incorps, a mine, perhaps from HYPONOMOS, from aποσομος, a mine, pernaps from iπο and τομος, a fettlement, or from iπο, ander, and τομος, a phagedenic ulcer. HYPOPEDIUM. A cataplasim for the fole of the foot-HYPOPHASIA, from ὑποφαιουμα, to appear a little. It is a fort of winking when the eye-lids are nearly closed. HYPOPHASIS. The name of a symptom which consists of closing the eyes during sleep, but only so, that a part of the eye appears, and a slight motion of the eye

a part of the eye appears, and a flight motion of the eye

НҮРОРН-

mentions two plants of this name, but attributes no medical virtue to them.

HYPOPHYLLOSPERMI, from υπο, under, φυλλον, a leaf, and στισμα, feed. Such plants as bear their feed on the back fide of their leaves.

HYPOPHYSIS. See TRICHIA.

HYPOPIA. Sugillations in the part under the eyes.

HYPOPLEURIOS. The PLEURA.

HYPOPYON, from \$\partial r\_0\$, under, and \$\pi\_{\pi\_0} r\_0\$, \$\pi\_{\pi\_0}\$. It is a collection of matter under the cornea. Though Mr. Bell confiders it an affection of fome of the coats of the eye. It is also called profis. It proceeds from an extravalation of blood, or a translation of pus, after an inflammation, the small-pox, &c. In the beginning it is attended with acute pain in the head and eye; and, according to the pain of the lead and eye; and, according to the pain of the lead and eye; and, according to the pain of the lead and eye; and, according to the pain of the lead and eye; and, according to the pain of the lead and eye; and, according to the pain of the lead and eye; and, according to the lead and eye; and acco ing to the degree of this diforder, it is followed by dim-

ing to the degree of this dilotder, it is followed by dim-nels of fight, blindnels, or death.

The cure is effected in the beginning by refolvent me-dicines, such as frequent application of a decoction of fage in wine, with bleeding and purging; or if this fail, rub the diseased part with your finger, to loosen the mat-ter, and then let the patient lay in a supine positure in a coach which is driven over rough roads; this is faid to have frequently dispersed the matter. Or, lastly, sometimes an operation is necessary, and is thus performed; place the patient as in couching a cataract, depress the lower eye-lid, while an affistant elevates the upper; then, with a lancet, cut through the cornea below the pupil, and about the space of a line from the white of the eye, make the aperture large enough to discharge the matter, and, the better to empty the abfcefs, prefs it gently, but fo as to force out the pus, or other contents. Drefs the wound with the mucilage of quinces, mixed with a little camphor. The operation should not be deferred too long, left the eye, by the pus remaining, fhould be fo injured, as to prove deftructive to vifion. See St. Yves on the Difeafes of the Eye. Heifter's Surgery. Bell's Surgery, vol. iii. p. 313, &c. Wallis's Sauvages's Nofology of the Eyes, p. 176, 186. White's Surgery, p. 232.

HYPORINION. A name for the parts of the upper-

lip, below the nostrils.

HYPOSARCA, from οτο, under, and σαρξ,

HYPOSARCIDIOS, flefb. An ANASARCA. In

Dr. Cullen's Nofology it is fynonymous with phy-

HYPOSPADIÆOS. The urethra terminating under

the glans.
HYPOSPATHISMUS. The name of an operation formerly used in surgery for removing defluxions in the eyes. It was thus named from the instrument with which it was performed. See P. Ægineta, lib. vi. cap. 6.

HYPOSPHAGMA. See APOSPHAGMA. It is also a

fugillation of the tunica adnata of the eye.
HYPOSTAPHYLE. RELAXATION of the UVULA. HYPOSTASIS, from bornus, to fubfide. The fedi-

HYPOTHENAR, from ore, under, and Strap, the palm of the band. See abductor minimi digiti manus: it is also that part of the hand which is opposite to the palm,
HYPOTHETON. A SUPPOSITORY.
HYPOXYLON. A species of agaric.
HYPOZOMA. The DIAPHRAGM. See DIAPHRAG-

HYPSILOGLOSSUS, i. e. Bastoglos-See Hyo-

HYPSILOIDES. The es byoides; also (GLOSSUS.

the basinglossis muscle.

HYPTIASMOS. A supine decubiture, or a nausea, with inclination to vomit.

HYPULUS, from bare, under, and san, a cicatrix, an ulcer which lies under a cicatrix.

HYSOPIFOLIA MINOR. A name for the falicaria hyffopifolio.
HYSOPHYLLUM. See Bupleurum.

HYSSOPUS. WINE impregnated with HYSSOP. HYSSOPUS. HYSSOP. From the Hebrew word ezeb, a boly berb, or a herb appointed for cleanfing holy places. Symphytum petraum. It is the hyljopus officinalis, or hyljopus angustifolia, spicis secundis foliis lanceolatis,

HYPOPHTHALMION. The part under the eye Linn. It is a low fhrubby plant, with brittle branched which is fubject to fwell in a cachexy or dropfy.

HYPOPHYLLOCARPODENDRON. Boerhaave leaves are oblong, narrow, and of a dark green colour. leaves are oblong, narrow, and of a dark green colour. The flowers are in loofe fpikes, of a blood colour. It is perennial, cultivated in gardens, and flowers in July and

> The leaves have an aromatic fmell, and a bitterifh, warm tafte. Water extracts the greatest part of their virtues, but spirit extracts them perfectly; and the extract made by evaporating the spirituous tincture, scarcely loses any degree of the virtues of the plant. From about fix pounds of leaves, an ounce of effential oil is obtained by diffilling

in water.

This plant is effeemed as an attenuant, corroborant, and expectorant: it is uteful in humoral affirmas, coughs, and other diforders of the breaft and ftomach, unaccount panied with inflammatory fymptoms. However these virtues are much disputed by some of our modern writers, particularly Cullen. In these cases an infusion of the leaves may be sweetened with honey, and drank at plea-fure. See Lewis's Mat. Med. Cullen's Mat. Med. HYSSOPUS CAPITATA. WILD THYME.

HYSTERA. The UTERUS; also the secundines. See INVOLUCRA.

HYSTERALGIA FEBRICOSA. A QUOTIDIAN FEVER, with pain in the womb.

HYSTERIALGES. Any thing that excites pain HYSTERALGIA in the uterus. Hippocrates applies this word to vinegar; others fignify by it, the pains which refemble labour-pains, and are generally known by the term falfe pains.

HYSTERIA FEBRICOSA. A TERTIAN FEVER,

with spaims and convultions.
HYSTERIA. HYSTER

HYSTERIA. HYSTERICS, from bespa, the womb, practifed medicine among women, and they gave the name of bysteries to this disease. It is one of those disorders that ranks among the nervous, and perhaps most frequently arises from a preternatural irritability uterus at first; however, a preternatural irritability in fome part, or in the habit in general, is attendant, when this diforder is prefent. Dr. Cullen places this genus of

discase in the class neuroses, and order spasmi.

A great variety of fymptoms attend this complaint, but its diftinguishing ones are a strangulation of the fauces, a rising in the throat, as if a ball was there, an intercepted breathing, or threatening fuffocation, fainting away, a lofs of voice, and a profound fleep. The belly is tunid, but the navel is drawn inward; there is a general flivering with coldness. Before the fit and after it, many other fymptoms attend, among which the most common are a frequent discharge of very pale or limpid urine, costiveness, anxiety, a palpitation of the heart, a general tremor, an unequal and languid pulse, coldness of the extremities, a pale countenance, convulfive twitchings, alternate laughing and crying. When the fit goes off, though the patient feems to be ready to expire, the whole of the diforder difappears, and, in tome inftances, a perfect health is reflored. Hoffman fays, that hysteric patients raysly dis without the attack of an enterior and tients rarely die without the attack of an epilepfy or apoplexy; from both which, as also from a swooning, it should be distinguished.

The causes in general are a preternatural irritability of the nervous, or spasmodic kind; or such in general as are

productive of nervous difeafes.

Girls on the approach of the menfes, and women be-coming pregnant, are frequently the fubjects of this dif-order, fo are those who labour under a difficult menstrua-

In order to the cure, if the constitution is fanguine and robust, bleed according to the strength of the patient. During the fit, if there are violent suffocations, hold pungent acid spirits under the nose; fuch as strong vinegar, and let moderate frictions be used about the precordia, and on the feet. Endeavour to procure a ftool by means of a clyfter, which may be made of an infusion of camomile flowers, and common falt; and as foon as the patient can swallow, give draughts with from 3 ii. to ₹ is. of acet. acer. in each. In tender habits, bleeding and pungent acids are to be avoided: and the fetid gums, or musk, according to the peculiarity of the constitution, are to be preferred: but a clyfter, as already preferibed, and frictions, also a moderately warm bath for the feet, may affist in relieving from the fit.

To prevent relapfes in conflitutions that are much difposed thereto, the particular causes attended to will generally direct the proper method. Many receive confiderable help by taking a feruple of the bark, night and morning. See Moraus Hypochondriacus, and Nervosa Febris. See Hoffman and Wallis's Sydenham on the Hyfterics. Cullen's First Lines, vol. iv.

HYSTERITIS. INFLAMMATION of the WOMB. Dr.

Cullen places this genus of difease in the class pyrexiae, and order phlegmasiae. See INFLAMMATIO UTERI.

HYSTEROCELE. An hernia caused by the uterus

falling through the peritonzem, from xnh, a tumor, and iraga, the womb. See HERNIA UTERI.

HYSTEROCYSTICA ISCHURIA. A SUPPRESSION of URINE, from the preffure of the uterus against the neck of the bladder. See Ischuria.

HYSTEROLOXIA. OBLIQUITY of the WOMB.
HYSTERON. The SECUNDINES. See INVOLUCEA.
HYSTEROPHYSE. See Physometra.

ALTHEA THEOPHR. &c.
IBIXUMA. See SAPONARIA.
ICACO. The AMERICAN PLUM. Miller takes notice of four species, but they are not remarkable in medicine. ICHOR, also called fanies. It is a thin, but acrid fluid, which distils from wounds.

ICHTHYA. The fkin of the monk-fish, i. e. fquatina, also the name of an hook for extracting the fœtus, fo called, Galen fays, from its likeness to the scale of fish. Erotion fays, that this word fignifies raspings.
ICHTHYEMATA. The SCALES of FISHES, and the

raspings of the bark of trees, or their scrapings.

CHTHYOCOLLA. Istno Lass; also called bus, FISH-GLUE, and alcanna. It is a folid glutinous sub-stance, prepared in Muscovy from a fish of the sturgeon kind, wich is caught in the rivers of Russia and Hungary. The skins, fins, &c. are boiled in water, the decoction is infpiffated to a due confiftence, and then poured out for as to form very thin cakes, which are either dried in that form, or cut while foft into flices, and rolled up into fpiral and other fhapes. Chufe that which is clear, thin, and

AMBLICHI SALES. A preparation with fal ammoniae. Some aromatic ingredients, &c. fo called from Iamblichus, the inventor of it.

It is one of the finelt of the animal glues, and has no particular fmell or tafte. When beat into threads, it reates animit. A physician who cures difeafes by ointments tritious aliment. A folution of it in water, if nicely spread upon filk, is an elegant plafter for flight injuries to the fkin. It is faid to agree with the gum tragacanth in its medical virtues, but that is rather disputable, for it, like all other animal mucilages, foon runs into a state of alkalescency, and belongs therefore more to the class of nutrientia, becoming more irritating than the mucilages of the vegetable class, and consequently not so demulcent when entering into the circulation, if any power of that fort is pre-ferved in them when entering the blood-veffels, and mixed along with the general mass of fluids. See Lewis's Mat. Med. Neumann's Chem. Works. Cullen's Mat. Med.

ICICA.

ICICARIBA.

GUM ELEMI. See ELEMI.

ICON. The abbreviation of icones plantarum.

ICIERICODES. The BILIOUS ARDENT FEVER.

According to Dr. Cullen, the typhus ieterodes. It is jaundice with a fever.

ICTERITIÆ. Difcolourations, or difeafes which occasion an unufual colour of the whole thin, and this with-

casion an unusual colour of the whole skin, and this with-

out an acute fever.

ICTERUS. The GOLDEN-THRUSH.

ICTERUS. The JAUNDICE. It is also called morbus arcustus, or arquatus, aurigo, morbus regius, icteri-tia, lefeoli morbus, by Paracellus, &c. It is a vitiated state of the blood and humours from the bile regurgitating, or being absorbed into it, by which the functions of the body are injured, and the skin is rendered yellow, and almost black. Dr. Cullen places this genus of difease in the class cachexize, and order impetigines. He diffinguishes five species. I. Leterus calculosus, when there is pain in the hypograftric region, which increases after eating, and when concretions pass into the intestines IBIRA-PITANGA, See LIGNUM BRASILIUM.

IBIRUBA. A species of plum-tree in Brasil.

IBISCUS. MARSHMALLOW. See ALTHÆA, and lefter spasmodic discases and affections of the mind. 3. It happens from after their birth.

The gammin in the mind. 3.

Items hepaticus, it is without pain, and follows a difeate of the liver. 4. Items gravidarum; it arifes during pregnancy, and gives way after delivery. 5. Items infantum. It happens from after their birth.

The genuine jaundice is when the bile is obstructed by gall-flones, or vifcid bile, plugging up its paffage into the duodenum. Sydenham speaks of a symptomatic jaundice which is produced by hysteric symptoms, but this is not observed in present practice, without the iderus spasmodicus may be considered of this species. Many cachectic patients have a very yellow ikin, but then they have not yellow eyes, and dark-coloured urine, nor afh-coloured itools, which never happen but when the gall duct are obstructed by bilious concretions, viscid bile by feirrhi, or fpaim. Infants often have a remarkable yellowners in their ikin, but their eyes are not tinged. This feems to arife from the meconium, or from fome cause which, by diffending the duodenum, fo contracts the paffage of the gall as to form an obstruction. The yellowness from the bite of a viper is not a species of jaundice.

The cause of the true jaundice is the bile mixing with 5 Q

The figns are, when at the fame time the skin is yellow, the whites of the eyes are also yellow; and the excrements are white, and the urine deposits a copious dark fediment. Befides thefe, an inactivity, anxiety, ficknefs, uneafinefs at the pit of the ftomach, itching in the fkin, and other fymptoms occasionally attend.

When a scirrhous liver is the cause no cure can be expected. An hæmorrhage is a dangerous fymptom, for then the blood is both acrid and thin. In adults this diforder often continues many months, even years, and if no other diforder attends, no danger is to be apprehended. If the gall-duct is obstructed by a scirrhus, either in it, or by convulsive twitchings, periodical head-achs, frequent in the duodenum, where it enters that intelline, danger is vomiting, &c. very great, and a cure not to be expected.

During the whole of this diforder, the patient should use frequent exercise, but not to satigue himself much; a warm bath, and chearful company, also relieve; the

diet should be attenuating and aperient.

As to medicines, it is proper, when other causes are not manifest, to prescribe with a view to gall-stones being the cause.

If pain is confiderable in or about the pit of the ftomach, proceed as directed for a ftone in the bile-duct.

If fickness and vomiting attend, the same method must be attended to as when a stone is passing from the gall-

bladder. See CALCULUS. If a purging attends, prevent its excess; give now and then as much of the ol. ricini as will be necessary to quicken the discharge by stool; and to strengthen, give bitters two or three times a day.

If the itching is so troublesome as to prevent sleep, an

opiate must be given at bed-time.

If the diforder is in its beginning, and if there is any feverish fymptoms, bleed according to the state of the pulle; then ease the stomach with an emetic of the antimonial kind; after which proceed with faponaceous and alkaline medicines, or in their flead the acetated kali.

If a viscid bile gives rise to their disorder, after bleeding, and an emetic, give aloetic and mercurial purges; after these the kali acetatum is the best attenuant and deobstruent; it hath all the advantages of loap, without its dilagreeable tafte; and if any extraordinary heat attends, it is ftill a most useful assistant, for while it allays accidental symptoms it carries on the principal work. It may be given to a dram, or a dram and a half, three times a day.

If a mere redundancy of bile produces a jaundice, it is known by the stools being highly coloured with the bile, and by their acrid and strong smell; in this case, the proper remedies are lenient, cooling purges, such as manna, tamarinds, or the ol. ricini. Acids and demulcents are

also necessary helps.

When an hæmorrhage is a troublesome symptom, the blood is in an aerid and diffolved state; aloetics and attenuants are now to be forborn; on the contrary, acids, de-mulcents, and particularly the ol. ricini, made into the form of an emulsion, also a decoction of hempseed in milk; and if a feverithness requires it, a little blood may be taken from the arm.

In case of a scirrhus, the extr. cicutæ is, perhaps, the

best palliative.

As an attenuant the rubia tinctoria is of fingular effica-The waters of Bath and Harrowgate are usually efteemed as almost specifics. Many agreeable and useful forms of medicines adapted to this disease in general, or torms of medicines adapted to this difeate in general, or to particular fymptoms, may be feen in Dr. Brooke's, and the London Practice of Physic. See also on the Jaundice, F. Hoffman. Petermannus's Dist. Scrutinio Itteri, &c. Huxham de Aere & Morb. Epid. p. 143, &c. Wallis's Sydenham, &c. Dr. William Heberden's Obs. in the Lond. Med. Trans. vol. ii. p. 123, &c. Med. Mus. vol. i. Cullen's First Lines, vol. iv. Decoe, on Biliary Concretions.

ICTUS. A STROKE OF BLOW. It fignifies also the pullation of an artery, and the sting of a bee, or any other

- Solaris. A STROKE of the SUN. Alfo called infolatio; and by the French coup de folcil. This name is given to diforders that arife from too violent an influence of the fun's heat, particularly on the head. A long exposure of the head to a hot fun hath often produced an inflammation that was speedily fatal.

the blood, from gall-stones, spasms, a scirrhus, &c. ob-structing its passage into the duodenum. A scirrhous liver is the cause of the worst kind.

A scirrhous continual involuntary motion of the eye-lids, a loss of sleep, drowsiness, in some with outrageous awakenings, a viodrowfiness, in some with outrageous awakenings, a vio-lent fever, faintness, loathing, thirst, &c.

Persons not accustomed to labour in the sun, are some-

times struck by its heat whilst on journies, &c. and die on the spot; others fall into a lethargy, and die in a few hours with fymptoms of raving madness. If a patient escapes with his life, he is frequently attacked afterwards with violent head-achs, which in fome instances affect the eye-lids greatly. In other inflances a delirium is brought on without a fever, gutta ferena, &c.
In infants this diforder manifests itself by a heavy, deep,

drowfiness; which continues several days, frequent ravings,

The effects of too much culinary fire are the fame with that of the fun; fleeping with the head near the fire hath

produced a mortal apoplexy during fleep.

The method of cure is much the fame as is purfued in the fanguineous inflammation. First bleed as freely as the strength will admit; after this the legs, or, if the diforder is violent, the whole body may be put into a warm bath, which should not be much hotter than new milk. Emollient clyfters should be frequently injected, almond emultion, lemonade, and fuch like demulcent cooling drinks should be freely given; linen cloths wrung out of vinegar and water may be applied on the face and scalp. See Tiffor's Advice.

IDÆUS DACTYLUS. A name for PÆONY ROOT.

Sec PÆONIA

IDÆA. SPOTTED RAMSONS.

TERTIA CLUSSI. See MESPILUS FRUCTU

IDEACH. Paracelfus fays it occurs in every plant,

but his meaning is unknown. IDEALES. A FAULTY A FAULTY JUDGMENT. ALIENATION of MIND. And discases in which the judgment is chiefly affected.

IDIOCRASIA, See IDIOSYNCRASIA.
IDIOPATHEIA, from 1818, private, or peculiar, and wath, an affection. A PRIMARY AND PROPER AFFEC-

TION OF ANY PART. Thus the head is an ecteur acoparacally in a lethargy, and the lungs in a pleurify; but when
these parts suffer by consent, that is by disorders residing
in other parts they are then said to suffer by sympathy.
IDIOSYNCRASIA. Idyosyncrasia, from 1313, peculiar,
our, with, and separagu, to mix, also idiocrasia, idiotropia.
Every individual hath a state of health peculiar to himself; and as different bodies feem to vary from each other, both with respect to the solids and fluids, though each may, at the same time be in a found condition; this peculiarity of conflitutions, by which they differ from other found bodies, is called IDIOSYNCRASY, or peculiarity of constitution. Diforders from idiofyncrafy, are confidered as incurable, having their cause in the original formation. It also

means peculiar constitutional antipathies.
IDIOTROPIA. See IDIOSYNCRASIA.

IDOU MOULLI. The name of a tall plum-tree growing in the East Indies. Its fruit is cooling, and the bark

is ufeful in many chronical difeafes.

IGASUR. See Nux vomica.

IGBUCAINI BRASILIANORUM. A tree in Brafil, whose fruit resembles apples, and its kernels are a pre-

fent remedy against the dysentery.

IGCIGA. The name of a tree which produces a fort of mastich of an agreeable scent. The bark, when bruised, yields a whitish liquor, which, when condensed, is a fort

of frankincense.

Another species, called igtaigeica, produces a rosin as hard and as clear as glass. See Raii Hist.

IGNAME. See CARA. A species of convolvulus. IGNIARIUS. FUNGUS. See AGARICUS.

IGNIS. FIRE. Some, as Bacon, Des Cartes, Boyle, fir Isaac Newton, &c. consider fire not as an element, or as a real existence, but as an adventitious and necessary property, resulting from the intestine motion of the intestible particles of matter. On the other hand, Homberg, Boerhaave, Lemery, s'Gravesend, &c. considered fire as a real existence, or a proper element. The judgment of these latter stands confirmed as a most solid truth, since the improvements made by the electric machine; befides, reporter of the head to a hot fun hath often produced an flammation that was speedily satal.

The diagnostics are a violent head-ach, a hot dry skin, taste, and painful to the touch, every property required in

an element is evidently the property of fire. The reality of fire is further evident, by those things which have a power of increasing its quantity, and those which can repel it. In the living human body, whatever increases the dequantity of crassamentum in the blood, increases the deare ulcers in the legs, but the patient can move about his gree of heat also; animal diet, aromatic drugs, &c. do business pretty well.

this: a permanent heat is produced by antimony, iron, and ILEUS. See ILIACA PASSIO. It is an ancient name the elixir of vitriol; but nitre, crude fal ammoniac, the fubtle gas from mines, from fermenting vegetable, or putrefying animal fubstances, powerfully repel all fire, and modica. extinguish it whatever state it is in.

For the influence of fire, with respect to life, health, and disease, see Crassamentum, Califum innatum,

ANIMALIS MOTUS.

Many diftempers have been named ignit, or fire, but principally the caufus, or burning fever, which Hippo-

angrene when it is just about to degenerate into it; hence it received the name of ignis calidus.

- it received the name of ignis calidus.

   FRIGIDUS. A COLD FIRE. A fphacelus hath been thus called, because the parts that are so affected become cold as the surrounding air.

   PERSICUS. ERYSIPELAS. And berpes exesses dens. Celsus calls it ignis facer; it corrodes like the ulcerous erysipelas, as deep as the fiesh, raising the skin, chiefly on the scalp, into scales of different theorems. part. Hoffman.
  - SANCTI ANTONII. Sec ERYSIPELAS.

- SYLVATICUS.

- VOLAGRIUS. Sec IMPETIGO.

VOLATICUS.

Ignis is also a name of several medicines, as mercury, and the essential oil that swims on the top of distilled waters, &cc.

The chemists use fire in different modes in performing

their operations, whence their

SAPIENTIUM, OF HEAT OF HORSE-DUNG.

- REVERBERATORIUM. REVERBERATORY FIRE It is made in a furnace covered with a dome, that thus the heat, or the flame, which hath always a tendency to efcape upwards, may be reverberated, or beat back on the vessels immediately exposed to it.

- ROTÆ, or FIRE for FUSION. It is when a veilel which contains some matter for fusion, is surround-

ed with red-hot coals.

The chemists formerly regulated their fire by different degrees, which they called the first; this was scarcely to be perceived; the fecond, was when the heat was manifeft, but not fufficient to hurt the fenfe; the third, which was when the heat was painful to the fense; the fourth, or when the heat was sufficient to destroy the body; and fifth, which was when the heat would cause gold to evaporate fumes. Boerhaave was the first who regulated the heat of fires, by means of a thermometer; and when the degrees of heat are mentioned in his writings, they are to be understood according to Fahrenheit's thermometer.

IGNYE. The HAM.

IGTAIGCICA. See IGCIGA.

ILAPHIS. A name in Myrepfus for the burdock. ILATHERA. The tree from which the cortex elu-

theria is taken.

ILECH. By this word Paracelfus feems to mean a

first principle.

ILEIDOS. In the Spagyric language it is the elemen-

ILEUM INTESTINUM, fo called from 11244, to turn about, because it makes many convolutions, EILEON, ILION. It is one of the small intestines. Where the jejunum ends, the ileum begins. Its convolutions furround those of the jejunum, on the two lateral and inferior sides, and it winds about from the lest side by the hypogastrium to the right fide, where it terminates in a transverse manner at the fleshy brim of the pelvis, and forms the first of the great intestines, called occum. Winslow observes, that the ileum is of a paler red than the jejunum. In all the length of this intestine, it is wide and easily dilatable; but at its extremity, as it enters the colon, it is narrow, and its fides are more firm and folid.

for the colic in the large intestines: See Colica. The chief of the varieties of ileus are varieties of colica spaf-

ILEX. The name of a kind of tree of the oak kind,

of which Boerhaave names three species.

- ACULEATA BACCIFERA. See AQUIFOLIUM: COCCIGETA, ilex aquifolia. The SCARLET OAK. Its berries are the CHERMES, which fee.

Trates often calls map, fire

IGNIS CALIDUS. A HOT FIRE, fome have called a gangrene. A violent inflammation hath been called a Italy and Languedoc. The bark, leaves, and acorns, called aculen, or acules, are more aftringent than those of

the oak.

- OBLONGO SERRATO FOLIO; also called ilex

angustifolio, and ilex arborea.

ILIA. The plural of ile. The FLANKS. They are the space between the lowest of the salfe ribs and the upper edge of the os ilium on each fide; they are the two divisions of the regio umbilicalis.

ILIACA. The ILIAC PASSION, alfo called mi-PASSIO. Servere mei, ilios, ileus, convolvulus, ilium, chordapfus, volvulus, tormentum, AN INTROSUSCEP-ILIACA. TION of the ILIUM, and the disease of the small intestines.

It is a violent pain in the fmall intestines, under which the peristaltic motion of the bowels is inverted, and all

their contents in desperate cases, are thrown up by vomit.

This disorder is of the acute, and generally, if not always, of the inflammatory kind. It is divided by some

into four species, as may observed below.

The causes are various but the symptoms are so similar that it is generally impossible to distinguish them. The immediate cause is, an inverted peristaltic motion of the intestines; and the causes producing the immediate one are generally faid to be, obstruction of the passage through the intestines, or irritation of the same. But some obferve that one species is caused by a phleymonous inflam-mation in the intestine; and this cause is known by the pulse being large, strong, somewhat hard, but not very quick; the blood being sizy; the patient rarely vomiting in the first stage of the disorder; his having no sickness or anxiety at the præcordia; and being relieved much by bleeding. The second species hath for its cause an ergspelatous instammation of the ilium; it is known by the intolerable pain at the feat of the difeafe; it is attended with vomiting foon, but not always at its first onset; there are extreme fickness or anxiety in the præcordia, insatiable thirft, great and fudden debility, and a pale dejected countenance; the pulse is small, weak and quick; the febrile heat inconsiderable and most remiss in the extrem in ties; fometimes there is a fense of great heat in the bow els, whilft the exterior parts are cold and bedewed with a cold clammy fweat, at leaft in the fecond ftage, when a mortification in the intestine is about to commence. The third species is most incident to youths betwint fifteen and twenty years of age; it is of a middle nature, betwint the sther two forts just described; in this case the blood is slorid and uniformly distributed throughout the febrile heat is pretty uniformly distributed throughout the body; the tongue is whitish, and the thirst is great; the pain is vehement; but the patient hath little or no anxiety or languor, and rarely vomits in the first stage of the disease. fourth species is produced by an introsusception of the intessine, called introsusceptio, which soon produces inflammation, or indeed may follow after an inflammation in begun. This last species some call the true islae passion. Dr. Hunter takes notice of a disease to which children are more particularly fubject, because their mesentery having fearce any fat upon it, eafily flips with the gut, and this he calls the valvalus or valvalus, of which he observes there are two kinds; the first is when a part of a gut is received into the part next above it; the other is when a part of the gut is received into the part of the gut next below it.

A costiveness usually precedes this disorder for some days, and pain foon is perceived in the belly about the na-vel; these pains increase; an inflation and diffention of the not even the leaft flatulence can pass downwards, but after much affliction it at last finds a way (though a fatal one)

by the mouth.

The iliac paffion should be distinguished from the ceeliac passion and from pains in the colon.

The prognostics are favourable whilst inflammation is absent, and elysters can be thrown up the anus, and are returned by stool; whilst the pains thist from place to place, and the pain and vomiting are only at intervals, there may be hope of a recovery; hope is yet better founded, if a laxative taken by the mouth palles by the anus; but when the violent fymptoms appear, there is but little room for hope. An entire suppression of urine is a mortal fymptom.

The principal indication of cure is to allay the pain

which lays a foundation for an inflammation.

Though the different species are not easily diftinguished, it is a favourable circumstance in the cure that the method is nearly the fame in them all; however, as in the second species bleeding is not so freely to be admitted of, an attention to the distinctions of the species may be

followed by advantage.

Begin the cure by bleeding, and repeating it as the pulse will admit. For the patient's drink, barley water, a decoction of marihmallow-roots, an infusion of linfeed or other demulcent liquors may be made; but in preference to all other, let fresh butter-milk be made by shaking cream in a bottle, so that the patient may take a tea-cup full frequently. The warm half bath is also peculiarly useful. Give purging medicines by the mouth and clysterwise as follows

R Calom. 3 i. extr. colocynth. comp. 3i. opii pulv. gr. iii. m. f. pil. No. xii. quarum fumat. iii. statim, &

repet. iii. quaq. hora postea vel pro re natà.

R Haust. salin. cum ol. ricini ver. 3 s. post sing. dos.
pillular. sumend. If inflammation is suspected, add nitre

to the draught.

First administer the more stimulating kind of clysters, and then the emollient ones. Clyfters of tobacco-fmoak are not to be omitted. It rarely happens that clyfters are fufficiently repeated.

Though the above cathartics are proposed, the fal cath. amar, or the natron vitriolatum are fometimes of more

Apply a blifter over that part of the belly where the pain is particularly complained of, or if the pain is gene-ral, the plafter may be applied on any part of the belly, or on the upper part of the thigh.

After each vomiting the faline mixture may be given in the act of fermentation, and mint-water may be taken with xv. or xx. drops of the tinct. opii. These may be repeated as oft as they may feem necessary in order to allay this discharge upwards.

If the fever increases, bleed as often and as freely as the pulse will admit of, and give nitre with camphor at proper

periods.

If a rupture is the cause, make no attempt to reduce it

before the fpafm and tension is removed.

If these means are successful, after the symptoms are abated, continue a cooling, emollient, and sparing diet for fome days.

See Hippocrates de Morbis; Aretæus; Cœlius Aurelianus; Celfus; F. Hoffman; Wallis's Sydenham; and the

Lond. Med. Obf. and Inq. vol. iv. p. 223, &c. Edinb. Med. Comment. vol. ix. p. 266, 278.

ILIACA MINOR. ARTERIA. It is the most posterior branch of the hypogastric artery. Sometimes it is the

branch of the glutara arteria.

— VASA. The ILIAC VESSELS, ARTERIÆ and

YENÆ, which fee.
ILIACÆ ARTERIÆ. The ILIAC ARTERIES. They are formed by the bifurcation of the aorta, at about the fourth vertebra of the loins. They defeend about three fingers breadth from their origin, and when they are arrived to the pfoas muscle (on each side) or rather are upon it, they each divide into two, an external and an internal; the external hath no particular name; the internal is called Hypogastrica. See Hypogastrica ARTERIA.

The external iliac, on each fide, runs down to the ligamentum Fallopii, under which it goes out of the abdomen. In this course it gives off only a few small arteries to the nyelalopia by this name.

belly gradually increases, then a hard tumor is felt in the peritonæum and parts near it; but as it passes out of the umbilical region, which furrounds the belly like a cord; belly under the ligament, it detatches two confiderable branches, one internal, the other external; the inner is called EPIGASTRICA, which fee, the external is called INNOMINATA, which fee; besides these two branches, the external islaca gives off a small branch internally, under the ligament, which runs to the vagina of the fpermatic chord, and fometimes another fmall twig goes from the outfide of the os ilium.

The internal iliac artery. See Hypogastrica Ar-

TERIÆ

— VENE. ILIAC VEINS. These are formed by the bifurcation of the vena cava, about the last vertebra of the loins. Presently after their leaving the vena cava, they each divide into two principal branches; one of these subdivisions is named iliaca externa or anterior; the other iliaca interna or posterior; the external is also simply named iliaca; the internal is called hypogastrica. The external feems to be the true continuation of the trunk; they run the fame courfe as the arteries of the fame name, The external iliac veins lie more or lefs on the infide of the arteries, and from a little before they leave the abdomen they accompany their corresponding arteries, both in their course, and in their divisions into branches. ILIACUS EXTERNUS, Musc. See Pyriformis.

INTERNUS, Musc. It lies upon the concave part of the ilium, and takes its origin likewise from the anterior edge of the bone; it runs down before the ploas muscle, and makes one mass with it; they then run over the head of the bone, and pass inwards, to be inferted into the little trochanter. It helps to lift the thigh up-

ILIADUM, It is the first matter of all things, con-ILIADUS. Is fisting of quickfilver, falt, and fulphur. These are Paracelsus's three principles. Iliadus is also a mineral spirit, which is contained in every element, and is the fupposed cause of diseases.

ILIASTER. Paracelsus says it is the occult virtue of nature, whence all things have their increase.

ILINGOS, from 1217t, a vortex. A VERTIGO, in which

all things appear to turn round, and the eyes grow dim.
ILION. ILEUM INTESTINUM.
ILIOS. The ILIAC PASSION. See PASSIO ILIACA. ILISCUS. Avicenna fays it is madness caused by love. ILIUM, Os. Alfo called os innominatum, but it is only the upper part thereof. It is called ilium, because it supports the parts that are called ilia. The ilium forms the upper and posterior portion of the pelvis; it reaches as far down as a transverse section of one third of the acetabulum. The external fide is convex, and called its dorfum; the internal part is named its cofta; the fuperior femicircular edge is called the fpine. Between the os fa-crum and the ilium is the fciatic notch, where the fciatic nerve and posterior crural vessels pass free from compres-

ILLEGITIMUS. ILLEGITIMATE. An epithet for the false ribs, also for some anomalous severs.

ILLINCTUS. A LINCTUS.

ILLISIO. See ENTHALASIS.
ILLOS. The EYE.
ILLOSIS. A DISTORTION of the EYES.
ILLUMINABILIS LAPIS. See BONONIENSIS LA-

ILLUTATIO. ILLUTATION. It is a befmearing any part of the body with mud, and renewing it as it grows dry, with a view of heating, drying and difcuffing. It is chiefly done with the mud found at the bottom of mineral fprings.
ILLYS. A person who squints, or looks with eyes

difforted.

ILYS. The FÆCES of WINE. It is also an epithet for fediment in ftools which refembles faces of wine; also the fediment in urine, when it refembles the fame.

IMAGINARII. Difeafes in which the imagination is

IMAGINARII. Difeases in which the imagination is principally affected.

IMAGINATIO. IMAGINATION. To the power of the mother's imagination many peculiarities in the feetus have been ascribed. Much hath been said on both sides, but though much of the error is confuted, the whole of the subject is not cleared up. See Philos. Trans. Abr. vol. ii. p. 222. Med. Mus. vol. iii. p. 273, &c.

IMBECILITAS OCULORUM. Celsus speaks of the modaletia by this name.

IMBIBITIO. In chemistry it is a kind of cohobation, when the liquor afcends and defcends upon a folid fubflance, until it is fixed therewith. Sometimes it fimply Egnifies cohobation, and any fort of impregnation.

IMBRICATUS. The leaves or feales of plants are faid to be imbricated when they are disposed so as to lie one on the edge of the other, after the manner of tiles on

IMMERSIO. Chemical immersion is a species of cal-cination, and is when a body is immersed in any sluid, in order to be corroded; or it is a species of lotion, as when any fubstance is plunged into a fluid, in order to deprive

it of a bad quality, or to communicate a good one to it.

IMMERSUS. See Subscapularis Musculus.

IMMORTALIS HERBA. See XERANTHEMUM. IMPASTATIO. IMPASTATION. The making of dry powders into paste, by means of some fluid. See INCOR-

IMPATIENS HERBA. See MOMORDICA and PER-

SICARIA SILIQUOSA.

IMPERATORIA. MASTERWORT. Also called afrantia, magistrantia, ostruthium, imperatoria major, imperatoria altruthium, struthium, smyrnion, and common masterwort. It is the imperatoria offruthium of Linn.
It is an umbelliferous plant, with large winged leaves,

divided into three indented fegments, producing thick, oblong, ftriated feeds, furrounded with a narrow leafy margin; the roots are oblong, thick, knobby, jointed with feveral lateral fibres, brown on the outfide, and whitish within. It is perennial, a native of the Alps and

Pyreneans.

The root is warm, grateful, and aromatic, nearly of the nature of angelica. Infufed in water, or digefted in fpirit of wine, it impregnates both menftruums ftrongly with its fmell, warmth, pungency, and bitternefs. On infpiffating the spirituous tincture very little of its flavour exhales; but water carries off nearly all the specific slavour exhales; but water carries off nearly all the specific slavour of the root in evaporation. If the root is held in the mouth it provokes saliva, and if swallowed it purges; whence it is called the countryman's purge: an infusion of it in water, and sweetened with honey, is an expectorant. The roots should be taken up in the middle of winter in the second year. This is also a name for ANGELICA, a species of the HERB CHRISTOPHER, a species of the HERB CHRISTOPHER, a species of the MARTANORY. cies of LOVAGE, and the SEA HART-WORT.

IMPERATORIA NIGRA. BLACK MASTERWORT, also called astransia nigra, astransia major, veratrum nigrum, bellebarus niger, and sanciala famina. This plant is kept in the gardens of the curious. It slowers in July. Its black and fibrous roots only are used.

See Raii Hist. Plant. Lewis's Mat. Med. Neumann's

Chem. works.
IMPETIGINES. Difeafes which occasion blemishes or defeedations in the skin. Hence imperigo, is called derbia, innis volagrius, or volaticus. falso terna, mentagra, derbia, ignis volagrius, or volaticus. It is used likewise for serpizo. See LEPRA, PURITUS, and HERPES.

Dr. Cullen ranks the impetiginous difeases as an order of the class called cachexize, and defines the impetigines to be those disorders from a general bad habit, manifesting themselves principally by dissiguring the skin and other external parts of the body. The itch, &c. though asserting the skin, yet not being connected necessarily with the habit, Dr. Cullen places in the class locales.

IMPETIGO of Celsus. Blancard says it is the lepra

- PLINII and ARABUM. Blancard fays it is that species of impetigo, or of the leproly of the Greeks, that

is known by the name of lichen.

IMPIA HERBA. See GNAPHALIUM VULG.

IMPLUVIUM. An EMBROCATION.

IMPOTENTIA. IMPOTENCE. With respect to men it is the same as sterility in women, that is, an inability

to propagate their fpecies.

IMPREGNATIO. IMPREGNATION. Alfo INGRAVI-DATION. A woman usually perceives the child to move at different periods; the foonest at the end of forty days, the latest at the end of five months. But some women, without being pregnant, perceive a motion like that of a child. La Motte thinks that a large child and a small quantity of water may be a reason why a pregnant woman to the child. man fometimes hardly perceives the motion of the child. The impregnation of plants, fee FARINA FOECUNDANS.

IMPRESSIO. See Depressio.
IMUS VENTER. The abdomen; but fometimes it

means only the hypogastrium.
INAIA BRASILIENSIS. A species of palm-tree. - GUACUIBA. A species of palm-tree. See PALMA COCCIFERA.

INCANTAMENTA. See AMULETA.
INCARNANTIA. Medicines which remove the obftructions to nature's filling up wounds or ulcers with

INCENDIUM. A BURNING FEVER, or fometimes INCESIO. any burning heat, also a hot inflam-

INCERATIO. INCERATION. It is the reduction of any dry fubitance to the confiftence of wax, by the gradual admixture of any fluid therewith.

INCERNICULUM. A STRAINER OF SIEVE. In anatomy it is a name for the pelvis of the kidney

INCINERATIO. INCINERATION. It is the burning of any thing to ashes.

INCISIO, from in and caedo, to cut. Incision. See

Bell on Ulcers, edit. 3. p. 76, &c.

INCISORES. CUTTERS, from incidere, to cut. A
name of the four anterior teeth in each jaw from their
use in cutting, called also ctenes. See CTEIS. Dentes
laster, riferit, dichafteres. The edges of the inciferes, by
use and friction, in some people become blunt and thickers. use and friction, in some people become blunt and thicker; and in others they sharpen one another, and become thinner. These teeth are convex externally, and concave internally; so that by their wrapping over one another when they are wore, it is the internal concave surface of the upper ones, and the external convex surface of the lower ones, that are wafted or wore. See DENS.

INCISORII DUCTUS. These are two canals which go from the bottom of the internal nares, across the arch of the palate, and open behind the first and largest of the

dentes inciforii; their lower orifices are in the foramen palatinum anterius, called nasopalatini dustus.

— INFERIORES COWPERI, Musc. They arise from the alveoli of the lateral incifores of the lower jaw, and are inferted into the middle of the semi-orbicularis

of the lower lip.

- LATERALES, Musc. A fort of biceps mufcles, which unite into one at their lower end: they arise from the os maxillare, below the middle tendon of the orbicularis palpebrarum, and below the edge of the orbit in the os maxillare, near the union of this bone, with the os malæ; these two portions (on each side) unite about the lateral dentes inciforii.

- MEDII, MUSC. Also called inciforii minores Cowperi, or incifores minores fuperiores. They are two fmall short muscles situated near each other below the feptum narium; they rife from the os maxillare, on the alveoli of the first inciferes, and are inserted into the middle and upper part of the upper lip.

INCISORIUM. A table whereon a patient is laid, in order to have an incision made on any part.

—— FORAMEN. This lies behind the dentes incifores

of the upper jaw, which divides into two, as it opens into the nofe on each fide of the feptum naft.

INCONTINENTIA. INCONTINENCE. In medicine it is when there is an inability in any of the organs to retain what should not be discharged without the concur-

INCORPORATIO. INCORPORATION. It is much the fame as impafiatio; it also fignifies the uniting oleous and terebinthinate substances with water into one equal body by the mediation of a third body added to them.

INCRASSANTIA. INCRASSATING MEDICINES, that is, such as reduce the too fluid blood and juices to a pro-

per confiftence.

INCRUSTATIO. INCRUSTATION. In furgery it is

the induction of a cruft, or eschar upon any part.

INCUBO, or INCUBUS. The NIGHT-MARE. It hath also been called ephialtes, from toansource, to leap upon; allo been called episiales, from teansum, to teap upon; epibole, from from imicana, to prefs upon; because the patient imagines that something leaps or prefles upon him, and babuxicarius. It is a species of oneirodynia.

Those who are disturbed by indigested crudities in the stomach are generally the subjects of this disorder. It lays a foundation for the epilepsy.

Under this complaint, which always happens during sleep, the patient cannot stir himself but with difficulty;

5 R

he is feized with a fense of weight, a dread of suffocation, an oppression as from somebody falling suddenly upon him, with an intent to deprive him of life and sense, not fuffering him to cry out; hence it is usual with these patients to flart up and cry out with a confused inarticulate

This diforder hath generally been supposed to proceed from a ftagnation of blood in the brain and lungs; but it is a nervous affection, and rifes chiefly from indigeftion: hence we observe that those with weak nerves, who lead fedentary lives, and feed heartily, are the most commonly affected with it. Nothing tends more to produce it than a heavy supper eaten late, or just before going to bed.
Wind is a frequent cause, deep thought, anxiety, or any
oppression on the mind, also produces it.

None are attacked with this disorder but when laid on

their backs; and if any person would awake the patient,

the complaint would immediately vanish.

If the patient hath a fanguine plethora, bleed, direct a fpare diet, and aloetic purges. Dr. Whytt fays that he generally found a glafs of brandy a cure, if taken at bed

A flight fupper, chearfulness before bed-time, due ex-ercise during the day, are the best remedies. See Cœlius Aurelianus Morb. Chron. lib. i. cap. 3. Lom-

mii Med. Obs. P. Ægineta, lib. iii. c. 15. Soranus's Aitio-

INCUS. The ANVIL. The name of one of the bones in the ear. It is broader than it is thick; it is articulated with the malleus, behind the manubrium, and from hence a fhort thick process projects backwards, and a long procefs downwards, which runs down parallel to the long procefs of the malleus, but rather more backward. The thort procefs is thick at its beginning, but decreafing it ends in a point, which is turned backwards and joined to the edge of the opening of the cellulæ maftoidæ. The long process at its extremity is rather bent inwards by which we may distinguish the incus of one ear from that of the other; for, turning the fhort process backwards and the long process downwards, if the bending in of the long leg be towards the left hand, it belongs to the right ear, and vice versa. See Auris.

INDEX. The fore-finger, from indicare, to point, because that finger is used in the demonstration of any

INDIÆ ORIENTALIS, RADIX GENUINA. See

INDIANA RADIX. See IPECACUANHA.

INDICATIO. INDICATION, also DELATIO. The diagnostics of a difease and its pathognomonic figns, are collections of particulars that occur to observation. Indieations are conclusions that arise from reasoning on these particulars called figns. The indication of cure, in all difeases, is to remove the proximate or immediate cause, for this the term accusatio is used.

INDICATOR. See EXTENSOR INDICIS.
INDICON. A plant in India which refembles pepper, and bearing a fruit called myrtidanon, from its refembling

a myrtle-berry.

INDICUM. The INDIGO BLUE PLANT; also called Indico-indigo, anil, caacbira nil, ifatis Indica, polygala Indica, emerus Americanus, agnil, glafum Indicum, Ameri ceachira, Indorum colutea, Indica herbacea enger, gali, herba de anil Lufitanis, hin-awaru, &c. It is a plant which is a native of South Carolina. In from fix weeks to two months from fowing the feed, the plant is ready for cutting up, in order to make the blue colour-ing matter called indigo. The indigo is a fecula, made by means of water and olive oil, from the juice of the leaves of this plant and the smallest branches. The best fort of indigo bears the surname of surquisse. The best is made a St. Christopher's and Martinico; it is in flat cakes, of a moderate thickness, not too foft nor too hard, of a deep violet colour; it fwims on water, and when broken hath no white fpots in it; laftly, fuch as is cop ifh or reddish, on being rubbed with one's nail, and hath the least dust and broken pieces in it.

There is a fort which is made from the leaves and the

stalks, which is named guatimala.

The plant is faid to be detergent, and of some use when

powdered and applied to ulcers

There is another plant which is called anil; it is used by way of decoction in nephritic colics, and suppressions of urine.

See Raii Hift. Plant. Lewis's Mat. Med. Neumanh's Chem. Works.

INDIGO. See INDICUM:

INDIGO. See INDICUM.

INDUSIUM. A SHIRT or SHIFT. Some difpute about changing the linen when the patient is fick. Clean linen promotes perspiration, and it may be renewed as often as the patient pleases, whether the disorder be of the acute or the chronical kind.

Except during a criss in fevers, whilft the patient is in

a fweat, a change of linen, if well dried and warmed,

may be daily used.

INDUSTUM. See AMNION:
INERTIÆ VIS. The power of inactivity, by this fir Ifaac Newton means that paffive principle in matter; by which bodies refift, to the utmost of their power, any change or alteration of their state, whatever it be, either of reft, motion, or its direction; and this refiftance is always equal in the fame body, and in different bodies, is proportional to the quantity of matter they contain. Hence in medicine it means when powers of the conflitution are torpid, or inert, and for want of their exertion leave the habit, both folids and fluids in a flate almost

of inactivity.
INFANS. An INFANT or CHILD. Fred. Hoffman

fays, that the human species are infants until they begin to talk, and children to the age of puberty.

Anatomy discovers to us, that during infancy there is much imperfection in the human frame, e. g. its parts are diffroportioned, and its organs incapable of those functions which in future life they are designed to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and panceas are much larger in proportion than in advanced life, their forestions. larger in proportion than in advanced life; their fecretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood fent through the heart of an infant, in a given time, is also more in proportion than that in adults. Now, though these circumstances have their important usefulness, yet the imperfection attending them, subjects this age to many injuries and dangers that a more perfect state is freed from.

Hippocrates enumerates the diforders of infants and children in his Aphorifms, lib. iii. aph. 24-26. Dr. Percival observes in his Essays Med. and Exp. that of all who are born alive, two-thirds of them live not to be two

years old.

Infants have a larger proportion of brain than adults, hence are more subject to nervous diforders, and hence the diagnostics of diseases are in many respects obscure or uncertain, as particularly those taken from the pulse, which from the irritability of the tender bodies of infants, is fuddenly affected by a variety of accidents too numer-ous, and feemingly too trivial, togain our attention. However, no very great embarrassment arises to the practirally acute, lefs complicated than those in adults, and are more easily discovered than is generally apprehended.

The vigour of children's constitutions depend most on

that of their mothers. Healthy women, who accustom themselves by exercise and air, and whose diet is more fuited to the robust than the delicate alone, bring forth

healthy children.

As foon as a child is born, the mucus with which its body is covered, is belt washed off with soap and water. The care of some nurses to clear away all the mucus at the first dressing of the child is imprudent, for the degree of rubbing which is fometimes required, produces inflammation, and much other uneafiness in the child; moderate cleanliness at the first prevents such ill effects, and the next dreffing will eafily and fafely complete this bufinefs.

After examining the new born infant with a view to discover any accidental injury, or natural imperfection,

The heads of infants are differently formed by the birth; but the nurse should dress them loosely, and leave their future formation to the action of the dura mater.

The next custom is to pour oil of almonds, and fyrup The next cultom is to pour oil of almonds, and fyrup of violets, or to thruft fugar and butter into the child's flomach; but this practice induces costiveness, by weakening the bowels: until the mother's milk begins to flow, which may be accelerated by applying the child to the breafts, it is rarely necessary to give the child any thing; for there is a mucus in the stomach of a new-born infant, which is generally a fufficient nourithment, until the mo-ther can afford the further needful. If any thing is done before the mother's milk can be obtained, let a tea fpoonful of the ol. ricini ver. be the medicine, and after it give only luke-warm water with an equal portion of new

If the child is to be nurfed without the breaft, the thinnell diet is the best; milk and water alone fusices, and is less subject to turn four than thicker meat; as the

firength increases, more folid diet may be given.

The cloathing of infants should be loose and cool; but not such as subjects them to the cold. Clean linen may be allowed every day, for it imbibes superfluous moisture, which otherwise might offend. Peculiar attention should be given to prevent their continuing wet, after they void their urine.

The diet should be in general as directed in the articles ABLACTATIO, and LACTATIO. If the stools are of a green or yellow colour, add now and then magnesia to the food, or give three or four of liquor c. c. in a spoonful of milk and water; fresh both, from which

the fat is skimmed, may be given once a day. The nursery should be a large room, and more than two should not be in the same bed. Small or crowded rooms, greatly relax the inhabitants, and fubject them to take cold.

Exercise is of the last importance; it conduces both to prefent health, and future vigour; but avoid much motion, except of the gentler kind, before the flomach hath digeffed, in some measure, its contents; and at all times avoid the dangerous practice of hoifting and toffing children high and violently, for thus their victuals from the found in their flomache, and direction is much injured. are foured in their ftomachs, and digeftion is much injured, and not unfrequently the tender ribs are bent, or broke, and thus irremediable ills arife, though the caufe at first was never noticed. Gently dandling, and rubbing the whole body before a fire every time it is dressed, washing with cold water, and afterwards drying it well, are fulli-

cient exercises during the first sew months.

As to the disorders that are proper to the infant state, they are chiesly inward sits, teething, the rickets, the thrush, watery gripes, and convulsions; these are com-mon to all ages. In infants, all these disorders generally fpring from one common cause, viz. an acid in the stomuch and bowels. This, in proportion to its degree, and according to the respective peculiarities in the conflitution of an individual, produces one or other of these diseases. To remedy these, give from gut. v. ad x. vin. antim. and if it does not operate upwards in half an hour, repeat the dose. It generally operates both ways, and then it is the most useful; as the child's strength increases give a larger dose. Repeat this kind of emetic as often as the fymptoms may require, and keep the child always as dry as possible, not neglecting to rub it as above hinted, every time it is dressed and undressed. See the respective articles under which the above named diseases are treated. See Percival's Essays Med. and Exp. ed. 2. p. 363—367; Armstrong on the Management and Diseases of Children. wrap the navel-firing in a rag, fufficiently folded, to pre-vent the coldness of the navel-firing from affecting the the reverse of circumcision, for it confines the prepuce so over the glans penis, that it cannot be drawn back. The operation is thus performed. Extend the fkin which is above the glans, and with ink mark the part on each fide through which the perforation is to be made; thenlet it retract itself. If the marks recur upon the glans, too much of the skin hath been taken up, and the marks must be made nearer to the end of the prepuce, but only so as that they may not return upon the glans, and thus the seat of the sibula is determined. Then a needle, armed with a waxed thread, is paffed through, and moved backward and forward every day, until a cicatrix is formed. After this the fibula is fixed.

Thus the ancient Romans were used to preserve their finging boys from all premature and prepofterous ideal venery, and to preferve their voices longer. See Celfus, lib. vii. cap. xxv. The fibula feems to have been a kind

INFLAMMATIO. INFLAMMATION. It is properly defined to be an increased circulation in any part, from irritation, external or internal, local or univerfal.

The immediate cause of inflammation is irritation. It does not depend on the quantity of craffamentum, nor the ardency of the blood: fpaim and infiammation mu-tually produce each other. Putrid matter is amongft the varieties which irritate the nervous and fensible parts, and fo excite inflammation. The kinds of irritation are, per-haps, as various, as are the different causes thereof; the haps, as various, as are the different causes thereof; the matter of the small-pox produces one, that of the itch another, &c. More sluid circulates through, and is more secreted, in a part that is instanted than when it is in a natural state. Sensibility and irritability are increased by inflammation, and are produced in parts that did not manifestly possess them before.

The mediate cause of inflammation is the increased sensibility, or irritability of the fibres; whence irregularity in the excreta and retents.

in the excreta and retenta.

The remote causes are wounds, bruises, sudden and excessive cold, luxations, aromatic aliments, &c. Dr. Cullen confiders spalm as the fole proximate cause of in-flammation, and says "A spalm of the extreme vessels takes place in inflammation, is prefumed from what is at the fame time the state of the whole arterial system. In all confiderable inflammations, though arifing in one part only, an affection is communicated to the whole fyftem; only, an affection is communicated to the whole system; in consequence of which, an inflammation is readily produced in other parts besides that first affected. This general affection is well known to physicians, under the name of diathess phlogistica. It most commonly appears in persons of the most rigid fibres; is often manifestly induced by the tonic or astringent power of cold; is increased by all tonic and stimulant powers applied to the body; is always attended by a hardness of the pusses, and is most effectually taken off by the relaxing power of blood-letting. From these circumstances it is probable. blood-letting. From these circumstances it is probable, that the diathesis phlogistica consists in an increased tone, or contractility, and perhaps contraction, of the muscu-lar fibres of the whole arterial fystem." First Lines of the Practice of Physic.

Inflammations receive different names, according to the different parts on which they manifest themselves, as in the inftances of a quinfy, pleurify, &c. called phlegmon-ous inflammations; and a catarrh, diarrhœa, &c. called inflammations of the mucous membrane.

However various may be the divisions and subdivisions of inflammation, like fever they are all but inflammation, differently circumstanced. If the sanguineous vessels, in those membranes that are inflamed, are the seat of the irritation (as in inflammations of the stomach, brain, &c.) the inflammation is then called phlegmonous; but when the irritation is on the furface of the membranes, it ftimulates the fecretory mucous glands to the accumulating and discharging more than in a natural state they usually do. So an irritation, and its confequent an extraordinary afflux, or circulation of humours through the part, constitutes inflammation in both cases.

All the inflammations that come under the name of phlegmonous, have the fame feat; they are all in the fan-guine arteries of the part inflamed. Dr. Boerhaave, to support his doctrine on this kind of inflammatien, speaks of the red blood being obstructed by an error of place (fee ERROR Locs); but obstruction is not a cause, though

it may be an effect of this diforder. The mucous membrane is the feat of those inflammations which come under the denomination of infiammations of the mucous membrane. If there are tumors, the inflammation is phleg-monous, and these are distinguished into phlegmonous and eryspelatous. The seat of the phlegmonous is in the sanguine arteries, and the cellular membrane; the feat of the eryfipelatous is in the skin, or other internal membranes, not cellular.

Dr. Cullen uses the term phlogosis, for this genus of disease. He places it in the class pyrexize, and order phlogmosise. Defines it to be a sever, reducts of an external part, with heat, and a painful tension. The species he points out are, 1. Phlogosis phlogmone, the phlogmonous inflammation. 2. Phlogosis erythema, crythema-

tous inflammation.

The principal effects of inflammations are heat, pain, fwelling, redness, an accelerated pulse, a dryness of the

fkin, and an itching.

The heat is excited by the reciprocal action and re-ac-tion of the folids and fluids. The irritation on the fibres increases the action of the vessels; the velocity of the fluids are thereby quickened through them, and thus heat is excited in proportion as there is craffamentum in the blood.

PAIN. This is excited by the diffension of the vessels

in a part already become preternaturally fensible. Swelling. This is not caused by obstructed blood, but by the excess of heat distending the cellular membrane; but a fwelling is not effential to an inflammation
REDNESS. This proceeds from the quantity of blood

brought to the part.

THE QUICKENED PULSE is from that law in nature, by which the heart always increases its efforts, to free its fubservient vessels from any injury they sustain from accidental, or preternatural irritation.

DRYNESS OF THE SKIN. This is from the stricture in the capillaries, whose use is nearly abolished by the irritation

on them.

ITCHING. This is but the beginning of what ends in

pain by its increase.

The prognostics are more or less favourable in proportion to the dignity of the part affected, the constitution of the patient, the intenseness of the symptoms, the attendance of other diforders, as the feurvy, pox, &c. In a part that is of a firm texture, and that hath but few veffels, such as the ligaments, glands, &c. the cure is often tedious, and a proper cure is not always effected, for a feirrhus is fometimes the confequence. If the fymptoms of inflammation ceafe fuddenly, the epidermis is raifed into blifters full of ichor, or finks, and the colour of the part becomes livid, whilft at the fame time the pulle is fmall, and the fenfibility of the part is leffened,

a gangrene is then approaching.

Sometimes an inflammation foon goes off, at others it is removed with difficulty, and often it terminates in other difeases. An inflammation can only terminate by a removal of its immediate cause, viz. the erethism of the vessels, or rather the irritating matter. But generally it is said to end in a resolution, suppuration, gangrene,

feirrhus, or cancer.

And first, of RESOLUTION: that is, when, upon removing the cause, the symptoms diminish gradually, and at last the patient is in the same state as before the disorder begun. And, unless morbific matter was the cause, this is the most desirable way of termination. A resolution may be brought about by some increased evacuation happening by nature's efforts, or by those of art; a sever coming on; or by a metastasis. But these are not properly the modes of the resolution of inflammation, but the methods which nature or are both about to the methods which nature or are both about to coming on; or by a metaftafis. But these are not properly the modes of the resolution of instammation, but
the irritation which nature or art hath taken to revolve the irritation which was the immediate cause. In all
these reversal instances the discharges by the kink, and to each draught just
to its free discharge by urine, add to each draught just
to much nitre as produces a due discharge that way;
though sometimes the nitre, by irritating too much, rathough sometimes the nitre, by irritating too much, rathe forcing of resolution collection are sometimes less.

these species of resolution callosities are sometimes left. Secondly, of SUPPURATION. This is more properly a consequence of inflammation than a mode of its termination. It happens when a quantity of blood is thrown out into fome cavity (the inflammation continuing) it ferments and is converted into pus, which afterwards acts as a ferment on the folid parts, and gives occasion for the conversion of the whole into a matter similar to itself,

the fymptoms of inflammation going off.

Thirdly, of a GANGRENE This may be a confequence

of inflammations going off; for now fenfation is destroyed, and life, with respect to the part that mortifies, is extinguished; whence no morbid cause can any longer be productive of effects.

Laftly, A SCIRRHUS AND CANCER feem to be peculiar difeases, not the modes by which inflammation terminates. Mr. Sharp observes, in his Introduction to the Operations of Surgery, that, "A scirrhous gland is generally mentioned as a fourth termination of inflammation; but with impropriety, fince it feldom or never occurs but in venereal, fcrophulous, or cancerous cases; when it is the forerunner, and not the consequence of an inflammation, the tumor generally appearing before the discoloration."

One general method of cure is that which is proper in

all the denominations of phlegmonous inflammations, however diffinguished by phlegmon, crysipelas, hot cedema, or whatever else. And in general there are but two indications; the first is to lessen or remove the irritation; the second is to abate the increased assure of the humours.

Though inflammations of all parts and kinds have the fame general treatment in order to their cure, yet regard should be had to their structure, situation, and connection of the parts, to the antecedent causes of the difor-

der, and the conflitution of the patient.

It is observable that a phlegmon, on its decline, affirmes fucceffively the forms of an eryfipelas and ordema, and then it vanishes; this would not happen so soon if they proceeded from inspirated blood, ferum, or lymph, wedged in smaller vessels than are destined to circulate through them; whence, as these different appearances of instrumental are known to arise successively in the fame place, it feems very certain that they proceed from the fame caufe, viz. from the fame kind of humours in the fame feries of veffels, and that they are nothing elfe but the different degrees of intenfity of the fame difeafe, also that the same general method of cure is proper for them all.

To answer the first indication, viz. to remove the irritating cause: 1. Endeavour to remove all that can continue the morbid irritation. 2. When spasms are the cause, opium is the properest remedy. 3. When a stimulating studies secreted on a sensible membrane, its action may be hindered by the application of oily, uncluous, or mu-cilaginous matters. The morbid acrimony may be deftroyed by proper alternatives, or mercury, &c. 5. De-ftroying or leffening the irritability of the part, by means of the bark, preparations of lead, &c. 6. The diftention of the internal veffels is removed by refloring the circulation on the external furface of the body, or giving inter-nally medicines to relax the fmall vessels throughout the fystem, by their action on the stomach; such as nitre, fat ammoniae, all the neutral falts, ipecacuanha, feneka root, antimonial preparations, cold water, external applications, fuch as finapifm, blifters, &c.

The SECOND INDICATION, viz. to abate the increased The SECOND INDICATION, viz. to abate the increased flux of the humours, is answered, I. By bleeding. 2. Purging with neutral salts. 3. By the application of sedatives to the stomach, as acids mixed in the patient's drink, and narcotics given at proper intervals in small doses. 4. Sedatives, such as the preparations of lead, &c. may be applied externally. And 5. An instammation may be excited on the skin, near the part originally affected (except the skin itself is the part instamed); to this end frictions, the volatile liniment, or even blisters, may be applied.

may be applied.

Mean while let a cooling attenuating diet be directed: barley-water, in which the true gum arabic is diffolved, is among the first for the common drink, and, in order

If the external inflammations are to be removed without a fuppuration, emollients should never be applied; they increase every degree of tumor, by adding to the quantity of matter there accumulated, and rendering the vesfels both more yielding to their impulse, and less able to carry them off; thus they counteract every intention of cure. The increased action of the vessels are to be allayed, and the fensibility of the part abated, by fuch feda-tives as neither increase the tumor, the pain, the heat, Thirdly, of A GANGRENE This may be a confequence or the tension; to this end faturnine topics, or in their of inflammation, but never can be confidered as a mode stead the simple aftringents and stimulants in common

use, such as the usual mixture of vinous spirit with vinegar, poffels the defired efficacy. When the feat of ingar, possets the desired esticacy. When the leat of inflantmation is a lax glandular part, applications that are
flrongly stimulant are the most safe and advantageous.
And where there is but little sensibility in the part, as in
the scrophulous tumors of the lymphatic glands, blisters
exceed all other topical remedies.

The belly should be kept lax in all kinds of inflammations; and internal ones are much relieved by a frequent
use of clysters.

Vapours and warm baths contribute much to relief, by leffening the irritation of the fibres, and by retarding the

When the inflammation abates, attenuants and aperients, such as guaiacum, sassaras, &c. are used with some advantage. Bell on Ulcers, edit. 3. p. 17—36. 47—53. Cullen's First Lines, edit. 4. vol. i. p. 211. Kirkland's Med. Surgery, vol. i. p. 235. Pearson's Principles of Surgery, vol. i. &c. White's Surgery, vol. i.

INFLAMMATIO VESICE. INFLAMMATION of the

BLADDER. See CYSTITIS.

It is produced by the usual causes of internal inflammation; an inflammation in its internal coat is fometimes

caused by a stone lodged in it.

The diagnostics are as follow; with a sever, a pressing and burning pain is perceived in the region of the bladder above the pubes, and in the perinaum; sometimes a redness is perceived in these parts, though the pain is deep seated. If the neck be the part affected, there is a retention of urine, with a constant stimulus in its eva-cuation; if the fundus be the part diseased, there is a continual dribbling, with great efforts to throw out a larger quantity at a time, which the patient conceives to be contained in the bladder. Frequent attempts to expel the fæces, with which the rectum appears to the patient to be always loaded; these increase the pain very much, particularly when any faces are actually contained, and especially if they are hard. The pulse is frequent and hard, and the extremities cold: there is great anxiety, reftleffness, fickness, vomiting, delirium, and other fymptoms of irritation.

This diforder usually terminates foon, either in a reco-

This diforder usually terminates soon, either in a recovery or death; frequently the latter. A gangrene comes on, by which the pain is removed; but the other symptoms continue until death delivers the miserable sufferer.

This disorder may pass off by an increased secretion of mucus from the internal membrane, or by a metastasis, or by suppuration; in which last case the matter may be discharged into the cavity of the bladder, and pass off with the urine; or into the cellular membrane, and so pass externally through the perineum; or lastly, into the cavity of the abdomen, where it proves statal. The ulcer in the bladder and perineum are difficult of cure.

Instammation in the external coat of the bladder should

Inflammation in the external coat of the bladder should be diftinguished from that of the internal; and inflammation in any part of the bladder should be distinguished from inflammation in the adjacent parts, also from that retention of urine which proceeds from other causes. In order to the cure, bleed according to the strength of the patient, and the violence of the symptoms.

Relaxant medicines, such as the pulv. antim. and hauft. falin. should be given as early as possible, and repeated as often as is convenient; for help must be speedy and powerful, or death foon puts a stop to the means.

Laxative and cooling clyfters should frequently be in-ected, or if these cannot be complied with, the cooling faline purges may be given by the mouth, and repeated fo

as to keep the bowels lax.

If the urine is retained, decoctions of mucilaginous herbs should be freely drank; or if need be, the cathe-ter may be used, though much care is required in its in-

If notwithstanding due evacuations, spasmodic contraction with much pain continues, opiates in small doses, such as tinct. opii gt. iii. may be repeated at proper in-

tervals.

If a redness appears externally, apply an anodyne emollient cataplasm, and cover it with bladders of warm water. If no appearance of inflammation is observed externally, rub the region of the bladder, and also the perinagum, with the linim. ammoniæ, Ph. Lond. to excite imflammation in the fkin.

The patient may be placed in the warm bath two of

three times a day.

If by uncertain horrors, and the departure of fome of the symptoms of inflammation, a suppuration is suspected, hasten its progress, inorder to as speedy a discharge of the matter as possible, which when evacuated, proceed as in cases of an ulcer in the urinary passage.

INFLAMMATIO OSSIUM. INFLAMMATION of the Bones.

The blood-veifels carried from the periofteum to the bones run between their laminæ, whilft others pass through particular perforations to the diploe of the cranium, and the marrow in the bones: hence the separation of the corrupted parts, and the restitution of such as are lost. Inflammation may therefore be feated in the bones, whence arifes violent pains, obstinate, and seeming to the patient to be deep-seated. Hence also a spina ventosa, &c. See INFLAMMATION of the periosseum.

INFLAMMATIO MAMMARUM MULIERUM. INFLAM-MATION in the Breafts of Women. See MASTODINIA.

This may happen at any other time, but generally it is the attendant of those who give suck. A shivering is most frequently a preceding symptom; then follows the inflammation, with more or less sever; a quick pulse, thirst, head-ach, and difficult respiration.

As the usual methods to prevent the afflux of milk in the breaft are uncertain, to guard against inflammation, the mother should consent to suckle her child, at least during the first month; and during this time, to order her diet fo as that the discharge by urine may be somewhat increased, and the bowels kept lax; the breasts should also be kept as empty as possible, by means of glasses of other contrivances for this purpose. But if, notwith-standing this, an inflammation actually takes place, bleed, direct a thin fpare diet, give laxatives, and apply the fol-lowing embrocation by means of linen rags, which should be moistened with it as often as they dry: R aque ammonize 3 fs. spt. camph. 3 i. ss. m.: If this is too irritating, add to it half an ounce or more of olive oil: or a fomentation may be used, which generally succeeds, made of a decoction of poppy heads, in a pint of which let there be diffolved an ounce of crude fal ammoniae. If the inflammation does not yield to this management in four or five days at the most, the best method is to encourage a suppuration without delay. See Assessus MAMMÆ, &c. Bell's Surgery, vol. v. p. 396:

INFLAMMATIO OCULI. INFLAMMATION of the Eye. Sec OPHTHALMIA.

INFLAMMATIO HEPATIS. INFLAMMATION of the Liver. See HEPATITIS.

INFLAMMATION of the Fauces. See CYNANCHE.

It is not very easy to discern whether or no these parts are inflamed, except there is also some degree of swelling; the degree of redness in a natural state admits of little or no change in the colour in consequence of inflammation. But when there is really an inflammation, there is generally tumor enough to differn the true state of the parts. For the method of cure, fee ANGINA.

INFLAMMATIO CORDIS. INFLAMMATION of the Heart. See CARDITIS.

In this case the pulse is small, irregular, and intermit-tent; great anxiety attends; the patient frequently swoons; and if not speedily relieved by art, this disorder soon becomes fatal. The method of cure is the same as that in the peripneumonia, and pleuritis.

INFLAMMATIO INTESTINORUM. INFLAMMATION of the Intestines or Guts. See Enteritis.

It is the inflammation of the exterior coats of the intef-tines that is here treated of; it differs greatly from an inflammation of the inner villous coat, or mucous mem-brane, in which case there is either aphthæ, or a dysentery. See DYSENTERIA. According to the different parts of the inteffine in which the inflammation is feated, different names have been given, as iliaca passio, enteritis, &c. but in all the treatment is the fame.

If a fharp pain, with a fever and nausea, is above the navel, and below the stomach, the colon under the sto-

much is the feat of the inflammation. If the pain is in the right hypochondrium, under the fpurious ribs, then that part of the colon which joins the ilium may be inflamed. If the pain is in the middle of the belly about the navel, the final guts are affected.

The colon was a second of the vin. antim. as will cause it to operate upward and downward; then give the mistura cretae. Ph. Lond. and the decoction of calcined hartshorn for common drink:

Cooling laxative clysters should be given every two or

The cause may be, external cold, indurated fieces, heavy or hard bodies lying in the intestines, introsusceptions, adhefive stimulants, hernias, wounds, or any other

cause of internal inflammations.

The usual symptoms are, a shivering, and acute burning pain in the belly, which is fixed in the part where it was first perceived; sometimes it increases a little, and then remits, but most frequently it is continually the fame. Generally the whole belly is affected at the same time with spalmodic pain, which extend to the loins; and flatulencies are often troublesome. The pulse is small, hard, frequent, and often it becomes at last irregular and intermittent. There is a coldness in the extremities, also a fudden and great profitation of strength. Sometimes a watery diarrheea attends, but more frequently the muscular fibres of the inflamed part contract so strongly, that nothing can pass through, although a motion returns very frequently; sometimes the anus is so contracted that a fmall pipe can hardly be introduced. Flatulencies in the ftomach, fickness, violent reachings, and vomiting, fre-quently attend. The tongue is dry, thirst great, the urine often pale and obstructed, fometimes it is high coloured, and difcharged with heat and difficulty. The breathing is quick. The patient bends forwards, fre-quently comprefies his belly, because the abdominal museles are fpasmodically contracted; the face is flushed. At length a delirium comes on, and convulsions, by which the patient is destroyed.

Inflammation in the bowels frequently terminates in a mortification; in which case the pain goes off, and the patient appears to himself for a little relieved; his face grows pale, the under eyer-lid becomes livid; but the pulse continues frequent, small, and often irregular; the extremeties are cold, delirium and convulsions now come on, and cut the patient off. Just before he expires it often happens that he discharges very fetid stools.

If this diforder is left to nature, it fometimes kills in a few hours, and almost always before the end of three days; so that there is rarely a suppuration. But if an abfcess is formed, the pain abates, and is converted rather into a fense of distension, and irregular cold fits, with the other fymptoms of internal fuppuration, arife; the con-traction of the mufcular fibres of the intestines, the great frequency of the pulse, and other symptoms go off. When this abscess bursts, the patient swoons, and seems freed

from a fense of weight in the part where it was.

Inflammation in the external membrane of the intestines Thould be diftinguished from the stone in the kidneys, or in the ureters, from inflammation of the kidneys or other of the abdominal vifeera, from fpasmodic pains of the belly, and from other obstructions there, in which no inflammation attends; it should also be carefully diffinguished from the colic, the hæmorrhoids, and from the iliac

paffion.

If the pain shifts, the vomiting returns only at inter-vals, and while the clysters pass downwards there is hope. If the patient furvives three days, and the pain abates fuddenly, with chilness and shivering, a suppuration is forming, which in about fourteen days will break; then forming, which in about fourteen days will break; then if the patient becomes tablid, the only help is a palliative one for a fhort time. When all paffes upwards, the patient is very weak, the pulfe fluttering, the countenance pale, the breath offensive, then danger is very great. Clammy fweats, a small intermitting pulse, fetid or black stools, a total abatement of pain, are signs of mortification being begun, and then death soon follows.

On the first attack, bleed freely, notwithstanding the smallness of the pulse and seeming weakness, for the

fmallnefs of the pulfe and feeming weaknefs, for the pulse becomes fuller, and the proftration of strength goes off as the inflammation abates. Repeat the bleeding at thort intervals, until the pulfe becomes foft.

Acids should be joined with every draught of the patient's common drink.

The antimonial powder should be given in such doses as the stomach will easily retain, and a faline draught thould be repeated every hour or two.

If acrimony is a suspected cause, bleed, give a dose of

three hours, until a ftool is procured. It should be ob-ferved that though the fal marin. is the best purgative in general for clyfters, it is improper if any inflammation is supected in the bowels. But tobacco-smook may be injected, and repeated at short intervals, until the defired effect is obtained.

Purges are contra-indicated by the contraction of the inflamed part; though when all other means fail of obtaining a paffage, purges with opiates must be tried; the sal cath. amar. is the best, of which two ounces may be diffolved in fb i. of water, and given by two or three spoons full every half hour, and to prevent vomiting give the tinct. opii, gt. xxv. in aq. cinnam. vel aq. menth. pip. If no liquid ftays on the ftomach, give pills, fuch as the following: R Pulv. jalap. & kali vitriolat. 22 5 s. opii, gr. i. fapo Venet. q. f. f. pil. vi. ftatim fumend. If these do not operate in two or three hours, repeat them.

Immediately after bleeding apply a blifter on the pained part; it often causes both clysters, and purgatives taken

by the mouth, to pais downwards.

Put the patient into a warm bath; let him fit there, with the water as high as his breaft, as long he can with-out fainting; repeat it if required; but be careful that the water be not too hot. In bringing him from the bath great care is required to guard against the cold. If the bath cannot be had, the legs may be put into warm water, and bladders of warm water may be applied to the ball. and bladders of warm water may be applied to the belly, and the like may also be laid to the fect.

If the vomiting is severe, or to prevent a purging me-dicine from returning, opiates may be admitted, other-wise their use is not advisable until all other means fail, and then give the following: R Antimonii tartarifati, gr. † ad †, fyr. papav. albi, 3 ii. ad 3 vi. aq. menth. fat. 3 ii. m. f. hauft. See ILIACA PASSIO.

In case of an abscess, see Abscessus Intestinorum.
The crythematic inflammation of the guts may be treated as that of the flomach. See INFLAMMATIO VEN-TRICULI. Cullen's First Lines, vol. i. p. 372. edit. 4-Edinb. Med. Comment, vol. iii. p. 122.

#### INFLAMMATIO ARTICULI INFLAMMATION in a Joint.

The rheumatism is an instance of this kind, but no great danger is to be apprehended from it, as it is feated only in the ligaments. In this cafe bleeding, mild eathartics, fudorifies, and a prudent use of opiates, are bene-ficial; and if the joint is rigid, a warm bath will relieve

The danger of a suppuration in a joint is from the length of discharge, and the absorption of the matter, which rarely fails to bring on a statal hectic; therefore, by all means, if possible, let this accident be prevented.

INFLAMMATIO RENUM. INFLAMMATION in the Kidneys. See NEPHRITIS.

#### INFLAMMATIO MEDIASTINI. INFLAMMATION of the MEDIASTINUM.

The cause is the same as in the pleurify, and the symp-toms are also in many instances the same. The pain strikes obliquely from the sternum through the breast to the back; there is a difficulty of breathing, and cough, attended fometimes with a fpitting. These symptoms are not so violent as in a pleurity, nor is the pain on inspiration so much increased, or the instammatory diathesis so great. The cure is the fame as in a pleurify; but fuppu-ration is very difficultly avoided, and when it happens it is always fatal.

# Inflammatio Mesenterii. Inflammation in the Mesentery. See Peritonitis Mesenterica.

When the mesentery is inflamed, there is a languid flow fever, without any thirst or other violent symptom, a loss of appetite, a sense of tension, and weight below the stomach, without much hardness, and only discoverable by pressing upon it. This tension is without much pain, because the mesentery hath but a small degree of tensation. The stools are often chylous, and succeeded by a discharge of thin ichor, without any sense of pain, is a frequent cause, when the periosteum within the bone sometimes pure and unmixed, and sometimes mixed with is the seat of the disorder. the fæces. These symptoms are mild and gentle, if the melentery only is inflamed; but if the liver, spleen, or any of the intestines are also affected, they are more vio-

These inflammations generally terminate in abscesses, or bring on a corruption of the melentery; the morbific matter is also fometimes translated to other parts, without being removed from the habit; hence the diforder often recurs, and fo continues for years; in which case some-times the sever returns, and is sometimes changed into a

When the presence of this kind of inflammation can be discovered, the method of cure will be the same as that for an inflamed liver or fpleen.

INFLAMMATIO OMENTI. See PERITONITIS.

INFLAMMATIO MUSCUL. ABDOMINIS. INFLAMMATION of the Muscle of the Belly. See Myocolitis.

When these parts are inflamed, the skin over them is greatly stretched, so that it cannot be pinched up with the singers; and if they are swelled, the sigure of the respective muscle is preserved; the inflamed muscle is very hard, and more so as it tends to suppurate; there is generally more or lefs of fever; during any action of the difeafed mufcle the pain is confiderably augmented, as in case of sneezing, straining at stool, or even in breath-

The rheumatism is sometimes fixed in these muscles; they also fuffer from preffure, as when patients with a ftone in their bladder seek for relief by resting their weight upon their belly when it is placed upon fome hard body,

This complaint should be distinguished from a colic, an inflammation in the liver, or any of the subjacent vif-

If this kind of inflammation terminates in an abfects, and it is discharged inwardly, it proves fatal. And if any tendency to a mortification appears in these muscles, the iffue is to be dreaded.

If the hardness is considerable, and a throbbing pain is perceived, an abscess is forming, and should be encouraged with all speed, and if possible the discharge should be made outwardly. Heurnius observes that these muscles have so thick a membrane, that tumors there require opening, and if the opening is neglected, they fome-times turn to a ftony hardness. Hildanus says, these tumors should be opened more early than is usually in other instances, in order to a discharge outwardly being fecured.

As a suppuration is so dangerous, and at the best is so very difficulty managed, to remove the inflammation by the speediest methods, before a tendency to the forming of an abfeefs can be manifested, will necessarily appear to be the most eligible method. Bleeding, then, with purging, and such other means as are used in other in-stances of infiammation in the external parts, should be applied, and steadily purfued.

#### INFLAMMATIO OESOPHAGI. INFLAMMATION of the Oefopbagus.

This is fometimes a fymptom attending a quinfy. See ANGINA. Befides other general methods of cure for inflammations, wash the mouth frequently with the following, and let a little of it be gradually swallowed as often. R Albuminis ovi (bene conquafati ad liquorem aquofum 3 ii. aq. rofar. & fyr. moror. aa 3 i. nitri purificati, gr.

## Inflammatio Pericardii. Inflammation of the Pericardium. See Pericarditis.

The fymptoms are chiefly the fame as those that attend a pleurify, but the pain seems to be deeper seated, and is not so much increased upon inspiration. If a cure is at-tempted, proceed as in the pleurify.

### INFLAMMATIO PERIOSTEI. INFLAMMATION of the Periofteum.

Befides the other usual causes of inflammation in other parts of the body, the veneral disease and the scurvy are causes of inflammation in this part. The venereal poison

· 37 . .

The external periofteum, that is, the membrane which covers the bone, and feparates betwixt it and the flesh; or the internal periodeum, that is, the membrane which lines the cavities of the cylindrical bones, and which feparates betwixt them and the marrow contained in

When the external periosteum is inflamed, a deep-feated pain and heat is felt, and fometimes a pullation; and when the part is not covered with much flesh, the pain will be augmented by preffure; mulcular motion, how-ever, increases the pain. That the inner membrane is the feat of the inflammation, is suggested from the want of pain on preffure, or on moving the muscles of the respective part, by not perceiving any pullation; by receiving no relief from any position of the pained part; and, par-ticularly, by a sensation like the splitting of the bone from within outwardly.

Inflammations in both membranes of the bone proceed from the fame causes, produce the same effects with re-spect to the part of the bone they adhere to, and terminate in the fame manner, viz. in an ablects or a gangrene; but when the inner membrane is affected, and becomes gangrenous, the case is always destructive of the whole marrow and bone.

If inflammations of these kinds are not speedily removed, the bone will be injured, and the periosteum upon the injured part destroyed, and it cannot be renewed until the bone exfoliates, and is renewed, during which time the incumbent parts will be irritated by an acrid fanies, by which malignant and incurable ulcers are often pro-duced, efpecially if it happens where a large portion of flesh covers the bone, and hinders a fafe incition on the

In general the cure is, as in other inflammations; but the particular intention will be to carry the peccant matter outwards by fomentations and incitions. As a suppuration near the bone is to be dreaded, endeavours to draw the diforder to the external part must be attempted; if it cannot be discussed by bleeding, strong purges, &c.
To invite to the external parts, softening somentations and poultices may be applied; but if these methods fail, the only remaining one is to cut down through the fields to the bone if the part of the control of the part of

to the bone, if the part admits of it.

When an abicels begins to form itself, it is known, and treated, as in the article Assess of the Periosteum.

These cases generally end in amputation.

### INFLAMMATIO RECTI. INFLAMMATION of the Reflum.

It is rarely fo acute as that of any of the small inteltines; nor fo apt to produce smallness of the pulse, or coldness of the extremities, or to affect the stomach; nor is there fuch a stricture as to render the intestines impervious. The cure is the fame as in inflammation in any of the other intellines, except that purgatives are used with advantage, and laxatives ought always to be employed.

#### INFLAMMATIO SPLENIS. INFLAMMATION of the Spleens See SPLENITIS.

Lommius observes, that this disorder rarely happens; that when it does, there is a hard and a throbbing tumor, a pain in the left hypochondrium, a continual violent fever, extreme heat, unquenchable thirst, the tongue is covered with a blackish mucus, a total loss of appetite, with a difficult with a difficult, and, as it were, imperfect refpiration, like that of children when they fob through anger. Areteus further fays, that the pain attending inflammation in the spleen is not considerable. If the distemper be not accompanied by an ulcer, but continues for a long time, the patients have an aversion to food, are swollen, have a bad habit, and a disagreeable aspect, and have many round livid, hollow, foul, and incurable ulcers over the whole body, but especially on the legs, which entirely emaciate and kill the patients; but such as have only a small, hard, and feirrhous tumor, feel little or no pain, and confe-quently live longer. But if the diftemper overpowers the patient, a dropfy, a confumption, or a colliquation of the whole body, are the certain confequence.

The general methods of removing other violent inter-nal inflammations must be used in this case. If the inflammation can be discussed, the patient is fafe; but if a

INFLAMMATIO VENTRICULI. INFLAMMATION of the Stomach. See Gastritis.

Alfo called inflammatory colic.

It is produced from nearly the fame causes as the inflammation of the intestines, excepting introsusception, and hardened freces, and it is more liable to be excited

by acrid fubstances

Many of the symptoms of an inflammation in the intef-tines attend. When the stomach is inflamed, there is a pungent, fixed, burning pain in it, with a pulfation, dif-tention, and tumor; the mildest things that are swallowed increase this pain, and at the same time bring on ficknefs, vomiting, purging, or hiccoughing; there is a con-tinual unneatmets about the precordia, a difficulty of breathing and swallowing, a pain in sneezing, the pulse is fmall, quick, hard, and intermitting, the extremities are cold, there are clammy sweats and faintings. When a wound in the stomach is the cause, there is frequently little or no pain, although all the other fymptoms take place, and the patient is cut off.

Inflammation in the ftomach must be distinguished from a cardialgia, and from an inflammation in the convex part

This diforder is of the most acute kind, and unless the most powerful means of relief are immediately employed,

it proves fatal.

In general, the fame method of cure which is proposed when the intestines are inflamed, must be pursued in this. The principal difference is, in this internal malady medicines can rarely be administered, on account of the great irritability of the stomach.

Bleeding is almost the only dependence, and it must be freely used, notwithstanding the lowness of the pulse, and repeated till the pulse rises.

From the weakness of the patient, cordials may seem to be indicated, but they are extremely injurious in this

Whatever is given to drink should neither be cold nor hot, but gently warmed. Demulcents and emollients are the properest for the common drink, with small portions of nitre, or of the rob of currants.

Emollient clyfters, with nitre, should frequently be administered, and they should be injected in large quantities, that they may act as fomentations, and as nutri-

Blifter the region of the Romach, particularly over the

part aggrieved.

Gentle anodynes, fuch as folution of gum arabic, or spermaceti made into draughts, in each of which may be gr. x. of nitre, and from iii. to v. drops of tinct, opii. gr. x. of nitre, and from iii. to v. drops of tinct. opii. These may be repeated as often as seems necessary for moderating the pain, and checking the vomiting. But the violence of the symptoms should be first abated.

Bladders of hot water should be kept constantly upon the region of the stomach. The legs may frequently beput into warm water, and sinapisms may be applied to the feet.

the feet.

If acrid poilon, or an excels of eating was the cause, a gentle emetic may be ventured on, but on all other occa-tions avoid this kind of remedy.

In case of an abscess bursting, give the balf, capivi ver.
i. three times a day in a draught of milk, and let a milk

diet be enjoined.

The above is the phlegmonic inflammation, but the following, viz. the erythematic inflammation of the flomach, most frequently occurs. It often occurs without at first manifesting its presence, but sometimes it is evident by the affection of the stomach spreading into the cefophagus, and appearing in the pharynx, as well as on the whole internal jurface of the mouth. When, therefore, an erythematic inflammation affects the mouth and fauces, and when at the fame time there shall be in the stomach an unufual sensibility to all acrids, with a frequent vomiting, the stomach is affected with the same inflammation. Even when no inflammation appears in the sauces, yet, if a pain be selt in the stomach, if there be a want of appetite, an anxiety, frequent vomiting, an unufual fembility with respect to acrids, some thirst,

fuppuration, or any other kind of termination follows, and frequency of pulfe, we may suspect the presence of the consequence is stall sooner or later.

this disease in the stomach. Erythematic inflammation often spreads from place to place on the same surface; occasioning diarrhoca in the intestines, and vomiting in the ftomach.

In order to the cure, the treatment will vary according to the causes, &c. When an acrid matter taken in by the mouth is the cause, this is to be evacuated by large draughts of warm mild liquids: then some general demulcent should be employed; or if the nature of the acrimony, and its proper corrector be known, it should be administered. If symptoms of inflammation are manifest, according to their degree, let bleeding, bliftering on the region of the stomach, fomentations on the belly, and frequent emollient laxative glyfters be used. But as the affection often arises in putrid diseases, &c. so in these cases bleeding cannot be admitted; all that can be done in fuch circumstances, is to avoid irritation, and to throw into the ftomach as much of acids, and of acefcent aliments, as it can bear. See Cullen's First Lines, vol. i. p. 356, &c. ed. 4.

INFLAMMATIO FEMORIS. INFLAMMATION of the Thigh.

The fascia lata semoris, is followed by very unkindly suppurations; and whenever matter is formed under it, we should give it vent as foon as it is discovered.

INFLAMMATIO TESTIUM. INFLAMMATION of the Teflicles. See HERNIA HUMORALIS.

INFLAMMATIO VAGINE. INFLAMMATION of the Vagina.

This accident fometimes happens after delivery. It is occasioned by the head of the child being long retained in

the pelvis.

If the fwelling and inflammation is not very great, they are generally removed by the discharge of the lochia; but if the internal membrane of the vagina is inflamed, emollient injections must be thrown up from time to emollient injections must be thrown up from time to time, and a piece of prepared fponge should be introduc-ed, to prevent its coalescing. The sponge may be thus prepared: take a piece of a proper size for keeping the vagina open, when it is expanded; soak it in warm wa-ter; then roll it tight from end to end with a string; cut-off any irregularities, or hard lumps, and lay it to dry; when dry, take off the string; the sponge being them the firm in that form; anoint it with lard, and introduce it into the varing, the mojisture of which will introduce it into the vagina, the moifture of which will

If the pressure on this part was so long continued as to obstruct the circulation in it, a mortification will enfue, which may either be total or partial: if it is total, the which may either be total or partial: it it is total, the patient will die; if partial only, the mortified parts will-flough off. This may be known to be the cafe, if the woman complains of great pain after delivery, a fetid fmell, and a difcharge of fharp ichor at first from the vagina, then pus and matter. When this is the cafe, emollient fomentations may be thrown up from time to time; doffils of lint may be dipped in fome proper balfam, and applied to the parts to deterge and heal them; and when the floughs are all cast off, great care should be taken to prevent the vagina from growing together, either by intro-ducing doffils of lint, or pieces of fponge into it.

INFLAMMATIO UTERI. INFLAMMATION of the Womb.
See Hysteritis: called allo, Metritis.

Women after child-birth, when the lochia are impeded,

are the most frequent subjects of this complaint.

The causes, besides the common ones of internal inflammations in general, are tearing, bruiles, external fti-muli, obstructed menstrua, or obstructed lochia. It often happens after abortion, and child-birth, especially when the lochia are prevented by cold, or other caufe, and is then attended with fymptoms different from those which appear when an uterus not lately impregnated is in-flamed.

In the first case there is a pain at the bottom of the belly, which for the most part is neither throbbing nor constantly acute; the pulse is frequent, especially after child-birth, often small, sometimes irregular; in strong habits, and after early abortions, hard; the patient is affected with delirium, a subsultus tendinum, and the other

fymptoms of irritation; the womb gangrenes and mortifies, and the patient finks. In the fecond, the pain is more confiant, bounded, and throbbing; the pulfe is hard, full, and ftrong, and other fymptoms of general inflammation attend; or if the difeafe rifes to a greater height, the pulfe is small and frequent, the symptoms of irritation attend, and suppuration is more liable to

In both, as different parts of the womb are affected, there is a strangury, or a suppression of urine; the little that is discharged is settle and hot, or a tenesmus attends, with a pain in going to flool; or there is pain in moving the lower extremities, or fwelling, with heat, to be felt by introducing a finger up the vagina, the os tineæ being flut; univerfal reftleffinefs, thick urine, pain upon exter-nal preffure, the belly is tenfe, a red ftain extends up to the navel, and turns black when fatal; and if it happens in an impregnated uterus, an abortion follows.

It often happens that the woman can only lie on her back, and on turning to either fide, the feels a painful heavy mass fall to that side, and at the same time an ex-cessive pain in the loins, kidnies, and groin, of the oppofite fide. The pains excited by inflammation in the womb fometimes extend to the infide of the thighs when the woman turns on her fide, or it is felt in the loins.

This diforder may be removed by a fpontaneous eruption of the menfes, or of the lochia; or after an abortion or child-birth, by the patient's falling into a constant, equal, gentle, long-continued sweat; or it may terminate in an abscess, or a mortification, both which last are almost always satal. Sometimes a metastasis proves a means

Bleeding, however ufeful in most inflammatory diforders, in this particular one, though not wholly useless, yet if freely used only increases the weakness, without lessening the inflammation.

of relief.

When inflammation attacks a womb not lately impregnated, the common remedies used in internal inflammations are to be employed, regard being had to whether the attendants are an inflammatory diathelis, or the fymp-

In abortions and labours, where the patient hath not been much weakened, if the pulse is hard, and not very frequent, the loss of blood by the arm may be followed with advantage, but it rarely happens that this evacuation can be repeated; therefore, the general method of cure will always depend on relaxants, such as the pulv. antim. and haust. falin. taking care that they do not produce a purging. To thefe, as necessary, may be added, anodyne and antispasmodic fomentations and poultices. In delicate or feeble constitutions, after child-birth, and

where there is no hardness, but great frequency of the pulse, this disorder too often proves satal. All that can be done is to keep the patient in bed, moderately warm, exciting, if possible, a gentle constant sweat by farinaceous decoctions, in small quantities at a time, but frequently repeated, and applying somentations and poul-

Perspiration may be free; the other usual evacuations by urine and stool may be moderately promoted; but all

very extraordinary ones are dangerous.

Always guard against preffure on the affected part, whether from any thing external, from urine in the bladder, or from feeces in the rectum. Urine, if necessary, may be drawn off with the catheter, and the bowels may be emptied by repeated clysters, which should be wa-

Blifters generally quicken the pulse too much, and feem not so useful in this case as in some other local inflamma-

No diforder requires more care to keep the patient composed in mind, and still in bed.

Until the fever and fpaims abate, the stimulant aromatics and emmenagogues will be improper; indeed the lochia are rarely promoted by them at any time.

If pain continues, notwithstanding the usual treatment, opiates may fometimes be given with success, as is directed in an inflammation of the intestines.

If a suppuration comes on, endeavour to procure an exit to the pus as soon as possible, which when it points to the perincum may be sometimes managed.

For what hath been taught by the ancients, on the subject of inflammation, see in Fernelius; also Magenise on the same are removed.

When an ardent fever is attended with an inflammatory diathefis, or when actual inflammation affects any part during the presence of a fever the patient is faid to labour under one of an inflammatory kind; but according to the different parts on which the inflammation is feated; different denominations are given to the diforder, as when it is feated in the throat it is called angina, &c.

In strong constitutions it is produced by any of the causes by which sever may be excited. A predisposition in some particular part, is the general cause of a partial inflammation affecting the lungs of one, the pleura of another. other, &c. When a fever attacks where this predifpo-fition prevails, the irritation, which is the immediate cause of all inflammations, acts with most advantage, and there most readily produces its effects. In some instances the fever precedes the inflammation, in others the former is the consequence of the latter.

The causes of inflammatory fevers are, in general whatever are the usual causes of fever, and of inflamma-

tion feparately.

The fymptoms in the beginning are often flight, but they are foon followed by a violent hot fit, in which all the fymptoms indicating frength appear in a great degree, the whole fever being often entirely terminated by topical the whole fever being often entirely terminated by topical. inflammation, or an harmorrhage, leaving only the inflammation of an harmorrhage, leaving only the inflammatory diathelis; or in a few periods the patient is deftroyed by the strong action of the vessels immediately affeeting the brain, or depriving him entirely of fleep, and, in confequence of that, caufing delirium, violent convul-fions, and death. If none of these things happen in the second week, the strength diminishes, and the sever goes off with a perfect criss, or imperfect critical symptoms appear after each exacerbation; these becoming gradually less, the white crust on the tongue falls off, but some-times leaves little exculcerations behind. If a local inflammation begins with the fymptoms of the first stage of fever, and they remain after the pain hath arisen; when the inflammation is diminished by any natural or artificial means, it often happens that the sever continues, increases, and is attended with weakness until the patient

When a pleurify, or other partial inflammation, arises in the hot fit of a fever, it is preceded by horror and rigor, in the hot fit of a fever, it is preceded by horror and rigor, cold, quickness of the pulse, and several of the other symptoms of the first stage, these are followed by the symptoms of the next stage; together with those of the inflammatory diathesis; after which the pain, and other symptoms of the inflammation in the side, or part affected, take place; and the symptoms of the sirst stage of sever commonly leave the patient, those of the inflammatory diathesis continuing. Sometimes the symptoms of the sirst stage of sever are relieved. In this case anxiety about the precordia, transparent urine, particular even. about the precordia, transparent urine, particular even-ing paroxysms, &c. continue along with the inflamma-tions, produce a different progress and termination of the disease, and require a variety in the treatment.

The indications of cure are, first, to reduce the fever by bleeding in the beginning, and repeating it as requir-ed. Secondly, to remove the increased irritability of the affected part. And, thirdly, to promote the secretions

and excretions.

The diet should be chiefly boiled oats, or barley, or sub-acid fruits; the drink should be taken frequently in small quantities. It may confift of whey, barley-water, water acidulated with vinegar, or the jelly of currants, or other fuch like fruits. It may be drank warm or cold as is most agreeable to the patient. Half a dram of nitre may be disolved in every pint of liquor in which no acid juice is mixed.

Let the room be frequently filled with a pure cool air.

If the patient hath any firength, let him be made to fit up a quarter or half an hour in a day. This leffens the fever, head-ach, and delirium; but when a falutary fweat comes on, he may lay ftill. The sheets may be changed every two or three days, until all putrid or other morbid

when on the first bleeding, the blood is rather florid than fizy, and no relief follows it, the operation should cauti-oully be repeated. Purging also, and the same general treatment as in an ardent fever, is to be urged in those of the inflammatory kind.

If the blood is fizy, the fal or liquor c. c. and the

fal fuccin, purificati, may be repeated at proper intervals. Nitre with camphor are also particularly useful, or Clutton's febrifuge spirit may be given in every draught of the

To promote the fecretions and excretions, antimonial preparations are to be preferred. The first dose should be given in a sufficient quantity to excite a gentle puking: the next two or three doses should keep up a nausea; and small quantities of an opiate, such as the tinct opii, et. iii. ad vi. or a proper quantity of the elix. opii camph. fhould be added. These relax and moderate the irritation preternaturally excited in the constitution. In cases which do not well admit of bleeding, as foon as the heat is fo abated, that a diaphoretic may be admitted, the pulv. rad. contrayerv. may be mixed with spermaceti, and to these the sal c. c. may be added, from gr. xv. to  $\ni$  i. in each dose; though, if there is a very loose texture observed in the blood, acids, with warm cordials, are to be preferred.

After due evacuations by bleeding and purging, if the pain is confiderable, apply a blifter over the pained part, when the inflammation is local. In all kinds of inflammatory fevers, when the patient becomes languid, or, per-haps, comatofe in the advanced state of the disorder, blifters are one of the principal kind of helps; cordials, as

camphor, faffron, &c. may accompany them.

If when the fever is nearly gone, the delirium, for want of fleep, continues, the lystem being greatly weakened, after all other means of procuring sleep are tried in a live way formations by given with advantage. vain, opiates may fometimes be given with advantage.

Let the patient's mouth and throat be frequently wash-

ed; his hands and feet bathed in luke-warm water; and fomentations be applied to those parts where the greatest number of vessels lie exposed to the touch.

Sometimes, after the inflammatory diathefis is conquered, this kind of fever ends in a violent putrid one, in which case it is to be treated in the same manner as though a

putrid fever had attacked the patient at the first.

See Fordyce's Elements of Physic, part ii. Fordyce's Enq. into the Causes, &c. of putrid and instammatory

INFLATIO. So an emphysema is fometimes called. INFLUENZA. Whilft it was the general opinion of philosophers, that all things upon earth were governed by the heavens, physicians imputed the epidemical ca-tarrhous semipestilential fever to the influence of the From Sydenham upwards to Hippocrates, it was known and is mentioned by the name of febris catarrhalis epidemica: but Sydenham chiefly calls it tuffis epidemica. Since Sydenham's time it hath been variously named, but is

now generally known by the name of influenza.

Dr. Cullen places this, difeafe in his nofology, as a va-

riety of his catarrhus a contagio.

In the year 1673, Sydenham treated of the nature and cure of the putrid fever, by him called variolous fever; he found that this fever returned every fummer after-wards, and was fucceeded by the cholera morbus, and bilious fever, (by him called the new fever). In 1675, thefe fevers were attended by a new fymptom, viz. an uncommon degree of fluper, which frequently ended in a coma, and was for that reason by Sydenham called the comatous fever. In the beginning of November of the fame year, this fever was complicated with a cough, and was described by Sydenham pretty nearly as follows. "This fever proceeded in this manner during the au-

tumn, fornetimes feizing the head, at others the bowels, every where raging under the appearance of fymptoms peculiar to those parts, till the end of October; when the weather, which till now had continued in a manner as

For the most part, the cure depends in a great measure of this constitution usually succeeded these coughs, and on a due discharge of blood. The bleeding may be repeated in many instances to a third or fourth time; but its symptoms. For whereas some little time before, it attacked the head and bowels, now it chiefly feized the lungs and pleura, whence arose peripneumonic and pleuretic symptoms; though it was still precisely the same sever that began in July 1673, and continued without any alteration of its symptoms till the rise of these catarrhs.

"These catarrhs and coughs continued to the end of November, after which they abated, but the sever still re-mained the same as it was before the catarrhs appeared; though it was neither quite so epidemic, nor accompanied with quite the fame fymptoms, thefe depending accident-

ally upon the catarrhs.
"In 1675, the feafon having continued unufually warm, like fummer, till towards the end of October, and being fuddenly fucceeded by cold and moift weather, a cough be-came more frequent than I remember to have known it at any other time; for it scarce suffered any one to escapof whatever age or conflitution he were, and feized whole families at once; nor was it remarkable only for the numbers it attacked (for every winter abundance of perfons are afflicted with a cough), but also on account of the danger that attended it: for as the conflitution, both now and during the preceding autumn, eminently tended to produce the epidemic fever above deferibed, and as there was now no other epidemic existing, which by its opposition might in some measure, lessen its violence, the cough made way for, and readily changed into the fever. In the mean while, as the cough affished the constitution in producing the fever so the fever on this recovery. in producing the fever, so the fever on this account attacked the lungs and pleura, just as it had affected the head even the week preceding this cough; which fudden alteration of the fymptoms, occasioned some, for want of fufficient attention, to efteem this fever, an effential pleu-

rify or peripneumony, though it remained the fame as it had been during this conflitution, i. e. fince July 1673.

"For it began now as it always did, with a pain in the head, back, and fome of the limbs; which were the fymptoms of every fever of this conflitution, except only that the febrile matter, when it was copiously deposited in the lungs and pleura, through the violence of the cough, eccasioned such symptoms as belong to those parts. But, nevertheless, as far as I could observe, the sever was the nevertheless, as far as I could observe, the sever was the very same with that which prevailed to the day when this cough first appeared; and this likewise the remedies to which it readily yielded plainly shewed. And though the pungent pain of the side, the difficulty of breathing, the colour of the blood that was taken away, and the rest of the symptoms that are usual in a pleurisy, seemed to intimate that it was an essential pleurisy; yet, this disease required no other method of cure than that which agreed with the sever of this constitution, and did no ways adwith the fever of this constitution, and did no ways admit of that which was proper in the true pleurify, as will hereafter appear. Add to this, that when a pleurify is the original difease, it usually arises betwixt spring and summer; whereas the distemper we now treat of, begun at a very different season, and is only to be reckoned a symptom of the sever which was peculiar to the current

fymptom of the fever which was peculiar to the current year, and the effect of the accidental cough.

Now, in order to proceed in a proper manner to the particular method of cure, which experience, shews to be requifite both in this cough and in those which happen in other years, provided they proceed from the fame causes, it is to be observed that the effluvia which used to be expelled the mass of blood by insensible perspiration, are struck in, and thrown upon the lungs, from the sudden froppage of the pores by cold, by irritating the lungs, immediately raife a cough; and the hot and excrementious vapours of the blood being hereby prevented from paffing off by perspiration, a fever is easily raifed in the mass; namely, when either the vapours are so copious that the lungs are unable to expel them, or the inflammation is increased by the adventitious heat arising from the use of overheating remedies, or too hot a regimen, fo as fuddenly to cause a sever in a person who was already too much disposed to one. But of whatever kind the stationary every where raging under the appearance of lymptoms appearance to one. But of whatever kind the flationary peculiar to those parts, till the end of October; when the weather, which till now had continued in a manner as warm as summer, changed suddenly to cold and moist; whence catarrhs and coughs became more frequent than I remember to have known them in any other season. But cough, whence it arose. In every cough, therefore, protecting from this cause, it is sufficiently manifest that regard must be had not only to the cough, but likewise to cooling liquors. And I never found it necessary to bleed

the fever that fo readily fucceeds it.

Relying on this foundation, I endeavoured to relieve fuch as required my affiftance by the following method: if the cough had not yet caufed a fever, and other fymptoms, which, as we faid, ufually accompany it, I judged it fufficient to forbid the ufe of fleth meats, and all kinds of spirituous liquors, and advised moderate exercise, going into the air, and a draught of a cooling pectoral ptilan to be taken between whiles. These sew things sufficed to relieve the cough; and prevent the fever, and other to releve the cough; and prevent the fever, and other fymptoms ufually attending it. For as by abftaining from flesh and spirituous liquors, along with the use of cooling medicines, the blood was so cooled, as not easily to admit of a febrile impression, so by the use of exercise those hot effluvia of the blood, which struck in, and occation a cough as often as the pores are stopped by sudden cold, are commodiously exhaled in the natural and true way, to the relief of the nations.

way, to the relief of the patient.

"With respect to quieting the cough, it is to be observed that opiates, spirituous liquors, and heating medicines used for this purpose are equally unsafe; for the matter of the cough being entangled and stiffened thereby, those vapours which should pais off from the blood, in a gentle and gradual manner, by coughing, are retained in the mass, and raise a fever: and this frequently proves very fatal to abundance of the common people, who, whilst they unadvisedly endeavour to check the cough, by taking burnt brandy, and other hot liquors, occasion pleuritic or peripneumonic diforders; and by this irrational procedure render this difease dangerous, and often mortal, which of its own nature is slight, and easily curable. Neither do they err lefs, though they feem to act more reasonably, who endeavour to remove the cause of the difease by raising fweat; for, though we do not deny that fpontaneous fweats frequently prove more effectual than all other helps in expelling the morbific cause, yet it is apparent that whilst we attempt to force sweat, we in-flame the blood, and may possibly destroy the patient, whom we defire to cure.

"But it happens fometimes, not only when the difease
has been unskilfully treated, in the manner above deferibed, but also spontaneously, at the beginning of the illness, or in a day or two afterwards, especially in tender and weakly persons, that the cough is succeeded by al-ternate intervals of heat and cold, a pain in the head, back, and limbs, and fometimes a tendency to fweat, ef-pecially in the night; all which fymptoms generally fol-lowed the fever of this conflitution, as it were, of the lungs, which occasioned a difficulty of breathing, ftopped

the cough, and increased the fever.

" According to the best observation I could make, the According to the best observation I could make, the fever, and its most dangerous fymptoms, were best relieved by bleeding in the arm, applying a blifter to the neck, and giving a glyster every day. In the mean time, I advised the patient to fit up some hours every day, to forbear slesh meats, and sometimes to drink small beer, sometimes milk and water, and sometimes a cooling as the field abated not in the lenient ptifan. If the pain of the fide abated not in two or three days, but continued very violent, I bled a fecond time, and advised the continuance of the glysters. But with respect to glysters, it must be carefully observed, ei-ther in this or other severs, that they are not to be long and frequently used when the disease is in its decline; efpecially in hylteric women, and in men that are subject to the hypochondriac disease; for the blood and juices of fuch persons are easily changed, and soon agitated and beated; whence the animal economy is disturbed, and the sebrile symptoms continued beyond the usual time.

"But to return, to our fubject; whilft by this means we allowed time that the blood might gradually free itfelf from those hot particles that were lodged in the pleura and lungs, all the symptoms usually went off in a gentle manner; whereas, when the difease was treated in a rough way, by giving abundance of remedies, it either destroyed the patient, or rendered it necessary to repeat bleeding oftener than the disease required, or would safely bear, in order to fave his life. For though repeated bleeding an-fwers every purpose in the true pleurity, and is alone suf-ficient for the cure thereof, provided there be no hin-drance from a hot regimen and heating medicines; yet, here, on the contrary, it sufficed to bleed once, or at most twice, in case the patient refrained from bed, and drank

more frequently, unlefs the fymptoms relating to the pleura and lungs were much increased by some adventitious heat, and even in this case the practice was not wholly

void of danger.

" Upon this occasion, I shall briefly deliver my fentiments with respect to a very trite and common opinion, viz-that a pleurify is found to be of so malignant a nature in fome years, that it will not then bear bleeding, at least not fo often as this diftemper ordinarily demands. Now, though I conceive that a true and effectial pleurify, which, as shall hereafter be observed, happens indifferently in all constitutions, does in all years equally indicate repeated bleeding; yet, it fometimes happens that the peculiar epidemic fever of the year, from fudden alteration of the manifest qualities of the air, readily throws off the morbid matter upon the pleura and lungs, while the fever notwithstanding continues exactly the same. Wherefore, in this case of the same that the same was the in this case, though bleeding may be used to abate this fymptom when it is very violent, yet, generally speaking, little more blood ought to be taken away than is required by the sever whereon this symptom depends; for if the fever be of a kind that will bear frequent bleeding, it may likewife be repeated in the pleurify, which is a fymptom thereof: but if the fever will not bear repeated bleeding, it will be prejudicial in the pleurify, which will go off with, or laft as long as the fever does. And in my judgment this was the cafe in the fymptomatic pleurify that accompanied the fever which prevailed here at the time the cough began, namely in winter 1675; and, therefore, I must observe, that whoever, in the cure of fevers, harh not always in view the constitution of the year, inafmuch as it tends to produce fome particular epidemie difease, and likewise to reduce all the contemporary diseases to its form and likeness, proceeds in an uncertain and fallacious way.

"In the month of November of the above mentioned

year, I attended the eldeft fon of fir Francis Wyndham in this fever. He complained of a pain in his fide, and the other fymptoms that attended those who had this dis-ease. I bled him but once, applied a blister to his neck, injected glyfters every day, gave him cooling ptifans and emulfions, and fometimes milk and water, or fmall beer, to drink; and advised his fitting up a few hours every day; and by this method he recovered in a few days, and

a purge completed the cure.
"But it must be remarked, that though these were the fymptoms which fucceeded the cough, during this winter, yet the cough, unattended with these fymptoms, was more prevalent at the same time. But this required neither bleeding nor glysters, provided a sever was not oc-

ther bleeding nor glyfters, provided a fever was not oc-casioned by a hot regimen, or heating medicines; it suf-sized to allow the benefit of the open air, and to forbid the use of slesh, wine, and such spirituous liquors which are apt to cause a sever." Wallis's Sydenham.

In the month of July, 1775, the putrid sever came on; was succeeded by the cholera morbus in August, and the bilious sever in September, as usual; this bilious sever, however, was attended with a degree of super, which went off with the other symptoms when properly treated; but was easily turned into a coma, when improperly treated at any period of the disease. See Dr. Grant's Ac-count of the Epidemic Cough and Fever, 1776, from Sydenham.

Sydenham.

This subject hath engaged the attention of many since the year 1775; and in 1782, Dr. J. C. Smyth gave his observations of this disorder, in the first volume of Medical Communications, p. 71. &c. the fubstance of which

is as follow.

The late influenza was very generally accompanied not only with the ufual catarrhal fymptoms, but with others no lefs diffressing to the patient, and which were still more alarming to the physician; such as great languor, lowered, and convession at the precording and convession and convession are the precording. lowness, and oppression at the precordia; anxiety, with frequent fighing, fickness, and violent head-ach. The pulle was uncommonly quick and irregular, and the fick were frequently delirious, especially in the night. The heat of the body was seldom considerable, particularly when compared with the violence of the other symptoms; the skin was moift, with a tendency to profuse fweating; the tongue white or yellowish, but moist. Some per-fons complained of severe muscular pains either general or local, others had eryfipelatous patches or efflorescences

on different parts of the body, which in one instance terminated in gangrene and death. I observed petechie but times ended in a malignant fever of difficult treatment, once, and then only two days before death. Those attacked with the influenza were in general taken fuddenly ill, and the fymptoms in the beginning, or for the first twenty-four or forty-eight hours were extremely violent, bearing no proportion either to the danger or duration of the diftemper. Children and old people either escaped entirely, or were affected in a flighter manner. Women with child, when seized with the disease, were apt to misearry; or if far advanced in their pregnancy, to be deli-vered before their time; in either cafe the hæmorrhagy was confiderable, and feveral died. Patients fubject to pulmonic complaints, fuffered much from the cough, difficult breathing, and other peripneumonic fymptoms, and to them also the disease proved dangerous or fatal.

The head-ach which accompanied the influenza may be

diftinguished into three kinds.

1st. The uneafy weight, foreness, and distension, of the forehead, usual in common colds. 2dly. The violent sick head-ach, arising from the affec-

tion of the stomach, and relieved by vomiting.

3dly. The head-ach, during which the patients com-plained of a fenfation as if their head was splitting, with a severe shooting pain at the vertex: this last head-ach was most usual in peripneumonic cases, and seemed chiefly occasioned by the violence of the cough. The fever began with irregular chilliness, had consi-

derable exacerbations and remiffions, and was always greatly increased towards night; but even then the heat of the body and thirst were seldom so great as might have been expected, and the accessions of sever were chiefly marked by the increased quickness of pulse and delirium. The frequency of the pulse was greater than is common in fevers; (it was often 120, even in the remiffions of fever, in the accellions 140, and fometimes fo frequent, that it was impossible to reckon it; in many instances it was irregular and intermitting;) nor do I remember to have felt so frequent, and at the same time so irregular a pulse, (the irregularity of the pulse is in a great measure characteristic of malignant contagious fevers,) in any fever attended with fo little danger, and of fo fpeedy and eafy a termination; the violence of this being commonly over in twenty-four or forty-eight hours. Many, from the beginning, were delirious in the night-time, and during the exacerbation of fever, who were perfectly recollected and diftinct in the day and during the remiffions; but even where the delirium continued, it was not a conftant one, as the fick knew those who spoke to them, would answer some questions distinctly, and a few minutes after wards talk incoherently; a fixed stare of the eyes at the time, and a kind of wildness in the countenance, were also very expressive of this state or condi-tion. The delirium which we have just now described, though unnoticed (so far as I know) by any practical wri-ter, is not unusual in the putrid sever, and differs as ma-terially from the low delirium incident to the last stage. of that difease, as it does from the phrenetic delirium of the febris ardens, or of any inflammatory fever. During the whole of the influenza, I met only one instance of true phrenetic delirium, and it may not be foreign to the purpose to remark, that it happened to a patient who had been three times bled, had fwallowed no heating cordials, and who was taken every day out of bed, conformable to the judicious practice of Sydenham (vid. De Febre comatofa), exprefsly with the intention of preventing this termination of the difease. Respecting the danger of the influenza, physicians, I find, have entertained somewhat opposite opinions; possibly owing to the difference of place and fituation. In London, although the diffemper doubtless proved fatal to many, yet it could hardly be accounted a dangerous one, if the number who died be compared with the prodigious number of those who recovered.

The late influenza might very properly have been named the iweating-ficknefs, as fweating was the natural and fpontaneous folution of it, and reft, abstinence, and warm diluents, were, in most instances, all that were necessary for the cure; yet, amidst such an amazing number and variety of cases, many occurred which required some further medical assistance, and when that became necessary, it was of the utmost importance that it should be procured early; for the disease, when necessary it should be procured early: for the difease, when neg-

tendency to profuse sweating often continued, it now only weakened the patient, and a critical or falutary folution of the difease, in consequence of this evacuation, was no longer to be expected; nor do I recollect a single example of profuse sweating being attended with any ad-vantage after the first forty-eight hours.

The medicines which I found most serviceable in abat-

ing or carrying off the fever were finall doses of an antimonial powder, composed chiefly of tartar, emet, the julep e camphora, with about a fourth part of the spt. Mindereri; the common faline draught, with ten or fifteen grains of the pulv. contrayerv. c. or, what I commonly preferred, from twenty to forty drops of the liquor anod min. Hoffmanni, adding occasionally, a small quantity of

the paregoric elixir.

In cases of great lowness, besides the drinks and nou-rishment usual in fevers, I allowed the sick white-wine

whey, wine and water, and weak real broth.

For removing the oppression at the precordia, sickness, and head-ach, no means were fo certain as vomiting with tart. emet. en lavage, i. e. giving it in finall dofes, largely diluted, and repeated every ten or fifteen minutes, until it produces the defired operation. This medicine administered in this manner, had also a very remarkable effect in bringing on a remission of the febrile symptoms, and in accelerating the termination of the difeate. It likewife commonly opened the body; when that was not

the case, some gentle laxative was given.

The cough required not only plentiful warm dilution, but opiates and blifters were also very necessary; and where the fick were attacked with stitches, or acute pains, about the cheft, with difficult or laborious breathing, and other peripneumonic fymptoms, the propriety of bleeding was, in my opinion, clearly and evidently pointed out; nor can I think any physician justifiable in neglecting the use of the lancet under such circumstances. At the fame time, I am ready to acknowledge, that bleeding, though necessary to obviate the fatal confequence of a particular fymptom, was by no means conducive to the general cure of the difeate; that, on the contrary, the lowness and dejection were often increased by it; that the blood taken away had not always an inflammatory appearance, but was fometimes florid, and the craffamentum tender; that the relief afforded by bleeding was neither fo confiderable, nor fo certain as in other fimiliar cases of peripneumony; and that in the course of the difcates of peripheumony; and that in the course of the chaese afe there frequently appeared unequivocal figns of a putrid tendency. But admitting the whole of these facts, and granting that they ought to make a physician cautious of taking away blood so freely, perhaps, as he otherwise would do, and as the urgency of the symptoms might seem to justify, yet they surely do not lead to an entire prohibition of the use of the lancet, at least in those cases where there was evidently no alternative, and where, although the effects of bleeding might be doubtful, the although the effects of bleeding might be doubtful, the confequence of omitting it was certain. Upon fuch occasions, the advice of Celfus is the voice of reason, "Satius est enim anceps auxilium experiri quam nul-"Satius eft enim anceps auxilium experiri quam nul-lum." Befides bleeding, blifters applied as near as pof-fible to the parts affected were here, as in fimilar cafes, of very effential fervice, in removing the flitches in the fide, and in relieving the difficulty of breathing, fo that we may juftly apply to them what an eminent author faid of the Peruvian bark, that he found it most fervice-able where it was most wanted; for in cases purely in-flammatory, where bleeding of itself will commonly do every thing, blifters are lefs necessary; but in those of a mixed nature, where the affiftance of blifters is more im-mediately required, the relief afforded by them is in genemediately required, the relief afforded by them is in general more certain.

Some may think it strange that amongst the remedies employed in the treatment of this disease, I have made no mention of oily medicines, fuch as emulions, line-tuffes, &c. nor of the Peruvian bark. In regard to oily medicines, I have often observed, that the advantage derived from them in cases of catarrh, attended with heat and fever, was extremely equivocal; and that wherever there were naufea, opprellion, and uneafinefeat the flomach, with a bitter tafte in the mouth, and nidorous crucksto frequently occurred in the influenza, I thought it fa-

fest to omit their use entirely.

As to the bark, I shall only remark, that in the influence, the cough, affection of the breathing, and oppression, at the precordia, where they occurred, were to me fufficient reasons for not employing it; and that even where these symptoms were not present, and in cases where the great lowners, and apparent putrid tendency, feemed not only to justify, but even to demand the use of the bark, I never was so fortunate as to see one single inflance where it produced any fentible good effect, either in moderating the fever, supporting the strength, checking the disposition to gangrene, or in preventing

the fatal cataltrophe that enfued.

When the fever, and other immediately alarming fymptoms of the influenza had ceased; there frequently remained a teafing cough; and convalescents in general complained of languor, want of appetite, and that their fleep was interrupted and unrefreshing. For removing these complaints, and completing the recovery of the patients, change of air, and riding on horseback, were the most effectual remedies; and to some they were absolutely neceffary. A milk diet was recommended where the cough was obstinate; but I did not find it either necessary or of advantage to enjoin so strict an antiphlogistic regimen as is usually done in similar complaints. Neither do I know of any instance where the cough terminated in a phthisis pulmonalis, and I am much inclined to believe that this fatal termination was much less frequent after the infinenza than after a common cold: For the lowness and want of appetite, chalybeate waters, especially when drauk at the spring, were of singular services. I also frequently prescribed, and I think with advantage, the clix. vitr. cum liquor. anod. Hoffmanni, taken to the quantity of thirty or forty drops in a bitter infusion, or in a decoction of the bark.

In this short account of the late influenza, I have offered no conjecture with regard to the original cause of the diftemper, or the manner in which it was propagated. I apprehend, from the present state of our knowledge, that we can hardly venture to say even what it is not; still less to assum, with any probability,

what it is:

See alfo, Observations on the Influenza by A. Broughton, M. D. A description of the Influenza by R. Hamilton, M. D. Dr. Fothergill's Works by Dr. Lettsom, 4to. p. 615, &c. Medical Observations and Inqueries,

to. p. 015, &c. Medical Observations and Inducries, rol. vi. p. 340, &c. Medical Transactions, vol. iii. p. 54, &c. Medical Communications, vol. i. p. 1, &c. Edinbs Medical Commentaries, vol. ix. p. 393, &c. INFRA SCAPULARIS, Musc. from infra, below, and fcapula, the shoulder-blade; also called infraspinatus, superscapellaris inferior, or subscapularis. It rises from the surface of the bone on its outside, as far as the basis of the fcapula, runs over the the capsular ligament, and is inferted into the outer tuberosity of the os humers, carrying ferted into the outer tuberofity of the os humeri, carrying the arm round, and partly railing it, being the reverse of

the fupra spinatus.

INFRA SPINATUS. See INFRA SCAPULARIS.

INFUNDIBULUM, from infunds, to pour in. It is called choana, chome. Between the basis of the anterior pillars of the fornix, and the anterior part of the union of the optic thalami, lies a cavity named infundibulum. It runs down towards the basis of the cerebrum, contracting gradually, and terminating in the glandula pituitaria. It also communicates with the lateral ventricles. Likewise it is a name of the pelvis of the kidneys. So the Latins

INFUSIO, from infundo, to pour in. INFUSION. It fignifies either the action of infufing any ingredient in a proper fluid, or the medicine prepared by his action.

By infusion in water, the gummy and faline parts of vegetables are extracted; and by the intervention of the gummy part, the refinous is also taken up by the same menstruum, so are the oily; so that in many instances the

tions, they did more harm than good; as these symptoms careous earth, but it hath no action on any other kind of earthy matter.

In making infusions, whether the water is cold or hot, the ingredients are only freeped in it, without boiling. It is the fame whether proof spirit, rectified spirit, urine, or whatever elfe is the menstruum.

In nervous diforders, infusions are best made in a vinous or a spirituous menstruum. Stomachic infusions should be moderately spirituous. Cathartic ones, whether saline or resinous, if for extemporaneous use, are best

made with hot water in the manner of tea.

Infusions should not be so fated with the ingredients as to make the medicine unpalatable: though where fetid fimples are required, this cannot be attended to.

Such infusions as are refinous should be given in wines so should all those that turn milky when mixed with water. Bitters in wine should be given before and after dinner, for then they affect the head less.

Many infusions are most agreeable when made with cold water; and they are stronger thus than when heat is used, as is instanced in the bark, camomile slowers, &c.

This mode in common is conveying different fubstances into the machine by impregnation, a watery menstruum with their most active parts. Variety of which will be found under the names of the fubitances used, as infusium allii. See Allium, &c.

INFUSIO. See TRANSFUSIO.

INFUSIOM. An INFUSION. Sometimes it means a elyfter, or an injection.

INGA. Ray takes notice of four trees of this name, but no medicinal properties are noticed.
INGRAVIDATIO. See IMPREGNATIO.

INGUEN. The GROIN. The two groins are the lateral divisions of the hypogastric region.

INGUINALIS. STARWORT. There are many speeies of this plant, but we have not many of them in England: nor are they remarkable for any medical quality. It is also called after atticut, afterifcus annuus, chryfanthe-

mum, conozoides, and golden starwort: These, with two or three others we have in England, are ornaments in the garden. There is also an aftersides, or baftard ftar-wort, and is likewife a name for the eryngium.

INHAMÆ ORIENTALE. POTATOES. Sec BAT-

TATAS HYSPANICA.

INHAME. See CARA BRASILIENSIBUS.

INHUMATIO. In chemistry, it is a method of digefting, by burying in horfe-dung, the veffel which

Contains the ingredients to be digested.

INIMBOIA, or INIMBAY. See BONDUCH INDORUM.

INION. The OCCIPUT. Blancard fays it is the beginning of the spinal marrow; others fay it the back part

INJACULATIO. So Helmont calls a diforder which confifts of a violent spasmodic pain in the stomach, and an immobility of the body.

INJECTIO. An INJECTION. Liquors to be used by way of injection, are contrived for the more immediate application to the part affected, and are adapted to the most latent cavities of the body. They should always be used whilst lukewarm. They may be applied either

by a fyringe or clyfter-pipe.

When injections are used in cases of gleets or gonor-rhoeas, Dr. Swediar advises that the fyringe used should have a short, but wide pipe, just as large that its orifice goes into the orifice of the urethra, and the pillon to go close to the sides of the tube. If the whole pipe of the syringe be much smaller than the orifice of the urethra, it is attended with two difadvantages: first, with a fmall pipe, if it is not perfectly fmooth, the patient easily wounds the inside of the urethra, thereby rendering himfelf liable to an ulceration of the part, and confequent abforption of the poison. Secondly, the liquid injected, in-flead of going into the cavity of the urethra, will, in proportion as the patient prefies the piston, run out side-ways, through the orifice of the urethra. If the pi-fton itself does not apply closely to the sides of the syringe, even if the pipe is sufficiently large, so that it perfectly closes the orifice of the urethra, the liquor will still gur-gitate between the piston and the syringe, instead of going into the urethra, and thus the patient was imagine that whole virtue of a plant, &c. is obtained. In general, water takes up more by infusion from dry herbs than from fresh ones, particularly the newly dried ones. From animal substances, water extracts the gelatinous and nutritious parts; whence glues, jellies, and broths, are obtained; and along with these it takes up principles of more activity. Water also dissolves some portion of cal-5 U

original feat of gonorrheeas, viz. just under the free-num, the patient should, with one hand, compress the urethra at the first curvature of the penis, where the fcrotum begins, while he holds and manages the fyringe with the fingers of the other. The piston, which should always go close and easy, ought then to be pressed softly and slowly, till he seels the urethra gently dilated, and thus keep the liquid injetted for a minute or two in the urethra, repeating the fame operation three or four times. By a rash or longer continued pressure of the piston, the irritation produced thereby in the urethra often does more harm than the injection does good. By attending to these directions, a double advan-tage is obtained. The liquid is properly applied to the part affected, at the fame time that no danger is incurred of driving some of the venereal poison lower down the urethra along with the injected liquid; but this precaution is unnecessary, if the seat of the disorder is lower down. With respect to the liquid itself, it should always, in cases of virulent gonorrhoea, be made lukewarm; but in gleets this is not necessary. In gonorrhoeas, if the liquid is too cold or too warm, it may easily hurt the patient, either by the retropulsion of the matter, or increasing the inflammation. In all cases before an injection is applied, the patient fhould attempt to make water.

Another observation deserves attention; viz. many who labour under gleets, after having for fome time made use of injections, and finding themselves much better, will grow careless in the application, and even sometimes neg-lest the injection altogether for a day, or half a day. The confequence of this is fometimes difagreeable: many instances have occurred in which, by neglecting to use the injection for a single day, the discharge has been greatly augmented, as if it had been a fresh gleet; and the relapse being more obstinate than the original disease, the patients have been obliged to continue the injections for more weeks than, perhaps, it would have required days to cure the diftemper, had they continued the use of them without interruption. In general, to prevent all danger of a relapfe, it is proper to apply the injections three, four, or, according to circumstances, fix times a day during the disease, and to continue the same regularly for ten or

In anatomy great improvement hath been made by means of injections. Ruyfch was the first who was eminent in their use. Rieger published Ruyfch's method. The properties required in the injecting matter, are, 1st, fluidity; but this alone is not sufficient, they must likewife, 2dly, grow stiff when cold, yet not so stiff but that they may remain tough and flexible; for were they too hard, the smaller vessels would always be in danger of being broke. The following poffers these properties.

### Fine Injection. By Dr. Nicholls.

Take hard white Spanish varnish, and hard brown Spanish varnish, of each equal parts; turpentine varnish, and vermilion, of each a sufficient quantity. Mix them.

### Coarfe Injection. By Dr. Nichells.

Take of yellow refin two pounds; of yellow wax one pound; of turpentine varnish a fusficient quantity.

These injections may be coloured with vermilion, indigo, blue, or with verdigrife. Whatever colouring matter is used, it must be ground extremely fine.

The fine injections, when used, should be as warm as they can be borne by one's finger if dipped therein. The coarfer fort should nearly boil.

The subject to be injected, after having their vessels

cleared of their contents, by fqueezing out the juices, should be made warm, by being steeped in warm water.

A fectus may be injected by the umbilicus; a child by the aorta ascendens from the left ventricle; an adult may be injected in the same manner as a child. injected in the fame manner as a child. Injection by the aorta does little more than fill the arteries: but by the umbilicus of a foctus, both arteries and veins are filled. When the arteries in the cornea are filled, the injection fhould not be pushed any longer. As foon as the injection is finished, put the subject into cold water that it may cool fuddenly.

the urethra; fo that by the conic form of its pipe, all paffage may be denied to the liquid betwixt it and the fides of the urethra. If the diforder lies in the usual more emptied than by any other method. When put into warm water, it may continue thirty-fix or forty-eight hours, the water being kept as hot as one can bear a hand

> To dry a preparation, hang it where a current of air can pass free, but guard it from dust; when dry, let it be well varnished. The shining varnish may be laid on it, with a brush. Whilst it is drying, if maggots appear, dab the part with hydrargyrus muriatus, dissolved in sp.

Acidum muriatum, or nitrofum, diluted, are the best for macerating injected preparations in. The rectified spirit of malt is the best for preserving

these preparations, or any anatomical preparations.

INNOMINATA ARTERIA. It is the external branch of the external iliac artery at its division about the hole in the ligamentum Poupartii. It ascends outwardly to the inside of the spine of the ilium. It is lost in the muscle of the belly, and it sends branches to the ilius

- CAVITAS. See AURICULA.

- GLANDULA. See CARUNCULA LACHRYMAand LACHRYMALIS GLANDULA.

INNOMINATI NERVI. A name of the fifth pair of nerves. See TRIGEMINI NERVI.
INNOMNATUM, Os. Os Ilii. So called because

it has no proper name, called also сожи effa. INNUTRITIO. See Аткорита.

INOCULATIO. See VARIOLE.

INOSCULATIO, from in and ofculum, a little mouth or orifice. See ANASTOMOSIS.

INPINGUEDO PORCI. The herb costus. INSANIA. DELIRIUM, OF MADNESS.

INSECTUM. An INSECT. These animals are thus named from their being marked, or diftinguished, by va-riety of parts, separated as it were by incisions. INSESSIO. INSESSION. A fitting over relaxing va-

pours; also a femicupium.

INSIDENTIA. See Epistasis.
INSIDIANS. Insidious, latent. It is an epithet of discases, which betray no evident symptom, but are ready on any provocation to break forth, as it were, by fur-

INSIPIDUS. See APRUM. TASTELESS. Galen fays that insipid substances nourishes more than acrimonious or bitter ones.

INSPIENTIA. A low degree of delirium.
INSOLATIO. INSOLATION. An exposing any thing to the sun. The disease thus named is the same with

INSOMNIUM. A DREAM. Lommius observes, that if dreams are different from what may be expected from the business of the day, they indicate some indisposition of

body. Hippocrates writ a book expressly on this subject.
INSPIRATIO. INSPIRATION. It is when the air is drawn into the lungs.

INSTILLATIO. It fometimes imports the fame as embrocatio.

INSTITA. A FILLET. Also a flat worm in the in-

INSUFFLATIO. INSUFFLATION. The blowing into any cavity, in order thereby to convey any thing medici-

nal to a part affected.

INSULTUS. The first invasion or access of a paro-

INTERGASTRUM. A term used by Paracelfus, which fignifies the decuffation of the optic nerves.

INTEGUMENTA. INTEGUMENTS. Thefe are the

cuticle, rete mucofum, cutis, and membrana cellularis.
INTEMPERANTIA. INTEMPERANCE. Befides its

ufual fignification respecting food, it sometimes is the fame as DYSCINESIA.

INTEMPERIES. See Dyscinesia.

INTENTIO. INTENTION. It is either extention or

INTERCEPTIO. See APOLEPSIS.
INTERCOSTALES ARTERIÆ. These come in pairs from the aorta, and run on the lower parts of each rib. There are eight, nine, or ten of thefe. The two or three upper come from the fubelavian. The intercostales The younger the subject the farther the matter will of the fuperior go to the muscles of the belly.

INTER-

The intercostal musculi, called also mesopleuries. The intercostal muscules. They are eleven in number on each side externally, and the same number are again on each side internally; so that in all there are some forty-four. The external ones pass downwards and forty-four the external ones pass downwards and forty-four. The external ones pass downwards and forty-four the external ones pass downwards are the external ones pass downwards and forty-four the forty-four. The external ones pais downwards and forwards; they rife from the edge of the superior, and are inserted into the edge of the insertion rib; their fibres run nearly parallel. Near the sternum they disappear. The internal ones are the reverse of the external, therefore they decussate each other. They depress the ribs.

— NERVI. The INTERCOSTAL NERVES, called also superior nervi majores. They are formed of some of the dorsal and indeed of all the spinal nerves, also of branches from the listh and fixth pairs from the brain.

branches from the fifth and fixth pairs from the brain.

They run on the other fide of the ribs.

VEN #. See Azygos.

INTERCURRENS FEBRIS. An INTERCURRENT FEVER. Some fevers are epidemical in certain feafons only, and indeed only prevail in fuch feafons; other fevers happen in all years, and indeed are fometimes epide-mic. Those which happen only in certain seasons are called flationary; but others are called by Sydenham intercurrents. See Sydenham's Works.

INTERCURRENS vel INTERCIDENS PULSUS. When between two strokes, at proper distances, a third

INTERCUS, from inter, between, and cutem, the fkin. See ANASARCA

INTERDENTIUM. The intervals between teeth of the fame order.

INTERDIGITUM. A CORN betwirt the toes.
INTERFŒMINEUM, from inter, between, and feur, the infide of the thigh. The PERINÆUM.

mur, the infide of the thigh. The PERINAUM.

INTERLUNIUS MORBUS. See EPILEPSIA.

INTERMISSIO. The intervals betwirt two fits of

any distemper.
INTERMITTENS FEBRIS. An INTERMITTENT FEVER. It is when the fever quits the patient for a time and then returns. When the cold fit is violent, or continues long, or is a principal part of the diforder, it is called an ague. With respect to the time of the fits returning, different names are given to this fever; e. g. quotidian, which is when the fit returns every day; tertian, when it returns every other day; and quartan, when the fit at-tends on the first and fourth day, the two intervening ones being free. Those are called autumnal which begin in August, and those vernal which begin in February.

gin in August, and those vernal which begin in February.

One species partakes very much of the nature of an ardent fever; it prevails in cold dry springs, from the same reason as pleurises and peripneumonies do. Another species, which is frequent in moist seasons and in marshy countries, has for a principal cause, a defect of vital heat, and an impoverished state of the blood. A third fort is caused by infectious effluvia. When any of these causes attend, an invariant or improved diet, disturbed passions, crudities an irregular or improper diet, difturbed passions, crudities in the primæ viæ, &c. may more readily prove the remote

The figns are, at the onfet and in the cold fit, heavinefs, a pain in the head and limbs, pain in the loins, paleness in the face, chillness in the extremities, yawning, stretching, and violent shaking, small flow pulse, thirst, retching, sometimes vomiting a bilious matter; and, in the hot fit, a heat of the whole body, redness, distention of the skin, a quick strong pulse, watchfulness, short breath, raving, high-coloured urine without a sediment, &c. These symptoms abate by degrees, and an univerfal sweat appears, which foon terminates this fit; this generally continues 10, 12, or 20 hours. The patient is indisposed the following day; he is chill and apt to shiver, hath a weak and slow pulse, his urine is thick and pale, and either deposits a fediment, or contains a small cloud suspended therein; the sediment is of a reddish colour, exactly referrebles think his day. fembling brick-dust; the urine is often frothy too, and there is generally a pellicle or very thin filmy ikin on the top of the urine, which also adheres to the fides of the glass that contains it: this last observation on the urine peculiarly characterifes the feveral species of intermittents. In the beginning of autumnal intermittents, they are sometimes not easily distinguished from continual severs. When weakly perfons are the fubjects, the intermissions are pro-portionably less distinct.

Obstinate intermittents often end in fatal dropsies, or other troublesome disorders. Vernal intermittents sometimes go off without any affistance after the return of a

respect to the swelling of the legs in adults.

The indications are, to restore the constitution to its natural degree of heat, and then to support a due degree

of perspiration.

If the diforder is owing to that state or habit of which an ardent fever is the ufual confequent, bleeding should begin the cure; this may be followed by fub-tepid baths, lenient purges, faline medicines, with either the fixed or the volatile alcalies, blifters, and a fupply of gruel, in proportion to the degree of thirst. If, after a few days, this method fails to relieve, the milder alexipharmics will certainly effect a cure. When this diforder is produced by dry cooling fprings, the bark is rarely useful, and if im-prudently administered, a continual fever is produced, the cure for which is bleeding and cooling medicines, until the intermittent is required. In cases where the bark is not convenient, Dr. Rutherford advises to give an antimonial vomit, and fo to manage that a fweat be excited by repeated draughts of some aperient diaphoretic drink before the cold fit approaches; the cold fit thus avoided, the hot one is prevented also. Hosiman used this method, and they both affert the happiest effects therefrom.

Intermittents are most frequent when the atmosphere is cold and moift, and when the causes of an impoverished blood are or have been present. In this case, instead of bleeding and the other means above proposed, a vomit may begin the cure; during the rigour of the following fit, give a few grains of the antimonial powder put the patient in bed, let him be fupplied with warm wine whey, and when a fweat comes on, endeavour to support it un-til the fit declines. In the interval, the bark, a generous

diet, and chalybeates, will effect the cure.

If putrid vapours were the cause, begin with an emetic in the following fit, when the heat and sweat succeed the thivering; fupply the patient with frequent draughts of warm wine whey. In the interval let cordials with the bark be given; their dofes should be large, and as fre-

quent as the ftomach will retain them,

As the bark is the great specific in this disorder, its use should never be restrained, except by too great heat; nor need the lateritious fediment in the urine be waited for, if the pulse is moderate. When the powder can be taken, its efficacy is most to be depended on; or it may be given in decoction, or cold infusion; but if an aversion to this medicine forbid the internal use, a waistcoat in which it is quilted may be worn next the skin, or a bath may be made of a strong decoction of this drug.

An opiate often succeeds, if given about half an hour before the fit. To an adult the tinct, opii may be given

from fifteen to twenty drops, in any convenient vehicle. When the hot fit is tedious and violent, expose the patient to cool air, and let him drink cold water as freely as his own fenfation will direct; thus the heat will foon

abate, and a falutary fweat come on.

Arfenic has in this complaint been given with great fuccefs in the following form. Take arfenic very finely powdered, and fixed alkaline falt, of each fixty-four grains, diffilled water, half a pint; these are to be put into a Florence slask, and placed in a fand heat: the water is then to boil slowly till the arsenic is persectly dissolved; when to boil lowly till the arient is perfectly disolved; when the folution is cold half an ounce of compound tincture of layender is to be added, and of distilled water, another half pint, more or less, so that the whole of the solution shall yield by measure a pint, or rather weigh sisteen ounces and a half. Patients from two to four years of age, may take from two to four drops; from five to feven years, from five to feven drops; from eight to twelve years, from feven to ten drops; from thirteen to eighteen and upwards, may take twelve drops at a dose, in any proper vehicle two or three times a day.

If the symptoms of an inflammation are attendant, let

those be removed before the bark is given.

Often, by too much purging, a dropfy is induced; whether to this or any other cause this symptom may be owing, attempt its cure by warm stomachic and antiscorbutic remedies; a mixture of fome ferruginous prepara-tion may accompany the bark, and after each dofe give a vinous infusion of fresh horse-radish root, with the tops of wormwood.

A cough with a hectic fever fometimes follows after the removal of the intermittent; in this case, daily gentle a disease attended with irregular or uncertain paroxysms.

purging, &c. as when the beily fwells and is hard.

In children a hard fwelled belly is a frequent fymptom; this is beft relieved by repeated purging with the pulv. bafilic. an antimonial vomit should now and then be interposed, and when the hardness and the tumor is abated give the bark with falt of steel.

If a madness should come on, cordials and restoratives are the properest means; composure must be indulged, and in general the same procedure as when this symptom is attendant on a NERVOUS FEVER, which fee.

In case of costiveness, rhubarb with emetic tartar may

be given, fo as to render the bowels eafy.

If bile in the blood-veffels feem to render the intermissions imperfect, the spirit of nitre is convenient, and for the most part to be preferred; but if the juices are vifcid, the neutral falts must also be administered.

For agreeable forms and efficacious preparations in a ufeful variety of modes, fee Brooke's and the London

Practice of Physic.

Those who die of intermittents usually depart in the hot

See Hoffman on Intermittents; Wallis's Sydenham; Fordyce's Elements, part the fecond; Practical Effays by D. Lyffons, M. D.

INTERNODIUM, from inter, between, and nodus, a int. An INTERNODE. In botany it is that part of the stalks of plants which are between the joints. In anatomy it is the KRUCKLES; also the space between one of the

joints of the fingers and another.

INTERNUNTII DIES. CRITICAL DAYS.

INTERNUS MALLEI. The laxator membrana tym-

pani, mallcolus internus.

INTEROSSEA ARTERIA. The CUBICAL ARTE-RY having in its course between the heads of the radius and ulna reached the interoffeous ligament, gives off the interoffesus arteries, which are two, an internal and an external one.

The internal one runs close to the ligament till it reaches below the pronator teres, where it perforates the ligament, and paffes to the convex fide of the carpus, and back of the hand, where it communicates with the external interoffeus, the radical, and the cubical arteries.

The external pierces the ligament about three fingers breadth below the articulation, and fends off a branch towards the external condyle of the os humeri, under the ulnaris externus and anconœus minimus, to which it is diffributed, as also to the supinator brevis. The interoffeous artery then runs downwards on the outfide of the ligament, and is diffributed to the ulnaris externus, extenfor digitorum communis, the extenfores pollicis indi-cis, and minimi digiti. And having reached the lower extremity of the ulna, it unites with a branch of the internal interessents artery, which at this place runs from within outwards, and is distributed with it on the convex fide of the carpus and back of the hand, communicating with the radial artery, and with a branch of the cubital. By these communications this artery forms an irregular arch, from whence branches are sent to the external interoffcous mufcles, and to the external lateral parts of the fingers.

INTEROSSEA LIGAMENTA. The interoffeous ligathents in the fore-arm are fixed by one edge along the fharp angle of each ulna, and by the other along that of the radius. They are principally made up of two very ftrong planes of fibres which crofs each other at oblique angles, and leave holes at different diffances, for the paf-fages of blood-veffels. This ligament ties the two bones elosely together, and the two planes ferve for the infertion of several muscles. In the supination of the hand it is very tight, but in the pronation it is folded a little length-

Way

INTEROSSEI MUSCULI. There are mufcles of this name both in the hands and feet. There are three in the upper part of the hand, and as many on the inferior; this name describes their origin; they join with the lumbricales, and are blended with them, performing the fame office. They move the fingers fideways

In the feet feveral fmall muscles fill up the four interflices between the metatarfal bones, much after the fame manner as in the hand. Their use with respect to the toes is fimilar to that of the fame fort of mulcles in the bands.

INTERPELLATUS MORBUS. In Paracelfus it is INTERPOLATUS DIES. In Paracelfus these are days interpolated betwixt two paroxysms:
INTERSCAPULIUM. The SPINA SCAPULÆ.

INTERSEPTUM. The uvula and the septum

INTERSPINALES COLLI. Winflow calls them

— Muscult.

Dr. Hunter fays they lie between the fpinal proceffes of the neck and loins, ferving to erect the body, by bringing the fpinal proceffes neater to each other: he calls them

INTERTRANSVERSALES MUSCULI, or INTRA-TRANSVERSALES. They lie between the transverse pro-cesses of the neck, serving to bend it to one side. These muscles appear also in the loins. Winslow calls them

transversales colli minores.

INTERTRIGO, from inter, between, and tero, to rub, called alfo attrita. A GALLING; or erofion of the cuti-cle, or of the skin. Children are apt to have excortations behind their ears, in the neek and thight; those on the lower parts are from the urine, or from being too fas-Wash them two or three times a day with warm water, and then apply chalk in fine powder, or fuller's earth, after diffolving it in water. Dr. Cullen places this as a variety of erythematous inflammation.

INTERVERTEBRALES MUSCULI. They arise

from the body of one vertebra laterally, and are inferted, after an oblique progress, into the back part of the other vertebra, immediately above it. They draw the vertebra,

mearer to one another, and a little to one fide.
INTESTINA TERRA. EARTH WORMS.

INTESTINA, from intus, within. The INTESTINES, commonly called the GUTS. From the pylorus to the anus is one continued canal, divided into the great and fmall inteffines, which are furbelowed upon the melen-tery and melocolon. The whole length of the inteffines is between seven and eight times the length of the body; the fmall ones are about five parts out of the feven or eight, which is the length of the whole. The fmall intestines are called DUODENUM, JEJUNUM, and ILEUM, which fee. Their diffinctions are fomewhat obscure, though generally marked out pretty nearly; the large inteffines are the COECUM, the COLON, and RECTUM, which fee.

The first coat of the intestines is from the peritoneum, and forms the external one, the fecond is the mufcular coat, the third is the nervous or cellular, the fourth is the villous. The villi are of different shapes and lengths in different parts of the intestines, more thick in the small, more long and thin in the large ones; they are thought to be fecerning, and abforbing organs, as there the arteries terminate, and the veins begin.

The glands of the inteffines are supposed to be lodged in the cellular coat, next the villous; they are divided into glandulæ folitaræ and aggregatæ; but their existence,

notwithstanding this, is not clear.

In the great intestines we may observe little holes, which when inflated, leads to cells analogous to the folliculi of Malpighi, and by analogy we may suppose glands to exist in the great intestines near the anus, to separate a lubricating mucus, for facilitating the passage of the

The arteries and veins run together on the inteffines. The use of the intestines is to complete the first digestion, strain off the chyle, and carry off the faces by the anus; all which are performed by the peristaltic motion,

caused by their muscular coat.

The peristaltic motion of the intestines is not constant, but takes place on proper oceasions, or as these bowels are stimulated by their contents. The action of the lungs on the diaphragm, and the action of the abdominal vetfels, conduce to the emptying of the stomach and guts; the chyle, bile, rarefied air, &c. excite occasionally the periftaltic motion, for the most speedy descent of what is to be cast out. See Haller's Physiology, left. 29, 31. INTESTINALIA ARTERIA. See DUODENALIS

ARTERIA, and GASTRICA DEXTRA ARTERIA.
INTESTINALIS VENA. See Duodenalis vena.

INTESTINORUM SOLAMEN. Thus Hoffman calls the femen anisi, and Van Helmont, the oleum anifi.

INTOXICATIO, from rotices, poifon, venom. It is

properly the fame as infectio, but it is now generally used in the fame sense as inebriation.
INFRASPINALIS. See INTERSPINALES.

INTRATRANSVERSALES. See INTERTRANS-

INTRICATUS. An epithet of the bicaudalis mufeulus. INTRINSECI. Painful diforders of the internal

INTRITUM, from interendo, to rub or grate, fimilar to entrimma. It is a culinary term for minced meats, or rather fuch as are prepared by pounding, as potted beef, &c.
INTROCESSIO. See Depriessio

INTROSUSSEPTIO, vel INTUSSUSCEPTIO. INTRO-SUSCEPTION. It is a preternatural ingress of one portion of an intestine into another, or a reduplication of the intestine. See ILIACA PASSIO.

INTSIA. A large evergreen tree in Malabar, called also acacia Malabarica glabsfa. The juice of the leaves and bark are used to case pains in the belly. See Raii Hist.

INTUMESCENTIÆ. Diforders attended with a puffinefs, or with a fwelling of the body, or of a confiderable part of it. It is the fecond order of the class cachexize of Cullen's Genera Morborum.

INTUSSUSCEPTIO. See INTROSUSCEPTION.

INTYBACEA. OYSTER-GREEN. See LACTUCA

INTYBUS. A name for the eichoreum latifolium five endivia vulg. for the hedypnois annua, for the hyoferis angustifolia, and for the lampfana. INULA. See ENULA.

INUNCTIO. INUNCTION. It is either the action of

INUNCTIO. INUNCTION. It is either the action of anointing, or the materials with which a part is anointed. INVERECUNDUM, Os. 'The as frontis. INVERSIO UTERI. See PROCIDENTIA UTERI. INVIDIA. ENVY. It is composed of desire, anger, and forrow. And as it participates of the debility of the last, so it likewise does of the sebrile commotion of the former; hence arises an hectic sever, which consumes the strength.

INVOLUCRA. The SECUNDINES; fecundines, from coming next after the child, called also byflyfa, berteron, membrana. They form an universal covering for the foctus, and the water in which it floats during pregnancy. They are membranes called CHORION and AMNION to which fome add the ALLANTOIS, also the PLACENTA, and part of the FUNIS UMBILICALIS, all which fee.

If in labour the membranes do not break immediately upon their being pushed into the vagina, they should be allowed to protrude still farther, in order to dilate the os externum. If they fuddenly burft, and difcharge much water, and the pains become flack thereon, the labour, however promising before, becomes tedious. To know if the membranes are broke (which is a proper enquiry when the head gets before the waters) observe whether the head of the child feels hairy or not; for while it is yet covered with the unbroken membrane, it is gloffy to the touch. Sometimes the head prefenting, fo that the fontanel is felt puffy and swelled, deceives us, and it is taken for the membranes, but that should be carefully distinguished. If during labour the waters push the membranes down in an oblong, or in a gut-like form, the birth will be tedious. The best form of the membranes when they protrude through the os internum, is a fhort, broad, or roundish one.

INVOLUCRUM. See PERICARDIUM.

ION. The VIOLET. IONIA. GEOUND-PINE. See CHAMÆPITYS.

IONTHLAPSI. Boerhaave mentions two species of this plant; they are found in France, Italy, and Spain; they are faid to be deterfive, aperitive, &c. but they are not noted much in practice. See LUNARIA.

IONTHOS. So the Greeks call those hard pimples in

the face which the Latins call by the name of varus, and

IOSACCAR. SUGAR of VIOLETS.

IOTACISMUS. A defect in the tongue or organs of speech, which renders a person incapable of pronouncing his letters.

IOUI. A restorative alimentary liquor prepared in Japan. It is made from the gravy of half roafted beef, but as to the rest it is kept a secret.

IPECACUANHA, also called radix Brafilianfis, ipecaccanha Brasiliensibus, berba paris Brasiliana polyecces, caa-apia, ippecacuanha; Indiana radis, ipep coamba, periclymenum paroum, iPECACOAN, or BRASILIAN ROOT. It is the psychetria emetica, or psychotria herbacea, procumbens, foliis lanceolatis glebris, stipulis extra foleaceis subulatis, capitulis axillaribus pedunculatis paucisforis, Linn. Curtis, in his Catalogue of Medicinal Plants, &c. contained in the London Botanic Garden, calls it viela iperacua. It is brought from the Spanish West Indies. Four forts are mentioned, viz. the grey, brown, white, and yellow. The grey is generally effected the most, but Neumann assures us that the brown is equally good. The white fort is much weaker than the other, and the yellow does not act in the leaft as an emetic, being merely purgative.

Ray fays that the *ipreceuanha* is a fpecies of the herb paris; it bears a number of berries. The roots of the brown and grey forts agree in their external figure, being about the thickness of a small quill, very unequal and knotty; they are in short pieces, variously bent and contorted, full of knots and wrinkles, and deep circular siffures, which reach down to a small whisth woody fibre that the point of each pieces, the control of the process of the that runs in the middle of each piece; the cortical part is compact, brittle and looks fmooth, and refinous, on breaking. They have a bitterish, somewhat acrid taste; but discover little or no smell when the quantity examined is finall; in large quantities they yield a difagreeable finell;

and in pulverization a kind of musty one.

Chufe the larger compact roots that have a refinous appearance. The flender, blackish brown, and those which

are full of fibres, are the worft.

The caapia, commonly fold under the name of white ipecacuanha, is imposed for the true ipecacuanha; but its roots are yellowish, or of a yellowish white colour. The aconitum, or apocynum, is another imposition; but the colour of its medullary sibre is of a deep reddish yellow colour, whereas that of the ipecacuanba is whitish, or of

a pale grey.

Helvetius first brought this root into repute as an antidyfenteric. Its activity, feems to refide in its cortical part, It abounds with refinous and gummy parts. Of all its preparations the powder is the best; two or three grains of which will produce two or three discharges by vomit; and in diarrhœas and dysenteries, in which perspiration is defective, after its puking two or three times, it excites a perferitation, if the patient is wrapped up warm. Its chief operation, is confidered as an emetic in proper dofes, in smaller dofes, as a nauseative and aperient, upon which its antidysenteric power seems to depend. See Cullen's. Mat. Medica.

The best menstruum for extracting the whole virtue of the root is one part pure spirit and two or three of water; of wines the Canary or mountain obtains most from it; but the London College directs the following:

Vinum IPECACUANHA. Wine of IPECACUANHA.

Take of the roots of ipecacuanha in powder, two ounces; of Spanish white wine, two pints; digest for ten days, and strain. Ph. Lond. 1788.

Dr. Alfton of Edinburgh fays, that the virtue of this root refides not in its oil, gum, or refin, but in its peculiar fpirit. See DIARRHOEA and DYSENTERIA, for its use in those disorders. If three grains of powdered ipecacuanha is added to fifteen grains of jalap, it operates downward both more certainly and efficaciously. To deceive children, mix 3 i. or 3 ss. of powdered ipe-

cacuanha with half a pint of boiling water in a tea-pot; difguise it with a little milk and sugar, and give a tea-cup full every ten or sisteen minutes, till it operates; when thus given, it needs nothing to work it off with. The College also orders

Pulvis IPECACUANHE Compositus. Compound Powder IPECACUANHA.

Take of ipecacuanha, hard purified opium, of each, rubbed into powder, one dram; of vitriolated kali in powder, an ounce. Pharm. Lond. 1788. The dofe is from ten to thirty grains; the former dose containing a grain of opium. This is very nearly the same as the powder of Dr. Dover's, and is confidered as one of the most certain fudorifies in practice, for which purpose it is given in rheumatism, dropsy, and other diseases where sweating 5 X

IPHOCOANHA. See IPECACUANHA.
IPHION. See ASPHODELUS LUTÆUS.
IQUETAIA. See SCROFULARIA AQUATICA.
IRA. ANGER. It produces a violent îtricture in the nervous and mufcular parts, and for a time increases the tone of all the fibres; it quickens the pulse and hurries respiration. The stomach and bowels suffer much by this passion, and sometimes the stricture on the gall-ducks is such that a jaundice is the confequence, though more fuch, that a jaundice is the confequence, though more frequently the gall is determined more copiously to the duodenum, producing a variety of difagreeable symptoms.

Anger also produces hæmorrhages from the nose, the lungs of the hamorrhoidal vessels, particularly in those who are

disposed to these evacuations, and has occasioned apoplexy.

During the fit of anger, or its immediate effects, carefully avoid vomits and purges; though if, in confequence of anger, much bile is thrown into the duodenum, as foon as the patient is composed, a little rhubarb, with nitre, may be given to determine it downwards, and abate its

acrimony

The first and principal step, when a patient is violently affected with anger, is, if the constitution is vigorous, to bleed; if the habit will not well admit of this operation, give the following, or other fimilar antispasmodic. R Sp. ætheris nitrof. tinet. castorei \$ 3 fs. camphor 3 i. m. dentur. gut. xx. vel. xxx. pro re nata. Sometimes a gentle opiate, mixed with cordials, is required.
IRACUNDUS MUSCUL. See ABDUCTOR OCULL.

IRAIBA. A species of PALM-RTEE. See Raii Hist. IRINGUS. ERYNGO. See ERYNGUM. IRIS. The fore-part of the choroides is thus named, because of the variety of its colours. It flies floating and loofe; it is convex to the anterior, and concave on the posterior part; the perforation in the middle of its fore-part, forms the pupilla. The iris, by contracting or dilating, excludes or admits of light in such proportions as the variety of circumstances may require, &c. It is disputed whether this power in the iris is owing to a nervous tension, or the action of muscular fibres; on examination, two orders of fibres are found between the laminæ of the iris, one of which is circular, the other radiated; whence it is most probable that muscular fibres produce these actions. See UVEA and CHOROIDES.

The operation of cutting the iris is required when a cataract adheres to it; and when from the contraction of its mufcular fibres the pupil is closed up. Thus both these disorders are sometimes remedied. Mr. Sharp, in his Operations, ch. xxix. directs the operator to proceed as follows: place the patient as for coucling, open and fix the eye with the speculum oculi, then introduce the knife in the fame part of the conjunctiva that is wounded in coucling. in couching; infinuate it with its blade held horizontally, and the back of it towards you, between the liga-mentum ciliare, and circumference of the iris, into the auterior chamber of the eye; and after it is advanced to the farther fide of it, make your incision quite through the membrane: and if the operation succeeds, it will, upon wounding, fly open, and appear a large ortifice, though not fo wide as it becomes afterwards. . Mr. Sharp further observes, that when the pupil is contracted from a paralytic disorder, this operation can hardly be encouraged.

IRIS. It is a perennial plant, with long, narrow, fword-like leaves, flunding edgewife to the flulk, and large naked flowers divided deeply into fix fegments, of which alternately one is erect, and another arched downward, with three finaller productions in the middle, in-closing the stamina and pistil; the roots are tuberous, ir-regular, and full of joints. Boerhaave mentions twenty-four species, and Dale adds two more. See also Envst-MUM. It is a name likewise of the hedge-mustard, her-woods take a kind of singer, a species of symbium; also a modactyls, a kind of ginger, a species of xyphium; also a species of crystal, and of a pastil, consisting of alum,

faffron, and myrrh.

IRIS FLORENTINA. FLORENTINE ORRIS, called alfo iris Illyrica, iris flore albo, and WHITE FLOWER DE LUCE.

is necessary, and that difficult to be procured by any other means.

See Lewis's Mat. Med. Lond. Med. Obf. and Inq. Italy, as being superior to those of our own growth. They are in oblong, flattish pieces, freed from the fibres, and brownish externally, but white, with brownish speeks, internally. They are cafily reduced to a powder of a farinaceous kind.

This root, in its recent flate, is naufeous, acrid, and purgative, but lofes these qualities by drying. The dry root is unctuous, bitterish, and pungent to the taste, not very strong, but durable in the mouth; hath a light, agreeable smell, which resembles violets, or rather raspectives and its communities of the strong purious and its communities. berries, and it communicates a flavour to fpirits, and to wines, which refembles them. As a medicine it is an useful expectorant; it attenuates viscid phlegm, and pro-motes its discharge. Which this might do in it is more recent, acrid state, Dr. Cullen says he cannot determine, but in the dried state in which we commonly have it in our shops, he considers it as an infignificant expectorant. Mat. Med. It is cut in the form of peas, and used for promoting the discharge in issues.

In diffillation it gives over all its flavour with water; its bitter remains in the extract. Rectified fpirit brings over a part of its flavour, and the extract is bitter, pungent, and glows in the mouth. See Lewis's Mat. Med. Neumann's Chem. Works.

IRIS TUBEROSA BULBOSA. See HERMODACTYLIS

FOLIO QUADRANGULO, &c.

— FOETIDA, also called spatula fatida, ayris, gladiolus fatidus, spurge-wort, stinking gladdon, or gladwyn. This is a wild species of iris; its root is thick, and forcading in the earth, with many fibres, from which fprings many leaves, longer, narrower, and tharper pointed than the common flower de luce; they have a strong smell. It is found in hedges, thickets, &c. The root is diurcitic, but not much deferving notice.

- PALUSTRIS, also called acorps adulterinus, gladielus luterus, pfeudeacerus, YELLOW FLOWER DE LUCE, YELLOW WATER-FLAG, SEDGES, &c. Iris pfeud-acorus, or iris palustris, foliis ensiformibus, corollis imberbibus, petalis interioribus stigmate minoribus, floribus luteis, Li YELLOW FLOWER DE LUCE. It is common by the fides of rivulets and marshes; the roots are reddish, the flowers stand several on a stalk, and are of a yellow colour; the

middle ribs of the leaves are prominent.

The roots of this species, when fresh, are more acrid, and strongly carthartic, than the above two species. Eighty drops of the expressed juice, repeated every hour or two, has purged, when jalap, gamboge, and mercurials have failed; but, like the other irifes it is too variable in its

strength to be received into general use.

LATIFOLIA TUBEROSA. See ZINGIBER.

VULGARIS, also called iris hortensis nostras, iris Germanica, Linn. Iris purpurea, the COMMON FURPLE.
FLOWER DE LUCE, iris, or erris. Its blue or purple flowers stand several on one stalk; their arched segments are bearded with a yellowish matter. The plant is a native of the mountainous parts of Germany; it is common in our gardens, and flowers in June.

The roots, when fresh, they are afterna irritating cathattic.

acrid naufeous tafte; they are a ftrong irritating cathartic, in which cafe the expressed juice hath been given in a dropfy, from 3 ii. to 3 iv. diluted with water. By gently infpillating the juice, it is lefs purging, and irritates lefs; but if infpillated to drynefs, it lofes all its purging quality. The dried root refembles in smell and faste the Florentine

IRRITABILITAS. IRRITABILITY. Irritation is a species of stimulus, expressing a lesser degree of it than ellication or corrugation, &c. and the parts on which ftimuli are capable of acting, so as to produce motion, are faid to be irritable, and this seems to be confined to the muscular fibres. What is produced on the ner-

woces fystem, is more properly termed sensibility.

The same species of stimulus, applied to different parts, produces different effects; thus urine does not affect the bladder, but if it is injected into the guts, it proves purgative, and distension is the chief stimulus that affects the blood-vessels.

Haller endeavours to prove the infensibility of the ten-dons, membranes, and ligaments. Dr. Hunter is of opinion, that the ligaments, tendons periosteum, and dura It is the iris forentina, or iris forentina caule foliis altiore, fubbifloro, floribus feffilibus albis, corollis barbatis, linn. It is fupposed to be only a variety of the common livis, or purple flower de luce. Its roots are brought from healthy state; even the bones become fensible when difordered; they also inflame and suppurate; and, in short, the effects of medicines are very often to be deduced from this irritability, as they depend on either increasing, or diminishing it. In slow fevers this irritation must be heightened, in ardent ones lessened. The same is observable in many other disorders.

Dr. Kirkland observes, that irritability is of two kinds, viz. inflammatory or fpafmodic. The first of these he says always arises from distention, or continued irritation; and always while the inflammation is attended with any confiderable degree of violence, produces a fever, and a quick pulse. The other kind is confined to the expanded brain, and never affects the pulse, or produces a fever;

but these two kinds may exist together.

See Haller's Treatise on Insensibility and Irritation; Dr. Whytt's Answer to Haller's Treatife on Sensibility and Irritability; the Difficulties in the Modern System of Physic, with Regard to the Sensibility and Irritability of the Parts of the Human Body, by Dr. De Haen; and Kirkland's Differtations on the Brain and Nerves; also on the Sympathy of the Nerves, and of different Kinds of Irritability. Cullen's Materia Medica.

IRUCAHA. A large tree in Maragnan; it bears an

agreeable fruit like a pear.

IS, 16, a fibre; its plural is 1006. Some fay that Hippocrates used this word indifferently for a fibre and a nerve, and it is clear that other writers have done the fame.

—— SATIVUM. MANNA GRASS. See GRAMEN.
ISCHIAS. A name of a fpecies of tithymalus, of the feiatica or ifchiadicus Morbus, and of two crural veins, one of which is called the greater, the other the leffer.

See CRURALIS VENA.

ISCHIADICUS MORRUS, also called ifchias, and

ISCHIADICUS MORBUS, also called ifebias, and the sciatica. Aretæus ranks this diforder as a species of the gout, and fays, that "it comes on the hind part of the thigh, the ham, or the tibia; at other times the pain feizes upon the acetabulum of the os femoris, and then attacks the buttock and loins, and feems to be any

thing rather than a fciatica."

The fciatica hath three feats: first, the tendinous expansion, which covers the muscles of the thigh. Se-condly, the coat of the feiatic nerve, and here the pain is more acute and violent, attended with a numbness; this is eafily accounted for, fince it is well known that any compression on a nerve causes deadness. Thirdly, the captular ligament; the depth and feverity of the pain leads us to judge of this part being the feat. In the first case, the usual anti-rheumatic medicines

may be given inwardly, and the volatile liniment ap-plied externally. The fecond requires the application of blifters, with what is necessary in the first. The third is best removed by mercurial alteratives; and, indeed, the other two, when obflinate, require a fimilar treat-ment. Dr. Fothergill recommends the following pills and draught, as being of all other means the most

ISCHURETICA. Medicines that remove a fuppreffion of urine

ISCHURIA, from 1070, to retain, and 2505, terine. An 15CHURY, a stoppage or supression of urine. La Motte distinguishes betwixt a retention, and a supression of urine. In a retention, the patient hath frequent mo-tions to make water without being able to void it; or if he does pass any, it is in very small quantities, and with difficulty; this is also called a STRANGURY. In a supreffion, there is feldom any inclination to discharge any urine; but if there is an inclination, the discharge is

An infeburia is of two kinds, viz. the true, in which case the bladder is full; and the spurious, in which the bladder is empty, for nothing defeends from the

Dr. Cullen places this genus of difease in the class lo-cales, and order epischeses. He diftinguishes four spe-cies. 1. Ischuria renalis, when the kidneys do not fecrete the urine, and confequently there cannot be any stimulus to discharge it. 2. Ischuria ureterica; there is pain in some part of the ureter, but no stimulus to discharge urine. 3. Ischuria vesicalis, when there is a tumor in the hypogastic region, pain at the neck of the hydrogram and a second uring to discharge urine. the bladder, and a frequent urging to discharge urine. 4. Iseburia urethralis, when there is swelling in the hypogastric region, a frequent defire to discharge urine, and the pain in the urethra-

The causes are various. Etmuller says, the most frequent is a want of mucus in the urethra. Other causes are a ftone in the kidneys or bladder; caruncles in the urethra; inflammation in any of those parts; a spasm in the neck of the bladder, or in the urethra; pain from the piles in pregnant women, the child's head prefling the neck of the bladder against the os pubis; a tumor, or ulcer, in the proftate gland; a defluxion of humour on the neck of the bladder; a retention of urine; a palfy in the detrufor uring; a retention of hardened excrements in the intestinum rectum, &c. A spurious ischury is when the kidneys secrete no urine, or when the ureters either do not receive, or do not transmit it; and this may happen from inflammation of the ureters, or in the kidneys. A view of the different causes may be perhaps best taken from the different varieties of ischury, noticed under the following words.

noticed under the following words.

THE VARIETIES OF THE FIRST SPECIES, are the ISCHURIA Lunatica. Nephrelminica; Nephrica; Nephroplethorica; Nephropolethorica; Nephropolegica; Nephrophelgmatica; Neterophrothromboides; Suppleta.

VARIETIES OF THE SECOND SPECIES, are ISCHURIA Ureteritica; Ureterolitica; Ureterothromboides; Urethromboides; Urethromboides; Urethromboides;

Urethrophlegmatica; Urethrothromboides; Urethroppica; Urethrohymenodes; Urethrelmintica; Urethritica; Peri-dofmica; Phimofica.

a pain and fwelling is observed about the pubes; a fupression from relaxation is distinguished from suppression from stricture, first, by the little pain attending the diforder; secondly by the introduction of the catheter; thirdly, from the distension of the bladder, observable from the fulness above the pubes; fourthly, from no ftimulus being excited in the bladder to discharge any fluid wherewith you distend it. If inflammation in the kidneys is the cause, the pain and heat are principally in that region. If a stone in the kidneys gives tife to the complaint, a vomiting is an attendant fymptom. If a ftone in the bladder obstructs the urine, a pain is felt there, and alfo along the urethra; a mucus, or pus, is excreted with pale urine; and generally the flone may be felt, if the catheter is introduced. If from inflammation in this neck of the bladder, there is also pain and a tumor there; the pain will be much increased if the perinœum is but flightly preffed; and if a finger is in-troduced into the anus, and turned towards the bladder, a tumor will eafily be perceived.

If this diforder is in a great degree, there is a tenef-

mus, coldness of the extremities, a vomiting, and a fe-

brile pulse.

If this disorder is the spurious kind, there is no tenfion, but rather a sense of emptiness about the pubes.

If this disorder continues above seven days, it proves

fatal; also, if from a wound of the spine, or luxation of its vertebræ. If the fmell of urine proceeds from the patient's mouth or nostrils, there is no hope. An hic-cough, and a tenesmus, are also unfavourable symptoms.

If the urine is lodged in the bladder, and cannot be voided, whether the cause be cold, a too long retention of urine, and whatever elfe that could deprive the fibres of the bladder of their contracting power, or if the suppression is from a spasmodic stricture in the neck of the bladder, an immediate recourse to the catheter is not convenient, for in these cases it causes much pain; but fuch medicines as oppose the cause should first be tried.

If the habit is plethoric, bleed, inject the turpentine clyfter, with a dram of the tinct. opil; and an oily mixture may be given, in which is the fp. nitrof. ætheris, with the tinct. opii, in proportion to the degree of pain; and the patient may be placed in a warm bath. If thefe fail a bougie may be introduced, or the catheter may

In children, a fupression of urine is often relieved by a poultice of raw onions, or of radifhes, applied to the

When a long retention of urine is the cause, cloths may be wrung out of cold water, and applied round the waift and belly; to this bleeding should, in some constitutions, precede.

If a relaxation or paralysis of the detrusor uringe be the caufe, give the bark with nervines, and apply cloths wrung from cold water round the belly and loins, or put the patient into a cold bath. Gentle pressure on the fhould now and then be used.

When caruncles obstruct the urethra, bougies should be introduced there.

When a retention of urine is produced, let the cause be what it may, every patient so circumstanced is spat-modically affected; and generally the introduction of a bougie will increase the spasm, produce a shivering, and then a sever sit; all which will return as often as the bougie is introduced, and the difease to be relieved will become proportionably obstinate. Yet, if the bougie is

introduced, without pain, and the patient discharges his urine more freely, its use may be continued.

If there is inflammation in the neck of the bladder, the catheter cannot be used before the inflammation abates; diuretics cannot conveniently be admitted; here nitrous medicines, neutral falts, the acidum muriaticum diluted in the patient's common drink, and fmall doses of camphor, may be frequently given. Decoctions of parfley roots, with a little nitre, may be drank in proporthon as the thirst requires; and bladders of warm water may be applied to the pubes and perinæum, or to the region of the kidneys, if the inflammation is there, and fuch other medicines as are recommended in the nephritis. Bleeding is here a principal remedy, and as a

When the suppressed urine is lodged in the bladder, laxative the fal cath, ainar, or the ol. ricini ver. may be

If a stone obstructs the neck of the bladder or the rethra, push it back with the catheter, or cut through the perimeum, and there extract it. Some advise never to use the catheter in retentions of urine from any cause but from a calculus obstructing its passage. But this advice may be too general; the use of this instrument is rarely required.

When the head of the child, in pregnant women, ob-tructs the passage of the urine, introduce a singer into the vagina, and push back the child's head until a due

evacuation is made.

When acrid urine is the cause, emulsions made with the ol. ricini, should be the common drink. Nitre mixed in oily draughts, and mucilaginous decoctions, are the proper remedies.

Spains are removed by fomentations, the warm bath, demulcents, clyfters, antifpafmodics, and anodynes.

When the urine is totally retained in the bladder, it is too common a practice to advise to introduce the camation or from fpafm, this conduct should carefully be avoided. Mr. Pott observes, that the best method of relieving this complaint, particularly when caufed by spasm, is by evacuation and anodyne relaxation. The ofs of blood he fays is often necessary; as to what quantity, the strength and state of the patient will determine. The intestines must be emptied by some gentle cathartic, But the most effectual relief will be from the warm bath, or femicupium, the application of bladders half filled with hot water to the pubes and perincum; and above all other remedies the injection of glysters, confisting of the decoct. pro enemate ol. and tinct. opii; or if after a due bleeding, if necessary, and emptying the bowels, a free dofe of opidm is given, and the patient is feated in a warm bath during twenty minutes or half an hour, re-peating this use of the bath oftener or feldomer as the cafe may feem to require, fuccefs will very rarely fail to attend; and if by these means, the urine begins to drop through the urethra, although but a drop in a minute at the first, by persevering steadily and closely, the bladder will at length effectually empty itself. Let the whole endeavour be to appease irritation and pain, to ac-complish which, although it may take up three or four or even feven days careful attention, it will amply reward the practitioner's care, and the patient's patience.

When great pain attends a retention or suppression of urine, the person called on for his assistance should first be well satisfied that the case is what it is supposed to be; he should observe whether the kidneys have done their office, and whether in reality there is urine in the bladder, which if full it will be so distended as to be felt above the os pubis, and by pressure on it a pain will be excited in the neck of the bladder. Another observation deserves attention in instances of this kind; viz. the bladder will contain fometimes, a large quantity, and not be affected by it; at other times a very fmall quantity will affect it; fo that when an obstruction takes place, an inflammation arifes, and fymptoms of irritation enfue; and, if relief is not immediately given, the patient is foon cut off. Dr. George Fordyce observes, that much of the difficulty and pain from retained urine is from the more or lefs fudden filling of the bladder or diffend-

When the urine is suppressed from the kidneys failing admitted; attempts may be made to relax the velfels of these organs by putting the patient frequently into the warm bath; and purgings may be admitted, as they in-creafe the fecretions in the inteffines.

If no other method will fucceed, a puncture may be made into the bladder, as directed in the article PERI-

NEUM, Puncture of the.

Indeed there are four methods proposed by different writers for drawing off the urine; viz. 1. By making an opening into the bladder above the os pubis, in the part where the high operation for the stone used to be performed. 2. By making a puncture in perinzo, and so getting into the bladder. 3. By making an opening into the bladder through the parts divided in the lateral operation for the stone. 4. By getting into the posterior part

part of the bladder through the rectum, with an instru-ment introduced up it for that purpose. But from the experience of some judicious practitioners, it can hardly experience of fome judicious practitioners, it can hardly be faid that their advantages are an encouragement to perform them. If one of these methods was determined on, Mr. Pott gives his opinion in favour of opening the bladder above the os pubis; but observes, that in his practice he hath not seen any of them to be necessary; and further, though he does not absolutely forbid, yet his persuasions against them do very little less.

See an instance of this disorder from a retroversion of the uterus, in the Lond. Med. Obs. and Inq. vol. iv. p. 388, &c. See Pott's Chirurgical Works. JACARANDA ALBA. It is like the European palmtree; it is plentiful in Brail. The Braillians make a pottage of it, which they call manipey, which is a good ftomachic. See Raii Hift.

JACARECATINGA. See CALAMUS AROMATI-

JACE BRASILIENSIBUS, also called melo Indicus, patheca, and citrullus. Ray makes it a species of anguria or citrullus, and calls it WATER-MELON; this fruit is as large as a man's head; it hath a green rind, and its pulp

is well tafted.

JACEA. KNAP-WEED or MATFELLON. Boerhaave enumerates forty-one species. The margins of the leaves are not serrated; the leaves and stalks are destitute of fpines; it is common in pasture grounds, and slowers in July and August. A slight astringency is attributed to it; but it is not regarded in practice. I It is a name of feveral

ORIENTALIS PATULA. See BEHEN ALBA.

RAMOSSISSIMA STELLATA RUPINA. See CAL-

CITRAPA. - STELLATA LUTEA, &c. See CALCITRAPA

JACOBÆA. RAGWORT. Boerhaave mentions eighteen species. It is also a name for several species of doria and fenecio.

- ALPINA, also called achillea Gallica, chryfanthemum Alpinum, CORN-MARIGOLD, and FINE-LEAVED MOUNTAIN-RAGWORT.

- AQUATICA, also called conyza aquatica, and after palufiris. It is a species of FLEA-BANE.

These nor any other species of rag-worts are of any

note in medicine.

- VULGARIS, called also berba fantli Jacobi, fene-

cio major, feggrum, and COMMON RAGWORT. It hath a firm round stalk, of a purplish colour; oblong dark green leaves, deeply jagged along almost to the ribs; on the top of the stalks are umbel-like clusters of yellow slowers, of the radiated discous kind, followed by small oblong seeds, winged with down. It is perennial, common in uncultivated fields and by road sides; it slowers in July.

The leaves have a rough hitterish taste, are sub-actid

The leaves have a rough bitterish taste, are sub-acrid

The leaves have a rough bitterith tafte, are sub-acrid and nauseous; on evaporating either the watery or spirituous tincture, the virtues of the plant remain in the extract, but the offensive slavour is dislipated.

JAGRA. A fort of sugar obtained from the juice of a species of palm-tree. See PALMA COCCIFERA.

JALAPA. JALAP. It is a native of the province of Chalapa, or Xalapa, in New Spain, from whence its name is derived, and written according to the pronunciation of different languages, so is called jalapium, gialappa, gialapium, mirabilis Peruviana, chalapa, xalapa, zalapa, &c. Some call it mecoachana nigra, convolvulus Americanus, bryonia Peruviana. canus, bryonia Peruviana.

The plant is a species of convolvulus. The convolvu-

lus jalapa; or convolvulus foliis difformibus; cordatis angulatis oblongis lanceolatifque, caule volubili, pedunculis unifloris, Linn. The plants raifed in Europe are

not fo good as the American.

The roots are brought from New Spain in transverse slices; they are solid, hard, weighty, of a blackish or dark brown colour on the cortical part, internally of a dark greyish colour, with several black circular striæ.

Chuse the hardest, darkest coloured, and those pieces which have the most of these resinous veins; those that break blackest, most compact, shining, and that burn readily at the slame of a candle. Worms rarely touch the resinous parts to when the pieces are designed for obscious. nous part; fo when the pieces are designed for obtaining the refin from them, the worm-eaten are as good as the

Pieces of briony root are sometimes mixed with the jalap, but are easily diffinguished by their paler colour and less compact texture, and by their not readily burning at the

fame of a candle.

Jolap hath fearcely any fmell, and but little tafte; when fwallowed it affects the throat with a flight pungency and heat, and occasions a spitting. In doses from ten grains to half a dram it is an effectual purge, but gripes and naufeates less than the generality of purging medicines in use. For children in general, and adults of a spongy lax habit, or of a leucophlegmatic disposition, it is more proper than for the robust and those with rigid fibres; it is diuretic as well as purgative, whence its preference in dropfies; in which case it is best given in wine, in which it

should stand a few hours before the taking of it.

Various are the means of correcting jalap. culiar uneafinesses complained of by particular persons, from taking this drug, as they are no other than what is common to all medicines of this kind, they may be relieved by changing the mode of administration, or such other circumstance as the fagacity of the attentive prac-

titioner will eafily fuggest.

If it be well triturated with crystals of tartar before exhibition, it will operate in smaller doses than when taken by itself, and at the same time very moderately without griping. Rubbed with hard sugar, it becomes a

good or fafe medicine for children, joined with calomel, and given in large dofes, it is rendered one of the most powerful purgatives either as a hydragogue or anthel-

Jalap confilts of an earthy, faline, and refinous part; but its purgative quality wholly depends on the refin.

### Refina JALAPII. Refin of JALAP.

Take any quantity of jalap root powdered; pour upon it fo much ipt. vini r. as will cover it to the height of four fingers, and digest them in a sand-heat, that the spirit may extract the refin ; filter the tincture through pa per; put it into a glass cucurbit, and diftil off one half of the spirit; add to the remainder a proper quantity of water, and the refin will precipitate; divide it into little cakes, and dry with a gentle heat. This has no place in the Pharm. Lond. 1788.

It is a pure refin: but its infolubility in any aqueous fluid forbids its use, except it is previously prepared by trituration with an alcaline falt, gum, fugar, or fuch like intermedium, to fit it for mixture with a watery liquor. If it is thus managed, a dose from gr. v. to x. operates with sufficient case and efficacy.

The jalap which remains after this resin is extracted,

gives out, by boiling in water, a mucilaginous fubstance which operates by urine, but not in any degree by stool.

From fixteen ounces of good jalap Neumann fays he hath obtained 3 v. and 3 iv. of pure refin.

This refin is frequently adulterated, and the variety of methods by which the fraud may be practifed are fuch as clude every known method of detecting it, fo that he who will use it must prepare it himself. will use it must prepare it himself.

The London College direct an extract to be made in

the same manner as that of the cort. Peruv. cum refina.

Sec CORT. PERUV.

From gr. x. to 3 i. is a dose. The advantage of this extract consists in the nearer equality of its strength than is found in the different parcels of the roots, fome of which afford only 3 ii. of refin from 16 i. whilft others afford 3 v. but this disproportion is not observed in the refins. However, except for the convenience of form, the tincture made with proof spirit, is made with less trouble, and will answer every purpose proposed by this gummy-refinous extract.

#### Tind. JALAPII. Tindure of JALAP.

Take of powdered jalap eight ounces, and of proof fpirit of wine two pounds; digeft with a moderate heat, for eight days, and ftrain off the tincture. The dose is from 3 i. to 3 fs. or more, mixed with fyrup it may be given to children with the greatest fasety. This is the purgative said to be given by the inoculators who received their instructions from SUTTON. Cullen's Mat. Med.

This tincture is tolerably certain in point of strength, for the above proportion of this menstruum does not take up the whole virtue of any kind of jalap. See Neumann's Chem. Works. Lewis's Mat. Med.

IALAPA ALBA. See MECHOACANA. ALBA.

JAMACARU. A name of feveral forts of fig-trees

in America. See Raii Hift.

JAMBOLONES, or JAMBOLOINS. A fhrub which grows in the East Indies, and resembles myrtle. See

JAMBOS. A tree growing in Malabar. It is a kind of plum-tree. Ray enumerates fix forts.

JANAMUNDA. The HERB BENNET. See CARYO-

JANGOMAS. It is a tree mentioned by Ray, whose fruit refembles that of the fervice-tree.

JANIPABA BRASILIENSIBUS, also called genipat, junipa, and junipapaceywa. It is a tall tree which grows in Malabar, &c. See Raii Hist.

Janipaba is also the name of the tallest tree in Brasil; it bears an apple about the fize of an orange. See Raii

JANITOR. The pylorus.

JANITRIX. The vena porta.

JAPARANDIBA. The name of a pomiferous tree in Brafil. See Raii Hift.

JARUINA. A fort of fig-tree in the island of Jucaija. JARUS. See ARUM.

ASMINOIDES. The COFFEE-TREE. Sec COFFEA; also a species of rhamnus.

JASMINUM. JASMINE, or JESSAMY, also called galfeminum. We have many species of it, and it is sufficiently known not to need a description. Besides, it is not in use, except for its flowers, which give a perfume to infipid expressed oils. The fort used formerly in medicine was the jasminum officinale, Linn. It is also a name of the coffee-tree. See COFFEA: of feveral forts of jalap, and two species of lilac.

JATROPHA. See CATAPUTIA MINOR.

JECORARIA. A name of the bepatica vulgaris; also

of a vein in the right hand. See Splenitis.

JECUR. The LIVER: called also bepar. diately below the diaphragm, on the right fide, is placed the liver, whose small lobe is still contiguous to the diaphragm, and goes to the fcrobiculus cordis. It is divided into two lobes befides the lobulus Spigelii; the large lobe is fituated on the right hypochondrium, con-tiguous to the diaphragm; it reaches as far back almost as the spine, and rests upon the right kidney; the small lobe runs close to the diaphragm, as far as the spleen. The convex side of the liver is usually connected to the diaphragm by three ligaments, which are continu-ations of the peritonæum; one lies near the edge of the extremity of each lobe, and one in the middle, and they are accordingly called the right, and left, and mid-dle ligaments. The liver is likewise connected to the dle ligaments. The treer is likewise connected a broad right ala of the tendinous part of the diaphragm by a broad adhesion, which is the reflection of the peritonzum, and is called the ligamentum coronarium. Under the great lobe, a little to the right, we see the gall-bladder. The lobe, a little to the right, we see the gall-bladder. The smaller lobe of the liver is in the left side, which is diftinguished above by a membranous ligament, and below by a large sciffure in the same direction as the superior ligament. The eminences on the concave side of the liver mass, fituated backwards near the great sciffure, which mass is named lobulus Spigelii; this lobe is attached by a little peduncle to the middle of the lower side of the great lobe. The first fissure we observe, next to the great one, is a notch at the anterior part of the liver, for the reception of the liver. tion of the ligamentary remains of the vena umbilicalis; the second fiffure is towards the posterior part of the liver, between the lobulus Spigelii, and the little lobe, where we observe the remains of the ductus venosus, which runs to be inferted into the vena cava, and is peculiar to the fœtus; upon the right of the lobulus Spigelii, between that and the great lobe, is another fiffure in which the vena cava runs down; the next fiffure is a transverse one, fituated before the lobulus Spigelii, this is called portæ; besides these, on the forepart of the great lobe there is a depression, for the reception of the gall-bladder; and we may observe on the under-side of the great lobe, a small cavity, where it rests on the right kidney.

The principal veffels of the liver are: 1st, From behind the pancreas, a mass of vessels and nerves run up to the portæ. 2d. The hepatic artery comes off from the coeliaca, and divides into two branches, one of which goes to each lobe. 3d. The vena portarum, when it arrives at the portæ, likewise divides into two, one of which enters the right, and the other the left lobe. 4th. From the duodenum and pancreas we fee the ductus communis choledochus, which, at a diffance from the portæ, divides into two ducts, viz. the cyftic, which goes to the gall-bladder, and the hepatic, which again is fubdivided into two, which go their respective lobes. 5th. The vena cava, in its passage through the diaphragm, sends off several branches, especially two which go to the liver, and are called vena cavæ hæpaticæ: their office is to throw are called vena cavæ hæpaticæ; their the blood into the vena cava, after the bile is fecreted. 6th. The blood from all the viscera is returned to the vena portarum, which ramifies through the liver like an artery; the lower part of this veffel is called vena portarum mefenterica; the upper part hath the name of hepatica given to it. Laftly, we may observe, that the greatest part of these vessels are inclosed in a membranous sheath, which from Glisson, who first took notice of it, is called capfula Gliffoniana. This author defcribes it as composed of cellular membranes, nerves, and peritoneum, which he alledges not only cover the veffels at their entrance, but ramifies through the liver with them; but the peritonzum must be absolutely excluded, for the nerves and

cellular membrane only go through the liver.

The external furface of the liver is smooth, and covered

with the peritoneum, which membrane is not only tied to the liver by the membrana cellularis, but by the veffels which run out to be spread upon it. The liver, except for the veffels, is very foft, and like a piece of congealed blood, Malpighi examined this, and brought it out to be a congeries of foliculi, where the veffels terminate and form the bile. Ruyfch makes it a congeries of veffels, even in the tendereit part of it. The penicilli of Ruyfch are a collection of veffels upon the furface: according to this author, the veffels do not terminate in the penicilli, but become infinitely finer, whence this vifcus cannot be fiructured as Malpighi imagines. The liver, according to the ancients, was the vifcus wherein the chyle was converted into blood, but fince the knowledge of the lac-teals, and the difcovery of the circulation of the blood, we have learned to know that the use of the liver is to secrete the bile. There are two kinds of blood which comes to the liver, viz. the arterial by the hepatic artery, and the venal by the vena portarum; a greater quantity of blood is fent by the latter than by the former, as it brings the blood from the splenic, melenteric, &c. veins; this latter also is that by which the bile is secreted. See Winslow's Anatomy, and Haller's Physiology, Lecture

The liver is the feat of various diforders, viz. inflammation, abfeefs, feirrhus, hydatids, &c. and in most of them the countenance hath a pale colour, or a yellowish one, with a greenish cast. Besides those disorders of this viscus, which have long since been noted by medical authors, Mr. Crawford mentions one which he denominates an enlargement of the liver. See his Essay on the Nature, Caufe, and Cure of a Difease incident to the Liver. The principal figns of it are, a great and fudden fwelling and hardness of the belly, with a difficulty of breathing, which latter is the only very troublesome symptom. Previous to thefe, a general weakness, a fense of tightness about the breaft, and a giddiness of the head on any little motion are perceived; then an cedematous fwelling appears in the legs, pains in the back, thirft, and lofs of appetite attend; the pulse is small and weak, but on bleeding it becomes more full and diffinit; the countenance is florid: as the belly enlarges, the breathing is more difficult, and then the feet of countenance is a the belly enlarges. the fenfe of oppression about the precordia, and a stricture about the cartilago ensiformis, becomes almost insupportable, foon terminating in a complete fuffocation. A vio-lent vertigo, and troublefome palpitation of the heart, are occasional symptoms. Some symptoms of this diforder refemble those of the scurvy; but the fore spongy gums, always attendant on the scurvy, are not observed here.

As foon as this difeafe is apprehended, support the pa-tient with a mild nourithing diet, and, when he is faint, give him vinous cordials. Bleed as the strength will adgive nim vinous cordials. Bleed as the lirengin will admit; after which two or three of the following pills are to be immediately given, and repeated once or twice in the space of twenty-sour hours, until they operate.

R Aloes Soccotor. 3 ss. rad. jalap. pulv. 3 i. calomelas, sap. Venet. ää 3 ii. balf. Locatel. q. s. ut f. massa, ex cujus singulis drachmis, formentur pilulæ, No. xii.

The patient is greatly relieved a few hours after bleeding; and by means of these pills, repeated at proper intervals, the complaints gradually abate, and the cure is generally completed in the space of nine or ten days. JEJUNUM. One of the small intestines, so called,

because it is generally found empty; named likewise nessis. Where the duodenum ends it begins, and is attached to the melocolon at its beginning; then it proceeds downwards from the left fide to the right, and obliquely forward, and makes feveral convolutions, which are chiefly

fituated in the upper part of the regio umbilicalis.

JEMOU, or JEMU. See GAMBOGIA.

JEQUI TINGUACU. A species of the soap-bearing

JESUITARUM PULVIS. JESUIT'S POWDER. The Peruvian bark, when powdered, was thus named, because that Father de Lugo, a Jesuit, first brought it to Rome, and the Jesuits there powdered it, and kept it among themselves as a lucrative article. See CORT. PERUVIAN.

JETAIBA. The Brasilian name for the locust-tree,

also the gum anime, and of the courbaril.

JETICA. The Brasilian name for Spanish potatoes-See BATTATAS HISPANICA.

JETICUCU. The Brafilian name for mechascan.
JITO. A name of two trees mentioned in Ray's History of Plants, but they are not of much note in me-

JONDRABA. A species of thlaspidium. JOVIS FLOS. Gracus. SAFFRON.

JUBA. In botany, it is a panicle, so called, from its refemblance to a horse's mane.

JUCAIA ARBOR. A tree which refembles the pome-granate-tree. See Raii Hift. JUDAICA ARBOR. See SILIQUASTRUM. JUDAICUM BITUMEN. See BITUMEN.

JUDICATORIA. A fynocha of four days.
JUGALE OS, vel JUGAMENTUM, from jugum, a

voke. Sec ZYGOMA.

JUGALIS SUTURA. The SAGITTAL SUTURE is fometimes thus called. It is also the future by which the os jugale is articulated to the bone of the upper

JUGIS VITA. See AGE Vita.
JUGLANS, from juvando, to help, and glans, a mut; or rather from Jovis glans, the nut of Jupiter. The WALLNUT. It is also called nun regia, regia vulgaris, nux bafilica, nux Perfica, nux Euboica, caryon, and caryon bafilican. It is the juglans regia, Linn. Boerhaave men-tions five species. The kernel is of the same nature as tions five species. that of almonds; the shells are aftringent; the oil expressed from the kernel is of the same nature also as that of almonds; an ointment made by boiling the leaves of the walnut-tree in lard is a ufeful application to old ulcers; the bark of the tree is a ftrong emetic; the catkins are

emetic; the juice of the root purges brikly; the powdered leaves destroy worms in the human body.

JUGULARES VENÆ. The JUGULAR VEINS.
They are the external and internal. They correspond with the carotid arteries. These are also called Venæ

JUGULUM. The THROAT, or anterior part of the neck. In Celfus, lib. viii. cap. 8. it fignifies the cla-

JUJUBA. Also called zizipha, ziziphus. The ju-jube-tree. The rhamnus ziziphus, Linn. Jujuhes are an half-dried fruit of the plum kind, about the fize and shape of an olive, consisting of a thickith, reddish, yellow ikin, a whitish fungous pulp, and a wrinkled stone pointed at both ends. They are the produce of a prickly tree, with three-ribbed leaves, and herbaceous or yellow-ish flowers, fometimes found wild, but commonly culti-

vated in the fouthern parts of Europe.

This fruit is incraffant and demulcent, and hath been

used in pectoral decoctions.

The sebesten, called also myxa, or myxaria, is a species of the same, but they are all neglected in the present

Zizipha, called also olea sylvestris, eleagnus orientalis, oleaster Cappadocicus, wild jujube, or olive of Bo-HEMIA.

This is a species of jujube, but it is not of any note in medicine.

JUJUBA INDICA, also called ziziphus Indica, zizyphus Zeylanica, periu toddali. The LACCA-TREE.

From this tree the gum lacca of the shops is ob-

JULAPIUM, called also julap, juleb, julepus; JULEP. This form of medicine the Arabians invented. It is a liquid medicine that is clear and fweet. It is fo called because usually prepared of sweet ingredients, or at least with sugar. The word julep, or juleb, in the Persian language, fignifies a fueet portion.

A julep among the ancients was a fweet apozem, pre-

pared as it was wanted.

A julep is an agreeable form for administering cordials, and fome other classes of medicines; but it is generally only a vehicle for other articles, or to render them more eafy in the stomach, or otherwise more effectual; on which account they should not only be contrived to be agreeable, but also of articles concurrent with the intention of the principal medicine. In this form are many medicines conveyed into the machine, and named after the material used, as Julepum 1. 2. Camphora; 2. Creta, a Moscho; but this term is now almost rejected.

JULEP. A name for fyrupus.
JUNCARIA. ITALIAN RUSHY HORSE-TAIL. Le-

mery mentions this as vulnerary, deterfive, &c. but it is | not known in prefent practice.

JUNCTURA, from jungo, to join. ARTICULA-

TION.

JUNCUS. The RUSH. Many are the species of rush mentioned by botanists, but they are not much noted in medicine.

JUNCUS BOMBYCINUS. See LINAGROSTIS. CAPIT. LANUQUIN.

- ODORATUS, called also fanum vel framen cametorum, febenanthus, bolofebanos, fquinanthum, juneus aromaticus, palea de mecha, gramen dactylon aromaticum, sweet-Rush, or Camel's-Hay. This is the principal, a dried herb of the grafs kind, brought from Turkey and Arabia. It refembles barley-ftraw. It is full of a fungous pith. It is the andropogon schananthus, Linn.

When in perfection it is agreeable to the smell; warm, bitterish, and not unpleasant to the taste. An extract possessies the chief of its virtues; but other more

valuable articles supercede its use.

JUNICA.

JUNIPAPACEYWA. See JANIPABA BRASILIENSIS.

JUNIPERINUM LIGNUM. Juniperus commuJUNIPERUS. JUNIPER. nis; or, juniperus
fol. ternis patentibus mucronatis, bacca longioribus, Linn. It is also called arceuthes. With us this is only a bush, but in Norway it grows to the fize of a large tree. It is an evergreen. Its leaves are flender, narrow, fliff, and fharp-pointed; the flowers are a kind of catkins; the berries have each three oblong irregular feeds.

The berries are chiefly brought to us from Holland, or from Italy. They should be chosen fresh, not much shrivelled and free from mouldiness. They have a moderately ftrong, but not difagreeable fmell; a warm pungent fweetish taste, which, if they are long chewed, or previously bruifed, is followed by a considerable bitternefs. The fweetness feems to reside in the juice, or pulpy part of the berry; the pungency, in the bark; the bitternefs, in the feeds; and the aromatic flavour in the oily veficles foread throughout the pulp, and the feeds. In the dried berries this oil is hardened into a refinous fubstance, which is visible on breaking the seeds.

They give out nearly all their virtue both to water and to fpirit. Diffilled with water, they yield a yellowish effential oil, which much refembles that of turpentine in

its medical qualities.

The'e berries are carminative, detergent, and diurctic,

approaching in quality to that of turpentine.

The London College order the fpiritus juniperi comp.

COMPOUND STIRIT of JUNIPER, formerly called aq.

juniperi composita, to be thus made:

Take of juniper berries, bruised, one pound; carraway and fennel seeds, bruised, of each one ounce and a half; proof spirit of wine, one gallon; water, quantity sufficient to avoid an empyreuma;—distill off a gallon. Pharm. Lond. 1788.

The coriander feeds also answer the same purpose as those herein ordered; but to a pound of the berries there should be half a pound of these.

Ros BACCHARUM JUNIPERI. The Ros of JUNIPER BERRIES.

Boil juniper berries well bruifed in water, or take the decoction, after diffilling them for the oil, and infpillate to the confifence of thick honey. This is fo effected among the Germans, as to have obtained the name of theriaca Germanorum. It may be used in catarrhs, weakness of the stomach, and difficulty in making water: though by fome it is confidered as an inactive preparation.

The wood of the juniper tree, called lignum juniperinum, and cedrinum lignum, is sudorific, and of similar qualities with that of guaiacum and faffafras, but much

inferior to either.

The refin which is obtained in warmer climes, particularly in Africa, where is a large species of juniper tree, is femipellucid, and of a pale yellowish colour; it is in glebes, resembling mattich, but larger. It is the fandaracha of the Arabians, and the gum juniper of the shops. From the use it is put to, some call it versix. This refin hath a light agreeable fmell, and not much tafte. It diffolves in fp. vini r. if violently flook in it; and in oils both expressed and distilled, but it gives nothing to water. See Lewis's Mat. Med. Cullen's Mat. Med.

JUNIPERUS. A name of feveral species of cedar. See CEDRUS FOLIO CYPRI, and CEDRUS PHOENICIA.

- LYCIA. See OLIBANUM.
- SABINA. See SABINA.
JUPICANGA, See CHINA OCCIDENTALIS. JUPITER. A name for TIN. See STANNUM.

JUS. BROTH. Broths made of the lean parts of beef, mutton, &c. are very nourifhing, when used as aliment; but it should be observed, that in weak, worn-out constitutions, firong broths cannot be digefted, and that the strength thereof should always be proportioned to the strength of the patient.

JUSTICIA; fo Dr. Houftoun named a plant in honour of James Juffice, efq. Miller mentions two species of it; but there are no medical virtues attributed to it. See ADHATODA, the genus of which Linnæus calls jufficia.

JUVANTIA, ADJUVANTIA. Whatever relieves under a distemper, whether it is an aliment, medicine, or any of the non-naturals, are thus named. Alfo, things that help; and ladentia, things that offend. Two technical terms. When the nature of a diftemper was doubtful or unknown, the ancients prescribed some innocent medicines which they were well acquainted with, and according as they did either good or hurt, though in a fmall degree, they formed a judgment of the method by which the cure was to be attempted.

JUXTANGINA. The species of quinfy called -cy-

nanche, or rather paracynanche.

## KAL

KABALA See CABALA.

KABOLOSSA

KABOLOSSA
KINBUNNAWELL. See CHINA OCCIDENTALIS.
KACHIMIA. A barbarous word for cacochymia.

KAHA. See Checoma.

KAIDA. Ray takes notice of four species of these shrubs, viz. kaida, kaida-taddi, perin-kaida taddi, and kaida-tsjerria. They are produced in the East Indies.

KAKA-MOULLON, KAHA MULLU. An East Indian sliquose tree. The bark is boiled in milk, and is

faid to cure a diabetes and gonorrheea. Raii Hift.

KAKA-NIARA. An Eaft Indian tree, the leaves of which deftroy worms. See Raii Hift.

KAKA-TODDALI. A fmall fhrub growing in Malabar, and much used there in various diforders from a redundancy of ferum. Raii Hift.

KAKIMIA. A barbarous word for cachymia.

KALENZI-KANSJAVA. See BANGUE.
KALI, also called falfola, falicarnia, alga marina,
salt-wort, and snail-seeded glass-wort. Miller

enumerates eighteen species.

Kali is a plant with fpreading, reddifh, pretty thick branches: oblong, narrow, pointed, fleshy leaves, like those of houseleek. The flowers are imperfect in the bofoms of the leaves, are followed each by one feed fpirally curled, and inclosed in the cup. It is annual, grows wild on the fea-coasts in the fouthern parts of Europe,

particularly of the Mediterranean.

The herb is juicy, taftes bitterifh, and remarkably fa-ne. The expressed juice, and infusions, or decoctions of the leaves, are faid to be powerfully aperient and diuretic, and in this intention have been much recommended in dropfies; but the kali is principally regarded on account of its yielding copiously the fixt alkaline salt, called
foda, or soude. The plant is cultivated about Montpelier, for the sake of the salt. Much of this salt is prepared at Alicant in Spain, from a different species of kali. Different marine plants contain this falt, and what is made in Scotland and Ireland is called KELP.

From the quercus marina, also called fueus vesiculosus, fucus maritimus, alga marina, SEA-OAK, OT SEA-WRACK. Much alkaline falt is obtained by incineration; the juice of its vesicles, left to putrify, yields on evaporation a

portion of acrid pungent falt.

This plant is a foft flippery one, common on rocks that are left dry at the ebb-tide; the leaves refemble those of the oak-tree in shape, the stakes running along the middle of the leaves, and terminated by watery bladders, containing either air or a slippery matter. The vessels begin to sill in March, and burst about the end of July, and discharge a matter thick as honey.

## KAL

If the putrid juice of this plant is applied to the skin, if finks into it immediately, excites a slight sense of purgency, and deterges like a solution of soap. One of the best applications at the decline of glandular swellings for perfectly discussing them, is a mixture of the juicy vesseles on the leaves of this plant, gathered in July, with an equal quantity of sea-water; they should be kept in a glass vessel for ten or sisten days, until the liquor becomes of the consistence of thin honey. The parts affected are to be rubbed with the strained liquor two or three times a day, and afterwards washed clean with water.

day, and afterwards washed clean with water.

The fixed alkaliue salts obtained from these plants are the same as the mineral fixed alkaline salt. See ALCALI

and ALGA.

KALI. A name of fome species of chenopodium. KALI, vice SAL ABSINTHII. See ALCALI. KALI ACETATUM. See SAL DIURETICUS. KALI TARTARISATUM. See TARTARUM. KALI VITRIOLATUM. See NITRUM VITRIOLA-TUM, under NITRUM.

KALI PURUM. PURE KALI. Formerly the ALKALI VE-GETABILE FIXUM CAUSTICUM. FIXED VEGET-ABLE CAUSTIC ALKALI.

Take the water of pure kali one gallon; evaporate it to dryness; afterwards melt it by fire, and let it be poured off. Ph. Lond. 1788.

KALI SULPHURATUM. SULPHURATED KALI, commonly called HEPAR SULPHURIS. LIVER of SULPHUR.

Take flowers of fulphur one ounce, kali five ounces; mix the falt with the fulphur melted by a flow fire, by constant stirring, till they perfectly unite. Ph. Lond. 1788. The dose is from five grains to a scruple. In tetters, and other cutaneous affections this has been recommended. Some have employed it diffolved in water, as a bath for the pfora; and in cases of tinea capitis it has often been used by way of lotion, and has been through recommended to prevent the effects of mineral

KALI TARTARISATUM. TARTARIZED KALI. For-merly Tartarum folubile. Soluble Tartar. See TARTARUM.

KALI AQUA. WATER of KALI, formerly LIXIVIUM TARTARI. LEY of TARTAR.

Take kali, one pound; fet it by in a moist place, till

it diffolves, and strain it. Ph. Lond. 1788.

This has the same medical properties as the kali preparatum, and is nothing more than that substance in a dissolved state; which may be made more extemporaneously by dissolving the falt in a proper proportion of distilled water.

KALI PURI AQUA. WATER of PURE KALI, formely LIXIVIUM SAPONARIUM. SOAP LEY.

Take of kali four pounds; quick-lime fix pounds; diffilled water four gallons; add to the lime four parts of water, and let them fland for an hour; then add the kali, and remaining part of the water; boil them for a

quarter of an hour; let the liquor cool, and ftrain: a pint of this liquor ought to weigh fixteen ounces. If the liquor raifes any effervescence by the addition of any acid, then add more lime. An earthen or glass vefect, then add more lime. An earthen or glass vefect, the liquor strained low; the fruit is divided into many partitions, the top of which comes when rine, and discloses many seeds. Boerfel thould be used in the process, and the liquor strained through linen. Pharm. Lond. 1788.

K. NDEL. Ray takes notice of fix species of this

thrub. Some of them are used for flaining linen with ; fome have medical virtues attributed to them, and others

KANELII. A name of two East Indian trees. They are ever-greens. The flowers are used in diarrheeas. See Raii Hift.

KAPA MARA. See ACAJAIBA. KARABE, i. c. CARABE. See Succinum and Am-

KARABITUS. An Arabic term for a pirenitis or delirium.

KARATAS. The PENGUIN, or wild ANANAS. It is common in the West Indies; the juice of the fruit is used to four punch with, but it is too auftere to be fwallowed

A LIP. The lips are all that are loofe before —— A LIP. The lips are all that are loose before the gums; the red part is called prolabium; the sphincher is called orbiculans labiorum. When the cuticula, which here is called epithelium, is taken off, there is a villous

ABBIA LEPORINA. The HARE-LIP; called alfo LABELLA LEP. LAGOSTOMA. It is when there is a fiffure in the upper lip, with a want of fubftance, like that of a hare, whence its name. The division is fometimes double, like the letter M; it is then called the DOUBLE. HARE-LIP. When this cafe happens to the under lip, it is called the SPURIOUS HARE-LIP. But fome late profef-

is called the spurious HARE-LIP. But iome late projectfors fay that this last never happens.

If an operation is required, first divide all its adhesions
internally with an incision knife, then with a straight pair
of scissars cut off all that is callous, so that you make an
angle at its upper part; then pierce the sip with two silver
pins, so as that the sides of the siffure may be brought and
kept in contact by them and the thread which is to be applied over them. Begin the thread on the upper pin. hinder the lips from teparating under the heads and points; apply little boliters to prevent their fitting uneafy upon the adjacent parts. Apply a pledgit of digeftive over the whole, fo as to keep the thread folt.

Mr. Pott observes, that when the bare-lip is double, it sometimes happens that the middle portion contracts itself up, and the bone projects. To begin the cure in this case remove the projecting bone by means of a chisself; when this is done the contracted part of the lip is to be brought down and detained there by bandage; atis to be brought down and detained there by bandage; afterwards proceed as in the fingle bare-lip, operating on one fide at a time, which is to be thoroughly healed before you proceed to the other. The pins should not be moved before the fixth or seventh day, and then first cut the stitches to see that the sless is securely joined before you move the pins. When a part of the bone is cut away, wait the healing thereof before you proceed with the bare-lip. See Le Dran's Operations. Heister's Surgery. Sharp's Operations. Bell's Surgery, vol. iv. p. 149. White's Surgery, p. 269.

LABIÆ PUDENDÆ. Called alfo CREMNOI. They arise from the mons Veneris, lying on the fore part of arite from the mons Veneris, lying on the fore part of the pubes, and extending down under the edge of the offa pubis, whose symphysis is exactly between them. They are more prominent and thick above than below, and unite below at the perinæum. They are com-posed of skin, cellular membraste, and fat; red with-in, and outwardly are covered with hair at the age of

puberty

LABIALES ARTERIÆ. See MAXILLARIÆ AR-

TERLE.

- GLANDULE. The LABIAL GLANDS. membrane which covers the infide of the lips is a con-tinuation of that on the cheeks; it is also perforated by many finall holes, which answer to the fame number of finall glands. See Winflow's Anatomy.

## LAC

LABIS. Any forceps, from naulare, to lay hold of. LABRA. See LABIA PUDENDA. LABRISULCIUM. A CHAP IN THE LIP, or the

fame as cheilscace. It is a scrophulous symptom.

The labrifulcium, or chapped upper-lip, as it is a scrophulous symptom, it requires the same treatment as is usual in that disease; thus the swelling of the lip is taken down, at least for a time, until a fresh cold, or other error of the non-naturals, occasion a new sluxion. The cleft or hap itself may be rubbed with the ol. cerm, or with the ol. amygd. and fpermaceti.

Arnoldus Boot treats of this fymptom particularly in his tenth chapter, under the name of cheilocace, where he observes that children are the usual subjects of it. See Turner's Surgery. This also is the name given to the

CANCRUM ORIS, which fee.

LABRUM VENERIS. The FULLER'S TRISTLE.

See CARDUUS FULLONUM SYLVESTRIS.

LABRUSCA, i. e. Vitis fylosfiris, feu ALBA. See BRYONIA ALBA.

LABURNUM, also called anagiris non fatida major, cytifus Alpinus, acopos, PEASE-COD-TREE, or STINKING BEAN-TREFOIL-TREE. Boerhaave mentions fixteen species. One of the species is called ebony of the Alps, as when polished it very much refembles ebony, and is used for making chairs, &c. It is easily raised, and would be a profitable article here for the cabinet-makers, &c.

LABYRINTHUS. The LABYRINTH. The second

LABYRINTHUS. The LABYRINTH. The lecond cavity of the ear, called also fodina. It lies in the pars petrofa of the temporal bone, which runs forward and inward. It is an oblong body, divided into three parts, called the vestibulum, the cochlea, and the semi-circular canals. The vestibulum (on which the stapes stands) is situated in the middle; the cochlea is the anterior, and lies forward and inward; and the semi-circular canals which compasses the posterior part, lies backward lar canals which compose the posterior part, lies backward and outward. The three parts of the labyrinth are lined by a fine periosteum, which spreads over and shuts the

two feneffree of the tympanum.

LAC. MILK. Milk is very little if at all different from the chyle, as when it is taken by the lacteals. See CHYLUS. It is a fluid prepared and fecreted in the bodies of animals, but not completely elaborated into an animal nature. On a chemical analysis it yields the same general principle with fubiliances of the vegetable king-

Milk differs in degrees of goodness in the following or-ders; the best is woman's, the next is ass's, mare's, goat's sheep's, and the worst is cow's, because it is the strongest

and most difficultly digested.

When milk is gone cold, like most other animal fluids, it loses much of its excellent qualities, and warming it is fo far from restoring them, that they are totally destroyed by it. When milk is boiled, it becomes a very improper aliment for weakly persons, and for those who have weak ftomachs.

If milk is directed for a nourifhing diet, and the patient is reduced to extreme feebleness, it should be fucked from the breaft of a middle-aged woman, of a good habit of body, who lives foberly, and uses moderate exercise; let the patient fuck four or five hours after the woman hath

alike improper. Of the advantage and difadvantage of using milk before and after the circumambient air is mixed with it, is frequently hinted at by Galen, and the pre-

ference of the first he strongly urges.

When a milk diet is used by persons whose strength is not so extremely reduced as to render a breast necessary, it should, if possible, be drank while warm from the cow; and in such disorders, or in such circumstances of the conflitution, as are relieved by a total diet of milt, at least four pints should be taken every day. This will not suf-fice for making or keeping the body robust; but for the valetudinary, the sedentary, and studious, it is not only fufficient, but the most proper.

When milk feems to difagree, a tea-spoon-full of the

spirit of hartshorn to a pint, or a draught of lime-water, if drank as foon as it is clear, and before the heat is diffipated, which is excited on mixing the lime and water together, or the chewing of bark in a morning, and a little rhubarb at night, will render it eafy on the flomach and promote its digeflion.

Milk is demulcent and nutritious; but whatever difpofes it to curdle, renders it in proportion indigestible; it is an improper aliment in febrile and bilious diforders; but gall, as well as lime-water, when taken into the stomach, powerfully disfolves milk that is coagulated

Milk confifts of oil, mucilage, fugar, water, and air. The connits of on, internage, lugar, water, and air.

The oil fpontaneously separates, and is called cream; the mucilage is the coagulable part, which is separated by mixing rennet with it, and of this they make checse: that it possesses air is proved by placing it under the receiver of an air-pump, after having heated it a little; and as to the sugar, it is separated by the following method.

#### SACCHARUM LACTIS. SUGAR of MILK.

Take the whey of cow's milk (made with calf's rennet), clarify it with the white of an egg, and if not per-fectly limpid, pass it through a filter, then evaporate it in a glass vessel, in the heat of a water-bath, and set in a cool cellar to crystallize. The crystals are to be washed with cold water. This is as directed in the Ph. Paris;

but Dr. Lewis recommends the following:

Take ass's milk, whilst new, and evaporate it to dry-nefs, digesting the dry mater in water till all its soluble parts are extracted, and then infpiffate the filtered liquor. This preparation is fweet, though neither white nor cryftalline; nor is it perhaps in the pure crystalline part of the milk that the virtue of it lies. The medicinal quality is in the faccharine part, whence women's and afs's are most medicinal; but the nutritive quality is in those parts which abound more in the milk of goats and cows, whence, as a nutritive, their milk is preferred.

According to Hoffman's observation, twelve ounces of woman's milk leaves on evaporation eight drams of folid matter, of which boiling water diffolyes fix drams; this folution yields a rich (weet falt. He observes the same of afs's milk. The fame quantity of cow's milk leaves thirteen drams of folid matter, from which water extracts only one dram and a half; the falt it affords is not very fweet, and it dissolves difficultly. All other milks are of

an intermediate nature.

#### SERUM LACTIS. The WHEY of MILK.

Whey from milk is cooling, diluent, and aperient; it promotes the natural excretions, and increases the action of the purgative fweets, as cassia, manna, &c. It contains the nutritive and most of the faccharine part of milk, though it is freed from the more indigestible caseous part. A more agreeable whey may be made by the following method than by that which is used in separating the curd for cheefe.

Evaporate new milk over a very gentle heat to dryness; then pour upon the remaining yellow grumous powder as much pure water as there was of milk, then boil them until the powder is diffolved, and strain it for use.

If whey is taken medicinally, it should be drank for fix or eight weeks, at the rate of four or five pints a day.

A pint of cow's milk being evaporated, about an ounce and a half of yellow powder remained, of which a dram and a half diffolved in water. From a pint of woman's milk, hardly an ounce of dry matter remained, but water

taken her ufual meals; much before or much after are diffolved more than one half it. The proportions were

the fame, when ass's milk was used.

Milk is supposed to contain a portion of animal mat-ter, and as the animals which afford it feed almost wholly, on vegetable substances, it is concluded to be an aliment of an intermediate nature between animal and vegetable; and thus should it be confidered in our application to and thus should it be considered in our application to valetudinarians. Dr. Cullen has given a long account of milk, and the separate parts of which it is composed, which is well worthy of being consulted. See his Mat. Med. 1789.

LAC ACTOSUM. 'The folvent with which the philo-

fopher's ftone is prepared.

- AMYGDAL A. MILK OF ALMONDS. So fome call the almond emulsion. See EMULSIO.

ASINIUM ARTIFICIALE. See ERYNGIUM.
 CALCIS. MILK OF LIME. So fome call the water which is whitened by a folution of quick-lime.

- LUNE also called agaricus mineralis, medulla faxi, marga candida, WHITE STONE MARLE. It is a species of marle which partakes very much of the nature of chalk. In reality it is a fort of calcareous earth.

- sulphuris. See Sulph. Præcipit.
- virginalis. See Benzoinum.
LACAPHTHON. P. Ægineta explains it as the bark of a tree of an aromatic kind. It is not certainly

known what it is.

LACCA. LAC, or GUM LAC; ancefa. It is a concrete brittle fubflance, of a dark red colour, brought from the East Indies; the best from Ceylon: it is incrusted on pieces of sticks, internally divided into cells; it is faid to be the refinous juice of the jujube-tree. See Jujuba (but most probably it is met with on different binds of trees), it is faid to be collected by winned red kinds of trees); it is faid to be collected by winged red infects of the ant kind, or it is their wax, and is impregnated with their colouring matter, and is either depe-fited by them on branches of trees, or on flicks placed for them; this is called STICK-LAC. In the cells, small red bodies are often observed, which appear to be the young infects. If the STICK-LAC is broken into fmall pieces, and is infused into warm water until it ceases to give any tincture to the liquor, the remainder appears of a transparent, yellowish, brown-colour, and is called seen-LAC; and on raising the heat fo as to melt the SEED-LAC, it rifes to the furface, and is formed into what is called SHELL-LAC.

The feed and fbell-lacs being robbed of the colour-ing animal matter, feems to be of an intermediate ing animal matter, feems to be of an intermediate nature between that of wax and refin, and to partake of the nature of both. They crumble on chewing, and do not foften or flick together again; laid on a hot iron, they catch fire, and foon burn away. If diffilled like wax, they yield an acid fpirit, and a butyraceous oil. Alkaline lixivia, and volatile alkaline fpirit, diffolve them into a purplift liquor. With the help of heat they diffolve in for whit. folve in fp. vini r. Alum promotes its folution in boiling water. It is not used in medicine; the colouring matter ferves as a paint, and the rest is employed for fealing-wax. See Neumann's Chem. Works. Dict. of Lewis's Mat. Med.

LACCOPEDON. So the Athenians called the lax part of the fcrotum.

LACERATURA. A LACERATED WOUND. The

fame as vulnus, which fee.

LACERTULI. Bundles, c. g. of fibres, &c.

LACERTUS. That part of the arm from the shoulder to the elbow.

LACERUM FORAMEN. It is one of the inner holes in the head through, which the third, fourth, first branch of the fifth, and the fixth pair of nerves

LACHRYMA ABIEGNA. See TEREBINTHINA. Joni, also called lithospermum, milium arundinaceum, REED MILLET, JOB'S TEARS. The seeds refemble tears, whence one of the names above given to

this plant, which hath the appearance of a reed. The

feeds are faid to be lithrontripic, but they are not in much hurtful, and often more pernicious, than an immoderate use. Raji Hist. Raji Hift.

LACHRYMALIA OSSA. See UNGUIS OSSA.

— PUNCTA. At a little diffance from the internal angle of the eye, on the edge of the eye-lids, may be feen two fmall holes, which are the orifices into the lachrymal channels and bag, and they are thus

LACHRYMALIS GLANDULA. The ancients called it innaminata glandula. In the upper part of the focket, a little above the external angle of the eye, is a depression, which receives the superior part of the glandula lacbrymalis. This gland is white, oblong, and of the conglomerate kind, composed of several small lobes, each of which fends out its excretory duct; it is fituated behind the tunica conjunctiva of the upper eye-lid, near the outer canthus; the ducts pierce obliquely the tunica conjunctiva of the upper-lid near the outer canthus, per-forate the internal membrane of the same eye-lid, and open on the infide of the tunica conjunctiva, near the fu-perior part of the tarfus. These ducts were first discover-ed in the quadruped; they are very small in the human subject. Dr. Hunter demonstrated them in the first course of lectures which he publicly gave. The use of these glands is to secrete a sluid for keeping the eye continually moift, and for washing away such foreign bodies as may

accidentaly be lodged there.

The fifth pair of nerves from the head, divided into branches, the first of which is called the orbitary branch; and this is subdivided into three more, the third of which is called the lachrymal branch;

it goes chiefly to the lachrymal gland. LACINIE. In botany it fignifies the incifores, or jags, on the borders of leaves or flowers; hence they are

faid to be laciniated, and called laciniati.

LACONICUM. A STOVE, BAGNIO, OF SWEATING-

ROOM. See CALIDARIUM.

LACTARIA. Aliments prepared of milk. The fame as la Ricinia

LACTATIO. LACTATION, or GIVING SUCK. The mother's breaft, if possible, should be allowed the child, at least during the first month, for thus the child is more peculiarly benefited by what it fucks, and the mother is preserved from more real inconveniences than the fallely delicate imagine they would suffer by compliance herewith; but if by reason of an infirm constitution, or other causes, the mother cannot suckle her child, let dry-nursing under the mother's eye be purfued.

When women lose their appetite by giving suck, both the children and themselves are thereby injured; wet nurses are to be preferred, who, during the time they give the breaft, have rather an increased appetite, and digest more quickly; the former are apt to waste away, and fometimes die confumptive. In thort, those nurses with whom lastation may for a while agree, should wean the child as soon as their appetite lessens, their strength seems to fail, or a tendency to hysteric symptoms are

When the new-born child is to be brought up by the mother's breaft, apply it in ten or twelve hours after de-livery faereto; thus the milk is fooner and more eafily fupplied, and there is lefs hazard of a fever than when the child is not put to it before the milk begins to flow of

If the mother does not fuckle her child, her breafts fhould be kept warm with flannels, or with a hare-kin, that a conflant perfpiration may be supported; thus there rarely will arise much inconvenience from the

The child, notwithstanding all our care in dry-nursing, fometimes pines if a breaft is not allowed. In this cafe, a wet-nurse should be provided, if possible one that hath not been long delivered of a child. She should be young, of a healthy habit, and an active disposition, a mild tem-per, and whose breasts are well filled with milk. If the milk is good, it is fweetish to the taste, and totally free from faltness; to the eye it appears thin, and of a bluish caft; that the woman hath her menfes, if in other respects objections are not made, this need not be any; and as to the cuftom with many, of abstaining from venery while they continue to fuckle a child, it is to far without reason to support it, that the truth is, a rigorous chastity is as

haired women being improper for wet-nuries.

If the menfes do not appear during the first months, but after fix or eight months sucking they begin to defeend, the child thould be weaned.

Wet-nurses should eat, at least, one hearty meal of animal food every day; with this a proper quantity of veget-ables should be mixed. Thin broth, or milk, are proper for their breakfalts and their suppers; and if the strength thould feem to fail a little, a draught of good ale should now and then be allowed; but spirituous liquors, must, in general, be foreborn, not but a fpoonful of rum may be allowed in a quart of milk and water, i. c. (a pint of each) which is a proper common drink.

Though it is well observed by Dr. Hunter, that the far greater number of those women who have cancers in the breast or womb, are old maids, and those who refuse to give fuck to their children; yet it is the unhappiness of some willing mothers not to be able; for instance, those with tender constitutions, and that are subject to nervous disorders; those who do not eat a fufficient quantity of folid food, nor enjoy the benefit of exercise and air: if chil-dren are kept at their breasts, they either die whilst young, or are weak and sickly after childhood is past, and so on

through remaining life.

LACTEA FEBRIS. The MILK-FEVER. This frequently happens after delivery. It is the cuftom of many, not to apply the child to its mother's breafts before the milk flows freely of itself; thus, by the third or fourth day after delivery, a fever is brought on, with a train of other ill effects. The milk-fever rarely happens to any but those who have deferred letting the child suck for two or three days after delivery; then the breaft is for full that it cannot easily be emptied, consequently, it be-comes inflamed, and the evacuation that way being suppressed, a fever is excited. Where there is a secretion of milk, its due discharge is as necessary as that of the lochia; the stoppage of either produces the same com-

plaint, viz. the milk-fever, by occasioning a plethora. Other imprudencies may give rise to this disorder, or accidents that were not so easy to avoid may be the preceding causes. The more immediate causes are a distension of the nerves in the breafts, which is readily diffinguished by the fwelling of the glands; and an abforption of milk, which hath become acrid by stagnating in the breast, and is known by a rigor and looseness coming on after the breasts

have been inflamed and painful.

The usual symptoms are pain and diffension in the breasts. These extend often to the arm-pits, where the pain is very considerable. Sometimes the breasts become hard, hot, and inflamed; then thirst, head-ach, and fear feel or fellow. ver foon follow.

If the diforder is not violent, it continues a day or two, then fpontaneously vanishes by a copious perspiration.

If the patient is fanguine and robust, blood may be

taken from the arm; but as this is rarely required, fome caution should attend its use. Apply the child to the breasts, and linen cloths dipped in fresh cool-drawn lineed oil must be laid over them; the bowels should be emptied by means of a clyfter, or a gentle cooling purge may be given. Thefe, with the faline mixture, and the ufual modes of administering antimonial preparations,

rarely fail to carry off the difease.

A thin, cooling diet, consisting chiefly of panada, barley-water, and fuch like, should be used, until the vio-

lence of the fymptoms are removed.

If the breafts should suppurate, proceed as in an ABSCESS of the BREAST, which see. See also Kirkland on Child-bed Fevers.

- VASA. The LACTEAL VESSELS. They arise by imperceptible beginnings from the intestines, and ramify upon them as the arteries; they run through the mesentery in long solitary trunks, and in their way to the receptaculum chyli through the lymphatic glands at the root of the melentery; they unite with each other, and with the lymphatics about the laft dorfal, or first and fecond lumbar vertebræ, to form the receptaculum chyli (which by and by becomes fmaller than many of its branches); it lies upon the right fide and behind the aorta; climbs up between the aorta and the vena azy-

gos behind the cofophagus, and here is called the thoracic, thus named, so are the glands, or their excretory ducts; when it arrives at the curvature of the acrta it passes in the urethra. They are any drain or furrow, from duct; when it arrives at the curvature of the actta it palies in the utcula.

to the left fide, lies close to the pleura, comes upon the fide of the vertebrae colli, and terminates in the angle between the internal jugular and the left fubclavian vein.

LADA. BLACK PEPPER. See PIPER NIGRUM.

LADA CHILLI. Guinea Pepper.

LADA CHILLI. Guinea Pepper. thoracic duct; so that every lacteal pressure will force up the chyle, as that by infpiration and the pulfation of the

Any compression upon the thoracic duct will occasion

an atrophy and death.

The latteals are the absorbents of the bowels, beginning in their inner furface; the same kind of vessels are called absorbents, or lymphatics, in other parts of the body, and take their rise from the surfaces of the respective parts; so that the latteals, lymphatics, and absorbents, are all the fame kinds of veticls. Dr. Hunter fays that the lacteals and lymphatics are the fame veffels, only differing in their fituation; and they both terminate in the

The vafa chylifera are also called venæ latter, because their valves are disposed as those of the blood-veins are, and because like them they convey their contents from

fmaller to larger tubes.

Dr. Harvey discovered the lymphatics in the year 1616. In 1627 they were published by another author. Afelius and Pecquet discovered the receptacle of the chyle and the thoracic duck. Pecquet demonstrated them at Paris in the year 1651 and 1652. Uzzzlius discovered the lacme the year 1051 and 1052. Ozzanus discovered the lat-teals in a dog, running to the mesenteric glands; this was in the year 1562. See Winslow's Anatomy, and Monro's description of the receptacles of the chyle and the thoracic duct, at the end of his Osteology. LACTICA. The Arabian name for that species of sever which the Greeks call typhes or typhedes.

LACTICINIA vel LACTARIA. Aliments prepared of milk, called GALACTINA. It is nied in another fenie

See ANIMELLA

LACTIFERI DUCTUS, vel TUBULI. The glandular body of the breaft contains a white mass, which is merely a collection of membranous ducts; they are narrow at their origin, broad in the middle, and contract again as they approach the papillae, near which they form a kind of circle of communication. These are lactiferous duets. See MAMMR.

LACTIFERUS. Lastiferous plants are those which

abound with a milky juice.

LACFUCA. LETTUCE, called also marullium. It is a plant with flender but firm stalks, which yield, as do the leaves, a milky juice on being wounded. The flower confifts of a number of flat flotculi fet in a finall fealy cup, followed by thort flat feeds, which are pointed at both ends, and winged with down. It is also the name of feveral forts of chondrilla.

AGNINA, alfo called locusta, valeriana eampestris inedera major, valerianella arven'is pracox humilis femine compresso, LAMES-LETTUCE, and CORN-SALLAD.

- MARINA, also called fueus lactucar folio, lichen arinus, muscus marinus, bryon marinum, intybacea. OYSTER-GREEN.

- SYLVESTRIS, called also fearisla, lastuca graveo-

This last is a species of fucus of the same use as the alga; but of lettuces that are proper species, Boerhaave

enumerates fifty-five different ones.

In general lettuces are emollient, refrigerating, fapona-ceous, refolvent, diuretic, and laxative. They are better to be eaten raw than boiled; though in this state they afford little nourishment, but when boiled they prove more fweet and mueilaginous, and therefore may be confidered as more mutritious. They are are cafily digested, but afford very little nourithment. Their milky juice inspiffated is a kind of opium; but as a medicine they are not celebrated.

LACTUCELLA. Sow THISTLE. LACTUCIMINA. APHTHE.

LACTUMEN. See ACHOR.

LACTUMINA. Little ulcers, or crufty feabs in the fkin, fo called because they chiefly happen to children at the breast.

LACUNE. Certain excretory ducts in the vagina are

LADANUM; also called labdanum, ciftus, ciftus ladanifera, ledon Cretenfe. The TRUE LADANIFEROUS SHRUB. Ciffus Creticus, Linns The gum labdanum is a refinous juice which exudes upon the leaves of this flirub ! it grows plentifully in Candy, Arabia, and other parts of the Archipelago The juice is collected by flightly bruifing the flirub, during the fummer heats, with a kind of rake, which hath feveral leather thongs fixed to it instead of teeth; the unctuous juice adheres to the thongs, and is afterwards feraped off with knives. The plant grows in fandy places on the fea-shore, which accounts for the quantity of fand that is mixed with the gum;

There are two forts of gum labdanum. The best is in dark-coloured black maffes, of the confiftence of a plaster, and grows still softer on being handled; the other is in long rolls eurled up. It is harder than the former, but of a paler colour.

In general, this gum agrees in virtues with the balfam of Peru, but is rarely used otherwise than in external applications, and amongst perfumes. It hath an agree-able smell, and a light, pungent, bitterish taste; recti-shed spirit of wine dissolves nearly the whole of the pure gun; water takes up by infusion much of its smell and tafte. By diftillation with water, an effential oil arifes,

leaving behind it a brittle refin.

Heat foon and eafily destroys the specific flavour of this gum. See Lewis's Mat. Med. Neumann's Chem.

Works.

LÆDENTIA. See JUVANTIA.

LAMOS. The GULLET OF THROAT. A Greek primitive.

LAGAROS. An epithet for the right ventricle of

the heart.

LAGOCHEILOS, from hayer, a bare, and xaiher, a lip. A person with a hare's lip.

LAGON. The FEANK.

LAGOPHTHALMIA, I from hayer, a bare, and LAGOPHTHALMUS, I optimize, an eye. See Ec-

LAGOPODIUM, called also pes leporinut, trifolium LAGOPUS, arvense bumile specatum, HARE's-FOOT, OF HARE'S-FOOT TREFOIL, HERB TRINITY, or TRINTTY-GRASS. Boerhaave reckons it a fpecies of trifolium. It is a low fpreading plant with narrow hairy leaves; the flowers are of a purple colour; the root perishes in winter. It grows amongst corn, and in fallow fields; it flowers in June and July. The whole plant is reckoned aftringent; but is rarely

LACOPUS. HARE-FOOTED; also a name of several species of trifolium and attagen.

LAGOSTOMA. The HARE-LIP. See LABIA LEPORINA.

LAIT REPANDU. See LYMPHÆDUCTUS.

LALO. It is the bark of the tree called bushab. It is mucilaginous, and powerfully promotes perspiration: See Couscous.

LAMAC. GUM. ARABICUM.

LAMBDACISMUS. A defect in speech, which con-

fifts in an inability to pronounce certain confonants.

LAMBDOIDES. The name of the future which runs betwixt the offa occipitis and parietalia. It is so called from its refemblance to the Greek letter A, lambda. It is also a name of the os hyoides.

LAMES PERSPIRABILES. So the ancients called

the cellular membrane.

LAMIA. See Canis Carcharias.

LAMINA CRIBROSA. The cribriform lamella. It is the horizontal plate of the os ethmoides, through which the olfactory nerves país. LAMINÆ SPONGIOSÆ INFERIORES. See Con-

CHÆ NARIUM INFERIORES.

LAMIUM. DEAD NETTLE. Boerhaave mentions feventeen species. It is also a name of several species of meliffa, marrubiastrum galopsis, and of the caf-LAMIUM ARCHANGEL, OF DEAD NETTLE.

- LUTEUM, called also galeopsis, leucas montana,

galesbdulon. YELLOW ARCHANGEL.

- MACULATUM, called also galeopsis lutea, milzadella, urtica lactea. Spotted Archangel.

--- Rubrum, also called lamium purpureum socii-dum, galeopus. RED ARCHANGEL, or SMALL DEAD

These plants are well known every where; infusions of them are commended as almost specific in the fluor albus, but experience hath not manifested any great usefulness, from them.

LAMPATAM. See CHINA ORIENTALIS. LAMPSANA, also called papillaris berba, napium, endivia erecta, &c. DOG-CRESSES, NIPPLE-WORT. It is a roughish plant, bearing small yellow slosculous flowers. It is annual, grows wild in fields, and by the fides of the roads. It is one of the bitter lactefeent plants, nearly fimilar in virtues to dandelion, endive, and others of the fame class. It hath been applied to ulcerations on the nipples, whence the names papillaris, and nipple-

The present practice does not notice it. It is also a used :

name of rapisfrum, and intybus.

LANA. Wool. Burnt wool is escharotic.

greafy with the fweat of the sheep, called aplytos by the Greeks. LANA SUCCIDA. SORDID WOOL, or that which is

LANARIA. A name of the lychnis fylvestris, of the

faponaria, and verbafeum.

LANGUOR. DEBILITY of SPIRITS.

LANGUOR PANNONICUS. See MORBUS HUNGARI-

LANIGERUS. Lanigerous trees are fuch as bear a woolly or downy fubstance, as is commonly contained in the catkins of the willow.

LANTANA. See VIBURNUM.

LANUGINOSUS, Lanuginous, or downy, as the

quince, &c.
LANUGO. Down. The feeds of plants which have a downy substance fastened to them, which ferves as wings to transport them, are termed lanuginous. They are also called pappous. See CHNUS.

LAONICA CURATIO. A method of curing the

gout by evaporating the morbid matter by topics.

LAPARA, the FLANKS, from Aana(u, to empty, because this part falls in as if empty.

LAPAROCELE. A rupture through the fide of the

LAPATHUM. Dock. It is a perennial plant, of which Boerhaave enumerates eighteen species. It is also

a name of a species of acetofa.

LAPATHUM ACUTUM; also called rumen; exylapachum; SHARP-POINTED DOCK. It is the rumen acutus, Linn. Docks are fo generally known as to render a de-feription needless. This species, whose leaves are sharper ointed than the common fort, hath a bitter aftringent tafte, but no remarkable fmell: the roots of the other common wild docks are nearly of the fame quality, equally discover their astringent matter both by the taste, and by striking an inky blackness with a solution of vitriol; but of the two, the sharp-pointed is to be preferred. The roots of both have a laxative as well as a corroborant quality; but the former quality is possessed in a very small degree. Water takes up all their virtue; and in fpring they are used with most advantage.

- Alpinum, also called hippelapathum retundife-lium, lapathum montanum, BASTARD MONKS RHUBARB. The leaves are very broad like those of burdock; the root is brown outwardly, and intenfely red within. This and the true species may be used indifferently.

· AQUATICUM; called also bydrolapathum; berta Britannica, lapathum palultre; GREAT WATER-DOCK. Hydrolapathum directed in the Materia Medica of the Edinb. College, is the rumen aquaticus, fol. cordatis acutis, floribus hermaphroditis, valvulis integerrimis nudis, Linn. But Dr. Broughton, in his Enchiri-dion Botanicum, deferibes the rumex hydrolapathum thus:—Rumex floribus hermaphroditis; valvulis integris graniferis foliis lanceolatis acutis. Hudf. 154. Mr. LAPPULA. A name of fome Curtis, in his Catalogue of Medicinal, &c. Plants, in bastard parsley. See CAUCALIS.

LAMIUM ALBUM, Linn. Also called urtica mortua, the London Botanic Garden, says, it is the rumex hy-Archangelica store albo, urtica alba, urtica iners. WHITE drolapathum, Linn. The leaves of this kind are from two to three feet long, and are faid to be laxative, but have upon trial been proved to be very inconfiderably fo; the roots are blackiff on the outfide, internally they are white, having a faint reddish tinge, which in drying changes in some parts to a yellowish or brown.

According to Muntingius, the name Britannicus is from a Teutonic word, which fignifies a power to fasten

loofe teeth.

This species of dock is found in most parts of England

by river fides.

It is a powerful antifcorbutic if freely taken internally; and a ftrong decoction of it puts a ftop to eating ulcers in the mouth and tonfils, cures spongy gums, &c. Boerhaave extols it from his own experience, as ufeful in fcorbutic, rheumatic, and cutaneous diforders, also in dif-orders from obstructed viscera. From the experience of others it is evidently useful in flatulent diforders, and a good affiftant to the flomach in its office of digefling.

If the root is dried and powdered, it is a powerful an-tifeptic, and in general is a good fubflitute for the bark; it is useful in many nervous diforders: but where the powder is unaccceptable, the following decoction may be

R Cort. e rad. hydrolap. # fs. coq. lenit. in aq. pluvialis # vi. ad # iv. & cola. cap. # fs. tepid. 4° in die.

The bark of the root contains the greatest proportion of the active parts; but the whole plant may be used, as it all contains the fame medical virtues with the root.

See Med. Muf. vol. i. p. 46, &c.

LAFATHUM HORTENSE, called also rhabarbarum monacherum, patientia, hippolapathum, fpinachia; MONKS RHU-BARB. The stalk of this dock is red, and branched towards the top; the root is thick at the head, but foon divides into feveral branches of a brown colour outwardly, and a deep yellow within. The virtues of the root are fimilar to those of the root of rhubarb, only differing in being less purgative and more astringent.

—— CHINENSE, ORIENTALE. See RHABARBARUM.

- RUBRUM; also called lapathum fanguineum, fan-

guis draconis berba, BLOOD-WORT.

The leaves are recommended as laxative, and the feeds for restraining uterine fluxes.

- UNCTUOSUM. See MERCURIALIS.

DOCK, or COMMON DOCK. The leaves are very large, roundift at the points, and are fourish to the taste. The root is bitter, astringent, and of a pale or yellowish colour. In France the root is in common use, and that for most of the same purposes as the great water-dock. The largest grow in most grounds, the smallest and most aftringent in dry.

LAPIDILLUM, or LAPIDILLUS. The name of a kind of fpoon, formerly used to take out small stones and fragments from the bladder.

LAPILLI. See Oculi Cancrorum. LAPIS. STONE. The fossilist divides flones into two classes; but according to the chemist, stone is formed by a mixture of an acid with earth, which is hardened by fubterranean heat, or petrified by cold. From the dif-ferent proportions of earth arifes different kinds of flones; the different kinds of earth diffolved by the acid af-fords another variety. A folution of fome metallic matter usually gives the colours. Stahl divides all flones into calcareous and vitrescible, but this arrangement is very exceptionable. All that hitherto have been examined, confift of crystalline, calcareous, argillaceous, talcky, or gypicous earths; they are rarely any of these pure, but mixed in different proportions with other mineral sub-stances. See Newmann's Chem. Works; Bomare's Dict. of Nat. Hift. It is also a name annexed to many natural and artificial preparations, as the lapis bezoar, infer-

nalis, prunellæ, &c.

Lapis ipse. See Adrop.

- ANIMALIS. See CHIFFR.

LAPPA. See BERDANA, MAJOR, MINOR, and ARCTICUM.

LAPPAGO. See HIPPOPHES; and, according to Blancard, it is aparine.

LAPPULA. A name of fome species of parsley.

LAPPULA CANARIA. A name for some species of

LAPPULA RUSTICORUM, i. e. Cynogloffum mi- they are expanded like a goofe's foot, and from the bra-

LAQUEUS. In furgery it is a noofe, and belongs to either bandages or instruments. See BROCHOS.

LAQUEUS GUTTURIS. A malignant inflammation of the tonfils.

LARBASON. See ANTIMONIUM.

LARDUM. BACON. It is a proper food for those

who use strong exercise.

LARIX. The LARCH-TREE. The leaves are long and narrow, produced out of little tubercles, but fall off in winter; the cones are small and oblong; the branches are regular as those of the fir-tree. This tree is very common on the Alps, and feveral parts of Germany, and from it is produced the Venice turpentine. Raii Hist. It is also a name for several species of cedar. See

LARVA. A MASK. When the face is burnt with gunpowder, &c. the application is a linen malk, with holes for the eyes, nofe, and mouth; this malk is moittened with proper remedies, and applied to the face; it is tied behind with fix tapes.

LARYNGÆÆ ARTERIÆ. See GUTTURALIS

ARTERIA.

LARYNGOTOMIA, from Angert, the threat, and

THATE, to cut, See TRACHEOTOMIA.

LARYNX. The larynx hath five cartilages; it forms the upper part of the wind-pipe. The first of the cartilages is the thyroid; it is placed just under the basis of the os hyoides; it is of a quadrangular figure, and stands in the anterior part of the neck, where the pomum Adami is feen; the lateral portion runs back, and ends in two processes, one of which runs up, the other down, and are connected by the os hyoides. The second is the critical cartilage; it flands beneath the preceding, it is of an annu-lar figure; the back part flands between the two processes of the thyroid, to which it is articulated. The two arytaid cartilages are joined to the posterior and superior parts of the cricoid, by peculiar articulations, that the glottis may be the more readily opened and contracted; each of these have a protuberance for the insertion of the muscles, which protuberance stands over the cricoid, and each have a process, where the ligament of the epiglottis is fixed; they are small at their base, and large at their upper part.
The fifth is the EPIGLOTTIS, which see.

LASCIVUS. So Paracelfus calls the chorea fantli

LASER. LASERPITIUM & ASAFOETIDA, or the

plant from which it flows.

LASERPITIUM, is a name of the oreofelinum, and of the filphium, called by the ancients, Altibi.

LASERPITIUM VULGATIUS; called also gentiana alba, cervicaria alba, Libanotis, Thapfia, sefeli Ethiopicum, cervaria nigra, the LESSER HERB FRANKIN-CENSE. LASSERWORT.

It is a plant which is found in great plenty in Switzerland, and on the Pyrenean mountains; the root is recom-mended as alexipharmic and uterine, but it is not in ufe.

Boerhaave enumerates fixteen species.

LASSITUDO. MUSCULAR DEBILITY. LATA LIGAMENTA. The broad ligaments of the womb are properly only a duplicature of the peritonzum, reflecting from the loins to the uterus, and are long enough

to admit it to hang down into the vagina.

LATER. A BRICK. Bricks are heated and applied to various parts of the body, or on cataplasms, to conti-nue their heat. And an oil is made by quenching hot brices in olive oil, until all the oil is imbibed, and then diffilling them in a retort until all the oil is drawn off; after which the spirit must be separated. This oil is named ofeum lateritium, philosophorum, vel sapientia.

LATERALES MUSC. So the masseer muscles are

named. See Masseter.

Musc. Nasi. See Obliquus Nasi Musc. ---- PROCESS. OSSIS SPHÆNOIDES. See SPHE-

NOIDES Os.

LATERALIA LIGAM. On the body of the os humeri there are two particular ligaments, which may be called lateral or intermuscular; they are long, flat, thin, narrow, fixed on one edge along the two lower thirds of the bone, and reaching to both condyles. They are braced pretty tight, and are very narrow at the upper part, but broader towards the condyles, from whence

LATERITIUM OL. called also divinum oleum. See

LATHYRIS. See CATAPUTIA MINOR, OCHRUS,

and NISSOLIA

LATISSIMUS (fo called because it is the broadest) DORSI, also ANISCALPTOR, which see. This muscle rifes from the fafcia lumborum at its lower part; higher from the fixth, feventh, or eighth vertebræ. At its anterior part it rifes from the ninth, tenth, eleventh, and twelfth ribs; its fibres run round the posterior and infetwelfth ribs; its fibres run round the posterior and inferior angle of the scapula, and its tendon is inferted into the posterior ridge of the groove of the biceps. Its office is to pull the arm backwards and close to the body.

LAUCANIA. The THROAT, or the OESOPHAGUS.

LAUDANUM, from lans, praise. The name implies that the medicine is worthy of praise; it is generally confined to preparations of opium.

LAUREOLA FOEMINA, also called mezerion, meterion, champelean, thempelean lawrifulia decides, progression.

ferion, chamalaa, thymelaa laurifolio deeiduo, mezereon, spurge-olive, widow-wall. Daphne mezereum, or daphne floribus purpureis sessilibus ternis causinis, sol. lanceolatis deciduis, Linn. It is a small tree or bush, with pale purplish, or white flowers, which are followed by bay-shaped leaves. The flowers appear in January.

In August or September the berries ripen.

A decoction of the cortical part of the roots is a powerful remedy in many venereal fymptoms, especially when affifted by the hydrargyrus muriatus. This bark should be gathered fresh as it is wanted. The best grows in a light foil. Boil an ounce of the fresh-gathered bark from the roots of mezereon, in twelve pints of water to eight; at the end of the boiling an ounce of liquorice root may be added; of the strained liquor half a pint may be drank four times a day. Dr. Russel strongly recommends the use of this decoction, particularly when nocturnal pains are violent in the venereal diforder; also for washing those nodes which proceed from a thickening of the membrane of the bones. See Lewis's Mat. Med. Lond. Med. Obf. and Inq. vol. iii. p. 189, &c.

It is faid to cure other remains of the lues venerea,

where mercury has failed; and Dr. Cullen recites one where many ulcers continued entirely cured by the ufe of a decoction of mezereon for two or three weeks. Dr. Home has found it not only cure fcirrhous tumors, which remain after the venereal disease, and after the use of mercury, but that it healed some scirrhi from other caufes. In cutaneous affections it has fometimes been fuccefsful. The bark of the root should only be used. Cullen's Mat. Med.

Cullen's Mat. Med.

— Mas, also called chamædaphne, thymelæa laurifolio sempervirens, daphneides, spurge Laurel. It
is the daphne laureola, Linn. It is a small shrub, its
leaves resemble those of the laurel, but are lesser; the
slowers consist of one leaf, which is greenish. The
leaves, berries, and bark, are acrid and hot, burning
and inflaming the mouth; if swallowed they vomit
and purge. In March or April the slowers appear; in
September the berries open. See Raii Hist. Lewis's
Mat. Med. Mat. Med.

LAURIFOLIA MAGELLANICA. See WINTE-RANUS CORTEX.

LAURINUM. The FLANDERS OIL of BAYS. See DAPNELÆON.

LAURO-CERASUS, also called padus-cerasus avium nigra, CERASUS RACEMOSA, fruelu non eduli, cerafus folio laurino, cerafus Trapezuntina, BAY CHERRY, or the LAUREL CHERRY, or CHERRY-BAY. It is the

prunus-lauro-cerafus of Linn.

The root of this tree or fhrub, is large, rough, and furnished with many fibres. The branches are woody, numerous, brown on the outfide, and white within. The leaves are large, flefhy, oblong, flining, pointed at both ends, and flightly ferrated at the edges; their upper furface is smooth, and of a beautiful dark green colour; the under fide is rough, ftrongly marked with fibres, and of a light green complexion. The flowers appear towards the superior part of the branches; they are pentapetalous, in five-leaved cups. They are followed by clusters of berries refembling cherries, and containing an oblong stone within the pulp of the fruit. It flowers in May, and ripens its fruit in September.

The leaves have a bitter tafte, with a flavour refem-bling that of bitter almonds, and the kernels of peaches and apricots; this flavour is communicated to water and to vinous spirits, either by infusion or distillation. These preparations are fo extremely deleterious, and fometimes fo fudden in their operation, as to occasion instant death. Dr. Mead relates, that a few fpoonfuls of laurel water killed a large dog while it was paffing down his throat, before it could be supposed to have reached the stomach-It is the most expeditious means of killing dogs and almost all kinds of animals; given by the mouth, or injected into the rectum, its operation is equally certain, and it acts the moment it touches the stomach, or is received into the intestines. It is speedily mortal to small animals, if applied to wounds of the mufcles. It is a fedative of the most powerful kind, and tends plainly to destroy the mobility of the nervous power, and thereby the vital principle; and when employed in fufficient quantity, it does this very fuddenly, without exciting inflammation on the part to which it hath been applied, and without producing any fensible change in the state of the fluids. This poison is of that class which produces epileptic fymptoms; it generally produces very ftrong convultions, and in a fhort time death. The spalmodic motions of the whole body are extremely violent on taking it. Two tea spoonfuls of laurel water were given to maidle fized rabbits; in half a minute they were convulsed, and in less than a minute they were dead. When it is given strong, and in large quantities, they die almost instantly, and without convillions, a fudden and univerfal paralytis coming on. Gives in less quantities the convultions are more or less strong. On diffection, after this poison has been taken, no uncommon appearances are observed in the stomach or intestines; the arteries are found empty, and the veins turgid with blood. The sinuses in the brain, and the veins in the pia mater are distended, but this feems to be occasioned more by the convulsions, than by the particular properties of the poison. Dr. Rutty of Dublin relates, that a girl of eighteen years of age, very well and healthy, took a quantity less than two fpoonfuls of the first runnings of the simple water of laurel leaves; and within half a minute after she fell laurel leaves; and within half a minute after the fell fied fpirit of wine; but if it is genuine it diffolves fanda-down, was convulted, foamed at the mouth, and died rac, and indeed is the best known solvent of amber. in a fhort time.

Although the poison of laurel appears to confift in the effential oil which it affords in distillation, yet it is ftrongly fuspected that an infusion of the leaves are also

It hath been generally observed, that if the animals that had fwallowed this poifon, vomited it up readily, they generally recovered: but its action feems too speedy to hope for relief by any means if swallowed by mankind. See VENENUM. Wilmer on Poisonous Vegetables, and

Cullen's Mat. Medica.

—— CASSIA. See FOLIUM.

LAURUS ALEXANDRINA, also called bippoglosfum, daphne, diglotfon, epiglotfie, ruscus latifolius, LAU-REL of ALEXANDRIA. Bonefacia, coracobo-tane.

— VULGARIS, diabexapela, diabexapte, COMMON LAUREL, or BAY-TREE. The laurus nobilis, or the laurus foliis lanceolatis venosis perennantibus, soribus

quadrifidis, Linn.
The bay-tree is generally well known; it is an evergreen, with oblong, stiff, smooth leaves; the flowers are of a palith yellow colour, and are followed by oblong dry berries, containing, under a thin black fkin, an horny thell, within which are lodged two dark brownish feeds joined together. It is a native of the fouth of Europe, and common in our gardens. The flowers appear in April or May, the berries ripen in September, and those which are used in the shops are generally brought from up the Streights, and are the fruit of the laurus Alexandrina.

The leaves have a light agreeable fmell, and a weak aromatic rough tafte. In distillation with water they yield a small quantity of a very fragrant effential oil; with rectified (pirit they afford a moderately warm pungent extract. The berries are stronger than the leaves, and yield more effential oil; on pressure they give out an insipid oil that is fluid, and on boiling they afford a thicker oil of a yellowish green colour. See DAPH-NEL ZON.

The leaves and the berries are stomachic, carminative,

as tea, and the effential oil of the berries is given from one to five drops. But the principal use of any part of this shrub, is of the berries, and those are chiefly employed externally.

LAURUS ROSEA. See NERION.

Laurus is a name for the campbor, cinnamon, cassia lignea, benzoinum, and faffafras. LAVACRA. Washes. Such as are used to im-

prove the fkin.

LAVANDULA, from lawands, washing, because it LAVENDULA, was used in baths on account of its fragrancy. LAVENDER, called also flachas, FRENCH LAVENDER.

LAVANDUDA LATIFOLIA, called also nardus Italica, spica mas, pseudonardus, aspic, COMMON BROAD-LEAVED LAVENDER, or SPIKE LAVENDER. Lavandula spica, or lavandula foliis lanceolatis integerrimis, fpicis nudis,

Lavender is a shrubby plant, with its leaves set in pairs, the stalks square whilst young, and round when grown old; on the tops of the branches are naked fpikes of bluish flowers, and sometimes of white. The common broad-leaved fort hath by much the larger fpike, though the flowers are lefs. The name of fpice, fpike, is given to lavender, because of all the verticilated plants, this alone bears a spike. Some writers give the name of fpike to the broad-leaved, and others to the narrow-leaved species. The broad-leaved is common in the southern parts of Europe; it is stronger both in small and taste than the narrow-leaved; by distillation it yields near thrice the quantity of essential oil, which is both near thrice the quantity of effential oil, which is both heavier and hotter than that from the other kind, but the flavour is not fo grateful. The water and fpirituous extracts made from each fort are very nearly alike.

In the fouth of France, where both forts grow wild, the broad-leaved is only used for obtaining the oil called OIL of SPIKE, and OIL of ASPIC, which, if genuine, is pale coloured, even limpid, though fometimes it is yellowish. The flowers contain almost all the oil; they should be macerated some days, and then distilled. This oil is adulterated with oil of turpentine, and with recti-

- Angustifolia, called also spica famina, spica vulgaris, pseudo-nardus, lavandula minor, com-MON LAVENDER, SPIKE, OF NARROW-LEAVED LA-VENDER. The leaves of this species are very narrow, and somewhat hoary; native in the southern parts of

Europe, but it grows in our gardens very vigorously. The flowers appear in June or July.

The flowers are very fragrant and agreeable to most people; they are bitterish, warm, and pungent to the taste; they are fometimes used as a mild stimulant and corroborant, in vertigos, palfies, tremors, and other de-bilities of the nervous fyftem, both internally and externally; and, in general, in all diforders in which is a

lax fibre. Dr. Cullen afferts, that whether applied externally or internally, it is a powerful flimulant of the nervous fystem, and that it will feldom go further than exciting the energy of the brain to a fuller impulse of the neryous power into the nerves of the animal functions, and feldom into those of the vital; hence may be more fafe in palfies than the warmer aromatics, especially if not given in a spirituous menstruum, or along with heating aromatics.

Water extracts by infusion, near all the virtue both of the flowers and leaves; but the flowers are so far preferable to the layer, that the latter are not much used. Lavender flowers afford the most oil when ready to fall off
spontaneously, and the seeds begin to shew themselves.

The effential oil when fresh, and from flowers that

were in perfection, is of a pale yellow colour, of a pun-gent tafte, very fragrant, possessing, in an eminent degree, the peculiar smell which is admired in the flowers.

The flowers may be feparated from the flowers.

The flowers may be feparated from the plant by drying them a little, and then gently beating them; they flould then be immediately committed to the ftill, and the process conducted with a well regulated gentle heat. This oil is given internally as a cordial, from one drop to five. It is also used as an internal ftimulant in palsies, lethargies, and other debilities of the nervous system. If for the process is mostlened with this oil, and applied to any part. The leaves and the berries are ftomachie, carminative, gies, and earlier debutted with this oil, and applied to any part infelted

Rectified spirit extracts the virtue from lavender most completely, and in distillation carries some of the odorife-

rous part over with it.

The London College directs a simple spirit from these flowers. R Florum recentium lavendular, p. fb i. ss. spt. vinosi tenuioris congium unum; distilla in balneo aquoso winofi tenuioris congium unum; diftilla in balneo aquofo m. libras quinq. LECTULUS. See EPITHEMA.

LEDON. Cretense labdanum. See LADANUM.

LEDUM. A name of a species of rosemary, and several species of ciftus.

LEGUMINOSA. See FABAGO.

LEGUMEN. Those species of plants which are called use, such as peas, beans, &c. They are so called be-PULSE, fuch as peas, beans, &c. They are fo called be-cause they may be gathered by the hand, without cutting. Ray reckons all those plants to be leguminous, which have

a papilionaceous flower. LEIOPODES. EVEN-FOOTED. Those are thus called the foles of whose feet are without the usual hollow part. Or rather, as Vogel describes it, when the middle of the infide of the foot is not hollow but plane. It is called

SPLAY-FOOT.

LEIPHÆMOI, from MITTE, to be deficient, and augz, blood. Those are thus called who have too little blood. LEIPODERMOS, from MITTE, to be deficient, and signa, the skin. A person is thus called who hath lost his

prepare.

LEIPOPSYCHIA, from λμπα, to leave; and ψυχη, the ul, or life. A FAINTING FIT, a LANGUOR, &c. It is fynonymous with adynamia.

LEIPOTHYMIA, from ANTH, to leave, and 30406, the mind. A FAINTING FIT, a SWOONING.

LEIPYRIA, from ANTH, to leave, and stup, heat or fire. A dangerous species of ardent sever, wherein the internal parts are fcorched with heat, whilft the external parts are cold. It is a kind of tertian.

LEMNIA TERRA, also called terra figillata, EARTH of LEMNOS, bashab. This, if genuine, may be confidered as similar to the Armenian bole, but, like it, is hardly ever met with, being substituted by mixtures of inferior earths and proper colouring matters. Four forts are spoken of, viz. a white, yellow, red, and a yellow-ish brown; this last is the best. There is a species of

infested with cutaneous infests, as the pediculi inguinales, bole that is of a red colour, which by some fossilogiste &c. they will soon be destroyed. is called LEMNIAN BOLE.

LEMPNIAS. See SIGILLATA TERRA.

LEMPNIAS CALCIS. SCALES of BRASS, which feparate when beat with a hammer.

LENOS. In Hippocrates it fignifies a channel or ex-cavation, made in fome machines for making extension, and reducing fractured bones. Herophilus gave this name

to what is called torcular Herophili.

LENS. The LENTIL. Boerhaave mentions three species; they are shaped like tares, but are less; they are a flatulent fort of food, and not eafily digetted. It is the ervum lens of Linnæus, that was formerly used as a medi-

ne. See Lenticula, also Lenticula palustris. LENTA FEBRIS. A slow Fever. See Hectica. LENTIBULARIA, called also millefolium, lenticula-tum aquaticum. Ray and Tournefort mention two species.

LENTICULA. LENTIGO. A FRECKLE or fmail puffule on the face or breaft. See EPHELIS, fee also PETECHIÆ. It is a name for LENTILS, also DUCK-MEAT. It grows on the furface of water that is not fubjected to much agitation. Its appearance is fimple and foliaceous; its roots are flender, capillaceous, and pellucid. Boerhaave mentions three species.

PALUSTRIS, called alfo lens palufiris, aquatica, lenticularia minor, DUCK-MEAT. It is cooling if used as

an external application.

— PALUSTRIS MAJOR, alfo called bederula
— AQUATICA TRISULCA, aquatica. These are of qualities fimilar to the former.

LENTICULARE. A LENTICULAR. It is also called

a RUGINE.

LENTICULARE os. A name of the fourth bone in the first row in the wrist. It is also called erbiculare, and

The os lenticulare, or obiculare in the ear, Dr. Hunter thinks is part of the incus, as its extremities stand upon a narrow neck, and is foon broken off, and in the adult

is one continued bone with the incus.

LENTICULARES, GLANDULE. They are the small glands of the intestines; and are so called on account of

their fize. See PETECHIE.

LENTICULARIS FEBRIS. A species of sever, with many irruptions about the fize of lentils. See PE-TECHIALIS FEBRIS.

LENTIGO. A FRECKLE.

LENTISCUS. MASTICHE. The LENTISK OF MASTICH-TREE. Piflachia lentifcus, or piftachia foliis abrupte pinnatis, foliois is lentifeus, Linn. Boerhaave mentions three species of it. It is an evergreen, with fost branches hanging downwards, and small stiff leaves pointed at both ends. Some trees produce reddish slowers, others produce blackish berries with white kernels. These trees are native in the fouthern parts of Europe, but bear the usual winters in our clime. In Turkey, and some other places, plantations are made for the sake of the resinous gum which we have under the name of mastich. It is obtained from incifions made in the trunks; it flows in drops in August. This refin is brought to us chiefly from Aleppo and Smyrna. The wood is fometimes brought from Marfeilles, in thick knotty pieces, covered with a brownish bark; it is internally of a whitish or a pale yeslowish co-

The wood is mildly balfamic and reftringent; the fmall tough fprigs are stronger than the larger pieces, and the bark is more than either, but none of them are of much value in medicine; yet a decoction of the wood hath ob-tained the name of aurum petabile. The refin, usually called gum mastich, by means of gum arabic, is distolved and rendered miscible with water; it possesses the fame virtues with turpentine in general; but as a mafticatory it is to be preferred. See Lewis's Mat. Med. Newman's Chem. Works. For that named FOLIIS SPINOSIS, FLORE SPICATO, &c. See BONDUCH INDORUM.

LENTOR, A VISCIDITY or SIZYNESS. When this is the ftate of the animal fluids, the body is variously dif-

ordered.

The LION. It is a name for feveral prepara-LEO. tions of the Spagirists, of the leprofy, &c.

FEROX. A species of FISH-THISTLE, mentioned

by Ray.

LEONINA LEPRA, or LEONTIASIS, OF LEONTION.

A variety of the ELEPHANTIASIS.

LEONIS ORA SÆVA. See ANTIRRHINUM. - OSSICULUM. See AQUILEGIA. LEONTICE VETERUM. See CACALIA.

LEONTODON. The DANDELION. See TARAX-

LEONTOPETALO, and LEONTOPETALON.
Names of the RED and of the BLACK TURNIP.
LEONTOPODIUM, also called filage Alpina, leontopedium majus, gnaphatium Alpinum, Lion's Foot. It grows on hills, and flowers in July. The bruised roots are famed for removing the blackness of bruises in the

LEONURUS. Lion's TAIL. Boerhaave mentions three species of this plant; but it is not noted for any medical virtue. See Cardiaca.

LEPIDIUM, also called piperitis, raphanus sylvestris, iberis, poor Man's Pepper, Pepper-Wort, DITTANDER: It is the lepidium latifolium, Linn. It is a plant with undivided leaves, fmall white flowers on the tops of the stalks, which are followed by heart-shaped pods. It is perennial, grows wild on the sides of rivers and shady places; it flowers in June and July. The whole plant is hot like pepper. It is also a name for the plumbage and draba.

---- GRAMINEO FOLIO, alfo called Iberius, carda-mantica, agricardamum. SCIATICA CRESSES. It is the lapidium iberis, Linn. This species hath long narrow leaves; the lower are on long pedicles and ferrated; the upper are entire, and without pedicles. It is annual, and

raifed in our gardens for culinary use.

These plants, when fresh gathered, have a quick, penetrating, pungent taste, which is almost dissipated in drying; it is retained in the expressed juice, extracted by water and by spirit, and rifes with both of them in distillation. In external applications they have been used against the sciatica, whence their name sciatica cresses. Internally they have the fame effects as the cochlearia and nafturtium.

LEPIDOCARPODENDRON, from MAN, feale, MAS-mos, fruit, and And son a tree. Boerhaave takes notice of twelve species of this tree; but their medicinal powers

are not remarkable.

LEPIDOIDES SUTURA, from AFTIG, a fcale, and testes, likeness. The fquamous future of the skull.

LEPIDOSARCOMA. So M. A. Severinus calls a

tumor of the mouth, which is farcomatous, and full of irregular scales, from xezes, a scale, and ozes, steft.

LEPORINA-LABRA. HARE-LIPS.

LEPORINUM ROSTRUM. The piece of flesh which often is feen betwixt the divisions of the hare-lip.

LEPRA, from γεπρις, rough, and that from λεπις, a fcale. The LEPROSY. Among the various diforders which arifefrom an impure ferum, and manifest themselves in the skin and subjacent integuments, are those which come under the names of itch, herpes, and lepross; of the latter there are different species on record, some of which are no where known to exist this day; and the rest are but obscurely understood. See Alphus.

The lepross, of whatever kind, is a chronical disorder;

in warm climes is very infectious, though not evidently fo in cold countries. Dr. Cullen places this genus of difeafe

lepra ichthyofis.

Fat people are observed to be more grievously afflicted with skin diseases, when they are the subjects of them, than the lean; also more subject to relapses after being

cured. The remote causes are, whatever diminishes the vital heat, and reduces the general strength of the body. The immediate cause is, a faulty serum; this stagnates in the integuments and skin, producing inflammation, exulceration, cruptions, &c. there.

The leprofy of the Arabians (which seems to be the

fame with that of the Greeks) is well described by Aetius as follows: " it is almost unknown in Italy (i. c. the lepra Arabum) but very frequent in some countries, is the disease which the Greeks term experience, and which is reckoned amongst the chronical disorders. By it the whole body is so disordered that the bones are said to be vitiated. The furface of the body is covered pretty thick with spots and tumors, the reducts of which is by degrees converted

into a black colour. The external skin becomes unequally thick, thin, hard, and soft; it is in a manner rendered rough by certain scales, clests, and chaps; the body grows lean; the face legs and feet swell. When this disorder is of long standing, the fingers and toes are concealed under a tumor, and a slight sever arises, which castly destroys the patient, labouring under so many disorders." In the West Indies this disorder is known by the name of the black severy, or Indian black severy. Its approach is there observed to be gradual; at first there are many spots on the body, of a yellow brown cast, which soon turn purple, and of a copper colour; these increase, grow thick, and rough, with hard scales; a numbness is selt on the singers and toes; the breath is sectid, the voice hoarse, the hard and scaly parts crack, and ulcers appear in different parts; but at length a sever comes on which closes the scene.

In hot countries seprens disorders are most frequent;

In hot countries leprous disorders are most frequent; and in different places there is some variety in the symptoms; but by the methods attempted for the cure, and the fuccess which attends them, the disorder seems to have but one general nature, however it appears, or by what-

ever name it is called.

Besides a thin laxative diet, warm baths, and a pure temperate air; antimonials, mixed with mercurials, are principally depended on; thefe are affilted by warm perfriratives fuch as guaiacum, sharp-pointed dock, sasfa-fras, &c. small doles of cantharides, so as to promote a moderately increased discharge by urine; nitre continued in small doses for a long time, and many other medicines, have been administered for the relief of these disorders; but none of them seem to have equalled the success which Dr. Lysons met with from the following decocion:

R Cort. interior. ulmi rec. 3 iv. coq. in aq. pura hiv. ad hij. colatura cap. h ss. bis die. It should continued feveral weeks. If after its use the efflorescences increase, it is a favourable symptom. See Aretæus, lib. iv. cap. 13. Celfus lib. iii. Hieronimus Mercurialis de Morbus cuta-neis. Lond. Med. Tranf. vol. i. & ii. Lond. Med. Obf. & Inq. vol. i. p. 201, &c. Lond. Med. Journal, vol. i.

p. 94. LEPRA ARABUM. Blancard fays it is the elephantiafis of the Greeks. Cullen makes it fynonymous with the

elephantiafis in his Nofology.

— GRÆCORUM, called alfo albaras nigra. See Atabaras. It is the impetigo of Celfus. Dr. Cullen reckons but one species of leprosy, the distinctions are but variation.

— ICHTHYOSIS. FISHY LEPROSY. Avicenna calls it albaras nigra. See ALBARA.

So far as my obscrvations have affifted me, this disease does not depend on a particular diet, as feveral of a family have lived together on fimilar food, when only one has have lived together on fimilar food, when only one has been afflicted; nor is it confined to any particular temperament. Though it usually appears in both fexes about the age of puberty, or, after that, towards the acme of life, in those especially of light-coloured hair, and smooth sine skin; yet it certainly is not contagious, as it subsists in individuals of a family, without affecting the rest, where no referve or precaution had been used in their communication. People advanced in years have it in lefs degree than the former, but no time of life is totally expense. in the class cachexia, and order impetigines. One species than the former, but no time of life is totally exempt only is known. Sauvages notes fix varieties, the chief of which observed with us are the lepra Gracorum, and the the skin, no function feems interrupted or impaired, nor any other complaint evident. It would, therefore, appear to be purely a topical cutaneous difease, which probably arises from some affection of the secretory organs or glands of the fkin.

At first it appears in red spots in the skin, of a roundish figure, which rises up into tensible eminences, and being feratched, a sluid ouzes out. When the cuticle becomes thin, they feem evidently more or lefs feparated, and then refemble fo many transparent scales, which generally do not fall off till a new cuticle is formed below, which in 2 little time rises again in the same manner in a dry scaly crusty eruption; sometimes confined to particular parts; at others occupying nearly the whole surface of the body, or removing from one part of it to another without any evident cause; and in summer, sometimes entirely leaving

the patient, and returning again in autumn and winter.

Purging by fea-water, and bathing therein; the use of other alterative waters; antimony variously prepared; mercury variously administered; these assisted with a de-

coction

coction of farfaparilla and mezercon, have all been used with a tedious perfeverance, and without effect; though fometimes the patient feems to be relieved thereby. Mereurials have been given with antimonials, but these, and even a fallwation, have been useless. Many topical applications have been tried with very little advantage. Blifters on the parts gave but a temporary relief, and that but thort. In my earlier practice, by the recommendation of a physician of unquestionably great abilities, I used the juniper thrub, as the ultimate remedy in obstinate cruptions, and in the milder kinds of herpes and fcorbutic eruptions; my fuccess was such as to give one expectation of equal advantage from it in this fort of leprofy, but experience shewed me my mistake. The most useful external application that I used, was bees wax and oil of olive in the form of a cerate. The only effectual internal medicine is the decoct, cort, interior, ulmi-

A boy about thirteen years of age took of the decoct. cort. inter. ulmi, 3 iij. every day, and in about two weeks produced a confiderable change, and at fix weeks end, a cure was effected. In another case of this kind, in a young woman, aged twenty-one, I ordered two aloetic pills every night at bed-time, and a pint of the decoct. ulmi to be drank every day, which reftored the skin to its former smoothness; but the itching still continued, on which account she took a nitrous mixture with the above medicines, and, in about two weeks more was cured. I have given nitre to 3 j. a day; but alone it never answers. While the decock ulmi is using, the body should be kept open, the patient should live upon a larger proportion of vegetable diet, avoiding those meats that are least perfpirable. If the disorder is obstinate, continue the decoct. cort. ulmi for some months. Sometimes the disorder feems entirely removed in the fpring when the warmth of the weather increases with the year; and returns with the returning cold towards the conclusion of autumn. It would hence be adviscable to repeat this decoction, with the other precautions at those periods when the disorder may be most suspected, till the patient has a probable fecurity against any future attack. Lettsom's Medical Memoirs.

LEPTOPHONIA, i. c. PARAPHONIA CLANGENS.

See PHARAPHONIA.

LEPTOPITYRON. BRAN.

LEROS. A SLIGHT DELIRIUM.

LESEOLI MORBUS. So Paracelfus calls the jaun-

dice. See ICTERUS.

LESEOLUS, by Paracelfus is called an highly diaphanous falt, which cures the jaundice, but does not fay how

it is compounded.

LETHARGUS. Desidio oblivio. LETHARGY, from has, forgetfulness, and appos, lazy, or stothful. A lethargic or sebrile sleepiness. It is an heavy and perpetual sleep, with scarce any intervals of waking; being awakened, the patient answers, but ignorant or forgetful of what he said, immediately sinks into the same state of sleep. The lethargy is generally symptomatic, and often the at-tendant of fever. In this difease, there seems to be an utter lofs of all the rational powers, and inaptitude to motion. Whence fome have named it defidia obliviofa. See Caros. Dr. Cullen confiders it as a fymptomatic

LETHARGUS à FRIGORE. APOPLEXIA

- LITERATORUM. APOPLEXIA SE- Sec APO-ROSA. PLEXIA.

à NARCOTICIS. APOPLEXIA VE-

LEUCANTHEMUM. It agrees in every thing with the chryfanthemum, except in the white colour of the femiflorets. Boerlfaave mentions eleven species. It is alfo a name for the COMMON CHAMOMILE. See CHA-

MOMELUM. LEUCANTHEMUM BELLIDIS FACIE, also called bellis major, and after annuns. These are not remarked for any extraordinary medical virtues.

- CANARIENSE, also called chamemelum Canarienfe. If the flowers or the wood are chewed, they produce the fame effects as the pellitory root.

TANACETI FLORE, also called tanacetum madere florum major, and matricaria tanaceti folio.

LEUCANTHE VETERUM. See CALCITRAPA

OFFICINALIS.

LEUCAS MONTANA. See LAMIUM LUTÆUM:

LEUCE. A fpecies of leprofy. See Alphus. LEUCOIUM. Of this kind of plant are the flock gillyflower and the wall-flower. Boerhaave enumerates thirty-one species, but their medical qualities deserve no

notice. See Cheiri, and Bulbonach.
LEUCOLACHANON. WILD VALERIAN. LEUCOMA. See Albugo, from Mus , white. LEUCONYMPHÆA. See NYMPHÆA.

LEUCOPHLEGMATIA, from Ascase, white, and Passua, phlegm. Aretween observes, that the leucophlegmatia differs from an anafarca, in that the flesh is not yet wasted, as is always the case when an anasarca is present; and that it is by far more eafily cured than an anafarca, because the texture of the blood is not so greatly injured. Indeed the leucophicgmatia is only the beginning of that diforder, the worlt state of which is the anafarea. Some-

times this word fignifies an emphysema.

LEUCOPIPER. WHITE PEPPER. See PIPER ALBUM. LEUCORRHŒA, from Assacs, white, and pise, 19

flow. See Fluor Albus.

LEUCORRHOIS. It is that species of diarrhora called diarrhora mucosa. See Diarrhora. It is also expressive of those pile cases, in which the discharge is not bloody, but only a mucus. Many writers use this

word as fynonymous with finer albus.

LEVATOR PALATI MOLLIS. This mufcle rifes

from the basis of the skull, near the articulation of the lower jaw, runs down the fauces, paties inwards and forwards fpreads itfelf on the palatum molle, and goes to

the uvula.

PALPEBRÆ SUPERIORIS. Aperiens palpebrarum reclus and elevator. It arises, on each side, from the bottom of the orbit by a small tendon, and as the sleshy fibres of this mufcle pass over the globe of the eye, they gradually spread, and afterwards terminate by a broad tendinous expansion in the superior part of the tarfus belonging to the upper lid.

PATIENTIA, I vel musculi angulares, patientias.

— SCAPULA, They rife, split into four little muscles, from the transverse processes of the four superior cervical vertebre. These branches join and make one sleshy belly, which are inscrted into the bases of their re-

spective scapulae above the spine.

LEVATORES ANI, called also elevatores. They rise with a broad base from the symphisis of the os pubis, the internal part of the ileum, and the sharp process of the ischium, directing their course towards the sphincter, and bending part of their fibres with those of it; wherefore they partly ferve to expel the fæces, but do not (as is generally supposed) compress the vesiculæ seminales in coition.

LEVATORES COM. LABIORUM, called also elevatores labiorum. These muscles rise from the cavity on each side under the os jugale, in the os maxillare, and are inferted with the zygomaticus major and others, into the angle of

the lips.

Costanum, also called fupra costales. These muscles rise from the transverse processes of the vertebre, and are inferted into the ribs; they are divided into two classes, viz. the longiores and the breviores. The brevi-ores are those which rise from the transverse processes, and are inferted into the next rib; the longiores run over one rib, and are inferted into the next.

- LABII INFERIORIS, called also parmentale. They rife from the fockets of the incifores, and are inferted

into the lower lips, named likewife elevatores.

LABII SUPERIORES. The rife from the os maxillare and defcend obliquely under the fkin of the upper

lip, called also elevatores.

LEVISTICUM, also called ligusticium, angelica montana or, ligufticum folis multiplicibus, foliolis fuperne inciff. floribus umbellatis luteis, Linn. It is a tall umbelliferous plant, with leaves divided like those of smallage; the root is thick, fleshy, and juicy, branched, and of a brown colour outwardly. It is a native of the fouth of Europe, but thrives in our gardens. It is perennial, flowers in June, and its feeds are ripe in August.

All the parts of this plant are aromatic, and firongly refemble angelica, but not fo agreeable. The feeds are warm and pungent, and most agreeably flavoured; the

with rectified spirit retains both the aroma and the vided at the top into several parts, by which character it is very clearly diffinguished from the lichen. fweet.

This plant is chiefly recommended as an anti-hyfteric. The root may be a fubflitute either for that of angelica or of mafter-wort. See Raii Hift. Lewis's Mat.

LEVITAS INTESTINORUM. See LIENTERIA. LIBANOTIS. Alfo called cachryis, cachryfera, FEN-LIBANOTOS. NEL HERB, FRANKINCENSE. This plant grows on mountains in Italy and Sicily. It flowers in May. The feed is called eacry. It is also a name for feveral forts of laserpitium, ferula glauco folio, ferula minor, rosmarinus, oreoscilinum apii, and several other plants. LIBDO. The ITCH.

LIBERANS AQUA, i. e. Aq. calcis. maj. com.
LIBERANS AQUA, i. e. Aq. calcis. maj. com.
LICHANOS. The FORE-FINGER.
LICHEN. In furgery. It is a kind of eruption variously named by different writers; fome name it ferpigs, or zerna, others call it petigo, farpedo, and voliatica. Blancard fays the feables of Celfus is the lichenes of the Greeks: the Greeks or Arabians reckon two forts, one milder than the other, and the impetigo Arabiam Plinii. Blancard further observes, that the lichenes are certain afperities of the fkin, and as it were tumors which itch much, and fend forth matter. Avicen observes, that the dry fort is the worst: he further adds, that one kind fpreads and is malignant, the other fixed and standing. This diforder affects any part of the body, but more particularly the face and chin. Sauvages and fome others rank it as a species of tinea, with which, perhaps, it may be as conveniently ranked as with any other of the like cutaneous itching ulcers.

In Botany. It is a floriferous and feminiferous kind of mofs, whole flowery little heads are furnished with many grains, and are variously shaped, producing as they ripen several little monopetalous flowers. The seeds, which are finall, flat, and orbicular, are contained in some peculiar open capfules, refting upon the plane of the leaves, and are fometimes found in the fame plant that bears the little heads, fometimes in other plants of the fame species. Befides these flowery little heads, there are observed in some species some umbellated heads of different figures, which produce neither flower nor feed, as other plants of the fame fpecies ufually do. The pedicles of both species are for the most part naked, and proceed from no vagina. The leaves are of an herbaceous confiftence, and of an indeterminate figure, widely fpreading, and running out into various roots from their back part. Boerhaave enumerates thirty-eight species. Every plant under the name of lieben is warming and aftringent. The lieben directed in the Pharmacopæia Coll. Edinb. is the lieben Islandicus, or lieben foliaceus afcendens laciniatus, mar-ginibus elevatis ciliatis, Linn. It is a name given to the Incluca marina, mufcus pinidatus, bepatica vulgaris, &c. befides the fucceeding, also to a species of leprosy, and certain warts which grow on horses legs.

LICHEN ARBOREUS PULLUS, called also muscus crusta. TREE LIVER-WORT. It grows to trees, and is used

inftead of the pulmonaria arborea.

- CINEREUS TERRESTRIS, called alfo lichenoides. Ash-coloured ground liver-wort. It is the lichen caninus, or lichen coriaccus repens lobatus obtufus planus: fubtus venofus villofus, pelta marginali adfeendente, Linn. It confifts of roundish thick leaves, divided about the edges into obtuse segments, flat above, of a reticular texture underneath, fastened to the earth by small fibres; when in perfection, of an afh grey colour, by age turning darker coloured or reddish. It grows on commons and open heaths, fpreads quickly on the ground, and is to be met with at all times of the year, but is supposed to be in its greatest vigour about the end of autumn, &c. to the winter.

From its fenfible qualities it does not appear to be possessed of any useful degree of medicinal virtue.

LICHENASTRUM. It is a fertile and very floriferous

kind of moss, with heads supported by pretty long pedi-cles; these heads as they ripen usually cleave into four equal parts as far as the base, resembling a cruciform flower, and discharge a fine secundating dust. The heads are simple and naked, each standing on is own pedicle, which culatum. The greater number of these teeth run tran-

toots are sweetish and more agreeable than the leaves; a is longer or shorter, and proceeds from a vagina or sheath; large quantity affords a little essential oil; an extract made sometimes simple, sometimes bivalve, and sometimes di-

LICHENOIDES. It is diftinguished from the conferval and ulva by its boffes and tubercles, and by the fame pe-culiarities it is diftinguished from the lichen and lichenaftrum. It is deltitue of flowery heads. It confifts of a middle fubftance, between the fungi and the moffes, whence many of its species are called musco-fungi. Their general divition is into those with and those without stalks, these are again subdivided each into three species. It is also a name for the lichen einer. terrestris.

LICHNIS SYLVESTRIS. See LYCHNIS. LIEN. The SPLEEN, OF MILT. See SPLEN. LIEN SINARUM. EGYPTIAN BEAN. See FARA

LIENIS INFLAMMATIO. See SPLENITIS.

LIENTERIA, from Muor, finosth, and sulepon, the gut.
A LIENTERY. The Latins call it levitas inteffinorum. It is a species of diarrhoea, in which the aliments are hurried through the body in a nearly indigested state. Fer-nelius attributes this diforder to a weakness of the first concoction; but Dr. Freind, with greater probability, supposes an obstruction of the intestinal glands to be a principal cause; and Fr. Sylvius says, that the orifices of the lacteals are in a great measure obstructed. Actuarius observes that an inveterate diarrhoa or dysentery most commonly produces the diftemper.

Etmuller proposes to strengthen the stomach with rhubarb, quinces, and fuch means as check vomiting: and Dr. Freind affures us that the most rational method is, gently to stimulate the intestinal tube, and to deterge the obstructed glands by means of gentle purges, and vomits of ipecacuanha at proper intervals. To these may be added moderate riding, stomachic and warm strengthening medicines. See COELIACA PASSIO, DIARRHOEA,

and Dysenteria.

LIENTERIA SPONTANEA. DIARRHOEA LIENTERIA. See DIARRHOEA.

LIGAMENTUM, from Ego, to tie. A LIGAMENT.
The ligaments, fo far as they relate to the bones, are tendinous, inclassic, glistening bodies. Every articulating bone is furnished with a capsular ligament, which ligament is composed of two layers; the external layer is the stronger, being made by the periosteum, the inner is thin and uniform. and uniform.

LIGAMENTUM ANNULARE. The ANNULAR LIGA-MENT. This name is given to a Egament on each ankle and each wrift, and this more on account of their nfe than their figure; they bridle the tendons of the muscles which pass through them. Hence the term FRANUM.

ARTERIOSUM. See DUCTUS ARTERIOSUS.

- CILIARE. It is the circular line on the globe of the eye, where the felerotis, choroides, retina, cornea, proceffus ciliares, and iris terminate, forming a whitifu ring fomewhat more dense than any other part of the coats. It is often confounded by writers with the processus ciliare. See Choroides.

Colt DEXTRUM. The mefentery having reached the end of the ileum joining the colon, the particular lamina which is turned to the right fide forms a small

transverse fold thus called.

- COLI SINISTRUM. The mefentery, here called mefocolon, having paffed below the left kidney, it contracts and forms a transverse fold thus named.

— Coli vel Nuchæ. See Cucularis.
— Cutaneum ossis coccygis. It goes out anteriorly from the extremity of the os coccygis. It is very flender, and divides into two portions at the orifice of the anus, which runs in the membrana adipofa, and are inferted in the fkin on each fide of the anus by a kind of expansion, and continuing to divaricate, they are lost on the two sides of the perinæum.

- DENTICULATUM. Between the anterior and posterior bundles of fibres which form the spinal nerves, a ligament is connected, by a number of threads, to each fide of the pia matral covering of the spinal marrow, through its whole length, for its support. As this ligament is fixed by a number of teeth, to the inner fide of the sheath formed by the dura mater, it has been called dentiverfely, some ascend, others descend, all split into fibres, of the asphodel; the slowers resemble that of the lily. which are incorporated with the fibres of the inner layer of the dura mater. From the conical lower end of the fpinal marrow a cord is produced, which reaches to the os coccygis, and there splits into threads, which may be confidered as the termination of the last teeth of this liga-

LIGAMENTUM HEPATIS SUSPENSORIUM. It was the

umbilical vein in the fœtus.

- INTER MAXILLARE. So Winflow calls a ligament on each fide of the face. It connects the two jaws, and gives infertion to the posterior fibres of the buccinator muscle. It is strong and broad, fixed to the outside of the upper jaw, above the last dens molaris, and at the fide of the apophysis peterigoideus internus. By the lower end it is fixed on the outside of the lower jaw, below the laft dens molaris.

- LATUM, or suspensorium hepatis. It is made up of the double membrane of the peritonaum, which covers the liver on each fide, and meets to be joined by the

fternum.

- POUPARTH. POUPART'S LIGAMENT. It is only the lower border of the descending oblique muscle of the belly stretched from the fore-part of the os ilium to the pubes, called also FALLOPH LIGAMENTUM.

—— PUBIS INTEROSSEUM. It is a firong triangular membrane, fixed by two of its edges in the interior branches of those bones, all the way up to their common symphysis; the third edge, which is lowest, is loofe, and this whole membrane, the middle of which is perforated than a particular hole is stretched were tight between the by a particular hole, is stretched very tight between the two bones, and under their cartilaginous arch to which

it adheres very closely.

ROTUNDUM. The ROUND LIGAMENT. There aretwoof this kind, one on each fide of the uterus. They are two long fmall plexuses of blood-vessels upon the fore-part of the ligamenta lata, whose use is not known. They run in the duplicature of the broad ligaments, from the corners of the fundus uteri pafs through the annular aper-

ture of the obliquus externus, and are lost in the middle and upper part of the fat in the groin.

LIGATIO. A BANDAGE OF LIGATURE, OF LIGATURA. S stiffness of the joint, and also that impotence which is supposed to be induced by magic.

LIGATURA VENERIS. A name for camphor, from a fupposition that it checks the venereal appetite. See CAMPHORA.

LIGNUM RHODIUM. RHODIUM WOOD. It is the genista Canariensis, Linn. called aspalathus.

LIGUSTICUM. See Levisticum, also a species of fefeli. The species used in medicine is the liguslicum le-

LIGUSTRICUM. See Seseli vulgare.
LIGUSTRUM INDICUM. Also called alcanna Cyrus Diofe. & Plinii, elbanne Arabum. EASTERN PRIVET. This is the kenna of the Turks and Moors. It is reckoned emmenagogue, but is little used, except to stain the nails of women and the beards of men of a red colour.

Phillyrea or MOCK-PRIVET is faid to dry and aftringe,

but like the reft is neglected in practice.

LIGUSTRUM ITALICUM. See ALATERNUS.

— VULGARE, also called ligustrum Germanicum, PRIMPRINT, or COMMON PRIVET. It is a firm with rough pliant branches, whence it is in much use for hedges in gardens; the flowers grow in spikes, they are of a whitiin colour, and followed by clusters of black berries; the flowers appear in May and June, the berries are ripe in September.

There are other species; but, though reckoned some-what astringent, and also useful in hysteric disorders, they

do not obtain in practice.

LILAC. The PIPE-TREE. Lilac is an Arabian name, though some derive it from the lily, because its slowers resemble a lily. The Greeks call it \(\Sup\_{17}\epsilon\_{\text{s}}\); the Latins \(\beta\_{1}\text{ing}\_{3}\), because when the pith is taken out of its thick branches, they are made into pipes. Boerhaave mentions five species, but they are not noted for medical virtues.

LILIASTRUM. ALPINUM MINUS. SPIDER-WORT.

This plant is chiefly used as an ornament in gardens,

though it is faid to be a relifter of poison, and useful in casing gripes, called also Phalangium allobrogicum.

LILIO-ASPHODELUS. It is so called because it par-

takes of the lily and of the afphodel; the root is like that

Boerhaave mentions two species, but attributes no medical virtue to them.

LILIO-FRITILLARIA. The root, fialk, and leaves refemble those of the lily; the flower resembles that of the

fritillaria. It is not noted as being medicinal.

— HYACINTHUS. The LILY-HYACINTH, called also byacinthus fellaris. The leaves and roots resemble those of the lily, but the flower more resembles that of the byacinth. The roots, like those of the lily, are diges-

- NARCISSUS. The DAFFODIL-LILY, also narciffo-colchicum. Boerhaave enumerates nine species; but

they have no medical virtue.

LILIUM. The LILY. This plant is fo well known as not to need a defeription. Boerhaave enumerates nineteen species, but there are very sew of them that are. ufeful in medicine. It is also a name given to many flowers, as LILIUM CONVALLIUM MINUS. See MONO-

- ALBUM. The COMMON WHITE LILY. Lilium candidum, or lilium Palæstinum, foliis sparsis, corollis campanulatis; intus glabris, Linn. It is perennial, a native of Syria and Paleftine, common in our gardens, and flowers in June. The flower gives an agreeable flavour to expressed oils, and the roots are useful in suppurating cataplasms. Dr. Alfton says that the roots are of the nature of squills. Godorus, serjeant-surgeon to queen Elizabeth, cured many dropsical people by giving them bread to eat in which these roots were baked.

- Convallium, also called convallaria, Maian-themum, MAY LILY, and LILY of the VALLEY. It is the convallaria majalis, Linn. The flowers of this kind of lily, are fmaller than those of any other; they have a penetrating bitter tafte, and a fragrant fmell: the bitter matter of these flowers remains both in the spirituous and watery extract, and is nearly as purgative as aloes.

The dried flowers are a firong flernutatory. The roots also possess the bitter and purging qualities of the flowers.

— Rubrum, also called bemerocallis lilium, pur-

purocroceum, lilium croceum. RED or ORANGE LILY. The leaves are cooling, and the roots are aperitive and

ZEYLANICUM SUPERBUM. Sec METHONICA. LIMATURÆ FERRI. Sec FERRUM.

LIMAX. See Cochlea Terrestris. LIMONIUM. Sea-Lavender. Boerhaave mentions fourteen species. It is aftringent, and faid to be given with fuecess against diarrhoeas, dysenteries, pro-fluvia, mensium, and all kinds of hamorrhages. The roots and leaves are the parts most used. It is also a name for beben rubrum.

LIMONUM. The LEMON-TREE. Citrus limon vulgaris petiolis linearibus, Linn. vel citrus medica, var. B. Linn. It is a native of Afia, but cultivated in the warmer parts of Europe: there are may varieties with respect to the fruit. Linnœus reckons the feveral citrons, as well as lemons, to be only varieties of one species, which is distinguished from the orange kind only by the pedicles of

the leaves being naked.

The yellow rind of lemons is a grateful aromatic, and very commonly used in stomach tinctures and infusions. Its flavour is the best adapted to accompany bitters. It affords an effential oil, commonly called the effence of lemon, which is extremely volatile, of a pale ftraw-colour, in fmell as agreable as the fresh peel, and is often employ-ed as a perfume; but it is often adulterated with spirit of wine, or with oil of turpentine; to detect which, add a little of the fuspected oil of lemon to a little spirit of wine, and if it is adulterated with oil of turpentine the mixture becoms milky; if the adulteration is with spirit, a mixture of it with the oil of turpentine becomes milky

The juice of lemon is more acid than that of oranges; fix drams of good lemon juice faturates about half a dram of fixed alkaline falt; and this mixture, with the addition of a fmall quantity of any aromatic water is much in use, for abating naufcas, vomiting, and fevers. See Neumann's Chem. Works. Lewis's Mat Med.

LINAGROSTIS. Tournefort mentions three fpecies of this plant, but they are not remarkable for medicinal virtues. It is also a name for the gramen tomentarium, linum pratense gnaphalium tragi, juncus bombytinus.

COTTON-GRASS. The panicula minor; and juncus capitulo]

lanuginoso, schanolaguros. HARE'S TAIL RUSH.
LINARIA, also called ofiris, urinaria, FLAX-WEED,
or COMMON TOAD-FLAX. The species formerly used in medicine, is the antirrhinum linaria, Linn. Boerhaave enumerates twenty-two species of linaria, but hardly any of them deferve any notice. The common fort so resembles the estula minor, that it is not distinguishable before the flowers appear, but by breaking the stalk; for the toad-flax is destitute of the milky juice which is observed in the effula. It is perennial, grows wild about the fides of dry fields, and flowers in June and July. If the leaves are inwardly used, they are diuretic and purgative; ex-ternally they have been commended against the piles. A name also for a species of clatine, of chenopodium, and elichryfum.

LINARIA HEDERACEO FOLIO, called also eymbalaria, IVY-LEAVED TOAD-FLAX. It grows on old walls in

Switzerland and Italy.

LINCTUS, also called lobse, eclegma, elixis, eligma, eclellos. Loch, and LAMBATIVE. This composition is thicker than syrup, but much foster than an electary; and was first made to be licked from a stick of liquorice, and then gradually fwallowed. It is a form that foon loathes; these may be used in disorders of the inward parts of the mouth, the fauces, and cofophagus, as in aphthe, tickling coughs from defluxions of thin ferum, &c.

LINEA ALBA, I it extends from the cartilago

EA ALBA, It extends from the cartilago CENTRALIS. enfiformis to the os pubis. From the os pubis to the navel it is a mere line, but higher it is broader. Its whiteness is caused by the tendons. It is made up and interwoven out of all the tendons of the abdominal muscles, which, being run together into one entire body, affifts each other's motion in compressing the

LINE E SEMILUNARES. They terminate the lower part of the external oblique mufele, and are lost at

the upper part.

TRANSVERSÆ. They pass between the lineæ alba and semilunares, and are formed by the intendinations of the recti muscles. They are not directly transverse as represented in figures, but are irregularly waved.

LINGODES. Fevers are fo called that are much at-

tended with an hiccough.

LINGUA, from lingendo, licking. The TONGUE. As to its structure, it is composed of two parts; the inferior is a mass of muscle; the upper surface is towards the apex, full of papillæ, which as you trace them backward, become more irregular and flat, whence authors treat of papillæ pyramidales, capitatæ, and lenticulares. Thefe papillæ are a mass of vessels running from the basis to-wards the apex. Near the epiglottis, the surface of the tongue is merely glandular. Near the middle of the tongue is applied the foramen cacum; Morgagni sirst deferibed it, and Vaterus hath fince found its ducts which discharge faliva. Under the papillæ, on the furface of the tongue, are fleshy fibres running in all possible direc-tions; it is owing to these that the tongue hath such vari-ety of motions. This is also a term given to many botanical fubstances.

LINGUA AVIS. See FRAXINUS.

—— CANINA. See CYNOGLOSSUM MAG. VULG.

- CERVINA, also called phillitis feologendrium. HIND'S, OF HART'S TONGUE. It is a plant with long, HIND's, or HART'S TONGUE. It is a plant with long, uncut, narrow leaves, of a bright green colour, ftanding on long hairy pedicles. There is no ftalk, nor any manifeit flowers; the feeds are a fine dust, lying in large, rough, brown, transverse streaks on the backs of the leaves. This plant is perennial, and is found green in all the feasons of the year. It delights in moith, shady, show places. The leaves are commended as aperient and corroborant, particularly in diseases of the vices. corroborant, particularly in difeases of the viscera: but

present practice does not employ them.

— MAJOR and AVIS. See/DORIA.

LINGUALES. The ninth pair of nerves. See Hy-POGLOSSI EXTERNI.

LINGUALES GLANDULE. They are those of the fora-men cacum of the basis of the tongue. LINGUALIS MUSCULUS. The MUSCLE of the TONGUE. It rifes from the basis of the os hyoides, and runs to the tip of the tongue. It is in general the fleshy fibres of the tongue, which run in may directions. turns the tongue laterally, and downwards.

LINIMENTUM. LINIMENT. It is a thinner kind of ointment, and principally defigned for an application where the tenderness of a part will not admit of a harder ointment.

LINIMENTUM ARCÆI. See ELEMI.

SAPONACEUM, now called linimentum faponis.
SAPONACEOUS LINIMENT. It was formerly called opedeldoe, and faponaceous balfam. It is chiefly employed for external purposes against rheumatic pains, sprains, bruises, and such like comptaints. The London College directs the following very liquid form, because the soap acts most to advantage when so diluted.

#### Soap LINIMENT.

Take of the spirit of rosemary, H i. hard Spanish soap, three ounces; camphor, one ounce; digest the soap in spirit of rosemary, until it is dissolved, and add to it the camphor. Ph. Lond. 1788.

LINOSYRIS NUPEORUM. See ELYCHRYSUM. LINTEUM. LINEN. In furgery it comprehends lint, tents, rollers, and compreffes. Where lint is applied to abforb the matter from a wound, pledgets of fine fpunge is more effectual, and should ever be preferred when any inconvenience is apprehended from the sharp-

nefs of the matter.

LINUM. LINE, or FLAX. Linum ulitatiffimum, or linum (ylveftre, foliis lanceolatis alternis, calycibus capfulfque mucronatis, petalis crenatis, floribus cæruleis, caule fubfolitario, Linn. This plant is properly called line only while it is an herb standing green in the field, and hath no inner bark; when the inner bark is perfected, and ever after, it is called flax. Boerhaave mentions sight species, but it is only the feed of the common sight species. tions eight species, but it is only the feed of the common

fort that is used in medicine.

Linefeed is of a reddish brown colour, glossy, flat, slip-pery, nearly oval, and pointed; it hath an unctuous mucilaginous, fweet tafte, but no fmell; the mucilage is in the fkin of the feed. On expression much oil is obtained from it. This oil, if drawn without heat, is infipid, but does not congeal with the winter's cold, nor does it form a folid foap when mixed with fixed alkaline falts, but acts more powerfully than any expressed oil as a menstruum on fulphureous bodies. When this oil is sweet, it is emollient; when rancid, it is better as an expectorant. Applied to burns and fealds it is ufeful; and when women's breafts are inflamed from the milk stagnating in them, it affords considerable relief. If the seeds are boiled in water, they afford a large quantity of mucilage; but if designed for inward use, an infusion is more agreeable. These infusions are emollient, incrassiant, and demulerate of use in tickling courses. mulcent, of use in tickling coughs, stranguries, &c.

#### Infusion of LINESEED.

A large spoonful of the unbruised seed may be insused in a quart of boiling water, to which half an ounce of the root of liquorice may be added; and when it is cold, the strained liquor may be used as common drink.

If an ounce of colt's foot leaves are added, it is called pectoral infusion.

The mucilage obtained by infpiffating the decoctions, is an excellent addition for reducing difguftful powders into the form of an electary: thus the compound paffes into

the form of an electary: thus the compound parent the ftomach, before the difguifful tafte can be perceived. The feeds may be used for maturating cataplasms after the oil is expressed from them. See Lewis's Mat. Med.

This is a name for the EARTH FLAX, and SALA-MANDER'S WOOL; to which are joined the following epithets: abestinum; carpatium; carysium; Cypricum; Creti-cum; fossile; Indicum; & vivum; see Amianthus; as

aspecies of linagrossis, and some other vegetable substances.

LINUM CATHARTICUM, Linn. Called also linum minimum, chamælinum, MOUNTAIN-FLAX, MILL MOUNTAIN, and PURGING FLAX. It is a fmall plant, with little, oblong, fmooth leaves, having one vein or ribrunning along the middle. The stalk is stender, teddish, divided towards the upper part into fine branches, bearing on the tops white flowers, followed, as in the common flax, by roundish ribbed capfulæ, with ten flattish slippery feeds in each. It is annual, grows wild on chalky hills, and dry pasture grounds. It is an effectual safe purge; a handful of the fresh leaves infused in wine or whey, or a dram of the leaves in powder, are a dose. See Rail Hist. Lewis's Mat. Med.

LIPIRIA

mind. FAINTING. Deliquum animi, & anima; fyncope, asphyxia; virium lapfus. Dr. Cullen places syncope as a genus of difease, in the class of neuroses, and order adynamine. He diftinguishes two species: 1. Syncope car-diaca: when from some fault in the heart or its nearest vessels. In this case there is no manifest cause, but at the intervals there is a violent palpitation of the heart.

2. Syncope occasionalis. In the instances of this species, a cause is manifest, and is generally an affection of the whole fystem.

In this disease the pulse and respiration become suddenly weaker than usual, and that in such a degree, that to the perception of the attendants they wholly

The flightest degree is that in which the patient con-flantly perceives, and understands, yet is without the power of speaking: this is called fainting. It often hap-pens to those who are disturbed with flatulencies, without any remarkable alteration in the pulse. If he loses his feelany remarkable alteration in the pulse. If he loses his feeling and understanding, with a considerable sinking of the pulse, it is called a syncope, or swooning. If the syncope is so violent, that the pulse seems totally extinguished, without any discernible breathing, with a manifest coldness of the whole body, and a wanly livid countenance, sometimes followed by death, it is called an asphyxy, which may signify a total resolution. This last degree, in most instances, constitute, according to Dr. Cullen's arrangement, varieties of apoplexy, and these chiefly are varieties of the species which he calls apoplexia venenata.

The causes are various, either too much or too little

The causes are various, either too much or too little blood; aload at, or other disorder in the stomach; nervous

blood; aload at, or other diforder in the stomach; nervous complaints; passions of the mind; a polypus in some of the principal blood-vessels, and various other disorders; as also opiates, and other volatile and active drugs, &c.

The different degrees of this disorder should be distinguished from hysteric sits, epilepsy, and the apoplexy.

People who are subject to frequent faintings, without any manifest cause, usually die suddenly, and are found to have polypuses in their principal blood-vessels. When after is the cause in weak persons, it is dangerous; and when occasioned by receives it is equally so. when occasioned by worms it is equally so.

During the fit, all that can be done is to reftore the mo-tion of the heart, which may be attempted by placing the patient in a proper pofture. Cold water, or vinegar and water, may be sprinkled on his face, and a little of the same poured down his throat. Strong vinegar may be held under his nostrils, the extremities should be well rubbed, and as foon as he can fwallow, give him a glass

of wine, or of fome cordial water.

After the fit, the cause must be removed. If this is pain, give fmall dofes of any convenient opiate at proper intervals; if violent evacuations, give gentle anodynes, a light cordial, but nourifhing diet, which must be allowed very frequently, as but small quantities can be taken at a time. Saffron may be added to any liquid part of diet. If the patient is robult, and a redundancy of blood overmes him, bleed, but wait his recovery from a prefent fit before performing this operation, except fome very ur-gent circumstance demands immediate bleeding. When indigestion is the cause, or other disorder in the stomach, a vomit may be given speedily, and then the respective disorder must be adverted to. When nervous affections give rise to this disorder, a supine posture, fresh air, and either sweets or seetids held to the nose (as the patient finds relief from one or the other) give the speediest help. When unruly passions, when anger, or grief, &c. produce this disorder, the fits are often tedious, and when removed foon return; in this case keep the patient still; in the fit, let the strongest vinegar be held to his nose; as foon as he begins to recover give a small dose of tinch opii in an agreeable cordial water; now and then give the sp. zetheris vitr. in his drink: if he complains of sickness, and a bitter taste in his mouth, give a gentle emetic, and after it the sp. zetheris nitr. or nitre itself, with a little rhubarb. See Cullen's First Lines, vol. iii.

LIPPITUDO. BLEAREYEDNESS. See EPIPHORA and XEROPTHALMIA. Celfus means by it an ophthalmia!

LIPIRIA. See Ardens Febris.

LIPODERMUS, from  $\lambda ii\pi\omega$ , to leave, and  $\delta ii\mu\alpha$ , the fine. One who hath loft his prepuce.

LIPOPSYCHIA, from  $\lambda ii\pi\omega$ , to leave, and  $\psi \nu \chi n$ , life.

A fainting fit.

LIPOTHYMIA, from  $\lambda ii\pi\omega$ , to leave, and  $\psi \nu \chi n$ , life.

LIPOTHYMIA, from  $\lambda ii\pi\omega$ , to leave, and  $\psi \nu \chi n$ , life.

Lipothymia are very hot, whilit the external are very cold.

LIQUIDAMBAR, called also liquidambra, stractions juice, of a yellow colour, inclining to red; hardens into a brittle result. It is the produce of a tree in especially virium lapsus.

LIPOTHYMIA, from  $\lambda ii\pi\omega$ , to leave, and  $\psi \nu \chi n$ , life.

Lipothymia, iii to external are very hot, whilit the e various parts of America called flyracifera. It is rarely met with genuine, and, when it is, its use is chiefly as a

perfume. See Lewis's Mat. Med.

LIQUIRITIA. See GLYCYRRHIZA.

LIQUOR AMNII. In midwifry this is generally called the WATERS. It is the fluid in which the fœtus fwims during gestation. This liquor contains air, whence supposed some children have been heard to cry in the

- MINERALIS ANODYNUS HOFFMANI. Fred. Hoffman, the author of this medicine, extols it as an anodyne and antipalmodic, but ather is a superior me-dicine of the same kind. In the Paris Pharmacopceia, the following is given as the method of preparing this liquor; but it is not certainly known to be as Hoffman was used to make it.

#### HOFFMAN'S MINERAL ANODYNE LIQUOR.

In half a pound of concentrated oil of vitriol, placed in a large glass retort, pour by little and little, through a long stemmed funnel, a pint and a half of highly rectified spirit of wine. Stop the mouth of the retort, digest for some days, and then distill with a gentle heat. At first a fragrant spirit of wine will said and from the retort of wine will said and the retort of wine will be wi grant spirit of wine will arise, and after it a more fragrant volatile spirit, which is to be caught in a fresh receiver; the receiver being again changed, a fuphureous volatile acid phlegm comes over; and, at length, a fweet oil of vitriol, which should be immediately separated, lest it be absorbed by the phlegm. Mix the first and second spirits together, and in two ounces of this mixture, disfolve together, and in two ounces of this mixture, diffolve twelve drops of the fweet oil just named. If the liquor hath any fulphureous fmell, rediffil it from a little falt of tartar. The College of Physicians of London order, inflead of this process, the following—the product of which Dr. Heald in his Remarks says, is supposed to be the celebrated liquor anodynus Hoffmanni, which they call spiritus atheris vitrislici compositus; compound spirit of vitriolic ather.—Take of spirit of vitriolic ather two pounds, oil of wine, three drams by weight; mix them. Pharm Lond. 1788. It is given as a sedative, and antispasmodic, in hysteric, arthritic, and other painful complaints of die, in hysterie, arthritie, and other painful complaints; to adults from thirty to an hundred drops, or more, along

with fome fugar, or fome appropriate mixture.

LIQUOR. This term is added to many fubflances, as liquor fireniacus. See BENZOINUM. Æthereus. See ÆTHER. Cereris. See ALLA. Metallicus. See Ak-GENTUM VIVUM. Salis. See CIRCULATUM.

LITERATUM LIGNUM, alfo called Sinenfe lignum.

LETTERED WOOD. It is brought from China; but it is

not used in medicine.

LITHAGOGUS, from 265, a stone, and are, to bring away. An epithet for a medicine that expels the stone.

LITHARGYRI ACETATI AQUA: See Plum-

LYTHARGYRUM, from xibst, a flone, and approprist, filver. LITHARGE: called alfo almakanda and almakift; calcites fa argyritis; cathmia. When filver is to be feparated from copper, or other impure mixture in the ore, it is put into a test, and with it is melted a great quantity of lead. When by the heat to which these matters are exposed, the lead, and the other impure metals, &c. which were in the filver ore, fwim like oil on the furface of the filver, the lead is gradually blown to the files of the teft, and then a notch being cut, the lead runs off, and when cool, appears in the form which we call lithurge. This litharge is of a deep yellow, or of a whitish colour, according to the different bodies that are mixed with it, or according to the different degrees of heat to which it was exposed, and according to the darkness or lightness of its colour, is called litharge of gold or of filver. The College of Phylicians order a cerate to be made of this, in the following manner:

Ceratum Lithargyri acetati. Cerate of acetated LITHARGE.

Take water of acetated litharge, two ounces and an half by meafore; yellow wax, four ounces; olive oil, 6 D nine

the remaining oil, and as foon as the mixture begins to thicken, pour in by degrees the water of the acetated lithurge, and flir conflantly till it is cold, then mix in the camphor before rubbed with oil. Ph. Lond. 1788.

LYTHARGYRUM, also called lythargyrus aureus, chry-

fitis, REDDISH, or GOLD LITHARGE.

LITHARGYRUS ARGENTEUS, called also argy-

ritis, WHITISH, OF SILVER LITHARGE.

Litharge diffolved in olive oil is the empl. lythargyri. LITHIASIS, from xdos, a flone. The GRAVEL or stone. See Calculus. Also a tumor on the eye-lid, in which is a hard concretion between its coats.

LITHODENDRON. See CORALLIUM.

LITHOEIDES, from siese, a flone, and er Sos, form, fo ealled from its hardness. An epithet for the os petrosum-LITHONFRIPTICUS, from xibse, a fione, and 3 govalus to break. An epithet for medicines that are faid to break the flone in the bladder. Though, the different flones that are generated in the human bladder, require different folvents when out of the body; and though art hath not yet afforded a medicine, which, when injected into the bladder, will without injury thereto, dislolve the flone therein lodged; it cannot thence be concluded, that there are no lithostriptic medicines. It may be here observed, that one solvent affects one subject, but hath no effect on another; fo a folvent may yet be met with that will de-ftroy the fione, and not hurt the human body. The water into which the boiled white of egg diffolves, will liquefy myrrh, but may be put into the human eye without caufing any uneafiness.

Soap-ley taken at first in fmall doses in broth that is freed from all its fat, succeeds in most cases which re-quire an alkaline solvent. The patient may begin with twenty drops, and gradually increase the dose as he is able: and by repeating it three times a day for fix, eight, or twelve months, the wished for effects often follow. See Blackrie on Dissolvents of the Stone. A solution of vegetable alkali impregnated with fixable air, has been faid to be fuccefsful in diffolying the calculus in the kidneys, of which feveral cafes have been published by Dr. Faloner of Bath.

LITHOPHITON. A LITHOPHYTE is a species of plant of a horny substance, seeming to be of a middle nature betwixt wood and stone. Boerhaave calls it keratophyton.

LITHOSPERMUM, called also milium folis, Ætonychum, GROMWELL, GRAY-MILL. The lithospermum officinale, Linn. It is a rough plant, with stiff branched
stalks, oblong actuminated leaves, fet alternately without pedicles, and whitish monopetalous flowers, scarcely longer than the cup, solitowed by roundish, hard feeds. It is perennial, grows wild in fields, and flowers in May and June. The feeds are diuretic. They are rarely used. See Lewis's Mat. Med. It is also a name for the lachry-ma Jobi; and some species of heliotropium.

LITHOTOMIA, from subos, a flone, and repose, to cut.

LITHOTOMY, or cutting for the flone.

This operation was performed in the time of Hippo-erates, but being then thought mere madness, it was only

performed by empirics.

When a flone is suspected to be lodged in the bladder, befides the common fymptoms of this cafe, it is usual for a furgeon to make a fuller examination, by introducing an inftrument, called a found, into the bladder, by which, if possible, to feel the finne. In order to this, Mr. Sharp directs the following method. "The patient being laid on an horizontal table, with his thighs elevated, and a little extended, pass the found with the concave part towards you, until it meets with some resistance in perince, a little above the antis; then turning it without much force, push it ments on into the bladder, and if it much force, push it gently on into the bladder, and if it meets with an obstruction at the neck, raise its extremity upwards, by inclining the handle of it towards you; or apwards, by inclining the handle of it towards you; of if it do not then flip in, withdraw it a quarter of an inch, and introducing your fore-finger into the rectum, lift it up, and it will feldom fail to enter. There is some art in turning the sound, in the proper place of the urethra, which surgeons not well versed in this operation cannot so well execute; therefore they may pass the instrument with the concave side always towards the abdomen of the nations." patient."

The common rule of knowing whether there is more

time ounces by measure; camphor, half a dram; rub | stones than one in the bladder, is not infallible (see Warthe camphor with a little of the oil, melt the wax with ner's Cases in Surgery); though if a stone is universally rough, there is rarely more than one: but if one part is polished, and another rough, it is almost certain that there are more. Some speak of an adhesion of the stone to the coats of the bladder. It indeed often happens that the bladder is wrinkled round the flone, and in extracting, the operator tearing a little of the inner coat of the bladder, imagines, or pretends, that there was an adhesion. If the flone is large, by introducing the found, the operator may hear it flrike against it, but cannot thus determine whether the flone is large or finall. Sometimes the operator examines, but cannot find a flone, though there is one; for inftances occur in which it is lodged in a fack. Before a patient is examined, he may use a little exercife, fuch as riding, or jumping, by which the flore may fall down to the neck of the bladder, for thus it may more readily be discovered:

After the operation, children relapfe more frequently than adults; and adults run greater hazards in the ope-

ration than children do.

From the variety in the apparatus, or in the modes of operation, different names have been given, as follow:

The Lesser Apparatus, called also the Celsian Method, cutting on the Gripe, and the Guidonian Method.

This way was directed and practifed by Celfus. Since the time of Johannes de Romanis, it is called eutting with the leffer apparatus, to diftinguish it from his new method, which, on account of the many instruments in it, is called cutting with the greater apparatus. Heister fays, this method is practicable in boys under fourteen years of age, because that in them the stone may be brought to the perinzum. He fays, he always performs it on children; and that it may be practifed on adults, when the flone causes a suppression of urine, by its adhering to the neck of the bladder, but otherwise it is dangerous to

The Greater Apparatus, called also Marianus's Method, and the Old Way.

This method was invented by Romanis but, published by Marianus, who was his pupil. Romanis confidered the shortness and dilatability of the urethra in women, and imagined that by an opening made in the urethra in men, near the bladder, it might be dilated, and the fine extracted with cafe.

The High Operation, also called Sectio Hipogastrica, and France's Method.

The great objections to this method are, as the bladder is apt to be thickened and inflamed, and cannot be diftended, the incition may happen to be made into the perito-neum; and alfo, if not being in a depending part, the urine and pus will infinuate themselves into cavities, so occasion inflammations, suppurations, and sistulas, which cannot often be healed.

#### The Lateral Operation.

This method was invented by an ecclefiaftic, who called himfelf Frere Jaques. Rau learned it of him, and Albinus published it. Various improvements have been made in this method, and it is yet continued in practice. Mr. Sharp directs it as follows, from Mr. Chefelden: "The patient being laid on a table, with his hands and feet tied, and the staff passed, as in the old way, let your affistant hold it a little slanting on one fide, so that the direction of it may run exactly through the middle of the direction of it may run exactly through the middle of the left erection of it may run exactly inrough the middle of the left erector penis, and accelerator uring mufcles; then make your incition through the ikin and fat very large, beginning in one fide of the feam in peringeo, a little above the place wounded in the old way, and finishing a little below the anus, between it and the tuberofity of the ifchium. This wound muft be carried on deeper between the muscles, till the prostate can be felt, when searching for the staff, and fixing it properly if it had slipped, you must turn the edge of the knife upwards, and cut the whole length of that gland from within outwards, at the fame time pushing down the rectum with a finger or two of the left-hand, by which precautions the cut will al-ways escape wounding; after this, introduce the forceps to take out the stone. After the operation is ended, if there is an hæmorrhage from the prostate gland, a silver canula of three or four inches long, covered with fine

tient may also take an opiate. If the wound does not bleed, a little dry lint, or a pledgit of digeflive, may be laid in it. If a pain is felt near the bladder foon after the dreffings are finished, a bladder of warm water may be applied over it; and if it increases, as there will be much danger therefrom, bleeding and clysters will be necessary." necessary.

When a fine flicks in the urethra of a man, proceed as directed in the article CALCULUS.

Women are rarely afflicted with a flone in the bladder, but when they are, it generally may be extracted through the urethra, which may be gradually dilated to an almost incredible fize. Stones have been extracted through a di-lated urethra, which weighed more than five ounces.

As the urethra is generally lacerated in fome degree by the paffuge of the flone, many prefer the making of an incision; but either method fucceeds so well, that it is difficult to say which is the best.

Mr. Bromfield gives the following instance of dilating the urethra, which is a far better method than those by means of tents, &c. By the help of a ftrait blunt direc-tor, he introduced into the bladder the closed end of the appendicula intestini cœci of a fmall animal; and leaving out, at a proper length thereof, the open end, he filled it with warm water by means of a fyringe, and prevented the water's escape by a ligature. He then made a twith or two of that part of the appendicula which was left out, that the contained water might, by being pressed on, distend the close end which was in the bladder: an affishant was directed to draw it forward from time to time, and occasionally to give a fresh twist. To as to fill time, and occasionally to give a fresh twist, so as to fill the end contained in the bladder more and more as the the end contained in the bladder more and more as the cervix vesicæ opened; by which process, continued for some time, the neck of the bladder was so opened, that the forceps might have easily been admitted if required, but the stone getting a passage by the help of the urine, this instrument was not needed. After the passage of the stone, the parts were somented with warm milk, and then with complete of signs and with complete the stone with complete the stone of the with camphorated fpirit of wine; very little inflamma-tion was observed, and no other disagreeable symptom. See his Observations and Cases, vol. iii

Mr. Gooch gives an instance of extracting a flow of four ounces weight, through an incision which he made from the vagina into the bladder. This procedure was attended with very little trouble, either to himself or the patient; the ulcer soon healed, by the use of soft bassamic injections, and no inconvenience was observed after the healing of the parts. See his Cases and Remarks, vol. ii. p. 182, &c.

LOBELIA. So father Plumier named a plant which he found in America, in honour of Lobel, a famed bo-tanist In North America there are five species. They are found in marfly grounds, and on the fides of rivers.

With the root of the lobelia the American Indians cure
the most virulent pox. They take five or fix-of the plants (fome take the roots either fresh or dry), and boil them in water. Early in the morning the patient drinks as much as he can of this decoction, and during the day it is his chief drink; by and by it begins to purge him, and the firength of the decoction is increased or lessened, as the patient can bear the evacuation. If any part is fore, it is to be washed with this decoction, and thus in two or three weeks a cure is performed. See Appendix to Brooke's Practice of Physic. The species recommended

rag, may be introduced into the bladder, and left there | by the College of Edinburgh is the lebelia fiphilitica, or two or three days, for it rarely fails to check it; the pa-

LOBELLUS, or LOBULUS. A SMALL LOBE. The small cells of fat are called lobuli adiposi, and the extremities of the bronchia, which end in little knobs, are called lobuli pulmonum. Winslow calls the lobe of the

car labus, or labulus.

LOBUS ECHINATUS; also called Bonduch Indorum. Miller mentions two species of a plant which is prickly, and climba up trees in some of the West India islands;

but no medical virtues are attributed to them.

LOCALES. Difeafes that affect, or have their feat, only in a particular part of the body, or of its limbs, fy-

nonymous with more

LOCALIS MEMBRANA. See PIA MATER.
LOCHIA, from MACOLOGI, to lie in child bed, or 20 x 6x, a
bed. The purgations of the uterus after child-BIRTH. This discharge is necessary to unload the vessels, and proceeds from the appendices cacee, after the feparation of the placenta: it continues for a quarter, half, or a whole hour after delivery, more or less, according to the state of the woman. The six contains a fanguine colour for three or four days, then gradually grows more ferous, until it totally ceafes. Sometimes it continues feveral weeks, but at length the uterus and its veffels contracting, it ceases. Baglivi observes that, when the breasts are full of pain, at the coming of the milk, the lochia ftop; but flow again as foon as the pain vanishes. Its quantity is generally lefs after a miscarriage than when a woman goes her full time, and it sooner stops when a woman gives fuck than when the does not.

The lechia may produce much diforder by being defi-

cient or redundant.

When the locbia are defective the belly swells, a heavy pain is felt there and in the loins, and fometimes in the groins alfo; a heat and pulfation in the uterus, which produces reflictines and a fever; a full hard pulse, pain in the head and back, a nausea, sometimes a vomiting, and a difficulty of breathing. The face looks red, the eyes are disordered, the rigors of acute severs come on, fainting, cold sweats, a pulsation and heat of the womb, a palfy in the lower part, and fometimes an epilepfy. The lochia fometimes diminishes gradually, and fometimes all at once, in the morbid suppression of them. Sometimes a delirium coming on, which increasing occafions convultions and death; and if the patient escapes with life, the lofes her fenfes and continues lunatic.

One of the principal causes of this disorder is, the woman's rifing too foon after delivery; whence the weakly, and those who are subjected to hysteric symptoms, should be very cautious in this respect; among other causes are, a defect or impoverishment of blood; an inspissation of the blood in the uterus from cold; a convulfive ftricture of the uterine veffels; a diarrhoea, or other flux; an in-

flammation of the uterus, &c.

The obstruction of this discharge is the worst, if it happens while the evacuated blood is florid; but far lefs troublefome when it grows ferous. In fome constitutions it is finall in quantity; but when no pain, fever, or other manifest ill effects are the consequence, it is not to be attended to.

The indications of cure are, to calm the spirits, and to promote the return of the impeded discharge. Means, however, are not to be persisted in, if relief is not obtained in two or three days; proper means having thus far been used, wait and see what time will produce: If the patient outlives the twentieth day, there is rarely any danger to fear. If the obstructed lechia have produced any other diforder, it will be best removed when the woman's strength is somewhat restored.

If on the suppression of the Ischia the pulse is full and hard, bleed, give warm camomile tea as oft as the patient can take it without puking; draughts may also be given, in which are the pulv. contrayers, and fal fuccin. or with conf. aromatica or mithridate, with finall dofes of the tinct. opii, and, if the heat requires it, add the kali acctatum. These may be repeated every three or four

If the pulse is observed to fink from the bleeding, it must not be repeated, but a blister should be applied as a ftimulant.

As different causes may retard or suppress the locbia,

the present or particular one should be attended to, in or-

der to the administration of proper help.

When cold is the cause (as for the most part it is) gen-

the anodynes and perspiratives will generally afford relief.

'The hurry and tumult both of body and mind, when labour is painful and tedious, produces spasmodic affections, and retard the lochia; in this case, if the pulse require it, bleed, give a laxative cooling clyfter, anodynes, and mild diaphoretics.

Depressing passions, in irritable habits, have sometimes this ill effect; in which case, keep the patient still and in bed, support her with every encouragement, let all she drinks be warm, and with cordials let such nervous medicines be mixed, as the peculiarity of her circumstances may require.

If inflammation is the case, proceed as directed in in-flammation of the part affected. The best fomentation is bladders of warm water laid over the part in which the

pain is most oppressive.

If the lochia is only diminished, gentle stimulants with perspiratives may be allowed; but if they are suppressed, there is for the most part a fever, in which case forcing

medicines are improper.

If the lochia returns not, but a shivering cold fit comes on, an abscess may be suspected to be forming in some part of the body, which will generally carry off the complaint, provided the patient hath strength to bear the discharge. These abscesses often happen in the breast, but they are feated in some other alandalar part fornetimes they are feated in some other glandular part.

Purging should be guarded against; but, though neu-tral medicines often purge in the beginning of their use, this effect generally ceases in a day, or early in the fe-cond. If a purging comes on, and the strength is not impaired by it, leave it to nature, as she often sets up one discharge to answer the end of another. But, if the strength seems to be affected by it, give opiates both by the mouth and clysterwise; this is the chief if not only resource, for astringents do little or no service.

If pain is confiderable, and makes the patient reftlefs, befides anodynes, emoilient clyfters should be frequently injected, not only to empty the bowels, but to act as a

fomentation to the parts.

If in weakly women, from rifing too foon, a delirium is brought on, it generally proceeds to a fatal madness: fometimes it ends in lunacy for life. In this case keep the patient in bed, avoid all evacuations except perspiration, and guard against every thing that can disturb: fal succin. spermacæti, pulv. rad. contray. emollient clysters, by way of fomentation, and bladders of warm water on the part most complained of, may be tried. The lochia are fometimes excessive. Here observe that

the quantity discharged by different women is so various, that it is not to be regarded whether little or much is loft in particular cases, if no bad symptoms come on in con-

fequence of it.

An immoderate flux is attended with weakness, loathing, fainting, convultions, a flow, weak, intermitting pulse, a pale countenance, excretions of grumous blood, pains in the hypochondrium, a tention of the belly, vertigo,

dimnels of fight, tingling in the ears, &c.

If any part of the placenta remaining in the uterus, or clots of blood, are lodged there, they may both irritate and prevent a due contraction of the uterus and its veffels, and so cause this complaint; these should immedi-

ately be brought away.

If the pulse is full and hard, and the patient's strength will admit, bleed; but this is rarely required. Ligatures about the wrift and ankles, and above the knees and elbows, are generally a more proper management. Aftringents, as alum, &c. are preferibed by many, but the fame proceeding as is directed in the article ABORTUS, in cafe of a flooding, may be confulted for what is farther needful in this cafe. See Wallis's Sydenham. La Motte's Observations.

LOCHIORRHEA. An excess of the lochia after they become pale or whitish. LOCULAMENTA. The cells in the fruit of plants, where the seeds are lodged, which are divided by small

LOCUSTA. The GRASSHOPPER, also the outer covering of the flower and grain of corn, which incloses the chaff; and it is a name for one species of valerianella, for the courbaril, and for lastuca agnina.

LOHOC: See LINCTUS. LOGAS. The white of the eye.

LOLIUM, from Johen, adulterine, as it was supposed to be generated of corrupted barley or wheat. The d is changed into l, from a custom in fome parts of Greece of changing the letters used in other parts. Lolium is also called ara, infelix gramen loliaceum, lolium album, lolium tremulentum; DARNEL, IVRAY, COCKLE, and the French call it DRUNKEN WHEAT.

It is diftinguished from other grain by its slender state ear, and by its grains with their husks on both sides as far as the stalks, being situated in the same plane. It is not used in medicine. Its most noted qualities are, its producing speedy drunkenness if taken inwardly, and preventing drunkenness if applied outwardly. It causes a vertigo and torpor, and by an imprudent use of it much mischief is produced. See Raii Hist.

Another species is called phanix, RAY-GRASS, or DAR-

LOMENTUM FABA. BEAN MEAL, or bread made

thereof. See FABA MAJOR.

LONCHITIS, from 2072n, a lance, because the leaves are sharp-pointed, and resemble the head of a lance. It aperient and diuretic, but not much used in the present actice. It is also a name for a species of polipodium. LONCHOTON. A name for the best species of vi-

LONGANON. Names for the intestinum restum.

LONGAON. Names for the intestinum restum.

LONGISSIMUS DORSI. This mufcle is thus named from its length. It is the longest in the back. It hath the fame origination with the facro-lumbaris; it is inferted by feveral digitations into the ribs on the infide of the upper part of this mufcle; betwixt it and the complexus, the transversalis colli of Albinus is feated, which runs from the transvere processes of the vertebrae of the back to those of the neck, and is an erector of the body.

Longissimus oculi. See Obliquus major oculi. Longissimus pollicis manus. See Flexor ter-

TH INTERNODII POLLICIS.

LONGUS COLLI. This muscle rises from the two upper vertebræ of the back, and runs to be inserted into the three upper vertebræ of the neck. It is made up of two planes, which decuffate each other; and it receives flips from some of the lower transverse processes of the neck. Its office is to bend the neck.

LONICERA PERICLYMENUM. See CAPRIFO-

LOPHADIA. Names of the first vertebræ of the LOPHIA. Sback. Lophia also sometimes signifies the upper part of the back of the neck.

LOPIMA. See CASTANEA.

LORA. See DEUTERIA.

LORDOSIS, from \$\text{\$\sigma\_0 \cdot o\_0}\$ os, bowed or bent inward. It is an affection of the fpine, in which it is bent inward, or toward the fore parts. It is the opposite to gibbosity. It is also a name for the lumbago, and the tabes derfairs. When it is spoken of the bones of the legs, it fignifies how leaved a property of the bones of the legs, it fignifies how leaved to the second to the legs.

LORICA. A kind of lute with which glass retorts, &c. are coated, before being put into the fire. Many kinds of of coating made for chemical veffels. See Dict. of

LORIND. MATRICIS. An epilepfy, or a convultive

disorder proceeding from the uterus.

LOTIO. A LOTION. It is an external fluid application. Embrecatio, lotio, and collyrium, are fimilar forms; but when used on the eyes, receives the name of collyrium; on the face, a letion; on any other part, an embro-cation. Letio, (from laware, to wash), sometimes fignifies a CLYSTER.

LOTUS. It is a species of plant of which Boerhaave enumerates fixteen. Those that are used in medicine are noticed under other names which they bear. It is also a name for melilotus, a species of coronilla, doryenium, and fome other plants.

ARBOR, called also celtis. The LOTE or NETTLE-TREE. Boerhaave mentions three species. They grow in the southern parts of Europe; their fruit which is a berry, is aftringent.

- URBANA, called also trifolium edoratum, melilotus major, ederata violacea. Sweet TREFOIL. It is the

wifelium caruleum, Linn. Boerhave ranks it as a fpecies mucus of the part, or of the fluids of the ulcer or wound, of melilot. The feeds, leaves, and flowers, are anodyne into a matter fimilar to itfelf, and when a fufficient quanand diaphoretic

LOXARTHRUS. An obliquity or perversion of the head of bones and the muscles annexed; of the joint

LUCIDUM SAL. See BONONIENSIS LAPIS.

LUCINA. See ALILAT.

LUDUS HELMONTII. The WAXEN VEIN, called also ludus Paracelfi. It is a stony substance, and seems to be indurated clay: it is found in pits, and is diffinguithed by the yellow cracks which are frequent in it, and which are filled up with yellow fpar. Paracelfus prescribed the cubic pyritæ, which are like dice, and called them ludi: Helmont mistook him, supposed this flone, which is mostly divided into fquares by the cracks, to be the fubitance. The fpar that fills up the cracks, is only to be used; for it is that alone which promotes urine, and is a species of calcareous stone. See Cr-

LUES. It is the PESTILENCE in men, and the MUR-

RAIN in beafts.

- DEIFICA. One of the pompous names for the

epilepfy.

NEURODES CONVULSIVA. It is a mild typhus.

VENEREA. The PLAGUE of VENUS, or VENEREAL DISEASE. Dr. Cullen names it fyphilis, and places it as a genus in the clafs cachesiae, and order impetigines. It is also called the VENEREAL PESTILENCE OF POX. Aphrodifius morbus, Gallicus morbus, grand-gor, Indicus morbus, Neapolitanus morbus. It is endemic in Peru. It was brought from the Spanish West Indies into Spain in 1493; in 1494 it was caried from Spain to Italy; in 1495 it was spread both in Naples and France: from these all Europe was infected. That this disorder was unknown to the Greeks and Romans appears from their abfolute filence concerning it. All physicians who lived at the time when it appeared first in Europe, unaninously declared their ignorance of it, any further than that it was brought into Europe at the close of the fifteenth century. See Astrue on the Venereal Disease, vol. i. b. i. century. See Aftrue on the Venereal Disease, von it is, c. 1. The first instances upon record of power, that is, of the venereal disease, imported from America, are in the writings of one Boyle, a Benedictine monk, and in Peter Margarit, a noble Catalonian, in 1494. The original disease is traced much higher, even from the year 1193. See SWEDIAUR.

Wherever this diforder attacks at the first, it is conveyed into the conftitution by the lymphatics; if the infection is received by the penis, by means of the abforbent or lymphatic veins, a bubo happens in the groin; for the lymphatics of the genitals pais through the inguinal glands; if at the hand, the axilla will be the feat of the bubo, for the fame kind of reason; if at the lips, the glands in the neck will turnify and inflame. This disorder never affects the viscera, but it attacks the bones; hardly a bone in the body but what hath been injured by it, though most com-monly it is feated in the shin bones, upper part of the clavicles, the bones of the arm near the joints of

the elbows, and fometimes the knees, ribs, or even the fpine; some external glands, the palate, nose, skin, or fome other part not out of the reach of furgery, are the usual parts affected. It is probable that the lacunze in the urethra are the first seat of infection; if so, the nearer the first seat of running is to the neck of the bladder, the more the uthera will be affected, the symptoms more

fevere, the discharge greater, and vice versa. The in-flammation and heat of urine is selt most near the glans, and the feat of inflammation and pain are most likely to

be the feat of the discharge.

In patients of a thin habit, the symptoms and cure are worse and more dissicult to manage than in the fat and plethoric. And in children this disorder is worse than in

It is always propagated by contagion. The venereal matter must be applied in a fluid state, either to some part where the mucus is very fost, as it is in the part of generation, &c. or to a wound or ulcer; or it may be given neration, &c. or to a wound or ulcer; or it may be given to a child from its mother during her pregnancy. The the urethra contracting, the stoppage is also increased; this generally goes off with a secretion of mucus from these these

tity hath been thus produced it brings on an inflammation in the mucous membrane, or glands, or in the wound, or ulcer, and it is afterwards fornctimes absorbed into the general fyftem of the veffels, but very feldom before; the first fymptom therefore appears in the part where the infection was received.

If children receive the infection from their mothers, they are fometimes born with fymptoms of the difeafe, as inflammations of the fkin, gonorrhoea, &c. but for the molt part there is no appearance for feveral days, but in about a week cruptions with brownish spots or scabs, degenerating in ulcers, arife about the angles of the mouth, or other parts of the head, over the body.

Women are not subject to so great a variety of symptoms as men are; their chief complaints are, a difficulty of urine, and a running; however, they are liable to chancres and warts, both within and without the labise pudendæ, as also buboes in the groin; and sometimes a

contraction of the spincter vaginge.

The first symptom observable in a fresh gonorrhoea in men is usually an agreeable sensation in the whole or the greatest part of the urinary passage; at this time, scarce any or no discharge is observable on the linen: then an uneafiness about the parts of generation, together with an appearance of a little whitish, or rather water-coloured, matter about the orifice of the uthera, when in the most favourable degree; but oftner it is whitish, and differs in colour and confiftence daily, becoming yellow; then, if the virulence is great, it is greenish, and fometimes ftreaked with blood. When the running is visible, there is also an inflammation and swelling about the orifice of the urethra; this fymptom is fometimes perceptible when no running appears; in this case there is a degree of pun gency on the evacuation of urine; the heat of urine is scarce perceived in voiding it, but immediately after the patient feels an extreme heat throughout the whole duck of the urethra, but more especially at its termination in the glans. Spots appear on the linen the edges of which are darker coloured than the centre; this dark margin is a principal mark to diftinguish the venereal discharge from those arising from other causes. From a defect of mucus in the urethra the urine excites a fmarting and pain there as it passes through. The matter discharged from the urethra increases in quantity. The inflammation at the end of the urethra increases too, as appears from the redness and hardness of the edge of its orifice. A tension and hardness is perceived through the whole length of the urc-thra, and a sensation of stricture in the penis, particu-larly during an erection. The matter discharged is thin-ner, loses its adhesiveness, and is more ill coloured. The inflammation often occasions a curvedness in the penis, and the stimulus, by which the inslammation is excited, occasions an erection too when the patient is warm in bed, and fometimes produces involuntary emiffions; this fymp-tom is called a cordee, or a priapifinus. If the inflammatory fymptoms are violent, a ftrangury comes on. Sometimes an inflammation in the prepute confines it from being drawn back, and thus forms a phymofis; or being drawn behind the glans cannot be returned, and is then called paraphymofis. When the firicture from these two last symptoms is not speedily relieved, a mortification comes on the part, or the whole of the penis becomes endematous, in which case, without great care, a gangrene follows. In all these cases ulcers are apt to be formed. Thus the inslammation continues to increase generally for about a week or two. If the mucus that is discarged washes away the venereal matter faster than it is formed, the symptoms may continue in the same state for some time, and then gradually decrease, and at length a cure is effected.

If the diforder ends not thus happily, ulcers are formed, or the venereal poison being absorbed, instead of a gonorthœa, a lues venerea, or pex, is the confequence. When the gonorrhœa is long continued, it fometimes produces a stricture in the urethra, and occasions a difficulty in the evacuation of the urine, which is often attended with pain, the water flowing out in a fmall ftream, or only by drops: fometimes it also produces an inflammation, and a disposition to contraction in the bladder, and

no fuch affection takes place, or if it does, goes off, and the floppage and pain continue for years. The tefficles, the floppage and pain continue for years. the inguinal glands, and other parts, are fubject to phleg-monous inflammations. Ulcers are formed in different parts of the body, as in the throat, occasioning hourseness, or perhaps a deafnels, from their fituation on the orifice of the Euflachian tube; or if these ulcers are very virulent, they eat through to the bone, and foon after deftroying it, a passage is formed from the mouth to the note. Ulcers are formed in the ikin; they begin with a purplish spot or brown feab. When ulcers from this caufe happen in the palms of the hands, the foles of the feet, behind the ears, about the anus, or the infides of the lips, they have the appearance of fiffures; they also ouze out a thin matter, and are attended with great foreness and pain; the fourf and scab with which these ulcers begin are of a yellowish colour, inclining to brown, like the honey-comb; it ap-pears on feveral parts of the body, by which circumftance they may be diftinguished from all others; sometimes they are broad, resembling the descriptions given of the le-profy by some writers; and the more this scurf spreads, the easier the patient becomes. All those venereal erup-tions are small, and most frequently are formed on the temples or other part of the head, and when they scale off they leave a mark nearly of a chocolate colour behind them. The venereal matter fixing on the eyes, produces an olphthalmy, and fometimes a lofs of fight: falling on the ears, a deafnefs, and a caries of the bones there follows. lows. It very often happens that the periofteum is affected, and when the patient begins to grow warm in bed violent pains are excited; these pains are seated in the head and in the middle part of the bones of the limbs; in the morning they abate, and during the day are rarely troublesome. Sometimes the periosteum swelling, becomes hard, and forms those tumors which are called nodes. Excrescences also arise on the glans penis, prepuce, anus, labia pu-denda, &c. these are seldom painful. Various other symptoms appear when no means have been used to check the progress of the diforder, but as mercury is so universally applied to, it is rare that even many of the above named appear in the fame patient.

Some conflitutions bear up many years, but others fink under the difease, and are carried off.

The venereal gonorrhoxa should be distinguished from that in which there is no infection, from the fluor albus, and from other increased secretions from the different parts fubject to this diftemper, from the involuntary emiffions of femen, from ulcers in the urinary pallages, von-real ulcers, pains, eruptions, &c. should be diffinguished from those which arise from any other cause.

The more regular the discharge from the urethra is made, the more mild are all the symptoms; but if the running is fmall in quantity, or the matter of a yellow or greenish colour, it is virulent. If, upon pressing the penis, a drop of limpid liquor, resembling the white of an

egg, is discharged, it indicates a safe cure.

As a preventive of this disorder, the following is recommended: R aquæ kali puri, 3 i. folv. in aq. font. th i. & cola per chartam. Some of this folution is to be mixed with a tea-cup full of water (fo much as the mouth can bear without pain), then fill a fyringe with the liquor, and inject it into the urethra, or vagina, retaining it there for about a minute; then add to the remainder of the liquor a tea-spoonful of the solution, and wash the glans, prepuce, labia pudendi, &c. Laftly, inject and wash with warm water.

When the diforder is contracted, the indications of cure are, to deflroy or evacuate the venereal infection,

and to remove the lymptoms excited by it.

A gonorrhoea, if recent, is best managed, by first treat-ing it as a topical inflammation: at the same time ren-dering the urine as soft as possible by the use of demulcent drinks; fuch as a decoction of marihmallow root, or

a folution of gum arabic in water.

The feat of the gonorrheea is always in the inner membrane of the urethra, but it may forced to the proflate and vesiculæ seminales, and by gently squeezing the penis it may generally be discovered in what particular part of the urethra this disorder hath its seat; for either a hardness will be felt in the part, or the patient will complain of pain on almost any degree of pressure thereon.

these parts; but it may have the other progresses and terminations of an inflammation of the bladder, and often be proper until the inflammatory symptoms abate: and then begin to rub the penis under the urethra with the ung. hydrargyri fort, every night at bed time; or inject a folution of hydrargyrus in the mucilage of gum arabie, rendered fufficiently fluid (with linfeed-oil fresh) drawn; repeat the injection three or four times a day, retaining it eight or ten minutes each time.

When injections are used, the patient should always make water first, for thus much of the virulent matter is washed away. The time to leave off injecting is when the running no longer stains the linen with a dark edged The running does not always ceafe at this time, but

though it continues a week or two, it gradually leffens.

During this time avoid all exceffes; let the exercife be gentle and moderate; the diet fomewhat abstemious, or at least free from every degree of what increases the natural

or excites an extraordinary heat.

If this method cannot be conformed to, give a few cooling purges at proper intervals, and one of the following pills, or two, if the patient can bear them without affecting his mouth, or exciting any of the fentible excretions R Calom. gr. i. antimonii tartarifati, gr. 1, conf. cynofb. q. f. f. pil. h. f. fumend. Or the following folution may be given night and morning with two or three diffes of tea, or a draught of milk and water, or whey: R hydrargyri muriati gr. xvi. fp. vini Gal. fbi. cujus cap. cochl. mediocr. vel magn. omn. mane nocteque. This laft, perfifted in for fome time, hath effectually removed the different degrees and lymptoms of a confirmed pox, especially when accompanied with a pint or more of a decoction of farfa-

When an ulcer appears, or any fymptom of the vene-real matter, being abtorbed, the use of mercury, or some other specific is necessary. If the mercury is used, it should be so managed that the whole habit may be affected by it, and yet none of the sensible discharges produced. It should be given so as to produce hardness, sullness, and a moderate frequency in the pulse, but nothing further; for mercury is most effectual and speedily useful when the patient's firength is not leffened by it. As to a falivation, it is not necessary, in order to a safe and essectual cure. Indeed an unruly patient is sometimes best managed this way. See Salivatio.

In the worst cases the mercury is best conveyed into the habit, through the ikin; but in lefs extraordinary circum-flances, its inward use may suffice. The solution of hydrargyrus muriatus is most convenient when the patient must be exposed to the air; otherwise preparations of crude mercury are to be preserved, or the pill with calom-& antimonium tartarifatum, above prescribed. If, without affecting the mouth, mercurials run off by the inteffines, give the following pill: R Opii & antimon. tartarifat. mend.

Sometimes it happens that whilft the patient continues in the air of a large town, all means prove ineffectual; but, foon after his removal into the country, he is reftored to health. It is also most fase to continue the use of mercurials for four or five weeks, although every fymptom

may have difappeared.

Dr. Smith recommends the following concile method of managing a confirmed lues veneren. Give mercury only by way of alterative, and administer it as follows: R hydrargyri calcin. gr. i. ad iii. fulph. ant. precip. g. ii. ad iv. extr. opii, gr. is. ad gr. i. conf. rofar. r. q. f. f. bol. omn. noct. hor. decubitus fumend.

During the use of the mercurial bolus the patient should take half a pint of the following decoclion four times a day: R Rad. farfaparil. \$\overline{3}\$ iij. laureolæ \$\overline{3}\$ iij. coq. ex aqfont. \$\overline{1}\$iij. & cola.

During the cure he directs that the patient be kept warm, use a light diet, drink plenty of broth and other thin liquors, and go frequently into a warm bath.

Sometimes the internal use of mercury produces un-easiness in the stomach and bowels, or passeth off by stool too freely; in these cases, as well as on other accounts, the mercury may with equal advantage be applied by rub-bing the ungt. hydrargyri fort. on the skin, as directed in

the article Salivatio, which fee.

To what is already faid, it may be added, that the Peruvian bark is a necessary addition in all cases where the

cedematous swellings.

In case of a woman's being pregnant, the same gentle method above recommended may be used with all the fafety and advantage that follows it when this supposed impediment does not attend. In the Lond. Med. Obf. and Inq. vol. ii. is an instance of a pregnant woman being cured by the use of hydrargyrus muriatus in sp. vin. Gal. taken inwardly, and washing the fores on the exter-

nal parts therewith.

Purges. These can only be required on account of particular fymptoms, or a particular habit of body: for the venereal poison is only to be destroyed by proper alteratives; therefore, as brift purges and mercurial medi-cines, when freely used, increase the irritability of the habit, and thereby render the cure more difficult, fome prudence is required in their use. The gentler purges that irritate least are to be preferred; and mercurials of the simplest kind should always be used; the continuance of either of them should be no longer than until the re-fpective ends are obtained. While the complaint is local, purges are obviously useless, except to remove some par-ticular symptom.

Nitre. It is commonly used to abate inflammation in

a gonorrhoea; but as it produces weakness and uneafiness about the neck of the bladder, and hath no pretension to the end for which it was given, that is, either to sheathe the acrimony of the fluids, or to defend the urethra from their stimuli, emollients and demulcents should be given in its stead. Decoction of marshmallow-roots, or solution of gum arabic, would be properly directed as common drink.

Lobelia. The root of this plant is one of the specifics used by the American Indians, by which the venereal dis-ease is destroyed, and all its symptoms removed.

Mezereon. The bark of its root is recommended as a radical cure, and as effectually removing nodes and nocturnal pains. See LAUREOLA FOEMINA. It should be

used for two or three months.

Sarfaparilla. The root foon relieves night-pains, head-achs, wasting, dry blotches, moistures, and even a caries in the bone is put a stop to, if a mild mercurial course accompanies it. The decoction should be made fresh, at the furthest, every day; and is best when not made with a mixture of guaiacum. Joined with mer-cury, it always essects a cure, and often cures after a long ufe of mercury hath failed.

As to the fymptoms which occasionally attend and require a particular management, the following methods

ufually fucceed.

Chancres, fee CHANCRE. Bubo, fee Bubo. Swelled

Tefficles, fee HERNIA HUMORALIS.

Caruncles in the Urethra. They rarely take place before the running is nearly stopped, if ever they are formed at all, for it is a cicatrix that is found on diffection; the ulcers in the urethra healing, leave a cicatrix which checks the free passage of the urine. A bougie passed up the urethra, a little beyond the place where it meets with refiftance and kept there an hour or more every day, is the proper method of cure. Sometimes a stricture in the urethra is mistaken for a caruncle, but the cure is the

Gumma, tophus, or nodus. These are tumors on the periofteum; the first is the softest; the last the hardest; they are most frequently caused by the venereal disorder; much pain attends them. The decoction of mezereon, as above named, is recommended as a radical cure; a falivation is not to be depended on: but furgery provides an effectual remedy, viz. by cutting down to the bone, taking out the tumor, or as much as can conveniently

be managed, and by bringing on a suppuration.

Ulcers. These are on the skin, or the mucous membrane; their edges are reddish, or fometimes of an ash-colour, but their surface is whitish, and their form irregular; they are fore or painful: if they are ill-treated, they eafily become cancerous, and hardly admit of a cure, though they are eafily brought to look well, and to have the appearance of a healing state. Rough medicines, and a too free use of mercury, produces the worst effects. Mild mercurials are always proper; if there is any morbid acrimony in the blood, demulcents should accompany the mercury; and the bark should never be omitted when

patient's strength is diminished, and where there are the cedematous swellings.

In case of a woman's being pregnant, the same gentle venereal, as well as other ulcers, are disposed to good

granulation and fuppuration by the use of the bark given with the mercury. The bark alone, by destroying the with the mercury. The bark alone, by deftroying the irritability of the tyftem, will make the ulcers put on a good appearance and heal; but after a time, the difeafe

will be apt to make its appearance again, fo that we flould never truft to any medicine but mercury. It deferves notice, that mercury will fometimes produce ulcers, on the tonfils, uvula, and infide of the cheek, which do not look much unlike a venereal ulcer, viz. deep, with a loofe flough, and unequal hard rifing craggy, edges, but appear fuperficial, i. c. more like an inflamed crofton. The bark with cleanlinefs, will remove these ulcers in a few days, even when to a person unused to observe these cases, the velum palati would seem likely to drop off in

two or three days.

Mr. Bell observes, in his Treatise on Ulcers, that those which he calls symptomatic, or that are the result of a venereal taint that hath been of a long continuance, are singular in the appearance of their discharge, which is as follows: at first it is thin, but soon becomes tough and viscid; having a very loathsome, though not the ordinary feetid putrid fmell, and a fingular greenish yellow colour. In such ulcers as have an old pax for their cause, we should depend on the effects of mercury given internally, contenting ourselves with such external applications as will keep the fore clean. In this manner, the different ulcers healing up merely by the use of internal remedies, proves almost to a certainty, that the dif-ease is eradicated from the habit; and further, it is the only proof that little or no more mercury is requir-ed. Venercal ulcers are apt to be inflamed, and then by the pain they occasion are very troublesome; if this inflammation becomes considerable, bleed; but for the most part a proper application of the faturnine poultice will suffice. The inflammation removed, the ungt. cereum. Ph. Edinb. will be the only needful dressing. The pilmere. Ph. Edinb. is generally the be best mercurial for inward use, but fometimes it fails, and then the hydrargyrus. muriatus is generally more fuccefsful; it may be given in the form of pills, or folution. In some obstinate venereal ulcers, it fometimes happens that various mercurial pre-parations are to be tried before it is known on which to depend; but when a proper one is discovered, it should be used for some time after every appearance that is venereal hath vanished. Whatever preparation of mercury be employed, it should always be continued till a foreness of the mouth be induced: and it should never be carried further than is necessary to produce a moderate spitting. Be careful to avoid a salivation; to guard against this, the warm bath should be used along with the mercury; or instead of the warm bath, the use of a flannel shirt next the skin; care being taken never to expose the body to much cold. If the ulcer is feated near a bone, and fungous flesh appears in it, a caries may be suspected; in which case, besides the necessary treatment for carious bones, mercury must be administered. These ulcers are not unfrequently obflinate and do not heal, although every venereal symptom hath vanished: here we may suspect the presence of some other disease, and that both have had their share in producing as well as continuing the ulcer. As soon as the disease is discovered, the proper remedies for its removal must be directed; and then a cure will foon be accomplished. It may be that the fores will not heal, though no other disease is attendant, but from the free use of mercury, &c. the body is ensembled; here the bark, or opium, or both, with a nourishing diet, a pure air, and moderate exercise may, be tried, and usually success will be the result. If the sloughs on these ulcers are tough, dreffings that gently stimulate will be required; e. g. R Ung. refine flavæ 3 i. hydrargyri nitratis rubri 3 ij. m. When the sloughs are cast off, and a proper discharge is produced, drefs with such other means as the then state of the fore requires. When a gland is the feat of a general ulcer, a kindly suppuration is then difficultly produced, and sometimes a cure cannot be performed, without destroying at least all the hardened part of it. This is best done by repeated applications of the argent. nitrati, which may be repeated every third or fourth day. See Bell on Ulcers, vol. vi. p. 381. &c.

Veneral ulcers, whether from buboes, chancres, or groin: it is from this that fome account for the pain that otherwife, when they appear cancerous, will gradually give is felt in the thigh during a fit of the flone. Way by the use of fresh air, a fuller diet, abitinence from mercury, or by means of hemlock applied outwardly, or given inwardly, whether with or without opiates. Sometimes, a more speedy effect has been observed from eating fix or more lemons in a day. See fome observations of this kind in the Lond. Med. Trans. vol. ii. p. 338, &c. Venereal ulcers in the throat may be conveniently relieved with the following: R hydrargyri muriati, gr. x. acidi muriatici, gut. v. tinch. lav. c. 3 i. m. cap. gut. v-xx. bis die, in aq. pura vel juscul. avenae. Warts and excrescences. When the insection is se-

curely destroyed, these may be removed either by a caustic or the knife. If they are cut away, destroy their roots with the argent nitratum, if they are warts, or hard-ish; but the foster rub them only with a mixture of quickfilver and lard, in equal quantities, or with the aq-phagaeden. When the whole is destroyed, heal the ul-

cer, as a common one.

Mr. Deafe, in the fourth volume of the Edinb. Medical Commentaries, observes, how difficult it is to eradicate venereal warts; and at the same time cautious against persisting very long in a course of mercury for their removal. He afferts, that they continue after the venereal virus is effectually removed from the habit, so then they are merely local, and require no other treatment than fuch applications as will remove and prevent them from

Pains in the bones. These are most troublesome in the night. The decoction of mezereon is here effectual; but an opiate should be given at bed-time, until the disease is vanished. In this case be attentive to the destruc-

tion of the venereal infection.

Phymofis. In the venereal difease this is usually of the codematous kind; and besides the use of proper mercueedematous kind; and belides the use of proper mercurials, the bark should also be given from an ounce, to an ounce and a half in twenty-four hours. In every kind of phymosis, let milk and water be injected between the prepue and glans very often. If by a due use of proper means the phymosis does not give way, it must be cut open with a knife; for beauty the incision may be made on the upper-part, but to avoid every inconvenience it may be in one fide. If the phymofis hath continued long, fo that the prepuce is hard and feirthous, the whole of the prepuce should be cut off. Externally the application of Goulard's feurning water, or other feet like cation of Goulard's faturnine water, or other fuch like application, may be used to remove the phymosis in the beginning, but emollient poultices must be forborne.

Paraphymosis. The same general method is proper here that is directed for the phymofis. Bell's Surgery, vol. I.

Cordee. See CHORDE.

LUJULA. WOOD-SORREL. It is the oxalis acets-

cella. Linn.

LUMBAGO, from lumbus, a loin. The rheumatic pain in the loins. See RHEUMATISMUS. Named also lordofis, nephralgia rheumatica. The Latins have so called a taber dorfalis. Pains from other causes, when in this part, alfo take this name.

LUMBAGO PSOADICA. - APOSTEMATOSA. See ARTHROPUOSIS. AB ARTHROCACE. ,

LUMBALIS, and LUMBARIS INTERNUS. Names for the pfoas mufcle. See Psoas. LUMBARES. The LUMBAL NERVES. They pass out from the spinal marrow through the vertebræ of the loins, and become larger from the first to the last. The first lumbal nerve throws a large branch backwards, and two filaments to the intercoftal; the trunk of the nerve goes through the pfoas mufcle, then to the fpine of the os ilium, at whose anterior superior process it throws off feveral branches to the muscles, and one to the spermatic cord in the male, and to the round ligament of the female. The first, going to join the second, gives off two filaments, one of which goes to the spermatic cord, the other passes under the ligamentum Poupartii to the Ischuria.

The second humbar nerve lies on the inside of the pfoas mufele, goes through the head of it, and runs along it; then goes through the annular aperture of the obliquus externus to the ferotum in males, and the labia in women. The fecond lumbal nerve joins with the third; and that again communicating with the fourth, form the crural nerve. See CRURALIS.

The fourth and fifth lumbar nerves, and the three first,

facral, form the nervus feiaticus, feiatic nerve, which paffing out at the great feiatic notch, runs down between the tuberculum ifchii and trochanter major, along the internal and posterior part of the thigh, between the biceps and seminervosus, as far as the ham, rather nearer the inner condyle of the os semonis than the

outer. See CAUDA EQUINA.

LUMBARES ARTERIA. They go out posteriorly from
the inferior descending aorta, in five or fix pairs, or more, much in the fame manner as the intercostals. The upper ones fend branches to the neighbouring parts of the diaphragm and intercoftal mufeles, and supply the place of femi-intercoftal arteries; they are also distributed to the psoas, and other adjacent muscles; and, by perforating the oblique muscles, they become external hypogastric arteries. They also go to the vertebral muscles, and enter the spinal canal.

-- VENA. Sometimes they proceed from the vena cava, near the bifurcation, and principally on the right fide; fometimes they proceed from the left iliae vein; this branch communicates with the azygos and intercoftal

veins.

LUMBARIS EXTERNUS. See QUADRATUS LUM-BORUM.

INTERNUS, i. c. Musc. psoas magnus. See Psoas.

REGIO. The REGION of the LOINS. It is the posterior external region of the belly. It extends from the lowest ribs on each side, and the last vertebra of the back, to the os facrum, and the neighbour-ing parts of the os ilium. The fides of this region are most properly called the loins, but the middle part hath no proper name in man. This region takes in also the mulculus quadratus lumborum on each fide the lower portions of the facro Inmbares, of the longiffimi, and latishimi dorfi, the musculus facer, &c.
LUMBRICALES MUSCULI. So called because they

are long and flender, like lumbricus, a worm; also fidici-nales; flexores primi internedii digiterum. These belong both to the hands and feet. They are the productions of the flexors of the fingers and the toes, and taking their origin from their respective tendons, they wheel about the basis of the fingers and toes, and join with the ex-tensors. Their office is, when the extensors have done their utmost to finish the extension, and when the slexora have done their utmost to finish the slexion. Brown calls

them, vermiculares, and flexores primi internedii.

LUMBRICI. The ROUND-WORMS. See VERMES.

LUMBRICORUM SEM. See SANTONICUM.

LUMBRICUS TERRESTIS. The EARTH WORM. Thefe worms are supposed to have an antispasmodic and diuretic virtue. If they are moistened with vinous spirits to prevent their putrefying, and set in a cellar, they are almost wholly resolved in a few days into a slimy liquor, which is said, when mixed with alkaline falts, to yield cryftals of nitre. They are as good as fnails for the fame purposes that faails are used.

LUMBUS VENERIS. See MILLEFOLIUM.

LUNA. So the chemists call SILVER. See ARGENTUM. LUNA PHILOSOPHORUM. See ANTIMONII REGULUS. LUNARE OS. The fecond bone of the first row in

the wrift. It is fo called, because one of its sides is in the form of a crescent. See Carpus.

LUNARIA. Moon-wort. Boerhaave mentions eleven species. It is a kind of ofmunda, and is sometimes so called; but it is not in use as a medicine.

LUNARIA, called also boriza. A name for a species of thlaspidium, of ofmunada, of ionthlaspi, of medicago, and bulbonach.

LUNATICA, ISCHURIA. A suppression of urine which returns monthly. It is noticed by Sauvages. See

LUNÆTRIA. In the chemical jargon, it is a species

LUNÆTRIA. In the chemical jargon, it is a species of hectic, which is curable in one period of the moon. LUPARIA. Also called aconitum Ponticum, aconitum folio Platani, aconitum Lycottonum luteum. Yellow Wolf's Bane. Like the other species it is possonous. LUPIA. A kind of tumor like a ganglion; it is hard, and may be seated on any part of the body. When it is in the inside of the eye-lid it is called chalaza. A round, small, soft tumor about the joints is called lupia. Dr. Cullen uses this term as the generic one for a wen.

Cullen uses this term as the generic one for A WEN. See Nævus.

LUPINUS. A LUPINE. It is a podded plant, and, with us, only an ornament in gardens. It flowers in June, and ripens its feeds in July and August. Boerhaave mentions seven species. That formerly used in medicine was the lupinus albus, Linn.

LUPULUS, also called Humulus, convolvulus perennis. The hop. This plant hath hollow stalks, and broad serrated leaves, which are cut into three, or five sharp-pointed sections. On the tops, grow loofe scall heads, with small stated samong them. It grows wild in hedges, and at the bottom of hills, in England and other parts of Europe; but those that are in use are cul-

in hedges, and at the bottom of hills, in England and other parts of Europe; but those that are in use are cultivated in plantations. It is perennial. In August and September, the scaly heads are dried in kilns by means of a gentle fire.

The scaly heads have a bitter, warm, aromatic taste; they give out their virtue to spirit, both proof and rectified, by maceration without heat; and to water, by warm insuson. The extracts obtained from the spirituous tincture is an elegant bitter; but the only present use of this article is for preserving malt-liquor. The Spaniards article is for preferving malt-liquor. The Spaniards boil a pound of HOP-roots in a gallon of water to fix pints, and drink half a pint of the decoction, whilft in bed, every morning; this they do to cure the lues venerea. See Lewis's Mat. Med.

LUPUS. A name for the CANCER, because it eats away the fieth like a wolf; called also former.

LUPUS PHILOSOPHORUM. See ANTIMONIUM.

LUSCIOSUS. One who only discerns objects that

are very near the eye.

LUSCITIOSI. See NYCTALOPS.

LUSCITIOSI. See NYCTALOPS.

LUTEA, called also lutesla, strutbium, and DYER'S

WEED. The root boiled with falt dyes wool of a fine
yellow colour. Dioscorides recommends it as useful in
the jaundice, but the present practice does not notice it.

LUTEUM MINUS. See RHODIA.

LUTUM. LUTE. Many chemical vessels require to

be covered with comething to preferve them from the vio-lence of the fire, from being broken or melted, and also to close exactly their joinings to each other. The matters prepared for those ends are, in general, called lutes; when this luting is applied as a cover to vessels, it is also called coaring. Glass vessels may be covered with a mixture of equal parts of coarse sand, and refractory clay, mixed up with water and a little hair, so as to form a liquid paste. This may be spread with a brush upon the glass, and when the first coat is dry, lay on another, &c. until the covering is sufficiently thick.

The lutes with which the joining of veffels are closed are of different kinds, according to the nature of the operations to be made, and of the fubftances to be diffilled in these vessels. When vapours of watery liquors, and such as are not corrosive, are to be prevented from escaping, it as are not corrolled, are to be prevented from eleaping, it is fufficient to furround the joining of the receiver to the nofe of the alembic, or of the retort, with flips of paper, or of linen, covered with a mixture of wheat-flour and water, of the confiftency of foft pafte, or flips of bladder wetted, may fuffice if carefully applied fo as to fecure every chink. When more penetrating and diffolying values of the confiftency of the configuration of the configuration of the configuration of the configuration. every chink. When more penetrating and disloving va-pours are to be fecured, the *lute* may confift of a foft paste made of quick-lime that is quenched in air, and mixed with the white of egg. When corrosive acid vapours are to be confined, the *lute*, known by the name of fat *lute*, is very proper; it is thus made: fift fine clay, that is well dried and powdered, through a filken fearce, moisten it with water, and then beat it into a stiff paste with line-feed oil that is boiled, and fit for the painter's use. This paste is to be applied to the junctures; but as it does not dry, it must be secured by means of slips of linen wrapped round it, and these slips must be covered with the lute

LUXATIO, also differentio, Eluxuatio, figifmen. A. LUXATURA, LUXATION OF DISLOCATION. Dr. Cullen places this genus of difeafe in the clafs locales, and order ectopia. Coclius Aurelianus calls it delocatio-P. Ægineta, in lib. vi. cap. 8. describes a luxation as follows: "it is a removal of the bone received from its proper cavity to another, by means of which voluntary motion is hindered." Boerhaave fays, that the removal of an articulated bone from its cavity, is etiher total or partial; and that the former is a luxation, and the latter a diffortion; but a partial luxation is properly termed a fubluxation; because a diffortion denotes a change in the fituation of the muscles. Another division is into simple and compound luxations: the first is, when a wound, a fracture, a contusion, or other marks of violence attend.

Luxations may proceed from external, or from inter-nal causes; and those from internal causes are thus known. 1. The limb is fo relaxed, that it may be easily moved in any direction. 2. There is a cavity about the joint, and a hollowner's between the bones, which may be felt with the fingers.

3. The difference which may easily be replaced, but foon flips out again spontaneously, because of the weakness of the ligament and muscles.

4. The difference that the found one.

5. No pain, inflammation or convulsion attends a function of this inflammation, or convultion, attends a luxation of this kind. 6. This happens generally to the upper part of the femur, or humerus, and fometimes in the articulation of the foot with the tibia. When a luxation happens from an external injury, the diagnostics are fometimes uncer-tain, because a violent contusion, or distortion, may render the joint tumid, which, with the pain, will obscure the evidences of a luxation. In such dubious cases we must suspend our judgment; and, indeed, could we be positive that a luxation had happened, until the inflammation and tumor had, in a good degree, given way, attempts towards a reduction would be improper. However, the most readily to discover a luxation, it may be observed, that when the head of a bone is removed out of its place, the other end will be distorted in an opposite discover. rection; for when the fuperior end is outwards, the inferior will be inwards, and vice verfa. Further, generally a tumor is observable where the dislocated part of the bone is seated, and an hollowness where it receded from; though where there is much flesh, the tumor and cavity are not eafily perceived.

Various symptoms occur in consequence of a luxation, but these are somewhat different, or as the parts are different in which the accident hath happened; in general, they are an immobility, or at least a defective motion of the dislocated limb; a distraction of some of the adjacent muscles, and a relaxation of others; a torpor of the sub-jacent parts; a compression of the adjacent vessels, whence an atrophy, or a gangrene, pain, an œdema, convul-

fion, &cc.

Compound luxations are more dangerous than com-pound fractures. Boerhaave fays, "The worst luxation of all is that produced by a folution, or a feparation of the epiphysis from the body of the bone. In general, a modelt prognostic is most consistent with skill, experience, and prudence; but difficulties and uncertainties are to be apprehended from the largeness of the luxation, that is, the distance of the dislocated bone from its proper place : the figure of the luxated limb; the part in which the luxation is feated; the parts preffed, or intercepted; pain, inflammation, and other violent fymptoms.

The principal indications of cure are, to reduce the luxated part; and fecondly, to retain it in its proper fituation. But if inflammation, or tumor are confiderable, these should be removed before a reduction is attempted. In reducing luxations, the muscles should all be put into a state of the greatest relaxation. Mr. Pott observes, that a state of the greatest relaxation. Mr. Pott observes; that the affistance of the muscles are the only cause of the dif-ficulty of reducing luxations; that much force is never required, provided the muscles are relaxed by a proper position of the limb; and that in recent cases, at least, the capsular ligament will rarely, if ever impede. The ex-tention should be gradual and continued, until the dislocated bone is on a level with the cavity from whence it receded, at which time, if the head does not return of itround it, and these slips must be covered with the late felf, it must be affisted by pressing upon it, and making a made of quenched lime and white of egg. Dick. Chem. lever of the dislocated bone. Dr. Hunter seems to think that

that the contraction of the mufcles is rarely an impediment to reduction, but the rupture in the capfular ligament; however, they both recommend a gentle extension, and to avoid every violent effort.

#### A LUXATION of the Ankle.

Dr. Hunter observes that when there is a luxation of the malleolus internus, there is generally a fracture of the fibula; but that if the person is of a lax habit, the liga-

ments may be relaxed without a fracture.

If the ankle is luxated inwardly, the bottom of the foot turns outward; if it is luxated outwardly, the bottom of the foot turns inward; if forward, the heel becomes shorter, and the foot longer than usual; if backwards, the heel feems lengthened, and the foot shortened. This kind of luxation is usually attended with violent pain, and often with other very violent fymptoms; and the difficulty of reducing the ankle is proportioned to the vio-lence of the cause. Place the patient on a table or bed, and the leg with the knee bent, should be firmly secured by an affistant or two. The foot is now to be put into that fituation which tends most effectually to relax all the muscles which belong to it; and being given to an affiftant, he must be defired to extend it in that diallistant, he must be defired to extend it in that direction till the most prominent point of the aftragalus
has clearly passed the end of the tibia, when the bone
will either slip into its place, or may be easily forced into
it. The reduction finished, the patient should keep in
bed until the symptoms leave him, and he is in some
measure able to rest upon his ankle. See Bell's Surgery,
vol. vi. p. 274. White's Surgery, p. 166.

#### A LUXATION of the Clavicle

When this accident happens, the fooner the reduction is performed the better, for old luxations of this kind are

rarely cured.

The clavicle may flip from the sternum either outwardly or inward; in the first case a preternatural tumor is observed about the joining of the bones: in the latter case, a finus is observed in the part affected, the aspera arteria, the carotids, the contiguous nerve, and the cefophagus, are fqueezed. As to the reduction of the bone in these cases, the same general methods will suffice which are laid down in a case of a fractured clavicle, when the accident hath happened near the breaft bone: the fame may be also observed with respect to a luxation happening next the acromion.

A luxation happening next the acromion is fometimes not easily diftinguished from a luxated humerus. Paré observes, when this case happens, that the upper part of the clavicle protuberates upwards, and a hollow or cavity is observed in the part where the clavicle is separated from the acromion; violent pains also attend, and the patient cannot move the arm upwards. If in this last case the reduction is not speedily effected, the arm will most probable soon becomes

bly foon become paralytic.

The greatest care is required in the use of bandages; a defect herein may leave a stiff or a luxated arm. bone is luxated near the sternum, and is started outward, besides bolsters to suppress the end of the bone, the capelline bandage should be used; but, if inward, the stellate bandage is to be preferred, on account of its keeping the shoulder back. If the luxation is next the scapula, the spica with two heads may be used. If both clavicles are displaced, the double spica must be applied as directed in luxutions of the humerus and scapula. See Bell's Surgery, vol. vi. p. 204. White's Surgery, p. 157.

### A LUXATION of the Os Coccygis.

It may be forced internally by a blow, and outwardly by a difficult birth. In this case violent pain is felt in the lower part of the spine, inflammations and suppuration in the rectum are produced; these symptoms, with the fight and touch, discover this luxquion.

If this luxation is outward, it may be replaced by preffure with the thumb; if inward, dip the fore-finger in oil, introduce it as high as possible up the anus, and push it outward, whilst the other fingers, applied externally,

guide it to a proper place.

The T bandage is proper here. After the bone is reduced, keep the patient pretty much in bed, and when he does arife, let him fit in a chair with a hole in it. See

#### A LUXATION of the Elbow.

A perfect luxation rarely happens here, except the ele-eranon is fractured, or the ligament greatly weakened. This luxation may be backward (which is most frequent), forward, outward, or inward. If the luxation is backward, the arm appears crooked and shorter, and cannot be extended; in the internal part of the flexure the humerus will be prominent; in the external, the olecranon, with a large cavity between both bones. When, by reason of the fracture of the olecranon, the cubit is pushed forward, the os humer; will stick out behind, the ulna forward, the os humeri will stick out behind, the ulna is prominent on the fore-part, and a sinus appears in proportion to the luxation. If the luxation is external, the tumor is fo too, and vice verfa.

In a violent luxation, or one of long flanding, the bone cannot be replaced without great difficulty, by reason of the strong ligaments and various processes. Recent and

flighter luxations are more easily restored.

If the ligaments and tendons are rigid, let emollient applications be used some time before attempting the reduc-tion; the egg liquor is useful in this case. See ANCHY-

Reduce this luxation by making an extension until the fore-arm can be put into a state of slexion, and then the reft is easily accomplished by bearing upon the lower end of the humerus with one hand, and by taking hold of the wrift and bending the elbow with the other, and if it is one either fide, the hand of the patient must be turned inward or outward, at the fame inftant, as the cafe requires. After reduction an arm should be hung in a sling for fome time, that the parts may recover their tone. See Bell's Surgery, vol. vi. p. 239. White's Surgery, p. 162.

#### LUXATION of the Fibula.

This bone may be separated from the tibia, either at the lower or fuperior part. When it happens at the inferior part it generally proceeds from a luxation of the foot externally; this bone must therefore be reduced, bound up, and the rest of the treatment must be agreeable to the directions given for luxations of the knee and patella. See Bell's Surgery, vol. xi. p. 273.

#### A LUXATION of the Fingers.

The joints of the fingers may be luxated in every direction; but an easy extension and gentle preflure with a finger and thumb will easily reduce them. See Luxation of the Metacarpus. See Bell's Surgery, vol. vi. p. 249. White's Surgery, p. 163.

#### A LUXATION of the Bones of the Foot and Toes.

A diflocation of these bones produces great pain, inflammations, and fometimes convultions, &c. if fpeedy affiftance is not obtained. They are reduced as directed in case of bones in the hand being the subjects of this accident. The toes are treated as directed for the fingers. See White's Surgery, p. 167.

#### A LUXATION of the Hand.

The hand may be luxated backward, forward, and on each fide but backward and forward most frequently. The hand is faid to be luxated forward when it inclines to the flexor muscles of the fingers; backwards, when it inclines towards the extenfor muscles; outwards, when there is a tumor near the thumb and a cavity near the little fin-

ger, and inwards when the reverse happens.

From the diffortion of the strong ligament there is exquifite pain and a rigidity of the fingers, which can nei-ther be bent nor extended, by reason of the compression of their tendons; from hence will follow inflammation, tumor, abfecfs, gangrene, and a caries of the fpongy bones of the carpus, which are feldom curable but by amputation. But in a recent inconfiderable luxation, a milder practice will complete the cure. This kind of lux-ation should therefore be speedily reduced. First by the hand and arm being extended in opposite directions; se-condly, by placing the sinus of the extended hand on a table or some other stat body, that the tumor may be de-pressed. This method must take place whatever part of the hand is luxated. See LUXATION of the Metacarpus.

#### A LUXATION of the Head.

A feparation of the bones of the cranium from the hy-Bell's Surgery, vol. vi. p. 201. White's Surgery, p. 157. drocephalus is by some called a luxation of the head. Whatever

Whatever else be the cause, compression and bandage, if those troublesome excertations and contusions, which too commonly attend the other methods. plied, besides the use of such means as are adapted to the disorder. Mr. Bell calls this a luxation of the cranium;

and in cases of luxation of the head, advises as follows:

In luxations of the head, the patient being seated upon the ground, and supported by an affistant, the surgeon standing behind should raise the head from the breast; and the affistant being desired to press down the shoulders, the head should be gradually pulled straight up till the dissociation is reduced; or, if this does not happen with thoderate extension, it may, at does not happen with moderate extension, it may, at the same time, be gently moved from side to side. A sudden crack or noise is heard on the reduction being completed. See Bell's Surgery, vol. vi. p. 183, 195.

#### A LUXATION of the Heel Bone.

This is luxated both inward and outward: A cavity on one fide, and a tumor on the other fide, discovers it; severe pain attends. Proceed to the cure as is directed when the bones of the hand are luxated.

#### A LUXATION of the Humerus.

The head of this bone may flip out before, behind (even under the fcapula), or downward; but never upwards, except the acromion and coracoid process are fractured. When the humerus is luxated downwards there is a cavity in the upper part of it, perceptible to the eye in some inflances, but to the finger in all, and a tumor in the arm-pit, because the head of the bone is lodged there; the luxated arm is longer than the other, and when it can be moved or extended, it gives exquisite pain in lifting it up to the mouth.

Fresh luxations are most easily reduced; those of long standing are restored with difficulty; but if the head of the humerus grows to the adjacent parts, a reduction can-not be effected by any means. See Medical Obf. and

Inq. vol. ii. p. 340.
To perform the reduction bend the fore-arm, and let an affiftant support it; then elevate the arm so that the elbow may be advanced somewhat above the shoulder, bringing it a little inward; then an affiftant properly makes the extension, whilst another, counteracting him, draws the inferior angle of the fcapula backward toward the spine, and present the acromion a very little down-wards; the operator, with his singers in the axilla present the head of the bone upward as soon as he perceives the extension to be fulficiently made, and at the same time, with his other hand, brings the elbow of the luxated arm to the patient's fide. An extension made downwards, or even horizontally, more frequently fails than when it is

made in forme degree upward.

When the luxation is forward, that is, when the head of the humerus is under the pectoral muscle, there is a cavity under the acromion, but the head of the luxated bone projects towards the breast more than when just in the axilla; and if the arm is moved, a more acute pain is the felt than in the preceding case; for the great artery and the nerves of the bones are much pressed. If this kind of luxation is not easily reduced by the method directed, when the head of the humerus is in the arm-pit, let a pulley from the top of a room be fastened to the arm, just above the elbow of the luxated arm, and the patient gradually raifed from the ground by it; this at least brings the head of the humerus into the axilla, whence, as above directed, it may be reftored into its proper place. In this process remember to let the fore-arm be brought toward the breaft, that the muscles may be relaxed.

If the lu-tion is backward, the cubit approaches the

procordia, and the head of the bone is prominent on the outfide of the floulder; the arm cannot be moved from the breaft, nor extended without great agony, and the lower angle of the scapula will be somewhat pushed out. In this case the general procedure may be the same as when the head of the humerus is under the pectoral muscle.

In want of a pulley, a tall ftrong man may take the pa-tient's arm over his shoulder and gently raise him from the ground, and the operator may push the head of the disso-cated bone into its place as the body becomes suspended. This method of suspending the patient is not so severe as it may feem; for as no force is used about the shoulder to make a counter extension, the patient does not suffer from

As to the use of machines for reducing a luxated humerus, it is agreed among furgeons of the greatest emi-nence that they are never needful. Freke's commander is preferred to all the rest of the instruments used for this purpose; in the use of it the limb may be moved in all directions during the extension, and the situation of the head of the bone can be examined; but great care is required to keep it perpendicular to the fide of the patient.

cal Obf. and Inq. vol. ii. p. 373. Bell's Surgery, vol. vi. p. 211. White's Surgery, p. 158.

#### A LUXATION of the Lower Jaw.

This bone is usually luxated forwards, and that on one or both its fides. If one fide only is luxated, the chin inclines to the opposite fide, and on the diflocated fide the mouth is wider open. When both fides are dislocated; the mouth gapes wide, the jaw starts forwards, and the chin falls towards the breast, so that the patient cannot shut his mouth, speak distinctly, nor swallow with ease. This accident may happen from a blow or from yawning. When one side only is dislocated, it is easily reduced; but, when both sides suffer, an immediate reduction is necessary, or violent symptoms soon follow, which are sometimes statal. or both its fides. If one fide only is luxated, the chin in-

fometimes fatal. In order to the reduction, place the patient in a low feat, with his head fecure against the breast of an affistant; then wrap your thumbs round with rags, to fave them from being bit; place them on the patient's teeth, as far back as you conveniently can, at the fame time fixing your fingers on the outfide of the jaw; when you have fecure hold of the jaw, press it downward; then backward, and then upward; if all this is done, as it were in the same inftant, the reduction will be complete; or, as Mr. Bell fays, when the fingers, &c. are applied as juft now directed, the furgeon must pull the under jaw forward, till he finds it move fomewhat from its fituation; and this being done, but not till then, he should press the jaw forcibly down with his thumbs, and moderately backward with the palms of his hands, when the ends of the

bone will immediately flip into their fituation. If only one fide is luxated, proceed in the fame man-ner, only preffing the affected fide most forcibly down-wards and backwards.

Bandages are useless in this case. See Bell's Surgery, vol. vi. p. 189, 190. White's Surgery, p. 155.

### A LUXATION of the Knee.

This is usually partial. If it is complete, it is casily This is utually partial. If it is complete, it is eafly reduced, but then it is to no purpose, because the cross ligaments are broken. A luxated knee-pan is a necessary attendant of a luxated knee, and indeed is often taken for it; but a proper luxation of the knee is when the tibia recedes from the femur, which happens backwards and to each fide, but never forward, because of the patella, which hinders it.

As this part is very little covered with flesh, dislocations here are eafily discovered.

If the luxation is partial, place the patient on a table, one affiftant taking hold of his thigh, and another extendone ainitiant taking noid of his thigh, and another extending his leg; in the mean time the operator may reduce the bone with his hands or his knees. In children and young persons, if the extension is made with violence, it endangers a separation of the epiphyses, which is a still worse disease than the luxation. See Bell's Surgery, vol. vi. p. 269. White's Surgery, p. 165.

#### A LUXATION of the Knee-pan-

This may happen externally and internally. In order to its reduction, let the patient's leg be pulled ftraight, or, if he can, he may fland on it erect; then let the operator take firm hold of the patella with his fingers, and force it into its place. After this nothing is required but to allow a little reft. Bell's Surgery, vol. vi. p. 267. White's Surgery, p. 165.

#### A LUXATION of the Metacarpus.

In this case, what is faid on a luxation of the hand will be a fufficient directions

Mr. Bell, in the fixth vol. of his Surgery, p. 251. fays, groin, and no grating can be perceived, as happens In the reduction of these dislocations, (viz. of the meta-the bone is fractured, and the limb moved. If the luxation is backwards, the limb is drawn upwards, till it be fomewhat raifed or elevated from the contiguous bone; for, as all the bones of the fingers and thumbs, as well as those of the metatarpus, are confiderably thicker at their extremities than in any other part, these projections are apt to be forced against each other when the extension is made in a straight direction. See Bell's Surgery, vol. vi. p. 249. White's Surgery, p. 163.

#### A LUXATION of the Neck.

A luxation between the head and the upper vertebra of the neck is immediate death, because of the pressure on the medulla oblongata, or medulla spinalis. When a man is said to have broken his neck there is a partial luxation of the first or second vertebra only; in this case the chin of the first or second vertebra only; in this case the chin is fixed to the breast, which prevents his speaking, swallowing, or moving the parts below. If an affistant is at hand, he must immediately turn the patient on his back, and fetting his feet against his shoulders (being himself seated on the ground) he must place his hand below the patient's ears, and pull, gradually increase the force with which he pulls, and in pulling move the head from side to fide.

After reduction, to prevent abfeeffes, &c. bathe the part with fp. vin. White s Surgery, p. 186.

#### A LUXATION of the Bone of the Nofe.

This accident is eafily discovered by the eye and the touch. The reduction is effected by a quill put up the noftrils, and then with the fingers replacing the bone or bones. After the reduction a fticking plaster may be ap-plied. Bell's Surgery, vol. vi. p. 184.

#### A LUXATION of the Ribs.

If a rib is forced inwards, the pleura is injured, from whence there proceeds excruciating pains, inflamma-tions, difficulty of breathing, coughs, ulcers, immobi-lity of the body, &c. thefe, with the external polition of the fide, evidently difcover this misfortune; the shortness of breathing is almost a pathognomonic fign. This lux-ation happens betwirt the rib and the spine.

Luxations internally are difficultly reduced, because Luxations internally are difficultly reduced, becaute neither the hands nor any inftrument can be applied to elevate them. However, the patient may be laid on his belly, over fome cylindrical body, and the anterior part of the rib being moved gently towards the back, or shook a little, the head may probably recover its fituation. If this fails, recourfe must be had to the method proposed for fractures of the ribs, when they are forced inwards, and a fplinter offends the pleura. But, if the fymptoms are not violent, nor the heads of the ribs much removed, forbear both the incision of the slesh, and the violent compulsion of the ribs, as luxated ribs have often remained fo without danger.

'The bandage should be a napkin and scapulary, and compresses may be applied after squeezing them out of cam-phorated spirit of wine. See Bell's Surgery, vol. vi. p. 208.

#### LUXATION of the Thigh Bone.

A fracture of the neck of this bone is fometimes mifhardcure of the neck of this bone is forestimes mil-taken for a luxation. The head of the thigh bone may be luxated downwards, forwards, inwards, ontwards, and backwards. This luxation, like that of the humerus, is always perfect, and most frequently happens inward and downward, the head of the bone tending towards the

large foramen of the os pubis.

When the luxation is outwards, the bone generally flips upwards at the fame time: if inwards and downwards, the leg is longer, and more bowed than the other, and the knee and foot turn outwards: the head of the bone is thrust near the lower part of the inguen and the fora-men of the os pubis; sometimes the compressure of a nerve, which communicates with the bladder, causes a suppression of urine, and the pressure on the crural nerve a numbness in the leg; a finus is perceived in the buttock, because of the great trochanter, and the rest of the bone; and if the reduction is long neglected, the limb withers; if the patient should not require a crutch, he will at least halt; the knee of the luxated limb cannot be brought to the other; the chief pain is perceived in the prefently vanished.

whence a cavity is perceived in the groin, and a tumor in that part of the buttock, where the head of the bone and the trochanter are lodged; the limb is shortened, the foot bends inward, the heel does not touch the ground, but the patient feems to fland on his toes, and the lux-ated limb is more easily inflected than extended; in this

ated firm is more easily inflected than extended; in this case, many stand and walk firmly without the bone being reduced, provided they have a high heel to their shoe. A fractured neck of the thigh bone is distinguished from a luxation of its head; first, when the thigh bone is luxated by a flux of humours, without any external violence, but only by walking or rising up: secondly, when it is but only by walking or riling up: lecondly, when it is unattended with pain, tumor, or inflammation: thirdly, when the whole limb may be bent, and turned about the acetabulum without any noife, which is ufually heard in fractures: the contrary figns indicate a fracture. In reducing the luxated head of the thigh bone, a longitudinal extension will not fusice, but it must be according to the direction of the corniv. Mr. Kirkland favor

to the direction of the cervix. Mr. Kirkland fays, "When a thigh is diflocated inward, or outward, follow Celfus's advice in laying the patient on one fide, fo that the part into which the bone hath flipped be always uppermost, and that from which it hath receded, lowermost; by which means the extension may be made in any direcby which means the extension may be made in any direc-tion you have a mind, and your own invention will point out to you twenty ways of securing the patient upon a bed (for a table is usually too high), so that a proper resistance be made to the extension. This done, the knee bent, and a towel fixed properly above it, you must place your-felf on that side of the thigh to which the bone is diffocated, with your knee near the head of the bone, and both hands on the corposite side of the knee of the patient an affiliant on the opposite side of the knee of the patient, an affistant being fixed at the ankle. The extension may then gradually be begun by three or four men, with the thigh rather in a state of flexion; and when there is reason to think that the head of the bone is brought to a level with the focket, the extension being steadily continued, the knee may be bent near to the abdomen, and, at the same time, whilst the knee pushes the bone towards its place, the ankle must be moved in the fame, but the knee of a patient in a contrary direction. Thus the head will always go into the focket, provided a due extension is made before you attempt to return it."

Sometimes the head of the thigh bone is pushed between the ischium and facrum; in this case, except the patient is very lean, before attempting the reduction, it may, perhaps, be most eligible to reduce the patient's flesh by repeated brisk purges, given at short intervals; for thus the state of the case is better discovered, and the reduction more easily effected. London Med. Journal, vol. v. p. 412. Bell's Surgery, vol. vi. p. 252. White's Surgery, p. 163. Edinburgh Med. Commentaries, vol. ii. p. 40.

A LUXATION of the Toes. See LUXATION of the Foot, &c.

#### A LUXATION of the Vertebrat.

These are rarely perfectly luxated. Those of the neck being fmall, and very moveable, are more subject to this accident than those of the back. Those of the loins are also more casily luxated than those of the back, because they are more moveable and smooth, are destitute of those sinuses with which the vertebre of the back are furnished, and have a thicker cartilage interposed betwixt each. \*Luxations of the vertebræ must be impersect, unless attended with a fracture, and a laceration of the spiral marrow, which threatens instant death. The imperfect luxations are often speedily fatal; and they most frequently happen in the upper vertebræ of the neck

Hippocrates observes that children, between the ages of four and ten, are apt to have luxations of the vertebras of the neck near the head, from an internal cause. An inftance of this kind I once met with: it was in a boy of about ten years of age; he voided two round worms, and, in feveral inftances, complained, as is ufual, when worms are the only manifest cause of any disorder; he obstinately refused every affistance from medicine, but after a few weeks his neck spontaneously and suddenly

The vertebræ of the back cannot move much without a mach-purges, gentle treatment, and, if possible, the pro-fracture; their upper or lower apophyses, and sometimes curing of sleep, are the principal means of relief.

LICHEN PIXIDATUS. See Muscus Pixidatus. only one of them are misplaced; great violence is generally required in order to a partial luxation; when a vertebra is luxated without a fracture, the body leans to one fide, or forward; if the left-fide is affected, the patient leans to the right, and vice verfa.

The common figns of a luxation of the vertebræ in the back, are, the back is crooked and unequal; the patient can neither stand nor walk, and his whole body feems paralytic; all the parts below the luxation are infentible and immoveable; the excrements and the urine cannot be discharged, or else they are involuntarily emitted; the lower parts gradually die, and very foon the death of the

perfon is the end of complaint.

All the luxations in the spine are very dangerous, both because of the injury that may be done to the spinal marrow, and the difficulty of reducing them. The danger is also greater, the nearer the luxation is to the head, because here the spinal marrow is soonest hurt. When several vertebræ are luxated together, the ill fymptoms are

not fo violent.

For reducing the vertebræ of the neck, fee LUXAvertebræ are diflocated, lay the patient on his belly over fome round body, as a tub, or drum; then two affiftants may deprefs both ends of the luxated fpine on each fide, which elevates, and gradually extends the vertebræ, the fpina dorsi being thus bent in form of an arch; after this, the furgeon presses down the inferior dislocated and prominent vertebræ, and, at the fame instant, expeditiously pushes the superior part of the body upwards. If the first attempt fails, repeat it two or three times. When the left apophysis only is displaced, after the patient is laid in the same posture, one affistant may depress the left coxa, and the other the right humerus; and the reverse, if the injury is on the other side. After the reduction, bleed, apply compresses wrung out of spirit of wine, and then the napkin and scapulary. See Lond. Med. Journ. vol. i. p. 326, 327. Bell's Surgery, vol. vi. p. 196. White's Surgery, p. 156.

### A LUXATION of the Wrift.

One or two of the bones in the wrift are fometimes removed from their place, which is discovered by a tumor in one part, or a cavity on another, perceptible to the touch; violent pain also attends. If the luxation is recent, treat it as a luxation of the hand. Bell's Surgery,

cent, treat it as a luxation of the hand. Bell's Surgery, vol. vi. p. 89, 246. White's Surgery, p. 163.

See Boerhaave's Aphorifms. Petit's Difeases of the Bones. Lond. Med. Obf. and Inq. vol. ii. p. 99, &c. Gooch's Cases and Remarks. Pott's General Remarks on Fractures and Dislocations. Kirkland's Obf. on Pott's Remarks. Med. Mut. vol. ii. p. 406. Heister's Surgery. Wiseman's Surgery. Bell's Surgery. White's Surgery, where luxations are more generally, and some more particularly treated of. ticularly treated of.

LYCANCHE. A fpecies of QUINSEY. See CY-

LYCANTHROPIA, from Acros, a wolf, and andputtos, a man. LYCANTHROPY. It is a species of melancholy, or of madness. Some call it melancholia errabunda, erratic melancholy, because the patient wanders about, and cannot rest in any one place. The Arabians call it kutu-buth, from an animal which perpetually moves up and down on the furface of ftagnant waters. Actius, in his Tetrabib. calls it cynanthropy, as well as lycanthropy. It is very probably the diforder with which the demoniac, mentioned in feripture, who dwelt among the tombs, was affected. Oribafius informs us, that, "These patients have their bandes in the night time, and in every tients leave their houses in the night time, and in every thing imitate wolves, wander about the tombs until break of day." Actuarius adds, that "they return home then, and come to their fenfes." You may know them by the following fymptoms, their looks are pale, their eyes dull, hollow, fixed, dry, and without the moifture of a tear. Their tongues are dry, and they are ready to perifh with thirft, their legs, from the bruifes they received in the pight (and according to Assiss, form the bruits). night, (and, according to Actius, from the bites of dogs) are full of incurable ulcers." Besides these symptoms,

LYCHNIS. Botanifts enumerate above eighty fpecies; it is a name given to various plants - as beben aib: vulg. antirrhinum; atocium; ocymoides; ocymastrum; saponaria; nigellustrum; muscipula. Lychnis Coronaria Dioscorides. Rose cam-

PION. It is cultivated in gardens, flowers in June, and

its feeds are purging.

Most of the lyehnifes are ornaments only in gardens; and the name is given to feveral plants not included in the long lift of Boerhaave's, which are called species of

the lychnis.

LYCHNIS is also a name for several vegetable products, viz. Lychnis fegetum major. See NIGELLASTRUM. Sylvestris. See Anterrhenum; Behen Al-BUM VULGARE; SAPONARIA; OCYMOIDES .- Viscoia rubra. See Muscipula.

LYCHNOIDES SEGETUM. See NIGELLASTRUM.

LYCIA. See CERUS CYPRI FOLIO.

LYCIUM. A name of the nandia, aziabalid, and of three fpecies of rhomnus, and fome other plants; also

called arbor-spinosa, INDIAN THORN.
It grows in the East Indics. Its inspissated juice is aftringent, called cate, and is, by fome, miftaken for the

terra Japonica.

LYCIUM BUXI FOLITS, also called pyracantha, BOX-THORN. It grows in hot countries. The rob of the fruit s aftringent, but is often mixed with amurca, or with the juice of wormwood, or the rob from the berries of periclimenum, or other fuch like, are fubfituted for it.

LYCOCTONUM. See ACONITUM, LYCOCTONUM, YELLOW POISONOUS ACONITE. It is also a species of

LYCOPERDON, from Numos, a wolf, and map & cre-pitus. The ancients gave it this name, because they

thought it fprung from the dung of wolves.

LYCOPERDON VULGARE, called also crepitus lupi, bovifta, fungus rotundus maximus pulverulentus; DUSTT MUSHROOMS, PUFF-BALLS. It is the lycoperdon bovifta, Linn. Boerhaave enumerates eleven species. They are round, or egg-shaped, whitish, with a short, and scarcely any pedicle; they grow in pasture grounds. When they are young they are covered with tubercles on the outside, and are pulpy within. By age they become smooth with-out, and inwardly are changed into a fine light brownish

Dr. Biffet fays, that it is the most powerful vegetable ftyptic yet kuown, when externally applied. Gooch prefers it to the agarie of the oak, and even to all fungous fubstances. It is fofter, and more absorbent than lint, and, if cut into flices, might answer as well as spunge, as recommended by Dr. Kirkland after amputation.

LYCOPERSICON, from humss, a welf, and wespenses,

a peach. WOLF's PEACH; called also amoris poma. The flowers refemble those of night-shade; the fruit is carnous and foft. Boerhaave mentions fix species, but Ray thinks them all poisonous.

LYCOPODIUM, called also museus clavatus, museus

terrefiris, muscus squamosus, plicaria, eingularia elumbos, wolf's-claw, and club-moss.

It is a fertile kind of moss, destitute of pedicles and capitella. It differs from the selago in that its capsules grow not scattered in the sinuses of the leaves, but are collected into a club; for each scale covers a kidney-shaped and bivalve capfule, which lofes no part of itfelf when ripe. It grows on heaths and hilly places, and flowers in July and August. It is reckoned cooling and aftringent.

LYCOPSIS ANGLICA. A name of fome species of

buglofs. See Buglossum sylvestre. LYCOPUS. WATERHORE-HOUND. See MARRU-

LYCOPUS. WATERHORE-HOURD. See MARKUBIUM AQUATICUM.
LYDIUS LAPIS. See Magnes.
LYGMOS. An Hiccough.
LYGISMOS. See Luxatio, from happiga, torqueo.
LYGUS. See Agnus castus.
LYMPHA. Lymph. It is a pellucid, infipid, pure
liquor, the more fubtil parts of which affords the matter
of the fluid of the brain. Initial marrow, nerves, and also night, (and, according to Actius, from the bites of dogs) are full of incurable ulcers." Befides these symptoms, of the suid of the brain, spinal marrow, nerves, and also it is observed by others, that they are very timorous, seek folitude, shun all human kind, they perpetually brood on the most extravagant fancies, &c. Bleeding, bitter sto- are circulated through the lymphatic vessels, by means of the walves. valves and conglobate glands, again conveyed to the heart, | ankle. The branch on the foot runs up on the outfide of where being again united with the blood, it is with it conveyed to all the parts of the body. Boerhaave fays,

that from eight ounces of blood feven ounces of lympo ariles, if diffilled with a gentle heat.

LYMPHÆ DUCTUS, or Lymphatica vafa. LYMPHATIC VESSELS; called by the French depot laiteux; emflure des jambes, lait repanda. They are divided into those of Bartholine, and called also absorbent lymphatics, and those of the moderns; these later lead into larger veins. The lymphatics of Bartholine arise from the surface of the cells of the membrana cellularis, the surfaces of the guts, of the urine and gall bladders, and of all other parts, and carry a pellucid liquor towards the receptacu-lum chyli, and thoracic duct, in which, as the lacteals do, they all terminate. The coats of these vessels are thin and transparent, they are much enouded with valves, but not so much as is represented in many figures; they are also very irregularly placed. The symphatics frequently anastomose, and in their way pass through the symphatic glands; before they enter a gland they ramify, and com-ing out in branches they unite again. The lymphatics are like the lacteals, which are abforbents; and the lymphatics are the general abforbents, and carry the juices to the duct, the receptaculum, and to the left subclavian vein-

The part of the absorbent system, called the lacteals, confifts of one trunk, the ductus thoracicus, and many branches, which are called latteals in the primæ viæ, and lymphatics every where elfe.

The lymphatic fyltem confilts of the lacteals, the lymphatic coffels, the conglobate glands, and the thoracic duct.

The lacteals begin from the intestinal tube. The lymphatic coffels arise from most parts of the body. The course of the lymph and of the chyle is from the ex-treme parts of the body towards the centre. The lymphatics commonly lie close to the large blood-vessels of the extremities. All the lacteals, and most of the lympha-ties, open into the thoracic dust, which lies upon the fpine, and runs up towards the neck, where it common-ly opens into the angle between the jugular and fubcla-vian veins of the left fide; and thus both the chyle and the lymph are mixed with the blood.

The lacteals, the lymphatics, and the thoracic duct, all agree in having their coats more thin, and more pellucid than those of the blood-vessels. But, although their coats are fo thin, they are very ftrong. Mr. Sheldon fays, that both the lacteals and lymphatics have a dense internal coat, which is smooth and polished on the inside; it is connected by a reticular substance on its outside, to the internal surface of the middle coat. This sine internal membrane prevents the transludations of the lymph and chyle, and produces certain duplicatures internally, which form the valves, found in every part of this fystem, and it is exactly similar to the internal coat of the veins. The fecond coat Mr. Sheldon thinks confilts chiefly of mufcular fibres, running in every possible direction; the greater number take the circular direction, and surround the internal membrane. He adds, that an outward coat may also be separated, which is made of a membrane similar to the pleura, or peritoneum.

The coats of the lacteal and symphatic veffels, have, in common with all other parts of the body, arteries and

veins for their nourishment. They have also nerves : from the blood-veffels running through them they are fubject to inflammation, and from their numerous nerves, they are as irritable as any fet of veffels in the human body. The lymphatic veffels abound more with valves than the veins do; these valves are generally two in number, and are of a semiluar shape. In most parts of the body the valves are so numerous, that there are three or four pair in the space of one inch, but sometimes there

is no more than one pair.

The lymphatic system, in different parts of its course, has the glands called conglobate, or *lympbatic*. These glands are so placed, that the vessels come in on one side, and pass out on the other in their way to the thoracie duct.

The lymphatic veffels of the lower extremities are those that are superficial, and those that are more deeply seated. The fuperficial ones lie between the fkin and the mufeles, and belong to the furface of the body or the fkin, and to the cellular membrane which lies immediately under it; one branch of the superficial ones runs upon the top of the foot, another is generally found just under the inner

the tendon of the tibialis anticus, until it hath got above the ankle; and running over the shin bone, it divides and forms a plexus, still ascending in the cellular membrane to the infide of the knee, from whence it flill advances up the infide of the thigh under the skin, and arriving at the groin, enters the *lymphatic* glands fituated there. These glands are fix, feven, or eight in number; of these, some lie in the very angle between the thigh and the abdomen, and others lie a few inches down on the forepart of the thigh. It is into these upper glands alone that the lymphatic vessels of the genitals enter, so that the venereal bubo which arises in consequence of an absorption of matter from these organs, is always seated in those upper glands; and the lower glands are never affected, except by the regurgitation of the matter, or from their vicinity to the glands first diseased, which very rarely happens. And as the upper glans are affected from the genitals, for the lower are usually first affected from the absorption of the acrid matter of an ulcer, &c. in the parts below them. The *lymphatic veffels* of the genitals having joined those of the thigh, a net work is formed, which enters the abdomon under the edge of the tendon of the external chiling angle of the external chiling and the external chiling angle of the external chiling angl of the external oblique mufele, called Poupart's ligament: fome branches of this plexus embrace the iliac artery. These superficial lymphatics, probably, are the trunks of these vessels which absorb from the skin and the cellular membrane immediately under it; and as no confiderable branches can be diftinguished on the outside of the leg or thigh, it is probable, that all the lymphatic veffets of those parts bend towards the inside. Upon these veffets, from the foot to the groin, there is commonly not one lymp. tic gland, but to this there are fometimes exceptions. Be-fides these superficial lymphatic vessels which he above all the muscles, or in the cellular membrane under the skin, the mutcles, or in the cellular membrane under the fkin, there is a fet deeper feated that lie amongst the muscles, and accompany the crural artery; of these, the principal trunk can be discovered by cutting down to the posterior tibial artery, near the inner ankle. From this ankle, the vessel passes up along with the posterior tibial artery, being hid amongst the muscles on the back part of the tibia. About the middle of the leg it enters a small gland which is met with in most subjects. Having possed through this is met with in most subjects. Having passed through this gland, it runs up to the back part of the ham, still lying close to the artery, and in the ham it usually passes through three glands. Hitherto this symphatic has been a single trunk; but after it has passed these glands, it commonly divides into two or three branches which still a divides into two or three branches, which still accompany

divides into two or three branches, which still accompany the crural artery, and pass with it through the perforation in the triceps muscle. Having passed the muscle, they go up with the artery and enter a glanid which is deeper teated than those which appear on the groin; from this gland they pass into the superficial glands.

The lymphatics of the lower extremities having now reached the trunk of the body, and having passed under Poupart's ligament, appear upon the sides of the offa pubis, near the pelvis. A part of them passes up along with the iliac artery upon the brim of the pelvis, and another part dips down into the cavity of the pelvis, and joins the internal iliac artery near the scale of the contents of the they are joined by the lymphatics from the contents of the they are joined by the lymphatics from the contents of the pelvis. Befides those lymphatic veffels which dip down into the cavity of the pelvis, on the infide of the external iliac artery, there are others which keep on the outfide of that artery upon the pfoas mufcle; of these, one part passes up to the loins, and goes under the aorta in differ-ent branches, getting from the left side to the right, and joining the thoracic duct. Another part passes under the joining the thoracic duct. Another part passes under the iliac arteries, and appears upon the os facrum, making a beautiful net-work, joining the *lymphatics* of the right side, and passing under the iliac artery, to form the net-work upon the upper part of the right ploas muscle. The *lymphatic vessels* of the right side, joined by some from the left, having reached the right lumbar region, appear there in the form of a plexus of large vessels, and pass through several glands. At this part they receive likewise large branches under the aorta, from the plexus on the left side branches under the aorta, from the plexus on the left fide of the loins, and having, at last got up as high as the second lumbar vertebra, they all join, and form a single trunk called the thoracic duck; at this part they are like-

wife joined by the lacteals.

Into the thoracic duct likewise enters the lymph of the other abdominal vifcera. This is brought by a number

The lymphatic veffels of the spleen pals from the concave side of that viscus, along with the splenic artery in the sinussity of the pancreas, by the lymphatic vessels of which they probably are joined.

To the stomach belong two sets of lymphatic vessels, the one running upon its lesser, and the other upon its greater curvature. Of these, the former accompanies the commany artery, and passes through some lymphatic glands. coronary artery, and paffes through some lymphasic glands that lie by its fide. The other set passes from the great curvature of the flomach, through fome lymphatic glands that lie close to the arteria gastrica dextra. Descending by the pylorus, it meets the plexus that accompanied the co-ronary artery; and near the leffer curvature of the duodenum, forms a confiderable net-work. Into this, not only the lymphatics from the spleen enter, but likewise those from the gall-bladder, together with those of the liver, which are very numerous both in its convex and on

liver, which are very numerous both in its convex and on its concave fide. Several branches proceed from this network, fome running under the duodenum, and others over it; which all open into the thoracic duct.

The lymphatics of the larger vifcera, (fuch as the liver, the fpleen, and the kidneys) are generally in two fets; one of which lies upon the furface of the organ, and the other accompanies the large blood-veffels in its centre. In the liver, these two fets have been found to communi-In the liver, these two sets have been found to communicate with each other: fo that, by injecting mercury into the lymphatic veffels which lie upon its convex furface, Mr. Hewfon hath filled those which accompany the pora bilarii & vena portarum in its centre. Most of the lym obstic veffels, which lie upon the convex furface of the liver, run towards its falciform ligament, and pass down by the fide of the vena cava. But fome of them run to-wards the right ligament of the liver, where they pass down upon the diaphragm to get to the thoracic duct. The lymphatics on the concave furface run towards the porter, where they join those which come from the centre of the liver, along with its large blood-vessels. The lym-phatic vessels of the stomach, enter with others into the thoracic duct.

The imphatics of the lungs are in two fets. One fet passes on the posterior part of each lobe by its root, into the thoracic duct, near the middle of the thorax; the other passes from the fore-part of each lobe up towards other pattes from the fore-part of each lobe up towards the jugular and subclavian veins. Some of the lymphatics, on the posterior part of the left lobe, pass under the aorta to get to the thoracic duct. Those from the anterior part of the left lobe, pass into the angle between the jugular and subclavian vein of the same side, joining the thoracic duct at its termination; while those from the fore-part of the right lobe do not communicate with the thoracic duct, but pass into the angle between the right jugular and the

right fubclavian vein.

The limphatics of the head and neck are as follow. By the fide of each internal jugular vein is a large lymphatic wiffel, which is the trunk of those of one fide of the head and neck. Smaller lymphatics are feen near the branches of the external carotid artery. From various circumstances, it is highly probable, that there are lymphatic wiffels on the external parts of the head; and though the laws been discovered on the brain, it is very probable. none have been discovered on the brain, it is very probable that it is not destitute of them. The small lymphatics which accompany the branches of the external carotid artery, unite upon the neck, and form a large trunk, which accompanies the internal jugular vein, passing through fome imphatic glands, near the termination of this trunk, in the angles between the jugular and subclavian veins. The glandula thyroidea has many lymphatic veffels which can fonetimes be inflated by blowing air into the cells of the gland; these veffels pass on each side of the trachea, one part going into the angle of the right fubclavian and jugular, and the other joining the thoracic duck upon the left fide.

Like the leg each arm hath two fets of lymphatic veffels, one fet which lies immediately under the integuments, belongs to the skin, and the cellular membrane, connecting it to the muscles; the other accompanies the large arteries, and belongs to the parts deeper feated.

The lymphatic velfels discovered and delineated, are in

of vessels; a plexus of which may be traced from each igeneral only to be considered as the trunks of the lymphatics, lying principally behind the emulgent artery, and opening into large lymphatic vessels near the aorta; with these also go the lymphatics of the glandulæ renales, or renal capsulæ.

The lamber of the last the area of the body, has one of these vessels adapted to absorption. That this is the case, seems to be proved by the area. the variolous matter; for at what part foever that matter is inferted, the lymphatic veffels take it up and carry it into the body, as can be traced by its inflaming the conglobate glands through which these veilels pass.

See Dr. Hunter's Commentaries. Monro's Descrip-

tion of the Human Lacteal Sac and Duct. Hewford's Experimental Inquiries into the Lymphatic System. Shel-

don's History of the Absorbent System.

Amongst disorders of the lymphatics, Mr. White feems very properly to place that called by Puzos, depot laiteur fur la cuiffe; by Sauvages, if chias a spargonost; and by others variously according to their apprehension of its nature and cause. Most writers have attributed this complaint to a deposition of milk; but Mr. White treats of it as an affection of the lymphatics in the part difeafed. Some have named it a dema lacteum.

The symptoms of this diforder, Mr. White bath with great accuracy laid down as follows. In about twelve or fifteen days after delivery, the patient is feized with great pain in the groin of one fide; accompanied with a con-fiderable degree of fever, which is feldom preceded by a fhivering fit and cold rigor. This part foon becomes affeeled with fwelling and tenfion, which extend to the labia pudendi of the fame fide only, and down the infide of the thigh, to the ham, the leg, the foot, and the whole limb; and the progress of the swelling is so quick, that in a day or two, the limb becomes twice the fize of the other, and is moved with great difficulty; it is hot and exquisitely tender, but not attended with external in-flammation. The pain in the groin is generally preced-ed by a pain in the small of the back, and sometimes by a pain at the bottom of the bolly, on the fame fide; the parts which fuffer the most pain are the groin, the ham, and the back part of the leg about its middle. The pain indeed extends over the whole limb, owing to the fudden diftension; but in a day or two it becomes less considerable. The (welling is general and equal all over the whole limb, in every flage of the diforder, it is much harder and firmer than anafarca; not fo cold in any state of the difease, nor so much diminished by an horizontal position; neither does it pit when pressed upon by the singer, nor any water issue from it, on its being puncturand even an equal to the touch in every part, except where the conglobate glands are fituated, which in fome cases are knotty and hard, as in the groin, the ham, and about the middle of the leg, at its back part. This diforder generally comes on about the second or third week after delivery; but in one instance I knew it to occur so early as twenty-four hours after, and another fo late as five weeks, but neither of these are usual. The first parts that begin to mend, both as to pain and fwelling, are the groin, and labium pudendi; the thigh next, and laftly the leg. The fever in fome patients subsides in two or three weeks, in others it continues fix or eight weeks, attended with a quick pulse and hectic fymptoms. It fometimes attacks both the extremities; but this rarely happens. After the disorder has sublisted a week or two, it is not uncommon for the found leg to fwell towards evening, and become cedematous; but then the groin and thigh are not affected on that fide, and the leg is much fofter to the touch than the other, and pits when prefied upon by the finger.

This diforder attacks women who are in full ftrength, and those who are reduced by flooding; those who have a moderate discharge of the lochia, and those who have a fmall or a large quantity; those who give suck, and those who do not; whether their breasts be drawn, or not; and whether they have much or but little milk. It attacks women who were delivered on the knee, and others who were delivered on the fide; but of those who were delivered on the fide, it appears that the greater number were affected on that fide, on which they lay at the time of delivery. It attacks women of all ranks, and of different habits, both the rich, and the poor; the most healthful, as well as those who have laboured under chronic difeafes; the ftrong and the weak; the lean and the corpulent; the fedentary, and the active; the young and the middle aged; after their first, or any other labour; and whether the labour be natural or preternatural; but I ferri ammoniacalis, gr. li. fs. m. f. hauftus, fexta qua-have not known it happen after a mifearriage, nor to a que hora fumendus. The limb may be chafed with woman more than once, though the has afterwards had more children. It happens at all feafons of the year indifcriminately; and in the country, as well as in large towns. It neither attacks either of the arms, or other parts of the body. I have never known it to suppurate, or prove fatal, or any material inconvenience to arise from it after a few months were elapsed, except a little swelling of the leg, after fatigue, particularly walking.
Mr. White proceeds to point out the diforders to which

it bears, in one point of view or another, a refemblance; as for example the feiatica, rheumatifm, anafarca, phlegmon, &c. and then observes that the proximate cause is an obstruction, detention, and accumulation of lymph in the limb. The parts affected are the whole of the limb from where the lymphatic vellels enter under Poupart's ligament into the pelvis. As this diforder happens only to lying-in women, and affects the lower extremities only, he adds, that we may conclude that this obstruction is occasioned by fome accident happening during the time of labour, or fome state peculiar to child-bed. As to the remote cause, conjectures may be various, and Mr. White thinks it probable from the child's head pressing the lymphatic velid or velidit, which arise from one of the lower extremities, against the brim of the pelvis, during a labour pain, so as to stop the progress of the lymph; whence it or they burst, and their contents escape. The extravalation in some habits is re-absorbed readily, in others not fo readily; when, by lying out of the course of its circu-lation, it will press against the uterus and bladder, and oceafion forcing pains, and even suppressions of urine. When the orifice made in the lymphatic vessel, or vessels, is healed and the diameter of the tube is contracted or closed, the lymph is retained in the lymphatic veffels and glands of the limb and labium pudendi, and diftends them to as to cause great pain and fwelling, which always begin in that part next to which the obstruction is formed: and when the obftruction is in part or wholly removed, or the lymph has found a fresh passage, the part next to it is consequently first relieved.

In order to the cure, in the first or inslammatory stage, antiphlogiftics will be necessary, more or less so as the patient's strength will admit; the bowels should be kept rather lax; and the pains alleviated by opiates internally, by anodyne fomentations, and by the warm and vapour bath; blifters on the upper part of the thigh have been found useful; antimonials, the faline draughts given in the act of effervescence, cool acidulated liquors, and cool air, all contribute to abate the fever. If the lochia happen to be acrid or putrid, it will be abforbed and aggravate the disease; but by frequent emollient, or antiseptic injections thrown up the vagina the severish disorder will be much assuged. In the second stage, that is, when the pain abates, the swelling and tension of the parts begin to lessen, but the quickness of the pulse, and some degree of fever remains, the patient may be allowed a little wine, and a fuller-dict. A dose or two of calomel, of two grains each, given at proper intervals, hath often been ufeful in this stage: before the patient is fit to take the bark, she may take myrrh two or three times a day, to the quantity of fifteen grains, in a neutral draught in the act of effervefcence: when this hath been continued a few days, it may be given in the following form which is more a tonic. R myrrhæ, gr. xii. aquæ menthæ fativæ, & aquæ diftil-latæ tingularum, 3 fs fpr. cinnamomi 3 i. kali pp. gr. vj.

warm oil, and bathing it in water heated to 82 degrees of Fahrenheit's thermometer is generally useful; after being accustomed a few days to this degree of heat, the water may only be heated to 76. The third stage is when the pain and fever have left the patient, and no complaint remains, except the swelling of the limb, and perhaps a general relaxation; at this period, the bark, with or without steel, will become necessary, and dipping the limb in cold water, and embrocating it with spirit of wine and camphor, or with distilled vincear, will assist in pracing camphor, or with diffilled vinegar, will affift in bracing it. A circular calico bandage applied to the limb will also assift in the recovery; and if the swelling is confined to the small of the leg, the bandage may be changed for a strait or laced stocking, or for a half-boot. Exercise on horfeback, and gentle rubbing of the limb, and ftroaking it upwards, to facilitate the return of the lymph, will be of advantage; but walking or doing any thing that can promote a greater fecretion of lymph, never fails to do manifelt injury in every flage of this difeate, and even until the lymph hath obtained as free a paffage as it usually had, and the patient hath recovered her full

See Mauriceau's Treatife des Maladies des Femmes groffes, &c. edit. 5. 4to. He there treats of it under the title of l'Enflure des Jambes et des Cuiffes de la Femme accouchée. Puzos's Memoir sur les Depots laiteux, appelles communement Lait repandu. M. Levret's Art des Accouchements, ch. iii. fect. 7. des Engorgement laiteux dans le baffin, et aux Extremités inferieures. Van Swieten's Commentary on Boerhaave's Aphorifm, 1329. M. Rau-lin's Treatife des Maladies des Femmes en Couchée, under the article depots laiteux aux aines & aux cuiffes. But Mr. White, in his Enquiry into the Nature and Caufe of that Swelling, in one or both of the Lower Extremities, which fometimes happens to lying-in Women, more accurately describes this diforder than any other writer; he is the first

who treats fatisfactorily on its nature, cure, &c.

The infection by poion, the imall pox when inoculated, the lues venerea, &c. is conveyed by the lymphatic, or abforbent veins. See Dr. Hunter's Commentaries. Dr. Fordyce's Elements, part the 1st. Hewfon's Exp. Inquiries, part ii. Sheldon's Hiltory of the Abforbent System.

LYRA. Thus the ancients called the inferior furface of that part of the brain which is called the fornix, because it is full of medullary lines, refembling the strings of the

LYSIMACHIA. YELLOW LOOSE-STRIFE, or WIL-Low HERB. Boerhaave enumerates fixteen species of Lysimachia. The name of Lysimachia is from Lysimachia, the son of a king of Sicily, who first discovered it. It is a small plant which is found about the sides of rivers, faid to be aftringent, but of no note in medicine, called also ænsthera. It is also a name for a species of the nummularia cassida, and several other plants.

LYTHARGYRUS. LYTHARGE. See PLUMBUM.
LYTHOPHYTON NIGRUM. BLACK CORAL.

See CORALLIUM NIGRUM.

LYSSA. The madness of dogs and wolves, or of men who are bit by them, call cynolyssa.

LYTHRON. Dust mixed with sweat; but Hippocrates occasionally expresses by it, the menstrual blood.

## MAC

or manipulus, a handful.

MABOUJA. A very hard root of a tree, of

which the American favages make clubs.
MACALEB. See MAHALEB.

MACALEB. See MAHALEB.

MACALEB SERAPIONIS, i. e. PHILLYREA LATIFOLIA

LEVIS. A species of mock privet. See PHILLYREA.

MACANDON, cada palava, a conserous tree mentioned by Bontius. It grows in Malabar; its fruit refembles the pine-nut, but it is not so hard; it is rather inspired to the taste; the flowers resemble those of the honey-suckle. The fruit is roasted, and eaten as a cure for desentation, and relief in the cholera morbus and for dyfenteries, and relief in the cholera morbus, and other complaints. Raii Hift.

MACAPATLI. See Sarsaparilla.

MACAXOCOTLIFERA. The name of a tree in the West Indies; it is about the fize of a plum-tree; its fruit is called macarocotl; it is red, of a long figure, of the fize of a walnut, and yellow within; it is fweet and laxative. Another species is the atoyaxacotl, and another is called continuously by the Mexicans, though others call it a species of mirobalan. Another species is called atoyaxocotl chichiliie; and the last species is called chichiaxocotl, which signifies running down with sweat. A decoction of the bark of these trees cures the itch, and the powder thereof heals ulcers. Raii Hist.

MACEDONISIUM SEMEN. Fuchfius informs us

that it is the feed of the herb Alexanders.

MACER. GRECIAN MACER. It is brought from Barbary; its thick yellow bark is aftringent, fo is the dried root. Its fruit, called macre, deftroys all forts of worms.

M. Jufficu thinks that the macer of the ancients is the fmareuba of the moderns.

MACERATIO. MACERATION. It is an infusion, or

a foaking of ingredients in water, or other fluid, in order to extract their virtue.

MACERONA. See HIPPOSELINUM.

MACHAMONA. A fort of calabash in Africa and America; the pulp of it is agreeable, and serves instead of remost for cauding milk. of rennet for cruding milk.

MACHÆRIA. PEACH KERNELS.

MACIA. See ANAGALLIS.

MACIES. Difeafes in which the body, or particular

parts, waste or wither.

MACIS. MACE. It is the middle bark of nutmegs. It is of a lively red colour when freih, but grows paler with age. It envelops the shell which contains the nnt-meg. It is dried in the sun upon hurdles, which are fixed one over another, and then it is fprinkled with feawater to prevent its crumbling in carriage. It hath a pleafant aromatic fmell, and a warm, pungent, bitterish take. Its qualities are fimilar to that of nutmeg, both as the subject of medicine, and of pharmacy. The principal difference is, that mace is warmer, more bitter, lefs unctuous, and fits easier on weak flomachs; in its yielding, by expression, a more suite oil; and, in distillation with water, a more subtle volatile one.

What is called in the shops expressed oil of mace, is pressed from nutnegs. See Nux Moschata.

The effential oil of mace is moderately pungent, very subtile and volatile, of a strong aromatic smell, like the

MAGALAIZE. See MANGANESE.

MAGDALEONES. Maffes of plafter, or of other compositions, reduced to a cylindrical form; they are also

called cylindri.
MAGDALIÆ, or MAGDALIDES, i. e. MAGDALEONES.
MAGELLANICA AROMATICA ARBOR. See

WINTERANUS CORTEX.

MAGISTERIUM. A MAGISTERY. This term hath various fignifications. 1. It is afcribed to powders made by folution and precipitation, fee BENZOINUM;-BISMU-THUM; -CALAMINARIS LAPIS. 2. It is bestowed on refins, or refinous extracts, as the magistery of scammony, &c. 3. The true magistery is when some of the menstruum remains united with the extracted effence. 4. The ancients mains united with the extracted effence. 4. The ancients gave this name to feveral white precipitates; and by this term they would have us to understand a very subtile preparation. 5. This word is generally used for a white powder, prepared from some mineral, vegetable, or ani-

The first chemists invented this term for some particular precipitated fubstances, but not for all; at present we have no general idea, or established characteristic, to distinguish magistery from precipitate. Every magistery is now fome kind of precipitate; but every precipitate is not a magistery. Magisteries are always very white, and lighter than other precipitates.

MAGISTRALIS. When applied to medicines, it is

the fame with medicamenta extemporanea.

MAGISTRANTIA, MASTERWORT. See IMPE-RATORIA

MAGMA, also ECPIESMA. In a more general fense, it is any thick ointment that will not run with the heat of the body, or a poultice that will not fpread, on account of its containing much water. In a stricter sense, it is the fæces of any ointment after the thinner parts are ftrained off: Galen reftrains the word to the fæces of myrobalans.

MAGNA ARTERIA. See AORTA.

MAGNATES. The LOAD-STONE. Called also calaMAGNES. Smita, lapis Lydius. It is called lapis Heracleies, or Heraclius, from Heraclea, a town in Lydia; and Magnefia, from a town in Lydia of the same name; and fideritis, from its attracting iron. It is an iron ore of different colours and folidity; the best are folid, and not porous, nor very heavy. The smaller stones will lift up more in proportion than the larger. It is somewhat astringent, but is not used in medicine. It attracts iron, or another many or results them, and directs it and or another magnet, or repels them, and directs its poles always to those of the world.

MAGNES ARSENICALIS. ARSENICAL MAGNET. Take crude antimony, yellow fulphur, and crystalline white arsenic, of each two ounces; powder them separately; then mix them well together; put the mixture in a glass body or crucible, and melt it in a gentle sand-heat, until it hath acquired the consistence of pitch; then the fire being removed, it concretes into a glassy mass of a

dark red colour.

Caution is required in handling this glaffy mass, as a

wound received from it may be dangerous.

This medicine is only to be applied externally, being a mild and gentle caultic; it hath been thought to be endued with a power of attracting poisonous and other morbific matter from the centre of the body to the surface, like a load-stone, and hence its name.

Besides other virtues attributed to it, Geosfroy say that it opens, cleanfes, and heals fcrophulous ulcers, with out the affiftance of ointment of any kind. It is pre-ferred by fome for making Mr. Plunket's cancer-plafter.

See CANCER.

- EPILEPSIA. Cinnabaris nativus. NATIVE CINNABAR, fo called because of its usefulness in epilepfies.

MAGNESE. See MANGANESE.

MAGNESIA. See ETHEL, also MANGANESE, chambar. It is often the same as marcasita. It is taken for the matter of the philosopher's stone, and for fulphur; it is a term of art; it fignifies melted tin, into which mercury being cast, is thoroughly mixed and in-corporated with it, into a brittle substance, and white mass; it is also a mixture of silver and mercury, and a very

fusile metal, called magnesia philosophorum.

MAGNESIA ALBA. The WHITE MAGNESIA, called also albus romanus pulvis, comitisse palma, vel palmeri pulvis. Alba is added to distinguish it from the magnesia, or manganese, which is employed in making glass. It is also called miraculum chemicum, the chemical miracle; because from two pellucid liquors a coagulum is formed, which contains the earth called magnejia alba. It was introduced as a medicine in the beginning of the eighteenth century, by count di Palma, at Rome, and continued a very lucrative feeret. It is a very white, subtil powder, or a peculiar earth; it is not calcareous, but poffessed of some peculiar properties. Dr. Lewis says, he never met with this earth in the mineral kingdom, except in the mother ley of nitre, and in the fal cathart. amar. but he found it in the earth into which vegetables are reduced by fire; and he afferts, that the incinerated earths of animals are of a different kind.

Mr. Henry, apothecary in Manchester, gives the fol-lowing process for making the magnesia.

"Dissolve any quantity of fal cath. amar. in its own weight of water; filter, and add to it by degrees, a filtered folution of pearl-ashes, in an equal quantity of water, ftirring them gently, until the mixed liquots have acquired the appearance of a complete coagulum; then cease adding any more of the alkaline lixivium, and immediately throw the mixture into a large veffel of boiling water; keep it boiling for a quarter of an hour, then take water; keep it bening for a quarter or att hour, then take it out, and put it into glazed earthen veffels; as foon as the powder hath fubfided, and before the water is quite cold, pour it off, and add a fresh quantity of boiling wa-ter; repeat these ablutions with several parcels of hot wa-ter, till the liquor hath entirely lost its faline taste; then let it be so agitated as to suspend the finer parts of the powder, in which state decant it into other vessels, and having separated the water from the magnesia, by inclina-tion, put it on large chalk-stones, until a considerable part of the humidity is absorbed; then wrap it up in sheets of white paper, and dry it before the fire. Pour hot water upon the remaining powder, filir and decant it in its turbid flate, and separate the magnifia from the water as before; thus the whole, or the most of it will be reduced to an equal degree of fineness.

"The largest the security for the most of it will be reduced to an equal degree of fineness.

"The larger the quantity of water into which the preci-pitated powder is cast, the more speedily and perfectly will the vitrolated tartar, which is formed by the alkali uniting with the acid of the sal cath. be washed off. The neutral salt should be washed off as quick as possible, other-wise, by allowing the mixture to stand for some time, the powder concretes into minute grains, which, when view-ed with a microscope, appear to be affemblages of needles diverging from a point. These concretions cannot be rediffolved by any washing, however long continued. Dr. Black orders four times the quantity of water to that of the folution to throw the coagulum into, but that is far too little. The water should be pure, diffilled is the best, and the last water should be pure, and the last water should be pure. too little. The water should be pure, distilled is the best, but it should be kept until its empyreuma is gone off. Hard, or impure water, makes magnesia coarse and disagreeable. The chalk stones on which the magnesia is dried, should be exposed to a moderate heat, that the mossfure may evaporate quickly. Cleanliness should be particularly attended to through the whole."

As magnesia contains about rath parts of fixed air, it should be calcined after it is made, and before it is administered, in statuent cases at least. It is calcined by putting it in a common crucible, and placing it in a glowing

ting it in a common crucible, and placing it in a glowing fire, and keeping it red-hot for the space of two hours.

Hostman observes, that magnesia often occasions statulencies, and gnawing pains in the belly, and generates corrosive juices in the stomach; but these inconveniences will not be complained of, if care, agrecable to the above

will not be complained of, if care, agreeable to the above processes, is not wanting.

In common with absorbents, it corrects acidities in the primæ viæ, relieves the heart-burn, and all symptoms that have an acid for their source; as siekness, giddiness, vomiting, pain in the stomach, &c. also the gripes, convulsions, &c. in children, from the same cause. It is preferred to all common absorbents, on account of its laxative quality, which it manifests when it meets with an acid in the stomach and bowels. If it is mixed with rhubarb, it is said to prevent the rhubarb from leaving a costiveness behind. If the magnessa is neither accompanied, nor met with by an acid, it is not purgative, but simply absorbent. See Hossman's Obs. Phys. Chem. lib. iv. Obs. ii. Dr. Black's Obs. on the Magnessa Alba, in the Essays Philos. and Literary of Edinb. vol. ii. Lond. Med. Trans. vol. ii. Mr. Heary's Strictures on Glass's Magnessa, and Mr. Heary's Reply to Dr. Glass's Examination of the Mr. Henry's Reply to Dr. Glass's Examination of the

MAGNESIA OPALINA, also called magnefia rubic. anti-MIGN. OPALIN, OF RUBY COLOURED MAGNESIA OF AN-TIMONY. In making the hepar antimonii, fome add to the antimony and nitre decrepitated fal ammoniac, and thus make the opalin. It is a much weaker emetic than the liver of antimony, and does not cause great sickness when given in confiderable doses to horses, but passes freely by fweat. Lemery directs it to be made of equal parts of antimony, nitre, and decrepitated fea-falt.

VITRIOLATA. See CATHARTICUS SAL.

MAGNUM DEI DONUM. So Dr. Mead calls the

cort. Peruvianus.

MAGNUM Os. Thus the third bone of the fecond ! row in the wrift is named. It is the largest of all the NIA. bones there. See CARPUS.

MAGNUS MORBUS. The GREAT DISEASE. So

Hippocrates calls the epilepfia.

MAGUDARIS. The root of filphium.

MAGUEI. An American name for fome species of

MAHALEB, also The ROCK WILD CHERRY of MACALEB. Austria. Cerafus fylvestris AUSTRIA. Cerafus Sylvestris MACALEB. AUSTRIA. Cerajus jylvejtris amara mabaleb putata. ROCK CHERRY. MAHMOODY, fee SCAMONIUM. MAIANTHEMUM. LILY of the VALLEY. See

LILLIUM CONVALLIUM.

MAIL-ANSCHI. A fpecies of rhamnus, growing in Malabar. A decoction of its root is commended against the gout; and a decoction of its leaves against the jaun-

MAIL-ELOU. It is a tall tree, fifty feet high, growing in Malabar; it is an evergeen. Of the bruifed leaves and bark is prepared an apozem against the after-pains of women in child-bed, and for promoting the lochia. MAIL-ELOU-KATOU. This is larger than the a-

bove fpecies; it is evergreen, and aftringent.

MAIL-OMBI. This is of the fize of an apple-tree. Raii Hift.

MAJORANA: MARJORAM. Botanists enumerate

five species - CRETICA, vel SYRIACA, called also origanum Smyrnium. Sec MARUM SYRIACUM.

- Majori Folio, called also amaracus sampsuchus. Sweet marjoram; but by lesser marjoram, they meant the marum. The Egyptians and Syrians call the sweet marjoram by the name of sampsuchus. It is the origanum majorana; or origanum foliis ovatis obtuss, spicis substitution of the structured in compaction pubescentillus. It is a law fubrotundis compactis pubefcentibus, Lin. It is a low plant, with flender, fquare branched, woody ftalks; and little, oval, formewhat downy leaves, fet in pairs; on the tops grow fealy heads of small whitish labiated flowers, whose upper-lip is erect and cloven, the lower is divided into three fegments. It is fown annually in gardens for culinary, as well as medicinal uses. The seeds rarely come to perfection with us. They are brought from the south of France, where the plant is faid to be indigenous.

The leaves and tops have a pleafant fmell, a warm aromatic bitterifh tafte. Infusions in water finell strong, but taste weak and unpleasant; a tincture made with rectified fpirit of wine, hath less smell but more tafte. In distillation this plant yields its virtue to water, and thus it affords an effential oil, Hoffman fays in the proportion of 3 i. from 3 kiv. of the leaves flightly dried. This oil is hot, but not so agreeable as the marjeram itself. When carefully drawn it is of a pale yellow colour; but, by long keeping, it turns reddifth, and if diffilled with too great heat, it is red at the first. The dose is two

The aromatic matter almost all rises in distillation, so that an extract possesses very little of the valuable parts of the plant, which is an useful medicine in some disorders of the head and nerves, fimilar to that of lavender, uterine obstructions, catarrhs, and humoral asthmas. The powdered leaves, the effential oil properly diluted, and the distilled water, are agreeable errhines.

— OLERACEA, called also origanum onites. Por MARJORAM. Lewis's Mat. Med; Raii Hist. See

ONITIS.

- ROTUNDIFOLIA, also called origano cognata, zazarhendi herba.

- TENUIFOLIA. MARJORAM GENTLE OF PE-

MALA, from a refemblance to uso so, Doric, or rather malum, apple, according to Martinius, the prominent part of the cheek. It is also the term given to different forts of fruit.

MALA ASSYRIA. The CITRON. See CITREUM.

— ÆTHIOPICA. A species of sycoperficon.

— AURANTIA. The ORANGE. See AURANTIA HYSPALENSIS.

- AUREA. See AMORIS POMA.

- AURANTIA CHINENSIA. Sco AURANTIA SI-NENSIS.
