# PRÆFATIO.

**N**EC inutile omnino sit nec ingratum, Academici, si Syllabo huic Anatomico pauca quædam de Usu Anatomiæ prænotaverim; cum plerique medicæ artis Tyroneſ ita ab impiâ istâ & inutili, ut videatur, cadaverum laniatione abhorreant, ut Humano ſe Sanguine imbrui, crimen plusquam expiabile credant: Hinc religiosæ nimis & effæminatæ menti ſe victos tradunt, in oppositas Empiricorum partes abeunt, & curativas indicationes a ſolis juvantibus & lædentibus ſumendas pronuntiant. Cum tamen fallax ſit omnis medicinæ praxis, & de corio Humano ſæpiſſimè luſura, quæ notæ corporis ſtructuræ non innititur.

Qui fieri enim poſſit, ut intelligatur morbi Pathologia, niſi ex cognitâ priùs partis Structurâ, cui ~~wād~~ insedit: Varium omnino cum ſit ejusdem morbi geniūm, pro varia partium indole, quæ eodem

## P R A E F A T I O.

dem morbo afficiantur. Ossium Fracturæ nihil per se habent periculi, eo tamen momenti sunt majoris, quo accuminata jam ossa has vel illas partes lacerant, quæ Inflammatione & Sphacelo facilius occupantur, & occupatæ mortem citius inducunt: Hinc quæ primo intuitu ejusdem fere indolis Fracturæ videantur, curationem tamen poscunt quam dissimillimam: Illis cum satis sit consultum, si dis-  
sistæ ossis partes fasciis componantur; His vero ne-  
cessè sit, ut cum Membro auferantur, ne pars sin-  
cera totumque tandem corpus in Sphacelum traha-  
tur: Hujus rei pro exemplo sit Cruris fractura,  
quæ si in superiorem incidat partem, nullius ple-  
rumque aut periculi est aut negotij, partes enim  
quæ ibi se lacerandas objiciunt, Membranosæ ple-  
rumque sunt & Musculosæ, quæ neque inflammati-  
oni adeo sunt aptæ, nec inflamatæ ita pertinaci-  
ter in Sphacelum ducunt: Quod si Cruris inferiori  
parti obtingat Fractura, summi ibi res est periculi,  
plurimi quippe Tendines ibi adsunt lacerandi, qui  
& facillimè inflammantur, & inflammati ferè sem-  
per Sphacelum induunt.

Idem profecto de Morbis inflamatoriis dicen-  
dum sit; quæ quidem tanto pejoris sunt ominis  
quantò partes vitæ magis necessarias, ~~vel~~ in suis  
officiis

## P R A E F A T I O.

officiis obeundis impedianc vel destruant : Hæc tamen ab inflammatoriis morbis pericula, ut ut magno distent intervallo, non aliter tamen sæpe dignoscuntur quam ex bene perspectâ Corporis Structurâ: Distensiva Pulmonum inflammatio, cum dolore plerumque careat, ex cervicis erectione & Clavicularum elevatione maxime dignoscitur ; dictam interim Peripneumoniam a Cervicis erectione & Clavicularum elevatione indicari, iis solis constat, quibus muscularum Scelenorum & Subclaviorum situs & usus prius innotuerunt ; neque ipsi tamen noscant quantum exinde periculi immineat, nisi Situm & Structuram eorum omnium intellexerint, quæ exinde ita aut comprimi aut destrui possint, ut tollatur Sanguinis motus.

Plura hujusmodi afferre possint exempla, hic vero loci satis sit observâsse, unicuique Morbo propria quædam dari symptomata a partis affectæ Structurâ, pendentia, quæ, si a vagis fictisque symptomatibus sæpius feligerentur, medicinæ praxin homine digniorem, medicis faciliorem totique humano generi feliciorem redderent.

Utcunque vero manca claudicet Pathologia, quæ principiis Anatomicis non innititur, magis adhuc laborat ars Therapeutica, quæ nullis ducta consiliis

## P R A E F A T I O.

quasi in tenebris oberrat, ibi forsan maxime obfuta, ubi maxime profuturam se sperat. In omni operatione Chirurgicâ, facilis profecto est in errorem lapsus, nec retro pedem referre tum forsan licet, cum alienæ ignorantiae poenas luiturus sit æger: ossi luxato quis succurrat, nisi ossium prius formas, juncturas & motus bene perspexerit, cum suus sit cuique ossi proprius reductionis modus? Cataractam quis deprimet, Calculum quis extrahet, nisi situm & structuram eorum omnium intellexerit quæ vulneranda, laceranda, aliove quo-cunque modo perturbanda occurrant?

Nec ab internis medicorum armis minus imminet periculi, nisi, quâ se torqueant, noscat Medicus: Quis enim aut purgans, aut Vomitorium quidpiam tutò adhibeat, nisi eorum operandi modum, eaque omnia, quæ exinde pati possint, noverit? Multis in morbis ita aut obsint, aut prosint vomitoria, ut nihil magis: Quâ tamen de causâ ita aut obsint aut prosint, iis solis constat, quibus corporis structura satis est perspecta: Vomitoria non modo in Ventriculum, sed in singula quæque Abdominis contenta pariter agunt: ea vero tantum a Vomitoriis impulsu absque insigni aliquo vel damno vel commodo passura vix credam.

## PRÆFATI<sup>O</sup>N.

Iniquè ideo ab iis factum est, qui, Anatomicis consiliis rejectis, medicamina sortiuntur ægris pro fortunâ vel lœsura vel profutura. Hos ego Celsi verbis monitos velim, Rationalem quidem Medicinam esse debere; cum itaque in interioribus partibus & dolores & morborum varia genera nascentur, neminem putent his adhibere posse remedia, ~~quæ~~ ipse ignoret. Necessarium ergo esse, incidere / & que corpora Mortuorum, eorumque viscera atque intestina scrutari.

Rationalem quidem Medicinam puto esse debere. Incidere autem vivorum corpora & crudele & Superovacuum est. Mortuorum corpora discentibus necessarium.

*N. B.* Prælectiones in hunc ordinem disponuntur, ut Membra quam citissimè a Trunko disjungerentur, quo commodius appropriatis menstruis a putrifactione & fœtore conservantur.

Mem: Nov. 30. Found y<sup>e</sup> right lobe of ye lungs of  
a Man putrid & a great number of Stones in y<sup>e</sup> Celleulo  
Glandularum prostatarum.

Bidloo's Errors. Fig. 1. Tab. 15. He calls the same  
Muscle N Stylohyoideus & Stylocratohyoideus under  
A. B. C. — Fig. 15. Tab: 23. is very ill express'd; his Sys-  
tem of Nerves. Arteries is corrected in the Appendix  
Fig. 4. — Fig. 5, 6. Tab: 24 Figures are erroneously  
express'd — Fig. 3, 4. Tab: 34. The Description of the  
Muscles of the Pharynx is erroneous as likewise are  
those of Riolanus, Spigelius, Testlingius, Bartholinus.  
They seem to have been all copied from the same Em-  
inenous Draught. Couper has give'n a more exact Fi-  
gure in his Appendix

Bidloo places the black Colour of the Ethiopians in  
a Liquor secreted thro' the Aqueous Ducts placed between  
the Papillo Pyramidales. Couper questions the existence  
of such Ducts. Kiril thinks it proceeds from the Muco-  
osity covering the Parenchyma of Skin. Fig. 6 T. 4. p. 15  
Tab. 9. Fig. 1. is very ill express'd the Brain freed from  
Dura Mater & taken out of the Skull. The Infundibu-  
lum & 2 white protuberances behind the Infundibu-  
lum very ill done. The two semi circular Branches  
that join the Carotid & Cervical Arteries called the Com-  
municant Branches express'd too large. At c, d, e, f,  
g, he has give'n very confus'd descriptions of several  
pair of Nerves, & hath left out the 7<sup>th</sup> Pair. Dr. Willis  
is guilty of some of the same Errors.

**Materia.** All the parts of a human Body are made up of fibres. Of these some are soft & flexible, & a little elastic & these are hollow like small pipes, or spongy & full of little cells, as the nervous & fleshy fibres. Others are more solid & flexible but w<sup>th</sup> a strong elasticity or spring, as the membranous & cartilaginous fibres: & a third sort are hard & inflexible as the fibres of the Bones. &c.

v. Boddy. **Fluida Sanguinis.** Sanguis primus intus ex sanguine  
cxxx. capsamento constitutus, sed in duas partes secernatur ex  
prop. viscidus at albumen oorum; prima transparens, lipide operata;  
secunda tenuis & per alia bicus fugitiva. Capsamentum  
prima pars fibrosa, altera ab aqua abstensa, impulsum  
rubicundissimum in fundo aqua subsistens.

**Fibra.** Most Fibres when examined w<sup>th</sup> a Microscope appear to consist of still smaller fibres. These first compose, Membranes, Veins, Lymphaticks, Nerves, ligaments &c. Then by various texture & different Combinations of some or all these parts the more compounded Organs are formed such as, the Lungs, Liver &c, the sum of all w<sup>ch</sup> put together form what we call the Body. v. &c.

**Lymphatica.** Malpighius thinks the Lymph-ducts arise from the Glands, & are excretory Vessels to them. Mr. Cowper thinks they arise from the Extremities of the Blood-vessels; & where there are Glands that have exporting Lymph-ducts he supposes they have likewise importing ones. This he ascertains from injecting the Lymphatic vessels into the Blood-vessels. Their Use is to carry back of superfluous parts of the Serum. It is highly probable they have a communication w<sup>th</sup> the arteries or veins because no Reason can be assigned why Lymph should ascend unless by the heart's motion communicated to the Lymph, by the intermedication of the Blood either in Veins or Arteries.

**Membrana.** This is a Compagny of fibres woven like a piece of silk, used for covering or lining any part.  
**Arteries** arise from 2 trunks from the left Ventricle of the heart, these tubes convey the Blood to the Extremities of the body.  
**Veins** are tubes that carry back the venous Blood to the Heart, from the Extremities of the body.

Nervi are solid cylindrical bodies consisting of straight fibres & arise from the Medulla oblongata, & medulla spinalis, & terminate in all the sensitive parts. They are immediate organs of sensation & the chief of Motor. v. Ch.

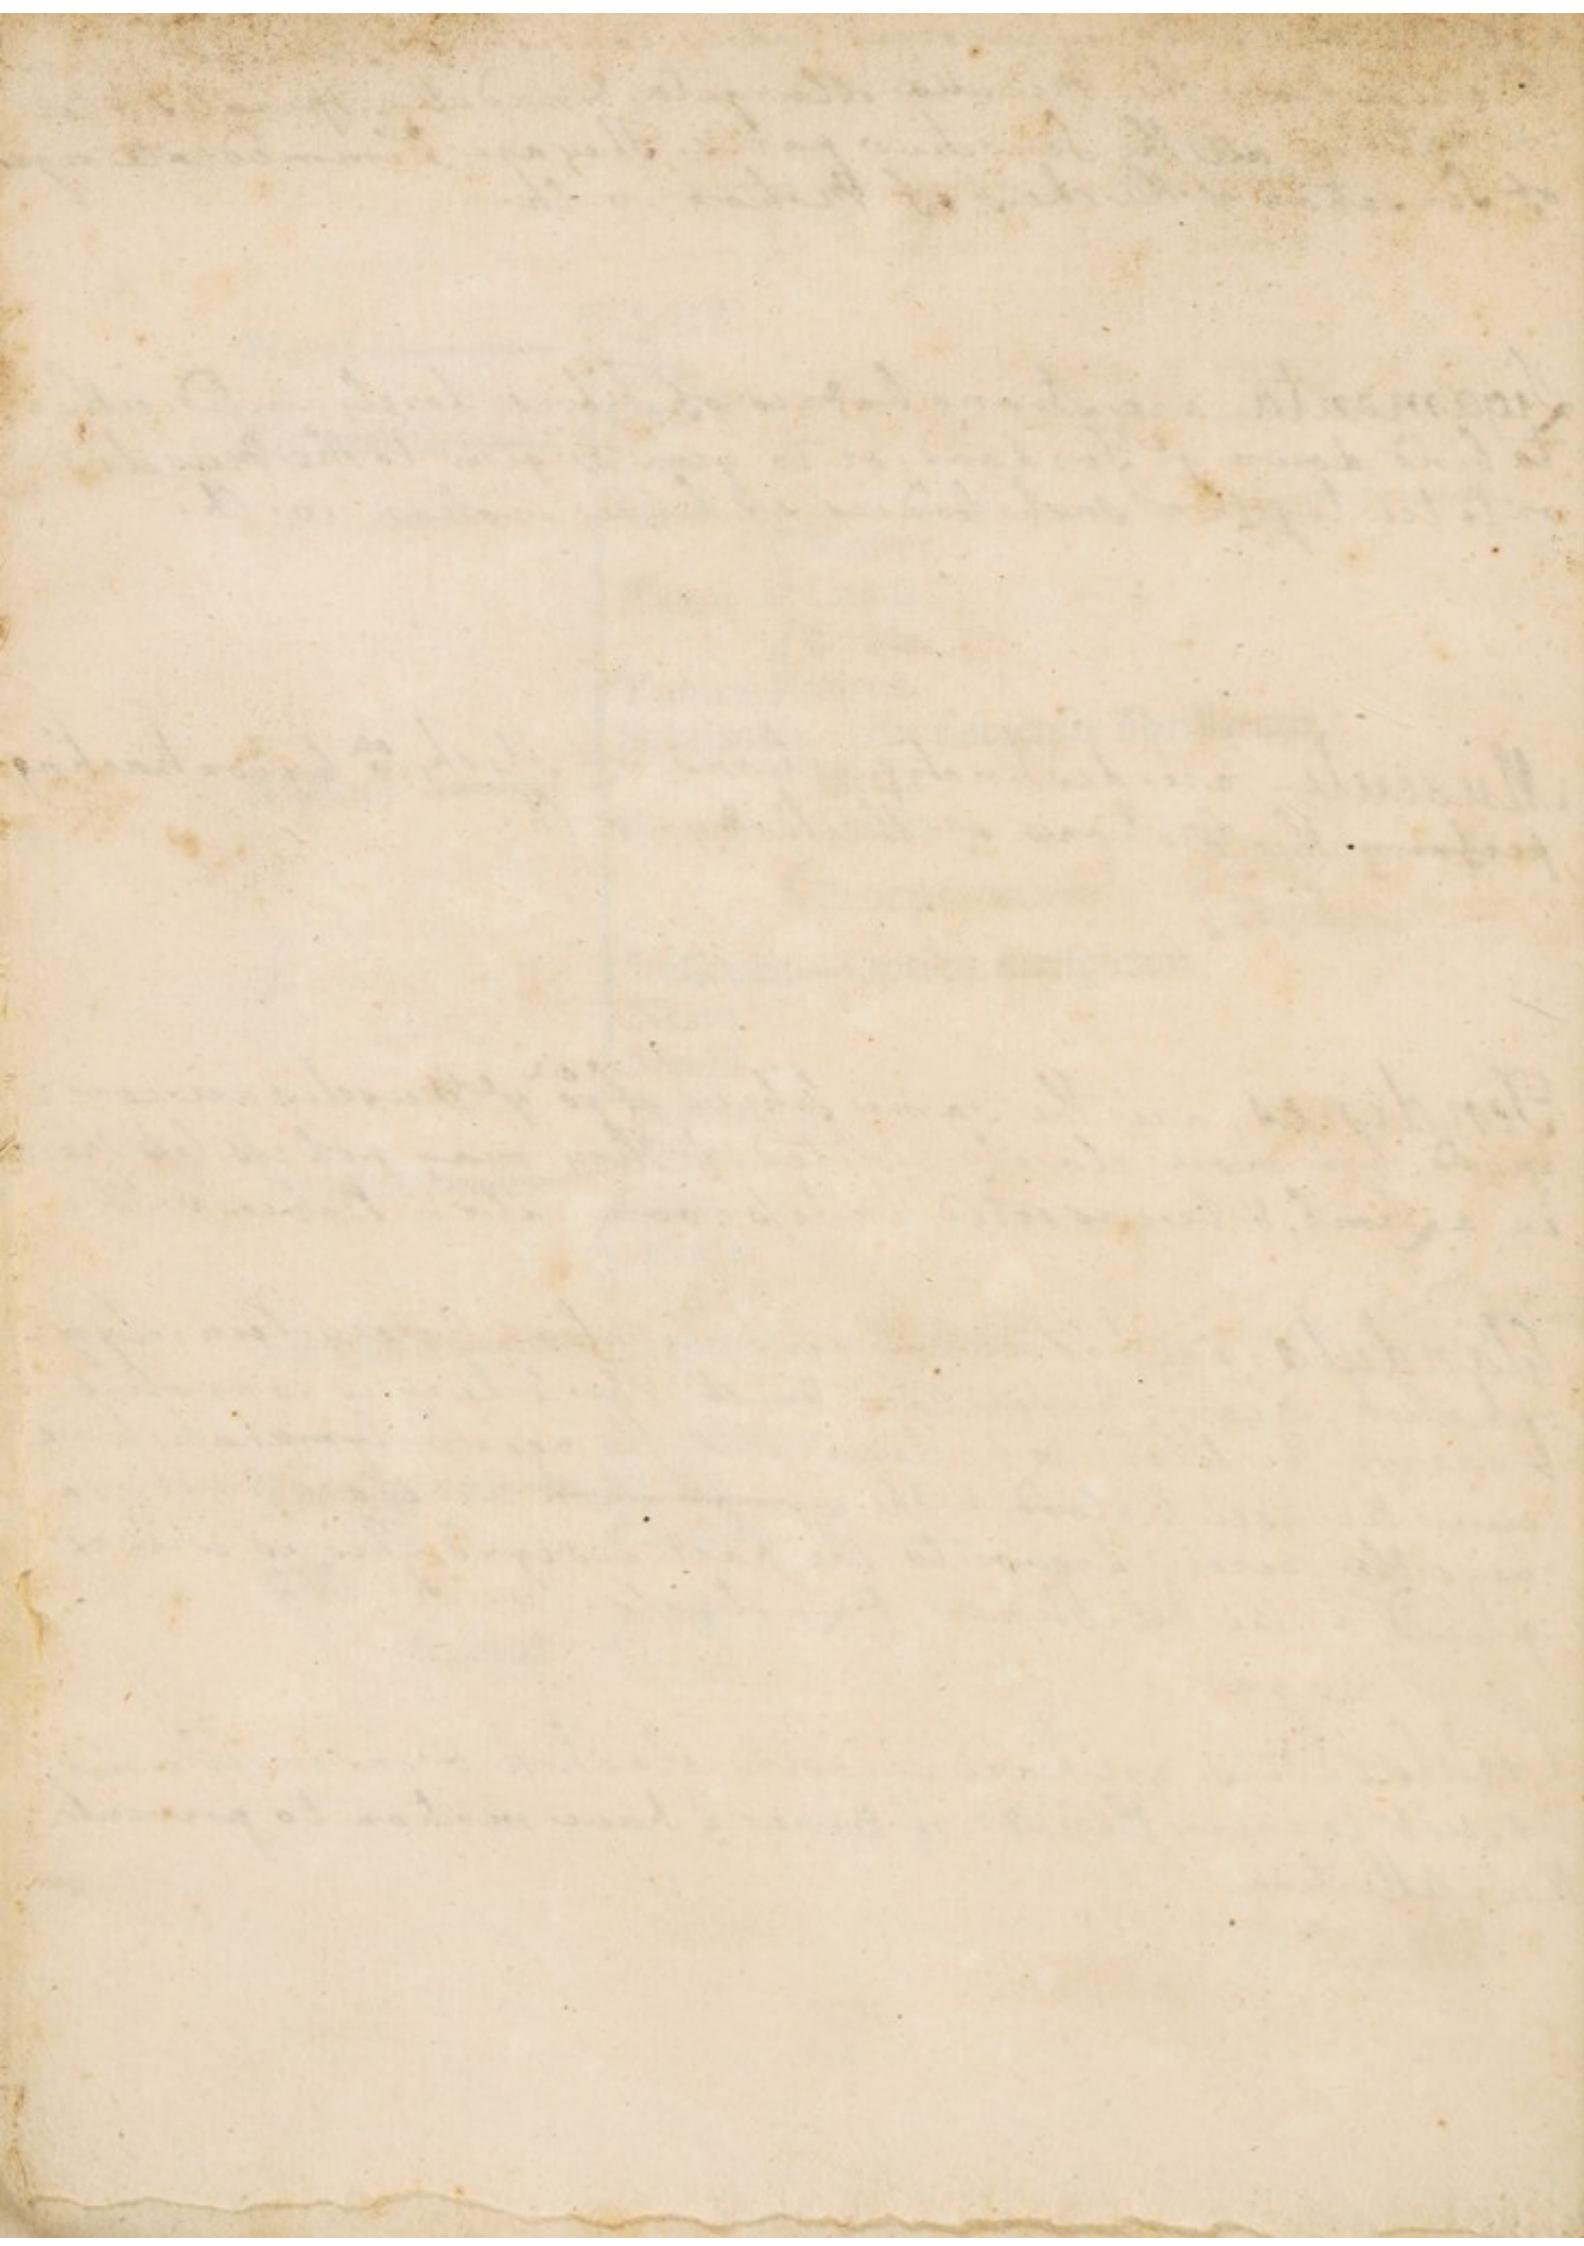

Ligamenta, are strong bodies of Fibres closely united, either to bind down of Tendons, or to give origin to the Muscles or to tie together such bodies as have motion. v. Ch.

Musculi. are distinct portions of flesh, by contracting perform the Motions of the Body. v. Ch.

Tendipes, are the same fibres of muscles accom-  
podd, but more closely united, & they may pass less space  
in a Limb, & be inserted in less room into a Bone. v. Ch.

Glandulae are bodies consisting of an Artery Vein, Lym-  
phatick, Nerve, & excretory duct. The Artery is convoluted  
& carry's the Blood to be depurated, the vein & lymphatick re-  
ceive the useless blood, & the lymphatick excretory duct con-  
veys the secreted liquor to the part design'd. This is well ex-  
plained by the Intestines & Lacteals. v. Ch.

Cartilagineas, are hard, smooth, elastic & insensible bod-  
ies, used to cover the Ends of Bones & have motion to prevent  
their Attrition.

The Bones are made up of hard Fibres held together by transverse ones. In a Fetus these fibres are porous. Probably they are nourished by Lymph. The marrow is to supply the Fibres of the Bones. The Penosteum has an exquisite Sense, perhaps it may be an expansion of the tendinous fibres of the Muscles.

Flat Bones <sup>w</sup> have their Fibres directed to all Sides begin to ossify in a middle point, like the Radj from the Center to the circumference of a Circle. Those flat Bones <sup>w</sup> have their Fibres nearly parallel, begin in a transverse middle Line in the middle of each fibre. The cylindrical Bones in a middle Ring — The Bones wast — The use of Penosteum, is to make the Muscles slide easily on the Bones. Cutting <sup>w</sup> a Trephine does not put the Patient to any extraordinary pain. The pain arises from cutting & lacerating of Nerves. Galileo has demonstrated the Increase of the Strength of a Bone, from the Increase of the Diameter. A Cable is not so easily bent, as the same number of Threads before they are twisted.

Ossa Sesamoidea are found in  $\gamma$  hands & feet, commonly two under  $\gamma$  Bone of  $\gamma$  Metatarsus that support the great Toe, one on each Side of the articulation. There is an Interval between these two <sup>w</sup> are joind together by ligaments  $\gamma$  one cannot move <sup>but</sup> the other. There is a Tendon  $\gamma$  goes between the two. When there happens but one Sesamoidea on the brink of the Articulation, there is a cavity left in the middle, into <sup>w</sup> the Tendon passes, & is there fix'd & this hinders the Compression. They are articulated by Ganglion as the Rotula. When the Toe has no Sesamoidea, nature supplies their want by Cartilages.

The Bones ossify from a point but not in straight lines but in such manner that resemble the Ramifications of an Artery. This relates only to those Bones  $\gamma$  ossify begin to ing Center

a] Galileo has demonstrated the Increase of the  
Strength of Ropes arise from the Increase of their  
Diameters. v. than Rul, & Chiselden.

A Cable is not so easily bent as the same Number  
of Threads before they are twisted.

## Prælectio Quarta.

## *De Ossibus & Suturis Cranii.*

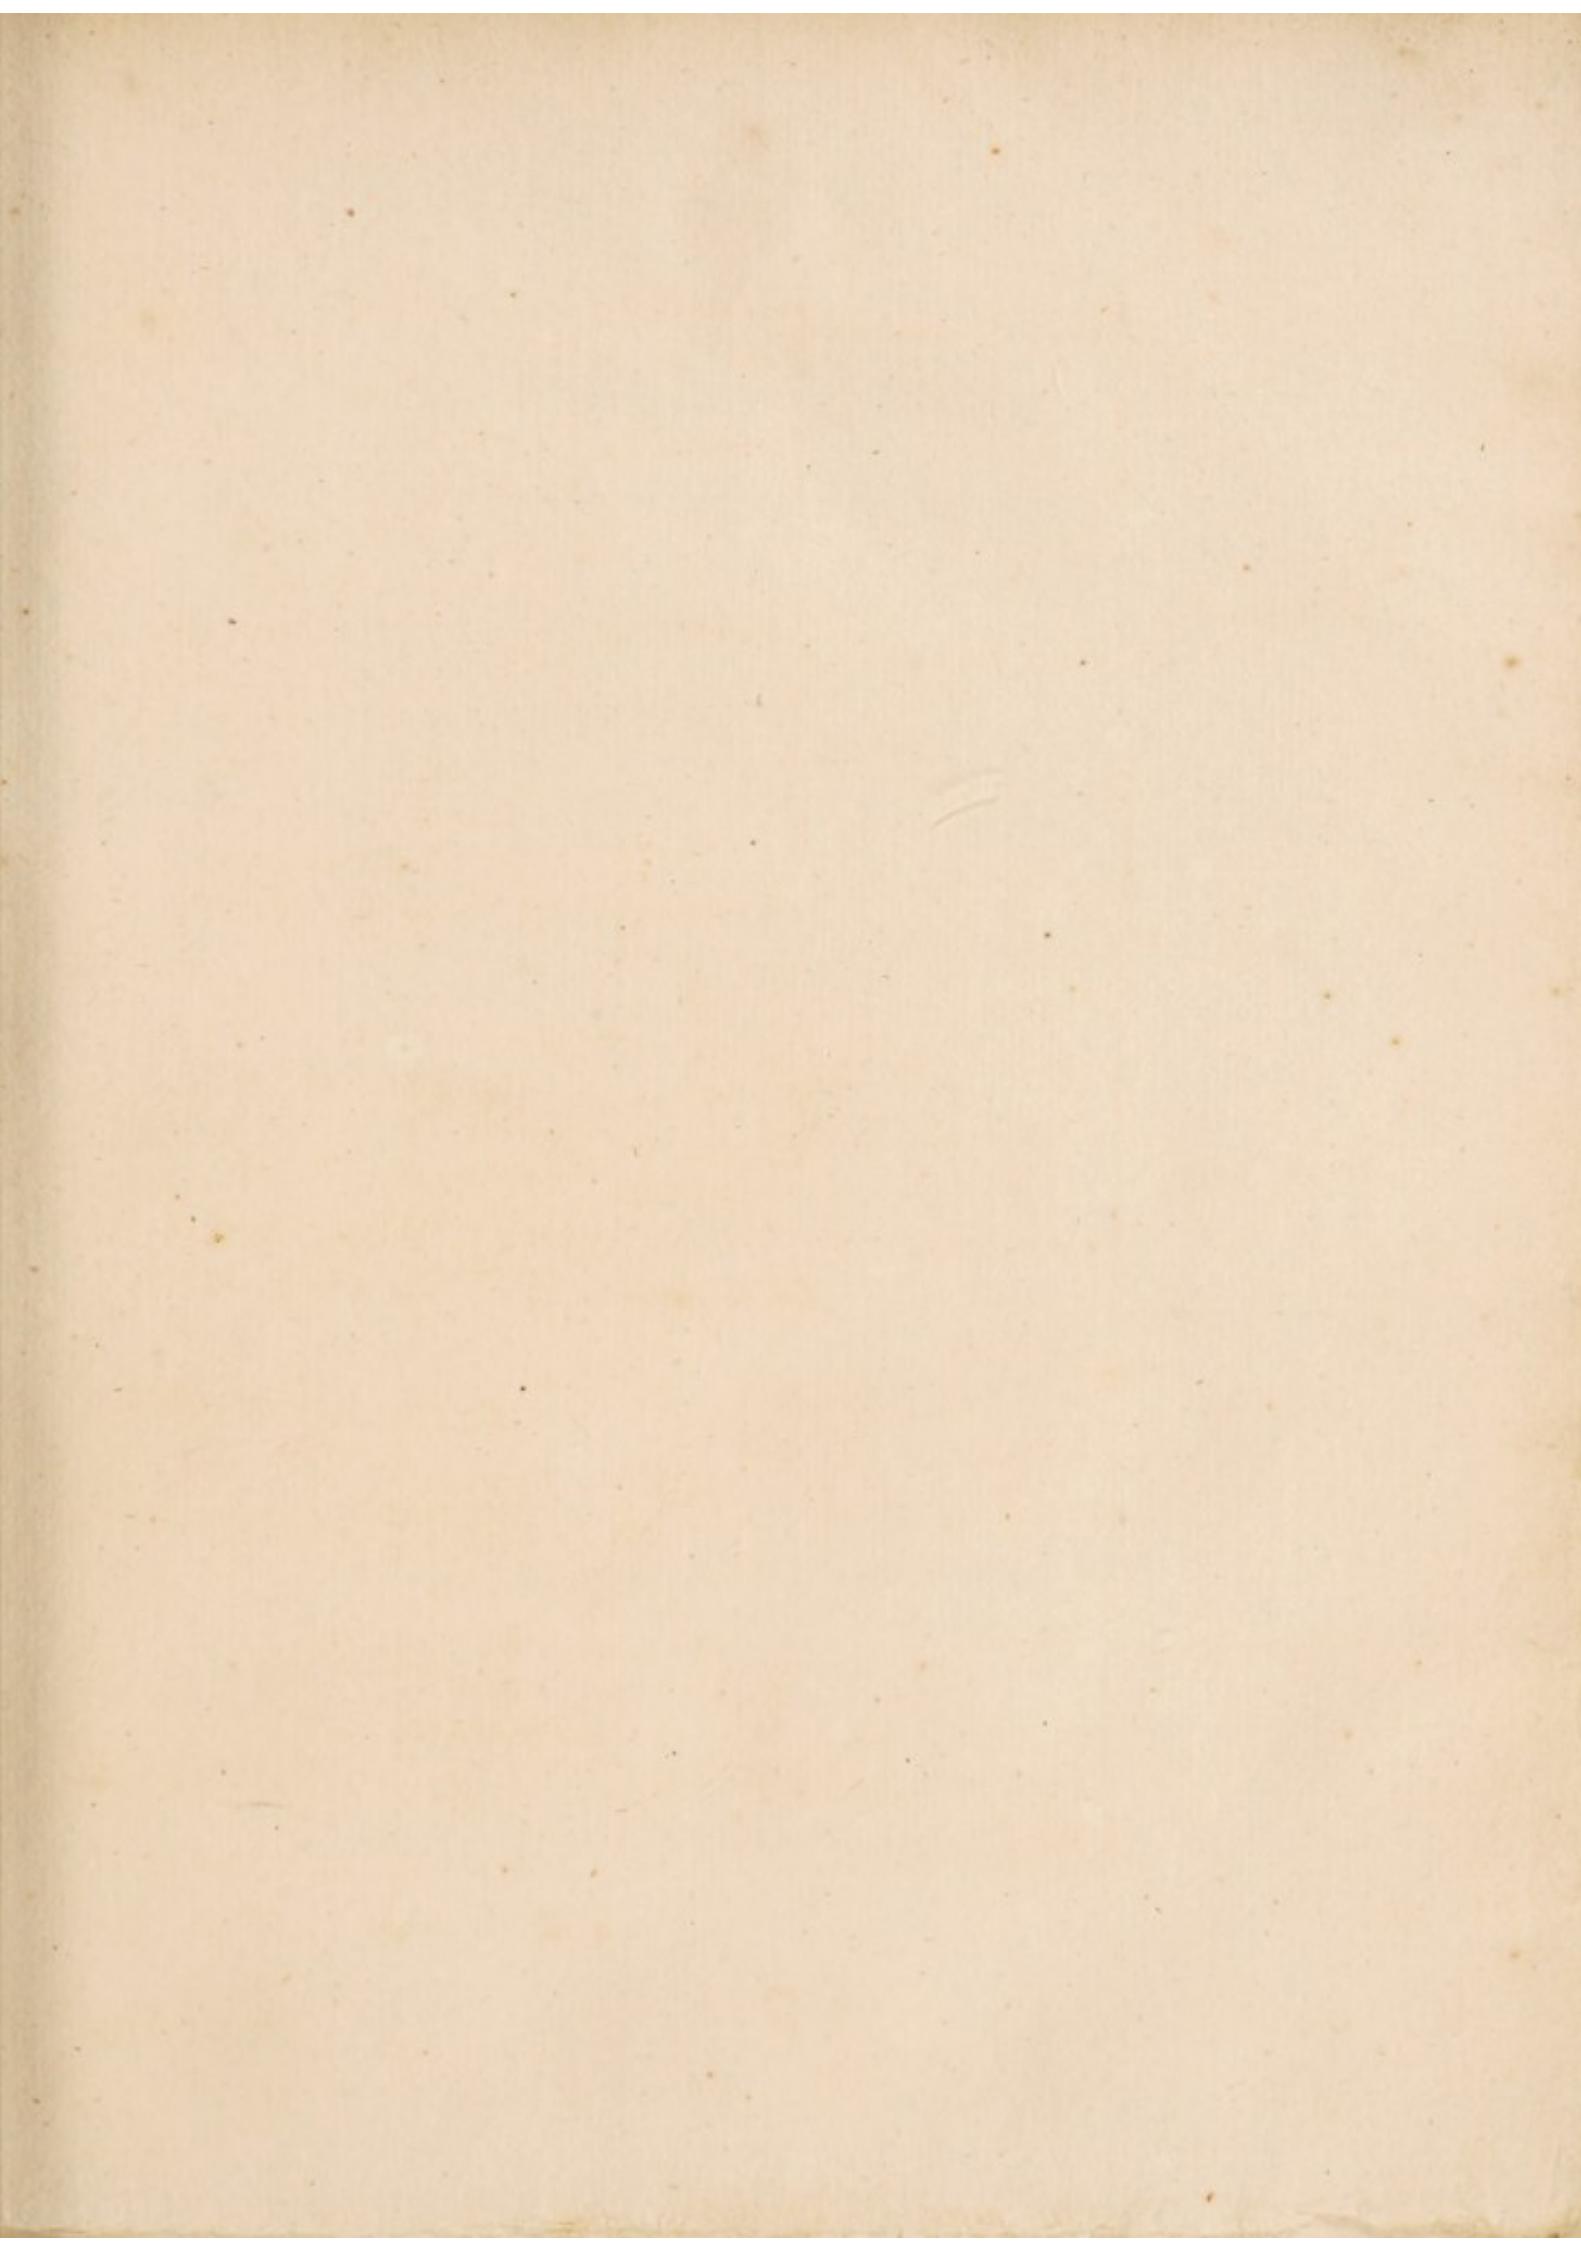

|           |       |  |
|-----------|-------|--|
|           | Caput | { Cranium.<br>Faëies.                  |
| Sceleton. |       | { Truncus.<br>Artus.                   |
|           |       | { Frontale.<br>Ethmoeides.             |
|           |       | { Parietalia, duo.<br>Temporalia, duo. |
|           |       | { Occipitale.<br>Sphænoeides.          |

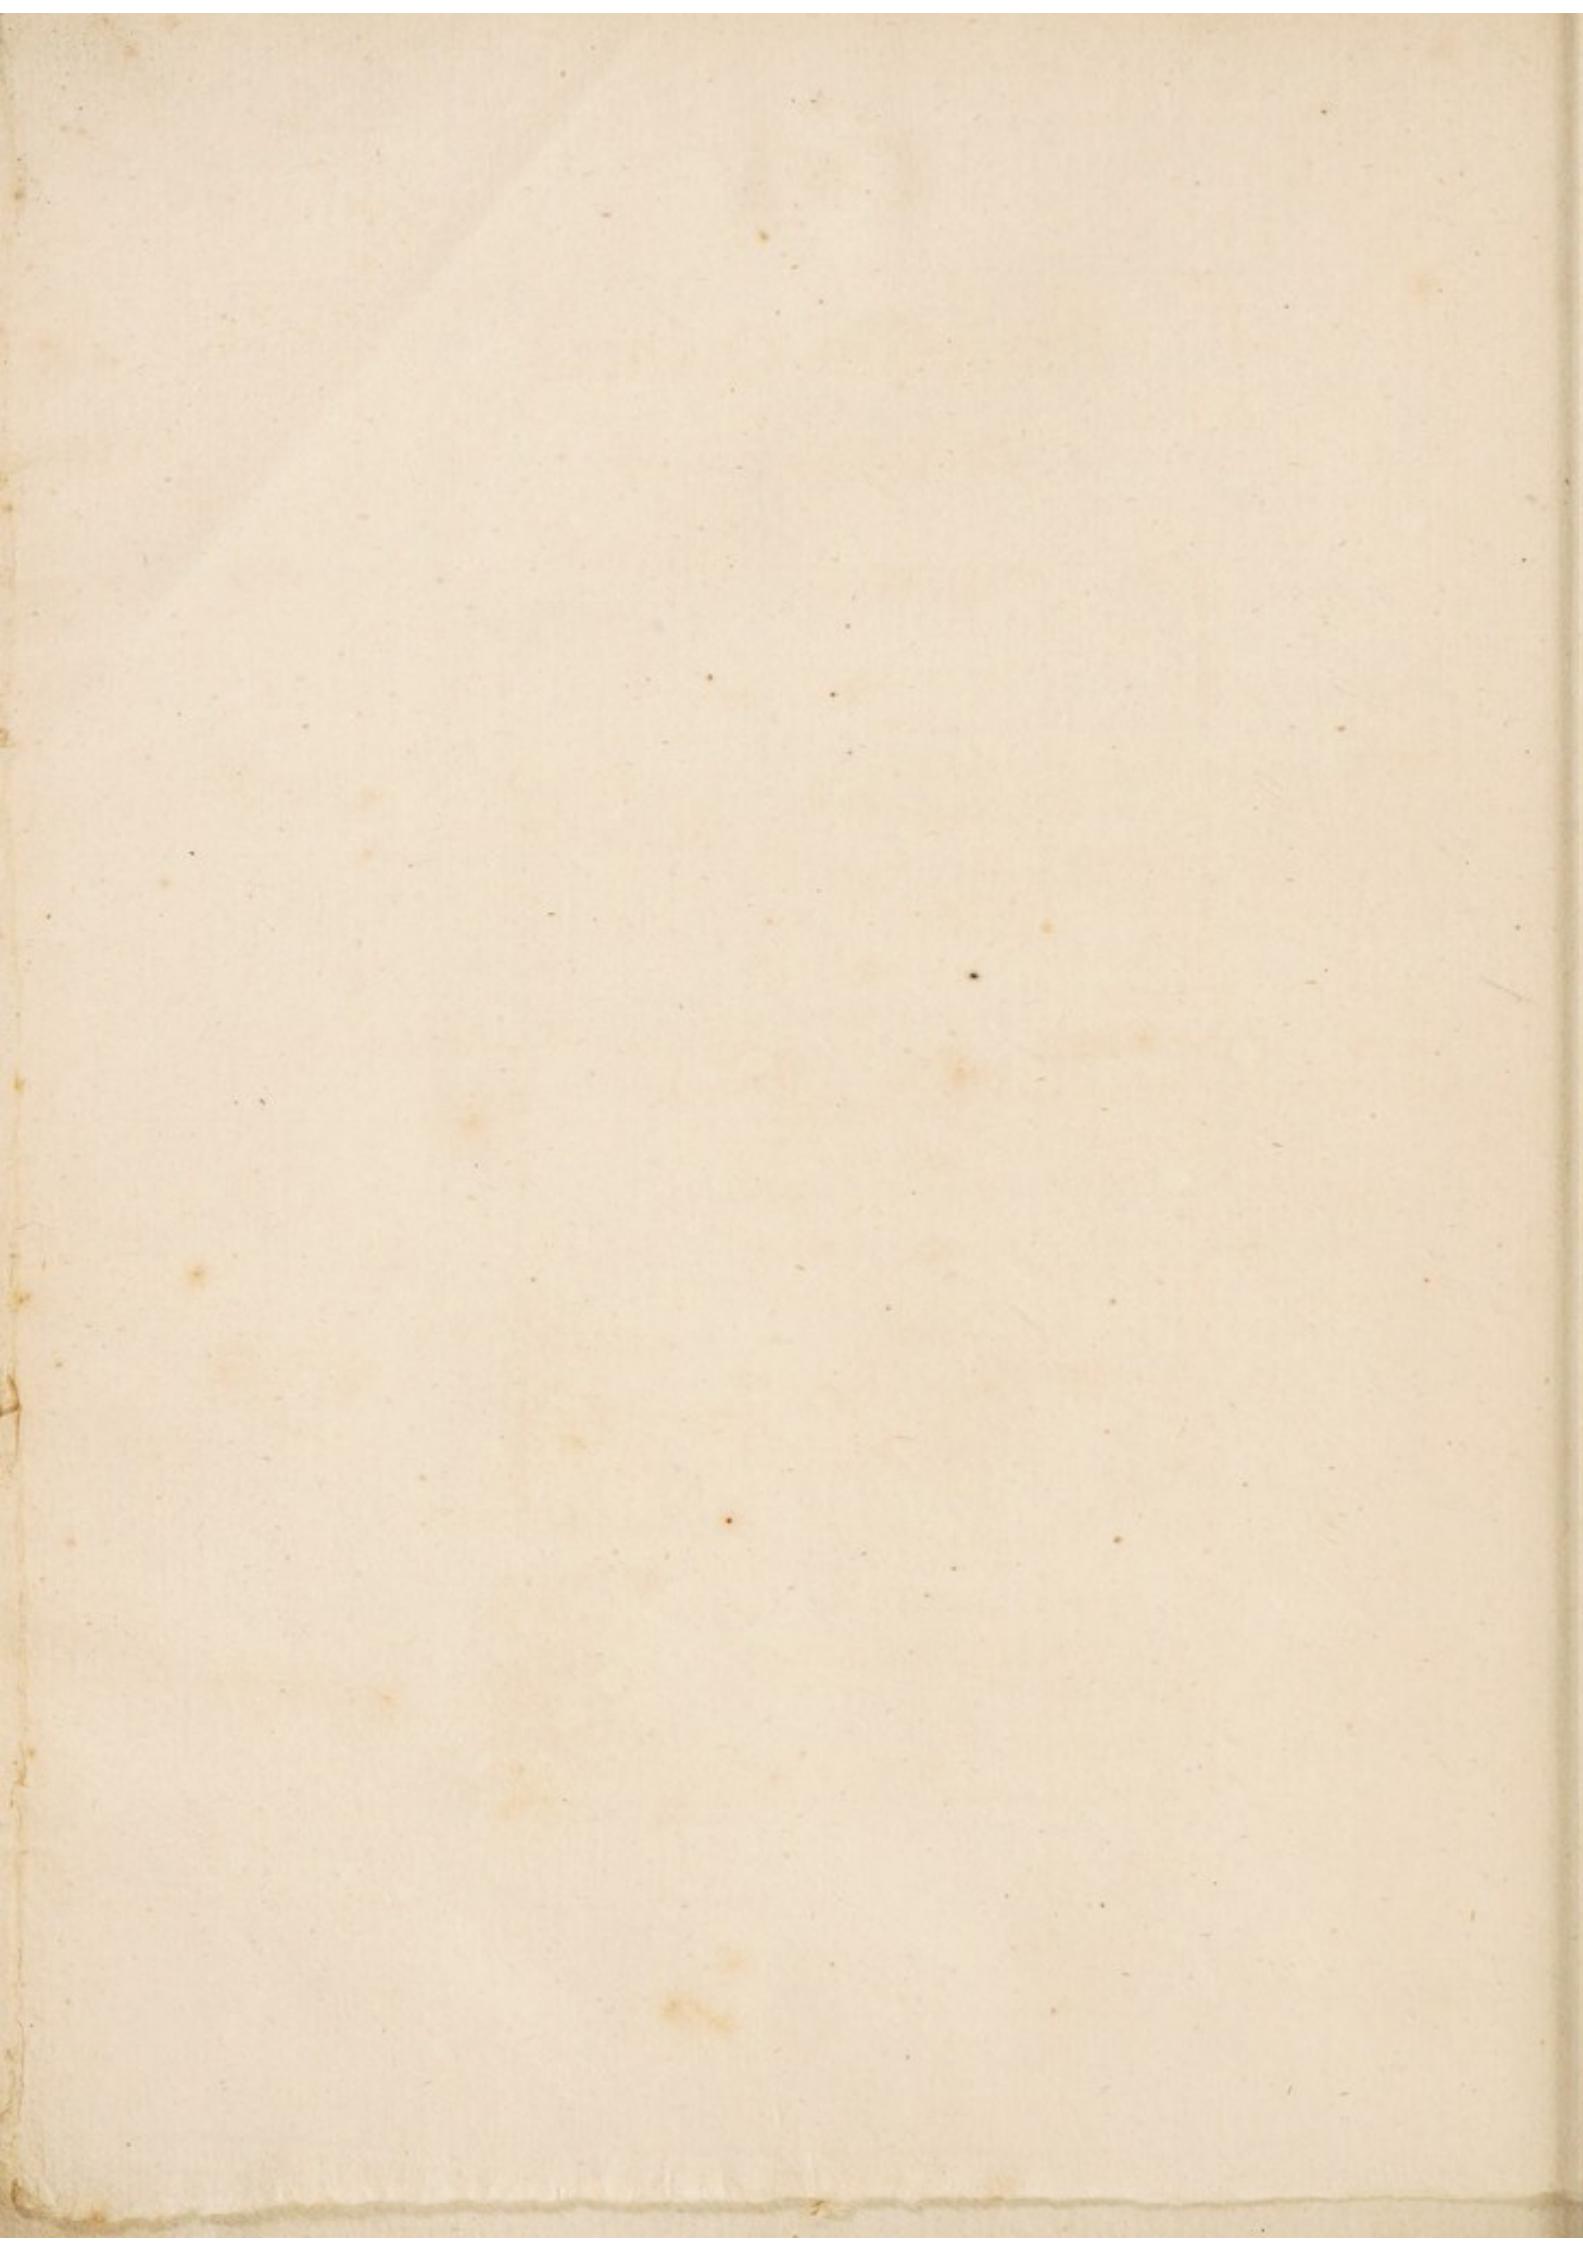

**Diaplectrosis**,  $\delta\alpha\pi\phi\nu\omega\sigma$  articulus when the Articulation is loose & soft.  
**Evacleros**. When y<sup>e</sup> head of y<sup>e</sup> Bone is large & enters into a deep cavity, as y<sup>e</sup> thigh & Ischium.  
**Acoepidio**, when y<sup>e</sup> head y<sup>t</sup> puts but a little forward is inserted in a shallow cavity as y<sup>e</sup> Os Humeri to Scapula  
**Glyptop**. When 2 Bones mutually receive each other in y<sup>e</sup> cavities & Eminencies.  
**Ginglimus primus**. When one Bone is received by another single Bone, & at the same time doth receive itself another, as you find in the Elbow bone & Arm.  
secured w<sup>s</sup>. When one bone receives another, & at the same time is rec<sup>d</sup> by another Bone, it did not receive itself, as in y<sup>e</sup> Vertebrae. A Vertebra receives y<sup>e</sup> w<sup>s</sup> is below, & is rec<sup>d</sup> by y<sup>e</sup> w<sup>s</sup> is above.  
**Tertius**. When the part turns upon an Axis, as the first Vertebra of y<sup>e</sup> neck w<sup>t</sup> y<sup>e</sup> second.  
**Eurodotos** is made for y<sup>e</sup> strengthening of y<sup>e</sup> Bones, y<sup>t</sup> are intended only for a small motion  
**Eurotopos** When Bones are joined by y<sup>e</sup> intermediation of a ligament, as y<sup>e</sup> wrist, Tarsus, Hyoides  
**Euroxosopos**, when by y<sup>e</sup> mediation of a Cartilage as y<sup>e</sup> pubis.  
**Sutura**,  $\pi\delta\phi\eta$ , when Bones are joined like y<sup>e</sup> teeth of saws.  
**Harmonia**, when by straight or oblique lines, like those of the face.  
**Eupros** y<sup>e</sup> Union of 2 Bones; as y<sup>e</sup> Os frontale  
**Tropo**pos, as the teeth in y<sup>e</sup> Joints.

The Bile assists digestion in uniting the Aqueous & Oily parts ye Elements like Soap & Water. F. N.

Pancreas has another use besides discharging a Juice to attenuate the Elements for Chylification, it is a discharge or purging of the vitiated parts of the Blood. The accidental use it is of in a Diarrhoea; this use is common to the Pancreas & the other Glands of the Intestines.

Digestion is breaking y<sup>e</sup> Molecules of the Alim<sup>ts</sup>, into such minute parts that they may enter y<sup>e</sup> Lactals. The Saliva, Sucus of the Glands in y<sup>e</sup> Stomach, y<sup>e</sup> Liquors we drink; the ranifying Heat of y<sup>e</sup> Stomach, the prepare of its vermicular Motion contribut to this End. Therefore viscid Liquors are bad, as well as spirituous ones. Tho sometimes they assist digestion by irritatin the Muscular Coat of y<sup>e</sup> Stomach to a stronger contraction. Kiel.

D<sup>r</sup>. Petean computes y<sup>e</sup> muscular force of y<sup>e</sup> Stomach to be = 17088 lb to w<sup>z</sup> being added y<sup>e</sup> absolute force of y<sup>e</sup> Diaphragm & abdominal Muscles the sum will amount to near 250734. This force of the Muscular Coat of y<sup>e</sup> Stomach is near 40 times greater than w<sup>z</sup> Borelli assigns to y<sup>e</sup> Heart & D<sup>r</sup>. Kiel has undertook to Demonstrate that force not to be thrice as many as Borelli computes to be 1000 p<sup>ds</sup>. It is plain y<sup>e</sup> abdominal Muscles & Diaphragm do not dissolve y<sup>e</sup> Liver & Viscera. D<sup>r</sup>. Deake supposes Digestion to be formed as in Papin's digestor; or tho' highly improbable yet it acc<sup>ts</sup> for the Bits of Bones and tearing y<sup>e</sup> Stomachs of Dogs.

Grauivorous Birds have two Stomachs y<sup>e</sup> first moistens, ye other grinds the element by y<sup>e</sup> assistance of little Stones. Snakes, some Birds & several kinds of fish seem to perform digestion by a Mastication, as they swallow their prey whole. In Horses & Oxen, It seems to be performed by

Oritur a Spasmo.

Ventriculi Tunica Villosa. This coat according to F. N. is suppose to be glandulous, & is a different one from that commonly taken notice of; for that only contains  $\text{g}$  Solitary Glands both in the Stomach & Guts. Their use in  $\text{g}$  Stomach he supposes to be to discharge a Lymph to soften the Aliment, by  $\text{en}$  means it is render'd more capable of being communicated by Tinctures B. No Purgs in the Stomach distended Thro these glandous Glands in the Intestines is discharged the aqueous humour that comes away by purges. F. N.

Mucus Intestinorum. Cowper supposes a Mucus secreted from Glands on the internal surface of the Peritoneum is lubricates them in their Peristaltick motion. Tho' a Dropsy proceeds frequently from the Rupture of Lymphaticks in the Abdomen; he thinks it not unlikely it should sometimes be occasion'd by large Exudations Thro these Glands in the Peritoneum seems much thickend at such a time.

**Renes** The right kidney placed lower in Men, than  
in Dogs. p. 2. The vein accompanies the artery within in  
Man, In Cats <sup>it</sup> is out. The exterior part is network; but change  
their circular into a serpentine progress. Next <sup>to</sup> <sup>the</sup> in these  
are some membranous tubes <sup>or</sup> which seems to proceed in a right  
line from <sup>the</sup> sides of the capillary arteries, these are the ex-  
cretory ducts or tubuli Belliniani, at their extremities they  
join & form 12 papillæ, these are only the end of <sup>the</sup> Ducts  
& not Glands as Eustachius believ'd. The Pelvis is of dilata-  
tion of <sup>the</sup> ureters <sup>or</sup> ends of 12 Membranous fistulas.  
**The Papilla.** M. p. 6. Malpighius says these are small bodies  
of a round figure annex'd to <sup>the</sup> ends of <sup>the</sup> arteries & joined to  
<sup>the</sup> tubuli Urinarij by proper Ducts <sup>or</sup> he supposes to biglands  
secretory of <sup>the</sup> urine, these Augsch denies.

Those glands <sup>which</sup> discharge a liquor at distant intervals  
have outlets, <sup>or</sup> are membranous follicles. The  
3 coats are not distinguishable; a nervous membrane  
whose inside is lined to mucous glands.

The longitudinal fibres of <sup>the</sup> Vesica Urinaria are  
from <sup>the</sup> os pubis: by these may the Fundus be pulled down  
by <sup>the</sup> oblique its cavity may be exposed.

Two fleshy productions pass from <sup>the</sup> ureters & join  
in being press'd by <sup>the</sup> urine close the orifices & open into  
the Vesica. N. Ranby discovered two Seminal arter-  
ies passing from <sup>the</sup> Glandula Prostatis. v. Ruttly.

When  $\text{g}^e$  Musculus Pyramidalis pulls down  $\text{g}^e$  Umbilicus  $\text{g}^e$  Ligamentum Vesico is relax'd,  $\text{g}^e$  vesica approaches more to a sphere &  $\text{g}^e$  Expulsion of Urine is most assisted.

Glandulae Renales are not proportionately larger in  
children than in Adults. F. N.

Castration may be performed by cutting the Vasa de-  
ferentia. Z. W. Then can become at Semen after it  
is duly elaborated & secreted. No vessels appear for its  
Conveyance. F. N.

Urettra. In superioro urethre, pariete multa interius pec-  
cunaria Foramina in eadem recta linea secundum Urettra  
longitudinem disponuntur. Ipsa liquorim emittant subalbiti-  
dum & crassissimum, consistente ist ex Mucosis Cowperi plan-  
dulis excretum. Progredi oblique sursum, ne aliquid Semini-  
ni & Urine inticeperint. Inferior Foraminum pars eadem  
membranâ, quâ Urettra, obducitur. Turgidibus Spongiosis Ure-  
thrae Corpore & Pene corporibus forte exprimitur. Liquor  
eodem processus modo subrotunda corpora in Multib[us] Urettra  
conspiciuntur. Methodus inveniendi hoc paroula forami-  
na. Aperita secundum longitudinem Urettra super-table  
lam sic extendatur, ut nihil digitis exprimat, nihil  
abstegat, sole vel praecara luce vane admixta, tum  
alba quedam vascula expectentur. v. Moszay.

Tres Cowperi, circa dorsi quadrantem infra prostatas  
duas alias glandulas minores, figura Ovalis depresso,  
magnitudines Phasolum quartes, utring[us] a latere Ure-

hore, aliquanto supra bulbum corporis cavernosi  
ejus locatas observeavi. Amotis musculi acceleratoris  
partibus superstantibus utring<sup>z</sup> urethra tactui sese offecunt  
duo corpora dura, quae sunt ha<sup>m</sup> glandulae. Tertia  
glandula in angulo curvatura<sup>r</sup> urethrae sub ossibus pubi  
in ea parte Perinei, que Ans adjaicit. Ut felicius  
quis hanc glandulam investiget, corpus cavernosum  
secundum longitudinem incidentem usq; fere ad  
membranam urethrae internam, tum corpus cavernosum  
caute a membra<sup>n</sup> separandum, quod dum fit, in  
dicto loco sese ostendit glandula. Ductuum excre-  
torium ostiola querenda in urethra circa digiti  
quadrantem infra priores. v. Coup. de gland. nos.

Compreſ-

Cot. Lower supposes the Mitral & Tricuspid  
Valves are relaxed in the Systole of the Heart & by their  
rising up stop up the passages of the Veins. W<sup>r</sup>. Coopers catha  
supposes these valves to be drawn downwards. Bidloo  
has given a very good Description of the Heart. Tab:  
22. Fig: 7.

# Muscle Intercostales

Interni are in Number eleven on each Side, arising from y<sup>e</sup> upper edge of each inferior rib, & inserted into y<sup>e</sup> lower edge of each immediately above it: the course of their fibres ascending obliquely forwards. But we have observed y<sup>e</sup> some parts of these Muscles lying next y<sup>e</sup> vertebræ, pass over y<sup>e</sup> rib immediately above y<sup>e</sup> origin & are inserted into y<sup>e</sup> next as represented. These seem to depress y<sup>e</sup> ribs. Externi. Are equal in N<sup>o</sup> to y<sup>e</sup> Interni. They arise from y<sup>e</sup> lower edges of y<sup>e</sup> upper Ribs & descending obliquely forwards are inserted into y<sup>e</sup> upper Edge of y<sup>e</sup> Rib next below, their fibres decussating those of y<sup>e</sup> internal order. The Scratores Costarum arising from y<sup>e</sup> transverse Processes of y<sup>e</sup> Vertebrae of y<sup>e</sup> Back, & are inserted into y<sup>e</sup> upper Edge of each Rib except y<sup>e</sup> first; we esteem these as parts of those external Intercostals. These appear internally by separating y<sup>e</sup> pleura <sup>on</sup> your Fingers. Vid Coop: Myotomia.

Westwood's R. small  
in coloration like a small  
flock of birds in the sky. The wings  
are black with white patches.  
The tail is long and deeply forked.  
The body is slender and the legs  
are long and thin. The feet are  
yellowish brown with black claws.  
The bill is long and slender.  
The feathers are soft and downy.  
The voice is a sharp chirping.  
The nest is made of twigs and  
leaves and is lined with fine grass.

Pterygoeidæus externus.  
Pterygoeidæus internus.

### Glandulæ

Os Hyoideus is joined to  $\gamma$  Tongue & Larynx, therefore  $\gamma$  Muscles  $\omega$  move it ought to be esteemed common to both.

Sternohyoideus. Origin, internal part of  $\gamma$  clavicle, Insertion the Basis of  $\delta$  forebone of Os Hyoideus, this pulls  $\delta$  Os directly downward.

Coracohyoideus. Origin. Superior costa of  $\delta$  Scapula  $\omega$  acting under  $\gamma$  Mastoides, becomes tendinous, grows fleshy again, & is inserted into  $\delta$  forebone of  $\gamma$  Os Hyoideus. Action. This pair assists  $\delta$  former in pulling  $\delta$  Bone tongue & Larynx downwards & <sup>upwards</sup> ~~forwards~~.

Stylohyoideus. Origin Procesus Styloides, Insertion os Hyoideus. Sometimes divided for  $\gamma$  papage of  $\gamma$  Digastricus thro' it. These Muscles  $\omega$   $\gamma$  Stylo glossi & Stylopharyngei acting on each side draw  $\gamma$  Os Hyoideus, Tongue & Larynx, whereby  $\gamma$  masticated Alim. is not only compressed into  $\delta$  Latus, but  $\gamma$  Epiglottis depressed, exactly covers the Rima of  $\gamma$  Larynx.

Mulohyoideus. Origin Maxilla inferior near  $\delta$  Dentis molares. Insertion os Hyoideus. Action to move  $\gamma$  Os tongue & Larynx upwards & forwards. This Muscle precesses glandula sublingualis,  $\omega$  lie immediately under  $\gamma$  on each side.

Geniohyoideus. This pair is short, thick & fleshy. Origin chin. Insertion, superior part of  $\delta$  forebone of  $\gamma$  Os Hyoideus. These pull the Os Hyoideus  $\omega$  upwards & forwards & assist  $\gamma$  Genioglossi in thrusting  $\delta$  tongue out of  $\gamma$  mouth.

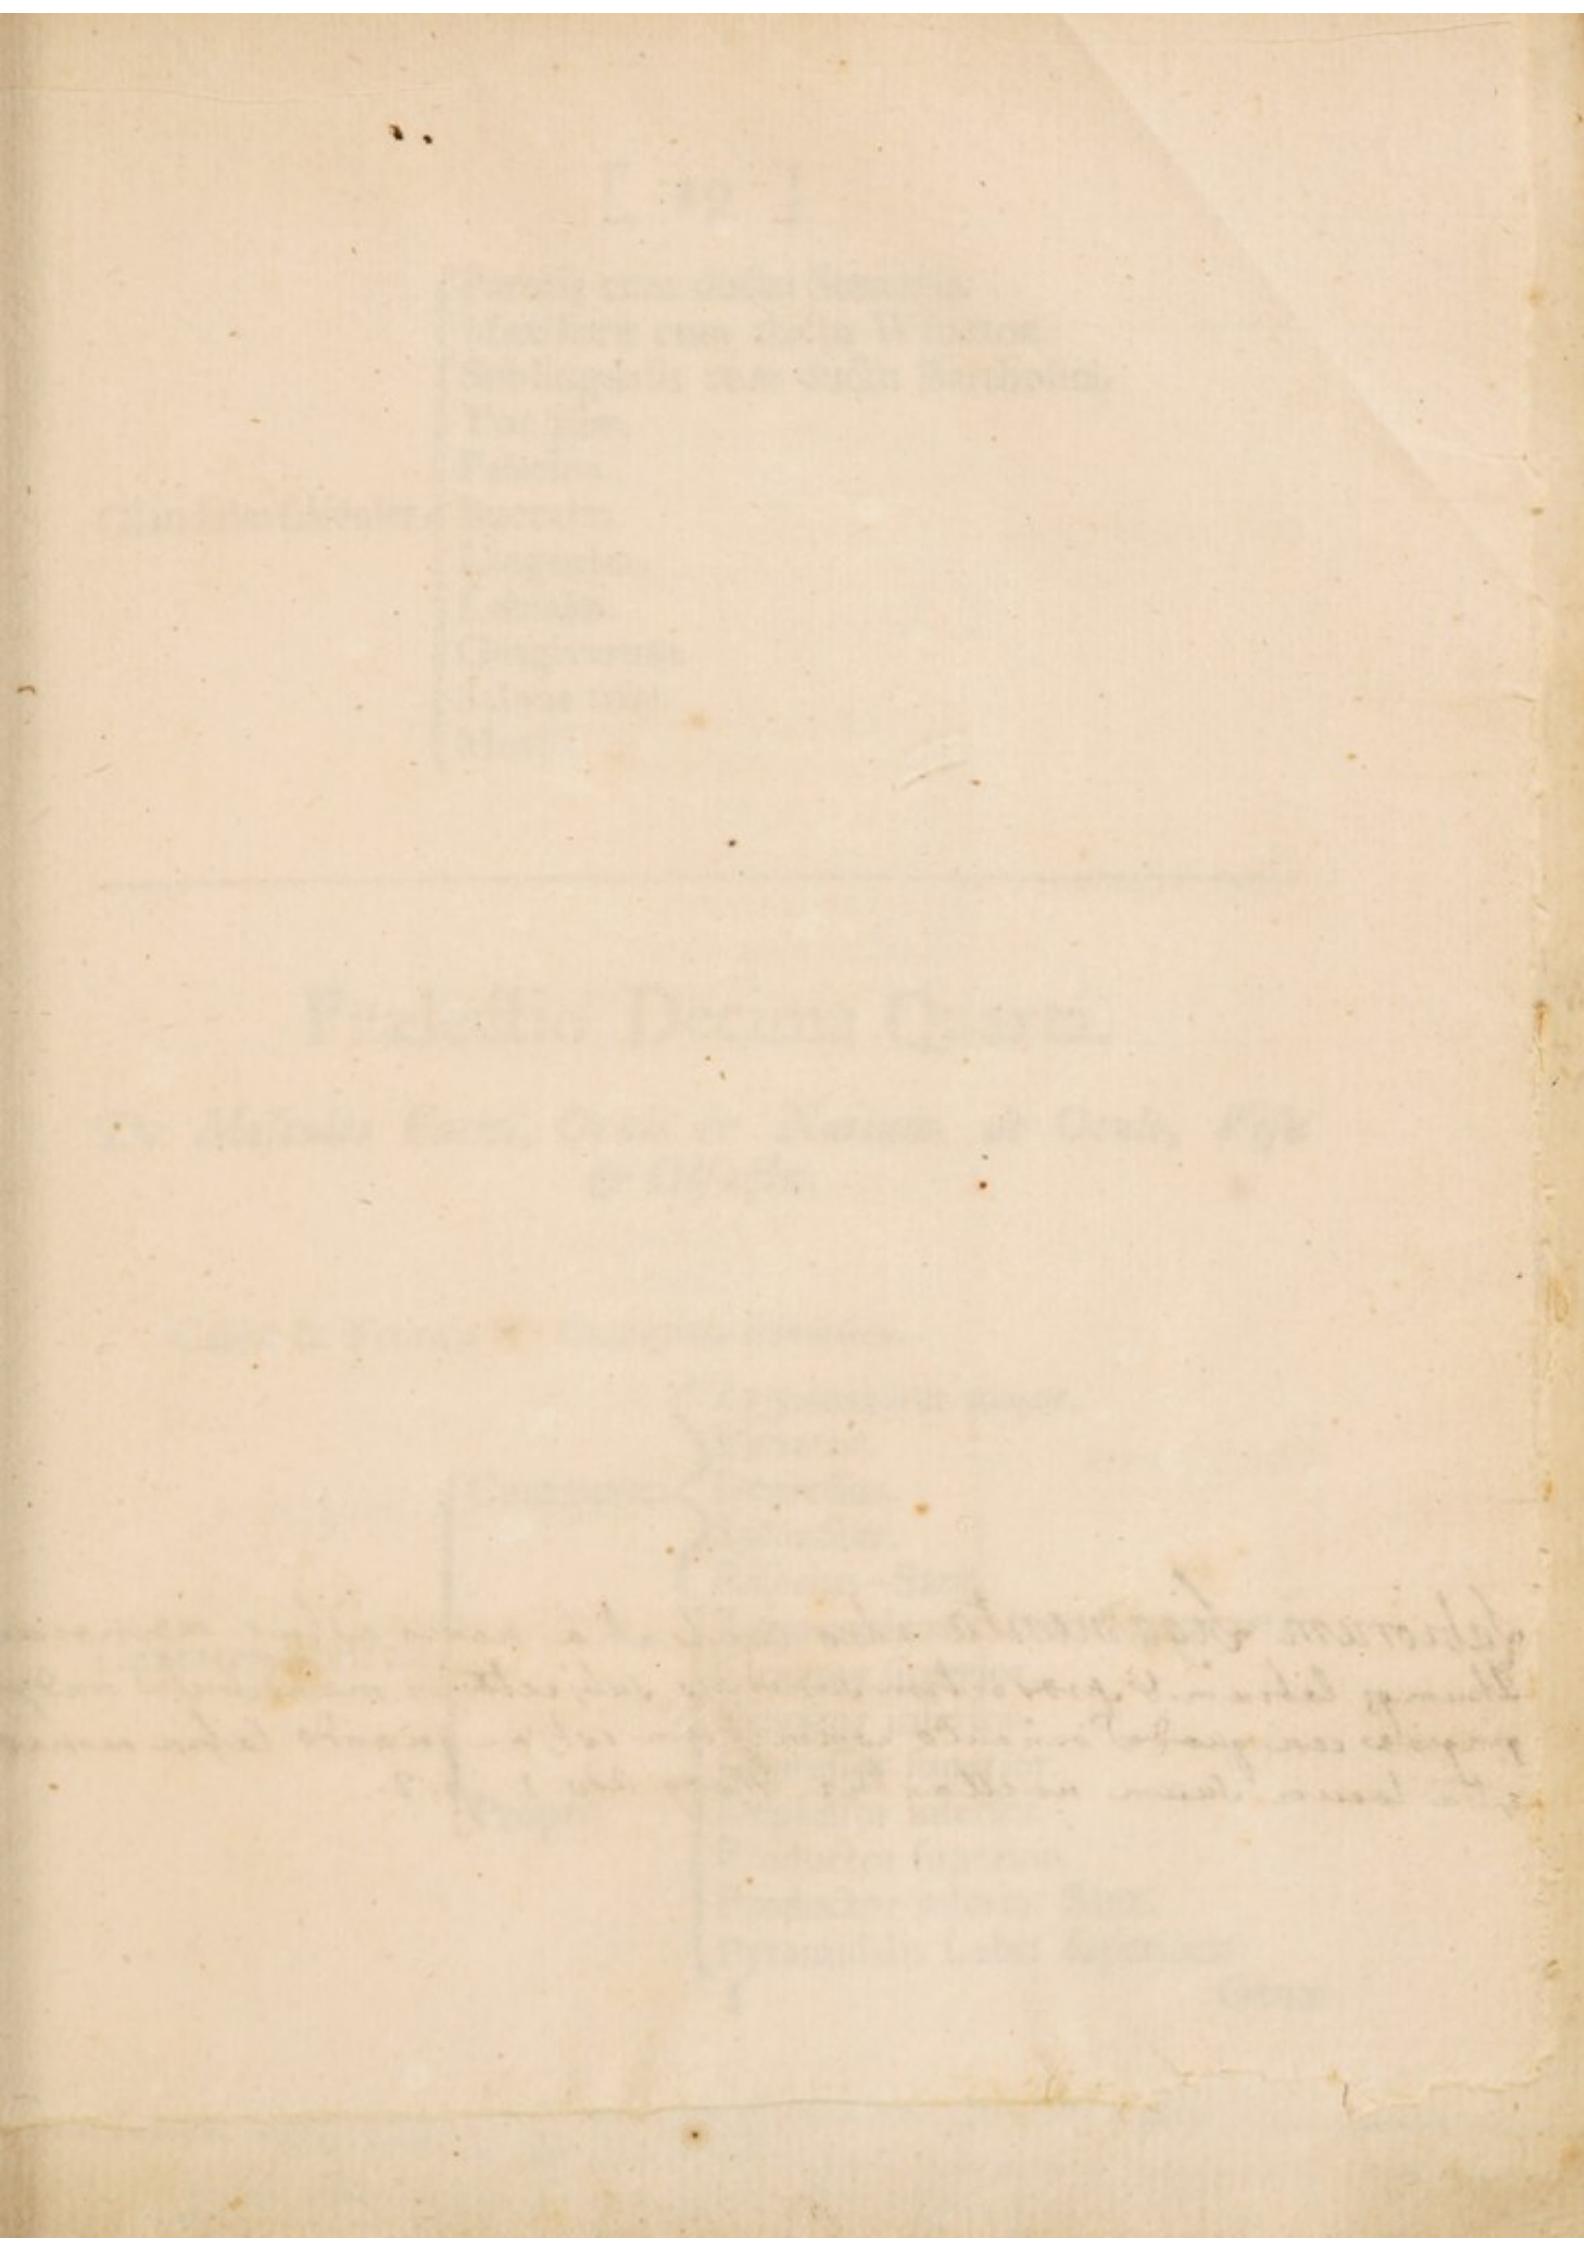

Genioglossus. This pair have a fleshy Origin from  $\gamma$  forepart of  $\delta$  lower Jaw internally, inserted into  $\delta$  middle part of whole body of  $\delta$  tongue. By  $\gamma$  action of  $\delta$  different series of Fibres of these Muscles  $\delta$  Tongue is either drawn in or out of  $\gamma$  Mouth.

Ceratoglossus. Origin, upper part of  $\gamma$  Os Hyoideus laterally. Insertion,  $\gamma$  Root of  $\delta$  tongue. Use These Muscles acting together draw the tongue into  $\delta$  mouth directly, if one acts alone, it draws it on one side.

Styloglossus. Origin, Apex of  $\gamma$  processus Styloides inserted into  $\gamma$  root & side of  $\delta$  tongue. This pulls  $\delta$  tongue upwards & inwards in deglutition.

Basioglossus. The Fibres of this Muscle at  $\gamma$  origin are from  $\gamma$  Basis of  $\delta$  Os Hyoideus & are intersected by  $\gamma$  hinder

parts of y<sup>e</sup> Gen<sup>i</sup> glops; but afterwards paps distinctly according to the length of the Tongue to its tip. N.B. Couper questions the existence of this pair in his former Edition.

labiorum ligamenta adeo evidenter nemo adhuc memoravit  
quam latum & prossertum superius, subjecto in mandibulis medys  
gingiva ea quodam vinculo commixtam est, ne quando labia non in  
ipsa locum suum recollantur. Morg. Ado. I. p. 3.

Tab. ii. *Glandula Lacrymatis.* Bidloo takes  
F. 5<sup>o</sup> notice of 2 Lachrymal Glands. The first placed  
near  $\delta$  Internus Canthus, emits Excretory Ducts  
that are received into other smaller glands whose  
Orifices open into the internal part of the Palpebra.  
This secreted Liquid conveyed thro' small Tubes  
moistens the internal parts of the Palpebra & the  
exterior Bulb of the Eye. The other Bidloo calls  
the Glans Lacrymatis, w<sup>ch</sup> has 2 Excretory ducts  
convey the superfluous moisture of the Palpebra  
p. 194 into the foramina varium. Heil calls these Orifici-  
es puncta lacrymata. He says the Tears fall-  
ing from the Cornea are stopped by the under Eyelid,  
along w<sup>ch</sup> they run, till they fall into the puncta  
lacrymata. These lead to a small Vesica situate  
on the Os lacrymate; from whence issue a small  
Tube that pierces this Bone into the Nose. Chisel-  
den & Blanckard call the first the Lacrymal Gland.  
Cowper says in the former place on Bidloo, that  
in the Canthus Internus Impostumations happen  
that occasion Tisulas in the Eye. He gives di-  
rections for the cure of it.

The Orbicularis Palpebrarum <sup>Musculus</sup> *apaceas*  
draws the Eyelids together. Galen & the Ancients not  
knowing The Palpebrarum apieens rectus divided  
this into 2. Bidloo fell into this mistake tho' Fallopi-  
cavus long discovered it. v. Bidl: Tab: 12. Fig: iv. DD.

*Glandula Arytenoides* vel laryngi suum maxime interdum  
vel vociferandum exprimunt. Morg.

*Epiglottis foraminulis* per via & foras excavatae in equalibus, quibus  
iam aeti glandulam incipit, polipinae propius basim velutinosa est.

Arteria Nervi circulare secundatur Humor Aqueus. N. Liquor injectus penasit  
apne arteria in Cameram aquae humoris.

Sternothyroideus & Hyothyroideus. Hi Musculi  
in Basi Sutiformis Cartilagineis implantare dicuntur  
sed falsissime. Morg.

In Sternohyoides & Sternothyroideis  
Musculis tendinea ensenophores apparent.

\* Muscles of the Uvula. *Glossostaphylinus*  
discovered by Valsalva. Origin on each side of the Tongue  
near its Root; inserted by an expansion on the forepart  
of the Uvula. They bring the Uvula downwards.

*Spheno-staphylinus*. Origin, Process of the Os Sphenoides, inserted laterally into the posterior part of the Uvula. These draw the Uvula upwards & backwards; & hinders the Aliment from regurgitating thro' the foramina nasum in deglutition.

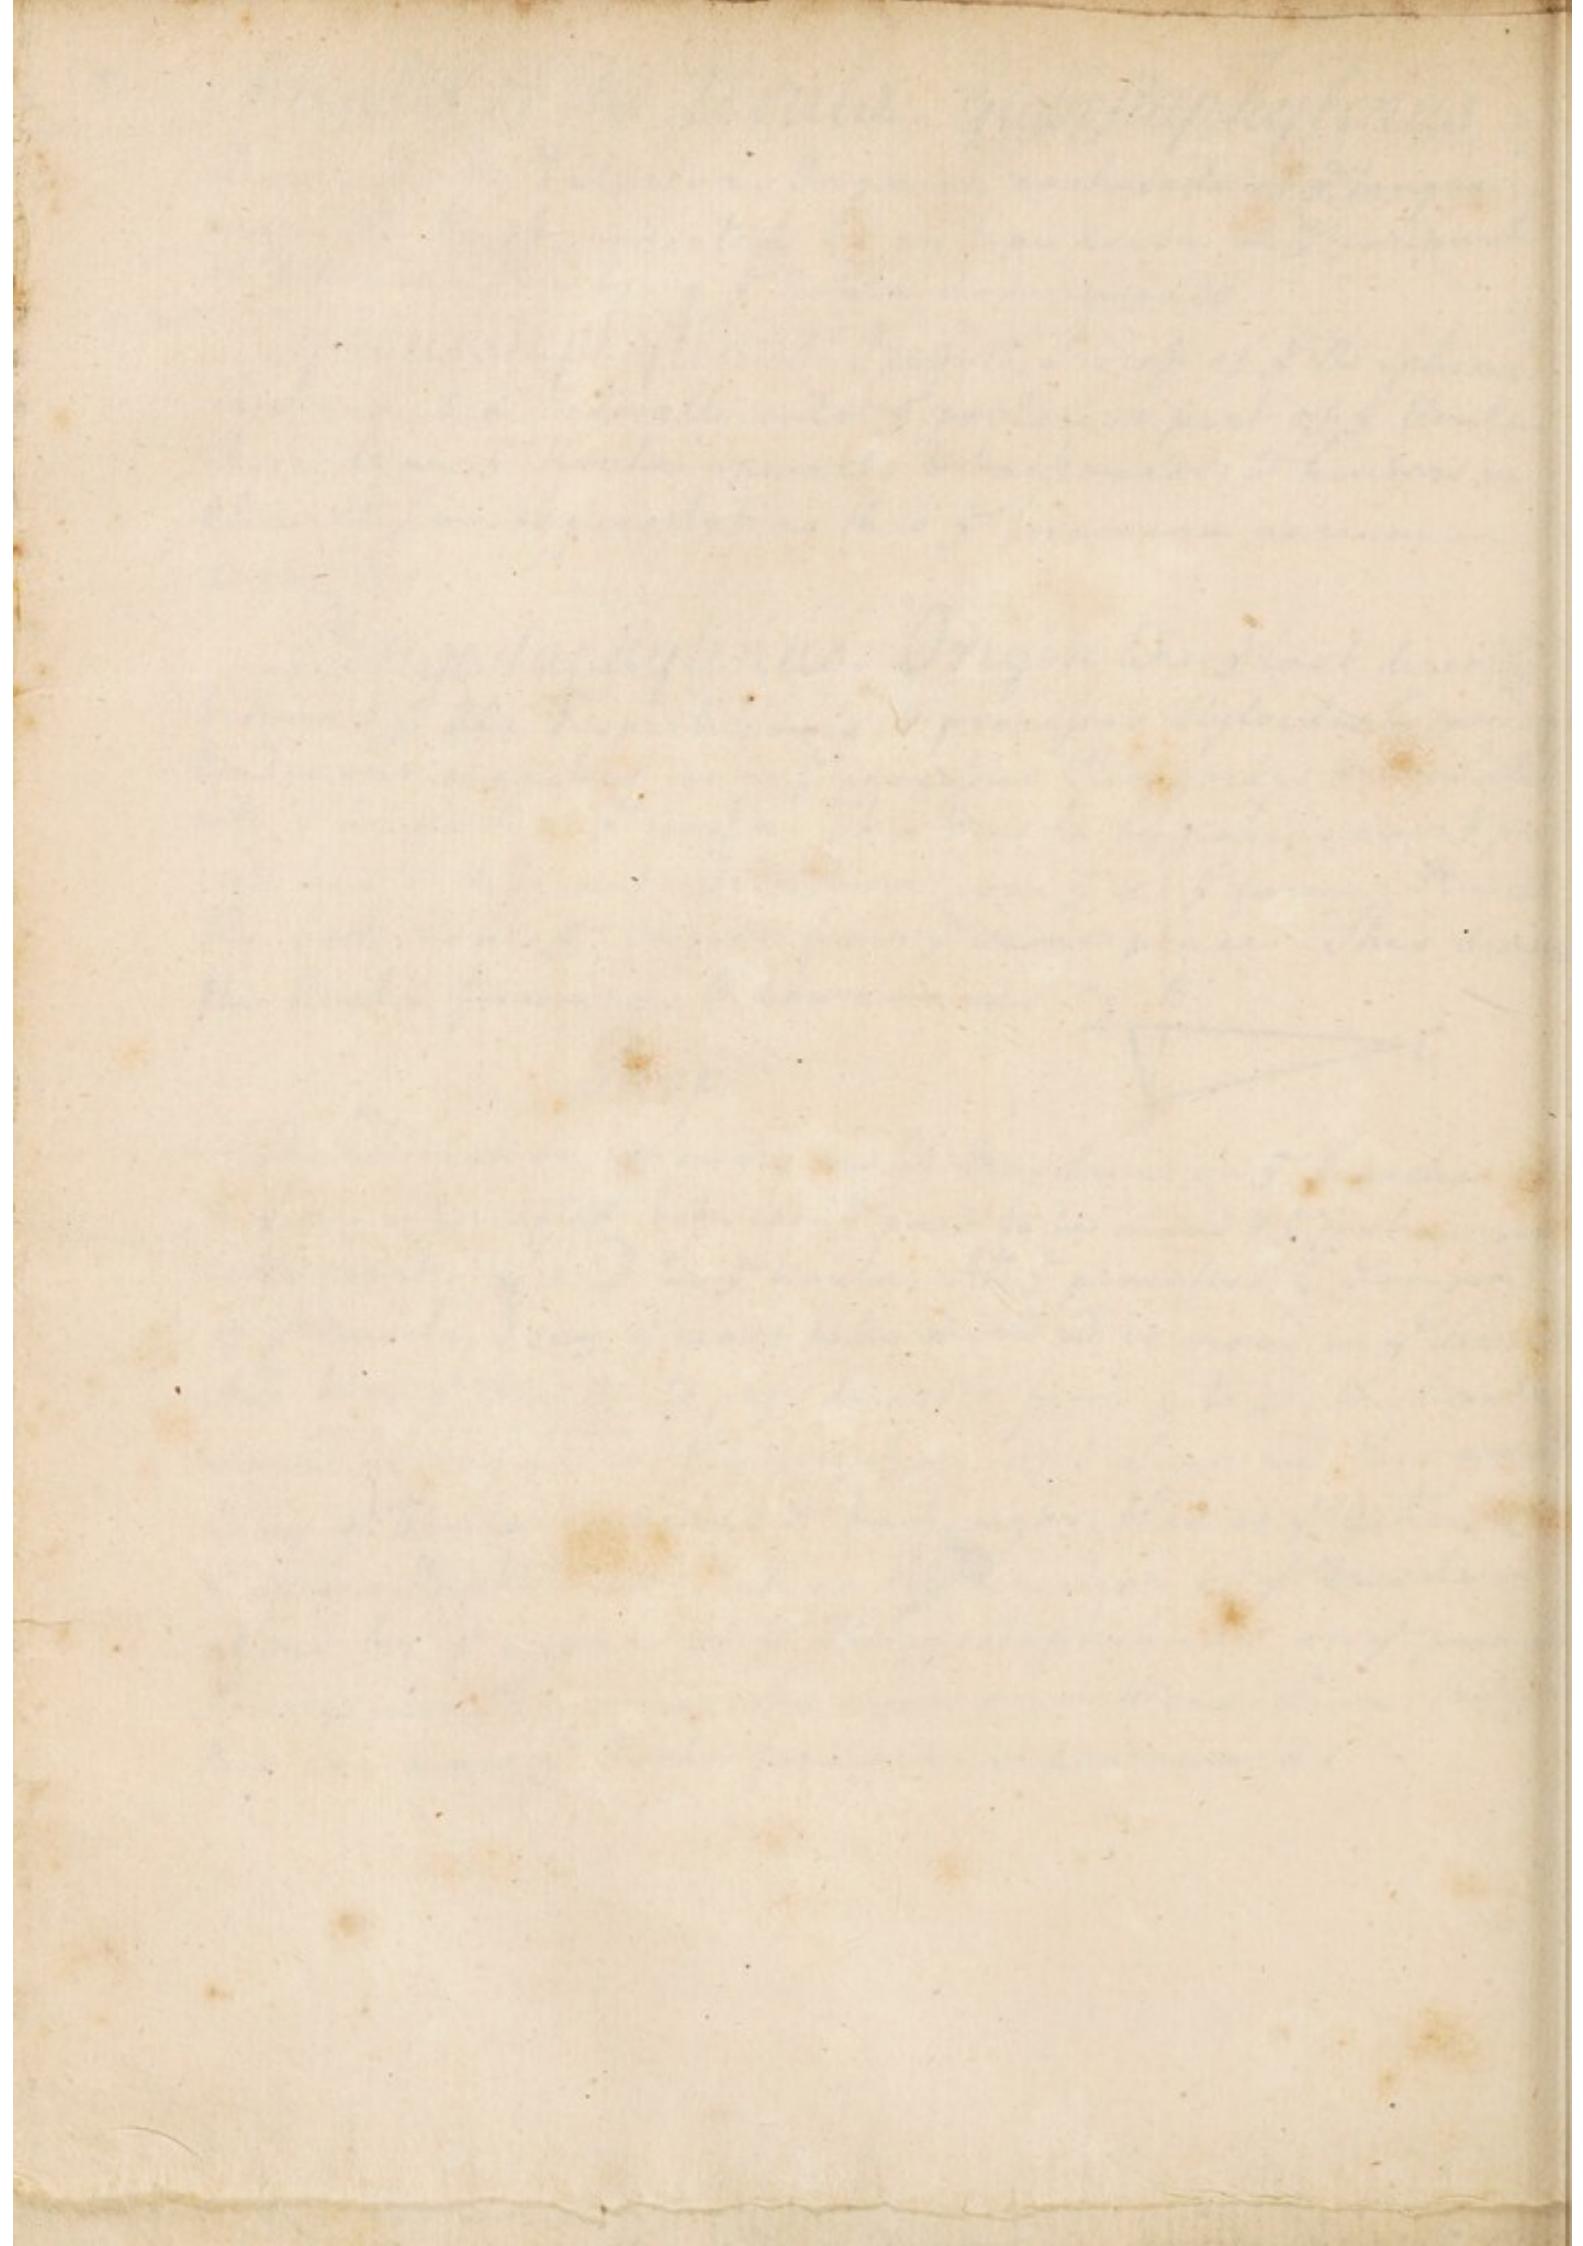

*Pterygostaphylinus*. Origin like the last, directly between the Ala Vespertilionis & processus Styloides, becoming tendinous marches over the processus Pterygoideus & is inserted into the forepart of the Uvula. This Muscle by passing over the processus has a different direction from that of the former Muscle tho' both have their origin from the same place. This draws the Uvula forwards & downwards.

Prop:

The Direction of every moved Muscle is in the direction of a Line intercepted between the part to be moved & the first immovable point. Let D be the Uvula, AB the processus, C the origin of the Muscle, I say the part to be moved D is moved in the direction AD. Was the Muscle to pass directly from C to D, the Uvula would be moved in the direction of the line CD, this would draw the Uvula upwards & backwards; this is the action of the Spheno-Staphylinus. But as the direction of the Muscle is altered by its passage of the Pterygostaphylinus on the processus Pterygoideus, tho' it has the same origin & insertion, therefore this can draw the Uvula forwards & downwards.

Praelatio Dicata.

Partes

Sebaceo. Nympharum Glan-  
dula extiterunt at glandulae in  
hominiis preputio. v. Morg.

Partes Externæ

Vagina. Corpus Glandulosum  
or part Analogous to ~~prostata~~:  
Prostate in Men & widd. Bidl:  
Gab: 51. Fig: 3. Cl: 2.

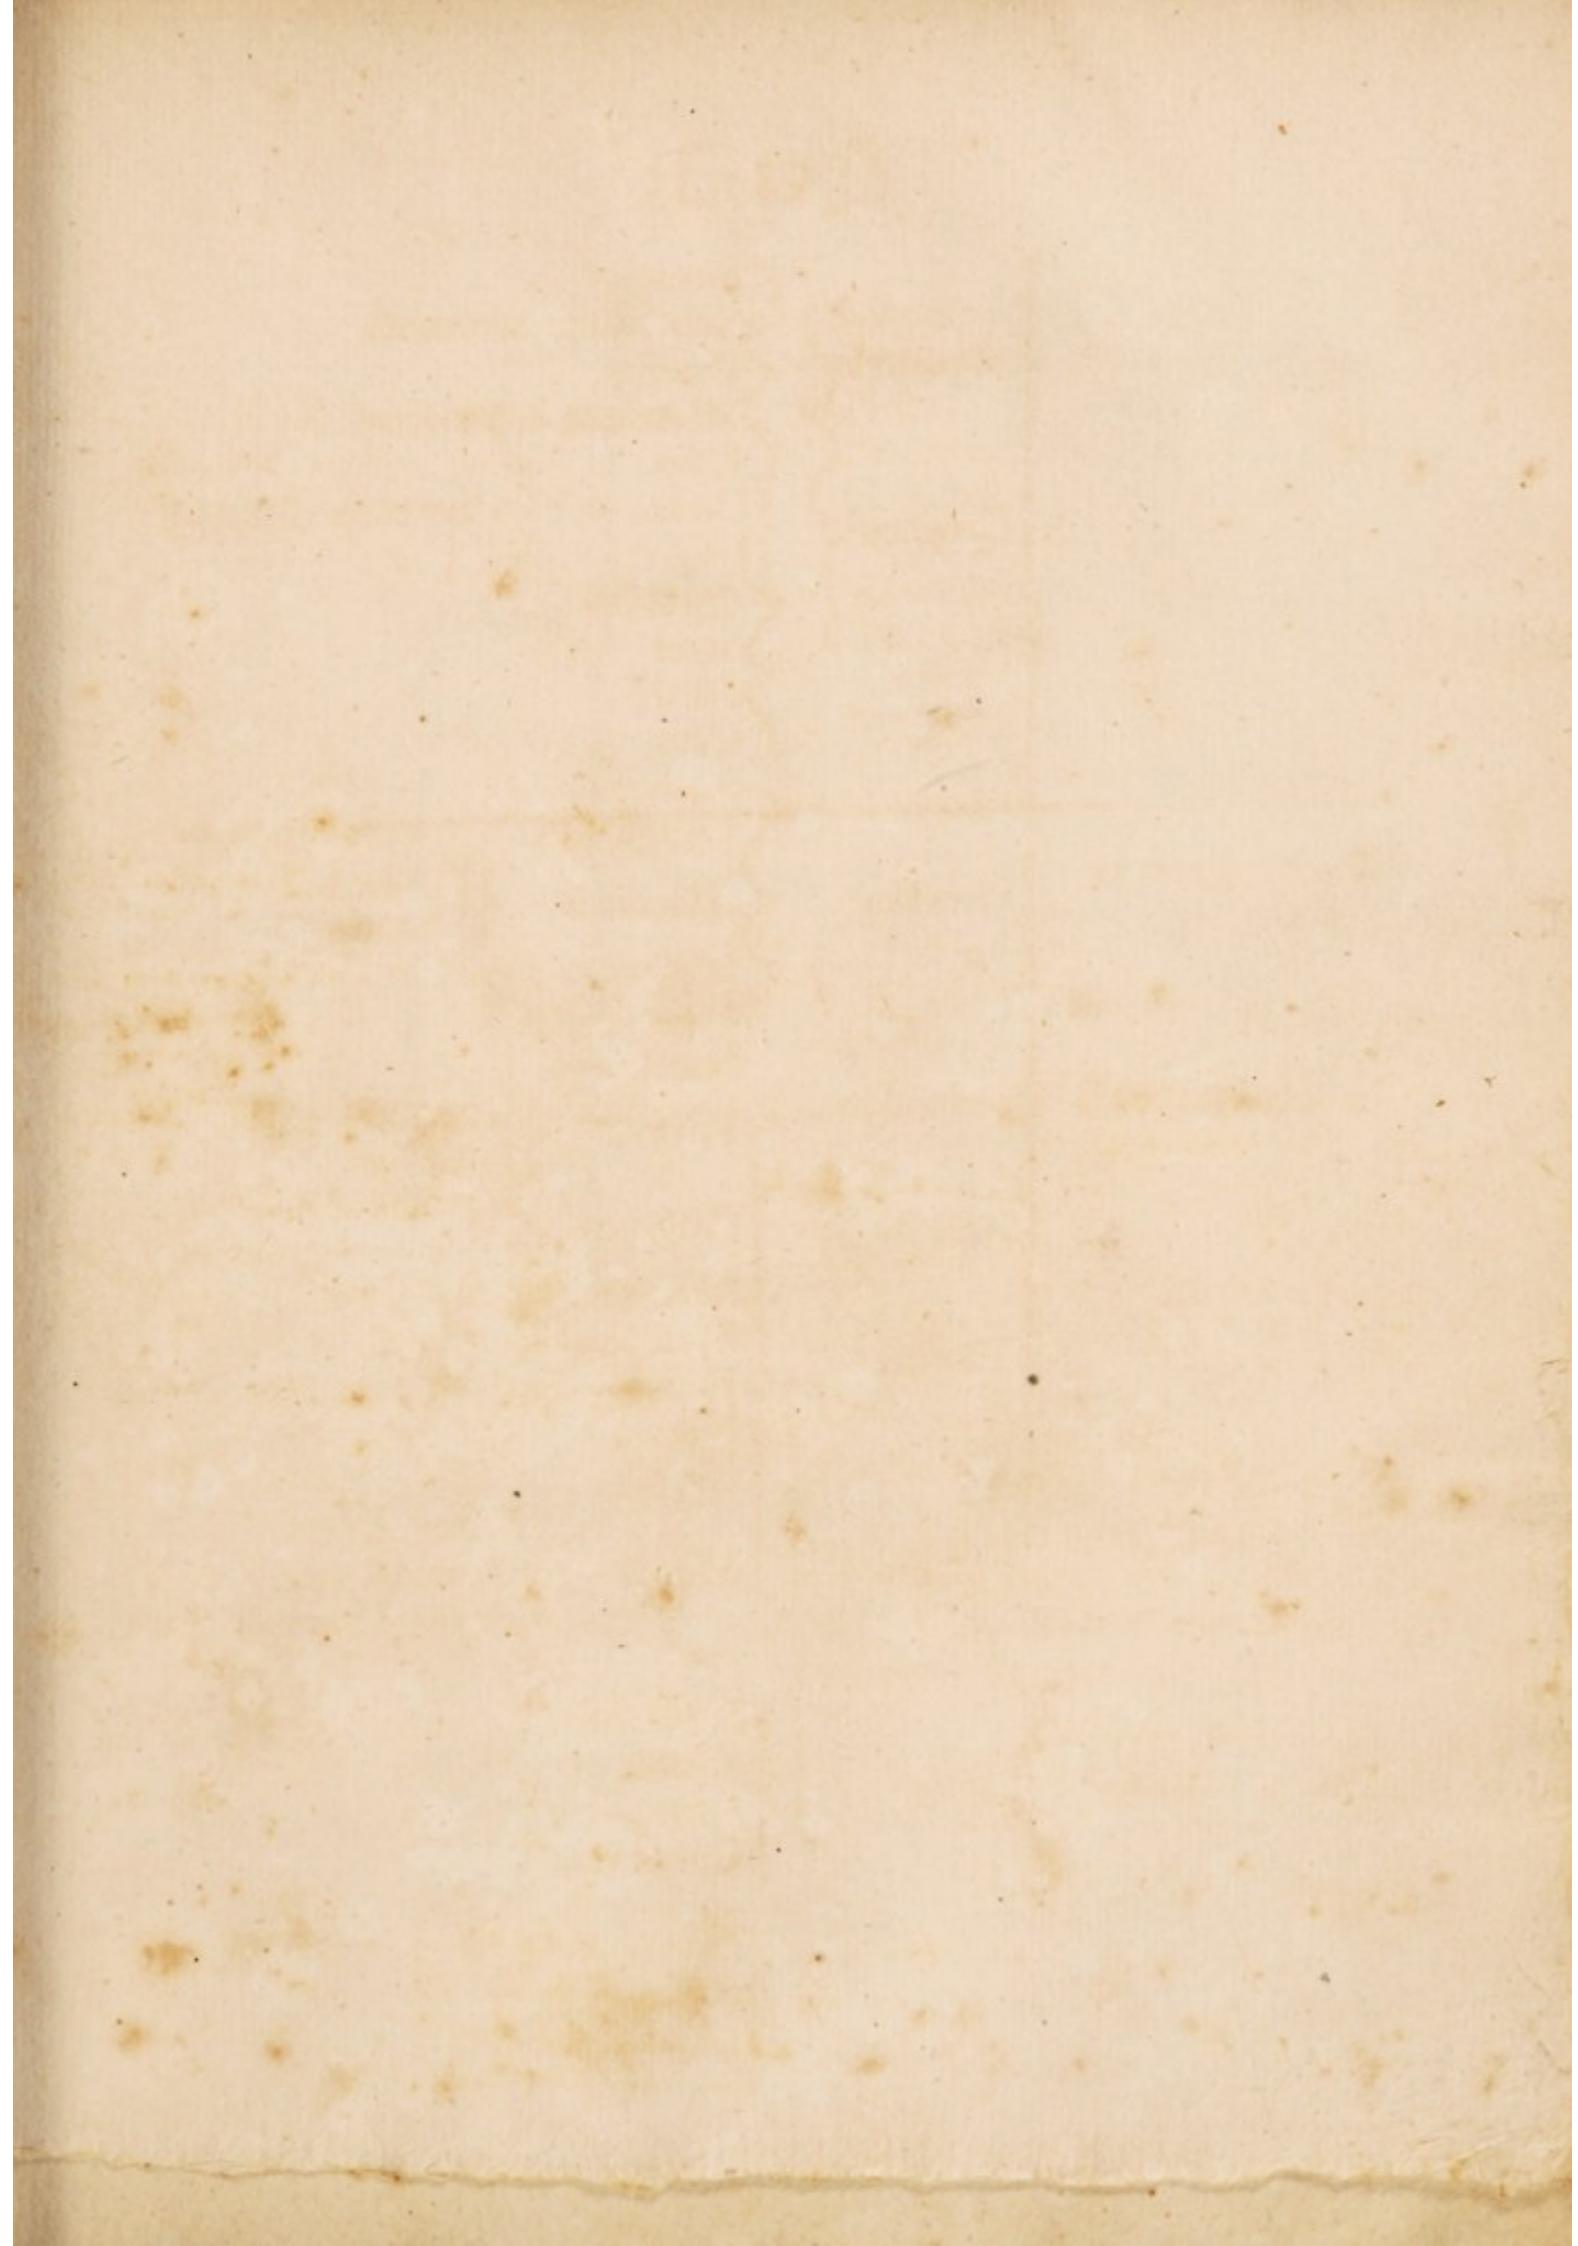

Fluor Albus. arises from too lax a lax 5<sup>th</sup> pollic: long:  
or in the Lacunæ; by co the secretion  
are larger. Sometimes a Scorbutic Symptom.

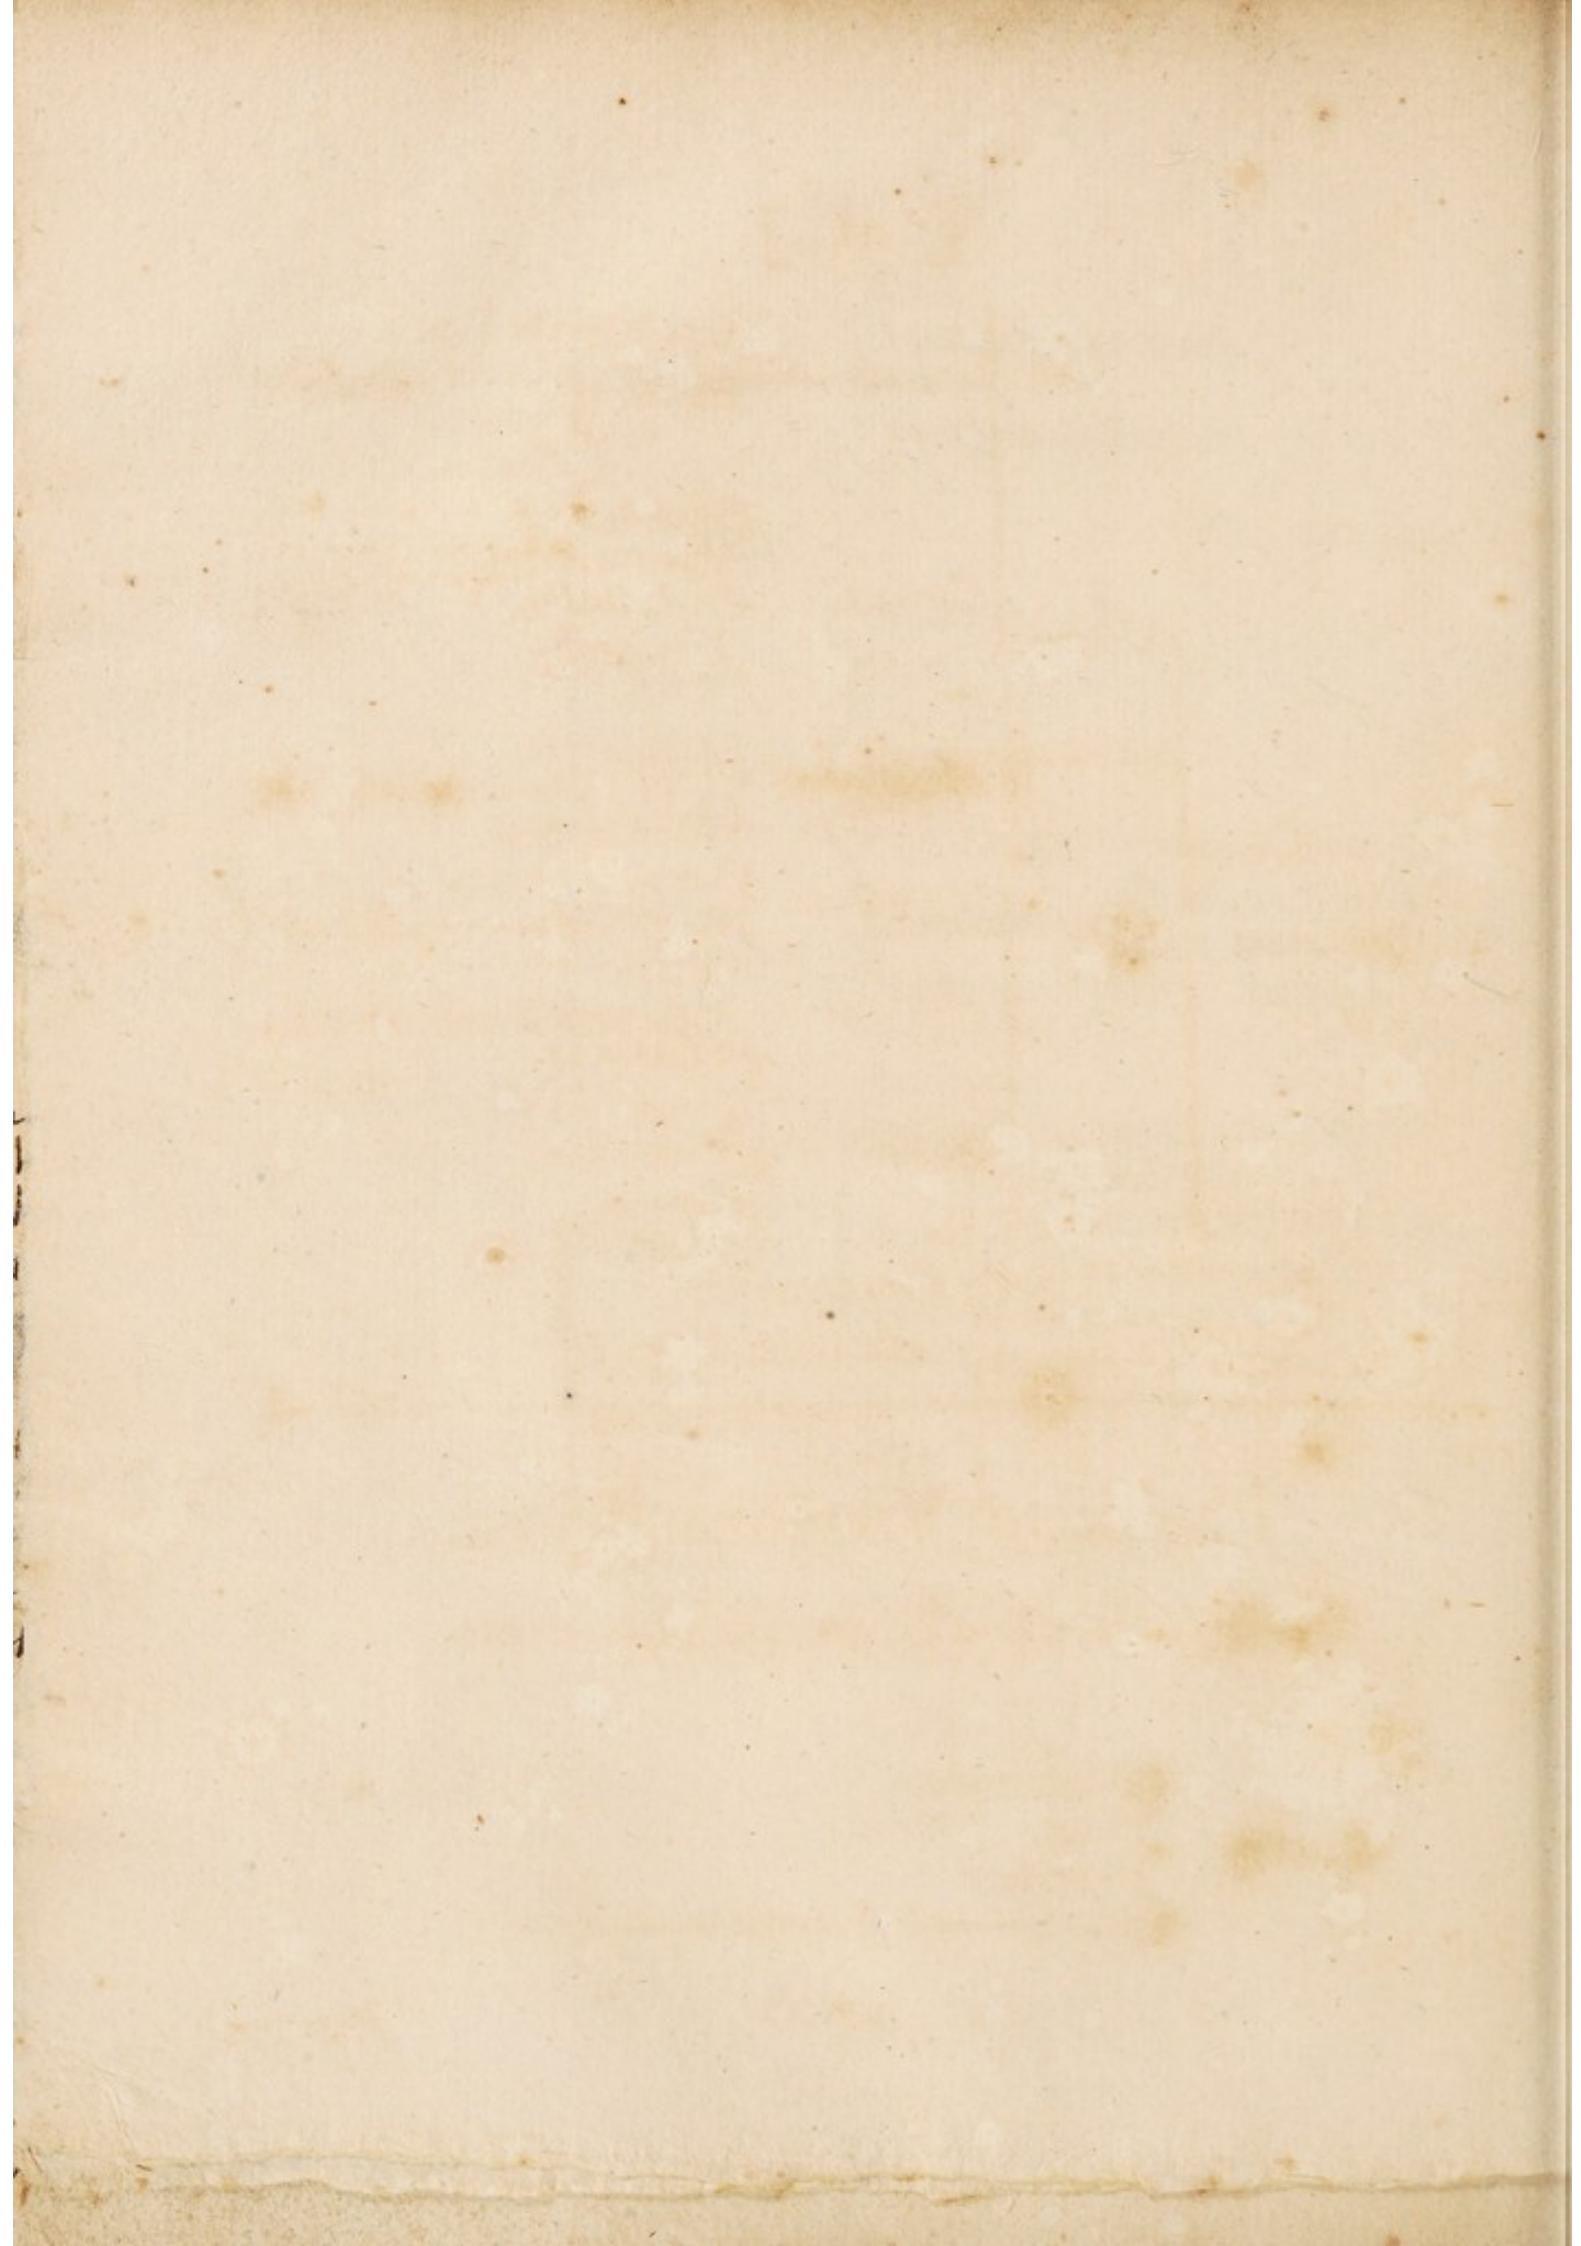

Gonorrhœa. Lacunæ first discovered by Brown &  
made the seat of this disease; Tho' Cold burn daid  
the first discovery to himself

Fluor Uterinus. Arises from too saline  
liquor secreted by Partes internæ  
the Lacunæ & Glandula Odoriferæ. This  
isease is like the Satyriosis in Men,  
is to be cured by Evacuations, & washing in Cold water.

Uteri Substantia est Muscularis. Motus est Vermicularis a Fundo  
ad Concrem in fato Excludendo, ut patet in Canis Divâ Sectione. Partes  
Motus est vermicularis a Cervice ad fundum, at Somen ad Orificia tubarum pro  
vivationem. Primus motus nunquam in Tominis conspiciebatur, Alter mente  
tabum modo secunda ex cogitatu.

Sinus. Couper reedons but 4. Longitudinalis Cerebri  
Laterales duo, & rectus. Where these meet is called Forcular.  
Hirophili. These Sinus receive the Blood from the Veins  
& discharge it into the internal Jugulars. Tab: 8.

Cowper denies Sensation to arise from an Impetus  
on the Fluidum Nervorum. He thinks the apparent con-  
tecture of the Nerves invalidates that Opinion. He rather  
believes the Contiguities of the Globular Cells are the Me-  
diuns between the Objects & the Commune Sensonium.  
He observes neither the Fibrilla of the Brain or the Nerves  
appear tubulated according to their Lengths; but that  
their cavities are frequently interrupted by divers Cells.  
to make a globular Appearance. This Structure he  
says may be prov'd from Microscopical Observations  
on the Tunica Retina of the Eye. App. Tab. 6. Fig. 26. 3.

Infundibulum; in the cavity of this the Export-  
ing Lymphaticks pass from the Pineal Gland; besides  
the Aqueous Humour of the Ventricles of the Brain  
is transmitted from the Cavity of the Infundibulum  
itself into the Pituitary Gland where it joins to the  
above mention'd Lympha. Cowp. App. Tab. 6. Fig: 26. 3.  
Lower in his treatise of Catarrhs denies the possibility  
of the Phlegm's arising from the Lymph that passes from  
the Glandula pituitaria. For if Ink be injected thro'  
the perforations of the Sella Turcica, it immediately  
passes into the Jugular Veins. This was tried on Humans.

*Nervi.* Willis supposes the Nerves of voluntary motion are separated in the Cerebrum, of involuntary in the Cerebellum. But Owls have no Cerebellum, yet their Hearts move. Par vagum <sup>or</sup> arise out of the Medulla oblongata assist the motion of the Heart <sup>or</sup> is involuntary, & the Larynx <sup>or</sup> is voluntary. Therefore is Willis's Hypothesis very erroneous.

*Nervus Olfactorius.* Willis says this pair besides serving for Sensation, discharge a Rheum <sup>into</sup> the Nostrils thro' the Os cribiforme. This is a very unreasonable conjecture.

*Nervorum Liquidus.* Leib imagines <sup>re</sup> must be a Liquidum in the Nerves <sup>or</sup> he supposes to be Tubes to convey it to its several parts. If Sensation be performed by the Nerves it must be either by the Undulation of a Fluid in the Nerves or by Vibrations of their Substances. It can't be by a Vibration, they are too Slack & too much surrounded by other bodies. Therefore it must be by a Fluid. p. 9.

*Cerebrum.* Lewenhoek observed the cerebral part of the Brain to be pellucid & Oily. He observed a Moisture distilled from this part in small Globules of  $w^m$   $2b=1$  Red Globule. These Globules This observation was made from the Cerebrum of a gallina Indica. He observed besides some other Globules,  $b=1$  Blood Globule. These Globules distilled from some minute disrupted Blood Viplets. Besides then he observed some other irregular pellucid Globules equal to & some bigger than the Globules of Blood. He saw some very small blood vesicles,  $\frac{1}{50}$  of a Blood globule could scarce pass thro'. Hence he supposes the particles of Blood are divided in the

Brain; so that they may enter the Orifices of these minute Vessels. He supposes from hence that the cortical or pellucid part of the Cerebrum is colour from the pellucid Globules, & the Subfusans colour from a mixture of the red Globules <sup>to</sup> these pellucid ones. When he separated the Cortical from the medullary parts he saw a prodigious Number a great Number of fine Blood Vessels interspersed like Membranes. Besides these some infinitely smaller, so that 1000 of a Blood Globule could but just enter their Orifices. The Medullary part consists of pellucid particles & the Fibilla appear'd like a fishing Net. He compar'd the Globules in the Cerebrum to a Sand, & found the Diameter of a Sand to exceed that of a Globule by 100, whence he concluded the Periphery of a Sand =  $1000000$  Globules by <sup>on</sup> w<sup>ch</sup> the Blood is ting'd red. He observ'd the minute blood vessels & guesses that if one of the Globules was divided into 64 parts, it could scarce enter the Orifices therefore  $64000000$  of a grain of Sand would be too big. But then he supposes the Globules to be flexible. These last Observations were made on the Cerebrum of a Sheep. N.B. The D<sup>r</sup>. Glafers must magnifie wonderfully. Common Microscopes can but just discover the Blood globules; but the D<sup>r</sup>. Discovered in the minutest Vessels of the Cerebrum are =  $\frac{1}{50}$  of a Common Blood Globule. v. Blanckard. Anat. p. 151.

From Levenhock's observations may be collected that the Arterous Fibilla are hollow, w<sup>ch</sup> will much confirm the Hypothesis concerning the Exis-

of the Liquidum Nervosum, & do some Service to the Vesicular Hypothesis of Muscular Motion grounded on the Supposition of the Existence of such a Fluid.

Lateral Sinus of the Dura Mater On the left, there is a bulbous protuberance contained in the cavity of the Os Petrosum; <sup>which</sup> is a Diverticulum to the Reftuent Blood, lest it shoud enter & press too suddenly into the Internal jugular vein. Comp. Tab. 6

Veins as well as Arteries in the Brain have a very peculiar Organization. Their trunks are very tortuous, <sup>which</sup> hinder the rapid Motion of the Blood into the Brain, <sup>as</sup> being near the Heart might suffer very much from the disorderly Motions of that Organ.

Nerves. The - 1<sup>st</sup> Pair the Olfactory - 2<sup>d</sup> - The Optick; near these lie the great Branches off the Carotid Arteries, <sup>which</sup> in a Plethora press on the Nerves & cause those disorderly appearance - 3<sup>d</sup> - Arise from the upper & forepart of the Annular process, where the Cerv. medulla oblongata meet. - 4<sup>th</sup> - Arise out the lower p<sup>t</sup> of the Medulla oblongata - 5<sup>th</sup> - Arise at the upper & lateral part of the Processus Annularis or Pons Varolii. - 6<sup>th</sup> - Arise from the hinder part of the Annular process near the Basis of the corpora Pyramidea.

Corpus

-7<sup>th</sup> - Are the auditory, each of <sup>or</sup> <sup>them</sup> are composed of two Nerves, one hard, the other soft, <sup>or</sup> <sup>they</sup> have distinct originals. The first arise from the Medulla oblongata, the other very remote from it. The soft Nerves are expanded <sup>to</sup> in the Labyrinths of the organs of hearing; the hard Nerves pass thro' the Bones & expand themselves in a larger Field as Vieusseux has expressed them - 8<sup>th</sup> - Par Vagum each of these have 10 or 12 Fibulae springing from the Medulla oblongata under the Corpora olivaria; At their Epoch they meet <sup>to</sup> the Spinal Accessory Nerves - 9<sup>th</sup> - Arise from the Corpora olivaria. The various originals of the right side differ from the Left - 10 - Brain or the S. of the Neck pass out of the S. Vertebra of the Neck & the Os Occipitis. Comp. App. Tab. 28.

M. Couper found by Microscope the nervous Fibulae composed of Fibres <sup>or</sup> in the Nerves appear Globular, in the Corpus callosum reticular.

insatio] Perform'd by the Nerves lodg'd in the Bapilla  
Pyramidales; thus tasting by those on the tongue feeling  
by those under the Catinula. Smelling by a porous  
Membrane expand'd <sup>in</sup> the Nose, ova Frontis, Os Spheno-  
noides, Sella Turcica. Hearing, The cartilages of the  
Auricula transmit the Air into the Meatus Auditory.  
The winding progres of this seems design'd to prevent  
any sudden Impression of the Air, & communicates  
its motion to the Procups of the Malleus; so this the  
Tympanum is articulated to the malleus, & then the Stapes by the  
Mediation of the Os Orbicularare. There is an Aperture  
from the Tympanum to the Palate, by this the sounds  
are impress'd on the Auditory Nerve. Seeing. By the  
light reflected thro' the Fumicles & Humour of the  
Eye. The Object is inverted. Cowper attempts to give  
a Reason for this, but <sup>satis</sup> infactorily.

Sternutatoria. In this operation the Breath is forced from ye Lungs thro' the Nose; so that the Mouth must be drawn down by Glosso-staphylinus & Pharygo-staphylinus & the Passage from ye trachea thro' ye mouth stopped. The Muscles of ye Thorax & Diaphragm seem to act w<sup>m</sup> more strength than in ordinary Expiration. The Air w<sup>m</sup> in ordinary Expiration should pass thro' the Mouth or Nose, now is forced only thro' the Nose, the velocity of the Air is increased by the stronger attraction action of these Muscles. By this means, as the quantity of Matter is of same but the velocity increased, the Momentum must be increased, therefore the pressure on the Vessels on the Inside the Nose must be greater. This additional pressure of the Air upon the Blood Vessels in the Nose must give a greater impetus to the Blood contained in them. By increased the motion of the Blood in the Capillary arteries, its motion must be increased in the Linous Veins & consequently in the Sinus. By this action therefore the obstructions in the Vessels of the Brain may possibly be removed. This shews, Sternutatory medicines may be of service in pains of the Head when they arise from obstructions upon this foundation the action of sneezing from taking of cold may be accounted for. If in a cold y<sup>e</sup> Quantity of Fluid be increased, a proportional increased Quantity will be carried by ye carotids into the Head. as the Vessels of the Head will be proportionably distended. This Distension of ye veins will make them press on the Nerves in the Nose, which will excite Nature to ye action of sneezing, in order to discharge the Load she labours under.

Purgantia. Dr. N. supposes y<sup>e</sup> Discharge of Water arising from purging Medicines not to be owing to any Secretion of Lymph thro' the Solitary glands of the Intestines, but thro' the Villous glands, y<sup>e</sup> make up y<sup>e</sup> Villous coats of y<sup>e</sup> Bowells. This depends on a precarious Hypothesis, viz: that those Villi are glands. Dr. Friends opinion seems better founded, That purging Medicines entering the Bloody attenuate it, & give it a greater Velocity. This will make y<sup>e</sup> Secretion in the Solitary Glands larger in a given time. The Existence of these Glands is not disputed. Dr. N. supposes the orifices of y<sup>e</sup> Sacculars constricted & closed by y<sup>e</sup> Action of y<sup>e</sup> purge; & therefore infers that a greater Quantity of Lymph is secreted thro' the Villous tubes. & why the Orifices of the Excretory Ducts of y<sup>e</sup> Villi should not likewise be obstructed by y<sup>e</sup> Purge as well as the Sacculars?

Spleen thicker & more red Particles  
Spleen makes & red particles of the Blood thicker, & more red. The  
Machina

*Machina Phylefora.* When the Aliments are well  
mashed by the teeth & Saliva, sufficiently dissolved in  
ye Stomach, it is thrust out into the Stomach by ye Contraction  
of its Muscular Coat into ye Intestines. When they pass into  
the Duodenum, the Bile & pancreatic juice mix with it  
attenuates & probably separates y<sup>e</sup> Feces from the Chyle; tho'  
the Lactals contribute much to this. The Peristaltick mo-  
tion of y<sup>e</sup> Bowels thrusts the grosser parts downward  
by ye Assistance of the pressure of y<sup>e</sup> Diaphragm, & the  
abdominal Muscles. The finer parts are squeezed into ye  
Orifices of y<sup>e</sup> Lactals, w<sup>t</sup> seems to be the use of y<sup>e</sup> Valves  
of y<sup>e</sup> Intestines, least y<sup>e</sup> Aliments should pass by too eas-  
ily. By the Lactals it passes to y<sup>e</sup> Mesenterick Glands  
where it is diluted by the Juices the Secrete. From  
hence it is convey'd to the Chyle Receptaculum. Here  
the Chyle meets the Lymphatick Fluids, & being perfected  
by this mixture to incorporate w<sup>t</sup> y<sup>e</sup> Blood, & passes up  
y<sup>e</sup> Ductus Thoracicus & mixes w<sup>t</sup> the Blood in the left  
Subclavian vein, & is then convey'd to y<sup>e</sup> Heart. R.R.

Cowper supposes Hunger to arise from an Irritation  
of ye Stomach caused by a copious quantity of a Mæstrum  
when it has nothing to act upon. This conjecture is  
founded on the natural Inclination there is <sup>to</sup> not to  
swallow y<sup>e</sup> Spittle at y<sup>e</sup> time. The Bile abounds w<sup>t</sup> a chini-  
cial Salt, cleanses the Cavities of the Bowels from the  
Mucus, & stimulates the Guts in their Peristaltick mo-  
tion. The Chyle is much retarded by the Valvula Contri-  
vantes found by the Rays of the inner Coat of the In-  
testines. The Peristaltick motion he attributes to the  
alternate Contraction of y<sup>e</sup> Longitudinal & circular fibres,  
or rather semicircular, & not spiral.

[ 51 ].

|                   |  | Ovariæ.              |

The Tube Fallopiana must have two vermicular motions one to carry the semen to the Ovarium so as to impregnate the Egg the other to bring back the Impregnated Egg to the Cavity of the Uterus.
