Phyladan in London Claing an Account of the MONTPELLER PRACTICA VENTEREAL DISEASE. Constituted Later and Spicer of that Med od nisone

# A LETTER from a Physician in London, to his Friend in the Country.

Honoured S I R,

RETURN you my most hearty Thanks for your kind Letter of Congratulation on my safe Return to England, after having been more than five Years out of it. So long an Absence, notwithstanding the Pleasure of seeing foreign Countries, and viewing the noble Remains of

Antiquity there, wou'd have been very irksome, had not your Goodness from Time to Time reliev'd me with your ingenious Letters, which contain'd every Thing curious and entertaining that happen'd here at Home. Among the many delightful Accounts with which you was pleas'd to favour me, allow me to mention that of the Coney-borough at Godalmin in Surrey, which coming to my Hands when I was at Rome, and being so extraordinary in its Kind, after having translated it into Italian, I found Means to have communicated to some of the Cardinals, who were so highly pleas'd with it, that, as 'twas currently reported there afterwards, they unanimously voted it a Place in the Vatican Library. But, be that as it will, this I am

A 2

fure

fure of, that I have not only feen, but receiv'd feveral' Papers written by you, that justly deserve a Place there. The whole Employment and Business of your Life feems to be nothing else but one continued Search and Pursuit after Knowledge; so that you may very properly be stil'd the BOYLE of the present Age. Scarce a Book that contains any Thing new or curious, is publish'd, but what finds a Place in your Library; and whenever any Discovery is propos'd to the World, you are never at Rest till you have found out whether it has Truth to support and recommend it. For which Reason I am the more surpriz'd to find that the Books written about the Montpellier, or new Method of curing the Venereal Difease, shou'd have escap'd your Curiofity; and that the very first Hint and Intimation you had of it, was from an Advertisement you met with by Chance in the publick Prints, which you took the Pains to transcribe and fend me to Montpellier, and

which was in the following Words. "WHEREAS great Numbers of Gentlemen go " yearly from this City, and other Parts of the King-"dom, to Montpellier, on Account of the Venereal " Disease, where they seldom fail to meet with a per-" fect Cure, perform'd after a safe and pleasant Manner, " by Mercurial Frictions, which often occasion no Spit-" ting at all, and at most so small an one, as is free " from all manner of Uneafiness and Danger: A Phy-" fician who has made that Distemper his particular "Study, in order to fave all Persons for the future the " Expence and Fatigue of fuch a Voyage Abroad, as " well as the Torture and Hazard of a Salivation at " Home, offers his Endeavours to convince them of " the Reasonableness and Essicacy of this new Method, " and at the same Time to shew them, that it is as ef-" fectual in England as in France, Change of Climate " making no Change at all in the Virtues of Mercury.

"The Person who now makes this Offer, was once as

much.

"much prejudiced against this Method of Cure, as any " Physician or Surgeon can possibly be at present, and " had in all Probability still continued so, had he not " been convinced by ocular Demonstration, having " made a Journey on Purpose to Montpellier, where he " was an Eye-witness of night wenty Cures perform'd " this way by Mr. CHICOYNEAU, Chancellor of that " University, and other Professors of Physick there; " and fince his Return from thence, having found by " several surprizing Cures effected here, even after Sa-" livation had prov'd ineffectual, that this most excel-" lent Method is altogether as efficacious at London as " at Montpellier, he thought himself oblig'd to publish " it for the publick Good; hoping it will not be the " less esteem'd, because communicated to the World " after this Manner, nor he himself censur'd as a Quack " or Impostor, for his Endeavours to contribute to the " Ease and Safety of Mankind.

"WHOEVER has a Mind to speak with the Person above-mention'd, is desir'd to send, or leave a Note at Mr. Howson's a Stationer, at the Rose and Crown

over against Exeter-Change in the Strand, mentioning

"Time and Place, and always giving at least a Day's

" Notice before-hand.

N. B. "This Method has been found effectual, not only in Venereal, but likewise in many other obstinate and inveterate Cases, even where Salivation had fail'd; and is so very easy to the Patient, that 'tis

" become a common Practice in France, particularly in

" the Southern Parts of it, for all young Gentlemen, who have meddled with common Women, tho' in

"Appearance they never receiv'd the least Damage,

" yet always for Safety's Sake, to undergo this Opera-

"tion a little before they Marry.

This, like other Advertisements that promise a Cure in all Venereal Cases, you at first imagin'd to be nothing but Quackery and Imposture; however, your uncom-

" mon

mon Curiofity carry'd you fo far, as to fend it me as far as Montpellier, defiring my Opinion of it; and at the same Time, if there was any real Foundation and Truth in what was there faid of fuch a new Method, that I wou'd make an exact Enquiry into it, and oblige you with a fuller and more particular Account of it at my Leisure. As to what is afferted in that Advertisement, relating to the Manner and Excellency of this new Practice, you may remember, Sir, I acquainted you at that Time, that there was nothing but what was very modest, and far below the Truth; and fince my Arrival at London, I have, upon Enquiry, found that the Author of it is fo far from being an ignorant Quack, as you imagin'd, that he is a graduate Physician, and a Person of Learning, Probity and Experience, who refided feveral Months at Montpellier, on purpose to be thoroughly acquainted with this new Method, by which he has effected a great many extraordinary Cures since his Return to London.

As to the Reason why this new Way of Curing the Venercal Disease, is call'd the Montpellier Practice, 'tis because it was first try'd and introduc'd there by Mr. Chicovneau, the Chancellor, and other Professors of Physick in that Place. The said Mr. Chicovneau, and Mr. Didier, one of the Professors, have both written on the Subject. Mr. Chicovneau's Book was translated into English, and illustrated with some Notes and Observations by Dr. Willoughby, and is entitled, The Practice of Salivation shewn to be of no Use or Efficacy in the Cure of the Venereal Disease, but greatly prejudicial to it, &c. To that therefore I might very well refer you, Sir, for sull Satisfaction in this Matter; but since you have laid your Commands upon me, be pleas'd to accept of the sollowing Account.

M v Stay at Montpellier was very nigh eight Months, in which time, according to the best Information I cou'd get, sifty seven Persons were cur'd of this modish Distem-

per, after the Manner in use there; I was an Eye-Witness of fifteen, seven of which were English, whom I vifited constantly four or five Times a Week with some of the Professors there. For I must inform you, Sir, that it is not at Montpellier as it is here in London, where the Surgeons pretend to engross the Cure of this Distemper wholly to themselves, and rashly throw People into Salivations without the Advice of a Physician; for there no Surgeon presumes to carry any Person thro' this safe and eafy Operation without the Affiftance of a Physician to advise and direct, while he himself only performs the manual Part of Unction or Rubbing. The Persons whom I constantly attended under this Operation were some of them in the most deplorable Condition that can be imagin'd, and three of them had been falivated before, without receiving any Benefit, and yet they were all perfectly cur'd by this Method. But before I proceed to give you an Account of the Manner of it, which is no more than a common Friction or Anointing with a Mercurial Unguent, 'twill not be improper to fay fomething of the Apparatus, or Way of preparing the Patient in order to undergo the Operation. Now, that is always at the Judgment of the Phylician, according to the particular Exigencies of different Constitutions, and after he has examin'd each Person's particular Case, and finds the present State of the Patient's Blood and Habit of Body to be. Sometimes Blood is order'd to be taken away once or oftner; fometimes the Patient is purg'd, sometimes laxative Ptisans, and a thin Diet are prescrib'd; but frequent Bathing is generally, if not always, order'd, to foften and relax the Fibres, and render the Body more perspirable; because, if any Evacuation be necessary in the Cure of this Distemper, so subtle a Body as the Venereal Poison, and so volatile a Body as Mercury, after it has been sufficiently rarified and circulated. with the Blood, will be best carried out of the Body by the Pores of infenfible Perspiration.

A FTER this Preparation is over, the whole Operation confifts in nothing more than rubbing the Patient with a Mercurial Ointment, in such Quantities, and at such Intervals of Time as the Physician shall judge proper; sometimes at the Distance of two, sometimes of three, and sometimes of four Days. As to the Quantity of Mercury, seldom more than fix Drams, but oftner less, is sufficient for any Cure. In rubbing, sometimes they begin with the Soles of the Feet, sometimes with the Small of the Legs, ascending every Time a little higher till they come up to the Knees. There are some that order the Arms to be rubb'd, and some the Thighs. After any Part has been rubb'd, a Linnen Garment is provided to be put on it, as Socks for the Feet, Linnen Stockings for the Legs, &c. - The Time requir'd for this Operation is according to the Condition the Patient is in, a bad Case requiring more time than a slight one, but is generally from three Weeks to five. The Patient during that Time is confin'd to his Chamber, observing a low and regular Diet, but oftentimes fuffers nothing more than a little Feyerish Heat and Restlesness for a Day or two, when the Operation is at the Height.

Thus, Sir, after this gentle and easy Manner is the most dreadful and inveterate Pox with all its most direful Symptoms perfectly and radically cur'd. But here no doubt, you will be curious to be inform'd whether or no in this Method of Cure, any great and sensible Evacuations, are caus'd by these Mercurial Frictions, and if not, how 'tis possible a Cure can be effected? To this I answer, that sometimes a gentle moderate Spitting will happen, nor is it possible to prevent it in some Constitutions; but then 'tis never carried high, nor encourag'd, 'tis neither troublesome nor dangerous. And as for any great and sensible Evacuation, I can by no means conceive it necessary, because the Venereal Poison is so little in Quantity, and of so subtle a Nature, that as it was receiv'd into the Body by the Pores, so I take them

to be the best and properest Outlets for it, whilst that great Discharge of nasty ropy Matter by the Glands of the Throat, is so far from contributing towards the Cure, that 'tis rather an Hindrance and Obstruction to it: Because, by that means, the Mercury escapes and flies away, before it has fufficiently infinuated and mix'd it self in the Habit of the Body. And when it runs off fo fast by the Salival Glands, and has not Time enough to penetrate into the finer Veffels, and inmost Recesses of the Body, 'tis impossible it shou'd induce such a Change in the Blood and Humours as is necessary, or cause any great and permanent Effect there; and for this Reason, no doubt it is, that Cures attempted by the usual Way of Salivation, are so often left imperfect and unfinish'd. For this I will venture to lay down as a General Rule, that cures in this Diftemper will always be found to be best perform'd, when the Mercury is longest detain'd in the Body. But because Venereal Patients are fometimes observ'd to grow well after a Salivation, and that a great Quantity of fetid Matter is always discharg'd during the Time of it, therefore such an Evacuation is by many judg'd necessary; and the greater the Quantity of Matter is that the Patient then spits, and the more noifome its Smell is, the more radicated and virulent is the Distemper thought to have been, as well as the more perfect and effectual its Cure. But that this is a very great Mistake will plainly appear from hence; that if two Perfons are put into a Salivation at the same time, the one vigorous and robust, of a full Habit of Body, and in perfeet Health; the other weak and thin, of a shatter'd Constitution, emaciated and worn out with Venereal Pleasures, and the common Consequence of 'em, a Venereal Lues; in this Case, I say, cæteris paribus, that the Saliva of the former Sound Person shall be as fetid, and its Quantity larger than that of the Infected. And if this be fo, then it plainly appears that the Evacuation of a great Quantity of fetid Matter by the Salival Glands, is not the least Proof either that a Person is infected with a Venereal Taint, or that

B

any Part of the Poison is discharg'd that Way. Those Persons are strangely ignorant of the Nature of Mercury, who imagine that it acts chiefly as an Evacuant; no, its principal Efficacy and Virtues in this Distemper are alterative; 'tis the greatest Deobstruent and Corrector of sharp corrofive Acidities in the World. 'Tis very well known, that in the flightest and lowest Salivation a great many Pounds of fetid Matter (all which is commonly thought to be Part of the Venereal Taint) are constantly difcharg'd; whereas I believe the greatest Quantity of Venereal Poison that ever any Man receiv'd at one Time never amounted to a Scruple in Weight. But then, Sir, you will perhaps fay, that tho' all that Matter which is evacuated in a Salivation be not Original Venereal Poifon, yet that 'tis nothing but filthy noxious Humours vitiated and corrupted by that Poison. But even this cannot be allow'd; because 'tis very certain that good as well as bad Juices are evacuated together in a Salivation. But fuppofing, Sir, what you imagine, that nothing but corrupt Humours are expell'd out of the Body at fuch a Time; yet, if by receiving a moderate Quantity of Mercury into the Body by Degrees, as in this new Method, those corrupt Humours can be so corrected and amended, as to become pure and falutary; you will allow, there will be no Necessity at all to evacuate them. That this may be done, and actually is fo in this new Method of Cure, will, I believe appear, if we weigh a little the Effects of this Venereal Poison on the Animal Juices, and at the same time consider the Virtues of Mercury, and its Manner of Operation in an human Body. Now, the Effect of that Poison, as well as of most others, when it gets into the Blood, consists in caufing Coagulations, and unnatural Cohefions of the Liquors, from whence arise Obstructions of the Glands; and when the Lymph has lain for some time obstructed there, it contracts an Acrimony, and becomes corrolive; frow whence arise Pains, Scabs, Ulcers, &c. But Mer-

cury,

eury, when mix'd with the Blood, by the Smallness of its Particles, is able to enter into those slender Canals, where the Blood it felf cannot freely pass, and by that Means fcours all the most minute Passages of the Body. And then by its Force and Weight, it breaks down all Obstructions, and opens the impassable Canals; and by Virtue of its Weight, and the Smallness of its Parts together, it fcours all the Glands of the Body, removes all viscid Concretions of Matter that have been lodg'd upon them, dissolves all unnatural Cohesions of the Juices, and renders them fluid, active, and ufeful. But there still remains another Property in Mercury, which compleats its Specifick Virtue in curing this Difeafe without Salivation, and that is its peculiar Power in destroying the Acrimony and Corrosiveness of the Animal Juices, and confequently of correcting all forts of foul, eroding, and fiftulating Ulcers. This Corrofiveness proceeds, no doubt, from the Pointedness of the minute Parts of the stagnated, putrifying Fluid. Now Mercury, where-ever it comes, not only removes all Obstructions, and makes the Vessels passable by Virtue of its Weight, but likewise by the same Power breaks off and planes the sharp Points and Angles of those Particles, and fo renders them harmless and innocent.

By this Time, Sir, I persuade my self you begin to be convinc'd that the Antivenereal Virtue of Mercury, or that Power by which it cures the Venereal Disease, is altogether independent of any Salival Evacuation. But to put this Matter beyond all future Doubt, I shall quote an Authority, which, I am sure, will be of great Weight with you, as well as with all other Persons of Learning and good Understanding; and that is, the learned Dr. Chevne, who, in his ingenious New Theory of Fevers, speaking of the Operation of Mercurial Medicines, p. 120, Sc. has the following Words: "But here it might be objected, says ke, that the grand Effect (as most Peo"ple believe) of mercurial Medicines is Salivation, and B 2

" that really the falivary Glands secern more of their "Fluids proportionally, than any other Glands of the

" Body. To this I answer:

" I. THAT the principal Effect of Mercury is the at-" tenuating the Fluids, the clearing the Canals, and the " destroying the Corrosiveness of the Obstructions; and " that Salivation has no more Title to be the principal

" Effect of Mercury, than infensible Perspiration.

" 2. It is evident that Salivation is not the main Ef-" fect of Mercury, from this, that many Persons are cur'd " of very dangerous Poxes, Ulcers and Rheumatisms, " without ever Salivating, at least at the ordinary Rate " of Salivation.

" 3. THE Reason why we seem to secera more by the " Salivary Glands proportionally, than by any, or most " others, is because the salivary Glands are more in Num-" ber than any of those which separate visible Fluids; " and consequently it is but reasonable they shou'd secern " more than any other. It is true, the Glands of insen-" fible Perspiration are more in Number than those; and " it is not to be doubted but they secern more likewise;

" and it will be found fo, whenever the Thing is exa-" min'd after Sanctorius's Method; but that Secretion

" not being visible, makes the Matter doubted.

IT appears from this Author, besides what I quoted him to prove, that upon Mercury's being mix'd with the Blood, the cuticular Discharge by the Pores of insensible Perspiration, is increas'd in Proportion to the salival Evacuation by the Glands of the Throat. I do not therefore positively affirm, Sir, that in a Salivation no part of the Venereal Poison whatever is carry'd out of the Body in the Saliva; all I contend for is, that a falival Evacuation is not necessary to the Cure of this Distemper; and that the Montpellier Method of curing it, by rubbing a less Quantity of Mercury into the Body, and at greater Intervals of Time, is in every Respect preserable to it; but more particularly, as it is a much more certain, eafy, and safe way of Cure. IN

and.

## Physician in London.

In the first Place, I believe, the most zealous Advocates and Sticklers for Salivating in the Venereal Difease, will allow that Salivations have often fail'd; nay, that many Persons have undergone that dreadful Operation twice, nay even thrice, and yet have not found an effectual Cure: Whereas upon the strictest Enquiry I was able to make at Montpellier, among many Hundreds who had been treated after this new way, I cou'd not find that any one Person, whose Case was truly Venereal, had miss'd a perfect Cure. I have fince made the fame Enquiry at Paris, and even here in London, and cannot yet find that it has ever fail'd; and that it has often cur'd, after Salivations have fail'd, is a most certain and undoubted Truth. If, Sir, you shou'd be furpriz'd, and wonder how 'tis possible that this new Method shou'd be more effectual than the common one by Salivation, fince in both Cafes the Cure feems to be owing to the same Cause, that is, the mechanical Powers of Mercury; and that the only Difference between them is, that in this new way, a less Quantity of Mercury is fent into the Body, and at a greater Interval of Time; whereas in the common way of raising a Salivation by Unction, a greater Quantity of Mercury is thrown into the Body in less Time, and confequently that a greater and more permanent Effect ought to be expected from it; what I have to fay is this, That when a confiderable Quantity of Mercury is thrown into the Blood in a short Time, it will not in this Case be so capable of rarefying and diffusing it self gradually and uniformly through all the Parts of Body, as when it is admitted into it flowly, and in small Quantities: For the fudden Rarefaction, and extreme Volatility of the Mercury, occasion'd by the natural Heat of the Body, will determine its principal Force and Efficacy upwards; that is, it will afcend in a strong plentiful Steam or Vapour to the Head, and be thrown off by the falival Glands, before it has had fufficient Time to mix and circulate with the Blood and Lymph, in all the flender minute Veffels,

and there induce that Change and Alteration in the animal Fluids, which it wou'd necessarily have effected, if it had continued in the Body a longer Time. And this, Sir, I take to be the true Reason why Salivations so often fail, and why this new Method is fo certain and effectual. And if this way of curing the Venereal Difeafe be more certain, I am persuaded there is no Body but will allow that it is infinitely more easy than the common way by Salivation. All that the Patient undergoes or fuffers, when treated after this new Manner, is only, as I told you before, a little flight feverish Heat and Uneafinefs, perhaps for two, or three Days at most, and fometimes a gentle moderate Spitting, attended with little or no Pain at all. But what is this in Comparison to what every Person suffers that goes through a Salivation? To those that have seen or undergone one themselves, I need fay but very little; but to those that have not, 'tis certainly a Sight very horrid and shocking to behold. To have the Head fwell'd to more than twice its natural Size, the Eyes ready to burst and fly out of it, the Teeth all loose, and just dropping out of their Sockets, besides a want of due Rest and Nourishment for Weeks together, and all that Time to do nothing but drivel out a fetid filthy Matter, that renders a Person nauseous to himself, and to all that come near him, is certainly a Condition no one would come into without the utmost and very last Necessity; and yet all that I have said comes vaftly short, and is but a very slight and imperfect Representation of what is constantly seen and suffer'd in every Salivation. So that I may with the utmost Truth affirm, that 'tis much better and easier, and what every Man in his Senses wou'd sooner chuse, to go thorough a Cure after this new Manner twenty Times, than to undergo the Pain and Torture of one Salivation. Nay, so very little is the Trouble or Uneasiness of it thought to be where it is commonly practis'd, that is to fay, in the Southern Parts of France, that 'tis undertaken with

the

the same Unconcern as we here take a Vomit, a Purge, or a little Blood away. And by Reason of its Easiness as well as Sasety, 'tis grown so familiar there, that no young Gentleman, who suspects himself to have contracted the least Venereal Taint, or who has once convers'd with a common Woman, ever thinks of entring into the State of Matrimony, nor will the Relations on the Bride's Side suffer it to be consummated, before he has gone through this Operation, to cleanse his Body from all possible Remains of it; which might otherwise perhaps lie lurking there many Years, and breaking out at last, utterly ruin his Wise's Constitution, as well as

transmit Rottenness to Posterity.

FROM hence, Sir, it appears, that this new Practice has both Certainty, Ease and Safety, to recommend it above the common way by Salivation, or any other way yet discover'd. Not one Instance, I believe, can be given of any Person that ever miscarry'd under it, or whose Constitution has suffer'd by it. But the same cannot be faid of Salivations, because 'tis notorious to all the World, that great Numbers die yearly under 'em; and that numberless Constitutions have been, and always will be, ruin'd by them. But as I am endeavouring to introduce a new Practice in Opposition to Salivation, and may therefore be suspected of Partiality in what I shall fay my felf; in order to shew the Danger and ill Confequences of throwing a great Quantity of Mercury into the Blood in a short space of Time, so as to raise a Salivation, as well as the great Advantages arifing from a prudent and moderate Use of it according to this new Method, I shall rather chuse to let another Person speak for me; and that is the learned Dr. Morgan, in his Philofopbical Principles of Medicine, p. 420. " When a Sub-" stance, says be, of such Force and Efficacy as Mercury " is thrown fuddenly in great Quantities, and with Vio-" lence upon any of the Glands, it must needs be ex-" tremely hurtful and mischievous: For, in this Case, " the

"the sudden Rarefaction, expansive Force, and violent Efforts of the Mercury, rous'd and excited into Action by the natural Heat, must overstretch the nervous Fibrillæ, suspend their Action, and quite break, dissolve and destroy the natural Structure and Conformation of the Parts; and the Structure and Organization of the Solids being thus broken and destroy'd, the Fluids must stagnate, corrupt and putrify, and the

" Obstructions become inveterate and incurable.

"Hence it is that they who have been too severely treated with Mercury in the Lues venerea, are very often made more deplorable Victims to the Fury of the Medicine, than to that of the Disease; and a Disemper which scarce deserves a Cure, is render'duncapable of any. I kow that the unhappy in this Case are generally impatient of Delay, and eager for a speedy Cure; but the Event seldom answers their Expectations, and a little present hasty Relief is for the most part follow'd with a long Train of hopeless and remediless Evils, which might have been prevented

" by a more rational and deliberate Method.

AND Pag. 426, after having shew'd the many and singular Virtues of Mercury, and that it is no ways hurtful to the Nerves, he proceeds thus; "I defire it may be " here observ'd, that what I have said of Mercury, as " one of the most effectual and powerful Deobstruents, " is to be understood as abstracted from Salivation, or " any fuch way of giving it, as to promote any great, " fenfible, or violent Evacuation. For where Mercury " is thus given, it must needs break, dissolve, and de-" ftroy the natural Texture and Conftitution of the So-" lids, and glandular Organs upon which it happens to " be precipitated, and thrown with fuch Violence; and " the elaftick Motive Fibrillæ, having thus loft their na-" tural Force and proper Action, any Lodgment of vif-" cid obstructing Matter upon such Glands for the future, " must be fix'd there without Remedy, and the Obstru-

" ction

# Physician in London.

ation become incurable. And hence it is that they " who have been injudiciously treated with Mercury by " too strong and violent Salivations, are often reduc'd to " the most deplorable Circumstances, and put out of all " the Hopes and Possibility of a Cure by any other Me-

" thod.

" I know it will be urg'd by some, that Salivation in " an high Degree is necessary to the Cure of the Venereal " Disease, where it is once strongly or deeply fix'd. But " fuch is my Incredulity and Diffidence, that I am very " apt to question the Truth of this in Fact; and I only "defire those, who have any great Experience in this " Case, to tell us faithfully whether they have ever known " a good Cure wrought by a high Salivation upon fuch as " have been much afflicted with hypochondriacal and hy-" sterical Disorders; and whether the Success has not fail'd " in Proportion to the Strength of the Salivation, and the "Overstretch of the obstructed convulsed Glands? But "this, I think, is certain, that the greater the Obstru-" ction of the Glands is, and the more they are tumefy'd, " distended and stimulated, the less capable will they be " of any violently impress'd Force of Mercury, and the " more necessary will it be to do the Work with more " Moderation, and in longer Time."

To what I have already cited, give me Leave, Sir, to add a few Lines from the ingenious Dr. Quincy, in his Essay on Venereal Diseases, subjoin'd to his Explanation of Sanctorius's Aphorisms, Pag. 463. " The common

" Methods of Salivation, Says he, and rough Catharticks, " do not only fail of Cure, but also occasion great

" Mischies; because they rob the Constitution of its " best Desence against the Distemper, a soft balsamick

" Blood, and leave it afterwards much more expos'd to

" a merciless Tormentor, whence infallibly also comes on

" an incurable Hectick."

WHAT these excellent Authors have said is so strong, full, and convincing, that tho' I cou'd produce the Opinions of several of the best and most learned Writers in

Phy-

Physick to the same Purpose, yet I shall trouble you with no more Quotations, but leave the whole Strefs and Iffue of the Dispute between this new Method of Cure, and the old one by Salivation, on their Evidence; and proceed to acquaint you, Sir, in what other Diseases, besides the Venereal, this Practice has been found successful. In all Foulnesses and Obstructions of the Glands, in all Lentors and Viscidities of the Blood and Humours, in all inveterate Pains of the Joints and Limbs, in all Scabs, Blotches, Ulcers, and Diftempers of the Skin, in all Cachexies or ill Habits of Body, in the Scurvey, Rheumatifm, and often in the Sciatica, and King's-Evil, it has been found the only effectual Cure in the World: And in many other Cases in which it has been try'd, and has not fucceeded so effectually, this however may be faid in its Commendation, that where it has not done much Good, it has however never done the leaft Harm; and may therefore in all Cases be very justly call'd safe Practice.

But here perhaps some one may object against the external Use of Mercury, and affirm, that ill Consequences have sometimes arisen from it; and may at the same Time demand, whether the Mercury which is rubb'd into the Body does not always remain in it; and if not, which way it is discharg'd out of it, when no Salivation ensues? Tis very well known that Mercury is made use of to raise Salivations outwardly apply'd in Unction, as well as inwardly taken; and that ill Consequences have sometimes arisen from it, when us'd both these ways, I make no Doubt; but then those ill Effects have always proceeded, not from the right Use, but from the Abuse of it; either for want of giving it with Judgment and Diferetion, or else because it was not rightly prepar'd. If too great' a Quantity of it be either taken inwardly, or rubb'd in by Unction in too short a Time, as is generally done in raifing a Salivation, 'twill for the most part do more Harm than Good; because in such a Case, it Life be not always in apparent Danger, the Conflitution certainly is. And where it is thrown into the Body by Friction, if the Ointment be not rightly prepar'd, as it often happens in common mercurial Unguents, Plaisters, Girdles, &c. ill Effects must necessarily and unavoidably follow. But where, in preparing the Ointment, the mercurial Globules are fufficiently divided, comminuted, and separated from each other; in fuch a Case, there is no doubt but it may be as fafely us'd, and with better Effect, than if inwardly taken. For when it is fo prepar'd, its fine and volatile Particles will not fail to mix and circulate with the Blood and Juices wherever they go; but where the Circulation happens to be broken off, the Mercury, whether inwardly taken, or outwardly apply'd, must of Necessity stop. As to the latter part of the Objection, in which 'tis apprehended, that the Mercury which is forc'd into the Body by Friction, will always remain there, and confequently produce bad Effects, unless it be carry'd off by a Salivation; this I am fure will be of no Weight at all with you, Sir, who perfectly understand the Animal Oeconomy, and know very well that as much at least, if not more, is carry'd out of the Body every Day by infensible Perspiration, than by all the fensible Evacuations put together. But to those who are ignorant of this, my Answer is, that there is more Danger in this new Method of Cure, that the Mercury shou'd fly off too fast, and leave the Body too soon, before it has produc'd the desir'd Effect on the Blood and Juices, than that it shou'd remain too long in the Body, and be attended with any ill Consequences. For when the Mercury has for some Time circulated with the Blood, since 'tis impossible to be affimilated with it, Nature wou'd not fail to exert her felf in order to expel it, if it was necessary; but as it is in self of so volatile a Nature, especially after being rarefy'd by the Heat of the Body, 'tis impossible it shou'd be long retain'd in it; but it flies out of it with Speed at every excretory Organ. So that some Part of it, when there is a Spitting, may possibly be carry'd off by the Salival Glands, some by the Glands of the Intestines, some by the Kidneys, but the far greatest Part, no doubt, flies off by the Pores of insensible Perspiration. As it was at first receiv'd into the

C 2

Body

Body by the Pores, so they seem to be the properest Outlet for so volatile a Body as Mercury, as well as for so subtle a Body as the Venereal Poison. And that a vast Quantity of Mercury is thrown out off the Body that Way, is evident from hence, that Gold Rings on Persons Fingers under a Salivation are often colour'd white by the Mercurial Effluvia that exhale from their Bodies at that Time.

THERE is but one other Objection, Sir, which I know ever has, or, I think, possibly can be made against this New Method of Cure, and that is, that notwithstanding it has succeeded very well in France, yet that perhaps it may not prove so effectual here in England. But to this I hope to give a very full and fatisfactory Answer. In the first place then, I presume, it will be allow'd me, that the natural Properties of Mercury are the fame in both Kingdoms, that 'tis both as heavy and as volatile in England as in France; and I have before shew'd, that 'tis by Virtue of its Mechanical Powers, and not by any great and fenfible Evacuations that are sometimes caus'd by it, that 'tis a Specifick in Venereal Cases. If Mercury be as effectual in England to remove Obstructions, disfolve unnatural Cohesions, correct the Acidities, and destroy the Corrosiveness of the Blood and Juices, as it is in France, then I am fure it will as effectually cure all Kind of Venereal Diforders in England as in France. If it be urg'd, that the Climate of France is hotter than that of England, and confequently the infensible Perspiration there greater than here with us; I know no Advantage at all that can arise from thence, but perhaps the contrary; that by means of a greater Perspiration, the Mercurial Effluvia may fly off too fast, before they have effected a sufficient Alteration and Change in the Blood and Fluids. And THAT perhaps is one Reason at least, why the Physicians at Montpellier never put any Person under this Operation in the hotter Months of the Year. And whoever confiders that more than two Pounds of fuch gross Substances as we daily eat and drink, are constantly car-

ry'd off by infensible Perspiration in four and twenty Hours, will be in no Pain at all for fear left an Ounce of so volatile a Body as Mercury, and so subtle a Body as the Venereal Poison, which is more than both put together amount to in Weight, shou'd not be transpir'd or carry'd out of the Body in almost as many Days. For the actual Venereal Taint, if we may judge of it from its Manner of Communication and Operation, is fo very fubtle, that on Account of its Quantity 'tis of no Consequence at all; but only from its mischievous Effects on the Blood and Humours. And the Mercury, when its Particles are fufficiently broken and separated from each other in preparing the Unguent, and 'tis afterwards rarefy'd by the natural Heat, becomes fo very Volatile, that it often flies off too foon, but never remains fo long in the Body as to produce any ill Effect. If this Way of Reasoning will not satisfy, I must appeal to Facts, against which there is no disputing. Dr. WILLOUGHBY, in his Notes and Observations on Mr. CHICOYNEAU'S Book, gives an Account of two or three Cases, of which he had then been an Eye-Witness here in England, where the Cure was effected after this Manner by Mercurial Frictions, without occasioning the least Salivation. The Author of the Advertisement you fent me to Montpellier, which is printed in the Beginning of this Letter, has perform'd a great Number of Cures here in Town after the same Manner; and there is a French Surgeon here at prefent who has likewise perform'd some; but for want of Judgment, or the Advice of a skilful Physician, he has likewise committed some Blunders. As for my own Part, I was refolv'd to make feveral Trials my felf before I wrote to you; in all which, I affure you, I have fucceeded even beyond my Expectation.

Thus, Sir, have I given you a short, but true Account of the Montpellier, or new Practice in Curing the Venereal Disease, and all its most diresul Attendants; I have likewise briefly shewn its Excellency and Prese-

rableness

rapident Y

rableness in every Respect to all other Methods yet discover'd; more particularly, as it is the most certain, easy, and safe Way of Cure yet known. At the same time, I think, I have fufficiently demonstrated the Inefficacy, Danger, and ill Consequences of the common Way by Salivation, not from my own Reasoning only, but from great and unquestionable Authorities: I have in some Measure endeavour'd to explain how Mercury operates, and effects fo certain a Cure in this Distemper when discreetly manag'd, and have shewn that 'tis chiefly, if not wholly owing to the Change and Alteration that is made in the Blood and Humours by the Weight and Volatility of the Mercurial Particles, and not to any great and fensible Evacuations that are sometimes occasion'd by it. I have acquainted you in what other Diseases, besides the Venereal, this new Practice has been found fuccessful, and have answer'd all the Objections, I ever heard were, or, think, can possibly, be made against it; and lastly, I have confirm'd its Usefulness and Success here in England by Facts not to be disputed. So that whilst I have been discharging my felf of a particular Obligation to you, I hope, I have at the same time done something for the general Good. For I can scarce persuade my self that any Person in his right Senses will for the future go as far as Montpellier for a Cure, which he may be fure of finding here at home; or undergo the Torture and Danger of a Salivation, when he can meet with a more effectual, safe, and eafy Cure without it. Shou'd this excellent Method once prevail here, as there is all imaginable Reason to believe it will, 'twou'd in a very short Time save many Thousands of his Majesty's Subjects; and allow me on this Occasion, the Vanity to assure you, that I have already fav'd one of the most valuable Lives in England by it. Nay, shou'd it once become universal, 'twou'd be the utter Downfal of all that profligate Tribe, who plague Mankind with their pretended Cures of this Distemper, from Dr. MI-BIN down to Dr. C-M.

# Physician in London.

Ir you shou'd ask me, Sir, how it comes to pass, that a Method which carries every Recommendation in the World along with it, shou'd not be more generally practis'd; I can only fay, that one principal Reason I take to be, because it is not generally known. discours'd with several Physicians here about it, who feem most of 'em entirely unacquainted with it; and the most Learned among them who approve of it, fay, that it does not lie directly in their Way, and that they have very. few Opportunities of making fuch Trials. The Meaning of which is, that thro' an ill Custom that has, I don't know how, prevail'd here, 'tis reckon'd diffreputable for a Physician so much as to give his Advice, or any way concern himfelf in Venereal Cases; and to do so, is enough to ruin him in his other Practice. So that the Surgeons are, in a manner, the only Advisers and Practitioners in fuch Cafes; and they fay Salivation is what they were bred to, what they have always practis'd, and what they will always frand by; nor will they by any Means whatever be prevail'd on to admit of a new French Method to cure an old French Difease. How good and just a Way of Reasoning theirs is, I leave you to judge, Sir. But yet this is to be faid for 'em, that how painful and dangerous soever a Cure by Salivation may be to the Patient; yet so plain, easy, and obvious is the Way of raifing it, that even Apothecaries Boys, and Surgeons Apprentices are not afraid to undertake it; with what Succefs, I will not fay. But 'tis quite otherwise at Montpellier, as I told you before, where the Surgeon only performs the Manual Part of Rubbing, while one of the Professors constantly stands by to advise and direct; and indeed they are well paid for their Attendance; an English Gentleman seldom or never coming off there for less than Eight hundred or a thousand Livres, and generally a handsome Present to the Phyfician befides.

But to do Justice to our London Surgeons, you must excuse me, Sir, if I cannot entirely agree with you, that it is wholly owing to their Forwardness and Presumption

in undertaking the Cure of this Diftemper themselves without any better Advice, that we meet with fo many imperfect Cures, and so many broken Constitutions; no, there are two Opinions, with neither of which I can by any Means agree, that have much contributed to the same End; the first is, that of some over-nice and scrupulous Gentlemen of the Faculty, who believe that all the Consequences and direful Effects of this Disease are no more than the just Reward of it, and that they who suffer under it, ought not to receive any Help or Assistance whatever; the other more general and prevailing Opinion is, what I just now mention'd, that 'tis dishonourable for a Physician of Note and Character any way to concern himself in the Cure of it; so that the Unhappy in these Circumstances are in a manner forc'd to put themselves under the Care of Surgeons, or elfe fall into worse Hands. But, for my own part, I think it so far from being a Dishonour, that I have always thought it a Duty, and shall always think so, to affift the Unhappy in every State and Condition of Life, and to leave it to Heaven alone to punish in the next World, the Crimes and Offences committed in this.

In a word, Sir, if the Publick shall happen to receive any Benefit and Advantage from what I have written concerning this New Method of Cure, as I flatter my self it will, the Merit will be chiefly yours, whose Request laid me under an Obligation of obeying you in the best Manner I was able; since upon so many Accounts you have a Right to command every Thing in the Power of,

SIR,

Your most Oblig'd, and

Most Obedient Servant,

Orange-fireet, near Leicester-Fields, Dec. 10. 1729 R. BROWN.
